Worry is inseparable from general practice: the family doctor works in comparative isolation and has to bear the weight of many important decisions alone. It is true that he has the consultant services behind him, but he has the difficult task of sorting out the "probables" from the "possibles" in serious diagnoses. If every possible case of poliomyelitis was sent into hospital, the wards would soon be full to overflowing. There are always problems arising in general practice, such as the terminal cancer case, the aged dement, or the dying child. Worrying as these cases may be, they are accepted like the night calls as a part and parcel of general practice. The consultation with a neurotic can produce quite a different set of reactions. For many doctors this is a worry that they do not willingly accept, and they respond to it with an emotional reaction out of all proportion to the demands of the patient. Two factors contribute to this attitude: the doctor is disquieted because he realizes that he does not fully understand the situation, and he feels guilty because he cannot do more than bluff his patient with a placebo. In an effort to assuage his conscience he may well be in danger of losing the sense of values he is so careful to preserve when dealing with organic disease, and as a consequence treat too many possibles as probables and submit patients unnecessarily to a variety of hospital investigations. This problem was one of those discussed at a well-attended and useful conference held in London recently by the metropolitan and home counties faculties of the College of General Practitioners and the Society for Psychosomatic Research. Speaking at the conference, Dr. R. R. Bomford suggested that a simple way in which to alleviate the doctor's worry was to encourage the patient to talk. The neurotic has the reputation, often quite wrongly, of being a great talker, and many doctors direct all their efforts towards denying him freedom of speech. Yet it is, as Bomford pointed out, by what the patient says and how he says it that the physician is guided towards the correct diagnosis. The careful analysis of the patient's description of his complaints in space, time, and character is often more important than the result of investigations which only serve to fix the neurosis and make its alleviation so much more difficult. There is always the fear that a

¹ Ernstene, A. C., *J. Amer. med. Ass.*, 1957, 165, 1110.

cerebral tumour will be diagnosed as a neurosis, but Bomford rightly stressed that such errors are rarely through ignorance of recondite facts but are almost always due to failures in simple history-taking and simple physical examination. It is true that such a diagnostic "brick" would be considered one of the mortal sins of medicine: on the other hand, the creation of a load of human misery by a chronic neurosis arising from over-investigation may not even be recognized as blameworthy. But whether investigations are essential or not for any particular purpose, in the end the doctor must make up his mind about the case. If it is decided that the problem is one of anxiety, then unqualified reassurance must be given. This applies equally to the specialist in hospital and to the general practitioner: the effect of reassurance is completely vitiated if there is any suggestion that the patient should report from time to time "to make quite sure."

No doctor can cure every patient, and worry is sometimes engendered by the conscientious doctor who sets himself too high a standard. For him Bomford repeated advice given 30 years ago by a surgical teacher: "You cannot be expected to reach a complete and final solution to every conceivable situation as many doctors feel they ought. You can only be expected to do your best with the facts available at the time and with the particular degree of knowledge and experience you have." Bomford was speaking from the point of view of the worried doctor, but Dr. A. Carlton Ernstene, chairman of the section of internal medicine at the annual meeting¹ of the American Medical Association in New York, made many of the same points in an address—entitled "Explaining to the Patient"—which examined the problem from the patient's viewpoint. Ernstene remarked: "Perhaps the commonest criticism of the physician today is a seeming lack of sympathetic interest in his patients." Not every family doctor feels drawn to formal or interpretative psychotherapy, but the importance of the listening ear cannot be overemphasized. Many of the worrying problems confronting the general practitioner can be eased or even solved if only the patient can be given time and opportunity to unburden himself.

POLYMYALGIA RHEUMATICA

In 1951 G. D. Kersley¹ reported a series of 13 patients who suddenly developed severe muscular pain and tenderness. The pain, though widespread, affected particularly the shoulders and thigh muscles. The erythrocyte sedimentation rate was raised in all cases, loss of weight, anaemia, and pyrexia were common, but none of the patients showed any evidence of joint disease. L. Bagratuni² described 7 similar cases in 1953 and drew attention to the similarity between the symptomatology of this condition and the prodromal symptoms of rheumatoid arthritis. In 1956 the same author reported³ a series of 21 similar cases, in 17 of which no involvement of the joints could be found, though minimal joint changes were present in 4 patients. He gave the name "anarthritic rheumatoid disease" to the disorder, taking the view that it is very closely related to rheumatoid

arthritis. In general, however, the prognosis is good and joint changes do not develop. A further description of what appears to have been the same disorder has recently come from H. S. Barber⁴ under the title "myalgic syndrome with constitutional effects (polymyalgia rheumatica)."

From these reports it is apparent that this syndrome is most common in middle-aged and elderly people, that it affects women more often than men, and that it is characterized by the relatively sudden onset, without precipitating cause, of widespread muscular pain. The pain usually begins in the neck and shoulders or in the buttocks and thighs, but subsequently spreads so widely that its very ubiquity may often suggest a psychogenic cause. Persistent pyrexia, disturbed sleep, lassitude and depression, loss of weight, hypochromic anaemia, and a general muscular stiffness, worse in the mornings, are common features. Signs of joint involvement are, however, conspicuous by their absence, but an almost constant sign is a greatly raised E.S.R., often to more than 100 mm. in 1 hour (Westergren). Hyperglobulinaemia is usual, the differential sheep-cell agglutination test is positive in a small number of cases, but L.E. cells are not found and muscle biopsy specimens obtained in four of Kersley's patients were normal. The disease tends to run a prolonged but remittent course of several months' or even some years' duration, but the eventual prognosis is good, and in Barber's experience some patients recover completely while in others the symptoms gradually become less troublesome. Salicylates may give symptomatic relief, but in resistant cases the response to cortisone is usually dramatic.

Barber remarks that the disorder shows certain resemblances to the syndrome of polymyositis.^{5,6} While the clinical picture certainly suggests a process of widespread inflammatory change in muscle, the syndrome to which the name polymyositis is now generally applied is very different both clinically and pathologically. It causes a weakness of girdle and proximal limb muscles, closely resembling muscular dystrophy in many respects; muscular pain and tenderness are usually minimal or even absent. Furthermore, in polymyositis, and in the closely related dermatomyositis, there are usually striking pathological changes in the muscle, whereas in the few cases of polymyalgia in which muscle biopsy has been undertaken the findings have been negative. Certainly the high E.S.R. and the clinical features of the polymyalgic syndrome suggest that, like polymyositis, it almost certainly belongs to the "collagen" group of diseases, but most of the information at present available indicates that it is a distinctive clinical syndrome, which, as Bagratuni has suggested, is more closely related to rheumatoid arthritis than to any other disease. These observations emphasize the need for measuring the erythrocyte sedimentation rate in any patient of the right age who complains of generalized muscular aches and pains. Probably the symptoms in many such patients

have been wrongly attributed to psychogenic causes in the past, when the judicious use of salicylates or of cortisone in severe cases might have relieved their suffering.

TISSUE DISTRIBUTION OF ANTIBIOTICS

In a leading article¹ drawing attention to Maxwell Finland's recent study² of antibiotic combinations, we quoted his remark that possibly "one or another of these erythromycin-like agents will be found to possess special virtues not yet revealed." In spite of the impressive evidence showing the superiority of erythromycin over oleandomycin and spiramycin, it would be unwise to assume too readily that no such special virtues can exist. It is, for instance, astonishing that spiramycin, with about one-twentieth of the anti-staphylococcal activity of erythromycin, should possess its adherents for the treatment of staphylococcal infections. The studies of Y. Chabbert and his colleagues³ may afford a clue to this mystery. These authors inoculated mice with staphylococci intravenously, treated them with various antibiotics for three days, and enumerated the surviving staphylococci in the kidney, an organ in which this infection is localized. They also estimated the antibiotic content of the blood during life and of the kidney *post mortem*, and, whereas these values were approximately equal for erythromycin, carbomycin, and oleandomycin, the concentration of spiramycin in the kidneys was five times higher than that in the blood. They believe that such concentration in a tissue may explain why the *in vivo* performance of spiramycin is better than its *in vitro* activity would suggest. This does not mean that spiramycin is a better drug than erythromycin: it only explains why it is not so much worse. Clearly the tissue distribution of antibiotics, if it can vary in this way, calls for much further study.

SCOTTISH PRESIDENTS

The new President of the Royal College of Surgeons of Edinburgh is Professor John Bruce, and of the Royal College of Physicians of Edinburgh Dr. A. Rae Gilchrist.

Professor Bruce, vice-president of the College, succeeds Sir Walter Mercer, who has held the presidency for six years. An Edinburgh man, Professor Bruce was appointed surgeon-in-charge at the Western General Hospital there in 1947, after serving in Burma during the war. He is now surgeon-in-charge at the Royal Infirmary, and last year was made regius professor of surgery in Edinburgh University. Dr. Gilchrist, who succeeds Sir Stanley Davidson, is also an Edinburgh graduate. A distinguished cardiologist, he has done much original work on the clinical use of anticoagulants in the treatment of coronary disease, and this *Journal* has had the privilege of publishing a number of papers by him. For the last 17 years he has been consulting physician at the Royal Infirmary, Edinburgh.

SOME NOTES ON NURSING FROM A PATIENT'S POINT OF VIEW

BY

Sir ERNEST KENNAWAY, D.M., D.Sc., F.R.S.

My experience of nursing has been gained during the last ten years as an in-patient on eight occasions, five for surgical procedures, in six hospitals. My nurses have been of a considerable range of nationality, and I have learned a great deal from talking to them, and from hearing them talk to each other. Occasionally things that should be done are not done, but I have never once had any cause for serious complaint. Ten days in hospital in Helsinki was an interesting experience, as none of my nurses knew any English, though one of them remembered a little German from a period in Switzerland as children's nurse, and my own Finnish was non-existent. But their experience of nursing, and anxiety to help, overcame all difficulties, and these good friends, wondering what I was accustomed to eat, brought me an overwhelming selection of foods.

The comfort of a patient in bed depends largely upon small matters which may seem very trivial but which are very important to him. For instance, no one, whether professional or amateur, who looks after a patient in bed ever seems able to understand that things placed for his use on the bedside table—a cup, a book, a telephone—should not be placed, as they invariably are, opposite his elbow, but about 18 inches further forward, opposite his hand. Again, if a patient is even slightly orthopnoeic he will not be able to sleep lying flat in bed, and requires some amount of slack in the bed-clothes to wrap around his shoulders. But his attendant will always aim at folding over the bed-clothes neatly at the level appropriate for an empty bed.

A phenomenon which must always excite the wonder of a patient immobilized in bed for many months (six in my own case) is the following. Towards the end of the long day, say about 8 p.m., one feels hot, irritable, restless, tickly, and thoroughly miserable and beastly in every way; the bed-clothes are all over the place, and one is equally sick of reading and of not reading. Then two women, who know their job, come into the room and carry out various operations, to the accompaniment of the freest possible criticism of the peculiar characteristics of nurses and of patients. In 10 minutes or so they depart. The patient feels wholly and entirely different; cool, comfortable, relaxed, and rather inclined to go to sleep. How is it done?

The subject of the early awakening of patients in the morning is a perennial source of complaint, and, certainly, to be aroused at 6 a.m. for the taking of a temperature is persistently normal may seem rather superfluous, but the question is bound up with the whole two-shift system of day- and night-nurses; the night-nurses have certain duties to carry out by 8 a.m., and the day-nurses are not at all sympathetic to any omissions. And no cup of tea in the day is more welcome than the early one, brought by the helpful ambulant patient and announced by the phrase "Avacuppateadad?"

The process of washing a male patient all over daily in bed by a female nurse raises questions which I have never heard even mentioned, but one hopes that nowadays one can discuss this matter without being prosecuted for obscenity. There is, of course, an obvious difference between old and young men in this matter. I have been washed by a Dutch nurse, gently, but thoroughly, as one washes one's own dog, and I have been demurely neglected for long periods. The rational system would seem to be for the nurse to provide a male patient, not unable to use

his hands, with facilities for washing his genitalia, and for the man to undertake this duty as a matter of course. But so long as the whole matter is buried in the deadly silence of convention nothing can be done. The male patient sometimes wonders what is the practice in the women's wards.

The present system of medical qualification discharges into the world of general medical practice doctors who have only the vaguest idea of the needs of a patient confined to bed, and of the many conditions which contribute to his welfare and comfort, and hence in many cases to his recovery. Every student of medicine should have some practical knowledge of nursing. This could be provided if each student, in turn, was immobilized for, say, a fortnight, by having a broom strapped to him, or her, from axilla to ankle as in pictures of first-aid for fractured femur, and during this period would be tended wholly by fellow-students of the same sex; at the end of this course both parties, nurses and nursed, would have learned a great deal about nursing.

A curious convention has been established that a patient in hospital who, after a period in bed, is allowed to get up, clad only in pyjamas, can put on a loosely fitting dressing-gown and slippers and is then clothed sufficiently to spend the day in a ward in which people who are not patients are wearing ordinary clothes and underclothes and even then may not feel unduly warm. Some kind of intermediate attire of a two-piece washable nature, which could perhaps be the same for both sexes, is required.

PAINTING FOR PLEASURE

BY

MERVYN LEVY, A.R.C.A., M.R.S.L.

Among those who find in painting the perfect form of creative relaxation from their work are many doctors. One need look no further than the annual exhibitions of the Medical Art Society for evidence of their enthusiasm and skill. But for every doctor who now paints for pleasure there must be many more who would like to—if only they knew how to begin. It is to them that this essay is addressed. The short answer to their problem is what Rembrandt is reported once to have said to a pupil: "Take up your brushes and start to paint, and when you have finished, put them down."

For those who find in golf or bridge merely an intensification of the exasperations of modern life, painting is the answer. There are no ultimates in art, so the painter escapes from the twin bondages of failure and success: his destiny is to journey, but not to arrive. Even his mistakes will be simply steps in an endless progression. Gradually he will learn to see. Little by little the mysteries of colour and line, of shape and form, will be revealed to him in their miraculous diversity. The contour of a face will become an ocean of subtle and intriguing undulations: the contemplation of a colour the study of all the other hues in proximity, since every colour both affects and in turn is affected by the colours that surround it, and by the prevailing conditions of light and atmosphere. He will learn that no colour exists in isolation. Through the act of painting a new world will be opened to him.

Take the Plunge

Put it to the test at once. Take a pencil and a piece of paper, and draw an apple. Then consider your drawing in relation to an actual apple. Every apple is basically a sphere; but every apple is also different from all other

apples. Your paper will almost certainly show some sort of circle—the symbol for all apples. But each individual apple has as much unique character as a face. Examine one. Its contour is far from circular, or spherical, in any mechanical sense of the term. Sections of straightness will almost certainly appear among the arcs and curves. In short, to draw the contour of a single apple is a far more complex and interesting problem than might at first have been imagined. And what of its colour? Is it green, yellow, gold, reddish? Place the apple in two or three different settings and lights—near a window, in shadow, under an artificial light. What is its colour now? There is of course no finality about this; its colour will vary with the prevailing circumstances. Here, then, in a solitary apple are embodied a number of absorbing problems. Indeed, your first painting might well be simply an apple.

Little need be said about style. Once brush is put to paper or canvas, even for the first time, the painter's own unique personal style will automatically assert itself. Very soon he will have evolved a manner of painting as individual as his handwriting.

Materials and Equipment

What materials and equipment are needed? Opaque water-paints are excellent for bold, freely executed work where expression of feeling and emotion is to predominate—children's painting, with its fierce verve, is an apt example. With this striking and vigorous medium full advantage can be taken of the "artist's licence" to distort form and colour to intensify the psychological conception. As does the caricaturist, so can the artist use distortion as a means of crystallizing the essence of his subject. For more thoughtful and disciplined work—such as the painting of the apple—I would suggest oils. Unlike opaque water-paints, which must be handled with speed since they dry rapidly, oils are a slow-drying medium that can be shaped and formed over a comparatively long period. Mistakes can be corrected, passages taken out, and the painting worked on, and into, for as long as the colour remains wet. Usually an oil painting takes a couple of days to dry (it takes many weeks to dry thoroughly), so a subject can be dealt with in a much more leisurely fashion than with water-colours.

Armed with these two media, the artist can swing happily from freedom to discipline, and back again. That is not to say that oils cannot be used freely; indeed they can. Their ultimate potential is very much more extensive than that of water-paints; and their richness and flexibility can satisfy every aesthetic need. But for the beginner opaque water-paints are deeply relaxing, since they facilitate, with a minimum of paraphernalia, the uninhibited flow of spontaneous emotion.

For painting in oils the range of colours listed below is quite enough to start with; too many create confusion. Besides, every colour of the spectrum and every shade of each colour can be made by mixing the three basic primaries, red, yellow, and blue, with the addition of varying amounts of white. These colour recipes are so elementary that there is no need to elaborate them here. The colours needed are white (I suggest zinc white, or titanium white, in a larger tube than the remainder, since more of it will be used), cadmium red, alizarin crimson, french ultramarine, cobalt blue, cadmium yellow, viridian green, and burnt umber. I have omitted black since this makes for dirty painting. There is no black in the spectrum and it is not scientific—as the Impressionists argued—to use an element which is not part of the chromatic structure of white light. Burnt umber has two immediate purposes. Mixed with a little turpentine it makes a thin, quick-drying substance for laying in the outlines of the subject with a fine brush. In its natural thick state it can be used for painting in monochrome, which is perhaps the best way of getting the "feel" of oils before plunging into colour.

About half a dozen long-handled hog-hair brushes will be needed: one or two round fine ones for "laying in" and

for detail, and three or four flat brushes of varying size for putting on broad slabs of thick colour. Palettes are obtainable in oval or oblong shapes, and of various sizes. A palette-knife is an indispensable tool. It can be used to mix colours, to scrape out unsatisfactory passages, to clean the palette at the end of a painting session, and even to paint. Palette-knife painting makes a stimulating change from brushwork. The colour is simply laid on with the blade of the knife. Or, combined with brushwork, the palette-knife can be used for such purposes as plastering on highlights in rich impasto.*

Other requirements are little tin dippers which clip on to the palette for holding linseed oil and turpentine. Linseed oil facilitates the manipulation of colours, making them less stiff and more amenable to mixing, while turpentine is used for making thin mixtures of colour in which to lay in the subject (this should always be done with a brush: the antiquated method of drawing the subject in charcoal or chalk is a dirty practice) and for cleaning brushes. The latter is best done in a jamjar containing an inch or so of turpentine; after removal of the thick colour, the brushes are finally washed in warm soapy water and stood, bristles uppermost, in a pot or jar. A good supply of rag for general wiping and cleaning purposes will be needed. After use, for instance, the palette should be scraped clean of waste paint and its surface wiped with rag and turpentine.

Only two items remain to complete the equipment for oil painting: an easel, which can be anything from a child's blackboard model to one of the relatively inexpensive sketching easels, and something on which to paint. Prepared canvases or canvas boards can of course be bought, but for the beginner it is less costly simply to treat some pieces of stout cardboard or plywood with two coats of common glue-size.

The materials for working in opaque water-colour are much simpler. The colours are best bought as "poster paint," either in pots or tubes. I would suggest white, black (permissible in free-expression painting where colour should be used imaginatively rather than literally), and a bright red, yellow, blue, and green. Long-handled hog-hair brushes, such as children use at school, are best. About six of these in varying sizes are enough for a start. For a palette in which to mix the colours a saucer or shallow dish makes a good substitute for an enamel palette from a shop. Drawing pins, pencils, jamjars, rag, some fairly large sheets of white cartridge paper (half imperial—15 by 22 inches), and a drawing-board—a piece of sturdy card will do—complete the equipment.

Art Societies

Once the plunge has been taken and painting begun, the artist will probably want to join a local art society and link up with others who paint for pleasure. Membership of such a group gives opportunities to attend a variety of meetings and to show pictures at the annual exhibitions.

In London there is the Medical Art Society. Founded in 1934 under the presidency of Sir Leonard Hill, the society is now a flourishing organization with a membership that has risen steadily from an original 20 to over 160. Now under the presidency of Sir Philip Manson-Bahr, the society holds its annual exhibition at the Walker Galleries in Bond Street, and meets once a month from October to May for discussions, lectures, and demonstrations.

But there is no reason why doctors far removed from the metropolis should not enjoy the pleasure of regular meetings in their own locality. One such group has recently come into being in the North of England. The Merseyside Medical Art Society, founded last year under the presidency of Professor B. G. Maegraith, of the Liverpool School of Tropical Medicine, is now planning its first exhibition.

But the first thing, naturally, is to make a start.

*Solid colour. Paint which is applied with maximum thickness. Heavy impasto is usually confined to the lighter areas in a painting, and especially to the highlights.

A SKIN GAME

[BY A MEDICAL CORRESPONDENT]

This was like throwing a little stone into a big pond and seeing the ripples appear unexpectedly a long way away. News travels fast, and the replies from the Western World reached me a good deal sooner than those from the Albany, a mile or so away.

It started in June with a telephone call from a voice, whose name I didn't catch but who said he was Pontificus, the gossip writer of the "Sunday Post." He told me that he had heard that pills containing a substance isolated from orange peel would influence skin pigmentation. Was this so? I had never heard of it, but I agreed it might be true. In that case, could pills turn white people black, and black people white, or was this quite impossible? I said that research into pigmentation was going on and might lead to this possibility before long; not an inconceivable idea. I should add that he was asking me these things not because I knew anything much about the subject, but because I am the amateur editor of a specialist medical journal; one pressman to another, as you might say.

I never read the gossip writers, so my first shock was delayed until Monday at lunch-time, when a gynaecological colleague genially greeted me with, "I was interested in your advertisement in the 'Sunday Post' yesterday." Finding Sunday's paper on Monday evening can be a very difficult task, even in June, when there are no fires to be lit. But eventually I found it, my little paragraph wrapped round a large picture of Jean Cocteau; his name was very clearly written under the picture, and there was no real excuse for thinking it was a picture of me.

"Black and Tan"

"An American manufacturer of cosmetics is, I hear, developing a pill that turns people brown. For some time doctors have been using a drug extracted from citrus peel oil, 8-methoxypsoralen, to protect patients with skins that are particularly sensitive to sunlight. Now certain limited tests seem to show that an offshoot of this drug will even produce a protective tan on people who shun the sun."

"If white people can be made brown, can black people be made white?" Dr. ——— tells me that there is no chemical reason why such a step should not be possible within the foreseeable future. A great deal of basic research on the nature of pigmentation is being done in America, which has a near monopoly on money—if not brains—for projects in this field. "It is possible, it seems, that within the next twenty years men will be able to change the colour of their skin *ad lib.* by swallowing the right pills. Colour may yet be easier to eliminate than the colour bar."

Actually there is nothing in this to take exception to, but people will read between the lines, with results that were interesting, also annoying, and sometimes rather pathetic. It was interesting for one thing to see how the newspapers copy stuff from each other. Many people wrote to me after they had read the same thing in their local paper within a week or two of the "Sunday Post" paragraph. Articles or paragraphs were mentioned from the *Trierischer Volksfreund*, the *Chicago Daily Tribune*, the *New York Daily News*, the *Cumberland News* (Maryland), the *Boston Daily Record*, the *Saskatoon Star Phoenix*, the *San Francisco Examiner*; several others who wrote mentioned their local paper, but did not give its name. All these paragraphs mentioned my name, and, so far as I could see from the cuttings I received, they did not add to or subtract from the original paragraph. One might at the same time observe that any mistake or misstatement at the outset would have been repeated innumerable times presumably; news travels—whether good, bad, or just plain wrong.

Although the original paragraph was quite restrained, this did not prevent readers assuming very much more than was really implied. From New York comes a letter which starts: "Read of your discovering pills that will change colored people white." From Minnesota: "Our whole family read an article you wrote in the 'Sunday Post.'"

From New York: "... I came across an article dealing with your past research work." Also from New York: "The 'Sunday Post' said to-day scientists expect to have new pill available within the next 20 years to change a person's color from black to white."

Instead of writing this humble account of events I could evidently have hit something of a journalistic jackpot. Some papers, such as the London "Sunday Telegraph," only rang up for more information. A publishing company of Chicago made the cryptic request, "Please forward us a tear sheet of your article... excerpts of which appeared in the 'London Post.'" A German paper which claimed to be the biggest Sunday paper of Western Germany asked me for 1,000 words; a Northern Italian paper wanted somewhat the same, and two American periodicals invited me to "get the story right."

Turning to a more practical side, there was evidently a commercial note in the letter I had from some "Packers of Quality Citrus Concentrates," with an address in Florida, and probably also in the letter from the director of the laboratories division of a large firm of manufacturing druggists in U.S.A.

All these letters were coming in a fairly steady stream for about three months.

Not surprisingly, some dermatological colleagues felt the pressure. A friend who practises in the West of England was constrained to write to me for information, and a professor of dermatology in the Middle West of U.S.A. wrote a sympathetic letter.

Most of these letters are from private people who are writing about themselves, their relatives, or their friends. Many of them are vitiligo patients, and it is instructive to see how this harmless disorder can bedevil a person's life. Letters from patients are often rather funny, and it is easy to be facetious about them; but they are based on some measure of suffering, and in reading them one can appreciate what a harvest there is for anyone who would exploit these trusting people.

From New York: "Now I think I've found new hope in reading your article... if these pills could help me please send me some and I'll pay you no matter what the cost... Any advice you have would mean more to me than anything in the world."

A mother from Dearborn, Michigan, said: "My 5-year-old son is an albino... He is a beautiful child, and although we love him as he is we are always seeking a way to help him..."

A lady wrote from Bavaria: "I would not care whether your treatment would take off the hair-dye too, as I much prefer to look like dead and old instead of spotted like a tiger."

More formally comes from Chelsea, London: "I would be very greatly obliged if your secretary could give me any details of the properties and availability of this drug."

Evidently most of these people have vitiligo, and I am not surprised they want to get rid of it. A few seem to be troubled by nothing more than freckles, and some only wish to avoid sunburn irrespective of the matter of pigmentation. There remain a few whose letters bring to mind the inherited racial pigmentation and the curse it carries in some countries. A Mexican magazine published an article on "Pills to Make Coloured Persons White," and when a reader wrote to that journal she was referred to me for details. Some of the letters I have received have been amusing; most of them annoying, as I felt it only right to answer them in some fashion. The one that has arrived most recently is neither of these. If I had any tendency either to laugh or to complain this letter brings me up sharp against a sad reality: from Miami, Florida: "I have read your article in a magazine and am so interested in the article. I want to be lighter or whiter than I am as I am quite dark (Negro) will you help me? What ever the pills cost for the treatment I will mail checks for the cost if you will tell me the instructions how to take them. Please; please; do help me."

So the ripples have spread, and for the few that I have actually seen there have, I suppose, been innumerable others in people whose hopes have been raised but who have not ventured to write to me; the other side of this which has so much struck me is the power of the newspapers and the great responsibility they bear. From all sorts of angles, it makes you think.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Blood Transfusion in Obstetric Haemorrhage

SIR,—I was interested in Mr. W. G. MacGregor and Dr. A. D. Tovey's article "Blood Transfusion in Obstetric Haemorrhage" (*Journal*, October 12, p. 855). Their contribution shows promise of proving an important advance in the treatment of shock in concealed accidental haemorrhage, and it is all the more praiseworthy if correction of blood volume deficit leads to a reduction of the incidence of bilateral cortical necrosis in these cases. Patients in whom concealed accidental haemorrhage is superimposed upon chronic anaemia of pregnancy are also likely to benefit from their extended haematological investigations.

The therapeutic blood transfusion test which they recommend for use in institutions at which facilities for special haematological investigations are lacking also sounds attractive, but it would be interesting to hear whether the authors have sufficient confidence in the signs and symptoms of over-transfusion given by "weakened" myocardia to recommend the application of this method to patients suffering from possible malnutrition and undetected chronic anaemia of pregnancy—both frequent complications in those parts of the world in which special haematological investigations are difficult to organize.

While agreeing with the authors' generalization that the "dangers of over-transfusion have been unduly emphasized," my own experience of obstetric haemorrhage among 34,000 deliveries and a number of pelvic exenterations undertaken in our teaching unit in Durban over the past three years has rendered me wary of over-transfusing myocardia which may be weakened (especially in megaloblastic anaemia). Might the authors not be persuaded, therefore, to modify their statement that "the dangers of over-transfusion have been unduly emphasized" to read as follows: "The dangers of over-transfusion in the presence of normal myocardia have been unduly emphasized"?

The authors state further that if a patient (suffering from accidental haemorrhage) "has been seemingly adequately transfused, but clinically the general condition, pulse rate, and possibly the blood pressure are unsatisfactory," she is in need of their therapeutic blood transfusion test (providing that there are no signs of circulatory overloading) which, if the pulse rate slows, should be continued until the pulse rate reaches 100. Here, once again, valuable emphasis is laid upon the avoidance of under-transfusion. Yet, surely, reliance upon continued transfusion is dependent upon complete or almost complete cessation of haemorrhage. While fairly easy to determine when haemorrhage is revealed, this estimation may be difficult in severe concealed accidental haemorrhage. Indeed, cases of this nature which do not respond satisfactorily to transfusion, or relapse, call for repeated clinical appraisal. Not only may a traumatic rupture of the uterus mimic a concealed accidental haemorrhage, but the Couvelaire uterus itself may rupture (particularly posteriorly) and produce continued intraperitoneal haemorrhage. Renewed or continued retroplacental haemorrhage and bleeding into the uterine musculature and broad ligament are also possibilities to bear in mind. Could these additional considerations not persuade the authors to be less absolute in their recommendation that caesarean

section and laparotomy be rigidly eschewed for maternal indications in concealed accidental haemorrhage—even at the expense of conflicting with the "Melbourne" viewpoint which they cite?—I am, etc.,

Durban, S. Africa.

DERK CRICHTON.

Testing for Occult Blood in Faeces

SIR,—I was much interested in the article by Dr. R. M. Bannerman (*Journal*, November 2, p. 1032) on the measurement of gastro-duodenal bleeding using radioactive chromium. The Gregersen test was employed for purposes of comparison. I was glad to learn that there is apparently no threat of a failure in the supply of benzidine at St. Thomas's Hospital. No doubt these investigations were completed a few months ago when stocks were still available, but it is now some months since our supply in Newcastle was cut off, and there seems no prospect of any further supply owing to the danger of manufacture. No reference to this was made in the article, and no doubt the author did not consider the matter as coming within its scope. Nevertheless, if such studies are to be pursued, and if occult blood testing is to be carried out on the scale which is clinically desirable, some substitute must be found.

It is this aspect of the subject to which I wish to draw attention. Kohn and O'Kelly¹ have described an orthotolidine method, but their test is not practicable for use in ward side-rooms or practitioners' surgeries. They do, however, also mention the possibility of the development of a slide test technique, and indicate a possible method. In my clinic a modification of this "slide method" is now in use, and is proving, for the most part, satisfactory. It was first checked against the Gregersen test, using the last supplies available, and correlated fairly well. We are, however, not entirely satisfied with it, and are looking for some way of checking its accuracy. The use of a radioactive substance looks very promising for this purpose. Our present technique is as follows.

Equipment Required.—Stock solution of 4% *o*-tolidine in ethyl alcohol; glacial acetic acid; hydrogen peroxide: 20 volumes; 5 ml. graduated glass cylinder with stopper; cavity tile. **Method.**—(1) Prepare freshly the testing solution as follows: Add 2 ml. of glacial acetic acid to 2 ml. of distilled water in the graduated glass cylinder, and make up to 5 ml. with the stock solution of *o*-tolidine. (2) A small portion of the stool should be taken from the centre of the stool with a clean glass rod, and spread over the floor of one of the cavities in the tile. (3) Place one or two drops of hydrogen peroxide on the surface of the faecal smear. (4) After 5 or 10 seconds add 2 or 3 drops of the prepared solution from the glass cylinder. (5) Watch for one minute and record as follows: A blue or blue-green colour appearing within 30 seconds indicates a positive result, and all positive results should be recorded by stating the time. Later results are regarded as negative or doubtful. It would be of interest to know the experience of other clinics.—I am, etc.,

Newcastle upon Tyne.

Dangers of Artificial Respiration

SIR,—Professor J. M. Webster's reference (*Journal*, November 30, p. 1314) to the possible danger in the application of artificial respiration, and to a fatal case resulting from it, emphasizes what I have been impressing on my classes of first-aiders for some years—that after middle age the chondro-sternal and costo-chondral cartilages tend to become "brittle," and that pressure on the chest from behind brings the risk of fracture. To picture the extreme hypothetical case, the chest cavity may become literally enclosed in a bony cage, upon which pressure will not produce any appreciable tidal-ventilation, but will increase fracture risk.

In the case to which Professor Webster refers, the two firemen were presumably physically strong men. In recent

practice in applying the Holger Nielsen method it has been found that the pressure transferred through the shoulder-blades to the sternum was as much as 95 lb. (43 kg.). Had the Schafer method been persisted in alone there would have been no such pressure on "fixed" bone. Pressure over the floating ribs and the surrounding soft tissues has the effect also of relaxing the diaphragm, the upward relaxation being reinforced by pressure exerted by the upper abdominal organs. In instances of the nature quoted by the Professor, the academic question of maximum tidal ventilation obviously cannot be suitably applied. It is better to aim at a modicum safely than to risk the danger of an attempt to reach a theoretical maximum. I would therefore suggest that after, say, 50 years of age—other conditions permitting—the method of choice should be that introduced by Professor Schafer.—I am, etc.,

R. J. MAULE HORNE.

Upper Parkstone, Dorset.

Casualty Department Attendance

SIR,—It was with great interest that I read Dr. P. Mestitz's article (*Journal*, November 9, p. 1108), and, while there are very many interesting points obviously beyond the scope of his survey, I would like to comment on a few.

First, regarding the motivation of coming to hospital and the frequency of the pain symptom. The patients have, as Dr. Mestitz suggested, dramatized their condition in order to justify their presence in the casualty department. But is not this something of an *a priori* necessity? Every effort is made to encourage the patient to attend his own general practitioner, and what would happen if the patient arrived at the casualty department and just asked for a check-up? He knows what would happen if he went to his practitioner: would he have his blood count performed, would he have a chest x-ray? Even the most diligent practitioner would find it hard to take more than 20 minutes from the waiting-room queue for a symptom-free patient. I am suggesting that this was the motivation of a considerable proportion of the 27% of "no organic cause found" group.

During my stay in this country I have been very impressed with the regular medical check-up policy, and although this never cured a neurosis it probably impeded a few. The point is well shown in Dr. Mestitz's remark that children, in the eyes of their parents, were more carefully examined by the hospital staff. Parents want to be sure about themselves, are healthy, just as they want to be sure about themselves. Of course, the busy casualty department of a hospital is not the place for this—but where is?

It would also have been interesting to have known what eventually happened to this 27% group. Did they come eventually back, were they referred elsewhere, or did the obviously more neurotic ones continue the trip from doctor to doctor in search of organicity? It seems somewhat myopic that only those that could be treated *ex pharmacopoeia* received any treatment, although such extended treatment as the neurotic patients would require is obviously beyond the casualty department. I know I am reflecting what were my own feelings, which I regretfully suspect are still felt by many present physicians, that when I ruled out the organic cause of a patient's symptoms I ruled in the neurotic one, and there my job ended; but the patient still had the symptom. Neurosis is a disease, a treatable disease, and one would stop the enormous time-wasting repetition of physical examinations and investigations, and, if a co-ordinated therapeutic attempt were made, the casualty officer would have more time for acute emergencies, and the general practitioner more time for examining his fit patients, and keeping them so.—I am, etc.,

Ann Arbor, Mich., U.S.A.

JOHN C. POLLARD.

Changing Pattern of Epistaxis

SIR,—I view with concern the frequent denigration of general practitioners by specialists in the medical press. In other words, I am fed up with the cracks at the G.P. The

article by Mr. J. P. Stewart entitled "Changing Pattern of Epistaxis" (*Journal*, November 23, p. 1231) is a case in point. Surely a quotation from a letter in the *Edinburgh Evening News* is out of place in a scientific article and can be considered a slur on the average general practitioner. It is the duty of the general practitioner to refer all suitable cases to a hospital; therefore we can be called a clearing station, but in this letter it has a derogatory meaning. The figures as given in Mr. Stewart's article do not bear out the opinion that reference to hospital is necessarily abused. Although the number of cases seen at the hospital increased since 1948, so did the number of cases needing admission, and it appears from the graph that the percentage of cases needing admission rose very considerably, hence indicating an increase in the severity of the cases referred by the G.P. (Out of the 100 cases seen in 1944, 6 required admission. Out of the 240 cases seen in 1956, 60 required admission.) Similarly, when we consider the actual treatment required at the hospital we see that they were of a type to require hospital assistance—i.e., 78% needed cauterization. In the treatment recommended by the author cauterization is only used in the third, or last, stage after the normal G.P. treatment has been carried out: yet 78% of the cases seen at the hospital needed cauterization.

With the improvement in the hospital service the hospitals must be used more and more by the general practitioner. Any technique which can be carried out more efficiently by the hospital than by the general practitioner must be carried out by the hospital. The general practitioner must obtain the best available treatment for his patient. Many techniques, and the cauterization of a nose is one, are not difficult, or even highly skilled, but they do require an amount of practice and the assistance of apparatus that justifies hospital attendance. Twenty-five years ago the general practitioners were forced to perform operations that they should never have performed. If they were intelligent or skilled they knew that they were doing work that they could not do as efficiently as they would desire. Now such a condition is a thing of the horrible past. Surely the desire of a conscientious practitioner is to obtain for his patients the quality of medical skill that he would obtain for his family and for himself, and such is not impossible of attainment.—I am, etc.,

Petworth, Sussex.

W. A. BALL.

The Misnamed Stethoscope

SIR,—In recent editions of the *Journal* some diversity of opinion on the correctness, or otherwise, of various medical words has arisen in your correspondence columns. Doctors are perhaps the greatest abbreviators of words, but until I read Dr. L. M. Shirlaw's letter (*Journal*, November 9, p. 1117) I had not previously come across the extraction of one or more letters from the middle of a word. We really cannot allow Dr. Shirlaw to get away with such traumatic surgical treatment of medical nomenclature.

Derivatives of words ending in "ix" are usually obtained by substituting the letter "c" in place of "x"—e.g., cervix—cervical; varix—varicose, varicectomy; appendix—appendicectomy, etc. Hence the two letters "ic" which Dr. Shirlaw has resected from the word appendicectomy actually form an important part of the word. The same applies in the word varicectomy. I would suggest, therefore, that the surgical procedure of appendectomy is contraindicated unless a definite diagnosis of appendicitis has been made.

May I take this opportunity to express concern at the way in which would-be lexicologists are playing around with perfectly satisfactory medical words and attempting to alter them in some way or other? This occupation is of very doubtful benefit, but certainly adds to the bewilderment of medical students just beginning their clinical studies, who are confronted with new and mysterious words at the turn of every page.—I am, etc.,

London, E.1.

R. H. PARROTT,
Medical Student.

Delayed Rupture of Spleen

SIR,—The following short note on a case of delayed rupture of the spleen five and a half weeks after injury, with no intra-abdominal signs prior to rupture, is intended to assist those who may have it in mind when examining a patient for a possible rupture of the spleen or who may be blamed for missing it.

The patient, who was an electrical engineer aged 53, was admitted to hospital suffering from a compound fracture of the os calcis, which was operated upon and put in plaster. He had fallen from a ladder. The patient remained in bed and had no other symptoms, except that 22 days after admission he complained of pain in the left loin. Examination of the abdomen by an abdominal surgeon revealed no abnormal signs. The wound of the heel became infected and finally healed on the 29th day after admission. From that time the patient appeared completely well and happy and remained in bed. On the 40th day following admission, while talking to his relations who were making their routine visit, he suddenly fainted, became collapsed after pointing to his chest, and died within 20 minutes. Necropsy revealed a rupture of the spleen down to the hilum, with a subcapsular haematoma undergoing organization.

Delayed rupture of the spleen can occur up to three months from the injury, and in cases where there is a history of abdominal injury it should clearly always be borne in mind. In this case there was no such history of abdominal injury, nor symptoms or signs of a possible rupture of the spleen.—I am, etc.,

London, W.1.

E. HAMBLBY.

Vision and Television

SIR,—Many oculists will, I think, disagree with Dr. A. H. Griffith's conclusions from his survey of the numbers of Cardiff schoolchildren who wear glasses and watch television (*Journal*, November 30, p. 1299). He suggests that eye strain "may impair the efficiency of children's eyes as an optical system" and "may accelerate and exaggerate the normal tendency towards myopia." This view, as it relates to myopia, is not generally accepted now, and has never been held for the other refractive errors. Unfortunately, the figures give no clue as to the relative proportions of the different types of ametropia from which the children suffered, so that no conclusions can be drawn concerning the relation between eye strain and myopia. The only conclusion which does seem to be justified is that the possessor of a television set is more likely to have his ametropia discovered, which is not altogether unexpected, nor perhaps such a grave danger as Dr. Griffith would suggest. There remains one small point for pedants—surely it was the glasses which were prescribed, not the children?—I am, etc.,

Yelverton, S. Devon.

IAN W. PAYNE.

SIR,—Dr. A. H. Griffith's paper (*Journal*, November 30, p. 1299) shows industry in producing figures and reducing them to percentages: he has combined them with some abstracts from the fourth volume of Sir Stewart Duke-Elder's incomparable textbook¹ to produce a misleading 2½ pages. He states as a fact the very assumption which his paper sets out to prove, saying, "Eye strain caused by constant difficulties of accommodation can and often does artificially exaggerate this trend towards myopia in those aged 8–13 years." I suspect that he believes this to be a universally accepted truth, but if he were to read a little further in Duke-Elder he would have found on pages 4246 onwards and 4335 onwards that there is no agreement on the aetiology of myopia. In fact, differing theories have led to contradictory advice in treatment being given, such as atropine or eserine, full correction, or under correction. The more violent, such as tenotomy of various extra-ocular muscles, or cauterization of the urethra, are now out of date, mercifully. For Dr. Griffith to state that eye strain is a cause of refractive error is an extraordinary statement;

most ophthalmic surgeons would now place it in the category of old wives' tales. Duggart² states firmly that eye strain in this sense does not exist.

There are other points open to criticism. Anyone who has conducted school eye clinics knows that many of the children sent from routine school checks do not in fact need glasses. Nor is any distinction made between simple and degenerative myopes, hypermetropes, squints, and children sent for infections or diseases; this is admitted, but surely it could have been corrected by using figures from the school eye clinics after the children had been diagnosed? Under these haphazard conditions it is useless to talk about "statistical differences." Finally, half-way down page 1301, the two sentences following "Obviously . . ." lead one to understand that Dr. Griffith supposes the uncorrected myope to accommodate more than the corrected; if one cares to reverse the facts one can indeed prove anything. Duggart says, "Ophthalmic folklore is more abundant than that relating to any other part of the body." It seems to me a pity to increase it. Does Dr. Griffith believe that listening to jazz will cause ear strain and deafness?—I am, etc.,

Canterbury.

R. A. D. CRAWFORD.

Influenza Epidemic

SIR,—It would appear from correspondence in the *Journal* that the severity of the recent influenza epidemic has varied considerably throughout the country. It might be interesting, therefore, to publish the following figures gleaned from a populous London county borough, which certainly indicate that we must have been fortunate so far as the severity is concerned, although the incidence was very high and created considerable pressure on all medical practitioners. Inquiry in this area has shown that there have been virtually no complications of otitis media and mastoiditis, which have been such a feature of previous epidemics. The under-mentioned figures were taken from eight representative practices in this area.

Practice	No. of Patients	No. of Deaths	Age at Death	No. of Cases Hospitalized
A	3,573	2	92 and 77	—
B	5,955	—	—	1
C	4,387	—	—	1
D	5,555	2	65 and 68	5*
E	3,945	—	—	4
F	2,463	—	—	2
G	3,198	1	63	—
H	4,020	—	—	3
Total	33,096	5	—	16

* Includes two deaths, remaining three hospitalized for social reasons.

The following figures obtained from two chemists give some indication of the increased volume of work: (1) Total number of prescriptions dispensed during a week in October, 1957, was 1,033, compared with 696 in the same period in 1956—an increase of 50%. This chemist informs me that the total dispensed in October, 1957, has only been equalled in two months (January, 1951, and January, 1953) since the commencement of the National Health Service. (2) Total number of prescriptions dispensed during September, 1957, was 2,550, compared with 3,683 in October, 1957—an increase of 44.3%.—I am, etc.,

London, E.12.

STANLEY THOMAS.

Mongolism in a Twin

SIR,—I was interested in the report by Dr. J. V. Morris (*Journal*, November 2, p. 1038) of mongolism in one of twins. As mongolism occurring in one of twins appears to be a rarity I wish to report two further cases.

Case 1.—Father and mother are aged 48 and 49 years respectively and are both of normal intelligence. There is no consanguinity. They have five living children, including the mongol and his twin brother. One child died in infancy from a "heart condi-

tion." Siblings of twins are: twins (boy and girl aged 22 years), a girl aged 14 years, and one girl (dead) would be 10 years old if she had lived. The twins were born on April 30, 1949, after a normal pregnancy and labour. The patient, a mongol, is a boy and his twin is a girl and is a normal child. The girl was born first: birth weight about 5½ lb. (2.5 kg.). The patient is a typical mongol, small in stature but sturdy, with typical facies, brachycephalic skull, hyperextensible joints, fissured tongue, and thumbs low set and incurved. His mental age is about 2½ years. He can say words indistinctly but cannot speak in sentences. The patient's father is a twin and he has four other brothers and four sisters. The father's twin brother is married and has two sons, the younger one being a mongol. On the mother's side the only history of twins is that her grandmother was a twin. No history of mongolism.

Case 2.—Father and mother aged 45 years and 50 years respectively. Both are of normal intelligence. There is no consanguinity. There are five living children in the family including the twins. One child died of burns when 18 months. Siblings of twins are: boy aged 20 years, girl aged 18 years, and boy aged 16 years. All are normal children, including the patient's twin sister. The twins were born on February 25, 1951, after a normal pregnancy and labour. The patient was born second and weighed over 5 lb. (2 kg.); the other twin was less than 5 lb. (2 kg.). The patient is a typical mongol with typical facies, brachycephalic skull, hyperextensible joints, fissured tongue, square hands with short fingers, and in-curving of little fingers of both hands. She is small and thick-set in stature. Her mental age is about 2 years; she can say words but cannot make sentences. There is no history of twinning in the father's side of the family. The mother's brother has twin sons and there is a history of twins in some cousins of the mother. There is no history of mongolism in either the father's or mother's family history.

There was a history of twinning in both cases. In Case 1 the twins' cousin is also a mongol. In both cases the mothers were rather elderly at the time of birth of the twins.—I am, etc.,

Banbridge, Co. Down.

J. A. MARK.

Sulphamerazine

SIR,—I also agree wholeheartedly with Dr. E. C. Atkinson (*Journal*, November 16, p. 1175) and Dr. S. E. Browne (*Journal*, November 30, p. 1304) in condemning the use of sulphamerazine. It is, however, characteristic of the *British National Formulary* 1957 that in the infants' section there are no "official" liquid antibiotics, and only two systemic chemotherapeutic mixtures, one of which contains this noxious substance.—I am, etc.,

Caterham, Surrey.

D. S. PORTER.

Dangers of Nitrous Oxide

SIR,—In your annotation (*Journal*, November 30, p. 1293) you make a very reasonable review of the position with regard to nitrous oxide in dental anaesthesia. Quite rightly you refer to Bourne's¹ warning article with regard to blood pressures and to Tom's² extremely useful article, pointing out the fact that nitrous oxide can be administered successfully with considerably more oxygen than we are sometimes prone to think.

I must, however, disagree with the sentence in which you state: "Secondly, when possible the patient should be horizontal rather than vertical." I think this statement, as it stands, is extremely dangerous. When a patient is in the horizontal position it is extremely difficult to get him or his head sufficiently on the side to be sure that no blood enters the pharynx while the dental surgeon is working, and I consider the extraction of anything more than one or two teeth in the horizontal position demands an endotracheal tube in the horizontal position. This is not true when anaesthetic with adequate packing. This is not true when the patient is in the vertical position. When nasal nitrous oxide is being given a very large number of teeth can be extracted and blood prevented from entering the pharynx by adequate packing under and around the tongue, with the head in such a position that when the blood reaches a certain level it will come out of the mouth and will not pass back towards the pharynx. If any inexperienced anaesthetist were to read your words and think that he could

place a patient in a horizontal position while using a nasal nitrous oxide anaesthetic he would soon get into trouble.—I am, etc.,

Northampton.

Drug Firm Representatives

SIR,—My W.P.B. receives a massive twice-daily dose of unopened advertising literature, much of which must compare in cost of production with the glossy magazines and bear correspondingly heavy postal charges. A large drawer contains samples from the post and the leavings of representatives. When it is too full to open comfortably, or my family needs medication, I explore, and out goes 90% to the incinerator. In one week my firm of three practitioners accepted about £7 worth of unsolicited samples.

I cannot believe that this experience is unusual or that the cost of high-pressure advertising is justified by prescribing results. It is noteworthy that the glossiest publications and the smoothest salesmen come from the firms whose headquarters are across the Atlantic and who produce the most expensive iron, tranquillizer, antibiotic, or what-have-you (are they paid in dollars?). The number of travellers who lurk in our waiting-rooms trying to look like patients seems weekly to increase. Equally increasing is the strain of remembering, or looking up, the various, often synonymous, trade names for products of reputed analogous therapeutic value. It is hard to believe that a good worthwhile drug would not sell at a much lower price without all this expensive ballyhoo. We are bound to remember that, in effect, the drug firms are selling to the State, and that, as taxpayers, we have a direct personal interest in reducing the N.H.S. drug bill. Card index schemes for the evaluation of different proprietaries would be helpful but not an adequate protection against the super-salesman. The next logical step would be the nationalization of pharmaceutical manufacturing and wholesaling. We detest nationalization, but, Sir, why shouldn't they have a taste of our medicine?—I am, etc.,

Rushden, Northants.

B. W. PAINE.

Drug Addiction

SIR,—With reference to Dr. E. Millington's letter (*Journal*, December 7, p. 1369), although I would certainly agree that drugs such as pethidine and methadone should not be prescribed for the arthritic patient, I cannot agree that these drugs should be withheld from the patient dying of cancer, when this is associated with severe intractable pain. It is just in these patients where strong analgesics are required to alleviate their suffering, and surely addiction is of little importance at this advanced stage of the disease.—I am, etc.,

London, N.7.

T. KRAFT.

Treatment of Leg Ulcers

SIR,—The enthusiasm shown by correspondents for Mr. A. Dickson Wright's methods of elastic bandaging for leg ulcers (*Journal*, November 9, p. 1111) is testimony enough of its efficacy. Let us never forget, however, that the basic essential of the treatment lies in the word *elastic*. Few of the modern patent supportive bandages have this "stretch and regain" property, and rigid support is a very different matter from elastic support. May I suggest to Mr. J. J. Moriarty (*Journal*, November 30, p. 1305) that sensitivity reactions are unlikely if he uses polyurethane foam pads rather than "sorbo" rubber on the actual ulcer. This material is cheaper, and easily obtainable.

Further, I am surprised to see that Mr. Moriarty advocates multiple ligations of the internal saphenous vein. Surely it is far more satisfactory to eliminate the vein by actually removing it. This can only be achieved by the stripping operation, as devised by Myer and introduced into this country by Rowden Foote. A meticulous "top-tie"

(including the descending branch of the circumflex iliac vein) and a full-length strip of the internal saphenous vein from the ankle to groin takes an average time of twenty to twenty-five minutes, and the only post-operative discomfort of which the patient may complain is caused by thrombosis in a small branch of the main vein. How much more uncomfortable it must be to have a thrombosis occurring throughout the whole length of the internal saphenous vein, when many multiple incisions and ligations have been made. I would beg Mr. Moriarty to give this treatment a fair trial.—I am, etc.,

London, N.W.3.

A. GORDON DINGLEY.

SIR,—In the care of ulcerated legs by pressure bandaging two items merit articulation—i.e., diagnosis and prevention of further ulceration. Regarding the diagnosis, this is wide; while over 90% of ulcers are due to hypertension in the superficial veins and are therefore venous, the remainder include arterial deficiency, diabetes, rheumatoid arthritis, trophic lesions, erythrocytosis, various anaemias, and the occasional tubercular, specific, and new growth lesions.

Implicit in pressure bandaging an ulcerated leg is an assumed diagnosis of a venous ulcer—i.e., hypertension from one source or another in the superficial veins. Pressure bandaging is over three hundred years old, but it was Arthur Dickson Wright who in 1930 measured the high pressure in the superficial veins. This tension must be overcome by continuously applying an equal pressure, and then its ill effects, such as swelling, eczema, and ulceration, will steadily subside. Healing is but the first step, for, generalizing, it is harder to keep an ulcer healed than to heal it. The tendency to spontaneous recurrence or trivial injury is known to all, lay and medical. Further treatment is necessary, medical and/or surgical. Medical care requires adjustment of the above factors and also mechanical protection by elastic stockings or bandaging.

Operation can materially assist in venous ulceration by interrupting the flow of high pressure from the deep to the superficial veins. All ages benefit from this. These leaks are at the ankle communicating veins (in at least 60% of venous ulcers), sapheno-femoral and sapheno-popliteal junctions, and leaking perforating veins passing into Hunter's canal, tensor fasciae femoris, the popliteal space, and calf. One or several of these may be affected. Their detection needs continuous search and a venogram in some cases, for all must be found to give maximal relief. After five years' experience I would particularly emphasize the value of Cockett's ligation of the ankle communicating veins, but like all radical operations it must be completely performed; if one leaking vein is missed it will keep the tissue impairment smouldering. The non-venous factors causing ulceration often improve by occlusive bandaging, but not pressure bandaging. A lumbar sympathectomy is valuable in limbs that feel like "pieces of fish" from ischaemia or erythrocytosis.

In the elderly with a composite ulcer, cure may not be possible, but a skilfully applied adhesive bandage can be worn unchanged for three, six, or even twelve months. Its protection goes far to prevent ulceration and keeps them ambulant—e.g., a man, aged 76, with a post-trench-foot ulceration of thirty years healed after lumbar sympathectomy in 1950, "keeps house" for his niece, who is a secretary. Those wishing satisfaction for their patients, their assistants, and an evergreen problem will find these in ulceration of the legs.—I am, etc.,

London, W.1.

HAROLD DODD.

The Fight for Fluoridation

SIR,—Professor R. A. McCance in his review of this book¹ (*Journal*, November 30, p. 1289) seems to me a little unfair to it and to the men whose enthusiastic efforts are described therein. I would not expect a scientific exposition in a work so titled, nor even journalistic medical science, but rather a

popular account of a matter of medical and scientific politics, such as it is. I think the author is to be congratulated on writing such an informative and readable book on the subject. It was, for example, news to me that a few enthusiastic individuals, sacrificing time, money, and dignity had needed the U.S. Public Health Service into action. We take our causes less seriously in this country it is a matter for shame rather than complacency, and a dignified aloofness is even more deplorable than frivolity. The book inspired me with fresh enthusiasm, and I recommend it to others who feel frustrated at the snail's pace of progress in this country.—I am, etc.,

London, S.W.10.

Knock-knee in Children

SIR,—Before discussing such a problem it should be defined, particularly in regard to the limits of normal variations. Dr. A. J. M. Morley (*Journal*, October 26, p. 976) has not done this. Of her four grades I should class the first three as within these normal limits; that is to say that their "knock-knee" is as imaginary a deformity as the "undescended testicle" that responds to hormones, or the "pre-dislocation" hip which gives such excellent results from wearing a pillow between the thighs.

There is no doubt at all that a number of people do end up as adults with a knock-knee that is a grave humiliation and disability in these days of bodily exposure. The present tendency to say that "the child will probably grow out of it," which seems to be the burden of Miss Morley's article, is responsible for many unnecessary tragedies. The result of leaving untreated an increasing angulation between the tibia and the femur is not so disastrous as similar delay in the cases of dislocated hips or "idiopathic scoliosis," but it is a reproach to our profession all the same.

Wrong angulation of the knees in otherwise normal children can invariably be corrected by early conservative measures, including efficient night-splints when wedges and exercises are not enough. The reason that some find that night-splints are not effective in cases of knock-knee is the same as in cases of talipes or infant scoliosis: the splints are ineffectively designed, badly applied, or both.

The one important point in diagnosis and prognosis is whether the angle between the tibia and the femur is increasing or decreasing. This angle is what matters, and the distance between the malleoli is a most unreliable guide to it; the "knobby" knee of so many muscular small boys will give a wide gap with a perfectly normal alignment of the bones.—I am, etc.,

DENIS BROWNE.

Candida Napkin Rashes

SIR,—In your annotation on candida napkin rash (*Journal*, November 23, p. 1229) I see yet another attempt by the specialists, this time the dermatologists, to undermine the confidence of the ordinary practitioner and to extend their field of operation by many acres of sore bottoms. It is as a mother of three children and a baby clinic doctor of several years' experience that I challenge its scientific accuracy. Where are the statistics to support the repetition of the old wives' tales that not rinsing the napkins the mystical three times and using those horrors to the nursing profession "the plastic or rubber pants" are the cause of ammonia dermatitis, napkin dermatitis, seborrhoeic dermatitis of the napkin area, infantile eczema of the napkin area, and now candida napkin rash? Has the incidence of these diseases been compared in babies clothed in rinsed and unrinsed napkins? Have babies' bottoms clad in plastic pants been compared with their brothers without those horrors?

For the hundreds of sore bottoms I encountered in my clinic practice I discovered a charm. It is to steep the napkins before washing in a gallon (4.5 litres) of water containing a tablespoonful of a household bleaching agent.

This is an even more "simple and expeditious" procedure than "the microscopical examination of a small quantity of epithelial debris taken from the lesion."—I am, etc.,

Portable Stand in Domiciliary Midwifery

SIR,—Good lighting is essential for the efficient practice of domiciliary midwifery, particularly for the repair of a torn perineum. By using a stand the light can be placed in the most advantageous position independent of the fittings and furnishings in the patient's house. I have designed the stand described below to fit into any midwifery bag, and it has proved entirely satisfactory under all conditions.

The stand consists of a 7-in. (18-cm.) length of hollow brass tubing to which a 3/16-in. (5-mm.) nut has been welded on to one end. The tubing can then be screwed on to any standard photographic tripod. A clip-on light is attached to the tubing and, by a bayonet plug, connected to the electric light point in the patient's room. This obviates the necessity of numerous three-point plug adaptors to fit the power points. A 150-watt pearl bulb provides sufficient light for any operation likely to be performed at home. Seven yards of flex allows complete mobility for the lamp under all conditions. The tripod I use has a universal joint so that the light can be directed at any angle I require. The advantage of hollow brass tubular rod is that a 4-in. (10-cm.) S-type hook of the type used by butchers, and covered by adhesive plaster, can be fitted into the upper end of the tube. This provides an ever-ready stand for giving intravenous blood or plasma in an emergency. The weight of the tripod tube and S-hook is 4½ oz. (130 g.) and that of the tripod telescoped down to 9 in. (23 cm.) with brass tube detached, is 12 oz. (340 g.). Fully extended the stand measures 54 in. (137 cm.) from the ground. This is usually adequate for transfusions, as the average height of a patient's bed at home is 20–24 in. (50–60 cm.) from the ground (in hospital it is about 34 in. (86 cm.)). If added height is required, the stand can be placed on a chair or a table. The tripod can be telescoped down to 9 in. (23 cm.) with brass tube detached.

Used in conjunction with a portable lithotomy frame, the stand allows the midwife attending the patient to become a useful assistant to the doctor during any operative procedure. In cases of haemorrhage valuable time is not wasted in looking for a stand from which the bottle of plasma can be suspended.—I am, etc.,

Liverpool, 18.

MERVYN GOODMAN.

Weight in Relation to Pregnancy Toxaemia

SIR,—The use of a standard weight for height estimation as employed by Dr. Cicely D. Williams (*Journal*, December 7, p. 1338) still seems unproven. First, the association of a pre-high standard weight for height in the majority of pre-eclamptics does not necessarily mean that there is a causal relationship between the two or that the finding is of value in prophylaxis. This has yet to be shown. Secondly, apart from purely aesthetic reasons, one cannot standardize a woman's weight to her height. Thirdly, the standard itself could be criticized, as it is 45 years old, American, and based on the non-pregnant condition.

The significance of initial weight and weight gain in pregnancy is still in some doubt. In some clinics the incidence of pre-eclampsia is higher in patients with obesity. Again there may be no causal relationship, as both clinical states may result from an endocrinal, nutritional, or psychosomatic disorder. Certain authors have reported a reduction in the incidence of pre-eclampsia following careful calorie calculations in the obese and overweight. More frequent visits, greater mental care, increased rest, and salt restriction are often coincident with the calorie reduction, and an adequately controlled series has yet to prove that weight restriction is the specific prophylactic.

Finally, the advice given by Dr. Williams, "If she is already hypertensive or oedematous she should, of course, be admitted; or she should be advised to restrict salt and calorie intake," is a little confusing. In the presence of an adequate bed state, hospital admission is imperative when hypertension or oedema occur.—I am, etc.,

CARL WOOD.

Preparation of Skin for Electrocardiography

SIR,—I was interested in a letter in your correspondence columns by Dr. James Maxwell (*Journal*, October 19, p. 942) on the preparation of skin for electrocardiography. I fully agree with the view expressed by Dr. Maxwell that special jelly application is not essential in the preparation of the skin before applying electrodes during electrocardiography. I have found in my experience that moistening the skin at the place of contact with the electrode by means of a small piece of flannel, soaked in water or 3% solution of sodium carbonate, gives satisfactory results. To obtain better results, however, the spot where the electrode will make contact must be rubbed until the skin shows slight reddening, so that the surface resistance of the body to the electrode is decreased.—I am, etc.,

Karachi.

MOHAMMED KAMAL.

Abuse of E.C.T.

SIR,—It would appear that over the past decade or more there has been an increase in the application of electro-shock in all forms of psychiatric disturbance, even including some cases of cerebro-degenerative disease and cerebro-vascular disease, and it is not unknown for this type of treatment to have been given in cases of cerebral tumour and disseminated sclerosis. In this respect it would be interesting to consider the agreement, reached at the Psychiatric International Congress in Paris in 1950, to the effect that E.C.T. is a treatment of choice in cases of depression, but is every mood of sadness to be diagnosed as depression and thereby treated by E.C.T., or can we be more precise in diagnosis? I would suggest we can.

The following factors appear to be operative in this increased abuse: (1) misguided zeal to treat the patients where no adequate treatment is available; (2) a substitute for old-fashioned seclusion; (3) too great an emphasis on statistical assessment, in which many fallacies can occur, without sufficient consideration of the ultimate effect on the patient; (4) the open door policy; (5) the inadequacy of the number of beds for the appropriate catchment area, and the increasing number of psychiatric patients being referred to a mental hospital. There are also many other reasons.

This policy would indicate a lack of concern for the future of psychiatry as a science, and complicates the work of those descriptive psychiatrists and other investigators in the psychiatric field who meet these cases following a "trial" of E.C.T. What appears to be required is a firmer adherence to both contraindications and indications for electro-shock. In this respect I would suggest that the time is ripe for reassessment and restatement of this subject by some authority, particularly for the guidance of those now embarking on a career in psychiatry.—I am, etc.,

St. Albans.

Nova et Vetera

HEBERDEN AND HARVEY

Professor Robert Platt, P.R.C.P., has presented the Heberden Society with the original of an autographical note by William Heberden (1710–1801) on the habits of Harvey communicated to him by Harvey's great-niece, as follows (spelling unchanged):

"1761, May 29. Mrs Harvey (great niece to Dr Harvey) told me that the Dr liv'd at his brother's at Roehampton, the later part of his life. That he used to walk out in a morning combing his head in the fields.

"That he was humoursome, & would sit down exactly at the same time he had appointed for dinner, whether the company were come or not.

"That his saltcellar was always fill'd with sugar, which he used to eat instead of salt.

"That if the gout was very painful to him in the night, he would rise & put his feet into cold water."

Obituary

Dame BARRIE LAMBERT, D.B.E., M.B., D.P.H.

Dame Barrie Lambert, who played a leading part in the reorganization of the hospital services of London, died at her home at Tunbridge Wells on December 11, aged 86. She was a past chairman of the public health and hospitals and medical services committees of the London County Council.

Florence Barrie Lambert was born on August 13, 1871, the daughter of a solicitor. After receiving her early education in France she trained as a nurse at the London Hospital and became a ward sister there. During the South African War she worked in the Imperial Yeomanry Hospital from 1899 to 1901, and it was after her return to

(Keystone Press Agency Ltd.)

Britain that she decided to become a doctor. Having been a medical student at the London School of Medicine for Women, she obtained the Durham degrees of M.B., B.S. in 1906, taking the Cambridge D.P.H. in the following year. After holding the posts of house-physician at the New Hospital for Women and resident medical officer at the East Anglian Sanatorium, she went into practice in London with her friend Miss Elizabeth Patteson. Even at this stage of her career she was interested in what is now called physical medicine, and after a period of study in Stockholm she joined the staff of the Swedish Institute in Cromwell Road as a medical assistant. Later she was appointed medical officer in charge of the mechanotherapeutic departments at the Charing Cross and the Royal Free Hospitals. During the first world war she achieved the almost unique distinction for a woman in those days of serving in the R.A.M.C. as a major: her main duty was to act as inspector of electrical and massage departments of convalescent camps.

For her war services she was appointed C.B.E. in 1920. In the previous year she had joined the newly established Ministry of Health as a medical officer, but she held this post for only two years, when she became able to take a more active part in public affairs. Elected to the London County Council as an alderman in 1922, she became one of those most closely associated with the work of developing London's health services. The hospital service in particular was her special concern. Not content with what might be termed "honorary" membership of the L.C.C. as an alderman, she contested successfully the Brixton division in 1928 as a municipal reform candidate, and from 1931 to 1946, when she again became an alderman, she represented the St. George's division of Westminster. Elected chairman of the public health committee in 1928, she remained in that office when the committee was renamed, first, the central public health committee, and, later, the hospital and medical services committee. The Local Government Act of 1929 added greatly to the work of the council and its committees. The central public health committee was required to assume the responsibility for the co-ordination and unification of the control of a large number of hospitals previously administered by the Metropolitan Asylums Board and the metropolitan boards of guardians. Barrie Lambert accepted the challenge, and devoted her whole time in an attempt to discover the most satisfactory solution to the many problems the council had to face. Her small figure became a familiar sight at all the municipal hospitals in the

London area, for she visited many of them over and over again in her search for facts and information. In 1938 she was promoted D.B.E. for her political and public service in London.

When the hospitals were incorporated in the National Health Service in 1948 she was appointed a member of the South-east Metropolitan Regional Hospital Board and became chairman of its nursing committee. Infant welfare was another of her interests, and at one time she was honorary director of the Central Council for Infant and Child Welfare and honorary secretary of the Central Committee for the Care of Cripples. She also found time to serve on the council of the Medical Defence Union, of which she was a vice-president, and on the committee of management of the Medical Insurance Agency.

H. R. writes: Dame Barrie (whose real name was Barraclough, shortened by her contemporaries to the form which she was quite glad to adopt) was quite one of the most remarkable women of her day. When the Neville Chamberlain Local Government Act of 1929 came into force in 1930 she was, and had been for some time, chairman of the Central Public Health Committee of the L.C.C., upon which fell the onerous job of implementing the Act in the County of London. In this task her right-hand man was the late Sir Frederick Menzies; between them they hammered out the integration of 84 hospitals, administered on 28 different systems, into one combined service. Party criticism never ruffled her: she knew her subject inside out and could give as good as she got if her policies were challenged by the opposition in County Hall. But her Socialist critics soon realized that her one constant ambition was the improvement of the London hospital system, and in the main they were, naturally enough, co-operative. Before the South African war she had been a ward sister at the London Hospital in Sidney Holland's day—in itself no mean advertisement of efficiency. While nursing the typhoid cases at Deelfontein and De Aar and other bases she was fired with the resolve to become a doctor; and after qualification she was one of the first to devote her energies to the then infant specialty of physiotherapy. When the first world war broke out she was worth her weight in gold to the war effort: her appointment to the R.A.M.C. as major "shook" many of the profession who did not know her record, but was in fact a far-seeing stroke of policy.

In person "Barrie" was *petite*, but full of bustling energy, had a keen sense of humour, a brilliant intelligence, and great loyalty to her friends. Broadminded, a good speaker without pretensions to high-flown rhetoric, a Conservative in politics with strongly progressive instincts, she had hosts of friends and practically no enemies. The conferment of D.B.E. was as welcome to her political opponents as to those of her own side at County Hall.

E. MILLICENT NOURSE, M.R.C.S., L.R.C.P.

Dr. Millicent Nourse died in the Evelyn Nursing Home on September 14, aged 56. She was the wife of Dr. H. E. Nourse, and with her death the district has lost a well-loved figure in both its medical and social life.

Dr. J. D. BORHAM writes: Ethel Millicent Nourse, the elder daughter of the late Lord Justice Sargant and of Lady Sargant, who survives her, was educated at Roedean and at Newnham, where she took the Natural Sciences Tripos, obtaining the B.A. degree in 1923 and later proceeding to M.A. She qualified in medicine from St. Mary's Hospital, in 1925. When the second world war threatened, Mill Nourse returned to her hospital for a refresher course and resumed medical work in helping her husband and colleagues in general practice. Her other activities included those of inspecting medical officer to St. Felix School, Southwold, medical officer to Silbury Convalescent Home, and medical officer to infant welfare centres in the county of Cambridgeshire. For the last 15 years of her life she was medical officer to Pye Radio Limited, where she entered wholeheartedly into the problems of all those with whom she

me into contact. During the war she maintained her household at Cambridge at full pitch, offering refuge to innumerable friends and acquaintances, and many there must who will look back with gratitude for the encouragement and help she gave so willingly and with an amazing depth of understanding and tenderness. Here was the mistress of the house, on whom all depended; here was the matriarch whose great managing power expressed itself notably in the organization of a wide home life, which she shared with friends, to whom she was as staunch as steel; here, above all, was the clear, direct knowledge of her surroundings and of her ideals, which was her hallmark. None of this has any meaning apart from her setting—her husband, her sons, a unit complete in itself. Men and women of judgment trusted her to an extraordinary degree and depended on her discrimination, honesty, and integrity. She had the craftsman's delight and pleasure in lovely needlework, and her interest in the ballet and the theatre was intellectual as well as emotional, for she had a brilliant brain. The loss experienced by us, her friends, makes us all the more conscious of the great sorrow which has befallen her husband and sons.

H. Q. FORSYTH THOMPSON, M.R.C.S., L.R.C.P.

Dr. H. Q. Forsyth Thompson, who was a medical officer in the Rand Mines for thirty years, died at Kenilworth, Cape Province, on August 14. He was 66 years of age.

Humphrey Quentin Forsyth Thompson was born at Springvale, Natal, and studied medicine at Guy's Hospital, where he was awarded the Hilton Prize. After qualification in 1915 he held an appointment at the King Edward VII Hospital for Officers for a short time before joining the Anglo-Russian Field Hospital for service in the first world war. He was awarded the Russian Cross of St. George for bravery and devotion to duty. The hospital was disbanded in 1917, and in the following year Dr. Forsyth Thompson was taken prisoner by the Bolsheviks. He managed to escape and to return to South Africa after a very difficult journey by way of Japan. In 1921 he was appointed a medical officer to the Corner House group of mines, resigning because of ill-health in 1950. Finding professional inactivity irksome, however, he was acting as a locum tenent when his fatal illness developed. Dr. Forsyth Thompson was president of the Transvaal Mine Medical Officers' Association in 1931, and during the second world war, when he deputized for Dr. A. J. Orenstein as chief medical officer of the Rand Mines group, he was chairman of a committee which, under the auspices of the South African Red Cross Society, published the *South African Digest of War Medicine*. An accomplished linguist, he could speak several European languages, including Russian, and could converse freely in Zulu, Xosa, and Sotho. He leaves a widow.

J. L. GLOVER, B.M., B.Ch.

Dr. J. L. Glover, who was in practice at Curry Rivel, Somerset, was killed in a motor-car accident on November 22. He was 58 years of age.

John Lee Glover, the son of Dr. John Abel Glover, was born in Kent on November 15, 1899. He was educated at Brighton College and Queen's College, Oxford, going on to Guy's Hospital for his clinical training. He graduated B.M., B.Ch. in 1927. For several years he worked at the Royal Portsmouth Hospital as house-physician, house-surgeon, and senior house-surgeon. After a short time in general practice at Gosport, he took over in 1935 the general practice in Curry Rivel, Somerset, where he remained for twenty-two years until his death. During the second world war he served on several of the local medical committees. He took a great interest in many of the village activities and gave much of his leisure time to the training of the local Red

Cross contingents. In 1931 he married Miss Margery Berry, and she survives him together with one son and one daughter.

R. D. R. writes: "George" Glover was known to me for many years as a friend and as a colleague. We met frequently in consultation and I never failed to be impressed by his shrewd and accurate judgment and above all by the wisdom and humanity he exhibited in considering the problems of his patients. Although without sentimentality, he had a deep and abiding sense of duty. In the best sense of the term he was a good family doctor. No one who attended his funeral and saw the church filled to capacity on a weekday and in a rural area could doubt the great respect and love he had inspired in his patients and in his friends. His tragic death is a great loss to the community he served so well. We extend our profound sympathy to his widow and family.

W. H. GEORGE, M.B., F.R.C.S.

Mr. W. H. George, surgeon to the Dudley Road Hospital, Birmingham, died on November 28 at the age of 60.

William Hubert George was born at Haverfordwest, Pembrokeshire, on January 8, 1897. After service as an infantryman, chiefly in Mesopotamia, in the first world war, he entered the medical school of the London Hospital in 1919. Qualifying M.R.C.S., L.R.C.P. in 1924, he ascended the ladder of house appointments at "The London" to the stage of house-surgeon. He was then attracted to obstetrics and gynaecology as a specialty and became senior resident accoucheur and, later, surgical first assistant and registrar. In 1927 he obtained the F.R.C.S., and in 1931 took the London degrees of M.B., B.S. Appointed obstetrician and gynaecologist to Dudley Road Hospital in 1930, he worked in that capacity for two and a half years with conspicuous success. In 1932 a vacancy on the general surgical staff of the hospital occurred, and Mr. George, who had for some time felt he would like to leave the narrower specialty of gynaecology for the wider field of general surgery, obtained the appointment. He remained on the staff of the hospital until his death. He is survived by his widow, a married daughter in Canada, another daughter in medical practice, and two sons of school age.

K. O. P. writes: W. H. George was truly a general surgeon with a special interest in colonic surgery, a wise and careful clinician, and a fine operator. His strong sense of humour, invariable courtesy, unruffled manner, keen mind, and constant interest in current affairs, both local and national, made him an admirable colleague and inspired his juniors. He was dealing with emergency admissions to his surgical unit within a few hours of the onset of the illness from which he died some twelve hours later at Dudley Road Hospital. In him his hospital has lost a greatly valued surgeon, and his colleagues a very good friend.

E. ROLAND THOMPSON, M.B., Ch.B.

Dr. E. Roland Thompson, who had been in practice in Crewkerne for 27 years, died suddenly on November 20, aged 75.

Born at Amoy, China, on October 19, 1882, Edward Roland Thompson returned to England at the age of 2 years. With both parents working as missionaries, there were long periods of separation, but family ties were strong. He was educated at Hymers College, Hull, and at Edinburgh University, where he graduated M.B., Ch.B. in 1906. After becoming resident medical officer at Birmingham City Infirmary and house-surgeon at Wolverhampton General Hospital he entered general practice as an assistant in Farnworth, Lancashire, work which he interrupted to take a trip to the Far East, including China and Japan. His letters and photographs during this trip formed a fascinating journal. He

returned to become a full partner in the same practice at Farnworth, and to employ in due course a succession of assistants, to all of whom he was an inspiring leader and a superb teacher. During the first world war Dr. Thompson served with distinction in the R.A.M.C. in Salonika and the Middle East. After the Armistice he was on the staff of General Sir George Milne, and was mentioned in dispatches. In 1929 he married Mrs. H. M. Hodge, and moved in the following year to Crewkerne, Somerset, where he worked in general practice in partnership with his stepson, Dr. R. Sessions Hodge. Later they were joined by another stepson, Dr. Gerard S. Hodge, now senior in the same practice. Mrs. Thompson died last year. Among the appointments held by Dr. Thompson in Crewkerne were those of medical officer of health to the urban district council, public vaccinator, factory surgeon, and medical officer to the Post Office. He was on the staff of Crewkerne Hospital, and was an outstanding obstetrician. A founder member of the West Somerset Medical Club, he did much to guide that lively body in its early days.

R. H. S. writes: Roland Thompson died as he had hoped to—suddenly, and in the midst of his work. His first love was his profession, his next his garden—which was outstandingly lovely. His patients trusted him for his skill and unflinching care and loved him for his wisdom and understanding: his flowers thrived—possibly for the same reasons. His salient characteristic was his matchless integrity. In his work and his play—and he had been an outstanding tennis player before his eyesight began to fail—he gave always of his best and expected no less of his associates. A commanding figure in any company, his reserve cloaked a most human personality of wide interests. He had the gentleness, neatness, and scrupulous care for small things of many big men: he was especially gentle with children and flowers, and a corm of a cyclamen brought from the Struma Valley in the first world war now spreads in the wood of his beloved garden at Crewkerne. He made no distinction between persons—folk in need were his care—but his uncompromising sense of essential values never deserted him, for he had no truck with humbug. He leaves us with the memory of a man of principle, an upright and fearless gentleman.

G. H. COLT, M.B., F.R.C.S.

Mr. R. FOSTER MOORE writes: There is no need to add to what has been said about G. H. Colt as a surgeon (November 9, p. 1118, and November 23, p. 1246), but it would seem proper that something more should be said of his remarkable ingenuity, which was especially shown in his attempt to deal with the wiring of aneurysms. He was house-surgeon to Sir D'Arcy Power, by whom he was encouraged, and it was he who carried out the first operation with Colt's contrivance. It was a case of aneurysm of the coeliac axis. The instrument was, essentially, a large Thomas Smith's cleft-palate needle—i.e., it was a sharp-pointed cannula, the last inch or so of which was sharply curved. At the base was a drum which carried the wire. The drum was wound by hand to drive the wire between two milled wheels so as to roughen its surface and thus encourage clotting, thence on, along the cannula, into the sac. Sir D'Arcy made a small incision through the skin, through which the instrument was thrust into the tumour. Colt, who was working the instrument, wound the drum and repeated, from time to time, what length of wire had been introduced. After what I should guess at three or four feet had been inserted, the wire was cut and a style was passed to push home what wire was in the cannula; the style and instrument were then removed. It was expected that, owing to the sharp curve at the end of the cannula, the wire would be found in the sac in the form of a sort of spiral spring. Post mortem it was discovered that the wire had travelled up the aorta and was only prevented from entering the ventricle by a loop having been caught in one of the aortic sinuses.

With this result in mind, and still with the idea of encouraging clotting, Colt contrived to insert a sort of

cagework of wire in the sac. The wire used was sprung with the result that when free it would take up a sharp curve. A bunch of such wires, all of one length, was taken. They were fixed together in one of two ways, by the ends and in the middle. The former, when free, spread out in an umbrella-like shape, and the latter took on a sort of spherical cage form. The bunch of wires so formed was placed in a straight, sharp-pointed cannula of appropriate size; this was then thrust, as before, into the aneurysmal cavity, and the bunch of wires delivered into the sac by a style. The instrument was then removed.

Of Colt's other contrivances, one should mention a mouth gag, strong in action and yet small, which had a considerable vogue, and, more especially, a new form of suprapubic dressing. This was composed of a sort of glass cover, rather larger than half a cricket ball. The edge was flanged and above it was a glass exit tube to which a length of rubber drainage tube was attached. A hole was cut in rubber sheeting of such size that it gripped neatly above the flange and made a watertight junction. The apparatus was fixed on the shaven skin around the operation wound with rubber tyre. The contrivance was afterwards copied and modified by others.

Medical Notes in Parliament

Medical Manpower Report

THE MINISTER OF HEALTH told Mr. A. BLENKINSOP (Newcastle upon Tyne, East, Lab.) on December 9 that the report of the Willink Committee on Medical Manpower was under consideration by the Government.

Mr. BLENKINSOP: Will the Minister bear in mind that it is extremely important to have the recommendations of the Royal Commission on doctors' pay before any action is taken, in view of the need to ensure that there is a fully adequate and developing service for patients and that the Royal Commission might well make recommendations? Mr. WALKER-SMITH: The action at present being taken on the report is to bring it to the attention of the University Grants Committee and the universities. That should in any event be done. I will bear in mind what Mr. Blenkinsop says in the general context of the timetable of the Royal Commission.

Mr. BLENKINSOP asked whether that meant the Minister was recommending the universities to take action on the basis of the report. It was a serious matter, and affected the whole future development of the Health Service. Mr. WALKER-SMITH said no. What it meant was that the report was being brought to their attention so that they might study it and its possible implications.

Senior Registrars and Consultants

Mr. KENNETH ROBINSON (St. Pancras, North, Lab.) asked the Minister if he had yet reached a decision as to the future of senior registrars who had completed four years in their grade. Mr. DAVID GRIFFITHS (Rother Valley, Lab.) asked for an impartial committee with a lay chairman to examine the position of senior registrars' and consultants' posts, and the remuneration for trained consultants and specialists. Mr. WALKER-SMITH told them that he was already in consultation with the profession on the position of senior registrars who had completed the normal term of service in the grade but had not obtained higher appointments. There was therefore no need for a special committee on the subject. Questions of remuneration were being considered by the Royal Commission.

Mr. BLENKINSOP asked if the Minister was satisfied that he was in consultation with people who were fully representative of this group of hospital staff, and was not taking his advice from a small and not fully representative section.

WALKER-SMITH said that he had not heard that suggested before. He thought his consultations with the Joint Consultants Committee were very satisfactory. Mr. D. GRIFFITHS said there were 400 senior registrars fully trained, and that they could not get recognized for consultant posts. Was it not crystal clear that the Ministry and the consultants' organizations had failed in their duty to these people? Mr. WALKER-SMITH replied that the 400 included large groups who had either not completed four years' training or were unlikely to be seeking ordinary consultant posts. The latest figure available to him of senior registrars in that position was 90, together with another 136 who were in their fourth year of training and who might therefore encounter the same difficulties. He said that to put the figures straight, but he recognized that there was a real problem.

Medical Practices Committee

Dr. DONALD JOHNSON (Carlisle, Con.) asked the Minister whether he would implement the recommendation of the Franks Committee that he should give reasons for his decision in cases of appeal from the Medical Practices Committee in respect of selections made for general practice vacancies. Mr. WALKER-SMITH: I have already done so.

Mental Patients Certification

Dr. D. JOHNSON asked the Minister whether he was aware that local authorities had in some cases approved doctors, for purposes of certification, who had no psychiatric practice other than their certifying duties and no continuing interest in the patients they recommended for admission to hospital; and, in view of his expressed intention to start implementing the recommendations of the Royal Commission by administrative means, if he would instruct local authorities to cease employing such doctors forthwith.

Mr. WALKER-SMITH replied that, for the purposes for which their approval was required, local health authorities generally approved medical practitioners experienced in the diagnosis and treatment of mental disorders, many of whom were directly employed by them in the exercise of their wider responsibilities for mental health services. This was what the Royal Commission had recommended.

Dr. EDITH SUMMERSKILL (Warrington, Lab.) asked the Minister if he agreed that the fact that these doctors were approved doctors meant that they were doctors of known competence. Mr. WALKER-SMITH: Yes, certainly.

Patient-Doctor Ratio

Mrs. LENA JEGGER (Holborn and St. Pancras, South, Lab.) asked if the Minister of Health could say whether there was a disturbingly large number of cases per doctor in mental hospitals; and if he would bear that in mind when considering the report of the Willink Committee, which seemed to suggest that in a few years' time there might be too many doctors. Mr. WALKER-SMITH explained that no analysis of medical staff by type of hospital had been made. It would be possible to do a comparison in relation to departments, by type of beds.

Poliomyelitis Vaccination

Mr. J. CRONIN (Loughborough, Lab.) asked if the Minister would make arrangements for a third dose of poliomyelitis vaccine to be given, if desired, to those persons who had received, or who were eligible for, inoculation with poliomyelitis vaccine. Mr. WALKER-SMITH said he would consider this in the light of further medical advice on the poliomyelitis vaccination programme which he expected to receive shortly.

Mr. CRONIN said it was widely recognized that a third dose conferred much higher protection than two doses, and this was the standard practice in the United States. Would the Minister see that this matter had all possible priority? Mr. WALKER-SMITH replied that this had to be taken in the context of the very considerable programme already placed on local health authorities for vaccination of the prescribed categories with two injections.

Dr. EDITH SUMMERSKILL said it had been shown that two doses did not necessarily confer immunity. Would it not be better to ensure that by giving a third dose there were groups effectively immunized, rather than have a large number who might not be effectively immunized? Mr. WALKER-SMITH said the evidence was not yet conclusive that a third injection was necessary to maintain an adequate level of protection, though it appeared that a third injection was likely to reinforce protection. On the other hand, they had a considerable programme in doing the initial two injections for the prescribed categories. It was a matter of making the best use of resources.

Mr. R. THOMPSON, Parliamentary Secretary, Ministry of Health, informed Mr. Cronin that up to September 30 approximately 40% of eligible applicants for poliomyelitis vaccination had applied for it. Mr. CRONIN said this suggested that the public relations side of the scheme had been inadequately handled. Since poliomyelitis could be stamped out if a sufficient proportion of the population were inoculated, would the Minister make sure that sufficient attention was given to the importance and utility of the scheme? Mr. THOMPSON did not agree. He did not think this had received undue lack of attention in the press recently. The public were well aware of the facilities available.

Influenza Epidemics

Mr. R. J. MELLISH (Bermondsey, Lab.) asked whether, in view of the more serious epidemics of influenza this winter, the Minister would encourage the public to take all practical steps for self-protection including oral vaccine courses. Mr. WALKER-SMITH replied that he had no information that pointed to there being a need for reconsidering the arrangements already made or in train for vaccination against influenza.

Mr. MELLISH referred to the oral vaccine scheme proposed by the *Star* newspaper, which he said the Ministry had turned down because they lacked imagination, but which was proving a success. Mr. WALKER-SMITH told him that scientific evidence in support of the efficacy of oral vaccines against influenza was slender. The *Star's* test, though it produced some evidence, could not be regarded as significant in the context of recommending that vaccine.

Consultants' Fees

Mr. GEORGE THOMAS (Cardiff, West, Lab.) asked the Minister whether he was aware that patients were able to purchase early admission to hospitals by paying a consultant's private fee; and, since this meant that other cases had to wait longer for admission, what action he was taking to end this practice; further, how many patients were given priority admission to the Moorfields Eye Hospital during 1955 and 1956 solely because they had paid a private fee to a consultant, and whether he would end this means of admission to hospital. Mr. WALKER-SMITH stated that Section 5 of the National Health Service Act, 1946, provided for beds to be set aside for private patients, and for doctors to be able to charge fees to those patients. These beds might also be used without payment for patients who urgently needed them on medical grounds and for whom suitable accommodation was not otherwise available. Earlier admission might sometimes be secured through use of private pay-beds, but the extent to which this had occurred at Moorfields Hospital was not known. The general question was fully considered by Parliament in 1946, and he was not satisfied that there was sufficient reason for departing from the decision then reached and embodied in the National Health Service Act.

Free Drugs for Private Patients

Mr. JOHN HALL (Wycombe, Con.) ran straight into trouble when he sought to introduce a Bill giving private patients the same right to supplies of drugs, medicines, and appliances as were afforded under the Health Service. The Bill, which he asked leave to introduce on December 11, was the National Health Service (Amendment) Bill, and it proposed

Westminster Children's Hospital.—On December 9 THE PRINCESS ROYAL visited the Westminster Children's Hospital, Vincent Square, to mark the fiftieth anniversary of its founding on its present site. The hospital was then known as the Infants' Hospital, having been founded by the Infants' Health Society. Claimed to be the first of its kind in Europe, the hospital's declared aims were "(1) To place the management of infants on a basis of scientific hygiene. (2) To place the treatment of disorders and diseases of nutrition occurring in infants upon a system in harmony with modern investigations. (3) To investigate and demonstrate the means by which the present disease and mortality in infants may be prevented." The present hospital has 108 beds. It was amalgamated with the Westminster Hospital after the passing of the National Health Service Act.

Princess Margaret at R.S.M.—PRINCESS MARGARET visited the Royal Society of Medicine on the evening of December 11 to receive a diploma of honorary fellowship. The

(Photo by BIPPA)

picture shows Princess Margaret signing the Roll, while the president of the Society, Sir CLEMENT PRICE THOMAS, and members of the council look on. The Princess made a short tour of the Society's house.

Dr. Béla Schick, the discoverer of the Schick test, was honoured by the Collegium Internationale Allergologicum at a dinner in New York last month, when he was made the Collegium's first honorary fellow. It was also announced that a special issue of the *International Archives of Allergy and Applied Immunology* next year would be dedicated to Dr. Schick as a Festschrift. Born in Hungary in 1877, Dr. Schick still participates in clinical conferences and carries out research. He is visiting professor of paediatrics at the Albert Einstein College of Medicine, New York, and also attends Mount Sinai Hospital and the Bethel Hospital, Brooklyn.

Perth Medical School.—The following appointments have been made in the new Medical School of the University of Western Australia at Perth: Dr. W. B. MACDONALD, lecturer in paediatrics at St. Mary's Hospital Medical School, London, to the chair of child health; Dr. R. B. LEFROY as senior assistant to the professor of medicine; Mr. J. G. BROCKIS, senior registrar at the Royal Infirmary, Cardiff, as senior assistant to the professor of surgery (and assistant surgeon, Royal Perth Hospital); Dr. C. J. PERRET, Ph.D., Lister Institute of Preventive Medicine, London, as senior lecturer in microbiology; Dr. K. E. MORTIMER, from Indonesia, as senior lecturer in anatomy; Dr. J. H. LITTLE as senior lecturer in pathology; Mr. R. PATON as junior assistant in the department of surgery; and Dr. B. KETTERER, Ph.D., as lecturer in biochemistry.

British Cardiac Society.—The autumn meeting of the British Cardiac Society was held at the Royal Society of Medicine, London, under the chairmanship of Dr. RAE GILCHRIST, on November 29. In the morning short com-

munications were given by members, after which the film "William Harvey and the Circulation of the Blood" was shown. In the afternoon further short communications followed. The Society's dinner was held at the Savoy Hotel at which the president, Dr. MAURICE CAMPBELL, took the chair.

British Association of Otolaryngologists.—At the annual general meeting held on December 6 the following were elected officers of the association for 1957-8: President, Mr. C. GILL-CAREY; immediate past president, Mr. I. SIMSON HALL; vice-president, Mr. R. R. SIMPSON; hon. treasurer, Mr. J. C. HOGG; and hon. secretary, Mr. MYLES L. FORMBY.

Prize for Radiation Studies.—A David Anderson-Berry medal, together with not less than £100, will be awarded in 1958 by the council of the Royal Society of Edinburgh. The prize will be awarded for recent work on the effects of x rays and other forms of radiation on living tissues. Published work will be taken into consideration if submitted to the Society with the application. In addition to direct application for the prize, proposals may be made on behalf of others. Applications and proposals must be in the hands of the General Secretary, Royal Society of Edinburgh, 22-24, George Street, Edinburgh, 2, Scotland, not later than March 31.

Dr. N. H. Ashton, director of the department of pathology at the Institute of Ophthalmology, has had conferred on him the title of professor of pathology in the University of London. Dr. Ashton and his associates at the institute played a leading part in demonstrating the role of excess oxygen in the aetiology of retrolental fibroplasia.

Tuberculosis Prize.—A prize of £50 is offered in 1958 to members of the British Tuberculosis Association for the best original unpublished paper on tuberculosis. The closing date is October 1. Further details may be obtained from the association's administrative secretary, 59, Portland Place, London, W.1.

COMING EVENTS

Oxford Graduates Medical Club.—Winter dinner at the Royal College of Surgeons, London, January 25, 1958, 7 for 7.30 p.m. Tickets (27s. 6d.) from Mr. SELWYN TAYLOR, F.R.C.S., 3 Roedean Crescent, Roehampton, London, S.W.15.

International College of Surgeons.—Meeting of the College's European Federation will be held in Brussels, May 15-18, 1958. Details from the College's secretariat, 1516, Lake Shore Drive, Chicago, 10, Illinois.

Fluorine and Dental Caries.—Fifth congress of the European Organization for Research on Fluorine and Dental Caries Prevention, May 30 to June 1, 1958, in Brussels. Details from Dr. ARVID SYRIST, Ecole Dentaire Royale, Malmö, Sweden.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Deacon.—On December 9, 1957, at the Birmingham Maternity Hospital, to Sibil, wife of A. L. Deacon, F.R.C.S., M.R.C.O.G., a daughter.
Slovick.—On November 25, 1957, to Pamela, wife of Dr. David Slovick, a son.

DEATHS

Agnew.—On December 3, 1957, Alan Percy Agnew, M.B., Ch.B., F.R.C.P.Ed., of "Ailsea," Mauchline, Ayrshire, late of Padilham, Lancs.
Pinkerton.—On December 2, 1957, Paul Barrar Pinkerton, M.B., Ch.B., of West Kirby, Cheshire.
Rhodes.—On November 26, 1957, at Chester Infirmary, Edward Llewellyn North Rhodes, M.B., B.Chir., D.P.H., late of 20, East Castle Street, Bridgnorth, Salop.
Rushforth.—On November 28, 1957, in New Zealand, Patrick Frank Finlay-Rushforth, M.B., Ch.B., formerly of 5, Greenhill Park, Edinburgh.
Thornton.—On December 1, 1957, in hospital, Frank Butler Thornton, M.B., B.S., of 21 Somers Road, Reigate, Surrey, aged 88.
Watts Tobin.—On December 1, 1957, at 62, Hurlingham Road, London, S.W., Oscar Watts-Tobin, M.R.C.S., L.R.C.P., D.P.H.
Wilson.—On October 31, 1957, at the Waverley Annexe, John Wilson, M.B., B.Ch., D.M.R.E., of Galgorm, Ballymena, Co. Antrim.

Any Questions?

Urban Doctor's Emergency Bag

Q.—What should the emergency bag of a doctor practising in an urban area contain?

A.—The selection and use of "bags" in general practice is largely an individual matter depending on the area of practice, the type of work being undertaken, and, above all, the doctor's personal likes and dislikes.

The majority of urban practitioners would appear to use three bags—a general bag for everyday use, a midwifery bag, and an emergency bag. The contents of this emergency bag will naturally depend on the emergencies likely to be encountered and the local facilities available to meet them. In an urban area hospitals should be easily accessible to deal with emergencies that cannot be dealt with by the family doctor. It is unnecessary, therefore, to plan for the management of the more complicated emergencies.

Provision must be made for four common components of emergencies—pain, anxiety, infection, and shock. To treat severe pain it is essential to have a supply of ampoules of morphine in $\frac{1}{2}$ gr. (16 mg.) and $\frac{1}{4}$ gr. (22 mg.) strengths. Pethidine in 100 mg. ampoules is also useful for the treatment of colics. Milder analgesics such as soluble aspirin and tablets are needed to treat less severe types of pain. For the alleviation of anxiety one or two types of barbiturate are useful. Personal preference is for quinalbarbitone $1\frac{1}{2}$ gr. (0.1 g.) and amylobarbitone 3 gr. (0.2 g.). Control of infection will require supplies of a sulphonamide preparation, penicillin, streptomycin, and a broad-spectrum antibiotic. Treatment of severe shock should not as a rule be undertaken in urban practice, as such cases are much better dealt with by urgent admission to a nearby hospital, but an intravenous set and a bottle of dextran should be kept in the car for dire emergencies such as a severe haematemesis or in obstetrics.

The further composition of the bag is best dealt with by considering the most commonly encountered emergencies. Since the treatment of many emergencies requires administration of drugs by injection, for a rapid effect, it is necessary to have available a number of sterile syringes—say 1 ml., 5 ml., and 10 ml.—with sharp needles of varying sizes. A long wide-bore needle and a flat piece of cork should also be carried to treat a tension pneumothorax, the needle being inserted through the cork before penetrating the skin.

Cardiovascular emergencies are of two main types—cardiac infarction and acute heart failure. Emergency management of cardiac infarction requires a supply of heparin for intravenous administration to start off anticoagulant therapy, which should be continued by using phenindione. Ampoules of aminophylline, digoxin, mersalyl, and nikethamide may be necessary for the management of acute heart failure. For the sake of completeness it is wise to include a hypotensive drug for possible control of an attack of hypertensive encephalopathy.

For strokes, coma, and fits a mouth gag, tongue forceps, and airways are needed to maintain an airway and a stomach tube for aspiration and feeding. Control of fits may require the use of intramuscular paraldehyde or intravenous thiopentone.

Psychiatric emergencies may entail the control of mania with injections of morphine and hyoscine or the emergency treatment of suicides with stomach washouts, apomorphine, and possibly the use of a barbiturate antagonist such as bemigrade or a morphine antagonist such as nalorphine.

Adrenaline, aminophylline, and cortisone or delta-cortisone preparations are needed for managing asthma; ampoules of ergometrine maleate for the control of haemorrhage associated with pregnancy; soluble insulin for diabetic coma; and 50% glucose for hypoglycaemic coma.

So far as equipment is concerned, it is assumed that provision is being made for treating accidents. For this emergency, sutures already threaded in sterile ampoules and sterile instruments are needed for suturing wounds and controlling haemorrhage. Procaine solution for local analgesia and antitetanus serum are other necessities, as are bandages, gauze, and cotton-wool, together with sterile syringes and needles. Control of epistaxis is a fairly common emergency, and for this a headlamp is essential as well as a nasal speculum, forceps, and gauze roll. Boilable rubber catheters, with sterile lubricant, must be included. My own custom is to keep all this surgical equipment in a small, second emergency bag.

Additions for the Rural Practitioner

Q.—The preceding answer describes the contents of an emergency bag suitable for urban practitioners. What additional items should a rural practitioner carry?

A.—A rural practitioner would not need many additional items. The only real difference in his work from that of his urban colleague is a matter of greater distance and less easy hospital facilities. It follows that he must be prepared to do more on the spot. Therefore he should carry a simple anaesthetic in which he must be adept; either open ethyl chloride and ether, or intravenous thiopentone sodium. For cleaning and suturing wounds and removing foreign bodies, a good supply of local analgesic is needed, along with sinus forceps, "fairy" Spencer-Wells, probes, an eye-spud, and material for dressings. Tetanus prophylaxis must always be given for wounds sustained out of doors, and for this will be needed tetanus toxoid for those previously actively immunized (an essential for anyone in a farming community) and antitetanus serum for those who are not. Splints are cumbersome to carry about always, but the bag should contain half a dozen 6-in. (15-cm.) bandages and triangular bandages for immobilizing a seriously injured limb.

For children, "nepenthe" is a useful analgesic and sedative. For retention of urine, propantheline, with lignocaine ointment for use with a Foley catheter, form a useful emergency combination.

Prospects for In Vitro Babies

Q.—(1) Can the mammalian ovum be fertilized and made to divide in vitro? If so, how far will the process go, and is fertilization by a spermatozoon essential as the initiating stimulus? (2) Can such a developing ovum be implanted in the uterus of an animal with any prospect of a full-term living foetus resulting? (3) Is there any fundamental obstacle to the production of a fully developed mammalian foetus in vitro?

A.—(1) Several investigators have claimed that they have observed the fertilization of mammalian (including human) eggs in vitro, but the evidence submitted is quite inconclusive. The degree of development recorded varies a great deal. Some investigators describe only the formation of male and female pronuclei. Others record the cleavage of the eggs in culture and even the birth of young (in rabbits) after transfer of the eggs to host animals. Cleavage of mammalian eggs can also be provoked by artificial stimuli, such as the application of heat or cold. Some degree of such "parthenogenetic" development can undoubtedly be obtained, but protracted development is unlikely, although again some investigators have reported the birth of alleged parthenogenes.

(2) Transfer of fertilized eggs from one animal to another is entirely practicable and has been done on numerous occasions in domestic and laboratory animals with the birth of young as the result. It is therefore reasonable to suppose that eggs fertilized in vitro and then transferred to a host will also give rise to viable young.

(3) Fertilized mammalian eggs may be maintained in culture to the blastocyst stage. Embryos removed from the

uterus in later phases of development can also be cultivated for limited periods. Eventually, however, in all such experiments, growth becomes disorganized and the embryo is reduced to a mass of poorly differentiated cells. This result is hardly surprising, in view of the many differences between the experimental and uterine environments, but the precise reasons for failure are not yet clearly understood.

White Eyelashes

Q.—Following treatment for conjunctivitis with penicillin eye ointment several months ago, a patient of mine has lost all the pigment in the eyelashes of her right eye. The lashes are otherwise normal. What is the explanation, and is there any safe preparation available for dyeing the lashes? At present the condition is very unsightly. Will the lashes regain their colour?

A.—White eyelashes are sometimes familial, and in that case are usually congenital. Acquired forms may result from alopecia areata; in this event there are usually, but not always, well-recognizable bald patches on the scalp or elsewhere, and of course the white lashes are the newly grown ones. In other cases white lashes may be a part of vitiligo. Vitiligo commonly affects the skin surface with or without involvement of the hair. It would be interesting to know whether, in this case, the skin of the eyelids is also affected. There remain some cases in which the eyelashes become white without any apparent involvement of the skin. It may be that these are really cases of vitiligo limited to the eyelashes, though it is not easy to prove this.

With the exercise of a little skill the affected lashes can be effectively coloured with the usual eyelash preparations; these are fairly harmless and seldom seem to give rise to trouble. The prognosis is doubtful; white eyelashes following alopecia areata are likely to darken, but in other cases the prospects of recovery are not good.

Calories from Alcoholic Drinks

Q.—What is the caloric value of pure ethyl alcohol? What are the caloric values (rough range) of spirits, fortified wines, ordinary wines, and ales, respectively? Is it true that in alcoholic beverages the content of alcohol accounts almost entirely for their caloric value?

A.—The caloric value of ethyl alcohol is 7 calories per gramme. Spirits (40% of alcohol) provide about 280 calories per 100 ml. Dry fortified wines (20%) provide 140 calories, and dry ordinary wine (15%) 105 calories. In the foregoing beverages it is correct that components other than alcohol may be neglected as sources of calories. Sweet wines may contain about 5% of sugar, which will contribute about one calorie for every five supplied as alcohol. Beer or stout, with 5% of alcohol, will provide 35 calories per 100 ml. from its content of alcohol, and about another 10 calories from its carbohydrate and protein, making 45 calories in all. Liqueurs may contain up to 42% of alcohol and 35% of sugar, providing over 400 calories per 100 ml., but of course they are usually consumed in minute quantities.

NOTES AND COMMENTS

Polio Hazard of Triple Antigen.—Dr. M. C. SPENCER (Burstow, Surrey) writes: Your expert, in assessing the risk of poliomyelitis incident to the use of the various immunizing agents ("Any Questions?" November 16, p. 1191), makes no mention of the fact that the combined double and triple antigens may be given by the subcutaneous route. I have always preferred this route, hoping that I would thus diminish the risk of polio. Perhaps I am mistaken. If indeed immunization by subcutaneous injection is free from risk it should become the routine method.

Dr. JOHN BURY (Ingatstone) writes: Your expert says that the risk of provocation poliomyelitis is increased in children of 6 months to 2 years. When immunization with triple antigen is started at 6-8 weeks, is there any risk, and, if so, of what order?

Dr. I. G. HAMILTON (Harlow, Essex) writes: I should like to know: (1) Is there any evidence that the repeated trauma of injections of the antigens separately carries a risk of provocation polio almost as high as that of the smaller number of "triple

antigen" injections? (2) If triple antigen is to be banned—the medical officers of health request at the local clinics—what, in the view of the experts, is the safest method of immunizing against smallpox, diphtheria, tetanus, pertussis, and polio? In what order and at what age should these procedures be performed?

OUR EXPERT replies: In reply to Dr. Spencer, the report of the Medical Research Council's committee on inoculation procedures and neurological lesions¹ stated that their observations on children said to have been injected subcutaneously did not confirm the widely held view that subcutaneous injections were safer than intramuscular injections. The committee found no reason to believe that a change to the subcutaneous route would get rid of the problem of provocation poliomyelitis.

In reply to Dr. Bury, the increased risk of developing paralytic poliomyelitis soon after injections of prophylactics has been shown to be present in children between 6 months and 9 years of age and not only in children between 6 months and 2 years of age. There is insufficient evidence to say if children given their first injection of triple antigen at about 8 weeks of age (and presumably the second and third injections at 12 and 16 weeks of age) are also at risk. Poliomyelitis is comparatively rare in the first year of life, but it does occur, even in the first 6 months of life, as Geffen and Tracy² have shown. Children below 6 months of age, therefore, are not necessarily immune, and the case mortality from poliomyelitis in this age group is higher than in older children.

In reply to Dr. Hamilton, (1) T.A.F. (toxoid-antitoxin floccules) and F.T. (formol toxoid) carry practically no risk; the risk with tetanus toxoid is not known; the risk with pertussis vaccine given alone appears to be much less than when it is mixed with diphtheria toxoid. Giving the antigens separately therefore should be less dangerous than mixing them even when the larger number of injections is taken into account. (2) Smallpox vaccination does not appear to carry any increased risk of paralytic poliomyelitis. The small amount of evidence available does not suggest that poliomyelitis vaccine precipitates paralysis at the site of injection (except of course in the early disaster in the United States when live virus was found in the vaccine, but no recurrence of this danger has been encountered). There are numerous possible immunization schemes. I suggest pertussis vaccine at about 8 and 12 weeks with a third dose at 1 year, and diphtheria immunization at 8 and 9 months with a third dose at 5 years. Poliomyelitis vaccine may be given at 6 and 7 months (with a third dose at 18 months when there is enough vaccine for third doses). Tetanus toxoid can be given at any time, and, as the risk of tetanus is very slight, a child need not necessarily be immunized in the first year unless there are special indications. The important point about primary tetanus immunization is that a third dose must be given 6 to 12 months after the second for a good level of immunity. A reinforcing dose of tetanus toxoid should also be given about five years after the third dose of the primary course, and perhaps again in another five years. Smallpox vaccination can be done at any time in the first four years of life. If it can be shown that babies below 6 months can be adequately vaccinated against poliomyelitis (and studies are at present being made), then it would seem logical to vaccinate against poliomyelitis early. If it can also be shown that poliomyelitis vaccine protects children against provocation poliomyelitis, then triple antigens may again be used freely. For the present it is important that the safest possible antigens should be used, and that, despite the increased number of injections, mothers should be encouraged to have their children immunized against diphtheria and vaccinated against pertussis and poliomyelitis.

SIR ROBERT PHILIP AND THE CONQUEST OF TUBERCULOSIS*

BY

CHRISTOPHER CLAYSON, M.D., F.R.C.P.Ed.

Dumfries and Galloway Sanatorium, Lochmaben

I am not here to honour Robert Philip, since that is for me impossible. His achievements for the benefit of his fellow men are set far above my power to add or detract. Indeed, if anyone is honoured here to-day it is I. I am honoured by the Royal Victoria Hospital Tuberculosis Trust, who have granted me the privilege of delivering this lecture as a memorial to their great founder; and I am honoured by the President and Council of the Royal College of Physicians of Edinburgh, who have permitted me to present my tribute to Robert Philip in the College of which he was one of the famous presidents of the past.

My task is threefold: firstly, I shall attempt to assess Philip's contribution to the control of tuberculosis; secondly, I propose to consider what still remains to be done before his dream of the eradication of tuberculosis comes true; and, thirdly, I intend to comment on the effects of recent trends on the co-ordinated tuberculosis scheme he created.

The Growth of the Edinburgh Scheme

Philip's greatest work was accomplished and his own greatness recognized long before I met him, and I have to go back in medical history to the year 1882 for the commencement of my appraisal. For it was in that year that Robert Koch discovered the tubercle bacillus and Robert Philip graduated in medicine. Doubtless the 36 people who were present when Koch delivered his famous paper on the aetiology of tuberculosis were greatly impressed with the clear, logical, scientific statement that they had heard. The famous postulates could not fail to excite the admiration of the trained observer: the identification of the bacillus in any type of tuberculous discharge; the separation of the bacillus from other organisms; the growth of the bacillus in culture; the inoculation of the culture into animals producing tuberculous lesions; and the recovery of the bacillus from the lesions so produced. All this was surely proof enough of the infective nature of tuberculosis, but its general acceptance was slow. Four years later a new edition of the principal British textbook of medicine still spoke of the infectivity of tuberculosis as a matter of doubt—acute and chronic phthisis would be shown to be varieties of the same disease only "if Koch's discovery of the tubercle bacillus should be confirmed" (Fagge, 1886).

*The Royal Victoria Hospital Tuberculosis Trust Memorial Lecture delivered in the Royal College of Physicians, Edinburgh, on December 13, 1957, to mark the centenary of the birth of R. W. Philip.

There was, however, one young man who immediately saw the greatness of the issues very clearly—in a way not common among men less than a year qualified. Philip propounded to his teachers a new doctrine. Clinical examination and what then passed for treatment were not enough. All relevant information should be gathered in what he called a "directory of tuberculosis." An account of the patient's environment must be recorded and, where possible, defects corrected. The patient should be taught, since he was the subject of an infective disease, how to prevent the infection spreading to others. All those in contact with the patient should be examined. Advice for the guidance not only of the sufferer but for the whole family should be issued. These new ideas did not commend themselves to his teachers, and he met much passive and even active opposition. All the more remarkable, therefore, that he succeeded, with the help of a voluntary committee of management and of a few professional friends, in establishing the Victoria Dispensary in Edinburgh in 1887, at a time when he was not quite 30 years of age. When so young a man could do that, small wonder that much else besides should follow.

The rest of the story is well known: the building of the Royal Victoria Hospital and the opening of the first colony, both under the aegis of the voluntary committee which later became the Royal Victoria Hospital Tuberculosis Trust. The City of Edinburgh made its contribution in the provision of beds at the City Hospital, and later in financial grants towards the work of the dispensary. By 1912 the Edinburgh Co-ordinated Anti-tuberculosis Scheme had become so well known that the Government set up a Departmental Committee to report on the general policy for the country as a whole. The result of their deliberations was the famous Astor Reports (1912-13).

It was in these reports that the principles of policy were laid down, and it is to these reports, therefore, that we must now turn for the next step in our appraisal of Philip's work.

In general, the reports recommended the adoption of the Edinburgh model for the United Kingdom. They described in detail the two essential units of the scheme. The first unit consisted of the dispensary for case-finding and assessment, treatment and aftercare, prevention and education. The second unit provided institutional treatment and comprised the sanatorium for early cases whose working capacity was likely to be restored, the hospital for advanced cases, the open-air school, and

the working colony; and in all these places education in its widest sense was to be stressed. The adoption of the Edinburgh Co-ordinated Scheme almost in its entirety was a great triumph for a great man, and it is not surprising that soon after the publication of the Interim Report Philip received the honour of knighthood. I suspect, however, that Philip was not completely satisfied with everything in these reports. I think, for instance, that he was very concerned about the way in which treatment and prevention were separated, and I am sure (recalling his lectures of later years as I do) that he was responsible for the sentence, "Effective treatment leads to prevention and effective prevention leads to diminished need for treatment." This is, if possible, even more true to-day than it was then, since modern chemotherapy is perhaps the most important preventive measure yet devised. Before the chemotherapy era at least 65% of respiratory cases were discharged from institutional treatment still expectorating tubercle bacilli. To-day only 3 to 5% are so discharged. As a result the number of infective cases at home is steadily diminishing. In my own area of Dumfries and Galloway that figure is now as low as 1% of the register, and a similar result is quoted from Edinburgh (Crofton, 1957).

There is another point which I know troubled Philip. The Astor Reports, having divided the tuberculosis service of the country into the two separate units, led to the creation of the two distinct categories of tuberculosis specialists—namely, the tuberculosis officer of the dispensary and the medical superintendent of the sanatorium. This division was certainly not in accordance with the Edinburgh model, where it was fundamental that the dispensary physician was also clinical chief of the associated institutions. Philip was absolutely correct, since all workers should take part in both sides of the service, and one of the good things the National Health Service has done is that it has returned to the original conception of Philip and gone a long way to eliminate the artificial division created by the Astor Reports.

Another matter in which the Astor Committee rather parted with Philip was in the siting of sanatoria. Philip always maintained that the sanatorium should be "under the eye of the citizens." The report agreed with this conception in principle, but stated it would increase the cost of the sanatorium site and that "a more isolated position is usually advisable." How Philip must have detested this loophole, for thus it came about that sanatoria were commonly built in inaccessible places, creating endless administrative problems which beset us to this day, and which could all have been avoided if his guidance had been followed.

A further point in Philip's scheme which was never universally adopted was the institutional separation of the early from the advanced cases. I myself was always most unhappy about this arrangement, and when I had a clinical charge of my own abolished it, since patients always knew the ominous distinction between being allotted a "hospital" as distinct from a "sanatorium" bed. But I can see the reasons for Philip's plan, and can see so clearly his mind at work. He always took what he called the broad view. Individuals meant less to him than the campaign, and if the separation of the advanced sufferers from the curable cases were to mean—as he believed—more efficient management of the greater number of patients, then that was how it had to be.

Happily the distinction has now almost vanished. Therapeutically there is no such thing as an advanced case of tuberculosis; therefore the sanatorium and hospital are one, and all are called hospitals. In a way this is a pity. The word "hospital" means a place for the care of the infirm. The word "sanatorium" means a place for the cure of disease. We are dropping the wrong word.

Bovine Tuberculosis

In the same year that saw the Interim Report of the Departmental Committee Sir John Fraser (then Mr. Fraser) published his famous work on the relative frequency of bovine and human tubercle bacilli in tuberculous disease of bones and joints in children, and Dr. Mitchell published parallel observations on tuberculous cervical glands. It is not surprising, therefore, that a large part of the Final Report (1913) dealt with bovine tuberculosis, and that in the following year the Milk and Dairies Acts were passed. This legislation aimed at ensuring the purity of milk supplies, but on account of the first world war the operation of the Act was postponed in Scotland until 1925, though the preparations for the grading of milk were made under an order of June, 1923.

Philip did not wait for the legislation. He decided to demonstrate in advance to the public and to the farming community alike that tubercle-free milk of the highest grade of purity could be marketed, not as a subsidized project, but as a strictly run commercial proposition. In this he was, as ever, loyally supported by the Royal Victoria Hospital Tuberculosis Trust. The Gracemount Farm Scheme was begun, and in it Philip and the Trust were aided successively by the practical knowledge of Dr. J. C. Simpson and of Mr. John Johnstone. The plan was a great success, and there can be no doubt that much of the progress made since that time has been due to the bold experiment Philip began in 1922. At that time half the milk in the country came from cows which were infected with the tubercle bacillus. Now only 2% of the milk produced in registered dairy farms is not guaranteed to be tubercle-free.

The Control of Tuberculosis

When Philip began his scheme in 1887 the number of deaths from tuberculosis (all forms) in Scotland was 10,275. The corresponding figure for respiratory tuberculosis was 7,418, and we may safely assume that a great many more were registered under some other diagnosis. In 1956 the figures were 801 for all forms and 715 for the respiratory forms of the disease, and I believe that very few additional deaths from tuberculosis are now certified as due to some other cause. This astonishing decline in the mortality from what was for long the most important cause of death is one of the most remarkable chapters in the story of medical progress.

Philip's aim was the control and eradication of tuberculosis. He was so confident that the scheme he had evolved would, if vigorously pressed, help to achieve this result that in 1913 he stated that "in a reasonably progressive community the 'passing of tuberculosis' should practically be an accomplished fact in a generation and a half." Calculated from 1913, a generation and a half brings us to the year 1958. Although he foresaw (Philip, 1913), chemotherapeutic developments in "combinations which may prove efficacious," two unexpected world wars and the cohort effects of the depression between have nevertheless made his prophecy somewhat over-optimistic. Despite this, the prediction of 45 years ago is so nearly true as to be yet another example of his remarkable prescience.

When a result is expected, and follows accurately measures designed to bring it about, it is natural to suppose that the two things are cause and effect. I believe it is so in this instance. Philip naturally liked to stress the effect of the anti-tuberculosis campaign, but in his analysis of the

causes of the decline in mortality he was quite fair. Tuberculosis he regarded as a sensitive index of the public health, and therefore the decline was due to a variety of *factors of general application*. There was the slow but sure rise in the standard of living and in the standard of education of the country. There was health legislation starting from the Local Government Board in 1871, the Public Health Acts of 1875 and 1897, the National Health Insurance Acts in 1912, the establishment of the Ministry of Health and the Board of Health for Scotland in 1919. But in addition to all these general measures two *special factors* operated. One was the diminution, by the elimination of susceptibles, of an epidemic of tuberculosis which had lasted 200 years or more. The other was the anti-tuberculosis campaign. The former factor was, in virtue of its nature, more effective in causing the decline of tuberculosis mortality in the nineteenth century, and was in the twentieth century losing its effect. But nevertheless the decline actually accelerated in the twentieth century, and this might reasonably, therefore, be deemed to be due to the effect of co-ordinated effort in the fight against tuberculosis. So ran Philip's argument, which I believe to be correct. Statisticians, however, have their doubts about its validity, and some consider that it is only in the recent chemotherapy era that a truly accelerating decline has taken place.

Be that as it may, the annual number of deaths at the present time is trifling. The annual number of new cases is still formidable, but is largely due to improved diagnosis, as is shown by the increasing proportion of early cases among those notified. These trends, combined with effective treatment, have led to an enormous saving of life, and we are fully justified in concluding that tuberculosis is now under control. This tremendous achievement has been due in very large measure to the firm purpose and sure vision of Robert Philip.

The Eradication of Tuberculosis

Let us be under no illusion as to what follows. The control of tuberculosis and the eradication of tuberculosis are two very different things. We now have to choose whether to be content with present progress and hope for the best, or whether to call for the tremendous effort which will be required for the elimination of the disease.

There can be only one answer to this, and we who have inherited the problem must aim at eradicating tuberculosis as speedily as may be. Philip's principles will remain the basis of the future intensive campaign, though certain requirements have changed and new techniques developed.

Four aims require to be restated and re-examined: (1) the prevention of infection in those not infected; (2) the prevention of the consequences of infection in those who are infected; (3) the discovery of all unknown cases; and (4) effective treatment and aftercare.

1. The Prevention of Infection

Prevention depends on the removal of active sources of tubercle bacilli, whether they be human or bovine. I have already referred to the successful campaign against tuberculosis in cattle and do not intend to discuss it further. There is still much to be said, however, concerning the elimination of human infection.

In the first place, prevention depends both on early diagnosis and on effective treatment. These are considered below, but meantime let me say that diagnosis if it is to be early, and treatment if it is to be effective, require not only a good physician, be he specialist or practitioner, but a good tuberculosis health visitor as well. The health visitor occupies a key place in the service, and the value of her work ever since Philip appointed his first two visiting sisters in 1887 has been so great that a special tribute is needed here in acknowledgment. As the years have passed, the scope of the tuberculosis health visitor's work has increased.

For example, she now has to deal with domiciliary chemotherapy, and especially with the chronic active case whose bacilli are resistant to all drugs, and she also has important duties in connexion with vaccination by B.C.G.

B.C.G. Vaccination

Calmette was, of course, very anxious to have Philip's support for the B.C.G. campaign and to extend it to this country in the nineteen-thirties. But Philip (1931) was extremely cautious as regards both the duration of protection and the possibility of risk—"Unfortunately by reason of the conditions of the [French] experiment we must remain in the dark for a considerable time yet." This darkness, however, has been resolved, and we now know that B.C.G. is virtually harmless and gives a high degree of protection for a period variously estimated at from five to ten years. The rationale for its continued use in this country may be stated as follows.

Our racial resistance has been slowly built up over two hundred years or more. It seems, however, that in the absence of natural tuberculous infection such resistance can be lost much more rapidly than it was gained (Heaf, 1956). Thus a few infective individuals could do great damage in a susceptible community. To minimize the consequences of this decline in resistance the widespread use of B.C.G. vaccination is indicated, and should continue until the opportunities for natural infection are so low that protective immunization is not worth while. Until that time comes, the groups more especially requiring protection are the tuberculin-negative adolescents, to whom medical officers of health offer vaccination before leaving school, and the tuberculin-negative contacts of active cases. These contacts should include doctors, nurses, and medical students.

How long should we go on with the policy of protective immunization? For the protection of contacts, vaccination is clearly needed so long as cases of active tuberculosis can be discovered, but for the mass vaccination of adolescents the answer is not so obvious.

We do not know as much as we would like to know about the level of tuberculous infection at different ages. Most of the available information in Scotland relates to the year 1954. Murray, Petrie, and Williamson (1955) tested 93.5% of the Musselburgh schoolchildren and found that 47% of those aged 13-14 years reacted to tuberculin. The corresponding figure for the whole of Scotland based on pre-B.C.G. testing in 1954 was 46% (Macgregor, 1957). This figure may well be only approximate, since it is based on tuberculin-testing a smaller percentage than Murray and his colleagues achieved of the total children in their last year at school. Again, various methods of testing, and, of course, many different observers, were involved, but the estimated figures for Scotland and the accurate figures for Musselburgh correspond so closely that they probably afford a reliable guide to the level of tuberculous infection at that time.

At the age of 18 information is very difficult to obtain, but N. W. Horne (1957, personal communication) found that 57% of nurses (not including those already vaccinated by B.C.G.) reacted to tuberculin. By the age of 24, 75% of the population reacted to tuberculin. The last figure is based on reports by Verney (1955), Giannini and Sloan (1957), and Imrie and Gemmill (1956).

Now we know that the number of children aged 14 in 1954 was 75,000 (Registrar-General). According to the information quoted above, 40,000 of those children did not react to tuberculin, but within the next 10 years, if the present rate of infection be maintained, 21,000 more will have converted. The number of persons subsequently developing tuberculous disease may be calculated in two ways: either as a percentage incidence (4%) of the number of converters, or as a morbidity rate for non-reactors of (1.94 per 1,000 per annum). In either case it seems that of the non-reactors leaving school in 1954, about 800 would develop clinical tuberculosis within, say, 10 years or so, unless protected by B.C.G.

In order to prevent these cases—or most of them, since even vaccinated subjects (0.34 per 1,000 per annum) develop tuberculosis—40,000 children would have had to be immunized, or 50 persons vaccinated for each case prevented. This is a perfectly reasonable demand on the public health services.

But the situation is changing rapidly year by year. The most detailed figures illustrative of this trend are those of Jarman (1955) in South Wales. Successive surveys in 1950–1 and 1953 demonstrated that the standardized percentage of positive reactors fell from 24.6 to 18.4, whilst the percentage of reversions increased by 13.4. These figures compared very favourably with a similar area (20.2, 18.2, and 2.2 respectively) where the same standard of intensive case-finding had not previously been carried out. It seems clear that in the short space of two to three years the chance of exposure to infection had decreased significantly as a result of intensive case-finding measures.

The latest figures (1956) for Scotland (Macgregor, 1957) show that only 20% of school-leavers now react to tuberculin, and in some rural areas—as, for instance, Dumfries and Galloway (S. K. Drainer, J. B. Shiel, and H. B. Brown, personal communication, 1957)—the figure is only 12%. At the present rate of progress we may quite soon reach the stage at which only 5% of school-leavers will react to tuberculin and only 10% of the population will react at the age of 24. Under these circumstances we would require (on the present population basis) to vaccinate over 72,000 school-leavers each year to prevent approximately 150 cases of tuberculosis, or 480 cases vaccinated for each case prevented. At that stage, having regard to the efficiency of modern methods of treatment, prevention by B.C.G. would become unnecessary. It may well be the treatment of the tuberculin reactor rather than the vaccination of the non-reactor that will become the important part of our programme. In other words, we must increasingly direct our energies towards preventing the consequences of infection—namely, the development of tuberculosis in later years.

2. Prevention of the Consequences of Infection

Despite the fact that B.C.G.-vaccinated school-leavers develop tuberculosis at the rate of 0.34 per 1,000 per annum, we press for vaccination, since without it tuberculosis would arise for a number of years at the rate of 1.94 per 1,000 per annum (M.R.C., 1956). It is a peculiar thing, therefore, that as yet we make no comparable effort on behalf of the school-leavers with the very strongly positive tuberculin reaction, for whom the corresponding morbidity figure is 2.93 per 1,000 (M.R.C., 1956). This seems to be illogical. If it is correct to prevent tuberculous infection in order to prevent tuberculous disease, surely it is also correct to treat tuberculous infection in order to prevent tuberculous disease.

The treatment of tuberculous infection is not new. Philip (1925) began it over 30 years ago. When the tuberculin-positive child showed signs of vague ill-health, or when the strongly positive reactor showed none, treatment was begun. Possibly two things were wrong with Philip's method. The first was that no genuine chemotherapy was available—only tuberculin; the second, that he called his procedure, perhaps a little pretentiously, "anticipatory detuberculation." This altitokenne aroused more criticism than most of his work, and the method was soon forgotten by all except a few of his pupils.

Philip always maintained that the pattern of mortality from tuberculosis in later life was set by the prevalence of infection in childhood, though he never adduced statistical proof of this statement. Proof came many years later through the cohort method of epidemiological study by Frost (1939) and Springett (1952). Brooks (1957) therefore concluded that under these circumstances it would be almost negligent not to treat tuberculous infection in early life. Such treatment is now being given. Heaf (1956) uses a combination of isoniazid and *p*-aminosalicylic acid. Waring

(1954) uses isoniazid alone. What the best procedure will prove to be, and what results will be achieved, must await the publication of controlled trials. Meantime Mitchison (1957) suggests that three groups of persons are suitable for prophylactic treatment. These briefly are: (a) individuals with increased exposure to tuberculosis, especially if transient; (b) recent converters; and (c) any tuberculin reactors in countries in which the incidence of infection has been reduced to a very low level. The last of these, Mitchison considers, offers the best chance for the final elimination of tuberculosis.

So it seems that Philip was right after all. How delighted he would have been to see his ideas vindicated. But I suspect that his pleasure in the rediscovery of his method would be somewhat diminished by the dropping of his elegant term "anticipatory detuberculation" in favour of the more prosaic "chemoprophylaxis."

3. The Detection of all Undiscovered Cases

Philip's teaching was that "we cannot wait for patients to present themselves at out-patient departments. We must search them out in their hiding-places" (Philip, 1909). This became the principal burden of dispensary practice, and especially of contact examination.

Two special methods of case-finding have, however, been developed. For one of these Philip was largely responsible, and in the other he was not.

The Tuberculin Test as a Case-finding Measure

Philip recommended regular tuberculin tests from infancy onwards. The child reactor became not only himself the subject of clinical interest but also the index case in the search for tuberculosis among family contacts. Once again Philip was ahead of his time. That particular method of case-finding could hardly be said to be of practical service in a country where 80% of the children aged 15 showed a positive tuberculin test. The method was more appropriate where there was a lower level of infection. The first major demonstration of this procedure was carried out in Cyprus. It was inspired by Philip and sponsored by the National Association for the Prevention of Tuberculosis, of which Philip was a founder member and for so many years Chairman of Council. The field work was undertaken by the late Noel Bardswell (1937, 1938–9), who based his search for tuberculosis in adults on tuberculin-testing the school population.

The level of infection in this country is now low enough to permit the method to be used effectively in school entrants, of whom only 1% (Doig, 1957) to 9.8% (Minto, 1957) are infected. MacDougall, Mikhail, and Tattersall (1953), for instance, were able to trace the source of infection in school entrants to a hitherto unknown case of pulmonary tuberculosis once for every 250 tuberculin tests performed. There is no doubt that we shall see much success from this type of case-finding provided home-visiting of contacts is carried out intensively enough.

Mass Radiography

Mass radiography has, of course, developed since Philip's day, though as one who pressed strongly for pre-employment examination for those entering industry (Philip, 1927) he doubtless would have welcomed such an important technical development. Mass radiography is the principal means of detecting cases of pulmonary tuberculosis among the apparently healthy. During the first eleven years of the service (1944–55) over two million examinations were carried out in Scotland and over 10,000 active cases discovered—a rate of 5 per 1,000. This is a very important contribution to the work of the chest service, not only from the point of view of early diagnosis but also of efficient therapy and prevention.

But it is not enough. Macgregor (1957) has pointed out that, of all the new cases of respiratory tuberculosis notified in 1954, only 13% were discovered by mass radiography.

The percentage for 1955 was 15. Most of these are probably discovered in the pre-symptomatic phase, but, even if we allow for the fact that some of the contact group are also diagnosed while apparently healthy, it seems unlikely that in Scotland as a whole as many as one-fifth of all new cases are discovered before symptoms have begun.

We do not know the number of undiscovered infective cases in Scotland. It must still be large, since over 6,000 new cases of tuberculosis have been notified annually of recent years. Various attempts have been made to determine the size of the "infective pool." The nearest approach to x-raying the whole of a defined population was achieved in Annandale, Dumfriesshire, where Cochran, Clayton, and Fletcher (1957) x-rayed 95.1% of 8,650 persons. In all, four surveys have x-rayed 90% or more of the populations concerned. Two of these were carried out in South Wales (Cochrane *et al.*, 1952, 1956) and two in Dumfriesshire. These investigations surveyed a total population of about 35,000. The combined results showed that for the industrialized areas the level of previously unknown infective tuberculosis was 2.2 per 1,000, and for rural areas 0.8 per 1,000. If we apply these rates to Scotland we may suggest that the "pool of infection" consists of about 6,000 persons.

This may well prove to be an underestimate when the full details of the recent Glasgow survey are available. We already know, however, the figures for clinically significant tuberculosis. In the Glasgow survey there were 9.5 per 1,000 and in the two Dumfriesshire surveys 2.7 per 1,000. If these figures are confirmed, I suggest that there are 23,000 unknown cases of clinically significant tuberculosis in the adult population of Scotland, and therefore 8,000 may well be infective.

Whether mass radiography, as at present practised, can discover these cases within any reasonable period of time is extremely doubtful. The available facilities are insufficient even for the large centres, so that the small burghs and landward areas (comprising nearly half the population) are virtually unexplored. Even in those places where mass radiography is in routine operation the problem is how to secure the attendance of that section of the people which has not hitherto volunteered.

There would appear to be three methods by which the service could be broadened and made more effective. These are: (a) the large industrial survey; (b) the small community survey; (c) group radiography.

The Large Industrial Survey.—This is the intensive type of campaign recently carried out with such great success in Glasgow. It was a superb effort of propaganda and organization, with mobilization of reinforcements for the city's chest service from other areas. The detailed results will be awaited with lively interest. Preliminary results indicate that 76% of the population of the city were x-rayed, a truly remarkable achievement. Clearly, however, the resources of Scotland are inadequate for this type of campaign to be more than a special occasion, for which quite exceptional arrangements were made to deal with an exceptional problem.

The Small Community Survey.—This is necessarily a more prolonged type of survey, which up to the present time has proved itself especially suited to securing a very high response in populations of up to 20,000 people. The successful surveys in Annandale (95.1%) and the Vale of Glamorgan (94.6%) have been commented on already. They were based on census-taking and conscientious home-visiting. The second survey by Cochran, Clayton, and Fletcher (the results of which are at present being analysed) showed that in the part of the town where a census and home-visiting were completed a 92.5% response was obtained, but in that part where no home-visiting was done and only the usual propaganda methods were relied on the response was 70% (figures provisional). It is, in my opinion, this painstaking extended area by area with careful home-visiting which offers the best prospect for the future.

Group Radiography.—This implies an admission that the mass radiography service is unable to x-ray a sufficient percentage of the population—or, alternatively, that financial resources are insufficient for it to do so—and should increasingly be used to examine those groups in which a high incidence of disease is expected or in which an isolated sputum-positive case could do considerable damage. This possibility is one requiring thorough investigation.

4. Efficient Treatment and Aftercare

To-day treatment is more effective than it has ever been, and conversion of sputum from positive to negative can almost always be assured. There are very few cases indeed, however advanced, that will not convert with six or nine months' chemotherapy. Provided, further, that treatment is conscientiously maintained for two to three years, even the most serious case may well become arrested. So far as the less serious cases are concerned, the controlled trial coordinated by Kay (1957) on behalf of the Research Committee of the Tuberculosis Society of Scotland showed that such patients need not cease work provided efficient chemotherapy can be maintained. For patients requiring rest in bed a controlled trial has recently been reported from Glasgow by Kennedy (1957). Results after six months indicated that, except for adolescents, such patients improved clinically and radiologically as much at home as in hospital provided all received efficient chemotherapy. Certain wider aspects of care work and prevention were, however, more difficult at home. This was not surprising, but the trends illustrated in these reports are indicative of the highly efficient standard of modern chemotherapy. Follow-up results will be awaited with great interest in order to assess the frequency of relapse in evaluating domiciliary treatment as contrasted with hospital treatment.

Relapse is, however, a diminishing problem. In the pre-chemotherapeutic era 27% of admissions to Dumfries and Galloway Sanatorium were on account of relapse. Last year this figure was 15%. These cases, however, were late relapses from the days when no chemotherapy was available or was given in a way we would now only regard as bad or suspect. In no case was relapse noted in which previous treatment had been regarded as correct. Nevertheless, tuberculosis has long been considered to be a chronic relapsing disease, and we still do not know how permanent chemotherapeutic cure may be. Consequently aftercare and supervision are increasing in importance.

An unsolved problem concerns the emergence of drug-resistant organisms. In my own area pre-treatment sputum testing has been carried out for the last three years and no patient with primarily resistant organisms has yet been found. But Fox and his colleagues (1957), in a nation-wide survey, estimated that 1 in 20 of the newly discovered cases of tuberculosis shows some degree of bacterial resistance. The problem has arisen, in part, from our own ignorance of chemotherapeutic methods some years back, and in part from lack of co-operation by patients. In Britain these drawbacks are now diminishing, but where tuberculosis is a much more serious problem, as in the underdeveloped countries, the almost inevitable emergence of resistant tubercle bacilli on a wide scale will be a serious menace. In this country, however, very few newly resistant strains should now emerge through defective treatment, and, indeed, there would be little excuse for this occurring.

In surveying these trends in prevention, ascertainment, and treatment, I think we may conclude that so far as treatment is concerned the prospects for eradicating tuberculosis are good, but in relation to finding the unknown case, on which depends successful prevention, we have still a long way to go.

Future Developments in the Tuberculosis Service

Finally, we must consider what the implications are of recent trends on the future of the service which Philip built up. The impact of these developments will be considerable.

Institutional Treatment

I recalled to your memory earlier in this lecture Philip's prophecy in 1913 regarding the passing of tuberculosis in a generation and a half. In 1927 in his Presidential Address to the British Medical Association in Edinburgh he repeated this prediction by saying that when the next meeting was held in Edinburgh (the date of which is now known to be 1959) tuberculosis would be largely a memory of the past. He elaborated this forecast and said that "in proportion as it is recognized that tuberculosis may be prevented or, at least, that the worse consequence of infection may be anticipated and averted, the scheme of remedial institutions which are immediately necessary because of the ignorance and neglect of the past will undergo progressive modification and curtailment." We are now witnessing the fulfilment of Philip's prediction exactly as he foretold.

There is, in my opinion, no real substitute for learning in the sanatorium "the physiological principles which make for health," but increasingly early diagnosis combined with modern chemotherapy has meant—as we have seen—that some patients do not require sanatorium treatment. A recent report on the Future Service for Tuberculosis and Diseases of the Chest in Scotland (1957) suggests that 25% of new cases are suitable for treatment at home. The report further indicates that by 1960 less than half the institutional beds in use in 1955 will be needed.

Dispensary or Chest Clinic

The diminishing trend in institutional work is not reflected in out-patient work, which is, on the contrary, increasing steadily. The available returns show that in the five years 1951-6 an increase of almost 30% in clinic attendances was registered. This has partly been due to the same factors which led to a diminished demand for in-patient treatment. In addition, chest clinics in collaboration with local health authorities are enlarging the scope and frequency of contact examinations. Any or all of the methods in which we considered that mass radiography might develop would throw an enormous amount of extra work on the clinics, which would increase still further if we look forward to the planned development of prophylactic chemotherapy. Lastly, but of more immediate consequence, there is a mounting awareness on the part of general practitioners of the possible significance of unexplained chest symptoms. For all these reasons the chest clinic is increasing in importance, and this trend will continue.

"The Chest Service"

It is significant that in recent years the word "dispensary" has been by common consent dropped, since it no longer indicates the functions of that institution, and has been replaced by the term "chest clinic." This change implies the recognition of the fact that the scope of the clinic is broadening. Whilst all forms of tuberculosis continue to be referred there, the clinic now is a special department to which practitioners are referring patients with all manner of respiratory disorders for investigation. Patients are no longer sent "to exclude tuberculosis" but for the diagnosis of any condition affecting the respiratory system.

The same tendency is observable in sanatoria. For years a proportion of non-tuberculous cases have been treated in sanatoria, but usually the shortage of beds prevented this type of work on any appreciable scale. Now that beds are freely available, however, practitioners are sending increasing numbers of patients suffering from many respiratory complaints—usually, however, the more chronic types—to sanatoria, in some of which special non-tuberculous chest units have been opened.

So we find that the scheme built up so many years ago by Sir Robert Philip is expanding its functions in a manner which would, I think, have pleased him. Indeed, he himself foresaw just such a development (Philip, 1918), and the provisional order relating to the chair of tuberculosis made it possible, when desirable, to include allied diseases within

the scope of the department. What was provided for in the academic sphere may well be fostered also in clinical practice. Indeed, the machinery of the chest hospital and chest clinic, springing as it does from the old tuberculosis service based on Philip's "physiological principles," is especially suited to the treatment of many respiratory disorders. So long as we maintain that old tradition, coupled with modern developments, we have all the necessary equipment for a broad and effective chest service, and it is to this amalgamation of tuberculosis and allied diseases that we must now address ourselves. Perhaps this development will be a step towards the reintegration of tuberculosis with general medicine, whence it came when Philip started his co-ordinated anti-tuberculosis scheme in the year of Queen Victoria's Jubilee.

Conclusion

What began as a tribute to Sir Robert Philip has developed into a commentary on the problems of to-day and to-morrow. Again and again I have stressed how clearly Philip foresaw the problems not only of his time but of ours. That his endeavours have borne fruit so abundantly in many lands has been due to two great gifts, which have been called in another connexion "high heart" and "sure vision." These are qualities which all may properly envy but few may ever achieve. It is enough for me to have worked with one who had them in full measure.

When the high heart we magnify,
And the sure vision celebrate,
And worship greatness passing by,
Ourselves are great.

The only new project noted in the 1956 annual report of the National Coal Board's medical service is a survey of the bacterial content of the air in mines. Earlier pilot studies have revealed unexpectedly high bacterial counts at the coal face, and the intention is to discover what bearing these may have on the causation of complicated pneumoconiosis and chronic bronchitis in miners. Research on cancer in coke-oven workers was discontinued in 1955, "as it had produced sufficiently reassuring and conclusive results." The report is issued from the National Coal Board, Hobart House, Grosvenor Place, London, S.W.1.

EFFECTS OF BEMEGRIDE ON
BARBITURATE OVERDOSAGE IN
HUMANS

BY

S. GERSHON, M.B., B.S.

AND

F. H. SHAW, M.Sc., Ph.D.

Department of Pharmacology, University of Melbourne

Shaw *et al.* (1954) and Shulman *et al.* (1955) have shown that bemegride (β -ethyl- β -methylglutarimide) is a valuable and effective barbiturate antagonist. Since then many reports have been published on the treatment of barbiturate poisoning by the use of bemegride, sometimes in combination with amiphenazole (2:4-diamino-5-phenylthiazole hydrochloride). Altogether the reports of the treatment of more than 200 cases of barbiturate poisoning (Canbach, 1955; Holten, 1955; von Planta and Klingler, 1956) have been communicated to us or published.

Perinpanayagam *et al.* (1955) reported the case of a child aged 15 months who was successfully treated with bemegride after taking 21 gr. (1.5 g.) of barbiturate, consisting of seven 3-gr. (0.2-g.) capsules of "tuinal" (quinalbarbitone sodium and amylobarbitone sodium). Clemmesen (1956) published his results on the treatment of over 70 cases of barbiturate poisoning, and this is the most extensive series treated with bemegride so far reported. Two cases of barbiturate poisoning were recently reported (private communication) in which bemegride treatment led to a successful outcome after the ingestion of doses of barbiturate within the fatal range. One had taken 16 g. of phenobarbitone and the other 23 g. of barbitone.

As a result of further work and the study of the results in the literature, bemegride alone is now used in the treatment of barbiturate poisoning. The use of amiphenazole is unnecessary, unless there is severe respiratory depression which is not amenable to bemegride. The results recorded below give further evidence that amiphenazole (orally) has little antidotal effect on barbiturate overdosage.

Animal experiments would suggest that parenterally administered bemegride was a convulsant drug; this, however, is not the case in humans, as has been shown by Harris (1955), using doses of up to 50 mg. intravenously. Coirault *et al.* (1956) and Delay *et al.* (1956) have shown that bemegride could be administered safely without the prior administration of barbiturate. These workers were primarily interested in the use of bemegride as a provocative test for epilepsy (Drossopoulou *et al.*, 1956). In summary, it has been shown that bemegride evokes changes in the E.E.G. in all subjects, normal or abnormal, as follows: (1) progressive modification in the form of slow bilateral synchronous activity; and (2) paroxysmal modifications in the form of bisynchronous multiple spikes and waves, either spontaneously or provoked by flicker and apt to end in the development of a generalized epileptic discharge.

However, in subjects with cerebral disorder it causes the appearance of changes which are never seen in normal subjects: (1) bisynchronous discharges of rhythmic 3 c./sec. spikes and waves, and (2) focal discharges of spikes, slow waves, or spikes and waves.

Sporadic discharges unaccompanied by clinical symptoms (interseizure discharges) or rhythmic discharges accompanied by partial epileptic seizures (seizure discharges) have been observed. Further details of the pharmacology of bemegride are given by Delay *et al.* (1956). Koppányi and Fazekas (1953) and Fazekas *et al.* (1956) have endeavoured to prepare a mixture of the various barbiturates and leptazol, whereby the effect of the accidental or intentional administration of large doses of barbiturate would be nullified and consequently poisoning would be prevented. They carried out trials on human volunteers, giving the barbiturate orally together with three times the amount of leptazol. Pentobarbitone sodium was given orally to 10 volunteers in doses ranging from 1.3 to 2 g. together with three times this amount of leptazol. All the subjects exhibited some signs of mild acute barbiturate intoxication, strongly resembling those of acute alcoholism. They either remained awake till their usual bedtime or were easily aroused if they fell asleep. They all showed ataxic gait and station; nystagmus, both horizontal and vertical; and difficulty in accommodation. Evidence of central nervous stimulation was observed in most of the subjects. Frank convulsions were not seen, but in four subjects involuntary clonic jerks and infrequent torsion spasms were observed. Also 7 out of 10 showed nausea, retching, and vomiting within one to four hours after ingestion.

This procedure was repeated on six volunteers using both secobarbitone and phenobarbitone. The results with both these barbiturates were much the same as recorded above with pentobarbitone except that one of the subjects receiving secobarbitone exhibited olfactory hallucinations. It was suggestive also from these results that, in humans, leptazol is more completely antagonistic to the central depressant effects of phenobarbitone.

Finally, it was found that leptazol stimulates the vomiting centre when administered in the doses used, even in the presence of large doses of barbiturate.

Present Investigation

In view of the above work we decided to determine the effects of oral bemegride on barbiturate overdosage in man. The possibility of a safe trial and a successful outcome was enhanced by the knowledge that Trautner *et al.* had successfully combined large doses of barbiturate and bemegride for the purpose of producing a continuous narcosis in psychiatric patients (see paper by Trautner *et al.* (1957) at page 1514). They report on the use of amylobarbitone together with a fixed proportion of 12% bemegride. The dose of barbiturate was given in the morning and progressively increased from 250 mg. up to a dose of 1,750 mg. Normal sleep resulted from the ingestion of the lower dose levels, but the resultant duration and depth of sleep progressively decreased or was completely absent on reaching the higher dosages. In each case the patients slept well during the night and with the higher dosages were mildly sedated during the following day. No untoward after-effects were observed in any of these cases.

The barbiturates studied in the present work were phenobarbitone and pentobarbitone, as representatives of the short- and long-acting groups respectively. The possible dangers inherent in this type of experiment were obviated by gradually increasing the dose of barbiturate in each patient. Furthermore, it was known from the work of Fazekas *et al.* (1956) that 2 g. of pentobarbitone could be successfully antagonized by leptazol, a much weaker antagonist than bemegride. Also from the literature it was known that about 1 g. of pentobarbitone would render a subject comatose with severe central nervous depression, whilst a

similar state would be produced by doses of phenobarbitone ranging from 1.5 to 4.8 g., with death resulting from doses ranging from 4.8 to 5.2 g.

Method

The subjects used in this investigation were all psychiatric patients. The procedure adopted was to place the patient on a couch at 9 a.m., about one hour after breakfast, when a physical examination was carried out and the blood pressure, pulse rate, temperature, and respirations were recorded. The patients were then given the appropriate mixture of barbiturate and bemegride in the form of a tablet. At half-hourly intervals the level of consciousness of the patients was noted, together with a record of the blood pressure, pulse rate, temperature, and respirations. The degree of depression of the central nervous system was assessed as:

Awake: when the patient was fully conscious and alert with clear orientation.

Drowsy: indicates that the patient was lightly and fitfully asleep but could at all times respond to the spoken voice. The patient may exhibit ataxic gait or station, slightly dysarthric speech.

Sleep: indicates that the patient was asleep but could at times respond to the spoken voice, and at all times to tactile and painful stimuli. All reflexes were normally present.

Narcotized: indicates a state in which the tendon and/or cutaneous reflexes were present but there was no response to the spoken voice, and no oral response to painful stimuli, the subject, however, still responding to this latter stimulus by withdrawal response.

Coma: indicates loss of response on strong supraorbital pressure with loss of reflexes, and unresponsiveness to any stimuli.

The commencing dose of barbiturate was a therapeutic one—namely, 250 mg. of phenobarbitone and 100 mg. of pentobarbitone—and the dose of barbiturate was then gradually increased by steps of about 25% with bemegride in the proportion of 10 to 25.6%. The interval between the administration of doses was three days in the lower dose range and one week at the higher levels. It is unlikely that with this procedure any degree of tolerance to the barbiturates would develop within the duration of the experiment. The lack of the development of tolerance was further shown by first increasing the dose gradually to the maximum figure recorded and then reducing it again over the same dose range. Identical effects were obtained at the same dose level on both occasions (see Tables I and II).

TABLE I.—Effect of Oral Administration of Pentobarbitone Sodium and Bemegride With or Without Amiphenazole in Psychiatric Patients

Case No.	Total Dose Pentobarbitone	Bemegride	Amiphenazole	Before Ingestion	Hours After Ingestion				Comments

21	1,250 "	25.6%	10%		Awake	Awake	Awake. Ate full meal	Drowsy	Awake in 7½ hours, able to get up and dress himself. Ate full meal and slept well throughout night. Drowsy following day
	2,000 "	25.6%	10%		"	"	Drowsy	Talkative. Ate full meal	Did not sleep during day. Slept well throughout night
23	1,000 "	25.6%	10%		Drowsy	Drowsy	"	Sleep	Awake in 9 hours. Slept well throughout night
	2,000 "	25.6%	10%		Showed twitching of limbs, lasted for about 1 minute, then vomited	"	Sleep	Drowsy	" "

During the trials all the routine resuscitative measures were on hand, but recourse to them was not required on any occasion.

However, with the moderate doses of barbiturate used and the availability of bemegride as an antidote the risk was assessed as nil. This conclusion was justified by the successful outcome of the work.

Results

This study was carried out on a total of 58 subjects. This number included those treated by Trautner *et al.* (1957) together with those observed by us. This group of 58 subjects received altogether 361 treatment doses of the various barbiturate-bemegride mixtures.

The groups studied were as follows: (1) amylobarbitone sodium, (2) phenobarbitone sodium, and (3) pentobarbitone sodium.

Group 1. Amylobarbitone Sodium and Bemegride

The eight subjects in this group received 58 treatments. The observations made with the mixture of amylobarbitone and a fixed dose of 12% bemegride are fully reported in the paper by Trautner *et al.* (1957). Their purpose was to produce by this form of medication a prolonged state of sleep and sedation in an attempt to promote a sleep pattern as similar as possible to normal sleep. The state obtained in these patients was such that they could be treated and dealt with easily and swiftly by the nursing staff.

These subjects were given various doses of amylobarbitone up to a maximum dose of 1,750 mg. at approximately 9 o'clock each morning, and all were awake by 6 p.m. and able to eat a meal. Vomiting occurred in one subject on three separate occasions, one to three hours after the ingestion of the tablets. Grand-mal seizures occurred on two occasions in one subject who was a known epileptic and who had had no seizures and no anticonvulsant medication for the previous two years. One seizure occurred one day after the ingestion of 500 mg. of amylobarbitone with 12% bemegride, and the other two days after taking 750 mg. of amylobarbitone and 90 mg. of bemegride. No further medication was given to this subject.

Group 2. Phenobarbitone Sodium and Bemegride

The 37 subjects in this group received 255 treatments with varying doses of phenobarbitone given with amounts of bemegride varying from 10 to 25.6% of the barbiturate dose. Amiphenazole was sometimes included in the mixture. A representative selection of the findings is presented in Table II, and a graphic representation of the effects obtained can be seen in Fig. 1.

Vomiting occurred in four of the subjects on a total of seven occasions out of 255 administrations. It occurred with different doses of barbiturate and bemegride and at time intervals between half to six hours after ingestion.

FIG. 1.—Diagrammatic representation of the effect of bemegride on the hypnotic action of phenobarbitone. Solid line, 17% bemegride. Dotted line, 25.6% bemegride.

Minor convulsions were observed in one subject on two occasions. Twitching of the limbs in this subject was observed on the first occasion after the ingestion of 1,750 mg. of phenobarbitone containing 25.6% bemegride and a minor convulsion after the ingestion of 2,000 mg. of phenobarbitone and 25.6% bemegride. These convulsive responses took place approximately two to three hours after ingestion of the tablets. On both occasions the convulsant responses were minimal, requiring no specific therapeutic measures. The patient's colour remained good, there was no injury to the tongue or incontinence of bowel or bladder, and the subject was not in any way distressed by the occurrence and had no memory of it. This patient did not show this response on lower doses of the tablets. So far as could be ascertained, this subject had no history of epilepsy, but it may be that the bemegride provoked a latent cerebral dysrhythmia (Drossopoulos *et al.*, 1956).

A group of six subjects were given a dose of 1,250 mg. of phenobarbitone sodium one day a week for 10 weeks. The amount of bemegride given together with this varied, being on some occasions 17% and on others 25.6%.

Some of these results are presented in Table II. They indicate that the same dose of barbiturate and bemegride given over a prolonged period results in the production of approximately the same depth and duration of sleep, and that with the higher dose of bemegride the duration and depth of sleep is diminished. This effect was most clearly seen when the different mixtures of barbiturate and bemegride were given to noisy, restless, and overactive subjects. A dose of the barbiturate-bemegride mixture that exerted a sedative effect on these subjects with psychomotor activity did not fully control them when the dose of bemegride was increased. An example of this effect is seen in Case 13 in Table II.

It was also observed, when large doses of the barbiturate-bemegride mixture of the order of 1,000 mg. or more of barbiturate were given, that in the majority of cases the subjects were still somewhat drowsy on the following day. If the dose of barbiturate was repeated with 15% or more bemegride when these subjects were still drowsy they showed a transient arousal about an hour after this ingestion before again becoming drowsy. A similar response was produced by the ingestion of 100 mg. of bemegride (bringing the total to 23%) when the subject became drowsy, with a resultant delay in the onset of sleep. An example of this delay in onset of sleep by an additional dose of bemegride was seen in Table II, Case 18, with the ingestion of 1,750 mg. of barbiturate.

Group 3. Pentobarbitone Sodium and Bemegride

This group comprised 13 patients who received treatment. The effects of bemegride on pentobarbitone sodium overdosage were essentially similar to its effects on the other barbiturates mentioned. However, the impression

FIG. 2.—Diagrammatic representation of the effect of bemegride on the hypnotic action of pentobarbitone.

was gained that the antidotal effect of bemegride with regard to pentobarbitone was somewhat less than that exerted against amylobarbitone and phenobarbitone. Furthermore, the resultant depth and duration of sleep produced by equivalent amounts of the pentobarbitone-bemegride mixture was deeper and longer than with equivalent amounts of the other two barbiturates (Fig. 2). But, apart from this, the general effects of bemegride on pentobarbitone overdosage are identical to those recorded above. The incidence of vomiting was also low in this series, occurring only once in two subjects. Convulsions or muscular twitching did not occur in this series.

Bemegride has been shown to have no haemotoxic effects in animal experiments (Dr. G. Bentley, 1956, personal communication). This was found to be the case in carrying out routine blood examinations in humans. Three subjects were given 200 mg. three times a day, after food, for six weeks; and haemoglobin and red- and white-cell examinations were carried out before, during, and after the examinations. None of these examinations revealed any abnormality. These examinations were repeated on four subjects receiving long courses of medication in each of Groups 2 and 3, with the same results as above. A general perusal of the results would suggest that the antagonistic effect of bemegride against the various barbiturates tested was not significantly influenced by the presence of amiphenazole.

Discussion

The present study was carried out to determine whether the well-known antagonism between bemegride and barbiturates also occurs following their simultaneous oral administration. In this work full control studies with the barbiturates were not carried out because data in the literature indicate that barbiturate doses of the magnitude may produce anaesthesia and coma with serious complications (Hambourger, 1939, 1940). The maximum doses of the barbiturates used were of the magnitude usually considered to produce severe poisoning in humans (Fazekas *et al.*, 1956).

Coma following oral ingestion of pentobarbitone sodium has been reported to result from approximately 1 g. (Krantz and Carr, 1954; Sollmann, 1948). Fisher *et al.* (1948) reported that patients who had taken 0.8 to 2 g. of pentobarbitone passed into coma. Fazekas *et al.* (1956) reported that 1 g. of pentobarbitone was capable of producing severe central depression.

Table I shows that 2 g. and over of pentobarbitone when given in combination with bemegride is well tolerated and given no serious depression of the central nervous system or other vital functions occurs. The acute toxic dose of phenobarbitone is larger than that of either pentobarbitone or amylobarbitone. Coma has been reported from doses varying from 1.5 to 4.8 g., with death occurring from doses varying from 4 to 5.2 g. (Koppanyi and Fazekas, 1950).

Worlock (1956) reported the successful treatment of 12 cases of barbiturate poisoning with bemegride (and amiphenazole). Seven of these cases are relative to this present study and that of Trautner *et al.* (1957). Four cases of amylobarbitone poisoning are reported in which the dose ranged from 1.5 to 2.8 g. of amylobarbitone, and three of phenobarbitone poisoning (0.75–2.8 g.). In all cases the patients were admitted "in an unconscious state and were unresponsive to any stimuli." In most cases deep reflexes were absent. The dosages of amylobarbitone and phenobarbitone which produced unconsciousness in these cases caused only a state varying from light sedation to sleep when combined with bemegride (see Tables I and II). Furthermore, as much as 2.6 g. of phenobarbitone when administered with 25.6% bemegride failed even to produce deep sleep in these subjects. In all the subjects investigated the vital functions of blood pressure and respiration were adequately maintained even on occasions when the subject was narcotized or in a deep sleep. It should be noted that in several cases the addition of amiphenazole had a

beneficial effect on respiration, and appeared to be effective in maintaining a good respiratory amplitude.

Bemegride itself has been found to have no chronic toxic effects in animals (Dr. G. A. Bentley, 1956, personal communication), and when administered orally to three subjects in doses of 300 mg. daily and to another three in a dose of 200 mg. three times a day for a period of eight weeks failed to produce any untoward or harmful effects. No abnormalities were seen in the red or white blood cells, and urinalysis did not show any changes. These doses did not produce any form of stimulation of the central nervous system either objectively or subjectively, and did not interfere in any way with the subjects' normal sleep pattern.

The results of this study would indicate that combinations of bemegride and barbiturates can be given in such amounts that they will not interfere with the sedative or hypnotic action of barbiturates, and the ingestion of similar combinations in larger amounts will protect against anaesthetic or toxic doses of barbiturates. Such a protection from the toxic effects of orally administered barbiturates by bemegride in man is not seen so readily in animals. Some degree of protection is evident in rats. In dogs there is only slight protection. It would appear that barbiturates cause a cardiovascular death in dogs which is not antagonized by bemegride (Dr. G. A. Bentley).

The present findings show that when bemegride was given with high doses of barbiturate for prolonged periods as sleep therapy to 58 subjects no barbiturate withdrawal symptoms of any kind occurred. The dosage used in these subjects can be seen from Tables I and II. One group of seven subjects was given a dose of 1,250 mg. of phenobarbitone with 17% bemegride, three times a week for six weeks, without any toxic effects either during or on discontinuance of administration. This observation is of particular interest in view of the statement by Kjaer-Larsen (1956) that bemegride produced an acute hallucinatory state in cases of acute barbiturate poisoning treated with this drug. Such states had not been reported by other workers in the same field. The hallucinatory phenomena as described by Kjaer-Larsen are a well-known complication of high barbiturate dosage, especially as the case material investigated by this author consisted of barbiturate addicts and psychotics. (For a previous communication on this problem see Gershon *et al.*, 1956.)

Barbiturate withdrawal symptoms of varying severity have been considered to be an almost constant accompaniment of the various forms of sleep treatment. Azima (1955) reported on 25 cases which received sleep treatment produced by giving approximately 550 mg. of barbiturates together with 50 mg. of chlorpromazine daily for approximately 20 to 25 days. In that series 13 developed complications of varying severity. Post-sleep convulsive seizures and a hallucinatory delirious syndrome are the most serious complications according to the literature on this subject (Kalinowsky and Hoch, 1952; Sargent and Slater, 1954; Floris and Della Rocca, 1955). When bemegride was given together with the barbiturates in this study there was a complete absence of such complications. This would agree with the results of Palmer (1956).

A combination of bemegride with a long- or medium-acting barbiturate seems to offer the following advantages: (1) Sleep therapy in psychiatric practice is made safer and more simple. A light sleep, not a coma, is produced, thus relieving the nursing staff of a great deal of responsibility. Withdrawal symptoms are not produced on cessation of administration. (2) Sedation of psychoneurotic cases in private practice is made safer. The possibility of suicide and addiction is greatly lessened. This combination allows of the production of a safe level of sleep for prolonged periods with complete safety, and as such may be of special use as a first-aid measure or treatment in dealing with disturbed psychiatric patients in private practice, in hospital, or for front-line military psychiatric casualties. However, further work would be required before this could be established as a routine therapeutic procedure.

Summary

The findings indicate that 10% or more bemegride in combination with barbiturates affords protection against the central depressant effects of the latter.

In humans bemegride is a more effective antidote to the central depressant effects of phenobarbitone than to those of amylobarbitone and pentobarbitone.

As a result of the ingestion of bemegride simultaneously with the barbiturate there is a delay in the onset of sleep, especially in those cases given a large dose of bemegride. This delay in onset of sleep was demonstrated more clearly when additional bemegride was given if the subject became drowsy.

Bemegride given in the amounts used in this investigation did not produce excessive stimulation of the central nervous system, as frank convulsions were never seen. The blood pressure was lowered but was maintained at a satisfactory level in all cases (see Tables I and II). The pulse rate and respiration were not greatly altered. It was found in some cases that the addition of amiphenazole had a beneficial effect on respiration, especially in maintaining a good amplitude. It is difficult to ascribe to amiphenazole any marked effects against barbiturate depression apart from that on respiration as noted above.

By using the appropriate concentrations of bemegride with barbiturate the depth and the duration of sleep could be modified. Those subjects given large doses of barbiturate (2 g. or more) with 25.6% bemegride showed signs of barbiturate overdosage for one or more days following ingestion, even though these signs were minimal on the day of treatment. Almost all cases, including those that remained awake on the treatment day, retired at their usual bedtime and slept well throughout the night. This was the case also in several disturbed subjects who usually required sedation at night.

Apart from the cases of vomiting mentioned, all the other subjects retained a good appetite and ate their meals with relish, even those who were roused from a drowsy state to eat their meals.

The treatment should not be given to persons with a known or suspected history of epilepsy.

The possibility of using a barbiturate-bemegride mixture to prevent accidental or intentional barbiturate overdosage is discussed.

We thank Dr. E. Cunningham Dax, chairman of the Mental Hygiene Authority, Victoria, and Dr. G. Goding, superintendent of the Sunbury Mental Hospital, without whose co-operation this work could not have been undertaken. The funds required for the investigation were provided by the National Health and Medical Research Council of Australia and Nicholas Pty. Ltd. We also acknowledge a generous gift of bemegride ("megimide") and amiphenazole ("daptazole") from Nicholas Pty. Ltd.

MODIFICATION OF BARBITURATE SLEEP TREATMENT BY THE USE OF BEMEGRIDE

BY

E. M. TRAUTNER, M.D.

Department of Physiology, University of Melbourne

T. W. MURRAY, M.B., Ch.B.

AND

C. H. NOACK, M.B., B.S.

Mental Hospital, Sunbury

Sleep treatment of neurotic or psychotic patients is a therapeutic procedure which consists mainly in keeping the patient in a condition of relaxed sleep in excess of the normal sleeping-time. The total sleeping-time is increased to 18–20 hours a day and the treatment is carried on for about four weeks.

The clinical indications and procedure vary from author to author, but a standard procedure was laid down by Kläsi (1922). This method has been widely used for the treatment of psychiatric cases in Russian medicine (Kerbikov, 1955; Ivanov, 1955). An extensive review of the Russian literature on this subject is given by Wortis (1953).

Other fields in which prolonged or intermittent sleep treatment has been advocated are as follows: acute coronary insufficiency, hypertension, post-operative convalescence, asthma, stuttering, and peptic ulcer (Wortis, 1953).

Kalinowsky and Hoch (1952) describe the standard practices and indications as usually employed in Western medicine.

In general, the most reliable employment of sleep treatment by itself is in the acute anxiety neuroses, particularly in persons of usually stable personality who have broken down. Once over the acute phase of anxiety other treatment may be considered and is then more easily implemented. The acutely ill anxiety neurotic is a much commoner phenomenon of war than of peace. This is a consequence of precipitating environmental factors involved. In such cases continuous sleep treatment is a form of first aid.

The risks of sleep treatment as routinely applied are far from negligible, especially in disturbed psychotic patients in whom the depth of the narcosis may have to be pushed to maximal limits. With continuous sleep

treatment the danger period extends throughout the day and night. Bronchopneumonia, depression of the respiratory centre, cardiovascular collapse, suppression of urine, bladder retention, dehydration fever, vitamin deficiencies, precipitated toxic confusional states, barbiturate withdrawal fits, and sciatic paralysis from a wrongly placed injection in the buttock all have been reported.

These warnings are easy to formulate in theory; but in practice, especially when groups of patients are treated, it is difficult to avoid incidents. The tolerance to barbiturates varies greatly from patient to patient. The onset of barbiturate poisoning is usually not recognized at the time, and it often manifests itself only after the course of prolonged sleep has been terminated—that is, when a barbiturate psychosis has developed. The incidence of this complication appears to be rather high (Floris and Della Rocca, 1955; Azima, 1955; Wulff, 1956). We have observed several cases in which, following the usual procedure of sleep treatment, the psychiatric condition had undergone persistent changes. Hallucinatory, paranoid, and other syndromes appeared which were not present at the beginning of the treatment. There seems at the present time to be insufficient evidence to exclude the possibility that repeated periods of coma lay the foundation either of barbiturate psychosis or of a more florid and aggravated symptomatology of the illness.

In view of these disadvantages we considered whether the danger of coma or of poisoning could not be avoided by a modified method. The approach is not original. Several workers have used mixtures of various barbiturates or combinations with chloraldehyde or other chemically unrelated hypnotics. Azima (1955) used a complex mixture containing chlorpromazine.

Other workers used combinations of barbiturates with analeptics like caffeine or leptazol (Zeleva, 1953). We have used barbiturate in combination with succinate and have presented our observations about its effect in schizophrenic conditions (Trautner *et al.*, 1954).

In 1954 Shaw and his colleagues introduced bemegride as a barbiturate antagonist for the treatment of acute barbiturate poisoning (Shaw, 1954; Shulman *et al.*, 1955). The full pharmacology of the drug, with indications for its use, is given by Delay *et al.* (1956). Combined with barbiturate this drug appears to alter the clinical picture of prolonged barbiturate administration (Palmer, 1956), and promises to eliminate some of the risks inherent in sleep therapy. Our aim was to investigate whether, with the addition of bemegride, even high barbiturate medication could be made clinically safe.

It is not our intention in this paper to discuss the therapeutic results obtained with the modified treatment, but only to show that such a method is practicable and is safer than unmodified sleep treatment.

Preliminary Tests

Preliminary tests were carried out on 12 healthy volunteers and on ourselves. Most of the subjects were people who occasionally took one or other barbiturate as a hypnotic at night, and were thus familiar with the dose required to produce sound sleep and with its side-effects.

The procedure adopted was to give a certain dose of a barbiturate alone, and on other occasions a mixture of the barbiturate with bemegride, and to compare the effect of the mixture regarding onset, depth, duration, and pleasantness of the sleep produced. The degree of restfulness on

waking up, as well as any after-effects appearing during the following day, was also noted.

The dosage used was from 1 to 8 gr. (65–520 mg.) of the various barbiturates together with 45 to 150 mg. of bemegride—that is, 12 to 23%. The mixed tablets were taken orally before retiring at night. If the dose of bemegride was taken separately half an hour before the barbiturate it appeared to have no effect on the action of the latter within this dose range. The barbiturates used were quinalbarbitone, phenobarbitone, amylobarbitone, and barbitone, depending upon the habit of the individual.

If the dose of bemegride was increased some effects of the increase became apparent. These effects were: a slight delay in the onset of sleep, a more restless sleep, or a shorter duration of total sleeping-time and possibly less "hang-over" when using the higher doses of barbiturate. However, it should be noted that all these effects were slight and within subjective variation.

Parallel tests were carried out using barbiturates combined with caffeine, amphetamine, and methyl phenidylate. The effect of the addition of these stimulants was the counteracting of some of the effects of the barbiturate with a resultant unpleasant, irritable, restless, and disturbed sleep. This effect, it should be noted, was in no way similar to that obtained when using bemegride. Also when amiphenazole was added no effect was noted on the onset, the duration, or the type of the resultant sleep.

Trials were carried out with doses of barbiturate (up to 1–1.5 g.) which, alone, were found to produce 14 to 18 hours of heavy sleep. Then on a subsequent occasion the same dose of barbiturate was taken in combination with 23% bemegride. The duration of the sleep was reduced to a total of 8 to 10 hours, and the sleep was distinctly lighter than previously. Furthermore, there were no noticeable after-effects such as drowsiness or excessive sedation, nor were there any periods of "second sleep" on the following day. As a result of these observations the investigation of the effects of this form of combined medication was carried out on psychiatric patients.

Observations on Psychiatric Patients

The observations were directed towards establishing (1) how the same patient responded to an increase of the barbiturate dose with and without the addition of bemegride; (2) whether an adequate degree of sedation without confusion could be reached in patients who did not satisfactorily respond to high barbiturate alone; (3) whether the combined barbiturate-bemegride medication could be maintained without danger of complications; (4) whether on interruption of the medication any prolonged side-effects or after-effects were present; and (5) whether, on gradual or abrupt reduction of the dose, any effects of the previous high barbiturate level could be observed.

It was found that for the purpose of the present investigation it was fully satisfactory to use a constant proportion containing 12% bemegride ready prepared in tablets. This procedure resulted in a medication in which the patient received very little bemegride if a low dose of barbiturate was given; but as the dose of barbiturate was increased the absolute quantity of bemegride increased likewise.

The barbiturates used in these trials were amylobarbitone, phenobarbitone, and pentobarbitone. The observations in the three series were very similar; only the first series of six cases is presented in detail (see Table).

Discussion

The observations presented here refer to an investigation into the practicability of a modified high barbiturate medication. The observations on the behaviour and clinical condition of the total group are used in arriving at the conclusion mentioned below. It is, however, only natural that the first questions asked refer to the selection of the patients actually treated and to the clinical observations made during or after this treatment.

All patients chosen were diagnosed as chronic schizophrenics of between two and five years' duration. All had received and failed to respond to the usual therapy, full coma insulin, with or without electric shock, and all had received at one or another time, without adequate response, one or more of the new drugs recommended for these conditions. All were disturbed enough to require hospitalization, but not sufficiently to require constant restraint or constant sedation—that is, they represent about the average level of the hospitalized chronic schizophrenic.

The individual selection from this group was made so as to choose individuals who might benefit from a suitable sedation—that is, those who were overexcited and seemed to be under a continual pressure of overactivity. Some were continuously mumbling or talking, others restlessly walking about or victimizing other patients or the staff with their conversation. None of them responded to mild sedation with the usual drugs. The patients were selected in groups of 6 to 8, more or less at random from 40 to 50 rather similar cases in the same ward. It was therefore surprising to find that, with one exception, no unpleasant side-effects, deterioration, or aggravation of symptoms were observed during the

period of high barbiturate ingestion. The one exception mentioned concerns a patient who responded well to bemegride-phenobarbitone medication up to 1.5 g. of phenobarbitone. But when the dose was further increased—that is, when the dose of bemegride approached 0.5 g.—he became overactive and abusive and had to be transferred to a closed ward. The symptoms subsided within a few days. When the patient was returned to lower bemegride-barbiturate doses he was merely sedated. Since two other patients showed mild twitches similar to the first signs of an impending epileptic fit, and since these symptoms also appeared only on high bemegride doses, it was assumed that the disturbance was due to the analeptic action of the drug.

All patients were first tried on the chosen barbiturate without bemegride. As would be expected, the individual response varied greatly; but with a sufficiently high dose they slept for several hours—a sleep which, at least for a short time, was deep enough for the patient to give no response to vocal or slightly painful stimuli. On awakening, the patients were often drowsy for several hours and refused to eat. Once this period of drowsiness had passed, however, they were unchanged in their mental outlook or their

Effect of Oral Administration of Amylobarbitone Sodium and Bemegride in Psychiatric Patients (Bemegride Equals 12% of the Barbiturate Dose)

behaviour. Several of the patients had previously undergone sleep treatment without much benefit.

