Austin Darley Wall was born on August 1, 1896. From Oundle he went on to St. Bartholomew's Hospital, where he was awarded the junior and senior scholarships in anatomy and physiology, and won both the Harvey and Foster prizes. Qualifying in 1918, he graduated M.B., B.S. in the following year. After serving in the Royal Navy for a time he held a number of resident appointments at Bart's, and, deciding to specialize in surgery, he took the F.R.C.S. in 1921. A few years later he went out to Shanghai, where he became honorary surgeon to the Shanghai General Hospital and to the Lester Chinese Hospital. He was also medical officer to the British Consulate and to the Shanghai Municipal Police. Returning to Britain shortly after the outbreak of the second world war, he came to live in Paignton. Early in 1940 he joined the R.A.M.C. and served as a surgical specialist until 1945, being mentioned in dispatches. On demobilization he returned to Paignton, where he was in general and surgical practice until his death. He was elected President of the Torquay and District Medical Society this year. He leaves a widow and two daughters.

J. F. B. writes: Mr. Wall as a person was extremely kind, patient, and courageous. No one ever saw him flustered, nor heard his voice raised in anger, yet he was energetic and determined in all his activities. As a consultant surgeon he was always practical and helpful, perhaps because he

was also a general practitioner himself and understood the nature of a family doctor's problems, and he was not above doing the most lowly surgical chores—a necessary asset when running the surgical services of a general-practitioner hospital with no resident staff. To this last quality can be attributed the opinion of a patient who said that he liked Paignton Hospital and thought the staff very kind and efficient, particularly the house-surgeon—the house-surgeon in question being Mr. Wall. His modesty was outstanding, and he was endowed with a sense of humour which always seemed to manifest itself unexpectedly, but kept on appearing regularly. His devoted work at Paignton, and the high quality of that work, will be much missed; but mostly we mourn the loss of a much-loved man.

Medico-Legal

MOTHER'S ADOPTION OF ILLEGITIMATE CHILD

[FROM OUR LEGAL CORRESPONDENT]

On November 28 the Court of Appeal decided (*The Times*, November 29) for the second time that there was no good reason in principle why an order should not be made under the Adoption Act, 1950, by which an unmarried mother could adopt her own child. The court's previous decision had not been reported, because it was given *in camera*.

The matter arose on appeal from a refusal by a county court judge to make the order on the application of the mother and on a report by the L.C.C. Welfare Officer that the child was well cared for and adoption seemed to be in her best interest. The judge had taken the view that the Adoption Act, 1950, had not been designed or intended to remove the stigma of illegitimacy, and that if he made an order it would be a precedent which would soon become common form and result in the abolition of illegitimacy.

In his judgment Lord Denning said that it was plain from the terms of Section 1 (3), Section 2 (1), and Section 12 (2) of the Act that Parliament had contemplated the making of an order in such circumstances. There were many advantages for the child if an order were made, in the field of the inheritance of property for example and by using the registration in the adopted children's register instead of the entry in the register of births. The child remained illegitimate even if adopted, but by being adopted it became in law the child of its mother for all purposes and so suffered none of the legal disabilities which attached to illegitimacy. If the mother was a suitable person and the home and other circumstances were suitable, the fact that the order was sought simply because the child was illegitimate was no bar to it being made.

Lord Justice Hodson added that the exercise of the court's discretion was of course required to see whether the mother could look after the welfare of the child, since the welfare of the child was the paramount object of the Act.

MAINTENANCE WHERE SPOUSES PART FOR MEDICAL REASONS

[FROM OUR LEGAL CORRESPONDENT]

Recently the Divorce Divisional Court upheld the refusal of the Kingston-upon-Hull magistrate to make a maintenance order against a husband whose wife was living apart from him for medical reasons (*The Times*, October 30).

The parties were married in 1948 and things went reasonably smoothly till 1952, when after a very difficult confinement the wife became a voluntary patient in a mental hospital. There she stayed until 1956, when she went to live with her mother because she suffered from a neurosis which produced acute revulsion to sexual relations, and if she had returned to live with her husband she would have had a serious breakdown in health.

In his judgment the President said that on the facts the husband was not in desertion, nor had he agreed to maintain her as a separated wife, so that wilful neglect to provide reasonable maintenance for her could not be imputed to him. The true solution to this difficult case was for the National Assistance Board to ask for an order for the wife's maintenance under Section 43 of the National Assistance Act, 1948, which could be made without any "wilful neglect" on the husband's part being established.

Medical Notes in Parliament

MENTAL ILLNESS

Research Projects

Dr. DONALD JOHNSON (Carlisle, Con.) asked the Minister of Health on December 8 whether he was satisfied with the adequacy of the machinery for approval of mental health research; in particular, whether this was acting quickly enough; and if he would make a statement. Mr. D. WALKER-SMITH: Yes. The machinery provides for rapid and regular consideration by the Medical Research Council of proposals and of the advice tendered by the Clinical Research Board about them.

Dr. JOHNSON said that in spite of what the Minister said complaints were received that it took sometimes 18 months to obtain a definite answer, Yes or No, on a research project, and delays of that kind were frustrating. Mr. WALKER-SMITH said he knew of two cases in which there had been unavoidable delay for personal reasons connected with the gentlemen who were to be put in charge of the projects. In the ordinary way the machinery was designed to be rapid, and was so in practice.

Mr. A. BLENKINSOP (Newcastle upon Tyne, East, Lab.) said that recently a number of scientists and medical men doing mental research, especially on schizophrenia, had been lost to the United States, and there was some anxiety about this trend. Mr. WALKER-SMITH explained that in one of the cases the professor concerned had taken an appointment in the United States. That was the reason for the delay. But the action was taken for personal reasons, and general conclusions of the kind Mr. Blenkinsop had mentioned should not be drawn from it.

Local Authority Welfare Services

Mr. BLENKINSOP asked what additional local authority expenditure on mental health and welfare services has been approved for 1959-60 and 1960-1. Mr. R. THOMPSON, Parliamentary Secretary, Ministry of Health, said that included in the figures of relevant expenditure taken into consideration in fixing the proposed totals of general grant for the first grant period were estimated amounts for these services of over £900,000 for 1959-60 and over £1¼m. for 1960-1 above the estimated figures for 1958-9.

Mr. BLENKINSOP asked if he thought these figures would make possible any kind of start in developing local authority services to provide for the numbers who would be able to come out of mental hospitals and institutes. Mr. THOMPSON: Indeed I do. It is estimated that the rate of development for which these increases provide in each year is about two and a half times the annual development rate achieved in recent years. Mr. BLENKINSOP: The Parliamentary Secretary knows that during the last few years there has been hardly any development at all. Why try to confuse the House by talking about two and a half times a rate of increase that has been negligible? Mr. THOMPSON said he could not accept that what was now spent on these services was negligible. A rate of two and a half times greater was considerable by any standards.

Consequences of Ratty Case

Mr. N. DODDS (Erith and Crayford, Lab.) asked the Minister in view of the decision in the High Court on the

illegal detention of Miss Kathleen Ratty, which resulted in her discharge as a mental defective, and the subsequent review of those mental defective patients detained under the same section of the Mental Deficiency Act, 1913, how many patients had been discharged as a result of this review; how many were still detained under this particular section of the Act; and why they had not yet been released. Mr. WALKER-SMITH: 1,957 have so far been discharged; 3,078 are still detained because they are unfit for discharge or have nowhere suitable to go.

Mr. DODDS expressed his delight that nearly 2,000 people who had been wrongfully certified had now been allowed out. But was it not a terrible indictment of the country that 3,000 people should be detained who had never been certified, largely because there was no other place for them than mental institutions? He asked the Minister to undo some of the wrong which had been done. Was it possible to give them some special rehabilitation courses to smooth their way back into the community? Mr. WALKER-SMITH pointed out that they did not know that all these cases were similar to the Ratty case, because they did not know the facts that were before the court. The board was not in a position at any time to know the facts before the court at the time of admission. These were cases which appeared on the face of it to have some similarity, but he was sure that what Mr. Dodds had in mind was that the basis of the Ratty decision was on the construction of the words "found neglected." There was no doubt that many of these 3,000 people were in need of care and treatment for their mental condition. Mr. DODDS: Yes, but not in mental institutions.

Sir GODFREY NICHOLSON (Farnham, Con.) said the anxiety and shame expressed by Mr. Dodds were widely shared on the Conservative side. Mr. WALKER-SMITH replied that before he used those expressions he should study the facts and realize what was the basis of the Ratty decision.

Leucotomy Operations

Mr. K. ROBINSON (St. Pancras, North, Lab.) asked how many leucotomy operations had been performed in mental and mental-deficiency hospitals in England and Wales during each of the last 10 years. Mr. WALKER-SMITH said the only information available was as follows: The numbers of leucotomy operations performed in N.H.S. hospitals in England and Wales in each of the years 1949 to 1952 were, respectively, 1,442, 1,337, 1,308, and 1,355. A special inquiry showed that, in 1957, 728 operations were performed in regional hospitals with 100 or more beds.

"Persomnia"

Mr. F. NOEL-BAKER (Swindon, Lab.) asked what steps the Minister would take to place the tranquillizing drug "persomnia" on Schedule 4, in view of the widespread anxiety in the medical profession about its unrestricted sale to the public and the danger of addiction. Mr. WALKER-SMITH said the Home Secretary had informed him that the Poisons Board was not prepared to recommend this. At the Board's suggestion, the problem was being referred to the Interdepartmental Committee on Drug Addiction.

CONDUCT OF MEDICAL RESEARCH

Experiment on Children

Mr. S. SWINGLER (Newcastle-under-Lyme, Lab.) asked if the Minister had considered the report sent to him of a clinical experiment in which mentally defective children in hospital were used as matched controls; whether parental consent was obtained before the children were so used; and what assurances were given that no harmful effects would result.

Mr. WALKER-SMITH: I have seen the report, and I regret to find on inquiry that parental consent was not obtained as it should have been before the drug was administered. I am assured that a single dose as given in this case has no harmful effects.

Mr. SWINGLER recalled that in February, 1945, he had called attention to a similar case of children in hospital

being used as "guinea-pigs" for scientific experiments involving the injection of drugs without there being any parental consent. Was this not very wrong, and as a second case had occurred should not the Minister issue some guidance to hospital authorities? There were many people who had the strongest objections to children being used in this way, especially when adults could volunteer for the purpose. Mr. WALKER-SMITH replied that guidance had been issued in the form of the Medical Research Council memorandum, which had been published. With regard to adults, in this case the drug was first tried out on the doctors who were to carry out the trials on the children.

Regulation of Clinical Experiments

Mr. SWINGLER asked to what extent the regulations permit the use of children in hospital for clinical experiments with or without parental consent. Mr. WALKER-SMITH: Investigations of this kind involve medical and ethical problems which are not susceptible of control by regulations. It is, however, my view that parental consent should be obtained, and I will draw the attention of responsible officers of hospital boards to this matter again.

Mr. SWINGLER said it was regrettable that this case should have occurred. "Will the Minister now make this instruction very emphatic to hospital authorities, so that no further cases may occur?" he asked. Mr. WALKER-SMITH: I will certainly try to ensure that the requirement is brought to the notice of all concerned. Having said that, I reiterate that no harm was done and that this was a valuable and useful experiment.

Mr. C. MAYHEW (Woolwich, East, Lab.): While the Minister rightly agrees to look carefully at the point raised by Mr. Swingler, will he bear in mind that a number of very promising research projects involve free access to patients? While he will look carefully at the matter, may I ask that he will not prejudice the success of those important researches? Mr. WALKER-SMITH: My general policy, in harmony with that of the Medical Research Council, is that there should be the greatest possible freedom from detailed supervision of clinical research in hospitals, for the reasons Mr. Mayhew has given. I do not regard that as incompatible with abiding by the view I have expressed about parental consent for these cases.

Expenditure on Cancer Research

Mr. H. HYND (Accrington, Lab.) asked the Minister what new steps he was taking to tackle the disease of cancer; how much he had spent from public funds on research into this disease during the last 12 months; and what amount had been contributed from other sources for this research in institutions for which he is responsible. Mr. H. ATKINS (Merton and Morden, Con.) asked what was the total of public funds to be spent on cancer research in this financial year, including both the block grant to the Institute of Cancer Research and any part of the general grant-in-aid to the Medical Research Council which was used for this purpose.

Mr. WALKER-SMITH: In the current financial year the Council's estimated expenditure on cancer research from public funds is £472,470; in addition, it is estimated that some £26,500 from other sources will be expended by the Council, approximately half of which will be in the Council's own research units and groups. In addition to the Council's expenditure in this field, further research is supported from public funds in the N.H.S. in the course of the treatment of patients; and in various university and medical school departments from University Grants Committee funds. It is, however, not possible to make a separate estimate of this expenditure. Every effort is constantly being made to achieve a break-through in this very difficult field, and the Medical Research Council will continue to develop its programme and to follow up every promising new approach. Mr. HYND said he appreciated what was being done, but was the Minister happy about the appeals that had to be made for private charitable contributions to such an important project? Mr. WALKER-SMITH: I see nothing

improper or unacceptable about private organizations and private funds supplementing the public effort. Cancer research is the sort of thing that ought to attract private as well as public support, and there is close co-ordination regarding the common objects of research.

Mr. ATKINS said that this expenditure was an investment in the future and would pay extremely good dividends. Would the Minister so represent it when he asked the Chancellor of the Exchequer for an increased grant next year? Mr. WALKER-SMITH: The amount of money available is such that cancer research is not handicapped by lack of funds. It is the intractable nature of the disease which prevents progress being as fast as we would wish.

Adequacy of M.R.C. Funds

Mr. BLENKINSOP asked if the Minister was satisfied with the amount of funds at present available for medical research; and what action he proposed to take to improve the situation. Mr. WALKER-SMITH: Yes, over the last ten years expenditure by the Medical Research Council has been more than trebled. The Council's resources are reviewed sympathetically each year in the light of new developments and new needs.

N.H.S. ADMINISTRATION

Senior Registrar Appointments

Mr. ROBINSON asked the Minister for a statement on the present position regarding time-expired senior registrars, indicating what proportion had been recommended for and have received permanent appointments. Mr. WALKER-SMITH: I explained my proposals in regard to time-expired senior registrars in my reply on April 21. Hospital boards have so far formulated proposals for 24 designated posts of which two are about to be approved and 22 are under consideration.

Mr. ROBINSON: Is that not a very small proportion of the whole? Why is progress so slow? Does the Minister not appreciate that a very great deal of anxiety and hardship is entailed? Mr. WALKER-SMITH: It has always been envisaged that there would be only a limited number of designated posts. I used that phrase, or words to that effect, in my answer on April 21. In regard to slow progress, it is a fact that two regional boards and five boards of governors have not yet replied, but I have reminded them of the urgency of doing so. Mr. A. BLENKINSOP: Does the Minister not feel that the time must come in a registrar's career when he needs some kind of certainty about his future? Mr. WALKER-SMITH: A good many of us in other fields of activity want certainty about our future (laughter)—on both sides of the House. We do our best for these people.

Hospital Waiting-lists

Mr. BLENKINSOP asked what was the latest available figure for those waiting for admission to hospital; and how this compared with twelve months previously. Mr. WALKER-SMITH stated that at the end of June, 1958, there were 442,000 names on the waiting-lists of N.H.S. hospitals in England and Wales. This figure was about 1% higher than that for June, 1957.

Mr. BLENKINSOP said there was great anxiety about the fact that during the last two years there had been a steady increase in the waiting-list compared with experience during some years before. What action was the Minister taking to secure a correction of this disquieting tendency? Mr. WALKER-SMITH: It has not been a steady increase. The figures fluctuate somewhat. At March 31 this year, for example, the figure was slightly lower than in March, 1957. In regard to previous years, the figures are a good deal lower than when Mr. Blenkinsop was concerned with these matters.

Medway Complaints

Mr. PERCY WELLS (Faversham, Lab.) asked the Minister if he had considered the complaints made at the annual general meeting of the Rochester and Chatham Division of the B.M.A. concerning the shortage of beds for acutely ill

* Measles not notifiable in Scotland, whence returns are approximate.
† Includes primary and influenzal pneumonia.
‡ Includes puerperal pyrexia.

Medical News

Chair of Medicine, St. George's Hospital.—Dr. A. C. DORNHORST, reader in medicine at St. Thomas's Hospital Medical School, has been appointed to a new London University chair of medicine at St. George's Hospital Medical School. Dr. Dornhorst graduated in medicine from St. Thomas's in 1937, proceeding M.D.(London) in 1939. He obtained the M.R.C.P. in 1938 and was elected F.R.C.P. in 1955. During the second world war he held the rank of lieutenant-colonel in the R.A.M.C.

Carbon-monoxide Poisoning.—In a circular to local authorities, dated December 8, the Ministry of Health amends the scale of medical and first-aid equipment in the Ambulance Service to bring it into line with the Medical Research Council's recent recommendations on the treatment of carbon-monoxide poisoning (*Journal*, December 6, p. 1408). The circular states that the Minister "has been advised by the Medical Research Council that, for the purpose of first-aid treatment of carbon-monoxide poisoning, use should be made of 5% carbon dioxide in oxygen instead of pure oxygen. He is further advised that pure oxygen should be used in the treatment of asphyxia and anoxia."

Research on Mental Deficiency.—On December 16 a new diagnostic and research department was opened at the Fountain Hospital, Tooting Grove. Space for the department has been found by adapting and redesigning what was previously a ward and adding a biochemical laboratory to it. The unit includes a day room for the children and two small dormitories (for 8 and 4 beds). Research into the cause and treatment of mental deficiency has been actively developed at the Fountain Hospital under Dr. BRIAN H. KIRMAN, and the new unit will make it possible with less disturbance to investigate and treat selected groups of children. At present two groups of children are in the unit, one for a biochemical investigation of phenylketonuria and the other for trial of a pituitary treatment of mongolism.

Handicapped School-leavers.—The British Council for Rehabilitation has set up a Working Party under the chairmanship of Dr. ELFED THOMAS, director of education for the City of Leicester, with the following terms of reference: "To investigate the needs of the physically and mentally handicapped school-leavers; to study the means of meeting their difficulties and to make recommendations." The Working Party includes educationists; representatives of the medical services, voluntary organizations, the Trades Union Congress, and industry, and observers from Ministries and local authorities. The British Council for Rehabilitation (Tavistock House South, Tavistock Square, London, W.C.1) would welcome evidence relevant to the above terms of reference.

Ciba Fellowship Trust.—Ciba Clayton Ltd., Ciba Laboratories Ltd., Ciba (A.R.L.) Ltd., and the Clayton Aniline Company Ltd. announce that they have set up a Ciba Fellowship Trust "for the purpose of improving and increasing the interchange of ideas between scientists in the United Kingdom and on the Continent. The trustees are Sir ARTHUR HARVEY, M.P., Lord HIVES, C.H., and Sir ALEXANDER TODD, F.R.S.

Several fellowships will be awarded for tenure during the academic year 1959-60 at Continental universities or for research in chemistry, physics or allied subjects. They will be awarded to graduates of United Kingdom universities or those who graduate there. Basic awards will vary between £500 and £800 a year.

Further details may be obtained from the secretary of the Trust, Ciba (A.R.L.) Limited, Duxford, Cambridge. The closing date for applications is January 31.

Royal Society.—Among those elected at the anniversary meeting of the Royal Society on December 1 as office

holders for 1959 were Sir LINDOR BROWN as biological secretary; and Sir CHARLES DODDS, Professor WILSON SMITH, and Professor J. Z. YOUNG as members of the council. Under the Royal Society and Nuffield Foundation Commonwealth bursaries scheme awards have been made to Dr. P. R. DAVIS (Royal Free School of Medicine) and Dr. A. IGGO (Department of Physiology, Edinburgh University). The former is to study primate skeletal remains in Africa, the latter neurophysiological techniques at Canberra.

Royal College of Physicians of Edinburgh.—The office bearers for the ensuing year are: *President*, Dr. A. RAE GILCHRIST; *vice-president*, Dr. J. D. S. CAMERON; *members of council*, Dr. I. G. W. HILL, Dr. J. G. M. HAMILTON, Dr. J. HALLIDAY CROOM, Dr. T. ANDERSON, and Dr. J. LAURIE; *treasurer*, Dr. J. ALASTAIR BRUCE; *secretary and registrar*, Dr. R. F. ROBERTSON; and *hon. librarian*, Dr. JOHN RITCHIE.

Royal College of Surgeons of Edinburgh.—At a meeting of the College on December 10, with Professor JOHN BRUCE, the president, in the chair, the fellowship without examination was awarded to Professor G. J. ROMANES. At a meeting held the same day the following who passed the requisite examinations were admitted fellows:

B. C. Abernethy, R. T. Aldridge, B. Azer-Fam, G. W. Burgess, I. Cher, A. B. Chinnappa, T. B. Comins, K. S. Davies, K. J. Dennis, A. K. Deshmukh, M. J. Flood, R. L. Gadd, D. S. Gill, A. G. Graham, J. M. Gray, H. Green, W. A. Hanna, J. A. Hunt, V. C. James, K. M. Kalappa, D. M. King, P. A. H. Klocker, S. G. Leitch, D. B. Longmore, C. R. Lulham, D. H. McClymont, A. E. Mody, P. J. B. Murray, J. R. Pearson, W. S. E. Perera, I. H. Rathor, M. R. Rayman, C. J. C. Renton, F. O. Stephens, R. D. Stride, N. Swarup, K. P. Tamaskar, H. J. S. Waldeck, G. F. Walker, R. K. Wats, and R. W. Weinberg.

Royal Faculty.—At a meeting of the Royal Faculty of Physicians and Surgeons of Glasgow on December 1, with Mr. ARTHUR JACOBS, the president, in the chair, the following were admitted fellows, *qua* physician: P. Damodaram, T. D. Grant, I. R. W. Lominski, A. MacNiven, I. Ramzy, M. A. Shoke.

Sheffield University.—A special degree congregation will be held on the occasion of the opening of the New University Library by Mr. T. S. ELIOT, O.M., on May 12, at which the honorary LL.D. will be conferred on Professor ROBERT PLATT, P.R.C.P., and the honorary D.Sc. on Sir HANS KREBS, F.R.S., Whitley professor of biochemistry at Oxford.

Empire Rheumatism Council.—Dr. J. THOMAS has been awarded a research fellowship for work on connective tissue enzymes. The Geigy travelling fellowship has been awarded to Dr. EVELYN HESS, who will spend a year at the Texas Southwestern Medical School, and the Wyeth fellowship in pharmacology has been awarded to Dr. V. MOSES for work on salicylates and other antirheumatic drugs.

British Association of Plastic Surgeons.—The following have been appointed to office for 1959: *President*, Mr. RAINSFORD MOWLEM; *immediate past president*, Mr. J. S. TOUGH; *hon. treasurer*, Mr. R. P. OSBORNE; *hon. editor*, Mr. A. B. WALLACE; *members of council*, Mr. T. GIBSON, Mr. P. H. JAYES, Professor T. P. KILNER, Air Commodore G. H. MORLEY, Mr. E. W. PEET, Mr. MORTIMER SHAW, and Dr. STUART GORDON (overseas representative); and *hon. secretary*, Mr. C. R. McLAUGHLIN.

British Association of Otolaryngologists.—The following have been elected officers for 1958-9: *President*, Mr. C. GILL-CAREY; *immediate past president*, Mr. I. SIMSON HALL; *vice-president*, Mr. R. R. SIMPSON; *hon. treasurer*, Mr. J. C. HOGG; and *hon. secretary*, Mr. MYLES L. FORMBY.

Christine Murrell Fellowship.—The Medical Women's Federation invites applications for this research fellowship, value £150, from Women on the British Medical Register. Further details from the Federation, Tavistock House North, Tavistock Square, London, W.C.1. The closing date is April 30, 1959.

Deputy Chief Nursing Officer.—The MINISTER OF HEALTH has appointed Miss DOROTHY MARION WHITE to be Deputy Chief Nursing Officer. From 1955 to 1957, Miss White was assistant matron at the General Infirmary, Leeds. Since then she has been assistant nursing officer to the S.E. Metropolitan Regional Hospital Board.

COMING EVENTS

Joint Endocrine Meeting.—The Section of Endocrinology of the Royal Society of Medicine and the Society of Endocrinology, with other interested bodies, are holding a joint meeting on April 24 and 25 at the Royal Society of Medicine. Details from the Section Secretary of the R.S.M., 1, Wimpole Street, London, W.1.

1959 Health Education Conference.—The conference will be on "The Elderly in the Community," January 22, 1959, at B.M.A. House (fee £1). Details from the Medical Director, Central Council for Health Education, Tavistock House North, Tavistock Square, London, W.C.1.

National Association for Mental Health.—Residential week-end conference in London for A.M.O.H.s working in maternity and child welfare clinics, February 20 to 22, 1959. Applications (by January 12, 1959) to the Education Secretary, N.A.M.H., 39, Queen Anne Street, London, W.1.

Ninth International Congress of Paediatrics.—The Congress will be held in Montreal from July 19 to 25. Application forms from the Hon. Secretary, British Paediatric Association, c/o Institute of Child Health, Great Ormond Street, London, W.C.1.

Darwinism and the Study of Society.—Conference to mark the centenary of *The Origin of Species*, April 8 to 10, 1959, at Adam House, Edinburgh. Details from Dr. M. P. BANTON, Social Sciences Research Centre (Edinburgh University), 39, George Square, Edinburgh, 8.

Ophthalmological Society of the U.K.—Annual congress, April 9 to 11, 1959, at the Royal Society of Medicine. Details from the Ophthalmological Society, 47, Lincoln's Inn Fields, London, W.C.2.

Medical Education and Licensure.—55th A.M.A. annual congress on medical education and licensure, Chicago, February 7 to 10, 1959. Details from the Council on Medical Education and Hospitals, American Medical Association, 535, North Dearborn Street, Chicago, 10, Illinois.

British Association of Physical Medicine.—Annual meeting, April 17 and 18, 1959, at Guy's Hospital. Last date for papers, January 30, 1959. Details from the B.A.P.M., 47, Lincoln's Inn Fields, London, W.C.2.

Central Council for Health Education.—Seminar in London for M.O.H.s on "The Promotion of Health in Middle Age," February 24 to 27, 1959. Details from the Medical Director of the Council, Tavistock House North, Tavistock Square, London, W.C.1.

International Congress on Plastic Surgery.—The British Association of Plastic Surgeons is holding an international congress in London from July 12 to 17, 1959. Detailed information may be obtained from the Organizing Secretary, Mr. DAVID MATTHEWS, International Congress on Plastic Surgery, c/o Institute of Child Health, Hospital for Sick Children, Great Ormond Street, London, W.C.1.

Pneumoconiosis.—The pneumoconiosis conference of the South African Council for Scientific and Industrial Research will be held from February 9 to 24, 1959, in Johannesburg. Details from the Secretary-General, 18, London House, Loveday Street, Johannesburg.

Institute of Diseases of the Chest.—Clinical demonstrations (without fee) for medical practitioners, on Fridays at 5 p.m. from January 2 to March 20, 1959. Details from the Secretary of the Institute, Brompton, London, S.W.3.

James Yearsley Lecture.—Dr. KARSTEN KETTEL, of Hillerød, Denmark, will lecture at 5.15 p.m. on March 6, 1959, at the Royal Society of Medicine, on "Surgery of the Facial Nerve in Atraumatic Facial Palsies."

APPOINTMENTS

ASH, E. BAYLIS, M.B., M.R.C.P., Honorary Consulting Dermatologist, United Birmingham Hospitals.

EAST ANGLIAN REGIONAL HOSPITAL BOARD.—P. E. JACKSON, M.D., M.R.C.P., Consultant Physician, Peterborough and Stamford Hospital Group; J. W. JACKSON, M.B., B.S., F.R.C.S., Consultant Orthopaedic Surgeon, Ipswich and East Suffolk Hospital Group; A. BRYCE, M.B., Ch.B., D.M.R.D., Consultant Radiologist, North Cambridgeshire Hospital Group; F. L. F. INNES, M.B., Ch.B., F.R.C.S.Ed., Consultant Plastic Surgeon, Regional Burns and Plastic Unit, West Norwich Hospital; J. ZAMLER, M.B., B.S., Assistant Clinical Pathologist, Papworth Hospital and County Hospital, Huntingdon; J. A. MORZAN-HUGHES, M.B., B.Chir., Medical Registrar, Norfolk and Norwich Hospital; M. C. G. MANTILL, M.B., B.Chir., Anaesthetic Registrar, United Norwich Hospitals; B. S. KUMAR, M.B., B.S., Surgical Registrar, Memorial Hospital, Peterborough; J. W. SMITH, M.B., B.S., Surgical Registrar, West Norfolk and King's Lynn General Hospital; T. OSBORN, B.M., B.Ch., Registrar in Psychiatry, Fulbourn Hospital and Addenbrooke's Hospital.

ELLIOTT, FRANK A., M.B., Ch.B., F.R.C.P., Professor of Clinical Neurology in the Medical School of the University of Pennsylvania and Director of Neurological Research and Education at the Pennsylvania Hospital, Philadelphia.

SOUTH-WESTERN REGIONAL HOSPITAL BOARD.—M. A. T. WATERS, M.B., B.S., M.R.C.P.Ed., D.P.M., Consultant Psychiatrist at Roundway Hospital, Devizes; D. R. TALWAR, M.B., B.S., D.A., Anaesthetic Registrar at Southmead Hospital, Bristol; A. J. NEWTON, M.B., B.S., Registrar in Orthopaedic and Traumatic Surgery to work at Torbay Hospital, Torquay, and Princess Elizabeth Orthopaedic Hospital, Exeter, on an exchange basis; F. W. WARD, M.B., B.S., Surgical Registrar at Cheltenham General Hospital.

BIRTHS, MARRIAGES, AND DEATHS

DEATHS

Aikman.—On December 5, 1958, at his home, 72, Chelmsford Place, Fulford Road, York, James Hislop Aikman, M.C., M.B., Ch.B., D.P.H. Beatty.—On November 26, 1958, at Tunbridge Wells, Kent, John Colley Pounden Beatty, M.B., B.Ch., D.P.H. Blair.—On December 7, 1958, at Bridge Street, Helmsley, Yorks, Alexander Campbell Blair, M.D., aged 90. Boyden.—On December 5, 1958, Percy Hamilton Boyden, M.D., surgeon captain, R.N., retired, of 30, Outram Road, Southsea, Hants. Bryson.—On November 30, 1958, at Richmond, Surrey, Reginald Bryson, F.R.C.S.Ed., Lieutenant-Colonel, I.M.S. (retired), aged 86. Burrell.—On December 7, 1958, at Aberystwyth, Cards, Charles Milwyn Burrell, M.B., B.Ch., of 22, North Parade, Aberystwyth. Cardis.—On December 1, 1958, at 32, Street Lane, Leeds, Yorks, Joseph Cardis, M.D., aged 57. Clyne.—On November 29, 1958, at Wealdens, Ashurst, near Southampton, Hants, Charles Clyne, M.C., M.D., D.T.M.&H. Cremin.—On December 3, 1958, in hospital, Maurice Cremin, L.R.C.P.& S.I. & L.M., of 40, Heather Drive, Dartford, Kent. Curlls.—On December 11, 1958, Edgar Stuart Curlls, T.D., M.B., B.S., F.F.A. R.C.S., of Beaconsfield, Bucks, and Ealing, London, W. Devitt.—On December 8, 1958, at Bournemouth, Hants, Herbert Pye Smith Devitt, M.R.C.S., L.R.C.P. Lamb.—On December 9, 1958, in a nursing-home, Teddington, Middx, David Lamb, M.B., C.M., F.R.F.P.S., J.P., late of 70, Mount Annan Drive, Glasgow, aged 88. Lambkin.—On December 4, 1958, Ernest Charles Lambkin, D.S.O., M.B., B.Ch., Lieutenant-Colonel, R.A.M.C. (retired), of Liskilleen, Shankill, Co. Dublin. Meccredy.—On December 4, 1958, Emily Mary Spencer Meccredy, M.D., of 11, Devonshire Place, London, W., formerly of 148, Harley Street, London, W. Neill.—On December 1, 1958, at Northern General Hospital, Edinburgh, James Hood Neill, M.B., Ch.B., of 4, Blinkbonny Crescent, Edinburgh, formerly of Kenya and Uganda. O'Brien.—On December 7, 1958, William O'Brien, M.B., Ch.B., of 284, Brockley Road, London, S.E. O'Connor.—On November 23, 1958, at his home, Ashwood House, Swindon Road, Kingswinford, Staffs, William Albert O'Connor, L.M.S.S.A., D.P.M., aged 61. Philip.—On December 7, 1958, at Balbogie, Huntly, Aberdeenshire, Peter William Philip, M.B., Ch.B., J.P. Phillips.—On December 10, 1958, at 7, Kilgraston Road, Edinburgh, Joseph Evelyn Phillips, M.B., Ch.B., of Barbados, British West Indies, late of 49, Minto Street, Edinburgh. Rowlands.—On November 22, 1958, at 25, Wimpole Street, London, W., Richard Pugh Rowlands, M.R.C.S., L.R.C.P., aged 86. Smith.—On November 28, 1958, at Putney, London, S.W., Hoyland Smith, M.R.C.S., L.R.C.P. Southwell-Sander.—On December 6, 1958, at his home, 8, Old Bury Hill, Dorking, Surrey, Geoffrey Henry George Southwell-Sander, M.B., B.Chir., D.P.H., D.I.H., Surgeon Captain, R.N. Stansfield.—On November 18, 1958, in hospital at Stroud, Walter Stansfield, M.R.C.S., L.R.C.P. Taylor.—On December 6, 1958, Elizabeth Morton Taylor, L.R.C.P.&S.E.I., L.R.F.P.S., of Ormsbank, Dalkeith, Midlothian, aged 88. Wall.—On November 25, 1958, at Paignton, Devon, Austin Darley Wall, M.B., F.R.C.S. Watts.—On December 3, 1958, Edward Croft Watts, M.D., F.R.C.S.Ed., D.P.H., of Lothians, Milford-on-Sea, Hants, aged 86. Weatherhead.—On November 22, 1958, at a Folkestone nursing-home, Ernest Weatherhead, M.B., of 1, Grimston Gardens, Folkestone, Kent, aged 84.

Any Questions?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Surgery for Diaphragmatic Eventration

Q.—Has surgery anything to offer in the treatment of diaphragmatic eventration in a patient of 64, whose symptoms are now becoming distressing on account of very considerable cardiac displacement to the right—the eventration being of the left leaf of the diaphragm?

A.—I assume that the patient has true eventration, a congenital defect in which the central tendon of the diaphragm is thinned and elevated but the muscle itself is intact and functional. The condition does not usually give rise to any ill effects but may cause gastric or cardio-respiratory symptoms. It may increase disability in an emphysematous patient with depressed pulmonary ventilation and vital capacity, not only by diminishing the total lung volume but also by allowing paroxysmal diaphragmatic movement. A thorough investigation of the cardio-respiratory system is essential in a patient of this age to ensure that the symptoms are not primarily cardiac in origin (it is unlikely that displacement of the heart *per se* will give rise to disability). Before any operation is contemplated all other means should be taken to increase pulmonary efficiency. If respiratory function is embarrassed by obesity, vigorous dieting is necessary. The patient should be advised to stop smoking. If, after all else has failed, there is good reason to suppose that pulmonary function would be significantly improved by restoring the diaphragm to its normal situation, then operation should be considered. However, this is a relatively recent development in thoracic surgery, and the results of treatment are not fully known.

Post-operative Bleeding in Hereditary Pseudohaemophilia

Q.—What is the treatment of post-operative bleeding associated with von Willebrand's disease (hereditary pseudohaemophilia)? Nillson *et al.*¹ suggest that a blood protein fraction is a specific. If injected at the time, it stops bleeding, or it can be given pre-operatively in known cases. Is this correct? Is the substance available in England; what is the dose; is it safe; and can it be used as a diagnostic test?

A.—The main haemostatic defect in von Willebrand's disease is a constitutional capillary abnormality. Coagulation defects may accompany the disease, but are, from the practical point of view, less important. When such a patient undergoes operation profuse bleeding from capillary vessels is the rule. If this bleeding is immediately arrested by firm pressure until clotting has occurred subsequent bleeding is not usually troublesome. But of course not all sites are susceptible to the application of firm pressure for five minutes. Thus a material which temporarily controlled the capillary bleeding would be a great advantage. The report of Nillson referred to is most promising and there is no reason to doubt the author's results. A similar, but not identical, material is made in this country by the Lister Institute. It has, so far as I know, not yet been used to control bleeding in patients with von Willebrand's disease and there is no guarantee that the material would have the effect described by Nillson. Moreover, there is no certainty that all patients classified as having Willebrand's disease have exactly the same defect. Again, the material, being prepared from fresh plasma, is in very short supply. Thus the questions of possible dosage, safety, and use as diagnostic material must await future research.

Treatment for Petit Mal

Q.—What treatment can be given to a child of 3 years who has petit mal and who has not responded to phenobarbitone or to "mysoline" and "diamox"?

A.—A most useful drug in petit mal is "tridione" (troxidone). To a child of 3 it can be given as a tablet of 0.15 g., or as tridione solution, each drachm of which contains 0.15 g. An average dose would be 0.15 g. four times a day. If tridione does not control the attacks, "paradione" (paramethadione) is worth trying. This is made up as pills, each containing 0.3 g., or as a solution, 1 ml. of which contains 0.3 g. The dosage is the same as tridione. The danger of these drugs, particularly of tridione, is agranulocytosis. Accordingly total and differential white counts should be performed when patients are on these drugs.

Aetiology of Pyloric Stenosis

Q.—Is pyloric stenosis less common in babies fed "on demand" than in those fed at fixed intervals?

A.—Congenital hypertrophic pyloric stenosis diagnosed by palpating the tumour and confirmed by radiography or by demonstration of its presence at operation is a familial condition. Furthermore, the tumour itself may be present at birth. It has recently been described in one of conjoined twins. It seems likely, therefore, that the basic cause is genetic, and possibly no other factor is involved. It has, however, at times been suggested that a second factor is required to produce the muscular hypertrophy and that this might be connected with overfeeding or with some other form of feeding mismanagement. There is no real evidence for this. Neither is there any statistical evidence to show whether or not pyloric stenosis is less common in demand-fed babies than others, but it seems unlikely. "Pyloric stenosis" is sometimes diagnosed on less strict criteria, with the result that other causes of vomiting are labelled as "pyloric stenosis," and it is possible that claims for an emotional or functional origin of the muscle hypertrophy have been based on such cases.

Dermatitis in Dentists

Q.—What are the common causes of dermatitis of the tips of the fingers in a dentist?

A.—The commonest cause is allergic sensitiveness to contact with local anaesthetics, but all other contacts in dentistry should be considered, such as antiseptics, antibiotics, nickel, chrome, oil of cloves, amalgam, acrylic resin, etc. In a recent case of this type the problem was not solved until patch-tests had extended to the home field and incriminated a streptocarpus plant.

Collected Articles from the "British Medical Journal"

The following books are available through booksellers or from the Publishing Manager, B.M.A. House. Prices, which include postage, are now the same for both inland and overseas.

Emergencies in General Practice (26s. 9d.).

Refresher Course for General Practitioners, Volumes 2 and 3 (26s. 9d.).

Clinical Pathology in General Practice (22s. 3d.).

Any Questions?, Volumes 2 and 3 (8s. 3d. each).

THE THREE PILLARS OF CLINICAL RESEARCH*

BY

H. J. B. ATKINS, D.M., M.Ch., F.R.C.S., Hon.F.A.C.S.

Director of the Department of Surgery, Guy's Hospital; Dean of the Institute of Basic Medical Sciences

Despite its title, this paper is really addressed to surgeons. The message, if there be a message, may be applicable to other groups within the profession, but I am not qualified to expound on the difficulties met with or the foibles displayed by my medical, gynaecological, paediatric, geriatric, or other colleagues in the course of their clinical inquiries; and so it is to the surgical fraternity primarily that I address myself.

As surgeons, we handle a great deal of material which is properly the substance of clinical research, but I am afraid that in many instances we handle it clumsily so that the final product is uncertain and open to criticism. Moreover, we are unduly addicted to armchair theorizing, and are, for instance, in the habit of extolling a method of therapy which is little more than the creature of our contemplation and has never been subjected to the rigours of experimental trial. Why we should behave like this when the man who said, "Why think? Why not try the experiment?" was himself a surgeon, it is difficult to say. Surgeons started off as anatomists, then they became pathologists, so that thirty years ago it was still possible to quote the aphorism: "Know your anatomy, know your pathology (and you'll know your surgery)." To-day, surgeons are physiologists; to-morrow perhaps they will be scientists, and so, more than two hundred years later, arrive breathless at the summit reached with such easy mastery by John Hunter.

Imagine a surgeon dissatisfied with his present methods of treatment and conscientiously and hopefully thinking how he might improve them. He summons his anatomical, pathological, and physiological knowledge to his aid. "Placed there," he will say, "it will have a better blood supply." "Thus and thus the lymphatics will be more completely removed." "Done so, the acid will be less injurious; radiotherapy, if necessary, more efficacious; the anastomosis more secure; the respiratory excursions less impeded; the enzymes more fruitful"; and so a new operation is born. So far, so good, but in ten years there is found to be a snag and students ask plaintively, "What is this operation 'gastrorrhaphy,' mentioned so enthusiastically in my father's textbook?"

The Stochastic System

The pattern for research should be, first, the idea; second, and if suitable, its trial on the experimental animal; thirdly, its trial on human beings; and fourthly, its announcement in the surgical journals. In much surgical research the two middle steps are omitted. One of the reasons for this is that surgeons are unfamiliar

*A lecture to the Medical Faculty delivered at Queen's College, Dundee, on October 30, 1958.

with the idea, which is a commonplace for physicists, of the stochastic system. An example will serve to show what is meant.

If I am completely uncertain which of two courses to adopt, I might toss a coin and act according to the dictates of what befell. I should regard this then as entirely a matter of chance, but if I knew all the facts this would not be the case. If I knew, for instance, the exact weight of the coin, its size, the strength of the impetus imparted to it, and the site of impaction in relation to its centre of gravity, the temperature and humidity of the atmosphere, the distribution of densities in the coin in relation to its centre of gravity, the distance it had to fall, and perhaps other factors such as the stickiness and temperature of my fingers, I should be able to calculate whether the coin would come down heads or tails. If, that is, I knew what are called the "hidden parameters," tossing a coin would no longer be a matter of chance. The spinning coin is not transgressing the principles of causality, and whether it comes down heads or tails is governed by strict law.

We may contrast such a system with that obtaining inside an unstable atom such as an atom of radium. Sooner or later this atom is going to discharge an emanation and become degraded to radon. On analogy with the above example we might argue that if we knew all the processes going on within the nucleus we could predict exactly when the atom of radium would disintegrate and that it is only the complexity and minuteness of these hidden parameters which prevents us from doing so. This, however, is not the case; no amount of knowledge, however intimate, of what is going on inside the nucleus would help us to determine whether the radium atom would disintegrate in the next ten seconds or in the next ten years. Such systems where the reactions are not individually determined according to the principles of causality are called stochastic systems.

Now, the human body has so many hidden parameters that to work out from the armchair how it is going to behave after a certain operation is a most uncertain enterprise. These hidden parameters are so multifarious that we may for practical purposes regard the human body as a stochastic system; indeed, if we admit the principle of free will, and if I understand him aright *pace* Spinoza's "metaphysical determinism," it is a stochastic system.

Trying Out

It is therefore the number of hidden parameters or even the possible stochastic nature of the system with which we are dealing which makes the application of cybernetic principles to the human organism so chancy.

is to be preferred to treatment A. Furthermore, the figures give some indication of how much better the one treatment is than the other. There are, however, other equally important advantages of expressing results numerically.

Supposing the relation of treatment to a variable is being considered, then if the results of treatment can be expressed numerically a "scattergram" can be constructed and the relation, if any, established on inspection or by calculation. Fig. 2 shows a hypothetical investigation to determine whether the success of a certain treatment is dependent on the initial weight of the patient. The results of treatment are expressed as time in days before the temperature settles, and the scattergram shows, in a way more clearly than any amount of verbal description would have done, that there is such a relation and that fat people respond better to treatment than thin. For more accurate work an exact coefficient of correlation could have been calculated. Finally, where a numerical assessment of treatment can be

FIG. 2.—Scattergram relating weight of patient to the period of pyrexia.

provided the whole investigation is susceptible to statistical analysis, and extravagant claims which are really quite unwarrantable are not put forward.

When there are all these advantages of precise mensuration it is a pity that surgeons as a whole dislike figures and that this dislike is often so ingrained that they do the most illogical things with them if they have to use them at all, as, for instance, in marking examinations. In nearly all surgical examinations there is a desire to give more weight to one part of the examination than to others. It is usually "the clinical" which is singled out for this special attention. In the Treasurer's Gold Medal in Clinical Surgery at Guy's Hospital, for instance, it has been the practice from time immemorial to mark the papers out of 200 and the clinical out of 300. This of course has no effect at all, because as often as not candidate A, who is slightly better than candidate B in the paper, will get 155 marks to B's 150, and, being slightly worse in the clinical, will get 250 to B's 255, so that their total marks are the same and nothing has been achieved. What is clearly needed in order to add weight to one part of an examination is to increase the range of marking in this part of the examination and never mind about the maximum. The fact that this anomaly is by no means confined to Guy's Hospital, but invades Queen Square, whether it be under the aegis of the Royal Colleges or London University, and is in evidence in the examinations of many provincial universities as well, only serves to show how inexpertly medical men can behave when dealing with figures.

Another type of illogical error is exemplified in *Against the Law* by Peter Wildeblood (1957). There occurs there the following statement, with the so-called evidence which is intended to support it.

"It is, of course, perfectly obvious that only a very small proportion of this 650,000 is noticeably odd. It is equally evident that homosexuality is not, as some propagandists would have us believe, a kind of fashionable vice restricted to decadent intellectuals and degenerate clergymen. This idea is extremely useful to those who wish to influence public opinion against homosexuality, and it succeeds because the British people, on the whole, despise intellectuals and distrust the clergy. But it does not happen to be correct.

In a recent survey of 321 court cases involving homosexuality, it was found that the accused men fell into the categories shown in Table I."

TABLE I.—Categories of Homosexuals (Peter Wildeblood, 1957)

Shop and clerical workers	16%	Schoolmasters	4%
Artisans (factory workers)	15%	Agricultural workers	4%
Transport and Post Office	11%	Clergymen	2%
Unskilled labourers	10%	Mentally deficient	2%
Armed Forces	10%	Independent means	11%
Hotel and domestic servants	7%	Unclassified	11%
Students, trainees, schoolboys	6%		

This table, of course, means nothing unless we are at the same time given the percentages of "shop and clerical workers," "artisans," and so forth in the general population. Indeed, it is not inconsistent with the possibility that all members of the above categories are homosexuals.

Incommensurable Qualities

This inability to think clearly in figures is often rationalized by claiming that so many of the results of clinical experiment cannot be satisfactorily expressed numerically. Some qualities of human behaviour are, of course, quite impossible to measure—such qualities, for instance, as bravery or fastidiousness; but this does not mean that inquiry related to these qualities cannot be given a numerical expression. For instance, if the 1st Battalion of the East Loamshires won 3 Victoria Crosses and 2 Military Crosses in the last war, whereas the 2nd Battalion won no medals and had a sergeant and four other ranks shot for cowardice in face of the enemy, there is good reason on purely numerical grounds for presuming that the 1st Battalion had a better morale than the 2nd Battalion, although morale is essentially a quality which cannot be measured.

Clearly a passion for mensuration can be overdone, as the following charming quotation from R. E. Dickinson (1958) attests: "Lord Kelvin said that we can know nothing of a matter unless we can measure it. Psychologists braced with their success in giving numerical values to I.Q. are now hoping to measure feminine beauty in precise units. The unit proposed is the milli-helen, the quantity of beauty required to launch exactly one ship."

Such endeavours to express essentially incommensurable qualities by numbers must of course be undertaken with great care. Often, however, if it is reasonable to adopt it, this method shows up in a vivid manner differences and relations which might otherwise be obscured in a mass of verbiage. A particularly valuable method of mensuration devised originally by Walpole and Paterson (1949) is the mean clinical value. This method of giving a numerical value to the effects of treatment is applicable especially to those conditions, such as advanced cancer of the breast, where there are apt to be many manifestations and where these manifestations may respond in a different manner to treatment or respond at a different time.

The working of the system is very simple, and depends upon deciding whether, as a result of treatment, a lesion is better than it was before treatment began or worse than it was before treatment began, or whether the situation is doubtful.

Mean Clinical Value

Before treatment all lesions are accurately assessed—by measurement if they are palpable or visible, and by studying their dimensions or densities if they are radiological. Subjective symptoms are better ignored, but the "presence" or "absence" of pain may well be a valuable index of the effect of treatment. In this way a baseline is made and the treatment is started. The patient is seen at four-weekly intervals thereafter and each lesion is again assessed. If the lesion has improved it is given 2 marks, if worse 0 marks, and if stationary or doubtful, 1 mark. These marks are then added together and divided by the number of lesions to obtain an average. The average is multiplied by the factor 6 to bring the figure to a manageable number, which is the mean clinical value (M.C.V.). It will be seen that the maximum M.C.V. is 12, which implies that all the

lesions are improving. An M.C.V. of 0 means that all the lesions are worsening, and an M.C.V. of 6 that the condition is stationary. This last mark may be due to the fact that all the lesions are stationary, or that half are improving while the other half are regressing, and it indicates, therefore, the response of the patient as a whole. The M.C.V. may have any figure between 0 and 12, and a graph can be drawn of the progress of a patient under treatment. The state of the lesions is compared with their state before treatment began and not with their state at the previous visit, because it is more satisfactory to have one standard than to have an ever-changing standard which is apt to lead to swings on the graph that have no real meaning.

The effect of this, however, is that, when a patient who has for some time responded to treatment begins to deteriorate, this deterioration is not at once reflected in the M.C.V. because the lesions may still be better than they were before treatment began and often there is a somewhat precipitate drop in the graph before death. This is, in practice, only a very slight disadvantage, because, certainly in the case of cancer of the breast, when a patient begins to deteriorate she does so very quickly, and the delay in the drop in the graph from this cause is generally only a matter of one period or at the most two periods. As has been indicated, if there is any uncertainty over whether a lesion is changing, then it is given a mark of 1. By the next visit this uncertainty has usually been resolved, and a lesion which looked as though it might have improved but about which there was some doubt has now unequivocally improved and can confidently be given a mark of 2. All that has occurred, therefore, as a result of the possibly mistaken assessment of the lesion at the visit when it was given the "uncertain" mark of 1 is that the shift in the graph has been delayed by four weeks. Conversely, the same applies to a lesion which seems to be deteriorating but about which there is some doubt, and the whole graph is therefore given a sure and steady delineation which properly represents the course of the patient under treatment, albeit with a slight latent period or what the cyberneticist might call "a threshold-controlled stability."

Radiological factors are assessed at every third visit in order not to multiply the number of x-ray films taken, and the previous mark allotted to this factor is retained in the interval to compute the M.C.V. for those two periods. This again leads to some lag, as the x-ray picture may have changed in the meantime and this is not reflected in the graph until later.

With all these slight and largely theoretical defects, the M.C.V. has proved in practice to be a tool of the greatest value in research. Thus, in comparing two methods of treatment, as for instance adrenalectomy and hypophysectomy, for carcinoma of the breast, the individual M.C.V. charts of all patients treated by one of these methods can be congealed into one average graph and compared with a similar average graph for the other method of treatment (Fig. 3).

FIG. 3.—Response to adrenalectomy and hypophysectomy, taking the average M.C.V.s of all patients at four-weekly periods after treatment.

Again, by taking an average of all the M.C.V. records of a particular patient, a single figure can be made to represent the overall response of that patient to the treatment, and a table (Table II) can be made out which gives a good idea of the effect of this measure as a whole. By the use of

TABLE II.—Effect of Oestrogen on 94 Cases of Advanced Cancer of Breast, as Expressed by Average M.C.V. Per Case—i.e., 17 Cases Had an Average M.C.V. Between 8 and 12, 39 Cases Between 7 and 4, etc.

Average M.C.V.	12-8	7-4	3-0	Unable to take drug
No. of cases	17	39	31	7

the "average M.C.V." derived in this way it is also possible to construct scattergrams (Fig. 4) and so determine a relation or lack of relation between the success of treatment and such factors as age, mitotic-cell count, or what you will.

There is one flaw in the M.C.V. system so far practised that is a serious theoretical disadvantage, but which has been so unobtrusive in practice that its full implications have only recently been appreciated.

If we consider a case, for instance, of cancer of the breast with multiple skeletal deposits and multiple skin lesions and in which there are so many lesions that it would be impossible to exploit them all, then it has been the practice to decide arbitrarily how many skeletal lesions and how many skin lesions should be taken as representatives to act as factors in assessing the M.C.V. Usually the obvious ones or the readily mensurable ones have been taken and the others have been ignored. If all the lesions vary in the same way with treatment, then it does not matter very much how many are taken as indices. If, on the other hand, one system improves while the other deteriorates, then it is clearly important how many factors have been taken in each system. For instance, to take an extreme and very unlikely case, if two factors have been taken in the skeletal system which is deteriorating and ten factors have been taken in the skin which is improving, the M.C.V. is 10; whereas if ten factors were taken in the skeletal system and two in the skin, the M.C.V. would be 2, which makes nonsense of the whole method.

In order to repair the flaw in such unusual cases J. Hayward has suggested the following modification of the system which is now being put into operation. The lesions in each system are grouped and an average is taken of these; the mean of the grouped figures is then taken to compute the M.C.V. Thus, in the example cited above, the M.C.V. would be calculated from the fact that the skeletal system scored 0 and the cutaneous system 2, so that the M.C.V. would be $\frac{0+2}{2} \times 6 = 6$, however many or however few lesions were taken from either system. There is no method of computation which takes care of the case—on perhaps out of several hundred—where there are so many lesions in one system that a selection has to be made of representative factors, but where the lesions common to one system are behaving in a different way under treatment.

Stress has been laid on the defects of a system which in practice runs very smoothly. If a visitor to the breast clinic at Guy's Hospital, where this system has been used now for many years, is asked to give a mark—somewhere between

FIG. 4.—Scattergram relating M.C.V. to resting-cell count.

0 and 12—to the effects of treatment, and basing his opinion on a general clinical assessment, without recourse to exact measurement, it is surprising how closely his guess coincides with the computed value. To state that a patient has an M.C.V. of 9 is a quicker, more useful, and more vivid way of expressing the conclusion that this patient is responding in some degree to treatment and that it is worth while persisting with this treatment, but that not all the lesions are reacting favourably. Furthermore, the alternative is to fall back on the dangerous use of "clinical impressions" which has been productive of such fallacious conclusions in the past.

Recording Measured Data

If we now turn to another aspect of mensuration—namely, that of recording measured data—some consideration must be given to the punch-card system. Smyth and Bainbridge (1957a) have introduced an extremely useful system for tabulating punch-card records which enables the interrelation of a number of factors to be studied readily. The article in which this method was described concerned the interplay of a number of obstetric factors such as the relation between stillbirths and post-maturity, forceps delivery and the duration of labour, and so forth. It included a specimen table consisting in fact of 32 variables, and was so alarming at first sight that it probably dissuaded many readers, who would otherwise have found the system extremely valuable, from pursuing the matter further.

Table III is extracted from their more elaborate table, and for simplicity shows the interrelation of only six of their factors. To quote, with certain modifications, from the paper by Smyth and Bainbridge, this table is constructed as follows:

"The principal cells on the *main diagonal* show the numerical incidence (upper figures) and percentages (lower figures) of 6 factors. The cells in the *bottom left-hand half* show the numerical incidence of patients having the two factors named in the intersecting row and column. (Where these factors are mutually exclusive, as in 'Breech' and 'Occipito-posterior,' the cell is left blank.) The cells in the *top right-hand half* contain two percentages—that is, the number of patients having both of the appropriate row and column factors expressed as a percentage of the total incidence of (1) the *column factor* (upper figures) and (2) the *row factor* (lower figures)."

"To See if these Percentages Differ Significantly From the Means.—Taking the lower percentage only, subtract it from the percentage in the principal cell on the same row (or vice versa); compare the answer with the figures in columns B to E on the same row; observe how many patients are needed for this difference to be significant; lastly, examine the principal cell in the same *column* to see if that number of patients occurs."

"Column A shows the minimum number of patients required in the *column principal cell* for the test to be applicable to that row."

Thus all the statistical analysis is worked out beforehand and all the clinical investigator has to do to see whether his results are significant is to use a table no more complicated,

as the authors point out, than a mileage chart in the *A.A. Handbook*. For instance, by following these rules it will be found that manual removal will be associated with breech delivery in a highly significant fashion, whereas relative disproportion and toxæmia are not so associated.

The construction of columns A, B, C, D, and E is a simple statistical exercise which a friendly colleague with an elementary knowledge of these matters may undertake in a very short time by reference to the instructions contained in the original article and subsequent correction (Smyth and Bainbridge, 1957b). The figures given in columns B to E are simply twice the standard deviation.

To help in using this method, Garside (1958) has published a table for ascertaining whether differences between percentages are statistically significant, and the result can be picked out by little more than simple inspection.

Another technique for presenting results, which may be very valuable where three variables are involved, and which is much neglected by workers in clinical fields, is the three-dimensional graph. A good example of this taken from a paper by Skoog (1957) is shown in Fig. 5, where the effect

FIG. 5.—A specimen three-dimensional graph relating growth of cells in tissue culture to the concentration of kinetin in the medium. Reproduced by permission of the Editor of the *Journal of the National Cancer Institute*.

of kinetin in different concentrations on the growth rate of cells in tissue culture is beautifully shown in a manner which graphically reveals the relevant points. Having inscribed these enrichments on the capital of the second pillar (I trust they will not be regarded as excrescences), we must now proceed to the third.

ANALYSIS

By analysis we mean, of course, statistical analysis. There are those good practical men with no nonsense about them, for whom the word "statistics" is anathema, who quote

TABLE III.—Method of Recording of Dependent and Independent Variables from Smyth and Bainbridge (1957a)

	Forceps	Manual Removal	Toxaemia	Relative Disproportion	Breech	Occipito-posterior	A	B	C	D	E
							No. of Patients required for Valid Result	Significant Difference at 5% Level			
								1,000	500	100	10
Forceps	213 9.16	6.6 19	7.5 6.8	15.9 53	13.6 63	11.7 42	54	1.38	2.29	5.64	18.2
Manual removal	14	75 3.23	12 3.8	1 2	8 13	3 3	158	0.84	1.40	3.46	11.15
Toxaemia	16	9	234 10.06	4.3 16	1.3 6.5	2.6 10	50	1.44	2.38	5.89	18.98
Relative disproportion	34	1	10	64 2.75	5 7	17 18	180	0.78	1.30	3.20	10.32
Breech	29	6	3	3	46 1.98		250	0.66	1.10	2.73	8.79
Occipito-posterior	25	2	6	11		60 2.58	194	0.76	1.26	3.10	10.00

the tag that "statistics can prove anything." Unfortunately, statistics have got to be used in nearly all clinical research, and it is better that they should be good statistics than bad. There is no need for the research worker in clinical medicine to have a knowledge of statistics, but it is an enormous advantage if he has, even though his knowledge of this subject is not very profound. To be able to do these things oneself, however, adds immensely to the interest and value of clinical research. Nevertheless, for the amateur, it would be wise to have the results checked by an expert, because it is fatally easy to make a gross error in a field in which one has not been bred.

Finney (1956) has said: "That a high proportion of those whom I have broadly classed as experimenters should have a knowledge and appreciation of statistical principles is of great value to the progress of their science, but perhaps not so much because they are thereby enabled to do their own statistical work as because they understand better what needs to be done and what conclusions can reasonably be drawn."

Statistics have two roles in clinical research: they act either as a brake or as a headlamp. In the first role they prevent the experimenter from claiming as a consequence a result which may have emerged entirely due to chance—they prevent him, that is, from making a fool of himself. The most mistrustful cannot but applaud such an effect of a study which on the whole they view with suspicion.

Sometimes, however, statistics act like a headlamp and reveal a truth which could not have been apparent without such an analysis. When a result arrived at by a statistical analysis conflicts with common sense, then the statistics are probably wrong; when it conflicts with emotion, as in the relation between cigarette smoking and lung cancer, then this is not necessarily the case.

It must be admitted, however, that many research workers in the clinical field whose contributions are of great value have such an antipathy to manipulating the relatively simple formulae which the practice of statistical analysis demands that they must rely entirely on a professional statistician to do this for them. To get the best out of their results, however, they would be wise to plan their investigation in the first place in consultation with a statistician, one of whose qualifications is that he has mastered the science of the design of experiments. In this way material will not be wasted, and expense and labour will be saved.

"Analysis of Contaminants"

Granted all this, there is still one aspect of analysis which must be done by the investigator himself, and it is this operation which I have termed the "analysis of contaminants."

It must be presumed that in any investigation great care has been taken to avoid sources of error, but, however careful one may be, these are likely to creep in, and, having analysed the results, it is now necessary to go back over the sources of error and see how these may have influenced the conclusions. In describing a system for an analysis of contaminants or sources of error, I have discussed elsewhere (Atkins, 1957) the reasons for doing this at this stage, but it will be necessary to recapitulate some of these reasons here, because this part of the work can be done only by the investigator himself and cannot be left to the statistician.

If, for instance, we are investigating the effect of pregnancy on breast cancer in some primitive community, we would compare a series of women who had been pregnant with a series who had never been pregnant, in relation to the incidence of cancer. We will suppose that it is found that the incidence of breast cancer is higher in the "non-pregnant" series. In such an investigation three contaminants might be considered. The first arises because unmarried women might fail to reveal that they had been pregnant. This means that the allegedly "non-pregnant" series may have been salted, if that is the right word to use, with women who had in fact been pregnant. The effect of this contaminant would be to make the two

series more alike than they should be; it would tend to favour a negative result to the investigation, and on that account it is referred to as a *negative contaminant*.

Furthermore, we might suppose, in a primitive community for instance, and indeed in this country up to a few years ago, that the possession of children ensured that the mother would be supported in her old age and would be more likely to live long enough to develop cancer of the breast. This contaminant, tending to lessen the positive difference between the "non-pregnant" and the "pregnant" series in relation to cancer, would also be a *negative contaminant*.

On the other hand, the fact that pregnant women are more likely to have suckled, and assuming, for the sake of argument, that suckling protected a woman from cancer of the breast, this contaminant would increase the difference between the two series and would on that account exaggerate the positive difference, and is therefore known as a *positive contaminant*.

Thus, a contaminant which tends to increase the greater or to decrease the less is a *positive contaminant*, and one which tends to do the reverse is a *negative contaminant*.

In the investigation which we have been considering we have assumed that analysis has revealed a positive result—namely, a significant difference between the two groups. It will be observed that the negative contaminants have tended to mask this significance, whereas the positive contaminant has tended to exaggerate it. If, on the other hand, an analysis had failed to reveal any difference between the two groups and that a negative result to the investigation was implied, then the negative contaminants would have strengthened this view and the positive contaminant would have weakened it. From this we may derive the general rule that contaminants bearing the opposite sign to the conclusion tend to conceal the conclusion and are, on that account, known as *inhibitory contaminants*; those bearing the same sign as the conclusion tend to exaggerate its significance and are on that account known as *illusive contaminants*. For a full discussion of this matter the reader is referred to the article quoted above, but it will be seen at once that the *illusive contaminants* are the treacherous ones, as they tend to make the investigator think that his results are more significant than they really are.

A paper giving an account of a clinical investigation, from which sources of error of this sort are inseparable, should contain—following the analysis—a formal statement of the inhibitory and illusive contaminants together with those which it is assumed do not affect the issue one way or the other and are known as *neutral contaminants*. In this manner the reader is able to assess the degree of confidence which can be placed in the investigation as a whole.

We have now completed our tour of the foundations of this edifice—clinical research. To establish these three pillars firmly on a bed of rock and to build on them requires a little extra thought and a great deal of additional careful work, but I believe in the end it will save future generations much labour and will prove far more enduring than the erection of a papier mâché façade to house some colourful exhibition on a foundation of sand.

I am grateful to Sir Charles Symonds for his helpful criticism.

DEVELOPMENT OF HIRSUTISM
AFTER PUBERTY*

BY

F. T. G. PRUNTY, M.D., F.R.C.P.

R. V. BROOKS, Ph.D., F.R.I.C.

AND

D. MATTINGLY, M.B., B.S., M.R.C.P.

From the Department of Metabolic Diseases, St. Thomas's Hospital, and the Department of Chemical Pathology, St. Thomas's Hospital Medical School, London

[WITH SPECIAL PLATE]

The problem of the development of hirsutism after puberty is of great medical importance, and an understanding of its causes is therefore necessary. At the present time it seems that the condition may be divided into three main categories: (1) associated with adrenal cortical dysfunction of demonstrable proportions, such as that seen in the adreno-genital syndrome (Wilkins *et al.*, 1955) or in adreno-cortical tumours; (2) Stein-Leventhal syndrome; and (3) simple (idiopathic or constitutional) hirsutism. Much comment has been made on the last of these conditions (Dorfman and Shipley, 1956), whereas the Stein-Leventhal syndrome is much less known; even Stein accumulated only 75 cases in a period of 20 years (Stein *et al.*, 1949). The most popular view at present is that some androgenic substance may be derived from the ovary of these patients (Plate, 1951) and that theca luteinization is of importance in the ovarian pathology (Culiner and Shippel, 1949). In this communication emphasis is laid upon the problems of diagnosis and aetiology, including an examination of the biochemical features of the steroids found in the urine, both with and without stimulation of the adrenal cortex by corticotrophin.

Present Series

The cases here presented were all characterized by the development of hirsutism after puberty. Clinical analysis of the group (Table I) shows that it may be subdivided. The ultimate criterion for the diagnosis of the Stein-Leventhal syndrome was examination of portions of the ovaries after operation. In some instances the size of the ovary and appearance of the capsule were almost normal. Indeed, the impression is gained that only minimal enlargement, if any enlargement at all, need be present. In one instance the ovaries reached nearly three times normal size. Microscopically, persistent follicles were always identified,

with a tendency to cyst formation, and proliferation and luteinization of the theca interna was present (Special Plate, Fig. 1).

Indications for laparotomy in these patients have been sterility or severe menstrual irregularity associated with

*Based on a communication given by F.T.G.P. at the Journée d'Endocrinologie de Marseille, May 9, 1958.

hirsutism, except in one instance where pain at menstruation was the immediate reason for operation. There have been clinical indications of at least a minor degree of ovarian enlargement. This evidence was obtained by vaginal examination with relaxation under anaesthesia, and confirmed, in all instances where it was done, by x-ray visualization after induction of pneumoperitoneum (Table II; Special Plate, Fig. 2). The dose of x rays involved is only 200 milliroentgens and has been considered negligible in the circumstances.

Examination of Table II will show that the patients with Stein-Leventhal ovaries were characterized by certain features, including the usual ones of sterility and menstrual irregularity. Ovulation, mental depression, and a family history of hirsutism were absent in comparison with the group designated as "hirsutism." This group of 32 patients

remained after deducting those patients with other diagnoses as indicated in Table I. The group of patients designated as likely cases of Stein-Leventhal syndrome did not have a laparotomy performed. They were separated on account of their lack of fertility and their menstrual history, and otherwise resemble the Stein-Leventhal group.

Among the "hirsutism" group ovulation tended to be present. Of the six cases with suspicious ovaries as shown by vaginal examination, four had irregular menses and in one case normal ovaries were found on laparotomy. This was the only instance where laparotomy has been performed with negative ovarian findings. Of the two cases with possible ovarian enlargement as seen radiographically, one had

TABLE III.—Features of Similarity in "Hirsutism" and Stein-Leventhal Syndrome

irregular menses and the other was the patient mentioned with normal ovaries. Of the eight patients with irregular periods, two at least may have Stein-Leventhal ovaries, so that here is clinical evidence that even this group of patients may not be quite homogeneous. In Table III are presented the characters which appeared common to all groups. There was, and especially among the "hirsutism" group, a strong tendency for hirsutism to appear in the years just after establishment of menstruation. Somewhat surprisingly, obesity was equally distributed among the patients, and therefore seems not to be a useful indication of the possible presence of the Stein-Leventhal syndrome. It should be noted that one of the group of "hirsutism" patients had an enlarged clitoris, and this point will again be referred to below.

Studies of Urinary Steroids

Resting Excretion

The excretion of ketogenic steroids as determined by minor modifications of the method of Norymberski *et al.* (1953) was normal in all groups of patients. In the

TABLE IV.—Resting 17-Ketosteroids and Ketogenic Steroids

	No. of Patients	17-Ketosteroids (mg. per day)	Ketogenic Steroids (mg. per day)
"Hirsutism"	32	13.8 ± 0.61 (S.E.)	11.5 ± 0.83 (25)
Stein-Leventhal syndrome	6	10.5 ± 1.02 (P < 0.05)	8.9 ± 1.08
? Stein-Leventhal syndrome	7	10.1 ± 0.60 (P < 0.01)	11.4 ± 1.27

"hirsutism" group the mean 17-ketosteroid level was above the normal average of 10 mg., and significantly above the mean of the Stein-Leventhal group (P=0.05) and the "? Stein-Leventhal" group (P=0.01) (Table IV). It will be seen from the accompanying diagram that there was a wide scatter of 17-ketosteroid levels in the "hirsutism" group. These determinations were made by the techniques of Gibson and Norymberski (1954).

Diagram showing correlation between resting 17-ketosteroids and 17-ketosteroid response to four-day test with corticotrophin. The dotted lines indicate the upper normal ranges.

Response to Corticotrophin

Corticotrophin was injected in the form of gel in a dosage of 20 U.S.P. units intramuscularly twice daily for four days according to the method previously described (Prunty, 1956). Two batches of corticotrophin of known potency (89754 and P 80205) were used. The figures in Table V are the means of the highest figures reached during this test, usually those of the third or fourth day. The values for a control group of 15 women unaffected by hirsutism and of similar age are included. None of the patients under study differed from normal in the excretion of ketogenic steroids. The "hirsutism" group gave a mean for 17-ketosteroids significantly greater than normal (P < 0.01), and for the ratio ketogenic steroids/17-ketosteroids significantly less than normal (P < 0.01). The "? Stein-Leventhal" group gave a mean figure for 17-ketosteroids possibly significantly less than the "hirsutism" group (P = < 0.05), but this was not true of the Stein-

TABLE V.—Steroid Response to Corticotrophin

	No. of Subjects	Ketogenic Steroids (mg. per day)	17-Ketosteroids (mg. per day)	Ratio Ketogenic Steroids/17-Ketosteroids
Controls	16	68.7 ± 6.9 (S.E.)	22.3 ± 1.95	3.24 ± 0.30
"Hirsutism"	25	67.6 ± 5.0	40.4 ± 3.0	1.80 ± 0.17
Stein-Leventhal syndrome	5	74.4 ± 14.0	32.2 ± 4.8	2.31 ± 0.37
? Stein-Leventhal syndrome	6	65.2 ± 15.3	26.5 ± 3.2	2.36 ± 0.43

Levels of significance for ketosteroid means: hirsutism/controls, P = < 0.01; ? Stein-Leventhal syndrome hirsutism, P = < 0.05; Stein-Leventhal syndrome/hirsutism, P = > 0.05. For K.G.S./K.S. ratio, hirsutism/controls, P = < 0.01.

Leventhal group (P = > 0.05). It should be emphasized that both these groups are small, as can be seen from the Table. A significant correlation was observed between the resting 17-ketosteroids and the level after corticotrophin injection in the "hirsutism" group (see Diagram).

Fractionation of 17-Ketosteroids

The resting urines of selected patients were extracted and the 17-ketosteroids fractionated according to the method of Brooks (1958), who gave data on six normal females aged 21-30. For this group the excretion of androsterone plus etiocholanolone amounted to 4.7 ± 1.06 (S.D.) mg. per day. Three "hirsutism" patients excreted from 7.7 to 13.6 mg. per day, and two others 3.7 and 6.7 mg. per day respectively. Two Stein-Leventhal patients excreted 5.3 and 7.0 mg. and two "? Stein-Leventhal" patients 4.0 and 10.7 mg. per day. In spite of this elevation in some patients of all groups it will be seen from Table VI that the ratio of androsterone/etiocholanolone was within limits in all cases. Of the two Stein-Leventhal patients, in one the ratio was at the lower level of normal and in the other at the upper limit. The ratio 11-hydroxyandrosterone/11-hydroxyetiocholanolone was increased in the two patients with adreno-genital syndrome and in one each of those with Stein-Leventhal syndrome and suspected Stein-Leventhal syndrome. It is possibly increased (3.6) in one of the "hirsutism" patients. The separated 17-ketosteroids were divided according to their chromatographic properties into two groups—a less-polar and a more-polar group (Brooks, 1958). The former may be of extra-adrenal origin in part—for example, from the testes in men—and the latter comprise the 11-oxygenated ketosteroids of adrenal origin. In six normal females Brooks found a ratio of less-polar/more-polar of 4.89 ± 0.95 (S.D.). The values for the Stein-Leventhal patients were well within this range (Table VI).

The excretion of dehydroepiandrosterone was increased in at least two of the "hirsutism" patients and in the two with adreno-genital syndrome. The data in Table VI for these two latter patients are taken from that of the case herein reported and from a pre-pubertal case recently examined by us.

Pregnanetriol Excretion

Urinary pregnanetriol has been determined by the method of Bongiovanni (1954), and in some instances confirmed by paper chromatographic separation. It is readily estimated and the importance of its estimation is considerable, for it is excreted in large amounts in the adreno-genital syndrome. It has been estimated in a group of cases, for the most part severely affected by hirsutism, where the possibility of the

TABLE VI.—Fractionated Resting 17-Ketosteroids

	No. of Subjects	Androsterone/Etiocholanolone	11-Hydroxyandrosterone/11-Hydroxyetiocholanolone	Dehydroepiandrosterone (mg. per day)	Less-polar/More-polar
Normal	6	2.37 ± 0.96	2.1-3.6 (4)	0.4 ± 0.36	4.85 ± 0.95
"Hirsutism"	5	1.31 ± 0.45 (S.D.)	2.2; 5.3 (2)	0.7-1.7 (3)	3.0-5.2 (5)
Stein-Leventhal syndrome	2	0.4; 2.1	1.9; 7.7	0.2; 0.5	3.6; 3.7 (2)
? Stein-Leventhal syndrome	2	1.1; 1.4	3.0; 4.7	0.2; 0.7	3.0; 6.2 (2)
Adreno-genital syndrome	2	1.0; 1.7	6.0; 5.0	3.6; 3.2	3.0; 2.0 (2)

presence of the adreno-genital syndrome arose. In all three groups the values in some cases, when given corticotrophin, were above the level of 5 mg. per day which is tentatively considered to be the upper limit of normal. It is striking that in one of the "hirsutism" patients a level of 16.4 mg. was reached (Table VII).

In considering the interpretation of high levels of pregnanetriol the following points are of importance. In the adreno-genital syndrome the metabolic block in steroid synthesis leads to a deficiency of corticoid metabolites in the urine, with a parallel increase of pregnanetriol and related substances. Therefore under these conditions the ratio of pregnanetriol/corticoid metabolites will be very high in comparison with the normal. If the ketogenic steroid method here employed is used for the determination of the corticoid metabolites, pregnanetriol is also included in the estimate. Since the chromogenicity of this substance after oxidation is approximately 1, an idea of the amount of the corticoid metabolites (sufficient for our purpose) can be

TABLE VII.—Pregnanetriol Excretion (mg. per day)

	Response to Corticotrophin		
	Resting Pregnanetriol	Pregnanetriol	17-Keto-steroids
"Hirsutism": 4 patients	0.8-1.8	2.4-4.8	31-52
Stein-Leventhal syndrome: 2 patients	1.1-2.7	7.6-16.4	36-74
"Hirsutism": 2 patients	1.7-1.8	4.4-5.6	16-40
Stein-Leventhal syndrome: 2 patients	1.4-2.6	6.9-10.3	27-37
"Hirsutism": 2 patients	2.6	2.4-6.0	17-38

obtained by subtracting the value for pregnanetriol from the figure for ketogenic steroids. Under normal circumstances the ratio is 1/10, but we have found that in the adreno-genital syndrome the value for pregnanetriol can even exceed that for ketogenic steroids, giving an apparent ratio of infinity. On direct determination by chromatography the resting ratio pregnanetriol/tetrahydrocortisone in the case in Table VIII is 6/1. Under normal circumstances, from data given by Prunty (1956) and by de Courcy *et al.* (1953), it should be in the neighbourhood of 1/3. This finding is therefore in agreement with the above conclusion.

Returning now to the question of the high values observed for pregnanetriol in some of the "hirsutism" cases given corticotrophin (Table VII), determination of the ratio pregnanetriol/(ketogenic steroids - pregnanetriol) in response to corticotrophin shows the values to fall between 1/6 and 1/8, and for the Stein-Leventhal syndrome between 1/9 and 1/13. It is therefore justifiable to conclude that the production of corticoid metabolites was good in these cases in response to corticotrophin, and that the degree of any metabolic block, if present, is of a much lower order than in the true adreno-genital syndrome.

Adreno-genital Syndrome and Carcinoma of Adrenal Cortex

It has been stated that one of the series of 49 cases of hirsutism developing after puberty is considered to be a true example of the adreno-genital syndrome. The features of this case are given in Table VIII. Apart from these it was noted that the patient was short in stature and union of her bony epiphyses had occurred. The main features of her steroid pattern have been indicated above. The resting value for 17-ketosteroids and their response to corticotrophin, although elevated, lie within the limits of the patients with hirsutism. The raised value of the ratio 11-hydroxyandrostenedione/11-hydroxyetiocholanolone (Table VI) conforms with the metabolic block in corticoid synthesis, and the elevation of dehydroepiandrosterone in many of these cases is well recognized (Broster *et al.*, 1953).

