The Defence Ministry claims that it has a case for entering into these two deals. Earlier this year, it required 1,500 lorries for which the Indian price quoted was Rs. 39,000 each, or Rs. 10,000 more than in previous years. Subsequently, a reduction of Rs. 600 a lorry was offered. Then again, the Ministry purchased 4,000 Studebaker lorries last year. The suppliers have since changed over to General Motors. The question is what is to become of the 4,000 Studebaker lorries as far as the supply of their spares, etcetera, is concerned. Then again, the Indian manufacturers add 100 percent profit to the cost of parts manufactured in India. As against this, spare parts under the agreement with M.A.N. will be supplied at the same price as components, or 50 percent less than is normally paid for them. It is further explained that the Army has already acquired a large number of three-tonners which, it thinks, are poor in quality, technical performance and durability for military purposes. In order to keep these vehicles roadworthy, it has become necessary to invest several lakhs of rupees in spares, and the poor quality of construction has already evoked criticism from the Army. An important factor is that the vehicles required by the Army are of a special variety designed for specific military purposes, and it is extremely important to have a uniform type. Standardisation is essential for technical and operational efficiency. As for the military type of vehicles required for the Army, the private sector produces only 35 percent of the components and it has no capacity to develop anything more than this ratio, although for the civil types of vehicles, it is able to turn out a greater percentage of components.

THE U.K. BANK RATE CUT AGAIN

MEASURE AIMED AT STIMULATING INDUSTRIAL EXPANSION

(FROM OUR LONDON CORRESPONDENT)

A FURTHER cut in the U.K. Bank rate, from 4½ percent to 4 percent, was announced last week and, like the fourth reduction which was made in August, took the market by surprise. The rate now stands at its lowest level since February 1955, when it was raised from 3½ percent to 4 percent. Having taken so long to make this move, which was largely a formality as far as its effect on interest rates generally is concerned, the inquisitive are busy searching around for hidden motives which might have influenced the Chancellor of the Exchequer. Another step in the stimulation of industrial expansion seems as likely an explanation as any, but it must also be remembered that Government stocks lately have displayed the need for a mild boost of this nature and that the U.K. Treasury is faced with a large conversion operation in January. Apart from this move, and the removal of the limit on house building by local authorities provided schemes are submitted immediately (which is aimed at increasing capital investment between now and the end of 1959 as part of the Government's plan to give a fillip to business activity), there were few domestic developments on the economic front last week. Mr. Macleod, Minister of Labour, while determined to revoke the industrial Disputes Order in spite of trade union objections, had second thoughts to the extent of being prepared to consider alternative ways and means of achieving the same purpose more effectively and efficiently than through the industrial Disputes Tribunal.

Free Trade Area Snags

The subject which has attracted considerable attention, and even influenced markets, was the unexpected rejection by the French Government of the British proposals for a free trade area, which gave rise to the demand in the House of Commons for an urgent and full debate on the future of European trade and co-operation in general. Mr. Maudling emphasised in the Commons that there was no question of an Anglo-French dispute, nor was there any conflict between trade claims on the Commonwealth and Europe. He admitted that unless something could be done to solve the difficulties, the consequences could "clearly be serious." "We do not believe," he concluded, "that any solution to these problems need be such as to involve the abandonment of the idea of the free trade area, to which so many Governments are so deeply attached." The French themselves have drawn up counter-proposals, the Benelux countries have offered a three-point way out of the impasse, and the Scandinavian countries are considering the formation of a common Nordic market, which could be a serious handicap to the hopes of the Rome Treaty powers if the wider free trade area scheme fails to materialise. At least, an interim compromise seems more or less certain.

Coal Stocks Cause Concern

Britain's stocks of coal reached the massive figure of 37,217,000 tons on 8th November, against 28,937,000 tons a year ago. The Ministry of Power has said that the total of undistributed stocks was 18,053,000 tons and of distributed stocks 19,164,000 tons. A year ago, undistributed stocks amounted to 8,712,000 tons and distributed stocks to 20,225,000 tons. Five years ago, undistributed stocks amounted to 1,154,000 tons and distributed stocks to 19,021,000 tons. Naturally, the quantity of the small butted and unsold coal, almost wholly of the storing type, lying in quarries, fields and other storing places, is causing much concern. As it is valued at £3 10s a ton, the stocks, on paper, are worth about £60 million in assets. How long the idle coal will be able to maintain this value is a matter for conjecture.

Advice to the Chancellor

The National Union of Manufacturers believe that the time has now come for a reduction in the standard rate of income tax. It has recommended to Mr. Heathcoat Amory, Chancellor of the Exchequer, that he should consider this step when preparing his next Budget. In its recommendations, the Union also urges him to simplify further and to reduce purchase tax. It recommends modifications in surtax and investment and depreciation allowances and a complete review into the structure and effects of death duties. Purchase tax on commercial road vehicles should be abolished now, it says.

The recommendations on death duties state that their destructive effect on the best type of private business is increasing. As the kind of enquiry

needed was necessarily a long process, it was strongly urged that in the meantime the worst effects should be mitigated by revising the rates of duty and grading them on the lines followed in surtax assessments. Advocating the restoration of the investment allowance on plant and machinery to 40 percent and an increase in the annual allowances for wear and tear, the Union says that this is still a matter in which the British industrialist is at a disadvantage compared with his foreign competitors. Nothing could justify the retention of such a handicap, it says.

Prospects for Shipping

Largely because of increased activity in the grain trades, the Chamber of Shipping's tramp freight index (base 1952=100) rose to 70.4 last month, the highest since December 1957, when the index number was 71.6. The October figure compares with 65.7 in September and with the 1958 "low" of 62.7 in April. The accent this month is still on grain. Rates, notably in the Pacific section, have tended to harden. In October, rates improved for coal, timber and ore, as well as grain. There

was more activity in fertilisers, although rates for sugar declined. Chinese chartering has been an important prop to the market over the past few months and a few ships have been attracted out of lay-up to handle business from this source. On the other hand, activity in coal has been reduced, but business, where obtainable, has been at generally firmer rates.

Advance Payment to India

Britain is to make an advance payment of £10 million to India for pensions under the Pensions (India, Pakistan and Burma) Act, 1955. Announcing this, the Commonwealth Relations Office said that the payment represented an advance of instalments under the Act due in 1962 and 1963 and part of that due in 1964. It was part of the £38.5 million which the United Kingdom offered to contribute in financial aid to India up to 31st March, 1959, following the meeting in Washington last August arranged by the World Bank. The balance of £28.5 million will be in the form of a credit under Section 3 of the Export Guarantees Act, 1949.

Brevities

Mr. C. F. Cobbold, Governor of the Bank of England, left London by air last week for Singapore, Malaya, Hongkong, Tokyo, the United States and Canada.

A Japanese trade mission of nine is now in London for a six-day visit during which it will be meeting British industrialists. It will also visit Manchester and Bradford.

After a period of comparative stability, the cost-of-living index has risen by one point. The figure on 14th October was 109, compared with 108 on 16th September. Calculated to one decimal, the October figure was 109.4, compared with 108.4 in September.

To men with a flair for the distinctive, the first choice of footwear has always been the Bata Ambassador. A supple blend of selected leather, Bata Ambassador shoes combine traditional craftsmanship with a fine styling and finish that is a necessity for the well-dressed man.

Engineering and Transport

IMPROVED WORKING RESULTS FOR
I. A. C.THE DIFFICULTIES OF MAKING JET
OPERATIONS PROFITABLE

(FROM OUR NEW DELHI CORRESPONDENT)

THE Indian Airlines Corporation flew 8,751,305 miles on its scheduled services, carrying 316,437 passengers, 47,858,065 lbs of cargo and 5,703,862 lbs of mail, during the six months ended June 1958. The respective figures for the preceding six months were 8,527,964 miles, 261,298 passengers, 41,691,648 lbs of cargo and 5,871,139 lbs of mail. The capacity ton-miles operated recorded an increase from 26,151,678 during the preceding half-year to 28,609,581 during the first half of 1958. There was also an increase in the overall load factor from 69.9 percent during the second half of 1957 to 72.8 percent during the first half of 1958.

From 1st April, 1958, *Heron* aircraft were introduced in place of *Dakotas* on the services operated by the Corporation on the Delhi-Agra-Jaipur route. A *Viscount* and a *Dakota* aircraft were introduced in place of the *Skymaster* on the night airmail service operated by the Corporation on the Delhi-Nagpur-Delhi sector of the Delhi-Nagpur-Madras route from 9th April, 1958. The *Viscount* aircraft carries passengers and operates from Palam airport, while the *Dakota* carries only mail and cargo and operates from Safdarjung airport. The *Viscount* aircraft was also substituted for the *Skymaster* on the daily service operated by the Corporation on the Calcutta-Bombay route from 1st May, 1958. The *Srinagar-Leh* service, which was suspended in December 1957 due to adverse winter weather conditions was resumed from 3rd April, 1958. From 7th April, 1958, the Corporation introduced a non-stop *Dakota* service between Delhi and Srinagar on a frequency of two services a week. The frequency of the Calcutta-Silchar daily scheduled freighter service was increased to ten a week from 6th June, 1958. From 15th June, 1958, a daily scheduled service on the Delhi-Hyderabad-Madras route with *Viscount* aircraft was introduced in place of the daily *Dakota* service on the Madras-Hyderabad-Nagpur-Bhopal-Delhi route.

The new route pattern is being criticised in some quarters. Some newspapers in south India reach Hyderabad and Bangalore a little late because of it. Bhopal has also been left out. The Act under which the airlines were nationalised and are operated, enables the Government of India to give directives to the Corporation to operate or not to operate a certain service. There is, however, an obligation attached to this provision, namely, that the Government of India will have to make good the loss incurred by the Corporation through a service undertaken in pursuance of the former's

directive. The Act is full of anomalies. It lays down, for example, that the Corporation will operate its services on commercial principles. And yet out of 40 routes, only two pay their way, as far as *Dakotas* are concerned. There is also "passenger resistance" to *Heron*s.

Proposed B.O.A.C.-A.I.I. Talks

B.O.A.C. and Air-India International will shortly begin talks for the revision of the Indo-British air agreement. One proposal is to pool their route earnings and divide them equally. There is a similar arrangement with Russia.

Interest Payment by A.I.I.

According to the annual report of Air-India International, the five-year moratorium on the payment of interest on Government investment in the Corporation expired on 31st July, 1958. The Corporation has requested the Government to extend the moratorium until the end of 1965. According to lobby reports, the Government has rejected this request.

Pan American Transatlantic Jet Service

Pan American World Airways, which flew *Boeing 707* across the Atlantic from New York to Paris has had to cancel its continuation to Rome as the Italian Government demanded that the U.S. airline impose a jet surcharge. Pan American is operating daily flights to Paris and began a daily service to London on 16th November. The inaugural jet flight carried 111 passengers, 40 in first and 71 in economy class.

Jet Service across the U.S.A.

American Airlines will be first across the U.S.A. with jets, with a New York-Los Angeles service starting on 11th January. The airline took delivery of its first *Boeing 707-120* recently, and has received permission from the airport authorities to operate in and out of New York International under the same conditions as those made earlier for Pan American's *707*'s and B.O.A.C.'s *Comet* IVs.

T.W.A. Jetstream Services

T.W.A.'s long-range "Jetstream" 1649As will take over all the airline's flights to the U.K., Europe and north Africa starting on 26th December. Under its winter time-table, effective from 26th October, one of these services is flown with a *Super-G*, all the rest with 1649As. The winter time-table adds Frankfurt as another European

terminal on T.W.A.'s polar route from the U.S. west coast. The airline placed 1049H *Super-Comet* on its all-cargo schedules between the U.S.A. and Europe on 6th November. The flights serve Shannon, Paris, Rome, Milan, Geneva and Gander.

B.O.A.C. Operating Procedure for Jets

In an appraisal of B.O.A.C.'s feat in launching its jet service, the free world's first since the *Comet* I, the *Aeroplan* supplies details of the airline's operating procedures on the north Atlantic route. Normally, the *Comet* service is flown with one stop westbound from Gander or Keflavik and non-stop eastbound from New York to London. Turnround times are planned at 45 minutes so that the overall westbound time via Gander will be 10 hours and 30 minutes; a non-stop New York-London trip eastbound will be about 8 hours and 30 minutes. The flight time for New York-London-Gander trip with maximum fuel (31,914 kilograms) against a 60-knot wind would permit a diversion to Sydney, Nova Scotia, after overflying Gander, with enough fuel still remaining for about one hour and 40 minutes, holding at 20,000 feet over Sydney. A payload of 10,000-12,000 lbs can be carried with the maximum fuel.

Swissair Cold Weather Flights

Swissair has been operating all its transatlantic passenger flights to New York with DC-7Cs since 24th November. Under its winter time-table started from 1st November, there will be nine passenger flights and two all-cargo runs. On 27th November, the airline will extend its Switzerland-Sao Paulo flight to Buenos Aires.

Colonial Coach Service

East African Airways has applied for permission to operate a colonial coach service with ex-B.O.A.C. DC-4M *Argonauts* between Nairobi and London at a frequency of once a week to start with, increasing later to twice a week.

Economies of Jet Operations

The big investment which international airlines have made in the jet age will require substantial traffic increases to pay off. *Life* magazine says in an article on what it calls the airlines' jet "gamble." In 1957, the 84 airlines (now 86) that belong to I.A.T.A. and handle more than 85 percent of all international traffic flew 1,300 million miles on routes that connect some 3,500 cities and carried 65 million passengers. Last year, these airlines earned a grand total of only \$50 million. Within the next four years, the world's civilian air fleet will be increased by 914 new planes that will cost \$2,800 million, almost as much as the aggregate worth of all the planes now flying. Almost half the orders have been placed by carriers outside the U.S.A. and a majority of the planes will fly on international routes. But the price tag, *Life* points out, is only the beginning of the outlays. Airlines will be called on to make. Substantial amounts will be required for new maintenance facilities, new hangars, training of ground and airline personnel, and replanning of ground handling facilities. Operating costs cannot, of course, be determined until the jets actually fly on regular schedules. *Life* feels that the best guess is "that if they are flown with utmost precision, at the optimum altitude, and without diversions or de-cost of operation a mile will be not much greater than that for piston planes." Initial costs will be high and the jets "will be an extravagance with full payloads. A fully employed *Boeing 707* passengers carried. By the time Pan American Paris will replace two piston flights on its winter of virtually all major airports, including New York International, London, Paris and Tokyo must be lengthened to meet the 11,000-foot requirement for full-load take-off in hot weather.

Appraisal of Costs

In another appraisal of jet costs, the *Wall Street Journal* says they will be high and the big question is "just how much profit is there?" A fully loaded *707* flying from Paris to New York and back, for example, could earn \$80,000 gross in less than 24 hours. With split-second scheduling, the same plane could complete another round trip to Miami (as Pan American and National plan), add another \$26,000 to its gross earnings and end up roughly three times as much revenue as the DC-7, the fastest piston flying, could produce in the same time. This is the theoretical maximum profit that can be calculated. Only experience will tell how much it will cost to keep the jets flying. Among the factors that will increase operating costs are sound suppressors, operating restrictions at airports, hot weather at take-off and at cruising altitude, wind and weather. Pan American Airways engineers estimate that noise suppressors line about \$115,000 a plane a year in added fuel costs, or a total of \$5 million annually for Pan American Airways's fleet of jets. Minimum altitude requirements of 12,000 feet immediately after take-off at New York can mean cuts in payload class fares totaling \$910. Hot weather means a en route stops—and increased costs. One airline heit while flying over the Atlantic could raise fuel consumption by several tons.

Jute

MEASURES TO LIFT RAW JUTE PRICES
DISCUSSED

SLUMP MIGHT AFFECT SOWINGS NEXT YEAR

THE continued downward trend in raw jute prices has caused considerable anxiety in trade circles. It is generally admitted that rates are too low, and most mills even would welcome a rise, if only to instil some life into the gunny markets. The main reason for the slump is the current bumper crop. The fear that present conditions will affect next year's sowings is very real, even though the bulk of the crop has already passed from the growers' hands at slightly higher prices than those ruling today; the time for sowing the next crop is still quite far. Over the past two years, it has been estimated that the growers' average cost of production has been between Rs. 20 and Rs. 25 a maund. Current market selling prices are now in most cases below this level. By allowing Rs. 4.50 to Rs. 5 a maund as marketing charges, it will be seen that the growers' return is well below their estimated average production costs on today's prices of Rs. 22 a maund for Assam jute.

So uncertain is the position, and so seriously it is looked upon in influential circles, that the subject has been discussed between the Government and the mills. The subject also figures high on the agenda of the current session of the Indian Central Jute Committee, which is discussing measures to fix minimum and maximum prices of jute. In contrast to the general air of depression prevailing today, it is encouraging to note the optimism displayed by the members of the I.J.M.A. delegation following a tour of Australia and the Far East. The Chairman of the I.J.M.A., who led the delegation, is confident that a large market exists for Indian goods in the countries visited, and in the light of bumper agricultural crops in those areas, it is hoped that the demand for Indian jute goods for packaging will be high. The tour is described as "most successful" and the visit has been well appreciated in Far Eastern countries.

The jute goods market has undergone many changes during the past week, the most significant being the continued fall in hessians. Fabrics in this category were strong because of steady demand in the face of a shortage. A squeeze developed and prices rose to new high levels. The demand has now been satisfied however, and prices have dropped by nearly Rs. 2 from the top. The difference between near and forward goods still remains at about Rs. 2.50 in favour of the former, but forward hessians are only slightly above the minimum levels laid down by the I.J.M.A. Poor shipping advice during the past week have given little confidence. The decrease in overseas enquiries, combined with the slump in fibre, have caused a weak undertone to prevail. Sacking has continued to fall under the influence of speculation, and is now below the level it was last February when the I.J.M.A. imposed minimum prices. For only very short periods during the intervening months has sacking touched the minimum levels, even for ready shipment, which currently enjoys a premium of about Rs. 1.50 over other deliveries of B Twills. Plain Cees, Cornsacks and A Twills, however, have a small premium in the forward section. With the current low level of fibre prices, it is still possible for combined business to be done at a profit. In February, when prices were at the present levels in the goods market, fibre prices were about Rs. 50 a ton higher.

Raw Jute Arrivals

During October, raw jute arrivals in Calcutta and mill stations amounted to 680,750 bales, consisting of 49,400 bales from Pakistan, an increase of 22,250 bales, and 631,350 bales from India, an increase of 250,750 bales. The overall increase over September is, therefore, 273,000 bales. Total arrivals from July to October 1958 now amount to 1,768,850 bales—159,900 bales from Pakistan and 1,608,950 bales from India.

THE JUTE MARKETS

Prices in the futures market fluctuated rapidly. As given by the East India Jute and Hessian Exchange Ltd. for the period 19th to 25th November, they were as follows:

	Hessians		Sacking		Raw Jute	
	40in 100z.		B Twills		Upper Assam	
	November		November		December	
	Rs. a	Rs. a	Rs a	Rs. a	Rs. a	Rs. a
	100 yds.	100 metres	100 bags		md.	100 kilos
Opening	43.70	47.79	95.85		23.06	61.78
Highest	43.96	48.06	96.30		23.08	61.83
Lowest	39.30	42.84	93.20		22.10	59.21
Closing	39.30	42.84	93.90		22.00	60.57

Manufactured Goods: The market was quiet at the opening last Thursday, and ready B Twills were quoted at Rs. 96.40, with forward shipment at Rs. 97.40. Hessian recorded small losses for 40in. 100z. to open at Rs. 43.85 for November and Rs. 39.85 for January-March. Reports of poor shipping instructions and the lack of overseas interest forced down prices, and the weakness of the fibre markets contributed to the decline. Sacking

dropped by Rs. 1.25 during the day, and the squeeze being lifted from ready hessians, 40in. 100z. fell by Rs. 1.85. Forward hessian fared better, and lost only 35nP. The difference between near and forward delivery was thus reduced to Rs. 2.50. Heavy speculative activity reduced sacking prices still further, while hessians showed irregular gains and losses. But over the week-end, fluctuations were narrow, and on Monday B Twills stood at Rs. 94.70 and 40in. 100z. hessian at Rs. 42.25. This was a drop of Rs. 1.70 in B Twills from the week's opening, and a drop of Rs. 1.65 in 40in. 100z. Ready hessian again came under the influence of bull liquidators at this stage and very weak conditions prevailed. Overseas buyers showed no interest and mill activity was negligible.

On Wednesday morning, quotations were as follows:

	November	December	Jan.-March
40in. 80z.	32.60 (35.53)	32.35 (35.26)	31.55 (34.39)
40in. 100z.	41.35 (45.07)	40.50 (44.14)	39.45 (43)
B Twills	94.25	94.85	95.90
Heavy Cees			
(Plain)	95.75	95.75	95.90
A Twills	116.25	116.50	116.50
Liverpools	109	108.50	108.50
Cornsacks	95	95.50	96.50

Raw Jute: Calcutta mills displayed little interest in raw jute during the past week, and spasmodic buying at cut rates was confined mainly to the Indian mills. Imports upcountry as well as in the Cossipore area were heavy. Sellers were keen to liquidate their holdings, and invariably offered at below the quoted rates. Opening quotations were on the basis of Rs. 22 a maund for Assam jute but were nominal. As the week progressed, sentiment became even weaker and prices dropped a further 25nP. Towards the close, sellers' ideas changed slightly due to a decline in imports upcountry, and they became more reserved. Prices, however, remained unaltered in the absence of business, and weak conditions continued to prevail.

Business was reported in Assam fibre at Rs. 22 and Northern at Rs. 20.75. Selected Murshidabad Tossa was done at Rs. 22.25 to Rs. 22.50 a maund, and desal Tossa at Rs. 22. Good agency mesta passed at Rs. 25.25 to Rs. 25.50 for Tops. Desal and Northern mesta was done at Rs. 19.75 to Rs. 20 basis Bottoms and Daissee mesta at Rs. 18.75. Jungli mesta Bottoms and B Bottoms were done at Rs. 18 and Rs. 16, respectively.

At the close, the market was unchanged and opening quotations on Wednesday morning were as follows:

	Landed at Mills	Rs. a maund	Rs. a 100 kilos	Shipment
Assam	22	58.96	December	
Northern	21	56.28	"	
Purnea Desal	20.25	54.27	"	
Daissee	23	61.64	"	
Assam Tossa	23.50	62.98	"	
Northern ex Calcutta	20.50	54.94	"	
Mesta:				
Assam-Northern	20	53.60	"	
Desal	20	53.00	"	
Daissee	19	50.92	"	
Jungli	18.50	49.58	"	
Bimil F A Q:	19.50	52.26	"	

THE FOREIGN JUTE MARKETS

FIBRE SALES AT BELOW THE
MINIMUM RATES

(FROM OUR DUNDEE CORRESPONDENT)

A SMALL volume of business was done in raw jute during the past week and sales took place at less than the fixed minima, thanks to those speculators who purchased fairly freely before the fixing of the rates. According to sellers, anything from 20s to 60s a ton less is being accepted for the secured lots, which are being offered quite freely in most grades, afloat or for shipment. It is estimated that there must be at least 10,000 bales of the secured lots which are yet to be sold. When this quantity is disposed of, it is believed that the minimum prices will be adhered to. It is reported in Dundee that forward business has been done for raw jute, May and June delivery, at around the existing minimum prices. Both buyers and sellers appear to be quite satisfied with the minimum prices and will be pleased if these rates prevail all the time to the end of the season. The Pakistan Jute Board will earn the gratitude of all members of the industry if they can prevent fluctuations in fibre prices. It is said that the minimum prices will not be reduced this season, but this does not preclude the possibility of an advance. Pakistan can always find something to keep up raw jute prices when the trend is downwards.

Mill Firsts are at £106. Mill Lightnings £90, and no offers of these are made at lower rates, but Mill Hearts can be bought at less than the minimum of £80 and grade Hearts under £67, while good marks of Daissee-2/3 are available at £93 and grade at £87, although the minima are £95 and £88, respectively. Grade Tossa is also being discounted by about £2 a ton on the minimum rates of £105 for assortment and £95 for fours, c.i.f. U.K., November-December shipment.

The Calcutta goods market is very irregular. Latest prices are 65s 9d for 40in. 100z. and 49s 3d for 71oz., November, 62s 6d and 47s 3d December and 60s and 45s 3d January-March, with B Twills at 145s, 145s 9d and 146s 6d for the respective positions of shipment, all f.o.b., Calcutta. Spinners

and manufacturers are comfortably sold over the next two months and prices for yarns and cloth are very firmly maintained. Dundee mills and factories are at present working to full capacity.

THE PAKISTANI JUTE MARKETS DEPRESSED CONDITIONS PREVAIL

(FROM A CORRESPONDENT)

STALE conditions continued to prevail in the raw jute market during the past week. Selling pressure increased while buyers were reluctant to purchase even at declining prices. Business was restricted and quiet. The dull overseas market was mainly responsible for the depressed conditions. There was some selective buying, but the overseas market was on the whole featureless. Values remained just around the minima with small premia for better qualities and scarce marks. It is reported that the recent dullness in the overseas market was due mainly to the stock position of mills abroad due to earlier purchases. India is also reported to be staying out and this has depressed the market further. Jute circles have forecast better foreign interest in the near future. This is based on the information of the stocks held by the foreign mills. Yet the prospects of lower exports this year cannot be ruled out.

Arrivals were on an average around 30,000 maunds a day, but clearance was poor and balers who had sufficient stocks in their godowns practically stopped buying. It is felt that the action of the Government in fixing minimum prices had some steadying influence. The trade feels that the new scheme will go far to remove uncertainties and serious price fluctuations, but at the same time, it is doubted whether Pakistan can afford to maintain such price levels. The total of Export Price Control forms registered with the State Bank of Pakistan up to 31st October, 1958, was for 2,380,931 bales, compared with that for the same period last year of 2,139,276 bales.

U.S. BURLAP CONSUMPTION AND STOCKS

U.S. burlap consumption in October continued to improve. The increase of 4 million yards over October last year was largely due to the recovery in piecemeal business reflecting the better industrial climate now in evidence. For the first ten months of this year, consumption was almost identical with that for the same period last year. U.S. burlap stocks at the end of October totalled the same as at the end of September. At 222 million yards, 117 million yards were spots and 105 million yards were afloats whereas at the end of September, spots accounted for 130 million yards and afloats 92 million yards. There was, therefore, quite a marked reduction in spot stocks last month. Appearing below are two tables which include the October figures—(1) based on member reports to the Textile Bag Manufacturers Association and the Burlap and Jute Association and (2) projected to represent the estimated consumption and stocks for the entire industry.

Nearly two hundred years ago, an English boy, James Watt, seeing a kettle lid rise and fall as the water boiled, sat fascinated. He had discovered the power of steam. In India today, more than 50% of the power produced is derived from steam. Texmaco, the first to build a Lancashire boiler, has considerably expanded its range of production to include another first—the fabrication of water-tube boilers in India. In collaboration with the world's best technical know-how, Texmaco is now equipped to manufacture and supply a wide range of Industrial Fire Tube, Water Tube and Locomotive boilers.

INDIAN ATTITUDE TO WORLD SUGAR PACT

PROSPECTS FOR EXPORTS

(BY A CORRESPONDENT)

WHETHER the Government of India joins the International Sugar Agreement, finalised by the International Sugar Conference held in Geneva in September-October 1958, will be decided in the next few days. In arriving at the decision, the main consideration will be whether participation will help the drive to increase sugar exports. An export quota of 150,000 tons of sugar a year has been allotted to India under the Agreement for the next three years. Is this adequate in terms of India's productive capacity as well as her need to export sugar in increasing quantities? Will joining the Agreement stand in the way of her selling sugar to some countries which are her neighbours and which have been her regular customers over a long period? These questions are important.

The Indian delegation to the recent International Sugar Conference in Geneva under the leadership of Mr. A. M. Thomas, Deputy Minister of Food, Government of India, did not press for the allocation of any specific quota. The figure of 150,000 tons allotted to India is, therefore, a recognition of India's status as an "exporting" country. Nevertheless, the delegation made suggestions which had the effect of indicating to the conference what would be a satisfactory arrangement from India's point of view.

Rising Indian Production

A fundamental point stressed was that the productive capacity of the sugar industry has been increasing and that India is in a position to export an appreciable quantity in spite of a progressive increase in indigenous consumption. Another important question was the price at which India could advantageously export sugar and which could be considered reasonable. The prices at which export is to take place should not necessitate—as it now does—subsidies, nor should they lead to violent fluctuations in the internal market. Other participating countries have to take into account the special requirements of under-developed countries like India by considering whether the export and price policies laid down in the Agreement would not impede the development of the local industry to its maximum extent, and whether they would raise the consumption of sugar internally.

Four years ago, India's production of sugar was about one million tons, and consumption about 1.8 million tons. By 1955-56, output had gone up to 1.85 million tons and consumption to 1.9 million tons. In 1956-57, which was the first year of the second five year plan, production rose to a little over two million tons and consumption to about two million tons. Production was short of consumption by about 800,000 tons in 1953-54. It came down to about 133,000 tons in 1954-55 and in 1955-56 it was further reduced to 95,000 tons. By 1956-57, the position had actually been reversed and there was a surplus of about 46,000 tons. During 1957-58, the increase of production over consumption is expected to be of more or less the same order. These figures do not take into account the production and consumption of khandsari sugar and gur, which are used by a fair proportion of the population. Simultaneously, with the narrowing of the disparity between consumption and production, the stock position has been improving during the past three years. While by the end of the 1954-55 season, the stock in hand was 543,000 tons, it was 532,000 tons in 1955-56 and 427,000 tons in 1956-57; it is estimated that the stock in hand at the end of 1957-58 could be about 356,000 tons. It may be

remembered that the Government of India has already made an allocation of 50,000 tons of sugar for export up to the end of October 1958 and that about 33,000 tons of it has already been contracted for.

Plan Target

The target for sugar production by the end of the second plan was fixed at 2.55 million tons. This was done after taking into account the latest trends in consumption, the potential increase in population during the five years and other relevant factors. A major proportion of the installed capacity required for the production of additional sugar has also been licensed. India's capacity for exporting sugar will have to be assessed from the standpoint of her progressively increasing production, and the carry-over stocks from year to year. To add to this, there is the present urgent need for earning as much foreign exchange as possible, and one of the commodities which can contribute substantially is sugar. On the basis that 15 percent of production could conveniently be exported by any country, India is entitled to an export quota of nearly 380,000 tons and in any case of not less than 200,000 tons a year.

For a long time up to 1953, India's status concerning sugar was that of an importing country. But under the provisions of the International Sugar Agreement concluded in 1953, she was placed in the category of exporting countries. For all practical purposes, however, it amounted only to a theoretical recognition, as she did not participate in the previous Agreement. In 1956, this recognition was given a practical shape when the International Sugar Council allotted to India a quota of 50,000 tons for export, 25,000 tons as the basic quota and 25,000 tons as an additional special reserve.

Reason for Keeping Out

India's non-participation so far was based on a few basic considerations. India did not stand to derive much benefit from the Agreement because of the restrictive scheme regulating the international supply and demand of sugar. There were also other restrictive clauses, which were considered unfavourable from the point of view of the Indian sugar industry.

The prices of Indian sugar, related as the cost is to the price of cane, are rather high compared with those of foreign sugar, and it will not be possible for India to avail of the export quota as the export price under the Agreement has been fixed within the range of between 3.25 U.S. cents and 4 U.S. cents. Nor will it be possible for India under the terms of the Agreement to subsidise exports, because it will be considered detrimental to the interests of other contracting countries.

The most important objection to participation in the Agreement, it would appear, is the implication that India would find herself in the position of having to limit her productive capacity. At the same time, it would also restrict India's freedom to sell her surplus sugar in the "free market" by entering into bilateral agreements with such countries. It is, of course, true that demand in the "free market" is inelastic, but the price in this market is of material concern to sugar producing interests in India and other non-participating countries with a developing industrial potential.

Exporting to Old Customers

Even though the International Sugar Conference of 1953 was ready to revise some of these restrictive clauses, it was felt that India would be unable to derive much benefit unless she could export sugar at competitive rates. By and large, while the broad advantage is there that in joining the Agreement, India would be assured of a ready market for her surplus sugar, there is also the disadvantage that this would be at the cost of the development of the local industry and the potential increase in internal consumption.

With her expanding production of sugar and also of khandsari and gur, India would be in a position to recapture some of the markets in the

neighbouring countries which she had lost during the period of short production and controls. For example, it was possible for the sugar industry in India to export about 150,000 tons of sugar in 1957 outside the Agreement, to those countries which constitute a sort of safe and permanent market for her.

The quota of 150,000 tons provisionally allotted to her falls short of the quantity which she is in a position conveniently to export, which is about 200,000 tons. But it is three times more than what the Government has allotted for export up to October 1958, and is nearly equal to the quantity which the industry itself exported last year. The quota is quite within India's capacity to export, but joining the Agreement will naturally depend on other factors such as have been discussed in this article.

WHOLESALE PRICE INDEX FALLS

THE official wholesale price index (base: year ended March 1953=100) registered a fall of 0.9 percent to 115.1 during the week ended 8th November, 1958, compared with 116.1 (revised) for the previous week. The index was lower by 1.0 percent when compared with the corresponding week of the earlier month but was higher by 4.9 percent than that of last year. The index for Food Articles declined by 1.2 percent to 120.2, compared with 121.6 (revised) for the previous week due to a fall in the prices of potatoes in Furrukhabad (-17%), gur in Muzaffarnagar (new crop) (-13%), mung in Bombay (-9%), cashewnuts in Mangalore and betelnuts in Bangalore (-8% each), groundnut oil in Madras (-7%), onions in Delhi (-6%), urad (-5%), rice, maize, gingelly oil and mustard oil (-2% each) and musur (-1%), in spite of a rise in the prices of oranges in Madras (+4%), arhar in Patna (+8%), bajra in Anakapalle, gram and mung in Patna and eggs in Madras (+6% each), ragi in Bangalore (+5%), black pepper (+2%) and wheat, jowar, chillies and cardamoms (+1% each). The index for Tobacco remained unchanged at its previous week's level of 92.4. The index for the Fuel, Power, Light and Lubricants group also stood stationary at the earlier week's level of 115.0. The prices of raw jute in Barachakia (-8%), groundnuts (-7%), bamboos (green) (-6%), linseed in Kanpur (-5%), castorseed and gingellyseed (-3% each), raw cotton and raw silk (-2% each) and cottonseed, tanning materials and raw hides (-1% each) witnessed a fall and, in consequence, the index for the Industrial Raw Materials receded by 2.2 percent to 113.1, compared with 115.7 (revised) for the earlier week. The prices of bamboos (dry) and lac (shell pure) (+5% each) and raw wool (+1%), however, showed a rise. The index for Intermediate Products increased by 0.3 percent to 109.8 due to a rise in the prices of aluminium circles in Bombay (+9%), zinc (electrolytic) in Bombay (+6%) and brass (+1%), in spite of a fall in the prices of linseed oil and rayon yarn (-2% each). Higher prices of jute manufactures and bicycles (+2% each) raised the index for Finished Products by 0.2 percent to 108.6 during the week.

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA

(Base: August 1939)

THE Middle Class Cost of Living Indices, by groups, have now been brought up to October 1958. As compared with September, the October Index for Food shows a rise of 9 points, while those for Fuel & Lighting, Clothing and

Miscellaneous remain unchanged at 281, 553 and 288 points, respectively.

Correlating all the factors, the Middle Class Cost of Living Index for Calcutta shows that the cost of living increased by 4 points during October 1958.

CONCILIATION BOARD FOR PLANTATION DISPUTES

NON-COMMUNIST UNIONS IN KERALA TO CO-OPERATE

(FROM OUR SOUTH INDIAN CORRESPONDENT)

THE Kerala Government's counter-proposal (as against the demand for adjudication put forward by the planters and I.N.T.U.C.-led unions) to constitute a conciliation board under Section 5 of the Industrial Disputes Act to go into the plantation labour dispute has been accepted by the non-communist unions, and the general strike proposed from 25th November has been called off. The board will be constituted with equal number of representatives of workers and employers, and an independent chairman having the status of a High Court judge.

The planters have extended a lukewarm reception to the Government proposal, although they have declared their intention to co-operate. They hope "that an industry-wide settlement would be the objective and that all the other parties involved in the wrangle, the trade unionists and the political wire-pullers, will play fair".

Government Explains

In the official Press release announcing the proposal to set up the conciliation board, the Government has given a few reasons why adjudication is not acceptable. One of them is that the Supreme Court bonus formula, being applicable to the plantations as well as to the majority of workers, would not constitute a matter for adjudication for any additional bonus for 1957. Another reason for ruling out adjudication is that the tribunals, being bound by the decision of the Supreme Court, might reject the theory of bonus as deferred wages. The Government has put forth a suggestion that industrial managements in the State have been paying a 4-per cent bonus as deferred wages ever since 1946. This is challenged by the Association of Planters of Kerala. In a Press statement, the secretary of the association says that the deferred wage theory of bonus has never been accepted by the employers in the State and the suggestion of the Government that industrial managements have been paying bonus as deferred wage is incorrect.

It is pointed out that the procedural difficulties in the way of constituting a board of conciliation

are many. The Government has hurriedly announced its decision to amend certain rules under the Industrial Disputes Act so that it could refer the dispute to conciliation even if some of the unions, or any of the parties to the dispute, decide to remain aloof. According to the proposed amendment, the Government will be armed with adequate legal powers to nominate anyone to the board as a representative when the union or association fails to do so.

Campaign against Rubber Board

The communist unions have been demanding the reconstitution of the Rubber Board with an adequate number of their representatives on it. All the three labour representatives, nominated recently to the Rubber Board, belong to the I.N.T.U.C. Communists claim the support of the majority of rubber estate workers, and, therefore, feel that they are entitled to get the largest representation on the Rubber Board. So they have addressed a communication to the Central Government demanding the Board's immediate reconstitution. If the Central Government fails to respond to their request, they threaten to strike and take other forms of direct action. This might be a clever move to shift their agitation to rubber estates in the Mundakayam Valley and elsewhere from the High Range tea plantations where they have not succeeded in their objectives.

Co-operative Marketing in Spices

The two-day conference on co-operative marketing of spices convened recently in Trivandrum by the Central Food and Agriculture Ministry has recommended the constitution of a central board for spices to act as a promotional and developmental body on behalf of the co-operatives. It was also decided that the inter-State and export trade in spices would be undertaken by the All-India Co-operative Marketing Federation in collaboration with the State Trading Corporation. The conference was attended by the representatives of the Central and State Governments and co-operative societies of the spice-producing States of Kerala, Mysore, Madras, Bombay, Orissa and Andhra, the Cashew and Pepper Export Promotion Council, the State Trading Corporation, the Reserve Bank and the State Bank.

Dr. Punjabrao Deshmukh, Union Minister for Co-operation, who presided over the meeting was highly optimistic about the scope of co-operative marketing in spices, cashewnut and arecanut. He said "if producers' co-operatives organise themselves properly they should be in a much better position than private dealers to expand our foreign trade to the great advantage not only of the producers but to the general economy of our country". He added that "our production costs are high due to the existence of too many middlemen in our trade and this acts as a great handicap in developing business in competitive foreign markets". The conference discussed the various difficulties, both organisational and financial, facing the co-operatives. There was unanimity of opinion that there should be as few tiers as possible between the primary marketing society, the Central Spice Board and the All-India Marketing Federation. The conference was of the view that each commodity has its own problem and that, therefore, the proposed central board for spices should be flexible and have separate committees under it for dealing with specific commodities.

Increasing Consumption of Rubber

The chairman of the Indian Rubber Board, Mr. Sankara Menon, has told the first meeting of the reconstituted board, held on 21st November, that heavy imports of rubber have become necessary to meet the mounting demand of the rubber goods manufacturing industry, and in order to prevent this heavy drain on foreign exchange, the growers should produce more rubber. It was thought some time ago that at least 2,000 tons more of rubber could be produced this year, but heavy monsoon and labour strikes have defeated all attempts at producing more. It is estimated that at least 200 tons of rubber might have been lost as a result of the recent strike on the estates in Kerala. Mr. Menon has pointed out that the inadequate supply of natural rubber has compelled the Indian manufacturing industry to use more and more of synthetic rubber. Now the Indian manufacturers are using synthetic rubber to the extent of 10 percent of their total consumption, against 40 percent used by their counterparts in other parts of the world. He has exhorted the growers in India to replace their existing low-yielding plants with high yielding strains. This could bring down their cost of production. He has advised the small growers to make full use of the assistance offered by the Rubber Board. It is gathered that the Rubber Board so far has given permission for subsidised replanting of 5,700 acres in 1959 and 2,000 acres in 1960 under its scheme, which aims at the subsidised replanting of 70,000 acres in ten years at the rate of 7,000 acres a year. The subsidy offered by the board varies from Rs. 250 to Rs. 400 an acre, the maximum being offered to small growers. The scheme is making poor progress due to little response from the growers who are not satisfied with the amount of assistance, and the procedural difficulties in obtaining it.

COCHIN TEA SALES

At Sale No. 33, 1,900,000 lbs of tea were on offer. There was considerably less demand and the market opened 10nP to 15nP lower for low mediums and mediums but declined further towards the close with heavy withdrawals. There was a fair demand for better liquoring sorts at lower rates following quality.

FAIR GENERAL DEMAND AT TEA EXPORT SALE

LOWER PRICE TREND IN DUSTS

AT Sale No. 21, (the sale reported last week in this column was No. 20), held on 24th and 26th November, offerings at the Export auction amounted to 71,375 chests for which there was quite a fair general demand, although again at lower rates. "Teas for price" and plain broken were 4nP to 8nP easier, while plain Fannings which received less support were up to 10nP easier. Medium B.P.'s and P.F.s, declined by 8nP to 10nP. Orthodox medium Assam B.P.'s were 10nP to 20nP easier, while similar O.F.s met with a limited demand at about 10nP to 15nP less with some withdrawals. There was a fair demand for the few best and also for the cheaper, more fibrous C.T.C.'s which were both irregularly 10nP easier. There were appreciable withdrawals of medium C.T.C.'s with ordinary liquors which met with restricted enquiry. Legg-cut Doocars declined by 6nP to 8nP. Whole leaf grades came to an easier market, but tippy teas and Darjeelings, although irregular, generally sold well.

Quotations	1958	1957
Clean Black Pekoe	1.95 to 2.00	2.40
Plain B.P.	1.58 to 1.62	1.64 to 1.66
Plain Fannings	1.70 to 1.76	1.72 to 1.76
Medium B.P.	1.72	1.70 to 1.74
Medium Fannings	1.78 to 1.82	1.82 to 1.84
Best Assam C.T.C. B.P.	2.00 to 2.05	3.10 to 3.50 (nom.)
Best Assam C.T.C. Fgs.	2.10 to 2.15	2.90 to 3.10

At the Internal Sale, there was a good general demand for the 22,686 chests of Dust on offer, although at generally lower rates. Orthodox descriptions were somewhat irregular and generally eased by 2nP or 4nP, and buyers showed less interest for the powdery types than in recent weeks. Legg-cut Doocars types also shared in the downward trend. There was a fair demand for the C.T.C. teas, but these were irregular while the poorer and medium types were generally 10nP to 15nP lower with the exception of the few brown grainy exportable types which were well supported and often sold above valuations. The better C.T.C. sorts received only a limited enquiry and were up to 25nP easier.

Quotations	1958	1957
Medium Doocars Dust	1.84	1.74
Medium Assam Grainy Dust	1.84	1.74 to 1.76
Medium Assam C.T.C. Dust	1.90 to 2.20	2.00 to 2.10
Best Assam C.T.C. Dust	2.80 to 3.00	(nom.) 3.00

There was a total of 1,865 chests of Leaf which met a good general demand, but sold at irregularly easier rates.

MORE GRAIN BOOKING IN FREIGHT MARKETS

FURTHER grain fixtures were made to India at unchanged rates, and a fair number of time charters were concluded for six and 12 months' trading in the freight markets during the past week. The current visit of Mr. Posthuma, the international port expert, is welcomed by ship operators in view of the alarmingly poor drafts now available in the river Hooghly, and the apparent inability of the Port Commissioners to effect any immediate improvement. It is to be hoped that a quick decision on the suitable steps will be taken by the Government after discussions with the visiting expert.

LINSEED STEADY

In spite of little enquiry, prices have remained steady over the past week because of a scarcity of supplies. Trading has been small with both buyers and sellers holding off. Crushers have been idle due to low stocks of oil. The oil market has been dull. Latest quotations are as follows: ready-November Rs. 26.12 a maund; December Rs. 26 a maund.

HIDES AND SKINS FIRM

The market in skins continued firm and prices showed an upward tendency. Stocks were less than in the previous week.

Bazaar Stocks

(Between 18th November to 24th November, 1958)
Cowhides: Wet Salted (ord.) 5,500 pcs. on the basis of Rs. 6.50 to Rs. 10.50; Wet Salted (slaughtered) 26,000 pcs. on the basis of Rs. 7.50 to Rs. 14.50 and Rs. 16.50 to Rs. 25.

The Dividend, if declared, will be paid to those Shareholders whose names appear in the Register of the Company on 17th December, 1958 or their Mandates and the Dividend Warrants will be posted from the 21st day of January, 1959 onwards.

EXPLANATORY STATEMENT AS REQUIRED BY SECTION 173 OF THE COMPANIES ACT, 1956.

Item No. 3:

Sir A. Ramaswami Mudaliar, K.C.S.I., who retires by rotation and is eligible for re-appointment has attained the age of 71 years and hence his re-appointment needs your approval by a resolution in respect of which a special notice has been given in accordance with the requirements of Sections 190 and 281 of the Companies Act, 1956. The Company has received such special notice from a Member notifying his intention to move the resolution as set out in the body of the Notice. Sir A. Ramaswami Mudaliar, K.C.S.I., joined the Board of Directors of the Company in 1949. During the long period of his association with the Company he has rendered very valuable service to the Company and it is in the interest of the Company that the Board should avail of his valuable advice which is of great asset to the Company by retaining him as a Director of the Company.

H indicates that Share capital is half paid. O, C. and Dd. indicate Ordinary Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

Dividends are cumulative and shares carry a Preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends.

Year Issued	NAMES	Amount issued in 100's Rs.	Rate per cent	Paid up per Share Rs.	Market Quotations 26-11-58 Rs.	A year ago Rs.	Year of issue	NAMES	Amount issued in 100's Rs.	Rate per cent	Paid up per Share Rs.	Market Quotations 26-11-58 Rs.	A year ago Rs.

ARBITRARY FOREIGN TAXES ON TEA

G.A.T.T. WRITES A BRIEF FOR INDIA

IN recent years, this newspaper has repeatedly urged the Indian Government to take diplomatic action, especially in Continental Europe, to secure a reduction in the exorbitant and arbitrary taxes imposed on tea. Our latest reference to this question was in our issue of 13th November. Since then, the important report written by G.A.T.T.'s experts and entitled *The Evolution of International Commerce*, has been published and includes a very forceful statement of our case. A detailed brief has now been written, and written by one of the most authoritative international bodies; it remains for the Government of India to plead it in the appropriate capitals. There is every reason to suppose that it would obtain a sympathetic hearing. The G.A.T.T. report is an international document, not a special plea by the tea-producing countries. Moreover, it makes clear that the wrong that is being done India in this matter is probably not deliberate, but results from a thoughtless hangover in the tax structures of certain western countries.

Tea is, in normal years, one of the two or three most important foreign exchange earners of the Indian economy. Anything that can be done to increase sales of Indian tea represents a valuable relief in the foreign exchange crisis which the course of development under the five year plans makes virtually chronic. Efforts have been made by the I.T.A. and more recently by the Indian Government, to promote tea sales abroad, particularly in countries where the tea-drinking habit is less developed than in the traditional markets, Britain and Australia. Although these efforts have been rewarded with some success—consumption of tea is rising in west Europe—a real invasion of these markets has been frustrated by the high price of tea to the consumer. This high price is not the fault of the Indian producer nor of the London middle man. In many cases, it is not the result of high import duties either—the situation would be simpler if it were, for then the matter could be dealt with in the normal tariff negotiations in G.A.T.T.

Very often it is the result of sumptuary taxes, which, as part of the domestic fiscal structure of the countries concerned, lie outside the scope of treaties and negotiations dealing with the promotion of world trade by means of lower import duties and larger import quotas. These taxes strike also coffee and tobacco, two other export commodities which interest India, although to a much smaller extent than tea. Whatever is the case with coffee and tobacco, it is certain that the taxes on tea have become, for some of the Governments who impose them, unprofitable taxes in that they are too high even to bring in maximum revenue—i.e., a lower rate of tax would bring in more revenue by stimulating consumption. We should not be surprised that such taxes nevertheless persist. The laziness and lack of imagination of taxation officials is much the same the world over. Have we not numerous such outdated and self-defeating taxes in this country? The exorbitant rates of taxation on tea, coffee and tobacco in some western countries date from a period, probably back in the last century, when these commodities could be regarded as upper-class luxuries with more justice than they could today. One suspects also that they have been singled out for unfair taxation because they are, or were, vaguely associated in the minds of administrators with sinful indulgence. This puritanical attitude to tea and coffee is perfectly compatible, for example in countries such as Spain, with an indulgent attitude to the consumption of cheap alcoholic drinks. At all events, it is probable, as the G.A.T.T. experts say, that such taxes are maintained by Governments who have no idea of the damage they are causing to the principal exports of certain under-developed countries and who would, if the matter were drawn forcibly to their attention in these terms, show the required goodwill.

The G.A.T.T. report says: "As for the principal commodities subject to domestic taxes in the industrialised countries of Continental west Europe (such as tea, coffee and tobacco), it seems that the

rate of taxation is so high as to limit considerably both consumption and the demand for imports. There is hardly any reason, outside the inertia of fiscal traditions, to lay the main burden of taxation on non-competitive imports by subjecting them to special domestic taxes which lend themselves much less to G.A.T.T.'s negotiating techniques for ordinary customs duties. As long as this situation lasts, it would be better to write into G.A.T.T.'s negotiating procedures the rules of the Havana Charter concerning domestic taxes." (The Havana Charter, which has remained a dead letter, attempted to deal with this problem, which lies outside the scope of G.A.T.T.) The report continues: "Many of the reasons which make it difficult sensibly to lessen the agricultural protectionism of the industrialised countries—lobbies that invoke political or social considerations or arguments about national security to maintain the protection of large sectors of national food production—have no relevance, usually, to the case of these domestic taxes. Moreover, these taxes strike above all at the export potential of some of the poorest of the undeveloped countries. The industrialised countries could contribute substantially, by a reduction of these fiscal duties, to opening up their markets to the exports of the non-industrialised regions, and consequently to helping these regions earn more from their exports in order to finance the imports required by their development plans."

After emphasising that the sacrifice of revenue suffered by the western Governments in reducing these taxes would be amply repaid by the increase in trade with the under-developed countries concerned, the report reverts to the subject in its conclusions. There it says: "...in the industrialised countries, fiscal duties constitute, for increased trade in certain agricultural commodities (particularly beverages of tropical origin), a much more serious obstacle than do fiscal duties imposed in the backward countries on manufactured articles.

PRIVATE LIBERTIES AND THE PUBLIC SECTOR

THE third plan, yet to be born, has already been launched. At least, the Prime Minister has begun to prepare the country psychologically for it. It is going to be bigger. (It is perhaps unkind to remind him that this does not quite accord with simultaneous talk—which here is accompanied by action—of pruning the plan now in process of execution.) The coming plan is also going to bring socialism nearer, from which goal, Mr. Nehru told a large Calcutta audience on Sunday, there will be no going back. Everything that stands in the way will be swept aside. He made no secret of it that the third plan will also see a steady expansion of the public sector. There is, indeed, a great deal that the public sector will have to do, if only because nobody else will. It has been suggested in these columns more than once that the contradiction between the private sector and the public in an economy such as India's is often grossly exaggerated—by both sec-

tors. Mr. Nehru's statement was merely one more example.

The purpose on the present occasion is not to recite once again the economic arguments against waste in the public sector. The Government must be well enough acquainted with them by now even if it does not admit the fact any more frequently or frankly than the private sector acknowledges its own numerous shortcomings. The object, rather, is to examine the political consequences of excessive expansion in the public sector. The argument is not going to be the sanctity of the individual's right to do business and make profits, on which everyone is entitled to his opinion and Mr. Nehru is well known. What is proposed here is to confront the Prime Minister with the values he believes in and then to show that these cannot be sustained in conditions that will inevitably be created by an expanding public sector.

That China's way is not India's has been proclaimed more than once, and there is no reason to doubt that the belief may not be held sincerely in New Delhi. Unfortunately, the history of man is strewn with instances in which sincerity was found an inadequate barrier against the forces it had itself unleashed, tendencies it had itself set in motion. Now, the first thing the public sector in every age and under every sky leads to is ceaseless multiplication of the bureaucracy. The bureaucracy, it is fair to remember, was created to ensure justice, to delay and soften the high-handedness of mediaeval potentates. It is at least equally true that the bureaucracy, may in its turn, come to be a more powerful instrument of tyranny than the one it had been devised to replace.

The danger is greatest in under-developed societies where there is not an abundance of

administrative talent. To expand the administration in such circumstances is to invite the spreading of inefficiency in wider and wider areas of life. It is not often realised that inefficiency is as sure a breeder of injustices as nepotism, corruption and so on—all of which exist too in no small measure. India's is one of the best civil services in this part of the world, in spite of the recent explainable deterioration in standards. But even here Ministers have been heard to complain that their nobly conceived schemes have gone awry because of the inadequacies of the administration. To give more into the hands of a bureaucracy in which the leaders themselves have so little confidence is certainly not to accelerate progress on the economic front. What political consequences follow failure there are how too well known to need recapitulation.

The fashionable passion for equality and social justice encourages endless proliferation of the bureaucracy, and in too many of the newly independent States it is an inadequate bureaucracy that will proliferate. Nor is it difficult to see exactly what will happen. Governments distrustful of private enterprise will take more and more upon themselves (which means their bureaucracies) and then not only will new grandiose schemes remain pathetically poised on paper, but even the elementary essentials of corporate life, which used to be fulfilled, however badly according to some, will just not be done at all. Popular pleasure at the removal of the malignant private sector will be short-lived, and admiration for Erehwons on paper will be no more enduring. Thus will be created a situation perhaps worse than the one the champions of justice and equality had sought, with the best intentions in the world, to put an end to.

The eclipse of democracy in one country after another in Asia and Africa has been explained or interpreted variously, and this newspaper analysed it only last week. It is not impossible that the infant democracies broke down on something much simpler. The new administrations may have just strangled themselves with the red-tape they created, which rope they imagined was the hallmark of a modern administration. It is, unfortunately or otherwise, but it has to work. And it cannot work when the bureaucracy is new and inexperienced and the society is old and unversed in the ways of form-filling. What happens in many new countries is that the bureaucracy imposes myriad controls in order to ensure justice and fairness, and neither justice nor fairness ensues because, meanwhile, pieces of paper (permits and such like) have been invested with a price the common people cannot pay—either in terms of cash or in those of "connections." Discontent follows before long, as it must. The relief with which the advent of a military régime has been received in India's neighbouring countries may well have proceeded from a revolt against the intolerable inefficiency of the bureaucracy.

This, then, is the danger latent in the public sector, which has functioned only for a few brief years and has already displayed so many warts on its face that it has to be on the defensive. The tendency now is to explain them away in terms of personal deficiencies. Hence the overdone publicity for particular delinquent Ministers and civil servants. Such, in fact, was the attitude of the early advocates and practitioners of modern capitalism until a more scientific approach came along. Since the chief advantage, or claim, of the new countries is that they are going to avoid the mistakes of earlier societies, it should be asked now whether this is really being done. Let individual officials guilty of any questionable conduct be punished by all means, but these so-called exemplary measures will avail a country nothing if the system is not looked into a little more closely. On the contrary, working on the excusable assumption that for every one case of dishonesty or incompetence discovered, at least a hundred lie forever concealed, the public mind will usually associate such individual examples with the quality and virtues of the system as a whole. It must be remembered that the majority of the already many known deficiencies of the public sector are inherent in the bureaucratic system itself. The search for scapegoats and the routine castigation of the private sector are red herrings across the trail of economic disaster. And, of course, no disaster today can be only economic.

U.K. UNEMPLOYMENT AND INFLATION

RISKS IN AN EXPANSIONARY POLICY

AN interesting innovation in British finance this year was the appointment of a three-man council to advise the Government on matters related to prices, wages and productivity. Its reports have emphasised the danger of inflation more than the danger of recession. Sir Harold Howitt is a member of this council; so his audience was probably not surprised when he said in his opening address to the national conference of the British Institute of Management near the end of November that the main challenge confronting management in the future was not lack of demand, but inflation. The theme of his address was that Britain had "a golden opportunity just now not only to scotch but even to kill the disease". Sir Harold produced figures to show that the kind of inflation that Britain had suffered in recent years was quite abnormal. In 1914, he said, retail prices were no higher than they had been 64 years previously. At the beginning of the Second World War, they were little more than 50 percent above the level of 1850. Prices rose during the war, and after it they continued to rise steeply, until they reached in 1958 nearly four times the level of 1914. Sir Harold did not accept the complacent assumption that "creeping" inflation could never develop into "galloping" inflation.

It so happened that when Sir Harold uttered his warning, the New York stock market had just suffered the first serious relapse of the current year and perhaps the most serious in several years; and the London stock market was, for a short time, severely shaken by this event. It happened also, however, that Sir Harold's warning coincided with the British banks' figures for November, showing for the third successive month—quite contrary to the seasonal trend—a steep rise in advances. This increase in the banks' lending is mainly to finance consumption, not investment, and all observers who are apprehensive of inflation are watching it closely. Another cause of anxiety in Britain is the persistent rise in wages, which continues even in the recession. This year's negotiations will evidently result in an average increase in wage-rates by some 4 percent. The figures for industrial production so far available show, by contrast, a decline of some 4½ percent. Higher wage-rates and lower output imply higher costs—at a time when the commodity element in industrial costs is no longer diminishing in value. It seems that prices must rise, unless profits are reduced and/or operations are made more efficient.

Both profits and efficiency were discussed by Sir Harold Howitt. It is often convenient to forget that profits as well as wages are an element in prices; though they are not equally inflationary, because profits much more than wages provide new capital. However that may be, Sir Harold said disapprovingly: "Profits of late years have been high." In British industry generally, profits (after provision for depreciation) aggregated roughly one-third of wages and salaries in the period 1950-56. Both elements, said Sir Harold, "must bear their share of responsibility for inflation". But wage increases can only be justified, he said, if they are kept within the limits of increases in productivity. The Government is now facing a double dilemma that must seriously affect its economic policy. Mr. Heathcoat Amory, Chancellor of the Exchequer, is well aware of the danger of inflation, but the Conservative Government as a body is primarily concerned with the problem of unemployment. Treatment of this problem is urgent, because the level of unemployment, though still low by pre-war standards, is high by post-war ones and is still tending to rise. So even Mr. Amory—speaking just after Sir Harold Howitt's statement on the "golden opportunity . . . to kill the disease"—felt justified in telling the National Union of Manufacturers that inflation had been "pretty well eliminated from the economy".

It is this kind of remark that worries orthodox economists and bankers. They fear that the Government is compromising the principle of "an honest pound" because putting that principle into effect has awkward political consequences. They note Mr. Amory's emphasis on the strength of the pound and of the reserves and on the high rate of voluntary saving, and they wonder if the Government takes due account of the fact that these favourable circumstances can change in a short time. Why, they ask, if the position is always "not quite strong enough" to allow convertibility of sterling, is it so easily judged to be strong enough to support a policy of reflation? The fact remains that Britain's finances are much strengthened; and it may be that the danger of a new outbreak of inflation lies not so much in what the Government is doing this year as in what it will feel compelled to do next year and later. The official publication *Economic Trends* has provided figures of overseas countries' balances in London as at end-September last. Comparison of these figures, and of those for the gold and dollar reserves, with the figures of a

year previously, shows the extent of the improvement in the first year after the crisis of 1957. The sterling balances were reduced over the year from £3,373 million to £3,266 million, while the reserves were increased from £661 million to £1,114 million. As the reserves are the liquid resources available to discharge, if necessary, the sterling liabilities, it can be calculated that the nation's "liquidity ratio" has been raised from 194 percent to 34 percent. This improvement alone may be considered to justify cautious economic expansion.

But what will happen if cautious expansion does not solve the problem of unemployment? There is no assurance that unemployed workers who have no special skill, and the growing number of unskilled juveniles (the rise in the birth rate that began during the war is beginning to affect the labour market), will be automatically absorbed into industry when industrial output is expanding. In most industries neither labour nor machinery is fully employed. The "hidden reserve" of labour will naturally be used before the "published reserve" shown in the unemployment figures, and some modern equipment will substantially increase output without using any more labour at all. This is a serious problem, which cannot be permanently solved by more and more financial stimulation.

OIL IN ASIA AND THE FAR EAST

THE exploitation of petroleum resources has received increasing attention in Asia and the Far East during recent years. There are probably three main reasons for this. Firstly, although oil is hardly the main source of energy in any country of the region yet, the need for it is growing as various economies are developed and modernised. Secondly, in the face of increasing balance of payments difficulties, it has become necessary for such countries as India to keep down imports and to explore domestic petroleum resources more vigorously. Thirdly, as world demand for petroleum products is rising, exporters such as Iran, Indonesia and British Borneo are benefiting from the development of their oil industries. The region as a whole, however, still has a long way to go before it becomes a major producer or consumer. This is evident from a factual but colourless study prepared by the U.N. Economic Commission for Asia and the Far East, which has been submitted to the Symposium on the Development of Asian Petroleum Resources now being held in New Delhi. The study points out that production of crude oil in Asia and the Far East during 1957 has averaged approximately 1,215,650 barrels a day, or about 1 percent of the total world production for the year. The average daily consumption of petroleum products has approximated 1,070,000 barrels, or about 6 percent of the average for the whole world. Japan and India are the two leading consuming countries, although both of them are small producers of crude oil. Iran, Indonesia and British Borneo, the principal producing countries, are also "the chief exporters of both crude oil and refined products." Eight countries of the region produce crude oil "in significant quantity," their output, in terms of barrels a day, being: Iran 723,700; Indonesia 314,700; British Borneo 116,200; China (mainland) 30,800; India 9,100; Burma 8,900; Japan 6,200 and Pakistan 6,000.

Turning to the subject of crude oil reserves, the study says that reports "vary widely according to the source, and are difficult to reconcile." However, proved reserves in the E.C.A.F.E. region (stretching from Iran to Japan) "are probably of the order of about 40,000 million barrels, plus or minus about 3,000 million barrels. By far the greater part of these reserves are in Iran, and the remainder of the region has reserves totalling from about 5,000 to 9,000 million barrels, which represent only about 20 percent of the total reserves credited to the region. Iran ranks third among the countries of the world that have substantial reserves, after Kuwait, with 50,000 million barrels, and Saudi Arabia, with 45,000 barrels." The rapid increase in the demand for petroleum products after the second World War has brought about a correspondingly large increase in crude oil production and refining capacity. The total capacity of crude oil refineries in the region was about 1,350,000 barrels a day at the end of 1957. More than one-third of this capacity is concentrated at the Abadan refinery. About one-third more of the total capacity is taken up by nearly 20 refineries located in various parts of Japan, and the remaining third is shared by seven other countries of the region, of which Indonesia and India have the largest capacity. The expansion of existing facilities and establishment of new refineries has been one of the most significant industrial developments within the region during the postwar period.

Surveying developments in individual countries, the E.C.A.F.E. study says that Burma's present production of crude oil and her refining capacity are about sufficient to meet requirements of petroleum products. However, if the postwar trend of steady increase in crude oil production and consumption of products continues, additional refining capacity will soon be required. In mainland China, the several new discoveries made in recent years

may change the petroleum situation greatly in the near future, and considerable progress has already been made in providing access by rail and road to the new potentially productive areas, to link these remote and sparsely inhabited localities with larger markets. India's current production of about 8,000 barrels daily of crude oil is sufficient to supply only about 6 percent of her petroleum requirements. Although consumption is expected to expand at the rate of more than 10 percent annually, the supply is likely to improve considerably in the near future when new fields, recently discovered, are brought to full production. Plans provide for the establishment of new refineries in Assam with a daily capacity of about 20,000 barrels, and in Bihar with a daily capacity of about 30,000 barrels. During the last few years, three refineries have been installed at centres on the coast to process imported crude at a total daily rate of about 70,000 barrels; this capacity is sufficient to supply nearly 70 percent of the current requirements of refined products. The total foreign investment in these refineries, equivalent to about Rs. 500 million, is the largest in any industrial undertaking since India attained independence. Indonesia is second only to Iran within the E.C.A.F.E. region both in production and proved reserves of crude oil, and in exports of crude oil and refined products. It ranks third after Iran and Japan in refining capacity.

Iran ranks first among the countries of the E.C.A.F.E. region as a producer of petroleum. Production of crude oil has recovered rapidly from

the interruptions that occurred during the nationalisation period, and it reached a total of 263 million barrels in 1957, as compared with 196 million barrels in 1956. During 1957, somewhat less than half the production was processed at the Abadan refinery for local use and for export as refined products, and the remainder of the crude was exported in bulk. Exploration activity was increased during 1957. Japan's petroleum industry has expanded rapidly since 1949. By 1952, the prewar consumption peak of 31,450,000 barrels was already surpassed and the consumption has since risen to more than 100,604,000 barrels of refined products in 1957. Domestic production of crude oil provides less than 3 percent of current requirements and the value of imported petroleum during 1957 was the equivalent of about \$680 million. There has been a rapid expansion of refining capacity from 68,000 barrels daily capacity in 1950 to its current level of more than 402,750 barrels daily, which is now more than enough to satisfy present requirements. In Pakistan, production of crude oil was 2,205,000 barrels in 1957, as compared with 400,000 barrels in 1948. The crude oil is processed at a refinery near Rawalpindi which was expanded in 1953 to its present crude throughput capacity of 5,500 barrels daily. The large Sui gas field, discovered in 1952, went into production in September 1955 when the pipeline to Karachi was completed; the use of the gas for industry has steadily increased, and the production in December 1957 had already reached the level of 1,020,000 cubic metres daily.

Current News and Comment

Industrial Activity

Corrected for seasonal fluctuations, *Capital's* Index of Industrial Activity shows a rise of 0.7 points during April 1958. Contributing to this were increases in tea, jute, cloth, coal, tyres and electricity. Sugar, yarn, cement, pig iron, finished steel, paper, motor-cars, bicycles and railway ton-miles declined.

Exports and Wages

Textile exports during 1958 have been running at an annual rate of 630 million yards, compared with 854 million yards in 1957 and the plan target of 1,000 million yards a year. This has caused the Government serious worry. The decline is attributed largely to increasing competition from communist China, which is in a position to export at prices below its production costs. But not everything that could be done to step up India's overseas sales of cotton textile products has been done. In his presidential address at the annual general meeting of the Delhi Cloth and General Mills Company last week in Delhi, Mr. Bharat Ram has stressed the need to make some sacrifice in order to increase exports, and he doubts whether the recent incentives announced by the Government for cotton textiles will by themselves yield substantial results. (A fuller version of the speech appears on another page.) It is claimed that Delhi Cloth has been able to maintain its exports because it has made sacrifices whenever necessary. Mr. Bharat Ram points out that wages in industry have risen by 45 percent between 1948-49 and 1956-57 (from Rs. 835 to Rs. 1,213 a year) according to a formula which ignores the important question of productivity. The rise in the national per capita income during this period has been only 19 percent, from Rs. 247 to Rs. 294. "This aspect of wage cost—their tendency to rise independently of increases in productivity and at a rate substantially higher than the levels of national income—must be held in check in the larger interests of the country," he says. He then suggests that industrial wages should be frozen at their current level and the freeze, in his opinion, should be accompanied by the imposition of a ceiling on dividends. Mr. Ram apparently overlooks the fact that the current taxation of dividends virtually amounts to a ceiling in many cases, and is thoroughly inequitable in its application. It has had a distinctly adverse effect on investor psychology. If a straightforward limit on investor psychology. If a straightforward limit is placed, the effect would be worse still. The need is neither to limit dividends nor to freeze wages, but to ensure that better productivity accompanies every rise in workers' earnings. Greater incentives for both capital and labour, and greater realism in economic policy, will remove the need for such palliatives as Mr. Bharat Ram recommends.

Rising Costs in Electricity

The Ahmedabad Electricity Company, says Mr. P. D. C. R. Clark, chairman, in his address to shareholders at the latest annual general meeting held last week, sold 10.78 percent more energy in the year ended 31st March, 1958, than during the pre-

vious year. The sales figures in absolute terms was 630.63 million kW. (A fuller version of the speech appears elsewhere in this issue of *Capital*). Notable increases of 23.84 percent and 14.71 percent, respectively, took place in sales to the north Gujarat grid and the Municipal Corporation. The rise in sales was accompanied by higher costs. The average delivered cost of a ton of coal during the year rose to Rs. 43.44 from Rs. 36.91 in the previous 12 months. It is expected that, during the current year, the cost will rise still further to round about Rs. 46 a ton. The main reasons for this trend, says Mr. Clark, are the successive increases in railway freights and the labour awards in the coal industry. "This ever-rising spiral of costs in general is a universal one and while your company has consistently absorbed them with its increasing growth and increasing efficiency, there is a limit to its ability to do so indefinitely."

The industry has apparently been permitted a rise of 1 percent, in the "rate of reasonable return" during the year with the increase in Bank rate of the same extent, but Mr. Clark points out that the rise is largely theoretical. The interest on borrowings, which used to be treated as a charge in arriving at the clear profit, has ceased to be admissible under the amended Electric Supply Act. "Therefore, even with the 6-percent reasonable return, the overall financial position will be almost the same as under the pre-amendment set-up, since interest on borrowings, which will not be admissible as a charge in computing the clear profit, will tend to neutralise the benefit of the increase in the rate of reasonable return." Discussing the company's plan to add a 30,000-kW capacity plant to its Sabarmati power-station, the chairman says that the licence to import plant is still awaited from the authorities. He assures shareholders that in spite of reports of an atomic power-station being installed at a site between Bombay and Ahmedabad, the company will pursue this development scheme since it is to cater for the load growth which is anticipated in the near future. The delay in getting import licences for essential spares, even in an emergency, has been worrying the management. He points out that the shortage of spares could immobilise important power-generating equipment with all its adverse effects on industrial production, and impresses upon the Government the need to make a special provision for public utility undertakings.

More Coal from Singareni

In his address from the chair at the annual general meeting of the Singareni Collieries Co. Ltd. in Hyderabad last week, Mr. S. J. Tarapore tells shareholders that working results during the past year have been good. The directors have accordingly recommended a dividend of 15 percent. (A fuller version of the speech appears elsewhere in this issue of *Capital*.) The output of the collieries during the year has increased by 14.1 percent compared with the previous year. The rise in production has helped reduce overheads and "narrowed the gap between the actual cost of implementing the award of the All-India Industrial Tribunal (Colliery Disputes) and the inadequate increase in the selling price of coal

granted by the Government." Although there has been a slight increase in the profit a ton of coal produced, the margin is "totally inadequate" for a wasting asset like the coal mines. The company aims to increase its output from 1.5 million tons in 1955 to 3 million tons in 1961. Its target for the current year is 2.16 million tons and it is probable that it will be achieved. "But it will be difficult to work to the planned programme the year after, although I have no doubt that we will catch up with the planned targets in the subsequent years." Because of the lack of funds, the company has refrained from entering into commitments for some of the most essential but expensive items required for achieving the planned target, such as sand-stowing plant, coal-cutting machines and mechanical loaders. The chairman says that since the details of financial assistance from the Government of India have now been almost finalised, it will be possible to go ahead "both with ordering the plant and entering into contracts for the civil works." This will help the collieries catch up with the planned targets.

Bid for Assam Saw

Two important developments concerning the Assam Saw Mills and Timber Co. Ltd. have been announced. One is that Bird and Co. (Private) Ltd. has given notice that it intends to resign the office of the managing agents to Assam Saw from 31st March, 1959. The other is that Jalan Industries (Private) Ltd. has put forward a proposal to acquire majority control of the share capital of Assam Saw by offering to pay Rs. 3 for each share in the latter tendered to it by 23rd December, 1958, inclusive. The Assam Saw directors have, in turn, told shareholders in a circular letter that they "would be well advised to sell their holdings at the price offered, the current quoted market price on the Calcutta Stock Exchange being under this figure, in view of the unlikelihood of any return under the present arrangements." In doing so, the directors state that the company has in recent years been going through difficult times and the debit balance in the profit and loss account now stands at nearly Rs. 5 lakhs. They are "unable to see brighter prospects for the future" unless orders for tea chests are substantially increased. Jalan Industries (Private) Ltd. thinks that if it has control of the Assam Saw capital, it will be able to effect economies, secure orders and place the company on a profit-earning basis once more; but it feels that it will be unable to carry out its proposals unless it acquires a sufficient number of shares to enable it to secure control of Assam Saw's finances.

Insurance and Workmen's Compensation

The Workmen's Compensation Amendment Bill, which has just been passed by the Rajya Sabha, is of considerable interest to insurers. It seeks to enlarge the benefits available to workmen under the original Act. The Deputy Minister for Labour, Mr. Abid Ali, has accepted an Opposition suggestion which reduces the period before which a temporarily disabled worker is not entitled to compensation from five days (under the amending Bill) to three days. Under the present Act, the waiting period is seven days. The Workmen's Compensation Act, 1923, which came into force on 1st July, 1924, has been amended several times. Legislation in 1929 enlarged the categories of workmen, removed restrictions on compensation in the building trades and altered the provisions relating to the distribution of compensation. In 1933, the Act was revised extensively on the lines recommended by the Royal Commission on Labour in 1931. The main amendments carried out were a considerable enlargement in the number of workmen covered by the Act, an increase in scales of compensation and a reduction of the "waiting period". By an amending Act of 1946, the wage limit for workers covered was increased from Rs. 300 to Rs. 400.

The working of the Act has shown that it requires to be amended further. Some of the important amendments which the latest Bill seeks to make relate to: (a) removing the distinction between an adult and a minor for the purposes of workmen's compensation; (b) reducing the waiting period of seven days to five days (now amended to three days) for being entitled to compensation, and, in cases where the period of disablement is 28 days or more, providing for payment of compensation from the date of disablement; (c) imposing a penalty for failure to pay compensation, when due; and (d) enlarging the scope of schedules of compensation. It was expected that the Workmen's Compensation Act would fast fade away following the inauguration of the Employees State Insurance Corporation, but experience suggests that the Corporation will take considerable time to cover all categories of workers all over India. It is fast enlarging its scope and has already covered various specified industries. Yet there are a considerable number of factories and establishments where workmen's compensation will continue to apply for some time. Therefore, the regulations

concerning the compensation payable to workers, it is claimed, have had to be amended. Mr. Abid Ali has assured the Rajya Sabha that some of the suggestions made by members to improve the Act further will be incorporated in subsequent amending legislation. The Government, in consultation with medical experts, is revising from time to time the list of occupational diseases so as to bring them within the purview of the Act.

Cloth Troubles Hit Cotton

The crisis in the textile industry is affecting the trade in raw cotton. Fibre consumption in Indian mills during the year ended 31st August, 1958, was 4,998,889 bales, against 5,233,049 bales during the previous 12 months. Speaking at the annual general meeting of the East India Cotton Association in Bombay last week, Mr. M. R. Ruia, president, said that the upward trend in consumption has been not only halted but reversed. At present, the burden of increased stocks is reflected in the prices of Indian cotton. The production of the latter during the current year is likely to amount to 5.2 million bales. To reduce stocks, the Government has cut the export duty from Rs. 50 to Rs. 25 a bale, with the simultaneous announcement of a further export quota of 250,000 bales, raising the total quota for the current season to 500,000 bales. "The removal of the uncertainty in the Government policy in the matter of exports, which was responsible for keeping away foreign buyers from the Indian market, will enable shippers here and buyers abroad to take a long-term view of the market and the latter would be assured of a continuous supply of cotton during the year required for their purpose." The Government is examining the question of extending special facilities to the cotton trade, as it will to the textile industry because of the accumulation of cloth stocks. Referring to imports of foreign cotton, Mr. Ruia said that the latest announcement on imports from the United States under P.L. 489 might improve the general outlook. Mills appear to have enough foreign cotton of up to 1½ in. staple for the next six months. But a further allocation of about 30,000 bales to 40,000 bales of staple varieties of 1½ in. and above would have to be made.

Sales Tax on Cloth

Kanpur's cloth traders will now have to pay about Rs. 1½ crores to the U.P. Government, which has finally rejected their plea that the amount representing the sales tax on cloth turnover between April 1956 and December 1957, when the Central additional excise duty replaced the sales tax, should be written off. The traders contended that there was uncertainty about the levy as the High Court had twice declared the Government notification and the Act void, and that they had not, therefore, collected the tax from consumers. They also argued that there was a decline in the gross turnover: that the rate of sales tax, being higher in U.P., had affected trade adversely; and that civil consumption in the State had gone down. On the other hand, the Government maintains that there has been no appreciable fall either in the gross turnover or in civil consumption. Total sales in U.P. were 452,688 bales in 1955-56 and 449,329 bales in 1957-58. The Government admits that sales of U.P.-made cloth dropped from 160,262 bales to 129,032 bales, but that is only because the State's products could not compete with those from outside. It did not affect the gross total turnover, and in any case the sales tax on U.P.-made cloth and outside cloth was the same. While there is undoubtedly considerable force in the Government's reasoning so far, it is difficult to agree with it that any exemption at this stage would create an "embarrassing precedent." The embarrassment is for traders who did not collect the tax from consumers but yet have to pay it to the Government as if they had collected it. Apart from anything else, considerations of equity suggest that the test to be applied is whether or not the trade has actually realised the tax from consumers. If it is true that it has not, the State Government should not penalise them with retrospective effect.

Reducing the Yarn Surplus

Although the Joshi Committee has done little to help textile mills, the question of forward trading in yarn is being discussed. The increased output of yarn in south India was commented on at the last meeting of the Madras Yarn Merchants Association. It is known that apart from the spinning mills, over a million spindles are at work in the composite mills also. Supplies, excluding the export quota, are estimated at 45,000 bales of 400 lbs each a month. The power cut in summer reduced output but that, too, gave no relief to merchants encumbered by large stocks throughout 1957-58. The usual suggestions were made about importing higher counts for the benefit of the handloom industry, and a subsidy for exports was advocated by spokesmen for the yarn trade. Textile interests are convinced that the excise duties

are restricting the domestic consumption of cloth, and that the export of yarn can be stimulated only by reducing the cost of production. It is urged that superior yarn should be manufactured for export and the official plea to "go coarse" should be ignored if India is not to lose foreign markets to China and Japan. Merchants appear to think that forward sales to other States will help draw funds needed by the mills, which have lately been compelled to take deposits at 6½ percent and over for working capital. Millowners may get relief from cheaper foreign cotton and the handloom industry need not be perturbed, since there is a large surplus of yarn at present and new mills under co-operative auspices are being set up.

No Protection for Art Silk

The recent recommendation of the Tariff Commission that protection to the art silk industry be withdrawn with effect from 1st January, 1959, has worried weaving mills. It appears that they have cause for concern. It is difficult to see how the Commission has come to the conclusion that art silk cloth is a luxury item. If this definition is accepted, it means that the industry might be subjected to other handicaps in addition to the abolition of protection. It is common knowledge that some varieties of rayon piecegoods sell at lower prices than cotton textiles. It is also common knowledge that the world trade in cotton textiles is shrinking, one of the reasons being that the synthetic fabrics industry is offering stiffer competition. Apart from being cheaper in some cases, synthetic fabrics have certain advantages over cotton piecegoods which make them economic in the long run. The rayon industry is the basis of synthetic fibres and fabrics; if properly developed, it could be a useful investment for the future. The second as-

NOTICE

With the weekly issue of CAPITAL which is to appear on 18th December, it is proposed to issue a supplement of approximately 150 pages, the Annual Review of Commerce, Trade and Industry. Besides essays on specific industries, such as jute, coal, tea, cotton textiles and sugar, the Review will contain exclusive articles by well-known authors. Dr. T. Balogh will write about the consumer in relation to economic development; Mr. V. T. Krishnamachari, deputy chairman of the Planning Commission, will discuss the prospects for the second plan; Mr. R. L. Garner, president of the International Finance Corporation, will say what India might expect from that body; Mr. Geoffrey Tyson will analyse the recovery of sterling; Mr. Neil McInnes will examine the causes of the decline in foreign private investment; and Professor B. R. Shenoy will explore the shadier nooks of the smuggled gold trade. In addition, Mr. Minoo Masani and Mr. A. D. Shroff will look into different aspects of the relationship between democracy and planning. Other articles will deal with industrial relations, company taxation, foreign trade, administrative corruption, steel expansion plans, banking developments, insurance, road transport, shipping, the oil industry and stock market prospects. The Review will be distributed free to all registered subscribers. Additional copies at Rs. 5 each may be obtained from the Manager, Capital, at 5 Mission Row, Calcutta-1. Orders for extra copies should be placed early.

sumption of the Tariff Commission that the industry is making excessive profits, some of which should be mopped up by heavier excise duties, is equally difficult to understand. The Commission made a random survey but it considered the case of only four manufacturing units. These four units have an installed capacity of 100 to 300 looms each, whereas the overwhelming majority of units operate on a much smaller scale. In fact, of the 3,883 factories in production, only 60 belong to the category investigated by the Commission. Many small units, which are more representative of the industry, have frequently changed hands because of the losses they have sustained as a result of the shortage and high prices of raw materials, the impact of the excise duty and other difficulties. It is hard to see how an industry working with plant which is several decades old and which was purchased second-hand at the time of installation can make excessive profits. If anything, the facts would indicate that the art silk mills are labouring under serious handicaps. The progress of the synthetic textile industry in Japan suggests that a properly reorganised rayon industry in this country could earn a fair amount of foreign exchange from south-east Asian, west Asian and African markets, where its products are in great demand.

Flood Control

After a cryptic statement that U.P.'s "master plan" for flood control has been examined by a high-level committee of the Government of India, the Central Deputy Minister for Irrigation, Mr. J. L. Hathi, is unable to, or will not, tell Parliament what the result of the scrutiny is. It is

difficult to appreciate the logic underlying the Centre's loan assistance which, according to Mr. Hathi, is not based on "master plans" but is given—apparently indiscriminately—to any scheme which is estimated to cost over Rs. 10 lakhs. A total sum of Rs. 805 lakhs has thus been given to U.P. during the last four years. The area annually subject to floods in the State is 7.6 million acres; the "master plan" proposes raising the level of about 7,000 villages and the construction of embankments so as to give protection to about 400,000 acres, besides strengthening the existing embankments which give protection to over 1 million acres. The building of flood detention reservoirs and a large number of new drains and channels is also contemplated in the plan.

Early this year, a high-level committee on floods frankly admitted that "absolute or permanent immunity from flood damage is not physically attainable by any known methods of flood control." It was highly sceptical about the usefulness of embankments. The Mississippi floods of 1927 were directly attributed to the existence of embankments, and the Irrawaddy floods in Burma in 1939 also gave rise to second thoughts on their construction. Embankments, in the opinion of the committee, are of doubtful value in such aggrading rivers as the Brahmaputra, the Kosi, the Teesta and the Himalayan tributaries of the Ganga. The danger that they might aggravate floods is less apparent in the case of degrading rivers which flow in deep channels. Even on poised rivers like the Krishna and the Godavari, the committee could not reach firm conclusions about embankments. As most of U.P.'s rivers are of the aggrading variety, the wisdom of sinking large sums of money in still more embankments is questionable. At the same time, it has been found that raising the level of villages en masse is difficult. Very often, only the house sites are raised, but that affords no protection to the crops. The possibility that flood detention reservoirs will add to the problem of water-logging, which is already serious in U.P., has also to be reckoned with.

Training in Leather Manufacture

The inadequate supply of raw materials is among the chief problems facing the leather industry, as was pointed out at a seminar organised last August in Hyderabad by the small-scale industries organisation of the Government of India. A small but significant step towards remedying the situation will have been taken when the model training centre in Bakshi-ka-Talab near Lucknow is converted into an all-India institution under the Dutch aid programme. A three-man Dutch delegation, has already visited the centre and expressed satisfaction with the work carried on there since 1952. Although primarily a State project, it has been actively supported by the F.A.O., which will continue to assist the Dutch team and the Government of India in implementing the present scheme also. Besides hide flaying, curing and tanning, the centre will provide training in various kinds of leather utilisation, including, of course, footwear. The total production of footwear of all types in the country last year was estimated at about 94 million pairs, which gives just one pair a year for every four persons. Because of the increase in the cost of living, many of those who are habituated to footwear make do with one pair instead of two or more, but even so a rise in demand may reasonably be expected. The domestic demand for leather belting far exceeds the supply at present; only 50 to 60 tons are produced annually, as against requirements of 350 tons. Raw hide production also bears no relation to the country's total cattle stock.

More Room for Management Studies

The Prime Minister laid the foundation stone of an annexe of the Indian Institute of Social Welfare and Business Management building in College Square, Calcutta, last Sunday. The Institute has done valuable work in providing various courses in management studies, and its expansion is to be welcomed. It is the only training centre of the Labour Ministry for Government labour officers. At the end of the course, an examination is held by Calcutta University and it awards diplomas in social work (labour welfare) to successful candidates. The Institute was selected by the Central Ministry of Scientific Research and Cultural Affairs for conducting the part-time diploma course in business management for junior executives in the eastern region. The course was first started in 1954, and in the past five years 180 junior executives have benefited from it. The Calcutta Management Association, which was formed on the Institute's initiative, is housed in its building. The course in general social welfare could not be started before 1957 because the Institute was not fully organised. In the course, graduate-social workers may specialise either in medical social work or in child welfare. Successful candidates are awarded a diploma in general social welfare by the board of governors of the Institute. Arrangements are also being made to introduce other

branches of social welfare, such as rural welfare and criminology. Because of the demand for the industrial administration course, the Institute has approached the Central Ministry of Scientific Research and Cultural Affairs for financial assistance. A course in municipal administration for the benefit of executives of local bodies was prepared in 1955 and it will be introduced on the completion of the new block.

The Institute's constitution provides for the encouragement of study, research and training in workers' education and welfare. It is proposed to introduce workers' education courses when the new block is completed. The research division is meant for conducting research work on specific economic, social, labour and management problems. The projects already undertaken are being financed by the Planning Commission and the Central Ministry of Education. The Institute is trying to create a business museum where old documents and commercial activities will be displayed through photographs in order to enable students to get an idea of the development of trade, commerce and industry in India. It is proposed to construct a four-storeyed building to house the safety museum, a statistical laboratory for the research division and the psychological testing and works study laboratories. The new building will provide more space for the library and will accommodate a conference room for group-discussions.

Cure for Cows

Of considerable interest to the dairy industry is the "new cure" for inflammation of the udders which, it is claimed, has been discovered by the U.P. Government after experiments conducted in co-operation with the Indian Council of Agricultural Research. Known also as "mastitis", the disease sharply reduces the milk secretion of a cow or a buffalo. The loss of milk from a cow during each lactation has been estimated at as much as 2,000 to 3,000 lbs. The treatment consists of the administration of an antibiotic combination of penicillin, streptomycin and sulphamezathin. It is claimed that it works miraculously against the various organisms responsible for the disease and that the cost of the treatment is only one-fourth of the cost of many proprietary drugs available in the market. By the addition of cobalt sulphate in small quantities, the cost can be reduced still further while enhancing the efficiency. The incidence of the disease has been found to range from 15 to 20 percent in many Government-organised dairy herds. The inflammatory process may be slow and quiet or acute and rapid. Bacteriological examination of milk helps the early detection of the disease even before other symptoms have developed. It is essential that the benefits of the discovery should be offered not only to Government or co-operative dairies but also to private milk producers who still constitute the vast majority; for this, a free diagnostic service seems to be the first step necessary.

Fish Marketing in the South

Appeals to eat more fish, particularly more sea fish, appear to be superfluous in Madras, where the per capita consumption in 1956-57 is officially estimated to have been 10.5 lbs higher than in other States. Increased supplies have been absorbed easily due to better marketing, greater attention having been paid to the big towns. Supplies are estimated at 60,000 tons of sea fish and 38,000 tons of fresh water fish a year. Fishermen have benefited from the fast transport and improved tackle provided in Pablo boats, of which many are equipped with marine diesel engines. In Mettur and Tuticorin, cold storage plant have been set up. It is estimated that 30,000 tons of the fish caught in Madras are used for curing and 50,000 tons go into general consumption, while 1,600 tons are used for extraction of oil and preparation of manure. There is, according to the Fisheries Department's detailed report for 1956-57, a large export trade in cured and dried fish, mainly with Ceylon; the trade is valued at Rs. 341 lakhs a year. Some exports go through Dhanushkodi, but the main centre is Tuticorin, while some supplies are sent via Nagapatnam to the Straits Settlements.

A marketing survey mentions the value of the Buckingham Canal for transporting fish from Andhra coastal ports to Madras in recent years. Trends in consumption suggest that places on the coast take less cured and dried fish than Madurai, which draws supplies regularly by passenger train from ports on the Ramnad coast and Tuticorin. It has been ascertained that Madras City, with a population of 1.7 million, consumes 9,122 tons of fish in a year, most of which come from villages within a distance of 20 miles. The trade in Madras City is handled in two wholesale markets where catches are put up for auction, the auctioneer's commission being 6½ percent of the sale price realised. Increased demand has led to stability in

retail prices and pomfret appears to be at a premium throughout the year.

Manganese Ore Duty

The recent abolition of the export duty on manganese ore has been welcomed by mining and trade circles, but it is not likely that it will achieve immediate results. Had the announcement come sooner, the story might have been different. Uncertainty about the Government's policy has led India's customers to cover their immediate requirements from elsewhere. It seems that the United States has made heavy purchases from Brazil, while Ghana, South Africa, Russia and some other Latin American countries have emerged as strong competitors. It is possible that when the main steel manufacturing countries, particularly the United States, start buying again, Indian manganese ore exports may look up. Meanwhile, exporters need to be assured that there will be no sudden shift in duty policy. The trade's complaint that the enhanced railway freight undermines its competitive capacity also deserves to be investigated.

"CAPITAL" CHRISTMAS TOY FUND

WE acknowledge, with thanks, the receipt of the following donations:

Rs. 242
Lloyds Bank Ltd., New Delhi and Delhi Staff.
Rs. 55
H. C. Chiswell Jones, H.K.S. Lindsay, G.A.R. Coulthard, R. Lawford, J.W. Grafton.
Rs. 50 each
J.G.W., "Anonymous", Sinclair.
Rs. 30
G.D.B.
Rs. 25
L.M.N.
Rs. 20 each
C.D.W., A.C., G.B.
Rs. 10 each
J.G., J.B.S., J.G.S., A.J.D., B.L., W.A.H.
Rs. 5 each
D.C.H., J.M., K.S.I.
Total Rs. 637
Previously acknowledged Rs. 2,803.25
Grand Total Rs. 3,440.25

We also acknowledge, with thanks, having received from Mr. A.R.P. Ramsay a fairly big collection of toys, including such items as a tricycle, a Fairy cycle, a large rocking horse and many children's books.

VALUE OF SILVER

WRITING upon this subject on the 11th July, 1893, immediately after the closing of the Mints, we observed: "The simplest plan of averting the evil consequences, likely to arise in India from the fall in the value of silver is to impose an import duty on silver. The white metal is a foreign product, and now that it is no longer to be coined, it becomes a pure luxury, and is, therefore, a most suitable subject for taxation. The duty will be as easily collected as the silver plate duty lately abolished in England, and unlike most taxes it will be universally welcomed. It will injure no one, and will directly benefit the numerous owners of silver jewellery. As the object of the tax will be to equalise the value of coined and uncoined silver, it should be levied on a sliding scale. The simplest plan will be to select as the basis of the calculation the London quotation for silver, which is the equivalent of our new specie import point, viz., 1s. 4½d. This quotation is 42½d. per ounce, and the import duty will be the difference between the current price of silver in London on the day of import and 42½d. This charge per ounce could be easily calculated, as 054 penny nowadays is the exact equivalent of one anna, and the effect of the duty will be to equalise the price of the coined and uncoined silver in India, and remove all the loss and risk that would otherwise arise from the fall in the local value of the uncoined metal." We are glad to find that these views some five years later have been substantially endorsed by Sir John Lubbock, whose speech at the Institute of Bankers in Ireland on the 29th October we printed in our last issue. It will be observed that Sir John Lubbock advocates a duty of 6d. an ounce on silver which, he says, would have three advantages: (1) It would bring in a substantial revenue; (2) It would tend to increase the demand for Council Bills; and (3) It would diminish the difference between the value of coined and uncoined silver in India. Our proposal, it will be observed, was to charge duty on a sliding scale so as to bring the value of silver to 42½d. per oz. in India.

"CAPITAL" INDEX OF INDIAN INDUSTRIAL ACTIVITY**

The Capital Index of Indian Industrial Activity (Base: 1953) has now been brought up to April 1958. Compared with the preceding month, there were increases in tea 40.44 points, jute 3.73 points, cloth 0.54 points, coal 3.38 points, tyres 14.30 points

and electricity 6.05 points, while decreases occurred in sugar 167.28 points, yarn 3.51 points, cement 11.62 points, pig iron 3.31 points, paper 6.61 points, motor-cars 116.11 points, finished steel 5.19 points,

bicycles 34.09 points and railway-ton miles 24.76 points.

Correlating all the factors, the Capital Index of Indian Industrial Activity increased by 0.7 points during April 1958.

THE AHMEDABAD ELECTRICITY COMPANY LIMITED

CHAIRMAN, MR. P. D. C. R. CLARK'S

REVIEW

Addressing the Forty-sixth Ordinary General Meeting of The Ahmedabad Electricity Company Limited, held on 28th November, 1958, the Chairman, Mr. P. D. C. R. Clark, said:—

The Directors' Report for the year ended 31st March, 1958, and the Audited Statement of Accounts for the same period, have been in your hands for some time now, and I shall confine my remarks at this Meeting to such aspects of your Company's Affairs and other policy matters as have not been included in the Report, or are not covered in detail herein.

The periods for the comparison of performance data and financial results are again not equal in that the previous period was for six months, i.e. October 1956 to March 1957, and I shall nevertheless make an attempt to give a brief review comparing the results of the year ended 31st March, 1958, with those in respect of the corresponding period ended 31st March, 1957.

Increased Sales

The overall sales of energy for the year ended 31st March, 1958, at 630.63 million kilo-watt-hours have registered an increase of 10.78% over the corresponding previous twelve months. Upon a class-wise basis, notable increases have taken place in the sales to the North Gujarat Grid and the Municipal Corporation, the percentage increases over the corresponding previous twelve months being 23.84% and 14.71% respectively. From the cost angle, the average delivered cost of coal per ton for the year under review was Rs. 43.44 as against the average cost of Rs. 39.61 per ton for the corresponding previous twelve months, and for the current year, namely 1958-59, we expect the average coal cost to increase still further to roundabout Rs. 46 per ton. The main causes of this trend in cost of coal have been successive increases in Railway freight and labour awards in the Coal Industry. This ever rising spiral of costs in general is a universal one and while your Company has so far consistently absorbed them with its increasing growth and increasing efficiency, there is a limit to its ability to do so indefinitely.

You were advised at the last Annual General Meeting of the implications of the linking of the Rate of Reasonable Return with the Reserve Bank Rate ruling on the 1st of April each year, which had been done under the Electricity (Supply) Amendment Act, 1956. The rate of Reasonable Return for the year ended 31st March, 1958, was 5½%, but for the current year 1958-59 this will be 6% since the Reserve Bank Rate has increased by ½%. You would doubtless like to ask me as to the anticipated financial results with the 6% Reasonable Return. I must point out in this connection that the interest on borrowings which was hitherto admissible as a charge in arriving at the Clear Profit ceased to be so admissible under the new amendments. Therefore, even with the 6 per cent. Reasonable Return, the overall financial position will be almost the same as under the pre-amendment set-up, since interest on borrowings, which will not be admissible as a charge in computing the Clear Profit, will tend to neutralise the benefit of the increase in the rate of Reasonable Return.

Grossing up of Dividends

Coming now to the topic which has been the subject of much preoccupation for the Electricity Supply Industry, namely the subject of grossing up of dividends in the hands of Shareholders for the purpose of tax credits, I would like to tell you that the Federation of Electricity Undertakings of India has recently submitted certain proposals to the Direct Taxes Administration Enquiry Committee, which proposals, if accepted by the Committee and implemented by Government, would remove once and for all the anomalies in the existing provisions of Law, and at the same time simplify tax credit procedures. The proposals envisage a deduction of tax at the Company rate from the gross dividends and the distribution of net dividends to shareholders, the tax deducted to be paid to Government irrespective of

the position of the Company vis-a-vis the total income under the Income-tax Act, and, to the extent it is in excess of the current tax liability of the Company, to be treated as a deposit for adjustment against the Company's future tax liabilities as and when they materialise. On the strength of the tax withholdings from gross dividends, the shareholders would currently receive the benefit of full tax credit—in other words, restore to you the right to "gross-up" your dividends from this Company which right, as you are so painfully aware, has been denied you in recent years. The Electricity (Supply) Act of course would have to be amended so as to admit the tax on gross dividends as a charge in the computation of Clear Profit. It has been shown to the Direct Taxes Administration Enquiry Committee that the proposals would not operate to the disadvantage of any of the three parties involved, namely the State, the Shareholders and the Companies.

At the last General Meeting a reference was made to the proposed addition of 30,000 kW. of generating plant to your Company's Sabarmati Power Station forming the first stage of the projected "C" Station Second Half Development. Your Directors at their Meeting held on 30th October, 1958, decided, subject to the receipt of the requisite Import Licence, to place on order one 30 M.W. Turbo-Alternator Set and ancillaries with Messrs. British Thomson-Houston Export Co. Ltd., two 200,000 lbs./hr. Spreader-Stoker Boilers with Messrs. Babcock & Wilcox Limited and ancillary Coal Handling Plant with Messrs. Strachan & Henshaw Ltd. The requisite applications have been forwarded to the Authorities concerned and are being followed up.

I would like once again to express our thanks to the Central Water & Power Commission and to its newly appointed Chairman Mr. M. Hayath. As you are, doubtless aware, we, as a Public Utility Company, and as Constituents of the Bombay Association of Electrical Undertakings and of The Federation of Electricity Undertakings of India, have frequently recourse to the guidance and assistance of this Department of the Central Government and this has always been readily forthcoming despite the great difficulties of the present situation.