Treatment with the bemegride-barbiturate combination was usually begun with a barbiturate content of an amount which by itself had been found to produce a few hours' sound sleep. The effect of the mixture differed from that of the barbiturate alone in the following two points: (1) despite very much higher barbiturate dosage neither primary coma nor after-sleep (secondary coma) was observed (see Gershon and Shaw, 1957); and (2) the patients showed a distinct sedation of two to three days' duration in so far as their ward behaviour improved.

The absence of a primary coma may be assumed to be due to the antagonistic effect of the bemegride. As the dose of amylobarbitone was increased above 800–1,000 mg. we kept the patients under constant observation because it was feared that they might sink into a deep stupor or coma. This was never the case; on the contrary, as the dose increased the sleep became lighter, the patients were continuously rousable, and after four to five hours many insisted on getting out of bed. None fell asleep later in the day, and in no case was excessive sleep observed during the following night.

We are not prepared to offer more than a tentative explanation of this observation. It appears that the danger of a coma after a high dose of barbiturate exists mainly during the first few hours after ingestion. This seems to be a paradox, since a patient who took, say, 1.6 g. of barbiturate in the bemegride mixture must, six to eight hours after ingestion, retain considerably more than another patient who received only 0.6 g. Yet the former were found to be awake, while the latter invariably slept into and through the night. We intend to investigate the actual barbiturate levels in the plasma of these patients. The facts so far observed seem to indicate that if by the action of bemegride the early onset of a coma can be prevented no late onset need be feared.

Since all patients suffered from some sort of overactivity (apart from their schizoid disturbances), the term "sedation" requires some qualification. The condition of the patients was not characterized by a "half-drunkenness" as frequently seen on high paraldehyde or barbiturate sedation, nor did it show the more or less apathetic semi-stupor encountered after high bromide medication and sometimes after some of the newer tranquilizers. The patients were aggressive or less insistent, and were more easily managed. Some who for many months had refused to do any work volunteered help; others were co-operative if asked, or attended entertainments without causing disturbance. They were more "normal" only so far as their behaviour was concerned, and a few were more willing to reveal and to discuss their problems. It is, however, doubtful whether any of them were more "rational," even if some appeared to be less preoccupied.

The degree of this sedation was practically the same on the second and third days, less on the fourth day. It was thus possible with two medications a week to sedate the patients so as to procure better manageability in the ward. At the same time they ate better and slept better. The question may thus be raised whether this general behavioural improvement, if maintained for a suitable period, would not finally result in a mental improvement, remission, or cure. So far we have been unable to answer this question, since we have not tried the medication with a view to treatment. We were concerned only with the basic questions of the most suitable regime and of the safety of the medication.

Optimum sedation appeared to be reached with a quantity of the mixture containing from 1 to 1.5 g. of barbiturate. Below this dosage the patients slept and awoke almost unchanged. Above it the degree of sedation did not appear to be further increased, but the possibility of undesired side-effects, such as nausea, due to the larger amounts of bemegride, seemed to be increased. If the higher dose was again reduced no effect of the previous excess of barbiturate was

noted. It thus seemed that, *per se*, this optimum dose was a constant and did not vary much with the patient.

Next to the danger of coma, the most important complication of high barbiturate medication is that of aggravation of psychotic symptoms. Persistent barbiturate psychosis constitutes a frequent problem. Wulff (1956) reports the incidence of barbiturate psychoses as high as 20% in sleep therapy. Its occurrence is probably higher than is recognized. We have seen several patients who were allegedly treated "on the accurate indications and procedures as presented in American or Continental literature" and who showed either a short grossly confused psychotic phase or, worse, whose condition had deteriorated by the addition of hallucinatory, delusional, and other symptoms previously not present. Some of these symptoms persisted for weeks, and even after they were no longer noticeable it could not be decided whether they had disappeared or were merely dissimulated or integrated.

In view of this danger we were rather cautious in our first attempts at repeated high barbiturate-bemegride medication. But we never encountered any sign of psychotic aggravation. Not one patient, whether he was suitable for sleep treatment or not, suffered from medication, and in no case were even transient additional symptoms produced. It is again assumed that this absence of late side-effects is due to the initial effect of bemegride, which, in a way to be further investigated, alters the impact of the high barbiturate concentration on the nerve cell or centre. These results stand in distinction to those of Kjaer-Larsen (1956), who found an incidence of 35% psychotic disturbances in barbiturate-poisoned subjects who had received treatment with bemegride.

On our observations we feel certain that moderately prolonged high barbiturate-bemegride medication is safe, and we feel justified in presenting our data for consideration in cases where the clinical picture calls for heavy sedation in a patient who is either not accessible to psychotherapy alone and/or does not satisfactorily respond to moderate doses of a barbiturate alone. We have not made any comparison of the sedation produced by bemegride-barbiturate mixture and by chlorpromazine or reserpine.

Summary

The effect of the addition of bemegride to barbiturates was investigated with respect to the depth and duration of the narcosis and to the side-effects and after-effects produced.

For the trials on volunteers and on patients 12–23% bemegride was given with the barbiturate. This mixture, given in tablets containing 250 mg. of barbiturate in each, was fully satisfactory for all purposes or observations required.

Up to a barbiturate intake of 750 mg. no effect on onset, depth, or duration of the sleep was observed. The mixture acted exactly as the same amount of the barbiturate alone.

On a barbiturate intake between 1 and 1.5 g. the duration and depth of the sleep were greatly reduced as compared with the effect of the same amount of barbiturate without bemegride. After waking there was little hangover or drowsiness, although the subjects were distinctly sedated for a period increasing with the dose and lasting from one to three days.

On a barbiturate intake between 1.5 and 3 g. the subjects either slept for a few hours only or were merely somnolent for four to five hours.

No instances of barbiturate poisoning, psychosis, or other undesirable after-effects were observed in a total of 58 subjects tested with the bemegride-barbiturate mixture. Even on prolonged administration of a high barbiturate dose given twice a week, the subjects were

merely sedated. Overactive psychiatric patients showed some evidence of behaviour improvement.

The observations are taken as indicating that 10–20% bemegride with barbiturate reduces or even prevents the development of coma or of prolonged sleep.

The observations are tentatively presented for consideration in the treatment of patients in whom sleep treatment or prolonged sedation is desired but can be maintained only by the use of high barbiturate doses which, if given alone, involve the risk of barbiturate poisoning or other serious complications.

We thank Dr. E. Cunningham Dax, chairman of the Mental Hygiene Authority, Victoria, and Dr. G. Goding, superintendent of the Sunbury Mental Hospital. Part of the funds required for this investigation were provided by the Mental Health Research Fund, University of Melbourne. We thank Nicholas Pty. Ltd. for a generous gift of bemegride ("megimide").

PORTABLE OXYGEN EQUIPMENT AND WALKING-AID IN PULMONARY EMPHYSEMA

BY

E. J. MORAN CAMPBELL, M.D., Ph.D., B.Sc.
M.R.C.P.

Assistant, Department of Medicine, Middlesex Hospital, London

The patient whose case is described below suffers from severe emphysema and has been greatly helped by portable O₂ equipment and a portable walking-aid. Physiological studies showed how these measures improved his pulmonary function. The main aim of this paper is to show how an appreciation of simple physiological principles enables an assessment of the potential value of such therapeutic measures to any individual patient to be made on clinical evidence.

Clinical Details

The patient, a motor engineer aged 59, was 5 ft. 9 in. (175 cm.) tall and had a surface area of 1.8 sq. m. (19.4 sq. ft.). He had suffered from increasingly severe dyspnoea for 33 years. There was no history of long-standing cough or sputum preceding the onset of dyspnoea. He had been increasingly incapacitated for the last seven years, and before admission could walk only 25 yards (23 metres). He continued to work by driving his car from the door of his house to the desk in the garage where he was employed. To climb the 14 stairs in his house caused him intense distress lasting 10–15 minutes and often forcing him to kneel on the stairs. He had not walked out of the front gate of his house for 10 years nor had a pair of shoes repaired for seven years. He had great difficulty in dressing himself and in eating his food. In recent years he had had a variable amount of mucoid sputum which caused bouts of

coughing leading to intense dyspnoea, and interrupting his sleep every few hours. He slept more comfortably lying flat than when propped up. Clinically and radiologically he had the changes of severe emphysema. He was cyanosed at rest and became very cyanosed on slight exertion. There was no clinical evidence of heart failure, and the transverse diameter of the heart was within normal limits. On screening, however, the right ventricle was moderately enlarged and the main pulmonary arteries were prominent. E.C.G. showed an incomplete right bundle-branch block. Repeated bacteriological examination of the sputum had not shown any pathogenic organism to be persistently present. The haemoglobin concentration was 19 g. per 100 ml., and the P.C.V. 63%.

A selection of the measurements of pulmonary function is given in Table I. These show the following abnormalities: chronic inflation of the lungs (increased residual volume);

TABLE I.—Pulmonary Function Tests (August, 1956). Patient Seated With Arms Supported

	Patient	Expected Normal
Vital capacity (l. B.T.P.)	2.5	4.1
Residual volume (l. B.T.P.)	7.9	3.0
Forced expired volume in 1 sec. (l. B.T.P.)	0.7	3.2
Maximum voluntary ventilation (l./min. B.T.P.)	24	100
Arterial blood:		
O ₂ tension (mm. Hg)	52	100
O ₂ saturation (%)	82	>95
CO ₂ tension (mm. Hg)	58	40
Maximum diffusing capacity for O ₂ (ml./min./mm. Hg)	8	40

difficulty in expelling air during expiration (reduced vital capacity and reduced forced expired volume); reduced ability to ventilate the lungs (low maximum voluntary ventilation); inadequate alveolar ventilation (elevated arterial CO₂ tension); reduced alveolar-capillary surface (low diffusing capacity). The low O₂ tension and saturation are due to a combination of factors as discussed later.

In spite of the intensive use of all forms of conventional treatment he remained completely incapacitated after two months in hospital.

Methods

Blood gas tensions were determined in duplicate by the Riley method (Riley, Campbell, and Shepard, 1957); the pH was measured at 37.5° C. with a Cambridge pH meter and Stadie electrode; gas analyses were performed with the Scholander apparatus; gas volumes were measured either with a spirometer or with a dry gas meter; and oxygen saturation was calculated from the oxygen tension and pH.

Portable Oxygen Equipment

Apparatus.—The apparatus was essentially that described by Cotes and Gilson (1956a, 1956b) and made by the Walter Kidde Company (Fig. 1). The oro-nasal mask did not always fit well, so that too much air tended to be drawn in around the facepiece during inspiration. We therefore also used a mouthpiece, which ensured that the O₂ in the reservoir bag was all inspired early in inspiration. This mouthpiece is like those used in physiological studies (Fig. 2). It is less comfortable than a mask, but as the chief use of the apparatus is during short periods of physical exertion the disadvantage is slight.

Clinical and Physiological Effects

The patient's clinical condition was variable and it was not possible to study all the factors at once, so a number of short controlled trials were performed; these gave the following information. (1) Wearing the apparatus with no O₂ flowing (unknown to the subject) did not increase exercise tolerance. (2) O₂ improved exercise tolerance threefold to sixfold. Without it he could walk 30–70 yards (27–64 metres), and with it 150–300 yards (137–274 metres). He was much more distressed at the limit of tolerance when exercising without added O₂ and his pulse rate was much higher. (3) The use of the "low" flow rate of the apparatus (2 l. O₂/min.) was as effective as the "high" (4 l./min.).

(4) The oro-nasal mask was as good as the mouthpiece if care was taken to keep it fitting properly. (5) A reservoir bag that permitted partial rebreathing was not as satisfactory as one that did not.

In Table II the effects of exercise on the arterial blood gas tensions are shown. This experiment was carried out as follows. The patient breathed with the apparatus at the selected flow rate for 10 minutes. He then exercised by stepping on and off an 8-in. (20-cm.) step 15 times in one minute (the most severe exercise he could perform without added O₂). Arterial blood was drawn immediately afterwards.

The following conclusions may be drawn from the results shown in Table II. (1) When exercising without added O₂ the arterial CO₂ tension increased only slightly above the resting value, showing that ventilation was increased sufficiently to maintain the composition of the alveolar air.

TABLE II.—Effects of Portable Oxygen on Arterial Blood During Exercise

	Rest	Exercise	
		Air	Air + O ₂ 2 l./min.
			Mask Mouthpiece
CO ₂ tension (mm. Hg)	59	62	70 73.5
pH	7.32	7.30	7.25 7.27
O ₂ tension (mm. Hg)	52	27	53 49.5
O ₂ saturation (%)	83	45.5	80 78

Fig. 1.—170-litre DH type portable oxygen set. Approximate weight, 3½ lb. (1.6 kg.); length, 18 in. (46 cm.); diameter, 3 in. (7.5 cm.).

Fig. 2.—Mouthpiece and reservoir bag.

The fall in the arterial O₂ tension and saturation must therefore have been due to deficient O₂ transfer from the alveolar air to the pulmonary capillary blood. (2) When exercising with added O₂ the arterial CO₂ tension rose significantly, showing that the ventilation was less than when exercising without added O₂. The increase in the O₂ tension and saturation must therefore all be attributed to the higher O₂ concentration in the inspired air. (3) The differences between the findings with the mask and with the mouthpiece are probably not significant.

It is noteworthy that the improvement in the arterial O₂ tension was obtained with a flow rate of only 2 l. O₂/min. added to a pulmonary ventilation of about 15 l./min. This result can be expected only with well-fitting masks.

Portable Walking-Aid

Apparatus.—The patient noticed that he was able to walk about the ward with much less distress if he leaned on a dressing trolley. A walking-aid of the type described by Hendry (1956) and manufactured by Messrs. Fordham Pressings, Ltd., of Wolverhampton, was obtained and modified to the patient's design as follows. Both hand-grip assemblies were removed from the standard model. Two new T-shaped brackets were made with the top pieces offset, longest end forward and sloping upwards from rear to front (see Fig. 3). A platform approximately 16 by 12 in. (40 by 30 cm.) was made to fit on top of the T-shaped brackets. On one side of the under-surface of the platform were placed two metal spring clips which mate with the top arm of the T-bracket and lock the machine in the open position. At the other end of the under-surface of the platform two brackets were fitted carrying a spindle which fitted through the tubular arm of the T-bracket. This arrangement enabled the platform to be swivelled downwards when the machine was folded up. The hand brake was fitted to the front end of the platform with a finger-control lever. A piece of foam rubber was cut to fit on the platform.

Fig. 3.—Portable walking-aid.

Clinical and Physiological Effects

Table III shows some of the effects of using the walking-aid. The use of the support caused little change in the ventilation at rest, but there was a decrease in the O₂ uptake and an increase in the arterial O₂ tension. These changes could be due to a decrease in the O₂ cost of standing or to a decrease in the O₂ cost of breathing, or to both. Studies on a normal subject whose O₂ cost of breathing was known to be negligible showed that the use of the support caused no decrease in total O₂ consumption. This finding suggests, therefore, that the reduced O₂ consumption of the patient when using the support was due in considerable part to a decreased O₂ cost of breathing. With special techniques (Campbell, Westlake, and Cherniack, 1957) the O₂ consumption of the patient's respiratory muscles when seated with back and shoulders supported was found to be about 40 ml./min. at a ventilation of 12 l./min. and 80–100 ml./min. at a ventilation of 18 l./min. On inspection and palpa-

TABLE III.—Effects of Portable Walking-Aid (January, 1957).
Level of Exercise Was Not Standardized, But Was Always Greater When Walking With Support than Without It

	Unsupported	Supported
Ventilation (l. min. B.T.P.):		
Standing still	12.6	13.2
Walking	14.8	18.7
Maximum voluntary	19.5	26.5
Vital capacity	2.7	2.7
O ₂ consumption (ml. min. S.T.P.):		
Standing still	335	298
Walking	472	502
Arterial blood:		
O ₂ tension (mm. Hg) and (saturation %):		
Standing still	32 (56)	40 (70)
Walking	26 (44)	33 (59)
CO ₂ tension (mm. Hg):		
Standing still	69	65.5
Walking	62	64.5

tion it was obvious that standing unsupported demanded much more use of the extensors of the back and the elevators of the shoulders during inspiration. This increased effort must have caused the O₂ cost of breathing to be even greater when standing than when sitting. Use of the walking-aid obviously reduced this extra effort and probably accounted for the smaller total O₂ intake when standing leaning on the trolley.

Table III also shows that during exercise the patient was able to maintain a greater ventilation and O₂ consumption when supported, and it is probable that a higher proportion of the total O₂ uptake was available to the rest of the body. The changes in the arterial blood gas tensions show that gaseous exchange was adequate to meet the increased requirements of exercise when the support was used.

Use of the support did not increase the vital capacity (or the inspiratory capacity). It did, however, enable him to take a much greater tidal volume with much less effort. It is noteworthy that the level of ventilation he was able to maintain when walking with the support was almost as great as his maximum voluntary ventilation when unsupported.

Simple trials showed that his exercise tolerance was increased sixfold to tenfold by the use of the walking-aid. Controlled trials showed that the combined use of the walking-aid and portable O₂ equipment further increased his exercise tolerance, and he was usually able to walk over half a mile (800 metres) without distress. These controlled trials also showed, in contrast to those performed without the walking-aid, that the "high" O₂ flow rate was more effective than the "low" flow rate, presumably because of the higher ventilation and O₂ consumption attained.

The main aims of physiotherapy in emphysema are increased diaphragmatic movement and relaxation of the muscles of the neck and shoulder-girdle. Despite intensive efforts under the guidance of a physiotherapist trained at the leading school of breathing exercises the patient was unable to increase diaphragmatic movement as judged radiologically, and unless he used his accessory muscles his ventilation in the erect posture was clearly inadequate. (He could not tolerate this type of breathing long enough for full measurements to be made, but his tidal volume fell from 530 to 480 ml.) The walking-aid supported his shoulders and caused relaxation of many muscles of the neck and back. The result is therefore not as greatly at variance with the aims of physiotherapy as might initially appear.

Discussion

The assessment of measures designed to help patients with emphysema is always difficult because the degree of breathlessness is very variable and may not correlate with measurable changes in respiratory function. This patient's case was exceptional in that the severity of his condition set physiological limits to his exercise tolerance which could be measured without having to rely on his subjective assessment of dyspnoea.

Although he can walk 30-70 yards (27-64 metres) unsupported and without O₂, this is only at the expense of an O₂ debt and severe desaturation of the blood. At such times his distress and cyanosis are extreme and his pulse rate usually exceeds 130 per minute. He is unable to main-

tain any steady level of exercise, and is unable to stand still unsupported for more than 10 minutes. Consideration of the work of breathing suggests that the O₂ cost of standing and breathing unsupported is greater than the O₂ uptake by the lungs. Any attempt to increase the O₂ uptake by increasing ventilation causes the respiratory muscles to use more O₂ than is taken in. This suggestion is difficult to prove but is supported by the fact that the arterial O₂ tension is lower when standing unsupported than when standing supported or sitting. In marked contrast to his distress when standing unsupported is his relative comfort when walking with the support of the trolley and using the portable O₂ equipment.

Modes of Action

When considering measures such as these it is convenient to regard the functional disorders of patients with emphysema as grouped in two categories: (1) difficulty in moving the air in and out of the lungs (impaired ventilatory function); and (2) difficulty in exchanging gases between the alveolar air and the blood (impaired alveolar-respiratory function). Impaired ventilatory function affects both O₂ and CO₂ exchange. If the impairment is severe the alveolar air and arterial blood have a lowered O₂ tension and a raised CO₂ tension. Impaired alveolar-respiratory function causes a low arterial O₂ tension but has a negligible effect on the arterial CO₂ tension. Detailed function studies of the patient showed that the low arterial O₂ tension and saturation at rest are almost equally due to both types of limitation. The further lowering of O₂ tension by exercise is, however, predominantly due to limitations of the second type. The walking-aid helps the patient by increasing the ventilation he can comfortably maintain and probably also decreases the O₂ cost of breathing, thereby making more O₂ available to the rest of the body. The portable O₂ equipment helps him by increasing the alveolar O₂ concentration, thereby facilitating the diffusion of O₂ into the blood and preventing the severe hypoxia brought on by exercise.

Selection of Patients

There are several reasons why it is not desirable to try these measures and simply to accept the patient's opinion about their benefit. Firstly, the sets of equipment described are moderately expensive; secondly, only a minority of patients are likely to be helped; thirdly, the patient's assessment of improvement in this condition is unreliable. There are few places where facilities exist for physiological studies such as those described in this paper. Fortunately, clinical guidance can be derived from the known functional disturbances in emphysema as described above. A useful clinical assessment of the relative importance of ventilatory and alveolar-respiratory insufficiency can be obtained by exercising a patient to the limit of his tolerance. He will, of course, be very breathless whichever type of disorder is dominant. However, if his arterial blood is not significantly desaturated—that is, he does not become very cyanosed—his limitation is probably ventilatory and he is having equal difficulty with CO₂ excretion and O₂ uptake. If he develops arterial desaturation he probably has an important degree of alveolar-respiratory insufficiency which limits O₂ uptake but not CO₂ output.

(1) *Portable O₂ Equipment*.—It follows, therefore, that portable O₂ is only likely to help patients who become cyanosed on exercise; that is to say, those with predominant alveolar-respiratory insufficiency.

(2) *Portable Walking-Aid*.—A portable walking-aid enables the accessory respiratory muscles to ventilate the lungs at less O₂ cost and with less discomfort. In few patients with emphysema, however, is the ventilatory inadequacy seriously aggravated by difficulty in using the accessory muscles. In most patients the respiratory muscles function adequately but the ventilation is limited by airway obstruction. Such patients do not require a walking-aid. Clinically the patients who are most likely to be helped by a walking-aid are those who have received full treatment to reduce airway resistance and who have had skilled instruction in breathing exercises but who still require to use the

back and shoulder muscles when walking. Orthopnoea is not by itself an indication, as it may be due to other factors such as congestive heart failure. Our patient sleeps lying flat. Clearly, therefore, only a minority of patients with flat, emphysema will benefit from these measures. Moreover, there are obvious practical limitations to their usefulness. However, the condition is so common and the disability of those severely affected is so distressing that any measures that can help them should be welcomed.

Summary

A case is described in which the patient was incapacitated by diffuse pulmonary emphysema. He has been greatly helped by portable oxygen equipment and by a portable walking-aid.

Physiological studies are described which show how these measures have improved his pulmonary function. Simple clinical methods can help to indicate which patients are likely to be helped by these measures.

I thank Professor A. Kekwick for his encouragement and advice in the preparation of this paper. I am grateful to Dr. E. K. Westlake and the clinical clerks who helped with some of the studies and to Dr. C. J. Dickinson, who read the manuscript. I also wish to acknowledge the excellent co-operation of the patient. The portable oxygen equipment was kindly lent by the Walter Kidde Company.

TREATMENT OF CHILBLAINS BY PHENOXYBENZAMINE

A CLINICAL TRIAL IN GENERAL PRACTICE BY THE SOUTH-EAST SCOTLAND FACULTY OF THE COLLEGE OF GENERAL PRACTITIONERS*

In 1954 a member of the Scottish Research Advisory Panel of the College of General Practitioners suggested that an investigation should be made into the effect on chilblains of a new substance, phenoxybenzamine, which opposes the vasoconstrictor action of the sympathetic nervous system. The Faculty Research Committee therefore designed a questionnaire to elicit not only data about the effect of this new substance but also a considerable amount of information on the natural history of chilblains and some of the causative factors. That inquiry was a failure in spite of much hard work by many of the practitioners taking part. The main reason for failure seemed to be a too ambitious and complex questionnaire.

The following winter, 1955-6, it was decided to repeat the inquiry on simpler lines. The Committee therefore prepared a new questionnaire, but it failed to satisfy our statistical adviser, who demonstrated its shortcomings and eventually redesigned the experiment.

Two lessons have been learned as a result of these early efforts: first, the importance of a simple questionnaire, and, second, the need of preliminary advice from a statistical expert.

Method

Arrangements were made with a pharmacist that the test substance, phenoxybenzamine, and lactose, as a control,

*Those taking part in the investigation were: Drs. J. A. D. Anderson, B. J. Brown, J. Campbell, H. A. Courtney, R. M. Dean, H. R. Dodson, A. G. Donald, A. M. Duff, M. D. L. Finlay, S. L. Forrest, A. Fraser-Darling, J. M. L. Goodbrand, R. R. Hamilton, G. Irvine, M. B. Jamieson, E. V. Kuenssberg, L. Lamont, A. H. D. Large, A. R. Laurence, R. M. McGregor, D. W. MacLean, G. MacNaughtan, W. W. W. McNeish, D. H. McVie, A. P. Motley, R. Scott, H. Sherry, and L. Wilkie.

should be distributed to the doctors taking part in such a way that neither doctor nor patient would know which was being administered. Capsules of 10 mg. of phenoxybenzamine and capsules of lactose were put in similar bottles, each bottle having an individual code number, the code being known only to the pharmacist. The practitioners concerned received equal numbers of bottles of phenoxybenzamine and of lactose, but the sequence of each set differed.

It was agreed that the patients should be told the object of the trial, that they should be given an explanation of the "double-blind" method, and that neither doctor nor patient should be asked to take part in this trial if either knew of any other medical substance which was believed by them to be effective in the treatment of chilblains.

The action of phenoxybenzamine was explained to each doctor taking part and the possible undesirable effects were described. The patients were told that they were taking part in the trial of a new drug, and treatment was begun cautiously with one capsule a day. If no undesirable effects had occurred and if cure had not been achieved at the end of the first week the dose was increased to two capsules a day during the second week. Similarly, the dose was raised to three capsules a day during the third and fourth weeks. If cure had been achieved at the end of the fourth week, treatment was continued with the same substance—whether it was phenoxybenzamine or lactose—until the end of the chilblain season or until the patient defaulted. If, on the other hand, there had been no cure at the end of four weeks, capsules known to contain phenoxybenzamine were given, beginning cautiously and continuing until the doctor felt that enough treatment had been given or the patient wished it to be stopped. The doctor might, if he thought fit, decide to give another form of treatment at the end of the fourth week. All treatment after the first four weeks, whether by phenoxybenzamine or lactose, was regarded as outside the trial, and none of these later results was used in the assessment. The trial, for any patient, lasted therefore for four weeks or less, but never more.

During the period of trial each doctor was expected to state in the appropriate column of the card, at the conclusion of each period—first, second, third, and fourth weeks—whether the outcome of the treatment was "good," "fair," or "poor." Good meant complete remission of the chilblains, poor meant no apparent effect from treatment, and fair meant some clinical improvement. The doctor was also asked to give in the appropriate space a final assessment at the end of each individual's trial period of four weeks or less.

It was eventually decided, since the numbers were relatively small, to add those assessed fair and poor together for statistical purposes.

Results

Of the 128 patients who took part in the trial, only 62 completed the course; 41 fell by the wayside in one way or another, but had continued treatment long enough to make analysis of the results possible; 9—all of whom, as was shown later, were taking phenoxybenzamine—had to be withdrawn from the trial because of undesirable side-effects; 7 defaulted so early that no results could be recorded; in 3 cases the cards were spoiled because of misunderstanding; and in 6 others the information was inadequate.

Table I shows the age and sex distribution of the 121 patients involved. It confirms our clinical impressions that chilblains are less common among older people and that they are found much more often in females than in males. It also shows that 59 were treated with phenoxybenzamine and 62 with lactose—about equal numbers.

Table II shows the results of treatment. The two groups that are most strictly comparable are the 28 patients who received phenoxybenzamine continuously for four weeks, and the 34 who had lactose continuously over a similar period. The months when these patients received their treatment are shown in Table III.

There was a much higher ratio of good to not-good results (24:4) in those who received phenoxybenzamine than in those given lactose (17:17). The difference is statistically significant, and the likelihood of this result having occurred by chance is less than 1 in 100.

TABLE I.—Age and Sex Distribution

Treatment	Sex	Age in Years				Total
		<20	20-39	40-59	60+	
Phenoxybenzamine hydrochloride	F	10	26	18	3	57
	M	—	1	—	1	2
Control	F	18	23	16	1	58
	M	2	1	1	—	4

In two cases no age was given.

TABLE II.—Results Grouped According to Duration of Treatment

Treatment	Duration in Weeks	Assessment			Total
		Good	Fair	Poor	
Phenoxybenzamine hydrochloride	<4	24	3	1	28
	4-10	11	3	2	16
	Total	35	6	3	44
Control	<4	17	6	11	34
	4-10	14	4	7	25
	Total	31	10	18	59

TABLE III.—Month When Four Weeks' Continuous Treatment was Started

Treatment	Dec.	Jan.	Feb.	March	Total
Control	13	12	9	—	34
Phenoxybenzamine hydrochloride	6	15	6	1	28

TABLE IV

Treatment	Age Group	Assessment		Total
		Good	Not Good	
Phenoxybenzamine hydrochloride	<40	25	5	30
	40+	10	3	13
	Total	35	8*	43*
Control	<40	17	21	38
	40+	13	7	20
	Total	30*	28	58*

* One patient whose age was not given is omitted from this total.

When all the results shown in Table II are included, the group of those receiving phenoxybenzamine and the group receiving lactose are not so strictly comparable, because the period of treatment and observation varied considerably from patient to patient in those who were under treatment for less than four weeks. The reason that treatment ceased in less than four weeks was that some patients did

Ratio of "good" to "not good" according to month of assessment.

was 31:28 (Table IV). This difference is also statistically significant, and the likelihood of this result having occurred by chance is again less than 1 in 100.

The Chart shows the ratio of good to not good for patients receiving lactose, according to the month of assessment. The ratio increases each successive month, and it is therefore tempting to ascribe this trend to presumably increasingly milder weather. The trend is not, however, statistically significant, and other factors may well be involved.

Discussion

The results indicate that phenoxybenzamine has a highly beneficial effect in the treatment of chilblains. The number of drugs for which similar claims have been made is of course legion, but very seldom, if ever, has any statistical proof been adduced in support of the claims made. It is not here claimed, however, that phenoxybenzamine is the ideal drug for use in this condition, which, though often very uncomfortable, is not dangerous. Undesirable side-effects are not rare, and in 9 out of 59 patients given the drug these effects were of such severity that administration had to be stopped and the cases withdrawn from the trial. In addition, undesirable side-effects of lesser degree occurred in a further 13 patients, making a total of 22. These undesirable side-effects included dizziness, paraesthesiae, tachycardia, swollen eyelids, lethargy, nasal congestion, and dryness of the mouth. In some degree counterbalancing this, seven of the patients receiving lactose had side-effects, including dizziness, headache, heartburn, and constipation; and in one case dizziness was so severe that treatment had to be discontinued. The incidence of side-effects in those treated by phenoxybenzamine, however, is higher than in those treated by lactose, and the difference being statistically significant, the side-effects can in part at least be attributed to the drug itself.

In these days of chemotherapy and antibiotics it is commonplace, even in general practice, to give drugs which have undesirable side-effects. In grave diseases or those which cause serious or long-continued discomfort the possibility of these fairly serious side-effects is often outweighed by the great benefit conferred by a potent drug. A different criterion has perhaps to be applied in judging undesirable side-effects in a condition such as chilblains. On the other hand, it is quite possible that a more cautious initial stage, and one which was more prolonged, would result in fewer patients failing to tolerate the drug.

The results of this inquiry being of statistical significance, it might well be worth while to repeat the trial on a larger numerical basis with a view to substantiating the present figures and arriving at the optimum dosage.

Summary

A "double-blind" controlled trial is described in which 128 patients with chilblains were treated with phenoxybenzamine or lactose. In 103 cases the results were analysed, the remainder being rejected for various reasons.

Both in the group of patients who completed a full course of four weeks' treatment and in the larger group which included also those under treatment for a shorter period, the results in patients who received phenoxybenzamine were significantly better than in those who received the control substance. It is therefore concluded that phenoxybenzamine has a definitely beneficial effect in the treatment of chilblains.

Undesirable side-effects occurred with both phenoxybenzamine and lactose. It was shown statistically that this was due, in part at least, to phenoxybenzamine. The significance of the side-effects of this drug is discussed.

We thank Professor D. M. Dunlop for his helpful advice throughout the investigation; Dr. P. L. McKinlay for his critical survey of the results; and Dr. A. Hall Ratcliffe for his design of the investigation and the analysis of the results. We are indebted to Dr. Kenneth Carter and Messrs. Smith, Kline and French for the supply of "dibenyline" (phenoxybenzamine) and control capsules.

INFLUENZA EPIDEMIC IN SINGAPORE CHILDREN

CLINICAL IMPRESSIONS

BY

YEOH OON SWEE, M.B., B.S.

AND

HELEN DOURADO, M.B., B.S.

From the Paediatric Unit, the General Hospital, Singapore

An epidemic of influenza swept over Singapore during May, 1957, and spread to the Federation of Malaya. Though both children and adults were affected, only the children who were admitted into the paediatric unit of the General Hospital, Singapore, are discussed here. It must be emphasized that during the influenzal epidemic only the severe cases, especially those with fits, were admitted. The less severe cases were treated in the out-patient department.

The 250 cases of influenza diagnosed clinically are discussed. In nine cases virus studies were done (see Table II). Often a history was obtained of other members of the family being affected with milder forms of the disease. To ensure an accurate clinical record the medical staff of the paediatric unit met frequently during and after the epidemic.

The increase in the number of admissions and deaths during the epidemic can be seen from the Chart and Table I. The rise in the number of deaths can be explained by the large number of admissions, as the mortality rate remained about the same.

TABLE I.—Number of Weekly Admissions and Deaths (January–June, 1957)

Date	Admissions	Deaths	Date	Admissions	Deaths
January 1-7	93	17	April 2-8	157	23

Clinical Manifestations

Age.—The maximum incidence occurred in the 1-5-year age group, though the youngest child affected was 21 days old.

Sex.—No discrepancy in the sex distribution was noticed.

Symptoms.—The onset was typically sudden, the disease reaching its maximum intensity in one to two days. The attack often started with a mild dry irritative cough, followed by a sudden onset of high fever, unassociated with rigors. Vomiting was common in younger children and occurred soon after taking feeds. Fits were very common. In 110 out of 250 cases fits were the prominent feature and were often the symptom that induced the parents to bring the child to hospital. The fits occurred suddenly and lasted for several minutes; repeated attacks one after the other were the rule rather than the exception.

Physical Examination.—The temperature ranged from 100 to 105° F. (38.7 to 40.6° C.), though hyperpyrexia of 105 to 107° F. (40.6 to 41.7° C.) was not unusual. Flushing of the skin was common, and in a few cases patches of erythematous weals of varying sizes, resembling urticaria, were seen. The throat was frequently red and granular. Nasal discharge was not very common and conjunctival injection was seen in only a few cases. The pulse was usually rapid, and a few cases showed peripheral circulatory collapse. Clinically the lungs were usually clear, but in a third of the cases crepitations and rhonchi revealed bronchitis and bronchopneumonia. The abdomen was soft and not tender, the liver and spleen were usually not enlarged, though in a few cases the spleen was just palpable and disappeared when the fever subsided. The lymph nodes

Showing the increase in the number of admissions and deaths during the epidemic, as compared with the corresponding period in 1956.

were not enlarged. In the central nervous system, drowsiness was a common feature, while those children with fits were often admitted in coma. Neck rigidity was not infrequent and Kernig's sign was positive in a few cases. Transient fine involuntary tremors of the hands were also seen in a few cases.

Investigations.—The total white-cell count was often normal, though in the first one or two days leucopenia, and in the next few days leucocytosis, were noted. A lumbar puncture was done in all cases presenting with fits, and in all the cerebrospinal fluid was normal. A radiograph of the chest was normal or showed increased hilar markings. In cases complicated by bronchopneumonia patchy opacities were seen. Serological tests on paired sera were done on nine cases. The first specimen (acute serum) was taken on the day of admission, and the next specimen (convalescent serum) 6-16 days later. By the haemagglutination inhibition tests, using the influenza type A/Singapore 1/57 strain, which was isolated from an adult during the same epidemic, five cases were positive and four were negative (see Table

II). Some of the cases giving a negative result may have been due to a different strain.

TABLE II

Case No.	Age	Acute Serum	Convalescent Serum
1	3 years	Positive (7)	Positive (14)
2	9 months	Negative (8)	" (20)
3	2 years	" (8)	" (19)
4	11 months	" (4)	" (20)
5	2 years	" (3)	" (13)
6	3 years	" (4)	Negative (10)
7	1 year	" (2)	" (9)
8	3½ years	" (4)	" (11)
9	3 "	" (2)	" (12)

Figures in parentheses represent the day of illness on which blood specimens were taken.

Course.—The fever lasted three to five days and convalescence was rapid in the uncomplicated cases.

Variations According to Age

Some features were more common in certain age groups than in others.

Neonatal Period.—Very few infants under 1 month were admitted into the hospital with influenza.

Infants.—Vomiting of feeds was common, associated with parenteral diarrhoea in some cases.

1-5 Years.—This age group suffered the brunt of the disease and included the largest number of severe cases with a high mortality. 151 of the 250 cases belonged to this age group, and of the 30 deaths 20 were in this group. Fits were characteristic and often followed one another in rapid succession. Peripheral circulatory collapse was the presenting feature in a few cases, and might even develop during stay in hospital. The onset was sudden. The child was comatose. The pulse was not palpable, and the blood pressure could not be recorded. The axillary temperature might be normal, but the rectal temperature was 105 to 107° F. (40.6 to 41.7° C.). The mortality in these cases was very high.

5-10 Years.—These children often complained of headache and general body aches. Constipation and profuse sweating were common. Epistaxis was almost confined to this group. The bleeding was so severe in some cases as to cause alarm, and often the blood from the nose was swallowed, and vomited later as coffee-ground material. Vomiting of clots of blood was seen in a few cases.

Pulmonary Complications

Persistent cough was the commonest complaint among the cases followed up as out-patients. Bronchitis and bronchopneumonia were seen in a third of the cases. These responded to sulphonamides or antibiotics. Two cases of lobar pneumonia were observed.

Lung Abscess.—There were three cases. A 5-year-old girl had cough and pain in the left chest for one week before admission: she had an abscess and consolidation of the lingula. A 6-year-old boy, with a history of fever and cough for nine days and breathlessness for four days, had consolidation and multiple abscesses in the right upper lobe. An 8-year-old boy had fever, breathlessness, and cough productive of blood-tinged sputum for 40 days. He had an abscess in the right lung which had burst and produced an empyema. It was interesting to note that these cases developed symptoms during the last two weeks of the epidemic.

Unilateral Empyema.—There were two cases. One case, referred to above, was the result of an abscess bursting into the pleural cavity. A 7-year-old girl after a week of fever and three days of cough and pain in the right chest was admitted with empyema on the right side.

Bilateral Empyema.—Two boys, 8 and 9 years old, were admitted with bilateral empyema. One gave a five-day history of fever and cough before admission, the other gave a three-day history. The onset and symptoms in both were very suggestive of influenza.

Neurological Complications

Tremors.—A 3-year-old girl had influenza with fits and bronchopneumonia. She gradually improved. On the tenth day of the illness she had coarse tremors and ataxia of all limbs, and this persisted till her discharge on the 28th day. A month later, in the follow-up clinic, the tremors had disappeared, but her legs were weak. The cerebrospinal fluid examined on the 2nd and 19th days was normal.

Hemiplegia.—A boy aged 2 years had influenza with fits and bronchopneumonia. He was semicomatose and remained in that state for the next few days. On the sixth day of illness he was noticed to have a spastic hemiplegia on the left side. On the seventh day he was fully conscious. On the tenth day the spasticity had disappeared on the left side but appeared on the right side. This developed into a right flaccid hemiplegia without any hemianopia. On discharge on the 34th day he could move his right upper limb slightly, but was flaccid in the right lower limb. Prior to the illness he was able to walk and to recognize, call, and play with his parents, whereas on discharge he was unable to sit up and ignored his parents completely. The cerebrospinal fluid examined on the 4th, 9th, and 17th days was normal.

Delayed convalescence was seen in the severe cases. Lethargy in the convalescent period was not uncommon. A few children, who prior to the attack of influenza were able to run about, complained of marked weakness of the legs for one to two months after the illness.

Second attacks of influenza were seen in a few cases. The first attack was mild and the child was not taken to see a doctor. The diagnosis was based on a typical history of slight fever, cough, and coryza. The second attack occurred 7 to 10 days later, with a high temperature, and required admission into hospital.

Prognosis and Treatment

The majority of cases did well. Untoward signs were hyperpyrexia, persistent fits, and peripheral circulatory collapse. The majority of deaths occurred in the first 24 hours after admission.

Among the 250 cases diagnosed clinically as influenza there were 30 deaths. Permission for necropsy was obtained in 25 cases, and the post-mortem diagnoses were: influenzal bronchopneumonia in 13 cases, bronchopneumonia in 11 cases, and bronchopneumonia with enteritis in one. It was our impression that many clinical cases of influenza were recorded as bronchopneumonia.

During the period of the epidemic, 1,231 patients were admitted, of whom 196 died. In 175 cases necropsy was performed. The post-mortem diagnoses were as follows: bronchopneumonia, 51; influenzal bronchopneumonia, 24; bronchopneumonia with gastro-enteritis, 13; lobar pneumonia, 10; collapse of lung, 4; acute bronchitis, 3; gastro-enteritis, 25; purulent meningitis, 7; congenital heart, 5; encephalitis, 3; miscellaneous, 30.

No specific drug was found to be effective against influenza. Treatment was mainly symptomatic. The sulphonamides and antibiotics were useful in preventing and treating secondary infections. Cortisone was used for some cases with circulatory collapse. It appeared to be of value in the case of a 4-year-old girl who had peripheral circulatory collapse and hyperpyrexia, and who was in coma for two days.

Case Reports

Case 1. A Typical Case with Fits.—A 3-year-old Indian boy was admitted on May 8, 1957. For three days he had a running nose, and at 10 a.m. on the day of admission he had a sudden onset of high fever. At 10.30 a.m. he had a fit, consisting of clonic spasms with loss of consciousness. At 11 a.m. he had another fit. On examination he was conscious but irritable, and his temperature was 104° F. (40° C.). The throat was red. The pulse was 160 a minute. There was nothing abnormal in the heart, lungs, or abdomen. There was no neck rigidity, and Kernig's sign was negative. Another fit occurred in the ward, and this was controlled by

an injection of paraldehyde. W.B.C. was 13,800 (P. 85%, L. 5%, M. 7%, E. 3%). C.S.F. cells, 1; total protein, 20 mg. per 100 ml.; globulin absent; sugar present; sulphachloride 700 mg. per 100 ml. He was treated with sulphadiazine and alkaline potassium citrate mixture. The temperature subsided to normal on the third day of admission and he was discharged on May 11.

Case 2. Epistaxis as a Presenting Symptom.—A 5-year-old Chinese boy was admitted on May 15 with the complaint of fever for four days, bleeding from the nose the night before admission, and vomiting of dark-coloured material on the day of admission. On examination the temperature was 101° F. (38.3° C.). There was fresh bleeding from the nose. There were no petechiae or ecchymoses in the skin. Nothing abnormal was found in the heart, lungs, abdomen, or nervous system. In the ward he vomited coffee-ground material. The epistaxis was controlled by packing the nose with gauze soaked in adrenaline. W.B.C. was 3,600 (P. 67%, L. 27%, M. 6%, E. 0%). The platelet count was 90,000 per c.mm. and the next day it was 110,000 per c.mm. The temperature became normal and he was discharged on May 17.

Case 3.—A 3-year-old Chinese boy was admitted on May 20 at 1 a.m. He had fever and cough for one day, and on the day of admission he passed loose motions on four occasions. He had a fit during the night. On examination he was conscious. The temperature was 104° F. (40° C.). The skin was hot and dry; the throat was red and granular, and the tonsils were enlarged. The pulse was 140 a minute. There was nothing abnormal in the heart, lungs, or abdomen. There was no neck rigidity, and Kernig's sign was negative. W.B.C. was 8,900 (P. 83%, L. 12%, M. 4%, E. 1%). He died the same day at 9.15 a.m. *Necropsy Report* (Dr. C. S. Muir): The heart appeared normal, as were the pharynx and larynx. The trachea was oedematous and showed slight congestion. The right lung showed a violaceous mottling with a large collapsed area 3 by 9 by 3 cm. at the base of the lower lobe. The cut surface showed bronchopneumonic change. The left lung showed bronchopneumonic change. The large intestine showed a few small pneumonic change. The liver showed ulcerated areas about 0.5 cm. across. The fatty change. The renal tract appeared normal. The pancreas, adrenals, thyroid, and spleen appeared normal. The brain was congested. The cause of death was influenzal bronchopneumonia.

Case 4. Case with Peripheral Circulatory Collapse.—An 8-months-old male Chinese child was admitted on May 20. For the last three days he had diarrhoea, passing watery yellow stools 10 times a day, and for two days had slight fever and vomited his feeds. On examination he was sitting up in bed. His temperature was 101° F. (38.3° C.) and he was not dehydrated. The throat was red and the tonsils were enlarged. There was nothing abnormal in the heart, lungs, abdomen, and central nervous system. On the morning of May 21 the temperature was normal. He was taking his feeds well. The stools were still watery. At 2.10 p.m. he suddenly had peripheral circulatory collapse. He was comatose. There was peripheral cyanosis. The pulse was not palpable. Respiration was rapid and shallow. The axillary temperature was 99° F. (37.2° C.), but the rectal temperature was 107° F. (41.7° C.). In spite of active sponging he died at 2.30 p.m. *Necropsy Report* (Dr. T. Balasingham): The child was well nourished. The heart showed slightly dilated right chamber. The muscle and valves were normal. The mucosa of the larynx and trachea was injected, and the lumen contained excess mucus. The lungs were slightly voluminous and reddish in colour. Both lungs showed patches of bronchopneumonia, and these areas were friable. The mucosa of the bronchi was injected. The spleen was twice the normal size, its capsule being tense. The pulp was swollen, red, and firm. Lymph follicles were indistinct. The liver and kidneys showed cloudy swelling. The stomach and intestines were normal. The mesenteric glands were prominent. The brain was injected. The cause of death was bronchopneumonia, probably influenzal.

Summary

An account is given of the clinical impressions of the influenzal epidemic as seen in 250 cases admitted into the paediatric unit of the General Hospital, Singapore.

The common presenting symptoms were sudden onset of fever, cough, and fits. The 1-5-year age group appeared to be most affected.

The main complications were pulmonary and neurological.

The number of admissions and deaths increased considerably during the epidemic, and the causes of death as revealed by necropsy are given.

There was no specific treatment.

Four typical cases with different features are described.

We wish to acknowledge the guidance and encouragement of Dr. C. Elaine Field, paediatric specialist, General Hospital, Singapore, who provided the stimulus for this paper. We are also indebted to Dr. G. Smith and Dr. Quah Quee Guan for invaluable advice and criticism; to Dr. A. Heah for compiling the figures and drawing the graph for the admissions and mortality; to our colleagues in the paediatric unit for their co-operation and assistance; to Dr. Lim Kok Ann, of the bacteriology department, University of Malaya, for the virus studies; and to the Director of Medical Services, Singapore, for permission to publish.

RAPID COLORIMETRIC MICRO-METHOD FOR ESTIMATING GLUCOSE IN BLOOD AND C.S.F. USING GLUCOSE OXIDASE

BY

J. E. MIDDLETON, B.M., M.R.C.P.

Lecturer in Clinical Pathology

AND

W. J. GRIFFITHS, Ph.D., B.Sc., A.R.I.C.

Chemical Pathologist

St. Thomas's Hospital, London

The availability of glucose oxidase (notatin), first described by Müller (1928) and studied in detail by Keilin and Hartree (1948a), an enzyme which specifically oxidizes β -glucose to gluconic acid with the formation of hydrogen peroxide, has resulted in the development of rapid qualitative tests for glucose in biological fluids and especially in urine (Adams, Burkhart, and Free, 1957; Luntz, 1957).

The use of this enzyme for the quantitative estimation of glucose has also been described: Keilin and Hartree (1948b) measured the oxygen uptake during the reaction, and Froesch and Renold (1956) the decrease in copper-reducing ability after complete destruction of the glucose by the enzyme. In both these methods the hydrogen peroxide formed was decomposed by catalase. However, while they are accurate these procedures are too time-consuming for routine clinical work.

Keston (1956) and Teller (1956) showed that when peroxidase is employed instead of catalase and a suitable chromogenic oxygen acceptor is added to the system, the colour produced is a measure of the amount of glucose originally present. The commercial urine-testing strips "clintix" and "tes-tape" utilize this reaction, and Kohn (1957) has described the use of clintix for the rapid but approximate determination of blood glucose.

The work here described was initiated with the object of devising a rapid and simple enzyme method which could be employed when a large number of blood

samples have to be analysed in a short time, as is necessary, for instance, in a diabetic clinic. We describe how, with a suitably buffered solution of glucose oxidase, peroxidase, and *o*-tolidine, glucose can be estimated in blood and C.S.F. with the accuracy of the best copper-reducing methods, more simply and quickly and without the use of heat.

Method

Reagents Used.—(1) Phosphate buffer, 0.5 M, pH 5: to 100 volumes of 0.5 M KH_2PO_4 (analytical reagent) are added 3.4 volumes of 0.5 M $\text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$, "Sørensen's salt." The pH should be checked. (2) Glucose oxidase: glucose oxidase powder (Sigma Chemical Co., potency 1,500 units per g.) and the liquid preparation "fermcozyme" (Fermco Chemicals Inc., potency 750 units per ml.) are equally suitable. (3) Peroxidase: "POD" (Boehringer and Soehne G.M.B.H.), a horse-radish peroxidase. This is expensive but economical in use. A stock solution containing 20 mg. per 100 ml. of the phosphate buffer may be kept in the refrigerator for at least two weeks. (4) *o*-Tolidine: a 1% solution of *o*-tolidine (A.R.) in ethanol. This should be kept in a brown bottle away from light. (5) NaCl, 0.9%. (6) $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$, 5%. (7) NaOH, 0.3 N.

(8) Buffered Enzyme-dye Solution.—(a) Using glucose oxidase powder: 250 mg. of the powder is dissolved in about 80 ml. of the phosphate buffer, 5 ml. of the stock peroxidase solution is added and the volume made up to 100 ml. with the buffer solution. This will keep in the refrigerator for at least two weeks. On the day of use 1 ml. of the *o*-tolidine solution is added to 100 ml. of this buffered enzyme solution with shaking and the mixture filtered; the filtrate should be protected from strong light, and if subsequently a fine precipitate forms this must be filtered off before use. The final concentration of peroxidase is 1 mg. per 100 ml. (b) Using fermcozyme: 0.5 ml. of this solution can replace the 250 mg. of glucose oxidase powder in the preparation described under (a), the amounts of peroxidase and *o*-tolidine remaining the same. Fermcozyme can be kept in the refrigerator for many months without loss of potency.

All commercial preparations of glucose oxidase contain catalase, which, if present in sufficient concentration, will prevent colour formation by competing with peroxidase for hydrogen peroxide. In the above solution, however, the peroxidase is present in excess and the colour production is adequate.

(9) Glucose Standards.—A permanent stock solution containing 100 mg. of pure glucose per 100 ml. is prepared in water saturated with benzoic acid. From this, standards containing 5, 10, 20, 30, and 40 mg. of glucose per 100 ml. are prepared by dilution with water saturated with benzoic acid; these are kept cold. The stock glucose solution should be prepared about 24 hours before use to allow the equilibrium mixture of α - and β -glucose to be attained. The solid sugar is usually predominantly the α form in commercial preparations, and, since glucose oxidase reacts only with β -glucose, a freshly prepared solution will not produce maximum colour if there should be insufficient glucomutarotase in the sample of glucose oxidase used.

Standardization of the Buffered Enzyme-dye Solution

The blue colour produced on the addition of glucose to the buffered enzyme-dye solution rapidly reaches a maximum and then fades at a slower rate. At the concentration of glucose oxidase recommended (375 units per 100 ml.) the addition of 0.2 ml. of glucose standards containing 5 to 40 mg. per 100 ml. to 4 ml. of the buffered enzyme-dye solution results in colour development which reaches a maximum at 10 to 12 minutes (Fig. 1). To counter possible variations in the potency of commercial enzyme preparations the following test should be made: to 4 ml. of the buffered enzyme-dye solution in a 6 by $\frac{1}{2}$ in. (15 by 2.2 cm.) test-tube is added 0.2 ml. of a 20 mg./100 ml. standard glucose solution. The colour is read at intervals of one minute on a photoelectric absorptiometer at 680 $m\mu$ and the

time taken to reach maximum absorption noted. If this is not 10 to 12 minutes the amount of glucose oxidase is either increased or decreased until the right amount is found. Under the foregoing conditions the logarithm of the time taken to reach maximum colour is approximately proportional to the logarithm of the glucose oxidase concentration. The amount of peroxidase recommended should be ample in all cases.

Procedure for Blood and C.S.F.

To 1 ml. of 0.9% NaCl is added 0.2 ml. of blood (capillary, oxalated, or heparinized venous blood; sodium fluoride is suitable in concentrations of not more than 10 mg. per 1 ml. of blood), 0.4 ml. of 5% ZnSO_4 is then added, followed by 0.4 ml. of 0.3 N NaOH, with shaking after each addition. Deproteinization should be carried out promptly, but, if for any reason this cannot be done, when using freshly shed blood the 0.9% NaCl should contain 50 mg. of potassium oxalate per 100 ml. to prevent clotting. The mixture is either centrifuged or filtered through a 4.25-cm. Whatman No. 41 filter paper.

Then 4 ml. of the buffered enzyme-dye solution is pipetted into a 6 by $\frac{1}{2}$ in. test-tube and 0.2 ml. of clear blood filtrate is added and mixed by a gentle swirl. Suitable standards, 0.2 ml. of each, are likewise added to 4 ml. of the buffered enzyme-dye solution at intervals of one minute. Up to 10 analyses, including the standards, may be carried through in one batch. After standing at room temperature for 10 minutes the blue colour is read at 680 $m\mu$ against a blank of buffered enzyme-dye solution. For greatest accuracy both standards and filtrates should be read at 10 minutes precisely, as was done in these studies; little error is incurred, however, by reading over the period of 10 to 16 minutes. The unknowns are read from a curve constructed from the standard values, which should be determined daily and for each new batch of buffered enzyme-dye solution so as to eliminate minor errors due to temperature fluctuation and slightly varying enzyme concentration. The blue colour is linear for blood-glucose values up to at least 400 mg. per 100 ml. If the blood glucose is found to be higher than this, 0.1 ml. of blood filtrate should be added to 4.1 ml. of enzyme-dye solution for greatest accuracy.

In the C.S.F. procedure 0.4 ml. of C.S.F. is added to 0.8 ml. of 0.9% NaCl, the solution is deproteinized, and the colour produced by 0.2 ml. of the filtrate is measured as in the procedure for blood; the glucose concentration found, divided by two, gives the C.S.F. value.

Results

It is well known that many methods in common use for the determination of blood sugar are really a measure of the total copper-reducing substances, which, in addition to glucose, include fructose, amino-acids, glutathione, phos-

FIG. 1.—Graphs of colour development, using 4 ml. of buffered enzyme-dye solution and 0.2 ml. of standard glucose solutions: A, 5 mg.; B, 10 mg.; C, 20 mg.; D, 40 mg.; and E, 50 mg. per 100 ml. Spekker absorptiometer, 1 cm. cell, Kodak No. 570 (680 $m\mu$) filters.

phorylated hexoses, glyceraldehyde, etc. Harding and Downs (1933) devised a method which does not include these non-glucose reducing substances; this was modified by Asatoor and King (1954), and it is their method which was used in comparison with the enzyme method described in this paper. In many instances the sugar was also determined simultaneously by the method of MacLean. The results are shown in Fig. 2. There is statistically a high degree of

FIG. 2.—Blood glucose by enzyme method versus those of Asatoor and King (full line=observed regression ($y=6.86+0.980x$)) and of MacLean.

correlation ($r=+0.995$) between the enzyme method and that of Asatoor and King (based on 64 parallel estimations). MacLean's method, on the other hand, gave generally higher values. This proves not only the accuracy of the enzyme method but, since this is specific for glucose, the virtue of this particular copper method for the estimation of true glucose.

Discussion

A modified Somogyi method for deproteinization, whereby blood is delivered first into an isotonic solution, was adopted in this work so as to be comparable with the procedure of Asatoor and King (1954), in which the red cells are also lysed. However, the specificity of the enzyme method is such that the values obtained are the same whether or not the blood is haemolysed before deproteinization. We favour the method described in this paper because it produces a less bulky precipitate and more filtrate is obtained. No difference was found when deproteinization was performed immediately, compared with a delay of five minutes to allow theoretically for complete diffusion of glucose from the intact red cells. If, however, the usual order of addition of ZnSO_4 and NaOH to laked blood was reversed, values consistently 3 to 4% higher were obtained. This may have been due to the liberation of glucose from some complex combination under the action of alkali.

Huggett and Nixon (1957a, 1957b) have published a method also based on that of Keston (1956) and Teller (1956), using glucose oxidase powder and peroxidase. They used *o*-dianisidine as the chromogenic oxygen acceptor and carried out the reaction at pH 7 at 35° C. Their method has the advantage that the orange-brown colour developed during the reaction is stable for some hours; on the other hand, a thermostatically controlled water-bath is necessary and full colour is not attained until after the lapse of 60 minutes. It is not therefore so well adapted to the purpose we had in mind as the method described above.

It would appear that the enzyme method gives true values for the glucose content of the fluids analysed. In the case of blood and C.S.F. these values are lower than are given by such methods as those of MacLean, Shaffer-Hartman, and

Folin and Wu, and the normal fasting blood glucose will be found to be from 50 to 90 mg. per 100 ml. The maximum value after an oral dose of 50 g. of glucose in the normal person is approximately 160 mg. per 100 ml.

The accuracy of the enzyme method is of such a high order that it will be found invaluable not only in clinics but in laboratories, where it can replace the usual copper-reducing methods with great economy in time and materials.

Summary

A rapid and accurate colorimetric micro-method for the estimation of glucose in blood and C.S.F. is described in which no heat is required. The procedure utilizes a suitably buffered solution of glucose oxidase, peroxidase, and *o*-tolidine of pH 5.

In the case of blood it has been shown that there is a close correlation between the values given by this method and that of Asatoor and King. Since the enzyme is specific for glucose the values obtained are lower than those given by copper-reducing methods such as that of MacLean, which include reducing substances other than glucose; this also applies to C.S.F.

The normal fasting blood glucose is found to be from 50 to 90 mg. per 100 ml., which after oral glucose rises to a maximum of approximately 160 mg. per 100 ml. in normal subjects.

We wish to thank Mr. L. J. Taylor, of Hughes and Hughes Ltd., for his helpful co-operation and for samples of fermcozyme.

The British agents for the enzyme preparations are: fermcozyme solution, Hughes and Hughes Ltd., 35, Crutched Friars, London, E.C.3; glucose oxidase powder, G. T. Gurr Ltd., 136-8, New King's Road, London, S.W.6; peroxidase powder, Courtin and Warner Ltd., Ballards Old Brewery, Lewes, Sussex.

Dr. C. A. BOUCHER, speaking at the annual meeting of the Distressed Gentlefolk's Aid Association on October 24, pointed out that old age did not begin suddenly at a certain time. Gradual deterioration in hearing and vision might commence in middle age. He said that the rather prevalent attitude of regarding old people as different beings needing special care and attention was not necessarily the right one. Old people, with a lifetime's experience behind them, were used to helping others, and therefore needed help and companionship rather than "sugary sympathy." The Distressed Gentlefolk's Aid Association clearly recognized the needs of the infirm in its homes, where it provided well-qualified staff and gave security to its residents. The building of a new home in Vicarage Gate, London, for 42 nursing cases and seven ambulant cases was to be welcomed. Contributing also to a solution of this problem is the Friends of the Poor and Gentlefolk's Help Society, which has ten homes for old people. An anonymous gift of £40,000 was announced at a recent meeting of this society, at which PRINCESS MARGARET presided. With this gift another residential home had been bought in Hampshire, providing accommodation for 25 to 30 people. Princess Margaret said that the generosity of the trustees of the London Parochial Charities had enabled them to add a new wing to the home in Hampstead. The society was now spending more than £100,000 a year, of which sum it had to find more than half: over the past ten years there had been an average deficit of £10,000 a year.

Medical Memoranda

Addison's Disease Occurring in Sisters

In an extensive review of Addison's disease, Guttman (1930) doubted the existence of a definite familial tendency, because of the infrequency of reports of occurrence in more than one member of the family. In a search through the literature, 10 families were found in which it seems probable that Addison's disease occurred in more than one member. A further example of Addison's disease occurring in one family is reported.

CASE 1

In February, 1954, when aged 53, an unmarried woman complained of weakness in the limbs, tiredness, and cramps in the arms and legs. She had vomited on several occasions during the past week and had had moderate diarrhoea, passing two or three loose stools a day.

Examination showed a very thin woman, lying with the hips and knees flexed. They were painful when attempts were made to straighten them, and these were followed by painful cramps in the muscles, with associated jerky flexor spasms. The skin was pigmented all over, the colour being light brown resembling a healthy sun-tan. The dorsal surfaces of the hands and the face and neck were darker than the trunk. Irregular patches of brown pigmentation were found on the buccal mucosa. There was slight tenderness in both loins. The tongue was furred and the patient was dehydrated. Her blood pressure was 85/50. There were no other abnormal physical signs at this time.

A diagnosis of Addison's disease was made and was confirmed by Dr. P. E. Thompson Hancock, under whom she was admitted to the Royal Free Hospital on February 26.

No other abnormality was noted after admission. Radiographs of the chest and abdomen were reported on as normal. Biochemical investigations at this time showed: serum sodium, 305 mg./100 ml.; serum potassium, 28.9 mg./100 ml.; blood urea, 70 mg./100 ml.; E.S.R. 28 mm. in the first hour; 17-ketosteroids, 1.75 mg.

She was treated with 12.5 mg. of cortisone twice daily and 2 g. of salt thrice daily, and the dehydration was corrected. She responded immediately with rapid improvement. The blood pressure rose to 110/65. She was discharged on April 5 for one month's convalescence.

Biochemical investigations at the time of discharge showed: serum sodium, 319 mg./100 ml.; serum potassium, 17 mg./100 ml.; blood urea, 35 mg./100 ml.; E.S.R. 17 mm.; 17-ketosteroids, 3.31 mg.

She has been under observation since discharge from hospital and continues to take 25 mg. of cortisone and 2 g. of salt daily. She states that she has never felt so well. The blood pressure in July was 115/70. This has steadily improved, the last recorded figure being 135/75 in November, 1954.

She is now fully recovered, and completely rehabilitated in her former occupation as a teacher.

CASE 2

In February, 1954, it was noticed that an elder sister of the above patient, aged 61 and unmarried, was also fairly deeply pigmented like her sister. She was under the care of one of my partners (G. A. S.). It was suggested that she might also be suffering from Addison's disease. Her blood pressure was recorded as 95/65. There was a diffuse light-brown pigmentation of her skin similar to that of her sister, but with no buccal pigmentation. She complained of some muscular weakness but no cramps. The weakness she admitted to having been present for many years, and she stated that she did not take much notice of it. Biochemical investigations at this time showed normal serum sodium and potassium levels.

In August, 1955, she complained of increasing weakness, breathlessness on exertion, and pain in the left chest

posteriorly on breathing deeply. The temperature orally was 99° F. (37.2° C.). Pigmentation was again noted, but there was no significant increase. She had marked postural weakness. The blood pressure was 90/60. There were no abnormal physical signs in the chest. It was thought that she might have had a cardiac infarction, and was advised to remain in bed. The next day she complained of increasing weakness and palpitation. She had vomited a number of times during the night. On examination she was lethargic and disorientated. There was gross weakness of the limbs. The systolic pressure was 65 mm. Hg; a clear diastolic pressure was not obtained. Biochemical investigations on August 26, 1955, showed: serum sodium 255 mg./100 ml.; serum potassium, 30 mg./100 ml.; chloride expressed as NaCl, 470 mg./100 ml.

She was admitted to the Royal Marsden Hospital on August 30, 1955, under Dr. Thompson Hancock. On examination in hospital she was thin, but not wasted; dehydrated; no ankle oedema; marked koilonychia. There was irregular pigmentation of the skin, most marked on the dorsa of the fingers and hands, flexures of elbows, cubital fossae, forehead, and the inner aspect of the lips. Small nodes were present in both axillae. Pulse was of very poor volume, slow but regular; blood pressure 75/55. Heart sounds were distant. Chest was not easy to examine, as the patient became distressed when she sat up. Abdomen N.A.D. Biochemical investigations on August 30 showed: blood sugar, 98 mg./100 ml.; serum potassium, 38 mg./100 ml.; serum sodium, 143 mg./100 ml.; chlorides, 491 mg./100 ml. A diagnosis of Addison's disease was made.

The patient died on the day following admission. At necropsy, carried out by Dr. J. W. Whittick, the adrenal cortical tissue was found to be greatly reduced in amount and, in some parts, absent. In the residual cortex, zonal architecture was lost; the cells were few in number but of giant size owing to cytoplasmic increase. Recent degenerative changes were present in many. No tuberculous reaction was present and there was no fibrosis. Medullary substance was normal in amount and appearance.

DISCUSSION

Both clinically and biochemically the diagnosis of Addison's disease seemed to be firmly established in these sisters. Although one brother was reported to have had a tuberculous knee at the age of 2, it would appear, in the absence of any further tuberculous disease in this family and from the post-mortem report of the sister who died, that the underlying pathology in each case was adrenocortical atrophy. An elder brother suffered from diabetes mellitus.

Harris-Jones and Nixon (1955) described the cases of two brothers with Addison's disease and familial spastic paraplegia. Another brother in this family suffered from diabetes mellitus. Fahr and Reiche (1919) found symptoms of Addison's disease in three brothers; one, aged 23, died, and necropsy showed atrophy of both suprarenals. Briggs *et al.* (1951) described the cases of two brothers with the disease, aged 12 and 17, the latter dying 72 hours after admission to hospital; necropsy revealed primary adrenocortical atrophy. Smith and Higgins (1952) reported Addison's disease occurring in two brothers, aged 19 and 20, in the United States Navy, with serum hepatitis in one. Curschmann (1940) reported four brothers affected, one of whom died from severe Addison's disease. Croom (1909) reported a family of three girls, the eldest aged 9, having frank Addison's disease and the other sisters showing pigmentation and listlessness.

Wilkins *et al.* (1940), Thelander and Cholfin (1941), and Thelander (1946) have reported several cases of adrenal insufficiency in young siblings in whom the adrenogenital syndrome was present.

Rolleston (1936) refers to reports in the literature of cases in two brothers described by Andrewes (1891), and states that he knew of two sisters having the disease. The case of a boy thought to have Addison's disease, whose mother had died of this illness, was reported by Borghini (1937).

Fleming and Miller (1900) reported frank Addison's disease in a mother whose four children were pigmented and subject to attacks of diarrhoea and vomiting.

In all these families where post-mortem records are available the essential finding was atrophy of the adrenal cortex in every case.

I wish to record my thanks to Dr. P. E. Thompson Hancock, of the Royal Free Hospital, for his help in presenting these cases.

P. H. HEWITT, M.B., B.Chir.

Encephalitis Due to the Psittacosis-Lymphogranuloma Venereum Group of Viruses. A Case of Ornithosis Encephalitis

Evidence that the viruses of the psittacosis-lymphogranuloma venereum group can cause infection of the nervous system was first produced in 1942, when Sabin and Aring described a case of meningo-encephalitis due to the virus of lymphogranuloma venereum. Subsequently, de Wilde (1951) described a case of encephalitis due to the ornithosis virus and Giroud *et al.* (1954) described similar cases.

Although meningeal involvement has been recorded as a post-mortem finding in psittacosis (Walton, 1954) no cases of encephalitis of similar aetiology have so far been described in the British literature.

It is well known that only a small proportion of cases in which virus involvement of the nervous system occurs ever exhibit clinical features of such infection. It is hoped that the presentation of the following case of ornithosis encephalitis will draw attention to this group of viruses as possible aetiological agents in virus infection of the nervous system.

CASE REPORT

A farmer aged 37 was admitted to hospital on December 9, 1954. The history obtained from his relatives was that he had been quite well until some two weeks previously, when he complained of general malaise and had influenza-like symptoms. He continued at work for another week, but then had to remain in bed owing to extreme lassitude. Some few days later there was evidence of deranged mental function in that he began talking to himself and was unable to hold a coherent conversation. His mental condition quickly deteriorated and led to his admission to hospital.

On admission he showed marked psychomotor overactivity, throwing himself about the bed and talking and shouting continually. He was doubly incontinent and would not take food or drink. Physical examination was difficult, but no abnormality was detected other than a slight pyrexia and a tachycardia. A lumbar puncture was performed, the pressure being raised, but it was thought that this was probably due to restlessness. The report was as follows: probably due to restlessness. The report was as follows: cells, 1 per c.mm.; protein, 55 mg. per 100 ml.; glucose, 51 mg. per 100 ml.; chlorides, 760 mg. per 100 ml. Haemoglobin was 100%; white blood count, 9,800; blood urea, 74 mg. per 100 ml.—no doubt due to inadequate fluid intake. The blood W.R. was ± (doubtful), Kahn positive.

There was no change in the patient's condition over 36 hours, and heavy sedation with morphine, hyoscine, and paraldehyde had no effect on the great mental unrest and insomnia. In view of this he was transferred to the psychiatric observation ward.

C

Again there were no abnormal signs on physical examination apart from some dehydration. The clinical picture was that of an organic reaction. A further lumbar puncture was performed which showed no increase in pressure, and the protein content had fallen to 30 mg. per 100 ml. In view of the extreme psychomotor overactivity he was treated with chlorpromazine hydrochloride, 50 mg. intramuscularly six-hourly, and procaine penicillin, one mega unit twice daily prophylactically. With this treatment an improvement was seen within a few hours; the patient became quieter and less restless although still incoherent. The clinical picture continued to improve rapidly, and it was significant that as consciousness became less clouded he complained of loss of vision.

In view of the history of an influenzal type of illness, the gross psychiatric symptomatology, the slight increase in C.S.F. protein, and the complaint of loss of visual acuity, a provisional diagnosis of virus encephalitis was made. The dosage of chlorpromazine hydrochloride was gradually reduced and finally discontinued after ten days' treatment. Penicillin was also discontinued. Within a fortnight of admission there was no evidence of any physical or mental abnormality. His vision had returned to normal and he was fully ambulant. He was able to give a good account of himself. He gave the information that he was a pigeon-fancier. He could not, however, recall illness in any of his birds.

Blood was sent for complement-fixation tests on December 26—that is, roughly one month after the onset of symptoms. The report was as follows:

Influenza	Q Fever	Psitt. L.G.V.	Aggl. Str. M.G.
Sol. A	Sol. B		
<1/8	<1/8	<1/8	≥ 1/128
			<1/10

A Frei test was negative, and both the blood W.R. and the Kahn test were negative by this time.

He was discharged from hospital some three weeks after admission, completely symptom-free.

On March 16, 1955, he was seen for follow-up interview. He had remained well. The complement-fixation tests were repeated, with the following result:

Influenza	Q Fever	Psitt. L.G.V.
Sol. A	Sol. B	
<1/8	<1/8	<1/8
		1/64

The Frei test was repeated, but was again negative.

In view of the positive Kahn and doubtful W.R. prior to the administration of penicillin, Price's precipitation reaction and a treponemal immobilization test were performed. Both were negative.

COMMENT

We feel that the falling titre against the psittacosis-lymphogranuloma venereum antigen and the persistent failure to obtain a positive skin reaction against the Frei antigen establishes this as a case of ornithosis/psittacosis encephalitis. Although there was a transient doubtful W.R. before penicillin was given, this was shown to be non-specific.

One of the most striking clinical responses to chlorpromazine hydrochloride is seen in its effect in states of acute excitement (Hamon *et al.*, 1952; Chatagnon and Chanoit, 1953). The response in this case after failure of other sedation is, we feel, worthy of note.

I thank Dr. W. J. Dunn for referring this case; Dr. Maurice Silverman for permission to publish; and Dr. L. A. Hatch, of the Virus Reference Laboratory, for the serological investigations.

Reviews

OCCUPATIONAL SKIN DISEASES

Occupational Diseases of the Skin. By Louis Schwartz, M.D., Louis Tulipan, M.D., and Donald J. Birmingham, M.D. Third edition. (Pp. 981; illustrated. 130s.) London: Henry Kimpton. 1957.

This standard textbook on occupational diseases of the skin is invaluable to dermatologists and to all those concerned in the health of the industrial worker. It is well written, and presented in a practical and most useful fashion. There is no great change from the second edition except for the addition of a few items to bring the work up to date. These include increased attention to radiation effects, with a chapter on atomic hazards by Dr. W. D. Norwood; a most useful chapter on occupational marks by Dr. F. Ronchese; and a good chapter on detergents and "surfactants" by Dr. A. M. Schwartz. This has increased the size of the book by a few pages. Dr. Donald J. Birmingham has replaced Dr. Samuel Peck as one of the authors.

It is an almost impossible task to keep entirely abreast of the hazards that are daily increasing and changing in industry with the march of science. There would appear, however, to be little of consequence that the authors have not included. The discussion of predisposing causes is valuable and interesting. The authors are sometimes misquoted as contending that workers who suffer from dermatitis due to hypersensitivity to allergic irritants may become "hardened"—that is, they may develop immunity if they continue at work. In fact, they say that this is unlikely to happen except in "green labour"—that is, new workers encountering an allergic irritant for the first time. This is probably true. They do not mention Bain's work (*Brit. J. Industr. Med.*, 1954, 11, 25), which showed a dramatic reduction in incidence of such reactions following premedication with antihistamines. References, indeed, remain for the most part American. This accounts for some minor omissions, such as Dogger Bank itch, purpuric eruptions from fabric finishes and nail varnishes, dermatitis from handling chlorpromazine, and mepacrine staining. There is no mention of kerato-acanthoma and its relation to occupation. The chapter on the investigation and prevention of occupational diseases is of great value to others as well as to doctors. The "patch test" is well and elaborately described and assessed—there is some repetition of this in the book—and stress is properly placed on the value of the uncovered patch test. The fact that hobbies and activities other than regular employment may cause dermatitis should be emphasized in the investigation of industrial problems. In the section on cancer coal is listed as a possible cause, while arsenic is not included in the causes of internal cancer, and the evidence of inorganic arsenic producing cancer from external contact is questioned. The presentation is very readable and often lightened by interesting historical touches.

J. T. INGRAM.

PSYCHO-ANALYSIS AND PSYCHOTHERAPY

Psycho-analysis and Psychotherapy: Developments in Theory, Technique, and Training. By Franz Alexander, M.D. (Pp. 299+xiv. 25s.) London: George Allen and Unwin Ltd. 1957.

Franz Alexander, one of the earliest of "institute-trained" psychoanalysts, graduated from Berlin to Chicago with the reputation of being a classical exponent of the science. Experience gained at the Chicago Institute of Psychoanalysis, which he founded, convinced him of the necessity to adapt classical technique to meet the needs of an ever-increasing clientele. His technical modifications gave rise to some perturbation on the part of those who regard anything short of the classical methods as being merely unanalysed transference therapy. The present book is an exercise in "short-term" apologetics advocating the "flex-

ible application of the known therapeutic factors" and supporting the view that psycho-analysis and "uncovering psychotherapies" constitute a continuum. The author, who is a clear writer as well as a skilled dialectician, argues these issues up hill and down dale, touching as he goes on such various matters as theories of treatment, the transference (including what he calls the "corrective emotional experience"), counter-transference, the therapeutic implications of regression, the frequency of interviews, planned interruption of treatment, and the training of psychoanalysts and of psychiatrists; not to mention a slightly hypomanic essay on psycho-analysis in Western culture. Significantly enough he nowhere meets the argument that, however much analytical ideas may be applied in short treatment, the result depends on unanalysed rapport; or, in other words, that the method is a refined form of suggestion rather than a selected form of psycho-analysis. In view of the recent spread of "general psychotherapy" in this country the book is one that should be read by both psychoanalysts and psychiatrists; although the latter will find some preliminary psycho-analytic orientation an advantage when following his technical argument. Even so they are not likely to relish his suggestion that all psychiatrists should undergo personal analysis.

EDWARD GLOVER.

FACT AND FICTION

The Century of the Surgeon. By Jürgen Thorwald. (Pp. 416+xii; illustrated. 25s.) London: Thames and Hudson Ltd. 1957.

Novelists, playwrights, and film-producers take liberties with the facts of history, but serious historians must never do this. Yet in unessential matter it is permissible even for the historian to introduce some fiction, always provided that the essential facts are accurate. In this book the story is related by an imaginary doctor who lived through the vital period of the birth of modern surgery. Born in 1826, he heard his father talk about the famous Ephraim McDowell; as a medical student he saw Horace Wells and Thomas Morton make the first attempts at anaesthesia, and later (money being no object) he travelled in Britain, France, Germany, Austria, and India. He had talks with Liston, Lister, Syme, Simpson, Henry Thompson, Cíviale, Péan, Mikulicz, Billroth, Maisonneuve, and Dieffenbach: he witnessed the sudden death of Dieffenbach in the operating theatre, and was himself operated on for stone in the bladder. He even went to Scutari and saw Florence Nightingale. His only child died from appendicitis and his young wife died of cancer of the stomach.

Judged simply as history the book is unbalanced; there are some inaccuracies of timing and wrong spelling of names, and emotion colours too many of the pages. However, it is an undoubted thriller, and is worth reading and keeping because the essential facts are scrupulously accurate, and the author has provided a remarkable series of 522 references so that the reader may follow up the narrative. There are certainly many interesting facts which will be looked for in vain in the ordinary histories of medicine.

ZACHARY COPE.

The sixth edition of Henderson's *Dictionary of Scientific Terms* (pp. 532+xvi; 32s.), prepared by J. H. Kenneth, gives the pronunciation, derivation, and definition of some 14,000 terms used in biology, botany, zoology, anatomy, cytology, genetics, embryology, and physiology. The dictionary, which first appeared in 1920, is published by Oliver and Boyd, Tweeddale Court, Edinburgh, 1.

The eighth edition of A. Lee McGregor's *Synopsis of Surgical Anatomy* (pp. 808+xii; John Wright and Sons, Ltd., Bristol, 1957; price 32s. 6d.) has been pruned by the omission of portions of the text which, though new when written, are now incorporated in current teaching. On the other hand, there are new sections on paragangliomas, adrenalectomy, and injuries to the large lymph ducts, while the sections on the surgery of the sympathetic have been rewritten and the whole work has been revised and brought up to date.

LIPOPROTEINS IN CORONARY ARTERY DISEASE

The circulating cholesterol and certain other lipids are transported in the plasma in combination with protein as macromolecular lipid-protein complexes. Cholesterol is attached mainly to the alpha and beta globulins, which can be separated by electrophoresis,¹ and these cholesterol-globulin complexes are called the alpha and beta lipoproteins. Various methods of analysis, in particular zone electrophoresis² and ultracentrifugation,³ have been employed for the study of these lipoproteins. Zone electrophoresis has confirmed the presence of two major lipoprotein fractions,⁴⁻⁷ and chemical analysis of these lipoproteins has been carried out⁸⁻⁹: in health 60-70% of the plasma cholesterol is attached to the beta lipoprotein and 30-40% to the alpha lipoprotein fraction. The ultracentrifuge causes large molecules, such as lipoproteins, to sink or float according to the density of the lipoprotein in relation to the medium. The density of the medium can be adjusted, and thus various groups of lipoproteins can be isolated and their concentration determined. In general, the lipoproteins of low density correspond to the beta lipoproteins and those of high density to the alpha lipoproteins.

There is much evidence that the circulating cholesterol is closely, but not necessarily causally, related to the development of coronary atheroma. Atheromatous plaques contain cholesterol, which can be derived from the plasma,¹⁰ and in most species the experimental production of atheroma is directly proportional to the duration and degree of hypercholesterolaemia. It has been established during the last

decade that the level of plasma cholesterol is raised in most patients with coronary artery disease, and this association has been the subject of several recent reviews.¹¹⁻¹³ The lipoprotein pattern in coronary artery disease has therefore been submitted to intensive study. There is now little doubt that in patients with coronary artery disease the concentration of the alpha lipoproteins is diminished, while the concentrations of the beta lipoproteins¹⁴⁻¹⁷ and of the low-density lipoproteins^{13, 18, 19} as determined by the ultracentrifuge are both increased. Indeed, J. W. Gofman and his colleagues²⁰ have worked out an "atherogenic index" whereby they claim to be able to assess the likelihood of the development of coronary artery disease in healthy people.

While studying the lipoproteins in various diseases W. G. Dangerfield and E. B. Smith,²¹ using paper electrophoresis and staining with Sudan black, observed a lipid-containing band in front of the beta lipoprotein band, a so-called pre-beta lipoprotein, in cases of nephrosis and diabetes and after coronary thrombosis. Recently this component has been studied in patients with coronary artery disease,^{22, 23} and in a group of 200 patients with unequivocal evidence of coronary artery disease E. M. M. Besterman²² observed a pre-beta band in 99%. There was reduction of the alpha lipoprotein band but no increase in the beta lipoprotein band in the coronary patients, and he suggested that previous observations of an increase in the concentration of beta lipoproteins may be due largely to an excess of this pre-beta lipoprotein. Unfortunately the control group for this study did not consist of healthy subjects of similar age and sex, and the pre-beta band was found in an unstated percentage of the controls, who were mostly patients with rheumatic and congenital heart disease. The lack of control of this investigation casts doubt on the claim that the presence of a pre-beta band provides a more specific measurement of atheroma than other lipoprotein analyses. The author did not differentiate between small, moderate, and large pre-beta bands, and therefore his claim is further weakened by the observations of E. B. Smith,²³ who

has now shown in a more carefully controlled study that the presence of a *moderate* pre-beta band does not differentiate patients who have developed clinical coronary disease from healthy individuals. However, with subjective visual assessment she found a *large* pre-beta band in 47% of patients with fresh myocardial infarction and 29% of patients with angina or an old myocardial infarct. This large pre-beta band apparently increases during the first three weeks after a myocardial infarction and decreases five or six weeks after the infarct. It is likely that this increase may help to explain the frequency with which Besterman observed a pre-beta band, since many of his patients were recovering from a myocardial infarct. Smith has shown that this band corresponds to the ultracentrifuge group of S_f 20-100 low-density lipoproteins, and it is a considerable advance that this group can now be identified by a comparatively simple electrophoretic procedure. High concentrations of the S_f 20-100 group had been observed in many patients with coronary artery disease,^{13 19 24} particularly in younger patients,¹³ and this might also have contributed to the high percentage of Besterman's patients in whom a pre-beta band was found. However, if this were so, it is surprising that Besterman's young coronary patients had normal cholesterol levels, since hypercholesterolaemia is more marked in young coronary patients than in older patients.^{13 25-27} For these various reasons Besterman's claim that a significant pre-beta lipoprotein is present in 99% of coronary patients should probably be disregarded until confirmed.

Since the circulating cholesterol is an integral part of the lipoproteins, the measurement of the latter is also a measure of the circulating cholesterol. An elaborate study²⁸ of healthy subjects has recently been completed in the United States in an attempt to answer the question, Has the measurement of the lipoproteins more or less to offer than a measurement of the plasma cholesterol as a means of determining which individuals have incipient coronary artery disease? Though there was some difference of opinion, it appears that the S_f 20-100 lipoprotein group and the plasma cholesterol were of equal and restricted clinical value in predicting the individuals who developed coronary artery disease during the period of observation. Ultracentrifugal analysis of the S_f 20-100 lipoproteins and assessment of the related "atherogenic index" had no obvious advantage over the simpler measurement of the circulating cholesterol. This study also showed that the levels of cholesterol and of S_f 20-100 lipoproteins were previously raised in a significant number of apparently healthy individuals who subsequently developed

coronary artery disease, and this finding is consistent with the high incidence of coronary artery disease in hypercholesterolaemic subjects.^{25 29}

It is probably true to say, therefore, that the simple measurement of the circulating cholesterol has almost as much value in coronary artery disease as the more elaborate determination of the alpha-beta lipoprotein ratio and the ultracentrifuge pattern. By correlating the ultracentrifuge pattern with the pre-beta band Smith's investigations have taken lipoprotein studies a stage further forward, but, although lipoprotein measurements are important to research, it seems unlikely that their measurement will have much value as routine clinical investigations.

EVOLUTION OF THE TUBERCULOSIS DISPENSARY

The centenary of the birth of Sir Robert Philip provides an opportunity of surveying progress in the fight against tuberculosis, and Dr. Christopher Clayson, in the memorial lecture he gave in Edinburgh earlier this month and which we publish in the opening pages of this issue, ably responded to the challenge of the occasion. Sir Robert Philip was the creator of the first effective schemes to control tuberculosis as an infectious disease, and he saw with remarkable prescience how medical progress—in chemotherapy, for instance—would within quite a short period of time make the control of tuberculosis a practical possibility. Philip's great qualities as a sagacious statesman and as a leader in social medicine are well brought out in the reminiscences of some of his friends and pupils which the National Association for the Prevention of Tuberculosis has brought together in a small book¹ as a centenary tribute. As Mr. Walter Elliot² pointed out when he unveiled a memorial plaque last July at the site of the first tuberculosis dispensary, founded 70 years ago, Philip had the great pioneer quality, a grasp of the obvious. Philip himself related how, when he returned to Edinburgh in 1883 after his studies in Vienna, he announced his intention of devoting himself to tuberculosis and was told by a professor in the medical faculty not to think of such a thing because the subject was exhausted.³ The practical implications of the discovery of the tubercle bacillus in the previous year, which seem so obvious to us now, were obvious then only to the exceptional man who had this pioneer quality. Philip proceeded, in face of all the difficulties

⁴ Brit. med. J., 1904, 1, 1357.

which beset pioneers, to establish an organization designed to control tuberculosis by treating it as an infectious disease, a concept which, even after the announcement of Koch's discovery, was slow in gaining general acceptance. The functions of Philip's tuberculosis dispensary included examination of patients at the dispensary and the keeping of records, including those of the home surroundings; instruction of patients, especially in ways of minimizing the risk of infection to others; the treatment of patients in their own homes, and the selection of those likely to respond to sanatorium treatment and those needing hospital treatment; and general education of patients, their friends, and relatives. It is interesting to find Philip discussing, in 1904, the home treatment of pulmonary tuberculosis,⁴ and to reflect how the urgent needs which developed during a major world war forty years later led to a revival of interest in this matter, though the vogue for polysyllabic pretentiousness had debased his simple word "home" into "domiciliary."

The basis of Philip's concept was to treat tuberculosis as a unitary problem. Recent developments in what are now called "the chest services" have militated both for and against the application of this concept. On the one hand, the tendency for the clinic physician to have control of beds, in either a hospital or sanatorium where he remains responsible for the treatment of patients from his clinic, is favourable to this concept. On the other hand, the tendency, of which the change of title from "tuberculosis dispensary" to "chest clinic" is a sign, towards the widening of the interests of the clinic physician to fields outside tuberculosis, while in many respects admirable, may well in the long run make it difficult to maintain the unity of treatment and prevention in tuberculosis. A situation may well arise at some time in the future in which the present organization becomes unworkable. Even after tuberculosis has become a rare disease, an integrated scheme for its prevention will still be required. If the existing organization remains unchanged, a physician who will deal clinically with a wide range of respiratory diseases, including only very few cases of tuberculosis, nevertheless will retain responsibility for a complex scheme of preventive measures. At this stage the question whether a physician whose main interests are clinical can be expected to be responsible for preventive measures directed towards a disease which he rarely sees will have to be faced. Although the principles underlying methods of control of tuberculosis remain unchanged, the organization which was efficient in applying them in Philip's day may well require modification as the epidemic situation alters.

As Dr. Clayson points out, we may be said at present to have controlled tuberculosis, but the eradication of tuberculosis is going to be much more difficult. The proper application of B.C.G. vaccination as the epidemiological situation changes, the use of chemoprophylaxis for those found by tuberculin testing to have been recently infected, thorough case-finding by all methods, especially by mass radiography, the routine radiography both of those whose occupation or environment places them at special risk and of those in whom, by virtue of their occupation, unsuspected tuberculous infection would be a special risk to others—all these have their part to play, and all of them were adumbrated, at least in principle, by Sir Robert Philip.

PROTECTION AGAINST IONIZING RADIATIONS

The need to protect hospital workers from the harmful effects of radiations has become more pressing with the growing use of radioactive substances in medicine. The problem is not a new one: recommendations for the protection of people using radium and radon were put forward by the National Radium Commission in 1929-30. In 1949 this advice was extended to include artificially produced radioactive isotopes, and further recommendations¹ for the maximum permissible amounts of many of these substances in the body were made in 1955. The surge of interest in the effects of atomic radiation has recently culminated in the formulation by the Radioactive Substances Standing Advisory Committee of a "Code of Practice for the Protection of Persons Exposed to Ionizing Radiations."² According to the preface the code is intended primarily for those who work in National Health Service hospitals. It is to be brought to the attention of the staffs of radiological, radiotherapy, and physics departments, and all employees concerned must read the relevant sections and sign a statement that they have understood them. The booklet consists of two sections, one on the more familiar problem of protection against x rays, whether used for diagnosis or therapy, the other on radioactive isotopes. The technical facts necessary for the interpretation of the various rules set out in the code are given in its supplement. All who work with radiation will do well to note the extension of the definition of "tolerance dose" (maximum 0.3 röntgen/week) to include a cumulative dose of 50 rem per decade: this allows an average dose of only 0.1 r/week. The amount of radiation received "should be systematically checked to ensure that maximum permissible doses . . . are not exceeded." Responsibility for this will be taken by the hospital physicists working in the major hospitals or by the Radiological Protection Service at Clifton Avenue, Belmont, Sutton, Surrey.

¹ "Recommendations of the International Commission on Radiological Protection," *Brit. J. Radiol.*, 1955, Supplement No. 6.

² Published by H.M.S.O., London. Price 8s. net.

No radiation worker can fail to benefit from a careful study of this code, which contains far more than a set of rules and should do much to ensure the safety of hospital staff exposed to radiation. For example, it gives useful information for assessing how much of a given radioisotope may be dangerous and for designing laboratories in which radioisotopes are to be handled. It also contains practical hints and tips such as a cleaning procedure for decontamination of the skin. It is perhaps a little disappointing to find that rules for the disposal of radioactive waste are not given; however, these are under consideration and will be issued shortly as an addition to the code. Expert advice will certainly be needed to put the code into practice in individual hospitals. The head of the department is, quite rightly, to be made responsible for working conditions and for the instruction of new personnel, but the code also designates a safety officer who is to be "specifically responsible for radiological protection measures." It would seem desirable to employ the services of the hospital physicist of the group or region for this duty; such an officer would be able to ensure, by means of periodic visits, that the spirit of the code was being applied in all the hospitals of the group. Many of the usual methods of protection are effective only if applied by the people concerned at all times: even in the larger centres it is no uncommon sight to see the most elementary mistakes being made, such as the pipetting of radioactive solutions by mouth. It is the responsibility of the head of the department and the safety officer to see that these things do not happen.

The radioisotope laboratory that a hospital requires will largely depend on the type and size of the hospital, but the code lays down a few general rules in terms of the quantity and radiotoxicity of the isotopes and the manipulations which are to be carried out with them. Where only very simple manipulations are made with solutions containing quantities of less than a millicurie of the more common isotopes, such as ^{131}I , ^{32}P , ^{59}Fe , ^{24}Na , and ^{51}Cr , a simple laboratory (grade C) will suffice. On the other hand, for those hospitals where ^{131}I , ^{32}P , and ^{198}Au are used for therapy, a rather more elaborate laboratory (grade B) is needed. However, even those facilities which are regarded as necessary for grade C laboratories often do not exist at the moment; and if they do exist they are often not used. In these laboratories only simple precautions are needed, such as the provision of benches with disposable covers, a good fume-hood, plenty of laboratory tongs and trays, and some lead to provide γ -ray shielding. It seems likely that the smaller hospitals would be well served with one isotope laboratory of the B or C type, while the larger ones might need a central grade B laboratory as a "hot lab.," which it would be sensible to site in a separate part of the hospital premises, and a series of grade C laboratories in those departments where tracer doses were being used. For the protection of those working in these laboratories the level of radioactivity is limited, and this ensures that the counting background will not be high. A simple instrument for detecting radioactive contamination in laboratories would be a valuable safeguard.

PSYCHOPATHS

One feature of the report of the Royal Commission on mental illness¹ which has stirred controversy is the use of the term "psychopathic." The Commission proposed to recognize three main groups of patients: (a) those suffering from mental illness, (b) "psychopathic patients or patients with psychopathic personality," and (c) "those of severely subnormal personality," which would include mainly idiots and imbeciles. Group (b) was to include any type of aggressive and inadequate personality not falling in either of the two other groups and requiring care and treatment. All patients at present classified as feeble-minded or moral defectives would also fall into this division. There is general agreement about the need for a category such as this, which would also comprise alcoholics and other addicts in need of care and treatment, but the proposed terminology has caused uneasiness, which has been ventilated in the correspondence columns of this *Journal*. Members attending a recent quarterly meeting of the Royal Medico-Psychological Association, while in principle welcoming the proposed grouping, were unanimous in objecting to a diagnostic term being adopted and newly adapted for legal and administrative purposes, especially one so controversial as "psychopath" or "psychopathic."

It was J. L. A. Koch² who in 1891 introduced the term in a book on what he called the psychopathic inferiorities. "Psychopathic" came to mean any kind of abnormal personality type which was not the manifestation of psychosis or mental defect. In one of the best-known monographs on the subject³ psychopaths are defined as "those abnormal personalities who suffer from their abnormalities or cause society to suffer." This definition embraces the neurotic as well. While many psychiatrists regard psychopathic personality traits as manifestations of a variation within the normal range, Sir David Henderson⁴ has regarded it as a true illness of obscure origin and spoken of psychopathic states which he proposed to divide into predominantly aggressive, inadequate, and creative types. So great has been the terminological confusion that some modern classifications of mental disorders avoid the term altogether and replace it by the more general one of "abnormal personality," of which they distinguish a considerable variety. Yet the term "psychopathic" is so well established and so handy grammatically that repeated proposals for its abolition have been disregarded. The *British Journal of Delinquency*⁵ published a special number devoted to the problem of the psychopathic offender, without, however, offering a precise definition of psychopathy.

There has been a tendency in the British and American literature to narrow the meaning of the term, with the result that it has become almost identical with "moral insanity." The most recent American monograph⁶ on the subject describes the psychopath as an "asocial,

¹ Cmd. 169, 1957. H.M.S.O., London.

⁴ Henderson, Sir David, *Psychopathic States*, 1939, London.
⁵ *Brit. J. Delinq.*, 1951, 2, 77.
⁶ McCord, W. and J., *Psychopathy and Delinquency*, 1956, New York and London.

aggressive, highly impulsive person, who feels little or no guilt and is unable to form lasting bonds of affection with other human beings." This definition has the approval of G. W. Allport, the author of a classical book on personality. Whatever one may think about this use of the term, it is a fact that the general public, the members of the legal profession, and most medical men regard psychopaths as antisocial, usually aggressive members of the community and as potential criminals. Many psychiatrists and psychologists use the term as a diagnosis. But to give, by law, this label to a large group of citizens in need of treatment, most of whom have never been and never will be in conflict with the criminal law, would cause much misunderstanding and distress. Besides, through the arbitrary stipulation of an official meaning of this controversial term, British psychiatrists would be at a considerable disadvantage in communicating with their colleagues abroad, who would not thus be restricted in the use of this term. It should be possible to devise a better one for that particular group of patients. Diagnosis by legislation would be as undesirable as legislation by diagnosis.

BOTULISM

Botulism has always aroused an interest out of all proportion to its frequency as a cause of food-poisoning. Every medical student probably knows that botulism is the model example of the action of an exotoxin which can cause death even if the organisms which produced it are no longer alive, and that the dose necessary to cause death is minute. A recent outbreak of botulism among Labrador Eskimos¹ illustrates the characteristic features of this deadly intoxication. A party consisting of six men, two women, and some children moved to an autumn sealing station, a hut which had not been used for some months. The women were asked to prepare an Eskimo dish called *utjak*—made by "placing seal flippers, complete with fur, in a container, and leaving this with a lid on it behind the stove for a variable period of several hours to several days." The temperature of the food during this period probably varied between 20 and 40° C. (75–120° F.). On this particular occasion there was considerable reluctance on the part of the women to prepare the meal at all. When it was finally prepared and eaten about noon on December 10, 1956, it did not seem to be very appetizing even to Eskimo taste. One man "thought it tasted bad, and vomited almost at once. He was the only man to survive." The first victim was a girl aged 6, who died within two to three hours, then at intervals from four hours up to three days five men died. The two women who prepared the meal under protest ate none of it and were unaffected. One other survivor was a girl of 8, who recovered in a few days. The main clinical features of the illness were difficulty in swallowing, regurgitation of fluids through the mouth, abdominal pain and distension and in some cases peculiarity of speech, various forms of paralysis, headache, and cramps. *Clostridium botulinum* type E was isolated from a sample of seal

flipper from the food consumed, and type E toxin was found in the flipper in a concentration of about 1,000 minimum lethal doses per gramme of flipper.

This grim story illustrates well the clinical features of the disease. Its epidemiological importance is discussed by K. F. Meyer² in a review of botulism as a world health problem. He states that "throughout the world during the past 50 years approximately 5,635 persons contracted botulism and 1,714 of these persons died." Meyer discusses successively the incidence of human and animal botulism throughout the world, the distribution of *Cl. botulinum* in nature, and the foods and types of *Cl. botulinum* associated with human botulism. It is interesting to learn that, even with such a serious condition as botulism, in about 10% of recorded episodes in the U.S.A. the causative food was not determined and that bacteriological proof was furnished in only about a third of clinically recognized episodes. The risk of botulism exists wherever there are large numbers of type A, B, or E spores of *Cl. botulinum* in the soil, and Meyer suggests that surveys are especially needed of the extent to which these occur in the soils of Asia and Africa. It is estimated that in the Union of South Africa alone 100,000 cattle die of botulism every year. Animals reared on phosphorus-deficient veldt apparently crave the bones of carrion, which may be highly toxic from contamination with *Cl. botulinum*. So far as the human disease is concerned, the danger arises always from carelessness in the preparation and preservation of vegetable and animal foods. Many outbreaks have followed home canning of vegetables, and it is essential that all forms of food processing should be carefully controlled. Only in this way is it possible to eliminate completely the risk of botulism.

SICKLE CELLS AND SALMONELLAE

A curious association between sickle-cell anaemia and salmonella infection has now been reported in a number of cases. F. J. Hodges and J. F. Holt¹ mentioned having seen five cases of *Salmonella paratyphi B* osteomyelitis in patients with sickle-cell anaemia. L. W. Diggs and colleagues² who in 1937 had been the first to state that patients with sickle-cell anaemia were particularly susceptible to bone infections, included in their series one patient with suppurative arthritis caused by that organism. Earlier in 1925 G. L. Carrington and W. C. Davison³ described salmonella osteitis in a Negro child, but a test for sickling was not performed. J. Vandepitte and his colleagues⁴ published in 1953 a series of five cases of salmonella osteitis in patients with sickle-cell anaemia observed in the Belgian Congo. They were not aware at the time of the reference to this association made by Hodges and Holt, but they collected five more isolated reports from the American literature, and one by B. Ehrenpreis and H. N. Schwinger,⁵ who, in an article on the radiological changes in sickle-cell disease, had mentioned two observations of infection of the bones by salmonella. There was also one description of an infection of the tibia with *Salmonella enteritidis* in an Arab child suffering from a long-standing haemolytic anaemia, but no examination for sickling had been

¹ Brocklehurst, J. C., *Brit. med. J.*, 1957, 2, 924.
² Meyer, K. F., *Bull. Wild Hlth Org.*, 1956, 15, 281.

made.⁶ Not all the observations are restricted to infections of the bones. J. and C. Lambotte-Legrans suggested in 1951⁷ that carriers of the sickle-cell trait as a whole (not only patients with sickle-cell anaemia) seemed to have a higher incidence of salmonella infections than non-sicklers, and A. I. Chernoff and A. M. Josephson⁸ described an aplastic crisis in a 6-months-old child with sickle-cell anaemia which had been precipitated by an infection with *Salmonella cholerae suis* without osteomyelitis. However, in ten further cases of sickle-cell anaemia complicated by salmonella infections only one showed no involvement of the bones. These include two single cases^{9, 10} and two series of four patients each.^{11, 12} Infections of the bone by salmonella are rare. Of a total of 2,000 salmonella cultures sent for identification to the New York Salmonella Center only three had been isolated from bone lesions.¹³ Of 233 salmonella cultures isolated in the Belgian Congo five only came from bone infections,¹⁴ and all these were associated with sickle-cell anaemia.⁴ It seems therefore established that there is a highly significant association between salmonella osteitis and sickling. No clear distinction is drawn in all instances between sickle-cell anaemia and sickle-cell disease in general. Indeed, if the observations of the Lambotte-Legrans⁷ and A. B. Raper¹⁵ can be extended, it might turn out that carriers of the sickle-cell trait are also more liable to suffer from salmonella infections than non-sicklers, a situation which would have important consequences for our conceptions of the population dynamics of sickling.

Hodges and Holt¹ suggested that capillary thromboses in the gastro-intestinal tract might lower the resistance of patients with sickle-cell anaemia to invasion of the body by intestinal organisms, and E. W. Hook and his colleagues¹² point out that the general debility and disease of the spleen associated with sickle-cell anaemia might well interfere with the general defence mechanisms after the body had been invaded by the salmonella. Once the organism had entered the blood stream it would find favourable conditions in areas of ischaemia and necrosis which result from the blockage of small vessels by sickled cells. The recognition of salmonella infection of the bones can be difficult in sickle-cell anaemia. Fever, pain, and swelling of the limbs and joints are found in both diseases. On x-ray examination the bone infarction of sickle-cell anaemia and of osteomyelitis look very much alike. Even if the diagnosis of osteomyelitis is made it will be difficult to decide whether the infection is not streptococcal or staphylococcal. Hook

and colleagues¹² emphasize the need for aspiration of the infected bone if the diagnosis is in doubt.

The most effective treatment of salmonella osteitis is chloramphenicol and surgical drainage. However the results are not dramatic. Holt and his colleagues found in one patient drug-sensitive organisms to persist in the tissues for months, and in another a recurrence of the osteomyelitis two years after the apparent healing of a previous infection.

DEATHS FROM CIRRHOSIS OF THE LIVER

According to statistics prepared by the Metropolitan Life Insurance Company of New York, cirrhosis of the liver is now one of the ten leading causes of death in the United States.¹ In fact, in late middle age there are only three diseases with a higher mortality—namely, heart disease, cancer, and cerebral haemorrhage. There has apparently been a steady rise in the number of deaths from cirrhosis since the nineteen-thirties, and the national rate for the United States now averages 10 per 100,000 population. Part of the increase is undoubtedly related to the falling death rate from infectious diseases, and improved methods of diagnosis may be a further contributory factor, but it seems justifiable to assume that there has been a real increase in the number of cases of cirrhosis. If this is so, then it is a disturbing fact, since the causes of portal (Laennec's) cirrhosis, the only common variety, remain as obscure to-day as they have always been.

Alcohol and infective hepatitis are at present the only two unequivocal aetiological factors, but there is no evidence that either is responsible for the current trend. The facts are against such a view. There has been no sharp rise in mortality rate in the post-war years, such as might have been expected as an aftermath of the great wartime epidemics of hepatitis. Moreover, the mortality rate in England and Wales, where infective hepatitis is a much commoner cause of cirrhosis than alcohol, has remained constant at 2.6 per 100,000 population since 1952.² Over a quarter of the deaths from cirrhosis in the United States in 1956 were attributed to alcohol, a figure which should be compared with the results of the survey by O. D. Ratnoff and A. J. Patek,³ in which alcoholism accounted for more than 50% of the cases. The discrepancy between these two findings is almost certainly due to incomplete reporting on death certificates rather than to any true decrease in the incidence of alcoholism as a causal factor.

Two features emerge from all investigations into the incidence of portal cirrhosis in temperate climates. The first is the marked difference in the importance of alcohol and infective hepatitis as aetiological agents in different countries,⁴ and the second is the fact that no antecedent cause is demonstrable in something like 40% of all patients with portal cirrhosis. There is surely a need for further epidemiological studies of this serious and by no means uncommon disease.

CARE OF THE DYING*

BY

IAN GRANT, M.B., Ch.B.

General Practitioner, Glasgow

After more than 30 years in general practice it still amazes me to see how few patients are aware that they are dying, and, of the few who are so aware, how little they fear the approach of death. William Hunter, shortly before his death, rose from his sick-bed to deliver a lecture on the "operations of surgery." By the end of the lecture his strength was so exhausted that he fainted away, and after he recovered consciousness he whispered to a friend, "If I had strength to hold a pen, I would write how easy and pleasant a thing it is to die." The great Sir William Osler on his deathbed said, "I have been too far across the river to go back and have it all over again."

Role of the G.P.

When care is no longer possible it is the duty of the practitioner to bring contentment and comfort to his patients and to try to lighten the burden of their afflictions. But, in my view, this does not mean necessarily that he should seek merely to prolong life. There are times when I have less and less sympathy with the superhuman efforts merely to extend life in old age. The complete curtailment of the activities, skilled nursing, and the assiduous care of the doctor are apt, all too frequently, to carry the aged patient tottering past the danger point and then leave him a helpless wreck of humanity.

There are, of course, special cases. I can recall a very wealthy man who had gifted most of his fortune to his family and who for the last six months of his life was gravely ill with congestive heart failure. If he died before a certain date very large sums were payable in death duties. Despite his great discomfort, I never knew a man who clung so tenaciously to life helped by the most skilled and tender nursing and assisted with all the advantages of modern pharmacy, but once the appointed date was attained he quickly gave up the struggle, and a few days later peacefully and contentedly passed into the unknown.

The philosophy of R. L. Stevenson merits much consideration. "We do not, properly speaking, love life but rather living," and again, "Does not life go down with better grace foaming in full body over a precipice than miserably struggling to an end in sandy deltas?" It is our duty to preserve not only health and life but also the joy of living, and often as a G.P. when dealing with cases of complete senility, when both mind and body have long since served their day and generation, one wonders whether one should really "strive officiously to keep alive" by the use of anti-biotics, blood transfusions, and intravenous injections of varying potency or whether we should not let nature take its course and let the weary pass quickly into eternal rest.

Need for More Hospital Accommodation

The phrase death agony is, I think, ill chosen. In the ordinary way death comes peacefully or, if not, can easily be made so by sedative and analgesic drugs. Relatives should not try to call back into activity a mind that is fitfully wandering, and, above all, there should always be present a good nurse—not necessarily a trained nurse—able and willing to give every help and comfort to the patient. More hospital accommodation should be available for the moribund. It is wrong that so many old people die in crowded and squalid surroundings often with young children crying or playing in the death chamber. It is bad for the children, who are often at a very impressionable age, and it

*Read at a Plenary Session at the Annual Meeting of the British Medical Association, Newcastle upon Tyne, 1957.

adds to the difficulties of the patient; and yet, in our overcrowded slum areas, how often are old people nursed in a crowded family living-room. Nowadays, in this welfare State, we do so much for youth. Should it not be a first priority to provide adequate hospital and nursing care for those who have served their country well and whose life is now drawing to a close? We have, to a large extent, provided adequate accommodation for births; surely it is not unreasonable to ask that the very ill and the aged should be permitted to die undisturbed by the everyday battle of family chores.

For those overtaken by grave injury, either by accident or in battle, the first need should be to ease pain, and for that purpose I advocate using morphine freely. If those sufferers must die, surely we should make their last hours as tranquil and pain-free as possible. Someone should always be at their side to take note of any message and to render them any little service. If at all possible we should never leave a gravely ill person to die alone. A return to consciousness and lucidity for a few minutes may sometimes occur, and to add loneliness to the tragedy of dying is an unkindness we should always avoid.

In general practice we find that senile patients linger on for many months, and it is impossible to forecast, even approximately, the time they may survive. Although their faculties are almost completely gone, careful nursing is essential. If possible, they should get out of bed for a little each day. Their joints must not be allowed to stiffen. So often there is a tendency for knees, hips, wrists, and elbows to become flexed and fixed, which adds greatly to the difficulties of nursing. Regular sponging and cleanliness; the watchful care of the skin to prevent bedsores, more particularly in the incontinent; small meals three to four times daily and restriction of evening fluids; and attention to bowels and bladder are all "musts" in the care of the dying. These senile patients seldom suffer pain and in their own way seem contented. Death when it comes to them is often sudden. Relatives can seldom be forewarned. The machine just runs down and they go to sleep. They seldom need drugs. For them patience and kindness in their nurse is often all that is necessary.

Telling the Patient

In malignant disease the G.P. is often called upon to treat the inoperable case or the case where operation has failed to effect a cure. The decision on what to tell the patient invariably devolves upon the G.P., and the decision is his personal responsibility. Many patients are of such character that the doctor, if he is specifically asked, will have no great difficulty in deciding to disclose the truth, but there are many other patients, and also patients' relatives, to whom the doctor finds it very difficult to decide what he should tell. The doctor must gauge, and correctly gauge, the temperament of the patient. He must do his best to alleviate both the fears and the discomforts of the sick man, but it is unfair that he should bear this burden alone. Some relative should be told, and must accept his or her share of the burden. The doctor should never rush in with bad news to a patient, but circumstances may compel a limit to medical prevarication. Financial adjustments may be necessary—a will perhaps may require to be made, relatives from a distance may require to be summoned. Great tact must be exercised, and never should a case be pronounced completely hopeless—serious, yes, but extraordinary recoveries are on record, and it is only the foolish who are completely dogmatic.

I often think that, with experience, one gets the feel of patients and whether they want to know the full facts or not. With Pilate, we may oft-times ask, "What is truth?", and so often, at best, we can tell only part of it, for we do not know the whole.

Use of Drugs

In the treatment of malignant cases it is well to withhold morphine as long as possible, for the patient so very quickly develops tolerance to the drug, and in a few months doses

must be increased to an amount far exceeding the pharmacopoeial dose.

The different curative and euphoric effects of morphine are sometimes astonishing. Frequently I have given a fairly large dose of morphine to a patient, and on returning next day found him physically much better and mentally much more tranquil and peaceful. A colleague had two patients with very important business interests which required, if possible, the continued presence of these men on the directorate. Both had malignant secondaries, but were able to remain at business for several months, although latterly they were each taking 14 gr. (0.9 g.) of morphine daily and remained at work.

Methadone, dihydrocodeine, codeine, and the barbiturates all have their uses in the less painful stages, but when the misery of the patient becomes desperate, as in advanced cancer of the tongue or secondaries in the bones, then indeed we should not spare the Waters of Lethe, and I am convinced that our first duty is to relieve pain and to induce merciful oblivion.

In the care of those dying from congestive heart failure, nursing plays a very important part. When the patient becomes waterlogged and restless, no position is comfortable for long and some little postural adjustment may be necessary every hour. An adjustable chair is a great boon, and sometimes these patients sleep more comfortably in a chair than in bed. Mersalyl and its synonyms are of much value, and aspiration of an ascites gives temporary relief, but this line of treatment should be delayed as long as possible. The abdomen again quickly fills up, and so often patients are disappointed and depressed at the recurrence of the fluid. The operation, although comparatively simple, becomes, after several aspirations, a major ordeal, and it is then again that I wonder whether we should strive officiously to keep alive. A similar problem faces us with uraemia. Should we persist with drugs which can give only temporary relief?

In a different category is tuberculosis, which only a decade ago took heavy toll often of the most able and intelligent of our population. Thanks to modern surgery and chemotherapy, the ravages of pulmonary tuberculosis have been checked and few tuberculous patients now can be classified as "the dying."

In general practice we must include the chronic rheumatoids and those with cerebral thrombosis and cerebral haemorrhage in the category of dying, although their span of life can never be told with any degree of accuracy. They become wholly dependent on their relatives. Their mental acumen deteriorates; they eat, they sleep, their bodily functions continue, but they are a constant problem to their relatives. They require endless nursing care and attention and so often they become incontinent and appear incapable of appreciating either instruction or encouragement.

A sedative at night is helpful, but it is wrong to prescribe morphine for these patients. There is little that we, as doctors, can do beyond keeping up the morale of the relatives even more than that of the patients. But for these cases, which cause an almost unbearable strain on conscientious relatives, there should be found in our N.H.S. some type of hospitalization.

Geriatric and Other Problems

Many lonely old people still die from malnutrition and some of its associated diseases such as the anaemias and scurvy. Admittedly, they are a geriatric problem and hospitalization in some form or other is the only answer. They get into a lethargic state both mentally and physically and become too weary to care for themselves. As practitioners, we can help by frequent visits to these old people, by arranging for meals on wheels, nursing care, and the provision of a home help, but all these facilities are still inadequately supplied, and the public conscience needs awakening to the requirements of those who have served their country faithfully and well during their working years.

So often as G.P.s our problem is a dual one—to care for the dying and to care for their relatives. How often do we see devoted mothers and dutiful daughters sacrificing their health and strength in attendance on a loved one. To them we must give what help and advice we can. No one should be allowed to remain on nursing duty night and day, and during the off-duty period the relative must have an occasional change of environment. There is nothing callous or heartless in a daughter going to a cinema or dance even though a parent is gravely ill with a chronic disease. The morale of relatives must be maintained, and for that purpose some of the tranquillizers are of value both for patients and for relatives.

Let us visit our dying patient as often as we can find time, but we should never discuss a patient's progress with relatives when in the sick-room. So often a patient may appear to be unconscious, but he or she may overhear an expression of opinion which, to one who is gravely ill, may cause added distress and anxiety. Let us remember that although we may be able to do little for the patient our visit is of inestimable help to anxious relatives and we can thereby make their duties a little less burdensome.

We, as general practitioners, must remember when associating with the sick that they require kindness most of all, and that they first and foremost wish and hope to find a comprehending and sympathetic friend in their physician.

WHEN IS A DOCTOR NEGLIGENT?

B.M.A. LECTURE BY MISS ROSE HEILBRON

MISS ROSE HEILBRON, LL.M., Q.C., Recorder of Burnley, delivered the annual B.M.A. lecture to the St. Pancras Division on December 11. She took as her subject "The Legal Responsibilities of Doctors."

Between the years 1948 and 1953 the total sum awarded against medical practitioners for professional negligence increased to a very alarming degree, said Miss Heilbron. Since 1953, however, the number of cases against doctors had decreased, and it was now less easy to recover damages; there had been a number of recent decisions embodying clearly expressed judicial opinion that a doctor should not be held liable for negligence merely because a mishap occurred. Nevertheless, the number of cases brought against doctors was still formidable, and it was therefore not surprising that the profession as a whole was now very conscious of its legal responsibilities and was anxious to know more about them.

Three Reasons for Increased Litigation

Three factors had contributed to the present state of affairs. The first was the introduction of the Health Service, the second the changes in the law relating to the liabilities of hospitals for the negligence of their staff, and the third the introduction of legal aid. All these changes occurred between 1946 and 1951.

It was clear that the attitude of the public towards hospitals and doctors had altered since the introduction of the Health Service. Before 1946, when hospitals were voluntary, far fewer medical actions were brought. Then there were the changes in the law itself. The law had developed so that, although for long it had been held that hospitals were not liable for the negligence of their doctors and nurses provided reasonable care had been taken in their selection, it was now clear that hospitals incurred not only a personal liability for acts of negligence causing damage—for instance, damage due to a negligent system adopted and maintained by them—but also a vicarious liability for the negligent acts of any member of their professional staff. This might even include the acts of a part-time visiting consultant, although that liability had not yet been clearly decided. This development could be traced mainly to decisions in three cases; and, although the alterations had occurred in a very short space

of time, the law had been moving in that direction since 1909, when there was a leading case on the subject.

The introduction of the legal aid scheme had clearly had a marked effect on the number of actions. Litigation was expensive, but actions against doctors where medical experts might have to be called on both sides, and where the cases might be lengthy, were certainly beyond the purse of the average plaintiff. Now, however, the legal aid scheme would underwrite a proper case, and in the result cases which could never have been brought before the Legal Aid Act of 1949 had been enabled to see the light of day. There had, of course, inevitably been some abuse; but it must not be overlooked that plaintiffs had been able, as a result of the scheme, to satisfy the courts of genuine acts of negligence resulting in very real damage.

Professional Negligence

The alterations in the law to which she had referred, continued Miss Heilbron, did not mean that the conception of negligence had changed. Negligence, as a civil wrong, remained the same, and the members of any profession were liable to be sued, with one notable exception—namely, members of the Bar. On the other hand, members of the Bar were not allowed to sue for their fees. Negligence had been defined as the omission to do something which a reasonable man guided by those considerations which ordinarily regulate the conduct of human affairs would do, or doing something which a prudent and reasonable man would not do. The question of negligence arose only in circumstances where there was imposed by the law a duty to take care. Certain persons in law owed a duty to certain other persons, and a doctor was one; for, once he undertook the responsibility of treating a patient, he assumed the duty of care.

The standard by which medical men were judged was neither inordinately high nor especially low. It was that of the ordinarily careful and competent practitioner. Where a man held himself out to the public as possessing the knowledge and skill of a doctor, he must attain the standard set by the courts, which was that of a reasonably skilful and careful member of his own profession. Consultants, of course, would be under a higher duty than a general practitioner, but the standard was still a reasonable one—namely, that of a reasonably skilful and careful consultant.

In the main, the medical practitioner was covered if he acted in accordance with approved practice. He was, moreover, entitled to act in accordance with the practice approved over, entitled to act in accordance with the practice approved at the date of his treatment, even though this might not accord with what was approved at a later date. However, there was the qualification that in a profession such as medicine, where there were so many modern developments and new techniques, practitioners must keep their knowledge up to date as possible. It might well be necessary for the doctor to be aware of newly recognized risks in old procedures. If he failed to know them he would be held to have been negligent—if a reasonably careful doctor would have known, but not otherwise. A doctor might be liable if he did something which experience before he did it had shown to be dangerous. For example, if owing to frequent accidents a certain anaesthetic were widely known to be dangerous and a practitioner used it, then he might be liable. On the other hand, he would not be liable if damage could have been averted only after reading one particular article in a medical journal.

A doctor was entitled to adopt his own method of treatment even if it did not meet with universal medical approval, so long as it was a mode of treatment approved by a substantial proportion of his colleagues and was carried out with care and skill.

Mistaken Diagnosis

How was it possible, asked Miss Heilbron, particularly in view of the divergence of judicial opinion which did occur,

to know which of the mishaps which could and did happen in practice would be held to be negligent and which would not?

Sometimes, for instance, a mistake in diagnosis or treatment was made and the consequences were serious. Medicine was not an exact science and no doctor's judgment was infallible. Many symptoms could be masked or misinterpreted, and despite every care in treatment an unforeseen complication might occur causing the patient's last condition to be worse than his first. The patient understandably might wrongly attribute his changed condition to the doctor and blame him for it, "but let me assure you," continued Miss Heilbron, "no court will lightly and without good evidence make a finding of negligence against a doctor. Such a finding is an irreparable blow to a doctor's reputation; therefore, the rule of law which makes it necessary for a plaintiff to prove his case is a salutary one, and goes a long way towards protecting doctors against unjustifiable findings against them." Of course that factor did not necessarily deter patients from bringing actions even though they might not win them.

A mistake in diagnosis was not necessarily negligent, but a wrong diagnosis was a frequent basis for action if the mistake resulted in the wrong treatment being given or a failure to follow the correct treatment, with resultant damage. Wrong diagnosis had been held to be negligent where, for instance, the missed signs and symptoms were such that no reasonably skilful and careful doctor would fail to recognize them. In that connexion, Miss Heilbron stressed that a doctor ought always to try to appreciate when a case was beyond his powers, and in cases of doubt to take an x-ray picture.

Another aspect of negligence was to be seen in those cases where it was considered necessary to delegate some part of the treatment to the patient—for example, the administration of insulin or certain electrical treatment. In such cases failure to give clear and unambiguous instructions might constitute negligence. The warning given, if any were necessary, must be abundantly clear, and the person giving it must make sure that the patient understood the possible risk. It behoved the doctor to take into account the intelligence of the patient and to explain in clear and simple terms what the danger might be. Doctors, like lawyers, tended to use language which the average person might find somewhat incomprehensible.

Other Aspects of Negligence

Giving injections was another source of frequent litigation against doctors. It was clear that accidents could happen and that they might not necessarily be due to negligence; but to make an injection into an artery instead of a vein or to use the wrong solution or an excessive amount had all been held to amount to negligence, although, of course, each case must necessarily depend upon its own facts and no general rule could be laid down.

With anaesthetics, if adverse effects were due solely to the personal idiosyncrasy of the patient, the doctor was not liable, of course. But if the wrong drug were administered, then there was likely to be a finding of negligence against the hospital, the doctor, or the nurse, or against all three. "Is it not possible to invent some infallible system of labelling or handing over such drugs," asked Miss Heilbron, "a system which could overcome the fallibility of human nature?"

There were many other aspects of negligence. Was it negligence, for instance, to deceive a patient about the possible dangers of a certain line of treatment? Was it negligence to omit to disclose certain matters to a patient? The answer would depend largely on the individual circumstance—the condition of the patient, his character, intelligence, and so on—and there would be room for more than one opinion.

Until those who teach obstetrics in this country realize that in forceps delivery under general anaesthesia the position of the patient can be of vital importance in determining the survival or the death of the patient when vomiting occurs, we cannot, unfortunately, expect any material improvement in the situation as regards aspiration asphyxia. There is, however, one alteration in the procedure in vogue at present which, if widely adopted, would certainly reduce the fatalities from aspiration of vomit. We know, from various sources, that in about half the fatal cases the vomiting and the inhalation of vomit occur during the induction of anaesthesia. If, therefore, those obstetricians who do not feel competent to put on forceps in the lateral position would at least allow the anaesthetist to induce the patient in that position, the vomit would in many cases be safely deposited on the operating table, perhaps even before the measured tread of the lithotomist is heard.—I am, etc.,

Knock-knee in Children

SIR.—The article by Dr. A. J. M. Morley (*Journal*, October 26, p. 976) and subsequent correspondence exhibit somewhat superficial thought; but fortunately the condition as now seen without a rachitic background is indeed benign, and usually outgrown.

The observation that knock-knee is common in fat children is a blinding glimpse of the obvious fact that if the femoral condyles are separated by thick wads of fat so also will separation of the malleoli be increased. Much confusion has arisen from using inter-malleolar separation as the only criterion of knock-knee. The majority of children exhibiting this knock-knee have in fact the same tibio-femoral angle of 10° (or 170°) measuring from the top of the tibial tubercle as apex along the tibial crest and the line of the femoral shaft. From this apex inter-malleolar separation is determined not only by the length of the tibia but by the angle and length of the femoral neck and by the separation of the femoral heads.

Basically it is relative widening of the distance between the trochanters—a normal phenomenon of growth due to alteration in the angle of the femoral neck (increasing varus, decreasing anteversion)—and increasing length which brings the malleoli together in the growing girl, whereas in the boy the angle at the knee grows less. Unless, therefore, there is marked increase in the tibio-femoral angle beyond 10° it seems senseless to try to obscure hip abnormality by straining the knee with splints. It is surely wiser to let the child grow nearly to completion and then, if very necessary, straighten the tibio-femoral angle by so simple and atraumatic a procedure as temporarily stapling the inner side of the lower femoral epiphysis. Surely, too, it is wise to protect the inner side of foot and knee from extra mechanical strain during the growing years by prescribing a Jones heel.—I am, etc.,

Combined Prophylactics

SIR.—We would like to thank Dr. J. S. Robertson for his letter (*Journal*, December 7, p. 1366) on the subject of our joint article (*Journal*, November 23, p. 1213). While we appreciate all he says, we would like to explain a few points. In respect of the use of statistics, results such as those referred to may be viewed from two aspects; first, to note trends, as shown by our finding that the doubling of the dose of tetanus toxoid from 3-6 Lf to the fixed amount of diphtheria toxoid increased the Schick conversion rate by about 5%, and a further doubling of the amount of tetanus toxoid to 12 Lf produced an additional improvement of approximately 10%; secondly, even if we

assume that the whole body of the data is homogeneous, then the value of χ^2 for Group 4, Table II (30 Lf diphtheria toxoid plus 12 Lf tetanus toxoid), becomes 5.6, which, for one degree of freedom, gives a value for P of 0.02, one even less than that given in the paper.

It may not be generally known that, while realizing that P.T.A.P. and A.P.T. are greatly superior to F.T., one of us (G. B.) was the first to try out modern purified F.T. when many were in despair about the boggy of post-inoculation paralysis. It appeared to be a retrograde step in the immunological sense. Later work, however, showed the marked toxoid adjuvant effect of admixture with pertussis vaccine, and we are sure Dr. Robertson will agree with us that any modification of the composition of a mixture should be subjected to clinical trials. It has been the purpose of our work on combined antigens, over the last five years, to demonstrate their field efficiency on a quantitative basis; we both wholly subscribe to their use, but insist on measurement at all stages, with particular stress on the merits of a good primary response.

Dr. Robertson's final remark on the need to adopt a course of action which will give the greatest overall efficiency is one that has never been absent from our minds; indeed, the prime difficulty here has been the lack of knowledge on what shall be regarded as an adequate antibody response. The whole problem is extremely complex, in which psychology and administration play a no less important part than the antigenic efficiency of the materials used.—We are, etc.,

London, W.2.

GUY BOUSFIELD.
L. B. HOLT.

SIR.—Dr. Guy Bousfield, in his article with Dr. L. B. Holt (*Journal*, November 23, p. 1213), recommends that inoculation should be performed in the arm of very young infants, both arms to be used for this purpose on each occasion. I have read elsewhere that inoculation in the buttock is to be preferred, since post-inoculation poliomyelitis affects the spinal cord at the level of the muscles injected. Until such time as immunization can be offered to all babies before other immunizations might it not be safer to use both buttocks in preference to both arms?—I am, etc.,

Enfield, Middx.

C. M. SMALL.

Cyanosis in Infancy

SIR.—In your interesting annotation on cyanosis in infancy (*Journal*, November 2, p. 1045) you have aptly alluded to the difficulty of explaining some of the attacks of intermittent cyanosis in the newborn period. The following two cases suggest viral encephalitis as a probable aetiological factor.

In an infant 30 days old attacks of intermittent cyanosis with disturbed respiratory rhythm were associated with rise of temperature up to 103° F. (39.4° C.) for two days. On the third day the attacks subsided with the appearance of limpness of the left lower extremity, clearly suggesting the diagnosis of polio-encephalitis. In another case, aged 3 weeks, no aetiological factor could be detected by a thorough investigation for congenital heart disease, diaphragmatic hernia, pulmonary collapse, or atelectasis. There was no history of prematurity, but the child was delivered by caesarean section at full term in a primipara. It was normal for three weeks. Then, with a mild upper respiratory tract infection and rise of temperature to 102° F. (38.9° C.) the child developed attacks of intermittent cyanosis with disturbed respiratory rhythm. The attacks gradually became more frequent and prolonged till, when I saw it, the child was intensely cyanosed most of the day. During the attack the child appeared unconscious, with eyes rolled up, fists clenched, legs stiff and stretched but without obvious clonic convulsion. The child was making a peculiar groaning noise with almost each respiration. All the deep and superficial reflexes were lost except a weak conjunctival and deglutition reflex. Lumbar puncture was not allowed,

as the end seemed imminent. The child was put on sedatives and antibiotics. The attacks improved gradually and the child became normal, and has remained so to this day, about two months after the illness. The diagnosis is still shrouded in mystery, but I believe that there is enough evidence to suspect that the illness of the child was only a manifestation of influenza, common at the time in India, producing a mild encephalitis.

So in newborn infants where the attacks of intermittent cyanosis and disturbed respiratory rhythm are associated with rise in temperature, viral encephalitis should be considered in the differential diagnosis.—I am, etc.,

Poona, India.

Homoeopathy

SIR.—Dr. H. L. Duke (*Journal*, November 30, p. 1306) has misunderstood me. I intended to convey the idea that the usual immunizing procedures against diphtheria were homoeopathic in nature. Most homoeopathic doctors, as far as I know, carry out ordinary diphtheria immunization. Dr. Duke, however, has raised an interesting point about oral vaccines which homoeopathic doctors have been using for many years. A preparation made from the influenza A (Asian) virus has been available since September of this year. Many of those using it have found it valuable as a prophylactic.

Regarding oral vaccines for diphtheria, the late Dr. John Paterson in 1941 published a paper entitled "A Preliminary Study of the Alteration of the Schick Test by a Homoeopathic Potency," and concluded that a negative Schick test could be produced following an original positive result in a number of cases greater than the normal Schick fluctuations, but that the percentage of successes with the doses tested was not sufficient to justify their substitution for the A.P.T. which was in current use then.—I am, etc.,

Early Separation of Handicapped Children from Parents

SIR.—It is difficult to reply cogently to Dr. J. E. G. Vincenzi's letter (*Journal*, November 30, p. 1304) because it contains so many generalizations which are unsupported by evidence. To write in terms of "likely to add maladjustment," "perfectly satisfactory homes," "as a general rule it is undesirable for a child to go to a boarding-school before the age of 7 or 8," does not increase our understanding of the facts which give rise to his concern for handicapped children in boarding-schools.

This school has on its roll day children, children who go home weekly, and full boarders. Their age of entry varies from 2 to 6-plus and they come from a variety of homes. Some are only children, some have deaf parents, some are from broken homes, and some have parents who can provide every facility, if required, from a lightweight hearing-aid to a tutor. Some have received training from their parents under the guidance of audiology units, some have been to other schools for hearing children or other schools for the deaf. Some have had no help at all. From my experience of this assorted group of children, I can make these categorical statements: (1) that the only children whose progress affords me some satisfaction are those who started full-time training before the age of 3, irrespective of their degree of hearing loss or their intelligence; (2) that the late entry children are more often more maladjusted than the children who start school early, and certainly are more educationally and socially backward; (3) that as many cases of maladjustment occur among the day children as occur among full boarders; and (4) that most cases of maladjustment arise from the child's relationship to the home, with deafness a contributory factor. To equate degree of maladjustment with the timing of entry into a boarding-school is a gross oversimplification.

Dr. Vincenzi would like to see some other method adopted to help the children overcome their handicap without their having to leave their parents' care. Many of these children are scattered thinly over a wide area of the country. What would he suggest? Peripatetic teachers? Would this provide enough teaching time? Could they carry around all the necessary amplifying equipment? Or does he suggest that the parents take over their training? Where would the parents receive their training? Would there be adequate supervision? Can the objective role of teacher be married to the subjective role of parent, bearing in mind that most of these parents are already overloaded with anxiety and guilt feelings?

If Dr. Vincenzi is advocating the setting up of numerous nursery schools for these children, sufficient in number for all children to get home at least for week-ends, he will have my keenest support. I could not, however, find virtue in any arrangement which deprives deaf children from access to full-time training using the best possible equipment by qualified teachers of the deaf.—I am, etc.,

Woodford Green, Essex.

B. I. INGALL,
Principal,
Nursery School for Deaf Children.

Mandible-assisted Breathing

SIR.—It occurred to me on reading the recently published articles on glossopharyngeal breathing (*Journal*, November 23, p. 1204 and 1205) how much more efficient it would be to have a lightweight respirator attached to the patient which could be worked by the masseter muscles by an attachment to the lower jaw, with small bellows or pump with unidirectional valves leading to the nasal air-piece, with or without a cuffed nasal tube; the air-piece would have to be well fitted with an inflatable cuff. It should be comparatively easy with such an arrangement to pump sufficient air through the nose with a few lower jaw movements, to inflate the lungs, the patient keeping the pharynx shut off by raising the tongue.

There are various methods of working this out mechanically which occurred to me, and which I have discussed with Medical and Industrial Equipment, Ltd., who are actively engaged in this development. I myself do not come in contact with these cases, but those interested in this development could get in touch with Medical and Industrial Equipment, Ltd., who are producing prototypes.—I am, etc.,

Windsor.

J. P. CUDDIGAN.

Drug Firm Representatives

SIR.—The barrage of high-pressure salesmanship to which we are subjected by the proprietary drug firms is a source of great concern to many practitioners. Our defences seem very inadequate. A course in pharmacology and materia medica taken 24 years ago is of limited value. A knowledge of the natural history of disease gleaned by those fortunate enough to have worked in the pre-antibiotic era is of considerably more value. It helps us to discriminate between conditions which need a little help and those for which drastic and expensive measures are justified. A determination, wearing rather thin, to confine one's therapy to remedies that are valuable and thoroughly understood is hard to maintain under present circumstances.

Very occasionally we receive a pamphlet from the Ministry of Health setting down in guarded words some advice on the complexities of modern drugs and how to avoid expensive prescribing. These pamphlets are of great value in helping the prescriber to assess the value of a new drug and compare its merits with those with which he is more familiar. But it is the feebleness of the Ministry of Health's counterblast which prompts me to add to this correspondence. The pamphlets are good, but we need many more of them and they must keep abreast of the latest fantasia swirling from the drug houses. The Ministry should carry the war into the enemy's camp and send representatives to our surgeries ready to give us unbiased information on the

merits of the advertiser's claims. We need someone unattached to any drug house who will interpret the complex formulae which disguise the true nature of many expensive and perhaps dangerous drugs now being thrust upon us from every side. We need someone to unmask the pharmacological mystery formulae, so that we can place the drug in its genuine category of usefulness. We need details of cost, which most advertisements still neglect to publish. We need someone to correlate the claims made for new and expensive drugs with the known facts. How many general practitioners or clinical consultants would benefit from the knowledge that a well-known proprietary tablet for irritating coughs consists of 10 mg. bis-[1-(carbo- β -diethylaminoethoxy)-1-phenylcyclopentane]-ethane disulphonate?

I, personally, should always find time to welcome a representative of this colour, and I think if prescribing under the National Health Service is to be replaced on a safe and rational basis something of this sort will have to be done.—I am, etc.,

Sheffield, 8.

E. C. ATKINSON.

Syringe Service for the Family Doctor

SIR,—In a recent meticulous survey for a central syringe service which would include the whole Health Service, E. Cameron Murphy¹ finds that the syringe usage of the general practitioner is 7% of the whole (hospital, public health, and G.P.). He concludes that it would be uneconomic to issue syringes to G.P.s unless they were "prepared to make considerable efforts to deliver and collect the syringes themselves."

Our experience at Westwood Hospital suggests that a large proportion would be so prepared. As an experiment, we have for some years made the hospital syringe service available to the general practitioner. It has been found that those living in the town—i.e., within one mile of the hospital—for the most part use the syringe service for all their injections and aspirations, while those from the villages—i.e., over five miles—mostly do not. The doctor or deputy calls at the "stericentre" twice weekly, where used equipment is replaced. Having dry, sterilized, oiled syringes with sharp needles always at hand is found to be a notable convenience and the time saved is appreciable. For the stericentre the work as suggested by the above survey is not great, in our case being equivalent to one more ward.

For those living at a distance we designed the flat syringe sterilizer,² by which six boiled but virtually dry sterile syringes are prepared and carried in a compact container.—I am, etc.,

Beverly, Yorks.

Vision and Television

SIR,—I entirely agree with the conclusions of Dr. A. H. Griffith (*Journal*, November 30, p. 1299). I have been very interested in the effects of television on eyes since 1950, and have kept complete records since then. I find that the percentage of eyestrain in both boys and girls of 11 and 12 years is slightly higher in my patients in Bermondsey and Edmonton compared with patients elsewhere. I would very much like to have views of other ophthalmologists who have been doing this research in other parts of Great Britain.—I am, etc.,

London, W.1.

R. U. HINGORANI.

"Butcher's Thigh"

SIR,—The need for prompt and efficient first-aid treatment in certain cases of this occupational injury, to which Mr. J. R. S. Paterson (*Journal*, November 30, p. 1309) has drawn attention, is illustrated by a case which came under my care at the Victoria Hospital, Blackpool.

Credit is due to Mr. M. Lange, who was then the surgical registrar, and who, receiving a terse summons from casualty, sought not to reason why but set off at high speed in that direction. Further spurred from afar by the sight of a blood-stained butcher seated in the hall, he reached the patient, the butcher's boy, who was quite unconscious and almost exsanguinated from a knife wound, 1 in. (2.5 cm.) long, situated just above the fold of the right groin. He had been brought by the butcher in his van from the scene of the accident, and, until oxygen was administered by the nursing staff, no form of treatment had been attempted. The bleeding was now minimal and it was easily controlled by pressure on the abdominal aorta through the relaxed abdominal wall. It was found that, with the fist on the umbilicus and the arm extended, an adequate pressure could be maintained for an indefinite period without fatigue. Meanwhile measures were taken to set up an intravenous plasma drip and to cross-match blood for transfusion, and shortly afterwards the whole cavalcade moved to the operating theatre. As the patient was still deeply unconscious, no anaesthetic was needed to explore the wound, and the bleeding site proved to be a V-shaped notch cut in the side of the external iliac artery. It was interesting to note how the bleeding from it could be controlled by compressing the aorta in the manner described. By the time an arterial suture was done and the operation completed the blood pressure was restored and the patient was in good condition, but he was still quite unconscious, and when later that day a spasmodic twitching developed in the limbs the outlook seemed poor. He recovered, however, and in 48 hours he was able to recognize his fiancée, a relationship he stoutly denied at first but happily accepted later. When last seen some six weeks after the accident he was back at work and complained only of an increased difficulty in counting the change.

This case illustrates very clearly the importance of the abdominal aorta as a pressure-point. The difficulty is not so much in teaching people *how* to use it as *when* to use it. It would be an intolerable manoeuvre to the conscious patient and not likely to be effective, and its use should be restricted to cases of desperate bleeding from wounds of the groin or lower abdomen, where no other first-aid measure is practicable. It is of interest to note that the technique of aortic compression is taught universally to Boy Scouts but not apparently approved by all of their seniors in the ambulance brigades.—I am, etc.,

Blackpool.

D. K. LENNOX.

Phenylbutazone

SIR,—I have noted of late letters in the *Journal* with reference to the dangerous side-effects of phenylbutazone in therapy. I therefore suggest tentatively a method I have found of value in warding off unpleasant sequelae of therapy, such as leucopenia, agranulocytosis, etc., or of correcting them if they have intruded.

It is to accompany the phenylbutazone with vitamin C in liberal dosage (100 mg. several times orally a day) and to catalyse the redux activity of the vitamin with small oral doses of a ferrous preparation, such as ferrous gluconate. As rheumatoid patients are initially deficient in vitamin-C storage, replenishment of stores should be a logical procedure, but the potentiation of the vitamin activity still, in my experience, is dependent on an appropriate catalyst such as the one I use.—I am, etc.,

Durban, S. Africa

J. DRUMMOND.

Mongolism in a Twin

SIR,—We have been very interested in the medical memorandum by Dr. J. V. Morris (*Journal*, November 2, p. 1038) on mongolism in a twin, and the subsequent correspondence. We would like to report a case of this condition, which we have at present, a condition which does not appear to be as

rare as was once thought. We think our case is of added interest in that the parents have had two other mongol children as well as the twin.

The father is aged 35 years, and is now out of work, with a chronic anxiety state. He was on a baker's delivery round previously. The mother is also aged 35 years. She has had seven confinements, all at home and carried out by the midwife. The first child, a girl, was stillborn at full term. This birth was in 1944, the weight was 9½ lb. (4.3 kg.). This child was probably normal. The second child, a male mongol, was born in 1945, and weighed 8½ lb. (3.9 kg.). He died at the age of 7½ months, and we do not know the cause of death. The third child, a male mongol, was born in 1946, and weighed 8½ lb. (3.8 kg.). He is alive now, quite healthy: he is clean in his habits, feeds himself, can dress and undress himself, and he is helpful around the house in small ways. He has an atrocious temper. He was graded when he was 6 years old, and given a mental age of 2 years. The fourth child, a normal girl, was born in 1949 and weighed 8½ lb. (3.8 kg.). In 1952 twins were born, two girls, one a mongol, and both were breech deliveries. This mongol wife states that there were two placentas. This mongol is more intelligent than the boy. She has talked at an earlier age and is already as advanced as he is. She has had no gradation tests yet. The other twin had some cerebral birth trauma resulting in a right hemiplegia, and subsequent epileptic fits. She has had only four of these, the hemiplegia has now cleared, and she is attending school, and appears to be of normal intelligence. In 1953 and 1954 normal girls were born. The one in 1953 weighed 8½ lb. (3.8 kg.), and the one in 1954 weighed 7½ lb. (3.5 kg.).

The children all play together, but the two-mongol children stick more together, play better together, and stand united against the other children in any quarrel. The mother says she always knows when she is having a mongol child, as she feels ill and vomits throughout the pregnancy. The mother's blood group is A₂ Rh-negative. So far as we can discover, there is no family history of twins or other mongols.—We are, etc.,

DAVID ANTHONY.

J. G. HUGH THOMAS.

Abercynon, Glam.

SIR,—With reference to the letter of Dr. L. L. Mistlin (*Journal*, November 16, p. 1179) concerning the aetiology of mongolism in a twin, in observations on over 500 human follicular and tubal ova, I do not see anything to prevent at times the second polar or the two polar bodies which may result from division of the first polar body from being fertilized. This may account for certain cases of twin pregnancy, and may have given rise to the mongolian twin cited in his letter.—I am, etc.,

New York.

LANDRUM B. SHETTLES.

"Nomen Proprium"

SIR,—The chairman and honorary secretary of the Association of Teaching Hospital Pharmacists oppose (*Journal*, December 7, p. 1366) the labelling of dispensed medicines on the grounds that such labelling increases the risk of ill-advised self-medication. Their hypothetical objections are heavily outweighed by other, practical, considerations. When a few years ago the local medical committee of which I am secretary sought the co-operation of the local pharmacists in labelling all dispensed medicines the committee had in mind the following points.

(1) A majority of doctors (at least in West Bromwich, and almost certainly elsewhere) practise in partnerships so that patients are sometimes of necessity seen in their homes by different doctors during the same illness. From their academic fastness your correspondents may think that "other proper systems of recording patients' treatments are available," but in the home there is no convenient practicable alternative method which does not share the objections voiced by your correspondents. (2) Rota systems result in

patients being seen by different doctors who are much less closely related than are partners. A considerable proportion of rota calls is to patients already under treatment by their own doctors. These facts make even more cogent the points raised in the above paragraph. (3) A case of accidental poisoning can well arise (especially in these days of tablets) in the absence of a prescriber, yet immediate identification of the drug taken might well be vitally necessary. (4) The use of the label as a reminder to a prescriber himself is quite incidental, but is not without its value.

Your correspondents' antipathy to self-medication may be reasonable. The pharmaceutical industry and the pharmaceutical trade, however, are to a significant extent dependent on the prevalence of this habit, and they have it in their power seriously to check the habit without their refusing to help doctors with fully labelled dispensed packages. A public which is so widely informed by press, radio, and television quite properly expects to be fully informed by its doctors, and information on the pharmacist's label is rarely news. Is it the wish of your pharmacist correspondents that doctors should begin to write prescriptions illegibly?—I am, etc.,

West Bromwich.

D. SAKLATVALA.

SIR,—The opinion expressed by the Association of Teaching Hospital Pharmacists (*Journal*, December 7, p. 1366) goes against the basic principle of contemporary clinical medicine, the necessity of treating patients as rational beings. To give to patients tablets or coloured liquids without telling them what they are is not only an insult to their intellect but makes us revert to the mysterious magic of the apothecaries of the Middle Ages and is thus unworthy of a scientific physician. If we except some cases of individuals of low intellect who need magic more than medicine, patients collaborate more effectively in their treatment when knowing what they are taking. Further, when they travel or move elsewhere and need medical help, this becomes more effective when the physician who sees them for the first time knows what they have been taking. Accidents also occur—when, for example, tablets of digoxin or of anti-histaminics are taken for vitamins—and this may involve responsibilities of pharmacists and physicians. There are, of course, rare cases in which the name of the medicine must not be divulged, and it is for such cases that a special sign is needed for the pharmacist, while maintaining as a general rule the careful labelling of the medicines. Until, however, such rational and scientific mode of prescribing is reached it is imperative for chemists to follow the instructions embodied in the term *nomen proprium*, as most of them ignore such instructions.

The Association of Teaching Hospital Pharmacists would have rendered a greater service to medical practice if they insisted on this point, instead of wishing to maintain this antiquated and anti-intellectual method of secrecy which is being abandoned in all other countries.—I am, etc.,

London, W.1.

A. P. CAWADIAS.

Night Hospital for Neuroses

SIR,—In January, 1958, we are opening a night hospital for the short-term treatment and resettlement of neurosis cases. Both men and women will be accepted. Patients will arrive between 6 and 8 p.m., and treatment will include individual, group, and social psychotherapy. An evening meal and breakfast will be available for patients, who will normally leave between 7 and 9 a.m.

It is hoped that these facilities will be particularly valuable for patients who are working, and special attention will be paid to the occupational aspects of each case. These facilities are being provided under the National Health Service, and cases for treatment are being considered now.—I am, etc.,

London, N.W.8.

JOSHUA BIERER,
Medical Director,
Marlborough Day Hospital.

Obituary

J. E. MOORE, M.D.

Dr. J. E. Moore died in the Johns Hopkins Hospital, Baltimore, where he was professor of medicine, on December 6, at the age of 65.

Joseph Earle Moore was born in Philadelphia on July 9, 1892, and graduated in medicine at Johns Hopkins University in 1916. He was destined to give distinguished service to the Johns Hopkins University and Hospital from 1916 until the time of his death, apart from a period of active service in the first world war. He was professor of medicine in the Johns Hopkins School of Medicine, being the first practising physician to be named as full professor, and adjunct professor of public health administration in the school of hygiene and public health of the Johns Hopkins University.

Earle Moore's special subject was the venereal diseases, and over the years he initiated and directed a series of brilliant researches into most aspects of this problem. His department at the Johns Hopkins Hospital became famous throughout the world, for he was a pioneer teacher in methods of V.D. control. His former students hold important positions in the subject throughout the United States and in many parts of the world. He was the author of textbooks entitled *The Modern Treatment of Syphilis and Penicillin in Syphilis*, and editor of the *American Journal of Syphilis, Gonorrhea and Venereal Diseases* for many years until it discontinued publication in 1954. Since then he has edited the *Journal of Chronic Diseases*. During the second world war he was adviser on V.D. control to the Surgeon Generals of the Armed Forces and the Public Health Services of the United States, and was chairman of the Subcommittee on Venereal Diseases of the National Research Council. For these services he was awarded the Medal of Merit of the United States in 1946. He was the director, guide, and ruling spirit of the intensive research into the use of penicillin in the treatment of syphilis which, as the result of co-operative efforts by American physicians and the United States Public Health Service, provided, during the late 1940's and subsequently, most complete and valuable information which otherwise might have taken many years to acquire. Earle Moore was a clear thinker, an excellent speaker, and a brilliant writer. So great was the affection and respect in which he was held by his colleagues that on his 60th birthday, in 1952, a dinner was held in Washington under the chairmanship of Dr. Thomas Parran, formerly Surgeon General to the United States Public Health Service, to commemorate the event. More than a hundred distinguished colleagues attended to do him honour. His many friends throughout the world, including a number of young physicians in this country who held fellowships in his department, will mourn the loss of an outstanding personality, a great figure, and a true friend.

Dr. Moore's first wife, Grace Barkley Moore, died in 1954. His second wife, formerly Mrs. Irene Mason Gieske, survives him.

Mr. A. J. KING writes: The death of Earle Moore will be a great sadness to his many friends, and to none more than in this country, which he loved and which he visited regularly for many years. His regard for Great Britain and for British people dates from the first world war, during which he was attached for a while to a British field ambulance in France, before the American Expeditionary Force became effective. He often spoke of the warmth of his reception and the friendliness which he encountered, under circumstances which might well have proved very difficult for a sensitive, inexperienced young physician. During his visits to London he twice addressed the Section of Experimental Medicine of the Royal Society of Medicine, and, on a number of occasions, the Medical Society for the Study of Venereal Diseases, of which he was an honorary member. In 1950 he was the Malcolm Morris Memorial lecturer. His

most recent visit was in the summer of this year, when he knew himself to be dying but faced the last painful months with the utmost courage and determination. A man of great strength of character, he was generous to a fault, and loyally devoted to his friends. He was an example and an inspiration to the many young men who came under his influence. In his own subject he stood head and shoulders above his contemporaries, and his contributions to medicine were such that posterity may well number him among the truly great.

L. E. NAPIER, C.I.E., F.R.C.P.

Dr. L. E. Napier, late director and professor of tropical medicine at the Calcutta School of Tropical Medicine, died at his home at Silchester, Hampshire, on December 15. He was 69 years of age.

Lionel Everard Napier was born at Preston on October 9, 1888, the son of the Rev. J. Russell Napier, vicar of Old Windsor. From St. John's School, Leatherhead, he went on to St. Bartholomew's Hospital to study medicine, and he remained a devoted Bart's man to the end of his life. Qualifying in 1914, he held one or two house appointments and then became assistant school medical officer to the Berkshire County Council. He did not work long in that capacity, however, for on joining the R.A.M.C. he went out to India and later to Mesopotamia, serving with distinction as a specialist in pathology. It was during his wartime service that he came to know Acton and Knowles, both colonels in the I.M.S., who inspired him to take up tropical medicine as a career. Returning to England in 1919, he was persuaded by these two friends to join the staff of the School of Tropical Medicine at Calcutta as pathologist and special research worker in kala-azar. He remained at that school in a teaching capacity for the next 22 years, eventually becoming professor of tropical medicine there and finally director.

In these capacities Napier was a great success. He impressed everyone by his competence and efficiency, and his fame, enhanced by his writings on the pathogenesis and treatment of kala-azar, soon became world-wide. With Dr. Ernest Muir he wrote a standard work on this disease, *Kala Azar—a Handbook*, published in 1923. Having taken the M.R.C.P. in 1935, he was elected F.R.C.P. in 1940. During most of the second world war he remained at his post in Calcutta and in 1942 was appointed C.I.E. In the following year he was invited by friends in the U.S.A. to teach tropical medicine at Columbia University, New York. Besides being appointed visiting professor to this university, he was also visiting lecturer in tropical medicine to Tulane University, New Orleans, and to Harvard University. While in the U.S.A. he enjoyed the leisure and library facilities that enabled him to write his chief work, *The Principles and Practice of Tropical Medicine* (1946).

Soon after Napier returned to England he was appointed specialist in tropical diseases to the Ministry of Pensions and consultant to Queen Mary's Hospital, Roehampton. In 1951 he became medical editor of the Caxton Publishing Company, and was engaged in preparing the *British Medical Dictionary*. For this exacting task he was eminently fitted by disposition and training, and he continued working at it until forced to resign by ill-health last year. His literary activities had always been an important part of his professional life. In India he was editor of the *Indian Medical Gazette* for many years, and after his return to London he became editor of the *Journal of Tropical Medicine and Hygiene*. In 1942 he wrote a book on *Haematological Technique* which had appeared first as a series of articles in the *Indian Journal of Medical Research*. He was also a frequent contributor of reviews to the *Tropical Diseases Bulletin*.

P. M.-B. writes: Tropical medicine has been left considerably poorer by the death of Lionel Everard Napier. Although he never studied tropical medicine in a course or attended a school of tropical medicine in his early years, he nevertheless acquired a very competent knowledge of the

subject by dint of practical experience in the field. In fact he became the world authority on kala-azar, a disease which fascinated him on his first acquaintance with it in India in the early days of the first world war. He came to be professor of tropical medicine at Calcutta and director of the school of tropical medicine there by a circuitous route. He led a very busy life, as is exemplified by the large amount of literature, and good literature too, which he turned out; and he remained busy till the day he died.

He had a very distinctive personality, giving one the instant impression of efficiency accompanied by accuracy. He was always kind, helpful, and charming: but there was also the other Napier with the analytical critical mind which he could turn on whenever occasion offered. Napier will be greatly missed in medical circles in the metropolis, and he will also be equally missed in many Eastern lands, where he was so well liked and well known.

E. M. writes: I first met L. E. Napier in 1920 when his laboratory was next door to mine at the School of Tropical Medicine in Calcutta. He was engaged in research into kala-azar, and, as I had previously wrote a textbook on the we co-operated at first and jointly wrote a textbook on the subject. Napier's work did much to throw light on the diagnosis, treatment, and aetiology of kala-azar. His work was careful and exact and of a high scientific standard. Later he investigated blood conditions prevalent in India, and also acted as editor of the *Indian Medical Gazette*. When I left India in 1935 he succeeded me as teacher of tropical medicine, a post which he held till he retired from India. Napier is perhaps best known for his book on tropical medicine, which is still one of the most authoritative and widely read works on diseases of the tropics.

I had the privilege of knowing him not only as a research worker but also as a friend, especially as for some time, being "grass widowers," we chummed together in Calcutta. He was a man of great charm and kindness, always ready to help those in need or difficulty, be it man or beast. It was only three weeks ago that I last met him at a laboratory meeting at the London School of Tropical Medicine, and we reminded each other that we were almost the last of that little band of investigators who worked at the "Tropical School" in Calcutta in the 'twenties and 'thirties.

P. J. GIBBONS, M.B., B.Ch.

Dr. P. J. Gibbons, a prominent general practitioner at Liverpool, died there on December 3 at the age of 54.

Patrick Joseph Gibbons was born on November 21, 1903, and was educated at the Christian Brothers School, West Port, and at University College, Galway, graduating M.B., B.Ch. from the National University of Ireland in 1928. Entering general practice almost at once, he was for some time at Dewsbury. On moving to Liverpool he filled resident posts at Bootle General, Alder Hey, and Smithdown Road hospitals. In 1933 he became a partner in one of the oldest-established practices in Liverpool, where he worked until his death. He was very widely known for his administrative work on behalf of the profession. He was appointed a member of the Liverpool insurance committee in 1941, continuing as a member of the Liverpool executive council until his death. A member of the Liverpool panel committee from 1937, and subsequently of the local medical committee, he was its chairman from 1951 to 1954. He was also a member of a hospital management committee, of the regional technical advisory committees on paediatrics and tuberculosis, of the Liverpool regional consultants and specialists committee from 1952 to 1956, and of the council of the Liverpool Medical Institution in 1955-6. From its formation he was a member of the Standing Pharmaceutical Advisory Committee of the Central Health Services Council, a unique position, as he was the only member of this committee who was not a pharmacist.

All these duties, however, were only a reflection of his interest in the British Medical Association. He was in the best sense of the word a B.M.A. man. He was chairman

of the Liverpool Division in 1953-4 and president of the Merseyside Branch in 1956-7: indeed, he was one of the prime movers in this Branch's formation. He was a member of the Council of the B.M.A. from 1947 to 1950 and of the General Medical Services Committee from 1950 until ill-health caused his resignation in 1956. At various times he served on a number of other B.M.A. committees, and was a representative of the Annual Representative Meeting from 1942 to 1953. He was a devout Catholic and had many interests outside the profession. In addition to his professional work, which was in the best traditions of general practice, he gave most valuable service to his colleagues and his patients in his administrative and committee work.

C. W. W. writes: P. J. Gibbons was probably the best-known general practitioner in Liverpool. In an industrial area of the city, he ran, with two partners, a busy practice which always kept up with the best professional standards. He had an Irishman's love of controversy and sense of fun, together with a great belief in the importance of the individual—whether the individual doctor or the individual patient. He was widely read and possessed a deep faith in Christian principles, which he regarded as the only sure guide to conduct and opinion. With these qualities it is not surprising to find him using his energies first in the Liverpool insurance committee, and later, in the context of the new Health Service, in the executive council and in the General Medical Services Committee, and always in the B.M.A., which he regarded as the important unifying influence of the profession. He received many honours in this field and he was known and respected at B.M.A. House, where he was a persistent advocate and generous opponent.

Here in Liverpool we regarded him not only as our negotiator, leader, and counsellor but also as our friend. There are many doctors in Liverpool who have sought his advice on professional or personal problems. He was always generous of his time, wise in his counsel, and reluctant to censure. He disliked many of the facets of our present Health Service because he hated bureaucracy and the domination of the individual by the State. He believed, nevertheless, that a health service was essential for our nation in these days; and he believed that any sacrifice was worth while in order to pass on the tradition and practice of an honourable profession, and in this he did not spare himself. He spent his energy freely on travel on B.M.A. business, on evening meetings, and work for his colleagues on the executive council and its subcommittees. It is difficult to realize that we shall not see his burly figure again, and we do not forget that the first sign of his fatal illness occurred while returning in the train from committee in London, or that the attack which necessitated his admission into hospital took place while he was explaining the facts of our dispute with the Government at a meeting last summer. He bore his last illness with great fortitude and an active mind, and we will remember him as a friend who not only upheld the traditions of a British family medical practitioner but gave himself unsparingly in his administrative work for his colleagues and the public. All this could not possibly have been achieved without the support of his wife, Dr. Hilda Gibbons, who, besides herself conducting a busy anaesthetic practice, ran the home with great efficiency and gave him constant help and support. Our deepest sympathy goes out to her and their six children, two of whom are following their parents in the medical profession.

H. A. WALLACE, M.B., B.S.

Dr. H. A. Wallace, who was in general practice at Sunderland for many years, died suddenly on October 11, aged 59. He had been in poor health for some months, but appeared to be recovering.

Born at Glasgow and educated at Sunderland, Hugh Archibald Wallace began his medical studies at Durham University College of Medicine in 1914. He then joined the Royal Navy and was on active service for three years. Graduating M.B., B.S. in 1923, he held resident appoint-

ments at the Royal Victoria Infirmary, Newcastle upon Tyne, and then entered general practice with his uncle, Dr. J. Bateman Morton. Later he joined the late Dr. I. G. Modlin, and on the latter's retirement carried on the practice single-handed. He was a member and past-president of the West End Medical Society and the Monkwearmouth Society. A popular founder-member of the Bats Society, he was recently its chairman.

P. A. writes: Dr. H. A. Wallace was a general practitioner of very wide experience, and had made himself very well acquainted with the rapid progress of medicine since the middle 'twenties. To the ill patient he gave every care; the less ill he advised and directed. He had treated his patients faithfully in the old days and the new—in the depression and the boom. The inconsequential manner which he assumed meant very little, for under that demeanour he was alert and acute. He was very witty and droll, and had a debonaire air—a pleasant "take-it-or-leave-it" attitude. He was very well read in a curiously diverse sort of way. In a journey he would talk about Roman remains, the execution of Anne Boleyn, Antarctic exploration, and the Stock Exchange. He was rather a specialist on old trials, especially poisoning. But what his friends admired about him was his courage. During his naval service he rescued a man from drowning: his story was that he was standing on the edge and fell in. He showed great fortitude from his late thirties and up to the very end. Archie Wallace laughed at us, with us, and at himself, and his friends will miss him grievously. To his widow and his family, and to his mother and uncle, we offer our deep and lasting sympathy.

A. AYRE SMITH, M.D.

Dr. Ayre Smith died at Romalldkirk, Co. Durham, on November 5 at the age of 81. For many years he was senior surgeon at the Sunderland Royal Infirmary and a leading medical practitioner.

Alan Ayre Smith was born at Sunderland, the son of Dr. Robert Ayre Smith, also a surgeon at the Royal Infirmary. Educated at Dulwich and Guy's Hospital, he qualified in 1901, graduated M.B., B.S. in 1905, and proceeded M.D. in 1907. Through his association with Guy's Hospital and Sir Alfred Fripp, he served in the South African War with the Imperial Yeomanry. Returning, he began practice in Sunderland and was elected surgeon to the Royal Infirmary in 1909. During the first world war he joined the R.A.M.C., and was in charge of No. 7 General Hospital in France and was twice mentioned in dispatches. On demobilization he recommenced his surgical appointment and his general practice. From 1922 he was senior surgeon of the infirmary.

P. A. writes: Ayre Smith carried out his surgical work with great efficiency and much skill. In addition to general surgery, he was keenly interested in injuries and orthopaedic conditions, on which he spent much time and obtained excellent results. He was for many years surgeon to the Sunderland Association Football Club. He had a rather colourful career. In addition to serving in two wars he was a very prominent Rugby footballer. He played for Richmond, Surrey, Durham, and the 1899 English side in Australia, playing in three representative matches. In hospital he was a personality with definite characteristics. His visits were performed with a touch of ceremony which is pleasant to recall. Exceedingly popular, he was "Treasure" for generations of the nursing staff. The carols outside his house on Christmas Eve were a delight. He had an ironic humour and hardly ever attended a meeting: for politics he had a cynical distaste. His general practice was of the higher social class and was conducted with great care and circumspection. Except for war service his life had always run in pleasant channels. He retired in 1937, and his former patients and the Royal Infirmary will always be greatly in his debt. To Mrs. Ayre Smith and his family his colleagues offer their profound sympathy.

OSCAR WATTS-TOBIN, M.R.C.S., L.R.C.P., D.P.H.

Dr. Oscar Watts-Tobin, who was in general practice, first in Stepney and then in Fulham, for many years, died suddenly on December 1. He was 70 years of age.

Oscar Watts-Tobin, who was born on July 8, 1886, was a political refugee from Rumania when he first came to England, and spent his early days here in the East End of London. After qualifying in pharmacy, he became a medical student at the London Hospital, qualifying in 1925 and taking the D.P.H. five years later. During his period of practice in Stepney he joined the Stepney Labour Party, and became mayor of the borough in 1921-2. He was also a founder member of the Socialist Medical Association. After his move to Fulham he became deputy secretary of the Chelsea and Fulham Division in 1943 and organized a study group which held a series of interesting meetings at Fulham town hall. From 1944 to 1948 he was honorary secretary and representative at the Annual Representative Meetings. After the National Health Service had been launched he retired from active participation in the affairs of the Division, since he was finding life an increasing strain and he had a very large practice. His wife, who survives him, was a very great help to him in his professional work. Their son is doing mathematical research at Cambridge.

C. W. R. writes: As deputy secretary to Oscar Watts-Tobin from 1944 to 1948 I had ample opportunity of witnessing his keenness and enthusiasm for a new socialized national health service. The "study groups" which he initiated under comfortable conditions at Fulham town hall were well conducted, thanks to his long experience in the running of committees. These discussions were the best I can remember being held by the Division. There was a large and distinguished socialist group who firmly believed that a whole-time salaried service was essential to the welfare of the public and the profession, and also many idealists who imagined that well-equipped health centres would spring up overnight. I opposed these views to the best of my ability, and numerous clashes of opinion occurred. Watts-Tobin frequently called me a reactionary, which I greatly resented, but in spite of this we were really on quite friendly terms, and I was glad that he had the courage to modify his views after he saw the full effects of the National Health Service after the Act became law. He will be long remembered by those who worked with him in the Chelsea and Fulham Division.

R. L. P. LYTLE, M.R.C.S., L.R.C.P.

Dr. R. L. P. Lytle died suddenly in the London Hospital on December 4, eight days after undergoing a hip operation. He was 43 years of age.

Robert Lyster Patrick Lytle was the second son of the late Dr. Robert ("Bob") Lytle and of Mrs. Mary Lytle, of Portsmouth. Educated at Haileybury, he received his medical training at St. Thomas's Hospital, qualifying M.R.C.S., L.R.C.P. in 1939. During the second world war he served with the Royal Air Force Volunteer Reserve in West Africa and France with the rank of squadron leader. After demobilization he settled in general practice in Southsea. He was honorary secretary of the Portsmouth Division of the British Medical Association in 1949-50. A natural athlete, at Haileybury he captained Rugby, boxing, and swimming, and played for the Public Schools fifteen. At St. Thomas's he was captain of Rugby, played for Surrey for four years, was a Barbarian, and received an Irish trial. He was also a notable squash player. In 1940 he married Miss Athalie King, who survives him. They led a full and happy family life, having a daughter and three sons.

B. W. writes: "Pat" Lytle was born into a high tradition of service. His father, who practised as a physician for many years, was one of the most universally loved figures in Portsmouth. Pat inherited from him a great gift of

kindness, coupled with wisdom and a capacity for hard work. It is small wonder that his practice rapidly expanded in the post-war years and that his name became so well known in and beyond the confines of the city. His work in recent years was made more difficult by the pain and disability caused by a progressive arthritis of the hip. Though he never complained, he was heard to remark on more than one occasion that his practice was unique in the percentage of patients that lived in the top story of high buildings. The sight of that tall, limping figure with the ready smile, and laughter bubbling never very far from the surface, brought happiness to patient and colleague alike. Pat has gone before his time, at the very height of his usefulness. Portsmouth has lost an outstanding doctor and the profession a beloved colleague. The deepest sympathy goes out to his wife and family, his mother, and his brothers, Dr. W. D. F. and Dr. John Lytle, and his sister.

W. J. P. MacMILLAN, O.B.E., M.D., F.R.C.S.C. F.A.C.S.

The Hon. William MacMillan, a former Premier of the Province of Prince Edward Island, Canada, and Lieutenant-Governor Designate of the Province, died on December 7. He was 76 years of age.

William Joseph Parnell MacMillan was born on March 24, 1881. From Kensington High School he went on to the Prince of Wales College, Charlottetown, Prince Edward Island, and from there he entered McGill University, Montreal, as a medical student. After graduating M.D., C.M. in 1908, and winning the Holmes gold medal, he returned to the Charlottetown and was appointed chief of the staff of the local hospital, a position he held for forty years. During the course of his medical career he was elected to the fellowship of the Royal College of Surgeons of Canada, the American College of Surgeons, and the International College of Surgeons. For eleven years he was president of the Prince Edward Island Division of the Canadian Red Cross, and for nineteen years an executive member of the Canadian Medical Association.

Attracted to politics in middle age, MacMillan was elected as a conservative to the legislature of Prince Edward Island in 1923, and became Minister without Portfolio. Eight years later he was appointed Minister of Education and Public Health, and from 1933 to 1935 he was Premier. From 1935 to 1950, when he resigned, he was Leader of the Opposition. Appointed C.B.E. in 1943, he was made a Knight Commander of the Order of St. Gregory four years later. Twice married, he had three sons and three daughters.

S. P. ROWLANDS, M.B., B.S.

Dr. S. P. Rowlands died suddenly on December 7 at Doncaster, where he had been in general practice for 33 years. He was 70 years of age.

Samuel Pryce Rowlands was born in Madagascar on August 28, 1887, the son of pioneer missionaries, the Rev. and Mrs. Thomas Rowlands. He spent the first eight years of his life in Madagascar and then came to Britain. He was educated at Cardiff and later entered King's College Hospital Medical School, London, where he graduated M.B., B.S. in 1912. After holding house appointments at King's College Hospital, the Royal Bucks Hospital, Aylesbury, and the Queen's Hospital for Children, he served with the British Red Cross in Serbia during the first world war and with the R.A.M.C. in Palestine, attaining the rank of captain. The rigours of wartime service impaired his health and he developed a peptic ulcer, for which he had a subtotal gastrectomy in 1948. It had been his intention to specialize in children's diseases after the first world war, but circumstances were not favourable and so he entered general practice in Cardiff, where he spent five years. He then moved to Doncaster, joining in partnership with the late Dr. A. E. Hockett.

Almost all Dr. Rowlands's spare time was spent in the study of botany, and he discovered several new varieties of ferns in the British Isles. For over 40 years a member of the British Pteridological Society, which is concerned with ferns, he had an expert knowledge of that group of plants and grew almost all the British species in his garden at Doncaster. He was also a member of the Botanical Society of the British Isles and of the British Bryological Society. During a three months' visit to America in 1912 he made many friends among the American botanists.

He loved his patients, particularly the young and the old, and his sincerity, quiet efficiency, and sustained interest in spite of ill-health made him the ideal confidant and family doctor. He leaves a widow and two daughters.—N. M.

D. S. writes: Though he was frail in physique and had a pale, lined face, Rowlands's eager spirit animated his features and fired his keen interest in natural history. He had an unusually clear memory for detail, and this, combined with a lifelong study of the flora of Great Britain, enabled him to become one of the outstanding amateur botanists of his day. The notes from his pen that appeared in the *British Fern Gazette* over many years are of enduring value, for they communicate accurate and discerning observations with precision. In addition, several county floras published in the last 30 years are indebted to him for records of ferns. Unlike some botanists, he was interested in the cultivation of plants as well as in their field study, seeing in this a means by which he could understand them better. In the field he was a delightful companion, and his affection for both plants and people seemed all the deeper for the slightly wry humour with which he expressed it. Though unassuming and somewhat diffident, Rowlands was a distinguished man; and, like many naturalists, he was exceptionally kind.

ISRAEL HARRIS, M.R.C.S., L.R.C.P.

Dr. Israel Harris, who was well known in Bootle both as a family doctor and as a town councillor, died at Liverpool on December 8 at the age of 56.

Israel Harris was born in Merthyr Tydfil on December 12, 1900. He studied medicine at the Westminster Hospital, London, qualifying in 1924. A year later he went to Bootle, where he became prominent in local affairs and where he worked until his untimely death. He leaves a widow and a son and daughter, both members of the medical profession.

D. B. writes: Just over 30 years ago an unknown young doctor came from South Wales to take over a decaying practice in the Merseyside borough of Bootle. At his untimely death on December 8, such was the regard and respect he had gained, the whole town mourned; for in those 30 years Israel Harris had given an unselfish service, professional and public, that can seldom have been surpassed. His whole life was service—professional, political, and humanitarian. He built up by hard work and a high degree of professional skill a large practice among a working-class population, whose problems he so well understood and who repaid him with gratitude and loyalty. But where he showed his great worth was in his work for his professional colleagues. Himself an upholder of the highest ethical standards of our profession, his example was that to which all his colleagues strove to attain. He was a pioneer in the formation of the Bootle Medical Group, a scheme dependent on professional good will which has attracted much attention throughout the country, and was its chairman since its inception. He had also served as chairman of the local medical committee, and his term of office was productive of much good work.

He gave great service to the hospitals of the area both before and after the inception of the National Health Service. In his position as a member of the North Liverpool hospital management committee he fought for, and gained, radiological and pathological services for his G.P. colleagues. His knowledge of hospital policy and administration can have been possessed by very few medical men. Politically,

Medico-Legal

£7,437 DAMAGES FOR DISMISSAL

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

At the end of an action in the High Court which lasted 10 days Mr. Justice Barry¹ awarded damages amounting to £7,437 to Mr. Alexander Howard Barber, surgeon, of Ash Grove, Rochdale, against the Manchester Regional Hospital Board. Mr. Barber's action was brought in respect of his dismissal in 1952 from his position as consultant surgeon in obstetrics and gynaecology at the Oldham and District General Hospital. The judge made a declaration that the Minister of Health, who was also a defendant in the action, had acted wrongfully and in breach of statutory duty in not hearing Mr. Barber's appeal against his dismissal.