The patient with adrenal carcinoma has been included as an example of a further cause for development of post-pubertal hirsutism, and data for this patient are also given

TABLE VIII.—Details of Case of Adreno-genital Syndrome and Case of Carcinoma of Adrenal Cortex

	Case of Adreno-genital Syndrome	Case of Carcinoma of Adrenal Cortex
Age	18 years	21 years
Onset	14	17
Menses	Regular	Regular
Clitoris	Enlarged	Enlarged
Ovary size	+	+
Obesity	Normal	None
Acne	Moderate	Moderate
17-Ketosteroids	14.8-20.8 mg. per day	29.8 mg. per day (β fraction 1.2 mg.)
Ketogenic steroids	10.6-19.0	11.7
Pregnanetriol	6/1	6/1
Pregnanetriol/tetrahydrocortisone	6/1	6/1
Response to corticotrophin:		
17-Ketosteroids	46 mg. per day	46 mg. per day
Pregnanetriol	54	54

in Table VIII. Here it is important to emphasize that elevation of the 17-ketosteroid level was not great enough to arouse high suspicion of the presence of carcinoma, and, as judged by assay of the β -ketonic 17-ketosteroid fraction, dehydroepiandrosterone excretion was not increased (data from Prunty, 1950; see also Dorfman and Shipley, 1956). By chance a definite pre-operative diagnosis of adrenal tumour was made possible by x-ray examination (Special Plate, Fig. 3); a small tumour with an accompanying calcified thrombus containing tumour cells was outlined above the left kidney simultaneously shown up by intravenous pyelography. The tumour, which weighed 23 g., was removed, but leaving some of the cells in the adrenal vein. Great improvement occurred in the patient's symptoms, and she is known to have survived longer than 10 years (Prunty, 1944).

The presence of enlargement of the clitoris in these two patients should be emphasized as indicating a greater degree of virilization than that occurring in the "hirsutism" group. It is true that one of the patients in this group (Table III) also had enlargement of the clitoris, but insufficient information was available at the time to establish whether she too had the adreno-genital syndrome; she showed a partial degree of improvement after subtotal adrenalectomy.

Gonadotrophin Excretion

Through the kindness of Dr. J. A. Loraine, of Edinburgh, quantitative estimations of the "total" gonadotrophin in the urine of two patients from each of the major groups has been made. The values reported in Table IX are expressed

TABLE IX.—Gonadotrophin Excretion (H.M.G. units per day)

	First Patient	Second Patient
"Hirsutism"	6	7
Stein-Leventhal syndrome	<10	6
? Stein-Leventhal syndrome	5	5

as units of the provisional standard H.M.G.-20A (1 unit equals 1 mg.). The method used was that of Loraine and Brown (see Loraine, 1958). All the values here reported are normal and do not differ from one another.

Discussions

From the clinical point of view the surprisingly high incidence of the Stein-Leventhal syndrome in the group of patients presenting with hirsutism is of special interest. The accompanying menstrual disturbance and sterility were important. Mental changes were much less frequent than in the other patients. The degree of ovarian enlargement in no case reached the dimensions given by Stein *et al.* (1949) as being commonly present. The importance of minimal ovarian enlargement must therefore be stressed.

Somewhat surprising was the normal menstruation of the patients with, respectively, adreno-genital syndrome and adrenal carcinoma; the former was also known to ovulate. The nature of the lesion in the adreno-genital case is of interest. The biochemical abnormality appeared to be that typical of the common pre-pubertal adreno-genital syndrome. However, menstruation, even with ovulation, is unusual in such patients when they reach puberty, and all the signs in our patients developed after puberty. It has been noted that the patient was short in stature, and this might possibly be the only indication that the adrenal condition could have been present before puberty. Recently Blizzard and Wilkins (1957) made brief mention of a case in which the condition apparently developed after puberty.

Many of the existing reports on hirsutism in the literature may be biased by the heterogeneity of clinical material and, in the case of observations on steroid metabolism, by the non-specificity of the methods used. In the present observations on steroid fractionation most of the necessary hydrolysis was performed by the use of glucuronidase (Brooks, 1958), so that artifact formation was minimized and specific chromatographic separation of the compounds was made. The levels of ketosteroids found agree with the elevation of values reported in some cases of hirsutism and with the majority of normal values in the Stein-Leventhal syndrome (Dorfman and Shipley, 1956; Jailer and Vande Weile, 1954). Ten of the 25 cases of hirsutism exceeded the normal range, both for resting 17-ketosteroids and in response to corticotrophin (see Diagram). This tendency for increased response to corticotrophin in 17-ketosteroid excretion is reflected in the low ratio ketogenic steroids/17-ketosteroids for the "hirsutism" group (Table V) previously reported by Prunty (1956), and has been commented on by Nabarro *et al.* (1958). It seems one indication that some alteration of adrenal androgen secretion might occur in these patients.

The ovarian secretion of an androgen such as testosterone, as suggested by Plate (1951), might be evidenced by changes in the ketosteroid fractions, although as testosterone itself, for instance, is a potent androgen the amounts secreted could perhaps be too small to affect the results very significantly. Administration of testosterone to human subjects has given widely varying results for the ratio of androstenedione/etiocholanolone (0.3-3.4), depending upon the conditions (Fukushima, Dobriner, and Gallagher, 1954; Fukushima, Bradlow, *et al.*, 1954; Rubin *et al.*, 1954), so that little may be deduced in this respect from these experiments. No definite abnormality has emerged from the present observations. The secretion of an androgen such as testosterone not metabolized to 11-oxygenated C₁₉ steroids should raise the ratio of less polar/more polar ketosteroids. This was not observed to occur in two patients with Stein-Leventhal syndrome. It has, however, been noted in two male patients studied by Brooks (1958), the values being 8.8 and 7.9 owing to an increased less-polar fraction. Calculation of the corresponding ratio from the data of Rubin *et al.* (1954) shows a similar ratio to ours for females, but there was no increase for males. The significance of changes in the ratio 11-hydroxyandrostenedione/11-hydroxyetiocholanolone has previously been discussed by Brooks (1958). Its increase is recognized in the adreno-genital syndrome and is to be expected. The significance of the rise in this ratio in the Stein-Leventhal and "Stein-Leventhal" patients requires further study.

The behaviour of pregnanetriol excretion in these patients resembled that of the "hirsutism" patients and not that of the adreno-genital syndrome. The results of the gonadotrophin assay do not lend support to the idea that there is a large increase of luteinizing-hormone production in the Stein-Leventhal syndrome. So far as they go the observations do not give support to the view that there is, by the methods used, a detectable increase of ovarian androgen in the Stein-Leventhal patients, but there are indications from the present work that alterations in adrenal secretion can also occur in this syndrome.

Summary

Clinical observations on a group of 49 women developing post-pubertal hirsutism indicate the importance of sterility and menstrual disturbance in the Stein-Leventhal syndrome. Ovarian enlargement may be minimal.

Further evidence for an increase in adrenal keto-steroid excretion in a large proportion of patients with hirsutism is presented, and the biochemical distinction of these cases from the adreno-genital syndrome discussed.

Limited observations have given no definite indication of increase of an ovarian androgen metabolized to 17-ketosteroids in the Stein-Leventhal syndrome, nor of any large increase of luteinizing-hormone production.

The somewhat unobtrusive occurrence of an adrenal cortical carcinoma as a cause of post-pubertal hirsutism and a probable instance of post-pubertal development of the adreno-genital syndrome are presented.

We are indebted to our colleagues in the Department of Obstetrics and Gynaecology, especially to the late Dr. K. Bowes, to Dr. J. W. McLaren, head of the Department of Radiology, and to Dr. R. G. Shorter, in the Department of Clinical Pathology, St. Thomas's Hospital, for their co-operation.

The terms of reference of the Food Standards Committee have now been revised. The Committee was set up in 1947 to advise Ministers on regulations to control the composition of food for the protection of consumers. The revised terms of reference are as follows: "To advise the Secretary of State for Scotland, the Minister of Agriculture, Fisheries, and Food, the Minister of Health, and as respects Northern Ireland the Secretary of State for the Home Department, on the composition, description, labelling, and advertising of food, with particular reference to the exercise of the powers conferred on Ministers by Sections 4, 5, and 7 of the Food and Drugs Act, 1955, and the corresponding provisions in enactments relating to Scotland and Northern Ireland." The new terms of reference give the Committee more scope to consider and recommend on the control of food labelling and advertising; previously the Committee could deal with the labelling only of foods for which standards of composition were prescribed. Another change is that liquid milk is no longer excluded, but the Committee will not deal with any aspect of milk until the Committee on the Composition of Milk has reported.

RELIEF OF DEAFNESS BY STAPES
MOBILIZATION

BY

E. H. MILES FOXEN, F.R.C.S., D.L.O.

Westminster Hospital, London

[WITH SPECIAL PLATE]

One of the greatest advances in the whole realm of otology of this century has been the perfection of the fenestration operation for the relief of otosclerotic deafness, and an interesting twist in the history of medicine is the fact that this elaborate surgical ritual should have been largely replaced by a manipulation so obvious and so seemingly simple as to be deemed in some quarters an "office procedure." It is also of interest to note that our forebears of the last century, in their attempts to alleviate deafness, turned their attention first to the stapes, and it was probably Kessel who carried out the first mobilization in 1875. Kessel gives a fascinating description of how in one case he freed the stapes, with a gratifying improvement in hearing, but with no relief from the tinnitus which was the patient's main complaint. On the following day he divided the stapedius tendon, and ultimately it was found that not only had the hearing improvement been maintained but the tinnitus cured (Kessel, 1876). During the ensuing 25 years further attempts either to mobilize or to remove the stapes were made, and these pioneering operations were associated with the names of Miot (1890), Boucheron (1888), and Faraci (1899) in Europe and Blake (1891, 1892, 1893), Jack (1891, 1892, 1893a, b, 1894), and Burnett (1893) in America.

The usual method was to approach the middle-ear cavity by incising the tympanic membrane rather than by reflecting it. Illumination was poor, and to the best of our knowledge no use was made of magnification—an adjunct which is to-day considered essential to the proper execution of the later stages of the operation. Notwithstanding such severe handicaps, large numbers of these operations were performed—more, in fact, than is generally realized—and Miot alone in 1890 published no fewer than 200 cases. It is therefore rather a mystery that at the turn of the century the sun should have gone down on stapes surgery, not to rise again for 50 years. It might be assumed that post-operative infection was responsible for bringing the technique into disrepute, for there were no guardian angels in the form of antibiotics to protect the patient's life and the surgeon's reputation; but it would seem that even in the absence of antibiotic "cover" serious post-operative complications did not occur. It is possible that the fear rather than the actual fact of intracranial complications was partly to blame, for such complications, which occurred frequently in the course of chronic middle-ear suppuration, often defied all attempts at treatment and terminated fatally. The relentless progress of these grim complications from stage to stage was well known to the general public, and they acquired a sinister reputation which persists to-day in spite of their rarity. Moreover, at the end of the last century the attitude of several distinguished otologists was unfavourable to the natural development of temporal-bone surgery in non-infected cases, and it was indicted for numerous reasons, many of which were invalid.

Samuel Rosen in 1952 rediscovered the operation when testing the stapes for immobility under local

analgesia (Rosen, 1953). It is said that the discovery was accidental, and great credit is due to him for his observation and perseverance, and for launching a method of relieving deafness which was destined to have such an impact on otology.

Indications for Stapes Mobilization

(1) The operation is most commonly indicated in cases of otosclerosis in which fenestration would have been advised formerly, and the various criteria on which the decision for that operation was based have been repeated on numerous occasions during the last 20 years. To recapitulate briefly, the diagnosis of otosclerosis should be firm and the hearing loss reasonably symmetrical. Pure-tone audiometry should ideally show a 35-55 decibel loss of air-conduction for the critical speech frequencies, with a satisfactory air-bone gap (preferably at least 20 decibels). Amplification should be well tolerated, paracusis present, and Schwartz's sign absent.

(2) Early cases of otosclerosis which hitherto would not have been subjected to the fenestration operation on account of its magnitude are suitable for stapes mobilization. In the past it was the usual practice to examine these cases at intervals of six or twelve months with the intention of advising operation when the hearing reached a level low enough to render a major surgical procedure worth while. This management, however, was not entirely free from objections. Patients would move and become lost from the follow-up, or would be inveigled into purchasing a hearing-aid (usually unsuitable, unwelcome, and very expensive), or, worst of all, would arrive for audiometry at the appointed time only to show a serious and inexplicable hearing loss placing them in the category of late and unsuitable cases.

(3) Late cases of otosclerosis have in many circumstances been regarded as unsuitable for fenestration. The perceptible element of the deafness may reduce the possible theoretical gain in hearing to such a level as to necessitate the wearing of a hearing-aid post-operatively. Obviously, it is of dubious value to subject the patient to a major operation giving but little hope of dispensing with an appliance but at the same time producing an operation cavity in which it may be impossible to wear that appliance. Stapes mobilization, however, in the same patient is a different proposition. There is a chance that it may permit the instrument to be discarded, but in the event of failure an aid may continue to be worn, even in the operated ear.

Finally, there is the very late case in which a powerful aid gives insufficient amplification, and here also the stapes operation is feasible, for it may improve the hearing sufficiently to enable the patient to obtain benefit from an aid.

(4) Unilateral cases of otosclerosis with good hearing in the contralateral ear have seldom, in my opinion, justified fenestration. The over-all subjective improvement is disappointing when the hearing level of a deafened ear is raised, provided the other ear is normal, and, though a dramatic difference may be shown audiometrically, the patient is seldom enthusiastic. Nevertheless, it is certainly most desirable that the hearing in both ears should be symmetrical, and stapes mobilization is without doubt justified in an endeavour to achieve this state.

(5) Patients suffering from conduction deafness caused by adhesions following serous otitis media are suitable for exploration of the tympanic cavity by the techniques of Lempert and Rosen. For many years the management of this type of deafness consisted of repeated politizerization or eustachian catheterization, involving the patient in great loss of time and not a little suffering, the net result being in most cases a minor and transient improvement in hearing. In recent years these methods of treatment have been used less and less, partly because their limitations are appreciated, and also for the reason that conduction deafness due to causes other than otosclerosis is seen less frequently than

hitherto owing, no doubt, to the increased care of the upper respiratory tract in childhood and to the introduction of antibiotics. Nevertheless these cases are seen in moderate numbers, and the technique of stapes surgery opens a new vista in their investigation and treatment.

(6) Lastly, the techniques referred to provide a direct and safe method for inspecting the tympanic cavity and for carrying out curative procedures in obscure cases of deafness the precise diagnosis of which may be in doubt prior to operation. These include such conditions as round-window otosclerosis (McLay, 1957) and traumatic ossicular dislocation (Gisselsson, 1958).

Technique

Anaesthesia

The operation is most commonly performed under local analgesia, which carries distinct advantages. The hearing may be tested at all stages, and the achievement of a mobile stapes is immediately verified by the hearing improvement obtained, thus obviating any manipulation which might be unnecessary and traumatic. Many persons in Great Britain, whilst being perfectly happy to undergo general anaesthesia, thanks no doubt to the high degree of perfection to which the latter has been raised by anaesthetists. It is my belief that such patients should not be denied the operation, but should be given a general anaesthetic, under which extremely good results may be obtained. Some surgeons, in fact, prefer general anaesthesia as a routine, as it gives them freedom of movement and freedom of speech (!) (Venters, 1958).

Premedication consists of pethidine, 100 mg. intramuscularly, and atropine, 1/100 gr. (0.65 mg.) subcutaneously, and is given 45 minutes beforehand. No shaving of hair or other local pre-operative preparation is necessary, but the meatus is carefully inspected on the day before operation in order to ensure the absence of cerumen or any inflammatory condition. After swabbing of the meatus and pinna with flavine 1:1,000 in 50% spirit, "xylotox" 2% with adrenaline 1:80,000 is injected at several points under the skin of the meatus at the junction of the osseous and cartilaginous parts of the latter. Only 1-2 ml. is used, and the extreme degree and widespread analgesic effect of this small quantity is surprising. It has not yet been my experience for the patient to complain of pain at any stage of the operation, apart from the initial needle prick. (Special Plate, Figs. 1 and 2.)

Operative Details

The incision is derived from that of Lempert for tympano-sympathectomy (Lempert, 1946), but differs slightly in position, being made from 12 o'clock to 6 o'clock in the skin of the posterior meatal wall. Its upper and lower extremities are 2 mm. from the edge of the tympanic membrane, but its centre portion is at least twice this distance. (Special Plate, Fig. 3; Text Fig. 1.) The most useful instrument for making the incision has proved to be one of Rosen's bone spoons which is sharpened before each operation until a knife-edge is obtained. This was suggested to me by McKenzie (McKenzie and Rainer, 1957) and has also been mentioned by Simson Hall (1958).

The collar of skin medial to the incision is now gently raised from the underlying bone until the edge of the tympanic membrane can be lifted from its sulcus, exposing underlying mucous membrane. The latter is pierced with a sharp seeker, which serves to divide it in the line of

the annulus tympanicus, and at this stage a large air-bubble invariably appears from the middle-ear cavity (Special Plate, Fig. 4; Text Fig. 2.) The posterior part of the tympanic membrane may now be folded forwards across the manubrium of the malleus, exposing the middle-ear cavity (Plate, Fig. 5; Text Fig. 3.) This first stage is very laborious, and must be executed with extreme caution in order to avoid tearing the tympano-meatal flap at the junction of the tympanic membrane with the delicate skin of the posterior

TEXT FIG. 2.—Entry into tympanic cavity.

TEXT FIG. 3.—Incudo-stapedial joint and stapedius tendon.

TEXT FIG. 4.—Incudo-stapedial joint, stapedius tendon, chorda tympani, and round-window niche.

TEXT FIG. 5.—Removal of part of tympanic ring.

meatal wall. In many cases the incudo-stapedial joint is now clearly seen, with the stapedius tendon and chorda tympani (Plate, Figs. 5 and 6; Text Fig. 4), but in some cases these structures are partly hidden by overhanging annulus tympanicus, which must be removed with Rosen's curette or Lempert's fenestration curettes (Text, Fig. 5).

At this juncture it is desirable to employ increased magnification if, as is often the case, the first stage has been carried out with the aid of a binocular loupe magnifying two diameters. The Zeiss operating microscope gives a large choice of magnifications, but for the preliminary steps in mobilization 10 or 16 diameters are adequate.

The stapes may now be tested for mobility, after which mobilization should be attempted, starting with manœuvres as atraumatic as possible, and in the event of failure passing on to manipulations involving greater forces. The reason for this orderly sequence is that the degree of fixity of the stapes varies from case to case, and it is obviously better to achieve mobilization with the minimum risk of trauma to the middle and internal ear structures. The first and least traumatic manipulation, which is perhaps most closely parallel to normal physiological movement, is the transscudial method advocated by Goodhill (1955), House (1957), and Scheer (1958). The point of the seeker is firmly planted in the tip of the long process of the incus and pulsating pressure is exerted towards the oval window, compressing the stapes from head to footplate (Text Fig. 6). In a

TEXT FIG. 1.—Incision in meatal wall.

TEXT FIG. 6.—Compression of stapes via incus.

small proportion of early cases mobility is effected, but only minimal pressure may be permitted or the stapedia crura might be fractured or driven through the footplate, and it is usually necessary to pass on to the second manoeuvre. (Text Fig. 7). This consists in attempting to rock the stapes from side to side in the axis of the long diameter of its footplate and is advocated by McKenzie and Rainer (1957); but the forces acting here are at right-angles to those when Rosen's original method of pressure on the anterior aspect of the stapedia neck is employed. My third manoeuvre is to attempt mobilization by downward pressure on the small lip of footplate which sometimes projects well in front of the anterior crus (Text Fig. 8); and, fourthly, to endeavour to prise the footplate loose in the manner described by Rosen (1955).

If all these methods fail, it is probable that further attempts at mobilization would fracture the stapedia crura, and it is advisable to proceed to Rosen's method of footplate fenestration (Rosen, 1956). The point of the instru-

TEXT FIG. 7.—Stapes rocking about axis in long diameter of footplate.

TEXT FIG. 8.—Downward pressure on footplate of stapes anteriorly.

ment used, which resembles a crochet hook, is inserted with extreme care through the footplate to a depth of not more than 1 mm., and on withdrawal brings away a small portion of bone, permitting the escape of a little perilymph. It is needless to stress that the footplate technique requires movements of precision which can be safely controlled only under high magnification.

In the conscious patient the hearing is tested from time to time, and there is usually little doubt when mobilization has been achieved, for the hearing improvement is sometimes dramatic and is enhanced by replacement of the tympanic membrane. "Gelfoam" provides a suitable dressing, and may be retained in position by a strip of $\frac{1}{4}$ inch (6.4 mm.)

ribbon gauze. Simson Hall (1958) places a small piece of oil-silk in contact with the tympanic membrane in order to lessen the risk of perforation—a method which would seem to be most advantageous, as the oil-silk may be left for a considerable time should a healing perforation be suspected, and will act as a perfect splint.

Post-operative Care

As a rule no particular sedation is required; the ribbon-gauze strip is removed after two to four days, and the patient is usually discharged on the fourth or fifth post-operative day. Penicillin is given regularly during this time. It is often found that the immediate improvement in hearing is temporarily lost, and it is wise to warn the patient that this is merely due to an accumulation of debris in the meatal canal and that the initial hearing improvement will almost certainly return when this clears. The debris usually separates and is extruded without assistance, and manipulations should be avoided so far as possible at the post-operative attendances.

If at the time of operation a successful outcome is expected but post-operative testing reveals no improvement in the hearing, a further exploration with attempted mobilization may be made at a later date. There is no contraindication to a repetition of the same technique; in fact, the exposure is often achieved more readily the second time. In the event of repeated failure, fenestration is advised if the case is considered suitable for this operation, and the fact that the patient has been the subject of one or more attempts at stapes mobilization in no way impedes the fenestration technique or reduces the chances of a successful outcome.

It may be of interest at this stage to collate certain aspects of the two operations—fenestration and stapes mobilization.

	Fenestration	Stapes Mobilization
Usual sojourn in hospital	2-3 weeks	3-5 days
Length of operation	1-3 hours	1/3-1 hour
Anesthetic	General (in U.K.)	Local or general
Post-operative vomiting	Occasional	Nil
" vertigo	Variable	Rare
" pain	Occasional	Slight
" otorrhoea	Not uncommon. May be intractable	Rare
Indications	Limited	Wide
Possibility of repeating operation in the event of failure	Revision difficult and hazardous, and seldom meets with lasting success	Operation can be repeated on same ear two or three times. Ultimately possible to fenestrate ear
Post-operative attendances	May be frequent if operation cavity becomes infected	Occasional

Complications

A search of the literature reveals that very few complications are reported, the most common complication occurring during operation and consisting of a fracture of the anterior crus or of both crura of the stapes. This is met by abandoning any further attempts at mobilization and proceeding straight to footplate fenestration. Occasionally tears occur in the tympanic membrane, but these seldom result in permanent perforations. In the first 50 cases operated on at Westminster Hospital one small perforation persisted, but the tympanic membrane was subsequently repaired by myringoplasty. There were also in this small series four cases of acute otitis media which occurred after the patients had been discharged from hospital, but the infection responded rapidly to antibiotic treatment in each case. In some series transient facial pareses, which have cleared up completely as soon as the effect of the local analgesic agent has passed off, have been reported.

It might be thought that complications would be likely to follow invasion of the sanctum of the inner ear by the footplate manoeuvres described, but Rosen (1958) reports that in over 200 footplate fenestrations there was not a single instance of labyrinthitis or involvement of the facial nerve.

Results

It is notoriously difficult to depict the results of a procedure designed to improve the hearing. Pre-operatively the patients fall into different categories as regards their suitability for operation and the amount of improvement which might be expected to accrue therefrom, so it is obviously invidious to compare the results obtained in one group with those in another unless the original pre-operative category of the patient is borne continually in mind. Pure-tone and even speech audiometry sometimes give a misleading picture which does not in every case correspond with the subjective sensations of the patient. Finally, the terms used by surgeons in describing improvement or deterioration, success or failure, though having an exact significance to their authors, do not always convey the same meaning to their readers.

Scheer (1957) found that the operation had resulted in the restoration of practical and functional hearing in 36% of cases, but later (Scheer, 1958), by including the footplate techniques, was able to obtain an acceptable hearing improvement in 75-80% of cases. Rosen (1958) in an analysis of 254 cases states that a significant improvement in hearing was obtained in 77%. Venters's (1958) initial successes (including "very successful" and "moderate") reached 70%, and the number maintained for six months or more 53%. It would seem that many surgeons find that of all their cases subjected to operation approximately one-third obtain a great, and in some cases dramatic, improvement in hearing; approximately one-third are improved, but to a lesser degree; whilst the remainder are scarcely affected. Of the first 50 cases operated upon at Westminster Hospital (admittedly a small number), 29 have shown a useful, and in some cases very great, improvement in the hearing, 11 have been moderately improved, and in 10 cases the hearing has remained unchanged. It is likely that in the course of time a few of the 29 "very successful" cases of the first 50 will deteriorate and enter other categories, so the eventual ratio of great improvement: slight improvement: no change may not be very far from 1:1:1.

Of extreme importance is the problem of the duration of improvement in terms of years. Rosen (1958) states that over 95% of the improved cases have maintained their hearing improvement, without regression, for periods of up to five years, and it is worthy of note that his first case, operated on in April, 1952, had at the time of reporting maintained his hearing improvement for 4 years 10 months.

Summary

The history of stapes mobilization is traced from the 1870's. After a dormant period of half a century the operation was resurrected by Rosen in 1952.

The indications for the operation are given, and it is noteworthy that stapes mobilization is more general in its application than fenestration of the labyrinth.

The technique is described. Local analgesia is preferred, but is not obligatory. After the incudo-stapedial joint and surrounding anatomical structures have been displayed, manoeuvres aimed at freeing the stapes are carried out. If mobilization is found to be impossible, fenestration of the stapes footplate is undertaken. The progress of the operation is controlled by hearing tests at intervals.

The post-operative care is mentioned, and a comparison between features of stapes mobilization and fenestration shows that when such matters as length of stay in hospital and post-operative discomfort, etc., are considered the magnitude of the former operation is much less than that of the latter.

Results to date suggest that, of the patients undergoing the operation, approximately one-third may be expected to obtain a useful, lasting, and in some cases

great hearing improvement, one-third a slight improvement, and one-third no improvement. In cases in which the result is disappointing, the fact that the operation may have been performed several times does not preclude a patient from undergoing fenestration of the labyrinth at a later date.

I thank Dr. Peter Hansell and Miss Jill Hassell of the Department of Medical Photography of Westminster Hospital for the illustrations.

Lecturer, Department of Medicine, University of Edinburgh

[WITH SPECIAL PLATE]

The title "familial haemophagocytic reticulosis" was given by Farquhar and Claireaux (1952) to an unusual disorder which affected the first two children of a family. Both infants had developed anorexia, vomiting, irritability, and pallor at the age of 9 weeks. Both had enlargement of the liver and spleen, and both had progressive anaemia, leucopenia with profound granulopenia, and thrombocytopenia. Smears of the peripheral blood always contained a high percentage of unrecognizable damaged cells and a small proportion of atypical mononuclear cells bearing some resemblance to those occurring in glandular fever. The first baby, a male, died at the age of 10 weeks. Clinical investigation of the second infant, a female, failed to reveal the cause of the pancytopenia. In particular, there was no evidence either of erythroblastosis foetalis or of exposure to drugs or poisons. The resistance of the red blood cells to hypotonic dilutions of saline was normal,

and the marrow was always richly cellular and normoblastic. Radiographs of the skeleton failed to reveal any sign of reticulo-endotheliosis. This infant appeared to respond temporarily to corticotrophin, but the improvement was not maintained and she died at the age of 22 weeks.

Necropsy revealed in both children a remarkable proliferation of histiocytes throughout the reticulo-endothelial system. This had not been apparent in the ante-mortem marrow smears. The histiocytes contained very many ingested red cells and less numerous white cells. The picture was not that of Letterer-Siwe's disease, and a suggestion that it might be identical with histiocytic medullary reticulosis was later refuted by Marshall (1956).

The third child of the family, a girl, was mentioned by the authors. She was normal clinically at birth, but smear cells were numerous in the peripheral blood films. A high percentage of atypical large lymphocytes appeared in the blood between the sixth and eighth weeks of life, and at the age of 10 weeks she developed severe anorexia. Neither liver nor spleen was palpable, but she had a mild anaemia, and the atypical lymphocytes persisted in the blood until she was 18 months old. She became no worse clinically, however, and when she was last examined at the age of 4 years 4 months the haemoglobin level and white-cell picture in the blood were found to be normal. She is now reported by her parents to be an apparently healthy 5-year-old.

The results of serological investigation of these children, the fourth child, the parents, and the paternal grandparents are given in the Table. Positive reactions to Coombs's test were reported in blood from Cases 2 and 3 and from the father. On the father Coombs's test on a later occasion gave a negative result. The paternal grandmother's test was in doubt, and she refused further investigation, possibly because she

suspected the discovery of a discrepancy between the genotypes of her son and her husband (see Table) indicating that they were not blood relations. No abnormal antibodies against a wide range of known blood groups (including MNS, P, Lewis, Lutheran, Kell, Duffy, and Kidd) could be found in the mother's blood after the birth of the second child. Her serum was tested by the indirect Coombs method against the cells of the paternal grandparents with negative results.

Although the parents had asked that the third pregnancy should be terminated shortly after conception had taken place, and this had been refused, they were so encouraged by the apparent health of this child that they decided to have more children. The object of the present paper is to present the clinical, haematological, and pathological findings in the fourth child (Case 4), and to record the results of further investigations of the parents. On the basis of these new data an attempt is made to discuss the nature of the disorder.

Details of Case 4

The baby, a male, was born outside Edinburgh. His blood picture was normal and the result of Coombs's test negative. When 14 weeks old he developed anorexia and irritability followed by pallor. He was admitted to the Royal Edinburgh Hospital for Sick Children four weeks later (Fig. A). Both liver and spleen were firmly enlarged. His haemoglobin was 65% (Sahli; 100% = 14.8 g.) and the total white cell count was 2,500 per c.mm. The peripheral blood smear contained 20% neutrophil polymorphs, 64% large lymphocytes, and 16% damaged cells. There were only 32,000 platelets in each c.mm of blood (Fig. B). The marrow showed very active erythropoiesis, nearly 40% of the nucleated cells being normoblasts at various stages; many were polychromatic with only partly condensed nuclei. Neutrophil and eosinophil myelocytes were present in fair numbers, but there were few mature granulocytes. Small lymphocytes were normal. There were many large cells with pale nuclei and clear, light-blue cytoplasm. Some of them were primitive cells, with nucleolated nuclei and more basophilic cytoplasm; others had abundant pale

cytoplasm and appeared to be a type of monocyte or histiocyte. Phagocytosis was not seen, but occasional cells of this type had vacuolated cytoplasm. They may have been the marrow representatives of the atypical large lymphocytes found in later blood smears and in the smears of siblings. The result of Coombs's test was negative, but platelet agglutinins were demonstrable in the serum (see Table). The blood picture deteriorated. The spleen had been clearly demonstrated as a major site of erythrophagocytosis in previous siblings. In addition, autoantibodies had been detected in Case 2 and possibly in Case 3, and the presence of severe pancytopenia without the usual signs of

increased blood destruction despite a hyperplastic marrow might have been due in part to hypersplenism. Splenectomy was carried out six days after the patient's admission to hospital. The spleen was enlarged; it measured $10 \times 7 \times 3.5$ cm. and weighed 110 g.; it was of normal consistency and was free from adhesions. The cut surface was deep red and the Malpighian bodies were inconspicuous. On microscopic examination the principal feature was proliferation of endothelial phagocytes in the pulp sinuses and

been withdrawn within the previous six hours and which had proved compatible with the recipient's blood after most careful cross-matching. At the time of this procedure a sample of the infant's erythrocytes was labelled with radioactive chromium and reinjected with a view to measuring the red-cell survival time.

No improvement followed the exchange transfusion and the child died nine days later. During this period the haemoglobin level fell from 63% to 28%. Seven days after

chromium-labelled cells had been injected only 34% of the injected radioactive material was present in the circulation, and at the time of death (that is, Day 9) only 11% remained. It was calculated that 50% of the injected radioactive material had been eliminated in five days. (Mean finding in five normal individuals, 26 days. This is in agreement with the results of Mollison (1956).)

Pathology.—The necropsy was restricted by limitation of the incision to the abdomen. The body was that of a male infant weighing 6,155 g. The skin was moderately jaundiced and there were petechiae on the trunk and limbs. The mucous membranes and nails were pale. The abdomen was greatly distended and a transverse surgical incision on the left side was recently healed. The significant pathological observations were as follows. The liver was moderately enlarged and weighed 447 g. It was light brown, and both the external and the cut surface showed red spots which measured up to 3 mm. in diameter and were slightly depressed. The consistence was normal and no

FIG. B.—Progress chart of fourth child.

fibrosis was detectable. Lymph nodes were not appreciably enlarged, but many were dull red or purple. The largest were in the upper abdomen. The bone marrow was deep red. Other macroscopical features were those resulting from anaemia.

On microscopic examination the outstanding pathological feature was the presence of many phagocytic histiocytes in various organs. They were conspicuous throughout the reticulo-endothelial system; in the bone marrow, lymph nodes, intestinal tissue, and liver; and also in the interlobular and interacinar stroma of the pancreas and among the disintegrated remains of the foetal cortex of the adrenal glands. The phagocytes were large cells, with swollen, often vacuolated cytoplasm, and in all the situations mentioned many of them contained erythrocytes in numbers varying from one to ten. In the bone marrow (Special Plate, Fig. 2) and lymph nodes (Plate, Fig. 3) nucleated cells had been phagocytosed, but it was uncertain whether these were normoblasts or lymphocytes. The phagocytes lay free in the bone-marrow spaces and in the sinuses of the lymph nodes. In the liver (Plate, Fig. 4) they infiltrated the widened and extended portal tracts and were found also in the sinuses, where they appeared to be proliferated Kupffer cells. This infiltration was not accompanied by any appreciable fibrosis. The depressed red spots noted macroscopically in the liver proved to be areas in which most of the epithelial cells had disappeared, leaving a network of wide sinuses.

In spite of the evidence of active blood destruction by phagocytosis, no deposition of haemosiderin was detected in any situation. The lymphoid tissue in all sites examined showed a reduction in the number of lymphocytes and absence of germinal centres in the follicles.

The infant's condition improved concurrently with a partial improvement in the blood picture (Special Plate, Fig. 1). Two weeks later, however, deterioration was noticeable. Although corticotrophin had failed to induce a remission in Case 2, a daily dose of 10 mg. of prednisolone was prescribed 15 days after splenectomy, and it was continued without benefit until the baby died.

Two possible explanations existed for the process being re-enacted in the fourth child. Either abnormality of his cells stimulated the proliferation of phagocytes in the reticulo-endothelial system, or the latter was of itself abnormal and engulfed blood cells indiscriminately. The appearance of the red cells was normal. No abnormal haemoglobin was present. It seemed reasonable to expect, however, that if the patient's cells were abnormal their replacement by normal compatible donor cells should be followed by a period of remission. On the other hand, if the patient's cells were normal and the reticulo-endothelial system was abnormal, then compatible donor cells should be removed as quickly as, or even more quickly than, those of the patient. Twenty-six days after admission a 1,200-ml. exchange transfusion was carried out with blood which had

Further Investigation of Parents (December, 1956—February 1957)

The father and mother were young and apparently healthy. They had not suffered from any significant illnesses earlier in life, but the father had vomited frequently in early infancy. There was no relevant medical history on either side of the family. In neither parent were there any abnormal physical findings, in particular there was no enlargement of liver, spleen, or lymph nodes.

The results of blood examination were as follows. Father: Hb 101%; R.B.C. 4,730,000 per c.mm.; C.I. 1.06; reticulocytes less than 1%. Mother: Hb 100%; R.B.C. 5,890,000 per c.mm.; C.I. 0.84; reticulocytes less than 1%. In films made from the peripheral blood the red cells, white cells, and platelets appeared normal. In both parents there was no increase of red-cell fragility in hypotonic dilutions of saline, the direct Coombs test was negative, the level of bilirubin in the serum was not raised, and there was no excess of urobilinogen in the urine. The father consented to sternal puncture. In smears made from the marrow aspirate the appearances were entirely normal.

The survival time of the parents' own red cells was then measured using radioactive chromium. In the mother 50% of the injected radioactive material had disappeared from the circulation in 27 days, indicating normal red-cell life. The life span of the father's erythrocytes, however, was significantly shortened, 50% of the injected radioactive material being eliminated within 20 days. Subsequently the fate of chromium-labelled cells from a healthy donor was studied, and it was found that their rate of elimination was also more rapid than in normal individuals, the 50% level of radioactivity being reached in 23 days.

Discussion

The apparent homochronous inheritance of a disorder which affected primarily either the blood cells or the reticulo-endothelial system, and which was responsible for the deaths of three siblings (two boys and a girl) and mildly affected the other, may be unique. In each of the fatal cases systemic upset developed in the third or fourth month of life, when each was found to have pancytopenia and enlargement of the liver and spleen. In Cases 2 and 4 the pancytopenia progressed in the presence of an apparently richly reactive, normoblastic bone marrow and in the absence of the usual evidence of haemolysis. Hypersplenism appeared to be a possible explanation of these features, but in the fourth child splenectomy failed to produce a haemopoietic response in keeping with the release of marrow inhibition. A temporary increase in granulocytes and platelets was not sustained. The main cause of the anaemia in each case appeared to be the excessive removal of red cells from the circulation as a result of erythrophagocytosis by histiocytes which had proliferated throughout the reticulo-endothelial system. Leucophagocytosis was also seen. Phagocytosis was never demonstrated in peripheral blood or marrow smears, although a proportion of large, atypical mononuclear cells was seen in both.

That the life span of the red cells was severely shortened was clearly demonstrated in the fourth child. No abnormality in either the appearance of the red cells or their osmotic fragility was found, and the presence of an abnormal haemoglobin was excluded. The occasional detection of autoantibodies in the serum of some members of the family strongly suggested that the excessive destruction of erythrocytes was due not to a red-cell defect but to extracorporeal factors. Had the last child survived for a longer period, a study of the fate of labelled corpuscles from a healthy donor would probably have confirmed this view, particularly as the haemoglobin level fell with great rapidity after exchange transfusion. Significant observations were, however, made in the father. Although he had at no time any abnormal clinical features, he was shown at one examination to be moderately anaemic, and an autoantibody was found in his serum. At a later date, despite a normal peripheral blood picture, the life span of

his own red cells and of donated corpuscles was appreciably shortened, indicating that he was suffering from a haemolytic disorder of extracorporeal type. It is reasonable to suppose that this was not a coincidence, but that the finding was a milder expression of the fatal illness encountered in three of the children. It would have been of great interest to make a fuller investigation of the surviving child, but red-cell-survival studies were not undertaken because of her age and because the parents had been encouraged to regard her as normal.

The familial incidence of some reticulo-endothelial disorders is well recognized. Thirty-five cases of familial leukaemia have been reported (Wintrobe, 1956). In eight families three or more members have been affected by Hodgkin's disease; it has appeared concurrently in identical twins, and on three occasions affected women have given birth to affected children. Leukaemia has affected as many as five of eight siblings in childhood and six persons in two generations. Wintrobe believes it likely that genetic factors do exert an influence in the aetiology of human leukaemia, but that the mode of inheritance is obscure. The so-called lipid reticuloses, Gaucher's and Niemann-Pick's disease, are familial, and Letterer-Siwe's disease has been reported in siblings.

The disorder which has been described in this paper presented in a lethal form in three children and as a relatively benign condition in the surviving child and in the father. If the condition was the result of a dominant characteristic, then one clinical picture might have been expected. It seems more likely that the condition was transmitted by a recessive gene, the lethal form being the expression of a homozygous state, and that the surviving child and her father are heterozygotes. Such a difference in the clinical expression of homozygous and heterozygous states is well recognized, as, for example, in thalassaemia, phenylketonuria, and mucopolysaccharidosis, where the heterozygotes may be shown to have a mild haemolytic process, an impaired phenylalanine tolerance, and an increased electrolyte content in sweat, respectively. Investigation of the mother of this family failed to demonstrate any abnormality, but the manifestations of recessive traits in carriers tend to be variable, and the absence of abnormality in the mother is not very unusual. The benign form might be phasic in character, as evidenced by the fluctuation in the condition of the father and of the surviving child. It is possible, therefore, that intermittently repeated examinations of the mother might yet have revealed some abnormality had she not expressed a wish to be excused from further investigation. In a small country community such as that in which the parents were raised the chance of a consanguineous marriage taking place is increased, particularly when the additional complication of illegitimacy is introduced, as in this case. The obtaining of a detailed family pedigree should form an important part of the investigation of further cases.

The disease appears to be a disorder of the reticulo-endothelial system characterized by the widespread proliferation of haemophagocytic histiocytes. The original title of familial haemophagocytic reticulosis appears to be an adequate description.

Summary

The clinical and pathological features of a further case of familial haemophagocytic reticulosis have been described, and an account has been given of investigations into the aetiology. The possible mode of inheritance is briefly discussed.

We are indebted to Professor R. W. B. Ellis for his helpful criticism of this paper, to Professor J. H. P. Jonxis, of Groningen, for the haemoglobin type of the fourth child, and to Dr. R. A. Cumming for the results of serological tests.

REACTION OF LUPUS ERYTHEMATOSUS SERUM WITH NUCLEI OF CIRCULATING AND NON-CIRCULATING CELLS

[WITH SPECIAL PLATE]

Friou (1957) was the first to demonstrate that tissue cells brought in contact with serum from patients suffering from disseminated lupus erythematosus (D.L.E.) and exposed subsequently to fluorescein-conjugated anti-human-globulin (A.H.G.) serum showed specific nuclear fluorescence. This application of Coons's fluorescent antibody technique has been further studied by Friou, Finch, and Detre (1957, 1958) and by Holborow *et al.* (1957). In addition, it has been demonstrated by Mellors *et al.* (1957) and Holman and Kunkel (1957) that the inclusion bodies in L.E. cells fluoresce on exposure to fluorescein-conjugated A.H.G. serum.

These results provide strong evidence for the belief that the serum in D.L.E. contains a globulin with an affinity for the nuclei of tissues and leucocytes. It has been suggested that this globulin is identical with the factor responsible for the formation of L.E. cells. Friou (1958) has shown that the capacity of serum from cases of D.L.E. to induce both phenomena is abolished by absorption of the serum with nucleohistone.

In the studies referred to attention has been mainly directed to the reaction of D.L.E. serum with tissues derived from other sources than patients with D.L.E. With the exception of reports on fluorescence of L.E. cells exposed to fluorescein-conjugated A.H.G. serum, no comment on the effect of D.L.E. serum on D.L.E. tissue has been found in the literature. It seemed important to determine whether D.L.E. tissue differed from normal tissue on exposure to D.L.E. serum, and in this report the results of such a study are presented.

Materials

Human Sera.—Serum was obtained from eight patients suffering from D.L.E. In all cases L.E. cells had been found on more than one occasion. All patients but one (Case 3) were receiving prednisolone or cortisone at the time of investigation, the daily dose being shown in the Table. Control sera were obtained from healthy members of the hospital staff. Sera were not heated before use, and when necessary were stored at -15°C . In a preliminary experiment it was found that sera retained their reactivity on storage for periods of at least six weeks.

Leucocytes.—Blood was obtained by ear-prick, films being spread on microscope slides as for routine haematological examination. Films were not fixed, and were used on the day of preparation.

Skin.—Portions of skin were obtained by biopsy from two patients (Cases 4 and 7) and from two healthy donors of corresponding blood groups. One patient (Case 4) and one control were of blood group O, and all sera were tested on sections from these individuals. Within one minute of biopsy the skin was frozen in test-tubes dipped in solid

CO_2 -acetone mixture. Sections were cut at $4-6\ \mu$ in a cryostat at -20°C . The sections were then transferred to slides, thawed, dried by fan, and used on the day of biopsy.

Buccal Mucosa.—Squamous epithelium was obtained by gently scraping the buccal mucous membrane with a metal spatula. The scrapings were transferred to slides and allowed to dry at room temperature. As with blood films and tissue, the cells were examined on the day of preparation.

Fluorescein-conjugated Anti-human-globulin.—Commercial A.H.G. (Coombs's) serum was conjugated with fluorescein isocyanate by the method of Coons and Kaplan (1950). The conjugated serum was absorbed with sheep-liver powder to reduce non-specific precipitation in tissues.

Methods

Sections of tissue or preparations of cells were exposed to human serum in a moist atmosphere at 37°C . Except when otherwise stated, the time of incubation was 30 minutes and the sera were undiluted. The preparations were then washed in two changes of phosphate-saline buffer at pH 7.0 and covered with a few drops of undiluted fluorescein-conjugated A.H.G. serum. After 30 minutes at room temperature the preparations were again washed in buffered saline and mounted in buffered glycerol at pH 7.0. Cover slips cut from OY12 (ultraviolet-absorbing) glass were used.

The specimens were examined in the fluorescence microscope as described by Alexander (1958), with the exception that plain glass microscope slides were used in the present work. When required the preparations were photographed and the field plotted with the aid of the graduated mechanical stage of the microscope. The cover slips were floated off and the tissue fixed in undiluted methyl alcohol. The preparations were then stained with Giemsa's stain and mounted in balsam. Fields were identified and rephotographed using a source of visible light.

Results

In most experiments the presence or absence of nuclear fluorescence was readily recognized, and examples are shown in Figs. 1, 2, 3, and 5 on the Special Plate. Figs. 4 and 6, which correspond to Figs. 3 and 5 respectively, are included as an aid to identification of individual nuclei.

Nuclear fluorescence as seen in Figs. 2 and 5 was observed only in tissues or cells which were pretreated with L.E. serum. Pretreatment with serum from healthy individuals or the direct application of fluorescein-conjugated A.H.G. serum to the preparations invariably gave negative results.

— Nuclear fluorescence present. — = Nuclear fluorescence absent.

The sera from eight patients suffering from D.L.E. were applied to autologous blood films, blood films from healthy donors, sections of skin from a patient with D.L.E., and sections of skin from a healthy individual. All but the autologous cells were obtained from individuals of blood group C. The results of this experiment are shown in the Table. Leucocytes from the healthy subject pretreated with all sera tested showed nuclear fluorescence when subsequently exposed to fluorescein-conjugated A.H.G. serum. Nuclei of autologous leucocytes fluoresced on pretreatment with six of the eight sera. Nuclei in sections of skin from a healthy subject

fluoresced when pretreated with six of eight sera, but nuclei in skin from a patient with D.L.E. (Case 4) showed fluorescence when pretreated with only three of the eight sera.

In view of the apparent diminution of affinity of L.E. serum for nuclei in L.E. tissue, skin obtained from another patient (Case 7) was examined. Pretreatment of this material with autologous serum gave an equivocal result, as shown in Fig. 7 on the Special Plate. Although diffuse fluorescence of epidermal cells was seen, selective fluorescence of nuclei did not occur. This finding cannot be explained by failure of autologous tissue and serum to react, as nuclear fluorescence was observed when tissue from Case 4 was pretreated with autologous serum. It was established by two experiments that the serum from Case 7 had not lost its potency. The serum was used to pretreat leucocytes from a healthy individual, and nuclear fluorescence was observed when the serum was diluted to 1:4,000. Undiluted serum produced nuclear fluorescence when applied to the cells for one minute.

The necessity for using fresh material in this type of investigation has been stressed by Holborow *et al.* (1957). The difficulty of obtaining regular supplies of tissue by biopsy is considerable, and it was decided to examine cells obtained by scraping the buccal mucosa. These could be taken as representative of fixed tissue cells as distinct from the circulating leucocytes. However, the nuclei of squamous cells from healthy individuals or patients with D.L.E. exposed to D.L.E. serum failed to show fluorescence on subsequent treatment with fluorescein-conjugated A.H.G. serum (Special Plate, Figs. 9 and 10). When, however, the time of exposure to D.L.E. serum was extended to 1½ hours nuclear fluorescence was observed in cells which had disrupted. As there was also evidence of diffuse bright fluorescence in structures thought to be of cytoplasmic origin, no conclusion can be drawn from these experiments. Further investigation with specific counter-stains for nuclear material is planned.

Discussion

These results confirm the findings of other workers that the nuclei of cells exposed to serum from patients suffering from D.L.E. adsorb a globulin detectable by application of fluorescein-conjugated A.H.G. serum. This property of L.E. serum is not apparently influenced by administration of steroid hormones.

It has been shown that the phenomenon is readily demonstrable in unfixed blood films. This technique, which avoids the need for preparing films from "buffy coats," would be useful in any large-scale investigation of the phenomenon in other diseases.

The observation that nuclear fluorescence is not present in tissue from cases of D.L.E. exposed directly to fluorescent A.H.G. serum, is in agreement with the findings of Mellors *et al.* (1957) in the D.L.E. kidney, and supports the hypothesis that absorption of L.E. globulin on nuclei occurs only *in vitro*. The fact that tissues and leucocytes derived from patients with D.L.E. appear to be less susceptible to uptake of globulin from L.E. serum may be explained by the relatively small number of patients available for study, but the anomalous behaviour of the serum from Case 7 toward nuclei in autologous skin and the nuclei in the skin of another patient is of interest. Recent experiments, which are still incomplete, suggest that the time of incubation of tissue and L.E. serum may have a considerable influence on the intensity of nuclear fluorescence and that individual sera and tissues may differ appreciably in the rate of reaction.

The results of experiments with squamous epithelium suggest that intact tissue cells resist invasion of the specific globulin in L.E. serum. It has been noted in examination of thick sections of skin that nuclear fluorescence may be apparent in the superficial layer, but not in deeper layers. Leucocytes, however, seem to be extremely susceptible to the specific globulin in L.E. serum, and this susceptibility may well be associated with their natural property of phagocytosis.

Summary

With the use of Coons's fluorescent antibody technique it has been confirmed that sera from patients suffering from D.L.E. contain a globulin which combines with nuclei of tissue cells and leucocytes. In a study of sera from eight cases of D.L.E. it was observed that nuclei of leucocytes from healthy individuals showed the greatest affinity for the specific globulin. No evidence of uptake of globulin in tissue from D.L.E. was found *in vivo*, but *in vitro* such tissue had less affinity for the specific globulin than tissue from healthy subjects. Nuclei of intact squamous epithelial cells pretreated with D.L.E. serum did not fluoresce on exposure to fluorescein-conjugated anti-human-globulin serum.

During the period of this investigation the Rheumatic Unit was in receipt of grants from the Nuffield Foundation, the Medical Research Council, and Boots Pure Drug Company Ltd.

We wish to thank Mrs. Betty Greenhill, A.I.M.L.T., and Mrs. Ruth Wallace for their skilled technical assistance.

LIQUID PARAFFIN AS A CAUSE OF OIL ASPIRATION PNEUMONIA

BY

GILBERT FORBES, M.D., B.Sc., F.R.C.S.Ed.
F.R.F.P.S.

Reader in Charge

AND

ANDREW BRADLEY, M.A., LL.B., M.B., B.S.
Lecturer

Department of Forensic Medicine, University of Sheffield

[WITH SPECIAL PLATE]

Liquid paraffin has, for various reasons, been under suspicion at different times since it began to be used to any extent medicinally at the beginning of this century. It has been charged with preventing intestinal absorption of food in general, and of vitamin A and its precursor, carotene, in particular, and on this latter count there is some justification for the charge. Since liquid paraffin is a mixture of liquid hydrocarbons obtained from petroleum, the possibility that it might contain carcinogenic fractions has been investigated (Boyd and Doll, 1954). At one time there was a practice of instilling liquid paraffin into the peritoneal cavity with the avowed object of preventing adhesions. The result has been to produce, in a number of cases, an oil granuloma of the peritoneum (Bennett and Collins, 1952). Probably, however, the most common danger arising from the medicinal use of liquid paraffin is the production of oil aspiration pneumonia.

The pneumonia which results from aspiration of oils and fats has been dealt with extensively in American literature, but has not received the same attention in Britain, although its incidence in this country may not be any less. The diagnosis of the condition in life is not

easy, since similar lesions may be produced by other agencies, and fats and oils are not often considered as aetiological agents, because of a fairly general lack of awareness of their ability to produce such lesions and a failure to elicit, in consequence, the relevant facts in the patient's history. In the cases described in this paper aspiration of oil was not considered in diagnosis during life. The diagnosis at necropsy also presents some difficulty.

Classification and Predisposing Factors

Ikedo (1937) classified oil aspiration pneumonia into two types, which he called "adult" and "infantile." The "infantile" type occurs in debilitated children and adults as a result of the administration of food and drugs containing animal oils. This type is essentially a diffuse low-grade pneumonia, and one of the main grounds of distinction from the "adult" type is that it may undergo resolution. The "adult" type occurs only among the older age groups as a result of habitual self-administration of liquid paraffin, either orally or intranasally, in large total amounts. Animal oil is of little importance in the "adult" type, where the lesion is a chronic granuloma.

Among the factors predisposing to aspiration of oil into the lungs are the feebleness associated with early infancy and old age, the disabilities arising from affections of the central nervous system, debility, recumbency, dysphagia, and lesions of the mouth, throat, oesophagus, and upper respiratory tract. The character of the oil also is an important factor. Liquid paraffin is implicated as the causal agent in the great majority of cases. Its blandness would seem to be the reason for its known capacity to enter the bronchial tree without exciting any reflex action. The type of case in which oil aspiration pneumonia is most likely to be found is the chronic sufferer from respiratory infection who for long periods uses oral or nasal sprays of which liquid paraffin is an ingredient, or the sufferer from chronic constipation who seeks relief in a regular oral dose of liquid paraffin over long periods (Freiman *et al.*, 1940).

Pathological Changes

There cannot be said to be a typical naked-eye appearance. There are irregular areas of consolidation in the lung, varying in size from 1 cm. or less in diameter to that of a whole lung segment. The lesions, being fibrous, have a tough or hard consistence, and are grey or yellow in colour. On naked-eye examination and radiologically (Siddons, 1958) they have been most often wrongly diagnosed as neoplastic infiltration or as caseous consolidation of tuberculosis. Microscopically, different fields may show different stages of reaction. In some areas an accumulation of phagocytes may be found occupying the alveoli. They are large, foamy, and vacuolated in varying degree. Strands of collagen fibres may be seen insinuating between these lipophages. Giant cells formed by the coalescence of the lipophages are commonly present. In yet other areas there is dense fibrosis with circular lacunae. Appropriate stains show these lacunae to be filled with fat.

As might be expected, there are a number of complications which will each add its quota to the appearances described. Recurrent bronchopneumonia, bronchiectasis, abscess formation, and emphysema have been known to complicate the disease. Bronchogenic carcinoma has been suggested as a complication.

The crux of the diagnosis lies in the demonstration of fatty material in lacunae in the densely fibroid lung tissue. To distinguish between mineral oils on the one hand, and vegetable and animal oils on the other, use has been made of the reaction of osmium tetroxide, which is reduced by the animal and vegetable oils to give a black precipitate, whilst mineral oils have no such action. Some investigators have carried out chemical analysis of lung tissue (Jampolis *et al.*, 1953; Wagner *et al.*, 1955).

Case Histories

Case 1.—A woman aged 54 was admitted to hospital on January 17, 1956, with a diagnosis of bronchitis, bronchiectasis, and right-sided heart failure. There was a history of chronic cough since childhood. A radiological report at that time mentioned gross bilateral emphysema secondary to chronic bronchitis, with bilateral bronchiectasis in the lower lobes. Investigation for tuberculosis was negative.

On admission she had marked dyspnoea at rest. There were diffuse bronchospasm and expiratory and inspiratory rhonchi, with coarse crepitations at both lung bases. Jugular venous pressure was raised. There was oedema of the ankles and sacrum. Laboratory investigation of the sputum showed normal flora, and two specimens were negative for acid-fast bacilli. The urine was sterile on culture, and apart from a trace of albumin was not otherwise abnormal. Blood urea was 47 mg. per 100 ml. Haemoglobin 87% (Haldane). White cells numbered 10,400 per c.mm., with normal differential count. Chest x-ray report on January 26 was a repeat of previous findings, but in addition there was general enlargement of the heart, the appearances suggesting myocardial failure. The patient responded temporarily to treatment, but died on February 7, 1956.

At necropsy the main findings were as follows. The abdomen was distended and the ankles and legs were oedematous. The trachea and bronchi were filled with frothy mucus. Both lungs showed diffuse emphysema, with extensive areas of patchy consolidation, particularly in the lower lobes. There was marked prominence of the bronchi and bronchioles. The right ventricle was hypertrophied. The liver on cut surface showed a nutmeg pattern. The peritoneal cavity contained 2 pints (1.1 litres) of serous fluid.

Histological examination of the lungs showed the changes of chronic bronchitis and emphysema. In many areas the alveoli were filled with large, foamy, pink macrophages, many of which contained two or more nuclei. In other areas there was a picture of extreme disorganization characterized by the presence of giant cells of bizarre shape, suggestive of foreign material in the lung tissue. In yet other areas were large collections of lymphocytes and plasma cells. There were also extensive areas of fibrosis, in the meshes of which, on staining with Sudan IV, were revealed a number of oil globules of varying size. These globules were found not to reduce osmium tetroxide. It was therefore concluded that the findings disclosed the presence of an oil aspiration pneumonia, in both acute and chronic stages, due to liquid paraffin.

Subsequent inquiry yielded no information as to the source of the aspirated oil. It was surmised that it was probably an oral or nasal spray containing liquid paraffin.

Case 2.*—A man aged 55 years, a universal grinder in a steel foundry, died suddenly on November 1, 1957. For several years he had been under the care of his doctor on and off because of pains in the chest, shortness of breath, and chronic cough; he had, in fact, been treated for bronchitis. Three weeks before his death he was seen by his doctor because of an attack of "influenza," and he had never fully recovered.

The main findings at necropsy related to the chest. There was a quantity of mucus in the trachea. In the lower lobe of the left lung were two dense fibrous masses, each about 1 in. (2.5 cm.) across. A similar mass was present just above the hilum of the right lung. There was no significant emphysema. The heart was substantially dilated and hypertrophied on the right side. Pulmonary fibrosis was present, and an important point was whether it was of industrial or non-industrial origin.

Histological examination revealed varying degrees of fibrosis throughout the lungs. In many areas the appearance was of a honeycomb of clear spaces, which by staining with Sudan IV were shown to be filled with fat (Special Plate,

*This and the following cases were the subject of necropsies undertaken on behalf of H.M. Coroners for the City of Sheffield and the County Borough of Rotherham.

Fig. 1). Osmium tetroxide was not reduced by this fat (Special Plate, Fig. 2). The framework of the honeycomb was of fibrous tissue, but this varied in appearance from area to area. In some areas this framework was of wide, dense, relatively acellular fibrous tissue, and here the clear spaces were largest in diameter. In other areas the fat-filled spaces were smaller and the fibrous-tissue framework was more slender and relatively cellular, the cells being a mixture of fibroblasts and vacuolated macrophages, also shown to be filled with fat. Occasional giant cells were to be seen in this fibrous framework. In some areas the normal alveolar pattern was to be seen, many of the alveoli containing numbers of the large macrophages in various stages of vacuolation, which we have learned to associate with lipid pneumonia (Special Plate, Fig. 3). Here and there throughout the lung fields were collections of lymphocytes and plasma cells. The basement membrane of the bronchi was thickened. No evidence of silicosis or tuberculosis was noted. There was dramatic narrowing of the branches of the pulmonary artery, with marked medial thickening. This was seen to a lesser extent in areas of lung tissue only slightly affected by fibrosis.

The cause of death was cor pulmonale due to pulmonary fibrosis following lipid pneumonia. In view of the findings an effort was made to trace the source of the aspirated oil, and it was found that the deceased had been in the habit of taking liquid paraffin as a purgative. This was the only ascertained source from which the lesion could have arisen.

Case 3.—A man aged 78 who had worked in various coal-mines all his life. Since the age of 70 he had had at least two strokes, from which he had made substantial recovery. For a number of years he had had shortness of breath, cough, and chest pains. By July, 1957, when he was admitted to hospital for a minor condition, he could do little more than totter about owing to senility. He was kept in hospital because of the difficulty of home nursing, and during his stay a chest radiograph was reported as showing nodular opacities in both lungs due to pneumoconiosis. On December 11, 1957, while sitting in the ward, he had sudden pain in the left leg, and examination elicited all the signs of arterial blockage in this limb. Gangrene of the limb developed, and he died on December 13.

Necropsy was undertaken to determine whether pneumoconiosis was the cause, or a contributory factor in the cause, of death. He was found to have died of bronchopneumonia due to gangrene of the left leg caused by femoral-artery occlusion and arteriosclerosis. An incidental finding was that in the lower part of the middle lobe of the right lung there was a fibrous honeycombed area, which was not pigmented and the appearance of which suggested that it might be an oil granuloma. Histological examination of this area showed that three stages of reaction could be distinguished (Special Plate, Fig. 4). In some fields the alveolar septa could be made out, and within the alveoli were collections of cells showing various degrees of vacuolation, most of them being, in fact, of signet-ring shape. Sudan-IV staining revealed them to be filled with fat. Their nuclei and cell membranes were in various stages of disintegration. Fine fibrous strands were just beginning to make their appearance, insinuating amongst these lipophages. In other fields the alveolar pattern was obliterated, and there were sheets of these signet-ring cells, distended in varying degree with fat, interspersed here and there with not very large clear spaces, which also proved to be filled with fat. In this type of field fibrous bands were more obvious and giant cells were also present. In yet other fields the picture was of a honeycomb of large clear spaces of varying size, shown to be filled with fat. Osmium tetroxide was not reduced by this fat. The framework of the honeycomb was dense fibrous tissue.

So far as the relatives knew, he had not been in the habit of taking liquid paraffin. He was described, however, as being always constipated and taking remedies for that condition. It may therefore very well be that he was in the habit of taking liquid paraffin unknown to his relatives.

Case 4.—A widower aged 79, retired pattern-maker, died suddenly on February 14, 1958. He had for some time been in failing health, and had been under the care of his doctor in the recent past, having had two attacks diagnosed as cerebral thrombosis, but at the time of his death had not been seen by his doctor for some weeks.

At necropsy he was found to have generalized arteriosclerosis, with two areas of old softening in the left cerebral hemisphere. The lungs showed bronchopneumonic change, and indeed the cause of death was bronchopneumonia complicating arteriosclerosis and cerebral thrombosis. In the lower lobe of the right lung a patch of consolidation was discovered, which was larger and had a much harder consistency than the surrounding patches of bronchopneumonic consolidation. Histological examination of this area revealed a picture similar in essentials to that described in Case 3. Sudan-IV staining showed the area to contain a large amount of fat (Special Plate, Fig. 5), which failed to reduce osmium tetroxide (Plate, Fig. 6).

Discussion

For practical purposes the agent responsible for oil aspiration pneumonia in adults is liquid paraffin. It gains access to the lungs most easily by its use as an ingredient of nasal or oral sprays. Some years ago it was commonly found in such sprays, and we cannot but feel that there must exist a considerable number of oil granulomata of the lung arising from their use. The evidence suggests that, once in the lung, liquid paraffin remains as an inert foreign body for many years, and probably permanently. From inquiries we have made it appears that the tendency now is for nose drops and sprays to be made up in an aqueous medium. A substantial proportion (about 20%) is, however, still being manufactured in a medium containing liquid paraffin, and we feel that their manufacture in an oily medium should be stopped. It is also clear that liquid paraffin gains access to the lungs as a result of oral administration, even in those who suffer no disability. A bland oil introduced by catheter into the pharynx of a healthy adult whilst asleep on his back was shown to be present in the lung the following morning (Pirie, 1932). It appears that there is still in Great Britain a steady sale for liquid paraffin as a laxative, and in our opinion its use for this purpose requires reappraisal.

Oil granuloma of the lung is largely preventable. Its presence is known to dispose to recurrent respiratory infection, and in these days when our lungs have to contend with so many other noxious substances this is one lesion which, however small, we can well afford to be without.

Summary

Four cases of oil aspiration pneumonia are described, two in which it was a contributory cause of death and two in which it was an incidental finding.

The pathogenesis and pathology of the condition are discussed.

The use of liquid paraffin as an ingredient of nasal and oral sprays, and also as a laxative, is criticized.

Our thanks are due to Dr. C. H. Hollins and Dr. T. V. Cooper, of Dorchester, for their assistance and for permission to publish the clinical details of Case 1. We are also grateful to A. P. Lockwood, Esq., H.M. Coroner for the City of Sheffield and for the Rotherham Division of the West Riding of Yorkshire, for permission to publish details of Cases 2 and 4; and to N. S. Robson, Esq., H.M. Coroner for the County Borough of Rotherham, whose authority we publish details of Case 3. For technical assistance and the preparation of the illustrations we are indebted to Mr. S. J. Gray.

DISPENSABILITY OF POST-OPERATIVE PENICILLIN IN SEPTIC-HAND SURGERY

BY

JOHN ANDERSON, M.B., Ch.B.

Late Senior House Officer, Casualty and Surgical
Out-patient Departments, Royal Infirmary, Dundee

The aim of this work was to evaluate the common use of penicillin after operations upon septic lesions of the hand. Localized infections only were considered, and attention was focused principally upon the rate of healing of abscess cavities following the evacuation of pent-up pus. Patients were treated in a special clinic, for Webster (1947) and other workers have obtained improved results by centralizing the treatment of hand sepsis.

Wilkes (1954) emphasized the economic importance of sepsis with a large series of hand infections where the average time lost from work was 24 days. A Ministry of Pensions and National Insurance digest for 1953-4 shows that the number of spells of certified incapacity due to cellulitis and abscess was 6% of the total from all causes. Although falling, this figure leaves no room for complacency, and close inspection of the methods of dealing with this type of lesion, with revision of these therapies where necessary, is constantly indicated.

Scope of the Investigation

All patients required surgery and were treated as out-patients. Children under 10 years were excluded. Each patient was assigned without bias to one of three categories—those dealt with by surgery alone, by surgery plus oral penicillin, or by surgery plus depot penicillin. There were 42, 34, and 27 patients respectively in each of these categories who had received various forms of chemotherapy elsewhere before attending the hand clinic.

The diagnostic classes were: (1) *Paronychia* of any degree, except with pus deep to the nail. (2) *Onychia*: pus under the nail (a) tracking from an adjacent focus such as a terminal abscess or paronychia, or (b) developing *in situ*—for example, an infected subungual haematoma. (3) *Pulp abscess* of the terminal pulp of the finger. (4) *Other abscesses*: (a) subcutaneous, on the volar or lateral aspects of a finger; (b) dorsal abscess of the hand or finger, often originating in an infected hair follicle; (c) web abscess; (d) palmar space abscess. (5) *Septic blister*: occasionally rectified if a subcutaneous extension was found at operation. (6) *Chronic infections* were those whose pre-operative duration exceeded 27 days.

When clinically indicated radiographs (of both hands) were taken.

At operation swabs were taken from the exposed infected tissues for culture and for sensitivity tests to penicillin and erythromycin.

The criteria of healing were a dry completely epithelized wound, full function of the affected member, and no need for further dressings or attendance. The healing-time was the number of days between operation and final discharge.

All the patients were seen by me pre- and post-operatively; some of the operations were done by colleagues with agreed uniformity of procedure.

Surgical Technique and Post-operative Treatment

Each locus of pus and the point of maximal tenderness were ascertained with patience and precision in the pre-operative planning of an approach to the lesion. The fore-

limb was thoroughly washed and upper garments were removed. All operations were performed under general anaesthesia (trichlorethylene, nitrous oxide, and oxygen) in a bloodless field obtained by elevation of the limb and applying a pneumatic tourniquet.

The planned incision, remote from pressure areas, of minimal length, and in the optimum position for drainage, was generally made in the line of a skin furrow (longitudinal or slightly oblique on the antero-lateral aspect of a finger or transverse on the dorsum). Sometimes an undesirable site where the abscess pointed had to be used.

The roof of a septic blister was removed and a collar-stud extension sought. In paronychia a formal flap was raised and an appropriate portion of the nail-base removed; a unilateral incision sufficed for less extensive cases. For onychia, only nail undermined by pus was removed; this was occasionally combined with a unilateral paronychia incision or the opening of a terminal abscess. Web-space abscess was opened by an antero-posterior incision.

Pus and slough were removed by gentle mopping or excision and the abscess cavity was inspected by direct vision. Loculations were opened, avoiding unnecessary interference with healthy tissue. The skin edges, always in a precarious state of vitality, were never forcibly retracted or held by coarse instruments. Only the corner of a small portion of tulle gras was slipped between the lips of the incision or under the paronychia flap. Early in the investigation it seemed beneficial to avoid too much tulle gras, so just enough was used to keep the wound edges apart or to cover a raw area with a little circumferential overlap.

A generous dressing of gauze and cotton-wool was firmly applied, the tourniquet released, and the limb elevated during the recovery period. The arm was kept in a sling and daily exercise periods were advised. Codeine compound tablets were prescribed. Two days after operation a simple dry dressing was applied, and also at later inspections at two- or three-day intervals, an infrequency which reduced the chance of cross-infection, the expenditure of materials, and the strain on the dressings staff.

Oral penicillin was given at the makers' recommendation of 1,200,000 units of "crystapen" daily in divided doses. A printed dosage schedule was included with each supply of tablets and a few patients suspected of not adhering to it were excluded from the series irrespective of their clinical progress.

Depot penicillin was given by intramuscular injection as "seclopen," 1 ml. containing 300,000 units of procaine benzylpenicillin and 100,000 units of sodium benzylpenicillin, morning and evening until the inflammatory reaction had subsided and the wound was virtually healed. Serum levels of penicillin were estimated in each of three blood samples obtained by venepuncture on successive post-operative days before the morning injection in 42 patients of this group.

Results

Of the 357 patients treated, 16 (4.4%) failed to return for dressings, 15 (4.3%) had chronic infections, and 6 (1.7%) had complications. No case of erysipeloid was seen. A patient with acute suppurative tenosynovitis and another two with septic interphalangeal arthritis were referred for in-patient treatment. Both cases of palmar abscess were superficial to the aponeurosis.

Table I shows that in the "depot penicillin" treatment group the overall average healing-time was 0.23 day less than in the "no chemotherapy" group. Shortening of the average healing-times in the depot category for onychia, pulp abscess, other abscesses, and septic blister was 0.2, 1.0, 0.4, and 0.6 day, respectively; paronychia took 0.02 day longer. In the "oral penicillin" category the healing-times were shorter in onychia, pulp abscess, and other abscesses by 2.1, 1.2, and 0.4 days respectively, but in the paronychia group healing took 1.6 days longer.

TABLE I.—Results of Treatment

Type of Lesion	No Chemotherapy		Oral Penicillin		Depot Penicillin		Total No. of Patients	Average Healing-time (Days)
	No. of Patients	Average Healing-time (Days)	No. of Patients	Average Healing-time (Days)	No. of Patients	Average Healing-time (Days)		
Paronychia ..	39	8.46	34	10.06	29	8.48	102	9.00
Onychia ..	13	8.92	10	6.80	31	8.19	54	8.19

Septic blister ..	3	6.00	3	6.00	5	5.40	11	5.73
Overall ..	106	9.42	110	9.50	104	9.19	320	

TABLE II.—Overall Results for Patients not Receiving Preoperative Chemotherapy

Post-operative Treatment Group					
No Chemotherapy		Oral Penicillin		Depot Penicillin	
No. of Patients	Average Healing-time (Days)	No. of Patients	Average Healing-time (Days)	No. of Patients	Average Healing-time (Days)
64	9.07	76	9.25	77	9.67

Patients who received no chemotherapy before operation were assessed separately (Table II). The overall average healing-time in the "depot" group was 0.4 and 0.6 day more than in the "oral" and "no chemotherapy" groups, respectively.

Chronic cases were placed on the same rota as acute cases and treated similarly; 13 (87%) were paronychia and 10 (66%) had received previous treatment by incision or penicillin or by both. The average healing-time was 12.3 days, although the average preoperative duration was 83.3 days, as Table III shows. Two (16.6%) gave cultures of *Staphylococcus aureus* sensitive to penicillin and erythromycin, 7 (58.3%) produced no growth, and 3 (25.1%) gave *Staph. aureus* resistant to penicillin but sensitive to erythromycin.

Bacteriological results are shown in Table IV. Of the 260 swabs taken from acute infections 220 (84.6%) produced growths of *Staph. aureus*, 37 (14.2%) gave no growth, 2 (0.8%) gave *Staph. albus*, and from 1 (0.4%) a strain of yeast was isolated. Of the cultures of *Staph. aureus* 183 (83%) were fully sensitive to penicillin, and 37 (17%) were penicillin-resistant. All were sensitive to erythromycin.

Penicillin Blood Levels.—Of the 42 patients whose blood samples were examined 34 (81%) had bacteriostatic levels of penicillin. The specimens from 4 (9.5%) patients were contaminated or destroyed and 4 (9.5%) had no penicillin or very small amounts.

X-ray films revealed no bone infections.

TABLE III.—Chronic Cases

Type of Lesion	No.	Duration (Days)	Healing Time (Days)
Paronychia ..	13 (87%)	85.2 (average)	12.7 (average)
Onychia ..	1 (7%)	112	12
Subcutaneous abscess ..	1 (7%)	30	8
Overall ..	15	83.3	12.3

TABLE IV.—Bacteriological Results

	<i>Staphylococcus aureus</i>				Other Growth	No Growth	Total Cultures
	Penicillin-sensitive	Penicillin-resistant	Erythromycin-sensitive	Total			
Acute infections	183 (83%)	37 (17%)	220 (100%)	220	3	37	260
Chronic infection	2 (40%)	3 (60%)	5 (100%)	5	—	7	12

Complications.—Six patients had prolonged healing-times due to factors summarized in Table V—namely, inadequate surgery in three cases; a yeast infection, refusal to rest the part, and general uncleanness in the others. Each had a deviation from the treatment method of its original category, perforce or through not attending, and therefore could not be legitimately included in one treatment group. However, an analysis including these cases, except No. 1, in their original categories showed no significant difference between the overall average healing-times of the different treatment groups.

An allergic reaction occurred in a patient who had a palmar abscess. While taking oral penicillin he developed a generalized irritative rash and swelling of the lips which was relieved by 50 mg. of diphenhydramine hydrochloride three times a day for a few days.

Occupation.—Table VI shows that more than half of the patients were unskilled workers, jute-workers, or housewives; groups which account for a high proportion of the population of Dundee. The remainder were distributed amongst engineering trades, miscellaneous skills, farm- and wood-workers, building and contracting trades, electricians,

TABLE V.—Complications

No.	Diagnosis	Healing Time (Days)	Details
1	Pulp abscess	189	Depot penicillin group. Yeast infection. Admitted for antibiotic and operative treatment. Large loss of pulp substance but good flexion finally.
2	" "	19	No chemotherapy group. Misdiagnosed and treated as septic blister. Given seclophen two days after operation. Discharged spontaneously.
3	Palm "	30	No chemotherapy group. Misdiagnosed as septic blister. No extension seen at operation but further incision and seclophen given 5 days later.
4	Paronychia	21	No chemotherapy group. Single incision inadequate. Double incision and removal of nail-base 10 days later.
5	"	45	No chemotherapy group. Robust farmer, declined to rest limb or attend for regular dressings. Repeatedly superinfected.
6	"	50	Depot penicillin group. Double incision and removal of nail-base adequate. Personal hygiene very poor.

TABLE VI.—Occupational Incidence

Occupation	No.
Unskilled worker	73 (20.4%)
Jute-worker	73 (20.4%)
Housewife	55 (15.4%)
Housewife with other occupation	19 (5.3%)
Unemployed and school children	45 (12.6%)
Engineering trades	34 (9.5%)
Unclassified skills	29 (8.2%)
Farm-worker	12 (3.4%)
Wood-worker	11 (3.2%)
Building and contracting trades	3 (0.8%)
Electrician	3 (0.8%)
	357 (100%)

and schoolchildren. The low occurrence of electricians, 0.8%, is surprising in view of their frequent handling of small, sharp-pointed instruments and wire.

The preponderance of unskilled workers suggests that occupational interest and skill may be associated with personal attendance to cleanliness and well-being, whilst the hazards of the home or the housewives' degree of selflessness may be of a high degree.

Discussion

Penicillin assistance to localization in infections of the hand is generally accepted and has been supported by Gordon (1951) and Robins (1952). Post-operatively its value is not clear. Curr (1945) found the results of administering intramuscular penicillin to a few cases not encouraging;

Harrison *et al.* (1949), in a detailed study, concluded that systemic penicillin produced a significant reduction in the healing-time in pulp infections; Bolton *et al.* (1947) noted benefit in bony felons but not in simple pulp abscesses; Pilcher *et al.* (1948) questioned the best application of penicillin to infected hands, although acknowledging the antibiotic's general benefits; and a reduction in healing-time of acute paronychia, effected by intramuscular procaine penicillin and particularly by benethamine penicillin, has been shown by Williams *et al.* (1956). Bentley (1950) has advised post-operative penicillin for several days in infections of the hand. Bailey (1952) suggests intelligent selection of cases for chemotherapy rather than routine penicillin cover, and the use of the newer antibiotics if penicillin-resistant strains of *Staph. aureus* continue to increase. These conflicting opinions prompted the investigation.

Part of the solution to the epidemiological and surgical problems posed by the continued emergence of resistant staphylococci is suggested by the work of Clarke *et al.* (1952), who found that the greatest numbers of resistant staphylococci were in environments where most antibiotic treatment was given, and by the investigations of Blowers *et al.* (1955), which showed that where the routine administration of penicillin was stopped the proportion of resistant strains declined. These findings strengthen the belief that excessive use of penicillin is an important factor in reducing its value and that this may be restored by limiting administration to essential cases.

To deny a patient the possible benefits of penicillin demands sound proof of its dispensability. The reduction in the overall average healing-time of less than a quarter of a day in the "depot penicillin" group as compared with the "no chemotherapy" group, under the conditions of this investigation, does not justify the administration of penicillin post-operatively without a special reason.

The argument that the uncontrolled factor of preoperative chemotherapy in this series might selectively affect healing times is invalidated by the figures in Table II, which closely correspond to the overall figures (Table I) of the whole series, upon which a statistical analysis was carried out.

The distributions of the observed healing-times about the means are not symmetrical, and in order to justify the application of conventional tests of significance to the data the transformation factor $y = \sqrt{x+1}$ was applied, where x was the healing-time in days. This brought the distributions closer to normality without selectively affecting the variance. An analysis of variance on the transformed data showed that the small differences in healing-time between the treatment groups could have arisen by chance on more than one occasion in 20 and thus did not achieve significance. However, the "depot penicillin" treatment effects for web abscess were significant at the 5% level, but there was no significant difference between the healing-time in the "no chemotherapy" and "oral penicillin" groups. The numbers in the dorsal (5), palmar abscess (2), and septic blister subgroups were too small for separate comparison.

TABLE VII.—Results of Treatment of Web Abscess

	No Chemotherapy	Oral Penicillin	Depot Penicillin
No. of cases	4	5	6
Average healing time (days)	11.5	12.2	7.3

Where $p < 0.05$.

Table VII shows the results of the treatment of web abscess. The reduction of four days in the average healing-time of the "depot penicillin" group may be due to the laxity of the tissues in the web spaces, permitting ready access of a blood-borne antibiotic which an increase in tension, such as would occur around an abscess in a digit, might be sufficient to reduce. Even in these cases, however,

the high blood levels obtained twice daily with seclophen seem to have been essential, and more cases are required to give confidence in the findings.