During a recent visit to Delhi, Mr. Hayath told us that the Country as a whole must be reconciled to delays in the implementation of even urgently needed power projects. This was said in no spirit of defeatism but with a sense of responsibility and a full knowledge of the realities of the situation.

Rationalisation of Power Capacity

This brings me to the subject of what may be termed "Rationalisation of power capacity" already available in the Country. It is well known that the ability of a Public Electric Supply Undertaking to serve its consumers is, among other things, limited by the maximum demand which it is capable of meeting. In most Undertakings this maximum demand or "peak" is created by the instantaneous lighting up time. It will be clear that if a careful survey is carried out in industrial establishments, there will be found certain loads or machines, not required for continuous operation, and which could be kept off the peak period (which in your Undertaking is only of half to one hour's duration), and worked exclusively during periods of low load—in other words 'off peak'.

In your own Undertaking there is a further possibility of reducing the peak demand by a judicious staggering of the half-hourly evening rest interval in Mills.

The full exploitation of these demand-saving measures will on the one hand reduce the consumer's bill by reducing his individual maximum demand and improving his load factor and on the other, release valuable power capacity to serve extensions in his own establishment or for other consumers. It is hoped that with the co-operation of the Mill-owners' Association it will be possible to achieve the maximum amount of load release by the judicious adoption of these measures without any loss of production and the minimum of inconvenience to labour and management. What I have just stated

should not be construed to mean that it is possible to defer by the slightest extent the implementation of the first 30 M.W. phase of the "C-2" Extensions which is being pressed forward with the utmost vigour.

Import Licences

Another matter which weighs heavily on the Managements of Public Utility Undertakings these days is the delay in obtaining Import Licences for even the most essential spare parts required in an emergency. We recently had the case of a relatively small item costing only a few hundred pounds where a delay of several weeks took place in receiving an Import Licence although the material was already manufactured and was awaiting transport by air. This delay cost the Company many times the value of the spare part concerned. It may be contended that the spare part in question should have been in ready stock. It will be easily realised that no organisation can afford to lock up capital by having in stock every possible spare part of the plant which would mean practically duplicating its cost. While a reasonable stock of spares has been provided by us in consultation with manufacturers for all possible eventualities, there is always the possibility of an unexpected item giving way or of a repeat failure. In such cases you can well appreciate the magnitude of the potential loss of production that would result from a single 15 M.W. machine being held up for a couple of months. It would, in fact, be equivalent to the loss in production from 15 Mills working full blast over that period! In view of this it is to be hoped that the Authorities in the Central Government would allow a reasonable latitude to the Central Water & Power Commission and similar Directorates to be invested with powers, within certain limits, to grant ad hoc emergency licences for spare parts required by important Industrial Undertakings, and particularly Public Utility Undertakings.

Unfortunately, in the early part of the current financial year the demand on your Power Station reached a level, which necessitated, as a short-term stop-gap measure, pending the commissioning of the fourth 15 M.W. Turbo-Alternator Set in the First Half of "C" Station, the introduction of a system of staggering of load releases. I am glad to advise you that the fourth 15 M.W. Set was commissioned on 24th October, 1958, and with this adoption, it is expected the situation will ease considerably. In a few months from now it is hoped that further substantial relief to the Station would be afforded by the South Gujarat Grid taking over the Baroda load.

Municipal Taxation

Another matter on which I am inclined to offer some remarks at this Meeting from the policy aspect is the question of Municipal Taxation, the latest position in respect of which has been reported to us in the Directors' Report for the year 1957-58. The 'profit method' of assessment, which has been turned down as inappropriate both by the Small Causes Court and the District Court, is a method involving financial implications of considerable magnitude, and from this point of view the pending reference before the High Court is of particular significance both for yourselves and for the consumers.

You will have seen several Press Reports during the last few months about the prospects of an atomic power plant being installed in India and of the likelihood that its site will be between Bombay and Ahmedabad. Whatever be the final outcome of this proposition, the proposed 15 M.W. extension forming the first phase of the Second Half of your "C" Power Station would in any case have to be implemented since it is required to cater for the anticipated load growth long before any atomic power could come into existence.

Your Management has been considering the prospects of introducing two-monthly meter reading and billing system, in place of the existing monthly meter reading and billing. The proposal has potentialities for economies in consumer-costs, but unfortunately its introduction is being delayed on account of some technical difficulties under the Electricity Duty Act and Rules.

Labour Relations

Labour relations have during the last year been cordial as usual. A new Union under the banner of "The Ahmedabad Miscellaneous Industrial Workers' Union" filed an application for registration as representative and approved Union in place of the Ahmedabad Electricity Employees' Union, and after conducting investigations the Registrar of the Industrial Court accepted the application.

Your Company has become an Ordinary Member of the Administrative Staff College of India at Hyderabad, and a Senior Engineering Executive has been deputed to attend the October/December 1958 Training Session of the College. Your Company has also become a joint subscriber, with the Agency Company, of the Personnel & Productivity Services.

A Long Service Award Scheme has been formulated in consultation with your sister Companies and is in the course of being implemented. The awards take the form of a gift and a certificate.

Coming to the Audited Statement of Accounts for the year ended 31st March, 1958, I feel that these have been straightforward in the form in which they have been presented to you. You will have noticed that after meeting the usual appropriations, Equalization of Dividends Reserve a Final Dividend of Rs. 4/- per Share, making 6½% for the year, has been recommended, leaving a balance of Rs. 857 to be carried forward to next year.

You will have seen from the Directors' Report that Mr. K. G. Milne and Mr. E. D. Sheppard resigned their seats on your Board in September last and the Board of Directors have recorded their appreciation of the services rendered to your Company by these two gentlemen.

In conclusion, I must refer to the good work performed by your Company's staff who have carried out their duties with zeal and energy, and I am happy to take this opportunity to thank them on your behalf.

I now propose that the Directors' Report together with the Audited Statement of Accounts for the year ended 31st March, 1958, be, and the same are hereby, approved, adopted and confirmed.

NOTE: This does not purport to be a record of the proceedings of the annual general meeting which will be sent separately to shareholders.

THE DELHI CLOTH & GENERAL MILLS COMPANY LIMITED

DELHI

CHAIRMAN, MR. BHARAT RAM ON TEXTILE EXPORTS

Speaking to the shareholders of the Delhi Cloth & General Mills Company Ltd. at the 70th Annual General Meeting held on 27th November 1958, Mr. Bharat Ram, Chairman of the Company, stated that the profits of the year were on the whole satisfactory, although the Textile Industry in India continued to face difficult conditions. The Textile Mills at Hissar and Lyallpur continued to improve, and the products of the Silk factory were increasingly liked in the market. Keeping in mind the trends and the products of the Silk factory were increasingly liked in the market. The sugar units had also done better during the year, and the Vanaspoti section showed satisfactory results in spite of changing costs and prices.

Continuing he said:

I must refer in this context to the very high burden of excise and cane cess on the white sugar industry as compared to Khandsari sugar. The production of Khandsari is getting a benefit of Rs. 13 per maund which is payable as excise and cane cess on each maund of white sugar, the rate of which is controlled at Rs. 36 per maund, with some adjustments for different varieties of sugar.

Unless the Government take immediate steps to remove this disparity the vacuum pan or white sugar industry is bound to suffer. The production of Khandsari sugar is increasing at a rapid rate.

The production of Khandsari sugar is a dual loss—to the State and Central Governments in the form of cess and excise not realised; and to the country on account of the waste of 30% precious food value involved in the inherently low recovery of sugar from cane by the process of Khandsari manufacture. The argument that cane at places which are away from factories has to be used is not a good argument, as cane in these places can be turned into gur. By converting cane into gur there is no loss of food value. Khandsari is also not a labour intensive industry as has been sometimes claimed.

Sugar Exports

A new welcome development which has taken place in the sugar industry in the year under review has been the Government's policy to export sugar under which every mill is required to export 2½% of its production, the individual contribution being pooled for sale abroad at whatever price is available. This element of compulsion in the matter of exports should be extended, I think, to many other industries in order to earn more foreign exchange.

With your permission, I will offer some remarks on the economic situation in the country which naturally affects our Company as well. There are numerous problems facing the country but I would like to highlight two problems which form the core of our economic difficulties. The two problems are the food situation and the shortage of foreign exchange resources.

In my view sufficient attention has not been given to the increase in food production which has resulted in a whole chain of higher prices and costs extending to industrial wages where dearness allowance rates vary with the cost of living indices. Until food production is increased consistently and wastage of foodgrains in storage and transit avoided the economy will continue to be under strain, more so in a lean harvest year.

While I do not underestimate the value of external help in the form of loans, grants and participation by foreign investors, it is necessary for us to realise that eventually we must stand on our own feet in the matter of earning foreign exchange adequate for needs of economic planning. It is a national task in which it is necessary for the Government, the manufacturer, the worker and the consumer all to make sacrifices. In fact, as is well-known, in some countries exports are being maintained and increased on the basis of prices which have no discernible relation to costs. Whatever the mechanics of the manner, it is my view that in any under-developed country like ours, engaged in a process of accelerating economic development, there is no alternative but to export—even at a sacrifice.

I had earlier referred to the Government's policy with regard to export of sugar and it seems to me that unless a similar policy is followed also in the case of other industries we may not be able to increase our exports to the required extent or even to maintain at present low levels.

This applies as much to the textile industry which is passing, as you know, through very critical times. On the one hand, cloth is not moving in the internal market and on the other hand, exports have been declining—on the basis of figures for the first half of the year the exports during 1958 might not exceed 630 m. yds. as compared to 854 m. yds. in 1957 and 1,000 m. yards postulated in the Second Plan. The Government have recently announced certain incentives for export. While I welcome the spirit behind these schemes, I doubt if these incentives will result in a substantial increase in the export of mill cloth. I am afraid that a substantial increase in our exports will come only if there is compulsion in the matter of exporting.

I am glad to say that the exports by our Organisation have been maintained—sometimes even at a sacrifice—in contrast to the sizable decline recorded for the country as a whole.

Wage Policy

Before I conclude, ladies and gentlemen, I would like to invite your attention to some aspects of wage policy. As you all know, the greater part of the industrial worker's wage today changes with the cost of living index—it has no relation to the important question whether his productivity justifies a higher wage or not. It has also, very often, no relation to the wage levels generally prevalent in the same centres. In fact, I will present figures below to indicate that in recent years manufacturing wages have gone up at a rate that is almost two and

we should follow a policy of low cost and low price economy. This policy will not only help our internal economy but will be the only permanent sustaining factor for maintaining and increasing our exports.

Personally, I would suggest that emoluments of industrial labour be frozen at their current level for the next few years. This freeze on wages should be accompanied, in my opinion, by the imposition of a ceiling on dividends, and on Managing Agents' commissions. This policy will not only help our internal economy but will be the only permanent sustaining factor for maintaining and increasing our exports.

To many of my friends, in industry and outside, these proposals might appear drastic. But I strongly feel that the alternative to old economic ills can only come from the conscious creation of a climate of all-round willingness to sacrifice in the larger, social interest.

Ladies and Gentlemen, as you are well aware this is the first time I am addressing you as the Chairman of this Company. I am a successor—not without a very human measure of hesitancy—to a very distinguished predecessor, Sir Shri Ram, who has been the wise architect of this large organisation. I am glad, however, that some of our burdens will be less because his counsel, as one of your Board of Directors will still be available to us. On your behalf and mine, I would like to convey him our gratitude and sincere good wishes. I am sure I will have your co-operation and good-will to be able to maintain the high traditions of your Company.

Before I conclude, ladies and gentlemen, let me convey my thanks to all my colleagues who form part of this Organisation—the D C M—whose efforts have been responsible for the satisfactory working of the Company even at such critical times.

THE SINGARENI COLLIERIES COMPANY LIMITED

CHAIRMAN, MR. S. J. TARAPORE'S REVIEW OF PROGRESS

Addressing the Thirty-seventh Annual General Meeting of the Shareholders of the Singareni Collieries Co. Ltd., held in Hyderabad-Deccan on 24th November, 1958, the Chairman Mr. S. J. Tarapore, said:—

Gentlemen,

I have great pleasure in welcoming you, particularly because this is the last time that I shall be addressing you as Chairman. The Annual Report and Accounts have been in your hands for some time and I take it that you have found time to peruse them carefully and I can consider them as read. I will, however, be glad to answer any questions that you may have to ask.

During the year our production increased by 14.1% over the production of the previous year, while the corresponding figure for the Coal Industry as a whole was 10.82%. This increase in production has in turn reduced our overheads and narrowed the gap between the actual cost of implementing the Award of the All India Industrial Tribunal (Colliery Disputes) and the inadequate increase in the selling price of coal granted by the Government. Although there has been a slight increase in the profit per ton from Rs. 0.99 in 1956 to 1.08 in 1957, the margin of profit is still inadequate for a wasting asset like the coal mines. The Government of India have appointed a Coal Price Revision Committee to examine and report upon the costs of production of coal and coke and to take into account all relevant factors which have a bearing on the coal production programme envisaged in the Second Five Year Plan, and to recommend changes in the present price structure. The relevant information has been placed before the Committee, and it has also investigated the production costs of some selected collieries. We now anxiously await the outcome of their finding and recommendation.

Expansion Scheme

It is our aim to increase our annual production from 1.5 million tons in 1955 to 3 million tons in 1961. Our target for 1958 is 2.16 million tons and we are quite hopeful of achieving it. But it will be difficult to work to the planned programme the year after although I have no doubt that we will catch up with the planned targets in the subsequent years. This perhaps needs an explanation. Because of lack of funds we refrained from entering into commitments for some of the most essential, but expensive items required for achieving the planned target, such

as, Sand Stowing Plant, Coal Cutting Machines, Mechanical Loaders, without which it is not possible to do intensified mining, Railway Sidings without which it is difficult to bring the increased output from the pit-head to the rail head, and housing for the workers near the new mines. I am glad to be able to say that details of terms for the financial assistance by the Government of India have now been almost finalised and that we shall soon be in a position to go ahead both with ordering the plant and entering into contracts for the civil works and catch up with the planned targets as soon as the necessary plant is received, and civil works completed.

Labour-Management Relations

I am happy to be able to record that during the tenure of my office as Chairman, the Company has shown a sustained progress. This is mainly due to co-operation between staff of all grades throughout our lines of management inborn of a realisation by all, of the basic fact, that their welfare is tied up with the welfare of the Company, and a conviction that their claim will not be overlooked at the time of apportioning the benefits. It may be relevant to mention here the impression that our President Dr. Rajendra Prasad got when he visited our mines at Kothagudem on 11th July 1958. While addressing the members of the Colliery Employees Recreation Club, which I may mention is open to all grades of workers, he said:—

"I find that your collieries are making progress and that your activities are expanding."

"The Nation is going ahead rapidly and we are making all-round progress. Our country is going in for mechanisation. Where the work is turned out with hand machines are now increasingly used. I find the same thing happening here. I have just paid a visit to your Power House and I have also seen mining machinery and equipment. From what I have seen I could say that you are making progress and working hard and that you are also showing initiative in your work."

"The industrial peace brought about in the Collieries by improving the lot of the workmen and the resulting increase in the production of coal would enable the country to go ahead uninterrupted with the programme of industrial expansion. I would advise all those connected with this premier and ever-growing industry to continue to work with zeal and enthusiasm to reach the plan targets. I am glad to see that you are all prosperous and happy."

As you must have noted the result of the working of the Company for the year under review has been good, and your Directors are in a happy position to recommend to you to sanction a dividend of 15%. I have no doubt that with the progressive management, with the excellent team of Officers, with understanding workers and with your co-operation the results will continue to be better and better year after year.

Note:—This is not a report of the Annual General Meeting.

Money

THE CALCUTTA MONEY MARKET

SLIGHT RISE IN ADVANCES

Wednesday, 3rd December.

THERE has been a rise this week in the total of advances outstanding in the Calcutta money market. The requirements of the jute industry have continued to increase, but there has been a further decline in demand from sugar mills. Accommodation against grain and seeds storage is unchanged. It is thought that this small increase in the figures for advances may indicate that this year's busy season has at last begun. Conditions are rather tighter in the inter-bank market and the call rate has increased to between 2 percent and 2½ percent.

There has been brisk business in the exchange market during the past week, with a fair quantity of both gunny and tea bills coming to hand. Remittance has been moderate. Sterling is fractionally weaker today after having steadied against all the Continental currencies following the publication of the sterling area's reserves for end-October. The U.S. dollar is steady against the pound, but the Canadian dollar is fractionally weaker.

SILVER WAS FIRM BECAUSE SUPPLIES BECAME scarce following reports that the Chinese Government had prohibited the export of silver coins to India. The price advanced from the previous week's level of Rs. 188 to Rs. 190.50, quoted today for the ready metal. The rate for forward delivery was Rs. 189.50. The London and New York silver prices were 77½d and 90½ cents, respectively.

In spite of the rise in silver, gold was dull and the price declined from Rs. 114.50 to Rs. 114. The sovereign fell from Rs. 74 to Rs. 73.75.

DURING THE WEEK ENDED 28TH NOVEMBER, 1958, Government of India Treasury bills for Rs. 6,63,00,000 were sold in favour of the Reserve Bank.

TENDERS FOR Rs. 3 CRORES OF 91-DAY GOVERNMENT of India Treasury bills were opened on Tuesday. The total amount offered was Rs. 4,55,00,000. Tenders at Rs. 99.995 were accepted in full and those at Rs. 99.390 allotted approximately 31 percent, the average rate of acceptance being Rs. 2.423 percent a year. Tenders for Rs. 3 crores of 91-day Government of India Treasury bills will be received up to Monday, 8th December.

IT IS STATED THAT 91-DAY INTERMEDIATE TREASURY bills will be sold from 3rd to 6th December, 1958, at Rs. 99.411 percent, subject to the conditions previously announced (that sales can be stopped at any time without notice if the Government thinks it necessary). The bills sold from 28th to 29th November amounted to Rs. 50,00,000.

THE LATEST RESERVE BANK STATEMENT SHOWS A decline of Rs. 7.51 crores to Rs. 1,555.18 crores in active notes during the week ended 28th November, 1958, while the total note issue rose by Rs. 90 lakhs to Rs. 1,595.42 crores. Notes held in the Banking Department consequently increased by Rs. 8.40 crores to Rs. 40.24 crores. Deposits of the Central Government were Rs. 7.57 crores higher at Rs. 59.00 crores but other Government accounts fell by Rs. 34 lakhs to Rs. 24.15 crores. Balances of commercial banks declined by Rs. 13.77 crores to Rs. 88.17 crores. Balances held abroad fell by Rs. 95 lakhs to Rs. 15.95 crores. Investments at Rs. 292.44 crores showed a decline of Rs. 11.43 crores. Other loans and advances were slightly higher at Rs. 54.38 crores, of which advances to scheduled banks against usance bills amounted to Rs. 67 lakhs (Rs. 70 lakhs). Ways and means advances stood at Rs. 21.93 crores, compared with Rs. 20.80 crores.

THE RETURN OF THE STATE BANK OF INDIA FOR THE week ended 21st November, 1958, shows a rise of Rs. 5.01 crores to Rs. 485.19 crores to total deposits. Investments in Government securities are down by Rs. 59 lakhs to Rs. 274.04 crores, while other authorised investments are up by Rs. 5 lakhs to Rs. 11.71 crores. Advances, including loans, cash credits, overdrafts and bills discounted and purchased have declined by Rs. 4.43 crores to Rs. 161.53 crores. Cash and balances are, in consequence, shown at Rs. 47.94 crores or Rs. 16.23 crores higher.

THE STATEMENT OF THE POSITION OF SCHEDULED banks for the week ended 21st November 1958, shows Demand and Time liabilities at Rs. 714.16 crores (Rs. 15.37 crores on account of borrowings from banks) and Rs. 928.20 crores (Rs. 38.83 crores), compared with Rs. 701.16 crores (Rs. 15.48 crores) and Rs. 921.13 crores (Rs. 37.58 crores), respectively, in the previous week. Cash has declined by Rs. 5.01 crores to Rs. 41.73 crores, while balances with the Reserve Bank have increased by Rs. 24.73 crores to Rs. 98.41 crores. There is a drop of Rs. 1.93 crores to Rs. 639.38 crores in investments. Advances and bills discounted at Rs. 831.14 crores show a fall of Rs. 9.94 crores. The ratios to total liabilities of cash and balances, and of advances and dis-

counts, are, in consequence, shown at 8.5 percent and 50.6 percent, against 7.4 percent and 51.7 percent.

TREASURY BILL MATURITIES

A Great Sound of Machines...

WHEN BALBIR SINGH came to Jamshedpur from Bahrein in 1957, the site for the new Rs. 100-million Blooming Mill—a key unit of Tata Steel's Two Million Ton expansion programme—had just been cleared after levelling a large hillock.

Today this new 46" Blooming Mill, the largest of its kind in India, with a rolling capacity of two million tons, is all set to produce the blooms and slabs from which rails, structurals, plates, sheets and many other products will be rolled.

Despite the Suez Crisis which delayed vital supplies and other difficulties, the rapid completion

of the Blooming Mill was made possible by the devoted service of men like Balbir Singh. He and hundreds of other Indians, assisted by American and German technicians, worked round-the-clock on this major expansion project to produce more steel to strengthen India's economy.

TATA STEEL
ON TO TWO MILLION TONS

research leads the way...

Several factors must be taken into account in the designing of a container for any product. Precisely what material should be used? How best can it be printed and fabricated? Will it stand the rigours of the climate and provide long shelf-life for the product?

In research lie the answers.

The Metal Box Company of India Ltd probe into every aspect of packaging before recommending a container to their customers. The container should be strong yet light, should be pilfer-proof and attractive. Above all, it should be chemically inert to the contents it packs. The efficient and superbly printed containers produced by

Metal Box are mainly the result of their painstaking research into packaging processes, raw materials, internal lacquers, printing inks and external finishes. Research, conducted by Metal Box in India and by their associates abroad, is perhaps the largest single factor that has helped them to give the lead in the manufacture of containers and closures.

As India's economy expands rapidly, an increasingly greater and more complex burden will have to be borne by the packaging industry. As leaders in the field, Metal Box are ready to meet this challenge of the future with all their resources and all their experience.

STOCK MARKET RECOVERS QUICKLY

CONVERSION OFFER LIFTS GILT-EDGED

London, 3rd December.

THE stock market recovered well during the past week from the setback initiated by the heavy fall on Wall Street earlier, and the losses sustained previously were virtually eliminated. The recovery started with the opening of a new account and gathered momentum in response to a sharp rally which developed on Wall Street. On balance, closing prices were around the levels prevailing before the Wall Street shake-out, which incidentally was the heaviest fall in three years. The trend on Wall Street dominated the London market for most of the week, but after mid-week other factors began to assert themselves. The Government's conversion offer to holders of 2 percent Conversion Stock—with the provision that no more than £250 million of stock will be accepted for conversion—favourably influenced gilt-edged. In contrast, the further fall in industrial production during October had a restraining effect on industrials, which quietened down considerably after the week-end and turned irregular. Gilt-edged recovered the falls which followed the shake-out in New York, and, if anything, were slightly higher on balance. Short and medium-dated stocks particularly responded to the terms of the conversion offer. Foreign bonds and rails showed very little change. Dollar stocks recovered to such an extent that prices were back to the levels prevailing before the setback in New York. Industrials recouped virtually all their losses and were only slightly below the year's peak reached immediately after the cut to 4 percent in the British Bank rate a fortnight ago. The main feature among them was the activity in British Aluminium following the start of the battle between an American company and Tube Investments for control over it. There was not much change in golds. Base metal shares were mainly lower and oils recorded small losses. Shell Transport, however, were appreciably lower following the quarterly report which was rather disappointing. Rubbers became steadier after their recent decline and then developed a firmer tendency on small buying. Teas continued to lose ground but later developed a steadier tendency. On balance, small losses predominated.

The Money Market

The money market had a fairly comfortable week, with several small factors collectively acting favourably. Calling was on a reduced scale and non-regular money came in adequate volume on most days. Even on Thursday, the usual shortage was down to a surmountable proportion and only a very small amount of official help was needed. End-month influences did tighten up credit in the latter part of the week, but there was no undue pressure. The rate for money varied from a high of 3½ percent, which was paid for the money injected by the authorities, while in the very easy phase in the early days the rate was down to 2 percent. There was a good enquiry for bills, with February and "hots" changing hands at 3½ percent and 3¼ percent. The rate for the same maturities later was 3¼ percent, reflecting a fall of just over ¼ percent in the Treasury bill rate to £3 6s 12d percent.

Stock Market Prospects

The Investors' Chronicle market newsletter writes: "The Bank rate cut was timely for London gilts after their decline. The reaction in industrials in sympathy with Wall Street was reinforced by a desire to consolidate. With international demand for gold shares expanding, all minor reactions are regarded as favourable buying opportunities. The technical position of base metal shares is not unfavourable. Wall Street's basic structure appears unimpaired and once the major consolidation has been completed, the primary trend should be resumed. In some quarters, the Bank rate cut implied that the Government was dissatisfied with the rate of economic recovery. The heavy discounting of future earnings by Wall Street prices was suddenly underlined by some disappointing business news. Wall Street may now be set for a major technical reaction. Until this is completed, no further major advance is likely in London and even then the tempo will depend on the Government's popularity. Short-term caution is definitely indicated."

Hongkong Gold Unchanged

The Hongkong gold market moved narrowly during the past week with the closing price showing no change over the period. Incentives were again lacking, especially with sterling abroad showing little variation. Opening at \$(H)252, the market drifted narrowly to reach \$(H)252½ and thereafter fluctuated fractionally either way, finally closing at \$(H)252.

NAMES AND DATES

Mr C. A. Pitts, a director of Imperial Chemical Industries (India) Ltd., has been appointed a director of the Alkali and Chemical Corporation of India Ltd.

The Chief Manager in India of William Jacks and Co Ltd., Mr. L. R. Patel, has been appointed a director of the company's head office in London with effect from 1st January, 1959.

Stocks and Shares

STOCK MARKET CLOSES ON A CAUTIOUS NOTE

OPERATORS AWAIT ASSOCHAM MEETING

Wednesday Evening.

EXCITEMENT in the Calcutta Stock Exchange ran high on the eve of the annual general meeting of the Indian Iron and Steel Company last Friday. All sorts of rumours were spread, and while the meeting was in session, the shares of the company fluctuated between Rs. 25.70 and Rs. 26. Afterwards, there was a feeling of quiet optimism, and most of the bears covered their short position. In the process, the price gradually recovered to Rs. 26.15. The market opened on Saturday on a steady note, and by Monday there was a further improvement to Rs. 26.40. Since then, the bulls appear to have become cautious following Mr. Nehru's comments during his week-long visit on the future of the public sector. From the proceedings of the Indian Iron meeting, the following conclusions emerged: The investment company which recently sold a block of approximately 185,000 shares, is unlikely to make further sales in the near future; it is too early to say whether the company will make the proposed issue; and there is little doubt that the proposed bonus issue will soon receive Government sanction.

Operators are now awaiting, with some anxiety, the speech of the Finance Minister at the Associated Chambers of Commerce annual meeting on Friday. Until this is out of the way, there is unlikely to be any major change in price trends. Government securities continued firm under the influence of relatively easy conditions in the money market. Owing to the acute shortage of scrip, buying orders were difficult to execute and prices tended to harden.

Selected preference shares met with keen investment enquiry, but sellers were few and far between. The only feature of interest was a drop in the price of Calcutta Electric from Rs. 11.37 to Rs. 11.12 in view of the fact that the dividend on the preference shares has now become taxable and the return has been correspondingly lowered.

In the banking section, Punjab National recovered from Rs. 55 to Rs. 56.25, following the Lok Sabha denial of a newspaper report that the chairman had been asked by the Reserve Bank to resign from the Board. Bank of Bikaner shares were firm at Rs. 27.50.

In the railway section, a solitary transaction was reported in Dehri-Rohtas at Rs. 11.06.

In cotton textiles, Cawnpore were marked down from Rs. 4.37 to Rs. 4.12 and Elgin Mills from Rs. 12.31 to Rs. 11.75. Jay Shree Textiles were slightly better at Rs. 8, as were Kesaram at Rs. 11.19.

In the absence of any stimulating news, coal shares displayed a softer trend, with the exception of Burrakur which recovered to Rs. 17.12 and Pench Valley to Rs. 24.25. Amalgamated were marked down to Rs. 21. Bengal to Rs. 266, East Indian to Rs. 23.06 and Raneeungee to Rs. 14.75.

There was a revival of interest in the jute section and prices improved on a wide front, as will be seen from the following table:

	Opening 27th Nov. 1958 Rs.	Closing 3rd Dec. 1958 Rs.
Agarpara	11.37	11.87
Anglo India	204	215
Auckland	157	162
Chitavalah	16	16.31
Kinnison	182	180
Megna	15.62	16.25
Union	204	217

In electrics, there was a small enquiry for Calcutta at the higher rate of Rs. 14.87, while Patna were easier at Rs. 12.25.

Sugar shares ruled quiet, with the exception of Dyer Meakin Breweries which were slightly better at Rs. 12.25. Belsund was sold at Rs. 11.25 against the previous rate of Rs. 11.75.

In the engineering section, Indian Iron & Steel fluctuated between Rs. 25.70 and Rs. 26.40 to close at Rs. 26.16. Guest, Keen, Williams improved further to Rs. 39, at which level buyers were somewhat cautious. Textile Machinery were dull at Rs. 21 and Jessops were easier at Rs. 25.75.

In paper, Orient recovered from Rs. 30.85 to Rs. 31 and Sirpur rose to Rs. 12.37 on scattered enquiry. In contrast, Titagur were easier at Rs. 42.62 and India Paper Pulp at Rs. 20.87.

In cement, Ashoka were marked at Rs. 7.12 and a small lot of Assam Bengal deferred was done at 50p. Dalmia were unchanged at Rs. 9.19, while Orissa improved from Rs. 11.50 to Rs. 11.87. Sone Valley were shaded at Rs. 5.19.

In shipping, India General Navigation were marked down by Rs. 3 to Rs. 52 while India Steamship spurted from Rs. 14.19 to Rs. 14.87.

Among miscellaneous industrials, Alkali & Chemical met with small profit-taking and reacted to Rs. 17 while Angelo Brothers were enquired for at Rs. 20.62. Birds Investments were better for at Rs. 13, as were Clive Row at Rs. 10. Dunlop Rubber were firm at Rs. 30.75 and Indian Oxygen were better at Rs. 23.25. Metal Box were taken

at Rs. 32.50. National Carbon were steady at Rs. 27.75 and Rohtas Industries were slightly better at Rs. 20.37.

In the mining group, Indian Copper closed slightly higher at Rs. 3.78, as did Orissa Minerals at Rs. 26.75.

There were a few bargain hunters in the tea section, and some retail business was completed. The outstanding feature was Pashok which spurted from Rs. 14 to Rs. 18 on interested buying.

PROVIDING Rs. 24.62 LAKHS (Rs. 24.15 LAKHS) FOR depreciation and Rs. 48.05 lakhs (Rs. 46.06 lakhs) for taxation, bringing in Rs. 92,528 and making other adjustments, there is a balance of Rs. 45,08,243 for the Titagur Paper Mills Company during the year ended last March. Important allocations include taxation contingencies reserve Rs. 4.75 lakhs (same), statutory development reserve Rs. 3.46 lakhs and new mill project reserve Rs. 7 lakhs (Rs. 21 lakhs). The ordinary dividend is maintained at 23.4/5 percent, leaving a carry-forward of Rs. 1,16,856. The directors state that the mills have continued to work to full capacity during the year and a higher level of production has been achieved. Satisfactory progress has been made with renovation and it has contributed to the increased production. The land question for the Choudwar mill still remains to be resolved. Nevertheless, construction has continued. Advantage has been taken of the closing down of the Standard Jute Mill to purchase the land and property in order to extend the mill area at Titagur.

THE INDIA STEAMSHIP COMPANY HAS MADE A PROFIT of Rs. 1.22 crores for the year ended last March, against Rs. 1.07 crores, after transferring Rs. 59.37 lakhs to depreciation and Rs. 53.37 lakhs to development rebate reserves. Bringing in Rs. 2,70,948, there is Rs. 1,24,30,763. General reserve is allocated Rs. 40 lakhs (Rs. 35 lakhs), fleet replacement reserve Rs. 9.96 lakhs, taxation reserve Rs. 12 lakhs (Rs. 15 lakhs) and dividend equalisation reserve Rs. 28.25 lakhs (Rs. 23.75 lakhs). The ordinary dividend of 10 percent is maintained, but the capital has meanwhile been increased by a one-for-ten free scrip issue. The carry-forward amounts to Rs. 8,09,413.

THE ALUMINIUM CORPORATION OF INDIA HAS earned a profit of Rs. 27.20 lakhs for the year ended last March. Bringing in Rs. 2,33,758, there is a balance of Rs. 29,54,219. Taxation provision absorbs Rs. 3 lakhs, depreciation Rs. 14 lakhs, and general reserve Rs. 4 lakhs. The ordinary dividend has been maintained at 9 percent, leaving a carry-forward of Rs. 92,284. The expansion plan for increasing output has, it is believed, been approved by the Government of India.

THERE IS A PROFIT OF Rs. 3.79 LAKHS FOR HOARE, Miller and Co. Ltd. during the year ended December 1957. Bringing in Rs. 17,183, there is Rs. 3,96,054. An ordinary dividend of 5 percent has been declared. Taxation reserve is allocated Rs. 32,500, leaving a balance of Rs. 1,87,554 to be carried forward.

Bombay Market

PRICES FLUCTUATE WITHIN NARROW LIMITS

CLOTH NEWS HELPS SENTIMENT

Wednesday Evening.

TRADING in the Bombay stock market was marked by see-saw movements during the past week. At the beginning, prices slumped on selling pressure in steels from Calcutta interests. Later, there was a recovery on short-covering induced by hopes of an increase in steel output due to the expansion schemes. The observations made by the chairman of the Indian Iron and Steel Company about the increased output, helped improve sentiment. Reports of an increased offtake of cloth contributed to recovery.

Tata Steel increased to Rs. 178 on replacement buying, but Indian Iron were hesitant around Rs. 26.20 on pressure from Lyons Range. Premier Construction were bought at Rs. 245 from knowledgeable quarters and Tata Locomotive were quietly steady at Rs. 157.50. Alcock Ashdown were offered at Rs. 260. Motor shares were quiet, and Premier Automobile were sold at Rs. 85.50. Hindustan Motor declined to Rs. 7.16 on pressure.

There was a mixed movement in the cotton mill group. Svadeshi and Central improved to Rs. 209 and Rs. 92, respectively, on reports of better working results. Bombay Dyeing were taken at

Rs. 56.90 and Century were shaded at Rs. 431 on profit-taking. Apollo were sold at Rs. 1.30 and India United Ordinary were indicated around Rs. 8.72. Simplex changed hands at Rs. 174 and Kohinoor met with scattered interest at Rs. 250.50.

In the miscellaneous group, Phalton Sugar declined to Rs. 163.50 on the reduction of the dividend from Rs. 12 to Rs. 10 a share. Belapur Sugar were quiet at Rs. 300 on fears of a decline in earnings. Cement shares lacked interest, and Associated Cement were sold at Rs. 153. Digvijay Cement were taken at Rs. 131. Among steamship company shares, Scindia lost at Rs. 21.08 on maintaining the dividend; the market had hoped for an increase in distribution. Great Eastern Shipping were taken at Rs. 27.10. In the mining group, Shivrajpur Syndicate were steady at Rs. 91 on the removal of the export duty on manganese ore. Bombay-Burmah reacted to Rs. 494 on fears of a decline in earnings. National Rayon lost at Rs. 241.25 and Tata Chemical came to hand at Rs. 14.96.

Turnover in banking and insurance shares was restricted and fluctuations were narrow. Central Bank changed hands at Rs. 58.30 and Punjab

National Bank were transacted at Rs. 56. New India Assurance were taken at Rs. 55.

There was a modest recovery in electricity supply company shares, and Ahmedabad Electric improved to Rs. 95.10. Bombay Suburban were taken at Rs. 110.25 and Tata Power came to hand at Rs. 1,225.

BRITISH TEXTILE REVIEW

END OF HIRE-PURCHASE
CURBS WORRIES MILLS

IN its home trade, the British textile industry is now more than ever concerned with "the credit war". Soon after Sir Raymond Streat, former chairman of the Cotton Board, had said that economic conditions did not warrant the setback in the industry, the remaining restrictions on hire-purchase trade were removed, and consumers began an orgy of buying of durable goods, committing themselves to repay substantial credits over months and years. To some extent, easier credit applies to textiles as well as to "hard" goods, but it is difficult to believe that these commitments for durables will not reduce the proportion of current earnings available for "soft" goods.

Previously, there had been some signs of improvement in trade. They were, however, sectional and did not appear to signify the beginning of a general recovery; and the long process of closing mills was continuing. Experience has varied widely this year, and it is estimated that reductions in output in the textile industry range from about 5 percent to about 20 percent, compared with last year's rates. The figures for production of man-made fibres published at the end of October showed that in the first three-quarters of this year, the output in this section was merely 20 percent down. The average of the nation's industrial production has been only a few percent less this year than in 1957: so the textile industry was particularly unfavoured even before the easing of credit which favours the more expensive consumer goods.

The Yarn Agreement

It was against this sombre background that the Restrictive Practices Court in London began a long hearing to decide whether the Yarn Spinners Association's agreement fixing minimum prices for cotton yarns was contrary to the public interest. Queen's counsel representing the Association pointed out that price fixing had legislative approval in 1939 and said that if it was necessary in 1939, it was "infinitely more necessary today". But the Restrictive Practices Act is now on the statute book, and any agreement in restraint of trade, if challenged, must be justified by the Association concerned to the satisfaction of the court.

This case goes to the root of Lancashire's problems, and the hearing has necessarily been focussed on essentials. It was argued for the Association that if the agreement were rescinded, the cotton industry would be doomed; but the evidence seemed to show, not that the industry itself would collapse but that the weaker units in it could not survive. So the first question was whether these weaker units ought to be artificially protected, and kept in being, by restricting competition. An affirmative answer cannot be accepted as obvious when the broad trend of the industry is towards consolidation into the most efficient units. The argument that the minimum price scheme is necessary to provide enough profit to finance re-equipment can likewise not be accepted without question: Is the industry maintaining a rate of investment that its true position does not justify?

Minimum Price Schedule

A more practical argument put forward in defence of the scheme was that if the minimum price schedule were withdrawn, standards of quality would collapse. It was said that if prices were free, it would be necessary to maintain some profit margin by debasing quality, that the home market would be interested more in price than in quality, that the export market would be suspicious of British quality, whether it were debased or not. One witness, an economist, went so far as to suggest that exports, which are predominantly in the high quality range, would be reduced by 50 to 75 percent if the price scheme were abolished. Such restrictions are, of course, hypothetical. What is certain is that, in the intensely competitive state of international trade, effective in the home market as well as abroad, the weavers need the cheapest prices which are compatible with quality.

Emphasis on Competition

An important development in the wool industry in October was in the direction of consolidation. It may be hoped that cotton spinning companies need an argument put forward by the board of Ilfracombe, Morris when it offered to buy a substantial block of shares in Salts (Saltaire); that, in view of plans for a European free trade area, units in the industry should combine and so strengthen the structure of the industry. (Emulating the procedure adopted in this case is not, however, recommended: the Stock Exchange disliked the method of acquiring only a majority of the shares and leaving a considerable minority with no influence on the management of the company.) Both the companies concerned are very big, and though no drastic organisational changes appear to be contemplated in this case, such developments can have important long-term effects.

J Whittingham is another important unit in the textile industry. Its chairman, Mr. L. C. Taussig, mentioned in his annual statement in October a significant effect of the decline in prices of wool that it had made the industry revise its allocation of fibres and reversing the tendency which was obvious when wool was dear, use more

wool and less man-made fibres in its mixtures. But the decline in prices has thoroughly unsettled the industry, and confidence has not been quickly restored by the recent strengthening of prices. Mr. Taussig spoke favourably of plans for more orderly marketing of commodities such as wool.

Fixing Export Quotas

Several other countries besides Britain are planning orderly marketing of manufactured textiles, and the countries which initiate the plans are the recipients, not the suppliers. While Britain and Hongkong have been trying vigorously, and not altogether successfully, to satisfy each other with a moderated trade, the United States has been considering whether to approach Hongkong with a proposal that the colony accept an export quota for the U.S. market, on the lines of the quota that the United States arranges with Japan; and France has imposed a quota on imports of textiles from Hongkong into French overseas territories—the explanation in this case being that Hongkong could be used as a front for exports from China or Japan. Such actions do not make the position any easier for Britain, which cannot impose restrictions on a British colony's goods and may be subject to still more pressure to receive them if other countries' import policies are more restrictive. Another chronic problem, affecting a wide range of textiles, is Italy. Attention has lately been focussed, in Britain and in other European countries, on its cut-price nylon stockings. The British industry is not worried by Italian quality, but Italian prices are causing serious anxiety. However, the Italian industry denies that its exports are assisted by anything more than legitimate refunds of taxes. Meanwhile, the European free trade area becomes less and less attractive to British textile firms.

SUGAR PRODUCTION AND STOCKS

According to the Indian Sugar Mills Association, the total production of sugar during the season 1957-58 was 1,976,000 tons against 2,026,000 in the season 1956-57. The offtake from factories during October 1958, was 175,000 tons (including despatches for export) against 182,000 tons during the corresponding period of the last season. The total despatches from factories in the season 1957-58 was 2,070,000 tons (including despatches for export), against 2,124,000 tons (including despatches for export) during the season 1956-57. The total closing stock of sugar with factories on 31st October, 1958, was 360,000 tons against 458,000 tons on the same date of the last season.

PROTECTION TO CAUSTIC SODA AND
BLEACHING POWDER INDUSTRIES

The Government of India's resolution on the Tariff Commission's Report (1958) on continuing protection to the caustic soda and bleaching powder industries has been published in the Gazette of India. The Government has accepted the Commission's main recommendations that (i) protection to the former should be continued for a further period of three years, that is, up to 31st December, 1961, and (ii) the protection granted to the latter including bleaching paste, should be discontinued after 31st December, 1958. As recommended by the Commission, the protective duties on caustic soda, both solid and other sorts, will be retained at the existing rate of 30 percent *ad valorem* (preferential) and 40 percent *ad valorem* (standard) as long as the tariff value of Rs. 28 a cwt. on solid caustic soda and Rs. 45 a cwt. on caustic soda of other sorts is retained. These protective duties will be altered correspondingly if a change in tariff values is effected in future. The Government has also noted certain other recommendations of the Tariff Commission for assistance to the industry and suitable steps will be taken to implement them as far as possible.

WHOLESALE PRICE INDEX FALLS

THE official wholesale price index (base: year ended March 1933=100) receded further by 0.8 percent to 113.9 during the week ended 15th November, 1958, compared with 114.8 (revised) for the previous week. The index was lower by 2.2 percent when compared with the corresponding week of the earlier month but was higher by 3.7 percent compared with that of last year. Lower prices of gur in Muzaffarnagar (-19%), oranges in Madras (-15%), cashewnuts in Mangalore (-12%), jowar in Hubli (-10%), maize in Dohad, mung in Hissar and ghee in Madras (-9% each), ragi in Salem (-6%), arhar (-5%), milk (-4%), groundnut oil, mustard oil and tea for internal consumption (-3% each), rice (-2%) and gingelly oil, black pepper, chillies and cardamoms (-1% each) brought down the index for Food Articles by 1.2 percent to 118.2, compared with 119.6 (revised) for the previous week although the prices of cloves (+18%), urad in Madras and oranges in Shillong (+12% each), onions and bananas (+9% each), potatoes in Patna (+7%), fish, and betelnuts in Mangalore (+6% each), wheat in Khagaria (+5%), coffee (+4%), coconut oil (+2%), barley and eggs (+1% each) witnessed an increase. A rise of 7 percent in the prices of raw tobacco (Pollah F.A.Q. medium) in Calcutta was responsible for raising the index for Tobacco by 1.7 percent to 95.1, compared with 93.5 (revised) for last week. The index for the Fuel, Power, Light and Lubricants group stood at 114.9 against 115.0 for the earlier week due to a fall in the

prices of castor oil (-1%). The prices of tanning materials (Konam bark) in Madras (-10%), cottonseed in Amravati and groundnuts (-8% each), mustardseed in Kanpur and rapeseed in Delhi (-5% each) and castorseed (-1%), moved down while linseed in Sahibganj (+10%), cottonseed in Hyderabad (+5%), rapeseed in Kaithal and bamboos (+4% each), lac (+3%) and raw jute, raw wool and gingellyseed (+1% each) showed advances and the index for Industrial Raw Materials fell by 0.9 percent to 111.9, compared with 113.1 for the previous week. The index for Intermediate Products declined by 0.4 percent to 109.6, compared with 110.0 (revised) for the earlier week due to a fall in the prices of aluminium (circles) (-8%), rayon yarn (-2%) and cotton and coir yarns (-1% each). The prices of zinc (+7%), lead (+5%) and brass and tin (+2% each), however, moved up. The index for Finished Products also fell by 0.4 percent to 108.3 against 208.7 (revised) for the previous week. Items which showed noticeable variations were: silk and rayon manufactures (-5%), glass (-2%) and bicycles (+3%).

Jute

I.C.J.C. RECOMMENDS FIXING FLOOR PRICES
FOR FIBRE

SUB-COMMITTEE APPOINTED TO EVOLVE FORMULA

ONE of the main subjects discussed at the annual meeting of the Indian Central Jute Committee in Calcutta during the past week was the considerable drop in jute prices this season. As expected, the Committee urged the Central Government to fix minimum prices immediately for each grade of raw jute and mesta, in an attempt to stabilise prices in the interests of growers. A nine-man sub-committee was formed to evolve a formula fixing the floor price of jute, and it was called upon to submit its report within two months. This might seem to be an abnormally long time for decisions to be reached. There are many people who think that minimum prices are not the solution. The trade has before it the example of finished goods; minimum prices were fixed for them as long ago as February, but this did not prevent rates, with the exception of hessians, falling to new low levels. Many sellers' organisations, as well as individual sellers, have asked the Government to allow the export of raw jute, which, they claim, will help lift fibre prices. But it is doubtful if any buyers could be found for the jute that might be available.

Slight Improvement

During the past week, there was a slight improvement in the raw jute position, partly on account of the discussions taking place, but mainly because of the decrease in imports in all upcountry agencies. The decrease was seasonal, but this year it appeared to have had more significance due to the depressed conditions. Sellers' ideas firmed up, but there was no appreciable change in prices, and business was still possible at cut rates. Calcutta mills, however, showed little interest, and it appeared that transactions were confined to mesta in the lower grades or high-quality jute. The Northern markets remained about Re. 1 a maund below the Assam districts, as it was reported that there was still a small margin of profit. In the local mesta districts, however, losses of from 25p to Re. 1 a maund were indicated in current prices. The only redeeming feature was that sellers were showing a reasonable profit on deliveries against previous contracts, all of which were signed at higher prices than those ruling today. Transport from some areas was restricted, especially from the desal stations, and sellers had full godowns due to the non-allocation of wagons. Booking was open through Sakrigalighat, however, and those who had given the option of delivering through this station did not regret it. Many buyers objected to the option as the privilege laid itself open to abuse. But most requests of this nature were genuine, as sellers were only too anxious to give a good tender and not have high-priced contracts cancelled.

The gunny section continued to be unpredictable. Reports of small business with the U.S.A. and rumours of a Government of India order for B Twills caused a firmer tendency to develop at first. Mills sold moderate quantities, and until the week-end conditions improved. The discussions at the I.C.J.C. meeting tended to create a steadier atmosphere, but after the week-end the market again slumped. The improvement in the earlier sessions bore little relation to the business done, which did not warrant large price movements. Mills lost interest after the week-end, with the result that in one day all the gains of the previous week were lost. There was no stability in the market, so erratic price fluctuations, governed principally by speculative activity, prevented genuine traders from formulating any policy. Current shipping advices were reported to be poor for the time of year, and the general undertone of the market was weak.

Pakistani Jute Crop

One of the main reasons why jute prices are low is the bumper jute crop in both India and Pakistan. This was emphasised during the past

week when the second estimate of the area under jute for the 1958-59 season in Pakistan was published. In spite of the fact that the acreage under jute decreased by 2.2 percent compared with the previous season, due to drought and other climatic conditions at the time of sowing, the estimate of output showed an increase of 4.3 percent. This was possible, according to the report, because of the introduction of improved methods of cultivation, favourable weather conditions, timely rain and sufficient steeping water.

THE JUTE MARKETS

There was a fair amount of activity in the futures markets and prices, as given by the East India Jute and Hessian Exchange Ltd. for the period 26th November to 2nd December, were as follows:

	Hessians 40in. 100z.	Sacking B Twills November	Raw Jute Upper Assam December
	Rs. a 100 yds.	Rs. a 100 metres	Rs. a md. 100 kilos
Opening	39.56	43.04	55.65
Highest	39.60	43.31	56.05
Lowest	39.24	42.77	55.45
Closing	39.24	42.77	55.45

Manufactured Goods: There were distinct signs of an improvement at the opening of the jute goods market last Thursday. Following rumours of business with the U.S.A. in hessians, and of a Government of India order for B Twills, prices in both sections rose rapidly and a steadier undertone developed. B Twills opened at Rs. 94.50 for ready shipment and Rs. 96.10 for January-March shipment, while 40in. 100z. hessians started at Rs. 41.75, this representing a premium of Rs. 2.25 over forward shipment. The market remained steady on reports of enquiries for sacking from the Far East, and over the next two days heavy goods advanced by 50p and hessians by Re. 1. Mills sold moderate quantities at these levels, and local shorts were active for near delivery goods. At this stage, there were hopes of a turn for the better, and some confidence was apparent. April-June quotations appeared for the first time after the week-end, and B Twills were quoted at Rs. 97.40, which represented a premium of Rs. 2.30 over the ready quotation. Hessians were a little quieter at this stage and April-June 40in. 100z. was called over at Rs. 39.40, a discount of Rs. 2.95 on ready hessians. The feeling of confidence was shattered overnight; with demand slackening and settlement day over, prices slumped and all the gains were nullified. B Twills lost 80p in the near position and Rs. 1.40 for April-June shipment, the quotations dropping to Rs. 94.30 and Rs. 96, respectively. In 40in. 100z. hessians, similar conditions prevailed, and losses of 35p and 15p reduced quotations to Rs. 42 and Rs. 39.25, respectively, for the near and forward positions. No fresh enquiries were received and the market in general was quiet.

On Wednesday morning, quotations were as follows:

	Ready	December	Jan.-Mar.	Apr.-June
40in. 80z.	32.90 (35.86)	32.75 (35.70)	31.60 (34.44)	31.40 (34.23)
40in. 100z.	41.75 (45.51)	40.75 (44.42)	39.40 (42.95)	39.25 (42.77)
B Twills	94.25	94.70	95.60	96.00
Heavy Cees				
(Plain)	98.25	97.50	98.75	99.00
A Twills	115.00	115.75	116.00	116.25
Liverpools	108.00	108.00	108.00	108.25
Cornacks	94.75	95.50	95.75	97.00

Raw Jute: There was very little activity in the fibre markets during the past week, but a steadier undertone developed, and sellers were inclined to be reserved due to the heavy fall in imports at most upcountry receiving stations. Arrivals fell by half, and although this was seasonal, such was the state of the market that it

had an abnormal effect. Prices in all the Assam agencies continued to rule well above those quoted in Calcutta, as did mesta rates, but conditions were easier in the Northern agencies, and business was still possible at a profit. Many sellers in this category were keen to transact, but mills showed little interest, and the bulk of the small business that was transacted was in the mesta fibres. The I. C. J. C. discussions about minimum prices induced a steadier tendency, but reports from up-country of increased supplies being available soon acted bearishly. Assam quotations opened on the basis of Rs. 21.75 a maund for December shipment, with Northern indications about Re. 1 lower. Before the week-end, rates advanced by 25p, and on Monday Assam jute improved further to Rs. 22.25. Prices fell back again on Tuesday, and the undertone was weak, but the majority of sellers were now keen for business.

Small lots of Northern jute passed at Rs. 21 a maund, and Northern Tossa at Rs. 22.25. Agartala Tossa was reported at Rs. 23.25, as also were small lots of Assam Tossa. Desal White passed at Rs. 20.25. The main business was in mesta, and Northern mesta fetched Rs. 19.75 to Rs. 21, while desal mesta was done at Rs. 19.50. Daisee mesta changed hands at Rs. 18.75 to Rs. 19, all for December shipment. Small lots of Daisee were reported from Rs. 22.75 to Rs. 23.50, according to district.

In Cossipore, imports continued to be good and wagon arrivals totalled 800 wagons, as against 700 during the previous week. During the corresponding week of last year, arrivals amounted to 890 wagons. There was daily business and good quality fibre was in demand, high prices being paid. Most sellers were keen for business. Quotations for Kishanganj jute were based on Rs. 20 a maund for garsat quality.

	Landed at Mills (Basis Bottoms)	Rs. a maund	Rs. a 100 kilos	Shipment Dec.-Jan.
Assam	22.00	58.96		
Northern	21.00	56.28

THE FOREIGN JUTE MARKETS

FIBRE SUPPLIES ABUNDANT

(FROM OUR DUNDEE CORRESPONDENT)

THE raw jute market in Dundee was in a stalemate during the past week. Each day, fibre was offered to spinners in abundance. Dealers who had no secured jute quoted the minimum prices, while the secured material quoted at £1 to £2 less, without attracting much attention from buyers. Spinners appear to believe that if they wait long enough, say, till the jute arrived in Dundee they will be able to purchase at a few pence less. Plenty of jute is being shipped from Pakistan, and there are at least 200,000 bales afloat to this centre. If the shipment period is for, say, November-December, the whole of the parcel is being despatched in November.

The existence of these secured lots—and there is still a fair number of them—creates a good deal of irregularity in prices. Mill Firsts and Mill Lightnings are not freely offered at £107 and £90, respectively, and sellers are not quoting less than Mill Hearts are available at £78 and grad Hearts at £65, December-January. The quality of cheaper classes of fibre is not good, and there is a scarcity of the better marks. Good marks of Daisee-2/3 are quoted at £95, but they are also offered at £93 and grade is from £87 to £88 for assortment, while grade Tossa-2/3 rules from £103 to the minimum of £105, and fours £93 to £95, December-January, or afloat. Sales are extremely limited at present.

The Calcutta goods market has been sagging steadily, due, it has been said, to the lack of demand from consuming centres. A wonderful recovery has been made, however, in the prices of hessians which have advanced by 1s 9d to 2s and sackings by 1s 6d on account of short-covering.

POSTWAR EXPANSION OF THE U.K. STEEL INDUSTRY

STEADY INCREASE IN DEMAND EXPECTED

(FROM A SPECIAL CORRESPONDENT)

At the end of the second World War, U.K. steel production capacity was approximately 12 million ingot tons. Since then a vast programme of modernisation and expansion has been taken in hand and it is scheduled to be completed by three stages in 1962. The first development programme, which was announced in 1946, aimed at increasing the output to 16 million tons (later raised to 18 million tons) by 1952-53. The higher target was largely reached in 1953. The second phase of expansion was designed to meet a demand for 22.5 million tons in 1958. Between 1953 and 1958 a production increase of 4.5 million tons is expected, compared with an actual rise of 2.75 million tons in the preceding five years. The third stage of development is calculated to raise Britain's steel output capacity to about 29 million ingot tons by 1962.

Under the Iron and Steel Act, 1953, this basic industry in Britain is within the sector of "private" ownership to enable it to enjoy the stimulus of commercial competition, while at the same time it is subject to statutory supervision in the public interest. The management and financial responsibility lies with the individual companies; but the Iron and Steel Board exercises general supervision over the industry. The Board is given powers in relation to such essential matters as development, prices, import of raw materials and iron and steel research and transport. In determining the prices of product, it pays due attention to the capital and operating costs of new plants and prices designed to encourage expansion and efficiency.

Modernisation and Expansion

Modernisation and expansion of the industry is a continuous process. The programme is, therefore, constantly reviewed in order that it might be adapted to changing conditions. Britain's steel target at present is to achieve a production capacity of 29 million ingot tons by 1962, against under 22 million tons in 1956. Virtually the entire expansion envisaged during the next five years is covered by specific projects which have already been approved. The fundamental facts of the steel industry are given in the following table:

U.K. STEEL DEMAND AND SUPPLY (1955-62)				
	(actual) 1955	(actual) 1956	(est.) 1957	(planned) 1962
Demand:				
Home consumption	17.9	18.4	19.0	23.7
Stock increase	0.7	1.0	0.5	0.3
Export	3.4	3.3	4.0	5.0
Demand margin	—	—	—	1.0
	22.0	11.7	23.5	30.0

Supply:				
Production	19.8	20.6	22.2	29.0
Re-usable steel	0.3	0.3	0.3	0.3
Import	1.9	1.8	1.0	0.4 x
Supply margin	—	—	—	0.3 x
	22.0	11.7	23.5	30.0

Increase in Demand

The latest expansion programme represents an estimated increase in consumption of 34 percent in the six years, 1956-62, compared with an actual rise in the six preceding years, 1950-56, of 21½ percent. An exceptionally rapid rise in the demand for tubes (50 percent) and plates (46 percent) is expected, primarily reflecting the requirements of the oil and shipbuilding industries. A higher than average expansion is envisaged in the production of tinplate (40 percent). For the entire period of 1950-62, the highest rate of growth is expected in the production of sheet (85 percent), reflecting, in the main, the needs of the motor-car industry.

At present, Britain's per capita steel consumption is less than half that of the United States, but 50 percent higher than that of Russia. Home consumption of finished steel rose from 11 million tons to 13½ million tons between 1951 and 1956. Most of the great U.K. steel-using industries have two features in common. They are makers of capital rather than consumer goods, with two notable exceptions, namely, motor-car and hollow-ware industries. All the other steel-consuming industries (such as mechanical and electrical engineering, building and construction industries, the railways, shipbuilding, collieries and the commercial vehicles section of the motor-car industry) are primarily concerned with providing capital goods for the investment sector of the economy. The second common feature is their dependence on the export trade. In the motor-car, mechanical and electrical engineering and shipbuilding industries, etcetera, nearly one-half of the output is exported. These "indirect" steel exports increased from 11 million tons a year before the second World War to 4 million tons in 1951, and to 4½ million tons in 1956. If to this is added the direct exports of steel exceeding 3.25 million tons in 1956, it becomes clear that over a third of Britain's steel supply is shipped abroad. There is scope for a further increase in exports, since the U.K. steel industry is fully competitive in terms of ore, fuel, capital and labour with the two other major steel exporters—the European Coal and Steel Community and the United States.

Production Plans

The British steel output of 29 million ingot tons in 1962 will call for about 20 million tons of pig iron, and the provision of approximately 22 million tons of home ore and 23 million tons of

imported ore. In other words, the domestic production of iron ore is to go up by 6 million tons compared with the 1956 output. In that year, ore imports totalled 14½ million tons. Problems of transporting foreign ore to Britain, and its handling at the docks had been foreseen, and provided for. In 1962, Britain has plans to produce, in addition to 29 million tons of ingots, 400,000 tons of steel castings and 4½ million tons of iron castings from 33.3 million tons of pig iron and scrap. The total quantity of scrap available from domestic sources in that year is placed at 13.2 million tons, and assuming only marginal imports of pig iron and scrap, home production of pig iron will have to rise to 20 million tons by 1962. It is estimated that the average percentage of pig iron used in steel manufacture will go up from 54 percent in 1956 to 60.8 percent in 1962. This substantial expansion of the pig iron output is to be mainly achieved by the construction of some new large blast furnaces, and enlargement of the existing ones.

The target of 20 million tons of pig iron to be produced by 1962 will require 18 million tons of blast furnace coke a year. To provide all the coke needed, both for blast furnaces and other uses, will call for about 49 million tons of coal, against 29½ million tons carbonised by the coking industry in 1956. Particular importance is attached to the achievement of consistency of the coal charge and, therefore, of the coke produced. With this end in view, the British Coke Research Association is going ahead with laboratory tests, small-scale experimental oven studies and the erection of a full-sized test oven plant at its new coke research centre near Chesterfield.

Liquid Fuels

In 1946, total liquid fuels delivered for the manufacture of British steel was a mere 52,000 tons; a decade later it exceeded 1.5 million tons. Postwar experience has been that 70 to 75 percent of the steel industry's consumption of all liquid fuels has been in melting furnaces. If this figure is taken to apply to future years, it may be expected, therefore, that in addition to the maximum of 625,000 tons of additional liquid fuels required for steel making by 1962, a further 320,000 tons or so, will be needed for reheating, etcetera, making a maximum liquid fuel intake of over 3 million tons in that year.

In the last two decades, the British steel industry has created new capacity for 8 million tons against the United States' 64 million tons. Can this country achieve a 40 percent increase in production capacity in about five years with the engineering resources locally available? British plant fabricators have followed the policy of working in association with their U.S. counterparts, so as to avail of U.S. designs and experience. Thanks to this inter-charge of technical information, U.K. plant fabricators are able to provide domestic steel makers with designs incorporating both their own and U.S. experience. Some part of the original mill equipment for the Steel Company of Wales, notably the hot strip mill at the Abbey works and the tinplate mill in Trostre, came from the United States. Also, a part of the mills was ordered in the latter, notably its kind to be installed in Britain. The rest of the increase in the steel output has been made from the home-built mills. The industry is expected to produce 3½ of the 8 million tons by 1958. The same time ago and is going ahead with production. So, the real problem is how to fabricate plants for the other 4½ million tons between now and 1962. British plant manufacturers are confident of managing this job. This process of expansion provides further opportunities for the people engaged in the industry as well as for new entrants. The unions associated with the British iron and steel industry are justly renowned for their realistic approach to problems of increased output and efficiency. In the eight years since 1948, steel production has increased by 40 percent and employment by only 8 percent.

Postwar Investment

In the post-war decade (1946-55), the British industry spent approximately £570 million on investment which is equivalent to £630 million at prices ruling in mid-1957. Of this, £128 million went for the replacement of fixed assets, £338 million for their expansion and £140 million for the current stocks and work-in-progress, etcetera. The current development programme will require some £600 million for fixed assets and £90 million at current prices. During the third phase of the industry's postwar modernisation and expansion, capital equipment required to support the efforts of steel workers is estimated to cost £15,000 an employee in a modern integrated steel plant. An industry as capital-intensive as steel, which is expanding fast in an inflationary climate, cannot fail to impose a heavy load on the nation's scarce real resources, such as labour, fuel, raw materials and plant capacity, not to speak of finance. It is a challenge which the industry alone cannot meet. It must be sustained by realistic official policies on prices and taxes governing depreciation, and it must, moreover, be able to attract the support of the capital market.

Expansion of the Colville Group

To cite a typical example of U.K. steel expansion, the Colville group, responsible for four-fifths of the Scottish steel production, found it necessary to expand beyond the limits of existing works and develop the virgin site in Ravenscraig. Site clearance and building over the new integrated works were completed during the past three years according to schedule. This project is

the largest ever tackled in the history of steel-making in Scotland, and its significant feature is not so much the extra ingot tonnage which becomes available at present as the fact that the ground available and planned lay-out of the works make room for the considerable expansion which is envisaged in the future. The outlay on this undertaking by mid-1957 was about £22½ million, or, say, £55 a ton of steel production which at present does not go beyond the melting shop. The construction of rolling mills, when started, will add to the cost of production of finished steel.

Ravenscraig is the first fully integrated iron and steel works to be built in Scotland. Following the general shortage of scrap, a higher proportion of pig iron is now required than was the case in the interwar period. The melting shop consists of 800-ton capacity hot metal mixers for handling the molten iron, and 200-ton fixed open hearth steel melting furnaces fired with a combination of coke oven gas and liquid fuel. Ample space is available for the future erection of additional furnaces. Molten iron is supplied from a blast furnace which has a rated output of 100 tons a day, and here again, there is room for at least two more furnaces if the need arises. A battery of 70 coke ovens has been erected with a modern by-product plant, producing ammonium sulphate and the normal range of benzole derivatives.

Special Handling of Raw Materials

Special attention has been paid to the efficient handling of raw materials, especially imported iron ore. At the General Terminus Quay in Glasgow, the new ore unloaders are capable of lifting 600 tons an hour from the ship to a conveyor system. The ore is then elevated into storage bunkers with a capacity of 14,000 tons and from there fed through loading hoppers into specially designed railway wagons for transporting to Motherwell. These wagons of 24½ tons capacity have bottom discharge gates to facilitate emptying at the iron works, where a train carrying 1,000 tons of ore is discharged and turned round in 45 minutes. Nearly 4 million cubic yards of earth had to be excavated in the initial stage. This job was greatly helped by the exceptionally dry summer of 1955, and much of it was accomplished ahead of schedule. While much ground is available for future expansion, the works is just near Colvilles' original Dalzell works and the Fleming works of the Lanarkshire Steel Company, belonging to the Colville group. Its advantageous location lends itself to close co-operation between the three units, which no doubt lent weight to the choice of Ravenscraig for this major development. For increasing the output of semi-finished and rolled steel products, the next stage in the development of the Colville works will include a cogging mill and two new four-high plate mills.

The fourth strip mill project announced in the U.K. House of Commons in mid-November has wide implications for British industry and for employment in the regions concerned. Richard Thomas and Baldwins Ltd is to build an integrated iron and steel works with a wide strip mill in Newport, Wales, and in Scotland, the Colville group will install a sheet mill at its new works in Ravenscraig. The former calls for an outlay of £100 million, and the latter, £30 million. The Colville project is a new departure for Scottish industry and provides a basis for light industries employing sheet and tinplate.

Main Strands

There are six main strands running through the development schemes of almost all the U.K. iron and steel firms. First is the marked increase in the size of the plant units, accounting for much of the rise in productivity. Second is balancing of the whole works, to ensure that the highest cost and capacity plant unit, frequently a rolling mill, is operated at around its optimum rate. Third is the better preparation of raw materials. Fourth is the trend towards further integration of processes to save fuel and transport costs. Fifth concerns the steady evolution towards the continuous processes which have revolutionised the production of sheet and tinplate. And the last relates to the extension of instrumentation and the application of electronics as an aid to management. This secures better products with the maximum economy of fuel and raw materials. In all these developments, the co-operation of workers has proved a vital factor in achieving fruitful results.

Basic Research

The British iron and steel industry is fully alive to the importance of basic research and development work. In the past, brilliant inventiveness of Bessemer and Hadfield, among others, put it in front of its competitors. In the future, this basic industry can only keep its leadership in high quality and low prices by constantly adapting its practices to make full use of scientific advances. It is doing its utmost to incorporate the latest technical developments in the design and operation of the new plants.

Research is carried out by all the larger British companies in their own research and development departments. These and the smaller firms, which cannot afford to have departments of their own, collaborate with the British Iron and Steel Research Association (B.I.S.R.A.), to carry on fundamental research and development work for the entire industry. The Association is at present busy on the following investigations: (1) new techniques of beneficiating low-grade domestic ores and agglomerating finely divided rich ores by sintering,

pelletising, briquetting and vacuum extrusion; (2) the use of gas turbines for blast furnace blowing and employment of electronic computer to make blast furnace practice more of a science and less of an art; (3) work on the aerodynamics of furnace flues and chambers and fundamentals of fuel atomisation and acceleration has resulted in better open hearth furnaces, lasting longer and utilising fuel more efficiently; (4) good progress has been made in developing the converter, particularly by either bottom, side, or top blowing, with oxygen to reduce the nitrogen content of steel; (5) studies on improving efficiency and reducing costs of electric arc furnaces; (6) work on "continuous casting"—a two strand pilot plant based on a new and improved British process operating in Sheffield is producing two billets at a time of high-speed, stainless and other alloy steels; and (7) work on improving fabrication of steel by the control of rolling mills.

Improvement in Working Methods

Both improvements in plant as well as in working methods have contributed to the largest output now obtained from producing units in the British iron and steel industry. In 1939, 71 furnaces in blast, making basic and hematite iron for steel manufacture, produced 6.5 million gross tons of iron. In 1957, the number of furnaces in blast was 77, but they accounted for 12.8 million tons of iron to make steel. Again, in the prewar years there were no furnaces with a greater hearth diameter than 25 feet. Today there are 15 such furnaces in operation or are under construction. Moreover, whereas in 1947 open hearth furnaces numbering 302 produced a little over 11 million tons, a decade later it required only 287 furnaces to produce 17.25 million tons. As with iron so with steel, the output of older units has been markedly improved compared with that ruling before the second World War. The use of sinter has contributed very definitely to the reduction in coke used in blast furnace operation in the postwar period.

The basic Bessemer steel has generally suffered in quality due to the presence of nitrogen creating brittleness. On the other hand, this process is most economical for producing very low carbon steels which are in great demand for fabrication of sheets. This has stimulated research into the use of pure oxygen in a modified Bessemer process, which by avoiding the use of air does away with the absorption of nitrogen. Another new development relates to vacuum melting, where the operation is carried out in a high vacuum furnace resulting in the evaporation of gases and impurities and is useful for

Benefits for Workers

The total labour force employed by the U.K. steel industry is about 300,000, the manual workers being organised into some 20 trade unions. The wages and salaries bill is of the order of £200 million (\$560 million) a year. An effective negotiating machinery and mutual trust and confidence have yielded tangible benefits to workers whose average earnings in 1957 were about £14 a week. The fact that the great majority of the men have a substantial proportion of their wage related to production has meant that the industry's plans, now running at £100 million a year, have been of direct benefit to them. The output performance has increased by 40 percent since 1948, and the unions themselves accept that a well-equipped and competitive industry is the best long-term safeguard for the security of their members. In fact, the British steel industry is proud of its record of good labour relations. The decline in U.K. steel production in 1958 was largely brought about by a fall in export demand coupled with the depletion of stocks. The long-term expansion plans of the industry are unlikely to be affected by this minor recession.

INDIA LEADS AMONG BUYERS OF U.K. AIRCRAFT

India was the leading overseas buyer of British aircraft during the first ten months of 1958, a period when the industry set up a new export record. Announcing this in London, the Society of British Aircraft Constructors says that during the period, India bought more than £15.5 million worth of British aircraft and parts. Total U.K. exports of the latter during the period were to the value of £126,883,826, which exceeded by 9 percent the previous annual record achieved in 1957. The ten-month total is nearly double the 1955 annual figure, and 45 percent more than the total achieved during the first ten months of 1957. During the period, India headed the overseas buyers with a total of £15,514,467. Next came Canada, with £13,471,828, and the United States, with £11,197,756. Other substantial buyers were the Federal Republic of Germany, Australia, the Netherlands, Iraq and France. For October, the aircraft industry's total exports exceeded by £1.5 million the October 1957 total, and topped the September 1958 figure by more than £600,000. To the month's total of about £10.5 million, India contributed £586,419—which placed her third, after the United States and Federal Germany.

He tears paper all day long!

HE'S not destructive by nature; it's his job to tear paper wrappers... scientifically, to test their strength.

Wrappers, containers, cartons and packing cases are subjected to exhaustive testing at Hindustan Lever! As for the products themselves—they are also constantly undergoing the most gruelling tests. From raw materials to finished product, experts, scientists and technicians are sampling and checking.

But why all this testing? Well, we know that you expect unvarying high quality of a Hindustan Lever product. The only way to maintain it is by quality control at every stage. This quality control also enables us to conserve precious national resources and vital production time.

FAIR GENERAL DEMAND AT TEA EXPORT SALE EASIER TREND IN DUSTS

AT Sale No. 22, held on 1st and 3rd December, offerings at the Export auction amounted to 67,692 chests. There was a fair general demand at easier rates. "Teas for price" were 4nP to 6nP easier, while plain and medium broken and Fannings declined by 6nP or 10nP. Orthodox medium Assam B.O.P.s were irregularly 10nP to 20nP easier but there was a better enquiry at often easier rates for similar O. Fgs. Tippy teas received good support. The few best liquoring C.T.C.'s on offer met with better demand and generally sold well but the remainder were 10nP to 15nP easier with appreciable withdrawals. Legg-cut descriptions were 6nP to 10nP easier. Whole leaf grades sold well and the stylish sorts were often dearer. There was a fair enquiry for Darjeeling teas at generally easier rates.

Quotations	1958	1957
Rs.	Rs.	Rs.
Clean Black Pekoe	1.85 to 2.00	2.30
Plain B.P.	1.56	1.56
Plain Fannings	1.62 to 1.66	1.64
Medium B.P.	1.64	1.60 to 1.64
Medium Fannings	1.70 to 1.74	1.70 to 1.74
Best Assam C.T.C. B.P.	2.10 (Nominal)	3.00 to 3.20
Best Assam C.T.C. Fgs.	2.20 (Nominal)	2.80 to 3.00

(Prices are exclusive of 3.125nP a lb as excise duty.)

At the Internal Sale, Dust offerings amounted to 21,096 chests. These met with only a fair general demand which weakened towards the close when there were a number of withdrawals. Orthodox descriptions eased by 4nP or 6nP and sometimes more. Plain and medium C.T.C.'s were also 10nP to 15nP easier, while the best liquoring ones in this category fetched prices around valuations. There was only a limited demand for Darjeelings and prices for these were irregular according to quality. Legg-cut Doonars shared in the decline and were 6nP below the last rates.

Quotations	1958	1957
Rs.	Rs.	Rs.
Medium Doonars Dust	1.78	1.68
Medium Assam Grains Dust	1.90	1.68 to 1.70
Medium Assam C.T.C. Dust	1.90 to 2.15	1.95 to 2.05
Best Assam C.T.C. Dust	2.40 to 2.80 (Nominal)	2.70 to 3.00

(Prices are exclusive of 3.125nP a lb as excise duty.)

The 3,596 chests of Leaf on offer met with a good general demand at lower rates. C.T.C. types declining more than orthodox descriptions.

FREIGHT MARKETS DULL

THERE was little of interest to report in the freight markets last week. Further fixtures of grain to India from the U.S.A. were made, and the lower rate of 62s 6d from Northern Range to west coast India was accepted. In the local coal market, a small ship was taken for Singapore at 30s. Mormugao-Japan ore was arranged at 38s 3d f.i.o. and Mormugao-Genoa at 31s 6d f.i.o. There is still no sign of any substantial recovery in the markets.

LINSEED FIRM

The market has continued firm over the past week and sellers have been reserved. The stock position in Calcutta is poor with arrivals scarce, so crushers are working on a hand-to-mouth basis. There has been some improvement in the oil market and small enquiries have been received from shippers and consumers. Supplies being limited, only small lots have been changing hands. Latest quotations are as follows: Ready-December Rs. 26.25 a maund.

HIDES AND SKINS STEADY

The market in skins ruled steady. Stocks were less than in the previous week.

Bazaar Sales

(Between 25th November and 1st December, 1958)
Cowhides: Wet salted (Slaughtered) 21,800 pcs. on the basis of Rs. 9.50 to Rs. 14.50 and Rs. 16.50 to Rs. 25.

Goatskins: Wet salted (Patna, Daissee, Kustia) 50,100 pcs. on the basis of Rs. 315 to Rs. 325, Rs. 350 to Rs. 360 and Rs. 380 to Rs. 400; Wet salted (he-killed) on the basis of Rs. 4.50 and (she-killed) on the basis of Rs. 4.00 a piece; Assam-Maldah-Dinajpur-Rampurhat 28,100 pcs. on the basis of Rs. 300 to Rs. 360; Purneah-Kissanganj 37,200 pcs. on the basis of Rs. 350 to Rs. 360; Patna-Pakur-Jhariah 30,500 pcs. on the basis of Rs. 310 to Rs. 330; Muzafferpore-Patna 78,400 pcs. on the basis of Rs. 325 to Rs. 337.50.

Bazaar Stocks

(1st December, 1958)

Cowhides: Wet salted 1,12,300 pcs.
Goatskins: Wet salted (Patna, Daissee, Kustia, Killed) 33,000 pcs.; Assam-Dinajpur 63,000 pcs.; Muzafferpore-Patna-Pakur-Purneah-Kissanganj 1,63,500 pcs.

COMPANY AND PUBLIC NOTICES

HUKUMCHAND JUTE MILLS, LTD. NOTICE TO SHARE-HOLDERS.

NOTICE is hereby given that the next Annual General Meeting of the Share-holders will be held at the Registered Office of the Company, 9, Brabourne Road, Calcutta, on Monday, the 29th December, 1958, at 4-30 P.M. for the following purposes:—

- (1) To receive and pass the Directors' Report and Audited Accounts for the year ended 31st March, 1958.
- (2) To declare Dividends.
- (3) To elect Directors in place of those retiring.
- (4) To appoint Auditors.
- (5) To pass the following resolution as a special Resolution:—

"Resolved that the draft Articles of Association of the Company submitted to this Meeting and signed by the Chairman for the purpose of identification be and are hereby adopted as the Articles of Association of the Company in substitution for and to the extension of all existing Articles of the Company."

- (6) To transact any other business that may be brought before the Meeting.

Dividends, if declared, will be paid to Registered Share-holders only.

The Share Transfer Register of the Company will be closed from the 17th December, 1958 to 29th December, 1958, both days inclusive.

By Order of the Board,
RAMDUTT RAMKISSENDASS,
Managing Agents.

Calcutta, 27th November, 1958.

Resolution in item No. 5 of the above Notice is intended to bring about a number of changes in our existing Articles of Association in order to bring them in line with the provisions of the Companies Act 1956. A separate Explanatory Statement under Sec. 173 has been sent to all the Share-holders along with the Notice.

A member entitled to attend and vote at the above Meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

THE FUTWAH-ISLAMPUR LIGHT RAILWAY COMPANY, LIMITED.

NOTICE is hereby given that the Eighty-fourth Ordinary General Meeting of the above-named Company (being an annual general meeting within the meaning of the Companies Act, 1956), will be held at the Registered Office, No. 12, Mission Row, Calcutta, on Friday the 26th December, 1958, at 11-20 a.m. for the following purposes:—

- (1) To receive and consider the Audited Accounts for the year ended 31st March, 1958, the Balance Sheet as at that date, and the Reports of the Board of Directors and the Auditors thereon.
- (2) To declare a Dividend, on the Ordinary Shares.
- (3) To appoint Directors in place of those retiring.
- (4) To appoint Auditors and fix their remuneration.

The Register of ordinary share-holders of the Company and the Transfer Books will be closed from the 17th to the 26th December, 1958, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a Proxy who need not be a member, to attend, and on a poll, to vote instead of himself.

By Order of the Board,
MARTIN BURN LTD.,
S. GUPTA,
Director,
Managing Agents.

12, Mission Row,
Calcutta 1,
The 1st December, 1958.

NOTE: The dividend, if declared, will be paid on or after the 26th December, 1958, only to those persons who are registered as holders of Ordinary Shares as at that date, or to their Mandatees.

THE INDO-BURMA PETROLEUM COMPANY LTD.

NOTICE is hereby given that the Preference Register of Members of the Company will be closed from the 15th December, 1958 to 30th December, 1958, both days inclusive for the purpose of payment of the dividend for the half year ending 31st December, 1958, on the 2nd January, 1959.

By Order of the Board,
STEEL BROTHERS & COMPANY LIMITED,
Managing Agents.

Gillander House,
Netaji Subhas Road,
Calcutta.
26th November, 1958.

THE HOWRAH-AMTA LIGHT RAILWAY COMPANY, LIMITED.

NOTICE is hereby given that the One Hundred and Twenty-fifth Ordinary General Meeting of the above-named Company (being an annual general meeting within the meaning of the Companies Act, 1956) will be held at the Registered Office No. 12, Mission Row, Calcutta on Monday, the 29th December, 1958 at 11-0 a.m. for the following purposes:—

- (1) To receive and consider the Audited Accounts for the year ended 31st March, 1958, the Balance Sheet as at that date, and the Reports of the Board of Directors and the Auditors thereon.
- (2) To declare a Dividend on the Ordinary Shares.
- (3) To appoint Directors in place of those retiring.
- (4) To appoint Auditors and fix their remuneration.

The Register of ordinary share-holders of the Company and the Transfer Books will be closed from the 20th to the 29th December, 1958, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a Proxy to attend, and on a poll, to vote instead of himself. A proxy need not be a member.

By Order of the Board,
MARTIN BURN LTD.,
S. GUPTA,
Director,
Managing Agents.

12, Mission Row,
Calcutta 1,
The 4th December, 1958.

NOTE: The Dividend, if declared will be paid on or after the 29th December, 1958 only to those persons who are registered as holders of Ordinary Shares as at that date, or to their Mandatees.

THE HOWRAH-SHEAKHALLA LIGHT RAILWAY COMPANY, LIMITED.

NOTICE is hereby given that the One Hundred and Twenty-fifth Ordinary General Meeting of the above-named Company (being an annual general meeting within the meaning of the Companies Act, 1956) will be held at the Registered Office No. 12, Mission Row, Calcutta on Monday, the 29th December, 1958 at 11-10 a.m. for the following purposes:—

- (1) To receive and consider the Audited Accounts for the year ended 31st March, 1958, the Balance Sheet as at that date, and the Reports of the Board of Directors and the Auditors thereon.
- (2) To declare a Dividend on the Ordinary Shares.
- (3) To appoint Directors in place of those retiring.
- (4) To appoint Auditors and fix their remuneration.

The Register of ordinary share-holders of the Company and the Transfer Books will be closed from 20th to 29th December, 1958, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a Proxy to attend, and on a poll, to vote instead of himself. A proxy need not be a member.

By Order of the Board,
MARTIN BURN LTD.,
S. GUPTA,
Director,
Managing Agents.

12, Mission Row,
Calcutta 1,
The 4th December, 1958.

NOTE: The Dividend, if declared will be paid on or after the 29th December, 1958 only to those persons who are registered as holders of Ordinary Shares as at that date, or to their Mandatees.

THE BORREA COAL COMPANY LIMITED NOTICE OF INTERIM DIVIDEND.

THE Board of Directors of the above Company has sanctioned payment of the following Interim Dividends in respect of the year ending 31st December, 1958, without any deduction for Income-tax payable by the Company:

On Preference Shares for half year at the rate of 6 1/2 per annum.

On Ordinary Shares ... 50 nP. per share, payable on or after 29th December, 1958, to those share-holders (or their mandatees) whose names appear in the Company's books on 22nd December, 1958, as the registered holders of the above shares.

The Share Transfer Registers of the Company will be closed from 15th to 22nd December, 1958, both days inclusive.

By Order of the Board,
F. W. HEILGERS & CO. (PRIVATE) LTD.,
Managing Agents.
Chartered Bank Buildings,
Calcutta, 27th November, 1958.

THE CALCUTTA JUTE MANUFACTURING CO. LTD.

NOTICE is hereby given that an Extraordinary General Meeting of the share-holders of the Calcutta Jute Manufacturing Co. Ltd. will be held at the Registered Office of the company, Stephen House, 4, Dalhousie Square East, Calcutta, on Monday, the 29th December, 1958 at 1 p.m. to consider and if thought fit to pass the following Resolutions with or without modifications:—

1. To be proposed as an Ordinary Resolution

RESOLVED that the provisional approval of the Central Government as contained in their letter No. 41(713)-CMN/57 dated the 28th October 1957 having been obtained for the re-appointment of M/s. Dayaram & Sons as Managing Agents of the company on the terms and conditions mentioned therein, the company do hereby consent to the re-appointment of the said Dayaram & Sons as Managing Agents of the company on terms and conditions as contained in the draft modified Managing Agency Agreement submitted to this meeting and for the purpose of identification signed by the Chairman of the meeting.

2. RESOLVED FURTHER that the Directors of the company be and are hereby authorised to enter into and execute the said Managing Agency Agreement on behalf of the company and to affix the company's Common Seal.

By Order of the Board,
FOR THE CALCUTTA JUTE MANUFACTURING CO. LTD.,
DEBI PRASAD PODDAR,
Director.

"Stephen House",

4, Dalhousie Square East,
Calcutta

Dated, the 29th November, 1958.

Note: A Member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and that a proxy need not be a member.

The draft modified Managing Agency Agreement and the letter from the Central Government approving the modifications will be available for inspection to all members of the company between 1 and 3 p.m. on any working day at the Registered Office of the company.

EXPLANATORY STATEMENT AS REQUIRED BY SECTION 173 OF THE COMPANIES ACT 1956.

This Resolution is necessary in view of the provisions of Section 329 of the Companies Act 1956. The existing Managing Agency Agreement has been modified in light of the Companies Act 1956. Necessary provisional sanction to the proposed variations in the Managing Agency Agreement has been obtained from the Central Government. Under the modified Agreement, the Managing Agents will get a commission of 10% of the net profits of the company as calculated under Sections 349 to 351 of the Companies Act 1956, subject to a minimum remuneration of Rs. 25,000/- in the event of absence or inadequacy of profits in any particular year.

Mr. Satnarain Poddar and Mr. Debi Prasad Poddar, Directors of the company are interested in the Resolution to the extent that they are members of the Managing Agents.

THE ARRAH-SASARAM LIGHT RAILWAY COMPANY, LTD.

NOTICE is hereby given that the Ninety-seventh Ordinary General Meeting of the above-named Company (being an annual general meeting within the meaning of the Companies Act, 1956), will be held at the Registered Office, No. 12, Mission Row, Calcutta, on Friday the 26th December, 1958, at 11-10 a.m. for the following purposes:—

- (1) To receive and consider the Audited Accounts for the year ended 31st March, 1958, the Balance Sheet as at that date, and the Reports of the Board of Directors and the Auditors thereon.
- (2) To declare a Dividend, on the Ordinary Shares.
- (3) To appoint Directors in place of those retiring.
- (4) To appoint Auditors and fix their remuneration.

The Register of ordinary share-holders of the Company and the Transfer Books will be closed from the 17th to the 26th December, 1958, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a Proxy to attend, and on a poll, to vote instead of himself. A Proxy need not be a member.

By Order of the Board,
MARTIN BURN LTD.,
S. GUPTA,
Director,
Managing Agents.

12, Mission Row,
Calcutta 1,
The 1st December, 1958.

NOTE: The dividend, if declared, will be paid on or after the 26th December, 1958, only to those persons who are registered as holders of Ordinary Shares as at that date, or to their Mandatees.

FORT GLOSTER INDUSTRIES LTD. Issue of 42,000 Ordinary Shares of Rs. 100/- each

at par
(This is not an offer)

NOTICE is hereby given that the Board of Directors have decided to install a plant for the manufacture of electrical wires and cables and to implement this project they have determined to issue 42,000 new Ordinary Shares of Rs. 100/- each at par. The new Ordinary Shares will rank pari passu with the existing Ordinary Shares in all respects save and except that they will proportionately participate to the extent of the amount paid on each share in any dividend which may be declared in respect of the financial year ending 31st March 1959, and will be offered for subscription at par (on payment of Rs. 50/- on application and the balance as and when call or calls is or are made by the Board of Directors in this respect) to the Ordinary Share-holders whose names are entered in the Register of Members of the Company on December 27, 1958 in the proportion of two new Ordinary Shares for every one Ordinary Share held by the shareholder on that date (The holders of the fractional shares will also be entitled to such Rights) with the right to renounce all or any of the shares so offered in favour of third parties, and the right to apply for additional shares at par subject to the condition that those share-holders who renounce their rights will not be entitled to apply for additional shares.

The Register of Members of the Company will remain closed from December 15, 1958 to December 27, 1958, (both days inclusive).

Persons holding shares on blank transfer deeds are advised in their own interest to lodge properly completed transfer deeds with the relative share certificates at the Company's Registered Office, 21, Strand Road, Calcutta for registration of the shares in their names before December 15, 1958 in default of which no claim by such persons shall lie against the Company. Circular Letters setting out the terms of the offer and detailing the procedure to be followed and Letters of Rights with forms of Renunciation, Acceptance and Request for additional shares will be issued to the aforementioned members on December 27, 1958 or as soon as practicable thereafter.

By Order of the Board,
KETTLEWELL BULLEN & CO., LTD.,
Managing Agents.

21, Strand Road,
Calcutta 1,
Dated, November 25, 1958.

THE CALCUTTA JUTE MANUFACTURING CO. LTD.

NOTICE is hereby given that the Fifty-second Ordinary General Meeting of the share-holders will be held at the Registered Office of the company, "Stephen House", fourth floor, No. 4, Dalhousie Square East, Calcutta, at 1-15 p.m. on Monday, the 29th December, 1958 for the following purposes:—

AGENDA:

1. To consider and approve the Audited accounts of the company for the year ended 31st December, 1957 and to receive the Directors' and Auditors' Reports thereon.
2. To appoint a director in place of Sri Gokulchand Saraf, retiring by rotation.
3. To appoint auditors and fix their remuneration.

The Share Transfer Books of the company will be closed from 22nd to 29th December, 1958, both days inclusive.

By Order of the Board,

Calcutta.
2nd December, 1958.

ROHTAS INDUSTRIES LIMITED

THE Twenty-fifth Annual General Meeting of the Share-holders of Rohtas Industries Limited will be held at the Registered Office of the Company at Dalmianagar on Tuesday, the 30th December 1958 at 11-30 A.M. to transact the following business:—

- (1) To receive and adopt the Directors' Report and the Audited Accounts for the financial period ended 31st March 1958.
- (2) To declare dividends.
- (3) To elect a Director in place of Shri Nand Lal Poddar who retires by rotation but, being eligible, offers himself for re-election.
- (4) To appoint Auditors for the current year and to fix their remuneration. The retiring Auditors, Messrs. K. N. Gutgutia & Co., being eligible, offer themselves for re-appointment.
- (5) As special business

(1) To consider and if thought fit to pass with or without modification the following Resolution which will be proposed as Special Resolution of which special notice has been received:

"RESOLVED that Shri S. P. Jain, Chairman and Director, and an associate of Messrs. Sahu Jain Limited, the Managing Agents of the Company, be and is hereby appointed a Director of the Company liable to retirement by rotation under Section 261 of the Companies Act, 1956."

(2) To be proposed as ordinary resolution: "RESOLVED that remuneration of Messrs. K. N. Gutgutia & Co., Chartered Accountants & Auditors for the financial period of 17 months ended 31st March 1958 be and is hereby sanctioned at Rs. 20,000/-."

The Share Transfer Books of the Company will remain closed from 25th December to 30 December 1958, both days inclusive.

By Order of the Board,
For SAHU JAIN LIMITED,
A. P. JAIN,
Director,
Managing Agents.

Calcutta:
2nd December 1958.

N.B. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself. Such proxy need not be a member of the Company. Proxies in order to be effective must be received by the Company not less than 48 hours before the meeting.

EXPLANATORY NOTE

Resolution No. 1:

In accordance with the stipulations made by the Company with the Industrial Finance Corporation of India in respect of the loan of Rs. 1 crore obtained from them, the Corporation has nominated one Director as their nominee on the Board of Directors of the Company, whose office as such will not be liable to be determined by rotation. Shri S. P. Jain, Chairman, Sahu Jain Ltd., the Managing Agents of the Company, is already an ex-officio Director nominated by them on the Board of the Company, whose office as such is not liable to be determined by rotation under Section 261 of the Companies Act, 1956. The number of non-rotational Directors, however, cannot exceed one-third of the total strength of the Board of Directors. At the request of the Board of Directors, the Managing Agents have agreed to withdraw the nomination of Shri S. P. Jain as an ex-officio Director on the Board of the Company for the time being on his appointment as a Director. Under Section 261(1) of the Companies Act, Special Notice for the same has been duly received. Shri S. P. Jain, Chairman of Sahu Jain Ltd., is father of Shri A. K. Jain and Shri A. P. Jain who are Directors of Sahu Jain Limited. Approval of the share-holders is, therefore, solicited for the said appointment under the provisions of the Companies Act. Messrs. Sahu Jain Ltd., the Managing Agents, are interested in the said proposal.

Resolution No. 2:

The Share-holders at the last Annual General Meeting appointed the Auditors on a remuneration of Rs. 15,000/- for the year 1956-57. Since the financial period has been extended by 5 months and the Statements of Accounts have been now made and audited for the period of 17 months ended 31st March 1958, Auditors demanded an increase in their remuneration for the increased work which has been agreed to by your Board of Directors to Rs. 20,000/- for the entire period subject to the consent and sanction of the share-holders which is hereby sought. The Managing Agents and/or the Directors have no interest.

THE BISRA STONE LIME CO. LTD.

THE Board of Directors of the Company has recommended a final Dividend on the Ordinary Shares @ 88nP per share, making a total Dividend of Rs. 1/75nP per share in respect of the year ended 31st March, 1958, without any deduction for Income Tax payable by the Company.

DEPARTMENT OF
IRRIGATION & WATERWAYS,
GOVERNMENT OF WEST BENGAL,
CALCUTTA (INDIA).
**Reclamation of the Northern
Salt Lake near Calcutta—City
Extension**

I. Tenders are invited from contractors of standing of India and abroad, having experience in the type of work mentioned herein for the work of "Reclamation of 3.75 sq. miles of the Northern Salt Lake near Calcutta—City Extension".

The work will consist of two Parts as described below:—

Part A of the work will consist of filling up and raising a portion of the Northern Salt Lake near Calcutta with material dredged from the bed of the river Hooghly and pumped into the Salt Lake and other ancillary work. According to estimate, the quantity of material which will be required for filling up the Northern Salt Lake will be approximately 660 million cubic feet. The work of filling must be completed within 6 years from the date of the order for commencement of the work.

Part B of the work will consist of supply of mechanical and electrical equipment necessary for the Bagdola Sewage Treatment Plant and installation of the Plant near Calcutta and other ancillary work required in connection with the diversion of the sewage flow which is now passing through the proposed City Extension Salt Lake. This work must be completed within 2 years from the date of the order for commencement of the work.

II. Tenders may be submitted for either or both Parts of the work.

III. Documents comprising Detailed Instructions to Tenderers, Conditions of Contract, Specifications, Bill of Materials, Form of Agreement and Drawings drawn up by Netherlands Engineering Consultants, Consulting Engineers, of 48 Javastreet, The Hague, Holland and accepted with modifications by the Government of West Bengal, may be inspected in the office of the Superintending Engineer, Greater Calcutta Drainage Circle, Irrigation & Waterways Department, 9, Brabourne Road (Fourth Floor), Calcutta-1, on any working day during office hours (10 A.M. to 5 P.M. on week-days, other than Saturdays, and 10 A.M. to 1-30 P.M. on Saturdays) and copies thereof may be had from him on payment to him a sum of Rs. 150/- in cash per set of documents for each Part of the work. The amount paid for copies of the documents will not be refunded.

IV. Tenders must be submitted in the prescribed form, in duplicate, in sealed covers, superscribed "Tender for Reclamation of 3.75 sq. miles of the Northern Salt Lake near Calcutta—City Extension, Part A and/or Part B" (as the case may be) and addressed to the Secretary to the Government of West Bengal, Irrigation and Waterways Department, Writers' Buildings, Calcutta-1, so as to reach him by 12 hours (noon) of Wednesday, the 18th day of March, 1959.

V. Tenders must be accompanied by a Letter of Guarantee from an approved Bank carrying on Banking Business in India for a sum of Rs. 2,00,000/- (Rupees two hundred thousand) as earnest money in respect of the tender for Part A of the work and Rs. 50,000/- (Rupees fifty thousand) for Part B of the work, or receipted challans showing deposit of the same amounts under the head "Revenue Deposit" in the Reserve Bank of India in favour of the Secretary to the Government of West Bengal, Irrigation and Waterways Department.

VI. Tenderers should state clearly the percentage of Foreign Exchange, if any, included in the amount quoted in the tender for each Part of the work.

VII. Tenderers should note that for work executed—

(a) no payment other than in Indian currency (Rupees) will be made before April, 1963; and

(b) payment in Foreign Exchange of the amount so payable, if any, will be made in equal half-yearly instalments spread over a period of 10 years after April, 1963.

The aforesaid terms relating to deferred payment have been approved by the Department of Economic Affairs—Ministry of Finance, Government of India.

Tenderers who wish to accept payment in foreign exchange in any manner other than what is indicated above may state their terms clearly. Such terms must not, however, in any case involve payment in foreign exchange earlier than April, 1963.

VIII. Tenders will be opened by the Secretary, Irrigation and Waterways Department, shortly after 12 hours (noon) of the 18th March, 1959, in his office at Writers' Buildings, Calcutta, in the presence of such tenderers or their accredited representatives who may attend.

IX. The authority empowered to accept tenders does not bind himself to accept the lowest or any other tender and will have the right to reject any tender or part of the tender without assigning any reasons therefor.

By Order of the Governor,

A. D. KHAN,

Secretary to the Govt. of West Bengal,
Irrigation and Waterways Department.

Dated, Calcutta,
The 3rd day of December, 1958.

THE BISRA STONE LIME CO. LTD.

NOTICE is hereby given to the members of the abovenamed Company that an Annual General Meeting of the Company will be held at the Registered Office, Chartered Bank Buildings, Calcutta, on Monday, the 29th December, 1958, at 10-15 a.m. for the following purposes:—

1. To consider and approve the Audited Accounts of the Company for the year ended 31st March, 1958 and to receive the Directors' and the Auditors' Reports thereon.
2. To declare the Dividend recommended by the Directors.
3. To appoint a Director in the place of a retiring Director.
4. To appoint Auditors and fix their remuneration.
5. As Special Business.

To consider and, if thought fit, to pass with or without modification, the following resolution which will be proposed as a Special Resolution, namely:—

"That the Regulations contained in the printed document submitted to the meeting and for the purpose of identification subscribed by the Chairman thereof be and the same are hereby approved and adopted as the Articles of Association of the Company in substitution for and to the exclusion of all existing Articles thereof".