Mr. Barber, who the judge said was a surgeon of considerable experience and distinction, had since 1937 virtually devoted his life to the Oldham Hospital, and particularly to the obstetrical and gynaecological department, which he had very largely built up. When the Health Service came into effect he was a transferable part-time officer, but by some extraordinary administrative error the Manchester Regional Hospital Board for several months regarded him as a full-time officer. Someone on the board quite inexcusably insisted that Mr. Barber, or the Oldham Corporation, his previous employers, were responsible for the error, and this provided a permanent black mark on his record with the board which was not forgotten.

The beginning of the trouble between Mr. Barber and the board was in 1950, when a dead foetus was found on an Oldham Corporation refuse dump which turned out to have come from the hospital, the proper procedure for its disposal having failed in the absence of the head porter and Mr. Barber. At the inquest there was a difference of opinion between the coroner and Mr. Barber, who maintained that on account of its extreme premature birth and the period of gestation neither its birth nor death were registrable. This attracted wide publicity, and seriously affected Mr. Barber's relations with the board, which shortly afterwards circularized its hospital management committees expressing the view that all such premature births and deaths should be registered.

Later that year the board received from the Ministry (who received them from the Director of Public Prosecutions) copies of statements obtained by the police in Oldham containing allegations about Mr. Barber's conduct at the hospital. A panel of professional men was set up by the board to investigate the matter, and a copy of the police dossier was given to them. Mr. Barber was sent by the secretary to the board only a brief note of the contents of the statements referring to alleged failure to give sufficient particulars on the death certificates of four women patients, alleged failure to issue birth and death certificates in respect of certain premature births, and allegations about his professional technique in the conduct of an operation in April, 1950. He received from start to finish no other information of the contents of the police dossier.

When Mr. Barber appeared before the panel he was told that he need not trouble about the infant deaths, as they had taken counsel's opinion, which was that he had acted perfectly correctly. There was discussion about the adult deaths. Shortly afterwards Dr. F. N. Marshall, the board's senior medical administrative officer, told him that the panel had decided the police had been vindictive and he need not worry further about it. Mr. Barber said he wanted to answer suggestions about his supposed clinical incompetence at the operation, but Dr. Marshall said that was not necessary.

The panel reported to the board that Mr. Barber's conduct had not been culpable or deserving of censure, but that he had shown lack of tact in dealing with matters he knew to be causing disquiet, and in particular had not been helpful

¹ *Manchester Guardian*, December 13 and 14, 1957.

he had been a member of the town council for over 20 years and for the past five years chairman of its health committee, a position to which he brought his great knowledge of social medicine. He also brought about a happy relationship between the preventive and curative aspects of medicine in the area. He was always proud of his Jewish ancestry, and when his people were cruelly persecuted during the early Hitler regime he threw himself wholeheartedly into measures for their relief. For years, among all his other humanitarian efforts, he laboured night and day for their succour. He was also a firm Zionist, and his standing among the Jewish community was that of a champion of his people. When war came, although 40 years of age, he volunteered and served for over five years, much of the time overseas in North Africa and Italy. Last year his fellow citizens chose this unassuming learned man to be their mayor, and he spent a happy year in this office, during which his professional colleagues gave a dinner in his honour which will long remain in their memory. He will be greatly missed, for here was a man who made only friends.

MARGARET H. WHITE, M.D.

Dr. Margaret H. White, wife of Dr. A. C. White, pharmacologist to the Wellcome Research Laboratories at Beckenham, died at Bromley Hospital on December 10.

Margaret Helen White (formerly Gordon) was a brilliant student at Edinburgh University, where she qualified in 1923 and obtained her doctorate in 1926. Even in those early days her career was hampered by the ill-health which recurred from time to time but failed to quench her courageous and buoyant spirit. Before her marriage she had specialized in obstetrics and was also for a time medical officer to McVitie and Price, the well-known biscuit manufacturers. Like so many other married medical women, she resumed her professional work during the second world war, when she took up an appointment at Woolwich Arsenal and was for a time senior medical officer at the Women's Hospital there. Although incapacitating major illness was her fate, her bravery and sane outlook on life were an inspiration to all who knew her. Our sympathy goes out to her husband, who was devoted to her.—H. J. P.

DAME BARRIE LAMBERT, D.B.E., M.B., D.P.H.

The obituary of Dame Barrie Lambert was published in the *Journal* of December 21, p. 1494.

A friend writes: After holding resident posts at the East Anglian Sanatorium and at the Elizabeth Garrett Anderson Hospital, Barrie Lambert went to Sweden, where she took a doctor's course in physiotherapy. Later she became a lecturer in physiotherapy in London. At the outbreak of the first world war she organized the first clinic for officers and men in Portland Place, which was financed by Mrs. Almeric Paget. This was inspected by Sir Alfred Keogh, who was so impressed with the value of the work that he asked her to start a similar department in the convalescent hospital he was starting at Eastbourne. For some months she acted as medical officer to the department, but, as the casualties increased, new convalescent hospitals were being started all over England, Scotland, Ireland, and Wales, and she was asked, together with Lady Essex French, to organize a corps of physiotherapists to staff these hospitals. This became the Almeric Paget Massage Corps, later the Military Massage Service, some 5,000 strong. Barrie Lambert was appointed inspector of the massage and electrical departments attached to the many convalescent hospitals and depots, with the title of Inspector of Military Massage and Electrical Services. She was the first woman to wear uniform and to wear the R.A.M.C. badge, and she had a personal letter from Sir Alfred Keogh giving her permission to wear the badge.

to the registrar. He had not culpably withheld information which should have been given on death certificates, but had shown errors of judgment. They did not express the view that Mr. Barber was unfitted to hold a consultant's post, and said it was for the board to decide how his services could be used in the future.

As the judge put it, the whole matter of the complaints against Mr. Barber was swallowed up in a vast administrative machine of panels, committees, subcommittees, reports, and correspondence. Contrary to the intentions of the distinguished professional men involved, there emerged from the machine a result unfavourable to Mr. Barber. In a sense he was condemned and punished unheard, for when the panel's report was considered by the board's consultant services committee they decided that his conduct be viewed with extreme disapproval, that as soon as possible a consultant be appointed to take charge of his unit, and that he should cease to have administrative responsibility.

The letter from the secretary announcing these decisions to Mr. Barber involved a complete rejection of the findings of the panel expressed in their report, and much of the letter bore no relation to the report. It was a letter of censure, and Mr. Barber when subsequently offered a contract depriving him of half his administrative responsibility reasonably thought that it was the first dose of this very bitter medicine and refused to sign it because he considered he was being punished unheard.

In January, 1952, the general purposes committee of the board authorized his dismissal on three months' notice, and in spite of attempts from many quarters to get him reinstated his contract was terminated from April 30, 1952. The Minister maintained that he had no jurisdiction to interfere on the ground that Mr. Barber had no written contract with the board.

Mr. Justice Barry held that from July, 1949, Mr. Barber had been employed by the board on a contract which incorporated the terms and conditions of service for Health Service officers, including clause 16, and that its termination was a breach of the board's contractual obligations. He did not think that the secretary or the senior administrative medical officer acted in bad faith, however wrong they may have been, in concluding that Mr. Barber was a nuisance and that it would be in everyone's interest to terminate his contract. If Mr. Barber's appeal to the Minister had been put before a professional committee the Minister would have been advised that substantial unfairness had entered into his dismissal, and so he would have continued his employment.

The judge held that Mr. Barber was entitled to recover the equivalent of five years' salary less tax, plus damages for the loss of his private practice as a result of the exclusion of his patients from all hospitals in the region. The total amount awarded was £7,437.

M.O.H. WINS SLANDER ACTION

A county medical officer of health won an action for slander against a member of the county council at Staffordshire Assizes on December 9. The case was heard before Mr. Justice Hinchcliffe; the plaintiff was Dr. Gerald Ramage, of Stafford, and the defendant Alderman George Wilfred Newman, of Brereton, near Rugeley, an industrial social welfare organizer, and a member of the Staffordshire County Council.

It was alleged that at a meeting of the Staffordshire County Education Committee on April 6, 1957, Mr. Newman, in the presence of a number of people, said of Dr. Ramage, "He is cleverer than you think. I have known him longer than you. There is a limit as to how far you can trust him." It was stated that the words complained of were spoken at the end of a meeting during which Mr. Newman had criticized the wording of certain forms sent to parents whose children, it was considered, should go to county special schools.

On behalf of Dr. Ramage it was contended that the words meant that he was false, unscrupulous, and untrustworthy in his behaviour as medical officer, and that he was therefore unfit for that position. Mr. Newman denied speaking the

words complained of, and said further that the words did not mean what was alleged, and that they were incapable of any of the meanings alleged or of any defamatory meaning.

In giving judgment, Mr. Justice Hinchcliffe said that he could not believe that five witnesses called by the plaintiff had "come to mislead the court." All that the defence witnesses had been able to say was that they did not remember that the words were used. He found that the defendant did speak the words complained of, and in his opinion the words were defamatory in the ordinary and natural meaning. Awarding Dr. Ramage 150 guineas damages, and costs, the judge remarked that it was a sum "to make it clear that slanderous and offensive statements are not to be tolerated." After the case, Dr. Ramage stated through his solicitor that the damages would be given to the N.S.P.C.C.

The Medical Protection Society instructed Messrs. Le Brasseur and Oakley, solicitors, to act for Dr. Ramage.

Medical Notes in Parliament

CARE OF THE DISABLED

Mr. ROBERT CARR, Parliamentary Secretary to the Ministry of Labour, told the Commons on December 13 that the Government would press on wherever possible with the implementation of the Piercy Committee recommendations on the rehabilitation and resettlement of the disabled, subject only to the urgent present need for economy. The Bill (promised in the Queen's Speech) was in course of preparation, and would be introduced in plenty of time for completion this session. It would amend the Disabled Persons Employment Act, and, although a valuable measure, would not be a major one. It would include two small alterations in the registration scheme for the disabled; would transfer statutory responsibility for supervising local authority schemes for sheltered employment from the health committees to the Ministry of Labour; and would reduce the minimum age for industrial rehabilitation and training from 16 to the school-leaving age.

He was replying to a debate initiated by Mr. EDWARD EVANS (Lowestoft, Lab.) on the care of the handicapped, and in recording the progress that had been made he said that it started with the great development and application of medical knowledge and treatment. Since July, 1945, almost 50,000 disabled persons, including blind, had been trained under the Vocational Training Scheme and placed in employment. In recent years these successful placings had averaged 91% of trainees who had completed the course—a tremendously encouraging figure. There had also been a striking decline in the number of severely disabled unemployed, from nearly 13,000 in 1946 to 4,000 in June, 1955, and 3,640 in October this year—almost the lowest figure since the registration scheme came into operation. The Piercy recommendations relating to the hospital and medical services—physiotherapy, resettlement clinics, rehabilitation centres, better information, and even persuasion for the medical profession—were not matters for direct Government action, but it was intended to circulate advice to the hospital authorities in the near future. He was disappointed that in view of the economic situation they could not undertake at this time to proceed with additional industrial rehabilitation units. The assessment of suitability for Remploi had been undertaken on an experimental basis, with satisfactory results, and this was being extended to a large number of units. The recommendation for an Exchequer grant to the welfare services was still under consideration. The Ministry of Health would issue early in the new year a circular to local authorities on the group of recommendations dealing with the further and better provision of welfare services, and this would include references to appliances and other aids. The training of disablement resettlement officers was to be extended from four days to one month.

Mr. Evans, who moved a resolution urging that future policy should be related to the recommendations of the Piercy Committee and other bodies concerned with the welfare of the handicapped—which was agreed to—has devoted himself to their welfare since he was a young assistant master in a London school for the blind 50 years ago. He emphasized the importance of early diagnosis, the need to educate the parent as well as the child, and the importance of the family doctor being made aware of the facilities available.

Sir KEITH JOSEPH (Leeds, North-East, Con.), speaking mainly about the medical aspects of rehabilitation, said that if the profession lived up to the standard of its leading doctors there would be a smaller number of people for whom rehabilitation would have to be sought. The Piercy report said that all doctors should be taught in their training about the facilities available, and what modern treatment offered. There was no need in hospitals for great empire-building departments concerned with rehabilitation with a capital R if every doctor and nurse had the right attitude towards mishaps. It was not easy, but it was the practice of many of the best doctors and nurses already.

Mr. SOMERVILLE HASTINGS (Barking, Lab.) stressed the importance of early recognition of disabilities of all kinds, and the need to realize that many disabled people had psychological as well as physical scars. It was unfortunate that many parents of what were called mentally retarded children seemed to hide them as soon as the disease was recognizable. He wanted to see any defect in children made a notifiable disease. The medical officer of health and the family doctor could then discuss what was best to be done and training could begin as soon as possible. He had suggestions to make about two special cases, the tuberculous and the epileptics, who shared the common difficulty that other people were not anxious to work with them. He thought they would be much better dealt with in sheltered workshops. No matter how much it might cost, it was important to provide facilities for the occupation in work of people who were a public danger because of their infection. For epileptics, he appealed for efforts to find employment for them in hospitals and local health institutions. People already engaged in health administration ought not to be frightened of them. This work would have to be very limited in scope, probably clerical, but there were spheres where he thought they could be occupied.

Senior Registrars

Mr. KENNETH ROBINSON (St. Pancras, North, Lab.) asked the Minister of Health on December 16 how long discussions had been going on with the Joint Consultants Committee on the future of senior registrars who had completed their normal term of service; and when he expected to announce a decision. Mr. D. WALKER-SMITH said the present series of discussions, which had raised issues of considerable complexity, had extended over the past two years, but developed from earlier discussions on junior hospital medical staffing. A decision would be reached as soon as possible.

Mr. ROBINSON wanted to know whether it was the Ministry or the consultants who were responsible for this interminable delay, which was causing acute anxiety and distress in breach of faith to them. Would he come to a decision quickly? Mr. WALKER-SMITH said he did not accept any allegations of breach of faith. He was getting on with this as fast as possible. His proposals went to the committee in November, and they were to be discussed again at the next meeting with the joint committee on December 30.

Psychiatrists

The MINISTER OF HEALTH stated, in answer to Mr. K. ROBINSON, that he was aware of the shortage of psychiatrists in all branches of the mental health services, and that this special consideration was before the Willink Committee on the future requirements of medical manpower. Mr. Robinson asked why there was no mention of psychiatry in the Willink Report. Mental hospitals were grossly under-

staffed, and patients were being denied treatment because the doctors were not available. Implementation of the Royal Commission's recommendations must involve a great expansion of the psychiatric service. How could this take place if the medical intake was to be restricted to 20% overall? Mr. WALKER-SMITH said he was not sure how far it was for him to interpret what was in the minds of the committee. He understood their conclusion was that it was not necessary for their purposes to include in the report a separate estimate for each specialty. In the evidence given by the Ministry special attention was drawn to the need for more psychiatrists.

Economics of the Health Service

Mr. J. CRONIN (Loughborough, Lab.) suggested the inclusion in the syllabus of medical and dental students of some elementary knowledge of the economics of the Health Service and of the costs of treatment for which they would eventually be responsible. Mr. WALKER-SMITH: I am considering a recommendation made in the Report of the Select Committee on Estimates on the Running Costs of Hospitals that I should urge upon all medical and dental schools and teaching hospitals the inclusion of these subjects in the curricula. Mr. CRONIN's comment was that this was satisfactory news, because for all practical purposes doctors in the Health Service had a blank cheque to an almost unlimited extent on public funds. It would be very useful to have some increase in their awareness of their financial responsibilities.

Doctors' Pay

Mrs. LENA JEGER (Holborn and St. Pancras, South, Lab.) asked if the Minister was aware of the financial difficulties of doctors in the Health Service who had to advance a trainee's monthly salary, for which they were reimbursed quarterly in arrears; and whether he would ask executive councils to make these refunds monthly in future. Mr. WALKER-SMITH said that no case of difficulty had come to his notice. Arrangements had recently been made for doctors to receive the main part of their remuneration monthly if they wished, and this should help to relieve any difficulties that might have arisen in the past.

Proprietary Drugs

Dr. EDITH SUMMERSKILL (Warrington, Lab.) asked if, in view of the usefulness of the *British National Formulary*, the Minister would arrange for its more frequent revision and distribution. Mr. WALKER-SMITH replied that a revised formulary was published by the British Medical Association and the Pharmaceutical Society of Great Britain at intervals of about two and a half years, and he understood that it would not be practicable to do so more frequently.

Dr. SUMMERSKILL asked the Minister what action he was taking to prevent doctors from prescribing proprietary drugs which were of no greater, or of less, value than comparable drugs listed in the *National Formulary*. Mr. WALKER-SMITH: I have no power to prevent doctors from prescribing the drugs they consider necessary. But they have been asked to pay regard to comparative price when considering whether to prescribe proprietary preparations which are the equivalent of, or analogous in therapeutic effect to, preparations in the *British National Formulary*; and not to prescribe proprietary preparations classified by Joint Committees of the Central and Scottish Health Services Councils as consisting of or containing drugs which, in the Committee's view, are not of proved therapeutic value. Dr. SUMMERSKILL said the answer had made it clear that proprietary drugs were being prescribed which had an equivalent in the *Formulary* and could therefore be prescribed more cheaply. In view of the fact that the price of prescriptions had soared, and the colossal size of the drug bill, would the Minister reconsider this? Mr. WALKER-SMITH explained that it would require legislation to ban the prescribing of any particular preparation, as the Health Service Act simply provided for the supply of proper and sufficient drugs and medicine. The Hinchliffe Committee was considering the cost of prescriptions. Meanwhile there was a

voluntary price agreement; and there were the *Prescribers' Notes* sent to all Health Service doctors, which should be helpful to them.

He stated in another reply that the average cost of each prescription dispensed in the Health Service was approximately 5s. 8d. in September, 1957, compared with 5s. in September, 1956.

Dental Caries

Mr. SOMERVILLE HASTINGS (Barking, Lab.) asked the Minister whether his attention had been called to a report indicating that the percentage of London children of 5 years of age with caries-free teeth had decreased considerably since 1947; what reports on this subject he had received from other parts of England and Wales; and if he would cause an inquiry to be made as to the reason for this deterioration and how it could be prevented. Dr. BARNET STROSS (Stoke-on-Trent, Central, Lab.), also had a question on this subject. Mr. RICHARD THOMPSON, Parliamentary Secretary, stated that, according to a recent report by Lady Mellanby and others, 15.5% of London schoolchildren aged 5 years were free from dental caries in 1955 compared with 28.1% in 1947. A report from Staffordshire which was included in the Chief Medical Officer's Annual Report for 1955 also showed a decrease. Research into the reasons and into methods of prevention was proceeding; but the Minister was advised that the deterioration was due largely to faulty dietetic habits and that the main hope of prevention lay in dental health education, reinforced where necessary by the fluoridation of water.

Poliomyelitis Vaccination

Mr. B. JANNER (Leicester, North-West, Lab.) asked if the Minister was aware that a public health inspector died recently of polio-encephalitis after having been refused vaccination against this disease; and if he would place among the priorities for anti-polio vaccination doctors, nurses, and public health officials whose work brought them into contact with polio cases. Mr. WALKER-SMITH said that he was aware of the case. Advice on priorities for vaccination was given by a committee set up by the Central and Scottish Health Services Councils. Vaccination was already available to hospital staff treating poliomyelitis cases in the infectious stage, and would shortly be offered to general medical practitioners and to ambulance staff. Public health inspectors were not at present included, but the extension of the priority arrangements to new groups was kept under frequent review.

Infection from Sea-bathing

Dr. REGINALD BENNETT (Gosport and Fareham, Con.) asked the Minister what action, other than routine, had been taken by his department and local health authorities to ascertain accurately the causes of the three cases of poliomyelitis, medically attributed to sea-bathing at one heavily polluted beach, particulars of which had been sent to him. Mr. WALKER-SMITH replied that further inquiries revealed that the notification of poliomyelitis in two of these cases had been corrected. He was advised that in the third case, as in most cases of poliomyelitis, it was not possible to establish accurately the mechanism of infection. Dr. BENNETT suggested that unless the most careful examination could be made of any case reported by doctors as having been probably infected by sea-bathing it was unlikely that evidence would be supplied on which to make a decision whether sea-bathing was to blame, and there would continue to be uncertainty behind which inertia could shelter. Mr. WALKER-SMITH said he would not like to think there was any inertia on such a subject. A committee of the Public Health Laboratory Service was making a survey of the bacterial pollution on various sections of the coast, and trying to find whether any relationship existed between enteric disease and recent bathing in heavily polluted sea-water.

Dr. BENNETT asked the Minister if he would encourage the taking, and posting up in public, of periodical bacterial counts of samples of sea- or river-water at locations where

there was suspected pollution, together with indications of how such counts compared with the worst degrees of uncleanliness allowed in swimming-baths. Mr. WALKER-SMITH said he did not think that the posting of such information would serve any useful purpose. He was advised that in view of the difficulty of interpreting such counts the information would be misleading to the public. Dr. BENNETT said tests were taken and were commonly found to be highly unsatisfactory. Mr. WALKER-SMITH replied that the conclusions could only be assessed by scientific people trained to evaluate the material.

Accidents in the Home

Mrs. P. McLAUGHLIN (Belfast, West, U.U.) asked the Minister to make arrangements that all home accidents which required hospital treatment should be reported to the local medical officer of health. Mr. THOMPSON told her it was proposed in circulars to local health and hospital authorities shortly to encourage the supply of information by hospitals to medical officers of health. Mrs. JEGER asked why the Minister was going only half-way, and suggested that notification should be made obligatory. Mr. THOMPSON told her it was not proposed that hospital authorities should notify details of each casualty treated. The patient's consent would be required before information could be transmitted.

Multiple Packs

Dr. J. DICKSON MABON (Greenock, Lab.) asked the Secretary of State for Scotland on December 17 whether the discussions with the medical profession for additional multiple packs, to which only the 1s. charge should apply, were complete; and why they had lasted over a year. Mr. J. S. MACLAY replied that the discussions on the suggestions that had so far been made for multiple packs were complete, and a proposal for a new dressings pack was under consideration by the manufacturers. The profession and the health departments had agreed that it would be impracticable to devise a pack for diabetic and T.B. patients or a dressings pack for colostomy patients that would meet the varied needs of a sufficient number of patients to make their production useful.

Drugs for Private Patients

Mr. JOHN HALL (Wycombe, Con.) has won the point, but lost the match. On December 17 the Speaker ruled that the device he had adopted for using the National Land Fund to finance free drugs for private patients was in order; but on the same day there appeared on the Commons proceedings a string of 13 other Bills, for various purposes but all financed in the same way, proposed by Opposition Members who the previous week had objected to Mr. Hall's scheme as a subterfuge to get round the rule that no private member can introduce legislation which imposes a charge on the public purse.

The SPEAKER ruled that Mr. Hall's argument was valid; the Land Fund was a separate entity, and new expenditure charged upon it did not result in a charge on the Exchequer; therefore Mr. Hall was entitled to seek leave to introduce his Bill. But further resort to the device might raise difficulties, and that might require reconsideration of the procedure by the House.

Mr. HALL said that when he first introduced the Bill it was his intention to try to remedy a long-standing injustice which prevented private patients obtaining their medicines and appliances under the same conditions as those ruling for State-registered patients, and to guard against a threat to the standard of medicine if private practice disappeared altogether. However, in view of the long list of Bills, which if debated would hold up Government business, and as he was not prepared to see his Bill used for that purpose, and on the understanding that he had the right to bring it forward in this or another way, he would withdraw the Bill. Whereupon Mr. MITCHISON (Kettering, Lab.) ended the match by withdrawing, on behalf of all the Labour Members concerned, the other proposals to finance private Members' legislation out of the Land Fund—but similarly reserving their right to reintroduce them.

non-paralytic cases than in the preceding week. The largest returns were Leicestershire 12 (Leicester C.B. 9), Kent 11 (Canterbury C.B. 2, Broadstairs and St. Peters U.D. 2, Margate M.B. 2), and Berkshire 7 (Reading C.B. 4, Newbury M.B. 2).

England and Wales in 1956

The infant mortality rate (24 per thousand live births) and the maternal mortality rate (0.46 per thousand live and still births) in England and Wales in 1956 were the lowest recorded annual rates. By contrast the general death rate (11.7 per thousand population) was the same as in 1955, and higher than in several previous years.

The general death rate from cancer, which has steadily increased for some years, did so again in 1956, when it was 2,112 per million population. The main types of cancer showing an increased death rate were cancer of lung and bronchus (110 per million population), cancer of breast in women (371 per million females), and cancer of the prostate (165 per million males). An increased death rate was also recorded as due to neoplasms of lymphatic and haematopoietic tissues, which category includes various types of leukaemia. The rate was 104 per million population in 1956, compared with 101 in 1955 and 65 in 1946.

There were 5,375 deaths from tuberculosis, 8 from diphtheria, 95 from whooping-cough, 15 from scarlet fever, 189 from meningococcal infections, 30 from measles, 106 from acute infectious encephalitis, 114 from acute poliomyelitis, 62 from herpes zoster, 12 from chicken-pox, 1 from rubella, 4 from mumps, 272 from infectious hepatitis, 6 from glandular fever, 1 from rabies, 4 from malaria, 10 from hydatid disease, and 5 from actinomycosis. Deaths from coronary artery disease again increased, numbering 46,921 for men and 27,869 for women, an increase over 1955 of 2,665 for men and 1,528 for women. Over 14% of all deaths were due to this cause.

The 356 deaths caused by accidental poisoning included 223 caused by barbiturates, 39 by aspirin and salicylates, and 17 by alcohol. Deaths from suicide numbered 4,282, giving a rate of 118 per million population, the highest since the war. Deaths from homicide numbered 181, a figure that has not appreciably changed for at least 10 years. Deaths from motor-vehicle traffic accidents numbered 4,939. This gave a rate of 113 per million population, which was the highest for many years.—*Registrar General's Statistical Review of England and Wales for the year 1956*, Part 1, Tables. Medical, H.M.S.O., 15s.

The graphs below show the uncorrected numbers of cases (deaths for influenza) of certain diseases notified weekly in England and Wales (great towns for influenza). Highest and lowest figures reported in each week during the years 1948-56 (influenza, 1952-6) are shown thus - - - - -, the figures for 1957 thus ———. Except for the curves showing notifications in 1957, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Infectious Diseases

The largest rises in the notifications of infectious diseases in England and Wales during the week ending December 7 were 371 for measles, from 1,843 to 2,214, 163 for acute pneumonia, from 486 to 649, and 115 for dysentery, from 461 to 576; the largest falls were 60 for whooping-cough, from 635 to 575, and 49 for scarlet fever, from 772 to 723.

The largest increases in the incidence of measles were 61 in Yorkshire North Riding, from 104 to 165 (Middlesbrough C.B. 150), 58 in Hertfordshire, from 55 to 113, 52 in Denbighshire, from 43 to 95 (Wrexham M.B. 31, Wrexham R.D. 64), and 43 in Glamorganshire, from 175 to 218; the only large fall was 49 in Norfolk, from 118 to 69. The largest falls in the number of notifications of scarlet fever were 24 in Yorkshire West Riding, from 110 to 86, and 22 in Lancashire, from 106 to 84. The only fluctuation of any size in the trends of whooping-cough was a decrease of 22 in Yorkshire West Riding, from 65 to 43. Only 1 case of diphtheria was notified, compared with 5 in the preceding week. The incidence of acute pneumonia increased throughout the country; the largest rise was 30 in Middlesex, from 18 to 48.

All the 6 cases of paratyphoid fever were notified in South Westmorland R.D.

81 cases of acute poliomyelitis were notified during the week, and these were 22 more for paralytic and 3 more for

The largest rise in the number of notifications of dysentery was 41 in London. The chief centres of infection during the week were London 135 (Islington 38, Hammersmith 14, Stoke Newington 12), Lancashire 125 (Eccles M.B. 38, Liverpool C.B. 28, Salford C.B. 21), Yorkshire West Riding 82 (Leeds C.B. 18, Sheffield C.B. 18, Huddersfield C.B. 12, Hemsworth R.D. 10), Middlesex 34 (Ealing M.B. 18), Durham 25 (Stanley U.D. 13), and Surrey 24 (Reigate M.B. 21).

Postgraduate Medical School.—Mr. ISAAC WOLFSON, chairman of Great Universal Stores Ltd., has given £125,000 to the building appeal fund of the Postgraduate Medical School of London. The money is to be used for the lecture theatre block, which will also contain the staff common rooms and dining-room (see *Journal*, 1956, 2, 1052). The Postgraduate Medical School launched an appeal for £750,000 in November, 1956. Up to date rather less than half this sum has been collected. Donations should be sent to the appeal treasurer, Postgraduate Medical School, Ducane Road, London, W.12.

Leverhulme Research Awards.—To mark the 25th year of their research award scheme the Leverhulme Trustees have issued a first report on it. The awards are made from a fund set up under the will of the first Viscount Leverhulme, the creator of the firm of Lever Brothers. He died in 1925. The income from this fund, states Sir HECTOR HETHERINGTON in an introductory note to the report, was to be applied to certain charities and "for the purpose of providing scholarships for such purposes of research and education" as the trustees should decide. In 1933 the trustees resolved to use £12,000 annually to assist experienced workers who by reason of their routine duties or by other causes were prevented from undertaking or completing valuable investigations, and this, though later broadened, has remained the Trustees' principal aim, the primary test for eligibility for a grant being that an undertaking should involve some loss of earnings. More recent schemes include awards for workers in Continental centres of learning, and for a two-way traffic between the staffs of the university colleges in Africa and the West Indies and those of British universities. Including this year, the trustees have now made 612 awards, costing a total of £276,548, of which 580 were of the general pattern described above. The report catalogues the 273 awards (costing £130,299) made during 1933-47, the first fifteen years of the scheme; and further reports covering the later years are promised at five-year intervals. The grants are listed under three headings: Arts and Humanities, Natural Sciences including Mathematics and Medicine, and Social Sciences. Brief notes are given of each fellow's subject of research, and of his publications and career. The present Leverhulme Trustees are Lord Heyworth, Mr. J. Lomax Simpson, the third Viscount Leverhulme, Mr. R. E. Huffman and Mr. G. J. Cole. The advisory committee under Sir Hector Hetherington's chairmanship comprises Lord Adrian, Sir James Chadwick, Sir Cyril Hinshelwood, Sir James Mountford, and Sir Ifor Evans. Copies of the report are available from the office of the advisory committee, St. Bridget's House, Bridewell Place, London, E.C.4.

King Edward's Fund.—The DUKE OF GLOUCESTER presided at a council meeting on December 12, at which LORD MCCORQUODALE presented the estimates for 1958. The latter said that £100,000 had been allocated for general hospitals, of which £25,000 was earmarked for hospital kitchens and catering facilities. In addition, £40,000 was reserved for the last of the Fund's twelve homes for the

aged sick, and £25,000 for grants to convalescent homes. Sir ARCHIBALD GRAY said the distribution committee had made a grant of £10,000 to the British Student Tuberculosis Foundation. This Foundation had been started, he said, entirely by university students, who since 1950 had collected something like £35,000 to help students with pulmonary tuberculosis. Up to the present, accommodation had been in two centres outside London, to which it was difficult for tutors from the various colleges to travel. Mottingham Hall, in the grounds of Grove Park Hospital, Lewisham, was now to be converted into a hostel, taking about 35 ambulant cases, and there would be two wards in Grove Park Hospital for those who had to be hospitalized. The students would thus get much better accommodation, with a resident warden, and be within easy reach of the various colleges of London University. Sir HENRY TIDY said that, owing to the improved treatment of heart cases, there was an increasing demand for convalescence for patients who could not manage stairs. Very few convalescent homes had sufficient rooms on the ground floor, and they were faced with building additional rooms or putting in lifts, which was an expensive matter. It was also announced that the Fund had completed its move from 10, Old Jewry, to its new premises at 34, King Street, London, E.C.2.

Tribute to Lord Nuffield.—On December 19 Sir HENRY DALE, O.M., F.R.S., Sir CLEMENT PRICE THOMAS, and Dr. W. N. PICKLES presented Lord NUFFIELD with a pair of diamond and pearl cuff-links and a cheque for over £3,500. These gifts were made to Lord Nuffield on behalf of doctors from all over the Commonwealth as tokens of the deep respect, affection, and admiration in which he is held by the medical profession. They had been subscribed for by individual doctors as an 80th-birthday tribute to "the most generous benefactor to medicine that this country has ever known."

Royal College of Surgeons.—At a meeting of the council on December 12 Lord WEBB-JOHNSON (past-president) was elected an honorary fellow of both the Faculty of Anaesthetists and the Faculty of Dental Surgery. The following lecturers for 1958 were appointed: Bradshaw, Sir ARCHIBALD MCINDOE; Robert Jones, Mr. NORMAN CAPENER; Thomas Vicary, Sir JOHN MCNEE; Charles Tomes, Professor H. G. RADDEN. Diplomas of fellowship were granted to the following:

P. L. Berger, N. E. Winstone, J. S. Mehta, P. M. Bacon, N. MacDonald, J. S. Lowry, T. R. Beatson, A. N. Cowan, D. J. C. Graff, A. H. Tooley, W. M. Huse, R. J. Jagose, D. Singh (otolaryngology), I. R. Stillman, J. R. Boule, R. B. Chattopadhyay, E. G. Brewin, R. N. McCann (ophthalmology), L. P. B. Kiriella, H. L. J. Lusby, B. K. Shenolikar, P. M. Yeoman, V. Marwah, H. J. Tighe, H. Weisl, W. G. T. Bell, A. G. Horsburgh, K. J. Millar, J. E. Reimer, A. Sinha (otolaryngology), M. D. M. Staunton, N. J. Blacklock, M. A. Browne, B. J. Ireland, C. Kathirkamanathan, S. Levitt, J. P. Lythgoe, J. H. Phillips, K. S. Subramaniam (ophthalmology), S. M. Bhatt, W. J. Burfitt-Williams, J. T. Dunn (otolaryngology), J. Fairgrieve, M. H. Gough, L. R. H. Gracey, R. L. Gupta, C. A. Holborow, L. Klenerman, K. W. Mills, J. G. Power, S. C. Simmons, A. R. Trist, R. D. Weeks, J. Winstanley (ophthalmology), A. G. Amias, R. C. Baillie, J. M. Beith, B. R. A. Binnewald, S. A. R. Gardezi, A. N. Griffith (otolaryngology), H. M. Hadley, T. M. Hannigan, I. M. Irving, G. Lautré, K. C. Mittal, J. W. Monaro, M. Y. Rai, W. H. Raynham, J. B. M. Roberts, H. B. Ross, J. H. Steyn, E. C. Watson, Y. N. Agrawal, J. M. Bremner, C. G. Clark, H. V. Crook, P. A. Harbison, J. D. Hughes, R. G. Kay, T. T. King, S. Mukerjee, A. S. Parikh, R. Tym, D. B. M. Williams, A. S. Cass, A. D'A. Pelly, P. M. Segelov.

Asian 'Flu Vaccines.—Vaccines against Asian influenza are now stated to be generally available in Britain on prescription. Messrs. Parke, Davis and Company announce that they are distributing influenza virus A (Asian) vaccine prepared at the Wright-Fleming Institute of Microbiology (St. Mary's Hospital Medical School), and Glaxo Laboratories Ltd. are distributing their own "Glaxo" Asian influenza vaccine. We summarized present experience with influenza vaccines in an annotation last week (*Journal*, December 21, p. 1482).

Van Meter Prize.—The American Goiter Association again offers the Van Meter Prize Award of \$300 and two honourable mentions for the best essays on original work on problems related to the thyroid gland. Essays may cover either clinical or research investigations, should not exceed 3,000 words in length, and must be presented in English. Duplicate typewritten copies, double spaced, should be sent to Dr. JOHN C. MCCLINTOCK, 149½, Washington Avenue, Albany, 10, New York, not later than February 1.

Medical Auxiliaries.—Recognition was granted by the Board of Registration during 1956-7 to the Society of Audiology Technicians and the Institute of Technicians in Venereology, it is stated in the Board's annual report. During the year registers of orthoptists, operating theatre technicians, and dispensing opticians were published. Further information about the Board's work is obtainable from the registrar, Board of Registration of Medical Auxiliaries, Tavistock House (North), Tavistock Square, London, W.C.1.

Unmarried Mothers.—The National Council for the Unmarried Mother and her Child asks to be kept informed of any research on unmarried mothers and their children. Details should be sent to the general secretary, 21, Coram Street, London, W.C.1. The intention is to compile a research register.

COMING EVENTS

Institute of Diseases of the Chest.—Clinical demonstrations, open to medical practitioners without fee, will be held at the Institute (in the grounds of the Brompton Hospital, Fulham Road, London, S.W.3) on Fridays at 5 p.m. from January 3 to March 21.

West German Medical Association.—International post-graduate medical courses on the "routine case in daily practice" at Davos, Switzerland, March 10-22, and at Bad Gastein, Austria, March 9-22. Details from Kongressbüro der Bundesärztekammer, 1, Haedenkampstrasse, Köln-Lindenthal.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Wednesday, January 1

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—5.30 p.m., Dr. I. Friedmann, Dr. D. A. Osborn, and Dr. S. Epstein: clinical-pathological conference.

Thursday, January 2

ROYAL EYE HOSPITAL.—5.15 p.m., Dr. T. H. Whittington: Ophthalmic Prisms and Their Use in Refraction Work.

Friday, January 3

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—5.30 p.m., Mr. A. Radcliffe: Tracheotomy and its Medical Implications.
ROYAL MEDICO-CHIRURGICAL SOCIETY OF GLASGOW.—At Royal Faculty of Physicians and Surgeons of Glasgow, 8.30 p.m., Dr. Gavin C. Arnell: Bright's Disease in Childhood.

Saturday, January 4

MIDLAND THORACIC SOCIETY.—At Birmingham Chest Clinic, subject: Problems Arising out of Drug Resistance. Papers by Dr. J. Aspin, Dr. D. J. O'Brien, and Dr. H. E. Thomas.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Billingham.—On December 10, 1957, at Queen Charlotte's Hospital, to Margaret (formerly Macpherson), M.B., B.S., wife of John Bingham, B.M., B.Ch., a son—Robert Iain Colin.
Martin.—On December 10, 1957, at 9, King Street, Chester, to Rosemary (formerly Bolam), M.B., Ch.B., and Geoffrey Martin, M.B., B.S., a daughter.
Watson.—On December 11, 1957, in Port of Spain, Trinidad, B.W.I., to Margaret (formerly Brocklebank), wife of H. Preston Watson, F.R.C.S.Ed., of Tobago, B.W.I., a daughter.

DEATHS

Clifford.—On November 30, 1957, in hospital, Vernon John Philip Clifford, L.R.C.P.&S.I. & L.M., late of Grosvenor Street, London, W., and Farnham, Surrey.
Grimwade.—On November 29, 1957, at Melbourne, Australia, Sidney Wilfred Grimwade, O.B.E., M.B., F.R.C.S.Ed., Surgeon Captain, R.N., retired, of 237, New Church Road, Hove, Sussex.
O'Driscoll.—On December 2, 1957, in a nursing-home, Timothy More O'Driscoll, L.R.C.P.&S.I., L.R.F.P.S., formerly of Lloyd Street, Manchester, aged 86.
Wallace.—On October 18, 1957, Hugh Archibald Wallace, M.B., B.S., of 148, Roker Avenue, Sunderland, Co. Durham.

Any Questions?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Steroid Therapy in the Elderly

Q.—Are there any specific contraindications to giving drugs such as cortisone or prednisone to elderly patients? I understand there is a special risk of fracture.

A.—In old age the bones ordinarily tend to become osteoporotic, and this occurs at a much earlier age in patients with rheumatoid arthritis, as it is also one of the earliest manifestations of that condition. Thinning of the bone cortex naturally increases its liability to fracture, and it is thought that in some cases steroid therapy, by virtue of its proteolytic action, reinforces this tendency. A considerable body of opinion holds, however, that many of the fractures reported as occurring in the early stages of steroid therapy are not due to this, but to the suddenly improved function of previously stiff joints exposing the bones to unaccustomed stresses and strains, more particularly in the case of weight-bearing bones. There are no other complications of steroid therapy peculiar to old age.

Women in the post-menopausal phase may have a special liability to develop osteoporosis whilst on steroid therapy, so that regular observation is important in such cases, and minimal dosage must be employed.

Zinc Ionization for Hay Fever

Q.—What is the rationale and value of zinc ionization in the treatment of hay fever?

A.—The effect of zinc ionization is to produce an acute inflammatory reaction of the nasal mucous membrane, but once the exudate has disappeared the mucosa becomes dry and its secretions scanty; thereafter it returns only slowly to its previous condition. It has been suggested that during the period of relief following ionization allergic reactions may take place but not to a degree sufficient to produce symptoms. Whether or not metallic zinc penetrates the tissues has been the subject of controversy.

Hansel¹ has found that patients responding satisfactorily are those who show a low degree of sensitivity with a negative or borderline skin reaction, and that the results in those with clearly positive skin reactions and a high degree of sensitivity are, in general, very unsatisfactory. The presence of infection is a contraindication to ionization, for there is a risk of producing an acute sinusitis.

This method of treatment had a wave of popularity which reached its peak in the early 1930's.

Endogenous Adrenaline in Asthma

Q.—Adrenaline undoubtedly relieves many acute attacks of asthma. Why at the height of an attack do not an asthmatic's own adrenals secrete enough adrenaline to relieve him?

A.—Animal experiments which led to the knowledge that under certain conditions of stress the adrenal medulla secretes adrenaline depended on the denervated heart as an indicator. In animals whose hearts had been denervated stresses such as fright or rage caused a tachycardia, but if the adrenals had been removed beforehand this did not occur. In man it is more difficult to assess the functioning of the adrenal medulla, and only recently has it been possible to measure blood levels of adrenaline and noradrenaline.

It is known that anger or excitement will sometimes relieve attacks of asthma, presumably owing to strong stimulation of, and an adequate response by, the adrenals. It is also known that, if asthmatics become overtired and overworried, attacks tend to be more frequent, and it is possible that under these conditions the adrenals (both medulla and cortex) have become exhausted. Clinically, although very helpful in many attacks of asthma, adrenaline often does not give complete relief even if given in maximum therapeutic doses, while in many cases of status asthmaticus adrenaline is quite ineffective. The beneficial effects of cortisone and corticotrophin in such cases are now well established. Thus, the relief of mild attacks of asthma may indeed be the responsibility of the adrenal medulla, but to suggest that this is the only mechanism is an oversimplification. Clinicians, however, agree that attention to the general health of the asthmatic is of considerable importance, and this may be the best way of enabling the patient's adrenals to secrete that extra adrenaline.

Radiiodine in Milk

Q.—What ill effects in infants, children, and adults might result from the ingestion of milk contaminated by radioactive iodine?

A.—Radioactive iodine is concentrated in the thyroid gland; hence its therapeutic use in thyroid disorders. The gland of the adult is relatively resistant to radiation, so that doses of several thousands of rads are needed to depress function. On the other hand the glands of infants are thought to be much more sensitive, since irradiation of this area with x or γ rays to doses of 200 r and upwards has led to an increased incidence of carcinoma of the thyroid.

Following the Windscale incident on October 10, the maximum permitted activity in milk of ¹³¹I (with an average life of 11.5 days and average energy of β rays of 0.2 Mev) was set as 0.1 μc/litre. A child drinking 1 litre of milk a day would imbibe 1.15 μc, of which about one-third might concentrate in the thyroid of mass perhaps 2 g. Since the intake is spread over a long time the dose D will be fairly uniformly distributed and

$$= \frac{1.15}{3 \times 2} \times \frac{3.7 \times 10^4 \times 8.64 \times 10^4}{6.25 \times 10^7} \times \frac{2}{10} \times 11.5$$

≈ 20 rads or about 10% of the minimal toxic dose. However, such calculations are far from precise, and hence the need for caution.

Omitted Booster Inoculations

Q.—A girl aged 10 was inoculated against diphtheria and pertussis at the age of about 1 year, but she did not have the usual booster doses when starting school. What is now the best way of protecting her against tetanus and giving her the booster doses against whooping-cough and diphtheria?

A.—In view of the child's age and previous history of inoculations, the three infections mentioned are considered separately. This is not a case for the use of a combined prophylactic, and problems of interference with immune responses do not arise.

Whooping-cough vaccination at the age of 10 is probably not worth while as at that age the disease is much less severe than in early life. Moreover, some severe reactions to the vaccine have been reported in older children.

For diphtheria a Schick test should be performed in the first instance, as at 10 the child may be a negative reactor, and not require a boosting dose of diphtheria prophylactic. If the child is positive, the presence or absence of a reaction to the Schick control should be noted as a guide to the likelihood of some reaction after an injection of prophylactic. Pronounced pseudo-reactors usually have large amounts of diphtheria antitoxin in their serum and do not require further immunization. If they are inoculated, very sore arms may result. Positive reactors without any "pseudo" element can be further immunized with any currently available diphtheria prophylactic.

Tetanus toxoid is probably the most important antigen for this girl at the present time. She should be given three doses of 1 ml., the first and second being spaced by 6 to 12 weeks, and the second and third by 6 to 12 months. A record card of all injections should be kept in a safe place, as in the event of a mishap it will be required at short notice by either the hospital or the family doctor.

With regard to the order of the injections, perhaps the first two doses of tetanus toxoid should be given first, followed one month later by the boosting dose of diphtheria prophylactic if the Schick reading shows that this injection is necessary.

Pain in Motor Neurone Disease

Q.—A patient with progressive muscular atrophy is often woken after a couple of hours' sleep by pain in one or both calves. Is this a recognized accompaniment of the condition or should some other cause be sought?

A.—Painful cramps and dysaesthesiae in the limbs often occur in motor neurone disease (progressive muscular atrophy). Pain is not otherwise a manifestation of the condition. The cause is likely to be muscle spasm or cramp. This might be relieved by the oral administration of procaine amide, 250 mg. nightly.

Focal Attacks of Numbness

Q.—An otherwise fit and mentally well-balanced young man of 21 years complains that for the past three years he has had attacks of numbness in his left arm, shoulder, and head. The attacks occur about once every two months. The numbness starts in the fingers of the left hand and fairly rapidly passes up the arm to the shoulder and includes the left side of the head, scalp, and tongue. After about 20 minutes, sensation returns at first proximally and then passes down to the hand. Diminished sensation remains in the finger tips for a few days. He states there is no loss of power. One aunt suffers from migraine. I have seen him on one occasion about five days after an attack. Sensation was then normal, and the only possible abnormal physical sign was absence of any movement in the left hallux when eliciting plantar response. What is the probable cause of this syndrome?

A.—This patient is suffering from attacks of migraine, which may be the result of a relatively benign organic disturbance in the right parietal area; this possibility could be demonstrated or excluded by carotid arteriography. Attacks of this sort are difficult to treat in the absence of a local cause because the patient does not have headaches and therefore the vasoconstrictors used for migraine will not be beneficial. This being so, it would be wise to admit this patient for investigation in a neurological unit.

Drugs to Improve Athletic Performance

Q.—Does the use of drugs improve athletic performance?

A.—Several chemical compounds have been thought to improve athletic performance. The ingestion of alkalis was suggested both on theoretical grounds and as a result of an observation that the performance of endurance running was improved. This finding was obtained, however, in untrained subjects without the emotional stress of actual competition, and Johnson and Black¹ were unable to show any improvement of competitive performance following ingestion of alkalis by trained athletes.

Cocaine obtained from the leaves of *Erythroxylon coca* has been used for centuries by the natives of Peru and Bolivia to increase endurance. This probably results from a central stimulant action whereby the sense of fatigue is lessened and the capacity for work is increased. Side-effects such as garrulity, restlessness, and excitement may be dangerous. I know of no experiments with cocaine in relation to athletic performances.

Amphetamine has been studied as a part of war-time research projects. Cuthbertson and Knox² showed that oral administration of 15 mg. amphetamine sulphate or 10 mg. methylamphetamine hydrochloride increased their subjects' capacity to sustain a given level of prolonged work on a bicycle ergometer. If deterioration had already set in, output rose within a half to one and a half hours, and the increase was usually maintained for one hour. They concluded that the wide individual variation in response with side-effects such as euphoria and lack of judgment precluded the indiscriminate use of these drugs, though in a given subject the effect could be predicted fairly accurately after a few trials. Their results are open to the criticism that the subjects were not fully trained athletes undergoing a competitive performance.

Thus there is no adequate evidence of the beneficial effect of alkalis, cocaine, or amphetamine on the performance of the fully trained athlete.

Prognosis in Hodgkin's Disease

Q.—What is the prognosis for a case of Hodgkin's disease receiving present-day treatment?

A.—The course is very variable, ranging from a few months to many years, certainly over ten years. A good working figure is to say that of the earlier cases some 40–50% will be alive at the fifth year, while of the total cases between 20–30% will be surviving.

NOTES AND COMMENTS

Dangers of Ultra-violet Light.—Dr. M. J. PURDY (Hamilton, New Zealand) writes: As one who finds ultra-violet therapy useful in some dermatological lesions I am interested in your reply under "Any Questions?" (September 14, p. 653). As it has been shown that ultra-violet radiation penetrates the skin only a fraction of a millimetre, why is it so important that the patient wears goggles, provided the eyes are kept shut? It can be most embarrassing for a patient to have to expose himself to his fellows with a pair of pallid areas set in a tanned face. Similarly, is it really necessary for the operator to wear goggles if he is avoiding direct exposure to the lamp?

OUR EXPERT replies: The skin of the eyelids is unduly sensitive to ultra-violet irradiation, since it is not normally exposed to the sun's rays. Thus keeping the eyes shut during irradiation with ultra-violet will protect the conjunctivae but is likely to result in red and oedematous eyelids. To avoid pale areas around the eyes, small pieces of cotton-wool retained by vaseline can be placed on the closed eyelids. It is unnecessary for the operator to wear goggles if direct exposure to the lamp is avoided.

Collected Articles from the "British Medical Journal"

The following books are available through booksellers or from the Publishing Manager, B.M.A. House. Prices, which include postage, are now the same for both inland and overseas.

- Emergencies in General Practice* (26s. 9d.).
- Refresher Course for General Practitioners*, Volumes 2 and 3 (26s. 9d. each).
- Clinical Pathology in General Practice* (22s. 3d.).
- Any Questions?*, Volumes 2 and 3 (8s. 3d. each).

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELGRAMS: Aitology, Westcent, London. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad. British Medical Association Journals

The British Medical Association has as one of its primary objects the promotion of the medical and allied sciences. To this end the Association has been active in medical publishing for many years, and is responsible for a comprehensive range of general and special journals.

BRITISH MEDICAL JOURNAL

Annual Subscription: United Kingdom and Irish Republic £6 6s., single copy 3s.
Abroad £4 4s., single copy 2s.

For over a hundred years the *British Medical Journal* has each week recorded current developments in the art and science of medicine. It includes a Supplement devoted to medico-political and administrative matters and to the business of the Association.

The Association also publishes the following twelve specialist journals, and two abstracting journals:

ANNALS OF THE RHEUMATIC DISEASES. Quarterly. Annual subscription £3, single copy 17s. 6d.

ARCHIVES OF DISEASE IN CHILDHOOD. Bi-monthly. Annual subscription £4 4s., single copy 17s. 6d.

BRITISH HEART JOURNAL. Quarterly. Annual subscription £3, single copy 17s. 6d.

BRITISH JOURNAL OF INDUSTRIAL MEDICINE. Quarterly. Annual Subscription £3, single copy 17s. 6d.

BRITISH JOURNAL OF OPHTHALMOLOGY. Monthly. Annual subscription £6*, single copy 12s.

BRITISH JOURNAL OF PHARMACOLOGY AND CHEMOTHERAPY. Quarterly. Annual subscription £4 4s., single copy 25s.

BRITISH JOURNAL OF PREVENTIVE AND SOCIAL MEDICINE. Quarterly. Annual subscription £3, single copy 17s. 6d.

BRITISH JOURNAL OF VENEREAL DISEASES. Quarterly. Annual subscription £3, single copy 17s. 6d.

JOURNAL OF CLINICAL PATHOLOGY. Bi-monthly. Annual subscription £4 4s., single copy 17s. 6d.

JOURNAL OF NEUROLOGY, NEUROSURGERY AND PSYCHIATRY. Quarterly. Annual subscription £3, single copy 17s. 6d.

MEDICAL AND BIOLOGICAL ILLUSTRATION. Quarterly. Annual subscription £3, single copy 17s. 6d.

THORAX. Quarterly. Annual subscription £3, single copy 17s. 6d.

ABSTRACTS OF WORLD MEDICINE

Monthly. Annual Subscription £4 4s., single copy 8s. 6d.

Provides a critical selection of informative abstracts, grouped in broad classifications, of the more important articles appearing in medical periodicals throughout the world. This journal aims to keep the specialist in touch with work done in other fields as well as in his own, and the general practitioner abreast of modern movements in medical science.

OPHTHALMIC LITERATURE

Six issues and index. Annual Subscription £4 4s., single copy 25s.

A comprehensive abstracting service covering ophthalmic journals and articles of ophthalmic interest published throughout the world.

*Combined annual subscription for the two ophthalmological journals: £9.

British Medical Association

PROCEEDINGS OF COUNCIL

A meeting of the Council was held at B.M.A. House on Wednesday, June 26, at 2 p.m. The Chairman of Council, Dr. S. WAND, was in the chair. The Chairman announced with regret the death of Dr. George Clark Trotter, a member of Council from 1923 to 1938.

Remuneration Dispute

Resolutions adopted by the Special Representative Meeting on June 12 were considered, and, where appropriate, these were referred to the Royal Commission Evidence and other Committees.

It was agreed to send the following resolution to the Minister of Health:

"That an assurance be sought that full consultation will take place immediately, between the Minister and the profession, after the Commission has reported."

With regard to the resolution, "That all future negotiations on remuneration problems should be conducted by Council on behalf of the profession," Dr. F. M. ROSE said the implication seemed to be that the Council should be responsible for all negotiating, and he pointed out that the G.M.S. Committee was in its own right negotiating on behalf of general practitioners. It was agreed, at the suggestion of the Chairman, that the resolution should be received and noted for future action and referred to the committee to be set up to consider unity in the profession.

It was agreed to send to the Minister the following resolutions:

"That in the opinion of this meeting the interim payment of 5% net, compared with our claim for 24% gross increase, is entirely inadequate and the Council should strive to initiate negotiations or, failing this, arbitration, with a view to increasing the interim payment forthwith."

"That this meeting agrees that efforts should be made to secure a more adequate interim adjustment pending the report of the Royal Commission."

The Council discussed at length the arrangements for the preparation and submission of evidence to the Royal Commission and the arrangements for the establishment of a committee of inquiry to examine the whole field of medical services in the light of experience gained of the National Health Service since 1948.

Unity in the Profession

The Council further considered the resolution passed at its previous meeting that a committee should be set up to

examine the subject of unity in the profession, so that action by the various sections of the profession might be better co-ordinated and unified, and appointed a committee composed of the Chairman of Council, Chairman of the Representative Body, and two representatives each of the Public Health and G.M.S. Committees, with two additional members whom the Joint Committee is to be invited to nominate.

Medical Refugees from Hungary

Brigadier Sandiford and Dr. Annis Gillie were appointed as representatives to serve on the committee which the British Council for Aid to Refugees has agreed to set up to administer the sum of £15,000 provided by the Lord Mayor's Fund to assist refugee doctors from Hungary wishing to obtain a British medical qualification with a view to practising in this country.

Central Consultants and Specialists Committee

The report of the Central Consultants and Specialists Committee, presented by Mr. T. HOLMES SELLORS, stated that the Registrars Group had considered the desirability of broadening its constitution so that it might represent all grades of hospital medical staff up to and including the senior registrar, and thus provide for closer liaison between the Group and the Central Consultants and Specialists Committee. The Committee submitted a recommendation which included the proposal that the Registrars Group Council should be renamed the Hospital Junior Staffs Central Committee and that the Regional Registrars Groups should be renamed Hospital Junior Staffs Regional Groups.

The CHAIRMAN questioned the constitutional position of the renamed committee and the use of "Central" in place of "Group." Dr. F. GRAY said that he agreed with the object, but there seemed to be some ambiguity about the proposal, and he suggested that the Council should agree to the proposal in principle, but that further consideration should be given to the details.

The Council agreed accordingly.

The Council considered a recommendation that "all hospital medical staff" should be substituted for "consultants and specialists" in the terms of reference of the Committee, and agreed that the terms of reference should read: "To consider and to act on matters affecting those engaged in consultant and hospital practice, including matters arising

¹ *Medical Superintendents and Medical Staff Committees, 1957.*
H.M.S.O., Edinburgh. Price 1s. 3d. net.

individual hospital in the regional hospital service. It recommends that boards of management not wishing to appoint a full-time medical superintendent should consider either the appointment of a senior clinician as part-time medical superintendent or the appointment, in co-operation with the local authority, of a joint medical officer of health and medical superintendent of the hospital group.

The report sets out the functions of a medical superintendent and adds that he should be co-ordinator of all activities within the hospital.

To provide a satisfactory career in medical administration, the subcommittee recommends that posts in the Department of Health, in the regional boards, and in the boards of management should form a single group. Medical superintendents' salaries should be increased so that posts of greatest responsibility attract amounts broadly comparable with consultants' salaries. A number of medical administrative posts should be established at large hospitals for those intending to make a career in medical administration.

With regard to medical staff committees, the subcommittee considers the general position at present to be unsatisfactory. Their functions should be (1) to be available for consultation by the board, (2) to advise and make representations to the board on the various aspects of the work of the hospital, and (3) to protect and foster the interests of the staff. Boards of management should look both to the medical superintendent and to the medical staff committee for advice on medical aspects of policy questions; and medical staff committees should have direct access to boards of management.

SCOTTISH HOSPITALS DISPUTE

SECRETARY OF STATE NOT TO INTERVENE: APPOINTMENT HELD UP FOR FOUR MONTHS

The Secretary of State has informed deputations from the B.M.A. and the Bruntisfield and Elsie Inglis Organizing Committee that he feels bound to maintain his previous decision not to intervene in a matter entrusted by Parliament to the regional board's discretion.

The dispute is over a post of consultant physician in two women's hospitals in Edinburgh, the Bruntisfield and the Elsie Inglis. The regional board has refused to restrict the post to women candidates. But the board has now given an undertaking in the Court of Session not to appoint a consultant for four months pending the hearing of an action by ten women resident in Edinburgh.

In a letter to Dr. E. R. C. Walker, Scottish Secretary of the B.M.A., the Secretary of State says that his policy is consistent with previous policy and that no encroachment of the specialist services on the hospital facilities for general practitioners would follow.

The following letter, dated June 13, was addressed by the Scottish Secretary of the B.M.A. to Mr. John S. Maclay, Secretary of State for Scotland:

Dear Mr. Maclay,

I am instructed to express to you on behalf of the Scottish Committee of the British Medical Association their grave concern over the recent decision of the South-Eastern Regional Hospital Board on the medical staffing of the Bruntisfield and Elsie Inglis Hospitals. It appears to them that this decision contravenes Section 6 (4) of the National Health Service (Scotland) Act and they regard it as, in any case, clearly contrary to the intention and spirit of this Section. I am asked to say that the Committee attach special importance to the provisions of this Section as an essential safeguard, under the circumstances of State-ownership of the hospitals, against arbitrary alteration of the character and purposes of transferred hospitals. It is considered, as indeed seems implicit in the terms of Section 6 (4), that changes of such a kind should be made only after full consideration and consultation and for the most cogent reasons. From the information available to them, the Committee do not feel that in the present instance these conditions have been fulfilled.

Holding these views, my Committee are naturally disappointed that you yourself have not seen fit to intervene with the Board in this case, and they believe that there may well be aspects of

the situation which have not been put before you. Accordingly, I am asked to say that the Committee would be happy to send a small deputation to meet you at any time suitable to yourself to put their viewpoint before you.

Yours sincerely,
E. R. C. WALKER,
Scottish Secretary.

On June 19 a deputation from the Scottish Committee met Mr. Maclay (see *Supplement*, June 29, p. 384), whose private secretary later addressed the following letter to the Scottish Secretary:

Dear Dr. Walker,

The Secretary of State has asked me to write to you in connexion with the deputation which your Association sent to him on Wednesday, June 19, about the filling of the consultant post at the Bruntisfield and Elsie Inglis Hospitals. Your deputation fully explained the reasons, referred to in your letter of June 13, for their view that the Secretary of State should intervene to ensure that in the special circumstances of these hospitals the vacant post should be filled by a woman.

In particular, the deputation suggested that the Regional Board's decision was contrary to section 6 (4) of the National Health Service (Scotland) Act, 1947, and clearly contrary to the intention and spirit of the section. The Secretary of State has, of course, no authority to give a binding interpretation of an Act of Parliament. He is, however, advised that in considering what is practicable under section 6 (4) of the Act the Board are bound to have regard to their general duties and obligations under the Act: and, furthermore, that the decision of the Board is in no way contrary to the provisions of section 6 (4).

The deputation suggested that the Regional Board in reaching their decision had not observed the recommendations in paragraphs 22 and 23 of the Scottish Health Services Council's Report on "The General Practitioner and the Hospital Service," published in 1952 that they should have constantly in mind the repercussions of their policy on general practice and make the fullest use of local medical committees and Liaison Committees for purposes of consultation.

The Secretary of State understands that the Regional Board took the view that their decision to advertise the duties of the consultant physician post at the two women's hospitals and at the Deaconess and Longmore Hospitals as open to both men and women physicians was consistent with the policy they had adopted in 1955, when a similar vacancy occurred in the Bruntisfield and Elsie Inglis Hospitals for a consultant in surgery: at that time also the possibility existed that a male consultant would be appointed. Further, it did not seem to them that their decision could have any repercussions upon general practice of the kind which the Report had in mind—namely, the encroachment of the specialist services on the facilities available in the hospitals to general practitioners.

The Secretary of State has asked me to tell you, therefore, that while he has carefully considered the views which you put forward, he feels bound to maintain his previous decision that he would not be justified in intervening in a matter which had been entrusted, in accordance with statute, to the Board's discretion.

Yours sincerely,
W. W. GAULD,
Private Secretary.

MATERNITY SERVICES IN SCOTLAND

SCOTTISH COMMITTEE'S EVIDENCE

The B.M.A. Scottish Committee last week submitted evidence to the Scottish Maternity Review Committee which was set up by the Scottish Health Services Council to report on the maternity services. After briefly referring to previous reports on the maternity services and the background leading to the present position, the Scottish Committee submitted its written evidence under such headings as administrative arrangements, normal midwifery, antenatal care, local authority clinics, and hospital and domiciliary confinements.

In summarizing the contents of its memorandum, the Committee states that it believes it to be possible, under present administrative arrangements, for the maternity services to provide the necessary "range of provision," and stresses the need for co-operation and good liaison between the general practitioner, the hospital, and the local authority. It urges that the family doctor should be considered as the

individual with overall responsibility for the pregnant woman; he is in a position to advise as to available facilities and to ensure that the patient gets the most satisfactory and comprehensive treatment. The Committee feels that, even if the patient decides to attend hospital (or elects to be confined by a midwife), the family doctor should be involved, since he may have to advise on matters possibly formed, associated with her pregnancy, and it is, in the Committee's opinion, essential that he should know she is pregnant and attending elsewhere.

The Committee suggests that the number of normal deliveries undertaken in specialist hospitals should be reduced in accordance with the nursing and bed position—after allowing for teaching purposes—and that admissions to such hospitals should be restricted; some beds should be made always available for emergency. Beds should be made available for general practitioners to conduct maternity cases either in a separate part of the specialist hospital or in a separate establishment, good liaison ensuring that the necessary specialist aid would be readily available if required.

More attention, the Committee thinks, should be given to facilities available at local authority clinics for parent-craft and allied subjects, and patients should be encouraged to take advantage of these facilities. It advocates an extension of the home-help services to improve conditions for home confinements. Finally, the Committee recommends the appointment of a standing advisory obstetrical committee of the Scottish Health Services Council and local professional advisory committees.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Woman Consultant for Women's Hospital

SIR,—In a report, *The General Practitioner and the Hospital Service*, issued by the Department of Health for Scotland in 1952,¹ the following statements occur:

"We have considered whether some adjustment of the administrative structure of the health services is desirable in the interests of ensuring that the needs of general practice are fully represented at the policy-making level in relation to the hospital and specialist services. . . . In particular, in the administration of the hospital and specialist services there must be the fullest effort to preserve a balanced approach in those fields in which there may be an apparent conflict of interest" (paras. 23 and 24).

A conflict of interest has arisen at the policy-making level in relation to the hospital and specialist services in Edinburgh. May I remind your readers briefly of the following facts?

In July, 1956, the Southern Hospital Group board of management gave its opinion that the coincidental vacancies for a consultant physician in four of the hospitals in their group should continue to operate as two appointments. Bruntisfield and Elsie Inglis Hospitals are women's hospitals staffed by women consultants, and Deaconess and Longmore Hospitals have heretofore been staffed by men. Even after receiving a delegation from the board of management, the South-eastern Regional Hospital Board ignored this opinion, and insisted that the two appointments be combined and advertised as open to men or women. The board of management unanimously decided to appeal to the Secretary of State for Scotland. The citizens of Edinburgh spontaneously protesting against the possible appointment of a man consultant to the women's hospitals. A deputation from the board of management was received at St. Andrew's House, but the Secretary of State refused to intervene. A mass meeting attended by over 2,000 people was held in the Usher Hall on April 17. At this meeting a resolution was passed calling for executive and/or legal action to maintain the *status quo* of the women's hospitals. Two points are to be noted here: if a woman fails to be appointed, there will be no woman consultant physician in south-eastern Scotland, and, further, this resolution carried the conflict

from a request for two appointments to the expressed desire of the people of Scotland for the continuance of the women's hospitals.

Support has been received from various medical bodies, the local medical committee, the regional consultants and specialists committee, the General Medical Services Subcommittee (Scotland), and the Scottish Committee of the British Medical Association. Questions have been asked in Parliament and the matter has been the subject of an adjournment debate. The Secretary of State has now personally received two deputations, and his decision is awaited.

The principles involved in this are of vital importance: (1) It is the duty of the Secretary of State "so far as is practicable to secure that the objects for which any such property was used immediately before the appointed day are not prejudiced." (N.H.S. (Scotland) Act, 1947: 6 (4)). There is nothing impracticable in maintaining the *status quo*. (2) It is conceivable that a regional hospital board may make an unwise decision. Even if this is done in all good faith, surely, in a democracy, reconsideration of a major issue should take into account the advice of medical bodies and the wishes of the public. If it fails to do this, and the Secretary of State refuses to intervene, then there is virtually no higher authority as a court of appeal. (3) This will be tantamount to giving all regional hospital boards in this country complete and dictatorial powers over the hospitals in their areas. (4) The regional hospital boards are not democratically appointed bodies. I would refer back to the opening paragraph in this letter. Is it not time that "some adjustment of the administrative structure of the health services is desirable"?—I am, etc.,

SUSANNE J. PATERSON.

Edinburgh.

N.H.S. Drugs for Private Patients

SIR,—Your leading article (*Journal*, June 15, p. 1408) on the subject of "N.H.S. Drugs for Private Patients" is most welcome to the Private Practice Group. The present state of affairs, we feel, merits the attention of both the public and the entire profession alike.

A grave injustice is being suffered by patients who seek their medical advice on a private or fee-paying basis. Private patients, since they contribute to the National Health Service in common with the rest of the public, may receive from any doctor, whether he be in the N.H.S. or wholly engaged in private practice, any of the N.H.S. benefits *with but one exception, that of prescriptions*. The right of the subscribing patient to receive N.H.S. benefits is thus clearly established, yet when the patient enters into a fee-paying relationship with his own doctor, one right only is denied to him—drugs under the N.H.S.

No criticism of excessive use or abuse of the N.H.S. by private patients or by their doctors has been levelled now or at any time since the N.H.S. came into being in 1948. Yet previous Ministers of Health have stated (*vide Supplement*, June 23, 1956, p. 391) that one of the main reasons why this single provision, that of prescribing for private patients on the same terms as N.H. patients, has been denied is because of the risk of over-prescribing. Surely it is ridiculous to use this argument in the light of experience with all other aspects of the private patient's use of the N.H.S. If this is insufficient answer, let it not be overlooked that doctors are prepared to safeguard the Ministry against over-prescribing by entering into agreements thereon.

We understand that the Ministry is experiencing difficulty in "estimating the cost of the concession" and in "working out the size of the problem." In common with other sections of the medical profession, we consider that no arguments based on cost, the size of the problem, or risks of over-prescribing can be justified as an excuse or an argument by either political party for the denial of an undoubted moral right to the subscribing patient. The use of the term "concession" used by parliamentarians in this issue must be forcefully repudiated. Something that has been paid for

by contributions and by taxation, and yet by law is not available, constitutes an injustice, and it cannot be a concession to remedy this injustice. This matter must stand firmly on the moral right of the subscribing patient, irrespective of whether it involves half the population of the country or a mere few hundred.

That the remedying of this injustice calls for amending legislation is too well known to call for comment, but we would suggest that the issue is one which should not be clouded or shelved for reasons of political expediency by arguments of class distinction, or by technical or administrative difficulties. The issue, we submit, is one of clear right to the subscribing patient, and should be recognized as such by both parties in the House, first by being acknowledged as a bad piece of legislation of itself, and secondly because of the many implications which legislation of this kind engenders.—I am, etc.,

London, N.W.3.

JOHN ETHERIDGE,
Acting Secretary,
Private Practice Group.

Standard of Medicine

SIR,—It is distressing to find the old red herring of the ineptitude of the full-list practitioner once again drawn across our problem of remuneration in general practice. What evidence has Dr. J. Hartsilver (*Supplement*, June 8, p. 330) to produce in proof of his statement that huge practices reduce "the practice of medicine to an ugly farce, with disastrous consequences"; and on what authority does he produce such a statement? In his thirty-three years of experience has he never met large practices of two or more partners whose waiting-rooms, surgical and medical equipment, dressing and examination rooms, have been of an order which could never be achieved by the small-list practitioner? Has he never witnessed the minor surgery carried out by such practices either in their own premises or in their local general-practitioner hospital, one partner anaesthetizing for the other? Has he never met a group practice in which each of the partners "specialized" in some branch of general practice to the mutual benefit of the whole practice? Let us add that many of the large-list practices of the above type that, we are happy to write, exist in this area have also representatives on the local medical committees and the College of General Practitioners.

The standard of medicine achieved in general practice depends on the ability and conscience of the individual doctor concerned and not on the size of his list. A large list—or public approval of a doctor's ability—is nothing to be ashamed of.

In fact, has not the present system of remuneration become lunatic? For whilst we are fully sympathetic to the difficulties experienced by the young general practitioner in setting out in general practice, should these difficulties be taken as an opportunity to underpay the full-list practitioner and to abuse his work?

The National Health Service came into being on the crest of the wave of socialism following the 1945 general election. There has been a general apathy in regard to initiative and incentive, a lassitudinous feeling that the State will provide all, with the minimum of effort on our part, and a four-day week for all. General practice has possibly attracted to itself those whose only wish is the minimum effort for the more mediocre but safe remuneration that it will provide. These "have-nots" then proceed to decry the efforts of those whose initiative, ability, and standard of work attract more patients, and consequently more pay, with such doctrines as limitation of lists, more pay for the small-list groups, and even a salaried service.

Finally, may we suggest that if improvement is sought in the remuneration, standard of work, and status of our profession some of the following points should be borne in mind: (1) The present pool capitation system be abandoned and a system of payment for services rendered be substituted. That this can be done without abuse has been shown in Australia. (2) General-practitioner hospitals be erected

in all areas, as promised in 1948, with the subsequent addition of general-practitioner maternity wards for those who wish to engage in midwifery. (3) The taking over by general practitioners of the public health antenatal clinics and infant welfare.—We are, etc.,

Southall, Middlesex.

MODERN PHARMACEUTICAL
ADVERTISINGSUGGESTIONS TO COUNTER ITS
DISADVANTAGES

BY

J. D. W. WHITNEY, M.B., M.R.C.S.
General Practitioner, London, W.12

There is an increasing tendency for pharmaceutical firms to harm their own interests by the "postal assault" method of competing for the doctors' attention. Some firms send out up to four advertisement circulars a week, while others who are less prolific tend to suffer because of the sins of the more enthusiastic ones. The doctor is forced by the sheer volume of literature to place the majority of it in the wastepaper basket. Thus, when a doctor wishes to prescribe a certain product there is often no literature available for him to consult.

Present Trends

The present trend of advertising is as follows: (1) Advertisements containing little or no formal information, merely serving the purpose of reminding the doctor of a drug's name and action. These are not worth keeping. (2) Advertisements often designed to show a certain product's action or advantage over a similar drug rather than giving a completely authoritative picture of the product as a whole. This means that to get a complete picture of a certain drug often several advertisements must be kept, and then of course there is repetition. (3) Advertisements which are completely informative and authoritative but not concise; some firms even send a bound book about one particular product. The difficulty, so far as filing is concerned, is that there is no uniformity in size of these books. This variety of methods makes the doctor's task a difficult one, as he cannot possibly find time to put together a file of advertisements which is not repetitive and which is not over-detailed in some products as opposed to others.

Some major firms have attempted to meet the problem by producing a card index, loose-leaf file, or catalogue covering their own particular products. If all the major firms advertised in this way doctors would have to keep over 50 loose-leaf files, card indices, and catalogues. This, I feel, would not be a great improvement or help to the busy G.P.

Chemists have had the problem to face, and as a result several good but incomplete schemes have been introduced through the auspices of the pharmaceutical journals. Their chief faults are that they are not back-dated to include previously introduced products; though excellent for

chemists, they do not include enough clinical information for doctors; and the card size is not likely to be convenient for doctors.

Standardized Reference Cards

I think, therefore, that a system of a standardized card index to include all products from all firms on the market and not advertised to the public would be the best idea, and one which, as I hope to show, would be to the doctors' and firms' mutual advantage.

The lay-out of my proposed standard card is shown and is self-explanatory. The size should be that of an N.H.S.

CODE No.	CARD PUBLICATION DATE DATE INTRODUCED
NAME OF PRODUCT & B.P.C. EQUIVALENT	CLINICAL USE (Space for picture of tablets)
NATURE OF PRODUCT	
INDICATIONS FOR USE	
DOSAGE	
SIDE-EFFECTS	
CONTRAINDICATIONS

BIBLIOGRAPHY	
MANUFACTURER'S NAME AND ADDRESS	(Space for notes overleaf)
Telephone No.	

Suggested standardized reference card showing headings.

medical record card—7½ in. × 5 in. (19 cm. × 12.7 cm.)—so that it can be filed with, or in the same file as, record cards. The card for each product should indicate whether it may be prescribed under the N.H.S. on Form E.C.10 as well as having the usual logical headings. It is most important that it should include in addition the following features, which are not always present on such cards:

Dr. BAILEY thought that the question of abuse was of primary importance, and suggested that the way to answer the problem was obviously to cut out the things which led to the abuse. There should be compulsory agreements between trainees and trainers. The present scheme was of insufficient value to warrant its continuation in an unamended form. It should be widened so that the moneys at present spent over a relatively small number of people could be spent over many more, giving a smaller amount to individual trainers. Dr. MATTHEWS said that he did not withdraw one word from the memorandum which he had submitted on the subject. There had been an increase in trainee assistantships, but it was a subsidized form of employment. In effect, the Ministry was paying doctors £1,000 to conceal unemployment. It was a luxury scheme and should be reviewed. Dr. DAVIES (of the G.M.S. Committee) said that the scheme had been reviewed in great detail three times. Previously the word "abuse" had been used in connexion with trainers, but it was now being applied to trainees. The money involved could not be used for any other purpose. If it was not used for the scheme it would be lost entirely. He assured the Subcommittee that a very high percentage of trainees subsequently established themselves in general practice. As to the question of responsibility, the scheme

envisaged that a moderate degree should be allowed to the trainee in his last three months.

After further discussion a resolution was drafted in the following terms:

"That it shall be the duty of the Advisory Subcommittee to make recommendations with a view to the elimination of abuses."

Remuneration

The Subcommittee considered memoranda submitted by Dr. Tomlins and Dr. Matthews concerned with remuneration to general practitioners. Dr. MATTHEWS said that all Dr. Tomlins's objections to payment by way of capitation fees could be overcome either by a reduction of lists or by item-of-service payments. Dr. DAVIES said that with the capitation fee system a doctor could largely answer his own problems. The doctor who gave a good service got a good list. Dr. ROSE thought there was no perfect system of remuneration but that capitation fees were the least likely to lead to abuses. The patient was the judge of the worth of his doctor, and he could remove himself from the doctor's list whenever he felt that he was not getting proper service. On the subject of the variation of capitation fees, Dr. MATTHEWS thought that there was a very good case for increasing remuneration with advancing years, and for higher qualifications.

The other members of the Subcommittee could not agree with Dr. Matthews. The extra payment would not be one based on merit. It would also have to be linked with a certain amount of reduction in lists and also with a compulsory retiring age, otherwise a man might be tempted to carry on for ever. Dr. EVANS said that the best general practitioners should be paid the most, and the mere possession of degrees and of experience outside general practice should not necessarily be rewarded in general practice.

On the subject of additional payments by item of service, Dr. TOMLINS said that one of the objections of the G.M.S. Committee was that if extra payments were made in this way under the present circumstances the money would have to come out of the pool, so that nothing would be gained. He thought that the pool should be abolished, because what it did in effect was to put the whole profession on one large salary. There was an absolute maximum to what they could earn. After further discussions the CHAIRMAN suggested that the two memoranda should be preserved and the discussion continued at the next meeting. This was agreed to.

Employment of Assistants

The Subcommittee considered a letter from an assistant, setting out various suggestions with regard to the employment of assistants. Dr. BAILEY suggested that there was a failure of B.M.A. publicity, in that the assistant in question never knew of the existence of the Subcommittee. The *Year Book* contained no information about it. The CHAIRMAN said that if that was the case representations should be made immediately. Dr. TOMLINS pointed out that a newly qualified doctor did not automatically receive a copy of the *Year Book*. He might be offered a copy for 2s. 6d. In Dr. Tomlins's case he had had to ask for a copy. He suggested that the letter from the assistant should be put on the agenda for discussion next time. At least the writer should be given a detailed reply.

HOSPITALITY

A Dutch doctor would be pleased to receive British girl in his family for three weeks during July and August. In return his daughter, aged 16 years, would like to come to Britain for a similar period. They live at Almelo, in the east of the Netherlands.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

N.O.T.B. ASSOCIATION

The N.O.T.B. Association held its second annual general meeting on June 14, preceded by the tenth council meeting. The council welcomed eleven new medical members and considered propaganda activities. Certain amendments to the minimum requirements covering N.O.T.B. medical eye centres were approved and it was agreed to circularize all members with an up-to-date copy. It was unanimously agreed to discuss the evidence to be placed before the Royal Commission considering doctors' remuneration at the next council meeting and to press for an upward revision of the sight-testing fee.

The council noted that Dr. R. U. Gillan and Dr. R. W. Stephenson were re-elected to the council and Mr. D. Langley and Mr. P. McG. Moffatt to the Medical Advisory Committee. Dr. Victor Purvis was unanimously reappointed to represent the N.O.T.B.A. on the Ophthalmic Group Committee. Future meetings of the council will be held on Thursdays from 1.30 p.m., instead of Fridays as heretofore.

The annual general meeting confirmed the appointment of two medical members to the council, increasing the number to ten, and amending the Articles of the Association accordingly. The annual report of the association was adopted and Messrs. Hibbert, Sier, Woods and Co. were reappointed auditors, pursuant to Section 159 of the Companies Act, 1948. The meeting passed the amended By-law No. 12 reading:

N.O.T.B. Medical Eye Centres

Each ophthalmic medical practitioner shall pay an economic rent towards the expenses of maintaining any N.O.T.B. Medical Eye Centre attended by him. In any case of dispute the matter shall be referred to the council for decision.

The meeting discussed the joint report on the future eye services and agreed that every effort should be made to encourage entrants into ophthalmology and enhance the status of those taking part in the Supplementary Ophthalmic Services. The meeting firmly supported an upward revision of the fee in Supplementary Ophthalmic Services.

The meeting, which was better attended this year, closed with a vote of thanks to the chairman and vice-chairman.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Size of Lists

SIR,—The underlying problems in general practitioners' remuneration lie much deeper than any percentage increase in payment, and the basic facts must be recognized and dealt with now. The average number of patients if divided among the total number of general practitioners is approximately 2,500. It follows therefore that never can more than one-third of the general practitioners receive either full remuneration or full employment so long as the maximum list remains at 3,500 patients. Unless and until the new list approximates to or is in fact the average list, then two-thirds of the doctors (some 14,000) can at no time in the foreseeable future hope to gain a full livelihood. Merely tinkering with the betterment factor cannot alter this statistical problem and fact.

As prime essentials therefore:

- (1) It is imperative to reduce the maximum permissible list to what is the overall national average if all the doctors had an equal list—approximately 2,500.
- (2) Adjust the present maximum remuneration to a new lowered maximum list.
- (3) When these two adjustments have been carried out, then and only then is the time for the Royal Commission, or any other body, to negotiate the betterment factor of 24% to meet the rising cost of living and practising.

Disaster and frustration are bound to follow any negotiations for an increase, even if a 24% to 30% increase were granted before steps one and two above were implemented, as all that would inevitably result is to perpetuate the system whereby two-thirds of the doctors will for ever be unable to obtain either full-list remuneration or full employment.

Naturally, when the maximum list is reduced and the remuneration adjusted to the new list figures, plus the betterment factor, up will go the cost of the N.H.S. However, that is inevitable, as the medical practitioner payments are and have been completely inadequate to two-thirds of the general medical practitioners participating in running of the general medical services. Furthermore, in view of the increasing proportion of new recruits to the profession compared with retirements, the choice is a reduction in the maximum list permissible, or a salaried service—and the latter is not very palatable.—I am, etc.,

E. B. ALLEN.

Englefield Green, Surrey.

Ophthalmic Services Committee

SIR,—I am instructed by the chairman of the Hull Ophthalmic Services Committee to draw your attention to the item headed "Reminder Notices" (report of the Ophthalmic Group Committee, *Supplement*, June 29, p. 382) and to say that (1) no correspondence has taken place between the clerk to the Hull Ophthalmic Services Committee and the Ministry of Health relating to reminder notices sent by ophthalmic opticians to hospital eye service patients, and (2) the Hull Ophthalmic Services Committee has no evidence of reminder notices having been sent by ophthalmic opticians to hospital eye service patients.—I am, etc.,

J. W. MILTON,

Clerk of the Council and Ophthalmic Services Committee.

Kingston-upon-Hull.

Doctors and the Health Service

SIR,—The futile correspondence on pay and conditions of service still drags on. In the words of Hotspur it is now "as tedious as a tired horse, a railing wife; worse than a smoky house."

May I have the temerity to suggest that it be closed until we hear the findings of the Royal Commission?—I am, etc.,

E. W. KINSEY.

Cymmer, Glam.

Unity

SIR,—In recent months a word that has been consistently used in relation to medico-political considerations is "unity." The implications do not appear to have been developed. The medical profession certainly has no unity of thought or opinion. To achieve unity of action surely implies a decision based on majority approval. If the minority refuse to abide by a majority decision, then to achieve unity of action surely implies the introduction of penalties or sanctions against the minority. To obtain a majority decision on any question this question must be referred to those affected by it, or the decision must be taken by representatives of those people, the delegates having received full authority and power from those whom they represent.

Last year, for a short period, I had the honour to be the representative, for one of the five regions in the country, of the Assistants and Young Practitioners Subcommittee of the G.M.S. Committee and also the assistants' representative on the G.M.S. Committee itself. At that time the only official representation of the nation's assistants was the Assistants and Young Practitioners Subcommittee. Yet at that time there was in Birmingham a local organization of assistants and young practitioners. Using this as a model, further local organizations were set up. The regional representatives of the Assistants and Young Practitioners Subcommittee are now able to refer questions back to these local organizations for discussion and decision, the results of which are then conveyed back to the regional

representatives in time for the next Assistants and Young Practitioners Subcommittee meeting in London.

If this arrangement can be made to work for a shifting population of itinerant assistants, then how much more easily could it be made to work for a static population of principals. For six years it had been said that, although the obtaining of the views of assistants "at the periphery" was desirable, it was not practical. Yet it has been shown to be a workable proposition, and the attendance at the local meetings is much higher than the 10% attendance at the usual B.M.A. meetings. Just as a local organization in Birmingham provided the model for national representation of assistants, I feel it equally possible for this assistants' method of representation to become a model for the principals.—I am, etc.,

R. DEAN JONES.

Cheadle, Staffs.

Breach of Contract

SIR,—It appears from the *Daily Telegraph* of May 13 that a sum of £1,100 has been withheld from a Kent doctor following alleged departure from the regulations in regard to prescribing medicines. Surely this decision on the part of the Minister represents an outrageous travesty of justice? Is this not a high-handed bureaucratic action which constitutes a dangerous legal precedent?

That the terms of service of the National Health Service empower the Minister to act in this manner I do not dispute, nor do I question that there may have been a misdemeanour; but, surely, the proper place for such a matter to be settled is a court of law, especially when so large a sum is involved? Is it right for the Minister to be able to take such summary action, and does the doctor have a fair hearing, with right of appeal? In a court of law, any breach of contract could be considered with absolute impartiality and a fair decision would be more likely to result. What trade union would tolerate an action of this nature by a works manager in respect of an employee?—I am, etc.,

G. C. SQUIRES.

Truro.

Unsolicited Rise

SIR,—A colleague who forsook the N.H.S. to take service in a sanatorium for tuberculous patients in North Carolina eighteen months ago has had his second unsolicited "rise." This time it will bring him an extra \$85 per month free of tax. This means on present exchange values roughly £360 per annum tax free. When this is compared with our own 5% taxable increase in five years, "It makes you think," to quote a favourite remark of the colleague in question.—I am, etc.,

DONALD M. O'CONNOR.

Launceston.

International Medicine

SIR,—Dr. V. Grantham's letter (*Supplement*, June 15, p. 348) reminds me that, a few years ago, an Austrian woman on my list asked me for a prescription for digitalis tablets to send to her father in Vienna. I refused. She changed her doctor.—I am, etc.,

W. E. LISHMAN.

Peverell, Plymouth.

Parking Restrictions

SIR,—I quite agree with Dr. E. Sutherland-Rawlings's suggestion in his letter (*Supplement*, June 8, p. 333). I have myself been involved in two cases of parking offences. On the first occasion I had left my car for an hour in a non-restricted street. On my return the police officer asked me to produce my licence, and I informed him that I was a medical practitioner on call; he replied that he did not see any B.M.A. badge on the car (I was getting a new one), and consequently would have to report the case. I have found on various occasions that it is usually the young policeman, who has probably just joined the beat, who is more than enthusiastic about parking regulations. The

older policemen, and those drafted in from the suburbs, are much more understanding. Medical friends of mine in Paris carry a medical emblem on their windscreens, and have no parking difficulties whatever.

Surely a scheme like this could be adopted in London?—I am, etc.,

London, W.1.

F. HUGHES.

Certificate for N₂O Anaesthesia

SIR,—There are several asinine regulations tormenting the present-day G.P., but surely one of the worst must be the necessity for an expectant mother to have a certificate authorizing N₂O anaesthesia. On several occasions expectant mothers have walked some distance to the surgery volunteering the statement that they have never felt better in their lives, and would I supply the midwife with a certificate for N₂O anaesthesia for their forthcoming confinement. I have always maintained that if a mother's health is such that domiciliary midwifery is advised, then she must of necessity be a suitable case for N₂O anaesthesia, and that the regulation requiring the midwife to have a certificate to that effect is one of the heights of bureaucratic folly. The crowning absurdity happened a few days ago. When I returned from my rounds there was a note on my appointments pad stating that a certain patient had had her baby a few hours previously and the nurse had asked me to leave a certificate authorizing N₂O anaesthesia, which she had already had. This must surely convert bureaucratic folly into a music-hall joke. Is it too much to expect the B.M.A. to do something about it?—I am, etc.,

Osgorthe.

W. M. L. HORNER.

H.M. Forces

ARMY

Colonel W. G. S. Foster, O.B.E., late R.A.M.C., has retired on retired pay (Reserve Liability).
Colonel C. A. Levy, late R.A.M.C., having attained the age limit for retirement, has retired on retired pay (Reserve Liability).
Lieutenant-Colonels A. G. D. Whyte, M.B.E., and R. A. Stephen, O.B.E., from R.A.M.C., to be Colonels.

ROYAL ARMY MEDICAL CORPS

Specialist.—Major A. G. Wright has relinquished his commission on completion of service, and has been granted the honorary rank of Lieutenant-Colonel.
Majors J. M. Matheson, O.B.E., and H. R. Miller to be Lieutenant-Colonels.
Captains T. Phillips, W. E. Clifford, J. B. J. Mulvey, M. P. Cardew, and J. H. Andrew to be Majors.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: D. W. Beckett, M.D., D.T.M.&H., Senior Medical Officer (Medical Superintendent), Fiji Leprosy Hospital, Makogai, Fiji; F. R. T. Hollins, M.B., B.Ch., D.P.H., Senior Medical Officer, Tanganyika; R. F. S. Kellett, M.B., D.P.H., Superintending Medical Officer (Specialist), Malaria Division Health Department, Trinidad; T. A. Lambo, M.D., D.P.M., Specialist, (Alienist), Western Region, Nigeria; P. J. Myles, L.A.H., D.A., Medical Officer, Grade "A" (Anaesthetist), Colonial Hospital, Port of Spain, Trinidad; T. C. Pang, M.B., B.S., D.R.C.O.G., Senior Forensic Pathologist, Hong Kong; C. S. Pitt, M.R.C.S., L.R.C.P., D.T.M.&H., D.P.H., Senior Medical Officer (Clinical), Kenya; H. S. Rassim, M.R.C.S., L.R.C.P., D.M.R.E., Radiological Specialist, Medical Department, Hong Kong; J. Reidy, M.B., B.Ch., D.P.H., D.C.H., Senior Medical Officer (Administrative), Kenya; N. P. St. C. Tracey, M.B., F.R.C.S., Senior Surgeon, British Guiana; F. M. W. Williams, M.B., B.S., M.R.C.P., Senior Physician, Public Hospital, Georgetown, British Guiana; H. W. Woolner, L.R.C.P.&S.Ed., D.P.H., Senior Health Officer, Western Region, Nigeria; W. de C. Baker, M.B., Ch.B., J. Dennis, M.B., B.S., and J. Hunter, M.B., Ch.B., Medical Officers, Kenya; N. H. Birch, M.B., F.R.C.S., Medical Officer, Special Grade, Tanganyika; Kathleen Burn, M.B., Ch.B., Lady M.R.C.P., Medical Officer (Special Grade), Kenya; K. Lal, M.B., B.S., D.M.R.T., D.M.R.D., Radiologist (Therapy), Singapore; R. G. McCormick, M.B., Ch.B., House-physician, St. Vincent, Windward Islands; Elizabeth Stewart, M.B., Ch.B., D.R.C.O.G., D.P.H., Medical Officer, Grade B, Health Department, Trinidad.

Association Notices

ELECTION OF MEMBER OF THE COUNCIL BY THE NEW SOUTH WALES AND QUEENSLAND BRANCHES

Notice is hereby given that, owing to the death of Dr. Isaac Jones, there is a vacancy in the Council of the Association. Nomination of candidates for election as a member of Council by the New South Wales and Queensland Branches for the remainder of the period ending with the conclusion of the Annual Representative Meeting, 1958, must be forwarded in writing so as to reach the Secretary not later than September 14, 1957.

Nominations must be signed by not fewer than three members of any Branch in the Group, and should be in the following form:

We, the undersigned, hereby nominate of (full name and address to be given) for election by the New South Wales and Queensland Branches as a member of the Council of the Association for the period ending July 14, 1958.

Signatures and addresses of three nominators

Branch

If a contest occurs, voting papers will be issued from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group.

A. MACRAE,
Secretary.

ANNUAL REPRESENTATIVE MEETING, NEWCASTLE UPON TYNE, 1957

Over 400 representatives from home constituencies and some 32 representatives from overseas attended the Annual Representative Meeting, which opened at the City Hall, Newcastle upon Tyne, on Wednesday, July 10, and continued on July 11, 12, 13, and 15.

The Chair was taken by Dr. I. D. GRANT (Glasgow), who was supported by Dr. A. H. HALL (President), Dr. S. WAND (Chairman of Council), Mr. WELDON WATTS (President-Elect), Mr. L. DOUGAL CALLANDER (Treasurer), and Dr. A. BEAUCHAMP (Deputy Chairman of the Representative Body). The Lord Mayor of Newcastle, Alderman J. W. TELFORD, attended the meeting and cordially welcomed the Association to the city.

There were nearly 300 motions and amendments on the main agenda, and an extra day was added to allow time for adequate discussion of the Report of the Constitution Committee.

FIRST DAY

Wednesday, July 10

The representatives met at 10 a.m.

The CHAIRMAN announced with regret that Dr. AGNES V. KELYNACK, Assistant Secretary of the Association, was ill, and it was unanimously agreed that a message of sympathy and good wishes be sent to her.

The Meeting also unanimously agreed that the following message of sympathy be sent to the Minister of Health, Mr. DENNIS VOSPER, who was still in hospital:

That the Representative Body of the British Medical Association assembled for its annual meeting in Newcastle has heard with regret of your illness and sends cordial good wishes for your speedy and complete recovery.

Order of Business

The Agenda Committee reported that the Council had decided that the report of the Constitution Committee should form the first item of business of the Meeting. The Committee proposed, therefore, that this debate should be taken immediately after the election of the President for 1958-9.

Standing Orders

A motion by the CHAIRMAN that the standing orders as circulated with the agenda be adopted as the standing orders of the Meeting, subject to any alteration made by the Representative Body in discussion of the report of the Constitution Committee, was carried.

Dr. L. CRAWFORD (St. Helens) moved the amendment to the standing orders to reduce the time limit of speeches for the duration of the Meeting to 10 minutes for a chairman of committee presenting a report, 5 minutes for a member of the meeting in moving any resolution, and 3 minutes for other speakers, instead of 15, 7, and 5 minutes respectively as provided in the standing orders.

The amendment was carried.

PRELIMINARY

In moving that the Annual and Supplementary Reports of Council under "Preliminary" be received, the CHAIRMAN OF COUNCIL, Dr. S. Wand, said he desired at the outset to pay tribute to his predecessor, Dr. E. A. GREGG. Tribute had been paid to Dr. Gregg in other places, but not in the most natural of all places, the Annual Representative Meeting. Dr. Gregg led the Association with great distinction through seven very difficult years, and showed great statesmanship, courage, and fortitude.

Dr. Wand said that the occasion of the award of the Gold Medal of the Association to Sir HENRY DALE would be the first time it had been awarded to a medical man who had not practised clinical medicine. He also referred to the fact that for the first time for many years nine foreign corresponding members had been appointed. They had all achieved high distinction in international medicine.

During the year the problem had had to be faced of doctor refugees from Hungary. They were still a problem. Dr. Wand said he was grateful to those who had subscribed well over £700 in answer to an appeal he had launched. The money had mainly been used to help the Austrian Medical Association, a small body which had had to do most of the work to help the refugees.

This year, for the first time, the membership of the Association exceeded 70,000. During the last session the work of the Association had been overshadowed by the remuneration dispute, but the Council and Committees had had to work as hard as ever in other fields. Dr. Wand paid special tribute to the work of the Commonwealth Medical Advisory Bureau, the success of which was largely due to its director, Brigadier H. A. Sandiford, who would soon be retiring on reaching the age limit. Mr. J. L. Gilks was retiring from the chairmanship of the Overseas Committee after nineteen years in the chair. Appreciation should be recorded of his sterling work. (Applause.) Another name which should

be mentioned was that of Major-General J. C. A. Dowse, who had ended his term of service on the Armed Forces Committee, where he had done wonderful work at a difficult time.

During the coming session the Association would be faced with four pieces of additional work of great magnitude. A Royal Commission Evidence Committee had been set up to co-ordinate the evidence of the committees of the Association in connexion with evidence to the Royal Commission. It would be representative of all the important Standing Committees of the Association, and representatives had been invited from the Society of Medical Officers of Health, which had accepted the invitation, and from the Joint Consultants Committee, whose decision was not yet known. He hoped that it would be possible to secure unity in the profession. Secondly, there would be a committee to look at the whole problem of co-ordination between the various sections of the profession, and thirdly a special committee to look at the future of the health services of this country.

Fourthly, there would probably be a committee to look at the Report of the Royal Commission on Mental Health, a report which showed an insight and enlightenment which would have seemed impossible twenty years ago.

Dr. Wand concluded by paying a warm tribute to the Secretary of the Association.

Election of Vice-President

Dr. WAND moved on behalf of the Council that Dr. T. C. Routley (Toronto) be elected a Vice-President of the Association in recognition of his distinguished services to the Association.

The motion was carried by acclamation.

Election of President

Dr. WAND moved on behalf of the Council that Professor A. P. Thomson, of Birmingham, be elected President of the Association for 1958-9.

The motion was carried by acclamation.

CONSTITUTION OF THE ASSOCIATION

The Chairman of the Constitution Committee, Mr. H. H. LANGSTON, moved the reception of the Annual Report of Council under "Constitution of the Association" and the report of the Constitution Committee.

As a result of the agitation started in 1900 the Association had in 1902 adopted a new constitution and articles which had remained basically the foundation of all its activities. His Committee, said Mr. Langston, had been appointed in 1953 to review that constitution and the later developments derived from it in the light of the needs of the present day, the terms of reference having been "to examine and report on the present structure of the Association with special reference to the Representative Body." In presenting his Report he paid special tribute to those founders of the present constitution, the members of the 1901 committee—a body which had been in many ways comparable to the present committee. How sound and far-sighted had been the planning and vision of those men was evident in the vigour and life of the great organization of the Association to-day. Mr. Langston felt sure, however, that those great men would be the first to acknowledge that the present changed conditions of medicine fully merited a review of the Association's work and its modification to the needs of the day.

The basic unit of the Association created by the 1902 constitution had been the Division. The Association in very large measure owed its life and vitality to the fact that it was built up from a foundation of local units embracing all medical men living and working in a particular area. The Association was to-day the only sort of unit wherein all medical men in an area could meet and discuss their individual and common problems. From the Divisions the Association drew its strength and prestige, and on account of them it was the only body in the country which could claim with authority to speak for the whole of medical practice in Britain. His Committee was unanimously of the

opinion that the Division in its present form should remain the basic unit of the Association's constitution.

In 1901 the division of medicine into branches had hardly begun, whereas now those separate streams of practice formed one of the Association's major problems. The Divisions catered for the individual doctor, but something more was now needed to form a meeting place for the different branches of medicine at local level—a need which it was considered that the Branches, as at present constituted for a very different purpose, could not meet. It was vitally necessary that in these days, not only centrally but locally, it should be possible to unite the whole profession as a union of all fields of practice, as opposed to a union of individuals, in one functional body sufficiently large for the purpose, rapidly able to mobilize its forces behind any section of the profession in need of support. Reorganization of the Branches on a basis corresponding in the main to the hospital regions would, it was considered, achieve the object and might go far to heal the present wide gap between the regional consultants and specialists committees and the local medical committees.

Major Change

Mr. Langston said his Committee fully realized that such a major change at Branch level might conflict with long-established local traditions and loyalties, but he asked the Meeting to examine the suggestion with an open mind, remembering the great need to bring the functional groups together into a unit of sufficient size to encompass them and meet their needs as groups and act for them.

The suggested reorganized Branch could be of vital significance to the Association. The last few months had shown that Medicine was a divided profession. It was divided because the functional groups, as group interests, had no peripheral focus where they could thrash out problems and interests that appeared to conflict. Action and reaction at the centre might be far more rapid and decisive if it were supported by concerted agreement reached peripherally. It might be the way to make *ad hoc* joint negotiating committees unnecessary. How much stronger in a local conflict one section would be if the support of others could be mobilized behind it locally. Provision had been made for those who did not wish to see the dissolution of the existing Branches by the suggestion to set up certain units, styled "groups," where locally desired. It was recognized that the reorganized Branches could not correspond absolutely with Regional Hospital Board areas in all cases and that certain marginal Divisions might wish to operate as they had done in the past.

Mr. Langston emphasized that the schedules attached to the Report setting out the scheme of reorganization were provisional. Once the principle of a Branch structure reorganized on the basis of the Regional Hospital Board was accepted, the detail of application could be worked out by the Council, probably through its Organization Committee in co-operation with the Divisions concerned.

Referring to paragraphs 60 to 90 of the report, he said the Committee had examined in detail the problems of the Representative Body in relation to its constitution, size, and order of business. It was remarkable that a body of such a size, faced with such varied and complex problems since the second world war, had not become completely bogged down in a morass of conflicting resolutions. On the contrary, the speaker pointed out, it had been able to produce a reasonably well co-ordinated policy in all the varied fields of medical practice. Nevertheless, he said, early in its discussions the majority of the Committee became convinced that a reduction in the size of the Representative Body was necessary, chiefly in order to increase efficiency and expedite the business, but also in order to have a wider choice of constituencies in which to hold Annual Representative Meetings. He pointed out that the effect of the recommendation to have a Representative Body of about 350 members would be that no Division would have more than five members. He drew special attention to Appendix D, which made it abundantly clear that the loss of representation by no means fell on the big Divisions alone but was fairly shared. The

recommendation that there should be added to the Representative Body four representatives directly elected by the Central Consultants and Specialists Committee had not, he said, been made without much thought and discussion with representatives of the General Medical Services Committee, the Public Health Committee, and the Central Consultants and Specialists Committee.

Mr. Langston said that there were reasons for recommending that the Scottish Committee be renamed the Scottish Council. The Committee believed that this change would increase the prestige of the Committee in Scotland without increase the prestige of the Committee in Scotland without in any way affecting its status *vis-à-vis* the Council of the B.M.A. or its relation with the General Medical Services Subcommittee (Scotland) or the Central Consultants and Specialists Committee (Scotland).

While the Report recommended no startling and revolutionary changes, Mr. Langston believed that the examination of the constitution had been as exhaustive as the Council would wish it to be. While he was well aware that certain recommendations seemed to cut across old and well-taken recommendations, he believed the proposed scheme for the Representative Body to view dispassionately might be that affecting its own size. If, however, the first consideration of the Meeting was to have a really effective "Parliament of Medicine," he did not think it would go far wrong. Perhaps a little more competition in being chosen for the office of Divisional representative would enhance the status of their debates.

Mr. Langston concluded by paying tribute to Dr. L. S. Potter, Secretary of the Committee, and to the members of the office staff who had helped, and thanked the members of the Committee, particularly the members of the Chairman's Subcommittee, for the long hours they had devoted to the work of the Committee.

Requests for Delay

A motion by Liverpool urged that discussion on the Report of the Constitution Committee be deferred until the 1958 Annual Representative Meeting. It stated that, owing to so much time having been spent on the question of remuneration, most doctors would not have been able to give sufficient attention to the consideration of the Report. Dr. BARBARA M. L. ABERCROMBY (Liverpool) said that decisions taken in haste might well result in repentance in leisure, and it was felt that it was far too important a matter for any decisions to be arrived at in a hurry.

Mr. LANGSTON asked the Representative Body not to accept the motion. It was, he said, three years since Council was instructed to set up the Constitution Committee, and it would take another two years for some parts of the Report, if it were accepted, to come into full effect. The Constitution Committee was not a standing but an *ad hoc* committee established on the instructions of the Representative Body, and it had completed its remit.

The motion was lost.

Motions by Enfield and Potters Bar and Hampstead proposed a discussion on the Report of the Constitution Committee but that final decisions on the recommendations should be deferred. Dr. R. B. L. RIDGE (Enfield and Potters Bar) said that, owing to the Association's preoccupation with the remuneration dispute, he had little doubt that the Report of the Constitution Committee had not received the full measure of consideration in Divisions which it so rightly deserved. Council had not as yet expressed its own opinions on the recommendations of the Constitution Committee, and on the recommendations of the Constitution Committee, and in Divisions should have the benefit of Council's opinions in making their decisions. It was over 50 years since the constitution was last revised, and there could be no question of urgency about taking any final decision at the Meeting. Nor should the Association be precipitate in adjusting its constitution from changes arising from the National Health Service, which might be modified itself in the light of longer experience. He stressed that the operative word in the

motion was "final." It would be unwise to fix a particular date for taking a final decision, bearing in mind that the A.R.M. next year might be preoccupied with the report of the Royal Commission.

Dr. L. J. STOLL (Hampstead) pointed out that in Hampstead, where the ratio of consultants and specialists to general practitioners was something like 60 to 20, it was found that the former were conspicuous by their absence, and, if the various sections of the profession were to be co-ordinated, it was essential to have the views and opinions of the consultants and specialists and all other members on hospital staffs. In the circumstances there was no need to hurry.

Dr. D. L. GULLICK (East Herts), who had served on the Committee, said that from the number of Divisions which had submitted motions on and amendments to the Constitution Committee's report there had been fairly wide consideration of the problem.

Dr. T. J. LEE (Wandsworth) said that a large Division such as his own had had much work to do in such matters as trying to organize the British Medical Guild and had been unable to study the Report adequately. He urged, therefore, that important decisions should be postponed. Dr. L. J. BARFORD (Reigate), also supporting the motions, said that major alterations of the constitution should be referred to the Divisions again. At the moment there was some apathy in the Association about amendments to the Constitution.

Dr. R. G. GIBSON (Council), opposing the motions, said that for three years or more the members of the Committee had thought of little else than the constitution, and it would not be fair to them or good for the Association to add another year. He represented 10 Divisions and had visited others, and he was convinced that they had all studied the Report. There had been ample time to consider it. Dr. MAXWELL H. SUMMERS (Buckinghamshire) agreed, and pleaded for support for the Constitution Committee.

Mr. LANGSTON hoped the motions would not be accepted, and suggested that Dr. Ridge had misunderstood the Council's attitude towards the Report. The Constitution Committee had been set up as a result of a motion passed by the A.R.M., which had included a recommendation that half its members should be representatives. The Council fully debated the Report but made no recommendation, feeling that the A.R.M. would desire to reach decisions on the basis of the Report of a Committee which it had itself set up. If no decisions were reached this year it would be necessary to have another discussion next year, and postponement would be a counsel of despair.

Dr. RIDGE, in reply, said the fact that 75 Divisions had submitted motions and amendments, while it might indicate the interest aroused, was also a measure of the disquiet which was felt in the Divisions about some of the recommendations, and was the strongest argument for going slowly and carefully in revising a constitution which had stood the test of time for 50 years and which, in its amended form, would, he hoped, last another 50.

The motion was lost.

PERIPHERAL ORGANIZATION

Mr. LANGSTON moved the first recommendation of his Committee.

That the Divisions as at present constituted should form the basic unit of the Association's constitution, and that no change of area should be effected except on the initiative or with the consent of the Divisions themselves.

The motion was agreed to without debate.

The Committee's second recommendation in respect of Divisions stated that, while ease of access for members was important in determining Division areas, the importance of maintaining a close relationship with local statutory or functional bodies and other local professional groups should not be overlooked.

The adoption of the recommendation was moved by Mr. LANGSTON and agreed to without debate.

Second Tier Unit

The Committee proposed that in order to maintain the unity of the profession within the Association in the changed circumstances created by the National Health Service, the "second tier unit," that is, the Branch, should be reconstituted on a regional basis, the regions so far as possible following those of the Regional Hospital Boards.

An amendment by Cambridge and Huntingdon provided that, where this was impracticable for geographical reasons, a third tier unit, the Regional Committee, should be formed.

Dr. C. W. WALKER (Cambridge and Huntingdon), moving the amendment, said they agreed with the idea of a Branch Council corresponding more or less to the area of the Regional Hospital Board, but a group Branch Council to run social activities and scientific activities for the whole of an area such as East Anglia seemed impracticable. If Cambridge were chosen as the centre it would cause antagonism in Ipswich and Norwich. Mr. LANGSTON suggested that the difficulty had been met in part by the suggestion of Groups, and in certain areas the existence of a third tier unit had been recognized, as for example in Wales. Later, similar problems would be considered in relation to the Metropolitan Counties Branch. He opposed the amendment as it stood, but said that the exact arrangements resulting from the scheme, if it was accepted in principle, would be a matter for discussion and negotiation with Divisions and with the proposed Groups.

Dr. A. BROWN (Cambridge and Huntingdon) said that in East Anglia in the old days they had had Branches and a Group which covered the area of the Regional Hospital Board, and when there were important enough matters to consider the Group was called together. He saw no point in changing the names. With large Branch areas the interest of the individual members in Branch work would diminish. Dr. R. W. MCCONNEL (Buckinghamshire) suggested that most of the areas were so big that nearly all the Branches would ask for a Regional Committee to be formed.

Dr. WAND proposed an amendment to the amendment, to make the formation of the suggested third tier unit dependent on the approval of the Council, which was accepted by Cambridge and Huntingdon and agreed to. The decision, therefore, was to insert in the recommendation, after the words "a regional basis," the words "Where this is impracticable for geographical reasons, and with the approval of the Council, a third tier unit, the Regional Committee, be formed."

Area of Branch Councils

An amendment by Enfield and Potters Bar stated that the choice of Regional Hospital Board boundaries to determine the areas of the new Branch Councils would not best serve the interests of the Association. Dr. R. B. L. RIDGE said that a Regional Board boundary cut across his Division. He assumed that the principal function of the new Branch Council would be liaison and the drawing together of the various sections of the profession. At divisional level this was most successful when the area of the Division corresponded to a Local Medical Committee functional area, defined as the area in which doctors were accustomed to send their ordinary cases to the same hospital centre for treatment. From a wider area the special and extraordinary cases would be sent to a higher medical centre, which in many cases might be a centre of medical teaching. These were the areas in which liaison and co-operation on a second tier level were most likely to be successful. In some cases the Regional Hospital Board areas fulfilled the requirements, but in London and the Home Counties they did not. To base the second tier organization on the hospital set-up placed a strong emphasis on the hospital and consultant-specialist side of the Association. The percentage attendance of hospital medical staff at Division and Branch meetings was much less than that of general practitioners and public health officers, and many consultants had little knowledge of Association affairs. The choice of the Regional Hospital Board areas as the areas of the new Branch Councils (the formation of which he endorsed) would not at the

present time best serve the interests of the Association as a whole.

Dr. J. A. L. VAUGHAN JONES (Leeds) supported the amendment, feeling that the recommendation as it stood had implications which had not been realized by the Constitution Committee. When the questionnaire on the revision of the Association's structure was sent out the replies showed a 3-to-1 majority for retaining the Branches as they then were. The complex mechanism of one tier, two tiers, two and a half tiers, and three tiers was a hotchpotch. The Branch was in danger of becoming an autonomous body which could take action first and refer to Headquarters afterwards. They had had enough autonomy in the last six months to make them suspicious of any further such developments. (Applause.) The Branch Council as at present constituted could function as a co-ordinating unit if the various sections co-operated properly. Acceptance of the proposal would imply approval of the N.H.S. structure whereby the Association would slavishly follow the idea of developing its branches on the Regional Hospital Board area basis. But the profession was split enough already. The suggested concept would perpetuate that. The Association should act as the British Medical Association and not as a collection of functional groups with divided loyalties. The present attempts to get liaison with the Regional Hospital Boards and the local Branches had been pathetic, and the meetings had been dropped from once a quarter to once a year. Administrative efficiency was not the only thing to be desired; local loyalties meant a great deal, and he asked representatives not to mortgage the future of the profession by accepting what seemed to be an easier administrative solution to a problem. "Let us be the British Medical Association, not a functional adjunct to the National Health Service, which has split the profession already," he concluded. The profession's weakness was in the functional group concept.

Dr. A. V. RUSSELL (Council) asked that the proposal in the Enfield and Potters Bar amendment should be accepted. The motion as it stood would mean, in his own area of South Staffordshire, being cut off from many colleagues in the county with whom co-operation had been enjoyed for many years. Dr. R. W. MCCONNEL (Buckinghamshire) objected to the amendment on the ground that it was too dogmatic. Dr. W. E. DORNAN (Council) supported the amendment. He said that the only real advantage offered by the Committee's proposal would be that, under the Branch Council aegis, the business of one Regional Hospital Board would be discussed. He could not accept Mr. Langston's claim that the proposal would provide better correlation between local medical committees and the Regional Hospital Boards.

London's Experience

Dr. F. GRAY (Council) said that it was surely the proposal that was dogmatic, not the amendment. It was up to the proposers to make out a case, and he submitted that they had not done so. Regional Hospital Board areas had been formed with a definite concept, but nobody had suggested that they were necessarily the right areas for B.M.A. units. Although it might be so in some areas, the proposal would press such a concept on the whole country. People would go any distance if there was important business for them to perform, but he doubted whether they would go long distances to attend the new Branch Councils. As an example of what had happened since the "quartering" of the London area, he said it had been proposed that in each quarter a co-ordinating committee should be set up to deal with the general practitioners' relationships with the regional boards. In No. 1 Area no such committee had ever been formed; in No. 2 Area it had been formed and had never met; in No. 3 Area it had been formed and had not met for four years; in No. 4 Area the committee's last meeting had been six months ago, since when nothing had been done, and it only met once a year. Dr. Gray asked the A.R.M. not to risk upsetting strong and vigorous Branches by their having to make fresh links.

Dr. R. G. GIBSON (Council), explaining how he visualized the new unit working, said that after a case had been reported the secretary of the new unit would immediately set up a

ad hoc committee within the area, informing Headquarters of this and asking them to be ready to give help if necessary. Then the secretary would inform the local authority or the regional board and ask them to make comments. Those affected by the matter under consideration would know that behind them there were not just a few members of a medical advisory committee but 1,300 doctors, a number which would impress their opponents. If the matter could not be settled locally, the whole force of B.M.A. Headquarters, representing 70,000 doctors, should come into action. Branches as at present constituted did not cover certain areas and overlapped elsewhere. The Constitution Committee had attempted to find a means whereby there could be complete and tidy co-ordination between all sections, and in the majority of areas the regional board area met the need most efficiently. Areas in which this was not so could be considered during the year.

Dr. F. A. BELAM (Guildford) supported the amendment. He said that Regional Hospital Board areas, particularly in the Metropolitan areas, were far too large and unwieldy. Functions of county areas were not well attended, and if the areas were any larger there might be no attendance at all. Dr. F. M. ROSE (Council) pointed out that in 1950 the old Lancashire and Cheshire Branch, consisting of about 28 Divisions, had been broken up into three new Branches. Before the break-up it had worked very well, but had worked even better since. He believed that Branches functioned better in small units, and that having them in Regional Hospital Board areas would achieve nothing. Dr. W. A. HYSLOP (Leeds), speaking as a member of a Regional Hospital Board, said it would be a mistake to give a Regional Hospital Board the idea that the B.M.A. was tailing behind. Dr. S. J. FIRTH (Brighton and Mid-Sussex) said that after careful consideration his Branch supported the amendment. The present constitution fostered unity of the profession within the Branch area. It was better to meet adjoining areas socially and discuss problems of common interest rather than be hidebound by having Regional Hospital Board areas.

Dr. W. MORGAN EVANS (South Middlesex) said he was Chairman of the Metropolitan Counties Branch Council and supported the amendment. At the time the Constitution Committee started its deliberations the Regional Hospital Boards were themselves in the melting-pot and only narrowly escaped destruction. He had had a lot to do with regional boards, and his experience was that they would not consider outside points of view. The real solution to getting adequate liaison with regional boards was to have increased representation on the boards. Dr. J. A. PRIDHAM (Council) opposed the amendment, which he said was a crucial one. The Committee, recognizing that there was nothing between the Division and the Council, had decided that there must be a second tier unit, and in determining what type of unit it should be had been concerned to get unity between different branches of the profession. They had to get the B.M.A. regional hospital organization into the new unit. He pointed out that if the general principle was accepted there was room for modification to deal with individual cases.

Mr. LANGSTON, replying to the debate, said that this had been one of the Committee's major problems on which more time had been spent than on almost anything else, and the recommendation had not been taken on a snap decision. It was not suggested, he pointed out, that there should be a Branch for every Regional Hospital Board area, and this would be a matter for discussion after accepting the principle. It had been recognized that there was a special problem with the Metropolitan Counties Branch, which he thought would have to continue as before. Where there was overlapping a Division would opt for whichever Branch it wished to belong to. The object of the recommendation was to bring together in one functional unit regional consultants and specialist committees, public health committees, and local medical committees, so that branches of the profession organized locally could meet and argue out their problems, and the Committee believed that the Regional Hospital Board area was the only basis for such a unit. He asked the Meeting to accept the recommendation in principle.

recognizing that there was a lot of detail to work out and possibly modifications to be made.

Dr. R. B. L. RIDGE (Enfield and Potters Bar) stressed that in the debate there had only been three speakers against the amendment. The position was that not only had the Branch Council to be reconstituted in its function—a matter which had yet to be debated and decided—but at the same time the Constitution Committee was suggesting that the new function, as yet undebated and untried, would be more successful on a regional board basis than on any other. In the same breath the Chairman admitted that there would have to be many modifications, and those modifications would introduce the most undesirable element of a third tier between the Division and the Council. He suggested it would be wiser first of all to try out the new Branch Councils in their existing areas and allow modification in areas to occur from the existing areas rather than from new areas.

In reply to a question from the floor, the CHAIRMAN said that recommendations which involved a change of policy would require a two-thirds majority.

The amendment by Enfield and Potters Bar, "that the choice of Regional Hospital Board boundaries to determine the areas of the new Branch Councils will not best serve the interests of the Association," was carried.

Freedom of Choice

Another amendment had been handed in seeking to add to the end of the recommendation the words "subject always to the overriding right of local units at their discretion to choose the Branch to which they shall belong."

The CHAIRMAN ruled that the final sentence of the recommendation was replaced by the Enfield and Potters Bar amendment which had just been passed.

Dr. WAND said that the Meeting was trying to determine the constitution which would serve the Association most adequately. The Constitution Committee had suggested a definite method whereby regional groups should be created; later the function of those groups would have to be considered. The A.R.M. had shown that it did not want Regional Hospital Board areas to be the determining factor, but it might be that when the functions of the groups had been determined representatives would be satisfied to have some change in some of the Branches in consultation with those Branches. The matter would then go back to the Organization Committee or the Constitution Committee and at a later stage there would be further consultation on the local determination. The immediate purpose of the discussion was to find out broadly what representatives wanted but not to define it precisely; the principle of the structure having been determined, it would be for the appropriate committee of the Council to determine its functions through the Council and in consultation with the areas concerned.

Dr. R. P. HENDRY (Rugby, with South Warwickshire) moved, as an amendment, to add at the end the words "subject always to the overriding right of local units at their discretion to choose the Branch to which they shall belong."

Mr. LANGSTON said that his Committee had always accepted that principle.

Dr. Hendry's amendment was carried.

After the CHAIRMAN had proposed that a vote be taken on the recommendation as a substantive motion, Dr. F. GRAY (Council) said that by the omission of the words "Regional Hospital Board" the whole basis of the proposal had gone. He thought that the Meeting should not pass theoretical resolutions not knowing what they meant. Mr. LANGSTON strongly disagreed. Branches had drawn attention to anomalies in their constitutions, and although the suggested Regional Hospital Board basis had been turned down, the amended proposal would still give the Council the opportunity to look at the present Branch structure and bring it up to date and in touch with the needs of the present day. Dr. WAND said that what was required was a functional unit in the Association which could act easily and effectively for all sections. That principle having

THE COUNCIL

Mr. LANGSTON formally moved that no change should be made in the constitution of, and the methods of election to, the Central Council of the Association. An amendment by East Herts that all members of Council (excepting those elected by Overseas Branches, by the Public Health Service, and by women members) should be elected by Representatives of Divisions, and not largely by members of grouped Branches as at present, was moved by Dr. D. L. GULLICK. He submitted that the reforms introduced some years ago had made no difference whatever. The average member was not really interested, except in times of crisis, in who served on the Council. On the other hand, every year the Representative Body elected some thirteen members of Council. For that election there were anything up to twenty excellent candidates, and the greatest interest was taken in the election. Surely it would be more healthy for the organization if all members of Council were elected by electors who took their duties as seriously as the Representative Body and not as happened in most cases, by three members in any one Branch who put up a candidate who was returned unopposed. Dr. A. BROWN (Cambridge and Huntingdon) said it was an attempt to swing back too far. He agreed with the mover of the amendment that there were many good points in the old method of elections, but it would be wrong for all members of Council to be elected by Representatives. Dr. C. M. SCOTT (Barnet) agreed. There was nothing more calculated to destroy the slight remaining enthusiasm among members than to take away their chance of a direct vote in Council elections. The whole matter should not be handed over lock, stock, and barrel to the A.R.M. Dr. J. ARTHUR MOODY (Council) said that to pass the amendment

The Cambridge and Huntingdon amendment was lost. South Staffordshire proposed that members of Council should be returned by single-member constituencies, and Dr. R. S. V. MARSHALL, in moving the amendment, said that multiple-member constituencies destroyed the direct contact of a member of Council with his constituents and might give centres with a large number of doctors an advantage over others. It would increase the representative nature of the Council to have only single-member constituencies. Dr. E. C. DAWSON (Council) said that the Derby Division sympathized with the view of South Staffordshire. A town with a large number of doctors, he suggested, could secure the election of one or more of them against the spread-out votes of the rest of the constituency in the case of constituencies

returning several members. With the single-member constituency it was easier for the representative to maintain contact with his constituents. Mr. LANGSTON felt that the amendment had great merit, and, in view of the reconsideration which was to take place, suggested that it should be accepted as a reference to Council.

The amendment was accepted as a reference to Council.

Young Practitioner Representation

Dr. R. P. HENDRY (Rugby, with South Warwickshire) proposed that one young practitioner should be appointed to the Council annually to hold office for two years, the method of election to be determined by the young practitioners. This, he suggested, would give the Council a more balanced appearance, and ensure that the younger members of the profession had their case considered and could see that it was being considered. Dr. F. GRAY (Council) said that everyone would sympathize with the idea behind the amendment, but it was debatable whether the object in view would be achieved by it. Council meetings lasted all day. It was difficult for established practitioners to find the time to attend them and would be almost impossible for younger and unestablished practitioners to do so, as had been found on the G.M.S. Committee. Secondly, a young practitioner in a hospital could not represent those in general practice, and *vice versa*. Thirdly, it would be difficult for one young man to represent all the young practitioners in the country or to be in touch with his constituents. Mr. LANGSTON agreed with Dr. Gray. The Constitution Committee, he said, had considered this matter very seriously and had brought it before Council, where it had been fully discussed, but the conclusion reached was that the proposal was impracticable.

Dr. HENDRY, in reply, explained that the idea was that there would be two young practitioners on the Council, one serving his first and one his second year, at any one time. It had been suggested that no young man could find the time, but out of four or five thousand young practitioners it should be possible to find a few who could do so, and in any case they should be offered the opportunity. If necessary, the young practitioners now serving on other committees could meet and decide who should represent them.

The amendment was lost.

Authority of Council

Dr. J. C. A. NORMAN (Bournemouth) moved :

That consideration be given to the reconstruction of Council so that it shall have the ultimate authority, on behalf of the Association, in all matters of policy and action affecting the whole profession.

He said that in the current remuneration dispute they had seen the Association allow its authority to pass to joint committees with the Royal Colleges; the Representative Body had been side-tracked and its decisions compromised in advance. No political party or Government or other institution could function properly unless there was a single ultimate authority, and the B.M.A. must be similarly constituted. To be effective and acceptable, the Council should be reconstituted so that it was properly representative of every section of the profession. The Council alone should consider and act on all matters affecting more than one section of the profession, and must have power to decide matters of policy and action as well as being the executive of the Association. He said that the Council, reconstituted and modernized in the manner suggested, should and would be able to act alone on behalf of the Association and its members without surrendering any of its authority to negotiating committees formed jointly with outside bodies.

Dr. V. COTTON-CORNWALL (Liverpool) opposed the amendment, though he said he would accept it as a reference to Council for its consideration. The amendment would make Council into an autocratic body which could completely overrule the Representative Body, which would no longer be the policy-forming body of the Association.

Dr. C. P. WALLACE (Guildford) supported the amendment. He said that recent events had shown that the profession could look forward to years of consistent failure if there were not appointed a Council in which the Meeting had confidence and which was given sufficient authority. The profession was suffering from divided authority, and, while it might need a great deal of hard thinking and surrendering of partial autonomy, he believed that to preserve the profession and its independence they must place whole-hearted confidence in a fully representative Council.

Dr. ANNIS GILLIE (Paddington), opposing the amendment, said that history had shown that the most dangerous form of government was an oligarchy. While a group of carefully elected and fully trusted men might seem to be the ideal body to have full power, men could change.

Mr. LANGSTON said he considered the amendment an invitation to the Representative Body to commit *hara-kiri*, and hoped the Meeting would not even accept it as a reference to Council.

The amendment was lost.

The motion was carried.

Because of the peculiar geographical difficulties in South Wales and Monmouthshire, Swansea proposed that the number of selected members of Council be increased by one, to be elected by the Aberystwyth, South-West Wales, and Swansea Divisions. Mid-Cheshire proposed as an amendment that in the revised grouping of Home Branches to form constituencies for the direct election of members of Council one of the two members of Council elected by the South Lancashire and East Cheshire Group should be a direct representative of Cheshire. A further amendment was proposed by Westminster and Holborn that the grouping of constituencies for direct election of members of Council in the area of the present Metropolitan Counties Branch should remain as at present.

The amendments were carried as references to Council.

REPRESENTATIVE BODY

Number of Representatives

The CHAIRMAN OF THE CONSTITUTION COMMITTEE moved the recommendation that the number of representatives of Home Divisions in the Representative Body be reduced by an amount which would ensure an overall membership of approximately 350. He believed the business of the Meeting would be helped and made more expeditious if it were reduced in size.

Dr. O. C. CARTER (Bournemouth) moved :

That this Representative Body believes that disadvantages outweigh any possible advantage in cutting the size of the Representative Body, and wishes that other means be first tried to make the working of the Representative Body more efficient.

He said a reduction in size would not facilitate smoother working of the Meeting, and there was no reason to suppose it would lead to any reduction in the number of notices of motion and amendments. The matter should not be decided on a belief that large numbers meant inefficiency. Dr. J. S. NOBLE (Blyth, Morpeth), supporting the amendment, said it had been admitted only that morning that the Representative Body had worked well. He was convinced that a reduction in size would lead to delegation and not representation. The standard of debate would not be affected, because the same people would be elected. He thought, indeed, there might be an argument for enlarging the Representative Body, and believed that every corporate Division should be represented.

Dr. ANNIS GILLIE (Paddington), supporting the amendment, drew attention to the fact that there were lesser sections within the profession members of whom would to a certain extent be passengers in such a Body until they felt their feet. It was sound that such members should represent their Divisions, and the tendency must be for them to represent those Divisions which could send more than one representative. It might be that there should be some

rearrangement of the multiple-represented Divisions, but it would be a tragedy to reduce the single representation of Divisions, as it would lessen the number of representatives who could present the problems of minority sections. Dr. J. C. ARTHUR (Gateshead) said that in his view the contention that the reduction of the size of the Representative Body would reduce the length of the debates would not hold water. Cutting the number of representatives from ten to five would not cut by five minutes the length of the debates. It would probably lengthen them. What would happen was that people would feel that they had been disfranchised and card votes would be demanded, which would take much more time.

Dr. G. CORMACK (Newcastle upon Tyne), also supporting the amendment, referred to the limitation in the choice of places in which to hold the Meetings, and said it did not matter where they were held. The existing arrangement had been shown by experience to work well, and in his view any step taken towards reducing the size of the Representative Body might well be a step towards its eventual abolition.

Mr. LANGSTON, in reply, said he had no doubt that it was past debates on the size of the Representative Body that had led to the formation of the Constitution Committee, and the feeling in that Committee was that its members had a duty to study and examine and to put forward suggestions for producing an efficient body of smaller size. In asking the Committee to examine the problem, presumably the Representative Body felt that it was too large. He could not believe that if the Body were made smaller than it was at present it would be difficult for minority points of view to be fully voiced. Surely members with points of view would make them to their representatives, who would see that the Body heard those points of view. He also thought a reduction in size would increase the interest in elections rather than the reverse. It would be for the good of the Association, too, if it could visit a number of places throughout the country which were at present precluded from receiving the Body would lead to increased use of the card vote, nor did he accept the suggestion that a card vote would involve waste of time.

Dr. D. L. GULLICK (East Herts) thought that the Meeting was in conscience bound to reject the amendment. If the Representative Body could do its work just as well with fewer members, it should accept the "Act of Self-denial." Dr. F. GRAY (Council) said that, having been a member of the Representative Body for 25 years, he believed in all sincerity that the meeting had conducted its business better in pre-war years, when it had been smaller, than since. Mr. A. LAWRENCE ABEL (Marylebone) expressed strong agreement with Bournemouth. The doctors who were coming for the Scientific Sessions the following week had not been thought of. Were they to be housed in caravans? They were just as much part of the Association's Annual Meeting as were the Representatives. He was opposed to any reduction in the number of Representatives.

Dr. CARTER, in reply, said that Mr. Langston had thought to this, that, and the other but had produced no argument to show how efficiency could be improved by his proposal. It was the Association's duty, surely, to pursue its policy of trying to achieve wider interest in medical politics by educating more and more instead of fewer and fewer of the younger men and women in the problems inherent in medical practice. The Representative Body, which had worked so well and wisely and had made the Association grow to its present strength, should not now have to pay the penalty of reducing itself in size and numbers.

The Bournemouth amendment was carried by a large majority.

Dr. A. G. CHAMBERLAIN (Dorset) moved that where a constituency had 100 members or more there should be at least two representatives. Mr. LANGSTON said the effect of the amendment would be to increase the size of the Representative Body by nearly 100 members. Dr. CHAMBERLAIN suggested that the amendment might be accepted as a refer-

ence to Council, so that care would be taken to see that the representation of the smaller constituencies was not unduly reduced.

The amendment was lost.

The Bournemouth amendment was then put as a substantive motion and carried.

Reconstitution of Meeting

Dr. R. B. L. RIDGE (Enfield and Potters Bar), at the suggestion of the Chairman and with the leave of the Meeting, moved a proposal in the name of Enfield and Potters Bar in the following amended form:

That the Council be instructed to consider whether the Representative Body should be reconstituted to embrace the Conference of Local Medical Committees and the Conference of Regional Consultants and Specialists Committees, with provision for both sectional and plenary sessions.

The motion was put forward, he said, primarily to raise the question of whether the Constitution Committee, in carrying out its admittedly very difficult remit, had maintained a sufficient breadth of vision in considering the reconstitution of the Representative Body. The Association, through the G.M.S. Committee, called a Conference of Local Medical Committees, and the Central Consultants and Specialists Committee could call, and had on one occasion called, a conference of Regional Consultants and Specialists Committees, and these two Conferences discussed on separate dates and in separate places a very large part of the subjects on the agenda of the A.R.M. The Representative Body might perhaps be reconstituted to embrace these two Conferences, which could continue to hold sectional sessions for domestic matters.

[At this point the suspension of Standing Order 70, forbidding smoking in the meeting, was moved from the body of the hall, but was defeated by a large majority.]

Dr. A. TALBOT ROGERS (Bromley) was of opinion that the proposal from Enfield and Potters Bar would be difficult to carry out. The G.M.S. Committee, though it fulfilled its function as a Standing Committee of the Association, owed some of its effectiveness to the fact that it was also the executive of the Conference of Local Medical Committees, and as such could take action on many matters with the Government. To "marry" the three bodies would not lead to celerity in the conduct of business. Mr. T. HOLMES SELLORS (Council) supported what Dr. Talbot Rogers had said, and pointed out that the Conference of Regional Consultants was not a body with any official standing or any power to control the action of the Central Consultants Committee; it was an *ad hoc* body, the future of which had not been decided. This form of "loose marriage" would hardly be appropriate. Dr. RIDGE, in reply, said the purpose of the motion was to find whether or not, after due consideration, there was thought to be anything of practical value in the suggestion, which should at any rate mean a saving in time and in the funds of the Association. There was ground for investigating whether or not the means employed by the profession for reaching decisions could be streamlined.

The motion was lost.

Card Vote

The Constitution Committee recommended that a card vote should be taken at a Representative Meeting if demanded by one-third of the representatives present (instead of "by a majority" of representatives, as at present).

Dr. J. P. SPARKS (Rugby, with South Warwickshire) proposed as an amendment that the demand should be by one-third of the representatives present "and voting." This would prevent an item of business being stultified by the purely negative expedient of abstention. Dr. C. P. WALLACE (Guildford) said that he wished to lodge the strongest possible protest against the recommendation. Over and over again the A.R.M. had discussed the Representative Body and its constitution, and the importance of the individual voting

Dr. Smith had outlined. But it was an undisputed fact that the bodies which did the negotiating with the Ministry could be approached only through the C.C. and S. Committee, and, though that body had extended much grace and favour, neither registrars nor S.H.M.O.s had ever succeeded in having anybody appointed from the Committee to the bodies which actually made the approach to the Ministry.

Dr. D. H. ANDERSON (Sheffield) also supported. One method the Council might consider of ensuring adequate representation for hospital staffs was by co-option to the Executive of the C.C. and S. Committee of such members so that they might have a vote in the highest executive level of that Committee. That, he thought, would go a long way towards meeting their requirements. Dr. R. L. CORMIE (Glasgow), speaking in support, said he doubted whether there would be any serious difficulty about junior officers attending an occasional meeting.

Dr. WAND asked that the matter should be referred to Council, in view of the fact that only two or three weeks ago Council had approved in principle a change in the constitution of the Registrars Group, and as the Central Consultants and Specialists Committee was associated with the Joint Consultants Committee. The Registrars Group had produced some of the most promising medical politicians the Association had ever seen. He did not believe that any section of the medical community had had better advocates than the registrars in the C.C. and S. Committee. Mr. LANGSTON acclaimed Dr. Wand's remarks as wise. The C.C. and S. Committee had reviewed its constitution and it had also been reviewed by the regional committees and their constituent hospital group medical advisory committees. He was quite convinced that the constitution as it now stood represented the wishes of the majority of the doctors working in the hospital service and did include adequate opportunity for the representation of minority viewpoints.

Dr. GERRARD said that he would be prepared for the motion to be treated as a reference to Council, and it was so decided.

Finance and Journal Committees

On the motion of the CHAIRMAN OF THE CONSTITUTION COMMITTEE, the following recommendation was carried:

That steps be taken to amend Standing Order 52 of the Representative Body by the deletion of the reference to the Finance and Journal Committees.

"Scottish Council"

The Meeting carried a motion by the CHAIRMAN OF THE CONSTITUTION COMMITTEE that the title "Scottish Committee" be changed to "Scottish Council."

Consultation Between Committees

The CHAIRMAN OF THE CONSTITUTION COMMITTEE moved that every committee should, in respect of any matter before it which was of special interest to another committee of the Association, consult that other committee. In the event of disagreement, no action should be taken without reference to Council. This was carried.

Powers of Autonomous Bodies

The recommendations of the Constitution Committee in respect of the autonomous bodies were that their existing relationship to the Association should be continued, subject to ratification annually by the Representative Body of their powers, and that the arrangement under which the Joint Committee between the Central Consultants and Specialists Committee of the B.M.A. and the Royal Colleges and the Scottish Royal Medical Corporations acts as the negotiating body with the Government in respect of those engaged in the hospital and specialist service under the National Health Service should be continued. The CHAIRMAN OF THE CONSTITUTION COMMITTEE moved the adoption of the recommendation.

The Meeting passed an amendment by Dr. R. P. LISTON (Tunbridge Wells) that, in view of the Council's decision to

set up a special committee to investigate unity within the profession, discussion on this recommendation should be deferred until the A.R.M. of 1958.

CONSTITUTION AND ORGANIZATION OF SPECIAL GROUPS

Mr. LANGSTON moved the Committee's recommendation:

(a) That no new Group should be formed, but if the need should arise for consideration of problems relating to any special interest, the need should be met by the formation of a subcommittee of the appropriate standing committee.

Dr. V. COTTON-CORNWALL (Liverpool) said he hoped the Meeting would reject the recommendation, which he considered ossifying. Mr. R. BREARLEY (Liverpool) supported the rejection. He pointed out that forming a new group was a laborious and difficult business, and the incidence of new groups had not yet reached epidemic proportions. It would be imprudent to write into the Constitution an embargo on new groups in unforeseen future circumstances.

Mr. LANGSTON pointed out that the specialist branches of medicine could form fifteen to twenty groups, and if all those groups appointed representatives to the C.C. and S. Committee the regional representatives, who were democratically elected by constituents in the regions, would be heavily outnumbered. The Committee thought the idea of groups formed for quite a different purpose long before there was a Consultants and Specialists Committee was out of date and outmoded. The recommendation, he said, allowed for special committees to be formed, as had happened several times in recent years, to consider special problems. Dr. A. REZLER (City) considered the recommendation objectionable. In one sense, he said, it would mean leaving the B.M.A. if one wanted to form a new group. He recalled how some years before he had been concerned with the formation of the Unestablished Practitioners Group, which had held meetings of up to 200, at one of which the suggestion had been made that they should leave the B.M.A. He thought that if the recommendation was accepted it would lead to the formation of new groups outside the B.M.A.

Mr. LANGSTON said he did not consider that the Constitution Committee's recommendation was an "ossifying resolution," whatever that might mean. It was an attempt to bring past practice into line with present needs. He reminded representatives that if the recommendation was not accepted it would be possible, so far as the Central Consultants and Specialists Committee was concerned, for a minority point of view to overrule the point of view of the elected representatives of the periphery.

A representative, speaking from the body of the hall, asked for figures showing the number of representatives on the C.C. and S. Committee, and their groups, as distinct from the direct representatives. Mr. LANGSTON, in reply, said there were 13 clinical groups with one representative each, the registrars and S.H.M.O.s with two, the officers of the Association, and representatives from the General Medical Services Committee, and the remainder were, broadly speaking, from the regional consultants and specialists committees.

Recommendation 30(a) was not adopted.

Mr. LANGSTON formally moved Recommendation 30(b):

That the constitution of the Senior Hospital Medical Officers and Registrars Groups be amended to provide that the Executive Committees of these Groups should function as subcommittees of the C.C. and S. Committee; and that these subcommittees should include members of the Groups elected on a regional basis, together with a minority of members appointed by the C.C. and S. Committee.

In moving the deletion of paragraph (b), Dr. T. W. DAVIES (Swansea) asked representatives to consider the constitution of the Groups in relation to the C.C. and S. Committee. No one could be a member of the Groups until he was a member of the parent Association. On the other hand, in view of the autonomous powers of the C.C. and S. Committee, it could be made up entirely of non-members of the Association. Therefore, if the motion were

carried, it was conceivable that the Executive Committees made up of members of the Association would be asked to become a subcommittee of a committee which could be entirely made up of non-members. If the motion were not accepted, the S.H.M.O.s Group and Registrars Group would retain their right to take resolutions direct to the Council.

Mr. LANGSTON stated that both points made by Swansea were incorrect. To take the second point first, the motion used the words—referring to the Groups—"should function as subcommittees of the Central Consultants and Specialists Committee." There was no suggestion that they should cease to be Groups. They existed as such. Efforts were being made to stop new Groups coming along. Secondly, the rule still stood that a member of a Group must be a member of the Association for the Groups which existed. The fact that members of the C.C. and S. Committee need not be members of the Association existed already, and was not altered by the motion.

Dr. S. WAND, Chairman of Council, said that the matter, which was complicated, had been referred to the Organization Committee to look into. There were certain difficulties which evolved from the use of nomenclature. He therefore suggested that Recommendation 30(b) be referred back to the Council, together with the amendments of Swansea, Manchester, and South Staffordshire. (Agreed.) It was indicated that the suggestion made by the Chairman of Council was completely acceptable to the Registrars.

Mr. LANGSTON formally moved that the report of the Constitution Committee, as amended, be approved.

The motion was carried, as was a motion by Rugby congratulating the Committee on the thoroughness of its investigation, the clarity of its report, and the soundness of its conclusions.

A.R.M. PROCEDURE

The following motion by Newcastle upon Tyne was referred to Council:

(a) That representatives at Representative Meetings of the B.M.A., when considering resolutions or amendments affecting essentially one section of the profession, should pay full respect to the views put forward by committees representing those individual groups.

(b) That, in order to avoid splits within the profession, machinery should be introduced in order that recommendations, made by interested committees, should not be reversed at Representative Meetings without giving opportunity for further discussion at periphery level, by those sections of the profession most concerned in the outcome of controversial resolutions or amendments.

The meeting rose at 6.45 p.m.

SECOND DAY

Thursday, July 11

The Representative Meeting met at 9.30 a.m., with Dr. I. D. GRANT in the chair.

REMUNERATION POLICY

Dr. H. G. DOWLER (Gloucestershire) moved:

That, as moral obligations have evidently ceased to be obligatory, every effort shall be made in future negotiations on terms of service in the National Health Service to ensure that only such terms as are enforceable in law shall be accepted on behalf of the profession.

It had come as a shock to many doctors, he said, to find that their agreement on remuneration could not be enforced in a court of law. The motion did not suggest any criticism of those who had negotiated on their behalf in 1948. A few months ago the Government had been indignant at the failure of Egypt to observe her moral obligations, but it had had no compunction in not fulfilling its obligations to the medical profession. If doctors failed to fulfil their obligations they were in for trouble, and the Government should be in the same position. Dr. J. S. NOBLE (Blyth, Morpeth) said that in a democracy the law was the Government, representing public opinion. When the Government was also the employer, the terms of service were the result of negotiation through strength or of scarcity

of servants. Neither condition applied in the present instance. In some places there were too many doctors, and the doctors were not united. The motion should be passed not in a mood of indignation but as a step towards the promotion of professional unity, for only by unity could the profession get what it wanted and deserved.

Dr. WAND, Chairman of Council, said it was interesting to consider recent events. The Association had been told that its claim could not be considered on its merits because it would have inflationary results that the country could not stand, and would set up a chain reaction which would upset the country's economy and lead to grave consequences. It was said that the country was fighting tooth and nail to avoid inflation, and only a few months ago they had been told that there was no change in the economic situation. What, however, had happened since? Only a few weeks later, the Civil Service had had an increase in pay which took account of increases in incomes outside the Service since mid-1956. He would be the last to suggest that Members of Parliament should not be adequately remunerated, but he could not make sense of the series of statements made to the Association by responsible Ministers in the light of the increase announced for Members of Parliament in the House a few days ago. (Applause.) He found it profoundly disturbing. The representatives present understood the situation as well as he did; what more could he say?

The motion was carried.

Message from Malta

The SECRETARY intervened to announce that a telegram had been received from the Malta Branch extending good wishes for the betterment of the medical profession in the United Kingdom.

Whole-time B.M.A. Negotiator

Dr. L. BELLMAN (East Yorkshire) moved a motion asking that, in view of the need for constant vigilance on matters relating to salaries and conditions of service, the Council should be instructed to set up a whole-time department for the provision of advice upon the drawing up of terms of service and negotiation of salaries for all branches of the profession.

He explained that the motion did not seek in any way to belittle the Association's negotiators. Indeed, it appeared that they had been even more conscientious recently than ever before; yet it could not be denied that there was a great deal of dissatisfaction in the profession about the present course of events and the results achieved. The Negotiating Committee had had no answer whatever when faced with a wily and unscrupulous opposition, and they had been left floundering. A suitable adviser, experienced in such matters, should be able to counter such moves and even forestall them. It might cost as much as £10,000 a year to get the right man, but the expenditure would be amply justified by the results which would be achieved.

Dr. J. L. MCCALLUM (Westminster and Holborn) moved to amend the motion by the deletion of the words "to set up a whole-time department . . ." etc., "and the substitution of an instruction to Council merely to negotiate on such matters for all branches of the profession. His Branch had felt that it would be unnecessary to set up a whole-time department; it would be better to leave the matter to Council for the time being, while the whole subject was under review. Dr. A. R. Fox (South-West Essex) supported the motion. He said there had been something lacking in the negotiations of the last few months. The Negotiating Committee could only be as good as the advice which it received from learned counsel, statisticians and others, and unfortunately it had not been very helpful; it had come at the wrong time and the interpretation of Spens had been subject to criticism. A full-time advisory body would be of great assistance in negotiating with the Ministry. The profession had a lot to learn from industrialists and politicians.

Dr. V. COTTON-CORNWALL (Liverpool) said that he would find the motion acceptable only if the words "prior consent" were replaced by the words "prior information." He did not think it was right to bind everybody down to obtaining permission beforehand, but his suggested wording would make it possible to see that nobody took independent action

without informing his colleagues on the committee that he could no longer support their views. Dr. WALLACE repudiated the suggestion that he was in any way indulging in recriminations. He had no ill feeling towards any individual in the Representative Body or the Negotiating Committee. He would be the first to pay tribute to the magnificent contribution to medical science which Sir Russell Brain had made, but he felt that when Sir Russell took part in medical politics he was as much open to criticism as was the humblest member of the Representative Body. The meaning inherent in the motion was that the profession should act together. It was not worth wasting time discussing whether the word "consent" or "information" should be used.

The Guildford motion was carried.

The Meeting carried a motion by Derby expressing the earnest hope that in future any medical committee or council (or similar body) which advised or acquiesced in any major change in medico-political policy would either take steps to ascertain the views of the profession as a whole, or else make it clear beyond peradventure that the opinion expressed was solely that of the individuals forming the committee, etc., and by no means necessarily that of the profession as a whole.

Amendments to By-laws

The Meeting agreed that By-law 16(1) should be so amended as to remedy the present inconsistency in respect of the compounded subscription payable by newly qualified practitioners. It adopted the alteration of the By-laws in the manner shown in Appendix VI and Appendix X of the Annual Report of Council.

The remainder of the Annual and Supplementary Reports of Council under "Organization" was approved.

Funds for Social Activities

Dr. J. W. RIDLEY (Cleveland) proposed that any Branch or Division which was not in possession of an established voluntary fund should be precluded from assistance from central funds for social activities, the cost of which could not be met from the annual capitation grant allocated by the Council.

The motion was carried.

Change of Divisions

Rugby proposed alterations in the By-laws relating to a member's change of Division. Dr. R. P. HENDRY said that, speaking as a Divisional secretary, he thought the fewer powers Divisional secretaries had the better, and members should be free to change their Division if they wished. Dr. A. ELLIOTT (Stratford) supported the motion, but suggested that hospital staff doctors should be members of the Division in which they worked in order to facilitate participation in the work of the Association, and pointed out that it was sometimes difficult to keep in touch with them owing to their frequent changes.

Dr. GIBSON opposed the motion, and said the present By-law had been carefully drafted to ensure the minimum of abuse. A change of Division could be made immediately, provided the reasons given were satisfactory. There was a danger in giving members *carte blanche* in changing that there might be canvassing. He said it was up to secretaries to keep in touch with hospitals and find out the names of their resident staff.

The motion was lost.

The following motion, moved by Dr. R. P. HENDRY (Rugby, with South Warwickshire) was accepted as a reference to Council:

That if a motion adopted by the Representative Body requires, for its implementation, an alteration to the Articles and/or By-laws, a draft of the proposed alteration should be forwarded to the sponsoring Division for comment before publication. After publication thereof in the Annual Report of Council, it should be possible for any Division, after due notice, to move an amendment thereto which, if carried, would not delay implementation for a further year.

Pre-registration Year Appointments

Dr. J. S. NOBLE (Blyth; Morpeth) asked the Representative Body to request the General Medical Council to include a period of work with an approved general practitioner as one of the appropriate appointments during the pre-registration year. The appointments were supposed, broadly speaking, to be in medicine and surgery. However, such specialties as skin, throat, nose, and ear, and so forth, were sometimes included. His constituency considered that as other subjects were included in the pre-registration appointment, why not general practice also? The College of General Practitioners had a register of teaching general practitioners, and the teaching hospitals probably knew the good general practitioners in their areas. One of the great causes of misunderstanding and frustration in the National Health Service was the lack of knowledge of the young doctor so far as the working of general practice was concerned. A bold move now in that direction would, in his view, produce a harvest of harmony and better understanding in the future.

Dr. A. G. HERON (Bristol) supported the motion. He said it was originally the policy of the Association, but the General Medical Council decided otherwise, and the Association seemed to have accepted the position. Pre-registration jobs were not by any means entirely satisfactory. Young doctors were either pushed into jobs in which they should not be at all, with far too many beds, too little cover, and too much responsibility, or else they were in jobs which were going to be of little use to them. Having had final-year students for periods of a fortnight himself, it was quite obvious that they were brimful of knowledge and produced diagnoses which frightened him to death; but they knew nothing at all about treatment and very little about the handling of patients as individuals. It was very largely those young practitioners who were responsible—they could not help it—for the increase in the drug bill, because they were at the mercy of the travellers and the literature. An additional increase in cost was due to the fact that they sent vast numbers of their patients to consultants. That probably was a very good thing, but surely they should not need that help. If those who were going into general practice were allowed to do a period of general practice in their pre-registration year, it would be of immense advantage.

Miss GLADYS M. SANDES (Marylebone) supported the motion. She said there were fewer opportunities for students to get the necessary experience in obstetric work. There were relatively few general practitioners who had the opportunity and time to take students. Where that scheme had been in operation the students had been most appreciative. At the same time, it would help in solving the difficulty of obtaining postgraduate obstetric students. Mr. A. STAVELEY GOUGH (West Herts) said it was wiser that pre-registration students should learn the practice of controlling patients in a hospital. Only in hospital were they able to get the moment-to-moment contact with colleagues and have a certain amount of independence in their practice under the safest conditions. It was not reasonable to take pre-registration students into general practice unless they could be given moment-to-moment supervision in their charge over the patient. The hospital system was over 250 short in the house-officer range, and general practitioners knew what difficulty there was in getting patients into hospitals where there was a deficiency in the number of residents. Therefore, if the motion were carried it would in the end mean a clogging of the system and would not be good for general practice.

Dr. R. M. S. MCCONAGHEY (Torquay) said that the greatest argument in favour of the motion was that all doctors, whatever they did afterwards, must know something about the early signs of disease. That can only be learned in general practice, and the more that people got to know how disease started the more understanding they would be. There were some exceptionally good teachers in general practice, and it was work which they could well do. Dr. A. R. FRENCH (Marylebone) said that many members would agree that general practice was the greatest specialty

of all. The Meeting ought, however, to be made aware of some facts. The pre-registration year was approved by Parliament in the Medical Act of 1950, and the Act laid down what the General Medical Council might or might not do. The General Medical Council could not implement the request unless the Act were amended by Parliament. It provided that there should be a period in medicine and a period in surgery, with the alternative for either of a period in obstetrics and gynaecology. The General Medical Council had laid down in Regulations under the Act that the periods mentioned should be six months, making a total of twelve months. In discussions with the Government before the Bill was introduced the profession pressed for the inclusion of a period in general practice, and this had been accepted to the extent that the Act provided that in a period, if it wished, make a period in general practice in a resident post in a health centre established under the 1946 Act an alternative to one or other of the periods of medicine or surgery. The regulations of the G.M.C. did not include any such approved posts; at the time they were drawn up there were no health centres falling within the provisions of the Act. He urged the mover of the motion to agree to its acceptance as a reference to Council. Dr. GIBSON said that the newly qualified practitioners feared that this might add to their pre-registration year and had asked the Association to resist any attempt to lengthen that period. He agreed with what Dr. French had said and hoped the mover would agree to the motion being a reference to Council.

Dr. NOBLE, in reply, said that the G.M.C. was in a position to ask the Government to amend any Act. One speaker against the motion had reminded him of a debate some years ago on sweated labour by suggesting that work in hospitals could not be done without the pre-registration students. That was an argument in favour of the motion. A practical background in general practice must be the basis for a comprehensive entry into any specialty. He asked the Meeting to accept the motion as a reference to Council.

The motion was carried as a reference to Council.

Membership Subscription During Pre-registration Year

A motion by Glasgow that the B.M.A. subscription during the pre-registration year should be 10s. 6d. was withdrawn by leave of the Meeting.

Subscriptions for Whole-time Salaried Officers

Dr. E. C. DAWSON (Council) moved on behalf of Derby that the annual subscription to the B.M.A. for whole-time salaried officers be reduced from six to four guineas, because of the anomalies which arose over income-tax payments. The rate of subscription and obtained no tax relief, so that their subscription cost them double that of their colleagues in general practice. They had to subscribe to other bodies, dealing with their specialties, and if the rising cost of living compelled them to cut down the number of bodies to which they subscribed the B.M.A. might be the first to go. Derby had brought forward a similar motion last year and the year before, and if defeated on the present occasion would continue to bring it forward in future years until it was adopted.

Mr. L. DOUGAL CALLANDER, the Treasurer, said that presumably the motion meant that the present concession rates available to many members who were remunerated on a whole-time salary basis should be extended to them all, irrespective of their salary or salary plus emoluments. This would lead to strong representations from other groups of members. The number of members paying the standard whole-time salaried basis and who were paying the revenue rate was approximately 6,000, and the loss of revenue which the motion would involve was approximately £12,500 per annum, which was fantastic and could not be entertained. At present the Association was in conflict with the Commissioners of Inland Revenue over Schedule E tax and had won the first round. The Commissioners had given notice of appeal, but had not yet stated their case. If the Associa-

tion was successful—and it was intended to go to the House of Lords if necessary—it was conceivable that men in whole-time salaried positions would also obtain some rebate. It would be better, therefore, to leave the matter alone for the moment.

Dr. DAWSON, in reply, said he understood that the Schedule E tax investigations related to part-time consultants; if full-time consultants received some relief it would be a long time ahead. With regard to the loss of subscriptions, on 6,000 members it would amount to about £12,500, but if the threats made by whole-time medical officers in the Derby area were carried out throughout the country, there would be a loss of £36,000 should they all resign.

The motion was lost.

WALES

Dr. A. MADDOCK JONES, Chairman of the Welsh Committee, presented the annual report of Council under "Wales."

The report was adopted.

SCOTLAND

Dr. W. M. KNOX, Chairman of the Scottish Committee, presented the annual report of Council under "Scotland." He said that yesterday's decision to change the title of the Scottish Committee to "Scottish Council" would greatly benefit the prestige of the Association in its dealings with the Department of Health and other organizations in Scotland. He also reminded representatives that B.M.A. House, Scotland, was open to every member of the Association and expressed the wish that all would make full use of it when visiting Edinburgh.

The report was adopted.

MEDICAL BENEVOLENCE

Dr. H. M. GOLDING (Bristol), Chairman of the Charities Committee, moved the approval of the annual report of Council under "Medical Benevolence." He first thanked the Meeting for having, under the Constitution Report, given his Committee two extra members, which he was sure would strengthen its position. He expressed disappointment at the fact that, for the second year running, there had been a decrease in the money given to medical benevolence. True, it was but a matter of £324 against a total of £12,500, but nevertheless it was a decrease. Just as everyone else was experiencing the effect of the rising cost of living, so were those for whom the charity operated, and it had become necessary to increase the grants to individual cases. Of the three types of case dealt with, the first was the immediate grant required to tide over in case of sudden emergency; the second related to assistance with school fees and possibly help through university; the third category was represented by those cases where illness and age made permanent help necessary. They all threw a strain on the funds. There had during the year been one extremely urgent case which had arisen in very tragic circumstances when it had been found that there was hardly enough money available in the fund to make a grant. The situation generally would be very much improved if more subscriptions could be given under covenant. Unfortunately, the B.M.A. Charity Trust Fund, not being a registered charity, was not entitled to receive covenanted subscriptions, although it was hoped that this might be remedied in the future. Meanwhile, there were the other funds which could be subscribed to by covenant.

He wished it to be well known that legacies for the fund should be left to "The British Medical Association Charities Trust Fund." It had been a bit of a struggle to obtain one legacy during the year because the money had been left to what had been described as "The B.M.A. Benevolent Fund"—something which did not exist. He emphasized that all funds received by the Charities Committee came from within the profession itself; thus the future welfare of the fund depended on representatives going back to their Divisions and creating interest in it there.

Dr. ANNIS GILLIE (Council), a member of the Charities Committee, appealed to representatives strongly to support the charities funds. While she realized that many contributed direct to local funds or to the Royal Medical Benevolent Fund, the actual sum that passed through the B.M.A. fund was pitifully small. The fund dealt with the immediate emergencies, such as the assistance of a widow left destitute by the death of a young husband. In such cases the Sir Charles Hastings Fund could send a cheque by return of post, but it had to be such a small cheque if the money were to go round. She did not want to drive home a sense of guilt about the matter, because charity did not flow from such a sense, but rather a sense of pride among members of the profession that they should be prepared to meet the emergencies of their colleagues' families.

The report was adopted.

A motion by East and Mid-Lothian requesting the Council to refer in its annual report to the very helpful work of the Ladies Guild of the Royal Medical Benevolent Fund was carried.

MEDICAL FILMS

On the annual report under "Medical Films," presented by Dr. R. P. LISTON, Chairman of the Film Committee, Torquay moved that, in view of the Report of the Piercy Committee and the apparent lack of knowledge by members of the medical profession of the potentialities of after-care and rehabilitation, "this Meeting regrets that the Council is unable to report progress on the production of the general film on rehabilitation."

Dr. LISTON said the difficulty was finance. The first step in this project was the production of a master film, which would cost £10,000 and could not be afforded out of Association funds. So far no trust had been found whose title deeds would allow the provision of funds for this purpose. Dr. J. A. L. VAUGHAN JONES (Council) regretted that it had not been possible to produce such a film. As rehabilitation was one of the main problems of the age and the solution of the problem would lower many of the Health Service costs, Government Departments should be forced to help.

The amendment was carried.

The Report as amended was approved.

OCCUPATIONAL HEALTH

Remuneration of Whole-time Industrial Medical Officers

Dr. J. A. L. VAUGHAN JONES, Chairman of the Occupational Health Committee, moved that the Report be received. He said that status had to be maintained in this field as in others, and status was not remote from remuneration. The main difficulty in getting salary ranges implemented in this field was that, apart from the nationalized industries, they were dealing with a voluntary medical service, and industry had to be convinced that the doctor in industry was an essential part of the industrial set-up, and that his contribution could be most effective in the drive for increased productivity. Super salesmanship was often required to make industry cognizant of its responsibility. The Committee also wished to emphasize achievement of the maximum of the range of salary after ten years' satisfactory service, a point sometimes overlooked in a contract of service.

The motion was carried.

Remuneration of Part-time Industrial Medical Officers

The revised recommended salary scale for part-time industrial medical officers was approved.

Moving the remainder of the Report, Dr. VAUGHAN JONES said that an approach had been made to the Minister of Labour and National Service regarding increased fees for factory doctors, whose fees had remained static since 1947, and from the preliminary conversations it appeared that there was hope that the objectives would be achieved. With regard to one-day certificates, he said there had been discussions with the British Employers' Confederation and the nationalized industries, and the T.U.C. had said they

would like a joint committee of the B.M.A. and the T.U.C. to discuss the matter. It was hoped that a solution would be arrived at as a result. He said it had been an uphill task developing the Occupational Health Service, and this country had lagged behind some others. The fact that progress had been slow was due partly to the mainly voluntary character of the service. The statutory basis in occupational health was relatively a small one and was carried out by the appointed factory doctors, who were mainly general practitioners, and the Factory Department Medical Inspectorate. Many large industries were convinced of the value of such services and had developed them efficiently, to the considerable benefit of both their managements and their workers. The advent of the nationalization of certain industries, he said, had resulted in the organization of efficient medical services in most of them, so that was no argument for the further nationalization of industry. The main obstacle to progress had been the small and smaller factories, and in this country, in spite of amalgamations, there were still over 200,000 factories with fewer than 26 workers. It was abundantly clear that it was not an economic proposition for a small factory to employ medical and nursing services unless the hazards present involved considerable risk. Grouping small factories on areal or trade basis should not have presented the difficulties which had occurred, he said, and cited the Slough Medical Service and, more recently, the Occupational Health Service started in Harlow New Town, both of which were subsidized in the first instance by the Nuffield Trust. It was to be wished that the benefices of that admirable institution could be extended all over the country. He was glad to note that an inquiry had been instituted in the Newcastle area. The grouping of small factories must be achieved to provide medical and nursing services, and it was to be hoped that this would be achieved by voluntary rather than statutory methods. Occupational health was the branch of medicine which offered the widest prospect of development, but it was not desirable that it should evolve as a full-time salaried service. That was the desire of some important bodies in the country. The changing pattern of industry brought additional problems daily—problems to which medicine could make its contribution—mechanization, automation, electronics, atomic energy, and agriculture with its mechanization and toxic pesticides. He urged that all members must take more interest in industry and its developments, if the profession were to accept its proper responsibilities to the nation's economy and its extended social responsibility to patients.

In 1949 the Ministry of Health asked the profession to accept an extended concept of treatment, a concept which ended only with the patient satisfactorily back at his own job or some alternative work more suited to his altered capacity. If the fact were accepted that treatment was not finished when the patient was cured, then the profession must know a great deal more about industry than many members knew at present. Paragraph 251 of the Report indicated that Council had approved a memorandum on short postgraduate courses on occupational health which appeared in Appendix VII. They would be available in the first instance at the Universities of London, Manchester, Durham, and Glasgow, but if sufficient demand were made in other areas then consideration would be given to the establishment of further courses. Efforts were being made to obtain financial assistance to enable general practitioners to get away from their practices for those short intensive courses. The content of the course as set out in the memorandum made everyone realize just how much the profession could contribute to industry if given the opportunity. The short intensive course was preferred to other forms of part-time instruction, but the courses would be varied to meet the demand. Opportunities for work in industry were bound to present themselves in the next few years, and it might be that some opportunities would occur very much sooner if an attempt were made to bring the first-aid services in industry up to the standards which should be maintained, and which unhappily too often were not

achieved. There might even be legislation requiring a much higher standard of first-aid than the present regulations demanded, and that was an opportunity for entry into industry which must not be neglected.

The B.M.A. Divisions had not taken the initiative which was urged last year in establishing additional Advisory Councils on occupational health, owing possibly to pre-occupation with other immediate problems; but that tripartite approach of employer, worker, and doctor opened up possibilities of the development of occupational health services if only the Divisions had the initiative to seek and to see the appropriate moment for the establishment of further Advisory Councils. It was, in effect, a call to action on the part of the profession, and a challenge to industry to realize its responsibilities, and if accepted by both the work would not have been in vain. In conclusion, Dr. VAUGHAN JONES said he desired to record in the Representative Meeting rather than the Council his very sincere thanks to the Secretariat for the assistance which he had received, and particularly to Dr. A. V. Kelynack and Dr. S. J. Hadfield.

The motion for the approval of the remainder of the Annual and Supplementary Reports of Council under "Occupational Health" was carried.

Dr. MAXWELL H. SUMMERS (Buckinghamshire) moved that the Meeting condemn any contract entered into by industrial management which gave absolute right to a "lay person" to be present at a medical examination, including retesting of colour vision. He said that the history of the matter went back to an agreement entered into in 1921 concerning eyesight standards. That agreement allowed the presence of a friend at the retesting of colour vision. It was contended that a contract of that nature entered into between management and a trade union was ethically wrong, since it imposed a restriction on the freedom of the medical officer, and gave the friend, who was invariably a trade union official, a right to be present at colour-vision retesting, which formed part of a medical examination. There would be no objection to a person's own general practitioner being present, of course, but the presence of a lay person by right was considered unethical.

Dr. R. FORBES (Hendon), in supporting the motion, said that any extension of the arrangements complained of would cut at the root of the privacy of consultations and examinations by medical practitioners. It was wrong that suspicion should be cast on the veracity or reliability of any doctor in carrying out colour-vision tests. The agreement which had been referred to originated in the desire of certain interested parties to ensure that the tests were carried out in accordance with their ideas. Dr. VAUGHAN JONES said that the matter affected one group of British industries which was divided into regions, and the complaint came from only one region. Since 1921 the other regions had all had this colour test for certain people in the industry. The complaint was made by one medical officer, all the others being perfectly happy about the arrangement which had been entered into between the management and the union. At the meeting of the Occupational Health Committee in April it had been resolved that the Ethical Committee be informed that the Occupational Health Committee considered it wrong in principle for a doctor to be bound in his clinical work by conditions imposed by an agreement made over his head between management and workers' representatives, and that it would be appropriate to oppose such an imposition as a general principle: secondly, the Committee appreciated that a doctor should examine a person only with his consent, and if that consent was conditional on the presence of a friend it was for the doctor to decide whether or not to accept the condition. If, however, an industrial medical officer refused to conduct an examination under such conditions it might well affect his personal position in relation to his employer. Having regard, however, to time-honoured custom and to the fact that the colour-vision test in the industry in question was in part a trade test which happened to be carried out by the medical officer, the Committee felt that no real objec-

tion could be taken to the requirement of the attendance of a friend at the colour-vision retest of a worker, as an exception to the general rule.

Dr. K. M. TOMLINSON (Gloucestershire) mentioned that when examining a patient in a skin clinic to see whether or not his dermatitis was occupational, a second person had been present, who turned out to be a trade union official. The motion would ensure that that sort of thing did not spread in industry. Dr. SUMMERS, in reply, appealed to the Meeting to support a member of the profession who was making a stand. The fact that his colleagues had fallen for "the T.U.C.'s three-card trick" should not affect the position.

The motion was carried.

ELECTION OF CHAIRMAN OF REPRESENTATIVE BODY

The SECRETARY announced that as a result of the ballot for the election of the Chairman of the Representative Body, Dr. A. BEAUCHAMP had been elected. (Applause.)

Dr. BEAUCHAMP thanked the members of the Representative Body for the confidence shown in him.

INTERNATIONAL RELATIONS

Dr. J. A. PRIDHAM, Chairman of the International Relations Committee, presented the Annual Report under "International Relations." He said that one of the best pieces of work accomplished last year by the World Medical Association had been to arrange a conference between itself and the International Red Cross and the International Committee of Military Medicine and Pharmacy, with an observer from the World Health Organization, at which one of the things discussed had been how to protect the civilian doctor and civilian medical personnel in time of war. The agreement reached had been submitted to the Association, adopted by the Council, and passed to the Government in the hope that they would adopt the emblem chosen and arrange a convention with a view to its general acceptance in time of war. Another matter on which the W.M.A. had been pressing its constituent associations—of which the B.M.A. was one—was the ratification of the Geneva Convention. The Government had professed itself as interested but had said that there was no time available to deal with the necessary legislation: it was caught out by the Suez crisis, for the troops had not been protected because the Convention had not been ratified. As a result of pressure by the Association and by the facts of life, the Government had now promised to introduce the necessary legislation this session.

The World Medical Association was the cornerstone of the Association's international relations and was vitally necessary in these days of international projects, agreements, and disagreements. All over the world doctors had the same problems, all fighting to prevent themselves being exploited by politicians who wanted votes and sometimes produced crazy schemes for the employment of doctors. He asked representatives to try to get support within their Divisions for the W.M.A. supporting group inaugurated last January. Medicine had no frontiers, and it was the duty of doctors to know about medical problems in other countries. If the W.M.A. had been in existence for a long time in 1948, or if the National Health Service were to be introduced now instead of then, things might have taken a turn which the medical profession would very much have preferred.

The report was adopted.

"BRITISH MEDICAL JOURNAL"

The Annual Report under "British Medical Journal" was introduced by the Chairman of the Journal Committee, Dr. J. G. M. HAMILTON.

He said that the *Journal* retained its pre-eminent place among medical weeklies. Some indication of its wide appeal could be gained from looking at the lay press. During the six months ending in June last there had been 151

notices of material from medical journals in 23 daily and 10 Sunday newspapers; the highest number, 86, had been from the *British Medical Journal*. The next in order of use to the daily press had been the *Lancet*, with 38 notices. The circulation of the *Journal*—now over 80,000 a week—could be regarded as an index of its quality, popularity, and usefulness throughout the world of medical people, and it was satisfactory to note a continued increase in the circulation of the *B.M.J.* to those who were not members of the Association. The other publications—*Abstracts of World Medicine* and the special journals—had all had increases in circulation. In an atmosphere of rising production costs it was reasonable to look not only to economy of management but to promotion of sales as a proper financial provision. The increase of 28.8% in the circulation of *Abstracts of World Medicine* had been in large measure due to the activities of the Association's agents in North America appointed some two years ago. The special journals had enjoyed an increase in circulation of 14% last year and 13% in the six months ended last June. As all these increases were more or less uniform, the Association might feel that its publishing house, with a turnover of half a million pounds or more a year, was being managed successfully and well, bringing out products of importance to the world of medicine.

The report was adopted.

PUBLIC HEALTH

In moving that the Annual and Supplementary Reports of Council under "Public Health" be received, Dr. J. B. TILLEY, Chairman of the Public Health Committee, referred to the work done by the Public Health Committee in connexion with remuneration during the past year, and said that the first item in the Report showed the position into which various bodies would have the public health practitioners led. The public health practitioners were asked by the County Councils Association if they would agree to wind up their Whitley machinery. There was perhaps not a great deal of love for the Whitley machinery, but it was not a winding up of the Whitley machinery in the sense that some wished. It was rather a proposition that something else should be substituted for it, and that the remuneration of public health doctors should be linked with that of local government officers. It had for some time been the policy of the Representative Body that doctors, no matter from what branch of medicine, should be considered as doctors from the point of view of remuneration. Therefore, on the recommendation of the Public Health Committee the Council told the County Councils Association that there was no point in discussing the proposed change with them.

The Committee had been concerned with prosecuting so far as possible the small gains which were made nearly 18 months ago; nearly all the local health authorities had implemented all the Whitley agreements. In the last year 11 appeals had been made on behalf of members. Five had been won and the remainder were pending. Not one had been lost. The appeals machinery was at least of some value. The Association had not had the same success in the north of Ireland. It was suggested to the Government of Northern Ireland that a two-tier appeal machinery should be set up as against the three-tier machinery in this country, and that the National Arbitration Tribunal should be amended to have doctors sitting on it when considering medical appeals. The Government of Northern Ireland were unable to agree. It had been possible, however, to get agreement that outstanding cases of appeal should be considered by independent arbitrators. On the question of remuneration for part-time work for local authorities, the agreement which was reached in Whitley Committee C was satisfactory, and members of that Committee were grateful for the help which the Chairman of Council had given them. Again nearly every authority had adopted the proposal.