The success of surgery in chronic infections was striking. Although the average healing-time exceeded that of acute infections the results in this small series warrant further investigation into the timing of surgical intervention and the extent of drainage required, particularly in paronychia.

The six complicated cases clearly portray the consequences of misdiagnosis or mistimed surgery. In the most favourable circumstances Cases 2, 3, and 4 might have been saved one or two weeks of disability each. The presence of these three patients in the "no chemotherapy" group must be regarded as coincidental when the progress of the 106 others in this group is considered. The prolonged healing-time is readily explicable in each case by the factors outlined in Table IV. Lessons learned from these cases were usefully applied in the management of others, particularly at the stage of planning the incision.

Summary and Conclusions

A study of the post-operative care of 357 cases of sepsis of the hand is described. Three unselected treatment groups were obtained, receiving either no chemotherapy, oral penicillin, or intramuscular penicillin. The respective healing-times were 9.4, 9.5, and 9.2 days.

Careful clinical examination, accurate diagnosis, and precise surgery are of greater importance than routine chemotherapy. Indications for chemotherapy are suggested.

Some observations on infecting organisms, chronic lesions, and occupational incidence are made.

Routine post-operative penicillin does not hasten healing in septic lesions of the hand which require surgical treatment, provided that a careful technique is based upon anatomically accurate diagnosis.

Penicillin has been safely excluded from the post-operative environment of uncomplicated acute infections of the hand, and this may be a more fundamental counter to the emergence of resistant organisms than recourse to other antibiotics.

Possibly web abscess and threatened infection of the structures that move or support the hand are the only firm indications for chemotherapy, which will not act as a cover for misdiagnosis or inappropriate surgery.

I thank Mr. W. F. Walker for mentorship at all stages of this work; Miss Rosemary J. Morton, of the Unit for Research on Climate and Working Efficiency, Oxford, for the statistical evaluations; and Dr. W. Shepherd, department of bacteriology, University of St. Andrews, for the bacteriological and blood investigations. The series was facilitated by the co-operation in organization and treatment methods of Sister Young and the nurses of the surgical out-patient department, Royal Infirmary, Dundee.

CLINICAL TRIALS WITH BEPHENIUM HYDROXYNAPHTHOATE AGAINST HOOKWORM IN CEYLON

BY

L. G. GOODWIN, M.B., B.S.

L. G. JAYEWARDENE, Ph.D., L.M.S., D.T.M.

AND

O. D. STANDEN, D.Sc.

From the Medical Research Institute, Colombo, and the
Wellcome Laboratories of Tropical Medicine, London

Copp, Standen, Scarnell, Rawes, and Burrows (1958) showed that members of a series of new quaternary ammonium compounds were active against a broad range of parasitic nematodes in laboratory and domestic animals. One of the most active compounds, bephenium embonate (benzylidimethyl-2-phenoxyethylammonium embonate), was shown by Rawes and Scarnell (1958) to be of value in the treatment of nematodiriasis in lambs.

The demonstration of high activity of bephenium salts against *Ancylostoma caninum* in dogs and cats (Copp *et al.*, 1958) led naturally to preliminary trials in London against hookworm infections in man. We are indebted to Professor A. W. Woodruff, of the Tropical Diseases Hospital, and Drs. D. H. Garrett and M. J. Andrewes, of the Dreadnought Hospital, for carrying out these trials. The results were encouraging and justified more extensive trials against heavier hookworm infections in Ceylon.

Tests in laboratory animals, including monkeys, showed that the toxicity of salts of bephenium was low. The less soluble salts, such as the 2-hydroxy-3-naphthoate and embonate, were poorly absorbed when given by mouth to human volunteers (Rogers, 1958).

Materials and Methods

Experiments with *A. caninum* in dogs and cats (Burrows, 1958), *Nippostrongylus muris* in rats, and *Nematospiroides dubius* in mice (Copp and Standen, 1958, in preparation) showed that bephenium halides, although more irritant, were appreciably more active against these organisms than were the less soluble hydroxynaphthoate and embonate. It was also found that equivalent anthelmintic activity was obtained when a proportion of the dose of halide was replaced by hydroxynaphthoate. On the basis of these observations, bephenium bromide, hydroxynaphthoate, and mixtures of these salts were selected for trial. The almost insoluble embonate was also tested.

Bephenium bromide and mixtures of bromide and hydroxynaphthoate were given as tablets, prepared so that they would disintegrate in the stomach within a few minutes of administration. The hydroxynaphthoate and embonate were given as tablets or as a sweetened and flavoured suspension in water. As a control group a proportion of the patients were treated with tetrachlorethylene. According to the general practice in Ceylon, it was administered together with a saline purge (Maplestone and Mukerji, 1939).

Faecal specimens were collected in ice-cream cartons. Patients whose stools contained hookworm ova on examination by direct smear were selected for treatment. Intercurrent infections with roundworm and whipworm, as seen by direct smear, were recorded. The number of

hookworm eggs per millilitre of faeces was determined before treatment by the dilution-count technique as described by Stoll and Hausheer (1926). Four days after treatment a further specimen was collected and examined by direct smear. If positive for hookworm ova, a dilution count was made. If negative, the specimen was examined after concentration by the M.I.F.C. method (Sapero and Lawless, 1953; Blagg, Schloegel, Mansour, and Khalaf, 1955). All counts were made in duplicate.

The effect of treatment was assessed by calculation of the percentage reduction in egg count. An arbitrary figure of 200 eggs/ml. was awarded to those specimens which were negative on direct smear but positive on concentration.

In some instances the stools passed after treatment were washed through a No. 60 sieve and the hookworms recovered for identification of species.

Patients were treated at the General Hospital and Lady Ridgeway Children's Hospital in Colombo, and at the General Hospital in Negombo. A group of Tamil labourers and their children were treated under field conditions at the Sapumalkande rubber estate, Dehiowita. Patients were selected for treatment with the different preparations of bephenium by a random method. A special group of children with infections which had proved resistant to successive treatments with tetrachlorethylene were given multiple doses of bephenium hydroxynaphthoate ("alcopar") at Ragama Convalescent Home.

Bephenium salts were given early in the morning on an empty stomach, and no food was allowed until at least two hours after the dose. No purge was given after the dose. One group of patients were given three doses on one day; the second and third doses were spaced between meals. Patients in hospital were treated with piperazine citrate syrup ("antepar") on the day before administration of a bephenium salt. Estate labourers were given no pre-treatment with piperazine. Throughout this report all doses of bephenium salts are expressed in terms of base: 1 g. of bephenium base is contained in 1.31 g. of bephenium bromide, 1.73 g. of bephenium hydroxynaphthoate, and 1.75 g. of bephenium embonate.

The weight of infection with hookworm before treatment varied greatly among the 284 patients treated. An analysis of the distribution of egg counts (Fig. 1) shows that patients admitted to hospital had a significantly higher mean rate of infection than the labourers at the rubber estate. The random selection of patients for the separate treatment groups resulted in fairly evenly distributed proportions of heavy, moderate, and light infections.

Effect of Bephenium Salts in Treatment of Hookworm Infection

Bephenium Hydroxynaphthoate

The first few patients were treated with small doses of bephenium, the size of the dose being adjusted in accordance with body weight. It soon became apparent that the less soluble salts had no toxic side-effects even when given in doses as large as 200 mg./kg. It was also clear that the small doses administered to children on the mg./kg. basis had no appreciable effect on the egg count. As a result of these preliminary tests it was concluded that a single dose of less than 2 g. in the child and in the adult was insufficient, and subsequently a standard dose of 2 to 3 g. of bephenium

FIG. 1.—Distribution of the number of hookworm eggs/ml. of faeces from 132 estate labourers and 109 hospital patients in Ceylon.

base was administered to all patients irrespective of weight and age. The drug has a bitter taste, but was accepted by both adults and children. Table I shows the results obtained with patients in hospital who were given single doses of bephenium hydroxynaphthoate. Hookworms were recovered from the stools of patients given as little as 1 g.

of bephenium even if the subsequent egg count showed no significant reduction. All hookworms isolated from the stools were identified as *Necator americanus*.

Twenty-seven patients were given 2 g. of hydroxynaphthoate three times on one day. The results are shown in Table II.

A group of children aged from 4 to 10 years were treated with multiple doses of bephenium hydroxynaphthoate. All had been admitted to hospital in a critical condition, suffering from malnutrition, anaemia, severe gastro-enteritis, and hookworm infection. Before treatment with bephenium their general condition had been improved by intravenous fluids, iron, and vitamins, but they were still passing several fluid stools each day. Some of the children had already received one or more treatments with tetrachlorethylene, but their stools still contained hookworm ova. Because of their precarious fluid balance, others were regarded by the physician as being too ill to be given tetrachlorethylene and subsequent purgation. In view of the persistent intestinal hurry, it was considered rational to administer more than one dose of bephenium. Doses of 2 g. were

given daily for four successive days; those who still retained some degree of infection and were still in hospital were given a further seven-day course of treatment. The results are given in full in Table III.

The effect of four 2-g. doses on the faecal egg count of one 6-year-old child is shown in Fig. 2. This child had advanced cirrhosis of the liver (confirmed by biopsy) and gross ascites. He was considered by the physician to be unsuited for treatment with tetrachlorethylene. Bephenium greatly reduced the egg count, and no toxic side-effects of any kind were observed. After treatment, hookworms were recovered from the stools. Examination of this child 10 weeks after treatment showed that the stools were free from hookworm ova.

In order to study the effectiveness of bephenium hydroxynaphthoate under field conditions, trials were carried out in a group of 132 Tamil labourers and their

families employed at the Sapumalkande rubber and tea estate near Dehiowita. The patients were divided into six treatment groups, which were given: (1) 3 g. of bephenium alone, as a suspension in water; (2) 3 g. of bephenium, as suspension, one hour after a dose of 1 oz. (30 g.) of magnesium sulphate in water; (3) 3 g. of bephenium, as suspension, together with the saline purge; (4) 3 g. of bephenium together with 1 fl. oz. (28 ml.) of piperazine citrate syrup; (5) 1 g. of bephenium, as suspension, daily for

majority of stools examined by direct smear were seen to contain numerous ova. No attempt was made to evaluate the number of roundworm ova per millilitre of faeces, and the effect of the drug was assessed by the presence or absence of eggs in direct smears at follow-up examinations.

Table V shows the results obtained against the inter-current *Ascaris* infections in the patients treated for hookworm with bephenium. Whilst a marked effect was seen against roundworm, there was no significant action against whipworm following a single 3-g. dose of bephenium.

* Dose in terms of base.

four or five days; (6) 30 minims (1.8 ml.) of tetrachlorethylene together with the saline purge. The results are shown in Table IV.

Bephenium Bromide

This salt has an extremely bitter taste, and was administered with difficulty because of its nauseating properties. Of the seven patients who were given 1.25 g. to 2.5 g. of the drug as tablets, two vomited almost immediately. Reduction of egg count in the stools was observed in only three of the patients, and the mean reduction for the series was 25%. The use of this salt was discontinued.

Mixtures of Bephenium Bromide and Hydroxynaphthoate

Small groups of patients were treated with doses of 2 to 2.5 g. of mixtures of bephenium bromide and hydroxynaphthoate in the proportions of 2:1, 1:1, and 1:2 respectively. The effectiveness of the dose was directly proportional to the amount of hydroxynaphthoate in the mixture. With a mixture containing 2 parts of bromide to 1 part of hydroxynaphthoate the mean reduction in egg count was 55% (4 cases); with equal proportions of salts this figure was 64% (5 cases); with a mixture of 1 part of bromide to 2 parts of hydroxynaphthoate the reduction was 70% (5 cases), a figure which is similar to that given by the hydroxynaphthoate alone. Mixtures containing the bromide caused nausea, and since they offered no advantage in effectiveness their use was discontinued.

Bephenium Embonate

Bephenium embonate was the least soluble of the compounds investigated. It was tested at doses of 0.75 to 5 g. in a series of 18 patients whose egg counts ranged from 83,800 to 200 eggs/ml. There was no correlation between anthelmintic effect and dose. Twelve of the patients (67%) showed a reduction of egg count, and the mean reduction for the series was 55%. The proportions of patients with reductions in egg counts of 100-75%, 74-25%, and 24-0% were 50%, 17%, and 33% respectively. These results compared unfavourably with those obtained with the hydroxynaphthoate.

Effect of Bephenium Hydroxynaphthoate Against Roundworm Infections

A high proportion of the persons at the Sapumalkande estate selected for treatment with bephenium for hookworm were intercurrently infected with roundworm and whipworm. Most of the roundworm infections were very heavy; the

Discussion

Tetrachlorethylene has been used for many years in the treatment of hookworm infection. It is cheap and effective and the toxicity is low. It is best administered in the morning, following a saline purge the night before. Two hours after the dose, a second purge is given to remove the tetrachlorethylene and thereby avoid absorption. This procedure rarely fails to remove most of the hookworms. For mass treatment in the field, in out-patient departments, and in crowded hospitals in the tropics with limited nursing staff, these optimal conditions for

treatment are often impracticable. Maplestone and Mukerji (1939) introduced a method in which the tetrachlorethylene is given together with the saline purge in a single dose; this is the method most widely used at present in Ceylon. Mass treatment for many years by this practical method has led to a considerable decrease in weight of infection in estate labour.

Tetrachlorethylene is unpleasant to take and often produces dizziness and nausea. These side-effects and the necessity for abstinence from food until the purge has taken effect usually involve absence from work on the day of treatment. In addition, roundworm infection is often

found in association with hookworm. Tetrachlorethylene has little anthelmintic value against roundworms, although it stimulates them and may constitute a danger when massive infections are present.

In patients suffering from heavy hookworm infection with severe anaemia, malnutrition, and diarrhoea the condition of the circulation is sometimes such that it is inadvisable to endanger the precarious fluid balance by giving a saline purge. Treatment with tetrachlorethylene must be withheld until the condition of the patient can be improved. This is an important consideration in the treatment of children, and the small dose of tetrachlorethylene which can be given safely is often valueless for the expulsion of the hookworms (Table I). These characteristics of tetrachlorethylene have stimulated the search for new remedies. The results obtained in the present clinical trial with bephenium hydroxynaphthoate show that this drug overcomes many of the disadvantages associated with the use of tetrachlorethylene. However, in view of the bitter flavour of bephenium it is desirable to withhold treatment from patients with severe vomiting and dehydration until the fluid balance has been restored by intravenous infusion.

Table I shows that a single dose of 2 to 3 g. of bephenium hydroxynaphthoate was at least as effective as 30 to 40 min. (1.8 to 2.4 ml.) of tetrachlorethylene, the dose used for treatment in Ceylon hospitals. Adult male patients weighed about 100 lb. (45.4 kg.) and were given 40 min. (2.4 ml.); adult females weighed about 80 lb. (36.3 kg.) and were given 30 min. (1.8 ml.). The larger dose of 60 min. (3.6 ml.) recommended by Maplestone and Mukerji (1939) was not used because previous experience in Ceylon had shown that it often caused dizziness and other unpleasant side-effects. The children recorded in Table I were 5 to 6 years old and weighed between 17½ and 26 lb. (7.9 and 11.8 kg.). They were given 5 min. (0.3 ml.) of tetrachlorethylene, which was ineffective.

When three doses of bephenium hydroxynaphthoate, each containing 2 g. of base, were given on the same day to a group of 27 patients, the effect was similar to that produced by the single dose containing 2 to 3 g. when assessed by the mean percentage reduction in egg count. Some of the patients were children who were passing several fluid stools a day, and the three-dose treatment had a greater effect upon their hookworm infection and general condition than would have been expected from a single dose.

The results in Table III were obtained with 18 children who were also suffering from chronic diarrhoea. Most of the children had been given treatment with ineffective doses of tetrachlorethylene on several occasions. After four successive daily doses of 2 g. of bephenium hydroxynaphthoate, 16 (89%) showed considerable reduction in egg count. All the children were passing formed stools, and their general condition had much improved. Five of the seven children who remained in hospital showed a further reduction in egg count after an additional course of seven doses of 2 g. One child, who was still passing hookworm ova in his stools, subsequently had a recurrence of diarrhoea. This was controlled by a further course of treatment of three doses of 2 g. in one day, which reduced the egg count to insignificant proportions.

It is doubtful if the result in this group of children could have been achieved with any treatment other than bephenium. Multiple-dose treatment with bephenium would appear to be particularly advantageous in hookworm infection associated with intestinal hurry; it is reasonable to suppose that greater opportunity for contact of the drug with the worms is provided by a succession of doses. The effect of bephenium in controlling the diarrhoea of patients infected with hookworms is of special interest because the drug sometimes caused looseness of the bowel when given in equivalent doses to normal volunteers in England (Rogers, 1958).

Table IV shows that when a saline purge was given one hour before a dose of 3 g. of bephenium as hydroxynaphthoate the results obtained were the same as those after the drug was given alone. On the other hand, when the purge was given together with the bephenium the results were much less satisfactory. It is likely that the drug was removed from its site of action before it had exerted its full effect. It is possible that the purge induced conditions similar to those in children with diarrhoea (Table III) and reduced the opportunity for contact of the drug with the worms.

The results obtained when a dose of 1 g. of bephenium was given daily for four to five days were similar to those recorded for a single dose of 3 g.

In earlier experiments with *N. muris* in rats it was observed that piperazine exerted an effect antagonistic to the anthelmintic action of bephenium halides. It was not known whether this antagonism would occur in hookworm infections in man. In the group of patients treated with bephenium hydroxynaphthoate and piperazine (Table IV) it was clear that the activity of bephenium was unimpaired.

It has been shown (Table V) that bephenium hydroxynaphthoate has a marked effect against roundworms. No additive effect was observed when it was given together with piperazine.

For assessment of results in these trials one duplicate egg count was made before and after treatment. It was appreciated that daily egg counts in any individual would show a marked variation, and that comparison of counts at two points several days apart might be suspect. In trials of drugs of doubtful efficacy against hookworm the arbitrary selection of two points in the daily variation sequence may lead to erroneous conclusions (Goodwin and Standen, 1958). This would be true if results of treatment related to single or small numbers of cases, but where overall reduction can be achieved in a series of reasonable length the anthelmintic effect becomes apparent.

Our results show quite clearly that bephenium hydroxynaphthoate is highly effective in the treatment of hookworm infections. This is most apparent in those cases where very heavy infections were cured, or the egg count was reduced to insignificant proportions. However, the effect of drug treatment is not shown so satisfactorily in cases where the infection is light and where only partial reduction in egg count has been obtained. Daily variation apart, this is largely due to the fact that any dilution egg-count technique is insufficiently sensitive to provide accurate information where the number of eggs in the faecal suspension is small. It has been shown by Beaver (1955) that 200-500 ova per ml. of faeces may be produced by not more than two female *N. americanus*. When such small numbers of worms are present the opportunity for variation in daily egg count is much increased. In these instances the application of a multiplication factor of 100 or 200 to the number of eggs seen in a small measured volume affords too wide a margin of error for accurate conclusions to be drawn.

Summary

Bephenium, a new anthelmintic, was compared with tetrachlorethylene in the treatment of 284 cases of hookworm infection in Ceylon.

Bephenium hydroxynaphthoate was selected as the most suitable salt. A single dose of 2 or 3 g. of base, or multiple doses given on successive days or three times on the same day, compared favourably in effectiveness with tetrachlorethylene.

No toxic side-effects were observed when large doses of bephenium were given.

Bephenium hydroxynaphthoate was particularly suitable for the treatment of patients with advanced anaemia, diarrhoea, and heavy hookworm infections because of its low toxicity and because no purge was necessary.

Bephenium hydroxynaphthoate was also effective against roundworm, which was present as a concurrent infection in 85 of the patients treated with this drug. Tetrachlorethylene was ineffective against roundworm in 16 patients treated.

We are grateful to Dr. D. L. J. Kahawita, Director of Health Services, Dr. R. D. de A. Seneviratne, Director of the Medical Research Institute, Dr. Stanley de Silva, and Dr. C. Ratnavel for the facilities which were provided for this work in Ceylon. We are also grateful to the physicians who co-operated in the investigation, and permitted us to treat their patients, particularly Dr. R. P. Jayewardene, Professor C. C. de Silva, and Dr. A. F. S. Perera, of the Colombo hospitals, and Dr. G. Chinniah, of the hospital at Negombo. Work on the Sapumalkande Estate was greatly assisted by the co-operation of Dr. O. J. S. MacDonald and Dr. N. J. Nipps, of the Planters' Association Health Scheme. We are indebted to the staff of the Medical Research Institute, especially to Mr. Y. Wijayarathnam, for technical assistance, to the nursing staff at the hospitals, and to the matron at Ragama Convalescent Home for their valuable help.

EXCRETION OF BEPHENIUM SALTS IN URINE OF HUMAN VOLUNTEERS

BY

E. W. ROGERS

Wellcome Laboratories of Tropical Medicine, London

Goodwin, Jayewardene, and Standen (1958) have shown that bephenium salts were effective for the treatment of hookworm in man. Of the various compounds used for clinical trials in Ceylon, bephenium hydroxynaphthoate ("alcopar") was the most active, the embonate and bromide being considered unsatisfactory for clinical use. No toxic side-effects were observed when large doses of the hydroxynaphthoate were given. The present paper describes the urinary excretion rates of bephenium salts in volunteers in Britain.

Determination of Bephenium in Urine

The concentration of bephenium in urine was measured by means of a modification of the methyl orange dye-lake procedure. This method was supplied by Dr. S. R. M. Bushby, of the Wellcome Research Laboratories, Beckenham.

Reagents.—*Ethylene dichloride*:—the solvent was shaken with activated carbon, filtered, washed with 1/5 of its volume of N/1 NaOH and then washed twice with an equal volume of distilled water; it was then filtered to remove residual water. *Methyl orange solution*:—a saturated solution of methyl orange was prepared in 0.5 M boric acid, and washed with an equal volume of ethylene dichloride. *Acid alcohol*:—2 ml. of concentrated HCl was added to 100 ml. of absolute ethanol. *Solid sodium chloride*. 40% w/v *Sodium hydroxide solution*. Glassware was washed in very dilute detergent, well rinsed, washed in dilute HCl, and then in distilled water. Acetone was not used for drying glassware. Failure to observe these precautions resulted in high "blank" values.

Procedure.—1 ml. of urine was pipetted into a tube and 300 mg. of solid sodium chloride was added. The tube was shaken to saturate the solution and 8 ml. of ethylene dichloride was added. The tube was stoppered, the contents were shaken for 10 minutes and then centrifuged; 6 ml. of the lower (solvent) layer was removed into a clean tube. 0.4 ml. of the methyl orange reagent was added and the tube shaken thoroughly. The excess of methyl orange solution was removed with a Pasteur pipette after centrifuging; 5 ml. of 40% sodium hydroxide was added and mixed by a brief shaking. The tube was centrifuged and 4 ml. of the upper (solvent) layer was removed into a clean tube. 0.4 ml. acid alcohol was added and the absorption was measured in an absorptiometer at 540 mμ. "Blanks" were prepared, using water instead of urine, and treated in the same way. A standard curve was prepared with solutions of bephenium hydroxynaphthoate of known strength, and the basic substances excreted in the urine were expressed as bephenium.

Excretion of Bephenium after Oral Administration in Man

The preparations used were: bephenium bromide as compressed tablets each containing 500 mg. of base, and

bephenium embonate and hydroxynaphthoate in the form of sweetened and flavoured emulsions containing 500 mg. of base per fl. dr. (140 mg. per ml.).

The volunteers were healthy normal adults. For each excretion study the subject was given the dose orally, followed by 100 ml. of diluted orange squash. Urine was collected at each emptying of the bladder, and the volume and time were noted. The urines were refrigerated until used for analysis; no preservatives were added. The Table shows the percentage of the dose recovered.

Figs. 1 and 2 show the cumulative excretion rates of the drug and its metabolites after doses of bephenium bromide, embonate, and hydroxynaphthoate. Fig. 3 shows the excretion rates of bephenium hydroxynaphthoate after the administration of 2.5 g. base daily on successive days. It will be seen that the excretion of bephenium and its

metabolites in man is low. The bromide, which is soluble to the extent of 30% in water, was excreted in larger amounts than the less soluble hydroxynaphthoate. The almost insoluble embonate was excreted in still smaller amounts.

As found by Goodwin *et al.* (1958) in Ceylon, the bromide gave rise to nausea and vomiting. Side-effects from the hydroxynaphthoate and embonate were slight; mild diarrhoea sometimes occurred after a single dose, and some volunteers complained of borborygmi. The same effects occurred daily after repeated doses of hydroxynaphthoate. Some subjects did not complain at all, and the intensity of side-effects was not correlated with the amount of drug excreted in the urine. Side-effects ceased completely 24 hours after the dose. It is interesting to note that no

side-effects were observed after treatment with embonate or hydroxynaphthoate in Ceylon, where many of the subjects were already suffering from gastro-enteritis. This might perhaps be explained by dietary differences; the digestive tracts of those accustomed to hot curries may well be less sensitive than those of subjects who partake of less-stimulating foods. It is also of interest that no such side-effects were encountered among mentally defective children in an institution in Britain where the drug was tested for its action on whipworm infection.

Medical Memoranda

Thrombocytopenic Purpura Apparently Due to Tablets Containing Salicylamide and Mephenesin ("Arthropax")

A woman aged 64 was seen by me on October 16, 1958, suffering from widespread purpura with subcutaneous ecchymoses and haemorrhages into the tongue. The rash had begun to appear ten days before and had gradually increased in severity. On inquiry it was found that she had been taking two tablets of arthropax three times daily for about three weeks on account of a painful arthritis of the left knee.

Apart from the haemorrhages physical examination was negative, and there was no previous history of important illness. The blood count was as follows: total red cells 2,977,000 per c.mm.; haemoglobin, 56% (8.3 g./100 ml.); colour index, 0.94; total white cells per c.mm., 6,900. Differential count: polymorphonuclears, 63.5%; lymphocytes, 30.0%; large mononuclears, 6.5%; eosinophils, nil; basophils, nil; aniso- and poikilocytosis, slight; nucleated red cells, nil; platelets, less than 10,000 per c.mm.

The patient, who was ambulant, was told to stop taking the tablets and sent home to rest. When the result of the blood count was received a few hours later her doctor was warned by telephone to report at once if her condition deteriorated, so that she could be admitted immediately. In fact the patient made an uninterrupted recovery; no new haemorrhages appeared and the existing ones gradually resolved.

On October 30 she was well except for some breathlessness on exertion. The blood count then was: total red cells, 2,730,000 per c.mm.; haemoglobin, 58% (8.6 g./100 ml.); colour index, 1.04; total white cells, 6,300 per c.mm. Differential count: polymorphonuclears, 61%; lymphocytes, 29%; large mononuclears, 10%; eosinophils, nil; basophils, nil; aniso- and poikilocytosis, fairly marked; nucleated red cells, nil; platelets, 173,000 per c.mm.

On November 28 the blood count was as follows: total red cells 3,740,000 per c.mm.; haemoglobin 70% (10.4 g./100 ml.); colour index, 0.94; total white cells 5,900 per c.mm. Differential count: polymorphonuclears, 70.0%; lymphocytes, 23.5%; large mononuclears, 5.0%; eosinophils, 1.5%; basophils, nil; aniso- and poikilocytosis, nil; nucleated red cells, nil; platelets, 179,000 per c.mm.

Arthropax tablets contain salicylamide 5 gr. (0.32 g.), mephenesin 1 gr. (65 mg.), aluminium glyciolate 1½ gr. (0.1 g.). The dose of both drugs is well within that which is considered to be safe, and the makers tell me that they have not heard of similar cases.

The question arises whether mephenesin or salicylamide was responsible, it being assumed that the patient had some idiosyncrasy. Both drugs contain a benzene ring. An orthopaedic colleague has told me of a case of purpura following mephenesin administration some years ago, but

FIG. 2.—Cumulative excretion rates of bephenium hydroxynaphthoate in human volunteers after three single doses in one day.

FIG. 3.—Hourly excretion rates of bephenium hydroxynaphthoate in human volunteers after successive daily doses.

was unable to give details. Salicylates are known very rarely to cause thrombocytopenic purpura. It is assumed that in this case a mild inhibition of red-cell production also occurred and accounted for the anaemia. Although no studies of haemolysis or liver function were made, the case seems worthy of a brief report so that prompt action may be taken in similar cases before platelet counts are reduced to such dangerous levels.

ROBERT PLATT, P.R.C.P.,
Royal Infirmary, Manchester.

Traumatic Fore-quarter Avulsion

Avulsion of the entire fore-quarter with survival is uncommon enough to justify the record of the following case.

CASE REPORT

At 3.30 a.m. on February 21, 1951, the sleeve of a Polish mine-worker aged 43 was caught in the conveyer belt and the left arm torn off. He was brought to hospital at about 5.30 a.m. in a pulseless condition due to shock. He was bleeding a little, but did not appear to have lost nearly as

much blood as might have been expected. He was admitted to the wards, and after resuscitation at 6.30 a.m. the blood pressure was found to be 110/70 mm. Hg. At 9.30 a.m. he was given an anaesthetic and taken to the operating theatre.

On removal of his clothing the left upper limb was found to be missing from a large skin envelope. The wound, which extended from the middle line of the back from the level of the sixth cervical spine obliquely

downwards to the outer side of the left nipple and for an inch or so below, was explored, and it was found that the clavicle had been fractured about its centre and the outer half of the clavicle, the entire scapula, and the left arm had been avulsed. All the muscles had retracted and the bony thorax was bare. The brachial plexus was not seen, but the subclavian vessels were sought for and ligated. The subclavian artery had been torn at about the spot where it becomes the axillary artery, and bleeding had been arrested by clotting and retraction of the vessel. The rough end of the fractured clavicle was trimmed and the wound closed with a continuous stitch after providing for drainage. There was some doubt about the viability of the skin, and as much as possible was retained in case of sloughing. From the time of admission until 6.15 p.m. 3 pints (1.7 litres) of blood were administered. At that time there was only minimal oozing and the blood pressure was 134/80, and the pulse rate 100. Apart from a little sloughing of the skin, which required trimming on March 12, the patient's progress from this time was uninterrupted. On the day following the accident it was noticed that he had a Horner's syndrome. On March 29 the wound had healed and he was discharged.

D. S. PRACY, F.R.C.S.Ed.

Unusual Length of a Plasmodium ovale Infection

Relapses of *Plasmodium ovale* infection are known to occur up to two years. A case has been reported by Jeffery *et al.* (1954) in which relapses with the Donaldson strain of this malarial parasite continued up to three and a half years. In the following case a relapse due to *P. ovale* occurred 52 months after possible exposure.

CASE REPORT

The patient, an Englishman aged 31, was admitted to hospital on June 24, 1957, with a history of severe throbbing occipital headache, vomiting, rigor, and fever the previous day. He had been getting attacks of headaches periodically every fortnight or so during the previous four years. He served in the British Forces at Kaduna, Nigeria, from July, 1951, to February, 1953. In September, 1952, he suffered from an attack of malaria and was treated in the Military Hospital at Kaduna. He took prophylactic proguanil every day until he arrived home in February, 1953.

On physical examination he looked ill but his temperature was normal. Systematic examination did not reveal any abnormality. A day after admission his temperature rose to 104° F. (40° C.), initiated by rigor. A blood film showed a heavy infection with *P. ovale*. Some of the red cells contained two or three ring forms. With prolonged staining Schüffner's dots were seen. The schizonts contained 8 to 10 merozoites arranged irregularly. (Diagnosis was confirmed by Professor P. C. C. Garnham.)

After a full course of chloroquine phosphate the patient has become symptomless, except for migraine.

COMMENT

This patient's history excludes any possibility of reinfection with malaria during the 52 months he lived in the British Isles. There seem to be no clinical grounds for regarding the headaches which occurred at fortnightly intervals as other than simple migraine. The headaches which necessitated his admission to hospital were accompanied by rigor and fever, and appeared clinically to be the first attack of malaria since September, 1952. A relapse of *P. ovale* infection has been shown to be accompanied by 18 to 20 merozoites (Garnham *et al.*); in this patient they numbered 8 to 10. This fact, combined with the clinical evidence, seems to indicate a primary infection after a prolonged interval rather than a simple relapse. Whichever interpretation is accepted, 52 months is the longest period recorded.

I am indebted to Professor P. C. C. Garnham and Dr. E. C. Hutchinson for their advice and help.

Jeffery, G. M., Young, M. D., and Wilcox, A. (1954). *Amer. J. trop. Med. Hyg.*, 3, 628.

The home population of England and Wales as at June 30, 1958, was 45,109,000, of whom 21,744,000 were males and 23,365,000 were females, according to the Registrar-General's latest estimates. The total is 202,000 more than in mid-1957. Within the conurbations there has been a continuation of the movement from the centre to more open residential areas outside. Thus the Administrative County of London lost 29,000 between 1957 and 1958, and other losses were in Birmingham C.B. (8,000), Liverpool C.B. (6,300), Manchester C.B. (5,100), Newcastle upon Tyne C.B. (2,700), Wolverhampton C.B. (2,100), East Ham C.B. (1,800), and Salford C.B. (1,700).

Reviews

THE REDISCOVERY OF NEOMYCIN

Neomycin: Its Nature and Practical Application. Edited by Selman A. Waksman. (Pp. 412+x; illustrated. 40s.) London: Baillière, Tindall and Cox, Ltd. 1958.

The curve of popularity of a successful antibiotic usually reaches its peak within two years of the drug's introduction, and to fall to a steady lower level when its limitations and perhaps its dangers become recognized. That of neomycin is unique in having a quite different shape. Originally commended for the treatment of tuberculosis, neomycin fell into disrepute because prolonged systemic treatment too often results in deafness and renal damage. In the eight years which have followed, other uses for it which obviate this risk have multiplied and there has been a slowly widening recognition of its valuable properties. These are its very broad "spectrum" of activity, its rapid bactericidal action, the fact that bacterial resistance to it rarely develops during treatment, and its apparent lack of sensitizing power. Staphylococci (but usually not streptococci) are as sensitive to it as coliform bacilli, and among the latter even *Proteus*, which often laughs at other broad-spectrum antibiotics, is highly sensitive. Because of its rapid action short periods of systemic treatment involving little risk of toxic effect are often successful, and these may be indicated in septicaemia, pneumonia, and urinary-tract infections. Other uses, involving no such risk, are local. These include oral administration, since little is then absorbed, whether for the treatment of enteritis or for the suppression of the bowel flora before operation, in which neomycin is more successful than any other drug. Application to infected skin and wounds, inhalation and instillation into infected cavities including the peritoneum, have also been successful.

Neomycin has assumed so important a place in therapeutics that an adequate work of reference on it has become a necessity, and this the discoverer himself with three editorial colleagues and no fewer than 32 other contributors have now provided. Earlier sections deal with laboratory aspects, and a final one with miscellaneous matters, including "formulation," uses outside the clinical field, nine pages of a list of proprietary preparations, a three-page list of manufacturers, and a bibliography of 691 items. The clinical sections deal fully with the main uses already mentioned and several others, among them the trivialities such as the suppression of axillary odours (is the use of a valuable antibiotic justifiable for this?) and some ingenious prophylactic applications in the urinary tract, including addition to pyelographic contrast media. There is some overlap and repetition among these chapters, particularly in regard to bacterial sensitivities, the effects of oral administration, and the risks of toxic effects. The chapter on urinary-tract infections makes no mention of the vital fact that neomycin is more active in alkaline than in acid media. Those authors who commit themselves seem agreed that systemic treatment with adequate doses in patients with good renal function can safely be given for five to seven days, and there are many situations in which this may be indicated. Clinicians who are not fully aware of the potentialities of this antibiotic except as a skin cream or an intestinal antiseptic will find much valuable information in these pages.

L. P. GARROD.

OPERATIVE SURGERY

Operative Surgery. Edited by Charles Rob, M.C., M.Chir., F.R.C.S., and Rodney Smith, M.S., F.R.C.S. Vol. 8. Part XVI: Neurosurgery (pp. 57). Part XVII: Eyes (pp. 83). Part XVIII: Ear, Nose and Throat (pp. 196). (Illustrated. £5 10s.) London: Butterworth and Co. (Publishers) Ltd. 1958.

The last volume of this big work deals with the operative treatment of conditions which affect the central nervous system, the eyes, ears, nose, and throat. The neurosurgery is mostly concerned with those emergency measures which

might have to be undertaken as a preliminary to transferring the patient to a special centre, but there are useful accounts of cerebral and cerebellar abscess. In the other sections of the book there are many operations which ought only to be performed by those with special experience; very skilful technique which only specialists gain is needed for corneal grafting, for dealing with a detached retina, and for performing a fenestration operation on the ear. All these operations and many others are well described and illustrated. The ending of a long and arduous task always brings a sense of relief even when the doing of it is to one's liking; we imagine the editors of this system will be relieved that the last volume has now been issued. We congratulate them on the completion of a remarkable and useful work.

ZACHARY COPE.

FUNGUS DISEASES

An Introduction to Medical Mycology. By George M. Lewis, M.D., Mary E. Hopper, M.S., J. Walter Wilson, M.D., and Orda A. Plunkett, Ph.D. Fourth edition. (Pp. 453+xvii; illustrated. £5 15s.) Chicago: Year Book Publishers, Inc. London: Interscience Publishers, Ltd. 1958.

In the earlier editions of this popular work the subject was presented mainly from the viewpoint of the dermatologist. In the new and enlarged fourth edition, however, to which two additional authors have contributed, the great progress in medical mycology during the ten years since the appearance of the third edition is fully reflected and a fairer balance is shown in the respective presentations of the superficial and deep mycoses.

The general plan of the original book has been followed, except that the fungus is now considered with the relevant disease and not in a separate section. The admirable half-tone illustrations, an outstanding feature of the earlier editions, have been increased to 650, in addition to two coloured plates of eight figures and numerous illustrations in the text. However, the new book is not just an atlas of fungus diseases. The chapters dealing with the systemic mycoses have been entirely rewritten and amplified, and this remark applies also to some of the chapters on the dermatophytoses, notably those on infections by *Trichophyton rubrum* and by *T. mentagrophytes* with its variety *T. interdigitale*. The sections dealing with immunology and allergy in superficial and deep mycoses are of particular interest, and the chapters on the fundamentals of elementary mycology and mycological technique, including diagnostic methods and the production of experimental infections in laboratory animals, should prove helpful to the pathologist and the clinician not versed in these matters. A new feature is a short account of fungus diseases in relation to workmen's compensation in the United States. The style is attractive, the descriptions are lucid and concise, and the book offers a simple and adequate introduction to the study of fungus diseases.

J. T. DUNCAN.*

COLLAPSE IN THE OPERATING ROOM

Cardiovascular Collapse in the Operating Room. By Herbert E. Natof and Max S. Sadove, M.D. (Pp. 197+xvi; illustrated. 45s.) London: Pitman Medical Publishing Co. Ltd. 1958.

"Death on the table" is no longer acceptable either as a diagnosis or as the inevitable price of surgery and anaesthesia. Interest has been growing in the varied mechanisms involved in these cases. Particularly does this interest centre on the influence which pre-existing disease may have on the liability to collapse in these circumstances. It is refreshing and most valuable to find the whole subject reviewed in a tidy and sober manner. The authors have studied what is now a very large literature, abstracted its essence, and set down the result against a background of their own experience, which covers 33 cases of "cardiac arrest" in 40,000 operations over a three-year period. It is gratifying that their own views on the prevention and treatment of these accidents conform closely to current

*This review was written shortly before Dr. Duncan's death

practice in Great Britain. Their style is characterized by brevity and by profuse references to literature. Some of the statistical information is presented in cartoon form, in an earnest desire to assist in their assimilation. If the result is not always a happy one, the reader is certain to be tolerant, for the importance of grasping the information is never in doubt. This book is a landmark in this field. It must surely become essential reading for anyone wishing to be knowledgeable about the many and varied aetiological factors which lead to collapse in the operating theatre, and wishing to contribute to the prevention and treatment of these calamities.

ADVANCES IN ALLERGY

Progress in Allergy: Fortschritte der Allergielehre. Volume V. Edited by Paul Kallos. Contributors: St. V. Boyden, L. Brent, M. M. Mayer, O. Ouchterlony, Z. Ovary, W. D. M. Paton, and B. H. Waksman. (Pp. 508+xxxix; illustrated. Sw. fr. 82.) Basel, New York: S. Karger, 1958.

This fifth volume of *Progress in Allergy* follows on similar lines to its predecessors and maintains the same high standards. It comprises a series of articles, each by an outstanding authority, reviewing comprehensively advances in various fields of endeavour all of which contribute to our knowledge of various aspects of the allergic reactions. Advances in the study of the serological properties of different kinds of antibodies and antigens are excellently described and reviewed by Ouchterlony, of Gothenburg, in his article on "Diffusion-in-gel Methods for Immunological Analysis." Boyden, of Copenhagen, also discusses important serological methods such as the Middlebrook-Dubois haemagglutination test and the "coated tanned red cell technique" in his article on the "Immunological Response to Antigens of the Tubercle Bacillus." Z. Ovary, from Johns Hopkins University, reviews the techniques of the sensitive methods developed by himself to demonstrate and measure antigen-antibody interactions in the skin of experimental animals and discusses cutaneous anaphylaxis and the Arthus phenomenon.

Brent, of University College, London, in an article on "Tissue Transplantation Immunity," points out that the grafting of skin has made a special contribution by the unravelling of the immunological factors which are involved. He reviews the evidence in favour of regarding transplantation immunity as related to tuberculin sensitivity and sensitization to simple chemical compounds. Professor Paton, of London, in an excellent article deals with "The Release of Histamine," and points out that to an important extent the physiology of histamine is now the physiology of the granules of the mast cells. In the group of auto-immunological disorders, Waksman, of Harvard Medical School, in an article on "Cell Lysis and Related Phenomena in Hypersensitive Reactions," reviews comprehensively the immunohaematologic diseases. The role of complement is dealt with by M. M. Mayer, of Johns Hopkins University, in his article "Studies on the Mechanism of Hemolysis by Antibody Complement." The introduction by Paul Kallos, the editor, reviews progress in allergy in general and with admirable comments. Each article has a very full list of references, and to all interested in these problems this book can be thoroughly recommended.

D. A. WILLIAMS.

BALLET PHYSIQUE

Ballet Physique, with Notes on Stresses and Injuries. By Celia Sparger, M.C.S.P., C.C.P.E. (Pp. 64; illustrated. 12s. 6d.) London: Adam and Charles Black, 1958.

The question of the relationship between physical form, anatomical structure, and artistic performance is one which has interested many observers, yet no acceptable conclusion has been advanced, and clearly no approach to a generalization can be arrived at unless each art is considered individually, so varied are they. In the case of the painter, for instance, provided he is not colour-blind or paralysed,

there is no recognizable physical characteristic; the underlying processes of production are psychological rather than physical. But what of the musical performer—the violinist, the pianist, the guitarist, and others? Here there is obviously a physical element, but it is one which is hampered only by rather gross anatomical defects: absence of a digit, fixity of joints, anaesthesia, and so on. There is no doubt that the essential mechanism is one of cerebral and neural activity producing the marvellous co-ordination of movement demanded for a perfect performance, and of course, behind all, an emotional driving force and determination. The great Paganini is represented in drawings of the time as tall and thin (as indeed he is known to have been), with long arms, thin hands, and fingers that fall well into the medical category of arachnodactyly. His technical abilities were so remarkable that for many years it was accepted that the typical hand and fingers of a great violinist should be long and thin. Yet many virtuosos of comparable technique since that time have hands which are quite podgy and muscular, as indeed might be expected from the constant exercise of the intrinsic hand muscles. Seemingly almost any normal hand would do as the executant mechanism provided the exceptional nervous control was present. It is recorded that one or two outstanding pianists of the last generation actually had the aponeurotic expansions of the extensor tendons of the ring fingers to the third and fifth digits divided to allow of greater individual freedom of movement. That the results were stated to be disappointing is perhaps not surprising, for individuality of finger movement is much more a question of brain and nerve than of tendons. We are thus left with the impression that instrumental virtuosity is generally a matter of nervous control rather than physical form.

The volume under review, however, deals with ballet physique, and in this form of art it is to be expected that physical attributes may be of greater significance. Miss Celia Sparger, from her extensive experience as physio-therapist at the Royal Ballet School, has attempted to find some correlation between physique, form, and performance, and especially to see if there are any characteristics of the young child aspirant which would enable the teacher to judge the future possibilities and thus save the unsuited much wasted effort, disappointment, and frustration. Of course there are definite deformities, such as spinal curvature, unequal limbs, hyperextension of the knees, hallux valgus, and so on, which make further training futile, but the impression we get from the rest of the book is that bodily form from the aesthetic point of view is much more important to success than structure and anatomy, provided that, as in the other arts, the nervous control is perfect. In the author's experience "the physical factor predominates very largely in those who fall by the wayside," and, although we cannot agree entirely with some of the opinions expressed, it would be an audacious reviewer who denied the truth of that statement. Indeed, Miss Sparger realizes how little dogmatism on such a subject is warranted, and we commend the opinion in her preface that "real artistry and the gift of movement will always weigh heavily in the balance against physical imperfections." As a guide to those who teach ballet, for whom it was primarily written, this book has both merit and value.

NORMAN C. LAKE.

A selection of the basic writings of Pavlov (*Experimental Psychology and Other Essays*; 653 pages, illustrated) has been published in Great Britain by Peter Owen, Ltd., price 70s. Included are papers on circulation, digestion, experimental psychology, sleep, hypnosis, and experimental psychopathology.

A collection of life tables and mortality tables have been constructed by R. A. M. Case and Joyce L. Harley, and they are issued under the title *Death Rates by Age and Sex for Tuberculosis and Selected Respiratory Disease, England and Wales 1911-1955* by the Chester Beatty Research Institute, Royal Cancer Hospital, London. Statistics are given for tuberculosis, bronchitis, bronchopneumonia, and lobar and undefined pneumonia.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY DECEMBER 27 1958

TOO SOLID FLESH

Twenty-five years ago obesity was generally held to derive from endocrine causes, known and unknown, so that any obese woman was suspected of Cushing's disease and too many fat boys were referred to consultants with a diagnosis of Fröhlich's syndrome. If an endocrine cause could not be proved—then some metabolic *mystique* was invoked, such as a lowered basal metabolism or some deviation in the individual handling of absorbed nutrients. Such superstitions were strongly attacked by Americans such as L. H. Newburgh,¹ J. W. Conn,² and E. H. Rynearson,³ who easily disposed of these false doctrines and emphasized the basic concept of an intake in excess of output as the cause of simple obesity. Prejudiced advocates of this hypothesis were sometimes even heard to deny that patients with Cushing's syndrome were really fat and the metabolic switch (gluconeogenesis) in this disease was conveniently ignored.

A more fruitful consequence of this rational approach was the inquiry into why some unfortunates eat more than they need. The psychologists investigated the personal and environmental background to obesity; and the animal physiologists made fascinating experiments in mice and rats to illustrate the hypothalamic control of appetite and the mechanism of satiety. It became apparent that the reasons why appetite was not correctly geared to metabolic requirements were exceedingly complicated in small animals and might well be not less complex in man. Simple obesity seemed to be not so simple after all.

At this time it was customary to deny the importance of daily activity in the prevention of obesity. Perhaps this was to be expected of a generation which had forgotten how to walk but had learnt to hike. And as for infrequent outbursts of violent exercise, it was said that the 300 calories

expended in half an hour's squash rackets were replaced by two dry Martinis. These opinions ignored earlier evidence⁴ that when activity is reduced appetite is sustained and weight is consequently increased. Meanwhile the statistics of the insurance companies showed that obesity constituted a hazard to both health and longevity; physicians and family doctors in their clinics and consulting rooms referred fat patients to dietitians or gave them printed diet-sheets accompanied by perfunctory warnings. The remission rate among those treated thus was moderately good but the relapse rate was high; and the weak-willed were assisted by an effective depressant of appetite—dexamphetamine. Food manufacturers, magazine-writers, the pharmaceutical industry, and the nutritionists introduced a great variety of slimming diets, and many books have also been written for the greedy public. All the diets advised, however described and no matter how much their minor differences are emphasized, are alike in prescribing a low intake of calories and carbohydrates.

There are signs that we are emerging from this period of clamour and confusion. There is an increasing awareness that what is now needed is the patient collection of more facts both by clinicians and by physiologists, not only to elucidate the deviations of the central and peripheral mechanism at work but also in order to correct these in the individual patient. J. Mayer⁵ and H. Bruch⁶ have recently published useful reviews of American work in this field, and it may not be chauvinist, even at Christmas-time, to point out that there has been much distinguished British work that they do not mention. Investigators here have been interested in the possibility that abnormal metabolic mechanisms were operating, whether primarily or secondarily disturbed. D. M. Lyon, D. M. Dunlop, and C. P. Stewart,⁷ by estimating respiratory quotients, showed that in undernourished obese subjects fat was converted into carbohydrate. A. Kekwick and G. L. S. Pawan⁸ have given patients iso-caloric diets containing varying quantities of protein, fat, and carbohydrate and shown that their loss of weight was most rapid when on a high fat intake and least rapid with high-carbohydrate diets. They concluded that the weight loss on the high-fat regime could not be entirely accounted for by loss of water, though R. Passmore, J. A. Strong, and F. J. Ritchie⁹ have shown that as much as 2-4 litres of body water may be lost in the first week when patients were put on diets with energy deficits of 2,500-3,000 calories. T. M. Chalmers and colleagues¹⁰ have detected a "fat-mobilizing substance" in the urine of obese patients given a diet of 90% fat or protein, but it disappears on a diet

of 90% carbohydrate. This "substance" may be concerned in the observations of Lyon and colleagues made 25 years ago.⁷

J. Booyens and R. A. McCance¹¹ have recently investigated the basal metabolic rates of 36 normal subjects and reported that three of them had rates which were 30% below the average for the group. None of these three persons was overweight, so their appetite centres had apparently no difficulty in gearing their food intake to their low metabolic turnover. Can the B.M.R. be put into top gear to allow for the maintenance of a stable weight despite forced feeding? E. C. Dodds¹² reported that it can, but this observation has not yet been confirmed.

Other workers have been interested in the effect of exercise on obesity. J. A. Strong and colleagues¹³ point out that, while it is true that one hour's walking each day will expend only 350 calories, yet three hours' daily walking for a month will utilize 9 lb. (4 kg.) of fat. They persuaded their obese patients to take this exercise on a daily diet of 400 calories, with consequent weight losses up to a maximum of 35 lb. (16 kg.) in six weeks. Contributing to the natural history of the disease, J. H. Sheldon¹⁴ has described the obesity of pregnancy and the puerperium—maternal obesity; O. H. Wolff¹⁵ has shown that the increased height of obese children, and their early puberty, are the result of a food intake in excess of their requirement; and A. G. Mullins¹⁶ reported recently that one-third of the obese adults in an out-patient clinic were cases of persistent juvenile obesity, and that the failure in this group to reduce weight was associated with psychological factors, in particular low intelligence. Children of low intelligence are not only less active mentally but also more inert physically than their brighter brethren.

There is in some recent literature a disposition to decry the importance of attempting to reduce weight by dietetic restriction. In so far as this emphasizes the importance of increased exercise one can heartily agree with it; and when it represents the need for a more careful consideration of the patient's history, constitution, personality, and environment, it is a healthy reaction from the diet-sheet-over-the-counter policy. Diets must be low both in calories and in carbohydrate; they can be sufficiently high in protein to provide for the nitrogen needs of adults, and also of growing children. Ketosis does not matter, and high-fat diets may assist weight reduction.

But when all is said and done the modern nutritionist has done little more than dot the "i's" and cross the "t's" of the following robust conclusion of Dr. Samuel Johnson¹⁷:

"Talking of a man who was grown very fat, so as to be incommoded with corpulency, he said, 'He eats too much, Sir.' BOSWELL: 'I don't know, Sir ;

you will see one man fat who eats moderately, and another lean who eats a great deal.' JOHNSON: 'Nay, Sir, whatever may be the quantity that a man eats, it is plain that if he is too fat, he has eaten more than he should have done. One man may have a digestion that consumes food better than common; but it is certain that solidity is increased by putting something to it.' BOSWELL: 'But may not solids swell and be distended?' JOHNSON: 'Yes, Sir, they may swell and be distended; but that is not fat.'"

DEFECTS IN STERILIZATION

Hospital infection is now causing more concern than at any time since before Lister. Two recent contributions to the subject are therefore timely. The first is the publication of a report by the Nuffield Provincial Hospitals Trust,¹ the second is the holding of a conference by the South-west Metropolitan Regional Hospital Board at Southampton last week which is reported in the *Journal* at p. 1589.

How far is the spread of infection in hospitals due to major faults in aseptic technique, and in particular to failure in processes of sterilization? Those who would answer that such elementary faults must be highly exceptional and can have little to do with the present state of affairs may be compelled to revise their ideas when they read the new report.¹ It is an instructive and disturbing document which deserves the closest attention from all engaged in any way in the practice of surgery. This is only an interim report. An operational research team which had completed a report² on the organization of central syringe services was instructed to study the organization of central supply departments for all sterile materials. The first question to be answered was whether such departments are necessary, and this entailed a study of present sterilizing practice. The results of this were so disquieting that it was decided to publish them at once.

The six hospitals studied were a London teaching hospital, three in provincial cities, and two cottage hospitals. They are not named, and it is not clear how they were chosen, but they are said to be representative. The first part of the report deals with ward practice, and criticizes many features of "utility rooms." These were found to be liable to contamination from open windows, from excessive traffic through them (one contained the ward

⁶ Howie, J. W., and Timbury, M. C., *Lancet*, 1956, 2, 669.

telephone), and from the disposal of soiled dressings. Many sterilizers were unsatisfactory in various ways, particularly in not being fitted with a rheostat, and excessive scaling was observed in them and on utensils boiled in them. Nine different disinfectant solutions were found to be in use for storing instruments or for actually sterilizing them; in this and other matters practice varied from ward to ward in the same hospital as well as in different hospitals, to the detriment of nurses' training. Arrangements for treating soiled linen are strongly criticized: nurses are expected not only to disinfect this but to dry it before dispatch to the laundry, and this entails hanging up large numbers of wet sheets in sluice- and bath-rooms.

Bed-pan washing was unsatisfactory; 64 out of 166 examined still contained faecal material. Dressing drums were often battered and so damaged, as by actual perforation or ill-fitting lids, that their contents were directly exposed to contamination. They were often too tightly packed or lined with unsatisfactory material or (in 46 out of 150 examined) not lined at all. After autoclaving they were not always labelled as sterilized. One way mentioned of distinguishing between sterile and unsterile drums on the same trolley was "to feel them to see which were warm." When syringes were sent for autoclaving they were often packed in drums or other metal receptacles (a cake tin and old tulle-gras tins are mentioned) or in tubes tightly plugged and even sealed with adhesive tape, so that penetration by steam, particularly of an assembled and lubricated syringe, could never have taken place. There are many photographs of such defective apparatus and of ward scenes illustrating these difficulties and dangers. A notable and regrettable omission is that of any reference to methods of sterilizing apparatus used for lumbar puncture, for this is the most dangerous of all ward procedures when sterility is in any doubt, and a central supply service can perform perhaps its most vital function in catering properly for it.

Operating-theatres are only briefly considered. Some structural and ventilating defects are mentioned, and the report also criticizes inadequate washing of walls and the laying out of sterile equipment on trolleys too long before it is to be used. In one theatre "the staff had to wage continual war on cockroaches," and in one autoclave room drums were contaminated by bird droppings from a ventilator—these are picturesque but evidently exceptional features. It is also probably exceptional for new scalpel blades to be "sterilized" chemically without removal of their protective grease. Criticism is concentrated in this part of the report not on the theatres but on the autoclaves. Those familiar with

the revelations of J. H. Bowie^{4 5} and of J. W. Howie and M. C. Timbury⁶ are aware that antiquated autoclaves are still in use, the satisfactory operation of which is either impossible or unduly time-consuming or damaging. Only one of the 25 autoclaves tested here was found defective from "mechanical inefficiency and old age"; for eight others classed as inefficient, five of which failed either to convert the colour of Browne's tubes or to kill test spores, faulty installation or, more commonly, faulty operation was responsible. In three instances the chamber drain through which air must be discharged was kept closed throughout the run. Air filtration was unsatisfactory in four instances, and the fact that no less than 38% of swabs from the interior of drums yielded bacterial growth is attributed largely to recontamination during the drying stage. These were only some of many cultures made from supposedly sterile materials in wards and theatres: of the total, 17% were unsterile.

The report finally makes recommendations for the immediate improvement of sterilizing practice without any great extra cost. Ward practices should be standardized, syringes sterilized centrally, and reform introduced in the disposal of soiled dressings (paper bags are preferred) and dirty linen. The report considers that drums should be abolished and replaced by cardboard boxes. These are exactly specified and have been shown to be well penetrated by steam and yet to protect their contents from subsequent contamination. No doubt drums must go, but consideration might have been given to another alternative, universally employed in the United States—that of wrapping in a double layer of fabric. Material like cardboard is loaded with spores of *Clostridia*—as indeed has been confirmed by cultivating the material of these boxes—and, though the manufacturer promises pre-sterilization and they ought in any case to be sterilized in use, such material may seem out of place in an operating theatre. The most important recommendations concern the operation of autoclaves and the defining of responsibility for supervision, particularly of this operation, and of other tasks as well. Autoclave attendants, whose standards of aseptic discipline are severely criticized apart from their actual operation of their machines, were variously under the impression that they were responsible to the head porter, the theatre sister, the secretary, or the engineer. One "was inclined to feel that he owed allegiance to the matron, but this was mainly because he also drove the nurses' bus." It is abundantly clear that this vital task should be in the hands of a man who understands it, which means training and upgrading, and he should evidently be responsible to someone—

according to this report the bacteriologist—who should also conduct monthly tests of working efficiency.

Hospitals throughout the country will do well to inquire whether the graver shortcomings described here exist in their own practice. It is surely an elementary requirement in the campaign against hospital infection that materials supposed to have been sterilized by heat should in fact be sterile and remain so. In some other matters, particularly of ward technique and where chemical disinfectants are concerned, it still seems necessary to define optimum methods. What is at present largely left to the ward or theatre sister could benefit by attention from both bacteriologist and surgeon.

ONE HUNDRED YEARS OF CELLULAR PATHOLOGY

The doctrine of cellular pathology as first expounded by Virchow in his epoch-making book¹ published 100 years ago focused attention on the histology of diseased organs. It replaced the outworn ideas of humoral pathology by the conception of pathological changes occurring within the individual constituent cells of an organ. A natural consequence of the famous maxim *omnis cellula e cellula* was that the origin of disease must henceforth be sought in hitherto unexplored territory to be revealed by the microscope. The familiar gross morbid changes of a diseased organ were now proclaimed to be only the visible manifestation of reactions taking place at the microscope level of histopathology. Speaking of the influence of Virchow's teaching on contemporary thought, Lord Lister once said that it "had swept away the false and barren theory of a structureless blastema, and established the true and fertile doctrine that every morbid structure consists of cells which have been derived from pre-existing cells as a progeny. . . . Even those morbid structures which deviate most from the normal structure are known to be derived as a progeny from normal tissue—from normal cells, driven to abnormal development by injurious agencies."

The general effect of Virchow's teaching was to lessen the importance of "humoral" pathology and greatly increase the importance of "cellular" pathology, and it was many years before advances in immunology and endocrinology began to readjust the balance. The many different varieties of "humoral" antibody which we now know to be of such importance in relation to the process of

immunity were undiscovered when Virchow first propounded the doctrine of cellular pathology.

Yet though he took his stand almost exclusively on the basis of pathological anatomy he did not minimize the importance of pathological physiology, and the logical development of Virchow's cellular pathology has resulted in great advances both in pathological anatomy and in pathological physiology. This is shown conclusively by the series of articles contributed to the current number² of the *Journal of Clinical Pathology*, which commemorates the centenary of Virchow's *Cellular Pathology*. The first article, by Sir Roy Cameron, is a richly illustrated historical review of the mid-nineteenth century period and the setting in which Virchow lived. Then follow a series of articles on subjects which may be described as natural developments of the doctrine of cellular pathology. Of special interest is the review of modern concepts of cellular structure by Professor Robert Cruickshank and the authoritative account by Dr. Honor Fell of the astonishing developments in the field of tissue culture.

Another natural development of cellular pathology has been the concept of the cell as a complete nutritional as well as a structural unit. This becomes clear from Dr. J. W. Harman's stimulating article on the cytochemical aspects of cellular pathology. It is as if a vast panorama of subcellular structure and function has been opened up, permitting advance "beyond the cellular into the subcellular range of disease." One other paper in this special number of the *Journal of Clinical Pathology* deserves special mention, that by Dr. A. G. Everson Pearse entitled "Extension of the Limits of Cellular Pathology—the Role of Enzyme Histochemistry." This shows how, by the application of new histological techniques, the limits of cellular pathology drawn up by Virchow 100 years ago have been pushed forward in precisely the way he foretold. In particular the newer techniques of functional histochemistry have begun to transform descriptive analytical histopathology into a new science of functional cytopathology.

One of the results of recent developments in the field of enzyme histochemistry has been to show how misleading it may be to regard tissues as homogeneous. It seems now as if histologically identical cells may have entirely different enzymic composition. Looking forward into the future Dr. Pearse thinks that a further application of the new techniques he has described may be expected in the field of experimental pharmacology "where it may be possible to demonstrate the earliest effects of drugs

upon cells in section, smears, or tissue cultures, with obvious economy of effort." Dr. Pearse concludes by wishing that Rudolf Virchow were here to-day to describe for himself the possibilities for even further extensions of the science of pathology as it seems to be opening up before us to-day. Cellular pathology has become an "expanding universe."

YAWNING

J. Barbizet has done a useful service in reminding us how little is known about the everyday occurrence of yawning. In a short article¹ he concisely and clearly covers almost all that can be said about it from the physiological, psychological, and clinical points of view. The act of yawning is involuntary and unfolds itself in a fairly consistent way, beginning with an active inspiratory movement that is chiefly remarkable for the enormous dilatation of the pharynx. At the height of the inspiration there are associated facial movements and then very often generalized stretching of the limbs. This is followed by the third phase of passive expiration. Such movements are seen also in many animals, and there is possibly a connexion between it and, for example, certain movements of birds' beaks accompanied by the flapping of wings.

Drowsiness and boredom are the usual precipitating causes of yawning. It has been observed in some neurophysiological experiments but usually in association with sleep. No "centre" for yawning has been detected by direct stimulation, nor have the conditions been defined that will invariably produce it. Barbizet considers it likely to be related to the activity of the brain-stem reticular formation, whose function is intimately related to the level of wakefulness of the brain. In support of this is the fact that yawning is commonly observed in association with lesions of the brain-stem or lesions indirectly compressing it. It is among the sequelae of encephalitis lethargica, and is occasionally seen as an aura of epilepsy. However, A. P. Heusner² cites various authors who describe the complex yawning-stretching act in anencephalic infants, which would put the controlling centre, if it exists, at the level of the lowest centre of respiration.

The possible functional significance of yawning is unsettled. The movement may increase venous circulation to the heart, and as a result of increased cardiac output the brain might benefit, but direct observations of the effect of yawning on the cerebral circulation are missing. Heusner finds a systemic vasoconstriction and transient tachycardia, probably the same as that obtained by any deep inspiration.³

In many ways the most interesting and tantalizing aspect of yawning is its relation to psychological factors and in particular the way in which it seems to be infectious in a group. The act is part of the complex language of gesture that long preceded speech as a

means of communication in the prehistory of man, a subject greatly enlarged by the work of ethologists such as Lorenz and Tinbergen. In some unknown way animals are tuned to respond to significant signals of their own species. Yawning is a relatively simple signal, and the perception of its social meaning—boredom, presumably—may hardly require any learning by environmental experience. We seem to know more about the social significance of yawning than the part, if any, it plays in the homeostasis of the body.

BLOOD SUGAR IN CYCLIC VOMITING

Cyclic or recurrent vomiting or the "periodic syndrome" has been recognized for a long time as one of the more common psychosomatic disorders of childhood. Its exact pathogenesis has not yet been determined, but it is known to be prevalent among only children, usually of highly strung temperament and above average mentality, and to be related possibly to migraine in later life. It has also been held, in a few cases, to be a manifestation of epilepsy, on the grounds that abnormalities in the E.E.G. are not infrequent and that phenytoin in such cases is the most successful therapeutic agent.¹

A number of biochemical studies have been undertaken, particularly of the ketosis, but the findings have varied. Blood-sugar estimations and glucose-tolerance curves have also produced conflicting results; for, though there is general agreement that the glucose-tolerance curve is within normal limits, some authors have reported hypoglycaemia and others hyperglycaemia. These differences may well be related to the phase of the attack in which the estimation is made. The general statement in most textbooks is that cyclic vomiting is associated with hypoglycaemia, and the importance of this is evident in the differential diagnosis between cyclic vomiting and diabetic coma. W. W. Payne, however, in 1951² reported raised blood sugars in his patients, and more recently L. Salomensen and K. Harnaes³ have supported him. They quote a number of Scandinavian authors who have found hyperglycaemia at the onset of the attack and add two cases of their own in which the levels of blood sugar were 400 and 276 mg. per 100 ml. respectively on the second day of the attack.

As the condition is usually benign and readily recognized in any child after the cycle has been established it might be thought that discussions about blood-sugar levels were more academic than practical, but, because of the differential diagnosis, it is important to ensure that nothing has been overlooked. Apart from diabetic coma, which may indeed be the first indication of diabetes in a child, appendicitis and cerebral tumour are two other conditions which may present similarly—both conditions which require urgent diagnosis. A good physical examination will go further, and more quickly, in excluding the more serious conditions, and the family doctor is wise if, at the onset of each recurrence, he just makes sure that it is running true to form.

TABLET TREATMENT OF DIABETES

Two recent reports,^{1,2} one from Germany and the other from Switzerland, review recent results with sulphonyl-urea derivatives in the treatment of diabetes. While presenting no new facts, these reports on the treatment of large numbers of diabetics over long periods help to confirm the opinions that have already been formed about existing oral antidiabetic drugs.³ Practically everywhere the original BZ 55 (carbutamide) has been replaced by D 860 (tolbutamide). Few side-effects after tolbutamide have been recorded, although the effective dose in grammes or tablets is slightly more than that of carbutamide. Among the older patients, mainly but not entirely in the category of obese, success in controlling glycosuria has been achieved in 80% or more. In contrast, there have been hardly any successes in younger patients (even up to the age of 40), and all the Continental writers agree that any patient on 40 units or more of insulin will not respond to treatment with tolbutamide. This confirms world-wide experience. Clinical symptoms of hypoglycaemia are rare, but one fatal case is reported.² German physicians now agree that strict dieting is necessary to control glycosuria during tablet treatment, and that patients taking tolbutamide tend to exert less self-discipline in restricting themselves to a diet than those taking insulin. As to the pharmacological action of tolbutamide, the Continental reports mostly concentrate on the theory that the beta cells of the pancreas are stimulated to secrete more insulin, which explains the failure of the tablets in severe diabetes and depancreatized animals.

HAZARDS OF MEPROBAMATE

Meprobamate ("equanil," "mepavlon," "miltown") was a late comer among the tranquillizers and has until recently been regarded as relatively innocuous compared with chlorpromazine and reserpine. Observations reported over the last few months indicate that this view can no longer be held; indeed, reports show that it can do serious harm. The drug has been shown to cause habituation,⁴ with a typical withdrawal syndrome including insomnia, vomiting, tremors, muscle twitching, anxiety, anorexia, ataxia, and, less frequently, hallucinations. In three out of four patients with the withdrawal syndrome grand-mal seizures developed. The risk of addiction was found to be especially serious in patients with a history of alcohol and other addictions.⁵ These observations are not invalidated by the outcome of a double-blind trial⁶ in which a group of elderly people failed to show withdrawal symptoms following eight weeks' administration of meprobamate. Evidence of the drug's toxicity has also been growing, and fatalities have been observed. Acute meprobamate poisoning is apt to produce stupor and coma up to complete respiratory and circulatory collapse. The usual analeptics proved effective antidotes in most cases. An average of one in 200 patients is believed

to show an idiosyncrasy to the drug.⁷ Its manifestations are urticaria, vomiting, fever, oedema, arthralgia, petechiae, bronchospasm, and headaches. Meprobamate has no longer a clean record with regard to suicide. L. W. Powell and his associates⁸ reported two cases of suicide following the ingestion of 12 g. and 20 g. respectively. Suicidal attempts with this drug have been observed not infrequently. Finally, a fatal case of aplastic anaemia due to meprobamate therapy has recently been recorded.⁹

It is not surprising that these reports come from the United States, where this drug has had a tremendous vogue, and they are worth bearing in mind over here. W. Sargent¹⁰ and others have found the drug of only limited value in the treatment of the neuroses compared with the much cheaper barbiturates, and there would seem to be rather few types of case in which benefit may be expected from it.

MEDICAL BENEVOLENCE

The advantage to be gained by subscribing to a charity under covenant is now well known: if a promise is made to make a payment for seven consecutive years recovery of income tax is then allowed at the standard rate on each payment, bringing substantial benefit to the charity without extra cost to the subscriber. The Charities Trust Fund of the B.M.A. has recently been recognized as a charity, and earlier this month the Chairman of Council, the Treasurer, and the Chairman of the Charities Committee urged members to give much-needed help to the medical charities by undertaking a covenant (*Journal*, December 6, p. 1410). They pointed out that appeals from aged and sick members of the profession and from widows and orphans are greater than ever, and because of the fall in the value of money the need keeps increasing. Those who do not already contribute independently, by covenant or otherwise, to individual charities will find on the form of application for the renewal of their subscription to the B.M.A. a "box" for indicating that they would like to undertake a covenant. The necessary forms will then be sent to them for completion. The fact that the renewal of subscription form comes at a time when there are many other demands for cash should not deter doctors from deciding to contribute to medical charities. In fact the New Year is an especially appropriate time to come to such a resolve. Particulars of individual charities are given on the back of the application form for the B.M.A. subscription. Each one attempts to fill a serious want, but those members who have no particular preference will find the B.M.A. Charities Trust Fund a very suitable object to support. As Dr. Wand and his colleagues explained in their letter: "The B.M.A. Charities Committee is a collecting body which advises the Council on the best method of distributing to other charities the money it collects in the Charities Trust Fund."

NOAH—AN ALBINO

BY

ARNOLD SORSBY, M.D., F.R.C.S.

Research Professor in Ophthalmology, Royal College of Surgeons of England and Royal Eye Hospital

Noah, with his wine, his ark, and the animals that came two by two, is probably the first vividly human figure in the Biblical account of the early days of man. In this he differs from the weak and gullible Adam, the milksop Abel, the stage villain Cain, and Methuselah, whose main distinction was not to have died young. Amongst Noah's shadowy progenitors his father, Lamech, has persisted as little more than a name. The birth of Noah is recorded in Genesis briefly, with an indication that he was called to a high mission¹: "And Lamech lived an hundred eighty and two years, and begat a son: And he called his name Noah, saying, This same shall comfort us concerning our work and toil of our hands, because of the ground which the Lord hath cursed." The subsequent account of the Flood and the emergence of Noah as the first boat-builder and sailor in the world's history reveals the nature of the mission to which he was born.

Enoch's Record of the Birth of Noah

A fuller account of the birth of Noah is contained in the Book of Enoch the Prophet, one of the more significant volumes in the Pseudepigrapha.² It appears to have been written in the second and first centuries B.C., and greatly influenced the writers of the New Testament, in which it is quoted by name in several passages. Possessing at first the weight of a canonical book, it gradually declined in importance and finally fell under a ban of the Church. It does not appear to have received much attention after the ninth century, and came to be regarded as lost till three manuscripts in Ethiopian were brought from Abyssinia by Bruce in 1773. The Book of Enoch, like the rest of the Apocalyptic literature, is heavy with primitive mythological and cosmological traditions. It relates in considerable detail of "the Watchers of heaven, who have deserted the lofty sky, and their holy everlasting station, who have been polluted with women."³ . . . And the women conceiving brought forth giants."⁴ The birth of Noah is recorded in similar mystical terms.⁵

After a time, my son Mathusala took a wife for his son Lamech.

She became pregnant by him, and brought forth a child, the flesh of which was white as snow, and red as a rose; and the hair of whose head was white like wool, and long; and whose eyes were beautiful. When he opened them, he illuminated all the house, like the sun; the whole house abounded with light.

And when he was taken from the hand of the midwife, opening also his mouth, he spoke to the Lord of righteousness. Then Lamech his father was afraid of him; and flying away came to his own father Mathusala, and said: I have begotten a son, unlike to other children. He is not human; but, resembling the offspring of the angels of heaven, is of a different nature from ours, being altogether unlike to us.

His eyes are bright as the rays of the sun; his countenance glorious, and he looks not as if he belonged to me, but to the angels.

I am afraid, lest something miraculous should take place on earth in his days.

And now, my father, let me entreat and request you to go to our progenitor Enoch, and to learn from him the truth; for his residence is with the angels.

When Mathusala heard the words of his son, he came to me at the extremities of the earth; for he had been informed that I was there: and he cried out.

I heard his voice, and went to him, saying; Behold I am here, my son; since thou art come to me.

He answered and said; On account of a great event have I come to thee; and on account of a sight difficult to be comprehended have I approached thee.

And now, my father, hear me; for to my son Lamech a child has been born, who resembles not him; and whose nature is not like the nature of man. His colour is whiter than snow; he is redder than the rose; the hair of his head is whiter than white wool; his eyes are like the rays of the sun; and when he opened them he illuminated the whole house.

When also he was taken from the hand of the midwife, he opened his mouth, and blessed the Lord of heaven.

His father Lamech feared, and fled to me, believing not that the child belonged to him, but that he resembled the angels of heaven. And behold I am come to thee, that thou mightest point out to me the truth.

Then I, Enoch, answered and said; The Lord will effect a new thing upon the earth. This have I explained, and seen in a vision. I have shown thee that in the generations of Jared my father, those who were from heaven disregarded the word of the Lord. Behold they committed crimes; laid aside their class, and intermingled with women. With them also they transgressed; married with them, and begot children.

A great destruction therefore shall come upon all the earth; a deluge, a great destruction, shall take place in one year.

This child which is born to you shall survive on the earth, and his three sons shall be saved with him. When all mankind who are on earth shall die, he shall be safe.

And his posterity shall beget on the earth giants, not spiritual, but carnal. Upon the earth shall a great punishment be inflicted, and it shall be washed from all corruption. Now therefore inform thy son Lamech, that he who is born is his child in truth; and he shall call his name Noah, for he shall be to you a survivor. He and his children shall be saved from the corruption which shall take place in the world; from all the sin and from all the iniquity which shall be consummated on earth in his days. Afterwards shall greater impiety take place than that which had been before consummated on the earth; for I am acquainted with holy mysteries, which the Lord himself has discovered and explained to me; and which I have read in the tablets of heaven.

In them I saw it written, that generation after generation shall transgress, until a righteous race shall arise; until transgression and crime perish from off the earth; until all goodness come upon it.

And now, my son, go, tell thy son Lamech,

That the child which is born is his child in truth; and that there is no deception.

When Mathusala heard the word of his father Enoch, who had shewn him every secret thing, he returned with understanding, and called the name of the child Noah; because he was to console the earth on account of all its destruction.

The version in Genesis, and that in the Book of Enoch, are thus supplementary. Both stress that Noah was born to a dedicated life, as is testified by his name, which is derived from the Hebrew verb signifying to comfort. The Book of Enoch, with its emphasis on his unusual appearance at birth, merely builds up a supernatural background to a worldly mission.

A Reconstructed Fragment

A totally different possibility is suggested by the deciphered fragment of Column II of a particularly badly preserved scroll from the Dead Sea caves (Qumran I), brilliantly identified by N. Avigad and Y. Yadin as a Genesis Apocryphon, and not the lost Book of Lamech as was first supposed. Their reconstruction of this fragment shows Lamech's preoccupation with his wife's faithfulness—a reaction noted repeatedly all through the ages in the literature on the birth of abnormal children to normal parents. It is only when Lamech is assured by his wife with considerable verbal emphasis that the unusual child is indeed his that he hastens to his father, Methuselah, and his grandfather, Enoch (who sojourns with the angels), to obtain a more complete explanation of an exceptional event.⁶

1. Then I thought in my heart that the conception had been from the Watchers and the ... from the holy ones or [?] the fallen angels.

2. And my heart was changed because of this child.

3. Then I, Lamech, was frightened and I came to BT'NWS, my wife, and [I said] ...

4. "[... Swear to me] by the Most High, the Lord of greatness, King of all worlds ..."

5. Sons of Heaven till thou tellest me all in truth if ...

6. [In truth?] Tell me without lies ...

7. By the King of all worlds till thou speakest with me in truth and with no lies ...

8. Then BT'NWS, my wife, spoke to me with vigour and with ...

9. And she said, "O my brother and O my lord, remember my pleasure ..."

10. the period, and my spirit into the midst of its sheath and I in truth all ...

11. And my heart then had changed within me greatly.

12. When BT'NWS, my wife, perceived that my countenance had changed ...

13. Then she suppressed her wrath and spoke to me and said, "O my lord and O my [brother] ..."

14. My pleasure, I swear to thee by the great Holy One, the King of H[eaven?] ...

15. that thine is this seed and from thee is this conception and from thee was the fruit formed ...

16. And it is no stranger's, nor is it of any of the Watchers or of the Sons of Heaven ... [What]

17. has so altered and blemished thy countenance and [why] is thy spirit so low? ...

18. In truth I speak with thee."

19. Then I, Lamech, hastened to Methuselah, my father, and I [told him] all ...

20. his father and he would of a surety learn all from him, for he was the beloved and [... with angels]

21. his lot was apportioned and to him they tell all. And when Methuselah heard ...

22. to Enoch, his father, to learn all in truth from him.

23. his will. And he went to ... and found him there ...

24. And he said to Enoch, his father, "O my father and O my lord, to whom I ..."

25. ... And I shall tell thee that thou shouldst not be angered that I have come hither ...

26. Fear ...

In the light of this fragment the account of Noah's appearance at birth, as given in the Book of Enoch, is clearly not that of a miraculous child but of an albino.

A body white as snow, hair white as wool, and eyes that are like the rays of the sun—these are the unequivocal physical features to be considered once the laudatory commendations are disregarded.