IMPROVEMENT TRUST LO

BANKS

H indicates that Share capital is half paid. O., C. and Dd. indicate Ordinary Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

LAND CEILINGS AND PROFIT CONTROLS

OLD NOTIONS FOR NAGPUR

THERE is an air of complete unreality about some of the recommendations made at last week-end meetings of the Congress Working Committee. The impression is created of a body that has completely lost its grasp of events, and no longer understands the subject it is discussing, turning to familiar ready-made remedies because it is intellectually incapable of thinking up any new ones. After so many months of bitter economic experience, it might have been expected that the Congress Party had learned something of the realities of modern development and was now prepared to put an end to this chasing of ideological sunbeams. Instead, it appears from the glaring inconsistencies in much that was resolved, and the self-defeating nature of the recommendations made, that the country's passage to comparatively calmer economic waters during the past few weeks has been altogether too easy. This would be a depressing conclusion to draw: surely it is not necessary that India dissolve into complete ruin before the Congress Party can be persuaded to accept the hard facts of economic life. A more cheerful construction to put on the subject is that the Government will throw out the more stupid of the Committee's proposals when they come to be debated at the January meeting of the All-India Congress Committee in Nagpur. It is to be hoped too that the job will be done quickly, before too much discussion about irrelevancies, and too great an airing of nonsense views, leads the electorate in this country and observers abroad to believe that India's ruling Party has completely taken leave of its economic senses. Never has it been more necessary to show that the tail does not wag the dog. There is something of the decayed smell of atavism about a number of these recommendations; to trot them out unselfishly in the year 8 A.P. (after planning) would be seriously damaging for the reputation of both the country and the Party.

The most objectionable of the recommendations is that for fixing ceilings on existing land holdings. The remainder of the agricultural policy is reasonable enough, as long as it is accepted as politically necessary to adopt a system of small-scale capitalist land ownership instead of a large-scale co-operative one—an odd decision when the trend elsewhere is towards more socialism. It is certainly time the States were hustled into completing their land reform programmes so that the country can settle down to increasing food production to the limit permitted by a land-holding policy which is badly misconceived in the first place. But to defy the dictates of experience and insist on imposing ceilings, is to make a dash back into the cosy shelter of ideology which will inevitably cost the country plenty, if not indeed its entire democratic future. To place a limit on efficient farming in this way is to abandon for good the policy of self-sufficiency in food production. Without a firm programme for encouraging or enforcing co-operation, the imposition of ceilings on existing land holdings will limit the tax revenue which can be raised from the agricultural sector just when the need to increase it is greatest. It will also, inevitably, lead to ceilings on urban incomes, which will mean the end in this country of economic development by democratic means. In every sense of the term, it is a retrogressive concept and would prove a disastrous step to take. It is not even as if it were really necessary to the rest of the land reform programme.

The suggestion for "control" on profits is scarcely less damaging, although it is not the kind of thing which could be maintained indefinitely if the private sector is to survive at all. Profits in Indian industry are already too low to encourage expansion, thanks to uneconomic taxation; to impose a rigid limit on them would be to kill the last vestige of incentive, reduce the tax yield and place a serious brake on the growth of enterprise and output. It is a step which has no economic justification whatever. The remainder of the points which the Working Committee has proposed are altogether too vague to be understood properly. Wages and salaries are already dependent on "work done",

except in the lower ranks of Government service and among certain grades of workers where it is impossible to effect adjustments anyway. Besides, surely it is understood that in the present state of labour relations in this country, it is simply not practicable to regulate wages. Due to past bungling, this matter has long since gone beyond Government control. What the Committee really means by its recommendation is, of course, a ceiling on higher salaries in business and the senior civil service—the old ideological hobby-horse which everybody with India's future at heart had hoped was long since pensioned off. The only conclusion possible from these recommendations for controlling incomes and profits is that the Working Committee simply does not know what it is talking about. Equally fuddling is the thinking which went into the proposal for stricter control of imports. Surely the Committee realises that if there is any scope at all for further cuts, its own Government stands condemned for not having made them earlier at a time of acute national emergency. The expansion of life insurance is another recommendation which suggests the Committee has no faith in some of its own Government's institutions—and it is one which contrasts oddly with the ideas about controlling wages and salaries. Only the proposal to limit non-essential and expensive building projects would seem to promise much scope, and here again it is the Government itself at which the criticism appears chiefly aimed.

In fact, the Committee's recommendations are a mass of contradictions from beginning to end. How does it propose, for instance, to encourage investment and capital formation when it would control personal incomes and paralyse the profit motive which is the main motive force in both these processes? What is the sense in placing emphasis on a rapid increase in agricultural production when efficiency is to be permanently limited by a ceiling on land holdings? How can savings be expanded if incomes and profits are to be progressively reduced by a large increase in State trading designed to earn huge surpluses by charging uneconomic prices? And what possible meaning can there be in recommending that only the essential needs of the people should be served when the whole purpose of economic development is that their standard of living be raised steadily higher above the subsistence level? In all this mess of muddled thinking it is refreshing to see that the Committee has apparently arrived at two relatively sound conclusions—that population growth is too rapid and that there is little scope for further taxation. It is a

pity that such realism on this latter subject could not have been applied in the mental processes dealing with profits, salaries and wages.

Before the recommendations of the Working Committee are dismissed altogether as being unlikely ever to find their way into official policy decisions, it is as well to weigh carefully their importance as indicators of the way the Party mind is still working. During the past few months, there has been a noticeable hardening in the Government's attitude towards the private sector. It is all very well to put this down to the need to propitiate uninitiated backbenchers. But this is not how it is working in practice. In a dozen subtle ways, the old ideological approach, which is almost entirely responsible for the difficulties in which the country now finds itself, is creeping back: the bear operators on India's share markets must have been reminded pleasantly of the good old days of Mr. Krishnamachari when they counted their windfall gains following the announcement of the Working Committee's recommendations. It does not seem impossible that another period of slow strangulation in the private sector is on the way. Already it is shouldering the entire burden of the foreign exchange shortage. The new investment policy of the Life Insurance Corporation is a threat to the independent existence of every public company in the country. Now it is proposed that the State Trading Corporation expand its activities not only into marketing, but into the investment field as well. Soon there may be no public company left in the country in which the dead hand of officialdom will not have a deciding say. Mr. Nehru has definitely re-affirmed in recent speeches that the old disastrous trends are to be renewed now that India's friends have been persuaded

transport of and general trade in such goods and commodities in India or anywhere in the world." (Details of the amendment are given by our New Delhi correspondent on a later page.)

From the immediate point of view, the first of these proposals is the more important. Foodgrains constitute the biggest single commodity group in domestic trade, and are among the largest items of imports. The Government has long been worried by the fact that their prices have been high, as a result of which the cost of living has risen and popular discontent has grown. In the search for scapegoats, it has ignored the primary causes of the dearth of food—that its production is inadequate, the population is multiplying, and deficit financing has been too large. Instead, it has found it politically more convenient to blame traders as unscrupulous and inefficient, and has in consequence decided to nationalise the wholesale business. This has been done in spite of the lessons of the past, when controls and rationing, on the one hand, led to widespread corruption and malpractices, and, on the other, hampered an increase in production. As an Andhra business man, Mr. M. G. Lakshminarasu, mentions in a recent statement, about Rs. 50 crores were lost in the first State trading experiment in foodgrains from 1949 to 1952; even the recent attempts to keep down prices by creating zones, fair price shops, ration shops, etcetera, have not succeeded. The foodgrains trade provides employment to over four million people, and he estimates that approximately Rs. 500 crores are invested in it; the traders advance money to farmers, apart from undertaking the financing, transportation and distribution of the food that is produced. These details give some idea of the serious difficulties which the State Trading Corporation, with its inadequate machinery and bureaucratic methods, is likely to face. Even though it is not displacing the entire trade, but only the wholesale business, there is cause for serious concern about how well it can cope with the work involved.

The argument about whether or not it can handle the wholesale trade in foodgrains efficiently may seem largely academic for the time being; practical results will perhaps be showing before long. But the Corporation's entry into this sphere raises an important question of principle. That, to put it plainly, is concerned with the point whether the Government's statements of intentions, or its promises, deserve to be taken seriously. Although the Corporation was started with the aim of exploring new avenues of trade (particularly foreign

trade) not yet developed by private enterprise, far and away the largest part of its business—foodgrains and cement—is now to be derived by elbowing out private enterprise. These two commodities are not the only examples of displacement; iron and manganese ore, sulphur, fertiliser ingredients, tobacco and non-ferrous metals are other cases where it has intruded unnecessarily. Against this background, the proposal to amend the Corporation's memorandum of association in order to enlarge its scope and functions has highly dangerous implications for private trade in the future. The amendment concerning commodity trading looks innocuous on paper, but might look a lot less so when it is implemented; it seems to imply further incursions into new branches of business regardless of whether or not private enterprise is established in them.

Much more serious is the amendment which will enable the Corporation to buy the stocks and shares of various companies. The justification underlying the move is by no means evident; it is quite possible that the Government will argue that it is necessary in order to enable the Corporation to help its subsidiary agencies with finance more liberally. But with the change in the aims and activities of the Corporation which is being brought about surreptitiously, the argument cannot be lightly accepted. The suspicion arises that the Corporation may no longer remain a purely trading organisation; it may be moulded into an instrument for implementing other aspects of the Government's policy which have little to do with trading. Already it has shown itself capable of acting as an instrument of fiscal policy, by the manner in which it has made huge profits on its cement distribution monopoly in order to finance road construction. If the resolutions passed at the latest meeting of the Congress Working Committee are any guide, this method of mulcting consumers may be extended as an alternative to the less disingenuous but politically troublesome method of imposing higher excise duties. Similarly, where the purchase of shares, etcetera, is concerned, it may not be done merely to help trading partners and subsidiaries with finance; it may become a supplementary method of back-door nationalisation, to be used in conjunction with the Life Insurance Corporation's right to buy a large percentage of the share capital of a company. It would not be wholly an exaggeration to visualise a future when the State Trading Corporation goes on acquiring new monopolies in order to inflate its profits, and then uses those profits to bolster the Government's revenues and to buy company shares with the ultimate aim of nationalisation.

that have built up Britain's banking, financial, insurance and marketing institutions". Sir Oscar believes that it is "infinitely more important" to conserve and develop this system than to keep the sterling area in existence.

The British Treasury and the Bank of England are certainly interested in developing the sterling system as "a vital national possession" (Sir Oscar's description), and they must be convinced that formal convertibility would assist such development. They will also take account of the fact that a very large business in transferable account sterling is transacted abroad and that their technical task of managing the currency would be easier if much of this business were brought to London. The resulting increase in London brokers' earnings could be considerable. In the last year or two—particularly in the first months after last year's crisis—some British economists have questioned the advantages to be derived from the sterling area or the sterling system (they have not always clearly differentiated the two concepts). They have argued that it is sometimes necessary to distort the whole economy in order to maintain an international banking function that does not produce sufficient earnings on overseas account to justify its dominance. Mr. Bareau is totally opposed to this idea: not only because the overseas earnings are in fact substantial (estimates of actual figures vary) but also because Britain is committed to international banking and cannot simply cease to function in that capacity. There is roughly £3,500 million of other countries' funds held in London as reserves for their currencies and as working balances for their international transactions, and if the use of this money were restricted it would not be left in London. The consequence of withdrawal of a large part of this money would be far worse than last year's crisis—which resulted partly from loss of confidence in sterling but more from normal use of the balances to finance sterling countries' imports in a difficult period.

In any case, providing capital to help the development of other countries is an obligation not directly related to the banking function—as much political as financial. Overseas countries, even sterling countries, have not had free access to the London capital market in recent years, and they have adapted themselves without serious difficulty to the lack of its facilities. But some of them

would certainly rely more on the Soviet bloc if British capital were permanently withheld, and Britain's export trade would soon suffer. It can be argued that British capital could be used more advantageously if the sterling area were strengthened, not weakened; for a more firmly co-ordinated area could allocate its capital more rationally and avoid the over-straining of the sterling system that occurs periodically.

The London capital market itself is being gradually transformed. The effects of the change are insidious rather than obvious, and cumulatively so significant that Mr. J. B. Kinross, general manager of the Industrial and Commercial Finance Corporation, said recently that a committee should be appointed by the Government to study the allocation of savings. Referring to the supply of savings, Mr. Kinross said: "The future belongs to the two extremes—the large institution and the small investor. I doubt if the Stock Exchange can cope adequately with the requirements of either of these." In fact, of course, the resources of these large institutions, particularly insurance companies, are an amalgamation of numerous individual small savings. The true function of the modern capital market is to place small savings not only where they are safe but also where they are needed; and the market is not yet adapted to this function. The financial machinery that London requires, either for external or for internal financing, is not the same now as it was in the 19th century or in the first half of the 20th. But institutions that have been in existence for hundreds of years have maintained themselves so long by virtue of their ability to adapt themselves, and there is no reason to suppose that ability has diminished.

A COMMUNIST-LED STRIKE

AMONG industrial disputes in India, the strike on the High Range tea estates in Kerala falls into a class by itself. It is unlikely there have ever been cases other than this one where a labour strike has received the active support of a State Government in complete disregard of all principles of fair play, let alone legality. In few instances, barring perhaps the communist-led labour trouble in Jamshedpur, has there been lawlessness of such magnitude and vandalism on private property let loose so wantonly. Little else is to be expected from a State whose Government is run by communists, a government whose attitude to the well accepted democratic principle of rule by law creates insecurity in the minds of all law-abiding people. That the communist acceptance of the parliamentary form of government is hypocritical, was proved only a few months after the Party assumed office. Since then, it has done nothing to disprove the charge that it is merely playing a tactical game to subvert the State from within. It is indeed a testimony to the genuinely democratic nature of government in India that the Namboodiripad Ministry has been allowed to continue in office even when it has merely been making a convenience of the autonomy which the Constitution confers on the States. Whether the time has come to modify that autonomy in the larger economic interests of this country, needs to be considered seriously. An eminent judge, who has just submitted his enquiry report on a police firing in Kerala, has suggested just this.

A booklet published by the Kanan Devan Planter's Association tells the story of the High Range strike in great detail, and one fact which stands out above everything else is the utter partisanship of the communist State Government. The chairman of the Association, Mr. J. B. Soutar, is on entirely correct ground in saying in his brief foreword that the strike raises important principles, and in that case, is of more than mere local interest. In the first place, it was a sectional strike led by communist agitators whose demands did not, apparently, have even the implicit support of those who did not fall in with them. That is why the I.N.T.U.C. unions, who have agreed to co-operate with the conciliation board which the Government of Kerala will be constituting shortly, have made reservations concerning the High Range strike. The I.N.T.U.C. president, Mr. G. Ramanujam, has characterised the decision to set up a conciliation board as "the weakest and most ineffective step... designed to prevent the Government of India appointing a national tribunal." He also points out that the weakness of this step lies in the fact that if there is no unanimity in the proposed board of conciliation, "there will be no finality about its recommendations," so the dispute cannot be solved. Yet the communist Government has rejected the recommendation of both the employers and the I.N.T.U.C. unions to refer the dispute to adjudication. It obviously fears that the communist unions will lose their case, and therefore their prestige. There is yet another reason why Mr. Namboodiripad has preferred conciliation to adjudication. In his Government's view, bonus is deferred wage and as such, its payment becomes automatic. Such nonsense of course, is in accordance with the outdated communist theory of surplus value, which

"the land of socialism" itself has already repudiated.

The communist strikers of the High Range estates have accused the management of pursuing dilatory tactics in matters concerning the payment of bonus. It was alleged by them before the strike was called that management representatives on the committee, which had been constituted to consider the question, had tried in one way or another to put off the decision as long as they could. To this, Mr. Soutar's answer is that it is not the employers' representatives who were responsible for a prompt decision not being taken. The boot was clearly on the other leg; labour representatives were simply not interested in looking through the enormous factual material which had been collected by the management for consideration by these committees. Moreover, high taxation, lower prices and increasing labour welfare burdens have steadily reduced the profit margins of the estates, and they can scarcely afford to pay more than the 4 percent bonus, which they have had to pay for 1957 accord-

Current News and Comment

Coal Prices and the Consumer

Not everybody will agree with the view of Mr. D. C. Driver, expressed in his presidential address at last Friday's annual meeting of the Coal Consumers Association in Calcutta, that the Government's attitude towards the coal industry is becoming more realistic. On the one question which has troubled the industry most—allowing a higher price for coal—relatively little has been done. The report of the Coal Prices Revision Committee hesitates to face the light of day; only when it arrives, and when something is done about it, will the Government's realism be really tested. Such evidence of "realism" as Mr. Driver mentions consists chiefly of avoiding some further new follies which the Government was about to commit. The application to old colliery leases of recent legislation increasing royalty rates was totally unjustified to begin with; the exemption given to such leases on second thoughts can hardly be described as a concession. The toning down of the increases in freight rates recommended by the Railway Freight Structure Enquiry Committee was again no notable example of official benevolence; the Government has done plenty of other violence; the Government has done plenty of other things to raise industrial and transport costs. The greater caution now being shown in proceeding with the scheme to amalgamate small collieries is praiseworthy, although not surprising in view of the complexities involved.

Representing a consumer association, it may not be surprising that Mr. Driver's speech tends to under-estimate the need for higher coal prices. Yet it might have been more valuable if it had made the point that higher prices in this unusual case are in the long-term interests of the consumers themselves. It is generally accepted that the demand for coal is likely to rise rapidly in years to come; if that demand is to be adequately met, consumers can lose nothing by declaring explicitly that the coal industry's ability to raise financial and material resources needs to be boldly reinforced. The best and quickest way of doing this would be to ensure that coal is allowed to fetch an economic price, which contributes towards the capital requirements of expansion. To the extent that consumers are at the same time interested in coal remaining cheap, they are entitled to urge strongly that its production costs be kept down. The Government's attitude on this point has been far from realistic.

Apart from price, a major difficulty for the coal industry and for coal consumers, as Mr. Driver recognises, is the shortage of transport. Railway facilities have been improving, but far too slowly in relation to requirements. Bolder measures seem to be necessary in order to enable coal to be moved easily and cheaply by rail, road and inland navigation. That is a department where the Government's "realism" has not always been evident. It has been even less evident on the question of issuing import licences for the capital equipment and spare parts required by the industry, and without which consumers will not in the future be able to get the coal they need.

Allocating Government Insurance

As a medium for channelling the general insurance business emanating from official sources such as Government institutions, Government-sponsored companies, municipalities and corporations, the Indian Insurance Companies Association's Pool has, on the whole, served its constituent member-companies well. But its status was considerably undermined when the Central Government stipulated last year that 50 percent of the business going to the Pool should be given to

the existing agreement on the payment of bonus to plantation workers in Kerala. Secondly, labour representatives were never unanimous on anything, and if one party happened to agree with the employers' point of view, the others promptly used the occasion to blackmail it as siding with management. Lastly, labour representatives themselves did not attend the meeting regularly. They, of course, had no need to, because they knew that the Government was doing their work for them. When workers' representatives, especially the communist ones, are so non-co-operative, adjudication of the disputes would have been the best thing, but the Kerala Government would have none of it because it is not sure of the communist case. The K. D. P. Association has done well to publish this factual booklet setting out neatly all the events in their chronological sequence. It shows how utterly unreasonable the Kerala Government has been. The explanation perhaps lies in the fact that this Government is smarting under a grievance through having had to eat the humble pie of an election pledge.

Government-subsidiary general insurance companies, meaning companies which came under State control through the nationalisation of life insurance. Even with these stipulations, the Pool authorities found it difficult to renew the agreement with the Government. Eventually it was renewed until 31st December, 1958. The question of renewal has again become important this year, but after many references, the Government, it is reported, has decided to make the subsidiary companies managers for accepting and servicing Government business, it being understood that the basis for allocating business to the members of the Pool will remain unaltered. The Pool as an entity is thus likely to go out of existence, and be replaced by the management of the subsidiary insurance companies in which the secretariat, records and organisation are likely to be integrated. On the face of it, it looks as if the interests of the member-companies of the Pool are likely to remain unimpaired. Management expenses are also likely to remain more or less at the same level, assuming that the present staff is integrated, unless subsidiary companies charge a management fee to be shared by member participants. That may offer considerable relief to the managing subsidiary companies in the matter of limitation of expenses to which they have to conform, if a part of the excess expenditure is debited to the Government business which is shared by participating companies.

The Government seems to be steadily expanding the scope of State trading in general insurance since the subsidiary companies came into its hands following the nationalisation of life insurance. This experiment of State trading in general insurance in direct competition with private insurance is claimed to be providing "experience"—a point made by Mr. Deshmukh while defending the retention of subsidiaries in official hands. There is hardly a parallel for such a policy in any other branch of trade in the country. The significance of this type of trading is, therefore, to be sought in something deeper than merely in the revenue account of trading itself. The right of the Government to trade in competition with the private sector need not be disputed, although the partiality for Government subsidiaries in the distribution of official business can be questioned. There are good reasons why Government business should be shared equitably with the private sector of general insurance. The weightage given in distributing business to a few selected companies, even though the Life Insurance Corporation might hold a majority of their shares, seems indefensible.

Development Capital for Electricity

Among the basic industries that are acutely short of development capital, the electric supply concerns are particularly important. They play an indispensable part in general economic development, yet are not permitted to earn a standard rate of return which would be sufficiently attractive for the investor. Because Bank rate in this country, to which the standard rate of return in electricity is linked, does not regulate general market rates of interest, the industry has for some time found it hard to raise fresh capital for financing development. In the meantime, valuable assets in many concerns are growing old, and some have approached the stage of obsolescence. These are among the basic facts relating to the electricity supply industry, which, Mr. K. G. Milne, president of the Federation of Electricity Undertakings of India, analysed at considerable length at the Federation's annual meeting last week-end in Bombay. Mr. Milne said that in

spite of the increase in Bank rate, which has permitted a corresponding rise in the standard rate of return, money market conditions have deteriorated to an extent that "the industry has not been able to absorb the shocks incidental to an inflationary situation, more especially the mechanism of Bank rate does not fully influence the interest rate in the money market at large. So has risen again the necessity for a further review of the law governing our industry". The industry, the president said, is fully aware of the need to regulate profits in a public utility undertaking where economic claims have to be balanced with social needs; but it "has also to function in an economy where investments flow where the return is the best."

As for alternative sources of capital, Mr. Milne points out that the term lending of banks is unsuited to the long-term needs of a basic industry. The effective lending rates of industrial finance institutions are generally higher than what the industry can pay under the Electricity (Supply) Act. "Debentures will have to be amortised over a period much shorter than the 'lives' prescribed by regulation for the assets which the loans will be used to purchase. One cannot fully resort to one's depreciation funds in order to liquidate such loans, and above everything else, debenture loans are difficult to raise at rates of interest anywhere approaching the standard rate of return allowed to the industry. "Mr. Milne said that capital investment in the licensees' sector of electricity supply enterprises amounted to Rs. 115 crores at the end of 1956; it is supposed to rise to Rs. 140 crores by the end of this year, implying an annual rate of investment of Rs. 15 crores a year on development. Self-financing, which is an important source of money in most industrialised countries, is now beyond the capacity of the electricity industry, but the present situation demands that it should be permitted to build a rehabilitation reserve either by raising the tariff a little, or by the grant of suitable tax concessions. There is yet another way—adopting the formula recommended by the Taxation Enquiry Commission under which "gross up" of dividends for tax relief once more becomes regularly available to shareholders. Referring to the Bill now before Parliament to amend the Electricity Supply Act of 1910, Mr. Milne said that the motion referring it to the Select Committee, "has been couched in a language of understanding and conveys the assurance that efficient undertakings operated by the licensees will be allowed to continue to function undisturbed under the normal terms of their licences". Mr. Jaisukhlal Hathi, Central Deputy Minister for Irrigation and Power, who attended the meeting, declared that the Government is considering certain measures to help the electricity supply industry to attract fresh capital, and that there are no plans at present to nationalise it.

The Progress of Indianisation

More up-to-date information is now available about the employment of Indians and non-Indians in foreign-owned or controlled industrial and commercial concerns in India. An analysis of the returns as on 1st January, 1958, shows that the employment of Indians in these concerns, on salaries of Rs. 1,000 and above, has increased further, both in absolute numbers and in terms of percentages. The position of Indians and non-Indians in the pay groups of Rs. 1,000 and above since 1947 is shown below:

Year	Indians	Percentage	Non-Indians	Percentage	Total
1947	504	7.9	5,844	92.1	6,348
1948	742	10.4	6,306	89.6	7,102
1949	1,085	13.9	6,709	86.1	7,794
1950	1,408	17.0	6,871	83.0	8,277
1951	1,734	20.4	6,953	79.6	8,737
1952	2,230	24.4	7,104	75.6	9,394
1954	3,346	32.3	7,008	67.7	10,554
1955	3,965	39.0	6,810	63.0	10,805
1956	4,685	41.6	6,506	58.4	11,251
1957	5,814	48.2	6,025	51.8	11,659
1958	6,704	54.3	5,652	45.7	13,356

The returns as on 1st January, 1958, show that the proportion of foreigners has declined in all categories of companies. But the proportion of Indians has steadily risen since 1947, while the total number of Indians has increased more than 13 times in the last 11 years. The percentage of Indians, which was 7.9 in 1947 and 20.4 in 1951, increased to 41.6 in 1956, 48.2 in 1957 and 54.3 in 1958. In the salary group of Rs. 1,000 to Rs. 1,500, Indians occupied 84.2 percent of the posts in 1958, against 77.7 percent in 1957 and 67.9 percent in 1956. In the next salary group of Rs. 1,501 to Rs. 2,000, 62.2 percent of the posts were held by Indians, against 54.2 percent in 1957. In the salary group of Rs. 2,001 to Rs. 3,000, 36.5 percent of the posts were filled by Indians, compared with 29.4 percent in 1957. In the next higher salary group of Rs. 3,001 to Rs. 5,000, Indians occupied 16.4 percent of the total number of posts, against 13.7 percent in the preceding year. In the highest salary group of Rs. 5,001 and above, Indians held 6 percent of the posts, against 5.1 percent in the last year. The total monthly "wage bill" for the 12,356 persons employed in foreign-owned or controlled firms in posts carrying salaries of Rs. 1,000 and above a month, works out to about Rs. 2.85

crores. Of this, about Rs. 1.08 crores are being paid to Indians, who account for 54.3 percent of the total employment, against Rs. 1.77 crores to non-Indians forming 45.7 percent. The salary group of Rs. 3,001 to Rs. 5,000 accounts for the largest part, that is, 26.5 percent of the total "wage bill", the salary group of Rs. 2,001 to Rs. 3,000 coming next with a share of 22.7 percent. The proportion of non-Indians in the salary groups of Rs. 1,000 and above has declined in all groups of companies during the current year. In 1958, none of the groups of firms had three-fourths or more of the staff earning Rs. 1,000 and above, as foreigners. In 1957, there were two such groups.

Foreigners held more than half but less than three-fourths of the posts in the following six groups of foreign companies as on 1st January, 1958: (i) plantation and allied companies (74.4 percent), (ii) jute mills and presses (72.9 percent), (iii) banking (68.2 percent), (iv) transit and transport (55.2 percent), (v) other minerals, building materials, etcetera (53 percent), and (vi) managing agency companies (51 percent). On 1st January, 1957, there were seven groups of firms in this category. The proportion of foreigners was less than half in the remaining 14 groups of companies: (i) other agents, merchants, shippers, import and export firms (49.2 percent), (ii) motor-vehicle dealers and manufacturers (49.1 percent), (iii) insurance companies (48.1 percent), (iv) sugar and breweries (44 percent), (v) machinery, equipment, tools, engineering, etcetera (40.9 percent), (vi) cotton mills and presses (38 percent), (vii) printing, publishing, stationery and allied trades (37.1 percent), (viii) metals, including iron and steel (31.7 percent), (ix) coal companies (30.7 percent), (x) chemicals and allied trades (30.1 percent), (xi) oil companies (27.7 percent), (xii) leather, rubber (trading and manufacture) (22 percent), (xiii) public utility companies (21.9 percent), (xiv) all other miscellaneous companies (41.2 percent). Of the total of 5,652 foreigners employed in foreign-controlled concerns in 1958, 4,927 (87.2 percent) were British. Americans constituted 3.5 percent, their number being 200, Italians, Germans, Australians, Chinese, Norwegians and Ceylonese recorded small increases, but there was a diminution in the number of Britons, Americans, Swiss, Greeks, Danes, French, New Zealanders, Dutch, Swedes, Austrians, Czechs, Japanese and Pakistanis.

Cloth Stocks and Exports

The decline in cloth stocks with mills at the end of November is welcome, but some of it has

occurred only because of a fall in production. The November output is estimated at 380 million yards, which is 42 million yards less than the October figure and the lowest for several months. At the same time, stocks which have been sold but the delivery of which has not yet been taken remain substantial. It seems unlikely that they represent genuine forward sales, and it could be that the trade is using mills as free warehouses and obtaining indirect credit. If this assumption is correct, there cannot have been any appreciable increase in offtake. It appeared recently that exports were picking up, but these hopes, based on spot buying by some foreign agencies, have proved short-lived and the overseas trade is once again stagnant. Several suggestions have been made to stimulate exports and one is that every mill should sell a percentage of its output in foreign markets. This proposal seems to be hardly practical. Not every mill produces cloth which is acceptable in foreign markets. It is a question of varieties and designs. Again, not every mill has connections abroad and these are not easy to make in a highly competitive market. Another important consideration is that marginal mills will not be able to compete with Japanese and Chinese goods. The suggestion that mills which are engaged in the export trade should be penalised by having to pay increased excise duty on their unfulfilled export quota is unfair; it smacks of the system of "norms" which operates in totalitarian countries. Very little attention seems to have been paid to the question of encouraging the trade to step up exports. A large proportion of the export business is done by merchant houses and it may be worth considering whether it is possible to offer them some export incentives as has been done in the case of the industry.

More Raw Rubber Needed

In his address from the chair at the annual general meeting of the Association of Rubber Manufacturers in India, held last week in Calcutta, Mr. J. Luckham stressed the difficulties facing the industry because the supply of its principal raw material is inadequate. Natural rubber output in India falls far short of demand, and the gap is likely to grow as the manufacturing industry continues to expand. Although an appreciable quantity of reclaimed rubber was used by the industry, raw rubber imports during the year ended 30th September, 1958, totalled 8,866 tons, including 3,000 tons of synthetic rubber. The total consumption, of both natural and synthetic, during this period was 37,133 tons compared with 34,085 tons in the previous year (a rise of 9 percent). "The imports have been, as in the past," said Mr. Luckham, "a serious drain on the country's foreign exchange resources. As the increased yield expected from the replanting programme now in progress in the south Indian plantations will not be available for several more years to come, and even when available, is not likely to be sufficient to meet the increased consumption, the only possibility of halting this heavy drain is by producing synthetic rubber in India." The consumption of the artificial product has been rising. During the year under review, the industry used 3,193 tons of synthetic rubber, compared with 2,887 tons in the preceding year. The chairman recalls that the Central Minister for Industry, in an article on the subject in the Association's monthly journal, said that the Government has been endeavouring to make the rubber manufacturing industry less and less dependent on imported raw materials within a reasonable time. In addition to the steps which are being taken to increase the output of natural rubber, the scope for setting up a synthetic (G.R.S.) rubber plant, by making use of the indigenously available alcohol, benzene and ethylene, is being explored. Mr. Luckham said that negotiations for this are now proceeding, and "if this comes about, it will serve to fill the gap in our raw material supply." Even so, the need to raise natural rubber output will remain, especially by improving the yield from existing acreage. The yield is very low in India, and the figures available indicate that no improvement has taken place for many years. A scheme was initiated some years ago to improve it, and to help finance the scheme, a levy of Rs. 8 a 100 lbs was added to the controlled price of rubber. Mr. Luckham estimated that at least Rs. 90 lakhs has been paid to rubber growers. "We are hopeful that good results will materialise before long."

Top-heavy Administration

The Estimates Committee of the U.P. Legislative Assembly has drawn pointed attention to what has long been evident—that the State's administration is top-heavy. Mr. K. M. Panikkar's minute of dissent to the States Reorganisation Committee's report was the first to expose U.P.'s claim that because of its large size, there is considerable economy in its administration. That the State Government itself did not perhaps seriously believe the claim is evident from its sustained but wholly fruitless efforts to reduce civil expenditure during the last

ten years, when over half a dozen committees have been appointed for the purpose. Indeed, it is reported that Mr. Charan Singh, until recently Finance Minister, was reluctant to take charge of the portfolio because of the opposition to economy measures from both the civil service and his own Cabinet colleagues. The latest report of the Estimates Committee declares that as many as 75 engineers' posts in the Irrigation Department are superfluous, but the Department maintains that no reduction in staff is possible because of its increased responsibilities. Incidentally, this is in direct contrast to Mr. Charan Singh's statement that economy would enhance administrative efficiency rather than undermine it. The Auditor-General's report, which has also been presented to the Legislature recently, criticises the Government for its failure to clear the growing volume of outstanding audit objections. The irregularities, committed mostly in the engineering departments, involve Rs. 23 crores in the Irrigation Department, Rs. 9 crores in the Power Department and Rs. 7 crores in the P.W.D. "The clearance of these objections," says the Auditor-General, "appears to be delayed without adequate reasons or justification, and delay in their settlement is likely to perpetuate the irregularities."

Taxing the Film-goer

It is no secret that the Congress régime in many States does not look kindly upon film-goers, although the eagerness of Congressmen in those same States to appear in newspapers on the screen is undiminished. The entertainment tax is often manipulated more for supposedly "moral" reasons than for economic ones. The U.P. Government, after experimenting for over a year with punitive rates of taxation, has now reverted to the sensible practice of levying the tax on a percentage basis. The Taxation Enquiry Commission and the Film Enquiry Committee were both strongly in favour of the percentage system: there was no valid reason, to begin with, why the Government should at all have departed from it and imposed the at inequitable slab system. As the State's Finance Minister, Mr. Ali Zaheer, declared while piloting the amending Bill, the slab system is inequitable because, under it, an admission charge of 15 annas carries a tax of 8 annas, whereas a ticket costing Rs. 1.06 attracts a tax of Re. 1. Also, at present, receipts from tickets of Re. 1 and less contribute 91 percent of the total proceeds. With the percentage system the rich will have to pay more, which, according to the Minister, is only fair. Under the existing system, the tax varies from 50 percent to 100 percent of the admission charge, but it has now been provided that the maximum will not exceed 50 percent of the admission charge. The estimated loss of revenue to the Exchequer is placed at Rs. 10 lakhs a year, but this loss may not occur if the reduced ticket prices encourage more people to see more films. While the public will, no doubt, be duly grateful for small mercies, even a tax rate of 50 percent will bear heavily on many cinema-goers, especially those with large families. Although the statement of objects and reasons in the U.P. Bill includes a reference to the Film Enquiry Committee, it omits to mention that the Committee actually recommended a flat rate of 20 percent on the gross ticket which, "by permitting re-adjustment of ticket prices, would have the effect of filling higher-priced seats more regularly and consequently bring in larger revenues." Assessing the tax on the gross ticket, according to the Committee, not merely eliminates anomalies but also has the psychological advantage of making the tax appear lower than it would otherwise.

Creating More Jobs

Unemployment has not decreased much in spite of the launching of two five year plans. Employment exchange figures show that the number registered with them was 338,402 in 1951, 647,100 in 1955 and 1,086,126 in July this year. Speaking at the quarterly general meeting of the Indian Chamber of Commerce in Calcutta last week, Mr. D. N. Jalan, president, said it is a paradox that in spite of the growth in economic activity and the implementation of the plans, the number of unemployed continues to rise. The problem is so difficult that it cannot be effectively tackled unless the rate of development is rapid. The population is increasing by 6 million each year, while the pace at which new jobs have been created hardly approaches this figure. "The basic problem of increasing employment opportunities is how to increase the resources of the country so as to augment incomes and demand for goods which alone can create more employment. In other words, the problem is of capital formation, of augmenting the financial resources of industry and reducing the rigours of labour laws, company legislation and other restrictions." The Government has tried to increase employment opportunities by supporting labour-intensive methods of production. Mr. Jalan said that although this policy helps to a certain extent the industrial structure is weakened "from the point of

view of the earning capacity of larger industries." It will ultimately hamper the ability to increase jobs.

Most people agree that there is scope for developing labour as well as capital-intensive industries; both can exist side by side in a developing economy. But on the pretext of providing more employment opportunities, it would be dangerous to develop small industries at the cost of technical efficiency. In many sectors, there is scope for developing them, perhaps with assistance in the initial stages but in no case should assistance be given permanently to inefficient enterprises. It is particularly short-sighted to develop small industries by creating handicaps for large ones; a superior process of production, as judged by quality, economy and efficiency, has to be allowed to prevail. In the long run, both large and small industries will flourish best in an atmosphere of free competition.

Man-made Fibres in Two Depressions

In the course of his speech at the annual meeting of the British Man-made Fibres Federation, Sir William Palmer, chairman, compared the recent depression in the man-made fibres industry, which it has shared with the textile industry as a whole, with the similar depression of 1952. The recession in the earlier year was more acute. "The fall in production of filament and staple man-made fibres was some 20 percent during the spring and summer of 1958, against 40 percent in 1952; during the same period, the production of woven cloth fell by some 20 percent in 1958, against 30 percent in 1952." Sir William said that the ultimate consumer had little or no responsibility for the in-

NOTICE

With this week's issue of CAPITAL is being published a supplement of 144 pages, the Annual Review of Commerce, Trade and Industry. Besides essays on specific industries, such as jute, coal, tea, cotton textiles and sugar, the Review contains exclusive articles by well-known authors. Dr. T. Balogh writes about the consumer in relation to economic development; Mr. V. T. Krishnamachari, deputy chairman of the Planning Commission discusses the prospects for the second plan; Mr. R. L. Garner, president of the International Finance Corporation, says what India might expect from that body; Mr. Geoffrey Tyson analyses the recovery of sterling; Mr. Neil McInnes examines the causes of the decline in foreign private investment; Mr. S. S. Khara discusses the growth of India's oil industry; and Professor B. R. Shenoy explores the shadier nooks of the smuggled gold trade. In addition, Mr. Minoo Masani and Mr. A. D. Shroff look into different aspects of the relationship between democracy and planning. Other articles deal with industrial relations, company taxation, foreign trade, administrative corruption, steel expansion plans, banking developments, insurance, road transport, shipping, the oil industry and stock market prospects. The Review is being distributed free to all registered subscribers. Additional copies at Rs. 5 each may be obtained from the Manager, Capital, at 5 Mission Row, Calcutta 1. Orders for extra copies should be placed early.

dustry's difficulties. Statistics show that sales of clothing of the kind in which the Federation is interested did not decline, imports failed to increase, and there was no sudden change from man-made to other fibres. The inevitable conclusion, he continued, was that the consumer had been supplied partly from the long pipeline. The same conclusion was reached about the depression of 1952, which could be explained by the fact that it came after a long period of rapid expansion with demand generally exceeding supply. There was then a sudden change in the market when shortage was overtaken and heavy stocks accumulated in anticipation of further expansion. The present depression, however, came at the end of a long period of relative stability. The chairman believes that one likely explanation of the slackening in activity could be the change in Bank rate in September last year, which increased the cost of carrying the normal and necessary stocks. Taking the comparison with 1952 a stage further, he is hopeful that the recovery which followed will be repeated. By the autumn of 1952, there were signs of an upturn and similar signs are evident this year, while by 1953 there was no doubt that the depression was over and in the earlier part of that year there were periods when demand was well in advance of supply. "It is possible that by 1959, this depression will have taken a similar course," he said, "but, unfortunately, that is not certain; history does not always repeat itself."

Land Ceilings and Output

The Mysore proposals for fixing ceilings on all private holdings of land, reducing rents and ex-

tending occupancy rights, have revived discussions in Madras about the need for agrarian reforms. The protection required for the cultivating tenant is already available, but the wisdom of fixing ceilings is still debated. If the Tamilnad Congress recommends legislation on the lines of Andhra, the aims of which have now been clarified by the Chief Minister, Mr. Sanjeeva Reddi, then the cultivating owner in Madras will be assured of an economic holding and an adequate income. It has been pointed out that Rs. 5,400 and not Rs. 3,600 a year is now required for an average family living only on agriculture, and the existence of a class living above the subsistence level is still required for village leadership. The Chief Minister of Andhra Pradesh has explained that land reforms have become inevitable, but he has also suggested that there must be a ceiling on industrial and other sources of income. If the latter idea is to be accepted, it may be necessary to ascertain what is the optimum income from trade or industry for Hindu undivided families, considering the present rates of income tax.

Many in Madras welcome the cautionary note which has been struck by Mr. U. N. Dhebar, the Congress President, who realises that agricultural tax applied now in most States ensures for the Government a share in what may be considered large incomes from land. But those who insist on the State establishing direct relationship with the actual tiller, could point out that there are intermediaries who need to be weeded out. Mr. Dhebar himself holds that intermediaries must go if agricultural production is to be stepped up. Experience, however, suggests that legislation for abolishing absentee landlordism, or minimising its evils, alone will not yield practical results. Further investment on land is equally necessary to raise food output.

Practice versus the Law

In an interesting case recently, the Kanpur Labour Court has accommodated in varying degrees the different viewpoints of the two parties. Ordering the reinstatement of six oil men of the Muir Mills, Kanpur, it observes that their refusal to oil the machines on working days does not constitute wilful insubordination punishable with dismissal. The past practice has been for the men to oil the machines on Sundays, when the mill is not working. But the law provides that if there are safety devices in a factory, the management can ask the workmen to clean and oil the machinery as their normal daily duty. Refusal by workmen would in this case, amount to insubordination punishable with scheduled penalties. The court, therefore, while ordering the reinstatement of the workmen with continuity of service, has disallowed their claim for compensation for the period of their unemployment. "The reason is," the court says, "that we cannot record a finding in this case that the management was not within its rights in suspending these workmen and terminating their services when they had refused to clean the disputed parts of the machinery on working days, as the stand taken by the employers, though against past practice, was within the legal provisions."

Mineral Discoveries in Madras

In recent years, Government geologists have undertaken detailed investigations of the mineral resources of Madras State, and their findings have helped many business concerns. Apart from iron ore and bauxite, samples of which have been collected, ilmenite has been located in Kanya Kumari in deposits spread over a coastal belt of 2½ miles. Large lime-kankar deposits have been found in Salem, where the magnesite reserves are also known to be substantial. The official report contains no reference to the transfer of the lease for these reserves by the Magnesite Syndicate to Burn and Company, which has been entrusted with the responsibility of using them. The engineering side of the Geological Survey is growing in importance. Sites for new dams have invariably been selected with its help. For example, the sites for work connected with the Parambikulam project, concerning which Kerala has lately reached an agreement with the Madras Government, were examined by geologists before they were chosen. It is quite likely that the masonry work for the proposed dam may be limited, and earthen embankments may reinforce the construction. In connection with the survey of the proposed railway line from Salem to Bangalore, the Ghat region has been examined and the feasibility of constructing tunnels has already been ascertained. The mapping of areas for mineral investigation is part of the programme, and there are chances of finding mica in Salem. The new mineral prospecting rules under which more leases were granted in 1956-57, entail the appointment of a State Government geologist. The vigorous development of the iron ore trade in Andhra Pradesh is one reason for Madras going ahead with detailed surveys. Another is the inception of the Neyveli lignite project,

MARTIN BURN LIMITED

BUILDERS · ENGINEERS · CONTRACTORS

which shows that Madras has minerals that can support industrial development.

Industrial Prospects in East Pakistan

Speaking at the annual general meeting of the Dacca-Narayanjan Chamber of Commerce and Industry held in Dacca last week, Mr. W. R. Longwill, president, reviewed the prospects for some of the major industries of East Pakistan. He said that although jute is the most important foreign exchange earner, the country no longer enjoys a virtual export monopoly. Apart from India, jute or similar types of fibre are being grown in increasing quantities in Burma, Brazil, China, Siam and Africa. During the 1957-58 season, overseas exports amounted to 3.9 million bales, while those to India were 600,000 bales, being practically the same as for the previous season. India's purchases this season have been negligible, resulting in a heavier accumulation of cuttings. "Pakistani jute as a packaging material will retain its predominant position in export markets as long as it is readily available at an economic price from the point of view of both buyers and sellers, and we have no doubt that the Government will bear this aspect before it in deliberations on the present or future position of this trade." The industry has suffered greatly due to the levy of an excise duty and the high cost of electric power, "which is 400 percent more than that paid by the Indian counterpart." Consumption of raw jute increased to 941,000 bales in 1957-58 from 800,000 bales in 1956-57. Production of finished goods rose to 157,900 tons from 144,500 tons.

As for the tea industry, there was an overall improvement in production, the average crop having risen by more than 20 percent. Furthermore, there has been a rise in local tea consumption during the last few years. Referring to taxation, Mr. Longwill said that it is necessary to provide incentives to companies and firms from which the Government gets large tax revenue. Under

the present system of taxation, which includes income tax, super tax and business profits tax, a Pakistani incorporated public company has to earn a taxable profit of Rs. 300 before the investor can receive Rs. 100 after taxation. In the case of a foreign company operating there, more than Rs. 500 may have to be earned as profits before Rs. 100 can be paid to shareholders. "Foreign capital, which is so necessary to our economy, will only be attracted if the net return as dividends after taxation is on par with other similar under-developed areas of the world."

Electricity in Madras

Proposals to link the power supply between States give added interest to the report on electricity development in Madras, especially as that State is still giving power to some areas in Andhra Pradesh. Since 1932-33, when the Pykara scheme was commissioned, progress has been steady, and the Madras Government now produces over 1,100 million units, of which only 2 percent represents power purchased. According to its latest administration report, 75 percent of the electricity is drawn from hydro-electric sources and 24.8 percent from thermal steam plant. The Kundah scheme, which will provide 160,000 kilowatts in the initial stage, and the Periyar scheme, which is to produce 150,000 kilowatts, will double the power supply in the State; extensions to Mettur will provide another substantial addition. The total investment in electricity schemes in Madras is estimated at about Rs. 67.48 crores, and the total capital expenditure in 1956-57 alone exceeded Rs. 13.47 crores. The gross revenue seems to be highest in the Madras thermal system, acquired by the Government in 1947-48, but the working expenses too appear to be higher there than in the hydro-electric systems. The maximum contribution to the total net revenue of Rs. 303.44 lakhs is made by the oldest system, the Pykara, because the working expenses are distinctly lower.

Building FOR THE 5 Year Plan and far beyond it

In steelworks construction at Durgapur, Jamshedpur and Hirapur in coal and ore handling plants, coal washeries, coke ovens in India's first polythene factory at Rishra in many sulphuric acid and other chemical plants in such great installations and many others, some already in service, some under construction, the work of Simon-Carves will speed the march of Indian industry for years to come.

SIMON-CARVES SPECIALITIES INCLUDE:

Steelworks erection and plant installation
Civil engineering construction
Coal washeries, coke ovens and by-product plants
Central and industrial power stations
Chemical plants for sulphuric acid, hydrochloric acid, chlorine, caustic soda, tar distillation, benzole refining and many other purposes
High-efficiency electro-precipitation of industrial mists and dusts

Simon-Carves design, engineer and execute complete contracts of any magnitude from site preparation to plant commissioning and operation.

COLLIERY, STEELWORKS, POWER AND CHEMICAL PLANTS BY

Simon-Carves Ltd

Incorporated in England. The liability of the members is limited.

CORRESPONDENCE

KERALA BOARD OF CONCILIATION

Sir,

Permit me to offer a word of clarification on your south Indian correspondent's report, published on page 772 of your issue of 4th December, 1958. Paragraph 2 of the report is likely to give the impression that the Association of Planters of Kerala, by not responding to the Government's invitation to nominate employers' representatives on the proposed Board of Conciliation, has created difficulties in the way of the formation of the Board. On the contrary, this Association has been merely anxious that the Board should be properly constituted in accordance with law, so that there should be no room for any criticism at a later date that the proceedings of the Board are null and void.

Paragraph 1 of your south Indian correspondent's report refers to Section 5 of the Industrial Disputes Act, and to Rule 6 of the Kerala Industrial Disputes Rules. These contain mandatory provisions of law to the effect that members of Boards of Conciliation shall be chosen on the recommendation of the parties to the dispute. In the present case, the employer-parties to the dispute are companies, partnerships or individual proprietors, and not individual planters numbering "more than 1,000." According to the Government notice dated 25th November, 1958, the number of employer-parties is only 160. We requested these 160 parties to channelise their nominations through this Association; and, as early as 29th November, and subject to confirmation from the parties, we did recommend to the Government the names of two representatives for appointment to the Board. It should be clear that this Association and our members, Indian or British, large or small, have given the Government the utmost co-operation and assistance in constituting it.

Yours, etc.,

O. C. MATHEW

(Secretary, the Association of Planters of Kerala)

Muttambalam P.O., Kerala, 10th December.

INDIAN TEA

WE mentioned in our last issue that the Committee of the Indian Tea Association had resolved not to exhibit at the coming Coolgardie Exhibition. Their decision is much to be regretted and is in somewhat striking contrast to the action of the Planters' Association in Ceylon. The "Thirty Committee" have voted a sum of £500 towards the expenses connected with the Exhibition in securing space and a suitable tea room where tea can be sold in cup and packet; and an appeal has been sent out by the Secretary of the Committee asking gardens to send contributions of three grades of tea, 20 lbs of each. The Chairman of the Planters' Association in a letter dated November 24, states: "I would point out the great importance of securing West Australia as a market for our teas, as from the latest statistics this Colony drinks 9½ lbs of tea per head of the population, and if strenuous efforts are made to popularise Ceylon tea at the forthcoming Coolgardie Exhibition, we may hope to convert them from the use of China teas." It will be seen that Ceylon neglects no opportunity of pushing her teas to the front, and as a result is securing fresh markets. The Indian Tea Association reminds us of the carter in the fable who, when his wheel got into the mud, contented himself with imploring Jove to help him; we fancy that if this kind of attitude is continued, Indian tea will be left out in the cold.

A Ditcher's Diary

THE LEADING ARTICLE IN *Capital's* ANNUAL NUMBER, published along with this issue, has been written specially for us by Dr. Thomas Balogh of Oxford. Dr. Balogh is a socialist of the intellectual, mid-European type, which I always feel has as much in common with the British variety of socialism as I have—that is practically nothing at all. Recently he has achieved a measure of popular fame as the brain behind the Labour Party's new expansionist policy, and as at least part author of that impressive exercise in public relations which immediately, so I thought, defeated its own aim of mass appeal by assuming a title as unwieldy as *Your personal guide to the future Labour offers you*. The theme of his supplement article is not a particularly new one. I personally remember his expounding a version of it at a lecture I attended as a student many years ago. But I read it again this time with renewed interest, because it seems to me to have more relevance for the world today than it had when I first heard it just after the war. The argument that unbridled consumer sovereignty cannot be relied upon to shape correctly developing economies such as India's, has already been more or less accepted. Planning, in other words, is recognised as being the only way of ensuring steady and orderly economic development in a hurry, although it is a good idea to remember that it has to be good planning, especially in a democracy where a Government is answerable for its mistakes. But for the developed countries of the West, consumer sovereignty has been quite sufficient since the war to maintain a rapid rate of advance in the right direction without resort to planning. Dr. Balogh's point about the neglect of "social" needs has been relevant enough—take the condition of Britain's roads, for instance—but does not seem to have caused much heart-searching so long as employment and the output of television sets have both remained high. What does give his ideas importance for the western countries nowadays is the output and productivity race which the communists have decided to challenge them to. I am not saying that the West's liberal economies should be turned into an imitation of their authoritarian rivals; no race would be worth winning which involved that. Nor do I suggest that the challenge should be taken up openly. But I do think that whether they like it or not, while the communists are in their present mood, the western countries are in a race, and that if they still consider the price too great to force their rate of economic advance higher than its present level, they will certainly have to ensure that there is no falling below it. All the is where Dr. Balogh's ideas come in. All the recent signs indicate that consumer sovereignty will be insufficient to keep the western economies moving in the right direction at a steady rate throughout the competitive 1960s just as it was in the depressed 1930s.

THE PROCEEDINGS OF THE RECENT SEMINAR IN New Delhi on the problems and prospects of democracy in Asia seem to me much less interesting than the list of participants. As I see it, this is really the toughest problem facing democracy: that everybody thinks he has a right to claim it for himself. All is not well with democracy in Asia, I know, but the worst autocrat in the world has nothing to learn about the subject from such "democrats" as the Ambassadors of Poland, Iraq and the United Arab Republic. Or, for that matter,

from Professor Hiren Mukherjee, the communist member of Parliament, who alone thought that democracy in Asia was not in danger. Of course it isn't, if by democracy you mean what Professor Mukherjee means. India is very often most unfairly criticised in the West, but I put it to Indian democrats whether a great deal of the misunderstanding is not directly attributable to the very undemocratic company they keep on so many occasions. Diplomatic relations are one thing. I have myself said how stupid I think the U.S.A. is for refusing to recognise communist China. It is altogether another matter when people behave as though there is no distinction at all between democrats and communists or tyrants of other varieties, who were well represented at the seminar. Some of the participants were representative of a number of recent direct subverters of democracy in Asia, and to pretend otherwise is as dangerous as mistaking undertakers for doctors or robbers for protectors of law and order.

CALCUTTA, SAYS PROFESSOR S. N. SEN, IS predominantly a city of men without women—to borrow a famous book title from Ernest Hemingway—and it is the lack of an ordered family life for the majority of households that is chiefly responsible for its instability. The professor is probably right; nothing keeps a man sober and well behaved more than the knowledge that he has the welfare and happiness of a wife and family to answer for. But two factors I would rank of equal importance, he simply skates over. These are the rapid growth in population which has taken place in the past few years and the fact that so many of the newcomers are completely apathetic and fatalistic in their outlook towards city life. This increase in numbers, much of it concentrated in the suburbs, is often neither migratory nor confined to single-member households; it is a genuine change-over from rural to urban living and the conditions it meets with are a fruitful source of social and political tension. I do not deny that migratory industrial workers and their lack of family life have added to Calcutta's troubles. But this is an old phenomenon. It was noted long ago by Aldous Huxley in his *Jesting Pilate*, where he described Indian industrial workers as country men transformed into "thievish and fornicating drunkards". The fatalism and apathy which is so much a feature of illiterate, superstitious first-generation town dwellers, contributes to the general chaos by lending itself to exploitation by Leftist agitators. It would be a mistake, for example, to believe that the hordes of demonstrators one sees on Calcutta's streets every day really understand the slogans they are shouting, let alone believe them. In their way, they are simply earning an honest anna in a novel and attractive profession; the significance of what they are doing escapes them completely. How can all this be dealt with? I certainly do not know, although alternative and more lucrative employment would be one answer. So would decentralisation in future town planning and the provision of more recreation facilities.

I DO NOT FOR A MOMENT BELIEVE THAT MANY of Lord Hardinge's countrymen will treat a young Lohian's vandalism on a statue of the former Viceroy in Patna as anything more than an isolated instance of individual misbehaviour. Fewer

statues of India's former rulers have come down in the past eleven years than fell in as many days in Hungary, the subject of the latter being Stalin. Here in Calcutta there was an unseemly controversy only recently over the statue of a great Indian. And I have been wondering whether all this is worth while. Young enthusiasts out to make news have scant respect for history as such, although the fact remains that Hardinge and all the others who did what they conceived to be their duty, belong as assuredly to Indian history as Alexander or Porus or Kanishka or Vallabhbhai Patel. History is undone, if ever, only in a limited sense; and a recent visitor to Europe, an Indian, was impressed to see how pathetically people in Newcastle-on-Tyne cherish their Roman wall and how jealously Greeks in Rhodes value the ancient bazaar—both reminders of foreign occupation. Age, I conclude, invests such experiences with respect and affection; and the recent past has no glamour. The current American craze for colonial furniture and colonial architecture may be put down to snobbery, but snobbery is a part of human nature, personal as well as national. Neither unduly sentimental nor mechanically scornful of surviving relics of British rule in India, I would not rule out the possibility that one day the same Lohians may change their attitude to statues of foreigners and their very living languages. Meanwhile? One can only hope that the steadily declining influence of Lohianism—his brand of socialism and patriotism really deserves a new name—will see to it that statues of the dead are left in the peace they have certainly earned.

TENNIS COURTS SEEM DESTINED TO PLAY AN important part in the rise of democracy. It was on a tennis court in post-revolution France that the first democratic constitution was drawn up; now, in post-war Japan, it is as a result of a friendship which apparently began on a tennis court that the monarchy will experience its first democratic marriage. The affair has, I see, aroused considerable interest in India. In spite of the legal abolition of all privileges associated with birth in this country, it would appear that people have still to outgrow their feudal past. But the main reason why the incident has attracted so much attention both here and throughout the world is perhaps because it represents such a revolutionary change in the concept of a monarchy which less than a generation ago was the inspiration for the cruellest and most destructive imperialistic outbursts of modern times. The emperor of Japan used to be looked upon as a descendant of God. Up to the end of the war, no sacrifice was considered too great in defence of his honour, and his aura had its institutional backing in what must have been one of the world's most exclusive aristocracies. Now this seems to be changing and it is from the emperor himself that the inspiration appears to be coming. He is said to be a completely changed man who is now trying hard to live the rôle of a constitutional monarch and, what is more important, taking an active interest in the course of his country's democracy. In a sense, he represents the new democratic spirit in Japan. Not so long ago, he permitted a princess to marry a commoner. Now the royal consent has been given without so much as a fuss (although the few families who traditionally supply the empress of Japan do not seem to have been too pleased with it) to the marriage of his heir to a commoner. I suppose it is all a sign of the times; even kings nowadays refuse to be shackled by the limitations and obligations which birth and circumstances have destined for them.

THE BOMBAY GAS COMPANY LIMITED

CHAIRMAN, MR. B. L. JALAN'S REVIEW

Extracts from the speech delivered by the Chairman, Mr. B. L. Jalan, at the Annual General Meeting of The Bombay Gas Company Limited held on Wednesday, the 17th December, 1958.

You are aware that our country has been faced with food shortage for quite some time now. It has been officially estimated that the total production of food grains in 1957-58 declined by about 6 million tons. This has to be put against an increase of population of about five million within a year. The obvious result was an increase in prices of food articles, and indeed, of all other commodities. While a more rational and realistic solution of the problem lies in increased and steady production, primarily through short-term minor irrigation schemes on self-help pattern, the Government have recently announced their decision to introduce State trading in food grains. In the light of our past experience of price controls and rationing in the country, one does not feel optimistic about the results of such a venture. Moreover, while this does not solve the basic problem, State trading would become redundant if, as is hoped, we are going to have a bumper crop this year. At the same time, it will create a lot of unemployment and reduction in the incomes of large numbers of middle class people. I will only reiterate that apart from the efforts to increase food production, what the Government should do is to maintain adequate buffer stocks. It is through such stocks alone that the Government can hold the price line. We should welcome the Prime Minister's statement that the Government have decided to maintain, and not merely build up, stocks of two million tons of food grains and to operate in the market to prevent fluctuations in food prices.

Foreign Exchange Problem

The increase in prices has been caused also by severe import cuts imposed during the last few quarters as a result of the dwindling of our foreign exchange reserves. It is, however, a matter of gratification that the Government have been trying to adopt all legitimate measures to improve the situation. As you are aware, a Creditors Conference was convened in Washington at the instance of the World Bank, and the friendly countries and the Bank promised further loan accommodation to help India tide over her difficult foreign exchange situation. It would not be out of place to mention here that the visit abroad of our distinguished Finance Minister, Mr. Morarji Desai, proved a great success in this context.

While it is likely that we have already arrested the unfavourable trend, the situation is yet far from being satisfactory. Our exports continue to maintain a low level, if not a downward trend. In 1957, our exports amounted to Rs. 643 crores, showing a monthly average of Rs. 54 crores. The average for the first eight months of the current year works out at Rs. 46 crores only.

The U.S. Recession

This unhappy feature in our export trade has been explained by various factors such as the recession in the United States in the early part of this year and economic war being waged by China by quoting below the lowest global prices. The economic climate in America, however, has greatly improved of late. The index of industrial production which had declined to 126 in July, 1958 (base 1947-49=100) rose to 138 according to latest figures available for mid-November. The various fiscal and monetary measures undertaken in that country have enabled her to make up a large part of the lost ground. But the planned and extra-market competition offered by the Chinese shall have to be reckoned with. Government assistance in adequate measure can play a great role in maintaining our competitive position especially in the field of

cotton textiles provided that in the meantime the textile industry is fully renovated and modernised.

Industrial Expansion Arrested

While it is true that our exchange position has improved it must be clear that this has been secured at great sacrifices. Such sacrifices have been made primarily in three directions. First, it has caused a considerable shortage of consumer articles in the country, which has also accentuated the rise in prices and general cost of living. Secondly, it has affected industrial production as a result of the shortage of raw materials and rise in the cost structure. This has also resulted in the growth of unemployment in certain important sections of the economy. Thirdly, it has greatly checked the growth of industry. A stage has been reached when several industrial projects have been or are being abandoned simply for want of Government permission, and such permission could not be given because it involves some foreign exchange expenditure. You are aware that sometime past the deferred payment system was invoked. It acted as a great deterrent to industrial expansion. Now even deferred payment system is not enough. It is generally required that a Project should not involve any foreign exchange payment at all at least until 1961. Even after that date, expenditure of foreign exchange will be permitted in cases where it has been proved to the satisfaction of the authorities that the new unit will be able to save corresponding amount of foreign exchange. To say the least, this is an unenviable position for any country which has launched a programme of rapid industrialisation. I should make it clear at this stage that I am not commenting on such measures initiated by the Government. I am only trying to draw a factual picture of our present conditions and to state that instead of encouraging industrial expansion we have to abandon otherwise very fruitful and profitable industrial projects only because of our foreign exchange situation. This is just the opposite of what we sought all these years since we embarked on our planned development. If we are to achieve only a moderate rate of growth, let alone ambitious, we shall have to create a situation that no industrial project is abandoned simply because it does not save as much foreign exchange as it spends.

One very effective way of solving this problem is to encourage flow of foreign capital into the country. At this stage, we should distinguish between foreign assistance on loan basis obtained on government account and equity capital. Our long-term exchange problem will be effectively solved only if we can encourage the flow of the latter.

Favourable Investment Climate

On the occasion of the annual meetings of the International Monetary Fund, the World Bank and the International Finance Corporation in October in New Delhi, I met several financial experts from other countries. If I found any unanimity in their views on any matter it was that the fund of available international capital is limited and that the flow of private foreign capital would depend greatly on the investment climate of the recipient countries. A country which could present a welcome climate for such flow, would not, however, face a shortage of capital.

The factors which constitute a favourable investment climate are quite well known: a fair return on capital, guarantee against risk of expropriation and non-convertibility, a reasonable level of taxation, an assurance against discriminating treatment, and an absence of restrictive labour laws. It is for us to see how far our economic policies conform to the international expectations in this regard. It is very clear, however, that imposition of taxes such as wealth tax on companies, which could not be justified on any plausible consideration, and like expenditure tax, which is not levied in any other country in the

world, and the collection in respect of which would hardly compensate the expenditure and efforts involved in such collection, do not constitute factors which create the desired climate.

Internal Capital Resources

While the problems of foreign capital and foreign exchange continue to be what they are, taxation, large government expenditures and high level of spending as a result of rise in prices have greatly affected domestic savings and investments. The general investment climate in the country is reflected in the index of prices of variable dividend industrial securities, which declined from an average of 123.8 in 1956 (base: 1949-50=100) to 113.7 in January, 1957, and to 97.2 in December of the same year. During the course of this year, the prices have advanced once again but this is reflective of the easy money market conditions caused by shrinkage in international trade and more particularly in imports and very much slackened industrial expansion. This is evident also from the rise in deposits of banks as against the fall in advances. Thus during the course of a year since the third week of November, 1957, deposits of Scheduled Banks rose from Rs. 1,359 crores to Rs. 1,575 crores, while the advances and bills discounted actually declined from Rs. 847 crores to Rs. 841 crores. There was, however, a sizable gain in the case of investment in Government securities of these banks, from Rs. 407 crores to Rs. 641 crores. This clearly indicates that banks have invested more in government securities and less in business and industry while expansion of industry and business is the burning need of the country. We should, in fact, follow the liberal Japanese method of providing credit facilities through which she has built up her disintegrated economy from a scratch.

Rising Costs

Coming to the affairs of our Company, the year under review has shown a balance of Rs. 181,466/- in Net Revenue Account. It was considered by your Board that such a small balance must result in a reduction in the rate of dividend payable this year as compared with the last, and accordingly a dividend of 4% free of tax is recommended. This will absorb a sum of Rs. 180,000/-, leaving only Rs. 1,466 as the amount to be carried forward to the next year. I cannot, therefore, say that the revenue position of the Company is satisfactory, but it is beyond the control of the management. The cost of coal, the main raw material required for our gas production and the freight thereon has been mounting and is a matter of serious concern to our industry. An increase of over Rs. 512 per ton came into effect in 1958 when the Company immediately approached the Government for revision of the price of Gas. As a result of our representation made in September, 1958, the Government of Bombay appointed an Advisory Committee to go into the matter, and after some hearings they submitted a report to the Government probably in July, 1958. This report is under the consideration of the Authorities and the Company is not aware if any suitable increase in Gas Price to offset these mounting costs will be authorised. In the meantime the ex-works cost of coal has increased again in 1957 and 1958, and we now have to pay Rs. 10.70 per ton more than we were paying in 1955. The financial position of the Company only improve if a fair and reasonable rate is allowed to cover the increase in costs.

Increased Production

The Company on its part has been making every effort to increase the production of gas to make it available to as many consumers as possible. The demand for additional gas continues and applications are received daily by the Company from new potential consumers. During 1957, 750 new gas connections were installed. In 1958 again, additional 1325 connections were given upto October last.

On the production side the volume of gas produced was again a record, and the following table sets out the comparative figures of gas produced in the years 1946, 1955, 1956 and 1957.

Year	Total Gas Production (Cu. Ft.)	Increase over 1946
1946	1,115,949,000	
1955	1,511,849,000	35.5%
1956	1,529,221,000	37.0%
1957	1,581,389,000	41.7%

The gas production in 1958 upto October was 1,374,683,000 cu. ft. which was 5.2% higher than that of the corresponding period of 1957.

Expansion Programme

New plant installed in 1957 included a third coal elevator, complete with overhead coal storage hopper and coal crusher, and a third retort charging machine. To deal with the increased coke produced from the retort house, which, you will recall was extended in 1956 by the addition of 5 new beds of retorts, a ramp was put into commission, and coke discharging boiler and a battery of three induced draught water coolers were also put into commission during the year.

Work was commenced in May 1957 upon the new 15" trunk main almost three miles long, from the Gas Works to the Opera House. Using imported pipes with specially designed joint rings, the work was completed in about seven months, despite delays caused during the monsoon period. The main was commissioned in January, 1958, and has been most beneficial in improving gas pressure in the central areas of the City.

Gas Works and district plant were maintained in good condition during the year, four beds of retorts tenance repairs. The gas production per ton of coal improved from 16,447 cubic feet in 1956 to 16,714 cubic feet in 1957.

This year your company also carried out the relighting of Netaji Subhas Road and Bombay Road No. 1 in front of the Sachivalaya. Your Director, Mr. K. K. Jalan was also present on the occasion of the much anticipated and had written to us that the "impediments" and the Company had provided "the glareless light being provided by your Company compares favourably even with fluorescent lamps. We hope all lovers of the City of Bombay find the charms of the "Queen's Necklace" doubly enhanced by the improved lighting.

Note:—This is not a report of the Annual General Meeting.

Money

THE CALCUTTA MONEY MARKET

ADVANCES RISE

Wednesday, 17th December.

THE largest increase for several months has taken place during the past week in advances outstanding in the Calcutta money market. The requirements of the jute industry are higher and those of the sugar mills have, for the first time, shown a substantial increase. There has been no change yet in outstandings against grain and seed storage or cotton piecegoods. The interbank market has become firm. The call rate has increased to 3½ percent and there are borrowers over at this level.

There has been a sharp fall in tea bills in the exchange market during the past week, and gunny documents have been moderate. Remittance has remained scarce. There have been wide fluctuations in the value of the pound on rumours that U.S. account and transferable account of sterling were to be merged. The pound has lost ground against most Continental currencies, but is fractionally higher against the U.S. and Canadian dollars.

BULLION WAS STEADY ON SMALLER ARRIVALS. Moves to tighten up anti-smuggling measures helped bullishness. Silver rose from the previous week's level of Rs. 191.50 to Rs. 192, quoted today for the ready metal and the rate for forward delivery was quoted at Rs. 190.75. The London and New York silver prices stood at 76½d and 90½ cents.

In sympathy with silver gold was steady but the price showed little change at Rs. 114.50. The sovereign was quoted at Rs. 74.

DURING THE WEEK ENDED 12TH DECEMBER, Government of India Treasury bills for Rs. 35,27,00,000 were sold in favour of the Reserve Bank.

TENDERS FOR Rs. 3 CRORES OF 91-DAY GOVERNMENT of India Treasury bills were opened on 16th December. The total amount offered was Rs. 3,60,00,000. Tenders at Rs. 99.390 were accepted in full and those at Rs. 99.385 were allotted approximately 58 percent, the average rate of acceptance being Rs. 2.445 percent a year. Tenders for Rs. 3 crores of 91-day Government of India Treasury bills will be received up to Monday, 5th January, 1959.

IT IS STATED THAT 91-DAY INTERMEDIATE TREASURY bills will be sold from 17th December to 3rd January, 1959, at Rs. 99.406 percent, subject to the conditions previously announced (that sales can be stopped at any time without notice if the Government thinks it necessary). There were no sales of these bills during the period 10th to 13th December.

RISES OF Rs. 13.40 CRORES TO Rs. 1,595.63 CRORES in active notes and of Rs. 9.72 crores to Rs. 1,602.99 crores in the total note issue were notable features of the return of the Reserve Bank of India for the week ended 12th December, 1958. Notes held in the Banking Department consequently declined by the Rs. 3.69 crores to Rs. 7.35 crores. Deposits of the Central Government increased by Rs. 4.66 crores to Rs. 66.25 crores while other Government accounts declined by Rs. 2.80 crores to Rs. 9.39 crores. Balances of commercial banks at Rs. 73.45 crores showed a rise of Rs. 43 lakhs. Balances held abroad again increased by Rs. 1.61 crores to Rs. 19.95 crores. Investments fell by Rs. 8.29 crores to Rs. 280.26 crores. Other loans and advances increased from Rs. 54.70 crores to Rs. 63.83 crores, of which advances to scheduled banks against usage bills amounted to Rs. 67.50 lakhs (Rs. 67.36 lakhs). Ways and means advances stood at Rs. 25.73 crores (Rs. 24.97 crores).

THE RETURN OF THE STATE BANK OF INDIA FOR the week ended 5th December, 1958, shows a drop of Rs. 2.57 crores to Rs. 470.02 crores in total deposits. Investments in Government securities are up by Rs. 2.23 crores to Rs. 276.43 crores, while other authorised investments remain unchanged at Rs. 11.71 crores. Advances, including loans, cash credits, overdrafts and bills discounted and purchased, have increased by Rs. 1.89 crores to Rs. 165.20 crores. Cash and balances are, in consequence, shown at Rs. 28.94 crores, or Rs. 9.30 crores less.

THE STATEMENT OF THE POSITION OF SCHEDULED banks for the week ended 5th December, 1958, shows Demand and Time liabilities at Rs. 705.02 crores (Rs. 22.27 crores on account of borrowings from banks) and Rs. 928.34 crores (Rs. 38.06 crores), compared with Rs. 712.46 crores (Rs. 17.07 crores), and Rs. 919.40 crores (Rs. 39.32 crores), respectively, in the previous week. Cash and balances with the Reserve Bank have declined by Rs. 84 lakhs and Rs. 15.81 crores to Rs. 39.45 crores and Rs. 6.63 crores, respectively. There is a rise of Rs. 6.63 crores to Rs. 649.63 crores in investments. Advances and bills discounted at Rs. 840.93 crores show an increase of Rs. 8.48 crores. The ratios of advances liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 6.7 percent and 51.5 percent, against 7.8 percent and 51.0 percent.

Safe way to store and handle corrosives

Carboys and containers moulded from POLYETHYLENE provide industry with a new, effective way to store and ship corrosives. Chemically inert, POLYETHYLENE is ideal for storing and transporting alkalies and most acids, distilled water and many other chemicals, electrolytic fluid etc. It never contaminates contents.

Resilient and unbreakable, POLYETHYLENE containers won't crush or leak. Being extremely light in weight, they enable substantial savings in shipping and handling costs.

POLYETHYLENE will shortly be manufactured in India by National Carbon Company (India) Limited at their plant at Trombay Island, Bombay.

QUIETER TREND IN STOCK MARKET

RISE IN GILT-EDGED AND INDUSTRIALS

London, 17th December.

ALTHOUGH conditions in the stock market were rather quieter during the past week than in many preceding ones, the general performance of most sections was satisfactory. Domestic sections were firm under the leadership of industrial equities, while gold shares maintained their recent gains. The exception to the satisfactory showing was provided by oil shares, which steadily lost ground under the leadership of Ultramar, which was particularly depressed on the oil policy statement by the President-elect of Venezuela. Domestic sections responded to the advance on Wall Street and to the U.K. unemployment figures, which indicated a slowing down in the rise in unemployment. But the main favourable influence was the marked improvement in the overseas trade figures for November which showed an appreciable rise in exports and a sharp contraction in the trade gap. In the industrial market trusts contributed to the improvement in prices which reached a new peak for the year before profit-taking caused a slight reaction. Brewery and steel shares were prominent being helped by some encouraging dividend statements. The gilt-edged market responded modestly to the trade figures and the further fall in the Treasury bill rate; prices improved under a small demand and gains were small. Foreign bonds met with a selective demand, with German and Japanese issues remaining firm, but the main feature was provided by Greek bonds, which went ahead sharply on debt settlement hopes. Dollar stocks were firm in response to Wall Street but the feature here was the elimination of the dollar premium which fell to nothing for the first time in three years. Insurance and banking shares were firm, with the latter responding to the scrip issue and dividend forecast by the Midland Bank, whose shares advanced sharply. Base metal shares moved within a narrow groove and recorded very little change. Rubber shares tended higher and there were one or two firm spots. Indonesian issues were firm. Tea shares were quiet but selectively firm with occasional bright spots among Indian issues, while among Ceylon shares, Consolidated Estates advanced on a dividend announcement.

The Money Market

Easy credit conditions persisted in the early days of the past week in the money market. The volume of credit was such that the authorities had to take action on a large scale to absorb surplus funds. This proved most effective, for on Thursday last the situation changed. Money became acutely short and the market was forced to borrow a moderately large amount from the Bank of England. Although the market had to pay the Bank rate terms of 4 percent for penal borrowing, it obtained its requirements over the week at cheaper levels with the rate for day-to-day loan quoted at 3 percent down to 2 1/2 percent for non-regular money. There was a fairly good demand for bills, with March and "hots" sold at 3 1/2 percent. It was expected that the market might be wary of making any further upward revisions of its effective bid at the weekly tender following the Bank of England borrowing, but discount houses felt they had no option but to do so in order to obtain as many bills as possible against the keen competition which continued. Consequently, at last Friday's tender, the market raised its bid by 7d to £99 4s 5d, at which price it secured a quota of 67 percent, while the average rate for bills came to just over 2s lower at £3 2s 4 1/2d percent.

Rise in Sterling Area Reserves

Commenting on the rise in the November gold and dollar reserve figures by \$41 million to a total of \$3,215 million, Reuter's financial editor writes: "As the payment to E.P.U. in November will be about \$12 million smaller, the true dollar gain in November was \$53 million. This compares with \$58 million in October which was the best figure since last May. The reserves have had 14 consecutive monthly gains since the 7 percent Bank rate and other remedial measures of September 1957. December seems bound to break the sequence since it suffers about \$190 million of debt payments. It has not yet been definitely announced that Britain intends to make the annual payment of the \$181 million which is due on 31st December on the north American debts. Last year, the payment was postponed and Britain was granted the right to postpone it in seven other years during the rest of this century. It is generally taken for granted that this year will not be selected as one of them and that the payment will be made on its due date."

Paris Gold Softer

After a firm start, the Paris gold market softened somewhat during the past week. Business was restricted and did not show a particular trend. Activity was subdued due to the uncertainty about the 1959 Budget, and in the absence of precise information, dealers were reluctant to commit themselves.

Dull Trend in Vegetable Oils

Sharp price cuts featured several sections of the vegetable oil and oilseeds market during the

past week, with negative trading in all but a few isolated sections. The most active of the oilseeds was palm kernels with sizeable tonnages of French West African reported to have been sold to European crushers at cheaper prices of £63 down to £62 1/2, c.i.f. for January-February shipments with further sellers at the lower level. As a result, prices of other types of kernels fell sharply, but they were rarely able to compete. Philippines copra declined further by \$5 a ton and while cheaper offers attracted more buying enquiries than of late, most buyers' ideas were still about \$2 a ton lower than sellers' quotations. Straits copra declined to £89 for December-January shipment, but here again buyers' ideas seemed little better than £87. Coconut oil continued to drift lower in a dull market, Ceylon crude bulk oil being offered at £1 1/2 a ton cheaper without evoking serious buying interest. The linseed oil market remained quiet with a modest turnover, ex-tank, U.K. terms at shaded rates. Early last week, further business was noted in Canadian linseed for April-May shipment at £48 c.i.f. net terms, and later sellers were said to have covered their deals at lower prices. Groundnut oil failed to make headway with buyers even though Nigerian oil was offered as much as £1 1/2 a ton lower than previous levels. The groundnuts market was quiet while castor oil was steady but most of the spot demand was satisfied by U.K. millers, and offers of imported goods remained neglected. Soya beans showed little change with fresh business restricted while interest in rapeseed quietened and prices moved in buyers' favour.

Sugar Futures Firm

World sugar futures closed firm on renewed trade and commission house demand during the past week. Domestic futures moved narrowly in a quiet session. According to local Press reports, the Cuban rebel leader, Castro, had announced that he would seek recognition by other countries as the head of the eastern end of Cuba. He hinted that sugar would move if he was successful in his endeavour. Trade quarters in Cuba said, however, that it was generally felt in the trade he would not get diplomatic recognition and, consequently, the movement of the sugar crop was still in doubt.

Fall in W. German Aluminium Output

The production of virgin aluminium in West Germany is expected to amount to about 135,000 tons this year, or about 20,000 tons less than in 1957, sources close to the industry say. From 1st February to 31st October, the output was 116,473 tons which was a decline of 13 percent compared with that of the same period last year. The decline in domestic production is attributed to higher imports which were expected to rise to 65,000 tons against about 40,000 tons in 1957. The consumption of aluminium showed a steady upward trend, and it is likely to be about 2 percent higher this year than in 1957. The production of semi-finished aluminium goods amounted to 138,188 tons in the first ten months of this year, which was 4.5 percent higher than in the same period of last year.

U.K. Tea Stocks

U.K. tea stocks in London and provincial warehouses for the week ended 5th December totalled 148,251,290 lbs against 144,805,320 lbs during the previous week. The total amount to be landed on 5th December was 22,955,790 lbs. Deliveries during the week totalled 11,767,470 lbs and landings 15,213,440 lbs. The total afloat stock on 5th December was 57,758,790 lbs including from Calcutta 38,305,540 lbs, from Chittagong 3,052,170 lbs, from Ceylon 2,614,580 lbs, from Colombo 13,491,500 lbs and from other ports 215,000 lbs. The average price realised at the auction during the current week was 52.93d a lb against last week's 52.48d a lb and 54.48d a lb in the corresponding period of last year.

U. K. Tea Imports

U. K. tea imports in October totalled 65,514,000 lbs, against 50,876,000 lbs in October last year, according to the International Tea Committee. Re-exports totalled 2,521,000 lbs against 2,485,000 lbs leaving net imports at 62,993,000 lbs, compared with 48,391,000 lbs. Chief suppliers during the month were India with 37,077,000 lbs, Ceylon with 18,131,000 lbs and China with 4,116,000 lbs. The total of imports during the first ten months of 1958 was 460,559,000 lbs against 501,044,000 lbs in the corresponding period of 1957. Net imports were 434,709,000 lbs, compared with 477,982,000 lbs.

NEW INDO-POLISH VENTURE TO PRODUCE ELECTRIC HOUSE SERVICE METERS

A collaboration agreement has recently been signed by Messrs S. L. Khemka and D. G. Mulharkar, directors of the Electro-Equipments Corporation Private Ltd, Bombay, and it has been endorsed by Messrs Z. Pluteczki and J. Zyzka, representatives of the Polish firm C.E.K.O.P., exporter of plant equipment and complete works. Under this agreement, the Electro-Equipments Corporation Private Ltd will establish a factory in Mulund, Bombay, in collaboration with the Polish manufacturers, to produce 60,000 electric house service meters a year. The enterprise involves an investment of about Rs. 40 lakhs and will provide employment for about 400 people. The factory is expected to go into production some time next year.

Stocks and Shares

CONTROL ON PROFITS PROPOSAL SCARES OPERATORS

SHARP DECLINE IN PRICES

Wednesday Evening.

THE Congress Working Committee's six-point programme for raising the resources required for the remainder of the second plan and third plan, particularly the proposal to control profits in the private sector, has had a disastrous effect on the stock market. Prices collapsed in sentiment in the stock market. In fact, it was when trading began on Monday, that the biggest decline in any single day during the current year. Indian Iron closed on Saturday last at Rs. 25.80; at the close of business on Monday the quotation had slumped to Rs. 24.80. Most sections of the market shared in the general decline and losses in some cases were severe. Operators now appear to have shed completely the conviction held earlier in the year that there has been a change in the Government's attitude towards the private sector. On a closer examination of the draft resolution however, it would appear that the decline in share prices has been overdone. It seems unlikely that the Government will give serious consideration to the proposal for a limit on profits because, apart from the difficulty of working out a satisfactory formula, the move would probably encourage dissipation of profits—just what the Government wishes to avoid.

The gilt-edged market ruled firm throughout—particularly State loans. There was a strong all-round enquiry for 4% and 4 1/2% State issues, with buyers willing to pay higher prices to obtain their requirements.

Preference shares maintained their popularity, but buying orders are still difficult to execute due to the almost complete absence of sellers of selected stocks.

The trend in the remaining sections of the market was downwards and buyers were conspicuous by their absence until today, when some bargain hunters were active and most shares staged a moderate recovery from the lowest levels touched. Indian Iron closed at Rs. 25.06 after being sold down to Rs. 24.75 yesterday.

According to a P.T.I. message just released, Mr. B. N. Chaturvedi, President, Calcutta Stock Exchange, has said in a statement today that the Congress Working Committee's draft resolution, had caused concern among the investing public. Commenting on the effects of the resolution, he said share values on the Calcutta and Bombay Stock Exchanges recorded a sharp decline on Monday and the confidence of investors recently to be somewhat disturbed. It is only recently that the share markets have shown signs of activity after the shock administered by the Central Budget of 1957-58. It is unfortunate, therefore, that at this juncture the Congress Working Committee should put forward the proposal for a ceiling on profits in the private sector without a proper appreciation of its implications.

He pointed out that the burden of taxation on companies and individuals has been steeply increased in the last few years and the Working Committee itself appears to be of the view that there is little scope for fresh taxation. The recent studies published by the Research Department of the Reserve Bank of India have clearly shown how, on account of high taxation, joint-stock companies are finding it extremely difficult to obtain the necessary resources for their efficient working. It is significant that the total incidence of taxes on income, wealth and dividends of companies in India amounts to about 56 percent compared with 41.6 percent in West Germany, 34.5 percent in Norway and 56 percent in Sweden.

Mr. Chaturvedi added that in the light of this high tax burden, it is not clear why there should be a statutory ceiling on profits. Such a proposal would hardly do any good to the economy. On the other hand, it would cause immense harm. It would make investments in industrial concerns less attractive and encourage the diversion of funds into non-productive channels. It would retard industrial expansion and have its impact on employment. Foreign capital would also be discouraged by such proposals. In short, the objectives of higher production, more employment and a better standard of living for all, will be made more difficult to achieve. In the last few years, a new type of investor has been emerging from among the middle classes. This person has now come to realise the value of investment in industries, and is beginning to take an interest in the share markets. It is necessary that at this moment, that nothing should be done to affect their morale. It is to be hoped that the country's leaders will refrain from implementing schemes which, though politically attractive, are harmful to the best interests of the country.

THE PROFIT OF THE PATRAKOLA TEA COMPANY has amounted to Rs. 14.55 lakhs for the year ended December 1957. The dividend is reduced from 25 percent to 10 percent and absorbs Rs. 3.60 lakhs. The directors comment that every effort is being made to obtain a remittance from Pakistan, without which "insufficient funds in India are available for the payment of the dividends." Revenue re-

serve is allocated Rs. 1 lakh, leaving a carry-forward of Rs. 1,47,310. Both the crop and the average sale price declined. Estimates for 1958 provide for a crop of 4,080,000 lbs at a cost of Rs. 57.14 lakhs.

PROVIDING Rs. 1.23 LAKHS (Rs. 2.08 LAKHS) for taxation, there is a profit of Rs. 1.51 lakhs for Anderson Wright Ltd for the year ended December 1957, against Rs. 2.55 lakhs. Debenture redemption reserve is allocated Rs. 50,000. The ordinary dividend is reduced by 1 percent to 3 1/2 percent to absorb Rs. 70,000, leaving a carry-forward of Rs. 7,803 against Rs. 66,951 brought in.

THERE IS A DECLINE OF Rs. 15.10 LAKHS TO Rs. 52.34 lakhs in the profit of the Suttle Cotton Mills during the year ended March 1958. The ordinary dividend is maintained at 60 percent. The taxation provision is lowered from Rs. 50.56 lakhs to Rs. 41.57 lakhs. Dividend equalisation reserve is allocated Rs. 1 lakh, leaving a carry-forward of Rs. 30,16,282 against Rs. 29,39,630 brought in.

PROVIDING Rs. 50 LAKHS (AGAINST Rs. 30 LAKHS) for depreciation, Rs. 12 lakhs for development rebate reserve and Rs. 38 lakhs (Rs. 40 lakhs) for taxation, the profit of the Orient Paper Mills has amounted to Rs. 26.80 lakhs (against Rs. 53.66 lakhs) for the year ended March 1958. Bringing in Rs. 2,63,477, there is a balance of Rs. 29,43,868. An ordinary dividend of Rs. 1.50 a share has been maintained and it absorbs Rs. 22.02 lakhs, leaving a balance of Rs. 1,20,326 to be carried forward. The directors state that the second paper machine was commissioned towards the end of the financial year under report and it is working satisfactorily. The programme for modernisation and extension of the board manufacturing plant is progressing satisfactorily and it is expected that the plant will go into production during the current financial year. The Amlai project in Madhya Pradesh is progressing. The company has already executed

Hirakud Power Station is protected with Shalimar Tarfelt

an agreement for having a part of the land acquired through the State Government. It is expected that the company will get possession of the land and will be able to start construction work on the site at an early date. Negotiations are also in progress with foreign suppliers to import machinery required for the project on a deferred payment basis. An application has been made to the Government, and as soon as the approval is received, the company will finalise the orders.

THE PROFIT OF JARDINE HENDERSON LTD has amounted to Rs. 15.25 lakhs for the year ended March 1958, against Rs. 27.75 lakhs in the previous year. Bringing in Rs. 4,71,170 and other miscellaneous receipts, there is a balance of Rs. 22,03,217. Taxation absorbs Rs. 6.20 lakhs and general reserve Rs. 2½ lakhs. An ordinary dividend of 2½ percent has been maintained, leaving a carry-forward of Rs. 4,92,742. The directors state that in spite of the diversification of the company's activities which has been achieved in recent years, its prosperity still depends in the main on the performance of the jute mill companies under its management. The improvement in the working of the mills has been fully maintained but the necessity for the mill companies themselves to build their liquid resources, which had been severely depleted through the implementation of large-scale modernisation programmes coincident with and followed by a period of trading losses during 1956 and the early part of 1957, is bound to delay the resumption of dividends from these companies at rates which will represent a reasonable return on the Jardine Henderson capital invested in their shares.

Bombay Market

PRICES FALL HEAVILY ON C.W.C. PROPOSAL BUDGET FEARS DEPRESS SENTIMENT

Wednesday Evening.

THERE was a heavy shake-out in the Bombay stock market last week. Operators were scared by a report that the Congress Working Committee has been discussing the possibility of controlling industrial profits. Considering that there is such a crying need for larger resources for economic development it is feared that there will be little chance of tax reliefs in the next Budget.

Towards the close, prices seemed to settle down at lower levels and selling pressure abated considerably. Tata Steel declined to Rs. 171 and Indian Iron were quoted at Rs. 25.20. A report that the share transfer books of the Indian Iron and Steel Company will be closed from 12th January for the purpose of issuing bonus shares, has had little effect. Tata Locomotive were steady at the lower level of Rs. 194 on support from the Life Insurance Corporation. Premier Construction were transacted at Rs. 229.75 and Alcock Ashdown were freely available at Rs. 232.50. Motor shares were quiet, and Premier Automobile declined to Rs. 79.90. Hindustan Motor were offered at Rs. 64.4.

Cotton mill shares showed losses all round. Bombay Dyeing dipped to Rs. 54.60 and Century were quoted lower at Rs. 411.50. Svadeshi were steady at Rs. 204.50 on influential support, but Kohinoor declined to Rs. 234.50 on pressure. Simcox came to hand at Rs. 168 and India United Ordinary were sold down to Rs. 8.40. At Rs. 1.24, Apollo met with virtually no support.

Miscellaneous shares toppled in sympathy with the general trend. Associated Cement were sold at Rs. 149.75 on a reduced dividend. Digvijay Cement

were taken at Rs. 128. Mining shares were subdued, and Shivarajpur Syndicate declined to Rs. 83. Sugar shares were quietly steady, and Belapur were bought at Rs. 292. Phalton changed hands at Rs. 157. Steamship company shares were quietly steady on prospects of increased tonnage. Scindia Steam were transacted at Rs. 21.04 and Great Eastern Shipping came to hand at Rs. 25. Bombay-Burmah backed to Rs. 475 on selling pressure and National Rayon were quoted lower at Rs. 232.25. Tata Chemical were available at Rs. 14.12.

There was little interest in banking shares considering the possibility of lower profits during the current year. United Commercial came to hand at Rs. 67.50 and Central Bank were transacted at Rs. 58.10. Scattered interest was taken in insurance shares but fluctuations were narrow. New India Assurance changed hands at Rs. 53.

Investment interest helped hold prices of electricity supply company shares. Ahmedabad Electric were bought at Rs. 94.10 and Tata Power were done at Rs. 121.50. Bombay Suburban were bought at Rs. 110.

THE WEEK'S TRANSACTIONS

Macfarlane & Co. (Defd.)-Rs 0/53-0/53-0/53-0/53- (0/47).

"CAPITAL" STOCKS AND SHARES INDEX *

The Capital Stocks and Shares Index (Base: 1939) has now been brought up to October 1958. Compared with September, the October indices for Government securities and preference shares show drops of 0.3 points and 0.1 point, respectively.

There were increases in banks 0.8 points, jutes 4.0 points, cement 1.5 points, engineering 19.2 points, papers 11.9 points and sugars 1.8 points, while decreases occurred in cottons 10.3 points, minings and oils 0.3 points, teas 1.7 points and

miscellaneous 2.6 points. The index for coal remained unchanged at 215.3 points. Combining all the factors, the Capital variable-yield securities index advanced by 3.5 points during October 1958.

Weights	Index of Govt. Securities	Index of Preference Shares	Variable-Yield Securities										Others	Combined Index
			Banks	Cotton Mills	Coal	Jute Mills	Mining and Oil	Cement and Lime etc.	Sug. and Metal Works	Tea Shares	Paper Mills	Sugar Shares

New Delhi

INDIA TO SEEK RUSSIAN AID FOR NEW OIL REFINERY

U.S. EXPORT-IMPORT BANK CREDIT FOR PRIVATE INDUSTRY

(FROM OUR NEW DELHI CORRESPONDENT)

THE Government of India will shortly approach Russia for financial and technical assistance to set up the second refinery in Barauni, Bihar, it is learnt. It will be recalled that the Government has decided to set up two refineries in the public sector, the smaller one in Assam and the bigger one in Bihar. It has already entered into an agreement with the Government of Rumania for financial and technical aid to establish the smaller refinery in Assam, the exact location of which has yet to be determined. The decision to approach Russia seems to indicate that no other foreign government has shown any great interest in the project. The oil refineries in the public sector will, therefore, be set up wholly with financial and technical assistance from the communist bloc. The ones in the private sector have been set up mainly on the guarantee that they will not be nationalised at least for a period of 30 years.

There are a few points worth considering about labour in these projected refineries. It is most likely that workers' unions will be under the full control of communists. The experience in Bhilai shows this. The workers of this Soviet aided steel-works have on the whole behaved better than those in Rourkela and Durgapur, but the fact of communist leadership in these strategic industries represents a danger which has to be always borne in mind.

Gas Production in Pakistan

Gas in Pakistan and oil in Assam were struck at about the same time in 1953. But Pakistan seems to have made ready use of its gas while the new oil find in Assam is yet to be exploited. The use of oil in Assam now represents a saving of Rs. 80,000 a day in foreign exchange to Pakistan. The total net foreign exchange saving so far has been about Rs. 35 crores. According to the latest figures, the present daily consumption of gas is nearly 40 million cubic feet, which is the equivalent of 1,000 tons of furnace oil. The Sui gas-field has recoverable reserves, equivalent to 125 million tons of fuel oil or 200 million tons of coal. Virtually all major industries south of Sui have switched on to gas. Small industries are steadily converting to gas. The number of commercial consumers rose from 18 to 184 during 1957, and domestic consumers from 12 to 333.

The Italian experts who came to study the possibility of oil exploration in India have just gone back to their country. In Italy, the oil industry is a State enterprise. Enquiries show that Italian oil interests may be prepared to undertake exploration in India for some quid pro quo to compensate them for the risk, involving a heavy capital outlay. Their collaboration will, however, depend on India's willingness to provide the requisite incentives.

Indigenous Motor-vehicle Components

The Minister for Commerce and Industry said in the Lok Sabha last week that "the percentages of indigenous content in different motor-vehicles manufactured in the country, as in April 1958," were as follows:

Cars	
Hindustan Ambassador	60 percent
Fiat "1100"	37 percent
Standard Vanguard	33 percent
Standard "10"	30 percent
Lorry and bus chassis	
Tata-Mercedes-Benz	53 percent
Dodge (medium diesel) 165in. W.B.	52 percent
Dodge (light-petrol) 126in. W.B.	26 percent
Dodge Power Wagon	26 percent
Leyland "Comet"	38 percent
Leyland Royal Tiger-Titan	9 percent
Willys' CJ-3B	58 percent

He also stated that Standard Motor Products of India Ltd, Madras, is the only firm which has so far been granted a licence under the Industries (Development and Regulation) Act, 1951, for the manufacture of agricultural tractors. It has been allowed the facility of importing its requirements of plant and machinery under the U.S. Export-Import Bank loan scheme. It is also being assisted to the extent possible considering the current foreign exchange situation, in procuring adequate quantities of components and raw materials. The capital invested by the firm, as on 30th September, 1958, is Rs. 1,46,55,932. This also covers its car manufacturing activities.

Two more schemes, including one of Mr. B. K. Khanna, have recently been approved by the Government, and the grant of licences to them awaits the approval of the terms of foreign collaboration. The tractor manufacturing programme is expected to start very soon. Standard Motors have so far been assembling tractors like other established importers.

Encouragement to Motor-car Producers

Two important developments are likely. First, the Government will consider very sympathetically

components, thus assuring a wide flexibility to meet eventualities.

Prime Minister on Third Plan

The Prime Minister said at a Press conference: "About the third five year plan, the position is this. I cannot say at the present moment what size it will be. Obviously, if we knew all about it, why should we have spent two years in discussing. We have two years still. But in the nature of things, the problem has to be viewed not from the point of view of putting up a factory here or a factory there, but the needs of the situation. In calculating the needs, what is the first thing you think of. Of course, the needs mean supplying the needs of the people of India, apart from certain needs like the defence needs and others. The first question that arises is: how many people? And then you not only take the population figure of today but of that date to which you are looking forward. Suppose we are planning, say, for ten years. So we have to think, let us say, of what the population of India will be ten years hence. Then we have to supply food for that increased population and something over. So that we have to produce that much food. We have to provide clothing for that population and so many other things which you may separate into categories—a few very essential, some essential, some important, some unimportant. You can leave out the latter categories, but you must take the essential categories.

"Then how do you get those things? Food—well, by better agriculture, by fertilisers, by better implements, by better seed, whatever it is. Now, therefore, we have to provide, let us say, fertilisers. Fertilisers, apart from green manure which is very important, come from fertiliser plant. We have to build fertiliser plant. Industry, well, whatever we want, we want machines to build industry. Who is going to produce the machines? We want bigger machines to produce the smaller machines. We want mining equipment for our mines, oil, coal. We must produce the mining equipment. Otherwise it is a terrific drain on us. After all, all this foreign exchange drain is a drain on capital goods. Therefore, we have to produce the capital goods. So you see one thing leads to another and you have to co-ordinate those things. You want to plan. You want coal, you want some other kind of power, may be atomic power. You want transport for raw material to go there and finished articles to come away. All this has to be seen in a co-ordinated way, to meet the needs and supply the needs of let us say, 400 million people in India or 420 million people in India ten years hence and you build up to it.

"Maybe, you cannot fully supply their needs in ten years, maybe 12 years, but you have to

The hairpin bends of Pikes Peak Mountain Climb

For the 29th consecutive race, Firestone tyres were on the winning cars in the Pikes Peak climb, where cars battle on dirt and gravel tracks around hairpin bends. The manufacturing skill and quality control that built these tyres ensure the same extra safety and dependability in the Firestone tyres for your car.

Firestone

New DeLuxe Champion • Tubeless or with Tube
the tyre with BUILT-IN PEACE OF MIND

form a picture of this process, remembering always that the needs are growing. The moment you slow down, the needs overwhelm you. That is not a process of calmly sitting down and saying we will do it not in five years but in ten years. But in ten years the problem is different, it is double the problem five years ago unless you catch up to it. Therein lies the need for tackling it with vigour in a big way so as to control this situation. Otherwise it becomes completely uncontrollable. Anybody who thinks of it must come to this conclusion whatever the detailed facts may be, but the broad fact is that the needs, economic needs or political needs, everything grows and grows in India and in any country and unless you are quick enough, it grows too fast for you and the population grows also. Therefore, you have to catch it by the neck somewhere or the other and get hold of it. You may go slowly about many other matters, but in basic matters you cannot afford to be slow. We have, because of our ignorance, gone rather slow in the past in certain matters. I should have liked a steel plant in the first plan. It would have helped us very much now. We did not, because we said we will do it later. Doing it later meant spending far more on it in foreign exchange and all kinds of things. Therefore, delay means a tremendously heavier burden later."