The Representative Body would recall that the Guillebaud Committee had some thoughts about medical officers of health and hospital management committees and hospital medical advisory committees. The Council approved in

principle the recommendations that medical officers of health should be appointed as honorary consultants to groups of hospitals and members of medical hospital advisory committees. It was not suggested that those positions should be held as of right, but Council was of the opinion that much value would accrue from such arrangements. Council was sorry that in the present instance the Ministry made its decision not to implement those recommendations before it had in fact heard the Association's views. Dealing with the appointment of medical officer of health vacancies, Dr. Tilley said that the filling of these without public advertisement—a procedure which could be sanctioned by the Minister of Health—might lead to establishing privileged groups. A protest had been made about this practice, and the Minister was asked if he would consult with the Association before consenting to the way of public advertisement, but he had said that he could not consult a third party before giving consent. While that may be technically correct, it was wrong that public appointments should not be made widely known, and the Minister had been asked to bear the Association's representations in mind. As new regulations for milk had been made, the Committee had felt it not worth spending time on making a report on this matter at present. It was regretted that it was not possible to report on infectious disease notification, but this was still being inquired into.

Married Women Doctors and Public Medical Appointments

Dr. J. C. ARTHUR (Gateshead) moved that further consideration should be given to the question of maternity leave for married women doctors. Municipal authorities had agreed that marriage was not necessarily a bar to the employment of women, but they did not all keep to their promises. Pregnant women were given three or four months' leave with pay before confinement and about three months with pay afterwards. This did not cost much in the case of lower-paid employees, but the rule jeopardized the position of those at the salary level of women medical officers of health. Authorities did not welcome paying a year's salary for six months' work. He suggested that an alternative of six or seven months' pregnancy leave on half-pay might be considered. Such an arrangement would deprive local authorities of any excuse to dismiss these doctors.

Dr. ANNIS GILLIE (Council) said the Medical Women's Federation had considered this matter and was of opinion that, provided there was no obvious risk to health, pregnant women in suitable types of employment, as for instance an assistant medical officer, should be free to work until perhaps a few weeks before delivery. Whatever the legal position may be, the maternity leave period was regarded as mandatory by local authorities, and the support of the Meeting would assist in establishing a rational basis for the professional employment of women by local authorities. Dr. JEMIMA M. M. CALDER (Glasgow) pointed out that, while many pregnant women could work until just before the confinement, they would welcome a reasonable time for convalescence. Dr. E. HUGHES (Reading) warned the Meeting of the danger of suggesting that there was less strain on a woman doctor during pregnancy than on a woman clerk. Dr. TILLEY replied that the agreement had been made in 1954, but the Public Health Committee had had no communication on the subject from any woman doctor. Dr. ARTHUR said that the investigation by the Medical Women's Federation had been prior to the agreement, and it was felt that the matter might be reconsidered.

The motion was carried.

Review of Remuneration

Dr. W. W. FULTON (Glasgow) moved:

That in view of the fact that public health practitioners have been excluded from the terms of reference of the Royal Commission, the full consultation that has been promised after the Royal Commission has reported shall include a review of the remuneration of public health doctors.

The remuneration claim had been made not for public health practitioners, but they had a prior claim which had not yet been met. As a general practitioner, Dr. Fulton thought that for the sake of unity in the profession it was most important to include public health practitioners in any review which took place. There was a desire among some public health practitioners to break away from the Association, but that would be suicidal. The motion was not intended to be in the form of a precise instruction; possibly its wording could be improved.

Dr. WAND pointed out that the motion could be interpreted to mean that consultations must not be entered into following the Report of the Royal Commission unless they included the public health medical officers. The consultations, however, would be with the Minister. General practitioners and hospital medical staffs were in contract in one way or another with the Minister, but public health medical officers were in contract with local authorities, and were concerned not only about their actual levels of remuneration but even more with their relativities with the remainder of the medical profession; they wanted to be compared with the other doctors and not with other employees of the local authority. A case, he hoped, would be presented to Whitley on their behalf, and this would be a case for relativity with the rest of the profession. That might precede the Report of the Royal Commission. If the motion was carried, it would not be possible to hold consultations with the Minister because the public health practitioners were not included, and they could not be included because their case would be before Whitley. The motive behind the motion was a proper one, but he would suggest the following wording:

That the position of the public health medical officers shall be reviewed after the report of the Royal Commission is received, and appropriate steps taken with a view to ensuring their proper status and remuneration *vis-à-vis* their colleagues in other branches of the medical profession.

Dr. FULTON, with the leave of the Meeting, withdrew his motion, and accepted that suggested by Dr. Wand, and the motion, so worded, was carried.

Health Visitors

Dr. G. S. R. LITTLE (Greenwich and Deptford) asked the Meeting to urge that health visitors should work in closer co-operation with general practitioners and not give medical advice to patients except with the family doctor's knowledge and consent. Some members of his Division, he said, had found that health visitors had taken the matter out of the hands of the general practitioner. This was usually due simply to lack of co-operation between the public health and general practitioner sides, and this co-operation must work both ways; general practitioners for their part must co-operate with the health visitors. Means must be devised to secure this closer co-operation. Dr. A. ELLIOTT (Stratford), supporting the motion, said that he came from an area where great efforts had been made to increase co-operation with health visitors. He agreed that it must be two-way traffic; in many cases the health visitor did not know who the general practitioner was and referred patients to the local authority clinic. In his borough a health visitor was seconded to his clinic, and this worked very well, the health visitor following up the cases in the home and reporting back to him.

Dr. A. J. R. F. JOHNSON (East Norfolk) moved to amend the motion by the addition of the words "nor should they be paid as much as the combined district nurse, midwife, health visitor (with certificate)." The practice of combining the duties of district nurse and health visitor wherever possible had been found successful in Norfolk since its adoption in the last few years and had been found to make for closer liaison with the general practitioner. As they were doing a double job with harder work and longer hours it was right that they should be paid more than those who undertook only one duty. Dr. D. L. GULLICK (East Herts)

said that despite the merits of the amendment he thought it was high time the Association ceased to express opinions about the wages of other professions. Dr. J. MADDISON (Public Health Service) agreed with the last speaker. How would doctors like any other body to tell them what their remuneration ought to be? The nurses had their own negotiating bodies and professional organizations which were quite able to look after their interests.

The East Norfolk amendment was lost.

Dr. R. M. S. MCCONAGHEY (Torquay) moved, as an amendment, the omission of the words suggesting that health visitors should not give advice to patients except with the family doctor's knowledge and consent. He said that the profession was coming to appreciate more and more how much the health visitor could do to help doctors so long as they received co-operation from the medical profession. To say that she must not give advice was to stultify her performance of her duties. Who was to say what was medical advice, anyway? The health visitor was supposed to help the patient in any way she could, and everything affecting the patient's health could be regarded as medical advice. Dr. N. NELSON (Dundee City) supported the amendment. He could not see why the health visitor should not give advice to patients, at any rate until the doctor arrived. The words under discussion insulted her intelligence.

Dr. A. REZLER (City) opposed the amendment on the ground that it weakened the motion. The basis of friction between health visitors and doctors was that the former were empowered under the National Health Service Act to give advice. Many medical practitioners had indicated that it was a bone of contention. Doctors were interested in the development of health visitors, but they must be wary of their over-development. Dr. J. B. TILLEY (Council) thought that the Representative Body would be well advised to accept the amendment. Last year's conference at Brighton had disclosed for the first time how fully the Representative Body appreciated the value of health visitors' work. There had been a time when the very words "health visitor" had been anathema to it, but co-operation was now growing. The best results would not be achieved by the medical profession saying that the nurses should *not* do something. Dr. A. R. FOX (South-West Essex) opposed the amendment and supported the motion. He thought that, with intelligent co-operation, most of the difficulties raised could be ironed out.

The amendment was carried.

The motion as amended was carried without further discussion.

ASSOCIATION FINANCE

Mr. L. DOUGAL CALLANDER, Treasurer, presenting the Financial Statement for 1956, said that representatives would be pleased to note that as a result of the increased membership, thanks to the great assistance of honorary secretaries of Divisions, the subscription sum received last year was the highest ever in the history of the Association. If there had not been that increased membership, it would have been necessary to present representatives with an adverse balance. There was a fall in net income from rents received from offices let in Tavistock House. That was largely due to an increase in establishment costs. Last year the winter was protracted and heating provided over a much longer period accounted for a slight reduction in the amount of profit. At the same time, cleaning costs also greatly increased. The position had now been stabilized, and it would be possible to hand over those increased charges to the tenants. Furthermore, as various leases of the office accommodation expired, rents were being increased when possible—some of them up to 50%—and he hoped that an increased income of something like £20,000 would eventually result. With regard to interest on investments and deposits, he had continued to adopt the method of buying Treasury Bills for ninety days, and it had been possible thereby to increase income by £1,400 a year compared with the previous year. The total income for the year was £287,000, which was an improvement on estimates. Turning to expenditure, it would

be observed, Mr. Callander said, that the increase of salaries of officials and clerical staff was reflected in the accounts. Last year it was decided not to ask the Defence Trust to make the usual contribution to the cost of the Public Relations Department, which it had done for several years, and that increased the cost to the Association from £2,500 to £4,000 a year. The National Insurance Defence Trust still continued to meet most of the cost of the General Medical Services Committee, and the Council acknowledged this assistance. The increase in the central meeting expenses was as anticipated. The Treasurer drew attention to the decrease in the surplus on publications. He reminded the Meeting that the Association had considerable hidden reserves, particularly in the value of the leasehold premises and the library. He considered that the balance-sheet reflected a sound position, even though it required careful watching.

Referring to the Charities Trust Fund, he thought the amount of £12,564 collected in the year was a very poor response from 70,000 members. He appealed to members to give more.

It was estimated, said Mr. Callander, that after making a careful pruning of expenditure there would be a deficit on December 31. It was early to give an accurate estimate, but it was clear that, with special representative meetings and extra Council meetings essential in connexion with the remuneration claim, the outlook of a surplus in a year's time was remote, although he hoped they might still "break even." He warned representatives that if the inflationary trend continued he might be compelled next year to ask for an increase in subscription. The only thing he could think of which would prevent this was an increase in membership.

Dr. CATHERINE HARROWER (Council) pointed out that the G.M.S. Committee expenses were not included in the item for central meeting expenses, which figure should be £37,000 instead of £22,000.

The motion was carried.

ESTATES

Mr. L. DOUGAL CALLANDER, moving the approval of the Annual and Supplementary Reports of Council under this head, said that after long negotiations with the London County Council the Association had secured town planning consent to the proposed building in Burton Street, which would provide accommodation of 20,000 sq. ft. and additional car parking space. It was estimated there would be a return from this project of 6½%. Rentals were going up. The return of a minimum of 6¼% was better than could be obtained, with capital depreciation, on Government trustee securities. The Council, however, had been presented with an alternative method of financing it. The Association had substantial sinking fund policies which would mature at various dates between 1966 and 1991. As the building was not likely to be completed before 1959 at the earliest, it was suggested that the Association should borrow the cost of the building from an insurance company. The interest on the loan would be more or less covered by the rental income, and in 1966 half the cost would be wiped out by the first sinking fund policy falling in. With 162 years of the lease to run, there would be ample time for those who followed to set up another policy. In 15 to 20 years there would be nothing owing at all. Financing the project would not involve any interference with the day-to-day work of the Association, nor was it suggested that any of the Association's securities should be sold. A debt of gratitude was owing to Sir Robert Bolam, of Newcastle, for the foresight he had shown when he persuaded the Association to buy B.M.A. House in Tavistock Square.

During the year a large part of the north and south wings of B.M.A. House were redecorated, and improvements made in the Library, particularly in lighting, which would save about £1,000 a year in the cost of electricity when the whole wing was developed as a library. A lease had been taken on a new building near the university in Belfast, and new offices had been opened in Edinburgh.

The motion was carried.

SCIENCE

Mr. J. R. NICHOLSON-LAILEY, Chairman of the Science Committee, presented the reports under "Science," and the Recommendations of the Special Coal-Gas Poisoning Subcommittee. Referring to the postage on books borrowed from the Library, he said that the Science Committee, in view of the need for economy, had with great regret advised the Council that the payment of the outgoing postage on books should be discontinued as a temporary measure. The Council had been able to implement this recommendation without delay, and there was accordingly no need for the motion on the subject standing in his name on the agenda, which he accordingly asked leave to withdraw. The motion in the name of the Chairman of the Science Committee dealing with the payment of postage on books was moved by members was, by leave, withdrawn, and the amendment on the same subject in the name of Dorset therefore became a motion.

The Library

Dr. A. G. CHAMBERLAIN (Dorset) moved:

That, with reference to para. 172 of the Annual Report of Council, this Meeting considers that the action taken by Council on item 95 of the agenda of the A.R.M., 1956, is unsatisfactory and that the Council should be requested to reconsider its opinion.*

At the last Representative Meeting, he said, he had moved that as members in the country did not have the benefit of the amenities of B.M.A. House, at least the Library facilities should be free and postage on books should be paid both ways. Instead of this, the Council had deprived members of the privilege they had previously enjoyed of the outward postage being defrayed by the Association. His Division took a poor view of this.

Dr. R. M. S. MCCONAGHEY (Torquay) said that this was a very small privilege which members had enjoyed. Many members of the Association had never been inside B.M.A. House. One of the main objects of the Association was the encouragement of postgraduate study, and the cost of paying the outward postage on books must have been very small. Mr. A. W. B. STRAHAN (Furness) referred to the Treasurer's statement that the financial position of the Association was sound owing to the large number of former members who had returned to the fold and to others who had joined during the last year or so. Some members now wanted to leave the Association, regarding the action of the Council in the matter of postage on books as cheeseparing in its worst form. The saving must be under £1,000 a year, and, apart from the *Journal*, the ability to borrow books from the Library was the one contact which most country members had with the Association, which was supposed to be a scientific as well as a political body. Mr. CALLANDER said that, although the Association had a good hidden reserve, from the income and expenditure point of view it was in a precarious position. Economies had to be made if the subscription was not to be increased. There was no alternative.

Dr. R. G. GIBSON (Council) said that while he was sorry to disagree with the Treasurer, appreciating as he did his difficulties, he regarded the proposal as really cheeseparing. The Library was one of the most effective ways of attracting membership. Professor H. W. RODGERS (Belfast) agreed that it was cheeseparing. Mr. NICHOLSON-LAILEY said it was considered that an economy of £1,200 a year was one which ought to be made. Both the Library Committee and the Science Committee had come to the decision with the utmost reluctance, regarding it as a temporary measure which would be removed when times improved. Dr. E. TOWNSEND (Cornwall) suggested that the desired saving in

*Item 95 of the A.R.M. (1956) agenda read as follows: "That this Meeting considers that the postal charges made by the B.M.A. Library should be abolished as a compensation to those members living at a distance from London who are not often able to enjoy the amenities of Headquarters." The Meeting referred the motion to Council for consideration.

most could be achieved by taking the zip-fastener out of the B.M.J.

The Dorset motion was carried.

A similar motion, moved by Dr. A. W. B. STRAHAN (Furness), deploring the charging of postage both ways on books borrowed from the Library, and calling on the Council to reduce the postage charge to one way only, was carried.

The remainder of the Report was adopted.

GENERAL MEDICAL SERVICES

Dr. A. B. DAVIES, Chairman of the General Medical Services Committee, presented the Annual and Supplementary Reports of Council under "General Medical Services." He said that the year had been one of unprecendented activity for the Committee. There had already been two Special Representative Meetings and two Conferences on remuneration, so he did not propose to refer to that subject; but it was necessary to say a little about the final settlement, which depended on practice expenses. On December 31 last a sum of £4½m. was negotiated and paid into the pool as a final settlement, and the then Minister of Health (Mr. Turton) unfortunately referred to it as a "pleasant surprise" or "Christmas Box" for doctors. Of course, it was nothing of the kind. It was in fact a very late repayment of expenses which had been incurred some 18 months to two years previously. A figure for the final settlement for 1955-6 had been negotiated with the Ministry, and for the current year the Committee had been successful in advancing the date when it would be paid. "We have been concerned for a long time that a substantial amount of our money has been remaining idle," continued Dr. Davies, "and we are not satisfied even with this; but I am sure that the profession will be pleased that the final settlement will be paid this year on October 1." He was not yet able to give the size of the final settlement, but it would not be less than the £4½m. achieved last year. This meant that some £200 per doctor with an average-size list would be repaid on October 1 in respect of expenses which had already been incurred in the year 1955-6.

He was pleased to inform the Meeting that at last the automatic right to monthly payments had been achieved, and it would begin to operate in October. Successful approaches had been made to the Ministry on the temporary resident's fee, the lower fee had been upgraded from 5s. to 7s. 6d., and the Committee hoped that the controversy about allowances in holiday camps and similar places would now be resolved.

Dr. Davies said the G.M.S. Committee had dealt with the difficulties following the Suez crisis, and the profession had been assured of adequate supplies of petrol; a scheme had been devised to deal with absentee practitioners in a short-term emergency, though this was not applicable in a major war.

Representations for more general-practitioner beds in hospitals were continuing. A little progress had been made, but not enough. In addition, the Committee was continually pressing for better general-practitioner representation on regional hospital boards, boards of teaching hospitals, and the like bodies, though a setback had been brought to Guillebaud Report. A problem which had been brought to the notice of the Committee in the past year was that of rehousing and redevelopment areas. There was hardship among some practitioners in demolition areas from loss of work, with accompanying loss of income. A special sub-committee had been set up to deal with this, and one approach had already been made to the Ministry. The trainee practitioner scheme, he said, had been approved by the Ministry without amendment. It had been sent out to executive councils, and was understood to be operating successfully. The G.M.S. Committee, Dr. Davies went on, together with other committees, had played its part in giving evidence before the Cranbrook Committee. The instructions given to the Committee by the Special Representative Meeting a few weeks before had been taken to heart and work had begun on preparing evidence for the Royal Com-

mission in association with other committees. This would be presented to a Steering Committee of the Council in order to get the greatest degree of co-ordination when going before the Royal Commission. He added: "We have set up a Committee and actually already started to work in preparing an alternative scheme for withdrawal from the Health Service, and we are already taking steps to increase the Fighting Fund."

ELECTION OF DEPUTY CHAIRMAN

At this point the SECRETARY announced that Dr. A. TALBOT ROGERS had been elected Deputy Chairman of the Representative Body for the Session 1957-8. Dr. TALBOT ROGERS said he was deeply conscious of the honour the Representative Body had done him. He was particularly happy to take on the post at that moment because he felt that with so wise a Chairman as Dr. A. Beauchamp as his mentor he would, under his tutelage, be able to learn how to look after the Meeting, and he hoped they would never have cause to regret their choice.

The debate on General Medical Services was resumed.

The Remuneration Claim

Dr. BARBARA M. L. ABERCROMBY (Liverpool) moved:

That this Meeting is of the opinion that the policy of penalizing small lists should cease and that the interim award should be applied towards loading the first 500 capitation fees on all lists, whatever their size.

Dr. F. GRAY (Council) pointed out that the motion did not state the size of the practice, and there might be a small list but a very large private practice. Provision had been made for the small-list practitioner starting a new practice in a designated area who got the initial practice allowance, which had been raised by the full 25% by using part of the interim award. Provision had also been made for the elderly practitioner with a small list, for whom a 20% rise had been arranged. This money did not come from the Government, and any extra money to be given to any other small-list practitioners must come from the general pool—namely, out of the pockets of colleagues. What possible justification could there be, he asked, for paying a subsidy to a doctor with a 500 list and a large private practice? Dr. MAXWELL H. SUMMERS (Buckinghamshire) felt the time had come when sentiment should disappear. If a small-list man was unable to keep his list at a reasonable size, let him retire gracefully or go elsewhere. Dr. DAVIES said that the small-list practitioner had not been penalized. Within the narrow limits of a small and inadequate interim award an effort had been made to try to make the best arrangements so that everybody got something.

The motion was lost.

Protection of Practices Scheme

Dr. DAVIES moved approval of para. 25 of the Annual Report of Council.

Dr. J. M. L. SHEARER (Mid-Essex) moved as an amendment that the Protection of Practices Scheme should be extended to provide protection for general practitioners when there was a massive call-up of them, as in wartime. Dr. W. MORGAN EVANS (South Middlesex) said that the present scheme for the protection of practices depended on three factors. The absentee doctor must declare his income at the moment when he was called up. His income was then made up to that figure from Government funds through the executive council, but never reached more than that initial figure, while the remaining practitioners who did his work would be paid half his original income. The absentee practitioner never increased his emoluments, no matter how long the emergency lasted, which was unjust. It meant that no medical officer in the Forces had an incentive to increase his pay, and this might lead young medical officers to refuse to accept promotion.

Dr. DAVIES said that in the opinion both of the Government and of the G.M.S. Committee there was nothing between the "small" type of war, for which the emergency

scheme had been prepared, and total war, with atomic weapons, in which no scheme for the protection of practices would be feasible, since it would involve mass mobilization of doctors and others, and everyone would be subject to drastic regulations.

The amendment was lost, and para. 25 of the Annual Report of Council was approved.

Practice Accommodation

Dr. J. M. L. SHEARER (Mid-Essex) moved on behalf of North-East Essex that in the exploratory discussions with the Ministry of Health on the question of practice accommodation, particularly in redevelopment areas, the question of the tenancy terms for suites in health centres on new housing estates should be included.

Dr. H. N. ROSE (Stratford) said two health centres had been established in Essex and a third had been proposed. When first established the charge per suite to the doctor was £250 per annum. It was recognized that this was not an economic figure, and in the past two years the cost to the county council had gone up from £600 to £1,200 per annum, and the county council wished to raise the charge to the doctors to £600. A young man starting at a health centre after entering the service would also have to pay £250 rent, exclusive of rates, for a house, and his position would be impossible. Dr. H. G. SCOTT-KERR (Gloucestershire) said it was better for the doctors who would use the centre to negotiate their own terms rather than have a hard-and-fast ruling from the Ministry. The type of practice carried on in health centres varied tremendously; in some a small number of doctors practised full-time, while in others a large number of doctors used the centre as a branch surgery. The amount paid by the doctor in the first case would be higher than in the second. He hoped the motion would be rejected. Dr. DAVIES mentioned that there was already a model scheme agreed between the London Local Medical Committee and the Ministry of Health and other bodies. The G.M.S. Committee had had no opportunity to discuss the matter in relation to other areas. He could accept the motion as a reference to Council.

The mover and the Meeting agreed to the motion being regarded as a reference to Council, and as such it was adopted.

Loans for Provision of Surgery Accommodation

Dr. C. W. WALKER (Cambridge and Huntingdon) moved that the following motion, referred by the A.R.M., 1956, for consideration by the Council, be approved with the addition of the words "when funds from the Group Practice Loans become available":

That the Minister of Health be pressed to increase the scope of interest-free loans for the provision of new surgery accommodation, to include all practitioners, either in single practice or in partnership, where such application is endorsed by the local medical committee and executive council.

The Council, he said, had taken the view that there was not enough money in the central pool, but the pool would accumulate large sums as loans were repaid.

Dr. A. BROWN (Cambridge and Huntingdon) suggested that the motion might well be referred to Council, so that Council could consider what should be done with the money when it became available. Dr. A. U. MACKINNON (Leeds) felt that the proposal should be pressed more strongly. What were obviously the wishes of the A.R.M. at Glasgow should be implemented. Dr. F. GRAY (Council) said that if money was taken out of the pool it meant that all doctors would be paying money to some doctors. It would be those who had not put their premises in order who would get the money. There were serious possibilities of abuse, and he hoped that the motion would be sent to Council for study and report. Dr. H. B. MUIR (Fife) said that the money that came from the pool came as much from the single-handed as from the group practice practitioners. Speaking as one of the latter himself, he had an uneasy feeling that the question of group practice was pushed a little too far. Most of those who attended the A.R.M. were, after all, able to

do so because they had partners, assistants, or colleagues at home to look after their practices. He felt that it would be a broad-minded and correct action to support the motion. Dr. G. S. R. LITTLE (Greenwich and Deptford) also supported the motion, which, he said, if carried would benefit the younger practitioners, several of whom had been unable to improve their premises because of lack of money. Dr. K. M. TOWNEND (East Somerset) said that no one would dispute that the motion would be acceptable to all in the right context, but, when everyone had applauded the idea of withdrawing from the service if necessary, the present proposal did not seem to follow logically. Dr. J. T. BALDWIN (East and Mid-Lothian) asked for strong support for the motion. It was well worth while doing something to enable doctors to improve their premises.

Dr. W. E. DORNAN (Council) asked that the matter should be referred to Council. He said that £100,000 was allocated each year to meet the cost of the loans and the fund now stood at half a million; in ten years' time it would amount to one million. If the doctors who had been receiving those loans had been paying interest that money would ultimately come to be paid to the central pool by way of the moiety which went in each year as practice expenses. The interest on the present sum was £25,000 per annum; that loss would grow in ten years' time to £50,000—money which was being saved to the Treasury and lost to the central pool for evermore. Dr. DAVIES thought it was time the meeting came down to earth. In the first place, the money was limited; secondly, it was the property of members. He hoped that the motion would be rejected out of hand and not even referred to Council.

Dr. WALKER, in reply, said that if doctors had pride in their profession surely they should take pride in their colleagues' premises. Anyone whose accommodation was shabby was letting down the profession. The motion seemed an excellent way of helping the single-handed practitioner who was doing his share of work for the profession. All would gain in course of time by having better premises everywhere.

The motion was lost.

WELCOME TO PRESIDENT-ELECT

The CHAIRMAN extended on behalf of Representatives a warm welcome to Professor A. P. Thomson, of Birmingham, the Association's President-Elect. Professor THOMSON said that yesterday the A.R.M. had conferred on him a signal honour and a very serious responsibility. He hoped that he would prove worthy of the first and equal to the second. The meeting rose at 5.30 p.m.

THIRD DAY

Friday, July 12

Representatives assembled at 10 a.m.

GENERAL MEDICAL SERVICES

Consideration of the annual report of Council under "General Medical Services" was resumed.

Mileage

The CHAIRMAN OF THE G.M.S. COMMITTEE (Dr. A. B. DAVIES) moved that para. 28 of the report (recording the issue by the Government Mileage Committee of an interim report which had been sent to local medical committees) be approved.

Dr. J. S. NOBLE (Blyth; Morpeth) moved as an amendment:

That the A.R.M. deplores the delay in the completion of the work of the Mileage Committee, in view of the hardship caused in certain areas.

He said that the Committee, after sitting for five years, had only produced an interim report, but in view of changing circumstances he would be content if the amendment was treated as a reference to Council.

Dr. A. BROWN (Council) asked the Representative Body to realize the magnitude of the Mileage Committee's task. It had to maintain its existing sum of £2m. so far as possible, and it was not possible to redistribute without taking something from somewhere else; the Committee's task was to decide from whom the money should be taken and to whom it should be given, and it was difficult to reconcile the conflicting views of those who felt they should receive a bigger slice of the cake. There were difficulties in establishing a common yardstick throughout the country when measuring the needs of the various areas. It should also be realized that the mileage scheme had never been intended to make some rural practitioners better off than their urban colleagues, but rather to bring them up to an appropriate comparable level. Dr. C. P. WALLACE (Guildford) said that there were grave misgivings about the findings and recommendations of the Committee. The interim report disclosed no adequate reasons for the drastic changes in distribution which were suggested. "From whom that hath not shall be taken that which he hath" might be a very sound principle in certain circumstances, but the report disclosed no justification for applying it to mileage redistribution. It would be a mistake to do anything which would create differences between rural, semi-rural, and urban practitioners. Dr. A. M. MAIDEN (Lincoln) asked representatives to remember that the document in question was in fact an interim report and that the motion relating to special mileage had still to come before the Representative Body; until the final report was issued there seemed to be no point in discussing it. The amendment was defeated and the paragraph was approved.

Emergency Call Service

Dr. DAVIES asked permission to withdraw the motion in his name for the approval of para. 29 of the Annual Report of Council dealing with the emergency call service. It was the policy of the Committee, he said, to encourage reasonable rotas among groups of practitioners to cover week-end and off-duty times, and this had been a success in the greater part of the country, but the Committee had evidence that there were difficulties in obtaining satisfactory rotas in some areas, of which London was the chief. The G.M.S. Committee saw no objection to a properly organized call service, and fruitful contacts had been established with the sponsors of the service in London from which it was hoped that something useful would emerge.

Leave was given to withdraw the motion, and amendments by Blyth, Wandsworth, Cumberland, and Swindon, and motions by Gateshead and by North Middlesex, dealing with the same subject, were also, by leave, withdrawn.

Obstetric Beds for General Practitioners

Dr. W. N. LEAK (Mid-Cheshire) moved that the Council should continue to press for the provision of more obstetric beds for general practitioners. A woman often had a happier and more satisfactory pregnancy, he said, if she knew that she would be looked after during her confinement by her own doctor. Work in a hospital had a stimulating effect on the doctor, reminding him of the high standards to which he had been trained, and which out of the hospital he might tend to forget. The nation needed general practitioners trained in obstetrics, and more obstetric beds for general practitioners were necessary. Until recently there had been no obstetric bed within fourteen miles of his home; now there were ten, some miles away, but for a population approaching 40,000 there should be three times that number.

Dr. A. B. DAVIES welcomed the motion, which represented the policy of the Committee.

Mr. J. R. NICHOLSON-LAILEY (Council), as a consultant and obstetrician, supported the motion. He came from an area, he said, in which the percentage of general-practitioner maternity beds was high compared with the rest of the country, and in that area (West Somerset) they were convinced that the rights of the general practitioners in those beds should be safeguarded. There was a long tradition of a high standard in general practice, owing to the fact that

there were these general-practitioner beds in association with the consultant set-up at the main base hospital. (Applause.) The problem was not only to provide obstetric beds for general practitioners where such beds did not exist, but to safeguard them where they did. The G.M.S. Committee had in mind the situation in Weymouth, where he did not think there was a single general-practitioner bed in the whole area. Dr. E. A. GERRARD (Manchester), supporting the motion, said that as a member of the staff of a large maternity hospital in an industrial area he knew that every morning several women went away disappointed, and often in tears, because no beds were available for them to have their babies. They were having their first baby, and believed that the right place for this was a hospital. Unless a woman came in the first ten weeks of her pregnancy there was no bed for her—an appalling state of affairs. It was in areas where there were the worst housing conditions that there were the fewest beds. They wanted to build a new wing to provide more beds, but were told that there was no money for the purpose, yet large sums were to be devoted to raising the pay of Members of Parliament. The only way out of the difficulty was to have more general-practitioner maternity beds. A general-practitioner maternity home could be run at less cost than a hospital.

Dr. P. PHILLIPS (Bristol) said that in the Bristol area sixty new schools had been built since the end of the war but not a single additional hospital bed provided. As a consultant in obstetrics he deplored the idea that ultimately all confinements should be in the hands of consultants. (Applause.) During the last few years the Association had been more obsessed by remuneration than by the efficiency of the Health Service, to which more attention should be given.

The motion was carried.

Trainee Practitioner Scheme

Dr. A. B. DAVIES moved the approval of the paragraph relating to the trainee general practitioner scheme. An amendment by Aberdeen and Kincardine Counties was withdrawn and the section was approved.

Dr. J. S. NOBLE (Blyth; Morpeth) proposed that Council should press the general adoption of the recommendations of the Special Subcommittee on the Trainee General Practitioner Scheme as accepted by the Minister of Health. His Division, he said, was divided on the trainee scheme, but all believed that if there was such a scheme it should be worked correctly and for the benefit of the profession as a whole. The greatest care should be taken in selection of trainers. One point not emphasized enough was that it should not be solely for people entering general practice; those intending to work in hospitals should also be given an opportunity. Dr. R. W. MCCONNELL (Buckinghamshire) opposed the motion. He thought the report was very good, but they did not want more regulations.

Dr. DAVIES replied that it was difficult to understand what the motion intended. The recommendation was that the local medical committee should try, so far as possible, to adopt a uniform standard. It was true that a certain amount of latitude was allowed, especially in regard to appeals, but by and large the Committee would welcome the adoption of regional appeals machinery.

The motion was lost.

Prescription Charges

Dr. W. N. LEAK (Mid-Cheshire) moved that a further protest should be made to the Minister with a view to getting prescription charges removed. Recalling that it was three years since the Association's policy was decided, Dr. Leak said that anything which tended to recreate a financial barrier tended to weaken the doctor's work. It distressed him to see the amount of anaemia among poorer women. The Ministry had drawn attention to the danger of anaemia in pregnancy—but created a financial disincentive to treatment. The 1s. prescription charge led to extravagance and waste, rather than economy, because of the tendency to prescribe more than was needed. In Scotland 500 phenobarbitone tablets

were being prescribed at a time to make people sleep, and 500 dexedrine tablets for the hangover next morning. The charges were pernicious economically, socially, and medically.

Dr. D. L. GULLICK (East Herts) disapproved in principle of prescription charges, but thought it would be better if a vote was not taken on the motion. The Meeting should beware of playing politics. Dr. W. A. HYSLOP (Leeds) said that the difficulties were very real. It was difficult for the dispensing doctor to collect all the shillings. Dr. F. E. GRAHAM-BONNALIE (Exeter) said that since the 1s. charge he found that the number of forms issued was the same, but the number of prescriptions was 25% less, because patients were not asking for things which they wanted but he did not think they needed. Mr. A. DICKSON WRIGHT (Marylebone) disagreed that it was a political issue. The shilling charge was brought in by the Labour Government. When the National Health Service was brought in everything was going to be free. It was going to be a Utopian paradise and was only going to cost £150m. a year. As time had gone by that figure had been passed four times. It was now nearly at the £700m. mark. In no other part of the world was this free service given. He thought it was a demoralizing thing that the British people should have all this medical service for nothing. In the advanced Socialist states of Scandinavia, and in Australia and New Zealand, the patients all paid something. Since Britain brought in the service, no other country had copied it, and he felt certain that no other country would. All this was given for nothing, and the patient lost his self-respect. He thought that the principle that the patient should pay a proportion was a principle they should stand by. Something for nothing was always a bit suspect. The standard of living in the working classes had gone up so much that they should pay something to the medical service. When everything was free we passed into an inferior position. He was strongly in favour of the patient making a contribution towards the cost, whether in hospital or out.

Dr. DAVIES said that the policy of the Committee was well known. It was absolutely opposed to prescription charges of all kinds, and repeated protests had been made. To continue doing so when the maximum publicity had been given to the Association's views would merely be banging their heads against a brick wall.

A motion to pass to next business was moved from the floor of the hall.

Dr. LEAK, opposing the motion, said there was nothing political in the matter at all. "We are the only people who can advise the Government without bias, because we are the only people who know how it works," he said.

The motion to pass to next business was lost.

The Mid-Cheshire motion was lost.

General-Practitioner Beds

Requesting the Council to pursue the matter of general-practitioner beds as one of urgency, Dr. W. N. LEAK (Mid-Cheshire) said that the National Health Service had been a more potent means of pushing general practitioners out of hospitals than of enabling them to practise their art there. Dr. DAVIES said that in 1953 there had been 2,119 general-practitioner beds; 1954's figure was 2,480, and for 1955 it was 2,664. Efforts were continuing to increase the availability of such beds.

The motion was carried.

OVERSEAS

Professor D. E. C. MEKIE presented the sections of the Council report under "Overseas." He said that at no period in its history had the Commonwealth character of the Association been more deeply shown than in relation to the recent grievous disputations in Malta. The Association had been able to offer more than advice; financial backing had been extended also. Some progress had now been achieved towards securing a solution to the problem which would be acceptable to the Maltese Branch. The Jamaica Branch, through its own efforts, had gone far towards establishing a

headquarters; they had not asked for a gift but for temporary assistance, which the Association had been able to give, and it was hoped that there would soon be a fine centre there.

The report was approved.

Greetings from Overseas Representatives

Dr. R. S. WILKINSON conveyed cordial greetings from South Australia. He said that his colleagues were most grateful for the various ways in which they had received help from England. He also thanked the people of Newcastle for their boundless hospitality. Dr. H. D. CHAMBERS, bringing greetings from Jamaica and Trinidad and Tobago, said that the most recent evidence of the good will and help extended from Britain to his Branch lay in the generous facilities afforded towards the building of a B.M.A. House in Jamaica. Dr. LUENA H. HATCHER brought best wishes from Fiji—exactly the other side of the world. She said that their small B.M.A. Branch there was of great assistance in bringing together the general practitioners, who were few in number, and the doctors in the Government medical service. Dr. O. K. OGAN, of Nigeria, brought greetings from West Africa. Speaking before such an assembly he said he felt like the peer who dreamt he was making a speech in the House of Lords and woke up to find it was true. He said that that region, through its representation in the Association, had come to learn that they had nothing much to boast about. For a total population of 40 million in the four British West African countries there were fewer than 1,500 doctors, so there was a challenge to be faced. However, this year, for the first time, the Nigerian Medical School at the new University College was admitting students for the full medical course, which was regarded as a great step forward. The message he wished to leave was one of gratitude. He and his colleagues were deeply touched by the wonderful hospitality extended by the B.M.A. in Newcastle, and he hoped that the time might come when West Africa might be acting as hosts to the B.M.A.

Mr. J. H. NORTH (New Zealand) conveyed greetings from the New Zealand Branch, which this year had reached a membership of 3,500, and expressed the hope that when the Association met in Auckland in 1961 there would be a good attendance from this country. New Zealand would do everything to make the stay of its visitors a happy one. Dr. H. B. D. VAUGHAN (Victoria) brought greetings from the Victorian Branch of the British Medical Association. He was glad to say "of the British Medical Association," because though they had grown up they kept their family name. They had, he said, a good medical system which gave a fair deal to both patient and doctor, but it had its dangers, and there might be a tendency to self-satisfaction and not to take a wide enough view.

The CHAIRMAN thanked all their colleagues from overseas for their most interesting contributions and added that he was sure the meeting would like to hear a word from Dr. Sen.

Dr. S. SEN (Indian Medical Association), in conveying the greetings of the Indian Medical Association, whose ties with the B.M.A. were very close, said that while grateful for all the help received from the B.M.A. his Association had one serious complaint to make. While sending an annual invitation to the Indian Medical Association, the B.M.A. had not so far accepted the invitation of the Indian Medical Association to be represented at its Annual Meeting, pleading financial stringency. Dr. Sen had been doing some lobbying, and the Treasurer had promised to consider the matter very sympathetically. Dr. Sen therefore formally invited the Association to send a delegate to the Annual Meeting of the Indian Association, to be held in Bangalore in December.

COMMONWEALTH AND INTERNATIONAL MEDICAL ADVISORY BUREAUX

Dr. H. GUY DAIN (Council) presented the Annual Report of Council under "Commonwealth Medical Advisory Bureau" and "International Medical Advisory Bureau," and moved that it be approved. Since the Report of Council

was printed, he pointed out, the name "Empire Medical Advisory Bureau" had been changed to "Commonwealth Medical Advisory Bureau." The Association had been able through this organization to render very great service to doctors from abroad visiting this country. It was no small matter that their confrères from overseas on arrival in this country should be met at the port with a letter of welcome and should be able to obtain from Brigadier H. A. Sandiford all the advice they needed and receive help in securing accommodation and take part in social gatherings at B.M.A. House. This was the last report which Brigadier Sandiford would submit, as he was retiring under the age limit. A great tribute was due to him. He started the Bureau from scratch in 1948 and had built it up. A document which he had compiled giving the opportunities for postgraduate study in this country was most valuable. They would wish him long life and happiness in his retirement.

Dr. C. P. WALLACE (Guildford) hoped that the Association would err on the side of extravagance in supporting the excellent work which Dr. Dain had outlined. As political bonds were relaxed, it became more than ever essential that medical science and the humanitarianism which it represented should contribute to the bonds of unity. He congratulated Dr. Dain and Brigadier Sandiford on the work which they had done. Professor H. W. RODGERS (Belfast) said that large numbers of bewildered students who arrived in London and had often to go on to provincial centres owed a great deal to Brigadier Sandiford's organization, a splendid concept of which the Association could be very proud.

The motion was carried.

The CHAIRMAN said the Meeting would wish to express special thanks to Brigadier Sandiford. He had done more to foster good relations with their friends abroad than any other person. He had done more for the Association than any other person. (Applause.)

Thanking the Meeting, Brigadier Sandiford said that he had not made the bureaux. He had a team, and had had assistance from everybody. He had enjoyed it.

GENERAL MEDICAL SERVICES Debate Resumed

Dr. J. H. STRANGER (North Glamorgan and Brecknock) moved a motion stressing the need for the provision of ancillary diagnostic services for the general practitioner, so as to reduce pressure on hospitals, and as a means of reducing hospital costs. Given adequate facilities for investigations, he said, not only could a general practitioner carry a case right up to hospital admission level, but very often, as a result of his diagnosis, he could treat the patient at home, so saving hospital beds. Dr. A. A. VICKERS (Worcester and Bromsgrove) said that in his x-ray department the number of patients being referred had doubled, but permission to increase staff had been refused. Radiographers were leaving the hospital service. There was no hope of getting the numbers of staff unless the people were prepared to pay the rate for the job, and that must be the rate which would keep a man.

Dr. G. S. R. LITTLE (Greenwich and Deptford) said that in some parts of the country diagnostic facilities for general practitioners were very limited and in many they did not exist at all. They were needed not only for saving money in the hospital side of the Service, but also for keeping up the enthusiasm of general practitioners. At the former Peckham Health Centre there was a general-practitioner diagnostic unit under the auspices of the London County Council and the Regional Hospital Board, and supported by the College of General Practitioners.

Dr. J. D. IRVING (Lewisham), speaking as a radiologist, said that very little, if any, more "rubbish" was received from general practitioners than from hospital staff. Within the last few months his department had had to withdraw their services to general practitioners. The motion should be supported, but it could not be implemented, at least this year. Dr. A. B. DAVIES said that the motion expressed the policy of the G.M.S. Committee. He was sorry to hear that

in certain areas there was no hope of implementing it, but it should be pressed, and it should be stressed that ultimately it would save money in the hospital service. Mr. A. DICKSON WRIGHT (Council) believed that 50% of the examinations ordered at present were unnecessary, and registrars and people of that class ordered these in most cases. He believed that general practitioners would be more sober in this matter than these young and ardent men, and would observe more restraint, and this would in time lead to great economies in the health services. A large amount of the routine work in hospitals was drifting into the hands of registrars. They had full powers to order these tests. A barium meal might run the country into £5 or more just by a signature of a pen, and perhaps it was just to shorten an interview with a loquacious patient. He believed that if more scope was given to general practitioners there would be a reduction in the number of unnecessary investigations, which at present was one of the main causes of the high costs of the hospital services.

North Glamorgan and Brecknock's motion was adopted.

National Insurance Certificates

Dr. A. B. DAVIES moved that para. 50 of the Annual Report of Council be approved.

An amendment by Gateshead, taken with an amendment by South Essex, to the effect that further efforts should be made to implement the 1956 resolution on four-weekly certificates, was moved by Dr. J. C. ARTHUR. He said that the modification of the certification procedure could be described as a rationalization: the present procedure was, in his opinion, stupid. The Ministry's attitude in the matter could only mean that the summation of mistaken diagnoses was so great as to cause financial embarrassment to the Ministry of National Insurance. In other words, the implication was that either certification by practitioners was grossly inaccurate or their diagnoses were rotten, which was damaging and untrue. It was difficult to see any reason why the concession should have been refused, unless it was that the Ministry of National Insurance was so hidebound with the friendly society set-up that it could not think in terms other than the weekly certificate. Dr. P. S. STEEN (South Essex) supported the amendment, because, he said, on very few occasions it was a source of irritation between the general practitioner, the patient, and also the hospital consultant staff. The occasions when difficulties were encountered were when people had fractures requiring daily treatment in hospital, and the problem was to catch the patient in order to give him the certificate. It was also difficult to understand the Ministry's objections, because there were as many mistakes made in prognosis at four weeks as there were at one week.

Dr. DAVIES said that the Ministry had met the Association handsomely in the matter of certification in the last two or three years, and the effect of the further privilege would be to give the practitioner authority to give a patient a blank cheque for a month's payment on National Insurance funds. The Committee's view was that the arguments set out in para. 50 were reasonable and fair. Nevertheless, an instruction had been received from the Conference to look at the matter again, and if it were the wish of the Meeting he was prepared to accept it.

The amendment that further efforts be made to implement the 1956 resolution on four-weekly certificates was carried as a substantive motion.

National Service Medical Boards

Dr. DAVIES moved that para. 51 of the Annual Report of Council be approved.

Dr. N. NELSON (Dundee City) moved that the chairman of a National Service Medical Board should communicate with the general practitioner concerned when a man was found to be unfit for National Service, giving the reason. A man rejected tried to find out from his doctor, who, without notification from the Board, had to make a full examination in order to ascertain the reason. Dr. H. F.

HISCOCKS (South-east Essex) said he assumed that the wording of the amendment would make it obligatory on the chairmen of all medical boards to notify the general practitioner in every case of unfitness. It was for that reason that he wished to oppose it. Speaking as the chairman of a medical board of long experience, he felt that the amendment might have been submitted in some lack of knowledge of all the circumstances. In quite a number of cases unfitness to serve was based on a certificate from a doctor whose patient was suffering from a condition which automatically rendered him unfit for service. He was not against the principle of notifying the general practitioner in all cases where it was considered desirable. The arrangements which had been made, and which were quite considerable and covered a number of disabilities, were quite adequate.

Dr. W. WOOLLEY (Council), also speaking as a chairman of a medical board, said that many candidates for National Service had no idea at all who their doctor was. In the case of the really important conditions, when a man was found to need treatment the position was covered. Dr. F. S. CATTO (Manchester) appealed to representatives not to swallow the amendment hook, line, and sinker. "If it does not choke you on the way down, you will soon be fighting the battle of the bulge," he said. The Ministry of Labour was in charge of the boards, and Ministry officials could insist that the examination should be confidential as between examinee and medical board. Many cases came up which were rejected and many of the young men were very excited and pent up. They did not wish their own doctor to know about conditions about which even their parents had no knowledge. He referred to such conditions as homosexuality, mental dullness, and so forth. It was right that the condition should be treated in confidence.

Dr. D. S. ROBERTSON (City of Edinburgh), speaking as another chairman of a medical board, said that the overriding objection to the amendment lay in the question of confidentiality. It was of fundamental importance that there should be no disclosure of information revealed by a medical board examination to any person, even the recruit's own doctor, without the consent of the man himself. Dr. DAVIES said that great progress had been made in the matter and the Committee was quite satisfied that the position as it stood was in the interests of all concerned. Dr. NELSON, in reply, said that if medical board doctors would not help their general-practitioner colleagues, how could the latter expect help from Government departments?

The amendment was defeated and the paragraph was approved.

Service Committee and Tribunal Regulations

Dr. A. B. DAVIES moved the approval of para. 55 of the Annual Report under "Service Committee and Tribunal Regulations."

Dr. R. S. V. MARSHALL (South Staffordshire) moved:

That the Regulations should be amended to permit legal representation of both complainant and respondent.

He said there had been a feeling among some of his constituents that cases which had been considered, upon Defence Union advice, to be trivial were found to be serious when they came before the tribunal and resulted in a substantial fine. While it was true that on appeal a case was considered *de novo*, so that in theory any lack of balance would be remedied, the fact remained that the doctor came to the appeal court as a defendant with at least one adverse judgment behind him.

Dr. R. FORBES (Hendon) asked the Representative Body not to depart from a tried and trusted procedure which doctors had found to be operating in their favour. The present procedure had been in operation for many years and the problems in connexion with it had been discussed by the Representative Body time and time again. He asked whether there would really be any advantage in having legal representation in a domestic type of tribunal, bearing in mind that if it were granted to one side it would have

to be granted to the other. It would change the whole atmosphere, converting it from a domestic tribunal to something in the nature of a court of law. Experience had shown that the present arrangements were adequate and operated fairly so far as the doctor was concerned. Of course there would be occasions when mistakes could occur—in which case there was full right of appeal with oral or written legal representation—but it had to be remembered that courts too made mistakes which resulted in appeals.

Dr. A. BARKER (Council) said that having appeared on many occasions at such tribunals in the capacity of "prisoner's friend" it was his experience that they were conducted fairly. He had at first thought that legal representation on such occasions would be a good thing, but had come to the conclusion that in most cases the domestic informal atmosphere was favourable to the doctor. There was no need to worry about an apparently trivial case turning out to be serious, for in such event an adjournment would always be granted. The regulations were so framed as to protect the doctor against the introduction of fresh material without being given the opportunity of an adjournment to reconsider his position. Dr. R. B. L. RIDGE (Enfield and Potters Bar) said that at a meeting held in conjunction with the local solicitors' association and addressed by a very eminent counsel on the doctor's contact with the law, his Division had been advised that doctors involved in Service Committee procedures might seriously prejudice the outcome of the case against them by not being legally advised and represented in the earlier stages. If an intending complainant had legal advice at an early stage many complaints would never come before the Committee.

Dr. ANNIS GILLIE (Council) opposed the amendment, speaking as a member of a Service Committee in an area with a large population. To begin with she had shared the views of the proposer of the amendment, but over and over again since then she had seen the advantages to both sides of the informal procedure, in which, however, the rules of evidence were observed. Over and over again in awkward cases it had been possible to secure reconciliation on the spot, which would have been difficult if the complainant's views had been crystallized by a legal adviser. In many cases the chairman felt that there was no *prima facie* case, and, if the Committee agreed, this eliminated them. Dr. F. GRAY (Council) said it was his duty to see doctors against whom a complaint was made before the sitting and to sit with them during the hearing. Most of the complaints were rejected; out of 25 consecutive cases a breach had been found in only four. Of the 21, one had said he felt as if he had been on trial; but what would have been his feelings if he had been subjected to cross-examination by a solicitor? If complainants could be legally represented they would go to a solicitor first, and the case would be made to appear much more serious.

Dr. MARSHALL, in reply, did not accept the statement that the rules of evidence were followed, which was contrary to his experience. The present rules governing the procedure dated from N.H.I. days, when the judgment did not affect a man's livelihood, but now it might.

The amendment was lost.

Dr. L. B. PALING (South Staffordshire) moved as an amendment that there should be a final appeal to the courts from a decision of the Minister in disciplinary cases against medical practitioners. The Minister, he said, should not be judge, jury, and in some cases executioner of a doctor's medical life. Dr. FORBES invited the Representative Body to reject the amendment. At the moment, he said, the procedure hung together. The amendment would make it possible for the aggrieved party—it could not be restricted to the doctor, so that it might be the complainant—to appeal to the court. This would mean taking the case from the more or less private Committee procedure and washing dirty linen in public. Dr. A. V. RUSSELL (Council) said that a part of the South Staffordshire Division had had one or two extremely unfortunate experiences, and this had led to the two amendments. The Service Committees and Tribunals often worked well, but sometimes, through no fault

their own, things could happen which were deplorable. He agreed that the right of appeal would have to be given to both sides, but contended that no dirty linen would be washed in public unless the appellant was desperately in need of true justice.

Dr. A. R. FRENCH (Marylebone) said that it was ensured that the Minister did not interfere until the whole machinery had been completed. There was first an investigation by what was a jury of the doctor's professional brethren, as to half its constitution, and lay people as to the other half. Although no legal representation was allowed at that stage, before the local medical committee, it was quite wrong to say that no advice was allowed. Advice could be obtained. At the next stage, that of appeal from the local executive council to the appeal tribunal, there was legal representation by a legal chairman.

Dr. MARSHALL, replying, said that two years ago at the conference of executive councils the legal chairman of the tribunal stated that there should be an appeal to the courts. The motion was lost. The report was then adopted.

Dr. H. J. BROWNE (North Staffordshire) moved:

That this Meeting reaffirms that it should be a requirement of the Regulations that proceedings against a doctor before a Service Committee should only be in respect of a breach of the Regulations and the doctor should be notified in advance of the Regulation of which he was alleged to be in breach.

There had been a case, he said, where it was clear that the chairman of a service committee had not applied the spirit of the regulations. His Division felt that a definite charge should be made in writing so that the doctor might be better able to defend himself. Dr. A. V. RUSSELL (Council) supported this simple justice. Doctors had been punished not for a breach of regulations but because they were held to have offended against the "spirit," which was wrong and unjust. Dr. F. E. GOULD (Birmingham) said that he had been a member of the tribunal and was secretary of a local medical committee, and he had never known a case in which the doctor was not informed of which regulation he was in breach.

Dr. F. GRAY (Council) explained that if an outside person brought a complaint to an executive council it could be investigated only if a breach of regulations was alleged. All doctors should get advice from the secretary of a defence society or the local medical committee. The only occasion on which an investigation could be made by the committee without a definite alleged breach was when it was referred by the executive council itself. Dr. F. M. ROSE (Council) hoped the motion would not be passed. If the hearing of a case which was not strictly under the regulations was prevented, it would be inviting the Minister to draft more strict regulations. Dr. R. W. MCCONNELL (Buckinghamshire) said that lately there had been a feeling that there had been cases where it was alleged that the doctor had not treated the patient properly. That was quite wrong. If the clerk of the executive council had to put down what particular regulation the doctor had broken, it would eliminate that kind of case. Dr. DAVIES hoped the Meeting would leave well alone and reject the motion.

The motion was put to the Meeting and the Deputy Chairman, Dr. A. BEAUCHAMP, declared that it was lost.

Dr. BROWNE suggested that as that represented a change of policy it required a two-thirds majority.

Dr. R. FORBES (Council) asked whether a quorum was present.

The DEPUTY CHAIRMAN ruled that there was. He then again put the motion and declared it defeated by a simple majority. He had said that if it was lost a change of policy was involved.

North Staffordshire accepting a proposal that the matter should be referred to Council, the motion was carried as a reference to Council.

Dr. H. J. BROWNE (North Staffordshire) moved that the Minister of Health be informed that grossly undue delay was occurring in the notification of appeal tribunal findings to the interested parties and demand that such delay should be cut to a minimum.

Dr. DAVIES, in reply, said that the relevant words were "grossly undue delay." If that were true, no one would disagree with the North Staffordshire motion; but a certain amount of delay was reasonable owing to the importance of the matter and the desirability of preparing documents on the evidence, and presenting them in a perfectly fair form. Nevertheless, the G.M.S. Committee would welcome some information on the matter, for up to the present there had been few, if any, complaints of that nature, and he would be prepared to accept it as a reference to Council if North Staffordshire would provide the information. (Agreed.)

Another motion by North Staffordshire, moved by Dr. R. W. RAE, to the effect that costs should be awarded against unsuccessful applicants to appeal tribunals, as provided for in the regulations, was accepted as a reference to Council.

General-Practitioner Refresher Courses

Dr. G. S. R. LITTLE (Greenwich and Deptford) moved:

That this Annual Representative Meeting deplores the inadequacy of payments made to general practitioners attending refresher courses, and urges that these be increased to at least 25 guineas per week.

He said it was quite obvious that practitioners were being deterred from doing postgraduate work on account of the expense. It was not possible for doctors to attend postgraduate courses, provide a locum, etc., on the grant which they were given at present.

Dr. W. B. ADAM (Tunbridge Wells) moved by way of amendment the deletion of the words "to at least 25 guineas per week." The motion as it stood, he said, was neither clear nor practicable. It did not state whether the 25 guineas was to be paid as an addition to the present allowance. If it meant that, then clearly it would be turned down by the Ministry. If the 25 guineas was to cover all expenses, on the other hand, it was not practicable because expenses varied very much from doctor to doctor.

The amendment was carried.

Dr. DAVIES said that last year the Committee had succeeded in raising the fee from 14 to 16 guineas, and representations had recently been made to the Ministry which had included a specimen budget of an actual case in Lancashire which appeared to justify a claim of the order of 22 guineas. He would gladly undertake to continue his efforts and asked that the matter be referred to Council.

The motion was carried as a reference to Council, as amended by the deletion of the words "to at least 25 guineas per week."

The remainder of the Annual Report under "General Medical Services" was approved.

Higher Capitation Fee for Elderly Patients

Dr. AVIS M. JONES (Exeter) proposed that a higher capitation fee should be paid for the treatment of persons over 65. She said that the number of people over 65 years of age was increasing year by year. Treating such people justified a higher capitation fee, as they were more likely to be ill and to have prolonged and chronic illnesses. The technical administration of the increase need not be difficult; each practitioner could apply for it in the same way as for mileage and drugs.

Dr. M. R. SHERIDAN (North Middlesex) described the motion as dangerous. The next step would be to ask for higher fees for the treatment of patients with chronic illnesses—diabetes, tuberculosis, and chronic bronchitis. A capitation fee must be administered as a flat system, and what was lost on the swings would be made up on the roundabouts. Dr. H. B. MUIR (Fife) supported the motion. Dr. D. L. GULLICK (East Herts) said that there were all sorts of patients who required extra care. Once the sort of thing that the motion proposed was started, where would it end? Dr. J. T. BALDWIN (East and Mid-Lothian) said that as a result of a survey he had undertaken in his own practice over one year's work he had discovered that the patients who had received the greatest number of items of service were between the ages of 16 and 59; they represented 31% of the

patients, receiving 41% of the items of service. Such figures, though they related only to his own practice, should make the Representative Body wary of accepting such a motion.

Dr. R. M. S. MCCONAGHEY (Torquay) said that he was privileged to live and work in a very beautiful part of the country, and he liked his old patients. Those who wished to live elsewhere were welcome to do so. Let doctors not squabble about the relative amounts of work that they did. Dr. DAVIES said that despite his sympathy for the views of the mover, she was pleading a special cause. In his own part of the Black Country two-thirds of the people over 50 had chronic bronchitis or chronic rheumatism, or both. Capitation fees were paid from a fixed pool; if more was paid to one section for a special cause it meant that there would be less for others. The proposal, therefore, was quite impracticable.

The motion was lost.

Loading of Capitation Fee for London Area

Dr. J. L. PATTON (Hendon) proposed that the Council be invited to give consideration to the loading of the capitation fee in the London area to meet the higher cost of living there. He said that the principle had long been accepted by the Civil Service. Dr. F. GRAY (Council) said that he came from London; the mover came from Middlesex. Dr. Patton was asking something for London which neither London nor anywhere else wanted.

The motion was lost.

Maternity Care

Dr. J. B. W. ROWE (Harrow) moved:

That it be a principle of Association policy that general practitioners who wish to undertake the antenatal care of their own patients shall be entitled to do so and that regional hospital boards be requested to ensure that the staffs of their constituent hospitals do not make the booking of the confinements of those patients in hospital conditional upon complete antenatal care being provided at their own or local authority clinics.

This arose, he said, out of difficulties which had arisen in his area from an obstetric consultant refusing to countenance the carrying out of antenatal care by the patient's general practitioner, and indicating to two patients that if they went to their own doctor for this purpose they had better make their own arrangements for their confinement. One general practitioner wrote to the hospital about this, and received in reply a letter from the senior registrar to the consultant saying that it was the practice to supervise the antenatal care of patients booked for confinement with the help of the local antenatal clinics. A month later the patient received a letter from the almoner to the same effect and adding, "If you wish to retain your hospital booking I hope you will attend your local clinic until you are 36 weeks pregnant, after which we shall see you each week." Another doctor had had a similar experience. Representations to the consultant in person had been rejected, and he had refused to meet a deputation from the Division to discuss the matter. There was a principle at stake, and the A.R.M. should confirm it by formal resolution, so that Regional Hospital Boards could be asked to take action mentioned in the second half of the motion.

Dr. W. MORGAN EVANS (South Middlesex) said the position revealed by the mover showed a deplorable state of affairs, and he appealed for support for the resolution, but he did not think that Regional Hospital Boards could be asked to "ensure" that the action suggested in the motion was taken. Regional boards had not that power, and he hoped that they would never have it, because to direct a medical man to do a certain thing in certain circumstances could interfere with his clinical freedom. In his own area there was the fullest co-operation of the team of general practitioner, consultant, and local authority welfare clinic. Mr. J. R. NICHOLSON-LAILEY (Council) said it was important to let the public know what was the position of the family doctor in obstetrics, because public opinion would influence the Government. It would be a tragedy if the family doctor felt that he could not submit cases to a consultant for fear

of losing them. In Mr. Nicholson-Lailey's part of the country the consultants worked with the general practitioners as a team. The very fine memorandum issued by the Central Health Services Council on antenatal care recognized the important position of the family doctor. As a result there had been meetings between consultants and family doctors throughout the country, and a much better team-spirit was being engendered. One difficulty had been the refusal of the Ministry to pay twice for a service, and if it could avoid paying the family doctor for antenatal care it did so.

Dr. JACK E. MILLER (Glasgow), supporting the motion, asked how long the profession would tolerate the continuous whittling away of the responsibility of the general practitioner to his patient, because of the attitude of consultants or regional boards. The invidious practice complained of existed also in Scotland. There was an increasing tendency for hospitals to make admission to hospital for confinement dependent on attending the antenatal clinic of the hospital concerned. Very often it was the junior hospital officers who laid this down, but sometimes it was done by senior officers and consultants. It was only the Association which could insist on the rights of the general practitioner.

The CHAIRMAN OF COUNCIL emphasized that safeguarding the position of the general practitioner was only a minor issue; what was important was to safeguard the patient. In its evidence to the Cranbrook Committee the Association had pointed out that in cases of doubt, or when the patient had to be seen at times other than when the clinic was held, it was the general practitioner who was responsible, and who could and did see the patient much more frequently if necessary. If that meant some duplication, it was not a bad thing. He did not like the wording of the motion, because it did not state the situation quite accurately and did not go far enough. Purely, therefore, to secure a better wording it would be better to pass it as a reference to Council.

Dr. JOAN CHAPPELL (North Middlesex) said that some patients were afraid to consult their own doctor lest they lost their bed for the confinement. There was no objection to the patient continuing to go to hospital, but the motion referred to patients being told to attend the local authority clinic and being forbidden to see their general practitioner. Mr. H. H. LANGSTON (Council) said that in the situation described the local practitioners would have behind them the support of all the other branches of the profession. It was an excellent example of the type of situation which the new Branch suggested by the Constitution Committee could deal with locally.

Dr. ROWE, in reply, agreed to the motion being accepted as a reference to Council if this was for the purpose of strengthening it.

The Meeting agreed to the motion being taken as a reference to Council, on that understanding, and as such, it was carried unanimously.

COLLECTION FOR MEDICAL CHARITIES

At this point the CHAIRMAN announced that as a result of a collection £248 9s. had been added to the charities of the Association. This was a magnificent contribution from the Representative Body and he wondered if representatives would agree to having a collection each year.

GENERAL MEDICAL SERVICES (continued)

Fees for Maternity Medical Services

Dr. J. B. BENNETT (Bath) moved that the fees for maternity services were inadequate and should be substantially raised forthwith. A similar motion had been before the Meeting last year, but certain changes since then justified bringing it up again. His Division thought that the views of the Representative Body on this question might be duly noted by the Cranbrook Committee and also by the Royal Commission. The fee had been 7 guineas since 1948. All were aware of the increase in the cost of living. There had also been an increase in the work done. Midwifery was regarded as one of the more exacting and permanently worrying aspects of general-practitioner work. Many patients were

shocked to learn of the fee that the doctor got for the work which he did.

Dr. J. J. COSGROVE (Londonderry, with North-east Ulster) said that the present inadequate fee contributed to the fact that partnerships were not undertaking midwifery, and to that extent general practice was suffering a loss in public esteem. Dr. EILEEN M. CLARKE (Nottinghamshire) moved an amendment:

That this Meeting is of the opinion that because the minimal obstetric requirements are inadequate and are habitually exceeded, they are therefore inadequately recompensed.

Dr. DAVIES said that a similar motion to this amendment was approved at the Conference of Local Medical Committees. While representatives might think there was a case for an increased payment for maternity cases, it must be remembered that it would be only at the expense of some other service, for it came from the central pool. Dr. R. W. MCCONNEL (Buckinghamshire) said they recognized that more should be done than the very low standard which the Government set for maternity medical services, and therefore the amendment, which was better than the motion, should be passed. Dr. A. M. GOLDTHORPE (South-east Essex) thought that at least the midwifery fee should be increased by the same extent as the capitation fee, as a first measure. After that there should be new fees on the basis of the new requirements. Dr. A. R. FRENCH (Marylebone) commented that the amendment merely said that the services were inadequately recompensed. It did not suggest a remedy, whereas the motion from Bath stated that the fees should be substantially raised forthwith. Dr. W. W. FULTON (Glasgow) thought the original motion adequate.

The amendment was lost and Bath's proposal was carried.

Pharmaceutical Literature

Dr. L. G. R. WAND (South Essex) moved:

That the co-operation of the pharmaceutical industry be sought in the preparation of standardized literature of a concise nature in respect of products prescribable on E.C.10 forms.

He said that what his Division felt was required was concise literature, suitable for card indexing, and easy for reference. Dr. E. COLIN-RUSS (City) did not like the reference. Let the industry give doctors information in what wording. Let the industry give doctors information in what ever form seemed most expedient, but let what doctors put on E.C.10s be left to the doctors. Dr. DAVIES said that the G.M.S. Committee had already taken action on these lines. They had asked the Association of Pharmaceutical Industries that advertising literature should be prepared of a size which would fit in an envelope, and should give the cost of the medicament, and if possible the Cohen Committee classification.

The motion was carried.

A motion by Lewisham deprecating the quantity of pharmaceutical advertisement sent to doctors, and requesting the Council to approach the pharmaceutical manufacturers to consider means of limiting it and channelling the available advertising in a more useful method, and calling for the banning of all unsolicited samples was moved by Dr. J. D. W. WHITNEY (Kensington and Hammersmith). He suggested that the industry should be encouraged to produce a standard card which would clearly state the information required about pharmaceutical products, and which could easily be kept and stored. Dr. S. NOV SCOTT (Council) asked the Meeting to turn down the motion. "Who are we to dictate to an industry how they should spend their money?" he asked. If a practitioner did not want the information which was sent out all he had to do was to write to the firm concerned and say so. Dr. J. D. IRVING (Lewisham) said that practitioners in Lewisham were exercised by the fact that they could not dispose of large numbers of unsolicited samples with ease. They might even be picked up by children, and, in fact, one child made himself ill by eating a box of suppositories. Dr. R. H. MOORE (North Middlesex) said that a year ago he started to collect the board boxes. Some practitioners depended on ethical

pharmaceutical firms for their knowledge of modern therapeutics, and they should be given a chance of providing such information properly. He supported the suggestion of a card which could be kept in a card index.

The motion was carried.

Medical Records

Dr. J. D. IRVING (Lewisham) moved that the Meeting recommend that Council set up a committee to make recommendations for improving forms E.C.5 and E.C.6.

Dr. J. E. MORRISON (Stirling) moved to amend the motion by deleting the reference to forms E.C.5 and 6 and substituting the words "the present system of record keeping in general practice." He thought that the proposal as it stood was merely nibbling at a problem which needed much study. The envelope and continuation card had been in existence since about 1911; they were quite useless for filing specialist's letters or even for ordinary, sensible record keeping. The whole matter required a complete overhaul. Dr. DAVIES said that both the motion and the amendment were like taking a sledge-hammer to crack a monkey-nut. There was existing machinery for dealing with the matter, and the Ministry had set up a permanent committee to control such things.

The amendment and motion were lost.

Dr. A. J. M. TUDOR-HART (Kensington and Hammersmith) moved to ask the Ministry of Health to provide a modified form of medical record envelope for filing continuation cards and hospital reports, pending the receipt of the permanent envelope from the executive council. He said that the objection to the proposal which had been put forward on previous occasions, that the records might be confused with the definitive records finally received with the patient's name and National Health Service number on them, and that unjustified claims for remuneration might be made by general practitioners on them, was quite invalid. In many cases the redundant envelope of another patient was used, with the original name crossed out, making the possibility of confusion greater rather than less.

Dr. DAVIES said it was a reasonable suggestion which he would gladly accept.

The motion was carried.

Blood Transfusion and Rh Factor

A motion by Mid-Cheshire asking that, in view of the apparent wastage of rare blood such as O negative, there should be a uniform system for obtaining blood grouping and Rh factor in cases of pregnancy was carried as a reference to Council.

Insulin Syringes

A Lancaster motion asking that 5-ml. insulin syringes graduated in 0.1 ml. should be made available was also carried as a reference to Council.

HOSPITAL AND CONSULTANT SERVICES

Mr. T. HOLMES SELLORS, Chairman of the Central Consultants and Specialists Committee, moved on behalf of the Council the approval of the Annual and Supplementary Reports of Council under "Hospital and Consultant Services," and the Memorandum on the Future of the Chest Services.

He said that during the past year the Committee's work had been concerned with a number of important matters in addition to those raised by the remuneration issue, some of which had been persistent perennials. There had been a carefully considered examination of the Committee's constitution and terms of reference, and the modifications effected were detailed in the report. The Committee was now satisfied that its representation was satisfactory and that no reinforcement from additional grades was necessary. Relations with the Joint Consultants Committee had also been examined. To have achieved a means whereby the two bodies could work together in a satisfactory and harmonious manner had been a considerable gain. One concession in particular which had been granted was the

inclusion of some of the Committee's consultants in the Consultants Advisory Committee, which gave advice on application for the creation of new consultant posts. Some progress had been made in dealings with the Ministry through the Joint Consultants Committee. On other points the debate continued. Junior hospital staff problems had continued to occupy a great deal of the Committee's time, but it was feared that much of the effort had been fruitless. The deliberations arising out of the Strachan Report on hospital staffing problems, particularly in relation to redundant senior hospital registrars and intermediates between consultants and hospital junior staff, had produced no solution, but it had clearly emerged that the suggested intermediate consultant grade should not in any way be countenanced if it could be avoided, for it was felt that it would in a short time suffer the same fate as had the S.H.M.O.'s grade, growing steadily instead of being restricted, finally resulting in sub-consultant status with sub-consultant pay. Efforts were being made to obtain some assurance that the time-expired senior registrar would continue his employment in a comparable post with increased salary. The Committee had been insistent that a review of the consultant establishment and hospital staffing as a whole should be carried out in the periphery and collected and brought in centrally to try to assess the real strength of hospital staffing.

The difficulties of S.H.M.O.s had been very much in the minds of the Committee, which had much sympathy with their problems while regretting its inability to do all that they required. Remuneration was another burning question, and at the request of the S.H.M.O.s the Association went to arbitration, asking for an annual increase of £200. The award was £75. That should be remembered by those who pinned so much faith to the principle of unilateral arbitration. Arbitration was not a panacea, and unilateral arbitration could work in reverse against the doctor. It was felt to be unwise at the moment to ask for a definite percentage increase in the salaries of S.H.M.O.s. To fix a definite percentage without more than a sentimental justification could lead to difficulties. The Ministry would not agree to a wholesale review of posts, but the Committee had looked at cases where S.H.M.O.s might have been unjustly graded at the time of their appointment and in a few had induced the Ministry to agree that their grading had been unjust and that they should be restored to higher position. The Management Side of Whitley Committee B had also agreed to look at a number of cases where S.H.M.O.s were working in established consultant posts, and estimated that there were about 200 doctors who might be considered. The Committee had sent to S.H.M.O.s a circular inviting applications from those who thought they were working under those conditions, and about 800 had been received. It would now be necessary to go through them and decide how many were doing consultant work. The Management Side would not admit them to consultant grade, but would raise their remuneration.

Continual pressure had been put on the Ministry to ensure that there was proper medical advice at Regional Hospital Board level. The right had been gained to proper representation at hospital level and at Ministry level, but at regional board level there was considerable resistance, the boards maintaining that their mechanism for obtaining medical advice was perfect. In spite of this they had agreed in some cases to make improvements.

It had caused great anxiety when the Inland Revenue decided to make Schedule E assessments on part-time workers. The Association won their case against this before the Special Commissioners, but the Inland Revenue had appealed and apparently refused to agree to a standstill in the interim. Pressure should be brought to bear on people with influence, as these matters were being discussed in Parliament, and the Government should accept a just allowance for the expenses of those working full- or part-time.

The terms and conditions of service provided for discussion and agreement on board-and-lodging charges. Nothing was done for some time, and then charges for

board and lodging had been proposed which were outrageous. The Association claimed that there should be a subsidized charge, because these doctors lived in for the benefit of the hospital service. The Association prepared figures which were regarded as the lowest possible for the resident officer grade, and after many months the Ministry accepted them. They were not acceptable to every member of the profession but were the best which could be obtained by hard bargaining. If an open costing method of arriving at the figures had been adopted, the house officers and registrars would have been worse off. With regard to travelling expenses, an effort was being made to find a reasonable answer to the difficult position of the man who lived twenty miles from one hospital and thirty from another, and whose consulting rooms were fifteen miles between the two.

Medical Membership of Hospital Boards

Mr. A. LAWRENCE ABEL (Marylebone) moved that the Meeting deplored the recent reduction of medical members on hospital boards and management committees, as this deprived the public of adequate medical opinion. The Guillebaud Committee—going, he thought, outside its terms of reference—had suggested that the representation of doctors on Regional Hospital Boards should be reduced to 25%, and this had been accepted by the Government.

The motion was carried.

Dr. R. M. S. MCCONAGHEY (Torquay) moved that the number of medical members on Regional Hospital Boards and Hospital Management Committees should not exceed 33% and should not be less than 25%. This was necessary, he contended, to ensure adequate representation of the very varied medical interests concerned.

Dr. J. G. M. HAMILTON (Council) moved an amendment to confine the motion to England and Wales, pointing out that in Scotland the Act provided for an upper limit of medical representation of 50%, and, while on most Regional Hospital Boards and management committees it was in fact below 50%, the proportion was usually higher than in England, and the motion might be used as a lever to secure a further reduction.

Dr. MCCONAGHEY accepted the amendment, and the motion was carried in the following amended form:

That the number of medical members on Regional Hospital Boards and Hospital Management Committees in England and Wales should not exceed 33% and should not be less than 25%.

Representation on Tax Schedule E

Standing Order 5 was suspended to enable Mr. A. LAWRENCE ABEL (Marylebone) to make a statement and move a motion. Mr. Abel said that *Hansard*, July 2, reported a debate about those of the professional classes who suffered under Schedule E. It was pointed out that a solicitor in practice could charge his subscription to the Law Society for tax purposes, but if he was a town clerk he had to pay the entire amount out of his pocket. The Financial Secretary replied that the Chancellor of the Exchequer intended to seek discussions with interested bodies and representatives of those professions particularly involved to see if there could be alleviation.

The Meeting agreed:

That Council be instructed to make representations to the Chancellor of the Exchequer as invited by the Financial Secretary to the Treasury in the House of Commons on July 2.

S.H.M.O.s and Registrars

Dr. A. ELLIOTT (Stratford) moved:

That this Representative Meeting is concerned with the prospects and future of registrars, and the supply and distribution of consultants. It asks Council to look at the problem afresh in consultation with doctors of the grades concerned and to report back to the Representative Body.

As tabled the motion included reference to S.H.M.O.s as well as registrars, but the Meeting gave Stratford permission to amend it.

The general practitioners in the Stratford Division, said Mr. Elliott, were horrified to learn that the senior registrar of the local hospital, after many years' service of the highest integrity and professional competence, had become redundant. His case was not atypical of a situation all over the country. He was 37, married with three children, and had obtained the M.R.C.P. in 1939. He had not been able, mainly because he was not at a teaching hospital, to obtain a consultant appointment. Up to 400 registrars were competing for a small number of appointments. There was a petting for a small number of appointments. There was a moral responsibility towards these men, who no longer had the chance of getting into general practice. To upgrade 400 to consultant status would cost £4m., not a large sum considering the amount spent on the Health Service to-day. What were these senior registrars doing if it was not consultant work?

Mr. B. W. ROWE (Council) said he had not heard whether a suggestion he made at a meeting of Council for the amelioration of the situation had been taken up by the C.C. and S. Committee with the Ministry. It arose from a practice which was beginning to grow in industry—namely, that when a superintendent of a department was getting near retiring age his immediate juniors were given much greater responsibility and promoted in effect to control the department under the guidance of their immediate superior. He suggested that senior registrars should be appointed now as consultants with those consultants who were almost at the point of retiring. Mr. J. P. JACKSON (Nottinghamshire) said there was no question that there was a real problem and a real need for an expansion of the consultant services. The waiting-lists of most hospitals were quite long. But while he supported the motion, he desired to sound a note of caution. If a consultant was appointed he must be given a place in which to work. The problem, he submitted, was bound up with the whole question of building in this country. The hospital buildings in this country were an absolute disgrace, and the projected plans for building were quite inadequate.

Dr. H. N. ROSE (Stratford) said there were between 300 and 400 senior registrars who were in the position of being either redundant or transitional. It was a complicated business to find the difference between those two words, but whatever it was, they meant that those registrars were on the way out. They were kept on a very temporary basis, living in a state of anxiety, and something must be done for them. Why were they redundant? It was certainly not because in all those respects those men were equivalent to the consultant status. The reason, so it was said, was that the consultant establishment was not sufficient. Everyone knew that there was enough work for those men. In fact, since the Act they had been doing a good deal of the work of the hospital service, yet they were now being told that they were redundant.

Mr. HOLMES SELLORS said he was in sympathy with much of what had been said, and he assured representatives that the various committees were aware of the problem and its extent. It was reckoned there were between 150 and 200 in what was called the "hard core" of the bulge of surplus registrars. It was also known that the distribution of registrars throughout the country was absolutely "haywire." There were far too many in medicine and surgery, and in other specialties there were not enough applicants. It was calculated that the immediate bulge would run out in about seven years, and at about that time it was foreseen that there would have to be some increase in the number of senior registrars again to keep pace with the appointments.

Dr. ELLIOTT, in reply, said that Mr. Holmes Sellors's remarks were not good enough. What would happen to those men in general medicine and surgery who had to wait for seven years? In spite of what had been said, some of those registrars were being reviewed by the regional staff committees and considered not suitable, because of their age, to continue as registrars, and their appointments were being terminated.

The motion was carried.

Internal Administration of Hospitals and S.H.M.O.s

The CHAIRMAN OF THE CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE moved the approval of paras. 71 and 77 of the Annual Report of Council.

Dr. V. COTTON-CORNWALL (Liverpool) moved the following joint amendment on behalf of his own Branch and of Rugby:

That, with reference to paras. 71 and 77 of the Annual Report of Council, this Meeting is of the opinion that Council, when it has received resolutions from the Representative Body deciding the policy of the Association, if it receives contrary advice from any of the committees to which the resolution has been referred for comment should seek a reversal of such policy by constitutional means.

His objection was to the form of words used by the Council in paras. 71 (dealing with internal administration of hospitals) and 77 (dealing with S.H.M.O.s) of the report. Representatives had been told many times during the last two days that the Representative Body was the policy-forming body of the Association and that the resolutions which it passed formed the policy of the Association. For two years running the Representative Body had said that the Association did not agree with the equal tripartite administration of hospitals, yet the language which the Council had used had done no more than to express half-hearted agreement with that resolution; it had been so ambiguous as to suggest that Council had in fact rejected the resolution; what it had in fact done was to damn it with faint praise. Reference had also been made to the "view" of the Representative Body. Resolutions passed by the Representative Body were not "views," they were the policy of the Association. If the Council considered that the Representative Body had passed a resolution which was inconsistent with the wishes of the Association its duty was to hold a referendum of the Association in order to discover whether or not it was right.

Dr. R. P. HENDRY (Rugby and South Warwickshire) said that last year the Representative Body had said that Council had failed to implement Resolution 208 of the previous year and, by so doing, had weakened the policy laid down; that meeting had also disapproved of the action of Council in not accepting that resolution as official policy. It would be hard to think of two more scathing condemnations of Council's action. Now, at a time when unity was so essential, it appeared that the Council could not afford the luxury of speaking its mind. He had not realized the full extent of the Council's muzzling attitude until yesterday. (Cries of "Withdraw.") He thought that a veil should be drawn over the activities of Council in that particular matter and that an assurance should be sought that in future no similar flagrant violations occurred. It was a matter of vital principle that the constitution should be upheld. There seemed to have been rather too much jerry-mandering with the constitution by the Council, ignoring it if it was inconvenient or if so advised. Dr. Wand had suggested that the Association suffered from a surfeit of democracy; Dr. Hendry said he suggested it was suffering from a surfeit of autonomy and autocracy.

The CHAIRMAN repudiated the suggestion that there had been any muzzling yesterday. It was up to the Representative Body itself to decide what it should or should not discuss and the Representative Body had made its own decision in the matter. Dr. HENDRY said that he had been referring to Motion 100 and to another from Torquay which the Meeting had decided not to debate. (Further cries of "Withdraw.") The CHAIRMAN repeated that there had been no muzzling. That decision had been taken by the Representative Body itself, which had a perfect right to decide whether or not in certain circumstances it wished to have a matter debated. It had decided that, in order to obtain unity and to avoid acrimony, those matters should not be discussed.

Dr. K. C. BAILEY (West Somerset) said that when he had first come to the Meeting 10 years ago the man who had impressed him most had been Dr. Wand; he had had the

feeling that if anything went wrong Dr. Wand would be the man to see that it was put right; Dr. Wand seemed to have done that consistently until the last year, when he appeared to have let the small matter under discussion slip by through having it referred to an autonomous body. The motion, said Dr. Bailey, should not have been included in the Hospital and Consultant Services section in any case, as it concerned only the constitution of the Association.

Dr. WAND said that never in the whole of his 24 years' membership of the Representative Body had such an amendment as that of Liverpool and Rugby come forward. Never had he heard of anything in such general terms. It had always been recognized that all the matters debated in the Representative Body's meetings could not be fully and finally decided in a body of that size and had to be considered by committees. Many of the Representative Body's discussions ended with resolutions deciding that particular items should be referred to committees, because in a committee-room, with a smaller number of people and with more time at their disposal, it was possible to come to a firm and final decision. Sometimes a borderline decision was reached, and in the light of changed circumstances it was desirable not to take action or that some opposing action should be recommended. That had never before been brought into question.

The Joint Consultants Committee was responsible for discussing the terms and conditions of service of those in the hospital service with the Government. One of the points raised in the resolution had been that no further S.H.M.O. posts should be established—a matter of major policy for discussion with the Government by the body set up to do so by the Representative Body itself. Was it now to be suggested that the Council should go through the whole of the referendum machinery over every matter of minor importance such as some of the items dealt with quickly at the end of a Meeting? Was it further to be suggested that circumstances might not change between the passing of the resolution and the time for its implementation which would make it foolish for the Council to implement it in the way originally decided? Was Council's hands to be so completely tied that they had to wait for a referendum—the production of a long document indicating all the pros and cons and necessitating the calling together of all the Divisions to discuss it? That was surely taking a sledgehammer to crack a nut! The Council could be relied on to consider every resolution carefully in the light of all the circumstances, and something would have to change very much before the Council would alter a single word agreed to by the Representative Meeting. In the present instance the matter concerned an autonomous body set up by the Representative Body. The Council was anxious about the mechanics by which the Association and the autonomous bodies came together and had set up a special committee to look into the subject. The Liverpool amendment related to an autonomous body. The autonomous bodies would come together in the new committee to consider how to deal with problems of the kind in question. It would be better to refer the amendment to that body, and not set up machinery which could only do harm when the resolutions of the R.B. came to be implemented. He hoped that next year it would be possible to make suggestions whereby the autonomous bodies and the Association could work more in harmony.

Dr. COTTON-CORNWALL, in reply, pointed out that Liverpool objected to a form of words used in the Report of Council. If the Council received from an autonomous body or from any committee advice which conflicted with a resolution adopted by the Representative Body, the Council could state that, in view of that advice, it had not taken action on the resolution and wished the Representative Body to discuss it again; but on more than one occasion it had put in its Report as its opinion something which had been the opinion of a committee and not of the Representative Body, which was the policy-forming body of the Association.

The Liverpool amendment was carried.

Dr. WAND pointed out that what the Representative Body had adopted was the text of the amendment and not the speech just made by the representative of Liverpool. Did the amendment mean that, if the Representative Body passed a resolution, then, no matter what happened thereafter, the Council could not, except after a referendum or postal vote, take any action contrary to that policy? (Cries of "Yes" and "No.")

Dr. C. P. WALLACE (Guildford), on a point of order, suggested that it was out of order for Dr. Wand to put questions to a large meeting on the interpretation of an amendment which it had just passed.

The CHAIRMAN replied that the amendment must come before the Meeting as a substantive motion and could be discussed as such.

Mr. H. H. LANGSTON (Winchester) said that there had been very little time to study the amendment, and its implications were far-reaching. He suggested that discussion on it as a substantive motion should be deferred until the following day.

The CHAIRMAN, after consulting and obtaining the agreement of the Meeting, announced that the discussion of the amendment as a substantive motion would be taken at about 10 o'clock the following morning.

The SECRETARY, in response to a request by a representative, read the relevant extracts from the following Articles of Association bearing on the subject just discussed: Articles 37 (Powers of the Representative Body), 43 (Powers and Duties of the Council), 40 (Taking of a Referendum), and 39.

Dr. J. N. SWAINSTON (South Shields) moved an amendment confirming the policy previously adopted in relation to S.H.M.O.s and instructing the Council to take active steps to secure implementation, particularly of the resolutions passed at the last Annual Representative Meeting.

"We feel that perhaps some of these resolutions have been lost," he said. They wanted the policy of the Association in these matters confirmed. No S.H.M.O.s had benefited since last year. They did not want delaying tactics through little committees interfering with the main cause. These S.H.M.O.s continued not only to exist but to be appointed, and it must be seen that S.H.M.O.s got justice despite any talks which were going on with committees.

Mr. J. R. NICHOLSON-LAILEY (Council) assured the Meeting that all that could be done on these resolutions was being done. It was a slow process. Governments took a lot of moving, but the Joint Negotiating Committee and the C.C. and S. Committee were in full sympathy. Dr. A. SMITH (Lanarkshire), Chairman of the Scottish Consultants and Specialists Committee, said that every measure which could be taken had been taken. The Consultants and Specialists Committee had spent more time on the affairs of S.H.M.O.s than on any other issue. It ought to receive their confidence. Dr. W. D. GRAY (Liverpool) said that the resolution did not ask for steps forthwith. They realized that the C.C. and S. Committee had done a great deal to help S.H.M.O.s. The Representative Body should not go away with the idea that S.H.M.O.s were constantly sniping at the C.C. and S. Committee, but they were an unhappy group and they looked to the R.B. to seek further advances.

Mr. HOLMES SELLORS warned that if the Representative Body was to pass resolutions which were clearly unobtainable, it would embarrass those negotiating with the other side.

A MEMBER from the floor of the hall suggested that the motion should be a reference to Council, but Dr. SWAINSTON, replying to the discussion, could see no point in a reference to Council. If passed, the resolution was a definite instruction to Council. They realized that these negotiations were slow. What they wanted was the moral backing of the Representative Body that it still felt the same way that it did last year.

The amendment was carried.

The Representative Body adjourned at 6 p.m.

FOURTH DAY

Saturday July 13

The representatives assembled at 9.30 a.m. Consideration of the Annual and Supplementary Reports of Council under "Hospital and Consultant Services" was resumed.

Shortage of Medical Auxiliaries

Dr. J. G. FREEMAN HEAL (Willesden) moved that the Meeting should express regret that the pay of medical auxiliaries in the hospital service was so low that they were leaving the N.H.S., so that it was impossible to give adequate facilities to practitioners for the investigation of patients and existing facilities were being withdrawn. Council was asked to do all in its power to remedy the situation.

He said that senior medical auxiliary staff were leaving the hospitals to go to higher-paid posts in commerce, industry, the Civil Service, and local government, and some of the posts did not even require their professional qualifications. There was a 10% shortage of physiotherapists, the situation being more grave in the non-teaching hospitals. Almoners, radiographers, and others were finding plenty of alternative employment, particularly in the Civil Service.

Dr. H. GLYN JONES (Bromley) supported the motion but expressed doubt that its acceptance would achieve much. He said that it had recently been found necessary to recommend to his hospital management committee that general practitioners should no longer have direct access to the services of the hospital radiographers. Cries of "Shame." Yes, it was a shame. That state of affairs, far from being peculiar to the technical grades, applied to the whole of the National Health Service on the hospital side. The motion under discussion related to medical auxiliaries, but what would the next step be? Clerks? Radiographers were paid less than develop year after year? How would the situation develop year after year? Radiographers were paid less than an apprentice cook, and even the latter could not be readily obtained nowadays. Hospital management committees obtained nowadays. Hospital management committees realized that pay was inadequate but had no voice in it, and over the whole of the Whitley machinery was the dead hand of the Treasury. Until this was shaken off the situation could never be altered. But if salary scales in the hospital and services were made comparable with those in industry and commerce it would cost the country £1,000m. a year instead of £600m., and it would be surprising if the national economy could stand that.

Miss GLADYS M. SANDES (Marylebone) drew attention to the increase in the male over the female population which was resulting in a shortage of women hospital employees for the various auxiliary grades. The day had passed when there had been a large pool of relatively free women from which to draw for such posts, and terms of service and legislation would now have to be framed with full realization of the fact that it would be necessary to employ a greater number of men. The CHAIRMAN OF THE C.C. AND S. COMMITTEE (Mr. T. Holmes Sellors) said that the Council were concerned about the immediate problems which the matter presented. The shortage was real and there were certain obvious remedies, such as increased rates of pay and incentive to recruitment. He hoped that the Meeting would give the motion its full support, because it might be the means of enabling the Association to start a wide campaign for salary increases, particularly on the radiographers' side, which, at the moment, was suffering the most.

The motion was carried.

Dr. J. D. IRVING (Lewisham) moved a motion, originally standing in the name of Winchester:

That Council continue to press upon the Ministry the urgency of improving the conditions of service and pay of radiographers.

He recalled that on the previous day a motion was passed which stressed the need for increased access to auxiliary diagnostic departments. So far as x-ray departments were concerned there was not a hope of getting it in the foreseeable future. At Lewisham, for instance, it had been neces-

sary to curtail the facilities for free access. He was convinced that there was no shortage of qualified radiographers in the country, and that the present shortage existed only in the National Health Service. Action at a national level must be taken at once. Recruitment must be increased, the career made attractive, and the status improved to attract the type of person needed. Dr. J. S. HAPPEL (Winchester) said that the position at Winchester during the past twelve months had been that it had been possible to employ only four radiographers out of an establishment of seven. Overnight and week-end emergency services had been carried on only under the greatest difficulty, and, of course, the four radiographers had been grossly overworked. Direct facilities to general practitioners had to be withdrawn. At Southampton a course in radiography was given, and it was understood that for the first time in history not a single suitable candidate had come forward. The position was likely to deteriorate. Dr. K. C. BAILEY (West Somerset) pleaded for consideration to be given to part-time radiographers who travelled considerable distances to the hospital.

Mr. HOLMES SELLORS agreed with what had been said. Parents who were considering entering their daughters for a career were often advised that there was a genetic risk attached to radiography. The profession, and particularly general practitioners, could help a great deal by stressing the precautions which were taken to minimize the risks. Dr. R. B. L. RIDGE (Enfield and Potters Bar) suggested as a short-term measure to ease the situation in radiological departments—particularly in view of what Mr. Dickson Wright had told the meeting about the spate of requests for x-rays from junior hospital staffs—the curtailment of facilities available to junior staffs and a maintenance of the facilities available to general practitioners.

The motion was carried.

Internal Administration of Hospitals and S.H.M.O.s (Resumed Debate)

The CHAIRMAN referred to the amendment by Liverpool which was considered the previous day, and which was now before the Meeting in the form of a substantive motion. He reminded representatives that on the previous day there was much discussion on how the matter would be dealt with. Perhaps the simplest approach would be for Dr. Wand to make a statement, for Liverpool to speak to the motion, and then for the Meeting to discuss it. (Agreed.)

Dr. WAND apologized again for his absence during the beginning of the debate on the Liverpool amendment on the previous day, but he had no apology to make for the arguments he had used—not even after rereading the motion. In fact, the motion as amended, though it made specific reference to paragraphs 71 and 77 of the Annual Report, was really hanging on to those paragraphs a declaration of major importance concerning the conduct of Association policy as determined by the Representative Body, and the way in which Council was empowered to take action. If he had been allowed to complete one sentence in the previous day's debate it might have made things easier. He suggested that the motion could, quite properly, read that the Council "when it has received resolutions from the Representative Body deciding the policy of the Association, if it receives contrary advice from any of the committees to which the resolution has been referred for comment should seek a reversal of such policy by constitutional means." The remainder of the motion could be forgotten.

At the conclusion of the debate he asked the Meeting certain questions. He was interrupted. He had asked those questions because it was important that as Chairman of Council he should know what was the intention of the Meeting in relation to the motion if passed, and how far Council would find itself hamstrung by the terms of that motion. In his view those were proper questions to ask. Council regarded itself as bound completely by motions passed by the A.R.M., except that circumstances could change which might make it necessary for Council to look

at modifications. Indeed, he recalled occasions on which the Representative Body had passed motions which were impossible to carry out.

The two themes of the present Meeting were, first, unity and harmony, and, secondly, that the Council should take more responsibility in regard to the Association and the resolutions of the Representative Body. He had worked hard recently to achieve harmony, but one resolution adopted by the Meeting had made his job much more difficult. The motion now before the Meeting referred to all committees, but mainly concerned the autonomous bodies which the Representative Body had set up and to which it gave certain powers, and was also aimed at the powers of the Council. It meant that the Council could deviate from a policy given to it only by using the constitutional means at its disposal, even in an emergency. What were those constitutional means? They were to wait for the next Representative Meeting, to call a special Representative Meeting, or to go through the machinery of a referendum. The terms of the motion which the Meeting was being asked to pass were out of all proportion to its purpose. He had given his word that the Council regarded the wishes of the Representative Body as sacrosanct, unless circumstances arose which could not have been foreseen. So far as the autonomous bodies were concerned, it was well known that a committee had been set up by the Council to look into the very matter which was in question. He appealed to the Meeting not to do something which would further embarrass the Council. After all, the Representative Body elected the Council, and the Council had to report to it at the end of each year. It was not reasonable to expect a body of responsible people in a constantly changing field always to be bound by a policy which might become out of date for some reason which could not be anticipated. Liverpool was indignant because something which it wanted done had not been done. That indignation was justified, but should not be used to create a situation which might embarrass the Council in every field in which it worked. Dr. Wand asked the Meeting to agree to refer back the two paragraphs in the Report of Council to which exception was taken, but to leave the Council free to interpret the wishes of the Representative Body. Through the special Committee which had been set up it would be possible to look at the position of the autonomous bodies and create co-ordinating machinery in all fields. The reference back would mean that this would be one of the matters considered by the special committee.

Dr. V. COTTON-CORNWALL (Liverpool) expressed full agreement with what he called the gist of Dr. Wand's remarks, but emphasized that the motion was not an attack on an autonomous body. Its origin was a criticism of the words used by the Council in the paragraphs of the Annual Report of which complaint was made. The Representative Body on two occasions had disagreed with equal tripartite administration in hospitals. The Council did not give effect to its wishes, and the Representative Body reiterated its opinion that no body other than medical should decide how patients in a hospital should be treated. The Council in its present Report had not shown clearly that it supported the policy decided on by the A.R.M. last year. If the constitution was unworkable it should be amended. He was not prepared to withdraw his motion, because there might be a danger in future of such action being interpreted as a surrender of the Representative Body's powers under the present constitution. If a state of emergency arose which required the Council to take certain action, it would not be blamed for doing so if it came before the Representative Body and justified what it had done. There was always the Nelsonic method of the blind eye, which the Council had adopted on previous occasions. If the Council referred something to an autonomous body which expressed a certain view, the Council was not justified in putting that view in its Report as the view of the Association if it was contrary to a decision of the Representative Body. The Council should abide by the Constitution or justify its action in not doing so.

Dr. A. SMITH (Lanarkshire) supported what Dr. Wand had said and contended that to pass the motion would be to hamstring the Council. (Cries of dissent.) Dr. Wand was facing the most difficult problem that had ever confronted him in striving for unity and harmony, and the Meeting should not make it impossible for the Council to act and for the autonomous bodies to express an opinion. What was essential was to set up a new kind of organization which would allow the Association to co-ordinate the activities of the various bodies so that there should not be disunity. Dr. K. C. BAILEY (West Somerset), while expressing sympathy with Dr. Wand and the Council, said that after waiting two years for the Council to implement the decision taken in 1955 the Representative Body could not be accused of impatience if it complained that nothing had been done. All that the Council had done was to evade the issue. Dr. A. V. RUSSELL (Council) emphasized that the Representative Body was right to be jealous of its powers and privileges as the only policy-forming body of the Association, but said that the Council might in changing circumstances be forced to take or refrain from taking certain action in opposition to what it had been told to do, and in that event must come before the Representative Meeting and justify what it had done. The right thing to do was to refer back the offending paragraphs and leave the matter there. Dr. C. P. WALLACE (Guildford) supported Dr. Russell's suggestion and emphasized the undesirability of sticking too closely to the letter of the law. The offending phrase in the Report was that the Council saw no reason to disturb the arrangements, after the Representative Body had given its reasons for wishing to do so. The Council had not given an adequate explanation of the difficulties of implementing the decision of the Representative Body, and the paragraphs should be referred back.

Dr. COTTON-CORNWALL, in view of all that had been said, said he was prepared to accept the proposal that paras. 71 and 77 of the Annual Report should be referred back to Council for further consideration.

The reference back to Council was accepted with applause.

Amendments to paragraph 77 of the Annual Report by Reading and Southampton were, with the leave of the Meeting, withdrawn.

Dr. J. B. S. MORGAN (Derby, with West Derbyshire) moved the following motion, which was carried without debate:

That this Meeting notes with approval the expressed opinion of the Central Consultants and Specialists Committee (*Supplement*, April 13, p. 207) that S.H.M.O.s be paid a salary of 80% of that for consultants throughout the scale, and requires the Council to take all possible steps to bring this into effect.

Distinction Awards

Mr. T. HOLMES SELLORS moved approval of para. 78 of the Annual Report of Council, dealing with distinction awards.

Dr. T. D. CULBERT (Manchester) moved as an amendment: That, apart from very exceptional cases, no further merit awards should be made, but that instead there should be substituted a system of responsibility payments.

Dr. CULBERT, in moving the amendment, asked how general practitioners would like a system of merit awards for general practice? Consultants and specialists did not like the system, but the Council stated in para. 78 of their Report that it did not "consider it desirable to take any action which would result in the abolition of distinction awards." Manchester proposed only that no further awards be made save in very exceptional cases. The money could be better be used to help registrars and consultants who in a group of hospitals were in charge of a particular specialty, such as the anaesthetic services in a group, and clinicians and medical superintendents who had extra responsibilities.

Mr. A. W. B. STRAHAN (Furness) opposing the amendment, said it would not be right for a man who did a good clinical job to get nothing for it while someone doing what was merely an office job received extra pay. To base the awards on responsibility rather than merit would be wrong. Mr.

H. H. LANGSTON (Winchester) said that from the time the Spens Evidence Committee met before the N.H.S. began and put evidence before the Spens Committee it had been recognized that the remuneration of consultants could not depend on seniority alone, and that the system must recognize outstanding work and provide some incentive. It was not true to say that the general practitioner had no merit award, because he could increase his list, but the consultant had a fixed number of sessions allotted to him. Consultants had never been happy about the merit award system, but Lord Moran, the Chairman of the Merit Award Committee, had discussed the matter frankly with the C.C. and S. Committee, and it had been made apparent that no consultant received a merit award on the recommendation of one individual, but that his colleagues, his specialist association (if any), and the teaching hospital or university were consulted. After the explanations given to it, the C.C. and S. Committee passed a resolution to the effect that it was not desirable that the system of distinction awards should be abolished. The Manchester representatives had been present at that meeting, but Mr. Langston had not seen one hand raised against that resolution. The A.R.M. should not reverse a decision recently taken by the C.C. and S. Committee.

Dr. A. SMITH (Lanarkshire) said that as a result of the explanations given them the Consultants and Specialists Committee for Scotland had been favourably impressed by the great care taken in making these awards and by the fact that Scotland got its fair share. Payment for responsibility had often been advocated, but there was much to be said against it; it could go to the type of person who liked a hierarchical system and who wanted responsibility without the need to do a great deal of clinical work. The desire to acquire power was always present when payment was linked with responsibility. The same difficulties would arise in determining responsibility as in determining merit, and merit terminating responsibility as in determining merit. Mr. J. R. NICHOLSON-LAILEY (Council) pointed out that the Association was engaged in a dispute on remuneration with the Government, and part of its argument was that the profession had gone into the service on Spens and wanted Spens upheld. These awards were part of Spens. If it was suggested that money was not wanted for these awards the Government would simply cut it out; it was most unlikely that the Government would agree to its being used for any other purpose. There had been great difficulty in the first place in getting the idea of merit awards accepted. This was a domestic matter affecting consultants and specialists, and the C.C. and S. Committee had reached a conclusion upon it and felt that where these awards were given they were deserved.

Dr. H. GLYN JONES (Bromley), while agreeing that the C.C. and S. Committee had recommended the continuance of the system, said that the consultants were dissatisfied with it, and also with the constitution of the C.C. and S. Committee, which did not reflect satisfactorily the opinions of consultants. It was impossible, he contended, to justify a system by which a committee met in secret, received evidence from no one knew whom, and then decided on the awards to be made. Dr. L. G. R. WAND (South Essex) maintained that the last A.R.M. had felt very strongly that there should be a system of responsibility payments instead of merit awards, and nothing had occurred since which would lead to a change of view.

Mr. HOLMES SELLORS said that no system could give complete satisfaction, but, although secrecy had its disadvantages, it saved a great deal of criticism and ill-feeling. It was necessary to consider the psychological effect on the profession of knowing that one man in a certain hospital had a merit award while another, perhaps his senior, had not. Dr. C. P. WALLACE (Guildford) maintained that secrecy in any realm was bad, and said that his Division was not at all happy about the methods by which the awards were made. He suggested that the amendment should be referred to the Council for consideration, and the Council could then tell the Minister that the time had come for adjustments to be made. He agreed that it was more important to recognize

merit than to recognize responsibility. Dr. CULBERT, in reply, said that justice might be done in the making of these awards, but nobody could know. Mr. A. LAWRENCE ABEL (Marylebone) urged that what was a domestic matter for consultants should be left to them.

The CHAIRMAN, pointing out that Minute 239 of the A.R.M., 1956, merely urged the Council to consider the desirability of abolishing the merit award scheme, ruled that the amendment would represent a change in policy and would require a two-thirds majority.

The amendment was lost.

The motion to approve para. 78 of the Annual Report of Council was adopted.

Dr. R. C. R. GETHEN (Guildford) moved:

That in any revision of the publicly administered medical services there should be no secrecy about any special payments made for merit or other grants.

This motion had been put up, he said, by the consultants of the Guildford Division, who had asked him as a general practitioner to move it. It referred to the future. After Lord Moran had addressed the C.C. and S. Committee, one regional committee had received only a statement that what had taken place was confidential and that its delegate could not pass on the information received. That was carrying secrecy too far. Mr. HOLMES SELLORS agreed that secrecy had many grave disadvantages, but maintained that the disadvantages of publicity were at least as serious. Originally they had wanted every merit award to be published, with the reasons for it, but they had quickly realized the implications of this; it would lead to consultants being regarded as in three categories, and do far more harm than the suspicion which must arise when secrecy was observed. Dr. C. P. WALLACE (Guildford) said there was no reason to be afraid of publicity. There were risks attaching to publicity, but the risks attaching to secrecy were infinitely greater. The possibilities of corruption were infinitely greater. To his astonishment Mr. Lawrence Abel stated that the matter was of a domestic nature. Why should he think that general practitioners were not deeply interested and concerned about the well-being of the specialists in this country?

Dr. J. C. KNOX (Tyneside) said that the consultants he was representing did not like the merit awards at all, and they felt that the worst aspect of them was that of secrecy. It was agreed that some consultants had a higher status and deserved a merit award, but if the merit awards were genuine there was no need for secrecy about them. At the same time it was not desirable that merit awards should go on for life. Dr. R. P. LISTON (Tunbridge Wells) said that he was convinced by the arguments which Mr. Holmes Sellors had put forward in regard to the necessity for secrecy, but there was one point which seemed to be of importance. It would have a great influence with him if he knew the names of the awarding committee. Dr. J. B. W. ROWE (Harrow) suggested that it might be possible to have what might be called partial secrecy—namely, that the C.C. and S. Committee should know who got the awards but their names should not be published in the press.

Mr. J. R. NICHOLSON-LAILEY (Council) said that the committee which decided the awards had a difficult enough task as it was, and if their names were made public that task would be made more difficult still. With regard to Dr. Rowe's suggestion, if names were made known even to a committee such as the C.C. and S. Committee, it would not be long before they were known everywhere. It would be better to leave the matter in dignified silence. Dr. GETHEN, in reply, said that there had been no really valid objection to the non-continuation of secrecy, and he asked for support in seeing that in due course it vanished.

The motion by Guildford was carried as a reference to Council.

Remuneration of Hospital Medical Staff

Dr. R. A. BLAIR (Manchester) moved:

That this Meeting considers that, taking into account the board-and-lodging charges, the 5% award to senior hospital staff.

This was agreed.

Board Decision

Details of the firm stand taken by the medical profession in Edinburgh against a recent Regional Hospital Board decision were given by Dr. ELIZABETH BAXENDINE (Edinburgh). Expressing concern about board decisions upon closing or changing the use of hospitals without making it apparent that they were prepared to give due weight to the views of the profession and of the local community, she revealed that her local Board had proposed to effect a certain change in two staff vacancies which had occurred at a women's hospital in Edinburgh. This had caused much local indignation. On four occasions questions had been asked in the House of Commons and the matter had been the subject of an adjournment debate; a spontaneous petition instigated by patients had borne some 28,000 signatures collected in little over three weeks; there had been a protest meeting attended by over 2,000. The Board of Management of the hospital concerned had appealed to the Secretary of State against the decision, its action having been officially supported by organizations representing over 200,000 women in Scotland. Professional support had been given by the Local Medical and Consultants and Specialists Committees as well as the Scottish Committee (now the Scottish Council) of the Association. Despite that, the Secretary of State, having delegated his powers to Regional Boards, had refused to intervene, after which 10 women resident in Edinburgh had instituted legal action against the Board in an endeavour to obtain an injunction restraining the Board from putting its decision into effect, and the case—brought under Section 6(4) of the National Health Service (Scotland) Act on the interpretation of the

Dr. Shearer also moved, on behalf of the same Division, that there should be a standard charge for all patients above school age when in hospital, towards the cost of their food.

Dr. W. B. ADAM (Tunbridge Wells) said it was absolutely imperative that every consultant should spend some time in general practice. It might, of course, have the unexpected effect that some of them might remain there, thus reducing the problem of redundant hospital officers. Mr. J. R. NICHOLSON-LAILEY said that anything which fostered a

Dr. JOAN CHAPPELL (North Middlesex), speaking to the Worcester and Bromsgrove motion, said that some old folk who lived alone were left to die alone. She thought that

better understanding between consultants and general practitioners was all to the good. In the old days aspiring consultants had often been driven by economic necessity into general practice for a while before they secured their consultants' jobs, and had benefited accordingly. He understood that Birmingham was not the only place where the scheme that Mr. Carson had mentioned was in operation. It was an excellent idea which had proved highly successful and he believed that before long it would be universally adopted. If aspiring consultants took the opportunity of doing general practice of some sort it could do nothing but good. Dr. BROWN said in reply that what he wanted was to see the registrar and the senior house officer placed completely on their own responsibility in general practice without all the help available in hospitals, learning what it was like to do the job on the spot.

The motion was carried.

Constitution of Joint Consultants Committee

Dr. D. H. ANDERSON (Sheffield) moved that the representatives appointed by the Central Consultants and Specialists Committee to the Joint Consultants Committee should always include one whole-time consultant, one consultant from a provincial non-teaching hospital, and one S.H.M.O. Although the motion had been defeated last year he thought the question should be examined again. Sheffield hoped that the Representative Body would recognize the justice of the claim that groups which had special problems and which together constituted a majority of the consultants and specialists should have direct representation in any future negotiations. The motion which had been carried in respect of the Staff Side of Whitley Committee B negotiations was a partial solution, but his own motion provided for the decision to be implemented at all stages in the negotiations. He would be prepared to have the matter treated as a reference to Council. Mr. J. R. NICHOLSON-LAILEY said that he would be prepared to accept it. The Whitley B resolution referred to was the important one because it was in the Whitley Committee that the terms and conditions of service for any section of the hospital and consultant services were discussed. Representatives could be assured that the legitimate interests of all sections of the hospital and consultant staffs would be properly looked after.

The motion was carried as a reference to Council.

"FAMILY DOCTOR"

Dr. O. C. CARTER, Chairman of the Family Doctor Committee, moved on behalf of the Council that the Annual Report of Council under "Family Doctor" be received and approved. In spite of many problems, 1956 had been a successful year for *Family Doctor* from many points of view. It had always been the policy of the Family Doctor Committee to bring it before an increasing public, and efforts had been made to improve and develop the magazine and its subsidiary activities in every possible way, while ensuring that the enterprise was conducted at no cost to the Association, and even with a modest surplus. The number of pages and their size had been increased. Many of the issues had been sold out. Early in 1956 the whole of a special issue of 150,000 copies under the title "Getting Married" had been sold in a few weeks. Very few were left of a second edition of 250,000. Up to last year over half a million copies of *Family Doctor* pamphlets had been sold, and this year the sale was 100,000 a month through retail chemists. Another publication, *You and Your Baby*, was available for general practitioners and had been re-edited at the request of many medical officers of health for distribution in clinics. One problem common to all magazines was that advertisement revenue had suffered very much from I.T.V. competition. *Family Doctor* and its associated publications were the product of team-work of the highest order between the editor, Dr. H. Flack, and the general manager, Mr. B. Edsall, and the whole credit for the success achieved should go to them. (Applause.)

The CHAIRMAN, there being no discussion, said he was sure the Meeting would desire to congratulate Dr. Carter on a successful year, due in no small measure to his work as Chairman of the Family Doctor Committee. (Applause.) The motion was carried.

COMPENSATION AND SUPERANNUATION

Dr. A. N. MATHIAS, Chairman of the Compensation and Superannuation Committee, presented the Annual and Supplementary Reports of Council under "Compensation and Superannuation" and moved that they be received. The most important item which the Council had considered under this heading during the past year, he said, was the claim for payment of compensation. Now that the Representative Body had decided that evidence should be given to the Royal Commission the Council considered that there was no reason to defer the compensation claim any longer, and but for the illness of the Minister he would have already been asked to receive a deputation. The Council had reviewed the superannuation schemes with special reference to increased benefits at an earlier retirement age. Many practitioners who had opted out of the scheme at its inception by reason of existing insurance commitments now wanted to come into it. The matter had been taken up with the Ministry, who pointed out that in all insurance matters the decision made by an optant was final and could not be changed some years later, for actuarial reasons. Arrangements had been made with the Ministry whereby all practitioners would be reminded by executive councils at, say, the age of 64½ that they should apply for an extension of pensionable age if they wished to continue to contribute until the age of 70. The Council was satisfied that the position with regard to widows' pensions was satisfactory and that no hardship was being suffered by the small number concerned. A deputation from the Council had been to the Treasury on the question of superannuation on sessional fees for Government departments other than the Ministry of Health, but as the idea was completely foreign to superannuation practice in Government departments other than the Ministry of Health, and would require legislation, the request could not be entertained. The question was not now so pressing, because practitioners with income from sessional appointments in Government schemes could take advantage of the personal pension schemes available under the Act of 1956. Estate duty on widows' pensions, which was referred to in para. 67 of the Report, was not likely to affect many doctors whose income came only from their profession, but in individual cases the office could give advice. Dr. Mathias thanked Dr. L. S. Potter for his invaluable help during the year.

Compensation

Dr. J. B. W. ROWE (Harrow) moved:

That if negotiations for payment of compensation in a lump sum fail, the Government be pressed to pay off all practice compensation due by allowing remission of all tax on income until the total compensation has been paid.

It might be, he said, that what was suggested was impracticable or might need an Act of Parliament, but something should be done. Dr. D. L. GULLICK (East Herts) said that this matter had caused serious irritation. Medical men had gone into the Service not realizing how quickly the pound would slide down the inflationary slope. He would support any means of overcoming the difficulty. One method of dealing with it might be for doctors to have £500 of the compensation due to them credited to them in the form of Premium Bonds. Dr. G. CORMACK (Newcastle upon Tyne) said that in his view the amendment would cause all kinds of difficulties. There was no doubt that the profession had been the victims of a swindle, and they should press for immediate payment adjusted to take into account the fall in the value of money. Dr. MATHIAS said he would be glad, with permission of the Meeting, to accept the motion as a reference to Council.

The motion was carried as a reference to Council.

Earlier Pensions

Dr. A. N. MATHIAS moved that para. 61 of the Annual Report of Council be approved. Dr. T. W. DAVIES (Swansea) moved that a proposal made at the last Annual Representative Meeting to the effect that full pension benefits should be available to practitioners who wished to retire after 20 years' service, even if they had not reached the age of 60 years, be referred back to Council for further consideration. In para. 61 of the Annual Report an explanation was given why it was felt that Council should not press to have the proposition implemented. He had been informed by a bank and an insurance company in Swansea that it would be actuarially possible. Dr. MATHIAS said that para. 61 set out what would happen if the ideas propounded by Swansea were brought into force. A valuation of the National Health Service superannuation scheme was started in 1955, and it was hoped that the Government actuary's report would be available this autumn. If there was anything in that valuation which led the Committee to suppose that a better bargain could be gained for doctors, he assured representatives that the Committee would go straight ahead.

The amendment was lost.

An amendment by Harrogate that pension benefit should be available to practitioners at any time after ten years' service, the pension being proportionate to the amount contributed, was, by leave, withdrawn.

Dr. A. N. MATHIAS moved that the remainder of the Annual and Supplementary Reports of Council under "Compensation and Superannuation" be approved.

A motion formally moved by Dr. J. C. ARTHUR (Gateshead) that further efforts be made to secure to doctors payment of that part of their compensation to which they could be shown to be entitled on taking another doctor into partnership was carried. Mr. A. LAWRENCE ABEL (Marylebone) moved that the present pension arrangements for consultants should be re-examined. He said he desired the matter to be kept under review.

The motion was accepted as a reference to Council.

PRIVATE PRACTICE

Dr. ALEXANDER BROWN, Chairman of the Private Practice Committee, presented the annual and supplementary reports of Council under "Private Practice." He said that the year had been very largely occupied in dealing with fees, large and small, and on the whole with success, except in those cases when Government departments applied to private practitioners for information about patients. The Committee had only been able to get an increase from 5s. to 7s. 6d., which it accepted without prejudice. The implementation of the scale of fees for doctors called in by the Division was a matter for negotiation between B.M.A. Divisions and local police authorities, but they had been encouraged by the number of local police authorities who accepted the scale. The Committee had been successful in dealing with the position of civilian medical practitioners in charge of R.A.F. camps. The Ministry of Transport was still not convinced that doctors had any special car parking problems, and Dr. Brown asked doctors to let the Committee know of difficulties, which they could take up with the Ministry of Transport. The Representative Body had asked the Committee to set out in booklet form a list of fees negotiated by the B.M.A. The Committee had come to the conclusion that it would not be worth while. The fees were constantly changing. When they changed they were published in the *Handbook* and the *Supplement*, and information could be obtained from Headquarters. A booklet would be out of date, and a needless expense to the Association.

Dr. R. HALE-WHITE (Marylebone) moved an amendment calling on the Government to put an end at an early date to the breach of faith whereby drugs were withheld from private patients. This was already the policy of the Association, he said, but it would be noticed that Marylebone

was appealing on behalf of patients—a very small minority of patients in this country. They wanted the Government to know that there was this small minority, and they asked the Meeting to vote solidly for the amendment. Dr. A. U. MACKINNON (Leeds) described the Government's action as a disgusting exhibition. It was a point of elementary justice. Dr. J. W. WIGG (St. Pancras) said that there was a great deal of danger in pressing this at the moment when the size of the central pool was likely to be reconsidered. It should be sought after the Royal Commission had reported.

Dr. A. B. DAVIES, Chairman of the General Medical Services Committee, said that the Council a few months ago decided that the invitation of the Minister to meet officers of the Ministry in exploratory talks should be accepted. The Association's deputation, which had a bias in favour of private practice, went to the Ministry and had talks on an exploratory basis. While no definite conclusions were reached, the meeting was most useful. Difficulties which they had not been aware of became apparent. They were doing the best they could with this problem. Dr. BROWN, who had been a member of the deputation, said the meeting with the Ministry officials had been most instructive. They found difficulties, and they were awaiting a document which the Ministry had promised.

The amendment was agreed to.

Medical Examination of Elderly Drivers

Dr. J. HODGE (Lancaster) moved that the question of the medical examination of elderly drivers should be reopened, and that the Council be instructed to reopen with the Accident Offices Association the Association's request that the fee for such medical examinations when carried out by an independent doctor should be similar to that payable for an examination for life insurance, and that it should be payable by the insurance company.

It was wrong that a doctor should be asked to certify as to the fitness of one of his own patients to drive. The matter was one of great importance to the driver himself, for it might involve his livelihood, and it might mean depriving the elderly driver of one of his remaining pleasures in life.

Dr. J. SHACKLETON BAILEY (East Suffolk) said that with an examination for life assurance the most that could go wrong was that the insurance company might find themselves a little more out of pocket than they had expected, but in the case of a private examination for fitness to drive the safety of the public had to be considered. Fees for such an examination should be comparable with those for ordinary insurance examinations. Dr. F. M. ROSE (Council) thought that it was the duty of the patient's own doctor to issue such certificates. The question of fitness would depend largely on the history of the patient, and who would be in a better position to know about that than his own doctor? Dr. W. B. ADAM (Tunbridge Wells) thought that the medical profession was being seriously put upon in the matter. The simple thing to do was to refuse to give medical certificates at all until the insurance companies asked people to produce a certificate of fitness to drive a motor-car. Dr. J. S. HAPPEL (Winchester) said that the insurance company could perhaps insist that the patient should go to their own doctor and he would still have to pay the fee.

Dr. BROWN said that the Association had been twice to the Accident Offices Association. They had made it clear that all that they were concerned with was the production of a certificate to cover them when issuing insurance to a person over 70. On the second occasion the Association's representatives had been more or less told that they should run the medical profession and leave the Accident Office to run the business of insurance. He did not think much would be achieved by going to them again. The only suggestion that they had had to make had been that as the Government had decided that such certificates were necessary for elderly drivers, the Government should take on the

SIR,—I should like to comment on one point in the letter from Drs. S. Ginsborg and M. B. Clyne (*Supplement*, July 6, p. 6), and that is about the taking over by general practitioners of public health antenatal clinics, which they recommend. As a resident in a maternity hospital outside Glasgow, many of our patients come from these antenatal clinics and a smaller proportion from their general practitioners. Obviously general practitioners vary, but in general the information accompanying a patient from the antenatal clinic is more complete. Surely it is this completeness of the antenatal care which is needed, otherwise part of the object of a specialized hospital is defeated. Of obstetric emergencies, for example, haemorrhage can be one of the most rapidly disastrous, and valuable time can be saved if the patient's blood group is known. The antenatal clinic invariably has this carried out, but not so commonly the general practitioner; and, in this area at least, blood grouping facilities are freely available to all practitioners. Possibly the answer is that the practitioners require more time per patient, which may involve the remuneration problem, but at present I would rather see the public health clinics continue their work.—I am, etc.,

D. STIRLING EDDIE.

Glasgow.

Association Notices

MIDDLEMORE PRIZE, 1958

The Middlemore Prize, which consists of a cheque for £50 and a certificate, was founded in 1880 by the late Richard Middlemore, F.R.C.S., of Birmingham, to be awarded for the best essay or work on any subject which the Council of the British Medical Association may from time to time select in any department of ophthalmic medicine or surgery. The Council of the British Medical Association is prepared to consider an award of the prize in the year 1958 to the author of the best essay on "Local Antibiotic Treatment in External Ocular Disease."

Notice of intention to enter for the competition should be made on the appropriate entry form, copies of which can be obtained from the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1. Essays must reach the Secretary on or before January 31, 1958. Each essay must be unsigned and accompanied by a slip containing the name and address of the author. Previous prizewinners are not precluded from entering. If no essay of sufficient merit is submitted, the prize will not be awarded in 1958, but will be offered again in the following year.

THE NATHANIEL BISHOP HARMAN PRIZE, 1958,
FOR RESEARCH IN HOSPITAL PRACTICE

The Council of the British Medical Association is prepared to consider the award of the Nathaniel Bishop Harman Prize in the year 1958. The value of the prize is approximately £100. The purpose of the prize is the promotion of systematic observation and research by consultant and specialist staff and senior registrars of hospitals not attached to recognized medical schools. It will be awarded for the best report on original clinical research in a form suitable for publication. The work submitted must include personal observations and experiences collected by the candidate in the course of his practice. A high order of excellence will be required. No report or study that has previously been published in the medical press or elsewhere will be considered eligible for the prize. Any registered medical practitioner on the staff of a hospital in Great Britain and Northern Ireland who is not a member of the staff of a recognized undergraduate or postgraduate medical school is eligible to compete. If any question arises in reference to the eligibility of a candidate or the admissibility of his entry, the decision of the Council shall be final.

Should the Council of the Association decide that no entry submitted is of sufficient merit, the prize will not be awarded in 1958, but will be offered again the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. Each entry, which must be typewritten or printed in the English language, should be unsigned, but accompanied by a note bearing the name of the writer. It is suggested that reports should be between 3,000 and 10,000 words. Candidates are required to complete an entry form, a copy of which can be obtained from the Secretary. Reports and entry forms must reach the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1958. Inquiries relative to the prize should be addressed to the Secretary.

A. MACRAE,
Secretary.

Diary of Central Meetings

JULY

- 22 Mon. Staff Side, General Whitley Council (at 14, Russell Square, W.C.), 11 a.m.
- 22 Mon. Full General Whitley Council (at 14, Russell Square, W.C.), 2.30 p.m.
- 24 Wed. Non-professional Group Committee, 2 p.m.
- 25 Thurs. Central Consultants and Specialists Committee, 10.30 a.m.
- 25 Thurs. Ingleby Evidence Committee, 11.30 a.m.
- 25 Thurs. Joint Committee of B.M.A. and Magistrates' Association, 2 p.m.

- 26 Fri. Staff Side, Committee C, Medical Whitley Council (at 14, Russell Square, W.C.), 10 a.m.
- 26 Fri. Full Committee C, Medical Whitley Council (at 14, Russell Square, W.C.), 11.30 a.m.
- 26 Fri. Joint Committee of the B.M.A. and Royal College of Nursing, 2 p.m.
- 26 Fri. Medico-Legal Subcommittee, Central Consultants and Specialists Committee, 2.30 p.m.
- 27 Sat. Venereologists Group Committee, 10 a.m.
- 29 Mon. Industrial Nursing Subcommittee, Occupational Health Committee, 2.30 p.m.
- 30 Tues. Staff Side, Committee B, Medical Whitley Council, 10.30 a.m.
- 30 Tues. Full Committee B, Medical Whitley Council (at 14, Russell Square, London, W.C.), 2 p.m.
- 31 Wed. Royal Commission Evidence Subcommittee, G.M.S. Committee, 2 p.m.

Meetings of Branches and Divisions

BRISTOL DIVISION.—Saturday, July 27, 2.30 p.m., visit to Department of Veterinary Surgery, Langford House, Langford, Somerset. B.M.A. members may each take one guest.

DORSET DIVISION.—Digby Hotel, Sherborne, Wednesday, July 24, 7.30 for 8.15 p.m., annual dinner. Ladies invited.

EASTBOURNE DIVISION.—At George Hotel, Hailsham, Tuesday, July 23, 7.15 for 7.45 p.m., dinner; 8.45 p.m., meeting.

SOUTHAMPTON DIVISION.—At Royal South Hants Hospital, Tuesday, July 23, 8.30 p.m., special general meeting.

WOOLWICH DIVISION.—At Eltham Cottage Hospital, Tuesday, July 23, 8.30 p.m., annual general meeting.

Meetings of Branches and Divisions

CITY OF ABERDEEN DIVISION

The following officers have been elected for 1957-8:

Chairman.—Dr. A. W. Forrest.
Vice-chairman.—Dr. J. S. Finnie.
Honorary Secretary and Treasurer.—Dr. W. H. Galloway.

DORSET DIVISION

A general meeting was held on May 3 in the Chest Clinic, Dorchester. Dr. T. V. Cooper was in the chair and 13 members were present.

INVERNESS-SHIRE DIVISION

At the annual meeting the following officers were elected:

Chairman.—Dr. A. J. Sangster.
Vice-chairman.—Dr. W. D. Wilson.
Joint Secretaries and Treasurers.—Dr. W. E. Smith and Dr. Mary H. MacArthur.

NOTTINGHAMSHIRE BRANCH

The following officers for 1957-8 were elected at the annual general meeting:

President.—Dr. R. K. Minto.
President-elect.—Dr. G. M. Woddis.
Immediate Past President.—Dr. Elspeth Warwick.
Joint Honorary Secretaries and Treasurers.—Mr. J. P. Jackson and Dr. R. E. Frears.

OLDHAM DIVISION

At the annual general meeting on May 27 the following officers were appointed:

Chairman.—Dr. M. Strang.
Vice-chairman.—Dr. A. McArthur.
Secretary and Treasurer.—Dr. C. H. Strachan.

SOUTH-EAST ESSEX DIVISION

The following officers were elected at the annual general meeting:

Chairman.—Dr. S. Cieman.
Vice-chairman.—Dr. A. E. Austen.
Chairman-elect.—Dr. J. Stevenson Logan.
Joint Honorary Secretaries.—Dr. G. T. Foster-Smith and Dr. J. A. Clappen.
Honorary Treasurer.—Dr. G. T. Foster-Smith.

SOUTH-WEST ESSEX DIVISION

At the annual general meeting on May 29 the following officers were elected:

Chairman.—Dr. M. Cohen.
Vice-chairman.—Dr. S. G. Alavoine.
Secretary and Treasurer.—Mr. A. N. Jones.

WIGAN DIVISION

At the annual general meeting held on May 30 the following officers were elected for 1957-8:

Chairman.—Dr. J. S. Mather.
Vice-chairman.—Dr. J. E. T. Shirlaw.
Honorary Secretary.—Dr. F. G. Ince.

British Medical Association

ANNUAL REPRESENTATIVE MEETING, NEWCASTLE UPON TYNE, 1957*
FIFTH DAY (continued)

Monday, July 15

OTHER MOTIONS BY DIVISIONS AND
BRANCHES (continued)

Report on Cruelty to Children

Dr. J. A. PRIDHAM (Dorset) moved:

That the Representative Body is of the opinion that the recommendations in Sections 130 and 131 of the Joint Committee of the British Medical Association and the Magistrates' Association on "Cruelty to and Neglect of Children" should be deleted from B.M.A. policy.

The matter, he explained, was of considerable importance to public health doctors, who had moved the motion at the Dorset Division meeting. They took exception to the paragraph which stated:

"It is therefore recommended that the provisions of the Children Act should be extended to empower the children's department of the local authority expressly to incur expenditure on preventive work, and encouragement should be offered to them to use this power."

The report had been circulated by the B.M.A. to local authorities, and in some cases the medical officer of health had objected to it in that it recommended granting the children's officer powers in the field of prevention. Already the lot of the medical officer of health was more difficult since the introduction of the Children Act, and the position was all the more deplorable in the light of the report of the Working Party on Health Visitors. Under the B.M.A. recommendation a good many of the responsibilities of the medical officer's department would be transferred to another department which was staffed by lay people. In some areas the health and children's departments worked together, but in others the co-operation was not so close. Dr. A. BARKER (Council) hoped the Meeting would support the motion. This was a matter which had been discussed at length by the B.M.A.'s Ingleby Evidence Committee, which was still sitting. The Committee took the view that such preventive work was best done through public health departments and that children's officers should in fact be under the control of the local health authority. If this Meeting should decide to delete these two paragraphs it

*The first part of this report appeared in last week's Supplement.

would strengthen the attitude which the Ingleby Evidence Committee proposed to take in this matter.

The CHAIRMAN pointed out that the Committee concerned was a Joint Committee of the B.M.A. and the Magistrates' Association and, although the Council had authorized the publication of its Report, what was in the Report was not B.M.A. policy but the policy of the Joint Committee, which was published by the Council for general information. The motion therefore required only a simple majority. It would not be possible to delete paragraphs from the Report.

Dr. C. P. WALLACE (Guildford) suggested the use of the words "should be reconsidered" instead of "should be deleted from B.M.A. policy." The CHAIRMAN of Council said the Report had been accepted by the Councils of the B.M.A. and of the Magistrates' Association, but had not been before the Representative Body and therefore strictly could not be regarded as B.M.A. policy, but only as something which had guided the Council. The motion asked the Council to be guided by a document which did not include the two paragraphs in question. It was only necessary to say, therefore, that those two paragraphs be not approved. Dr. J. R. BAKER (Scunthorpe), opposing the motion, said that a woman who had taken a social science diploma could not be regarded as a lay person in regard to the matters dealt with, and was probably as well qualified as was a health visitor to deal with them. The work of child-care officers was highly technical, and he thought that the policy of the Joint Committee was correct.

The Meeting agreed to the amendment of the motion by the deletion of the words "should be deleted from B.M.A. policy" and the insertion of "be not approved" in their place.

Dr. E. HUGHES (Reading), supporting the motion, said that an agreement had been reached between the health department and general practitioners, and the introduction of an independent department would be a complication in many areas. In his area there were specially trained social workers for doing this work, but they worked in his department and took the department's view regarding relations with general practitioners. Dr. J. B. TILLEY (Council), who also supported the motion, said that the Public Health Committee viewed with some anxiety the B.M.A.'s association with the paragraphs in question. No one questioned the value of the work of the children's officers, and the children's departments

throughout the country were doing this work better than it could be done by any other department of local government, but they had been established to deal with deprived children, while the family doctor, the district nurse, and the health visitor were concerned with ordinary homes, and it was not correct to say, as the Report did, that "Such preventive work as is undertaken is carried out by visiting officers." Many doctors took steps to prevent the children under their care being neglected. Preventive work in the home, where there might be difficulties due to health problems or low mentality of the parents, called for joint efforts by doctor, nurse, and social worker, and was best carried out by the health department.

Dr. F. A. BELAM (Guildford) referred to a case in which his health visitor feared that a child would be subject to ill-treatment and might even be in danger of being murdered that night. As it was after five o'clock, and impossible to get in touch with the children's department, he enlisted the help of the local representative of that department and of the N.S.P.C.C. inspector, and the child had been moved. The following day the head of the children's department complained that he had got into touch with one of her people without her authority. That was the attitude often adopted by the children's department. It was the health officer who knew about these cases. Dr. T. J. LEE (Wandsworth) expressed the opinion that the motion dealt with an interdepartmental squabble and that it would be better to refer it to the Council, which would take an independent view. The work of the children's officers was excellent. Those who investigated these cases must be highly qualified, and this was a legal as well as a professional matter. In his area the medical officer of health and the children's department worked together very well. Dr. PRIDHAM did not agree to the reference of the motion to Council, and it was accordingly put to the Meeting in the following amended form:

That the Representative Body is of the opinion that the recommendations in Sections 130 and 131 of the Joint Committee of the B.M.A. and the Magistrates' Association Report on "Cruelty to and Neglect of Children" should not be approved.

The motion, so amended, was carried.

DISTINGUISHED GUESTS

The CHAIRMAN referred to the presence of two distinguished visitors, Dr. H. Grant-Whyte, President-Elect of the South African Medical Association, and Dr. W. J. Royards, Past President of the Royal Netherlands Medical Association, and invited them to address the Meeting.

Dr. GRANT-WHYTE said he was deeply sensible of the honour of speaking from such an illustrious platform and was most grateful for the opportunity of listening to the deliberations of the Representative Body. As President-Elect of the South African Medical Association and President of the Congress to be held in Durban in September, he extended a hearty invitation to those who would go there and brought the warmest good wishes of his Association to the B.M.A. South Africa was remote from this country in distance but only 24 hours away in time, and the S.A.M.A., being charged, like the B.M.A., with the special interests of the profession and the general health and well-being of the nation, watched with close attention and interest all that affected the B.M.A. and the work which it was doing, and the experiment in socialized medicine in Britain. Many South African doctors had received their training in this country and looked to it for inspiration and hoped to benefit by the increasing knowledge and research available here. South Africa had its own problems of medical education and medical science in its multiracial society.

Dr. ROYARDS welcomed the opportunity to convey to the Meeting the greetings of his Dutch colleagues and thanked the Association for the opportunity to be present. The Royal Netherlands Association greatly valued its relationship with the British Medical Association. They had the same problems, though they did not always adopt the same answers to them.

PRIVATE PRACTICE

Remuneration of Medical Officers of Private and Public Schools

Dr. ALEXANDER BROWN, Chairman of the Private Practice Committee, moved the adoption of the following recommendation of Council:

That where practitioners are appointed to undertake special routine medical examinations of scholars at private or public boarding schools, and to advise the school authorities generally on matters of health and hygiene, the remuneration should not be less than £1 15s. per scholar per annum for duties outside the National Health Service.

The motion was carried.

The remainder of the Annual and Supplementary Reports of Council under "Private Practice" were approved.

Shortened Form of Insurance Examination

Dr. G. N. MACKENZIE (Dumfries and Galloway) moved that the shortened form of insurance examination be abolished. There were, he said, three forms: the long form, which attracted a fee of £2 2s.; the form which required no examination, which attracted a fee of £1 11s. 6d.; and what was called the shortened form, for a fee of 15s., which he considered an insult, because filling it in conscientiously required as much work as the long form. It should be abolished. Dr. E. C. DAWSON (Council) said that when the shortened form was first introduced it was thought that it would require less work, but the policy of the insurance companies had been altered, and they now accepted insurances without examination and obtained reports from their own doctors, so that doctors in private practice had to deal with shortened forms only when there was some history of previous disease. It had been said that what they lost on the roundabouts they would gain on the swings, but they were now gaining nothing on the swings but continuing to lose on the roundabouts. Complete abolition of the shortened form might be going too far, but the Council should look at the matter to see what could be done.

Dr. F. E. GOULD (Birmingham) said he would like to know more about the second form mentioned by the mover, which required no examination and attracted a fee of £1 11s. 6d. Dr. BROWN said he would be pleased to accept the motion, but pointed out that originally the shortened form had been put forward by the Association itself, and that the shortened form was for insurance policies for small amounts and the insurance companies said that they could not afford to pay a higher fee. The argument which had been used in negotiating with them was that it was the examination which took the time, not the filling in of the form.

The CHAIRMAN mentioned that as it involved an alteration of policy the motion would require a two-thirds majority. The motion was lost.

Dr. A. G. CHAMBERLAIN (Dorset) moved:

That this Meeting considers that the fee for a short examination for life assurance should be £1 1s.

For a report which merely involved looking up the records and making an abstract, he said, a fee of £1 1s. was paid, so that to pay only 15s. where clinical work was involved was an anomaly. Dr. A. REZLER (City) maintained that both the long and the short forms involved the same amount of work, and the fee should not depend on the amount of the policy. Many insurance companies already paid a fee of £1 1s. without demur. He suggested that doctors should decline to fill in the short form at the lower fee. Dr. R. HALE-WHITE (Marylebone) said it was a misapprehension to think that it was the smaller policy which involved a smaller fee. The smaller fee was for a shorter form used for a special type of small premium policy. He favoured the fee of £1 1s. Dr. BROWN preferred not to be tied to a specific fee; he might be offered 25s. or 20s.

Dr. CHAMBERLAIN, with the agreement of the Meeting, amended the motion to read:

That this Meeting considers that the fee for a short examination for life assurance should be increased.

The motion, so worded, was carried.

Fees for Certificates for Notifiable Diseases

Dr. L. F. KEENAN (Harrow) moved on behalf of Hendon:

That in the opinion of the Representative Body the fees payable for the notification of infectious diseases, vaccinations, and immunizations should be increased forthwith and that the Council be requested to take appropriate steps to secure this object at an early date.

(With this motion there was taken a motion by Harrow, "That negotiations be instituted to increase the present fees payable by local authorities for the notification of infectious diseases, vaccinations, and immunizations.")

The notification fee for scarlet fever, he said, had been fixed in 1879 and not altered since, while those for the notification of immunization had not been altered for the last nine years, and it was now proposed to pay the same fee for notification of immunization against poliomyelitis. The present fees were ludicrous. Dr. A. B. DAVIES (Council) pointed out that there was no fee payable to the insurance practitioner for vaccination and immunization; the fee was for the report, and, however desirable it might seem that such fees should be increased, it should be borne in mind that any such increase would be deducted from the central pool.

The CHAIRMAN OF COUNCIL—Dr. Davies's statement having been greeted with some expression of incredulity—affirmed that it was quite correct. When the supplementary annual payment to doctors was made, he said, a calculation was made of all moneys paid to practitioners in the N.H.S., the sums being added together and deducted from the sum which general practitioners in the aggregate received—what was called the global sum. The amount of the supplementary payment was related to what was left to be paid after those deductions had been made. As this matter affected also the Public Health Committee and the G.M.S. Committee, and as the Association was preparing evidence for the Royal Commission, it would be better to treat the motion as a reference to Council.

Dr. KEENAN agreed to the motion being a reference to Council, and, with the agreement of the Meeting, it was adopted as such.

Poisons List

Dr. J. P. SPARKS (Rugby with South Warwickshire) moved the inclusion of synthetic oestrogens in the Poisons List in Schedule 4. There was a danger, he said, that the prolonged administration of oestrogens could be carcinogenic.

Dr. S. NOY SCOTT (Council) expressed the hope that the Meeting would either reject the motion or refer it to Council. A year ago, he said, a small committee which had gone into the matter had found that there was some evidence of abuse, but insufficient to justify a recommendation that the synthetic oestrogens should be put on the special list. The pharmacists, however, had agreed to recommend that people asking for them over the counter should be referred to their doctor. Mr. A. LAWRENCE ABEL (Marylebone) supported the reference of the motion to Council. It seemed, he said, that there was some danger of long-continued use producing cancer of the breast.

The motion, with the consent of the mover and the Meeting, was carried as a reference to Council.

Dr. H. H. D. SUTHERLAND moved on behalf of both Kensington and Hammersmith and of the council of the Metropolitan Counties Branch:

That this Meeting is concerned at the difficulties of parking a car in present-day traffic conditions when a doctor is using a car in the course of his professional commitments, and, bearing in mind that additional problems will arise on the introduction of parking meters, instructs the Council to make urgent representations to the Ministry of Transport to assist doctors in their ever-increasing traffic problems.

Those who worked in crowded cities, Dr. Sutherland said, were lucky if they could find a parking place within half a mile from the place where they had to see a patient on an urgent call. Three services were enabled to stop—the

ambulance service, the fire service, and the police. He did not suggest that doctors should get all the privileges of those three services, but they did require some consideration. The average doctor was not known to the average policeman in London, whatever might be the position in provincial towns. He asked the Meeting to allow the matter to be put as a matter of urgency by the Council.

Dr. A. V. RUSSELL (Council) said that traffic restriction was becoming more and more of a restriction on doctors' activities. In Wolverhampton the Association had provided counsel to fight the case of the local doctors, but unfortunately lost it. At first the police authorities were considerate, but as time passed things were becoming more and more impossible.

Dr. BROWN said that if he was to go to the Ministry of Transport again he must be given concrete cases to quote.

Dr. SUTHERLAND handed him a list of such cases.

The motion was carried.

MEDICAL ETHICS

Dr. R. FORBES, chairman of the Central Ethical Committee, presented the Annual and Supplementary Reports of Council under "Medical Ethics." He remarked that the size of the report was no measure of the work that the Committee had done for all doctors during the past year. Many questions put to the secretariat on ethical issues were passed on to the Committee and they called for detailed answers. In addition general as well as specific advice was given. Professional secrecy continued to occupy the Committee's mind.

Not very long ago a survey carried out by Dr. E. C. Dawson into the views entertained by a variety of people on this subject was published in the *Journal* (1954, 2, 1474). The findings were a little surprising. There were arguments which had still to be met from inside as well as outside the profession which postulated that there might be grounds for modification of the rule of absolute secrecy. The Committee would consider this matter and report at the next Annual Representative Meeting. Last year the Meeting approved a report on indirect advertising. Since that decision there had been consequential questions. The Committee had also had contact with an increasing number of lay organizations which sought to establish restricted panels of specialists and proposed that they should make their services available at reduced fees. Agreement had been reached with certain of them on the wording of their literature. The Committee had also considered a document from the Royal College of Nursing on the duties and legal position of nurses. The nursing profession believed that nurses were not being used for their primary duty and were being encouraged to do duties of a technical nature. That might be true in some instances. The Committee had discussed this document with the Royal College of Nursing, which was proposing to send it to the Ministry and had sent it to hospitals. The Central Ethical Committee had some criticisms to make, and Dr. Forbes thought that they would get agreement with the College. It was quite impracticable to draw a kind of ring of demarcation around the nurse and say: "Thus far and no further." The relationship between hospital staff, general practitioners, and nurses must be that of a team. The Committee hoped to be in a position next year to make recommendations with regard to an amendment to Articles 10 and 11 of the Articles of Association, which dealt with the investigation of complaints by the Committee and the Association. As a result of a case which the Committee investigated some time ago, it became apparent that there was need to amend the articles so that the Council had a definite right to intervene in any case where it was proposed that a member should be expelled from the Association. Counsel's opinion had been obtained on the matter. The "Ethical Code Relating to Consultations and Cognate Matters," a set of rules originally prepared by a great personality in the Association, C. O. Hawthorne, had been brought up to date by the Committee.

Ethical Code Relating to Consultations and Cognate Matters

The revised "Ethical Code Relating to Consultations and Cognate Matters" (Appendix VIII to the Supplementary Report) was approved.

Dr. FORBES moved that the remainder of the report under "Medical Ethics" be approved.

Dr. C. P. WALLACE (Guildford) said that events had been moving rapidly and the Ethical Committee had been moving slowly. He asked the chairman of the Committee to what extent the question of television appearances by members of the medical profession had received renewed thought during the year. The whole picture of medical ethics had in fact been altered by such events as the publication by the Association of popular medical booklets by named authors on subjects such as "Slim Safely," "Having a Baby," "How your Life Began," and "The Facts of Life"—excellent examples of infringement of the rule of ethics, but there was not one member of the Representative Body who would not welcome such efforts to bring popular medicine to the public. Some of the television appearances during the year would also be warmly approved of, particularly the occasion on which Sir Russell Brain, Dr. Wand, and other distinguished members of the profession had taken part in a programme the value of which was fully realized but which none the less constituted a breach of the principle of anonymity. He asked for an assurance that the Committee would consider the changes necessary in view of altered conditions.

Dr. FORBES said that the Committee would carry out its duties to which the Representative Body had committed it in the way that it thought proper. He reminded Representatives that the policy on anonymity which the Committee had pursued had been that laid down by the A.R.M. last year. It would surely have been folly for the Ethical Committee, immediately after the Representative Body's approval of such policy, to have applied itself to a modification of it forthwith, which was what appeared to have been suggested by Dr. Wallace.

The motion was carried.

Members of Profession and Evidence in Courts of Law

Dr. C. GROVES (East Yorkshire) moved that the Meeting should deprecate the increasing tendency for members of the profession to appear in courts of law and give evidence prejudicial to the competence and prestige of other medical practitioners when that evidence was a matter of opinion not based on personal knowledge of the case. He said that the whole question of medical evidence was thought by many to need revision, but that until such time as some more satisfactory system was introduced the motion would express the hope that unsupportable, dogmatic evidence would cease to be heard in the courts, especially when it impugned the good name of many doctors and, with theirs, that of the whole profession.

Dr. D. L. GULLICK (East Herts) described the motion as "woolly and pernicious." The speaker had implied that there had been an increasing tendency for such things to happen but had brought no evidence of it. If it was not safe to give evidence against a doctor without first-hand knowledge it would rule out the giving of evidence in that doctor's favour without first-hand knowledge. However regrettable it might be that a doctor's conduct should be called into question, it was quite pernicious to seek to deny a litigant the right to get what assistance he could from any medical man whose conscience, after careful consideration of the matter, led him to the opinion that the litigant had been wronged. Dr. FORBES said that to carry the motion would be contrary to the public interest and to judicial practice; neither would it be in the interests of aggrieved patients who had a proper case for consideration by the courts. It would also be against the interests of practitioners themselves, who might be involved in cases coming before courts for decision. Anything which might give the impression that

the profession was banding itself together to prevent doctors giving expert evidence if such evidence was detrimental to a defendant doctor was certainly not in the public interest. Dr. A. R. FRENCH (Marylebone) said it would be impossible for the medical protection and defence societies to defend a doctor against an accusation of negligence without being able to call expert evidence.

The motion was lost.

General Practitioners and Dentists' Premises

Dr. R. HALE-WHITE (Marylebone) moved that Council should consider with a view to its rescission the resolution adopted by the Central Ethical Committee in December, 1950, that in the interest of maintaining high ethical standards general practitioners and dentists should, wherever practicable, avoid sharing the same premises for professional purposes. He said that such sharing was quite common in Marylebone, though he was unable to speak to the situation in other parts of the country, and he considered that the words "wherever practicable" did not suffice to wriggle out of the fact that the resolution was a woolly one. Dr. F. E. GOULD (Birmingham) asked that Council should consider in the same remit the question of ophthalmic group practitioners sharing premises with dispensing opticians—a far more dangerous matter from the ethical point of view.

At the request of Dr. FORBES, Dr. HALE-WHITE agreed that the words "with a view to its rescission" should be omitted, and the motion as amended was carried as a reference to Council.

PUBLIC RELATIONS

Dr. H. GUY DAIN, chairman of the Public Relations Committee, moved on behalf of the Council that the Annual Report under "Public Relations" be received. He said that the department had really justified itself during the year. As the Association's claim had become understood by the public, the press, and Parliament, reaction against its complete rejection had been most favourable to the profession. Strong feeling had been expressed in both Houses of Parliament that the doctors were not getting a fair deal, and there had been widespread press support also. When it had been decided that it was necessary for the Association to take action which might result in doctors resigning from the Service the Public Relations Committee had called a conference of members of the press and public relations secretaries which had been very well attended and had resulted in the public relations secretaries being in a position properly to instruct members in their own Divisions. The Department had been successful in accomplishing an arrangement by which the press could get better satisfaction when making inquiries at hospitals, and an appropriate code, drawn up in a friendly spirit with the press, had been issued by the Ministry of Health to all hospitals as a guide to giving information. Considerable success had been achieved by the transference of the Hastings Lectures to the provinces, particularly in Leeds.

Remuneration Claim

Dr. A. A. VICKERS (Worcester and Bromsgrove) moved: That this Meeting notes with appreciation the efforts of the Public Relations Officer (Mr. John Pringle) in connexion with the recent remuneration claim.

He asked members of the press to draw the attention of their editors to the meaning of the word "strike," which the dictionary defined as "the concerted cessation of work by a body of workers." The verb "to strike" meant to refuse to continue work. That word had been wrongly applied throughout the press to the proposals which the profession had made for resigning from the Service.

The motion was carried unanimously.

Dr. H. G. St. M. REES (West Suffolk) asked for permission to withdraw a motion to the effect that a public press campaign be planned to show the doctors' position in the

present dispute, and, if necessary, that space should be bought in the popular press for that purpose.

The motion was, by leave, withdrawn.

Dr. J. H. STRANGER (North Glamorgan and Brecknock) moved:

That the negotiating body be instructed to initiate a wider public campaign to explain and organize support for the doctors' remuneration claim.

He said that, while his Division was very grateful to the press, space was limited and it was felt that there was an opportunity for the Association to produce its own explanatory booklet. The booklet could be based on the evidence about to be given to the Royal Commission. Doctors could hand a copy of the booklet to patients or friends who raised queries about the dispute. Dr. H. RYAN (Glasgow) supported the motion in general terms. Although the public relations department had done an excellent job, every attempt should be made to increase efforts over the next twelve months. Dr. W. WOOLLEY (Council) hoped that representatives would not feel that they could sit down and leave it all to the centre. They had far more chance of making the public realize the profession's case. Dr. W. A. B. COOPER (Preston) spoke against the motion. They had already had a surfeit of publicity. The public was tired of hearing about the doctors and their claim. The press had placed the profession's case on many occasions very well, but in long articles which the public did not bother to read.

Dr. WAND said that the evidence to the Royal Commission would not be just a simple statement. It might be a long document with many appendices and would be followed by oral evidence and perhaps another document and more oral evidence. Dr. Wand suggested that the meeting could leave the matter to the common sense of the Council and pass to the next business. Dr. DAIN thought it was very impolitic on the part of the profession to arrange any increase in publicity at the moment when they had decided to give evidence to the Royal Commission. After evidence had been given and the Royal Commission had reported, they might need all the publicity they could get, but at the moment they should keep quiet.

It was agreed to pass to the next business and the report was adopted.

REFORM OF THE NATIONAL HEALTH SERVICE

The Annual Report of Council under "Reform of the National Health Service" was presented by the Chairman of the Amending Acts Committee, Dr. H. H. D. SUTHERLAND. He said that the Committee had looked again at the question of a code of conduct for patients. As the Representative Body was aware, the regulations had been scrutinized by a special subcommittee, and in its opinion they did not call for special action now. The education of the public in the use of the National Health Service had received attention. There was a real need for a national campaign to instruct people on its proper use. The matter had been drawn to the attention of the Ministry of Health, with a hope that there should be such a campaign and also a national advisory body, possibly on the lines of the National Fuel Industry Committee, set up.

The Committee had looked at various health service schemes in the Dominions. The Council had been instructed by the Special Representative Meeting to reinvestigate the introduction of an independent British medical service. It was not quite clear whether it should be an alternative scheme to the present one or operating side by side with it. Finance was the great difficulty. Inquiries had been made in respect of the cover which could be obtained in any side-by-side or alternative scheme. An alternative scheme had not yet been fully thought out, but it would include the most favourable features of health service schemes in the British Commonwealth. Dr. Sutherland mentioned that the Australian scheme had received favourable attention by the Committee.

There were seven fundamental points of such a scheme:

(1) It should be free from party political control.
(2) It should be financed partly by contributions from patients either through an insurance scheme or otherwise, and partly by Government contribution through taxation. (This would reduce costs to the central funds, and therefore such a scheme might commend itself to the present Government in its financial difficulties.)

(3) The scheme should include a list of life-saving drugs that were free to everybody. Other drugs could and should be paid for by the patient, either directly or indirectly.

(4) Practitioners in the Service should have the right to engage in private practice outside it; private practice would probably be encouraged by the existence of a list of free life-saving drugs and necessary dressings.

(5) Remuneration might be on an item-of-service basis.

(6) The Service should be under the control of an independent board or corporation responsible to the Privy Council.

(7) There should be provision for the care of the old and indigent without any financial burden to the patient.

The Committee believed that such a scheme would have advantages to the public by reducing the cost to the nation, giving greater freedom in the choice of doctor, and improving the doctor-patient relationship.

Code of Conduct for Patients

Dr. B. RAEBURN (Manchester) moved an amendment that complaints against doctors should not be accepted by executive councils unless accompanied by a deposit, which might be forfeit if the complaint proved to be unjustifiable. He said that one of the first principles of the reform of the Health Service (which all agreed was essential) was to maintain the doctor-patient relationship and at the same time uphold the dignity of the profession. This could be done only by discouraging frivolous complaints by frivolous patients. In certain areas of the country dictation by the patient was causing further irritation to an already harassed practitioner, who asked the patient to leave his list. The patient left the list—and lodged a complaint with the executive council. What redress had the doctor got? None at all. Dr. Raeburn agreed that it was not happening all over the country, but it was happening in some areas. Dr. A. BARKER (Council) hoped the Meeting would not accept this amendment, which immediately suggested a bias in any case which came before the Medical Services Committee. Dr. C. P. WALLACE (Guildford) considered it a very irresponsible amendment. He hoped that the Representative Body would not be so foolish as to make it appear that the profession was trying to obstruct patients who, as they thought, had a legitimate grievance. Dr. RAEBURN replied that Manchester did not want to obstruct patients. All they wanted to see was fair play.

The amendment was lost.

ARBITRATION MACHINERY

The Meeting approved the Supplementary Report of Council under "Arbitration Machinery."

Dr. R. HALE-WHITE (Marylebone) moved a recommendation for the appointment of an impartial, independent, non-political body to deal with disputes when Whitley and Ministry decisions were unfavourable to the profession. With the permission of Reading he linked with this reference to Council a motion from that Division stating that the Meeting believed that, in order to prevent constantly recurring crises of confidence between the medical profession and the Government in the future, there must be permanent machinery for arbitration and review of terms and conditions of service when needed. The motion was carried as a reference to Council.

ARMED FORCES

Major-General J. C. A. DOWSE, presenting the Annual Report under "Armed Forces," said the year had been one of considerable importance, and indeed of interest and

anxiety. After a long period of gestation, the dream baby of the medical services of the armed Forces was born—the report of the Waverley Committee. But it was born blind—blind to sense and reality. The Waverley Committee's recommendations would not produce a good career for the young doctor in the Forces. The Committee had had no answer to representation to the Government, but it was understood that the whole matter was still under consideration. It had always been the Association's aim to maintain the principle of the B.M.A. that doctors should be paid as doctors. They must try to make certain that doctors in the armed Forces were remunerated at least as well as their brethren in civil life.

Major-General Dowse said that, as this was the last time he would have the honour to present this report to the Representative Body, he wished to thank the staff of the B.M.A. and in particular Dr. E. Grey-Turner.

The report was approved.

OTHER ASSOCIATION ACTIVITIES

The CHAIRMAN OF COUNCIL (Dr. Wand) moved that the Annual Report of Council under this heading be received.

Catering

Dr. J. S. HAPPEL (Winchester) moved that Council be instructed to undertake alterations to the Dining-room to bring it up to a standard worthy of the Association and of its guests, particularly those from overseas. It was a measure of the greatness of the Association, he said, that only after five days of solemn conference should Representatives begin to consider something relating to their own stomachs. He asked that the matter be treated as a reference to Council.

It was so agreed.

The remainder of the report was approved.

On the motion of the Chairman, the minutes of the A.R.M. were provisionally approved.

OTHER BUSINESS

Dr. IAN G. INNES (Council) paid a warm tribute to Dr. Grant's work as Chairman of the Representative Body during the past three years. Dr. Grant, he said, had carried out his duties with that thoroughness, frankness, and fairness which the Association expected of its Chairmen, and it was gratifying to know that his sagacity would be available to the Council in future years. But Dr. Grant's services had not been restricted to his activities in the chair; as overseas ambassador he had been to many parts of the world. (Prolonged applause.)

The CHAIRMAN (Dr. Grant) thanked the Representative Body for the way in which it had responded to Dr. Innes's remarks. He had very much enjoyed working as chairman—an enjoyment which had been greatly contributed to by the fact that each and every member of the Annual Representative Meeting had been most kind and courteous to him. He expressed his thanks to Dr. A. Macrae and all members of the secretariat and staff, both in Newcastle and in the regions, perhaps more particularly in Scotland, where Dr. J. T. McCutcheon in Glasgow had been a tower of strength. He thanked also the lay staff of the Association. The amount of work with which they had had to cope recently had been tremendous. To them, almost more than anyone else, the Association owed the success and the smoothness with which the Meetings had progressed. In particular, he wished to refer to the work done by Mr. Scrivener, the chief clerk, and Miss Brookes. Thanks were also extended to the editorial department. The work done by the editor and his staff, particularly with regard to the leading articles in the *Journal* during the recent days of crisis, had earned for them the Association's most warm-hearted thanks. Finally, he expressed his own particular thanks to his Deputy, Dr. Beauchamp.

The proceedings of the Annual Representative Meeting concluded at 1.15 p.m.

ANNUAL DINNER OF THE B.M.A.

The Annual Dinner was held in the Old Assembly Rooms, Newcastle upon Tyne, on July 16. The President, Mr. WELDON WATTS, occupied the chair, and cordially welcomed some 350 members and guests, among whom were Viscount Runciman of Doxford, the Lord Mayor of Newcastle, Alderman J. W. Telford, and the Lady Mayoress, and the Bishops of Durham and of Newcastle.

The toast of "The British Medical Association" was proposed by Viscount RUNCIMAN, who said that if there were no more to his pleasant task than expressing gratitude to the Association for its hospitality and wishing good luck to the President it would be a very simple matter. But when it came to proposing the toast of the Association itself, he found the prospect a little more daunting. There were certain compelling reasons for that. The first of these was that probably everything which could be said about doctors had been said a great many times over for a great many years. The second reason was that for a layman to address members of the medical profession was a task not lightly to be undertaken: were not doctors by training critical, were they not bound to diagnose motives as well as symptoms, were they not persistent in controversy, and did not the proceedings of the Association bear testimony to the almost unrestrained eloquence of which they were themselves capable on almost any subject? Mentioning the remuneration dispute, Viscount Runciman said, "The sooner you can arrive at a satisfactory settlement of the terms and conditions under which your profession serves, the happier you will be, and I am sure all of us will be happier also."

If in the course of time the increase in the specialist services continued, as he hoped it would, it was also to be hoped that it would not lead to the prejudice of general practice. There were probably very few people who, if they considered their lives honestly, did not owe a real debt of gratitude at one time or another to a general practitioner, not merely for having cured them of this ailment or that, but for a great many things which went beyond the bounds of what to the layman, at any rate, appeared to be conventional medicine. The part which was played, particularly, perhaps, in the country districts, by the general practitioner, by the family doctor, as guide, philosopher, and friend on all manner of problems which professionally he might well eschew was of such value to this country that one hoped it would never be allowed to fail.

The range of duties of the British Medical Association was wide. It included negotiating with the outside world maintaining the honour and, it was hoped, the prosperity of the profession, the promotion of research, and assisting the Government. All those duties necessarily had a great beneficial effect on the lives of everyone, and the fact that the Association discharged them all was a matter for pride and gratitude.

The President's Reply

The PRESIDENT, in responding to the toast, thanked Lord Runciman for his lucid and witty speech, and welcomed all those who had attended the Meeting, having a special word for those who had come from overseas to join in the deliberations and to discuss their own problems. They had been coming now for many years and had learned so well from the mistakes made in this country that many of them were operating medical services in their own countries which were the subject of envy.

He thanked the Association for choosing Newcastle once more for the Meeting, and expressed the hope that there would not be such a long gap before the next Meeting in Newcastle as there had been between 1921 and 1957. In the interval there had been great strides made in medicine, surgery, anaesthesia, resuscitation, and preventive medicine. In fact the profession was now holding many potent weapons in its hands, and it was up to members of the B.M.A. to see that they used those weapons for the benefit of their patients with no interference from any outside

body. The position of the doctor had changed in that time. He was now employed wholly or partly by the State, and that might suggest a division of loyalties. It would, however, be agreed that old customs and privileges must remain, and the doctor must be able to carry out his work in his own way for the benefit of his patients.

Referring to the recent difficulties with the Government, the President said that it had been necessary to accept a position with which the profession did not really agree; but it had accepted it and it was possible that it might be for the good. The period of grace which had been given should be used in making sure that the profession had a policy which was agreed by all sections of the community of medicine, and a policy by which the profession was prepared to stand. That policy should be ready before the Royal Commission made its report. In that connexion the President stressed the importance of encouraging younger members of the profession to take part in medical politics, because the decisions made next year would alter the position of medicine and medical practitioners for many years to come, and the young people would have to work in the system which evolved from the decisions made.

In conclusion, the President said he desired to thank all those who had helped to make the Meeting a success, particularly the City of Newcastle, the University, Headquarters' staff headed by the Secretary, Dr. Angus Macrae, the Local Arrangements Committee, which had worked extremely well with no fuss or trouble, the Ladies' Committee, and those hard-working members who had been looking after the science sections.

The Guests

The CHAIRMAN OF COUNCIL (Dr. S. Wand) said that the Annual Dinner was a highlight of a very great Meeting. It was the occasion upon which the Association was able to extend hospitality to very distinguished guests, and it was his privilege to propose their health. First he extended a cordial welcome to the Lord Mayor of Newcastle, Alderman Telford, and to the Lady Mayoress, and expressed gratitude once again for the ample facilities and hospitality which had been extended to members during their stay in Newcastle. He also extended a particularly cordial welcome to the Sheriff of Newcastle, Alderman Miss E. B. Temple, the Sheriff's lady, Councillor Mrs. McCambridge. A cordial welcome was also extended to the Town Clerk of Newcastle.

The Chairman of Council said that the Association was particularly pleased to welcome the Right Reverend the Lord Bishop of Durham, Dr. Maurice H. Harland, and the Right Reverend the Lord Bishop of Newcastle, Dr. Hugh Ashdown, as well as the vice-chancellor of the University and his lady, Dr. and Mrs. C. I. C. Bosanquet. He also welcomed the dean of the Faculty of Medicine, Professor R. B. Green, the dean of the Dental School, Professor Robert Bradlaw, and Mr. E. M. Bettenson, registrar of the University.

Viscount Ridley, the chairman of the council of King's College, and Viscountess Ridley, who had been very kind to the ladies during the Meeting, were very welcome and distinguished guests. Lady Ridley took a great interest in medical affairs and was a member of the regional hospital board: she was also the daughter of Sir Edward Lutyens, who designed the centre court of B.M.A. House.

There were also guests from kindred associations to whom a cordial welcome was extended. They included the president of the British Dental Association, Mr. H. Davis, the president of the Faculty of Radiologists, Dr. S. Whately Davidson, the president of the Association of Surgeons of Great Britain, Emeritus Professor H. Hodgson, and Dr. J. H. Hunt, representing the president of the College of General Practitioners. Among the distinguished colleagues from overseas, Dr. Wand extended a hearty welcome to Dr. Ernst Fromm, the treasurer of the World Medical Association, and Mrs. Fromm, Dr. S. C. Sen, of the Indian Medical Association, and representatives from the Branches of the Association in South Africa, India, Australia, and other places. To them all the Association offered the warmest greetings.

The LORD MAYOR OF NEWCASTLE UPON TYNE, Alderman J. W. Telford, in a brief response, thanked the Chairman of Council for the kind way in which he had welcomed the many guests. It was, he said, interesting to hear about the Association's earlier visits to Newcastle. Apparently the first time the Association received hospitality from Newcastle was in 1870, but, continued the Mayor amid laughter, there was no record of the Association having returned that hospitality before the 1957 Meeting.

He paid a tribute to the President, Mr. Weldon Watts, and particularly to Mrs. Weldon Watts, for it was of the greatest value when holding high office to have one's wife by one's side. Although, concluded the Lord Mayor, there were times when one did not see eye to eye with the Health Service or with doctors, there was no doubt that the main objective was for the benefit of mankind.

Dr. S. C. SEN (Indian Medical Association), who also responded, thanked the Association on behalf of his fellow guests, all of whom had thoroughly enjoyed the hospitality and kindness shown them. Speaking on his own behalf, ever since 1947 Dr. Sen said he had had the good fortune to come into close contact with the office-bearers and officials of the Association, and as the years had rolled by he had got to know them well ; so much so that when he entered the precincts of B.M.A. House he always received a smiling welcome from everyone he met there. That was something to be proud of.

The Indian Medical Association was very young and it looked to the British Medical Association for guidance and consideration. Attending the meetings of the Representative Body had been a great education for him, and, although his association did not always agree with the decisions taken, he realized how progressive the British Medical Association in fact was.

ADJOURNED ANNUAL GENERAL MEETING

The Adjourned 125th Annual General Meeting of the Association was held in the City Hall, Newcastle upon Tyne, on the evening of July 15. Among the distinguished company assembled, over which the retiring President, Dr. ALEXANDER HALL, presided, were the Lord Mayor and Lady Mayoress of Newcastle.

Installation of President

In installing his successor, Mr. WELDON P. T. WATTS, as President of the Association for 1957-8, Dr. HALL said that although Mr. Weldon Watts needed no introduction 'twixt Trent and Tweed, there were many from without those bounds who had not the privilege of his personal acquaintanceship and were not fully aware of the outstanding personal qualities, the high professional attainments, and the long experience and service in Association affairs, both locally and centrally, which equipped him so admirably for the high office to which he had been appointed.

Weldon Watts was educated at Sherbourne, and during the first world war served as a pilot in the Royal Flying Corps and was awarded the A.F.C. After qualification he turned his special attention to surgery, where his gifts were quickly recognized. Appointment followed appointment, until he was now the senior surgeon at the Royal Victoria Infirmary. Yet, in spite of a very busy professional life, he had found time for many other interests. Rugby football, in college and county, owed much to his full support ever since he was a student. On the river, moors, and coast of Northumberland he found not only scope for his sporting instincts with rod and gun, but delight also in the fields of ornithology and botany. But his most preoccupying sideline had been the British Medical Association. He was 15 years the secretary of his Division, 20 years one of its representatives at the Annual Representative Meeting, and 16 years a member of Council. Little

wonder that both his Division and his Branch had honoured him by selecting him as their chairman, or that the Association had chosen him as its President for 1957-8. One had only to listen to the terms in which he was referred to on all sides to realize how high the name of Weldon Watts stood in the esteem and affection of his colleagues and fellow citizens.

Dr. Hall then inducted Mr. Weldon Watts as President, and invested him with the Presidential Badge of Office.

Mrs. Weldon Watts was then invested with the President's lady's badge by Mrs. ALEXANDER HALL, who expressed the hope that it would give Mrs. Weldon Watts as much pleasure as it had given her during the previous year.

Dr. S. WAND, Chairman of Council, moved a vote of thanks to the retiring President. It was, he said, sincerely to be hoped that the past year of office had given as much satisfaction to Dr. Hall as it had to those who had been at his side in the Association's work. It was exceptional for a general practitioner to be appointed President of the Association, and Dr. Hall was an exceptional person. The way in which he had conducted himself during his year of office must have given great satisfaction and pride to those of his colleagues in Sussex who nominated him to the Presidency. Dr. Hall had represented the Association here and abroad, and in all cases he had conducted himself in a way which had brought great credit to the B.M.A. All through his year of office Mrs. Hall had been at his side helping him in all his work.

The vote of thanks was carried by acclamation.

Introduction of Delegates and Overseas Representatives

The following delegates from kindred associations were then introduced to the President by the CHAIRMAN OF COUNCIL: Dr. Ernst Fromm (World Medical Association), Dr. Hereford Still (Canadian Medical Association), Dr. K. E. Iversen (Danish Medical Association), Dr. Tapani Kosonen (Finnish Medical Association), Dr. A. Kolbeinsson (Icelandic Medical Association), Dr. S. C. Sen (Indian Medical Association), Dr. I. Izkovitch (Medical Association of Israel), Dr. W. J. Royards (Royal Netherlands Medical Association), Dr. Ole Harlem (Norwegian Medical Association), Dr. H. Grant-Whyte (Medical Association of South Africa), Dr. At Ketusingha (Medical Association of Thailand), and Professor Dr. Vojislav Danilovic (Union of Medical Societies of Yugoslavia).

The following representatives of Overseas Branches were next introduced:

Dr. V. Ruth Hume (Kenya), Dr. G. H. V. Clarke, Dr. T. O. Ogunlesi, and Dr. O. K. Ogan (Nigeria), Dr. Luena H. Hatcher (Fiji), Dr. J. Adrian Paul, Dr. J. P. Lytle, and Dr. M. H. Elliot-Smith (New South Wales), Dr. L. T. Jobbins (Queensland), Dr. I. S. Magarey, Dr. R. S. Wilkinson (South Australia), Dr. W. McL. Thomson (Tasmania), Mr. I. L. McVey and Dr. H. B. D. Vaughan (Victoria), Mr. J. H. North and Dr. T. A. Macfarlane (New Zealand), Dr. Koraishia Mohideen (Hong Kong and China), Professor E. N. MacDermott, Dr. P. Moran and Dr. J. P. Morehan (Republic of Ireland), Dr. N. H. Skelton-Browne (Mediterranean and Middle East), Dr. E. H. Back and Dr. H. D. Chambers (Jamaica), and Mr. L. A. H. McShine (Trinidad and Tobago).

The Association Prizes were then presented by the PRESIDENT.

Sir Henry Hallett Dale

At a Meeting of the Council on November 7, 1956, it was resolved that the Gold Medal of the Association for Distinguished Merit be awarded to Sir HENRY HALLETT DALE, in recognition of his distinguished services in the fields of physiology and pharmacology.

Before the President presented Sir Henry Hallett Dale with the Gold Medal of the Association, Dr. WAND, Chairman of Council, read the following citation:

It is customary for a recipient of the Gold Medal of the British Medical Association to be given at the same time a document of some five hundred words containing a concise statement of the services and achievements in recognition of which the award is made. To observe this tradition on the present occasion is manifestly impossible; for you have taken all medical science for your province, and so numerous and varied are your contributions to the advancement of learning that a volume would be needed to tell the phenomenal story and no brief catalogue will serve.

In the first of a series of papers published in your honour by the *British Medical Journal* on the occasion of your eightieth birthday, Lord Adrian, then President of the Royal Society, began thus: "There is no one who could write adequately about the whole field of Sir Henry Dale's scientific work." In the words of a leading article in the same issue: "Indeed, nobody can again hope to attain the degree of understanding and experience in every aspect of medical research such as Sir Henry can bring to bear upon any problem before him, whether it be biological standardization, the properties of chemotherapeutic agents, or synaptic transmission of the nerve impulse."

It may be fitting to mention here your work on ergot, leading in one direction to the isolation of ergometrine—thereby, incidentally, confirming the general practitioner's confidence and long-held belief in the efficacy of the watery extract of ergot—and in the other to researches on histamine and shock, and the eventual application of antihistaminic drugs in medical practice. And then the work on acetylcholine and the chemical transmission of the effect of nerve impulses for which in 1936 you shared with Professor Otto Loewi that much-coveted honour in the world of science, the Nobel Prize.

Under your guidance and direction the National Institute for Medical Research provided, as it has been put, "a nursery from which emerged many whose inspiration and accomplishment owe much to a director who continued to work with his own hands for as long as a laboratory was available." Then, in the dark days of the war, as the eighth medical man to occupy that pre-eminent position, you were elected President of the Royal Society, and thereby assumed a burden of responsibility such as had not fallen upon the shoulders of your distinguished predecessors.

But despite all these pressing preoccupations in your long and active life in the world of research and learning, you, Sir Henry, have always responded most generously to any request for help from our Association and from more than one Editor of the *British Medical Journal*. Your knowledge and your wisdom have found expression in writings that have delighted all with their literary grace and masterly comprehension of the vast complexities of medicine to-day.

Honours have been showered upon you in full measure, but the Council of the Association is happy in the knowledge that you have found genuine pleasure in being chosen for the present award and in discovering that this is the first occasion on which the Medal of the Association, instituted eighty years ago, has been presented to one who has devoted his whole professional life to research and has at no time engaged in the practice of clinical medicine.

It is in boundless admiration, in deep gratitude, and in warm affection that the Council asks you to accept the highest honour that it can bestow.