Origin of Noah's Albinism

The fragment also allows some conclusions on the mode of inheritance of Noah's albinism. On the strength of line 9, and their reconstruction of the last word in line 13, Avigad and Yadin hold that BT'NWS, Lamech's wife, was also his sister. If this were so—and such relationship was not particularly unusual in primitive societies—Noah becomes the offspring of an extreme type of consanguineous marriage, and his albinism would illustrate not only the antiquity of the affection, but also the fact that the first recorded case showed parental consanguinity. On this reading, Methuselah can now claim the additional distinction of being the first authenticated carrier of albinism—unless the distinction belongs to his anonymous wife (Fig. 1). Avigad and Yadin, however, point out that their reading is contradicted by the one other extant reference to Lamech's wife.⁷

The Book of Jubilees, iv, 28, refers to her as "Betenos the daughter of Baraki'il, the daughter of his [Lamech's] father's brother (or father's sister)." This would seem to show Lamech and his wife as first cousins—the common type of consanguinity in albinism—and would exclude Methuselah's wife as a carrier (Fig. 2). On either reading the consanguineous origin of Noah's albinism is beyond question. BT'NWS and Lamech not only produced Noah but also made genetic history. They deserve better than the oblivion that shrouds them.

The possibility that Noah inherited his albinism from a fallen angel need not be considered seriously. Such a supposition raises considerable genetic difficulties. One would have to postulate that BT'NWS and the angel were unrelated carriers of the gene at a time when it could not have been widely scattered, or, again, alternatively, and even less plausibly, that albinism in angels is

FIG. 1.—Lamech and his wife, shown as brother and sister, must have inherited their recessive gene for albinism from either their father, Methuselah (I, 1), or their mother (I, 2).

FIG. 2.—Lamech and his wife are shown as first cousins. Lamech must have inherited his recessive gene from his father, Methuselah, whilst BT'NWS inherited it from one of her parents, who is recorded as a sib of Methuselah.

dominant and not recessive as in man. Besides, it is not at all certain that albinism occurs in angels, other than seraphim. And clearly fallen angels are no seraphim.

HOSPITAL STERILIZATION
CONFERENCE AT SOUTHAMPTON

[FROM A SPECIAL CORRESPONDENT]

On December 17 the South-west Metropolitan Regional Hospital Board held a conference on "Hospital Sterilization" at Southampton University. It was attended by over 300 representatives of the medical, nursing, engineering, and administrative staffs of the hospitals in the region and by members of hospital management committees.

Opening the conference, Dr. J. REVANS, the Board's deputy S.A.M.O., said they had with them Brigadier J. D. WELCH, the leader of the Nuffield team whose report on sterilization practice in six hospitals* was about to be published, and he would give them a first-hand account of the results of this investigation. The audience would well appreciate the importance of the subject in view of the recent outbreaks of post-operative wound sepsis in the area due to both staphylococcus phage type 80 and *Clostridium tetani*.

Nuffield Investigation

Brigadier WELCH said that, when the Nuffield Provincial Hospitals Trust's operational research team started its investigation they decided to carry it out in three phases. The first was to look into present methods of sterilizing in hospitals. The second was to investigate the working of central sterile supply services on the Continent and in the U.S.A. The last phase would entail experimental trial of a central service in selected hospitals in this country. So far they had completed only the first phase, which was what he would discuss.

Six fairly typical hospitals had been chosen—a London teaching hospital, three large provincial general hospitals, and two cottage hospitals. The team had studied nurses at their sterilization tasks, making time studies and taking swabs for culture from all sterile equipment, instruments, dressings, etc. They had also studied conditions in ward sterilizing and sluice rooms, and had examined ward sterilizers, the storage of dressings, and the conditions of drums. A fairly intensive study had also been made of existing hospital autoclaves, their functioning and siting, and the people who operated them. The results of their investigations disclosed a disturbing situation, which Brigadier Welch illustrated by means of a film. It showed how haphazard were many of the methods of timing the boiling of instruments. The results of swabbing showed that 18% of all ward equipment, and 12% of all theatre equipment, was contaminated, figures which, he said, were fairly typical.

Autoclaving Technique Condemned

Autoclave departments were singled out for particularly heavy attack, not only by Brigadier Welch but also by all the subsequent medical speakers. They all stressed that immediate action was needed to correct this most unsatisfactory state of affairs. Much was due to the total lack of training of the autoclave operators, who were usually porters with other hospital jobs, most of whom had little idea of to whom they were responsible.

*Present Sterilizing Practice in Six Hospitals, 1958, Nuffield Provincial Hospitals Trust. See also p. 1582 of this issue.

Brigadier Welch suggested the following short-term remedies that could be adopted immediately by hospitals at relatively low cost: (1) Improvement in the working of autoclaves. (2) Substitution of, say, steam-sterilized cardboard boxes for the present "iniquitous" hospital drums. (3) The introduction of central syringe sterilizing services. (4) Raising the standards of dressing techniques in the wards. (5) Better methods for the disposal of soiled linen and dressings. (6) The clear definition of responsibility in all sterilizing duties, particularly autoclaving.

Professor J. W. HOWIE (Glasgow), speaking on steam sterilization, discussed how a good autoclave should work. He preferred to discard the name "autoclave" and refer to the machines as high-pressure steam sterilizers. He called ward sterilizers "boilers," since they were not sterilizers: boiling did not totally destroy all forms of bacterial life, which was what sterilization meant. This could be accomplished only by exposing bacteria in dressings and instruments (both cutting and otherwise and including endoscopic instruments suitably protected) to dry steam or high-temperature steam under pressure. Provided this steam was at the high "phase boundary" temperature at which the change from water to steam occurred latent heat would be given out, and it was this which killed the bacteria. This vital fact was not generally appreciated. It was of the greatest importance that whoever was responsible for an autoclave should know the temperature reached in the chamber of the sterilizer. This information, which must be entered on the pressure-recording chart, was essential in order to assess whether the contents had been sterilized or not. Human errors were as much to blame for inefficient sterilization as mechanical, and modern over-reliance on antibiotics had led to a dangerous relaxation of standards.

The "Iniquitous" Drum

Professor C. A. WELLS (Liverpool), himself a surgeon, said that in the last few years surgeons had allowed themselves to become too complacent about post-operative sepsis. In any outbreak of sepsis responsibility should rest fair and square on the shoulders of the surgeons, who had been lulled into a sense of false security by the bacteriologists. Professor Wells then showed a film to illustrate faulty techniques in the wards, in autoclaving, and in the maintenance and storage of drums. He suggested the establishment of special "pre-operative wards," and supported Brigadier Welch's plea for the replacement of the "iniquitous" drum by the cardboard boxes, which would stand steam sterilization under pressure at temperatures high enough to kill any spores of *Cl. tetani*. The cardboard boxes could be used as an interim measure until the introduction of special individual packs.

Another Horrifying Survey

In the afternoon Dr. E. M. DARMADY described the control and supervision of hospital sterilization carried out to-day in hospitals in the Portsmouth area. He illustrated his talk with some excellent slides of the many horrifying conditions found in present-day sterilizing practice, even in hospitals with good nursing standards.

A team consisting of a doctor, a bacteriologist, and a senior bacteriological technician under Dr. Darmady's supervision had carried out a survey similar in type to the Nuffield investigation. This team had focused its attention on ward sterilization techniques and the conditions under which nursing staff were expected to perform their sterilizing and dressing duties. These conditions were both unfair to the nurses and dangerous: 20% of swabs from Cheatle's forceps were contaminated, 17% from syringes, 21% from instruments, 36% from bowls, gallipots, receivers, etc., and 24% from the contents of drums. Ward boilers were quite unable to sterilize efficiently, and this had been neatly demonstrated by attaching thermocouples to the instruments being boiled. Equally ineffective were the so-called antiseptic solutions used for cutting instruments. The proper cleaning of instruments by scrubbing them with soap and water before sterilization was important.

Ward Dressing Techniques

Ward dressing techniques in the different hospitals had also been studied, and in some they were antiquated and dangerous. Sometimes trolleys were laid out for as many as 15 consecutive dressings, a nurse merely covering them between dressings with a sterile towel from a dressing bowl on the trolley. Used dressings might be placed in uncovered bowls on the lower shelf of the trolley, remaining uncovered till the end of a long dressing round. A very high proportion of bed-pans had shown heavy contamination with faecal organisms after so-called cleaning either by hand or in standard bed-pan sterilizers.

Answering questions from surgeons on the sterilization of cutting instruments, Dr. Darmady said that exposure to steam at 190° C. for 1½ minutes would not blunt their edges. In a series of tests on "antiseptic" lotions used for storing such instruments all the solutions had grown *Cl. tetani* freely.

Mr. E. H. HURST, group secretary of the Portsmouth Hospitals, then gave the lay administrator's point of view. He said the "hidden costs" of the present methods of sterilization were enormous and not fully appreciated. They included the cost of maintaining and repairing ward boilers, apart from their high fuel consumption, and the large number of man-hours spent in operating and maintaining a series of autoclaves sited in different parts of a hospital. The only way for lay committees to deal with the problem was to take a lesson from industry and tackle it along the lines of work-study investigations. He agreed that the training and employment of autoclave attendants needed thorough revision. The present very low wage rates should also be reviewed so as to attract men of an altogether higher standard of intelligence.

A Matron's View

The last speaker was Miss DE LA COURT, matron of the Queen Alexandra Hospital, Portsmouth. She said that this was the first time in her 21 years as a matron she had attended a really tripartite discussion on the subject of sterilization. After hearing of some of the horrifying conditions still existing to-day, it seemed to her that we had gone back to the days before Florence Nightingale. One reason for the slackening in standards was the different teaching of nurses in different hospitals. One fact might be taught in the nursing schools and another on the wards. There was need for a uniform standard of teaching throughout the country. Regular "procedure" meetings, as at her own hospital, between matron, sisters, and staff nurses were helpful. Written reports of the meetings were circulated to all nursing staff and pinned up in sterilizing rooms.

Unfortunately there was no time for a general discussion. The conference was summed up by Mr. N. F. ADENEY (Bournemouth) and Dr. J. DOCKRAY (Isle of Wight).

Reports of Societies

HEBERDEN ORATION

PATHOGENESIS OF RHEUMATOID ARTHRITIS

This year's Heberden Oration was given by Professor CHARLES RAGAN, professor of medicine at Columbia University, New York, at the annual meeting of the Heberden Society on December 5. His theme was the role of hypersensitivity in the pathogenesis of rheumatoid arthritis.

Dr. Ragan recalled that four main theories had been advanced to explain rheumatoid arthritis. These were infection and focal sepsis; metabolic abnormality; endocrine abnormality; and hypersensitivity. His own working hypothesis of the pathology of rheumatoid arthritis was that it was primarily a vasculitis. In this context the theory of hypersensitivity was attractive, and the existence of the

rheumatoid factor—which was a gamma globulin and which might be described as "an antibody to an antibody when the latter exists as an antigen-antibody complex"—made the theory more tenable. However, there were a number of difficulties.

There was no animal in which induced hypersensitivity could lead to sustained arthritis and vasculitis. The presence of vasculitis did not necessarily imply hypersensitivity, since Rickettsiae and even viruses could produce a widespread change of this type. All connective-tissue constituents so far tried had failed to produce anything resembling rheumatoid arthritis when injected into animals, even when adjuvants were used. Transfusion of the rheumatoid factor in volunteers did not produce disease, and patients with agammaglobulinaemia could get something that looked like rheumatoid arthritis.

If the rheumatoid factor were an antibody it was species non-specific. However, so were the thyroid antibodies described in recent years in connexion with thyroiditis. One of the biggest difficulties was that about 5% of the population of temperate countries showed a positive test for the rheumatoid factor without having rheumatoid arthritis, and many patients with the disease did not have the rheumatoid factor. In a recent incomplete survey of the native population of Liberia by Columbia University, no example of rheumatoid arthritis was found. Nevertheless 15% of the subjects showed a positive reaction for the rheumatoid factor as measured by the FII tanned sheep-cell agglutination reaction. In contrast the frequency of rheumatoid arthritis in the negro population in the United States was similar to that seen in the white population. Nevertheless, until the possible pathogenic role of the rheumatoid factor was thoroughly and completely disproved, it provided the only support for the implication of hypersensitivity in the pathogenesis of rheumatoid arthritis. If its role were disproved we faced a long, hard struggle which could be solved in the foreseeable future only with great luck and a dash of serendipity.

TUMOURS IN CHILDHOOD

Basing his remarks on the first five years' experience of the Manchester Children's Tumour Registry, Dr. J. K. STEWARD addressed the Manchester Medical Society (Section of Surgery), on November 11, on "Tumours in Childhood." Thanks to the reduction in frequency and seriousness of bacterial infections in children, tumours were now, he said, the second commonest cause of death between the ages of 1 to 15 years.

Since September, 1953, the Manchester Children's Tumour Registry had been collecting information about children in the North-west Hospital Region suffering from tumours. During this period they had registered 460 cases, representing 90% of the children certified as having died from tumours. Analysis showed that about one-third of the tumours were derived from the reticulo-endothelial system and another third from the nervous system. The overall mortality was at least 70%.

Sixty per cent. of the children were in hospital within two months of the start of their illness. On average a general practitioner saw a child with a tumour only once in 20 years, so earlier reference to hospital was unlikely to be possible. After admission any delay in diagnosis was very rare. He thought, therefore, that earlier diagnosis could probably contribute very little improvement to the results of treatment. Among the reasons why so many of the children were beyond hope of a cure when their condition was first diagnosed was that 84% of the fatal cases had either reticulo-endothelial or intracranial tumours, or tumours arising in the posterior abdominal wall. The poor prognosis of reticulo-endothelial tumours affected patients of all ages and was not just a problem of childhood. Of the intracranial tumours about half arose in, or involved, the brain stem or the third ventricle. Tumours of the posterior abdominal wall needed to attain a very large size

(Continued at foot of next page)

To-day's Drugs

With the help of expert contributors we publish below notes on a selection of drugs in current use.

Prednelan-N Injection (Glaxo).—1 ml. of this sterile suspension contains 25 mg. of prednisolone acetate and 5 mg. of neomycin sulphate. Because of its local anti-inflammatory action it is intended as an intra-articular injection in cases of rheumatoid arthritis, traumatic arthritis, osteoarthritis, and other similar conditions; the dose varies according to the size of the joint injected. The neomycin is added as a safeguard against infection, but the writer's preference is to maintain a strict sterile regime rather than to inject an antibiotic into a joint prophylactically.

N.H.S. basic price: six 1-ml. ampoules, 36s.

Mycifradin Tablets (Upjohn).

Neomin Tablets (Glaxo).

Nivemycin Tablets (Boots).

These are tablets of neomycin sulphate. When this antibiotic is given by the mouth little is absorbed, and it is in fact the most efficient of all intestinal antiseptics. It is superior to streptomycin, which can be administered by this route with similar results, in its "broad spectrum," its greater activity against certain bacteria (notably staphylococci and *Proteus*, but not streptococci), and in that bacterial resistance to it is rare, not readily acquired, and unaccompanied by sensitizing capacity and the fact that it is rarely given systemically are other advantages. It is chiefly used for suppressing the intestinal flora before operation on the colon. Two days' treatment is usually ample, and a daily total dose of 3 g. has been found satisfactory when measures are also taken to reduce the bulk and solidity of the bowel contents. Neomycin has also been given for much longer periods to patients with liver failure, in which benefit results from diminished formation of ammonia in the bowel. It can be used for the treatment of acute infections of the intestinal tract (*Shigella*, *Salmonella*, or, in infants, pathogenic *Escherichia coli*), though it is difficult to assess the relative merits of this and other antibiotics for these purposes.

N.H.S. basic price: mycifradin, 20 tabs. 0.5 g., 65s.; neomin, 20 tabs. 350 mg., 67s. 6d.; nivemycin, 20 tabs. 0.5 g., 65s.

Correction.—A note on "marcoumar" and "marevan" (December 13, p. 1471) described these anticoagulants as preparations of warfarin sodium. Marevan is, but marcoumar is not, though both are coumarin derivatives. We regret the error. Some of the details given in the note, and in particular dosage, are incorrect for marcoumar, whose dosage is much lower. It will be the subject of a note in this column at a future date.

(Continued from preceding page)

before they caused symptoms. The main reasons for the high mortality for tumours in childhood were therefore, it seemed, because they were reticulo-endothelial in origin or else arose in a situation where removal was impossible or where symptoms occurred late.

If surgery and irradiation were the only possible forms of treatment, the future for these patients would be very poor. However, the increasing success of chemotherapy in leukaemia was very encouraging. The fact that on rare occasions some tumours in children might regress spontaneously suggested that there was a natural resistance to their growth. Dr. Steward demonstrated a retinoblastoma which had regressed in this way.

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Carbon-monoxide Poisoning

SIR.—Carbon-monoxide poisoning is very important because it is so common. Nine people die of it, on average, every day in England and Wales and there are many more non-fatal cases. In 1957 carbon-monoxide deaths totalled 3,409¹—nearly three times as many as caused by all other kinds of poisoning combined. For every three deaths from road traffic accidents, which cause such public concern, there were two deaths from carbon monoxide.

The proper treatment of this condition is obviously a matter of great importance. For many years it has been accepted as being the inhalation of 7% carbon dioxide in oxygen (carbogen) which very greatly increases pulmonary ventilation and speeds clearance of carbon monoxide from the blood. It has long been recognized that the main life-saving application of this treatment is by first-aid workers, because severely poisoned patients will die, or be beyond recovery, by the time they get to hospital if carbogen treatment is not started by those who first reach them. Unfortunately, in this country carbogen was removed from ambulances and first-aid services several years ago on direction, privately circulated to authorities, of the Breathing Apparatus Committee of the Medical Research Council. The medical profession as a whole was not informed by publication in the medical press till four years later.² The official advice was then challenged.³ Now, after nearly four more years, the Council has just issued a statement (*Journal*, December 6, p. 1408) reversing its former advice and advocating restoration of carbogen.

The Council's statement does not set forth the evidence which has caused this change of mind. This is a serious omission, because restoration of 7% carbogen is not advised and it is said: "In the light of present knowledge the subcommittee do not consider that there is anything to be gained by the use of higher percentages [than 5%] of carbon dioxide in oxygen." It might seem that the difference between using 5% and 7% carbogen is unimportant. *In fact, it is a matter of very great consequence, because saving of life may be reduced to about one-third of what it might be.*

When carbogen first displaced oxygen, nearly 40 years ago, as the accepted treatment of carbon-monoxide poisoning, it was used in 5% strength. Later, it was found that 7% produced very much more vigorous breathing and should therefore be considerably more effective, because the speed of elimination of carbon monoxide is related to the pulmonary ventilation. It was shown that the curve of increased breathing in response to inhalation of carbogen mixtures of increasing strength in unpoisoned individuals rose gently up to 5% (the amount of carbon dioxide normally present in the lungs) and then very steeply from 5 to 7%. In these normal subjects 7% carbogen doubled or trebled the pulmonary ventilation produced by 5% carbogen and caused the volume of respiration to increase to about seven times the amount when air or oxygen alone was breathed.^{4,5} These findings needed confirmation in patients poisoned by carbon monoxide in case the poisoning should produce some radical alteration in response. The emergency conditions of very severe poisoning in human beings precluded strictly comparable experimental studies, but survival was regarded as being perhaps the ultimate criterion. A large-scale practical trial was carried out in New York⁶ by specially trained resuscitation crews over a period of eight years, during which 7,845 poisoned patients were treated. In the three years 1926 to 1928, 5% carbogen was used in treating 2,854 patients, and there were 234 deaths (82 per 1,000). In the next five years 7% carbogen was used for 4,991 patients, and 156 deaths occurred (31 per 1,000)—i.e., the deaths were reduced to almost one-third of what they would have been had 5% continued to be used. For the last quarter of a century 7% carbogen has been used in treating a very large number of patients all over the world.

The Council surely should not advise 5% carbogen unless it can quote evidence adequate to refute the New York experience. It is therefore pertinent to ask for the results of whatever experiments were done to compare the efficacy of 5 and 7% carbogen. If the Council still persists in giving advice contrary to accepted opinion, then, I submit with respect, the responsibility lies upon it to produce irrefutable evidence to support its attitude. It would not so much matter if its statement was just an expression of opinion, but it will be taken as *official direction* on which executive authorities will act all over Britain.

It would seem possible that the Council has not yet fully rid itself of the fear that carbogen may cause carbon-dioxide poisoning in cases of carbon-monoxide poisoning "in respiratory failure." This alleged danger was stressed in the Breathing Apparatus Committee's report,² but it was merely presumed from theoretical considerations and no direct factual evidence was presented. Now that some practical research has been done, the Council's statement admits that respiratory failure either never occurs in carbon-monoxide poisoning or is so rare and so brief as to have only academic significance. Most forms of asphyxia, other than carbon-monoxide poisoning, are accompanied not only by oxygen lack but also by obstruction to carbon-dioxide excretion, and in them, as the Committee rightly stated, oxygen alone should be used. This is not in dispute. But carbon-monoxide poisoning is a special, though very important, type of hypoxia in which there is massive bar to oxygen uptake but little or no interference with carbon-dioxide output.

7% carbogen causes very great increase in breathing within a few seconds of inhalation. Its speed of action is most urgently needed in severe cases because they are very near to dying from damage to vital organs by extreme oxygen deprivation. Fortunately, carbogen administration is simple for first-aid workers to carry out anywhere, given suitable portable apparatus, and easy to maintain in the confined space of an ambulance or mine. The increased pulmonary ventilation which 7% carbogen produces is very much greater than can be achieved by manual artificial respiration, though this may sometimes be needed to start carbogen inhalation in dying patients or in attempting to revive those who seem dead. First-aid workers need instruction in the use of carbogen and require particularly to be taught that its administration must be started instantly. They also need to be impressed that patients poisoned with carbon monoxide look *deceptively well*; they have a good colour and quiet breathing and may seem no more than confused, stuporose, or sleeping. Nevertheless, they need immediate carbogen treatment.

I am sorry, Sir, once more to write about this matter, and only do so because I firmly believe that many needless deaths will continue to occur if 7% carbogen is not restored. Medical officers who have the duty of determining the equipment of ambulances and other first-aid services might well weigh carefully their responsibility before they issue orders to re-equip with 5% carbogen instead of 7%. They and the rest of the medical profession should have the opportunity of examining evidence when official direction is contrary to generally accepted opinion.—I am, etc.,

SIR,—The statement by the Medical Research Council and your annotation (*Journal*, December 6, pp. 1400 and 1408) on the use of carbon-dioxide-oxygen mixture in carbon-monoxide poisoning are interesting and of value in the first-aid treatment of gassing cases, but are lacking in practical guidance to those concerned in providing first-aid services.

It is all very well for the Medical Research Council to repeat that "it should not in practice be difficult for

first-aid workers to distinguish between these two groups of patients," when deciding whether the mixture or pure oxygen is the correct treatment, but what is implied is that the first-aid workers will have both carbon-dioxide-oxygen mixture and pure oxygen with them at the time. This means duplicating the resuscitation sets and cylinders.

The practice of carrying cylinders of the mixture in ambulances was discontinued and oxygen was substituted on the last recommendation of the M.R.C. on this subject, and in industry the same procedure was carried out. Have the ambulance services and industry now to carry both? This would mean a great increase in expenditure initially, and in maintenance, and is this really justified when the M.R.C. report states that "the differences in practice between the effectiveness of the two methods of treatment are almost certainly small"? Could we not have a more practical authoritative statement on this subject—as to whether first-aid services should have the added expense and upkeep of maintaining two types of resuscitation equipment, or whether, taking all factors into account, oxygen alone is not sufficient?—I am, etc.,

Sheffield, 10.

JAMES GREGORY.

Afibrinogenaemia after Transfusion

SIR,—Mr. James M. Moore's paper in your issue of November 15 (p. 1201) is doubtless of much value to those concerned with blood disorders. I would like to know why a young woman of 25, apparently in good condition, needed two pints (1.1 l.) of blood during and after a planned gastrectomy? Mr. Moore says her condition was good after the operation and that there was little blood lost—as one would expect. Why, then, transfuse her? Will Mr. Moore please tell us?—I am, etc.,

Worcester Park, Surrey.

H. J. FRIEND.

SIR,—I was particularly interested in the account of a fatal case of uncontrollable post-operative haemorrhage after incompatible transfusion by Mr. James M. Moore, which appeared in the *Journal* of November 15 (p. 1201). Some years ago I was concerned in an investigation into three similar deaths. All three followed major thoracic surgery. All three had been transfused with many pints of stored citrated blood over a short period of time—i.e., 3–4 hours. All three had a clotting defect, and in all three the type of haemorrhage was identical with that described—namely, a general oozing over the whole area of trauma. None of the three cases received any incompatible blood and none received any dextran. At the time of this investigation I made the tentative suggestion that future cases of uncontrolled concealed haemorrhage might be transfused with fresh heparinized blood, the advantage of heparin over citrate being that it can be neutralized *in vivo* if necessary.

I have reason to believe that this regime was adopted with considerable success by one of the leading teaching hospitals. I myself have only had the opportunity of observing the effects of such treatment on one case. This was a young man aged 28 who was admitted to hospital after a severe melaena. He was transfused with many pints of stored citrated blood over a period of about a week, but continued to bleed. After two pints (1.1 l.) of fresh heparinized blood the haemorrhage ceased and he was eventually brought successfully to operation. At operation he was found to have a large carcinomatous growth in the stomach which eventually killed him.

In Mr. Moore's case the operation was completed at 12 noon. During operation one pint (0.6 l.) of blood was transfused. "The patient's condition was good immediately after operation which had not been associated with significant loss of blood." A second bottle of blood was started at 12.30 p.m. I think it is generally agreed that if a patient requires only one pint of blood, then blood is not essential. One must therefore ask the question, Why any blood at all in this case and why a second bottle? Has not the time arrived when the medical profession generally should give serious consideration to the extravagant use of blood with all its concomitant risks in general surgery? Am I old-fashioned in suggesting that blood should only be transfused when it is essential to save life?

Although it was right and proper, it is particularly unfortunate in this case that it was necessary to draw attention to the somewhat doubtful evidence that dextran can produce a haemostatic defect, for it would appear that this was the ideal type of case where a little dextran would have been adequate to maintain this patient's condition. The dextran administered to this patient could have played no part in the result, since the coagulation defect was known to be present before it had been transfused. Furthermore, although some interaction between dextran and fibrinogen has been demonstrated *in vitro* at very low temperatures, this has never been shown to occur at body temperature or *in vivo*. If my memory does not play me false I believe it is correct to state that the only haemostatic defect which has been found in patients transfused with dextran has been a prolongation of the bleeding time, the cause of which was obscure. A number of such cases concerned volunteers with a normal blood volume who were transfused with 0.5 to 1 litre of dextran. It will be understood, therefore, that following transfusion the cardiovascular system of these volunteers was considerably overloaded. Such cases therefore bear no true relationship to cases transfused with dextran in order to combat hypovolaemic shock.

Dextran has now been used with success for the treatment of many thousands of cases of hypovolaemic shock either alone or in combination with blood. For this purpose it has proved itself to be a cheap, reliable, and very valuable therapeutic agent which is free from the many dangers associated with blood and plasma. It is suggested therefore that dextran could replace a great deal of the blood used to-day with benefit to all concerned.—I am, etc.,

London, N.W.3.

S. G. RAINSFORD,
Late Director of the Royal Naval
Blood Transfusion Service.

B.M.A. Clinical Meeting

SIR,—The perhaps faintly apologetic tone of the first paragraph of your leading article in the *Journal* of December 13 (p. 1457), commenting on the inaugural Annual Clinical Meeting of the Association, I confess disturbs me. From it I am to gather that, "not insensitive" to the critic who says that "an organization costing a quarter of a million pounds a year" is "spending too much of its energy on getting more money for doctors," those responsible for the conduct of B.M.A. affairs have, as a kind of partial answer, instituted this purely scientific and clinical meeting. It is doubtless purely lack of space which prohibited you, having once raised this question, from administering the full and final real answer to any such critic, which is historical.

Forty years ago the B.M.A. was urging better facilities for treatment, particularly for the poor. The Government's Dawson Report¹ (1920) resulted, abortive as regards any implementation. In 1930 the Association produced its *Proposals for a General Medical Service for the Nation*,² revised for a second edition in 1938: and then came the Beveridge Report³ (1942) and the Act of 1946.⁴

Now, Sir, as one privileged to be present at every debate by the Representative Body on all these Government or B.M.A. schemes from the first-mentioned to the last, I wish to emphasize that it was an outstanding and striking feature that all these annual debates confined themselves entirely to matters of fundamental principles in the endeavours to formulate schemes in the public interest which at the same time could, on broad principle, be acceptable to the profession: indeed, none of the above documents discuss remuneration except perhaps to say that arrangements would have to be made.

This feature of the Representative Body debates ever commanded my own admiration, though it was much criticized at our periphery. It was only when, faced with revolutionary governmental proposals, the profession at last reached the stage demanding public negotiation of remuneration for all that was to be required of it that Spens, in two main reports,^{5,6} hit the headlines in a matter of deep national concern. Hence, Sir, the unwonted prominence of the money questions to-day; and hence also the critics whom you cite, nearly all of them ignorant of

the Association's true record of quiet background energy expended in these matters for forty years, a record which, in fairness, cannot be too widely stressed.—I am, etc.,

Newquay, Cornwall.

Inorganic Arsenic

SIR,—On several recent occasions I have seen and heard about arsenical keratoses, pigmentation, and multiple epitheliomata in adult patients. On inquiry, I am informed that in two recently observed cases the patients (both women) had received medicine containing arsenic over a period of time many years ago and that it is now known that arsenic, very gradually and perhaps after an interval of many years, may cause the epithelial disease noted. In fact, the content of the arsenic is greater in those sites in which superficial epitheliomata occur than in other parts of the skin.¹ In conversation I was informed that arsenic is still sometimes recommended as a dermatological remedy.

Is there, in fact, any evidence of even the slightest value in inorganic arsenic medication? I was somewhat alarmed to see in *The Extra Pharmacopoeia*, 1958, that there are still four preparations containing inorganic arsenic, and even in the *British National Formulary*, 1957, it says (p. 116):

"When Mist. Ferr. Arsen. is prescribed, Mist. Ferr. et Ammon. Cit. containing Arsenical Solution, 3 m. in each 1/2 fl. oz., shall be dispensed."

In view of the possibilities of remote dermatological disease of a serious nature arising from arsenic, given perhaps many years before, would it be wise to reconsider most carefully whether inorganic arsenic should be abolished from the *Pharmacopoeia*?—I am, etc.,

Cancer Survival Rates

SIR,—I would like to draw attention to the situation that has arisen from the practice among some writers of attempting to correct the "crude survival rates" in ordinary use, by making use of the probability that some of those who died before the expiration of say "x" years died from some other cause than cancer. Dr. Percy Stocks¹ suggested that the factor p_0 based on vital statistics and introduced by Berkson in 1942 could be applied to the data in question. The application of this factor can result in the anomalous conclusion that a 10-year survival rate can exceed its associated 5-year rate.^{1,2} This seems devoid of common sense.

This is a matter of serious concern. Some of the hospital boards prepare annual reports about the results of cancer treatment, others are preparing to follow suit. The need for a method of presenting results in a manner free of anomaly is a real one. It is significant that the W.H.O. figures published periodically are expressed in "crude survival rates." Those coming from Radium Hemmet, Stockholm, are in the same form. It may be that there is a more essentially true form of rendering the data than this, but until it has been tested and agreed upon it is not desirable to continue with the crude rates?—I am, etc.,

SIDNEY RUSS.

Antibiotics in Acute Tonsillitis and Otitis Media

SIR,—In the recent correspondence about the treatment of otitis media initiated by Dr. John Fry's most valuable article (*Journal*, October 11, p. 883) I have seen no mention of myringotomy, and wonder whether this has now been completely discarded. Recurrence of otitis media in cases which I had thought adequately treated with antibiotics led me this year to do a myringotomy as well in all but the mildest cases, and, although one can hardly judge the value of it yet, I find a definite note of "pus present" in 10 cases out of 27 and "thin fluid" in another two. Previously I should have treated all these patients with antibiotics alone, and can well picture the formation of a jelly-like mass as described by Dr. Peter A. Walford (*Journal*, November 29, p. 1353). After reading his letter I am all the more doubtful of using antibiotics in this condition unless a perforation is present, whether natural or artificial.—I am, etc.,

Hereford.

A. F. STALLARD.

Decline of Pertussis

SIR,—Professor A. D. Gardner's letter in your issue of September 13 (p. 688) headed "The Decline of Pertussis" has interested me. After being in general practice in England for many years, I have worked in Tanganyika for the last 1½ years as a Mission doctor in an up-country station. I have compared the incidence of whooping-cough in these two places. Here whooping-cough appears to be the most frequent of the infectious diseases of childhood, with a seasonal prevalence from September to December. It occurs most frequently between ages 2 to 6. In addition to its prevalence, its severity is very noticeable and is in great contrast to my experience of it in England. The attacks of whooping are very distressing to witness, the spasms so prolonged before ending in vomiting. The children have generally been ill many days before being brought to hospital. Fatality has occurred only amongst the younger children, but the incidence of resulting morbidity must be high in patients of all ages.

Up to the present no preventive inoculation has been used here. However, I have recently started inoculating a few children and hope to extend this work. Expense is restricting, but the belief which I share with your correspondent that inoculation is so worth while is encouraging.—I am, etc.,

Handeni, Tanganyika.

JESSIE E. PRINGLE.

Medicine on Television

SIR,—Everybody will agree with your correspondent Professor Roger Warwick (*Journal*, November 29, p. 1354), that medicine should not be turned into a "peepshow," but, judging from Mr. Dickson Wright's remarks at the meeting, it would seem that he lives in the world of fifty years ago. Surely the first thing to decide is what is the objective to be aimed at by bringing medicine before the public, by means of television, radio, lectures, newspaper articles, etc.? I suggest that the prime object should be to get rid of or at least diminish fear of disease.

To do this, all drama must be taken out of medical displays and talks. The slightest suggestion of the dramatic builds up the idea of "crisis," which leads to fear. In the old days the public had greater faith in their doctor, and to be told that there "was nothing to worry about" was sufficient. The days of the "High Priest" are gone, and to-day it is necessary to use a different technique—namely, to appeal to the common sense of the patient. Too many family doctors treat their patients as idiots. I realized this after lectures to the public (84 this year so far), when in conversation with members of the audience. For example, on more than one occasion it has been said, "I could not possibly talk to my doctor about cancer. I hate being laughed at." Many people have spoken in praise of the television series *Your Life in Their Hands*. There is much

still to be learnt about the best way of "putting it across" by these various publicity methods, and Dr. C. M. Fletcher is undoubtedly right in advocating more scientific surveys of the results.—I am, etc.,

MALCOLM DONALDSON,
Hon. Secretary,
Cancer Information Association.

Oxford.

Chlorothiazide in Epilepsy

SIR,—The clinical effects of "diamox" (acetazolamide) and "saluric" (chlorothiazide) on sodium and water metabolism seem to have some similarities. In addition the former has been found useful in the treatment of idiopathic epilepsy. In the hope that chlorothiazide might also be beneficial in control of idiopathic epilepsy, we tried this drug in six female patients suffering from this disorder.

Out of a ward of 50 epileptics, six patients who satisfied the criteria of suffering from chronic idiopathic epilepsy without any other disorder were selected. The average age of patients was 48 years and the average duration of hospitalization was 12 years. In three of them the main problem was frequency of fits (average of three fits a week) and in the other three it was the marked disturbance of behaviour (e.g., impulsiveness, constant quarrelling, physical violence, destruction of property, etc.). All had been tried on the well-known anticonvulsant drugs without much beneficial effect. During the trial these drugs and the patient's environment were unchanged. Each patient was given 500 mg. of chlorothiazide orally each morning, four mornings a week. Record of patients' behaviour and fits was charted on a specially designed item sheet consisting of 30 items, by the same observer throughout. After a trial of eight weeks no patient showed any appreciable change either in frequency of fits or behaviour disturbance; there were also no untoward side-effects noted clinically.

It is well known that acetazolamide has a marked generalized antagonistic effect on carbonic anhydrase, an action very feebly shown by chlorothiazide. In this may lie the explanation of the failure of chlorothiazide in epilepsy. It also appears that the salt-water depletion and diuresis brought about by both these drugs contribute little, if at all, towards amelioration of epilepsy.

The work was carried out at Cane Hill Hospital, Coulsdon, Surrey, and the drug was kindly supplied by Messrs. Merck Sharp and Dohme Ltd., Hoddesdon, Herts.

—We are, etc.,

Warlingham Park Hospital,
Warlingham, Surrey.N. H. RATHOD.
ANDREW SKARBK.**Toxic Psychosis after Atropine Eye-drops**

SIR,—Drs. J. P. Baker and J. D. Farley (*Journal*, December 6, p. 1390) have drawn attention to the psychiatric aspects of atropine intoxication, following prolonged topical exhibition of the drug in ophthalmic practice. Their suggestion, "that closer investigation might be made into the origin of states of minor emotional disturbance, usually attributed to psychological stress, in patients undergoing eye surgery with prolonged routine atropinization," merits comment.

In my personal experience the majority of cases of mental disturbance amongst ophthalmic in-patients occur after cataract extraction in the elderly, episodes of senile dementia coming on within two to four days of operation. Atropine may not have been exhibited at all, or, at the most, only as daily instillations since operation. Retinal detachment cases rarely show psychotic symptoms, as occurred in the case described by Drs. Baker and Farley; their reactions appear to be the responses of differing personalities to the extreme tedium of the post-operative regime, and they revert to normal promptly as soon as the patient is allowed more freedom, although topical atropine is continued.

Clearly atropine must be regarded in future in the same light as hyoscine, which is occasionally responsible for the sudden appearance of psychotic symptoms. The problem is one of idiosyncrasy involving a few patients only, and leaves untouched the larger issue of the management of senile ophthalmic in-patients.—I am, etc.,

Moorfields Eye Hospital,
London.

D. W. HILL.

Artificial Insemination

SIR,—Members of the Association will recall that the Annual Representative Meeting passed the following resolution:

310. **Resolved:** That this Meeting, while making no pronouncement on the non-medical aspects of A.I.D., authorizes the Council to submit evidence to the Government Committee on this subject from the medical point of view, if so requested.

A request has now been received by the Association from the Departmental Committee set up by H.M. Government to submit evidence, and the Council has decided to do so, within the terms of the foregoing resolution. The Science Committee has been asked to inform the Council on the medical aspects of A.I.D., and to enable it to do so it is anxious to collect as much up-to-date evidence as possible. As chairman of that committee, I am writing to seek the assistance of any practitioner who is in a position to provide it on a particular aspect of the problem. The committee is most anxious to obtain evidence on the subsequent psychological well-being, or otherwise, of any married couple who have availed themselves of A.I.D.—and, even more important, the subsequent effects on the child or children born as a result. May I ask any family doctor who has such a family under his care to supply the committee with written evidence bearing on this point? The committee will be most grateful for all such help, which will, of course, be treated as confidential in the highest degree.—I am, etc.,

B.M.A. House,
Tavistock Square,
London, W.C.1.J. R. NICHOLSON-LAILEY,
Chairman of the
Science Committee of the B.M.A.**Tuberculous Meningitis after B.C.G.**

SIR,—I wish to endorse the opinion of Dr. H. G. Calwell (*Journal*, November 29, p. 1356) regarding the paper on "Tuberculous Meningitis Following B.C.G. Vaccination" by Drs. Mary R. Kerr and J. M. Dunbar (*Journal*, October 25, p. 1019). In Dublin city 85,038 children and young adults were B.C.G.-vaccinated from October, 1948, to October, 1958, and in the whole decade no case of tuberculous meningitis and no death from any form of tuberculosis occurred in this large number of vaccinated personnel.

We have always adhered to Calmette's teaching, as expressed by Professor Robert Debré in his letter in the *Journal* of November 22 (p. 1292), and strict isolation periods have been observed in all cases that had exposure to home infection. In my opinion, the tuberculous meningitis case described by Drs. Kerr and Dunbar serves as a warning to all B.C.G.-vaccinators not to omit pre- and post-vaccinal isolation in these home-contact cases. When these isolation periods are observed, as in Dublin and Belfast, there is no incidence of tuberculous meningitis in B.C.G.-vaccinated personnel.—I am, etc.,

Tuberculosis Section,
Corporation of Dublin.

M. DUNLEVY.

Hospital Blankets

SIR,—Could not some contamination be avoided if blankets were put into zipped cotton cases? Blankets could be kept smooth by use of blanket pins or clips. Perhaps a bottom blanket could be replaced by the easily boiled cotton quilted pads used for this purpose in hospitals in the U.S.A.—I am, etc.,

Oxford.

K. F. BURN.

Coloured Signals

SIR,—Between October and December, 1957, there was a correspondence in *The Field* of considerable medical interest. Some contributors described the flash of green light seen just as the sun was rising or setting over the sea, and one suggested that this was due to the last yellowish rays blending with the blue of the water. But, arising out of this, another contributor described how, when driving behind another car at night, he had a momentary impression of green as its tail lights disappeared. And another, with memories of night operations in the first war, remarked that eye fatigue in the small hours was far from rare.

Might the eye tire for some colours faster than for others? Inquiry from an expert established that this phenomenon of apparent colour change is quite well known; he also stated that if a red light is observed through a moving screen it may appear green, the converse also occurring. Can we be certain, then, that a train driver seeing a light known to be red through the lattice work of a bridge, which lattice work was crossing his field of vision, might not report the wrong colour—red for green and green for red? And might not a fireman, after looking too long into the fire, have a momentary fatigue of the eye for red?—I am, etc.,

Hitchin, Herts.

Chloroquine in Rheumatoid Arthritis

SIR,—The article by Drs. H. Fuld and L. Horwich entitled "Treatment of Rheumatoid Arthritis with Chloroquine" (*Journal*, November 15, p. 1199) is a type of study that appears commonly in journals both in this country and in Great Britain. It is a type of study that is responsible for the multiplicity of drugs used in rheumatoid arthritis and for the many types of therapy which give in the hands of most practitioners only indifferent results.

Those of us who work extensively with rheumatoid arthritis know that it is subject to many influences: the emotional state of the patient, the season of the year, the barometric pressure, the weather, the financial status of the patient, the presence or absence of secondary infections, the presence or absence of epidemic upper respiratory infections in the community, and other factors which do not occur to me now or of which I am ignorant. Certainly one of the most important factors is the enthusiasm and friendliness of the attending physician. If he is dull and disinterested, but with little hope for improvement for the patient, his patients do not do well. On the other hand, should he be experimenting with a new medication, and should he have a spirit of enthusiasm and hopefulness, should he inquire with interest in all the symptoms of the patient, should he listen with care to their complaints, and should he examine their painful joints with more than usual devotion, the patient almost always responds by some degree of subjective improvement. We have seen this time and time again in a large metropolitan arthritis clinic.

Therefore, no study on the effectiveness of a drug or method of treatment of rheumatoid arthritis is of value unless it is combined with a controlled study of untreated patients. The doctor himself must not know which are the ones receiving treatment and which are the ones that do not. The number of cases in both the controlled and the treated groups must be statistically significant. Otherwise there will be no end to the types of treatment which enthusiastic physicians will recommend on the basis of various uncontrolled and superficially convincing reports.

I find the recommendation of chloroquine not especially disturbing, since, in our own experience with it, we found no serious toxic results, although it was of little benefit. The recommendation, however, of blood transfusions is very disturbing, since all transfusions carry a danger of homologous serum jaundice. I am unaware of any valid study which establishes the value of such a definitely hazardous method of treatment of rheumatoid arthritis.—I am, etc.,

Cedar of Lebanon Hospital,
Los Angeles.

R. R. MERLISS.

Christabel Pankhurst Memorial

SIR,—Last month will be remembered in our constitutional history as the one in which women first sat as members of the House of Lords. This event calls to mind the advance that women have made in status in recent times. In the nineteenth century they were regarded in effect as second-class citizens. But step by step during the last 50 years legal discriminations have been removed until to-day very few remain.

We recognize the debt we owe to the pioneers who pressed women's enfranchisement on reluctant Governments. Notable among them was Christabel Pankhurst, who as a young law student struck a new note of defiance by adopting

what later came to be known as militant tactics and thereby made "Votes for Women" front page news. During the nine years in which the conflict raged she displayed courage, political insight, and leadership to a high degree, and devoted the whole of her youth to obtaining the enfranchisement of her sex.

The older generation of doctors will recall that one of the Pankhursts' earliest supporters was Dr. Elizabeth Garrett Anderson, who suffered imprisonment in the cause. They will also recall the influential committee of doctors, headed by Sir Victor Horsley and Dr. Haden Guest, to bring pressure on the Government to stop the brutality of forcible feeding as done by prison authorities. Doctors, both men and women, were splendid in the assistance they gave to the suffragettes released from prison in shocking condition, and in dealing with injuries sustained when thrown out from political meetings.

Dame Christabel died a few months ago, and many people feel that a national memorial should be erected to her. We have therefore formed a committee, of which Lady Pethick-Lawrence is treasurer, to raise a fund for this purpose. This committee is representative of women prominent in all professions in life. Lady Astor, Miss Rose Heilbron, Dame Vera Loughton Mathews, D.B.E., Dame Sybil Thorndike, D.B.E., together with women M.P.s and old suffragettes, and with Dame Christabel's young cousin, Miss Goulden Bach, as secretary.

I am glad to be chosen to represent the women doctors, and I hope both men and women members of the profession will be staunch to-day in support of this memorial, and send their cheques to our Treasurer, at 11, Old Square, Lincoln's Inn, London, W.C.2. Our proposal, which has been approved in principle by the Ministry of Works, is the addition of a semicircular low wall to Mrs. Pankhurst's statue in Victoria Tower Gardens adjacent to the House of Lords. The wall will terminate in two piers showing on one a bronze relief of Dame Christabel, and on the other a replica of the Women's Social and Political Union prison brooch. The design appears to be particularly appropriate, for, inasmuch as Christabel and her mother jointly led the militant campaign, so should they be remembered together by future generations.—I am, etc.,

London, W.1.

A. LOUISE McILROY.

Onset Enuresis

SIR,—The statistics produced by Drs. J. D. Paulett and E. Tuckman (*Journal*, November 22, p. 1266) are impressive; but before we are tempted to conclude that onset enuresis results from raising the poor above their station it would be interesting to hear that it is less frequent in a poor population which has not been recently re-housed. The writings of some workers—for example, Spinley¹ and Kerr²—indicate that it is far from unknown.

We find it impossible to recollect, to a greater accuracy than plus or minus one year, the age at which our two sons, now aged respectively 8 and 14, became reliably dry at night. Has a scientific training made us less observant than the patients who contributed to Dr. Tuckman's third table, or more preoccupied, or just less willing to commit ourselves to a categorical statement?—We are, etc.,

KENNETH ULYATT.

FRANCES MARGARET ULYATT.

London, S.E. 27.

POINTS FROM LETTERS

Hypnotherapy

Drs. GORDON AMBROSE and GEORGE NEWBOLD (London, W.1) write: Dr. William Sargant's review of our book *Hypnosis in Health and Sickness* (*Journal*, December 6, p. 1396) was very like the curate's egg. We would like to correct one or two points in the review. It is not made absolutely clear that (and here we quote from the preface) "... we felt the time was ripe for the publication of a work which would present to the public, so far as our limitations permitted, a reasonable picture of the place of hypnotherapy in modern medicine." Dr. Sargant recites a long list of subheadings from two chapters, and possibly implies that hypnosis is seen by us as a panacea for all ills. We have been particularly careful in all our writings to refute this claim.

Obituary

G. H. G. SOUTHWELL-SANDER, M.B., D.P.H.
D.I.H.

Surgeon-captain G. H. G. Southwell-Sander, who did much to improve working conditions in the dockyards and ships of the Royal Navy, died suddenly at his home near Dorking on December 6. He was 53.

Geoffrey Henry George Southwell-Sander was the only son of the late Dr. G. A. Southwell-Sander, who practised in Watlington, Kent. From Charterhouse he went on to Caius College, Cambridge, and then to St. Thomas's Hospital, qualifying in 1930 and graduating M.B., B.Ch. in 1931. He was house-physician at the Brompton Hospital, house-surgeon at the Royal Victoria and West Hants Hospital, Boscombe, and a resident medical officer at the sanatorium at Milford in Surrey. His interest in tuberculosis led him to a wider view of preventive medicine, and he took the D.P.H. at the London School of Hygiene and Tropical Medicine in 1933. After a short spell in his father's practice near Maidstone he entered the medical service of the Royal Navy late in 1933. Not long afterwards, to his great satisfaction, he was sent out to the China Station and spent some time up the Yangtze. On his return home he married Elsie (Jackie) Graham, daughter of Dr. James Graham, and worked for a time in London as a house-physician at the Postgraduate Hospital at Hammersmith. His one and only hospital appointment in the Navy was that of clinical pathologist at the R.N. Hospital, Bermuda, where he served from 1938 to 1941, carrying out his duties there with characteristic thoroughness, zeal, and ability. Later in the war he saw active service in the Arctic and elsewhere. His subsequent career was mainly in the fields of preventive medicine and industrial health.

R. L. G. P. writes: The sudden death of Geoffrey Southwell-Sander has come as a great shock and brought much distress to his many friends, both inside and outside the Service. His health had been far from robust for some years, but he did not allow this sombre handicap to interfere in any way with the high standard of work which he incessantly maintained throughout his life.

It was while serving in the Medical Department, Admiralty, from 1943 to 1944 that his interest in industrial medicine became enthusiastically stimulated. He obtained the D.I.H. in 1950, and there is no doubt that he put industrial medicine on the map so far as the Royal Navy is concerned. He emphasized the opportunities in this direction that arise in H.M. dockyards, H.M. aircraft repair yards, and last, but not least, in H.M. ships themselves. He fully appreciated the fact that preventive medicine is second to none in the practice of medicine, and he was constantly endeavouring to the best of his ability, which was considerable, to put this conception across to all and sundry. He was one of the original members of the Joint Services and Factory Committee on Occupational Health, which consists of Service members from the three fighting Services and civil experts in various fields of industrial medicine. He did good work in H.M. Dockyard, Singapore, and the Naval Base from 1950 to 1952, but it was while holding the appointment of senior medical officer, H.M. Dockyard, Portsmouth, from 1952 to 1955 that he achieved outstanding success. He reorganized the medical section of the dockyard, and was of the greatest help to the Medical Director-General during the period when the Home Dockyard Regulations were being revised and brought up to date. Old routine measures were dropped, and modern views were introduced, largely as the result of Geoffrey Southwell-Sander's personal experience in industrial medicine.

In 1955 he rejoined the Medical Department, Admiralty, as assistant to the Medical Director-General in hygiene, preventive medicine, and industrial medicine. A year

later he was elected president of the Services Group of the Society of Medical Officers of Health: his presidential address on "Preventive Medicine in the Navy" was written in his usual lucid and attractive prose, and was published in the journals of the Society of Medical Officers of Health and of the Royal Navy Medical Service. He also wrote a reference book on industrial health which was officially approved and circulated to all medical officers. A new comprehensive handbook for medical and dental officers is being prepared, and he wrote the section on industrial medicine and some of the portions connected with hygiene and preventive medicine. He also gave lectures on industrial health to newly joined medical officers at the R.N. Medical School, Alverstoke. His contributions in hygiene, preventive medicine, and industrial medicine have been outstanding during recent years not only in the Navy but also in the Services Group of the Society of Medical Officers of Health and in conference at the Joint Services and Factory Committee on Occupational Health. He was also Naval secretary of the Epidemiology Section of the Royal Society of Medicine, as well as being on the committee of the United Services Section. He was awarded the Gilbert Blane medal in 1947 and the Parkes Memorial prize in 1955.

Geoffrey was a very conscientious, zealous, and likable medical officer. Modest and very unostentatious, he had great ability and much administrative acumen. His judgment was true, and he was always friendly and pleasant. His demise is a great loss to the Service which he loved and for which he did distinguished work. At home he took an interest in church affairs and was certainly a true practitioner of the Christian faith. Our deepest sympathy is tendered to his wife and son.

A friend writes: If it is old-fashioned to set oneself high ideals and to live by them, then Geoffrey Southwell-Sander was old-fashioned. The traditional loyalties were much more than mere traditions to him: he set his course by them. He found in the Senior Service a career which suited him down to the ground, for he enjoyed life in the Navy not only for its obvious advantages—he loved travel, for instance, and sport, and good fellowship—but also because it met his need for professional endeavour in the field of preventive medicine. Wherever he went the health and welfare of the men for whom he was responsible mattered intensely to him, and he obtained great satisfaction from his later work as a specialist in occupational health. With all this he had an enviable capacity for getting the best out of life. Knowledgeable and enthusiastic about history, art, literature, and music, he was the ideal travelling companion. His light-heartedness was infectious and his steadfastness in difficult times vastly encouraging. Devoted to his family, Geoffrey Southwell-Sander was a home-loving man, and it is indeed sad that he enjoyed for such a comparatively short time the new home near Dorking which he and his wife had made so elegantly their own. He died at the height of his career, leaving a widow and son whose friends will share their grief.

P. W. PHILIP, M.B., Ch.B.

Dr. Peter W. Philip, the last general-practitioner surgeon in Aberdeenshire, died at his home in Huntly on December 7 after a long illness. He was 58 years of age.

Peter William Philip was born on November 14, 1900, and studied medicine at Aberdeen University, where he graduated M.B., Ch.B. in 1924—the record post-war year of the Aberdeen Medical School. After graduation he had no hope of a house job in his teaching hospital in competition with ex-Service men who had but recently commanded men in battle, and he went as assistant to the late Dr. John O. Wilson at Huntly. There his work in the Huntly Cottage Hospital impressed the late Mr. F. K. Smith, visiting surgeon from Aberdeen Royal Infirmary, and he made Philip his house-surgeon a year after graduation and gave him special operative experience. Thereafter he returned to Huntly, this time as a partner, and for more

than 30 years he served his people in the northern foothills of the Grampians. In that stormy rural area, 40 miles from Aberdeen, his undoubted skill as a surgeon saved many lives, but he was also a first-rate family doctor with a large practice.

His capacity for work and his zest for life gave him many activities outside his profession. He was a justice of the peace and an elder of the Scottish Kirk. A staunch conservative, he was vice-chairman of the West Aberdeenshire Conservative Association. In the medico-political field he was chairman of the Aberdeen and Kincardine Counties Division of the B.M.A. in 1951–2, a member of the local medical committee, and its representative on the Scottish Medical Services Subcommittee. He was a member of the local executive council since its inception. While he lifted trophies at bridge and bowls, his rarest pleasure was in fishing and shooting. As a raconteur he was in great demand at medical dinners, rotary clubs, and manifold societies. Unsparing of himself, he died in his prime, and our sympathy goes out to his widow, to his three daughters, one a doctor, and to his son.

D. G. G. writes: There was magic in the name of Peter Philip. Born a Buchan peasant—as pure a country stock as our Aberdeen-Angus cattle—lost as a student among so many ten-talented ex-Service men of the 1914–18 war, he yet blossomed forth to become one of the outstanding medical personalities of his generation in the North-east of Scotland. Stories of him were legion. He had become a legend in his own lifetime, and the legend will live for the rest of the century. His clothes the rough home-spun, his speech rich in his native Doric, his body strong to endure the long tramps through the snow-blocked roads, Philip of Huntly was loved by cottar and laird, both of whom he bullied impartially. Perhaps his best anecdote was of the patient who mistook a horse powder for a headache powder, and so often had he told it that it became a classic. But one he did not tell was of the case of post-partum haemorrhage in a lonely glen, when he took off nearly two pints of his own blood and transfused the patient. I remember when I was demobbed in the autumn of 1945 he came to stay a week-end with me to catch an Ythan salmon, and in his waders he had two bottles of Glenlivet, one for the ghillie and the other for his host.

The B.M.A. was dear to him, and he made a grand Division chairman. He relished his championship of the rural doctor and was a refreshing breeze among the cobwebs of St. Andrew's House in Edinburgh when he gave evidence before the jaded but delighted officials. Sir William Osler thought the lone figure in the gig, the rural doctor, the noblest figure in medicine: if Osler is waiting in the Elysian fields to welcome the country G.P.s, the front-line troops of the profession, then he will find in Peter Philip a common spark, and, who knows, there may be a Scottish burn there with deep salmon pools galore.

G. K. STRODE, M.D.

Dr. George K. Strode, formerly director of the International Health Division of the Rockefeller Foundation, died in the Memorial Hospital, Brattleboro, Vermont, on October 27. He was 72 years of age.

Sir ALLEN DALEY writes: The Old Guard of the Rockefeller Foundation of New York is dwindling rapidly as a result of death or retirement because of age. Within the past two years we have mourned the loss of Alan Gregg, the director of the Division of Medical Sciences, and of Pat O'Brien, a member of the same division. Now we learn of the death of Dr. George King Strode, the last director of the International Health Division. Just before he retired the Foundation had amalgamated the Divisions of Medical Sciences and International Health in a new division which it named the Division of Medicine and Public Health, with Strode as its first director.

Born in Pennsbury, Pennsylvania, George King Strode graduated in science from Haverford College in 1908 and in

medicine from the University of Pennsylvania in 1912. He was a Master of Public Health of Harvard. Soon after graduation he joined the staff of the state health department of Pennsylvania at Harrisburg. After seeing active service in France during the first world war he became, in 1920, a full-time officer of the Rockefeller Foundation. After his retirement in 1951 he lived in Whitingham, a remote spot in the State of Vermont. He worked for the foundation in Brazil until 1926 and from then until 1938 he was in charge of its medical and public health work in Europe, Africa, and the Near East, with headquarters in Paris. He was chairman of the Paris office from 1932 until he returned to New York in 1938. During the second world war he was a member of the American Red Cross Missions to Russia in 1941, Iceland in 1942, and North Africa in 1942-3. He had received decorations from many European countries, and was a Commander of the French Legion of Honour and an Honorary Fellow of the Society of Medical Officers of Health. A book on yellow fever which he edited was published in 1951.

Many Britishers retain happy memories of the warmth of the hospitality dispensed in their New York apartment by George Strode and his charming wife. He was a kindly and understanding man, beloved by all who had dealings with him. Wielding great power over the destinies of men and institutions of learning in many countries, he never let that go to his head or warp his judgment. George lived up to the motto of the Foundation, "The Welfare of Mankind throughout the World," and was always striving to achieve that aim somewhere. He guided the public-health work of the Rockefeller Foundation in the international field at a time when it was spending millions of dollars every year on its various and far-flung projects. The health and well-being of millions of people all over the world have benefited.

Medical Notes in Parliament

HOUSE OF LORDS

Injury from Nuclear Installations

The Nuclear Installations (Licensing and Insurance) Bill, which is intended to control in the interests of safety the building and operation of nuclear reactors and other fixed nuclear installations, completed its passage through the House of Lords on December 16. It authorizes, for this purpose, a system of licensing (excluding installations of the Atomic Energy Authority); and imposes on persons granted a licence to operate installations an absolute liability (similar to that of the A.E.A.) for all hurt to persons or damage to property caused by radiation, even though due to unavoidable accident. A licensee is obliged to take out cover, by insurance or other means, up to £5m. in respect of any one occurrence. The Bill as drafted also fixed the period within which claims for hurt or damage by radiation must be made at 10 years.

Objection was taken to this proposed time limit when the Bill was considered in committee, and Lord TAYLOR moved an amendment to delete it. Arguing that the Government were attempting to legislate for the unknown, he urged that the case against a 10-year limit was very strong. Diseases like leukaemia—bone sarcoma, aplastic anaemia, and aleukaemic leukaemia—were fatal, usually within a period of about five years. In many cases there was no known cause; but where there was a known cause the date of onset of a disease might be very much longer, and it was this latent period between the start of the cause and the development of the disease which was vitally important in connexion with the period in which a claim could be made. The principal hazard of a disaster in a nuclear plant was the liberation of radio-strontium, which could be picked up by the body and by a continuous process of radiation caused

damage to the bone marrow, and ultimately death. The half-life of radio-strontium was 28 years, and the effect of radiation on the bone marrow appeared to be cumulative. This was a field of great technical difficulty, presenting medical research workers with the greatest problem, because no one knew exactly what the situation was. There was a useful analogous argument from radium and x rays; the first harmful effects of x rays were recorded in 1896, but it was not until 1914 that the first x-ray death in a radiologist occurred, from aplastic anaemia. The interval between the onset of the first changes as a result of x-irradiation and the development of malignant disease was anything between three and 27 years. On this experience the proper time limit, if there was to be one, should be some 30 years. The arbitrary choice of 10 years was unrealistic and not related to existing knowledge. Lord Taylor mentioned also the group of changes that could be caused by radio-caesium on the sexual cells, and the M.R.C. Report of 1956 and the U.N. Scientific Committee's Report this year which spoke of "a 30-year genetic dose."

The Minister of Power, Lord MILLS, expressed some sympathy with the purpose of the amendment, but objected that it would put an unlimited liability on the licensee and on insurance. The longer a claim was delayed the more difficult it would be for medical evidence to establish whether an injury was caused by exposure to radioactivity from the licensee's reactor at a particular time, or by something unconnected with it. A 10-year period was favoured by other member countries of the Organization for European Economic Co-operation, and was likely to be adopted for the purpose of any European convention on the insurance of nuclear risks. This argument was not accepted as convincing, and eventually Viscount HAILSHAM, Lord President of the Council, agreed that the matter should be given further consideration.

The subject came up again on the report stage on December 16, when Lord MILLS brought in a Government amendment to provide a time limit of 30 years. The Opposition still found any time limit unacceptable, on the ground that they were dealing with a type of injury which even the most eminent scientists did not understand. They carried their objections to a division, in which a proposal by Lord SILKIN to remove the time limit altogether was defeated by 69 votes to 37. The Government amendment was then agreed to and the Bill given its third reading.

Adequacy of Mental Research Programmes

Lord STONHAM asked on December 11 if the Government were aware that only 2% of the Medical Research Council's budget was spent on research into the causes of mental illness, and whether, having regard to the statement in the Report of the Ministry of Health for the year 1957 that "psychiatrists are still a long way from a scientific understanding of most of the major forms of mental illness," they would take steps to increase facilities for such research.

The Lord President of the Council, Viscount HAILSHAM: "No, my Lords." The Medical Research Council's expenditure on research into the causes of mental illness had been steadily rising during the past few years, and in the present financial year would amount to some £130,000. This was over 4%, and not 2%, of the Council's annual budget. Arrangements had recently been made by the Council to undertake a full-scale review of research in this field with a view to considering its future development. In addition, a number of voluntary organizations and philanthropic trusts, such as the Mental Health Research Fund, the Ford Nuffield Foundation, the Wellcome Trust, and the Ford Foundation, made important contributions to psychiatric research. The Mental Health Research Fund, for example, spent about £36,000 during the financial year 1957-8, and their total expenditure since 1954 was estimated at £86,000. During the past five years the Nuffield Foundation had also spent a substantial sum on subjects relevant to mental disorder. The Leverhulme Trust and the Ford Foundation had made large block grants to the Mental Health Research

Fund; and the Wellcome Trust had made direct contributions to work in this field. As "observational" research might be an integral part of clinical practice, the work of those in psychiatric practice in teaching and mental hospitals should be included in the total sum of the nation's research, but this could not be measured in exact financial terms nor described as a specific research programme. Certain London teaching hospitals, for example, had active neuropsychiatric units to which research fellows, supported by endowment funds, were appointed by the hospitals themselves. Research of this kind was also supported at many other hospitals through regional hospital boards. Expenditure within the Health Service in this way was estimated at £25,000 for 1957. University psychiatric departments also made individual contributions to research in this subject.

QUESTIONS IN THE COMMONS

Hospital Building Programme 1960-1

Sir KEITH JOSEPH (Leeds, North-east, Con.) asked the Minister of Health on December 17 whether he was now in a position to make a further statement about the Government's hospital building programme. Mr. D. WALKER-SMITH: "Yes. It is proposed, subject to the voting by Parliament of the necessary funds, that £25½m. shall be spent on capital development in the hospital service in England and Wales in 1960-1, compared with £22m. already announced for next year, 1959-60." Hospital boards, said the Minister, were being informed of their individual allocations within this total for the modernization of mental hospitals, the replacement of obsolete plant, and ordinary capital expenditure. £10m. would be set aside for the programme of major projects which were financed centrally. This programme would be further expanded, and he was that day inviting boards to bring to completion the planning of a number of additional major projects. He hoped that they would try to complete the planning by 1960-1.

Mr. Walker-Smith went on to say that he had already authorized the arranging of an architectural competition which was in hand for the planning of the new Cardiff teaching hospitals; and he was also considering what dental hospital projects should be undertaken to increase the output of the dental schools.

The major new building projects now selected included the first phases of new general hospitals for north Tees-side and at Northwick Park for the Wembley-Harrow area; a further stage of the new Sheffield teaching hospital of which the out-patient department was now being built; the start of the reconstruction of Queen Mary's Hospital, Sidcup; a blood transfusion centre at Liverpool; and later stages of some new hospitals already in the programme. There would be new radiotherapy departments at Newcastle, Sheffield, and Birmingham.

In the sphere of large-scale extensions a large extension of the High Wycombe Memorial Hospital was proposed and a number of other hospitals were to be improved or developed. They were Crewe Memorial Hospital; the Mayday Hospital, Croydon; Queen Mary's, Stratford; the Royal Gwent Hospital, Newport; Southampton General Hospital; and St. Stephen's Hospital, Fulham Road. There was a new maternity wing at Billinge Hospital, Wigan, and a new maternity unit was included in proposals for expanding the Yeovil and District Hospital. Further development would be undertaken at the Good Hope Hospital, Sutton Coldfield, and at the Coventry and Warwick Hospital. He was also increasing the allocations made last year in order to allow development to take place at both Ilford and Barking, and to permit as the first phase of hospital development in Hull the improvement of the Western General Hospital. He was also asking for plans to be prepared for certain hospital development in Bradford, and details of this would be worked out with the Leeds Regional Hospital Board.

In the mental health field the Minister proposed to provide additional beds at the mental deficiency hospitals at Greaves

Hall, Southport, Cranage Hall, Holmes Chapel, and Oakwood Park, Conway; extensions to Borocourt (near Reading) and Little Plumstead (near Norwich) Mental Deficiency Hospitals; improvements at Fulbourne Mental Hospital, near Cambridge; and new long-stay annexes at Lynfield Mount Mental Hospital, Bradford. A psychiatric block was also to be provided at the new Welwyn Hospital which was now being built.

Hallucinogenic Drugs

Dr. DONALD JOHNSON (Carlisle, Con.) asked the Home Secretary if he was aware of the dangerous hallucinogenic properties of such new drugs as mescaline and lysergic acid diethylamide, and when he proposed to bring them under the Dangerous Drugs Acts. Mr. BUTLER stated on December 11 that he was informed there was no evidence that these drugs were addiction-producing. It would not therefore be appropriate to control them under the Dangerous Drugs Act, 1951.

Legal Actions in the Health Service

Dr. JOHNSON asked the Minister of Health if he would state the number of legal actions in which the Health Service, or any of its employees, had been defendant in each year since the inception of the Service. What had been the total cost to the Exchequer in settling such actions, including those settled out of court? Mr. R. THOMPSON, Parliamentary Secretary, stated on December 12 that the only statistics centrally available were the total amounts paid in compensation of all kinds by hospital authorities and executive councils in England and Wales, whether or not legal action was involved. These were as follows:

Period ended						£
March 31						
1949	..	..	..	..	..	7,560
1950	..	..	..	..	..	23,636
1951	..	..	..	..	..	38,556
1952	..	..	..	..	..	106,574
1953	..	..	..	..	..	152,590
1954	..	..	..	..	..	159,047
1955	..	..	..	..	..	91,535
1956	..	..	..	..	..	110,321
1957	..	..	..	..	..	116,136
1958	..	..	..	..	..	100,826

Nuclear Information Withheld from M.O.H.

Mr. W. COLDRIK (Bristol, North-east, Lab.) asked the Minister of Housing and Local Government why he had declined to supply the M.O.H. for Bristol with the whereabouts of the sources of various radioactive materials in the city. Mr. J. R. BEVINS, the Parliamentary Secretary, told him on December 9 that in supplying radioisotopes the Atomic Energy Authority acted as a commercial concern, and it was not normal practice to make known the full details of such transactions. The Department followed up deliveries and was able to ensure that any requisite statutory consent for disposal of waste was obtained from the appropriate authorities. The Minister had assured the M.O.H. for Bristol that there was no danger to public health from disposals of radioactive waste in his area.

Parking Meters in St. Marylebone

Sir WAVELL WAKEFIELD (St. Marylebone, Con.) asked the Minister of Transport and Civil Aviation what progress he had made in connexion with approving the establishment of a parking scheme for St. Marylebone. Mr. H. WATKINSON told him on December 10 that he had fully considered the St. Marylebone Borough Council parking scheme in the light of the objections made to it, the report of Sir Reginald Sharpe, who conducted a public inquiry, the report of the London and Home Counties Traffic Advisory Committee, and the results of the experiment in North-west Mayfair. He had decided to approve the scheme with some modifications: when these had been settled he would make the necessary Order and Regulations.

Vital Statistics

Accidental Deaths Increase

In the third quarter in England and Wales accidental deaths numbered 3,550, or 146 more than in the third quarter last year, according to the Registrar-General's return for the third quarter. A notable increase was deaths from coal-gas poisoning—from 68 last year to 114 this year. The total of home accidents in the third quarter this year, 1,234, was 44 lower than last. The accidental deaths in the quarter were as follows:

	Age		
	0-14	15-64	65 and Over
Home accidents	111	223	900
Transport	217	978	313
Other	160	490	158

They show that twice as many children were killed on the road as in the home, and three times as many old people in the home as on the road.

Week Ending December 6

The largest fluctuations in the notifications of infectious diseases in England and Wales during the week ending December 6 were increases of 1,472 for measles, from 6,910 to 8,382, 89 for acute pneumonia, from 407 to 496, 53 for scarlet fever, from 1,164 to 1,217, and 25 for whooping-cough, from 724 to 749; the largest decreases were 78 for dysentery, from 1,098 to 1,020, and 58 for food-poisoning, from 236 to 178.

The largest rises in the incidence of measles were 188 in Lancashire, from 739 to 927 (Liverpool C.B. 136, Manchester C.B. 116), 163 in London, from 398 to 561 (Wandsworth 109, Hammersmith 84, Paddington 78), 161 in Staffordshire, from 209 to 370 (Newcastle-under-Lyme M.B. 75), 114 in Yorkshire West Riding, from 837 to 951 (York C.B. 188, Halifax C.B. 104). The largest rise in the number of notifications of scarlet fever was 34 in Essex, from 72 to 106. Only small changes occurred in the local trends of whooping-cough. 4 cases of diphtheria were notified, being 3 fewer than in the preceding week; no administrative area had more than 1 case.

The notifications of acute poliomyelitis numbered 53, and these were 9 fewer for paralytic and 7 fewer for non-paralytic cases than in the preceding week. The largest returns were Lancashire 9 (Manchester C.B. 4), London 7 (Islington 2), Yorkshire West Riding 7 (Huddersfield C.B. 2), Hampshire 5 (Southampton C.B. 4).

The largest falls in the incidence of dysentery were 56 in Yorkshire West Riding and 45 in Warwickshire. The chief centres of infection during the week were Yorkshire West Riding 120 (Leeds C.B. 73, Huddersfield C.B. 12), Glamorganshire 127 (Cardiff C.B. 63, Llantrisant and Llantwit Fardre R.D. 30, Rhondda M.B. 26), Lancashire 101 (Eccles M.B. 15, Liverpool C.B. 13, Nelson M.B. 13), Middlesex 95 (Hendon M.B. 79), London 88 (Battersea 19, Wandsworth 12, Kensington 10), Warwickshire 71 (Coventry C.B. 60, Birmingham C.B. 10), Essex 55 (Rochford R.D. 19, East Ham C.B. 16), Kent 40 (Maidstone R.D. 13, Royal Tunbridge Wells M.B. 11), Hertfordshire 39 (Welwyn Garden City U.D. 36), Northumberland 34 (Ashington U.D. 14, Newbiggin-by-the-Sea U.D. 12), Surrey 27 (Coulsdon and Purley U.D. 19), Yorkshire East Riding 25 (Kingston upon Hull C.B. 20), Durham 23, Hampshire 21 (Southampton C.B. 15), Bedfordshire 21 (Amphill R.D. 21), Staffordshire 21.

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the years 1949-57 are shown thus - - - - -, the figures for 1958 thus ———. Except for the curves showing notifications in 1958, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Medical News

New Hospital Board.—From April 1, 1959, the Wessex Regional Hospital Area is to be formed from what is now the western portion of the South-west Metropolitan Regional Hospital Area. A regional hospital board will be constituted for it (S.I. 1958, No. 2093).

Association for the Study of Medical Education.—The Rockefeller Foundation has made a grant of £10,000 to the Royal College of Physicians for use towards the general expenses of the Association for the Study of Medical Education during the first five years of its development.

Chemists' Federation.—The Federation has announced its dissolution as from December 31. This follows the recent judgment by the Restrictive Practices Court (*Journal*, November 15, p. 1236). The Federation comments in a statement as follows: "As a result of this judgment it remained open to the Registrar under section 20 of the Act to apply to the Court for an injunction restraining members of the Federation from giving effect to, or enforcing, or purporting to enforce the agreement. The Chemists' Federation council, after taking legal opinion, decided that the dissolution of the Federation was necessary in order to protect the rights of the individual member."

Prescribed Industrial Diseases.—A right of appeal from medical boards' decisions on whether or not a person claiming benefit under the industrial injuries scheme is suffering from one of certain prescribed industrial diseases is provided by new regulations made by the Minister of Pensions and National Insurance (S.I. 1958, No. 2112, H.M.S.O., price 3d.). These regulations will apply to decisions given by medical boards on or after January 5. Appeals will be decided by the same tribunals as already consider appeals against boards' assessments of extent of disablement.

Chief Medical Adviser, Nigeria.—Dr. C. M. NORMAN-WILLIAMS will succeed Sir SAMUEL MANUWA as Chief Medical Adviser to the Federal Government of Nigeria, on the latter's retirement on January 2.

Mr. B. W. Rycroft has been elected honorary member of the Ophthalmological Societies of New Zealand, Australia, and South Africa.

COMING EVENTS

"Alcoholism and Drug Addiction."—Week-end course (£3 15s.) arranged by the Institute for the Study and Treatment of Delinquency, January 2-4, at Avoncroft College, Bromsgrove. Details from I.S.T.D., 8, Bourdon Street, Davies Street, London, W.1. (MAYfair 3472.)

London Medical Orchestra Society.—Informal concert including works by Rossini, Beethoven, and Haydn, January 17, 7.30 p.m., at Quintin School, Marlborough Hill, London, N.W.8. Admission free.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Friday, January 2
ROYAL MEDICO-CHIRURGICAL SOCIETY OF GLASGOW.—At Royal Faculty of Physicians and Surgeons of Glasgow, 8.30 p.m., discussion: Management of Incurable Illness. Panel, Dr. W. F. Anderson, Dr. A. McCrone, Mr. J. L. Orr, and Miss A. Keen.

Saturday, January 3
MIDLAND THORACIC SOCIETY.—At Birmingham Medical Institute, 3 p.m., short papers by Dr. J. Aspin, Mr. E. G. Dolton, and Dr. J. Leahy.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Lindan.—On December 12, 1958, at Cleveland, Ohio, U.S.A., to Dr. Rosemary Lindan (formerly Jackson), and Olgiard Lindan, M.D., Ph.D., a sister for Nicholas and Christina—Camilla Elspeth.

Twidle.—On December 10, 1958, at Sheffield, Yorks., to Ruth Carol (formerly Wiltie), wife of Surgeon Lieutenant Robert S. H. Twidle, R.N., a son.

DEATHS

Wardale.—On December 7, 1958, at his home, near Haydon Bridge, Northumberland, John Dobson Wardale, M.B., B.S., aged 90.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending December 6 (No. 49) and corresponding week 1957.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the whole of England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

CASES	1958					1957

STILLBIRTHS ..	325	30	35			26	20			

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenza pneumonia.

§ Includes puerperal pyrexia.

Any Questions ?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Sequestrenized Blood for Transfusion

Q.—Is sequestrenized blood better for routine transfusions than citrated blood, and how is it prepared ?

A.—Sequestrene (Na_2 , ethylene diamine tetracetic acid) is accepted as the anticoagulant of choice in the preparation of whole blood or platelet concentrates for transfusion.¹ For this purpose the anticoagulant should be contained either in a siliconed bottle or in a plastic bag. The platelet transfusion may be given either as fresh whole blood, platelet-rich plasma, or as a platelet concentrate in its own plasma or saline. If transfused within a few hours after collection good results are to be expected. Where there is severe thrombocytopenia the platelets from 4 pints (2.3 l.) of whole blood should be given either as whole blood or as a concentrate. After such a transfusion it is not uncommon for there to be an improvement in the clinical state of the patient without any detectable rise in the number of circulating platelets.

Sequestrene solutions can be sterilized by autoclaving without loss of activity. The amount of sequestrene necessary to inhibit the coagulation of 97 ml. of blood is 3 ml. of a 4.5% w/v isotonic solution.² Alternatively 10 ml. of a 1% solution of sequestrene in saline may be used for 90 ml. of blood.¹ With small volumes of anticoagulant efficient mixing of the blood and anticoagulant at the time of collection is important. The ability of platelets to improve haemostatic function on transfusion is impaired after 12 hours, and after 24 hours' storage the platelets would appear to be quite inactive in this respect.

Sequestrene does not appear to have any advantage over citrate apart from its use in platelet transfusions. When mixed with dextrose it preserves red cells as well as acid citrate dextrose.³ While no toxic effects have been recorded in humans, it can be presumed, on the basis of rabbit experiments,⁴ that 7 g. administered to a 70-kg. human might produce tetany. This would represent approximately a 10-pint (5.7-l.) transfusion of blood collected in 4.5% sequestrene. If citrate intoxication is considered to be a danger, such as in exchange transfusion, heparin remains the anticoagulant of choice.

Internal Medicine

Q.—What is the significance of the term "internal" as applied to medicine ?

A.—The word "internal" applied to the province of the physician in the vast field of medicine seems to have been introduced by the German schools early last century, when the term *Innere Medizin* was coined. It is not, perhaps, the most suitable adjective, but it seems to be useful and essential as a successor to the earlier term "practice of physic," which is still used in certain universities. The wide applicability of the word "medicine" is unfortunate. It may be applied to (1) a drug or remedy, (2) the entire field of the prevention and cure of disease, and (3) medicine as opposed to surgery. For centuries it was actually opposed, and the surgeon was a mere craftsman. When surgery, and also obstetrics, became a part of medicine or medical knowledge, and when there arose, besides these two, a large number of specialties which also belonged to "medicine," the need to distinguish all these facets of medical knowledge became

obvious, and there appeared forensic medicine, social medicine, preventive medicine—and internal medicine. Perhaps "internal" signified the diseases which were medical and incurable to distinguish them from diseases surgical and curable, as some wag once said. Internal medicine is a term now in general use, whatever the reason of the choice of adjective.