Aid to Private Sector

At present, a sum of about Rs. 25 crores has been tentatively earmarked for private sector projects under the agreement with the U.S. Export-Import Bank authorities. No firm allocations for individual industries in the private sector have been decided as it is now proposed to adjust them in accordance with the actual needs of the industries concerned after consideration of the applications received in response to the public notices issued earlier this year. As on 1st December, 1958, the position in relation to the applications approved and licences issued under the U.S. Export-Import Bank loan programme for private sector industries, is as follows:

Industry	(Rs. lakhs)	
	Approvals	Licensing
1. Textiles	359.62	205.00
2. Chemicals	576.74	191.55
3. Engineering	296.29	174.00
4. Motor-vehicles	235.50	—
5. Machine Tools	114.59	31.09
6. Coal Mines	—	—
	1,582.74	601.64

There have so far been no worthwhile applications from private coal mines. The firms whose

applications for importing equipment under the credit scheme are approved usually take some time for negotiating with foreign suppliers before approaching the licensing authorities with the necessary particulars for import permits. So far no drawings have been made from the loan. In accordance with the procedure for reimbursement under the loan agreement, it is only after orders have been placed and payments made for goods on delivery from the foreign exchange resources of the country, that the Government can prefer a claim and obtain reimbursement from the U.S. Export-Import Bank. The interest will, of course, be chargeable only from the time of drawing and on the actual amount drawn.

Triangular Trade

The Governments of Burma and the United States have concluded an agreement by which the latter will be financing the former's purchase of cotton textiles from India in Indian rupees. These rupees have been acquired by the U.S. Government through the sale of surplus agricultural commodities to India under the P.L. 480 Agreement. The Government of India has agreed to extend its co-operation in the matter.

Marketing of Handloom Products

A proposal to send a delegation to west Africa to study the marketing possibilities for handloom products has been made by the All-India Handloom Board, and is at present under examination.

N.I.D.C. Loan to Textile Mills

The National Industrial Development Corporation has approved up to 30th November, 1958, the grant of loans to the extent of Rs. 3.71 crores to cotton textile mills for the rehabilitation and modernisation of their machinery. Of this amount, applications from parties for loans amounting to Rs. 90.91 lakhs have been withdrawn. The amount actually drawn up to 30th November, 1958, is Rs. 82 lakhs. The entire advance is for the purchase of machinery, and amounts drawn represent purchases completed.

Heavy Engineering Corporation

There is a proposal to set up a heavy engineering corporation in the near future. Details are under consideration.

Nepa Newsprint

The distribution of Nepa newsprint is handled by the Nepa Mills through the agents appointed by the management as well as direct to news-

papers and the printers and publishers of textbooks and books of general interest.

Production of Non-ferrous Metals

The production of aluminium, zinc, copper, and lead during the year ended 1st April, 1958, was as follows:

Aluminium (unwrought)	7,888 tons
Copper (unwrought)	7,734 tons
Lead (unwrought)	3,270 tons
Zinc (concentrates only)	6,888 tons

The present annual consumption of these four metals in all forms is as given below:

Aluminium	27,000 to 28,000 tons
Copper	45,000 tons
Lead	18,000 to 20,000 tons
Zinc (as metal)	50,000 to 55,000 tons

The gap between indigenous production and demand by the end of the second five year plan is estimated as follows:

Aluminium	22,000 tons
Copper	40,000 tons
Lead	15,000 tons
Zinc	50,000 tons

Raw Cotton Imports and Exports

The Cotton Advisory Board has recommended that 600,000 bales of foreign cotton be imported during the 1958-59 season. As for exports, the Board has recommended an immediate release of 150,000 bales of Bengal Deshi, 25,000 bales of old Punjab cotton not above 13/16in. and 50,000 bales of cotton not above 1in. and a further release of an additional 50,000 bales of cotton not above 1in., after taking into account the crop conditions at that time. It has suggested that the export duty on cotton should be abolished. The Government has released the following import and export quotas during the current cotton season:

Imports: 20,000 bales of 1½ in. stapling and above, and 10,000 bales of 1½ in. stapling and above for import from soft currency areas.

Exports: 250,000 bales of Bengal Deshi cotton; 150,000 bales of cottons (other than Bengal Deshi) not above 1in. in staple; 100,000 bales of new cotton of staple length below 1in. 20,000 bales of old cotton of the 1957-58 and earlier seasons (other than Bengal Deshi) not above 1½ in. in staple, over and above the 30,000 bales permitted during the 1957-58 season.

As for export duty, the Government has reduced the duty on raw cotton from Rs. 50 a bale to Rs. 25 a bale with effect from 15th November, 1958.

Heavy Engineering Projects

Arrangements are being made to obtain as early as possible detailed project reports for a structural shop and a plate and vessel works as recommended by the U.K. heavy engineering mission. As for the machine tool works, certain offers have been received and efforts will be made to fit in this one with the other heavy engineering projects in view, if satisfactory arrangements can be made for the foreign exchange payments. But no progress concerning these two projects has been made so far in view of the limited resources available during the second plan period.

State Trading Corporation

The following is the amended clause of the memorandum of association of the State Trading Corporation, as approved by the Government of India. It is yet to be filed with the Registrar of Companies. The objects for which the company is established are:

(i) To organise and effect exports from, and imports into, India of all such goods and commodities as may be determined by the company from time to time and to undertake the purchase, sale and transport of and general trade in such goods and commodities in India or anywhere else in the world.

(ii) To acquire and undertake the whole or any part of the business, property and liabilities of any person or company and to improve, manage, develop, grant rights or privilege concerning, or otherwise deal with, all or any part of the property and rights of such person or the company.

(iii) To subscribe for, take, or otherwise acquire, and hold shares, stock, debentures or other securities of any other company.

(iv) To give guarantees and indemnities for the performance of contracts in which the Corporation is interested; and

(v) To do all such other things as are incidental or conducive to the attainment of the above objects.

Manufacture of Drugs

Messrs. Merck Sharp and Dohme International of New York, U.S.A., will be establishing, within a period of 12 months, a new industrial undertaking for the manufacture of some drugs. Messrs. Merck Sharp Dohme (India) Private Ltd. will have a 40-percent Indian capital participation. Messrs. Tata Sons are going to be their Indian partners. The plant will ultimately be located in Thana, facilities during the building period of the plant in Bombay.

Concession to Foreign Investors

The Finance Minister introduced a Bill in Parliament last week amending the Foreign Exchange Regulation Act, in order to make it clear that

the Government's power to prohibit the holder of notified security payable outside India in a notified country from having payment of such security made in India without the permission of the Reserve Bank, does not apply to a foreign investor. So far it has been open to the Government to notify at any time that the repayment of a loan made by a foreign investor to an Indian company will not be permitted even in India without the specific approval of the Reserve Bank. Henceforth, this power will be restricted to Government securities relating to loans floated before 15th August, 1947, and payable outside India in any country or place notified in this behalf by the Central Government.

Wool Exports Fall

Exports of home-grown wool from India declined between the first and second quarters of this year; in the latter period they amounted to 7.1 million lbs. or a reduction of 13 percent. This was 37 percent less than in the second quarter of 1957. The January-March 1958 shipments to the United Kingdom were only half as big at 2 million lbs. causing that country to fall to the third place, and those to the United States fell by 9 percent to 2 million lbs. These, together with smaller decreases to Belgium, France and the Netherlands, more than offset a five-fold expansion in exports to Russia, which amounted to 2.2 million lbs during the quarter, and caused that country to become the largest single market for Indian wool. It will be recalled that Russian wool purchases amounting to over 6 million lbs were reported to have been made between March and May this year.

EXPORTS AND RE-EXPORTS OF RAW WOOL FROM INDIA (in 1000 lbs)

	Quarterly average		1958	
	1956	1957	Jan.-Mar.	Apr.-June
Belgium	343	436	394	169
France	209	528	411	267
West Germany	188	318	123	186
Netherlands	133	143	131	124
Russia	1,089	1,422	477	2,208
United Kingdom	3,856	4,100	4,174	1,906
United States	2,756	2,229	2,182	1,977
Other countries	195	276	248	253
Total	8,769	9,452	8,140	7,090
Re-exports total	1,028	15	—	—

Imports Decline

Seaborne imports of raw wool were seasonally higher during January-March, but fell off quite sharply during April-June to 540,000 lbs. This was less than half as great as in the first quarter, and 22 percent less than a year previously. The decline, compared with January-March, was mainly in receipts from Australia and New Zealand. Imports recovered during April-June to 4.3 million lbs. which was 23 percent greater than in the preceding quarter, although 14 percent less than during April-June 1957. Imports from the U.K. rose by 17 percent between the first and second quarters to 3.2 million lbs. and those from Australia were 45 percent greater at 1.2 million lbs. Yarn imports during April-June amounted to 800,000 lbs. which was 43 percent and the corresponding period a year ago. Compared with the January-March figures, the receipts from Italy, the dominant supplier, were down by 42 percent.

SEABORNE IMPORTS OF RAW WOOL, TOPS AND YARN INTO INDIA (in 1000 lbs)

	Quarterly average		1958	
	1956	1957	Jan.-Mar.	Apr.-June
Raw Wool:				
Australia	324	337	682	297
New Zealand	310	365	564	213
United Kingdom	371	63	56	11
Other countries	25	4	9	20
Total	1,030	771	1,311	541
Wool Tops:				
United Kingdom	2,781	2,830	2,704	3,161
Australia	—	1,022	799	1,156
Other countries	962	215	43	28
	3,743	4,067	3,546	4,345
Wool Yarn:				
United Kingdom	70	48	26	8
Italy	1,166	1,042	1,363	785
Japan	26	20	32	2
Other countries	37	25	2	10
	1,299	1,135	1,423	805

Receipts of wool tissues, affected by further cuts in import licences, dropped sharply between the first and second quarters of 1958, amounting to only 46,000 linear yards in April-June, half as great as in the previous quarter and only one-seventh their level a year earlier. Compared with April-June 1957 the largest reduction occurred in imports of woollen and worsted piecegoods. Imports of blankets and rugs also fell very sharply to only 2,000 lbs during the second quarter of 1958. The output of woollen and worsted yarn in the

April-June quarter amounted to 6.8 million lbs, 2 percent lower than in January-March and brought the total for the first half of the year to 13.8 million lbs, or 12 percent greater than a year earlier. Production of cloth came to 4.2 million linear yards in the second quarter, which was 11 percent less than in the preceding quarter. The six months' cumulative total from January at 9 million linear yards was 29 percent greater than a year previously.

Foreign Trade

The growing volume of Indo-Russian trade has caused some apprehension in quarters which have been regular exporters to India. They feel that India's future trade pattern could develop on lines which may not be favourable to them. India's foreign exchange difficulties, they point out, will last for at least ten years, during which her trade will either have to be on a barter basis, or with the countries which now advance her loans.

The latest available trade statistics show that India's exports have been stable around Rs. 550 crores, while imports have risen from Rs. 570 crores in 1953 to Rs. 1,025 crores in 1957, or an increase of Rs. 455 crores. During this period, the adverse balance of trade has increased by Rs. 38 crores to Rs. 420 crores. In the first eight months of 1958, imports totalled Rs. 512 crores, or Rs. 147 crores less than in the corresponding period of last year. Exports declined by Rs. 62 crores to Rs. 349 crores. The reduction in exports was largely due to a fall in prices. Some feel that it is for the traditional traders with India to correct the situation by acting in the G.A.T.T. and Commonwealth spirit, not only by increasing imports from India, but also by helping stabilise the prices of primary products at a reasonable level. As far as the communist bloc is concerned, India's plan is to supplement rather than to supplant her trade with her established customers.

The Last Phase

THE COMMISSIONING OF THE NEW Rs. 70-million Blast Furnace in Jamshedpur in October marks the beginning of the end of the expansion programme started in December 1955 to double Tata Steel's capacity to two million tons a year.

One of the largest in the world, the new Blast Furnace will produce 1,650 tons of molten iron per day. Completed earlier was the third Steel Melting Shop with its seven open hearth furnaces, which alone will produce 1.3 million tons of steel ingots a year. Also in operation now is the new Rs. 100-million Blooming Mill with a primary rolling capacity of two million tons.

Covering every phase of operation from the winning of ore to the rolling of finished steel, the expansion will be virtually completed by the end of 1958. The capital investment on expansion and annual replacements by Tata Steel over the five years 1955-60 is estimated at Rs. 1,330 million—more than one-fifth of the total outlay by organised industries in the private sector.

EFFECT OF STRIKE ON KERALA PLANTATIONS TEA CROP SUFFERS

(FROM OUR SOUTH INDIAN CORRESPONDENT.)

INDIA has lost about 2.2 million lbs of tea valued at Rs. 51 lakhs on account of the recent strike on the High Ranges, according to the chairman of the Kanan Devan Planters Association. He estimates the loss of foreign exchange at Rs. 44 lakhs, of Central revenue at Rs. 16 lakhs and of State revenue at Rs. 14 lakhs. Workers have lost not less than Rs. 6 lakhs. The loss suffered by individual workers is difficult to assess accurately since payment to pluckers is made on a piece-rate basis. But those who worked got anything between Rs. 90.35 and Rs. 116.10 for October. The chairman, Mr. J. B. Soutar, has given these figures in a 43-page brochure entitled the *High Range Strike* which has just been published. The figures relate only to October. The long period of neglect of the tea bush in the growing season has led to overgrowth and coarsening of the leaf. This has resulted in a slower growth and hence lower yields for next few months. Areas which are grossly overgrown have had to be cut back to stimulate leaf growth. It is likely, therefore, that a smaller crop will be produced in these areas for a period of anything up to eight weeks.

These developments will adversely affect the quantity and quality of tea produced between now and March. A decline in quantity will reduce Government revenues and foreign exchange earnings. The deterioration in quality and hence lower prices will have similar effects, and these will be aggravated by the fact that it is only between December and March that climatic conditions in the High Range are suitable for the production of good quality teas. As most of these teas are normally exported to the United States and other hard currency areas, the result will be to reduce the contribution the High Range annually makes to the nation's dollar earnings, Mr. Soutar says.

Cases of Violence

Other important points the chairman makes in the booklet are that the communist union started and conducted the strike in utter disregard of the provisions of the code of conduct, adopted at the Maini Tal conference, that union leaders and propagandists from outside incited violence and that the State Government openly supported strikers. There were as many as 27 cases of beating, 34 of stoning, 94 of obstruction with violence and 24 of sabotage indulged in by strikers within the course of 26 days. It was after a particularly violent session of speeches in Munnar on 19th October, sponsored by communist leaders, that incidents occurred on 20th October which led to the police firing in Guderal and Talliar estates. This resulted in the death of two and injury to many. The chairman challenges the Chief Minister's claim that absolute protection was given by the police to managerial staff. He characterises the State Labour Minister's Press statement to the effect that his Government is convinced that the strike was fully justified as "highly partisan". In spite of intimidation, violence and propaganda by communists, workers joined work in great numbers. The I.N.T.U.C. union, which claims a considerable membership, gave a lead to workers to face the consequences.

Coercive Pressure

Mr. Soutar says in the booklet that even after the strike was called off on 30th October, lawlessness and violence continued on the estates. The union leader, Mrs. Rosamma Punnose, continued her fast even after the suspension of the strike. This was an act of coercion which made the resumption of normal working conditions difficult. Sporadic inter-union fights and attacks on individual workers were still continuing two weeks after the suspension of the strike. Whereas the labour force had previously worked together in amity and peace, there is now resentment and animosity between different groups and this often results in violence at the slightest provocation. In conclusion, Mr. Soutar says that as in the strike in Jamshedpur earlier in the year, the High Range strike appears to have been designed to which is vital to the success of the second five year plan. It is well known that the tea industry is the largest single earner of foreign exchange. "At a time when the foreign exchange shortage is of crucial importance, this concentration of violence investment is of foreign origin may not be without significance," the chairman says.

Extent of Losses

In the Kerala Legislative Assembly, the Minister for Law and Order, Mr. Krishna Iyer, has said in reply to a question that on account of the recent strike on plantations, Rs. 61 lakhs worth of tea has been lost. The Government has incurred an expenditure of Rs. 20,318 towards police arrangements on estates during the strike period. The State Labour Minister said that more than 500,000 man-days were lost as a result of the strike. He was closely questioned by members of the House on this issue but did not give any clear reply. The Minister said that 28 cases involving 354 persons were registered by the police in connection with the High Range strike.

Mrs. Rosamma Punnose, leader of the communist union on High Range plantations, has made sweeping allegations against the Kanan Devan Company in the State Legislature. She has said that the company is running "a State Government," paying scant regard for the State Government's laws and violating the provisions of the agreement with the latter on which it is holding its properties extending over 138,000 acres on the High Ranges. She has alleged that the company is diverting the profits it makes from its properties in the State to plantations in East Africa. She has complained that the company is victimising those who participated in the "peaceful strike" on its estates. The Chief Minister has said in reply that as for the allegation that the company is violating the agreement, the State Government is examining the question and necessary action will be taken if the allegation is found true and that the Government is taking measures to see that workers are not victimised.

Background to the Agreement

The State Revenue Minister has said in reply to a question in the House that the agreement between the company and the State Government on the lease of land to the former will expire in 1984. It was first made in 1877. The parties to the original agreement were Mr. John Daniel Munro and the Raja of Poonjar. According to it, the Poonjar chief granted, for purposes of cultivation and for opening homesteads and farmsteads, an extensive area of jungle forest and grass land on the High Ranges for a nominal annual tax. This was ratified by the then Travancore Government. It was renewed in 1944 and the Kanan Devan Company came in the place of Mr. Munro and the other party to the agreement was the Government of Travancore. The company made great improvements on these lands within the last 80 years, opened fine tea estates, constructed roads and buildings, hospitals, schools and the Munnar town itself. The relations between the company and the Communist Party have not been cordial and the latter has been demanding the nationalisation of the properties owned by the company in Kerala. The recent strike, which ended in a fiasco, has worsened the relations between the two and the allegations of communist leaders against the company have to be viewed against this background.

CALCUTTA TEA AUCTIONS IN NOVEMBER

EASIER TREND IN PRICES

FOUR sales were held in November, and offerings totalled approximately 282,000 packages. The market continued to decline throughout the month, and any benefit to producers which might have been achieved due to the recent changes in excise and export duties was quickly eliminated, say Messrs Carritt Moran and Co. Private Ltd. in their monthly tea market review. CTC teas were again the weakest feature, and were often difficult to sell at prices well below valuations, quotations being 80p to Re. 1 a lb below the levels ruling at the same time last year. Well made and stylish whole leaf grades were well supported, and bright liquoring orthodox Assams and Darjeelings came to a ready market, although these also eased steadily due to the limited demand for them. Orthodox Assams O.F.s were a weak feature, and were very cheap, but tippy teas continued to sell well. The recent strong demand for P.F.s. eased considerably in the last sale of the month due to the absence of Middle East operators.

Leaf appearance from most Darjeeling estates continued very satisfactory and although quality showed a further slight decline, the standard of cup quality was fully average for the time of year. In the last two sales, a few invoices showed signs of seasonal improvement and were brighter in character. There was little change to note in the quality of offerings from Assam, which remained at a satisfactory standard for rains teas. In the last sale, a few invoices were seen which showed a very slight improvement. Cup quality of Dooars teas showed little change and was about average, but more fibre was frequently noticeable in teas of non-wither Legg-cut manufacture. There was little noticeable change in Cachar teas, either in leaf appearance or cup quality, both of which were about average for the time of year.

Quotations		1958-59	1957-58

" " 20 " " "	...	1.68	1.60
" " 20 " " "	...	1.65	1.63
" " 21 " " "	...	1.60	1.68

With 7,134 chests on offer during the month, internal Leaf offerings, which have generally been of a starchy and fibrous residual type, followed the general downward trend in the export market. Dust offerings which totalled 84,030 chests, were generally of average quality for the time of year, although there was a noticeable increase in the quantity of teas of a fibrous description coming to the market. A good general demand prevailed throughout the month although the trend was easier for CTC types, with black leaf Middle East types and plainer liquoring sorts declining with the departure of Egyptian buyers in the middle of the month. Legg-cut teas continued to meet useful enquiry but they also shared in the general decline in price. Darjeeling Dusts, which sold well at generally dearer rates earlier in the month,

were lower with the slackening demand in Sale No. 21.

Quotations		1958-59	1957-58
		Rs. 4P	Rs. 4P
Sale No. 18 Clean Common Dust	...	1.86	1.70
Sale No. 19 " " "	...	1.88	1.77
Sale No. 20 " " "	...	1.86	1.77
Sale No. 21 " " "	...	1.82	1.73

Export sales up to and including Sale No. 21 totalled 1,081,974 chests at an average price of Rs. 2.47, compared with 1,025,863 chests at an average price of Rs. 2.36. Internal sales at 24,399 chests of Leaf and 359,258 chests of Dust at the average prices of Rs. 1.70 and Rs. 2.03 go against 36,055 chests and 345,736 chests (Rs. 1.52 and Rs. 1.91), respectively.

The estimated north-Indian crop to the end of October 1958 was 463,425,133 lbs compared with 468,642,248 lbs to the same date of last year. The average figure at this date for the three years, 1955-57 was 474,254,142 lbs. Business in Export quota was done at 3nP a lb for the first few days of the month, and declined to 2nP a lb, business being transacted at or about this price until 16th November. The price, however, gradually fell further to 1nP a lb strengthening to 2nP towards the end of the month, and business at the close was transacted at this price.

Arrivals (in chests) in Calcutta warehouses from 24th October, 1958, to 23rd November, 1958, with the corresponding figures in parentheses, were: by steamer 549,058 (539,862), by rail 155,488 (169,512) and by air 8,047 (21,275), totalling 712,593 (730,649) chests. Arrivals since the beginning of the season, 1st April, 1958, to 23rd November, 1958, have been: by steamer 2,508,970 (2,238,791), by rail 672,879 (708,619) and by air 81,536 (133,568) chests.

COCHIN TEA SALES

At Dust Sale Z, 800,000 lbs of tea were on offer. Demand was good but prices were irregular. Low medium and mediums were firm and were occasionally dearer while high grown remained irregularly easier.

Aluminium Landmark..

The famous statue of EROS, the Greek God of Love, typifies the heart of London to millions of people all over the world. But the statue has another distinction. It was the first ever made of aluminium. Once rare, aluminium is now indispensable—for lightness and its other fine properties it is without a competitor. An historic landmark in cable manufacture was the advent of aluminium sheathing for power cables. In Henley Aluminium Sheathed Cable, the electrical industry now has a product of remarkably high quality.

- ★ Easily installed—comparative rigidity.
- ★ Are considerably lighter than the equivalent lead-sheathed Cable.
- ★ Give superior mechanical protection. ★ Permit fewer supports.
- ★ Have smooth, clean and tidy appearance. ★ Resist vibration.

From the leading
container makers come
pressed metal
industrial
components!

The Metal Box Company of India Ltd have become the leading container manufacturers in India in the short span of 15 years. Today, over a thousand packers and bottlers are using Metal Box products to package Rs 100 crore worth of consumer goods every year!

But that is not all. The manufacture of decorative containers and closures calls for specialisation in the forming of metal sheets to various shapes and within narrow tolerances. The experience gained by Metal Box in the pressing of steel, aluminium, tinplate, brass and other alloys, as well as in the impact extrusion of pure tin, lead alloy and aluminium is now proving useful in the production of deep drawn and shallow stamped as well as extruded industrial components. Covers for fan

regulators and house meters, hub caps for automobiles, chassis and transformer cans for radios, lead capsules for insulators, parts for duplicators—these are but a few of the many components regularly supplied by Metal Box. Scrupulous attention paid to the quality of metals used and stringent quality control to ensure precision fitting, have been largely responsible for the components made by Metal Box gaining acceptance as the finest made in India.

India's programme of industrialization places a heavy and complex burden on ancillary industries, and Metal Box, the leaders in the packaging field, are ready to meet this challenge with all their resources and all their experience.

GOOD GENERAL DEMAND AT
TEA EXPORT SALE

DUST PRICES IRREGULAR

AT Sale No. 24, held on 15th and 17th December, offerings at the Export auction amounted to 61,267 chests. There was a good general demand but most descriptions generally tended easier. "Teas for price" met with fair enquiry but at easier rates. Plain broken were about 2n to 4n easier, similar Fannings being irregular and sometimes lower. Medium B.P.'s declined by up to 4n while P. Fgs. in this category were barely steady. Orthodox B.O.P.'s were an irregular feature and were about 10n to 20n easier. There was fair support for O. Fgs. grades at irregular rates. Clean black teas from all districts again sold well, the tippest sorts being keenly competed for. There was more support for C.T.C.'s, particularly the cheapest kinds which were often dearer, while the few best liquoring descriptions met with good enquiry. Stylish whole leaf grades sold well while others showed an easier tendency. There was a fair demand for Darjeelings at lower rates.

Quotations	1958	1957
	Rs.	Rs.
Clean Black Pekoe	1.95	2.25 to 2.30
Plain B. P.	1.54 to 1.58	1.50 to 1.52
Plain Fannings	1.54 to 1.70	1.50 to 1.58
Medium B. P.	1.62	2.80 to 3.00
Medium Fannings	1.70 to 1.76	1.54 to 1.58
Best Assam C.T.C. B. P.	2.10	(Nom.) 1.60 to 1.64
Best Assam C.T.C. Fgs.	2.20	(Nom.) 2.00 to 2.80

At the Internal Sale, there was a stronger and more general demand for the 19,645 chests of Dust on offer. Clean orthodox descriptions were generally 4n to 6n easier but buyers showed more interest in the small powdery types. Leg-cut teas were a little irregular and were generally easier. Darjeeling teas were also irregular depending on quality. There was a better demand for C.T.C. teas than in recent weeks and these generally sold at about last rates, the smaller types receiving better enquiry. The best C.T.C.'s on offer often sold well above valuations.

Quotations	1958	1957
	Rs.	Rs.
Medium Deers Dust	1.68 to 1.70	1.58 to 1.60
Medium Assam Grainy Dust	1.72 to 1.74	1.60 to 1.64
Medium Assam C.T.C. Dust	1.85 to 2.05	1.70 to 1.80
Best Assam C.T.C. Dust	2.40 to 2.80 (Nominal)	2.40 to 2.85

Leaf offerings amounted to 2,743 chests for which there was a fair demand at slightly easier rates. The few types of green tea on offer met with a good demand and sold at rates above valuations.

FREIGHT MARKETS QUIET

The freight markets were quiet during the past week, and the approach of the year-end holidays will not improve the situation. Two tankers were taken on trip time charter in the United States for re-delivery Bombay and would presumably be used in the grain trade. They are the Candia 20,533 d.w. at \$10.13 with delivery U.S. Pacific and the Atlantic Marchness 17,800 d.w. at \$10.25 with delivery U.S. Gulf. Further standard tonnage was taken for grain to India and Pakistan. U.S. flag tonnage being fixed at \$10.20.65 to the latter destination against

\$10.25 for free tonnage and at \$10.25.25 against 77s 6d to the former. The market met with an unusual enquiry for freezer space from Hsingkong to Adabiya for frozen meat.

LINSEED FIRM

A moderately firm undertone prevailed in the linseed market during the past week, and in spite of limited trading, prices were well maintained. The supplies of seeds and oil were poor and both buyers and sellers were reserved. The oil market was inactive with buyers hesitant. Latest quotations were as follows: Ready-December Rs. 26.12 a maund.

HIDES AND SKINS STEADY

The market ruled steady. Stocks were less than in the previous week.

Bazaar Sales

(Between 9th December and 15th December, 1958)
Cowhides: Wet salted (Ord.) 19,600 pcs. on the basis of Rs. 6.50 to Rs. 11.50; Wet salted (Slaughter-e.) 28,700 pcs. on the basis of Rs. 9.50 to Rs. 15.50 and Rs. 17.50 to Rs. 25.00; Wet salted (Ord.) 6,300 pcs. on the basis of 72n to 78 n a piece.

Goatskins: Wet salted (Patna, Daissee and Kustia) 49,600 pcs. on the basis of Rs. 300 to Rs. 320, Rs. 350 to Rs. 360 and Rs. 380 to Rs. 400. Wet salted (he-killed) on the basis of Rs. 4.62 and (she-killed) on the basis of Rs. 3.87 a piece; Assam-Dinajpur-Purulia 43,400 pcs. on the basis of Rs. 300 to Rs. 340 and Rs. 350 to Rs. 365; Patna-Pakur (Ord.) 6,300 pcs. on the basis of Rs. 310 to Rs. 340; Muzafferpore-Patna 25,750 pcs. on the basis of Rs. 330 to Rs. 350; Muzafferpore-Dinajpur (heavy) 1,500 pcs. on the basis of Rs. 390 to Rs. 400.

Bazaar Stocks

(15th December, 1958)

Cowhides: Wet salted 1,18,000 pcs.

Goatskins: Wet salted (Daissee, Killed, Kustia, Patna) 32,600 pcs.; Assam-Dinajpur 46,000 pcs.; Muzafferpore - Patna - Pakur-Purneah-Kissanganj 1,22,500 pcs.

SUGAR IMPROVES

During the week ended 17th December, sugar sales in the Calcutta market averaged 4,000 bags daily. Arrivals a day were 2,000 bags, and stocks totalled 105,000 bags. Rates for ready sugar export-Kantapur delivery were Rs. 38.12 to Rs. 38.50 for ordinary grain and Rs. 40.44 to Rs. 40.81 for big grain. There was some improvement in prices.

SHELLAC STEADY

During the week ended 16th December, the market was steady. The range of quotations was as follows:

Standard Pure Buttonlac	Rs 88 buyers, 90 sellers.
TN Pure Shellac	Rs 63 buyers, 68 sellers.
Standard One Shellac	Rs 78 buyers, 80 sellers.
F.O. Superfine Shellac	Rs 80 buyers, 82 sellers.
Lemon No. 2 Shellac	Rs 84 buyers, 85 sellers.
Lemon No. 1 Shellac	Rs 88 buyers, 90 sellers.
Kusmi Seedlac No. 2	Rs 73 sellers.
Kusmi Seedlac No. 1	Rs 78 sellers.
Golden Kusmi Seedlac	Rs 82 sellers.
One B Seedlac	Rs 72 sellers.
Two B Seedlac	Rs 65.75 done, 66 sellers.
Golden Bysaky Seedlac	Rs 74 sellers.
Manbhumi Fine Seedlac	Rs 70 sellers, 69 done and buyers, 70 sellers.
London Standard	Rs 68 sellers, 66 done and buyers, 69 sellers.
Fine Bysaky Seedlac	Rs 62 sellers, 59 done and buyers, 62 sellers.
Genuine Bysaky Seedlac	and buyers, 62 sellers.

Shipments during August were 26,886 packages, September 26,959 packages and October 29,650 packages.

NEW ELECTRONIC TELEPRINTING
EQUIPMENT

An electronic teleprinting device which receives messages automatically and, it is claimed, can produce a printed copy 45 times faster than the average typist has been developed by the Burroughs Corporation. The firm says that further developments will give the unit a theoretical top speed which will enable it to print three full-sized novels in a minute—an output of 500,000 words. The equipment already exists to feed a teleprinter with information at high speed, for example, by magnetic tape, but until now it has been impossible to reproduce it in a printed form. The firm explains the working of its new unit in this way: The teleprinter shoots letters electronically at a coated paper through a series of electrode 'guns' which aim their beams at rapidly moving paper. Each line of text passes over powdered ink and a heated roller and it appears a split second later as clean, dry, readable type. The unit is said to be able to produce printed copy at speeds up to 3,000 words a minute. Its development was the result of joint efforts of the Burroughs Corporation and the U.S. Army Signal Corps Research and Development Laboratory. It is expected that the printer will be an integral part of the U.S. Army's new system of associated teleprinter units, all operating at 750 words a minute. But its basic design, according to the firm, makes it easily adaptable to civilian applications such as sending out weather forecasts, stock exchange reports, telegraph messages and news reports.

Engineering and Transport

AIRCRAFT LANDING SIMPLIFIED

NEW AUTOMATIC DEVICE
DEVELOPED

PILOTS at the Royal Aircraft Establishment in Bedford showed recently to officials of the U.K. Ministry of Supply and to technical representatives of British and foreign civil airlines how it is possible to bring aircraft down on to a runway by means of a fully automatic landing system which, it is believed, could be of great use in fog and in bad weather. The landing system is known as B.L.E.U. and has been developed by the Blind Landing Unit of the Royal Aircraft Establishment. It serves to guide an aircraft on to the edge and along the length of a runway from a height of a few hundred feet, and by demonstration can perform this function without human aid. So far more than 2,000 landings have been carried out with the help of the system and on no occasion has an electronic or mechanical failure occurred. No aircraft has ended up in a field.

How it Works

Two electrical components form the essential novelty of the new system. So as to give the autopilot of an aircraft accurate information about the direction of the runway, two cables fed with alternating current (at 600 and 900 cycles a second) have been laid along the two edges of the runway. They extend backwards into the agricultural land of Bedfordshire, a distance of 5,000 feet. A sensing device in the aircraft can detect the magnetic field from the two cables and can thus detect how far off its true heading line an approaching aircraft might be. Information about the height of an aircraft above the ground is provided by a specially designed altimeter which reflects a radio beam from the ground. This instrument is said to be capable, under most conditions, of an accuracy of about two feet, and it, too, can be used to tell an auto-pilot how far the height of an aircraft might depart from some ideal approach trajectory. Both pieces of information are in B.L.E.U. fed into an automatic pilot equipped with pre-determined information about the approach to the edge of a runway which a particular aircraft ought to make. The auto-pilot can then make the appropriate alterations to the aerodynamic control surfaces and the engine throttle settings so as to bring the aircraft back on to course.

As it is now being used, the system assumes that an aircraft has been guided down to a few hundred feet above the edge of a runway by means of a standard instrument landing system working on radio beams. From some chosen point (which may vary with the aircraft), a machine is then put into a gentle dive towards the runway. At some further chosen point, the rate of descent is checked, the crabwise motion of the aircraft towards the runway found in strong cross winds is corrected by application of the rudder and the aircraft touches down. Throughout this process, the pilot sits looking at a dial of flashing lights which tell him that the electronic equipment is working properly, and he is ready to interrupt the automatic touchdown if any instrument should suggest that things are not working as they should. The pilots have been completely used to the system now, and they are also enthusiastic about it. The engineers who have developed it claimed that the accuracy with which B.L.E.U. can bring an aircraft on to a runway is considerably greater than that with which human pilots are accustomed to land in good weather.

U.S. Rival

A rival equipment has been developed to roughly the same stage of accuracy in the United States. It works with the help of an accurate radar aerial at the end of a runway. Its disadvantages are that pilots would have to trust themselves to a piece of complicated ground equipment which would have had to be serviced by staff not employed by the same firm. On the other hand, B.L.E.U. needs some 5,000 feet along which two magnetic leader cables can be laid in advance of the end of a runway. It remains to be seen which, if either of the systems in aircraft whose captains merely sit and watch their instruments.

NEW COMPANY TO MANUFACTURE
ELECTRIC TOOLS

Rallis India Ltd of Bombay and Wolf Electric Tools Ltd of London are to start a new industry in India. They are collaborating in the manufacture of a representative range of 25 types of Wolf styled Ralliwolf Private Limited, was registered recently. Freehold land has been acquired in Mulund near Bombay and building operations have started. It is expected that the new factory will be ready for occupation in the middle of 1959, and it is planned that by 1962 the tools will be almost entirely manufactured in India.

COMPANY AND PUBLIC NOTICES

THE INDIAN IRON AND STEEL COMPANY
LIMITED

NOTICE is hereby given that consent has been accorded by the Controller of Capital Issues and the Reserve Bank of India to an issue of Bonus Ordinary Shares in the proportion of One Bonus Share for every five existing Ordinary Shares by capitalisation of the major portion of the amount standing to the credit of the Share Premium Account.

The Ordinary Share Registers and Transfer Books of the Company will be closed for the purpose of this Bonus Issue from the 12th to the 22nd January 1959, both days inclusive, and the issue of Bonus Shares if sanctioned at the General Meeting of the Company to be convened in due course for the 24th February 1959, will be made to those persons who are registered as holders of Ordinary Shares on the 22nd day of January 1959.

It is the intention that individual allotments of Bonus Shares shall be of whole numbers of shares only and that certificates covering such shares will be issued to the Shareholders promptly following the date of the General Meeting. It is further the intention that fractional entitlements shall be compensated in cash by distribution of the sale proceeds of the shares constituting the total of such fractions. Shareholders desirous of receiving their entire bonus entitlement in shares are accordingly advised that it will be necessary that the holdings in respect of which they are registered on the 22nd January 1959, shall represent exact multiples of five.

By Order of the Board,
MARTIN BURN LIMITED,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

12, Mission Row,
Calcutta,
15th December, 1958.

JESSOP & COMPANY, LIMITED.

NOTICE is hereby given that an Extraordinary General Meeting of Members of the Company will be held at its Registered Office, 63, Netaji Subhas Road, Calcutta, on Friday, the 9th of January, 1959 at 11-00 a.m. to consider and to pass the following, with or without modification, as a special resolution:—

"That the borrowing powers of the Board of Management be raised to Rs. 300 lakhs."

Explanatory Statement.—The New Coach Works and other extensions of the Company's manufacturing facilities are now in operation and will be reaching full capacity within the next few months. The orders already in hand and anticipated are such that the Company's greatly increased manufacturing resources will be fully utilised. This very large increase in the Company's business will require substantial additional finance, much of which it is proposed to find by borrowing from the Company's Bankers and other sources if necessary.

Consent of the Shareholders in a General Meeting is required in terms of Section 293(d) of the Companies' Act, 1956 to the Board of Management borrowing money in excess of the statutory limit. None of the members of the Board of Management is in any way interested in the proposed resolution.

By Order of the Board of Management,

D. D. MARKAN,
Secretary.

Calcutta, 11th December, 1958.

BURN & COMPANY LIMITED.
NOTICE.

NOTICE is hereby given that the Board of Directors has sanctioned payment of the dividend on 6% and 7% Preference Shares of the Company for the half-year ending 31st December, 1958. Payment will be made on or after the 10th January, 1959, to those shareholders whose names appear on the Company's respective Pref. Registers on the 31st December, 1958, or in accordance with their instructions.

By Order of the Board,
MARTIN BURN LTD.,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

12, Mission Row,
Calcutta,
16th December, 1958.

THE CALCUTTA TRAMWAYS COMPANY LTD.

(Incorporated in England)

NOTICE is hereby given that the Preference Share Transfer Books will be closed from the 18th to the 31st December, 1958 (both days inclusive), for the preparation of Dividend Warrants in respect of the Final Dividend of 2½%, less Income-tax payable on the 1st January, 1959, on account of the profits for the year ending 31st December, 1958.

By Order of the Board,
A. C. T. BLEASE,
Agent.

P4, Mission Row Extension,
Calcutta-1,
Dated, 11th December, 1958.

DYER MEAKIN BREWERIES LTD.

NOTICE is hereby given that the Share Transfer Registers of the Company will be closed from 29th December, 1958 to 12th January, 1959, both days inclusive, for the forthcoming Annual General Meeting. Transfer Deeds awaiting registration should therefore be sent to the Company promptly.

K. G. KHANNA,
Secretary.

Solan Brewery,
8th December, 1958.

THE HOWRAH-AMTA LIGHT RAILWAY
CO. LTD.

NOTICE is hereby given that the Board of Directors has sanctioned payment of dividend on 5% Cumulative Preference Share Capital of the Company for the half-year ending 31st December, 1958. Payment will be made on or after 1st January, 1959, to those Preference Shareholders whose names appear on the Company's Register on the 31st December, 1958, or to their mandates.

By Order of the Board,
MARTIN BURN LTD.,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

STATE CONCERNS NOT TO USE "PRIVATE"
IN THEIR NAMES

The Central Deputy Minister for Commerce and Industry, Mr. Satish Chandra, said in reply to a question in the Lok Sabha that it had been decided to exempt Government companies from the requirements of Section 13 of the Companies Act, 1956, under which companies registered as private limited ones have to use the word "private" in their names. He drew the attention of the members to a draft notification laid on the table of the House on 17th November, in accordance with Section 620 of the Act.

TRANSFORMERS...

POWERFUL
PARTNERS

IN INDIA'S EXPANDING INDUSTRIES

Today, more than ever, the partnership of Brush-Kirloskar Transformers is sought in furthering industrial expansion. Built for reliable service, Brush-Kirloskar Distribution, Power, Mining and Rectifier Transformers are in great demand all over India. Range Transformers - from 15 to 3000 kVA, 33 kV, are available from the manufacturers or the selling agents.

REFLECTIONS ON AN ANNIVERSARY

CALCUTTA STOCK EXCHANGE MARKS ITS GOLDEN JUBILEE

IT is not pleasant for any institution to find, after half a century of life, that an influential section of public opinion believes it serves no purpose which justifies survival. Felicitations on the fiftieth anniversary of the Calcutta Stock Exchange Association, therefore, have been tinged with anxiety about the future of such an institution in a socialistic pattern of society. The Association has made its golden jubilee contribution towards educating official and public opinion in a published symposium entitled *The Stock Exchange*. That this, in fact, needed to be done is a striking commentary on the appalling ignorance and ideological prejudice that characterises so much official and popular economic thinking in India today.

It ought to be evident—although high-level diatribes against these useful institutions show it is not—that a stock exchange is merely a market which exists to provide facilities for trading in securities, in much the same way as a fish market provides facilities for trading in fish. As such, it is an integral part of a private enterprise or mixed economy, and so long as any government intends to continue attracting private savings for its own industrial projects by the issue of interest-bearing bonds, a market for trading in gilt-edged securities can hardly be dispensed with. Liquidity of investments, which it is the function of the stock exchange to provide, is necessary for the cooperation of the public sector as well as the private. But the rôle of the stock exchange in assisting government financing will always remain secondary to its characteristic function of providing risk capital for private industrial enterprise. There has been no suggestion, even in the more irresponsible official pronouncements, that the pursuit of the socialist pattern of society involves the extinction of joint stock enterprise altogether. On the contrary, if economic development is to be transformed from a political catchword into an accomplished fact, it is certain that by far the greater part of the work will fall to joint stock companies financed by the savings of private investors. Thus, stock exchanges have a more vital task to perform in the future than at any time in the past. Paradoxically, the faster the country moves towards the socialist pattern, the greater will be the importance of stock exchanges and the more vital their place in the national economy. It is perhaps significant that at no time has the British Labour Party officially belittled the utility of stock exchanges or, when in power, made any deliberate attempt to interfere with their working.

Risk capital for industry is likely to be needed in the India of the future on a scale greater than ever before. As socialist fiscal policy breaks up concentrations of wealth and reduces economic inequality, it is to the little man that the stock exchanges will increasingly have to turn for the flow of savings required to sustain new investment. Already *zaminsdars* and princes have vanished from the investment scene. Their place has been taken by the monolithic Life Insurance Corporation which, with its continuously growing resources, represents a far greater concentration of power than even the most opulent of private investors. The almost pathological suspicion of private concentrations of wealth and power, and a naive faith that a far greater concentration in the hands of bureaucrats is innocuous or actually beneficial, is a familiar feature of socialist thinking. But those who believe that democracy and decentralisation, whether political or economic, are inseparable, will see in the power of the L.I.C. to dominate the stock markets a dangerous trend which needs to be countered by the rise of an ever-growing mass of individual investors.

There are other ways in which the pursuit of a socialistic pattern of society tends to increase rather than decrease the importance of stock exchanges. The trend towards widening the base of taxation to include capital—as exemplified by the wealth tax, the capital gains tax, the estate duty and the gift tax—makes it imperative that there should be some reliable indication of the present

value of claims to wealth held in the form of industrial shares and government securities. This is a function which an active, efficient stock exchange, in which speculation as well as genuine investment dealing finds a place, is particularly fitted to perform. The expansion of the economic functions of government, the increased scale of taxation and official borrowing thereby necessitated, and the growing reliance on deficit financing with its far-reaching monetary and other repercussions, make it more necessary than ever that there should be a sensitive barometer of the economic weather. It has been repeatedly affirmed that the socialist pattern does not mean wholesale nationalisation. The limits of co-operation as a form of economic organisation are increasingly apparent. It is reasonable to expect, therefore, that there will be a substantial expansion of joint stock enterprise in the development of small and medium-scale industries, with a corresponding increase in the number of securities whose ready marketability and day-to-day evaluation the stock exchanges will be called upon to ensure.

It is hoped that foreign private capital will increasingly be invited and encouraged to help in building the socialist pattern of society. But prospective foreign investors can hardly be blamed if they regard the state of the Indian stock markets as a fair reflection of the profitability of investment in this country, and make their investment decisions accordingly. So far the Government, while admitting the need to attract foreign capital, has shown an extraordinary indifference towards the relation between the domestic investment climate as reflected in the stock exchanges, and the chances of impressing foreign investors. Such an attitude towards investors—no doubt considered by good socialists to be mere "capitalists" and therefore unworthy of consideration—has already cost the country dear. Unfortunately, current events seem to hold out little hope of a reversal of this unrealistic attitude. On the contrary, recent signs point to a distinct strengthening of ideological prejudice against the private sector in general and investors in particular. The decision to nationalise the wholesale trade in foodgrains, the incursion of ordinance factories into lorry manufacture, the renewed emphasis on ceilings on landholdings, proposals to impose ceilings on urban incomes and to curb profits, not to mention the recent pronouncements of the Prime Minister and the Finance Minister, have all given the impression that a further sharp leftward swing in economic policy is in the offing. So far, there are no signs that the logic of circumstances is going to compel a recognition of the importance of stock

JOBS AFTER RETIREMENT

An unseemly controversy has erupted during the past few weeks about Government servants taking jobs with private business organisations after they retire. The immediate motive for making a variety of insinuations against officials who have done this is not easy to discover; it may well be largely personal. Among those whose names have been mentioned are a former chairman of the Railway Board, a former High Commissioner, and even former Ministers (with their connections and progeny). This is not the place to discuss the merits or demerits of the way in which particular appointments to business houses have been offered and accepted. It only needs to be said that, on the evidence which is so far available, charges of irregularity can hardly be sustained. As far as many Lok Sabha members are concerned, the "evidence" offered by them in last week's debate consisted almost wholly of presumptions. Those presumptions were neither necessarily wrong nor necessarily right; but it would be ill-conceived to try and rush the Government into a drastic change of policy merely because some members of Parliament have a habit of smelling a rat in whichever corner they may happen to insert their noses. The issue de-

exchanges and a revision of policy towards private investors.

If Indian stock exchanges are to prove equal to the challenge that faces them, some revolutionary changes in organisation and methods of business will be needed. Even then, the difficulties will be formidable. Among the comparatively well-to-do nowadays, the number of those who have the habit of investing in stock exchange securities is small. To carry the story of the stock exchange to the masses and to break through age-old thought patterns and behaviour, to convince ignorant peasants and labourers that it would be better, both in their own interest and that of the nation, that such meagre savings as they are capable of making should be productively invested in industrial equities instead of being hoarded in barren gold, will be far from simple. The Government, for its part, has not made things easier, because, on a number of occasions, Government policy has brought about conditions in which those who hoarded bullion proved to be wiser than those who bought shares. The inevitable risks of investment in equities have been increased as a result of the vagaries of official economic policy and successive additions to the burden of taxation on investment. At the best of times, the small saver is in no position to take risks with his money. It would be disastrous if he were to be made the victim of misguided anti-capitalist prejudice in the minds of policy-makers. For such persons, the danger is that the savings which constitute their standby in bad times will, if invested in equities, suffer erosion through a fall in share prices just when they are most needed. There is wisdom in the old maxim for labourers: "Do not invest your savings in your job."

Yet it is quite clear in this jubilee year of the Calcutta Stock Exchange that the effort is worth making. Already the problem of internal resources seems to be on the way to becoming as great a bottleneck in the path of development as the foreign exchange shortage. If even a fraction of the Rs. 3,500 crores estimated to be locked up in bullion could be made available for industrial investment, the economic scene would be transformed. The broad lines of approach to the problem are known and the experience of other countries, where too the spreading of the investment habit is engaging attention, could provide useful guidance. The unit trust, which enables the small investors to enjoy a measure of security by spreading risks over a wide range of investments, the monthly investment plan devised by the New York Stock Exchange to enable office workers to invest a part of their earnings each month, the splitting of high-priced stocks into units of smaller denominations, a suitable modification in the minimum unit for a stock exchange transaction, some form of preferential brokerage for small investors and bonus payments to workers in the form of shares are all perhaps worthy of further study to discover their suitability for Indian conditions. Even some form of investors' co-operatives may be worth considering.

serves to be examined on broader considerations than purely personal or sectional ones. If that were not done, business concerns and Government servants would be at a serious disadvantage by reason of the relative silence it is necessary for them to maintain. But for this silence, they might, for instance, be able to put matters in a better perspective by pointing to the various forms of pressures that parliamentarians themselves sometimes use, not only to make their own employment fuller and more lucrative, but also that of their nephews and nieces. Contrary to that impression the Lok Sabha debate might have tended to give, favouritism and self-seeking are not the monopoly of business houses and Government servants alone.

Turning to the broader issues involved, the first point that needs to be recognised is that the age at which Government servants usually retire in this country is relatively low. It has been kept that way not because constant ministerial interference in day-to-day administration causes dyspepsia, but because the general standard of human fitness is lower than in richer countries and temperate climates. At 55, which is the common age of retirement, many officials are past the

prime of their mental (and, of course, physical) powers. Yet there are many who are not, and who could still serve the country usefully. At a time when administrative and technical talent is scarce, to sentence the latter to compulsory idleness is wasteful. The Government itself has often recognised as much by granting extensions of service to those about to retire, although the practice has sometimes been misused for the retention of incompetent favourites as well. But in granting extensions, the serious difficulty which has arisen is that the promotion of younger officials has been blocked, with highly demoralising effects. The difficulty has occasionally been evaded by establishing a large crop of "officers on special duty", or by assigning the retiring officials to relatively independent, *ad hoc* enquiries, investigations and institutions. However, the scope for such employment is limited in relation to the numbers retiring each year. In any case, even this trend is not entirely healthy, according to some; the current passion for appointing retired high court judges to conduct special investigations, for example, is alleged, rightly or wrongly, to be compromising their independence, as well as the independence of some who are yet to retire.

The question arises how the waste implicit in premature retirement (premature in the context of the individuals' abilities) is to be avoided. The fact is that it cannot be unless the Government can find ways of using them or unless private concerns can recruit them as liberally as might be feasible. The limitations applying to continuing employment with the Government, or even with State enterprises, are severe, considering that the system of seniorities and promotions is highly rigid. In the case of private business organisations, it is relatively easier to fit in senior men and give them the salaries appropriate to their abilities. The main objection to allowing retired officials to join business firms, as voiced in the Lok Sabha debate, was that the prospect of further employment would encourage favouritism and corruption. This, according to some, would be particularly the case where the individuals concerned felt themselves compelled to supplement their pensions and savings in order to maintain the standard of living to which they were accustomed, or for other personal reasons. A not wholly fair insinuation made during the

debate was that since officials approaching retirement usually occupy the more responsible posts, the scope for favouritism and corruption in their case is larger.

These objections are not such as can be lightly dismissed if the moral health of the administration is to be raised. Yet, to give them undue weight by imposing a blanket ban on the employment of retired officials by private firms would be unjudicious. There are many types of Government service where the scope for corruption and favouritism is large, as Central and State Ministers know well, sometimes even from personal experience. No method has yet been devised whereby the temptations ancillary to authority can be totally eliminated. The important point is to concentrate first on improving the moral tone of the administration. This can be done mainly if Ministers and senior officials set a clear example of disinterest in handling Government work, especially by resisting the pressures which come not only from business men but also from parliamentarians and Party members. The second need is to reduce the incentive for pressure and corruption by eliminating red-tape and administrative inefficiency; if temptations are offered to officials, the reason, more often than not, is that without those temptations the particular case they are entrusted with would never be considered speedily or attentively. There might be a case for devising measures to restrain officials from joining business concerns with which they have had dealings in their last years of service; but the implications of such a move need to be examined more closely than they have been so far. When that is done, it is important to remember that the attractions of Government service cannot be whittled down much further without serious consequences for future recruitment. The official pensions which seem to have excited the envy of many Lok Sabha members are small in relation to the new, highly-inflated cost of living; the earnings of the senior cadres have fallen; and officers can no longer save for their retirement on the scale their predecessors did. Government service has to offer suitable rewards if it is to attract talent; the prospect of penury after 55, resulting from enforced idleness, cannot be the best that Parliament and the country would wish to offer.

THE TUNISIAN ECONOMIC PROBLEM

HABIB Bourguiba's paternal dictatorship in Tunisia has been in the news in the past year mainly for its courageous defiance both of France and of Nasser. Resisting both the assaults of a dying colonialism in Algiers and of the new Arab imperialism in Cairo, this tiny country (it has a population of under four million) became for a time the symbol of uncommitted nationalism, a symbol so important that for its preservation Washington and London were prepared to support it against the anger of their allies in Paris. The coming to power of General de Gaulle, who withdrew all French troops from Tunisia and stilled the anti-Bourguiba faction in Algiers, has removed the dangers on Tunisia's western frontier and thus allowed Mr. Bourguiba to concentrate his attention on his enemies in the east, to be precise in Colonel Nasser's Cairo. But this double struggle is sapping the foundations of the Tunisian economy, already wrestling with the classic problems of underdevelopment in a newly independent nation.

Tunisia's dispute with France cuts off the source of economic aid that is essential for development. Political independence has not lessened the country's dependence on the French economy: France buys 55 percent of Tunisian exports and supplies 62 percent of imports. The balance of trade is chronically deficit—imports are worth almost twice as much as exports—and is only rectified by Tunisia's membership of the franc zone, i.e., by French subsidies. The internal budget is similarly financed from Paris. For the first five-year plan (1949-53), France supplied 102 milliard francs while internal Tunisian resources—budget surplus plus loans—supplied only 11 milliards; for the second plan (1954-57), France provided 63 milliards and Tunisia only seven milliards. As with all members and former members of the French Union, Tunisia is caught up in the French inflation, so that its export prices are uncompetitive in all other markets. Its exports of wine, phosphates and lead would find no buyers outside the closed-circuit price inflation of the French trading zone.

This acute dependence on France may be taken as the measure of Mr. Bourguiba's courage in defying Paris by helping the Algerian rebels. It may also be taken as explaining—even justifying—French impatience with that same defiance. Mr. Bourguiba's position is already untenable in international law—an independent country has no business nurturing rebellion in a neighbouring State—but, looked at from the French side, it is unforgivable impertinence when adopted by a new country that owes not only its independence but also its economic existence to the State whose power it is seeking to overthrow in Algeria. At

all events, it is obvious that every new friction with France reduces the flow of aid to the Tunisian economy.

The quarrel with Nasser is no less economically disastrous. Nasser is constantly at work seeking to stir up trouble in Tunisia to extend his own power towards the west, and of course this denies the country that political peace it needs for any economic progress. The materials for Nasser's propaganda are ready to hand not in the Tunisian people themselves—who are well enough content with Mr. Bourguiba's leadership—but in the mass of Algerian refugees and in the army of the F.L.N., which is larger than all the Tunisian armed forces and virtually controls large parts of the country. Moreover, both Nasser and Salah ben Youssef, the exiled enemy of Bourguiba whom Nasser protects in Cairo, make the main theme of their campaign against Bourguiba the allegation that Tunisia is not "really" independent—or, in the coarser language of Radio Cairo, that Bourguiba is a French puppet. The absurdity of this claim does not exempt Mr. Bourguiba from efforts to prove how wrong it is—and thus he is led into ultra-nationalist demonstrations of "super-independence", which further reduce his credit not only in France but elsewhere in the west. An example was furnished last month in his over-sensitive reaction to the normal American conditions attached to any sale of arms. Another is furnished this month in his decision to oust the large local community of French origin, whose energy and industry are the steel-frame of the Tunisian economy.

Throughout these political vicissitudes, Tunisia has to reckon with basic economic problems which reproduce India's own as in a test-tube. A death-rate reduced by the benefits of imperialism, a birth-rate let out of control by the same influences, a population that doubles every generation, half the population under the age of 20 and thus unable to work productively, two-thirds of the people engaged in agriculture, native arts and crafts on the point of extinction, reliance on a few raw materials for export earnings, a primitive secondary industry, 38 percent of adult males unemployed, a drift of population towards unlovely urban agglomerations that have already sucked in 35 percent of the inhabitants, and an unintelligent agricultural practice that allows swollen herds to convert pastures into desert. With all that, Tunisia can correctly boast of a higher standard of living, of education and of health than is known in Nasser's Egypt, which now seeks to teach her lessons in "progress". But it has often enough been proven that a dynamic ideology can enable a more backward State to subvert a richer one, and Bourguiba's Tunisia will not be secure until it has removed the threats on its eastern and western borders—i.e., reached an agreement with Cairo and helped de Gaulle make peace in Algeria—so that it can at last attend with a whole mind to economic difficulties that are familiar, on a much larger scale, in this country.

THE CONTROL OF COMPANIES

DIRECTORS' RELATIONS WITH THEIR SHAREHOLDERS

THE struggle for control of the British Aluminium Company is important not only because of the status of the company itself, but also because of the principles involved in the dispute. It has focussed attention on the whole problem of the relations between the directors who manage a company and the shareholders who own it. The case of British Aluminium is not concerned with a simple "take-over bid", or with two rival bids. Closely linked with the problem of control of the company is that of providing additional capital for it. It was the B.A. directors' agreement with Aluminium Company of America, planned to provide American capital in exchange for an issue of shares that would give A.L.C.O.A. one-third of B.A.'s ordinary capital, that aroused criticism and protest. But there would have been little criticism and still less protest if Tube Investments—one of the very big groups in British industry, and supported in this case by a promise of American capital from Reynolds Metals—had not previously made known its intention to make an attractive offer for the ordinary shares of British Aluminium. It was felt that in this confused situation the shareholders should have been consulted at every step.

In the midst of this dispute, another huge British undertaking, Electric and Musical Industries, introduced a proposal to increase its authorised capital, so making a large block of unissued shares available for some such transaction as B.A. had concluded with A.L.C.O.A. But E.M.I.'s directors had sensed the mood of the City, and they stated that they had no intention of issuing without the shareholders' consent such shares as would "substantially alter the control of the company". The one-third interest in B.A. that B.A.'s directors intended to give to A.L.C.O.A. is generally considered large enough to represent effective control of a company's operations, and effective control should not be handed over—especially not to a foreign company—until shareholders have been consulted and have approved the change. When it is said that "the City" disapproved of the procedure, what is meant is not only that the Stock Exchange criticised it, but also that the big institutions were offended by the B.A. directors' behaviour. Some of these institutions, mainly insurance companies, have substantial holdings in B.A. and both sides in the dispute have been in conference with their representatives. Shareholders outside the City have thus been made aware of an important element in modern finance—a body of shareholders that can be, as a group, consulted by the directors of their company or of some other interested company, apart from any approach that may be made to the shareholders in general.

This development suggests further developments. It is the declared policy of insurance companies to spread their funds widely and to limit their interest in any one company to a small proportion of its capital. What they desire (though hostile critics are not easily convinced of the fact) is simply a good investment: they do not wish to participate in control. But as insurance companies' funds increase, it becomes more difficult to limit the size of their individual holdings. Involuntarily, they become major shareholders, and in any critical situation it is natural to consult them as such. And when they have been consulted and have decided on a course of action, it is natural that they guide the general body of unorganised shareholders. There are occasions

when the institutions are outvoted on some important issue, but the anxious efforts of interested parties to get the institutions on their side in any dispute are sufficient evidence of the influence of these bodies—even if it is a somewhat reluctant influence. It would be wrong to suggest that the institutions were a coherent body of investors, forming a solid nucleus in many companies. In fact, though their interests correspond, their opinions may differ. In "the Aluminium affairs", it seems, some institutions were favourably impressed by the arguments for associating with A.L.C.O.A.—and for retaining British Aluminium as a nominally independent company—while others were strongly attracted by the T.I.-Reynolds bid—which would provide them with T.I. ordinary shares and cash in exchange for their B.A. ordinary shares. But such incidental differences do not alter the central fact that the institutions are emerging as a distinct class of investors—a class that may be consulted round a conference table when a dispute arises in a company's affairs.

The influence of the institutional investors—meaning, still, primarily the insurance companies—will inevitably continue to grow, unless they make big changes in their investment policies to the detriment of ordinary shares; which is very unlikely. Saving through the medium of insurance increases year after year, and the insurance companies have since the war invested in ordinary

shares an increasing proportion of an increasing total of resources. Even if (as some people believe) they are now mostly satisfied with the proportion of funds invested in ordinary shares and will not increase it further, the steady accumulation of funds implies a continuing increase in the amount invested in ordinary shares; and the whole market is not growing fast enough to counteract this growth in the institutions' influence. A possible development in the coming years is an extension of informal relations between directors and big shareholders. It is not essentially a democratic development, and when something similar occurs in parliamentary government—when a government seems to prefer private discussions to debates—the practice is usually criticised. Evidence that insurance companies were "interfering" in the management of industry would certainly be resented; yet they are, it must be admitted, better qualified to advise than are many simple shareholders—some of whom do not even know what products their company makes or what services it performs. Partly because of this indifference, some directors feel that shareholders are not fit to be consulted. The institutions can intervene, discreetly, making constructive suggestions where appropriate and sometimes exercising a restraining hand. Directors must be allowed full freedom in the day-to-day management of companies, but they should be deferential where matters of basic policy are concerned.

L.I.C. authorities. This has provoked the Central Finance Ministry into issuing a Press note making it clear that the Government has not taken a decision on the question but has left it to the discretion of the Corporation. The Press note adds that the Government has only decided that the Corporation may, at its discretion, grant a bonus to its ministerial employees on a non-profit-sharing basis, due regard being paid to the provisions of the Insurance Act, 1938, concerning the limitation of expenses. The present decision, the Press note points out, revokes the directive given last year not to pay bonus to L.I.C. staff.

The decision, if it may be called one, is important in as much as it concedes for the first time, subject to certain limitations, payment of bonus to employees of a particular unit in the public sector. The payment of bonus on a non-profit-sharing basis would presumably be designed to exclude other industries and trading organisations in the public sector from its scope. In life insurance, the payment of bonus has throughout been on a non-profit-sharing basis, that is to say, it has not been paid out of the valuation surplus. It was, for the companies, an annual expense. The L.I.C. is now bound by Section 40B of the Insurance Act, 1938, in the matter of limitation of expenses. Its expenses in 1957 and 1958 are reported to have been high and in excess of the limits prescribed. But the employees will no doubt contend that the excessive expenditure is attributable to integration and the new pattern of organisation; that such expenses are temporary and inevitable during large-scale reorganisation; and that they will cease to have a bearing as soon as the L.I.C. is stabilised. Excessive expenditure being thus a result of State policy, the employees will endeavour to use the present concession to their maximum advantage. The grant of bonus to L.I.C. employees, whatever the technical language in which it may be couched, is bound to have repercussions from which other sectors of State enterprise will find it difficult to escape.

More Raw Film Imports

The success of the representations made about increasing raw film imports by the south Indian film industry is attributed to the effective backing of the Madras Government, particularly the Chief Minister. The responsive attitude of New Delhi evokes satisfaction, even though imports will be held at the 1956 level and only exporters of films will receive special consideration in future. The State Government has a distinct interest in the film industry, having realised over Rs. 1.2 crores in 1957-58 by way of entertainment tax. The largest collections were made in Madras city, which has 40 cinemas. The increase in the production of films in recent years has been reflected in the collections and local bodies have benefited by the sharing arrangement. The film industry claims that its contribution to Madras State's revenue justifies special encouragement. It is evident that the restricted import of foreign films at present has helped strengthen the case. But the industry's problems have not been completely solved by the new quota arrangements, according to some. Receipts from Ceylon may suffer because of the language policy adopted there, and finance will present a problem even if a corporation is set up to assist eligible producers. Fears of unemployment among artists and technicians have, however, been dispelled by the assurance that reasonable imports of raw film will be allowed and Andhra Pradesh's claim to a separate quota will not prejudice the industry in Madras State. Mofussil studios are now well established and Sinhalese film producers are among their clients. One new trend is for north Indian producers to use facilities in south India to produce versions in more than one language; another is to produce Hindi versions of the box-office hits made in south Indian languages.

Too Much Tea

The north Indian tea crop up to November 1958 has been 22.5 million lbs above the corresponding figure of the last season. Mr. W. E. Postlethwaite, chairman of the Calcutta Tea Traders Association, said at the annual general meeting last week that there are indications of an undesirable surplus developing in the world tea markets. The crop in south India has been estimated at a higher figure than in the previous year; so has the production of Pakistan and Africa. Ceylon's output is likely to equal the record she established last year. "From recent figures it would seem that the world crop is about 52 to 53 million lbs up on last year", the chairman added. The surplus will consist mainly of lower quality teas; the appearance of China teas, which are suitable for U.K. blenders, at the London auctions, is likely to add to the glut. If the prices of cheaper teas are to be maintained at an economic level, the chairman pointed out, it is essential that in the fairly near future, the various producing countries "should endeavour to reach accord in the matter of ensuring that world tea supplies do not substantially

Current News and Comment

Bombay Gas Pays Less

Although production rose from 1,529.2 million cubic feet in 1956 to 1,581.4 million cubic feet in 1957 (and the 1957 figure represents a rise of 41.7 percent over that for 1946), the Bombay Gas Company has reduced the dividend to 4 percent for the past working year. Mr. B. L. Jalan, chairman, in his address to shareholders at the annual general meeting held last week in Bombay attributes the cut to a rise in the cost of coal and in the cost of transporting it. (A fuller version of the speech appeared in last week's issue of *Capital*.) The net revenue for 1957 was only Rs. 1,61,466; after Rs. 1,60,000 is allocated for a 4 percent tax-free dividend, Rs. 1,466 remains as the amount to be carried forward. "I cannot, therefore, say that the revenue position of the company is satisfactory, but it is beyond the control of the management", declares Mr. Jalan. Coal, the main raw material for gas production, and the freight charges incurred, have cost the company steadily more. An increase of Rs. 5.12 a ton came into effect in 1956, whereafter the company immediately approached the Bombay Government for a revision of the gas price. The latter appointed an advisory committee to examine the question; the report, which the committee submitted in July this year, is still being considered by the Government. Meanwhile, the cost of coal has been raised in 1957 and again in 1958, with the result that the company now has to pay Rs. 10.70 a ton more than it did in 1955. Since there has been no suitable increase in the price of gas, the company's earnings have inevitably shrunk.

The rising trend in gas output continues, and up to October this year, it was 1,374.7 million cubic feet, which was 5.2 percent higher than in the corresponding period of 1957. Gas sales in 1957 increased by 3.4 percent compared with 1956. "It is of interest to note that we are responsible for lighting almost two-thirds of the total public lamps in the city of Bombay", Mr. Jalan says. Demand has been increasing, and applications are received daily by the company from new potential consumers. During 1957, 750 new gas connections were installed, and the number of applicants on the waiting list at the close of the year was 13,106. During the current year, additional connections given up to October were 1,325. Discussing the expansion programme, Mr. Jalan says that the new stand-by plant installed in 1957 included a third coal elevator, complete with overhead coal storage hopper and coal crusher, and a third retort-charging machine. To deal with the increased coke produced from the retort house, which was extended in 1956 by the addition of five new beds, a second coke quenching station and coke discharging ramp was commissioned. A fourth Lancashire boiler and a battery of three induced draught water coolers were also put into commission during the year under review. The new 15-inch trunk main, put into operation in January this year, has improved gas pressure in the central areas of the city. Because maintenance of the plant has been good, gas production a ton of coal increased from 16,447 cubic feet in 1956 to 16,714 cubic feet in 1957.

More for Cane-growers

In his address from the chair to shareholders of the Deccan Sugar and Akhbari Co Ltd, Mr. C.

R. Srinivasan discusses some of the issues facing the sugar industry. (A fuller version of the address appears on another page of this week's *Capital*.) The Government, "abandoning the traditional practice of fixing a minimum sugarcane price," has this year so amended the Sugarcane Control Order that the factories, apart from paying a minimum price initially, will have to pay something more in strict proportion to their profits above a certain level. Mr. Srinivasan says that while it is fair to let cane-growers share in the prosperity of sugar factories, the interests of shareholders as well as the industry's need for maintaining adequate reserves cannot be overlooked. The Indian Sugar Mills Association is "actively engaged in presenting the industry's case." Mr. Srinivasan refers to the Government's decision to allow the export of 50,000 tons of sugar through the Indian Sugar Mills Association, and says the quota represents 2½ percent of the production of all factories for the 1957-58 season. As Indian sugar now has to sell in a highly competitive overseas market (exports last year were considerably helped by the Suez crisis), a loss of Rs. 300 a ton has to be incurred on exports. The loss has to be "borne by the factories out of the profit margin on internal sales". In other words, the loss on exports has to be made up by an increase in domestic prices.

Mr. Srinivasan argues that if domestic output can be increased, the sacrifice of the indigenous consumer will be correspondingly reduced. In this connection, he points out that increasing competition from *khandasari* producers, who enjoy considerable protection because they do not have to pay Rs. 350 a ton as cess and excise, which white sugar has to pay, has actually had the result of reducing the latter's output. "Under normal conditions of taxation, the *khandasari* industry cannot thrive, but with sugar paying Rs. 350 a ton as between cess and excise, *khandasari* enjoys a measure of protection that is afforded to no other industry." Moreover, *khandasari* units are being set up in factory areas, taking away the cane which would otherwise have been used by the white sugar industry. When "supplies of the vital raw material are taken off and factories are left with less than enough cane for economic crushing," Mr. Srinivasan adds, the cost of manufacture increases. The chairman says that the formula of the Government in relation to the cost and prices in the sugar industry is unrealistic. On the industry's representation, the Tariff Commission has been asked to examine the matter. It has also been directed to submit a preliminary report on the allowances for rehabilitation and profits, which is awaited with interest by manufacturers.

Bonus to L.I.C. Staff

The lengthy controversy about bonus for the staff of the Life Insurance Corporation has come to the forefront with the Press statement attributed to Mr. C. S. Bose, general secretary of the All-India Insurance Employees Association. Mr. Bose is reported as saying that the Government has already decided to grant two months salary as bonus to L.I.C. employees. The Joint Secretary to the Central Finance Ministry according to him, has stated that the Government has conveyed its decision to the

exceed the amount which the international market is able to absorb." The initial talks in Colombo for the renewal of the International Tea Agreement were conducted in a friendly atmosphere, but if it proves impossible to reach an agreement, the problem, as far as the Indian tea industry is concerned, will have to be solved by suitable fiscal action. "Alternatively, one can visualise the time when many of the weaker units in this country will perforce have to cease production", Mr. Postlethwaite warned.

A brighter feature of the situation is the way in which prices have been maintained at the London auctions in spite of crop increases in most of the producing countries. It is thought that the per capita offtake in the United Kingdom has gone up. Yet the "salvation of the industry as a whole—particularly plain teas—is the internal demand in India". Mr. Postlethwaite hoped that more intensive and widespread propaganda will be carried out to expand the domestic market. It will also be necessary to grant some additional relief to the common tea producer over and above the recent reduction in export duty and the zonal method of charging excise duty. The Government should give sympathetic consideration to the representation which the industry has made for the abolition of the Assam carriage tax and the West Bengal octroi. The chairman referred to a mild anomaly which has developed on account of the continued health and strength of the internal market. With certain kinds of teas, "we now see that internal operators are so placed as to outbid buyers for the out-markets. Were this situation to develop, thought may be necessary as to how, at least, export and internal demand may be placed on a fair parity."

Cane-growers on Strike

It is not difficult to understand why the Praja Socialist Party, which has organised the "supply strike" of sugarcane growers in Uttar Pradesh, should now be anxious to get the support of the Chief Minister in mediation with millowners. If millowners, as a result of mediation, voluntarily

agree to pay more for cane, the political dividends would go to the Praja-Socialists. But the Chief Minister has made it perfectly clear that he does not intend to oblige the Opposition party in this manner. Taking the cue from the Bihar Legislative Assembly, the U.P. Legislature passed a resolution some time ago urging the Centre to raise the price of cane from Rs. 1.44 a maund to Rs. 1.75. The Central Government, however, has turned down the demand, for reasons which Mr. A. P. Jain, the Central Minister for Agriculture, has explained in Parliament. The strike has already affected the cane supplies of many mills and inevitably led to their closure, which result the Opposition, with its perverse logic, has interpreted as retaliation by the mills. Nearly one-quarter of U.P.'s rural population will be affected if the strike spreads and the cane is allowed to perish. It has been suggested that if mills are unwilling to pay anything more than the officially fixed price—and there is no reason why they should—the State Government should suspend the operation of the U.P. Sugarcane Regulation of Supply and Purchase Act, under which the growers are bound to give deliveries to mills from certain areas at controlled rates. In a free market, however, the cultivator might well find that his manufacturers are his only customers; the price of gur has declined. As for khandasari sugar, the industry is developed only in west U.P. and not in the east. Mr. Mahabir Tyagi, M.P., has put forward the novel suggestion that cane prices should be fixed on a slab system, a higher price being paid to the small grower. According to Mr. Tyagi, this will not lead to the diversion of more land for sugarcane cultivation, as the small grower will have to allot his holdings between cash crops and food crops. The suggestion looks attractive but it would amount to putting a premium on inefficiency. Ultimately, it seems there is no better solution than paying for cane on the basis of its quality, but this is precisely what U.P. and Bihar seem determined not to do.

State Loans to Private Industry

When about three years ago the U.P. Government decided, on its own initiative, to encourage the establishment of new industries in the State by offering financial and other inducements to prospective entrepreneurs, it started a controversy which has not yet died down. The audit report for 1955, placed on the table of the State Legislative Assembly recently, comments on the irregularities in granting a loan of Rs. 1.45 crores to a Calcutta company for setting up a soda ash-cum-ammonium chloride factory in Uttar Pradesh. The report says that at the time the lump-sum payment was made to the company, it had not received a licence from the Central Government for starting the factory, nor had it secured the site or the import licence for foreign equipment. The agreement also did not stipulate any time limit for completion of the project. The jute mill in West Bengal which was mortgaged as security for the loan was, according to the report, over-valued. "The mode of valuation of these assets adopted by the valuers—the valuation of replacement costs less depreciation by the straight line method—and accepted by the Government is fallacious, as the readily saleable value of the assets should be the criterion in the case of mortgage of such assets." In as much as the land of the factory was also over-valued and certain readily saleable assets were already mortgaged to the State Bank for a secured loan, the report concludes that "it cannot be said that the Government took adequate precautions to safeguard its interests while granting and releasing the loan." The company's recent offer to the U.P. Government to sell its power plant, after the latter had rejected its request in July this year for a further loan of Rs. 1 crore, was also the subject of a statement by the Chief Minister in the Assembly. The entire question, according to the Chief Minister, is being examined by experts, and if a decision on principle is taken, another committee of experts from the Central and State Governments will fix the price for the plant. In fairness to the company, however, Dr. Sampurnanand admits that it relied for power on the Rihand Dam and it was only because power from Rihand would not be available until 1961 that the company was obliged to invest so heavily in a power plant of its own. The factory will go into production next February and the funds are needed for doubling the output at the suggestion of the Central Government.

The Price of "Pans"

Millions of people happily chewing the pan are perhaps unaware of the controversy now going on in Uttar Pradesh over the economics of the kattha industry. Over 20,000 workers are engaged in extracting kattha from trees called khair, which are owned mostly by the Forest Department of the State. The Department releases annually about 40,000 trees, of which 16,000 are allotted to a factory in Iznagar and the rest sold by public auction. Recently one or two more factories have cropped up, and a controversy has

started about the large number of people at present engaged in kattha manufacture on a cottage industry basis being thrown out of employment as a result. It is pointed out on behalf of the factories that the entire forest operations have to be carried out in an identical manner under both systems, and that the labour-saving is only in the manufacturing stage. The factory kattha is also of superior quality and it differs from the cottage product almost as much as factory sugar differs from gur. As for the price of the trees, it is perhaps true that the negotiated rates payable by the factories are somewhat lower than might have been fetched at an open auction. But, against this, while the bidder at an auction offers his price for lots of his choice, the factories have to take the trees marked out by the Forest Department. The factory kattha is sold at Rs. 12 to Rs. 16 a seer, whereas the cottage product is sold at rates varying from Rs. 6 to Rs. 8. The factory says that the higher price is justified not only by the superior quality of the kattha, but also by the low extraction percentage in the factory method. The ultimate implications to the consumer of this shift towards factory production remain to be seen, but it goes without saying that a rise in pan prices will make the Government highly unpopular, although it may make the roads less colourful and slippery.

Sad Song about Sarongs

The report that the import of sarongs or lungis has been banned by the Ceylon Government has disturbed the Indian textile trade. Anxiety centres not on the fact that the emporium set up by the Handloom Board in Colombo to push sales of Indian fabrics will suffer: it is concerned more with the prospective collapse of an old-established trade. Certain changes in Ceylon's import duties earlier this year indicated that, to conserve foreign exchange, quotas and other restrictions would be introduced. Since India's import licensing is far from liberal and many imports from Ceylon are subject to restrictions imposed in the interests of Indian coconut oil and copra producers, the sarongs ban may be due partly to a desire to hit back: it may partly also be intended to encourage the Ceylonese handloom industry in view of an accumulation of stocks there. The Handloom Board's annual reports suggest that Ceylon has been the biggest foreign market for Indian lungis; the Persian Gulf, Aden and Malaya take much less. The East Pakistani market was lost before 1954 and the trade passing through Calcutta has shrunk quickly because of exchange difficulties with Pakistan. Imports of handloom goods into Ceylon, estimated at over Rs. 2 crores in 1957, showed that from 1954 the export trade with that country had remained stable while Burma and Indonesia had curtailed their offtake.

The chances of Ceylon buying mill yarn in quantity to develop her handloom industry are not considered good. It is obvious that weavers in Madras and Andhra will be hit, even if the trade in Madras handkerchiefs with West Africa is maintained. A large part of the exports to Ceylon pass through Tuticorin, which is the nearest port, and Tamil Muslim merchants enjoy the largest share in the lungi trade. In the postwar period, there was a boom in lungis and exporters did very well. The domestic market will not be able to absorb the lungis which now cannot be sold in Ceylon as their price is high compared with that of dhotis. References to a breach of G.A.T.T. on the part of Ceylon might perhaps lead to a protest, but the impression is that Indo-Ceylonese relations are so strained that the protest would do little good. There may be a counter-plea that the rebate given on handloom fabrics and the special cess levied on mill cloth to aid the handloom industry amount to a subsidy, and the Ceylon Government might argue that "dumping" invites import restrictions. The Ceylon view has to be taken into account in view of the impression that exporters in Madras were not wholly unprepared for the lungi ban.

The Cost of Justice

Few deny that there is too much litigation in this country, but it is questionable whether the best way to discourage it is to raise court fees. U.P.'s Finance Minister, Syed Ali Zaheer, has not, however, been able to give any other reason for the Bill which he has just piloted for raising the fee for various types of cases, particularly for writ petitions. He admits that the resulting increase in revenue will be insignificant, but hopes that it will deter people from rushing to court on the slightest provocation. Even so, increasing the court fee for writ petitions from Rs. 3.75 to Rs. 50 must cause serious misgivings. The original Bill proposed a fee of Rs. 100, but the Minister reduced it by half in view of the strong criticism from all sections of the House. Filing writ petitions is a highly valuable privilege necessary for the vindication of the fundamental rights guaranteed by the Constitution. According to Syed Ali Zaheer, writs

are mostly filed by students who are not admitted to examinations, by Government servants who are dismissed from service, and by business men. Seventy percent of the claims, 75 percent of the appeals and 80 percent of the writs are rejected. But by making it impossible for the poor to file writs, the U.P. Government is violating one of the basic principles of the rule of law, namely, that justice should not only be done but should also be seen to be done. The U.P. Bar Association has raised the pertinent point whether the standard of court fees payable should not be of an all-India character. When each State fixes its own court fees, justice becomes costlier in some than in others. Syed Ali Zaheer's answer is that even now there is no uniformity. For bail applications, the fee in U.P. is Re. 1, as against Rs. 1.50 in Madras. Madras also levies fees on applications made to the Government, whereas U.P. charges nothing.

Atomic Power in the Far East

The General Electric Company has signed a contract with Japan's First Atomic Power Industrial Group for "licensing arrangements to undertake constructional work in the Far East." This has been announced in Tokyo by the Fuji Electric Company, one of the principal firms in the group. The agreement is subject to approval by the Japanese Government and to the Britons obtaining a contract to build a nuclear power-station in Japan or elsewhere in the Far East. When such a contract has been awarded, the Japanese group will begin building work. This does not mean that the British nuclear power industrial group, of which General Electric forms a part, will necessarily receive a contract for a nuclear power-station near Tokyo. But the Fuji Company says that the agreement has been concluded in anticipation of an order from the Japanese Atomic Power Company to General Electric. Even if

NOTICE

There will be no issue of CAPITAL on 1st January, 1959, as the markets will be closed for the Christmas holidays. The first issue of the New Year will be published on Thursday, 8th January, 1959.

General Electric fails to win the contract for a power-station in Japan, the agreement is not meaningless. Other nuclear power-stations will undoubtedly be built in the Far East. It is not considered likely in London that the Japanese Government will veto the agreement. The power-station contract may not be awarded until April. A "letter of intent", which was to have been sent in December to one of the three British consortia that have presented tenders, will probably not go until next year and building work may not begin until July or August, nearly a year later than estimated. According to the Fuji Company, the licence fee in the agreement will be between £140,000 and £180,000. Royalties will also be payable to the British firm.

Backdoor Nationalisation

A survey of the nationalised industries by the U.K. Institute of Directors, sent to the Institute's 30,000 members, concedes that nationalisation in some form has become a permanent feature of certain sections of the economy. But it attacks the socialist plan for extending control by buying shares. "There is no place for the State in the free enterprise board-room," the survey concludes. "The philosophies of the two systems are so incompatible that it could not even be a marriage of convenience." The survey, *Nationalisation: the Great Dilemma*, says the lesson to be learnt from experience of nationalisation is that the removal of the spur of free enterprise automatically slows down the tempo of an industry. The workers have found that in getting rid of the directors they have become subject to the "remote control of a faceless machine." Led by socialist propaganda to believe that elimination of the profit motive would reduce prices, the people have instead found themselves shareholders in industries which build up staggering losses the consumers have to pay for. "The most successful of the nationalised industries has not done anything which private enterprise has not done as well or better."

Insurance of Atomic Risks

There has evidently been some fresh thinking on the question of atomic risks as far as insurers are concerned, for Mr. A. B. Stewart of Lloyd's has recently made a strong plea to the marine insurance market to underwrite nuclear risks without resorting to pools. He argues that those who believe that nuclear risks are too catastrophic for insurance have been unduly pessimistic. Mr. Stewart, addressing the Insurance Institute of

London on "Marine Insurance and the Atom," emphasised that he is referring solely to marine underwriters and not to the non-marine market (which has already formed a single insurance pool in which the companies and Lloyd's have marshalled their resources). Cargoes in transit, in his view, are less vulnerable than property insured by the non-marine market. This is because most of the time they are in the holds of vessels or warehouses and have protective packing. Another factor preventing the "accumulation" of radiation risks is that if the wind direction is constant, as it usually is at sea, a turn of the rudder can take ships out of the path of radioactive dust. The fact that water is the ideal cleanser further reduces the chance of a big claim on the high seas. Even in a dock area subject to winds from most directions, it is unlikely that many vessels would be affected. The cargo risk cannot compare with the effects of a windstorm through the ports and coastal areas of the United States, a risk they do cover. As for isotopes or fissionable cargoes, most are a better risk than ordinary cargo by reason of their value, their packing and the extreme care taken. With non-nuclear hulls, the contamination risk is principally a matter of cleansing: costly sometimes but not a total loss. It will be some years, said Mr. Stewart, before the problems of nuclear hulls arise, although in 1960 the nuclear-powered U.S. Government-owned vessel *Savannah* will be in commission. This will be protected worldwide under the Price-Anderson Act amendment. On the subject of the capacity of the marine insurance market to pay nuclear claims, Mr. Stewart pointed to the big claims that have been met by Lloyd's and the insurance companies in recent years. The total possible claim on the *Queen Mary* and the *Queen Elizabeth* is £214 million. Nuclear reactors, said Mr. Stewart, will always represent only a small section of the non-marine underwriter's business. The marine underwriter is different: sooner than many think, the insurance of nuclear-powered vessels and their cargoes might comprise the major part of marine insurance business. Summarising his proposals, Mr. Stewart said that the nuclear risk should be included for all ordinary and fissionable cargoes and for conventional hulls, the last named to include damage from shore reactors. For nuclear hulls, he proposed to include the nuclear risk and to add liability to other vessels and cargoes whether there is a collision or not, full liability to be paid and not three-fourths as in non-nuclear collisions. Liability to third parties, however, should be limited to £5 million.

Killicks to Make Snowcem

Killick Industries Ltd. has framed plans to manufacture Snowcem decorative waterproof cement coatings in India. Snowcem is a cement coating which contains a water-proofing compound to resist the ingress of moisture or torrential rain when applied to buildings externally, and at the same time is semi-porous to permit rising dampness to come to the surface of the exterior walls and evaporate. For many years, it has been imported but recently it has become impossible to obtain supplies from the United Kingdom on account of the stringent import restrictions. Killick Industries Ltd. has, therefore, finalised arrangements with the U.K. party owning the sole rights for the manufacture and sale of Snowcem in India to form a new company in Bombay to be called Snowcem India Private Ltd., which will undertake the manufacture of Snowcem in Chandivli, Bombay 37. An application has been submitted to the Registrar of Companies, Bombay, to permit the formation of Snowcem India Private Ltd. The scheme, has already received the approval of the Central Ministry of Commerce and Industry, and equipment for the factory has just started arriving from Europe. It is hoped to complete the factory construction work and have the plant installed to undertake the manufacture of initial supplies of Snowcem during April or May 1959. The company will receive the full technical assistance of the U.K. participant, including the testing of all raw materials and finished samples in U.K. laboratories. Basically, Indian raw materials and pigments will be used wherever possible.

Clearing the Pavements

The Madras Corporation, after undertaking a survey of the many slums in the city, has made out a case for substantial assistance for clearing them. But an even more pressing problem is presented by pavement-dwellers. It is estimated that 6,500 families live on the streets. They belong mostly to the depressed classes and are self-supporting. A pre-war count made in connection with the Reverend C. W. Ranson's sociological study of Madras, then described as a city in transition, put the number of pavement-dwellers at over 10,000. The increase in 25 years to over 32,000 (taking the average family as consisting of five members) is due to the growth of trade and industry in Madras and the influx of the landless poor. Most towns are encumbered by pavement-dwellers but the

If you use the TELEPHONE—

you should know about S.T.C.

In many telephone exchanges in this country and overseas S.T.C. equipment is in service, for the telephone and Standard grew up side by side. Many of the important developments in this, and other branches of telecommunications, were pioneered by S.T.C. Today it is one of the biggest organisations in the Commonwealth, producing all types of telecommunication systems and equipment. Still the search goes on for more and more advanced communications, for in this field, leadership is Standard practice.

Standard Telephones and Cables Limited

(Incorporated in England with limited liability)

well-to-do localities are free from them, as the Reverend Mr. Ranson noted. Although the climate usually does little harm to the pavement-dwellers' health, the heavy rains this year made their lot unbearable. The usual solutions—an early provision of cheap housing in new estates and transport to places of work—cannot be easily adopted. Grants from welfare funds of charity trusts cannot help much. An increase in municipal rates to an adequate level was advocated by the clergyman who, after his survey of the sanitary conditions, suggested that positive remedies be taken to deal with the growing evil. The Corporation has provided street-taps and free lighting to help even pavement-dwellers, but a greater effort is needed in view of the findings of the recent enquiry. In order to raise revenue, an extension of municipal trading alone will not be sufficient, and the Corporation officials feel that a rise in the levies, especially in business areas, will be necessary. Perhaps more borrowing will have to be undertaken. The Corporation does not have a large public debt, but the clearance of slums, if financed only by a loan, will require borrowing from the market on a substantial scale.

New Definition for Textiles

The use of the word "textile" is so frequent when referring to a fabric of any sort that it is unlikely anyone could give an accurate definition of what the word really means. Indeed this is a question which has been discussed for a long time, and a new definition is given in the current issue of the *Journal of the Textile Institute*. In 1947, the Institute's Textile Terms and Definitions Committee suggested: "Textile—fibrous material;

textile fabric—a laminar structure composed of interlacing threads; cloth—a generic term embracing all textile fabrics and laminar felts." These definitions received considerable criticism. The Institute now suggests two definitions because it would seem that any definition of the word "textile" must be twofold to embrace both the fibre and the article manufactured from it. The new suggested definition is: "Textile—a fibrous material suitable for being spun and made into a yarn; an assembly of interlacing yarns or fibres in the form of woven, knitted or other structures." The suggestion is to be placed before the Terms and Definitions Committee and the Institute will welcome any comment which will help the committee in its deliberations.

British Textile Machinery Exports

British exports of textile machinery were valued at £29,792,000 in the nine months ended September, against £31,642,000 for the same period in 1957 and £34,088,000 in 1956. The decrease in volume of the trade was rather more strongly marked, the total of 845,000 cwt. comparing with 1,031,000 cwt. in the corresponding period of 1957 and 1,237,000 cwt. in that of 1956. A fall from £5,601,000 to £2,801,000 in exports to India during the period is the biggest change shown in the geographical distribution of the trade, but shipments to France were only £1,483,000, against £2,346,000, those to the United States were almost halved, at £832,000 against £1,625,000, and those to Pakistan decreased in an even larger proportion, to £582,000, against £1,677,000. Useful increases were, however, achieved in some directions. Exports to Australia were £2,792,000 compared with

£2,055,000, and those to West Germany were £2,350,000, compared with £1,689,000.

Propaganda for Cotton

Although cotton still accounts for 65 percent of world consumption of textile fibres, its share is steadily declining and it is facing growing competition from other fibres. For this reason, the International Federation of Cotton and Allied Textile Industries recently examined the need for sales promotional activities and market research to help stimulate cotton consumption. Cotton is very much the poor relation in present sales promotion schemes directed to textile consumption; the producers of manmade fibres, wool, silk, linen and jute are providing funds which are five to ten times as great as those now being provided by cotton producers. In the United States, the National Cotton Council operates programmes of market research, public relations and sales promotion costing about \$1.4 million a year to stimulate cotton consumption. In addition, the U.S. cotton industry, with the help of the Department of Agriculture, supplies \$1 million annually for promotion through the International Cotton Council to cotton industry organisations in Europe and Japan. The only other cotton-producing countries supporting promotional activity outside their own borders, even on a limited scale, have been Egypt and the Sudan. The Federation believes that cotton textile promotion should be introduced quickly in many markets where programmes do not now exist and that the present schemes should be made stronger and more effective. It is, therefore, submitting a "Statement on Cotton Textile Promotional Activities" to trade associations representing cotton-growing and exporting interests and to the responsible government departments in the cotton-producing countries.

"CAPITAL" CHRISTMAS TOY FUND

WE acknowledge, with thanks, the receipt of the following donations:

Rs. 100

H. E. the Governor of Bombay

Rs. 50

Members of staff of National Overseas and Grindlays Bank Ltd., formerly National Bank of India, Calcutta.

Rs. 21

Anonymous

Rs. 15

R. M. Hannah

Total Rs. 186

Previously acknowledged Rs. 4,676.25.

Grand Total Rs. 4,862.25.

SMOKE NUISANCE

IN our last issue we criticised the Bengal Council Act II of 1903, which is the Act passed "to abate and prevent nuisances arising from the smoke of furnaces in the town and suburbs of Calcutta." We now propose to consider the English legislation on the subject. The basis of that law is the Public Health Act, 1875. The heading of "Nuisances" in that Act covers seven kinds of objectionable premises or conditions of premises, the last of which is smoke produced by mills, factories, dyehouses, breweries, gasworks, etc. The chimneys of private dwelling-houses are exempted from this classification; though people familiar with the conditions of residence in India know only too well the choking and discomfort caused by the dwellers in *bustees*, in which, however, chimneys are shown, does not deal with dwelling houses of Act there are two important provisions: the second deals with nuisance arising from a fireplace or furnace that does not consume its smoke. The wording of this proviso is noteworthy: "The court shall hold that no nuisance is created within the meaning of this Act, and dismiss the complaint, if it is satisfied that such fireplace or furnace is constructed in such manner as to consume as far as practicable, having regard to the nature of the manufacture or trade, all smoke arising therefrom, and that such fireplace or furnace has been carefully attended to by the person having the charge thereof." The italics are ours. The reader will observe at once that this proviso recognises that there are trades or manufactures in which the production of a good deal of smoke is inevitable.

FROM

CAPITAL
22nd December, 1898

CORRECTION

In the Current News and Comment item "More Raw Rubber Needed" which appeared in the 18th December issue of Capital, it was stated that a levy of Rs. 8 a 100 lbs was added to the controlled price of raw rubber in order to help finance a scheme for improving yields. The correct figure is Rs. 6 a 100 lbs.

A Ditcher's Diary

FOR THOSE TO WHOM CHRISTMAS MEANS MORE than spending money they cannot afford, on presents that are not worth it, for people they hate the sight of, my sympathy this year is unbounded. It takes no great astuteness to appreciate that this has been the dullest Christmas Calcutta has experienced for some time. I know why my own is the most cheerless since the one I spent in bed with measles, but why it should be the same for others is a subject worth investigating, because I would be surprised if the reason applied only to the Christian community. I made a few enquiries of my own the other day in that barometer of Calcutta's festive feelings, the New Market. "Why are people not buying so much this year?" I asked some stall keepers. "High prices", said one. "A year of economic crisis has made them anxious", said another. "Nothing worth selling", said a third after trying for ten minutes to interest me in a pipe stand on which he had heaped all the superlatives he could put his tongue to. I met a friend and asked him, "Because it costs Rs. 52 a bottle when you can get it" was his answer. Clearly I was getting nowhere; there were obviously as many answers as there were people not buying. And none of them were particularly satisfactory. They were all what a psychiatrist might call rationalisations: I know from my own experience of wartime Christmases in Britain that good cheer does not always depend on prices and circumstances. "Why," I asked myself, "are the sacrifices of economic development affecting people's morale in this way?" Perhaps because, the answer came, those who are imposing them too easily give the impression they are enjoying it. It seems to me that what is sapping people's spirits—the fact that there is too much eagerness to pile on burdens for their own sake and too little inclination to justify their necessity. In other words, it is sympathy that is lacking. India is in the grip of an asceticism of which socialism is only a manifestation; and in such circumstances festivities like Christmas are usually among the first casualties. Too much sacrifice for sacrifice's sake and too few glimpses of the brave new world it is all supposed to be in aid of—surely India's problem must have been repeated throughout history a hundred times over. But at least there is one consolation this year. Up to the time of going to press, the total collection for Capital's Christmas Toy Fund had reached Rs. 4,826, which is the highest since 1953. There, certainly, is one good reason for rejoicing, and may I, on behalf of the children who will benefit thereby, thank all those whose generosity has made this year's Fund such a success.

BOTH AS CHANCELLOR OF VISVA-BHARATI AND Prime Minister of India—and as a student of history—Mr. Nehru may well have wondered during his recent visit to Santiniketan how men die and institutions decay. Even before Visva-Bharati was made a Central university, reports from Bolpur were of a depressing character. No great literary creation, no worthwhile research, no extension of the good work started by the Poet—only stories of intrigue and sometimes what looked like small causes court reports. It was foreseeable that a part of the university's initial idealism would depart with the death of its great founder. It is also understandable that there should now be a conflict between original ideals and the present times. What is not nearly so excusable is the rôle of a certain group of former students of Visva-Bharati

who appear to have powerful friends at court in New Delhi. It is unlikely that Mr. Nehru got anywhere near unravelling the myriad conspiracies at work for gaining control of this seat of learning and yet, as Chancellor, a part of the responsibility for decisions taken is certainly his. If politicians got involved in the Banaras Hindu University scandal, the Visva-Bharati one seems to be the work of academicians turned politicians or lawyers trying to turn educationalists. It is quite ridiculous the way the search for an adequate vice-chancellor has been going on, and I have seen some very strange names mentioned in newspaper reports. It is said that Mahatma Gandhi wanted the winding up of the Congress party after the achievement of Independence. A similar course for Visva-Bharati would perhaps be too drastic, but there is no case at all for wasting public funds on an institution which does nothing to preserve the reputation of its founder and fails to live up to the standard of even an ordinary university.

POLITICAL EQUATIONS, A GAME MADE POPULAR hereabouts by the late Professor Benoy Sarkar, are not very scientific. One such as India 1757—England 1757, but England 1959—India 2059 would tell a very small part of the truth about the economic positions of the two countries. But I have been wondering since the news of Mao Tse-tung's decision to give up the chairmanship of the Republic, whether it is not possible to equate Stalin's Russia with Mao's China. History, of course, never repeats itself in quite the same fashion, and it is easy to see that while Stalin's Russia had to struggle hard to acquire an international personality, Mao's China is already a world power. No sooner had the revolution succeeded than there were countries falling over one another to recognise her. Continuing the same trend, Iraq and Sudan just walked home. But, *mutatis mutandis*, China is going through the same ruthless political and economic processes that Russia did to consolidate her revolution and give it economic teeth. Indeed, in some respects the processes may well be more brutal, for forty years have now to be packed into ten and the population in China's case is at least three times larger. So we shall see many more changes; and, one more difference, we shall know about them even less than we did about Russian purges. Those open trials Stalin staged were poor propaganda for Russia and communism, and Mao and his successor(s) are unlikely to repeat the mistake. All this can, of course, be dismissed as the internal affairs of China, to pry into which is considered almost indecent, but a Russian or an American may well ask why the same tolerance is not extended to what happens in Budapest or Little Rock. I think it is entirely right that Notting Hill got the publicity it did, and I do not think it at all right that much worse tyranny in other countries should be passed over in the name of international decorum.