The Charles Oliver Hawthorne Clinical Prize, 1957, was presented to Dr. JOHN EDWARD DAVIES, of Carmarthen; the Occupational Health Prize, 1957, to Dr. CHARLES PETER CHIVERS, of Cheshire; the first prize in the Claire Wand Fund Essay Competition, 1957, to Dr. RANALD PHILIP CLAYTON HANDFIELD-JONES, of Buckinghamshire, and the second prize to Dr. JOHN KIRKPATRICK PATERSON, of Huntingdonshire. The Sir Dawson Williams Prize, 1957, was presented to Mr. DENIS JOHN BROWNE.

President's Address

The PRESIDENT then delivered his address, which was published in the last issue of the *British Medical Journal* (p. 117). Dr. A. BEAUCHAMP, Chairman of the Representative Body, proposed a vote of thanks to the President for his most interesting address.

The vote of thanks was carried by prolonged acclamation, and the whole company then adjourned to the Old Assembly Rooms, where members and guests were received by Mr. and Mrs. Weldon Watts.

RELIGIOUS SERVICES

BISHOP OF DURHAM ON FIGHTING ILLNESS

Taking as his text the words of the Evangelist, "They that be whole need not the physician, but they that are sick," the Lord Bishop of Durham, the Right Rev. Dr. MAURICE H. HARLAND, condemned those who, he said, got no further than the first part of that text, believing that there was no need for the medical profession and that all ills would be cured by faith in God alone. The bishop was preaching on Tuesday, July 16, in St. Nicholas's Cathedral, Newcastle upon Tyne, at the official service held in connexion with the Annual Meeting.

It was necessary, he said, to consider the sentence in its entirety: those who were sick *did* need the physician. Christ had given definite commandments to His Church that the sick should be healed. The battle for health against sickness should be waged. The battle for health against sickness was as old as humanity itself, and there was even evidence that disease had existed before the advent of man. Rather than seek an answer to the question, so frequently put, "How can these things be in a world created by the good God?"—something which must always remain a mystery—it was more profitable to face the facts and determine what had been done and what was being done about it. God had endowed all men with gifts enabling them to carry out their particular work; not the least of those gifts were those which He granted to the doctors, surgeons, nurses, and others whose work led them to serve health. Christ Himself went about healing the sick, thereby clearly indicating that, whatever the cause of the disorders which He cured, they were all to be regarded as ills to be fought and overcome and not to be faithfully accepted as the will of God to which submission must be made.

"God has given you your desires and gifts for your work," he reminded his congregation of doctors. "It is He who gives you what success you have attained and will attain. Whether they knew it or not, they were God's ministers; theirs was a holy calling, a ministry of love being exercised by our Lord Himself through mankind, for 'from the most High cometh healing.'"

"We thank God for you," he continued, "and also for the work of His spirit through you, inspiring you and leading you in the marvellous advances and discoveries of your science and craft." It was a most comforting thought that things which only a short time ago had been considered incurable were now being cured. Humanity need never despair of fresh light and new knowledge continually being given to those great souls who would never seek it in vain. The truly faithful held that there was no disease under the sun for which God had not provided a remedy somewhere. Those who worked for medicine worked for Him; they were physicians of the soul as well as of the body.

Divine Healing

In recent years there had been increasing interest in what was variously called "spiritual" or "divine" healing, usually associated with prayer and the laying on of hands or anointing with oils as in the Old Testament. While it was true that Christ had given a command to His Church to heal the sick, that particular part of the Church's ministry had for centuries been largely neglected. As chairman of the Churches' Council of Healing it had been his own lot to try to understand that, and his efforts in that direction were continuing in his capacity as chairman of an important commission which the Archbishops of Canterbury and York, at the request of the two Convocations, had appointed to investigate the whole matter. It was a strong and varied body which included doctors, surgeons, hospital matrons, theologians, psychologists, and others, and it was hoped that its report would be published in the autumn of this year.

It was already perfectly clear that did not recognize the essential place and function of the medical profession. It was necessary to remember, however, that there were

states which arose from the condition of a person's soul which it was, generally speaking, beyond the power and competence of doctors to heal. It was they who needed the physician of the soul.

The bishop said he had welcomed the opportunity of heading the 1947 delegation of the Churches' Council of Healing which had met the Central Ethical Committee of the British Medical Association at the request of that body. It had been a highly profitable meeting and had been fully reported in the *Supplement to the British Medical Journal*.

It had always been his own good fortune, as a parish priest, to have worked in the closest touch with doctors, people for whom he had the greatest admiration; each—priest and doctor—recognized the complementary nature of their work. His hope and prayer for the future, said the bishop, was that medicine and the Church would grow together in an understanding of the greatness of each of their callings, especially with regard to the sick and suffering; that the rising tide of recognition of the things of the spirit would lead to a better training both of clergy and of medical students; and, above all, that all might see God in the work that He had chosen for each individual to perform.

ROMAN CATHOLIC SERVICE

The annual Roman Catholic service was held on Saturday morning, July 13, in St. Mary's Cathedral, Newcastle upon Tyne. A large congregation attended Mass celebrated by the Right Rev. Mgr. JOHN J. CUNNINGHAM, Vicar-General of the Roman Catholic Diocese of Hexham and Newcastle. The sermon was preached by the Rev. Fr. GEORGE DWYER, Superior of the Catholic Missionary Society.

Father Dwyer said that upon examining the agenda for the A.R.M. he had been impressed by the great list of professional subjects set down for discussion; but there was one subject which had been missing and yet would be very much in the forefront of every doctor's mind at the present time: the status of the doctor in the eyes of the public and the people to whom he ministered. The time had been when the doctor had been regarded by the public with a certain awe, which stemmed partly from a reverence for the unknown and partly from his very different social and economic standing; nowadays the "unknown" was something which had very much diminished. But a third reason for the awe with which the doctor had been regarded—the devotion, compassion, and zeal of the doctor—was certainly not one whit diminished.

The teaching of the Catholic Church was and always had been that, first of all, the doctor's vocation was a spiritual thing. But that did not mean mankind should despise the body; on the contrary, far from being just "soul," man was "the ensouled body," and the subject for the doctor, just as for the priest, was the whole man, body and soul in one person. It was a spiritual vocation for the doctor to devote himself to the healing of the body and the curing of ills. All the aspects of the vast field of preventive medicine and hygiene were positive things by which the doctor was concerned to help man use to the full the powers God had given him. Besides being spiritual and positive, the doctor's vocation was also one of realism. Every Catholic doctor knew that this life was but a preparation for the next; the more profoundly he realized that, the better doctor he would be. Preparation of a patient for death was also part of a doctor's function. The tragedy and dignity of man lay in the fact that, of all creation, only man knew that he must die—dignity because he could learn to die like a man; the man who knew what death was—the portal of life eternal—would have confidence in the grace of God, which was given in abundance at the time when mortal life was coming to its end. In that connexion, although the administration of pain-killing drugs in the last extremity was perfectly legitimate in the eyes of the Catholic Church even though they might hasten death, it was not legitimate to choose death itself as a means of alleviating pain.

**British Medical Journal Supplement*, November 8, 1947, p. 112.

JEWISH SERVICE

A special service, conducted by the Rev. S. P. TOPEROFF, was held on July 13 at the Leazes Park Road Synagogue, Newcastle, for Jewish doctors attending the Annual Meeting. The service was followed by a reception in the vestry room of the Synagogue.

In his address the Rabbi pointed out that in ancient Israel the priest was both the teacher and the doctor. Thus it was said that in biblical times health was wedded to religion and the priest played a doctor role. It was written in *Ecclesiasticus*, "Honour a physician," and at all times Jewish literature abounded with sayings and aphorisms on the important position the doctor held in all communities. For this reason Mr. Toperoff was pleased to welcome the delegates to the B.M.A. meeting. As the Temple of old was served by the priest who healed and hallowed, so they maintained that the synagogue could heal and hallow Judaism to-day. Health could be procured not only by drugs but also by peace of mind. To-day the former struggle between religion and psychology was being dissolved and the psychologist and the priest were beginning to respect one another, for were they not both striving for the same goal? Judaism always recognized the vital part which peace of mind could play. To maintain good health one should live a harmonious life and be at peace with one's fellow men and God. If there had been failure to bring about peace between man and man in the political field, the time had arrived when the protagonists of religion and health should walk together and so create a healthy, sound, and balanced mind capable of battling with the many problems of to-day.

CHURCHES' COUNCIL OF HEALING
PRESCRIPTION FOR HEALTH

"A Prescription for Health" was the theme of a well-attended meeting organized by the Churches' Council of Healing at the Old Assembly Rooms, Newcastle, on July 12. A meeting of doctors and clergy had now become a tradition at the B.M.A. Annual Meeting, remarked the Right Rev. HUGH E. ASHDOWN, Bishop of Newcastle, who presided. It was, he said, one of the most important events.

Dr. R. W. LUXTON said that on the matter of health the thinking of the medical profession was confused. Doctors knew something about disease, but they did not know much about health. Health was not the absence of something wrong, but the presence of something right. There would be a real National Health Service when there was clear understanding and collaboration between all those whose vocation was concerned to bring man to man. Listing the requirements for health, Dr. Luxton said the first ingredient was healthy food for the mind. The second was sound habits. Self-discipline was of real importance for health; lack of it led men into slavery to food, to tobacco, to sex, even to their job. When a person had something bigger to work for, self-discipline merged into self-realization. If a man's daily work was uncreative, he became subtly frustrated. The instilling of absolute moral values could protect, for the mind could create resistances.

Many thoughtful people believed that there were also diseases of the spirit, which were important in themselves and had secondary effects. Dr. Luxton instanced pride, jealousy, greed, self-pity, self-indulgence, and perhaps chronic fearfulness. Daily meditation was essential for the health of the mind and spirit. People looked for the Kingdom of God everywhere except where, they were told on the best authority, it was to be found—within them. Meditation was a time which saved time—it clarified what was important and transformed the way one lived. Many members of the medical profession had had their spiritual education neglected.

Clergy and doctors were dispensers of health. They received their own instruction in the language of their crafts. Dr. Luxton wondered if they transmitted their knowledge in plain English. And why should people accept the doctor's

advice on health when he was not living in a healthy way? Too many doctors were pale and harassed and driven by a sense of duty. If a nation was to be great, it must have integrated health. Britain was suffering from "the second rate." It needed a spiritual ideology with a background of first-rate moral standards.

The Bishop of Lichfield, the Right Rev. Dr. A. S. REEVE, chairman of the Churches' Council of Healing, spoke of the awful paradox of our time. On the one hand, doctors could do amazing things. The average span of life had been raised by a number of years; infant mortality had been eliminated and hopes were bright in others. On the other hand, man was to-day capable of planning his own death, which was a power he never had before. What was the good of a prescription for health if all the time, leering round the corner, was the skeleton of death? He had not come, he said, to urge that they should press for the unilateral cessation of all nuclear bomb tests, but it had to be realized that the most important matter was a moral one, and it was far more important than any scientific or economic one.

Instead of love one found fear and hatred and suspicion. Tremendous power was concentrated to-day in the hands of men who were not bound by any moral restraint. Never could anything in this life be separated from the moral question, and it was the answer given to the moral question that would be the deciding factor. But did his audience seriously think that man would give the right answer by his own unaided strength? That was what many people thought. What they had to remember was that, if they were going to give the right answer to this moral problem, they must seek the spiritual strength which came from God.

The Bishop of Lichfield hoped the medical profession would never approach their work on the purely physical plane. He believed our Lord's mission to be in the first place the salvation of souls. In a sense the miracles were a secondary part. But one could not tear them out of the Gospel story. Doctors and clergy should work together and be on friendly terms, because together they might be able to do much for their people. It was not the teaching of the Churches' Council of Healing that if only people had enough faith they would be well. That would be wrong. But it was difficult for a man to be made well unless he had faith in the doctor who was looking after him and in God.

Dr. H. H. D. SUTHERLAND proposed a vote of thanks.

PROCEEDINGS OF COUNCIL

The last meeting of the Council for the session 1956-7 was held at Newcastle on July 12, with Dr. S. WAND in the chair. The main business of the meeting was the consideration of brief reports from a few committees which had met since the last meeting of Council.

On the recommendation of the Office Committee it was decided to add to the Association's *Book of Valour*, which is now being prepared, the names of Wilmot Fenwick, of Grenfell, New South Wales, who on August 27, 1956, took a leading part in the rescue of a boy who had fallen down a mine shaft; and John Charles Malcolm Wilkinson, R.A.F., who on December 3, 1956, parachuted in adverse weather conditions to give a blood transfusion to a woman on Christmas Island with severe haemorrhage.

Dr. J. G. M. HAMILTON presented a progress report from the Journal Committee, and Dr. A. N. MATHIAS reported that the Compensation and Superannuation Committee is making an approach to the Minister of Health on outstanding compensation questions. The Welsh Committee's request, moved by SIR TUDOR THOMAS, for representation of the Principality of Wales on the Association's Royal Commission Evidence Committee was granted, and a report from the Medical Education Committee on preliminary arrangements for the second world conference on medical education in 1959 was received.

Two recommendations from the Psychological Medicine Group Committee on the report of the Royal Commission on

the Law Relating to Mental Illness and Mental Deficiency were approved. The report was welcomed as an important step towards enlightened legislation in the field of mental health, and it was hoped that the implementation of the Commission's principal recommendations will not be unduly delayed. A Committee has been appointed to consider the report in detail and to make appropriate representations to the Ministry of Health.

FIRST MEETING OF NEW COUNCIL

The first meeting of the new Council was held at Newcastle upon Tyne on July 15, at the conclusion of the Annual Representative Meeting.

Before welcoming new members Dr. S. WAND, Chairman of Council, expressed gratitude to Major-General J. C. A. Dowse, Dr. F. Gray, and Dr. J. A. Pridham, all of whom were no longer members of Council. Major-General Dowse did outstanding work as Chairman of the Armed Forces Committee; Dr. Gray had been a member of Council for many years and had made great contributions to its work; and Dr. Pridham also served the Council for many years as Chairman of the Organization Committee, the International Relations Committee, and more recently as Chairman of the World Medical Association Supporting Committee. The Association owed those members a debt of gratitude for their devoted services.

He extended a cordial welcome to the new members of Council: Professor A. P. Thomson, President-Elect, Dr. W. N. Leak, Dr. J. S. Noble, Major-General R. Murphy, and Dr. A. Talbot Rogers.

The Council then dealt with the business of electing its representatives on the standing committees, the appointment or reappointment of many special committees, and the representation of the Association on outside bodies.

Help for Chairman

Under any other business, Mr. L. DOUGAL CALLANDER, the Treasurer, said it would readily be agreed that the burden which fell upon the shoulders of Dr. Wand as Chairman of Council was very great. His commitments in the immediate future were heavy. There was the preparation of evidence for the Royal Commission; he had also to tour the Branches in Central and East Africa and then to go even farther afield on behalf of the Association in September. Therefore Dr. Wand had made a suggestion, with which the Treasurer agreed, that if he found conditions at the beginning of September imposed too great a strain he might have power to take someone from Headquarters with him to Africa to relieve him of some of the burden. The extra cost would be in the region of £400, and the Treasurer moved the suspension of Standing Order 13 to enable the Council to approve this expenditure.

Dr. WAND said he had made the suggestion simply in case one of two things happened: either the amount of work before and after his tour was so great that he found it difficult to do it effectively without assistance, or, alternatively, other matters blew up that might make it necessary for him to come back in the middle of his tour. Dr. A. BEAUCHAMP, Chairman of the Representative Body, seconded the suspension of Standing Order 13.

Dr. A. TALBOT ROGERS, supporting the motion, said that the Chairman of Council should be asked to take an assistant with him in any event.

The motion was carried.

BRITISH MEDICAL GUILD

The meeting of Council was followed by a meeting of the trustees of the British Medical Guild, Dr. S. WAND occupying the chair.

Dr. Wand was appointed Chairman of the Board, Dr. Catherine Harrower was appointed Treasurer, and the other

officers, staff, and executive committee were reappointed. The financial statement was approved.

Dispute on Remuneration

The following Minute of the Special Representative Meeting of the Association, held on June 12, 1957, was considered:

Resolved: That the Council be instructed to request the British Medical Guild to institute an inquiry to learn whether there is evidence of financial hardship among members of the profession as a whole.

Dr. F. M. ROSE said that his Division had considered this would be a good thing to do, and that evidence of hardship could be obtained better through small groups rather than from any large central inquiry. The CHAIRMAN, in reply, said that the Royal Commission had sent out a questionnaire which included matters of this kind. The questionnaire had been submitted to the Association's advisers and a reply was awaited. No action could be taken until their advice was received. Dr. ROSE concurred with the Chairman's remarks, and the matter was received and noted for further action at the appropriate time.

Malta

It was reported that the medical profession in Malta was engaged in a fresh dispute with the Maltese Government concerning the implementation of the recommendations of the Commission which recently investigated the medical services of the Island, and that the Medical Officers' Union had asked whether another instalment from the fund voted by the British Medical Guild last year was available.

A suggestion that if and when the Chairman of the Guild was satisfied that moneys were needed for proper purposes he should be empowered to authorize the sending up to £1,000 of such moneys as still remained available to Malta was agreed to.

OVERSEAS CONFERENCE

The Overseas Conference in connexion with the Association's Annual Meeting was held at King's College, Newcastle upon Tyne, on July 17, Professor D. E. C. MEKIE, deputy chairman of the Overseas Committee, occupying the chair. The Chairman of Council and the Chairman of the Representative Body attended the Conference.

Mr. J. L. Gilks

Having extended a cordial welcome to members attending the Overseas Conference, the CHAIRMAN said that Mr. J. L. Gilks, after long and meritorious service, retired this year from the Chairmanship of the Overseas Committee. His work for the past nineteen years had been noteworthy, and those who were in touch with Headquarters knew how much he had done.

The Overseas Committee of the B.M.A. suffered from certain special handicaps. First, knowledge at Headquarters of the problems which faced the overseas Branches was limited. Secondly, overseas Branches had a peculiar though almost universal hesitancy in providing the necessary information to enable Headquarters to do something for them. In spite of those handicaps, said Professor Mekie, there was no lack of desire on the part of Headquarters to be of service, and the purpose of the Conference was to try to provide an opportunity to learn from delegates what their problems were. The Conference had no executive powers, but the views which were expressed were reported in full to the Overseas Committee, and it was hoped that representatives from overseas Branches would not hesitate to make known their thoughts, wishes, and aspirations. The main topic of discussion would be the report of Dr. E. Grey-Turner, the indefatigable secretary of the Overseas Committee.

Secretary's Report

Dr. E. GREY-TURNER, Assistant Secretary, began by briefly stating how the Overseas Committee was constituted. It was a Standing Committee of the Association consisting of the four chief officers—the President, Chairman of Council, Chairman of the Representative Body, and the Treasurer, and the seven representatives of overseas constituencies on the Council. There were also two members of the Committee appointed by the Council and two by the Representative Body. They were not necessarily people who had first-hand knowledge of overseas affairs. One member was appointed by the Organization Committee, and there was provision by which two additional members could be co-opted. Mr. Gilks, in his nineteen years as Chairman, had certainly seen great changes in the influence and activity of the Committee, which, no doubt, were in large part due to himself.

During the past year the Committee had been concerned with the question of ethical rules for overseas Branches. It arose because of an ethical complaint in an overseas Branch. The Central Ethical Committee decided there was nothing that the Branch or Head Office could do, because the Branch concerned had not adopted the Association's ethical rules. Failure by Branches to adopt the rules deprived them of ethical powers. The Overseas Committee had to consider whether it ought to advise all overseas Branches to adopt the ethical rules, which were very detailed. A suggestion was made to the Ethical Committee that it might draw up a simplified version of the rules for overseas Branches, but the reply was given on legal advice that the only ethical rules which could safely be adopted were those in existence. Therefore the choice was before the overseas Branches. Ethical standards were under fire in many parts of the world, and it was felt that overseas Branches should do whatever they could to maintain the good name of the profession; but the fact must be faced that in certain parts of the world accepted standards of conduct were not necessarily the same as those in the United Kingdom. How far the rules would be generally adopted by overseas Branches remained to be seen.

Overseas Civil Service

The British Overseas Civil Services, of which the former Colonial Medical Service was one, had changed in character. Two white papers were issued, one in 1954, entitled "Re-organization of the Colonial Service," which was largely a matter of changing the title of the Service and giving certain assurances to serving officers, and another in 1956, entitled "Her Majesty's Overseas Civil Service," which was more far-reaching. It announced certain changes in the character of the Service. The two main problems facing the Medical Service and the Overseas Committee were, first, the filling of short-term appointments, and, secondly, the filling of long-term career appointments. There were many territories which had their own medical schools, and the time was not far distant when they would be able to staff the whole of the Medical Service with local graduates. The problem in those countries was the short-term filling of certain posts. Then there were other parts of the world where there were no local medical schools and where doctors had to be imported or trained abroad. Those territories were dependent on the long-term or career men.

The main obstacle to recruitment in both categories was the same, namely, the difficulty of re-entering medical employment in the United Kingdom on return. This was one of the effects of the National Health Service. The energies of the Committee had been devoted for a long time to trying to devise some scheme by which re-entry into medical work in this country could be greatly facilitated, if not guaranteed, for the man who was prepared to go overseas and fill a gap.

Two schemes were under immediate consideration. One was devised by Professor Charles Wells, of Liverpool, for meeting the short-term problem by the appointment of men

to consultant posts two or three years in advance of the date on which the vacancy would occur. They could then go overseas for that period. That scheme was at present being considered by the Joint Consultants Committee. The other, devised by Professor Hill, of the Royal Free Hospital, London, was an elaborate scheme for secondment from medical schools and hospitals in this country. It would cost money, and the question was, Who would pay?

The Overseas Committee might recommend to Council that a small conference of interested people might be convened to discuss the problem.

Remuneration

The main cause of dissatisfaction with remuneration overseas was not with absolute levels of salaries but with the relative levels in comparison with other services such as the administrative service and the agricultural service. In the last 30 years there had been a relative decline in the remuneration of the medical branch. Medical officers in Nyasaland, for example, had, over the last 30 years, received an increase of 120% at the maximum of their scale. In the administrative section, the district commissioner, a comparable officer, in the same period had received an increase of 164%. The Nyasaland figures showed that other branches had had even greater relative increases. It was the relative depreciation which annoyed overseas doctors and which was at the root of most of the dissatisfaction about remuneration. Again, the Committee in the past year had been brought face to face with discrimination between the salaries of men and women doctors, and for various reasons it had been unable in some cases to alter the situation.

Middle East

The Middle East, Egyptian, and Sudan Branches' activities were brought to a complete halt last year by the Suez emergency. However, the Middle East Branch was now cautiously reviving its activities, although the Egyptian Branch was absolutely dormant, the secretary having been expelled from Egypt. The Sudan Branch was about to revive its activities.

Discussion

Dr. S. WAND, Chairman of Council, referred to the question of medical officers' incomes compared with those of other overseas officers, and said he recalled a conversation which he had with a chief officer who was not very responsive to a claim for increased remuneration for doctors. The officer rejected the argument that the doctor had a longer period of training on the grounds that the doctor nowadays in some parts of the Commonwealth was less important than some of the other officers.

Dr. N. H. SKELTON-BROWNE (Aden) said that as a result of certain difficulty in recruiting sufficient medical officers in Aden, although no official representations had been made, there had been numerous attempts made in the local press to persuade the Government to allow the registration of foreign medical practitioners. Dr. E. H. BACK (Jamaica) said that in British Honduras the doctors were almost entirely in possession of qualifications not registrable in the United Kingdom. That was due to the difficulty of recruiting doctors with United Kingdom registration. So far as Jamaica was concerned, there was a law whereby the Government was empowered to put a person on the Register if he had been approved by local examiners under the aegis of the University College of the West Indies. Therefore an American graduate could in fact be passed by the University College and he would then be put on the Register.

In reply to Dr. WAND, who asked whether American qualifications were not being accepted in Bermuda, Dr. GREY-TURNER said that the law allowed the local medical board to register any degree. Normally British and Canadian degrees were accepted, but there was little doubt that there would be one or two American graduates. Mr. C. BELFIELD CLARKE (Overseas Committee) said it was customary for graduates from Canada and America who wanted

to practise in the West Indies to go to Nova Scotia, where there was reciprocity with United Kingdom qualifications. The CHAIRMAN said it was probably the feeling of the meeting that everything possible should be done to ensure that registration was linked with medical education of a standard which would be regarded as suitable for reciprocity.

Mr. L. A. H. McSHINE (Trinidad and Tobago) asked whether there were any plans for the secondment of junior doctors, of which there was a greater shortage in Trinidad than of senior practitioners. The CHAIRMAN replied that the problem was to find a scheme which would be applicable to a wide variety of conditions.

Dr. T. O. O. OGUNLESI (Nigeria) assured the Conference that, so far as the Nigeria Branch was concerned, the principle of equal pay for men and women was wholeheartedly supported. On the question of arrangements for doctors who went to Nigeria from the United Kingdom and had he had spoken to junior colleagues in hospitals and had been impressed by their enthusiasm. Leaders in West Africa had given assurances on the good will which existed in West Africa towards those who were willing to go there. It remained only for the leaders of the profession in the United Kingdom to convince the Government of the need for making arrangements for officers to be employed on their return. Organization of the B.M.A. was the main problem in Nigeria, and when one thought of a two-tier system of organization for an area which was more than three times the size of the United Kingdom, it gave some idea of the difficulty. At the same time, it might be found necessary now in Nigeria to have a B.M.A. Branch in each region of the country with a Federal Council. Hitherto there had been one Branch and three Divisions. As to medical progress in Nigeria, perhaps the most important single event in recent years had been the opening of the University College Hospital. It would make a two-way system of exchange of medical knowledge a practicable proposition.

Dr. V. RUTH HUME (Kenya) asked whether there was any scheme for the re-employment of doctors who would not be in a position to apply for specialist posts on return to the United Kingdom but who would be interested in general practice, and who would possess added knowledge, judgment, and capability as a result of being their own specialists when practising abroad. Dr. WAND, in reply, said that the chance of anybody over 55 years of age going into general practice in this country, except by putting up a plate, was remote. Immobilization was one of the greatest prices which it had been necessary to pay for the National Health Service.

The CHAIRMAN added that doctors serving overseas faced two great difficulties at the moment. Whereas in former days medical officers returned to this country and bought small practices, to-day on retiring at 55 the opportunities in this country were nil, and it was hardly possible to live on the pension. The second difficulty was in connexion with the doctor recruited in this country who had worked in some overseas territory which had developed to the stage where it no longer required an expatriate service. Politically that might be very good, but it was not fair to ask those who were serving there to bear the sacrifice of the transition. True, they received compensation, but there was no money which could compensate a man for being cut off in the middle of his career. It was hoped that there would have been something in the U.K. Government's scheme for the formation of a special list; but B.M.A. representatives had come away from the Colonial Office feeling that the whole White Paper was a political stunt. The question of general duty officers had been studied and it was suggested that an outlet might be found in the home Civil Service, but it was greeted in Whitehall with a blank stare.

Dr. O. K. OGAN (Nigeria) pointed out that the specialist who went out from this country must come from a unit where younger people were being trained all the time, and he wondered whether it was the appropriate time to suggest that something might be done to encourage the employment in the U.K. of overseas doctors of intermediate seniority. Dr. LUENA H. HATCHER (Fiji) said that with the formation

of universities and medical schools in the Colonies it would be interesting to know whether anything was being done to limit the number of students who qualified in the United Kingdom. Dr. WAND said that the Willink Committee was expected to report in the near future on that subject. The CHAIRMAN added that some deans were limiting entrants to some extent.

Dr. M. H. ELLIOT-SMITH (New South Wales) said that a number of doctors who retired from the Colonial Service in middle age came to Australia, and were very happy there. It would seem that the type of work which might appeal to them would be insurance examinations and industrial medical work, and he wondered whether insurance companies might be ready to supply information when such vacancies occurred. A number of practitioners had asked him about practice in Australia. The Australian medical schools produced adequate numbers, but there was a slight lag, and there were a few opportunities still in Australia for United Kingdom graduates. There were opportunities for specialists in ear, nose, throat, and ophthalmology in the capital cities, and there were always opportunities in the more remote areas. Dr. L. T. JOBBINS (Queensland) said that Queensland differed somewhat from the other States in that it had a free hospital service and a National Health Service, and no political party was prepared to alter it. The chances of breaking into specialists' appointments in the large hospitals in Australia were not very good, but recently in Queensland there had been a new idea. The South Brisbane Hospital had been opened to a few superintendents of country hospitals. By serving the Government for three or four years, in which the opportunities for work were good, those men were given the opportunity of coming to the city, where they would receive £600 or £700 for three sessions and would be given the chance to establish themselves. That applied to overseas graduates.

Mr. J. COOK (Uganda) said it was of course possible to be seconded from the National Health Service into the overseas medical service, and that raised a point which had distressed some doctors in East Africa. There was a limit of six years on secondment, and he wondered whether the Committee had considered the possibility of asking for the limit to be raised. Dr. GREY-TURNER replied that it was not a true secondment at all. The Colonial Office was asked whether the six years' limit could be raised. The Colonial Office took it up with the Ministry of Health, who replied that it could not. The Ministry was, however, prepared to stretch it a little.

Dr. WAND suggested that the point should be noted for future reference.

Mr. L. A. H. McSHINE (Trinidad and Tobago) said that his Branch was shocked at the very low salaries paid to specialists. Secondly, it was felt desirable that there should be a separation of the medical service from the Civil Service. At the moment the services were being run as one, thus giving rise to inertia and inefficiency. His Branch desired to have a service run by the Emergency Medical Services Council on the pattern of the regional board system in the United Kingdom. Mr. J. B. DAVID (Ghana) asked whether the Central Council had any further plans for trying to restore the power to buy and sell practices. In his view many difficulties would disappear if that was possible. Dr. WAND said the matter had been discussed and a decision made to take no action. All political parties were opposed to the sale and purchase of practices, and there were other difficulties.

In concluding the discussion, the CHAIRMAN thanked representatives for their contributions, and assured them that the Committee's one desire was to serve them.

Overseas Luncheon

The luncheon to overseas representatives was held at the Old Assembly Rooms on July 12, when nearly 60 representatives were present. The Chairman of the Representative Body, Dr. I. D. GRANT, welcomed the visitors, and Dr. M. H. ELLIOT-SMITH (New South Wales) replied.

CHRISTIAN MEDICAL FELLOWSHIP

CHANGING STANDARDS IN MEDICAL PRACTICE

The annual Breakfast of the Christian Medical Fellowship upon the occasion of this year's Annual Meeting of the B.M.A. took place on Tuesday, July 16, at the Royal Station Hotel, Newcastle. The chair was taken by the President of the Association, Mr. WELDON WATTS, who introduced the morning's speaker, Dr. ROBERT G. COCHRANE, as the son of a famous father. Both had worked for many years in the Far East in the medical field. Dr. Cochrane, he said, had helped to make Vellore the great teaching hospital that it was to-day.

Dr. COCHRANE, who is consultant at St. Thomas's Hospital and at St. John's Hospital for Diseases of the Skin and adviser in leprosy to the Ministry of Health, then addressed the meeting on "Changing Standards in Medical Practice." He said that various influences were at work to-day in the nation's medical life threatening the relationship between the doctor and the patient, between the doctor and the State, and, last but not least, between the doctor and his colleagues. To-day's society evinced, on the one hand, an almost panic-stricken attitude towards nuclear weapons, and, on the other, an endeavour by certain sections blissfully to forget the stresses and strains of modern life through the primitive and altogether insidious and sensual medium of "rock 'n roll." Such alterations in national life were becoming a danger to the medical profession, changing in a subtle manner the whole ethical approach. There was also pressure from certain quarters to mould the profession into a State department. It was the duty of doctors to be aware of such changes and to refuse to surrender to the enervating influences which surrounded them; they must be ever alert against perils which might attempt to lower their ethical standards. There was a particular need at present for wisdom and leadership. Apathy should be thrown aside, and then there would no longer be any need for medical men to devise ways and means whereby their rights could be safeguarded and their interests protected.

Christianity and Medicine

There was a tendency for the profession to accept far too easily the benefits of its heritage without realizing that the high standards enjoyed to-day had come about largely as a result of the influence of Christianity on medicine. Such dangerous trends and tendencies were symptomatic of the age in which we lived. The only solution lay in the reformation which took place in the changed and redeemed heart. An ethical medical code had of course been in existence long before the Christian era. As far back as 2000 B.C. the ancient Babylonians and Greeks had had good and learned physicians. But the attitude of the ancient Greeks towards medicine had left much to be desired; a materialistic atmosphere prevailed in which only those who had good chances of survival received much consideration. With the introduction of Christianity and the later extension of compassion had come into the healing of the sick. Christ, as it had been said, had brought sentiment down to earth, but He could never be described as sentimental. The Christian influence had given to human life a dignity and value which it never before had been accorded. Dr. Cochrane said he could speak from personal experience of the power, strength, and inspiration that the doctor could bring to a patient by turning his thoughts away from the material transient things to the eternal verities of heaven itself.

It was appropriate that time should be allotted during the A.R.M. to considering the importance of Christianity in relation to medical practice, from the viewpoint of the doctor's responsibility to his patients, from the viewpoint of members of the profession as individuals and as units in the National Health Service, and from the viewpoint of the doctor's responsibility to the world of man at large, both nationally and internationally.

Research in Leprosy

Turning to the subject of clinical experimentation in medical research, Dr. Cochrane said that during the last fifteen years he had been endeavouring to bring leprosy into the realm of medical research; but not until it was regarded in the same way as malaria and similar diseases and made the subject of fundamental research would the disease really be understood, and not until then would doctors be persuaded that research work in the leprosy field was really worth while.

Dr. Cochrane ended by reminding his audience of the great opportunities and responsibilities which doctors of the present generation had in the realm of teaching, through which they could determine and mould the future of medicine, both at home and overseas. Such should be their standards that by their example the future profession would be manned by men and women of the utmost integrity.

Dr. I. D. GRANT, Chairman of the Representative Body, proposing a vote of thanks to Dr. Cochrane, said it was indeed true that many changes were taking place in medicine; it was only right and proper to remember that those changes in many cases were spiritual as well as material.

HONORARY DEGREES AT NEWCASTLE

The University of Durham held a Congregation on Thursday, July 18, for the conferment of honorary degrees by the Vice-Chancellor, Dr. C. L. C. BOSANQUET.

In presenting the first candidate, Dr. ALEX HALL, immediate Past-President of the B.M.A., for the honorary degree of D.C.L., the public orator described him as only the third general practitioner to hold office as President of the Association. His election as President in 1956 was evidence of the very deep respect felt for him by his colleagues, and he had discharged his duties most ably and with equal dignity and charm.

Dr. SOLOMON WAND, Chairman of Council of the B.M.A., also received the honorary D.C.L. The public orator described his long and distinguished record of service in the B.M.A. General practitioners were well aware how much they owed to his wisdom and courage during difficult years. "He is an impressive example of the right man in the right place, of a batsman to send in to awe and fascinate the onlookers by fearless facing of hostile bowling." In him the Association had a negotiator of quick brain, and, rarer still, friendly and appreciative but *tenacem propositi*.

The third candidate was Sir GEORGE PICKERING, Regius professor of medicine in the University of Oxford, who received the honorary degree of D.Sc. After listing Sir George Pickering's distinguished record as a research worker and the honours that had been bestowed on him all over the world, the public orator said that the Queen that week had showed that she shared the University of Durham's high opinion of him by conferring on him the honour of knighthood.

The last candidate, this time for the honorary degree of M.D., was Dr. MONA MACNAUGHTON, who, in the words of the public orator, was "a general practitioner of remarkable energy and strength of character." She had done much public service besides meeting the demands of her very busy practice in Newcastle, and in 1955-6 she was president of the Medical Women's Federation. Further, she was the first chairman of the North-eastern Faculty Board of the College of General Practitioners. She had also been chairman of the Newcastle upon Tyne Division of the B.M.A. "Her services to the medical profession and to the public advantage had won for her great and just regard."

University Reception

After the Congregation the Vice-Chancellor and Mrs. Bosanquet received the guests at a reception given by the University and Council of King's College in King's Hall. A colourful audience, arrayed in gowns of many hues, greatly enjoyed the University's hospitality and listened with pleasure to a short piano recital given by Mrs. Gwen Polwarth,

who played Schubert, Chopin, and Bartok, and Mr. Jack Armstrong—piper to the Duke of Northumberland—who set feet tapping to the rhythm of Northumbrian folk tunes.

CIVIC RECEPTION AND DANCE

On Wednesday evening the Lord Mayor and Lady Mayoress of Newcastle upon Tyne, Alderman and Mrs. J. W. TELFORD, on behalf of the City Council, held a reception and dance for those attending the Meeting. With the Lord Mayor and Lady Mayoress to receive the guests were the City's Sheriff, Miss E. B. TEMPLE, and her lady, Councillor Mrs. I. McCAMBRIDGE. The reception and dance were at the Old Assembly Rooms, an eighteenth-century building of great charm and distinction near the centre of the city. After the reception there was dancing till midnight in the large ballroom with its seven magnificent cut-glass chandeliers. The hospitality was on a scale that visitors have learnt to regard as typically Novocastrian.

GOLF COMPETITIONS

The B.M.A. Annual Golf Competitions took place during the Meeting at Newcastle. The Notts Ladies' Challenge Cup was played at Benton Park Club, and was won by Mrs. C. E. SHAFTO, of Newcastle upon Tyne. The competitions for the Leinster and Childe Cups were fought out over the Northumberland Golf Club's course at High Gosforth Park, and were won by Dr. H. D. GOLDER (Low Fell) and Dr. ALAN MARTIN (Tynemouth) respectively. Dr. Golder finished two-up on bogey, and Dr. Martin was all square. The Treasurer's Cup, also competed for at the Northumberland Golf Club, was won by Mr. A. B. McCULLOCH (Bishop Auckland), playing from a handicap of 14, with a net score of 70.

IN AND AROUND NEWCASTLE

Water in the Best Spirit

The weather in Newcastle during the Annual Meeting was not good. One particular downpour, which made front-page news in the *Evening Chronicle*, happened at a time when representatives were hard at work under cover, and so passed them by. As for the rest it amounted to no more than an inconvenience. Nothing, however, could damp the warmth of welcome that was extended to our medical hosts, this applied all down the line from our medical hosts, any time to interrupt their business to help a stranger with a kind, if not always immediately understandable, word. The floral decorations, which everywhere, except in the City Hall, were the work of the Ladies Committee, under the chairmanship of Mrs. Weldon Watts, ably abetted by its secretary, Dr. Mona Macnaughton, were a memorable sight constantly remarked upon. The get-together cocktail party given by the North of England and Tees-side Branches on the Newcastle Division to travel-worn representatives on July 9 set the tone of hospitality for the next 10 days. Dr. J. C. ARTHUR, President of the North of England Branch, with Mrs. ARTHUR, received the guests, who, incidentally, had their first glimpse of the charm of the Old Assembly Rooms, where many other functions were to be held.

Birds Under Foot

Those who were fortunate enough to be included in a visit to the Farne Islands had a memorable Sunday. By the time the coach arrived at Seahouses the weather was lifting, and the actual trip to the islands, although not precisely smooth, was accomplished without rain. The spectacle on the cliffs of the black sentinel cormorants, the serried ranks of puffins and guillemots, the nesting gulls and kittiwakes, and the thousands of terns with their tilting flight, was one to delight any naturalist.

a large colony of seals, for the most part bobbing solemnly about in the water like the elderly members of some marine club. With engines shut off the boats crept within a stone's throw of a small group airing themselves on the rocks; a few lumbered heavily into the water, but some remained to exchange interested stares with their medical visitors. A landing was made on one of the islands where the nests of the terns and eider duck were so thick on the ground that care was needed not to tread on the eggs; and the fledglings posed obligingly immobile for their photographs. An excellent tea was provided by the North Northumberland Division, and before their departure Dr. H. H. GOODMAN described for the guests conditions on the islands in his grandfather's time; in those days the doctor had to rely for the passage on sail or oars and was not uncommonly stranded on the islands by weather for several days. On the return journey fine views of Bamburgh and Alnwick castles were obtained.

The weather was not so kind to those who went on the all-day Sunday excursion to the Roman wall, organized by Dr. G. R. FREEDMAN. All were agreed that it was a most interesting outing, the success of which was in no small measure due to the excellence of the guides, who made history in stone come to life. The afternoon visit to Durham Cathedral was equally memorable.

Social Occasions

On Saturday evening, July 13, a reception was held by Miss TRUESDALE, Warden of the Ethel Williams Hall, Longbenton, and Mr. and Mrs. LINTON SNAITH. During the course of the evening, which fortunately remained fine, the Newcastle and District Branch of the Royal Scottish Country Dance Society, headed by their piper, Mr. MICHAEL HARPER, gave a brilliant display of Scottish and Irish dancing in the floodlit garden, and Mr. BASIL CLOUGH sang local folk songs to the Northumbrian pipes. Nearly 200 people were present at this very lively and informal occasion.

A large audience attended a concert in the City Hall on Sunday evening, July 14, sponsored by Abbott Laboratories Ltd. Conducted by HARRY BLECH, the London Mozart Players, led by ROBERT MASTERS, played Mozart's Symphony No. 35 in D Major, K.385 (Haffner), and Prokofiev's Symphony No. 1 in D Major, Op. 25 (Classical). Mr. ALFREDO CAMPOLI was the soloist in Mendelssohn's Violin Concerto in E Minor, Op. 64, and this combination of popular virtuoso and favourite piece was greatly appreciated. It was a special privilege to have Miss MURIEL SMITH as the other soloist, for during the recent operatic season at Covent Garden she has added greatly to her fame. Her attractive rendering of Mozart's arias *Deh, per questo istante (La Clemenza di Tito)* and *Voi, che sapete (Le Nozze di Figaro)* rounded off a thoroughly enjoyable evening.

Scottish News

B.M.A. SCOTTISH HOUSE

FACILITIES AVAILABLE

The following facilities will be available at Scottish House, 7, Drumsheugh Gardens, Edinburgh, 3, from August 1:

Catering

10.30 a.m. to 11.30 a.m.	...	Morning coffee
12.30 p.m. to 2 p.m.	...	Light lunches
3.30 p.m. to 4.30 p.m.	...	Afternoon tea

Bar

11.30 a.m. to 2.30 p.m.	} ...	Weekdays
5 p.m. to 7 p.m.		
11.30 a.m. to 1 p.m.	...	Saturdays

Message Service.—A telephone message service (Edinburgh 33646) has been introduced, and it is hoped that doctors in the area will find it useful. If a doctor knows that he is to be in the vicinity of Drumsheugh Gardens during his rounds he may arrange for messages to be

telephoned there, and he will receive them when he calls at Scottish House. The Association cannot, however, undertake to attempt to trace a doctor while on his rounds.

Members' Accommodation.—Members of the Association are entitled to entertain adult guests in the Common Room and Dining-room. Members' wives unaccompanied by a member will also be welcome in the Dining-room provided they indicate in the visitors' book the name of the member introducing them. Members' families and guests unaccompanied by a member may also use the Garden Room.

Library.—So far there are only a few reference books in the Library. The room, however, is available as a reading- or writing-room for members.

Many inquiries have been received regarding sleeping accommodation at Scottish House. There is, however, no such accommodation available.

Correspondence

Senior Registrar Problem

SIR,—Mr. T. H. Berrill's letter (*Supplement*, June 8, p. 330) should help us to see the senior registrar problem in its true perspective. To suggest, as some have done, that there are too many senior registrars in the hospital service is a strange misrepresentation of the situation. The fact is, of course, that there are too few consultants in many of our hospitals and that we are saved from the consequences of this deficiency only by relying on senior registrars and registrars for work that is properly the responsibility of consultants. All senior staff must be well aware of the extent to which the working of the hospitals is dependent on senior registrars.

It may be understandable that the Ministry should adopt a complacent attitude to this situation, but its supine acceptance by our profession is quite inexplicable. The total number of hospital consultants is still well below that estimated as necessary to staff our hospitals in the Government's own publications, and the number of suitably trained specialists required to correct this deficiency is certainly not less than that of the existing body of "term-expired" senior registrars. All these colleagues have been regularly recommended every year by their own seniors for continued training, and it is inconceivable that these same seniors could allow them to be discarded at the end of their training when the need for their services in the hospitals is so great. All sections of the profession should be equally interested in remedying staff deficiencies in our hospitals. The scheme suggested by Mr. Berrill would promptly solve this serious problem, and, as he has shown, the financial expenditure is not very great. The Government could be made to face it at once if the necessary pressure were brought to bear by a united profession.

Is it too much to ask that all our professional organizations should address themselves to this problem and spare no exertion until the Government is made to realize its urgency? They would be acting in the interests both of the hospital service and of a very ill-used group of our professional colleagues.—We are, etc.,

Pharmaceutical Advertising

SIR,—I would like to congratulate Dr. J. D. W. Whitney (*Supplement*, July 13, p. 7) upon his thoughtful and constructive attempt at banishing that curse of the doctor's breakfast table, the morning's drug-mail. He is indeed a medical Daniel after my heart. I have forgotten when I last attempted to retain any of the matter that arrives in this way, and my reasons have always been precisely those that Dr. Whitney outlines.

If I wish to know about any proprietary, I look instead at the advertisements in the medical press. In addition, I always interview the drug representatives, from whom I extract painfully certain basic facts about each product and enter them in an interleaved copy of the *National Formulary*, to which I have compiled an index of my own. Those few facts that I have selected turn out once again to be almost precisely the ones Dr. Whitney shows upon his specimen card.

I need not say how much better if the various firms would band together to afford me this simple information quite painlessly and in a form which could be assembled and even brought up to date. Sweet indeed may be the uses of advertisement, but the point is surely soon approaching where competition will strangle the entire market.—I am, etc.,

Richmond.

JOHN DANCY.

SIR,—Dr. J. D. W. Whitney, in his article entitled "Modern Pharmaceutical Advertising" (*Supplement*, July 13, p. 7), asks for the opinions of members of the pharmaceutical industry on how his proposed scheme may be improved upon. May I make the following suggestions? (1) The scheme should be administered by a representative body appointed by the B.M.A., the Royal Colleges, the Pharmaceutical Society of Great Britain, the Association of British Pharmaceutical Industry, and the Ministry of Health. It would be financed partly by Government grant and partly by the A.B.P.I., but income would also be derived from manufacturers desiring to have their products included in the scheme. (2) The body responsible for working the scheme would refuse to include any product in the scheme unless it was satisfied that the product was either (a) a standard drug or combination of drugs the properties of which were well known and that its use in therapeutics was generally acknowledged to be desirable, or (b) that the product was either a new therapeutic substance or a new presentation or modification of an existing product which constituted a real contribution to therapeutics. In the case of (b) the product must have been submitted to satisfactory clinical trials, evidence of which must be produced by the manufacturer. No product would be included in the scheme which was advertised to the public, or advertised to the medical profession in misleading and exaggerated terms.

The great majority of pharmacists would welcome such a scheme, particularly if the responsible body would make it clear that acceptance of the product was a recommendation that it should be prescribed and that practitioners were advised not to prescribe new preparations not accepted. Dr. Whitney, in dealing with a phenomenon which merely has nuisance value, has given the outline of a scheme which could be developed to deal with a more serious problem—the flood of so-called new remedies poured out by the pharmaceutical industry, many of which are formulations of existing well-known drugs the advantages of which have not been demonstrated, some new substances the pharmacological properties, therapeutic use, and possible side effects of which are unknown, and some which constitute valuable contributions to therapeutics. Most general practitioners have neither the time nor the capacity to distinguish to which class any new product belongs. The acceptance by an authoritative body such as I have suggested of a new product, coupled with the supply of clear and concise information, would be of considerable help to prescribers, and I have no doubt that in time the manufacturers of

"catch-penny" new remedies would find it unprofitable to continue their activities.—I am, etc.,

G. RAINE,
Chief Pharmacist, St. George's Hospital.
London, S.W.1.

SIR,—I wish I had written Dr. J. D. W. Whitney's article (*Supplement*, July 13, p. 7) demonstrating a common-sense way of providing up-to-date information about proprietary drugs. The need for such a guide as this has prompted me to write to 67 manufacturers during the past three years suggesting a similar plan and inviting comments. Only 42 of them replied. Some approved of the idea; others put forward objections, of which three recurred frequently but were anything but convincing. The first was that such uniformity would be disastrous to firms who diminished their advertising budget to finance the scheme while the clamour of their competitors continued to sell the goods. Surely, however, even firms who contributed to the index would not be completely prevented from advertising? I would not be certain that those who did not join in such a scheme at its inception would very soon be at a disadvantage. Many firms say that it is impossible to condense all the necessary information into the allotted space, but if they would leave out their little chats on the pharmacological oddities of the menopausal marmoset they could do so easily in every case. I will challenge all comers on this issue.

There seems to be a dislike in some quarters of quoting prices, which leads one to suspect that the firms concerned are ashamed of them. The actual arguments put forward are that a doctor should not count the cost of doing good to his patients (a convenient half-truth), that there are several different prices which could be quoted (but we do not need to know to the nearest halfpenny), and that prices are always fluctuating (a contingency already covered by the Whitney scheme). The card index, by showing up the occasional outrageously expensive product, would encourage economical prescribing and is worthy of support from the Ministry of Health. It appears that these critics have yet to produce a sound reason for their disapproval of such a useful system. I hope, therefore, that Dr. Whitney's suggestions will be supported by a medical profession hitherto stunned into apathy by the postal assault. I wonder how many doctors have written to the Association of British Pharmaceutical Industry with suggestions as they were invited to do (*Journal*, November 24, 1956, p. 1238).—I am, etc.,

Walsall.

J. P. LESTER.

Training Medical Administrators

SIR,—I thought that it would be of interest to your readers to know the results of the advertisement for a trainee appointment as administrative medical officer to the Newcastle Regional Hospital Board, which was referred to in the *Supplement* of April 27 (p. 232). There was a very good response, the Board receiving 25 applications from a wide field of applicants, including those now engaged in clinical hospital work, in public health, in general practice, and in other walks of life. The successful applicant is in fact now an orthopaedic registrar in a teaching hospital. He will be taking up his duties on September 1.—I am, etc.,

R. H. M. STEWART,
Senior Administrative Medical Officer,
Newcastle Regional Hospital Board.
Newcastle upon Tyne.

Plan for Remuneration

SIR,—Now that a Royal Commission has been appointed and one may expect reforms to parts of the N.H.S. to arise from its recommendations, we should do what we can to assist this end. Reform offers the most substantial improvements, and we have the chance to state the case to an impartial body not bound by political expediency or chicanery. It is not enough that we simply sit back and await its findings.

A percentage increase in remuneration will not of itself cure faults in the present system. In general practice there

must also be changes in the method of payment which will relate the fees to the quality and content of the services rendered. The capitation fee is not adequate when patients can call upon the services of their doctor to an unlimited extent. Some measures to restrain the over-demanding members of the population should accompany any revised system of remuneration. The fear that this would deter deserving cases from seeking advice is, in my experience, not borne out in fact. Why not a separate and realistic health stamp sufficient to cover costs and leave a working surplus? The latter could be used to build hospitals and a contingency fund. If a no-claims bonus is a useful restraint in private insurance, it should be even more so in the national schemes. Then, when the normal rate of demand is known, an idea of the maximum list can be gained. Since this is such an individual problem, so dependent upon the working tempo and the kind of work the doctor wishes to go for, I should like to put forward the following ideas, based upon provisions already in existence which have been introduced at various times since the Act.

We have a system incorporating all three methods of payment—namely, salary, capitation, and fee per item for special services. What are the initial practice allowance and supplementary annual payments but various forms of salary by which doctors in certain circumstances are paid in addition to their capitations? There are also one or two item fees at present, but they are a first charge on the residue of the central pool, thereby reducing the amount for general distribution. Finally, mileage and dispensing payments partly relate expenses to some individual practices. This is a plan within the existing framework and not therefore open to the plea of administrative impracticability, except possibly in the proposed treatment of loadings—and even this is already devised in National Insurance.

Salary.—A calculated minimum, to which may be applied annual increments based upon years of service, the object being to recognize the value of experience.

Capitation.—These fees are directly related to the size of a list and therefore roughly the amount of work done. But even this would be more equitable if the loadings, instead of being notional, were applied to, say, those under the age of 16 and over the age of 60, in which groups much of the work lies. (These ages are chosen to coincide with National Insurance and thereby provide an administrative tie-up.) The object here is to try to ensure fairer distribution to those practitioners with a preponderance in these groups.

Per Item.—A scale of fees for certain stipulated services over and above the normal day-to-day work. The object of this scale is to reward those providing special services, but leave those who did not wish to do so no worse off. Make these payments independent of the central pool.

Expenses.—Treat these as a separate factor, so that net remuneration is independent of them, and refund expenses more realistically in relation to individual practices. Earmark sums to be spent in improving practices.

Parity.—In line with the abolition of the sale of goodwill, provision for junior partners and assistants to reach parity after a definite period. In addition to earnings, a permanently low share also affects the pension.

It is my firm belief that until this Welfare State is on a sound actuarial basis, self-funding and self-supporting, then sooner or later it must fail through lack of resources. I do not wish to appear presumptuous but merely wish to add to the many better-informed opinions which must surely be expressed upon this important issue. Unrealistic adjustments to contributions, indiscriminate prescription charges, and ignoring legitimate pay claims are merely political expedients which put off the evil day.—I am, etc.,

Sowerby Bridge.

E. A. HUMPHREY.

Voice from Retirement

SIR,—At the present time, when everyone seems to be dissatisfied with their pay or income, I hesitate to join the great throng of discontented workers. However, I feel that I speak for many who must be similarly situated. Having practised many years in London, and, after the first war, in the country, I find myself on retirement with no pension and

little capital. It may be pointed out that, after working for so many years, I should have saved enough money to retire in comfort, if not affluence. Perhaps I, and all of us, should have done so. However, the education of two sons at public schools used up any money I might have put by for a rainy day. Also I feel that I cannot be blamed for not foreseeing the National Health Service. On retirement I received about the same sum that I paid for my practice—that is, half the sum at the present value of money. I think that those situated as I am have a real grievance, but as so many people are complaining at the present time I am content to state my case and leave it at that.—I am, etc.,

Newbury.

ALLAN FINN.

Promises

SIR.—In your leading article (*Journal*, June 15, p. 1408) you state, "It is indeed hard to see why—and hard to understand why Governments and political parties will not keep their promises." This expectation of the profession that Governments and politicians will keep their promises has been the source of most of the troubles of the profession since the N.H.S. was proposed. It is time we realized that these people never intend to honour their promises unless it suits them. They consider anything else outside the limits of practical politics.—I am, etc.,

Eastbourne.

S. A. MCSWINEY.

H.M. Forces

Brigadier P. J. L. Capon, late R.A.M.C., Director of Army Health, has been appointed Honorary Physician to the Queen, in succession to Major-General F. C. Hilton-Sergeant, C.B., C.B.E., retired.

Surgeon Commander T. S. Eimerl, D.S.C., R.N.V.R., has been awarded the R.N.V.R. Decoration.

Surgeon Commander D. F. Heath, R.N.V.R., has been awarded the Royal Naval and Royal Marine Forces Volunteer Reserve Decoration.

Surgeon Commander D. R. Goodfellow, V.R.D., R.N.Z.N.V.R., has been awarded a Clasp to the R.N.V.R. Decoration.

A *Supplement* to the *London Gazette* has announced the following awards:

Fourth Clasp to the Territorial Efficiency Decoration.—Major F. J. L. Lang, M.B.E., T.D., R.A.M.C.

Third Clasp to the Territorial Efficiency Decoration.—Major J. B. Bishop, T.D., R.A.M.C.

Second Clasp to the Territorial Efficiency Decoration.—Colonel V. K. Drennan, T.D., Lieutenant-Colonel (Acting Colonel) A. E. K. Price, T.D., Major S. Freeman, T.D. (retired), and Major M. W. Lloyd-Owen, T.D., R.A.M.C.

Territorial Efficiency Decoration.—Majors H. G. Floyd, R. Lamb, and I. B. Speight (now T.A.R.O.), R.A.M.C.

ROYAL NAVY

Surgeon Commanders C. P. Collins, D.S.C., and J. M. Holford, O.B.E., to be Surgeon Captains.

Surgeon Lieutenant-Commanders J. D. Stride, R. W. B. Scutt, W. B. Jack, M.B.E., M. P. Glanville, and G. N. Shell to be Surgeon Commanders.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant W. T. Newman to be Surgeon Lieutenant-Commander.

ROYAL ARMY MEDICAL CORPS

Captains C. W. Bowen, M.C., and N. E. Quin to be Majors.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Colonel J. W. Hirst, O.B.E., T.D., has been appointed Honorary Colonel 49th (W.R. & M.) Inf. Div., R.A.M.C., in succession to Colonel J. E. Rusby, M.C., T.D., J.P., whose tenure has expired.

Major (Acting Lieutenant-Colonel) J. P. Mitchell to be Lieutenant-Colonel.

Major R. S. Taylor, O.B.E., T.D., has been granted the acting rank of Lieutenant-Colonel.

Major G. D. Thompson, T.D., has retired, and has been granted the honorary rank of Lieutenant-Colonel. (Substituted for the notification in a *Supplement* to the *London Gazette* dated May 17.)

Captains (Acting Majors) H. Thompson, G. M. DeKeyser, and G. J. Hadfield to be Majors.

Captains D. V. Salkeld, P. Wilson, E. J. Clegg, J. F. Bell, and D. P. Winstanley to be Majors.

Captains A. R. Horler, A. R. H. Worssam, H. B. Juby, and D. W. Davison have been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY
MEDICAL CORPS

Colonel (Honorary Brigadier) G. J. V. Crosby, C.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Brigadier.

Colonels E. H. Evans, T.D., and D. H. Young, O.B.E., T.D., from Active List, to be Colonels.

Colonel D. P. Levack, C.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Colonel.

Lieutenant-Colonels C. O. Carter and N. Pyecroft, M.C., T.D., from Active List, to be Lieutenant-Colonels.

Lieutenant-Colonel D. W. E. Burridge, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Lieutenant-Colonel.

Major (Honorary Colonel) W. Bruce, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Colonel.

Majors (Honorary Lieutenant-Colonels) A. J. King, T.D., R. W. Fairbrother, T.D., and E. F. S. Morrison, M.C., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Majors G. A. Bell, T.D., G. H. Sanderson, T.D., D. H. Jenkins, and D. E. Sharvill, from Active List, to be Majors.

Majors R. A. P. Gray, T.D., C. N. Suter, and P. D. Thomson, T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the rank of Major.

Captain (Honorary Major) E. J. C. Hewitt, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

Captain (Honorary Major) J. A. W. Shearer has ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

NEW SURGERY ACCOMMODATION FOR
GENERAL PRACTICE

BY

J. COMYN, M.B.E., M.R.C.S., L.R.C.P.

AND

J. P. BARHAM, M.B., B.S.

The following description of new surgery accommodation is presented in the hope that our ideas may be of some help to others embarking on similar schemes.

We are two general practitioners working in partnership. We both live away from the centre of the town, and see patients at a lock-up surgery which is more centrally situated. Patients on either doctor's list may consult whichever doctor is most convenient; night emergency calls and week-end duty are carried out by each doctor in turn for one week.

Our previous surgery accommodation was situated in the main street. This was passed by the executive council as adequate, but it was very noisy, and consisted of only three main rooms and a storage and records room. One sink served the whole unit. Outside was a narrow pavement, leaving no room for prams, cycles, etc. No amount of internal reorganization would diminish the noise, as daylight came only from this direction. The consulting-room next to the waiting-room was not fully sound-insulated from the waiting-room itself.

We decided that, there being no other suitable existing premises in the town, it would be necessary to build anew. The difficulty immediately arose—where? Town-planning permission was refused for a single-story building in the main street with consulting-rooms at the back, and we did not wish to run to the cost of a two-story building when we planned to use only the ground floor. Eventually we decided to purchase part of the garden of an old house with frontage on a small street off the main road. This offered relative quiet and a fairly central position.

We found Stephen Taylor's *Good General Practice* very valuable in formulating our ideas of necessary accommodation, and finally decided that we would need a waiting-room of 210 square feet (19.5 square metres), two consulting-rooms each about 100 square feet (9.3 square metres), a clinical examination-rooms (one to each consulting-room), an office, and two lavatories (one for staff, one for patients).

General Design

The design should allow for working as at present, without secretarial help, or allow for the employment of a secretary in the future. The clinical room acts as a store for drugs, dressings, and instruments, and has a sink, sterilizer, gas-ring, microscope, etc.

These requirements were presented to an architect, who evolved the plan shown in Fig. 1 after various proposals and counter-proposals. It was not possible, without cramping

some features, to include Stephen Taylor's admirable recommendation—a lobby between each consulting-room and examination-room.

At this stage we found it essential to think of many small points—for example, which way a door should open. In the examination-rooms the couches would be in the way of doors opening inwards from the consulting-rooms.

Main Points

1. Both consulting-rooms are a sufficient distance away from the waiting-room to allow privacy. The consulting-rooms are each fitted with a wash-basin, and there is enough space for a large desk, patient's chair, doctor's chair, book-case, and dressings cupboard without overcrowding. There would be sufficient space also for an examination-couch if required, but we neither of us have one in the consulting-room at present.

2. The two examination-rooms open, one from each consulting-room, as shown in Fig. 1. Each contains an examination-couch, patient's chair, and wall hooks for

FIG. 1.—Plan of the building.

clothes. Windows are of obscured glass. There is also space for a small cabinet for instruments and dressings despite the size of the room—one is 9 by 5 feet (2.7 by 1.5 metres). We decided that, there being a wash-basin in the consulting-room adjoining, there was no need for a wash-basin in the examination-room.

3. The swing-doors from the hall can be locked, allowing patients to use the waiting-room before the doctor arrives.

4. The "back hall" is large enough to accommodate the record files, for running the unit without secretarial help.

5. A telephone exchange is fitted in the office. From this extensions run externally to each of our houses, so that calls are taken when the surgery is unattended. An internal extension runs to the first consulting-room, and from there to the second. This allows external or internal conversations from either consulting-room if the unit is run without secretarial help.

6. Floors are of thermoplastic tiles throughout. These are bright and easy to keep clean.

7. Electric tubular heaters have been installed, except in the waiting-room, where an electric convection heater is thought to be less dangerous for unwatched children. Water heating is by small gas heaters—an instantaneous heat in each consulting-room, and the gas storage heater in the clinical room.

8. The clinical room has been arranged as shown in Fig. 2. The laboratory section is on shelves above and below the sink—urine testing, stains, microscope, etc. Injections and dangerous drugs are in the cupboard by the sterilizer.

Fig. 2.—Plan of the clinical room.

9. An electric call sign, operated by a switch on the doctor's desk, shows the name of the doctor calling on a lighted sign in the waiting-room.

Other Features

The whole design is calculated to give light airy accommodation. The flat roof is in three layers to provide insulation from the sun's rays and to prevent heat loss in winter. A tower for the water-tank is insulated, and, because the building may be left without heat on cold week-ends in winter, an electric tubular heater is installed there. A red warning light in the clinical room shows when this heater is operating.

The external appearance is shown in Fig. 3. The walls are of red brick over a slate plinth, and the window-sills are also of slate. A concrete forecourt allows us to park our cars off the street, and allows plenty of room for cycles, prams, etc. Small flower-beds add to the cheerful appearance. Internally, floors are light blue, as is the wood-work; doors are flush-finished, surfaced with light oak-faced ply. A particularly pleasing appearance is given to the waiting-room by a plywood dado with fluted surface, topped by an oak rubbing-rail.

We have found an extractor fan an essential piece of apparatus for a waiting-room, both here and at our previous surgery. Patients seem loath to open windows, but the fan will clear the heaviest flog in a few moments.

Fig. 3.—Photograph of the exterior.

The entire cost of the scheme, including land, is within £3,800. Architects for the building were Messrs. Jackson and Jackson, of Folkestone.

Conclusion

We have now completed six months' work in the new building, and are well pleased with the result. No more do buses roar past as we strain to hear a foetal heart. Our surroundings are cheerful and everything is to hand. The patients are appreciative, and use the building with care. Many at first believed that the surgery was built by the State. We have been careful to point out that we have not even benefited by a Government loan for the project. Indeed, the credit squeeze has been a further stumbling-block. Even so, we feel that the project was well worth undertaking.

REFORMED HEALTH SERVICE FELLOWSHIP'S PLAN FOR SUBSIDIZED PERSONAL INSURANCE

Under the title "Towards a Reformed Health Service" the Fellowship for Freedom in Medicine published on July 26 its outline of a new plan for State-subsidized compulsory personal insurance as a method of financing the payment of doctors' fees and hospital charges and the purchase of prescribed drugs and appliances. In a foreword, Dr. R. HALE-WHITE, Chairman of the Fellowship, writes that the main objectives of the scheme are: "To check the deterioration of the traditional high standards of Medicine; to adjust the present distorted balance between insurance contributions and State subsidy, thus putting a curb on the ever-mounting cost of the Service to the taxpayer; to enable the family doctor to perform his proper function in the service of his patients, and so to relieve the burden placed on the hospitals; to give greater freedom to the patient and to restore his sense of personal responsibility for his own and his family's health."

Proposals for Insurance Scheme

Under the plan all employed, self-employed, and persons not gainfully occupied would be required to insure with an approved (non-profit-making) insurance society against the risk of ill-health. Their contributions would cover any dependants. Pensioners and others whose income is below a prescribed level would not be required to insure. They and their dependants would be wholly a charge on the State.

The premium rates and the scale of benefits would be fixed, but a society would be at liberty to offer optional benefits for extra premiums (for example, towards the cost of private beds, specialists' fees, etc.). The standard premium envisaged for an adult male employee would be 1s. 9d. a week, the employer contributing a like sum, which would approximate to 2d. in the £ on average wages. Lower scales of premium are suggested for women, juveniles, and others not liable for the basic rate. It is estimated that the total contributions in insurance premiums would amount to £202.93m. per annum.

A suggested alternative method of financing the insurance fund would be to assess the premium to be paid by the employee at say 3s. 6d. per week, with the proviso that no one should pay more than 2d. in the £ on his earnings. Employers would contribute like for like with their employees. Self-employed would be assessed at the same rate on their gross incomes.

The insurance societies would not be required to collect weekly contributions. This would be done either by employers or by organizations such as clubs, benevolent societies, etc. Administrative expenses of the societies, it is estimated, would be 10%, but in view of the large sums involved might well prove less.

Family Doctor Service

According to the Fellowship scheme, insured patients would be free to consult any family doctor they chose. Fees

¹ Copies may be obtained free from the Fellowship for Freedom in Medicine, 45, Nottingham Place, London, W.1.

would be charged for services rendered. A schedule of standard benefits would be agreed upon between the Ministry, the doctor approved societies, and the medical profession. The doctor would, as in the Norwegian and New Zealand schemes, name his own fee, which would not be wholly covered by the scheduled benefit. The society and the State would provide the benefit in proportions of 60% and 40% respectively and the patient would pay the balance.

The following example is given of the way in which doctors' fees might be met:

	Doctor's Fees £ s. d.	Scheduled Benefits £ s. d.	Patient Pays s. d.
Consultation ..	7 0	6 0	1 0
Domiciliary visit ..	12 0	10 0	2 0
Special investigations ..	1 1 0	18 0	3 0
Minor operation ..	3 5 0	3 0 0	5 0
Consultation ..	7 0	6 0	1 0
	£5 12 0	£5 0 0	12 0

In the scheme outlined the gross contribution by insurance societies and patients to the general medical services would be nearly £44m. and the State subsidy £24m. Pensioners and those in the low-income group and their dependants would receive all medical services and drugs at the cost of the State.

Hospital Service

The Fellowship's scheme for the hospital service would be applicable to all hospitals, including maternity, mental deficiency, and infectious fever hospitals, and, within prescribed limits, to nursing-homes and home nursing. It is calculated from available data that the total annual expenditure on hospitals would be met by an average fee of £18 4s. per week per occupied bed and 10s. per out-patient or casualty per visit. It is envisaged that the patient should pay an attendance fee of 2s. a day and contribute 2s. a visit in-patient boarding fee of 2s. a day and contribute 2s. a visit to the out-patients' or casualty departments. The society would pay 60% of the balance of the in-patients' fees and the State 40%. In the case of out-patients and casualties the society and the State would make equal contributions of 4s. per visit, leaving the patient to pay 2s.

The income of the insurance societies would enable them to provide an average of £10 10s. a week for a maximum period of 10 weeks per annum for every in-patient, and 4s. a day for every out-patient up to 10 visits per annum. The sources of the hospitals' payment would thus be:

	In-patients (per week) £ s. d.	Out-patients (per visit) s. d.
Insurance society ..	10 10 0	4 0
Exchequer ..	7 0 0	4 0
Patient ..	14 0	2 0
	£18 4 0	10 0

After ten weeks, or ten out-patient visits per annum, the whole cost would be borne by the Exchequer.

Payments by the society and the Exchequer would be available (up to ten weeks per annum) to patients who choose to occupy private hospital or nursing-home beds, or for whom their doctor certifies the need for a nurse in their own homes, or who are transferred from hospitals to convalescent homes. Patients would be liable for the balance of the fees; after ten weeks they would be assisted only by the Exchequer contribution—that is, 40% of the benefit. Insurance societies would be at liberty to offer additional benefits for additional (optional) premiums.

On the basis of the scheme outlined, the gross contribution by insurance societies and patients to the hospitals would exceed £150m. a year, and the cost to the Exchequer of the hospital service would be correspondingly reduced. No changes in the existing financial arrangements between hospitals and their staffs is contemplated.

Pharmaceutical Service

Under the Fellowship's plan for pharmaceutical services, the present uniform charge of 1s. per item dispensed would be abolished. A working list of "vital" drugs and essential appliances would be drawn up by an expert committee, who would revise the list from time to time, and these would be

provided free—or nearly free. All other pharmaceutical products and appliances would be paid for in full except by the non-insured, who would make a small token payment, recoverable if hardship was involved.

It is estimated that the adoption of this scheme would save the Exchequer at least £20m. per annum.

Advantages of the Scheme

The Fellowship believes that its plan would be advantageous to patients, doctors, hospitals, and to the Exchequer. A free health service would still be available for those who cannot afford to pay, while those who can afford it would be obliged to insure themselves, with State aid. Every insured person would be a private patient, and thus "the traditional and invaluable personal relationship between doctor and patient would be restored; and the patient would regain his respect for his doctor and his sense of responsibility for his own and his family's health." The arrangement by which the State would undertake the whole cost of long-stay patients in hospital after 10 weeks would dispose of any fear a patient might have of the cost of a long illness.

The Fellowship foresees a regaining of status and enthusiasm for work by family doctors. The plan would bring proper rewards for good work and experience and encouragement to the G.P. "to undertake, as in the past (until 1948), such diagnoses, treatment, pathological examinations, and minor operations as lay within his power, instead of referring so many of his patients to hospital." It is believed that "doctors would be freed from bureaucratic interference and from the threat of a State monopoly in Medicine," and that "the way would be clear for the revival of the (optional) right to buy and sell the goodwill of practices—to the great advantage of entrants into practice and of those wishing to 'ease off' or move elsewhere or retire." It is also believed that practice vacancies in industrial areas would be more readily filled if young doctors saw a prospect of subsequently acquiring a practice elsewhere.

With an improvement in the standard of general practice the demands upon hospitals would be reduced. With the hospitals deriving 60% of their revenues from private sources the way would be open for a relaxation of remote control over insignificant expenditure and for a greater measure of financial autonomy.

The Fellowship states that its scheme would offer an immediate saving to the Exchequer of £140m. a year. This would allow for a reduction in taxation, which would compensate for the increased contributions.

MEDICAL PRACTICES COMMITTEE

CLASSIFICATION OF AREAS AT JUNE 30, 1957

The numerals I, II, and III denote Designated, Intermediate, and Restricted areas respectively. In those Designated areas marked with an asterisk the admission of one or two doctors may result in reclassification of the area, and doctors who wish to start a practice in any of these areas are advised to consult the executive council for the area to ascertain the up-to-date position before entering into firm commitments.

In urban areas the designation does not necessarily apply to any part where the population density is lower than in the area generally—for example, the rural fringe of many urban areas. In rural areas the designation applies to the centres of population only.

Amendments of these classifications will be published periodically.

ENGLAND : COUNTIES

Bedfordshire.—I: *Leighton Buzzard. II: Bedford, Eaton Socon, Sandy, and Potton; Barton and Shillington; Bedford; Biggleswade, Dunstable; Harrold, Sharnbrook, Riseley, and Turvey; Luton; Bedford and Arlesey; Woburn, Toddington, and Cranfield.

Berkshire.—II: Borough of Maidenhead. Borough and Rural Districts of Abingdon; Newbury; Wallingford, Windsor; Wokingham. Urban and Rural District of Wantage (except

Brightwalton). Rural Districts of Bradfield; Cookham; Faringdon, Binfield, Crowthorne, and Sandhurst (Easthampstead R.D.). III: Rural District of Hungerford. District of Brightwalton (Wantage U. and R.D.). Bracknell New Town (Easthampstead R.D.).

Buckinghamshire.—II: Amersham; Aylesbury; Bletchley; Buckingham; Chalfont St. Giles, Chalfont St. Peter, and Gerrards Cross; Chesham; Datchet; Eton; Flackwell Heath; High Wycombe; Long Crendon; Marlow; Newport Pagnell; Olney; Slough and Cippenham (except Langley with Stoke Poges and Wexham Court); Stony Stratford, New Bradwell-cum-Wolverton, and Hanslope; Wendover; Whitechurch and Cublington; Wing; Winslow; Woburn Sands. III: Beaconsfield and Seer Green; Bourne End; Colnbrook; Great Missenden and Prestwood; Iwer; Haddenham; Hambledon; Lane End; Langley with Stoke Poges and Wexham Court (Slough and Cippenham); Prince's Risborough and Hampden; Steeple Claydon; Stokenchurch; Waddesdon; Wraybury.

Cambridgeshire.—II: Cambridgeshire (except Isleham). III: Isleham.

Cheshire.—I: Crewe and Nantwich (subdistrict "A," *Crewe and Haslington); Hyde, Dukinfield, and Stalybridge (*Hyde); Runcorn (*Runcorn); Wirral (*New Ferry and Bebington). II: Altrincham (subdistricts of Altrincham, Bowden, Broadheath, and West Timperley); Hale; Timperley; Bredbury and Romiley (Bredbury, Romiley, and Woodley); Hazel Grove and Bramhall; Marple and Marple Bridge; Disley and High Lane; Cheadle and Gatley (Cheadle and Gatley; Cheadle Hulme); Chester (Ellesmere Port, Whitby, and Little Sutton; Malpas; Tarporley); Congleton (Congleton); Crewe and Nantwich (Nantwich; Sandbach; Alsager); Hoylake and West Kirby (Hoylake, Meols, and Greasby; West Kirby and Caldby; Heswall, Irby, and Pensby); Hyde, Dukinfield, and Stalybridge* (Dukinfield; Stalybridge); Knutsford and Wilmslow (Knutsford; Lymm; Macclesfield (Macclesfield; Poynton); Mid-Cheshire (Northwick and Weaverham with Cuddington, Sandiway, and Rudheath; Winsford; Middlewich); Runcorn (Frodsham; Stockton Heath); Sale (Sale); Wirral (Bromborough and Eastham; Neston, Parkgate, and Willaston). III: Chester (subdistricts of Upton-by-Chester and Bache; Farndon; Tattenhall); Crewe and Nantwich (Audlem; Wrenbury; Holmes Chapel; Shavington); Hyde, Dukinfield, and Stalybridge (Hollingworth and Mottram); Knutsford and Wilmslow (Wilmslow and Handforth with Styal; Alderley Edge; Chelford, Mobberley, Warford, and Great Warford; Partington); Macclesfield (Bollington); Mid-Cheshire (Great Budworth; Davenham); Runcorn (Helsby; Stretton; Grappenhall).

Cornwall.—II: Albaston, Callington, and Calstock; Bodmin; Bude; Bugle and St. Dennis; Camborne; Carn Brea; Chacewater; Falmouth; Helston; Launceston; Liskeard; Marazion; Newquay; Padstow; Penryn; Penzance; Perranporth; Porthleven; Port Isaac; Probus; Redruth; St. Agnes; St. Austell; St. Blazey; St. Columb; St. Ives and Carbis Bay; St. Just; Truro. III: Boscawen; Camelford; Cawsand; Constantine; Constantine Bay; Delabole; Downderry; Fowey; Grampound; Hayle; Lizard (The); Looe; Lostwithiel; Mevagissey; Millbrook; Mullion; Pensilva; Perranarworthal; Polperro; Polyphant; Praze; Rock; Ruanhighlanes; St. Germans; St. Keverne; St. Mawes; St. Stephen; Saltash; Tintagel; Torpoint; Townshend; Tywardreath; Upton Cross; Wadebridge; Widemouth Bay.

Cumberland.—II: Aspatria; Brampton; Cleator Moor; Cockermouth; Egremont; Keswick; Longtown; Maryport; Millom; Penrith; Silloth; Whitehaven and Rowrah; Wigton; Workington. III: Alston; Bootle; Caldbeck; Dalston; Distington; Gosforth; Harrington; High Hesket; Kirkbride; Kirkoswald; Ravenglass; Wetheral.

Derbyshire.—I: Urban Districts of *Heanor; *Long Eaton; *Swadlincote. Rural Districts of *Blackwell; *Chesterfield; *Clowne. II: Boroughs of Buxton; Chesterfield; Glossop; Ilkeston. Urban Districts of Alfreton; Bolsover; Clay Cross; Dronfield; Matlock; New Mills; Ripley; Staveley; Wirksworth. Urban and Rural Districts of Ashbourne; Bakewell; Belper. Rural Districts of Chapen-en-le-Frith; Repton, Shardlow. III: Urban District of Whaley Bridge.

Devon and Exeter.—II: County Borough of Exeter. Boroughs of Barnstaple; Bideford (with Instow); Dartmouth with Kingswear; Honiton; Okehampton; South Molton; Tiverton; Torquay. Urban Districts of Ashburton and Buckfastleigh; Axminster; Crediton (with Sandford); Dawlish; Exmouth; Ilfracombe (with Coombe Martin, Woolacombe, Mortehoe, and Lee); Kingsbridge; Newton Abbot (with Kingsteignton); Northam (with Appledore and Westward Ho); Paignton; Salcombe; Tavistock. Rural Districts of Honiton; Plympton St. Mary (except Newton Ferrers and Yealmpton); Kingskerswell and Ipplepen (Newton Abbot Rural District). III: Boroughs of Torrington (Great); Totnes. Urban Districts of Brixham (with Churston

Ferrers and Galmpton); Budleigh Salterton; Holsworthy; Lynton (with Lynmouth); Ottery St. Mary; Seaton (with Colyton); Sidmouth (with Sidbury); Teignmouth (with Shaldon and Bishopsteignton). Rural Districts of Axminster; Barnstaple; Bideford; Crediton; Holsworthy; Kingsbridge; Newton Abbot (except Kingskerswell and Ipplepen); Okehampton; St. Thomas; South Molton; Tavistock; Tiverton; Torrington; Totnes; Newton Ferrers and Yealmpton (Plympton St. Mary R.D.).

Dorset.—II: Blandford and district; Bridport and district; Broadstone and district; Charmouth, Lyme Regis and district; Dorchester and district; Milton Abbas and Winterborne Stickland; Poole, with Branksome (North) and Parkstone (North); Portland; Shaftesbury and district; Sherborne and district; Sturminster Newton, Marnhull and district; Swanage and district; Weymouth, with Broadway, Chickerell, Preston, and Wyke Regis; Wimborne and district; Winfrith, Wool and district. III: Abbotsbury; Beaminster; Bere Regis; Branksome Park, Canford Cliffs, Sandbanks, Lilliput, and Parkstone (South); Cerne Abbas and district and Glanvilles Wootton and Buckland Newton and district; Child Okeford and district; Corfe Castle and district; Cranborne and district; Evershot and district; Ferndown and West Moors; Gillingham, Bourton and district; Handley and district; Lytchett Minster, Lytchett Matravers and district; Maiden Newton and district; Puddletown and district; Stalbridge and district; Verwood and district; Wareham and district; Yetminster and district.

Durham.—I: Urban Districts of *Billingham; *Bishop Auckland and *Bishop Auckland town; *Brandon and Byshottles; *Consett; *Felling; *Hebburn; *Houghton-le-Spring; *Seaham; *Spennymoor; *Stanley; *Washington. Rural Districts of *Chester-le-Street; *Durham; *Easington. II: Municipal Boroughs of Durham; Hartlepool; Jarrow; Stockton-on-Tees. Urban Districts of Barnard Castle; Blaydon; Boldon; Chester-le-Street; Crook and Willington; Hetton; Ryton; Shildon; Tow Law; Whickham (including Dunstan). Darlington R.D.; Sedgfield R.D. (except Sedgfield Village and Stillington); Sunderland R.D.; Evenwood, Cockfield and Butterknowle (Barnard Castle R.D.); Lanchester R.D.; Stockton-on-Tees R.D.; Weardale R.D.; Gainford (Barnard Castle R.D.); Middleton-in-Teesdale (Barnard Castle R.D.); Sedgfield Village (Sedgfield R.D.); Stillington (Sedgfield R.D.).

Essex.—I: Municipal Borough of *Dagenham (except Marks Gate Estate). Urban District of *Baintree and Bocking. Rural District of *Tendring (except Gt. Bentley, St. Osyth, and Thorpe-le-Soken); *Marks Gate Housing Estate (including that part which falls within Ilford Borough). II: Municipal Boroughs of Barking; Chelmsford; Chingford; Colchester; Harwich; Ilford (except Marks Gate Housing Estate); Leyton; Maldon; Romford; Saffron Walden; Walthamstow; Wanstead and Woodford. Urban Districts of Benfleet; Basildon (except Basildon New Town); Brentwood; Burnham-on-Crouch; Canvey Island; Chigwell; Clacton-on-Sea; Epping; Frinton and Walton; Halstead; Hornchurch; Rayleigh; Thurrock (except Aveley Housing Estate); Waltham Holy Cross; Witham. Rural Districts of Epping and Ongar (except Harlow New Town); Great Dunmow; Halstead; Lendin and Winstree; Rochford; Aveley Housing Estate (Thurrock U.D.); Basildon New Town (Basildon U.D.); Harlow New Town (Epping and Ongar R.D.). III: Urban Districts of Brightlingsea; West Mersea; Wivenhoe. Rural Districts of Braintree; Chelmsford; Malden; Saffron Walden, Great Bentley (Tendring R.D.); St. Osyth (Tendring R.D.); Thorpe-le-Soken (Tendring R.D.).

Gloucestershire and City.—II: Almondsbury, Olveston, and Patchway; Berkeley; Bishop's Cleeve, Cleeve Hill, and Winchcomb; Brockworth, Churchdown, and Hucclecote; Charlton Kings, Cheltenham, and Prestbury; Chipping Sodbury and Yate; Cinderford and Drybrook; Cirencester, Rendcombe, and South Cerney; Coleford, Parkend, and Yorkley; Corse and Newent; Cranham and Painswick; Dursley, Uley, and Wotton-under-Edge; Filton, Little Stoke, and Stoke Gifford; Frampton Cotterell, Hambrook, and Stapleton; Gloucester; Hanham, Kingswood, and Warmley; Lydbrook and Ruardean; Lydney; Mangotsfield; St. Briavels; Stroud and Stonehouse; Tetbury; Tewkesbury; Tidenham. III: Bitton, Oldland, and Oldland Common; Blakeney; Blockley and Moreton-in-Marsh; Bourton-on-the-Water and Stow-on-the-Wold; Bream; Brimscombe (Burlington) and Minchinhampton; Chalford and Eastcombe; Chipping Campden and Mickleton; Fairford and Lechlade; Frampton-on-Severn; Marshfield and Wick; Mitcheldean; Nailsworth; Newnham and Westbury-on-Severn; Northleach; Pilning; Thornbury.

Hampshire.—I: Municipal Borough of *Aldershot. Municipal Borough of *Basingstoke. II: Boroughs of Christchurch (except Mudeford); Eastleigh; Gosport; Lymington; Boroughs and Rural Districts of Andover; Romsey. Municipal Borough and northern half of Rural District of Winchester. III: Districts

of Fareham; Farnborough; Havant and Waterloo (except Leigh Park Housing Estate). Rural Districts of Basingstoke; Droxford; Kingsclere and Whitechurch; New Forest; Ringwood and Fordingbridge; Stockbridge; Winchester (southern half). Urban and Rural Districts of Alton; Petersfield (except Liss). Rural District of Hartley Wintney and Urban District of Fleet. III: District of Hartley Urban and Rural District; Leigh Park Housing Liss (Petersfield Urban and Rural District); Mudeford (that Estate (Havant and Waterloo Urban District); Mudeford (that portion of the Borough of Christchurch immediately east of a "Stanpit" which is within a radius of approximately half a mile from the point of the seafront known as "Sandhills").

Herefordshire.—II: Bromyard and district; Grosmont, Ewyas Harold, Longtown, Vowchurch and district; Hereford and district; Kingston and district; Ledbury and district; Leominster and district; Much Birch and district; Ross-on-Wye and district; Fown III: Colwall, Cradley and district; Eardisley and district; Fownhope and district; Kingstone and district; Leintwardine and district; Letton and district; Pembridge and district; Tarrington and district; Weobley and district.

Hertfordshire.—I: District of *Waltham Cross. II: City of Hertford. III: District of *Hemel Hempstead; Hertford; Watford. St. Albans. Boroughs of Hemel Hempstead; Berkham Urban Districts of Baldock; Barnet and East Barnet; Berkhamsted; Bishop's Stortford; Bushey; Cheshunt and Goff's Oak; Chorley Wood; Harpenden; Hitchin; Hoddesdon; Leighton; Rickmansworth; Royston; Sawbridgeworth; Stevenage; Tring; Ware; Welwyn Garden City. Rural Districts of Braughing; Elstree and Boreham Wood; Hatfield; Hemel Hempstead; Hertford; Hitchin; St. Albans; Watford. III: Rural Districts of Ware; Welwyn.

Huntingdonshire.—II: Huntingdon; Kimbolton; Ramsey; St. Ives; St. Neots; Warboys; Yaxley. III: Alconbury Weston; Buckden; Somersham; Stilton.

Isle of Ely.—II: Chatteris; Ely; Haddenham; Littleport; March; Parson Drove; Sutton; Wisbech; Whittlesey. III: Doddington; Manea; Mepal; Thorney. **Isle of Wight.**—II: Cowes district; Newport district; Ryde district; Sandown and Shanklin district; Ventnor district. III: Rural Areas of Totland, Freshwater, and Yarmouth; Bembridge; Niton; Shorwell; Limerstone.

Isles of Scilly.—III: Whole of area.

Kent and Canterbury.—I: Borough of *Gravesend. II: Beckenham; Bexley; Bromley; Canterbury; Chatham; Dartford; Deal; Dover; Erith; Faversham; Folkestone; Gillingham; Hythe; Maidstone; Margate; Ramsgate; Rochester (Rochester); Rochester (Strood); Tenterden. Royal Borough of Tunbridge Wells. Urban Districts of Ashford; Broadstairs and St. Peters; Chislehurst and Sidcup; Crayford; Herne Bay; Northfleet; Orpington; Penge; Sevenoaks; Sittingbourne and Milton Regis; Southborough; Swanscombe; Tonbridge; Whitstable. Rural Districts of Ashford West; Dartford; Easry (except Easry and Districts of Ashford West; Dartford; Romney Marsh; Minster); Malling (except East Peckham); Romney Marsh; Strood (except Halling); Swale; Tonbridge (except Brenchley, Strood (except Halling); Isle of Sheppey; Otford and Shoreham Langton, and Pembury); Isle of Lydd; New Romney (Sevenoaks R.D.). III: Boroughs of Lydd; Bridge Blean; Sandwich. Rural Districts of Ashford East; Sevenoaks (except Cranbrook; Dover; Elham; Maidstone. Districts of Otford and Shoreham); Tenterden; Maidstone (Easry R.D.); Brenchley (Tonbridge R.D.); Halling (Strood R.D.); Langton East Peckham (Malling R.D.); Pembury (Tonbridge R.D.).

Lancashire.—I: Districts of *Ashton-in-Makerfield; *Ashton-under-Lyne; *Aspull; *Bacup; *Barrowford; *Chadderton; *Denton; *Droylsden; *Farnworth and Kearsley; *Haydock; *Heywood; *Hindley; *Huyton-with-Roby; *Irlam; *Leigh; *Leyland; *Litherland; *Prescot; *Radcliffe; *Tyldesley; *Urmston; *Westhoughton; *Whitworth; *Widnes; *Worsley. II: Districts of Abram; Accrington; Adlington; Atherton; Billinge and Winstanley; Brierfield; Chorley; Clayton-le-Moor; Clitheroe; Colne; Crompton; Crosby; Dalton-in-Furness; Darwen; Eccles; Failsworth; Fleetwood; Formby; Fulwood; Golborne; Great Harwood; Haslingden; Horwich; Ince-in-Makerfield; Kirkham; Lancaster; Lees; Littleborough; Little Lever; Longridge; Lytham-St. Anne's; Middleton; Milnrow; Morecambe and Heysham; Mossley; Nelson; Newton-le-Morecambe and Heysham; Mossley; Padham; Prestwich; Willows; Ormskirk; Orrell; Oswaldtwistle; Royton; Skelmersdale; Ramsbottom; Rawtenstall; Rishton; Swinton and Pendlebury; Standish-with-Langtree; Stretford; Turtton; Ulverston; Upholland; Thornton Cleveleys; Tottington; Withnell. Rural Districts of Walton-le-Dale; Warden; Whitefield; Preston; Warrington; Blackburn; Burnley; Chorley; Lancaster; Preston; Districts of ton; West Lancashire; Whiston; Wigan. III: Districts of Blackrod; Carnforth; Church; Grange; Poulton-le-Fylde; Preesall; Rainford. Rural Districts of Clitheroe; Fylde; Garstang; Lunedale; Ulverston.

Leicestershire and Rutland.—I: District of *Hinckley. II: Borough of Loughborough. Rural District of Loughborough.

Districts of Ashby-de-la-Zouch; Coalville; Leicester (surrounding places); Lutterworth (except Peatling Parva); Market Harborough (except Hallaton); Melton Mowbray (except Bottesford and Somerby); Oadby and Wigston; Rutland (except Market Overton and Uppingham). III: Bottesford (Melton Mowbray); Hallaton (Market Harborough); Market Overton (Rutland); Peatling Parva (Lutterworth and district); Somerby (Melton Mowbray); Uppingham (Rutland).

Lincolnshire (Holland).—I: *Spalding Town (Spalding U. and R.D.). II: Boston Borough and R.D.; East Elloe R.D.; Spalding U. and R.D. (except Spalding Town).

Lincolnshire (Kesteven).—I: District of *Stamford. II: Districts of Bourne; Grantham; Market Deeping; North Hykeham; Sleaford. III: Districts of Ancaster and Gaythorpe; Basingham; Billinghay; Castle Bytham; Colsterworth; Corby; Heckington; Heighington; Horbling and Billingborough; Long Bennington; Martin; Metheringham; Navenby; Rippingale; Ropsley; Ruskington and Leasingham; Woolsthorpe by Belvoir.

Lincolnshire (Lindsey).—I: Brigg Area (*Barton-on-Humber U.D.). II: Brigg Area (Scunthorpe Borough; Brigg U.D.; Gainsborough U.D.); Gainsborough Area (Gainsborough U. and R.D., except Newton-on-Trent, Willingham by Stow, and Scotter); Grimsby Area (Grimsby R.D.; Cleethorpes Borough); Horncastle Area (Horncastle U. and R.D., except Tetford); Isle of Axholme Area (Isle of Axholme R.D.); Louth Area (Louth Borough; Louth R.D., except Thoresby North); Spilsby Area (Spilsby R.D., except Hogsthorpe); Skegness U.D.; Alford U.D.; Welton Area (Welton R.D., except Bardney, Dunholme, and Ingham). III: Caistor Area (Caistor R.D.; Market Rasen U.D.); Gainsborough Area (Newton-on-Trent; Willingham by Stow; Scotter, Gainsborough R.D.); Horncastle Area (Tetford, Horncastle R.D.); Louth Area (Thoresby North, Louth R.D.; Mablethorpe and Sutton U.D.); Spilsby Area (Hogsthorpe, Spilsby R.D.); Welton Area (Bardney, Dunholme, and Ingham, Welton R.D.).

London.—I: Borough of Camberwell (*West and Town Hall Wards; *Coburg, Addington, St. George's, North Peckham, and Marlborough Wards); Hackney (*Kingsmead and Wick Wards); Lambeth (*Prince's and Oval Wards). II: Boroughs of Battersea; Bermondsey; Bethnal Green; Camberwell (except West and Town Hall Wards; Coburg, Addington, St. George's, North Peckham, and Marlborough Wards); City of London and Shore-ditch; Deptford; Finsbury; Fulham; Greenwich; Hackney (except Kingsmead, Triangle, Victoria, and Wick Wards); Hammer-smith; Hampstead (except Central Town and Town Wards); Holborn; Islington; Kensington, North; Lambeth (except Herne Hill, Prince's, and Oval Wards; Lewisham; Paddington, North of Harrow Road; Poplar; St. Marylebone, North; St. Pancras (except Whitfield No. 7 Ward); Southwark; Stepney; Stoke Newington; Wandsworth (except Putney and Streatham Common Wards); Westminster (except Wards of St. Margaret, Knightsbridge, St. George, and Hamlet of Knightsbridge); Woolwich. III: Boroughs of Chelsea; Hackney (Triangle and Victoria Wards); Hampstead (Central and Town Wards); Kensington, South; Lambeth (Herne Hill Ward); Paddington, South of Harrow Road; St. Marylebone, South; St. Pancras (Whitfield Ward); Wandsworth (Putney and Streatham Common Wards); Westminster (St. Margaret, Knightsbridge, St. George, and Hamlet of Knightsbridge Wards).

Middlesex.—I: Boroughs of Brentford and Chiswick (*Turnham Green Ward); Enfield (*Green Street and Ponders End Wards; *Ordinance and Enfield Wards). Boroughs of Southall; Wood Green (*Noel Park and Town Hall Wards). Urban Districts of *Hayes and Harlington (East Ward); *Ruislip (Northwood). II: Boroughs of Acton; Brentford and Chiswick (except Bedford Park, Old Chiswick, and Turnham Green Wards); Ealing; Edmonton; Enfield (except Green Street and Ponders End Wards, Ordinance and Enfield Wash Wards); Finchley (except Manor, St. Mary's, and the Bishop's Wards); Harrow (except Pinner South Ward); Hendon (except Garden Suburb and Golders Green Wards); Heston and Isleworth; Hounslow; Southgate; Tottenham (except White Hart Lane Ward); Twickenham; Uxbridge; Wembley; Willesden; Wood Green (except Noel Park and Town Hall Wards). Urban Districts of Feltham; Friern Barnet; Hayes and Harlington (except Harlington and East Wards); Potter's Bar; Staines; Sunbury-on-Thames; Yiewsley and West Drayton. III: Boroughs of Brentford and Chiswick (Bedford Park and Old Chiswick Wards); Finchley (Manor, St. Mary's, and the Bishop's Wards); Harrow (Pinner South Ward); Hendon (Garden Suburb and Golders Green Wards); Tottenham (White Hart Lane Ward). Urban District of Hayes and Harlington (Harlington Ward).

Norfolk.—I: Municipal Borough of *King's Lynn. Rural District of *Blofield and Flegg. II: Municipal Borough of Thetford. Urban and Rural District of Swaffham. Urban Districts of Cromer; Downham Market; North Walsham; Sheringham;

ing parishes of 1999.

Brynamman; Ferryside; Llanybyther; Llandilo; Nantgaredig; Pontyberem and Pontyates; Trimsaran; Whitland.

Denbighshire and Flintshire.—I: *Connah's Quay. II: Buckley; Chirk; Denbigh; Ffynnongroew; Flint; Holywell; Mold; Prestatyn; Rhosllanerchrugog; Rhyl; Ruthin; St. Asaph (excluding Dyserth); Wrexham (excluding Coedpoeth, Holt, and Llay, including Brymbo, Cefn Mawr, Gresford, Rossett, and Ruabon). III: Abergele; Caergwrle (practice area immediately around Hawarden); Cerrigydruidion; Coedpoeth (Wrexham R.D.); Colwyn Bay; Dyserth (St. Asaph R.D.); Glynceiriog; Hanmer; Hawarden; Holt (Wrexham R.D.); Llanfairtalhaiarn; Llangollen; Llanrhaidr-ym-Mochnant; Llanrwst; Llay (Wrexham R.D.); Overton.

Glamorganshire.—I: *Rural District of Pontardawe (excluding Cwmllynfell, Brynamman, Gwauncaegurwen, and Pontardawe). *Townships of Treorchy, Llwynypia, Ferndale, Tylorstown, Wattstown, and Ynyshir (Rhondda M.B.). II: Boroughs of Barry; Cowbridge; Neath; Port Talbot (excluding Bryn); Rhondda (excluding Trehafod, Treorchy, Llwynypia, Ferndale, Tylorstown, Wattstown, and Ynyshir). Radnorshire.—II: Knighton; Llandrindod Wells; Llanbister. III: New Radnor; Presteigne; Rhayader. Swansea (II).

Correspondence

Advertisements for Junior Hospital Staff

SIR,—May I ask for a little extra consideration for hospital junior medical staff that would make a considerable difference to them, and would cost consultants and administrative staff no extra money and very little time? I am referring to the form of advertising hospital junior medical posts in the medical journals.

All of us holding junior hospital appointments are anxious to find a post to succeed our present ones with as little gap between them as possible, for with our meagre salaries the loss of two or three weeks' earnings is of serious import. Further, in order to be able to enjoy the two-weeks paid holiday which customarily may be taken only at the end of a six-months appointment, it allays considerable mental anxiety to have a post to follow on already securely

promised, or, failing that, at least be certain that one has not been applying for posts the interviews for which will be held during those precious two weeks. Of 109 separate advertisements for junior hospital posts in surgery published in the *B.M.J.* on June 20, 41 gave less than three weeks' notice before the date on which the appointment was due to start, 3 were vague to the point of saying "vacant soon," and no fewer than 37 gave no indication of any sort of when the post would become vacant; not a single one in the whole list gave the date of interviews.

May I make a plea, then, that in advertising junior hospital posts the date on which they fall vacant should always be mentioned; that, where possible, at least six weeks' notice should be given; and that the date on which interviews will be held should also be given? Finally, one advertisement for a registrar in the *B.M.J.* of July 20 asks for "Applications (12 copies) . . ." Is this not just a little unreasonable? For the advertising authorities could procure copies of applications with the greatest ease, considering the skilled clerical staff at their command, whereas the task of producing 12 copies (I have seen 28 demanded) laboriously in longhand does not bear thinking about. Might I suggest that the *B.M.J.* produces a form covering these various points which could be sent to prospective advertisers?—I am, etc.,

Weymouth.

SAMUEL PRIESTMAN.

B.M.A. FILM COMPETITION

The closing date for entries for the Film Competition is September 30. Some misunderstanding is believed to have occurred as a result of there being different closing dates for the receipt of entry forms and of the films themselves, and films have been received without the submission of an entry form. Those planning to enter films but who have not submitted an entry form are asked to communicate with the Secretary as soon as possible.

Association Notices

ARMED FORCES COMMITTEE

Election of Direct Representatives

The constitution of the Armed Forces Committee provides for a retired medical officer from each of the following branches of the Services to be elected to it:

Medical Branch, Royal Navy.
Medical Branch, R.N.V.R.
Royal Army Medical Corps.
R.A.M.C. (T.A. or A.E.R.).
Medical Branch, Royal Air Force.
Medical Branch, R.Aux.A.F. or R.A.F.V.R.

There are six vacancies to be filled for the 1957-8 session. Members of the Association at present serving on the active lists of each of the above branches and corps are invited to nominate a retired medical officer (who must also be a member of the Association) of their own branch or corps as a candidate for election.

Nominations, on forms to be obtained from me, must reach me by Monday, September 2, 1957. Voting papers will be issued where more than one candidate is nominated.

A. MACRAE,
Secretary.

Meetings of Branches and Divisions

WEST MIDDLESEX DIVISION

The following officers were elected at the annual general meeting on May 9:

Chairman.—Dr. C. J. Cobbe.
Vice-chairman.—Dr. A. H. Weston.
Joint Honorary Secretaries.—Dr. R. E. W. Oliver and Dr. F. H. Scoones.
Honorary Treasurer.—Dr. R. E. W. Oliver.

NEW SURGERY PREMISES FOR GROUP PRACTICE

BY

RONALD R. LANE, M.B., Ch.B.
General Practitioner, Bolsover, Derbyshire

In the hope that it may be of help to any of my fellow practitioners who are contemplating building new surgery premises, especially for a group practice, I have set down the following brief description of the building which my partners and I have had erected, together with a short account of how we set about the job and our experience of working in it.

Requirements

Our partnership of four, finding the old surgery premises originally planned for two doctors quite inadequate, felt compelled to provide a new building. A suitable central site was acquired, and in order to carry out our project it was decided that we must start making a list of the essential requirements which the new building must meet. These were: (1) There must be adequate heating arrangements; (2) there must be complete privacy for patients and doctors; (3) the building must be easy to maintain and clean; (4) the working of the building must be simple; (5) the cost should be as low as possible consistent with good-quality and lasting materials; (6) there must be good lighting by day and by night; (7) communications must be adequate and time-saving. In amplification of these points we made the following further decisions.

Heating.—We wanted a system, suitable for lock-up premises, which would be economical, clean, without fumes, reliable, and require a minimum of attention. Temperature control must be simple and efficient, and there must be a good hot-water supply at all times.

Privacy.—Consulting-rooms must be sound-proof, so that patients and doctors might be assured of privacy. Noise in the waiting-room must not reach the consulting-rooms.

Maintenance.—There must be a minimal need of interior decoration, and scrubbing, cleaning, and dusting must be reduced to a minimum. The drainage system must be straightforward, and provision must be made for disposal of soiled dressings.

Simple Working of the Building.—For the patient the method of procedure must be simple, with a minimum of directions. The doctor's consulting-rooms must be readily identifiable. The corridors and doorways must have adequate width. It must be possible for an ambulance to drive up to the front door. The whole building must be on one level, and the steps at the outer doors must not exceed four inches (10 cm.) in height. There must be a lavatory for patients. The building must be so designed that they

can walk straight through—from entrance to waiting-room, to office, to doctor, and to exit—and there must be full control of the doors by the receptionist. The waiting-room must be of adequate size, and the seats comfortable and

can walk straight through—from entrance to waiting-room, to office, to doctor, and to exit—and there must be full control of the doors by the receptionist. The waiting-room must be of adequate size, and the seats comfortable and durable; also, it must be apart from the other rooms. The consulting-rooms should be of such a size, and so arranged, that movement on the part of the doctor is reduced to a minimum; and a portion of each room should be curtained off to give privacy for patients dressing and for couch examinations. Scrubbing-up facilities, too, must be provided in each room. There must be a room in which doctors may meet together privately, see consultants, entertain guests, and carry on partnership business. There must also be a private toilet for the doctors. It must be kept in mind, when planning, that the guest room might be used as an additional consultation room if so required at some future time. There should be a simple method of calling for the next patient.

Minimum Cost.—We thought a simple oblong double-pile building would best achieve this object. The cost, including fitted furniture, proved to be about £6,000.

Communications.—The doctor must be able to communicate from his consulting-room with the receptionist, his partners, and the outside world.

FIG. 1.—Architect's plan of the surgery.

Planning the Building

Having decided what we wanted, we drew a few rough plans to see how all these objects might be achieved. Next we called in the architect, whom we found to be very helpful. He entered into every problem with the utmost interest and enthusiasm. Taking our crude efforts, he soon developed them into a handsome and harmonious design, making numerous minor alterations in the layout and suggesting many improvements. The accompanying Plan (Fig. 1) shows the final result, and will save much description. Tenders were sent out, and a local builder was given the contract. Again we were fortunate in our choice. He too tackled the job with enthusiasm, and not only closely supervised the work in all its stages but made frequent helpful suggestions as the work progressed.

After working in the new premises for about seventeen months we feel that the requirements we stipulated have been achieved with considerable success, and apart from a few minor details we should make no alterations if we had to do the job again.

Building began in July, 1955, and the premises were opened in February, 1956 (Fig. 2). A brief description may be given of some of its principal features.

Fig. 2.—Photograph of the building.

Main Features of the Building

Heating is by a fuel-oil heater. This heats air which is then blown by an electric fan through ducts leading to all parts of the building. The temperature is controlled by a thermostat in the corridor, with further control by louvers in each room. The system also provides hot water, and there is an immersion heater in addition for use in the summer if the oil heater is not required. The burners need a minimum of attention (a few minutes every three or four weeks). The oil tank holds 600 gallons (2,727 litres) and requires replenishing about twice a year. A pipe leads from the tank to a point near the roadside, so that an oil tanker lorry may stand in the road and blow oil into the tank. To ensure minimal heat loss the following are provided: (1) Fibre-glass below the hardwood floors and over the ceilings; (2) special insulating blocks and plaster for the walls; (3) a specially constructed roof, with layers of compressed straw and felt; (4) internal doors so arranged as to prevent any through draughts; (5) aluminium blinds to several windows.

Sound-insulation has been achieved by packed doors (without keyhole), acoustic ceilings overlaid with hardboard and two inches (5 cm.) of sand. The wall in the waiting-room next to No. 2 consulting-room is covered with linoleum squares, which, in addition to assisting in sound-insulation, enhances the appearance of the waiting-room.

Interior Decorations.—As surgery premises can never be completely closed down, interior redecoration presented a big problem. This has been overcome by covering the walls of the waiting-room, the corridor, the office, and the toilets with a cold cement glaze which will never require more than a wipe down to maintain its original freshness.

The other rooms have been distempered, as they can be redecorated during each doctor's holiday period. This enables each doctor to choose his own colour.

Woodwork.—Hardwood has been used extensively throughout the building. The floors are of "keru" strips; and for the window boards, doors, architraves, shelves, and drawers sapele wood has been employed. The desks in the consulting-rooms are french-polished sapele. The advantages of using these hardwoods—namely, handsome appearance, ease of cleaning, and no necessity for painting—make it well worth the extra initial expense. All the mouldings are plain. The floors in the corridor, in the waiting-room, and in the toilets are covered with composition tiles with coved corners. "Formica" has been used to cover the tops of the drawers and cupboards in the office and consulting-rooms, in colours which harmonize with the furnishings and walls of the respective rooms.

Dressings are disposed of in an electric incinerator. Cleaning of the building inside and out, including windows, gullies, etc., occupies one woman about twelve to fifteen hours a week. Paving slabs have been set round the sides and back of the building, which gives a neat and tidy appearance and helps the window-cleaner.

Working Procedure

On entering, the patient goes to the window of the office and informs the receptionist which doctor he wishes to see. The receptionist takes out the respective medical record envelope, and places it on a ledge beneath the window in order of patient's arrival, in separate piles for each doctor. The doctor indicates to the receptionist that he is ready to see a patient by pressing a buzzer which operates an indicator in the office. The receptionist then calls the patient by name and directs him with his M.R.E. to the doctor. After the consultation the patient leaves the building by the door at the end of the corridor, which is used as an exit only. The doctor's rooms are indicated by a name-plate on the door and by an illuminated sign over the door, projecting from the wall. There is a Yale lock and a closing spring on the exit door, to ensure one-way traffic. The front door, in addition to a Yale lock, has a dead lock which is turned at the end of surgery and the key removed, to prevent anyone in the waiting-room from admitting a "gate-crasher" friend after hours: a most useful bit of furniture.

The seating in the waiting-room is fixed, and was specially designed by the architect, taking into account comfort, hard wearing, easy cleaning, and safety for children. The accommodation is in the ratio of about one seat to every 200 patients on the list. The upholstery is blue.

The size of the consulting-rooms has been found to be very satisfactory, and the curtained-off portion invaluable. The curtains are suspended from silent plastic runners.

Between consultation rooms 3 and 4 it will be noticed that there is a small room which communicates with them. This has been used as an examination room by the two doctors occupying those rooms. It has also proved a very useful place in which to allow patients to rest whilst waiting for an ambulance, or if taken ill at the surgery, thus obviating a consulting-room being temporarily put out of action.

The aluminium venetian blinds have also been well worth the expense; they shade the room in strong sunlight, act as heat insulators, and facilitate eye examinations. Mixer taps with elbow control have also proved their worth.

The very wide gateway to the car park is most convenient, and the pram shelter under the gable has been much appreciated.

The window in the office which looks into the waiting-room is so designed that the receptionist can see the main entrance, the whole waiting-room, the entrance to the corridor and the patients' toilet, a facility which is invaluable.

As no one lives on the premises, there is a notice-board on the wall near the door which gives the surgery hours, the surgery telephone number, and name and address of the doctor on duty for emergencies. The last is on a small detachable board (one for each doctor) which is hung on small hooks on the main board. Having always had a doctor resident at the surgery before we moved to these new premises, we were a little apprehensive about how the new system would work. We were therefore happy to find that we have had neither any difficulty nor any complaint: the single surgery telephone number which is always tied up with the man on duty, in conjunction with the notice-board, copes with all the needs.

Lighting.—Tungsten lighting in plain opalescent bowls attached to the ceiling has proved satisfactory. There are also desk lights, and a wall light over each couch in the consulting-rooms. A master-switch in the vestibule controls all the lights of the building. It is switched off by the last person to leave, ensuring that no light will be left on inadvertently. The master-switch, of course, also controls the small light within the bell-push. All electric wires run in the roof space, the straightforward design of the building making for simplicity and economy in this respect.

Communications.—There is a switchboard in the office with extensions to the internal phones and to the homes of the doctors. By this arrangement it is possible, by using of the surgery number, for patients to get into contact at all times with the doctor on duty. It is also a great convenience to be able to take outside calls in the consulting-rooms, and to speak to the receptionist or one's partners.

Points of Interest

The new premises have been greatly appreciated by all members of the firm. Some of the great advantages we have experienced are as follows: (1) It is seldom necessary to leave one's consulting-room throughout a session. (2) The doctor always has the patient's record before him—valuable when several doctors work together as a team. (3) During surgery hours one can enter and leave the building without passing through the waiting-room. (4) There is a minimal interval between consultations. (5) The guest room is a great convenience. (6) Everything proceeds in a very orderly manner, and control, as regards prompt closing, etc., is easy.

Patients have often expressed their appreciation of the new building. The points that seem to have impressed them most are: (1) after a consultation it is not necessary to go back through the waiting-room; (2) there is no "jumping the queue" (often mentioned by the older patients); (3) the warmth in the waiting-room and in the consulting rooms when undressing; (4) the privacy; (5) the lavatory accommodation.

There are additional points which may be of interest. Along the outer wall of the office are two benches with a lavatory bowl between. On the left bench is the sterilizer and the urine-testing apparatus. The right bench is used by the receptionist for writing, etc. Under the benches are cupboards and drawers. The medical record envelopes are kept in open shelves and are stacked edge-on. There is an electric clock.

The guest room has a wardrobe for the use of each partner, and above the wardrobes are small cupboards, which are very useful for storing dressings, bandages, odds and ends. A poison cupboard, with movable shelves, is also provided. There is a brush cupboard in the corridor, and a mixer tap on the wall of the patients' lavatory, for the use of the cleaner.

The windows of the building are large, mostly of double-paned glass to ensure privacy without the use of curtains. One wall of the waiting-room consists mainly of glass bricks. Glass bricks of the "obscured" type have also been used in the corridor walls with very good effect. A

very large letter-box with extra wide mouth, set in the exit door, has so far been able to receive the increasing volume of mail sent out to general practitioners.

The amount of garden has been kept very small. The site was originally a small plantation, and we have been able to preserve a few trees.

In the work of erecting this building we have received help and encouragement from many sources. We should like especially to express our gratitude to the Derbyshire Executive Council, particularly the chairman and the clerk, Drs. W. S. Macdonald and H. C. Faulkner and Mr. Roffey of the Ministry of Health, the Bolsover Urban District Council, the Derbyshire Local Medical Committee, Mr. G. R. Crosby, of Messrs. Wilcockson and Cutts, Architects, and Mr. J. A. Brown, the contractor.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

EVIDENCE TO ROYAL COMMISSION

The Central Consultants and Specialists Committee spent a large part of its all-day meeting at B.M.A. House on July 25 considering evidence to be given to the Royal Commission. In addition to receiving an explanatory statement from the Joint Consultants Committee, it discussed and amended a draft statement of its own evidence. Mr. T. HOLMES SELLORS was in the chair. The CHAIRMAN explained that the Joint Consultants Committee was submitting evidence in its own right and each constituent body of the Joint Committee had also the right to submit evidence separately. It had seemed to be the general opinion that the Central Consultants and Specialists Committee should submit its evidence through the Association. They had therefore the advantage of being able to submit two lines of evidence, if they wished. One might be on the lines of the profession as a whole and the other, through the Joint Committee, could stress the views of consultants. The Joint Consultants Committee's explanatory statement was intended to give background evidence and would be followed by more detailed comments.

At this stage, the Chairman pointed out, they were seeking to give an outline of what a doctor is, what a consultant is, and how a man became a consultant. Later they would give the details of education and entry into medicine and the length of training necessary. Was the standard of medical entry as high as in the past or had it diminished since the introduction of the National Health Service? That was one of the many points which would be dealt with later. At the moment they were dealing only with a preliminary document, giving the background.

There was a long discussion on the position of senior hospital medical officers, following a suggestion that no further appointments should be made to this grade. The Chairman said that they had accepted that this would be a diminishing grade, but that there would be a residuum of S.H.M.O.s. It had been pointed out that there must be a grade not provided for in Spens between the training grade and the consultant grade, to fit in certain people. As a result, the S.H.M.O. grade had been constituted and a circular of limitation issued. "It is the abuse of that circular which has landed us in trouble," he said. "The position has got out of control."

Professor G. I. STRACHAN said the original idea had been to merge the S.H.M.O. grade with the suggested assistant grade, with the necessary safeguards, and to make it a fluid grade from which promotions would be made to consultant status, but the Ministry's attitude had changed the whole position and made them turn round and say, "We are not willing to agree to a subgrade because of the advantage which would be taken of it."

It was agreed that a small committee should examine the draft statements on the relation of the consultant to the community, to the general practitioner, and to the N.H.S., and on the place of medicine in society, and to prepare a

The United Kingdom and Norway have concluded an agreement under which the Norwegian health services will be available for all British nationals, including tourists. The agreement, which will not come into operation until it has been ratified, also covers cash benefits provided by the two countries for unemployment, sickness, maternity, old age, widowhood, orphanhood, industrial injury, and death.

SUPPLEMENT TO THE 93
BRITISH MEDICAL JOURNAL

LANCASTER DIVISION

At the annual general meeting held on May 28 the following officers were elected:

Chairman.—Dr. J. Hodge.
Immediate Past Chairman.—Dr. R. F. Dawson.
Vice-chairman.—Dr. J. Findlater.
Honorary Secretary.—Dr. J. F. M. Milner.
Honorary Treasurer.—Dr. G. H. Anderson.

LEEDS DIVISION

The following officers were elected at the annual meeting:

Chairman.—Dr. Moray Melvin.
Vice-chairman.—Dr. Wm. MacAdam.
Immediate Past Chairman.—Dr. C. M. Gray.
Honorary Secretary.—Dr. J. H. E. Moore.
Honorary Treasurer.—Dr. E. C. Benn.

LINCOLN DIVISION

The annual general meeting was held in Lincoln on May 26. The following officers were elected:

Chairman.—Dr. K. O'Toole.
Vice-chairman.—Dr. C. A. Lillcrap.
Secretary and Treasurer.—Dr. C. E. Friskney.

MERSEYSIDE BRANCH

The annual general meeting was held on June 12 on the premises of Messrs. Pilkington Bros., Ltd., at St. Helens. Sixty-five members were present. The following officers were elected:

President.—Dr. L. Crawford.
President-elect.—Dr. E. A. K. Hoppins.
Secretary and Treasurer.—Dr. V. Cotton Cornwall.
Assistant Secretary.—Dr. H. C. W. Baker.

Members were entertained to lunch by Messrs. Pilkington Bros. and toured the glass works in the afternoon.

NORTH-EAST SUFFOLK DIVISION

At the annual meeting held on May 26 the following officers were elected:

Chairman.—Dr. E. S. Nicholson.
Vice-chairman.—Dr. J. D. J. Boswell.
Honorary Secretary and Treasurer.—Dr. N. B. Eastwood.

NORTH GLAMORGAN AND BRECKNOCK DIVISION

At the annual general meeting held on May 17 at the Boot Hotel, Aberdare, the following officers were elected:

Chairman.—Dr. A. Coleman.
Vice-chairman.—Dr. J. W. R. Battram.
Secretary and Treasurer.—Dr. F. J. Doherty.
Assistant Secretary.—Dr. Gwyn Morgan.

NORTHERN IRELAND BRANCH

At the annual meeting held on May 16, 1957, at the Royal Victoria Hospital, Belfast, the following officers were elected for 1957-8:

President.—Mr. G. G. Lytle.
President-elect.—Mr. W. S. Braidwood.
Vice-president.—Dr. W. G. Swann.
Honorary Secretary.—Dr. D. L. W. Chapman.
Honorary Treasurer.—Dr. H. Gray.

NORTH-WEST WALES DIVISION

The following officers were elected at the annual general meeting in April:

Chairman.—Dr. T. A. Griffiths.
Vice-chairman.—Dr. E. H. Morris.
Honorary Secretary.—Mr. W. Macfarlane.

RICHMOND DIVISION

At the annual meeting on May 31 the following officers were elected for 1957-8:

Chairman.—Dr. W. N. Gilchrist.
Vice-chairman.—Dr. A. G. Manley.
Honorary Secretary and Treasurer.—Dr. L. H. Worth.
Assistant Secretary.—Dr. N. M. J. Cowan.

SALISBURY DIVISION

The annual general meeting was held on May 23 at Salisbury General Infirmary. The following officers were elected:

Chairman.—Dr. A. L. Leigh Silver.
Vice-chairman.—Dr. F. J. G. Lishman.
Honorary Secretary.—Dr. I. E. Jameson.
Honorary Assistant Secretary.—Dr. J. P. Norris.
Honorary Treasurer.—Dr. P. S. Allenby.

SCUNTHORPE DIVISION

The following officers have been elected:

Chairman.—Dr. J. H. Foxton.
Vice-chairman.—Dr. J. H. D. Millar.
Honorary Secretary and Treasurer.—Dr. J. R. Baker.
Assistant Honorary Secretary.—Dr. G. B. Oliver.

SOUTH-EASTERN COUNTIES DIVISION

A joint meeting of members of the Division and all general practitioners in Roxburgh, Berwick, and Selkirk was held at Peel Hospital on June 2. Dr. G. W. Balfour was in the chair. Dr. E. R. C. Walker discussed the position of the dispute with the Government and answered questions. After discussion, members unanimously agreed that the B.M.A. should give evidence to the Royal Commission and defer decision regarding withdrawal from the Service until the Royal Commission had published its findings.

SOUTHERN BRANCH

The 81st annual meeting was held at Southsea on June 1, 1957. The following officers were elected for 1957-8:

President.—Dr. F. R. Langmaid.
Vice-presidents.—Drs. P. A. Knill Jones and G. Swift.
President-elect.—Dr. F. Caldecott.
Honorary Secretary and Treasurer.—Dr. R. H. Balfour Barrow.
Honorary Assistant Secretary.—Dr. Ronald Gibson.
Dr. Langmaid took as the subject for his presidential address "Doctor on the Bench." Subsequently the members were entertained by the Portsmouth Division, and later visited H.M.S. Victory and the Victory Museum.

STIRLING BRANCH

The annual general meeting was held on May 26. The following officers were elected:

President.—Dr. G. D. Park.
President-elect.—Dr. A. P. Russell.
Vice-president.—Dr. A. S. Biggart.
Past President.—Dr. N. L. Macleod.
Honorary Secretary.—Dr. J. E. Morrison.

STOCKTON DIVISION

The annual general meeting was held on May 27. The following officers were elected:

Chairman.—Mr. E. H. Travers.
Vice-chairman.—Dr. T. E. Moody.
Honorary Secretary.—Dr. A. M. Brown.

SURREY BRANCH

The annual general meeting was held on June 11. The following officers were elected:

President.—Dr. J. O. M. Rees.
President-elect.—Dr. A. G. Manley.
Vice-president.—Dr. R. Enoch and Dr. A. R. Bowtell.
Honorary Secretary.—Dr. L. A. Gibbons.

SUSSEX BRANCH

At the annual general meeting held on June 26 the following officers were elected:

President.—Dr. C. Gibson.
President-elect.—Dr. R. Green.
Vice-presidents.—Dr. A. G. Ross and Dr. L. A. Hiscock.
Honorary Secretary.—Dr. S. P. Hall-Smith.
Honorary Treasurer.—Dr. S. J. Firth.

SWANSEA DIVISION

The annual meeting was held on June 6 at the Swansea General Hospital. Dr. I. P. G. Howells was in the chair. The following officers were elected:

Chairman.—Dr. H. William Howell.
Vice-chairman.—Dr. T. H. Anderson.
Senior Secretary and Treasurer.—Dr. Idwal Pugh.
Junior Secretary.—Dr. T. Oakley Lewis.
Charities Secretaries.—Dr. J. Bowen-Jones and Dr. T. Ben Thomas.

WEMBLEY DIVISION

The annual general meeting was held on May 13 at the board room, Wembley Hospital. Dr. M. Latner took the chair and 17 members were present. The following officers were elected:

Chairman.—Dr. M. Latner.
Vice-chairman.—Dr. P. H. Addison.
Honorary Secretary.—Dr. M. E. Arnold.
Honorary Treasurer.—Dr. D. C. Barker.
Prior to the meeting an American film, "The Medical Witness," was shown.

WEST HERTFORDSHIRE DIVISION

At the annual general meeting held on May 22 the following officers were re-elected:

Chairman.—Dr. G. M. Greig.
Vice-chairman.—Dr. Margaret E. Edmunds.
Immediate Past Chairman.—Dr. R. Fisher.
Honorary Secretary and Treasurer.—Dr. D. G. Wilson.

WEST NORFOLK DIVISION

The annual general meeting was held on June 6. The following officers were elected:

Chairman.—Dr. C. G. Bree.
Vice-chairman.—Dr. Gwendolen M. O'Shaughnessy.
Honorary Secretary and Treasurer.—Dr. C. R. F. Hewlett.

SOVIET GENERAL PRACTITIONERS
AND POLYCLINICS

BY

R. S. SAXTON, M.B., D.T.M.&H.
D.Obst.R.C.O.G.

General Practitioner, Brighton

In my endeavour to find out if there was such a person as a general practitioner in the Soviet Union, and, if so, what it felt like to be one, I located her (70% of doctors in the U.S.S.R. are women) as the section doctor of a polyclinic. "Section" in this context refers to a section of the district served by a polyclinic. The actual work of the section doctor corresponds fairly closely to the work of a British general practitioner, but, like some British G.P.s, she does not do any surgery, midwifery, anaesthetics, or any treatment of a specialist nature. She is described as a physician therapist. I attended her surgery, visited her patients with her, and met her personally in her home. Hence I got many valuable impressions as well as more tangible facts and figures. However, lack of time, language difficulties, and errors in notes and memory are my excuses for any inaccuracies and the many omissions in the following account.

Staffing

The institution known as a polyclinic varies in size and scope according to the size and special needs of the population served. Thus in a large urban residential district there might be a number of children's polyclinics staffed with paediatricians, including the local school doctors, and an adults' polyclinic; and in an industrial district there would be factory polyclinics, including on their staff doctors with specific duties in various parts of the factory. Within this comprehensive scheme covering the whole population there is a considerable degree of overlapping which allows for freedom of choice of polyclinic in some cases, and of section doctor in most cases. Thus adults of the family of a worker may attend that worker's factory polyclinic, as is usually the case, for instance, in the Tashkent Textile Combine, where most of the workers live fairly near at hand. This arrangement does not apply, however, in the "High speed" shoe factory to any extent, as most of the workers live a fair distance away. Although this is the present pattern of polyclinics—that is, geographically isolated from hospitals—it is understood that future building in urban areas will tend more and more to polyclinics in conjunction with district hospitals.

The source of much of my information is polyclinic No. 71, situated in the Leningrad district of Moscow. It

serves an adult population of 70,000 people who live within 2 km. (mostly much less) of it, in an area where many new six- to eight-story blocks of flats have replaced old wooden houses. In the same district are various children's polyclinics serving populations of about 20,000 children.

Moscow polyclinic No. 71 has a medical and dental staff of 94. Dentists are called "stomatologists" and rank as specialist doctors. Doctors engaged in public health in the area are also included in this figure. The 94 medically qualified staff are classified as follows:

4 administrative staff	11 stomatologists
19 section doctors	2 dermatologists
5 surgeons	2 oto-laryngologists
4 pathologists	1 urologist
3 ophthalmologists	3 radiologists
1 gastro-enterologist	3 medical referees
1 haematologist	3 Pasteur Institute doctors
3 neurologists	6 sanitary doctors
1 endocrinologist	1 epidemiologist
5 gynaecologists	
11 emergency doctors (2 on day duty and 11 on night duty)	
5 ward doctors (interchangeable on a rota basis with the section and emergency doctors)	

The status of the specialist is that of a registrar, and the scope of his work limited. For instance, no major surgery is undertaken.

I do not profess to know the precise role of each of these categories, and know of their work only to the extent that it impinges on that of the section doctor. They work six hours a day, and their pay varies from the director at 1,700 roubles a month to the specialist at 930 roubles a month and the section doctor at 800 roubles a month. Any attempt to translate these figures into English equivalents is bound to be misleading. 800 roubles a month is about what a skilled worker in industry earns with an 8-hour working day. The higher ranks of the profession—for example, professors of medicine—earn very considerably more. The doctors are expecting a 15% rise in salary very soon. They are also permitted to undertake extra part-time work and private practice, though the latter is, I understand, rare. I have since learned that the section doctor's pay is now 725 to 1,100 roubles a month according to seniority.

Working Arrangements

A typical adults' polyclinic, such as No. 71, is a large three-story building with a semicircular drive having two entrances from the road. The doors to the central entrance hall are flanked by two cloak-rooms, where attendants take charge of overcoats, hats, etc. Opposite the entrance is the reception desk. It has numerous sections labelled alphabetically to indicate where patients' records are kept. The building contains numerous consultation rooms leading off a fairly wide passages. Outside each consultation room are a few chairs for the convenience of waiting patients. There

are also an x-ray department, physiotherapy department, operating theatre, antenatal clinic, a number of small wards totalling 50 beds, and all other offices appropriate to the staff listed.

The ambulant patient wishing to consult a doctor may phone the reception desk or call in and make an appointment. If the matter is of some urgency the patient may call at the usual hours of the appropriate doctor and have an immediate appointment. If not urgent a specific time is arranged, and there may be a delay of a day or two. So far as is reasonably possible the section doctor sees five patients an hour and the specialist eight patients an hour in their clinics. If the patient thinks the illness is in the domain of a specialist, the receptionist will advise whether this is so, and make an appointment accordingly. Thus many patients will by-pass the section doctor. However, all the medical records are kept together, so that all previous records are available which-ever doctor is consulted. Although normally the section doctor is selected for a patient on a geographical basis, the patient is at liberty to change to one of the others on demand, by applying at the reception desk. The patient with an appointment collects a slip of paper appropriately inscribed from the reception desk and proceeds to the corresponding clinic, where the nurse admits him when the doctor is ready. A clerk from the reception desk brings the patient's records to the doctor.

The section doctor's clinic is a comfortable little room where doctor and nurse together interview their patients. It has a desk, chairs, couch, cupboards, etc., and usually several indoor plants for decoration. The consultation and examination are, according to our standards, friendly and orthodox. The doctor may then issue a prescription for medicine, send the patient for laboratory or x-ray investigation, for various forms of special treatment—physical medicine, inhalations, injections, etc.—or for further specialist advice, or admit the patient. The doctor can also issue certificates of incapacity to work, valid up to one week. If the patient is considered to be unfit after that period, certification has to be by the polyclinic medical commission (the medical referees). After six months' incapacity a district medical commission reviews the case, and may make a pension award.

Domiciliary Visits

If the patient is unfit to attend the polyclinic he sends a message which is dealt with by the receptionist. If the matter is not of immediate urgency, and the corresponding section doctor has not yet gone on her round, a visit is booked for that doctor, who usually has five or six visits a working day and three hours to do them in, with car and chauffeur provided. If the matter is too urgent to await the section doctor's normal visiting hours, or if the round has started, one of the emergency doctors is sent. On rest days only a team of specialists is on duty. All patients are visited on the day the request is made.

The section doctor starts her round with a list of visits, including acute cases she is currently visiting or has taken over from the emergency team, and chronic cases which she visits at regular intervals. She has ample time to take off her coat and hat, sit down and talk over the domestic problems, examine the patient, and give such prescriptions or treatment as she thinks fit. The patient usually announces his temperature at the beginning of the consultation. A doctor can admit a patient to the polyclinic wards or call in one of the specialists for a domiciliary visit, which she does fairly frequently (estimated at 10–12% of cases). It is particularly when going on her round with the doctor, seeing her ill patients, or meeting her well patients casually in the street that one realizes that doctors in the U.S.S.R. are respected and esteemed by the people as much as in England.

The drugs and treatment used in the Soviet Union are in the main similar to those used in this country. In addition to chemotherapeutic and antibiotic remedies, however, they still employ drugs and therapeutic methods which we have replaced or do not consider useful. For instance, dry

cupping is still practised, and in hypertension leeches are applied to the mastoid region and intramuscular injections of magnesium sulphate are given. In general, the more expensive drugs and all injections are given by doctors or nurses calling at the patient's home, and these are free. Most medicines to be taken by mouth are sold at State pharmacies against prescription, and are fairly cheap. If the patient, however, is considered financially unable to buy such medicines, the polyclinic can authorize free dispensing.

Corresponding to the section doctor there is a section nurse who attends the clinic with the doctor, and visits patients as needed in the same section of the district.

Prevention

There is always a stress on prophylaxis in medical work in the U.S.S.R., as the following random examples which came to my attention indicate. All medically qualified persons are expected to spend four hours per month in health education. At the polyclinic the doctors are on the look-out for those in subnormal health who might benefit from sanatorium or rest-home treatment. The regular observation of cases of hypertension is also considered as a means of prophylaxis. Efforts are made to have a regular annual overhaul of all workers, and this is compulsory for all juveniles under 18. Women workers are invited to attend the gynaecologist three times a year with a view to detecting early cancerous or precancerous conditions (some consider cervical erosions to be precancerous).

The doctors at the polyclinic are also encouraged to keep their professional ideas and skills up to date, and to improve them. There is a weekly conference of doctors at which some of them give a five-minute talk on an interesting case. Every three months the ward doctors are replaced by some of the section doctors, who will thus have three months with greater possibilities to study sick patients and keep in touch with the various departments of the polyclinic. Specialists may go at intervals to hospitals. For instance, surgeons spend four months out of each year at hospitals. The regular and relatively short hours of work allow time for study, for writing, or even for another part-time job, and financial and other incentives are not lacking to encourage these things.

In her home life the doctor can get right away from her job. After her six hours the emergency doctors take over all responsibility; she does not do any midwifery. Often husband and wife go out to work, and they may employ a domestic worker in the home. They appear to live in modest comfort. The nature of their work does not require such an elaborate establishment as a British G.P. It is not necessary to have a car or even a telephone, though most of them probably have the latter. Secretarial and nursing assistance, surgery accommodation, instruments and apparatus, transport, stationery—in fact, every conceivable necessity for the job—is provided by the polyclinic.

Conclusion

To sum up. Every family in the Soviet Union has its own general practitioner, called a section doctor, and if there are children in the family there are two G.P.s, one a paediatrician. There is a reasonable freedom of choice of doctor in spite of the State salaried service. The work of the section doctor is unhurried and is facilitated by the constant nursing assistance in the surgery, and the easy access to specialist clinics. The number of consultations is small in proportion to the number on the doctor's list, and is evenly distributed from day to day. This is achieved by an appointments system run by trained receptionists who direct cases obviously requiring specialist advice direct to the appropriate specialist. Domiciliary work is also leisurely and is facilitated by the provision of a car and chauffeur, ease of admission to a bed in the polyclinic, and ease of obtaining specialist advice in the home. The doctor is free to prescribe as she thinks fit what is available. There is a personal and friendly relationship between doctor and patient, and the doctor is a well-respected member of the community. The doctor's

work for the polyclinic is limited to six hours a day, six days a week. Outside these hours she is free from all responsibility for her patients, and other doctors are standing by for any emergencies.

The polyclinic is a most valuable institution for both prophylaxis and treatment. It is at the same time a valuable centre for education of both the patient and the doctor, and a means of rationalizing and easing the work of the general practitioner.

PUBLIC HEALTH COMMITTEE

The Public Health Committee, at a meeting held at B.M.A. House on August 2, re-elected Dr. J. B. TILLEY as its Chairman. Thanking the members, the CHAIRMAN referred to the recent death of Dr. G. F. Buchan. They all knew what Dr. Buchan had done for the Public Health Service. "He is a great loss to our particular branch of the profession," said Dr. Tilley.

Royal Commission

Dr. H. D. CHALKE reported a good deal of disquiet among those who had read the report of the proceedings at Newcastle upon Tyne, and, more particularly, the following resolution passed by the Representative Meeting there:

That the position of the public health medical officers shall be reviewed after the report of the Royal Commission is received and appropriate steps taken with a view to ensuring their proper status and remuneration *vis-à-vis* their colleagues in other branches of the medical profession.

There had been read into that the implication that nothing was to be done about remuneration in the public health service until the Royal Commission had reported. It should be made quite clear that that resolution did not preclude steps being taken in the interim.

The CHAIRMAN agreed, pointing out that even taking the wording as it stood there was nothing to say that the position could not be reviewed before the event. He himself hoped that something would be done in that direction long before the report of the Commission; and it might be that further steps would have to be taken after the report was issued.

Dr. S. WAND, Chairman of Council, expressed his concurrence with what the Chairman had said.

Evidence to Royal Commission

The CHAIRMAN reported that he, together with the Chairman of Council and the Secretary, had called on the Chairman of the Royal Commission, who had refused to include the public health medical officers in the Commission's inquiry. He had added, however, that the Commission would be anxious to have evidence on remuneration in the public health service. His view was that it might have taken that evidence approached the form that it might have taken had the public health service been considered along with the other branches of the profession, as the appearance of that evidence in the published proceedings of the Commission might be helpful to the public health medical officers later.

Following that meeting, said Dr. Tilley, he and Dr. Wand had seen the Minister of Health. Dr. Wand had pressed the Minister exceedingly hard. Dr. Tilley had had to tell the Minister that the Whitley machinery had not broken down, nor had the Public Health Committee considered a recasting of the scheme of remuneration since the initial claim was made in 1950. He had inferred, from what the Minister said, that his view was that until the Whitley machinery had broken down on the recasting of a whole new scale of salaries he could do nothing about it.

Following a lively discussion, in which the Chairman of Council took a prominent part, it was decided to set up a special evidence subcommittee comprising the Chairman and Drs. Chalke, Harding, Hughes, Kelman, and Pickup.

The Committee appointed its Chairman and Dr. Hughes to be its representatives on the Evidence Committee of the Association.

Public Health Autonomy

The Committee then gave its attention to a letter from the Society of Medical Officers of Health, dated May 24, which read as follows:

I am desired by the Council of the Society which met to-day to request that the British Medical Association create an autonomous section which will be responsible for negotiations and for public statements on public health matters.

A long and lively discussion ensued, in the course of which the Chairman of Council went into the history of autonomy, being closely questioned on a number of points. At the conclusion of the debate the Committee passed the following resolution:

That it be recommended to the Council [of the B.M.A.] that the Committee on Professional Co-ordination be asked to give full consideration to the position of the Public Health Committee in relation to the autonomous committees of the Association.

It was also resolved that the matter should receive further consideration at the next meeting of the Public Health Committee.

Recognition of Previous Experience in Fixing Commencing Salary

The Committee considered a report that the previous professional experience, other than in the local authority service, of dentists, but not of doctors, was taken into consideration by an authority when fixing the commencing salary. The Committee regarded this as an anomaly which should be referred to Whitley Committee C.

Dr. Kelynack

The Committee heard a report on the illness of Dr. A. V. Kelynack, and resolved to convey to her its sympathy and good wishes.

Scottish News

ASSISTANTS AND YOUNG PRACTITIONERS IN SCOTLAND

CONFERENCE OF REPRESENTATIVES

The General Medical Services Subcommittee (Scotland) has decided to sponsor a conference of representatives of assistants and young practitioners in Scottish House on Tuesday, September 24. The purpose of the conference is to afford the Scottish representatives on the Assistants and Young Practitioners' Subcommittee—Dr. C. Grant (Pitlochry) and Dr. K. Adams (Glasgow)—an opportunity of discussing with representatives of their constituents any problems of common interest. Each local medical committee in Scotland has been invited to send representatives to the conference, and in addition there will be present Dr. W. M. Knox (Chairman of the Scottish Committee), Dr. C. J. Swanson (Chairman of the G.M.S. Subcommittee (Scotland)), and Dr. J. T. Baldwin (Chairman of the Scottish Medical Practices Committee), together with Dr. E. R. C. Walker, Scottish Secretary of the B.M.A., and Dr. J. T. McCutcheon, Assistant Scottish Secretary.

If any assistant or unestablished practitioner in Scotland would like any particular matter discussed, he should communicate with the Assistant Scottish Secretary, B.M.A., Scottish House, 7, Drumsheugh Gardens, Edinburgh, 3, by Tuesday, September 10.

Scottish House Telephone Number Changed

The telephone number of B.M.A. Scottish House, Edinburgh, will be changed, as from August 31, to Caledonian 7184.

General Practitioners, Wimborne, Dorset

The practice had been run for over thirty years from its own Georgian building in the centre of the town. It was decided that, as a result of taking in a fourth partner, the difficulty of working on two floors warranted a major alteration to a surgery unit completely on the ground floor.

It took nearly a year to approve a final plan owing to the difficulty of matching the cost with a scheme agreeable to all four partners. We were grateful to the architect, who produced something like twenty-five modified plans and variations.

It was decided that the new building (see Fig. 1) should consist of: (a) four consulting-rooms, each with its own separate examination room; (b) waiting-room; (c) reception, for filing of cards and secretarial work; (d) dispensary; (e) treatment room. These were to be so arranged as to conserve time and motion. In addition, storage space had to be provided for drugs, dressings, bottles, and other containers. Finally, it was hoped to combine the efficiency of a modern clinic with the more homely atmosphere of the family doctor.

Certain difficulties presented in the site. The old building consisted of a ground floor with two stories above and a building attached to it on either side. At the back was a series of long barn-like outhouses with a garden beyond. Behind this was a further garden belonging to two old cottages on the road from which all building access would have to come. Thus any new building would have to be long and narrow.

The conversion, begun in September, 1955, was in the main completed in eight months, but certain items were not finished until November, 1956. We were greatly assisted

by the Ministry of Health with an interest-free loan for the greater part of the cost.

FIG. 2.—Portion of a waiting-room seat.

Converted Building

The Waiting-room.—This is a fine, light, lofty room with "dunlopillo" bench-seats on three walls, of the pattern used in St. Thomas's Hospital out-patient department. They are comfortable,

anatomically correct for support, and prevent greasy heads from reaching the walls. Six seats per doctor are found to be adequate with an appointment system (which has been working well for two years), and there is seating for twenty-five persons, with plenty of space for extra chairs in the centre, should the occasion ever arise.

The Reception Counter (Fig. 3).—This forms the fourth wall of the waiting-room. At one side of it is a sound-proofed telephone recess, and behind it four filing trays (see Fig. 4). Each of these can hold—sloped and slotted for ease of identification—2,500 N.H.S. cards at a convenient height for the receptionist. There is room for at least one more. On the wall above the counter are four vertical call lights,

FIG. 3.—View of the reception room from the waiting-room, showing the seats, reception counter, files for N.H. cards, and the dispensary beyond.

a different colour for each doctor. In the reception room there are also the secretary's desk and files and some bulk dispensing stores.

The Dispensary.—This has "formica"-topped dispensing benches against two walls with shelves above for drugs, and drawers and shelves beneath for bottles, containers, corks, and labels. At the end of one is a telephone exchange with two outside lines, at the end of the other a sterilizing bench. In the centre of the room is a table for dealing with the dispensers' written work. On the third wall are terraced shelves for day-to-day drugs, the poison cupboard, and a shelf with a tray for each doctor, acting as a receptacle for the record cards of the day's new visits. A spike in the corner of each tray takes incoming messages and reports. On the fourth wall are further terraced drug shelves and a desk for the day-book.

The Treatment Room.—A room is used for dressings to avoid needless blocking of an examination room and to provide a place for minor operations under gas or local analgesia and for manipulations: a special couch of adjustable height has been made, providing for one or the other. A bench with microscope and centrifuge allows for the simpler pathological investigations. Against a wall is the apparatus for weighing and measuring.

FIG. 4.—Filing tray.

The Storeroom.

—Shelves are provided for bottles and other containers, with a sink for washing them.

Off this room is the W.C. for doctors and staff. A separate W.C. and wash-basin for patients is situated off the main passage.

Consulting Units (Figs. 5 and 6).—These consist of a consulting-room and an examination room with a wash-basin in each, connected by soundproof doors. Though the units are entirely self-contained, each doctor is in communication with the others, the dispensary, and the reception by an internal telephone system. There is, in addition, a Post Office telephone for outside calls through the dispensary switchboard. There is a call-light switch in each room, operating the lights on the wall between waiting- and reception rooms. When one is switched on, the light is seen by the waiting patients, and it is accompanied by a gentle "ping" on a bell, wired in series, to attract the attention of the receptionist, who may be otherwise occupied. A two-way switch enables her to put out the light, without the "ping," when she has directed the patient to the appropriate doctor.

The doors from the examination rooms to the passage can be opened only from the inside, as the outside handles are dummies. On the inner side of each door is fixed a sloped mirror. In addition to allowing for personal inspection, by placing the patient ten feet away he can observe the image, twenty feet away, of a sight-testing card placed at his side.

The Utility Room.—This room has cupboards on the walls for bulk storage and houses one of the tape recorders. Here, undisturbed, the secretary can type, the partners can meet, the staff can spend off-duty time if they wish, and antenatal relaxation classes are held.

FIG. 5.—View of passage with the consulting-rooms on right and dispensary hatch on left.

FIG. 6.—View of one of the consulting-rooms.

Working Routine

It can be seen from the plan that all patients enter through the front porch and not down the side passage as formerly. This is now used for prams, contains a shelf from which medicines can be collected at night, serves as a separate entrance for the offices into which the floors above have now been converted, and leads to the side entrance for the delivery of bulk stores and gives access to the dustbins.

From the porch, patients enter the waiting-room, where the receptionist checks their appointments or gives one to the next patient he or she is directed to the appropriate room. On returning, a chit is handed in at the dispensary hatch. If a dispensing patient, and a seat opposite can be used while the prescription is being made up. The patient then leaves through the "Exit Only" in the porch or passes through the waiting-room to make an appointment for the next attendance.

Between the morning and evening surgery, if a patient comes to collect medicine, request a visit, or make an appointment out of surgery hours, a notice put on the reception counter at the end of surgery directs him to the dispensary hatch.

Heating

Heating is done centrally by an oil-fired boiler. The installation was a considerable expense and formed about one-seventh of the total cost. However, once installed, it requires no attention beyond periodical servicing and the keeping of fuel in the tank, and produces no dirt or smell. A special thermostat turns on the heat at a time varying with the outside temperature, so that the building is warmed

to the required degree. The system is economical and efficient, and the lobby acts as an air-lock to prevent cold air directly entering the building. For the same reason the back door to the car park was not placed in line with the passage. It is thought that the previous fuel cost will be considerably reduced.

Constructional Points

Before considering individual items, the value of a quantity surveyor must be stressed. In addition to checking all matters concerned with building, he was able to estimate the price of any suggested alteration, and thus the cost was kept down to near the set limit.

As the premises had to continue in full use during the whole of the conversion, the order and manner in which the building was done had to be thought out and agreed with the contractor at each stage. This did not turn out to be as alarming as anticipated, though a good deal more dusty.

Roof.—The cheapest and most practical material was found to be "stramit," made of compressed straw, and an insulator of heat.

Floors.—After much inspection of samples and consideration of cost, "ruboleum" (thick linoleum) tiles were chosen—French grey in the consulting units and red everywhere else. This seemed to combine economy, durability, absence of noise, and a pleasing effect. When the waiting-room floor had to be completely removed on account of dry rot, it was decided to lay oak blocks. Although more expensive, these do not so easily show the dust and dirt from boots straight in from the road, and most of it has shaken off by the time the ruboleum passage is reached.

Colour Scheme.—The final choice fell on mushroom for woodwork and pale pink for all walls. This gives a warm white effect instead of the cold appearance of white or cream. Emulsion paint was used throughout for ease of washing.

Soundproofing.—In spite of a "soundproof" door, flush with the examination room wall to the consulting-room, it was found that everything spoken in one room could be heard in the other. This prevented a patient being seen in the consulting-room while another was dressing or undressing. After many experiments a second door flush with the consulting-room wall was fitted with the side facing the first door covered with acoustic tiles. The air space thus formed has made the doors completely soundproof, without detracting from the appearance in either room. The additional door causes only minimal inconvenience.

Low Voltage.—As it was a question of "now or never" while the building was being wired, a low-voltage system was installed in consulting- and examination rooms so that a wall plug gave two or six volts as required by the instrument used. It was thought that this might be of value in future developments, but at present "anglepoise" lamps are used in each examination room. Three are of the mobile stand type and one is a wall fixture.

Cost.—For construction, materials, fees, and car park, this was £10,050. For furnishing and additional equipment, £450, or, put another way, £3 approximately per square foot. This means that, paid for over twenty years, it will cost each of the partners, allowing for interest-free loan, about £130 per annum.

Conclusion

A pleasant, modern, and efficient unit has been created with which all the doctors are delighted. It has undoubtedly made work easier for everyone and enhanced the efficiency, while the comments from the patients have been most encouraging.

GENERAL MEDICAL SERVICES

MONTHLY ADVANCE PAYMENTS

The Minister of Health has agreed to give effect to the G.M.S. Committee's request that general practitioners who apply may receive monthly advance payments on account without pleading difficulty or hardship. Amending regulations to make this possible will come into effect at the beginning of October. No advance will be for more than one-third of the sum due to a practitioner for the quarter by way of capitation payments and loadings. The Minister's agreement was on the understanding that the introduction of the system would not lead to the employment by executive councils of extra staff.

REMUNERATION OF GENERAL PRACTITIONERS

AMOUNT OF BACK-PAYMENTS AGREED

The final amount of the central pool for the remuneration of general medical practitioners in the National Health Service for the year ended March 31, 1956, has now been agreed by the Ministry and representatives of the profession, and the amount owing for that year is £5,208,420 for Great Britain (£4,660,322 for England and Wales). A further sum of £49,773 for Great Britain has also been agreed as additional amount owing for the year ended March 31, 1955. The amount owing to doctors will be added to their quarterly cheques due on September 30.

COMMITTEE OF PUBLIC ACCOUNTS
COMMENTS ON PRESCRIBING

In its third report¹ for the session 1956-7, the Committee of Public Accounts comments on the increase in total cost of prescriptions in the National Health Service from £34m. in 1949 to £63m. in 1956. During this time there was a 14% increase in the number of prescriptions dispensed, but the main cause of the increased cost was the higher average cost per prescription, which rose from 3s. 1d. in 1949 to 5s. 0½d. in 1956. One of the principal causes of this continuous rise in the average cost per prescription in the Committee's opinion was the increased prescribing of proprietary preparations. The proportion of proprietaries in all prescriptions in England and Wales was 18% in 1950, 32% in 1954, 36% in 1955, and was still rising in 1956. Corresponding figures for Scotland were 26%, 42%, and 46%. A test in England and Wales for July to October, 1955, showed that 88% of these proprietaries (costing about £20m.) were in categories which the Joint Committee on Prescribing had classified as not therapeutically superior to standard preparations, and 15% of them had an absolute standard equivalent. As much as 4-5% of the cost of ingredients in all prescriptions was for proprietaries classified by the Joint Committee as of unproved therapeutic value and which in 1953 the Ministry had suggested should not be prescribed.

The Committee regrets that the independent committee proposed by the Minister in September, 1956, had taken so long in beginning its work of inquiring into the cost of prescribing, and comments that owing to the delay by the B.M.A. in nominating five general-practitioner members the committee was not able to be formed until June this year. The co-operation of the B.M.A. having now been secured, the Committee trusts that "an early attack will be made on what the accounting officer of the Ministry described as the biggest problem of the Health Service."

Figures for 1957

Prescribing statistics for the first four months of 1957 have just been issued by the Joint Pricing Committee for England.

¹ Third Report from the Committee of Public Accounts, Session 1956-7, 1957. H.M.S.O., London. Price 1s. 6d. net.

From January to April the total number of prescriptions was 64,688,441. The total cost, including ingredients, dispensing fees, and container allowances, was £18,374,926 13s. 9d. The average total cost per prescription (to the nearest penny) was 5s. 8d.

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Complete Revision of N.H.S.

SIR,—The present dearth of correspondence in the *Supplement* upon the subject of remuneration is a significant indication of the success of the Government's predetermined and cleverly executed policy to dampen the ardour and create apathy among the periphery of the profession. It is pertinent to note that the Government did not require the findings of a Royal Commission in order to vote themselves an increased remuneration of 36%. It is also interesting to note, in the current advertisements for overseas appointments, the magnificent terms offered for a medical officer to one of Her Majesty's Embassies for a doctor to care for the staff and their families. Nothing cut-price there!

Without the support of the periphery of the profession our leaders are hamstrung, but Council are certainly committee-bound if they really require a special committee in order to determine the unity in the profession. And, above all, why does it take them such an interminable length of time to launch the only measure which is likely to be of any true value—namely, a complete revision of every aspect of the N.H.S. in the light of experience gained since 1948? Consequent upon this, a completely new basis of remuneration, possibly along similar lines to the Australian system, with payment for services rendered, would do much to correct the present deterioration of general-practitioner service. Certainly some form of financial deterrent to the patients for measures other than those truly essential for life is an absolute necessity.

The present physical and mental stress of life in general practice is accentuated by contact with the thoughtless or selfish patient, who deems the Service to be his absolute right and abuses it accordingly, much more than by dealing with genuine sickness and distress. The latter provides the only true form of recompense, but it is unfortunately inclined to turn bitter and sour under the influence of the former, and few of us are sufficiently saintly to be completely satisfied by the prospects of receiving our reward in heaven, despite the odds being in favour of us not having to wait for it too long.—We are, etc.,

Doncaster.

G. R. OUTWIN.
J. V. CHIPPINDALE.

Remuneration in the Public Health Service

SIR,—The recent award of the Whitley Council, whereby general practitioners undertaking part-time duties as medical officers for local authorities are remunerated at the rate of £3 12s. 6d. per session (*Supplement*, December 29, 1956, p. 228), which on a basis of a possible eleven sessions per week is equivalent to a salary of £2,073 per annum, indicates that a remunerative bias would appear to exist in favour of this branch of the profession. It is hoped, of course, that this whole subject may actually now be under consideration by the various committees concerned, for does not the Whitley Council also recommend that a full-time superannuable medical officer, irrespective of his professional experience other than with a local authority, should commence at a salary of only £1,050, or about half the present rate for the part-time unsuperannuable doctor?

Now the Spens formula, as recommended for use by the Whitley Council in appointments for part-time medical officers of health, if applied to a basic salary of £1,050, would

mean that a part-time practitioner employed by a local authority would be remunerated at the rate of £1,312 per annum. Even if this method of computation is not applicable in this instance, obviously both the British Medical Association and the Whitley Council regarded £1,358, which was the rate prior to the recent award, as too low. But what the rate prior to the recent award for the full-time officer under of the rate of remuneration for the full-time officer under taking the same duties? Surely professional service with a local authority cannot assume a peculiarly upgraded character just because a general practitioner is the employee; and if the British Medical Association successfully negotiated an increase of about 50% in remuneration for part-time medical officers, there must be ample precedent for the negotiation of a suitable adjustment in the salaries of full-time officers.

But, apart from the moral and ethical aspects of this issue, unless there is an early revision of remuneration, may not local authorities now find it to their financial advantage to employ full-time superannuable officers, as long as their commencing salaries are nearly half of those of part-time officers, although such an action would be contrary to the policy both of the Ministry of Health and of the Association? Unfortunately, I do not know the exact details of the relative financial position, but it would appear that the factor of one-quarter as used in the Spens formula must be of significance as offsetting the value of superannuation when comparing the relative value of part-time and full-time appointments. Where the number of sessions involved could be eleven each week for a total of £1,475 in the factor, when applied to the maximum of £1,866, which would medical officer's scale, gives the figure £1,866, which would thus represent a saving to the employing authority of £207 at this level, and of £761 at the minimum point on the scale.—I am, etc.,

C. J. MACQUILLAN.

Wingham, Kent.

Medical Booklets

SIR,—I entirely agree with Dr. H. G. Howitt's letter (*Supplement*, August 10, p. 91) and I entirely disagree with that of Dr. R. Prosper Liston (*Supplement*, August 17, p. 98) about the publication of medical booklets. General practitioners perhaps see the effect of these booklets on the public better than those who write them. They only add fuel to the pernicious preoccupation with illness so general to-day, and I am unable to imagine that anything but harm can be done by publishing them. I feel certain that the majority of family doctors would be on Dr. Howitt's side.—I am, etc.,

Bourton-on-the-Water, Glos.

ALISTAIR ARGYLL ROBERTSON.

Modern Pharmaceutical Advertising

SIR,—I feel that Dr. J. D. W. Whitney's scheme for distributing details of pharmaceutical drugs by the advertisers themselves (*Supplement*, July 13, p. 7) is of such great importance to both practitioners and advertisers alike that the opportunity must not be missed of initiating it at once. I believe the only way to overcome the reluctance of the advertisers to inaugurate this plan is to impress upon them the general demand for such a service. I therefore suggest that a petition is organized which as many doctors as possible sign. This could be organized by the B.M.A. or the College of General Practitioners, I suggest. Once such a scheme has been introduced doctors will come to bless Dr. Whitney's name, and I am sure the drug houses that produce a reliable product at a reasonable price will profit still more.—I am, etc.,

Little Dean, Glos.

RICHARD M. WHITTINGTON.

SIR,—May I add my whole-hearted support for Dr. J. D. W. Whitney's scheme for an index of pharmaceutical products (*Supplement*, July 13, p. 7)? I discuss this with most of the representatives who visit me, but unfortunately such methods are not their responsibilities. No doubt the heads of the major firms read the *B.M.J.*, and I hope they make note of all important suggestions.—I am, etc.,

P. B. BAILEY.

Bristol 2.

Examination of Elderly Drivers

SIR,—I was sorry to see that the motion proposed by Dr. J. Hodge at the A.R.M. at Newcastle (*Supplement*, July 20, p. 55) was lost. In this practice, and in many others, there has been a very considerable increase in the number of patients aged 70 or over who present themselves for medical examination in connexion with renewal of their motor insurance policies. With an ageing population this number will presumably increase in the future.

Two questions arise from this situation: (1) How detailed an examination should be carried out by the doctor concerned? Under the Road Traffic Acts all that is required is that a driver should be able to read a car number plate at 25 yards; that he does not suffer from fits, faints, or black-outs; and that he has the use of his hands and feet. Is examination to be confined only to these specific points, or should a detailed examination, including urinalysis, be performed in order to exclude any systemic disease which might render someone unfit to drive? (2) What fee should be payable to the doctor for such an examination? If the doctor confines himself merely to the above conditions he may well feel a sense of shame in asking any sort of fee from his patient, knowing that only the most cursory examination has been performed. If, however, a detailed examination is preferred by the insurance companies, then surely the fee should be something approaching that payable for life insurance examinations. As Dr. Shackleton Bailey pointed out, the responsibility resting with the doctor could be greater than that incurred with life insurance, and the cost of his omissions or errors measured not only in pounds but in lives.

It would seem that the time is indeed ripe for these matters to be settled by the B.M.A. once and for all, so that the same uniformity of procedure may be achieved as already exists for life insurance examination.—I am, etc.,

Lyndhurst, Hants.

H. M. BAIRD.

Medical Shopping Lists

SIR,—I have recently been told by young men who have worked with me that they have often found it almost impossible to make a clinical check on their patients. Apparently in widely separate parts of the country there is a growing tendency among patients to dictate to their doctors as to what treatment they will require: "I'll have the usual linctus and pills; another bottle of embrocation; some more cotton-wool, and lint, etc." Suggestions that an examination might be needed are often regarded as scandalous. Often, too, the patient brings a list as though going to a shop and treats the doctor as a tradesman. My young friends have often felt unable to resist the importunities, as they know that there was a risk that they would thus lose patients from the practice. Instead they are themselves drifting into other branches of medicine and to service abroad.

This is a sad state of affairs even if it is not widespread, for it is a tendency which might extend and lead to depreciation of the value of that most valuable citizen the family doctor. No doubt the College of General Practitioners is tackling the problem, but it is evidently not yet solved.—I am, etc.,

Bushey Heath, Herts.

G. H. JENNINGS.

B.M.A. Negotiator

SIR,—Dr. L. E. Lucas's suggestion (*Supplement*, August 10, p. 91) of appointing a skilled negotiator in our dealings with the Government is, I fear, completely out-dated. I had hoped that a Conservative Government would treat our claims with a modicum of respect and understanding, but it is obvious that this trust was misplaced and that our last hope of managing our affairs in a reasonable and professional manner is gone.

In the modern world, unless our negotiators have power behind them, they will fail. They must be able to say that the whole profession will resign unless reasonable claims

are met, and they must be quite certain of this. From past experience, I fear that this is a forlorn hope unless trade union principles are adopted, with "closed shop," "black-legs," and the rest of the horrors. I feel that the time has come when we must decide whether to carry on with a gradual decline in our standard of living and a gradual increase in our working hours and conditions, or to become a trade union and suffer the petty tyrannies and loss of self-respect which that might entail. I see no half-way course. I wish I could.—I am, etc.,

Wyke Regis, Dorset.

ELLIS PARKINSON.

Maternity Care

SIR,—In the *Supplement* of July 20 (p. 42) comment is made on certain difficulties arising in the Harrow area. I do not know whether the Edgware General Hospital is the hospital referred to, or if I am the obstetric consultant in question, but should this be the case certain statements are factually incorrect. First, in the practice of this hospital no expectant mother is ever "forbidden" to see her own general practitioner, even though duplication of antenatal care ensues. Secondly, I have never "refused to meet a deputation from the Division," but on the contrary have from time to time attended several committees for full discussion. The Honorary Secretary of the Harrow Division, whose attention was drawn to these facts, has informed me that his committee is unable to make any comment to me as I am not a member of the British Medical Association, but I feel sure that you would welcome an opportunity to correct any inadvertent misrepresentations.—I am, etc.,

Edgware, Middx.

E. AP I. ROSSER.

Association Notices**PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1958**

The Council of the British Medical Association is prepared to consider the award, in 1958, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "What I Have Learned from Contact with the Patient's Relatives."

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1958. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows: an Ernest Hart Memorial Scholarship, of the value of £300; a Walter Dixon Scholarship, of the value of £300; four ordinary Research Scholarships, each of the value of £200.

The scholarships are given to candidates recommended by the Science Committee of the Association as qualified to undertake

research in any subject (including State medicine) relating to causation, prevention, or treatment of disease.

Each scholarship is tenable for one year, commencing on October 1, 1958. A current scholar may apply to be reappointed for a further year, though no scholarship will be renewed more than twice. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships, including renewals, must be made not later than March 1, 1958, on the prescribed form, a copy of which will be supplied by me on request. Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

SIR CHARLES HASTINGS AND CHARLES OLIVER HAWTHORNE CLINICAL PRIZES, 1958

The Sir Charles Hastings Clinical Prize Competition is established by the Association for the promotion of systematic observation, research, and record in general practice. The competition has been extended by the addition of a second prize known as the Charles Oliver Hawthorne Clinical Prize. The following are the regulations governing the awards:

1. The Sir Charles Hastings Clinical Prize, consisting of a certificate and £75, will be awarded for the best entry.
2. The Charles Oliver Hawthorne Clinical Prize, consisting of a certificate and £50, will be awarded for the second best entry.
3. Any member of the Association who is engaged in general practice is eligible to compete for these prizes.
4. The work submitted must include personal observations and experiences collected by the candidate in general practice, and a high order of excellence will be required. If no work entered is of sufficient merit, no award will be made. Candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.
5. Essays, or whatever form the candidate desires his work to take, must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than December 31, 1957.
6. A prizewinner in any year is eligible for an award of either of the prizes in any subsequent year. A study or essay that has been published in the medical press or elsewhere will not be considered eligible for a prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work.
7. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her entry, the decision of the Council on any such point shall be final.
8. Preliminary notice of entry for this competition is required, on a form of application to be obtained from the Secretary.
9. Each entry, which should be unsigned, must be typewritten or printed on one side of the paper only and accompanied by a separate note of the candidate's name and address.
10. No definite limits are laid down as to the length of the work submitted, but the Council anticipates that for this competition 3,000 to 10,000 words would be suitable.
11. Inquiries relative to the prizes should be addressed to the Secretary.

British Medical Association**PROCEEDINGS OF COUNCIL**

A Special Meeting of the Council was held at B.M.A. House on August 21, Dr. S. WAND, Chairman of Council, occupying the chair.

The meeting had been convened for the purpose of advising the Chairman on certain confidential matters, some of them connected with the evidence being sought by the Royal Commission on Doctors' and Dentists' Remuneration, and receiving a statement from the Treasurer concerning the financial position of the Association in relation to increasing costs and, in particular, the forthcoming increases in postage and telephone charges.

Association's Financial Position

The TREASURER (Mr. L. DOUGAL CALLANDER) reminded the Council of his statement to the Representative Meeting in Newcastle that it was clear from the heavy expenditure incurred in extra representative meetings, Council meetings, and other meetings in connexion with the remuneration claim that budget estimates for the year would be considerably exceeded, and that the final deficit would be greater than had been anticipated when the budget was agreed in January, 1957.

The chief financial cost coming upon the Association was the increase in postal and telephone charges on October 1. These were unforeseeable and therefore no provision had been made for them. In a full year this would amount to a considerable sum. There was an increase in the Association's subscription to the World Medical Association, and the cost of extra meetings in connexion with the remuneration claim. The full effect of all these costs would be an adverse balance. It would seem therefore that the Association must face an increase in membership subscription.

Royal Commission Evidence Committee

The Council approved a recommendation from the Central Consultants and Specialists Committee that its representation on the Evidence Committee should be increased from two to four members, and that in addition the Central Consultants and Specialists Committee (Scotland) should be invited to appoint a representative to sit on the Evidence Committee. Approval was given also to a suggestion that members of the Joint Consultants Committee should be welcomed at meetings of the Evidence Committee as observers.

Acting Chairman of Council

Dr. A. B. DAVIES moved that Dr. E. A. Gregg, immediate past Chairman of Council, be invited to occupy the chair

during the absence abroad of Dr. Wand between September 7 and October 6.

Dr. E. A. GREGG declined the invitation, stating that he would be away from London himself in September.

Dr. I. GRANT moved in that event that Dr. H. Guy Dain be invited to occupy the chair in the absence of Dr. Wand. The motion was carried unanimously.

Interim Adjustments of Remuneration

It was agreed that it should be left to the Chairman to try to see the Parliamentary Secretary to the Ministry of Health regarding the resolutions of the A.R.M. calling for an increase in the amounts of the interim adjustment of medical remuneration in the National Health Service.

All India Medical Conference

On the motion of Dr. I. GRANT it was resolved that no action be taken until October with regard to sending a representative to the All India Medical Conference to be held in Bangalore on December 26 to 28.

It was agreed that the next meeting of Council, originally to be held on October 30, should be postponed until November 5.

Questions Answered**Replacement of Stethoscope**

Q.—I am in whole-time salaried employment as a senior registrar. I have bought an electronic stethoscope to replace one of the standard type, which I can no longer use owing to deafness. My claim that the cost of the instrument should be allowed as an expense was refused by the income-tax authorities on the ground that the hospital supplied all necessary instruments. Am I entitled to any allowance?

A.—Whole-time salaried employees are assessed to income tax under Schedule E, and the only expenses allowed under that Schedule are those wholly and necessarily incurred in the carrying out of the duties of the employment. The word "necessarily" is defined very strictly, and if it is a fact that the hospital provides all necessary instruments there can be no claim for those provided privately. Unfortunately, there is no consideration in the tax law for any illness or incapacity, and, although the need may be through deafness, the expenditure is regarded as of a personal nature.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Consultants' Contracts

SIR,—I shall be grateful if you will permit me to comment upon the letter of Mr. D. G. Wilson Clyne (*Supplement*, August 17, p. 98), in which he refers to the remarks I made at the recent A.R.M. I well remember that at the time when "contracts" were being negotiated doubts were cast as to whether they constituted valid legal documents, and that they were signed by many consultants only with considerable hesitation and misgiving. In my speech at Newcastle, however, I was referring to the repeated acceptance by the Government of the day of the Spens principles as the basis of remuneration of both consultants and general practitioners. These repeated assurances, followed as they were by the Danckwerts adjudication, did, I think, lead the majority of members of the profession to believe that the Spens formulae would continue to form the basis of remuneration until, after due consultation with the profession, legislation was introduced setting out an alternative.

Mr. Clyne is doubtless aware that recently the Council has sought the advice of three learned counsel in this matter, and it was their unfavourable report that led me to say what I did. The strong support that my motion received at Newcastle allows one to hope that, as the profession is now aware that the unsatisfactory position in which it finds itself is in part due to the absence of legally enforceable agreements on remuneration, all members of it will be firmly and unitedly resolved not to be persuaded into a similar position again.—I am, etc.,

Churchdown, Glos.

H. G. DOWLER.

Practice Vacancies for Ex-registrars

SIR,—Three years ago, having held the M.R.C.P. for seven years, and served a medical apprenticeship as registrar and senior registrar, I decided to enter general practice. Supposing that I would ultimately have a sound chance in open competition, I worked for two years as an assistant before applying for advertised practice vacancies. Now follows my experience to date.

Of three vacancies for which I applied, I was short-listed for only one—that with the smallest list. At the interview the Medical Practices Committee felt "bound to point out" that this was only my second attempt at a practice vacancy, whereas another candidate (who was actually appointed) was making his tenth attempt. Since his only medical qualification came from a provincial Polish university, great weight was evidently placed on compassionate considerations. For another vacancy the majority of short-listed candidates were already principals in general practice, the eldest being 58 years old. In exasperation, I appealed, mainly on the grounds that men with my background should at least be short-listed on equal terms with established principals. In its statement to the Minister, the executive council actually cited against my candidature that I had no experience as a principal in general practice. The Medical Practices Committee supported its choice (also a principal) on the grounds that he had recently narrowly missed a favourable practice appointment elsewhere within their aegis. I suggested, in substance, that musical chairs played among general practice principals was not in the interests either of the public or of professional incentive. The Medical Practices Committee's representative replied that the position was, after all, only that of a school headmaster leaving his pupils for a superior appointment at another school.

The above signs suggest that the Medical Practices Committee is blessed with compassion. It seems the greater pity that it has none to spare for the ex-registrar, who feels his arduous training has gone both unwanted and unrewarded,

whose income stays at half the reputed average of general practitioners, who gets consciously older without security of any kind, and who, scanning at last the overseas advertisements, feels that omnipotent hands have steered his gaze, against his own wishes, and perhaps even against those of his countrymen.—I am, etc.,

"ANOTHER EX."

Trainee Assistant Scheme

SIR,—It is refreshing to see a committee of the B.M.A. offering criticism of the trainee assistant scheme (*Supplement*, July 13, p. 9)—or more particularly of its extreme liability to abuse as at present administered. It is unfortunate that the scheme has to be looked upon, in the present state of medical employment, as creating jobs for assistants and thereby having some virtue, but this cannot suppress criticism for ever. I am sure that this, and only this, prevents many "glad to be employed" trainees from criticizing the abuse of the scheme—not only are they pleased to have employment but they must bank on a good testimonial too. In any shake-up of the Health Service, let us rid it of these privileges of a free assistant and unsupervised principal. Apart from a free assistant, the principal can enjoy a cut in mileage costs, an increase in off duty, and a complete cancellation of locumtenent fees. Surely it is our duty to the taxpayer to bring some apparent justice into the scheme.—I am, etc.,

Landrindod Wells.

H. J. HOUGHTON.

Remuneration in the Public Health Service

SIR,—The deplorable delay in negotiating even the miserly award of 1951 was, and still is, financially crippling to the public health M.O., unless he has considerable private means. I am retiring after 26 years in public health out of a professional life of 43 years. I recall that in 1924 Dr. C. Courtenay Lord, the deputy secretary of the B.M.A., advised me to think carefully before I left private practice for public health. So I cannot blame the B.M.A. entirely for my position in 1957.—I am, etc.,

Saltburn, Yorks.

W. H. BUTCHER.

Payment of Nurses

SIR,—In the *Supplement* of July 20 (p. 33) Dr. D. L. Gullick is reported as suggesting that the payment of nurses should be no concern of the medical profession. This is a fallacy which was supported by a member of the public health service. If the position of the district nurse, who does most arduous and responsible nursing, is lowered relatively to her colleagues', recruits will not be forthcoming. Their work is absolutely indispensable to the family doctor, and any discussion of their salaries and terms of service is very much his concern.—I am, etc.,

Plymouth.

O. LL. LANDER.

Reform of Health Service

SIR,—I should like heartily to endorse all that Dr. John Willis writes (*Supplement*, August 17, p. 98) on the part the general practitioner has to play in the hospital service. The two-way traffic of ideas between both consultants and junior hospital staff and the G.P. working part-time in hospital can only be of benefit to all concerned, including the patient. Surely the main reason why the G.P.s are excluded from part-time appointments at hospitals is economic. While the Ministry of Health can staff its hospitals below consultant level by doctors who are willing to work for a few shillings an hour all hours of the day and night, they are not going to employ G.P.s at a much greater cost. Both the overseas doctor who is prepared to work here for a few years in order to gain experience, and the British doctor who has dedicated himself to his specialty and is aspiring to consultant status, are, to put it crudely, "undercutting" the G.P. If the B.M.A. is to succeed in fostering a policy of G.P. assistantships in hospitals it must see that parity

in remuneration is established between the junior hospital staff and their G.P. colleagues so that it ceases to be much cheaper for the Ministry of Health to employ full-time junior hospital staff.—I am, etc.,

JOHN F. PATRICK.