Mumps Orchitis

Q.—What is the latest form of treatment—prophylactic and therapeutic—of mumps orchitis ?

A.—Antibiotics are of no value in the treatment of mumps. If orchitis develops cortisone may be tried; 300 mg. should be given by mouth as the first dose, followed by 100 mg. every six to eight hours for two to four days. Sometimes the effect is dramatic, symptoms subsiding within 24 hours. Orchitis has, however, developed in the unaffected testicle during cortisone treatment so that there seems to be no grounds for the prophylactic use of the drug.

Control of Haemophilia

Q.—What specific therapy is of value in the prevention and treatment of bleeding episodes in haemophilia ? Is any other drug therapy of value ?

A.—Haemophilia is caused by a congenital deficiency in the blood of a factor (antihæmophilic globulin) required for normal coagulation. The only treatment which can prevent or cure bleeding is the replacement of this substance in the patient's blood. The substance may be supplied by the transfusion of whole fresh blood or fresh plasma. To be effective it is necessary to use large amounts of blood or plasma. For an adult patient haemostatic levels of antihæmophilic globulin are not achieved with less than a litre of fresh plasma, and most of the activity disappears from the patient's blood in 24 hours. For this reason it is most desirable to have a concentrated form of antihæmophilic globulin. Concentrated material from human blood is now made in small amounts by the Lister Institute in London, and has proved useful for dental extractions and relatively minor procedures. Antihæmophilic globulin made from animal blood has been made and used successfully for volunteers and for dangerously ill patients at Oxford,¹⁻⁴ and is now available commercially, but, like the human material, only to haemophilia centres.

It seems to be the general experience of medical workers that the egg-white preparation mentioned in the question has no effect on the coagulation defect in haemophilia.

— Twelfth General Assembly; presidential address, 133

British Medical Association Journals

The British Medical Association has as one of its primary objects the promotion of the medical and allied sciences. To this end the Association has been active in medical publishing for many years, and is responsible for a comprehensive range of general and special journals.

BRITISH MEDICAL JOURNAL

Annual Subscription: United Kingdom and Irish Republic £6 6s., single copy 3s.
Abroad £4 4s., single copy 2s.

For over a hundred years the *British Medical Journal* has each week recorded current developments in the art and science of medicine. It includes a Supplement devoted to medico-political and administrative matters and to the business of the Association.

The Association also publishes the following twelve specialist journals, and two abstracting journals:

ANNALS OF THE RHEUMATIC DISEASES. Quarterly. Annual subscription £3, single copy 17s. 6d.

ARCHIVES OF DISEASE IN CHILDHOOD. Bi-monthly. Annual subscription £4 4s., single copy 17s. 6d.

BRITISH HEART JOURNAL. Quarterly. Annual subscription £3, single copy 17s. 6d.

BRITISH JOURNAL OF INDUSTRIAL MEDICINE. Quarterly. Annual subscription £3, single copy 17s. 6d.

BRITISH JOURNAL OF OPHTHALMOLOGY. Monthly. Annual subscription £6*, single copy 12s.

BRITISH JOURNAL OF PHARMACOLOGY AND CHEMOTHERAPY. Quarterly. Annual subscription £4 4s., single copy 25s.

BRITISH JOURNAL OF PREVENTIVE AND SOCIAL MEDICINE. Quarterly. Annual subscription £3, single copy 17s. 6d.

BRITISH JOURNAL OF VENEREAL DISEASES. Quarterly. Annual subscription £3, single copy 17s. 6d.

JOURNAL OF CLINICAL PATHOLOGY. Bi-monthly. Annual subscription £4 4s., single copy 17s. 6d.

JOURNAL OF NEUROLOGY, NEURO-SURGERY AND PSYCHIATRY. Quarterly. Annual subscription £3, single copy 17s. 6d.

MEDICAL AND BIOLOGICAL ILLUSTRATION. Quarterly. Annual subscription £3, single copy 17s. 6d.

THORAX. Quarterly. Annual subscription £3, single copy 17s. 6d.

ABSTRACTS OF WORLD MEDICINE

Monthly. Annual subscription £4 4s., single copy 8s. 6d.

Provides a critical selection of informative abstracts, grouped in broad classifications, of the more important articles appearing in medical periodicals throughout the world. This journal aims to keep the specialist in touch with work done in other fields as well as in his own, and the general practitioner abreast of modern movements in medical science.

OPHTHALMIC LITERATURE

Six issues and index. Annual subscription £4 4s., single copy 25s.

A comprehensive abstracting service covering ophthalmic journals and articles of ophthalmic interest published throughout the world.

*Combined annual subscription for the two ophthalmological journals: £9.

THE NATIONAL HEALTH SERVICE AFTER TEN YEARS

BY

H. GUY DAIN, M.D., LL.D., F.R.C.S.

Chairman of Council of the B.M.A., 1943 to 1949

Now that ten years' experience of the Health Service is available, there is considerable agreement that it is opportune to review the conditions, to discover where it has succeeded in attaining its objects, and what are its advantages and its deficiencies or defects.

From the point of view of the "consumer"—that is, every inhabitant of the country, whether Britisher or visitor—it has been an enormous benefit and success. In no other country, whether Welfare State or not, is it possible to have, on requirement, all the professional services that may be needed for the treatment of all kinds of illness or accident without fee or charge; consequently without any hesitation to call for help on account of the possible cost. Any Britisher who has had the misfortune to be taken ill while abroad, or on holiday in most countries overseas, will have discovered how costly medical care has become in these progressive days, with all their modern discoveries and developments. Accordingly, for the patients the Service has been a boon, and the knowledge that it is there and available has been a great comfort even at the time when you have

no need for it yourself. The absence of any financial barrier between doctor and patient must make the doctor-patient relationship easier and more satisfactory.

So far this is all to the good, and it is desirable that the scheme should be looked at critically in its working arrangements to discover where and why it is not functioning as well as it might.

As to the form of a National Health Service, it has to be remembered that in this country since 1911 a service, the N.H.I., had been in operation for general practice, and that on many occasions the Conference of Local Medical and Panel Committees and the Representative Body had asked for its scope to be extended to include the dependants of the workers. The fundamental principle of the Service was the insurance of the patient for the service of his doctor by the payment of an annual premium, the doctor averaging the risks (as in all insurance) over the number insured. Medical services in many countries have always been on a fee-per-service basis, or provided for the less well-to-do by salaried medical officers.

With this background we come to the time, about 1942, when the public and Parliament (all parties) were feeling that no one, however poor, should want for medical care on account of the cost.

The B.M.A.'s Proposals

The problem was offered to Sir William Beveridge as part of Social Security. He produced a report recommending a complete medical service for all, as well as the other "welfare" benefits. The B.M.A. had these problems well in mind, and in 1928 had produced proposals for "A General Medical Service for the Nation." These proposals were revised and published in 1938, and did recommend a two-way extension of benefits for some 90% of the population. Following from this, and in line with public thinking, the B.M.A. set up a planning commission which issued an interim report in 1942. This dealt with hospital as well as G.P. services, and doubtless had some influence on the findings of the Beveridge Report. The far-reaching proposals of this report were matters of great concern to the B.M.A., and it was only after long debate that, at a Special Representative Meeting in April, 1943, the following resolutions were passed:

"That the Government's invitation to enter into discussions without commitment be accepted.

"That a committee representative of the profession as a whole should, in response to the Government's invitation, now enter into discussions with representatives of the Minister of Health on 'a scheme for comprehensive health and rehabilitation services, for the prevention and cure of disease and restoration of capacity for work, available to all members of the community' (Assumption B of the Beveridge report), in the light of the following undertakings now given:

"(a) That, at the conclusion of the discussions and at the appropriate time or times during the discussions, but in any case before negotiations open and before any proposals are submitted by the Government to Parliament, the full machinery of the Association, including the Council, and its Committees, Groups, Panel Committees, Divisions, and the Representative Body, will be used to consider the Government's proposals and to decide the Association's view thereon.

"(b) That every practicable step will be taken to give all members of the profession, whether members or non-members of the Association, an opportunity to express their views and in particular that every practicable step will be taken to give to members of the profession on service an opportunity of expressing their views, to assess those views, and to present them to the meeting or meetings of the Representative Body called to consider any proposals by the Government."

With this authorization by the Representative Body, the Council started talks with the then Minister of Health, Mr. Ernest Brown (Liberal National), who produced the Department's ideas of a whole-time salaried general practice service, with doctors to be appointed by the Ministry to areas and blocks of patients without any option to either doctor or patient. The reaction of the B.M.A. representatives was so sudden and complete that Mr. Brown withdrew the scheme, and talks began.

This experience, however, showed the ideas of the Department. From this point, over the next four years, prolonged discussions continued, and gradually one after another essential conditions were established; the right of any doctor to take part in the Service if he wished, the right to practise where he liked, the right of doctor and patient to choose one another, the right of the doctor not to be dismissed the Service except after a Tribunal decision, nor his name removed from the Executive Council list.

The Government's Views

In 1944 Mr. H. U. Willink (Conservative) produced a White Paper which proposed, among other unsuitable points, to put the hospitals in the control of the local health authorities, whose health committees would be appointing the whole-time consultant staff. And so these discussions continued.

It was argued that when the Government was providing the greater part of a doctor's income it was not reasonable that he should be able to buy or sell the practice, and that the transference of "blocks" of patients from one doctor to another was undesirable. In the end the Government agreed to buy the goodwill, and pay compensation, ultimately fixed at £66 million. It is interesting to note that the transfer of blocks of patients is no longer improper now that it is done by the Service.

The Social Security idea that everyone must be provided for in the Service was opposed by the B.M.A., and it was only after much consideration at a Special Representative Meeting in May, 1945, that the 100% condition was accepted and the following resolution passed:

"That the Association, regarding the 100% issue as one for Parliament to decide, is willing to negotiate terms and conditions for such a 100% service, if such be decided upon, provided that ample safeguards are introduced to ensure that any member of the community, whatever his income, should be enabled to obtain his medical service, in part or in whole, privately, as for example by grant-in-aid provisions."

In 1945 a General Election had produced a Socialist Government with now a Labour Minister of Health (Mr. Aneurin Bevan). Negotiations had to be started all over again with a new Government known to be in favour of a whole-time salaried service. It was only after difficult negotiations and several Special Representative Meetings that the Minister agreed to provide that a whole-time salaried service could not be established by regulations but only by Act of Parliament, and he discarded the £300 a year basic salary proposal.

And so in July, 1948, the National Health Service Act, more or less as we know it to-day, came into force; a scheme much more liberal and to our liking than the proposals of Mr. Ernest Brown or Mr. Willink.

The Spens Committees

Both the Ministry of Health and the B.M.A., with thirty years' experience of National Health Insurance behind them, and the recurring acrimonious monetary disputes that had occurred, agreed that for the new service an effort should be made to find a method of fixing remuneration that would prevent the recurrence of financial squabbles. The result was the establishment of the two Spens Committees, both parties approving the idea, and agreeing on the members of the Committees. The decisions of the Committees were accepted and the start was made. In the result, in the ten years of the Service, the experiences have been dismally disappointing. Every Government, and every Minister since, has gone back on the idea and strenuously resisted putting "Spens" into operation.

To maintain our financial position, after much unpleasant wrangling, the Danckwerts tribunal was agreed and an award to 1951 values given.

Insecure Conditions

To-day we are awaiting the decision of a Royal Commission, set up to do just what we hoped "Spens" had accomplished, that remuneration should be adjusted to altered values, and varied with work done, without either the Minister or the B.M.A. being involved in bargaining. This experience is so disturbing, and so vitiates the smooth working of the Service, that the most serious consideration will require to be given to the question of whether the medical profession can continue in conditions of such insecurity.

What guarantee can be given that this or any future Government will implement the award of any Royal Commission or independent tribunal?

The Whitley machinery, set up in the Service, was expected to provide for the settlement of disputes, but the Minister has always refused to agree that either side should be able to take any unresolved question to arbitration. Whitley without agreement on arbitration is almost useless.

Then in 1955 the claim for an adjustment to take account of the altered value of money was met with a blank refusal. The Minister, this time a Conservative Government, the Chancellor, and the Prime Minister, in turn refused (it might be said, rudely) even to look at the claim. Continued pressure was required before, without any consultation, a Royal Commission was appointed.

In the day-to-day working, with the public taking full advantage of their benefits, and the doctors loyally looking after their patients, it was inevitable that some difficulties would arise. They have really been remarkably few. Both doctors and patients would seem to set a better value on a Service if some payment is made at the time. This points to the need to look at, and appraise, some of the Medical Services in other countries, where a fee-per-service system is in vogue, when considering future services in this country. In the meantime it would probably remove some disgruntlement if the doctor could make a charge (to be fixed) for late and night calls for visits. Experience of public medical services of earlier days showed that this provision protected the doctor from frivolous calls, and that the patient really in need did not grudge the fee; after all, the amount of money received was negligible. It would seem that it would be for the smooth running of the Service if the present complete freedom of access had a small deterrent.

For the general practitioner the transfer of the practice from his own hands to the Government has had a serious limiting effect in that it is now very difficult indeed for a doctor to change the area of his practice. It is interesting that in some countries, where a fee per service has always existed, goodwill is not bought or sold, the doctor making no attempt to find a successor. If, when the Government had bought the goodwill of practices, the transfer of lists had ceased, there would have been much more freedom of movement of doctors from area to area.

On the hospital side it has been most unfortunate that no proper estimate of cost or of development was made

in advance. With medical and surgical progress new methods and materials continually evolve and costs increase, but there is never the proper money to staff the hospitals, and still less the capital necessary to build new ones. It is humiliating to see the up-to-date new hospitals being built in many other countries, less materially well off than Great Britain, and to reflect that we have not been able to afford new buildings for nearly ten years. At the same time, no other country has felt able to pay for complete access to all drugs, or free-at-the-time access to all professional services.

Conclusion

The present scheme, which we can now look at critically after ten years, was our own method of choice as against a whole-time salaried service for G.P.s. It certainly has provided clinical freedom. The capitation payment is sometimes said to encourage a minimum service, but the way that private practice steadily diminishes is evidence of the efficient way that the G.P. gives his service, even if it is contended that a fee per service offers a greater incentive. Here is a useful subject for group discussion and perhaps a plebiscite.

Having regard to the great importance of the Health Service in the general welfare of the community, it is to be hoped that the matter of the control of the Service will be reconsidered. It requires a small body of knowledgeable people, mostly doctors, to be permanently in charge and able to provide continuity and outlook for development in these fast-moving times. The present Civil Service method under a Minister, who changes so frequently that if he is in office long enough to plan ahead a little he certainly will not be there to see his ideas carried out, is never likely to arrive at a proper integration of the many aspects of medicine—teaching, research, preventive medicine, occupational health, and hospital and general practitioner curative services.

What an opportunity for statesmanship.

THROUGH THE EYES OF CONSULTANTS

LESSONS FROM THE PAST

BY

LORD MORAN, M.D., F.R.C.P.

President, Royal College of Physicians, 1941 to 1950

Though the National Health Service was actually introduced by a Labour Government, its roots date back to the Beveridge Report which was submitted to the Coalition Government in 1942, when Sir Winston Churchill was Prime Minister. I remember Lord Waverley saying that if the Labour Party had not launched the Service the Conservatives would have done so when they took office. All three political parties were committed to provide a health service for the country. It was, in short, politically inevitable. Moreover, it was unavoidable on account of finance. The hospitals were, broadly speaking, bankrupt; they could not have carried on without large Government grants. The profession had the choice between a service set up by the Ministry of Health without any help or advice from doctors, and one shaped and moulded by their own hands. They chose the latter: they could do no other.

Do they regret that decision? If the consultants were asked at the present moment whether they desired to go back to the days of the old voluntary hospitals, where all the work was carried out without remuneration, I believe the overwhelming majority would prefer the conditions of to-day.

If I am right in this, then the consultants accept the nationalization of hospitals. Moreover, Mr. Aneurin Bevan's plan was on the whole more liberal than that submitted by Mr. Willink to the Tory Party. For if Mr. Willink had had his way, the doctor would have been an employee of the local authority.

Lord Radcliffe has lately compared medicine and the law. The law, he said, was not a progressive science; it is the same now as it was 50 years ago; whereas there have been revolutionary changes in medicine. They are such that the Dean of Harvard Medical School has said that in 10 years' time half of what we now know will be found to be wrong. And, alas, we do not know which half. It is perhaps rash to attempt to measure a progressive science of this kind, bounding forward all the time, by the footrule of the administrator. All the same, the Ministry of Health can claim a considerable administrative achievement.

Redistribution of Consultants

Before the National Health Service, consultants congregated in the great centres of population. It was economically difficult or impossible for many consultants to exist

a substantial subsidy from central Government funds—subsidies which they had learned to enjoy during the war years as part of the emergency hospital system.

In Great Britain we elected to try out a National Health Service, universal in its benefits and based on a small insurance premium common to all and collected by the State. In Australia and New Zealand the State contribution to the medical care of the individual took the form of a grant-in-aid for services rendered. The United States chose the system of voluntary insurance, and the growth of that system since 1941 has been spectacular. Thus to-day one hundred and ten million United States citizens are insured for hospital maintenance, ninety-four million for specialist fees, and fifty-eight million for general medical care. Side by side with this spontaneous voluntary effort the United States has expanded the medical facilities of the Veterans Administration in the form of a nation-wide hospital system entirely financed from the Federal Treasury.

Medical science cannot stand still. Diagnosis and treatment must be continuously advancing both in accuracy and in safety. The "precision tools" of the laboratories on which the practice of modern medicine is coming more and more to rely, are increasing in number and complexity. Medicine is already responding to the nuclear energy age in the diagnostic and therapeutic use of radioactive isotopes.

Thus we see the growing edge of knowledge on which the leading hospitals stand. They cannot retreat. If they are to go forward with confidence and enthusiasm they must be reassured that the sinews of war will not be withheld from them.

The National Health Service

The National Health Service, inside whose framework the teaching and non-teaching hospitals function, has now been on trial for ten years. Its three outstanding achievements are universally acclaimed.

(1) The unified hospital system created by the merger of the voluntary and local authority hospitals under one direction, thus eliminating old rivalries which in many areas stood in the path of progress.

(2) The establishment of the region as the planning unit. The teaching hospitals, of course, lie outside the jurisdiction of regional hospital boards, but in most parts of the United Kingdom there is the closest collaboration between boards of governors and regional hospital boards in the planning of clinical services.

(3) The distribution of consultants and specialists to smaller hospital centres where, before the National Health Service, no such skilled services were available. This is perhaps the great achievement of the three.

It is not surprising that now, at the end of a ten years' trial, the National Health Service is being subjected to a barrage of criticism from many different quarters. There are two recurring themes based on the ideas of extravagance as a whole or in particular fields.

The first is the fragmentation of the Service—the apparent failure to bring together in one unified and economical whole the three main sections—the general-practitioner service, the hospital services, and the local authority services. This criticism has been voiced in *The Times* in a leading article.¹ Co-ordination, or a merger of the three parts of the National Health Service under unified guidance, sounds attractive in theory, but there is no guarantee that such a system would result in major economies. In his responsibility for the three sections of the National Health Service the Minister of Health is in the same position as the Minister of Defence, and in this respect alone has an unenviable task.

The second criticism is that there is excessive expenditure on drugs, especially on the more costly types. The cure of this malady in the end must be left to the clinical teachers in the medical schools, who alone can introduce

¹ *The Times*, April 19, 1958.

a sense of responsibility and perspective in the education of the medical students of the future.

So much for overspending. On the other side of the picture is the criticism in relation to the hospital services that not enough money is made available (a) to rehabilitate obsolescent institutions; (b) to build new hospitals; and (c) to provide an ever-expanding income which will allow our leading hospitals to plan and experiment and so keep abreast of the advancing front of medical science.

During the past ten years we must recognize that within the restricted budgets allocated to regional hospital boards and boards of governors a great deal of hospital structural rehabilitation has been carried out—the modernization of kitchens; engineering services, laundries, and so on; and in many centres entirely new casualty and out-patient blocks and operating theatre units. The problem of priorities has been as difficult in the periphery as it has been at Whitehall. No Minister of Health, no board of governors, no regional hospital board, can expect to achieve universal popularity in their respective "constituencies."

In the early days of the National Health Service we had all hoped that the patching up of obsolescent structures would be a temporary affair, and that the epidemic of new hospital construction which has swept the North American continent, Scandinavia, Switzerland, and more recently France and Germany would spread to Great Britain. This has not happened, and we have been compelled to contemplate another long period of practising twentieth-century medicine in nineteenth-century structures. None the less it is twentieth-century medicine, and, despite our physical and financial handicaps, British medicine so far retains a position of leadership. But a sense of frustration prolonged indefinitely must in the end handicap progress by limiting the freedom to experiment which is the life blood of medical science.

Future Sources of Hospital Finance

We may now ask ourselves whether during the next ten years—the second decade of the life of the National Health Service—its adolescence—we can expect to see released from Central Government funds year by year sums which will enable us both to remedy the physical defects in our hospital services and to provide for the ever-expanding needs of scientific medicine. It is estimated that for 1958-9 the gross expenditure on health services will be £736m., of which £421m. will go to the hospitals. Will £421m. give us all that we need for our hospitals? It seems unlikely. If this sum or its inflated equivalent is to represent a "squeeze in perpetuity," what then? The difficult problem of deciding on priorities within scanty budgets will continue to dominate the picture. But there is a time limit to the enjoyment of such austerities. The Minister of Health, a harassed man whoever holds that office, in one of his latest pronouncements, has suggested that the upgrading of the non-teaching hospitals is an important priority. This may be good news for regional hospital boards but not so good for boards of governors, and for the universities, if they feel, as they should, an acute sense of responsibility for the structural quality of the teaching hospitals as apart from their staffs. In this matter it is my opinion that the universities have not always brought up their heaviest artillery to be pointed at Central Government. I make this statement as a deliberate challenge to the Vice-Chancellors, who are naturally more concerned with the physical extension of the universities which is proceeding apace.

We therefore face what to me is an inescapable conclusion: that for their special requirements in the future the hospitals must not only be set free but must be encouraged to seek additional sources of finance outside the Central Government budgets of the National Health Service. For the teaching hospitals this should be a welcome return to old practices and in keeping with their long heritage. In appeals to the community, to industry, and to philanthropic individuals they would thus behave as do the universities. Such efforts might enable us to see in the space of a few years several new teaching hospitals in this country, each

embodying completely novel features—i.e., hospitals designed specially for the purpose of teaching the undergraduate.

Like many others who have given thought to the problems of hospital design in terms of function, I have my own conception of the structure of the ideal teaching hospital. I give you this in broad outline for what it is worth. (1) The closer integration in each major clinical block of the needs of the patient with the needs of the student. That is to say, that wards, laboratories, teaching rooms, departmental libraries, and so on should be one integrated whole. (2) That the out-patient centre or polyclinic should provide such diagnostic facilities and amenities for patients as will reduce the need for the occupancy of expensive beds. (3) That within each main clinical block the university units should lose their geographical isolation, and, better still, their separate identity. This means that the scientific and academic facilities, research laboratories, and so on, which in most teaching hospitals, if not all, have been reserved for the professorial units, should in the future be so designed and sited that they are shared in common by both full-time and part-time university clinical teachers. In this way the medical, surgical, and other major clinical divisions of the teaching hospital would become the university units of the future. And so the concept of the university hospital which, alas, some of us failed to persuade the Goodenough Committee to accept in the spacious days not so long ago might one day come to exert a dominant influence in the structure of medical education. A university hospital would then have two financial godfathers at Central Government level, health and education. We have recently heard that £64m. is to be set aside for new university colleges to foster the applied sciences. Where do the teaching hospitals come into this picture? Do we see the way ahead clearly? Perhaps we need not be unduly pessimistic, but the nation must be told that we cannot be left high and dry if British medicine is to retain a position of world leadership.

THE INTEGRITY OF MEDICINE*

BY

HECTOR R. MacLENNAN, M.D., F.R.C.O.G.
F.R.F.P.S.

Senior Consulting Gynaecologist, Victoria Infirmary,
Glasgow

If the normal span of active professional life can be considered to be in the region of forty years, then I have been fortunately placed; by accident of age I have spent half of my life in the profession before the National Health Service was instituted and hope to spend the second half—indeed, have already spent half of that half—under the new regime. I am therefore not an old man looking back nor a young man looking forward, but I am one with experience of the old who is trying to grapple with the problems of the new.

Older members of the profession are familiar with the state of medicine as it existed before 1948, but, as a result of the introduction of the N.H.S. shortly after the termination of a long war, an entire generation of doctors has sprung up who are largely unfamiliar with medicine as it used to be practised.

Pre-war Medicine

The profession of medicine as it existed prior to the last war, and indeed for half a century before that, was a well-integrated profession in which each and every

*Presidential Address delivered to the Royal Medico-Chirurgical Society of Glasgow on October 4, 1957.

section of the profession was closely interrelated. As a result of this harmonious interrelationship or integration, doctoring was an honourable calling.

The general practitioner was regarded by his patients as the family doctor and friend. The consultants and specialists depended upon him for the bulk of their private practice. The local authority looked to him to implement its measures of public health. In many hospitals, both urban and rural, he played a useful part on the visiting staff, and even in the larger teaching hospitals he was a frequent and welcome visitor. As a result of this he was a highly respected member of the community. It should be remembered that he managed to maintain this position irrespective of the fact that in many instances a large proportion of his work was paid for by national insurance.

The consultant or specialist also commanded a share of the public esteem relative to the service which he offered the community through the family doctor and by the distinction he achieved in his hospital work, both as a healer of the sick and as a teacher of students. It is important to recall that an honorary consultant appointment in a large voluntary hospital, and in particular a teaching hospital, was not only the gateway to private practice but carried with it enormous prestige in the eyes of the public. To emphasize this point it may be remembered that a number of consultant posts were not honorary but were paid for by local authorities, and these posts held a much lower prestige value and were less sought after.

The ancillary non-clinical branches of the profession—the pathologists, bacteriologists, and medical officers of health—were less well integrated with the main body of the profession by the very nature of their work, which tended to segregate them in laboratories and offices. But the most notable members in these fields made their contribution to the general well-being not only by their teaching but also by maintaining a close liaison between ward and laboratory, or, in the case of the medical officers of health, between their office and the general practitioner.

Many of us will remember, for example, the solemn procession of the chief, subchief, assistants, and residents to the post-mortem room laboratory while Sir Robert Muir discussed the shortcomings of bedside diagnosis. Others will recall Carl Browning's journeys into the wards to advocate and control the greater use of aniline dyes and in particular acriflavine in the control of sepsis. These men showed by example how the clinician or field worker could be integrated with "back-room boy" or research worker.

In public health the greatest figures were those who remembered they were doctors first and challenged when necessary lay authority; men like Sir Alexander Macgregor of Glasgow, Buchan of Willesden, and Professor James Mackintosh, now of London, while ardent civil servants, were barriers against bureaucracy when it transgressed the medical field.

It was to some extent because of this integration and because of the respect and popularity in which the medical profession was held by the public that politicians of all parties were eager to make political capital out of what was already an effective service. Beveridge, the Liberal, Brown, the National Liberal, Willink, the Conservative, and Bevan, the Socialist, could not conceive a Welfare State in which the profession did not play a major part. In the end it fell to a Labour Government

to introduce legislation embodying much of what had been discussed and approved by *ad hoc* committees of all political parties, together with their professional and economic advisers.

The National Health Service

There is no doubt, and it would be foolish to deny, that the institution of the N.H.S. has effected many major improvements in the health facilities offered to the nation. As examples, one might cite the inclusion in the Service of that section of the population which, prior to the Act, was impoverished and uninsured. Many peripheral hospitals have been upgraded and expanded. There have been improvements in the mental health services. More attractive conditions have been provided for laboratory workers. These and many others are unquestionable advances. It would be wrong to think that these benefits could not have been achieved during the last ten years by any other means. Some would undoubtedly have evolved from the gradual expansion of the older voluntary schemes, the sources of which have now dried up. Private insurance would have looked after other aspects, as has happened in the United States. Local authorities would not have stood still on matters affecting the health of their community. Improvements would have certainly taken place. None the less, it is true to say that all the political parties were at the end of the war agreed that the Health Service should be taken over by the nation and financed by the nation, and as a result we have now had a National Health Service for almost ten years.

My purpose is to examine the effects of this Service upon the profession as a whole and to note whether any change has come over its component parts. For no matter how good the Health Service is to-day, and it is a good service, its future will depend essentially on the quality of the medical profession itself and the esteem in which it is held by the public.

No matter how excellent the administration, irrespective of the extent of the ancillary services (so-called) and regardless of the grants from the Exchequer, the health of the nation will depend upon the integrity, in its widest sense, of the medical profession. They represent the keystone of the arch upon which this mighty national edifice is supported.

To-day the Health Service is being maintained to a large extent by those who were trained and nurtured on ethical standards which existed before its introduction. I do not exclude from this group those younger doctors who, by example, precept, or natural inclination, have adopted similar standards. But while such members of the profession are bound to be affected by the revolution which has taken place, how much greater will be the effects upon those whose standards are based solely upon terms and conditions of the new Service. Let us examine the new situation and endeavour to ascertain, so far as is possible, how it affects the profession in the eyes of the public it seeks to serve.

The first fundamental consideration is that the general public feel that by their health contribution and by Exchequer grants they are paying for the medical service.

It is common knowledge that every member of the public to-day is entitled to the services of a general practitioner. The practitioner is paid according to the number of patients he may have to serve. Every patient is entitled to free hospital service, and these hospitals are manned by consultants and specialists, and specialists in training, who again are paid. The ancillary services—pathologists, bacteriologists, radiologists—are also the paid servants of the public. Thus there arises in the public mind a conviction that the services received have been paid for, and paid in full, and that such payment discharges further obligation to the profession. The profession cannot expect payment and gratitude in the proportion which was formerly given to it, for in former days gratitude was often all that doctors could expect.

Money and Medicine

Confused thinking about the relationship between money and medicine is not new. In 300 B.C. Aristotle, while defending just payment, pointed out that there were other considerations of imponderable value, and exemplified this by saying: "The quality of courage, for example, is not intended to make money, neither is this the aim of the general's or the physician's art, but the one aims at victory and the other at health." Indeed, this is an ever-recurring theme in the history of medicine. In 1903 Sir William Osler stated that in every age there have been Eliahs ready to give up in despair at the progress of commercialism in the profession (Osler, 1939), and himself quotes Garth in 1699 saying: "How sickening Physick hangs her pensive head. And what was once a Science, now's a Trade."

The regard of the public for the profession thrives upon deeper emotional roots than mere payment can satisfy. When men or women are sick they think in terms of human values rather than payment. The sick are frightened and we remove the fear; they are unhappy—we may bring some happiness. They are tiresome and exasperating to their relatives and even to themselves; we try to bring patience and understanding to comfort them. I should like to quote here from the great English poet John Donne in his "Devotions," which was written while he lay seriously ill during the winter of 1623; he wrote: "I observe the physician, with the same diligence as the disease; I see he fears, and I fear with him: I overtake him, I overrun him in his fear, and I go the faster because he makes his pace slow; I fear the more because he disguises his fear, and I see it with the more sharpness because he would not have me see it. He knows that his fear shall not disorder the practice and exercise of his art, but he knows that my fear may disorder the effect and working of his practice." These human values which the medical profession has to offer are perhaps its strongest contribution to society. If the enormous administrative machine which the N.H.S. has created or if other present-day attitudes cause decline in these human relationships, then the prestige of the profession will also fall.

We must, however, recognize that no profession maintains a static position. The teaching profession has suffered a change from the days of Oliver Goldsmith's rustics who, regarding the village teacher, "gazed and gazed and still the wonder grew that one small head could carry all he knew." There is little wonder left in the world to-day, and the teachers have, I think, less regard than is their due. Could this be the result of the absorption of their profession by the State machine? That interesting speculation must be left aside.

The position of the Church is more difficult to assess, for in the Ministry, considered as a profession, there is a vocational element even greater than in medicine. In the last century and the early part of the present one it commanded an almost universal respect. To-day it appears to have lost ground; whether this be due to internal schism or to the pressures and lures of advancing and applied science would be impossible to say, and again this problem would distract us from our own.

Practitioner-Consultant Relationship

Are there factors within our own profession to-day which might endanger its position? Let us examine such possible causes of disintegration, for if we are weak within we will be in no position to withstand assault from without. To take the relationship between general practitioner and consultant first. Is it what it was? Is there a cleavage here? Is there a possibility of disintegration arising in this field of medical relations? John Hunt (1957), in discussing the renaissance of general practice, makes reference to this question and concludes, "Family doctors and specialists have worked together, on the whole happily, for tens of thousands of years, and I believe they will continue to do so." His optimism may be justified,

but, as his observation was parenthetical to his main theme, he unfortunately adduces but slight evidence to support this view.

Unhappily, the mechanism of the schism is all too apparent. The general practitioner works under a totally different administrative structure from the specialist. The local medical committee has no counterpart amongst the consultants and specialists. The executive council, the immediate controlling and employing body, in the case of the general practitioner, is vastly different from the regional hospital board, the employer of the consultant, and again there is little or no liaison between them. This results in a division of the profession at the administrative level and in each side having little knowledge of the administrative problems of the other. There can be, and has been, disunity at the highest level when approaches are made to the Government: for example, at the inception of the Service the famous Presidents' letter to *The Times*, in which the Royal Colleges diverged sharply from the Negotiating Committee. Later, when unity has apparently and at least superficially been achieved, we see a separate and at least superficially achieved, we see a separate Danckwerts award to the practitioners. More recently still, divisions arise when negotiations break down and an exchange of letters between the President of the Royal College of Physicians of London and the Prime Minister still further divides the profession.

The policy of divide and rule which, as a political expedient, has been successfully employed by successive Governments in so many fields has not as yet been entirely successful in medicine. The credit for having withstood this assault and maintaining our integrity must accrue to those very leaders of the profession, both consultant and general practitioner, at whose heads so much criticism has been levelled by the rank and file. For when they have diverged and endangered professional unity they have until now quickly closed the breach. Divergence of opinion is inevitable and desirable in a healthy profession. Divergence in action, however, may lead to disintegration, and therein lies a danger of which we must be fully conscious.

If we examine still further the consultant-general practitioner relationship in its day-to-day aspects it is possible to detect a more insidious danger. I refer to the maintenance of a degree of private practice without or within the Health Service. If private practice perishes we have embarked upon a whole-time State salaried medical service, whether we like it or do not like it. Surely if such a salaried medical service is inevitable or desirable it should be imposed or accepted by a process of discussion and negotiation. If it were to arise simply as a result of the attrition of private practice, then later negotiations of the profession with the employing body would be from a position of weakness, and it is questionable whether medicine would receive much consideration from the controllers of the machinery of the State.

The maintenance of a strong practitioner-consultant relationship is essential to the survival of private practice on an ethical level. This exists to-day amongst the older general practitioners and consultants, but what of the young part-time consultants and senior registrars? How many young practitioners realize that their opposite number, the young specialist, is often part-time and that that part of his time which he lays aside for private practice can only be utilized by the general practitioner selecting suitable cases for him to see? It is easier and often quicker to recommend all patients without discrimination to hospital, but it is the sure way towards removing private practice from medicine and setting up a barrier between the practitioner and the consultant.

Association Through the Domiciliary Visit

Apart altogether from the angle of private practice, we have opportunities within the Act of associating consultants and practitioners through the medium of the properly conducted domiciliary visit. This excellent provision in the

Act has removed from the practitioner whose patient could not afford private care the need to ask a favour of the consultant. In the past these "favours" were freely given, and, as our Faculty states at the end of each of its minutes, "and the poor were visited gratis." Nevertheless, the practitioners who sought such help from a consultant might well feel embarrassed, and, as our American friends would say, unduly obligated to him. To-day that feeling no longer exists; the basis of consultation is on an equal footing. But consultation must take place. We are all aware that domiciliary visits are sometimes paid by the consultant in the absence of the family doctor. Such an occurrence is very occasionally unavoidable, but were it to become prevalent it would destroy the basis of consultation, and, to quote from John Donne once more: "When there is room for consultation things are not desperate. They consult; so there is nothing rashly, inconsiderately done; and then they write, they prescribe, so there is nothing covertly, disguisedly, unavowedly done."

We have managed to achieve great equality in the profession in this country, and that equality depends in no small measure upon the interdependence of the consultant and the general practitioner. It is by no means so in the so-called egalitarian countries where private practice is non-existent. There the hospital chief has a position of privilege and respect far greater than his fellow doctors—a curious paradox which has never existed in Great Britain. On this matter I should again like to quote from Hunt's Lloyd Roberts Lecture (it should be noted that he is not referring to private practice): "A specialist appreciates a general practitioner who uses him efficiently; and often there are no greater friends or more loyal colleagues than a general practitioner with a special interest and a consultant in that subject, be they neighbours or many miles apart. They speak the same technical language, and learn from each other every time they meet. Such close and friendly co-operation between general practitioners and consultants is possible in all branches of medicine, and is much to be desired."

The College of General Practitioners, recently founded, is a most encouraging move towards greater unity among doctors. In contrast to the British Medical Association, which embraces all branches of the profession and which nowadays is forced more and more to be concerned with administrative, financial, and negotiating duties, the College of General Practitioners is drawn solely from one section of the medical community, and could move either towards or away from its sister colleges and associations. All the indications, however, are towards union. No single agency could have done more than the College of General Practitioners to develop a proper liaison between the two great branches of the profession. Already they have in the West of Scotland instituted postgraduate courses and brought once more within the ambit of the hospital many doctors who would otherwise have been excluded.

Whole- and Part-time Consultants

Having touched on the relationship or integration of the two main branches of the profession, it might be of interest to turn for a moment to the specialists and consultants themselves—the teachers, the non-teachers, the basic research workers, the clinical research workers—and to observe to what extent this section of the profession is within itself integrated (I refer to the whole-time consultants and the part-time consultants).

One of the better features of the National Health Service is that the conditions allow the consultant to practise either whole-time or part-time. The value of this system is that it allows a consultant to choose the form of service which suits his own particular temperament and gives the patient a freedom of choice of specialists which would otherwise be unobtainable. As the relationship between consultant and patient should always be to some extent personal and humanistic, it follows that the advantages or disadvantages of one or other form of service (whole- or

part-time) will seem different to doctors of different temperaments. Thus there can be no uniformity of opinion on the relative advantages or disadvantages of the two methods.

Many influences serve to direct the doctor to a particular form of medical hospital practice: chance; a desire to pursue a specialty such as laboratory medicine where the posts are full-time; geographical conditions; domestic considerations; personal economics; or a liking for a particular type of life—all or any of these and possibly others enter into the decision. It is desirable that facilities should exist in hospital practice for each type of work. It would be entirely wrong to consider that one is "better" than another, or that all doctors should be expected to undertake their work under the same conditions. It is undesirable to imply that there is some fundamental difference between those who prefer whole-time and those who prefer part-time work.

Differences sometimes arise between those involved in original or basic research and those whose interests lie more particularly in the clinical field. Intellectual snobbery on the part of the basic scientist may lead him to denigrate the work of the clinical research worker, and much more so the clinician who has no aptitude for research but is yet none the less competent in the practical field. Equal and opposite is the sneering or patronizing attitude of some clinicians towards the "backroom boys." Both attitudes are deplorable, and the reputation of the profession is tarnished by such lack of sympathetic understanding. Osler (1897) puts it well when he tells us that medicine is seen at its best in men whose faculties have had the highest and most harmonious culture—the Harveys, the Pagets, the Jenners, the Gairdners. These and men like them have been the heaven which has raised our profession above the dead level of a business.

Our Clear Duty

If we turn now from the possibilities of disintegration of the medical profession from within we become conscious of many new trends which may affect us from without.

The profession to-day can be profoundly influenced by the actions of the new bodies concerned with the administration of the Health Service—regional boards, executive councils, hospital boards of management, and many other administrative committees, local, regional, and even national—upon which we as a profession have representation.

It is perhaps a truism to mention that our only title to sit on these various bodies is that we are members of the medical profession. The other members of these committees are widely chosen from every walk of life, and are mostly recommended representatives of other interested bodies, local authorities, universities, trade unions. Such lay representatives are usually drawn from people who have shown some aptitude for public service; they give of their time and service voluntarily. The impact which our representatives make upon this cross-section of the intelligent public can be immense for good or ill. We as a profession may well be judged, and often are judged, by the behaviour of our representatives upon these various committees throughout the country. Never before have our representatives had such a platform; never before has there been such potential for advertising the credit or bankruptcy of the profession. Therefore it is our clear duty to choose from ourselves those who most truly represent us. It is the duty of those chosen to serve, and, in serving, to realize the importance of the trust imposed upon them, not as individuals but as members of a learned and honourable profession.

Relations with the Press

If we wish to examine still further the impact of our profession upon the mass of the general public we would do well to consider our relations with the press. This new mammoth moulder of public opinion was described recently by the Moderator of the General Assembly of the Church of Scotland as follows: "Sensational newspapers are in-

creasingly mastering the minds of men to-day as much as kings mastered them in former times." There is no doubt that to-day the press and its close relations, radio and television broadcasting, are not only organs of opinion but often organizers of opinion. Properly utilized, they can confer considerable benefits on society as regards the medical education of the public. Improperly used, they can cause infinite harm by instilling fear and even panic, or by arousing antagonisms between professions or within professions themselves. We have only to recall their handling of such difficult problems as the availability of polio or Salk vaccines, not to mention their current campaign on influenza vaccination, to realize that they have an enormous power. Inflammatory references to a strike of doctors are examples in another field.

Our professional administrative bodies, and even our professional medical incorporations and associations, have perhaps paid too little attention to the importance of a proper public relations mechanism whereby the considered opinions of the profession as a whole are communicated in proper form to the public through the press. As a result the press will seize upon a story or a name and give publicity to some facet of medicine which is actually harmful to their millions of readers.

Of this wide subject, which will be debated at another meeting of our society, I should like to consider only one aspect—namely, medical anonymity. Anonymity has long been a bulwark of correct professional behaviour in this country, and when it is grossly abused can even be considered by the General Medical Council as infamous conduct. There are those in our profession to-day who regard medical anonymity as an anachronism in modern times. One learned professor bemoans the fact that he cannot have the publicity for his utterances that is accorded to those of Sir Mortimer Wheeler or Bertrand Russell—he surely forgets that to be a distinguished member of our ancient profession should be in itself sufficient reward and that if he is worthy of acclaim he will be accorded it by his peers and not by sensation-seeking journalists or impresarios of the stage, screen, or radio. If we look back to Aristotle, we find him saying in his examination of the problems of the reasons for and against sovereignty of the people—and this question of press publicity has just that element behind it—"He who can judge of the healing of a sick man would be one who could himself treat his disease and make him whole—that is, in other words, the physician; and so in all professions and arts. As then the physician ought to be called to account by physicians, so ought men in general to be called to account by their peers."

Make no mistake, certain sections of the press are anxious to break down professional anonymity. Adversity, in the shape of failure to obtain signed medical articles, makes strange bedfellows when we have Francis Williams, the left-wing editor of *Forward*, joining the Conservative contrailing and oddly anonymous "Pharos" of the *Spectator* in deploring medical anonymity.

The public, by and large, are incapable of assessing the worth of medical articles; it would be wrong to place upon them the further burden of trying to assess the worth of the various authors. Our American colleagues have been lax in this respect, and the increasing health hysteria of the American public can be partially accounted for by this lapse from medical wisdom and discretion.

Playing the Greater Part

It would be proper to say that in reviewing the integrity of the medical profession I have largely concerned myself with British medicine. We have a greater part to play in medicine throughout the world. We must strive to maintain high standards throughout the Commonwealth, and we must try to look on our Commonwealth as an opportunity to enlarge our unity. We must welcome our colleagues from abroad and must travel among them ourselves, conscious and proud of our common membership of a high

calling. We must try to encourage overseas visitors to study in our hospitals, to strive for our higher medical degrees. We would do well to spread the net even more widely by encouraging general practitioners from abroad to associate themselves for a period of time with the leading members of that branch of medicine in this country. For if our pro-

fession is healthy and active—and I believe it is—then Britain could become a Mecca of medical learning.

SOME COMMONWEALTH COMMENTS

THE NATIONAL HEALTH SERVICE IN AUSTRALIA

BY

RONALD R. WINTON, M.B., B.S.

Editor of the Medical Journal of Australia

Recently Mr. Malcolm Muggeridge, who is visiting Australia, broadcast over the Australian national network. Amongst other matters he referred to the Welfare State and commented: "This Welfare State is a kind of zoo, which provides its inmates with ease and comfort but unfits them for life in their natural habitat. Mangy and bleary-eyed, they grumble and growl as they walk up and down their cages waiting for slabs of welfare to be thrown to them at meal-times."

This was a considerable overstatement, and no doubt Mr. Muggeridge was quite conscious of that fact, but his comment contains enough truth to arouse suspicion about the Welfare State and its implications—suspicion which has been felt for a long time by a strong body of public opinion in Australia, and which has undoubtedly influenced the development of our National Health Service.

It is generally conceded that the complexities of our age place an increasing and often intolerable burden on the weaker brother in most communities, and society's sense of collective responsibility for him has grown. This is right and good. The problems arise when we debate how that responsibility should be discharged.

In Australia the view has prevailed that the benevolent but bureaucratic grandfather who presides over the Welfare State is not for us. Various social services provide for those with genuine needs, but a premium is still put on self-reliance and independence of spirit. This is especially so in the National Health Service. The position was well expressed by Sir Earle Page, then Commonwealth Minister for Health, in a speech in the House of Representatives in Canberra on October 26, 1955:

"Our programme has been carried out by the active, co-operative and intelligent partnership of governments, hospitals and staffs, doctors, chemists, insurance organizations and individuals. This partnership encourages and stimulates self-help, which helps the whole community. It dovetails together the various phases of the health organization which act and interact cumulatively on one another to secure the best results for the sick and other elements of the partnership. Each partner has defined functions and obligations with the aim, within its specific field, of implementing measures to cure disease, shorten the duration of sickness and to make the scheme pay more back to the community than it costs."

These words are still true in 1958. Despite certain defects, which will be mentioned later, the National Health Service in Australia is working well. It is

generally acceptable to the Government, to the people, and to those who have to work it, and, as we see it, favours the best interests of the community.

Principal Aspects of the Service

The National Health Service in Australia has many ramifications, but four aspects need special mention: (1) the provision of medical benefits, (2) the provision of hospital benefits, (3) the pensioner medical service, and (4) the free provision of certain essential drugs.

Medical Benefits

The essence of the medical benefits system is that the Commonwealth Government encourages the people to join voluntary insurance schemes run by non-governmental agencies. Members of these schemes have the choice of a number of contribution scales, corresponding to which are scales of benefits to be paid by the fund to the contributor should he incur medical expenses. The Commonwealth Government itself provides a benefit, there being a benefit for every type of service received. The voluntary insurance fund's benefit must at least match the Government's benefit, but the total benefit paid must not exceed 90% of the doctor's charge. The following points should be stressed: (1) The doctor charges the patient on the usual fee-for-service basis. (2) The Government and the benefits fund normally do not pay the doctor direct, but reimburse the patient; that is to say, no third party intervenes between patient and doctor. (3) The patient always pays part of the fee as well as contributing to the insurance fund. (4) The Government pays its share of the benefit through the fund, not direct to the patient. (5) The patient receives no Government benefit unless he is a member of a fund. (6) There is complete freedom of choice of doctor by patient, and of patient by doctor. (7) There is no State interference in where and how a doctor practises, provided he observes the usual ethical and legal requirements.

It is unnecessary to labour the fact that this system differs in both principle and practice from the British system. Its great advantages, in our eyes at least, are that it leaves intact the time-honoured doctor-patient relationship, it encourages self-help rather than dependence on the State, and yet it relieves the patient of much of the financial burden of medical treatment. At the same time the Australian doctor remains free of the bureaucratic control that appears to prevail in Britain.

Hospital Benefits

Hospital benefits are also managed according to contributory schemes, with the exception that a Government benefit is paid in every case, whether or not the patient belongs to a contributory scheme. However, the amount of the Government benefit is much greater if the patient is a contributor to a fund; and this, with the benefit from the fund itself, is usually sufficient (it may even be more than sufficient) to pay the hospital fee. An important advantage of this system is that it allows a patient of moderate means

to be treated in a private hospital by the doctor of his choice. If this, with or without the assistance of the benefit scheme, is beyond his means, he may still seek treatment at a public hospital; there medical treatment is free, whether the visiting medical staff is paid, as it is in Queensland and a few other places, or whether it attends on an honorary basis, as it still does in most places. In most hospitals, again with the notable exception of Queensland, a means test is imposed.

Pensioner Medical Service

For recipients of old age, invalid, and certain other pensions, which are governed by means tests, the Government provides free medical treatment, covering the usual general practitioner services, and a wide range of free medicines (basically those drugs listed in the current *British Pharmacopoeia* with certain additions). However, even here there is for all practical purposes free choice of patient by doctor and of doctor by patient; and although for convenience the doctor is paid direct by the Government on submission of a voucher signed by the patient, he is in fact only acting as the patient's agent and has no personal contract with the Government. Thus the doctor-patient relationship is maintained without intervention of a third party. Some time ago the Commonwealth Government liberalized the means test for the old-age pension and brought a large number of members of a higher-income group within its provisions. However, as a result of representations by the British Medical Association, this last group is not eligible for the free pensioner medical service and is encouraged to subscribe to a medical benefits fund. This no doubt has caused a certain amount of heartburning, but the profession has remained firm in its attitude lest the extension of this free service to a higher-income group should be the thin end of a wedge leading to a general free national medical service.

The fee paid by the Government for medical attendance on a pensioner is less than that normally charged by a doctor to his private patients. The profession has always emphasized that it is thus providing a service at a concessional rate. The Government justifies the lower rate on the grounds that the doctor is assured of payment, whereas in the past it was the custom to treat pensioners either free or for a very small fee.

Free Essential Drugs

Apart from the more extensive provision of free drugs for pensioners, a carefully controlled list of essential drugs is provided free for all patients on production of a doctor's prescription. These are usually described as "life-saving and disease-preventing drugs," although the list is a little broader than the description implies. It includes such things as the antibiotics and sulphonamides, insulin, a number of cardiac drugs, vitamin B₁₂, injectable analgesics, the main vaccines and antisera, and various others. It excludes compounded preparations. The list is strictly controlled, being determined by an expert advisory committee, the four medical members of which are appointed from a panel nominated by the British Medical Association. It is not intended to provide "free medicine" in any extensive way; so it does not encourage the prescription of useless bottles of medicine to please the patient, and it keeps the cost to the country within reasonable bounds. This, we understand, is in favourable contrast with the situation in Britain.

Other Provisions

Among other important though lesser provisions of the National Health Service are the free supply of milk to school-children and a liberal system of pensions for sufferers from tuberculosis, designed to ensure that they can commit themselves to adequate treatment without undue worry about the economic needs of their dependants.

Defects in the Service

Experience with the National Health Service in Australia has revealed or emphasized certain defects. Two are most important. The first is that the benefit schemes mostly exclude pre-existing chronic ailments from those for which benefits are paid. The second is that benefits are inadequate in certain cases, especially in relation to the catastrophic type of illness. These are serious defects, since they amount to the position that the service either does not provide or provides inadequately for certain of the groups in the community that most need help.

Both the Government and the organized medical profession are well aware of these defects and are anxious to overcome them. There is hope that at least a partial solution will be found soon, but any solution will inevitably mean greatly increased Government expenditure.

From the doctor's point of view there are two unsatisfactory aspects of the present hospital benefits system. The first is that the means test is not always enforced, so that the doctor gives honorary service to those who are quite able to pay. The second is that if a member of a benefits fund is treated in a public ward the doctor may not charge him a fee, and the benefit theoretically due goes unpaid. From the patient's point of view the hospital benefits system does not, of course, cover the cost of a bed in a more expensive private hospital.

The important point, however, is that these are all defects of detail. The principles of the scheme are, we believe, essentially sound.

Medico-political Background

The picture of the existing National Health Service is incomplete without some reference to its political and medico-political background.

In the 1940's the medical profession in Australia through the Federal Council of the British Medical Association engaged in prolonged negotiations and eventually in pitched battle with the Government of the day over the latter's proposed health service. This was essentially a nationalized service, unacceptable to the medical profession in principle and in detail. The profession's opposition was remarkably successful, and the Government concerned went out of office without putting its health scheme into effect. The outlook of the new Government was essentially different, and the new Minister for Health, Sir Earle Page, was a practising medical man fully appreciative of the profession's views. Under his guidance the present scheme was evolved and brought into use. On Sir Earle Page's retirement from the Health portfolio another practising medical man, Dr. Donald Cameron, took his place. It is hoped that he will find the remedy to the present defects of the Service, so that it will be politically unassailable.

The present Federal Opposition party has given much thought to the National Health Service, and to what it would do should it again assume control of the Government at a future election. A short time ago a sectional committee of the Opposition Party produced a plan for a National Health Service based very closely on the British Service. This was never officially accepted by the party, and it is understood that the plan has been abandoned, or at any rate shelved. However, nationalization is a major plank in this party's platform, and it would be unwise to attempt to prophesy its future health policy.

It should be mentioned in passing that the organized medical profession in Australia is not involved in party politics. It has when necessary opposed both right- and left-wing parties on matters of principle, and it is prepared, on the other hand, to co-operate in any satisfactory health scheme irrespective of the politics of the party in power.

The profession is wholly opposed to any health scheme which interposes a third party between the doctor and patient or which involves bureaucratic control and excessive

paper work. It dislikes capitation and salaried services, and is committed to maintain the fee-for-service method of payment so far as is practically possible. It is apprehensive about the abuses so often associated with completely free services. Its members are in general sincerely concerned that they should render a sound medical service to their patients, and, looking at the matter realistically, are unable to dissociate this from satisfactory working conditions and reasonable payment. They accept the present National Health Service as sound in principle, and look to see its defects in detail overcome.

As it happens, the profession is at present fortunate. Having one of its members as a Minister for Health is a tremendous advantage; but when it comes to a dispute the profession is still in a strong position. Practically all its practising members belong to the British Medical Association, which has in broad terms been conceded the leadership of the profession in medico-political negotiations. The profession also enjoys good social status in the community.

Traditionally, medical practice in Australia is free and its standard high. While the profession remains united there is little reason to fear any interference with this tradition.

The Australian and British Health Services

As we see it in Australia, our Health Service is fundamentally different from the British Service. Its great advantage is that it is sound in principle from the point of view of all parties; its defects are in detail. The British Service would appear to be unsound in principle, interfering with the freedom and so the effectiveness of medical practice, intervening in the doctor-patient relationship, and breeding an attitude of State-dependence. Frankly, we find it incongruous and depressing to contemplate, nourished as we are, perhaps more than any other Dominion, on the idea of Britain as the home of the free.

There may be advantages in the British National Health Service that we do not see, and it would be both odious and dangerous for us to be smug. Nevertheless, our scheme appears to be sound, and it should remain so while our politicians and the community generally continue to turn a deaf ear to the siren songs of the Welfare State.

HEALTH INSURANCE IN CANADA AND BRITAIN

BY

STANLEY GILDER, M.B., B.Sc.

Editor of the Canadian Medical Association Journal

With the rapid development of a universal hospital insurance scheme in Canada during the last year, it is tempting to make comparisons between the Canadian scene in 1958 and the British scene in 1948. Unfortunately, this is an impossible task, for the thought of a comparison on a national scale can spring only from an illusion, widespread in Britain and the rest of Europe, that Canada may be regarded as an entity for such a purpose. Now Canada has ten provinces, and it was long ago laid down that the health of the population should be a provincial and not a national matter. It is true that there is a Ministry of National Health and Welfare in Ottawa as a part of the federal Government, but it is mainly concerned with such matters as cannot be properly dealt with by provincial health ministries.

Thus at no time in the foreseeable future will there be a uniform pattern of health insurance across Canada; each province will decide for itself whether it wants a universal insurance scheme, what sort of a scheme it wants, how it is to be paid for, and how administered.

That is why the provisions of the new Bill 320, which governs hospital insurance in Canada on a basis of universal availability within a province and joint provincial-federal financing, have purposely been left vague. Each province must write in the details itself, and each provincial medical association must, if it can, negotiate such agreements as are necessary to work the scheme with its own provincial Government. And these Governments may of course be of a different political hue from the federal Government, which is at present overwhelmingly conservative. Indeed, many Canadian voters apparently see no inconsistency in voting for one party at provincial elections and another at federal elections.

Hospital Insurance

The present pattern across Canada varies greatly from province to province, although indications are that within the next few months all but one of the 10 provinces will be operating some hospital insurance scheme backed by federal and provincial money—some of course have already started. The one exception is the province of Quebec, where the inscrutable Mr. Duplessis, Premier of the province and an ardent champion of its independence, has not seen fit to inform the medical profession—or, for that matter, anyone else—on his plans for the future. Characteristically, he recently announced that he would construct health centres (presumably for diagnostic work), beginning with a pilot project in Montreal, but gave no clue to their administration or financing or staffing. At the other end of the scale is Ontario, where the Ontario Medical Association, the provincial division of the Canadian Medical Association, has a representative on the six-man commission which will administer the forthcoming compulsory hospital insurance plan.

But it must not be thought that this diversity implies a chaotic situation across Canada. Absence of the European passion for standardization has not affected the basic questions at all. As regards hospitalization, there are two questions that the Canadian citizen needs to know the answer to: (1) If I am indigent, can I still get hospital care? (2) If I am healthy and working, can I insure against any medical care in hospital that I may need in the future? Or, if I am out of hospital but handicapped (say by diabetes or degenerative heart disease) can I still insure against future hospital costs? The answer to the first question is that for many years the indigent have been able to get free treatment in any of the provinces. Sometimes the hospital or the physician has received a fee for such service; more often he has not. The answer to the second question is that within the near future this will be possible in all the provinces with the exception noted—and maybe the situation will change even there.

How the insurance money is collected is a secondary matter. It may be by a sales tax or by regular premiums deducted from a pay-roll, or by municipal or provincial taxes; or it may change from time to time (for instance, in British Columbia payment was at first by premium and later by a sales tax, which has now reached 5%). The method of administration is also secondary—it may be through a provincial hospital commission, with or without medical society representation, or even at the municipal level with a minimum of provincial supervision.

Attitude of the Profession

What has the attitude of organized medicine in Canada been to health insurance in general? I think it has been a more positive one than that of the British physician before 1948 was. The Canadian Medical Association began to study health insurance as early as 1934, and, after a decade during which it debated often and at length the issues involved, the Association formulated certain "Principles of Health Insurance" and thus gave its official blessing to the

concept of prepayment for medical care. In 1955 the General Council of the Association published a statement on health insurance acceptable to all its provincial divisions. Perhaps the most important thought in this was that prepaid health care should be introduced by stages, and that hospital care and diagnostic services should be the first steps. The Association also felt strongly that representatives of organized medicine should participate in the administration of insurance plans, and not only in an advisory capacity. This goal has not been achieved in most provinces. Within the last couple of years the Association has appointed a strong advisory committee to the federal Government, drawn from the officers and officials of the Association, and this committee has had an opportunity of putting the views of organized medicine before the Minister of National Health and Welfare in Ottawa, and also before the Prime Minister, Mr. Diefenbaker.

For a symposium on hospital insurance in Canada, prepared in collaboration with the C.M.A. Committee on Economics, the reader is referred to the May 15 issue of the *Canadian Medical Association Journal*, in which the present situation in Canada is discussed from many standpoints—organized medicine, the Government administrator, the hospital administrator, the prepaid-plan administrator, the teacher, and the surveyor of hospitals. This issue gives some idea of the views of physicians in various provinces which already have experience of a universal hospital insurance scheme.

Organized Medicine in the Various Provinces

It must be remembered that universal provincial hospital insurance began in Canada in January, 1947, when the Saskatchewan Government brought in the first compulsory hospital plan on the North American continent; this was followed by a British Columbia plan in 1949, and an Alberta plan in 1950. The Saskatchewan plan was first operated by a hospital commission, but is now administered by the provincial department of public health; and in the symposium referred to above Lloyd Brown (1958) notes that, while much valuable work has been done, "it has been difficult to maintain a healthy liaison between government and associated vitally concerned groups, who are allowed to function or contribute only from a substantial distance." He gives examples of the dangers of the present system, as in 1956 when the Government decided without prior consultation to include payment for all out-patient pathology studies at an arbitrary rate.

In British Columbia the relationship between the profession and the Government has been unsatisfactory. (An illustration of this is the somewhat tolerant attitude of certain legislators to naturopaths, chiropractors, and cancer quacks.) Watson (1958) points out that hospital insurance was foisted on an unprepared profession in 1949 without prior discussion, and that liaison between the provincial medical society and the Government was not obtained until six years later—even so, it is only an unofficial committee which binds the two together. The substitution of a sales tax for individual premiums seems to have diminished the responsibility of the individual citizen according to Watson. The most dangerous aspect of the scheme is that in 1952 hospital budgets and numbers of personnel and services were frozen, so that no improvement in services in the last six years has been financially possible.

In Alberta, where the patient is expected to pay two dollars (roughly 14s.) a day in a public ward for hospital care, drugs, operating-room fees, and diagnostic tests, Morgan (1958) reports lengthening waiting-lists for admission in some areas, due to an increase in admission for investigation, since the Government will not pay for out-patient investigations. He feels that an extension of the insurance programme to cover out-patient services is inevitable. The main concern of organized medicine in this province has been to maintain the radiologist and the pathologist as independent practitioners rather than employees of a hospital.

Newfoundland has long had a system of coverage for its cottage hospitals, which serve the community in the lonely outposts, and recently its energetic premier, Mr. Smallwood, burst forth with a scheme for free treatment of children under the age of 16 which took the profession by surprise. However, harmony seems to have been restored, and a satisfactory agreement has been negotiated between the provincial Government and the local division of the Canadian Medical Association to implement this unique service.

Five other provinces are in process of organizing their hospital insurance scheme. One might cite Nova Scotia and Ontario in particular as areas where the provincial medical association is involved in the planning of the Service. The Nova Scotia profession seems to be lending its Government much-needed help in clarifying some of the medical issues involved. The Ontario Medical Association has been very active in medical economics for some time. The Association presented a brief to its provincial Government, indicating that it favoured basic ward-care insurance for every citizen, administration of the insurance scheme by a commission (on which it now has a representative), separation of "hospital" from "physicians'" services in financing and administration, and payment of medical services by fee for service. Its brief was well received, and since the setting up of the Ontario Hospital Commission the Executive Committee of the O.M.A. has acted as a liaison body between organized medicine and the Government. On the advice of the O.M.A., the insurance plan is to include only in-patients at first.

Looking at Bill 320 or the Hospital Insurance and Diagnostic Services Act, passed unanimously by the Parliament of Canada last year, and providing for universally available schemes financed jointly by federal and provincial Governments, one can distinguish certain areas which have aroused and will continue to arouse great controversy. A vexed question is that of the distinction between "hospital" and "physicians'" services. Should a pathologist or a radiologist giving service to in-patients be regarded as giving hospital or physician's services? Ought he to be a salaried employee of the hospital or a man working on fee for service, or a combination of both? This situation is complicated by the fact that in some provinces some radiologists are on salary and others are not. In British Columbia the radiologist is a salaried employee of the hospital, so is the pathologist, but the anaesthetist is an individual practitioner using hospital facilities like the surgeon or physician. These difficulties are as yet unresolved. Again, the question of inclusion of out-patient facilities in insurance schemes has as yet no complete answer. If they are not to be included there is going to be a great deal of unnecessary utilization of hospital beds for investigations; if they are included, the question of remuneration of medical staff comes in to complicate the picture.

The question of deterrents to frivolous use of hospital beds is also unanswered. Payment of small sums by the patient each time he uses the hospital, as a deterrent, is not much in favour with politicians, though if the patient were made to pay for the first few days in hospital the costs of a scheme would be cut enormously. On the other hand, there is a distressing tendency, openly expressed in Manitoba recently, to make the doctor the scapegoat for excessive use of beds. British physicians will not need to be told how exasperating this attitude is; at the recent annual meeting of the Ontario Medical Association, the provincial Government was told plainly that the doctors would not be responsible for any consequences of overuse. It is the duty of the Government to arrange an educational campaign designed to remind citizens of their responsibility in these matters; with the present shortage of beds in Ontario, however, one doubts and fears.

Two Troublesome Problems

There are two other worrying aspects of hospital insurance which have not caused trouble in Britain. The first is the provision of teaching-beds. In Canada, in general, the

number of public-ward beds has gradually shrunk, and, conversely, the number of semi-private or private beds has increased, concomitantly with the spread of private insurance schemes. Since in the great majority of hospitals only the public-ward patients are used for teaching medical students, medical educators have been alarmed at the prospect of inadequate material. Their alarm was expressed in a brief to the Minister of National Health and Welfare last autumn, asking for safeguards in any legislation or regulations concerning hospital insurance to assure that every school of medicine should have enough beds under the control of the faculty of medicine (10 beds per senior student was recommended as a minimum). The solution to this will be to make available for teaching all patients admitted to hospitals connected with a medical school. This has been done in the comparatively new University Hospital in Saskatoon.

The other problem is that of hospital accreditation. For some years a joint commission of U.S. and Canadian representatives has surveyed hospitals in Canada at their own request, and either granted or refused accreditation in accordance with certain standards. The time has now come when Canada feels that it can be independent of the U.S.A. in this field. Accordingly, from January 1, 1959, a Canadian Commission on Hospital Accreditation, which has already been working through the older joint commission for five years, will take over sole responsibility for accreditation of Canadian hospitals. This commission is a fine example of the good work that voluntary bodies can do. It was formed when the Canadian Medical Association invited the Canadian Hospital Association, the Royal College of Physicians and Surgeons of Canada, and L'Association des Médecins de Langue Française du Canada to establish an accrediting body. In a pertinent article Kirk Lyon (1958) expressed the hope that provincial Governments would not see fit to exercise their rights under Bill 320 and establish ten governmental bodies in the ten provinces to enforce standards in the hospitals under their jurisdiction, with the principle of grants as rewards, or monetary penalties for failure to meet standards.

It is natural that Canadian doctors, faced with hospital insurance and the distinct possibility of Government-sponsored plans for medical care insurance outside hospital at some date in the foreseeable future, should look at the National Health Service in Britain with critical eyes. They recognize that the situation is very different in the two countries. The N.H.S. was introduced at a time when many British doctors had only just come back from a lengthy spell of national service, and had not yet been given time or opportunity to taste the fruits of peaceful private practice—at a time, too, when their country was facing poverty and bankruptcy. Health insurance is coming to a prosperous and expanding Canada with a philosophy very different from that of the Welfare State, and it would seem invidious to make any comparison between the two countries. Nevertheless, it may be helpful to quote the Past-President of the Canadian Medical Association, Dr. Morley Young (1958), a man who has given much thought to the subject and whose words would find a wide assent among informed Canadian physicians. He says: "May we be bold enough at this time to look at the British scene and say: (1) The whole scheme was introduced too suddenly; (2) somehow, somewhere, liaison with Government failed; (3) the medical profession did not appear to speak with one voice; (4) the general practitioner was denied hospital privileges."

It will have been perceived, from what has been written above, that Canada is trying not to make the mistake of biting off too much at once. First the hospital service, then the diagnostic service, then the out-patient service, then . . . ? Canadian medicine is also trying with all its might to retain close contact with Government both in Ottawa and in the provinces, being as helpful as it can in areas of agreement and as reasonable as it can in areas of disagreement. The Canadian Medical Association and its provincial divisions are striving to maintain at all costs the unity of the profession, and to negotiate with Govern-

ments through one and only one body, no matter what branch of the profession is involved. Lastly, there is now a widespread belief in Canada that general practitioners need hospital privileges of some sort if they are to function efficiently. To quote Dr. Young again: "... I have said that when hospital privileges are denied a medical practitioner, for any reason whatsoever, his standard of practice is at once lowered."

THE SOCIAL SECURITY MEDICAL SERVICES IN NEW ZEALAND

BY

J. P. S. JAMIESON, C.B.E., M.D., F.R.A.C.S.

President, New Zealand Branch, B.M.A., 1938-9; Chairman, National Health Insurance Committee of the New Zealand Branch Council, B.M.A., 1935 to 1945

To understand the social security medical services in New Zealand it is necessary to take a glance at the system which existed before their introduction, and also at the controversies that accompanied their development.

New Zealand never had a "panel system" like that of Great Britain after 1911. Medical practice remained mainly private practice for thirty years longer. Public hospitals, financed by local rates, government subsidy, patients' fees, and voluntary contributions, and administered by local boards, served all parts. Staffing was by skeleton interns, filled out by honoraries. There were many small private hospitals. The bulk of the wage-earning people obtained their domiciliary attendance through the friendly societies. Better-off people paid for themselves. The poor were assisted by hospital boards, and relied largely on the benevolent services of the doctors. Specialists were few and almost confined to the four cities. Hence doctors, generally, had to be prepared to deal with whatever turned up. As a consequence few, if any, countries had such a large proportion of men with senior qualifications in general practice. Over all presided, not very obtrusively, the first Government Department of Health ever set up in the British Empire.

Preparations for a Health Service

In the early 'thirties, during the hardships of "the depression," it became evident that a greater participation by the State in health matters was inevitable. Realizing this, the New Zealand Branch of the British Medical Association set up a committee to investigate, acquire data, and prepare plans. Over a period of two years this committee examined the needs of its own country and inquired into the systems of other countries. It was assisted by the Association in Great Britain, by the British Ministry of Health, and by travelling members of the Branch. At the change of government in 1935 the Branch offered its assistance to the Government of the day. Years of discussion followed.

Briefly paraphrased, the advice of the Branch was to proceed gradually by evolutionary stages, first making

improvements where most necessary and lightening burdens where they pressed most heavily. Emphasis to be on prevention and research. The costly parts of diagnosis—x-ray examination and laboratory and pathological investigation—to be made more accessible. Those unable to pay for medical services to receive them free, at cost of the State. The cost of maternity and hospitals to be lightened. Those with smaller incomes to be insured against sickness in the home on a contributory subsidized basis. Those with higher incomes to make their own arrangements, insurance being open to them. Essential and costly drugs to be made available, but not those that people customarily bought without prescription of their own preference.

Negotiation with the Government was not easy. Objection was made to our advice that it involved "discrimination," and the Government's own ideas were never fully disclosed. Very gradually it became clear that their mind was set on no evolutionary process, but on a universal revolutionary system by which, in keeping with the ideology of "State ownership and control," all medical service would be entirely under the Government, and all doctors would become virtually State employees. The State as paymaster struck at the root of the "patient-doctor" relationship, and the prospect of regimentation was seen. The Social Security Act was passed in 1938, and the profession drew itself together in defence of its freedom. The solidarity of the profession was remarkable. More than 90% stood firmly behind the efforts of the Branch.

The Government pressed on to "implement" its plans. Free mental hospital treatment was first introduced, followed by the offer of a free maternity contract. This was a crude, coercive plan at flat rate. Only a handful were prepared to accept it. On its failure the Minister invited the Branch to draw up its own scheme. This was done, the officers of the Department of Health participating. The Act was amended, and the maternity service so brought in has worked well ever since. Then came free pharmaceutical service. The Government had been well warned by the Branch that, without safeguards, this would become costly beyond commensurate benefit. The warning was brushed aside.

Introduction of Services

In spite of the fact that the war was now in full blast and at least a third of the doctors had been absorbed in military service, and were thereby voiceless, in quick succession came Free General Medical Service and Free Hospital Service. The latter involved only a change from the former honorary hospital appointments to a part-time, paid, surgical, medical, and specialist service in hospitals. The General Medical Service was more difficult.

At first there was a Government suggestion of "zoning": one doctor on State pay for so many people over such-and-such an area—like a milk-run. This idea had a short life, and has been forgotten. Next the Government offered a capitation contract of its own devising at 15s. per head per annum. A very few doctors accepted this, and some of them quickly made their fortune thereby, on account of huge lists. Over 90% stood firm and would not accept the contract; for capitation as a basis of medical service was repugnant, and still remains so.

On the failure of the capitation contract the Government introduced a "fee-for-service" system, at 7s. 6d. for consultation or visit, 12s. 6d. for consultation or visit at night and on Sundays and statutory holidays, and mileage for country visits.

Although the officers of the Branch saw in this the danger of the State interposing between patient and doctor and ultimate domination of the profession, the prospect of every service being paid for, with no bad debts, was so attractive that some members were shaken; but the Branch stood firm. At this juncture the Prime Minister intervened with the proposal of an alternative to the "fee-for-service" claim

on the Fund by every general practitioner. He suggested that those who preferred might charge the patient himself such fee as he thought fit, and the patient could obtain, on presentation of his receipted account, a refund equal to the fee-for-service payments. It was instantly seen that by this method the State did not come between doctor and patient, the patient-doctor relationship was preserved, and the doctor would not be in any sense a Government servant in his practice. The proposal was accepted on the spot. So there came into use two methods of practice—the one called "Fee-for-Service" and the other "Refund."

The Prime Minister was a man who, from early associations, interest in health matters, service on hospital boards, and, at one stage, as Minister of Health, had a far better appreciation of professional viewpoints than any of his colleagues.

The "Fee-for-Service" system was later amended to allow a doctor to charge an additional fee to the patient over that claimed from the Social Security Fund. This came to be known as the "Schedule System." Regulations and a Disciplinary Committee correct abuses.

Provision was made, on a salary basis, for the service of certain small isolated communities and for people living in scattered districts in which a doctor ordinarily could not make a living. This is the "Special Areas" plan.

Bursaries were established for the training of medical students. Those are under a bond of service to the Government so severe that it would not be tolerated by any trade union in respect of its apprentices.

Specialist service has been talked of; but there seems no great need. There are specialists on the staffs of the free hospitals, and the patients of private specialists get the ordinary refund on their accounts for each attendance.

Later, radiological, diagnostic, laboratory, and pathological services were established, with great lack of technicians. As in the case of the maternity service, the original radiological service failed, and the system now operating was devised by the radiologists themselves with departmental officers. It should be said that, however difficult some of the Ministers were found, the Health Department's officers were always reasonable and tactful.

Thus, by the end of the war, or shortly after, the Free Medical Service of the Social Security Welfare State was established in a way reverse from the advice of the British Medical Association. Research is still out in the cold, and other things we put first came last. By the end of the war there was in force a system by which the young men on demobilization could establish themselves in practice very readily.

What are the Results?

It would be invidious and impossible to assess how much of the present state of medical service in New Zealand is due to the Social Security system and how much to the progress of medicine itself. What follows must be taken in full context.

Medical services are available "free" to everyone from birth till death: "free," but paid for by taxation, which is heavy. The system is costly by former standards; yet the cost of general-practitioner service absorbs but a fraction more than one penny of the one-and-sixpenny Social Security tax. Medical service is efficient. People are living longer. Maternal mortality is one of the lowest in the world. Neonatal deaths have diminished. Rehabilitation from invalidism to work is quicker than it used to be. At the same time, in the advances of such things as thoracic surgery, cardiovascular, plastic, and neurosurgery, New Zealand keeps step, and has even bred some of the eminent workers in those. Doctors are fully employed. They can practise wherever they choose as freely as any quack. They can sell the goodwill of their practice as can the publican or pastry-cook.

With the general increase of medical knowledge, the many postgraduate courses held, the visits of travelling professors and of other teachers of distinction from abroad attending meetings of the Association and the Colleges, and the growth of local clinical societies, doctors have never been as well instructed as they are now: a great factor—due to the profession itself and not to Social Security. Without the impetus of medicine itself the Social Security Medical Services would have been as static and fixed as, say, the rules and procedure of the Stamps and Deeds Department.

It has been always the ideal of the Association that the medical service of the people should be a synergism between the privately working doctors and the local and general health authorities. Doctor and patient should do what they could together. When the position was one they could not cope with they should be able to call in the assistance of the local and general health organizations and collaborate in the patient's interest. This ideal has been almost realized. The invention of the Refund System made it possible, for those prepared to risk unpaid accounts, to practise, except

for increased documentation, almost as if State Medicine did not exist.

All is not beyond reproach. There is not the same amount of personal attention by doctors. It is more profitable to "see" six or ten patients than to spend the time in the examination and diagnosis of one, or to undertake minor surgery. So there is undue reference of patients to hospital for things the doctor should do for himself. Quantity rather than quality pays better. There is waste of drugs. In some cases there is a tendency to exploit the Fund by over-attendance. Specialism grows apace, and the tendency is to specialize immediately, without the invaluable training of a period of general practice. This change from the doctor of former days, comprehensive in his scope, to the modern who, though the facilities for diagnosis and treatment are so much better, refers more and more to hospitals and specialists, is leading to a change in the popular regard of "the doctor." He is losing his former prestige. There remains also the tendency, common to all governments, to take more and more control of the individual.

AN AMERICAN VIEW

AN AMERICAN REPORT ON THE NATIONAL HEALTH SERVICE*

BY

PAUL F. GEMMILL, Ph.D.

Professor of Economics, Wharton School of Finance and Commerce, University of Pennsylvania

If I have any qualifications for speaking on the subject that has been assigned me, they are the direct result of the seven months I spent in 1956 in England, Scotland, and Wales studying the British National Health Service. My purpose in making this study was threefold. First of all I wanted to get an accurate, fairly detailed picture of the Health Service in operation. Second, I wanted to inquire into some questions that had been raised—in some cases by my fellow-Americans—about the adequacy and efficiency of the Service. Third, I wanted to hear from the British people themselves—and particularly from general practitioners and patients—how they felt about their National Health Service after eight years of experience with it.

Just before we sailed for England last year a friend asked my wife how we expected to spend our time. When told that I was going to make a study of the National Health Service, she exclaimed: "Oh, socialized medicine! I hope he isn't for it!" My wife gave what I am sure was the perfect answer: "He isn't making a study for it or against it," she said; "he is making a study of it." That is precisely what I tried to do, and (so far as I am able to judge) succeeded in doing.

I think Mark Twain had the right idea about handling certain kinds of controversial issues, if we may believe a story so venerable that the younger members of my audience are unlikely ever to have heard it and the others will have had ample time to forget it. It runs to the effect that Mark Twain was a guest at a small dinner in the course of which a discussion arose as to the relative merits of heaven and hell. By and by one of the ladies turned to him, and said: "Mr. Clemens, you haven't given us your opinion. Won't you tell us what you think about the relative merits of heaven and hell?" "Madam," he replied, "I am silent of necessity. I have friends in both places."

*Presented to the International Insurance Conference at Philadelphia on May 22, 1957.