"JUST BECAUSE BILL RUNS THE HOMES FOR KHAKI British Babies . . . he gets his K. What about those two power stations I got for British industry in Byelorussia this year? . . . Don't they think that's worth anything?" This is one of the grouches of the big British business man, according to Roy Lewis and Rosemary Stewart, the authors of an intriguing pilot study of this surprisingly ill-documented subject, published in the November number

of *Encounter*. Honours, it is felt, are far from evenly distributed; too many go to the do-gooders, politicians, and civil servants, and far too few to the men who get on with the job of production. But in general the authors seem to feel that we can stop worrying about our tycoons. In spite of their ulcers, high blood pressure, and hardening arteries, and "all assertions to the contrary notwithstanding, we do know that it is a very enjoyable life." Money, they say, is one of the reasons for this; power—though power of a much more limited sort than the far Left used to credit them with—another; but most important is the sense of "escape to an increasing degree from the frustrations of being bossed." One of the most interesting parts of the study deals with "status symbols," the measurements of success in business. Where a man eats is important, of course. In a big concern . . . there may be as many as six or seven grades of eating-place, and one company known to us was even thinking of introducing five different managers' dining-rooms to enhance the sense of rank and emphasise the value of promotion." And "the lavatory is one of the most important status symbols, as to meet a junior employee in a place of common humanity would be an affront to dignity." Any sizeable business house usually has several grades of lavatory, and directors may have a special one to which they have a key. Status symbols apart, the authors find that the prospect of retirement is one of the more worrying preoccupations of top management. "Twenty British directors selected at random were asked by us if they had any plans of retirement; not one had made any." To the dedicated business man the firm has been his life, and "retiring to him is the end of life—death." Which brings them back to their original point: that chairmen and directors seem to find the game well worth the ordeal of burning the candle at both ends.

PERHAPS THE MOST UNFORTUNATE RESULT OF THE communist practice of using everything to serve the purpose of the State is that such superb artistic productions as *The Bolshoi Ballet* are apt not to evoke the spontaneous acclaim they undoubtedly deserve. An ovation for them is too much like making a choice between ideologies. Like London audiences before me, I decided there would be no question of allowing the cold war to interfere with my enjoyment of the ballet—in its film version, of course—when I visited the New Empire Cinema the other evening. It is a decision I have not regretted. A good deal of the credit goes to the film's director, Dr. Paul Czinner, for one of the most enjoyable couple of hours I have ever spent. But for the artistry, discipline and spectacle of the ballet corps itself, I was almost speechless with admiration by the time the performance was over. Surely there can be no body of players anywhere in the world to surpass this one in achievement and dedication. If this is propaganda, however sophisticated, then let there be more of it. I was frankly amazed at the grace, vivacity and suppleness of the prima ballerina, Galina Ulanova, who, I believe, lacks only a few summers to her fiftieth birthday. While not normally enthusiastic about this form of art, and remembering with some slight distaste the time I wasted watching the gawky amateurishness of a ballet performance in Leningrad only a few months ago, I feel that to have missed this experience would have been among life's major disappointments. As I left the building, after the show, it occurred to me that, Pasternaks notwithstanding, Russia has allowed some genuine artists to develop their genius, presumably without too much bureaucratic interference, but not, of course, without a sternly practical end in view.

SIXTY-SECOND ANNUAL GENERAL MEETING

MR. C. R. SRINIVASAN'S REVIEW

Presiding over the Sixty-second Annual General Meeting of the Shareholders of the Company held on 16th December, 1958, Mr. C. R. Srinivasan, Chairman, said:—

Gentlemen:

"The Report of the Directors and the Statement of Accounts for the year ended 31st May 1958 have been in your hands for the necessary time stipulated by law and, with your permission, we will take them as read."

I have no doubt the Shareholders will agree with me that the result of the Company's operations for the year we are now reviewing has been most satisfactory and has enabled your Directors to propose payment of dividends on the Ordinary Share Capital totalling 18%.

A perusal of the Directors' Report and the Accounts for the year 1957-58 together with the Notes accompanying the Accounts gives, I think, a very clear picture of the Company's operations for the past year. You will see that sales at just over Rs. 3,28,00,000/- constitute a record. The gross revenue of sales was over Rs. 1 crore above the figure for the previous year but, of this figure, additional tax accounted for Rs. 35,00,000/-.

I shall, of course, do my best to answer any questions which Shareholders may wish to raise about the accounts at the conclusion of my speech but there are a couple of points on which I will comment now which have not been covered by the Directors' Report or the Notes on the accounts.

The first one is that Shareholders will be glad to know that as a result of the substantial improvement in the Company's cash position, your Directors have decided, since the close of the financial year we are now reviewing, that the mortgage loan advanced to the Company by the Industrial Finance Corporation of India can be dispensed with. At 31st May the amount outstanding on this loan was Rs. 10.4 lakhs and the whole of this was repaid on 1st November 1958 together with interest accrued up to the date of repayment.

I would like to take this opportunity of expressing to the Industrial Finance Corporation of India the appreciation of the Company, its Shareholders and Directors, for the assistance rendered by the Corporation and for the unfailing courtesy and co-operation we have at all times received from the Corporation.

The second point I would comment on is that in N° 10 on the accounts Shareholders may have noticed a substantial increase of nearly Rs. 7 lakhs in the item of Consumable Stores.

The reason for this is the inclusion under this heading of new items of machinery and spares which have since been installed at the factories but which at 31st May last were in store awaiting issue when the time came.

Turning now from the accounts themselves, Shareholders will be glad to learn that the reconditioning of the factory at Samalkot and the expansion of the boiling house at Pugalur to which I referred in my speech last year are now practically completed except for the installation of a new boiler at Samalkot which will be finished in the next off season as all the material for this item had not been received in time for it to have been installed before the commencement of crushing at Samalkot at the beginning of December. The supply of cane to both factories was satisfactory throughout 1957-58. Although production of sugar at Samalkot has been maintained the price realised continues to be low. This is because nearly two-thirds of the production has to be sold outside Andhra in far off markets like Cochin. This is a difficulty we share with most other factories in coastal Andhra and it is likely to continue since Andhra has a large surplus for export to its neighbours. The increased cess on cane of Rs. 5/- per ton has come to stay in Andhra as appeals to the Government have not had any effect. It was only to be expected that the Government of Madras could raise the cess next and this they have done by fixing the rate at Rs. 2/- per ton, an increase of 100%.

Sugar Exports

An outstanding event in the sugar industry this year was the announcement by the Government of India in June last of a quota of 50,000 tons of sugar for export through the agency of the Indian Sugar Mills Association. The quota represents 2½% of the production of all factories for the 1957-58 Season. This is the first time Indian sugar has been offered abroad in 1957 having had the benefit of the unusual circumstances that followed on after the Suez crisis. The loss on export is of the order of Rs. 300/- per ton and this is to be borne by the factories out of the profit margin on internal sales. Export, in other words, is possible only so long as there is a strong internal demand at profitable prices. The export quotas of the Pugalur and Samalkot factories were 534.2 tons and 253.7 tons respectively and the loss, about Rs. 2.40 lakhs, will be reflected in the figures of lower realisation for sugar in the accounts for the current year.

Soon after the export quota was announced there was an increase in sugar prices in the North largely due to speculative activities following the political upheaval in Iraq. As this event faded from the headlines and manufacturers offered their sugar freely, prices started to come down, but, just then, the Government of India intervened and imposed control over the factory prices in U.P., North Bihar and the Punjab and introduced a system of allotments of sugar to any one who applied for it. It is the contention of the industry that the prices fixed are unremunerative and, having failed to convince Government of the justice of this case, some factories have filed an application in the Supreme Court for a writ restraining Government from exercising control.

The Government of India has abandoned the traditional practice of announcing a minimum price payable for cane and has amended the Sugarcane Control Order in such a way as to provide an initial minimum payment as also a subsequent payment designed to give the grower a share of anything the factory realises above a certain minimum. I do not quarrel with the growers' right to share in excess realisation but, in common with a majority of those responsible for the affairs of sugar manufacturing concerns, I wonder if the new formula will provide the essential margin that any Company needs before price linking can apply. I am sure you will agree that the Shareholder is entitled to a dividend equal to that which he can look for in the industry in other industries before he is asked to share with the grower. I am equally certain that he is entitled to be certain that adequate sums can be put to reserve before profit sharing applies. Holding these views, I am happy to know that the Indian Sugar Mills Association as mentioned later in these remarks is actively engaged in presenting the industry's case. Even though not opposed by sharing proposals, there is one serious criticism of the new proposals which I must point out. Hitherto if our technical staff suggested a scheme involving capital expenditure designed to improve efficiency, we considered it from the angle of the increased earning per rupee of expenditure and decided for or against largely on merit. Under the new formula the benefits of any such increases will automatically accrue more substantially to the growers than even to shareholders and therefore the same degree of inducement to invest with a view to improved performance is no longer there. I hope the Government will give this aspect due consideration before the next cane price announcement is due to appear.

Cost Structure Enquiry

As a consequence of the protest made by the Indian Sugar Mills Association against the imposition of control and the introduction of what they believe to be an unrealistic formula, a reference was recently made by Government to the Tariff Commission for a fresh examination of the cost structure of sugar and the fair price payable to the industry. The Commission has also been requested to submit a preliminary report on the allowances for rehabilitation and profits—two items of the cost structure on which there is divergence of view between the industry and Government. The Tariff Commission's findings will be awaited with interest.

The sugar industry has often been accused of erasing before it is hurt, but I must risk exposing this Company to the accusation in making a reference to the danger which the industry faces from the encouragement that is given to the khandasari industry.

Khandasari is not very well known in South India. It is really a refinement of the jaggery industry and employs the principle of centrifuging the massecuite in order to produce a near-white sugar. Under normal conditions of taxation the khandasari industry cannot thrive, but with sugar paying Rs. 350/- per ton as between Cess and Excise, khandasari enjoys a measure of protection that is afforded to no other industry. I have said that khandasari is a refinement of the jaggery industry, and if its activities are confined to taking cane from areas that do not provide sugar factories, then as a sugar manufacturer I can watch it with envy because of the immunity it enjoys from taxation, but without animosity. When, however, as is happening in North India, khandasari units are set up in factory areas, the threat to the white sugar industry is very real. Supplies of vital raw material are taken off and factories are left with less than enough cane for economic crushing. Thus the cost of manufacture of white sugar is increased. Furthermore, the quantity of white sugar is reduced and, if we are to export, this has serious repercussions. I have mentioned earlier in this speech that there is a loss of Rs. 300/- a ton on each ton of sugar exported. With 2½% of total production exported, the loss per ton on total production is only one-fortieth or approximately Rs. 8/- per ton on total production. If the total quantity of white sugar is reduced and the quantity Government set aside for export increased, the percentage rises. At 5% the cost per ton on total production is Rs. 16/- per ton and at 10%, the loss per ton on total production has risen to Rs. 33/-.

These are facts that must be taken into account by the Centre and, if we are to retain a healthy white sugar industry and to use this as an instrument for earning foreign exchange, then Government must interfere to prevent khandasari taking cane from factory areas.

Production Prospects

Adverting to production and prospects for the current year, the Pugalur Special Season closed on 4th November 1958 after crushing 49,700 tons of cane from which a sugar recovery of 8.65% was obtained. This constitutes a welcome improvement over the recovery for last year's Special Season which was only 8.79%. The Main Season at Pugalur started on 7th December and during the month between the close of the Special Season and the start of the Main Season the programme of additions and modifications to this factory was completed and we confidently expect a further improvement in its performance.

The target of crushing at Pugalur is 1½ lakh tons during the current Main Season, to be followed by 60,000 tons to be handled during the 1959 Special Season.

At Samalkot, production began on 8th December and despite the potential hazards associated with the commissioning of new machinery you will be pleased to hear that the turbine driven mills are operating smoothly.

The target of cane to be crushed at Samalkot during the current season is 1 lakh tons.

Production of Co. gas at Samalkot continues to make quite a useful contribution to the earnings of that factory and no difficulty is being experienced at present in selling the entire production. Unfortunately, due to the lack of spirit for industrial uses in the area served by the Samalkot factory is not good and so no contribution is arising at present to the factory's earnings from this particular source.

Labour

After prolonged discussions, an Agreement was concluded with the Labour Union at Samalkot in August, 1957, settling the question of wages, dearness allowance, and bonus for three years. A satisfactory settlement was also concluded with the Staff at this Factory. Unfortunately, it has been impossible so far to conclude such a comprehensive agreement with the Labour at Pugalur, as, although the questions of wages and dearness allowance have been settled, the Labour at this Factory have refused to sign an agreement on the question of bonus.

Meanwhile, certain work, mainly in the Cane Yard and Sugar Godown which hitherto was carried out by contractors at Pugalur, has been taken over directly by the Factory. The workers are, however, engaged on a piece-work basis with a minimum guarantee wage and, so far, the results are satisfactory.

You will have noticed a good deal in the Press about the Code of Discipline in industry which, if implemented fully, could have nothing but good results. Unfortunately, I have to report that at Pugalur, where we have two different Unions affiliated to different political parties, each has, within the last few months, called an illegal strike. While the consequences of neither have been serious and the trouble has been speedily settled, the fact that the Code of Discipline can be so totally ignored by Union leaders gives cause for considerable disquiet.

Before I close I would like to express our appreciation of the work done by the Staff at our two factories. At Pugalur, with the very long season, staff is under unusual strain and they have responded magnificently. The new machinery and get the factory ready for the 1958-59 Season and I am told that the manner in which their work has been carried out is deserving of much praise. I am sure you will join me in factories."

The Report & Accounts for the year ended 31st May 1958, were unanimously adopted and a final dividend at the rate of 10%, free of Income Tax, dividend of 3% free of Income Tax was declared on the Ordinary Share Capital of the Company for the year ended 31st May 1958, the dividends being payable on the 17th December 1958.

The retiring Director, Kumararajah M.A.M. Sir T. S. Venkataraman was re-elected and Director of the Company by a Special Resolution passed in accordance with Section 281 of the Companies Act, 1956. The retiring Auditors, Messrs. Lovelock & Lewes, were re-appointed on the same remuneration as for the previous year.

N.B.:—This does not purport to be a Report of the Proceedings of the General Meeting.

INDIA STEAMSHIP COMPANY LIMITED

CHAIRMAN REPORTS INCREASE IN FREIGHT EARNINGS

Addressing the Annual General Meeting of the Shareholders of India Steamship Company Limited held on 22nd December, 1958, Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L.(Oxon), Chairman of the Company, said:—

Gentlemen,

The Audited Accounts and Directors' Report for the period ending March 31, 1958, have been in your possession for some time. With your permission I shall take them as read.

Trading Experience

The Directors' Report shows that the freight earned during the year was Rs. 7,75,04,245/- as against Rs. 6,00,17,168/- in the previous year and Rs. 5,26,11,831/- in 1955-56. The total number of round voyages made during the year was 30.5. Both in the number of round voyages and in the amount of freight earned in the year under review, the figures exceed all previous records. The average duration of the round voyages is slightly less than in previous years. The increase in earnings, and the number of round voyages completed are partly due to the number of ships in service and operated during this period. Other factors which contributed to these satisfactory results will be referred to later.

The Company made a net profit of Rs. 1,21,59,779/- after setting aside Rs. 53,37,000/- for Development Rebate and Rs. 59,37,481/- for depreciation. The amount for Development Rebate has been shown separately and set aside for the purpose of expansion of the fleet in accordance with the recent legislation on the subject. This is a matter of sincere gratification to your Board, as I have no doubt it is to you.

Port Conditions

Conditions in some of the ports are still causing concern to shipping companies, though for reasons different from those which have prevailed hitherto. In my address last year I said: "I am glad to inform you that owing to the vigorous steps adopted by the port authorities and the Transport Ministry in finding berths for ships has virtually been eliminated and it is possible to arrive in Bombay and Madras and even in Calcutta, subject to draft restrictions, for a steamer to find a berth on arrival." It is a matter for regret that these draft restrictions have developed so seriously that it is little satisfaction to the shipping companies to know that berths are available. In the Port of Calcutta, the river drafts have fallen so sharply that the delays are now experienced at Sandheads and ships awaiting proper drafts are held up for days before proceeding to the vacant berths. The Port of Calcutta is the most important port from the point of the volume of traffic both inwards and outwards. There are other minor disadvantages at this port arising out of the salinity of the fresh water in the river which add to the difficulties. The Government of India is showing a commendable desire to increase exports to various countries and an equal anxiety to bring about a reduction in freights to achieve its objective. The most practical way of achieving this objective is to improve conditions of navigability in the various ports of India and I trust that the measures contemplated for the purpose will be implemented at a very early date. I referred last year to the piece rate system for dock labour in the Port of Calcutta which I hoped would be introduced soon. It is a matter for regret that a scheme which has been found satisfactory in Bombay and Madras has not yet been introduced in the Port of Calcutta where it is most needed and where healthy labour relations can be promoted by its adoption. I trust there will be no further delay in implementing the scheme.

Progress

During the year, another ship the "Indian Security" has been added to your fleet. Two more ships, the "Indian Strength" and the "Indian Progress" have both been launched and the first of these is now on her maiden voyage to India. The other ship will, it is hoped be ready for trials towards the end of the year and is expected to make the maiden voyage early in January. During the current year, there will therefore be in the service of the Company 15 ocean going vessels and one coastal vessel. Within the last fortnight, a new vessel has been launched at Visakhapatnam—The "Indian Industry".

This is the first ship which is being built by the Hindustan Shipyard for your Company. Besides these, two ships are on order in Germany and they are expected to be delivered by the end of 1959. All these ships were contracted for according to a phased programme in 1956.

We are grateful to the Government for the financial assistance by way of loan which has been sanctioned and for the foreign exchange allotted which has enabled us to expand our fleet to this extent. We have, however, a further programme of expansion including an option with a German shipyard for the construction of two more ships in 1960 and additional ships in the following years. The foreign exchange requirements for these ships have been engaging the attention of both the Government and your Board and it is clear, despite the difficulties so obvious, that a solution has to be found.

Earnings and Dividend

I have referred to the profit earned by your Company during the financial year. This profit, I wish to emphasize, is to be related not to the paid up capital only but to the total capital employed including borrowed capital. On this basis, it will be realised that at the end of the year, i.e., 31st March 1958, the total cost of the fleet was Rs. 13,40,78,416/- and, after deducting the amount written off for depreciation, the net value of your fleet was Rs. 10,19,90,379/-. I trust these figures will give a better perspective of the net profit earned by your Company and its ratio

the report which has long since passed. From every point of view therefore, it seems to be necessary that facilities should be given by way of loan, to build such ships as soon as possible both in Indian ship-building yards and in foreign yards. In either case, it is quite clear that foreign exchange will be necessary and it is my hope that, realising the gravity of the situation and the urgency of developing the Indian Mercantile Marine, a proper and appropriate priority will be given to the requirements of foreign exchange for building ships for Indian companies.

It is hardly necessary to repeat that a ship begins to earn foreign exchange from the date that it is handed over after trial to the company. You have seen from the Balance Sheet that the freight earned is Rs. 7,75,00,000 and a careful calculation has been made of how much this is represented by foreign exchange earnings with the result that Rs. 3 crores or 40% of the earnings is the foreign exchange content of these receipts. The other companies engaged in overseas trade can show similar results and I would earnestly suggest that the time has come for considering the giving of a high priority for foreign exchange loans to Indian shipping companies.

Thanks

We are indeed indebted to the Minister of Transport, to the Secretary and officers in the Ministry and to the Director-General of Shipping and his officers for the help they have rendered to Indian shipping and for the advice they have given from time to time. They have shown a deep and abiding interest in Indian shipping and have done their best to promote the expansion of such shipping. I trust that the importance that they have attached to such expansion is shared by the Government of India as a whole. A new Mercantile Marine Act has now been passed—a purely Indian law—is now effective as much to promote and foster the development of Indian shipping as to regulate and prescribe its activities. I hope that both aspects of the law will receive equal attention and that Indian shipping will be made to feel that restrictions and controls are only one phase and occasional while they are coupled with assistance and encouragement which will be constant and that both are equally for the benefit of the industry.

Tribute

The results that I have referred to, of the financial working of the Company during the year, could not have been achieved without the whole-hearted and devoted contribution which all its officers, afloat and ashore, of all ranks and its agents and brokers both in India and abroad, have made. On your behalf and on behalf of the Directors, I wish to convey our special thanks to all of them for their good and enthusiastic work throughout the year.

We have received during the year the continued and firm support of some shippers both in this country and overseas and I should like to thank them for the confidence that they have placed in our service and the recognition that they have shown of the competency of that service. Our fleet, one of the fastest in cargo service from India to the United Kingdom and Continent, if not the fastest, has established itself for its reliability and for the ready and careful handling of the cargo entrusted to it. It will still be our endeavour to improve further so that, comparatively new as we are to the shipping world, we shall have established a reputation second to no other shipping line, however long established it may have been. I wish to thank you, gentlemen, for your attendance at this meeting and to join with you in the hope that the Company will further progress in the years to come and have to its credit more than the financial results—the reserve of goodwill of all those connected with it, of our shippers, and I hope, of our Government too.

Note:—This is not a report of the Annual General Meeting.

A Tribute to Men of Vision

IN 1908, The Bank of Baroda was inaugurated—in response to a demand voiced by the people of Baroda themselves for a purely Indian bank that would cater for their requirements. And on the occasion of the Bank's Golden Jubilee, we pay glad tribute to its Founder Directors, men whose vision and initiative led to the Bank's establishment under the distinguished patronage of H. H. Maharaja Sir Sayajirao Gaekwad III... and to those who have guided it through fifty years of service and achievement.

All types of banking business. Started with a paid-up capital of Rs 6,92,700 and with one office employing fewer than 20 people, the Bank has today a paid-up capital of Rs 1,25,00,000 and over 83 offices in India and abroad giving employment to more than 2,800 people.

The Bank carries on all types of banking business and offers safe deposit locker facilities in thirty-six cities. Its Executor and Trusteeship Department in Bombay renders valuable services, and considerable foreign exchange business is handled through the Bank's foreign branches and correspondent banks. Its Golden Jubilee year has been marked by the absorption of the business of The Hind Bank by amalgamation, one result of which is that The Bank of Baroda now has an office in Pakistan.

Inspired by its past record, the Directors and Management of The Bank of Baroda look forward with confidence to a future of continuing service to the country... in the tradition so firmly established and worthily maintained during the past half-century.

Money

THE CALCUTTA MONEY MARKET.

CALL RATE RISES

Tuesday, 23rd December.

THE seasonal increase in demand for advances has persisted during the past week. The rise continues to be moderate and is partly accounted for by a sudden jump in demand from upcountry banks for window-dressing purposes. Increased funds have gone to the sugar mills during the past week and on account of grain and seeds storage in upcountry areas. Demand from the jute mills remains unchanged. The interbank market has become firmer. End-of-the-year considerations have pushed the call rate up to 3½ percent, but business is reported to have been done at even higher levels.

Very few tea bills have been seen this week in the exchange market. The supply of gunny bills has remained fair. Remittance has been poor. Sterling lost fractionally against the U.S. dollar during the week, but was marked up slightly against the Canadian dollar. Against all the main Continental currencies, the pound remains firm.

BULLION WAS QUIET ON PROFIT-TAKING. THE year-end closing of accounts called for caution. Silver declined from the previous week's level of Rs. 192 to Rs. 191.25, quoted today for ready delivery. The forward rate was Rs. 190.25. The London and New York silver prices were quoted at 75½d and 89½ cents.

Gold was quiet in sympathy with silver and the price dropped from Rs 114.50 to Rs. 114. The sovereign at Rs. 73.75 showed a decline of 25p.

THE RETURN OF THE STATE BANK OF INDIA FOR the week ended 12th December, 1958, shows a drop of Rs. 1.44 crores to Rs. 468.58 crores in total deposits. Investments in Government securities are down by Rs. 2.71 crores to Rs. 273.72 crores, while other authorised investments remain unchanged at Rs. 11.71 crores. Advances, including loans, cash credits, overdrafts and bills discounted and purchased have increased by Rs. 3.25 crores to Rs. 168.45 crores. Cash and balances are, in consequence, shown at Rs. 31.31 crores or Rs. 2.37 crores higher.

THE STATEMENT OF THE POSITION OF SCHEDULED banks for the week ended 12th December, 1958, shows Demand and Time liabilities at Rs. 706.41 crores (Rs. 21.09 crores on account of borrowings from banks) and Rs. 924.42 crores (Rs. 37.07 crores), compared with Rs. 705.02 crores (Rs. 22.27 crores) and Rs. 928.34 crores (Rs. 38.06 crores), respectively, in the previous week. Cash has increased by Rs. 7 lakhs to Rs. 39.52 crores, while balances with the Reserve Bank have declined by Rs. 66 lakhs to Rs. 70.03 crores. There is a drop of Rs. 1.92 crores to Rs. 647.71 crores in investments. Advances and bills discounted at Rs. 849.76 crores show an increase of Rs. 8.83 crores. The ratios to total liabilities of cash and balances and of advances and discounts, are, in consequence, shown at 6.7 percent and 52.1 percent, against 6.7 percent and 51.5 percent.

THE FOLLOWING IS A STATEMENT OF THE CASH balances of the Central Government on the last day of September 1958:

	Rs.
(1) At the Reserve Bank of India in India	50,86,92,000
(2) At treasuries in India	22,39,000
(3) In England (Sterling converted at 18d the rupee)	91,70,000
Total	52,01,01,000

TREASURY BILL MATURITIES

FIRM UNDERTONE IN STOCK MARKETS

INDUSTRIALS AND GILT-EDGED RISE

London, 23rd December.

A VERY satisfactory tone was maintained in the stock markets during the past week on selective buying, although, as usual, there was some contraction in business before the Christmas holiday. Several good features developed, particularly in the industrial market, but an exception to the general underlying firmness was provided by oil shares which continued to lose ground on further consideration of the Venezuelan President's statement on oil policy, and receded further on the news that Venezuelan income tax has been increased by 10 percent. The generally firm tendency was based on a number of factors. They included the statement by the President of the Board of Trade that the December unemployment figures would show a small improvement, the strength of Wall Street, the rise in retail sales in November and buying by recently formed unit trusts. Apart from these good features in industrials, movements in prices were usually small. Gilt-edged rose on modest demand and were often a fraction better. The small rise in the Treasury bill rate after its recent fall had little or no effect on the market. The feature in foreign bonds was the sharp advance in Greeks on debt settlement hopes and the more encouraging situation in Cyprus. Ralls were featureless and dollar stocks moved up in line with Wall Street. Banking shares were firm, buying being encouraged by Martins' scrip issue and the dividend announcement which followed the previous week's similar announcement by Midland. Insurance shares were selectively firm. Interest in industrials was selective rather than general; the overall trend was somewhat irregular, but several good features developed and gains were well in the majority on the week. Gold shares fluctuated within narrow limits and recorded little change on balance. Coppers and tins were irregular but leads and zincs occasionally improved. Oil recorded quite heavy losses under the lead of Ultramar. Rubbers inclined higher. Indonesians made further headway, with Anglo-Indonesians adding to the previous week's gains. Elsewhere, Cila Kalimpong and Bukit Rajah were among the firm spots. Teas were quiet and irregular.

The Money Market

Credit conditions were not so comfortable in the money market during the past week. There was a contraction in the volume of credit and in the earlier part of the week it was only just about adequate. Thursday was very difficult and the market was forced to repeat its moderately large borrowing from the Bank of England. The market had to pay rather more for its overall borrowing during the week with 3 percent being the more effective rate, while the lowest was 2-3/8 percent and the highest 3-1/8 percent. Bill business was less keen with the March maturities and "hots" sold at 3-1/16 percent. The forcing of the market into the Bank of England had its desired effect on the Treasury bill rate at the tender last Friday. Discount

houses reduced the price of their effective bid, and the Treasury had to pay a little more for its short-term borrowing with the average rate for the bills a little higher at £3-3s 0.9d percent.

Stock Market Prospects

The Investors' Chronicle market newsletter writes: London gilt-edged have formed a strong base from which they should rise above the recent highs. After a healthy pause, industrials have acted favourably and the upturn on Wall Street will probably carry them forward before the year-end. With the year-end selling completed, gold shares should resume their primary upturn on a broad front. Buyers for base metal shares have reappeared on support for the metal and on New York advice. Venezuelan politics have unsettled leading oils. Wall Street's line of least resistance appears to be upwards. The Dow Jones industrial average should rise to around 580 in the near future.

Paris Gold Booms

After a steady but hesitant start, the Paris gold market gradually firmed to finish the past week with boom conditions. The trend was due to large covering operations by financiers and dealers on unconfirmed rumours that the start of the European Common Market might coincide with monetary reform in France. Market talk that Britain might decide to make the pound sterling convertible added to the flurry.

Rubber Futures Steadier

Rubber futures steadied in New York during the past week on trade covering and small buying. Dealers said that foreign quotations were steady for the period, with some Russian nibbling in the Far East. Shipment offerings did not press upon the market, although factory buying was only moderate. Detroit sources said that motor-vehicle production would slip to an estimated 134,000 cars a week as a strike continued to halt most of Chrysler Corporation's output. Last week, the industry turned out 137,835 motor-cars and in the same week a year ago 140,451 motor-cars rolled off the assembly lines. Production was also affected by a glass shortage at the American Motors Corporation and some reduction in Saturday work. A strike at one of Chrysler's main suppliers, Electric Autolite, which began in mid-November, was still on and 11 plants were affected.

Sugar Futures Quiet

World sugar futures moved narrowly during the past week, with traders continuing to watch Cuban rebel developments. U.S. domestic futures were quiet and easier on small liquidation. Meanwhile, dealers said that American underwriters had raised war risk rates on sugar shipments between Cuba and the United States and Canada. The rates had been increased from 24 cents a \$100 to 25 cents, while from Oriente province, which was the rebel stronghold, the rate had gone up to 50 cents a \$100. There were some Cuban shipping points which were not affected by the increases.

NAMES AND DATES

Mr J. K. Srivastava, chairman, board of directors, New Victoria Mills Co. Ltd., Kanpur, has been re-elected president of the Upper India Chamber of Commerce, Kanpur. This is his third consecutive term of office.

LONDON INSURANCE LETTER

INVESTING FUNDS IN ORDINARY SHARES

THE sharp break in Wall Street prices in November had no lasting effect on security prices in London, but it caused a temporary setback sufficient to make insurance companies' investment managers pause. Erratic behaviour in the market has no bearing on the long-term investment policy, but in this case deeper problems than the market's "nerves" were involved. The section of City opinion, which believed the short "bull market" to be nearly ended, gained adherents, although some of them reverted later to the more confident belief that the "bull market" had still a long term to run. Two questions for investment managers at this time are (long-term) whether to continue to increase the proportion of funds invested in ordinary shares and if so (short-term) when to buy ordinary shares. There is no sense in buying shares "near the top", in a market which will soon subside steadily to lower levels. The rise this year has been considerable, and it is not yet supported by economic recovery in Britain. Investors are relying on the Government's resolve to stop the recession, but they do not know how soon the Government's policy—aided, perhaps, from outside—will increase production and trade. It may be that the rise in ordinary shares was premature.

Cyclic changes in values of ordinary shares are an acknowledged disadvantage of this type of investment for insurance funds, and it is one reason why some investment managers still feel little enthusiasm for ordinary shares. The accounts for 1957 show that the percentage of ordinary shares in investment portfolios ranges between 41 percent and 10 percent. But the proportion has, over the whole range, grown fairly steadily since the war: first because the emphasis on Government stocks during the war was abnormal, later because inflation and the growth potential of industry exerted a positive pull towards ordinary shares.

Basic Question

The basic question now is whether the movement into ordinary shares has gone far enough. The accounts for 1958 will be studied with special interest for evidence of a change in the trend, although there is no reason to believe that there has been a change this year. The companies' new investments in ordinary shares last year was of the order of £100 million. The increase in debenture and preference issues, together, was nearly as large. So the complaint that not enough insurance money is being made available to industry is losing some of its force, although it is not of course always available where most needed for development. There is more discussion now on the question whether enough money is being made available to the Government. The authorities' financing problems would certainly be eased if insurance companies became again net buyers of Government stocks. In each of the last two years, they have reduced their holdings of Government stocks by £20 million or more.

That insurance, in the broad sense, is an increasingly popular form of saving is confirmed again in the recently published Report of the Industrial Assurance Commissioner for 1957. Simple life assurance does not, of course, benefit the person whose life is insured; so premiums payable for simple life policies are not personal savings in the ordinary sense. That the working community is more interested in saving than in insurance proper is suggested by the fact that 65 percent of new industrial assurances, written in 1957, contained an endowment element. Such policies' proportions of total sums assured and of premiums payable, 74 percent and 79 percent, respectively, are even more impressive.

Industrial Assurance

Industrial assurance is defined as life assurance for which premiums are payable at intervals of less than two months and received by house-to-house collectors. It has been a subject of controversy for many years, on account of the high cost of collecting, and the multiplicity of companies and societies, doing this kind of work distresses even the keenest advocates of competition. In his report this year, the Industrial Assurance Commissioner, Sir Cecil Crabbe, sheds some new light on this problem. For the first time in some years, the number of new policies increased last year, from 5.7 million in 1956 to 5.8 million; but the number of new policies written by societies, as distinct from companies, diminished. All but a tiny fraction of the business, valued at £345 million, was transacted by 14 companies and 12 collecting societies, but that fraction was shared among one company and 85 societies. Some of the latter are quite uneconomic. The management expenses of the companies averaged last year some 30 percent to 35 percent of premium income, those of the societies about 40 percent. But, whereas a few of the societies could show a ratio of expenses to premium income at least as favourable as that of the leading companies, some societies' expenses were actually in excess of their premium income. The Commissioner pertinently enquires whether members of some societies are getting any benefit from their current payments.

The complication arises from the facts that many schemes already functioning will have to be drastically changed to conform with the requirements of the intended Act and that the scarcity of available actuaries is so acute that, as Mr. F. M. Redington, president of the Institute of Actuaries, has warned, long delays in effecting the required changes will be unavoidable. The pension officer of Unilever, Mr. V. R. Jackson, has described the option to contract out as "a freedom not worth having"—indeed, "an embarrassment".

Stocks and Shares

SPECULATIVES IMPROVE ON REPORTS OF L.I.C. BUYING

APPROACH OF HOLIDAYS AFFECTS SENTIMENT

Tuesday Evening.

SPECULATIVE prices rallied last week-end from the levels to which they had sunk following last week's announcement of the Congress Working Committee's recommendations. The improvement was due almost entirely to the reported buying of equities by the Life Insurance Corporation. This is thought to be the first time the Corporation has entered the market with the deliberate intention of stabilising prices. The buying was restricted entirely to Bombay, but the effect seems to have been beneficial all round. On Saturday, the price of Indian Irons rose to Rs. 25.26 in official dealings, from its previous level of Rs. 24.80. After the week-end prices once again receded, illustrating clearly the complete lack of confidence on the part of operators. On the kerb, the price of Indian Irons slumped to Rs. 24.66 on Monday. There has been no further fall today. Sentiment is also being affected by year-end considerations and the approach of the Christmas holidays. Indian Irons closed this afternoon at Rs. 24.90. The undertone of the market remains uncertain, and it is difficult to imagine what prospects exist of a revival in confidence before the January A.I.C.C. meeting is out of the way and a verdict has been given on the question of ceilings on incomes and control of profits.

The main investment counters have remained lifeless. Jute shares have been fairly well maintained and there have been fractional improvements in selected miscellaneous counters. The tea and coal sections have ruled dull and neglected.

The gilt-edged market ruled steady throughout, although prices showed little variation. Three percent Conversion Loan improved from Rs. 73.15 to Rs. 73.20 while 3½ 1970-75 rose by 5np to close at Rs. 90.70. Other issues were quoted around last week's levels.

Bank shares were slightly easier with United Commercial being marked down from Rs. 67.50 to Rs. 67. The quotation of Punjab National Bank shares was adjusted yesterday to Rs. 22.75 according to the new paid-up value, namely Rs. 10 instead of Rs. 25.

There was an unsatisfied demand for selected preference shares, but sellers were not forthcoming.

In railways, a solitary transaction was reported in Dehri Rohtas at Rs. 11.19.

In cotton textiles, Dunbar improved from Rs. 128 to Rs. 131 and Kesoram from Rs. 11.31 to Rs. 12.

In coals, Amalgamated were unchanged at Rs. 21.12 as were Bengal at Rs. 260 and Burrakur at Rs. 16.50. Pench Valley were better at Rs. 24.50, as were South Karanpura at Rs. 11.75.

Prices of jute shares were well maintained although business was on a much reduced scale. Here is a chart showing representative price movements:

	Opening 18th Dec., 1958	Closing 23rd Dec., 1958
Anglo-India	Rs. 202	Rs. 200
Belvedere	143 c.d.	143 x.d.
Chitavalasah	15.25	14.87
Howrah	18.62	18.75
Kamarhatti	170	168
Megna	14.62	14.62
Reliance	7.75	7.05

Electric supply shares were more or less unchanged and business was of a retail nature.

In sugar, Belsund were better at Rs. 11.69 and Darbhanga improved from Rs. 18.50 to Rs. 19.25. There was a spectacular improvement in the price of Dyer Meakin Breweries from Rs. 12 to Rs. 15.25.

In the engineering group Indian Iron & Steel fluctuated between Rs. 25.26 and Rs. 24.75 to close at Rs. 24.90. Braithwaite were easier at Rs. 31 while Guest, Keen, Williams recovered from Rs. 36.75 to Rs. 37.50. Indian Galvanizing rose from Rs. 16 to Rs. 16.75. Textile Machinery were depressed at Rs. 20.25.

In paper, Sirpur were higher at Rs. 12.19 while other issues were more or less unchanged from last week's levels.

Cement shares showed little change except in the case of Orissa which improved from Rs. 11.50 to Rs. 11.75.

In the insurance section, New Asiatic were shaded at Rs. 2.75 as were Ruby General at Rs. 6.12.

In shipping, India Steamship were better at Rs. 13.56 x.d. and India General Navigation were unchanged at Rs. 52.

Among miscellaneous industrials, Alkali & Chemical were steady at Rs. 17.50 while Angelo Brothers were quiet at Rs. 19.19. Britannia Biscuits eased to Rs. 16.87 as did Clive Row investment to Rs. 11.44. Dunlop Rubber were steady at Rs. 30.12 as were Indian Aluminium at Rs. 16 and Indian Oxygen at Rs. 23.50. Indian Cables were softer at Rs. 27.12. Martin Burn were steady at Rs. 28.87 while National Carbon were

slightly easier at Rs. 28.87. Rallis were marked down to Rs. 39.50.

In the mining group Indian Copper were depressed at Rs. 3.50 while Metal Corporation improved to Rs. 7.31.

Tea shares were dull and featureless.

THE PROFIT OF THE DECCAN SUGAR AND ABEKHARI Company has amounted to Rs. 30.39 lakhs for the year ended May 1958. Taxation provision absorbs Rs. 17.58 lakhs. Bringing in Rs. 1,16,220, there is Rs. 13,97,863. An ordinary dividend of 18 percent has been declared, including an interim of 5 percent. Allocations include capital reserve Rs. 32,000, general reserve Rs. 3 lakhs and dividend equalisation reserve Rs. 14 lakhs, leaving a carry-forward of Rs. 1,49,743. The Samalkot factory produced 10,015 tons of sugar, against 10,822 tons. The average recovery fell by 0.28 percent to 8.98 percent.

THRE IS A LOSS OF Rs. 40,632 FOR THE GAIRKHATA Tea Company during the year ended December 1957, against a profit of Rs. 3.32 lakhs in the previous year. The dividend has been passed over, leaving a debit balance of Rs. 43,162 to be carried forward. The crop fell from 12,958 maunds to 12,128 maunds and the average sale price from Rs. 2.34 to Rs. 1.88 a lb.

ROHTAS INDUSTRIES LTD HAS EARNED A PROFIT OF Rs. 2 crores for the 17 months ended March 1958. Bringing in Rs. 49,402 and other miscellaneous receipts, there is a balance of Rs. 2,01,64,025. Allocations include development rebate reserve Rs. 13.15 lakhs, depreciation Rs. 83.31 lakhs, taxation provision Rs. 10 lakhs and general reserve Rs. 83.12 lakhs. An ordinary dividend of Rs. 2 a share has been declared, leaving a carry-forward of Rs. 93,507. The paper factory has been modernised and expanded. During the period under review, the company issued bonus shares

in the proportion of one for ten shares held by capitalising partly the share premium account and partly the general reserve.

THE MIDNAPORE ZEMINDARY CO LTD HAS INCURRED a loss of Rs. 1.87 lakhs for the year ended April 1958, after providing Rs. 58,219 for depreciation. A debit balance of Rs. 18,62,208 is carried forward. The directors state that the book value of the company's assets which have been acquired by the State Governments of West Bengal, Bihar and East Bengal, appears in the balance-sheet at Rs. 82,27,951, although the maximum compensation for zamindari rights, etcetera, receivable from the State Governments is not expected to exceed Rs. 44,28,958. In February 1958, the directors recommended that a return of capital of Rs. 7.50 a share be made, and on 28th March, 1958, the special resolution for reducing the company's capital was passed. But it has not yet been possible to obtain the High Court's sanction for the return of capital. Shareholders will be advised immediately the High Court's sanction is received.

THE HATTIKHIRA TEA COMPANY HAS MADE A LOSS of Rs. 1.26 lakhs for the year ended December

1957. The dividend has been passed over, and a debit balance of Rs. 1,06,851 is carried forward, against Rs. 18,736 brought in. The output declined from 16,910 maunds to 16,239 maunds and the average sale price from Rs. 1.77 to Rs. 1.67 a lb. Estimates for 1958 provide for a crop of 20,000 maunds at a cost of Rs. 23.33 lakhs.

Bombay Market

SELLING PRESSURE SLIGHT DESPITE UNCERTAINTIES TRADING RESTRICTED AND PRICES SHADED

Tuesday Evening.

THE Bombay stock market was quietly steady last week, although trading was restricted and prices were shaded on balance. Apart from the Christmas holidays, operators were disinclined to extend commitments due to a number of uncertain-

ties. The first is the Congress Working Committee's resolution relating to industrial profits. It is true that the resolution is still nebulous and that there is no evidence to suggest that any further move could be taken to regulate profits as they are already strictly controlled by a number of statutory enactments as well as by high taxation.

For the time being pessimism prevails about the prospect of any relief in taxation considering that there will be a shortage of financial resources for the plan. Nevertheless, there has not been much selling pressure, especially in "blue chips" as they are still considered as satisfactory investment by market standards.

Tata Steel closed at Rs. 171 but Indian Iron were lowered to Rs. 25.10 on pressure from Calcutta interests. Tata Locomotive were taken at Rs. 154.50 but Premier Construction dipped to Rs. 226.50 on a bout of heavy selling pressure. Alcock Ashdown were freely available at Rs. 237.50. Motor shares were quiet, and Hindustan Motor declined to Rs. 6.48 on pressure. A decline in sales lowered the price of Premier Automobile to Rs. 79.50 but Mahindra and Mahindra were fairly steady at Rs. 18.40.

Cotton mill shares disclosed losses all round. Bombay Dyeing fell to Rs. 55 and Century were sold down to Rs. 413.50. Simplex were available at Rs. 169 and Kohinoor were transacted at Rs. 232. Sivasahi were steady at Rs. 202 on interested support. India United Ordinary were freely offered at Rs. 8.44 and Apollo at Rs. 1.24 found little support.

Miscellaneous shares were shaded in sympathy with the general trend. Sugar shares were hesitant considering the move for increasing sugarcane prices. Belapur were lowered to Rs. 295 and Phalton were dealt in at Rs. 158. Cement shares were quiet, and Associated Cement declined to Rs. 150 on a report that the company has no intention of issuing any bonus shares for the time being. Digvijay Cement were done at Rs. 128. Mining shares were quietly steady, and Shivrajpur Syndicate realised Rs. 85.50. Steamship company shares were quiet, and Scindia Steam were placed at Rs. 20.92. Great Eastern Shipping lost at Rs. 25.10. Tata Oil were, however, a steady feature and improved to Rs. 41.75 on rumours of a bonus issue by capitalising the share premium account. National Rayon reacted to Rs. 228 on profit-taking and Bombay-Burmah were lower at Rs. 471 on an uncertain outlook for the tea industry. Tata Chemical were quoted at Rs. 14.24.

Turnover in bank shares were restricted and fluctuations were narrow. Bank of Baroda were bought at Rs. 124 and Bank of India changed hands at Rs. 137. Among insurance scrip, British India General came to hand at Rs. 13.40 and New India Assurance were done at Rs. 52.

Scattered interest was taken in electricity supply company shares, and Andhra Valley were taken at Rs. 1.195. Ahmedabad Electric were transacted at Rs. 94.50 and Bombay Suburban changed hands at Rs. 110.

THE WEEK'S TRANSACTIONS

[In the following list of stocks and shares in which transactions have taken place during the past week, the figures indicate Opening Quotations. Highest for the week. Lowest for the week Closing Quotations. Quotations for the corresponding Date a Year Ago, the last named being shown in parentheses and will not be given where such a quotation is not available.]

LETTERS TO BHAI SAHIB. This is the fifth in a series of 9 advertisements. Look for the sixth advertisement in this publication next month.

"No ordinary beverage, Bhai Sahib"

Dear Bhai Sahib,

In your letter you mention that you have come across a widespread belief that tea is one of the oldest beverages known to man, and ask how old it is. Indeed, Bhai Sahib, written records testify that it was known 4,695 years ago!

Tea has been praised by seers, by politicians, social reformers, artists and athletes. It warms you in cold weather, cools you in hot weather, and it is healthy and beneficial all year round. Certainly, tea is no ordinary beverage, Bhai Sahib.

And as an industry tea is as cheering to the country's economy as it is to those who drink it. For instance, over a million people are employed in growing tea! In bringing tea to the country's remote towns and villages Brooke Bond alone maintain 5 factories, 30 branches, and 2,242 depots and sub-depots. Besides

Brooke Bond provide a source of trade for over 5 lakh dealers throughout the country. The Government of India considers the tea industry very important indeed... so much so that steps are being taken to increase tea consumption within the country.

But will that not lead to a shortage of tea for export, you may ask. Not really—there is plenty of tea for all and the Second Five Year Plan aims to raise production still more.

To keep this vital industry healthy, make sure that the tea you get is fresh and pure. Always buy tea marketed by an organisation you can trust—an organisation like Brooke Bond who have the most efficient distribution system in India and guarantee every packet of the tea they sell.

Yours truly,

G. V. Krishnamurthy

Chairman,
Brooke

GUR AND SUGAR EXPORTS COMPARED

A-I.I. AND I.A.C. MAY BE AMALGAMATED

(FROM OUR NEW DELHI CORRESPONDENT)

IN the ten months ended August 1958, 32,093 tons of gur were exported by India, earning Rs. 1.23 crores of foreign exchange. These exports were not subsidised; and not many people are likely to have heard of the gur producers' achievement. An export quota of 50,000 tons has been fixed for sugar. Of this, 40,210 tons have been exported, earning Rs. 2.12 crores of foreign exchange. Side by side, the retail price of sugar has gone up to Rs. 1-12 a seer. Replying to a debate in the Lok Sabha last week urging the Government to raise the price of sugarcane from Rs. 1-7 a maund to Rs. 1-12 a maund, the Food and Agriculture Minister, Mr. A. P. Jain, said: "Our present ex-factory price of sugar in Uttar Pradesh and Bihar is Rs. 36 a maund, that is, no mill can sell sugar—a particular quality of sugar, namely, D-29—for more than Rs. 36 a maund, and if any factory sells it at a higher price, then it is an offence calling for a heavy penalty. Out of this Rs. 36, Rs. 13 or Rs. 14 are either taxes or the levy which we impose on sugar in order to meet the losses on export. That leaves a balance of Rs. 22 or Rs. 23 to Rs. 17. Even then, our ex-factory price of sugar today is Rs. 6 to Rs. 7 higher than the world price."

"What is the other feature of the rural economy today? The price of jute this year is approximately 20 percent lower than what it was last year. The price of cotton is approximately 18 to 20 percent lower than what it was last year. The price of rice is also about 5 percent lower. In this part of the year than what it was last year. So, the parity prices of agricultural produce—of course, this House has always been showing great anxiety about the rise in foodgrains prices—are now coming down. In Uttar Pradesh during the last four years, namely, since 1953-54, the area under sugarcane has gone up from 1,973,000 acres to 3,017,000 acres. All over the country, the area under sugarcane has gone up from 3,485,000 acres in 1953-54 to 5,021,000 acres now."

Co-operative Sugar Factories

A decision to issue licences to co-operative sugar factories has been reached, it is believed. As already reported, a consortium to manufacture sugar mill machinery in India is being formed, to which Rs. 75-lakh worth of foreign exchange will be released in 1959 for importing plant and equipment. Eight sugar mills will be licensed, two in 1960 and four in 1961, to which Rs. 25-lakh worth of foreign exchange each will be released. The Government will shortly screen applications to select eight out of the 12 submitted for setting up co-operative sugar factories.

Air Services

The Government is actively considering a scheme to amalgamate Air-India International and the Indian Airlines Corporation. Amending legislation may be brought up during the Budget session of Parliament. Meanwhile, the Director-General, Posts and Telegraphs, Mr. V. Shanker, has taken over the chairmanship of the Indian Airlines Corporation.

Mr. G. L. Mehta

Mr. G. L. Mehta is tipped here to become chairman of the National Shipping Board.

Prospects for Pig Iron Exports

India, it is claimed, will soon be able to start exporting pig iron. This has become possible because of the commissioning of new blast furnaces in the works of both I.I.S.C.O. and T.I.S.C.O. in the private sector. The first blast furnaces of the Rourkela and Bhilai plants are expected to be commissioned in a few weeks' time. The second and third blast furnaces will follow in the course of a year. In anticipation, pig iron imports were stopped by the Government several months ago. Most of the additional production of pig iron will in time be used for steel-making. But while the blast furnaces can attain full production in a comparatively short time, the processes of steel-making and rolling the ingots into the shapes and sizes required by the consumer, usually take longer to reach the stage of full production. The interval between iron production and its regular conversion to steel will be relatively short in each particular steel works. But taken together, there will in the next two years be some surplus, perhaps about one million tons, for export.

Atomic Energy in Third Plan

The Government has decided that a minimum of 250,000 kW of nuclear power will be included in the power programme of the third plan. Exploratory talks are in progress with manufacturers of atomic power-stations abroad. No decision has yet been taken on the location of the power-stations.

Nitric Acid Plant

It has been decided to award the contract for the construction of the nitric acid and nitro-limestone plant of the fertiliser factory in Rourkela to Sindri Fertilisers and Chemicals. The terms and conditions of the contract are still under negotiation. Sindri Fertilisers and Chemicals has a sufficient number of technologists and

to use the services of Kaiser Engineers of the U.S.A. for technical collaboration. The Government has given its approval for Kaiser Engineers to undertake an engineering study of the project. The project report is awaited. Tentative suggestions for setting up an aluminium plant in Mettur in Madras State have been made by one party in collaboration with an Italian firm, some representatives of which recently visited the site for a first-hand study of the local conditions.

Two firms, namely, Glaxo Laboratories (India) Private Ltd and Voltas Ltd, have been licensed to set up new industrial undertakings in Bombay for the manufacture of 10 million m.u. each of Vitamin A initially from imported intermediates, and ultimately from lemongrass oil. The foreign collaborators in the case of Glaxo Laboratories (Private) Ltd are Distillation Products Incorporated of the U.S.A. Voltas Limited of Bombay have been licensed under the Industries (Development and Regulation) Act, 1951, to establish a new industrial undertaking in the name of Roche Products Private Ltd. for the manufacture of Vitamin A and pharmaceutical specialties in collaboration with Hoffmann La Roche of Switzerland. The total capital cost is estimated to be Rs. 2 crores approximately. The initial plant will be established within a period of 18 months, while the entire manufacturing programme from the basic stage will be completed within five years. Approximately 45 tons of lemongrass oil will be required for the manufacture of 10 million m.u. of Vitamin A.

Surgical and Hospital Equipment

Messrs Johnson and Johnson have been allowed to set

centre. The scheme has been sponsored jointly by the Governments of Madras and Mysore. Its estimated cost of Rs. 13,10,250 will be shared equally among the two State Governments and the Central Government. The scheme is being administered by the Government of Madras and is intended to ensure supply of good quality woollen yarn for the manufacture of druggets. The details of the estimated cost are:

Cost of building	Rs. 4,20,250
Cost of machinery	Rs. 5,90,000
Working capital	Rs. 3,00,000
Total	Rs. 13,10,250

The Government of India provided a grant of Rs. 2 lakhs for the year 1958-59. The centre has been located in Vinnamangalam (North Arcot district). The construction of the building has since been completed and some progress has been made in securing machinery. An expenditure of Rs. 5,30,793 has been incurred up to 30th September, 1958. The centre is expected to start functioning by April 1959.

Finance for Tea Industry

The question of providing long-term finance to the tea industry has been engaging the attention of the Government for some time. Discussions are expected to take place in Calcutta towards the end of this month with banks. The desirability of forming a finance corporation for the industry will be examined.

Raising Raw Rubber Output

The production of raw rubber in India has increased from 15,422 tons in 1948 to 23,767 tons in 1957. This year it is expected to be about 24,000 tons. At the same time, consumption has increased from 19,719 tons in 1948 to 31,763 tons in 1957. By 1960, it is expected to touch the 40,000-ton mark. Various incentives for increasing the production of natural rubber are being offered to growers. A scheme has been sanctioned for replanting 70,000 acres of old low-yielding rubber lands with high-yielding strains spread over a period of ten years. The scheme provides for the payment of subsidy to the planters on a slab basis

ranging from Rs. 250 to Rs. 400 an acre. It started operating from 1957, and about 5,000 acres have already been replanted. An extension service has been instituted under which field officers and rubber instructors supervise the progress of replanting and give technical advice to growers, especially small holders. Since 1949, a scheme for the subsidised distribution of high-yielding rubber seeds has been in operation. In 1958, 2,424,500 seeds were distributed to 3,314 growers. At the pace at which the consumption of rubber in the country is increasing, it may not be able to cover the gap between production and consumption in a sufficiently short period of time. There is, therefore, a proposal to set up a synthetic rubber plant at an estimated cost of Rs. 15 crores and with a capacity of 20,000 tons a year. Negotiations with foreign firms for securing suitable terms of collaboration are in progress.

Loan for National Rayon

The U.S. Export-Import Bank has agreed to advance a \$1.8-million loan to the National Rayon Corporation Ltd.

Deepening Bombay Harbour

There has been a steady silting of the main harbour channel of Bombay port. The depths in the channel at present are about five to six feet less than those shown on the Admiralty Chart of 1921, and the depths now available in certain portions are 27 feet below the chart datum. The Bombay Port Trust proposes to undertake a large-scale programme of dredging to improve depths in the harbour channel so as to facilitate entry by deep-draft vessels. An area three miles west of Malabar Point has been tentatively selected as a suitable dumping ground for the silt deposits, but a final decision will be taken after the results of the proposed radio-active tracer experiments are available. The cost of the project is placed at Rs. 8 crores.

Railway Electrification

Orders worth about Rs. 10 crores have been placed with Italian, British and Japanese firms for the design, supply, erection and commissioning of overhead equipment for some sections of the Eastern and South-Eastern Railways included in

the Calcutta electrification project. The three firms have agreed to employ indigenous materials and labour to the maximum extent possible. The contract awarded to the Italian firm covers about 200 route miles on the Eastern Railway from Durgapur to Gaya and a small section on the South-Eastern Railway from Asansol to Ramkanali station. The British firm has been awarded a contract for about 160 route miles on the South-Eastern Railway between Tatanagar and Rourkela and a small branch line from Rajkharwan to Dongaposi. The Japanese firm will cover the South-Eastern Railway section from Ramkanali to Kandra, a distance of about 76 miles. Altogether, the three contracts will cover about 450 route miles.

Manufacture of Machinery

The setting up of a few standing committees of experts for planning the production of machinery and equipment for different industries which are imported, was recommended at the meeting of the chairmen of Development Councils held here last week. The Minister for Industry, Mr. Manubhai Shah, presided.

Mr. Shah pointed out that the country is still importing machinery worth over Rs. 100 crores a year. These imports are likely to go up to Rs. 200 crores a year by the end of 1959. Self-sufficiency in machinery, imports of which are costing a lot of foreign exchange, should be reached at the earliest possible time. It is, therefore, necessary that the different Development Councils should pay attention to the indigenous manufacture of machinery.

During the discussions which followed it was generally agreed that a few standing committees for dealing with the requirements of electrical engineering and pump and engine factories, metallurgical industries, electro-chemical industries and industrial machinery, machine tools and automobile industries should be set up to assess the requirements and draw up production programmes. The committees would be asked to assess the existing capacities for machine-building, to review the requirements of balancing equipment, to increase the production of existing units and to create new capacity.

London

PARLIAMENT DEBATES UNEMPLOYMENT

NEED TO RELIEVE LOCAL DISTRESS EMPHASISED

(FROM OUR LONDON CORRESPONDENT)

THE House of Commons has been debating an Opposition censure motion which places the responsibility for unemployment on the Government's economic policy. On balance, however, there can be little doubt that the hesitancy which has marked the switch-over from credit squeeze and restriction to spending spree and re-expansion—to avoid further inflation and yet another exchange crisis—has been well justified. The statistical position today makes that only too clear. Furthermore, an unemployment level of 2.4 percent of the working population is by no means as catastrophic as Labour politicians and the trade unions try to make out for political reasons. Indeed, that figure will almost certainly rise a bit further at the turn of the year, before seasonal factors and the Government's anti-unemployment measures get it back to normal. The latter are already showing some signs of effectiveness and should at least ensure that the situation does not get out of hand. There is scope right now for some constructive co-operation to relieve the distress in certain localities where unemployment is above the average, and in certain industries which are particularly affected for one reason or another. The debate in Parliament hardly suggests that hopes for this are bright, at least as long as politics continue to bedevil the issue as they do at present and it remains Labour's plank in its election campaign. Official quarters, none the less, are quietly confident.

A contributory factor to the anxiety felt in some quarters has been the threat of a complete breakdown in the European Free Trade Area negotiations. This might well have come about last week-end as a result of France's apparent determination to "go it alone" by refusing to accept any compromise to avert the dangers of trade discrimination against all countries in O.E.E.C. but outside the Common Market which was inherent in her attitude. Sir David Eccles, Britain's Board of Trade President, made a dramatic eleventh-hour offer to the effect that if the six Common Market countries extended to the other 11 O.E.E.C. nations quota concessions amounting to 3 percent of their national production, Britain would match this by corresponding arrangements with all the countries of west Europe. Sixteen of the 17 countries involved are ready to support this compromise. France alone remains unconvinced. Further consideration has been put off until the middle of January, by when it is hoped that France will have been persuaded not to risk endangering west European unity by a further display of intransigence.

Jumps in Bank Advances

At last, it is possible to get a rough picture of borrowers' response to the ending of the credit squeeze. In the latest quarterly analysis of advances issued by the British Bankers Association, it is shown that between August and November the total of bank loans jumped by nearly £130 million, which compares with an increase in the preceding quarter of just over £60 million. Outstanding in the latest quarterly figures is the rise of £47.4 million to £383.2 million in bank loans of "personal and professional" category. At their present level, these loans are £661 million higher than in November 1957. Another significant movement is the rise in the past quarter of £12.3 million to £39.6 million in bank advances to hire-purchase finance companies. The ending of the credit squeeze is also reflected, allowing for seasonal factors, in a jump of £25.6 million to £201.1 million in bank advances to the retail trade. Loans to public utilities, other than transport, are up by £12 million to £80 million, and to the food, drink and tobacco trades by £15.4 million to £162.6 million. So far, there is no discernible reflection in bank lending figures of any effects of credit relaxations on industrial borrowing. Loans to most of the major industries showed no significant trend during the quarter.

Coal Consumption still Declining

Inland consumption of coal, exports and bunkers, in the first 49 weeks of 1958 amounted to 194,834,000 tons, against 207,285,000 tons in the corresponding period of the previous year. Output of deep-mined and open-cast coal in the first 50 weeks was 208,695,300 tons, compared with 216,889,200 tons. The Ministry of Power, when releasing these figures, said that stocks of undistributed coal, mostly small, now stand at 19,623,000 tons, against 8,993,000 tons a year ago. Total disposals of home-produced large coal in the first 48 weeks of 1958 amounted to 42,526,000 tons, against 45,433,000 tons in 1957. Output in the same periods was 199,577,000 tons and 207,251,600 tons, respectively. In view of the rather unpromising situation which these figures show, it is encouraging to learn that the National Union of Mine-workers has agreed to co-operate with the National Coal Board in seeking ways and means of minimising hardship in giving effect to the latter's proposal to close a number of uneconomic pits as a measure of economy. That does not mean that all the Board's proposals are to be accepted, but

any co-operation could lead to give and take on both sides.

More Hire-purchase Helps Employment

The ending of hire-purchase restrictions is already helping the employment figures in Britain. In October, when controls were only partially lifted, the hire-purchase debt rose by £12 million to a total of £527 million, compared with £464 million at the same time last year. This was good news for the furniture industry particularly. Reports from furniture-making centres now show that more people are in work, short-time working is disappearing and more firms are on overtime. This improving situation is likely to be shown in the next detailed employment figures from the Ministry of Labour. It is already clear that even more hire-purchase records have been broken in November. Controls on motor-cars, T.V. sets and refrigerators were swept away at the end of October. The figures already issued show that in November twice as many new motor-cars were bought as in October, while used car deals were up by one-third. Figures for instalment buying of washing machines, vacuum cleaners and other household goods are likely to show an even more spectacular increase. Delivery dates for popular makes of some domestic goods have now lengthened to many months. The Board of Trade's hire-purchase figures do not give the complete picture of Britain's buying spree. The banks loaned an extra £105 million to their customers in the two months after the middle of September.

Defence Bonds Conversion

The Treasury has announced that a conversion offer will be made to holders of the 24 percent Defence Bonds purchased between 1st April, 1949, and 30th September, 1949, and maturing between 1st April, 1959, and 30th September, 1959, of which £3,250,000 are outstanding. The holders will be invited to change their holdings into 5 percent Defence Bonds (conversion issue) on the tenth anniversary of the date of purchase. Those who accept will be paid interest at 24 percent for the period from 1st April, 1959, to the date of exchange, and at 5 percent from the date of exchange to 30th September, 1959. The maturity premium of £1 percent will be paid on the date of exchange, together with the final interest payment of 24 percent. The first payment of interest at 5 percent on those bonds which are converted will be made on 1st October, 1959. Acceptance of the offer of conversion will not involve any break in the holders' encashment rights.

Savings still Rising

Although it is the Christmas shopping season, there is still no halt to the phenomenal rise in

savings reported by the National Savings movement. In one week, savers have managed to put in nearly £9 million more than they took out. Generally, at this time of year they are taking out more than they put in. For the first 36 weeks of the current financial year, the cumulative savings surplus has risen to £164 million, against a tenth of that amount—or £16 million,—a year ago. There seems little doubt that the high rate of interest on Savings Certificates, together with a greater feeling of security about the future value of the pound, are big factors in the savings boom.

Expenditure on Advertising

The total expenditure on advertising in the United Kingdom in 1956 was £309 million and the provisional estimate for 1957 is £334 million, states *Advertising Expenditure, 1956*, the third quadrennial survey of the Advertising Association. Both figures were slightly less than 2 percent of the national income, which was lower than the equivalent percentage for 1938. Spending on television advertising (including production costs) is put at £2,400,000 in 1955, £10,600,000 in 1956 and about £27 million in 1957, when it represented about 8 percent of total advertising. There was a doubling between 1953 and 1956 of expenditure on advertising in national newspapers—from £24,330,000 to £47,510,000—with a further 14 percent increase in display advertising revenue between 1956 and 1957. Spending by national advertisers in the provincial Press also doubled from £8,500,000 in 1952 to £17 million in 1956 and local classified advertising in the provincial Press grew by 25 percent. The overall effect was that the share of the provincial newspapers in the total declined slightly between 1952 and 1956. It would appear, says the survey, that the newspaper Press was not adversely affected by television advertising in 1956, although the slowing of expansion during 1957 may have been caused in part by the growth of television. For magazines and periodicals, there was little expansion in their advertising revenue between 1955 and 1956 and a slight decline occurred last year.

Brevities

The index of retail prices rose by one point to 110 between 14th October and 18th November, mainly because of increases in the average prices of coal, cheese and butter. Calculated to one decimal, the November index was 109.8, compared with 109.4 for October.

During the current year, according to a Parliamentary reply during question time, a sum of the order of £100 million, about half of it from public funds, will be made available from United Kingdom sources for expenditure in Colonial territories.

The Council of the Building Societies Association has announced, after meeting in London, that it cannot recommend any change in rates of mortgage interest, but the question is to be kept under constant review.

The Chamber of Shipping's index of tramp shipping freights for November is 76.4, compared with 70.4 for October. The main gains in the individual commodity index are in grain, sugar and timber. Coal and ore rates have both declined slightly. The index for tramp time-charter rates is up from 54.2 to 59.6.

FIREBRICKS SILICA BRICKS and SILLIMANITE BRICKS

made to the shape, size and quality you require for locomotives, boilers, coke ovens, high temperature oil and gas fired furnaces and electric furnaces etc.

We now have a fully mechanized plant with up-to-date equipment for the high speed manufacture of standard firebricks. Contact us for your requirements of Regulars, especially Moderate Heat Duty Bricks.

STEADY RISE IN SINO-RUSSIAN TRADE

SCOPE OF BARTER TRANSACTIONS EXPANDS

(FROM A SPECIAL CORRESPONDENT)

BEFORE the Chinese communists came to power, Sino-Russian trade represented only a negligible percentage of the Chinese foreign trade—0.35 percent in 1936, and 0.65 percent and 5 percent, respectively, of her imports and exports in 1946. In 1947, Russia was 14th on the list of countries to which China exported her goods, and 26th on that of countries from which China received her imports. But trade between mainland China and Russia began to flourish in 1948 after communist forces occupied the north-east. In 1949, Russia moved up to third place on China's list of export countries and fifth place on that of import countries. This rise continued particularly markedly after the signing of the barter agreement between the two countries in February 1950, in which year the volume of trade increased by 69 percent over 1949, and represented 31 percent of the total foreign trade of mainland China. In the two following years, 44.7 percent and 53.42 percent, respectively, of communist China's imports came from Russia and 51.51 percent and 54 percent of her exports went to that country. By 1953, trade with that country formed 56 percent of China's entire foreign trade.

A survey of Sino-Russian trade during the past eight years shows certain striking features. According to official figures published by Russia, prior to 1956 communist China imported more goods from that country than she exported to it; the excess of imports over exports from 1949 to 1952 reached some 2,173 million roubles, and in 1953 it was 891.4 million roubles. In 1956, trade with Russia went the other way, but the excess of exports over imports was only around 124 million roubles. Imports were again in excess in 1957. This was in sharp contrast to communist China's excess of exports over imports in trade with the free world.

Fixing Commodity Prices

According to Mr. Yeh Chi-chuang's report, communist China fixes the prices of commodities according to international market prices when doing business with capitalist countries. Since communist China adopted the system of separating domestic from foreign prices, definite differences resulted when prices abroad were converted into prices at home according to foreign exchange rates. The result of this practice is that export goods suffer a loss, whereas import goods make a profit. This shows that communist China's foreign exchange rates are "overvalued". As for the trade with Russia, although international market prices were also taken into consideration, yet since the signing of the first trade agreement on 19th April, 1950, only the prices of a few commodities have been adjusted while those of the majority have remained constant during the past seven years. According to Mr. Yeh Chi-chuang's report, which compares 1956 with 1950 on the basis of international market prices of capitalist countries, the prices of wool, rice, tung oil and jute exported by communist China to Russia dropped by 10 percent to 30 percent, whereas those of soyabean, black tea, raw silk, tin ore and tungsten ore rose by 10 percent to 160 percent.

On the other hand, among Chinese imports from that country, prices of diesel oil and gaso-

line remained more or less constant, whereas those of machinery equipment, thick steel plates and moulding steel rose by 30 percent to 140 percent. It is interesting to examine the export price of soyabean, for instance: the price a metric ton was 380 roubles (\$ (U.S.) 95 at the official exchange rate, and \$38 at the black market rate), which was much lower than the international market price. Yet, the price of thick steel plates imported from Russia was 402 roubles a ton (\$100.5), which was higher than the international price. Even Chinese communist reports openly admitted that prices of articles imported from Russia are at least 30 percent dearer than those manufactured in the mainland; sometimes prices of imported commodities are even two times higher than those of local commodities.

No Change in Trade Pattern

Although the trade with Russia is much to the disadvantage of communist China, the Peking régime has shown no sign of changing the trend of trade with Moscow. At present Russia is the sole creditor of communist China. According to the report of the latter's Finance Minister, Mr. Li Hsien-nien, during the past eight years communist China has run into a debt of more than 5.2 billion yuan. At the present rate of paying Russia an annual sum of 700 million yuan, communist China would get out of debt (and interest) in at least eight years. Besides, the only way it could pay its debts would be to export more and more goods to Russia. For this reason, even if the Peking régime could reduce its imports of machinery from the latter, it would still have to increase its exports.

The scope of barter trade between communist China and Russia is expanding continuously. From the latter half of 1957, the commercial ministries of the two countries began to barter articles of daily necessity under an agreement according to which Russia would supply communist China with bicycles, wrist watches, plastic manufactures, cameras, small electric fans, etcetera, and would get in return leather articles, soap, tooth-brushes, etcetera. Since in April 1958, a Russian delegation went to Peking to negotiate the expansion of the scope of the barter of commodities of daily necessity, there is every reason to believe that the trade connections between the two countries are being strengthened.

Further Expansion

According to reports published by communist China's trade journals this year, Peking will continue to expand its trade with Russia and various "people's democracies" during the second five year plan period, in order "to promote the common prosperity of the socialist camp and enhance the political friendship and unity among the socialist countries." All these symptoms seem to indicate one result: that during its second five year plan period, communist China's trade with Russia will still form at least 50 percent of its total foreign trade. As for the items of goods traded between the two countries, Russian official reports say that from 1950 to 1956 the largest item exported from that country to communist China was machinery equipment. This represented, in 1956, 41.6 percent of the total value of goods imported by communist China from Russia in that year. The second and third largest items were petroleum products and ferrous metals, forming 11.7 percent and 8.5 percent, respectively, of 1956 yearly imports. According to Mr. Yeh Chi-chuang, during the first five year plan period, communist China imported from Russia some 3,000 metal-cutting lathes, over 2 million tons of ferrous metals, more than 10,000 tractors for agricultural use, 5,053,000 tons of petroleum and 100 million yuan's worth of scientific instruments.

Of the goods exported from communist China to Russia, foodstuffs in crude and processed forms took the lion's share, representing 47.1 percent of her exports to Russia in 1950, 44 percent in 1952, 44.4 percent in 1953 and 40.4 percent in 1956. According to Mr. Yeh Chi-chuang's report, the amounts of grain exports, not including soyabean, were 900,000 tons in 1953, 800,000 tons in 1954, 1 million tons in 1955, 1.32 million tons in 1956 and 780,000 tons in 1957. The export of soyabean was about 1 million tons each year. Together, the total annual exports of grains, including soyabean, reached about 2 million tons. The report says that the price of soyabean exported to Russia was fixed at 380 roubles a ton, and that quantities of soyabean and rice exported to the Russia were about the same, the average export price of each ton would be 470 roubles, and taking the Russian trade figures as a basis of calculation, it is found that in each year from 1952 to 1956 communist China exported at least 1 million tons of grain to that country.

Exports of Metallic Ores

The second largest item of communist China's exports to Russia was metallic ores, mainly tungsten, tin, antimony and mercury, which represented 17.7 percent of the former's exports to the latter in 1952, 21.3 percent in 1953 and 16.5 percent in 1956. In 1956 the value of these ores was placed at 500 million roubles. According to Mr. Yeh Chi-chuang's report, the price of tin exported to Russia in 1956 was fixed at 8,116 roubles a ton, and the yearly export to that country of various kinds of rare metallic ores reached over 60,000 tons. After metallic ores came silk, tung oil, jute, wool and other Chinese products. Statistics for 1957 showed that the quantity of silk exported from communist China to Russia during that year increased by as much as six times over that in 1951.

Jute

INCREASE IN FUTURES MARGIN DEPOSITS CRITICISED

EXCHANGE TRADING COMES TO A STANDSTILL

THE East India Jute and Hessian Exchange in Calcutta, the official body under whose auspices futures trading in raw jute and jute goods is conducted, announced over the week-end that, in view of the present emergency, additional margin deposits would be required from sellers on their outstanding sales, as well as on the outstanding sales made on account of or on behalf of their clients at the close of each working day. These deposits have been increased from Rs. 150 to Rs. 2 a 100 yards for hessian cloth, should transactions be conducted below Rs. 39.50 a 100 yards. In sackings, they have been raised from Rs. 3 to Rs. 5 for sales below Rs. 95 a 100 bags. For raw jute, they have been increased from Rs. 2.25 to Rs. 3 for contracts made below Rs. 22.50 a maund. The deposits are still refundable if prices go above the minimum levels. It has again been emphasised that the period of emergency will be reviewed from time to time. Margin deposits were originally instituted by the Board on 29th September, 1958.

The move has not been popular in the trade. As a protest against the higher deposits, operators have refused to enter into negotiations, and no transactions have been concluded. Consequently, since the week-end, the gunny market has been virtually closed, and prices have been nominal. Overseas buyers are showing no interest and the general undertone is quiet. Speculative activity in the early part of the past week was responsible for some fluctuations, and just before the week-end for some fluctuations on local shipper covering. Advances were recorded on local shipper covering. The general tendency however, is downward. Further Calcutta mills are anxiously awaiting the disposal developments particularly concerning the agreement of their gunny stocks. Under a gentleman's agreement member mills of the I.J.M.A. have for some months been asked not to sell their production below certain minimum prices: at the same time they have been urged to purchase three or four months' stock of raw jute in an attempt to stabilise the fibre market. The efforts have had little effect and prices in all sections of the market have continued to fall. Consequently, most mills have relatively high-priced jute in their books, against which there are no sales. The profit they would have made at the time of buying jute, had they done combined business, has now disappeared. It is understood that the position is again being discussed with the Government, and the outcome of the talks is eagerly awaited by the trade.

Export of Jute

The question of exporting Indian jute continues to provoke much comment. It is understood that the State Trading Corporation will make purchases from producing centres and the jute thus obtained will be available for export. The fibre will be bought as far as possible through co-operative societies in an attempt to ensure that the benefit really is already out of the co-operative societies' hands. Any jute which they and other upcountry sellers now have for disposal is not of the quality that is required for export. So far, no indication has been given about the quality of the jute to be exported, and overseas buyers have not shown much interest in taking Indian fibre. Nor has the market shown any signs of revival as a result of these decisions. In fact, since the announcement, the general undertone has been weaker.

THE JUTE MARKETS

There was very little activity in the futures markets during the past week. No closing prices are available due to the complete cessation of activity by operators in protest against the introduction of higher margin deposits. Other prices, as given by the East India Jute and Hessian Exchange Ltd. were as follows:

		Hessians 40in 10oz.		Sacking B Twills	Raw Jute Upper Assam December	
		Rs a 100 yds	Rs a 100 metres	Rs a 100 bags	Rs a md.	Rs a 100 kilos
Opening		39.06	42.72	95.40	23.90	62.42
Highest		39.06	42.72	95.50	23.90	62.42
		38.62	42.24	94.25	22.64	60.66

Manufactured Goods: The gunny market was virtually unchanged at the opening last Thursday. Prices were based on B Twills at Rs 94.40 for December, with forward shipment at Rs 40 for December shipment, which was only 90nP above the forward shipment rates. Price movements were influenced by speculative activity, but the general undertone was quiet. On Friday, the market was depressed and losses of 30nP or 40nP were recorded in both sections. Rates recovered on Saturday as rumours about the decision of the East India Jute and Hessian Exchange to impose higher margin deposits began to circulate. No genuine business was recorded, and overseas interest was negligible. The general dissatisfaction over the imposition of higher margin deposits was apparent after the week-end, when sellers, as a

mark of protest, refrained from carrying out any transactions in the futures market, and no official quotations were available. As a result, the goods market was virtually closed. Throughout the week, Calcutta mills showed no interest and there was little of note to record. Business was confined to speculation and local shipper covering.

On Tuesday morning, opening quotations were as follows:

	December	January	Jan-March	April-June
40in 8oz	32.35 (38.26)	31.75 (34.61)	31.45 (34.28)	31.30 (34.12)
40in 10oz	40.05 (43.65)	39.35 (42.90)	39.15 (42.67)	39.10 (42.61)
B Twills	94.25	95.00	94.85	95.35
Heavy Cees	95.25	95.00	94.85	95.35
(Plain)	115.25	115.50	115.50	115.50
A Twills	109.00	108.25	108.25	108.50
Liverpools	94.75	95.00	95.75	96.10

Raw Jute: Throughout the past week, the fibre markets were depressed. Only casual business was reported, mainly by Indian mills. Prices moved within narrow limits, and quotations for Assam Bottoms varied between Rs 21 and Rs 20.50 a maund. A fair amount of business was transacted both upcountry and in Cossipore; sellers were very active covering December shipment contracts, mostly at higher rates. Consequently, in spite of the lack of mill business, markets upcountry were well maintained and for the most part sellers were not anxious for business. Towards the close, conditions weakened and business was transacted at cut rates, with sellers over.

Business was reported in Assam Middles only at Rs 23.75 and in Northern Middles only at Rs 23.25. Tosses Bottoms passed at Rs 21 a maund. Desal White was done at Rs 19 to Rs 19.50. There was a little interest in mesta and mills bought Daissee mesta at Rs 16.50 to Rs 17.50 basis Bottoms.

Wagon arrivals in Cossipore showed an improvement of 110 over the previous week and totalled 770. This figure was slightly higher than that for the corresponding period of last year. A fair amount of activity was reported, mainly covering against higher-priced December contracts.

	Landed at Mills (Basis Bottoms)	Rs a maund	Rs a 100-kilos	Shipment
Assam Northern	20.75	55.61	34.27	Dec Jan.
Purnea Desal	20.25	54.97	"	"

THE FOREIGN JUTE MARKETS

RISE IN FIBRE PRICES

(FROM OUR DUNDEE CORRESPONDENT)

THE quietly rising tendency in fibre prices during the past week has indirectly improved business in jute yarns and cloth in the Dundee market. But in spite of the increase in prices, there has been much irregularity in quotations. Some shippers have secured parcels of jute to dispose of and they are offering them at under the fixed minimum rates, but not at a higher discount than before. They are not even in a hurry to sell as they were a week or two ago, since it is believed that jute prices may advance by a few pounds a ton in the not too distant future. It is puzzling that there should be a scarcity of good quality jute from the present crop, especially when reports were circulating in the markets that that crop would be large. Some dealers think that this is just a case of manipulation on the part of Pakistan. They have been saying for some weeks that that country will do something to arrest the declining tendency in fibre prices.

Many arbitrations are being held on fibre arrivals in Dundee from Pakistan and some fairly hefty allowances are being given for poor quality Mill Firsts have been raised to £109 which is the lowest price, compared with the fixed minimum rate of £106. Mill Lightnings are most often quoted at £92 and even £94 is wanted by free-sellers (minimum £90), but grades below are minimally offered at a pound or two below the minimum. Mill Hearts are at £80 but £79 is also quoted and Grade Hearts at £67. £66 could be done, with good Daissee-2/3 at £95 (£93 10s) and Grade Daissee-2/3 £88 (£87), while Grade Tossa-2/3 is scarce and there are few sellers at from £106 to £110 (minimum £105) but fours are obtainable at £94. (minimum £95), all c.i.f. U.K.

Calcutta goods have moved up lately to 60s 6d for 40in 10oz and 45s 3d December. 59s 9d and 45s January 59s 3d and 44s 9d February and 59s and 44s 6d March, with B Twills at 14s 9d, 142s 3d,

143s 3d and 143s 9d for the respective positions of shipment, all f.o.b., Calcutta. Jute yarns are firm although a quick delivery is unobtainable for all qualities. Cloth also is firm and is much in demand.

U.S. BURLAP CONSUMPTION AND STOCKS

U.S. burlap consumption normally falls off in November from the usual peaks quite generally occurring in October of each year. Following this pattern, the decline last November from October was about what might be expected. It was, however, 2 million yards better than for November last year, reflecting an encouraging upturn in bag cut-up more significant because there was a decline in piecegoods business. For the first 11 months of this year, consumption continues to be almost identical with that for the same period last year. U.S. burlap stocks at the end of November again showed little change. At 223 million yards, 111 million yards were spots and 112 million yards were afloat. Appearing below are two tables which include the November figures—(1) based on member reports to the Textile Bag Manufacturers Association and the Burlap and Jute Association and (2) projected to represent the estimated consumption and stocks for the entire industry:

U.S. Burlap Consumption (as reported to T.B.M.A.)	1958	1957	U.S. Burlap Consumption (estimated industry total)	1958	1957

Commodity Markets

EXPORTS OF ART SILK
GOODS RISEKEEN COMPETITION FROM
HONGKONG

(FROM A CORRESPONDENT)

INDIA'S art silk apparel has started selling well in overseas markets. Exports have recorded a smart rise in recent months. Against goods worth a mere Rs. 19,900 exported in the first quarter of this year, in the second quarter, they rose to a value of Rs. 44,300, and in the third quarter to Rs. 1,58,207. October exports alone are valued at Rs. 1,37,866, bringing the January-October total to Rs. 3,59,273.

The efforts of the Silk and Rayon Textiles Export Promotion Council to make the rayon apparel industry "export-conscious" have evidently been successful. But its exports so far have been given little "incentive". The new incentive of art silk yarn import licence for 50 percent of the f.o.b. value of art silk garments exported, provided in the October-March policy, should help raise exports of these goods substantially. In spite of keen competition from Hongkong in these garments due essentially to the modern machinery and devices used by the industry there, Indian goods have been selling well in countries such as Saudi Arabia, Bahrain, Singapore, Aden, Tanganyika and Afghanistan. Although there has been considerable progress in the ready-made garment manufacture in India in recent years, there are not many units with modern equipment which can produce goods in quantity and quality. The Silk and Rayon Textiles Export Promotion Council, it is reported, will be soon conducting a survey of the industry to assess correctly its production capacity, manufacturing ranges and export possibilities. There is great scope for the development of this industry, and incentives such as the one now granted, should induce the manufacturers to install modern machinery and produce cheaper and better goods for the domestic and export markets.

WHOLESALE PRICE INDEX FALLS

THE official wholesale price index (base: year ended March 1953=100) declined by 0.4 percent to 112.0 during the week ended 6th December, 1958, compared with 112.4 (revised) for the earlier week. The index was lower by 2.4 percent when compared with that of a month ago, but was higher by 4.1 percent compared with the corresponding week of last year. The index for Food Articles receded further by 0.8 percent to 114.2 due to a fall in the prices of bananas in Bombay (-18%), jowar in Jhalawar (-14%), in Hubli (-8%) and in Mohal (-5%), meat in Bombay (-11%), mustard oil in Delhi (-10%), onions in Calcutta (-9%), salt in Tuticorin (-7%), cardamoms in Calcutta (-5%), rice, mung, urad, milk, eggs and black pepper (-3% each), coconut oil and tea for export (-2% each) and maize, ghee, groundnut oil and gingelly oil (-1% each) although the prices of onions in Delhi (+21%), potatoes (+17%), jowar in Jhansi (+15%), in Hyderabad (+10%) and in Akola (+7%), arhar in Patna (+12%), wheat in Bombay, bajra in Hissar, and gur in Muzaffarnagar (+6% each), cummin (+5%), ragi, cashewnuts and tea for internal consumption (+2% each) and barley, coffee and chillies (+1% each) showed advances. The index for Tobacco also fell by 1.7 percent to 94.1 as a result of a decline in the price of raw tobacco (-2%). The index for the Fuel, Power, Light and Lubricants group worked out to 115.1, compared with 115.0 for the previous week. Lower prices of rapeseed in Calcutta (-6%), copra (-4%), groundnuts (-3%) and raw wool, cottonseed and lac (-1% each) brought down the index for Industrial Raw Materials by 0.3 percent to 112.5, against 112.8 (revised) for last week. The prices of tanning materials—Kanam bark (+13%), gingellyseed in Jhansi (+11%), raw jute in Parachakia and bamboos (+6% each), rapeseed in Kanpur (+5%), and linseed (+2% each), however, showed a rise. An increase in the prices of tin (+3%), rayon yarn, zinc and brass (+2% each) and linseed oil and lead (+1% each) was responsible for raising the index for Intermediate Products by 0.6 percent to 109.9. The prices of jute manufactures and oilcakes (+1% each) moved up while general chemicals (-2%) showed a fall and the index for Finished Products advanced by 0.2 percent to 108.4, compared with 108.2 (revised) for the earlier week.

INDEX NUMBERS BY GROUPS AND SUB-GROUPS

(Base: 1952-53=100)

Engineering and Transport

B.O.A.C. JET SERVICE TO CANADA STARTED

EFFORT TO REDUCE COMPETITION ON
INTRA-EUROPEAN ROUTES

(FROM OUR NEW DELHI CORRESPONDENT)

THE first commercial pure jet service between Britain and Canada was inaugurated by the British Overseas Airways Corporation on 19th December with Comet 4 aircraft. The jet aircraft will operate a once-a-week service between London and Montreal. B.O.A.C. will open its Comet service to Japan in April next year via India. According to present plans, it will leave New Delhi at 9-20 p.m. and will be in London next morning at 10-20 a.m. With Boeings, Qantas will start its commercial jet service in October-November 1959.

B.E.A. is negotiating pool arrangements with several airlines which, if successful, would reduce competition with Continental carriers on intra-European routes. Agreements under discussion include one with Air France for the London-France route and with Swissair for the London-Switzerland route. B.E.A. already operates night tourist flights between London and Switzerland in pool with Swissair. It now operates from London to Düsseldorf and Frankfurt in pool with Lufthansa, to Barcelona, Palma and Madrid in pool with Iberia, to Brussels in pool with Sabena, to Amsterdam with K.L.M., and to the Scandinavian capitals with S.A.S. B.E.A. also has pool agreements with carriers for services to eastern Europe: with C.S.A. for flights to Prague and with L.O.T. for services to Warsaw. Some flights from London to Milan and Rome are operated in pool with Alitalia. B.E.A. services to Athens from London and between Athens and Istanbul, Cyprus, Beirut and Tel Aviv are flown in pool with Olympic Airways. Air France and S.A.S. have signed a five-year agreement effective from 1st November, covering a pooling of services on the Paris-Copenhagen-Stockholm route. Each carrier initially will offer a daily round trip service on the route. The two companies have 40 Caravelles on order between them and plan to use them on this route. Swissair and Austrian Airlines have been operating their Zurich-Vienna services in pool twice daily.

S. A. S.-Swissair Agreement

S.A.S. and Swissair have concluded an important agreement under which S.A.S. will lease four aircraft of its Caravelle fleet to Swissair for four years. Delivery of these aircraft to Swissair will take place during the summer of 1960. Swissair will use these Caravelle jets under its own flag for the same purpose as planned by S.A.S.—that is, for medium distance routes within Europe and adjoining areas. S.A.S. and Swissair have their DC-8s, Convair 440s and Caravelles manufactured with identical equipment and accessories. By so doing, and by selecting the same type of aircraft, S.A.S. and Swissair have created a basis for a joint maintenance organisation for their jet fleets. The Caravelle and DC-8 aircraft owned or leased by S.A.S. at its bases in Scandinavia. Swissair will do the maintenance work in Switzerland for the Convair 440s owned or leased by S.A.S. In this way, the maintenance facilities of both companies will be better used and more rationally operated, which should lead to considerable savings. The S.A.S.-Swissair agreement will enable both companies to operate a highly competitive jet fleet from 1960-61. Each carrier will have at its disposal three different types of the most modern jet aircraft. This will make it possible for both to operate long-distance as well as medium and short-distance jet routes with the economically most suitable equipment. Technical work, particularly aircraft maintenance, will be simplified and less expensive. The co-operation will also enable the companies to reduce their investments to a lower level than would be possible with separate operations. The inter-company standardisation of the three aircraft types creates the possibility of temporary exchanges of equipment between the two carriers.

Nigerian Agreement with B.O.A.C.

Nigeria has signed a 15-year agreement with B.O.A.C. Under the agreement, W.A.A.C. (Nigeria) Ltd will charter aircraft from B.O.A.C. for the carriage of passengers, mail and freight between Nigeria and the U.K. Initially, the charter will consist of two Stratocruiser flights weekly between Lagos and London. It is expected that the Stratocruisers will be replaced by Britannias during the summer of 1959, and that there will be a parity of frequency with B.O.A.C. on the route within a year after the introduction of the Britannias. All traffic revenue on the route from B.O.A.C. services and services chartered to W.A.A.C. (Nigeria) Ltd, will be pooled. The Nigerian Government holds 51 percent of the equity capital of W.A.A.C. (Nigeria) Ltd, the remaining 49 percent being divided between the Elder Dempster Shipping Company which holds two-thirds, and B.O.A.C. which holds 164 percent of the capital. Sir George Cribb, deputy chairman of B.O.A.C., represents the Corporation on the board of W.A.A.C. (Nigeria) Ltd. Qantas will begin a weekly Super-Constellation service from Melbourne to Auckland and Nandi on 7th December. Provision for this service was made in the recently concluded Australia-New Zealand agree-

ment and it will be operated under charter to T.E.A.L. The New Zealand airline already operates one service a week on the same route and other services from Sydney.

Air Ceylon

K.L.M. has decided to reduce its holdings in Air Ceylon from 49 percent to 26 percent. The Ceylon Government will increase its holdings by a like amount from 51 percent to 74 percent. Air Ceylon, it is reported, is interested in acquiring Electras.

New Aeroflot Service

Aeroflot has opened Tu-104A jet service on its 2,175-mile route between Moscow and Alma Ata near the Chinese border. The twin jets make the flight in four hours and 20 minutes, compared with about 18 hours for piston-engined 11-14s.

U.K. Aviation Export Insurance

The British Government has agreed to insure up to seven years' credit on export sales of the Comet IV, the Viscount and the Britannia and the engines which power them. British builders have alleged that they are competing on unfair terms with U.S. manufacturers because the latter are able to offer buyers long-term credit facilities through the U.S. Export-Import Bank. The U.K. Government's action was taken to permit British companies to compete with the U.S. aircraft manufacturers on equal terms. A vigorous effort by the British aircraft industry to book new orders can be expected to result from the new Government policy. Iberia's officials are due in England for new talks with De Havilland and Rolls-Royce.

U.S. Bank Loan for Foreign Airlines

The U.S. Export-Import Bank lent \$52.2 million during the fiscal year ended last 30th June to finance the purchases of 24 aircraft by airlines in Brazil, France, Indonesia, and Pakistan. Air France bought 17 Boeing 707 jets.

Pan American Obtains Bank Credit

Pan American Airways has arranged a \$130-million three-year revolving credit with a group of 39 U.S. banks, in what is described as the biggest financing ever obtained by an airline. Pan American Airways will use the credit towards the purchase of its 44 jets on order, 23 Boeing 707s and 21 DC-8s. The airline has received three 707s and will get three more before the end of the year. Subsequent deliveries will begin late next summer at the rate of two or three a month. DC-8s will not be delivered until the end of 1959.

Earnings from Pan American Jet Service

Pan American Airways' transatlantic jet service is producing high load factors, the overall average for both the eastbound and westbound flights being about 95 percent. During the period 26th October to 8th November, Pan American Airways' 707-121s carried a total of 2,951 passengers. A full round-trip load of passengers to Paris earned \$70,000 daily, which, it is understood, allowed a substantial operating profit from each trip. The New York-Paris flight of 4th November was the only not-stop flight during the period, and the trip was made in a record air time of seven hours and one minute. Pan American will have six Boeing 707s before the end of 1958.

Runways for Jets

Among European gateways, the Brussels airport will have a 11,480-foot long runway, one of the longest in Europe, by 1960. It will be able to handle jets at full load for non-stop flights between Belgium and the Congo and between Belgium and the U.S.A. Amsterdam's Schiphol airport is already handling one Russian Tu-104 jet flight a week from Moscow. It now has one runway 8,370 feet long, and at least one more of 11,100 feet will be ready by 1960. Bonn, the main runway in Rhein-Main, now 9,850 feet, said to be the longest in Europe at present, will be extended by 2,000

feet next year. A second runway of about 6,000 feet long is to be extended to 9,850 feet late 1959 or early in 1960. Berlin's Tempelhof airport authorities say that the airport could handle "short and medium-range service" by 1960, but according to city officials, the airport will never be able to handle jets because of its location in the middle of the heavily populated districts. The new runway at Orly in Paris, now being built, will be 10,825 feet long. A fairly short runway at L. Bourget is being used by Pan American's 707s and Aeroflot's Tu-104s. Two main runways of Copehagen's Kastrup airport are being extended to 10,800 feet, and another will be lengthened to 10,200 feet. London Airport has been ready for the jet age for ten years. Its two main instrumented runways are 9,575 feet long and 300 feet wide. In the Pacific, a \$22-million construction programme at Honolulu is under way. The new west runway will be shortened from 13,028 feet to 12,500 feet to provide the necessary clearance for the C.A.A.'s new instrument landing system facility now under construction. At Tokyo Airport, U.S. jet services must await the extension of the present 8,400-foot runway by another 5,000 feet, which is expected to be completed by October 1959. Smaller Comets, it is scheduled, will be landing at Tokyo by next spring.

Travellers from U.S.A.

Of the 1,122,312 persons who travelled from the U.S.A. to foreign countries during the first six months of 1958, 846,091 or 76.3 percent went by air. The U.S. Immigration and Naturalisation Service reports. The increase in the number over the last half of 1957, was 88,431. U.S. airlines carried 518,642 passengers, or 60.5 percent of the overseas traffic. Non-U.S. airlines carried 338,448. U.S. flag ships carried 89,619 passengers during the first half of 1958, representing 33.7 percent of all sea passenger traffic. The C.A.A. discloses that U.S. airlines flew more passengers from Berlin last year than from any other outside point. The city's total for 1957 was 318,491 persons. The cities following Berlin in that order were Havana with 185,950, Frankfurt 143,115, Mexico city 104,103, Nassau 95,115 and Montreal 91,437. London ranked eighth with 97,751. Rome thirteenth with 63,000, Paris fourteenth with 57,423. Cities generating the most passenger traffic do not, however, necessarily account for the largest number of aircraft departures. The non-U.S. cities showing highest departures in order of rank are Havana, Berlin, London, Frankfurt, Shannon-Dublin, Montreal, Panama City, Gander, Paris, and Mexico city. Shannon-Dublin, Gander and Paris rank fifth, eighth, and ninth respectively, in aircraft departures, although they are not among the top ten which provided the most of passengers. A drop below the level of aircraft departures in 1958, from Shannon-Dublin and Gander indicates that the longer-range plane, which are being put into service are beginning to fly non-stop to their destinations.

Replacement of Piston Aircraft

The replacement of piston planes with jets by major airlines could result in improved air services in the outlying areas of the world, the New York Times suggests. Some 556 commercial jets of various types are on order by 13 U.S. and 25 non-U.S. airlines for delivery between now and 1964, according to the International Air Transport Association. In addition, 14 U.S. carriers have ordered 176 turboprops and non-U.S. lines 264, which add up to a total of 440. The acquisition of these jets and turboprops means, according to experts, that some 1,500 piston planes will eventually be supplanted in the U.S. and some 1,800 more abroad. The replacement, of course, will be gradual. Aircraft dealers point out that the piston-engine planes thus made available will not, in an operational sense, be obsolescent. An extensive market for these planes will be available, the dealers believe, among airlines which have never contemplated using jets because they serve areas for which jets are not suitable. In such areas as Alaska, northern Canada, and parts of South America, jets would not work for both physical and financial reasons. Airlines serving such areas will discover that DC-4s which once cost \$750,000 each are now available for \$300,000. A DC-6B can now be bought for about \$750,000, the former price of a DC-4. Three principal markets for pistons are some of the countries outside the U.S.A., the U.S. feeder, non-scheduled and charter carriers, and the U.S. business corporations, many of which own their own planes. There are today between 3,500 and 4,000 private planes flying for American business organisations. They include the Viscounts and Convairs.

Concrete Roads
stand the test of time and traffic

The ever-growing traffic in India needs concrete roads, because:

Concrete Roads

- Cost less to build than any other road of equal load-carrying capacity
- Cost less to maintain
- Give long years of service
- Give better visibility
- Help to avoid accidents

Build to last with

STRONG GENERAL DEMAND AT
TEA EXPORT SALE

DUSTS SUPPORTED WELL

AT Sale No. 25, held on 22nd and 23rd December, offerings at the Export auction amounted to 48,934 chests for which there was a strong general demand, especially for those with clean and black leaf appearance. "Teas for price" were firm, while Medium and Plain B.P.'s were from 2nP to 4nP dearer, if they were free from stalk and fibre, while similar Fannings were about 4nP dearer and sometimes more. There was good support for orthodox B.O.P.'s: those with tip and O.F.s. were a strong feature and often appreciably dearer. C.T.C. teas were in good demand, and prices, although often dearer were irregular with some withdrawals of the more ordinary descriptions. The few very best kinds were 10nP to 20nP dearer. Legg-cut descriptions were well supported. There was a better demand for Darjeelings and whole leaf grades, the stylish ones being often dearer.

Quotations	1958	1957
Rs.	Rs.	Rs.
Clean Black Pekoe	1.88	2.25 to 2.30
Plain B.P.	1.54 to 1.60	1.48 to 1.52

Best Assam C.T.C. B.P.	2.30 (Nominal)	2.60 to 2.80
Best Assam C.T.C. Fgs.	2.30 (Nominal)	2.40 to 2.60

At the Internal Sale, there was a strong demand for the 18,258 chests of Dusts on offer, and prices were generally dearer. Orthodox descriptions sold readily at rates which were fully firm and often dearer, while Legg-cut teas also shared a similar demand. Plain and medium C.T.C. types were somewhat irregular, and fetched prices which were firm or up to 10nP dearer. Small leafed fibrous grades sold well but others of this type did not receive the same interest. Best C.T.C.'s, where quality was maintained, sold at dearer rates. Darjeelings sold at rates above valuations where quality was present, and those without flavour met with little interest.

Quotations	1958	1957
Rs.	Rs.	Rs.
Medium Doors Dust	1.70	1.60 to 1.62
Medium Assam Grains Dust	1.74 to 1.78	1.62 to 1.66
Medium Assam C.T.C. Dust	1.90 to 2.10	1.80 to 1.90
Best Assam C.T.C. Dust	2.30 to 3.00 (nom.)	2.45 to 2.70

With 2,455 chests of Leaf on offer, there was a good general demand, and prices ruled dearer, particularly for Fannings grades.