Manchester, 16.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library rules will be forwarded on application to the Librarian at B.M.A. House.

H.M. Forces

Surgeon Lieutenant-Commander H. E. Rutherford, R.N.V.R., has been awarded the Royal Naval and Royal Marine Forces Volunteer Reserve Decoration.

REGULAR ARMY RESERVE OF OFFICERS
ROYAL ARMY MEDICAL CORPS

Class III.—Captain (War Substantive Major) (Honorary Lieutenant-Colonel) J. M. Corall, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, retaining the honorary rank of Lieutenant-Colonel.

ARMY EMERGENCY RESERVE OF OFFICERS
ROYAL ARMY MEDICAL CORPS

Captain J. F. Watkins has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Major G. J. L. Hamilton has resigned his commission. Majors C. E. Hagenbach and J. G. Oliver, T.D., having attained the age limit, have retired, retaining the rank of Major. Captain E. Jones to be Major. Captain A. A. Shivas has been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel (Brevet Colonel) H. D. Chalke, O.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Lieutenant-Colonel (Brevet Colonel). Major (Honorary Colonel) C. R. Croft, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Colonel. Majors A. F. Alsop and J. D. Pike, having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the rank of Major.

ROYAL AIR FORCE

Air Vice-Marshal (Acting Air Marshal) P. B. L. Potter, C.B.E., Q.H.S., to be Air Marshal. Air Commodore (Acting Air Vice-Marshal) A. F. Cook, C.B.E., Q.H.P., to be Air Vice-Marshal. Air Commodore F. W. P. Dixon, C.B.E., Q.H.S., to be Air Vice-Marshal. Group Captains G. H. Morley, O.B.E., W. P. Stamm, J. S. Wilson, L. M. Crooks, O.B.E., and S. R. C. Nelson, O.B.E., to be Air Commodores. Wing Commanders C. E. G. Wickham, A. Muir, F. V. MacLaine, E. B. Harvey, D. W. I. Thomas, and H. H. S. Brown, A.F.C., to be Group Captains. Squadron Leader P. R. Travers to be Wing Commander. Squadron Leader M. T. F. Carpendale has relinquished his Emergency List commission on enrolment in the R.C.A.F. (Auxiliary). Squadron Leader A. R. D. Bartels has resigned his commission. Flight Lieutenants D. A. Hanley, D. C. Symington, G. H. Swapp, J. Boothman, and N. M. Munnich have been transferred to the Reserve, retaining the rank of Squadron Leader. Flight Lieutenants J. G. Kingan, P. J. Grant, P. Howard, O.B.E., and A. T. Barwood to be Squadron Leaders. Flight Lieutenant K. G. Williams has retired at his own request, retaining the rank of Squadron Leader.

ROYAL AIR FORCE RESERVE OF OFFICERS

Squadron Leader D. G. Smith has relinquished his commission, retaining the rank of Wing Commander. Squadron Leader J. W. G. Weddle has relinquished his commission, retaining his rank. Flight Lieutenant D. A. Duthie has relinquished his commission, retaining the rank of Squadron Leader.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: S. O. Franklin, M.B., B.Ch., B.A.O., Senior Medical Officer (Administration), Western Region, Nigeria; G. A. Jeffery, M.B., Ch.B., D.T.M.&H., Medical Officer, Tanganyika; H. A. H. Melville, M.B., B.Ch., D.R.C.O.G., Medical Officer, Grade "A," Barbados; Z. G. Panos, Dip.Med. (Athens), D.P.H., Assistant Director of Medical Services, Cyprus; J. Seegohin, M.D., Director of Medical Superintendent, Health Department, D.T.M.&H., Mauritius; A. E. O. Williams, F.R.C.S., Surgeon Specialist, Mauritius; A. V. Morris, M.D., Registrar (Surgical), Bar-Sierre Leone; H. V. Morris, M.D., Registrar (Surgical), Barbados; T. K. O'Leary, L.A.H., Medical Officer, Uganda; W. F. Ta-Min, M.B., Ch.B., Medical Officer, Grade B (Anaesthesia), M.R.C.S., L.R.C.P., D.A., Medical Officer, Grade B (Anaesthetist), Trinidad; Abdul Ghani Bin Mohamed, L.M.S., J.F. McGarity, M.B., B.S., D.P.H., and Tan Hor Kee, L.M.S., Medical Officers, Admin. G., Federation of Malaya; Che Lah bin Mohamed Joonos, L.M.S., and Lai Nyeen Soon, L.R.C.P.&S.Ed., Medical Officers, Admin. F., Federation of Malaya; Haji Abbas bin Haji Alias, K. L. Verghese, and Thelma M. Ward, M.B., B.S., Medical Officers, Admin. H., Federation of Malaya; S. C. Buck, M.B., B.Ch., Senior Pathologist (Pathologist), Fedration of Nigeria; S. W. Ferreira, M.D., D.P.H., Deputy Chief of Medical Officer, Jamaica; C. M. Norman-Williams, M.B., Ch.B., Medical Officer, D.P.H., Principal Medical Officer, Federation of D.T.M.&H., D.P.H., B.S., C.P.H., Medical Officer of Nigeria; C. E. Camm, M.B., B.Ch., Pathologist, Fedration of Nigeria; Joan Hardy, M.B., B.Ch., Pathologist, Fedration of Nigeria; C. R. Mooton, L.R.C.P.&S.Ed., Medical Officer, British Guiana; Elizabeth S. Ordish, M.B., B.S., Lady Medical Officer, Uganda; J. P. Puthumana, M.B., B.S., Medical Officer, Western Region, Nigeria; W. F. Ross, M.B., B.S., Medical Officer, Eastern Region, Nigeria; Gertrude M. D. Scully, M.B., Ch.B., D.P.H., Medical Officer for Schools, Trinidad.

Association Notices

GENERAL MEDICAL SERVICES COMMITTEE
ASSISTANTS AND YOUNG PRACTITIONERS
SUBCOMMITTEE

The following have been returned as representatives of un-established principals and assistants on the Assistants and Young Practitioners Subcommittee for 1957-8:

Region	Unestablished Principal	Assistant
1	No nomination	W. P. Hayne (Culmstock, Devon)
2	R. T. Jones (Basildon)	No nomination
3	I. M. Quest (St. Helens, Lancs)	No nomination
4	No nomination	No nomination
5	F. G. Tomlins (Chingford, E.4)	No nomination

PRIZE ESSAY COMPETITION FOR MEDICAL
STUDENTS, 1958

The Council of the British Medical Association is prepared to consider the award, in 1958, of prizes to medical students for essays submitted in open competition. The subject of the essay is: "The Value of Observation in the Training of Medical Students."

Prizes of £25 will normally be offered, but the Council will take into consideration the number and standard of the essays received when determining the awards to be made. Any medical student who is a registered member of a medical school in the United Kingdom, Commonwealth and Empire, or the Republic of Ireland at the time of submission of the essay is eligible to compete for a prize. Previous prizewinners are eligible for a second award. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and the medical school of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1958. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

A. MACRAE,
Secretary.

Diary of Central Meetings

SEPTEMBER

- 3 Tues. Remuneration Subcommittee, Public Health Committee, 11 a.m.
18 Wed. Film Committee, 2 p.m.
19 Thurs. G.M.S. Committee, 10.30 a.m.

Branch and Division Meetings to be Held

COVENTRY DIVISION.—Thursday, September 5, summer outing. Visit to Shakespeare Memorial Theatre to see "The Tempest." 5 p.m., bus will leave Coventry and Warwickshire Hospital (outside Nurses' Home); 6 p.m., dinner at The Swan's Nest Hotel, Stratford on Avon.

Meetings of Branches and Divisions

BLYTH DIVISION

The following office-bearers were elected by the annual general meeting:

Chairman.—Dr. John Brown.
Vice-chairman.—Dr. R. J. P. R. Campbell.
Honorary Secretary.—Dr. E. B. Ross.

BURTON-ON-TRENT DIVISION

At the annual general meeting held on July 2 the following officers were elected for 1957-8:

Chairman.—Dr. A. J. Robertson.
Vice-chairman.—Dr. R. Paterson.
Joint Secretaries.—Dr. G. C. D. Dutton and Dr. A. P. Phillips.
Treasurer.—Dr. A. P. Phillips.

CAMBRIDGE AND HUNTINGDON BRANCH

At the annual meeting held on July 2 the following officers were elected for 1957-8:

President.—Dr. K. S. Maurice-Smith.
President-elect.—Dr. S. H. Pritchard.
Vice-presidents.—Drs. C. A. N. Hicks and C. W. Walker.
Honorary Secretary and Treasurer.—Dr. T. B. Anderson.

EAST KENT DIVISION

The following officers have been elected for 1957-8:

Chairman.—Dr. G. L. Brocklehurst.
Vice-chairman.—Dr. M. Curwen.
Honorary Secretary.—Dr. M. S. Harvey.
Honorary Treasurer.—Dr. W. G. Sutcliffe.

FURNESS DIVISION

The annual general meeting was held on June 6. The following officers were elected:

Chairman.—Mr. A. W. B. Strahan.
Vice-chairman.—Dr. J. R. Turner.
Honorary Secretary.—Dr. T. S. Moore.
Honorary Treasurer.—Dr. H. R. Turner.

GHANA BRANCH

The annual general meeting was held on May 10 at Accra. Dr. R. A. S. Hoyte and Dr. J. B. David were re-elected as president and honorary secretary respectively. It was agreed that the name of the Branch be altered from "Gold Coast" to "Ghana," and the honorary secretary was deputed to discuss the formation of a Ghana Medical Association, in line with other Dominions, with the secretary of the Overseas Committee in London.

HALIFAX DIVISION

The following officers were elected at the annual general meeting:

President.—Dr. I. Calvert Wilson.
President-elect.—Dr. K. G. Marshall.
Honorary Secretary and Treasurer.—Dr. B. Mann.

HOLLAND DIVISION

At the annual meeting held at Boston on July 1 the following officers were elected:

Chairman.—Dr. G. R. Usmar.
Vice-chairman.—Dr. W. O. Nowlan.
Honorary Secretary.—Dr. J. E. Darlow.
Honorary Treasurer.—Dr. A. S. Wilson.

LEICESTERSHIRE AND RUTLAND BRANCH

The annual general meeting was held at the Grand Hotel, Leicester, on June 5. Mr. A. McMurry took the chair and 42 members attended. The following officers were elected:

President.—Dr. J. Cook.
President-elect.—Mr. E. R. Frizelle.
Past President.—Mr. A. McMurry.
Secretary.—Dr. G. L. Ward.

SOUTH ESSEX DIVISION

The annual general meeting was held on June 21 at the Railway Hotel, Hornchurch. The following officers were elected:

Chairman.—Dr. P. S. Steen.
Vice-chairman.—Dr. J. Gorman.
Secretary.—Dr. J. G. Fife.
Assistant Secretary.—Dr. R. M. S. Matthews.

SUFFOLK BRANCH

The annual meeting was held at Everard's Hotel on June 13. Mr. G. F. Langley took the chair, and 17 members were present. The following officers were elected:

President.—Mr. D. Martin.
President-elect.—Dr. J. Shackleton Bailey.
Vice-president.—Dr. P. G. Levick.
Immediate Past President.—Mr. G. F. Langley.
Honorary Secretary and Treasurer.—Dr. W. P. Grieve.

Ethics of Consultation

SIR,—Acceptance of patients by specialists and a few consultants without introductions from general practitioners, referred to by Dr. Guy Neely (*Supplement*, August 10, p. 91), is within the experience of provident association's principal general practitioner is the provident association's principal safeguard against exploitation by patients who rush to a specialist for advice or treatment well within the competence of their own doctors, and by a minority of consultants and specialists who are prepared to accept patients direct. There fore provident associations protect themselves by excluding themselves from liability for specialist advice or treatment obtained without an introduction from a general practitioner, except in cases of grave emergency.

Some consultants and specialists and many subscribers assume that provident association subscriptions are actuarially calculated to provide for the payment of maximum claims in every case. Nothing could be further from the truth. They are based on the average cost of settling claims. If maximum claims were always made subscribers would have to rise beyond the capacity of most patients to pay. It is not surprising that the inflationary situation which is being reflected in the average cost of claims' settlements which is being reflected in the revision of provident association subscriptions or the introduction of new schedules at considerably higher rates. It is often argued that inflation cannot affect provident associations because they have contracted to pay stated sums in money. But they have not: they have contracted to pay up to certain sums.

Provident association policy and benefits spring directly from B.M.A. policy. The Annual Representative Meeting in 1934 approved a document entitled "Notes on the Establishment and Development of Provident Associations, together with Draft Memorandum and Articles of a Provident Association." Paragraph 5 of this document stated: "The medical profession should be remunerated for services to persons within the defined income groups on the basis of a schedule of charges, agreed between the provident association and the medical profession." The concept of "defined income groups" has long disappeared, but it was the intention in 1934 that provident associations should be able to afford cover as distinct from grant-in-aid. The Nuffield Provident Guarantee Fund tried to secure the implementation of the "cover" principle in 1944, but failed. Provident associations, therefore, except in the case of one or two small associations which have local agreements with the local consultants and surgeons, can only offer "grants-in-aid."

Private patients, however, resent the old "hit and miss" principle of fee charging and want security—or, in other words, cover. The hit-and-miss principle, by which I mean assessing on available evidence how much the patient can afford, has resulted in provident associations offering several scales of subscriptions with liability up to various maxima. By and large, subscribers tend to pay the higher scales of subscriptions if they have the means. Subscribers, however, many of them relics of a medical world fast disappearing, know that most consultants and specialists now hold part-time hospital appointments which give them, in the mind of the layman, a reasonable basic salary. Consultants and specialists, therefore, if they wish to retain private patients should be particularly careful what they ask the patient to pay. For many elderly patients living on fixed incomes and pathetically struggling to keep up old standards, there is a definite limit. If their provident association has to meet more and more maximum claims up go the provident rates and out go the private patients to the National Health Service.

If a patient is subscribing little it may well be that a physician or surgeon willing to accept the provident association's maximum is rendering a service to the patient which the provident association must recognize. But, with the more affluent subscribers, able to afford higher subscriptions, questioning subscribers on how much is the maximum they can get from their provident association is extremely dangerous if private practice is to survive. Even business tycoons join provident associations, but if they are mulcted it still comes back on the provident association. Rates have to be raised, and the average private patient is offended because he or she—particularly she—cannot go on paying more and more. The interests of consultants and specialists who wish to avoid a 100% State service and the interests of the private patient are common. Consultants and specialists should be careful not to kill the goose which lays the golden eggs.—I am, etc.,

Bristol.

JOHN DODD,
Secretary, The Western Provident
Association for Hospital and Nursing
Home Services.

New Surgery Premises

SIR,—I was very interested in the description of new surgery premises by Dr. R. R. Lane (*Supplement*, August 10, p. 87). While full of admiration for the general lay-out, I am surprised that it was not found possible to give each consulting-room a separate examination-room in addition to a screened couch. My three partners and I use common surgery premises where we had a centrally placed room which was formerly a private waiting-room. This had outlived its usefulness, and we turned it into three examination-rooms with a lobby so that patients could leave without having to return to the consulting-rooms. We have found

2747

allowance) have done very little towards reducing the numbers of experienced assistants seeking a practice or partnership. The abuses continue: the false carrot of the "probable view," the waiting on the son to qualify, the man with two assistants, whom he changes regularly, etc. Perhaps the bitterest frustration of all is that there is no reward for experience—a man with six or seven years' experience of general practice is still offered the same salary as one just qualified.

The damp squib of the mass resignation having fizzled out, the Government has given the sulky little boys a present of a 5% rise. Shortly before this display of benevolence the Government increased the salaries of all junior hospital staff. The trainee assistant has also benefited. The assistant, however, has not even been mentioned. As at the time of the Danckwerts award he is left to the generosity (or lack of it) of his principal. This situation is intolerable. The maximum size of lists must be cut, assistantships must be regarded in all instances as a probation period for partnership, and experience must be rewarded. It is time indeed that it be generally realized that under the N.H.S. an assistant is an anomaly.—I am, etc.,

Lurgan, Co. Armagh

W. K. BRESLIN.

Practice Compensation

SIR,—Is anything being done about our compensation money, which has already lost one-quarter of its purchasing power since 1948? If so, may we be told something about it?—I am, etc.,

Launceston, Cornwall

DONALD M. O'CONNOR.

Maternity Medical Services

SIR,—I would like to contribute a few words on the vexed subject of the maternity medical services. First, the only purpose of the obstetric list should be to provide a list of doctors who are prepared to look after the maternity cases of doctors who do not wish to practise obstetrics. At present the main reason for having one's name on the list is in order to receive an extra 2 guineas for doing the same work. Certain criteria are laid down by most of the local obstetric committees before a doctor is included in the list, but these vary throughout the country, and in any case one's registered qualifications are sufficient authority for one to practise medicine in any of its many branches. If the extra 2 guineas is a recognition of some special skill gained in a resident appointment or of a higher degree in obstetrics, one would expect that the local medical committees would set up a cardiac list or a dermatology list and approve of special higher capitation fees to doctors on these lists for their patients who suffered from heart or skin conditions. The process could become quite out of hand. The difference in fees must end.

Secondly, the ridiculously low fee of 7 guineas must be revised. I would suggest it should be about 12½ guineas, the figure being arrived at as follows: (1) Initial general and pelvic examination, £1 1s.; (2) approximately six subsequent antenatal examinations, £2 5s.; (3) attendance during the confinement, £4 4s.; (4) approximately 12 visits during the puerperium, £4 10s.; (5) post-natal general and pelvic examination, £1 1s. In my opinion these fees are very reasonable, and I believe they would represent a fair reward for the work done.—I am, etc.,

Hornchurch, Essex.

R. G. TROUP.

Maternity Care

SIR,—We feel that attention should be brought to the lack of liaison between general practitioners in the Harrow area and the consulting staff of the obstetric department of Edgware General Hospital. Mr. E. ap I. Rosser implies in his letter in the *Supplement* of August 24 (p. 104) that no difficulties have arisen.

In 1949 we and a number of our colleagues sent a letter to the Medical Director of Edgware General Hospital concerning the lack of liaison, but received a negative reply

that the hospital authorities were quite happy with their existing arrangements where patients received all their antenatal care until the eighth month of pregnancy at the clinics run by the local authority. In practice our patients are actively discouraged from receiving antenatal care from their own general practitioners, regardless of the fact that patients may wish to do so and ignoring the fact that in the event of any emergency—for example, a threatened miscarriage—it would be the general practitioner who would be summoned, being available at all hours.

We suggest that Edgware General Hospital should adopt the practice existing in other parts of Britain, where the patient is initially examined at the hospital to secure acceptance for hospital confinement and where she could also receive her chest x-ray and blood tests. Her general practitioner could then resume her antenatal care until the eighth month of pregnancy, when the hospital could undertake the final examinations.

We do strongly suggest that it is not just a matter of remuneration but that the present attitude of Edgware General Hospital and the diminishing number of domiciliary confinements is preventing general practitioners who wish to do so from increasing their experience of obstetrics.—We are, etc.,

M. E. WINTERS. N. S. SEAFORD.
C. R. D. PORTER. J. HAMILTON.
F. O'SULLIVAN.

Branch and Division Meetings to be Held

SOUTH MIDDLESEX DIVISION.—At Casino Hotel, Tagg's Island, Hampton Court, Monday, September 16, 9 p.m. General meeting.

Meetings of Branches and Divisions

JERSEY DIVISION

At the annual general meeting the following officers were elected:

Chairman.—Dr. R. N. McKinstry.
Vice-chairman.—Dr. D. N. Scott-Warren.
Honorary Secretary and Treasurer.—Dr. R. L. Osmont.

SOUTH-WESTERN BRANCH

At the annual meeting on June 1 the following officers were appointed:

President.—Dr. R. M. S. McConaghey.
President-elect.—Dr. H. S. Gausson.
Honorary Secretary and Treasurer.—Dr. G. Bonnalie.

Members of statutory bodies in the Health Service have had their expenses allowances increased under the National Health Service (Travelling Allowances, etc.) Amendment No. 2 Regulations, 1957. Fees of 15s. are increased to 20s., and of 30s. to 40s. The regulations also revoke the temporary increases in travelling expenses owing to the Suez crisis.

Maternity Care

SIR.—I have every sympathy with Dr. W. Desmond Martin (*Supplement*, September 7, p. 110), being a displaced obstetrician myself and trying with difficulty to keep my hand in and obtain an adequate share of the 20% of cases in urban areas which are still confined at home. In addition, since 1952, when I lost the second obstetrical post due to administrative changes under the N.H.S., a post I had held for 25 years, it has, even with an obstetric diploma, been a hard fight to persuade executive councils and consultants at five neighbouring hospitals, to which my patients are admitted for confinement, that I was competent to do their antenatal supervision and that it was right, proper, and desirable that I should. Four of the consultants have been my colleagues in institutional posts.

Although I have established my personal position, there are many other doctors who are equally competent and experienced and entitled to be mainly responsible for their patient's antenatal care after the initial hospital bookings and procedures and up to the 36th week. What happens then depends on the consultant. One with whom I work is happy for me to continue to supervise to term and do the postnatal examination so long as she sees the patient at or about the 36th week. Two arguments are advanced against this: (1) Doctors are not all equally competent and conscientious, and opening the door to those that are would lead to difficulties with those who were debarred. (2) It is said that it is desirable that the hospital should be responsible for all examinations.

The first argument is a cogent one, and as a specialist in this field I admit its force. I know how irresponsibly some of the so-called antenatal supervision is carried out, but while the organization remains as it is, keen and competent doctors should not be debarred from participating to the full. There should be no difficulty in knowing those doctors who are safe, and these would be ready to reveal the extent of their experience. It is not unnatural that the patient's family doctor should include this work in his reproductive for her care. Her life is bound up with her reproductive experiences and her happiness is dependent upon them. If during pregnancy she has intercurrent troubles or complications, it is her doctor whom she seeks to put them right and when the baby is born the child is quickly registered with him and becomes an additional stone on which his practice is built. Further, he should not be excluded from intimate knowledge of what takes place during his patient's pregnancies and labours.

The second argument holds very little water provided that the first is countered. I have worked in the antenatal department of a large hospital, and know that the patient is seen not just by one person but by one of four or more doctors and many of the nursing staff during subsequent visits. In

other words, she is seen by the "department." In contrast with this, if her own doctor watches her she sees one person who carries out a series of consecutive examinations, answers all her questions himself, conditions her for her coming experience, and hands her over to the hospital during the last month, mentally well poised and, so far as can be seen by antenatal care, likely to have a safe and uncomplicated labour. This cannot be so effectively done by a number of people. An essential condition is that the doctor should be prepared to do regular examinations until the 36th week, not the minimum two required by the regulations, communicate with the hospital if complications arise, and send a full report with the patient when she attends at the 36th week.

There are some of the younger consultants who approve and encourage this interrelation, and it would be good if there were more of them. It is certainly a better arrangement than referring mothers to the local authority clinic. These may be staffed by local practitioners of experience, as they are in the borough I serve, but quite often they are managed by part- or full-time M.O.s with less obstetric and general knowledge than the patient's own doctor. It may well be that when the Cranbrook Committee presents its report it will recommend that every woman should be confined in hospital, as is the view of some of its members and some consultants. Until then, it is in the interests of the patient that her own doctor, if he has the aptitude and inclination, should be given as great a measure of responsibility in antenatal care as possible. Childbirth is still one of the mother's greatest joys and one of the doctor's greatest satisfactions.—I am, etc.,

London, S.W.19.

E. GERARD HOUSDEN.

Practice Vacancies for Ex-registrars

SIR.—Your commendable publication of a letter on general practice vacancies for ex-registrars (*Supplement*, August 31, p. 106) has resulted in my receiving an interesting communication on this subject from the Ministry of Health. One excerpt from it is of great importance to all registrars who still hope for fair treatment. It says "previous experience in running a practice, and not merely in general practice, has to be weighed against any advantage in qualification, and may be the determining factor, particularly when the vacant practice is a large one." The accentuations, incidentally, are not mine. I only hope that the profession, and particularly the Registrars' Association, will not let this unjust trend in policy pass unchallenged.—I am, etc.,

London, N.2.

A. GEE.

Trainee Assistant Scheme

SIR.—Your correspondent Dr. H. J. Houghton's cynical attack (*Supplement*, August 31, p. 106) on the trainee-assistant scheme demands an answer. I was a trainee in a large group practice in a Cornish mining town for a very valuable year. The first two weeks I spent sitting in on my trainer's surgeries and going with him on visits. After this "basic" period I took my own surgery daily and did my "basic" period I took my own surgery daily and did my own visits. My presence did not greatly relieve my trainer, as he was always present at the surgery when I was

2748

taking surgery so that I could go to him as problems arose. The visits I made during the early period were picked cases of interest and were mainly children. If I saw a chronic case more than once it was at a request and not an order. I took my turn on the emergency rota, but as a trainee I was not allowed to work on Sunday. Gradually I built a small surgery of my own and a visiting-list of my own, while the supervision became more relaxed, but the kindly guidance of my trainer was always available. I spent a very happy and valuable year as a trainee, and shall always remember with gratitude my trainer's high standard of medicine and medical etiquette, and above all his genuine interest in my work and welfare.

Perhaps the key to the trainee problem is found in the large group practice where the initial burden of carrying a learner, and later the advantage of an extra pair of hands, is relatively shared by a group so that there is no great individual advantage in having a free assistant. On the contrary, there is the fact that the whole practice must maintain a high standard in face of a critical ex-"house doctor."—I am, etc.,

Brighton.

COLIN D. CHILVERS.

SIR,—It would be more honest if the general practitioner trainee reverted to the more commonly used title of trainee assistant, for a working assistant is what he inevitably becomes even when not deliberately employed as such. Either a trainee sits at the foot of his principal, like a hospital student, or he is given responsibility for the care of his patients. Every trainee, as the result of conscription and the pre-registration year, has at least three years of clinical work behind him, and usually several more in other hospital posts. So the trainee will always seek greater responsibility, and the principal then finds himself with an assistant under the scheme at the public expense, enjoying, moreover, the same protection against future competition as though he were paying the salary himself. That this form of abuse is widespread is evident from the many advertisements requiring trainees to possess a car, and offering them attractive accommodation. For what purpose does a genuine trainee require a car, and whoever heard of a teacher offering free lodging to his pupils save for services rendered?—I am etc.,

S. GOLDWATER.

London Water Rate

SIR,—Many London practitioners must have felt aggrieved, as we did, when the recent revaluation sent our water rates soaring. After some correspondence with the Metropolitan Water Board we have stumbled on a closely guarded secret—that a 40% reduction of water rate is allowable on surgery premises occupied only by a caretaker. This is according to the Metropolitan Water Board Act of 1927. So we have been paying 66% excess water rate on two surgeries for twenty years. It is a pity that there is no way of recovering this overpayment from the Metropolitan Water Board.—We are, etc.,

Inquiry into the N.H.S.

SIR,—Dr. Ellis Parkinson's endearing but pathetic hope (*Supplement*, August 24, p. 103) of "a modicum of respect and understanding" for our claims from a Conservative Government (or indeed any other kind of Government) has been shattered, and he sees the dilemma now as a choice between trade union closed-shop tactics and a gradual decline of the profession's standard of living.

It is true, of course, that negotiations unbacked by power are unlikely to succeed. But the power which should be enlisted is public opinion, not a medical trade union. This the B.M.A. has singularly failed to do. It chose to challenge the Government on the single issue of pay. This was a major tactical error. It gave the impression to the public, poorly informed by the press, that the doctors were only interested in bettering their lot—an issue hardly likely to rouse the nation, whatever the merits of the case. Further, they were on very shaky ground; it is now clear that prior

to the Health Service the B.M.A. bungled its negotiations with the Ministry of Health; for the result, to quote Dr. H. G. Dowler (*Supplement*, August 31, p. 106), is "the absence of legally enforceable agreements on remuneration." One wonders what the B.M.A. was doing ten years ago behind those closed doors. No doubt Whitehall laughs now as it must have laughed then at the Association's inept negotiations, its fatuous posters, its empty threats, and its acrobatics when its bluff was called. The public, unimpressed, looked on.

But patients and doctors can surely unite in common interest in demanding a better Health Service. The queues in the waiting-room, the decline of standards of general practice, the widespread discontent within the profession, the prospect of unemployment amongst doctors, and the huge expense of the Service are all compelling reasons for an inquiry into the N.H.S.—to improve it, not to wreck it. In this context the question of remuneration would logically arise as an important though subsidiary factor. The B.M.A. would do well to accept its present defeat with good grace, to say resolutely that the present Service is not good enough, and to press for a full independent inquiry.—I am, etc.,

London, N.W.11.

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At Guild of Undergraduates Union (Debating Hall), Edgbaston, Tuesday, September 24, 8 p.m. Wine-tasting evening.
BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, September 27, 8.15 p.m., meeting. Address by Mr. E. F. Chin: "The Present Scope of Cardiac Surgery."
BRISTOL DIVISION.—At Grand Hotel, Broad Street, Bristol, Wednesday, September 25, 7.15 for 7.30 p.m. Meeting arranged by Bristol Pharmaceutical Society. Subjects: "Longer Life for B.C.G."; "A Vitamin Emerges: the Story of B ₁₂ ." Dr. P. W. Muggleton will show the films and give descriptive talks.
EAST SUFFOLK DIVISION.—At Canteen, Anglesea Road Wing, Ipswich and East Suffolk Hospital, Thursday, September 26, 8.30 p.m., combined general and scientific meeting. B.M.A. Lecture by Dr. F. E. Camps: "Death Visited the Home." (Illustrated.)
GLASGOW DIVISION.—At Glasgow Regional Office, 234, St. Vincent Street, Glasgow, Friday, September 27, 8.30 p.m., meeting.
HYDE DIVISION.—At Pack Horse Inn, Mottram, Wednesday, September 25, annual general meeting. To follow annual meeting of local medical committee at 8.45 p.m.
LANCASTER DIVISION.—At Town Hall, Lancaster, Tuesday, September 24, 8 p.m., meeting, under the auspices of the Bishop of Lancaster, the Right Reverend A. L. E. Hoskyns-Abraham, and the B.M.A., to discuss the relationship between clergy and doctors in the care of the sick. Two main speakers, Canon M. M. Martin and Mr. Ian Orr. There will be a general discussion. Questions will be answered by a panel of clergy and doctors.
LINCOLNSHIRE BRANCH.—At Blue Bell Hotel, Scunthorpe, Thursday, September 26, 12.45 for 1 p.m., luncheon; 2 p.m., annual meeting.
MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Macclesfield Arms Hotel, Thursday, September 26, 8.15 for 8.45 p.m., inaugural dinner-social. Members' wives are invited.
SOUTH ESSEX DIVISION.—At Nurses' Lecture Theatre, Oldchurch Hospital, Romford, Friday, September 27, 9 p.m., meeting. Lecture by Dr. J. Keighley: "Hypnotism."
SOUTH-WEST ESSEX DIVISION.—At Board Room, Langthorne Hospital, Leytonstone, E., Wednesday, September 25, 8.30 p.m., meeting. Mr. Michael Ward: "Ascent of Everest."
SUTTON COLDFIELD DIVISION.—At Fox and Hounds, Sherrstone, Monday, September 23, 8 p.m., meeting.
TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, September 27, 3 p.m., clinical meeting.

GENERAL MEDICAL SERVICES COMMITTEE

A two-day meeting of the General Medical Services Committee was held at B.M.A. House on Wednesday and Thursday, September 18 and 19, 1957, with Dr. A. B. DAVIES in the chair. The Committee devoted the whole of the Wednesday meeting to consideration of a draft memorandum of evidence to the Steering Committee for inclusion in the Council's evidence to the Royal Commission on Doctors' and Dentists' Remuneration.

Executive Councils' Association

One of the first items to be debated on the Thursday was the impending clash of dates between the Executive Councils' Conference and the October meeting of the Committee. From year to year some six to ten members of the Committee were appointed to attend the Conference, said the CHAIRMAN, referring those present to the correspondence shown in the agenda.

Dr. H. S. HOWIE WOOD said that an occasional conflict of loyalties was inevitable, but when it happened, as in this case it did, with monotonous regularity, the Committee should act once and for all to avoid it in future. With this view Dr. F. GRAY agreed, saying that the Executive Councils' Association had been repeatedly told that the Committee met on the third Thursday of each month, and it was a pity that more effective liaison had not taken place.

Committee Meetings

There was before the Committee the Minute of Council of November 7, 1956, which incorporated the observations of the Finance Committee on the need for all possible economy consistent with efficiency. The TREASURER (Mr. L. Dougal Callander) referred to the greatly increased cost of postage and telephones, which would come into force on October 1. There was clearly a need to exercise all possible economy in all aspects of the Association's work.

Dr. F. GRAY remarked that the Minute could hardly be said to apply to the G.M.S. Committee, which, apart from a fixed amount provided by the B.M.A., met all its own expenses. The CHAIRMAN wound up the discussion by saying that enough had been said to show the seriousness of the position.

Rushed Conferences

Letters of complaint were considered. They came from the Birkenhead, Glamorgan, Norfolk, and Cheshire Local Medical Committees, the burden of complaint being that as a result of the present procedure many important matters were rushed through Conferences of Local Medical Committees with undue haste; that the microphone was largely monopolized by G.M.S. Committee spokesmen; and that decisions on important subjects had been arrived at after the most perfunctory treatment. There was a suggestion that the Conference should continue into a second day.

The CHAIRMAN said that the letters indicated a sense of

frustration, but the fact remained that the Conference had only itself to blame, as it made all decisions as to limitation of speeches, references to committees, and the like. The answer really lay with the representatives themselves.

Dr. B. BURNS thought that the last Conference had been rather hurried. There had been a large agenda for a one-day session.

While it was essential to remember, said Dr. A. TALBOT ROGERS, that the Conference was really the G.M.S. Committee giving a report of its stewardship and listening to criticisms, there was a tendency for too many members of the Committee to use the microphone. After half an hour of that, the representatives often felt that they had had enough and moved "Next business." On the other hand, with longer Conferences it often happened that not a great deal was accomplished on the first day and there was a rush of work on the next.

The view of Dr. W. MORGAN EVANS was that, while the object of the Conference was to give instructions to the G.M.S. Committee, the only member of the Committee whom the provincial medical men wished to hear was the Chairman. The Chairman was then virtually the mouthpiece of the Committee, and the Conference regarded as unnecessary the habit of other members using the microphone unless they had been so instructed by their constituents.

Dr. A. N. MATHIAS, recalling that he would be the Chairman of the next Conference, said that it had a purpose other than that of instructing the G.M.S. Committee. It was a place of education, where those from the periphery, with their local views, were taught to meet others, to listen to their points of view, and to become medico-politically conscious. He had no doubt that in the next few years the profession would have on its hands a real fight with the Government, and, unless they educated the periphery, roused their enthusiasm, and encouraged them in every way, there would not be that peripheral support without which there was no hope of success.

Dr. F. GRAY said that the duration of Conference was a matter to be decided by Conference. He could not agree with Dr. Morgan Evans's view that the G.M.S. Committee Chairman should act as sole spokesman for the Committee.

It was agreed that the Committee would be able to decide at a reasonable time before convening next year's Conference how many days it would need, and that, in the meantime, the letters should be referred to the Agenda Committee for its consideration.

Calculation of Central Pool

The CHAIRMAN reported that the final settlement for 1955-6 had been agreed with the Ministry. There was, in addition, a sum of £43,000 from the previous year, and an additional Exchequer superannuation contribution of £6,000. The final settlement amounted to £5,203,000—the highest sum ever paid out.

Dr. W. M. KNOX did not like the term "final settlement" and could not understand how it had come to be used. It had previously been known as a "supplementary payment" and in Scotland was still paid as such.

The CHAIRMAN indicated that the term "final settlement" was originally recommended by the Working Party. He informed Dr. F. LISHMAN, who had pointed out the possible serious income-tax effects of two balancing payments in the one year, that when some years previously a similar situation had arisen the Inland Revenue authorities had made no difficulty, and the Committee then adopted a motion by Dr. A. TALBOT ROGERS that in the present case a similar approach should be made to the Inland Revenue.

Referring to Resolution 51 of the Annual Conference, the CHAIRMAN said the Ministry had already been persuaded to advance payment by three months this year, making the date October 1 instead of December 31. The Ministry was giving further consideration to the question, though it still made the reservation that a certain sum should be held back for various contingencies.

Resolution 53, that Conference no longer regarded the present method of distribution of final settlement as satisfactory, was in a different category, continued the Chairman, and it was agreed that it should be fully discussed at a later date.

It was decided to take no further action on Resolution 55, which asked for interest to be paid on all sums outstanding in the central pool six months after the end of the relevant year.

The CHAIRMAN reported that the Ministry had agreed to raise the net income limit by £100 per annum and the "ceiling" from £1,500 to £1,600 per annum. For the sake of simplicity those payments already in force this year would receive a 5% increase. On the proposal of Dr. F. GRAY it was agreed to discuss these proposals further with the Ministry.

The CHAIRMAN stated that Conference had been told that the Ministry had agreed to the principle of monthly payments. The mechanics of distribution had not proved easy, but he thought that the Ministry's suggestion was perfectly fair and would not prejudice anyone.

Service Committees and Tribunal Regulations: Medical Advisory Committees

The CHAIRMAN said that, though the small group appointed at the last meeting to consider the personnel of the panel of medical practitioners from which members of advisory committees were chosen was not yet in a position to finalize matters, a start had been made. It had received a comprehensive list from the Ministry and had made preliminary recommendations. The 10-year rule should obviously remain. About half-a-dozen on the list were dead and the names would have to be removed. Those who were originally on the list but no longer members of the G.M.S. Committee had been reviewed.

One matter on which the Chairman and his colleagues in the group would like the advice of the Committee was on whether there should be a qualifying period even for members of the Committee, as it occasionally happened that somebody was a member for one year only. Should there be a minimum period of membership of two or three years, during which time the member gained experience?

Dr. C. M. SCOTT proposed a qualifying period of two years. In the first year a member was in no fit position to represent his colleagues on disciplinary matters.

Describing it as a "delicate and difficult subject," Dr. F. GRAY informed the Committee that the list consisted of 60 names. Of those, six were dead, as the Chairman had mentioned, and 31 were G.M.S. members. Of the remaining 23 it was felt that some had not always the necessary experience.

It was agreed that there should be a two-year probationary period; that the subcommittee should have discretion in the "pruning" of the 23 names remaining; and that those already on the list should remain even though they might not have served the probationary period.

Assistants and Young Practitioners Subcommittee

Dr. F. GRAY presented the minutes of the Subcommittee, drawing attention to its resolution:

"That it be recommended to the G.M.S. Committee: (a) that it should be the duty of the Advisory Committee to make recommendations with a view to the elimination of abuses; (b) that a report on his traineeship should be sought from the trainee about nine months after he has completed his training with a view to such reports being considered when the trainee's application for the next following year is being considered."

The Committee received the report and referred the resolution to the Trainee General Practitioner Advisory Committee.

Practice Vacancy Appeal

Dr. M. SORSBY made strong complaint of the Ministry's attitude in a case where the Minister had reversed a decision of the Appeal Committee. The letter from the Ministry stated that it was the Minister's "... function to review the manner in which the selection has been made by the Medical Practices Committee (in consultation with the Executive Council) and only to overrule the Medical Practices Committee (the statutory body responsible) if he thought that there has been some real miscarriage of justice through an oversight or impropriety on their part." That, asserted Dr. Sorsby, was an attempt by the Ministry to set up new ways and means of saying that whatever the Medical Practices Committee decided was sacrosanct and that only very occasionally would an appeal be permitted. If that was to be the case, then there was no point in having appeals. In any case, though the Minister had the right of reversal, he should state his reasons.

He was strongly supported by Drs. F. GRAY, A. TALBOT ROGERS, J. T. BALDWIN, and J. A. PRIDHAM, and it was decided to send a strong letter to the Ministry, followed by further discussions.

Influenza Epidemic

Dr. F. M. ROSE drew attention to a broadcast recently made on this subject by a spokesman of the Ministry of Health, who had advised sufferers to go to bed for a few days and take some aspirin. Although that might seem labour-saving advice from the profession's point of view, continued Dr. Rose, it had serious implications, inviting, as it did, the patient to make his own diagnosis and to take a preparation not always suitable to all patients. The Ministry ought to be "brought to book," as otherwise it might issue similar advice on other illnesses.

The CHAIRMAN said that a deputation, representative of the General Medical Services, Central Consultants and Specialists, and Public Health Committees, had attended at the Ministry of Health on September 3 with a view to devising, if possible, some procedure to cope with an epidemic on a large scale. He himself had spoken of the need for combining all available resources and had suggested that as many beds as possible should be available in special hospitals which could be brought into use in time of epidemic.

Though it had been agreed on all sides that action would necessarily be a combined operation, it was also considered that machinery on a purely national basis would not be practicable but should be operated locally and provincially. The bodies concerned would be the local medical committees, hospital management committees, and local health committees. It was believed that the medical officers of health would know almost as soon as the general practitioners that there was an epidemic and that therefore they should be responsible for convening meetings at which local "skeleton" schemes could be evolved.

It was understood the Chief Medical Officer was sending a letter to medical officers of health of local health authorities about co-operation in the event of an epidemic during the winter, and the Committee agreed that, with the agreement of the Ministry, the Secretary should send copies of that letter to local medical committees and ask them to accept the proposals therein contained.

Drugs for Private Patients

The CHAIRMAN reported that a deputation, led by Dr. S. WAND (Chairman of Council), had discussed the subject with the Ministry. The Ministry's view was that in order to maintain proper control all private patients and their doctors would have to be identified by being registered with executive councils. There would also be dangers of inflation as a result of private patients changing their doctors, and ample checks would have to be provided. The Chairman went on to say that the most important point was that, having dealt with all such problems, the G.M.S. Committee would then have to face a method of payment based not on the Danckwerts recommendation of the numbers of doctors in the Service but on the number of patients. It was obvious that, in view of the lateness of the hour, the Committee could not give to the subject that day the full consideration that it deserved.

It was agreed to refer the matter to the Private Practice Committee and to debate it again in the light of that Committee's views.

Time, and a consequently diminishing attendance, precluded the completion of a very heavy agenda, but in the course of the proceedings the Committee dealt appropriately with the various Resolutions referred to it by the Annual Representative Meeting, and by the Annual Conference of Local Medical Committees held on June 6, 1957. In particular, a long series of resolutions from the latter Conference and emanating from Kent and Canterbury, calling for revision of the Service Committees and Tribunal Regulations, resulted in the reconstitution of the former subcommittee presided over by Dr. H. GUY DAIN. Among other subjects, the Committee also gave consideration to group practice loans, elimination of inflation, protection of practices, postgraduate courses in occupational health, and the Scottish reports.

GENERAL MEDICAL SERVICES DEFENCE TRUST

The Minutes of the meeting of the Trustees held on April 18, 1957, having been signed as a correct record, and the officers of the Trust having been reappointed, Dr. KATE HARROWER spoke on the financial situation of the Trust for the period January 1 to June 30, 1957.

NATIONAL INSURANCE DEFENCE TRUST

The formal business having been transacted, Dr. HARROWER said that the accounts told the "same sad story" of rising costs. Conferences had cost £4,065 as against £1,649 in the previous year. Committee fares had increased and that would probably prove to be a continuing trend. Contributions towards committee expenses were very much greater consequent upon the decision to meet all expenses above £500. There was also a guarantee of £10,000 to the Guild. Total expenditure before income tax amounted to £20,000-odd as compared with a little over £5,000 in the comparable half-year of 1956. There was an overall deficit of over £6,000, but that would mean the recovery of some income tax already paid.

Dr. Harrower then dealt with the recommendation of the Alternative Service Subcommittee of a special levy of 1d. per patient per quarter—an item in the main agenda of the G.M.S. Committee which had been deferred to that stage. As Deputy Treasurer she would like to see all extra moneys obtained paid directly into the fund in order to bring it as near as possible to the £1m. The drawback of a special fighting fund was that it was accounted for separately and any balance subsequently returned proportionately to the donors.

Following on the remarks of several members, the CHAIRMAN said there could not be an alternative scheme for withdrawal if there was not the money to run it. Dr. R. B. L. RIDGE had suggested that they were unlikely to

receive the money unless those at the periphery saw what the scheme was, and he had also gathered that there was not at present a great deal of enthusiasm for a special levy. The general tenor of the debate so far was that the long-term interest would be better served by boosting the normal funds.

Dr. H. S. HOWIE WOOD recommended an appeal to the large percentage of the membership that had never paid so much as a penny to any of the defence trusts. In his own area he thought the percentage was as high as 40%.

In his own area, and in the north of England generally, said Dr. J. C. ARTHUR, the membership was very keen on a feasible and workable alternative scheme. If that could be presented to them they would be liable to "play ball," but they would expect all the money to be spent on the special purpose for which they had been contributing for years.

Dr. STEVENSON reminded the Committee that the special subcommittee had been instructed by Conference to formulate an alternative plan to get the profession "out," if necessary, after the publication of the Royal Commission's report. It seemed to him that the Committee was tending to discuss whether the alternative plan should be total or progressive, and that would put the subcommittee in a difficult position. If the withdrawal was to be progressive then the sooner there was a fighting fund the better. A total withdrawal would inevitably mean a very substantial fighting fund. The Committee was therefore prejudging the issue of a total or a progressive withdrawal and should make its decision in that light.

Replying to a further point put by Dr. RIDGE, the CHAIRMAN said that the subcommittee foresaw that some money would be needed in any event, but if there was to be a phased withdrawal the money must be produced as early as possible. As Dr. STEVENSON had said, complete withdrawal would involve an enormous sum.

As a member of the Alternative Service Subcommittee, Dr. B. CARDEW said that the G.M.S. Committee must not look to the subcommittee for some new and miraculous suggestion. On the other hand, if, following the report of the Royal Commission, negotiations broke down, the Conference would regard it as a rather feeble effort by the subcommittee if all that had been done had been to ask local medical committees to get their contributions up to normal. The special levy would at least show that business was meant.

Dr. B. BURNS's opinion was that the implication of Dr. STEVENSON's remarks was that the Association either had very large reserves in hand or there could be no total withdrawal at all. The only alternative, therefore, was a phased withdrawal. In any conflict with the Ministry, the stock method used by the antagonists of action was to say there was no money in the "kitty." He thought the levy should be more than the penny suggested, but in any case it should be sufficient to tell the profession as a whole that there might well be a conflict next year and that as much money as could be obtained was needed. If that was not enough incentive to the membership to contribute there was no hope in any case.

Dr. J. A. PRIDHAM agreed with the previous speaker that they need not bother about enormous reserves. It was not proposed that they would be keeping the whole of the profession, but the profession should know that a considerable amount of money would be needed to run an alternative scheme and to help those who might be in a very bad way. The profession must be persuaded that, unless they were to surrender entirely to the Government, there would have to be a fight and that they must be prepared to raise the money for an alternative scheme.

Agreeing with Dr. Pridham, Dr. C. M. SCOTT said that in the subcommittee there had been comparative unanimity of opinion that phased withdrawal was dead and that the only chance of success lay in a mass withdrawal.

This was confirmed by the CHAIRMAN, who nevertheless brought the Committee back to the realization that, whatever the scheme, money would be needed. A number of other views were expressed before Dr. GOULD put the motion that local medical committees should be approached

to increase both their local subscriptions and their subscriptions to the funds. This was carried, as was Dr. C. J. SWANSON'S proposal that the request for the special levy should be deferred until the Alternative Service Subcommittee had completed its report.

SERVICE ON DISABLEMENT ADVISORY COMMITTEES

INCREASED FEES

Following representations by the Association, the Ministry of Labour and National Service has agreed that, with effect from October 1, 1957, the fees paid to doctors serving on panels of disablement advisory committees of the Ministry should be increased as follows: session of up to 1½ hours—£2 7s. 6d. (increased from £1 15s.); session of 1½–2½ hours—£3 3s. (increased from £2 5s.).

The Association pressed for a fee of £3 12s. 6d. for the longer session, but the Ministry refused to raise the fee above £3 3s.

S.H.M.O.s IN CONSULTANT POSTS

There are a large number of appeals to go before Committee B of the Medical Whitley Council on behalf of S.H.M.O.s who are asking for their position to be reviewed. It is not expected, therefore, that Committee B will finish considering these appeals before next spring. The B.M.A. has been preparing the evidence for the cases.

ASSAM BRANCH

The annual general meeting was held on February 16, 1957, at the Central Hospital of the Jokai (Assam) Tea Company Ltd. at Panitola. Mr. G. B. Young was elected president of the Branch for the ensuing year, and Dr. D. A. H. McNaught honorary secretary and treasurer.

The president, Dr. W. J. Savage, addressed the meeting on "The Value of Antenatal Exercises," and was followed by Dr. J. G. M. Wilson, who spoke on "Medical Effects of Atomic Explosions," and Mrs. J. Axel Hojer, who gave an account of a recent visit to Hiroshima and Nagasaki. Professor J. Axel Hojer spoke on Assam Government rural welfare and medical services. A clinical meeting was held in the afternoon. Dr. and Mrs. D. A. H. McNaught entertained members and guests to a cocktail party the previous evening; the annual dinner was held in the home of Mr. and Mrs. G. B. Young on February 16, Professor and Mrs. J. A. Hojer being guests of honour.

Questions Answered

Cost of Attendance at Professional Congress

Q.—I am a part-time consultant with a regional hospital board and recently attended a professional congress. Can I claim the expenses incurred against income tax?

A.—A consultant's costs for attending a professional congress are regarded as being of a personal or capital nature for the purpose of improving his professional knowledge. Allowances for tax purposes could be obtained only if the attendance could be shown to be a necessary part of the duties of his employment in accordance with the strict interpretation of Schedule E rules. If, however, the consultant also had a private practice assessed under Schedule D, and particularly if this assessment included his income from his hospital employment, a claim for costs could be submitted under the wider rules of this schedule as expenditure incurred wholly and exclusively for the purpose of his practice. The ground for such a claim would be that in a

consultant specialist practice it is essential to be in line with the most advanced medical knowledge and developments and that this expense is incurred to maintain full efficiency. If this argument could be supported by the facts of the individual case there should be good prospects of a reasonable settlement with the Inland Revenue authority.

Correspondence

Provident Associations

SIR.—The secretary of the Western Provident Association for Hospital and Nursing Home Services raised several separate issues in his letter on ethics of consultation (*Supplement*, September 7, p. 109). In pleading to the profession not to claim the maximum rates for which provident associations insured their members, he states: "It is often argued that inflation cannot affect provident associations because they have contracted to pay stated sums in money. But they have not: they contracted to pay up to certain sums." This is an important point, but the secretary of the Western Association must surely be aware that in at least one large national provident association it is equally clearly stated that the benefits for which premiums are accepted are "designed to provide the maximum assistance towards the cost of treatment" (my italics).

All fair-minded readers must agree with the secretary that there is no justification for "mulcting" even the "business tycoon," but it is doubtful if many will accept his thesis that by charging fees as laid down in the benefits available the practitioner is doing this. He states that the private patient "wants security—or, in other words, cover," but he must know that, as far as room charges alone are concerned, quite apart from medical or surgical fees, it is only the top scale of insurance which covers these. As for professional fees, he must be aware that in the lower benefit groups the amount offered for, say, a major surgical operation is less, and often considerably less, than the statutory fee for such a procedure in a private room of a State hospital.

In other words, if the assurance company were being fair to its prospective clients it would make it clear (as it possibly does) that if they join the lower groups the benefits they receive will need to be supplemented from their own resources to meet the cost of room charges and possibly of medical fees. I use "possibly" deliberately because, as the secretary must know, there are specialists who consistently reduce their fees to the level of what the association pays for the lower-scale benefits in a genuine effort to help patients in the lower-income group and to lessen the load on the general ward waiting-lists. In fact some even go further and on occasions themselves pay out of the reduced fee they receive the difference between the room charges and what the patient receives from the association toward the cost of these.

On the other hand, when the "business tycoon" is insured in the highest scale and demands the best room in the nursing-home, with television and telephone complete, together with, if possible, the prettiest nurse, it would seem reasonable that he should be charged whatever full fee the surgeon of his choice normally demands for the prostatectomy he performs. The fact that the patient is already heavily insured for benefits is no argument in favour of the surgeon reducing his fee. While agreeing with Mr. Dodd that "consultants and specialists should be careful not to kill the goose which lays the golden eggs," it may seem fair to suggest that there is also no excuse for sponsoring the equivalent of an egg marketing board to issue standardized china ones.—I am, etc.,

Oxford.

JOHN STALLWORTHY.

Congratulations not Appropriate

SIR.—I wonder how many doctors have been congratulated, as I have been over the past two weeks, on a rise in pay by patients who assume that this happens automatically

each time the National Insurance stamp goes up. To add to this belief the Ministry resorts to a form of deception by printing on the stamp itself: "Includes Health Service Contribution." Surely it is time we had a simple easy-to-understand poster to explain the stamp and how we are paid.—I am, etc.,

P. L. RHODES.

Winkleigh, N. Devon.

Ethics on Holiday

SIR.—I see that the question of ethics has been receiving some attention in the *Supplement* of late, and I should like to draw attention to a form of unethical conduct which has been giving us some annoyance in the north-west Highlands and which I regret to say has increased recently as these areas have become more popular as holiday resorts. This is the habit of some of the doctors on holiday from the south of treating some of our patients without our knowledge and then sailing off, leaving us to clear up their mess. There are always a few hypochondriacs in every practice who like to ask all and sundry for their advice, but any doctor of experience knows very well that the worst thing he can do for them is to give in to the temptation to play to the gallery and take these people in hand on a casual basis; for anything he does can have only a very transitory effect, and, lacking the detailed knowledge of the patient which the local practitioner possesses, he can do irreparable harm by his meddling. I can think of two recent cases off-hand. One, an asthmatic, given cortisone, with a resulting withdrawal reaction worse than the original state, and the other a query anaemia, being carefully nursed along in order to get a clear-cut blood picture, given vitamin B₁₂, which completely ruined any chance of making an accurate diagnosis.

Were it the young and newly qualified who behaved in this way, we might excuse them in their newness, but I regret to say it is more often the older practitioners, who should know better, who indulge in this practice; perhaps because they are not too successful in their own practices and this is a way of bolstering their ego—who knows? Some even have the impudence to write to try to teach us what to do next, in the smug belief that we in the Highlands cannot possibly know much about medicine, and they are therefore being helpful.

I think the B.M.A. might well issue a warning to all concerned to leave their bags at home and enjoy their holiday as a holiday, and, if they really want to help the local doctor, offer to stand in for him and let him have a day's fishing in peace; that would really be appreciated.—I am, etc.,

R. S. C. FERGUSON.

Lochinver, Sutherland.

Medical Booklets

SIR.—Dr. C. P. Wallace's political skill is clearly shown in countering criticisms by rhetoric (*Supplement*, September 7, p. 110). He mourns, with Horace, the passing years and deplores the morbid thoughts of those who fail to read the booklets which alone are suitable for the public. He adds fuel to the fire of introspective thought by advocating any form of medical study by the sick. Distrust of a doctor is still a never dispelled by debate. Treatment *fide et fiducia* is still a *sine qua non* of general practice.—I am, etc.,

H. G. HOWITT.

London, S.W.16.

Socialized Medicine

SIR.—Following a recent visit to North America several facts emerged clearly in my mind. We in England, both lay and medical alike, because we are so close to the problem, are not fully aware how far we have drifted away from those who have continued to practise unfettered, free-enterprise medicine. Medically speaking, we here now live in a different world. We are encompassed in a rigid system of medicine which becomes all the more obvious when observed from a distance.

I had the pleasure of meeting a number of American and Canadian practitioners. It became obvious to me that many of these seemed concerned and pessimistic about our

socialized medicine, as they call it. It seems that we have set a false limitation to our medical achievements by allowing ourselves to become encompassed so easily in a Government system ultimately controlled by the Treasury. I met doctors in single-handed practice and in large partnerships. I found that a given doctor, if he so wishes, can build up any type or size of practice to which he aspires, provided he settles in a suitable district. He can change his area of practice with comparative ease, and some financial loss as one would expect, and he can have a close contact with one or more hospitals. In America the public ultimately decides what should be spent on medicine as in other matters. They expect value for money. Sentiment is not entirely absent or considered to be out of date. Voluntary contributions are readily made to hospitals and medical charities. In Great Britain it appears that we and the public have a restricted notion as to the value and cost of treatment. Our facilities and treatment are limited by the Treasury and are unrelated to the real cost and needs of a satisfactory service.

Foolishly, for a number of reasons, we have destroyed the will and mechanism for the collection of charitable and voluntary donations. As a profession we have allowed ourselves to become hopelessly bogged down by a political system, planned and implemented by politicians. We can expect no mercy until we ourselves by our own strength and initiative cast aside the yoke and bondage which are producing doctors limited in outlook and bereft of initiative and hope for the future.—I am, etc.,

Wembley.

M. E. ARNOLD.

Remuneration in the Public Health Service

SIR.—"The moral and ethical aspects of this issue," which Dr. C. J. MacQuillan implied that he had discussed in his letter (*Supplement*, August 24, p. 102), were in fact barely mentioned. Instead, what is presumably a genuine concern about pay in the public health service was obscured by rather bitter and confused words about pay to other doctors for part-time work with that service.

Dr. MacQuillan's comparison between commencing salaries of full-time public health doctors and sessional payments to general practitioners is not a valid one. And "professional service with a local authority" does in fact merit "a peculiarly upgraded character" when the doctor involved has special ability and experience in the work to be done. General practice gives unique and continuing familiarity with normal clinical phenomena which is the real basis of medical practice and a most essential basis of paediatric and obstetric work which the local authority often (and quite rationally) asks the general practitioner to do.

The latest rates of pay for doctors doing this part-time work were announced some nine months ago (*Supplement*, December 29, 1956, p. 228). It cannot have taken many medical officers this length of time to work out the implications developed in the last paragraph of Dr. MacQuillan's letter. Of course it may be cheaper to employ full-time salaried doctors to do specialized clinical work in which they are not specially trained or experienced. If Dr. MacQuillan wishes to save ratepayers' money it is quite ethical to suggest they pay doctors less; but it is surely not ethical to suggest that because it would be cheaper to employ salaried rather than part-time doctors for some particular work it behoves the local authority to do so without regard to the skill and experience of the individual doctors concerned.—I am, etc.,

J. P. BIRKETT.

Newcastle upon Tyne, 4.

Applications for Consultant Appointments

SIR.—I would like to make an appeal, through your columns, to certain regional hospital boards and boards of governors of teaching hospitals to show a little more courtesy when dealing with our applications for consultant appointments. Three consecutive recent experiences will illustrate my point.

In each instance the post advertised was a new appointment, either whole-time or maximum part-time, made

jointly by the regional hospital board and the teaching hospital. The appointment was in one of the more specialized branches of surgery and it was therefore unlikely that the total number of applicants would exceed twelve. Thus the boards concerned cannot argue that they were swamped with applications and therefore could not deal with them promptly. In each case 16 copies of the application were required and in each case these were dispatched by registered post 10 days before the closing date for applications.

The first hospital acknowledged the application by return post. Within 14 days the interview was held, the appointment made, and the short-listed candidates were paid their expenses within two days. The second hospital did not acknowledge receipt of the applications until a second letter was sent 10 days later. The interview was not held until ten weeks after the closing date, and expenses for the short-listed candidates were not paid until five weeks later, even though the expenses claim had been handed in at the time of the interview. The third hospital only acknowledged receipt of the 16 applications 10 days after the closing date, in a letter which informed the candidate that he would be written to again "in due course." Ten weeks have now elapsed since the candidates were interviewed and the appointment made, but no further communication has yet been received from the hospital administrator concerned.

In view of the widespread belief that doctors are most unbusinesslike in dealing with their correspondence, it is a pleasure to record the teaching hospital administrator in the first example mentioned above was medically qualified whereas the other two were not.—I am, etc.,

SENIOR REGISTRAR.

Practice Compensation

SIR,—Dr. D. M. O'Connor (*Supplement*, September 14, p. 112) asks what is being done about our compensation money. I think he should have known the answer. Nothing is being done—i.e., achieved. What is being done—i.e., achieved—about the perpetual assistant? Nothing. If a man requires help in his practice then he requires a partner. Persistently to employ an assistant is, to my mind, a form of cheating. What is being done about the unfortunate senior registrars, who, owing to the curious conduct of some executive councils, find it difficult if not impossible to get into general practice, or who cannot attain any stability in their professional status? Again, nothing.

There seems to be a nebulous idea that at B.M.A. Headquarters there is some magical body which will produce the rabbits out of the hat with little help from anyone else. Until it is appreciated that the B.M.A., by and large, is the profession as a whole, and until the profession as a whole is prepared to help itself, little is likely to be achieved. I can only speak for my own divisional area, but, even at the crucial time when the Guild was trying to produce some cohesion in the profession, at no meeting was there as much as a 25% attendance. At the ordinary B.M.A. meetings the attendance is usually less than 10%. I am afraid that while this state of affairs persists the answer to Dr. O'Connor's question and to many others must remain "Nothing."—I am, etc.,

Cheriton Bishop, Devon.

F. E. GRAHAM-BONNALIE.

SIR,—May I support Dr. D. M. O'Connor (*Supplement*, September 14, p. 112) in his query regarding practice compensation? That the profession was hoodwinked in 1948 in this respect has long been obvious. The astonishing thing is that it has caused so little comment, even from those most affected. As things are, general practitioners who were in early middle life in 1948, and who must, of necessity, carry on in the Health Service, can now virtually say goodbye to the product of perhaps 20 years of blood, toil, tears, and sweat (in 10-15 years from now what will their compensation be worth?). Older and younger practitioners are, of course, likewise affected. Many of us, like Dr. O'Connor, would like to know if "anything is being done."—I am, etc.,

Sidcup, Kent.

Branch and Division Meetings to be Held

BRIGHTON AND MID-SUSSEX DIVISION.—At Hotel Metropole, Brighton, Tuesday, October 1, 8.30 p.m., annual general meeting. Dr. William Bradley: "Polio-myelitis."

BROMLEY DIVISION.—At Beckenham Hospital, Wednesday, October 2, 8.15 for 8.30 p.m., Professor Robert Platt, P.R.C.P.: "Human Genetics."

CUMBERLAND DIVISION.—At County Hotel, Carlisle, Sunday, September 29, 3 p.m., annual meeting.

DARTFORD DIVISION.—At Livingstone Hospital, Dartford, Thursday, October 3, 8.45 p.m., G.P. clinical meeting.

DUMFRIES AND GALLOWAY DIVISION.—At Gracefield Arts Centre, Friday, October 4, 7.45 p.m., meeting arranged by Local Dental Group in co-operation with Mr. Gillanders, of Department of Extramural Studies of Glasgow University. Talk by Dr. J. A. Imrie on some forensic experiences in which identification has been made largely through dental studies. B.M.A. members are invited.

EAST HERTS DIVISION.—At Hertford County Hospital, Wednesday, October 2, 8.30 p.m., meeting. Films presented by Dr. D. L. Gullick: (1) "The Medical Witness"; (2) "The Surgical Treatment of the Tetralogy of Fallot"; (3) "The Human Cervix in Health and Disease"; (4) "Blood Transfusions."

ESSEX BRANCH.—At Garons Banqueting Hall, High Street, Southend-on-Sea, Saturday, October 5, 12.30 for 1 p.m., official luncheon; 2.30 p.m., annual general meeting.

ISLE OF WIGHT DIVISION.—At Regency Restaurant (Week's Café), Newport, Isle of Wight, Friday, October 4, 7.30 p.m., meeting. Lecture by Dr. F. E. Camps: "Poisoning: Accident? Suicide? or Murder?" At the invitation of the Isle of Wight Branch of the Pharmaceutical Society all medical practitioners in the area of the Division are welcome.

LEWISHAM DIVISION.—At Committee Room, Lewisham General Hospital, High Street, S.E., Tuesday, October 1, 8.30 p.m., meeting. Talk by Mr. Patrick Back: "The Trial of Adelaide Bartlett." Members may take their wives or a guest, and members of Woolwich and Greenwich and Deptford Divisions are invited.

MID-ESSEX DIVISION.—At Out-patient Department, Chelmsford and Essex Hospital, Sunday, October 6, 10.30 a.m., annual general meeting. Address by Dr. A. Talbot Rogers: "B.M.A. Policy."

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Tuesday, October 1, 2.30 p.m., practitioners' round. Mr. T. M. Henneby: Orthopaedic and General Surgical Cases.

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, October 1, 7.30 for 7.45 p.m., informal supper; 8.30 p.m., lecture by Mr. D. S. Pracy: "Medicine and Doctors of the Renaissance and Shakespeare."

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, October 1, 7.45 p.m., clinical evening.

SOUTH MIDDLESEX DIVISION.—At Red Lion Hotel, Hounslow, Wednesday, October 2, 7.30 for 8 p.m., medical practitioners and pharmacists' supper. Film: "The Life and Work of William Harvey."

WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, October 1, 9 p.m., meeting. Talk by Dr. M. E. Arnold: "Transatlantic Medicine, with special reference to General Practice and Private Insurance Schemes" (illustrated). Members of Harrow, Hampstead, and Willesden Divisions are invited.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

The Royal Commission and After

SIR,—While we are preparing evidence to submit to the Royal Commission, we ought at the same time to be preparing centrally plans for action in case things go amiss. Our aim ought to be to replan the National Health Service so that it runs efficiently, economically, with fair dealing for the patients and people who work the Service, and so that they suffer the minimum of interference from party politics—any party. Many of the organizational defects are known, such as the wasteful annual freeze of block grants to hospitals, the position of registrars, drugs for private patients, etc., but it might be wise to have an independent inquiry to report on and recommend improvements.

The medical profession still smarts from what I think has been a most cynical display of political chicanery. We should be determined that it does not happen again. Our discomfiture arose because the Government claimed that the Spens recommendations did not constitute (as we believed they did) a basis for arbitration, and that therefore there could be no arbitration. As we can have no faith in mere Government promises, what we seek is an agreed, legally binding alternative to the Spens recommendations, with machinery that cannot be evaded in case of unsettled disputes. These surely are our inalienable rights and basic to our independence. It is, or was, I believe, a first principle of conventional diplomacy that "a power can survive only if it is willing to fight for its interpretation of justice and its conception of vital interests." This is equally applicable to our profession.

We are not an irresponsible profession, putting forward repeated and frivolous demands. On the contrary, we have been too forbearing. Let us see that we do not become pusillanimous. If the Commission does not recommend, or the Government does not implement, the above basic rights, we should solemnly warn them that there will be no more retreats by us. For action we should be welded together: specialists, hospital medical employees of all grades, medical officers of health, and general practitioners. All must be prepared to withdraw completely and simultaneously from the National Health Service. It is no use to be squeamish or half-hearted about it, or to expect one section to carry the load alone for all. It is the only way that the public and the Government will come to realize that they must keep faith with what seem to them to be "little things," and it would be short, sharp, and very salutary.—I am, etc.,

G. W. M. MACKAY.

London, N.8.

Practice Vacancies for Ex-registrars

SIR,—“Another Ex” has raised an important issue (*Supplement*, August 31, p. 106)—namely, that of awarding preference to his group in the general policy of filling practice vacancies. A great deal of sympathy must be felt for those who, having been led by the nose by the unfulfilled promises of the politicians, are now having to make a fresh start in another branch of medical practice. In his own particular case, which he quotes in outline, he cannot give all the facts, therefore judgment cannot be properly made. One may imagine, however, that his applications have been limited to those attractive areas south of a line drawn from Cardiff to the Wash.

There are principals who, after many years of arduous general practice, find themselves with insoluble problems, the only answer to which is a move to another area. It is facetious to suggest that any principal contemplates this decision lightly. The 58-year-old principal may well have had a recent coronary thrombosis. A change to a smaller practice, in a more favourable area, would prove life-preserving. A younger principal may have a growing family, but a dwindling income from a practice in a depopulating country area. Another may be under inexorable domestic pressure to move from an industrial slum, in order to prevent a family split. A doctor in the highlands of Scotland, with failing physical vigour, may seek a less arduous, more compact, urban practice.

These problems, some private in nature, should not have to be ventilated to a practice committee in order to justify a move, as has been suggested. No doubt correspondents could multiply these examples many times over. It would be most unwise for “Another Ex” to be so consumed by bitterness and self-pity to deny that others have less pressing problems than his own. There are at least two other methods of achieving the status of principal other than by applying for practice vacancies. He should try them. I am sure that the Medical Practices Committee must give most weight to experience in general practice, personal qualities, and the particular requirements of the practice to be filled in deciding on a candidate for the vacancy. The justice of giving precedence in allocating vacancies to any particular problem group is not self-evident, and is certainly unproven.—I am, etc.,

HOWARD S. REEVE.

London, S.E.13.

SIR,—I can hardly find words to express my amazement at Dr. A. Gee's letter on practice vacancies for ex-registrars (*Supplement*, September 21, p. 113). To me it seems not only reasonable but just that the applicant with the best experience should be selected to fill a practice vacancy. It would appear that Dr. Gee has had insufficient experience of general practice to learn that it is in many ways a specialty in its own right, the only adequate training being practice

2750

experience. Higher qualifications and numerous hospital appointments cannot be regarded as anything other than a good background. The lot of many registrars is indeed unhappy, but it is quite certain that it will not be improved by labelling as unjust procedure which is patently fair and common-sense.

In case any of your readers are in doubt as to where my interests and sympathies lie, I should add that I have been a principal in general practice and am now a registrar.—I am, etc.,

Portsmouth.

JOHN BURSTON.

Senior Registrar Problem

SIR,—During the prolonged correspondence and discussions on the difficulties of the senior registrar, it has always been concluded that the problem would be solved by the establishment of permanent appointments in some intermediate assistant consultant grade for a proportion of those not able in a reasonable time to reach full consultant status. It has thereupon been concluded promptly that such a grade would be an S.H.M.O. under another name. The S.H.M.O. grade is shunned because it is a blind alley in itself and to it is attached the stigma of "failed consultant."

At present, regulations state that no consultant appointment may be made under the age of 32 years, except under extraordinary circumstances, and no registrar is appointed until he has held resident junior house appointments. Let there be a ladder of progress in which no step may be passed over and in which no one may be appointed to a step who has not held a post on the previous step for at least two years. The progressions would be: (1) not less than two years as a junior resident (including the pre-registration year); (2) not less than two years as a registrar; (3) not less than two years as a senior registrar; (4) not less than two years as an S.H.M.O. (or assistant consultant); (5) consultant. Teaching hospitals would be reluctant to have assistant consultants, and selection committees would be forced in most cases to appoint to clinical posts persons who had had practical (as well as teaching and/or research) experience.

There is no need to juggle with the present terminology. Insistence on the above minimum period in each grade, before appointment to the next grade, would suffice to ensure that newly appointed consultants have practical experience; to remove the stigma at present attached to the term S.H.M.O.; and to prevent the brilliant research man getting a clinical job for which he is quite unsuited, in preference to his comparably qualified and clinically more experienced colleague.

A person qualifying at 24 years could still have reasonable hope of becoming a consultant at the age of 32. If he cannot make the grade, at least he would have security as an assistant consultant (or S.H.M.O.), and the reassurance that consultants can only be appointed from others in that same grade.—I am, etc.,

Worcester.

ANTHONY A. VICKERS.

Medical Record Envelopes

SIR,—Now that the National Health Service has been in existence for over nine years most of us are finding the medical record envelopes (forms E.C.5 and 6) far too small to hold the numerous clinical records that have accumulated with many of our "chronics."

Most hospital reports are on quarto paper (10 by 8 in.—25.5 by 20.5 cm.), though shorter ones may be on sexto (8 by 6½ in.—20.5 by 16.5 cm.), or even octavo (8 by 5 in.—20.5 by 12.5 cm.). The present size of form E.C.5 (5 by 7 in.—12.5 by 17.5 cm.) means that it is just too small to hold quarto paper folded once (5 by 8 in.—12.5 by 20.5 cm.), and it must be folded twice (5 by 4 in.—12.5 by 10 cm.). If a large number of them accumulate they make a fat unwieldy packet which it is difficult to get in and out of the envelope.

I like to keep the reports for each patient pinned together with paper-clips in chronological order. But I find that when more than two dozen sheets have collected (as with quite

a number of patients) it is very difficult to fold such a thick packet twice without tearing the outer ones (it being now ½ in. (12.7 mm.) thick). As a result I use larger envelopes for such copious records (I find forms E.C.3 quite useful for this purpose). My record is one old lady who has 39 sheets in hers. What some of them will be like in another nine years one shudders to think.

The ideal envelope would be large enough to take quarto folded once (or octavo unfolded)—say 8½ by 6 in. (21.7 by 15.2 cm.). They would be very little bigger than the present size and far more convenient. I presume the present size was ordained when the old N.H.I. Act came into being in 1912. No doubt it was hoped that all reports would be on sexto paper which would fit into the envelopes folded once. This has not happened, and I expect it is extremely unlikely that the hospitals can be induced to stick to sexto paper now. Is it not high time a change in size of the record envelope was made before it becomes quite unusable for most patients?—I am, etc.,

Merioneth.

C. C. M. WATSON.

Maternity Medical Services

SIR,—I read Dr. R. G. Troup's letter (*Supplement*, September 14, p. 112) with interest. His quite justifiable annoyance with the present system of admission to the obstetric list, however, misses one important point. Two years ago I warned that there was a move to make obstetrics a "closed shop" for the Royal College of Obstetricians and Gynaecologists and that the time would come when the minimum qualification for practising midwifery would be the possession of the D.R.C.O.G. This point has almost arrived, as from April, 1958, the only qualifications that will be accepted for inclusion on the Essex obstetric list will be the possession of the D.R.C.O.G. or evidence that the applicant has held a six months' resident obstetric post.

The conditions for taking the D.R.C.O.G. have been progressively stiffened over the past few years. I believe they now require that the applicant must have done a resident obstetric job after the completion of the two pre-registration medical and surgical house posts. The position is now that there are very few obstetric resident posts available, certainly not enough for all prospective G.P.s to get one. Doctors already in practice cannot possibly abandon their practices to do a six months' resident appointment, and they are not now to be permitted to do part-time work at an obstetric hospital to get postgraduate experience, which would qualify them for inclusion in the obstetric list. This manoeuvre, for it is nothing less, does nothing to raise the standard of obstetrics, since any doctor can still do midwifery for his own patients at the lesser and totally inadequate fee.

The very consultants who have inflicted this repressive measure on the younger doctors cannot be very impressed with the teaching they give to their medical students, if they consider them unfit to be on the obstetric list. Why, then, have a midwifery examination at all as part of the final examination for medical degrees? What they are in effect saying is "Here is your medical degree; you have satisfied us with your knowledge in obstetrics, but we do not consider you are safe to undertake a normal confinement, nor have you enough knowledge to recognize an obstetric abnormality and seek help from a consultant when it arises." How farcical can we get?—I am, etc.,

Upminster, Essex.

E. ANTHONY.

SIR,—General practitioners in Essex recently received from the local executive council a circular laying down the criteria for admission to the obstetric list. These are that candidates must have had at least six months' obstetric housework or that they be in possession of a special qualification in obstetrics. This usurpation by the local obstetric committees of the rights of the qualifying bodies should lead to a review of the composition and powers of obstetric committees.

By this dictum the executive council have denied the right of general practitioners ever to undertake midwifery if they do not possess the above criteria. The knowledge and experience of the long-established practitioner who decides to change his area of practice will be cast away. The practical technique of the medical officer who has worked overseas under the most arduous conditions will be set aside in favour of the young newly qualified doctor who may have been fortunate enough to have obtained a six months' house job. The keen and enthusiastic general practitioner who would wish to study midwifery in his spare time will no longer be able to apply for admission to the obstetric list. These categories of general practitioners will be permitted to practice "cut-price" midwifery. Surely, if an obstetrician is not worth the munificent sum of 7 guineas because of his inability to satisfy the obstetric committee's criteria he should not be allowed to practise midwifery at all.

These events are striking at the very root of Association policy, and it is to be hoped that prompt action will be forthcoming.—I am, etc.,

I. M. SEGAL.

Seven Kings, Essex.

Cost of N.H.S.

SIR,—The cost of prescriptions appears to be the main target for economies in the N.H.S., but I would like to point out another and even vaster expense—namely, the cost of treating road casualties.

If I knock someone down, and in so doing break his leg and at the same time dent my mudguard, the insurance company will mend my mudguard and compensate the victim. The N.H.S., on the other hand, is expected to cover the cost of treatment and hospitalization, which in many cases is extensive and prolonged. There are roughly about 250,000 of these road casualties annually, and it would be interesting to know the cost of treating them. Do the insurance companies subscribe to this N.H.S. expenditure?—I am, etc.,

J. D. CONDON.

Blackburn.

Trainee Assistant Scheme

SIR,—The simple and obvious solution to the views of admirers and opponents of the trainee assistant scheme is to limit each trainer to one trainee per three or five years. At a stroke this would prevent the abuse of a continuous line of trainee assistants (these forming, in fact, a permanent assistantship without a view). Further, it would enable a greater number of competent would-be trainers to implant their ideas. Why this simple expedient has not been tried by the powers that be is beyond me—maybe it is too simple, or too effective for those that abuse the scheme.—I am, etc.,

T. RUSSELL.

Hayes, Middlesex.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Avy, A. P.: *Les Aérosols*. 1956.
Bardin, P.: *et al.* *ABC de Cardiologie*. Second edition. 1955.
Barer, R.: *Lecture Notes on the Use of the Microscope*. 1956.
Bladergroen, W.: *Einführung in die Energetik und Kinetik biologischer Vorgänge*. 1955.
Burn, J. H.: *Lecture Notes on Pharmacology and Signs in Clinical Medicine*. Sixth edition. 1957.
Chamberlain, E. N.: *Symptoms and Signs in Clinical Medicine*. 1955.
Chandler, A. C.: *Introduction to Parasitology*. Ninth edition. 1955.
Ciba Foundation Symposium: *Porphyria Biosynthesis and Metabolism*. 1955.
Foldes, F. F.: *Muscle Relaxants in Anesthesiology*. 1957.
Furlong, R.: *Injuries of the Hand*. 1957.
Goslings, J., and Van Swaay, H. (Editors): *Contemporary Rheumatology*. 1956.
Graham, H.: *Surgeons All*. Second edition. 1956.
Granit, R.: *Receptors and Sensory Perception*. 1955.
Greither, A.: *Dermatologische der Mundhöhle und der Mundumgebung*. 1955.

H.M. Forces

Major-General F. McL. Richardson, D.S.O., O.B.E., late R.A.M.C., has been appointed Honorary Surgeon to the Queen, in succession to Major-General C. W. Greenway, C.B., C.B.E., retired.

Colonel A. H. Charles, T.D., A.E.R.O., has been appointed Honorary Surgeon to the Queen, in succession to Brigadier W. R. Ward, T.D., who has been transferred to the T.A.R.O.

Surgeon Commander F. R. Badenoch, M.B.E., and Surgeon Lieutenant-Commander R. C. Ponder, R.N.V.R., have been awarded the Royal Naval and Royal Marine Forces Volunteer Reserve Decoration.

A *Supplement* to the *London Gazette* has announced the following awards:

Second Clasp to the Territorial Efficiency Decoration.—Colonel D. P. Holmes, T.D., and Major (Acting Lieutenant-Colonel) A. S. Bookless, T.D., R.A.M.C.

First Clasp to the Territorial Efficiency Decoration.—Lieutenant-Colonel W. K. McCollum, T.D., and Major J. B. Fulton (now T.A.R.O.), R.A.M.C.

Territorial Efficiency Decoration.—Major J. B. Fulton (now T.A.R.O.) and Captain (Honorary Major) E. J. C. Hewitt (retired), R.A.M.C.

ROYAL NAVY

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant A. J. R. Hudson to be Surgeon Lieutenant-Commander.

ARMY

Colonel M. J. Kohane, M.C., late R.A.M.C., has retired on retired pay on account of disability.

Colonel A. McMillan, late R.A.M.C., having attained the age limit for retirement, has retired on retired pay (Reserve Liability). Lieutenant-Colonels L. G. Irvine and J. A. D. Johnston, O.B.E., M.C., from R.A.M.C., to be Colonels.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: J. H. M. Chen, M.B., F.R.C.S., and G. H. V. Clarke, M.B., B.S., Senior Specialists, Federation of Nigeria; A. D. Low, M.R.C.S., L.R.C.P., Senior Medical Officer, St. Vincent, Windward Islands; I. W. J. McAdam, M.B., F.R.C.S., Senior Specialist, Uganda; A. L. McKnight, M.B., Ch.B., Senior Medical Officer (Clinical), Southern Cameroons; A. S. Moodie, M.B., Ch.B., D.P.H., Senior Specialist (Tuberculosis Service), Hong Kong; R. F. Payne, M.R.C.S., L.R.C.P., D.T.M.&H., Medical Superintendent, Victoria Hospital, Gambia; B. P. Bhattacharya, M.B., B.S., and J. N. Ghose, M.B., B.S., D.T.M., Medical Officers, British Guiana; M. A. C. Beaubrun, M.B., Ch.B., Medical Officer, Barbados; A. Bisset, M.B., Ch.B., Medical Officer (Psychiatrist), Honduras; R. H. Prince, M.D., M.B., B.S., Medical Officer, Western Nigeria; J. P. Puthumana, M.B., B.S., Specialist, E.N.T., Uganda; Isobel R. S. Troup, M.B., Ch.B., C.P.H., D.P.H., Medical Officer (Special Grade), Uganda; J. A. J. Wiehe, M.B., B.Ch., Medical Officer, Mauritius.

A practitioner whose car had been removed had also been told by letter that as the Commissioner had no power to reserve space on the highway for any particular class of road user he was not able to make any suggestion regarding parking adjacent to his own premises.

The CHAIRMAN recalled that assurances had been given by the police at a previous local inquiry into parking restrictions, but later it was learnt that assistance would only be given to doctors dealing with a real emergency; so far as the ordinary course of practice was concerned, the doctor would have no special privilege. A deputation from the Committee to the Ministry of Transport had been listened to for a whole afternoon, but nothing had been done. It was agreed to recommend to the General Medical Services, Central Consultants and Specialists, and Public Health Committees that the Council should be asked to send a deputation to the Minister of Health to point out the danger of interference with the efficiency of the Health Service if the doctors were not assisted in their parking difficulties, and requesting his support in an approach to the Minister of Transport.

Fees

The Medical Adviser to the Treasury had given an assurance that 25s. was not regarded as the maximum fee in sickness absence cases involving a report of more than usual intricacy or for an examination of more than usual length, and that, when justified, up to £2 2s. would be paid in these special cases. The Committee decided that when there was any doubt local treasury medical officers should be advised to claim the higher fee.

The Committee accepted under protest the revised fee of £1 11s. 6d. for a pre-employment examination for the National Health Service, maintaining that the correct fee should be at least £2 2s. Similar action was taken in regard to the increase to 2s. 6d. in the fee for vaccination certificates for Service families going abroad. For several years the Committee has repeatedly sought to have the fee increased from 1s. to 5s.

In order that there should be no doubt at all as to the policy of the Association on the amount of the fee for a full clinical medical examination, involving no special investigation, and report, the Committee thought it would be advisable to make a clear recommendation that this fee should be not less than £2 2s.

A suggestion had been received that the fee recommended by the Association for the completion of cremation certificates B or C should now be increased. The Committee decided that it would be inadvisable to suggest such an increase at present.

EVIDENCE TO ROYAL COMMISSION COUNCIL MEETING SHORTLY

The B.M.A.'s Evidence Committee which is preparing the Association's evidence to the Royal Commission on doctors' and dentists' remuneration is meeting on October 16 to consider statements drafted by the General Medical Services and Central Consultants and Specialists Committees, and the Council will meet on two consecutive days early in November to consider, in addition to its routine business, a first memorandum of evidence which the Evidence Committee will present for its approval.

A special Remuneration Subcommittee of the Public Health Committee has already met three times. The subcommittee is preparing a plan for the reform of the structure of remuneration in the public health medical service to make it reasonably comparable with remuneration in general and hospital practice. The plan will go eventually to the Council in the form of a draft statement for submission to the Royal Commission. It will go also to the Staff Side of Whitley Committee C as a basis for a fresh claim which the Staff Side will be advised to try to negotiate with the Management Side.

RUNNING COSTS OF HOSPITALS

SELECT COMMITTEE'S COMMENTS

Recommendations that the Minister of Health should inquire into domiciliary consultations to determine the extent, if any, of misuse and recommend the controls, if any, needed to prevent abuse, and that medical students should be required before qualifying to have a proper knowledge of the financial structure of the National Health Service, are among those made in a report on the running costs of hospitals by the Select Committee on Estimates, published last week. The Committee also commented on the unnecessary load borne by the hospital and specialist services, and referred to it as "undoubtedly one of the most difficult (and least satisfactory) aspects of the whole National Health Service." The Committee stated that it had been impressed by the devotion and enthusiasm that prevail throughout the service, but it had also been depressed by the apparent lack of vigour with which some fundamental problems are being faced by the Ministry.

Those in Need

In the interests of the hospital service, the Ministry of Health should ensure that expensive hospital facilities are devoted only to those sick people truly in need of them, the Committee states. It had evidence, it said, of patients attending out-patients who could well have been examined and treated by general practitioners. Also patients were unnecessarily retained as out-patients for treatment by consultants who could be referred back to their general practitioners. Hospital beds were being uneconomically occupied by patients admitted for observation who could have attended as out-patients if facilities (such as a rest room) had been available. There were, too, a certain number of chronic sick being retained in acute wards because of a shortage of chronic beds, and there were patients in chronic sick beds who could not be discharged because no other suitable care or accommodation was available. The same applied to 10,000 old patients in mental hospitals. In the Committee's opinion the answer undoubtedly lay partly in extending such services as the maternity and child welfare services, the home nursing service, the use of mental welfare officers, and the provision of home helps, as well as an expansion of certain types of hospitals and wards. But eventually hospital authorities, the general practitioners, and the local authorities must all work together if the limited resources of the hospital service are not to be wastefully employed.

Domiciliary Consultative Service

The Committee expresses concern about the possibility that this service may be abused. A growth of from 175,504 visits in 1951 to an estimated 270,618 in 1956 is described, and it is thought that there is some laxity on the part of general practitioners in unnecessarily asking for domiciliary visits. Surprise is expressed that out of 2,627 domiciliary visits made by whole-time consultants in the South-east Metropolitan Region between November, 1955, and December, 1956, the general practitioner was present in only 38% of cases. It appeared to the Committee "that the requirement of the terms and conditions of service for hospital medical staff is not being complied with." It then recommends that the Minister should institute an inquiry into the extent, if any, of the misuse.

Cost Consciousness

The estimated hospital expenditure on drugs rose from £6.70 million in 1953-4 to £7.71 million in 1955-6, despite a fall in the price of drugs of about 13%. The Committee wonders if such growing expenditure is justified by the therapeutic effect at a time when all sectors of the hospital service are short of money. Although one of the most effective ways of economizing is for hospital management

¹ *Running Costs of Hospitals*, Sixth Report from the Select Committee on Estimates, Session 1956-7, 1957. H.M.S.O., London.

committees and boards of governors to place the responsibility for keeping down the drug bill on the medical staff, the Committee does not accept the view that the control of drug expenditure should be left entirely to doctors. Witness after witness before the Committee had referred to the lack of cost consciousness among doctors. Steps taken by the Ministry to inform hospital doctors on the costs of drugs had, apparently, not been enough to correct this. The Committee believes that "the problem can only be solved at the source—by ensuring that no medical student be qualified as a doctor without being made aware of the financial responsibilities of his position in the Health Service, and of the costs of the treatments he will have to prescribe." Medical students should be required, it says, to satisfy their examiners that they have a proper knowledge of the financial structure of the N.H.S. and the costs of treatment for which they may be responsible.

Administration

The Committee has a number of comments on the administration of the hospital service. It does not believe there is any gross inefficiency or obvious waste, but it thinks there is a better value could be got for the money spent. It was a question of fostering throughout the service a sense of mutual benefit from economies effected. As the Ministry's opportunities of direct control are so limited, the Committee considers it essential, in the interests of the hospital service, that the Ministry should use its powers of planning, guiding, and advising, and in particular of allocating money, so that the limited resources are made available, as smoothly as possible, where they are most needed, and to ensure that they are expended as efficiently as possible. These obligations can be met satisfactorily only if the Ministry acts with vigour and foresight. The Committee is not satisfied that it has always done so.

Scottish News

SCOTTISH ASSOCIATION OF EXECUTIVE COUNCILS

LOOKING BACKWARD AND FORWARD

The Tenth Annual Conference of the Scottish Association of Executive Councils was held in Pitlochry on September 26 and 27 under the chairmanship of Mr. R. S. STARK BROWN (Glasgow), president of the association.

Presidential Address

Mr. BROWN reviewed the years that had gone, and took stock of the present position of the Health Service in Scotland. The value for money spent on the Health Service could properly be judged only against the benefits flowing from increased good health. Mr. Brown noted that such information as was available suggested that, despite the introduction of potent new drugs, weeks of sickness benefit for men might now be about 5% higher than in pre-war days, while those for single women were possibly 10% higher. The total sick list was formidable. Why this should be so was far from clear. The answer might be that the standard of incapacity had shifted. He hoped that the nation might yet be capable of doing better things than breaking records in the consumption of drugs.

Mr. Brown took figures for the cost of the Service in Scotland in 1950 and compared them with costs in 1956. In 1950 the total cost of the Service, apart from local authority expenditure, had been £41.5 millions. In 1956 it was £55.8 millions. Expenditure on hospital services had increased from £24.5 millions (59.04% of the total) to £39.7 millions (71.15% of the total). General medical services had risen from £5.3 millions (12.77% of the total) to £6.9 millions (12.36% of the total). Pharmaceutical services had increased from £3.7 millions (8.92% of the total) to £5.1 millions

(9.14% of the total)—after deduction of £781,000 of charges. The National Health Service, therefore, was "big business" and must be a considerable factor in the national problem of inflation. Everyone should constantly be endeavouring to find where economies could be made. So far as the general medical services branch of the Service was concerned it seemed to Mr. Brown that some economy might be possible in prescribing. This needed the close attention of local medical committees and executive councils. There was need, too, for a national effort to convince the public that a change in the way of living would often be more helpful than a bottle of medicine.

Status of the General Practitioner

Mr. Brown went on to say that executive councils were not directly concerned with scales of remuneration, but they were, however, concerned that some means should be found of conducting such matters with dignity and in a forum that resembled neither the market-place nor the political arena. It was to be hoped that the Royal Commission would soon point the way. He thought that one should not, from mere convenience, accept a system which could encourage mediocrity in the performance of professional duties, and there should be some recognition of special ability and experience.

Mr. Brown concluded by expressing disappointment that nothing had come of the recommendations in the Scottish Health Services Council's report on the general practitioner and the Health Service. The committee had advocated general-practitioner beds in hospitals and even general-practitioner hospitals in suitable areas. It had also recognized that general-practitioner midwifery should be encouraged and that restriction of their facilities for conducting hospital confinements would react unfavourably on the standard of their domiciliary midwifery. Mr. Brown regarded the report as possibly the most important yet issued in connexion with the development of the N.H.S.

Acid Test

Mr. JOHN A. MACK, Stevenson Lecturer in Citizenship at Glasgow University, who addressed the Conference, thought the acid test for the Health Service in the next five, and indeed the next 50, years was whether it could live up to its professed purpose of fundamental prevention. The immediate and always pressing purpose of diagnosing and treating illness was, on the whole, being done more effectively than ever before. The more long-range and vital task of preventing serious illness was also being accomplished, and represented the great achievement of the generation of medical men born at the beginning of the century. Diphtheria immunization and other preventive inoculations, the use of the antibiotics, the early diagnosis of tuberculosis, the general and continuous reduction of infant and maternal mortality constituted a great record. But it was not enough. The main purpose of the Service was the most fundamental prevention of all—the continuous improvement of the physical and mental health of the people and prevention of illness by the sensible practice of starting them healthy and keeping them healthy. We were still a long way from having achieved that.

New Family Doctor Centre

Mr. J. ANDERSON, Secretary to the Department of Health for Scotland, speaking to the Conference on September 27, disclosed that a new family doctor centre was to be set up in Edinburgh as a self-contained unit providing facilities for a wide range of diagnostic procedures (see annotation at p. 875). These would include a laboratory and x-ray and electrocardiograph equipment which would enable general practitioners to deal with many types of cases which otherwise would have to be referred to hospital out-patients. It was hoped that the centre would be available for about 100 of Edinburgh's 300 family doctors, who would be able to meet by appointment at the centre any of their patients who needed special investigation or follow-up. The centre had been sponsored by the Nuffield Provincial Hospitals Trust

and the Department of Health, and the former was contributing £17,000 towards the capital cost of £25,000 and £13,000 towards the running costs during the first three years. These would amount to about £10,000 a year.

New President

The new president of the Scottish Association of Executive Councils is Dr. JAMES M. GILL, Inverurie. The new vice-president is Mr. JOHN S. BANKS, of John o' Groats, chairman of Caithness Executive Council.

GLASGOW DOCTORS PRAISED EXECUTIVE COUNCIL STATEMENT

Glasgow Executive Council issued a statement on October 6 recording its appreciation of the services being rendered by the medical profession during the present influenza epidemic. Particularly commended are the steps taken by the profession in taking over at short notice the work of single-handed doctors incapacitated by illness.

Correspondence

Remuneration in the Public Health Service

SIR,—With reference to Dr. J. P. Birkett's reply (*Supplement*, September 28, p. 119) to my letter (*Supplement*, August 24, p. 102), if the Whitley award of December, 1956, is in recognition of the general practitioner's experience, and in that the Whitley Council has also recommended that dental officers' previous experience in practice should receive incremental recognition for five years, the anomalous situation now exists wherein, of the three main professional groups working in a local authority clinic, the only group singled out by the Whitley Council for non-recognition of previous experience, other than with a local authority, is the full-time medical staff. Surely many full-time doctors must also have "special ability and experience in the work to be done" which would justify monetary consideration by the Whitley Council?—I am, etc.,

Wingham, Kent.

C. J. MACQUILLAN.

Ethics on Holiday

SIR,—I was amazed to read the letter from Dr. R. S. C. Fergusson (*Supplement*, September 28, p. 119) on the unethical practices of doctors holidaying in the area in which he resides. Apart from the fact that they are committing a flagrant breach of medical etiquette, I would have thought that, being on holiday, they would be only too glad to be free from the shackles of present-day practice, whether N.H.S. or not.

For my own part, whether going on holiday, week-end, or even on my half-day, it is my invariable custom to remove from my car my emergency bag, from my pockets my syringe, clinical thermometer, morphine and other tablets, and, in fact, anything connected with medicine. Should I, or my family, be taken ill while on holiday in this country, then I should call in the local G.P., who can then collect his justly earned 17s. If abroad, then I should take what I consider a justifiable risk and pay the necessary fees. Any tablets we have on holiday are contained in my wife's handbag—she is perhaps a bit more provident than I.—I am, etc.,

Heywood, Lancs.

W. L. YOUNG.

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. John Bodkin Adams (Eastbourne) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations, 1953, apply.

Branch and Division Meetings to be Held

- BARNESLEY DIVISION.**—At Three Cranes Hotel, Barnsley, Wednesday, October 16, 7.30 for 8 p.m., dinner and dance.
- BIRMINGHAM DIVISION.**—At Birmingham Medical Institute, 36, Harborne Road, Edgbaston, Tuesday, October 15, 8.30 p.m., meeting. Mr. A. L. Deacon: "Obstetrics Without Tears."
- BLACKBURN DIVISION.**—At Moorcock Inn, Waddington, near Clitheroe, Thursday, October 17, 8.30 p.m., annual B.M.A. dinner and dance. Guests are invited.
- BRIGHTON AND MID-SUSSEX DIVISION.**—At Preston Parish Church (St. John's), Sunday, October 20, 6.30 p.m., annual church service. Address by Reverend R. M. Raper.
- COVENTRY DIVISION.**—(1) At Grosvenor Room, Hotel Leofric, Coventry, Tuesday, October 15, 7.30 for 8 p.m., annual dinner. Address by Dr. W. H. C. Croft: "Notes and Jottings." (2) At St. Theresa's Roman Catholic Church, Coleshill, Sunday, October 20, 6.30 p.m., annual church service.
- DEWSBURY DIVISION.**—At Staincliffe General Hospital, Friday, October 18, 8.15 p.m., clinical meeting.
- EAST KENT DIVISION.**—At the Cathedral Church of Christ, Canterbury, Sunday, October 20, 2.45 for 3 p.m., St. Luke's Tide Evensong for those concerned with the care and healing of the sick.
- GLASGOW DIVISION.**—At Royal Faculty of Physicians and Surgeons of Glasgow, 242, St. Vincent Street, Glasgow, Thursday, October 17, 8.30 p.m., meeting.
- GUILDFORD DIVISION.**—At Board Room, Royal Surrey County Hospital, Thursday, October 17, 8.30 p.m., meeting. Dr. J. Maurice Campbell: "Selection of Patients for Cardiac Surgery."
- FIFE DIVISION.**—At Main Committee Room, Town House, Kirkcaldy, Thursday, October 17, 3 p.m., meeting.
- HASTINGS DIVISION.**—At St. Mary Magdalen Church, Warrior Square, Hastings, Sunday, October 20, 3 p.m., annual united St. Luke's Day Service. Preacher, Mr. Arnold S. Aldis.
- HOLLAND DIVISION.**—At White Hart Hotel, Boston, Saturday, October 12, 8 for 8.30 p.m., dinner. 9.30 p.m., Dr. L. S. Potter (Assistant Secretary, B.M.A.): "Personal Service."
- MANCHESTER DIVISION.**—At Fallowfield Hotel, Wilbraham Road, Manchester, Tuesday, October 15, 8.30 p.m., adjourned annual general meeting.
- NORTH MIDDLESEX DIVISION.**—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, October 15, (1) 2.30 p.m., practitioners' round. Dr. N. Whittaker: Medical cases, including Diabetic. (2) 8.30 for 8.45 p.m., meeting. Paper by Dr. I. C. Gilliland: "Thyroid Disorders."
- RICHMOND DIVISION.**—At Royal Hospital, Richmond, Friday, October 18, 3.30 p.m., clinical meeting. Short lecture by Dr. Gerald Slot.
- RUGBY DIVISION.**—At Grand Hotel, Rugby, Thursday, October 17, 8 for 8.30 p.m., informal supper; 9.30 p.m., ordinary meeting.
- SCARBOROUGH DIVISION.**—At Board Room, Scarborough Hospital, Thursday, October 17, 8.30 p.m., meeting. Lecture by Lieutenant-Colonel A. D. Young, D.S.O., R.A.M.C.: "Medical Aspects of Nuclear Explosions."
- SOUTHAMPTON DIVISION.**—(1) At Conference Room, Civic Centre, Southampton, Wednesday, October 16, 8.30 p.m., ladies' night. Address by Captain G. W. Wakeford, F.R.A.S., A.I.N.A., F.R.S.A.: "Training of Officers for the Merchant Navy." (2) At St. James' Road Methodist Church, Southampton, Sunday, October 20, 6.15 p.m., annual thanksgiving service.
- WAKEFIELD DIVISION.**—At Board Room, Clayton Hospital, Wakefield, Thursday, October 17, 8 p.m., meeting. Lecture by Dr. William Whitaker: "Cardiology."
- WARRINGTON DIVISION.**—At Nurses' Lecture Room, Warrington General Hospital, Friday, October 18, 8.30 p.m., clinical meeting. Talk by Dr. G. B. Manning: "Dead Men's Tales" (illustrated by lantern slides).
- WEST MIDDLESEX DIVISION.**—Thursday, October 17, Atomic Energy Research Establishment, Harwell, Berks. Motor-coach will leave Ealing at 12 noon, returning at 6.30 p.m.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

A meeting of the Central Consultants and Specialists Committee was held at B.M.A. House on October 3. Mr. T. ROW-HOLMES SELLORS was appointed Chairman and Dr. T. Row-Land Hill Deputy Chairman of the Committee for the session 1957-8.

Evidence to Royal Commission

Dr. D. P. STEVENSON (Deputy Secretary) reported that the G.M.S. Committee evidence had been approved by that Committee. In certain respects the draft of the Central Consultants and Specialists Committee and that of the G.M.S. Committee overlapped, and he had been endeavouring to draft a composite document for the consideration of the Evidence Committee.

A further draft document of the Committee's evidence to the Royal Commission on Doctors' and Dentists' Remuneration was then considered by the Committee.

The CHAIRMAN, in reply to a question, said that all the evidence from the regions had been collected and all the points made during the discussion would be taken into account.

The document was approved for forwarding to the B.M.A.'s Evidence Committee.

An explanatory statement prepared by the Joint Consultants Committee for the Royal Commission was also received.

Remuneration of S.H.M.O.s

A resolution of the Welsh Regional Consultants and Specialists Committee to the effect that the Central Consultants and Specialists Committee be specifically asked to approve in principle that the salaries of S.H.M.O.s should amount to 80% of those of consultants was further considered.

Mr. J. R. NICHOLSON-LAILEY said that, while fully in sympathy with the S.H.M.O.s, one point which ought to be considered was the possibility of confusing the issue in the appeals which were now going forward on behalf of S.H.M.O.s who were claiming remuneration at consultant rate if it could be proved that they were doing consultants' work. At the same time, of course, it had to be borne in mind that the S.H.M.O. was someone who was between a senior registrar and a consultant and was doing very important work. Eighty per cent. in that case was a reasonable figure.

Professor G. I. STRACHAN said he doubted whether the question could reasonably be confused. Professor P. C. P. CLOAKE moved that the matter be referred to the Executive Committee, which should meet the S.H.M.O.s and obtain some explanation of the figure of 80%. Dr. J. D. S. CAMERON seconded the motion.

Dr. T. F. MCCARTHY pointed out that the Executive Committee had already been approached with the figure of 80%, and it had been discussed by the Staff Side of Whitley B. The latter, while not giving a firm opinion, had expressed themselves generally in favour. Mr. A. LAWRENCE ABEL said he appreciated all the difficulties, but the Committee had always been sympathetic towards the S.H.M.O.s. In his view, all the difficulties would be met if the words "not less than" were inserted after "amount to." He moved an amendment to this effect. Professor STRACHAN seconded the amendment, which was carried.

An amendment to add the words "at corresponding points in the salary scale," moved by Mr. A. N. GUTHKELCH, was also carried.

Remuneration of Whole-time University Medically Qualified Teachers and Research Workers

A long resolution of the Non-professorial Medical Teachers and Research Workers Group Committee was considered. Briefly, it was a reaffirmation of the Group Committee's view that the same basic rates should apply to medical teachers and research workers in non-clinical departments as applied to medical teachers and research workers in clinical departments. It also regretted that the Central Consultants and Specialists Committee did not feel able to support the recommendation. The latter Committee, in a resolution, had pointed out that it should be made clear, in that part of the Group Committee's memorandum which dealt with the question of financial recognition of increased responsibility, that when an individual was receiving an N.H.S. merit award he should not also be eligible for additional responsibility payment from the university.

Dr. E. BERESFORD DAVIES said he understood that the universities had their methods of remuneration, and that they did not bear much comparison one with the other. Some universities, notably Cambridge, paid additional sums of money which were for increased responsibility or increased merit. What seemed to be a problem was that anything done through the N.H.S. would cover up confusion which existed within the universities. What was wrong was the method of remuneration of university officers, whether pre-clinical or clinical. He wondered whether a merit award as such could be applicable to somebody who was not doing any clinical work at all—somebody engaged in the teaching of very important clinical subjects or research. There were also people who were doing a certain amount of clinical work in clinical departments with colleagues who were often employed wholly by the N.H.S. Were those people to be regarded in exactly the same light? If merit awards tended to go to university officers there would be fewer for those engaged purely in clinical work in the N.H.S. He suggested that the Committee should indicate that it regarded it as

Advisory Councils on Occupational Health

From the suggestions received from Advisory Councils on Occupational Health the following has been selected as the principal subject for discussion at next year's conference of Advisory Councils on Occupational Health: "Optimum Mental Health as a Factor in the Achievement of a High Standard of Happiness and Productivity in Industry."

The CHAIRMAN thought that for the future consideration might be given to altering the composition of the employees' section of these councils, as a number of interests were not represented on trades councils. The employers and employees had learned from serving on these Occupational Health Advisory Councils, commented the Chairman, but it was probably the doctors who had learned most. They got to know far more about the difficulties of industry than they would in a course of lectures.

Remuneration

The Committee agreed that the matter of the remuneration of part-time medical officers at Industrial Rehabilitation Units should be taken up with the Treasury, having regard to the new scales for industrial medical officers approved by the Representative Body. Because this would take time, the Treasury should be asked to make any adjustment retrospective to the date of receiving the application. Another salary matter was that of the negotiations on fees paid to appointed factory doctors, which are in progress. The Committee received a report.

Draft Legislation

In reply to a request that the B.M.A., through its Occupational Health Committee, should be consulted in the case of draft legislation relating to occupational health matters, a letter from the Ministry of Labour and National Service announced that where this was considered appropriate, having regard to the subject-matter and other relevant considerations, arrangements would be made for it to be done. Further matters before the Committee included occupational aspects of dermatitis, co-ordination in the field of occupational health research, and the preliminary draft of the Factories (Ionizing Radiations) Special Regulations.

TAX ASSESSMENT OF PART-TIME CONSULTANTS**APPEAL STILL OUTSTANDING**

No date has yet been fixed for the hearing of the Crown appeal to the High Court against the decision of the special commissioners that part-time consultants should be assessed under Schedule D in respect of the whole of their professional earnings.

Meanwhile, the position is still that which was advised by the Association (*Supplement*, November 17, 1956, p. 194). Save in exceptional cases, part-time consultants will continue to be assessed under the schedule at present applying to them. If the special commissioners' decision is upheld, and it is decided that part-time consultants should be wholly assessed under Schedule D, all Schedule E assessments in respect of which a notice of appeal has been given will be abandoned by the Crown and the liability will be dealt with under Schedule D. In the meantime, consultants under Schedule D will continue to pay tax as before. Those paying tax under P.A.Y.E. will continue to do so and the tax paid will be available if necessary to satisfy the Schedule D assessments. If tax is not paid under P.A.Y.E. substantial arrears may accrue while the test cases are under appeal, and consultants may have to find large sums to pay the tax which has mounted up.

MEDICAL ETHICS

The Central Ethical Committee held its first meeting of the session on September 24. Dr. S. NOY SCOTT was elected Chairman and Dr. ANNIS GILLIE Deputy Chairman of the Committee. Tributes were paid to the retiring Chairman, Dr. R. FORBES, who had indicated that he did not wish to stand for re-election. Dr. P. Y. LYLE was welcomed as a new member of the Committee.

Disclosure of Information

The Committee considered correspondence about the hospital cancer registration scheme, and decided to make representations to the Ministry of Health that prior consent of the patient (or the nearest competent relative) should be obtained in all cases before professional information was disclosed in connexion with this scheme.

Instances had been reported in which confidential information given by doctors arranging ambulance transport for patients had been automatically made available by the ambulance service to the police. The fact that such unauthorized disclosure could occur even on occasion was a matter of concern, and it was decided to refer the problem to the Public Health Committee for further advice.

Sharing of Premises by Doctors and Dentists

The Committee had before it a resolution from the Annual Representative Meeting that the policy adopted by the Committee in 1950 on the sharing of premises by doctors and dentists should be reconsidered. The Committee's attitude had been that it was in the interest of maintaining high ethical standards that doctors and dentists should, whenever practicable, avoid sharing the same premises for professional purposes. Drs. O. C. CARTER and R. HALE-WHITE, representing the Journal Committee, joined the Committee in its discussion of this item in view of the fact that advertisements for shared premises were received for publication in the *Journal*. It was stated that in certain areas such sharing was common practice and eminently desirable. On the other hand, the view was expressed that it was an arrangement that might result on occasions in the direction of patients. After a full examination of the problem, in which reference was made to the economic factors which might lead to a more general development of the practice of sharing premises, it was decided to consider at the next meeting proposals for the possible alteration of the existing policy.

Display of Practitioners' Names

A private practitioner had inquired whether there would be any ethical objection to the display of his name as a private practitioner in the local post office. He drew attention to the fact that the names of National Health Service general practitioners were made available at local post offices on printed lists. The Committee, however, took the view that medical practitioners were sometimes required by Acts of Parliament or by regulations to do certain things which were contrary to the ethical code of the profession. Before the introduction of the National Health Insurance Act it would have been held to be unethical for doctors' names to be displayed in the form of a printed list in post offices. It was a requirement of the National Health Service Act that the names of doctors in the Service should be displayed, but it did not follow that there would be no objection to a similar display of the names of private practitioners.

The annual report of the council of the Association of Certifying Factory Surgeons covering the work of the association during 1956 has now been published, with a foreword by Sir George Barnett, H.M. Chief Inspector of Factories. The number of appointed factory doctors has risen to over 2,000. Copies of the report are available from the secretary of the Association of Certifying Factory Surgeons, Dr. M. E. M. Herford, Ferneham, Farnham Royal, Bucks.

Scottish News**SCOTTISH COUNCIL DINNER**

The chairman and members of the Scottish Council of the B.M.A. were the hosts at a dinner given in Edinburgh on October 9. The occasion was a memorable one, not only because this was the first function of its kind to be held in the newly renovated B.M.A. Scottish House in Drumsheugh Gardens, but also because it was the first dinner given by the Scottish Council since its change of title from Scottish Committee. After the chairman, Dr. W. M. KNOX, had proposed the loyal toast, Lord CLYDE, Q.C., Lord President of the Court of Session, proposed the toast to the B.M.A. Large organizations, he said, gave the opportunity for building up a huge bureaucratic machine which had great benefits—nobody was ever responsible for anything that went wrong. "The could ever be blamed for anything that went wrong," said Lord introduction of the National Health Service, "gave the British Medical Association every temptation in the world to assume the mantle of dictator and to defy the unfortunate people of this country. It is to its immense credit that it resisted any temptation of that sort, and, by resisting it, retained the confidence of the people in your profession."

In replying to the toast, the President of the B.M.A., Mr. WELDON WATTS, congratulated the Scottish Council on its beautiful premises. Making a plea for unity in the profession, he said that the B.M.A. this year had had a lot of publicity. But the claim for adjustment of remuneration had been consistently side-stepped. Mr. Watts thought that the profession had been wise to accept the Royal Commission, and now the B.M.A. was preparing evidence for it. "We have been given some months of grace," he said, "and we must use them to try to agree on the evidence that we are to give. We must take this opportunity to reunite ourselves, so that when the Commission reports we will stand by." Young doctors, Mr. Watts concluded, should be brought into the discussions and should share the responsibility for the decisions to be made.

"An Outstanding Day"

Dr. IAN GRANT, proposing the health of the guests, said that it was an outstanding day for the B.M.A. in Scotland, that it was the first time we in Scotland have been able to ask for "it is the first time we in Scotland have been able to ask for numerous friends to come and have dinner with us in our new building." Among the guests welcomed by Dr. Grant were Lord Clyde, Lord Strathclyde, Sir Stanley Davidson, President of the Royal College of Physicians of Edinburgh, Sir David Campbell, President of the General Medical Council, Dr. Jean Mackintosh, President of the Medical Women's Federation, Dr. Kenneth Cowan, chief medical officer, Department of Health for Scotland, Professor G. L. Montgomery, chairman of the Scottish Health Services Council, Dr. John Hewitt, representing the Scottish Standing Committee of the Royal College of Obstetricians and Gynaecologists, and Dr. W. S. Gardner, chairman of the Scottish Branch of the College of State for Scotland, said in response that he hoped that Dr. Grant would take it as a compliment when he said that he personified the friendly and close relations between the profession in Scotland and the Scottish Office. Lord Strathclyde continued: "Sometimes one may use a phrase like 'friendly relations' in the diplomatic sense when it is not actually untrue but is not particularly true either. In this case it is genuinely true. We on St. Andrew's House look to your Association for advice on all manner of problems, and discuss with you all sorts of difficulties. Committees have been created for this purpose; but what is really important, of course, is the good personal relationships that have been built up through the years. Everyone has kept in mind the ultimate aim, which is to get the best value we can out of the Health Service, and to

offer the best service we can to the patient." That ultimate aim was perhaps achieved as well in Scotland as in any country in the world. The first credit for that had to go to the doctors.

Increasing Numbers of Doctors

Since the Health Service began the number of doctors in practice in Scotland had grown very considerably. Lord Strathclyde said that the number of full-time family doctors had risen since 1949 by one-eighth—nine now where there were eight before. The number of senior hospital doctors had risen by one-third in the same period—four now where there used to be three. Lord Strathclyde added: "I would like as a layman to thank you who are doctors, for the splendid service you give us as patients, and for the great advances that have been made in our time."

Dr. A. MACRAE, Secretary of the Association, proposed the toast of the Scottish Council. From its very beginning in 1903, when it met for the first time in Perth, the Scottish Committee attracted to its membership men of intellectual eminence and professional distinction, he said. Among its original members were Dr. Robert—later Sir Robert—Philip and Dr. N. Walker, who became Sir Norman Walker and President of the General Medical Council, father of Dr. Edward Walker, himself a former member of the Scottish Committee and now the esteemed Scottish Secretary of the B.M.A.

Referring to the Committee's recent change of name to Scottish Council, Dr. Macrae said "a thistle by any other name would prove as prickly." But a thistle had a gentle aspect too, for what could be softer than thistledown? He alluded to the robust independence of mind displayed by the Scottish Council members on the "other council of our Association which sits in London, England." Speaking of the co-operative relationship which the Scottish Council had established with other bodies in Scotland, notably the Department of Health and the Royal Medical Corporations, Dr. Macrae said it was a relationship which they in the south had long envied and had signally failed to emulate. With some diffidence, since he was himself a member of the B.M.A. staff, but with conviction that it should be said, Dr. Macrae concluded with the statement—he called it an understatement—that the Scottish Council had been well served in the past and was well served to-day by the staff of the Association in Scotland. The great ones of the B.M.A. came and went, but the staff remained year after year, maintaining a continuity of tradition and helping to guide decisions which later they became responsible for executing. Dr. W. M. KNOX, chairman of the Scottish Council, replied to the toast.

During the dinner Dr. S. WAND, Chairman of Council of the B.M.A., presented to the Scottish Council two very handsome clocks to grace the Scottish House of the Association.

**MEDICAL NIGHT CALL SERVICE
CONTRARY TO BEST INTERESTS OF
PRACTICE**

Glasgow Executive Council and Glasgow Local Medical Committee have notified general practitioners in the area of their views on a proposed medical night call service. A circular had recently been sent to doctors by a newly formed organization announcing a proposal to inaugurate a medical service for nights, half-days, and week-ends at an inclusive fee and for other periods at specified rates.

The Executive Council and the Local Medical Committee consider the present deputizing arrangements satisfactory, and, in the particular circumstances of medical practice in Glasgow, that they should be adequate to enable all doctors to have a reasonable amount of time off duty. The Executive Council also holds the view that any practitioner on the medical list taking part in the proposed service might be in breach of paragraph 8 of his terms of service.

The Local Medical Committee asks doctors to consider the ethical implications of the scheme. One of its specific

objections to the type of service proposed is that a doctor using it would have no direct personal knowledge of who his deputy would be from time to time, or of his qualifications and experience. In the Local Medical Committee's opinion it is contrary to the best interests of medical practice for a practitioner to be able to sub-contract to a non-statutory organization, and thereby relieve himself of a share of his commitments up to approximately two-thirds of his total hours of responsibility.

Correspondence

Practice Vacancies for Ex-registrars

SIR.—On the subject of practice vacancies for ex-registrars, Dr. Howard S. Reeve (*Supplement*, October 5, p. 121) writes: "I am sure that the Medical Practices Committee must give most weight to experience in general practice, personal qualities, and the particular requirements of the practice to be filled in deciding on a candidate for the vacancy."

I agree that this should be so, but the application form, E.C.16A, gives the selection committee very little information under these headings, particularly the last two. So far as "the particular requirements" of the practice are concerned, they do not even know whether their candidate is married, his nationality, or his religion.—I am, etc.,

Hereford.

BRIAN PRENDERGAST.

Practice Vacancy Appeal

SIR.—In the report (*Supplement*, September 28, p. 115) of the G.M.S. Committee's debate at its last meeting on a practice vacancy appeal, it is stated that I strongly supported Dr. M. Sorsby's complaint against the Ministry's attitude. My remarks may have been more incoherent than usual, but I did conclude by saying that in my opinion the Ministry's attitude was correct.—I am, etc.,

Penicuik, Midlothian.

JOHN T. BALDWIN.

Locum Pool

SIR.—The present influenza epidemic has served to accentuate a major deficiency in the general medical service of the N.H.S.—namely, the non-existence of a properly organized locum pool. Whether it is another step towards a full-time salaried service or not, every patient is entitled to know that, in the event of illness or accident befalling his own doctor, a deputy is quickly and easily forthcoming. The position in this part of the country is ludicrous, as the difficulty of obtaining any kind of locum is unbelievable. This problem must be tackled forthwith, so that our great medical service should not belie its name now or in the future.—I am, etc.,

Gateshead, 11.

T. L. C. DALE.

Medical Employment

SIR.—It is common knowledge to-day that the position of house-surgeons, house-physicians, and registrars is not satisfactory. Would it be possible to have any information on the following lines: (1) How many men and women become doctors in the United Kingdom each year? (2) How many of them are unemployed 12 months later? (3) What employment is taken up by those who qualify and are not unemployed, expressed in percentages (general practice, Services, research, hospitals, etc.)?

If some plain answers were forthcoming to these questions some of the mysteries of medical employment, and some of the anomalies which are so freely talked about, might be tackled. Meantime, medical schools announce that they have eight candidates for every vacancy.—I am, etc.,

Peterborough.

G. F. WALKER.

Medical Record Envelopes

SIR.—The letter by Dr. C. C. M. Watson (*Supplement*, October 5, p. 122) concerning the inadequacy of the present medical record envelopes deserves all the support general practitioners can give. The defect is a major problem in practice and unless corrected will rapidly reduce record-keeping to virtual chaos. No one will deny that records are essential from all angles—clinical, legal, and administrative—but to try to put a quart into a pint pot does not work. Having had to enlarge cabinet accommodation several times since 1948, solely on account of accumulation of reports, etc., I have estimated that to accommodate 1,000 medical record envelopes it now requires cabinet space for 1,500; and only absolutely necessary reports are retained.

The solution is not easy. It is obvious that the present size and capacity of the medical record envelopes is too small. To issue a larger type would be expensive for the Ministry—and for the doctor—whose files the larger type would not fit. It might be possible to make the present size expandable by inserting gusset sides. Continuation cards should be $\frac{1}{2}$ in. (1.3 cm.) narrower and have round corners. Hospital reports and letters should be reduced to a standardized type and size which does not require folding—one of the causes of strain on envelopes. Such a reduction in size might help to reduce hospital costs. Patients' names on medical record envelopes should be typed in much larger characters to obviate wear and tear in locating them. Spare medical record envelopes might be issued by executive councils for use in replacing tattered and useless ones in use. To prevent "inflation" the old one could be returned to the council. At present the old one has to be sent to the council before a new one is issued; the contents which caused the damage have to be retained loose, or a temporary envelope made to hold them. This process savours too much of the Army system where the broken thermometer pieces had to be returned before a new one could be obtained. It is out of place in practice.

Postages of all N.H.S. documents might be met by franked labels—and, documents apart, why not include franked labels for postage of blood specimens, Hogben test urines, and similar specimens? Postal charges on such essentials are surely part of the Service liabilities; if postage is left to the patient, there is always a strong risk of loss or delay.—I am, etc.,

Burton-on-Trent.

E. M. R. FRAZER.

H.M. Forces

ROYAL NAVY

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenants W. T. Jones, G. W. C. Johnson, W. E. D. Markland, and K. C. G. Taylor to be Surgeon Lieutenant-Commanders.

ROYAL ARMY MEDICAL CORPS

Majors G. L. Ritchie and J. N. Hamill to be Lieutenant-Colonels.

Captains G. F. Harris, P. St. G. Anderson, O.B.E., N. G. Kirby, M. F. Cannell, and R. A. Miller to be Majors.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonels (Acting Colonels) W. S. Harvey, M.B.E., T.D., G. F. Edwards, M.B.E., A. McC. Campbell, D.S.O., O.B.E., T.D., T. H. Dockrell, T.D., and H. K. Meller, M.B.E., T.D., to be Colonels.

Majors (Acting Lieutenant-Colonels) R. B. Wilson and F. G. Wood-Smith to be Lieutenant-Colonels.

Captain (Acting Major) H. W. Martin to be Major.

Captain G. H. Dunkerley to be Major.

Captains J. P. Hopewell, H. J. Woodliff, and K. B. Taylor have been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonels (Acting Colonels) I. C. A. D. P. Graham, T.D., J. McL. Ross, M.B.E., and H. A. Mullen, T.D., to be Colonels.

Majors (Acting Lieutenant-Colonels) H. F. T. MacPetridge, D.S.O., E. J. Ewell, T.D., H. A. Palmer, J. R. G. Damrel, D. K. W. Picken, T.D., and J. Bunting, T.D., to be Lieutenant-Colonels.

Major J. S. B. Mackay, T.D., has retired, and has been re-granted the honorary rank of Lieutenant-Colonel. (Substituted for the notification in a *Supplement* to the *London Gazette* dated March 5.)

Major R. H. Mortis, T.D., has retired, retaining the rank of Major.

Major C. H. Johnson, T.D., has resigned his commission, retaining the rank of Major.

Captains (Acting Majors) J. R. Horler and T. W. A. Glenister to be Majors.

Captains J. L. J. de Bary, W. Rotheram, and W. B. Wolstenholme to be Majors.

Captains J. D. Shapland, R. Mathieson, and J. H. Vance have been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel R. J. S. Doherty, T.D., from Unattached List, to be Colonel.

Lieutenant-Colonel A. C. Houghton, T.D., from Unattached List, T.A., to be Lieutenant-Colonel.

Major (Honorary Lieutenant-Colonel) H. Gass, O.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Majors R. W. W. Brown, T.D., and R. C. M. Dingwall, from Active List, to be Majors.

ROYAL AIR FORCE

Group Captain R. L. C. Fisher has retired.
Wing Commanders J. D. Tonkinson, J. B. Ross, R. M. Hewat, J. H. Lewis, P. A. Wilkinson, and C. G. Burgess to be Group Captains.

Squadron Leaders I. M. O'Connor, F. L. A. Vernon, and H. B. Kelly to be Wing Commanders.

Squadron Leader R. S. Wambeck, D.F.C., has been transferred to the Reserve.

Flight Lieutenants A. M. Macleod, J. D. Keir, S. M. Laird, and J. F. Hobson to be Squadron Leaders.

Flight Lieutenants A. N. E. Watt, D. D. Cracknell, and R. N. Ibbotson have been transferred to the Reserve, retaining the rank of Squadron Leader.

ROYAL AUXILIARY AIR FORCE

Squadron Leaders R. N. A. Leyton, M. Y. Paget, R. Mathieson, T. F. Stewart, P. R. Kemp, and H. O. Williams have been transferred to the Reserve.

Squadron Leaders W. D. Coltart and R. Mathieson have relinquished their commissions.

Squadron Leader A. Skene, M.B.E., has relinquished his commission, retaining his rank.

Flight Lieutenant R. C. H. Tripp to be Squadron Leader.

ROYAL AIR FORCE VOLUNTEER RESERVE

Squadron Leaders J. Watkins-Pitchford, P. R. B. Grimaldi, A. J. Smith, E. S. Nicholson, M.B.E., W. B. Waterfall, and J. Whitehead have relinquished their commissions, retaining their rank.

Flight Lieutenants H. L. Duncan and R. McK. Miller have relinquished their commissions, retaining the rank of Wing Commander.

Flight Lieutenants H. J. Knox, D. E. Mitchell, J. S. Hall, S. Rosehill, and E. G. Patchett have relinquished their commissions, retaining the rank of Squadron Leader.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Association Notices

ELECTION OF MEMBERS OF THE COUNCIL BY BRANCHES NOT IN GREAT BRITAIN AND NORTHERN IRELAND

Notice is hereby given that nominations of candidates for election as members of Council by the following grouped Branches for the period of three years commencing from the termination of the Annual Representative Meeting, 1958, must be submitted in writing so as to reach the Secretary not later than February 10, 1958.

	No. of Members of Council to be Elected by Group
Branches in the Republic of Ireland	1
Fiji, New Zealand	1
New South Wales, Queensland	1
South Australian, Tasmanian, Victorian, Western Australian	1
Assam, Baluchistan, Borneo, Hong Kong and China, Malaya, North-West Frontier, Punjab, Sind	1
Aden, Cyprus, Egyptian, Gibraltar, Ghana, Kenya, Malta, Manicaland, Mashonaland, Matabeleland, Mauritius, Middle East, Midlands, Nigeria, Northern Rhodesia, Nyasaland, Seychelles, Sierra Leone, Sudan, Tanganyika, Uganda, Zanzibar	1
Bahamas, Barbados, Bermuda, British Guiana, British Honduras, Grenada, Jamaica, Leeward Islands, St. Lucia, St. Vincent, Trinidad and Tobago	1

Nominations must be signed by not fewer than three members of any Branch in the Group, and must be in the following form, or one to the like effect:

We, the undersigned, hereby nominate..... of (full name and address to be given) for election by the (state the names of the Branches in the Group) Branches as a member of the Council of the Association for the three years 1958-61.
Signatures and addresses of three nominators.....
Date.....

A notice will be published by the Council in the *Supplement* to the *British Medical Journal* of February 22, 1958, giving the nominations received in respect of each Group.

Where contests occur, voting papers containing the names of all duly nominated candidates will be issued from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group.

By Order,
A. MACRAE,
Secretary.

THE NATHANIEL BISHOP HARMAN PRIZE, 1958, FOR RESEARCH IN HOSPITAL PRACTICE

The Council of the British Medical Association is prepared to consider the award of the Nathaniel Bishop Harman Prize in the year 1958. The value of the prize is approximately £100. The purpose of the prize is the promotion of systematic observation and research by consultant and specialist staff and senior registrars of hospitals not attached to recognized medical schools. It will be awarded for the best report on original clinical research in a form suitable for publication. The work submitted must include personal observations and experiences collected by the candidate in the course of his practice. A high order of excellence will be required. No report or study that has previously been published in the medical press or elsewhere will be considered eligible for the prize. Any registered medical practitioner on the staff of a hospital in Great Britain and Northern Ireland who is not a member of the staff of a recognized undergraduate or postgraduate medical school is eligible to compete. If any question arises in reference to the eligibility of a candidate or the admissibility of his entry, the decision of the Council shall be final.

Should the Council of the Association decide that no entry submitted is of sufficient merit, the prize will not be awarded in

1958, but will be offered again the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. Each entry, which must be typewritten or printed in the English language, should be unsigned, but accompanied by a note bearing the name of the writer. It is suggested that reports should be between 3,000 and 10,000 words. Candidates are required to complete an entry form, a copy of which can be obtained from the Secretary. Reports and entry forms must reach the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1958. Inquiries relative to the prize should be addressed to the Secretary.

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1958

The Council of the British Medical Association is prepared to consider the award, in 1958, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "What I Have Learned from Contact with the Patient's Relatives."

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1958. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

A. MACRAE,
Secretary.

Diary of Central Meetings

OCTOBER

- 21 Mon. S.H.M.O.s Group Council, 2 p.m.
- 22 Tues. Scientific Exhibition Subcommittee, Arrangements Committee (Birmingham, 1958) (at Queen Elizabeth Hospital, Birmingham), 5 p.m.
- 22 Tues. N.E. Metropolitan Regional Consultants and Specialists Committee, 5.30 p.m.
- 23 Wed. Alcohol and Road Accidents Committee, 2 p.m.
- 23 Wed. Emergency Call Subcommittee, G.M.S. Committee, 2 p.m.
- 23 Wed. Staffing Committee, 2 p.m.
- 24 Thurs. Journal Committee, 11 a.m.
- 24 Thurs. Ingleby Evidence Committee, 11.30 a.m.
- 24 Thurs. Compensation and Superannuation Committee, 2 p.m.
- 24 Thurs. Joint Committee of B.M.A. and Magistrates' Association, 2 p.m.
- 25 Fri. Medical Act Committee, 2 p.m.
- 25 Fri. Consulting Pathologists Group, 3 p.m.
- 28 Mon. Staff Side, General Whitley Council (at 14, Russell Square, London, W.C.1), 11 a.m.
- 28 Mon. Full General Whitley Council (at 14, Russell Square, London, W.C.1), 2.30 p.m.
- 28 Mon. S.W. Metropolitan (Eastern Area) Regional Consultants and Specialists Committee, 5 p.m.
- 29 Tues. Financial Advisory Committee, 11.30 a.m.
- 29 Tues. Finance Committee, 2 p.m.
- 30 Wed. Catering Committee, 11.30 a.m.
- 30 Wed. Drugs for Private Patients Subcommittee, Private Practice Committee, 2 p.m.
- 30 Wed. Estates Committee, 2 p.m.
- 30 Wed. Hinchliffe Evidence Committee, 2 p.m.

NOVEMBER

- 5 Tues. Special Meeting of Council, 10 a.m.
- 6 Wed. Council, 10 a.m.
- 12 Tues. Arrangements Committee (Edinburgh, 1959), 12 noon.

Branch and Division Meetings to be Held

ABERYSTWYTH DIVISION.—At Talbot Hotel, Aberystwyth, Saturday, October 26, 7.30 p.m., dinner-meeting. Lecture by Dr. R. Byron Evans: "Some Problems in the Treatment of Heart Diseases." Wives of members, and guests, are welcome.

BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Bournemouth, Friday, October 25, 8.15 p.m., meeting. Address by Dr. R. Forbes: "Medical Litigation, Past and Present."

BRISTOL DIVISION.—At Bristol Cathedral, Sunday, October 20, 11 a.m., St. Luke's Tide Service to which members and their friends are invited. Sermon by the Archdeacon, the Venerable P. G. Reddick.

DARTFORD DIVISION.—At Royal Clarendon Hotel, Gravesend, Wednesday, October 23, 8 for 8.30 p.m., annual dinner. Ladies are invited.

EASTBOURNE DIVISION.—At Avenue House, Tuesday, October 22, 8.30 p.m., meeting. Illustrated talk by Dr. K. O. A. Vickery: "Thoughts on Prevention."

EAST HERTS DIVISION.—At Herts and Essex General Hospital, Bishop's Stortford, Thursday, October 24, 8 p.m., clinical meeting.

EAST NORFOLK DIVISION.—At Green Lounge, Bell Hotel, Norwich, Wednesday, October 23, 8.30 p.m., A.G.M.

FINCHLEY DIVISION.—At Finchley Memorial Hospital, N., Friday, October 25, 8.30 p.m., meeting. Talk by Mr. S. A. Keeble on "Preparation of Poliomyelitis Vaccine," illustrated by sound film and slides.

GRIMSBY DIVISION.—(1) At Grimsby Parish Church, Sunday, October 20, 6.30 p.m., annual St. Luke's Tide Service. Preacher, the Rev. R. A. Spalding. (2) At Winter Gardens, Cleethorpes, Thursday, October 24, 7.45 p.m., annual general meeting; 8.15 p.m., annual dinner. Principal guest, Rt. Rev. the Bishop of Lincoln, Dr. K. Riches. All medical practitioners in the area of the Division are invited.

HEREFORD DIVISION.—At Hereford Cathedral, Sunday, October 20, 6.30 p.m., St. Luke's Tide Service.

LAMBETH AND SOUTHWARK DIVISION.—At Antenatal Out-patient Department, Lambeth Hospital, Brook Drive, Kennington Road, S.E., Sunday, October 27, 11 a.m., clinical meeting.

LIVERPOOL DIVISION.—At Exchange Hotel, Tuesday, October 22, 8.30 p.m., annual general meeting, followed by buffet supper and film: "So Long As They Are Happy."

LONDONDERRY DIVISION.—At City and County Hospital, Londonderry, Friday, October 25, 8.15 p.m., meeting. Dr. D. J. C. Dawson: "Anxiety and Depression."

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Heald Green Hotel, Wednesday, October 23, 8 for 8.15 p.m., hot-pot supper. Chief guest and speaker, Dr. J. Blair Hartley: "To be X-rayed or not X-rayed. That is the Question."

MAIDSTONE DIVISION.—At Preston Hall Hospital, Maidstone, Friday, October 25, 8 p.m., meeting. B.M.A. Lecture by Dr. W. R. Bett: "An Alcoholic Excursion Through the Ages."

MID-ESSEX DIVISION.—At Army and Navy Hotel, Chelmsford, Wednesday, October 23, 7.30 for 8 p.m., annual dinner. Guests of honour, Mr. A. Lawrence Abel and Dr. Bruce Cardew.

NORTHERN IRELAND BRANCH.—At Upper Lecture Theatre, Institute of Clinical Science, Grosvenor Road, Belfast, Thursday, October 24, 8.30 p.m., opening meeting of session. Presidential Address: "The First Twelve Months" (illustrated). Wives and friends of members are invited.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Tuesday, October 22, 2.30 p.m., practitioners' round. Dr. V. B. Levison: "Radiotherapy."

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, October 21, meeting. B.M.A. lecture by Dr. F. E. Camps: "Why Do They Die?"

SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Thursday, October 24, 8.30 p.m., annual general meeting. Short films: "Industrial Dermatitis," and "Rehabilitation in Industry."

SOUTH-WEST WALES DIVISION.—At Boar's Head Hotel, Carmarthen, Saturday, October 26, 7.30 for 7.45 p.m., dinner. B.M.A. lecture by Mr. A. C. H. Bell: "General Practitioners and the Maternity Services."

STOCKPORT DIVISION.—At Alma Lodge Hotel, Buxton Road, Stockport, Tuesday, October 22, 8.30 p.m., annual general meeting. Dr. E. E. Claxton (Assistant Secretary, B.M.A.) will give an account of the progress of the Royal Commission on medical remuneration.

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devons Road, Bow, E., Friday, October 25, 3 p.m., meeting. Dr. N. A. Thorne: "Contact Dermatitis."

WANDSWORTH DIVISION.—At Out-patients Department, St. James' Hospital, Sarsfield Road, S.W., Thursday, October 24, 8.30 p.m., sherry party. Hospital doctors, wives, and friends are invited.

WEST SOMERSET DIVISION.—At County Hotel, Taunton, Friday, October 25, 7.45 for 8.15 p.m., joint annual dinner with British Dental Association. Guest speaker, Mr. A. M. Horsnell: "Diet and Caries." Ladies are invited.

WEST SUSSEX DIVISION.—At Burlington Hotel, Worthing, Wednesday, October 23, 6.30 p.m., general meeting. Films: (1) "Circular Vascular Suture" (Russian); (2) "The Medical Witness." 8 p.m., dinner.

WIGAN DIVISION.—At Lewis' Restaurant, Wallgate, Wigan, Thursday, October 24, 8.15 p.m., general meeting.

GENERAL MEDICAL SERVICES COMMITTEE

A meeting of the General Medical Services Committee was held at B.M.A. House on October 17 with Dr. A. B. DAVIES in the chair. During the meeting the Committee agreed to the Royal Commission's request for an inquiry into doctors' expenses for 1955-6, but insisted that the promise to the profession of a further full inquiry for a later year should be implemented.

Practice Expenses Inquiry

A letter had been received from the Inland Revenue asking for formal agreement from the Association to the inquiry into doctors' expenses for 1955-6, as requested by the Royal Commission. The CHAIRMAN reported that the B.M.A.'s Evidence Committee had agreed to the proposal, provided that a further full inquiry with special reference to rerating, previously arranged for 1956-7, should also take place and that the profession would have the right to displace and that the figures that emerged with the Ministry before they went to the Royal Commission. Since then, Professor Allen and Mr. Bucknill had attended a technical subcommittee meeting on practice expenses at the Ministry, and a scheme had been agreed for using sub-samples in the years between full inquiries. It appeared that the Inland Revenue did not now wish to make the full inquiry in 1956-7 which it had agreed to.

Dr. A. TALBOT ROGERS thought they should not be satisfied unless they were promised a full inquiry in 1956-7. That was the only way to obtain accurate information on the rating changes. If the Royal Commission wanted a full inquiry in 1955-6, that was their business and it need not prevent an inquiry the following year.

Dr. S. WAND thought that 1957-8 would be a better year for the inquiry from the profession's point of view. In many parts of the country rates had been paid at the old level until appeals had been heard, and the increased rates might therefore not be seen from an inquiry in 1956-7.

The DEPUTY SECRETARY (Dr. D. P. Stevenson) submitted that if the profession agreed to the 1955-6 inquiry they would be unlikely to get another inquiry in two years' time. Dr. TALBOT ROGERS said he could not see how they could refuse the Royal Commission's request. To do so would be to delay the Commission's work, and the profession would be blamed for the delay. At the same time, he thought they must insist on the promised inquiry in 1956-7 or 1957-8. Dr. WAND also felt that they could not resist the request. They should reply that in the circumstances they would not insist on a full inquiry in 1956-7 but would insist on one in 1957-8.

It was agreed to accede to the Royal Commission's request for a 1955-6 inquiry, but on the understanding that there would be a further full inquiry in respect of 1956-7 or 1957-8.

Royal Commission on Remuneration

Dr. DAVIES told the Committee that on its behalf he had attended the last meeting of the Central Consultants Com-

mittee and had taken part in the debate on evidence to be submitted to the Royal Commission. On October 16 there had been a meeting of the Evidence Committee, when the documents of both the Central Consultants Committee and the G.M.S. Committee had been merged to provide a very sound presentation of the profession's case. The impact of evidence from other bodies on the profession's evidence was studied. The draft evidence was to be amended in the light of the Evidence Committee's discussion and would be presented to the Council on November 5.

Referring to the evidence submitted by the Medical Practitioners' Union, Dr. Davies said much of it was devoted to distribution matters which, if considered with undue weight by the Royal Commission, might draw red herrings across the path of the main issue. The Royal Commission had itself admitted that it was not part of its task to make recommendations about distribution. Dr. Davies suggested a meeting between Dr. B. Cardew and himself, Dr. Stevenson, Dr. A. N. Mathias, and Dr. F. Gray to consider how far the points raised by the Union's document might be considered to the mutual advantage of all concerned.

Dr. B. CARDEW said that the Union's view had been determined largely by questions asked by the Commission, which made it perfectly clear that although the Commission would not recommend a detailed scheme of remuneration, which was clearly outside its province, it was concerned with the spread of income. Some of the Commission's questions were so pointed that they could not be answered except in terms of distribution. He said that he would be delighted to meet other members of the Committee to discuss the matter.

Remuneration

Dr. WAND reported that he was shortly to see the new Minister of Health to discuss the need for a further interim adjustment.

Alternative Service

The Committee discussed at length the report of the Alternative Service Subcommittee. The Subcommittee felt that a scheme involving total withdrawal from the Health Service would be the one most likely to find favour with the majority of general practitioners should the situation resulting from the report of the Royal Commission be unfavourable. The Subcommittee believed that the profession had to face that, in a major dispute with the Government on an important point of principle, some practitioners were likely to suffer temporary inconvenience and financial hardship. What was required was a workable scheme to supplement the incomes of those hardest hit and which would maintain total remuneration at an adequate level.

The Subcommittee considered a variation which might be termed "local" withdrawal. The Subcommittee sought the Committee's guidance on that issue. It also suggested that the views of practitioners should be obtained on whether a figure of 80% of doctors in favour of withdrawal was essential to the success of any scheme. The Subcommittee believed that it was. Dr. DAVIES said that hitherto a complete withdrawal from the Service had been regarded as

practicable only if there were sufficient financial reserves in a fighting fund to cover those who might suffer. He pointed out that, if the profession intended to fight, it had to fight even though somebody might be hurt. Throughout the last year the profession had been running away from a decision to fight. The Subcommittee, he said, wished to stress that the decision depended on the "stamina and spine" of the profession. If there was not to be a phased withdrawal, then it must be total withdrawal, which meant that some people would be hurt.

Dr. S. NOY SCOTT said that he came from an area which was largely against withdrawal. The suggested figure of 80% in favour of withdrawal should be the minimum at which the profession should aim. Dr. J. C. ARTHUR said that it was a vitally important matter. It was essential that there should be an adequate alternative scheme, but adequate did not mean that nobody could be hurt. It meant some sort of service with some sort of pay for practitioners. Doctors would expect that all the funds accumulated already would, if necessary, be expended on this issue. There might be several alternative schemes, but, whichever one was used, it should be made clear exactly what it was proposed to do. Practitioners were asking whether the Public Medical Service could not be revived or whether some insurance scheme could be devised to meet the case. Before action was taken practitioners would want to know that those things had been considered. In the past alternative schemes had been far too amorphous.

Dr. R. B. L. RIDGE said that in the event of withdrawal a scheme must be devised which did not hurt the patients. Dr. C. M. SCOTT said that it was an amazing position in which it was suggested that neither the doctor nor the patient must be hurt. Soon they would hear that the Government must not be hurt. If the profession wanted any kind of fight it had to be realized that somebody might be hurt. Dr. RIDGE asserted that a withdrawal meant a return to private practice, because doctors were not capable of organizing themselves for a fight. Some doctors wanted a regular cheque and private practice—the best of both worlds. If there was an impasse with the Government there would have to be a return to private practice.

Dr. B. BURNS said the two issues were how a doctor would get his living in the event of withdrawal and how the patient would pay. If the patients were not to have to pay, there would be no withdrawal. They must look facts in the face. Money must be collected from doctors to finance any scheme. Although it appeared that the Royal Commission would report later than it had said, time was not on the profession's side. Dr. D. L. S. JOHNSTON said that, once it had been decided whether to have total or local withdrawal, it could be decided what types of services could be operated in different areas.

Dr. DAVIES said that the Subcommittee's report was not intended to be final. Dr. TALBOT ROGERS suggested that the Subcommittee should prepare a list of possible schemes and present it to the Committee with the pros and cons in each case.

It was decided to alter the terms of reference of the Alternative Service Subcommittee as follows :

To consider and report on alternative scheme(s) for providing medical care for the public in the event of withdrawal from the National Health Service.

Dr. Talbot Rogers was appointed a member of the Subcommittee.

Death Certification

The Committee discussed a proposal, put forward by the General Register Office, that there should be an additional question on pregnancy in the medical certificate of cause of death. A letter from the General Register Office said that if the question were added to the form it would be possible to undertake a more precise analysis of all deaths of women, or at least of married women, which occurred during or shortly after pregnancy, whether or not the death was, in the opinion of the certifying practitioner, due to or associated with maternal conditions.

Dr. DAVIES said that it had been pointed out that all the information the General Register Officer wanted could be obtained by sending the usual supplementary question back to the doctor. However, in reply it had been explained that unless there was some statement about pregnancy the registrar would never be in a position to write back. During a discussion in which some speakers thought the information could be supplied in the case of married women, Dr. C. J. SWANSON said that in 20 years' experience the procedure, which was followed in Scotland, had never given him a moment's bother. Other speakers said the statistics would be valueless if they were incomplete, which meant that the information would have to be supplied in the case of single women.

Dr. F. GRAY said that if pregnancy were in any way associated with a death it was already the doctor's duty to make a note of that fact. It had been suggested that the information might be limited to married women, but that was useless in a scientific inquiry. The whole thing seemed wrong to him. If it was thought that doctors were not doing their job, the doctors should be told so. If some useful statistical information was required, it should be sought in other ways by proper means. Dr. H. D. CHALKE said that, on balance, opinion should be in favour of a proposal which aimed at obtaining some very urgent and invaluable information which, it seemed, could not be obtained in any other way. That was why the Public Health Committee had recommended that the information should be supplied.

The Committee decided to recommend to Council that the present procedure should not be changed.

Maternity Medical Services

In a discussion on maternity medical services, Dr. G. P. WILLIAMS said that there was a small G.P. hospital in his area, and yet the gynaecologist was trying to insist that all patients booked for the hospital had to go to his clinic before being admitted to the hospital. Dr. Williams said that he had informed his patients that they should not go unless he sent them, and that when the time came, if anyone tried to stop them entering the hospital, he himself would take them in. He declared, "We are breeding a generation of younger doctors who in a comparatively short time will not be able to do domiciliary midwifery. It is already beginning to happen." It was the proper work of the general practitioner to attend his patient, under proper circumstances, in the patient's own home.

**EXECUTIVE COUNCILS' ASSOCIATION
(ENGLAND)**

TENTH ANNUAL MEETING

The principal speaker at the tenth annual meeting of the Executive Councils' Association (England) of the National Health Service at Harrogate on October 16 and 17 was Mr. RICHARD THOMPSON, M.P., Parliamentary Secretary to the Ministry of Health.

Poliomyelitis Vaccination

Mr. Thompson said that the Government had announced (*Journal*, October 19, p. 951) its intention of offering poliomyelitis vaccination before next summer to all children under 15 and to expectant mothers. So far the offer had been made only to children up to the age of 10. There were about 12 million children under 15 in Great Britain, and, during the course of a year, some 750,000 expectant mothers, but even assuming half that total came forward they were left with a formidable total to be given two injections between now and the summer. The task was going to mean a very special effort on the part of the health authorities and the general practitioners who were being asked to undertake it.

OPHTHALMIC GROUP COMMITTEE

Mr. O. GAYER MORGAN was re-elected Chairman at the first meeting in the new session of the Ophthalmic Group Committee, held at B.M.A. House on October 11. The Committee defined its position over the statutory registration of opticians, adhering to the full recommendations of the Crook Committee, and approved a report on the future of the ophthalmic services, after making an amendment that free spectacles for people aged 55 and upwards should be given after hospital examination only.

The CHAIRMAN welcomed two new members to the Committee—Mr. R. J. Smith and Mr. S. B. Smith.

Future of Ophthalmic Services

Comments from regional meetings on the report on the future of the ophthalmic services were before the Committee. The report was prepared by a Joint Subcommittee set up by the Council of the Faculty of Ophthalmologists and the Ophthalmic Group Committee. The various suggestions put forward by the regions were considered. One point on which there was some criticism was a recommendation that ophthalmic medical practitioners should have the right to advise the general practitioner of the diagnosis and make suggestions about the disposal of a case, and the right to prescribe under the Supplementary Ophthalmic Service cycloplegic drugs for the purpose of examination. However, the Committee felt the recommendation was necessary as a measure for improving the status of ophthalmic medical practitioners.

The report also stated that, apart from the importance attached to a medical eye examination, there was reason to believe that to some extent the present charge for spectacles constituted a deterrent to using the service, particularly in the case of elderly patients. It recommended that in addition to the existing free range of spectacles for children there should be a free range for adults, or, if not for all, for those over 50 or 55 years of age.

An amendment that free spectacles for people aged 55 and upwards be given after hospital examination only was carried.

Medical Eye Centres

A letter from the Council of the N.O.T.B. Association expressed full approval of the Ophthalmic Group Committee's proposals on medical eye centres. The Association's minimum requirements already contained a recommendation that "the entrances to the centre should be prominent and easily accessible to the public—they should, if possible, be on the ground floor, but not higher than the first unless a lift is available, and should preferably have separate entrance for ophthalmologists." The following recommendation from the Committee was now to be incorporated: "Professional plates must be displayed at all eye centres where there are separate premises or separate entrances for ophthalmic medical practitioners, but, where there are not, the practitioner's name must be exhibited on the door of the consulting room."

Statutory Registration of Opticians

The CHAIRMAN recalled that the Committee had discussed the statutory registration of opticians on many occasions and had never been able to make up its mind whether the registration of opticians was so important in itself for other reasons that it was prepared to let the Government delete the main plank on which the Crook Committee reached unanimous agreement—the assumption that, one day, opticians should not undertake both sight-testing and the dispensing of spectacles. The Government had subsequently decided to implement the report but not this part; nor would it condemn the selling of glasses in stores. After discussion the Committee decided to adhere to the whole Crook report or nothing. That was to say that initially there should be three registers—one of opticians who test sight and dispense spectacles as well, one of opticians who do

It had been decided to purchase Salk vaccine from Canada and America as a temporary measure until supplies of British vaccine were increased, but it would be subjected to the same stringent tests as the home product. For that reason it could not be available until the end of the year, which meant that vaccination must be concentrated in the first six months of next year. If a parent did not wish his child to be vaccinated with the Salk vaccine he would be offered an opportunity of having the British vaccine some time next year. Doctors and local authorities would be supplied with full information about the Salk vaccine and the tests to which it had been subjected, so that they could advise parents in the knowledge of the facts.

Prescribing Costs

Referring to the increased charge for prescriptions, Mr. Thompson said that this was followed by a substantial fall in the number of prescriptions and a rise in the average cost. The total of prescriptions for December, 1956, the first month of the revised charges, was 21% less than that for the previous December. Not all of the reduction could be due to the alteration in charges. Some of it was owing to a low incidence of sickness. There was a sharp rise of about 5d. in the average cost of the prescription in December, 1956, compared with the previous month, and this was almost entirely owing to the prescribing of larger quantities less often. The practice was not necessarily wasteful in suitable cases where the doctor was convinced of a continuing need, and in that way people were relieved of some of their charges.

President's Address

In his presidential address Colonel W. F. BRACEWELL (Doncaster) said that now that there was a great increase in the average expectancy of life there must be industrial planning to enable old people to carry on working after the normal retiring age. He referred to the gap which many people were unable to fill when their working life was over, and said that physical and mental decay were apt to set in leading to chronic illness, disability, and permanent treatment in hospitals. Means must be found to postpone, or to avoid in so far as possible, the necessity for domiciliary helpers and residential establishments. Experiments had been made by a number of industrial concerns to enable those past working age to work, in factory space set apart for them, at their own speed and to go and come as they felt able. But here, he suggested, was a psychological mistake, for men avoided, at all costs, being sent to the "graveyard," as they called it. Other means must be found to enable these people to continue in work. In particular, housing should fit the needs of the less active so that they could continue to live in their own homes as happy and useful members of the community in touch with their relatives and neighbours.

Filling Practice Vacancies

Filling Practice Vacancies

The meeting passed a resolution, submitted by Kent and Canterbury, on the subject of filling practice vacancies. It suggested that, to avoid delays which occurred owing to a present protracted arrangements for the appointment of a successor to fill an advertised vacancy, strong representations should be made to the Minister of Health urging a suitable amendment to the National Health Service Acts and Regulations so as to enable executive councils to make appointments to fill vacancies, subject to the following provisos : (1) that the prior consent of the Medical Practices Committee be obtained to the filling of the vacancy ; (2) that any applicant who has been asked to attend for interview shall be given the right of appeal within seven days of notification of appointment, such appeal to be determined by the Medical Practices Committee, whose decision shall be final.

The meeting also passed a resolution from Middlesex, moved by Dr. W. MORGAN EVANS, asking that executive councils should have greater power to control the opening of branch surgeries and requesting the Minister to agree to an appropriate amendment of the terms of service.

dispensing work only, and one of opticians who do sight testing only—but that eventually only the second and third registers would exist, the final decision being left in the hands of the proposed optical council.

Sight-testing Fee

It was reported to the Committee that as the sight-testing fee for ophthalmic medical practitioners providing supplementary ophthalmic services was linked with the salaries of consultants and senior hospital medical officers, the Minister of Health had made an interim increase in line with the latter's 5% increase. The sight-testing fee payable to ophthalmic medical practitioners included an allowance of 33½% for expenses, and the Minister thought that the equivalent of the interim increase would be represented by an increase of 8d. in the total sight-testing fee. Mr. H. V. INGRAM asked about the 12s. 6d. fee paid by local executive councils. The DEPUTY SECRETARY, Dr. D. P. Stevenson, said that this should also be increased by 5%, and he would raise the matter.

Evidence to Royal Commission

The DEPUTY SECRETARY outlined the memorandum on the question of the sight-testing fee which will be put before the Royal Commission on Doctors' and Dentists' Remuneration. He said that it would point out that ophthalmic medical practitioners were the only section of the profession who were now getting very substantially less than what was deemed appropriate for them in 1948—and indeed less than in 1938. The memorandum is to be circulated to members of the Committee.

Fee for Re-examination

The Management Side of Committee C of the Medical Whitley Council suggested that since there was a reduced fee for a re-examination of blind and partially sighted persons in the consulting-room, the fee payable for a visit to a patient's home should be similarly reduced by one guinea if the previous Form B.D. 8 was available. The Staff Side agreed to this.

Members of the Committee, however, expressed dissatisfaction, stressing the inconvenience and work involved in a domiciliary re-examination. Mr. J. J. HEALY said that in point of fact the fee of £4 4s. was not commensurate with the work done. The Committee asked that the matter should be sent back to the Whitley Council with an application for every domiciliary visit to be paid for at £4 4s.

Contact Lens Fitters

A letter from a practitioner expressed concern about the fitting of contact lenses for Health Service and private patients. Members agreed with a statement in the letter that the standard of fitters trained at the Contact Lens Department at Moorfields Hospital was far higher than that provided by commercial fitters, but Mr. A. G. CROSS said that it was difficult to find people for training because of the salaries offered. The meeting decided to press the Ministry for an increase in salary for contact lens fitters, pointing out that the Ministry would thereby save money which it was spending at present on farming out work.

HOSPITALITY

A German doctor's daughter, aged 16, would like to stay with a British doctor's family, not in a town, during August, 1958, and would receive the British doctor's daughter during June/July. Another German doctor would like to arrange holiday exchanges for his two sons aged 17 and 19 during next summer.

Would anyone interested please get into touch with Brigadier H. A. Sandiford, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

HOSPITALS CONTRIBUTORY SCHEMES

NEED FOR EXPANSION

The ninth annual general meeting of the British Hospitals Contributory Schemes Association (1948) was held at Manchester on October 3. The president, Mr. HENRY LESSER, said that, notwithstanding the revolutionary changes brought about by a nine-year-old National Health Service, the hospital contributory scheme movement in Britain had attracted a large amount of public support. The question was how to widen the area and scope of its activities to the greater benefit of patients and hospitals throughout the country. The fact alone that nearly four million people took advantage of the scheme facilities suggested that many thousands more contributors could be recruited if more intensive efforts were made. As the years went on there was little doubt, said Mr. Lesser, that modifications would be made in the National Health Service. It was plain that the State could only go part of the way when one considered the immense sum spent by the taxpayer on the health services; the individual would always need to supplement State provision by voluntary effort on his own behalf. The hospitals contributory schemes made grants towards the free funds of hospitals for extending amenity services to patients. During 1956 the grants increased by nearly £13,000 to £75,500, making the aggregate since 1948 to nearly £600,000.

HOLLAND DIVISION

PRESENTATION TO DR. A. S. WILSON

A dinner meeting of the Holland Division on October 12, presided over by the chairman, Dr. G. R. USMAR, was taken as an occasion for paying a tribute to Dr. ALEXANDER S. WILSON, who is retiring from the secretaryship of the Division after 34 years in office. In presenting him with a silver salver, engraved with the Association's coat of arms, and on the reverse side with the subscribers' signatures, Dr. R. E. CROCKATT spoke of the esteem in which Dr. Wilson was held by his colleagues. Dr. J. COTTRELL also spoke of Dr. Wilson's outstanding services to the Association, not only in the Division but also in the Lincolnshire Branch, in the Representative Body for 27 years, and as a member of the General Medical Services Committee for 8 years. Dr. L. S. POTTER gave an address entitled, appropriately, "Personal Service."

Scottish News

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

The first meeting of the General Medical Services Subcommittee (Scotland) for the session 1957-8 was held at Scottish House, Edinburgh, on October 1. Dr. K. HARROWER, Glasgow, was appointed Chairman. On taking the chair, Dr. Harrower thanked Dr. C. J. SWANSON, Aberfeldy, for having been such an outstanding Chairman of the Subcommittee during the past three years, and the Subcommittee unanimously recorded its appreciation of his services.

Influenza

The Subcommittee considered the difficulties being encountered by practitioners in certain areas as a result of outbreaks of influenza, and discussed ways and means of alleviating the situation. It was decided to seek the co-operation of Dr. KENNETH COWAN, Chief Medical Officer of the Department of Health for Scotland, in an endeavour to promote local action which would result in the best use being made of all the services available. It was also decided

that through publicity in the lay press employers should be asked not to request medical certificates of incapacity immediately an employee was absent from work.

Inducement Payments

The Subcommittee agreed to the Department of Health's proposals for increasing inducement payments as a result of the interim award of 5% which was made to general practitioners earlier in the year.

General Practitioners and the Hospital Service

The Subcommittee considered a letter from the Caithness Local Medical Committee about a proposal to appoint a consultant physician, resident within the area, for the counties of Caithness and Sutherland. The Subcommittee agreed to discuss the situation with the Department of Health at their next routine meeting and recommend that serious attention should be given to the views held by the profession locally.

Prescribing Costs

The Subcommittee considered an invitation from the Secretary of the Scottish Committee on Prescribing Costs to submit evidence to it. The Subcommittee understood that a similar invitation had been sent to the Joint Consultants Committee (Scotland), which had referred it to the Consultants Committee (Scotland) and Specialists Committee (Scotland). The Subcommittee resolved to recommend to the Scottish Council of the B.M.A. that the latter should submit evidence on behalf of the profession generally and that the evidence should be prepared by an *ad hoc* committee consisting of representatives of the Scottish Council, Central Consultants and Specialists Committee (Scotland), and the General Medical Services Subcommittee (Scotland).

Postgraduate Refresher Courses

The Subcommittee agreed to a communication from the Department, following representations from the Subcommittee, regarding an increase in the maximum rates of subsistence and locumtenent payments which may be made to doctors attending university postgraduate refresher courses. It is proposed that in future the maximum payment for a locumtenent employed by a principal should be increased to 17 guineas per week (from 16 guineas). The maximum subsistence expenses allowed will be at the rate of 36s. per night (previously £1) if the doctor is necessarily absent from home at night, and at the rate of 9s. per day (previously 5s.) if his attendance at the course does not entail absence from home at night. As formerly, doctors will be asked to show what their actual expenses have been and reimbursement up to the maxima will be made.

Conference of Assistants

Dr. W. M. KNOX, Chairman of the Scottish Council, gave a report of the Conference of Assistants which had been held at Scottish House recently. He said that the conference had been comparatively well attended in spite of the outbreak of influenza, and that it appeared to serve a useful purpose in that the representatives were able to get an insight into the working of the Association and to have an opportunity of airing their views together with their representatives on the Assistants and Young Practitioners Subcommittee of the General Medical Services Subcommittee (Scotland). Among the matters discussed were the method of Scottish representation on the Assistants and Young Practitioners Subcommittee of the General Medical Services Subcommittee (Scotland), the trainee general practitioner scheme, combined training posts, and the details issued by executive councils in connexion with practice vacancies. Dr. Knox said it was interesting that, generally speaking, the Assistants present were of the opinion that the trainee general practitioner scheme was meeting with general approval.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Running Costs of Hospitals

SIR,—General practitioners will not find their hearts warmed by the latest report from the Select Committee on Estimates¹ (see *Supplement*, October 12, p. 126). Entitled *Running Costs of Hospitals*, it nevertheless contrives to give G.P.s several gratuitous raps on the knuckles. These naughty boys are responsible for the fact that expensive hospital facilities are not being devoted only to those sick patients truly in need of them; moreover, they are making far too much use of the domiciliary consultation scheme. Eventually, hospital authorities, general practitioners, and local authorities must all work together, we are told—"so that the limited resources of the hospital service are not to be wastefully employed."

A more fatuous and short-sighted report has seldom appeared in recent times. If the politicians on the committee had sought evidence from the G.P.s they castigate so severely, they would soon have found the remedy for what they call "the unnecessary load borne by the hospital and specialist services." Three bold strokes of policy are needed: (1) Reduce the unnecessary load borne by the general practitioner services, by introducing a system of direct payment by the patient for services rendered. There must be a direct economic deterrent to prevent people coming up to us demanding cough medicines, codeine, and sticking plasters. They must be taught to buy from the chemists their own simple remedies for scratched fingers, flea bites, and the occasional headache. They must be made to pay for the luxury of calling us out unnecessarily, and for not bothering to put in their requests for visits at a reasonable time. (2) Give us cottage hospitals so that we can nurse more of our sick patients ourselves. Many illnesses can be cured without the elaborate systems of investigation and therapy lavished upon them in the general hospitals. We would like to care for our own uncomplicated confinements, pneumonias, rheumatic fevers, cardiac failures, otitis medias, and a host of other maladies which we are competent and anxious to look after ourselves. But we must have beds, for so often we have to send patients into hospital because the home conditions are unsuitable and home nursing services inadequate. It cannot be repeated too often that cottage hospital beds are much cheaper to run than general hospital beds. (3) Put the home helps, the health visitors, and the district nurses under our control. We can employ them to greater advantage than the public health authorities, because we know the needs of the individual patients and their families better.

Finally, may I predict that any attempt by the politicians to put the screws on the domiciliary consultation scheme will provoke a most forceful response from G.P.s. This is one of the few really satisfactory provisions of the Health Service. It has led to better care for our patients, an enhanced dignity for ourselves in the eyes of both patients and consultants, and a very considerable economy in the use of the hospital services. Only a politician could seize on this, of all things, for adverse criticism and cheeseparing control.—I am, etc.,

Peterborough.

CYRIL HART.

Reorganization of Medical Practice

SIR,—Consultants and specialists, general practitioners, and others serving in the National Health Service are somewhat in the position of Civil Servants, yet the principle of Civil Service appears to be unacceptable to many of them. I think, however, that a properly established Civil Service of

doctors in the N.H.S., with a mainly medically staffed central administrative authority, would lend itself eventually to an upgrading of the profession, better living conditions, and consequent benefit to the patients.

The particular grading of newly qualified medical practitioners in the service could be agreed, and from this basic status pay could be on an increasing scale, primarily dependent on years of service. A system of grading could be used for the various types of employment in the N.H.S. Practitioners could then reach senior status after so many years in a particular employment, receiving extra pay for higher degrees or diplomas obtained. They could choose to serve either whole- or part-time. G.P.s' lists could be gradually reduced to a maximum of 2,500. The reasonable, agreed, or actual expenses of doctors in the course of their N.H.S. employment, or allowances in lieu, should be paid with the pay cheques.

The position of assistant would no longer be tenable, as all doctors in the N.H.S. would be principals in their own right. Arrangements could be made for new entrants to serve six months under the aegis of senior general practitioners. They could then enter a pool of junior general practitioners awaiting their turn for a position in the area of their choice. While in this pool, they could be available for relief for holidays, sickness, and emergencies. They would receive a proper salary and expenses. Settled junior general practitioners would, initially, have to use premises owned by others. The N.H.S. could reimburse the owners concerned.

The present discontent and poor payment in many cases is due in part to the politicians, but also to those doctors who blankly refuse the premise of a Civil Service. A properly organized medical Civil Service and, if necessary, a tie-up with a stronger union would eliminate extra paper work and the more doubtful aspects of medical practice. It would protect the future of medical practice in Britain, and would be of untold benefit in releasing doctors from side issues. They could then concentrate on the health and welfare of their patients. Doctors who insist that a Civil Service would be detrimental to the profession might do well to reconsider their attitude in the light of past and present events.—I am, etc.,

Birmingham.

Branch and Division Meetings to be Held

BRADFORD DIVISION.—At Medical Societies' Room, Bradford Royal Infirmary, Wednesday, October 30, 8.15 p.m., meeting. Lecture by Dr. J. G. Craig: "Getting Old."

CAMBERWELL DIVISION.—At Dulwich Hospital, East Dulwich Grove, S.E., Tuesday, October 29, 8.45 p.m., meeting. Address by Dr. R. Forbes: "Recent Developments in Medical Litigation." Legal or dental friends are invited.

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, W.C. Tuesday, October 29, 8.30 p.m., meeting. B.M.A. lecture by Sir Russell Brain: "Pain in the Arm." Members of St. Pancras Division are invited.

LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, S.E. (1) Friday, November 1, 8.30 p.m., meeting with Consultant Staff of Lewisham Hospital Group. (2) Sunday, November 3, 10.30 a.m., clinical meeting.

MIDLAND BRANCH.—At the Grand Hotel, Birmingham, Saturday, November 2, 7 for 7.30 p.m., annual dinner.

NORTH-EAST ESSEX DIVISION.—At Out-patients' Hall, Essex County Hospital, Colchester, Wednesday, October 30, 7.45 p.m., clinical meeting.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Tuesday, October 29, 2.30 p.m., practitioners' round. Mr. K. A. K. Hudson: Obstetric and gynaecological cases.

NORTH STAFFS DIVISION.—At North Stafford Hotel, Station Road, Stoke-on-Trent, Monday, October 28, 8 p.m., joint meeting with North Staffs Branch of Pharmaceutical Society. Lecture by Dr. P. W. Muggleton, Ph.D.: "Vaccines Against Poliomyelitis and Tuberculosis." Illustrated by two films: (1) "Defence Against Poliomyelitis"; (2) "Longer Life for B.C.G."

READING DIVISION.—At Library, Royal Berkshire Hospital, Reading, Wednesday, October 30, 8.30 p.m., meeting. Lecture by Dr. J. A. Pridham: "World Medical Association and its Objects." Members' wives are invited.

SALISBURY DIVISION.—At Royal Military Hospital, Tidworth (C Block), Friday, November 1, 8 p.m., clinical meeting and discussion. All medical practitioners in the area of the Division are invited.

SOUTH ESSEX DIVISION.—At Golden Lion Hotel, High Street, Romford, Friday, November 1, 8 for 8.30 p.m., informal dinner. Lecture by Mr. A. M. A. Moore: "Painful Conditions of the Hand and Foot."

SOUTH SHIELDS DIVISION.—At Ingham Infirmary, South Shields, Wednesday, October 30, 8.30 p.m., meeting. Dr. H. L. Cohen: "R.A.M.C. Memories."

SWANSEA DIVISION.—At Morriston Hospital, Swansea, Thursday, October 31, 7.30 p.m., clinical meeting.

WEST NORFOLK DIVISION.—At Wenss Hotel, King's Lynn, Thursday, October 31, 8.30 p.m., meeting, which will include a programme of medical and other short films.

Meetings of Branches and Divisions

DERBY DIVISION

The following officers have been elected:

Chairman.—Dr. J. Moir.
Vice-chairman.—Dr. E. C. Dawson.
Honorary Secretary and Treasurer.—Dr. R. G. Cooke.
Honorary Assistant Secretary.—Dr. J. B. S. Morgan.

HUDDERSFIELD DIVISION

The following officers have been appointed for 1957-8:

Chairman.—Mr. F. W. Shepherd.
Vice-chairman.—Dr. L. E. Lucas.
Honorary Secretary and Treasurer.—Dr. W. Brown.

WEST SOMERSET DIVISION

The following officers were elected at the annual general meeting on July 30:

Chairman.—Mr. R. D. Rowlands.
Vice-chairman.—Dr. T. L. H. Shore.
Honorary Secretary.—Dr. J. R. Sinton.
Honorary Assistant Secretary.—Dr. D. Kibblewhite.
Honorary Treasurer.—Dr. I. C. F. Hungerford.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY NOVEMBER 2 1957

CONTENTS

Public Health Committee	143	Diary of Central Meetings	144
Correspondence	143	Branch and Division Meetings to be Held	144

PUBLIC HEALTH COMMITTEE

A meeting of the Public Health Committee was held on October 18 at B.M.A. House. Dr. J. B. TILLEY was in the chair.

Public Health Service Remuneration

The Committee discussed the minutes of the preliminary meetings of a subcommittee which is drafting evidence on the remuneration of public health doctors for submission to the Royal Commission. The subcommittee hopes to submit a draft memorandum of evidence at the next meeting of the Committee, to be held on December 6, and it was decided to invite the Staff Side of Whitley Committee C to join the Committee in considering the memorandum on this date.

Ambulance Personnel—Disclosure of Information

The Committee discussed a minute from the Central Ethical Committee (see *Supplement*, October 19, p. 132) which sought the Committee's advice on the disclosure by ambulance men of information received when attending a case. The minute was accompanied by a letter from a doctor in London who complained that when he had attended a patient for gas poisoning the ambulance men whom he had summoned had notified the police, who arrived at the house in question in the early hours of the morning to question the widowed mother of the patient.

Dr. TILLEY said that this was not a matter of the ethics of the profession. Ambulance men were not members of the profession and their behaviour could not be considered as a matter of medical ethics. It was a matter for local authorities, who employed the ambulance men, to decide what their employees should tell the police. If a doctor asked ambulance men to keep a matter confidential, he felt that the ambulance men should comply, but the Committee could go no further than that.

Dr. J. B. S. MORGAN did not entirely agree. When they spoke about medical ethics they were referring to the standards of behaviour of doctors, but although those standards applied between one doctor and another, they also applied to relationships between the medical profession and other professions. The procedure in Wolverhampton, which provided the specific case on which the Central Ethical Committee sought the advice of the Public Health Committee, was that the ambulance men should report the case matter to the police unless the doctor attending the case asked them to keep confidential any information which they obtained. Dr. Morgan said that that was not enough. A doctor might be busily engrossed in other things concerning the patient and might forget to say yes or no. No disclosure should be made unless the doctor expressed a wish that the police should be informed. It should otherwise be regarded as routine that no disclosure should be made. On the other hand, if any member of the public saw one person stabbing another, it was obviously his duty to inform the police. There had to be discretion in the matter.

Dr. ALUN EVANS said that in the London case the police had probably gone to the house in question for reasons of public safety. It was probable that the only information

which they had was that there had been a case of gas poisoning. Dr. W. G. HARDING said that there had been a new procedure in London for the last two years and it covered the point at issue. There was a service order which reminded ambulance men of the cases they had to report to the police—accident, illness in a public place, suicide, attempted suicide, and so on. It said that in any case of suicide, attempted suicide, self-inflicted injury, poisoning, or abortion, if a doctor had already attended or attended before the ambulance arrived, instead of reporting to the police, the ambulance crew reported to headquarters, who got in touch with the doctor. The onus was then on the doctor.

Dr. K. S. MAURICE-SMITH said that they were putting doctors completely at the mercy of the ambulance driver. Worthy men though they were, ambulance drivers were sometimes restricted in intelligence. Dr. HARDING said that under the London system the ambulance control room told the doctor it was up to him whether he reported the case. Dr. L. ROBERTS pointed out that it was sometimes the hospital authorities who reported the matter to the police. That was a loophole which must be closed.

The Committee decided to tell the Central Ethical Committee that it was in favour of the London procedure.