So far as the N.H.S. is concerned, I am in much the same position as that described by Mark Twain, in that I have "friends in both places"—British friends who praise the Service enthusiastically, and other British friends who criticize it with vigour. Following Mark Twain's lead, I have no intention of taking sides. My present task, as I see it, is to try to do a job of accurate reporting; and I shall stick as close as possible to the news columns and do my best to keep away from the editorial page. Having heard this, you will certainly not expect me to present "an American view" of the British Health Service, in the sense of presuming to make a personal appraisal of it. What you may depend upon getting is a plain, unvarnished account of what some British doctors and British patients told an American who was trying to learn all he could about their nation-wide system of medical care.

Development of the Service

I should like, first of all, to emphasize the fact, which is not too well known in the United States, that the National Health Service is not a scheme that was hastily thrown together but a piece of social provision which had its beginning some forty-five years ago and has been discussed almost continuously ever since; and that the Liberal Party, Labour Party, and Conservative Party have all played a part in its development.

British writers usually date the beginning of the Service back to 1911, when David Lloyd George, the Chancellor of the Exchequer, managed to put through Parliament the National Insurance Act, the country's first compulsory health insurance Bill. Contributions to this scheme were compulsory for all manual workers with annual incomes smaller than £160 (about \$775 at that time), and for all employers. An insured worker was entitled to "family doctor" care from a practitioner of his own choosing, and to free medicine, but not to specialist or hospital care; and a married worker's insurance did not cover his or her spouse or their children.

The scheme caught on; and in 1930, and again in 1938, the British Medical Association (which in 1911 had opposed the Lloyd George Bill) urged that health insurance coverage be extended to dependants, and that its benefits be expanded to include specialists, ophthalmic, dental, and full maternity care. In February, 1943, the Churchill Coalition Government accepted in principle the "Cradle to Grave" Report of Sir William Beveridge, which recommended, among other things, a national health service which would provide "full preventive and curative treatment of every kind for every citizen, . . . without an economic barrier at any point to delay recourse to it." A year later the Churchill Government published, and thus made available for public discussion, an 83-page White Paper describing a detailed but tentative proposal for a national health service which, in the words of Mr. Churchill himself, would "insure that everybody in the country, irrespective of means, age, sex, or occupation, shall have equal opportunities to benefit from the best and most up-to-date medical and allied services available."

The picture changed somewhat when, in 1945, the Labour Party came into power, and with it a new health scheme (the so-called Bevan Act) which for more than a year was discussed in public and debated in Parliament. While it was under consideration in Parliament the *Lancet* commented editorially: "Seldom has a Bill been presented after so full a canvass of those affected, or so wide an exploration of alternatives." The Bill was passed in 1946 by a vote of 261 to 113, to go into effect on July 5, 1948. Its actual operation—under a Labour Government from 1948 to 1951, and under the Conservatives ever since—has been marked by frequent arguments over details. But the principle of the National Health Service—free access for all to every kind of medical care—has been accepted by all political parties in Britain.

The Inquiry

And now I should like to report on the answers that doctors, patients, and others in Britain have given me in reply to specific questions. The information comes, so far as doctors are concerned, from 139 general medical practices, which (because many are partnerships) include 372 general practitioners who provide family-doctor service for about 850,000 patients.*

*Responsibility for the choice of participants in the survey is entirely my own. I neither sought nor received assistance in this matter. Lacking facilities for getting a sample of general practitioners that could be called statistically representative, I picked 14 centres of population; and, working out from these centres, I got "returns" from 48 English, Scots, and Welsh cities, towns, and villages—which included industrial, commercial, residential, resort, university, shipping, and other types of communities. In choosing specific doctors for interviews I used the N.H.S. general-practice lists found in post offices, selecting from them both one-man practices and partnerships of various sizes, and also practices in different parts of a city or town. I then interviewed the doctors in their surgeries; or, if a personal interview could not be arranged, left a questionnaire together with stamped envelope for its return to my Philadelphia address. The average number of patients per doctor in the practices surveyed was 2,283, which happened to be almost identical with the average for Britain as a whole. These doctors were requested to answer 31 questions, and co-operated most generously. For their many courtesies and invaluable help, so willingly extended, I am deeply grateful.

In seeking information from N.H.S. patients, I placed questionnaires for patients in the hands of 1,500 prospective participants, personally or by mail, aiming at and obtaining substantial diversity in location, age, sex, occupation, and economic status. Each questionnaire was accompanied by a printed explanation of the purpose of the survey, and by a stamped envelope directed to my American address, making it easy for those solicited to answer or not answer, as they preferred. Twenty questions were asked, and nearly all were answered. Patients were asked to preserve their anonymity by omitting their names. Returns from the 600 participating patients (40% of all who were invited) showed a wide distribution geographically (49 counties); occupationally (93 classifications, including skilled and unskilled workers, housewives, bank officers, business executives, sales people, retired persons, civil servants, professional men, and so on); and economically (stretching over ten income brackets running from a "low" of "under £250" (\$700) to a "high" of over £3,500 (\$9,800) a year). From the procedure used, it follows that the answers to my questions do not necessarily reflect the opinion of N.H.S. general practitioners and patients in Britain as a whole.

Some of the views on the National Health Service that have been expressed in both Britain and the United States have stated quite bluntly that the general practitioners in the Service were leading a pretty miserable existence because of overwork—that the Ministry of Health had given them an exceedingly heavy load of "paper work"; that their patients (because the Service was free) kept them busy attending to the most trivial ailments; that, in general, the doctors had so many patients they could not possibly give them proper care; and so on.

What do the doctors themselves have to say about these charges of overwork? How serious, for example, is the problem of paper work, which includes keeping medical records for each patient; issuing medical certificates of many kinds; and, indeed, handling any or all of the 43 "forms in general use by doctors," the mere listing of which fills two pages of the *Medical Practitioners' Handbook*? The fact is that some of these forms are used often, others seldom, and still others almost never. To my question: "Do you find the volume of 'paper work' very burdensome?" only 39% of my doctors said *Yes*, while the other 61% said *No*. Some doctors volunteered the information, which was later widely confirmed by others, that the increase in *certain kinds* of paper work has been largely, if not fully, offset by the almost total disappearance of one especially unpleasant type—sending out bills for services rendered to private patients. To-day, because of the N.H.S., such patients comprise less than 5% of the population.

It should be noted that the trend towards general-practitioner *partnerships* which has been apparent since the start of the Service in 1948 has helped to lessen the burdensomeness of paper work. A partnership of two or more doctors is often able to afford secretarial help, and thus is relieved of much of the handling of medical records and other office chores which are performed personally by many of the single-handed practitioners, as the British call them.

Patients' Visits

There is a fairly general agreement among British general practitioners that patients do sometimes make nuisances of themselves. (American doctors may have a similar feeling about their patients, but in the United States the patients are at least required to pay each time for the privilege.) In this connexion I asked the British doctors this question: "Do patients, often, occasionally, or almost never take up your time with very minor ailments?" Here are their answers: 49% said *often*; 30% *occasionally*; 21% *almost never*. From these replies it would seem that four-fifths of these doctors (those who said "often" or "occasionally") feel that part of their time is being spent on patients who need little or no medical treatment.

Having duly recorded each doctor's answer, I frequently pursued the matter a little further, asking, "What do you consider a very minor ailment?" The wide variety of reactions to this query suggests the improbability of being able to arrive at a workable definition which would enable the layman to know, in the absence of considerable pain, whether or not his condition warranted a visit to or from his doctor. Several doctors argued strongly that it is the doctor's job, and not his patient's, to decide whether there is need for treatment, and that patients should be encouraged to seek medical advice freely. One doctor put it this way: "A patient should see his doctor whenever he feels at all below par. If he doesn't, he will be worried about his condition. What many patients need most of all is reassurance."

Though very frequent office visits are commonly regarded as a nuisance, especially when, in the doctor's judgment, they turn out to be unnecessary, they are *not always* rated by him as "unproductive labour." "Do you think," I asked my doctors, "that requests for medical attention for very minor ailments lead often, occasionally, or almost never to the prevention of serious ailments or to their detection

while still in their early stages?" The answers were: *often*, 11%; *occasionally*, 60%; *almost never*, 29%. These replies are particularly interesting when considered side by side with the answers to the previous question. For against the gloomy conclusion reached by most of these practitioners, that some of their time is taken up by people with very minor ailments, can be set the countervailing consideration that their patients' ready access to medical service does sometimes lead to the prevention or early detection of serious ailments.

Quality of Medical Care

Are British doctors overwhelmed by having too many patients to look after? I decided to ask the doctors themselves. Those who took part in my survey have an average of 2,283 patients each: 53% of them have fewer than this average, 47% have more. A very few have maximum lists of 3,500 patients. Most of these doctors have at least two and often three office-hours (called "surgery-hours" in Britain) a day. Though an office-hour is nominally 60 minutes, it sometimes—and in the winter *very often*—runs to 120 minutes or more; and sandwiched in between these office sessions are visits to the homes of house-bound patients. British general practitioners are also subject to emergency calls at any time.

To these busy doctors I put the following question: "With your present list of patients, do you find it reasonably easy, or difficult, or almost impossible to give them what you regard as adequate medical care?" The answers may surprise you, as indeed they surprised me; for 58.8% said they found it *reasonably easy*, 37.8% found it *difficult*, and only 3.4% reported that it was *almost impossible* for them to do an adequate job.

In about two-thirds of these returns, the report "reasonably easy" came from doctors with fewer than the average number of patients, and the answer "difficult" or "almost impossible" from those having *more* than the average—as one might perhaps expect to be the case. However, 13% of the doctors who answered "difficult" or "almost impossible" had fewer than the average, and in two instances fewer than a thousand patients; while 18½% of those who had more than the average, and often the maximum or near-maximum number of patients, replied that it was "reasonably easy" to give them adequate medical care.

Problem of Waiting

The problem of "long waits" is understandably a matter of special concern to patients. Waiting of any kind is likely to be tedious business, and waiting for medical service is no exception to the general rule. Though medical attention is not always sought promptly, it is a type of service which, once it has definitely been decided upon, is usually wanted without delay. Waiting in doctors' offices and in out-patient departments of hospitals is an old story in Britain, but it increased enormously with the greatly expanded demand that followed the introduction of nation-wide medical provision in 1948, and much has been written and spoken (especially by persons unfriendly to the Service) about the interminably long waits to which the Health Service patients are said to be subjected.

Some of these waits are indeed long, but some are quite short, as I can testify from considerable experience. I think it highly probable that in 1956 I did more waiting to get *general-practitioner attention* than any other person in Britain. The attention that I wanted was interviews with the doctors, who granted them willingly and generously. I discovered that the simplest way to meet a doctor was to walk into his waiting-room, unknown, and unannounced, and join the patients who, true to the good old British custom of "queuing up," were waiting their turns to enter the consulting-room. By waiving my turn and waiting until the last of the bona-fide patients had gone in, I was able to talk to the doctor at once or to arrange for an interview

at his convenience; and meanwhile I could note approximately how long each patient had had to wait, and how much time each was given by the doctor.

From these "long waits" of mine—often repeated three or four times a day for many weeks—I learned that the time a patient spends in the doctor's waiting-room is long or short, depending upon such things as the hour at which he arrives; the nature of the ailments of the persons who precede him, for this will affect the amount of the doctor's time *they* take up; and the time of year, for waits are usually much longer in the busy winter season than in the relatively slack summer. Unfortunately, much of this information proved interesting rather than important, for it did not lend itself to useful generalization. The question which I finally asked the patients I interviewed was this: "How often, in the past year or so, have you had to wait as long as one and a half hours in the doctor's office before getting attention?" 6% replied that they *usually* had to wait that length of time; 15% said *occasionally*; 79% *almost never*.

A similar question, but one relating to waits in hospital out-patient departments, asked how often these patients had had to wait more than two hours before seeing the doctor with whom they had an appointment: 13% answered that they *usually* had to wait longer than two hours; 25% said *occasionally*; 62%, *almost never*. Reporting great improvement in the matter of out-patient waits, the Minister of Health stated last year that in the vast majority of hospitals the average waiting-time (that is, from the time of the appointment to the time when seen by the doctor) "does not now exceed 30 minutes, and is frequently less."

Hospital Service

Though more than half of the total annual expenditure for the National Health Service consists of hospital and specialist costs, there has always been, and continues to be, a shortage of hospital service, both in-patient and out-patient, and a long list of applicants waiting for appointments. For, despite the almost revolutionary improvements that were made in hospital plant and staff during and after the second world war, the unprecedented demand for hospital service which accompanied the adoption of the National Health Service in 1948 was one that was bound to outstrip supply for years to come. The latest published figures show that on December 31, 1956, there were in Britain 431,000 persons on hospital in-patient and out-patient waiting-lists. However, waiting-list figures show a decrease from a 1950 peak of 531,000 to the 1956 total of 431,000—a slow but steady decline, year by year, except for 1953, when there was an unexplained increase over the preceding year.

Among the people on waiting-lists are many kinds of illnesses and many degrees of urgency. Faced with a shortage of hospital facilities, the British follow the principle of first things first, and thus presumably ensure that patients whose lives might be endangered by a delay in treatment are cared for ahead of those whose ailments are of a less serious nature. The testimony of general practitioners seems to indicate that, in general, they can get hospital service for their patients when it is urgently needed. I asked the doctors: "When you refer patients to hospital for examination or bed-occupancy, do you have difficulty getting them admitted promptly?" 73½% said *No*; the other 26½% said *Yes*, frequently adding "unless very urgent," and explaining that their greatest difficulty was gaining admission for chronic invalids and for the aged, who are likely to be long-term inmates once they get in.

The notion—which had some currency in the early years of the Service—that "patients who genuinely require hospital treatment are *often* kept out of hospital because the beds are occupied by persons with minor ailments" found support from only 2½% of the doctors questioned; 20% said that this occurs *occasionally*; according to 77% of the respondents, it *almost never* happens.

To the short but important question, "Would it be correct to say that 'an emergency case can always get into hospital promptly'?" the answer from 98% of the doctors was an unqualified *Yes*.

Remuneration

The question of doctor's pay has been much discussed in Britain during the past year or so. The general practitioner has a "panel" (or list) of patients who have chosen him as their personal or family doctor. His chief source of income is a specified payment of so much a year—called a "capitation" fee—which he receives for each of his listed patients. This fee is 17s. (\$2.38) a year for each of a doctor's first 500 patients, 27s. (\$3.78) a year for each of the next 1,000 patients, and then back to 17s. each for the remainder.

A general practitioner with the average number of patients (about 2,300) receives in capitation fees a gross annual income of £2,455, which is equivalent to \$6,874 at the current rate of exchange. A doctor with a panel of the maximum size that is permitted (3,500 patients) is paid £3,475 (\$9,730) in capitation fees. After subtracting the necessary costs of running his practice (about one-third of the gross income), the doctor with an average panel will have left from his capitation fees a net income (before taxes) of £1,637 (\$4,584) and the doctor with a full panel approximately £2,317 (\$6,488). (Because consumer prices are lower in Britain than in the United States, these amounts in dollars must be raised about 25% if they are to reflect British purchasing power accurately. For example, an English general practitioner with a net income of £2,317 (\$6,488) can buy with this amount of money a standard of living comparable to that purchasable with \$8,110 in the United States.)

Doctors on the staffs of British hospitals differ widely in pay, with incomes running as high as £5,300 (\$14,840) a year for a small number of top-level "medical consultants," and as low as £1,100 (\$3,080) for first-year "senior registrars." The maximum basic salary for full-time consultants is £3,100 (\$8,680) a year; but the payment of "distinction awards" in recognition of special merit brings an additional \$1,400 a year to 20%, \$4,200 to 10%, and \$7,000 to 4% of the total number of consultants. Raising these dollar figures by one-fourth to make allowance for Britain's lower consumer prices, we see the possibility of 34% of the more fortunate British consultants getting salaries equivalent to American incomes of \$12,600, \$15,400, or \$18,550.

General practitioners and part-time consultants may also accept private patients, and may supplement their incomes in other ways that do not interfere with their giving proper service to their National Health Service patients. However, my survey showed that about four-fifths of the general practitioners were getting more than 90% of their income from Health Service practice, and that this pay was made up overwhelmingly of capitation fees.

In 1956, general practitioners with the average number of patients (but with no other source of income) were in the highest 2.4% of British income-getters. Those with the maximum of 3,500 patients were in the highest 1.4%, as were also all full-time consultants of at least three years' standing. Though these figures might seem to indicate that doctors as a class are doing relatively well, the fact remains that they have made frequent requests for increases but have had no boost in pay in the past six years. They have recently been pressing their demand in unusually vigorous language, insisting that the much-cited "Spens Reports" promised them money incomes that would keep pace with changes in the cost of living. According to the *British Medical Journal*: "Doctors are united in considering that the Government, by its apparent repudiation of the Spens Reports, has broken faith with the profession." The Government's stand has been that "in the present circumstances (the serious inflationary threat that the country is facing), it would not be right to give consideration to a claim for a general increase in medical remuneration." The Government has set up a Royal Commission to study the

whole situation, granted an interim pay increase of 10% to junior grades of hospital doctors and dentists, and implied that there would be interim increases for others as well. But there were no deafening cheers of approval from the doctors, by whom these actions were construed as tactics of delay.

It is all very confusing, especially to foreigners, who may not have followed closely the lively give-and-take that has marked negotiations between the Ministry of Health and the medical profession in the past dozen years. Americans, reading in their daily papers some months ago that the British Medical Association was making plans for a "selective withdrawal" from the Service in October, 1957, might have supposed that the very survival of the National Health Service was in danger. However, the *New York Times* reported on May 2, 1957, that the British Medical Association had voted "to defer indefinitely a decision on a plan for the progressive withdrawal of general practitioners from the National Health Service"; but added that "a spokesman for the Medical Association's Council made it plain that the withdrawal plan would be revived if the physicians were not satisfied with the findings of the Royal Commission appointed to inquire into the dispute." Predictions are always risky, but it is a fairly safe guess that withdrawal from the Service is not in the cards. Among the reasons for regarding a concerted (or even "selective") withdrawal by the doctors as unlikely are the difficulty of practising medicine outside the Service, the possibility of endangering the doctors' claims to valuable annuity rights and other highly prized benefits which are payable at retirement or death, and the widespread antagonism that withdrawal would arouse among the British people, with whom the Health Service is exceedingly popular, and who (as the *Lancet* points out) "do not readily understand how doctors justify an average 'wage claim' for an additional £10 a week, which is more than many of them earn altogether."

But no doubt the strongest of all deterrents to withdrawal would be the doctors' devotion to their calling. British doctors may be overworked and underpaid, as their representatives claim they are; but they believe in the importance of their job, and state with pride and a high degree of accord that under the National Health Service the medical needs of Britain as a whole are being better met than ever before. The dispute over pay may be sharp and even bitter, but surely not so explosive as to shatter or severely shake the great medical tradition that the patients' needs always come first. "Whatever is decided," concluded the *British Medical Journal* in one of its spirited bouts with the Ministry of Health, "the public may be assured—if such assurance is really necessary—that the sick and the suffering will be cared for as they have always been."

Reactions to the Service

What do the doctors who provide medical treatment, and the patients who receive it, like and what do they dislike about the National Health Service? Here is a quick and admittedly inadequate sketch of patient and doctor reactions to specific aspects of the Service, beginning with some of the things the patients do not like.

Patients' Dislikes.—(1) In general, they dislike waiting. Waiting in doctors' offices, though protested mildly, is usually taken pretty much in stride; but patients often speak rather heatedly about long waits they have in the past had to undergo as hospital out-patients. (The recent improvement in out-patient waits, announced by the Minister of Health, may be expected to lessen criticism on this score.) (2) They dislike the small amount of time given them in the consulting-rooms of some doctors, though many patients state emphatically that their own doctors give all the time that is needed. (3) A relatively small number of patients express profound dislike of the dental charges—maximum £1 (\$2.80) for "conservative" work—£4 3s. (\$12) for dentures—of the charge for spectacles—about £1 10s. (\$4.20) a pair—and even of the prescription charge—1s. (14 cents)—

per item. (4) They dislike having foreigners, while in Britain, getting medical care free. (According to competent authorities, abuse of this privilege by foreigners, though quite common in the early days of the Service, is no longer widespread.)

Patients' Likes.—Balanced against these dislikes are things which the patients say they like very much: (1) The fact that medical provision is now a matter of right and not charity. (2) The fact that medical care of high quality, formerly available only for the well-to-do, is now accessible to persons in even the lowest-income groups. (3) Confidence that the cost of a catastrophic illness will not wreck a family's financial programme. (4) The comprehensiveness of the Service and its nation-wide coverage.

General Practitioners' Dislikes.—These include the following. (1) The doctor's inability to sell his practice, which is no longer his personal property. (The compensation provided by the Government for this loss of the right to sell the "goodwill" in a practice is regarded by many practitioners as inadequate.) (2) The doctors dislike being unable to move readily to another area. (In the interests of having a better distribution of practitioners throughout the country, doctors are prevented from moving their practices into "over-doctored" areas, but are offered financial inducements to go to "under-doctored" parts of the country.) (3) As has been noted, the doctors are very unhappy that their pay has not kept pace with increases in the cost of living, and feel that the Government has not lived up to its promises in this respect. (4) The doctors dislike the requirement that private patients must pay for their medicine. Their objection seems to be twofold: first, they feel that this discrimination against private patients just isn't cricket; second, they regard it as a device designed to bring about the gradual but complete extinction of private practice in Britain.

Doctors' Gains.—There are, on the other hand, many things about the Service which the doctors regard as definite gains: (1) They like the ability they now have to prescribe the best medicines (regardless of cost) for even the poorest patient, knowing that a lack of funds will not prevent the prescription from being filled. (2) They like the privilege of visiting their patients as often as they think desirable, without being suspected of making frequent visits for financial reasons. (3) They like the annuity scheme, which puts 6% of their annual net income (together with 8% supplied by the Government) into a fund that provides a life annuity upon retirement. (4) They like very much the great reduction that has taken place in "out of bed" night early-evening calls when the introduction of the Health Service made it possible to have these home visits without charge. (5) As I have said, the doctors are happy to be relieved of the need to bill their patients, and to be freed also from bad debts; and they like (in a profession that is highly seasonal) the stability that is provided by having four equal payments of income per year. (6) Finally, the doctors take satisfaction in the fact—to which I shall refer again—that, in their opinion, the medical needs of Britain as a whole are now being better met than ever before.

Broader Aspects

I turn now from doctor-patient views on specific aspects of the Service to appraisals of a broader nature. "From your personal experience," I asked the patients, "do you consider the N.H.S. service better or worse than the service you got before 1948, or about the same?" 37% said *better*; 13% *worse*; 50% *about the same*.

To the very general question, "Do you feel that you are now getting satisfactory service of the several kinds provided by the Health Service?" 91% of the patients answered *Yes*; 9% *No*.

The "home services" supplied by the N.H.S.—specialist, midwife, home visitor, home nurse, and domestic help—have

proved popular. Slightly more than one-half of the patients in my survey had used one or more of these services, and 98% of the users pronounced them "quite satisfactory."

How well the seriously ill are cared for is a matter of grave concern to patients and their families. This fact led to the following question: "Have you or a member of your household ever had, under N.H.S., what the doctor clearly regarded as a serious illness?" One-half of the answers were *Yes*; and the illnesses that were named included pneumonia, thrombosis, ulcers, punctured lung, heart ailments, polio, diabetes, cancer, and a host of others. Many of these patients were treated at home, others were in hospital from a few days to a year or more. What I especially wanted to know was how the patients themselves appraised the care they received—whether they thought it excellent, good, fair, or poor. 76% reported that they had had *excellent* care; 18.9% said *good*; 2.9% *fair*; 2.2% *poor*. In general, these patients were loud in their praise of the hospitals, doctors, and nurses.

Seeking a professional appraisal of present-day British medical care, I asked the general practitioners this question: "Under N.H.S., are the medical needs of the country as a whole being better met, less well met, or cared for 'about the same' as before N.H.S.?" The answers were: *Better met*, 87%; *less well met*, 3%; *about the same*, 10%. I also put to the doctors a question about the permanence of the Service: "Do you regard the N.H.S., or something of substantially the same nature, as a permanent British institution—that is, is it here to stay?" 98½% said *Yes*; 1½% said *No*. When this question was put to Members of Parliament (Conservative and Labour), to journalists, to university professors, to business men, and others outside the field of medicine, the answer was again almost unanimously *Yes*.

I was not the only one in Britain in 1956 who was asking doctors and patients about the Health Service. I think you may be interested in two questions asked in a nation-wide poll taken by the British Institute of Public Opinion (the Gallup Poll) in June, 1956. The first, directed to general practitioners, read: "Suppose you had a chance to go back and vote on whether the N.H.S. should be started or not. How would you vote—in favour of starting it, or against starting it?" The answers: *In favour*, 67%; *against*, 31%; *undecided*, 2%. The second Gallup question was for the patients: "As far as you personally are concerned, how would you rate N.H.S.—favourably or unfavourably?" The answers were: *favourably*, 89%; *unfavourably*, 4%; *undecided*, 7%.

Conclusion

I found in Britain no tendency to claim for the National Health Service anything approaching perfection. I do not recall talking with anyone who did not mention the need for more dentists and nurses, more general practitioners and smaller "panels" of patients, more adequate health provision for the aged and mentally ill, more capital investment in hospitals, more emphasis upon preventive medicine, better integration of all parts of the Service, or some other shortcoming which I was told must one day be taken care of. On the whole, however, the British attitude seems to be one of restrained optimism, as is indicated by this observation from an administrative officer of a London hospital: "We know all too well the many problems we must solve," he said, "but we know, too, that we have something worth while, and we shall never stop trying to make the Service better until we have finally won through."

I close my report of British opinion on the National Health Service with a final word of appraisal from a Conservative Member of Parliament, who said to me: "We do not have a first-class, but only a second-class medical service. However, before 1948 it was only fourth-class. It has been improving ever since, and by and by we shall have a Health Service that is truly first-class."

RESOLUTIONS OF THE REPRESENTATIVE BODY ON THE N.H.S.

Reproduced below are some of the resolutions adopted by the Representative Body of the B.M.A. on the subject of the National Health Service during the period 1944-57—that is, the four years of preparatory work and the first decade of the operation of the National Health Service Act.

Preliminary Events

In 1940 a Medical Planning Commission was set up by the B.M.A., with the co-operation of the Royal Colleges and the Royal Scottish Corporations, to "study wartime developments and their effects on the country's medical services, both present and future."

In November, 1942, before the Commission's suggestions had been fully discussed, Sir William Beveridge published his report and recommendations. He assumed—"Assumption B"—that there should be

"Comprehensive health and rehabilitation services for prevention and cure of disease and restoration of capacity for work, available to all members of the community."

The Government accepted Assumption B and invited the profession to enter into discussions on its implementation. A Special Representative Meeting in April, 1943, resolved:

That the Government's invitation to enter into discussions without commitment be accepted.

That a committee representative of the profession as a whole should, in response to the Government's invitation, now enter into discussions with representatives of the Minister of Health on "a scheme for comprehensive health and rehabilitation services, for the prevention and cure of disease and restoration of capacity for work, available to all members of the community" (Assumption B of the Beveridge report), in the light of the following undertakings now given:

(a) That, at the conclusion of the discussions and at the appropriate time or times during the discussions, but in any case before negotiations open and before any proposals are submitted by the Government to Parliament, the full machinery of the Association, including the Council and its Committees, Groups, Panel Committees, Divisions, and the Representative Body, will be used to consider the Government's proposals and to decide the Association's views thereon.

(b) That every practicable step will be taken to give all members of the profession, whether members or non-members of the Association, an opportunity to express their views and in particular that every practicable step will be taken to give members of the profession on service an opportunity of expressing their views, to assess those views, and to present them to the meeting or meetings of the Representative Body called to consider any proposals by the Government.

A.R.M., 1944

The Representative Body debated the Government's White Paper on its proposals for a National Health Service, and resolved:

That the Representative Body wishes to put on record that this Body would resist to the utmost any Government control of doctors in clinical matters, or any interference in the present doctor-patient relationship, and that no doctor be compelled to undertake medical practices which are contrary to his conscience freely exercised.

That no scheme for a National Health Service shall be accepted which does not allow to the individual medical practitioner full rights of scientific and political publication, freedom of speech, including the right to criticize the service, and full political rights.

Availability of Service

The meeting gave its views on the "100% issue" in the following resolution:

That pending further information on: (1) the general professional and administrative arrangements, both central and local, (2) the machinery whereby private practice is to be continued, including safeguards to secure its preservation for those members of the community who are able and willing to provide the medical service for themselves, there be affirmed the view of the A.R.M.,

1943, "that a comprehensive medical service should be available to all who need it, but it is unnecessary for the State to provide it for those who are willing and able to provide it for themselves."

General Principles

Approval was given to the following principles which should govern the provision of the Health Service:

(1) Freedom for people to use or not to use these facilities at their own wish; no compulsion into the new service, either for patient or for doctor. (2) Freedom for people to choose their own medical advisers. (3) Freedom for the doctor to pursue his professional methods in his own individual way. (4) The personal doctor-patient relationship to be preserved, and the whole service founded on the "family doctor" idea. (5) The responsibility for organizing and running the new service should be placed on the shoulders of the profession to the greatest extent possible without sacrificing the ultimate control of public expenditure by Parliament and the local authorities. (6) The service should not be a full-time salaried service under Government or local authority control.

The Representative Body approved the paragraph of the Council's report in which the following sentence occurs:

Neither a corporate body nor a department can of itself prove satisfactory unless the arrangements within it and in association with it are such as to secure the fundamental requirement that, subject to the responsibility of the Minister to Parliament, responsibility for medical policy and medical advice is borne by the medical profession.

It was also resolved:

That it be an instruction to the Association's representatives on the Negotiating Committee that, without prejudice to other issues, including the 100% question, remuneration and compensation, consideration of administrative structure, central and local, should precede consideration of all other questions, and that agreement on this subject is an essential prerequisite to discussion of other subjects.

S.R.M., 1945

A Special Representative Meeting was called on May 3 to discuss proposals for the administration of the Health Service. It agreed that an administrative plan proposed by the Minister be generally approved as a workable basis of the new Health Service, subject to reconsideration on the following points: (a) That the Ministry of Health should be concerned with all civilian health services in which the Government is involved and with none other. (b) That the local organization should function so as to secure really effective planning at the regional level and a proper integration of all local medical services, consultant, specialist, general practitioner, and other. (c) That, in relation to the suggested "single executive authority" areas, the area of planning should be related to natural medical areas and the area machinery should conform to that proposed for the composite areas.

100% Issue

The 100% issue was again debated and the following resolution resulted:

That the Association, regarding the 100% issue as one for Parliament to decide, is willing to negotiate terms and conditions for such a 100% service, if such be decided upon, provided that ample safeguards are introduced to ensure that any member of the community, whatever his income, should be enabled to obtain his medical service, in part or in whole, privately, as for example by grant-in-aid provisions. (Carried by a large majority. A preceding motion that there should be an income limit for people using the service was lost by 162 to 64.)

A.R.M., 1945

The Representative Body defined its policy for safeguarding private practice:

That all persons compulsorily insured should have the right to opt out from the Government service in matters of medical advice and treatment and receive a financial grant towards a private

contract, and that no new agreements be entered into which do not effectively safeguard this right; that insured patients should be in a position to assign to the hospital or nursing institution of their choice any financial grant received through their health insurance authority. (Carried by 114 to 74.)

That Council be requested to give concrete proposals safeguarding private practice under the 100% National Health Service.

S.R.M., 1946

The Government published its N.H.S. Bill, and a Special Representative Meeting was held on May 1 and 2.

The meeting supported the following principles stated by the Negotiating Committee and was prepared to support the Negotiating Committee in ensuring that they were not infringed.

(1) The medical profession is, in the public interest, opposed to any form of service which leads directly or indirectly to the profession as a whole becoming full-time salaried servants of the State or local authorities.

(2) The medical profession should remain free to exercise the art and science of medicine according to its traditions, standards, and knowledge, the individual doctor retaining full responsibility for the care of the patient, freedom of judgment, action, speech, and publication, without interference in his professional work.

(3) The citizen should be free to choose or change his or her family doctor, to choose, in consultation with his family doctor, the hospital at which he should be treated, and free to decide whether he avails himself of the public service or obtains the medical service he needs independently.

(4) Doctors should, like other workers, be free to choose the form, place, and type of work they prefer without governmental or other direction.

(5) Every registered medical practitioner should be entitled as a right to participate in the public service.

(6) The hospital service should be planned over natural hospital areas centred on universities in order that these centres of education and research may influence the whole service.

(7) There should be adequate representation of the medical profession on all administrative bodies associated with the new service in order that doctors may make their contribution to the efficiency of the service.

Opposition to Bill

The meeting expressed its opposition to the Bill as follows:

That the profession, while anxious and willing to co-operate with the Government in evolving a complete Health Service, is opposed on grounds of public interest to certain important features of the Government's proposals which render the Bill, in its present form, not only unacceptable to the profession, but also constitute strong reasons for advising the public against its acceptance. (Carried *nem. con.*)

That this meeting considers that the standard of a Health Service depends appreciably upon the maintenance and development of a high degree of skill, initiative, and sense of responsibility in the general practitioner, and that these qualities will be discouraged by the proposals of this Bill, which places hospitals, general practitioner services, and public health facilities under three separate organizations. This meeting presses for an amendment to the Bill whereby the family doctor will be assured of the right to assume personal responsibility in hospital for such of his patients as come within his scope, thus working in collaboration with the specialist services as a respected member of a team, rather than acting as a mere signpost to the various departments.

That this meeting disapproves of the administration set out in the White Paper, especially as to the powers given to the Minister, and demands that the Central Health Services Council shall have the right to guide the Minister and the right to publish its recommendations.

That this meeting views with great disfavour the transference of hospitals to State ownership and the consequent destruction of local interest in hospital services, and the confiscation of trust funds intended by donors for specific purposes.

Conditions of Service

The Bill proposed that the sale of goodwill of practices should be abolished, and the Representative Body resolved:

That this meeting regards as essential to the freedom of the patient and the profession the right to buy and sell practices as at present. (Carried by 229 to 13.)

It also laid down as Association policy that:

The freedom of the citizen requires that not only shall he be free to obtain his medical care privately but that the financial and administrative arrangements should not be such as to penalize him or his doctor if he does.

The meeting asserted that "subject to their fulfilling the normal professional requirements, doctors should have every facility to transfer from one branch of the service to another." It also resolved:

That the remuneration of general medical practitioners under any National Health Service should take the form of an adequate capitation fee without a fixed part salary and without a tapering scale of payment. (Carried by 209 to 8.)

That the specialist in the National Health Service should have the right to decide whether he will do part- or full-time work.

That any doctor while practising privately, either in special or in general practice, must enjoy the same privileges and rights and have all the facilities for treating his patients as are now held by all registered practitioners.

That general practitioners should have the same privileges as specialists and consultants in regard to pay beds in hospitals.

The availability of the service was again debated and it was resolved:

That all persons should be compulsorily insured and a complete medical service should be made available to all who need it or desire it, provided that a State monopoly of medicine is avoided.

That the patient who elects to obtain medical advice privately shall not be required to pay for drugs and appliances.

G.P. Spens Report

The Representative Body unanimously approved a recommendation of the Council:

That the Representative Body welcomes and approves the majority report of the Interdepartmental Committee on the Remuneration of General Practitioners [the G.P. Spens Committee].

S.R.M., 1947

A Special Representative Meeting was called on January 28 to consider the following recommendation of Council:

That the Association, having considered the final results of the plebiscite and the Minister's letter of January 6 to the Presidents of the Royal Colleges and desiring to secure for the people the best possible health service, is willing that discussions be entered into with the Minister to that end, provided that such discussions are comprehensive in their scope, and that the possibility that they may lead to further legislation is not excluded; and that after the conclusion of these discussions, a second plebiscite of the profession be taken on the issue of entering the service.

The Representative Body agreed to the recommendation by 252 votes to 17. The plebiscite referred to was held at the end of 1946, and the result (*Journal*, December 21, 1946, p. 957) showed an overall majority against entering into discussion with the Minister.

S.R.M., 1948

At a Special Representative Meeting on January 8, requisitioned by the Council to give a lead to the profession prior to a second plebiscite, the following declaration was resolved on with one dissentient:

The elected representatives of the medical profession in Great Britain and Northern Ireland meeting in London this 8th day of January, 1948, solemnly declare that in their considered opinion the National Health Service Act, 1946, in its present form is so grossly at variance with the essential principles of our profession that it should be rejected absolutely by all practitioners.

The second plebiscite showed that a 9 to 1 majority (in an 84% poll) of the medical profession disapproved of the Medical Act in the form in which it then was (*Journal*, February 21, 1948, p. 353). A Special Representative Meeting on March 17 resolved:

That the Representative Body, reaffirming the whole-hearted desire of the medical profession for a comprehensive health service available to everyone, urges that in the public interest such

changes should be made in the National Health Service Acts of 1946 and 1947 as are necessary to maintain the integrity of medicine and to prevent doctors being turned into State servants with harmful consequences to patient and doctor alike. The Representative Body therefore expresses the hope that the Government will make it possible for the profession to co-operate by making such changes, and states its view that it is not in the best interests of the public or of medicine for members of the profession to enter the service until such changes are made. (Carried unanimously.)

That, in view of the recent B.M.A. plebiscite result, which expressed a 90% disapproval of the National Health Act in its present form, the Representative Body, while agreeing with a comprehensive health service available to everyone, requests that it should be postponed until the necessary hospitals and other facilities have been built and equipped and the personnel for a complete service have been trained.

Many other resolutions critical of particular provisions in the Act were passed.

A Special Representative Meeting was held on May 28 to decide Association policy in the light of the results of a third plebiscite held in April, after the Minister had made some concessions to professional opinion. In a 77% poll, 2 out of every 3 doctors still disapproved of the Act. In answer to a question on accepting service under the Act, 12,799 were in favour, and 13,891 against (*Journal*, May 8, 1948, p. 893). The S.R.M. resolved:

That, despite the insufficiency of the safeguards to the profession's freedoms and the misgivings of a substantial section of the profession, the Representative Body, anxious as ever that in the public interest a comprehensive health service should be made available to the community, is prepared to advise the profession to co-operate in the new service on the understanding that the Minister will continue negotiations on outstanding matters, including terms and conditions of service for consultants and specialists, general practitioners, public health officers, and others.

That the Representative Body urges the profession to maintain its strength and unity in order to mould the service in accordance with the public interest and with enlightened professional opinion and continuously to protect the profession's legitimate freedoms and interests.

S.R.M., 1949

A Special Representative Meeting on March 29 debated general-practitioner remuneration, and resolved:

That this meeting is greatly disturbed by the serious financial position created by the National Health Service for many general practitioners, and wishes to support the efforts of the General Medical Services Committee to obtain an adequate betterment factor in the implementation of the Spens Committee report.

A.R.M., 1949

In May, 1949, the Minister presented to Parliament a Bill to amend certain parts of the N.H.S. Act. The Representative Body, meeting in June, commented as follows:

That this meeting registers its profound dissatisfaction at the Minister's breach of faith in not honouring his undertaking to consult the medical profession before presenting the Amending Bill to Parliament. (Carried unanimously.)

That disappointment and resentment be expressed by the Representative Body at the failure of the Minister to include in the Amending Bill provision for the free supply of medicines and scheduled appliances to private patients.

That as the Minister of Health has withdrawn the official assurances and undertakings, repeatedly given to the profession, on the question of arbitration in the event of a dispute, this Representative Body demands that effective action be taken forthwith to insist that arbitration machinery (including arbitration for resolution of disputes involving finance) be set up, and that demands for arbitration by the profession shall not be subject to the Minister's veto.

This Representative Body therefore calls upon the Minister of Health to redeem his Government's pledges by the necessary alteration in the Amending Bill. (Carried unanimously.)

The Representative Body also "regretfully recorded" that the Minister and Ministry of Health had shown "little or no desire for co-operation with the medical profession" and had "met the profession's suggestions with indifference

and procrastination," and that these were added reasons why the service was "falling far below the standard the public were led to expect."

A.R.M., 1950

The Representative Body called for reform of the Health Service:

That this meeting considers the time long overdue when the B.M.A. should formulate a detailed programme of reforms the profession desires to be adopted in relation to the National Health Service, and instructs Council to draw up such a list forthwith for submission to, and discussion by, Branches and Divisions.

It approved resolutions of the Conference of Local Medical Committees on (a) the claim for an adjustment of the remuneration of G.P.s; (b) the lowered status of the G.P.; (c) relation of G.P.s to hospitals. It instructed Council to continue to try to get the principle that private patients are entitled to free medicines and appliances accepted by the Government. And it expressed concern about registrars in the following resolution:

That in view of the large number of trainee specialists and the few specialist appointments available, the future position of such trainees be considered urgently by the Central Consultants and Specialists Committee so that these men might know their prospects.

A.R.M., 1951

The Representative Body recorded "that, although general practitioners are referred to as 'the backbone of the profession,' their opportunities for clinical work in the National Health Service have diminished. This seriously imperils their status and is contrary to the public interest." The meeting urged the G.M.S. Committee to bring continually to the notice of the Ministry the need for increasing the scope of the general practitioner services. It instructed the Council:

That since private practice supplies an indispensable element in this country's medical services, the Council should press urgently and insistently for the removal of the liabilities imposed by the National Health Service Act on private practitioners and their patients.

S.R.M., 1951

A Special Representative Meeting was called on December 13 to consider Council's report on the reform of the National Health Service. The following resolutions, among others, were passed:

That an amending Act should provide for the establishment of a National Health Service court of arbitration to which could be referred by the Ministers or representatives of the Management or Staff Side of Whitley Council disputes on the terms of service, including remuneration, without the consent of the other party, whether existing terms or new terms affecting any section or individual member of the profession.

That the present control exercised by regional hospital boards be modified so as to permit to hospital management committees: (a) a wider measure of executive powers; and (b) a greater measure of financial authority; and (c) these committees should include representatives of the general practitioners and public health medical officers elected by the profession in the area.

That a scheme of block grants, similar to the university grants system, be devised for hospital finance, the grants being paid to hospital management committees, with amounts for capital and maintenance expenditure to cover as long a period as possible, surpluses being carried on from year to year.

That there should be set up at all levels of hospital administration co-ordinating machinery... in the form of cross-representation and liaison of all branches of medical practice...

That section 38 of the N.H.S. Act, 1946, be amended... to entitle patients obtaining their medical care privately to obtain drugs, spectacles, and appliances at the public expense on the prescription of the attending practitioner... and any other hospital services, including pathology, x-rays, and physiotherapy, on the same terms as patients registered in the National Health Service...

That the National Health Service regulations be extended so as to provide disciplinary arrangements for the patient.

That medical advisory committees to advise boards of governors, regional hospital boards, and hospital management committees be elected respectively by the medical staff committees of teaching hospitals, by the medical staff committees of the non-teaching hospitals in the region, and the medical staff committees of the hospital group, statutory recognition to be given to the committees so electing and so elected. . . .

That this meeting welcomes the recommendations of the first interim report of the Council [on reform of the Health Service], but considers that the time is now opportune for consideration to be given to the amendment of the Acts as they now stand, with emphasis on decentralization, and unification of all parts of the service.

A.R.M., 1952

The Representative Body expressed its opinion on terms and conditions of service as follows:

That it be an instruction to the Council to make all possible efforts to achieve direct access to pathology and x-ray departments for all general practitioners.

That this meeting is concerned that after four years' operation of the National Health Service Act, 1946, its enactments have failed to facilitate the entry of doctors into practice and requests that this deplorable situation be further examined and reported on by the Council.

That this Representative Body considers that the impending dismissal of senior registrars is unjust, and that, in view of the grave difficulties most of these registrars will have in finding alternative employment, this meeting considers it is the responsibility of the Ministry of Health to provide suitable alternative employment for these doctors in view of their age and experience.

That this meeting deplores the fact that the Minister of Health refuses to negotiate with the medical profession on the question of a separate arbitration machinery. This Representative Body refuses to accept the Minister's view that the profession shall only negotiate through the General Council of the Health Services Whitley Councils. It re-endorses the decision taken at the Special Representative Meeting, December, 1951. (Carried unanimously.)

A.R.M., 1953

The Representative Body again deplored "the lack of a Whitley Court of Arbitration to which there should be a right of appeal by unilateral reference and where the ruling should be binding on both parties," and instructed Council to take immediate and urgent action.

The Council was instructed to make further representations to the Minister on drugs for private patients.

Two other resolutions were as follows:

That the Amending Acts Committee having recommended the restoration of the right to sell goodwill, this Representative Meeting instructs the Council of the Association to produce a scheme for the return of goodwill and to report to the Representative Body in 1954. (Carried by 144-137.)

That it should be the policy of the British Medical Association to strive for the early establishment of general-practitioner hospitals.

A.R.M., 1954

The following were among the resolutions adopted by the Representative Body:

That there should be the unilateral right to arbitration.

That this meeting deplores the inadequacy of the recent agreement reached on the remuneration of hospital medical staffs, and urges that steps be taken to reopen this matter immediately, with a view to obtaining the implementation of the Spens report as applied to consultants and specialists and obtaining adequate betterment. In the event of disagreement, the matter should be referred to arbitration.

That the disparity between remuneration in the public health service, and that of the medical profession as a whole, is a threat to the rest of the profession, and contrary to public interest.

That this meeting considers that the restoration of the right to buy and sell the goodwill of medical practices in the National Health Service is impracticable. (Carried by 135-124.)

That this A.R.M. reaffirms that opposition to any form of full-time salaried general medical service is the policy of the British Medical Association. (One dissentient.)

A.R.M., 1955

The Representative Body was of the opinion "that there should be a maximum expansion of the consultant establishment so as to provide a service adequate for the needs of the country in accordance with the expressed policy of the Central Consultants and Specialists and Joint Consultants Committees."

A.R.M., 1956

The Representative Body laid down Association policy on various matters in the following terms:

That this meeting urges that general practitioners should have access to hospital facilities, including beds, throughout the country.

That the Association affirms its adherence to the principle that medical men and women, in whatever form of medical practice or service they are engaged, should be remunerated as doctors, and that their remuneration should not be determined by relation to that of lay personnel employed in the same sphere.

That, since the two Spens Reports have established agreed levels of remuneration for general practitioners and hospital medical staffs, and indirectly for most other sections of the profession, the Association reaffirms its policy to maintain these reports as the basis of professional remuneration.

That the Government be urged to set up forthwith an independent committee of inquiry to consider what should be the range of remuneration of medical officers in the public health service, having regard to the remuneration of other sections of the profession and the desirability of the public health service maintaining its power to attract a suitable type of recruit.

That the Association develop a policy whereby the Council will come to assume fuller responsibility for all future claims submitted by any section of the profession.

S.R.M., 1957

At a Special Representative Meeting held on June 13 to consider the current dispute with the Minister on remuneration the Representative Body resolved:

That the Association should continue to press for the implementation of the Spens Reports, until such time as another arrangement is made.

The Representative Body also resolved:

That the Council be instructed to institute with some degree of urgency and through a committee representative of the interests concerned, both medical and lay, an inquiry into the whole field of medical services in the light of the experience gained of the National Health Service since 1948, with the aim of eradicating those faults of the system which cause dissatisfaction to the public and frustration to the profession; and to consider alternative schemes.

A.R.M., 1957

The following resolutions were passed by the Representative Body:

That this meeting stresses the need for the provision of ancillary diagnostic services for the general practitioner, so as to reduce pressure on hospitals, and as a means of reducing hospital costs.

That this Representative Meeting is concerned with the prospects and future of registrars and the supply and distribution of consultants. It asks Council to look at the problem afresh in consultation with doctors of the grades concerned and to report back to the Representative Body.

That this meeting notes with approval the expressed opinion of the Central Consultants and Specialists Committee (Supplement, April 13, 1957, p. 207) that senior hospital medical officers be paid a salary of 80% of that for consultants throughout the scale, and requires the Council to take all possible steps to bring this into effect.

That this meeting calls on the Government to put an end at an early date to the breach of faith whereby drugs are withheld from private patients.

That the position of the public health medical officers shall be reviewed after the report of the Royal Commission is received, and appropriate steps taken with a view to ensuring their proper status and remuneration *vis-à-vis* their colleagues in other branches of the medical profession.

MERIT AWARDS FOR GENERAL PRACTITIONERS

BY

J. F. BURDON, M.B., B.S., D.A.

General Practitioner, Paignton, Devon

Recent suggestions (e.g., Evans, 1958) that general practitioners should receive merit awards prompt two questions: How is merit to be judged? And is it not already rewarded? These may be considered together, and in doing so I propose to discuss the following criteria which have been commonly advanced as being those by which merit can be determined.

Criteria of Merit

Optimum Size of List

A good doctor attracts patients easily, but is too sensible to take on too many. There is therefore an ideal size of list.

This argument breaks down owing to individual variations. Each doctor has different capacities; sparsity of population handicaps some doctors, and confines them to small lists; some doctors spend time in hospital appointments, or have other commitments which take away from their ordinary work; local competition may be fierce in over-doctored areas; some doctors may be easygoing when their patients make undue demands, others more resistant to exploitation—all these affect the list size of the doctors concerned, quite apart from their personal merits.

The smaller the list of a doctor, the more time he will have for each interview, and this makes for better work; but the larger the list the wider the experience of the doctor, and the more likely he is to have ancillary help and superior organization, if only to cope with numbers.

The only practical procedure is to let each doctor take on all he can or will; with a safety proviso of a maximum number beyond which it is ridiculous to assume that he can give an adequate service, even when aided by a local hospital's out-patient department.

Seniority of Doctor

Increasing age brings increasing experience, and this is easy to measure.

It does not follow that a doctor will keep abreast of developments in medicine, and the reading of journals is apt to fall off as retirement nears. It is also absurd to suppose

that the older man is necessarily more deserving than the younger. Either might be brilliant, energetic, interested, and well adapted, and the better doctor.

Postgraduate Study

The College of General Practitioners has adopted the criterion for its members that they must do prescribed minimum periods of approved study at intervals. The College is a select body of enthusiastic practitioners, apparently needing no incentive to keep up their efforts, and it has not seen fit to do more than leave it to members to carry out their undertakings.

If postgraduate study was to become a hallmark of merit, many more courses would be needed to satisfy the demand which would arise, and if a cash income depended on attendances it would bring after it a system of registration and probably inspection. Training staffs would need to be augmented. And if facilities were provided for all, there would still be no likelihood that equal profit would accrue from equal attendance or effort. Talents, teachers, and material all vary from place to place.

If only a limited number of doctors applied for postgraduate courses, as at present, they would seem to be the ones worthy of merit awards. If such a plan was followed, membership of the College would be the obvious criterion, and its rules governing entry would need to be reconsidered. But a better solution is to pay more to doctors who take postgraduate courses, and so encourage them to improve themselves and reward them for doing so in the same act.

Adequacy of Premises and Equipment

Although a minimum standard is generally accepted (Taylor, 1954) for waiting-room, consulting-room, and other needs, much variation is permissible according to local conditions. For instance, it is not necessary for a doctor to provide minor surgical facilities if these are available to him at a near-by cottage hospital. Similarly, a doctor running an appointment system does not need a large waiting-room.

Ancillary staff also affect the issue. If the doctor has time to do their work himself, and prefers to do so rather than pay them for doing it for him, he is not necessarily a worse doctor on that account. And if partners employ ancillary staff, it might be difficult to allot proportions of merit among them. If premises and equipment were to be a measure of merit, much window-dressing might result.

Academic Achievements

When a doctor wins an academic prize he shows merit, which is rewarded by the prize and the prestige which he

earnings. He need not be paid twice. The same applies to diplomas and higher degrees, the reward lying in the honour conferred or distinction given. Rates of pay may depend on certain diplomas—for example, the D.P.M.—and access to jobs be helped by possessing them, but it would be a sad development if all academic honours were valued in terms of cash. A doctor's ability to attract work is enhanced by high qualifications, and it seems wrong and unnecessary to penalize the others, some of whom are without extra letters for reasons other than lack of ability, and who are fine, practical doctors.

Contributions to research are difficult to judge, and their worth may become clear only after many years. It is good if a doctor does research, even if it later proves fruitless, and, conversely, a brilliant idea may have come easily to a lucky man who happened to observe some vital clue but who could hardly claim great merit.

Hospital posts held before entering general practice are different expressions of diplomas and higher degrees, and the same arguments apply to them. They were adequately rewarded at the time (or should have been), and do not necessarily fit a doctor for extramural practice. It would be a strange system which allowed a doctor who had been squeezed out of hospital work by better men to go into general practice reluctantly and find himself credited with merit by virtue of his previous hospital work.

Hospital Staff Membership

Doctors who enjoy the advantages and stimulation of hospital work as members of a general-practitioner hospital's staff are better doctors for the connexion, but are already paid for their hospital duties through the management committees and regional boards. If they are not being paid enough, that is a separate issue. The wider scope of their work is offset by the time demanded by their hospital responsibilities. On balance, there seems to be no claim for them to be paid more per patient than their less fortunate colleagues.

Offices Held

To be elected president of a learned society shows that the doctor so honoured is held high in the esteem of his fellows. But the honour does not need cash embellishments, and to introduce such posts as criteria for merit awards would detract from their value as posts of honour. The same applies to honorary posts generally.

It would be a grave and deplorable thing if everyone insisted on being paid for every effort he made in every direction, and it is not fitting that voluntary services should be weighed and judged when determining rates of pay for ordinary work.

Teaching Students

The increasing tendency to teach students the rudiments of general practice before their final examination is an excellent development. Doctors who participate find the teaching situation acts as a tonic, and they are forced to keep up to date in their knowledge. Any payment they may earn by teaching efforts should originate from their pupils through the university, or through Government grants specifically awarded for teaching, and not as a mark of meritorious general practice. Their patients gain something from the flow of new ideas, but lose privacy and cannot be dealt with so quickly as when no students are present. There is both a gain and a loss in efficiency.

Submission of Theses

Not every doctor can write a thesis, and a board of examiners would have to be created to judge such work. This suggested criterion has no advantages over the M.D., and the same arguments apply against it.

Esteem of Colleagues

Judgment by one's peers has always seemed fair to English-speaking people, and a judgment could be made if every general practitioner was given a ballot form on which

to write the names of his colleagues in order of merit. But a doctor might be unpopular for reasons other than his ability and quality of service to his patients, and in rural areas there might be few to speak for him. It would not be easy to adjust the marking to allow for this.

If consultants' and specialists' opinions were sought, similar problems would arise. There would also be an inevitable lack of uniformity up and down the country. There might be possible abuses—would, for instance, a high rate of domiciliary consultations earn a high or low mark? And who, general-practitioner colleague or consultant, would agree to act as judge in the face of "Judge not, lest ye be judged"? Those who undertake such judging in the consultant field have much criticism to contend with, and prefer to remain anonymous; or at least they do not let their deliberations and findings see the light of day. Who can blame them?

Conclusion

No single method of determining merit in general practice has been found free from faults. It seems unlikely that a faultless whole could be built from such parts, and there is no guarantee whatever that the different faults would cancel each other out—they are so different in quality.

But the merit-worthy general practitioner, who undoubtedly does exist, is not without consolation. He is being paid the rate for the job, a fundamental principle of paid-labour relations in these enlightened times, and he can, by reason of his ability, make his patients more healthy than those of the next doctor. He thus attends less illness and gains more leisure, or is able to care for more patients. The increase of work in the preventive field costs him much less in time and energy than the illness he prevents would have done, and he derives happiness and satisfaction from his work—things which he could not buy with extra income.

Finally, qualities like kindness and patience cannot be measured, judged, or priced; yet how meritorious is the doctor who has them! Such merit seeks no reward in cash.

OPTICIANS ACT

N.O.T.B. ASSOCIATION'S INFLUENCE

The Opticians Bill received the Royal Assent on July 7. The N.O.T.B. Association's bulletin for June records the association's difficulty in getting changes made in the Bill, as it had come unexpectedly in the form of a Private Member's Bill. Summarizing the position, Dr. D. P. STEVENSON, the N.O.T.B.A.'s medical secretary, points out that the following conditions had been secured by amendments: (1) The functions of an ophthalmic optician had now been defined, and all cases requiring treatment must be referred to the general practitioner. (2) A further ophthalmologist would be appointed to the General Optical Council. (3) There would be a complete ban on unrestricted practice. (4) Protection had been achieved for N.O.T.B. medical eye centres.

TRADE UNION MEMBERSHIP

The following local authorities are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham.

Non-County Borough Councils.—Crewe.

The Minister of Health, Mr. Derek Walker-Smith, told Parliament recently that the average cost of a Health Service prescription had gone up about 4d. since the end of last year and had now passed the 6s. 4d. mark. He said he was "in consultation" about the interim report of the Hinchliffe Committee which is examining prescribing costs.

ROYAL COMMISSION ON DOCTORS' AND DENTISTS' REMUNERATION

SCOTTISH ASSOCIATION OF MEDICAL ADMINISTRATORS' EVIDENCE

A plea for the recognition of medical administration as a specialty in its own right, with salary grades with top figures of from £2,350 to £3,250, was made to the Royal Commission on Doctors' and Dentists' Remuneration by representatives of the Scottish Association of Medical Administrators at the morning session on June 19. Principal spokesman was the association's chairman, Dr. S. G. M. Francis, the other witnesses being Dr. C. Bainbridge (vice-chairman), Dr. F. D. Beddard, Dr. W. Mackie, and Dr. P. W. R. Petrie (hon. secretary and treasurer).

In a short historical outline, Dr. Francis said that the association was founded four years ago as a result of an agreement among the members to leave the Scottish branch of the Medical Superintendents' Society and form themselves into a separate Scottish association of doctors employed in hospital administration. Paid-up membership was about 50, potential membership being 85. It had a good representation from regional hospital boards, there were two senior administrative medical officers on the council, and, to a man, the Scottish administrative medical superintendents supported it strongly.

Medical Superintendents' Work

Sir HUGH WATSON explained that the Commission was not concerned with the merits of the divergence of view between England and Scotland on whether hospital superintendents should be medical or laymen but accepted the Scottish system as it was. Dr. PETRIE agreed, in answer to Sir Hugh's question, that the Scottish association's view was that hospitals ought to be administered by doctors rather than by laymen. Asked to describe the relationship of the medical superintendent to his board, he said it varied to some extent from board to board, but, generally speaking, in Scotland the medical superintendent was at the moment considered to be the chief executive officer, expected to have an overall picture of what went on in the hospital and to take decisions on all matters affecting patients except matters concerned with finance. He was required to interest himself in the organization of out-patient departments, records, and catering. Budgetary matters were excluded from his sphere except so far as medical equipment was concerned. It should be possible in some hospitals to off-load some of that administrative work to lay administration. In the past, medical superintendents had been much more concerned with such matters than they were to-day. The supervision and organization of the out-patient department was one of the medical superintendent's main functions, but once it was effectively organized it did not require a great deal of his time to keep the machinery in motion.

Sir HUGH WATSON (quoting from the Henderson report): "He ought to be a co-ordinator of all activities in the hospital." Dr. PETRIE: "We think that is fundamental."

Asked to deal with the subject of the relations between the medical superintendent and the medical staff, Dr. FRANCIS described them as "extremely good." There was a very well organized system of medical staff committees which found it very convenient to put their proposals through the medical superintendent to the board of management, and the superintendent transmitted the replies back to them. Describing the division of day-to-day management duties, he explained that the secretary was responsible for the minutes of the board of management, conducting correspondence on its behalf and custody of the funds; he could be loosely described as "the business manager of the hospital." The physician was responsible for the actual treatment of the patients. But the final responsibility when

things went wrong lay with the superintendent. He dealt with all complaints. Dr. Francis then gave examples of the sort of emergency which did arise in hospitals, and, when asked by the CHAIRMAN, Sir Harry Pilkington, whether the decisions which had been taken in those cases could not have been just as effectively taken by somebody who was not medically qualified, he said he did not think the medical staff would accept such decisions so readily from a layman.

A Specialty

Sir HUGH WATSON: "Are you describing the medical superintendent as a specialist in the sense that a consultant is described as a specialist?"—"The consultant has to take a senior qualification; on that basis we would not be in the same category, but the training, for a medical superintendent to be any good, is just as long and just as difficult to accomplish. You don't want them to go in for it too young. They must have had a very good clinical training and be able to understand the problems of a hospital. It is a difficult thing to do: it needs tact and a practical sort of mind. The registrar or senior registrar who has had a good training and finds in his early thirties that he has an aptitude for it should be seconded for training as a potential officer or administrator of a regional board."

Dr. BAINBRIDGE said the problem was that there was no qualification or degree which was particularly related to medical superintendents; on the other hand it was necessary to consider the length and breadth of experience that were required before taking up such a post. Dr. FRANCIS said that there were training courses for medical administrators in the U.S.A. and Canada. Of the practice in other countries, generally speaking it could be said that hospitals founded by the Churches tended to have lay administration while those founded by the profession tended towards medical administration. In Belgium and France and further south the former method prevailed, while in Holland and further north the accent was on the latter. Medical administration was not universal in the U.S.A. and Canada because of the difficulty in obtaining men of the required calibre.

The CHAIRMAN: "If you are once a medical administrator, do you remain as such or do you come back to consultant jobs and clinical responsibilities?" Dr. FRANCIS answered, "No," while Dr. PETRIE explained that it was not a question of their losing the ability to make use of their clinical training—they could not be good superintendents unless they were doctors—rather had they widened the narrower sphere of their clinical work. Recruitment was proving difficult; men of first-rate quality, although available, were hanging back because the remuneration was so poor. Dr. FRANCIS agreed there was no inducement for a man to take on work with the very wide responsibilities involved when his consultant colleagues were getting a thousand a year more than he was. He agreed with Sir Hugh Watson that the remuneration had been regulated by Whitley Committee B, and that the arguments being put forward had already been pressed before that body. In Scotland the B.M.A., the consultants and specialists, and the profession in general had always supported the idea that medical administrators should have a reasonable salary in comparison with their other professional brethren. Discussions had taken place with the Department of Health some eight years ago, after which it had been recommended that medical superintendents should be paid roughly the same as consultants, but nothing had come of it. Fundamentally, the position was that the Henderson recommendation on salaries simply confirmed what the B.M.A. and the whole profession in Scotland had said right from the beginning.

Dr. BAINBRIDGE said the only promotion prospect for a medical superintendent was with a regional hospital board,

but there were only 20 such senior posts throughout Great Britain. Dr. BEDDARD said that medical superintendents regarded themselves as members of the specialist staff; they had to know the Acts and regulations and to have all sorts of background knowledge and be able to apply it; they were meeting the specialists in clinical medicine on equal terms, being expected to live and work with them. The Henderson report was regarded by them as having recognized the fact that the senior medical administrators in the service were of comparable status with the specialist staff.

Sir HUGH WATSON pointed out that the Ministry's publication *Headquarters Medical Staff for Regional Hospital Boards—Scale of Remuneration*, put out last June, was full of unchallenged facts. Dr. FRANCIS said he did not think it had been circulated in Scotland. Sir HUGH WATSON: "It has been on sale there." (Laughter.)

Sir HUGH continued: "I find it very difficult to swallow—to put it crudely—the conception that, even with his experience and his knowledge of Acts of Parliament, the medical superintendent can be compared with a consultant from the point of view of his attainments, his ability, and the discipline through which he has gone, and I can't help feeling that that is why Whitley Committee B has not been able to award any higher remuneration than it has up to date." Dr. FRANCIS replied that there was no way of learning to be a medical superintendent at the present time, apart from taking the D.P.H., doing a certain amount of administrative training, and learning it as an apprentice. It was a little hard to penalize them just because there was not a qualification they could take. "We are not unrealistic enough to think that the superintendent of a smallish hospital should get the same scale as a consultant; we feel that the three top jobs should get a little less than the consultants and that the others should be scaled down accordingly," he said.

The Scottish Association of Medical Administrators' memorandum of evidence proposed salary grades with top figures of from £2,350 to £3,250.

A witness said that his association's claim was not for a cost-of-living increase, but to put right something which they felt should have been put right eight years ago. He also explained that normally in Scotland a medical superintendent was provided with a residence on the hospital premises for which he paid a rent fixed by the Treasury; formerly he had got his house free. In reply to a question by Sir Hugh Watson on the subject of entertainment allowances, he said that with a reasonable salary, comparable to that of the consultants, he would personally be perfectly prepared to entertain visitors to the hospital, although he found it difficult to do so on what he was receiving at present.

Dr. BEDDARD said that the same applied to regional board administrators, who had many visitors, but he did not think any of his colleagues would make a tremendous point about it. Asked by Mr. J. H. Gunlake what kind of allowance he had in mind, he said something between £25 and £50 a year on the present remuneration.

MEDICAL SUPERINTENDENTS' SOCIETY'S EVIDENCE

At the afternoon session the Medical Superintendents' Society representatives put forward their claim that a medical superintendent should be given extra remuneration over and above his purely clinical colleague. "Only he has his finger on the pulse of all the hospital activities, and his value to a management committee which regularly seeks his opinion on different problems is immense," said the written memorandum.

The Society's witnesses were: Dr. G. McCoull (president), Dr. M. J. Brookes (chairman of council), Dr. V. Cotton-Cornwall, Dr. A. Skene, and Mr. J. M. Milloy (hon. secretary). Dr. McCoull explained that the Society's membership numbered 250; potential membership was about 400, 95% of whom were of consultant status.

Consultant Status

It was pointed out in the written memorandum that the mental and mental deficiency hospitals accounted for about 45% of the country's hospital beds; all such hospitals had as their chief officer a medical superintendent with statutory powers; many of the former municipal hospitals still had medical superintendents, so that over 50% of the hospital beds of the country were administered by medical superintendents—yet the very existence of the medical or physician superintendent had been tacitly ignored by the Ministry of Health. Most medical superintendents were consultants in their various specialties and remunerated as such. The Society knew of only two medical superintendents in England and Wales whose work was wholly administrative; all others combined clinical and administrative duties.

Dr. SKENE said that in 11 hospital regions for which there had figures there were 368,600 beds, 221,600 of which were in hospitals administered by medical superintendents—just over 60%. Sir HUGH WATSON: "Yet you say that the very existence of the medical superintendents has been tacitly ignored by the Ministry of Health?" Dr. MCCOULL: "With any document from the Ministry the set-up is such that it comes down through lay hands and very often we find that the medical superintendent of the hospital is simply not named; it goes to the lay side and we are often bypassed." In the Ministry's official "Hospitals' Directory" no medical superintendent was mentioned.

Sir HUGH WATSON: "It is astonishing, because medical superintendents are recognized in their scale for remuneration as though the whole of their duties were clinical." Medical superintendents, he added, were graded as consultants. Dr. SKENE said they were recognized as consultants for the purposes of remuneration, but for the purposes of administration in the general hospitals there was no doubt that there was considerable substance in Dr. McCoull's remarks.

Mr. MILLOY said the Ministry's attention had been called to the matter on a number of occasions, and it had only issued polite replies. In reply to Sir HUGH WATSON, he said about 90% of the Society's members were superintendents of mental hospitals; the figure in respect of infectious diseases hospitals was small, while for general hospitals it was 7 or 8%. There were about a dozen medical superintendents in the country graded as S.H.M.O.s. In general the Society accepted the definition of the duties of the medical superintendent as laid down in the Bradbeer report, although in mental deficiency hospitals there was something extra.

Merit Awards

Dr. COTTON-CORNWALL said that the lack of interest shown by consultants in the merit award system did not correspond with the facts. Dr. MCCOULL said the Society strongly protested against the decision that administration did not count for merit awards; it was part of the man's total professional capacity and should be taken into account. The CHAIRMAN said there had been a generally expressed feeling that the line of demarcation should be left where it was. Dr. SKENE said it was felt that the medical administrator's job was an important one for the good of the hospital service; consequently, any condition of service which made it less attractive or carried with it a handicap was not calculated to maintain the quality of the service in which the members were interested.

Sir HUGH WATSON said the Commission had so far been impressed by the argument that the realm outside clinical medicine was a wide one, but he pointed out that medical superintendents were consultants to begin with. Dr. SKENE said that the physician superintendent consultant was handicapped in relation to his consultant colleagues. There was a limit to the amount of work which he could put into 24 hours. He was expected to carry out clinical duties in 9/11ths of his time, with the medical administration of a large hospital over and above that. He was often doing

administrative work which prevented him devoting his time to work which might make him eligible for the merit award.

Discrepancy in Figures

Sir HUGH WATSON pointed out that throughout England and Wales there appeared to be 129 doctors who acted as medical superintendents for a certain number of hospitals, and he wished to know whether that was, broadly speaking, the total number. Dr. MCCOULL said that the Ministry's factual memorandum of evidence gave the number of medical superintendents and deputies as 77, but the Society thought it was nearly 400, although the figures were not too certain.

The CHAIRMAN asked why such uncertainty existed, and Dr. MCCOULL said he thought it was because of the nomenclature used, which was sometimes "medical superintendent," sometimes "physician superintendent," sometimes "medical director." People tended just to look for the term "medical superintendent."

Sir HUGH WATSON said that, in view of the statutory obligation to have a medical superintendent in mental hospitals, there must be more than the figure of 44 quoted in Appendix C of the Bradbeer report. Dr. MCCOULL agreed that there must be many more.

The CHAIRMAN said that the Ministry's factual memorandum had come out in July last year, since when there should have been enough time to establish the true facts. Dr. SKENE said the Society had not had it until October.

More on Merit Awards

Returning to the subject of merit awards, Dr. MCCOULL said it was the Society's view that there should be a small body elected or appointed by the doctors to deal with the matter. The CHAIRMAN said it had been suggested, and fairly well accepted, that the comparatively informal method of ascertaining merit worked better than a formal committee method. Sir HUGH WATSON emphasized Lord Moran's statement that there had never been any doubt about who should have "A" awards; there had been some doubt, but not a lot, about "B" awards.

The CHAIRMAN: "Is this partly connected with the feeling that in the particular sphere of mental health there has not been as much recognition as in some of the other spheres?" Dr. MCCOULL: "That has not come into my mind up to the moment." He agreed that, on the whole, it worked as well as it could do under the present system. Dr. SKENE said that, allowing for human fallibility, he thought it was reasonably satisfactory.

Dr. COTTON-CORNWALL said that, although the end-result might be very similar to what it might be if there were an elected committee making recommendations, people would feel they had been more fairly treated if the latter system obtained. He thought the difficulty was restricted to the "C" award and did not arise in the case of the other two. Dr. BROOKE stated that people were fairly satisfied within his region. Mr. MILLOY: "In my region we don't know much about it."

Medical Administrator's Function

Sir HUGH WATSON then asked for the general view on the place of medical administration in general and special hospitals.

Dr. MCCOULL said he could speak with authority only on the mental and perhaps the mental deficiency sides, in which spheres he had no doubt at all that medical administration was an absolute necessity. He did not think that any other system such as those used in most general hospitals now would work. There was no way of looking after a person's total life 24 hours a day, perhaps for years, other than by an administration which had a doctor as its head.

Sir HUGH WATSON: "That means that the doctor supervises, if he does not deal with the details of the whole administration of the hospital?" Dr. BROOKES: "In the mental hospital he correlates the other departments and acts

as a liaison." Dr. SKENE said that position was obviously different with general hospitals in England, but the Society took the view that the employment of a medical superintendent in a hospital was highly desirable because the basic fact was that the hospital was simply a building to enable sick members of the public to be treated by doctors and nurses, and it seemed reasonable that the administration of such a place should be carried on by a medical man.

Asked by Sir Hugh Watson to comment on the importance of "the freedom of the subject," Dr. MCCOULL said that the responsibility in that field had been tremendous of late. There had been accusations that people had been kept too long in mental hospitals. New regulations, however, were lightening the responsibility. Previously a mental patient had to be certified on coming into the hospital, recertified at the end of the first year, again at the end of the second year, and then at the end of five years. They were now taking in patients more informally and such recertification was no longer necessary, but early experience showed that the responsibility of taking in mental defectives under uncertified conditions would be very much greater than when they had been certified. "I think we all welcome the informality," he said, "but it will put on the doctor a very much increased responsibility." The CHAIRMAN: "In an ordinary mental deficiency hospital, does that invariably come directly on the medical superintendent, or has he the ultimate responsibility but doctors under him take the decision in most cases?"—"In my hospital the other doctors take a very large share of the responsibility, but any questions of doubt I have to decide."

Allocation of Duties

Sir HUGH WATSON: "How much time is involved in clinical work and how much in administrative work in a hospital such as yours?" Dr. MCCOULL: "Everyone will speak as though doctors work 38½ hours a week as medical superintendents. I can double that almost every week in the year, so I don't know whether to take a proportion of 38½ or somewhere about 72. I would say that the actual administration, as administration, does not take very much. There are other people to do this work—group secretaries, group engineers. But there is the work which is looked upon by some people as administrative but which in our opinion is purely medical. With so many 'unknowns' I cannot get a definite proportion." Sir HUGH WATSON: "How far is a medical superintendent responsible for the clinical work of other consultants?"—"I would say not at all. Of course, he has to see that outside consultants turn up in time and do not keep other doctors and patients waiting, and he is responsible for seeing that the consultant is thoroughly looked after and has all the equipment he needs. If he is a part-time consultant he has to see that the job is properly carried out and that the nurses are at their work, but I do not think the medical superintendent has any responsibility for the clinical work carried out."

"You say that the S.H.M.O. grade should be abolished: what would you suggest to replace it?" Dr. MCCOULL: "Very largely, we think there ought to be a broadening-out of the consultant grade. We do not think that some form of junior-, sub-, or assistant-consultant is the right answer." He said his Society thought that the grade should die out, as such and in name, but that those who were already left in it should have a regular review of their status, because there were S.H.M.O.s doing consultants' work. Dr. COTTON-CORNWALL said the problem could not be tackled until there had been a whole, general review of hospital staffing—for which purpose a working party had been set up. Broadly speaking, the second memorandum submitted by the B.M.A. to the Commission had dealt with it very fairly and fully.

Sir HUGH WATSON agreed that the setting up of a working party had, at least to some extent, taken the matter away from the Commission.

Dr. COTTON-CORNWALL said that the grade had caused tremendous frustration. Doctors who had been in the

service before 1948 felt in many cases that they were being very unfairly treated *vis-à-vis* their colleagues, who, before 1948, had been considered to be their equals.

Extra Remuneration

Asked to explain the view expressed in the written memorandum that a medical superintendent should be given extra remuneration over and above his purely clinical colleagues, Dr. McCOLL said it was because a medical superintendent was more completely whole-time than anyone else and carried a burden of responsibility which no other member of the profession had. He disagreed with the Bradbeer Committee's contention that a medical superintendent should be paid for the sessions in which he was acting as such on the same scale as those in which he was acting in his consultant capacity. Dr. SKENE said the Ministry recognized the principle that the medical superintendent should be paid as a whole-time consultant if he was employed for up to 2/11ths of his time on administrative duties and the remainder on clinical work; but if it was 8/11ths clinical and 3/11ths administrative he was paid for his 3/11ths at administrative rates and not as a medical man at all.

The CHAIRMAN: "Where would you draw the line? If it was 1/11th clinical and 10/11ths administration you would not expect him to be paid as a clinician?"—"If it is a hospital with 250 beds he can undertake medical administration in 2/11ths of the time; if it has 1,250 beds it is less likely that he can undertake the same responsibility, and it seems anomalous that for undertaking the more onerous task he should suffer financially. This applies to general hospitals and sanatoria." The CHAIRMAN: "But you pointed out that the big general hospitals, on the whole, would not have medical superintendents?"—"A considerable proportion of general hospital beds are not under medical superintendents, but in fact a very considerable number of the really big hospitals do have medical administrators."

Dr. McCOLL said that medical superintendents felt that they ought to be paid as consultants, if they were consultants, for their clinical work, and, because they took on added responsibility as medical superintendents, there ought to be a component in their total remuneration to cover that point. Sir HUGH WATSON: "What criteria would you suggest should be employed in appraising that figure?"—"We think that size has to count largely, and beds are as far as we have got, although we do realize that there are other matters which will come into any scale." Sir HUGH: "If it is not beds it is out-patients?"—"Yes."

The CHAIRMAN: "I am left with a rather vague impression of something very complicated that would be a matter of individual assessment and judgment in most cases." Dr. BROOKES: "No more complicated, surely, than some other salary scales attached to hospital work in other than medical things. We want a system that varies according to the responsibilities and the work done." Dr. COTTON-CORNWALL: "An attempt to equate remuneration with the total administrative load in a particular appointment."

Sir HUGH WATSON: "Is it somewhat comparable to the responsibility pay which was given to certain schoolmasters, such as heads of departments?" Dr. COTTON-CORNWALL: "I would say we are thinking along those lines. But the head of a department is under a different kind of responsibility from that which a medical superintendent takes in relation to the whole of his charge."

Sir HUGH WATSON: "To what extent could the function of dealing with staff, whether medical or lay, be dealt with by a person with reasonable tact and personality and some administrative knowledge and experience? Do you think that a lay person who had some business experience, if he had tact, personality, and understanding, could deal to a very considerable extent with the problems about which you have been talking?"

Dr. McCOLL replied that it might appear that he could—if such a man existed—but there was something in hospital

administration over and above the official duties which was impossible to describe. It was so difficult for doctors to get it over that there was a component in hospital administration which consisted in binding everybody together. Dr. SKENE said that such a "paragon" could undertake all the duties for a considerable time, but when it came to a medical decision there was undoubtedly at least the desirability of having a medical man to undertake the responsibility.

Mr. MILLOY protested against statements that being a whole-time salaried doctor made him like an officer of Whitehall or Savile Row. He did not want such statements to go unchallenged. The CHAIRMAN: "You consider that you are doctors just as much as anybody else?" Mr. MILLOY: "I feel just as free now as I ever did before."

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

MINISTER'S ACTION ON REGISTRARS NOT APPROVED

The Central Consultants and Specialists Committee and the Joint Consultants Committee were not associated with and did not approve of the Minister of Health's proposal for specially designated posts for time-expired senior registrars. This was made clear at the meeting of the Central Consultants and Specialists Committee at B.M.A. House on June 26, when it was stated that some members of the profession were wrongly of the impression that the proposals had been accepted by the Committee and were critical of it on this account. Mr. T. HOLMES SELLORS, chairman of the Committee, presided. A suggestion that members of the hospital medical staff should be allowed to attend the Committee as observers was referred to the Executive Committee. A number of members spoke favourably on it.

Hospital Medical Staffing

A large portion of the whole-day meeting was devoted to the question of hospital medical staffing. Before the Committee were resolutions from the Hospital Junior Staffs Group Council and the Birmingham Regional Junior Staffs Group deploring the Minister's decision to create designated posts in a new category, and a report by the Committee's Medical Staffing Subcommittee with its own suggestion for a future staffing structure.

The CHAIRMAN said that the Minister's decision to create special posts for time-expired senior registrars was taken quite unilaterally. Four foolscap pages of careful argument in favour of a subconsultant grade had been presented by the Ministry to the Royal Commission on Doctors' and Dentists' Remuneration, and presumably the creation of this grade would be in the minds of the Ministry representatives on the working party which the Minister had appointed to review hospital staffing, warned Mr. Holmes Sellors.