FREIGHT MARKETS QUIET

THE freight markets have continued to be quiet over the past week, and grain fixtures to India have predominated. The tanker mentioned in a previous report, as fixed on time charter for the grain trade, has now been chartered to Bombay at 88s from north Pacific. Other fixtures included Northern Range to Bombay at 87s 6d for a 19,000 tonner and a nitrate cargo from Tocopilla to three ports India at 100s f.o. Ore cargoes were arranged from Karwar to Poland at 55s 6d, and to Adriatic at 42s, while Mormugao-west Italy was done at 34s and Mormugao-Japan at 39s.

LINSEED FIRM

The undertone was firm during the past week, and prices advanced with sellers reserved. Stocks were scarce. With very few crushers operating, the daily turnover in the seeds market was nominal. In the oil section, apart from goods in the hands of one or two leading stockholders, supplies were negligible. Small local enquiries were received from millers, and prices rose. Latest quotations are as follows: December-January Rs. 26.50 a maund.

HIDES AND SKINS STEADY

The market continued steady. Stocks were less than in the previous week.

Bazaar Sales

(Between 16th December and 22nd December, 1958)
Cowhides: Wet salted (Ord.) 15,200 pcs. on the basis of Rs. 6.50 to Rs. 11.50; Wet salted (Slaughtered) 27,800 pcs. on the basis of Rs. 7.50 to Rs. 15.50 and Rs. 17.50 to Rs. 26.

TEA COMPANIES

O. Po. and Dd. indicate Ordinary Preferred Ordinary and Deferred Shares respectively. P. next to the name of the company indicates that the Company also is Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer the Key (last page) under the numbers indicated.

JULY 1958

CAPITAL

Regd. No. C2

Rs.5 per Copy

a survey
of India's
foreign trade
1958

since 1898

The hulls, the holds, the interiors and the super-structures of thousands of tons of shipping carrying India's foreign trade are protected and decorated by a wide range of marine finishes manufactured by

SHALIMAR PAINT, COLOUR & VARNISH COMPANY PRIVATE LIMITED

Suppliers to India's leading ship-builders and repairers since 1896

THE SECOND FIVE YEAR PLAN

*We're all in it—and we all
have a contribution to make*

We at G.K.W. believe that we are doing as much as any other organisation to ensure that the targets are reached and, if possible, exceeded.

After all, the core of the Plan is the expansion of the country's transport facilities and the construction of new steel works—and this is where we come in. For example—we are supplying points and crossings, railway fastenings and mechanical signalling equipment for Indian Railways and for the new steel plants' sidings, together with many other components and railway equipment for the mighty Ganga Bridge. We roll special spring steel for railway wagon and carriage springs and supply a wide range of forgings and fastenings to the wagon builders.

We're helping in a hundred and one other ways too—insulator pins for national and rural electrification schemes; telegraph stalks for the Posts and Telegraphs Department; fastenings and forgings for the cycle and automobile industries; and grinding balls to help ensure a steady rise in cement production.

The core of the Plan is transportation and steel—and we are doing our bit to help.

GKW

GUEST, KEEN, WILLIAMS, LIMITED

CALCUTTA BOMBAY MADRAS NEW DELHI

'English Electric' 38,000 KVA Transformers installed at the Delhi Grid Sub-station distributing BHAKRA NANGAL POWER to Delhi.

For the Hirakud Dam Project in Orissa two 37,500 KW generating units are being supplied by the Company. Alongside is shown one of the generating units.

'ENGLISH ELECTRIC'

**TAKES PART
IN
INDIA'S
DEVELOPMENT**

For India, the 'English Electric' Group of Companies have built or are manufacturing a great range of equipment including:

- 'English Electric' CANBERRA jet bombers
- Steam locomotives
- Electric locomotives—including electrical equipment and mechanical parts
- Electric equipment for multiple unit trains
- Napier 'Deltic' diesel engines for marine propulsion
- Electrical generating plant including steam, hydro or diesel prime movers
- Transformers of all ratings including the largest and the first three phase 220,000 volt transformers for India
- Air break, oil immersed and air blast switchgear
- Many thousands of horsepower of electrical drives for steel, jute and cotton mills etc.
- Marconi radar, communication and broadcasting equipment

The Sarda Power House has an installed capacity of 41,400 KW and is the largest hydro-electric station in Uttar Pradesh. The English Electric Company supplied, erected and commissioned all the plant for this Power House. Above is shown one of six 'English Electric' 132 kV Oil Circuit Breakers installed at this site.

One of the twelve 3,120 H.P. electric locomotives built by 'English Electric' for the Eastern Railway, India.

THE ENGLISH ELECTRIC COMPANY LIMITED

(Incorporated in England. Liability of Members Limited)

Partners in Progress with Vulcan Foundry, Robert Stephenson & Hawthorne, Napier's and Marconi's
Members of the English Electric Group.

NEW DELHI CALCUTTA BOMBAY MADRAS LUCKNOW

FLY WORLD-WIDE BY B.O.A.C. BRITANNIA

World's fastest, smoothest jet-prop airliner!

The magnificent new B.O.A.C. *Britannia* is now serving U.K., U.S.A., East, Central and South Africa, Middle East, Pakistan, India, Ceylon, Singapore, Malaya, Australia, Hong Kong and Tokyo. The *Britannia* is the pride of B.O.A.C.'s world-wide fleet...to fly in one is to enjoy perfection in air travel! Speed, comfort, courtesy...all these words mean so much more than ever before. Every minute of your journey will be a revelation...a new, wonderful experience. Remember—whether you fly de Luxe, First Class or Tourist—B.O.A.C. has the reputation for the world's finest, most dependable passenger service. Discover for yourself why B.O.A.C. leads the world in air travel!

For full details of de Luxe, First Class and Tourist services world-wide, consult your local Travel Agent or B.O.A.C. offices at Bombay, Calcutta, Delhi and Madras.

Remember—It costs no more to fly by B.O.A.C.

BRITISH OVERSEAS AIRWAYS CORPORATION WITH S.A.A., C.A.A., QANTAS AND T.E.A.L.

TRAVELLING REQUISITES.....

We manufacture:

EXPANDING FIBRE SUITCASES, CANE BINDING FIBRE TRUNKS OF SPECIAL QUALITY, STITCHED QUALITY FIBRE SUITCASES, LOOSE TOP CHROME LEATHER SUITCASES, GLADSTONE BAGS, FILE CASES, PORTFOLIO BAGS, ETC. ALL VERY ATTRACTIVE AND COMFORTABLE FOR AIR, ROAD AND RAIL TRAVELLING.

We export:

LOOSE TOP CHROME LEATHER SUITCASES WITH CENTRAL STRAP, HARD TOP SUITCASES MADE FROM BEST QUALITY CHROME LEATHER, GLADSTONE BAGS, FILE CASES, PORTFOLIO BAGS, LADIES' FANCY HAND BAGS MADE FROM LEATHER, VELVET, SILK, ETC. EMBROIDERED WITH ZARI AND ALSO OTHER TRAVELLING REQUISITES.

Expanding Fibre Suitcase—special travelling quality.

Loose Top Chrome Leather Suitcase—special Export quality.

Helping the Nation to help itself...

...to achieve the nation's cherished goal in the least possible time.

...to increase production and the national wealth. We supply machines in every field of the nation's development plans—reliable machines from reputed manufacturers, specialists of many years in their respective line of production.

Booth and Clyde Cranes

A complete range of machines and equipment for the Textile Industry from over 30 well known U.K. and Continental Manufacturers

Prachitt Brothers Wood Preservation Equipment

David Brown Radicon Worm Reducers

Clearing Presses

Byron Jackson Pumps

A complete range of goods, services and raw materials for the nation's workshops from English Steel Corp., Darlington Steel Corp., Morgans, Forge, Foseco, Germ Mond, Wiggins, Germ Lubricants & Associated Engineering Manufacturers of Australia.

Fellows Hand-operated Overhead Travelling Cranes

Ruston-Bucyrus & Bucyrus-Erie Excavators

Mindrill Diamond Drill

Coley Thermometers, Drayton Armstrong Steam Traps and Controllers

Helicopters and Aircraft

Paxman Rotary Vacuum Filters

Mindrill Reamer Shells, Mindrill Wedge Reaming Bits

Mindrill Diamond Drill

Hirakud Power Station is protected with Shalimar Tarfelt

Project proofing with Shalimar TARFELT

Waterproofing is our business and has been so for several decades now. As a result, in every corner of India, you will find scores of buildings from thermal power stations to the shell arch roofed working bays of new and

expanding industries, from public buildings, old and new, to vast labour colonies, all waterproofed by Shalimar Tarfelt—manufactured, applied and guaranteed by Shalimar Tar Products.

are the guarantee of a profitable operation of the industrial plants installed by us.

We are ready to serve you with a project and or a geological survey; we can perform the erection, put the plants into operation and train your personnel. In recent years we constructed a number of industrial plants and power stations all over the world.

Our program includes:

- **Mines and steel works**—coal washing machines, ore dressing plants, rolling mills etc.
- **Power plants**—Steam power plants, water power plants.
- **Chemical Industry**—Equipment of heavy and light chemical industries.
- **Food Industry**—Beet and cane sugar mills, distilleries, refrigerating equipment, slaughterhouses etc.
- **Building Industry**—Cement works, refractory equipments, gipsien plants etc.
- **Wood Industry**—Saw mills, plywood and veneer works etc.
- **Other Industries**—Equipment for the production of rubber and leather footwear, bicycles, motorcycles, motorcars, sewing machines and equipment for many other engineering works.

RISING TREND IN FOODGRAIN IMPORTS

DIFFICULTIES IN WIPING OUT THE GROWING DEFICIT

THOSE who plead for continued imports of foodgrains for the next few years are not oblivious to the sacrifice these imports involve. Nor are they necessarily diffident about the ability of the country to attain self-sufficiency ultimately. They only emphasise that till the higher production takes the country's food economy clearly out of the wood, imports of foodgrains, which are the first necessity of life, have to be given as high a priority as accorded to the most essential of the industrial projects. It is necessary to clarify that imports of foodgrains are not a new or a recent burden on our external resources. The country has been a net importer of foodgrains ever since 1920-21, that is to say, for a long time before the rich producing areas went over to Pakistan and even before the outbreak of the second world war. However important it might be to stop these imports in the interest of a larger inflow of capital goods for industrial development, the tradition of being a net importer cannot end abruptly, and only a mighty effort for increased production over the next few years can gradually reduce our dependence on imports.

What is more significant is that our imports have been showing a secular rise over the past three decades or more. Net imports of undivided India progressively rose from an average of 160,000 tons during the quinquennium ended 1924-25 to that of 1,388,000 tons during the quinquennium ended 1939-40. Net imports of the region which, on partition, constituted the Indian Union were even larger. For the three years ended 1938-39, they averaged 2,090,000 tons; for the subsequent triennium ended 1941-42, they rose to an average of 2.2 million tons. The average for the triennium ended 1949 increased to 2,960,000 tons and the average for the subsequent triennium ended 1952 showed a further increase to 3,571,000 tons. After 1952, internal production improved and imports went down. In the latter half of 1955, food prices started rising and imports of cereals had to be stepped up to 1,420,000 tons in 1956 and 3,576,000 tons in 1957. Except for the early part of the first plan period when larger imports were facilitated by the U.S. loan for the purchase of about 2 million tons of wheat, imports of cereals in 1957 were the highest. In spite of the rising level of imports, the per capita consumption of cereals is still below the prewar level. Against the prewar figure of about 14ozs., the per capita consumption was 12.5ozs. a day in 1949-50 (the base year of the first five year plan), 12.6ozs. a day in 1955-56, the final year of the first five year plan and 13.2ozs. in 1956-57. In 1957-58, the per capita consumption is expected to be lower than in the previous year. Thus, the country is faced with the task of offsetting the forces which have been causing a widening deficit in the past. A realistic appreciation of the situation in the light of these past trends would be that with the best of efforts, it would not be possible to wipe out completely a growing deficit, and some imports for some years to come would be necessary.

Increased Deficit

Before the beginning of the era of planning, the deficit went on increasing because of the rapid growth in population on the one hand and stagnant agriculture on the other. This deficit was reflected partly in increased imports and partly in a sharp rise in prices. Since the commencement of the first five year plan, production has considerably increased, but side by side with this, an additional factor of improvement in the community's purchasing power, besides the growth in population, has pushed up the demand for foodgrains, so that the deficit widened further, manifesting itself again in higher imports and a rise in prices.

For the future, the Foodgrains Enquiry Committee has estimated an additional demand of about 8.5 million tons of cereals (excluding pulses) during the second plan period. Against this, improvement in the production potential during the first two years of the second plan has been unsatisfactory. The largest contribution to increased agricultural production is to come from fertilisers and manures. The availability of fertilisers is already lagging considerably behind the plan

targets of annual consumption. Against the target of increasing consumption of ammonium sulphate by about 1,250,000 tons during the second plan period, the increase in consumption expected in 1957-58 is about 200,000 tons, which works out to about 15 percent of the target.

Improved Seeds

Multiplication of improved seeds comes next in importance. But here also, there is a gap between the target and achievement, though not as wide as in the case of fertilisers. Against the second plan target of 4,185 farms, 385 farms were set up in 1956-57 and 608 farms (provisional) in 1957-58. Thus the achievement in the first two years is about 23 percent of the plan target. In the field of irrigation, the shortfall is serious. Against the plan target of 12 million acres, additional irrigation achieved during the first two years is expected to be 1.8 million acres, or hardly 15 percent of the target. About 1/6th of the target of additional production is to be achieved by general improvement in agricultural practices with the help of the community development organisation. In this direction also, there appears to be a considerable gap between expectation and actual progress. The efforts to increase agricultural production are no doubt being intensified, but even with accelerated efforts, it would be good luck if the country achieved more than two-thirds of the target of additional production of about 13 million tons of cereals (excluding pulses) during the second plan period. Moreover, most of the important programmes such as seed multiplication, major and

By

Asoka Mehta

minor irrigation and the development of local manurial resources would yield results in the final year of the plan or even later, so that taking the remaining three-year period of the second plan as a whole, the deficit would continue to be large.

The country is already in the third year of the second plan and the future import policy has to be visualised in the context of requirements in the third plan. During the third plan period, a still larger demand for foodgrains may be expected. For one thing, the rate of population growth may go up as a result of the decline in birth rate lagging behind the decline in death rate. Secondly, even assuming the same rate of population growth as in the second plan period, the increase in actual numbers would be greater; thirdly, the per capita income should rise faster during the third plan period than in the second plan. The latter visualised certain rough estimates of national income at the end of the third and subsequent plan periods. On the basis of these figures, the increase in per capita expenditure during the third plan period works out to Rs. 47 against Rs. 33 in the second plan period. On account of these factors, the demand for cereals (excluding pulses) during the third plan period may increase by 10 million tons over and above the additional demand of 8.5 million tons expected during the second plan period. While the demand will go up cumulatively, the production drive is bound to come up against heavier odds as a result of decreasing returns in the absence of scope for bringing new fertile areas of land under cultivation.

Reserve Stocks

The need to build up reserve stocks and to bring down prices further emphasises the indispensability of imports. Stocks of cereals with the Central and State Governments at the beginning of 1958 amounted to 290,000 tons of rice and 750,000 tons of wheat. In view of the shortfall in production during the current year, the level of stocks at the end of 1958, which in the case of rice is already miserably low, may be expected to run down further. The minimum prudent reserve of one million tons

each of rice and wheat still remains an idea to be attained. It is now being emphasised that in view of the wide fluctuations in annual output of foodgrains, and also because of the rising level of production and consumption, the reserve of even 2 million tons of cereals is inadequate. A few lakh tons of cereals must therefore be set apart for building up an adequate national reserve. Further, prices of all important cereals, except wheat, were, in 1957, the highest in recent years. Imports are needed not only to balance up with the requirements at the existing level of prices but to bring down prices from the prevailing peaks.

One often confronts the argument that imports forming a small part of the total output, their discontinuance or substantial curtailment would not involve much sacrifice while it will give tremendous relief to the country's balance of payments position. It is true that imports in 1957, for example, constituted only 6.2 percent of the output of 57.3 million tons of cereals. It is also true that these imports involved a huge cost of about Rs. 162.2 crores in 1957. But the whole argument is based on an inadequate appreciation of the rôle that imports play. Firstly, imports fill the gap between total domestic requirements and production. Discontinuance of imports would affect the consumption level of the common man which is already considerably below the prewar level and, in terms of calories, works out roughly to 2,200 an adult a day against the standard diet of 3,000 calories. The more important function of imports, however, is to make up the deficiency in the availability of cereals for the non-agricultural population, particularly the urban population, and to keep down the prices of cereals thereby preventing any sharp rise in the cost of living and the country's general price line. In this rôle, the importance of imports has to be viewed in relation to the marketable surplus. Assuming amidst a wide divergence of estimates, that the marketable surplus of cereals is 25 percent of the output, imports in 1957 constituted about 24.8 percent of the marketable surplus. Without a corresponding increase in the marketable surplus, the brunt of discontinuance or curtailment of imports would be borne by the non-agricultural population, and there would be a sharp rise in prices of cereals which would jeopardise the whole plan of economic development.

Rationing and Procurement

Controls in the form of rationing and procurement would not be a remedy against this possibility. It is doubtful if coercive methods like Government procurement would help in enlarging the marketable surplus. Even the introduction of the intensive method of procurement, by which the surplus of each cultivator is separately assessed and taken over, would not be of much help, apart from its being unwieldy, irksome and deterrent to increasing production. Marketable surplus would have to be enhanced by the method of inducements and incentives, and this is bound to be a slow process. Till now no worthwhile scheme of inducing the cultivator to part with a larger part of his produce seems to have been introduced. Without an increase in the marketable surplus to replace imports, no system of distribution control can succeed. The belief that by introducing rationing, consumer demand and prices can be kept in check, is open to serious misgivings. Many experts in food administration hold the view that rationing does not help in restricting consumption particularly when it is introduced in a limited sector. In the past, the system of rationing has been sustained on increasing imports. That being so, how can rationing and procurement be visualised as a means of cutting down imports?

The only remedy for dispensing with imports lies in producing enough to match additional demand and also to cover up the existing gap. Experience in the sphere of production in recent years shows that it would not be possible to become self-sufficient so long as a considerably larger part of the resources is not switched on to agriculture. Indian agriculture, which suffers from the basic handicaps of a low proportion of irrigated area and the necessity to increase output by intensive methods, will not be able to prove equal to

INDIA and ICI

From Rs. 16 crores of ICI research spring new products, new techniques, improved methods and materials.

Scientific research and investigation never cease in the ICI Laboratories in Britain. Specialists are constantly at work—studying, probing and experimenting. In 1956, for example, ICI spent more than £ 12 million, approximately Rs. 16 crores, in employing leading specialists in every field of research.

Basically, that is 'good business'—to keep ahead of competition and abreast of the latest developments.

The outcome of this research is, of course, universally applicable. Here, these new products, processes, discoveries and techniques are speedily made available through the medium of ICI (India) and its associated companies. In India's fields, in her factories, her hospitals, her homes, the standards of living, of health, of technical production—all are being raised by the application of ever-changing, ever-improving methods and materials.

With the establishment
of new Industries
ICI gives a pledge of faith
in the future.

ICI has given solid proof of its faith in the future of India. Numerous projects have been investigated and capital has been invested in schemes where local conditions promised sound development. These are mentioned alongside.

In addition to production, I.C.I. (India) furnishes free technical advice and service on the use of the products it sells. Specialists are available to assist customers in every way. This free service ranges from training their staff to answering technical problems and even to trying to assist in marketing.

THE ALKALI & CHEMICAL CORPORATION OF INDIA LIMITED, RISHRA, WEST BENGAL: Produces Caustic Soda, Chlorine, Hydrochloric Acid; 'Gammexane' brand B. H. C. Insecticides; 'Duco', 'Dulux', 'Necol', and Stoving Enamels; 'Deoxidine', 'Granodine' and 'Alocrome' pretreatment products.

A Rs. 3 crore project is under construction for the manufacture of 'Alkathene' brand of Polythene.

ATIC INDUSTRIES PRIVATE LTD., BULSAR: Manufactures Vat Dye for the Indian Textile Industry. Atic is a partnership between Atul Products Ltd., and ICI.

INDIAN EXPLOSIVES LTD., GOMIA, BIHAR is a joint venture of ICI and the Government of India. The factory is now under construction at Gomia, close to the Bihar coal fields: it will make industrial blasting explosives.

I.C.I. (INDIA) PRIVATE LTD.: Makes in Calcutta, 'Alkathene' Film and 'Alkathene' Pipe for cold water and irrigation systems; at Sevri, Bombay, dyestuffs are processed and packed to the exact requirements of the Indian market, and a comprehensive range of auxiliary products is manufactured for the bleaching, dyeing, printing and finishing of textile fibres.

IMPERIAL CHEMICAL INDUSTRIES (INDIA) PRIVATE LIMITED

the needs of the country, unless the scale of investment is considerably enlarged. The suggestion that greater allocations to agriculture, even by extra deficit financing, would be a good remedy for shortage, high prices, the drain on foreign exchange resources and other ills of the country's food economy, deserves consideration. Increased allocations will be useful only to the extent the organisational efforts in rural areas are stepped up. The real bottleneck that needs to be smashed up with truly national effort is the one created by co-operation and planned efforts in villages by villagers.

Import Programmes

In the meantime, policy has to be framed on the basis of need for imports of 2 to 3 million tons annually for some years to come, and, in the light of this prognosis, it would be advisable to enter into long-term arrangements with surplus countries for the supply of rice and wheat. As for rice, Burma, Thailand and the United States are the three major rice exporting countries. The main supplier of rice to India in the past has been Burma. For the future also, India may have to depend largely on Burma for her rice requirements. The U.S. rice being much more costly, dependence on that country has to be ruled out, except on an aid basis. Thailand rice would also prove more costly. Before 1953, India was receiving supplies from Thailand but now the former does not fit in with the pattern of the latter's rice exports to the neighbouring countries of Malaya, Singapore, Japan, Hongkong and Indonesia. From the point of view of traditional trade links, geographical proximity, costs and tastes, Burma rice would be most suitable for India. New sources of supply, like Egypt, are now emerging, but if suitable terms are offered India may enter into a long-term arrangement with Burma to the mutual advantage of both countries. Under the existing rice agreement with Burma for the supply of 2 million tons of rice between 1956 and 1960, India is to get 350,000 tons each in 1959 and 1960. Since this quantity would not be sufficient, fresh arrangements may be concluded for rice supplies from 1959 onwards.

In line with the position in the past decade and a half, rice would form a relatively small part of total imports, wheat figuring much more prominently. During the prewar period, indeed, rice imports constituted the bulk of total imports of cereals into the Indian Union. But since the second world war, rice imports have greatly dwindled. Between 1944 and 1957, rice imports never touched even the 1-million-ton mark, the highest quantity imported being 870,000 tons in 1948. The world availability of foodgrains has been such that India has come to depend more on wheat than on rice and this position seems to have come to stay. Nevertheless, the tendency of a shift in consumption habits to rice in the wake of a rise in incomes of the people has to be kept in mind. This has been partially offset by Government efforts to popularise wheat in place of rice, but on the whole the share of rice in total consumption of cereals in the country has been slightly rising over the past few years. Considering this, we may have to arrange for imports of 500,000 tons to 700,000 tons of rice annually for the next few years.

Wheat Supplies

The rest of the country's requirements of over 2 million tons would have to be met by the import of wheat, as imports of coarse grains which are no less costly than wheat are not desirable. Of the four major exporters of wheat, namely, the United States, Canada, Australia and Argentina, India has in the past been receiving supplies of wheat mainly from the United States and Australia. Australia has been the largest supplier, except in 1951, 1952, 1953 and 1957 when the U.S.A. became the most important source of supply on account of the offer of sizeable quantities of wheat on an aid basis.

In 1957, out of the total imports of 2,846,000 tons of wheat, 2,674,000 tons came from the U.S.A., mostly under aid programmes. The amount of \$(U.S.) 225 million available for the purchase of wheat under the P.L. 480 programme, (including the diversion of part of the funds originally earmarked for cotton) has been fully utilised in two instead of three years as originally envisaged under the Agreement. The import of a quantity of about 3,700,000 tons purchased with these funds has been practically completed. Another quantity of about 200,000 tons purchased with the help of about \$(U.S.) 17.9 million received as aid under the P.L. 665 programme during the financial year 1957-58 has also been utilised fully. In 1957, Canada also made available to India aid totalling \$7 million under the Colombo Plan for the purchase of wheat. With this amount, about 115,000 tons

of wheat was purchased and has already been received in India.

Future Requirements

For India's import requirements in the second half of 1958 and the subsequent period, there are hardly any arrangements at present, except for the grant of about \$8 million worth of wheat from Canada under the Colombo Plan, which will fetch about 125,000 tons of wheat, and another agreement with Canada for the purchase of wheat worth \$25 million on a deferred payment basis. India is also entitled to a quota of 200,000 tons annually under the International Wheat Agreement, which is effective for a three-year period beginning August 1956. It is desirable that in the case of wheat also, India should enter into long-term arrangements with the supplying countries for her future requirements, though the world supply position of wheat not being as difficult as that of rice, it is not necessary that India should commit herself for all her anticipated requirements for the next few years.

The Government of India has already taken up with the U. S. Government the question of further supplies of wheat under aid programmes. Although U.S. wheat is costlier than Australian wheat and more so compared with Canadian wheat, a fresh agreement with the U.S.A. for wheat supplies on an aid basis has obvious advantages of being partly an outright grant and partly a long-term loan. Of the amount of \$(U.S.) 362 million provided under the existing P.L. 480 agreement for the purchase of foodgrains and other products, about \$(U.S.) 54 million is to be used as a grant and \$(U.S.) 234 million as a loan to the Government of India for economic development. The balance is to be utilised by the U.S. Government for its expenditure in India. The advantage of getting supplies from the U.S.A. in

barter against manganese ore is, however, not very clear and the Government of India might as well consider, in the light of wheat prices in different supplying countries, the possibility of direct or tripartite arrangements by which India can get Canadian or Australian wheat against the supply of manganese ore. The question of arranging for supplies from other sources would depend on the outcome of the present negotiations with the United States. If the latter agrees to supply as much quantity as it did in the past two years under the P.L. 480 and P.L. 665 programmes, then no other advance arrangements would be necessary. India's attitude to the International Wheat Agreement, which might come up for renewal next year, would also depend on the possibilities of wheat supplies from the United States.

Element of Flexibility

Some people are sanguine about production in Indian agriculture soon outpacing demand. Even if that happens, long-term arrangements for the import of wheat and rice would not be undesirable, because they would help the country in diversifying her agriculture and laying greater stress on those commercial crops which are more paying than foodgrains, especially coarse grains. Furthermore, it needs to be recognised that if from the food surpluses of the U.S.A., India can obtain, on the basis of grants and long-term low interest loans, adequate imports, a new element of flexibility would be introduced in her fiscal policies. It would then be possible to step up the tempo of development and risk greater deficit financing. Food imports, provided no immediate payments have to be made, can impart an accelerating impulse to economic development. There should, therefore, be no conflict between urgent, intensive efforts at food production and steady imports of foodgrains, the bulk of which come in the form of loans.

**MORE
PIPES**

With the erection of the second spun pipe plant at the Kulti Works of The Indian Iron and Steel Co. Ltd. the production of spun iron pipes will increase from 60,000 to 150,000 tons per year. This additional tonnage will save India Rs. 8 crores annually in foreign exchange. The output of the plant will help to satisfy India's growing demands for pipe mains. Employing the latest techniques, this unit is the first to produce 16" to 27" diameter spun iron pipes in the country.

TECHNIQUES OF SALES PROMOTION ABROAD

DETAILED STUDY OF CONSUMER PREFERENCES NEEDED

The writer of this article has recently completed a tour of East Africa and the countries of the Middle East to study the sales promotion methods which would be most suitable to support the drive for export of Indian goods. His observations are, therefore, confined to the countries he has visited.

IT is now generally accepted that India has to diversify her export trade, both in relation to destination and the nature of products, in order to earn the foreign exchange which is so vital for her economy. The Government is providing various incentives to manufacturers to increase exports; but very serious difficulties still stand in the way of export promotion. These are the shortage of basic materials, unsatisfied demand in the home market, etcetera. It is hoped that these internal difficulties will be gradually removed so that manufacturers might feel that the task of export promotion is indeed practical as well as profitable.

Much has to be done abroad by way of sales promotion activities and market research before India can hope to create a substantial export market in countries where she has to face serious competition. There is a widespread belief in foreign countries that the only exports which India has to offer are the traditional items such as tea, coffee, jute, ores and mica. Although India is the second most industrialised country in Asia, her achievements in the field of engineering and allied industries are not sufficiently known to the outside world. In fact, a considerable amount of persuasion was necessary to convince the secretary of a

"It's nice seeing you again, cousin."

"We are always glad to have you over. Was the journey from India tiring?"

"Oh, no... And how is business?"

"We can't complain. The firm market is pretty strong—we want more of your implements. There's a lot of building work, too, and in the workshops they are asking for your diesel engines."

"Oh, never mind. Let's have some tea."

"Thanks, but let me give you our local address..."

I must tell you about our electric motors, wires and cables—not to mention our fans..."

"Confidentially, your sewing machines are making a great hit—not to mention your space ships..."

"Don't be silly. You mean our..."

"Oh, never mind. Let's have some tea."

"Thanks, but let me give you our local address..."

A facsimile of an advertisement released in East Africa. Such efforts need to be combined with brand advertising for specific products

chamber of commerce in one of the countries visited by the writer that India did possess an atomic reactor. It is, therefore, of the utmost importance that in countries abroad India should be able to create an atmosphere of product acceptance.

Promotional Activities

When I say that India must create an atmosphere of product acceptance, I have in mind what may be termed general promotional activities on behalf of Indian products. Students from neighbouring countries come to study in Indian universities. It may be worth while to invite them to visit some of India's important industrial units and to ask them to record their impressions over All India Radio in the broadcasts beamed to their countries. There are, of course, numerous other ways such as taking part in industrial fairs and exhibitions, the display of documentary films on Indian industrial achievements through the embassies abroad and other such well-tried methods. It is unnecessary to dwell in detail on such well-known promotional activities but it is distressing to notice how woefully inadequate are the Indian embassies and trade offices abroad in putting such methods into practice.

This was brought home to me in practice when I visited several of our embassies and consulates abroad which maintained show windows where some of our products were displayed. Almost invariably such display lacks a professional touch and it appears to be a jumble show of various kinds of materials from Banaras brocades to brassware. It would be worth while to put such show windows in a proper shape, displaying the goods more attractively and changing the display from time to time. Through well-maintained showrooms in the important foreign trade centres, interesting and attractive documentaries, exchange of trade missions, etcetera, a general atmosphere can be created outside in favour of the new products which India now wishes to export.

Market Peculiarities

Such activities, however, can never replace the basic task of studying each individual market in

horizontal bars. In East Africa, on the other hand, a bicycle which has some additional decorative items, giving it a more handsome appearance, finds a good market. The attachment to the front fork of two shining chromium-plated, so-called "shock absorbers" at once lifts the machine out of the ordinary run!

An instance was brought to the notice of the writer about a consignment of table fans. The fans were exported to Egypt with plugs that did not fit the Egyptian type of sockets. Such a minor irregularity upsets customers even when the product itself is quite good. The fans manufactured in Holland, Italy, the United States and Japan have a better finish. It was clear that much thought had been given to minute details while manufacturing them. For instance, the colour of the wire, the guards and knobs of table fans were matched with the colour of the fans. Models exported from India have been known to have grey oscillating knobs, black wire and nickel guards on green fans. Similarly, new buildings in Egypt, which have rather low ceilings in order to provide more floors, are not very suitable for ceiling fans, and here pedestal types are more popular. There is also a feeling that direct breeze is unhygienic; to please such consumers a reputed British manufacturer has introduced "floor fans" which are mounted flush on the floor to keep the room cool by increased circulation of air.

It is, therefore, necessary to make a detailed study of consumer preferences and prejudices in relation to each type of product in a given market. This will enable Indian manufacturers to adopt special designs for their export products. The instances quoted here should suffice to prove that little attention is paid by Indian exporters and manufacturers to this aspect of sales promotion.

Brand Names

It will be useful to refer to the importance of brand names. East Africa is a particularly brand-conscious market and the brand name is something which must conjure up for the East African buyer a vivid picture of the qualities which he expects from the product. In this aspect, there seems to

BATTERIES are our business

For over 60 years Chloride have been making batteries and nothing else. Our products provide an unfailing source of power in Generating Stations, Sub-Stations, Telephone Exchanges, Industrial Factories, Railway Coaches, Aircraft and Exide Batteries are fitted on more motor vehicles in India, new and old, than any other make.

Industries, Electric Supply and Development Projects, Railways and Transport Operators depend on Chloride and Exide products as do India's motor vehicle manufacturers.

They are thus assured of a quality product unequalled in performance and reliability and backed by an efficient and comprehensive Service Organisation. Manufacturing more than 150,000 Storage Batteries per year of all kinds, the Exide Factory near Calcutta, is India's largest and foremost producer and ranks with the world's leading and best equipped Storage Battery Factories. Continuous research and development keep us consistently ahead of the times in all that is new in battery development.

SALES AGENCIES

Inside the home of an East African wage-earner

be no reason why a sewing machine made in India, for instance, should not sell under one particular brand name in East Africa and under another in Arab countries.

While in Nairobi, an instance was quoted to the writer as to how the sales of a new brand of shaving blades were increased many times by the clever use of a popular African term. In all advertising material, this packet of blades was displayed alongside a single bold word *Kali*, which means "sharp" or "fierce". It appears that within a short time the African consumer would ask for this blade as *Kali* blades, this new name being more intelligible in the territory, practically replacing the original brand name.

Distribution Channels

Both East Africa and Arab countries present a picture of rising incomes and improved standards of consumption. In the latter, particularly, where incomes have been considerably increased by oil revenues, a promising market appears to exist for a great variety of products. Competition has become very severe indeed since not only traditional exporters are well entrenched but also Russia, east European countries and Japan are making a serious bid to capture these markets. India's competitors score very heavily in one aspect at least. By and large, they have developed excellent distribution arrangements, suited to consumer preferences in these countries.

In contrast, with few exceptions, the distribution arrangements for Indian products still lag behind. The writer came across instances where "agents" for Indian products were Government servants who promoted (!) the sale of their products during their leisure hours. There are undoubtedly some agents for Indian products who seem to be doing excellent work. Some of them pointed out to the writer the practical difficulties which arose from a faulty selection of agents; they are unfamiliar with the techniques of active sales promotion and are content to wait passively for customers to call. They resist distribution to retailers as they do not wish to share their commission with others.

The distribution methods of India's competitors, on the other hand, are shown by such instances as the opening of a very large departmental store in Teheran, one of the largest in the Middle East, by a West German trade association. A great variety of products is displayed there and some 50 Iranian girls were taken to West Germany for training and brought back to supervise sales. Side by side, there is an ex-building contractor in this town, with no organisation worth the name, trying to sell a certain brand of a machine made in India.

After-sales Service

An inseparable part of distribution is to provide adequate after-sales service where the products so require. Several British and U.S. exporters

regularly recruit local staff and take them to their home factories for training before they send them back to work as their agents. There is hardly any instance where an Indian exporter has shown similar imagination.

Our backwardness in this matter will be borne out by the following example. In Cairo, a water cooler made in India was purchased by a university with the promise to buy four more. Unfortunately, within a week, the water cooler started leaking and the distributors could offer no service facilities whatsoever. A large number of letters were written to the manufacturers, complaints were lodged with the Commercial Secretary of the Indian Embassy, but to no effect. Such instances are by no means rare.

Appointment of Agents

In the Middle East, there is a very strong sentiment in favour of appointing the nationals of the

country concerned as agents, and in some cases there is legislation to enforce this. One cannot emphasise too strongly that the first requisite for entering an export market—after a product has been suitably designed and priced—is the appointment of an agent who is competent to serve the needs of the market and is acceptable to his customers. In the hands of the agents lie the prestige of the product and the goodwill of the manufacturer. Before appointing any agents, their resources and business integrity must be carefully investigated.

The question of setting up an adequate distribution arrangement presents many other specific problems, such as the grant of credit facilities, to which attention has been drawn by the various trade delegations sponsored by the Export Promotion Councils. An inadequate study of the special features of wholesale and retail trade in a given country can also lead to errors in the location of showrooms, trade offices, etcetera. In East Africa, it was impressed upon the writer that the chief commercial centre was Nairobi and not Mombasa where very recently a showroom had been opened by the Engineering Export Promotion Council and where also the Indian Trade Commissioner's office is located. It was pointed out that although there existed a large number of wholesale dealers in Mombasa, the demand for products really originated from Nairobi, which would be a more correct choice for locating the showrooms for Indian products. In Cairo, again, the Indian trade centre is located at one extremity, at Midan Al-Tahrir. The Japanese trade centre is situated at the best site—in the heart of the city—on 26th July Street.

In the Middle East, the Persian Gulf ports of Kuwait and Bahrain were literally flooded with all kinds of goods from many countries. The pattern and direction of trade in the Persian Gulf and in the entire Middle East are undergoing a considerable change due partly to political reasons and partly to the entry of new competitors. Unfortunately, India has no commercial office located in the Persian Gulf area. It would seem appropriate, therefore, to appoint a Trade Commissioner working exclusively for that area. Furthermore, individual exporters may be well advised to pay special attention to appointing competent agents in these two ports.

Advertising Media

There is a popular Arabic proverb—"The brains of the Arabs are in their eyes". From this follows the reasonable conclusion: show an Arab your product if you wish to interest him in it. Naturally, the most effective means of sales promotion in this area is through audio-visual means such as showrooms, fairs and films. Reference has already been made to the department store opened in Iran by West Germany which is proving a great success. Newspapers in the Arab world, with the exception of Egypt, have small circulations. Because of the absence of well-established advertising agencies in many of the Arab countries, control over newspaper advertising is difficult to achieve, and it is usual for advertisements, scheduled for a particular

Inside a departmental store in Cairo during the festival season

date, not to appear as desired. Both in the Middle East and in East Africa, successful advertisers have combined Press advertising with demonstrations, showrooms and other such media. A very interesting example is provided in a promotion campaign for British textiles in East Africa through the organisation of a fashion parade. The design of the material was actually done on the spot in Uganda in keeping with local tastes and motifs and the material was manufactured in the U.K.

Point-of-sale display items are also very popular and, throughout the Middle East, a visitor cannot help noticing how some well-known brands of soft drinks have achieved phenomenal sales aided by the ubiquitous dealer signs. In East Africa, a renowned sewing machine manufacturer concentrates his sales promotion efforts by putting up sales and service offices with attractive show windows, combined with touring vans which serve as mobile exhibitions reaching to the remote interior. Indian films are extremely popular throughout East Africa and the Middle East countries. While in Teheran, the writer was told that there were 300 Indian films awaiting release. In East Africa, television is to be introduced towards the end of this year. There can be no doubt that this will be a very promising medium if commercials are permitted.

Export Promotion Councils

India has 14 Export Promotion Councils, apart from the Tea, Coffee and Coir Boards, which have their individual committees. Some of the Export Promotion Councils are doing admirable work by participating in foreign trade shows and exhibitions. They are also conducting market surveys and collecting useful information. The Engineering Export Promotion Council has just completed an introductory publicity programme in East Africa and in the Middle East countries. The Export Promotion Councils have taken up the responsibility for investigating all complaints received from foreign importers and are attempting to maintain some control on the quality of exported goods. A quality and guarantee mark on all products exported by members of the respective Export Promotion Councils can go a long way towards removing complaints about the quality of Indian goods.

To my consternation I was told in an important trade centre, in the Middle East that an order accepted by a visiting trade delegation 12 months earlier had not yet been executed! The Export Promotion Councils will, it is hoped, take more interest in ensuring that deliveries are made according to schedule. It would seem advisable to co-ordinate the work of the different Export Promotion Councils to avoid duplication and overlapping. For this purpose, a central organisation on the lines of Japan's Export Trade Recovery Organisation or the U.K. Board of Trade may be created to undertake such centralised functions as the collection of economic data and general sales promotion activities in aid of products made in India.

Rôle of Advertising Agencies

Those who remember advertising in India in the early 'thirties will recall the instances when foreign manufacturers advertised "Bovril" in the

taken by just anyone who has a few thousand rupees to spare. One cannot too strongly discourage the tendency observed of late to make funds available to local agents and leave the task of sales promotion of Indian products entirely in their hands. Successful competitors abroad have invariably kept a close check on advertising and sales promotion in the territories concerned in order to make an effective impression on the market. The individual exporter advertising in countries abroad is certain to get much better value for his money if he is able to control and direct the main forms which his advertising programme will assume. He should have at his disposal all the relevant media information, market research studies, etcetera, basing upon which he will draw up his broad plan of "campaign". On the other hand, if this task is left to the local agent, there is no guarantee that the funds available will be spent in the most desirable manner and not be disbursed as a result of various irrelevant considerations.

In course of time when Indian exporters are able to appoint trained and experienced local agents, only the broad recommendations for advertising need be made at home and the detailed implementation can then be left to local agents. This emphasis on central planning of advertising is all the more necessary as an immediate measure because advertising agencies in countries where India is now exporting, with some exceptions, have yet to reach a level where they can be asked to undertake such planning independently. In this connection, it may be pointed out that the commercial officers attached to Indian embassies or trade offices should include at least some who have a professional training in marketing and market research. Whereas it is not difficult to collect statistics of imports and other such easily available information, and send them in a periodical report, it is much more difficult—but infinitely more profitable—to receive reports on changing tastes and preferences among buyers, competitors' activities, the emergence of new advertising media, etcetera.

CAUSE AND CONSEQUENCES OF THE FOREIGN EXCHANGE CRISIS

MORE EXTERNAL ASSISTANCE URGENTLY NEEDED

THE Central Minister of Agriculture, Dr. P. R. Deshmukh, disclosed recently that the import of tractors has been completely stopped due to the foreign exchange scarcity, while the stock with the Central Tractor Organisation has grown too obsolete to serve any useful purpose. For an economy still predominantly agricultural, this is a bad thing to happen, but it was bound to all the same. The industrial bias of the second five year plan, which initially provided very little for agriculture (but which mistake has now been rectified to a certain extent) was sure to lead to the latter being deprived of its due share of finance and capital implements which need to be imported. This fear was expressed by the Oxford economist, Dr. Thomas Balogh, when he offered his criticisms of the second plan at its beginning. The stopping of tractor imports not only confirms his fear. It also points to the larger problem of the new balance of payments crisis which threatens to hold up the progress of many key development projects in a way which may affect even the "hard core" of the plan itself.

This is indeed a sad commentary on the nature of economic planning. The planners had been warned by a member of their own economists' advisory panel, Dr. B. R. Shenoy, that they had

By

P. C. Mahanti

altogether overlooked the importance of foreign aid for a plan which needed plant, machinery and other goods from abroad far in excess of what any probable trade surplus could pay for. But in the prevailing mood of optimism, the over-optimistic architects of the second five year plan ignored that counsel, although they were to realise later the shaky foundation of unsound assumptions on which they had built so heavy and elaborate a structure. But then the realisation came too late, and the damage had already been done. Import licences were issued on a liberal scale for goods which had little relation to the development projects in hand; and as for machinery imports, there seems to have been keen competition among the various Ministries of the Government of India to get in first and book as much as possible of what they considered their requirements of machinery and other development goods. As a result, one notices an abnormally high volume of imports in the first and the second year of the plan itself, much more than what the plan provided for, and far in excess of what was really necessary. The following two tables show the plan provisions for imports and estimates of exports and the actual volumes of these during the first two years of the current quinquennium.

TABLE II
INDIA'S OVERALL BALANCE OF PAYMENTS
(Crores of rupees)

	1956-57	1955-56	1954-55

Source: Reserve Bank of India

Origin of the Crisis

As these two tables show, imports in 1956-57, i.e., the first year of the plan, amounted to Rs. 1,076.5 crores against Rs. 750.6 crores in 1955-56 and Rs. 683.8 crores in 1954-55, and against the plan provision for that year of Rs. 783 crores. Exports during the year were Rs. 637 crores, which were substantially in excess of what the planners had expected. So the present foreign exchange scarcity and the resulting balance of payments crisis owe their origin largely to this extravagance in imports during the first year of the plan. It is necessary to point out here that the gap in the balance of payments which the planners had estimated at Rs. 1,200 crores, was to be bridged by foreign aid, the use of past but unused allocations, and by drawing down the sterling balances to the extent of Rs. 200 crores over the entire five-year period. But as it has happened, this latter Rs. 200-crore limit was crossed even before the plan had lived the first eight months of its life, and during the last week of May this year, the amount of the balances was Rs. 248.08 crores. At the start of the plan, this was Rs. 746.13 crores. The following table shows the progressively rapid manner in which the sterling balances have been drawn down since March 1956.

TABLE I

* Includes the balances held abroad on that date.

It would thus seem that during the first 26 months of the plan, the country's foreign exchange reserves have been reduced by Rs. 498.05 crores, and if the Rs. 92-odd crores of the I.M.F. credit are taken into account, the loss reaches the proportions of Rs. 600 crores. The total commitments for foreign payments outstanding on 31st March this year amounted to Rs. 884 crores, against which India's foreign currency reserves are now around Rs. 248 crores. The latest reports indicate that the balance of payments position is worsening, and fears are being expressed that commercial imports might have to be suspended altogether, at least temporarily for a period of three months beginning with October 1958.

Admission of Error

It is necessary to know the details of the transactions leading to this sorry pass. While he was holding the Finance portfolio temporarily after Mr. Krishnamachari's exit, Mr. Nehru, with his characteristic candour, admitted that there had been lapses in the matter. "That is to say, we were not fully seized of what was happening and there was lack of co-ordination. Otherwise, we could have taken steps which we took later. We used to have a kind of foreign exchange budget some years ago and it is not clear to me how it lapsed—partly, I suppose, because we were actually gaining in foreign exchange and there was a period of boom and optimism as the first plan succeeded. It was wrong that it lapsed. Different Ministries went on ordering things without anybody knowing the entire picture for some time. Since the beginning of 1957, strict budgeting of foreign exchange is being kept." It is indeed extraordinary how such a thing was happening right under the very nose of the Union Cabinet, which was supposed to be approving half-yearly import policies. But apart from the recklessly competitive import by the Ministries of the Government of India, there were other reasons for the increase as well.

In a pamphlet discussing the foreign exchange crisis, the National Council of Applied Economic Research lists a number of other reasons for which the Government cannot be entirely blamed. In the first place, foodgrain imports had to be heavily increased due to price rises within the country since the beginning of 1956. Government imports of food rose sharply from 400,000 tons in 1955-56 to more than 2 million tons in 1956-57. Secondly, many estimates of foreign exchange expenditure have had to be raised, either due to initial under-estimating, or due to price increases abroad of many items of imports. The Suez crisis, too, aggravated the difficulties. Higher appropriations for defence

It all adds up to 2 million tons

Thirty-three months from start to finish. That is the time schedule for Tata Steel's expansion project designed to double capacity to two million tons of steel ingots by the end of 1958—one-third of the Second Five-Year Plan target of six million tons.

This expansion will cover every phase of operation from the winning of ore and the mining of coal to installing new rolling capacity for shaping end products.

and enlarged imports "due to auxiliary and ancillary investment taking place on the base of the economy for which no proper allowance was made in the plan," were, to a certain extent, contributory factors. The Council also says that the private sector took full advantage of the liberal import licensing policy which was pursued by the Government from 1955.

"Partly on account of the buoyant conditions in the economy," it goes on, "there was a general relaxation at about that time in the import policy, and licences were granted for a wide group of commodities including consumer goods and intermediate goods which can be put to use to produce consumer goods. In the absence of machinery for adequate screening, it is quite possible that a large proportion of the imported iron and steel, for example, has gone into construction; some imports of machinery are likely to be in the nature of air-conditioning and refrigerating plants. The prosperity set in motion by the general boom conditions in the economy would also explain the ascending level of imports of woollen textiles, rayon, watches, electrical appliances, etc." It has also been pointed out that in the import figures for principal commodities, the item "others" in the year 1956-57 jumped to Rs. 266 crores from Rs. 174 crores in the previous year. This item, among other things, consisted of a whole range of consumer and intermediate goods, and although Mr. Krishnamachari tried to explain the increase away by stating that a major part of it was on Government account, he did not explain the precise nature of the rise in these imports.

The Lessons

It will, however, be useless to harp on these past mistakes, but their lessons need to be emphasised. It is indeed curious how the important Ministries of the Central Government were blissfully ignorant of the economics of a gigantic plan of industrial development, and the Government of India itself continued to be unmindful of its responsibilities for exercising a proper check on foreign exchange expenditure, until the realities of the situation woke it up with a jolt. Now, the Government has admitted its errors and its fault, but mere penitence is not enough. The foreign exchange reserves, as pointed out already, are down to a very inadequate level. The gold reserve is just enough to provide the statutory backing for the currency, but even if that is done away with in an emergency, the addition of Rs. 118 crores or so of gold will not completely save the situation, as the outstanding commitments are already too large. Balances that Indian exchange banks may be holding abroad are unlikely to be substantial, and the latest position of such balances is very difficult to ascertain.

The present rate of outgoings from the foreign exchange reserve is of the order of Rs. 6 crores a week, and this figure may well increase to Rs. 9 crores a week during the June-October period, because of heavier commitments. If this is going to be the rate during the rest of the year, then India will be left with very little foreign exchange to meet the obligations arising from her current transactions. This is scarcely a comforting outlook for the country. Her defence needs and food requirements being what they are, it will be extremely imprudent to allow the reserves to be so badly run down.

What then is the way out? The solution lies in action on many fronts. First, exports need to be increased to meet not only part of the past commitments but to finance current transactions as well. Second, considerable cuts in defence expenditure, or alternatively, further restriction on imports, will be necessary in spite of the harmful effects the latter may exercise on the price level and the quality standards of Indian products. Third, more foreign loans; and fourth, inducements to direct private foreign investment. It is necessary to examine the possibilities of each of these to see how far they individually can contribute to the solution of the problem.

No Scope for More Exports

Exports first. While a lot is being said and done to raise the exports of this country, the result has by no means been commensurate with the efforts being made. Falling overseas demand and prices for India's principal exports, notably tea and cotton piecegoods, increasing competition from rivals and the recession in the United States, make the prospects for exports at the moment look bleak. In fact, according to the latest available figures, tea exports were sharply down in 1957, and the trend, judging from the shipments to the U.K., seems to be continuing. Cotton piecegoods exports have been running at a definitely low level. Jute goods are likely to be affected by the current American recession and the restriction of imports by Argentina due to her foreign exchange difficulties. These are the principal exports of India, accounting for the major part of the total trade. Although exports in the first year of the plan were higher than the target, it is unlikely that the total

targets (see table below) for the entire five-year period, will be achieved, even though a certain measure of diversification is possible by including commodities such as sugar, and more engineering goods.

EXPORT TARGETS FOR THE SECOND FIVE YEAR PLAN (In crores of rupees)

	1955	1960-61	Five-year total
1. Tea	112	133	635
2. Jute goods	126	118	610
3. Cotton yarn and manufactures	63	84	375
4. Oils (excluding mineral oils)	39	24	110
5. Tobacco	11	17	75
6. Hides, skins and leather (raw, tanned and dressed)	27	28	140
7. Cotton raw and whole	35	22	110
8. Metallic ores and scrap iron and steel	20	27	115
9. Coal and coke	8	3	25
10. Chemicals, drugs and medicines	4	5	25
11. Cutlery, hardware, vehicles, electric goods and apparatus and machinery	4	4	20
12. Others	151	150	725
Total	596	615	2,965

False Remedy

Devaluation has been suggested as a remedy against foreign competition and foreign consumer resistance to Indian goods. The counsel is by no means a sound one, and overlooks many serious implications. At any rate, India does not stand to gain much from such a course with a plan that is so import-intensive, and the frequent devaluation of a currency may actually do more harm than good by undermining the confidence abroad in the stability of the Indian rupee's exchange value.

The mobilisation of gold hoards has been suggested as a measure which will enable India to finance a good part of her industrial plan. The proposal is attractive, but its practicability is doubtful. In the first place, the international value of gold is considerably lower than that obtaining at home, and the Government cannot persuade the people to part with their gold hoards—an appreciating asset—for less than what they will otherwise get. In that case, the Government will have to pay the difference between the world price and the Indian rate out of current revenues and so create a budgetary embarrassment. An industrialist has suggested that ten-year gold certificates with an attractive rate of interest could be the right answer to the problem. The suggestion has possibilities which may be well worth examining.

ing, but no substantial relief can be expected from this source if the wealth tax is going to stay.

A cut in defence expenditure, especially the foreign exchange component, seems to be called for. Although India's security interests are important, she now has to choose literally between the Biblical alternatives of swords and ploughshares. If she chooses the former, then the fate of the plan becomes uncertain. The tradition and the culture of this country require that the latter be given preference, although it is not suggested that security interests should be completely neglected. Alternately, commercial imports may have to be totally stopped. In that case, not only will an impetus have been given to the inflationary pressure at home; it may even provoke retaliation abroad. Foreign trade, after all, is a two-way traffic, and no country will be willing to import from India all the time unless it can sell her something in return.

The Best Answer

Loans from foreign Governments and international institutions, therefore, provide the best answer to the problem. This has its less pleasant sides, especially when it is remembered that the loans will have to be repaid. As it is, India has already incurred foreign debts which will involve an annual repayment of Rs. 92 crores or so, over the best part of the third plan period—and most of it to hard-currency countries. And if India is to pursue her development plans, it is to the United States that she has to turn more and more, especially for the "off-shore" type of aid. The only other country that can offer substantial help is West Germany, but this latter country, due to her European commitments, may not be in a position to offer much assistance. The World Bank will only lend money against specific projects, and the I.M.F. loans are, by definition, short-term, and will have to be repaid within a few years. The U.K., the traditional provider of capital to the Commonwealth countries, no longer has enough to spare for others, although she still claims by far the biggest proportion of foreign investment in India. The Russians have been talking of an "economic offensive", but it may turn out to be all sound and fury, and in any case, with China and the satellites on their hands, they will not have enough surplus to lend to an uncommitted country such as India. Thus the United States remains the only source of hope from which India can expect adequate help. That country has given the largest amount of aid to India so far and if the right relationship can be created between this country and the United States—which would not necessarily involve any compromise for India's neutralist foreign policy in any substantial sense—the former may offer aid on even a more generous scale.

Direct private foreign investment, it is true, holds no remedy for the present crisis, but India is going to face balance of payments problems for a long time, at any rate during her third plan, when also she will have to find an average of Rs. 100 crores a year for repaying the loans and credits which she is now obtaining. Moreover, direct private investment is twice-blessed; it saves the country some foreign exchange expenditure, and brings with it valuable managerial and technical skill not easily available to an under-developed country.

PORT TROUBLES AFFECTING FOREIGN TRADE

FACILITIES INADEQUATE: LABOUR UNREST

WHILE congestion is not a feature peculiar to Indian ports, the frequency with which it is recurring in India is extremely disturbing. Throughout the major part of the latter half of last year, there was acute congestion in the ports of Calcutta, Bombay, Madras and Visakhapatnam, which handle almost the entire volume of the country's overseas trade. A contributory factor towards this congestion was the simultaneous arrival of vessels via the Suez Canal and of vessels via the Cape of Good Hope. Other factors which aggravated the situation were the arrival in large quantities of iron, steel and heavy machinery for plan projects and the inadequate facilities available at the ports.

By January this year, there was no congestion anywhere except at Visakhapatnam but, while it is true that the situation in general has eased, the question which immediately arises is, at what cost? Apart from delays to shipping, which have cost shipowners a great deal of money, importers have been put to great difficulty in tracing their cargo, which has been scattered over several widely dispersed points, particularly at Calcutta, due to the extensive use of lighters. In many cases, cargo consisting of essential machinery and spare parts, imported after a great deal of trouble because of the rigid import licensing rules, remains untraced to this day. The ultimate responsibility for finding cargo rests on the importer as the methods employed by the port authorities towards this end can best be termed as indifferent and inadequate.

The problem has been accentuated by the slow rate of clearance of cargo, especially project and railway material. At Calcutta, heavy lift yards still lie congested due mainly to the lack of adequate storage facilities at reception points and the short supply of special types of rolling stock. Approximately 30,000 tons of steel are reported to be lying uncleared in the Calcutta port area, whereas industries are clamouring against the cut in steel imports. At Visakhapatnam, the position was rendered acute by frequent labour strikes and

A vessel undergoing repairs in one of the Port Commissioners' dry docks

By

A Special Correspondent

the slow rate of unloading of cargo, intended for the Bhilai steel plant. The latter was caused by the fact that only one heavy lift crane was available and, in a number of cases, derricks on vessels were unable to lift loads heavier than two tons, whereas most of the cargo was in excess of this weight. It is reported that in instances where heavier derricks were available, masters of vessels had refused the use of these on the ground that the charter-party did not provide for their use. In all these circumstances, the prevailing state of affairs is unsatisfactory from the point of view of importers as well as shipowners.

Underlying Causes

However, to attribute congestion to any one cause, be it "bunching of ships" or inadequate port facilities, can only be regarded as an over-simplification. The causes underlying congestion are many and complex and, in some ways, peculiar to the port concerned. For purposes of analysis, they can generally be reduced to the following:

- An increase in the number of ships using the port. The statistics confirm that there has been a marked rise in the number of ships entering and leaving Indian ports.
- Labour trouble in the form of strikes, go-slow tactics, etcetera.
- Accumulation of cargo in port premises.
- The difficult nature of the cargo being handled. It is not only the tonnage but the type of cargo that is important.
- Inadequacy of port facilities, namely, lack of berths, shortage of essential personnel, (i.e., harbour masters, pilots, etcetera) and lack of proper cargo-handling appliances.
- Lack of co-ordination among different interests, namely, port authorities, railways, stevedores, importers, steamer agents, Customs, shippers, etcetera.

(g) Lack of planning in the reception and storage of cargo after clearance.

(h) Inadequate supply of railway wagons. As far as Calcutta is concerned, the short supply of special types of rolling stock had caused a severe bottleneck and impeded the movement of cargo out of the port.

(i) Bunching of ships and other causes.

It will be appreciated that some of these causes are beyond the control of the port authority, but in a country where the economy is planned and which can ill afford the colossal expense and wastage of resources that congestion entails, it is not unreasonable to expect a solution to these problems.

Value of Trade and Tonnage Handled

While most people are aware of the vital rôle of ports in fulfilling the targets set in the second plan, and in the earning and conservation of foreign exchange, the fact that there have been very substantial increases in the value of trade, both coastal and foreign, and in the tonnage of traffic passing through the major ports, is perhaps not as widely appreciated as it should be. The following tables show the rising trend in the value of trade and in the tonnage of traffic:—(Table 1)

It is unfortunate that, in spite of the considerable increase in traffic, there has been no corresponding addition to port facilities with the result that ships with essential commodities, including foodgrains and urgently required plan material, have been forced to wait for long periods before commencing discharge. In these circumstances, the only conclusion that can be reached is that the existing port capacity is inadequate and lagging behind other development projects in the second plan. Allowing for the inadequacy of port capacity, there are good grounds to suggest that the performance of individual ports would have been much better had the output of labour not fallen in the past few years. It is generally admitted that the rate of loading and unloading has deteriorated considerably since decausalisation. This view is supported by the evidence contained in the report of the Vastit Committee, which enquired into the working of various decausalisation schemes introduced in the ports of Calcutta, Bombay and Madras. The tonnages handled by these three ports are given below:

	1946-47	1950-51	1953-54	1956-57
Madras	1,736,903	2,174,128	2,138,935	2,666,000
Bombay	5,275,000	6,887,000	6,727,000	12,274,434
Calcutta	6,438,065	7,501,499	8,059,099	8,869,210

(Figures are in Rs. 000)

Building India's Shipping Power

THE FIRST FIVE-YEAR PLAN witnessed the addition of six ships to Great Eastern Shipping Company's fleet. Of still more importance to the Indian shipping industry was Great Eastern's acquisition of m. t. "Jag Jyoti", the first Indian-owned commercial

tanker and m. v. "Jag Laxmi", the largest dry-cargo ship on the Indian register.

Under the second Plan also, Great Eastern have rededicated themselves to the task of further expanding and strengthening the national mercantile marine.

liary port to Calcutta; and (e) speeding up clearance of cargo from port premises.

National Harbour Board

There is also the permanent high-level body known as the National Harbour Board which held its last meeting on 30th August, 1957, and decided to accept the report of the National Committee for the study of depths to be created at seaports and other entrances. This report recommended that the target for such depths should be such as will provide 32-foot drafts at berths for general, bulk cargo and passenger vessels, and 35-foot draft for oil tankers. This is not applicable to Calcutta in view of the inherent difficulties, but the Committee suggested that the target should be stepped up from 26 feet, the present aim of the Calcutta Port Commissioners, to 28 feet. The Board also recommended a broad-gauge rail link for Kandla, a long-felt need; suggested examination by the State Government of the feasibility of using Geonkhali as a minor port; and recommended that the Government give priority to projects designed to ensure perennial headwater supply to the Hooghly. All these are highly important measures, which require immediate action. In spite of these steps and the ambitious projects for port development included in the first and second five year plans, one cannot help feeling that the authorities have shown a deplorable lack of a sense of urgency and that, had very acute congestion not occurred last year, the gravity of the situation would, perhaps, still not have been realised.

Reconstruction in Europe

The postwar reconstruction of European Continental ports, particularly Amsterdam, Rotterdam, Hamburg and Bremen, provides an extremely good example of modern trends. At Amsterdam and Rotterdam, about 60 percent of the cargo is discharged directly into lighters, which are mainly self-propelled, thus minimising the use of tugs. Roads have been made wider to cope with increased road transport and the quality of the paving for quays and shed floors has been improved to allow the use of fork-lift trucks. Level luffing cranes with a radius of about 100 feet have been provided for the handling of general cargo and these cranes are capable of lifting 2½ tons and double the load at half the radius. A long radius is necessary in order that cargoes can be discharged into lighters, which are moored, two or three deep, alongside the vessel.

Handling Foodgrains

The handling of grain cargoes has seen many changes in the past. In view of the fact that food-grain imports into India are more or less a regular feature and are not likely to cease in the foreseeable future, it is of the utmost importance that modern and efficient methods of handling are introduced at Indian ports without delay. Most European ports are equipped with grain elevators and silos for the rapid discharge of vessels. As an indication of craneage facilities available in a modern port, the particulars for Hamburg are: quay cranes 878, floating cranes 13, transporters for garb handling of bulk cargoes 32, floating coal elevators five, and grain elevators 57 (including 16 of the floating type).

In British ports, taking Bristol as an example, one finds many improvements. For instance, for the haulage of wagons within the port area, the use of diesel shunting locomotives has been adopted. These locomotives are of 200 b.h.p. and 300 b.h.p. and capable of drawing 1,000 tons. They are less expensive to operate and no water softening plant is necessary. In addition, the risk of fire is much less. The port authorities realised the increasing importance of road transport many years ago and the port is provided with excellent road connections, which are fully capable of bearing high traffic densities. The use of fork-lift trucks and other mechanical handling appliances is also widespread.

Development Expenditure

In India, the first five year plan provided for an expenditure of Rs. 62 crores for the development of port facilities, which included the modernisation of existing facilities and the provision of additional berths and wharves at Calcutta, Madras and Cochin; the construction of a marine oil terminal at Bombay; the improvement of minor ports; and the development of Kandla. Including the expenditure in the first plan, it is estimated that Calcutta port development will have cost about Rs. 25 crores by 1960-61. The projects cover improvement of the river, construction of harbour craft and dredgers, a 100-ton floating crane, diversion of railway lines, strengthening of the quay walls at Kidderpore docks, and the construction of a general cargo berth. The installation of a 200-ton crane, a semi-mechanical plant capable of shipping 4,000 tons of ore a day at No. 5, King George's Dock, and a mechanical coal loader of the belt conveyor type, has been completed. It is anticipated that, at the end of the second plan period, the capacity of Cal-

BRANCHES AND AGENCIES AT PRINCIPAL PORTS

The substantial increase in the tonnage handled by the Bombay Port Trust in the year 1956-57 is partly accounted for by the improvement in labour output brought about by the implementation of a piece-rate scheme with effect from March 1956. A similar system of payment by results has been introduced recently in the port of Madras and has resulted in a vast improvement in the output of labour and in their earnings. An example of the extent of improvement will be apparent from the following Press report in the *Madras Mail* of 28th March: "Mr. E. C. Sanker, Regional Manager, State Trading Corporation, today claimed that the international record, established recently in the matter of loading of cargo by manual labour at the Madras port, by the Corporation, had been bettered. The Corporation loaded 4,457 tons of iron ore by manual labour in s.s. *Shofuku Maru* to Japan yesterday within 21 hours as against 4,127 tons within 22 hours on 20th February."

There is a strong possibility of a similar scheme being introduced in Calcutta in the near future. Although the Jeejeebhoy Committee has drawn up a scheme, implementation has been delayed due to the non-agreement of labour unions. The benefits of such a system are obvious and it is essential

that it be introduced in Calcutta without delay.

It would not be correct to say that the Government is unaware of the difficulties confronting Indian ports. So far as Visakhapatnam is concerned, Mr. K. Mitter, Director of Operations, Port of Calcutta, was deputed to visit the port and recommend remedial measures. He has since submitted a report to the Government. Steps have also been taken for the provision of an additional 30-ton floating crane.

Mechanical Equipment

Realising the importance of mechanical equipment, a Government purchasing delegation went abroad in November last year. The estimated value of equipment it proposed to purchase was about Rs. 1 crore. In addition, the Government of India requested the British Government to supply expert advice on measures to ease congestion and a team of experts visited the ports of Calcutta, Bombay, Visakhapatnam and Madras under the Colombo Plan. The team has completed its work and submitted to the Government of India its report, which is understood to have stressed the importance of the following: (a) mechanisation; (b) efficiency of port operation; (c) simplification of Customs procedure; (d) construction of an auxi-

A 200-ton electric crane

cutta port will have increased by about 1.5 million tons a year.

In Calcutta, the main problem is the Hooghly river with its shoals, sand bars and difficult crossings. For many years, anxiety has been expressed about the future of the river and the fate of the port. The conservancy of the river poses many problems and opinions expressed by various committees and experts appointed by the Government over the last century not only contradict one another but tend to confirm the unpredictability of the river. The difficulties are emphasised by the fact that for only four months in the year does the Hooghly river obtain sufficient head-water supply; for the rest of the year, the river becomes a tidal inlet. Dredging, which was commenced in 1907 by the port authorities, is now continued at the considerable cost of over Rs. 50 lakhs a year. Various remedial measures, including river training works, have been undertaken from time to time, the latest being the construction of a spur at Akra at a cost of over Rs. 27 lakhs. It is in the light of these facts, as well as increased ore shipments and food imports, that the proposal for an auxiliary port at Geonkhali or Haldia attains significance.

Water Level Falls

Apart from the problem of maintaining the river, a more recent difficulty which has caused considerable concern is the fall in the water level inside the Kidderpore docks. This led to limitations in drafts and is reported to be the result of the failure of the Chetla Boat Canal and Tolly's Nullah to supply sufficient water to the docks. The position has improved since, but unless remedial measures, including intensive dredging, are undertaken on a priority basis, the difficulties are likely to recur. It is understood that the maintenance of Tolly's Nullah is the responsibility of the State Government. It is hoped that the situation, which calls for co-ordination between the Central Government, the State Government and the port authorities, will be tackled promptly.

The development plans of the Madras Port Trust are estimated to cost about Rs. 15 crores, and on completion will increase its capacity from 2.5 million tons to over 4 million tons a year. Included in this expenditure is a short-term plan involving an expenditure of about Rs. 1.5 crores, which is expected to be completed this year. The projects cover the construction of two new semi-mechanised berths for coal and ore. The second plan projects for Bombay include the modernisation of Prince's and Victoria docks, expansion of Hughes' dry dock, dredging of the main harbour channel, replacement of hydraulic cranes by modern electric cranes and reconstruction of sheds and warehouses.

Lighterage Facilities

Returning to the subject of Calcutta, sufficient attention does not appear to have been paid to the expansion of lighterage facilities. This form of transport was very useful during the last period of congestion. Coupled with the development of inland water transport, for which the Hooghly river provides vast possibilities, it should be able to augment the port's capacity. The efficient operation of the Calcutta Port Commissioners' Railway, which has about 200 miles of permanent way and connects with the Eastern Railway, is also essential if the smooth flow of traffic is to be maintained.

ed and congestion avoided. The existing marshalling yards in the port are outmoded and cannot cope with heavy traffic. It is imperative that these yards are expanded and remodelled without delay in the light of present-day requirements. It is understood that provision has been made for this work in the second plan.

Labour Disputes

Against the background of inadequate facilities, out-of-date appliances and substantial increases in tonnage, the ports have had to cope with labour problems arising out of disputes covering every section of port and dock labour and resulting in strikes, go-slow tactics and other disruptive moves. These problems have been accentuated by the spate of labour legislation introduced in the last decade, including various decasualisation schemes applicable to stevedore and shore labour, the fissiparous tendencies in the port labour movement manifesting themselves in the multiplicity of trade unions and the absence of a consistent labour policy. In the same way as cargo-handling appliances have been developed and improved in the light of experience, so have changes occurred in the field of labour-management relations. Long-term agreements and schemes for payment by results are two examples which come readily to mind.

Appreciation of developments in this sphere by the authorities concerned has been slow and belated. It is true that dock labour throughout the world is generally difficult and the Government has indicated its awareness of the problem by referring disputes to adjudication and by the appoint-

ment of various committees, e.g., the Vasisht Committee which enquired into the operation of decasualisation schemes covering stevedore labour; the Chowdhury Committee which enquired into service conditions and allied problems relating to port labour; and the Jeejeebhoy Committee which has devised a piece-rate scheme for Calcutta port. But, in spite of these measures, the unions do not appear to be satisfied, as will be evident from the recent strike of the All-India Port and Dock Workers Federation. The wastage of port capacity, loss of foreign exchange, detention of ships, loss of man-hours, etcetera, due to labour disputes over the past few years have been colossal.

Port Administration

It has been said that port administration is a complex affair and is essentially a matter that requires close co-ordination of various interests so as to keep pace with constantly changing problems. In practice, however, the tendency of administrations in Indian ports today is to assume a rigid, monolithic structure, with practically all power concentrated at the top. While this might make for more unified control, it certainly makes the administrative machine unwieldy and slow to act in emergencies. In brief, over-centralisation at the top leads to the evasion of responsibility below. Port operation is a dynamic process, particularly in present times when the type of cargo-handling appliances and the pattern of trade are all changing rapidly. Foresight, planning and the ability to make quick decisions are essential at all levels.

The Integrated Second Five-Year Plan of the new State of Bombay which combines the schemes and provisions in the Second Five-Year Plans of the old Bombay State (Minus transferred territories), Vidarbha, Marathwada, Saurashtra and Kutch is of the order of Rs. 350.28 crores. The allocation of outlay among the various heads of development is as follows:-

Agriculture & Community Development
which includes Animal Husbandry, Dairying and Milk Supply, Forests, Fisheries, Co-operation and Community Development Projects, etc. Rs. 8,675.22 lakhs

Irrigation and Power
which includes Multipurpose Projects, Major and Medium Irrigation Projects and Power Projects Rs. 13,659.17 lakhs

Industry and Mining
which includes Mineral Development, Large and Medium Industry and Village & Small Scale Industries Rs. 1,318.97 lakhs

Transport & Communications
which includes Roads Development, Transport, Ports & Harbours Rs. 2,924.41 lakhs

Social Services
which includes Education, Health, Housing, Welfare of Backward Classes & Social and Labour Welfare Rs. 7,610.96 lakhs

Miscellaneous
Development of National and Regional Languages, Encouragement to Arts and Culture, etc. Rs. 881.20 lakhs

Khemchand Rajkumar's

GROUP OF INDUSTRIES

STEEL ROLLING

Five Steel Rolling Mills in West Bengal producing bars, rods, angles, channels, and special sections. The group has plans to install three new Rolling Mills in the near future.

TINPLATE PRODUCTION

Khemchand Rajkumar's new tinplate plant has just gone into production at Paharpur near Calcutta. With a rated capacity of 24,000 tons per year, this new factory will help to bridge the gap between India's production of tinplate and her demand.

BARREL RECONDITIONING

Barrel Reconditioning plants renovate about 800/1000 barrels a day. These are the only plants of their kind in India.

RAILWAY SUPPLIES

Khemchand Rajkumar maintain regular supplies to the Indian Railways of steel sections, plates, sheets, bars, track material and tested bars rolled in their own mills.

IMPORTS

Khemchand Rajkumar have 58 years of experience in the importation of steel products of all types, and have good contacts and facilities all over the world.

EXPORTS

With three large hydraulic presses for baling, Khemchand Rajkumar are one of the largest exporters of steel scrap.

Growing Competition in World Tea Markets

Heavy Taxation Hampers Indian Industry

BEFORE one discusses specific aspects of Indian tea exports, it is essential to examine the production of tea generally in relation to the economy of the country. One cannot export a commodity before it is produced, so it is as well to consider the "man-made climate" with which producers have to contend. There can be no doubt that the troubles of the Indian tea industry are caused by a tragic misunderstanding on the part of a relatively few individuals. Those who work for the tea industry may not be unusually familiar with the intricacies of other industries, but they feel that they are able to assess to some extent the serious situation in which the country is now placed and the part that tea could play in helping India to put her affairs in a healthier state. They are experts in their own sphere, and any criticism they might have to make of the manner in which the Government treats the industry should not be interpreted as a lack of patriotism or a desire to carp. Tea is the country's leading earner of foreign exchange, but it is doubtful whether it can keep this position unless there is a drastic change of heart or a broader outlook on the part of the Government. The desire is to help the Government and there need be no doubt about that.

Official Sympathy

It has recently been seen how the textile industry has been assisted by a modification in its excise duties. There have also been second thoughts on what once seemed an urgent need for companies to deposit part of their current profits and reserves for the national good. In consequence, one is encouraged to think that official understanding and

plan was framed, and even up to the time of its acceptance and initial implementation, few were aware of this oversight. In consequence, today there is a heavy backlog of commitments even though the second plan has been severely pruned. Added to this, there is the regrettable and steady expenditure on defence and foodgrains, which would not be necessary if neighbourly relations and husbandry were better.

How the foreign exchange situation has deteriorated may be judged from the fact that in April 1956, India's sterling balances stood at Rs. 527 crores. They were down to some Rs. 280 crores by April 1958. This was in spite of a credit of Rs. 61 crores in 1957 from the International Monetary Fund. Thus, in two years, there was a decline of over 50 percent. Although fresh loans have just been granted by foreign countries they are smaller than was originally hoped for and estimated. These temporary boosts, moreover, are like stimulants in that there is always a moment of reckoning to follow. India will soon have to repay Rs. 95 crores received as a "standby credit" and during 1960-63 sums of Rs. 92 crores, Rs. 123 crores and Rs. 107 crores, respectively, will come up for repayment unless more long-dated agreements can be negotiated and applied to the shorter-term obligations. Provided the demands of labour can be kept within reason, iron and steel exports might soon begin to help. But much depends on food supplies and on whether some way can be found to prevent the population increasing to proportions with which no planning can cope. This is a truly frightening problem.

Increasing Population

In the tea-growing areas alone, the population is increasing at an extraordinary rate, with four births to one death, and double the number of persons required to work the area under cultivation are now sustained. Roughly speaking, the one million workers in the industry support an additional one million dependants; thus, it would perhaps be accurate to say that the Indian tea producer provides the wherewithal for two million people. From this small example of the tea garden population, it is easy to see that, unless the economy expands rapidly, serious dangers of further unemployment and starvation lie ahead.

It is said that something of the order of one-fifth of India's foreign exchange earnings is necessary to fund interest charges and loan repayments, without any new loans being taken into consideration at all. This means about Rs. 125 crores each year, which, significantly, is a sum that the tea in-

dustry could readily earn in foreign exchange provided the Government removes various obstacles and handicaps. This figure of Rs. 125 crores is an important one to bear in mind.

Suspended Animation

The Indian tea industry today finds itself in a curious state of suspended animation and uncertainty, at a time when the one condition it wants is an assurance of stability for some years to come. By this is implied stability in the cost of producing each pound of tea, and stability in the price paid for each pound of tea. After the slump in the early 1930's, British and Dutch interests had such a preponderance of control over tea production that it was relatively simple to reach agreement round a table on the precise share that each country should have in the right to export tea. As a result, the years 1934 to 1939 became an era of stability and healthy progress. Then came the second world war and subsequently the birth of Asian independence with different national policies in the various tea producing countries. It was only to be expected that many of these policies would be based on narrower domestic issues and would fail to take into account the wider and more long-term considerations that were needed. This conflict of national interests is the tea industry's main problem.

The time has now come when it may be virtually impossible to visualise any hope of agreement—even if India, Ceylon, Pakistan, Indonesia and the seven Governments concerned in the African continent were to meet in a friendly way in order to discuss and agree upon their individual shares of world tea exports. Ceylon has recently made it clear that she has no intention whatsoever of participating in such a policy. From 1st April this year, every pound of tea exported from Ceylon will pay an additional duty which is designed to finance a scheme for replanting 5,000 acres annually with high-yielding strains. Thus, the yearly increase in the Ceylon crop will be accelerated. This is the very crop which is at present swelling the world's supply of tea beyond the world's current ability to buy. As the scope for increased internal consumption in Ceylon is extremely limited, it means that the Colombo Government has decided to increase exports regardless of what happens to other producing countries. It is fortunate (although not for Indonesia) that production in the islands of Java and Sumatra has decreased by nearly two-thirds. If these islands had reported a similar pattern of increased production as India and Ceylon since the last world war, they would have been able to export 250 million lbs or more, instead of the 70 or 80 million lbs they now produce under rather unhappy conditions.

Competition from China

Then there is China. According to Press reports, and they could well be true, her present production is over 300 million lbs. It is also claimed that, by 1960, it will be of the order of 800 million lbs. The question arises as to how much of this will be exported. With China wanting to earn more foreign exchange, it may be assumed that her tea exports will increase and make India's task more difficult. With the type of Government one normally associates with Iron Curtain countries, care will be taken to see that the cost to the overseas buyer will be so adjusted that Chinese tea is as cheap as, if not cheaper than, any other country's. Thus, China may soon be a powerful influence in the world market. Much has been written about what is happening in Africa, and it is certain that production there will increase very sharply indeed. What is more important, however, is that the quality of African tea is now showing such a marked improvement that it will soon be competing with medium Ceylon and Indian tea. Pakistan, Formosa, Iran, the Argentine and others who plan to increase their output have also to be reckoned with.

How does India stand, considering that output will rise sharply in so many territories abroad? She is still, admittedly, the largest single producer, harvesting nearly 700 million lbs each year. She also has one of the world's biggest potential markets at home. But does her industry prosper as well as it could? Does it contribute as much as it could to the economy of India? The answer is a definite "No". The initial trouble springs from the fact that the Indian tea industry, particularly in the north, is being forced to live beyond its

Sorting and grading of tea leaves before being packed into paper-lined chests

THE SCINDIA STEAM NAVIGATION COMPANY LTD. SCINDIA HOUSE, BALLARD ESTATE, BOMBAY. 1957-58

An Assamese woman labourer plucking tea leaves

means. Oddly enough, the past season has shown that the difference between happiness and misery is about 24nP a lb for the majority of estates there. By "majority" is meant some 60 percent, and this 60 percent represents such a large number of tea garden labourers and their dependants that it is an extremely serious matter. It also means large parts of India in the geographical sense. The whole of Cachar, much of Assam, Darjeeling, the Terai and the Doars, as well as Kerala and Malabar, are involved.

Excessive Supplies

The reasons which bring this about are two-fold. Firstly, Indian tea has to compete in a world market, where there is an excess of supply over demand at the present time. As a result, prices are below a level at which at least 60 percent of the Indian producers would be able to sell their crops without loss. The second reason is that the cost of producing a pound of tea is not now a matter over which the producer has much control. It is mainly the Government which determines the chief factors in the cost structure, and the Government has seen fit to complicate the issue in two separate but telling ways. In the first instance, legislation has been introduced which forces producers to provide standards of living and employment which are proving to be too severe a strain on their resources and income. To mention only a small example, the employer's contribution to the provident fund scheme and "holidays with pay" mean an increase of about 12 percent alone under the heading of "wages". In the second instance, the Government heavily taxes the commodity while it is on its way to the consumer; the loads and handicaps thus imposed put it at a growing disadvantage in the world market. The painful and laborious way in which this is done is best shown by the fact that no less than five authorities collect taxes; the trouble and work that is entailed can easily be imagined.

The measures which are necessary to bring about a more healthy atmosphere are simple enough. It is obvious that the Government's policy for improving tea garden labour conditions is not only too severe but too sudden for the industry to sustain at this juncture. It is necessary to revise this aspect completely and to rephase the programme in order to spread out these worthy improvements over a much longer period. Governments, especially State Governments, would be well advised to remember that additional duties on fuel and its passage have an effect on the costs of tea production. That is where the south Indian planter, with water as his main power resource, is more fortunate.

Internal Consumption

Strong emphasis is necessary on increasing internal consumption. The increase is taking place only slowly. Better standards of living will help but the improvement is being vitiated by the rapidly rising cost of the basic necessities of life. Poor husbandry and rapacious distribution are delaying the day when the standard of living of the 370 million adults of India will be sufficiently raised to enable them to spend 4nP a week or Rs. 2 a year more on buying tea. Just that little amount would provide the Indian tea industry with a degree of stability and security which is sadly lacking today.

The quickest remedy, however, is elementary and could be put into effect by a stroke of the pen.

This is a complete reorientation of the Government's policy in taxing the commodity on its way to the consumer. Taxation at a single point, however, is not enough. At present, if one were to take a pound of tea which is placed on a ship in Calcutta after having been sold at the Calcutta auctions at Rs. 1.75 a lb (which is the Calcutta Export auction average for the past season), it would be found that over 25 percent of the price is represented by different Government taxes. Since this pound of tea has to compete in world markets against the products of some countries whose Governments have no duties and taxes on tea at all, it can be plainly seen why Indian tea is placed at such a disadvantage when at least 50nP a lb goes to the Indian Exchequer. It is not as if the Central Government is the only one to blame; the Government of Assam, West Bengal, Kerala and Madras collect revenue under different titles by taxing tea on its way to the consumer abroad. Small wonder, then, that the foreign housewife sometimes shows her resentment at this state of affairs by buying less of Indian tea.

Tax Collections

Looking at the problem in a different way, in a year of reasonable prices when there is also a reasonable margin of profit for all producers, the Central Government is able to gather into its coffers something of the order of Rs. 125 crores in income, corporation and agricultural taxes. At the same time, under similar favourable circumstances, a figure of the same order, Rs. 125 crores, is earned by the country in foreign exchange. Yet, at the moment, when one considers Central and State direct duties and taxes of some 50nP a lb imposed on the commodity on its way to the consumer, about Rs. 20 crores to Rs. 25 crores are extracted. It is this relatively small sum which is at the moment prejudicing the possibility of the Government gaining its Rs. 125 crores from taxation on producers' results and the further Rs. 125 crores which can be gained by India in foreign exchange. It seems difficult to believe that hard-headed and mature administrators would risk damaging Rs. 250 crores for a mere tenth of this amount. It is similar to saying: "Do you want your Rs. 250 crores for certain or maybe more, or do you want to have a gamble on the side which will bring in Rs. 20 crores or Rs. 25 crores while the Rs. 250 crores might become only Rs. 100 crores?" That, in a nutshell, is the present risk which is being taken. And beyond all doubt it is being taken unsuccessfully. Moreover, as has been shown earlier, it is this very sum of Rs. 125 crores of foreign exchange which is at present necessary to fund the different interest charges and loan repayments to which the country is at present committed and which will be needed more and more urgently each succeeding year.

The potentialities of the Indian tea industry are thus being harmed by a policy of trying to grab money from it at the wrong stage. There can be no question whatsoever that taxation of the commodity on its way to the consumer not only puts Indian tea in a wholly unfavourable position in the world market, but detracts from the possibility of producers making the profit which the Government could subsequently tax in the normal way. A policy of patience would give this industry the fair fighting chance it requires to fulfil, and pos-

sibly increase, its contribution to the economy. Above all, a policy of patience would also reduce the price of the commodity to the consumer, when tea becomes cheap, consumption increases and the whole situation becomes healthier. Employment increases not only within the industry itself, but in all the industries which are ancillary to tea. With a rapidly growing population, the production of tea should expand in common with all other industries.

Dogmatic Approach

The future, both immediate and over a longer term, depends entirely on what the Government does. Every aspect of tea—its production, its export, its finance and, in a manner of speaking, its consumption—depends on what New Delhi decides. A dogmatic approach to problems will not produce the answer that is required. The views expressed here would find the whole-hearted support of the Indian tea industry. Any matter which affects exports should be made solely an affair for legislation by the Central Government in a similar manner to defence. In India, there are instances of State Governments being in a position to impose taxes which are capable of denying the Centre not only foreign exchange, but revenue from taxation on company profits. At the moment, Rs. 20 crores to Rs. 25 crores are taken away unnecessarily by State taxes instead of being put to better use for the general economy. The amount of useless paperwork which is involved in the paying and gathering of this amount is incredible.

Another aspect to consider is the present import policy. The day will come when imports of materials for the second five year plan will be greatly reduced. As it is, when a ship arrives in an Indian port with a full cargo, it often leaves with only half a cargo of exports. This is bad enough, but no one can expect the shipping lines to continue sending empty ships to India in the hope of taking away exports unless they come here with a reasonable amount of inward freight. How can tea be sold to foreign countries unless their goods are bought in exchange?

Partial Reduction

A partial reduction or refund of one or more of the various duties or taxes will not be sufficient. A refund of 12nP a lb is certainly not enough when a minimum of 25nP is required by 60 percent of the producers. Only the full 50nP would put India on a proper footing with her most favourably placed competitors. A man with double pneumonia may feel better when his doctor decides that the pneumonia has become singular but he is still not healthy. The present troubles of the Indian tea industry can be summed up well in Tolstoy's words written over 50 years ago, when he said: "I sit on a man's back, choking him and making him carry me, and yet assure myself and others that I am very sorry for him and wish to ease his lot by all possible means... except by getting off his back."

A great and immediate responsibility, therefore, lies on the Indian Government to use its foresight and make decisions which will give the tea industry the degree of prosperity and stability which it has to have if it is to thrive. And thrive it must unless the fortunes of the country as a whole are to be allowed to wane. It is only the Government which can help by removing the shackles which now bind the industry so unwisely and so cruelly.

INDIAN TEA

THROUGH THE EYES OF A U.K. DISTRIBUTOR

THE THREAT FROM LOW-COST COMPETITORS

THE tea industry today provides a means of livelihood to many hundreds of thousands of the population of India. By virtue of the magnitude and value of its exports, it also takes pride of place at the top of the list as an earner of foreign currency. In 1956, tea exported from India totalled 520 million lbs, of which the United Kingdom accounted for 280 million lbs, or well over half the exportable quantity. It can readily be seen, therefore, that the United Kingdom is India's best customer by a very considerable margin.

Why has Indian tea found so staunch a supporter in the English consumer? At the turn of the nineteenth century, the habit of tea-drinking was becoming more widespread, but it was nevertheless still largely confined to the wealthier sections of the population, and the source of importation was virtually the monopoly of China. In 1850, as a result of the foresight of Lord William Bentinck, Viceroy of India, under whose chairmanship a Tea Committee had been set up some years previously, small quantities of tea were reaching London from Assam. The inherent strength, pungency and robustness of north Indian tea, as opposed to the more delicate and fragrant China growth, appealed better to the palate of the average Englishman, and by 1900 consumption was trebled, having reached the proportions of 6 lbs a head a year. It is the history of a great partnership—tea-drinking in Britain had become a national institution, a development that could not have taken place without the progressive opening up of new areas of production in India. A basis had been laid for what is now recognised in the United Kingdom as integral requisites of a cup of tea—strength, colour and pungency. To this day, these are the essential characteristics that a blender seeks as a foundation for the products which he markets in blends that cover a wide variety of quality and price. India, particularly north India, furnishes a large proportion of the components.

Uniformity in Blends

Although there are as many as 100 firms in Britain today, which blend and distribute rather more than 500 million lbs during the course of a year, the bulk of the trade is in the hands of four concerns. It is the job of the blender to ensure that the quality of the blends which he sells is such that the consumer can purchase a packet brand mark regularly throughout the 12 months of the year with the knowledge that the standard will remain constant. This is not as simple as it might appear at first sight. The products of the blender's strength and richness in processing green leaf from

art are the result of painstaking experiments and conform to precise formulae which may include teas from 30 or more gardens in a number of growing districts and countries. His task is further complicated by the fact that not only does the quality of teas differ in relation to their country of origin and district; but supplies from individual gardens throughout the course of a manufacturing season vary markedly as a result of climatic conditions affecting growth. To generalise, the slower the growth, the finer the quality, so that from north India, for example, teas which are harvested in the early and late stages of the season may be described as the "cream" of the crop by reason of the comparatively cool conditions that have nourished them. In the intervening period, however, with the onset of warmer temperatures and the monsoon, a humid atmosphere prevails and accelerates the growth of the green leaf, with quality giving place to quantity. The blender, therefore, must assure himself of the finer grades, during the limited period that they are available, in quantities sufficient to keep his blends up to standard to cover the time when

a garden in Assam. Although the appearance of the tea suffered to some extent, this was more than offset by the distinct improvement in liquor. The finished article, when introduced to the London trade in the early 1930's, was well received and quickly became known as "grape-nuts" due to the similarity of its leaf to the familiar breakfast cereal. It prospered; and at a time when prices in the London auctions had sunk well below 1s a lb, it realised levels many pence in excess of this figure. The early success of C.T.C. manufacture, coming at a time of acute price depression for all descriptions of teas, caught the imagination of producers, who hailed its coming as a cure for their ills. It was generally believed that the purchase of a machine and the incorporation of its process within the normal routine of manufacture would transform, as if by magic, teas of indifferent quality to the rich liquoring standard that had been achieved by Sir Donald McKercher. Many machines were bought, but for the most part unsuccessfully. Those gardens that had happier results with C.T.C. manufacture had used their machines with intelligence; they had paid particular attention to the different conditions induced during the process of fermentation, and in the firing, or drying, of the fermented leaf. In the main, however, C.T.C. manufacture received a setback and the cult was virtually put into cold storage until the years following the war.

A brief digression is necessary now to appreciate the full significance of Sir Donald McKercher's invention. Most distributors market their packets from the low to the high-priced blends in 4lb standard and small-leaf packs. The former comprise largely the leafier or B.O.P. and B.P. grades, while the latter, as their description implies, are composed of the smaller or fannings grades. In prewar years, the proportion of standards to small-leaf blends bought by the consumer was roughly 80 percent to 20 percent. Today, these figures have undergone a revolutionary change with the small-leaf packet in the ascendancy at 60 percent. The question may well be asked, therefore, as to what is the cause of this distinct reversal in consumer preference. Does the answer lie in the C.T.C. machine? In Britain today, more and more people are turning to the small-leaf blend—the tea that provides a strong and colouring infusion in the shortest time. Whether the pioneers of C.T.C. manufacture have been instrumental in influencing the taste of the U.K. consumer, or the indecorous bustle of the modern age with a consequent decline in the ritual of tea-making in the home is responsible, is perhaps as difficult to answer as the problem of the chicken and the egg. Which came first is debatable, but since 1950, there has been a progressive increase in the number of gardens in Assam that have adopted C.T.C. manufacture, and by far the greatest percentage of it has found its way to Britain.

Ready Market

C.T.C. teas that have been manufactured with care and forethought find a ready market in the United Kingdom. The size of the leaf, the character of the liquor and the tendency of the process to yield a higher percentage of fannings, make them welcome components of small-leaf blends. Once again, however, some producers are repeating the errors of their predecessors in the 1930's, treating C.T.C. manufacture as a sort of formula for success. Unless care is devoted from fermentation to drying and adequate provision is made for firing machines, such producers would be well advised to stick to the orthodox methods of manufacture. Producers might also with advantage pay heed to the dangers

By
E. C. T. Holmes

only the relatively poor quality "monsoon" descriptions can be bought in the primary markets of the world. By virtue of the buffer stock which he holds, the blender can also offset to some extent the variations of prices in primary markets that have so bedevilled all sections of the industry in recent years.

C.T.C. Manufacture

One of the most important developments during the present century has been the evolution of C.T.C. manufacture. It has had a far-reaching effect on the drinking habits of the U.K. consumer, and Sir Donald McKercher, its inventor, undoubtedly had this market in view when the machine was first conceived. Briefly, the process of C.T.C.—Crushing, Tearing, Curling the leaf—replaces, or acts as an ancillary to, the normal procedure of rolling, the method by which the green leaf is treated with the object of breaking up the leaf cells and releasing the juices. By its application, Sir Donald was able to obtain greater colour, strength and richness in processing green leaf from

A packing machine—its crew and the finished article

of manufacturing C.T.C. teas in excess of the ability of the United Kingdom to absorb them. It has already been observed that the C.T.C. machine causes a higher percentage of fannings and small-grade tea; in other words, a heavy tea with a low c.c. measurement. While the tendency remains for the U.K. consumer to drink greater quantities of small-leaf blends, there is no cause for alarm; but there are, nevertheless, indications that any further increase in the proportion of fannings grades may upset the existing balance. The blender must have access to sufficient quantities of grades with a higher c.c. measurement in order to obtain a snug fill for his larger size standard leaf packet. Without these, a loose pack will ensue, resulting in damage to the contents and possible leakages. A shortage of orthodox B.O.P. grades in the circumstances might develop and could well stimulate a demand for them to the detriment of recent purchasers of C.T.C. machines.

At the general meeting of the Indian Tea Association in Calcutta some time ago, the chairman in his address emphasised the need for producers to market good tea. He said: "Good tea will cost you more in the shops, but will be worth more in the home, for you will get more cups to the packet, and the tea will be better. Quality remains when price is forgotten". These are wise words indeed, and should be read, marked and learned by all sections of the producing community, for never has the U.K. consumer been more quality conscious than he is at the present time. During the war, and in the years that followed for a period of a decade, his appetite for tea was subjugated by rationing in quantities ranging between 2 and 2½ ounces a week. It did not take him long to discover that not only did the more expensive blends provide a more palatable cup of tea, but they gave him considerably more cups to the pound. The lesson, perforce learned in an emergency, is remembered to this day and no greater proof is needed to bear out this statement than a reference to the prices that useful teas have realised in the peak quality periods of 1956 and 1957. There has been an insufficient quantity of them to meet the demand. The advice to the would-be horse buyer that it costs as much to feed a bad 'un as a good 'un is perhaps apposite in this context. From the stages of plucking and packing on the garden, carriage to Calcutta, imposition of taxes and duties, ocean freight, warehousing, right through to the distributors' processing, packing and ultimate delivery to the shop from which the consumer makes his purchase, both good and bad teas have been subject to the same costs. The inference is clear.

Adequate Supplies

International conflict, strikes and other man-made contingencies excepted, there is no escape from the fact that there is, and there will continue to be, more than enough tea in volume to meet world demand. In the past, India's cost of production has been to the buyer a useful yardstick for gauging the right time to enter the market to acquire supplies of the lower qualities. In theory, it has been accepted that should prices have sunk

to around or below this figure, it was reasonable to expect such a level to be of comparatively short duration; the existence of companies manufacturing low-grade tea could only continue for a limited period in such circumstances and would lead, if prolonged, to economic failure and ultimate closure. A condition of restriction by the survival of the fittest would follow. It is doubtful if a buyer can rely any longer on this rough and ready method of calculating market trends, and it is likely to lose all significance in the future.

India's costs of production, due in a very large measure to the enormous burden of Government taxes and duties that the industry is forced to bear, have been inflated out of all proportion in comparison with those of the newer producing countries. Africa, for example, has doubled her output since prewar years and now provides an annual supply of over 60 million lbs. While the influence of Indonesia has dwindled to some extent, the difference is more than made up by other countries, India herself included; and on the London market, there is a constant flow of supplies from Japan, Formosa and Iran—ironically enough, subsidised by the Iranian Government—and from districts, hardly associated with the export of tea, in Mauritius, Mozambique, the Argentine and Brazil. China is also making a determined bid to recapture a market that once was wholly hers; she has seen fit to send to Britain some representatives of her tea industry in order to obtain a first-hand knowledge of the requirements of the trade, and what is more, to cater for them. Whereas a price given to the owners of estates in any of these countries might allow a comfortable margin of profit, if applied to the Indian growers' product, it is certain to show a loss.

Low and Medium Qualities

Surely even the most confirmed optimist cannot help but harbour a feeling of apprehension for the future of low and even medium quality producing gardens in India, for it must be remembered that during the monsoon, standards deteriorate to such an extent that a very large number of the better class estates fall into this category. From time to time, leaders of the producing side of the industry have stressed the need to avoid over-production and have recommended a renewal of the International Tea Agreement as a means to this end. But does the remedy really lie here? In the first place, it is essential that India and Ceylon, as the two major producing countries, initiate an agreement of this kind, but eventually, to be effective, it must embrace India's competitors in low-priced tea, otherwise it will be the latter who will benefit most from restriction. Indonesia, where production remains much below prewar levels, would obviously be unwilling to conform, but why should producers in Africa, China, Japan and Formosa associate themselves with a proposal to limit production when existing market prices are giving them an adequate margin of profit? There are those who put their faith in an increase in internal consumption as a means of salvation for the producer of common tea, and it is indeed possible that the day may dawn when India's own

requirements of tea will be such that her export markets will be of secondary consideration. To describe this as wishful thinking is an exaggeration; but that it is essentially a long-term development cannot be denied.

The Indian tea industry has for many years enjoyed a well-earned reputation for efficiency coupled with an ability to solve its own problems with realism and determination. Conditions on the estates have been progressively improved so that the tea garden employee of today can count himself as one of the more fortunate of India's workers. Not only does his remuneration compare very favourably with that of his fellows in other occupations; he is also provided with comfortable housing, welfare and medical facilities, education for his children and food at subsidised rates—all by the industry. It is most commendable, and no one would grudge the worker his prosperity. It is progress, and who would wish to retreat from what has been achieved by attempting economies in this direction? But it costs money—money that must inevitably be reflected in the costs of production.