Correspondence

Because of heavy pressure on our space correspondents are asked to keep their letters short.

Treatment Under Ophthalmic Services

SIR,—At the moment, while working for the fellowship, I am engaged in ophthalmic school clinics as S.H.M.O. My duties are to see and prescribe for all children up to school-leaving age anything might be of interest to your readers as an insight into who really treats patients in the supplementary eye service, and the position we doctors occupy.

I saw a child of 3½ years eight months ago. She was a full albino, with typical eyes and myopia to the extent of minus 5 dioptres with cylinder in each eye. All that was indicated was the appropriate glasses slightly tinted, and these were prescribed. Two weeks ago the mother returned of her own accord and told me the glasses were cracked and, as the child appeared to miss them a great deal, could I let her have a replacement? As the glasses required more light absorption for the child's comfort, Crookes "B" lenses were ordered. Not long after this the mother returned to the clinic with a letter from the supplementary eye services demanding a full explanation of how the glasses got broken and stating that nothing could be done about replacement until an explanation was forthcoming.

I rang the person responsible for this letter (a clerk) and asked for the reason. I was told it was his job to prevent excess prescribing. When I pointed out that the glasses were different, that the child was an albino, that she saw little without them, and that she was only 3 years old, this

made no impression. I was rather annoyed at this, and the clerk then informed me that the person who would make the final decision was the referee (an optician). In short, a doctor's (specialist's) findings are vetted by a clerk and, as a final court, by an optician, before his treatment is allowed and his patient gets what is medically required. When I objected to having to be dictated to by an optician, I was told that he was a man of great experience, and whether an oculist's or an optician's opinion was the more valuable was again a matter of personal opinion.

On this I left the matter, wondering what was the value of a specialist medical opinion in this age of "free" medicine. This is by no means the first of such incidents. I could quote many more.—I am, etc.,

Belfast.

ERIC C. COWAN.

Red Tape

SIR.—As a general medical practitioner, I am interested to know if the following incident is peculiar to my county only. On applying for a county ambulance for a National Health patient to be taken—and here is the crux of the matter—to one of London's few remaining voluntary hospitals (now designated as "disclaimed") I was informed that the patient had no right to an ambulance to take him to a non-National Health hospital without special permission from headquarters. This seems to be political red tape of the most injurious nature, both to the welfare of the patient and to the medical profession as a whole.—I am, etc.,

Oxted, Surrey.

C. G. WALKER.

Anonymity in Broadcasting

SIR.—For some time now I have been struck by certain inconsistencies in the relationship of members of the medical profession to "advertising." Please allow me to cite contrasting examples. In the television programme "Is This Your Problem?" a psychiatrist appears who is referred to as "the Doctor," yet on the occasions when a clergyman is a member of the panel he is referred to by name. If it is assumed that mention of the doctor's name would boost the number of patients consulting him, does it not follow that the clergyman's pews should be filled on ensuing Sundays, and perhaps eventually his stipend raised due to increased membership of his church? Earlier in the year a doctor who had written a letter to the *B.M.J.* on a subject which caught the eye of a newspaper reporter had a write-up of his article, plus a photograph of himself, in a newspaper. This was followed up by a mention, including his name, on the late night B.B.C. television news. I have my doubts as to whether the doctor's permission was sought, and if his practice has increased thereby. Stage comedians are quick to seize upon likely material from everyday life, so it did not surprise me to hear in a recent play an actor, when asked his name, counter quickly to the effect, "National Health doctor—no advertising!" Having appeared once on television myself (incognito), and not being in general or consultant practice, it will be readily understood that I have no personal axe to grind, but is it not time that the "all or none" law applied?—I am, etc.,

Fife.

JAMES A. PETRIE.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: B. R. Davis, M.B., Ch.B., D.C.P., Pathologist, Pneumoconiosis Medical and Research Bureau, Northern Rhodesia; G. H. Fletcher, M.B., Ch.B., T.D.D., Medical Officer-in-Charge, Sub-Bureau of the Pneumoconiosis Medical and Research Bureau, Northern Rhodesia; H. M. Forde, M.D., M.R.C.P., D.P.H., D.T.M.&H., Specialist Physician, General Hospital, Barbados; O. C. Fung, M.B., F.R.C.S., Medical Officer, Grade A, Port of Spain General Hospital, Health Department, Trinidad; M. P. Otolorin, M.R.C.S., L.R.C.P., Senior Medical Officer (Administration), Adeoyo Hospital, Western Nigeria; S. J. Benjamin, L.R.C.P.&S.Ed., Houseman, Sierra Leone; G. I. B. da Costa, M.B., F.R.C.S., Surgeon Specialist, Western Nigeria; W. T. M. Gilbert, L.R.C.P.&S.I., Senior Medical Officer, St. Helena; K. B. Kugelgen, M.D., Medical Officer, Northern Nigeria; R. K. Mukherjee, M.B., B.S., D.P.H., Medical Officer of Health, Trinidad; K. M. Stewart, M.B., Ch.B., Medical Officer, Uganda.

Branch and Division Meetings to be Held

- ALDERSHOT AND FARNHAM DIVISION.—At Queen's Hotel, Farnborough, Wednesday, November 6, 8.30 p.m., meeting. Lecture by Mr. Ewart Williams: "Management of the Third Stage of Labour and the Use of the Flying Squad."
- ASHTON-UNDER-LYNE DIVISION.—At Regis Suite, Alma Lodge Hotel, Stockport, Thursday, November 7, 8.30 p.m. to 1 a.m., annual dinner-dance.
- BARNSELY DIVISION.—At Queen's Hotel, Barnsley, Friday, November 8, 8 p.m., meeting. Dr. J. Miller: "Coloured Teeth."
- BIRMINGHAM DIVISION.—At Birmingham Medical Institute, 36, Harborne Road, Edgbaston, Friday, November 8, 8.30 p.m., joint meeting by invitation of Medical Women's Federation. Dr. J. H. Cyriax: "Disk Lesions."
- BRISTOL DIVISION.—At Grand Spa Hotel, Clifton, Bristol, Tuesday, November 5, 8 p.m. to 1 a.m., annual dance.
- BROMLEY DIVISION.—At Beckenham Hospital, Wednesday, November 6, 8.15 for 8.30 p.m., Dr. Neville Oswald: "Chronic Bronchitis."
- ENFIELD AND POTTERS BAR DIVISION.—At George Hotel, Enfield, Thursday, November 7, 8.15 for 8.45 p.m., meeting. Lecture by Dr. Walter Hedgcock (Assistant Secretary, B.M.A.): "Organization of the Medical Profession."
- GLASGOW DIVISION.—At Grosvenor Restaurant, Glasgow, Tuesday, November 5, 7 for 7.30 p.m., annual dinner and dance.
- KENSINGTON AND HAMMERSMITH DIVISION.—At Students' Common Room, Hammersmith Hospital, Du Cane Road, W., Friday, November 8, 8.30 p.m., meeting. Symposium on General Practitioner Obstetrics and Antenatal Care. Contributions by Professor J. C. McClure Browne, Mrs. M. E. M. Beart, and Dr. A. Ryle.
- LEIGH DIVISION.—At Waterfields Restaurant, Leigh Road, Leigh, Friday, November 8, 7.30 for 8 p.m., annual dinner. Male guests invited.
- MACCLESFIELD AND EAST CHESHIRE DIVISION.—At West Park Hospital, Macclesfield, Sunday, November 10, 10.30 a.m., clinical meeting.
- NORTH-EAST ULSTER DIVISION.—At Fawcett's Royal Hotel, Portrush, Friday, November 8, 8.30 p.m., annual ladies' night dinner-dance.
- NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Tuesday, November 5, 2.30 p.m., practitioners' round. Mr. B. H. Page: Genito-urinary and general surgical cases.
- SOUTH STAFFS DIVISION.—At the Victoria Hotel, Wolverhampton, Wednesday, November 6, 8.30 p.m. to 1 a.m., annual dance. Non-medical guests welcomed.
- SOUTH-WEST ESSEX DIVISION.—At Out-patient Department, Thorpe Coombe Maternity Hospital, Forest Road, Walthamstow, E., Wednesday, November 6, 8.30 p.m., meeting. Dr. J. D. Kershaw: "Some Impressions of Medicine in the U.S.S.R." (illustrated).
- TUNBRIDGE WELLS DIVISION.—At Elizabethan Barn, Tunbridge Wells, Thursday, November 7, 8 for 8.30 p.m. to 1.30 a.m., dinner-dance. Guests, Dr. Alexander Hall and Dr. Ian D. Grant and their ladies.
- WAKEFIELD DIVISION.—At Rehabilitation Department, Pinderfields General Hospital, Wakefield, Thursday, November 7, 8 p.m., meeting. Lecture and clinical demonstration of cases by Mr. J. M. P. Clark: "Poliomyelitis."
- WEST SUFFOLK DIVISION.—At Everard's Hotel, Bury St. Edmunds, Saturday, November 9, 7.30 for 8 p.m., "Doctors' Armistice" dinner.
- WIGAN DIVISION.—At Haigh Hall, Wigan, Wednesday, November 6, 7.30 for 8 p.m., annual dinner and dance. Non-medical guests invited by members welcome.

The Presidential Meeting of the Welsh Branch of the Society of Medical Officers of Health will be held at B.M.A. House, 195, Newport Road, Cardiff, on Friday, November 8, at 6.30 p.m.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY NOVEMBER 9 1957

Pay Protest Conference	145	Correspondence	147
Consulting Pathologists Group	145	Diary of Central Meetings	148
Overseas Committee	146	Branch and Division Meetings	148

PAY PROTEST CONFERENCE

FIFTY-FIVE ORGANIZATIONS INVITED

The Staff Side of the General Whitley Council is calling a conference on November 13 of all organizations with members in the N.H.S. The purpose of the conference is to persuade the Minister of Health to withdraw his veto on the 3% wage increase granted by Whitley Council to members of the administrative and clerical staff in the Health Service with salaries below £1,200 a year. The B.M.A. is among the 55 organizations asked to attend the conference, which is the first of its kind. Last week the B.M.A. issued a statement that the Minister's decision to overrule agreed negotiating machinery was bound to "lessen confidence in the minds of those who are dependent on the Government for their remuneration." The Minister has agreed to the Whitley Council award of 5% to administrative and clerical staff with salaries above £1,200 a year because they did not benefit from the award of 3% granted to others last December.

CONSULTING PATHOLOGISTS GROUP

A meeting of the Consulting Pathologists Group was held at B.M.A. House on October 25. Dr. S. C. DYKE took the chair.

Fees Payable Under Coroners Acts

Dr. J. D. ALLAN GRAY, chairman of the Group Committee, reported that the Committee had considered a model schedule, for adoption by local authorities, of the fees, allowances, and disbursements payable by coroners under the Coroners Acts. The Committee's only comment, he said, had been to take exception to the use of the term "medical practitioner" rather than "pathologist." He said that the Private Practice Committee and the Council had been informed, but had approved the schedule in its original form. In discussion of the matter by the Committee it had been suggested that the Council may have been influenced by the belief that in some areas pathologists were not always available for post-mortem examinations and therefore retention of the wider term was preferable. The Committee had taken the view that another approach should be made to the Coroners' Society on the subject of post-mortem examinations being carried out by others than pathologists, and the Committee had asked members of the Group for information on the matter.

Dr. DYKE said that they all knew that the Coroners' Rules published in 1953 had specifically laid down that whenever possible coroners should call in pathologists who were properly qualified to do post-mortem examinations. That rule was being widely disregarded. The Committee wished to go further into the matter and wanted more information. It also wanted the views of the Group on

how far it was desirable to probe the matter further. Dr. K. S. RODAN said that in some areas general practitioners were doing the work and had done so for many years. It would be embarrassing to take the work from them. In his area the coroner had thought that the rule might be more strongly worded. Dr. J. C. VALENTINE said that he would find a certain difficulty in doing all the work in his area if it were taken from general practitioners. Dr. RODAN commented that in his area there would be no difficulty because on an average there was only one necropsy a week, but Dr. VALENTINE stated he was already doing three or four a week on his own and someone else was performing a similar number. This was in addition to hospital work. Attending an inquest and so on all took valuable time.

It was agreed to ask members of the Group for more information on the matter.

Domiciliary Consultations

Dr. GRAY reported that the Committee had considered whether domiciliary visits for repeated tests should be regarded as domiciliary consultations. The practice in different regions varied considerably. The Committee had agreed with a memorandum from the Association of Clinical Pathologists that "consultation" signified two or more practitioners taking counsel together on a clinical problem; that a "domiciliary consultation" was a consultation in the patient's own home; and that a "visit" solely for the purpose of collecting material, the nature of the examination of which the practitioner in charge had already determined, merely in order to save the practitioner from so doing, could not be regarded as a "consultation." However, if the general practitioner sought the advice of the pathologist on the clinical problem, it would be appropriate for the domiciliary consultation form to be completed. In certain circumstances there would have to be successive visits to the patient's home, and these could not be regarded as separate consultations. The matter had been forwarded to the Central Consultants and Specialists Committee and the Joint Consultants Committee. The latter had discussed it with the Ministry, which appeared to take a less strict view than that taken in the memorandum.

Dr. TAYLOR said that a Select Committee of the House of Commons had used the term "abusive" about the large number of domiciliary visits carried out by full-time consultants when general practitioners were not present. When a pathologist made a visit the consultation was frequently held outside the patient's home after further investigation had taken place. Dr. F. J. PICK said that the pathologist might visit the patient to decide what specimens should be taken. If the general practitioner asked him to go, he should go. If he had to make a visit because the general practitioner could not obtain a specimen himself, there was nothing wrong with charging for a domiciliary visit. Dr. DYKE pointed out that the memorandum suggested that a domiciliary visit should not be charged every time in cases where a series of specimens was required.

SIR,—Once again in your columns the suggestion has been made that a "properly organized locum pool" is needed as an essential part of the N.H.S. (Dr. T. L. C. Dale, *Supplement*, October 19, p. 134). Once again no suggestion has been made of where these locums are to come from. At present, entirely owing to the considerable pool of

H. P. HILDITCH.

EAST KENT DIVISION.—At Beresford Hotel, Birchington, Thursday, November 14, 7.30 p.m., dinner; 8.45 p.m., meeting.

power Tooting, S.W., Tuesday, November 12, 8.30 p.m., clinical meeting in conjunction with South London Faculty of the College of General Practitioners.

Chairman's Visit to Africa

The CHAIRMAN reported that, in accordance with the Council's wishes Professor D. E. C. Mekie had accompanied him on his recent tour of Branches in Central and East Africa. Before visiting the Branches Dr. Wand said that, at the special request of the Medical Association of South Africa, he had paid a short visit to Durban, where he addressed a medical meeting and presented to the M.A.S.A. a gavel and block made from the wood of the Dickens mulberry tree.

Professor D. E. C. MCKIE said that in more than the metaphorical sense Dr. Wand was weighed in the African balance and found not to be wanting. The tour had produced a number of problems which would have to be studied, and, although the report which would appear could not include all the minor problems raised, the work which it would be necessary to do would be considerable.

British Commonwealth Medical Conference

On the motion of Dr. I. GRANT, it was agreed that the Fifth British Commonwealth Medical Conference, due to be held in London in July, 1958, immediately before the Annual Meeting, should be postponed to 1959, so that it could be associated with the Joint B.M.A. and C.M.A. Meeting in Edinburgh in that year. Other bodies represented in the Conference had already signified agreement.

Relinquishment of Capitation Grant by New Zealand Branch

It was reported that a letter had been received from the New Zealand Branch in which it was stated that the Council of the Branch had unanimously resolved to relinquish the capitation grant which it received from the parent body of 6s. per member per annum.

Mr. L. DOUGAL CALLANDER (Treasurer) stated that the kindly gesture on the part of the New Zealand Branch would save the Association some £750 a year.

Visit to Germany

It was reported that Dr. E. GREY-TURNER (Assistant Secretary) had attended a symposium concerning national health services at Baden-Baden on October 19, for which he composed a paper on the British National Health Service and delivered it in German. The Council expressed appreciation of Dr. Grey-Turner's work on this matter.

Further Interim Payment

The CHAIRMAN OF COUNCIL reported that he had seen the Minister and had presented to him the views of the Representative Body on a further interim payment.

Association's Medal for Distinguished Merit

A recommendation made by the Office Committee that the Gold Medal of the Association for Distinguished Merit be awarded to Lord Adrian, O.M., in recognition of his distinguished services to medicine, particularly his research in the physiology of the nervous system, was adopted.

Vice-President

The Council agreed that it be recommended to the Representative Body that J. L. Gilks, Bournemouth, be elected a Vice-President in recognition of his distinguished services to the Association. At the same time the CHAIRMAN reported with great regret the death of Mrs. Gilks on November 4.

Book of Valour

The Council unanimously accepted the Office Committee's recommendation that an entry be made in the Association's Book of Valour recording the brave action of Flight-Lieutenant Charles Anthony Sidney Evans, M.B.E., M.B., B.S., as described in the *London Gazette* of July 5, 1957.

Finance Committee

Mr. L. DOUGAL CALLANDER (Treasurer) reported that the improvement on the *Journal* and Publications account and the Estates Budget had met the greater part of the additional expenditure incurred in connexion with the remuneration claim.

In pursuance of the resolution of the Council at its last meeting in regard to the financial position of the Association, the Committee had again reviewed the question of an increase in the membership subscription rates. From the figures which were at present available of the present and future level of income and expenditure, the Finance Committee was of the opinion that an increase in the membership subscription rates was inevitable. It proposed, therefore, to examine the position in greater detail and would report to a subsequent meeting of the Council.

Mr. H. H. LANGSTON asked what would be the approximate annual saving if the number of representatives in the Representative Body was reduced to 350.

Mr. CALLANDER, in reply, said the saving would be £1,200 per annum.

Whitley Council Conference

A motion that the Association accept the invitation to attend as observers the conference on November 13 of representatives of all Staff Sides organizations represented on any N.H.S. Whitley Council (*Supplement*, November 9, p. 145) was carried.

Government and Arbitration

The Council spent a considerable time discussing the implications of recent Government statements in the field of arbitration. It decided to reserve its comments until it presented its evidence to the Royal Commission under Section C of the Commission's terms of reference.*

Overseas Committee

Professor MEKIE, Chairman of the Committee, reported that the Committee had considered the report of a Commission appointed to review salaries attaching to the senior posts in the Civil Service of Fiji, and the action of the Legislative Council of Fiji thereon. Medical salaries had been "reserved" by the Colonial Office, in giving general approval to the revised salaries, and the Committee, after receiving the views of the Fiji Branch, was protesting to the Colonial Office both against the inadequacy of the salaries recommended and the refusal of the Legislative Council of Fiji to adopt the principle of inducement payments to expatriate officers, although such payments were recommended by the Commissioner and were commonly made in other colonial territories as a means of attracting officers with the requisite experience and training from the United Kingdom.

Journal Committee

The Journal Committee presented a report, at the request of Council, on the present position and future prospects of *Abstracts of World Medicine*; it was satisfied that there was a need for the service so provided to medicine and accordingly resolved not to recommend any change of policy. Dr. J. G. M. HAMILTON, Chairman of the Committee, pointed out that the circulation had steeply increased during the past two years.

Dr. Hamilton, reporting on the considerable additional cost to the Journals Department of the increased postal charges, said that as a result of various steps taken to increase revenue and effect economies the greater part of the increased cost would be met.

Dr. C. J. C. BRITTON expressed the view that it was unnecessary for the *Journal* to have an abstracting service. No doubt it was of value to some people, but he questioned whether it added sufficient prestige to the Association, and whether the expenditure was justified.

Scottish Council

It was reported that Drs. W. M. KNOX and G. W. IRELAND were re-elected Chairman and Deputy Chairman respectively for the Session 1957-8.

The Council received with regret the report of the death of Dr. J. F. Lambie, a member of the Scottish Committee from 1942 to 1950.

Organization Committee

Dr. R. G. GIBSON, presenting the report of the Organization Committee, reported that the Committee had considered the procedure to be adopted in holding a second Scientific Meeting of the Association. Briefly, the proposal was for a scientific function of high standard, organized on an informal basis which would appeal to the postgraduate. The meeting would occupy a long week-end during the winter months, and would normally be held only in those towns which could not accommodate the Annual Meeting of the Association. Certain details remained to be decided, but the Committee recommended that the title should be

*Section C of the Royal Commission's terms of reference asks it to consider whether, and if so what, arrangements should be made to keep proper current levels of remuneration under review.

"The B.M.A. Annual Clinical Meeting"; that the meeting be held annually, normally in December, and for the first time in December, 1958; that the place of meeting in each year be determined by the Council; that the organization of the meeting be vested in a small committee of management, one-half of its members to be appointed by the local Division or Branch acting as host, and the other half by the Council, with the Officers of the Association *ex officio*; and that it be referred to the Organization Committee to draw up a definite scheme of constitution.

The recommendation was approved.

A recommendation that the office be authorized, in the interest of members of the Association, to explore with the Association of British Pharmaceutical Industry the possibility of co-operation with that body in respect of the mailing lists used by pharmaceutical firms for advertisement of their products to the medical profession was accepted.

A recommendation that Council approve the publication of a *Gazetteer of Hospital Resident Posts* in the United Kingdom, to include details of accommodation and amenities in hospitals and other information which might be useful to those seeking junior hospital appointments, particularly provisionally registered practitioners, was considered.

Dr. W. WOOLLEY asked whether the Association was going to hold itself responsible for classifying the hospitals. "Are we going to turn ourselves into an A.A. and have one, two, or three stars against various places?" he added. Dr. GIBSON replied that information was being classified, but not hospitals.

The CHAIRMAN pointed out that the Finance Committee had considered the recommendation but had been unable to make a decision, as no sum of money was mentioned. To make a decision, as the recommendation read, "approve the If Council, as the recommendation read, "approve the publication," it would be committing itself to a sum of money for something about which it knew nothing. The Council was interested in the project and would like more information.

Mr. H. H. LANGSTON asked whether Council would accept the words "Council approves the principle of the production of the *Gazetteer*." There had been profound dissatisfaction of the quarters and accommodation offered to the young doctor in hospital, and in his view Council should take some action in the direction suggested. It was difficult to think of a more effective weapon than a *Gazetteer* in improving quarters for young practitioners.

The CHAIRMAN stated that, provided the cost was not great, Council would approve a publication of the kind suggested. Council was very sympathetic towards the project, but it would like to know what finances of the Association would be involved. In the meantime the Central Consultants and Specialists Committee and the Journal Committee would consider the matter.

Occupational Health Committee

It was reported that the Committee had expressed its deep appreciation of Dr. J. A. L. Vaughan Jones's outstanding service over the past 11 years, during which he had held office as its Chairman and as Chairman of its predecessor, the Industrial Medicine Committee. It had placed on record its warmest thanks to Dr. Vaughan Jones for his untiring efforts on behalf of industrial medical officers, and towards the advancement of the occupational health service.

The CHAIRMAN said that members of Council would desire to be associated with the tribute paid to Dr. Vaughan Jones for his outstanding service to the Occupational Health Committee.

At the same time, they would desire to congratulate Dr. H. Alexander, the new Chairman of the Committee.

It was reported that the Ministry of Labour had agreed to raise the fees paid to lecturers at courses for Disabling Resettlement Officers in accordance with the following recommendations of the Association, with effect from June 24: Up to 1½ hours, £3 3s. (raised from £2 12s. 6d.), and 1½ to 2½ hours, £5 5s. (raised from £4 4s.). The Ministry had also agreed to raise the fees for doctors serv-

ing on Panels of Disablement Advisory Committees as follows, with effect from October 1, 1957: Up to 1½ hours, £2 7s. 6d. (raised from £1 15s.); 1½ to 2½ hours, £3 3s. (raised from £2 5s.). The new fee for a session of up to 1½ hours was in accordance with the Association's recommendation.

Central Ethical Committee

In presenting the report of the Committee, Dr. S. NOY SCOTT, the Chairman of the Committee, paid a warm tribute, which the Council heartily endorsed, to the outstanding services of the retiring Chairman, Dr. R. Forbes.

It was reported that a private practitioner had inquired whether in view of the fact that the names of N.H.S. doctors were displayed in the post office, there would be any ethical objection to the similar display of his own name. It was pointed out to the inquirer that medical practitioners were sometimes required by Acts of Parliament or regulations to do certain things which were contrary to the ethical code of the profession. Before the introduction of the National Health Insurance Act it would have been regarded as unethical for doctors' names to be displayed in the form of a printed list in post offices. Although it was a requirement under the National Health Service Act for the names of doctors in the Service to be exhibited, it did not follow that there would be no objection to the similar display of the names of private practitioners.

In 1954 representations were made to the Colonial Office about the position of Colonial Medical Officers who might be required under the Malayan General Orders to make confidential reports on Government employees. Advice had now been received from the Colonial Office that the offending order had been deleted.

General Medical Services Committee

Dr. A. B. DAVIES presented the report of the G.M.S. Committee.

A recommendation that the General Register Office be informed that the Association did not favour the addition of a question about recent pregnancy to the medical certificate of the cause of death was approved.

It was reported that following the interim increase of 5% in aggregate general practitioner net remuneration the Committee sought an increase in the level of inducement payments, which were not met from the central pool. In reply the Ministry offered an increase which in the majority of cases would amount to about £25 per annum—an amount which the Committee did not feel to be adequate. The matter was being pursued. The Ministry had agreed to add 5% to the bed fund of £25 per occupied bed per annum. That fund formed the basis of the remuneration of general practitioners on the staffs of cottage hospitals.

A number of resolutions carried by the A.R.M. concerning various aspects of the trainee general practitioner scheme were to be considered by the advisory committee set up to keep the scheme under review.

It was reported that the Committee was taking up with the Ministry the question of the provision of four-weekly certificates raised by both the Annual Representative Meeting and the Annual Conference. If it were not possible to persuade the Ministry to allow such certificates to be given in the first instance, the Committee would press for them to be permissible after the first week of incapacity.

Further discussions had taken place with the Ministry in the light of the view expressed by the Representative Body that there was a need for a national policy on immunization against tetanus. The Committee was informed that the Medical Research Council was currently considering the question of the risk of provocation from combining tetanus and other antigens, and it had agreed to await any evidence which might be forthcoming from the Medical Research Council before the matter was pursued further.

Discussions were proceeding with the Ministry of Health on a number of points in connexion with the increased prescription charges. First, the Committee was seeking to find some means whereby dispensing doctors might be spared

the task of carrying with them separate receipt forms of various denominations. Secondly, the Committee was exploring the possibility of producing additional multiple packs which might eliminate some of the worst discriminatory factors of the present charges.

Science Committee

The Committee, its chairman, Mr. J. R. NICHOLSON-LAILEY, reported, had reluctantly come to the conclusion that the proposed scheme for the evaluation of new medical products by laboratory methods should be held in abeyance in view of the expenses involved and the apparently restricted use which would be made of the services of such an organization.

Central Consultants and Specialists Committee

Mr. T. HOLMES SELLORS presented the report of the Committee.

Recommendations dealing with the constitution of the Committee and of the Registrars Group Council, renamed the Hospital Junior Staffs Group Council, were approved; but, owing to the length of the report and the lateness of the hour, it was agreed that further consideration of the report should be deferred.

Public Health Committee

In the absence of the chairman, Dr. J. B. TILLEY, Dr. A. BARKER presented the Committee's report.

A recommendation was unanimously adopted that the Ministry of Health be urged to undertake a full inquiry into the possible dangers to health of the continued disposal of sewage in the sea, with a view to Government action to resolve the problem where necessary.

In view of the increasing incidence of poliomyelitis and the importance of poliomyelitis vaccination, the Ministry of Health was to be recommended to review the whole question of the timing and relative importance of injections with the various antigens and to consider the advisability of recommending that the two injections of poliomyelitis vaccine should take place first, followed later by injection with the combined diphtheria-pertussis or diphtheria-pertussis-tetanus antigens.

Private Practice Committee

Dr. I. M. JONES, the Committee's chairman, put forward a recommendation, endorsed by other committees, that the Council should send a deputation to the Minister of Health concerning doctors' car-parking difficulties, which was approved. The deputation would also seek an assurance that the additional expenses incurred by general practitioners and specialists who had to pay parking-meter charges in the course of their work for the Service would be met by the Ministry of Health, and ask the Minister to request the Minister of Transport to take action which would allow the profession generally more freedom to carry out its commitments in regard to the health of the nation.

A recommendation from the Committee that when a full clinical examination is commissioned by a third party and no special investigation is involved the fee for the examination and report should be a minimum of £2 2s. was approved.

Other Committees

Reports of the Public Relations Committee, presented by Dr. H. G. DAIN, the Amending Acts Committee, presented by Dr. H. H. D. SUTHERLAND, and the Armed Forces Committee, presented by Air Vice-Marshal W. E. BARNES, and other committees were received and approved.

Dangerous Drugs Act : Withdrawal of Authority

The Home Office announces that Dr. James Christian Hall (London, E.) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations, 1953, apply.

MEDICAL MANPOWER

FUTURE RECRUITMENT OF THE PROFESSION

Reproduced below is a summary, published in the "Supplement" of September 22, 1956, of the B.M.A.'s evidence to the Willink Committee.

The British Medical Association submitted a memorandum of evidence to the departmental committee (the Willink Committee) appointed by the Minister of Health and the Secretary of State for Scotland to estimate on a long-term basis the number of medical practitioners likely to be engaged in all branches of the profession in the future and the consequent intake of medical students required. For this purpose the Council of the Association set up a special committee consisting of the principal officers and the chairmen of all interested committees.

At the outset an important caveat is entered. The Association feels that any decision about the future size of the profession should evolve largely from conditions of supply and demand. The size of the profession should be self-adjusting through the maintenance of a high standard of general education, or scientific training, and of personal qualities. The interest of the Minister in medical recruitment is limited to the provision of doctors for the National Health Service, which is only a part—although a large one—of the activities of the profession.

In 1910 the population of Great Britain was 40.5 million. It has increased since then by 10 million, or 25%, and, what is perhaps more important from a medical point of view, it has increased disproportionately in the older age groups. Of the present population of 49.63 million, 6.89 million are males over 65 or females over 60. In 1964 the Government Actuary estimates that of a population of 50.86 million, 7.75 million will be in that over-65 or 60 category, and in 1979, with a population of 52.23 million, the number will be 9.5 million.

Doctors Available

While the population has increased by about 25% since 1910, the number of medical practitioners has risen by nearly 80% (from 34,000 to 61,000), though by no means all the doctors on the *Medical Register* are fully occupied in active practice in this country. This increasing number of doctors reflects, in the Association's view, the higher standard of service provided and a greater demand for doctors' services. Calculations, which must be treated with reserve because some unknown factors enter into them, suggest that the number of doctors actively engaged in general practice is 23,100; in consultant work, 8,849; on hospital staffs, 10,057; and in the public health service, 2,490.

In general practice many older practitioners who entered the National Health Service in 1948 will be eligible for a pension in 1958, but the number who may retire immediately can only be conjectured. It may well be smaller than might be supposed because the pension will not be large and the value of the compensation for loss of goodwill of former practices which they receive on retirement will have fallen with the decline in money values. It must be expected, therefore, that many practitioners will continue to work after 65.

Whatever the result of the arithmetical calculations, the Association would be opposed to the setting of an upper limit to the number of entrants to the profession. Sufficient doctors must be available to meet a changing and expanding service and the possible shifting of balance between the different branches of practice. Advances in therapy, the possible appearance of new specialties, the emphasis in modern medicine on prevention and detection of disease in the early stages, the early recognition of deviations from mental health, the treatment and aftercare involved in the new concepts of social medicine, the rapid development in occupational health—all these factors call for consideration, and a further important factor is that the doctor should be given time to keep abreast of modern knowledge and methods. A ceiling for medical entry is therefore undesirable or even out of the question.

No Substantial Unemployment

It is believed that any allegation of substantial unemployment in the medical profession is unfounded. The overcrowding which is sometimes alleged is fictitious. It is true that appointments in surgery and medicine are not easy to obtain, but there is believed to be no shortage of vacancies in anaesthetics, psychiatry, and radiology. Medical men are badly needed in the medical branches of the armed Forces and in the Oversea Civil Service.

The trend for many years until 1954 had been for the numbers of general practitioners to fall while the population rose. During the first seven years of the post-war period doctors who would have liked to enter general practice were deterred by what they considered inadequate financial reward, especially as it became clear that the Spens recommendations were not in fact being fully implemented. The Association holds the view that during the next ten years an increase in the number of general practitioners will be necessary.

It is also impossible to estimate how far future advances in medicine will affect the character and scope of hospital practice. Among other things the memorandum points out that greater provision should be made for the employment of suitably trained and experienced general practitioners in of hospitals. It is emphasized that the field of specialist practice should be considered as a whole rather than the different specialties in isolation. Taking everything into consideration, the following rough estimate of the total number of hospital staff in the consultant and S.H.M.O. grades likely to be required in the next ten or twenty years is given in the memorandum:

	Whole-time Equivalent	Whole-time and Part-time
Present establishment (1954)	7,124	9,708
	Whole-time Basis	Whole-time and Part- time Equivalent
Estimated future requirements	9,435	12,974

While bearing in mind the possibility of alterations in the public health service, it is felt that the total number of medical officers required is unlikely to be altered materially, unless the Government envisages a complete reorganization of the service as a whole.

Between 600 and 700 general practitioners are believed to be engaged predominantly in private practice. This number is likely to remain fairly stationary, though, should the Government accept the Association's policy of securing for private patients the right to obtain medicines in the service, the number of patients privately treated and of practitioners to attend them would doubtless increase.

The memorandum includes a brief reference to the requirements in wartime (in cold, warm, and hot war), but the surplus of doctors who would be required in nuclear warfare is beyond estimate.

Conclusion

Summarizing its conclusions, the memorandum repeats that any calculation of the actual number of doctors required during the next ten or twenty years is subject to many unpredictable and imponderable factors. Not the least of these is the rapid change in the scope of medicine. Any figure can be only a rough estimate, and, in any event, the mere numbers are not the criterion of the standing of the profession or the value of its work. It is much more important that the new entrants should be of high calibre and should feel a vocation for medicine.

MEMBERS OF WILLINK COMMITTEE

The following were appointed by the Minister of Health in February, 1955, as members of the committee to investigate future needs in medical manpower (the Willink Committee): Mr. Henry Willink, Q.C. (chairman), Dr. J. T. Baldwin, Sir Harold Boldero, Sir John Charles, Sir Henry Cohen, Sir Andrew Davidson, Dr. A. B. Davies, Mr. J. P. Dodds, Sir Geoffrey Jefferson, Mr. L. G. K. Starke, and Mr. A. B. Taylor.

SCOTTISH COMMITTEE'S MEMORANDUM

The following is an abridged version of the summary of the B.M.A. Scottish Committee's evidence to the Willink Committee. The summary was published in the "Supplement" of October 13, 1956.

The Scottish Committee of the British Medical Association has submitted a memorandum of evidence to the departmental committee (the Willink Committee) appointed by the Minister of Health and the Secretary of State for Scotland to estimate on a long-term basis the number of medical practitioners likely to be engaged in all branches of the profession in the future and the consequent intake of medical students required.

Broadly speaking, the Committee feels that almost every aspect of the subject is "fraught with prognostic difficulty." It was possible to discern certain trends, but their continuance depended upon factors so unpredictable that "nothing short of efficient crystal gazing could give the answer." However, the Committee has set out those considerations which have enabled it to reach some conclusions.

Present Situation

An assumption that the expected phase of expansion of the profession following the start of the Health Service might be followed by one of contraction when the declared objects of the Service are attained is not as logical as it appears, the Committee says, because there are many imponderable factors which can influence future developments and make unpredictable demands on medical manpower. It is by no means certain that much contraction can be looked for as a result of an efficient health service or even that such contraction will occur at all. The Committee thinks that the spreading of hospital and specialist service throughout Scotland is well advanced and that any further increase in hospital medical establishments will mainly reflect developments in medical knowledge and practice.

Superficial consideration might suggest that the increase in hospital attendance would lead to a reduction in general-practitioner attendance, but this is not so. The Committee thinks it more likely that the reverse is true, and that it is because people are going more readily to see their family doctors that more of them are being referred to hospital. Whatever may be the actual balance of effect of the Service, there can be little doubt that the percentage increase in the total of general medical services has been substantially greater than the percentage increase in the total numbers of practitioners.

Both the number and proportion of those with small lists are appreciably less in 1955 than in 1951. This indicates that the capacity of general practice as a whole to undertake more service is to this extent reduced. It is widely, although by no means universally, considered that the permitted maximum for lists is still too high. If this view became more generally accepted the broad tendency, observable since the inauguration of the Service, towards "spreading the load" of general practice is likely to continue. It is highly probable that in such circumstances it would prove necessary to have more doctors engaged in general practice.

Intake of Medical Students

The Committee calculates, very much in round figures, that British medical schools will require to produce enough replacements for a total present medical force of about 66,000 and to allow for an increase during the next 10 to 25 years of about 10%.

Admissions to Scottish medical schools have fallen by about 20%, while applications are not far short of 50% about 20%, while applications are not far short of 50% less than they were seven or eight years ago. It is recognized by the Committee that the high level of applications in the early post-war years reflects the backlog of demand created by the war, but it doubts if this factor alone fully explains the large drop in applications in 1951 and 1952. It believes

these figures support the fairly general impression that there has been a significant decline in the number not only of those seriously contemplating entry into the medical profession but also of those measuring up to selection committee standards.

Twenty or more years ago the majority of applicants came from professional families, many from medical families. Nowadays, the Committee is informed, such applicants constitute quite a small proportion of the total. Formerly doctors for the most part were pleased when their children elected to follow in the parental footsteps and encouraged them to do so, but now they are much less enthusiastic and sometimes actively discouraging.

Economic factors operate in the same direction. Many professional-class parents, often unable to obtain grants from public funds, find the cost of putting their sons and daughters through medicine under present conditions more than they can undertake.

Apart from their intrinsic importance these aspects are relevant to the practical considerations which have led to the present inquiry. If, for example, there were to be a really serious dearth of suitable applicants, estimates of required intake at which the Committee might arrive could prove to be largely of academic interest. The Committee feels, however, that it is reasonable to hope that any falling off in numbers of suitable recruits to the medical profession is only temporary and that in the long run the high place of medicine as a career of choice will be recovered.

The Future

The factors likely to influence medical requirements seem to the Committee to fall into two interdependent main groups—namely, those immediately and directly affecting the practice of medicine, and those affecting the general level of health in the community and thus indirectly the practice of medicine. Most obvious in the first group are advances in the knowledge and understanding of disease processes and in the means of treating or preventing them. There is no reason at all to suppose that this process of advance will halt, and illnesses which now make heavy demands on medical services may in quite a few years' time have largely disappeared.

A less obvious factor in this group is the system of organizing and financing a medical service which depends for its finance on an annual parliamentary vote. It seems to the Committee that this must have a bearing on the "number of medical practitioners likely to be engaged in all branches of the profession in the future." Under such a system the amount of money to be devoted to the medical service must be determined, at least to some extent, by considerations unconnected with actual medical need. Secondly, the amount to be spent has to be determined in advance, and of course the decision as to what the nation is to pay for its doctoring has to be a collective, not an individual, one as it is under less highly organized systems. Whatever may be its other merits or demerits, such a system does not make for flexibility of response to changing need, and changes in establishment are consequently rendered less likely than they would be under less centralized arrangements.

This relative inflexibility is likely to affect mostly the situation in the hospital and specialist services. At the same time the Committee finds it easy to imagine that changes in the organization, administration, and financing of the public health and general medical services also could materially affect the numbers of doctors required to undertake them. While it is not at all unlikely that such changes will come about, it seems to the Committee quite impossible at the present juncture to forecast either when they are likely to occur or what form they might take.

The Committee is not entirely convinced that the increasing age of the population more or less automatically results in an increasing need for medical services. Much illness suffered by the elderly is preventable. Much of the thought and effort of the developing specialty of geriatrics is directed to prevention of this kind of illness. To the

extent that this objective is attained an ultimate reduction in the demand for medical services for the elderly can be anticipated.

Studies of schoolchildren and young adults over the years reveal evidence of continuing improvement in the general level of physical health among the younger age-groups in the community. This has resulted in the main from the application of medical knowledge to the problems of disease prevention, principally but not exclusively through those practising in the public health service. There remains much scope for fresh developments in the field of preventive medicine, as well as for more effective prosecution of measures already initiated. No one can say with certainty, but it is undoubtedly possible that application of the principles and practice of preventive medicine to the problems of psychogenic disorder might result in improvement in the general level of mental health comparable with that already achieved in relation to physical health. No matter how vigorously this desirable end were pursued, however, it could be achieved neither quickly nor without initially increasing rather than diminishing the need for doctors.

It is the Committee's belief that quantitative limitation of entry, based on population, might well have an adverse qualitative effect on the total recruitment in this country. Should a policy of limitation appear to be indicated as a result of the Willink Committee's inquiry and estimates, this object could be better achieved by raising the standards of entry and qualification in all the schools. Any policy which had the effect of partially dismantling, as it were, the carefully built up apparatus of medical teaching would be most unwise.

Conclusion

In conclusion, it must, the Committee thinks, be anticipated that the number of doctors engaged in all branches of the profession will during the next 10 to 25 years be not less than it is at present and is likely to be more. If, after making allowance for "wastage" (by death, retirement, marriage of women doctors, etc.), an average practising life of 30 years is assumed, the annual number required for replacement would be 2,200. The figure for 1955, by which time presumably adjustment to the new registration requirements had been made, was 2,309. An intake into the profession of this order does not allow a large margin for meeting the increased demand for doctors which the Committee believes is likely to arise in the proximate future. To produce this number of graduates would require an annual intake of students of nearly 3,000 (allowing for a student wastage of approximately one-eighth), a number which is in excess of the present total intake of the British and Irish schools. From this it seems possible to the Committee to draw at least the negative conclusion that there is no *prima-facie* argument in favour of quantitative limitation of student intake to British medical schools. At the same time it does not think that positive steps need to be taken now to increase intake, because adjustment will occur without this.

The Committee thinks that some of the factors which could influence future requirements might conceivably be less difficult to assess in a few years' time, and that the Departmental Committee should consider postponing, perhaps for five years, a forecast of long-term requirements. Finally, the Committee thinks that it would be valuable to keep up-to-date the statistical information collected for the present inquiry and to keep the situation under periodic review.

HOSPITALITY

A French doctor's son, aged 19, would like to spend 12 days at Christmas with a British family, either on an exchange or paying guest basis.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

S.H.M.O. GROUP COUNCIL

The S.H.M.O. Group Council met on October 21 under the chairmanship of Mr. G. Waring Robinson, the main business being to consider a report on the work of its Group Executive Committee during the past twelve months.

Representation on Other Committees

The Executive Committee had appointed Dr. T. F. McCarthy and Dr. J. H. Thomas as its representatives on the Central Consultants and Specialists Committee, with Mr. G. Waring Robinson and Dr. T. Reeves as deputies. Mr. G. Lowe had been appointed as an observer on the General Medical Services Committee. The Scottish Central Consultants and Specialists Committee had agreed to include two S.H.M.O. representatives in its personnel.

Liaison with C.C. and S. Committee

The Executive Committee reported that it had informed the Central Consultants and Specialists Committee that it could not accept a proposal to become a subcommittee of the Central Consultants and Specialists Committee, but, with the object of increasing the liaison between the two, it suggested that a representative or observer of the Group should be included in the personnel of the Executive of the Central Consultants and Specialists Committee. This had not been approved by the C.C. and S. Committee, but it had been approved by the Group would give an assurance that representatives of the Group would be invited to its Executive's meetings for the discussion of any items of particular interest to S.H.M.O.s. The C.C. and S. Committee had made the alternative suggestion that it should appoint representatives on the Group Council.

The Group Council agreed to this suggestion.

Remuneration

The Group Council noted with approval that the principle that S.H.M.O.s' remuneration should be 80% of that of consultants had been agreed to by the Central Consultants and Specialists Committee at its meeting on October 3.

S.H.M.O.s in Consultant Posts

It was reported that in response to a notice in the *Supplement* (February 9, p. 60), some 930 S.H.M.O.s had applied for consideration of their claim for payment on the consultant scale. Examination of the applications was now well advanced.

Royal Commission

The Executive Committee had informed the Central Consultants and Specialists Committee that it fully supported the general claim for an increase of 24% in remuneration and that, as the S.H.M.O. grade was not specifically included within the scope of the Spens Report, it wished to put forward a plea for special consideration of the position of the grade in the remuneration structure. It was further reported that suggestions which the Executive Committee had put forward for modifying the preliminary statement of evidence to the Royal Commission had been accepted by the C.C. and S. Committee, and that an assurance had been given that the Group Executive Committee would be enabled to present its own statement for submission to the Royal Commission later in the year.

The Group Council requested its Executive Committee to proceed with the drafting of the S.H.M.O.s' case.

Future of S.H.M.O. Grade

The Group Executive Committee had followed closely the negotiations between the Joint Consultants Committee and the Ministry of Health on the future of the S.H.M.O. grade and had been given an opportunity of discussing the matter with the Joint Committee. The Group Executive Committee's representatives had informed the Joint Consultants Committee that in its view two things were

essential: (1) there should be a review not only of consultant posts, but also of those occupied by S.H.M.O.s and senior registrars; and (2) there should be an appropriate ratio between the number of consultants and those in intermediate grade posts.

The Joint Consultants Committee had stated that it appreciated the problems of the S.H.M.O. grade, and the views expressed on behalf of the Group Committee were substantially in accord with those of the Joint Consultants Committee itself. So far no proposals had emanated from the discussions between the Ministry and the Joint Committee which the Joint Consultants Committee felt could usefully be put to its constituent bodies for consideration.

Survey

The Group Council passed a vote of thanks to the Chairman for undertaking a survey, covering some 200 individuals selected at random, of the qualifications of S.H.M.O.s, from which valuable information was obtained. Analysis of the first 140 replies to a questionnaire revealed, among other things, that 52.1% held high qualifications, 45% held specialist diplomas, 17.1% held both, and 80% held one or the other; 20% had only specialist experience; 47.9% had written original articles, 39.3% had carried out research, 32.1% had done both, and 55% had done one or the other.

Vacancies on Executive Committee

A ballot at the Group Council meeting to fill four vacancies on the Group Executive Committee, caused by retirement on completion of members' term of office and casual vacancies caused by the resignation of two members who had taken up appointments overseas, resulted in the re-election of Drs. J. A. Rankin, J. F. Swan, T. Reeves, and Mr. G. Lowe, and the election of Drs. A. D. Gray and W. J. Wilson, both of whom had previously served on the Committee as co-opted members.

Correspondence

Because of heavy pressure on our space correspondents are asked to keep their letters short.

Mass Radiography and Medical Officers

SIR,—Dr. F. H. Tyrer draws attention to the anachronistic situation created by the Ministry of Health's instructions to directors of mass miniature radiography units that they may not disclose the result of an employee's examination to the medical officer of his employing organization, notwithstanding the patient's specific consent. Dr. Tyrer's communication should be noted by all with an interest in medical ethics.

There is an odd belief still existing in some circles (including seemingly the Ministry of Health) that we industrial medical officers are divorced from the observance of medical ethics, and that we do not respect professional conduct. Nine times out of ten it is the industrial medical officer himself who arranges the examination and who, by virtue of his status, is able to persuade his management to provide facilities for the unit to operate. There is no ill-feeling to be found between units and industrial medical officers; on the contrary, but many firms, including some of the largest in the country, find this pettifogging intrusion into normal professional relations so irksome and such a negation of the value of a radiological survey that they prefer to spend considerable sums on private mass radiography services, where the reports are sent first to the medical officer. These private surveys, in my experience, produce more volunteers than do unit surveys—some indication of the confidence felt by employees in their medical officer's ethics. Needless to say, he, in his turn, reports abnormal findings to the

employees' private doctors, but not to the employer. It is high time for the Ministry to face realities.—I am, etc.,
Isleworth, Middx.
GERALD OLLERENSHAW.

Obstetric House Appointments

SIR,—May I, through the courtesy of your columns, draw attention to the disparity between the demand for, and the supply of, recognized obstetric house appointments? With as many as 30 applicants for each post it is not unusual for one to spend three months and attend six or more interviews before being successful. It is not my purpose to bemoan the fact, but rather to invite those with the necessary access to the official mind to take active steps to stop a regrettable waste of doctor-power. A variety of solutions is obvious. The lack of interest, drive, and initiative to institute them is, alas, equally obvious.—I am, etc.,
Birmingham.

Branch and Division Meetings to be Held

BARNESLEY DIVISION.—At Beckett Hospital, Barnsley, Friday, November 22, 8 p.m., clinical evening.

BIRMINGHAM DIVISION.—At Birmingham Medical Institute 36, Harborne Road, Edgbaston, Tuesday, November 19, 8.30 p.m., meeting. Dr. V. H. Springett: "Eradication of Tuberculosis—How Long?"

BLACKBURN DIVISION.—At the White Bull Hotel, Blackburn, Tuesday, November 19, 8.15 p.m., meeting. B.M.A. Lecture by Professor C. A. Wells: "Oesophageal Reflux and Stenosis in Dyspepsia and Dysphagia."

BRADFORD DIVISION.—At Out-patient Department, Bradford Royal Infirmary, Tuesday, November 19, 8.15 p.m., clinical meeting in conjunction with Bradford Medico-Chirurgical Society.

CAMBERWELL DIVISION.—At Dulwich Hospital, East Dulwich Grove, S.E., Thursday, November 21, 8.45 p.m., meeting. Address by Sir Francis Walshe: "The Roles of the Doctor, the Lawyer, and the Injury in the Production of the Traumatic Neurosis."

CARDIFF DIVISION.—At Park Hotel, Cardiff, Wednesday, November 20, 8 p.m., supper meeting for members and their ladies. Address by Mr. G. C. Diamond: "The State Educational System and the Changes that are Being Advocated."

CLEVELAND DIVISION.—At Hinton's Café, Corporation Road, Middlesbrough, Thursday, November 21, 7.30 p.m., supper meeting. B.M.A. Lecture by Professor J. Chassar Moir: "Shock and Sudden Death in Obstetric Practice."

DARTFORD DIVISION.—At Bow Arrow Hospital, Dartford, Tuesday, November 19, 8.30 p.m., meeting. Dr. M. O. J. Gibson will talk about some of the cases seen in the non-tuberculous unit of the Hospital. Lantern slides will be shown.

DUDLEY DIVISION.—At Nurses' Lecture Theatre, Guest Hospital, Dudley, Tuesday, November 19, 9 p.m., A.G.M.

DUMFRIES AND GALLOWAY DIVISION.—At Cresswell Maternity Hospital, Dumfries, Sunday, November 17, 3 p.m., meeting. Address by Dr. J. L. Halliday: "Persons and Their Illnesses."

GLASGOW DIVISION.—At Royal Faculty of Physicians and Surgeons of Glasgow, 242, St. Vincent Street, Friday, November

22, 8 for 8.30 p.m., meeting. Address by Dr. A. Rae Gilchrist: "Coronary Thrombosis."

GRIMSBY DIVISION.—At Royal Hotel, Grimsby, Tuesday, November 19, 8.30 p.m., meeting. Lecture by Mr. Patrick Clarkson: "The Breast in Art, History, and Religion," with a note on the Contribution of Plastic Surgery. All medical practitioners in the area of the Division are invited.

HALIFAX DIVISION.—At Old Cock Hotel, Halifax, Wednesday, November 20, 8 for 8.30 p.m., annual supper. Guest, Mr. B. W. Little (Coroner to Halifax).

HUDDERSFIELD DIVISION.—At Whiteley's Ballroom, Huddersfield, Friday, November 22, 8.30 p.m. to 1.30 a.m., annual B.M.A. dance.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Macclesfield Arms Hotel, Wednesday, November 20, 8 for 8.15 p.m., dinner. A talk will follow: "The Wolfenden Report—Medical, Legal, and Moral Aspects." Guest speakers, Dr. N. J. de V. Mather, Mr. J. Shorrocks, Mr. H. Briggs, and the Reverend E. Mercer. A discussion will follow.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, November 19 (1) 2.30 p.m., practitioners' round. Dr. R. Kempthorne: medical cases, including cardiac. (2) 8.45 p.m., meeting. Paper by Mr. Anthony Green: "New Views of Radiotherapy, Moving Beam Therapy, and Certain Aspects of Isotopes," accompanied by film on moving beam therapy and demonstration of isotopes by Dr. W. A. Jennings.

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle upon Tyne, Thursday, November 21, 7.15 p.m., clinical demonstration in the Out-patient Department; 8.30 p.m., round table discussion on the Care of the Long-term Sick. Chairman, the Lord Bishop of Newcastle; speakers the Rev. L. H. Allison, the Rev. J. R. Dean, Dr. T. H. Bates, and Dr. N. D. Gofton.

NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Monday, November 18, 7.30 p.m., meeting of North Midland Local Association of British Optical Association, to which B.M.A. members in the area of the Division are invited. Lecture by Dr. H. King: "The London Planetarium."

NOTTINGHAMSHIRE BRANCH.—At Portland Building, Nottingham University, Wednesday, November 20, 7.30 for 8 p.m., annual dinner.

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, November 18, 9 p.m., meeting. Dr. M. C. G. Isaacs: "Management and Diagnosis of Some Bleeding Diseases."

READING DIVISION.—At Phyllis Court, Henley-on-Thames, Wednesday, November 20, 7.30 for 8 p.m., annual dinner-dance.

REIGATE DIVISION.—At Burford Bridge Hotel, Boxhill, Friday, November 22, 7.30 for 8 p.m., annual dinner and dance.

ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Thursday, November 21, 8.30 p.m., combined meeting with Hampstead Division. Lecture by Dr. E. Mildred Creak: "Problem of Backwardness." Members of the City Division are invited.

SALFORD DIVISION.—At Park Hotel, Monton Road, Monton, Tuesday, November 19, joint meeting with members of Salford and District Section of East Lancashire and East Cheshire Branch, B.D.A. 7.30 for 7.45 p.m., dinner. General discussion to be introduced by Dr. I. H. Heslop and Dr. F. M. Rifkin: "Medical-Dental Relationship in General Practice."

SCARBOROUGH DIVISION.—At Board Room, Scarborough Hospital, Thursday, November 21, 8.30 p.m., meeting. Lecture by Professor G. A. Smart: "Functions of the Adrenal Cortex."

SOUTHAMPTON DIVISION.—(1) Wednesday, November 20, at Royal Hotel, 7 p.m., dinner; at Conference Room, Civic Centre, Southampton, 8.30 p.m., general meeting. Address by Professor John McMichael, F.R.S.: "Hypertension." (2) At St. Mary's Church, St. Mary's, Southampton, Sunday, November 24, 11 a.m., service for doctors and their families.

SOUTH ESSEX DIVISION.—At Nurses' Lecture Room, Oldchurch Hospital, Romford, Friday, November 22, 9 p.m., meeting. Lecture by Mr. Peter Martin: "Vascular Surgery." His film will also be shown.

SOUTH-WEST WALES DIVISION.—At Mariners Hotel, Haverfordwest, Saturday, November 23, 7 p.m., dinner; 8.15 p.m., meeting. Mr. Emlyn E. Lewis: "Some Aspects of Plastic Surgery and the Treatment of Burns" (illustrated by lantern slides).

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Friday, November 22, 9.15 p.m., meeting. Address by Dr. Paul Davison: "Management of the Cardiac Patient."

SWANSEA DIVISION.—At Langland Bay Hotel, Thursday, November 21, 7.15 for 8 p.m., annual dinner. Chief Guests, Mr. H. Edmund Davies, Q.C., and Dr. A. Macrae (Secretary, B.M.A.).

WANDSWORTH DIVISION.—Sunday, November 24, 10.30 a.m., visit to the Fountain Hospital.

WEST MIDDLESEX DIVISION.—At Acton Technical College (new building), W., Tuesday, November 19, 8 p.m., joint meeting with B.D.A. Talk by Dr. A. A. Mason: "Present Position of Hypnosis in Medicine and Dentistry." A short sound film will be shown.

WIGAN DIVISION.—At Lewis' Restaurant, Wallgate, Wigan, Thursday, November 21, 8 p.m., meeting; 8.30 p.m., buffet supper; 9.15 p.m., lecture by Dr. C. A. Clarke: "Genetics in Clinical Medicine."

WINCHESTER DIVISION.—At the Royal Hotel, Winchester, Saturday, November 23, 7 p.m., annual meeting; 8 p.m., dinner. Guest of Honour, Dr. Ian D. Grant, who will talk on "The Need for Unity in the Profession."

I. INTRODUCTION

1. The British Medical Association

1. The British Medical Association is a voluntary organization of over 71,000 members, all registered medical practitioners engaged in various forms of practice at home and overseas. It therefore speaks with authority for all branches of the profession.

2. The Council of the Association has of course obtained the views of those Standing Committees—the Central Consultants and Specialists Committee and the General Medical Services Committee—which have special responsibilities in the fields of hospital and general practice.

3. The Central Consultants and Specialists Committee is a Standing Committee of the Council. It is in addition the central body of a comprehensive organization representative of all consultants and hospital medical staffs. It con-

sists of representatives of committees set up in each of the hospital regions which in their turn represent the senior medical staff—consultants and senior hospital medical officers—of the teaching and non-teaching hospitals in the region. It also includes representatives of registrars and of certain specialist groups—for example, in anaesthetics, orthopaedics, radiology, etc. Thus this nation-wide organization represents some 18,000 members of hospital medical staffs working in the National Health Service.

4. The General Medical Services Committee is likewise a Standing Committee of the Council, and is also the Executive of the Annual Conference of Representatives of Local Medical Committees which considers matters affecting all practitioners—whether members of the Association or not—providing general medical services under Part IV of the National Health Service Acts. In this way the General Medical Services Committee represents some 23,000 princi-

pals and assistants engaged in National Health Service general practice in the United Kingdom.

5. The constitution of these two Standing Committees of the Council places the Association in a unique position and enables it to speak with particular authority on behalf of all members of hospital medical staffs and all general practitioners on the matters now under review by the Royal Commission.

2. Preliminary Statement of the Association's Views

6. The Royal Commission has on more than one occasion expressed its intention to proceed with its task as speedily as possible, and the Council is therefore anxious that a preliminary statement of the Association's views on the general issues involved should be submitted to the Commission with the least possible delay.

7. In the main, this preliminary statement outlines the history of the profession's negotiations with the Government; sets out the basis and amount of the present remuneration claim, and describes the training, duties, and responsibilities of doctors who are engaged in hospital and general practice under the National Health Service.

8. The Commission will no doubt subsequently require evidence on more detailed matters within its terms of reference, and it is the Council's intention to submit further memoranda on a number of subjects not covered by this preliminary statement. These will include more detailed evidence, for example, upon the position of junior hospital staff, senior hospital medical officers and registrars, medical superintendents, administrative medical staff of regional hospital boards, ophthalmic medical practitioners, medical officers in the Public Health Service, and university teaching staff. The Council will make also known its views on that part of the Commission's remit which deals with arrangements to keep remuneration under review. Memoranda on these and other matters will be submitted by the Council with the least possible delay.

3. The Government's Obligation to the Profession

9. The history of the remuneration dispute and the events which led to the appointment of the Royal Commission are fully set out in later sections and in the various appendices to this memorandum, but the Council wishes to place on record in this introductory section that in deciding to give evidence before the Royal Commission the profession does so without prejudice to its right to press for the fulfilment of the Government's clear moral obligation to honour the promises made to the profession when it entered the National Health Service on the appointed day.

10. The Council does not believe that any useful purpose would be served by indulging in recriminations, however justified, over the tactless and high-handed manner in which the Government has dealt with the profession's claim. Whatever its legal position may be, the profession's moral rights are unassailable, and the Council cannot but contrast the treatment so far meted out to the medical profession with the alacrity shown by the Government in recent years in meeting its obligations to many other sections of the community, particularly those who are in a position to bring pressure to bear in support of their claims. The nature and traditions of medicine are such that the profession is reluctant to resort to measures used in other spheres in support of remuneration claims, and there can be little doubt that this fact has influenced the attitude adopted towards it. Against this background, notwithstanding its decision to give evidence to the Royal Commission, the Council must make its own attitude to the Government's definite obligations quite clear.

4. The Royal Commission's Terms of Reference

11. The Council wishes to draw attention to the developments which have taken place since the Royal Commission

was appointed on February 28, 1957, with the following terms of reference:

To consider:

(1) how the levels of professional remuneration from all sources now received by doctors and dentists taking any part in the National Health Service compare with the remuneration received by members of other professions, by other members of the medical and dental professions, and by people engaged in connected occupations;

(2) what, in the light of the foregoing, should be the proper current levels of remuneration of such doctors and dentists by the National Health Service;

(3) whether, and if so what, arrangements should be made to keep that remuneration under review;

and to make recommendations.

12. Firstly, the Commission itself made the following public statement on April 12, 1957:

In view of doubts cast on the interpretation of the terms of reference, the Royal Commission have given urgent consideration to this matter, and think it may be convenient if they announce publicly how they have decided to proceed. They have shown this statement to the sponsoring Ministers, and they understand that it is wholly consistent with the intentions formed by the Government when advising the appointment of the Royal Commission.

1. The Spens Reports and the Danckwerts Award will be studied by the Commission, and also the Reports of any other Commissions and Committees in so far as they are relevant to the circumstances of the medical and dental professions and to the relationship of those professions to the community as a whole.

2. The Commission will bear in mind the need for maintaining a proper level of recruitment to the medical and dental professions in competition with other callings, and will consider evidence as to conditions imposed by the nature of the work.

3. The phrase "other professions" will be interpreted widely so as not to exclude, for example, science and other graduates in industry at all levels.

4. The Commission are not asked to recommend remuneration for doctors and dentists employed by local authorities; but these doctors and dentists are among the "other members of the medical and dental professions" on whose remuneration evidence will be received for purposes of comparison.

5. "Other connected occupations" cover a wide range of persons, including on the one hand hospital administrators, and on the other, nurses and medical auxiliaries, whose remuneration will be considered with special reference to differentials.

6. The Commission will in the light of all this and any other relevant evidence recommend such "current levels of remuneration" as appear to the Commission to be justified.

7. The Commission's duty to recommend current levels of remuneration calls for recommendations covering, for example, average incomes and the desirable spread between extremes; but it does not call for the construction of detailed schemes of distribution.

8. After consideration of the desirable current levels of remuneration for doctors and dentists, the Commission will consider whether, and if so what, arrangements should be made to keep that remuneration under review.

In a separate notice the Royal Commission are asking all interested persons or organizations to offer evidence. Preliminary inquiries have shown that the preparation of this evidence will take some of the bodies concerned considerable time. The Commission are anxious to complete their task with the utmost speed consistent with thorough examination of all the relevant issues, and hope that all written evidence and submissions to the Commission will be in their hands within the next three months.

Secondly, on April 23, 1957, the Chairman of the Commission offered the following additional statement:

That part of the Royal Commission's task that consists of considering what should be the proper current levels of remuneration of Doctors and Dentists will include hearing submissions from those professions as to the remuneration which they are now claiming.

Thirdly, the following exchange of letters took place as the result of an interview between the Chairman of Council of the Association and the Minister of Health on April 26:

Dear Mr. Vosper,

Dr. Wand asks me to say that he will be extremely grateful if you can find it possible to send him a letter by hand to-day, addressed to B.M.A. House, to confirm the assurance you gave him yesterday afternoon, which I understand was in the following terms:

"Following the Report of the Royal Commission there will be full consultation with the profession before implementation of any of its findings, such consultation to include any other matters relevant to the Report or to the present dispute."

Dr. Wand would be grateful also if you could now assure him that the terms of the Public Statement issued by the Royal Commission will be regarded as prevailing over the Terms of Reference as originally drafted.

Finally, Dr. Wand would greatly appreciate any observations you may be able to offer as a result of your further consideration of the position of the Public Health medical officers in relation to the Royal Commission.

Dear Dr. Wand,

I was glad of the opportunity of a long talk with you yesterday and I hope you feel—as I do—that it is that kind of in-day and I hope you feel—as I do—that it is that kind of in-day formal and personal discussion which does most to clear away misunderstandings.

First, let me confirm what I said to you when I assured you that, following the report of the Royal Commission, there will be full consultation with the profession before implementation of any of its findings and that such consultation could of course include any matters relevant to the report or the present dispute.

Second, you seemed to fear some inconsistency between the terms of reference of the Commission and the public statements issued by its Chairman. I can certainly reassure you here too. It is normal that the interpretation of the terms of reference of a Royal Commission should be a matter for its Chairman and the Commission, and you can certainly regard the public statements which have been issued as having full validity.

Finally, I have thought—as you asked—about the position of the public health medical officers. I cannot add anything of substance to what I said in my letter of April 17 on this, but let me repeat that I am sure that any settlement for others, following the Commission's report, could not fail to be taken into account in considering the position of these officers and any claim through the normal machinery would of necessity be considered in the light of the report and of any settlement subsequent to it.

I do hope that these remarks, and our talk yesterday, will help to rid us of unnecessary apprehensions.

13. The Council still maintains that the dispute on remuneration ought to have been settled by the accepted methods of negotiation and arbitration. This is by no means the first occasion upon which the Government and the profession have been in dispute on levels of remuneration from public sources. Since the inception of the National Health Insurance scheme in 1911 there have been repeated disagreements on levels of remuneration, and in 1946 the first of the two Spens Committees was set up to determine what should be the proper remuneration of general practitioners in a nationally organized service. The Spens Committee corroborated the profession's view that for National Insurance patients general practitioners had been seriously underpaid for very many years, and in point of fact this underpayment has never been made good. In 1952 the Danckwerts Adjudication endorsed the profession's claim for a substantial increase in remuneration to implement the Spens recommendations and in this instance made the proper adjustment for the underpaid years of the new comprehensive Service. As will be shown later, a similar disagreement occurred after the publication of the Spens Report for hospital medical staffs in 1948 and also before certain adjustments were made in 1954.

14. In the case of the present claim, however, the Government refused either to negotiate or refer the matter to arbitration, and the Council therefore takes the view that the dispute can only be satisfactorily resolved by the Commission

if its recommendations are determined in the light of all that has happened in the past, particularly the Government's promises to the profession following the publication of the Spens Reports. This view would seem to be supported by the Commission's interpretation of its remit as set out above.

15. Later sections of this memorandum set out in detail the circumstances in which the profession agreed to take part in the National Health Service.

16. It must, however, be stressed that a proper implementation of the Spens Reports is fundamental to the Association's case. It was the Government's decision to set up the Spens Committees. The profession warmly supported this decision and accepted the principles and recommendations of the two Reports, has continued to stand by them, and sees no reason to depart from them. Nor must it be overlooked that in the case of general practitioners the Permanent Secretary to the Ministry of Health in a letter addressed to the Association on May 2, 1950, stated:

"The Minister agrees that the Spens Report remains the basis of the remuneration of general medical practitioners until such time as after the usual consultations some other basis is substituted."

This statement makes it clear that until some other basis is agreed with the profession the Spens principles must stand.

17. Indeed, the principles laid down by the two Spens Reports were a sheet anchor for the profession in the difficult transition from private to public practice inasmuch as—after a thorough review—they determined what should be the proper "social and economic status" of the medical profession in the community as a whole. Had there been no National Health Service individual members of the profession would have kept their place in the community by the normal practice still open to other self-employed persons—namely, by adjusting fees and prices to meet the altered circumstances brought about by changes in the value of money. The certainty that this method of adjustment would not be possible in a public service was clearly in the minds of those who drafted the General Practitioner and Consultant Spens Reports, and was the reason for their recommendation (paras. 6 and 2 respectively) that their findings would fail to maintain the status of and recruitment to the medical profession unless adjustments were made from time to time to meet changing conditions. The Government for its part accepted the Spens principles and has at no time advanced any convincing reason for discarding them. True, it has disputed the amount of the adjustment required in an inflationary era, and so far as the Council is concerned that is the only matter now in dispute.

18. The Council therefore submits that any radical departure from the principles laid down by the Spens Committee would be a breach of the undertaking given by the Government and would remove the only safeguards open to the profession whereby its status and powers of recruitment can be ensured.

19. The Council, having made its position quite clear on these major questions of principle, recognizes that the Commission will need to have the fullest possible account of the events which have led up to the present situation. The following paragraphs and appendices to this memorandum set out the history of the Association's dealings with the Ministry on remuneration and elaborate the arguments in favour of maintaining the place of the medical profession vis-à-vis the community as a whole.

II. PAST HISTORY—THE SPENS REPORTS AND PRESENT LEVELS OF REMUNERATION

20. In order that the present dispute may be judged objectively it is necessary to go back in history to the points at which the present agreed bases of remuneration in the two fields emerged—the Reports of the Spens Committees on the remuneration of consultants and specialists and on the remuneration of general practitioners. Although both general practitioners and hospital medical staffs are now on

common ground in their approach to the problem, up to 1956 these two branches of the profession negotiated with the Government independently of each other and levels of remuneration in each field developed quite separately. This was perhaps inevitable, for they emanated from two separate sets of recommendations which were published independently and at an interval of two years. Moreover, different channels of negotiation existed in the two fields of practice. This section of the Council's memorandum is therefore devoted to an account of the negotiations which took place in each field prior to 1956 to secure the implementation of the recommendations of the two Spens Committees.

A. GENERAL PRACTITIONERS

1. The General Practitioner Spens Committee

21. The proposals for a comprehensive National Health Service carried with them many implications for general practitioners who had hitherto practised medicine mainly free of Government control and who were then, in common with all other professions, free to seek their own level of remuneration by arrangement with the individual patient. True, there existed the old National Health Insurance Scheme, but this catered for less than half of the population and provided considerably less than half of the general practitioners' total income. For the most part, remuneration did not depend upon public funds.

22. The establishment of a National Health Service and the acceptance of the principle of collective responsibility have virtually led to a State monopoly of general medical practice, and the opportunities for practice outside the Service have now become almost negligible. Indeed, the fact that almost the whole population have now signed on the lists of general practitioners in the National Health Service is proof not only of the way in which general practitioners have fulfilled their part of the contract and of the value of their services, but of the complete dependence of the profession on the Government, which has a clear duty to ensure that doctors do not suffer financially just because their opportunities outside the Service are now so few. All this was envisaged by the Association during the discussions with the Government preceding the appointed day, when it was agreed that there must be some equitable basis upon which doctors could participate in the National Health Service. Furthermore, there was a vital need to ensure that the Service would continue to attract a sufficient number of recruits of the right calibre to its ranks.

23. There was no lack of encouragement on the part of the profession to a comprehensive health service. Indeed, the need has been stressed by the Association on many occasions and the views of its Medical Planning Commission were quoted by Lord (then Sir William) Beveridge in his report in 1942 as being in accord with his own assumption that a comprehensive health service would be an integral part of any scheme of social security. Nevertheless, remuneration apart, many important principles were involved in the transition from private to public practice, and general practitioners had to be mindful both of the interests of their patients and of their own future when the new scheme was being evolved.

24. From their own viewpoint general practitioners welcomed the Government's decision to set up a Committee under the chairmanship of Sir Will Spens, with the following terms of reference:

To consider, after obtaining whatever information and evidence it thinks fit, what ought to be the range of total professional income of a registered medical practitioner in any publicly organized service of general medical practice; to consider this with due regard to what have been the normal financial expectations of general medical practice in the past, and to the desirability of maintaining in the future the proper social and economic status of general medical practice and its power to attract a suitable type of recruit to the profession; and to make recommendations.

25. The profession gave its wholehearted support and co-operation to the General Practitioner Spens Committee

which reported in 1946 (the report is set out in Appendix I), and its recommendations were accepted without reservation by both the profession and the Government. The latter, in addition to public statements, wrote to the Association on July 22, 1946, in the following terms:

The Minister desires to make his attitude to the Spens Report quite clear. He fully accepts the substance of the recommendations upon the general scope and range of remuneration which general practitioners should enjoy in a public service.

26. It was on the basis of this clear assurance that general practitioners agreed to enter the National Health Service on July 5, 1948.

2. Implementation of the General Practitioner Spens Report

27. Once agreement had been reached on the basic principles upon which general practitioners were to be remunerated in the National Health Service, it became necessary first to translate those principles into terms of the global sum of money necessary to give effect to them, and, second, to calculate the amount which should be added to that global sum to take account of the fall in the value of money and the increases which had taken place in the remuneration of other professions since 1939.

28. The first task did not prove difficult. With the co-operation of the Government the necessary calculations were made and agreement reached that the required sum to give effect to the Spens recommendations in terms of the 1939 value of money and in respect of the 17,900 principals in general practice in 1939 was £19.89m., plus £11.35m. for practice expenses, making a total of £31.24m.

29. The second task, however, led to a protracted dispute upon the correct adjustment to be made in the light of the following paragraph (para. 6) of the Spens Report:

We leave to others the problem of the necessary adjustment to present conditions, but we would observe in this connexion that such adjustment should have direct regard not only to estimates of the changes in the value of money but to the increases which have in fact taken place since 1939 in incomes in other professions. In our judgment it is only if corresponding changes are made in the incomes of general practitioners that the recruitment and status of their profession will be maintained as against these professions.

30. Eventually, the Ministry proceeded to make various arbitrary adjustments to the agreed global sum. In particular, in what it alleged to be in conformity with the Spens recommendations, it imposed an arbitrary betterment factor which the Danckwerts Award subsequently proved to be grossly inadequate.

31. The Council maintained from the start that the Government's method of calculating the global total of general practitioner remuneration could not implement the Spens recommendations. The betterment factor arbitrarily applied was obviously much too low, having regard to both changes in the value of money and the increases which had taken place in the incomes of other professions. Furthermore, in the year 1948-9, 18,812 doctors were being asked to share the adjusted remuneration applicable to 17,900 general practitioners pre-war. In spite of this, subsequent negotiations with the Ministry of Health proved completely abortive.

32. It is pertinent at this stage to draw attention to yet another assurance of the Government's intention to implement the Spens recommendations, for in the House of Commons on January 21, 1949, the Parliamentary Secretary to the Ministry of Health said:

I say to the House quite seriously that when the final payments for the period July 5 last to March 31, 1949, have been made we shall then be able to see whether the remuneration of general practitioners does, in fact, accord with the Spens recommendations. If it does not, the arrangements will be reviewed to see what adjustments are necessary to give effect to those recommendations.

3. The Danckwerts Adjudication

33. Finally, after some four years of fruitless discussion had failed to produce any offer of a reasonable settlement, the Ministers agreed to the submission of the dispute to an independent arbitrator. Mr. Justice Danckwerts accepted this appointment, and his terms of reference, agreed by both parties, were as follows:

To determine the size of the Central Pool, after taking account of remuneration from all other sources received by general practitioners, in order to give effect to the recommendations of the Spens Committee, having regard to the change in the value of money since 1939, to the increases which have taken place in incomes in other professions, and to all other relevant factors.

34. Once again the Government reiterated their acceptance of the Spens recommendations as the basis of general practitioner remuneration in the National Health Service.

35. The Statement of Case submitted to the Adjudicator by the General Medical Services Committee of the Association is set out in Appendix II. This document sets out in detail the questions then in dispute which were not the Spens recommendations themselves but merely the method by which the Government had decided to implement them. It also provides a full history of events to that time.

36. The results of the adjudication justified the contentions which the Association had made in the course of its long and stultifying negotiations with the Government.

37. On every important issue the adjudicator found in the profession's favour.

38. He established two vital principles, (1) that the Central Pool was to be adjusted in relation to the number of doctors in the Service each year, and (2) that differential betterment factors for the years in question far in excess of the Ministry's arbitrary figure were to operate. In the financial years 1948-9 and 1949-50 the betterment factor was to be 85% and for the financial year 1950-1 it was to be 100%.

39. These principles which were so clearly established in the profession's favour provide judicial proof of the intentions underlying para. 6 of the Spens Report.

40. The amount due to the profession including arrears for the period July 5, 1948, to March 31, 1952, alone amounted to over £39m. The magnitude of the sum itself illustrates the extent of the injustice which had been perpetrated since the National Health Service came into being. The actual award made by Mr. Justice Danckwerts on March 24, 1952, is set out in Appendix III.

4. The Working Party on the Distribution of the Pool

41. To complete this account of events at that time, it must be emphasized that, although the recommendations of the Spens Committee were concerned both with the size of professional incomes to be shared by general practitioners in a publicly organized Health Service and with the spread of those incomes over the range of general practitioners engaged in the Service, Mr. Justice Danckwerts was asked to adjudicate only on the total sum required to give effect to the recommendations and not with the manner in which that total sum should be distributed among the individual practitioners or the various categories of practitioners indicated in the Spens Report.

42. The distribution of the new total sum available was, at the Government's insistence, the subject of an independent and separate inquiry, undertaken by a Working Party consisting of representatives of the Ministry of Health, the Secretary of State for Scotland, and the General Medical Services Committee of the Association.

43. Both the Ministry and the General Medical Services Committee agreed that the determination of the total sum required to give effect to the Spens recommendations was a matter which should be kept separate and distinct from the question as to how that total sum was to be distributed among the general practitioners concerned. This is borne out by the agreed terms of reference of the Working Party, namely:

To secure an equitable distribution of the Central Pool based upon the recommendations of the Spens Committee, the object being to enable the best possible medical service to be available to the public, and to safeguard the standard of medical service by discouraging unduly large lists; at the same time, to bring about a relative improvement in the position of those practitioners least favourably placed under the present plan of distribution, to make it easier for new doctors to enter practice, and to stimulate group practice.

44. The Working Party's report is set out in Appendix IV and forms the present agreed basis of distributing the existing Central Pool.

B. HOSPITAL MEDICAL STAFFS

1. The Consultant Spens Committee

45. Before the introduction of the National Health Service in 1948 consultants (apart from the relatively small number employed in local authority hospitals) received no remuneration from their hospital authorities, and depended for their professional income upon the fees from private practice.

46. With the decision to introduce a "free" hospital service which would to a large extent remove the consultants' source of income it was necessary to find a satisfactory basis for their remuneration in the National Health Service. In 1947 the Government set up a Committee, under the chairmanship of Sir Will Spens, with the following terms of reference:

To consider, after obtaining whatever information and evidence we thought fit, what ought to be the range of total professional remuneration of registered medical practitioners engaged in the different branches of consultant or specialist practice in any publicly organized hospital and specialist service; to consider this with due regard to what have been the financial expectations of consultant and specialist practice in the past, to the financial expectations in other branches of the past, to the necessary postgraduate training and medical practice, to the desirability of maintaining qualifications required and to the desirability of maintaining the proper social and economic status of specialist practice and its power to attract a suitable type of recruit, having regard to other forms of medical practice; and to make recommendations.

47. It was clear that the establishment of a National Health Service and the acquisition by the State of the overwhelming majority of hospitals throughout the country would lead virtually to a State monopoly of hospital practice, and the evidence given to the Spens Committee of the range of consultant income in 1938-9 stressed that the financial position of the hospital doctor in the future should be determined largely in relation to the position in the community he had attained under conditions of private enterprise. It was pointed out that if sight were to be lost of this important consideration it was likely to turn the attention of suitable entrants to other careers where financial reward is still dependent on personal effort and not subject to political considerations or to Government bargaining. Consultants gave their whole-hearted support and co-operation to the Consultant Spens Committee which reported in 1948 (the Report is set out in Appendix V).

48. The recommendations of the Consultant Spens Committee were accepted by both hospital medical staffs and the Government. The then Minister of Health (Mr. Bevan) stated in the House of Commons on June 3, 1948:

The Report will be available to Honourable Members, I hope, to-morrow afternoon. I should like to add that the Government accept the recommendations in principle. . . .

2. The Implementation of the Consultant Spens Report

49. The Consultant Spens Committee, like the General Practitioner Spens Committee, framed its recommendations in terms of the 1939 value of money, and its intentions for the future were clearly set out in the following extract from its Report:

We leave to others the problem of the necessary adjustments to present-day values of money, but we desire to emphasize as strongly as possible that such adjustments should have direct

regard not only to estimates of the change in the value of money but to the increases which have in fact taken place since 1939 in incomes both in the medical and in other professions. In our judgment it is only if corresponding changes are made in the incomes of consultants and specialists that the recruitment and status of the various branches of specialist practice will be maintained.

50. Since the Consultant Spens Committee completed its task in 1948 only a few months before the introduction of the National Health Service, it followed that there was no opportunity of negotiating terms and conditions of service for hospital medical staffs before the Service began. Hospital medical staffs therefore entered the Service on interim terms, relying on the assurance of the Government that it had accepted the Spens Report in principle and in the expectation that the Spens proposals would be implemented retrospectively and adjusted by the addition of an adequate betterment factor. In the meantime, the Joint Consultants Committee (a Committee established in 1948 by agreement between the Royal Colleges, the Scottish Corporations, and the British Medical Association, to enable negotiations with the Government on matters affecting the hospital and consultant services to be conducted by one professional body) and the Ministry of Health had embarked upon a series of discussions on draft terms of service offered by the department in the light of the Spens Report.

51. The Spens Committee recommended that there should be a basic incremental scale for consultants ranging from £1,500 to £2,500 and that in addition individual merit should be rewarded by means of special distinction awards. These awards of £500, £1,500, and £2,500 per annum were to be granted by the Minister on the advice of a national committee of doctors and laymen, 20% of consultants receiving the lowest award, 10% the second award, and 4% the highest award. All these recommendations were made in terms of 1939 values of money.

52. During 1948 and the early part of 1949 the Joint Consultants Committee was in dispute with the Ministry on a number of fundamental issues and did not feel able to advise consultants to enter into permanent contracts with their employing authorities. In July, 1949, the Ministry, intending no doubt to bring matters to a head, wrote to the Joint Consultants Committee in the following terms:

You will appreciate the impossibility of a situation in which consultants and specialists are continuing to be advised to postpone entering into contracts, while being assured by us that any solution will be retrospective for them. This is an aspect that we shall be bound sooner or later to review and we want you to help us to make any such review unnecessary by joining us in speeding the solution.

53. The Joint Consultants Committee thereupon sought and obtained a number of assurances from the Ministry which it was hoped would give a measure of protection to consultants in the future, and subsequently felt able to advise hospital staffs to enter into permanent contracts based upon the Terms of Service.

54. The terms offered by the Ministry in 1949 were approximately 20% above the incremental scale, but no betterment was attached to merit awards, which remained unaltered at the 1939 figure recommended by the Spens Committee. But worse was to come in 1954, for, as will be shown later, when hospital medical staff salaries were increased in that year a downward adjustment was made in the basic salary of consultants holding the highest or second merit awards, so that in effect these consultants suffered a reduction of £300 and £200 respectively in the value of these two awards. This inequity was increased still further in 1957, as the 5% interim payment for consultants did not apply to merit awards.

55. The Council is wholly opposed to this levelling down of the income of the most able members of the consultant profession, being of the opinion that the outstanding attainments and value to the community of this comparatively small group of consultants should be reflected in a high order of remuneration as in other walks of life.

56. Moreover, the Council believes that the special distinction awards system is an appropriate method of rewarding the more able members of the consultant section of the profession and of ensuring that a significant minority have an opportunity to earn incomes comparable with the highest which can be earned in other professions. Only in this way can the best possible recruits be attracted to consultant practice, and in the Council's view such a method is indeed necessary as an incentive to efficiency. The attachment of higher salaries to specific hospital posts would not be a satisfactory alternative. It would create a false distinction between the work of different hospitals, and would tend to operate against the policy of the Government, and of the profession, to promote the establishment of a consultant service of equal standard throughout the country.

57. It must be emphasized that at no time did consultants accept the 20% betterment factor arbitrarily imposed by the Ministry as implementing the Consultant Spens Report. The Government would not agree that in the Whitley machinery either party could go to arbitration without the consent of the other. This refusal has been continued to the present day. Consultants therefore have throughout had no right to arbitration on the implementation of the Consultant Spens recommendations, and, in common with the general practitioners at that time, they had no opportunity of contesting the Government's decision to impose an inadequate betterment factor.

3. The 1954 Award to Hospital Medical Staffs

58. Subsequently, in 1952, after the Danckwerts Adjudication had established that in the general practitioner field the betterment factor for the year 1950-1 should be at the level of 100% over 1939, the Staff Side of Committee B of the Medical Whitley Council lodged a claim for a similar betterment for hospital medical staffs. It was, however, rejected by the Government, which once again refused to submit the claim to arbitration. Indeed, it was not until 1954 that the Government decided to make an award to hospital medical staffs which had as its object a settlement of limited application—that is, that of protecting recruitment to the hospital service and of restoring to a limited extent, although not in precise terms of betterment, the balance between consultant and general practitioner remuneration which had been disturbed by the Danckwerts Award. Details of the 1954 Award for hospital medical staffs are set out in Appendix VI.

C. CONCLUSION

59. This historical survey of the profession's past negotiations with the Government shows—beyond all doubt—that both sections of the profession joined the National Health Service in 1948 on the basis of assurances by the Government that their future remuneration would be in accord with the principles set out in the two Spens Reports.

60. It also places on record that the Government's since it assumed responsibility for almost the whole of the profession's total remuneration has been reluctant to discharge its moral obligations, and such adjustments as have been made have only followed lengthy and bitter arguments and in one case a judicial arbitration. It is therefore not surprising that the Government's conduct over remuneration in the past has left the profession with little confidence in it as an "employer."

III. THE PRESENT REMUNERATION CLAIM

1. The 1956 Claim

61. With the settlement of these outstanding differences by Mr. Justice Danckwerts and in the case of hospital medical staffs but to a lesser extent the 1954 Award, the profession looked forward to a period of financial stability and the continued fulfilment of the terms upon which it entered the Service. Unfortunately as time went on and inflation progressed, it became increasingly obvious that neither the

100% betterment factor established by Mr. Justice Danckwerts nor the 1954 adjustment for hospital medical staffs was any longer sufficient to give effect to the Spens recommendations.

62. The Spens betterment factor depended upon two separate issues—variations in the value of money and the extent to which the remuneration of other professions had increased—and it became increasingly apparent to the profession that there had been substantial changes in both fields since the Adjudicator determined the issue in 1952, and that an overall increase in the size of the Central Pool and a corresponding adjustment in the remuneration of hospital medical staffs was necessary.

63. Some five years later the profession found itself in a situation where the value of its remuneration was again substantially below the standards laid down in the Spens reports. During these difficult years the profession had been reluctant, in view of the national situation, to press its case, but by January, 1956, it felt compelled to seek an adjustment in remuneration to enable doctors to keep abreast of the steep and continuing rise in the cost of living since April, 1951.

64. The Minister of Health was so informed on February 4, 1956, and a precise claim was submitted to the Ministry of Health on June 14 in that year (see Appendix VII).

65. Subsequently, following discussions with Ministers and at the Ministers' invitation, a supplementary memorandum was submitted on September 12, 1956, amplifying certain aspects of the claim (see Appendix VIII).

66. These documents set out the grounds for the profession's claim for an increase of not less than 24% in the remuneration of hospital medical staffs as at June, 1956. They also explain that, in claiming such an adjustment, the profession is doing no more than to seek the fulfilment of the Government's promises made to the profession when it agreed to enter the National Health Service in 1948.

67. Subsequent developments have not altered the Association's view that these obligations remain binding upon the Government.

2. The Claim Over the Period 1951-7

68. The main burden of the evidence is already available in the carefully reasoned documents submitted to Ministers in June and September last year. These documents, however, show the extent of the claim only up to April, 1956, and need revision in the light of subsequent developments which have still further worsened the profession's economic position. The following paragraphs (prepared by Professor R. G. D. Allen, C.B.E., M.A., D.Sc.Econ., Professor of Statistics in the University of London) bring the position up to date and set out concisely the present claim in terms of the percentage increases necessary in professional remuneration year by year from April, 1951, to October, 1957.

69. The changes which have taken place in the value of money over this period are best shown in reciprocal form, as increases in the price level as measured by the index number of market prices for all consumers calculated by the Central Statistical Office. The figures shown below are taken from the 1957 Blue Book on National Income and Expenditure. Since the index is only computed for calendar years, figures for months are to be obtained by interpolation and extrapolation by use of the Ministry of Labour index of retail prices.

Period	Price Index 1948 = 100	% Increase from April 1, 1951
Average 1950	105.9	111.0
April 1, 1951	114.6	9.2
Average 1951	121.2	11.4
" 1952	123.7	13.5
" 1953	126.0	17.4
" 1954	130.3	22.7
" 1955	136.2	
April, 1957	139.5	27.7
July, 1957	142.3	
October, 1957	143.2	

70. The percentage increases in prices from April 1, 1951, can now be expressed for financial years, by simple interpolation between calendar years:

Financial Year	% Increase in Prices from April 1, 1951
1951-2	4.7
1952-3	9.8
1953-4	11.9
1954-5	14.5
1955-6	18.7
1956-7	24.0
1957-8	29.0*

* Based on price index for October, 1957.

71. This set of figures represents the Council's claim—that is, the percentage increases in remuneration, year by year, required to give effect to the Spens recommendation on the decline in the value of money. In the first year (1951-2) following that covered by the Danckwerts award, remuneration should have been increased by nearly 5% to compensate for the decline in the value of money. This figure increases as shown until, in the current year (1957-8), the necessary increase is 29%.

72. Thus at the present time an increase of 29% is required to give effect to the recommendations of the Spens Reports. In addition the profession can equitably claim that the considerable underpayment of past years should now be made good.

73. A further memorandum by Professor Allen showing the changes which have occurred in the distribution of higher incomes over the period concerned appears in Appendix IX. This illustrates the Council's contention that there have been considerable changes in the distribution of higher incomes during the period now under review.

3. The Doctors' Contribution to the National Economy

74. All the arguments so far adduced merely show the extent to which the profession's relative position in society has fallen short of the standards applicable in 1948 and ignore any changes which have taken place in the economic position of the community as a whole.

75. It is common knowledge that the standard of living of many sections of the community has undergone a considerable upward change in the post-war years. The extent of this movement can best be measured by reference to the Government's own statistical evaluation of the increase which has taken place in the national income over the period concerned—the accepted method of computing changes in the community's economic well-being.

76. The following figures are from the 1957 Blue Book on National Income and Expenditure:

Gross Domestic Product, United Kingdom

	1949	1950	1951	1952	1953	1954	1955	1956
Aggregate product				1948 = 103				
By value (current factor cost)	107.0	111.0	123.5	136.0	144.8	153.9	163.6	176.2
By volume (1948 factor cost)	104.4	107.4	112.0	112.3	116.9	121.8	125.9	127.6
Working population†	100.0	100.8	102.0	102.3	102.6	103.9	105.0	105.8
Product per head								
By value (current factor cost)	107.0	110.2	121.1	133.0	141.2	148.2	155.9	166.5
By volume (1948 factor cost)	104.4	106.6	109.8	109.9	113.9	117.2	119.9	120.6

† Including armed Forces and unemployed; Ministry of Labour data.

†N.B.—Throughout this document figures relating to both the profession's claim and present levels of remuneration ignore the interim payments made by the Government earlier this year and require modification to that extent.

IV. LIFE, DUTIES, AND RESPONSIBILITIES IN MEDICAL PRACTICE

A. THE PLACE OF MEDICINE IN THE COMMUNITY

106. The various aspects of the problem so far dealt with in this memorandum have in the main been confined to the remuneration claim itself, and it is necessary to say something about a doctor's duties and responsibilities, and the contribution which medicine has made to the community.

107. The first concerns of medicine are maintenance of health, prevention of illness, and restoration of the sick. Modern developments in medical practice have brought great benefits to the patient, and the community has gained from the decreased incidence of disease, shorter periods of illness and incapacity, more and better working years, and a greater expectation of life. These benefits have developed over the years and existed long before the State became interested in and financially responsible for the health and welfare of its individual citizens.

108. With the introduction of the Welfare State medicine has come into increasing prominence as a factor in the national economy. The Beveridge Report laid down "that a comprehensive National Health Service will ensure that for every citizen there is available whatever medical treatment he requires." Also that as "a logical corollary to the payment of high benefits in disability that determined effort should be made by the State to reduce the number of cases for which benefit is needed." And again that the individual must "recognize the duty to be well." In the existing national economy the ambition to maintain and improve the standard of living is closely linked with the health of the nation as a whole and the individual in particular, and on these factors, as has been stressed elsewhere in this memorandum, a large measure of the productivity of the country depends. The responsibility placed on the medical profession at the present time is greater than it has ever been, for whilst there is still the accepted and direct duty of the doctor to his patient there is now a greater indirect responsibility for national health.

109. The medical practitioner has at times been referred to as a "technician." This is a complete misconception of the doctor's duties and responsibilities. It is true that medicine calls for the use of techniques, but the practice of a technique involves no more than the accurate repetition of a known procedure. Medicine, however, embraces far more than this and is at its best only if each case is viewed as a problem of the interaction of the variable factors of disease and the constitution of the individual patient.

110. A doctor working in the National Health Service is remunerated by the State for the services that he provides, but this does not necessarily represent the whole of his professional activity or his value to the community. A high standard of remuneration and satisfactory conditions of service are essential if sufficient recruits of the proper quality are to be attracted to medicine, and at the present time the relative attractions of other professions and occupations to a boy with scientific leanings have to be taken into account. Moreover, the comparative freedom of members of other professions to change employment or to move from one area to another must be weighed against the monopolistic control which virtually exists in medicine to-day and isolates doctors from such freedom. If the remuneration of the profession is progressively and relatively reduced there can be little incentive, other than that of vocation, for an entry into medicine. In other parts of the world where the salaries of the medical profession have been "pegged" during an inflationary period there has been a marked fall in quality of the entry of medical students.

111. The special responsibilities of a doctor, as compared with most professional men, need to be stressed. The medical practitioner is at all times on demand and accepts continuous responsibility for the medical care of his patients. He cannot definitely state that at any given time his work

will be finished, nor can he delegate any of his professional activities except to a colleague. The disruption of family life, as well recognized and interruptions are frequent. In spite of this every doctor has to keep abreast of current advances in medicine and to find time for reading and study. The tradition of medicine imbues its practitioners with a sense of responsibility and independence which must be encouraged and preserved.

112. Medicine will no doubt continue to gain recruits who are attracted by the interest and ideals of the profession, but many men of the type needed in medicine and who would have embarked on a medical career may fail to do so if the financial inducement is inadequate.

113. In the Council's view the difficulties of life in medical practice, the heavy and unique responsibilities entailed, combined with the length of training, place the doctor in a special position in the community—a factor which was clearly recognized by the Spens Committees and which formed the basis of their recommendations.

114. In the modern state those who practise medicine have a responsibility additional to their clinical work in relation to the individual patient. The vast fields in which medicine now plays a part are clearly indicated by the need for medical advice in so many State Departments and the impact of the medical angle in legislation. The practising doctor therefore in his daily work has to be fully alive to the broad social responsibilities of medicine. If the clinical practice of medicine is not maintained in a healthy and thriving condition, if its status is diminished, if its rewards are not such as to attract recruits of the right calibre, then the advice on which the community depends for future social progress is not long likely to remain of high quality.

115. The Council submits that the considerations which so greatly influenced the Spens Committees are unchanged to-day and cannot be disregarded in any assessment of the status and remuneration of the medical profession.

B. HOSPITAL MEDICAL STAFFS—DESCRIPTION, DUTIES, AND RESPONSIBILITIES

1. Structure of Hospital Medical Staffing

116. The hospitals in the National Health Service may be classified as follows: undergraduate and postgraduate teaching hospitals; general hospitals, providing a full range of specialist treatment; special hospitals, devoted to specific diseases—for example, cancer; mental hospitals; chronic sick hospitals; general practitioner (or cottage) hospitals; infectious disease and chest hospitals and sanatoria.

117. The cottage hospitals are staffed by general practitioners who for the most part use the beds therein to provide institutional treatment for patients who do not require specialist treatment, but who for medical or social reasons cannot so effectively be treated at home. Consultants are often attached to such hospitals to give advice at the request of the general practitioner, and in some of these hospitals some specialist services are available.

118. While the general pattern of medical staffing is similar in all hospitals with a consultant staff, that of the teaching and major non-teaching hospitals is necessarily modified because it is in them that the training of registrars and particularly senior registrars is usually conducted.

119. In the mental hospitals, and infectious diseases and tuberculosis sanatoria, a medical superintendent is normally appointed as the chief administrative officer of the hospital. Usually this officer has a mixture of clinical and administrative duties, though in a small number of cases his duties are solely administrative.

120. Members of hospital medical staff are engaged under contract with hospital authorities, and on a salaried basis, but their position *vis-à-vis* the hospital administration is unique. Upon the consultant, and through him the medical staff generally, rests the final responsibility for deciding upon the treatment of patients. Medical considerations are of primary importance in the treatment of hospital patients, and all hospital administration must be subservient to this end.

121. The clinical work of hospitals is carried out by doctors who fall into two groups—that is, permanent and temporary. University whole-time teaching staffs whose duties involve work in the hospital service usually have an honorary contract with the hospital board.

122. The senior medical staff are employed under so-called permanent contracts. With few exceptions (for example, the cottage hospital, in which general practitioners continue the treatment of their patients who need institutional care) the general responsibility for the treatment of patients in hospital wards and out-patient departments rests with consultants.

123. The only other senior permanent appointment on the hospital medical staff is the senior hospital medical officer. This grade, which is for medical staff who are not of "senior officers performing clinical duties" was introduced at the consultant status and not registrars, was introduced at the beginning of the service as a transitional grade for certain types of medical officer transferred from the ex-local authority hospitals, and for other doctors with limited qualifications, having experience or responsibility in a narrow field.

124. The grade was accepted by the profession on this understanding, but when the Ministry instructed hospital boards to appoint professional committees to review the grading of hospital staff prior to the offer of permanent contracts in the new service, it was found that the grade was widely used for the grading of medical men who had previously been undertaking hospital work with full clinical responsibility. Since the inception of the service many new appointments have been made in the grade following adoption of the document R.H.B. 50/96 of men with qualifications and experience equal to that of their consultant colleagues.

125. Appointments in the two senior grades may either be part-time with the right to engage in private or other practice, or whole-time.

126. Appointments are regarded as secure until the retiring age as defined in the Terms of Service, and a consultant or senior hospital medical officer has a right of appeal to the Minister of Health if he considers his appointment is being terminated unfairly. Alteration of contract is mainly occasioned by local reorganization of the hospital service. The Minister has laid on hospital boards a moral obligation to do all that they can to find suitable alternative work for consultants or senior hospital medical officers whose contracts are terminated, or whose sessions are reduced, but in practice the fulfilment of this moral obligation has given rise to certain difficulties.

127. The junior grades are regarded as temporary, with periods of tenure varying from six months to four years or more in the case of the senior registrar. House officer appointments are resident, as are also many registrar and senior registrar posts.

128. A more detailed description of the various grades is set out below.

2. Consultants

129. The hospital consultant stems from the hospital physician or surgeon whose origins are very far back in medical history, in fact to the time of the sixteenth and seventeenth centuries, when the Royal Colleges of Physicians and Surgeons were founded.

130. The different types of hospital physician and surgeon have multiplied in modern times so that there are now consultants practising highly specialized branches of their subject. Associated with these has steadily grown up a group of hospital consultants who are of similar professional attainments and whose work is ancillary to the bedside care of and responsibility for patients (for example, pathologists, radiologists, bacteriologists, and anaesthetists).

131. The postgraduate training for the potential consultant is long, exacting, and competitive. He will hold a series of house appointments immediately after qualification, and will then be appointed to posts of higher responsibility in

the registrar grades. He may be a registrar for two or more years, and a senior registrar for a further four years, and during this part of his training his degree of responsibility steadily increases.

132. In addition the aspirant to a consultant post must acquire the higher qualifications appropriate to his chosen specialty. Only a part of the necessary study may be undertaken while holding a hospital post, after which the doctor is invariably compelled to take time off to attend a course at his own expense. It is also desirable that some time should be devoted to research.

133. The consultant is thus one who has undergone the appropriate postgraduate training designed to produce a man of wide clinical and practical experience, with full academic qualifications in his specialty and as great a knowledge of his subject as possible.

134. The consultant is the leader of a team which the hospital provides for the fullest treatment for the sick. This principle of consultant responsibility for work in a modern hospital is fundamental. Upon it the quality of hospital medical service directly depends. Sufficient consultants should always be appointed for this to be a reality in practice. Similar considerations apply in the staffing of the diagnostic and other special departments (for example, pathology, radiology). The consultant is in charge of a number of beds, of a department, or both, and the junior members of his team are his assistants, and are responsible to him.

135. The word "consultant" defines the function of a hospital doctor of this status in relation to general practitioners, as regards both hospital and private practice. The consultant is not normally approached direct by the public, but, just as a barrister accepts his clients from a solicitor, so the consultant receives his patients in private practice from the general practitioner. He advises and helps the latter in the treatment of his patients. As far as the hospital is concerned consultants receive their patients in most instances from general practitioners through out-patients, or in the case of an emergency direct into the hospital beds.

136. By virtue of his professional authority the consultant carries, in addition to his purely professional responsibilities, considerable responsibility for advising and guiding the hospital administrative authorities on matters of policy and development. The incidence of these duties varies from time to time, and is often heavy. It adds considerably to the service rendered by the consultant to his hospital.

137. Consultants are chiefly responsible for the clinical teaching of undergraduate and postgraduate students and of various types of auxiliary workers and do much of such teaching themselves. They are also in a large part responsible for the advancement of medicine by research. The position of such persons in the community and the remuneration they receive should be commensurate with their authority, responsibility, and abilities. It is most important for the future of medicine that nothing should happen to diminish this status or the standard required of persons holding it.

3. Senior Hospital Medical Officers

138. The senior hospital medical officer grade was not referred to in the Spens Report, and it was common ground between the Joint Consultants Committee and the Ministry that after being used initially for the assimilation of medical staff already engaged in the hospital service the need for the grade was temporary and that the numbers in it should diminish.

139. In 1949-50, in order to clarify the future use to be made of the grade, discussions took place between the Ministry and the Joint Consultants Committee which resulted in the issue of circular R.H.B. 50/96—Appendix X—defining in the issue of circular R.H.B. 50/96—Appendix X—defining those posts in the medical establishments of hospitals which might be designated in the senior hospital medical officer grade. This circular is still operative and a considerable number of new appointments have been made in accordance with a varying interpretation of its provisions.

for a shorter working week in the future. This illustrates and reinforces the Council's view that it is well-nigh impossible to draw any effective comparison between one profession and another.

168. The general practitioner is assumed to be at all times fit and mentally alert, for the patient not unnaturally expects his doctor to be able to deal effectively and promptly with any one of the many serious emergencies which may arise at any time of the day or night even though the doctor may be at the point of exhaustion following a prolonged spell of duty.

169. The very nature of a general practitioner's work makes him liable to spells of severe physical and mental exhaustion even though it so often happens that he is called upon to make a decision—on which the patient's life may depend—at a time when both these factors may operate. Such decisions are frequently made when no outside opinion or help is possible, and, although all this is accepted as an essential facet of his vocation, it places a heavy strain on the general practitioner which has no parallel in other professions.

170. In addition, the general practitioner's working life must be viewed against the risk of litigation or complaints by patients not only of his professional skill but of any apparent discourtesy, however provoking the circumstances may be.

171. Any patient may make a complaint about the general practitioner, however trivial, and the doctor may in consequence be called before a Medical Service Committee to justify his action. The disciplinary machinery necessary in a publicly organized service of the present kind is additional to the powers exercised by the General Medical Council over the whole profession.

172. In addition to the high educational standards which are required, the general practitioner must possess certain personal qualities if he is to be a family doctor in the true sense of the words. The general practitioner's intimate relationship with those he serves leads to his assumption of the role of guide, philosopher, and friend to his patients. He must be a good mixer, one who is equally at home with all classes of society and an individual who has the full confidence of his patients. Above all he must be a profound student of human nature and possess immense reserves of mental and physical stamina. He has very limited time for recreation and leisure, since the calls on his service are continuous and exacting and little dependence can be placed upon him for social or family engagements.

173. The doctor's wife and family inescapably share the strain of general practice. Many doctors' houses are large and old and not easily adaptable to present-day conditions when domestic help is virtually unobtainable. In other walks of life the situation would be met by moving to a smaller, more easily and cheaply run house, but a doctor is tied to the area of his practice, so this is often impossible. Meals are irregular and must be taken at times to meet the needs of the practice and not the convenience of the family. For example, general practitioners hold an evening surgery for the benefit of those at work. This may finish at a late hour and be followed by visits to patients, requests for which have come in late in the day. This often means that meals must be duplicated. At night emergency calls are disturbing to those living in a doctor's house as well as to the doctor who must respond to them. Domestic duties must be undertaken amidst a succession of telephone calls and patients calling at the house both in and out of normal surgery hours. Indeed, the doctor's family provides for the National Health Service a formidable ancillary force.

174. Some indication of the effects of the doctor's arduous life and heavy responsibilities can be obtained from the Registrar-General's analysis of occupational mortality rates in successive age groups at the 1931 population census date.

175. The available information for males in England and Wales is as follows:

Death Rates from All Causes (Death Rates for All Males=100)

	Age Group							
	25-	35-	45-	55-	60-	65-	70-	75-
1931								
Doctors	92	94	108	111	103	95	103	
All professional men	83	79	88	95	98	93	96	

From: 1931 Census, Decennial Supplement, Part IIA, Occupational Mortality, pp. 217, 256
Doctors: Physicians, surgeons, registered general practitioners.
All professional men: Social Class I.

It must be noted that, in each age group, the death rate for doctors or professional men is expressed as a percentage of the death rate for all males. For example, in 1931 the death rate among doctors aged 55-65 was 11% higher than the death rate among all males in the same age group.

176. The Council had hoped that the results of the next survey based on the 1951 population census data would now be available, but unfortunately this latest analysis has not yet been published by the Registrar-General.

177. On the evidence of the 1931 data, however, death rates among doctors were considerably higher than for all professional men at all ages—and in the critical age groups from 45 to 70 higher also than the average for all men.

178. It is also of interest to note the results of an investigation carried out in 1952 into coronary heart disease in medical practitioners.* Here again, as the following table shows, the incidence of the disease fell most heavily upon those in general practice:

Incidence of Coronary Heart Disease—Standardized Rate per 1,000 Men Aged 40-59

General practitioners	7.1
Other doctors	3.3
Miscellaneous, non-medical group	2.5

2. Overall Responsibility for the Medical Care of the Population

179. The Council must also refer to another of the major principles accepted by both the profession and the Government, namely, the recognition of the overall responsibility of the profession for the medical care of the population as a whole.

180. Not only is the general practitioner in the Health Service responsible for patients on his own National Health Service list but he is also liable to treat any person who happens to be in his area. Again, he may be summoned to any emergency—even where the patient is not normally a National Health Service patient. He may even have patients arbitrarily allocated to him by the Executive Council. His responsibility for general medical services is thus both unlimited and continuous.

181. In every other walk of life the professional man's responsibilities are limited by the individual arrangements which he makes with members of the public. No solicitor or accountant, for example, is under any obligation to provide professional services without limitation to any member of the public who cares to call upon him. In the case of National Health Service general practice any failure on the part of the doctor to answer a call for assistance from any person, whether on his list or not, can lead to a complaint by a patient and an investigation by a Medical Service Committee.

182. Similarly with off-duty time and holidays the general practitioner remains at all times personally responsible for the medical care of his patients. He must provide a deputy whenever he is absent, and even then he must accept responsibility for anything that may happen during his absence.

183. The principle of collective responsibility, inescapable in a publicly organized service, plays no part in the life of other professions who are under no obligation to provide continuous cover.

* "Coronary Heart Disease in Medical Practitioners," *British Medical Journal*, March 8, 1952.

184. There can be no doubt that this principle of collective responsibility was accepted by the Government, and the following extract from the Minister's case to Mr. Justice Danckwerts sets out their policy on the matter:

43. In negotiations between the Parties, preparatory to the coming into force of the National Health Service, it was agreed with the British Medical Association that the profession would accept collective responsibility for all the civilian population taking advantage of the General Medical Services and that there should be a Central Pool to provide for the remuneration of general practitioners providing General Medical Services.

It will be seen that the acceptance of this principle led with the agreement of the profession, to the Pool method of payment. Under this method general practitioners as a body are entitled to an agreed global sum of money corresponding to the Spens recommendations as interpreted by the Danckwerts Award for accepting overall responsibility. In the Council's view this method represents the only practical way of remunerating a profession which accepts an overriding responsibility shared by agreement between its own members. The Council is certain that the retention of this method of payment is essential and maintains that any question of distribution of the global sum between individual members of the profession should rest with the profession in consultation and agreement with the Ministry of Health.

185. The global sum referred to in paragraph 184 above represents total general practitioner remuneration from all sources—that is, not only general practice in the National Health Service but maternity services, hospital, and public health appointments, medical boards, superannuation contributions, and private practice, etc. (By way of illustration a detailed computation of the Pool for the years 1953-4 and 1954-5 is set out in Appendix XI.) The Ministry's contribution for General Medical Services, known as the Central Pool, is arrived at by deducting from all other sources (in the aggregate income earned from all other sources including private practice). To the extent that such income may increase or decrease, the size of the Central Pool varies. Thus the global sum is the maximum overall income, and whilst other professions can supplement their income by undertaking additional work, this cannot happen in general practice, where additional income is merely deducted from the amount which the Ministry pays into the Central Pool. It is therefore vital to the profession that the global sum is adequate for its purpose.

186. For all these reasons the Council wishes to record its firm conviction that any departure from the Pool method of payment would be a breach of the undertaking given by the Government to the profession when it entered the Service.

3. Financial Incentives in General Practice

187. In this memorandum the Council has as yet made no mention of the vital need for re-establishing suitable incentives in general practice. Such a need is clearly recognized by as in other fields and professions, was clearly recognized by the Spens Committee, who, in their recommendations, stated that in a small proportion of cases it should be possible for general practitioners to obtain net incomes of at least £2,500 per annum in terms of 1939 values of money. Translated into present-day money values, such a level (approximately £6,250) is now unobtainable in relation to the size of the Central Pool and the maximum permitted list of 3,500 patients allowed in general practice. In fact, the maximum net income from capitation fees and loadings on a list of this size, even allowing 8% for the distribution of the balance of the Central Pool each year, only approximates to the level recommended in terms of 1939 values of money. It is possible if partnership terms advantageous to the senior partner(s) can be made for this level to be exceeded, but even this can only be effective for a limited time, for the terms of partnership agreements are governed to no small extent by the National Health Service Acts.

188. There can be a similar temporary financial advantage in certain cases where an assistant is employed. This also

is limited by a number of factors. Assistantship arrangements are now subject to stringent reviews by Executive Councils. The average extra cost to a doctor who employs an assistant is such that only in the upper range of the additional list of patients allowed in respect of the employment of an assistant can he hope to derive any financial advantage.

189. In fact, in nearly all cases, both when taking an assistant and in the initial stages of a partnership, the principal suffers a financial loss which cannot be offset as in the days before the National Health Service, when the incoming practitioner purchased his share of the practice. Furthermore, unless the practice is capable of steady expansion this leeway can never be made up. The fact is that the level indicated by the Spens Committee as providing a suitable incentive is entirely absent from the present financial arrangements. It is true that substantial additional remuneration over and above the total capitation fees and loadings is paid out from the Pool, but it would be quite wrong to assume that these are distributed anything like proportionately to earnings from capitation fees. Indeed, the Council holds the view that a general practitioner with a maximum list is less likely either to practise in an area where the opportunity for other medical work exists or to find time for other professional activities which would bring him in a return anything like proportionate to his remuneration from capitation fees and loadings.

190. Again, it must be emphasized that if general practitioners as a group earned more outside their general practice—for example, for work in hospitals, which has increased and is increasing—then the operation of the Central Pool seems to it that they get less for their general practice; the net average is maintained.

191. The present average earnings of £2,222 include both the superannuation contributions of the doctor himself (6% or £120) and that of the Exchequer (8% or about £160).

192. There are therefore three average net earnings figures to be borne in mind; the full £2,222, a figure of about £2,060 excluding Exchequer superannuation contributions, and one of about £1,940 excluding superannuation provisions altogether.

4. The Changing Pattern of General Practice

193. Not only has the quantity of work increased since the inception of the National Health Service—perhaps this was to be expected—but the qualitative element has changed with the advances of medical science. On the first issue it is not easy to estimate the effect of the National Health Service on the volume of service required of the family doctor, and no accurate or specific figures are available. It is, however, common knowledge that the waiting time in doctors' surgeries is increasing, and it is the general experience of practitioners that the demand on their services has increased since the inception of the Service.

194. The root causes are not difficult to find. Many illnesses formerly requiring admission to hospital are now treated successfully by the general practitioner in the home. The increasing longevity of the population generally has likewise led to greater demands upon the general practitioner's time. Many diseases have lost their fatal effect as a result of modern therapeutic measures, but the patients nevertheless often need continuing and careful treatment. Again, the increasing tendency to early ambulation after operation adds to the general practitioner's responsibilities and work. Modern diagnostic procedures in the surgery are similarly more time-consuming. It can fairly be said that the public has come more and more to rely on the doctor for every aberration from the normal and is increasingly seeking advice for the preservation of normal health and for the prevention of illness. The introduction of a "free" health service has naturally increased the calls upon the general practitioner. There has, for instance, been a marked rise in the number of late calls, and undoubtedly there is a section of the public, admittedly small, who make unnecessary calls upon the doctor's time.

195. As far as the qualitative element is concerned, the field of psychoneurosis provides an excellent illustration of present-day trends. Perhaps in recent years there has been a section of medicine which has called for so much time and care as that of the mentally sick. There is no doubt that the intense pressure of modern life, its speed of movement and action, completely altered social standards, and many other factors have affected large sections of the public. The general practitioner is frequently consulted by persons who break down under stress and quite often attend the surgery with ill-defined symptoms simulating organic disease but which are really based on concealed fears. To-day this type of patient requires much more time and painstaking examination than ever before. Not only does he require sympathy and reassurance but he is only too well aware of the wide field of costly investigation available at hospital and often is not satisfied until many of these tests have been undertaken and proved negative. The general practitioner has a difficult and time-consuming task in separating the organic from the psychoneurotic. Demands for "stimulants," the fight against depression and insomnia, the craze for slimming and, more recently, "tranquillizers," are examples of the type of new problems which are facing the doctor to-day. All told, society expects much from the family doctor and makes many demands upon him which must be met if he is to fulfil his proper place in society. He in turn has a right to expect security and a feeling of confidence in his "employers."

5. Postgraduate Education

196. The administration of new drugs and forms of treatment have completely changed the course of many diseases. Medical science is never static, and a general practitioner must at all times keep himself abreast of advances in pharmacology and therapeutics where new remedies are constantly under trial and review. It is necessary for a doctor to read widely medical journals and new textbooks, to attend meetings and clinical demonstrations, and, whenever possible, to take postgraduate courses.

197. It cannot be sufficiently emphasized that the general practitioner is the first barrier against disease, and it is only by his intimate knowledge of the patient's medical history and social environment that he is able to make a considered diagnosis, and by his constant application to postgraduate study to make the latest advances in medical research and treatment available to his patients.

198. Postgraduate study has become an inescapable part of a doctor's life and was recognized by the Spens Committee as an important factor in assessing the general practitioner's remuneration.

6. Comparative Lack of Mobility in the Profession

199. Members of other professions are free to practise wherever they wish. The medical profession accepted in the interests of the nation that there should be some restriction on the movement of doctors in the National Health Service in order that the existing medical personnel should be spread evenly to meet the needs of the various parts of the country. This means that a general practitioner has a restricted choice so far as the area of his practice and residence are concerned. Similarly, it is extremely difficult for an established practitioner to change his area of practice or his residence.

200. Indeed, the opportunities are almost negligible, for, in spite of efforts made by the profession, the Medical Practices Committee, and the Ministry to facilitate the exchange of practices, the actual number of exchanges which have come to fruition since the Service began some nine years ago is only twenty-three in England and Wales.

201. Another major factor which has given rise to the profession's immobility has been the prohibition of the right to buy and sell the goodwill of medical practices. Before 1948 a general practitioner who through ill-health or because of illness in his family or who in later years wished to exchange the heat and burden of a busy indus-

trial practice for lighter work in a more desirable area could realize the value of his goodwill and achieve his objective by outright purchase of a smaller practice. The prohibition of the sale of goodwill means that such a situation is impossible to-day.

202. The Government's decision to abolish the purchase and sale of practices has led to a serious and understandable grievance amongst older practitioners. A practitioner before the National Health Service Act received for his practice when he sold a share of the whole a capital tax-free sum. A successful industrious practitioner would substantially increase the value of the goodwill. The Government compensated those doctors when they abolished this right by compensating at the 1946 value of those practices. This sum was payable (save in exceptional cases) only when a doctor retired from the National Health Service. This frozen money has now depreciated. Its present value is only 61.3% of its value in 1946.

203. Finally, it must be pointed out that a doctor by the very nature of his training is unable to find employment in any other field. There are few, if any, opportunities open to doctors outside medicine. This is in contrast to other professions, where opportunities for changing from professional to executive work—particularly in industry—are quite common.

V. SUMMARY

204. It will be seen that this preliminary memorandum of evidence falls into three main sections: first, the Council's view of the Commission's task; second, the claim itself (set out in detail in Appendices VII and VIII) and the events leading up to that claim; and third, a number of subsections which demonstrate the unique position which the medical practitioner holds in the community. These latter subsections illustrate the inherent difficulties of drawing any valid comparison between a doctor's training, responsibilities, and the heavy strain to which he is subjected, and the nature of the work undertaken by other professions, most of which have not the same vocational aspect.

205. The Council submits again that its claim is unassailable on moral grounds and that the profession has a right to expect that the Government will honour the unequivocal promises made to it that remuneration would be based upon the recommendations of the two Spens Reports, the arguments for which have been set out in full in earlier paragraphs of this memorandum.

206. The medical profession has given loyal and unstinting service to the community since it agreed to co-operate in the National Health Service and its patience has been sorely tried by the Government's curt rejection of a just claim—a claim, moreover, which was not submitted until after five years of restraint in deference to the general economic position of the country.

207. The Council has a duty to ensure that the position of the profession is not worsened simply because the State has now assumed responsibility for the greater part of its remuneration. It looks to the Commission not only to redress the underpayment which it has suffered over the years, but to recommend such levels of remuneration for the future as will maintain the principles established by the Spens Reports and thus attract to medicine a proper share of the best recruits.

The following Appendices have been sent to the Royal Commission.

- I. The Spens Report on the Remuneration of General Practitioners.
- II. Statement of Case by the General Medical Services Committee to the Adjudicator (Mr. Justice Danckwerts).

MEDICAL PRACTICES COMMITTEE AMENDMENT OF CLASSIFICATION OF AREAS

The following areas have been reclassified by the Medical Practices Committee as "designated":

London.—Borough of Battersea: *Bolingbroke, Thornton, Broomwood, and Nightingale Wards.
Middlesex.—Borough of Enfield: *Ordnance and Enfield Wash Wards; *Borough of Southall; Borough of Tottenham: *Chestnuts Ward.
Warwickshire.—*District of Bedworth.
Worcestershire.—*Kidderminster.
Southend-on-Sea.—*Southend and Thorpe Bay.
West Hartlepool.—*Whole of County Borough.

The following areas have been reclassified as "intermediate":

Bedfordshire.—Leighton Buzzard.
Buckinghamshire.—Colnbrook.
Cheshire.—Hollingworth, Mottram, and Tintwistle (sub-district "D" of Hyde, Dukinfield, and Stalybridge).
Derbyshire.—Urban District of Long Eaton.
Durham.—Rural District of Durham.
Essex.—Mark's Gate Housing Estate (including that part which falls within the Borough of Ilford).
Hampshire.—Borough of Basingstoke.
Lancashire.—Urban District of Church.
Lincolnshire (Lindsey).—Urban District of Barton-on-Humber.
Middlesex.—Borough of Wood Green: Alexandra-Bowes Ward.
Norfolk.—Municipal Borough of King's Lynn.
Northumberland.—District of Wallsend.
Staffordshire.—Rural District of Stafford (except Gt. Haywood).

Surrey.—Worcester Park. Borough of Sutton and Cheam (except Worcester Park); Borough of Malden and Coombe (except Worcester Park); Borough of Epsom and Ewell (except Worcester Park).

Sussex (East).—Rural District of Uckfield (except Parishes of Uckfield, Buxted, and Wadhurst with Ticehurst).
Sussex (West).—Urban District and Rural District of Crawley.
Yorks (W.R.).—Urban District of Tickhill.
Birmingham.—Stechford District.
Manchester.—Moss Side, Rusholme, and Whalley Range.
Glamorgan.—Llantwit Fardre Rural District (except the townships of Llantrisant, Talbot Green, and Pontyclun within a radius of 1½ miles of the junction at Talbot Green of road A473 and A4119).

The following areas have been reclassified as "restricted":

Somerset.—Urban District of Crewkerne.
Sussex (East).—Parishes of Uckfield and Buxted (Uckfield Rural District).
Westmorland.—Kirkby Lonsdale.
Yorks (W.R.).—Urban District of Meltham.
Carmarthenshire.—Garnant and Glanamman.
Glamorgan.—Pontyclun and Llantrisant (within a radius of 1½ miles from the junction of roads A473 and A4119).

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham.
Non-County Borough Councils.—Crewe.

Dangerous Drugs Act: Restoration of Authority

The Home Office announces that the authorities granted by the Dangerous Drugs Regulations, 1953, under the Dangerous Drugs Act, 1951, have been restored to Dr. Malcolm Andrew Graham-Yool, O.B.E.

- VII. The Joint Remuneration Claim lodged in 1956.
- VIII. A Supplement to the Joint Remuneration Claim.
- IX. Memorandum by Professor R. G. D. Allen on Changes in the Distribution of Higher Incomes.
- X. Ministry of Health Circular R.H.B. 50/96 on the Senior Hospital Medical Officer Grade.
- XI. Explanatory Memorandum on General Practitioner Remuneration and the Calculation of the Central Pool for 1953-4 and 1954-5.

SUPPLEMENTARY OPHTHALMIC SERVICE G.P.s' RIGHT TO ADVISE

The B.M.A.'s Ophthalmic Group Committee believes that some general practitioners do not know that they have the right to advise a patient to consult a particular practitioner in the Supplementary Ophthalmic Service. An authoritative ruling on this was obtained from the Ministry of Health in 1952 (Supplement, August 2, 1952, p. 86). The Ministry stated that there was nothing in any of the regulations made under the National Health Service Act to prevent a general practitioner from supplying a patient with the name of either an ophthalmic medical practitioner or an ophthalmic optician, provided that no attempt was made to conceal from the patient the fact that the patient had a free choice in selecting an ophthalmic medical practitioner or ophthalmic optician to test his sight.

The statement on the back of form O.S.C.1 informs the applicant that he may have his sight tested by any ophthalmic medical practitioner or any ophthalmic optician who has undertaken to provide supplementary ophthalmic services under the National Health Service.

QUEEN'S INSTITUTE OF DISTRICT NURSING

RECRUITMENT MAINTAINED

The President of the Queen's Institute of District Nursing, PRINCESS ALICE, COUNTESS OF ATHLONE, occupied the chair at the annual meeting, held in Church House, Westminster, on October 29. She was supported by the Minister of Health, Mr. DEREK WALKER-SMITH. The Chairman, Mr. A. H. M. WEDDERBURN, said that in the last few years recruitment and training of district nurses had been maintained at over 700 a year; but the Institute viewed with the greatest concern the recent Whitley Council salary awards, which meant that a nurse who was a qualified district nurse/ midwife and health visitor would receive less than one who was engaged on health visitor duties only. Evidence was received daily of young women in the middle of their training cutting it short and saying, "I am off to do my health visiting services. Why should I worry about nursing when I can get an easier life as a health visitor?"

The MINISTER OF HEALTH referred to the question of training. As was known, an advisory committee on the training of district nurses had been set up and had made a start. Its membership was strong in nursing and medical to any deterioration in the quality of district nursing—indeed, quite the contrary. With regard to the future, it would be nice to be able to say that in so worthy a service they could proceed regardless of cost. But they could not isolate any aspect of our social services, however deserving and desirable, from the economic factor, and it followed that what they had to aim at was the highest common factor of efficiency and economy. There were, said the Minister, two strong reasons for expanding the domestic health services and notably home nursing—economic and social. Economically it would relieve the strain on the hospitals, and on the social side home nursing was for many patients in every sense the best form of care.

FUTURE OF JOINT NEGOTIATION

DEPUTATION TO PRIME MINISTER
REQUESTED

A conference of representatives of all organizations forming the Staff Sides of the Whitley Councils for the Health Service took place on November 13 to discuss the Minister of Health's veto of the 3% salary increase granted by Whitley Council to administrative and clerical staff in the Service with salaries below £1,200 a year. The B.M.A. sent observers to the conference. It was decided without dissent to request the Staff Side of the General Whitley Council to send a deputation to the Prime Minister to discuss the future of joint negotiation. The meeting also passed a resolution expressing grave concern at the Minister's veto, which was regarded as a violation of past assurances that Whitley Council agreements would be effective and as a destructive blow at the system of collective bargaining in the Service. Nalco (the National and Local Government Officers Association) and the National Union of Public Employees, representing a large majority of the staff affected by the veto, had already instructed their members to ban overtime work from November 18 in protest. Other unions with members in the Health Service, such as the National Union of General and Municipal Workers, the Transport and General Workers Union, and the Confederation of Health Service Employees, were expected to issue similar instructions.

HOSPITAL JUNIOR STAFFS

NEW B.M.A. GROUP

The Council approved on November 6 a reconstitution of the Registrars Group of the B.M.A. to include all grades of hospital junior medical staffs. The object of the Group, which will now be known as the Hospital Junior Staffs Group, will be "to represent the views and to promote and protect the professional interests and well-being of all grades of hospital junior medical staff in Great Britain and Northern Ireland."

As with the former Registrars Group, the Hospital Junior Staffs Group Council will consist of two representatives from each hospital region, elected through the hospital junior staffs regional groups. In addition, it will include two representatives appointed by the Central Consultants and Specialists Committee, and in turn the Group Council will appoint two representatives to the Central Consultants and Specialists Committee.

All grades of hospital junior medical staff will be entitled to attend and take part in regional meetings, and regional groups are being asked to establish means for keeping in regular contact with all hospital junior medical staffs in their region.

NIGERIA BRANCH

The annual general meeting of the Nigeria Branch of the B.M.A. was held in Ibadan on September 21. Sir Kofu Abayomi was elected president of the Branch, and Dr. M. A. Majekodunmi honorary secretary and treasurer.

A clinical session was held in the morning, at which the following papers were read: "Protein Requirements in Man" (Professor Emmett Holt, of New York University); "Kwashiorkor" (Dr. Cicely D. Williams, of the London School of Hygiene and Tropical Medicine); "Methionine and Cystine Requirements of Nigerian Adult Males" (Dr. Bruce Nicol, adviser on nutrition to the Government of the Federation of Nigeria); and "Effects of Malnutrition during Pregnancy and Lactation" (Dr. M. A. Majekodunmi). This was followed by a symposium on "A Nutritional Policy for

Nigeria," at which the chairman was the president Sir Kofu Abayomi, and the organizer Dr. W. R. F. Collis. The Premier of the Western Region, Chief Obafemi Awolowo, was a guest at the luncheon held at the University College Hospital. Other guests were the Federal Minister of Health, the Ministers of Health of the Eastern and Western Regions, Professor Holt, Dr. Cicely Williams, and Sir Sydney Philipson, chairman of the University College Council. A cocktail party and buffet supper and dance were held in the evening for members and guests.

N.O.T.B. ASSOCIATION COUNCIL MEETING

The N.O.T.B. Association held its eleventh council meeting on October 10 under the chairmanship of Dr. J. N. TENNENT. The chairman welcomed Mr. G. W. Black, of Leeds, and Dr. S. B. Smith, of Manchester, as additional council members appointed by the Ophthalmic Group Committee of the British Medical Association. The election of a deputy for the chairman of the Medical Advisory Committee to attend council meetings as an observer was approved and Dr. C. Watney Roe, of West Kensington, has agreed to act in this capacity.

The council decided to examine in more detail a suggestion that statistics on the eye conditions found by medical members in examinations under the Supplementary Ophthalmic Services should be collated on the lines introduced previously by the late Mr. Bishop Harman. It was noted that one executive council took some six weeks to settle accounts, while others cleared them in one to four weeks. The council considered that, if members felt the delay in payment was likely to cause personal inconvenience, formal individual complaints should be made to the executive council, but that this was not a matter in which the association should intervene.

Scottish News

HOSPITAL RUNNING COSTS IN SCOTLAND
ANNUAL ANALYSIS

According to the annual analysis of the running costs of Scottish Hospitals¹ for the year ended March 31, 1957, the average weekly net cost per in-patient, including specialist services, in a medium-sized (51-300 beds) general hospital in Scotland was £17 15s. 1d., representing an increase of 7% over the previous year. The figure for major teaching hospitals was £18 14s. 8d., an increase of 8% over the previous year. The average inclusive cost of each out-patient attendance was 8s. 11d. in the medium-sized general hospitals and 9s. 5d. in the major teaching hospitals.

The average in-patient costs in other types of hospitals were:—General: over 300 beds £17 10s. 10d., up to 50 beds £15 12s. 4d.; chronic sick, £9 1s. 9d.; convalescent, £9 1s. 11d.; sanatoria, £13 9s. 7d.; isolation and tuberculosis, £15 15s. 5d.; maternity, £21 16s. 10d.; mental, £6 7s. 7d.; mental deficiency, £5 10s. 6d. Of every £1 spent in treating and maintaining a patient in hospital, 11s. 9d. was spent on salaries and wages; 2s. 7d. on provisions; 1s. 4d. on drugs, dressings, bedding, etc.; 2s. 4d. on domestic repairs, heat, light, etc.; and 2s. on overheads. The average weekly cost of provisions per person (patients and staff) was £1 3s.

The average daily number of in-patients in all hospitals was 54,539, and the total number of out-patient attendances was 5,588,350.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Medical Practice in Canada

SIR,—I have read with much interest an article written by two old friends. This was "The Pattern of Health Organization in Canada" by Professor Alex. Mair and Dr. Gordon H. M. Hatcher (*Journal*, September 7, p. 539). One statement in that paper requires some explanation and amplification. It is stated: "A few provinces have reciprocity with the British Medical Register, while others, notably the Quebec and British Columbia, present obstacles to the British immigrant in the form of residential requirements or very high fees."

My motives in writing to you are purely selfish; I would hate to see excellent British physicians emigrating to other provinces in Canada in preference to British Columbia because they may think that peculiar obstacles may face them here. I, obviously, am in no position to refer to the situation in Quebec, but I think I can speak with some authority about British Columbia as one who has had the privilege of helping British physicians in their preparation for examination, as an examiner in basic sciences for the British Columbia College of Physicians and Surgeons, and as an examiner for the Medical Council of Canada and for the Royal College of Physicians and Surgeons of Canada. The British physician seeking licensure in this province is treated exactly the same as our own Canadian confrères; neither more nor less is required of him. There is no residency requirement nor is there any additional fee charged. If he is a university graduate and if he has completed the required time and content of experience as a house-surgeon, then he is eligible for licensure on exactly the same basis as our own men.

I would suggest that any British physician contemplating emigration to British Columbia should do two things. He should read the excellent article by Dr. Arthur D. Kelly, General Secretary, Canadian Medical Association (*Supplement*, January 26, p. 35), and he should write to the Registrar, British Columbia College of Physicians and Surgeons, 1807, West 10th Avenue, Vancouver, B.C. From these two sources I am sure that he will obtain all the information he requires. I think he will also find that we put no special blocks in his way; we merely ask that his training be equal to that of our own graduates.—I am, etc.,

JAMES M. MATHER.

Vancouver, Canada.

SIR,—Since I left England 2½ years ago there seems to have been little change in the situation. The senior registrars are still unable to find permanent appointments and the registrars find their progress in the training ladder blocked by senior registrars playing general post. Many of the registrars have spent as much time in their specialties as the senior registrars, and, even if willing to abandon their ambitions, cannot do so because the parallel ladder in general practice is also full and there seems to be a tendency for principals not to employ assistants with higher qualifications.

I think that a lot of these unfortunates could find a reasonable compromise by emigration. True, in this direction at any rate, there is no great need for medical immigration on a large scale, but there are quite a few vacancies in more areas, and with persistence openings can be found in the populated districts. In Canada there are the additional hurdles of sitting examinations for registration in four of the provinces and for recognition as a specialist if one wishes to follow a specialty. To sit the specialty examinations one needs to produce evidence of training acceptable to the Royal College of Physicians and Surgeons of Canada, but for many registrars of my vintage this should prove very little of a problem. One then has the freedom to

enter private practice, eking out one's specialty with general practice if the area demands it. As I have said, compromise is necessary in many cases, but this is a much more interesting life than general practice as now followed in the United Kingdom. Care of one's patients in hospital is an integral part of the general practitioner's existence, and in most areas he has the freedom to carry on the treatment of his patients as far as he feels himself capable. To anyone with adequate training the scope is considerable. Academically speaking one can become a little isolated, but this is one of the drawbacks to be accepted. It can be offset by the fact that it is usually possible financially to attend postgraduate courses at regular intervals.

To anyone who seems to have reached a dead end I recommend consideration of this course. Life is not entirely a bed of roses abroad, but there is a little more flexibility in medical practice, and taking it by and large a comfortable living can be made usually in an interesting and fairly satisfying manner.—I am, etc.,

Moose Jaw, Saskatoon,
Canada.

W. E. J. BENNETT.

Remuneration Claim

SIR,—The railwaymen, the busmen, and the doctors are indignant. They are pressing on with their claims. I am sure I am not the only doctor who feels ashamed, but how can we let the public know?—I am, etc.,

London, N.W.4.

R. W. COCKSHUT.

Organization of General Practice

SIR,—I am engaged in collecting material for a book on the organization of general practice in Britain. I would be most grateful if any of your readers who have unpublished material on the content and organization of family doctoring in the early part of the century would be kind enough to lend it to me. I particularly require material on the work of the contract practices and other forms of local organization of medical care before 1911. All diaries or letters of G.P.s of this period would be particularly useful. Material sent will be looked after most carefully and returned as soon as copies have been made.—I am, etc.,

55, Russell Square,
London, W.C.1.

H. C. FAULKNER.

Medical Guild Funds

SIR,—I am at a loss to understand why the profession is not taking advantage of these months of waiting for the recommendation of the Royal Commission to build up the funds of the British Medical Guild. Our signed authorities have been returned and the levy abandoned.

Surely we should be seizing this respite to build up sizable funds and thus eliminate the necessity of postponing action when we get the inevitable answer. After all, contributions are returnable if, by any conceivable chance, they are not needed.

The Minister of Health's refusal to grant a 3% rise to N.H.S. workers gives a very clear indication of his reaction to any suggestion of increased remuneration for doctors—by whomsoever it may be recommended. If, after the happenings of the past year, anyone thinks we will get our dues without concerted action, he must be strangely deluded.—I am, etc.,

Epping, Essex.

R. H. LONGTON.

Medical Record Envelopes

SIR,—Concerning the inadequacy of the present medical record envelopes referred to by Dr. E. M. R. Frazer (*Supplement*, October 19, p. 134): throughout my years in practice it has not been considered necessary to retain medical reports. Instead a few hours each week has been sufficient to record salient facts from such reports on to record envelope or continuation card, and only occasionally when it is felt there is a real necessity—for example, pending court case, compensation dispute, etc.—is a complete report

retained and filed. In actual practice, on receipt of a hospital or other report, I underline in red pencil the information to be recorded (which is often very little) and my wife carries out the necessary transfers. In this way medical record card envelopes do not become over-bulky, and, when reference is made, it is so much easier to read concise extracts from a patient's medical history than extract from his record card envelope a number of reports which invariably have to be sorted and put in order before a logical sequence of events can be traced.

I heartily agree with Dr. Frazer that continuation cards should be about half an inch (1.25 cm.) narrower and have rounded corners, and that patients' names should be typed in large characters. No alteration in size of the present medical record envelope is necessary.—I am, etc.,

Pyle, Glam.

R. J. PHILLIPS.

Plight of Rural G.P.

SIR.—In the evidence to be submitted to the Royal Commission dealing with National Health Service remuneration, I wonder if the plight of the single-handed rural general practitioner will be fully and fairly considered in relation to his difficulties and expenses in obtaining leave of absence from his practice. By his terms of contract in the Service, every G.P. is, technically, on duty 24 hours a day, 7 days a week, 52 weeks a year, bank holidays included. No provision exists in the Service for annual leave, half-days, week-ends, or sick leave (is there any other service, however sponsored or remunerated, which makes equivalent demands?). In partnership practices it is possible to arrange for each partner, and even the assistant, to be off duty for his regular half-day and Sunday or week-end, and for his untrammelled annual holiday. Similar conditions apply to practitioners in urban areas who have succeeded in making reciprocal deputizing arrangements with their neighbours. All these fortunate individuals, moreover, may, during their periods of freedom, leave their houses untenanted and confine their expenditure to the pleasures of their holiday.

Contrast this with the lot of the single-handed country G.P. He quite probably can arrange for his nearest neighbour to cover his half-day and alternate Sundays. But a week-end is almost out of the question, there are no nights off duty, while the annual holiday entails enormous expense. A locumtenent has to be engaged at £18 18s. a week, a car has to be provided (hire and maintenance may cost £7 a week), the house has to be kept open with a resident maid in attendance (food, light, heat, and service may cost £12 a week). These figures are from a recent experience. £38 is a frightful and frightening sum to contemplate expending each week before beginning to buy the first minute's pleasure of one's holiday. Yet the rate of remuneration and of expense allowance are calculated on exactly the same scale for the single-handed rural G.P. as they are for his more fortunate colleague in a partnership practice. If there is a true disparity here it cries out for adjustment and relief.—I am, etc.,

March.

GORDON L. McCULLOCH.

Reorganization of Medical Practice

SIR.—Dr. D. White's letter (*Supplement*, October 26, p. 141) was very interesting and I heartily agree with his views on the subject. The present system gives us all the disadvantages of a civil service but none of its advantages. At present we have no provision for annual leave, for absence during illness, no increase in salary for seniority, for higher degrees, or for postgraduate study. The capitation system has a demoralizing effect on medical ethics—a subject which seems to be neglected in present-day training. In the scramble for "heads," ethics and etiquette are conveniently forgotten and even canvassing, openly or discreetly, is not a rare occurrence. The sooner the capitation system is scrapped the sooner will the medical profession regain its old dignity and respect.—I am, etc.,

Wetherby, Yorks.

S. T. PYBUS.

Another Stone

SIR.—The Ministry of Health has issued an edict that visiting staffs shall pay for tea taken during out-patient and operating sessions at the hospitals, as they say that this amounts to an increase in emoluments. In my opinion this is not so, but is a decrease rather than an increase, as on the appointed day we were all receiving this small amenity; and surely, if it is considered an emolument, it was included in the terms of service. Therefore, in fact, I consider the Ministry is breaking our contract. This is yet another stone added to the growing monument of discontent subsequent to the inauguration of the National Health Service.—I am, etc.,

Cheltenham.

H. SANDEMAN ALLEN.

Locum Pool

SIR.—In answer to Dr. H. P. Hilditch's letter (*Supplement*, November 9, p. 147), in which he refers to locums as casual labourers, perhaps I should point out that in Her Majesty's prisons the "casuals" have, on the whole, a happier time than the "long-termers," or "lifers," as I believe they are professionally called. Judging by the spate of bellyaching letters which have appeared in the *Journal* during the past two years, this would appear to be the case in that prison without bars, the National Health Service.

To the lay reader of these letters it would appear to be the ambition of many members of the medical profession to ride around in gold-plated Daimlers, with no thought at all of the present financial condition of this country. Surely it is the duty of all doctors, and indeed of anyone seeking to earn an honest living in this country, to tighten their belts and live as economically as possible in order to give the country a chance to ride the storm of financial inflation which is at present threatening to engulf it.—I am, etc.,

Brighton.

GERALD W. WILLCOX.

Poliomyelitis Vaccination

SIR.—At the New Year large consignments of anti-poliomyelitis vaccine are expected to become available and a vaccination campaign on a very large scale will begin. It will be on so large a scale that the existing staffs of the local health authorities will not be able to cope with it, and they may invite general practitioners to help by attending clinics to administer vaccine, and agree to pay them sessional fees at the rates approved by the British Medical Association. These sessional fees, paid by the local authorities, will be taken into account in determining the size of the central pool. In other words, we shall reimburse the Treasury out of our final settlements the sums we receive from the council. As a profession we shall receive nothing for this work, we shall be paying each other for doing it, and helping the Ministry to shift a part of the cost of the National Health Service from the taxes to the rates.

This should be borne in mind in shaping our reply if we receive from, or with the approval of, the Ministry, which treated our claim for increased pay with such contempt, a request that we, at the busiest season of our year, undertake for them these extra duties without any extra reward.—I am, etc.,

Rugby.

HENRY FLOYD.

Haemorrhage Following Dental Extractions

SIR.—Twice during the last week I have had to get out of bed at an early hour in the morning to stop haemorrhage from dental extractions. This is not only hard and unfair to a doctor, particularly during the present influenza epidemic, but it is also hard on the patient, who has to submit to the relatively unskilled attention of a doctor trying to do work properly belonging to a dentist.

This could very easily be prevented if dentists would give to each patient after extractions a card containing simple instruction on how to cope with possible haemorrhage.

Nov. 23, 1957

ASSOCIATION NOTICES

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL 177

and the dentist's telephone number in case these measures fail. Dentists would then have the privilege of completing their own work in the early hours.

I cannot really see why this long overdue step is not a matter of agreement between the B.M.A. and B.D.A. It would end a lot of hard feeling.—I am, etc.,

H. S. SAMUEL.

- 5 Thurs. Medical Students and Newly Qualified Practitioners' Subcommittee, Organization Committee, 2 p.m.
- 5 Thurs. Otolaryngologists Group Committee, 2 p.m.
- 6 Fri. Staff Side Committee C, Medical Whitley Council, 10.30 a.m.
- 6 Fri. Staff Side Committee C, Medical Whitley Council, and Public Health Committee, joint meeting, 11.15 a.m. Meeting of Public Health Committee will follow.
- 10 Tues. Special Propaganda Subcommittee, Organization Committee, 11.30 a.m.
- 10 Tues. Public Relations Committee, 2 p.m.
- 10 Tues. Regulations and Standing Orders Subcommittee, Organization Committee, 2 p.m.
- 11 Wed. Committee on Medical Education, 2 p.m.
- 18 Wed. Council, 10 a.m.
- 19 Thurs. G.M.S. Committee, 10.30 a.m.

Branch and Division Meetings to be Held

ABERYSTWYTH DIVISION.—At Talbot Hotel, Aberystwyth, Saturday, November 30, 7.30 p.m., dinner-meeting. Lecture by Mr. L. J. Temple: "Place of Surgery in Heart Diseases." Wives of members, and guests, are invited.

BARNET DIVISION.—At Barnet General Hospital, Friday, November 29, 8.15 p.m., clinical meeting to be held jointly with Finchley Division.

BARNLEY DIVISION.—At Queen's Hotel, Barnsley, Thursday, November 28, 8.30 p.m., general meeting.

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Bournemouth, Friday, November 29, 8.15 p.m., meeting. Address by Mr. J. S. Tomkinson: "History and Present-day Practice of Contraception."

BRIGHTON AND MID-SUSSEX DIVISION.—At Lady Chichester Hospital, Hove, Tuesday, November 26, 8 p.m., clinical meeting.

CAMBRIDGE AND HUNTINGDON BRANCH.—At Milton Arms Hotel, Milton Road, Cambridge, Friday, November 29, 8 p.m., meeting. Discussion to be opened by Dr. C. W. Walker and Mr. J. F. R. Withycombe: "Ways and Means of Reducing Hospital Waiting-lists."

COVENTRY DIVISION.—At Board Room, Coventry and Warwickshire Hospital, Tuesday, November 26, 8.30 p.m., meeting.

BRAINS TRUST: "Allergy." EASTBOURNE DIVISION.—At Burlington Hotel, Tuesday, November 26, 8.30 p.m., combined meeting with Pharmaceutical Society. Talk by Mr. C. Cuthbert: "Some Medico-Legal Aspects of the Investigation of Crime."

GUILDFORD DIVISION.—At Board Room, Royal Surrey County Hospital, Thursday, November 28, 8.30 p.m., meeting. Mr. D. J. Browne: "Early Diagnosis of Congenital Abnormalities."

HYDE DIVISION.—At Pack Horse Inn, Mottram, Wednesday, November 27, 8.45 p.m., scientific meeting. Dr. F. A. L. da Cunha: "Gynaecology and General Practice."

INVERNESS DIVISION.—At Staff Recreation Room, Royal Northern Infirmary, Inverness, Thursday, November 28, 5 p.m., meeting in conjunction with Highland Medical Society. B.M.A. meeting in conjunction with Highland Medical Society. B.M.A. Lecture by Dr. Sheila Sherlock: "Recent Advances in the Treatment of Liver Disease." Following the lecture, an informal dinner will be held in the Royal Hotel, Inverness, at 7.30 for 8 p.m. Medical guests are invited.

LAMBETH AND SOUTHWARK DIVISION.—At Antenatal Clinic, Lambeth Hospital, Kennington Road, S.E., Sunday, December 1, 11 a.m., clinical meeting.

METROPOLITAN COUNTIES BRANCH.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Thursday, November 28, 5 p.m., meeting. Brains Trust for senior students in the London area. A panel of examiners will answer questions on "How to Pass Examinations."

MID-HERTS DIVISION.—At Hill End Hospital, St. Albans, Friday, November 29, 8.30 p.m., annual dance.

NORTH-EAST ESSEX DIVISION.—At George Hotel, Colchester, Thursday, November 28, 8.30 p.m., meeting of B.D.A. to which all B.M.A. members in the area of the Division are invited. Talk by Mr. Harry Radin: "Hypnosis in Dentistry." He will also show a film which he has brought back from the International Dental Conference in Rome.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Tuesday, November 26, 2.30 p.m., practitioners' round. Mr. A. W. Purdie: "Obstetric and Gynaecological Cases."

OXFORD DIVISION.—At Nuffield Maternity Home Lecture Theatre, Oxford, Wednesday, November 27, 8.15 p.m., annual general meeting. Professor P. R. Allison: "Heartburn."

ROCHESTER, CHATHAM, AND GILLINGHAM DIVISION.—At St. Bartholomew's Hospital, Rochester, Thursday, November 28, 8.30 p.m., meeting. Lecture by Mr. W. J. Harris: "The Doctor and the Coroner." All medical practitioners in the area of the Division are invited.

SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Shrewsbury, Friday, November 29, 8.30 p.m., meeting. B.M.A. Lecture by Dr. F. E. Camps: "Mouves for Murder."

SOUTH MIDDLESEX DIVISION.—At Jersey Room, Red Lion Hotel, Thursday, November 28, 7.15 for 7.45 p.m., annual dinner-dance.

SOUTH SHIELDS DIVISION.—At X-ray Department, South Shields General Hospital, Wednesday, November 27, 8.30 p.m., meeting. Mr. J. S. Fraser: "General Practitioner Responsibility in Gynaecology."

SOUTH-WEST ESSEX DIVISION.—At Wanstead Hospital, Hermon Hill, Wanstead, E., Tuesday, November 26, 8.45 p.m., meeting. Dr. E. Frankel: "Clinical Demonstration on Medical Cases, With Special Reference to Recent Advances."

SOUTH-WESTERN BRANCH.—At Torbay Hospital, Torquay, Thursday, November 28, 3 p.m., combined clinical meeting with Torquay and District Medical Society.

STOCKPORT DIVISION.—At Alma Lodge Hotel, Stockport, Thursday, November 28, 7.30 for 8 p.m., annual B.M.A. dinner and dance.

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, November 29, 3 p.m., clinical meeting.

WEMBLEY DIVISION.—At Board Room, Wembley Hospital, Tuesday, November 26, 9 p.m., meeting. Discussion to be introduced by Dr. G. F. Abercrombie: "The Hospital and the General Practitioner." Members of Willesden, Hampstead, and Harrow Divisions are invited.

WEST SUSSEX DIVISION.—At King's Head Hotel, Horsham, Wednesday, November 27, 6.30 p.m., general meeting. Sir Geoffrey Todd: "Advances in the Management of Some Commoner Chest Conditions." After dinner, at 8 p.m., Sir Geoffrey Todd will answer questions, assisted by Dr. K. M. Hume.

Meetings of Branches and Divisions

BARNESLEY DIVISION

The following officers have been appointed for 1957-8:

Chairman.—Dr. J. Costello.
Vice-chairman.—Dr. L. V. Broadhead.
Secretary and Treasurer.—Dr. J. H. Ritchie.
Assistant Secretary.—Dr. D. H. Pick.

BISHOP AUCKLAND DIVISION

The following officers have been elected for 1957-8:

Chairman.—Dr. J. Leslie.
Vice-chairman.—Dr. F. Robertson.
Honorary Secretary and Treasurer.—Dr. F. Lishman.

BRISTOL DIVISION

The following officers have been appointed for 1957-8:

Chairman.—Dr. R. M. Courtney.
Chairman-elect.—Mr. A. Palin.
Secretaries.—Dr. A. S. Anderson and Dr. Sarah Walker.
Treasurer.—Dr. C. Dix.

DONCASTER DIVISION

At the annual general meeting on June 3 the following officers were elected:

Chairman.—Dr. J. M. Hain.
Vice-chairman.—Dr. R. W. L. Ward.
Honorary Secretary.—Dr. G. R. Outwin.
Assistant Honorary Secretary.—Dr. P. J. Shields.
Honorary Treasurer.—Mr. L. Dougal Callander.

EASTBOURNE DIVISION

The following officers have been elected for 1957-8:

Chairman.—Dr. K. Vickery.
Vice-chairman.—Dr. S. Freedman.
Honorary Secretary.—Dr. D. A. Craib.
Honorary Treasurer.—Dr. F. Marshall.

FINCHLEY DIVISION

The following officers have been elected for 1957:

Chairman.—Dr. V. A. Brady.
Vice-chairman.—Dr. H. Elliman.
Honorary Secretary and Treasurer.—Dr. A. W. Hay.
Assistant Honorary Secretary.—Dr. F. Steel.

LANARKSHIRE DIVISION

At the annual general meeting the following officers were appointed for 1957-8:

Chairman.—Dr. J. Rodger Sutherland.
Vice-chairman.—Dr. G. S. Park Noble.
Honorary Secretary and Treasurer.—Dr. J. C. Macarthur.
Immediate Past Chairman.—Dr. Neil Douglas.

NEWCASTLE UPON TYNE DIVISION

The following officers were appointed at the annual meeting:

Chairman.—Dr. W. Hunter.
Vice-chairman.—Dr. R. Wear.
Past Chairman.—Dr. E. G. Brewis.
Honorary Secretary and Treasurer.—Dr. G. W. Anderson.
Assistant Honorary Secretary and Treasurer.—Dr. G. Cormack.

NORTH-EAST ULSTER DIVISION

The following officers were elected at the annual meeting:

Chairman.—Dr. G. P. McC. Marshall.
Vice-chairman.—Dr. R. A. Monteith.
Honorary Secretary.—Dr. W. J. C. Hill.
Assistant Secretary.—Dr. C. Burns.
Honorary Treasurer.—Dr. S. M. Bolton.

NORWICH DIVISION

At the annual meeting on July 8 the following officers were elected for 1957-8:

Chairman.—Dr. A. W. Taylor.
Vice-chairman.—Dr. R. A. C. Rice.
Honorary Secretary.—Dr. R. H. Scott.
Honorary Treasurer.—Dr. M. H. Clement.

NYASALAND BRANCH

The annual general meeting was held in the Mission Hospital, Blantyre, on May 29. Dr. R. G. Dabb took the chair and 12 members were present. The following officers were elected:

President.—Dr. Hilda I. Goodall.
Vice-president.—Dr. R. N. Weir.
Honorary Secretary and Treasurer.—Dr. A. P. Baker.

PETERBOROUGH DIVISION

The following officers were appointed at the annual meeting on July 24:

Chairman.—Dr. J. I. Williams.
Vice-chairman.—Dr. G. F. Walker.
Honorary Secretary.—Dr. J. Harkness.

SOUTH-WEST WALES DIVISION

The following officers have been elected for 1957-8:

Chairman.—Mr. J. R. E. James.
Vice-chairman.—Dr. D. Gwyn Jones.
Honorary Secretary and Treasurer.—Dr. J. E. Crane.
Assistant Honorary Secretary.—Dr. D. J. Davies.

TEES-SIDE BRANCH

At the annual general meeting the following office bearers were elected:

President.—Mr. A. E. P. Parker.
President-elect.—Dr. R. W. P. Jackson.
Vice-presidents.—Mr. W. Irving and Dr. A. Morrison.
Honorary Secretary and Treasurer.—Dr. J. G. Warnock.
Honorary Assistant Secretary and Treasurer.—Dr. G. Blair.

WILLESDEN DIVISION

The following officers have been elected:

Chairman.—Dr. A. N. Mathias.
Vice-chairman.—Dr. G. Freeman Heal.
Honorary Secretary and Treasurer.—Dr. M. Mundy.
Assistant Honorary Secretary.—Dr. D. J. ...

HUNTERIAN SOCIETY DEBATE STATE-CONTROLLED MEDICINE

It was standing-room only at the annual discussion meeting of the Hunterian Society held at the Apothecaries' Hall, London, on November 18. Many medical and non-medical guests were among the 300 or so present, and it was the first time the Society had held a debate on a medico-political subject. The motion before the meeting was:

"A full-time State-controlled medical service is contrary to the best interests of the patient."

The speakers for the motion were Sir Francis Walshe, F.R.S., and Mr. Douglas Woodruff, and the speakers against were Lord Attlee and Dr. Bruce Cardew.

Common Interest

Sir FRANCIS WALSH, having submitted that the interest of the patient, of the community, of the doctor, and of medicine were but aspects of a common interest, and that what was detrimental to one must be detrimental to all, asked whether a State-paid whole-time medical service could serve the common interest in all its aspects optimally, or could it serve them at all? In posing that question it was necessary, he said, to consider the constitution of the medical profession. It was a corporation set up by Statute, the Medical Act of 1858. Hitherto the centre of organization, the seat of order and of government for doctors had rightly lain within the profession; for the governing body, the General Medical Council, was composed of doctors—men who knew the profession from within, which was the only vantage point from which it could be understood and adapted to the changing conditions of our age.

Move to Whitehall

"Since the coming into force of the National Health Act of 1948 we have lost something of our former freedom, and our situation has been modified for the worse," continued Sir Francis Walshe. "The head and centre of the organization of our profession has moved to Whitehall, and a minutely detailed control of many aspects of the doctor's life has been imposed and is maintained by an unending spate of leaflets from the Ministry." That detailed control lay in the hands of a lay bureaucracy of civil servants, to whom medicine was nothing more than a body of men and women, of activities and of institutions, there to be regulated and administered according to a pattern over which the profession had no control, by persons to whom administration was an end in itself.

Impersonal Relationship

What, then, asked Sir Francis Walshe, could be looked for if a whole-time State-paid medical service was set up? First it would require special discriminatory legislation

against a special group—against the rule of law—and, secondly, in practice it would destroy the doctor-patient relationship. It would destroy incentive amongst doctors and thus reduce the profession of medicine in this country to a dead level of mediocrity. "I believe that this relationship is already deteriorating on the side of both doctors and patients," he said. For the young doctor who had known nothing else than the medical practice of the past decade it must seem easy to regard it as a business affair which could be run on fixed hours. The patient was coming to regard his doctor as but one of the amenities provided under the so-called Welfare State. The mutual consideration and confidence that should subsist between the two was lessening and a state of affairs resembling the impersonal relationship between civil servant and public was appearing in medicine. The more the doctor was treated as a civil servant the more like one he must become.

"I am not saying that in former days every doctor filled the ideal of the good physician," concluded Sir Francis Walshe, "nor am I suggesting that this ideal is not to be found to-day; but I am suggesting that in the past when the doctor fell below this ideal it was from the inherent weaknesses of human nature, and not primarily from the system under which he worked. The system under which he now largely works itself tends to make him take a less high notion of his role."

Ability to Pay

Lord ATTLEE, opposing the motion, recalled that in earlier days good medical service was restricted to the people who could pay for it, except for a certain number at the bottom end of the scale who might get good treatment in hospitals. At the same time, those hospitals were badly distributed and were supported by flag days and other efforts.

The proposer had spoken about the doctor-patient relationship, but what about the old "sixpenny club doctor" in the East End of London from whom the patient obtained his bottle of medicine—where was the close relationship? Again, even if there was that relationship, in those days a doctor could sell his practice and the patients were sold with it. The organization of the health service in those days could not be called organization at all. It was based largely on ability to pay, and distribution of medical care was uneven. It was difficult for many people to obtain adequate treatment, particularly those in the middle class.

Lord Attlee said he was not afraid of too much interference by the State in setting up a medical service. He was afraid of the syndicalist system in which the people of one profession had complete control of it. He was opposed to being bossed by anybody. The genius of the British system was that there was always a lay person over a profession.

Ideal of Service

In his view there were two essentials. The first was that people should have a proper medical service and, secondly, that the community should be well served. He suggested that in the past the community were not really well served. Where the professional code came in they were, but there was a great deal of commercialism as well. There had been real progress in changing the basis of the profession from one of concealed commercialism to one of public service. "I am sure that the further you get away from commercialism and the nearer you get to the ideal of service the better it is for the profession," he said.

There had to be a compromise between the running of a profession by its own people and its necessary subordination to the community. To go one way entirely was wrong. Entire bossing by the profession was wrong, he concluded. Entire bossing by the State was wrong. In his view there was at present a fairly good compromise, but leaning a little too much towards the profession.

Voluntary Association

Mr. DOUGLAS WOODRUFF said that Lord Attlee had ended on a characteristic note of compromise, but the terms of the motion did not suggest a compromise. The real question was, "Where do we go from here?"

In the earlier days, to which Lord Attlee referred, the doctor could go to a particular place and put up his plate, and his ideal was to stay in that place and to grow in his practice with the income and the goodwill that would attach to it provided he was competent and kind. He rested on the good opinion of the people he served, and it was difficult to conceive of a more wholesome or better way in which provision for retirement and old age was made. On the question of hospitals, they had grown and prospered in this country because, more than in other countries, this country had lived by the principle of the voluntary society and the voluntary association.

Mr. Woodruff reminded those present that in 1971 one person in five in Britain would be an old-age pensioner, and that was the time of life when there was the greatest need of a doctor. In his submission, the condition of old age was singularly ill-suited to the contractual relationship with the State which the full-time salaried medical service presupposed. That which was reasonable and feasible in certain walks of life broke down completely in the presence of an ageing population where there was no limit to what could be spent on them and what they might demand. "It is a condition in which the mind is as important as the body," he continued, "where the will to live and the desire to be self-reliant matters greatly; yet we are by public policy extending an invitation to old people and to their children to dump the whole problem on the community." In his view that large section of the community which needed medical attention more than any other was the best argument for maintaining a voluntary service; for maintaining a medical profession with large numbers of doctors engaged also in private practice.

Powers of State

It was tragic, concluded Mr. Woodruff, that there had been a generation of statesmen and thinkers between 1870 and the present time who found the solution to all the material ills which they wanted to remedy in increasing the powers of the State, which meant, in effect, the powers of the civil servants and politicians. That was not the genius of this country. The genius of this country was to have a strong nation rather than a strong State, and in the decades ahead care must be taken not to throw away any of the sources of strength which had stood the test of time. He was surprised that Lord Attlee should object to a powerful profession but approve a powerful civil service. His argument appeared to be that over the civil servants were the politicians. In that case he, Mr. Woodruff, was thankful that watching over the politicians were the journalists and the power of a free press.

High Standards

Dr. BRUCE CARDEW, opposing the motion, said that the argument raised by the previous speaker concerning elderly people was amazing. It was known from experience in the 'twenties and 'thirties that the aged poor of the country had no medical treatment apart from that produced by charity, and charity failed entirely to produce the very thing that age wanted—that is, the best medical treatment which could be provided.

On the question of whether a whole-time State-controlled salaried service would be in the best interest of the patient, he said that out of the 19,000 or 20,000 doctors working in the hospital service something like 16,000 were paid by salary, and he had not noticed that the standards of medicine had dropped remarkably. Again, it would be a rash man who asserted that the standards of medicine practised by the part-time consultant were higher than those offered by those paid on a whole-time basis. Of course medicine was divided into the U and non-U doctors, the former being those paid on a 9/11ths basis and the latter on a whole-time basis; but no one could pretend that the hospital service was not rendering extremely good service to the community.

No Interference

It was difficult to follow the reasoning that somehow the inventive genius of the profession was likely to be stifled because of the threat of a whole-time salaried service. Most of the discoveries in medicine during the last century had been made by people who were working on a salaried basis. Again, was it true to suggest that the State via its Civil Service was cramping the style of doctors? He had never met a case of any sort of interference whatever from Whitehall with the clinical judgment of a doctor.

So far as the future of general practice was concerned, in his view in a modern society it was wrong that the populace should be looked after by doctors who had to find for themselves all the means of treating their patients. It would be a desirable state of affairs if young doctors, when qualified, could go straight into a properly equipped unit with ancillary staff and nurses, as well as having the time in which to do their work properly. In his opinion British medicine would grow in that way. The State would take over the obligation of providing those premises and a decent domiciliary service for the patients and proper hours of leisure for the doctors. "I believe we are moving in the right direction," concluded Dr. Cardew. "We have many lessons to learn and a long way to go; but it would be the gravest possible mistake to turn our backs on this service and move back into the past."

The motion was carried by an overwhelming majority, only about 10 hands being raised against it.

GENERAL MEDICAL SERVICES COMMITTEE

A meeting of the General Medical Services Committee was held at B.M.A. House on November 21, with Dr. A. B. DAVIES in the chair.

Committee on Professional Co-ordination

It was reported that the Council had appointed a Committee on Professional Co-ordination with the following reference:

To consider and report upon ways and means of co-ordinating and unifying the action of various sections of the medical profession.

The Committee was invited to appoint two members to the new Committee. It proceeded to nominate its Chairman and the Chairman of the Conference of Local Medical Committees.

In reply to Dr. O. C. CARTER, who asked whether arrangements could be made for the Private Practices Committee to be represented, the CHAIRMAN stated that the constitution and conduct of the Committee were matters for Council.

The DEPUTY SECRETARY, Dr. D. P. STEVENSON, reported that a letter had been received from the Secretary of the Staff Side of the General Whitley Council in which reference was made to a request to the Prime Minister to receive a deputation to discuss the action taken by the Minister of Health in refusing to implement a Whitley Council agreement on the salaries of clerical staff in the National Health Service. It was suggested that the deputation should consist of the Chairman and Secretary of the General Whitley Council Staff Side, accompanied by the Chairman or nominee of each of the eight functional councils of Whitley.

Dr. STEVENSON reminded the Committee that the Medical Functional Council consisted of representatives of Committees A, B, and C. He said that as time was short the views of each autonomous committee, or its chairman, were being sought on whether the Medical Functional Council should be represented.

After some discussion, the Committee took the view that, since medical remuneration was being reviewed by a Royal Commission whose terms of reference included ways and means of keeping medical remuneration under review, and on which evidence would be given, it would be difficult to take part in the proposed discussion with the Prime Minister. It was decided to convey this view to the Chairmen of Committees B and C.

The Committee, nevertheless, had every sympathy with the staff side of the General Whitley Council, and wished the deputation every possible success in the action which it was taking.

Income Tax on Final Settlement Moneys

The CHAIRMAN reported that a letter had been received from the Inland Revenue, following a meeting on October 23 with Committee representatives. This letter set out the views of the Inland Revenue authorities on the tax treatment of cases where two supplementary payments were received in the same financial year.

The letter pointed out that there was no difficulty where the recipient was assessed on an "earnings" basis. Where, however, a "cash" basis applied, the question arose whether the circumstances were of such a nature as to warrant some special adjustment being made as had been made following the Danckwerts award. After going into the matter carefully, the Inland Revenue authorities did not consider that fully, the Inland Revenue authorities could be made for another on the present occasion a case could be made for another departure from the normal operation of the "cash" basis. In any event the tax concessions in the last budget would mean that in the majority of cases it would not be to the doctor's advantage to spread back the payments. Nevertheless, should it appear that there were actual cases in which substantial hardship would be involved, and details of such cases were forwarded, the Inland Revenue agreed to consider the matter further.

Inducement Payments

The Committee considered a letter from the Ministry of Health in which it was stated that the Ministry was recalculating all existing payments on the basis of an increase of £100 in the income limit, without applying a rigid maximum. That was in accord with the increased inducement payments agreed between the Department of Health for Scotland and the British Medical Association in Scotland. The Committee approved the proposals.

Supplementary Annual Payments

The CHAIRMAN reported that a letter had been received from a practitioner pointing out that in the case of practitioners under 60 years of age the scheme of supplementary annual payments came to an end in March, 1958.

Dr. TALBOT ROGERS asked whether it would be possible to find out from the Ministry how many doctors fell into this category. He thought the Committee should have this information before making any approach to the Ministry. Dr. F. GRAY pointed out that those doctors received supplementary payments solely because originally they had

a basic salary. There were others in similar circumstances who did not receive a salary or supplementary payments. In his view the Committee should hesitate before it expressed willingness to consider further subsidies to people in that category when they were given what was, after all, generous payment for five years.

It was agreed that the position should be explored in the light of information concerning the number of doctors there were in that category.

Remuneration of S.H.M.O.s

The Committee agreed to support the S.H.M.O.s Group Executive Committee on the principle that S.H.M.O.s' remuneration should be 80% of the consultant scale. The principle had already been approved by the Representative Body and the Central Consultants and Specialists Committee.

Unsigned Letters from Consultants

The views of the G.M.S. Committee were sought on whether general practitioners would prefer to receive letters about hospital patients promptly, even if on occasion it meant that the letter was unsigned, or whether they would prefer some delay in order that the letter should bear the consultant's signature. The Committee felt that all letters should be signed personally by the consultant responsible and that to avoid delay consultants who attended hospital infrequently should dictate their letters and then have them sent on by post for signature. (Agreed.)

Discount on Drugs

The Committee received a letter from the Ministry of Health, stating that, in response to its representations and commencing with prescriptions dispensed in the quarter ending December 31, 1957, the basic price of a proprietary preparation for the purpose of pricing would be taken as the retail price less 20%. Where purchase tax was payable, the basic price would be four-fifths of the retail price, inclusive of tax. On-cost, dispensing fee, and container allowance would continue to be paid according to the Drug Tariff.

National Insurance Certificates for Hospital Out-patients

The Committee was asked to comment on a resolution from the Birmingham Regional Consultants and Specialists Committee, which had been considered by the Central Consultants and Specialists Committee, that the former disapproved of the posting of notices in out-patient departments to the effect that National Insurance certificates would be given to patients. Professor Cloake had stated that his Regional Committee was not opposed to hospital out-patients being given National Insurance certificates of incapacity by the hospital staff in appropriate cases. It was, however, opposed to the posting of notices in the hospital which might encourage out-patients to ask for certificates in circumstances where it was more appropriate for the certificate to be given by the general practitioner.

Dr. A. N. MATHIAS proposed that in all cases the certificate should be issued by the person who had clinical responsibility for the condition for which the patient was being treated. (Agreed.) So far as the notice was concerned, Dr. F. E. GOULD said it would seem to rest upon where the notice was sited and the type of hospital concerned. In an accident hospital it was as well for it to be posted in the casualty department, but it should not be posted in the out-patient department of a general hospital.

It was agreed that at the next meeting of the Central Consultants and Specialists Committee the Chairman would mention the points raised.

GENERAL MEDICAL SERVICES DEFENCE TRUST

A meeting of the Trustees of the General Medical Services Defence Trust was held on Thursday, November 21, 1957.

ROYAL COMMISSION ON DOCTORS' AND DENTISTS' REMUNERATION QUESTIONNAIRE ON DOCTORS' EARNINGS

The Royal Commission on Doctors' and Dentists' Remuneration are about to issue a questionnaire on net professional earnings to random samples of doctors and of members of certain other professions. A statement by the B.M.A. and the Joint Consultants Committee is being issued by the Commission with the questionnaire and is reproduced below.

Joint Statement by British Medical Association and Joint Consultants Committee

1. The British Medical Association and the Joint Consultants Committee (representing the Royal Colleges and the Scottish Royal Medical Corporations, as well as the Central Consultants and Specialists Committee of the B.M.A.) have been given the opportunity by the Royal Commission of examining the enclosed questionnaire in draft. As a result of their suggestions it has been substantially modified.

2. They have made it clear, however, and the Commission agree, that in making these suggestions to the Commission they were not in any way committing themselves either to the value of the questionnaire as a method of ascertaining the facts which it seeks to ascertain or to the appropriateness of such an inquiry as a preliminary to determining what should be the future remuneration of the medical profession. They have explained to the Commission that they reserve completely the right to criticize any unforeseen defects in the questionnaire which the inquiry may bring to light; to criticize the results of the inquiry; and to criticize any conclusions or recommendations which the Commission may base on these results.

3. They have informed the Commission that, in particular, they doubt whether the replies from members of the professions with which Medicine and Dentistry are to be compared will reveal the full range of incomes earned, since these professions have no direct interest in the work of the Commission and it is possible that members of these professions earning the higher incomes, particularly as self-employed persons, will feel no obligation to disclose the amounts of their incomes—not to mention the additional emoluments received in many cases as "fringe benefits."

4. They have been given an assurance that they will have an opportunity of examining and commenting on the figures obtained from members of the various professions included in this inquiry before the Commission finally decide upon their recommendations.

5. The doubts entertained by the British Medical Association and the Joint Consultants Committee have been noted by the Commission, who feel, however, that evidence obtained in this way is likely to be more complete than that upon which they would otherwise have to rely.

6. It has been ascertained that the Commission are seeking information about the net professional incomes earned before the war. This information, together with the results of this questionnaire inquiry, might be of assistance in estimating the extent to which effect has been given to the Spens recommendation that adjustments of medical remuneration should have direct regard to the actual increases since 1939 in incomes in other professions.

7. In view of all this, neither the Joint Consultants Committee nor the Council of the British Medical Association believes that there can be any objection to the questionnaire being completed by the doctors selected to receive it. Indeed, they hope that all such doctors, having read this statement, may be disposed to fill in the questionnaire and to return it promptly to the Social Survey, since it is most desirable that the Royal Commission should be helped to complete their

report at the earliest possible date, whether or not their recommendations prove to be acceptable to the medical profession.