Professor G. I. STRACHAN said that the fact that the designated posts seemed to be additional to the registrar establishment aggravated the position. There should be a reduction of the number of registrars to clear the bottleneck.

Subcommittee's Proposals

The Committee's Medical Staffing Subcommittee's proposals were outlined by Professor Strachan. They had been considered by the Executive Committee in the light of comments at the previous meeting. Professor P. C. P. CLOAKE said the Committee should realize that the proposals were intended for the future pattern of hospital staff as a whole. The present problems of the senior registrar bulge and S.H.M.O.s should be looked on as separate. "These proposals are intended to eliminate the recurrence of the problems we have now."

Dr. T. ROWLAND HILL was emphatic that, apart from certain well-defined exceptions, there should be only one career grade in the hospital service, and that was the consultant grade. He explained that the proposals followed this principle. The next stage, he thought, would be to fight for it on the working party. "What we call the senior registrar to-day is really too senior to be a registrar; he is really a consultant and sooner or later he should be called so." A decision on a man's future should be made at a stage early enough in his career for him to go into another branch of practice if he is not chosen to continue in hospital practice. There was no doubt that what had to be fought was a determined effort to get a large volume of work in hospitals, which ought to be done by consultants, done by the people paid permanently at a lower rate. The fact that the Government had been to the trouble already, without consulting the profession, to associate themselves with that view and put it in writing before the Royal Commission was an indication of how serious the matter was.

"In my opinion the action of the Ministry in creating these designated posts for time-expired registrars is probably not what it appears on the surface—an attempt at the expense of public funds to be kind to time-expired senior registrars," continued Dr. Rowland Hill. "There are party political factors. But, much more than that, my personal opinion is that this is a 'try-out,' well before the working party can report, of a subconsultant grade, and we should face up to that."

In Germany, where a similar situation had been developing in hospital staffing to that in this country, it had been decided that the only sound policy was to increase the number of consultants in the immediate future and decrease the number of men junior to that rank.

Principles for the Working Party

Mr. J. R. NICHOLSON-LAILEY enunciated three principles to be placed before the working party. First, there must be no impairment of the quality of the consultant service to be given by consultants properly trained. "Secondly, we must not train brilliant men and women and then throw them on the scrap-heap, which is what is tending to happen at present." Thirdly, there must be no "dead-end" grade, such as the S.H.M.O. grade had become; unfortunately it was there, and as long as it was there the Ministry had their subconsultant grade. It was true that part of a consultant's training consisted in taking consultant responsibility while he was a registrar. More and more responsibility was delegated to him by his chief. But the Ministry did not see the difference between this and the senior registrar who had carried on for five or six years and was really a consultant.

Mr. Nicholson-Lailey made a plea for the inclusion of a non-teaching hospital consultant on the working party. Practically everybody on the working party was connected with a teaching hospital, he pointed out, and yet a very large number of hospital beds were staffed by non-teaching consultants. "They have their staffing problems. It was from them that the original stimulus came for setting up the Strachan Committee. It would be a great advantage if the Ministry could be persuaded to put at least one non-teaching consultant on the working party, preferably from a provincial hospital. I do not think the S.H.M.O. is found in the teaching hospital at all. Again the distribution of senior registrars is quite different. There are few senior registrars in non-teaching hospitals."

Dr. J. VALENTINE added that there was no representation on the working party of psychiatry or mental hospitals. Their Mental hospitals contained 40% of hospital beds. Their staffing structure was traditionally different, and unless there was someone with knowledge of it the working party would be at a disadvantage.

In answer to Mr. T. H. DOCKRELL, the CHAIRMAN said it had been the policy of the Committee from the beginning that the consultant establishment should be increased. It also said that it did not see how this could be done without a review of what was needed. The Ministry had refused

a review and had put up the idea of subconsultants. Without a review one was fishing in the dark, and the situation was that, instead of being appointed consultant at 32, as Spens intended, doctors were now much nearer 40.

Dr. ALEXANDER SMITH read the resolution of the Scottish Consultants and Specialists Committee disapproving the Secretary of State for Scotland's proposals for registrars, welcoming the setting up of the working party and expressing willingness to co-operate with it, and urging that senior registrars should be given security of tenure until the working party reported and that they should be given a salary increase.

Professor STRACHAN said that Dr. Rowland Hill had pointed out the dangers of the Minister's proposed new posts. "I think we have been to blame in not emphasizing to the profession that this was done in the teeth of our opposition," he added. "I have not seen it stated in the *Journal** or elsewhere that we are in no way agreeable to the establishment of these new posts, and it is not the first time we have slipped up in this way." On one point Professor Strachan did not agree with Dr. Rowland Hill. The future consultant was not more or less selected when he began his senior registrar appointment. He was tentatively selected as a potential consultant then. The final selection should only come at the end of four years. Possibly 90% would go on.

Representation on Working Party

Dr. J. D. PROCTOR supported Mr. Nicholson-Lailey's plea for representation of the provincial hospitals on the working party, and suggested that region by region the consultant should decide what they considered was a reasonable consultant establishment. Dr. ALEXANDER SMITH pointed out that in the constitution of the working party all the Royal Colleges were represented except the Royal Faculty of Physicians and Surgeons of Glasgow, and asked that it might be given some representation. Sir RUSSELL BRAIN thought there was a great deal to be said for keeping the working party small. "The danger is that if you enlarge it—and that means one on each side—it will be too unwieldy." He had in mind that the matter could be dealt with by the use of deputies, and the working party would be taking evidence and visiting hospitals. "I would be sorry to see it enlarged beyond the present number of 12, which is already too much." He was very much in agreement with what Dr. Rowland Hill had said, but they had to face what was likely to happen. It was really a question of money.

Dr. G. S. W. ORGANE said that, if the working party arrived at an opinion that a certain number of consultants was necessary, the responsibility for not accepting that recommendation must fall on the Government's shoulders. Mr. R. J. RUTHERFORD underlined the difficulties of getting registrars in provincial hospitals.

On the motion of Professor STRACHAN it was agreed that the modifications to the Medical Staffing Subcommittee's proposals now presented be approved and that they be forwarded to the Joint Consultants Committee for the use of its members.

Registration of Medical Auxiliaries

It was reported that Dr. Rowland Hill and Sir Russell Brain were to meet two representatives of each of the bodies of medical auxiliaries to consider a new scheme which has been put forward for discussion for the registration of medical auxiliaries. Under this there would be a registration board for each type of auxiliary on which

*We commented on the Minister's proposal to create new posts for time-expired registrars in an annotation headed "The Plight of the Registrars" on April 26 (p. 993). Here we stated the Joint Committee's and the registrars' opposition to the proposal and why they opposed it. The letters on the subject exchanged between the Minister and Sir Russell Brain were published in the *Supplement* of April 26 at pp. 216-217, and we reported the Central Consultants and Specialists Committee's debate on this matter in the *Supplement* of May 10 at pp. 235-6.—Ed., B.M.J.

the auxiliaries themselves would in each case be in a majority. There would be a co-ordinating council of doctors, auxiliaries, and independent persons appointed by the Privy Council and other bodies. "It would have the power of veto only," explained Sir RUSSELL BRAIN. "It would have no power to put forward any alternative proposals." This was not in accordance with the view which had been put forward in the past by the Joint Committee.

Mr. H. H. LANGSTON said that orthopaedic surgeons were worried lest the individual registration boards should put up unacceptable conditions and it would be impossible to alter them. The Orthopaedic Group of the B.M.A. would support increased power for the co-ordinating council. Dr. HUGH DAVIES was sure the Association's Radiologists Group would support those views. Dr. A. T. RICHARDSON, supporting from the Physical Medicine Group, mentioned that already the Chartered Society of Physiotherapy had altered its ethical rules so that members could carry out treatment without a doctor's instructions. There was a move for independence which would upset the whole structure of medicine. Mr. O. GAYER MORGAN and Dr. A. GRAY associated the Ophthalmologists and Pathologists Groups with what had been said, and Sir RUSSELL BRAIN asked for details of the Chartered Society's action to bring to the notice of the meeting.

Tribute to Lord Webb-Johnson

Mr. HOLMES SELLORS and Sir RUSSELL BRAIN left the meeting to attend the memorial service to Lord Webb-Johnson, and Dr. ROWLAND HILL, deputy chairman, who took the chair, paid tribute to Lord Webb-Johnson's services in the discussions leading up to the National Health Service. Although he became a controversial figure, there could be no doubt that Lord Webb-Johnson's work was of very great value indeed in safeguarding professional interests at the outset of the National Health Service. "Perhaps his greatest contribution," said Dr. Hill, "was that he was the man more than any other who persuaded Aneurin Bevan—and that, you can imagine, took considerable powers of persuasion—of the need for the provision of private beds in National Health Service hospitals."

The Committee recorded its regret at Lord Webb-Johnson's death and appreciation of his past services as a member of the negotiating committee and of the Joint Consultants Committee.

Delay in Advertising Posts

The Junior Staffs Group Council urged that regional boards should make repeated and more energetic efforts to advertise vacant posts, which often remained vacant for many months, making it necessary for hospital junior staffs in adjacent hospitals to cover. Professor STRACHAN said that in his region a man might have left three weeks before an advertisement appeared. "That is due entirely to slackness on the part of the administration of the regional board," he declared.

Chairman's Burden

Such is the burden of B.M.A. work on the chairman of the Central Consultants and Specialists Committee, the Executive Committee reported, "that no consultant with wide clinical commitments can accept the chairmanship without danger of seriously disrupting his professional work." The Executive felt that the solution of the problem could adequately be met by the appointment of a second deputy-chairman, and for the chairman and his two deputies to agree upon a general division of responsibility.

Mr. LANGSTON said that the chairman should be present in the Council and Representative Body. "But I would put in a plea for more support from consultants in the work of those bodies," continued Mr. Langston. "I think there is a reluctance among consultants to seek membership of the Representative Body. I admit the Representative Meeting takes a lot of time and a great deal of the discussion would not concern us, but perhaps because of the lack of repre-

sentation of this committee a great burden of answering questions on resolutions is put on the chairman. It is easier in that we now have four representatives from the Committee to the A.R.M., but if other members sought election through Divisions it would aid him. The same applies to Council."

Supporting the Committee's proposals, Dr. R. P. KEMP said it was vital that the chairman should be in active clinical practice.

There was less support for the Executive's other proposal that, once a member had been appointed to the Executive or the Chair, and so long as the member held office, the regional committee or other body by whom he was appointed should be free to appoint a further representative for the period during which the office was held.

Mr. W. S. LEWIN said that the Committee was still building itself up as the body representing the views of the consultants and specialists of the country. It was by no means in a secure position. One of the essential things was to ensure that the chairman and deputy-chairmen were acting clinicians. Once make the post of chairman so burdensome that it could be occupied only by one who was more in the medico-political field or retired and there would be a breakaway. Members of the Executive Committee were by and large those who had been members for a number of years. Under the present arrangement that could only mean that other people in the regions were not having the opportunity of reaching the Central Consultants and Specialists Committee and widening its representation. "I am sure we must continue to build at the periphery," concluded Mr. Lewin.

Mr. A. N. GUTHKELCH moved an amendment which confined the Executive's proposal for the appointment of a further representative to the case of the chairman and deputy-chairmen. "While I am in favour of the idea that the office of chairman and two deputy-chairmen should be supra-regional, I am not in favour of a place on the Executive being supra-regional," he declared.

After further discussion the amendment was carried. The Committee accepted the proposal for an additional deputy-chairman.

Elections

In 1956 the Committee decided that it would elect its chairman, deputy-chairman, and members of its Executive and its representatives on the Joint Consultants Committee for the forthcoming year at the last regular meeting of each session instead of the first meeting of the new session, when a proportion of the members might be newcomers to the Committee. This is subject to the formal confirmation of the appointment of chairman at the first meeting in the autumn.

Mr. HOLMES SELLORS, who had intimated that he would not be willing to stand again for the chairmanship of the Committee, agreed, in view of the arrangements which had been made and the further consideration to be given by the Executive to relieving the burden of the chairman, to accept the renomination which was pressed upon him by members. Dr. Rowland Hill and Mr. Langston were elected joint deputy-chairmen.

Loss of Personal Property in Hospitals

"Another example of the juggernaut of the National Health Service having taken over the perquisites of junior hospital staff," was Mr. RUTHERFORD's comment on the confirmation from the Association's solicitor that in general a hospital authority has no duty towards the belongings of an employee, and that the only way in which an employing authority could be held liable would be by an express provision in the contract. "It comes into the category of one of those little pin-pricks to which the Royal College of Surgeons of Edinburgh referred in evidence to the Royal Commission," said Dr. ROWLAND HILL. "Pin-pricks such as charging everyone 3d. or 6d. for a cup of tea, even a consultant who came at night to do an emergency."

Inquiries of the Medical Insurance Agency, the Executive Committee's report added, indicated that it was possible for hospital residents to insure their personal belongings against all risks, under a group policy, for a modest premium.

Merit Awards for Psychiatrists

The Association's Psychological Medicine Group Committee told the Committee that it strongly supported representations by the Royal Medico-Psychological Association deploring the disparity between psychiatry and general medicine and general surgery in the distribution of distinction awards. Dr. VALENTINE said it had been claimed that the candidates for awards in psychiatry were not of the same category as those in general medicine and surgery. That could not be held when one considered the status of British psychiatry throughout the world. "Nowadays it is the mental hospitals in Britain that are most frequently visited by our colleagues abroad," he remarked.

The Executive had suggested that the marked disparity between the relative number of distinction awards in psychiatry and in general medicine and surgery might partly be explained by the greater expansion in psychiatry since the Health Service, and that the Group and the R.M.P.A. be asked for a "break-down" of the consultant establishment in psychiatry, showing the age-distribution and length of consultant service. On this Dr. VALENTINE commented: "A concomitant should be a break-down of the establishment in general medicine and surgery." Although members of the merit awards committee were not representatives of specialties, he added, one never failed to find physicians, surgeons, or obstetricians and gynaecologists. "Psychiatry is one of the major specialties, and it is going in the future to expand to a very great extent."

Dr. R. ORTON said the break-down should include S.H.M.O.s, who were in greater proportion in psychiatry. Mr. LANGSTON pointed out that others, such as chest physicians and anaesthetists, might be in the same position as regards proportion of merit awards. Dr. J. B. S. MORGAN said that immediately one brought out figures one was dealing with quantities. Figures were of no value, because this was a question of quality. But Dr. VALENTINE thought figures were valuable as showing trends.

It was agreed to seek the information.

"Merit" or "Special Responsibility"?

The Committee made clear its opposition to a system whereby distinction awards would be allocated on the basis of special responsibilities attached to posts rather than on the professional distinction of individual consultants, and for administrative qualities rather than clinical eminence. As a matter of urgency the Executive had already urged the Joint Consultants Committee to ensure that evidence be presented to the Royal Commission to this effect. The Executive did this when it learned that at the request of the Royal Commission the Ministry was seeking information about consultant posts involving special responsibility.

Said the CHAIRMAN: "We have always laid down that the highest form of payment is for clinical responsibility. We were never fond of the term 'director.' There might be a person in administrative charge, but he should not get extra for that." The part of the Ministry's evidence on merit awards was extremely well balanced, and it came down against payments for "responsibility."

Local Authorities and the N.H.S.

The Sheffield Division sent a resolution strongly resenting any suggestion that the hospital services should be returned to the control of local authorities, "and that, further, every effort should be made to have Part III Services, as defined by the National Health Service Act, removed from the control of local authorities and absorbed in the structure of the National Health Service." The Council had received the first part, and referred the second to the Central Consultants and other committees.

In a short debate reference was made to "enlightened" authorities where the welfare department was under the medical officer of health. The resolution was referred to the Liaison Committee.

Local Hospital Reorganization

It was reported that, as a result of a local hospital reorganization, the hospital appointment of a medical officer of health had been terminated. The Executive stated he had been advised of his right of appeal under paragraph 16 of the terms of service. "Hospital reorganizations, and developments in medical science, may, from time to time, mean that doctors working in one specialty may have to change to another specialty," stated the report. "The Executive would be strongly opposed, however, to boards deciding to displace a consultant (or S.H.M.O.) in one specialty and to transfer his work to a consultant (or S.H.M.O.) in another specialty."

Psychiatrists Employed by Local Health Authorities

"Local authorities advertise for specialists in psychiatry for the performance of duties requiring considerable clinical experience and knowledge and they advertise at rates of pay very much less than the National Health Service," Dr. VALENTINE told the Committee. "As a result the candidates that they get and appoint may be of inferior quality."

In the opinion of the Psychiatric Group Committee, the most satisfactory solution would be for local authorities needing the services of psychiatrists to obtain them by arrangement with hospital boards in the same way, for instance, as they obtained the services of chest physicians. Dr. MORGAN thought the most satisfactory solution was for local authorities to pay the same as the National Health Service.

Dr. VALENTINE said his Group would be glad for the matter to be referred to the Public Health Committee, and this was done.

Private Beds

The CHAIRMAN remarked that a review made on a Ministry basis of available private beds would give a fallacious figure which yielded no index of the pressure of applications on that section of beds. The Central Consultants and Specialists Committee, however, had asked to be notified of any intention to make an approach for additional private beds locally, so that it might make simultaneous representation to the Ministry of Health.

From Taunton came a report that, since 1948, the B.M.A. Division, the medical staff committee, and the hospital management committee had all pressed the regional hospital board to provide private beds in Taunton where none existed. Patients had to go 13 miles to Bridgwater (4 private beds in a hospital of 72 beds) or to Wellington, a distance of 8 miles, where there were two private beds in a cottage hospital of 20 beds. Something like three-quarters of the patients who had to go to Bridgwater and Wellington were in fact resident in Taunton, and a large number of them were admitted to the general wards although they would in fact prefer private accommodation if such existed. All that was needed was £2,000 to £3,000 to alter an already existing, unused ward.

Mr. NICHOLSON-LAILEY told the Committee: "The regional board have listened sympathetically, the management committee are behind us. Not only are there no private beds; there are no separate rooms in which we can accommodate patients needing a separate room. There is no accommodation for sick nurses."

Moral Obligation

Considerable concern was expressed at the wording of a letter from the secretary to the Management Side of Whitley Committee B which claimed "it was for members of appointments committees to decide what weight to give to a 'moral obligation' and that this was not a question in which the Minister could intervene." The moral obligation referred to was that of finding displaced consultants and S.H.M.O.s other employment. The CHAIRMAN said that in

a number of cases employing authorities had exerted themselves, but there was a small nucleus of cases of people who had been displaced and for whom no further appointment had been found. "I have asked the Minister to discuss these outstanding cases," reported Mr. Holmes Sellors. "He has accepted. He has said that he will suggest a date some time."

Dr. ROWLAND HILL said he was very worried about the letter from the secretary of the Management Side. "There has been a narrowing down, what Freud termed 'an active process of forgetting things.'" Originally the Ministry agreed that, if a consultant lost a post or part of a post through no fault of his own, the Minister accepted a moral obligation to do all in his power to find alternative work. The statement that it was for appointments committees to decide what weight to give to the moral obligation was the opposite of what was agreed.

Mr. LANGSTON said it was always understood that it was the Ministry that accepted the moral obligation; this narrowed it down. And Professor CLOAKE remarked that the appointing body was the board. The selection committee was quite a different thing and it would be ridiculous to suggest that the moral obligation be put on them. This was the first time there had been any suggestion that the Minister himself had not an obligation. "We should repudiate the suggestion and refuse to accept it completely," Professor Cloake asserted.

The CHAIRMAN promised that the matter would be taken up by the Staff Side and the statement would be challenged.

Tuberculosis in Industry

The Tuberculosis Group did not see anything to be gained by the director of a mass miniature radiography unit, which was not a diagnostic unit, notifying an industrial medical officer that "Mr. A" possibly had tuberculosis and he was being referred to the chest physician, Dr. PETER EDWARDS told the Committee. It was unnecessary and duplicating work. The Committee accepted the views of the Chest Group Committee, which confirmed those of the Public Health Committee but were contrary to those of the Occupational Health Committee. The Group considered, however, that, subject to the patient's consent, information should be made available to the industrial medical officer by the chest physician following a firm diagnosis.

"Discretion" in Starting Salaries

It was reported that, following a submission from Whitley Committee B that it was important that newly appointed consultants and S.H.M.O.s over the age of 32 should always have their cases considered in the light of the discretion to fix the starting salary up to four incremental points above the minimum of the scale, the Minister had sent a circular to boards stating that he is in general agreement with the views expressed.

S.H.M.O.s in Consultant Posts

A resolution from the S.E. Metropolitan Regional Consultants and Specialists Committee was considered which urged a settlement of the cases of S.H.M.O.s undertaking consultant duties, now under consideration in Whitley Committee B. The resolution stated that this should be regarded as a matter of urgency and it should not be allowed to restrict the completion of the work of the working party on hospital staffing.

Mr. A. LAWRENCE ABEL recalled that it was now eighteen months since the Central Consultants and Specialists Committee asked 3,000 S.H.M.O.s whether they thought they should be upgraded. One in three replied, and all these replies had been investigated by a review committee. It was agreed that about 500 were doing consultant work of consultant standard, and their colleagues locally agreed that they had full clinical responsibility. "It is our duty to do something about this injustice," declared Mr. Abel. It was really a matter of public opinion rather than medical opinion.

Dr. ROWLAND HILL said a subcommittee of Whitley Committee B was dealing with individual cases. What would come out of the examination was another thing.

Dr. E. BERESFORD DAVIES exemplified a psychiatric S.H.M.O. who was deputy-superintendent of a hospital. If his chief was on leave he had entire responsibility, and in effect, whether he liked it or not, was bound to do the work of a consultant. Dr. ROWLAND HILL said that if a case was strong enough, with the backing of the B.M.A., an appeal could be made to the regional Whitley appeals machinery not on behalf of the man's grade but on the grading of the post. Several such appeals had been won, and the Whitley appeals machinery had upgraded the posts.

Observers at Committee's Meetings

The Committee was asked by the S.W. Metropolitan (Eastern Area) Regional Consultants and Specialists Committee to consider the suggestion that members of hospital medical staffs should be allowed to attend the meetings of the Committee as observers. "Will they sit on the window-ledge?" asked Mr. GUTHKELCH, looking round the nearly full Council chamber where the Committee meets. Mr. LAWRENCE ABEL thought that only one or two would turn up. He suggested trying it for 12 months as an experiment. Dr. H. G. H. RICHARDS supported the suggestion in the resolution. He thought that a great deal of criticism could be allayed if the Committee allowed each regional committee to send one observer, perhaps with the right to speak. Of course they would have to undertake to respect the chairman's direction on matters that were confidential. Mr. W. S. LEWIN suggested that the most effective procedure would be to invite each management committee group in turn to send two or three observers. Mr. BERESFORD DAVIES disagreed. He thought it would be better if it were allowed to be known that, if people applied to come to the meeting, their case would be considered.

The matter was referred to the Executive Committee.

New Region

Notification was formally received of the division next year of the South-west Metropolitan Hospital Area into two regions. Said Mr. LANGSTON: "This is something which in our part of the region is warmly welcomed."

New Members

There have been two changes in membership of the Committee. Mr. R. V. Cooke has been elected from the South-western Region in place of Mr. A. Daunt Bateman, and Dr. A. Paton in place of Dr. G. R. Venning represents the Hospital Junior Staffs Group.

THE DAIN FUND

REPORT OF THE TRUSTEES, 1957-8

The Trustees of the Dain Fund report that during the year ended April 30, 1958, twenty-three cases have been assisted by the fund, the grants amounting to £2,315 12s. Sixteen of these have been helped over a period of years. Satisfactory reports on progress in school and university have been received in all cases.

New Cases

Seven new cases have been undertaken by the Trustees. Help may be requested for most of these for a period of years.

The widow of a public health doctor who died from poliomyelitis applied for assistance for this year in the education of the eldest of her three daughters. It is hoped that the temporary help given will enable suitable arrangements to be made for the education of all the family.

Help has been given to the daughter of a general practitioner who died as a result of an accident when returning from a night call. The daughter is a student undertaking a three-year college course.

Assistance with school fees for her son has been given to the widow of a naval medical officer who died in the course of his duty while rendering medical assistance at an accident.

The widow of a general practitioner, whose sudden death left her without the necessary means, has been helped with school fees so that her youngest son could finish his education and continue to avail himself of the scholarship he already held.

The widow of a doctor who died in 1950 has been given financial assistance to enable her son to complete his medical education.

The sudden death in tragic circumstances of her young general-practitioner husband left a widow with insufficient money to educate her two young sons, after settlement of debts. The widow hopes to find employment, but cannot do so until she has handed over the house and installed a successor into the practice. The Trustees have helped with two terms' school fees and will review the case later when the widow has resettled.

The widow of a general practitioner has been given assistance in meeting the extra expenses connected with her daughter's continued education at the school at which she was already being educated.

Cases Concluded

Three of the cases which have been helped by the Fund should be concluded this year. The Trustees report that in each case the conclusion of education seems to have been satisfactory. The first was helped with university fees, without which help he could not have attended the university. Following excellent reports on his academic progress, and a very distinguished career in sport, he has now achieved an honours degree. The second was a medical student when his father died suddenly. Help was given so that he could continue with his course. He hopes to qualify in October, 1958. The son of a consultant who died suddenly in early middle age has been helped with school fees and has now obtained an appointment as a student apprentice.

Nearly every case assisted by the Fund needs help over a period of years. School fees, as many of the profession know, are mounting, and the help required, in consequence, increases. The Trustees earnestly request subscribers to continue their support and to help further by enlisting the support of others. They endorse the gratitude expressed by those who have been helped, and once again record their appreciation of the help and generous donations given by local medical committees.

The Trustees also express their thanks to the Royal Medical Benevolent Fund and their Ladies' Guild and the Royal Medical Foundation of Epsom College for the help and advice which have been extended to the Fund during the year. They remind individual members of the profession that valuable help can be given to the Fund by completing a form of covenant for seven years or by sending a donation to the secretary.

WINCHESTER ADDRESS

MEDICINE'S "ARCHAIC CURTAINS OF MYSTERY"

Nearly 300 doctors and their guests heard the Rector of Edinburgh University, Dr. JAMES ROBERTSON JUSTICE, better known, perhaps, in his role as a film actor, make a plea for the abolition of mystery in medicine when giving this year's Winchester address on June 26.

Dr. Justice praised the "closed shop" in medicine in so far as it upheld the rigorous standards of conduct which made the British medical profession the envy of many other countries. But medicine, an empirical science, tended to be too esoteric, to share its mysteries only with the initiated, and to assume that it was bad for a patient to know too much. This attitude was based on false premises. The speaker agreed that "popular medicine" was a horror to be avoided at all costs, but he felt very strongly that the medical profession should cease to take refuge behind the archaic curtains of mystery. People had come to take medicine for granted, and if this was to be corrected it was necessary for doctors to take patients into their confidence much more. "Having spent a large part of my life

in your hands," Dr. Justice told the doctors in his audience. "I have been irritated to a state of frenzy by the hush-hush tactics of members of your profession." He objected not only to the "conspiracy of silence" but to the puritanical attitude that suffering was somehow linked with sin and that an ability to endure pain was a sign of merit.

The days of the great individualist were now over, Dr. Justice commented, and with the spread of knowledge it was impossible for a man to know more than a narrow shaft of the whole subject. The doctor was part of a team of specialists. The biochemist, the cytologist, the radiologist, the pathologist, and the physicist, with his radioactive isotopes, all funnelled their findings through the doctor at the bedside. Medicine was no longer a mystery, because the doctor had to rely on so many non-medical men for his data. "Hence obscurantism must defeat itself," he concluded, "for medicine is now so linked with the other sciences, which have thrown off the stigma of alchemy and are not obsessed with mystery, that she will have to fall in line."

Before Dr. Justice gave his address Dr. J. R. BODINGTON, chairman of the Winchester Division, who presided, presented Dr. BALFOUR BARROW with the scroll admitting him to the Roll of Fellows of the Association.

TUBERCULOSIS AND DISEASES OF THE CHEST GROUP

ANNUAL MEETING

What is to be the future of chest services? For how long should a treated case of tubercle be followed up? These were among the questions considered at the annual meeting of the Tuberculosis and Diseases of the Chest Group at B.M.A. House, London, on July 1. In their annual report the Group Committee stated that it could not "emphasize too strongly the danger to the community which is resulting from attempts to curtail the chest service."

Dr. PETER EDWARDS, chairman of the Group Committee, was elected chairman of the meeting. The present membership of the Group is 506.

Future of Chest Services

Since it was undesirable that work on a study of the future of chest services should be duplicated, the Group Committee, it was reported, had agreed that the Joint Tuberculosis Council should set up its proposed special committee and that its draft reports should be submitted to the Group Committee with the object of an agreed report being produced. The intention was that the final document would be submitted by the Group Committee through the Central Consultants and Specialists Committee to the Joint Consultants Committee, while the Joint Tuberculosis Council will take the report to the Ministry through its own channels.

Dr. NORMAN ENGLAND said that statistical evidence had been collected. At the earliest the report could not be ready before October. It was not a job that could be rushed. Referring to the future of the chest service, Dr. England said that if a chest clinic was providing a good service, used by general practitioners and the public, no regional board would want to close it. But if the service supposed to be provided was not being provided, that perhaps was another matter. Dr. HUGH RAMSAY remarked that, with the best will in the world, the fact of empty beds had to be faced and from the administrative point of view this problem of redundancy was a real one. It was up to chest physicians to show that their service was not a more or less extinct one, which it was not.

Emphasizing the point made in the Group Committee's report that the chest physicians had a special and epidemiological approach to their work and that it should be made use of in studying chronic chest conditions such as bronchitis,

asthma, and cardiac diseases, Dr. EDWARDS said that chest physicians had been a help to general practitioners in this way. Dr. F. RIDEHALGH remarked that if a chest physician had beds and was doing good work he would have so many patients sent to him that he could not be redundant. There might be more out-patient work than in the past. The real danger was that as chest physicians retired they would be replaced by general physicians. That was the policy which some regional boards had decided upon.

How Long?

The Group discussed the problem of how long a case of tuberculosis should be followed up. Professor F. R. G. HEAF remarked that this was one of those questions one could not answer. A figure could not be laid down, and it depended on the clinical state of the patient.

The Group Committee's report stated: "Evidence shows that tuberculosis is ceasing to be the national menace which it was at one time. Fewer cases of tuberculosis are proving fatal and more are recovering, but at the same time there is no doubt that the work of chest clinics is increasing. . . . It is felt that the general physician can learn much from the experience of the chest physician, and while the chest service should be integrated within the whole ambit of medicine there are special contributions which it can make."

S.H.M.O.s and Consultant Work

On the question of S.H.M.O.s and consultant work the CHAIRMAN commented: "A terrific amount of labour has been put into this matter by the Group and the S.H.M.O. Group and it is all very disappointing. The position is anything but what we had hoped. The Ministry seems to find methods all the time of pushing things on and on, and now, with the appointment of the working party on hospital staffing, there will be more delay."

Dr. D. L. PUGH agreed that this was a fair summary of a disappointing position. The review panels worked hard and in most cases the appeals were considered to be justified. He understood that the number of appeals caused concern to the Ministry. The Assistant Secretary (Dr. E. E. CLAXTON) reported that the Staff Side of Committee B of the Whitley Council were still pressing individual cases. There seemed no doubt that some 550 S.H.M.O.s in all branches were doing consultant work. There were really shocking examples of first-class S.H.M.O.s doing consultant work and thereby saving regional boards money.

Representations made by the B.M.A. to the Northern Ireland Tuberculosis Authority on the staffing of the chest service are reported under "Northern Ireland News" on this page.

Domiciliary Consultations

The CHAIRMAN reported that, under an agreement reached during the year, only domiciliary visits to patients under active treatment for tuberculosis did not now rank for payment of fees (*Supplement*, March 29, p. 139). He paid tribute to Dr. H. Midgley Turner's handling of these negotiations.

Mass Miniature Radiography

The Ministry had not accepted the Group Committee's representations on static mass miniature radiography units. The Group Committee, said Dr. EDWARDS, had pointed out that primarily the M.M.R. service was for dealing with cases of tuberculosis, and therefore miniature camera units should be under the control of chest physicians and be placed in chest units, which if possible should be in a general hospital. Whether they were in a general hospital or not the chest physician should be in clinical charge. The Ministry had preferred not to be too dogmatic about the control of these units and preferred to see different methods tried (*Supplement*, April 5, p. 146).

Dr. A. GORDON EVANS thought that the principle that the units should be under the charge of chest physicians should be pressed for. But Dr. HUGH RAMSAY said that the principle was not easy to uphold. He referred to general practitioners being given direct access to hospital facilities. Dr.

ENGLAND also thought that here it was necessary to be liberal because of providing general practitioners access to x-ray examinations not only for chest but other diseases. Dr. T. W. DAVIES, however, entered a plea for not giving in to everything.

Tuberculosis in Industry

The Committee were invited to comment on representations made to the Ministry of Health by the Association of Industrial Medical Officers that industrial medical officers should be notified by the M.M.R. unit, with the patient's consent, of any cases referred to general practitioners as requiring further investigation.

The view taken by the Group Committee, which was shared by the Public Health Committee, was that notification to the I.M.O. about patients who have been examined at M.M.R. units would not be in keeping with the confidential nature of the scheme, and, furthermore, it might unnecessarily endanger a patient's employment. It was felt that there was not such a degree of urgency as would justify informing the I.M.O. before a proper investigation and diagnosis had been made.

The Committee fully agreed, however, that it was desirable, subject to the patient's consent, that information should be made available to the industrial medical officer by the chest physician when a firm diagnosis had been made. Industrial medical officers should be encouraged to establish close liaison with their local chest physicians.

Northern Ireland News

BRANCH ANNUAL MEETING

Mr. W. S. BRAIDWOOD was elected president, and Dr. J. B. MCKINNEY vice-president, at the annual meeting of the Association's Northern Ireland Branch on May 22. Dr. J. NORRIS WHYTE was made president-elect, Dr. A. W. MOORE was appointed honorary treasurer, and Dr. D. L. W. CHAPMAN was reappointed in office as honorary secretary.

Dealings with the Northern Ireland Ministry of Health and Local Government and the various Health Service authorities figured largely in the honorary secretary's report on the activities of the Branch Council and its committees in the year 1957-8. Agreement has still not been reached with the Ministry on appeals machinery in Northern Ireland, and the Branch Council's disappointment at the slow progress made is recorded.

Staffing of Chest Service

Deputations, which included Dr. Peter Edwards, Chairman of the Association's Tuberculosis and Diseases of the Chest Group, met representatives of the Ministry and of the Northern Ireland Tuberculosis Authority on the matter of senior medical staffing of the chest service. The Association's spokesmen expressed concern about the insufficient number of consultants in chest medicine who had to carry the responsibility for the service, and pointed out that many S.H.M.O.s were working without supervision. As a result of this discussion a joint committee, consisting of representatives of the N. Ireland Tuberculosis and Hospitals Authorities, with representatives of the Ministry of Health and Local Government as observers, has been set up to report on future developments of chest medicine in N. Ireland. One of the matters to be considered will be medical staffing. The Branch Council asked the Minister for adequate B.M.A. representation on this joint committee and for consultation on any medical staffing changes recommended. The Minister promised consultation, but, on the question of representation on the committee, he replied that this was a matter for the authorities concerned. The latter were then approached, but they informed the Association that, "after carefully considering the matter," they felt that the membership of the committee, which consisted solely of members of the two authorities, should not be altered. However, an

assurance of consultations between the committee and the Association when proposals were formulated was given.

Hospital Staffing

The General Medical Services Committee (N.I.) is reported to have pressed, with the support of consultant obstetricians, the Hospitals Authority for general-practitioner obstetric hospital facilities in Belfast, and it is hoped as a result that a separate hospital unit will be put at the disposal of G.P.s in the near future.

The Consultants and Specialists Group (N.I.) has asked the Hospitals Authority to carry out a review of S.H.M.O. grading in N. Ireland. Medical staff committees of hospitals are supplying information on the present and future staffing needs of their hospitals, and a special subcommittee has been appointed to report on this information and make recommendations which will be considered by the Group and subsequently discussed with the Hospitals Authority.

AMERICAN MEDICAL ASSOCIATION ANNUAL MEETING

Dr. Gunnar Gunderson, La Crosse, Wisconsin, was installed 112th President of the American Medical Association at its annual meeting in San Francisco last month. Dr. Frank H. Krusen, professor of physical medicine and rehabilitation, Mayo Foundation, University of Minnesota, received the A.M.A.'s distinguished service award for 1958.

The two main subjects for general discussion at the scientific meeting were the management of the severely injured patient and a review of the hazards encountered in the use of certain therapeutic agents. There were 20 scientific sections and a full programme of colour television demonstrations. Scientific exhibits exceeded 300, and a factor common to a number of them was an emphasis on alcoholism, a problem now claiming attention in the U.S.A. Technical exhibitions, of which there were also more than 300 and which were aptly described in the meeting's daily bulletin as a "scientific supermarket," included a giant "walk round" model of a human cell magnified more than a million times. About 16,000 doctors attended the meeting.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Service

SIR,—In 1943, realizing that some form of national medical service was inevitable and not very far off, the doctors in the southern group of islands here met together to consider the matter. At that time we all had learned the requirements of doctor and patient in our respective areas, the most junior having been in charge for over ten years. We had to take into account not only the exceptional circumstances, varying from one island to another, but also that the doctor lived as one of a friendly community, serving and advising everyone in it as necessary, and having to depend on them in some matters as they had to rely on him; that he had to have a status, which he must maintain; and that the stability of the service depended on one and all knowing that whatever was necessary would be done or provided without delay, within the limits of possibility. In view of these considerations we gave ourselves the terms: "If we were giving up, and our sons taking over in our place, what should the service set-up for them be?"

On certain matters we were unanimous, and these were formulated and forwarded to the Department of Health for Scotland, who "noted" them. About the same time,

similar measures were taken by the practitioners in the more northerly, and more compact, group of Lewis and Harris. Their conclusions were largely similar and were also "noted" by the Department. In 1944 the findings common to both were embodied in a motion to a B.M.A. conference in Edinburgh, and were warmly approved by our Scottish colleagues, but the representatives from the Association Headquarters in London spoke so strongly and repeatedly against them that they got them watered down to insignificance.

Again, to quote from a survey of existing health services in Scotland in Appendix A of the White Paper, *A National Health Service*, "The keystone of this structure [a complete medical service available to all classes in the Highlands and Islands area] is the Highlands and Islands Medical Service, a unique effort in co-operation between the State and doctors in private general practice, which has revolutionized medical provision in the area. A Subcommittee of the Scottish Health Services Committee, reporting in 1936 on the suitability of the Service to the peculiar conditions of the Highlands and Islands, suggested that it might even provide a model on which to build the future medical service in Scotland as a whole." In the event, of course, it was much otherwise. The H. and I. Service was destroyed, and not by the Government but by the "profession," or its representatives, our Association, in insistence on a narrow doctrine based on the interests of those who already had large panel practices.

The present obvious shambles follows various loudly acclaimed "victories." Victories, perhaps, but temporary, sectional, and expedient. Now, to get out of a somewhat tragic position, we resolutely say we are going to scour the world to see what we can find elsewhere in the way of medical services on which to shape for ourselves. Would it be too much to suggest that we go back to the beginning and look at the knowledge and experience which we had available at the start? Could we listen to those who know their local requirements and allow them to Serve?—I am, etc.,

North Uist,
Outer Hebrides.

ALEX. J. MACLEOD.

Books on Disease

SIR,—I should like to comment on this section of Dr. H. A. Clegg's paper on professional ethics (*Supplement*, June 21, p. 341). It is rather startling to me, as I have written two such books, one under a pseudonym and the other now in the press, for publication by the British Medical Association, when Dr. Clegg asserts, "I very much doubt the value of such books, and despite the authority behind some of them I think the writers run the risk of offence against medical ethics" (my italics).

I think any capable writer could avoid the pitfalls mentioned in the two following paragraphs—leading the patient to suppose that he could diagnose his own illness or giving dogmatic advice that might undermine his confidence in his regular medical attendant. But I am not at all sure that laymen are so innocent as to imagine that doctors invariably see eye to eye. There is a cynical saying: "Doctors differ and patients die." We need to disprove it, not by keeping up the pretence of a non-existent professional unanimity, but by demonstrating that honest discussion of our various theories can materially prevent the patients' dying.—I am, etc.,

London, W.1.

F. R. C. CASSON.

Consultant Ethics

SIR,—We have noted with disapproval the increase in the number of patients seen directly by consultants, privately, and without reference by a general practitioner. Worse, we have received verbal instructions from the person consulted via the patient and without the politeness of a letter. At times these verbal instructions have contained the implication

of a criticism of the general practitioner made by the consultant to the patient.

We feel that either the old-fashioned courtesies of general practitioner-consultant relations should be enforceable by the Central Ethical Committee, or that the B.M.A. should provide a list of established, experienced, and recognized specialists in their respective fields. We wish to emphasize that these suggestions are also directed at protecting the body of wise and reputable consultants from the parasitic "consultoid" infection which has recently become manifest.—We are, etc.,

S. GINSBORG.
M. B. CLYNE.
P. FREELING.

Southall, Middlesex.

Doctors' Remuneration

SIR,—The Royal Commission has been considering the remuneration of doctors and dentists as compared with the incomes of other professions. Examples have recently come to my notice from which it appears that some technicians' and manual workers' earnings compare favourably with those of general practitioners: (1) For cleaning a watch—with a year's guarantee—charge, £1 1s. (2) For repair to a washing machine which took $\frac{1}{2}$ hour—labour only—charge, 19s. (3) For replacing washers on three ordinary taps—time spent was about 20 minutes—charge, £1 1s. A recent calculation showed that my average (gross) remuneration for undertaking the care of a patient for one year was about 18s.

The technicians mentioned above have their fixed working hours, and they are not subject to legal penalties if they fail to carry out their work promptly. It took four months, and repeated requests, to persuade a well-known firm to repair its own washing machine, and that for a minor defect which could have been put right promptly. If a doctor defers a visit, even for four days, the penalty may be considerable. I have thought it well to draw the attention of the Chairman of the Royal Commission to these facts.—I am, etc.,

Stanmore, Middlesex.

H. BARBARA WOODHOUSE.

Removal from the List

SIR,—I have not agreed with many of the things that Dr. A. M. Goldthorpe (*Supplement*, May 31, p. 291, and April 19, p. 209) has written about the attitude of doctor to patient, but I feel that some answer must be given to the "more holy than thou" stand taken up by Dr. L. A. Nichols (*Supplement*, June 14, p. 340). A doctor, we are taught, should be a cultured man with a sufficient amount of leisure to improve that culture. He should be a man who is known to his fellow men and be able to help them and take part in their affairs outside the professional sphere.

I take it that Dr. Nichols has a small, selected, and hand-picked practice, which leaves him ample time to cultivate his psychiatry. One hopes that it also enables him to make a living. What about active membership of professional bodies? What about participation in communal affairs? Or does Dr. Nichols think that these may be safely left to those unsympathetic doctors who have developed a disliking for their patients? This attitude of "leave me alone to practise medicine and do not bother me with other matters" was the subject of a warning by Dr. S. Wand at the recent Conference of Honorary Secretaries.

We are all agreed on one thing—we want to do the best that we can for all of our patients. We want to be allowed sufficient time in which to do this, and to take part in all of those other activities that our liberal education has taught us to expect. Unfortunately, so long as the present set-up of the N.H.S. remains in being, we shall not be able to achieve these things, and, until we can bring together such divergent points of view as those expressed by Drs. Goldthorpe and Nichols, many of us must be anxious for the future of general medical practice in this country.—I am, etc.,

Seven Kings, Essex.

I. M. SEGAL.

Association Notices

KATHERINE BISHOP HARMAN PRIZE

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman prize in the year 1959. The value of the prize is £75. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing. It will be awarded for the best contribution (not previously published) submitted in open competition, competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any registered medical practitioner in (a) the British Commonwealth and Empire or the Republic of Ireland and (b) any member of the British Medical Association, wherever resident, is eligible to compete.

Should the Council of the Association decide that no contribution submitted is of sufficient merit, the prize will not be awarded in 1959 but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each contribution must be typewritten or printed in the English language, and must be accompanied by a detachable slip bearing the candidate's name and address. The Council anticipates that contributions should be between 3,000 and 10,000 words, although no definite limits are laid down. Preliminary notice of entry is required and a form for this purpose can be obtained from the Secretary. Essays must be forwarded so as to reach the Secretary, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1959. Inquiries relative to the prize should be addressed to the Secretary.

A. MACRAE,
Secretary.

ANNUAL REPRESENTATIVE MEETING, BIRMINGHAM, 1958

Nearly 500 representatives from home constituencies and over 30 representatives from overseas attended the Annual Representative Meeting, which opened at Birmingham University on Thursday, July 10.

The chair was taken by Dr. A. BEAUCHAMP (Birmingham), who was supported by Mr. WELDON WATTS (President), Dr. S. WAND (Chairman of Council), Professor A. P. THOMSON (President-Elect), Mr. L. DOUGAL CALLANDER (Treasurer), and Dr. A. TALBOT ROGERS (Deputy Chairman of the Representative Body).

PRELIMINARY

The CHAIRMAN OF COUNCIL (Dr. S. Wand), in moving that the Annual and Supplementary Reports of Council under "Preliminary" and the summary of action taken on last year's resolutions be received, said that the most important item on the report was that which disclosed that next year's President at the Edinburgh meeting would be His Royal Highness The Duke of Edinburgh. "He has done great honour to our Association, and we humbly acknowledge that," he said, amid applause. It had been decided, Dr. Wand said, to award the Gold Medal of the Association to a distinguished medical scientist, Lord Adrian, O.M., F.R.S. The Council had taken the unusual step of recommending the election of three vice-presidents in one year. The work for the Association done by many whose services were given largely in their own areas had been recognized by adding their names to the Roll of Fellows. Further names had been added to the Book of Valour, said Dr. Wand, and during the course of the year he had had an opportunity of visiting in Africa one of the places at which one of those acts of valour had been carried out.

Dr. Wand paid tribute to an oration delivered in the Great Hall of B.M.A. House on June 25 by "the doyen of British surgery," Sir Gordon Gordon-Taylor, commemorating the Jubilee of the Royal Army Medical Corps (*Journal*, July 5, p. 42). Sir Gordon had expressed the opinion that the part played by the Association in forming the R.A.M.C. was the most important piece of work undertaken by the Association.

Referring to staff changes, the Chairman of Council said that Brigadier H. A. Sandiford, who had organized the Association's Commonwealth and Overseas Visitors' Bureaux, had been succeeded by Dr. R. A. Pallister. Owing to ill-health Dr. Agnes Kelynack unfortunately had had

to tender her resignation. She had had a great influence on the whole Association. She was for many years secretary of the Public Health Committee and of the Charities Committee, and was Joint Secretary of the General Practitioner Spens Committee. Dr. Wand's suggestion that a message should be sent wishing her well was received with acclamation.

At this point the Annual Representative Meeting was adjourned for the holding of an Extraordinary General Meeting.

EXTRAORDINARY GENERAL MEETING

The Resolution published in the *Supplement* to the *British Medical Journal*, April 12, page 158, was carried *nem. con.*

The Extraordinary General Meeting concluded.

ANNUAL REPRESENTATIVE MEETING CONTINUED

Dr. Macrae's Retirement

Dr. S. WAND, Chairman of Council, continuing his introduction of the Annual and Supplementary Reports of Council, next referred to the impending retirement of Dr. Angus Macrae, Secretary of the Association, and said that he would be succeeded by Dr. D. P. Stevenson. Dr. Wand was sure that with the assistance of his very loyal colleagues, the other medical secretaries, he would prove a worthy successor to a long line of distinguished Secretaries. Paying tribute to Dr. Macrae, Dr. Wand said he was a man whose self-effacement tended to cloak his effectiveness, but those in close association with him realized that Dr. Macrae was "not merely a good Secretary, he is of the great. I have never seen him ruffled; I have never heard him complain. . . . He is learned, and he has a fund of sound common sense. There are no words to express his loyalty to the Association."

Dr. MACRAE was asked to address the Meeting, and representatives rose in their places to accord him an ovation. He said that Dr. Wand, as one might expect of someone of his exuberant temperament, had in painting his picture slapped on the colours with a certain lack of restraint. He expressed great appreciation to the Representative Body for its kindness. He added: "For more reasons than one I am sorry to be going. But the time has come to go, and it is right that I should go, and therefore I am happy to be going."

Heavy Session

The CHAIRMAN OF COUNCIL said that the past year had been one of the heaviest in the history of the Association, the principal business being the preparation of evidence for the Royal Commission. Evidence had been given to the Hinchliffe Committee on the cost of prescribing, whose recently issued interim report had vindicated the doctors of the charge of irresponsibility in prescribing.

A very useful and successful Junior Members Forum had been held, and this initial venture, the credit for which was owed to Dr. R. G. Gibson, would be repeated. In December the Association would be holding in Southampton its first annual clinical meeting. Parking motor-cars in big cities was becoming an increasingly difficult problem for doctors, and the Association had made representations in every proper quarter on their behalf. It was not impossible, unless a solution was found, that people who lived in the centre of a big town would not be able to obtain a National Health Service practitioner to look after them.

Dr. Wand said that during the past year he had had the privilege, with Professor D. E. C. Mekie, Chairman of the Overseas Committee, of visiting the Association's Central and East African Branches, and they had been much impressed by the magnificent work of the doctors there, conducted often in most difficult circumstances. In the coming year he hoped to visit the Mediterranean Branches.

Relations with the B.B.C.

Reference was made in the Report to a conflict with the B.B.C. earlier in the year. In this field Dr. Wand thought it might be well to look only to the future, which seemed more hopeful. Broadcasts and television programmes on medical subjects must have a useful educational object, and full regard must be paid to the views of those who were in constant contact with patients. They had suggested to the B.B.C. in the past that the Association had some help to give, and that help would continue to be freely offered. In the last week or two exploratory discussions with the Corporation had proved not unfruitful, and he hoped that bickering would now be a thing of the past.

Increase for M.O.H.s Refused

The Public Health Committee had taken its case for a 5% increase in remuneration to the Industrial Court. The Court had pronounced to the effect that the pay of doctors in the public health service should be related to that of their colleagues on the local authority staff and not to that of their colleagues in other branches of medicine, which was the Association's policy.

Minister's "No"

Dr. Wand told the meeting that on June 17, accompanied by Dr. A. B. Davies and Mr. T. Holmes Sellors, he had visited the Minister of Health, Mr. Derek Walker-Smith, and put to him a claim for a further interim adjustment in remuneration in view of Mr. Vosper's, the previous Minister's, undertaking that a claim would be considered if the Royal Commission had not reported by Easter, 1958. Dr. Wand had asked the Minister for a written answer in time for the present meeting. That letter had been received only the previous afternoon. It read:

"Dear Dr. Wand,

"You came to see me with your colleagues on the 17th June and put to me the medical profession's case for a further interim increase in remuneration. I had the benefit of a very full statement of your case and you will recall that we considered the position for no less than two and three-quarter hours. I am now writing, as I promised, to put on record—necessarily in a highly summarized form—the reasons why I was not able to agree to an immediate further adjustment.

You pointed out that my predecessor had undertaken that a claim could be considered if the Royal Commission had not reported by Easter, 1958. (You will, of course, remember that my predecessor's letter of the 6th June, 1957, in which he gave this

undertaking, concluded with the phrase 'But you will, I know, understand that it is impossible for me to commit myself in any way at this stage, when neither we nor you can have any idea what might happen in the interim or what such a claim might amount to.'")

"The reasons why I am unable to agree that the circumstances warrant a further interim increase at the present time are broadly twofold. In the first place, although the Royal Commission are not yet ready to report, they are pressing ahead with all speed and, assuming that their Report is not unduly delayed, a further increase would run the risk of prejudicing their work. Secondly, the economic situation of the country at the present time must be taken into account. Circumstances since April and May, 1957, to date have not changed so greatly as to justify an increase. Moreover, no other people remunerated from the public purse who received a pay increase of 5% in April and May, 1957, have yet received any further award. A further award to the doctors might well lead to claims for increases in remuneration of an inflationary nature from others and it remains just as important as ever to secure stability in wages and salaries.

"It is of course open to the Association to make further representations at any time, but what I have said in this letter represents the view I am bound to take at present."

"It has taken a long time," Dr. Wand remarked, "to say No." He would like to comment on one or two statements in the letter. The Minister referred to prejudicing the Royal Commission. A few weeks ago a new grade of registrar had been determined unilaterally by the Minister. Did that prejudice the Commission any less than an interim adjustment? How did the Minister know that the Royal Commission would be prejudiced? Dr. Wand had offered to write to the Chairman of the Royal Commission and ask whether such an adjustment would prejudice the Commission. It was an extraordinary comment on the Minister's opinion of the Royal Commission if he thought it would be prejudiced.

Then there was the reference to the economic situation of the country. That was always brought in; they were always told that they were too early or too late in their claims. What was the relevance of the statement that no increase of 5% had been given to others since May, 1957? What other section of the community had had only 5% since 1951? In his last paragraph the Minister stated that it was open to the Association to make further representations at any time. "We have heard that one before," Dr. Wand commented, "but we shall go back."

"We must ponder the position of a profession," he added, "whose future can be determined in this way, financially and otherwise, by having regard to considerations of political expediency and without any regard to common justice." He believed that the Meeting would like more time to consider the matter before discussing it, and therefore suggested to the Chairman that items 37 to 39 should be deferred until Saturday.

Professional Unity

Dr. Wand then turned to the subject of unity within the profession. The Council, he said, had given much time and thought to that problem, but considered that it was not only impossible but in fact undesirable completely to solidify a profession such as that of medicine. It did desire, however, to bring together all doctors and all organizations in a brotherhood which, while respecting the opinions of others, would effect and maintain a loyal general professional outlook. A most friendly relationship had been established with the Royal Colleges, the Royal Scottish Corporations, the Society of Medical Officers of Health, and the College of General Practitioners in regard to the proposed Review Committee. It would also be noted that the Consultants and Specialists Committee had recommended that the Presidents of the Colleges or their nominees should be ex-officio members of that committee. Dr. Wand reminded representatives that he had said two years ago, when he became Chairman of Council, that if, when he left the chair, such a thing had happened, he would feel that he had played a part in doing something for the future of medicine.

There had also been some bringing together of the young men in the Junior Forum, while several committees had been investigating the difficult problem of to-and-fro machinery from the centre to the periphery. If the best medical services were to be available to the country, they must be run in the light of medical need and the opinions of those whose duty it was to minister to the sick and prevent disease, and not to suit administrative convenience.

"There are doctors who feel themselves above medical politics," he said. "They are walking about with their heads in the clouds, because in the National Health Service political action is necessary to preserve those essential professional freedoms which doctors must have in carrying out their work."

After 10 years of the National Health Service, Dr. Wand continued, he could say quite unashamedly that the public had had wonderful value for its money. (*Applause.*) That had been due to the devotion—in spite of many frustrations and disappointments—of those engaged in the practice of medicine and its associated professions and callings. "After 10 years I can also say to you that our relationship with Government officials has been consistently good; but when we come to the realms of higher policy, can we say the same of our relations with Government?" he asked. It was not only from the point of view of remuneration that the profession needed to be alive to the danger of unilateral Ministerial decisions, for such decisions, occurring frequently, would definitely lead to control of the profession. There had been more than one example, of which certainly one at least had had an ominous ring, and they were inconsistent with the profession's conception of the partnership of endeavour and of a free doctor-Government relationship which was necessary if the public was to have the best possible service. Now was a time for preparation, when each member of the profession must get in touch with his colleagues, learn to understand the brotherhood of medicine, and keep in touch with medico-political affairs. Unity or loyalty must lie ultimately in the heart of the individual. As a profession those engaged in medicine could be strong only if they were united in the face of common danger. "In the future not only will our future depend on our strength, but the quality of the medical service which we are able to give to the community will itself depend upon that strength," he concluded, amid applause.

Election of President

On the motion of Dr. Wand, it was unanimously decided by acclamation,

"That the Association do honour itself by electing His Royal Highness The Prince Philip, Duke of Edinburgh, K.G., K.T., as President of the Association for session 1959-60."

Election of Vice-Presidents

On the motion of Dr. Wand, the following were unanimously, and with acclaim, elected vice-presidents of the Association in recognition of their distinguished service: Mr. J. L. Gilks (Bournemouth), Dr. Ian D. Grant (Glasgow), and Dr. J. A. L. Vaughan Jones (Leeds).

CIVIC WELCOME

At 11 a.m. the meeting suspended its business to receive the LORD MAYOR OF BIRMINGHAM (Alderman Donald Johnstone), who extended a civic welcome to the Association. The Chairman replied.

COMMITTEE TO REVIEW THE MEDICAL SERVICES

Dr. S. WAND, Chairman of Council, moved:

That the action taken by the Council be approved; and that the Council be authorized, in consultation with the Royal Colleges, the Scottish Royal Medical Corporations, the College of General Practitioners, and the Society of Medical Officers of Health, to determine the size and the precise composition and terms of reference of the committee to review the medical services, and to appoint the chairman of the committee.

He said the Council had given considerable thought to the matter and vigorously pursued it. The task was not easy of fulfilment if the objects in mind were to be achieved. It was clear, after a decade of the National Health Service, that certain investigations would have to be made, and it had seemed not impossible that the Government might consider setting up a Royal Commission; it was therefore important to hear the views of the whole profession in good time. The findings of a review committee, representing medicine in its widest fields, would have a tremendous impact on the profession and the public.

Amendments by East Hertfordshire and others deplored the failure of the Council to set up a committee to review the whole field of medical services, as it was instructed to do by the S.R.M. in May, 1957.

Dr. J. S. ROSS (East Herts) said that it had been expected that a report would be made long before the Royal Commission reported, and in the Divisions there was disappointment at the delay in setting up the committee. It had been thought that its report would be the touchstone for deciding what to do when the Royal Commission reported. However, provided an assurance could be given that other means could be found for discussing the whole position before the Royal Commission reported, he would be prepared to withdraw the amendment. Dr. L. J. LANKESTER (Reigate) welcomed the representation of the Royal Colleges on the Review Committee, and hoped it would bring in a new era when the Royal Colleges and the B.M.A. could work together. The Committee's task was a long-term one, and it would be of great value should there be a Royal Commission on the Health Service. He asked for an assurance that a short-term policy would be evolved ready for the Royal Commission's report next spring.

Dr. C. P. WALLACE (Guildford) did not criticize the suggestion that there should be adequate and full representation of the Royal Colleges, and if necessary all other important academic bodies, on the Review Committee, but he was disappointed and dismayed at the apparent dilatoriness of the Council in a matter which had been described as one of urgency. Dr. A. R. FOX (South-west Essex) said that most of those present had spent most of their spare time in the ten years of the National Health Service sitting on committees trying to bring order out of chaos, but still they felt a sense of frustration. It certainly looked as if the profession was being sacrificed to political expediency. They hoped the Council would expedite matters.

Dr. WAND said there was some confusion of thought about the purpose of the Review Committee and that of the Committee set up by the G.M.S. Committee to make plans for an alternative service in the event of a conflict with the Government. The Review Committee would be concerned with long-term policy and preparing for possibly 25 years ahead. Such a matter could not and should not be hurried. He emphasized that the investigation into an alternative service in the event of a conflict was being treated as a matter of urgency.

The amendment was withdrawn. The substantive motion was then put and carried.

A motion by East Herts, that the medical practitioners of this country would not be able to have the type of Health Service they want until it was known what form of Health Service the majority of them would support, was carried as a reference to Council.

Doctors' Frustration

Dr. B. BURNS (Sheffield) moved:

That in the opinion of this Meeting the frustration of family doctors in the National Health Service in its present form arises from two basic causes: (1) The terms of service inseparable from capitation fee remuneration, and (2) the abuse of the "free" service by certain patients.

Dr. Burns pointed out that the demand for changes in the general-practitioner service had been first voiced by the Representative Body within two years of the inception of the Service, and it was growing rapidly more insistent. It

was not enough to demand reform and then placidly leave all the vital decisions to a committee. "The family doctor," he said, "has borne the burden of this Service for ten weary, unhappy years. He needs no Royal College to tell him why he is frustrated. If the Representative Body has not the courage or ability to express an informed opinion on the cause of this trouble we have no business to be here, so let us say what we know to be the truth, even if we incur unpopularity as a result." While most patients were decent, considerate people whom it was a delight to treat, he said, "We also know the others, the relentless minority." It was a mockery to talk of vocation when the free service was driving doctors into hiding. When the profession's leaders capitulated in 1948, said Dr. Burns, they failed to protect doctors against the onslaught of people who instinctively abuse anything placed at their disposal. If the doctor's time was to be of value to patients, they must pay for it. "Only by a charge for service can we guarantee to provide a proper standard of care for those who need it by deterring those who do not."

Dr. Burns asserted that the capitation method of payment was the nearest approach to medical serfdom any country had yet achieved. "How else," he asked, "could you put the family doctor at the mercy of the electorate in perpetuity?" He challenged the Government to devise a method of payment more calculated to debase the standard of general practice. Such a method of payment had been condemned by doctors in Australia and New Zealand. "The capitation fee," he said, "brings out the worst in the doctor, and the free service brings out the worst in the patient."

Dr. J. S. NOBLE (Council), opposing the motion, said that while many doctors were not contented with all aspects of the National Health Service, to imply that all doctors were unhappy, frustrated, and trammelled by an unpleasant minority was unjustified. The capitation fee question was not one which could be decided suddenly; it needed to be examined in great detail by the committee. He added that he felt a little ashamed that the meeting should be asked almost to blame the patients for abuse of the Service. "Doctors," he said, "are responsible for the running of their practices. Patients respond to the treatment they get. Slack doctors produce contempt; efficient doctors produce respect."

Dr. F. GRAY (St. Pancras) also opposed the motion, which he condemned as reckless and irresponsible. If the profession committed itself to a decision against the capitation fee, he pointed out, it might play into the hands of a future Government, whose reaction would be to replace that system with a salaried service. The CHAIRMAN OF COUNCIL pointed out that if it passed the motion the Meeting would be committed to something different from the capitation fee, while by rejecting it it would be committed to the capitation fee. To do either of these things would mean anticipating the findings of the Review Committee, and he suggested that the Meeting should either pass to the next business or refer the matter to the Council. It was inadvisable at this juncture to take a decision.

Dr. W. P. LAMBIE (Sheffield), as a younger practitioner, supported the motion in order, he said, "to make a heartfelt protest against the insidious corruption of the art and practice of medicine over the past ten years." A great majority of the younger practitioners were clamouring for a full-time salaried service. They had become so veneered with cynicism and disgust that they could see only the personal advantages which they imagined that it would bring. One of its major attractions lay in the paradox that only in a full-time service would the practitioner not be on duty full-time. They could not continue as at present, and the only real alternative to the capitation fee was a fee per item of service. This would wipe out the present frustrations and discontents, particularly if the patient paid a proportion of the cost of the item at the time. Those who genuinely could not pay should not have to do so. It would mean lifting the emphasis from the swallowing of pharmaceuticals and the provision of a service given to the patient by the individual doctor.

A motion to pass to the next business was carried to the necessary majority.

In reply to Dr. J. N. SWANTON (South Shields), who moved that the committee to review the medical services should pay particular regard to administrative costs, the CHAIRMAN OF COUNCIL hoped that the Committee would pay attention to everything that was done in the National Health Service. The Committee would be free to suggest modifications in its terms of reference if it found that they were restricting its investigations.

The South Shields motion was carried.

A telegram was read from the Irish Medical Association conveying its good wishes to the Meeting.

Schedule E Expenses

Dr. D. W. K. BUCHANAN (Dundee) moved a motion exploring the lack of income-tax relief for whole-time specialists in respect of their cars, telephones, and medical subscriptions. This motion had been carried by a previous Representative Meeting, but it was desirable to strengthen the hands of the Council in obtaining justice for consultants. The TREASURER (Mr. L. Dougal Callander) said the Chancellor of the Exchequer had promised that subscriptions to professional societies would be allowed as an expense against taxable income. The Finance Bill was still under discussion, but the Association had already instructed its solicitors to take the necessary steps for getting the B.M.A. subscription recognized as coming under the provisions of the Act when passed.

Inflammable Clothing

Dr. MARIAN M. REEKIE (Manchester) moved: "That this Meeting is profoundly dissatisfied with the report of the Committee of the British Standards Institution (1957) concerning inflammable clothing." This report stated that, whilst it would appear that there were a few materials which burned abnormally quickly and presented a positive fire risk, there was no evidence that some fabrics were so inflammable that they burned almost spontaneously, but that there was need for vigilance with regard to any new fabrics. The report tended to place most of the responsibility on adults and parents. Parents should be educated to buy only clothes which had been rendered non-inflammable or were of fire-resisting material; but when such clothing cost 50-60% more than other types—and she had had that figure from a member of the B.S.I.—their desire to do so was undermined by the temptation to spend less and take the risk. She had asked many patients what they would do if fire-resisting material was available at a higher price, and almost all of them said, "I would take the risk, because I have a fireguard." Fireguards, however, did not keep out sparks and could be moved by children. Children also often played with matches—and the hospitals saw the results. In 1955, deaths from burns due to clothing catching fire numbered 725, and many more had been injured, some severely. The B.S.I. report stated that at any one time 550 people were in hospital under treatment for burns due to clothing catching fire.

Dr. ANNIS GILLIE (Paddington), supporting the motion, said that while provision of the right sort of materials at suitable prices was a matter of priority, it must go hand in hand with the education of the public to ask for it. It was for the medical profession to hammer home to mothers the fact that dangerously inflammable material was as injurious to children as letting them cross traffic roads unattended and alone—as dangerous as dirty milk. Dr. B. H. PENTNEY (Camberwell), supporting, suggested there should be some sort of subsidy to produce non-inflammable material. Miss GLADYS M. SANDES (Marylebone), also speaking in support, pointed out that a lot of work had already been done on the subject of flame-resistant materials. The real problem lay in the difficulty of producing materials which, when so treated, would still be acceptable to world fashion.

Dr. REEKIE, replying, agreed that a lot of work on the subject had been done by the industry concerned, but asked that every effort should be made to render clothing much safer than it was at present.

The Manchester motion expressing dissatisfaction with the report of the British Standards Institution concerning inflammable clothing was carried.

THE ROYAL COMMISSION

Dr. WAND moved that the Annual and Supplementary Reports of Council under the above heading be received. He felt it would be wrong for him to comment on the evidence given by the Association to the Royal Commission at the present stage. The Association was in the course of preparing what might be its last memorandum of evidence, although it might produce rebutting evidence, orally or in writing. The members of the Commission had certainly made themselves familiar with a most difficult subject in a very short time.

Mr. E. N. CALLUM (Kingston-on-Thames) moved:

That the question of doctors' remuneration should be treated by the Government with the utmost urgency.

He did not think the Royal Commission was proceeding speedily enough. The original understanding had been that something would be heard by Easter. Was it to be 1958, 1959, or 1960? Meanwhile the cost of living was certainly not going down. Comparing notes with colleagues disclosed that a very high proportion were overdrawn—many of them with heavy family and other responsibilities—and the status of the profession, as compared with before the war, was very poor indeed.

Dr. A. V. RUSSELL (Council) asked that the motion be referred to Council. While everybody in the hall would be in sympathy with the spirit behind it, any Royal Commission proceeding with all speed, at best, took years to report; there was nothing that the Association could do to speed up its work while it still had evidence to hear. Dr. R. P. LISTON (Tunbridge Wells) opposed the motion on the ground that it would be bad policy for the Association at the moment to attempt to show impatience with the work the Royal Commission was undertaking. He had attended one of its sittings as a spectator and had been impressed by how meticulously the members had informed themselves of the problems with which they had to deal. He had not heard one question addressed to Dr. Wand or any of his colleagues which had not had a very direct bearing on the subject. Whatever the result of the Royal Commission's findings, it had been determined to take the greatest care.

Dr. C. P. WALLACE (Guildford) protested against any comment being made on the work of the Royal Commission. It would be equally unsuitable for anyone to praise or blame a judge or jury while they were still in the course of their important and responsible work. Dr. W. WOOLLEY (Council) pointed out that the motion made no reference at all to the Royal Commission; it referred merely to "The Government." Its place on the agenda under the "Royal Commission" heading seemed scarcely suitable. The CHAIRMAN said that the Agenda Committee had found difficulty in deciding which part of the agenda the motion should occupy and had eventually decided that there was no other place for it than where it stood.

Dr. J. S. M. ORD (Glasgow) supported the motion. It was the policy of the Government, he said, to delay on financial matters. Dr. G. CORMACK (Newcastle upon Tyne) objected to the proposed reference to Council and asked that the motion be carried. The Royal Commission had been unilaterally appointed by the Government irrespective of the profession's wishes in the matter; no doubt it was competent, but so were all Royal Commissions; they were appointed for that very reason.

Dr. CALLUM, in reply, still asked that the motion should be carried in its existing form.

The motion, calling on the Government to treat with urgency the question of doctors' remuneration, was carried.

Dr. H. H. GOODMAN (Newcastle upon Tyne) moved that:

In view of the fact that the Royal Commission is now sitting and will, amongst other things, discuss the future remuneration of the profession, all resolutions relating specifically to levels of remuneration which appear in the Agenda of this Annual Representative Meeting be allowed to lie on the table.

By giving evidence to the Royal Commission, the Association had tacitly accepted that body and its functions. It was undesirable to embarrass the Royal Commission by having a public discussion on remuneration at present. It should be allowed to work out its problems free from an atmosphere of disturbing influences. The motion asked that the subject be treated more or less as *sub judice*; that, however, did not preclude the profession from combating any adverse situation which might arise in future. But it was not desirable that remuneration problems should be bandied about in public at a time when the Government's main preoccupation was to limit public expenditure.

Dr. J. S. NOBLE (Council) thought that the Minister's letter quoted during the morning should be an adequate answer to the motion, which, he said, did not refer to remuneration in the National Health Service alone, whereas the Royal Commission was mainly concerned with doctors in that Service. Negotiations were in progress on various other aspects of the profession. To accept the motion would be to tie the hands of the leaders of the profession, who, in the highly volatile political atmosphere of the moment, should be free to press and make demands when they felt it was necessary.

A motion from the floor to proceed to next business failed to secure the necessary two-thirds majority.

A further motion from the floor asked that "the question be now put."

Dr. WAND said it seemed inconceivable that they should be so anxious to put their heads on the martyrs' block by asking for such proposals as that contained in the motion under discussion. "If this motion becomes your policy and the Royal Commission does not report until 1959, you will be laying things on the table and the table will collapse."

It was decided that the question should then be put to the vote, and the motion was lost.

A motion by Dr. R. W. MCCONNEL (Buckinghamshire) calling for a request to the Royal Commission to announce the proposed publication date of its report two months beforehand was lost.

A Glasgow motion asking Council to consider the advisability of preparing a précis of the evidence so far presented to the Royal Commission and distributing it to the profession was, by leave, withdrawn.

Upon a Manchester motion, the Representative Body decided to express its thanks to all who, on its behalf, had been concerned in the preparation and presentation of evidence to the Royal Commission. Dr. A. F. DUNN CARRIE, in moving, paid a special tribute to the work of Dr. A. Macrae.

The motion was carried with acclamation.

Further Interim Adjustment

A Harrogate motion asking that an interim increase in payment of 10% over and above the increases granted last year should be granted to all doctors in the National Health Service, including hospital doctors, pending the report of the Royal Commission, was, by leave, withdrawn.

Consideration of motions by Portsmouth and by Rugby with South Warwickshire on the subject of the interim adjustment were, by leave, deferred for later consideration.

PRIVATE PRACTICE

Dr. I. M. JONES, Chairman of the Private Practice Committee, moved the reception of the Annual and Supplementary Reports of Council under Private Practice and the Personal Accident Insurance Scheme for Members of the B.M.A.

Referring first to two matters which were not included in the report, Dr. Jones said that an offer had been received

from the Life Offices Association to increase the fee for the short form of life assurance from 15s. to £1 1s. Secondly, after discussions with the Liner Committee, some improvement had been obtained in the fees paid to ship surgeons giving attention to Government-assisted passengers.

There were three or four matters over and above those two which had occupied a major part of the Committee's time during the year. Dr. Jones recalled that in February there was a long debate in the House of Commons, when suggestions were made that the confirmatory certificate necessary before a deceased person could be cremated should be abolished. There was another suggestion that doctors should issue such certificates free of charge. There was the further issue of whether a doctor should always, before signing Certificate C, have a talk with the practitioner who attended the deceased, and the issue of whether he should always examine the body. There had also been some disagreement about who should act as crematorium referees. The Private Practice Committee had set up a sub-committee which would review the whole aspect of cremation certification and would report to the A.R.M. in 1959.

Another matter which had occupied a great deal of time was traffic and parking problems. The parking restrictions were interfering with the conduct of practice in the metropolis, and there had been cases where doctors' cars had been towed away by the police. "Medical practice cannot be conducted against a background of the doctor being at the mercy of the favour of the police," said Dr. Jones. The problem was being tackled. According to the latest Road Traffic Act, whilst local authorities were given power to make all sorts of parking restrictions, they were also, under the same Act, given power to make a large number of exceptions. A policy had been formulated whereby certain premises, such as hospitals and doctors' residences and surgeries, should be listed as essential premises, outside which no parking meters would be erected, and the Ministry had been asked to issue parking licences to doctors which would enable the holder to park outside his residence or in "no parking" places, or in meter parking places free of charge. A deputation had interviewed officials of the Ministry of Health on the subject and had been extremely well received; there had been complete accord and the Ministry had offered to accompany the Association in any discussion of the matter with the Ministry of Transport.

The Minister of Transport at first refused to meet the Association, but had now agreed to do so immediately after the Marylebone Inquiry report had been issued and he had taken a decision on it. He had indicated that no extension of the parking meter scheme would be made until the Marylebone scheme had had a full trial and he had had a discussion with the Association.

Drugs for Private Patients

Last year a deputation from the Association had discussed the scheme of drugs for private patients with officials of the Ministry of Health, and later a memorandum had been received from the Ministry making four main points: (i) that before there could be further discussion there must be an estimate of the cost of the scheme; (ii) that registration of both the private practitioner and the private patient with the executive council would be necessary; (iii) that it must be possible to deal punitively with and recover money from the private practitioner if he abused the Service; and (iv) that the institution of the scheme might call for a recalculation of the basis of the central pool.

A memorandum in reply had been drawn up by his Committee in the autumn, agreed to by a joint subcommittee of his Committee and the General Medical Services Committee, approved by the Council, published in the *Supplement* to the *B.M.J.* (February 15, p. 67), and sent to the Ministry of Health. In reply to point (i), it showed that the cost could not be more, and would probably be less, than £1,500,000 in a full year, which would be only a tiny

fraction of the total cost of the N.H.S. On (ii), the agreed in principle with the registration of the private practitioner, but not with the registration of private patients. Registration would be anathema to private patients, and any private-patient list would suffer from inflation, because many would receive treatment at different times from different doctors. With regard to (iii), they agreed that the private practitioner should enter into a legal contract with the executive council which would enable the council to recover from him any sum of money which he was fined for abuse of the Service, and that the permission to prescribe drugs for private patients could be withdrawn if abused, but that private practitioners should have the right of appeal from the decisions of the local medical committee. They did not say much about (iv), because it had not been clear that the Government intended to put forward legislation, and such a scheme would require an Amending Act. In any case agreement on the details would not be reached until after the Royal Commission had reported, and after that there might not be a central pool calculated as at present.

They felt that the Ministry's memorandum might be a sincere attempt to devise means for bringing about a desired end, or it might be intended to postpone indefinitely something which was not desired, but which for political reasons the Ministry did not wish publicly to refuse, or that the Ministry might simply be trying to show private practitioners that they could get what they wanted only by entering the Service.

The memorandum had been sent to the Ministry in January, and the Ministry had been reminded that the Association was anxious to continue the discussion, but so far no reply had been received. The Council had appointed a small negotiating committee to discuss the matter with the Ministry when that became possible. The institution of a scheme to provide drugs for private patients was a simple matter of justice to the people of this country and would enhance the standing of medical practice.

There had also, Dr. Jones added, been set up a special committee to deal entirely with the problems of private practitioners. An insurance scheme for private general practice, along the lines of the many existing provident schemes for consultant practice in hospitals and nursing-homes, was desirable. During the past year a memorandum had been prepared on the availability of pay beds in hospitals and nursing-homes throughout the country, and publicity had been given in the *Journal* to the conclusions jointly arrived at by the Private Practice and Central Consultants and Specialists Committees—namely, that in any area where local practitioners considered there was a shortage of pay beds liaison should be established between the Divisions concerned with the hospital or hospital group medical committees, who should make joint representation to the regional hospital board and local hospital management committee, simultaneously advising the central office of their action so that the Central Consultants and Specialists Committee could take up the question of the shortage with the Ministry.

Mr. E. N. CALLUM (Kingston-on-Thames), moving that all patients, private or otherwise, should be entitled to drugs under the National Health Service, pointed out that at the inception of the Service the then Minister of Health had promised that patients should have part or all of the Service. That private patients were not getting part was all "part and parcel of the great confidence trick played on the profession when it was persuaded to join in this National Health Service in 1948."

Dr. L. J. BARFORD (Reigate) asked from which fund drugs for private patients would be paid for, and whether this amount would automatically reduce the amount of the capitation fee. Dr. A. B. DAVIES (Chairman, G.M.S. Committee) said that in the Council's view there were approximately 2% of the population not using the N.H.S. Service. If they were allowed to have drugs on E.C.10s, it would mean a net increase of that proportion to be paid for by the Government in its pharmaceutical bill. However,

the Government had threatened that an extension of drugs to private patients could lead the Government to reconsider the whole basis of doctors' remuneration, particularly the Danckwerts Award. After recent joint approaches the Government tactics had altered a little, and it now said that if the privilege were granted there would be an increase in private practice, and the present £2m. per annum at present allowed in the Central Pool for private practice could be increased. This would mean that more would be subtracted from the global sum, leaving less available for distribution to practitioners. By using a different-coloured E.C.10 for identifying private patients' prescriptions, the figure could be arrived at, and, on an estimate of £1m., the privilege could, on the Government's argument, cost every general practitioner £50 a year. While, he said, the G.M.S. Committee were agreed on the desirability of private patients having free drugs, they were also concerned to see that it did not lead to a reduction in doctors' remuneration.