Repealing Taxes

In the eyes of a British distributor—admittedly viewing the situation from afar but, because of the distance, on a wider canvas—there is only one way of enabling the common tea producer to compete in world markets, and that is by immediately repealing the taxes and duties which fasten on the commodity like so many leeches, from the moment of production to the time of its departure from the shores of India. Unquestionably, these impositions play an important part in the internal economy of modern India, but so too does the tea industry, and it is the very existence of a large number of estates that is now threatened. It is shock treatment that the patient requires. Anything short of a complete abolition of taxes and duties on tea is insufficiently strong medicine. The dose should be administered to all growths, high and low quality alike, for it is not difficult to visualise the complications and chaos following attempts to confine treatment to a section of producers only.

The decision of the Indian Government to break away from the International Tea Bureau and plough a lonely furrow in the field of propaganda caused worldwide regret to many in the industry. Is it not possible that the resources of the producing countries of the world can be combined once again to maintain and promote the popularity of tea as a beverage? The promotion of tea as opposed to other kinds of liquid refreshment is what matters, and how much more effective that can be if it is directed as a full-blooded campaign, rather than in the form of unco-ordinated spasms as are seen at present.

A final word of warning: do not accept as a matter of course the continued allegiance of the British housewife to the cup that cheers. Such thinking is dangerous, for there are others knocking at the door. Manufacturers of rival beverages, particularly of soft drinks and coffee, are making strenuous efforts to increase the sales of their products in the United Kingdom. Their appeals may find a response in the younger generation before the seeds of the inherent preference for "Tea above all" have had time to germinate. What a tragedy it would be to the industry as a whole if the consumption of tea in Britain were allowed to decline through a belief that the market is an assured one, come what may.

Serving heavy industry ... conserving foreign exchange **SCHLOEMANN**

As early as 1937, the existing blooming mill at TISCO was modernised by Schloemann. So satisfactory has been the performance of the plant that TISCO have ordered from Schloemann a new blooming and slabbing mill with appurtenant auxiliary equipment, for their expansion programme.

ROLLING MILLS

HAMMERS

PRESSES

Among the industrial undertakings in India which are using or have ordered Schloemann plant and equipment are:

Tata Iron & Steel Co. Limited
Hindustan Steel Limited
Mysore Iron & Steel Works
Tata Locomotive & Engineering Co. Limited
Indian Steel & Wire Products Limited
Krishna Steel Industries

IN HER steady progress towards economic and industrial advancement, India demands the finest plant and equipment for her heavy industries—and Schloemann have been supplying the country with the latest designs in rolling mills, hammers and presses for over a quarter of a century.

Designed to meet the needs of modern heavy industry, Schloemann plants help to cut down running costs, and achieve maximum output of the highest standard—help the country towards self-sufficiency, thereby conserving vital foreign exchange.

SELLING JUTE GOODS IN THE NORTH AMERICAN MARKET IMPORTANCE OF QUALITY, ADAPTABILITY AND PRICES

THE north American market, which embraces the United States and Canada, outranks all other overseas hessian markets in its importance to the Calcutta mills. In 1957, hessian imports from Calcutta to the United States and Canada totalled approximately 875 million yards, which equalled 55 percent of the Indian mills' production in this category during that year. The dominance of these exports in India's foreign trade is indicated by the fact that in the year ended March 1957, jute goods accounted for 20 percent of India's total foreign exchange earnings and 42 percent of her dollar earnings. The facts indicate the importance of the American market to the Calcutta jute industry and to the economy of India; when it is considered that about 87 percent of hessian imports into the United States in 1957 came from India, one might ask if there is a challenge to an industry which enjoys this dominant position of leadership.

The very fact of leadership, however, gives rise to a challenge both at home and abroad for the jute industry to meet its problems from within and the multiple threats of competition from without. The future, therefore, demands bold action on both fronts to sustain the leadership now enjoyed and to share in the growth of the American economy in the years ahead. In the years since 1951, when the postwar low point in consumption in the American market was reached, much has been accomplished to restore the confidence of American consumers in the ability of the Indian jute industry to serve them adequately. Nevertheless, during the years of uncertainty which followed the war, competition established a foothold in this market from which it has advanced to a well-entrenched position that requires constant effort to combat.

Steady and Adequate Supplies

On the positive side of accomplishment, the maintenance of steady and adequate supplies of hessian has won back consumers who were discouraged by the shortages which produced many problems for those using the fabric for packaging and industrial textile purposes. In addition, the maintenance of competitive and relatively stable prices has removed the most serious handicap which hessian faced in a highly competitive market. On the other hand, progress there has not been matched by an improvement in quality, and this is a factor of great importance in the packaging field, which still accounts for the largest share of hessian consumption. The most frequent complaint about quality refers to the colour of goods, as there is an almost universal demand for bright,

clean fabrics which will take the printing of a multi-coloured brand with clear and sharp definition. It might seem strange to find such emphasis on the appearance of a rough-and-tough package like a hessian bag; but it must be remembered that in a market such as north America, where manufacturers compete for buyer acceptance of their products with all kinds of packaging appeal, even the jute bag is subject to these standards.

Pains have been taken to explain to consumers that the Calcutta mills are handicapped by the quality of the jute they have to spin and that efforts are being made to improve quality at the agricultural level under the sponsorship of the Government of India. While that may be some assurance for the future, in the final analysis the consumer wants results. It, therefore, behoves everyone concerned—the cultivator, the Government and the industry—to redouble the effort. There is too much at stake to count on the patience of consumers to wait for what they want. The importance of bright, clean fabrics is further indicated by the tendency of consumers to ask for hessian from Indian mills' competitors to whom jute of good colour is available. Poor quality jute gives rise to even more serious complaints about strength and irregular weave. Such defects often do not appear until a bag made from this fabric bursts in transit, with the loss of valuable contents. By that time, the ultimate consumer, the bag buyer and the bag manufacturer are all involved, so that dissatisfaction with the jute package is compounded. With competition as stiff as it is, and jute packaging pitted against paper and bulk handling for consumer favour, these incidents go far to damage the long-term prospects of hessian with its users. No effort should be spared to overcome the shortcomings, so that as a result of better quality

From

A Special Correspondent in the U.S.A.

jute and more rigid quality control at the mills, the consumer can be assured of a high-grade fabric that will offset the pressure from competitive substitutes.

Market Development Programme

The market development programme which the Indian Jute Mills Association inaugurated through its New York office and its collateral agency, the Burlap Council, in 1952, has established a means of contact and communication with American consumers and has been welcomed by them. It is now accepted by the trade in the United States and Canada as a source of information and official liaison with the Calcutta industry. By means of publicity, advertising and direct personal contact with the trade and consumer, the American market has been kept informed of developments in the jute industry. The advantage of keeping the trade and consumers well informed can be measured by the penalties which misinformation and misunderstanding involve. While progress has been achieved in making jute goods more attractive to the consumer in the American market, there is still a lot to be done to improve the position. It may be one thing to claim credit for plentiful supplies at competitive and stable prices. But the claim, to mean much, must be for goods of a quality that stimulates demand. Thus, wherever improvement can be effected, it should be done with despatch, and it might help to see greater flexibility in the policy concerning special constructions which could help to evolve new uses for jute fabrics.

The best example so far of how the Calcutta mills have catered to a new market for jute fabrics is the case of jute backing for tufted carpeting. This new and rapidly expanding market has over the past several years caught the imagination of some of the Calcutta mills and they have equipped themselves with the wide looms necessary to supply these goods, so that Calcutta now supplies a substantial share of the demand. The growth of

the tufted carpet business in recent years has been phenomenal, with production increasing from a mere 3 million square yards before the war to nearly 50 million square yards last year. The long-range outlook for these types of carpets and the backing fabric on which they are tufted indicate a further expansion over the years ahead, although a period of hesitation may be at hand during the present lag in the U.S. economy. It, therefore, seems that the Indian jute mills will continue to supply this market, although they will have to be constantly on the alert for any changes in constructions that may be required as the carpet tufting manufacturers are constantly in search of ways and means to make a better product at lower cost.

Tufted Carpet Backing

Over the last three years, the consumption of hessian for piecegoods, which generally refers to industrial textiles as distinguished from bags, has shown a significant gain. Last year, it amounted to 8 percent over the year before. Tufted carpet backing made its contribution to this showing, but reports from the bag companies and importers also indicate that their sales of hessian as piecegoods for miscellaneous industrial purposes have increased to some extent. It is of significance that in 1957 24 percent of the total U.S. consumption was for industrial uses. A few years ago, 20 percent for this purpose was considered normal. There seems to be no doubt that the industrial market can be expanded if the means to do so can be found. The method of distributing jute goods in the United States and Canada is traditional in as much as it is done through importers. These are either bag companies who are concerned chiefly with the manufacture and sale of containers, or importers who sell to non-importing bag manufacturers and consumers of piecegoods. Some of the larger bag manufacturing concerns do produce special textile containers, water-proofed, or paper-lined or with various laminates for the carriage of commodities other than the usual agricultural produce. This takes some research and a certain amount of engineering in order to produce a bag suitable for the job. Importers as such, on the other hand, have no similar facilities. They buy from Calcutta and, in turn, sell whatever fabric or construction is ordered, but they can offer no technical advice as an inducement to further sales. Nor do they advertise their wares to any appreciable extent.

Vinyl-coated Fabrics

For certain uses, the economy and strength of hessian cloth recommends it as an industrial textile of considerable interest. It does so, for instance, in the case of vinyl-coated fabrics that are

Some 50-lb potato bags

A burlap membrane for built-up roofing

used widely by the motor-vehicle industry for interior upholstery, boot liners, etcetera, as well as by the luggage trade. The combination of hessian with a coloured vinyl coating which may be embossed or printed with a variation of patterns, has been found most effective for such uses in which there is considerable volume. Here, again, the quality of the jute fabric and the end-result are of the utmost importance. Imperfections or irregularities can show through the coating, with the result that the finish is impaired. Moreover, the presence of an undue amount of speck or root has led to complaints about oil stains which sometimes show up after the fabric has been in use. The motor-vehicle industry is most exacting in its specifications, and when the serviceability of a material is in question, the manufacturers readily turn to other materials even at higher cost to avoid imperfections. While it might be contended that this precision in specifications is asking too much of a rough fabric made from a coarse fibre like jute, the fact is that consumers have to be given what they want if it is at all physically possible, or the prospect of getting this business may be sacrificed.

The North American Office of the I.J.M.A. has conducted experimental work on new industrial uses for jute fabrics as part of the general market development programme in America. This effort has been centred in two principal fields, namely, perfecting and improving the bale covering for raw cotton, and the use of a jute membrane in irrigation canal linings. In the case of the cotton bale covering, experiments on this project have been shared by the Burlap Council and several of the domestic bag manufacturers along with the National Cotton Council of America. The latter organisation has been commissioned by its members to make studies and conduct experiments for improving the bale covering of new cotton so as to protect it from contamination in transit.

Covering for Cotton Bales

At present, the cotton bale is covered by jute cotton bagging and/or second-hand sugar bags. This covering is highly unsatisfactory and, in time, will be discarded. By changing from one type of jute fabric to another it could be said that it is "taking money out of one pocket and putting it in another" but this might not be the case. With the number of materials such as paper, cotton, plastics and others that were submitted for testing, it was essential to keep a jute fabric of some kind in the mind of the cotton industry during the testing programme or lose the whole business by default. Fortunately, the hessian-polythene laminate bale covers that have been included in the tests in the last three years have given a highly satisfactory performance as against other materials; they are, therefore, receiving favourable consideration. A cost study is now being made by the U.S. Department of Agriculture to determine just how much more the U.S. cotton industry can afford to pay for a better bale cover. A decision on a new cover will have to await the results of this study plus the modification of some long-standing practices of the cotton trade which mitigate the effectiveness of any improvement. Nevertheless, the experimental work of the Burlap Council has maintained the prospect of a jute bale covering of some sort being kept in use.

Over the past three years, experiments have been sponsored by the I.J.M.A. through the Burlap Council for the development of a hessian-asphalt method of lining irrigation ditches. A low-cost method of lining such ditches and canals has long been sought by the agricultural authorities to control the loss of water through seepage in the better irrigated areas of the 17 western States.

Burlap travels by air in modern luggage

Burlap feed bags represent the largest sale of all hessian products

The conservation of water is becoming more important in these States each year as the available water supply and the cost of devoting it to crops make it a valuable commodity. The experiments so far carried out under the auspices of the U.S. Department of Agriculture have demonstrated the physical practicability of using hessian as a membrane to strengthen the asphalt lining. At this juncture, the problem resolves itself into one of fostering the commercial exploitation of this development through contractors and Government agencies who can encourage its use by commercial farmers. The marketing problem is complex and the progress to be expected is necessarily slow, but if these aspects of the job can be resolved, the potential market to be realised is very large. For example, last year, in one of the irrigation States alone, over 500 miles of ditches were lined with concrete. Had they been lined by the hessian-asphalt method, they would have consumed over 5 million yards of cloth.

Severe Competition

These are some of the things that are being done to expand the use of jute goods for industrial textile or non-packaging purposes. On the other hand, the use of burlap for agricultural and industrial packaging still accounts for the great bulk of the consumption in the north American market. At the same time, however, it is in this area that competition is most severe and the fight to hold the share of the market which hessian enjoys is most intense. Progress has been made against heavy odds. It cannot now be overlooked for a moment that the limited resources of the promotion effort must contend with the millions of dollars spent by competitors.

The importance of the packaging market for hessian is illustrated by the fact that in 1957 the cut-up for bags accounted for 76 percent of total consumption. The competitive factors are severe and difficult to counteract as they spring not only from price advantages but also from changing trends in packaging methods. In the first place, the multiwall paper bag has the advantage of a lower initial cost, and in the second instance, there is an ever-growing trend towards small consumer packages for produce. Bulk handling of manufactured animal feed and other commodities is another threat. These call for the most aggressive and ingenious measures in the promotion of jute packaging.

Manufactured Feed Industry

The manufactured feed industry is a good example of the problem. This is the largest single market for hessian bags, and at the same time the one in which they meet the stiffest competition. The comparatively recent growth of bulk deliveries in the feed industry has accounted for about 12 percent to 14 percent of the total production being shipped in this manner. Fortunately, it appears that there are economic limitations to such a trend in that bulk is primarily suitable for the larger commercial farms. Nevertheless, what

might be lost in this direction because of a definite economic reason has to be offset in another direction, if possible. The expansion of the so-called "return bag programme" in the feed industry seems that a trend in this direction is under way. A recent survey shows that in a large area of the central west, where about 66 percent of the total manufactured feed is produced and consumed, from 41 percent to 56 percent of the feed produced, depending on the State, is shipped in multiwall paper bags. It is hoped that a concentration of promotion efforts there can recapture a substantial portion of the market from the multiwall paper bag, with the introduction of returnable jute bags which can show a net cost advantage by reason of the many trips possible as against the single trip of the paper bag.

The major bag manufacturers have made progress in the development of special containers for industrial products by various combinations of hessian with paper, polythene and even cotton where the bag is designed to fit the packaging of specific commodities. In fact, this has been carried so far as to include semi-liquid products and those which have been shipped in fibre drums. By careful engineering and clever design, such cost lower than rigid containers. The use of tubing More manufacturers are becoming aware of the use of such tubing made from hessian cloth for the shipment of many products.

Improving Quality of Fibre

This discussion illustrates the great importance of the north American market to the Indian jute industry, both in the present and for the future. It emphasises the rôle of jute goods exports from India to the United States and Canada in the maintenance of India's foreign exchange position. The need for improving the quality of jute fibre seems clear. In a market where the pressure of competition makes it easy for consumers to demand and get the best, there is no substitute for quality. Those in north America who are familiar with the economic obstacles which have confronted the filling of the problem, but when it comes to the matter of filling their requirements for industrial textiles or packaging materials, the one who meets their needs at the best price will get the business.

At today's levels and even at slightly higher prices, jute goods are cheap and the outlook in the American market for volume should be good. The recession in the American economy which clouds the future just now should be of no more than temporary duration. After it has run its course, there is substantial confidence that the underlying growth factor in the economy will again make itself felt. This presents an opportunity for the jute industry to share in the growth to the degree that it satisfies the demands of consumers.

FALLING RAW JUTE IMPORTS FROM PAKISTAN

DOMESTIC PRODUCTION OF FIBRE INCREASES

OVER the years since partition, there has been a rapid change in the position concerning the import of raw jute from Pakistan to India. According to trade estimates, India's requirements of raw jute are in the region of 7 million bales. After allowing for a carry-over of about 500,000 bales into the next season, the estimated domestic consumption in India is about 6.5 million bales a year. Separate accounts of raw jute supply by India and Pakistan to the industry were not introduced until the 1950-51 season, so the figures which follow start from that year.

ARRIVALS IN CALCUTTA IN 000'S OF BALES

Season	India Pakistan		Percentage from Total Pakistan	
	India	Pakistan	Total	Pakistan

It will be noted that in the 1950-51 season, India imported 50 percent of her requirements from Pakistan. At that time, India was the latter's biggest customer, and Pakistan, not having a jute industry of her own, was a willing party to all transactions. Over the next few seasons, India

By

A Special Correspondent

adopted a grow-more-jute campaign, the success of which can be gauged from the fact that from 1952 to 1956 India's dependence on Pakistani jute was greatly reduced, imports dropping to an average of about 25 percent of her requirements from 50 percent in 1950-51. During this time, Pakistan's own jute industry was developing, and her internal consumption was on the increase. Last season, raw jute imports from Pakistan dropped to 10 percent of the total, reducing the previous season's total imports from that country by more than half.

The fall was sharp, and it reflects India's growing independence of Pakistani supplies. In that season, however, smuggling activity in jute across the border increased considerably. Some estimates put the figure at 1 million bales, which was higher than the quantity officially imported. Official estimates, however, indicate that a quantity of 500,000 bales was smuggled across the border in the 1956-57 season. To curb this state of affairs, the Pakistani Jute Marketing Corporation opened a purchasing campaign in the border regions, but the quantity purchased from the five-mile border belt in no way covered the estimated crop in this region, so it is doubtful if this was an effective check to smuggling.

Great Achievement

India's jute production of 5,550,000 bales in the 1956-57 season from about 3 million bales in 1951 was a superb achievement. This represented an increase of about 90 percent, but there is still a deficiency. The quality of Indian jute has deteriorated and a large percentage of the increase consists of mesta, bimli and low quality fibres, the emphasis having been on quantity rather than on quality. India is in very short supply of white jute particularly the long jat variety, which is required for the manufacture of good quality hessian. This can only come from East Pakistan. So it would appear that even if India keeps increasing her production, she will still be dependent on Pakistan for this variety of jute.

Cuttings is another category for which India mainly depends on Pakistan. In previous years, licences were issued freely for the import of cuttings, but this year, the authorities have changed their policy, and now only issue licences to mills on a quota basis, depending on the quantity of long jute consumed over a given period. This was done in the interest of economy and to maintain India's restriction on imports, but the object of this was defeated when they also issued licences ad lib to sellers, i.e., non-consumers. That led to an immediate and wide difference in price between cuttings imported against sellers' licences and those imported against buyers' licences. Sellers began to hold those mills to ransom which found that their own quota was not sufficient for their requirements, and premiums of up to Rs. 12 a bale were reported. Latterly, however, the licensing authorities indicated that any purchases made by mills without their own licences would be considered to have been purchased under their licence number, and an equivalent amount would be deducted from it. This put a stop to the "grey market", but brought into being other malpractices, such as wrong invoicing consignments. Instances have already been dealt with under the latter category, and heavy penalties imposed.

Pakistani Crop

Estimates of the size of the Pakistani crop vary, but trade estimates put it at about 7 million bales. Of this quantity, 4.2 million bales (60 percent) are earmarked for export (other than India), and 1.4 million bales for Pakistan's own consumption. India is expected to take up another 10 percent or about 700,000 bales, which leaves Pakistan with a 10 percent surplus, although a large portion of this must be maintained as a carry-over. Pakistan is now facing competition from many new jute growing sources, and it is doubtful whether she can

continue to demand such high prices for a commodity in which she is fast losing the export monopoly. Many Far Eastern countries will soon prove formidable competitors, Burma, China, Thailand, and in another sphere, Brazil, are all potential raw jute producers, and healthy competition is all that is required to alter Pakistan's attitude. Substitutes are fast making an inroad into the preserves of jute goods, and unless fibre prices in Pakistan fall, this threat will soon become a reality.

Pakistan's jute production target for the 1958-59 season shows a considerable drop. The Jute Cultivation Advisory Board recommended that the production should not exceed 5.5 million bales, this being its estimate of the total requirements of foreign countries as well as those of the local mills. This represents a drop of about 20 percent on last season. India, on the other hand, plans a 25 percent increase in the jute crop for 1958-59, making a total of 5.1 million bales. Add to this a mesta crop of about 1.2 million bales, the total availability of indigenous jute to the Indian industry next season should be in the region of 6.3 million bales. This, however, depends on whether the increase of 18 percent recommended in acreage will produce the extra 25 percent crop. Without an all-out effort to produce a larger average yield an acre, which at present is very low, the production target will not be attained. The average yield an acre in India stands at the very low figure of 2.33 bales (44 lbs), whereas in China and Brazil, where jute-growing is in its infancy and the methods used are often primitive, the yield is nearly double this. The difference in the two types of soil and the high fertility conditions in other countries are no doubt largely responsible for the better yield, but intensive efforts to improve cultivation standards in India can produce better results, too.

THE DIFFICULTIES FACING GUNNY EXPORTS

IMPORTANCE OF COMPETITIVE PRICES

BEING principally a packaging or reinforcing material, jute goods must not only be cheap but must also stay cheap. Competing materials fluctuate less widely in price. The graph of Indian goods prices for a very long period looks like the temperature chart of a person suffering from fever. Modern technology might yet find an all-purpose substitute for jute and then the latter will go the same way as indigo unless it can keep one jump ahead in utility and value. The trade has to export or die. The wishes of customers are, therefore, of prime importance, and except in the case of special constructions, cheapness comes first. But, along with cheapness, customers ask for a reasonably stable price and may even be prepared to pay a little more for a substitute if they know that its price is not likely to rise suddenly. The re-use value of jute bags is now a less powerful selling point than in the past, as many customers prefer a container which need only be used once, provided it is cheap enough. Markets lost because of the price factor cannot easily be regained, particularly when competing materials are attractive and durable, when new and expensive plant has been installed to use those materials, or when bulk handling has been introduced.

Although jute goods need to be cheap, standards of quality have to be maintained. Even if the lowest possible grade of raw material is used, buyers have a right to expect goods which conform to specifications and mills have a duty to supply them. Some mills are traditionally averse to meeting claims, which frequently leave the shipper no alternative but to pay up, but in the long run this unyielding attitude is against the interests of the industry. On the other hand, buyers should recognise that they are encouraging bad quality if price alone is their yardstick and that the selective buying of goods which are up to standard, even if it means paying a little extra,

By

A Special Correspondent

will benefit them in the end. The root cause of the gunny trade's present difficulties is the uncertain supply of raw material. This fact has been magnified out of all proportion by ruthless speculation. The jute trade, by its very nature, is speculative, since it depends on the forces of nature and no one knows what the next season may bring. But, and it is a large "but," there are too many people in the trade whose principal and only business is speculation—too many people between the manufacturer and the consumer.

Stabilising Factor

The bazaar, as it is called, was traditionally a stabilising factor, but the big names in the market have gone and have not been replaced. It has now little holding power and is blown by the winds of opportunism and uncertainty. This uncertainty and the general malaise of the trade have been increased by a number of serious financial failures among speculators. Genuine shippers deprecate the continual discounting of prices, which is only possible in a weak market, although it must be recognised that this is an effect and not a cause of the present situation. A particularly undesirable feature of recent months was the severe and unjustified fall in prices last February caused by "bear" hammering. This was stopped only by the resolute action of the Indian Jute Mills Association in recommending floor prices which, to the surprise—and perhaps dismay—of prophets, met with success. The establishment of the official futures market in March 1958 is also a step in the right direction, although time alone will tell whether it will be effective. Very strict control is necessary if it is to fulfil its ultimate object—the well-being of the jute industry as a whole. It is to be hoped that the mills themselves will make use of the facilities.

Much ink has flowed in recent years in describing the difficulties of the trade. It might be useful to list the main factors which are likely to help or hinder the shipper in fulfilling his function of exporting the maximum quantity of jute goods from India. The first of these factors is the relatively high price of raw jute and the industry's dependence on supplies from Pakistan. There has

been a remarkable increase in the production of Indian jute, although it is probable that the diversion of land from foodgrains to jute has reached the limit. The next step is to increase the yield an acre, which offers much scope for improvement. Mills have shown great resourcefulness in batching fibre of a quality which would have been beyond the imagination of a prewar manager. Modernisation of machinery has helped, but the use of finance for this purpose has reduced the resources available for day-to-day running; a feature of recent years has been the inadequacy of buffer stocks of raw material which has left mills at the mercy of raw jute suppliers. Generous credit facilities from banks are needed, but these are not easy to obtain on a sufficient scale in the present state of the money market. The quantity of jute imported from Pakistan has been greatly reduced but self-sufficiency and a balance for export is needed before India can be comfortably placed.

Production Abroad Increasing

The second factor is the expansion of the jute industry in other countries. There has been a gradual growth of manufacturing units in many places, mainly to cater for internal requirements. This has been fostered by Pakistan's need to export its own jute crop and can only be countered if Indian manufactured goods are cheap. Thirdly, Government imposts are far too heavy. The recent imposition of a duty on industrial electric power by the West Bengal Government is a big burden on an industry which, in the interests of improved efficiency, has in recent years switched over to electricity. The duty will cost the industry approximately Rs. 47 lakhs a year and some relief seems to be called for to promote the export drive. Fourthly, freight rates are high. The rates charged by shipping conferences are well above the free rates in the world freight market, although recently there has been a welcome, if small, reduction in the rate to American west coast and Gulf ports. Shipping companies undoubtedly have their difficulties, but from the point of view of the gunny shipper, their rates are still too high.

Modernisation of Mills

Against these points, there is the fact that the modernisation and rationalisation of mills in India is being pursued with vigour and determination. Some progress has been achieved in increasing work-loads over and above the improvement which might be expected from the introduction of modern machinery. It is to be hoped that the Indian mill worker will realise and accept such an increase both for his own good and for the preservation of the industry. The attitude of the Central Government on export duties and working hours has been

Some jute plants of improved quality

come more realistic. It is now realised that an increase in working hours will not by itself increase exports, but will rather act as a brake in view of the still tight raw material position. New uses are being developed for jute goods, one of the most hopeful of which is the use of hessian for irrigation canal linings.

The Indian jute industry, and with it the Calcutta gunny trade, is by no means down and out. But its most vital requirement seems to be a substantial increase in jute yields an acre, so that raw material supplies are cheap and sufficient, thus reducing the possibility of wild price fluctuations, while at the same time giving the cultivator an attractive return.

Cloth In a Highly Competitive World Market

Modernisation of Indian Industry Necessary

THE difficulties which under-developed countries have to face in building a stable export trade have been well described in a U.N. publication, *World Economic Survey*, 1956. It says: "In comparison with the industrially advanced countries, external circumstances have commonly assumed greater importance in determining the trends in their external balances. A fundamental reason for this is that the export earnings of almost every primary producing country are derived from a very limited range of commodities, and this dependence upon a few commodities renders the long-term trend in the external balance of each country vulnerable to structural changes in world import demand for primary products". India has still a long way to go before her exports can be diversified. Until that happy position is reached, she has perforce to lean heavily upon a few commodities in order to earn foreign exchange. Tea, jute goods and cotton textile are her major earners of external resources and great reliance will have to be placed on them for many years to come. The planners are fully conscious of this fact, and have accordingly prescribed ambitious export targets for the commodities under the current plan.

It has been laid down that annual exports of cotton piecegoods should reach 1,000 million yards by the end of the plan period. The planners expect that the annual average of foreign exchange earnings, through exports of cotton yarn and manufactures, will be Rs. 75 crores, or a total of Rs. 375 crores in the five-year period of the present plan. The two-fold task which has thus been set for the industry is stupendous in relation to its performance in recent years. Except in 1942 and 1950, India's shipments of cotton fabrics have never attained the level of 1,000 million yards. For this reason, it has not been possible to earn foreign exchange through cotton manufactures on the scale visualised in the second plan. Foreign exchange earnings from this source amounted to Rs. 72 crores in 1954, Rs. 63 crores in 1955, Rs. 62 crores in 1956 and Rs. 68 crores in the first nine months of 1957. These facts are recalled in order to emphasise the need for a realistic and farsighted policy, designed to strengthen the industry's efforts to create a wider and sustained demand for its products in overseas markets. Considering the present condition of the mill sector, burdened as it is with inefficient and worn-out equipment and with cost inflation, it is too much to expect that the targets can be attained, especially when competition in the steadily shrinking world market for cotton tex-

An automatic loom in a textile mill

tiles is increasing. The total volume of cloth entering the international market averaged 6,080 million yards a year in the years 1936-38, but the average is now about 5,000 million yards a year.

Changing Pattern

The reasons for the changing pattern of world trade in cotton fabrics are obvious. Many countries, which were long content to have agricultural economies, have now embarked upon ambitious industrial projects, both to reduce their dependence on imports and to raise the living standards of their people. Their initial steps in that direction have generally taken the form of setting up cotton spinning and weaving factories. The tendency to establish new textile industries is particularly noticeable in countries which are large growers of cotton. Ample protection is given to nascent enterprises by their Governments through stringent restrictions on imports. These developments have inevitably

ensured efficiency and economy in production. A team of Canadian experts which reported a few years ago said that the major part of the Japanese textile industry "has efficient machinery which is highly suitable to manufacturing conditions in that country". In recent years, the Indian Government has been showing commendable awareness of the need to modernise textile equipment. For instance, it has sanctioned the installation of 18,000 additional automatic looms in order to enable mills to produce 350 million yards of cloth a year exclusively for export. But little or no progress has been made in that direction, partly because of foreign exchange difficulties and partly on account of the domestic financial stringency. Perhaps a stronger deterrent to the mills' acquiring more automatic looms under this scheme is their well-founded reluctance to accept the obligation of fulfilling the onerous export quotas prescribed by the Government. The insistence that, over and above 350 million yards, the industry should export 87½ percent of the present despatches, cannot be termed fair, especially in the present state of the world market for textiles. The cause of export promotion would perhaps be better served if this stipulation were withdrawn.

By

Kasturbhai Lalbhai

Newer Competitors

intensified competition among the exporting countries, which are making a desperate bid to secure as big a share of the diminishing world trade in cloth as their competitive power and resourcefulness permit. If India is to attain first place among her competitors, it is imperative that her piecegoods should win the approval of her overseas customers for both quality and price. Indeed, quality and price are the two indispensable criteria to consider in expanding exports.

Great Urgency

Judged from this point of view, the case for the modernisation and rationalisation of mills acquires great urgency. It is futile to expect the industry to increase exports vigorously without strengthening it with efficient and up-to-date equipment. Japan has derived much of her formidable competitive power from her modern machinery, which greatly enhances productivity and

The modernisation and rationalisation of mills is particularly important considering that even India's newer competitors have improved their chances of success by using better productive equipment. For example, Pakistan has taken rapid strides towards developing its textile industry, which was very small when that country came into existence 11 years ago. Most of her cotton spinning and weaving mills are equipped with modern machinery, and many have installed up-to-date dyeing, bleaching and mercerising plant. Moreover, the depreciation allowances are reported to be so liberal that within a short period they are able to write off their plant. A large volume of grey cloth produced in that country is exported to Canada, South Africa and the United Kingdom. Pakistan also does a brisk overseas trade in yarn, considerable quantities of which are sent to Hong-kong and the United Kingdom. No special pleading is thus necessary for rescuing the Indian cotton mills from the incubus of antiquated and run-down machinery. In recent years, many expert bodies have urged that the programme of modernisation

should be implemented with vigour, and the latest to reinforce this plea is the Export Promotion Committee which reported in August 1957. The Committee says: "A considerable part of the equipment is old and outmoded and consequently, in the highly competitive export market, our cotton textiles have a tendency to lose ground. There is, therefore, no doubt that unless our industry also benefits from the use of the latest machines and techniques, our cotton cloth will have to struggle hard to maintain the markets it now has, let alone increasing exports." Such a development cannot be contemplated with equanimity.

Good Opportunities

If she cares to take advantage of her opportunities, India has many good ones for building a large and lucrative export trade in cotton textiles on a durable basis. From the manner in which the textile industry has been growing in the other parts of the world, it is reasonable to infer that the international trade in cotton cloth will eventually be dominated by those exporting countries whose mills are assured of abundant supplies of home-grown cotton. The export record of the two foremost textile exporting countries of the world which do not produce their own cotton supports

this view. Barely five decades ago, Lancashire's annual exports of cloth amounted to 7,000 million yards, but they have now declined to 700 million yards. In spite of her formidable competitive strength and her primacy as an exporter of cloth, Japan's position is by no means impregnable. "If we compare postwar exports with prewar", says a recent study on the Japanese cotton textile industry, "the volume has declined to less than one-half of the prewar high of 2,725 million square yards in 1935, or the 1934-36 average of 2,671 million square yards. The recent trend is that the volume of cotton cloth exports is stabilised at a level of about 1,200 million square yards".

A promising future lies before India, although she has to reckon with such factors as the advent of new competitors, the decline in the total volume of cotton fabrics entering the world market, and the marked increase in man-made fibre products in international trade. Even so, the scope for Indian piecegoods abroad is big enough to enable them to fulfil the planners' stipulations concerning volume and value. But certain steps have to be taken in order to make the goal realisable. The imperative need for modernisation has already been discussed. Every assistance has to be given to the industry to acquire its new equipment on

the most advantageous terms, from any country that is willing to offer them. It follows that foreign exchange should be made readily available to it. Also, generous financial assistance should be rendered to those units whose resources are not adequate to meet the heavy capital expenditure.

Production Costs

The industry has to be encouraged to reduce its costs of production in order to enable it to offer its products at reasonable prices to domestic and overseas consumers. Labour is entitled to a higher standard of living, but in the wider interests of itself, the industry and the nation, the demand for better wages should not be divorced from the need for greater effort. Modernisation offers the best opportunity for labour to increase its productivity and thus earn more. There is no reason why the planners' expectations concerning the export trade in cotton textiles should not be realised if the measures advocated here are adopted. Apart from an assured supply of home-grown raw material, the industry has great experience, skill and ability. These are inestimable assets, which few countries that have lately set up their own textile industries possess. Full advantage should be taken of these assets in the wider interests of the country.

A. E. I. H-POWER A MILESTONE IN THERMONUCLEAR RESEARCH

The joint statement on thermonuclear research by the U.K. Atomic Energy Authority and the U.S. Atomic Energy Commission does not mean that the goal of electricity generation by this means has been reached: but it does mean that an important milestone has been passed.

The achievement of the teams of scientists at the Atomic Energy Research Establishment, Harwell, and at the Associated Electrical Industries Research Laboratory, Aldermaston Court, has been to fuse pairs of heavy hydrogen atoms together into helium atoms under controlled conditions. During this process energy is emitted in the form of neutrons. This fusion can only take place at immensely high temperatures, and a major problem has been to achieve such temperatures without vaporizing the container in which the reaction occurs.

AEI IS HELPING TO HARNESS THE POWER OF HYDROGEN FUSION

The Atomic Energy Research Establishment first achieved controlled thermonuclear reactions in an electrical discharge chamber, known as Zeta, at a temperature a thousand times hotter than the sun's surface.

AEI is proud that one of its Companies, METROPOLITAN-VICKERS, built and partly designed Zeta. An AEI research team, working for the most part under contract to A.E.R.E. and using a much smaller torus or discharge chamber known as Sceptre III, followed this success with controlled reactions at a temperature of nearly 4 million degrees.

THE CONSTRUCTION OF SCEPTRE III

SCEPTRE III is an aluminium torus made of 12" diameter tubing with a mean ring diameter of 45". It is threaded by an iron core weighing 4 tons. Into this apparatus, energies of up to 40,000 joules have been discharged, causing currents of up to 200,000 amperes to flow in the heavy hydrogen gas. Temperatures of nearly 4 million degrees have been reached.

AEI AND NUCLEAR POWER

The prospects of using the power of fusion are, however, still distant and nuclear fission stations will clearly be needed for many years. AEI's leadership in the nuclear field is further illustrated by its part in the building of the Berkeley Nuclear Power Station.

AEI AND THERMAL POWER

43% of the major generating plant put into service in England's coal and oil-fired stations last year was built by AEI.

AEI AND WATER POWER

The four most powerful waterwheel generators in the world—at Quebec—were built by AEI. The waterwheel generators for the BHAKRA DAM in INDIA are now under construction and erection on site will start this year. Other important waterwheel generators have recently been installed at San Esteban and Los Peares in Spain and more have been ordered for the Kariba project.

AEI BRINGS POWER INTO YOUR HOME

The chances are that the power which comes into your home is brought there by AEI cables and controlled by AEI switchgear and transformers. Inside your home you can have heating, cooking and refrigeration by AEI Domestic Appliances, lighting by AEI fittings and MAZDA lamps and Ediswan valves in your radio set. These are all ways in which AEI SPELLS POWER FOR EVERYONE.

CALCUTTA

EXPORT PROSPECTS FOR COFFEE

PROBLEM OF SUBSIDISING THE DOMESTIC MARKET

COFFEE is India's oldest plantation crop, although not the largest. The time of its introduction into this country has been variously estimated at between 1600 A.D. and 1695 A.D., although an earlier period cannot entirely be ruled out. The main planting districts of south India were at one time covered with coffee. There were 269,266 acres under it in 1896, a figure which is higher than the present acreage. From the day the first small consignment of Indian coffee was sent, probably towards the close of the eighteenth century, to the 'forties of this century, the importance of its cultivation rested on exports. From 1941, after the sudden loss of the long-established Continental market, a reorientation of marketing policy took place. The industry was then forced to seek an internal market for its produce. Till that time, the coffee available for domestic consumption was what was left over after exports had been made. During the past 17 years, the policy of developing the internal market has been substantially in force, as the home market provides the best guarantee of stability for the rapidly growing coffee production.

Among the large number of India's agricultural crops, coffee alone is being wholly marketed through one central agency, namely, the Coffee

Board, as quoted in the New York Coffee and Sugar Exchange:

	Plantation A in Rs. a cwt.	Colombian Manizales *in Rs. a cwt.
1946	121	81-1
1947	134	112-1
1948	225	121-1
1949	187	200-8
1950	207	285-6
1951	218.11	314-13
1952	251.11	304-1
1953	219.4	319-1
1954	205.3	426-12
1955	217.5	346-12
1956	213.7	396-6
1957	222.11	

*Converted.

Since 1951, the Board has been fixing its release prices at lower than the rates, at which the minimum returns to the growers have been fixed. For instance, Rs. 1-10 a point was fixed as the basic release price, against the minimum of Rs. 1-12 payable to the growers. This was achieved by diverting part of the extra earnings from exports to subsidise internal prices. As against a payment of Rs. 2-12 a point to the grower on his 1956-57 crop, the internal basic release price was fixed at Rs. 2-2 a point.

Enquiry, Commission

The turning point came when the Coffee Bill, along with a Bill amending the Tea Board Act and another amending the Rubber Production and Marketing Act, was introduced in Parliament in December 1952. A heated controversy was generated by these Bills, and it took two years before the amended Coffee Bill was passed. Much was said against the Board and the growers in order to weaken the opposition to the Coffee Bill, and what was then said has now contributed greatly to the misconceptions about the industry. To this was added the weight of the Plantation Enquiry Commission's report. The Commission was itself a by-product of the controversy over the Coffee Bill. It suffered not only by the controversies surrounding it and which conditioned some of its thinking, but it was composed of persons who were unfamiliar with plantation facts and suspicious of

those who could have correctly interpreted the enormous volume of facts the Commission managed to collect.

Recommendation on Replanting

The three reports published, nearly two years after the Commission's appointment, gave rise to a few controversies which has not yet completely died down. Many of its observations and conclusions were open to serious criticisms, which considerably weakened the reliance that could be placed upon the whole document. One of the sensational proposals which appears in the Commission's reports on all the three plantation crops, relates to replanting. The proposal proceeded on the assumption that tea, coffee and rubber plants had a fixed productive life at the end of which they must be removed and replaced by new plants. It assumed that the tea plants which exceeded 60 years of life, the coffee plants which were more than 40 years in age and rubber plants existing longer than 32 years required to be replaced by fresh plants. It then went on to suggest that since many plantations were beyond these years, they were all in a state of declining productivity and, therefore, a large proportion of the present plantation acreage stood in need of replacement. Having started from a false premise, the Commission arrived at the odd conclusion that the "over-aged" plants, irrespective of actual performance, should be replaced. It chose to ignore its own figures relating to the progressive rise in production of plantation crops, unit-wise, and for the industry as a whole. To take coffee as an example, the Commission pointed out that 76.8 percent of the partly non-Indian companies and 37.8 percent of the Indian companies should have started replanting since 1953. The following figures showing the production of coffee in India do not quite support the Commission's view.

PRODUCTION OF COFFEE IN INDIA

	in tons
1951-52	21,257
1952-53	23,609
1953-54	29,649
1954-55	25,058
1955-56	34,588
1956-57	42,020
1957-58	39,290 (provisional)

Source: the Coffee Board

Evolution of Coffee Board

The evolution of the Coffee Board is a significant part of coffee history. At one time, growers were relatively well organised, one of their associations being as old as 94 years in 1958. The representatives of the old and established growers' bodies were nominated to the Board, bringing to it not only experience but also influence and ability. They gave the Board the full weight of the sanction of their associations, and gave real authority to the decisions of this body. The Board's growth in stature and functions owes not a little to the ease with which even decisions unpalatable to the growers could be implemented. A striking example was when the Board decided to hold internal prices down irrespective of the rise in world prices since 1948, and went on to reduce release prices below the minimum price payable to the growers, without their protesting against it.

There is a strong popular belief that coffee prices are high. The fact that during the past ten years prices in India have been one-half to one-third of world prices, has had no obvious effect on this fallacy. There were occasions when auction prices were high relative to the price at which coffee was offered by the Board, but they were so spasmodic and infrequent as not seriously to disturb the general trend in retail prices, except during a short period of four months in 1952, when the possibility of a reduction in internal stocks due to exports upset the market.

Given below are the average prices realised in the internal market for Plantation A, compared with the world price of an equivalent grade of

During the same period, the rise in coffee acreage was barely over 10 percent compared with the rise in production of 97 percent. This fact alone was sufficient for the Commission to see the error in its estimates of the coffee plant's productive life.

In coffee plantations, there is a standard practice of infilling wherever plants died out due to various causes. The planter also recognises a plant when it becomes non-productive. This is a continuous process and has the merit of allowing plants to exist as long as they are productive. The Commission's recommendation in favour of enforced abandonment of this commonsense practice would impose upon the industry a wasteful replanting system which would cost even the country dearly, not to speak of the industry. The Commission's report abounds in such wholly impracticable ideas, which provide nothing more than a certain amount of amusement to the experienced planter, but material for criticism to those who do not understand the facts of the industry. The Government's decision not to accept the Commission's report until expert opinion on the subject has been obtained, is very sensible indeed.

Rise in Home Consumption

The internal consumption of coffee has been vigorously promoted during a period of 15 years, after a re-orientation took place in marketing policy. From a consumption level of 7,000 to 8,000 tons before the war, the progress has been quite striking. The quantity absorbed within the country was over 26,000 tons last year. The rise in production has, however, outstripped the increase in home consumption, leaving an ever-increasing quantity for export. Last year, 15,200 tons were earmarked for this purpose and during this year over 10,000 tons are likely to be available. With such large quantities, the problem is a serious one.

The internal pricing system is based on a surplus from export earnings. The premium earned from exports has been partly diverted to subsidise the Indian consumer. With the fall in prices overseas, the situation changes and the subsidy will have to be either withdrawn or the minimum payment to the growers reduced.

There have been two separate and mutually contradictory attitudes towards exports. From 1948 to 1952, the Government's attitude was in favour of maximising the export of coffee. On certain occasions, the Coffee Board ran the risk of having inadequate stocks for the internal market in trying to accommodate the Government's view in the matter. An abrupt reversal of the policy took place late in 1952, and that has continued up to now. During last year, a reversal was thought likely when the need for higher exports, even if that resulted in a temporary shortage at home, became pressing. Unfortunately, the Government's coffee policy in favour of the internal market was formulated precisely during the years when the overseas market offered the best of prices, and its enthusiasm for exports became pronounced just when the world prices have dropped almost to the level of internal values.

These shifts in policies have created a number of marketing problems which go contrary to the country's and the industry's best interests. Along with the decision to place the internal market in a favoured position, the demands for making the best coffees available to it became strident. On the other hand, in maintaining the export, the primary requirement is to establish a reputation for quality and steadiness in supplies. India's reputation as a producer of quality coffee was established over a long period of time during the latter half of the last and the first quarter of this century. The foreign buyer cannot have any certainty of

Indian supplies so long as India's coffee policy alternates arbitrarily between an excessive care for the internal market and enthusiastic drive for export.

Developing Exports

If the export market is to be fostered, a consistent policy of developing sound connections abroad and guaranteeing supplies would be required. There is a natural difficulty arising in the case of a crop like coffee which may vary greatly in size due to seasonal changes. Subject to this qualification, the normal trade practices will have to be followed, even if marketing is in the hands of a Statutory Board. In the event of a fall in the world market to below the Indian level, a more complicated problem would arise in the matter of internal prices. Although the internal release price has been maintained at less than the minimum guaranteed price to the growers, the actual pool sales have been recording a higher average price. It may not, therefore, greatly affect the market if the Board finally decides to fix the minimum release price at the level which was guaranteed in the past to the growers. The major issue would be whether the growers can go on working on what was accepted by them in 1954. Since that time, there have been changes in the cost structure, part of which has of course been offset by larger crops. Last May, the predominant coffee area of Mysore accepted a major wage revision for its labour, amounting to a 30 to 40 percent increase in the total wage bill. This has been further increased by another agreement with the staff during March this year. Not only the availability of many important supplies to coffee estates has suffered, but their prices too have sharply risen. Among these are sprayer equipment and fertilisers. With the increase in interest rates the cost of financing the crop has also gone up. The cumulative effect of all these increases may not be absorbed by the increase in crops, when the export premium has disappeared.

As to the future of the industry, there is one school of thought which believes in consolidation rather than expansion. This section might be favoured by circumstances in the coming years if a world agreement on production and export is not satisfactorily concluded. In the event of such an agreement, any heavy increase in production may have to find an outlet within the country. That may call for a more vigorous propaganda drive. Another school of thought believes that the Indian market has such vast potentialities that any amount of increase in production can eventually be absorbed within the country, even if it is possible to have temporary maladjustments. Whatever the future may hold, the coffee growers appear to be actively interested in improving their properties and expanding their cultivation.

Export Earnings From Smaller Plantation Products

Increasing Competition for Pepper

PLANTATION crops occupy an important place in India's export trade, contributing almost 30 percent of what is earned from it. Tea and coffee are no doubt the largest contributors, but such products as cashew, pepper, ginger, lemongrass oil, cardamom and coir (an important by-product of coconut, which is another plantation crop) together earn Rs. 30 crores to Rs. 40 crores in foreign exchange every year. The employment opportunities provided by these relatively minor products on the west coast of India, where they are cultivated and processed and from where they are exported, are large. They play a significant rôle in the export trade and the west coast economy.

At present, cashew is the most important of the smaller plantation products from the export point of view. The cashew processing industry is of recent origin, with hardly 30 years of history. The crop was introduced into India. Its cultivation is now being increasingly undertaken on a plantation scale in certain parts of Kerala, Madras, Mysore, Andhra and Bombay, but the present stands are mostly scattered around the homesteads and the otherwise uncultivated lands in certain areas of the west coast. Processing and marketing have not been co-ordinated with cultivation, but the co-ordination is developing as the processing units become concentrated in certain areas and compete for raw nut supplies.

Cashewnut Output

India produces about 60,000 tons of cashew nuts, which meet about 40 percent of the requirements of the processing units here. The rest of the requirements comes as imports from East Africa. Last year, both indigenous production and imports touched new peaks, the total supply being 160,000

By

K. K. Kurian

tons to 170,000 tons. Exports of processed kernels, too, were the highest on record, amounting to 32,994 tons. The record earnings from cashew exports were over Rs. 15 crores.

India has a monopoly in this trade and the largest market for the edible nut is the United States, which absorbs very nearly 80 percent of India's production. Other important consumers are the United Kingdom, Canada, Australia and Russia. In 1957, Russia alone took 1,806 tons, against 807 tons jointly purchased by her, China and Czechoslovakia in 1956.

Cashew shell liquid, which is a by-product obtained in the course of processing raw nuts, also has a very good market abroad. In 1957, India has exported 5,925 tons of this oil. The principal buyers were Japan, the United States, Britain, Australia, Italy, France and Czechoslovakia, the last three being new customers. Cashew shell oil is used mainly in the manufacture of paints and for conditioning fishing nets. India earns about Rs. 50 lakhs a year by exporting it.

Cashew-processing is one of Kerala's major industries, providing direct employment to about 80,000 workers for nine or ten months every year. But it has earned the notoriety of being the problem industry of the State. An inadequate supply of raw nuts and the difficulty in procuring them, the absence of a proper system of equitable distribution of the available raw nuts, and very often the difficulties in raising adequate finance for running the industry continuously, are some of the problems of the processors. The difficulties in getting continuous employment throughout the year and earning a living wage are among the main problems of the workers. In fact, the number of factories existing today and the workers engaged in them are not commensurate with the scope for development considering the raw materials available. The industry has been facing crises every year for one reason or another. As a remedy, a proposal is being examined by the manufacturers' association as well as the Government to set up a

What salt means to you!

How long ago man discovered salt is lost in antiquity, but he learnt that it came from the rocks and the sea. As he realised the value of salt, he made it an article of currency and commerce.

Science has gone far since then, and today it has learned to make many and varied uses of salt. Can you imagine your common salt being turned into a number of heavy chemicals, such as soda ash, caustic soda, bicarbonate of soda, magnesium chloride, bleaching powder and bromides? Can you imagine getting along without salt in the twentieth-century?

At the Mithapur Works of Tata Chemicals, salt and other marine products are extracted from the sea and converted into these alkalis and heavy chemicals. They find their way into many other factories where paper, leather, soap, glass, textiles and pharmaceutical products are made.

Here, then, is an industry using the boundless waters of the sea to keep the wheels of other industries moving. It is the aim of Tata Chemicals to assure the country of a national supply of these basic chemicals.

AIR CONDITIONING ON THE INDIAN RAILWAYS

In the year 1937, some 40 years after the introduction of electric lighting for Railway Carriages, the Great Indian Peninsular Railway built 5 fully air-conditioned coaches for use on the Bombay-Calcutta Mail Service. The War retarded progress in air-conditioned travel. Nevertheless, during these years, the Railways were able to build 32 fully air-conditioned Ambulance Trains for the Army.

Since the end of the War, progress has been enormous and over 200 coaches have been put into service.

The latest development in air-conditioning is the introduction of the first fully air-conditioned vestibuled express consisting of both third and first class accommodation and dining car facilities.

It is a matter of pride to us that all these coaches have been fitted with Stone's electro-mechanical system of air-conditioning providing trouble free service under rigorous conditions and a standard of comfort unmatched in any other mode of travel.

Pepper vines with the berries

trading corporation to purchase and distribute the raw nuts and to sell the finished products.

History of Pepper Trade

Indian pepper is known as the king of spices. Black pepper has for centuries been a staple commodity in the trade between India and the west. It is said that Alexander the Great first imported it to Europe and pepper has consequently been known there for over 2,200 years. During the middle ages, it was the most desired of all spices and the trade was highly lucrative. The Portuguese navigator, Vasco da Gama, came to Malabar in search of the commodity. But towards the end of the last century, India's supremacy in the pepper trade was challenged by Indonesia where the crop was introduced from its traditional home in Malabar by the Dutch 400 years ago. Just before the last war, Indonesia was in a position to supply as much as 94 percent of the pepper reaching world markets.

The rise and fall of pepper in India's export trade over the past decade has been spectacular. After the removal of U.S. price control over the commodity in 1947, its value shot up with amazing rapidity. The Japanese occupation of Indonesia and the surrounding islands during the second world war completely cut supplies from there, so India enjoyed a monopoly in the world pepper market until 1953. During the five-year period after 1948, Indian pepper prices touched the fantastically high level of over Rs. 600 to Rs. 700 a cwt. It is estimated that the pepper-growing districts of the west coast earned from these exports during this boom more than Rs. 100 crores after paying Rs. 17 crores in export duty. The following year, however, marked the beginning of a recession. From the high level of Rs. 600 a cwt. early in 1953, prices came down to Rs. 85 a cwt. in the harvest season towards the end of last year.

Subsidiary Crop

Pepper is a subsidiary crop in India. Only in a few cases are there plantation holdings. This gives the growers a resilience to hold out against a falling market. But this is as well a weakness of the Indian pepper-growing industry. There has been very little change in the agricultural practices and commercial exploitation of this crop in India for many centuries, whereas Indonesia and Sarawak, late comers into the field, have developed this industry on a plantation basis and offer formidable competition to India in the world market. Certain reports indicate that the industry in Sarawak is facing ruin due to pest attack. Also the present uneconomic price makes it impossible for the planters there to take due cultural care of their pepper vines, so production, it is stated, is declining, perhaps not to the extent which could give a fillip to the market now over-loaded with supplies amounting to over 70,000 tons. Of this, India's share is about 24,000 tons, Indonesia's 20,000 tons, Sarawak's 19,000 tons and other countries like Ceylon and Brazil have produced 7,000 tons.

India's export earnings from pepper were just over Rs. 1 crore in 1945-46. But within five years, export values rose to Rs. 14 crores. In 1951-52, an all-time record of Rs. 23.26 crores was reached. The earnings dropped to Rs. 16 crores next year, and in 1955-56 it fell to Rs. 4.7 crores. In 1957, exports totalled 14,154 tons, an increase of 1,851 tons over the 1956 figure. But the lower rate of prices

which obtained might well have neutralised any increase in value.

Largest Customer

India's largest customer has been the United States which bought 93 percent of its requirements from this country in 1951. The United States imported that year nearly 9,400 tons of pepper from India whose total exports amounted to 16,632 tons. The U.S. still continues to be the largest buyer, but India's position as the chief supplier was lost in 1957. Indonesia took that position with an export of 6,210 tons to the United States, representing roughly 40 percent of the total U.S. pepper imports in 1957, against India's share of 36 percent amounting to 5,688 tons.

U.S. importers are highly price-conscious. With their hand-to-mouth buying policy for the last three or four years, and with supply exceeding demand, the position of the Indian growers has become precarious. They are compelled to make substantial concessions. As a matter of fact, a regular tug-of-war has been going on between the growers in India and the importers in the United States on the price issue, and many a time the growers have had to give ground. A significant development in the pepper market is the growing demand from Russia and other east European countries. Russia imported 4,000 tons of pepper from India during 1957. Poland took another 500 tons and Rumania 400 tons. Yugoslavia and

Hungary and some other countries, too, have made purchases. Hope is being expressed in certain quarters that with rising standards of living and their increasing familiarity with pepper, the east European countries will become important markets for this. With the increase in mutual trade, the capacity of these countries to buy more and more of Indian pepper would naturally increase. Also, the number of countries which import Indian pepper increased from 54 to 65 in 1957, which is a welcome development.

Exportable Surplus

If India wants to earn more on pepper exports, it has been argued, she must produce more. The exportable surplus has dwindled on account of the larger home off-take because of the heavy fall in prices. It is estimated that domestic consumption now can absorb as much as 50 percent of the total output. But it still is an export-based industry, and in the face of terrible competition from other sources the production cost has to be adequately brought down. Here also comes the question whether production should be increased by bringing

more land under cultivation. But in view of the present low prices which many of the growers in India and elsewhere consider uneconomic and the increasing pressure on land in the pepper growing areas of India, this looks to be a proposition of doubtful value. However, production can be raised to a certain extent by giving more care to the present stands, and by making additions wherever economically possible.

Another problem for the trade is the high rate of freight on pepper exports from India to foreign countries. The cost of transport forms a substantial share of the price in the consuming countries overseas. In a declining market, it has become more and more necessary to get these rates reduced, and the trade is impressing upon the Government the need for taking steps to bring about a reduction in shipping charges. The Coastal Conference has recently reduced the freight on pepper shipments from the Malabar coast to Bombay. A forward market for pepper has been opened in Cochin. A section of the trade has been complaining that speculative activity has become the predominant feature of this market. The forward markets are

provided for hedging purposes and not for gambling, it says. It is neither in the interest of the trade nor that of exports to use these markets for purely speculative purposes.

Higher Cardamom Exports

Cardamom is another important spice, which shares the honour with pepper as one of India's traditional exports. India is its largest producer, although the attack of thrips and indiscriminate extension of peasant cultivation on the cardamom hills of Kerala have been reducing the area suitable for this crop. It is grown in south India in most cases on a plantation scale under the shades of thick forests. The price of cardamom rose 100 percent to Rs. 9 a lb in 1955, and since then it has been steadily rising. With an export of 830 tons, the country earned Rs. 1.81 crores in 1955. Marketing has been organised with the opening of auction sales, the latest being the one opened in Cochin by Messrs Carritt Moran and Company.

Prospects for Ginger

Ginger is also a spice exported from India. The commercial production of dry ginger is concentrated

TOWARDS BETTER TONNAGE

**MEN & MACHINES MAKE
A BETTER PORT**

**CALCUTTA PORT
COMMISSIONERS**

Issued by the Commissioners for the Port of Calcutta.

In 1955-56 the total tonnage handled was 80,30,735. In 1956-57 the tonnage increased to 88,69,210.

But the figures hardly tell the full story. In judging the capacity and the efficiency of the Port's working, the type of cargo and not merely the tonnage should be taken into account. Types of cargo handled determine the speed of loading and unloading. It is much less easy and less quick to unload steel and machinery than to unload food-grains or any other homogeneous cargo.

To-day's cargo consists largely of items that require better equipment that helps the workers to increase their output.

Above all the Port needs more and more co-operation of the workers for a drive towards better and greater tonnage.

trated in certain parts of Kerala. The total production in India is something like 16,000 tons, of which nearly 10,000 tons are exported. Indian ginger has to meet competition from Sierra Leone and Jamaica in the world market. In the U.S. market, Jamaican ginger gets a premium of 100 percent over Indian ginger, for being better in quality. India's chief market is the Middle East. In 1954 and 1955, ginger sold well because of crop failures in other production centres, but since 1956, prices have been on the decline. The present price of Rs. 35 a cwt. compares with Rs. 200 and above realised in the boom period two years ago. India's export trade in this commodity is largely concentrated in the hands of Bombay dealers, although it is produced in Kerala.

Lemongrass Oil

Lemongrass oil is India's number one essential oil, having a very good market abroad. It is extracted from lemongrass grown in certain parts of Kerala. The annual production is around 1,000 to 1,400 tons, and the area under cultivation is over 40,000 acres. The average yield is less than 2 lbs to 1,000 lbs of grass distilled. The highest yield goes up to 7½ lbs. In the natural state, India's lemongrass oil is of the best quality, providing a citral content exceeding 83 percent against the trade specification of 75 percent. But the industry is unorganised, and the method of production is primitive. This oil, too, had wide fluctuations in its prices, varying from Rs. 50 a dozen bottles to Rs. 325 a dozen bottles of 1½ lbs each. The price has been steady for some time at about Rs. 65. Last year, both production and export touched new peaks, the respective figures being 1,400 tons and 1,200 tons. With the introduction of Agmark, the scope for adulteration has decreased considerably, and the confidence of foreign buyers in the quality of the Indian oil is increasing. India's rivals in the world market are Honduras and Haiti, but the competition is not very significant. India's largest buyer is the United States, followed by the U.K. and Switzerland. Russia, too, has started buying this oil. Lemongrass oil is used in the manufacture of Vitamin A and a wide range of perfumes. Now that the Swiss pharmaceutical firm of Hoffmann-La-Rouche, in collaboration with the Indian firm of Voltas, is going to start a factory in India for the manufacture of Vitamin A, etcetera, it can be expected that a market for lemongrass oil will develop within this country as well. This oil earns

for India over Rs. 1 crore in foreign exchange every year.

Problems of Coir

Coir is a by-product of the coconut palm. As early as in the 11th century A.D., coir was used as ship's cables, fenders and rigging. During the 13th century, there was evidence of coir yarn being used in the building of ships in the Persian Gulf. Thus coir, like some other export materials of Malabar, has been occupying an important place from ancient times in the export trade of India. Coir is produced from the fibre extracted from coconut husks after soaking them in brackish water for about eight months. A variety of materials such as mats and matting, carpets, rugs, ropes, etcetera, are produced with it. Some 600,000 people are engaged in the production of coir fibre and yarn, and 300,000 to 400,000 more in other spheres of the industry on the west coast. India's annual production of coir yarn is round about 120,000 tons, out of which 52,000 tons are absorbed in the internal market, 23,000 tons are used in the manufacture of various products in the coir factories in India and 45,000 tons are exported. Through the export of yarn and other coir products, India earns nearly Rs. 10 crores a year.

Among the buyers abroad, the U.K. absorbs the largest quantity, followed by the Netherlands, West Germany, Italy, France, the United States, Russia and a number of other countries.

The coir industry, too, has a multitude of problems. Its dependence on foreign markets, like most other west coast products, is a great weakness which occasionally lands the industry in deep waters. For instance, a slump has set in in the middle industry since the middle of last year due to a fall in foreign demand. This has caused a lot of hardship to thousands of families who depend on this industry for their livelihood. Both the Central and State Governments have been trying to take the coir industry out of the wood, but they have not yet succeeded. A statutory board for coir was constituted by the Central Government in 1953. This board has been doing some useful work in the re-organisation of the coir industry, and in finding out markets for coir goods both in this country and abroad. A new feature in the official coir policy is the discouraging of export of yarn in order to increase the export of finished products. The coir manufacturers of Europe have been looking upon this policy with disfavour and they have not hesitated to give the

warning that if coir yarn is not made available to them in sufficient quantities, they will be forced to use more and more of the substitute fibres in their manufactures. The manufacturing interests in India complain that the high import duties against their products imposed by the consuming countries of Europe are really a great handicap in enlarging their exports, and they have been pressing the Government of India to use its good offices to get these duties reduced. The Central Government is sending out a trade delegation headed by the Chairman of the Coir Board to explore the possibilities of exporting more of India's coir products to the United States, Canada and the United Kingdom, some time in June this year.

Export Promotion Council

With the object of promoting the export trade of India's cashew and pepper, a Council was set up in Cochin in 1955. This body claims that it has taken many useful promotional measures within the short period of its existence. These include the participation in 22 fairs and exhibitions, a market survey in central European countries through a trade delegation sent out in 1956, publicity abroad through the distribution of attractive information literature, supply of market information from foreign countries to the local trade and liaison with research organisations and specified institutions, and making available to the trade details of any innovation in pepper and cashew industries. It also collects and disseminates useful information to the Indian exporters of cashew and pepper through a bulletin it publishes.

The Pepper and Cashew Export Promotion Council is experiencing some difficulty due to insufficiency of funds. It has to depend on voluntary contributions from the trade which is not at all organised, and which has not yet started appreciating the usefulness of its activities. Even the president of the Pepper and Ginger Merchants Association of Bombay has aired his pessimism against the Export Promotion Council. He said recently: "The presently constituted Export Promotion Council can do little in promoting exports in view of the limited surplus pepper available for export at present, and also increased local consumption at the lower price level. The pepper trade is in the hands of established traders who are competent enough to export the maximum available quantities and can diversify this trade according to the requirements of the different regions." The attitude of the cashew trade is also not much different.

The inadequate supply of cashew, and to a certain extent, the supply of pepper also is a problem that confronts the country at present. The Governments in the growing States, with the help of the Central Government and the Indian Council of Agricultural Research, are taking measures to increase the production of these crops through extensive cultivation and improved methods of agriculture based on research. Research stations for cashew and pepper as well as for cardamom, ginger and lemongrass are already functioning in certain areas of south India, and more, it is proposed, will be established. Excepting cashew and cardamom, all the other commodities dealt with in this article have been experiencing a heavy slump for some time. There is little likelihood that the fantastic level of prices which they once reached will ever be attained again. As the sound existence of these industries requires an economic level of prices, no pains should be spared towards that end, and none is being spared. As sizeable foreign exchange earners, these commodities deserve constant attention.

(The photograph in page 51 by courtesy of the Agricultural Department, Kerala).

Growing Difficulties in Exporting Engineering Goods

Need to Provide Cheap and Adequate Shipping Facilities

THE engineering industry has made phenomenal progress in recent years. Its growth started during the war, and was accelerated after the first plan was launched. It is in the fitness of things that the Government of India and the Planning Commission have given top priority to the production of steel, pig iron, heavy machine tools and machinery. The progress of the engineering industry is illustrated by the following statistics:

STATEMENT SHOWING THE INDEX OF PRODUCTION OF THE ENGINEERING INDUSTRY.

	1951	1955	1956	1957
General industrial production	100	122.1	132.6	147.4
General engineering and electrical engineering	100	183.3	218.1	240.1
Diesel engines	100	141.0	165.8	227.8
Power-driven pumps	100	83.3	113.6	154.0
Sewing machines	100	228.2	293.3	374.7
Machine tools	100	157.3	254.1	528.6
Electric motors	100	176.3	251.4	328.9
Power-driven transformers	100	289.5	471.1	624.9
Electric lamps	100	156.2	198.0	213.0
Electric fans	100	132.8	159.5	247.0
Winding wire	100	204.0	256.6	342.1

The figures are not exhaustive, but they indicate a satisfactory rate of development. The industry, in fact, holds out a big promise for the future.

By
R. K. Singh
Deputy Secretary,
Engineering Export Promotion Council

There is a vast scope for it both inside and outside the country.

Value of Exports

At present, the value of engineering goods exports amounts to a little less than Rs. 4½ crores. This is a small proportion of the country's total exports, but in the coverage of articles and countries, the industry has shown a remarkable achievement. It is at present exporting more than 100 different engineering goods to as many as 42 countries. These goods can be classified into the following categories:

A blast furnace in a steel works

(a) Light engineering goods have achieved a high degree of improvement in quality and have gained popularity. They include diesel engines, electric fans, sewing machines and steel furniture.

(b) Machine tools and industrial machinery have been exported in small quantities, but they have great potentialities provided prices are competitive. They include machine tools, scientific instruments, textiles, sugar, tea and other mill machinery.

(c) Prices of certain goods are greatly influenced by raw material costs. Among them are cast iron goods like pipes and fittings, manhole covers and G.I. products. Their exports are fluctuating in accordance with their capacity to compete with other countries.

(d) Light engineering goods have been exported in the past but are gradually being displaced either on account of competition or because foreign countries are restricting imports to promote local production. Such goods belong mostly to the consumer categories such as aluminium utensils, G.I. buckets, hurricane lanterns and steel-folding furniture.

Serious Handicaps

Exports of all these categories have suffered serious handicaps with the result that there has been hardly any improvement during the last two years, as will be seen from the following table:

Countries	1956	1957	Three months ended 31st March, 1957	Three months ended 31st March, 1958
	Rs.	Rs.	Rs.	Rs.
Africa	87,45,505	84,43,327	16,81,446	18,19,804
South-east Asia	1,21,53,219	1,29,86,528	30,76,001	29,90,552
West Asia	1,43,40,758	1,21,16,015	31,06,784	34,88,961
Australia	4,10,074	4,99,049	44,879	23,706
New Zealand	1,60,636	2,01,712	18,896	12,049
Others	78,13,311	96,27,215	18,38,803	19,96,127
Grand total	4,36,543	4,36,76,850	97,86,781	1,03,33,061

The statement shows that exports have remained almost stationary during the last two years. The Government has tried to help in increasing them, but it is evident that the difficulties are serious. Manufacturers are keen to export, and substantial enquiries come from abroad, but there are two serious handicaps. One is that shipping facilities are inadequate and freight rates are high. The second is that the supply of raw materials is inadequate and costly.

Freight Rates

The Central Government is aware of the difficulties, and efforts are being made to overcome them. But little success has been achieved so far. It is felt that the exporter has to be given shipping facilities when he wants them. The freight which he pays should bear some relation to that paid by his competitor in Japan, the U.K. or the Continent, considering the distance involved. The basis of calculating freight for a commodity should also be

the NEW sensational HIND AMBASSADOR

It's here! The wonderful New HIND AMBASSADOR. A prince among cycles.

It combines unique features of lightness, endurance and design—and is yet reasonably priced.

See some of the New HIND AMBASSADOR'S highlights:

- 1 New smoother-rolling hub richly finished in chrome. Its narrow barrel opens on both sides. The hub caps can be removed and cleaned without dismantling the entire wheel.
- 2 New monsoon-proof rims—manufactured perfectly true. As precision-made as the best available anywhere.
- 3 Superbly chromium-plated rust-proof handlebars with unbreakable plastic grips—specially designed and angled for greater comfort.
- 4 Fully rivetted chain wheel fitted with a square crank. Joggled fixed design. Chromium-plated.

Yes, the HIND AMBASSADOR is the achievement of many years of experience in cycle-engineering. An outstanding cycle, the HIND AMBASSADOR is built by the people who know—the people who have the million-cycle record in India.

HIND CYCLES LTD. 250 WORLI BOMBAY 18
ASP/HC 127

A giant ladle pouring "blown" metal

the same as in other countries. At present, no uniform rule seems to exist. Certain shipping companies charge freight on a weight basis, while others charge it on a measurement basis. Sometimes the freight from Bombay to a particular destination is on a weight basis, but from Calcutta it is on a measurement basis. As for the supply of raw materials, it is far less than the actual requirements. Moreover, actual deliveries for replenishment are very much delayed. The prices of pig iron and steel have been raised during the last two years. Manufacturers are, therefore, finding it difficult to compete because of the present price they have to pay for steel.

Facilities for Japanese Exporters

The Indian exporter is at a disadvantage compared with his counterpart in other countries in relation to various other matters. For instance, a Japanese exporter gets the following facilities:

(a) *Facilities for discounting bills:* Whether the goods are against L.C., D.P. or D.A., there are facilities for discounting the bills and the exporter can get short or long-term loans from exchange banks and the Import and Export Bank of Japan. The rate of interest charged to the exporter is normally 3 percent lower than the usual Bank rate.

(b) *Relief on income tax:* The manufacturer or exporter gets a rebate on income tax to the extent of 3 percent of his total export. For instance, if the total income tax liability comes to Rs. 1 lakh and he has exported goods worth Rs. 10 lakhs, then he gets a rebate of Rs. 30,000 (3 percent of Rs. 10 lakhs) and he has to pay a tax of Rs. 70,000 only.

(c) *Retention of foreign exchange:* An exporter is allowed approximately 3 percent of the total foreign exchange earned in importing restricted or banned items on which he makes good profit and which partly pays for the lower price he may have charged on his exports.

(d) *Free market surveys and display of goods at international trade fairs and exhibitions:* The Japan External Trade Recovery Organisation, which is Government-sponsored, and on which the Government spends nearly Rs. 2 crores a year, has more than 40 offices, trade centres and representatives in different countries. Through these offices and representatives, the Jetro carries on market surveys, free of cost, or at a very nominal cost. The goods are sent from factory to different trade fairs and exhibitions, free of cost, and the Jetro officials attend to enquiries.

(e) *Assistance in publicity:* The Government helps exporters or associations in printing publicity literature. It also pays full or half of the costs for preparing documentary films or for visual publicity through television.

Besides, the Japanese exporters have absolutely no difficulty in securing raw materials and shipping facilities.

Commendable Initiative

In spite of the handicaps and the disadvantages referred to above, exporters of engineering goods have shown commendable initiative in exporting their products to Australia, New Zealand, Fiji Islands, Indonesia and other south-east Asian countries, west Asia, east and west Africa. Some of them have secured orders from the United States, the United Kingdom and the Continent, and they are confident that they can sell their goods in these industrialised countries as well. They are looking towards new markets in West Indies, Latin America and west Africa. What they want is uniform facilities as their counterparts in Japan, the United

Kingdom or the Continent. There is a great future for engineering goods and it is encouraging that all those concerned in their exports are making earnest efforts to expand them.

Some of the countries in south-east Asia have started industrialising themselves. Their requirements are now being met from local sources.

Some of them like to secure collaboration from Indian firms. But it is necessary to watch the developments in the neighbouring countries in order to make suitable adjustments in the export programme. As the five year plans progress, India will be in a position to offer such engineering goods as her neighbours need for setting up their own industries.

THE CASE FOR RESUMING SUGAR EXPORTS

PRODUCTION EXCEEDING HOME REQUIREMENTS

IN current discussions on Indian sugar exports, there is a tendency to regard the sugar exports of 1957 as a fortuitous occurrence made possible by an unusual and transitory combination of circumstances. It is true that the failure of the world beet crop in 1956-57, the closure of the Suez Canal and the resulting dislocation of normal trade, created a world shortage of exportable sugar and abnormally high prices in importing countries. Indian sugar was thus able to find buyers abroad at profitable prices. With the return of more normal conditions on the world market, sugar prices have fallen steeply, the profit on exports has turned into a loss and the Indian sugar industry is faced with the problem of devising an acceptable and practicable scheme for covering the loss on sugar which may be exported in future.

It would be undesirable, both for the Indian sugar industry and for the economy as a whole, if no further sugar exports were to be made. For a newcomer to the export business, India has done remarkably well. Some 153,000 tons of sugar were

exported, earning Rs. 12 crores of foreign exchange, at a time when a serious balance of payments deficit threatened to disrupt the second five year plan. Credit for this achievement should go to the Indian Sugar Mills Association, which, at the instance of the Government, acted as the sole agency for organising and promoting sugar exports. It built up a Sugar Exports Division for the purpose which succeeded in establishing Indian sugar in the neighbouring markets of China, Malaya, Burma, Ceylon, Iraq, Saudi Arabia, the Sudan and East Africa. Indian sugar exports became a source of anxiety to old-established sugar exporting countries such as the U.K. and Formosa. The chairman of the well-known British sugar firm of Tate and Lyle, is on record, at the latest annual general meeting of the company, as having described Indian sugar exports as a threat, directed at taking away some of their business. This tribute is a measure of the success which India achieved at her very first attempt at exports.

By

S. S. Kanoria

From the industry's point of view, the need for sugar exports arises from the big increase in productive capacity which is likely to come into existence over the next few years. Since 1953-54, when production was about 1 million tons, it rose in 1956-57 to 2,026,000 tons, a more than 100 percent increase. The figure for the 1957-58 season is likely to show a small decline from this all-time record, on account of a setback to cane cultivation caused by drought in cane-growing areas in U.P. and Bihar. But this probably represents only a brief interruption in the broad upward trend of output. The target for the second five year plan is 2.25 million tons by 1960-61. Provision has been made for about 56 new factories with a total capacity of 600,000 tons a year. This is in addition to the extensions allowed to existing units, which will

increase capacity by another 400,000 tons. It will be seen that if all the projects, both for new units and expansion of existing ones are brought to fruition, capacity in the industry will exceed the target of the plan by a substantial margin. The sugar industry has probably left behind the cycle of under-production and over-production which characterised it in the past, and its face is now set towards continual expansion.

The benefits accruing from this process do not consist only in the increased availability of sugar, although as a basic energy food, whose per capita consumption in India is deplorably low by any decent standard, that is itself a significant step towards raising the living standards of the masses. The rise in sugar production means more employment, more income (not only for those employed in sugar factories, but also for cane-growers and the sugar trade), more capital investment, more industrial expansion and a larger national income, as well as more revenue to Central and State Governments. It represents an important contribution to the economic advance of the country and if, for any reason, the expansion of the industry is halted or reversed, that would be a major setback for the economy as a whole. This is where sugar exports have an important rôle to fill. Internal consumption has been on the increase and there have been times in the last few years, when domestic production, although on the rise, has had to be supplemented by imports. The rise in demand that started with the decontrol of sugar in 1951-52 has continued under the influence of rising

TRAVEL HABITS

- **CLEANLINESS** is next to Godliness. Let us cultivate the habit of cleanliness. We can help by not throwing scraps of food, skins and peel of fruit and water on platforms or in compartments. These should be consigned to the dustbins.
- **SPITTING** indiscriminately on platforms is unhygienic. It is also bad manners. Let us use spittoons.
- Let us not use cooled and filtered drinking water for other purposes.
- Let us avoid sitting with the feet on the seat. This is annoying to others in the compartment and is not good manners either.
- Booking our heavy luggage in the brake-van will give our fellow passengers and ourselves more room in the compartments.
- It is an offence to smoke in a railway train when requested by a fellow passenger not to. Let us avoid smoking when requested, or when the compartment is crowded or the doors and windows are shut.
- Railways are the Nation's property. We can help to safeguard these by apprehending persons pilfering or causing damage to railway property. They should be pointed out or turned over to uniformed Railway Staff on duty. Unsocial elements indulging in unauthorised alarm chain pulling could be dealt with in like manner.

incomes, the increase in population and the movement from rural areas to the towns. But it is almost certain that the increase in productive capacity contemplated under the second five year plan, will exceed the rate of consumption growth. From the consumer's point of view, this is an advantage. It means that the recurring shortages which caused so much hardship and led to so much recrimination in past years, need no longer be feared. It is better that productive capacity should go ahead of consumption, than that consumption should first increase, create shortages and high prices and then belatedly, induce a balancing increase in production. But if the industry is to continue the process of healthy expansion, it is imperative that an outlet in the form of exports must be found for the sugar which is in excess of domestic requirements. Otherwise, over-production, losses, and the resulting closing down of the smaller and weaker units in the industry will halt the expansion process and create unemployment among workers in the industry and trade, distress among cane-growers, losses to investors and a substantial decline of revenue to the Central and State Governments. Consumers may derive a temporary benefit in the form of lower prices. But this advantage will be short-lived. When the industry has adjusted itself to the new conditions through the weeding out of surplus, that is, less efficient units, the glut will end and prices will again settle at the point of equilibrium of demand and supply. But the equilibrium thus attained will be at a lower level of national income, employment and prosperity.

Variations in Production

Should sugar exports become a permanent feature of Indian foreign trade, it would be possible to use them as a sort of safety valve to regulate an even flow of sugar for internal consumption. Production of white sugar is, by its very nature, subject to wide variations from year to year. Cane supplies to mills are dependent, not only on the vagaries of the monsoon and the ravages of pests and plant diseases, but also on the prices of other crops and of gur and khandsari. Consumption, too, is difficult to estimate with any approach to accuracy. For some years now, there has been a rising trend in consumption, reflecting a change in dietetic habits with rising money incomes and the movement from rural to urban areas. But experience has shown that estimates of consumption may prove to be wide off the mark. The recurring crises of over-production and under-production, which marked the history of the sugar industry in the past could be avoided, if the volume of sugar exports is varied from year to year in such a way as to ensure a balance between supply and demand at home.

For the moment, the picture of an impending glut of sugar, under the pressure of which prices will fall to uneconomic levels, appears to have little relation to reality. Sugar prices have been rising steadily. There is reason to believe that the recent increase in prices does not reflect the current statistical position and is very largely the result of speculative activities. The 1957-58 season opened with a carry-over of 459,000 tons and tions up to the end of April was 1,910,000 tons and is expected to reach 1,975,000 tons against 2,026,000 tons in 1956-57. The fall in estimated output is the result of reduced cane supplies on account of drought and cane disease in parts of U.P. and Bihar. Consumption in 1957-58, it is expected, will be about the same as production which means that, in the absence of exports, there will again be a carry-over of around 450,000 tons. On the basis of these figures, the export of 100,000 tons will leave a carry-over of 350,000 tons, well over 15 percent of the current consumption, which is considered adequate according to the terms of the International Sugar Agreement.

This suggests that while 100,000 tons of sugar may be exported this year without disturbing internal market equilibrium, there is no overriding necessity to divert sugar to the export market, in order to avert over-production and a serious fall in prices. But it would be extremely short-sighted to conclude from this that sugar exports are no longer necessary. The pioneering work done in building up a world market for Indian sugar will be wasted if exports cease and will have to be done all over again, probably under much more difficult circumstances when the need for sugar exports again arises. In spite of the relatively comfortable present position, there can be little doubt that such conditions will arise in the next few years. Productive capacity will almost certainly grow at a faster rate than home consumption and, without an export market, the outlook for the industry is grim. All this is apart from the more general advantages of sugar exports, such as the earning of foreign exchange and helping broaden the base of India's export trade. From the national point of view as well as that of producers and consumers of sugar, it is

greatly to be desired that sugar exports be continued.

The Price Problem

The crux of the problem is price. The abnormal prices which enabled sugar from India to sell at a profit in foreign markets have now declined to a level at which Indian sugar can be exported only at a loss. The difference between the Indian and world prices is about Rs. 10 a maund. The difficulty is to devise some way in which this loss can be made up. The fund built up by the Indian Sugar Mills Association out of profits on exports in 1957 is almost exhausted. The industry, already working under the limitations imposed by a rigid cost structure and a narrow profit margin, is in no position to bear losses of such an order. Any suggestion that cane-growers be called upon to bear the burden of subsidising exports, through a reduction in the minimum price paid by mills for sugarcane, will encounter strong opposition from the growers and their politically influential supporters. In the prevailing mood of labour, any reduction of wages or welfare benefits is unthinkable.

The idea of calling upon consumers to bear the burden of losses which will be incurred on exports, through higher internal prices, is not likely to be popular. A rise in the price of a commodity, which enters into the cost of living, at a time when the rise in the living costs has already reduced the purchasing power of the common man's limited income, is certain to be strongly resisted. But if sugar exports are considered necessary, it is perhaps not unreasonable to ask that the nation, as a whole, should be prepared to make a small sacrifice for it. If the burden is distributed over the many millions of consumers in the country, the incidence a head is likely to be so small and can be carried comparatively easily. If, on the contrary, it is concentrated on some small group,

such as millowners or labourers in sugar factories or cane-growers, the burden a head, among the members of the group concerned, is bound to be very much heavier. In concrete terms, if about one-twentieth of the sugar produced in the country is exported (100,000 tons out of about 2 million tons) and the loss on exports is Rs. 10 a maund on the total output, a rise in the price of 50nP a maund comes to a little over 1nP a seer. This small sacrifice by consumers will suffice to keep up sugar exports, earn about Rs. 5 crores of foreign exchange and ensure the healthy growth of the sugar industry. The doubling of the excise duty on sugar in the Budget of May 1957, imposed a burden on consumers about eight times as great.

Efficiency of Industry

The Indian sugar industry has been subjected to a great deal of ill-informed criticism on this matter. It has been said that long-suffering consumers have been supporting the industry since the grant of protection in 1932, that in all these years, the industry has not been able to reach a level of efficiency at which it would be capable of meeting foreign competition on equal terms and that it is intolerable that consumers should now be required to make further sacrifices for subsidising sugar exports. If this view is to be accepted, then the sugar industry would have to restrict its expansion rate to the absorptive capacity of the home market. It can think of exports only when it has attained the level of efficiency of the major sugar-producing countries of the world. Considering the low yield of sugarcane in India, its poor sucrose content, the high officially-fixed minimum cane price which the mills are compelled to pay and the crushing burden of taxation which the industry has to carry, it would not be surprising if the Indian industry produced sugar at a relatively high cost and sold it at a relatively high price. The truth is that, in spite of these handicaps, Indian sugar is produced at a lower cost and sold

A wider world for fabrics

In many countries, the subtle influences of past traditions and customs have been combined with modern materials and design to create new trends in fashion. This resurgence-in-textiles on the part of European and other nations has broadened their panorama of progress, created a wider world for fabrics through expanded production, employment and opportunity. The textile industry is just one of many nourished by Caltex quality fuels and lubricants. Through the power of petroleum, Caltex keeps industry and every segment of society expanding, aiding the prosperity of today and holding forth the promise of an even brighter tomorrow to over 70 countries—partner in progress in Europe, Africa, Asia, Australia and New Zealand.

It will be seen that with the exception of Cuba and the Philippines, Indian sugar was cheaper, on that date, than that of any other country. The position has altered somewhat, with the doubling of the excise duty in May 1957, for which it is obviously unfair to hold the Indian producers responsible. But even with this handicap, Indian sugar remains cheaper than that of most other countries. Allowing for variations in taxation, retail sugar prices in different countries are more or less a reliable index of the differences in the cost of production. More direct evidence about Indian cost of production, compared with that of other countries, is furnished in a study conducted by the author and Mr. M. N. Pittie as members of the Government-sponsored delegation to Australia and Indonesia in 1955. The findings are summarised below:

	India	Indonesia	Australia
Based on price-sharing formula fixed by the Government of India for season 1953-54. West U.P. recovery 9.88		Based on season 1954 price and Kasimo formula at present applicable in Java for distribution of price between factory and grower	Based on the present selling price of 9d a lb and the actuals of 1954
Grower's share	14-9-3 60 percent	15-7-6 55 percent	11-1-2 48.4 percent

*** P. 113 & 114—The Report of the Sugar Delegation to Australia and Indonesia (1955).

This and similar other studies should serve to dispel the popular notion about the high manufacturing costs of the Indian sugar industry. On the contrary, all the available evidence points to the fact that the manufacturing costs in India are the lowest in the world. The high cost of cane is more than offset by the very low processing costs, and profit margins are among the lowest in the world. Compared with some other countries, it has the further advantage that it produces white sugar directly, instead of making raw sugar first and then refining it separately.

Subsidised Exports

It is evident from the above that the relatively low prices at which much foreign sugar is sold in the world market is no indication of superior efficiency or low internal prices. The truth is that almost every important sugar exporting country follows the practice of subsidising exports, through raising the internal price of sugar. Thus Indonesia, which exports about 50 percent of its production of 800,000 tons sells at about Rs. 20 a maund in the international market against an internal price of Rs. 48 a maund. Australia follows the same principle. In both these countries, there are producers' organisations, which handle the sales of the entire sugar output, both in the home market and abroad. The total realisation on account of all such sales is pooled and each producer gets his share, irrespective of whether his particular product was sold in the home market or abroad. In this way, it is a simple matter for these countries to sell at a low price for export and make up the loss by maintaining a higher price at home.

The U.S.A. follows the practice of importing sugar from friendly countries, whose economies it wishes to support, at a price higher than that of the world market. It restricts its imports to a few favoured countries, who are granted quotas for the purpose. Among these are Cuba and the

Philippines. Without such support, Cuba would find it hard to retain its position as the world's largest exporter of sugar. The following table comparing the prices of Cuban sugar for shipment to the U.S.A. with those it charges the rest of the world, shows that the former paid a premium over the world price in the neighbourhood of 1½ to 2 cents a lb, which is equivalent to Rs. 5.62 to Rs. 7.50 a maund.

Commonwealth Agreement

Exporting countries in the Commonwealth are supported by the Commonwealth Sugar Agreement, if they are its members. Even in the U.K. which purchases the bulk of its requirements of raw sugar, to maintain its export trade in refined sugar, the consumer has to pay a high price in order to subsidise exports. Only recently there was a levy of 8s a cwt. (Rs. 2.43 a maund) on the home consumer, to enable the refineries to sell at competitive rates in the world market.

The conclusion seems inescapable that since the major sugar exporting countries, almost without exception, adopt some sort of subsidy, India cannot hope to build up foreign trade in sugar unless she does likewise. Burdening the consumer is an unpleasant necessity, but the proportion of likely exports to internal consumption is so small that no serious hardship will be involved. If it is desired to spare the consumer, the alternative is that the Government should reduce the tax burden on sugar. If India is to continue as an exporting country, the present level of taxation, particularly since the heavy increase of excise duty in May 1957, appears altogether inappropriate. A reduction of excise duty by even 50p a maund will suffice for 100,000 tons of sugar to be exported and in that case, no extra burden need be imposed on home consumers. Should revenue considerations preclude even this small concession, the Government might consider whether the loss of revenue could not be more than made up by bringing khandsari within the scope of the excise duty on sugar. Not only would this enable the Government to grant the tax relief for exports, it would have the further advantage of ending the present unwarranted discrimination in favour of a wasteful process of manufacture. Any discouragement to this branch of the sugar industry that may result from increased taxation, would be a national gain, as it would divert cane to vacuum pan factories, where the recovery percentage is higher.

Export Policy For Oils And Oilseeds In Retrospect Need For A Well-Organised Marketing Structure

OILSEEDS, vegetable oils and allied products have for many years been traditional items among India's exports, although they are not as important as, say, jute or tea. It will be useful to analyse the trend of the exports of these commodities against the background of their supply and demand position, prices and the Government's policy. An attempt will be made to evaluate the future prospects and to examine the considerations which should govern policy decisions.

The pattern of foreign trade of a country changes with economic development. In its pre-industrialisation stage, raw material exports are the largest and with the growth of local industries, the exports of semi- and fully-manufactured goods increase. To a large extent this shift in emphasis is the result of the conscious manipulation of policy which aims to encourage local industry. Oil and oilseed exports have undergone a similar change. In the prewar years, oilseed exports were considerable and in recent years the Government's policy has been intended to encourage local seed crushing which not only provides employment opportunities but also supplies oilcake for internal consumption. Following the same logic, exports of hydrogenated oils have been encouraged in preference to crude oils.

TABLE 1
VALUE OF EXPORTS FROM INDIA.
(In lakhs of rupees)

Year	Seed	Oil	Vanaspathi	Total	Wholesale Price Index (1939=100)
1950-51	1,803	2,319	N.A.	3,922	409.7

1956-57	47	1,451	206	1,694	414.0

Source: Statistics of Foreign Trade of India

The above table gives a summary of the developments during 1950-57. The total export earnings of this group of commodities have been fluctuating with a secular tendency to fall. The highest was in 1950-51 at Rs. 3,922 lakhs and the lowest in 1953-54 at Rs. 672 lakhs. Wholesale price index figures, as shown in the table, indicate that the fall in the real value of export earnings is greater than what the actual values show. Another conclusion which can be drawn from it is the changing composition of the group earnings. Oilseed exports have declined. Hydrogenated oils have increased. The share of oils in the total has shown a steady rise.

These broad trends are significant; but to arrive at meaningful conclusions, it is necessary to analyse the components of the group, each of which has a different problem. In the oilseeds group, groundnut has been the major item. Exports of castorseed and linseed stopped from 1952-53. Some quantities of kardi, niger and sesameseeds were exported but irregularly. As for oils, groundnut, linseed and castor oils account for 90 percent of the total. By relating oils with oilseed exports, it is possible to draw a distinction between edible and non-edible oils. In the edible oil group, both oilseeds and oils have been exported, the latter accounting for a larger share than the former. On the other hand, a complete substitution of seeds by oil has taken place in the non-edible oil group. This classification is significant from yet another point of view. Edible oil and seed exports have been influenced by internal supply and demand considerations to a greater extent than non-edible oils, the latter have been very much under the influence of international prices. Consequently, this distinction is of material importance for future policy making.

World Demand for Groundnut

As groundnut is the most important item in the edible oils and oilseeds group, the trends of exports in this commodity should be analysed in detail. India used to meet a great bulk of the world demand for groundnuts. In the average prewar years, over a third of the total harvest was sold abroad. With increasing local demand for oil and the Government's policy for encouraging the ex-

port of oil in preference to seed, oil and some quantities of the hand-picked selected variety of groundnuts were exported. The table below gives details of the estimated amounts of oil crushed and exported from the country. Production has steadily increased while exports have fluctuated from almost nothing to 162,000 tons.

TABLE 2

PRODUCTION AND EXPORT OF VEGETABLE OILS
(In tons)

Year	Groundnut		Castor		Linseed	
	Production	Export	Production	Export	Production	Export
1952	654,003	60,541	39,327	32,367	93,611	33,720
1953	623,356	16,132	39,760	27,452	106,059	7,310
1954	794,727	26,822	42,120	22,573	110,768	2,656
1955	941,598	162,327	48,360	42,373	114,394	71,403
1956	956,183	28,366	48,360	40,755	123,869	48,043
1957*	969,564	5	50,310	39,360	104,421	9,547

* Provisional—1957 export figures are for the period January-September only.

N.B.—The export figures have been taken from official publications. Production has been estimated after taking into consideration, exports, seed set apart for sowing, use as seed, etcetera. As it is felt that the castor crop is under-estimated, seed provision has been omitted.

The Government's export policy for groundnut seed and oil has been changing from year to year. In 1950, an annual ceiling of 80,000 tons (in terms of seed and oil) was fixed for export. Each year an appropriate quota within the ceiling was issued taking into consideration the actual supply position at the time. The quota for 1952-53 was fixed at 60,000 tons of oil. But the crop turned out to be disappointing, scarcities developed and prices shot up. In June 1952, the price of groundnut oil was Rs. 1,187 a ton and this rose to Rs. 2,173 during the corresponding month of the following year. Consequently, exports were banned from June 1953, in order to stabilise local prices. With a better crop in the subsequent year and oil prices varying from Rs. 1,120 a ton to Rs. 1,150 a ton, the Government took a favourable view of the situation. Quotas were released six times between 2nd August, 1954, and 19th March, 1955. These totalled

May 1954 : Duty reduced to Rs. 200 a ton from Rs. 300 a ton.
January 1955 : Duty reduced to Rs. 125 a ton.
April 1956 : Duty increased to Rs. 175 a ton.
April 1958 : Duty reduced to Rs. 100 a ton.

The fluctuations in the export trade can be attributed to the world demand for the oil and export duties. Every reduction in the duty was followed by a favourable reaction in exports. Unlike castor oil, linseed oil has both local and export outlets. It has an estimated consumption of 30,000 tons for edible purposes. The paint industry, the largest industrial user of this oil, accounts for another 45,000 tons. The balance, after meeting the needs for minor uses, can be spared for export. Table 2 indicates that supplies have been adequate. Unlike castor oil, Indian linseed oil does not hold a unique position in world markets. The net world exports of linseed oil and seed in 1956 were 324,100 metric tons. India did not participate in the seed trade and contributed only 26 percent of the oil exports. Indian export figures have been erratic during the last seven years, reflecting the uncertainties of the world market conditions. The U.K. and Australia are the major consumers, the former accounting for a larger offtake.

By

A Special Correspondent

Government Policy

137,000 tons against the normal 60,000 to 80,000 tons. Export duty was reduced from Rs. 350 a ton to Rs. 100 a ton by the end of 1954. One of the reasons for this liberal policy was presumably to steady the declining level of domestic prices. This policy was not continued in 1956 as oil prices rose. In the interest of the domestic consumer, no fresh quotas were granted. The restrictions have continued since then. It is clear, therefore, that the export policy for this commodity was primarily intended to hold the domestic price line. Foreign exchange earnings and international prices have played little part in determining the Government's policy. This is the reason why there have been so many fluctuations in exports. The exports of other edible oil and oilseeds have been irregular and the export policy was framed on the broad consideration which governed that for groundnut oil and seed.

Exports of Castor Oil

Among non-edible oils and oilseeds, castor oil is important. The local use of this oil is small and most of the output is exported. The world net exports of castorseed and oil amounted to 102,500 metric tons (in terms of oil) in 1956 (39,000 tons of seed and 63,500 tons of oil). After 1953, India has not figured in the seed trade at all but accounted for 65 percent of the oil exports in 1956, with Brazil as the only competitor. The level of exports in the past three years has been around 40,000 tons. Analysing the consumption pattern of the exported oil, it is found that in the last seven years the United States has replaced the United Kingdom as a major consumer. Exports to the U.K. have increased from 9,000 tons to 13,000 tons while to the U.S.A. the rise is from 3,000 tons to 24,000 tons. If this trend were to continue in the future, India's castor oil

TABLE 3
EXPORT OF HYDROGENATED OILS BY DESTINATIONS
(In tons)

Countries	Years		
	1954-55	1955-56	1956-57
U.K.	7,134	7,590	4,214
West Asia	128	132	101
Singapore	101	64	181
Burma	626	651	972
Australia	180	700	1,408
Others	1,953	3,764	4,271
Total	9,804	12,901	11,187

Source: Director-General of Commercial Intelligence and Statistics

It is clear from the above table that the U.K. has been the largest consumer even though India's

exports to that country have been decreasing. Australia, east and west Asia are slowly coming into prominence as importers. The market for this product in these countries consists of sales of hardened oil for industrial purposes and branded edible goods for the household consumer. In Asian countries, Indian exports have to compete with European products which sell cheaper. But there is still scope for increasing exports of these commodities, particularly branded edible products. The Government's policy has been one of encouraging exports by liberal licensing and by granting excise duty rebates, etcetera.

Targets under Second Plan

The second plan, which began with a deficit in oil supply, provided for an increase of 27 percent in the output of major oilseeds, that is, from 5.6 million tons in 1955-56 to 7 million tons in 1960-61. Subsequently, this was revised upwards to 7.6 million tons. Considering the rising demand for oils in the country for edible and non-edible purposes, it is felt that these targets, even if they are realised, would mean a shortfall. The brunt of this excess demand over supply will perhaps have to be borne by groundnut oil since it has both an industrial and edible use. The supply position of castor and linseed oil is comfortable and barring a large-scale crop failure, their output could perhaps meet both local and export demand on the present scale. The urgency of increasing production is not the same for all oils.

An attempt to increase exports is an important activity of any Government. But export promotion has a greater urgency in the present context of India's large foreign exchange needs. While the need for stepping up exports of oils and oilseeds has been well recognised, the implications for policy making are not so well understood. A successful promotional policy should consist of three parts, one designed to encourage edible oil exports, another to step up non-edible oil sales abroad and the third to provide assistance such as market information, fiscal concessions and a steady export policy for the trade.

Domestic Demand

Exports of edible oils are closely linked with the problem of domestic demand. As long as the latter is not met, exports may not be desirable. Thus the answer to this question in the long run is to increase output and in the short run to find substitute oils. Cottonseed oil, with large potentialities, promises to be good for experiments. If a change were possible, the groundnut oil surplus so obtained might be made available for export. Some have suggested that local consumers should be deprived of supplies so that some oil might be diverted for export. The Export Promotion Committee Report (August 1957) recommended this course as one of the possible measures which could be taken by the Government. When one considers the low fat consumption in the country, the wisdom of this course appears doubtful. It would appear that guaranteeing an adequate supply of edible oils at fair prices should be taken up as the first target. The need to increase export earnings, however urgent, should be accorded only a second priority.