W. RUSSELL BRAIN,
Chairman, Joint Consultants Committee.
S. WAND,
Chairman of Council, British Medical Association.

CORRESPONDENCE WITH ROYAL COMMISSION

The following correspondence on the subject of the questionnaire is published at the request of the Chairman of Council of the B.M.A., Dr. Wand, and with the consent of the Chairman of the Royal Commission.

Letter from Secretary of the Commission to Joint Secretaries of the Joint Consultants Committee

August 16, 1957.

Dear Sir Harold Boldero and Dr. Macrae,

Thank you for your letter of August 13 about the draft questionnaire form. Your two suggestions, viz., the inclusion of teaching as a category of medical work and the acceptance of an indication of two forms of practice of roughly equal primacy on the part of consultants, had been previously made to the Royal Commission and have been accepted. I enclose a copy of a later version (Q.15) in which you will see that these and other changes have been made.

I quite understand that the Joint Consultants Committee is not committed to approval of the Royal Commission's terms of reference, and I am sure that you on your part will understand that the Commission have no option but to carry out their remit which obliges them to find out as much as they can about the present incomes of doctors. The Commission have endeavoured to make it clear to all concerned that the close attention they intend to give to the present-day incomes in the medical, dental, and other professions does not at all imply that in reaching their decisions they will pay attention to nothing else. The Commission will certainly pay attention to all the factors which were deemed of importance by the Spens Committees and will hope to receive evidence on these, among other matters, from the profession, but it would be idle for them to shut their eyes to the experience of nine years' actual operation of a publicly organized medical service which was not available to those Committees.

The Royal Commission are most appreciative of the help they are receiving from the Joint Consultants Committee and other medical bodies in the preparation of their work, but, while they hope that their methods and conclusions will finally appear reasonable to members of the professions most closely concerned, they are fully conscious that the responsibility is theirs alone, and they would not for a moment suggest that the many kindnesses they have received from medical men should be turned against the latter in the form of any suggestion that they are committed in advance to approval of the Commission's labours.

What they do hope is that the leaders of the profession will accept the fact that rightly or wrongly an investigation into existing incomes must form part of the Commission's work and must, for good or ill, influence its final result; and the Commission therefore trust that, after due consultation on the mechanics of the survey, the Joint Consultants Committee will help it to be done well instead of badly, by encouraging doctors to answer the questions that will be put to them. Such encouragement need not imply approval of the appointment of the Royal Commission or of its terms of reference and will debar no one from criticizing its report: it need imply no more than a recognition that the investigation is in fact taking place and that it would be a national misfortune if its conclusions were distorted by any partial withholding of evidence.

Yours sincerely,
(Signed) W. A. Fuller.

Letter from Chairman of the Commission to Chairman of Council of the British Medical Association

August 17, 1957.

Dear Dr. Wand,

I was very glad to see you again with some of my colleagues on Wednesday to discuss further details in the questionnaire that we are sending out to a sample of doctors, so as to ensure that it is easy for the recipients to understand and to reply to, and we much appreciate the help we have received from you in framing it.

We have, since considered and accepted your suggestions in the notes interest on practice compensation should be specifically excluded, and that part-time Registrars and "10(b)s" should be referred to in question 3, and that question 8 should be so revised as to cover the period from 1952 and not to exclude doctors who commenced practice within the relevant period. This leaves certain technical taxation points which we will decide after clearing them with accountants and the Inland Revenue.

We attach great importance to this investigation by questionnaire and intend that it should be carried through without delay. Our terms of reference specifically require us to inquire into the remuneration from all sources now received by doctors taking any part in the National Health Service, and it is indeed a normal part of the function of a Royal Commission, as opposed to an adjudicator, to make a wide and comprehensive survey before proceeding to recommendations. Apart, however, from this specific duty laid upon us, it would be impossible for us to express an opinion as to how doctors' remuneration ought to be changed until we know what it is now; diagnosis must precede recommendations for treatment. As you know, the Commission, whatever we may ultimately decide when we have obtained all the evidence, cannot at this stage accept as axiomatic that Spens is binding for all time and that its implementation requires no more than a reassessment of the cost of living. We have to survey the field without preconceptions and form our own opinion as to what would be just. We give considerable weight to the requirement made more specifically to Spens than to ourselves to pay regard to the need to maintain the proper social and economic status of the medical profession and to the Spens' own concern that regard should be had to increases in the remuneration of other professions: we consider it essential to inform ourselves as to how far these requirements have in fact been met.

You raised the important question of the size and composition of the sample which, as agreed with Professor Allen, we now intend shall be taken from lists to be obtained from the Ministry of Health of doctors practising in the National Health Service or holding honorary appointments at hospitals. This will probably enable a larger sample to be taken but its actual size and composition will not be settled until our own statisticians have discussed it with Professor Allen as soon as the latter returns from holiday, in order to ensure that the survey shall be statistically sound.

At a previous meeting we raised with you the question how this questionnaire should be distributed. It would appear to us that there are four possible methods and, judging from our conversations with other professional bodies, there is no uniform preference for one method over the others. The four methods are:

- That the British Medical Association should itself, as the principal authoritative body in the medical profession, send out the questionnaire to the selected sample with a covering letter asking those who receive it to fill in the form and send it back to the British Medical Association who will then pass it on for the results to be recorded and summarized by the Social Survey who are acting on our behalf.
- That the British Medical Association should send out the questionnaire with a covering letter asking those who receive it to fill in the form and send it back direct to the Social Survey.
- That Social Survey should send it out direct and should include with it, or quote, a statement by the British Medical Association advising doctors to reply to it.
- That the Social Survey should send it out direct without any reference at all to the British Medical Association.

I would be grateful if you would let us know as soon as possible which method your Council would prefer. I should add that if the Association prefer to send out the documents themselves, we would be able to provide the necessary stationery and franked envelopes.

I think I explained when you were here, that we intend to send a very similar form of questionnaire to a number of other professions with whom we are at present engaged in preliminary discussions. Here again our aim, in consultation with our statisticians and the leaders of the respective professions, will be to approach samples so selected with regard to the special features of each profession as to give a statistically sound view of the whole range of incomes within them, including self-employed members as well as those in salaried employment and those who have found their way into business management. Should the first response be in any way doubtful it is intended to have a follow-up of non-responders by the staff of Social Survey.

We also discussed the proposal to put forward by agreement to 1955-6 the investigation by the Inland Revenue into the expenses of general practitioners which had been planned for

1956-7. We appreciate your need of information about the effect of changes in rating and do not ask your consent to any change which would deprive you of this. We understand that the Revenue think they can give you what you want by doing a full-scale survey of 1955-6 and a more limited one of 1956-7, but this is, of course, subject to your approval and will, we understand, be discussed between the Revenue and Professor Allen on his return. As regards the use to be made of the figures so obtained, we have carefully considered your views to which, we understand, you now attach considerable importance and I can give you an assurance that if the figures are made available to us, we shall not, without your consent, use them as evidence of anything except expenses.

Yours sincerely,
(Signed) Harry Pilkington.

Letter from Chairman of Council of the British Medical Association to Chairman of the Commission

August 29, 1957

Dear Sir Harry,

I am sorry that, for a reason which I shall explain, I have not been able to reply earlier to the letter which you kindly wrote to me on August 17.

Your letter was considered by the Council of the Association last week and the Council was grateful for your explanation of the position as seen by the Royal Commission and for the assurance given in your final sentence.

The Council discussed the four suggested methods of distributing the questionnaire, and had little difficulty in deciding that methods (i) and (ii) were unacceptable. This is your project, not ours; and, despite any explanation that might be included in a covering letter, the issue of the questionnaire from our office might make us appear to be giving the inquiry a form of sponsorship which in the circumstances would be inappropriate.

The Council, however, certainly has no wish to discourage doctors from completing the questionnaire. On the contrary, it hopes that all doctors who receive it will complete and return it promptly, especially as you have now made it clear that it is proposed to compare present with pre-war incomes in order to ascertain how far the Spens requirements have been met. The Council was therefore strongly inclined to favour the method which you had proposed as number (iii), according to which the questionnaire would be sent out by the Social Survey, accompanied by a statement from the Association in which doctors would be encouraged to answer it; but the Council was anxious to be assured of an opportunity of making a critical examination of the detailed results of this inquiry before the Commission finally decide what value is to be placed on them. I hope that you may see no difficulty in giving us this assurance.

Finally, the Council thought that it would help the Commission to obtain a full response if a statement of the kind proposed took the form of a joint statement by the Association and the Colleges, as represented by the Joint Consultants Committee. I have been having discussions about this with Sir Russell Brain and this is why I have postponed my reply to you. I now enclose a statement, prepared in consultation with Sir Russell, which would meet the wishes of the Council of the Association, and I am authorized by Sir Russell to say that it would have the approval also of the Joint Consultants Committee. I hope that you may consider it likely to prove helpful.

The profession as a whole will naturally expect to be informed of what its representative organizations are doing in this matter, and Sir Russell and I propose, with your concurrence, to arrange publication in the medical press of the letter written, I understand, by the Secretary of the Commission on August 16 to the Joint Secretaries of the Joint Consultants Committee; your letter to me, dated August 17; this letter of mine in reply, with the proposed joint statement; and a further letter which I trust you will be able to send me, informing me of your acceptance of the joint statement and your consent to publication.

Yours sincerely,
S. Wand,
Chairman of Council.

ADDENDUM

As regards the reference to the registrars in the second paragraph of Sir Harry Pilkington's letter of August 17, it has subsequently been agreed that registrars will not be asked to fill in the forms as their earnings can be ascertained centrally.

There is also a reference in the last paragraph of the same letter to an investigation by the Inland Revenue into the practice expenses of general practitioners. The Association has agreed to accede to the Royal Commission's request for a 1955-6 inquiry, but on the understanding that there would be a further full inquiry in respect of 1956-7 or 1957-8.

Correspondence

Medical Guild Funds

SIR,—Dr. R. H. Longton in his letter (*Supplement*, November 23, p. 175) is anxious that the funds of the British Medical Guild should be increased. The fact is that the Guild can have no funds of its own, and operates solely on moneys given from any or all of the Defence Trusts, of which there are three—namely, the Hospitals and Medical Staffs Defence Trust, the Public Health Defence Trust, and the General Medical Services Defence Trust. Funds from these have been, and will be again, available to the Guild. I agree completely that this is the time when these Defence Trusts must be built up as much as possible, and endeavours are being made now to do so. When the Royal Commission reports at some future date, there will, of necessity, be long and protracted negotiations on the findings. There may be a bitter struggle, and the resources of the Trusts through the Guild may well be severely taxed. I am grateful to Dr. Longton for his plea that the three Defence Trusts should be wholeheartedly supported and increased. Only by this means will the profession be in a position, through the financial resources of the Guild, to undertake future negotiation (immediate or remote) from a position of strength.—I am, etc.,

Glasgow, W.2.

KATE HARROWER,
Treasurer, British Medical Guild.

Medical Manpower

SIR,—I was interested and amazed to read of the B.M.A.'s evidence to the Willink Committee (*Supplement*, November 16, p. 152), especially the statement that allegations of overcrowding and unemployment are fictitious. I fail to see how anyone can make this statement when the number of applicants for general practice vacancies often exceed 150 and average, I am told, nearly 40, when it is stated in the press that 200 doctors were unemployed during the recent influenza epidemic, and when newly qualified doctors are averaging 15 months to do their two pre-registration hospital posts. Many of my contemporaries have spent months unemployed trying to get jobs and receiving apologetic replies from G.P.s saying they were inundated with applicants. Is there one N.H.S. vacancy that has not been filled immediately? I have yet to see one readvertised. I cannot imagine that this state of affairs exists in other professions, and suggest that it is about time our B.M.A. representatives took their heads out of the sand.—I am, etc.,

Cheltenham.

J. R. ANDREWS.

Branch and Division Meetings to be Held

BATH, BRISTOL, AND SOMERSET BRANCH.—At Pump Room, Bath, Wednesday, December 4, 8.15 for 8.30 p.m., annual general meeting. Presidential Address by Dr. G. D. Kersley: "Nuclear Warfare."

BROMLEY DIVISION.—At Farnborough Hospital, Wednesday, December 4, 8.15 for 8.30 p.m., popular lecture by Sir Cecil Wakeley: "The Barber Surgeons and Their Successors." Wives and friends are invited to attend.

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Tuesday, December 3, 8.30 p.m., meeting. Mr. N. C. Tanner: "Wind or Flatulence." Members of the St. Pancras Division are invited.

COUNTY ARMAGH DIVISION.—At Nurses' Lecture Room, Lurgan and Portadown Hospital, Tuesday, December 3, 8.30 p.m., meeting. Lecture by Dr. Joseph Lowry: "Some Considerations on Present Day Antibiotic Therapy."

COVENTRY DIVISION.—At Hotel Leofric, Thursday, December 5, 7.15 for 7.45 p.m., Ladies' Night.

EAST HERTS DIVISION.—At Lister Hospital, Hitchin, Thursday, December 5, 8 p.m., clinical meeting.

EAST YORKSHIRE BRANCH.—At Royal Station Hotel, Hull, Thursday, December 5, 8 for 8.30 p.m., annual dinner dance.

GRIMSBY DIVISION.—At Winter Gardens, Cleethorpes, Thursday, December 5, 8 p.m. to 1 a.m., annual dance for members of the profession and their guests.

HOLLAND DIVISION.—At White Hart Hotel, Boston, Saturday, December 7, 8 for 8.30 p.m., joint meeting with local legal profession. Dr. D. H. Fulton: "Interesting Forensic Problems" (illustrated).

HYDE DIVISION AND GLOSSOP MEDICAL SOCIETY.—At Kenilworth Hotel, Cheadle Hulme, Thursday, December 5, 8.30 for 9 p.m., annual dinner dance.

LEIGH DIVISION.—At Casino Ballroom, Leigh, Wednesday, December 4, 8.30 for 9 p.m., dinner, followed by annual ball.

LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, S.E., Friday, December 6, 8.30 p.m., meeting. Mr. S. M. Cohen: "Peripheral Vascular Disease."

LONDONDERRY DIVISION.—At City Hotel, Londonderry, Thursday, December 5, 8.30 for 9 p.m., dinner dance.

MIDLAND BRANCH.—At Birmingham Medical Institute, 36, Harborne Road, Edgbaston, Birmingham, Thursday, December 5, 3 p.m., 96th annual meeting.

MONMOUTHSHIRE DIVISION.—At St. Mellons County Club, Thursday, December 5, 8 p.m. to 2 a.m., annual dinner-dance.

NORTH-EAST ESSEX DIVISION.—At Officers' Club, Abbey Gardens, Colchester, Tuesday, December 3, 8 for 8.30 p.m., meeting. Discussion: "Effects of Gamma Radiation on the Public." Major Duke, lecturer to the Army, will show films and Mr. R. D. S. Rhys Lewis will discuss the medical application of radiation.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, December 3, 2.30 p.m., clinical meeting.

NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Tuesday, December 3, 8 p.m., annual supper meeting. Lecture by Dr. C. H. Catlin: "Recent Advances in the Oral Treatment of Diabetes."

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, December 3, 7.30 for 7.45 p.m., supper; "Therapy with Cortisone." Lecture and film by Dr. J. J. F. Merry.

READING DIVISION.—At Library, Royal Berkshire Hospital, Mr. S. F. Logan Dahne: "Heraldry—Local, General, and Medical" (illustrated). Members' wives are invited.

ROCHDALE DIVISION.—At Turner Hall, Birch Hill Hospital, Rochdale, Saturday, December 7, 7 for 7.30 p.m., annual dinner. Speakers: Professor W. I. C. Morris and Mr. G. K. Tutton. Medical guests are invited.

SCUNTHORPE DIVISION.—At the Blue Bell Hotel, Scunthorpe, Thursday, December 5, 8 p.m. to 2 a.m., buffet-dance. Friends invited.

SOUTH BEDFORDSHIRE DIVISION.—At Warden Tavern, Wednesday, December 4, 8 p.m., annual general meeting.

SOUTH ESSEX DIVISION.—At Hutton Masonic Hall, Thursday, December 5, 7.30 p.m., annual dinner and dance.

SOUTH STAFFS DIVISION.—At Star and Garter Hotel, Wolverhampton, Tuesday, December 3, 8 for 8.15 p.m., supper meeting. 9.15 p.m., B.M.A. lecture by Dr. W. N. Pickles: "Epidemics in a Yorkshire Dale" (illustrated). Wives are invited.

SWANSEA DIVISION.—At Brangwyn Hall, Swansea, Friday, December 6, 8 p.m. to 1 a.m., annual ball.

WEST BROMWICH AND SMETHWICK DIVISION.—At Sandwell Hotel, West Bromwich, Wednesday, December 4, 8 for 8.30 p.m., annual general meeting. Informal supper, followed by address by Dr. William Tregear: "Changing Face of General Practice."

WEST HERTS DIVISION.—At Peace Memorial Hospital, Watford, Friday, December 6, 9 p.m., meeting. B.M.A. Lecture by Dr. J. H. Glyn: "To Use or Not to Use Steroids in Rheumatism."

WEST MIDDLESEX DIVISION.—At Oldfield Hotel, Greenford Road, Greenford, Thursday, December 5, 8.30 for 9 p.m., annual dinner dance.

GENERAL MEDICAL COUNCIL

The General Medical Council met on November 26 with the President, Sir DAVID CAMPBELL, in the chair.

Appointments

Dr. Macdonald Critchley, who was introduced by Lord Cohen of Birkenhead, was appointed a member of the Council, as representative of the Society of Apothecaries of London, for the period of one year from August 20, 1957; and Professor A. L. Banks, introduced by Dr. G. A. Clark, was appointed a member of the Council, as representative of the University of Cambridge, for the period of five years from October 22, 1957.

On the motion of Lord COHEN OF BIRKENHEAD, seconded by Dr. H. GUY DAIN, Dr. E. A. Gregg was unanimously elected treasurer in the place of the late Dr. J. P. Hedley.

PRESIDENT'S ADDRESS

In accordance with the Council's decision that editions of the *British Pharmacopoeia* should be published at intervals of five years, it proposed, the PRESIDENT said, to publish a new edition in March, 1958, which would supersede that of 1953. It would take effect from September 1.

A further list of variations in approved hospitals and recognized house officer posts in the British Isles had recently been issued. The rate of change was such that the issue of a new complete edition of the list might need to be considered next year. There were now 764 approved hospitals with 1,298 medical posts and 1,568 surgical posts. In addition there were 382 posts in midwifery (which the Act allows applicants to count instead of either medicine or surgery) and 24 posts which provided mixed experience. There had been few changes in approved hospitals in colonial territories during the past year, but recently a fourth edition had been issued of the list of approved hospitals in overseas countries excluding colonial territories. Unlike previous editions, the fourth contained only hospitals which had been approved for an indefinite period by the United States of America, seven in Canada, one in France, one in Ghana, and seven in the Federation of Rhodesia and Nyasaland. In addition, a number of other overseas hospitals had been approved from time to time by licensing bodies in connexion with the employment of individual practitioners, but these had been too numerous to be shown conveniently in the latest edition of the list. The names of 206 practitioners, together with a further 43 originally registered in Scotland, were erased from the *Register* recently because they could not be traced. Registrars of the General and Branch Councils had a duty to keep the *Register* correct by erasing the names of practitioners who had died and by making such alterations as might be necessary in the addresses of registered medical practitioners. If no reply from a practitioner to a letter of inquiry from

the registrar to his registered address is received within six months the practitioner's name may be erased from the *Register*. The sending of 8,718 letters to practitioners whose surnames began with the letters Sm to Z was completed this year. No reply was received from 1,881 of these. Further efforts to trace these were successful in all but the 249 now erased.

The first Medical Disciplinary Committee (Procedure) Rules were made in 1951, said the President. Experience of six and a half years had suggested a number of possible improvements. Also the Judicial Committee of the Privy Council had advised a widening of the present rule on admissibility of evidence. Between this session and the next it was proposed to consult (in the words of the Act) "such bodies or persons representing medical practitioners, or medical practitioners of any description, as appear to the Committee requisite to be consulted." The Disciplinary Committee hoped to get its rules revised by next May.

The President concluded by reporting that the new recommendations of the Council on the medical curriculum (*Journal*, June 8, p. 1351, and *Supplement*, p. 327) had, in the main, been very favourably received.

BUSINESS AGENDA

Pharmacopoeia Committee

Dr. H. GUY DAIN, in moving the adoption of the report of the Pharmacopoeia Committee, announced that the new *Pharmacopoeia* was in print and arrangements had been made with the publishers for it to be available for sale by March 3. According to the regulations it would then be able to come into effect on September 1. The number of new drugs was almost incalculable, and two lists of new drugs had been issued since the Council's last meeting in May.

The Pharmacopoeia Committee had elected two new members to the Commission to replace two members who had resigned. The new members were Professor E. J. WAYNE, of Glasgow, and Mr. D. W. Hudson. Mr. Hudson's appointment marked the first time in the history of the Commission that a retail pharmacist had been elected to it.

Application by Practitioner for Removal from
Register

A recommendation by the executive committee that under section 5 of chapter XIV of the *Standing Orders* the Council direct the Registrar to remove the name of Harold George White Cooke from the *Register* was accepted by the Council.

The PRESIDENT said that the practitioner had pointed out certain reasons why his name should be removed, and that he had applied to the Royal College of Surgeons of England and the Royal College of Physicians of London, who granted the applicant's qualifications, and who had intimated that they had no objection to the removal of his name from the *Register*.

University College of the West Indies

On October 28 the Privy Council invited the Council's observations on an application by the University of London for the approval by the Privy Council of the continued recognition of the University College of the West Indies for admission of students to examinations for qualifications registrable under the Medical Act. The President pointed out that in May, 1955, the Council had made no observations on a proposal to continue existing recognition of the College from January, 1955, to December, 1957, and on his direction the Privy Council were informed on November 5 that he did not expect the Council would wish to offer any observations on that application. (Agreed.)

Proposed Recognition of University College, Ibadan (Nigeria)

The PRESIDENT reported that a letter was received from the Privy Council in October inviting the Council's observations on a proposal by the University of London to recognize, in accordance with statute 130 of the University Statutes, the University College, Ibadan (Nigeria), as an institution or school whose students might be admitted to the examinations of the University of London for the degrees of Bachelor of Medicine and Bachelor of Surgery. The Council was fortunate in that one of its members, Dr. E. R. Boland, was one of the inspectors who could speak from his own knowledge.

Dr. E. R. BOLAND said that the hospital, which was recently formally opened, was very modern with full departments and ancillary services. It would challenge comparison with any hospital in this country. It was fully staffed with teachers in medicine, obstetrics, and surgery. The inspectors for the University had made some proposals for strengthening the surgical teams, but they were convinced that the hospital was fully competent to train clinical students. So far as equipment was concerned, he did not think it could be improved.

The Council agreed to recognition being given.

Medical Act, 1956

The PRESIDENT recalled that a year ago Council approved a report by its executive committee proposing minor amendments to correct certain anomalies in the Medical Acts. The first anomaly concerned the person from overseas who came to this country and took a registrable qualification. Although that person might have had long hospital experience, according to the Acts it was still necessary for him to do the prescribed period in medicine and surgery in this country. Amendment of the Act was sought in order to make it possible for the Council to recognize the experience of such an individual.

The second anomaly concerned those who took registrable qualifications in this country before 1953 but who, for some reason or other, did not put their names on the Register. When they desired to become registered in this country they found that it was necessary to do one year in a resident house officer appointment, six months' medicine and six months' surgery, although they might have done far more than that elsewhere.

There was a third provision which was equally important—namely, the provision in the Act that an individual, before he could become provisionally registered, must not only have passed the necessary qualifying examination but must also have proved that he had been appointed to a post in a hospital. That created administrative difficulties.

Dr. J. G. McCRIE said some members of the Conference of Provincial Deans felt that more control could be exercised over graduates if, before they took their first appointment, they had to be signed up as having been selected. That provided an opportunity of explaining fully what was meant by six months' medicine and six months' surgery. Therefore he viewed with trepidation the abolition of the certificate of selection for employment. However, the point

made by the Registrar was recognized—namely, that it normally applied only to the first appointment and not to the second, over which there was no control.

It was agreed that steps should be taken to secure the proposed amendments.

That concluded public business.

MEDICAL DISCIPLINARY COMMITTEE

The Medical Disciplinary Committee of the General Medical Council met on Thursday, November 28, with the President, Sir DAVID CAMPBELL, in the chair.

Applications for Restoration

There were four applications for restoration to the Register. The committee, after hearing representations on their behalf, restored the names of BASIL ARTHUR FURNISS, SUMATAPALAGE REGINALD GUNWARDENE, and FRANK STANLEY MELLOWS. The application for restoration of ROBERT VIVIAN STORER was refused.

Cases Adjourned for Judgment

ADAM CLARK, registered as of 139A, Riddiford Road, Wellington, New Zealand, was represented, in his absence, by Mr. N. Vengroff, solicitor, upon the further consideration of his case, in which judgment had been postponed in November, 1955. Upon his conviction on May 10, 1955, at the Central Criminal Court of conspiracy to defraud dog owners and persons wagering at greyhound racing tracks by administering drugs to animals running in such races, he had been sentenced to 15 months' imprisonment. Mr. WIDGERY said he had produced nine testimonials from various people, among whom were a doctor, a justice of the peace, a bank manager, and a police officer.

The committee decided that, in view of the satisfactory information which had been received concerning his conduct, his name should not be erased by reason of the conviction.

Similar decisions were made in the cases of CLARENCE JAMES JOHN SILVEIRA, registered as of 34, Hodgkin Park Crescent, Benwell, Newcastle upon Tyne, upon whom judgment had been postponed in November, 1956, upon an accusation of canvassing, and JOHN KELVIN, registered as of 1446, Dumbarton Road, Glasgow, in whose case judgment had been postponed in November, 1955, subject to an interim appearance in November of last year. He had been accused of associating with an organization in the U.S.A. known as the Akers' Hair & Scalp Clinics which had procured for him advertisements and reports in American newspapers.

NEW CASES**Dr. J. B. Adams**

The committee next inquired into the case of JOHN BODKIN ADAMS, registered as of 6, Trinity Trees, Eastbourne, who pleaded guilty at the Sussex Assizes in July to three indictments alleging forgery, false representations, obstruction of a police officer in the exercise of his powers under the Dangerous Drugs Act, attempted concealment of drugs, and failure to keep a dangerous drugs register. He was ordered to pay fines totalling £2,400 and the costs of the prosecution.

Mr. WIDGERY said that, of the three groups of charges, the first concerned allegations of forgery relating to National Health prescriptions for medicines or appliances given to four of his private patients, the second involved the making of false statements on cremation forms in respect of three persons, while the last indictment dealt with charges under the Dangerous Drugs Act, 1951, and the regulations made thereunder. All the incidents had arisen in the course of his practice as a general practitioner in Eastbourne.

Forged Prescriptions

It was improper, under the National Health Regulations, for a doctor to issue prescriptions to his private patients; clearly it was a criminal act for him to forge the name of another practitioner or to sign a prescription in another doctor's name for such a purpose. In count 1 of the first

indictment, Dr. Adams had been convicted of forging the name of a Dr. Emslie upon an E.C.10 form in order to obtain a sputum autovaccine for one of Dr. Emslie's patients who had consulted Dr. Adams privately in January, 1952. There would have been no difficulty in the patient's transfer to Dr. Adams's list if he had wanted to, but, so far as was known, no such suggestion had been made by Dr. Adams. There would have been nothing to prevent the patient getting the prescription from his own doctor in the proper way. When taxed with the matter by Dr. Emslie, Dr. Adams had said he realized it was a very silly thing to do, expressed his regrets, and said he really did not know why he had used the name. Dr. Emslie accepted that apology but left Dr. Adams in no doubt about the serious view he took of the incident. Despite that rather unpleasant experience, Dr. Adams had repeated the offence on three further occasions by signing prescription forms *per pro* other doctors, although using his own signature.

False Representations and Obstruction

Dealing with the second indictment, Mr. WIDGERY outlined the purpose and nature of the formalities preceding cremation. It was alleged that on three occasions Dr. Adams made wilful false statements on Forms B to the effect that he had no pecuniary interest in the death of the patient concerned. The first of these forms related to a Mrs. Amy Ware, who died in February, 1950, leaving property worth about £8,900, out of which Dr. Adams received a legacy of £1,000; the second form related to the death at the age of 88 of Mr. J. P. Downs in May, 1955, who had included Dr. Adams in his will as a legatee for a similar sum. Mr. A. J. Hullett, the subject of the third Form B, died in March, 1946, aged 71, and from him Dr. Adams had received a legacy of £500.

The incidents the subject of the third indictment all arose out of a visit by Detective Superintendent Hannam and two other police officers to Dr. Adams at Eastbourne in November, 1956, for the purpose of executing a warrant directing Police Constable Brynley Pugh to conduct a search under the Dangerous Drugs Act.

In Defence

Mr. N. LEIGH TAYLOR, of Messrs. Hempson's, Solicitors to the Medical Defence Union, who appeared for Dr. Adams, pointed out that it was almost exactly a year since his client had first been arrested on charges in connexion with the subject-matter of the third indictment. Since then he had never been free of trials of some kind. He had practised in Eastbourne ever since 1922, and had never previously been in any sort of trouble. He had occupied positions in various local professional bodies and committees over the years, all of which involved some election or voting of some kind in his favour by his colleagues.

The intense publicity which all phases of his case had received had increased to an appreciable extent the burden which had fallen upon those who had had to defend Dr. Adams. Mr. Taylor then gave a detailed account of the ordeals which he said his client had experienced in the last twelve months. Dr. Adams had received letters from no fewer than 150 of his patients in Eastbourne, and, without exception, they expressed conviction of his innocence of the accusations made against him and had something grateful or pleasant to say about what he had done in the past.

Turning to the charges under consideration, Mr. Taylor said that Dr. Adams, who had been described by the learned judge at Lewes as "breaking the regulations left, right, and centre," could be shown, in seven years, to have made only five errors in respect of prescription forms. It had been open to him to suggest the transfer to his own list of the person named in connexion with the first prescription count, but for three years he had refrained from doing so because he had not wanted to take patients from another doctor's list. With regard to the cremation certificates, the prosecution's medical witnesses themselves had agreed that they had never known the particular question in Form B to be

answered in any other way. In so far as Dr. Adams had erred in that respect, he had done so in the company of some, at least, of his professional colleagues in the same area.

Although the trial judge had been unconvinced of the truth of Dr. Adams's explanation of the offences which were the subject-matter of the third indictment, Mr. Taylor submitted that the committee were not bound by that. In fact, Dr. Adams had qualified some 35 years ago in Belfast and had no recollection of ever having received any instructions about keeping a dangerous drugs register. From then on, in the hospital service and then in general practice in Eastbourne—where, up to 1949, his partnership had employed a fully qualified dispenser who had no doubt kept proper records—the thought of a dangerous drugs register had never passed through his mind.

Mr. Taylor, summing up his remarks, said he hoped he had convinced the committee, first, that the offences in the first indictment were the result of no other motive than the well-being of Dr. Adams's patients; that his false statements on the cremation certificates had been no more than what the judge had described as "stupid lies"; and that, as regards the third indictment, the offence of not keeping a register was the result of inadvertence and the other two charges arose out of a stupid act done in a moment of panic. "If ever a man stood before you with a claim to the mercy of his professional colleagues, that man is Dr. Adams."

After an eleven-minute discussion *in camera*, the Chairman announced that, by reason of the convictions proved against Dr. Adams, the committee had directed that his name should be erased from the Register.

Dr. Adams has 28 days in which to appeal.

A report of the remainder of the Disciplinary Committee's business will appear in next week's Supplement.

**FELLOWSHIP FOR FREEDOM IN
MEDICINE****ANNUAL GENERAL MEETING**

At the annual general meeting of the Fellowship for Freedom in Medicine, held at Caxton Hall, Westminster, on November 23, the Fellowship's document entitled "Towards a Reformed Health Service" was discussed. This was followed by an Address by Sir FRANCIS WALSH, F.R.S., on "The Price of Freedom." This is published in full at page 1361 of this week's Journal.

Unjustifiable Assertion

At the conclusion of Sir Francis Walsh's address, three resolutions were before the meeting. Mr. R. S. MURLEY moved that:

Whereas the highest medical and nursing standards of this country have for many years been the admiration of others, this meeting takes strong exception to the constantly repeated assertion, by politicians and propagandists, that the National Health Service is "the envy of the world." There is no justification whatsoever for this assertion, which is completely refuted by the fact that no other country has attempted to base a Health Service on the British system.

The resolution, he said, arose from a feeling of resentment that certain people, notably politicians and propagandists, were busy cashing in on the real and supposed merits of the National Health Service, and, more important, that such people sought to credit the Health Service with virtues which bore no possible relationship to the National Health Service Acts.

Mrs. K. M. LOGAN DAHNE seconded the resolution, which was carried.

The next resolution, moved by Dr. D. B. HITCHINGS, was as follows:

The futility of the recent attempts to negotiate on the question of the doctors' remuneration has glaringly revealed how the pro-

fession has been deprived of any power to control its own destiny. This meeting therefore instructs the executive to intensify its efforts to secure revision of the N.H.S. Acts and the setting up of an independent court of arbitration.

Dr. C. P. WALLACE seconded the resolution, which was carried.

A third resolution

That this meeting reaffirms its belief that it is in the best interests of the National Health Service and an act of common justice that private patients should be supplied with their drugs and appliances on similar terms of equity as apply to N.H.S. patients.

moved by Dr. JOHN ETHERIDGE, and seconded by Dr. A. V. RUSSELL, was also carried.

Next Step

Speaking on the next step, the Chairman, Dr. R. HALE-WHITE, said that the profession was in a worse position than a year ago. Events might develop in various ways. He thought the Royal Commission's report was more likely to be favourable than otherwise—but that was not worth much. Neither side was bound by its findings. Leaving aside the Royal Commission, as being an instrument for procrastination and nothing more, they found the profession still ranged against its employers, but with a difference, because it became more and more difficult for the Government to find money for an increase in remuneration. Indeed, it would seem now to be impossible. There had already been an edict that the Treasury should not finance an increased cost in any of the concerns for which the State was financially responsible—and of course the N.H.S. was one of these.

There were two escape routes. The Government and the profession could co-operate to produce a new Health Service, but Dr. Hale-White did not think it was likely that the Conservative Party would voluntarily risk this unpopular step within a year or so of a General Election. For all its faults there was no doubt that the present N.H.S. was popular with millions in the country—so was every other method of spending other people's money. Alternatively the doctors could give notice of resignation, and if they did so in sufficient numbers the Service would collapse and a new system would be evolved. This would be a very different matter for the Government. It would be the profession who would be unpopular and not the Government. If this came about, in spite of temporary inconvenience, the public would gain in the long run, as they would get a better Health Service, for the speaker thought it inconceivable that, once free, the doctors would ever submit to party political control again. They would then have only a single loyalty—namely, to their patients.

Dr. Hale-White thought there was a likely chance that such a situation might arise. The Government had already fired the first shot in its battle against inflation. If it gave way, even in part, to the demands of any nationalized industry, there would be such disillusionment and disgust throughout all the ranks of the National Health Service—medical and lay—that there would rapidly ensue a widespread resignation from the Service and it would break down. On the other hand, if the first shot of the Government's was the beginning of an unwavering stand against inflation, then the basic expenses of the Service could not be met and it would be shown up to all for what it was—an ill-devised and extravagant luxury which the country could not afford.

Administrative Inflation

On this theme, some very interesting facts were coming to light in the dispute between the Minister of Health and Nalگو, continued the Chairman. There were, for instance, 40,000 clerks and administrators in the Health Service—rather more than all the doctors put together. At one hospital in London—King's College—the administrative and clerical staff was under 30 in 1948; to-day it was 160. "Please note," said Dr. Hale-White, "that the Guillebaud Committee could not find that 'there is any large inflation of clerical or administrative staff at the present time.'"

It must not be thought that those non-doctors in the Health Service included nurses or personal secretaries. They were mostly clerks who spent their time entering up the sort of information about patients that a general practitioner did in the ordinary course of his work without extra cost to the nation. Another large body spent their time collecting and rendering information to regional hospital boards and the Ministry. That was subsequently translated into statistics which were out of date before they were compiled.

"We in the Fellowship are convinced that some sort of Health Service is very desirable for the country," said Dr. Hale-White. "If the present Service sank it would have served a purpose in showing the pitfalls to be avoided in any system which replaced it. It did not matter whether the new scheme was theirs—as outlined in 'Towards a Reformed Health Service'—or one based on it or completely different, 'so long as it brings the doctor and patient together again and gives the country proper value for money.' When the profession's testing-time came, possibly in the spring, it must not yield to bullying or temptation. There must be no question of the Government saying, 'Do this and your pay will be so and so.' Rather should it say, 'This is the sum we can afford; how comprehensive a Service can you give for it?'"

Secretary's Report

Dr. E. C. WARNER, the Fellowship's honorary secretary, reported on the year's work. The medical membership was now 2,005, compared with 2,016 a year ago, and the lay membership 180. A memorandum of evidence had been submitted to the Cranbrook Committee on maternity services, and this evidence had expressed the Fellowship's anxiety to restore midwifery to the overall care of the family doctor, for whom obstetric beds should be available. The Guillebaud Committee's report had been subjected to critical commentary, which was widely quoted in the press, and this had been followed up by the publication of the Fellowship's outline of a new plan for subsidized personal insurance ("Towards a Reformed Health Service"). A document was now being prepared for the Royal Commission on doctors' and dentists' remuneration setting out the Fellowship's views on methods of remuneration other than by capitation fee.

The executive committee had been strengthened by the addition of five new members: Drs. J. M. Alston (London), B. Burns (Sheffield), D. R. Harrocks (Bournemouth), Miss G. Sandes (London), and Mr. H. Duckworth (Honorary Solicitor).

HOSPITAL ADMINISTRATIVE STAFF

NEW GRADING STRUCTURE RECOMMENDED

New gradings for hospital administrative staff are recommended in a report¹ by Sir Noel Hall, principal of the Administrative Staff College, Henley-on-Thames, published on November 25. Sir Noel was asked by the Minister of Health and the Secretary of State for Scotland in January to make recommendations for the immediate overhaul of the existing grading and salary structure of the hospital service's administrative and clerical staff. It will be for the Whitley Council concerned to determine by negotiation the actual salaries of the various groups, but the report states that it would be an advantage in the grading structure to which the new salaries would be attached being settled by other means. This report comes at a time when the Minister of Health has just vetoed a 3% pay increase recommended by the Whitley Council for administrative staff with salaries below £1,200 per annum (see *Supplement*, November 9, p. 145).

The main faults found by Sir Noel in the present administrative structure were that it offered poor promotion

¹ Report on the Grading Structure of Administrative and Clerical Staff in the Hospital Service. H.M.S.O. 2s. 6d.

prospects, and was not sufficiently attractive for the better-qualified school-leaver. Relation of salaries to responsibility measured in terms of numbers of hospital beds—the points system—should be abolished. The position of the hospital secretary should be improved and it is recommended that he should be given specific responsibilities. Direct control of senior appointments made by hospital management committees, either by the Ministry or by regional boards, is not recommended; as an alternative the building up of an information and advisory service to be organized initially at regional board level is suggested.

Sir Noel Hall recommends the abolition of the existing lettered grades and their replacement by (1) a general clerical grade together with a supervising clerical grade; (2) separate grades for both shorthand-typists and machine operators, together with provision for specialist supervision where this is required; and (3) three administrative grades—the first is junior administrative, the second general administrative, and the third senior administrative.

Existing designated grades with a maximum equal to or below the level of present grade G should, Sir Noel says, be assimilated to the new grades recommended above, and remaining designated posts be reclassified as super-scale posts.

BIRMINGHAM REGION CONSULTANTS

ANNUAL MEETING

Professor G. I. STRACHAN, Chairman of the B.M.A.'s Hospital Staffing Committee, was the guest speaker at the Annual General Meeting of the consultants and specialists of the Birmingham region on November 15. He gave an appreciation of what, he said, was the present rather unsatisfactory position of hospital staffing which had arisen largely from the failure of the Ministry to accept the safeguards against exploitation of intermediate grades of staff, which were essential requisites of any scheme acceptable to the profession.

It was accepted generally that appointment to consultant rank must be competitive and that therefore there must be some unavoidable wastage of aspirants. It was of paramount importance that the major sorting-out of potential specialists should take place at the intermediate registrar level before they were too deeply committed to a hospital career. Once promoted to senior registrar, the opportunity for ultimate further promotion to consultant must be made more favourable, and a ratio of about five chances in six was considered a reasonable aim.

In the discussion which followed, representatives of the regional registrars group gave an account of future prospects situation in the region. Their forecast of future prospects was rather a gloomy one. After analysing the fate of past Birmingham region registrars, and deploring the long tenure of some present registrars, an estimate of probable consultant vacancies in the next few years was given. This figure contrasted unfavourably with the potential number of candidates for such posts.

Certain proposals were made for improving the situation. The main ones were that senior registrar posts should be fewer in number and, in the major specialties, should be held only in the teaching hospitals. No further senior registrars should be appointed except as vacancies arose among the present ranks, and annual increments in registrar pay should continue, if necessary, after the fourth year of tenure of a post. These proposals would imply some redistribution of registrar and senior house officer establishments, and some increase in the consultant establishment, particularly in the periphery of the region.

Professor Strachan indicated that certain of these suggestions were already being implemented or discussed. He pointed out that, whereas some increase in consultant establishment was probably needed, no vast expansion could be contemplated, nor was it, indeed, necessary.

Dr. G. E. OWEN WILLIAMS was in the chair.

FRANKS COMMITTEE REPORT WELCOMED

N.H.S. TRIBUNAL CHAIRMAN'S REPORT

In his report on the work of the National Health Service Tribunal for England and Wales for the three-year period July, 1954, to July, 1957, the Chairman, Sir Reginald Sharpe, Q.C., welcomes the recommendations of the Committee on Administrative Tribunals and Inquiries (the Franks Committee, see *Journal*, November 9, p. 1103). In his evidence to the Committee Sir Reginald said that it would be preferable for an appeal from a decision of the Tribunal to lie to the High Court instead of to the Minister of Health, as at present, and that the Tribunal proceedings should be in public. He therefore notes with satisfaction that the Franks Committee has recommended the latter, and also its recommendations that there should be no right of appeal from a decision of the Tribunal, and that the Tribunal's jurisdiction should be extended to cover the hearing of appeals from disciplinary decisions of executive councils—appeals which at present go to the Minister of Health.

Six Cases

The Tribunal directed that the practitioner's name should be removed from the executive council list in six cases during the three-year period under review. They concerned three medical practitioners and three dentists. In the first three-year period there had been fifteen cases in which the Tribunal directed that the practitioner's name should be removed from the list—namely, one medical practitioner, two chemists, nine dentists, and three opticians—and in the second three-year period there were seventeen such cases—namely, seven medical practitioners, six dentists, and four opticians. No representation against a chemist was made during the third three-year period, just as there had been none during the second three-year period.

Correspondence

Distribution of Income

SIR,—Your leading article on "Evidence to the Royal Commission" (*Journal*, November 23, p. 1225) prompts me to ask if, in fact, there has been justice within the profession, or, perhaps, more important, will there be justice within, in the future? The cutting down of the size of lists hit the top-income man, and the new distribution after the Danckwerts award further cut his "differential," so that, until the 5% award, the top-income man had received an increase of only 4%, whereas the middle man had received 46%.

Surely this is rather strange, for is it not a fact that it is the lowering of our relative financial position as compared with previously comparable groups that is the basis for our pay claim, and the very essence of Spens? I bring these facts to your notice, Sir, not in any spirit of complaint, but because I note that some planner is now suggesting that 2,000 patients should be the upper limit and that, generally speaking, more pay at the bottom and less at the top should be the future policy.

If all this comes to pass, so be it, but I am old-fashioned enough to plead that at least we should be allowed to keep our patients, even if we are not paid for them, for, whatever others may say, I am still happy with my 4,000+ patients, and, with all humility, I believe they are quite happy with me.—I am, etc.,

A. A. CLAY.

Newport Pagnell, Bucks.

Senior Registrar Problem

SIR,—We, the undersigned, subscribe to the following opinions on the senior registrar problem. Rightly or wrongly, for better or for worse, the Health Service is in effect and by intention the only employer of nearly all

the doctors in this country. As a Service it must therefore consider its obligation to its officers exactly as the Army does.

The problem of the passed-over senior registrar is in no way different from the problem of the passed-over major. The Army does not normally dismiss majors who fail to obtain promotion. The Army major (except the unfortunate victims of the recent axe) would normally expect security of office for a period long enough for him to bring up his children, and a reasonable pension at the time of his retirement. The senior registrar is entitled to expect similar security of employment should he be unable to obtain promotion. The Health Service is well known to be under strength in consultants and over strength in senior registrars. A partial solution of the passed-over senior registrar problem would therefore occur if the Service were brought up to consultant strength. But the problem of security of employment would still exist for some of the unsuccessful senior registrars and for their successors, for it is not possible for the hospital service to function without its junior officers, especially the senior grades, who are key men just as majors are in the Army. The only way of dealing with the insecurity of these men's position is to take them on for a long period with proper increments of salary and pensions. The passed-over officer is a regrettable but inevitable phenomenon and nobody on entering a Service would expect as a right to be promoted to the very top. We cannot all be generals or even colonels. The nomenclature of these junior officers is beside the point. Any name will do, and changing the name of a passed-over senior registrar will not alter his circumstances.

The Government, therefore, has a clear and twofold duty. First, it must fill its establishment of consultant posts. Secondly, it must give long-term security of employment to its junior medical officers, and the junior medical officers who fail to get promotion will have to sigh and be thankful at least for freedom from gnawing anxiety about the future. In our opinion that is all the senior registrars expect, and the Government will be guilty if they fail to provide it.—We are, etc.,

Public Health Remuneration

SIR,—At a time when restraint in salary and wage demands is clearly desirable one is reluctant to add to the correspondence on the subject, nevertheless I cannot resist drawing attention to a current example of the parlous condition of public health remuneration in relation even to the existing rewards in other branches of the profession. I refer to the advertisement on page 60 of the *Journal* of November 16. For the honour of taking up an appointment as medical officer of health of a county borough, where for good measure he will also be principal school medical officer and director of welfare services, a doctor is offered the handsome inducement of £1,800 per annum, with a few paltry increments of £55.

I quote this instance because it is an example of a senior appointment in the public health service having responsibility for all local health and welfare services—one of only 83 of its kind up and down the country. What an incentive for the young aspirant in the public health service to encourage him to take his additional qualifications and serve the necessary years in junior appointments. Will Committee C of the Whitley Council please note with urgency? Many

more examples could be quoted from your advertisement columns, all, to our shame, within the terms of the present agreements.—I am, etc.,

Eastbourne.

KENNETH O. A. VICKERY.

Remuneration Claim

SIR,—When I last wrote to you (*Supplement*, February 23, p. 94) I expressed the fear that, by the misdirected approach of our leaders to the Minister, we would blunder into defeat. That fear has unfortunately been fulfilled, and our leaders, by their unbelievably feeble efforts as negotiators, have succeeded only in dividing the profession and forfeiting our confidence and trust. Upon the failures of the past depends our policy for the future. So let us briefly recapitulate for a moment the dismal sequence of events since the days of brave words, of being "on the eve of severe conflict with the State," of the "profession getting geared for action," of "weapons sharpened now," etc.

(1) It was contended that the Government were under a definite contractual obligation to agree to an immediate and satisfactory settlement of our claim of 24%. And, of course, there was no such legal contract. (2) Negotiations were conducted under the threat of mass withdrawal from the Service. But cold feet supervened and dissuaded our leaders. (3) Mass resignation was then whittled down to phased temporary withdrawal in selected areas—areas where such action would most embarrass the Government. This was "the best thing that could be offered"—Dr. A. B. Davies (*Supplement*, May 11, p. 258). But even that was abandoned. Thus was a "phased" climb-down just about complete. (4) Then the cry went up for arbitration. But the Chairman of Council added this rider, "If an adjudicator, who ought to be a judge, produced a fair figure . . . the doctors would accept it" (*Journal*, March 2, p. 508). Is it any wonder then that the Government said "No"? In any case, the issues in the opinion of reasonable men were too deep and irreconcilable for arbitration. (5) Finally, it was decided not to co-operate with the Royal Commission. This decision was later reversed, accompanied by an avalanche of words intended to prove that changed circumstances justified the volte-face. But we were not impressed.

And so the war machine, geared for action, creaked and groaned to a standstill. The sharpened weapons were found to be blunt. The men who so impetuously mounted their steeds shouting "Spens for ever" dismounted. And the battle was lost. In all fairness to our negotiators it must, however, be admitted that they were encouraged by the fireside soldiers on the periphery who bravely voted for withdrawal but, when the hour of battle approached, lacked the courage for action—unless everyone else in the area was prepared to do likewise. Let us be honest with ourselves in future and face up to realities. These events I have recapitulated more in sorrow than in anger. I have done so in the hope that the blunders of the past will not be repeated, because I believe they have done more to lower the prestige of the profession than anything else.

And now, what of the future? Alas, in the *Supplement* of October 26 (p. 137) I see we have not learned the lessons of failure. The old machinery is being dragged out again in the forlorn hope that it will work better this time. So once again it is mass withdrawal versus withdrawal in selected areas, and what form an alternative health service should take, etc. My views as a G.P. (and I have good reason to believe they are shared by a vast number of the profession) are as follows.

(1) *Mass withdrawal*.—This is doomed to failure. With all its attendant discomfitures to both patient and doctor, how long would we survive this precarious way of life? Not long, and the Government knows it. Yet some easy minds believe the Government would capitulate in a week. (2) *Temporary withdrawal in selected areas*.—This, of course, means the doctors, unpaid, would run the Government's service for them. And with no embarrassment to the Government whatever. So also is this idea doomed. (3) *Alternative service*.—The medical profession has failed to produce an alternative and better service. And the reason is not far to seek. And it is this. They can't. There is not much wrong with the Service, and evidently, in spite of all our criticisms, we are happy to remain in it if the remuneration satisfies us. Great publicity is given to the fact that many doctors

are leaving the country, but that great numbers of doctors are clamouring to enter the Service is scarcely mentioned (Hush!—keep it quiet, the Government are fools and don't know). Our leaders seem to be imbued with the idea that we want a different method of payment, partly on a per item of service basis. We do not. Let us therefore concentrate on improving the present Service and stop nagging. By doing so we will raise the standard of medicine and our own prestige at the same time. (4) *Royal Commission*.—Now we are told (*Supplement*, October 26, p. 137) that, should the situation resulting from the report of the Royal Commission be unfavourable, total withdrawal would most likely find favour with the majority of G.P.s.

I write during the lull when heads are cool. I earnestly hope that in future negotiations with the Government we will discard the methods of the past, of bluff, threats, and obstinacy. Let our representatives in London do some hard thinking. Our leaders have made a complete hash of things and should resign. We want men of wisdom and vision, men who are honest with themselves, who can, with hands washed clean of the past, go to the Minister with a reasoned case and present it with a dignity worthy of our profession.—I am, etc.,

ROBERT RITCHIE.

Perth.

Medical Administration

SIR,—I read with great interest Dr. J. C. Sawle Thomas's plea (*Supplement*, November 9, p. 147) to have medical administration recognized as a specialty in its own right and his attempt to impress upon all doctors the need to ensure that the right men are placed in administrative positions. There is little one can add to the points he has made bar give examples, but I would note that a man's station in life tends to be estimated by the amount which he is paid, and therefore how well he dresses, where he lives, the type of car he rides in, and so on. This situation can be made worse in the eyes of other doctors when the low salary for a post attracts persons of poorer ability and medical standing. The position of regional psychiatrists is a good example. At the commencement of the Health Service these were all persons who enjoyed consultant status for the clinical portion of their duties, but who were paid at a lower rate for their work as regional psychiatrists. The discrepancy in the two halves of their earnings was not apparent to them until the salaries to be paid to consultants were published some time after they had taken up their administrative posts. Their number is diminishing annually and they are having to be replaced by administrative medical officers, frequently with no psychiatric experience. Psychiatrists appointed to local authorities are another example. The salaries offered can only attract people of inferior status, and yet the Royal Commission is urging that more and more responsibility for psychiatric patients be placed upon the shoulders of local authorities.—I am, etc.,

F. J. S. ESHER.

Sheffield, 6.

Medical Record Envelopes

SIR,—Concerning the lack of correlation between sizes of reports and record envelopes argued by Dr. C. C. M. Watson (*Supplement*, October 5, p. 122), Dr. E. M. R. Frazer (*Supplement*, October 19, p. 134), and Dr. R. J. Phillips (*Supplement*, November 23, p. 175), the alteration of record envelope sizes would be a useless and expensive procedure as long as reporting authorities fail to realize the size of report required by the general practitioner. Furthermore, old reports designed to fit in the present envelope would still have to be accommodated.

The only permanent solution to this problem is for hospitals, etc., to realize that we do require reports to be 6½ in. by 4½ in.; meanwhile we must try temporary expedients—by 4½ in.; and used by Dr. Phillips (scrapping reports that suggested and used by Dr. Phillips) is a good and writing a summary of each on the M.R.C. is a good one, but is confusing to other doctors, to whom patients may be transferred. I have records forwarded from a doctor

using this system in perfectly good handwriting, with each report neatly indicated by a red rubber-stamped arrow, and I still find I need to know exactly what each consultant has written and that it is better to have these reports filed in date order.

My own solution is even simpler. For a small outlay I have obtained a photographer's 7-in. guillotine, and I trim all reports down to the required size—in most cases without even one fold. In this way I can accommodate all necessary reports without inserting gusset sides on the envelope. In one case I have 39 reports and 9 continuation cards in one envelope, and these slide in and out with ease, even though the envelope is old and battered and patched. With gusset sides there would be no limit to the accommodation. The most recent hospital report is always to the front, and the current continuation card to the rear, and both can be consulted at a glance. Most of the trimmed-off information (name of hospital management committee, typist's initials, *per pro* signature) is worthless, and any useful notes (date, initials of hospital and consultant) can, if trimmed off, be inserted in the margin.—I am, etc.,

H. DAVIDSON.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Physiotherapy Department, Farnham Hospital, Surrey, Tuesday, December 10, 8.15 p.m., clinical meeting.
 BARNSELY DIVISION.—At Queen's Hotel, Barnsley, Friday, December 13, 8 p.m., meeting. Mr. J. N. Ritchie, F.R.C.V.S.: "Some Problems Common to Medical and Veterinary Science."
 BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, North Shore, Blackpool, Wednesday, December 11, 7.15 p.m., dinner: 8.30 p.m., lecture by Professor A. M. Boyd: "Management of Arteriosclerosis of the Lower Extremities."
 CROYDON DIVISION.—At Kennard's Restaurant, Croydon, Thursday, December 12, 7.30 for 8 p.m., annual dinner and dance.
 DEWSBURY DIVISION.—At Dewsbury General Hospital, Friday, December 13, 8.30 p.m., meeting. Dr. William Whitaker: "Heart Failure in Chronic Lung Disease."
 DORSET DIVISION.—At Nurses' Teaching Unit, Dorset County Hospital (The Old Vicarage), Friday, December 13, 8.30 p.m., general meeting. Address by Mr. M. Pickering Pick: "Pain in the Arm, and Common Allied Problems."
 EAST HERTS DIVISION.—At Lister Hospital, Hitchin, Thursday, December 12, 8.15 p.m., meeting to which members of South Bedfordshire Division have been invited. Papers by Dr. I. C. K. Mackenzie, Dr. G. H. Rittman, and Mr. J. J. Shipman and Mr. A. G. Young.
 EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, December 12, 7.30 p.m., dinner: 8.45 p.m., meeting. Dr. F. M. Hall: "Radioactive Isotopes."
 EAST NORFOLK DIVISION.—At Dining Room, Royal Hotel, Norwich, Saturday, December 14, 8.45 p.m., social evening with a chat on Witchcraft by the Reverend M. Tyler Whittle. For members, their wives, and guests.
 EAST YORKSHIRE BRANCH.—At 68, Park Street, Hull, Wednesday, December 11, 8.30 p.m., meeting. B.M.A. Lecture by Dr. W. R. S. Doll: "Mortality of Doctors in Relation to their Smoking Habits."
 ENFIELD AND POTTERS BAR DIVISION.—At Nurses' Recreation Room, Chase Farm Hospital, Enfield, Wednesday, December 11, 8.30 for 8.45 p.m., meeting. Address by Dr. C. Allan Birch: "Medical Accidents."
 GUILDFORD DIVISION.—At Board Room, Royal Surrey County Hospital, Thursday, December 12, 8.30 p.m., meeting. Dr. H. J. Wallace: "Relation of Dermatology to General Medicine."
 HASTINGS DIVISION.—(1) At St. Helen's Hospital, Tuesday, December 10, 8.15 p.m., clinical meeting. (2) At Queen's Hotel, Hastings, Friday, December 13, 7.30 for 8.15 p.m., annual dinner and dance.
 HENDON DIVISION.—At Hendon Hall Hotel, Ashley Lane, N.W., Tuesday, December 10, 8.45 p.m., clinical meeting. Mr. Oliver Jones: "Observations on the Veterinary Attention for Captive Wild Animals." Friends of members are invited.
 KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Tuesday, December 10, 8 p.m., meeting. Professor C. G. Rob: "Arterial Grafting as it Affects General Medicine."
 MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Out-patient Department, West Park Hospital, Macclesfield, Sunday, December 8, 10.30 a.m., clinical meeting. The Medico-Pathological

Society invites all B.M.A. members in the area of the Division to attend. Cases by Dr. J. D. Allan, followed by short paper: "Renal Abnormalities in Relation to Abdominal Pain in Children."

MIDLAND BRANCH.—At Wilton Room, Grand Hotel, Colmore Row, Birmingham, Friday, December 13, 12.30 for 1 p.m., luncheon for newly qualified graduates.

NORTHERN IRELAND BRANCH.—At Orpheus Ballroom, Belfast, Thursday, December 12, 8 for 8.30 p.m., dinner-dance.

PADDINGTON DIVISION.—At Lecture Theatre, Wright-Fleming Institute, St. Mary's Hospital Medical School, Norfolk Place, W., Tuesday, December 10, 8.45 p.m., annual general meeting. Film on rheumatoid arthritis: "One Man's Challenge."

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, December 10, 8.30 p.m., meeting. Mr. W. I. Daggett: "Use and Abuse of Nasal Decongestants."

RICHMOND DIVISION.—At Reception Rooms, Watney Brewery, Mortlake Green, Friday, December 13, 8 p.m., general meeting. Lecture by Mr. A. R. Makey: "Some Aspects of Thoracic Surgery" (with lantern slides).

ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Wednesday, December 11, 8.30 p.m., meeting. B.M.A. Lecture by Miss Rose Heilbron Q.C.: "Legal Responsibilities of Doctors." Members of City and Hampstead Divisions are invited.

SCARBOROUGH DIVISION.—At Pavilion Hotel, Scarborough, Thursday, December 12, 7.45 for 8.15 p.m., annual dinner.

SHROPSHIRE AND MID-WALES BRANCH.—At Raven Hotel, Thursday, December 12, 7.30 for 8 p.m., dinner-dance.

SOUTH-EAST ESSEX DIVISION.—At Garon's Banqueting Hall, Southend-on-Sea, Friday, December 13, 7.30 for 8.15 p.m., annual dinner-dance.

SOUTH MIDDLESEX DIVISION.—At Casino Hotel, Tagg's Island, Monday, December 9, 9 p.m., annual general meeting.

TUNBRIDGE WELLS DIVISION.—At Pembury Hospital, Tuesday, December 10, 8.30 p.m., clinical meeting.

WARRINGTON DIVISION.—At Lymm Hotel, Wednesday, December 11, 7.30 for 8 p.m., Divisional dinner for male members. Male guests are invited.

WEST DENBIGH AND FLINT DIVISION.—At Marine Hydro, Rhyl, Thursday, December 12, 7.15 for 7.30 p.m., dinner: 9 p.m., B.M.A. lecture by Dr. T. D. Kellock: "Pregnancy and Diabetes."

WIGAN DIVISION.—At Lewis' Restaurant, Wallgate, Wigan, Thursday, December 12, 8 for 8.30 p.m., buffet supper; 9.15 p.m., address by Mr. Thomas Moore: "Significance of Haematuria" (illustrated by lantern slides).

Meetings of Branches and Divisions

BOURNEMOUTH DIVISION

The following officers were elected at the annual general meeting:

Chairman.—Mr. J. W. Nankivell.
 Vice-chairman.—Dr. E. G. R. Grant.
 Honorary Secretary and Treasurer.—Dr. A. S. Ogden.
 Honorary Assistant Secretary.—Dr. R. G. Nicholson.

DORSET DIVISION

The following officers have been elected for 1957-8:
 Chairman.—Dr. T. V. Cooper.
 Vice-chairman.—Dr. E. H. Parkinson.
 Honorary Secretary and Treasurer.—Dr. A. N. Blades.

LEWISHAM DIVISION

The following officers have been elected for 1957-8:
 Chairman.—Dr. T. V. Mendelsohn.
 Vice-chairman.—Dr. S. Ida Fisher.
 Secretary.—Dr. R. Li. Meyrick.

LINCOLNSHIRE BRANCH

The following officers have been elected for 1957-8:
 President.—Dr. N. V. M. Dodds.
 Vice-president.—Dr. V. G. Best.
 Honorary Secretary.—Dr. J. Cottrell.

NORFOLK BRANCH

The following officers have been elected for 1957-8:
 President.—Dr. J. S. Stuart.
 President-elect.—Dr. K. A. Latter.
 Vice-presidents.—Dr. P. S. Marshall and Dr. I. C. Robertson.
 Honorary Secretary.—Dr. A. Batty Shaw.

WEST SUSSEX DIVISION

The following officers were elected at the annual general meeting held on July 7:
 Chairman.—Dr. A. G. Ross.
 Vice-chairman.—Drs. A. S. Partridge and T. L. Scott.
 Secretary and Treasurer.—Dr. T. P. Mulcahy.

WOOLWICH DIVISION

The following officers have been elected:
 Chairman.—Dr. A. Sidgwick.
 Vice-chairman.—Dr. R. Burns.
 Honorary Secretary and Treasurer.—Dr. C. Clark.

ROYAL COMMISSION DELAYED
LETTER FROM CHAIRMAN

The B.M.A. has received a copy of the following letter written by the chairman of the Royal Commission on Doctors' and Dentists' Remuneration to the Minister of Health and the Secretary of State for Scotland.
 December 3, 1957.

Dear Mr. Walker-Smith,
 Shortly after the Royal Commission was appointed I undertook that if it appeared that evidence was not going to be received in sufficient time for us to complete our task by Easter, 1958, I would so inform you.

The task is proving more complicated and is taking longer than I had expected when we were appointed: much of the important preliminary evidence is only coming in now, and, as our questionnaires to members of all the professions are only now being issued in stages over the next two months, some of the evidence will not have been completed until after Easter. There is, therefore, no chance that our report and recommendations will be ready until some considerable time after that.
 I would not like to make any estimate at this stage as to when our task will be completed, but I should like to assure you that the Royal Commission remains fully conscious of the urgency.

Yours sincerely,
 (Signed) Harry Pilkington.

The possibility that the Commission's task might take longer than expected was raised with Mr. Vosper, then Minister of Health, by the Chairman of Council in May of this year. The Minister, in a letter dated May 15, stated:

I think, however, that should the chairman of the Royal Commission make a statement to this effect [that the Commission's report was unduly delayed] your Council can be assured that I would be prepared to consider any representation they may make.

The Council will be considering this new development at its meeting on December 18.

ROYAL COMMISSION ON DOCTORS' AND
DENTISTS' REMUNERATION
FIRST ORAL EVIDENCE

The Royal Commission on Doctors' and Dentists' Remuneration held its first public session at 10, Carlton House Terrace on December 5, when oral evidence was given by representatives of the Socialist Medical Association and the Whole-time Consultants Association.

Interested in Facts

At the outset, the Chairman of the Commission, Sir HARRY PILKINGTON, said representatives of bodies who appeared

before the Commission would understand that the Commission would naturally wish to test the truth of what were said to be matters of fact, since the Commission above all was interested in facts. Questioning would imply neither disbelief nor sympathy. For convenience the task of looking at documents had been given to two committees of the Commission; the chairman of the committee which had studied the memoranda from the two organizations represented was Sir David Hughes Parry, Q.C. Much of the evidence submitted by some bodies—and this applied to some of the evidence of the Socialist Medical Association but not that of the Whole-time Consultants Association—was of interest but was strictly outside the terms of reference. The Commission would be asking questions on this for information, but would not make recommendations.

Whole-time Service Economical

The Socialist Medical Association was represented by Dr. D. Stark Murray, President, Dr. Horace Joules, Vice-president, and Dr. David Kerr, Secretary. Dr. MURRAY said the association had a membership of just over 2,000, of whom about 470 were doctors and 30 dentists; the rest were every type of health worker. There were also associate members, individuals, and organizations such as trade unions.

Sir DAVID HUGHES PARRY asked about the statement in the S.M.A.'s written evidence that "the principle already established in the National Health Service for all but a small group of health workers, that of whole-time salaried employment, must be established for all if a satisfactory method of payment is to be worked out. Particularly is this method of payment to be worked out. Particularly is this method to be more economical (as shown by Titmuss and Abel-Smith) but more efficient and conducive to a far higher standard of medical care."

"Would it be fair to say that you base that reason—the economic—on the article written by Titmuss and Abel-Smith?" Sir David asked. Dr. MURRAY replied: "We base it on our own general experience, but it so happens that Titmuss and Abel-Smith have given the only published figures available." The part-time consultant used a good deal of time, for which the National Health Service paid. In going from hospital to hospital. This led to a great deal of inefficiency in the hospitals because one was never able to organize the work of the hospital with such accuracy as one could with whole-time people who were known to be on the spot and expected to be on the spot. Dr. JOULES said that splintering of appointments was fantastic, particularly in certain specialties, such as otorhinolaryngology. In reply to the CHAIRMAN, Dr. MURRAY said there was no suggestion that private practice should be legally imposed.

¹ Abel-Smith, B., and Titmuss, R. M., *The Cost of the National Health Service in England and Wales*, 1956. Cambridge.

to have been given and signed by Mr. Homi Shapurji Mehta, well knowing that such certificate had not in fact been so signed and given, and that the statements in it concerning the nature of the appointments he had held were untrue.

The accused pleaded guilty on July 28 at the County of London Quarter Sessions to unlawfully attempting to procure himself to be fully registered by virtue of a certificate which he knew to be false. He had been granted a conditional discharge and ordered to pay costs. As a conditional discharge was not regarded as a "conviction" for the purposes of the present proceedings, it would be necessary to prove the charges.

Mr. H. J. PHILLIMORE, Q.C., who, with Mr. JOHN MOYLAN, appeared on behalf of Badve, said there was nothing he could say which would palliate the offence itself; it was right that Badve had not been as frank as could have been wished. This 31-year-old man had done a silly and dishonest thing. There were available tributes to the value of his services and general behaviour in a number of hospitals since July, 1954, showing him to be a conscientious practitioner who got on well with his fellows.

Counsel submitted that all the evidence disclosed Badve to be a young man who, but for his incredibly stupid act, obviously had a good future before him.

The committee decided that the facts proved were abundantly capable of supporting a finding that the accused had been guilty of infamous conduct in a professional respect, and postponed judgment for six months. Meanwhile he would be required to furnish the names of professional colleagues and other persons of standing to whom the Council could refer for confidential information on the accused's conduct in the interval.

Defending counsel were instructed by Messrs. Davies (Evan) & Co., Solicitors, of Buckingham Gate, S.W.1.

Working as Railway Porter

ALEXANDER WINCHESTER ST. CLAIR GREIG, registered as of 26, Kersland Street, Glasgow, W.2, made his second appearance following postponement of judgment for two years in November, 1955, subject to an interim appearance in November, 1956. He had had, over 13 years, three convictions for driving a motor-car when under the influence of drink. Mr. WIDGERY said that there were testimonials.

The CHAIRMAN asked Dr. Greig what work he was doing. Dr. Greig replied that he was working as a railway porter. The CHAIRMAN: Why are you not working at your profession?—I cannot get a job. How long have you been working as a railway porter?—Nine months. Have you been off-duty during that time?—No. Have you tried getting a job?—Yes I have, but I do not get much encouragement. Not even a hospital job?—I have been in touch with the B.M.A. and various other people. Did they know about this hanging over you?—Yes. But your habits have been completely sober since you were here before?—Yes.

After the committee had deliberated *in camera* the CHAIRMAN announced: "In view of the satisfactory information concerning your conduct, which has been given to the committee in confidence, they have determined that the Registrar shall not be directed to erase your name from the Register by reason of the convictions proved against you. That concludes the case. May I express the personal hope that you will soon be able to be employed as a doctor?"

The committee also decided, in view of satisfactory information, not to erase the name of JOSEPH WHITE O'BRIEN, M.C., registered as c/o W. H. Winder and Woodhouse, solicitors, 23, Sun Street, Lancaster, who had four convictions involving drink, three of them concerning a motor-car. Judgment had been postponed for two years, subject to an interim appearance in November, 1956.

Judgment Postponed Again

JOSEPH JOHN McMENEMY, registered as of Burnside, Bargeddie, Glasgow, was not present but was represented

by Mr. Baylis, of Messrs. Hempsons. Judgment had been postponed following two convictions for being in charge of and driving motor-cars when under the influence of drink.

Mr. WIDGERY told the committee that Dr. McMenemy was abroad. Judgment had been postponed until May, 1957, when the committee were told that he had gone to a hospital in America, to take up an appointment. Mr. WIDGERY understood that since May the practitioner had been dismissed from the hospital for intemperance, neglect of duty, and unethical conduct.

Mr. BAYLIS said that what Mr. WIDGERY had said was news to him to a certain extent. Messrs. Hempsons received a letter in which Dr. McMenemy said that he had left the United States of America and taken up an appointment in Canada, and supplying the names of references. Mr. Baylis pointed out that he had not had an opportunity of seeing the letter before the committee referred to by Mr. WIDGERY. The letter was not evidence against his client, nor was what Mr. Baylis said evidence either. But his instructions were that those facts were disputed, and that Dr. McMenemy was not dismissed because of intemperate habits but for other reasons.

When the committee had deliberated *in camera*, the LEGAL ASSESSOR announced that he had advised them that they could obtain evidence from America either in the form of statutory declarations or their equivalent or by arrangements for persons to make statements in circumstances which would enable Dr. McMenemy or his legal advisers to participate. If in the interval between now and next May—to which date the committee postponed judgment—it was thought desirable to do that, Mr. Baylis would be forewarned.

The committee decided that the evidence so far received concerning Dr. McMenemy did not warrant the case being discharged. Before May, 1958, he would again be asked to furnish the names of professional colleagues and other persons of standing to whom the Council would be able to apply for information on his conduct and habits in the interval.

Judgment Postponed for Six Months

Mr. HAINES, solicitor, on behalf of DAVID PHILIP LEWIS-BADGETT, registered as of Manor Lodge, Mossley, Manchester, who was not present, admitted convictions. These were for being in charge of a motor-car when under the influence of drink or drugs (date of offence January 15, 1951) and for being in charge of a motor vehicle when under the influence of drink (date of offence October 29, 1954). The hearing of the case by the committee had been postponed since 1956 in the light of medical certificates that the practitioner was unfit to travel to London. Mr. WIDGERY said that he had had a leg amputated, he had a neuroma on the site of amputation, and he had intermittent haemoptysis.

Mr. HAINES said that Dr. Lewis-Badgett had been a Welsh international Rugby player and a swimmer. After a successful medical career he was stricken with a grave illness. He was never completely free from pain, but at times it became wellnigh intolerable. The two offences for which he was convicted were associated with bouts of severe pain and illness. On one occasion he had taken "physeptone" with some alcohol. He had a very big practice before any of this started—he was in partnership with his wife—and the numbers remained virtually the same; it was a good practice of about 4,000 patients.

The committee decided that convictions appeared to indicate habits that were detrimental to the practitioner and his profession and might well be a danger to patients. To give him an opportunity to overcome his tendency to drink to excess, they postponed judgment for six months.

Supplying Tablets to Procure Miscarriage

The committee adjourned the inquiry into the case of ARTHUR ALFRED HILL, registered as of 25, Holywood Road, Belfast, until their session in May, 1958, in order that the

Council's solicitor could obtain further information on the circumstances leading up to a second conviction. This was a conviction at Belfast City Commission on indictment of supplying tablets to another person with intent to procure a miscarriage (date of offence between August 1 and 31, 1956) for which he was sentenced to three months' imprisonment. The first conviction was at Belfast Petty Sessions in 1950 of driving a motor-car when under the influence of drink. He was then fined £5, with an alternative of one month's imprisonment, and his driving licence was suspended for 12 months. The committee found the convictions proved.

Mr. WIDGERY said that he had had great difficulty in obtaining any information concerning the convictions. The information on the first was given on the certificate of conviction. With regard to the second, he had obtained a newspaper report in which the judge was reported to have said that he thought the doctor's trouble was that he had been drinking and dropped into this sort of thing.

Dr. HILL told the committee that he was on holiday when the first offence was committed. He admitted he gave the tablets, but he was led to believe that the woman was only a few days past her periods. A man was charged with aiding and abetting by receiving the tablets, and he was found not guilty.

Testimonials to Dr. Hill were read.

Gross Indecency

JOHN MILLER HUNTER MITCHELL, registered as of 96, Spottiswoode Street, Edinburgh, was found to have been convicted on July 9, 1957, at Portsmouth Magistrates' Court, after pleading guilty, of importuning for immoral purposes (fine, £25), and at the Sheriff Court, Edinburgh, on August 27 of committing acts of gross indecency with another male person (£10 or 60 days' imprisonment).

Mr. BAYLIS, on behalf of the Medical and Dental Union of Scotland, who appeared for Dr. Mitchell, said that he was not permitted to go to school until he was somewhat older than usual. As a result of his upbringing he became a shy and nervous boy and man and one who remained lacking confidence in himself. After qualification in 1940 he joined the Royal Naval Volunteer Reserve and served for five years. During a sentimental holiday at Southsea he became acutely depressed and the first offence was committed. When he returned to Edinburgh he found to his distress that a small report had appeared in the Edinburgh newspapers. The hospital authorities suggested that the proper course would be to resign, and he did so. During the next six-seven weeks he tried to get other appointments. It was at this period that the second offence was committed. Immediately afterwards he placed himself in the hands of the Davidson clinic. It was hoped that psychiatric treatment would help him to adjust in some way to his disability.

The committee took a grave view of the convictions. They decided to postpone judgment until their session in November, 1959, but they expected Dr. Mitchell to appear before them at their meeting in November, 1958. Before that time he would be asked to furnish the names of professional colleagues and other persons of standing to whom the Council could apply for information on his conduct in the meantime.

Forged Prescription

ROBERT CREMONA, registered as c/o Midland Bank Ltd., 62, Westbourne Grove, London, W.2, appeared before the committee following conviction at Bow Street Magistrates' Court in May of obtaining, with intent to defraud, 30 tablets of "dicodid" and 100 tablets of "suavitil" by means of a forged National Health Service prescription, for which he was fined £5, 13 similar offences being taken into consideration, and procuring, contrary to the Dangerous Drugs Act, 1951, 30 tablets of dicodid, for which he was fined £5, ten similar offences being taken into consideration. He was represented by Mr. Baylis, on behalf of the Medical Defence Union.

Mr. WIDGERY said that this was a case of a doctor forging prescriptions in the name of another practitioner in order to obtain drugs for his own use. He admitted the offence. He said he had done it in order to obtain the drugs when he had no money.

Mr. BAYLIS said that Dr. Cremona sincerely regretted his foolish act. There were certain mitigating factors. Dr. Cremona was 33 years of age and was born in Rome. Before he could take the second part of the final M.B. examination at King's College Hospital he contracted tuberculosis and spent the next three years in a sanatorium. In 1951 he resumed his studies and qualified. He took a number of hospital appointments, but unfortunately became oppressed with the idea that he was going to have a relapse of the tuberculosis. He was very much alone; his parents had returned to Italy. He developed bronchitis and had a fairly long spell out of work, and was frightened to consult his own doctor as he would have ordered a chest x-ray. He started treating himself. His doctor gave him, in October, 1954, a number of E.C.10 forms signed, with which Dr. Cremona obtained preparations for the treatment of tuberculosis, but his anxiety increased to such an extent that from January to May, 1956, he voluntarily went to the Maudsley Hospital. On his discharge he became even more depressed and anxious. He had to seek National Assistance. He had run out of the E.C.10 forms signed by his doctor, and he foolishly obtained blank forms. He was taking no drugs or medicines whatsoever now and had secured an appointment with a chest clinic. Mr. Baylis read a number of testimonials from doctors.

The CHAIRMAN told Dr. Cremona that the committee took a grave view of convictions of this nature. Judgment would be postponed for one year until November, 1958, when he would be asked to furnish reports on his habits and conduct in the interval.

Under Influence of Drink

Two convictions of being in charge of a motor-car when under the influence of drink were admitted by WILLIAM DAVID SMITH, registered as of 118, Marlborough Park Central, Belfast.

Dr. Smith was not represented. Mr. WIDGERY read a letter on his behalf from Mr. W. E. Robinson, who was Dr. Smith's solicitor until he retired from practice as a solicitor in February last. "With regard to the first offence, which occurred at 10 o'clock in the evening, Dr. Smith was not on medical duty nor was he liable to be available for calls. Regarding the second offence in May of this year, Dr. Smith had in fact at the beginning of 1956 ceased general practice and, naturally enough, was not subject to medical duties on that occasion."

The CHAIRMAN: Are you in practice at the moment? Dr. SMITH: Not at the moment. I am working at home for the fellowship.

The committee postponed judgment for one year.

Improper Relationship

WILLIAM FREDERICK HOWSON RAY, registered as of Kennoway, Ashley Road, Hale, Cheshire, was charged with infamous conduct in a professional respect in that from December, 1956, to February, 1957, he behaved improperly towards and had sexual intercourse with a woman patient, who had since died, with whom he stood in professional relationship.

Mr. WIDGERY said that the complainant was a Mr. J. A. Beetson, who was the patient's brother-in-law, but as Dr. Ray admitted these charges he would not be called. A letter from Mr. Beetson was read. A copy of this letter and a statutory declaration had been sent to Dr. Ray, and he was asked for an explanation. Dr. Ray had replied to the Registrar that he much regretted having to admit the misconduct, which worried him at the time, and he had most bitterly regretted it ever since.

in the teaching hospital. No person should be appointed to a senior registrar post without at least two years' clinical work in his proposed specialty at registrar level. There should be a sufficient number of senior house-officer posts in the teaching hospital for preliminary postgraduate training (this would enable the senior registrar establishment to be reduced). These changes would require some expansion of consultant staffing in peripheral hospitals. As it was now accepted that a senior registrar post was not limited in tenure, annual increments of salary should continue after the fourth year. No new senior registrars should be appointed except as vacancies arose, and transitional posts should not be continued beyond the present holder.

Commenting on these proposals, Dr. Shinton said that his Group turned down the idea of a "junior consultant" because it felt it was cheap labour. Its second proposal—that there should be no middle-grade registrar posts in the teaching hospital—was made because they had to think of the staffing of the peripheral hospitals. There was more suitable clinic material in these hospitals for the man thinking of taking his higher qualification than in a teaching hospital. The aim of the proposal to require two years' clinical work at registrar level was to avoid a person taking a research post for two years and then climbing up the ladder the back way.

Dr. H. WATSON said there was nothing in these suggestions (from London and Birmingham) which the Council had not thrashed out before, and Dr. F. T. PAGE considered that there was a growing feeling among not only junior hospital staff but also consultants that some form of "junior consultant" must come. They had to be clear what they meant by this type of post. One conception was a permanent career grade, analogous to the S.H.M.O., and another was a true assistant consultant as there was before the war.

Dr. R. P. CUMMING said that the "short-term" solution in the North-east Metropolitan Group's proposals had been rejected before; it was more or less what was suggested in the Strachan report.

He raised the question of the interpretation of the Minister's undertaking that regional boards should give security of tenure until the completion of the staffing review. Regional boards claimed that there was no such agreement, he said. What was the point of prolonged negotiations if people did not honour their agreements?

It was agreed that the Chairman, armed with definite evidence, should approach the Joint Consultants Committee and ask for its support in an attempt to get a written agreement to replace the existing verbal one.

Evidence to Royal Commission

The Group Council spent a considerable time debating the memorandum of evidence it wished submitted to the Royal Commission on Doctors' and Dentists' Remuneration. First, there was a resolution from the North-east Metropolitan Region Group that the Group Council should seek the widest possible publicity in both lay and medical press to all evidence submitted to the Royal Commission. It was understood that after the Royal Commission had received a copy the memorandum should be sent to the medical press. It was stated that the Group Council's memorandum would go to the B.M.A.'s Consultants and Specialists and Evidence Committees and would be treated as one of the series of documents which would be forwarded to the Commission following the main document on the profession's claim. The Group Council expressed a wish to give oral evidence as well.

While endorsing the general claim of the profession for proper betterment, the document dealt with other factors, such as lack of promotion prospects and insecurity of tenure, which caused serious financial loss to hospital junior staffs. The meeting decided that the salary of senior house officers should also have an incremental rise in the same way as registrars and senior registrars. Dr. HONEY instanced the position of the more senior man who had tried general practice, and decided to come back into hospital.

Dr. WATSON, extending the moral support of the Scottish Group Council for the evidence being produced by the Central Group Council, hoped that the Central Council would similarly give moral support to the memorandum of the Scottish Council. This contained an analysis of prospects which showed just how bad these were. Of 250 senior registrars in Scotland of average age 35, 41 had already been senior registrars for at least four years. Many others had held senior registrar appointments before the present one. The chances of a senior registrar in Scotland getting a consultant post there had been worked out. There were five appointments per annum, assuming these all went to Scottish senior registrars. [See *Journal*, p. 1426.]

Appointments

The present representatives on the Central Consultants and Specialists Committee—Mr. R. Brearley and Dr. G. R. Venning, with Dr. J. E. Forster and Dr. F. T. Page as deputies—were re-elected, it being understood that if a vice-chairman was elected he should be the second representative. Dr. Page was nominated to the Central Medical Recruitment Committee.

WINCHESTER DIVISION

ANNUAL MEETING AND DINNER

Dr. IAN GRANT, immediate past chairman of the Representative Body of the B.M.A., responded to the toast of the Association, proposed by Dr. J. R. BODINGTON, at the Winchester Division's annual dinner on November 23. A record number of members and their guests were presided over by Dr. J. T. ROWE.

Dr. GRANT spoke of the weakness inherent in a voluntary association which gave full reign to the ways of democracy. Yet this weakness was also its strength. "When we do unite in a big matter of principle, we unite as free and independent individuals." There was no coercion. The increasingly large number of young men and women who came to the Annual Representative Meeting gave him great hope in the future of medicine. A blending of enthusiastic youth, experienced middle age, and a leavening of elder statesmen was what was required. "However much we seem to be drifting apart into the various sections of medicine, however many watertight compartments encircled our varying spheres of usefulness, you and I still know that we must have some common forum where our difficulties and problems can be debated and some common umbrella underneath which we can shelter in time of storm."

As individualists, fully occupied with their own job, few doctors ever stopped to think how their colleagues were faring. "We should all recognize," said Dr. Grant, "that each branch of our profession occupies a position of equal importance in society and that there is no question of superiority and inferiority as between the good consultant and the good general practitioner. . . . Differences seem to have increased with the advent of the National Health Service, and the old personal relationships between consultants and practitioners seem to have crumbled." Perhaps this was because the young graduate now had to choose his particular niche almost on the day he graduated, and there was no longer much likelihood of the consultant knowing anything about general practice or the general practitioner being able to obtain a post on the hospital staff except in a very junior capacity. When they got to recognize one another as friends and colleagues, and got to the verities of the Hippocratic Oath, then they would be well on the way to securing a united front. In Canada, New Zealand, Australia, and even in the small European countries of Belgium, Holland, and Sweden, the profession had been able to resist Government interference and autocracy.

Degrading Wrangles

The B.M.A. existed to promote the honour and interests of the medical profession. "Since the inception of the

National Health Service, we often feel that the lay public, and indeed many of our own members, regard us as fulfilling only one of these objects—the interests of the medical profession." In the press emphasis was always laid on the doctors' demand for more money, and many doctors felt that the constant battle with the Treasury over finance was something unworthy of the profession's great heritage. "Prior to Government control," the speaker pointed out, "we, as doctors, seldom if ever entered into arguments with our patients on the amount of our fees." Perhaps one day it might be possible—in Dr. Grant's opinion it was certainly desirable—to remove the National Health Service from the arena of party politics and let both parties co-operate with the doctors in providing the best service which the country could afford. "It may even be possible to leave to some commission or committee composed of doctors with financial knowledge and economic experts with an independent chairman to keep under review our remuneration in the National Health Service and to remove for ever the squalid, degrading, and almost indecent wrangles with the Ministry over filthy lucre."

There was, in the Council of the B.M.A., a greater realization of the need for the profession to achieve, both in its own interests and in the interests of the common people of Britain, a National Health Service of which one day it might be proud. That day had not yet come. In Scotland, Dr. Grant thought, they were just a little ahead of the south. The presidents of colleges, who were regular in attendance and contributed much of value to the debates. In the south, the Royal Colleges seemed to keep more aloof. In conclusion, Dr. Grant appealed to the younger members to take an interest in the affairs of the B.M.A.—which were their own affairs.

At the annual meeting of the Division, which preceded the dinner, the following officers were elected: Dr. J. R. BODINGTON, chairman; Dr. G. Swift, vice-chairman; Dr. J. Forbes, honorary secretary and treasurer; Dr. R. G. Gibson, honorary public relations secretary.

OPTICIANS BILL CRITICIZED

OPHTHALMIC GROUP COMMITTEE'S MEMORANDUM

The B.M.A.'s Ophthalmic Group Committee held an emergency meeting at B.M.A. House on December 2, with Mr. O. GAYER MORGAN in the chair, to discuss the implications of the Opticians Bill (see *Journal*, December 7, p. 1360).

The Committee took strong exception to the principles of the Bill. Moreover, it had been available only for a week, which was an inadequate period for studying a measure of such importance. The care of the eyes was of particular concern to the medical profession, and it could not be separated from care of the general health. Section 41 of the National Health Service Act envisaged the possibility that the present supplementary ophthalmic service would eventually become part of the hospital service.

The Committee decided to send a memorandum, signed by its chairman, to all members of the House of Commons explaining why it objected to the Bill. The following paragraphs are taken from the memorandum.

Divergence of Bill from Crook Report

The principal ground for objection to the Opticians Bill . . . is that it diverges widely from the recommendations unanimously agreed by the Crook Committee—arrived at after long examination of all the questions involved in the registration of opticians. The Ophthalmic Group Committee accepted in principle the statutory registration of opticians, subject to some indispensable safeguards. Certain important safeguards which the Crook Committee recommended should accompany registration do not appear in the present Bill.

Wide Powers of General Optical Council

Exceptionally wide and undefined powers are to be given to the General Optical Council—wider than those of the General Medical Council—without laying down any adequate safeguards. For example, under clause 4, subsection 2 (a), the right of the public to have a medical eye examination carried out by an ophthalmic medical practitioner at a medical eye centre sponsored by the National Ophthalmic Treatment Board Association—a right which they have enjoyed for 28 years and which has been of great benefit to the public—would be taken away. This would seriously curtail the services rendered, which are of the order of a million medical eye examinations a year. It would also endanger the livelihood of a very large number of ophthalmologists.

Inadequate Medical Representation

The medical profession is, nevertheless, to have only five representatives on the Council out of the 23 members to be established under the proposed Act. This is a quite inadequate representation in view of the fundamental importance of medical knowledge in questions with which the General Optical Council will frequently be concerned. For example, the General Optical Council will be allowed to make regulations to control the administration of drugs by persons who are not medically qualified, and also to regulate the practice of orthoptics by unsupervised opticians. The Bill provides for three additional members of the General Optical Council beyond the number recommended by the Crook Report; five out of the total only are required to be registered medical practitioners.

Definition of Opticians' Functions

The Bill, moreover, is an unsatisfactory measure in a matter which the Crook Committee regarded as fundamental. The Crook Committee, appreciating that its task was to bring some order into the optical field, laid down precise definitions of the functions of the ophthalmic optician and the dispensing optician:

"An Ophthalmic Optician is concerned with the investigation of the functions of vision, with a view to the correction or relief of visual defects due to anatomical or physiological variations, without recourse to medicine or surgery, and with the prescribing, fitting and servicing of optical appliances for these purposes."

"A Dispensing Optician is concerned with the making up of optical prescriptions and the fitting and servicing of optical appliances."

In contrast with this the present Bill supplies no adequate definition of the functions of these two sets of persons. It merely, in clause 2, defines ophthalmic opticians as "persons qualified both to test sight and to fit and supply optical appliances." In the same clause it defines dispensing opticians as "persons qualified to fit and supply optical appliances (whether or not they are also qualified to test sight)." The divergences between the language of the Bill and the definitions of the Crook Report are significant and, from the medical point of view, of the highest importance. It is worth recalling the language used by the Crook Report (para. 118):

"We feel sure that ophthalmic opticians themselves will agree with us that it would be unfortunate if the public were mistakenly to infer that they possess any diagnostic training or ability which properly pertains only to medical men. . . . Their registration should not imply an ability to diagnose ocular or other diseases."

Registers to be Maintained

The Crook Committee recommended that there should be set up a General Optical Council with power to establish and maintain three separate registers to cover the following categories: (1) Opticians who test sight and dispense spectacles as well. (2) Opticians who do dispensing work only. (3) Opticians who do sight-testing only. The Com-

mittee said that they believed that sight-testing opticians would, "by relinquishing the supply of spectacles, one day achieve complete professional status" (para. 66) and then only the second and third registers would exist.

The Crook Committee recognized that opticians who to-day do both sight-testing and dispensing could not reasonably have this right taken away at once, or at any time, without warning. So they also laid down conditions which must be satisfied so that rightful interests were safeguarded and no hardship was caused before the first (dual-purpose) register was closed. In contrast, the present Bill does not specify a date by which the third register must be set up, nor does it provide that at some future date the dual-purpose register will be closed and eye-testing finally divorced from the dispensing and sale of glasses. The Committee feels that this omission from the objects of the Bill is fundamental and contrary to the intentions of the Crook Committee. A further point which must not be overlooked is that there is nothing in the Bill which would preclude sight-testing by unqualified persons.

OPTICIANS SUPPORT BILL

The Association of Optical Practitioners is in favour of the Opticians Bill now before Parliament. Mr. G. H. Giles, secretary of the association, is reported as saying that it would protect the public by preventing quackery. In a circular to M.P.s, the Association of Optical Practitioners said it was difficult to understand the B.M.A.'s objection to the Bill, as it closely followed the Crook Committee's recommendations. If there was a misunderstanding an amendment could be put into the Bill to protect the livelihood of ophthalmic medical practitioners. Opticians would not oppose this.

ST. MARYLEBONE PARKING METER SCHEME

The evidence of the medical objectors to the St. Marylebone parking meter scheme had not been reached when the public inquiry into the scheme by the Ministry of Transport adjourned on December 3 at St. Marylebone Town Hall. They are expected to be called when the inquiry is resumed on December 16. The inquiry is being conducted by Sir REGINALD SHARPE, Q.C. The scheme put forward by St. Marylebone Borough Council covers an area bounded by Oxford Street, Edgware Road, George Street, and Marylebone Road. Parking in this area would be allowed only at parking meters, except for vehicles loading and unloading, which would be able to wait without charge anywhere except at intersections.

Mr. C. W. HUTCHINGS, giving evidence for the Commissioners of the Metropolitan Police, was asked whether he knew that there was a London Local Medical Committee. He said he did not know that. When it was suggested to him that this committee, as a body created by Parliament, should have been consulted, Mr. Hutchings said that he did not think it was the Commissioners' function to consult anybody. The CHAIRMAN: "I do not think it is any more important than that the B.M.A. were not consulted."

In re-examination, Mr. ERIC BLAIN, for St. Marylebone Borough Council, recalled that Mr. W. B. Harris, counsel for the B.M.A., had suggested that doctors would be at the mercy of Marylebone parking meter attendants. Mr. HUTCHINGS agreed that they were at the mercy of the police now. Asked what view he took of doctors' chances of being able to leave a car near their patient's residence if there were 500 cars parked legitimately instead of 1,000 as at present, Mr. Hutchings said he thought they would find it easier. Replying to Mr. W. B. HARRIS, for the B.M.A., Mr. HUTCHINGS said that they had come to the conclusion that there was no necessity for the exemption of doctors from the scheme.

BRITISH UNITED PROVIDENT ASSOCIATION

TENTH ANNIVERSARY

The British United Provident Association, which provides insurance cover against the cost of private treatment of illness, recently celebrated its tenth anniversary. Founded in 1947, the association has in the past 10 years increased its subscription income from £125,000 to £2,115,000, and its benefit payments from £86,000 to £1,801,000. It now has nearly three-quarters of a million subscribers. At the outset the association paid 68% of its subscription income in benefits and 20% in administration; now it pays 85% in benefits and 10% in administration. There were no "group schemes" for staffs of companies, etc., in 1947; now there are over 2,500. The number of principal offices in the United Kingdom has increased from four to twelve. In pursuit of its policy of decentralization, the association is opening three new branches at Cambridge, Exeter, and Nottingham.

The association is non-profit-making and is managed by governors who give their services without remuneration. Lord Nuffield is the president, and the chairman of the board is Sir Andrew Rowell.

Scottish News

PUBLIC HEALTH COMMITTEE (SCOTLAND)

A meeting of the Public Health Committee (Scotland) was held in the B.M.A.'s Scottish House, Edinburgh, on November 11. Dr. J. RIDDELL (Midlothian and Peebles Counties) was appointed chairman of the Committee and Dr. J. KELMAN (Perth County) deputy chairman.

Tuberculosis and Diseases of the Chest

The Committee considered the report of the Tuberculosis and Diseases of the Chest Subcommittee of the Central Consultants and Specialists Committee (Scotland). It was agreed that there were some points which merited discussion with the Subcommittee, and it was decided to arrange a discussion as soon as possible.

Car and Subsistence Allowances

The CHAIRMAN reported that the claim on car and subsistence allowances had been referred to the Industrial Court, and was to be considered on November 12.

Building Legislation Committee

The Committee had before it a summary of the recommendations in the report of the Committee on Building Legislation in Scotland. It was agreed that this was a matter which should be referred to a joint meeting of the Committee and the appropriate Committee of the Scottish Branch of the Society of Medical Officers of Health.

Remuneration Subcommittee

The Committee considered and commented upon certain proposals of the Remuneration Subcommittee of the Public Health Committee, and resolved to forward its views on the situation to the Subcommittee.

Health Visitors

The CHAIRMAN referred to certain awards recently made to health visitors, as a consequence of which a nurse holding her health visitor's certificate but combining other duties with her health-visiting work would receive £50 per annum less than a full-time health visitor. Members of the Committee felt that this was likely to have unfortunate repercussions by encouraging nurses carrying out combined duties and holding health visitor certificates to seek full-time appointments as health visitors, and that every opportunity should be taken of drawing the attention of those concerned to this anomalous situation.

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Medical Manpower

SIR.—From personal experiences I can corroborate Dr. J. R. Andrews's report (*Supplement*, November 30, p. 184) to the effect that advertisement of a vacancy in general practice will bring in an enormous number of applications for it. I would add that most of these come from men with adequate preliminary experience of G.P. work and a more extensive hospital training than was enjoyed by the majority of doctors in practice at the outset of the N.H.S. That, of course, is partly due to the necessity for these young men to keep in some sort of employment while they attempt to gain a foothold in general practice.

It may be a good thing that newly qualified men are compelled to remain in hospital longer than their predecessors and the present keen competition for an opening in general practice must also raise the standard of it. Allegations that this unemployment is fictitious are certainly absurd, but if Dr. Andrews or anyone else is going to make it the basis of an argument that entrance to the medical profession should be further restricted, I would profoundly disagree. In the first place, in addition to what I have already pointed out, it must be remembered that these young doctors, though unemployed from the point of view of their ultimate aspirations, are nevertheless doing a lot of useful work that must be performed by men of suitable qualifications and experience. Secondly, they comprise only a small percentage of present medical manpower, and if all of them were immediately absorbed into permanent posts in general practice it would do little to dispel the public impression of a real shortage of doctors created by hours of waiting for medical attention in and out of hospital. Moreover there is also a definite feeling among many patients that, even after prolonged waiting for G.P. attention, the doctor often appears to have too little time to give it.

Here, then, we have the sort of "poverty in the midst of plenty" paradox that is utterly unrealistic, and to base plans for the future on either the impressions of waiting doctors or patients now is largely irrelevant. Even if we could assess the medical manpower needed for defence, nuclear industry, preventive medicine, research, and so forth, with any exactitude on the basis of present-day programmes, we cannot possibly do that in relation to the future of hospital and domiciliary medical services. The truth is that the number of doctors required in future will be secondary to a number of other factors. To take only one: development of hospitals and health centres served by suitable home-to-clinic transport might revolutionize, if not improve, our conception of medical manpower. The truth is that any estimate of the future number of doctors required is subsidiary to the whole problem of the future of the Health Service. Indeed, it is intimately related to the question at present under consideration by a Royal Commission, and to consider it now is to anticipate to some extent the findings of that Commission. I have more than once endeavoured to emphasize the importance of obtaining a firm understanding of permanent value about the doctor's standard of living in terms other than a number of Government of living in terms other than a number of Government printed currency notes. That, in my view, is a prime necessity, though obviously many of my colleagues, as lately demonstrated, are prepared to submit to torn-up agreements and the inevitable debasement that every Government will bring about with every opportunity circumstances present.

Having secured the status of the profession morally and financially, let our representatives and the public representatives work out the standard of medical attention they require both in epidemics and times of national emergency and during relatively healthy periods. Let them plan even another service, and certainly the new hospitals and other institutions with all the ancillary services that will be

required in the next fifty years. Then perhaps there might be a basis on which to estimate the required medical manpower, especially if the economic implications are fully faced. The present unemployment situation is not "fictitious," but the whole relationship of medical manpower to medical needs of the public is artificial, and there would appear to be far too great a tendency to take the *status quo* as a standard, modifying it according to one's particular view on the present unemployment question. In my view, this unadventurous stick-in-the-mud outlook, together with the present fractional tackling of the whole future, combine to present a very gloomy prospect. By all means await the report of the Royal Commission and negotiate a permanent settlement of financial status. Then, with the cost of the elements settled, the rest of the quantitative and qualitative factors relating patients to doctors and other personnel can be planned in the light of what is desirable and what we are likely to be able to afford. Many, like myself, will hope to see more doctors in future attending fewer patients and without any considerable debasement of the doctor. Surely we should at least not preclude this possibility by cutting down the future number of doctors now. What a tragedy it will be if our sons are to enter an atomic age of plenty for which too few have been trained to provide a standard of medical attention consistent with it.—I am, etc.,

J. SHACKLETON BAILEY.

Eye, Suffolk.

Evidence to Royal Commission

SIR.—May I, without impertinence, express my admiration for the drafting of the memorandum for submission to the Royal Commission? In that part of the document which treats of administrative problems there are two statements which seem to me to deserve special emphasis. (1) That it is the privilege and duty of the consultants on the staff of each hospital to advise and guide its administrative authority on all matters of policy and development. (2) That the appointment of more consultant physicians and surgeons is much overdue. I believe that it is common knowledge throughout the hospital service that the majority of those who hold these posts in the general hospital are much overworked.—I am, etc.,

K. W. MONSARRAT.

Faringdon, Berks

SIR.—The evidence to the Royal Commission (*Supplement*, November 23, p. 157) is a workmanlike document, such as the railwaymen and busmen produce. The claim is for a 24% increase—nobody would be more surprised than our negotiators if the Government conceded the 24% increase, or even a 12% increase. Our negotiators have, as usual, omitted the only approach that the Government could not refuse to consider—namely, a 24% increase associated with elimination of wasteful expenditure in the Service.

Every G.P. is aware that millions are being wasted in unnecessary and expensive drugs—and millions are also being wasted on easy sick-pay certificates. Under a capitation system such economies are impossible. Under a salaried service, the economies in the above wasteful expenditure would balance the 24% increase. The brutal truth is that, with the cancer of inflation sapping the life-blood of the country, the capitation system is a luxury which the country cannot afford.—I am, etc.,

B. HIRSH.

Manchester.

Reference to Specialist Clinics

SIR.—It is suggested in the report of the Select Committee on Estimates that the general practitioner should "reduce the burden on hospitals by avoiding unnecessary reference to specialist clinics." But, as Dr. Avery Jones points out in evidence, "the financial incentive acting on the doctor (if he allows it to act) is in favour of his discharging responsibility for anything at all difficult and sending the patient straight to a specialist. What pays the doctor is to have the biggest allowable list of patients, the least allowable equipment, and no conscience about shedding his own load."

This is indeed a fundamental defect of the present system. I would, however, comment that, contrary to popular impression, very few practitioners (and those only in large urban areas) can at all readily alter the size of their lists, and "the least allowable equipment, and no conscience" is not likely to attract a large one. But in any case all this has very little to do with reference to specialist clinics. The vast majority of general practitioners wish to do more for their patients. The so-called "unnecessary" use of specialist departments is more than anything else the inevitable outcome of the lack of ancillary diagnostic facilities. I do not believe this criticism even arises when ancillary diagnostic services are available to general practitioners. Moreover, the resulting opportunity to do so much more for one's patients greatly increases clinical interest. Much higher standards of practice are then attainable. Inevitably a doctor in such a position will tend to have a smaller list and in consequence a smaller financial return—and this is but another anomaly of the system. Where the contrary obtains, the "unnecessary" use of specialist services is said to be extravagant and bad for the clinics. It is probably worse for the general practitioners. They must suffer both resentment and frustration. Can they be blamed if a few do indeed seek the maximum gain by giving the smallest service to the greatest number?

These facts illustrate but a few of many agreed defects in our present system. Is it not time we put an end to fatuous recrimination and set about constructive reform?—I am, etc.,

Stratford-on-Avon.

E. O. EVANS.

G.P.s' Postal Expenses

SIR,—I have received a letter from the clerk of the Middlesex Executive Council this morning to the effect that understamped packages have been received from me on which the council has had to pay a surcharge, for which I am truly sorry.

Practitioners working for executive councils seem to me to be at a disadvantage in having to stamp their packages containing the property and documents of the various councils. The increase in postage just now imposed, of course, makes this heavy item a still heavier burden to be borne by doctors. This morning, by the same post, I received a communication from the divisional medical officer which was officially stamped and enclosed a prepaid envelope for a reply. If the divisional medical officer receives official envelopes for official correspondence, why does the general practitioner still have to pay for official communications between headquarters and himself? The Royal Commission is now sitting and I suggest that the B.M.A. draws attention to this anomaly and seeks to get it rectified.—I am, etc.,

London, W.5.

ROBERT H. BAILEY.

Remuneration Claim

SIR,—In a leading article (*Journal*, November 23, p. 1225) we are told that the Royal Commission may not reach its conclusions until after the life of the present Government has come to an end. As negotiations on the basis of its recommendations would no doubt take months longer, we can fairly look forward to a further wait of, say, three years before a settlement is likely to be reached. There is no guarantee that the Government of the day would accept the Commission's findings, and, judging by events, past and present, we have every reason to believe that it will not meet its responsibilities in this matter. I find this prospect a little disturbing.

Since 1951 the cost of living has risen by approximately 4-5% per annum, so that now it stands 29% higher than when the last settlement was reached. It is not difficult to calculate that, as a result of inflation, we have each lost on average a year's salary altogether since 1951. If the cost

of living continues to rise at this rate, and we must expect that it will, by 1960 our incomes will be worth only two-thirds of their 1951 values. Does anyone seriously believe that we shall ever get more than the merest fraction of our just demand, or that it will be backdated, if at all, by more than a few weeks? Wage and salary restraint is all very well, but neither the Government nor the public has the right to expect us to see our incomes eroded away on this scale and just let the situation drift on.

I submit that we should insist on an immediate interim increase of, say, 15% or 20% backdated to June, 1956. Failing this, we should withdraw entirely from the N.H.S. as soon as this can be organized, certainly not later than the autumn of 1958. Few of us can like taking this step, but I fear that unless we do we shall suffer a permanent substantial reduction in our remuneration.—I am, etc.,

Southampton.

F. L. HEBER.

SIR,—With due respect to Dr. R. W. Cockshut (*Supplement*, November 23, p. 175), I am sure that I am not the only doctor who feels ashamed that, whereas the railwaymen and the busmen have a certain feeling of both loyalty and co-operation, the medical profession has not. This is in spite of the fact that the medical profession should have a stronger comradeship as its members experienced the same long and intense period of training and yet still find themselves unable to co-operate in any form of pay claim. I feel that each doctor should endeavour to review the plight of the profession as a whole rather than his own personal problem.—I am, etc.,

Edgware, Middx.

G. NEWMAN.

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At Birmingham Medical Institute, 36, Harborne Road, Edgbaston, Tuesday, December 17, 8 to 10 p.m., reception and sherry party. Friends are invited.

BRIGHTON AND MID-SUSSEX DIVISION.—At Hotel Metropole, Brighton, Friday, December 20, 8.30 p.m. to 2 a.m., annual ball.

DARTFORD DIVISION.—At the Railway Hotel, Wednesday, December 18, 8.30 p.m., annual social meeting.

EASTBOURNE DIVISION.—At Burlington Hotel, Tuesday, December 17, 8.30 p.m., meeting. Talk by Dr. A. N. Mathias: "What Happens to Your Money."

GLASGOW DIVISION.—At Hall of Royal Faculty of Physicians and Surgeons of Glasgow, 242, St. Vincent Street, Glasgow, Saturday, December 21, 7.30 to 9.30 p.m., cocktail party. Non-medical guests are also invited.

LANCASTER DIVISION.—At Grosvenor Hotel, Morecambe, Friday, December 20, 9.30 p.m., annual ball.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Tuesday, December 17, 2.30 p.m., practitioners' round. Dr. D. G. Ferriman: Medical cases, including endocrine.

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, December 16, 9 p.m., meeting. Dr. H. C. Warrington: "Artificial Radio-isotopes in Clinical Medicine."

TOWER HAMLETS DIVISION.—St. Andrew's Hospital, Devon Road, Bow, E., Friday, December 20, 3 p.m., meeting. Mr. G. A. Barclay: "Peripheral Vascular Diseases and Gangrene."

CENTRAL CONSULTANTS AND SPECIALISTS
COMMITTEE

At a meeting of the Central Consultants and Specialists Committee held at B.M.A. House on December 5, the Chairman, Mr. T. HOLMES SELLORS, reported that Sir Russell Brain had accepted an invitation to serve on the committee as a co-opted member for the session 1957-8. It was also reported that Mr. H. H. Langston had found it necessary to reduce his commitments and had regrettably resigned from the Executive and as a representative on the Joint Consultants Committee. A vote of thanks to Mr. Langston for his past services, proposed by Professor P. C. P. CLOAKE, was carried by acclamation. Mr. R. J. Rutherford was elected to take Mr. Langston's place on the Executive, Professor Cloake to take his place on the Joint Consultants Committee, and Mr. W. S. Lewin to take his place on the Royal Commission Evidence Committee.

Professor Cloake was elected the Committee's representative on the Amending Acts Committee in place of Mr. C. E. Kindersley, who had expressed a wish not to be the Committee's representative. Mr. H. G. Hanley was elected as its representative on the Compensation and Superannuation Committee, and Professor G. I. Strachan and Mr. J. R. Nicholson-Lailey as its representatives on the S.H.M.O.s Group Council.

Report of Executive
Superannuation Arrangements

The CHAIRMAN reported that the B.M.A.'s Compensation and Superannuation Committee had drawn attention to certain anomalies which could arise in calculating the pensions of hospital medical staff whose service was partly on a whole-time basis and partly on a part-time basis. The Executive's attention had also been drawn to a complaint from a whole-time consultant, who pointed out that, as his pension was assessed on 80ths of his average remuneration over the three years preceding retirement, he would receive no benefit in respect of domiciliary consultation fees if in fact he undertook no domiciliary consultations during the last three years. The Executive understood that if an officer suffered a reduction in remuneration "not attributable to his own act" he could elect to continue to make contributions as if his remuneration had not been reduced.

Mr. LEWIN suggested that the question of superannuation should be investigated more fully, because a consultant should be investigated more fully, because a consultant might change his commitments several times during his career, and it would seem that some simpler method might be worked out by which he was given the best of all possible arrangements.

Commenting on the CHAIRMAN's suggestion that an effort might be made to produce a simplified version of the pension rights, Dr. S. WAND, Chairman of Council, said he

would take his hat off to anyone who could simplify the pension arrangements.

Mr. J. R. NICHOLSON-LAILEY said it was unfair that consultants should be penalized for a decision which they had to make blindly in their early days because they did not know what the circumstances would be. In answer to Dr. R. KEMP, who suggested that the Committee should look to the British Medical Association for help in the matter, Dr. WAND pointed out that the Association already had a department which could answer any question dealing with superannuation. He suggested that, if the problems were placed before the Compensation and Superannuation Committee, that Committee would be able to give the necessary advice.

Whole-time Medically Qualified University Teachers and
Research Workers

The CHAIRMAN reported that the Executive, after a long discussion, recommended that the Non-Professorial Medical Teachers and Research Workers Group Committee be informed that in the opinion of the Central Consultants and Specialists Committee: (1) the remuneration (inclusive of family and other allowances) of whole-time clinical teachers should be at the same level as that of hospital medical staff of equivalent status; (2) the remuneration (inclusive of family and other allowances) of preclinical teachers should be linked to that of hospital staff of equivalent status, but at a slightly lower level (a figure of 90% being suggested); and (3) that the Central Consultants and Specialists Committee would be prepared to support a claim for increased remuneration for medically qualified teachers and research workers on the foregoing basis.

The recommendations were adopted.

Hospital Private Beds

The CHAIRMAN reported that the Executive had discussed with representatives of the Private Practice Committee the question of the distribution of hospital private beds in the light of the inquiries made by the Private Practice and Central Consultants and Specialists Committees. It was clear that there was no general shortage of private beds, except perhaps for obstetrics and geriatric cases, and the Private Practice Committee's representatives had agreed with the Executive that any claim for additional private beds should be made on the merits of individual cases.

Dr. H. G. H. RICHARDS said that in some provincial hospitals there was a very bad standard of accommodation in private wards, and in his view the reason was that the fees for private beds did not go into the hospital management committee's funds but straight back to the board. The result was that the hospital management committee was not interested in keeping up the standard of accommodation. Dr. R. KEMP agreed that service and accommodation were often poor.

The CHAIRMAN's suggestion that the Joint Consultants Committee should take up the matter was agreed to.

Moral Obligation

The CHAIRMAN said the Executive proposed to send full details of cases where consultants (or S.H.M.O.s) had had their sessions reduced, or contracts terminated, through redundancy, and where the hospital boards concerned had failed to find the consultant alternative employment, to the Minister of Health. The Minister would also be asked to receive a deputation to discuss the position of those consultants.

Responsibilities of Autonomy

It was reported by the CHAIRMAN that the Executive had considered a minute of the A.R.M. in which it was resolved that the following recommendation of the Constitution Committee be adopted:

That By-law 80 be amended to provide that every Committee shall, in respect of any matter before it which is of special interest to another Committee of the Association, consult that other Committee. In the event of disagreement no action shall be taken without reference to the Council.

The Executive felt, he said, that the Central Consultants and Specialists Committee could not subscribe to the last sentence of the resolution, which would appear to interfere with the autonomous powers of the Committee. However, before expressing a firm opinion the Executive suggested that the views of the General Medical Services Committee should be sought.

Dr. WAND pointed out that the purpose of the resolution was to secure unity. The Central Consultants and Specialists Committee was a committee of the Council, and in the past the Council had been the overriding body of the Association responsible for carrying out duties laid upon it by the Representative Body. If the Committee did not subscribe to that view it meant that in the event of it consulting another committee, and that other committee disagreeing, the Central Consultants and Specialists Committee would stand entirely on its own decision and not leave it to Council to debate. He urged the Committee to refer the matter back to the Executive or to express no opinion and refer it to the Committee on Co-ordination.

Dr. J. B. S. MORGAN, speaking as the representative of the Public Health Committee, stated that some members of his Committee were distressed by unilateral action. Fragmentation of the Association would be disastrous, and if there were a conflict between two committees the matter should be sent to Council, where all committees were represented. He appealed for unity. Mr. A. N. GUTHKELCH said it rather depended on what was meant by "reference to the Council." It could, among other things, mean that no action could be taken without the Council being referred to and that there would be complete adherence to the Council's final decision. If it meant that, members of regional organizations who were not members of the Association would feel in a very unfortunate position indeed. Not all the members of the Committee were members of the Association, and those who were not presumably did not feel any particular obligation to abide by decisions of the Council.

Dr. WAND suggested that if the Committee decided that it was not in agreement with the last sentence of the resolution, then it must agree with the opposing statement, which was that action should be taken without bothering to refer the matter to Council and without hearing what Council, representing the whole profession, had to say. Dr. A. BEAUCHAMP, Chairman of the Representative Body, said that the resolution did not mean anything other than a true reference to Council. The Council should consider the matter in question, and in the event of disagreement should send it back to the autonomous body that proposed it.

The CHAIRMAN said the difficulty was that the resolution was read by many members of the Executive as a prohibition of action, even after the matter had been referred to other bodies.

Professor CLOAKE said he saw no fundamental difficulty about delaying any action which the Committee might take until the matter was referred to Council. Whether, following upon that, the Committee was still free to act or not was the matter mainly at issue, and it would be interesting to hear Dr. WAND's view upon that particular point. Dr. WAND, in reply, said that the Central Consultants and Specialists Committee had its own rights and responsibilities as an autonomous body; but it did not take any action without referring it to the Council, and, if the matter were referred to another body, the Committee waited to hear what that other body had to say. Having heard it, as reasonable people the Committee would reconsider the matter. That was all that was contained in the sentence objected to.

The CHAIRMAN suggested that the matter should be referred back to the Executive, and that the views of the General Medical Services Committee and the Public Health Committee should be obtained in the light of the discussion.

Report on Work of Joint Consultants Committee

Hospital Medical Staffing

The CHAIRMAN recalled that, as previously reported, the Joint Consultants Committee proposed to the Ministry that no long-term changes in hospital medical staffing should be made until there had been a review of hospital establishments, but that in the meantime senior registrars who had completed their tenure should be given security in the grade with the rising salary scale. To deal more fully with the matter the CHAIRMAN welcomed Sir Russell Brain and invited him to address the Committee.

Sir RUSSELL BRAIN expressed appreciation at being invited to join the Committee. It would, he said, be helpful to hear the views of the Committee. The problem to which the Chairman had referred had dragged on for a very long time, and the latest proposals of the Ministry did not seem to take matters much further. The Ministry had refused to relate any system of prolongation and increased remuneration of senior registrars with the proposals put forward for a review of the needs of consultants. The Joint Consultants Committee still felt that many time-expired senior registrars were doing consultant work and were recognized as fully trained consultants, and that the answer was to obtain consultant posts for them; but it was not one which the Ministry seemed disposed to contemplate. The Joint Consultants Committee had decided to meet the Ministry this year and to put forward the various points and to hear once again what the Ministry had to say.

Dr. T. ROWLAND HILL said that what disturbed him most was that he felt an effort was being made to force a new grade into the service permanently, which would apparently save money and would in practice enable consultant appointments to be made less frequently in the future, and for a great deal of work to continue to be done in the service by fully trained and qualified senior registrars paid at a much lower rate than consultants. If in the main clinical streams to-day regional boards were to promote to consultant status, say, 100 senior registrars in the jobs they were doing at present, and not increase the establishment of senior registrars, the long-term problem would be solved, and the financial cost would probably not be as great as the creation of a new grade.

Professor CLOAKE suggested that the Central Consultants and Specialists Committee should support the Joint Consultants Committee's view that any proposal which would lead to a subconsultant grade was wholly unacceptable. Mr. H. W. RODGERS said that what the fully trained senior registrars needed more than anything else was some security of tenure. A gradation was also required between the upper registrars' scale and the consultants' scale with security of promotion.

After some further discussion, including the suggestion by Mr. LEWIN that there were consultant posts which had already been approved in principle by the Ministry and which could be established if regional boards were prepared

to find the money, the Committee signified general support for the views expressed by Sir Russell Brain and Dr. Rowland Hill.

Senior Registrars in Anaesthetics

It was reported that the question of the senior registrar establishment in anaesthetics had been discussed, and as a result the Joint Consultants Committee had recommended to the Ministry that the establishment should be increased by 10 per annum over the next three years.

Remuneration of S.H.M.O.s

The Joint Consultants Committee had decided to take no action for the time being upon the Central Consultants and Specialists Committee's resolution affirming the principle that the salaries of S.H.M.O.s should be not less than 80% of those of consultants.

Domiciliary Consultations by Chest Physicians

The CHAIRMAN said it was a major triumph on the part of the representatives of the chest physicians that at the last meeting of Whitley Committee B the Management Side agreed to remove the restriction on the payment of fees to chest physicians for domiciliary consultations in respect of all patients on the tuberculosis register by limiting that restriction in future to patients "under active treatment."

Domiciliary Consultation Fees, Lecture Fees, Etc.

A resolution from the South-west Metropolitan (Eastern Area) Regional Consultants and Specialists Committee dealing with domiciliary consultation fees, lecture fees, etc., was considered. The resolution asked the Committee to press for an increase in domiciliary consultation fees, which had remained at the same level for nearly 10 years; to press for an increase on other fees representing items of service or expenses, and to make representations for the payment of the additional fee in respect of all domiciliary consultations carried out at a distance of 10 miles or more from the consultant's home or consulting-room.

It was agreed that the matter should go forward to Committee B and be given as evidence before the Royal Commission. It was also decided that a flat rate be proposed for lectures whether by consultants, S.H.M.O.s, or registrars.

Medico-legal Subcommittee

In presenting the report of the Medico-legal Subcommittee, Dr. S. COCHRANE SHANKS, its chairman, said the important item was that relating to a draft memorandum issued by the Ministry dealing with the supply of information to solicitors, etc., in respect of hospital patients engaged in legal proceedings. The whole matter was still under consideration.

The remainder of the report was approved.

Reconsideration of Decisions of Policy

The following motion, moved by Mr. A. N. GUTHKELCH in order, he said, to simplify the work of the Committee, was carried:

That it be a standing order of the Committee that no motion affecting a matter of policy, on which the opinion of the Central Consultants and Specialists Committee has already been expressed, shall be permitted to be placed on the agenda of the Committee on a second or subsequent occasion during the same annual session of the Committee except by special leave of the Executive or of the Committee itself.

Child Guidance

The CHAIRMAN stated that at its meeting on November 6 the Council deferred consideration of the views of the Central Consultants and Specialists Committee upon the draft circular on child guidance services in order to allow the Psychological Medicine Group Committee an opportunity of commenting on the circular. The Group Committee had considered the matter, and the CHAIRMAN invited Dr. A. D. MCINNES to outline the Group Committee's views.

Dr. MCINNES said that the circular placed emphasis on certain aspects of child guidance psychiatry which in the experience of many had been unsatisfactory. Among those was the provision and fostering of joint clinics, which the Ministry appeared to assume worked satisfactorily. That was not the experience of many who worked in that field. It led to a position in which the psychiatrist did not have internal control in the clinic to give him the clinical freedom which he required for the proper discharge of his medical responsibilities to the children and to their parents. An unfortunate result of that was that the psychiatrist tended to become isolated from his medical colleagues in psychiatric teams, and the best psychiatrists in child psychiatry were not applying for the posts.

The problem was essentially clinical and not primarily educational, yet the bias of the Ministry's circular was educational. The need at the present stage was for stronger medical orientation. General practitioners were lacking in confidence in the child guidance clinics. They were disinclined to refer children to them because they felt that orientation was predominantly educational instead of medical. It was regrettable, and he suggested (1) that the Ministry should be invited to examine more closely the defects of the joint clinic system; (2) that the Ministry should be invited to examine and study the schemes already in existence of a different kind; and (3) asked to be somewhat more encouraging in the sponsoring and development of still further pilot schemes in other areas designed to eliminate some of the defects of the existing clinics and child guidance systems, and designed to use more fruitfully the resources of the National Health Service in respect to the general practitioner body, hospital body, as well as the resources of the local authorities.

Dr. R. ORTON agreed that child psychiatry ought really to be very much more a part of the National Health Service and not part of the educational system. Dr. E. BERESFORD DAVIES reported that in the Cambridge and East Anglia regions it had been found possible to integrate all psychiatric endeavour, including that of child psychiatry, which was a move in the right direction. Dr. A. J. SANGSTER reported on a Group meeting discussion from which it appeared that opinions were held that there was room for both child psychiatry and child guidance. It was pointed out that in general practice there was a great amount of guidance necessary in people's difficulties, and that if, after guidance, a person was still maladjusted, that was the time when the psychiatrist could come into the picture. It was appreciated that there were tensions in the joint clinic, but the suggestion was made that some of those tensions were due to the psychiatrists not being adequately adjusted to the objects of child guidance within the educational framework. Dr. MORGAN suggested that, before the circular was rejected, a subcommittee might be appointed to look at various schemes throughout the country in order to see whether some compromise arrangement could not be made.

On the suggestion of the CHAIRMAN it was agreed that the matter should be referred to the Joint Consultants Committee and to the Liaison Committee.

Proposed Transfer of Fulham Hospital

After considering a resolution asking the Central Consultants and Specialists Committee to support the General Medical Services Committee's view that the Council be recommended to press for a public inquiry into the proposed transfer of Fulham Hospital to Charing Cross Teaching Hospital Group, the Committee agreed to suggest that further inquiries should be instituted with the Ministry, that it being pointed out that the Committee was anxious about the position of the existing staff if transfer took place.

Medical Organization in Mental Hospitals

The Committee agreed to support the following recommendation:

That in the opinion of the Standing Joint Committee of the Royal Medico-Psychological Association and Psychological

Medicine Group Committee should be made obligatory for every mental and mental deficiency hospital to have a medical staff committee which should meet regularly at least once a month, should include representatives of the junior grades of medical staff, and should have power to co-opt consultants from other specialties. The chairman of the medical staff committee should be elected annually and should not be eligible for immediate re-election. The medical staff committee should have direct access to the hospital management committee.

Hospital Gazetteer

The Committee supported the idea of compiling a gazetteer which would classify posts available in hospitals according to the standards of accommodation, board, and other amenities for their resident staff, if it were economically practicable.

Mileage Allowances

The CHAIRMAN reported that following discussion in the General Whitley Council of the Staff Side's claim for an increase in mileage allowance, and the refusal of the Management Side to allow the claim, it had been agreed to refer the matter to the Industrial Court.

HOSPITAL MEDICAL STAFFS DEFENCE TRUST

A meeting of the Trustees was held at B.M.A. House on December 5. Mr. T. HOLMES SELLORS was appointed Chairman of the Trustees for the Session 1957-8.

Appeal for Contributions

The CHAIRMAN reported that as a result of a recent appeal for contributions to the Trust funds sent to consultants and S.H.M.O.s in England and Wales, £1,361 9s. had so far been received, and a similar appeal in Northern Ireland resulted in £51 11s. being received. Mr. L. DOUGAL CALLANDER, Hon. Treasurer, added that only 34% of consultants contributed at all, and present contributions averaged about £6,800 per annum.

PUBLIC HEALTH COMMITTEE

EVIDENCE FOR ROYAL COMMISSION

A meeting of the Public Health Committee was held at B.M.A. House on December 6, with Dr. J. B. TILLEY in the chair. A draft memorandum of evidence for submission to the Royal Commission on Doctors' and Dentists' Remuneration was approved. During the discussion of this matter the Committee was joined by the Staff Side of Committee C of the Medical Whitley Council.

Health Visitors

The Council had asked the Committee to give further consideration to the Annual Representative Meeting's resolution that health visitors should work in closer co-operation with general practitioners.

Dr. W. A. HORNE suggested that general practitioners should work in co-operation with health visitors. Dr. S. WAND, Chairman of Council, speaking as a general practitioner, said that, although general practitioners did get help from health visitors, one of the main troubles was that the health visitors had so much to do and so much ground to cover that it was difficult to get the co-operation that could only come with frequent meetings, at which doctor and health visitor could talk about their difficulties. Perhaps some member of the Committee who had knowledge of health visitors in the big towns might like to submit a memorandum. What was wanted were suggestions for practical ways in which meetings between general practitioners and health visitors could take place. Dr. HORNE replied that in Glasgow meetings had been arranged, and attendances were extremely poor.

The Committee agreed to consider the matter at its next meeting.

Maternity Leave for Married Women Doctors

A letter from the honorary secretary of the Gateshead Division said that because of the expense of the six months' paid maternity leave in the case of relatively highly paid employees such as doctors, councils, although they had, in theory, agreed to employ married women, in fact employed them as little as possible because of the potential expenditure without return. The Gateshead point of view, which was strongly supported by the Medical Women's Federation, the letter continued, was that six months' leave was quite unnecessarily long. Were it, say, four months, with perhaps some of it on half pay, councils would be much more ready to employ married women, with a consequent material increase in the available employment for this class of doctors.

Dr. ELSPETH WARWICK asked what local authority took into consideration a doctor's future pregnancies when engaging her. Dr. MARY ESSLEMONT said that the Department of Health for Scotland had informed her that it was not compulsory for the doctor to go off duty for the whole of this period, but Dr. H. M. COHEN said that in his authority women employees had to be away for 14 weeks.

The matter arose out of a resolution from Gateshead passed by the Annual Representative Meeting. The Committee had asked the Division for information, since members were not aware of any general dissatisfaction or of any difficulties which had arisen in applying the existing agreement of Committee C. It now noted that no evidence had been produced.

Question of Autonomy

In an oral report on a discussion which the Chairman of Council and the Secretary had with the executive committee of the Society of Medical Officers of Health on the suggestion that an autonomous section should be established to deal with public health matters, the Secretary, Dr. A. MACRAE, said that there was a feeling within the Society in consequence of recent events, and that was why this subject arose. As this question had been referred to the Committee on Professional Co-ordination, which would start its work very soon, it was agreed that the Committee could not usefully discuss it further at this stage.

Dr. WAND said he wished the profession generally would look forward and not backwards, and if they looked backwards that they would not only look back to the things which had gone wrong but at the things which had gone right. Dr. A. BROWN asked whether this meant fragmentation, with the Public Health Committee going one way and the Society going another? If so, he did not like it at all. Dr. J. B. S. MORGAN said that the Chairman of Council was doing his best to prevent fragmentation.

Society of Medical Officers of Health

The CHAIRMAN OF COUNCIL, reporting on the meeting with the executive committee of the Society of Medical Officers of Health at which a draft new agreement between the Association and the Society, to replace the existing one signed in 1923, was discussed, said that he did not agree that the original draft was a desirable one. A revised form of words, now before the Committee, was better, but Dr. WAND emphasized that it was not his function to say that he approved the revised draft. The revised version would provide that when agreement is reached between the Society and the Association the two shall act on the matter as may be agreed between them. When agreement was not reached the matter could be considered by a joint committee. When agreement was then not reached, either party would be free to act separately as though the agreement did not exist.

Dr. WAND said that he had agreed that this draft should be presented to the Public Health Committee for its opinion, and that opinion, which was very important, would go to Council together with the draft agreement, and also to the Annual Representative Meeting, which would have to approve the revised agreement.

Dr. J. B. S. MORGAN asked whether the agreement meant that the Society would have the same sort of autonomy as the Central Consultants and Specialists Committee? Dr. WAND replied that it would have much more. The Society would not have to disagree under the terms of the agreement, and it would be free to do what it liked, without reporting to the Council of the B.M.A. If the Central Consultants and Specialists Committee took action as an autonomous body, it still had to report to Council.

Dr. W. G. HARDING said that the Society did not intend to meddle with salary matters, but instanced the work of the Cranbrook Committee as a matter on which the Society felt it had a very proper right to speak. Dr. WAND said that the main difference between the present draft agreement and the 1923 one was that under the 1923 agreement it was left to the Association to take action, but in the suggested agreement the two would take action on the matter "as may be agreed between them." It was now up to the Public Health Committee to say whether this was desirable, and for Council to say whether they approved it. Dr. ESSLEMONT thought that if there was to be an autonomous body like the Consultants and Specialists Committee, the Public Health Committee should be that body.

After the SECRETARY had pointed out that a change in the agreement with the Society would have to await the Annual Representative Meeting and that there would therefore be no delay in deferring the matter, the Committee decided to discuss the subject at its next meeting in January.

Child Guidance

The Committee adhered to its previous recommendation that a circular to local education authorities, the draft of which, from the Ministry of Education, read: "It will normally be desirable for a full-time officer of the local education authority to be made responsible for its day-to-day running," should be amended by substituting the words "the principal school medical officer or an officer deputed by him" for "a full-time officer of the local education authority." The Committee was informed that the Psychological Medicine Group Committee felt it was primarily a matter of treatment and therefore should come under the hospital authority.

Dr. WAND said the answer would come when there were psychiatric out-patient departments for adults and children as part of a general hospital, which was one of the Association's recommendations accepted by the Royal Commission on mental health.

Whitley Appeals

The Committee was informed that a formal appeal under the Whitley appeals machinery taken by the Association on behalf of a deputy medical officer of health, whose annual increments were less than those of the medical officer of health, had been determined in favour of the doctor. The council concerned had not yet confirmed its acceptance of the findings of the Appeals Committee.

The SECRETARY announced that Lanarkshire County Council had implemented the findings of the Whitley Appeals Committee in respect of a medical officer.

Committee Members

Dr. F. A. Belam was again nominated as the Committee's representative for appointment by Council to the Central Medical Recruitment Committee. Dr. A. BROWN, Dr. H. M. COHEN, and Dr. J. B. S. MORGAN were appointed previously to the Compensation and Superannuation Committee. Dr. G. Stableforth was now appointed an additional member.

Senior Registrar Problem

Dr. J. BURKINSHAW (St. James' Hospital, Balham, S.W.12) writes: The co-signatories of the letter on the senior registrar problem (*Supplement*, December 7, p. 189) wish it to be known that they were writing in their capacity as members of a hospital consultant staff.

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

A meeting of the Assistants and Young Practitioners Subcommittee of the General Medical Services Committee was held at B.M.A. House on November 29. Dr. F. GRAY was re-elected Chairman of the Subcommittee.

Evolution of General Practice

The Committee devoted most of its time to continuing consideration of the principles for the evolution of general practice which had occupied much of its time in the preceding session. The Subcommittee had before it two memoranda, by Dr. R. M. S. MATTHEWS (Romford) and Dr. F. G. TOMLINS (Chingford), on the subject.

Opening the discussion, Dr. I. M. QUEST (St. Helens) said that the crying need was for a complete reorganization of the Health Service. There were grave deficiencies in the present capitation system; no matter how much work a doctor did, he still received the same remuneration. That was no encouragement to the younger members of the profession. Dr. TOMLINS emphasized that under the present arrangements the profession was very much in the hands of the Government. Dr. R. T. JONES (Basildon, Essex) was lukewarm in his attitude towards a capitation fee system based on age. He preferred a system based on the rate for the job, and Dr. W. P. HAYNE (Culmstock, Devon) agreed with him. If a doctor could not attract more patients by his experience as he grew older, that was hard luck and no reason for increasing his capitation fee. Dr. IAN C. RITCHIE (Leeds) thought such a system would be difficult to operate. The principle was sound, depending on the age from which it began to operate and assuming that there was a maximum age for retirement.

Dr. S. W. ALBRIGHT (Birmingham) disagreed with the principle. Up to a point a doctor might become more skilled, but after that his skill would decrease. Dr. TOMLINS pointed out that rewards based on what a doctor could do were by no means rewards based on what he did do. It would be very difficult to make suitable distinctions. He also disagreed with the principle, as did Dr. C. W. GRANT and Dr. K. S. MAURICE-SMITH (G.M.S. Committee).

Dr. G. D. W. ADAMSON (Kirkcaldy) was in favour of increased remuneration as a doctor grew older. There were greater responsibilities, such as family duties, and one had grown very much richer in experience which one could use for the benefit of the patient. Although perhaps one was not as up to date as a younger man, one was nevertheless a better doctor. Such a system would enhance entry into the profession. Dr. TOMLINS said that Dr. Adamson's views were correct only if they were coupled with the suggestion, made by Dr. Jones, that lists should be reduced as age increased.

The Subcommittee decided not to give further consideration to a system of capitation fee based on age.

Professional Status

Dr. MATTHEWS'S memorandum next suggested that the capitation fee should be linked with a higher degree, supplemented by proof of up-to-date postgraduate study. This system would encourage postgraduate work. Dr. QUEST said that here again the basic factor was whether a doctor was a sound general practitioner and not what degree he had. On that basis, it did not matter whether the G.P. had a fellowship or not. Dr. JONES was also against the proposition, but Dr. C. GRANT (Pitlochry) thought that this was the only way in which capitation fees could be related to quality rather than quantity. The College of General Practitioners in Canada had a very strict schedule of how much postgraduate work had to be undertaken if a G.P. was to be a member of the College. This was a suggestion which merited investigation, although he did not necessarily agree that the basis should be a higher degree. Postgraduate education was much more important and membership of the proposed College of General Practitioners in this country

might provide the desired standards. Dr. ALBRIGHT said that his experience of general practitioners was that the man with higher qualifications was not necessarily the better man.

Dr. ADAMSON saw the possible danger of class distinction in the profession if there were gradings of that sort in professional status. Dr. MAURICE-SMITH said that a society of individualists could not be graded by a yardstick. If a doctor did good work he was bound to get more patients.

The Subcommittee agreed that a capitation fee should not be related to the holding of higher degrees, though it recognized the need for postgraduate study.

Size of Lists

Dr. MATTHEWS proposed in his memorandum that, rather than formally reduce lists, it would be better to produce a scheme of remuneration which would make the retention of full and over-full lists unnecessary. He thought that the large increase of 2,000 permitted for an assistant was undesirable and that the dignity of the profession was not enhanced when one member was able to make a profit out of another. Dr. QUEST was opposed to the list system, but said that if lists were to be reduced the capitation fee would have to be increased, because it was unreasonable to ask a man to give up part of his income. Where the money was to be found was not the concern of the profession. Dr. JONES was in favour of a reduction to 2,500 whether or not the remuneration remained the same, but he did not think that doctors with lists of 3,500 could be persuaded to share his view until the financial incentive to amass large lists had been removed. He suggested that the capitation rate for the first 500 patients should be four times that for the 500 patients in the 2,000 to 2,500 range. Dr. GRANT said that a doctor with a list of 2,500 was certainly giving a better service than a doctor with 3,500 patients, a view with which Dr. RITCHIE agreed, though, he said, much depended on where the practice was situated.

Dr. TOMLINS said that, while there was much to be said for the proposition, once again it was only a case of giving a doctor a chance to do better work. With the present system it was not possible to reduce the size of lists while retaining the same remuneration. Such a move might be a move towards a salaried service. Dr. MAURICE-SMITH said that all practices were not comparable. In an industrial area a doctor could send many of his patients to the local hospital, and it had long been recognized that, for a man who liked the work, a practice of 3,500 in an area like that was reasonable. In a country area the situation was very different because of the difficulties of distance and transportation.

Dealing with the number of patients necessary to warrant the appointment of an assistant, Dr. TOMLINS pointed out that an assistant permitted a doctor to undertake industrial and other work. He thought that the extra list permitted on the appointment of an assistant should be a maximum of 1,000.

There was broad agreement that the numbers on lists, with and without assistants, might be reduced, but it was agreed not to take a decision until the Subcommittee had finished discussing expenses, with which question it was engaged when the meeting was adjourned.

WISDOM AND POWER

The following is from a leading article in *The Times* of December 9.

"Certainly, there is much to be said for a Hobbesian interpretation of British politics in the past decade. The people have passionately wanted mutually incompatible objects—full employment, unrestricted trade unionism, low prices, moderate taxes, and elaborate social services; the classes have been bitterly divided to such an extent that philosophers have postulated the co-existence in society of two absolutely different moralities, the morality of free enterprise and self-help on the one hand and that of collectivism and equality on the other. . . . There is

manifestly no commonly accepted and easily defined code of justice to which wage claims, the future of the Welfare State, and all the other contentious questions which divide us can be submitted. . . . There is no way discoverable to the human intellect by which economics can be taken outside the sphere of politics. Our country is governed by the perennial attempt to leave a harmonious pattern out of social conflicts which cannot be finally eliminated. Neither force alone nor wisdom alone can solve the dilemma. . . . A society which has no political aristocracy to patronize intellect . . . should look for new ways of uniting wisdom and power."

Scottish News

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

The Subcommittee met in the B.M.A.'s Scottish House on November 14, with Dr. C. HARROWER in the chair. Dr. R. C. HAMILTON (Kilmarnock) was appointed vice-chairman of the Subcommittee. The CHAIRMAN welcomed Mr. J. Graham Stewart (representative of the Scottish General Dental Services Committee) to the Subcommittee, and Dr. Peter Philip, of Huntly, on his return after his recent illness.

Prescribing Costs

A brief report was received from Dr. C. J. SWANSON on the preliminary discussions of the *ad hoc* committee which had been appointed by the Scottish Council to prepare evidence for submission to the Scottish Prescribing Costs Committee.

Elimination of Inflation

It was reported that the Department of Health had arranged a meeting on November 28 to discuss the general arrangements for the elimination of inflation of doctors' lists. The Department had indicated that there would be present—apart from their own and the Subcommittee's representatives—representatives from the Scottish Association of Executive Councils, the Society of Clerks, and the Registrar-General's Office. The Subcommittee appointed five representatives to attend on its behalf.

Training in the Highlands and Islands

The Department of Health had intimated that it had approved an arrangement whereby general practitioners in the Highlands and Islands with lists of 1,500 or fewer patients should be given an opportunity to occupy a hospital post for a period of a month, and that financial assistance similar to that given for postgraduate refresher courses would be available to them. A month in hospital under these arrangements would exhaust a general practitioner's entitlement to postgraduate training for a period of two years. It was stated that a circular giving particulars of the scheme would be issued through executive councils to all general practitioners in the six Highland counties.

Poliomyelitis Vaccine

The CHAIRMAN reported that, at a routine meeting with the Department, the participation of general practitioners in the scheme for vaccination of all children under 15 years and expectant and nursing mothers had been discussed. The Department said that all general practitioners would receive a medical memorandum soon which would give them the information they needed for advising patients about the vaccine. A circular would also be issued to general practitioners, through executive councils, explaining the vaccination programme; the details of it would be a matter for arrangement between the medical officer of health and the local medical committee.

Committee on Administrative Tribunals and Inquiries

The Secretary of State had asked for the views of the Subcommittee on certain parts of the report of the Committee

on Administrative Tribunals and Inquiries (the Franks Committee) which related to the National Health Service, but the Subcommittee decided that the matter should be referred to the Subcommittee on Medical Service Committee and Tribunal Procedure.

Mileage

Dr. SWANSON gave a report on the meeting of the working party of the Mileage Subcommittee of the Scottish Advisory Distribution Committee, and said that it was intended to have a complete survey of the mileage position in Scotland. It was hoped that the returns might be completed by the end of the year.

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Global Sum

SIR.—We write to express our amazement that the Council of the British Medical Association appears to be giving its wholehearted support to a continuation of the "global sum" method of capitation payment (evidence to Royal Commission, paragraphs 184, 185, and 186, *Supplement*, November 23, p. 157). As they themselves say (paragraph 190), "if general practitioners . . . earned more outside their general practice . . . then the operation of the central pool sees to it that they get less for their general practice."

Perhaps a simplified example will show how this works out. Let us take for the purposes of illustration an imaginary G.P. service in which there are 10 principals, each doing solely N.H.S. work, and each receiving £1,000 per annum. The global sum in their case would be £10,000. Now let us suppose that one of these practitioners is lucky enough to land a job as medical examiner for an insurance company, whereby he receives £100 per annum. Since the global sum remains constant—namely, £10,000—there is therefore left available for distribution as remuneration for his N.H.S. work only £9,900, and that means that each G.P. receives in respect of his N.H.S. work only £990, instead of his previous £1,000. It would seem, therefore, that by using his initiative the one enterprising practitioner has reduced his colleagues' income, while from their point of view they are receiving less money for doing the same amount of work. We consider such a system quite indefensible. It is no answer to say that his colleagues could have been equally enterprising: there are just not enough jobs with insurance companies, medical boards, etc., to go round.

The state of affairs existing within the N.H.S. as regards domiciliary midwifery is very similar. We regard as infinitely preferable a system such as that advocated by the Medical Practitioners' Union whereby the central pool is calculated to give adequate remuneration to a practitioner doing N.H.S. general practice *alone*, taking into account his responsibility for the population as a whole. This can be, and very often is, a full-time job, and deserves adequate remuneration on its own merits, without regard to other sources of income. If, then, a doctor is prepared to sacrifice some of his scant leisure, or to work even harder to augment his remuneration from some source outside his N.H.S. general practice, we consider this is entirely his own business. We see no reason why so doing should result in him (and his colleagues) being paid less for their N.H.S. practice work.

The B.M.A. claims to represent some 23,000 principals and assistants engaged in N.H.S. general practice. In its advocacy of the global sum method of payment it certainly does not represent us.—We are, etc.,

ARTHUR HOWELL,
A. S. IRELAND,
J. F. STEPHEN.

Edinburgh.

The Price of Freedom

SIR.—In his scholarly address (*Journal*, December 7, p. 1361) Sir Francis Walshe makes very cogent and disquieting comment on the declared policy of the Royal College of Physicians. Sir Francis also observes that "if we will not learn the lessons of history we are doomed." One of the lessons of history was learned when, in 1640, the first session of the Long Parliament abolished the Star Chamber, the High Commission, and the whole Prerogative System. This "great irreversible victory," as Trevelyan terms it, was the work not only of the future roundheads but also of the "constitutional cavaliers." All felt that the oppressive tyranny of the prerogative system was intolerable. Yet the system had been valuable in its day. As Sir Francis points out, another autocratic early Tudor institution (in whose favour similar arguments had been urged) is still with us and still dabbling in politics. This institution, no doubt valuable in its day, is as representative as a rotten borough; the Constitution precludes the great majority—approximately four out of five—of consultants practising medicine, and many practising pathology and radiology, from effective voice in the policy of the royal colleges. Thus the inclusion of this anachronism discredits the collective authority and prestige of the royal colleges as a whole, since all know that the R.C.P. is unrepresentative of the great majority of physicians. Furthermore, by a cruel stroke of fate, pathologists are also compelled to accept the R.C.P. as the "appropriate royal college."

The abolition of the Star Chamber was, of course, a legislative act. While the R.C.P. is of such value to the Government in power—as Sir Francis points out—a similar legislative act of reform is to-day unlikely. The only alternative to such reform seems to be virtual deletion of the R.C.P. from the counsels of the profession so that Governments will realize that, as at present constituted, the R.C.P. is distrusted and is no guide to medical opinion and hence of little value to central government.—I am, etc.,

Sheffield, 1.

J. L. EDWARDS.

SIR.—I was astonished to read Lord Attlee's childish words at the Hunterian Society debate (*Supplement*, November 30, p. 179). He seems to be obsessed with the idea of "bossing and being bossed." Nobody in the profession wants to either boss anybody or be bossed by anybody, though I am not sure that the same can be said of the politicians, and he may well be talking about his own projected feelings. He obviously has no idea of the integrity and independence and the putting of self into the background that is necessary in the giving of a professional opinion. We are taught to do this, and in order to do it we must remain free, and not be harassed by politics, politicians, or political ideals.—I am, etc.,

E. ROBINSON.

Chislehurst, Kent.

Proceedings of the G.M.C.

SIR.—I have recently observed, from the public gallery, a session of the Disciplinary Committee of the General Medical Council. I would like to make the following initial criticisms of the arrangements.

First, the defendant doctor is apparently seated on a hard chair on a raised dais behind a kind of narrow wooden pulpit. This contrivance would appear to allow him no reasonable comfort, and no place whatever on which to put any documents or books. It is perhaps best described as a sort of pillory. By English law, a defendant is presumed innocent until proved guilty after a proper trial. Furthermore, this is a professional committee, not a criminal court. This whole apparatus places her, or him, at a psychological disadvantage. In my opinion, therefore, this is not the right sort of seating or position in which to place a lady or gentleman fighting for her or his professional life. Meanwhile, the members of the Disciplinary Committee have comfortable red-leather-backed chairs, set behind adequate tables, on which they can write and place papers or books. I think

this arrangement is manifestly unfair, a subtle and cunning relic of last-century cruelty. In my view, the defendant doctor is entitled to a decent padded chair and a decent table, at which he can sit with dignity; and, incidentally, a flask of water and a glass. Heaven knows the G.M.C. has adequate funds to provide these.

Secondly, the public gallery is very small, and all the chairs were apparently occupied by members of the press. Members of the public, including ladies and doctors, were thus forced to stand in a very small area, possibly 7 ft. square, near the door. The door opened inwards on to this area, with resultant confusion on any entry or exit. I am not certain about this point, but am under the impression that such doors in such public places must open outwards to comply with by-laws, in case of fire and so on. It appears to me that there was another gallery at the other end of the hall which could quite easily accommodate either the press or the public, to the more comfortable advantage of each.

Finally, there is a third point on which I seek enlightenment from some expert. On what authority is the press allowed to make verbatim reports of the proceedings? I am not at present arguing for or against such action. I merely want to know what the ruling is, and who gave it, and when. I am under the impression that similar professional bodies, such as the solicitors, merely announce the results of such domestic trials. Perhaps some official of the G.M.C. will answer these questions.—I am, etc.,

Herne Bay, Kent.

C. T. H. WHITESIDE.

Professional Expenses

SIR,—I see from the press that a medical practitioner has been censured by the authorities for alleged failing to keep abreast of the times in his specialty. Perhaps this is an opportune moment, therefore, to press yet again for the implementation of the facilities for postgraduate study envisaged in the Spens Report. Under existing conditions a full-time consultant who is keen enough to try to keep up with the times is penalized financially for his efforts. Travelling expenses to, and subsistence at, scientific meetings must be borne wholly out of his own pocket, and therefore meetings held at distant towns, which would necessitate staying the night in an hotel, are out of the question for most. The Inland Revenue give no rebate on subscriptions to learned societies or to the even more expensive scientific journals, and neither does he get any help from them with the purchase and maintenance of a motor-car. The Government are therefore actually encouraging the fault they now see fit to condemn. May we perhaps hope that the Royal Commission will recommend the ending of these very obvious injustices?—I am, etc.,

Tunbridge Wells.

W. M. R. HENDERSON.

Medical Manpower

SIR,—I am astonished that Dr. J. R. Andrews's lack of observation and misinterpretation of a few figures (*Supplement*, November 30, p. 184) should lead to such extraordinary views on medical manpower. In that same issue of the *Journal* there are advertisements for no fewer than 500 appointments, many of which have appeared more than once. In the *Journal* of August 3 there is likewise a list of several hundred designated and intermediate areas where doctors may set up in practice. There are more than enough vacancies to absorb all the unemployed doctors. The trouble is that doctors cannot always find the type of opening they require (and experience in a large number of locums has shown me that 50% of doctors have been forced by financial circumstances into openings which they do not like) and that they cannot afford to keep themselves for three or four years while building up a practice from scratch, so that the intermediate areas are likely to remain so until doctors can reap the reward of their earlier years of privation by realizing their capital gains in the sale of their practices.

The average list is 2,500. Experience in many locums and in my own practice has shown that it is impossible for a doctor to care for a list of over 2,000 adequately all the

time, although he may be able to do so for most of the time. There is no doubt that 2,000 should be the maximum for any list: this would not only create further vacancies but would result in improved standards of medicine and less burden on the out-patient departments of hospitals. Then gone would be the days when locums hear it said, "Oh, but he's not an examining doctor, Sir," or, "I've been trying to ask about this for a long time, but my doctor is always in such a hurry." Doctors with lists of four or five thousand may see 50 patients at a surgery and do 50 visits a day, but such feats in the surgery and on the daily round merely make a mockery of medicine. Of them I say, "Thank God that I am not one of their patients," and I only regret that there are occasionally times when I say the same of myself in spite of a list in keeping with my own ideas—I am, etc.,

Brampton, Hunts.

R. T. D. FITZGERALD.

Association Notices

GENERAL MEDICAL SERVICES COMMITTEE

Assistants and Young Practitioners Subcommittee

The following have been returned to fill vacancies for assistants on the Assistants and Young Practitioners Subcommittee for 1957-8.

Region	Assistant
3	S. W. Albright (Birmingham).
4	I. C. Ritchie (Leeds).
5	R. E. Hancock (London, N.21).

Diary of Central Meetings

JANUARY	
1 Wed.	Emergency Call Subcommittee, G.M.S. Committee, 12 noon and 2.30 p.m.
2 Thurs.	Alternative Service Subcommittee, G.M.S. Committee, 2 p.m.
6 Mon.	Medical Act Committee, 2 p.m.
10 Fri.	Overseas Committee, 2 p.m.
16 Thurs.	G.M.S. Committee, 10.30 a.m.
28 Tues.	Alcohol and Road Accidents Committee, 2 p.m.

Meetings of Branches and Divisions

ABERYSTWYTH DIVISION

The following officers have been elected for 1957-8:
Chairman.—Dr. Ll. ap Davies.
Vice-chairman.—Dr. E. D. Clifford-Jones.
Honorary Secretary and Treasurer.—Dr. J. O. Thomas.

BORDER COUNTIES BRANCH

The following officers have been elected:
President.—Dr. W. G. Scott-Harden.
President-elect.—Dr. J. B. Dewar.
Vice-presidents.—Mr. R. M. Hill and Dr. C. Stewart.
Honorary Secretary.—Dr. J. S. Moffat.

ROCHDALE DIVISION

The following officers have been appointed:
Chairman.—Dr. R. M. Maher.
Vice-chairman.—Dr. G. Allan Wilson.
Honorary Secretary and Treasurer.—Dr. H. B. Kilroe.

SOUTH WARWICKSHIRE DIVISION

The following officers have been elected for 1957-8:
Chairman.—Dr. J. C. E. Pougher.
Vice-chairman.—Dr. D. F. L. Croft.
Honorary Secretary and Treasurer.—Dr. E. D. O. Campbell.

STAFFORDSHIRE BRANCH

The following officers have been elected for 1957-8:
President.—Dr. Elizabeth J. Findlay.
President-elect.—Dr. N. J. Cochran.
Vice-presidents.—Mr. E. H. Richards and Dr. R. S. V. Marshall.
Honorary Secretary and Treasurer.—Dr. R. W. Rae.

WEST DENBIGH AND FLINT DIVISION

The following officers have been elected for 1957-8:
Chairman.—Dr. J. G. Thomas.
Vice-chairman.—Mr. Austin Holmes.
Honorary Secretary and Treasurer.—Dr. P. M. Anderson.

OCCUPATIONAL HEALTH COMMITTEE

A meeting of the Occupational Health Committee was held at B.M.A. House on December 11, Dr. H. ALEXANDER occupying the chair.

Part-time Medical Officers of Industrial Rehabilitation Units

The CHAIRMAN reported that the Council approved on November 6 the Committee's recommendation that the Treasury be urged to increase the remuneration of Medical Officers of Industrial Rehabilitation Units with effect from July 1, 1957, to bring it into line with the revised recommendations on remuneration of part-time Industrial Medical Officers approved by the A.R.M., 1957. The reply of the Treasury was now awaited.

Industrial Managements and Medical Examinations

The CHAIRMAN reported that the Council on November 6 accepted the view of the Committee that it would be inappropriate to support a medical officer of British Railways in making representations to the British Transport Commission against the agreement between the Commission and the trade unions which made it obligatory for a medical officer to accept the presence of a "lay person" at a colour vision retest. Since then, however, at the request of the medical officer concerned, a meeting had been held from which there emerged a proposal for a conference consisting of members of the Committee, observers from the Ethical Committee, of the doctor in question, other regional medical officers, and possibly observers from the aviation and shipping industries.

Dr. G. E. GRAVES PEIRCE said that he had never experienced any difficulty over a long period of years with regard to having a "friend" present at colour vision retests. After prolonged discussion, on the motion of Dr. L. G. NORMAN, seconded by Professor I. G. DAVIES, the Committee reaffirmed its view and decided not to request the Council to take any further action.

Medical Supervision of First-aid Services

Dr. R. A. GORDON SMITH reported that the planning subcommittee had further discussed an earlier recommendation that the Ministry of Labour and National Service be informed that, in the Committee's view, the organization and control of first-aid services within a factory should be under the direct supervision of a registered medical practitioner, and had agreed to delete the word "direct."

Dr. R. PIPER, who had been invited to attend the meeting, said he was interested in the word "direct" and what it meant. Dr. F. H. TYRER suggested that the recommendation was impracticable and utopian. The CHAIRMAN said it was

appreciated that it would be difficult to implement, but it was rather an expression of principle. Dr. NORMAN agreed that it was impracticable, but suggested that it should still be an aim. Dr. PIPER said that in view of investigations having shown an appalling lack of first-aid services, politicians would become interested very soon and would enforce some form of first-aid services in factories. If no action were taken by the Committee it would go by default. Professor I. G. DAVIES said that however impracticable the recommendation might be so far as implementation was concerned, it was an expression of faith.

Dr. J. ROGAN moved by way of amendment that the Committee appreciated the difficulties of implementing the recommendation at an early date, but the attention of those concerned was drawn to the resources of the medical staffs of the Ministry of Labour and National Service and the existing industrial medical services.

The amendment was agreed to.

Co-option and Representation

The question of the procedure for co-opting members for future sessions was further considered, and it was agreed to refer the matter to the Organization Committee. The CHAIRMAN reported that Dr. R. S. F. Schilling had indicated that he was unable to accept the Committee's invitation to serve as its deputy representative on the Public Health Committee. Dr. Peter Edwards was appointed in his place.

Conference of Advisory Councils

The CHAIRMAN reported that Mr. L. C. White, of Brighton, had accepted the invitation to take the chair at the 1958 conference of advisory councils on occupational health. The principal subject of the conference was to be "Optimum Mental Health as a Factor in the Achievement of a High Standard of Happiness and Productivity in Industry," a High Standard of Happiness and Productivity in Industry, and, having considered the appropriate government departments and other bodies to be invited to send observers to the Conference, the Committee appointed Mr. L. C. White, Dr. H. Alexander, and Dr. J. A. L. Vaughan Jones, members of the agenda committee, for the conference.

Occupational Health Research

Following a resolution of the previous meeting of the Committee, the CHAIRMAN said that the Chief Medical Officer of the Ministry of Pensions and National Insurance and the Senior Medical Inspector of Factories were asked whether there had been any developments in connexion with the work of the two Interdepartmental Co-ordinating Committees about which the Lord President of the Council informed the Association in June, 1956. Replies had been

received from the Ministry of Pensions and National Insurance and from the Ministry of Labour and National Service, neither of which, suggested Dr. C. H. WHITTLE, added very much to that already known, and it was agreed that some further specific information should be sought.

Mackenzie Industrial Health Lecture, 1958

An invitation from the Science Committee to nominate a lecturer to give the Mackenzie Industrial Health Lecture, 1958, was considered, and a name was sent forward. The CHAIRMAN reminded the Committee that in 1940 the Industrial Health Education Society, on its liquidation, transferred its surplus funds, amounting to £350, to the British Medical Association for the purpose of instituting a memorial lecture associated with the names of its founder, Mr. Mackenzie, on the relation of health to industry. The lecture was biennial and was arranged to coincide with any industrial conference with an audience, lay and medical, who were personally interested in industrial medicine, or with the B.M.A. Annual Representative Meeting.

Other Business

The CHAIRMAN reported that a Private Member's Bill had been introduced to provide for securing the safety, health, and welfare of persons employed in offices, and for purposes connected therewith. It was read the first time on November 20 and was awaiting printing. It would be read a second time on January 24, 1958.

Other matters before the Committee included the Agriculture (Safety, Health and Welfare Provisions) Act, 1956, first-aid leaflet, N.O.T.B. clinics at industrial concerns, the terms and conditions of service of medical officers of the National Dock Labour Board, and the Factories (Ionizing Radiations) Special Regulations.

FORENSIC MEDICINE

The Forensic Medicine Subcommittee of the B.M.A.'s Private Practice Committee at its meeting on December 2 appointed Dr. R. D. TEARE chairman for the session. In his unavoidable absence Dr. R. FORBES was elected to the chair for the meeting.

Mileage Allowance

The Committee had before it a draft rule from the Home Office designed to give effect to the arrangement agreed between the B.M.A., the Local Authority Associations, and the Home Office that provision should be made in the Coroners (Fees and Allowances) Rules for the payment of a travelling allowance at a rate of 1s. per mile outside a radius of two miles to practitioners undertaking post-mortem examinations for coroners. It was decided to recommend acceptance of the terms of the draft rule, which would give power to local authorities to pay these mileage fees, with slight amendment of the two-mile radius provision to allow for occasions when a pathologist performed a series of necropsies for the coroner at different mortuaries.

"Twenty-four Hour Rule"

Information had been received from a B.M.A. Division that a local coroner had agreed to adopt the procedure outlined in the current edition of *Jervis on Coroners* in preference to the "24-hour rule." It was agreed by the Committee that when hospital authorities understood and complied with the coroner's wish that certain deaths, whether occurring within 24 hours of admission or not, should be reported to him direct, there seemed to be no purpose in reporting cases merely because death had occurred within that period. The Committee felt it should be appreciated that the 24-hour rule, though it had been in vogue in many areas for a considerable number of years.

¹ Purchase, W. B., and Wollaston, H. W., *Jervis on the Office and Duties of Coroners with Forms and Precedents*, 1957. London.

was purely a convention and had no legal sanction. The Committee agreed that a death should be reported to the coroner and no necropsy made without his permission in the following cases. (1) Sudden deaths. (2) Deaths reportable to the coroner by statute. (3) Violent and unnatural deaths, including those associated with accident or misadventure; alcoholism; anaesthetics or surgical procedures; drugs, including therapeutic preparations; crime, including suspected criminal abortion; industrial diseases; pensionable disabilities; poisoning; suicidal acts; and stillbirths, when there may have been a possibility of the child being born alive.

Other Business

A number of other items were considered relating to fees for police calls in the Metropolitan area and in Wiltshire.

CHEQUES ACT

The Cheques Act, 1957, which came into force on October 17, makes the endorsement of cheques unnecessary, and it establishes the paid cheque as prima facie evidence of payment. Apart from a few exceptions, therefore, cheques need no longer be endorsed before paying them into the bank, and receipts need be sent only if specifically requested by the payer. The Chancellor of the Exchequer said in the House of Commons on November 12 that the Inland Revenue would accept an unendorsed paid cheque as evidence of payment when accompanied by the invoice or unreceipted account to which it referred. Invoices and accounts rendered should therefore be kept in future, and not returned with the cheque in payment, as has been the custom.

The Council of the Association has decided to make a considerable saving in expenses by not sending receipts in future unless they are requested by members at the time of making payment or afterwards.

ORGANIZATION

The Annual Conference of Honorary Secretaries of Branches and Divisions will be held at B.M.A. House, London, on the morning and afternoon of May 9. The Annual Conference of Regional Officers will be held on May 8, and officers will attend the secretaries' conference the following day as observers.

The Young Practitioner

It is reported that the Winchester Division has surmounted the difficulty of getting in touch with students and newly qualified practitioners in the area by arranging with hospital secretaries and the clerk of the executive council for the Division secretary to be informed periodically of the names of all incoming housemen and newly qualified practitioners. The latter are encouraged to attend Division meetings.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham.
Non-County Borough Councils.—Crewes.

Dr. A. H. Rankin has recently retired after nearly 16 years' service as honorary secretary of the Chesterfield Division of the B.M.A. At a dinner-dance held at the Station Hotel, Chesterfield, on November 6 he was presented with a standard lamp and shade and books. In making the presentation, the chairman, Dr. J. M. Ridyard, complimented Dr. Rankin on his long service as honorary secretary and on his many other services to the practitioners of the district by his work on committees.

MEDICAL WAR RELIEF FUND

SEVENTEENTH ANNUAL REPORT

The Committee of the Medical War Relief Fund, at a meeting at B.M.A. House on October 10, received and approved a report prepared by the Distribution Subcommittee on its work during the 12 months until August 31, 1957.

Seven educational grants, amounting to £520, and seven maintenance grants totalling £382, had been made. In addition, six special gifts, amounting to £140, were approved. Satisfactory reports have been received on the progress of all the children helped. One boy has completed his medical training during the year. A girl has matriculated and is now taking a university arts course, and a boy has won a State scholarship to Cambridge University. The fact that seven awards were made for education, as compared with fifteen for the year 1955-6, shows how the work of the Fund is decreasing. It is anticipated that the present available funds will enable the seven children now being helped to complete their education.

The Committee wishes to express its gratitude to the benevolent funds for their helpful guidance and co-operation and to Messrs. Price, Waterhouse and Co. for the continued assistance they have given as Honorary Auditors.

The audited statement of accounts for the year ended August 31, 1957, is appended to this report.

S. WAND, Chairman.

STATEMENT OF ACCOUNT—AUGUST 31, 1957

Chartered Accountants.

A reciprocal social security agreement between the United Kingdom and Israel, covering cash benefits for old age, widowhood, orphanhood, maternity, and industrial injury, came into force on November 1. Under the agreement, insurance contributions in either country can be added together to qualify for benefit, and those entitled to a British maternity grant or industrial injury benefit can receive medical treatment in Israel under the same conditions as Israeli beneficiaries.

ST. MARYLEBONE PARKING METER SCHEME

Doctors gave evidence when the public inquiry (see *Supplement*, December 14, p. 202) before the Ministry of Transport and Civil Aviation Inspector, Sir REGINALD SHARPE, Q.C., into St. Marylebone Borough Council's parking meter scheme was resumed at St. Marylebone Town Hall on December 16. The council has asked the Minister to ban parking in an area bounded by Oxford Street, Edgware Road, George Street, and Marylebone Road, except at parking places, where a charge would be made; it is proposed that the money should be collected by parking meters. The only exceptions would be vehicles loading and unloading, which would be able to wait without charge, except at intersections.

Car Absolutely Essential

Dr. ANNIS GILLIE, answering Mr. W. B. HARRIS, counsel instructed on behalf of the B.M.A., said she lived in Connaught Square, London. She said she had a mews garage, but she did not use it because she might not be able to get out, and she preferred to use a service garage across the road. Mr. Harris pointed out that there were two problems: What was a doctor to do living in the area? and What was a doctor to do coming into the area—where was he to put his car? Dr. Gillie told Mr. Harris that the area of her practice, in the main, was in the potential controlled zone. "At present do you find it possible to park outside your house or near it?" Mr. Harris asked. She replied: "Outside the house it is extremely difficult. Cars are always parked outside my house, and I park in the third rank." Mr. Harris: "Is it necessary for a doctor to have a car readily available for use?" Dr. Gillie: "Absolutely essential."

Asked how often she had cases of emergencies per week requiring immediate attention, Dr. Gillie said on an average three, apart from midwifery cases. She had had to take steps to limit her practice in one area of Westminster because it was quite impossible to be sure of finding a place for a car. Not infrequently she was rung up by clubs and hotels to come and see a patient as a matter of urgency. Asked if she had tried using taxis, Dr. Gillie said that this was very unsatisfactory in the middle of the day; on occasions she had had to wait for 20 minutes when she rang up for a taxi. She did not think it would be possible to carry on practice under the proposed order which would provide paid parking places and streets where parking would be prohibited. Asked about the B.M.A.'s suggested scheme that doctors should apply to the Ministry of Health to become "essential persons" who would have dispensation to park free in the parking bays and park in no-waiting streets when on duty, Dr. Gillie said: "I think it would be workable and practical, and I think it is absolutely essential." Without this dispensation the public were going to suffer. The cost of payments for parking in the parking bays and the fines of £5 for the first day and £10 for the second day would be formidable, and then it would be necessary for a doctor to keep there longer than the scheduled time. Dr. Gillie told Mr. Harris that it would be impossible for a doctor to pass on any extra financial burden to the National Health Service patient.

Finally, Mr. Harris asked: "To sum up, is it necessary, if this scheme goes through, that doctors be permitted when 'on the job' to park without let or hindrance in the parking bays, and secondly to park in the no-waiting streets?" Dr. Gillie: "I think it is absolutely essential if the patients' interests are to be covered."

Answering Mr. LESLIE G. SCARMAN, Q.C., cross-examining for St. Marylebone Borough Council, Dr. Gillie agreed that the problems of doctors had to be considered against the problems of other road users—bearing in mind that doctors did contract to go to patients, and that there could be an inquiry on complaint from any patient. At the conclusion

While on the subject of doctors' pay, I would like to add that, during a period of seven days recently, I kept a careful record of the number of items of service—i.e., visits and consultations. This number divided into my gross weekly remuneration gave a figure of 5s. 2d. for each item. This was the gross fee per item in a fairly quiet week, by no

must be unsigned and accompanied by a slip containing the name and address of the author. Previous prizewinners are not precluded from entering. If no essay of sufficient merit is submitted, the prize will not be awarded in 1958, but will be offered again in the following year.

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1958

The Council of the British Medical Association is prepared to consider the award, in 1958, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "What I Have Learned from Contact with the Patient's Relatives."

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1958. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

THE NATHANIEL BISHOP HARMAN PRIZE, 1958, FOR RESEARCH IN HOSPITAL PRACTICE

The Council of the British Medical Association is prepared to consider the award of the Nathaniel Bishop Harman Prize in the year 1958. The value of the prize is approximately £100. The purpose of the prize is the promotion of systematic observation and research by consultant and specialist staff and senior registrars of hospitals not attached to recognized medical schools. It will be awarded for the best report on original clinical research in a form suitable for publication. The work submitted must include personal observations and experiences collected by the candidate in the course of his practice. A high order of excellence will be required. No report or study that has previously been published in the medical press or elsewhere will be considered eligible for the prize. Any registered medical practitioner on the staff of a hospital in Great Britain and Northern Ireland who is not a member of the staff of a recognized undergraduate or postgraduate medical school is eligible to compete. If any question arises in reference to the eligibility of a candidate or the admissibility of his entry, the decision of the Council shall be final.

Should the Council of the Association decide that no entry submitted is of sufficient merit, the prize will not be awarded in 1958, but will be offered again the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. Each entry, which must be typewritten or printed in the English language, should be unsigned, but accompanied by a note bearing the name of the candidate. It is suggested that reports should be between 3,000 and 10,000 words. Candidates are required to complete an entry form, a copy of which can be obtained from the Secretary. Reports and entry forms must reach the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1958. Inquiries relative to the prize should be addressed to the Secretary.

A. MACRAE,
Secretary.

Diary of Central Meetings

JANUARY

- 1 Wed. Emergency Call Subcommittee, G.M.S. Committee, 12 noon and 2.30 p.m.
- 2 Thurs. Alternative Service Subcommittee, G.M.S. Committee, 2 p.m.
- 6 Mon. Medical Act Committee, 2 p.m.
- 8 Wed. Remuneration Subcommittee, Occupational Health Committee, 2 p.m.
- 10 Fri. Public Health Committee and Staff Side Committee C, Medical Whitley Council, joint meeting, 11.30 a.m.
- 10 Fri. Overseas Committee, 2 p.m.
- 15 Wed. Private Practice Committee, 2 p.m.
- 16 Thurs. G.M.S. Committee, 10.30 a.m.
- 16 Thurs. Ingleby Evidence Committee, 2 p.m.
- 22 Wed. Joint Committee of the B.M.A. and the Magistrates' Association, 10 a.m.
- 23 Thurs. Organization Committee, 2 p.m.
- 28 Tues. Alcohol and Road Accidents Committee, 2 p.m.

Branch and Division Meetings to be Held

CARDIFF DIVISION.—At Park Hotel, Cardiff, Tuesday, December 31, 8 p.m. to 2 a.m., annual supper dance.

LEICESTERSHIRE AND RUTLAND BRANCH.—At King's Hall, Grand Hotel, Leicester, Wednesday, January 1, 8.15 p.m., meeting. Mr. Charles Evans: "Ascent of Kangchenjunga, 1956." Members' wives and friends are invited.

Meetings of Branches and Divisions

ALDERSHOT AND FARNHAM DIVISION

The following officers were elected at the annual general meeting on August 10:

Chairman.—Dr. F. Caldecott.
Vice-chairman.—Dr. F. Brockington.
Honorary Secretary.—Dr. C. C. Thomas.
Honorary Treasurer.—Dr. C. R. Tilly.

CUMBERLAND DIVISION

The following officers were elected at the annual meeting on June 1:

Chairman.—Dr. T. McL. Galloway.
Vice-chairman.—Dr. W. H. P. Minto.
Honorary Secretary and Treasurer.—Dr. T. Gardner.

NORTHERN COUNTIES OF SCOTLAND BRANCH

The following officers have been elected for 1957-8:

President.—Dr. C. S. Sandeman.
President-elect.—Dr. W. I. A. Fell.
Vice-president.—Dr. A. J. MacLeod.
Joint Honorary Secretaries.—Dr. G. F. F. Sinclair and Dr. J. E. Tillotson.

SARAWAK DIVISION

The annual meeting was held on June 19. The following officers were elected for 1957-8:

Chairman.—Dr. E. H. Wallace.
Secretary and Treasurer.—Dr. Chong Chun Hian.

STOCKPORT DIVISION

The annual general meeting was held on October 22 at the Alma Lodge Hotel. Twenty-nine members attended. The meeting was addressed by Dr. E. E. Claxton. The following officers were elected:

Chairman.—Dr. J. Donaldson.
Vice-chairman.—Dr. G. S. Parker.
Honorary Secretary.—Dr. G. B. Hirst.
Assistant Secretary.—Dr. J. Edwardes.

STRATFORD DIVISION

The annual meeting was held on October 8. The following officers were elected:

Chairman.—Dr. H. R. England.
Vice-chairman.—Dr. A. F. McDonald.
Honorary Secretary.—Dr. A. Elliott.
Honorary Assistant Secretary.—Dr. I. M. Segal.
Honorary Treasurer.—Dr. E. D. Fox.

SUTHERLAND DIVISION

A meeting was held on October 15 in the Sutherland Arm Hotel, Lairg. Thirteen members (72%) were present. Sir David Campbell, President of the General Medical Council, addressed the meeting on the subject of his Council. Later he was entertained by the Division at a dinner.

WEST LOTHIAN DIVISION

The following officers were elected at the annual general meeting on June 27:

Chairman.—Dr. J. C. Macmillan.
Vice-chairman.—Dr. A. Browning.
Honorary Secretary and Treasurer.—Dr. Maxwell Gardiner.