Export Promotion of Non-edible Oils

The considerations for non-edible oils are different. The profitability of producing castor-seed and linseed depends on export possibilities. Their export promotion should, therefore, be undertaken on the basis of an altogether different criterion. The problem is one of diversifying and increasing the trade. As it is, India depends on two or three countries for her sales and one wonders whether the Indian trader has got the right price for his goods. Hitherto, the Government's policy has regulated the flow of exports through the manipulation of export duties. By and large, it has been beneficial except on occasions like the imposition of an export duty of Rs. 250 a ton on linseed oil. Perhaps the defect is more with the use of the technique than the technique itself. To obtain good results, the Government's policy should go beyond the manipulation of duties. For example, the adequacy of the present marketing organisation can be evaluated—a project which could be profitably undertaken jointly by the Government and the trade. A well-organised marketing structure is a precondition for successful promotional activity.

There is also a need to render assistance to exporters. The Export Promotion Committee recommended a list of desirable concessions and the Government might consider granting them in so far as they do not conflict with the existing policies. The future trend in oil exports depends on two factors, first, to increase domestic supply and secondly, to implement a rational promotional policy.

Monetary Anaemia in the Lac Trade

Synthetic Substitutes Threaten Exports

INDIAN readers with lac interests might remember seeing a competent Indian Ministry of Information documentary film entitled *Lakhs from Lac*. At the time it was shown in Calcutta, there was some comment, superficially jocular but fundamentally serious, by traders, to the effect that the euphonic title was apt to give a misleading impression of the commodity's profitability to them. Nowadays, there is not the least trace of a smile when the trader complains that lac lacks lakhs. He alludes not only to the painful truth that it is extremely difficult for him to earn a modest profit, but also affirms that the trade suffers from a shortage of finance which has become chronic.

Some of the factors causing this monetary anaemia are common to most primary products for which the conditions of international trade are unfavourable. Another, particular to lac, is that two important concerns, one of exporters and the other of brokers, both of which acted as merchant bankers to the numerous small businesses conducting a major part of the trade, have closed their lac departments in recent years. Because of their specialised knowledge of the commodity and of the traders they financed, those concerns were prepared to accept risks which commercial banks could not entertain. Other financiers have had their available funds reduced by losses and taxation; or finding their taxed profits too small in relation

to the development of synthetic dyes. But within a few years they were quite happy to let the dye run to waste, because the rapidly industrialising European and American countries found multitudinous uses for the resin which previously had very little commercial value. There was another near-panic when synthetic resins displaced shellac in U.S.-made gramophone records, but within a very short time an enormous demand was created in that country for seedlac as an ingredient in "no-rub" polishes. That the shellac-type gramophone disc is not yet an anachronism is indicated by the table of statistics for U.K. production and sales of records, which is reproduced on this page from the British Board of Trade Journal of 31st January, 1958.

Although the table also indicates a trend in favour of microgroove records, for which it has

A basket of sticklac freshly cut

to the risks involved, have diverted their money to uses offering better rewards. Money was also put into the trade by speculators, until they found that the main reward they earned was disapprobation. The activities of those relics of a time (not so long ago) when boldness was all, were severely curtailed by measures applied under the Forward Trading Act. The effective closing of the "fatka" was welcomed by responsible traders who, while entertaining no doubt about the demise of that unsettling institution having been good and timely, have since suffered from the lack of hedging facilities; the use of the recently reorganised London terminal market is denied them by the Reserve Bank's refusal of permission to remit differences.

Fall in Prices

A debilitated trade has not had the strength in an unfavourable commercial climate to resist successfully the overwhelming factors which have brought prices down to a point at which lac is remarkably good value for consumers' money, but which has markedly reduced foreign exchange earnings from a sustained volume of exports. The trade is not in immediate danger of dying from this malady. A similarly low price level prevailed from April 1952 to June 1953, but those rates were more than doubled by the winter of 1954-55. Nature's most versatile plastic resin is as resilient in commerce as it is in application. There is, however, a very real risk of debility, if left untreated, resulting in the trade dwindling into insignificance.

Serious Crises

The commodity has survived several serious crises in its long history. Traders were probably desperate when the demand for lac dye practically ceased in the third quarter of the last century due

been impossible to modify shellac, and sales of single-speed (78 r.p.m.) record-players in the U.K. are probably small nowadays, obviously many millions of shellac-type records (78s) will be bought there and in less prosperous countries before users go to the expense of acquiring multi-speed players or can afford the expensive "thirty-threes"—or, in rural areas, have electricity to drive the three/four-speed players. None of this is intended to suggest that the trade is complacent or can afford to wait for another near-miracle to save shellac from going the way of indigo. It is undeniable, however, that shellac interests cannot begin to mobilise a significant fraction of the vast financial resources devoted to research and expansion by the giant concerns exploiting synthetic resins.

Synthetics Lack Versatility

About these substitutes for lac, it may be said in general that each is developed specially for a particular purpose. The demand arises from lac being found unsuitable (for microgroove gramophone records, for example), or too expensive (in

the past), or too liable to wide fluctuations in price (not lately), or too inconstant in properties (remediable by scientific control of manufacture). In general, no synthetic can match the versatility of lac, and for certain applications, no synthetic has yet been developed to a point where it is a fully satisfactory substitute for lac. But the trade has to realise that it is only a matter of time, and not much time, before research chemists with every conceivable facility available produce substitutes eminently suitable for the major industrial processes still using lac. For instance, earlier in this article the 78 r.p.m. record was categorised as "shellac-type". It is believed that no synthetic has been found to equal shellac for those discs but certainly a lot of research has that aim.

Synthetic resins have one very practical and considerable advantage over the natural product: not being dependent upon the vagaries of a very sensitive insect for their raw material, not being exposed to the vicissitudes of an equally sensitive commodity market, they are stable in price. Prospective users, knowing that they can plan on the substitute being available at a certain price for as long ahead as they care to look, will have little hesitation in undertaking the modifications to their plant that its use might need. Once having made the conversion, they will be very reluctant to consider incurring the expense of reconvertng for using lac, unless they are perfectly sure that lac will be available at an economic price for as long as they plan.

All this serves to emphasise what is only too evident: money is the bifurcated root of evil in the lac trade, the furcations being capital and price. How is the trade to raise capital? How are prices to be stabilised? Some traders, rugged individualists, who would bitterly oppose governmental interference were they prospering, tend to adopt the welfare State "the-world-owes-me-a-living" attitude and look to New Delhi for help when they are in trouble. Time may have eroded their memories of the Indian Government's intervention in 1946, when it banned the import of lac. That measure was directly responsible for creating in Thailand

The native process of washing

a competitive industry which broke India's virtual world monopoly in lac and its ill-effects are still being felt today. With their Indian market for sticklac and seedlac denied them, the Siamese were forced to seek other outlets. Aided by their free dollar market, they took away from this country a major share of U.S. bleachers' demand for seed-lac. By July 1947, when, having realised what harm it was doing the Indian Government rescinded the ban, the Thailand-U.S. trade was well established. Had not nature come to India's aid by giving Thailand a very small crop last year, the lac trade here would have been in an even sorer state than it is at present.

Cess on Exports

A governmental measure of long standing is the collection of a cess on exports, the proceeds being intended for expenditure on measures to improve all aspects of the trade under the auspices of the Indian Lac Cess Committee, on which official nominees are prominent. This body celebrated its silver jubilee in 1956, which was the year Dr. Louis A. Jordan presented his *Report on Lac* to its president. Dr. Jordan, the distinguished Director of the Paint Research Station in Britain, whose concern with the commodity started soon after the publication of the 1921 Lindsay-Harlow report on lac, was commissioned under the Colombo Plan "to enquire into matters touching the development of the lac industries, to examine the research potential of the Indian Lac Research Institute, and to make recommendations likely to promote the utilisation of lac with special reference to the (surface) coating industries".

For all the ordinary man-in-the-trade knows, his invaluable report has been eaten by white ants. Or perhaps it gathers dust in some official records room because paragraph 28 of its summary reads: "The Indian Lac Cess Committee is expressly responsible for management and purports to be the effective governing instrument of the Indian Lac Research Institute, but actually it has become little more than an advisory committee to the Ministry of Food and Agriculture and the Indian Lac Research Institute is run as an appendage of that Ministry". Dr. Jordan had no doubt that this administrative system handicapped the effective use of the lac cess funds, which amount to about Rs. 6 lakhs a year. Traders endorse his opinion, being sure that the money could be put to more effective and practical use if it were spent on sales promotional activities in consuming countries. Such measures should not be those which sellers ought properly to take on their own initiative, but might best consist of co-operative technical services to compete with those offered by sellers of synthetics, for, with synthetic resins, consumers buy technical service to help them get the best value for money, and prompt, skilled guidance which serves to bring the benefits of manufacturers' laboratories to the consumers' factories.

Liaison with Consumers

India's second five year plan recognises the need for effective liaison with lac consuming markets. As a result, the Shellac Export Promotion Council has been established. As this body was not officially inaugurated until February 1958, no assessment of its effectiveness can yet be made. But in his report, Dr. Jordan warned that an Export Promotion Council would be no substitute for technical service, and its chairman, in his introductory

speech at the inaugural meeting, made it obvious that the Council is price-conscious in the wrong way. The chairman, Mr. C. R. B. Menon, of the Department of Commercial Intelligence and Statistics, Ministry of Commerce and Industry, was reported as saying: "The commodity, 90 percent of which is at present exported, brings the country some Rs. 7 crores to Rs. 10 crores a year, the amount depending on the price. Several circumstances have contributed to a lowering of the price in recent months and the consequent loss of foreign exchange. Due to the relative inelasticity of production, any large quantitative increase in exports is not to be expected in the near future. The immediate objective which the Council has set before it is that of securing an increase in price to a level which would be attractive to the foreign importers and users of shellac and remunerative to the Indian trade and industry."

Fallacious Reasoning

It seems reasonable to assume that Mr. Menon expressed, in the words italicised, a typical official idea on how to increase earnings. The fallacy in the argument is obvious to the practical lac trader. Up to the time of writing, no official action has been announced "to secure an increase in price". The trade hopes the Government has realised that any such move would very likely result in losing customers for lac by influencing them to use substitutes, further reducing exchange earnings and traders' incomes. In fairness to Mr. Menon, it should be mentioned that earlier in his speech he showed full awareness of the typical trader's tendency to wait for business to revive, when he said: "India does not sell but is bought from, that is to say, Indian produce finds a market abroad because there are buyers, and not because of efforts made by us in

creating or increasing the demand. We do not do enough, indeed very little, to draw the attention of the world to our commodities and manufactured goods or their merits. We tend to leave the goods to sell themselves".

Yet another quasi-governmental organisation is interested in lac—the State Trading Corporation of India (Private) Ltd. It has been doing something to "draw the attention of the world" to lac by circularising quotations to regular importers in certain countries and soliciting their business. Some recipients may have been misled by the word "Private" in the title, and by the amateurish nature of those overtures, into thinking that the concern is yet another bazaar party trying to compete in a shrinking trade.

Governmental Interference

The belief of responsible traders that governmental interference of any kind is undesirable is not for doctrine's sake. They hold that the best man to do the job is the one whose pocket is affected, the practical business man who depends on the export of lac for his living. The leading ones are members of the Calcutta Shellac Trade Association. Since he spurns the Government's hand, is the lac trader doing so much on his own initiative that the trade's future is safe? Whatever individual concerns may be doing, the sad fact is that the strength of the Calcutta Shellac Trade Association seems to be dissipated in trying to settle interminable petty trade disputes. One of its declared purposes is "to object to and oppose any action detrimental to the interest of the lac industry and trade". Since major happenings detrimental to the trade are generally outside its control, the Association might well devote itself to positive action designed to support and promote all conceivable measures to save the trade from extinction. To quote again from Dr. Jordan's report: "It is to be hoped that the traders' associations, especially the Calcutta one which is paramount in this matter, will recognise that the recent decision against Government action (Indian Lac Cess Committee Report, December 1955) is really no more than a respite. It should be recognised by the trade as an opportunity to show a quality of statesmanship in setting its house in order".

Fixing Prices

The actual context of that quotation and the decision to which it refers was the shelving of the question of the Government imposing maximum and minimum prices. Meantime, that particular question—"How are prices to be stabilised?"—has changed its relevance, because between February 1957 and April 1958, the limits of T.N.'s fluctuations have been Rs. 90 and Rs. 70. Price, therefore, is not at present a handicap for exports, but it will take many years of such stability for lac to lose its reputation of being volatile in price—a reputation which deters many a likely buyer overseas. Also, there remains the possibility of prices becoming unreasonably high at a time when inadequate incentives, or adverse weather, result in poor crops.

The question which is of immediate and urgent importance is: "How is the trade to raise capital?" If aid from the public sector is ruled out as unlikely to be offered, and undesirable if it were, the trade has to do its very utmost to see that the lac cess funds are used to the best possible effect. It has also to put its own house in order so as to attract fresh capital from private sources.

The process of winnowing to remove sticks

Changes In The Raw Cotton Trade

Domestic Output Increasing: Surplus Of Short Staples

THE rapid growth of the textile industry in recent years has had a substantial effect on the export and import of raw cotton. In the years before partition, local requirements of fibre were much smaller than they are now and the cotton grown in the territories of what is now Pakistan was available. There was thus a substantial overall surplus and fibre, of any staple, was allowed for export free of all restrictions. The following figures relating to the all-India commercial cotton production, the consumption of east Indian cotton by mills and the quantity exported in the year 1946-47 (in bales of 400 lbs each) illustrate roughly the position as it was before partition:

UNDIVIDED INDIA		
Production Bales	Mill consumption Bales	Exports Bales
4,200,000	3,161,500	1,110,000

After the country was partitioned in August 1947, the situation altered radically. The Pakistani crop was no longer available, whereas the requirements of the mill industry, most of which was situated in the Indian Union, as it is today, were not reduced to anything like the same extent. The following figures illustrate approximately the internal supply and the mill consumption of east Indian cotton in the Indian Union immediately after partition, namely, during the 1947-48 season:

INDIAN UNION	
Cotton production Bales	Mill consumption Bales
2,687,000	3,586,666

It is apparent that, with a supply and demand position such as this, free exports of cotton could not be allowed to continue. In the first two years after partition, the situation was met by drawing on a large carry-over. But the requirements of the textile industry could not continue to be fulfilled in this way, so in 1949-50, following the short crop of 2,050,000 bales, the Government imposed restrictions on exports. The restrictions took the form of periodical releases of export quotas to established shippers on the basis of certain percentages of their past performance in a given period, with some quantities reserved for new shippers. The Government released these quotas piecemeal, in accordance with the prospects of the growing crops and taking into consideration the requirements of the textile industry. This ensured that the country would not be left short of the cotton which it required.

In the first year of export restrictions, quotas for the export of 200,000 bales were released. These quotas have since exceeded the 500,000 bales given in the 1954-55 season, when the cotton crop in the Indian Union was the biggest on record. Last season, export quotas for 400,000 bales were released, whereas so far this season, with only four months of the cotton year to go, only 200,000 bales of quotas have been released (150,000 bales of Bengal Deshi and 50,000 bales of cotton other than Bengal Deshi not above $\frac{3}{8}$ inch in staple length). In addition, Assam-Comilla cotton, Indian Zoda and Yellow Pickings are freely licensed for export up to the end of the current season. It is doubtful, in view of the tight statistical position, whether more than a further 50,000 bales will be released.

Crops and Consumption

The following table shows the size of the crops, the consumption of Indian cotton by the textile industry and the export quotas released during the last year of undivided India and the ten years since partition:

Season	CONSUMPTION			Total East Indian	Export quotas released
	Production Bales	Indian Bales	Pakistan Bales		
1946-47	2,687,000	2,144,871	1,016,836	3,161,507	Export free
1947-48	2,687,000	2,263,450	723,216	3,586,666	"
1948-49	2,047,000	3,123,915	410,956	3,534,871	"
1949-50	2,623,746	2,544,174	203,442	2,747,616	200,000
1950-51	3,129,585	2,516,963	17,578	2,534,541	160,000
1951-52	3,695,000	2,967,453	4,185	2,971,638	350,000
1952-53	3,499,790	3,611,630	855	3,612,585	250,000
1953-54	4,351,585	3,886,746	368	3,887,118	175,000
1954-55	5,106,000	4,138,438	4,916	4,143,354	531,000
1955-56	4,423,539	4,365,466	—	4,365,466	425,000
1956-57	4,822,208	4,965,581	42	4,965,623	400,000

A cotton plantation

Great progress has been made in increasing cotton production so as to keep pace with the expanding consumption of the textile industry. But before the quantities released for export can be increased materially, more Indian cotton will have to be grown. India has always been the home of short-staple cottons and has supplied the world with these varieties. There has always been, and still is, a surplus of them left after meeting the requirements of her own industry. It is these varieties which she should continue to export. This would not only earn foreign exchange, but would also at the same time help ensure continuity of supplies to foreign countries and the retention of export connections. By short-staple cotton is meant cotton of less than $\frac{3}{8}$ inch staple, and it includes Bengal Deshi and Assam-Comillas.

Exportable Varieties

Assam-Comilla is a particularly rough, short-staple cotton, which is mixed with wool in the

From

A Special Correspondent

manufacture of blankets and is hardly used in this country. Its export is and always has been unrestricted. The crop is a small one, averaging only about 20,000 bales a year. It is grown in West Bengal, Assam and Tripura, and exported from Calcutta. Bengal cotton, in spite of its name, is grown in Punjab and Rajasthan, and is one of the original indigenous varieties produced in this country. Its staple length varies from $\frac{1}{2}$ inch to $\frac{3}{4}$ inch. The crop, since partition, has amounted to about 350,000 bales a year, of which the textile industry consumes only about 150,000 bales. The remainder is surplus and is exported. The main consumers of this cotton are Japan, the United States, the U.K. and the Continent of Europe, where the cotton is spun into coarse-count yarn varying from 2's to 8's; the yarn in turn is used largely for the manufacture of canvas, coarse furnishing materials and surgical dressings. The rougher Bengal Deshi is used for the same purpose as Assam-Comilla. The only other country in the world which produces a similar variety of cotton is Pakistan. India's Bengal Deshi exports depend to some extent on the availability and offerings of Pakistani Bengal Deshi.

Besides these two styles of cottons, a portion of the shorter-staple Oomra Deshi, grown in Madhya Pradesh and the Vidharba district of Bombay State, and Dholleras grown in Saurashtra, are also usually licensed for export. This is done when the statistical position allows it, and provided the staple length is adjudged, by the Ad Hoc Valua-

tion Committee of the Textile Commissioner, to be less than the required maximum. Occasionally Coconada cotton, a reddish-tinged variety grown in an area of Andhra Pradesh, is also licensed for export.

Efforts are being made by bringing new lands under cultivation, by using improved seeds and by popularising the use of fertilisers, to increase and improve the cotton grown in this country. These efforts are mainly directed towards producing fibre suitable for use by the textile industry. A network of canals is now being dug in Punjab and Rajasthan, which will irrigate thousands of acres, on some of which more Bengal cottons will undoubtedly be sown. Most of the cotton so produced should be surplus to India's spinning requirements and may be exported. But it is doubtful whether, for a long time to come (if ever), India will be able to export, in quantity, any cotton other than short-staple. The textile industry, which at present aims at exporting 1,000 million yards of cloth a year, only manufactures enough to supply 16.5 yards of cloth a head a year to the population of India. The second five year plan aims at increasing the availability to 18.5 yards a head, but even this is an extremely low level of consumption and there is plenty of scope for expanding it. Because of the scope for a large increase in the manufacture and consumption of textiles in this country, there is less scope for a large increase in raw cotton exports in the near future.

Imported Growth

No country can be entirely self-sufficient, nor is it altogether desirable that it should be so. India has to import a considerable quantity of foreign cotton in order to meet the requirements of her textile industry. The quantity of Indian cotton grown is insufficient to meet requirements. Also, since none of the cotton grown here has a staple length of more than $1\frac{1}{4}$ inches, foreign cotton has to be imported for manufacturing fine and superfine cloth. In recent years, as the standard of living has improved, the demand for the better cloths has increased. To some extent, this tendency has been met by a steady improvement in the cottons produced at home, but the stage has not yet been reached when the country can do away entirely with the import of long-staple foreign cottons. Although the consumption of such cottons has been reduced from approximately 700,000 bales (of 400 lbs each) immediately prior to partition (in 1951-52 it reached nearly 1.1 million bales) to approximately 575,000 bales last season, every effort is being made to reduce it further by producing in the country adequate supplies of cotton of long staple, comparable in quality with East African, Egyptian and Sudan growths.

Improved Cultivation

In recent years, with the completion of various multi-purpose irrigation projects by the Government and as a result of intensive efforts on the part of the Indian Central Cotton Committee, several improved varieties of cotton have been

A woman with a head-load of cotton

evolved and introduced in general cultivation, such as MCU-1 and MCU-2 in Madras State, and the Indo-American strains 134.Co.2-M and 170.Co.2 in Bombay State. It is hoped that with the expansion of the cultivation of these improved varieties, cotton suitable for the manufacture of fine cloth will be available within the country, and imports of comparable cottons, if not altogether eliminated, will at any rate be considerably reduced in the not-too-distant future. As for cotton of extra long-staple suitable for superfine cloth, the country will continue depending for years to come on imports.

Progress has, however, been made in the cultivation of "Sea Island Andrews" cotton in Kerala. Although the cultivation of this strain is still in an exploratory stage, its successful acclimatisation in that State indicates clearly the possibility of growing extra long-staple cotton in this country. The following table shows imports of foreign cottons into India (in bales of 400 lbs each) during the ten years since partition:

	Egyptians	Sudans	East Africans	U.S.A.	Others*
1947-48	237,250	88,000	171,000	17,250	260,000**

U.S. Aid Programmes

Imports are at present confined to cottons with a staple length of 1½ inches and above. Those from the sterling area countries depend on the availability of foreign exchange, while imports from the United States are governed by the Indo-U.S. Agricultural Commodities Agreement concluded in August 1956. All imports are closely controlled by the Government. It is guided by the Textile Commissioner, who maintains a large organisation in Bombay to keep in close touch with the various cotton interests. No cotton can be imported without an import licence. The main factors governing decisions to allow imports and to issue quotas are the requirements of the mills and the availability of foreign exchange.

During this season and the last one, U.S. cotton has been imported under Public Laws 480 and 665

A woman worker collecting cotton

of the U.S. aid programme. A special procedure has been laid down by the Government, under which mills or importers were allowed to import the cotton within a certain quantitative ceiling at a fixed rate of exchange and to contract for and ship the cotton within a stipulated period specified in the P.L. 480 and P.L. 665 purchase authorisations issued by the U.S. Department of Agriculture. Against the two purchase authorisations issued to India towards the close of the last season, for \$22,256,000, a quantity of approximately 132,760 bales has been licensed for import in the current year. Import quotas for cotton from the sterling area—Egyptian, Sudan, East African, Peruvian and others—periodically released so far this season amount to 165,000 bales. Unlike the procedure for U.S. cotton, licences for sterling area cotton are issued only to actual users. It is not possible for importers to trade in these cottons as they used to do in the past. Since the quantities periodically released are very small, the Textile Commissioner has now been allocating quotas to mills on the basis of their average yearly consumption of comparable cottons in the past three seasons. This method of distribution is a great improvement on the "first come, first served" procedure followed until recently by the import authorities.

The Prospects

According to the present programme, during the next four months of the current season, it is expected that the following further quantities of foreign cottons will be permitted for import: (a) about 60,000 bales of 400 lbs each of U.S. cotton under P.L. 480 and (b) about 55,000 bales of 400 lbs each from all sterling area countries of cotton stapling 1½ inches and above.

The following growths of foreign cotton are usually consumed by the textile industry here and are mainly permitted for import:

- (1) **Egyptians:** Karnak, Menoufi and Giza 30 for spinning yarn suitable for superfine cloth.
- (2) **Sudans:** All grades of Gezira Sakels ('S's) and Lamberts ('L's), Private Estates ('P.L's), and occasionally some quantities of 'K's', 'K.L's, 'W.L's and Tokars. The higher grades of Sakels can be, and are, used in substitution for the higher Egyptian Karnaks and Menoufis, whereas the lower grades of the Lamberts are interchangeable with the higher growths of East African and U.S. cottons.
- (3) **East Africans:** BP 52, Masaka, Bunyoro, Busoga, Budama, West Nile, Bukhedi, Kenya, Lango, Teso and Acholi grown in the Uganda Protectorate and Mwanza, Shinyanga and Central Line Tanganyika grown in the territory of Tanganyika and used for fine cloth.
- (4) **Peruvians:** Pima cotton, mainly of staple length 1½ inches and above, for superfine and some Tanguis cottons which have a staple length of about 1½ inches and are used for fine cloth.
- (5) **U. S. A.:** California Acala 4-42 and Elpaso descriptions of Strict Middling to Good Middling in grade and of staple length 1½ inches and upwards, from which also fine cloth is produced.

The prospects are that with the country making every effort to become self-supporting, imports will remain rationed, the emphasis being on reduction. Only in years of crop failures at home can one foresee any liberalisation.

RIISING DEMAND FOR PETROLEUM PRODUCTS

OUTPUT AND CONSUMPTION PATTERNS DISSIMILAR

THE industrial and economic progress of a country depends on its commercial sources of energy, such as coal, electricity and oil. Although atomic energy too will become available on a commercial scale in the future, its impact is not likely to be felt for some time. Coal, which supplanted other non-commercial sources of energy, such as wood, during the Industrial Revolution, has in turn been losing ground to oil since the turn of the century. This is especially true of the past 30 years, as will be seen from the following figures:

WORLD PATTERN OF EFFECTIVELY UTILISED ENERGY

	Percentage To Total	Contribution
	1925	1955
Coal and lignite	77	45
Petroleum fuels and natural gas	20	49
Hydro-electricity	3	6
	100	100

For sources of energy, there has been a progressive shift from the coalfields of Europe and the United States to the oilfields of the Middle East and the Caribbean. World production of oil has gone up from 100 million tons in 1920 to 800 million tons in 1955 and over 880 million tons in 1957. Hydro-electricity has been growing steadily in importance, but its contribution to the world supply of energy is still relatively small. The energy picture in India, as in other industrially under-developed countries, is different in as much as approximately 80 percent of her power requirements are at present obtained from animal dung, wood, agricultural waste, etcetera, and from living energy (animal and human). The remaining 20

By

J. Charanjiva

percent comes from coal, oil and electricity. If living energy is excluded the following picture emerges:

SOURCES OF ENERGY SUPPLY IN INDIA: 1955.

	Million Tons of Coal Equivalent	Percentage of Total
Animal dung	90.0	65.4
Wood	9.7	7.1
Coal	28.3	20.6
Oil	5.1	3.6
Electricity	4.5	3.3
	137.6	100.0

Excluding non-commercial forms of energy (animal dung and wood), it is seen that coal currently supplies 80 percent and oil about 13 percent of India's industrial energy. But she provides no exception to the rapid and worldwide growth in the demand for oil. It seems likely that the bulk of the increase in energy requirements here will be met by oil, as it is elsewhere. The demand for oil, which has doubled during the seven years to 1955, is likely to double again in less than ten years. As against the current annual requirements of nearly 5 million tons, the four refineries in India are producing a little over 4 million tons. But if the quantity of oil refined has increased, so have

Wax scale being removed from a hydraulic filter press during paraffin wax manufacture

India's needs, which are growing at the rate of approximately 8 percent a year compound. More oil will have to be found to meet the requirements, especially in view of the programme of heavy industrialisation included in the five year plans. Requirements are likely to approximate 9 or 10 million tons by 1965 and even this might well prove to be an under-estimate.

Pattern of Demand

Although refining capacity in India at present is only slightly below the current demand for petroleum, she has to import, in addition to crude, approximately 34 percent of her requirements of products. This is due to an imbalance between the pattern of demand for products in India and the pattern of refinery output. The latter depends on several factors, such as the types of crude or mixtures of crudes used, the specifications for the quality of the products required, and the special equipment provided in the refinery. While the proportion of the different products can be varied to a certain extent, there is a limit to the variation. Usually, a minimum amount of each product must be made out of a barrel of crude processed in a refinery.

The pattern of product consumption varies in different countries, depending on their state of industrialisation, economic development and per capita income, etcetera. Motor gasoline in the United States accounted for 41.8 percent of her total consumption of petroleum in 1956, as against an average of some 22.6 percent for the rest of the world (excluding the communist bloc) and 25 percent in the U.K. Fuel oils accounted for 20.3 percent of the products in the United States, compared with 42.3 percent in the rest of the world (excluding the communist bloc) and 43.6 percent in the U.K. The main reasons for these differences are: (a) the huge number of motor-vehicles in the United States; and (b) the relatively greater use of fuel oil by industry in western Europe.

Kerosene Consumption

In India, the most important product, in terms of tonnages, is kerosene, which is used mainly for lighting in the over half-a-million villages dotted all over the country. It accounts for over 31 percent of her total oil needs. Next in importance is motor spirit, which claims some 16 percent of petroleum consumption. The use of motor spirit has been virtually static. High-speed diesel oil, on the other hand, is increasing fast, at a rate of over 30 percent, due to the increased dieselisation of commercial road vehicles and because it is being used in many projects. Light diesel oil and furnace oil are increasing at the rate of nearly 6 percent a year.

The net result is that an imbalance has been growing between demand and indigenous output, with potentially large surpluses of motor spirit and, to a certain extent, furnace oil, coupled with big shortfalls in kerosene and diesel fuels, particularly high-speed diesel oil. Over 1.5 million tons of products, including kerosene and diesel oil, had to be imported during 1957, and over 200,000 tons each of motor spirit and furnace oil, which were surplus to India's requirements, had to be exported. In addition, about 26,000 tons of paraffin wax, which is produced by the Assam Oil Company's refinery in Digboi, were exported during the same year.

Shortage and Surplus

It looks as if, in the future, India is likely to run short of middle distillates (that is, kerosene and gas oil) and have more than adequate supplies of motor spirit and fuel oil. This is attributable to the strong switch-over from motor gasoline to gas oil (high-speed diesel oil) for road transport which has developed in recent years and which shows signs of increasing in the future. It cannot be remedied by increased domestic refining capacity alone, since that would aggravate the surplus of motor gasoline and furnace oil, especially the former. Furthermore, the possibility of finding suitable export markets is not strong, as the world

THE TRAVANCORE BANK LIMITED

Head Office: TRIVANDRUM

The Bank offers complete Banking facilities for Trade and Commerce with the fast developing industrial State of Kerala.

- Current Accounts, Fixed & Short Term Deposits and Savings Bank accounts opened on attractive terms.
- ADVANCES granted against Government and other approved Securities.
- All types of internal and international Banking Business transacted.
- For details, please apply to nearest Branch.

supply of motor gasoline is moving towards a surplus.

India can well be proud of her four refineries—Burmah-Shell's and Stanvac's in Bombay, Caltex's in Visakhapatnam, which came on stream in the middle of 1957, and the Assam Oil Company's refinery in Digboi, which is the oldest in India. It is intended to set up two more refineries, in Assam and in Bihar, in the public sector. While these are taking the country nearer self-sufficiency, it has to be appreciated that the demand for petroleum products is growing at the rate of about 8 percent a year compound; the problem of imbalance between the pattern of demand and product output will also continue until a satisfactory way is found to absorb the surplus products, preferably within the country.

Crude Oil Requirements

The major problem of finding more oil in India itself will still remain. At her present rate of industrial and economic development, she will need over 7.5 million tons of crude in 1961, and 20 million tons or more by 1971. It is estimated that, on an average, every additional ton of oil required in excess of the existing demand calls for an investment of approximately £50 or Rs. 660. About half this sum is required to finance the exploration and production of oil from the oilfields, the other half being for refineries, tankers, research and marketing facilities. Thus, an overall investment of some Rs. 350 crores at current prices is required to meet India's future requirements over and above the present levels by, say, 1965, and double this amount by, say, 1970. The oil industry calls for a high degree of capital formation in order to ensure that the sources of supply do not run dry—for oil is a wasting asset—and that the instruments of production and manufacture together with the means of transport and distribution can meet the demand.

EXPORT PROSPECTS FOR MICA IMPROVE

MORE RESEARCH ON NEW USES REQUIRED

ONLY a couple of years ago, the mica industry and trade was in the doldrums because foreign demand was poor and export prospects were bleak. But the outlook has since improved, and exports have increased. The major problem for the industry is that it has all along catered to the needs of foreign markets, and has not tried to develop domestic demand. With a decline in exports, it suffers badly. But it is probable that the establishment of a large number of industries under the second plan will substantially increase the domestic demand for this important mineral, although this will also depend partly on successful research into its many new uses. Some of the national laboratories have conducted investigations, and the new uses will need to be publicised in foreign markets in order to increase demand. With the development of atomic energy in under-developed as well as advanced economies, the demand for mica will increase, especially because of its insulating properties.

A special variety of the mineral, known as phlogopite mica, can be used in electrical installations even at high temperatures, such as in aeroplane engine spark-plugs. There is fair scope for using ground mica in the emulsion paint industry. The utility of the mineral in the manufacture of condensers is great. It owes its strategic importance to a unique combination of physical and chemical properties, which make it difficult to replace by any natural or synthetic product, especially in the electrical industry. As *Research and Industry*, published by the Council of Scientific and Industrial Research, has said, the most important physical property of mica is that it lends itself to easy and accurate splitting into thin sheets or films of any specified thickness. For example, it can be split into flexible and transparent films as thin as 0.00025 in. At present, the internal consumption of the mineral is reported to be 10,000 lbs a year. The

By

A. K. Ganguly

principal users are the railways, electricity supply undertakings and the iron and steel industry. The Journal estimates that 865 tons of insulating materials will be required in the country by 1960-61. It expects an increase in consumption with the development of the electrical industry. It would be a welcome development indeed if the domestic market is expanded during the next few years, for it is not advisable for the industry to depend too much on the vagaries of foreign demand. The expansion of the domestic market will be a difficult task, but with the development of new uses, the objective might be realised in the foreseeable future. Its realisation will help prevent the collapse of the weaker units in the industry if foreign demand declines.

Methods of Production

The mica industry has labour-intensive methods of production. Most units do not even use mechanical power, and the processing is usually done by hand. They are organised on a cottage industry basis. Most of the processing units are located adjacent to the mica belt, which extends over an area of 3,500 square miles. An improvement in methods of production could help strengthen their economic position. They should see to it that costs are reduced, so that they may be able to increase exports. Mica is manufactured at present in Rajasthan, Kerala, Andhra and Bihar; the latter two States produce the mineral which is most suitable for export. The kind of mica produced in Rajasthan and Kerala does not undergo all types of processing. Producers in Andhra and Bihar carry on several operations, namely, cobbing, rifting, cutting, splitting and screening. India is still the foremost producer of the mineral, contributing about 70 percent or 80 percent of the total world supply. Other principal producers are Brazil, Madagascar, Canada, the United States and

Tanganyika. The total production in India was 465,014 cwts. in 1955, 560,685 cwts. in 1956 and 606,883 cwts. in 1957. Although the industry enjoys a near-monopoly, it has not yet been developed to any worthwhile extent.

Proposal for Grinding Plant

The possibility of using mica scrap for the development of a grinding industry has, in recent times, engaged the attention of the Government of India. The Indian Glass and Ceramic Research Institute has been working on the technical possibilities of producing ground mica which might be sold at home and abroad at competitive prices. The Export Promotion Wing of the Central Ministry of Commerce and Industry has also been reviewing the competitive position in international markets. It is due to the availability of cheap mica scrap and labour that a foreign firm submitted a proposal to the Government to establish a grinding plant in collaboration with Indian enterprise. The scheme gave details of the capital investment required, the size of the plant and the estimated annual production. Subsequently, the Central Ministry of Commerce and Industry sent the details of the foreign firm's proposal to the National Council of Applied Economic Research and sought advice on the action which should be taken.

The Council in its pamphlet, entitled *Prospects for a Mica Grinding Plant in India*, published recently, has endeavoured to estimate the world consumption of ground mica. It says that the main source of world supply is the United States. Most of the European countries import the mineral from India and grind it for domestic use, in addition to importing ground mica from the United States. The case for establishing the plant, therefore, depends on the ability to sell the finished product in international markets at competitive prices. The Council says that the nature and extent of the competition which India will face and the prospects of her ability to meet it need thorough investigation.

Production Capacity

The foreign firm has proposed the establishment of a wet grinding plant, having a production capacity of 1,000 tons a day, with a capital investment of Rs. 1.25 crores. It estimates the annual requirements of scrap for grinding purposes at 250,000 tons. This would mean an annual production of about 225,000 tons of wet ground mica. The United States produced 91,695 tons of dry and 14,490 tons of wet ground mica in 1955. The scheme suggested by the foreign firm proposes, therefore, the creation of an installed capacity to produce more than twice the entire U.S. output. The Council says in its pamphlet: "World consumption of ground mica will not reach this level in the next 20 years. Without further consideration, then, this proposal may be rejected. The possibility of a more modest-sized plant needs further consideration."

The main recommendations which the Council has made to the Government concerning the establishment of the mica grinding plant are the following:

1. The foreign firm's proposal to set up a mica wet grinding plant of 1,000 tons a day should be rejected.
2. India should set up a wet grinding plant with a capacity of 1,000 tons a year which, if necessary, might be increased to 2,000 tons a year.
3. There is no need to look for foreign investment as the amount required is not large and is readily available in India.
4. Indian mica interests should be allowed to participate in the project.
5. Further consideration should be given by mica specialists to the question whether an Indian wet grinding process should be used or whether technical aid should be invited from abroad.
6. Efforts should be made to sell ground mica

in European and Asian markets but the U.S. market should not be ignored.

Increased Exports

The foreign exchange crisis has compelled the Government to pay more attention to increasing mica exports. India being the major source of supply for world markets, the efforts will probably not be in vain. But there are serious practical difficulties. Brazil is trying hard to increase her sales to the United States, although the latter still imports a large quantity of Indian mica. Europe consumes about 25 percent of this country's output. Producers were much concerned when the value of exports declined from Rs. 12,52,67,701 in 1951 to Rs. 6,57,29,609 in 1954, which led to the collapse of many units. It is possible that the decline was accentuated by the disposal of surplus stocks by the International Joint Mica Mission, which reportedly released no less than 3,070,000 lbs of unused mica splittings on to world markets. Furthermore, some consuming countries also curtailed their imports. There was a revival in foreign demand in 1955. In 1956, the value of exports amounted to Rs. 8,74,58,162, and in 1957, it increased to Rs. 8,87,69,558.

EXPORTS OF MICA DURING JANUARY-DECEMBER 1957 AND IN THE CORRESPONDING PERIOD OF 1956

Months	1957		1956	
	Quantity in cwts.	Value in Rs.	Quantity in cwts.	Value in Rs.
January	44,779	71,69,184	36,417	69,71,369
February	43,281	67,92,977	39,076	72,98,728
March	48,928	78,11,025	47,112	77,69,108
April	37,867	70,58,346	67,077	75,83,186
May	35,974	76,84,005	48,855	86,50,289
June	26,267	71,48,420	48,828	71,05,888
July	31,929	57,66,649	26,211	70,60,087
August	29,851	67,55,330	23,890	72,59,187
September	23,720	74,19,037	29,412	71,65,225
October	29,738	73,54,321	23,129	60,72,191
November	23,907	76,61,105	38,563	84,66,271
December	49,438	87,97,763	34,172	73,68,030
Total	425,679	8,74,58,162	652,742	8,87,69,558

In spite of the improvement in the volume and value of exports in recent years, it is unfortunate that they have not returned to the level of 1951-52. A spirit of complacency, born of the fact that India supplies the largest amount of mica in the world and that the industry enjoys a near-monopoly position, seems to be proving a handicap.

Development of Substitutes

The only redeeming feature is that the country produces superior grades of mica, namely, the muscovite ruby and the stained ruby, green and black varieties, which are of great value to certain important industries. Extensive research programmes have been undertaken abroad to evolve substitutes. Ceramic cores have replaced mica in most spark-plugs, even for aeroplanes. Furthermore, ceramic sheets and shapes have replaced mica in certain types of capacitors. But these materials, which have been developed only recently due to the shortage of mica in some foreign countries, are unlikely to replace the mineral in its essential uses. Meanwhile, efforts have been made by the Mycalex Corporation of America to produce synthetic mica and a plant has been installed for this purpose. The company has also developed an electrical insulating material, known as super mica ceramic, which can withstand radiation and a temperature of 1,000 degrees Fahrenheit. It is said that the new material is being used in nuclear projects. Synthetic mica, in a form suitable for use in radar and radio equipment, is reported to have been produced at the Colorado School of Mines in the United States. Cakes of the material weighing up to 500 lbs have been made by a new coal hearth process. These developments suggest that the pro-

ducing countries should make greater efforts to establish the superiority of natural mica.

Mica Export Promotion Council

The Central Government appreciates the need to increase exports. It is with this in view that the Mica Export Promotion Council has been brought into being. While inaugurating the Council in December 1956, Mr. D. P. Karmarkar, the then Central Minister for Trade, said that the Government would be ready to provide all possible assistance to help it in its work. The Government has already granted substantial financial assistance; if the required resources are available, the task of carrying on publicity and propaganda campaigns and undertaking market surveys should not prove difficult. But it is necessary that producers and traders should co-operate, otherwise it will be diffi-

cult to carry on promotional campaigns. The Council's constitution shows that its main task is to promote exports by sending out trade missions; by conducting propaganda, regularly and continuously, in foreign markets, and by collecting statistics on mining, exports, manufacture and trading.

There is some controversy over the practice of sending shipments on a consignment basis. Some say that the practice has on the whole affected exports and should be banned by legislation. It is argued that it provides an opportunity for importers to exploit the Indian exporters by forcing the latter to sell the goods at reduced prices. The Mica Export Promotion Council has urged the Government to ban shipments on a purely consignment basis and to permit exports only against letters of credit opened for not less than 85 per cent of the value of the goods.

Pre-shipment Inspection

The Council thinks that there is a crucial need to introduce a system of inspection before mica is shipped, since buyers often complain that sub-standard materials are received from suppliers here. On the other hand, the latter complain that importers either reject the goods or are sometimes reluctant to pay the full price for flimsy reasons. To help solve these problems, the Council has set up an inspectorate. The agency will inspect mica before shipment on the basis of samples sent to it by buyers. It is true that there will remain considerable scope for differences of opinion about quality, the more so since mica is a mineral which has to be visually examined in deciding its quality before shipment. In order to minimise such differences of opinion, it is considered necessary to appoint a panel of judges to assess the quality in cases of dispute between the inspectorate and the shipper; the opinion of the majority of judges will be final. The scheme for pre-shipment inspection will shortly be considered by the members of the Council. In the light of their views, it will be modified, if necessary, before being finally approved by the Committee of Administration. Since there is no machinery at present to settle disputes between buyers and sellers, the Council has prepared a draft form of arbitration rules and they will be

finalised in the near future. When they are implemented, both buyers and sellers will have the confidence that in cases of dispute, justice will be done to the aggrieved party and that the unscrupulous dealer will not be allowed to go scot-free.

Appointment of Correspondents

It is necessary to undertake industrial and market surveys in schemes for export promotion, so the Council wants to prepare an industrial survey; this is a difficult task because of the reluctance of some traders to furnish information. The Council, since its inception, has appreciated the need to appoint correspondents in foreign countries. Two U.S. firms were recommended for this purpose by its trade representatives there. One quoted a very high fee for sending only four quarterly reports. The Committee of Administration, therefore, could not accept the offer. As far as the United Kingdom is concerned, it has been resolved that the mica business there is very well organised and that no purpose would be served by appointing correspondents. A correspondent has been appointed in Japan, free of cost. In countries like West Germany and Switzerland, none have been appointed because of the high charges involved.

Market Surveys

As for the market surveys of foreign countries, the Government of India has agreed to shoulder the responsibility. The Council has received a report on market conditions in Switzerland. The Central Government has expressed its willingness to arrange foreign exchange for those concerns which want to send their representatives to foreign countries for their own business, but the condition is that their reports on the markets will be given to the Government for circulation to the trade. The Council compiles statistics for the information of its members. This helps it maintain a record of the monthly export of mica to different countries. The data should prove helpful in preparing a comprehensive market survey.

The Council's record of activity indicates that it is keen to help mica exporters develop their business. The Central Government occasionally informs it of foreign fairs and exhibitions, and the Council, in turn, circulates the information to exporters. Recently, some firms have expressed their willingness to exhibit goods in showrooms and booths in a few countries. The Council proposes to compile a trade directory containing the names and addresses of exporters and importers. The preparation of a code of conduct for exporters might prove helpful to foreign buyers, who complain that they are often not dealt with fairly. The Council proposes to treat exporters who observe the code better than those who do not. The importance of a code of conduct cannot be under-estimated considering that mica has been included in some recent trade agreements, such as the Indo-Greek one. In the recent extension of the Indo-Hungarian trade agreement also, provision has been made for exporting mica from India.

It is evident that the Central Government attaches great importance to increasing mica exports. A sub-committee has been appointed to advise it on all matters connected with the industry and trade. This measure has been taken in accordance with the recommendations of the Mineral Advisory Board. It has been decided that the Mica Advisory Committee should not continue as an independent body but should become a sub-committee of the Board. The Joint Secretary to the Department of Mines and Fuel will be chairman of the sub-committee, and the Director of the Geological Survey of India will be vice-chairman. Other members will be the Director of the Indian Bureau of Mines, two representatives of the Government of Bihar, one representative each of the Governments of Andhra, Rajasthan and West Bengal. Besides, a few representatives of mica associations are to be included.

U.S. Decision on Price Equalisation

Although no export target has yet been fixed, on account of the vagaries of foreign demand, the outlook is brighter than it was a couple of years ago. The most important development during the current year which is likely to boost exports is the decision of the General Administrative Services of the U.S. Government to equalise the prices of Indian mica with that from Brazil. This equalisation means an increase in the prices of the former, especially for strategic grades, by 20 per cent on an weighted average. It had been a long-standing grievance of exporters here that Brazilian mica was purchased by the U.S. Government at a higher price. It is expected, therefore, that the decision will encourage traders to increase exports to the United States. With greater initiative from the Export Promotion Council and the Government, the mica industry and trade might be able to level attained during 1951-52. Indeed, there is reason to believe that this expectation will be fulfilled in the foreseeable future.

MEASURES TO PROMOTE TOBACCO EXPORTS IMPORTANCE OF QUALITY CONTROL SCHEMES

TOBACCO exports earn about Rs. 12 crores of foreign exchange. The commodity is the foremost contributor of excise revenue in India and brings the Indian Exchequer over Rs. 35 crores annually. It provides employment for millions of people in the country and is a good source of income for a large number of growers and their dependents. Among Indian exports, tobacco holds the ninth position and among the world producers of tobacco, India is next only to the U.S.A. and China. She holds fifth position among the tobacco exporting countries, the first four being the U.S.A., the Federation of Rhodesia and Nyasaland, Turkey and Greece. India's position in the export trade in tobacco, however, does not bear a very close relationship to her production. The following table giving the statistics for 1956 illustrates this:

Country	Production (million lbs)	Exports (million lbs)	Percentage of exports to production
U.S.A.	2,125	510	24.0
China	1,630	N.A.	—
*India	685	100	14.60
Brazil	329	67	20.36
Japan	333	1	0.3
Turkey	246	130	52.85
Rhodesia and Nyasaland	199	165	82.91
Canada	168	30	17.86
Greece	168	110	65.48

(*The production and export figures relate to 1956-57).

N.A.—Not available

The Federation of Rhodesia and Nyasaland exports nearly 83 per cent of its output, the U.S.A. 24 per cent, Greece, Turkey and Canada about 65

Burley, sun-cured Natu (country) and bidi tobaccos. Virginia tobacco accounts for more than 75 per cent of the exportable quantities. Indian flue-cured Virginia is well known for its bright colour and other agreeable qualities. It is also comparatively cheaper than tobaccos of other origins. Only about one-seventh of the country's output, that is, about 100 million lbs, is exported. Exports averaged about 50 million lbs in the two years before the second world war; during the war, they fell to as low a figure as 13 million lbs, but shot up to 75 million lbs in 1946-47. In the next two years, they came down once again to 53 million lbs and 56 million lbs, respectively, but went up in 1949-50: The figures for exports of both manufactured and unmanufactured tobacco since 1949-50 are given below on the basis of statistics released by the Director-General of Commercial Intelligence and Statistics, Calcutta.

Year	Quantity (Million lbs)	Value (Million rupees)
1949-50	86.64	119.63
1950-51	98.29	152.10
1951-52	107.46	169.35
1952-53	81.19	138.52
1953-54	73.10	120.95
1954-55	88.74	129.87
1955-56	92.35	118.29
1956-57	99.92	138.27

The U.K. Market

The most important market for Indian tobacco is the U.K. Before the war, she took over 50 per cent of India's total exports and a major portion of the remainder went to Aden and the dependencies, Burma, China, Japan, the Straits Settlements, the Federated Malay States and the Netherlands.

Exportable Varieties

The important types exported out of India are flue-cured Virginia, sun-cured Virginia, White

Workers sort out tobacco leaves according to grades

During the later war years, Burma and China completely dropped out from India's export trade, while there was a big increase in the off-take of Egypt and Ceylon. The present markets for Indian tobacco, together with the situation in each of these markets, may now be outlined.

The U.K. has always been the biggest buyer of Indian tobacco. F.C.V. tobacco forms the bulk of Indian tobacco exports to the U.K. The bright colour grades 1 to 4 are preferred. This is used in the manufacture of cigarettes, as the characteristics of Indian F.C.V. tobacco enable it to be readily blended with other tobaccos. The other types of Indian tobacco purchased by the U.K. are White Burley and sun-cured Virginia for pipe and shag mixtures. C.D.K. and C.H.D. grades of sun-cured country (Natu) tobacco are also imported by the U.K. India faces keen competition in the U.K., mainly from the U.S.A., the Federation of Rhodesia and Nyasaland and Canada. The U.S.A. is the largest supplier of leaf tobacco to the U.K. followed by Rhodesia and India. Her annual off-take of Indian tobacco is roughly 35 million lbs. About 33.5 million lbs of Indian tobacco worth Rs. 8.75 crores were imported into the U.K. during 1956-57.

The Continental countries which purchase Indian F.C.V. tobacco are Belgium, Sweden, the Netherlands, France, Germany, Switzerland, Italy, Portugal and Denmark. Their imports consist mostly of the low and medium grades of F.C.V. tobacco, with occasional demand for top grades also.

Asian Countries

Among Asian and near Eastern countries, the prominent ones are Pakistan, Afghanistan, Aden and dependencies, Bahrain Islands, Yemen, Saudi Arabia and Ceylon. They imported the following quantities over the last seven years:

Year	Quantity (Million lbs)	Value (Million rupees)
1950-51	17.16	29.65
1951-52	13.98	25.29
1952-53	8.91	17.99
1953-54	11.94	16.63
1954-55	12.46	17.04
1955-56	11.00	15.50
1956-57	11.46	16.40

In previous years, Afghanistan and Aden and dependencies imported mostly bidi and hookah tobaccos. But of late, they have shown interest in low-grade Indian flue-cured Virginia tobacco also. In 1956-57, Afghanistan did not import any quantity of Indian tobacco. Ceylon takes both Virginia as well as bidi tobacco and bidis. Bahrain Islands, Yemen and Saudi Arabia import only bidi tobacco. Pakistan was the second largest importer of Indian tobacco till 1951-52; since then her purchases have dwindled. Her imports consisted mostly of bidi and bidi tobacco as well as Virginia tobacco. Imports of Indian tobacco in certain countries during 1956-57 were as follows:

Country	Quantity (lbs)	Value (Rs.)
Aden	6,496,545	30,61,592
Ceylon	3,299,105	1,20,08,019
Saudi Arabia	861,467	8,06,050
Yemen	673,553	2,94,730
Bahrain Islands	113,674	1,19,671
Pakistan	13,543	1,23,392

2, DALHOUSIE SQUARE EAST, CALCUTTA-1

BOMBAY - MADRAS - DELHI

Among the Eastern countries, the prominent ones are Hongkong, Indo-China, Federation of Malaya, Burma, Indonesia, Japan and China. Hongkong is a big assembling centre though no tobacco is grown there. The bulk of Hongkong's imports consists of F.C.V. tobacco for use in cigarettes. Prior to the second world war, China was the main source of supply but during the past few years most of these imports came from the United States and India. Quantities of Indian tobacco imported into Hongkong are shown below:

Year	Quantity (Million lbs)
1950-51	1.26
1951-52	18.22
1952-53	2.39
1953-54	2.82
1954-55	3.34
1955-56	1.20
1956-57	1.32

Exports to Indo-China and Malaya

Indo-China is also a market for Indian low-grade F.C.V. tobacco. Indian exports to Indo-China have been increasing since 1950-51. In 1956-57, she did not, however, purchase any Indian tobacco. Malaya is not an important tobacco producing country. She depends on foreign imports for her requirements. The country needs Indian manufactured tobacco like cigarettes, cigars and bidis. The demand for raw tobacco is limited to lower grades. Malayan imports of Indian tobacco during 1950-51 to 1956-57 are given below:

Year	Quantity (lbs)
1950-51	164,322
1951-52	347,699
1952-53	192,373
1953-54	137,886
1954-55	199,217
1955-56	280,108
1956-57	491,611

Imports of Burma

In the postwar years, Burma's exports and imports of which the major portion was with India, have considerably dwindled. The unmanufactured tobacco, imported from India, consists of Bhengi from Bengal and Lanka or Coringee type from Andhra, the former being used for chewing and the other two types for making cheroots. Indian tobacco imports into Burma during the last seven years were as follows:

Year	Quantity (lbs)
1950-51	341,359
1951-52	294,388
1952-53	42,560
1953-54	299,029
1954-55	614,671
1955-56	115,958
1956-57	Nil

Indonesian Production

Indonesia produced about 240 million lbs of tobacco, mostly cigar leaves, during 1935-39. Of these about 100 million lbs were exported. The acreage under tobacco, however, dwindled very much during and after the second world war. In 1950, she produced only 67 million lbs of tobacco. The production in 1956 amounted to 146 million lbs from an area of 374,000 acres. The country imports tobacco and tobacco products mainly from the United States, Holland and the United Kingdom. She did not import much from India except in the recent past. Of late, due to a variety of reasons, there has been a decline in production, and this has compelled Indonesia to turn her attention to India. Indian tobacco imports into Indonesia have been as follows:

Year	Quantity (Million lbs)
1950-51	3.0
1951-52	1.97
1952-53	3.43
1953-54	2.44
1954-55	0.319
1955-56	13.43
1956-57	4.55

Recently, Indonesia imported sizeable quantities of tobacco from the United States under P.L. 480.

A sample of tobacco from a bale

Consequently, her imports of F.C.V. tobacco from India dwindled.

Japanese Needs

Japan is not self-sufficient in Virginia tobacco. She is, therefore, importing it from the United States and sometimes from India. The dollar scarcity, combined with cheapness and suitability of Indian tobacco, induced her to give more attention to the latter. Till 1951, she was interested more in Indian sun-cured Natu tobacco than in the F.C.V. During 1952-53, she bought Indian Virginia grade 4, L.B.Y. and L.B.Y.2, besides C.B.R. and C.D.K. grades of sun-cured country tobacco. Japan's purchases of Indian tobacco during the last seven years have been as follows:

Year	Quantity (Million lbs)
1950-51	1.17
1951-52	1.93
1952-53	14.51
1953-54	10.05
1954-55	5.89
1955-56	7.73
1956-57	0.98

Estimated Output in China

China is said to be the second largest tobacco producing country in the world with an annual estimated production of about 1,600 million lbs. Of this, a quantity of about 300 million lbs is reported to be of Virginia type. Occasionally, she also imports Virginia tobacco for blending purposes. She previously obtained Indian tobacco through Hongkong. China's purchases consist mostly of low-grade F.C.V. tobacco. As a result of the efforts made by the Tobacco Trade Delegation, sponsored by the Government of India in 1954, a successful deal was negotiated for exporting 4.5 million lbs of tobacco. She has shown more interest in Indian tobacco and has made further purchases during the succeeding three years. The quantity of Indian tobacco imported into China during the last seven years is given in the following table:

Year	Quantity (Million lbs)
1950-51	0.07
1951-52	3.32
1952-53	0.37
1953-54	1.56
1954-55	15.11
1955-56	21.33
1956-57	28.00

Russian Imports

Among other countries, the important ones are Russia, Australia and New Zealand. Russia imports Virginia tobacco. Of late, she has shown a greater interest in Indian tobacco, especially in

low grades. Indian tobacco imports into Russia for the last seven years are shown below:

Year	Quantity (Million lbs)
1950-51	8.41
1951-52	7.58
1952-53	3.64
1953-54	Nil
1954-55	Negligible
1955-56	Negligible
1956-57	2.40

Australia and New Zealand purchase only a few thousand lbs of Indian tobacco. It is understood that these countries will purchase a larger quantity of Indian F.C.V. tobacco, if packed in hands. The imports of Indian tobacco into Australia during 1956-57 were 11,212 lbs worth Rs. 16,546. Imports into New Zealand were negligible.

Efforts are, however, being made by the Government of India to maintain and expand these markets.

Quality Control Measures

Under these measures, the export is prohibited of flue-cured Virginia, sun-cured Virginia, sun-cured "Natu" (country), White Burley, Jutti "Motihari", Jati, "Jati Bispah" and Desi tobacco of chewing type and top leaf tobacco of any varieties of Virginia, unless they are graded and marked in accordance with the rules framed under the Agricultural Produce (Grading and Marking) Act, 1937, and certified to that effect by the Agricultural Marketing Adviser or an officer authorised by him for the purpose. The grades prescribed under the Act are popularly known as "Agmark". The quality definitions for different grades and for different types of tobacco are determined in close consultation with the representatives of growers, merchants, exporters and foreign buyers.

The Tobacco Marketing Development Officers, on behalf of the Agricultural Marketing Adviser to the Government of India, inspect the contents of each package containing any of the above mentioned types, affix labels of appropriate grade before export. Each consignment of tobacco packages is also covered by a certificate of "Agmark" grading which is issued after carrying out a further inspection. There is also a further check by the officers at the ports of shipment to detect any misgrading or cases of deterioration of quality and/or weevil infestation in transit or during storage. On account of such constant checks undertaken by the inspecting officers of the Government, the quality of the different specified grades is assured to the foreign buyer.

The Government is anxious to develop tobacco production on scientific lines and to improve marketing and research. It accordingly constituted the Indian Central Tobacco Committee in 1945 and charged it with the function of undertaking such measures as would improve the quality of Indian tobacco and its marketing. The Government has also constituted a Tobacco Export Promotion Council whose aim it is to develop the export trade in tobacco.

Official Assistance

The Government of India has all along encouraged the development of the export trade in Indian tobacco by rendering all possible assistance to exporters. The most important measures so far taken by it may be briefly summarised as follows:

1. "Agmark" grades were fixed to enable traders to effect sales and purchases on that basis.
2. The Indian Central Tobacco Committee was constituted in 1945 and various research stations were established for the improvement and development of tobacco.
3. Tobacco Sales Officers were appointed in London, Antwerp and Hongkong. They look after Indian tobacco interests in these countries concerned.
4. A five-man delegation was sent in June 1954 for promoting export of Indian tobacco in the south-eastern countries of Asia. It improved the prospects of the trade with these countries and also eased the situation created by the accumulation of stocks. A two-man delegation was also sent to African and west Asian countries in May 1956 to find out the possibility of exporting Indian bidis and bidi tobacco to those countries.

5. Tobacco has been included as one of the items for export in trade agreements entered into with foreign countries, wherever possible.

6. With a view to popularising Indian tobacco in foreign countries, samples and other publicity materials were distributed abroad through the Indian Government trade representatives.

7. An Export Promotion Council was constituted to support, maintain and promote exports of unmanufactured tobacco by effecting suitable measures which may be deemed necessary. The Council started functioning from January 1956.

8. Tobacco research and development is being intensified with special emphasis on the improvement of quality under the second five year plan.

ELECTRICAL EQUIPMENT IMPORTS LIKELY TO RISE DOMESTIC MANUFACTURE BEING DIVERSIFIED

ELECTRICAL equipment forms a considerable proportion of India's total imports, and its quantity has increased almost steadily in recent years. This is to be expected, since the use of such equipment can be taken as an index of a country's development. Canada is perhaps the most rapidly developing country in the world, and although a considerable amount of manufacture is carried on within her territories, her imports of electrical equipment totalled nearly Rs. 142 crores in 1956, a figure nearly twice as great as that of the next largest importer, the Netherlands. A country cannot develop fast industrially and at the same time develop and manufacture all the equipment needed for its industrialisation. This is realised by most countries, as will be seen from Tables I and II below. Table I shows the total imports of electrical equipment by ten major importing countries in 1955. Table II shows the position in 1956, but for ready reference, and for comparison, some of the principal suppliers have also been shown.

TABLE I

IMPORTS OF ELECTRICAL EQUIPMENT BY THE TEN LARGEST IMPORTERS: 1955
(In crores of rupees)

1. Canada	121.1
2. Holland	65.5
3. Belgium	41.6
4. Australia	38.4
5. Sweden	36.5
6. India	33.7
7. Venezuela	33.7
8. South Africa	33.1
9. U.S.A.	32.3
10. U.K.	31.3

TABLE II

IMPORTS OF ELECTRICAL EQUIPMENT IN CRORES OF RUPEES BY THE TEN LARGEST IMPORTERS WITH THEIR PRINCIPAL SUPPLIERS: 1956

	Total	U.K.	U.S.A.	West Germany
1. Canada	141.6	17	120	—
2. Netherlands	83.2	11	—	32.25
3. U.S.A.	59.0	12.25	—	11.3
4. Belgium	49.0	4.7	6.4	17.3
5. India	44.25	28.25	3.1	7.2
6. Sweden	43.86	5.87	2.8	19.75
7. Australia	43.3	28.25	4.8	2.13
8. France	38.25	5.6	11.0	12.0
9. Venezuela	36.8	4.13	24.1	5.73
10. South Africa	34.25	21.0	4.7	2.93

It will be noted from Table II that India has moved up from sixth place to fifth place. The interesting point about these tables is that nearly all the major manufacturing countries are major importers of electrical equipment. This is not surprising in the case of an industry which develops so rapidly. If the industrialisation of India proceeds at the intended rate, it seems most unlikely that imports of electrical and allied equipment will stop as India's manufacturing facilities increase. It would not, in any case, be good policy to ban imports of all types, since immediately this is done, progress stops. The free inter-change of ideas and equipment round the world is the best incentive to progress. This is a factor which is realised even by such a country as the U.S.A., which prides itself on being well to the forefront in electrical equipment manufacture, but nevertheless imports large quantities every year. Russia imports large quantities of electrical equipment, and it is of interest to note that the electrical propulsion equipment for three of her latest ice breakers has been supplied by the U.K. To quote a non-electrical example involving an apparently simple article, a British-designed hatch cover is fitted to 98 per cent of all cargo-carrying tonnage built today.

Steady Increase

Electrical imports into India have, of course, shown a steady increase through the years, although the figures for 1950 and 1954 were unexpectedly low. The figures (in crores of rupees) for imports are given in Table III.

TABLE III
IMPORTS OF ELECTRICAL EQUIPMENT INTO INDIA

	From All Sources	From U.K.
Year 1948	24.37	—
" 1949	29.06	—
" 1950	21.94	—
" 1951	29.29	—
" 1952	32.93	—
" 1953	31.88	24.00
" 1954	27.30	19.75
" 1955	135.44	21.68
" 1956	146.40	28.28
" 1957	133.32	29.3

† These two figures are lower in Tables I and II as they are derived from exporting countries' statistics.

* January to September only.

Although the manufacture of electrical equipment has increased enormously in India, the total value of imports has steadily risen. It seems reasonable to suppose that this will continue to be the case; in fact, if India intends to carry on developing, it must. The nature of future imports will, of course, show a gradual change. Many years ago, large quantities of lamps, small motors, medium-sized transformers, fans, etcetera, were imported. Indigenous manufacture is taking care of these requirements now, and the nature and scope of manufacture will increase. The new heavy electrical equipment plant in Bhopal will raise the indigenous production of electrical equipment, and will enable local manufacture to cover a very much wider field than hitherto. It will, however, be impossible for many years to cater for all of India's requirements internally, and in fact it will be uneconomic to do so. The

By

H. C. Hardy

Difficulties of Importers

probability is that electrical imports will steadily increase, with a bias towards heavier equipment, major generating plant and specialist equipment of various sorts, while in turn India will probably increase exports to neighbouring countries which are less developed.

Nuclear Plant

Nuclear power plant, both conventional nuclear stations and, at some time in the future, plant operated on the fusion reaction, will inevitably form a considerable portion of electrical imports. The general tendency throughout the world has been for the consumption of electricity, and in turn the manufacture of electrical plant, to double every ten years. One supposes that there must be an end to this increase, but the end is not yet in sight. It seems that fossil fuels of all types will become too valuable to use for this purpose, since these fossil fuels can also be utilised in many other ways. In India at the moment the bias is towards hydro power, and the number of hydro stations now under construction, or for which tenders have recently been called, totals a little over twice the capacity of steam stations in the same category. This, however, must come to an end eventually, since the total hydro potential of any country is not extensible. India's hydro potential is very considerable and will take many years to exploit fully, but it seems inevitable that the sources which can be economically exploited will be utilised in the foreseeable future.

As far as nuclear equipment is concerned, there are very few countries in a position to export plant of this nature, and of these Britain is the leading one, as well as being one of the leading exporters of electrical equipment in the world. The latest year for which world import figures are available is 1956 (Table II above), from which it will be seen that, out of total imports of Rs. 44.25 crores of electrical equipment, the U.K. supplied India with Rs. 28.25 crores. The total of U.K. exports to India was Rs. 29.3 crores in the period

January to December 1957. A fair proportion of these imports cover generating plant, and over half the generators in India are of British manufacture. Actually, the proportion of hydro plant is about half British manufacture, and the proportion of steam generating plant rather more in Britain's favour. This equipment has set a high standard of reliability and service. Other notable installations are the five 100,000 kVA (maximum rating 115,000 kVA) generators for the Bhakra power station, 3,000 volt pumpless rectifiers for the Calcutta-Burdwan section of the Eastern Railway, and rolling stock for the same railway.

U.K. Plans

As far as nuclear power stations are concerned, there are now in the U.K., in operation or under construction, nuclear power stations totalling 1,803 mW. Three further sites have been chosen, two for 500 mW stations and one for a 150 mW station. By 1970, half of Britain's power requirements may be met by nuclear power. This has given the U.K. a considerable lead in the manufacture of nuclear power plant, and has left her in a position to design and export complete plant. There is a considerable market for nuclear power plant in the East, and particularly in India in areas to which coal has to be hauled over considerable distances. The setting up of nuclear power plant in such areas would be equivalent to a considerable expansion in railway facilities, since the transport of coal is not required for nuclear stations.

Japan is the first eastern country really to go ahead with nuclear power plant. After investigations round the world, the Japanese Atomic Power Company has asked a number of British industrial groups to tender for the supply of nuclear power plant. Tenders have to be submitted by 31st July; the Japanese hope that building will start this year, or early next year, and the station will be operating in 1963. It is worth noting that, although Japan is an exporting country, the specifications are for the supply of the complete plant, including generating plant, although Japan is a large manufacturer of such plant. The reasons for doing this will be obvious to engineers.

Although it is expected that imports of electrical equipment into India will continue, and will in fact go on expanding, this does not mean that importation is always as easy as it might be. There are a number of snags and difficulties, and these have tended to increase over the years. One difficulty arises from selective restrictions on imports, which are sometimes imposed in much too narrow a manner. An importer is frequently asked to purchase a certain portion of his requirements from an indigenous source, when, in point of fact, the equipment from the indigenous source does not meet the specification. This does not mean that indigenous equipment may be badly designed or may not be up to standard; but some of the requirements of power plant are for very specialised equipment. Some local manufacturers are also inclined to be a bit optimistic and state that they make a wider range of equipment than they really do. This is a situation which is difficult to avoid, since one can scarcely expect staff dealing with matters of this kind to be fully familiar with all aspects of electrical engineering, but it does frequently cause the importer trouble and delay.

Another difficulty, as far as supplies of generating plant are concerned, is the present tendency to go through a specification, say, for a complete power station, and pick out the lowest part offers, thus splitting the order between a large number of manufacturers without taking into account the expenditure necessary on co-ordination. Admittedly, most large power stations contain plant manufactured by several manufacturers, and there are well defined lines of demarcation, but one occasionally finds cases where switchgear of half a dozen different types in a station has been split up between half a dozen different manufacturers. This may show a saving on paper, but by the time the plant is fully installed, it does not usually do so, particularly since splitting to such an extent involves the unnecessary multiplication of erection staff. If, for instance, there are six different

suppliers of switchgear, there will probably be six different, fairly expensive, erection engineers, whereas, in the case of one supplier, one senior man and several juniors only would be required, quite apart from the extra cost to the customer of co-ordination, etcetera.

Buying Cheap

The custom of almost invariably accepting the cheapest tender is also a source of some difficulty to those countries which adopt high standards of safety and reliability. Unfortunately, it is commonly supposed that all plant manufactured to the same standard is of equal quality, whereas a standard can never be anything more than a statement of performance, so far as rises in temperature, use of materials, etcetera, are concerned. It can never be an indication of quality. The reputation of the manufacturer is the only reliable guide. The practice of buying purely on the basis of price is, of course, one which mainly affects Government departments. It is a condition that may rectify itself in time, since it cannot be supposed that the cheapest apparatus is always the best. One can scarcely suppose that those who apply this ruling in official dealings apply it also when purchasing goods for their own consumption. In such cases, a more careful eye is obviously kept on quality.

The wording of the present Electricity Act causes difficulty to any large firm of electrical contractors, the difficulty in fact being obvious from the wording of Rule 45(1) which says:

"45. Precautions to be adopted by consumers, owners, electrical contractors, electrical workmen and suppliers.

- (1) No electrical installation work, including additions, alterations, repairs and adjustments to existing installations, except such replacement of lamps, fans, fuses, switches, low voltage domestic appliances and fittings as in no way alters its capacity or character, shall be carried out upon the premises of or on behalf of any consumer or owner, for the purpose of supply to such consumer or owner, except by an electrical contractor licensed in this behalf by the State Government and under the direct supervision of a person holding a certificate of competency issued or recognised by the State Government.

Provided that in the case of works executed for or on behalf of the Central Government and in the case of installations in mines, oil fields and railways, the Central Government and in other cases the State Government may, by notification in the

official Gazette exempt, on such conditions as it may impose, any such work described therein either generally or in the sub-rule as requires such work to be carried out by an electrical contractor licensed by the State Government in this behalf."

State Jurisdiction

The second paragraph of this Rule makes it obvious that the Central Government is not in all cases prepared to accept the jurisdiction of the State Government. The private sector must do so, and this often leaves the contractor in difficulties when installing plant, say, for a large private consumer. The main difficulty here concerns certificates of competency. It was assumed when these Rules were drafted that certificates of competency issued by one State would be recognised by another, but in point of fact they seldom are, the apparent reason being that each State Government receives a fee for a certificate of competency, and insists on getting it. As a result, an application for certificates of competency for staff in a given State, in order to carry out a particular job, usually results in a request from the State Government concerned to open an office in that State. The applicant is often also informed that 70 percent of his wiremen will have to hold State Government permits. This is all very well if the contractor happens to be one engaged in wiring houses, but a company engaged in heavy engineering projects does not employ wiremen. It employs supervisors, who could qualify for permits, and in fact who usually do possess such permits, but it does not employ wiremen on the erection of heavy switchgear, transformers, generators, etcetera, nor in fact would the result be satisfactory if it did so.

Another difficulty is that if one imports a "technician", one has to prove that he is a technician and capable of doing the job before permission can be obtained to bring him to India. But, having brought him into the country, the whole affair has to be gone through all over again with the State Government concerned before the man can qualify as a supervisor. The obvious remedy for this, so far as the country as a whole is concerned, is for some form of Central registration, where the emphasis is on practical ability and past experience in the erection and commissioning of heavy equipment. This is an important point in that, so far as most State rules are concerned, anyone with an engineering degree can usually obtain a permit with little or no trouble and no experience. A practical man who has had 20 years of experience in the art and practice of his profession, and does not possess a degree, finds it difficult to obtain a permit, although there is no comparison between the abilities of the two in doing an erection job. There is nothing new in the idea of Central issue of certificates of competency, nor the issue automatically of such certificates to imported staff, as this is done by many other countries which have such rules. These countries, quite rightly, argue that employers would not be willing to pay the fares of a man half way across the world, and his salary, if they were not confident that he could do the job, and the manufacturer of the equipment is surely the person best qualified to make this assumption.

Central Licences

A remedy for this would be some form of Central Government licence for power erection staff, worked on an entirely different manner from the usual State rules, which cater more for house wiring, etcetera. Few contractors would mind a more stringent examination for their staff, if the examination were conducted by someone fully conversant with heavy plant erection. Some State Governments are much better than others, and some go very thoroughly into the question of testing, cable jointers, etcetera, but the present system could do with a great deal of improvement. It is unfair to expect a company working over the whole of India to have separate licences for its supervisory staff in each and every State. The cost is negligible, but the total cost to an employer, taking into account the total staff hours required to get the licences, would be very considerable.

Sales tax is a constant source of worry to the electrical importer, but the same worries apply to importers of all other equipment. Due to its special nature, there is possibly more scope for argument in the case of machinery, especially composite plant, than in the case of ordinary merchandise. Difficulties in the interpretation of the rules are aggravated by the fact that Acts of this nature are generally written in such a manner as to apply perfectly to wholesale and retail dealings in ordinary merchandise, and ignore the more complex transactions. The greatest difficulty, as far as importers are concerned, arises from the present restrictions which have been necessitated by the shortage of foreign exchange. It is, however, supposed that this will rectify itself in time, and is, in any case, a factor which affects all importers and not only electrical equipment importers.

The Outlook For Wool Exports

Increasing Scope for Domestic Manufacture

INDIA'S wool exports consist mainly of raw wool. Carpets come second, and other manufactures, such as hosiery, wool cloth and shawls, take third place. The first statistics relating to raw wool exports from India date back to 1834, when approximately 70,000 lbs was shipped. Foreign manufacturers appreciated the quality of the tough springy wool and exports increased steadily, reaching an all-time peak of 69 million lbs (from undivided India) in the year 1939-40. Traditionally, Britain has been the chief customer; in fact, even today consignments of Indian wool are sent for auction in Liverpool. There is no auction market here. Particularly since the war, the practice of making contracts of sale direct with foreign manufacturers has grown, indicating the increased respect for the integrity of the exporter. (One reason advanced in justification of the Liverpool auctions was that the system permitted foreign buyers to inspect the wools personally, obviating the chance of fraud).

From A Special Correspondent

Recently, the desirability of setting up an auction market in India was considered, but the idea has been dropped. The proportion now being sent for auction abroad is too small to justify the expense. The average quantity of raw wool exported annually over the past five years is 31.6 million lbs, the average value being Rs. 8.76 crores. The U.K. takes the highest proportion—52 percent—followed by the U.S.A.—31 percent. West European countries also buy Indian wool, as does Australia (the world's biggest wool-producing country) where Indian-type wool is not grown. In recent years, Russia has lifted some useful weights of raw wool from the Indian market. This is a new development, and it is hoped that she will become a regular customer.

Carpet weaving was introduced into India at least 500 years ago by the Muslims. Unfortunately, those carpets were overshadowed by the more famous Persian and Turkish ones, and attracted little attention abroad until the 1870's, the time of the Kashmir carpet revival, and some 25 years later when the Mirzapur carpets grew popular. From then on, exports increased steadily, the best prewar year being 1936-37, when 9.9 million lbs was sent abroad, mostly to the U.K. Postwar demand, intensified by the backlog from the war

Bales are press-packed for export

years, sent exports up to 15.5 million lbs in 1946-47, and for the first and only time, the U.S.A. took the chief share—26 percent of the total. Again, in 1950-51 the export figure reached a peak of 14 million lbs, the U.K. taking over 80 percent, but since that year, carpet exports have not exceeded 12 million lbs in weight.

Carpet-making Centres

The main manufacturing centres in India are Srinagar, Agra, Jaipur, Gwalior and the Bhadohi-Mirzapur area, while druggets (woven floor-covering, having no separately-made pile) come from the south. Carpet weaving is purely a cottage industry, and carpet weavers are among the lowest-paid workers. But almost 90 percent of the total product is sold in foreign countries in direct competition with machine-made carpets. This important economic consideration makes it difficult to

increase the rates of pay. Yet it does not dispose of the problem. Superior varieties of carpets usually contain a percentage of foreign wool as a rule, either Australian or New Zealand, which helps make the pile closer and finer while detracting little from the strength which the more wiry Indian wool imparts. This type of carpet is most popular in Canada and the U.S.A., but the British favour less luxurious types. Neighbouring Asian and Middle East countries are India's best customers for other sorts of wool manufactures—in the main hosiery goods, and cloth and shawls which have been made from imported wool. The particular set-up of the hosiery industry in Ludhiana puts it in an especially favourable position as far as prices are concerned. Knitting machines, which are found in literally hundreds of houses in the city, are worked on a family basis or occasionally with one or two paid employees. Indian-made hosiery goods are supplied to the Defence Services in Burma and form an important part of the commodities passing through Kalimpong into Tibet and the adjoining parts of China proper.

The position of the big cloth manufacturing units in India has never been so competitive in foreign markets, because in their case labour laws are applied much more effectively. The industry has to bear greater burdens of tax and excise duty, and overheads in general are greater. Nevertheless, last year two mills got substantial contracts for the supply of wool cloth to Russia. The value of all-wool manufactures exported is now averaging something over Rs. 4 crores, the overwhelming proportion of which relates to carpet exports.

Clash of Interests

In any consideration of wool exports or the promotion of wool exports, one invariably comes across evidence of the clash of interests of exporters of raw wool and manufacturers of carpets. The first blow was struck by the manufacturers when, on their suggestion, the export of raw wool was totally banned on 8th July, 1950. The ban was temporary, but since then raw wool exports have never been free from restriction. The manufacturers pointed out that so much wool was going out of the country that their industry was being starved. The exporters retorted that the wool grower naturally sold to the man who paid the highest price; all that the manufacturers had to do to secure the necessary wool was to raise their buying limits. But there are important reasons why the interests of the home industry should be looked after. There are two wool-shearings a year: the autumn clip which is mostly yellowish in colour, and the spring clip which yields mostly

Wool being weighed at a warehouse

white wool. Stocks of white wool, which dyes to a greater variety of shades than yellow, might well be exhausted by the combined demand of manufacturers and exporters before the new season's shearing starts, so the carpet manufacturer can experience real difficulties. The suggestion has been made that carpet manufacturers set up a joint buying organisation which can afford to purchase and carry through the season the anticipated necessary amounts of wool, but so far it has not been found practicable to implement this.

Two factors influencing a favourable attitude to the carpet manufacturers' case cannot be disputed. It is a cottage industry and should be encouraged as much as any other cottage industry for the main reason that it provides employment or part-employment to thousands of poor villagers. It is no valid counter-argument to claim that carpets are a "luxury" item in India; that would lead to a totally unacceptable conclusion. Actually any other cottage industry products can also be classed as "luxuries" if by that one means that they are beyond the pocket of the poorer people and a comfort in life rather than a strict necessity. Secondly, it must never be forgotten that it is better to export manufactured goods, which include in their sale the value of Indian labour, than untreated raw material. So the export licensing authorities have

had the difficult job of attempting to reconcile the just needs of the carpet industry with the necessity of exporting all surplus wool. This policy showed itself in a quantitative ceiling on exports, and for one period of 16 months in a 30 percent *ad valorem* export duty on raw wool. The restrictions favoured carpet manufacturers by forcing the retention in the country of stocks of wool which might otherwise have been exported; as a natural sequel, internal prices eased somewhat.

Export Restrictions

Although no better formula has yet been found, this procedure is not wholly satisfactory. The carpet manufacturers still complain they are not getting sufficient white wool. (Restrictions are on quantity and not quality.) Secondly, the mechanised industry, where using indigenous wool, is gaining precisely the same incidental advantage from export restrictions as the cottage industry. If this is justified, then it is for reasons not so far made clear. Thirdly, it is the unorganised wool grower who is footing the bill. He gets a lower price because of the restrictions. The raw wool export allocation today stands at around 35 million lbs. for the year. Manufacturers say this should be cut; wool exporters say restrictions are no longer necessary. In the absence of accurate statistics and in the face of often completely contradictory claims, the authorities have presumably used their experience of licensing over the past eight years as their chief guide in deciding what is a fair estimate of the surplus, and arrived at this figure. If this is so, then one can anticipate an increase in raw wool exports only if there is an increase in production or if there is a decrease in home consumption. There is some evidence of an increase in wool production, but this is a naturally slow and gradual development. On the other hand, the home industry will almost certainly demand more, not less, Indian wool because supplies of foreign wool have been greatly curtailed. The official policy is now to substitute indigenous wool for imported wool wherever this can reasonably be done, even if this does mean some lowering of the quality of the end-product. (Indian wool generally is not suitable for clothing, but there are many border line cases where it could be used more extensively). Any move to compel the reduction of raw wool exports on these grounds might be resisted, however, unless the end-product of manufacture was intended for export too—as it is in the case of carpets. More important economically than mere quantity is the matter of value. The average price for Indian white wool for the quarter, January-March 1958, is 15 percent below the average for the full year 1957. One can reasonably anticipate a hardening of the international wool market, but he would be a very optimistic observer who could expect Indian raw wool to bring more foreign exchange in 1958 than it

brought in 1957, in spite of all efforts. The odds are that it will bring less.

Withstanding Competition

The case of carpets is quite different. In the past, the industry proved itself capable of exporting larger quantities, and it can surely do the same again. It has the manufacturing capacity and the raw materials. The competition from foreign-made carpets is much more than was the case when Indian carpet exports touched the 14-million-lb mark in 1950-51. Even so, it is not crippling competition, or the present export figures would not be maintained. Under the export promotion scheme of incentives, carpet exports should also qualify for a proportionate benefit. Exact details of the form these incentives will take have not yet been decided, or, alternatively, not yet been published, but the principle is to grant to an exporter of finished goods a licence to import additional quantities of raw material or machinery. The value of the licence is a proportion of the value of the goods exported, and the proportion depends upon a scale which will be laid down by the Government. The mechanised wool industry and therefore, indirectly also the hosiery industry which depends on it for yarn, has been given a basic allocation of Rs. 9 crores of foreign exchange to buy raw wool and wool tops during the current year. In value, this is about 20 percent less than that actually imported during the previous 12 months, but because wool prices are so far at a lower level this year, the actual decrease in the quantity is likely to be relatively less. An incentive system which permits additional imports of raw materials would be very attractive to manufacturers.

Over the past few years, the interhal demand for Indian mill-made wool cloth has improved tremendously, and during 1957 it was actually much greater than supply in some brands. Now that imports of foreign cloth and the like have been stopped completely, it must further increase and the manufacturers will be assured of a profitable home market for some years to come; that might permit them to sell at lower prices for export. India's northern neighbours could well prove to be good and regular customers for wool cloth and hosiery—that is, Tibet and China in particular, and possibly Russia, too. It would certainly strengthen the position of the industry in India to have a wider diversity of customers. Apart from its own efforts, the industry relies, too, on those of the Government to step up exports: for example, the concluding of trade agreements and the setting up of export promotion bodies. The combined efforts of both should lead to success. Whether this will be sufficient to offset the reduction in raw wool earnings this year is doubtful, but the tendency is encouraging.

PROSPECTS FOR CHEMICAL IMPORTS

RAPID EXPANSION OF PRODUCTION CAPACITY NEEDED

CHEMICALS are the basic ingredients for a developing economy, as they are needed by industries and consumers for a variety of purposes. The demand for them grows at a rate directly commensurate with the progress of industrialisation, and the per capita consumption of some basic chemicals is the measure of a country's prosperity, as will be seen from the figures given in the table below:

Per Capita Consumption of Some Basic Chemicals

	(in terms of lbs)			
	1955			
	Soda ash	Caustic soda	Fertilisers	Sulphuric acid
India	0.7	0.5	0.7	1.2
U.S.A.	62.0	41.0	34.0	170.0
U.K.	36.0	20.0	16.0	85.0
West Germany	42.0	22.0	21.0	93.0
France	34.0	15.0	21.0	71.0
Russia	13.0	25.0	12.0	120.0
Japan	62.0	52.0	14.5	210.0

In the absence of a large chemical industry, India has had, so far, to depend mainly on imports to satisfy the growing demand for her products. With the launching of the five year plans, a real start has been made to lay its foundations on a big scale and in a manner so that the demand for basic chemicals can be met from within the country.

The foreign exchange crisis has compelled the Government to adopt a policy of restricting imports to a bare minimum. The imports of chemicals, as of other commodities, have been seriously reduced. It is feared in many quarters that the reduction of imports of chemicals might affect the production programme of other industries. There is also a possibility that the restrictions might give an impetus to indigenous entrepreneurs to expand

From

A Special Correspondent

existing undertakings or set up new units. It is necessary to review the trend in imports of important chemicals grouped under main headings such as alkalies, fertilisers, dyestuffs, drugs and pharmaceuticals, explosives and plastics, which between them account for more than 90 percent of the total imports of all chemicals. An attempt is also made to describe the future outlook in the light of the schemes for development during the second plan period. Since independence, a substantial expansion of the production capacity of existing plants and the establishment of new units for the manufacture of chemicals has taken place. These chemicals were not hitherto made in the country, namely, D.D.T., B.H.C., hydrogen peroxide, ammonium chloride, stable bleaching powder, calcium carbide but are now being produced as shown in the table below:

	Production of Chemicals in India	
	1947	1957
	(Tons)	(Tons)
Sulphuric acid	60,000	191,000
Caustic soda	3,300	42,000
Soda ash	13,600	91,000
Liquid chlorine	1,700	15,700
Ammonium sulphate	21,300	370,000 (Est.)
Superphosphate	5,000	140,000
Ammonium chloride	—	4,900 (Est.)
Calcium carbide	—	3,600
B.H.C.	—	1,850
Hydrogen peroxide	—	611

In spite of this progress, the value of chemical

imports increased from Rs. 35 crores in 1947-48 to Rs. 48 crores in 1956-57. The proportion of total imports represented by chemicals has, however, remained fairly constant at an average of 6.6 percent for the period 1947-48 to 1956-57, the figure for 1956-57 being 5.7 percent. Compared with this, the proportion of total imports represented by chemical products in the O.E.E.C. countries was 4.4 percent in 1955; for U.K. and West Germany the proportions were identical, that is, only 3 percent. The relative importance of the different groups of chemicals from the point of view of imports is shown below:

Products	Imports of Chemicals into India (C. I. F. Value in Rs. Crores)									
	1947-48	1948-49	1949-50	1950-51	1951-52	1952-53	1953-54	1954-55	1955-56	1956-57
Alkalies	2.58	13.44	1.00	1.70	6.99	4.11	4.32	6.04	5.50	7.90
Fertilisers	4.63	4.92	6.55	12.34	3.83	2.03	3.41	1.19	2.24	4.02
Dyestuffs	18.03	15.68	11.10	14.60	19.28	10.42	18.86	19.28	17.64	15.64
Explosives	0.62	0.74	0.58	0.96	1.43	1.93	1.33	1.68	1.77	2.17
Drugs and pharmaceuticals	9.53	7.94	7.86	9.94	15.15	11.33	12.29	13.11	14.80	14.09
Plastics	—	—	—	1.61	2.68	2.39	2.40	2.78	3.33	4.15
Total :	35.39	42.72	27.09	41.15	49.36	32.21	42.61	44.68	45.28	48.17

The above figures show that dyestuffs and pharmaceuticals constitute the major portion of imports accounting for more than 50 percent of their total value. Next in importance are alkalies (mainly soda ash and caustic soda), fertilisers and, of late, plastics are also becoming quite important. Imports of commercial explosives have also

stripped the indigenous production, as will be seen from import figures during the last ten years.

Imports of Soda Ash into India

Year : April to March	Tons Per Annum
1946-47	57,883
1947-48	67,948
1948-49	162,593
1949-50	12,295
1950-51	29,816
1951-52	31,819
1952-53	81,585
1953-54	40,917
1954-55	94,485
1955-56	71,016
1956-57	89,590

Consumption of Soda Ash

It has been estimated that the consumption of soda ash will increase to 300,000 tons by 1960-61 from the present rate of about 160,000 tons a year. Several schemes are being implemented to make the country self-sufficient in this chemical. These are summarised in the table below:

Soda Ash Plants in India: Present and Projected

Producers	Location	Capacity tons a year	Probable date of completion
Tata Chemicals	Mithapur	72,000 (present capacity)	—
		72,000 (expansion)	1960
D. C. W.	Dhrangadhara	36,000 (present capacity)	—
		18,000 (expansion)	1960
New Central Jute Mills	Banaras	40,000 (new unit)	1958
Saurashtra Chemicals	Porbandar	68,000 (new unit)	1958
Total :		304,000	

substantially increased during recent years with the increase in large-scale mining of coal and other minerals, and the construction of roads, bridges and dams, etcetera.

Imports of Sulphur

An item of great importance, not shown in the above list, is sulphur which is the principal raw material for the manufacture of sulphuric acid. India is entirely dependent on imports for this material. The production of sulphuric acid increased from 60,000 tons a year in 1946 to 191,000 tons a year in 1957, while the value of imports of sulphur increased from Rs. 50 lakhs to Rs. 2 crores. If the production targets of the former are to be achieved by 1960-61, about 200,000 tons of sulphur to the value of Rs. 5 crores a year will have to be imported. In view of the strategic importance of this material and the need to spend a large amount of foreign exchange in its imports, the Government is considering a proposal to make sulphur from pyrites, deposits of which are said to be available in Bihar.

It is necessary to examine some of the key industries to find out how far the dependence on imports might be reduced with the completion of the various projects in hand.

Development of Alkali Industry

Soda ash and lime caustic soda are the two most important chemicals in this group. In view of the complexity of the manufacturing process, the difficulty of finding a suitable location due to the non-availability of all the raw materials in adequate quantities within close proximity and on account of the high capital cost of production a ton, the development of the alkali industry has been slow and halting so far. There are two units now operating in Saurashtra with a production capacity of 350 tons a day, that is, 108,000 tons a year. The demand for the commodity has far out-

If all the above projects are completed and commissioned according to schedule, the country may become more or less self-sufficient in light soda ash by 1961. But with an improvement in the standard of living and industrial development, the demand for soda ash is expected to increase rapidly, and unless planning for additional production capacity is taken in hand, a gap is bound to appear between indigenous supply and demand from 1961 onwards.

The problem of heavy ash, mainly used by the glass and the bichromate industries, needs special mention. Its demand, which is now of the order of 50,000 tons a year, has so far been met from imports of the natural variety from Magadi in Kenya. Being of natural origin, it is cheaper than the synthetic product and is preferred by the glass and the bichromate industries for technical reasons. The cost of production of synthetic heavy ash which may be produced by the units mentioned above is expected to be higher than that of the imported natural variety. This will, in consequence, affect the cost of production of the glass and the bichromate industries.

Production of Caustic Soda

The caustic soda industry was started only during the early years of the second world war. Until then, the indigenous requirements were met from imports. Its production increased from about 4,000 tons in 1947 to 42,500 tons in 1957, the installed capacity being 51,000 tons. Most of the units use the electrolytic process. Only one unit makes caustic soda by the lime soda process. With the growth of the viscose rayon, paper and soap industries, the consumption of the chemical has increased from about 40,000 tons in 1947 to 120,000 tons in 1957, of which about 80,000 tons is imported at present.

As a result of the expansion of the existing

units and the installation of new ones, it may be expected that the installed capacity for caustic soda and the demand for it will be balanced by 1961. It must be borne in mind that since most of the existing and the new units are based on the electrolytic process, the economics of caustic soda manufacture will depend primarily on the satisfactory utilisation of the co-product chlorine. It is doubtful if all the chlorine which will be produced along with caustic soda will be used simultaneously either as liquid chlorine or for making various chlorine derivatives.

Manufacture of Dyestuffs

The dyestuffs industry is still in the initial stages of growth, although since independence significant progress has taken place. It produces at present a wide range of dyes—azodyes, solubilisated vats, rapid fast colours, sulphur black, vat dyes, naphthols and fast colour bases, etcetera. The value of indigenous production has increased from Rs. 2 crores in 1954 to Rs. 5 crores in 1957, while the imports have declined from Rs. 19 crores in 1953-54 to Rs. 15.6 crores in 1956-57. The production is, however, based on the processing of imported finished products or penultimate products so that the net gain by way of saving in foreign

exchange is only of the order of 20 to 25 percent of the value of output.

The Government proposes to sponsor, with foreign collaboration, the manufacture of basic organic chemicals and intermediates under the auspices of the National Industrial Development Corporation. The production of the vast range of intermediates will necessarily have to be phased over a number of years and may not be completed before 1965. During the intervening period of seven or eight years, imports of dyestuffs and intermediates will be necessary.

Drugs and Pharmaceuticals

Although the pharmaceuticals industry has made considerable progress during the last decade, the dependence on imports for new synthetic drugs, antibiotics, vitamin preparations and patent and proprietary medicines has been substantial. Imports of drugs and pharmaceuticals have increased from about Rs. 8 crores in 1948-49 to Rs. 14 crores in 1956-57 while the indigenous processing capacity has increased in value from Rs. 12 crores in 1948 to about Rs. 39 to Rs. 40 crores in 1957. Current proposals to manufacture intermediates for dyestuffs, plastics and drugs in three

units to be set up in the public sector, when implemented, will make the country almost self-sufficient in the requirements of basic drugs and pharmaceuticals. This is unlikely to happen before 1965 and till then imports of essential drugs will have to continue.

Importance of Fertilisers

The recent heavy expenditure of foreign exchange on imports of foodgrains has underlined the urgent need for increased agricultural production. The importance of fertilisers in increasing the yield an acre cannot be over-emphasised. It is said that one ton of nitrogenous fertiliser increases the yield of foodgrains by three tons. The consumption of the former in India is about 1 million tons, and it is expected to increase to 1.6 million tons by 1960-61 while the potential demand is estimated to be considerably more. Though the indigenous production has increased from 23,000 tons only in 1947 to 370,000 tons in 1957, large quantities have still to be imported. During the second plan, three new units are proposed to be set up along with the expansion of the existing undertakings. Even these three units are considered inadequate as is evident from the recent shift in the Government's policy inviting the private sector to set up new fertiliser units. The need to ensure adequate supplies through imports until there is sufficient indigenous capacity is therefore self-evident.

Industrial Explosives

The market for industrial explosives offered by India's mining industry, hydro-electric and other public works schemes has increased steadily during the last decade from about 1,000 tons a year in 1947 to 5,000 tons in 1957. All of them have so far been imported. A factory to make 5,000 tons of commercial explosives a year initially will start production by the end of 1958, and with a further expansion in its capacity as the demand develops, it will meet most of the country's requirements of commercial explosives from 1960 onwards. The manufacture of safety fuses is also envisaged.

Progress of Plastics Industry

The plastics industry has made phenomenal progress during the postwar period in most of the industrially advanced countries of the world. In India, the progress so far has been mainly in the moulding and fabricating branch of the industry. The imports of moulding powders have increased substantially from Rs. 1 crore in 1950-51 to Rs. 4 crores in 1956-57. So far only phenol formaldehyde moulding powder has been made in the country, based on imported raw materials. Recently, a unit for making polystyrene was started in Bombay, the monomer being imported for the present. Two new units to make the versatile plastic, polythene, are being installed, one in Rishra, West Bengal; and the other in Trombay, Bombay. A scheme to make P.V.C. is also progressing. Even after all these units start production, there will still be a considerable demand for many varieties of plastics.

Future Outlook

In summing up the outlook for the future, it may be said that the pattern of imports will change during the coming years, and their size in terms of money value will decline, but not substantially. The proportion of total imports represented by chemical products is likely to remain substantially unchanged. It is probable that the country will become more or less independent of imports of acids, alkalies, industrial explosives and certain inorganic basic chemicals and plastics. Within the next three or four years or so, there will be a need to import dyestuffs, new synthetic drugs including hormones and amino acids, newer plastics, synthetic fibres, detergents, plasticisers, certain raw materials for the paint industry, etcetera, even though a substantial capacity for some of these may come into existence. In future, the heavy organics, fine chemicals and more complex chemical products will account for the bulk of the imports instead of the basic chemicals which constitute the major share of imports as at present. A probable indication of the amount of imports which may be necessary in 1960-61 is given below:

Estimates of Imports (Value in crores of rupees)

	1957	1960-61
Alkalies ...	7.90	2.00
Fertilisers ...	4.00	3.00
Dyestuffs ...	15.84	12.00
Explosives ...	2.17	0.10
Drugs and pharmaceuticals ...	14.10	10.00
Plastics ...	4.15	2.00
Sulphur ...	1.50	5.00
Miscellaneous ...	—	5.00
Total ...	49.66	39.10

Pillars of Industry

- Plants to wash and carbonise millions of tons of coal a year for the hungry steelworks
- Plants to produce coal by-products, sulphuric acid and other vital heavy chemicals
- Plants to generate the steam and electric power that keep industry on the march

To build such plants is a key task to which Simon-Carves bring half a century's experience, gained in every continent of the world, of engineering design, scientific research, and applying their immense resources to India's industrial growth.

large scale contracting. At the new Durgapur steelworks, at the great steelworks at Jamshedpur and Hirapur, and at many centres of chemical production Simon-Carves are

What have minerals to do with their happiness?

This is not a wealthy family, yet it is happy and contented. Father has a good job, mother has time to relax and entertain friends, and the children are getting a good education. Their comfortable home has amenities which, a generation ago, were privileges of only the rich.

10 collieries and a coke plant with an annual output of 2,000,000 tons of coal and coke of all classes.

Capacity of over 47,000 tons per annum of first grade paper. Pioneers in the manufacture of paper in India.

Largest manufacturers of lime for building and industrial purposes in India, and lime and limestone and Dolomite for flux purposes. Total output 960,000 tons per annum.

Technical laboratory facilities for testing of chemicals, mineral ores, geological specimens, refractories etc. Research and investigation on similar lines.

Indian Patent Stone is the first name in prestressed concrete in India.

Annual output of quality tea chests: 5,00,000.

Tubewells sunk by Water Flush, Percussion and Calyx methods.

Manganese Ore, Manganese Dioxide, Iron Ore, Kyanite, Chrome Ore, Bauxite, Gypsum. Total output over 700,000 tons per annum.

Fireclay & Silica bricks for high quality furnace lining. Annual production is about 72,000 tons.