Dr. C. W. WALKER (Cambridge and Huntingdon) opposed the motion. What was being asked for, he said, was State drugs for fee-paying patients. He submitted further that no patients were entitled to drugs under the National Health Service; it was the E.C.10 with the doctor's signature on it which entitled a patient to drugs, and therefore the doctor must have an agreement with the Government about prescribing for his fee-paying patients. They should, he said, go to the Government with a scheme for the benefit of patients, private or otherwise. He did not know which doctors were to have this privilege. If it was to be all registered medical practitioners, the Government would lay down very hard regulations to restrict abuse, but if it was to be only general practitioners they might be more lenient. If it was restricted to purely private practitioners he believed the Government would allow almost a gentleman's agreement.

Dr. A. V. RUSSELL (Council) pointed out that private patients paid as much towards the Service as any other member of the community, and for the Government to say that they could use part of the Service under penalty of reducing the global sum from which N.H.S. doctors were paid was a dishonest and inequitable argument. The money for drugs came out of the Pharmaceutical Fund, he said: "If it comes out of the global pool, then we are being done." Dr. W. MORGAN EVANS (South Middlesex), speaking as a member of the G.M.S. and Private Practice Committees, said the only way to decide the issue was on the basis of common justice. Everybody in the country should be entitled to such drugs as were necessary for his treatment. That had been promised, and was implied in the Act. This view was endorsed by Dr. D. L. GULLICK (East Herts), who asked the meeting not to allow its judgment to be clouded by Dr. Davies's figures. It was, he said, a matter of equity.

Dr. C. P. WALLACE (Guildford) said that in voting for the motion representatives would be following what had been the Association's policy since the inception of the Service, and hoped they would not be swayed by the possibilities of threats mentioned by Dr. Davies. Dr. I. M. JONES said that the practitioners able to prescribe on E.C.10s for private patients had been defined and should be those engaged in private general practice. They should be asked to apply to the local executive council for permission so to prescribe, the local executive council, guided by the local medical and the local executive committee, should have power to decide whether a man was or was not a bona-fide general medical practitioner. He submitted that until the Ministry agreed that a practicable scheme could be put into operation there was no point in discussing what effect any mythical scheme might have on any central pool. While he agreed with Dr. Davies's figures, he pointed out that the £50 reduction would be offset by fees to be expected from private patients using the scheme, and in the view of the Council the net result would be a gain to general medical practitioners.

The Kingston-on-Thames motion was carried. Motions in the names of Harrow and Guildford deploring the delay in reaching agreement with the Government on the right of private patients to obtain drugs and requesting

the Council to press with urgency for the provision of such drugs and appliances for private patients on the same terms as for N.H.S. patients were carried.

After Dr. JONES had asked for the rejection of a Harrow motion calling for an application of the same principle for a test period of three years, it was decided to pass to next business.

Life Assurance Reports

Dr. R. P. HENDRY (Rugby (with South Warwickshire)) moved that the meeting should express itself as seeing no objection to the issue of "attendance reports," provided that a suitable form of consent, separate from the proposal, signed by the patient, was forwarded to the practitioner. The motion suggested as a suitable form of consent the words:

I agree that the Company may, at its own expense, before accepting me for life assurance seek medical information from any doctor who has at any time attended me and I hereby authorize any such doctor to give such information.

The point at issue was evidence of the patient's consent. It was also important that the patient himself should understand the form of consent which he had given.

Dr. JONES, asking for the rejection of the motion, said that the form of wording suggested differed from that produced by the Association's solicitors and agreed to by the Life Officers Association. The latter body had reaffirmed as recently as May last their intention to incorporate in all forms sent to doctors requesting an attendance report a statement to the effect that the consent of the patient had been received in a form acceptable to the British Medical Association. Dr. HENDRY, in reply, said it seemed that nobody could be under any doubt whatever if they received a patient's signed certificate. The question lay in the difference between what should happen and what did happen.

The motion was lost.

Dr. J. P. SPARKS (Rugby (with South Warwickshire)) moved that the Council should make further representations to the few Life Assurance Companies which did not yet pay the now customary fee of one guinea for full attendance reports. Some companies were paying only 10s. 6d. for such reports, which he regarded as a negligible fee.

Dr. JONES said it was not true to suggest, as the motion did, that a guinea was the maximum fee ever paid for such reports; some companies were in fact paying more, and the effect of the motion would be to ask that those higher fees should be reduced. Secondly, it was undesirable to suggest that individual companies should be approached rather than that such matters should be dealt with through the Life Officers Association, with whom the Association had conducted all its negotiations in an excellent atmosphere. It had not agreed, last May, to the request for a guinea minimum for attendance reports but had indicated that all the best companies in fact paid that amount, and that it was up to any practitioner who received less to apply for the full guinea, and it would be paid.

The motion was lost.

Dr. JONES moved that the following recommendation of the Council be adopted: "That when a full clinical examination is commissioned by a third party and no special investigation is involved, the fee for the examination and report should be a minimum of £2 2s." The passing of the resolution would do two things. Doctors would know what was the appropriate fee for a report and, secondly, it would help to bring central and local government bodies into line with the banks, large industrial undertakings, etc.

The motion was carried.

Dr. JONES accepted a motion, moved on behalf of East Yorkshire by Dr. C. GROVES, that hospital medical officers should receive a fee for completion of Certificate B of the cremation form. He pointed out, however, that as recently as last month an endeavour to obtain what the motion asked was turned down. Unfortunately, some doctors had been disregarding the policy of the Association in the matter of fees for cremation certificates. He reminded representa-

tives that the appropriate fee for Part B, when it was legitimate to charge a fee, and for part C in all circumstances was £2 2s. Doctors who charged more were prejudicing the continuance of the existing understanding with the Home Office.

The motion was carried.

Message to the Queen

The Representative Body unanimously agreed that the following loyal message should be sent to Her Majesty the Queen:

The Representative Body of the British Medical Association assembled at the Annual Representative Meeting in Birmingham sends loyal greetings to Her Majesty the Queen and earnestly hopes that Her Majesty may speedily be restored to complete health.

Personal Accident Insurance for Members

Dr. JONES recalled that a year ago the Representative Body passed a resolution asking Council to look into the possibility of arranging with the Medical Insurance Agency a scheme of insurance to protect doctors against the contingency of death or disablement by accident while engaged in their professional duties. The task was remitted to the Private Practice Committee. The Committee's first thought was of the difficulties in defining when a doctor was on professional duty, and for that reason, and others, it was decided that it would be better, if it could be done, to have a scheme which covered a doctor against accident in all circumstances. The Committee's second thought was to see if the scheme could be made available as part of the general benefits accorded to all members in return for their membership subscription. It became clear, however, that to get this it would be necessary to alter the Articles of Association in a way which would, on other grounds, be totally unacceptable. But the rates of premium and benefits offered for a policy issued to the Association and being given as a right to all members were so attractive that Dr. Jones asked the Medical Insurance Agency to see what could be done to obtain these rates even though policies were issued on an individual basis. After further negotiation the Agency agreed.

The cover was world-wide. There was no barrier of colour, race, or creed in the policy, and on that ground it was unique. Again, it was unique in that overseas members benefited equally with home members at exactly the same rate of premium, although in most overseas territories insurance premiums were appreciably higher than those in this country. Thirdly, it was available to women on the same terms as to men. Fourthly, it had fewer exclusions than any other policy, and for a doctor actually in the act of proceeding to or giving aid to any distressed person there were no exclusions whatever. Exclusions applied only to accidents occurring outside the realm of professional duty, and even then they were less than in other policies available on the market. Further, no medical examination was required before taking out the policy. It was available to all members of the Association up to the age of 70. Benefit would be paid under the policy on death occurring within 52 weeks of actual injury.

The policy had been taken out with a company carrying assets of over £100m. It covered against death or disablement by any accident, and it was calculated in units of benefit of £1,000. The premium per unit of benefit was 10s. for full cover and 7s. for fatal accident cover only. The maximum holding was 10 units per member. Those rates were just over one-third of the lowest rates available to ordinary members of the public and less than half any offered, even on a restricted basis, to any section of the community.

Dr. Jones paid tribute to Mr. A. N. Dixon, Manager of the Medical Insurance Agency, Dr. Walter Hedgcock, Assistant Secretary of the Association, the Chairman of Council, and the Treasurer of the Association for all that they had done to make the scheme possible.

Dr. W. N. LEAK (Mid-Cheshire), whose Division had brought this matter before the Council for two years running, thanked the Private Practice Committee and Dr. Jones for their work and hoped that all members of the Association would take advantage of the scheme. In answer to Dr. J. B. WRATHALL ROWE'S question whether the scheme would cover the result of accidental infections in the course of professional work, Dr. I. M. JONES reiterated that there were no exclusions whatever on death or total disablement resulting from accidents occurring in the course of professional duty. The company had agreed to submit any dispute to a referee or referees appointed by the Association, whose decision would be final. The policy would be available from the time the motion was passed. The Association had promised to do everything possible to ensure that the company got a minimum of 50,000 units, and the company had agreed to leave the premiums unaltered for three years.

The motion was carried.

The remainder of the Annual and Supplementary Reports of Council under "Private Practice" was approved.

Road Accidents

Dr. R. A. LEADER (East Suffolk) moved:

That this Meeting declares that it is wrong that prevention of road accidents due to medical causes of unfitness to drive a motor-car should remain incidental to the interests of insurance companies, especially as these appear to leave the obtaining of certificates of fitness to drive entirely to the initiative of prospective policy-holders.

If the patient's doctor refused to give a certificate, he said, the patient could go to another doctor, concealing what had happened, and the certificate of the second doctor would be accepted by the insurance company.

Dr. I. M. JONES confessed his inability to understand what the motion meant. On the assumption that it asked for compulsory medical examination before the issue of a driving licence, he pointed out that the Occupational Health Committee had not gone so far as that, even for drivers of heavy vehicles. There was no evidence that an appreciable number of accidents were caused by the illness of the driver, and in such cases it was usually a case of sudden collapse which could not have been forecast by previous medical examination.

The motion was lost.

Duration Certificates

Dr. R. P. HENDRY (Rugby (with South Warwickshire)) moved:

That this Meeting is of the opinion that "duration certificates" are noxious (i.e., certificates regarding the medical history of a person who has died shortly after being accepted without medical opinion for life assurance). They should be discontinued altogether, and for the present be issued only, at the discretion of the practitioner, provided all the following conditions are fulfilled:

(a) the original proposal signed by the deceased contained a clause clearly authorizing the doctor to issue a report in the event of his early death.

(b) This proposal form be shown to the doctor and a photostatic copy or duplicate be supplied for his retention.

(c) The proposer dies within three years of taking out the policy.

(d) The policy be taken out prior to January 1, 1959.

(e) That, where applicable, a paragraph be inserted on the certificate stressing that although the doctor may have been aware of serious illness the assured may not have known of this.

The object of the duration certificate, he explained, was to enable the company to avoid paying the claim. It involved a breach of professional secrecy and was repugnant to the principles of British justice; it should be for the company to prove guilt and not for the relatives to prove innocence. If the company took a calculated risk it should abide by its bargain. It could always go to the courts and

subpoena the doctor. The certificate might lead to injustice, because the basis of the contract was good faith, not good medical knowledge, and the assured might not have known that he was a bad risk. The motion did not say that doctors must not give these certificates, but that they should not do so.

Dr. R. S. V. MARSHALL (South Staffordshire) said that he did not regard it as his duty to treat the burnt fingers of assurance companies. He never gave duration certificates, although he had been offered as much as five guineas for one, and he had never been made to go to court.

Dr. W. MORGAN EVANS (South Middlesex), speaking as a member of the G.M.S. and Private Practice Committees, strongly opposed the motion. In 30 years he had never given a duration certificate, and said that when asked for one he invariably advised the patient to tell the insurance company that his doctor was behind him, and never once had an insurance company failed to pay. Insurance companies knew the risks they were undertaking when accepting an insurer, and they should not attempt to ride out of their responsibilities on the backs of doctors. Dr. I. M. JONES, opposing the motion, pointed out that in view of a resolution passed in 1949 it would require a two-thirds majority, as it was contrary to present Association policy. Dr. HENDRY replied that under the 1949 resolution it was Association policy to give duration certificates. It was also important to remember that the patient may have been ill to the doctor's but not the patient's knowledge.

The motion was lost.

Medical Examination of Nursing Candidates

Mr. G. E. MOLONEY (Oxford) moved:

That the prevalent practice of some hospitals of demanding a preliminary medical examination of candidates for training as nurses by the candidate's general practitioner is deprecated, but where such an examination is required the appropriate fee be paid by the authority concerned.

He pointed out that some, particularly teaching, hospitals demanded that prospective trainee nurses be medically examined by a general practitioner before being taken on the staff, but he had been informed that the Ministry considered such examinations unnecessary on the ground that nurses had a full medical examination after joining the staff. However, although hospitals were authorized to pay a fee when demanding a prior examination, some had refused to pay, saying that the prospective nurse should pay it. Doctors were reluctant to collect a fee from a prospective nurse.

An amendment by North Staffs to insert the words "and medical ancillaries" after the word "nurses" was accepted by Oxford and agreed to by the meeting.

Dr. L. J. BARFORD (Reigate) opposed the motion. He said that if it were passed great difficulty would be experienced over trainee nurses from abroad, some of whom had spent years going from hospital to hospital in an attempt to pass the preliminary medical examination. Also, if accepted, what was to prevent the same principle being extended to prospective university students who required a medical certificate before being accepted? Miss GLADYS M. SANDES (Marylebone) thought there was much muddled thinking over the problem. Anxious as they all were to recruit nurses and ancillary staff, they must avoid accepting trainees who subsequently had to be paid although unable to work. This could be prevented by a prior medical examination. Examinations carried out by hospitals were done by members of the staff without extra pay, and in large hospitals this could be very unfair to the consultant or senior officer.

Dr. D. L. GULLICK (E. Herts) asked if it would not be better to sort out medically unfit candidates before they started their training rather than to take them in and then have to spend more money and time on them before they were subjected to the disappointment of being rejected after having once started. He suggested that the word "encouraged" should replace the word "deprecated." Dr. S. G. BROOK (Barnstaple) said his Branch could not accept the motion as it stood. He had experienced no difficulty about the fee once it had been pointed out that

the Ministry allowed it. No one could object to a preliminary examination by a general practitioner. Dr. H. S. HOWIE WOOD (Isle of Wight) said that at a time when many doctors were having difficulty in finding enough money to live on and educate their children properly it seemed silly to despise the humble guinea or two which could be obtained in this way.

Dr. A. R. FRENCH (Marylebone) asked the mover to give a specific answer to the criticism which had been expressed of the word "deprecated," and asked whether Mr. Moloney had used it because he did not consider the general practitioner to be competent to perform the examination or because he was asked to do it without a fee. The Representative Body had already been told that the doctor could be paid a fee for the work. Dr. JONES opposed the motion, for its acceptance would mean rejecting the idea of pre-employment examinations. Surely no doctor would want to refuse to examine one of his own patients for fitness for training as a nurse. The second part of the motion was unnecessary, the Ministry having already authorized a fee of one guinea for such examinations.

Mr. MOLONEY, in reply, emphasized that there had been no intention to deprecate the services and skills of the general practitioner; his objection was to the fact that the doctor either did not get a fee or had difficulty in getting it. The Ministry allowed a fee to be paid when the hospital believed a pre-registration examination to be necessary. He knew of one hospital in the Oxford area which would not pay the fee, so that the doctor had to collect it from the person concerned, who was sometimes his own patient. The Ministry, while approving the fee, disapproved of having too many such examinations, because on entering the hospital the nurse was nearly always examined by a general practitioner employed there for that purpose.

The motion was not carried.

Sickness Insurance Society Premiums

Mr. G. E. MOLONEY (Oxford) then moved that the premium to private sickness insurance societies should be untaxed. He said there were people whose personal position made it necessary for them to have some privacy in hospital, yet most of them got no financial help towards hospital expenses from their contributions to the National Health Service. Many patients who desired privacy in their treatment were turning to private insurance to help towards meeting the whole or part of the cost. A patient who made his own arrangements for treatment, thereby relieving the National Health Service of the cost of that treatment, got no tax relief for the money spent in that way. Last May the Minister had refused to allow only the difference between the cost of a public and a private bed to be charged, because he had said there were difficulties involved. The method proposed by the motion was almost free of administrative and financial difficulties and had been well tried and found successful in other countries, including Southern Ireland.

Dr. JONES said that he would be happy to accept the motion as a reference to Council, as there were difficulties in it other than those outlined by the proposer, and this was agreed to. The motion was, accordingly, so referred.

Election of Representative of R.N. Medical Branch on the Council

Dr. WAND moved the acceptance of the recommendation of Council, passed at its meeting last evening, that Surgeon Rear-Admiral J. Hamilton should be elected to represent the medical branch of the Royal Navy on the Council of the Association for the period 1958-61.

The motion was carried.

ORGANIZATION

Dr. A. TALBOT ROGERS, Deputy Chairman of the Representative Body, took the Chair at this stage of the meeting.

The Chairman of the Organization Committee, Dr. RONALD G. GIBSON, moved the reception of the Annual and

Supplementary Reports of Council under "Organization" and the proposals for Amendments of Articles, By-laws, and Representative Body Standing Orders. He reported that the present membership of the Association was 70,683.

Dr. Gibson recalled the pledge he gave last year that the Committee would do everything possible to get the younger doctors together to discuss their problems. That had been done in the Junior Members Forum, to which the Chairman of Council had already referred, and which had been very successful. The older members went to the Forum prepared for attacks by angry young men, but they did not come. It was obvious that these younger practitioners had a great deal to give to the Association, and the future of the Association depended on them. Other things had been done for the younger doctor, one of which was the preparation of a hospital gazetteer—an A.A. book of hospitals. Dr. Gibson also referred to the Honorary Secretaries' Conference, which this year was bigger than ever. Dr. Potter, who did so much to promote this conference, could be justly proud of it.

Dealing with the Roll of Fellows, Dr. Gibson said the Committee was worried because some Divisions were regarding the bestowal of the Fellowship as a compliment to their members rather than as an honour. "We hope that you will impress upon Divisions that this is an honour given by the Association on behalf of the Division, and that you will keep the standard as high as possible," he concluded.

Dr. Gibson acknowledged the help his Committee had received during the year from the British Medical Students Association, and especially the co-operation of those members of it who sat on the Medical Students and Young Practitioners Subcommittee.

During the latter part of the last session the Committee had been considering intraprofessional relations, and although, said Dr. Gibson, he could talk for hours on the subject, he only proposed to touch on two points. The first referred to the word "unity." A resolution on the need for unity was passed by the Conference of Local Medical Committees. The Junior Members Forum also referred to it and suggested that rather than unity the Association should seek loyalty. In order to obtain loyalty it was necessary to obtain understanding, and in order to obtain understanding there must be an adequate information service to members. "Information service starts in the home of the individual member," continued Dr. Gibson. "He must know from day to day what his problems are and must know the problems of his neighbours. The information service must be comprehensive and geared to move at any speed in any direction, and one must ask the question whether that service is available at the moment."

Secondly, in spite of the machinations of the Minister and his Civil Service masters, medicine was still a dignified, learned, and noble profession, and in six months' time it might be that the profession would have to fight for its dignity and nobility. Some thought that it could be the last battle. The question was whether the profession's army at the moment was fit for such a battle. Could it fight as one man and, if not, why not? The Organization Committee had looked into the question of an information service with two points in mind: first, that it was absolutely necessary and, secondly, it was urgently necessary if the profession were to be ready early next year to fight the crucial battle should it arise. The Organization Committee would do everything possible, if it was the wish of the Representative Body, to help to bring about a comprehensive and adequate information service within the Association during the ensuing year.

Motions to the A.R.M.

Dr. R. G. GIBSON (Chairman, Organization Committee) moved the adoption of the following Recommendation of the Council:

That the terms of By-law 47 should be so amended as to permit those bodies of members empowered to elect members to the Representative Body to submit through the medium of one of their appointed representatives motions for inclusion in the Agenda of the Representative Meeting.

The CHAIRMAN announced that an amendment to this motion had been received, proposed by Dr. R. P. Hendry (Rugby (with South Warwickshire)) and Dr. R. S. V. Marshall (South Staffordshire), to omit the words "through the medium of one of their appointed representatives."

Dr. HENDRY, moving the amendment, pointed out that the normal method for submitting motions for inclusion in the Agenda was by the secretary of the various groups, not by the representative who proposed them in the A.R.M.

Dr. GIBSON accepted the amendment, and his motion, so amended, was carried.

Quorum of Council

On the motion of Dr. R. G. GIBSON, the Meeting adopted without debate a recommendation of the Council that By-law 66 be amended so as to increase the size of the quorum of the Council from 15 to 20.

Amendments to Articles, By-laws, and R.B. Standing Orders

On the motion of Dr. GIBSON, the Meeting also adopted without debate a recommendation of the Council that the Articles and By-laws of the Association and the Standing Orders of the Representative Body be altered in the manner shown in Appendix VI to the Report of Council, and that the Council be instructed to submit the amendments of Articles concerned to an Extraordinary General Meeting of the Association.

Autonomous Bodies

Dr. GIBSON moved the adoption of the following recommendation of the Council:

That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1958-9.

That the Representative Body looks to these Committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

Pending the report of the Co-ordination Committee, he said, the wording was the same as before.

Dr. R. P. HENDRY (Rugby (with South Warwickshire)) moved as an amendment that the first paragraph of the recommendation be amended to read:

That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed only in so far as they affect the purely domestic affairs of these Committees and not in respect of activities in which other branches of the profession are concerned.

The object, he said, was to profit by the misfortunes of the past and safeguard the future. The autonomous bodies did a vast amount of work for the profession and he had nothing against them, but the events of last year had shown a serious flaw in the set-up, when the various bodies had announced separately their intentions, irrespective of the views of the profession as a whole. Unity of action was essential to progress. A majority as well as a minority had some rights.

The CHAIRMAN OF COUNCIL emphasized that they must look forward and not backwards. Since last year, great progress had been made towards unifying the profession. The amendment, if carried, would have to be considered by the autonomous bodies and was bound to lead to that type of discussion which the events of the past year had tended to eliminate. The atmosphere between the Colleges and the Association to-day was better than it had been for a very long time, and the same applied in the general medical services field.

Dr. O. C. CARTER (Bournemouth) said the amendment was not an attack on the autonomous bodies. It was impossible to do without them; they included some of the most important people in the profession. It was essential, however, to avoid a repetition of the chaos which had occurred over the giving of evidence to the Royal Commission. They could not run the risk of different bodies speaking with

different voices. Dr. J. S. NOBLE (Council) regarded the amendment as dangerous and bound to cause friction. It was the duty of the Association, as the only body representing the whole profession, to lead it and not to drive it.

Dr. GIBSON said that the amendment was impracticable because of the impossibility of drawing a hard and fast line between what were and what were not purely domestic affairs, and thought that Rugby's aim would be better achieved by cross-representation between committees.

A motion to pass to next business was moved, seconded, and carried.

An amendment by Torquay was withdrawn, and the recommendation of the Council was adopted.

The A.R.M. received a recommendation from the meeting of 1957, which deferred discussion on it in view of the Council's decision to set up a special committee to investigate unity within the profession.

(a) That the existing relationship of the autonomous bodies to the Association should be continued, subject to ratification annually by the Representative Body of the powers of these bodies.

(b) That the arrangements under which the Joint Committee between the Central Consultants and Specialists Committee of the B.M.A. and the Royal Colleges and the Scottish Royal Medical Corporations acts as the negotiating body with the Government in respect of those engaged in the hospital and specialist service under the N.H.S. should be continued.

Intraprofessional Relations

Mr. H. H. LANGSTON (Winchester), moving that Council be instructed to set up an intraprofessional information service as a matter of urgency, said that every member of the Association should know what members in other parts of the country were thinking, yet every conflict with central Government made more obvious the lack of cohesion and unity in the profession. While repudiating the type of trade unionism by which the leaders decided policies which the rank and file must follow irrespective of the dictates of their own hearts and consciences, he believed the profession must have the confidence springing from certain knowledge of general medical opinion. A great deal more could be done, he said, by way of dissemination of information from the centre to the periphery and from the periphery to Headquarters, from Division to Division, and doctor to doctor quarters, to produce unity and loyalty of purpose. "We cannot," he added, "afford to be indecisive. The Council must be in a position to know and to reach decisions quickly, otherwise once again we shall be too late and we shall lose the battle."

Dr. R. P. LISTON (Tunbridge Wells) said that the Public Relations Committee, of which he was a member, had discussed this subject at length. Various memoranda had been submitted to the Committee, and he believed that if the proposals for local organization which he himself had put forward in a memorandum were accepted it would achieve everything required at the periphery. He thought that information from the centre to the periphery was already given to those who wanted to read it, first through the *Supplement to the Journal*, and secondly to a limited number of people through a personal, unofficial, highly informative letter from the Secretary to the chairmen and secretaries of Divisions. However, to this second means he had two rooted objections: that it was issued at irregular periods, and that it was of limited distribution. He thought there was no foundation for the allegation that the profession was not being adequately informed. He had sent a questionnaire to members of his Division. Of 138 forms sent out, 114 were returned. Seventy-six said they were interested in medico-politics, and 89 indicated that if they were not properly informed it was not the fault of Headquarters. The *Supplement* was read regularly by 60 of those replying and they thought the information it contained was adequate. The periphery would be informed if it would read what was made available.

Dr. JOAN CHAPPELL (North Middlesex), supporting the motion, said that the complexity and quantity of the work

at Headquarters was increasing, and new means were required to maintain its quality. She believed that the proposed scheme would facilitate a two-way exchange of facts and opinions, and would demonstrate to the Royal Commission and the Ministry that the profession was closing its ranks and was preparing against the possibility of an adverse report. Dr. J. C. ARTHUR (Gateshead) said that the Association's experience in these matters was very similar to that of the trade unions. About 10% of members turned up at meetings and of the other 90% very little was known. But the latter had an information service in the form of the *Journal* and the *Supplement*. He felt that no useful purpose would be served by setting up another service. The matter was not one of quite such urgency as that at the moment; it should be approached with great care and circumspection. He suggested that the motion should be rejected.

Dr. J. S. HAPPEL (Winchester) emphasized that the motion had been worded in general terms only, leaving it to the Council and the secretariat to work out details. It might well be that the object envisaged by the Winchester motion could be obtained at very little cost to the Association. But whether it would cost little or much, the results last year had been so bad that his Division felt that things would have to be altered and that if the Finance Committee could not find the money to advance one of the basic aims of the Association, then indeed things had come to a pretty pass. The major fault in the existing information services was that they were no particular person's responsibility. Dr. W. E. DORNAN (Council) said that the great weakness of the Association as a body negotiating with the Government in the National Health Service was the complete lack of knowledge of what the doctor in his surgery was thinking. Nor had the information in the hands of the leaders of the profession gone to the periphery sufficiently early and in sufficiently palatable form to be easily digested by the ordinary doctor. That had made the Association a laughing-stock among comparable organizations which were aware of what their members thought. The problem could only be solved by having an efficient two-way source of information from the periphery to Headquarters and back again. The National Farmers' Union had devised methods of doing this, and how highly they were respected in Government circles. They nearly always got their way. Winchester was right to stress the urgency of the matter. The Association's last chance was likely to come next year, and it was essential for a service of the sort suggested to be organized at least six months before the Royal Commission reported, the details worked out and the proper staff employed to man it. Council should be instructed to do it now; not invited to think about it.

Dr. WAND said a lot of heat was being engendered over certain aspects of the resolution, but it was about matters on which all were entirely in agreement. It was agreed that there was a need for the best possible to-and-fro service between the centre and the periphery; but the motion merely instructed Council to do a certain thing; it did not ask for a re-examination of the intraprofessional information service with a view to its overhaul and tightening up. It could only be assumed that what was envisaged was a completely independent service, and such a thing must inevitably, to some extent, work in conflict or antagonism with the Secretary, who was doing the same kind of work. The motion made no reference to the relationship between the suggested service and the remainder of the profession. The suggested scheme was incomplete in so many details. He asked whether the Representative Body was prepared to agree to the formation of such a service without knowing what it would involve or what it would cost. He suggested that the Council be asked to investigate and re-examine the matter.

Dr. A. V. RUSSELL (Council) supported the motion, but he did not believe that a service of the type envisaged would cost an enormous amount of money. He felt that before the Association came into possible conflict with the Government both Headquarters and the periphery must know what

opinions were held and what it was proposed should be done. He did not think it would be necessary to set up a new department; the Association already had a very efficient department dealing with public relations, and, for the rest of it, an efficient committee clerk could probably do all that was necessary—certainly all that the mover of the motion had in mind.

Dr. J. S. NOBLE (Council), responding to Dr. Wand's request that those who supported the motion should say exactly what was meant by it, said that the Association had worked well with its present structure for over 50 years, but had now reached a stage where it must change with the times. The first operation should be the appointment of a full-time information officer, whether medical or lay, who would work in close co-operation with the Public Relations Department and in contact with all the Committees, his duty being to collect, correlate, and disseminate information, and the appointment at a lower level of officers, to begin with voluntary, whose job it would be to contact all doctors within their area. It might be said that this was impossible, but other organizations had done something on these lines. In time, these people might become full-time servants of the organization. In addition, a newsletter might be produced periodically to reach every practitioner, which should be attractively produced. Part of the cost could be covered by advertisements. So far as the collection of information from the periphery was concerned, nothing more had been heard of the excellent suggestion from Edinburgh for a statistical survey. The first task, however, was to appoint an information officer.

Dr. ENID A. HUGHES (West Denbigh and Flint) said that her Division was very much in favour of anything which would lead to proper understanding between the various branches of the profession. Some years ago they had felt that the Welsh Committee lacked information both from the north and from the south, and also that the consultant and other branches were completely ignorant of each other's goings on. They therefore suggested, and it was agreed, that the local medical committees and the consultants and specialists should be asked to furnish the Branch secretary with reports of their meetings. Her Division suggested that local Divisional secretaries should be furnished with reports from the local medical committees and local consultants and specialists. In that way the Divisions would know what was going on in all branches of the profession.

Dr. I. M. JONES (Chairman, Private Practice Committee) remarked that since Dr. Wand had asked for further details of the Winchester proposal Dr. Noble had spoken—with the support of Winchester, Dr. Jones understood.

Mr. H. H. LANGSTON (Winchester) broke in to say that he had had no knowledge beforehand of what Dr. Noble was going to say.

Dr. JONES: "I understand that Mr. Langston supports the claims that Dr. Noble made."

Mr. LANGSTON: "I protest. Such assumptions have no foundation."

The CHAIRMAN: "I must ask Dr. Jones not to refer to what he thinks Mr. Langston may be going to say, but to confine his remarks to what has actually been said."

Dr. JONES went on to say that Dr. Noble proposed taking away duties at present carried out by the secretariat. The Council gave instructions and the secretariat carried them out. The secretariat had carried on an information service for some time. The proposal for a weekly newsletter had been put to the Finance Committee the previous day. Calculations had been made and it had been estimated that this might cost as much as £40,000 in one year.

The CHAIRMAN intervened to point out that various estimates had been given in the Council meeting and there had been no firm result. The Council would discuss the matter again later.

Dr. JONES contended that in any event the proposals must involve an expenditure of several thousand pounds, which would inevitably result in a considerable rise in the subscription rate. Several Representatives suggested from the floor of the hall that, in order to give more time for the

consideration of the matter, the debate should be adjourned until the following day.

The CHAIRMAN, while feeling that there were advantages in disposing of the matter that day, said he would be prepared to accept a motion for adjournment.

The CHAIRMAN OF COUNCIL (Dr. Wand), rising to a point of order, said that the Finance Committee had made certain recommendations on this subject to the Council, and asked leave, in the absence of the Treasurer, to bring the Finance Committee's decisions to the notice of the Meeting.

The CHAIRMAN said he would accept the interventions from the floor of the hall as a motion that the Meeting be adjourned.

The motion for adjournment was seconded and carried by the necessary majority, and the Meeting adjourned until the following day.

Friday, July 11

The A.R.M. resumed at 9.30 a.m., with Dr. A. BEAUCHAMP in the chair.

ORGANIZATION (continued)

Intraprofessional Relations

Recalling that the A.R.M. had adjourned the previous evening without having voted on the Winchester motion which sought to instruct Council to set up an intraprofessional information service as a matter of urgency, the CHAIRMAN announced that an amendment to the motion had since been handed in, and called upon the mover.

Dr. J. G. M. HAMILTON (Edinburgh) moved, as an amendment:

The Representative Body, being aware of the pressing need to improve intraprofessional relationships and solidarity, instructs the Council to consider as a matter of urgency the specific arrangements, staffing and otherwise, necessary to achieve this object.

The R.B. had appeared last night, Dr. Hamilton said, to have been unanimous in its view that there was a need for some improvement in the provision of information and intraprofessional relations generally; the difficulty and related to the manner in which this could be achieved, and speakers had expressed doubts on the practicability of the various methods proposed. The purpose of the amendment was to emphasize the point on which the R.B. had seemed to be reasonably agreed—the need for something to be done urgently in view of the approaching medico-political storm. It was thought also that Representatives might care to remit to Council for consideration the question of the techniques to be employed for achieving this end, it being manifestly ridiculous to suggest that a matter of that sort, requiring detailed study, could be dealt with by a body of over 500 people.

Mr. H. H. LANGSTON (Winchester) said that his Division would be happy to accept the amendment as an alternative to the Winchester motion, which, he said, had not been intended to suggest specific measures but merely to point out the need to be sure that the whole profession was really ready when next year the report of the Royal Commission burst upon it. Hitherto the Government had been in a position to gamble on the chance that the profession could not be firm and decisive because it did not really know the measure of support which it could command. He felt that Dr. Hamilton's wording would achieve what was needed. The Edinburgh text was carried as a substantive motion in place of the Winchester proposal, and the remaining motions under "Intraprofessional Relations" were referred to Council.

Message from H.M. the Queen

The CHAIRMAN read the following telegram received from Her Majesty the Queen:

Please convey to the Representatives of the British Medical Association, assembled at their Annual Meeting in Birmingham, the sincere thanks of the Queen for their loyal greetings and their kind message, which Her Majesty greatly appreciates.

The remainder of the report under "Organization" was approved.

Referendum

Dr. R. P. HENDRY (Rugby (with South Warwickshire)) then moved what he described as a "six-pronged" motion seeking to amend article 40 of the Constitution, which, he explained, provided that within a month of the annual meeting of the R.B. the Council, when considering the resolutions passed thereat, could with a 50% majority and a 66% quorum decide to institute a referendum on any matter on which it considered that the R.B. had been "talking through their hats." The motion set out in detail the procedure for doing this. It was intended to set out the circumstances in which there was a valid reason for the Council not accepting R.B. decisions and a procedure of "delay of implementation" for dealing with such objections; it went on to provide that if circumstances later changed the Council might take similar action with the same quorum and majority—a matter not covered by the present constitution so far as a referendum was concerned—and that in cases where it was decided to invoke a delay of implementation a notice to that effect should appear in the *Journal*, and that, in the absence of any objection by the number of individuals who could call for an extraordinary meeting of the Association or by the number of Divisions who could request a supplementary Representative Meeting, the motion should stand over to the next meeting of the R.B., to be reviewed in the light of new information or changed circumstances, when a final decision would be made.

Dr. GIBSON (Chairman of the Organization Committee) said that after careful examination the Committee thought the motion if accepted would cause more delay rather than less; if anything, it appeared to tie the hands of Council. However, he was prepared to accept it as a reference to Council. Dr. Hendry concurred, and the Meeting agreed to this course.

CONSTITUTION OF THE ASSOCIATION

The Chairman of the Constitution Committee, Mr. H. H. LANGSTON, moved the reception of the Annual Report of Council under this head.

The reorganization of Branches, he said, was the main consideration arising out of last year's A.R.M. decision that the function of a Branch as it existed in some areas required at least modification and extension to meet present-day conditions, and that, if it were necessary to achieve this so that the views of all sections of the profession in an area or region could be properly ascertained and co-ordinated, the Branch area should be varied and the Branch reconstituted. Recalling last year's debate, he said that in view of the Meeting's opinion that there was no universal panacea for achieving the necessary co-ordination, and that it was necessary for each Branch to examine the problem individually, the relevant documents had again been resubmitted to Branches, whose comments were still awaited. Since it had been agreed that change was necessary, he asked for constructive proposals from Branches and Divisions in the light of what they desired the function and purpose of Branches to be. As an example, he cited a recent resolution of the Metropolitan Counties Branch that in each area of the four Metropolitan regional hospital boards there should be appointed a standing committee consisting of the chairman and secretary of each B.M.A. Division within the area, with a convener, to meet as and when appropriate.

Dr. R. A. LEADER (East Suffolk) moved as an amendment that, bearing in mind the importance of liaison between peripheral units and the central body in future relations with the Government concerning the general-practitioner service, no administrative unit should be interposed between the Divisions and the Council. He emphasized that this was not intended as a stricture on Branch activities. Dr. J. A. PRIDHAM (Dorset), opposing the amendment, suggested that East Suffolk did not intend it to be taken very seriously, but used it to air their fears of a second tier. There was no need for any fear; the second

tier unit was not something interposed between the Divisions and the centre, but rather something to bind them together. It would allow those in any Division who were interested in medical politics to meet their colleagues in neighbouring Divisions and the members of central committees, and so obtain first-hand knowledge of their views. Dr. ANNIS GILLIE (Paddington) enlarged on what Mr. Langston had said about the Metropolitan Counties Branch resolution, and said that it had been adopted at a joint meeting at which were present representatives of the Metropolitan Counties Branch Council and of all the Branches within the areas of the four Metropolitan regional hospital boards. The meeting had brought out the advantages of a meeting covering a big area of this kind without losing the identity of the individual Branches.

Mr. LANGSTON pointed out that there was no question of something being interposed between a Division and the centre which would mean that everything from the Division would have to go through the Branch. The Branch would have specific functions of a kind which the Division could not cover, but the Division would have full access to the centre.

Dr. LEADER, in view of the assurances given, asked leave to withdraw the amendment, and this was accorded.

A motion by Bournemouth on the same subject was also, by leave, withdrawn, and the remainder of the Annual Report of Council under "Constitution of the Association" was approved.

A motion by Tunbridge Wells recommending the Council to appoint a small executive committee to expedite the conduct of its business was, with the leave of the Meeting, withdrawn.

Co-ordination of the Profession

Dr. S. WAND, speaking as Chairman of the Committee on Professional Co-ordination, moved the approval of the Annual and Supplementary Reports of Council under "Co-ordination of the Profession." The Committee, he said, had nothing dramatic to offer; co-ordination proceeded by evolution rather than by edict, and it was not possible to impose unity between democratic institutions simply by passing resolutions. There were three tiers of co-ordination. The first was organizational, between the Association and the Royal Colleges and bodies such as the Society of Medical Officers of Health; the second was intra-B.M.A. co-ordination, and the third was co-ordination at the periphery, where there must be unity and loyalty in the hearts of individuals. The Meeting had already discussed the improvement of this last type of co-ordination. On intra-B.M.A. co-ordination a recommendation had been made which, though small, was important, and was designed to close a gap which existed in getting together the doctors in different groups in the Divisions and Branches. It was at the top level that most progress had been made, and the dark clouds which had overshadowed medical unity a year ago were disappearing. There was a much better feeling between the Association and the Colleges and the Society of Medical Officers of Health.

The motion was carried.

Dr. A. M. MAIDEN (Lincoln) moved "that this meeting welcomes any action which will promote unity on matters affecting the general welfare of the profession." Although it was obvious that the matter of unity in the profession was firmly in the minds of the Council, he said that it might serve to emphasize to the Council that there might be other unexplored avenues between the doctor at the periphery and Headquarters. Mr. A. LAWRENCE ABEL (Marylebone) said it had been made clear that some action must be taken by the Association to promote unity on matters affecting the general welfare of the profession. Those who were not quite anaesthetized by the Royal Commission would wake up to the fact that each member of the profession must be in contact with every other. On July 5, continued Mr. Abel, a number of "young" men aged 65 would be retiring from the Health Service. Already he had heard one or two of them wondering what they were going to do. He submitted

that ten, twenty, or thirty of these retired doctors could be employed by Headquarters to visit every doctor in the country who did not attend B.M.A. meetings. Mr. Abel said he had estimated that if twenty such men were employed by Headquarters it would take approximately three months, visiting five doctors a day, to make the calls. It was a constructive proposal.

Dr. S. WAND said that Council did everything in its power to carry out the wishes of the Representative Body, but Council could never pretend to know all there was to know about everything that was in the mind of every doctor in the periphery.

Dr. MAIDEN, in reply, said that he was prepared to accept Mr. Lawrence Abel's suggestion.

The motion was carried.

ELECTION OF CHAIRMAN

The Representative Body received with acclamation the announcement that Dr. A. BEAUCHAMP (Birmingham) had been re-elected unopposed as Chairman of the Representative Body.

The CHAIRMAN thanked Representatives for the trust which they had reposed in him.

PUBLIC RELATIONS

In moving that the Annual Report of Council under "Public Relations" be received, Dr. H. GUY DAIN, Chairman of the Public Relations Committee, drew attention to the very valuable work which was done by the Public Relations Department for the Association and, indeed, for the whole profession. The responsibility had increased greatly in recent years, and it was true to say that the last year had been not only the heaviest but most effective in the way of putting across Association policy and the sense in which the Association served the interests of the profession and the public. There had been close co-operation with the press in making the profession's views known on all subjects which had arisen during the year—not the least among them being the trouble with the Royal Commission.

With regard to relationships with the B.B.C., Dr. Dain said that the Public Relations Department had endeavoured to improve relationships with the B.B.C. Deputations had gone to the B.B.C. several times to discuss some particular subject of which the Association disapproved, and had been able to influence the B.B.C. in that way. So far as intra-professional relationships were concerned, the Public Relations Department had made a start on that subject with the man at the periphery. The "group" method had been adopted, and it was suggested that the new central information service should regularly furnish the groups with information, and in return Headquarters would find out the views of members. There were many subjects which groups of doctors living near to one another could discuss, and the results of those discussions could be sent back to Headquarters. "It is up to you," Dr. Dain told Representatives, "to go back to your own areas and see that the method suggested by the Public Relations Committee of putting the groups into action is adopted."

Dr. G. S. R. LITTLE (Greenwich and Deptford) expressed concern about the relationship between the Association and the B.B.C., while fully bearing in mind the assurance given by Dr. Wand yesterday. The Association not having been consulted about the *Your Life in Their Hands* television programmes, the Council had been concerned in case live operations should be televised. A leading article in the *Journal* had suggested that disease was being dramatized. He felt that the B.B.C.'s honest intention of being instructive had been somewhat misinterpreted by the profession, which had not done itself any good by suggesting that such programmes were a cheap form of public entertainment. They had in fact continued after the Council meeting of February 19, at which the matter had been discussed, and there was no evidence of any adverse public reaction. "We must aim in future at co-operating with the B.B.C.," he said. "Don't let this ever occur again. We are apt to be

looked upon by the public with a little disfavour when we batten down and blow cold over things of this nature."

Dr. WAND pleaded with the A.R.M. not to embark upon a discussion of this subject; rather, to let the past be past, to think only of what good could be done in this field by healthy co-operation in the future, and to consider the general principles of approach to such programmes. As he had indicated yesterday, exploratory discussions of an encouraging character had taken place. "We may have to revise our own ethical approach to these developments, which are bound to take place and which are taking place in other countries, particularly in the North Americas," he said.

Dr. DORIS ODLUM (Bournemouth) urged the need for a very warm and close liaison between the profession and the B.B.C. She thought that the medical profession ought to take a more active role by way of suggesting programmes which would be of value, rather than leaving all the initiative to the B.B.C. There was a real need for an active and live relationship. There was a feeling among the public that doctors were trying to hide from them the secrets or mysteries of their calling.

The CHAIRMAN said the general feeling of the meeting seemed to be in agreement with the views expressed by Dr. Wand in his desire that the subject should not be discussed further, and this was agreed to.

A Harrow motion which sought to call upon the B.B.C. to consult with the Association before again televising or broadcasting programmes liable artificially to increase the work of doctors and cause anxiety in the population at large, and expressing objection to the Ministry of Health co-operating in the presentation of such programmes without prior consultation with the profession, was, by leave, withdrawn.

Television Programmes

Dr. K. W. BEETHAM (East Yorks) moved that the Representative Body deplore the use of television for the purposes of cancer education.

He said that the continuing alarming increase in cancer mortality, plus the fact that inevitably cancer research was a slow business, inspired a minority of the profession to believe that improvement could be achieved if the public were told the facts of cancer. He maintained that if the profession could not tell all the facts it should divulge none. Cancer educationists did little harm, he continued, until recently, when eight million people had 30 minutes of intensive cancer education on television from the Christie Hospital, Manchester. While it had been maintained that if one life could be saved a programme of that nature was justified, he preferred to judge it by the harm it must have done. For example, it had been reported that the programme was a contributory factor to a suicide. Moreover, after seeing such a programme possibly hundreds of thousands might some time develop a mild cancerphobia and a small percentage a moderately severe cancerphobia. Speaking as one who spent almost all his working day dealing with cancer patients, he said that many such patients who had seen the programme confessed subsequently they wished they had not. He emphasized that the profession should be most cautious before embarking on such a campaign, before being sure whether cancer education was a good or a bad thing.

Dr. G. CORMACK (Newcastle upon Tyne), opposing the motion, did not see why cancer should not be a subject of education for the public. He said that to attempt to control the activities of television authorities would redound to the profession's discredit, for it was a medium which the public regarded as a source of entertainment and education. The television authorities were in touch with public feeling and opinion much more than doctors, and would present programmes they considered of interest, and for the medical profession to contradict their view was to adopt an ostrich-like attitude and would achieve nothing. The late reporting of cancer symptoms by patients was a cause of concern to doctors, and something which brought

these symptoms to the notice of people must do some good. Anyway, people could always read about cancer, and the sources chosen by the public were not always the best and were outside the profession's control. Dr. B. H. PENTNEY (Camberwell), endorsing Dr. Cormack's remarks, said that as cancer education progressed it would help to reduce cancer mortality.

Mr. A. LAWRENCE ABEL (Marylebone) also opposed the motion. A recent hospital analysis of over 1,000 cases showed that 10 years ago 40% of breast cancers were reported early and 60% late; the figures were now 50% early and 50% late, and he pointed out that at that rate of progress it would be 50 years before women would attend early enough for cure. It was, he said, necessary to differentiate between cancerphobia and the fear of cancer. It was the doctor's duty to do away with the fear of cancer, and people should know that if reported in the early stages it could be cured. He was sure that in relying on the report of the Public Relations Committee they were carrying on the highest traditions of the profession and helping to do away with not only cancer itself but the fear of cancer.

OVERSEAS

It being 11 a.m., the Meeting proceeded, under the Standing Orders, to the consideration of Overseas business.

Professor D. E. C. MEKIE, in moving that the Annual and Supplementary Reports of Council under "Overseas" be approved, said that throughout the world many territories were moving in the direction of or had already attained independence, which was inevitable and right. One of the first effects of home rule was the determination to set up an independent local medical service. He had been proud to see his old assistants and students assuming new responsibilities and undertaking the work in a very wonderful way, but it meant that members of the old Colonial Service found their appointments suddenly terminated, and, although they received compensation, no monetary payment could compensate for the loss of a career. Their chance of entering general practice or of obtaining a specialist post in this country was small. The Government of this country, having recruited these men and offered them career appointments overseas, should be prepared to accept more responsibility than it did at present for ensuring that they had an opportunity to carry on medical work elsewhere, overseas or at home.

Many overseas territories which had attained independence wished to supply their deficiencies by recruiting men from outside on short-term contracts. After a doctor had served for a few years overseas, however, he might find that his whole career in this country had ended. This was a matter which it was hoped to discuss at length at a conference to be held in the autumn. In these overseas territories doctors, like other professional people, formed only a small minority, and there was a political opportunity to exploit their weakness. The Association wished to see a strong sense of unity among doctors in dealing with local governments, and, without wanting to interfere with the autonomy of overseas Divisions, wanted them to be strong.

The report was adopted.

Greetings from Overseas Representatives

Professor E. N. MACDERMOTT, President of the Irish Medical Association, conveyed its cordial greetings. The two Associations, he said, were linked by the closest bonds and had always worked in amity. The Irish Medical Association was grateful for the very generous help it had received from the British Medical Association and wished to reciprocate when the opportunity offered. Dr. A. P. CRAWFORD brought greetings from Queensland and expressed his gratitude for the help received from this country. They in turn, he said, were always delighted to help doctors from this country who came to Australia.

Mr. K. C. T. RAWLE, a Past-President of the New South Wales Branch, said that the high regard in which the medical profession was held both at home and overseas was

in large measure due to the fact that doctors belonged to a Commonwealth-wide organization, the British Medical Association. In Australia they had a fee-for-service system, the patient being given substantial assistance in meeting the cost of medical and hospital care by voluntary insurance, subsidized by the Government. This system had the approval of the public and of medical opinion. It resulted in a high standard of professional practice, with professional freedom, freedom to practise in any branch of medicine, freedom to prescribe whatever was necessary in the interests of the patient, and a confidential yet independent doctor-patient relationship. (Applause.)

Professor J. L. WRIGHT (New Zealand) brought fraternal greetings from the New Zealand Branch and issued an invitation to British Representatives to visit Auckland in 1961. Dr. A. D. McSHINE, in bringing the greetings of the Trinidad and Tobago Branch, said that the greatest task of his Branch was to ensure that the Government recognized the British Medical Association as the sole bargaining power of the doctors.

Dr. E. M. CLARK (Uganda) expressed gratitude for the interest and concern shown by the Overseas Committee about conditions in Her Majesty's Overseas Civil Service. The members of his Branch were most happy that the Chairman of Council and the Chairman of the Overseas Committee had been able to visit Uganda. It was a great help to the Association there. Dr. A. S. VALENTINE (Sierra Leone) brought fraternal greetings from West Africa and from Sierra Leone in particular. He extended an invitation to the Chairman and members of the Overseas Committee to visit the Sierra Leone Branch.

The CHAIRMAN thanked the overseas visitors for their remarks. It was a pleasure to have them at the meeting, and it was to be hoped that there would be many more present next year.

COMMONWEALTH MEDICAL ADVISORY BUREAU

In the absence of Mr. A. M. A. MOORE, Chairman of the Committee of Management of the Commonwealth Medical Advisory Bureau, Dr. H. GUY DAIN moved the reception and approval of the Annual Report under "Commonwealth Medical Advisory Bureau." The success of the Bureau, which was in its tenth year, was shown by the work which had been done. During the previous year more than a thousand doctors from the Commonwealth had sought the help of the Bureau, which had been able to find accommodation for more than 200 doctors. The Bureau also provided doctors in the Commonwealth with information in a booklet which was distributed to them on the nature of the post-graduate degrees and courses which could be found in this country.

The motion was carried.

INTERNATIONAL MEDICAL ADVISORY BUREAU

Dr. DAIN, in the absence of Mr. Moore, also moved the reception and approval of the Annual Report under "International Medical Advisory Bureau."

In the current year, he said, there were 470 new inquiries, mostly concerned with accommodation. The Bureau also proved very helpful indeed to the Hungarian refugee doctors. It had undertaken another job in connexion with the exchange of visits between people in this country and those in other countries. 566 inquiries had been received, and it was known that at least 167 holiday exchanges had been arranged by the Bureau.

The motion was carried.

INTERNATIONAL RELATIONS

The Chairman of the International Relations Committee (Dr. I. D. GRANT), moving the reception of the Annual Report of Council under "International Relations," first paid tribute to the work of Dr. J. A. Pridham, who had been the Committee's chairman for the last ten years; Dr.

Pridham was also one of the founder members of the World Medical Association, and there were many who were unaware of the tremendous amount of work he had done for both bodies.

The work of the International Relations Committee this year, said Dr. Grant, had been mainly concerned with the World Medical Association. The latter body—consisting of 52 member nations—acted, among other things, as a watchdog of the World Health Organization, the latter being run by the governments while the former was run by doctors. The W.M.A. also served as a forum for international medical problems. A British supporting group for the W.M.A. had been formed during the year with Dr. Alexander H. Hall, Past President of the Association, as chairman. So far there were only 34 individual members and some corporate members, and he asked Representatives to join it. The individual subscription was £2 10s., which entitled members to attend all the W.M.A. conferences. While many people considered that the W.M.A. was extravagantly run—a view with which he had a certain amount of sympathy—it had to be remembered that the finances were provided very largely from American sources.

The British Medical Association's annual subscription to the World Medical Association was about £7,000, and, while it did not provide any tangible, direct benefit for individual members in this country, they were, none the less, by virtue of that expenditure, taking a part in an international organization to which all the member nations except ten paid their full dues.

Dr. J. A. PRIDHAM (Dorset), appealing for membership for the British Supporting Group, said that to many Representatives the W.M.A. was perhaps an esoteric body, somewhat removed; however, it was extremely necessary for the doctors of the world, and if it should cease to exist within a few weeks or months someone would be trying to create something similar. In addition to individual membership, there was an associate membership, for a subscription of 10s. The corporate body membership had just been reduced to £3.

Dr. R. L. LUFFINGHAM (East Yorkshire) moved to amend the sentence in the report reading, "The subjects discussed by the General Assembly included . . . the alleged persecution of medical practitioners in Cuba by the Cuban Government" by the omission of the word "alleged." This referred to the report made by the B.M.A. delegates attending the General Assembly of the W.M.A. last October. There was now sufficient evidence to show that what the delegation had heard on that occasion was no more than the plain, unvarnished truth. Any observer of the proceedings of the W.M.A. could not fail to be struck by its perspicacity and urgent desire to maintain the highest standards of medical practice. It was taken for granted in this country that doctors could safely treat their patients without interference from anybody and that they could, without fear of reprisal or political action, treat people whose ideas were opposed to those of the government in power. In Cuba that was not so. The Government there was a dictatorship against which armed conflict was being waged, amounting to limited civil war. The Cuban delegates had risen at the General Assembly to describe incidents of interference in the practice of medicine there on the orders of the reigning dictator, including imprisonment of doctors for treating medically patients with political views against the dictatorship; interrogation, including physical beating, and imprisonment of doctors for refusing to disclose matters of a medical nature to the police concerning their patients; mounting guards of armed police outside the doctor's surgery in order to intimidate him and prevent, though not by physical violence, the free access of patients to their doctors. The Assembly had received the report with shocked surprise.

Dr. MARY ESSLEMONT (City of Aberdeen) pointed out that, although the incidents were alleged at the time of the conference, the subsequent report from the Secretary-General virtually established their truth. Dr. GRANT said that the word "alleged" had been used in the report because it dealt with what had transpired at the conference.

While in no way doubting the statements of their Cuban colleagues, the Council felt that they should if possible be substantiated by outside observers, and permission for such an investigation had been made to the Cuban Government. If it was the wish of the Meeting he would raise no objection to the removal of the word. Dr. S. WAND opposed the amendment on the ground that removal of the word "alleged" would make the report inaccurate.

Dr. LUFFINGHAM said that it was not the intention of the amendment to ask for the deletion of the word; it merely asked the Meeting not to agree with its use.

In reply to a point of order by Dr. Wand, the CHAIRMAN said that acceptance of the amendment would not indicate that the word be expunged from the report.

The amendment was agreed to and carried as a substantive motion.

The Annual Report of Council under "International Relations" was approved.

Reinstatement by Federal German Medical Authorities of Practitioner Guilty of Medical War Crimes

Dr. E. TOWNSEND (Cornwall) moved:

That this Representative Body expresses its deep distress on learning that the Federal German Medical Authorities have seen fit to permit the reinstatement of a practitioner guilty of medical war crimes. It instructs Council to take whatever steps seem practical and effective to bring the views of the British Medical Association to the notice of those responsible for this cynical affront to the honour, morals, and high ideals of the true practice of medicine throughout the world.

Dr. Townsend said that his first contact with a concentration camp was in May, 1945, when shortly after being released by the Russians from a prisoner-of-war camp in Eastern Germany he assisted in helping to rescue the survivors from a small concentration camp on the other side of the town. The Germans had marched off all those capable of walking, leaving the remainder behind a live electric fence. He had, he said, seen things he wished he could forget and hoped never to see again. Later in the same year he had returned to Germany as a civilian and he had had ample opportunity to meet not only displaced persons but some of the survivors from medical war crimes. He particularly remembered a house in Lübeck containing a number of women victims of sterilization, carried out so that they might be used for the pleasure of the German Army.

Dr. Townsend then referred to Dr. Herta Oberheuser, who was convicted at the Nuremberg war crimes trials. She was, he said, a young, fanatical Nazi doctor who volunteered to be camp doctor at the notorious Ravensbrück concentration camp for women. There, under the name of research, human experiments were carried out. At Nuremberg convincing evidence had been produced to show that Herta Oberheuser was responsible for selecting the victims of these experiments, that she examined them and assisted at the operations. The trial report said that she "faithfully co-operated at the conclusion of each operation by deliberately neglecting the patients so that wounds became infected," and she had admitted that many of her patients had died as a result of the experiments. In 1947 she had been sentenced to 20 years' imprisonment, her immediate superior being executed. In 1951 her sentence was reduced to 10 years, and in 1952 she was released. Subsequently, not only had she been reinstated and been practising as a doctor, but had been treated as a returned prisoner-of-war, by which means she had been granted an *ex gratia* payment and also given an interest-free loan to enable her to set up in practice. In addition, she had been admitted to the insurance list, which was essential for any doctor wishing to make a living in Germany. Hans Eisele, from Buchenwald, had also been convicted at Nuremberg but was again in practice and had been assisted in the same way. Hans Gorgass, convicted of killing a thousand victims in a mental hospital in trying to find a method of euthan-

asia, had been sentenced to death but reprieved, and was also in practice and had received so-called compensation.

What of the victims? Very few had received anything. "It may be said," Dr. Townsend went on, "that this is all past history, or that these doctors may have reformed and should have another chance. But past history lives on. Real evil does not end with its perpetration. It is our plain duty to protest against such men and women being allowed to practise again. It is a violation of the very basis of medical practice. I ask you to pass this motion as a protest against these acts which have taken place in Germany." (*Prolonged applause.*)

Dr. I. H. MILNER (City), supporting the motion, quoted from Albert Deutsch's note on the book *Doctors of Infamy*, by Mitscherlich and Mielke:

"It is not for the sake of vengeance that the record of the foul deeds of the medical perverts under Nazism should be read and remembered. It is far more important to the maintenance and progress of civilization that the tragic record be remembered as an episode in history which must not be repeated."

Dr. I. D. GRANT (Council) said that the International Relations Committee had not been idle so far as this matter was concerned. It had written to the West German Medical Association referring to an article in the *Daily Express* about Herta Oberheuser and setting out what had happened to her. The Committee's letter continued:

The article has given rise to letters of protest in the correspondence columns of the *British Medical Journal*. Some doctors have suggested that the British Medical Association should make some official protest against the return of Herta Oberheuser to medical practice. It may be necessary for our International Relations Committee to consider this matter. In this connexion I would be most grateful if you could send me answers to the three following questions: (1) Was the name of Herta Oberheuser erased from the medical register of Federal Germany when she was convicted of carrying out criminal experiments on human beings? (2) If so, when was her name restored to the medical register? (3) Has the German Chamber of Doctors expressed any opinion or made any public statement about the resumption of medical practice by Herta Oberheuser?

On July 3 the following reply had been received:

In Germany a doctor receives permission to practise from the State. The State alone can take away this permission. In the Oberheuser case the competent authority is the Ministry of the Interior of the province of Schleswig-Holstein; therefore questions (1) and (2) cannot be answered, because we have no medical register for West Germany maintained by the medical profession such as you have in England. The Chamber of Doctors, therefore, has no power to take away from Dr. Oberheuser the right to practise her profession. Both the Chamber of Doctors of Schleswig-Holstein and the Federal Chamber of Doctors have represented to the Ministry of the Interior of Schleswig-Holstein that Dr. Oberheuser's approbation should be withdrawn. The Ministry of the Interior, however, could not do this for legal reasons because a criminal inquiry from the Public Prosecutor's Office was in progress against Dr. Oberheuser. . . . The inquiry has now been suspended because it is not permissible to undertake criminal proceedings for acts which have already been regularly judged by the Military Court No. 1. No new evidence was forthcoming to promote a new charge. After the suspension of the inquiry by the Public Prosecutor's office, the Ministry of the Interior of Schleswig-Holstein has now instituted proceedings for the withdrawal of the approbation. The German medical profession hopes that the withdrawal of the approbation will be pronounced and that the right to practise medicine will be taken away from Dr. Oberheuser.

We German doctors deplore the fact that we have not the legal right in the Oberheuser case to withdraw permission to practise. You can perhaps imagine that such a case will be dragged through every possible stage in the legal machinery of the courts.

The letter went on to say:

Through the article in the *Daily Express* the impression has been created that the doctors of Germany do not wish to separate themselves from the reprehensible actions of Dr. Oberheuser or of certain other doctors. This is untrue. After the war the representatives of the German doctors always separated themselves publicly from the crimes against humanity and in particular from experiments on human beings that had been committed by certain doctors and condemned them most strongly.

In answer to the third question it was stated that the Federal Chamber of Doctors had taken every step within the ambit of the law to prevent the practice of medicine by Dr. Oberheuser.

A motion from the floor that the question be now put was carried by the requisite majority.

The Representative Body agreed to a suggestion by the mover of the motion, Dr. TOWNSEND, that the words "Federal" and "Medical" should be deleted.

The motion, as amended, was carried.

PUBLIC RELATIONS (continued)

Television Programmes

The Meeting resumed consideration of the motion standing in the name of the East Yorkshire Branch deploring the use of television for the purposes of cancer education.

Dr. BEETHAM, in reply, said that the motion was not directed against the B.B.C. It was directed against cancer education to the millions.

The motion was lost.

National Insurance Contribution to N.H.S.

Dr. T. M. GALLOWAY (Worcester and Bromsgrove) moved:

That this Meeting considers that publicity should be given to the fact that only a small proportion of the weekly National Insurance Contribution goes to the National Health Service.

The motion, he said, reflected the concern of his Branch that the weekly National Insurance contribution was too often described as a "National Health contribution," and the weekly stamp was too often referred to as the "health stamp." The contribution had been raised many times since it was instituted ten years ago, and in the advertisements giving public notice of the fact it was not pointed out that only about one-tenth of the money went to the Health Service. He suggested that posters might be introduced for display in surgeries setting out how the contribution was made up.

Dr. A. B. DAVIES (Walsall and Lichfield) urged the Meeting to support the motion. The present adult male stamp was 17s. 6d., made up of the contribution by the employer and employee, and it covered such things as old-age pension, widow's pension, sick pay, disablement benefit, unemployment benefit, maternity benefit, and funeral benefit. Out of the 17s. 6d., 1s. 8d. was the contribution towards the National Health Service. That by no means defrayed the cost of the Service but only a small portion of it. The greater part of the cost of the Service came from general taxation.

Mr. A. DICKSON WRIGHT (Marylebone) exhorted the meeting to support the motion, and urged all Representatives in their own special spheres to bring home to the public that the National Health Service was a form of public assistance. He had discovered that there was a great ignorance so far as the question of the contribution was concerned, and many people were under the impression that 1s. 4d. a week paid for the whole of the Health Service. It took more than the whole of the tobacco revenue to keep the National Health Service afloat.

Dr. H. GUY DAIN (Council) said that on a public document issued by the Government which he had received there was the statement that the National Health Service contribution had been increased by 6d. for men and 4d. for women, and it then gave the details of how much of the contribution went to the National Health Service. Therefore, it would appear that the Government was doing what the motion sought to do.

The motion was carried.

Speaking to the motion that the remainder of the Report under "Public Relations" be approved, Dr. J. F. L. KING (Kensington and Hammersmith) asked the Committee to ensure that continuous vigilance was exercised, especially so far as the B.B.C. was concerned.

The remainder of the Report under "Public Relations" was approved.

MEDICAL BENEVOLENCE

In moving that the Annual Report of Council under "Medical Benevolence" be approved, Dr. H. M. GOLDING, Chairman of the Charities Committee, referred to the retirement of Dr. Agnes V. Kelynack, who was secretary of the Committee for fourteen years. Her experience and enthusiasm had been of great value to the Committee, he said, and she would be greatly missed.

Dr. Golding said he was happy to report that the Committee showed an increase in subscriptions of £862 over the previous year. That included the great collection at Newcastle of nearly £250, for which the Committee expressed its gratitude. The Committee also expressed thanks and appreciation to the Ladies' Guild for the work which they did. The Committee was in contact with all the established medical funds and with charities outside medicine. "As in the New Testament," he said, "the poor are always with us. There is the unfortunate doctor who is overcome by illness or other circumstances and there are always the widows and orphans who need our help." There were also the "invisible beneficiaries"—the young doctor going into practice. But there had been a time when medical benevolence had been a life-line to him personally, giving him freedom from fear.

Dr. Golding said that the Council had set up a Charities Trust Fund. This would not compete in any way with the established medical charities and would not treat individual cases, but would hand the funds over to other medical charities. The idea had first been thought of in 1930. He reminded Representatives that the Charities Committee could receive covenanted subscriptions, recovering income tax on them to the extent of about 14s. 10d. in every pound. Last year the fund had received £4,538 in uncovenanted subscriptions; if they could all have been made under covenant the extra benefit would have been very great.

A motion from the floor that the sitting be adjourned until after lunch to secure a larger attendance achieved the necessary two-thirds majority of those present and was agreed to.

On the resumption, the Chair was taken by Dr. A. TALBOT ROGERS (Deputy Chairman), who invited Dr. H. M. Golding to repeat that part of his speech dealing with the new form of covenant, in view of the small attendance before the adjournment.

Having done this, Dr. GOLDING said it had been calculated that the £4,538 to which he had referred would under covenant become £7,813. When annual subscription forms were sent out there would be included a place for indicating that members wished to enter into a covenant, and he hoped members would take that means of joining the scheme.

Dr. J. W. WIGG (St. Pancras), adding his voice to Dr. Golding's appeal, said that from his work in an industrial practice he knew what living on public assistance meant. He believed that there were doctors' dependants drawing public assistance. Dr. J. S. ROSS (East Herts) thought that the amount subscribed to charities by the profession was parsimonious in the extreme. There was not enough money-collecting effort in Divisions, and he hoped the Association would endeavour to arrange for a local secretary in every Division to encourage medical benevolence.

The Annual Report of Council under "Medical Benevolence" was approved.

PUBLIC HEALTH

Moving the reception of the Annual and Supplementary Reports under this head, Dr. J. B. TILLEY (Chairman of the Public Health Committee) said that the Society of Medical Officers of Health had requested that the section of the Association's organization dealing with the affairs of public health doctors should have the same autonomy as other sections of the profession, and the Council had asked the Committee on Professional Co-ordination to consider the position of the Public Health Committee in relation to the autonomous powers of other committees. The Association's

agreement with the Society of Medical Officers of Health for action on matters of mutual concern had also been considered, the present arrangements being unsatisfactory, and he said he would later move for agreement of revised arrangements allowing for freedom of action to both parties in a manner satisfactory to both. The Council, he continued, felt that co-operation with health visitors was improving. However, less hopefully, much as the introduction of chiropody into the National Health Service was favoured, it was felt that nothing was to be gained by pressing for this at present.

In December last the Staff Side of Whitley Committee C had made a claim for an increase in remuneration of 5%, based on the increase in the cost of living since the previous rise in salaries. This had been rejected by the Management Side and, by agreement, referred to arbitration. The claim had been rejected by the Industrial Court, which said that public health doctors must be considered as part of the local government hierarchy and that their salaries should not be considered in isolation, without prejudice to any claim which might be made on their behalf after the claims of other local authority officers had been settled. The Management Side, in rejecting the claim, had said nothing about the local government hierarchy. It was the policy of the Association that doctors' salaries should be considered in relation to the remuneration of other doctors and not in relation to that of lay personnel working in the same field. It was most unsatisfactory that the Industrial Court should have made such a pronouncement on a matter on which it had not been asked to give an opinion.

In 1957 the then Minister of Health had informed the Association that although the public health doctors had not been included within the terms of reference of the Royal Commission, when any settlement was made after the Commission reported its recommendations would be considered in considering the remuneration of public health doctors. It would be impossible to carry that out if the terms of the award of the Industrial Court were strictly adhered to. Legal opinion had been taken, and there seemed to be some doubt about whether the wording used by the Court meant that there must be a fixed relationship with other local government salaries, but it was clear that the Court meant that final arrangements could not be made until other arrangements had been made final. When the Association had considered the position of the public health doctors after the Royal Commission had been set up it decided to press for an independent inquiry into public health remuneration, and Dr. Tilley and Dr. Wand had seen the then Minister, who had said that he could not set up an independent inquiry unless the normal negotiating machinery had broken down. The possibility of its breaking down was very real. It was farcical to pretend that the Whitley machinery was negotiating salaries for a group of people when it was simply reiterating what had been said in negotiations elsewhere. If the Association believed that the salaries of doctors in any branch of the profession must stand by its guns, and the Public Health Committee would recommend to the Council that all possible steps should be taken to establish this principle.

The motion was carried.

Agreement with Society of Medical Officers of Health
The following Recommendation of the Council was adopted without debate, on the motion of the Chairman of the Public Health Committee (Dr. TILLEY):

That the following draft new agreement between the Association and the Society be approved for adoption in lieu of the agreement adopted by the A.R.M., 1939:

1. If either the Society of Medical Officers of Health or the British Medical Association proposes to formulate or urge any medico-political policy which is or may be of mutual concern to the other, the Society or Association, as the case may be, shall communicate its opinions or proposals to the other and shall refrain from taking any further action on such policy except in accordance with para. 2.

2. (a) Where agreement is reached between the Society and the Association on the matter referred by one to the other, the two shall act on the matter as may be agreed between them.

(b) Where agreement is not reached and when it is deemed necessary by either the Society or the Association, the matter will be considered by a joint committee, and, if agreement is then reached, the two shall act in accordance with para. 2 (a).

(c) When agreement is not reached, either party will be free to act separately as though the agreement did not exist.

Domiciliary Chiropody

Dr. J. S. HAPPEL (Winchester) moved as an amendment:

That (with reference to para. 100 of the Annual Report of Council) this Meeting instructs Council to press for implementation of the service of domiciliary chiropody, which should become a facility under the National Health Service, and does not accept the opinion of the Council that no useful purpose would be served by pressing the matter at this stage.

In his part of rural Hampshire, he said, many retired people from London came to live. Most of them were not well off, and their feet did not take kindly to having to walk a mile or two to reach a shop. Many were already in ill-health. The Council had approached the Ministry of Health about this, and their representations had been turned down.

Dr. J. MADDISON (Public Health Service) said that under one section of the Public Assistance Act it was possible for a local authority to contribute to the funds of any voluntary organization which concerned itself with recreation and meals for old people. The Act did not say in what way that money should be used. If local authorities could be persuaded to give funds to such a voluntary committee that committee could pay the salary of a chiropodist in the area. The voluntary committee could be composed of members of the health committee, and it could further use the town clerk as its secretary, the treasurer of the authority as its treasurer, and the medical officer of health as its doctor. If the medical officer could persuade his authority to allow one of the clinics to be used by the voluntary committee, that would be one way of surmounting the difficulty.

Dr. TILLEY said that the Public Health Committee was aware of the arrangements which Dr. Maddison had outlined. Everyone was agreed about the desirability of the service, but having considered the matter very carefully the Council had decided it was not the time to press for it.

Dr. A. REZLER (City) supported the amendment, which was carried.

Sewage in the Sea

The meeting considered a motion, moved by Dr. R. P. LISTON (Tunbridge Wells), urging the Government to undertake a full inquiry into the possible danger to public health from the continued disposal of sewage into the sea and river estuaries. Dr. Liston said that the reason for putting the motion forward was to enable practitioners to give a perfectly firm answer when patients asked, "Doctor, is it safe for me to bring my wife and children to the sea?"

Dr. DORIS ODLUM (Bournemouth) said that those people living on the coast knew that sewage in the sea was unsightly and was undesirable on that ground, but how far it was in fact a menace to health was not yet known. It was a subject on which the public needed a good deal of reassurance. The Association should be able to give a lead and ask for an inquiry to ascertain the facts. Dr. R. COVE-SMITH (Marebone) supported the motion. The main point to be stressed, he said, was that effluent and the materials therein should be reduced to as fine a state of division as possible. The criterion of pure and sterile effluent was probably impossible. Dr. H. S. HOWIE WOOD (Isle of Wight) said he understood that by modern techniques it was possible to carry sewage effluent into the sea provided that it had been properly treated and that it was discharged at a sufficient distance from the beach. He suggested that the Public Health Committee might investigate the matter.

Dr. TILLEY, in reply, said that the motion of the sea could not be controlled but that which went into it could be. There was no doubt that in a perfect world Britain would

be surrounded by a beautiful blue or green sea without any obnoxious substance in it at all, but the cost would be very great indeed. At the same time there was no real evidence of grave danger to health arising from the system of sewage disposal into tidal waters. There had been an indication by the Ministry of Housing and Local Government that an inquiry into the matter in connexion with sea-bathing was already in progress.

The motion was carried.

Notification of Infectious Diseases

Dr. A. A. COCHRANE (Dartford) moved:

That this Meeting calls upon the Council to implement the resolution passed in 1955 when it was resolved that this Meeting is of the opinion that a review of the legislation concerning the notification of infectious diseases should be carried out by the Association with a view to making recommendations to the Ministry regarding the form of revision, which is long overdue.

He explained that since putting the motion down he had learned that a special subcommittee of the Public Health Committee had been set up to examine the whole question. There were at present certain diseases which were notifiable although it was no longer necessary that they should be, including pneumonia, relapsing fever, membranous croup, scarlet fever, erysipelas, malaria, whooping-cough, and measles; there were other complaints which ought to be notifiable, such as German measles. Public money was thereby wasted. Fees paid during an epidemic might amount to £3,000 a week over the whole country. The fee paid for notification should be raised but fewer diseases ought to be notifiable, so that the usefulness of notification might be increased. Most of the present legislation dated from 1889.

The motion was carried without further discussion and the remainder of the report under "Public Health" was approved.

Public Health Administration

Dr. J. B. WRATHALL ROWE (Harrow) moved:

That this Meeting, noting with concern a tendency on the part of certain local authorities to separate their public health functions into self-contained departments, reaffirms the principle that all public health work, whether that of medical personnel, public health inspectors, or other auxiliary workers, should be under the direction of the medical officer of health, and that no part of it should be placed under lay control.

In recent months some local authorities had granted chief officer status to the lay head of their public health inspectorate, thereby reducing the authority of the medical officer of health and weakening the overall general direction which he formerly exercised over the environmental health services for which he was statutorily responsible. The preservation of health, in whatever context, should always be a medical matter, especially where infectious diseases were involved. Where it was necessary to apply knowledge of bacteriology and pathology the lay officer could only work by rule of thumb, not having received a sufficiently comprehensive technical and scientific education to enable him to do otherwise; but the rule-of-thumb approach might be distinctly dangerous and might even result in the spread of diseases among the community rather than its control.

Dr. R. M. S. MCCONAGHEY (Torquay) moved to amend the motion by the deletion of the words in the last line, "and that no part of it should be placed under lay control." In many districts three or four local authorities were served by one medical officer, who would find it difficult to keep complete control over his sanitary inspectors all the time. The motion would be stronger with those last words and would be more easily applicable. Dr. ROWE thought that the deletion would, to a certain extent, weaken the medical officer's general direction. If the public health inspector was given chief officer status it might happen that he was not subject to the direction of the M.O.H. Dr. F. A. BELAM (Guildford) said he had been M.O.H. of three different areas and had been perfectly capable of controlling them all without any difficulty at all. Dr. J. B. TILLEY said

that his committee would welcome the motion, with or without the amendment. If it was firmly agreed that the whole department should be under the M.O.H., then it followed that no part of it was under lay control.

Dr. MCCONAGHEY, in reply, emphasized that he had nothing to do with public health administration; his informants had been medical officers who had complained of experiencing difficulty if they could not allow a certain amount of control to their lay officers.

The amendment was lost, and the motion was carried.

At this point Dr. Beauchamp resumed the chair.

Medical Examination of Immigrants

Dr. R. LL. MEYRICK (Lewisham) moved that Council should campaign vigorously for the medical examination of all immigrants to this country. He said the purpose of the motion was not to influence adversely legitimate immigration, but doctors had a duty to offer protection both to our own population and to those coming here. The United Kingdom was one of the few countries which did not raise protective barriers against immigrants, with the result that there was increasing evidence of the existence of a pool of ill-health constantly being supplemented and replenished from abroad. Taking tuberculosis as an example, he said that in 1956 a review of mass radiographs in South-east London showed an incidence of 3.6 cases per thousand overall, but 14.2 per thousand amongst those living in common lodging-houses and similar institutions. In September, 1957, of 245 tuberculous immigrants examined, no fewer than 205 had arrived within the previous 12 months suffering from the disease. Another review of 32,000 x-ray films showed that the tuberculosis rate was five to seven times higher amongst immigrants than amongst the indigenous population. He fervently asked the Representative Body to demand protection for patients by the simple expedient of medical examination of immigrants.

Dr. H. D. CHALKE (Council) pointed out that a similar motion had been carried a few years ago at Brighton, since when the situation had worsened considerably. For the first time since records had been kept, he said, more people were coming into this country than were leaving it, and this at a time when for the first time since about 1870 tuberculosis was on the run. There were now two groups increasing the incidence of the disease. First, there was a high incidence among those from places such as Pakistan—of whom there were 1,000 wandering around cold and unemployed in Leeds at Easter—and rural people coming to an urban environment, conditions they had never before known, living in poor, overcrowded conditions, wandering about and changing their address, perhaps before attending a chest clinic when told to do so. Secondly, there were those from, for example, Ireland, who had not such a high incidence of the disease but who had a high susceptibility to it. The Government had said that the problem could be dealt with by co-operation, yet an edict from Whitehall had prevented the examination of Hungarian refugees, despite the existence of a scheme devised in co-operation between medical officers of health and mass radiography units, who had x-ray plant made available. Since then a minimum of 60 or 70 of those refugees had been wandering about in an infectious condition. There was, he said, no question of racial discrimination. These people had to be protected against themselves and helped to help themselves. He pointed out that immigrants into New Zealand, Australia, and Canada had to have proper x-ray examinations, and the United Kingdom was getting the rejects.

The motion was carried.

Milk

Dr. I. M. JONES (Sunderland) moved:

That this Meeting reaffirms the great value which the profession has hitherto attached to milk as a food and deplores the recent decision of Her Majesty's Government sharply to discourage the production of milk at a time when the average liquid consumption remains below that level which is desirable in the best interest of the health of the nation.

Since 1956, he said, Government policy had been to encourage beef production and discourage milk production by making beef production more profitable. From 1956 to 1958 the price of beef increased by 13%, while, despite production costs rising more for the dairy farmer than the stock farmer, the price of milk to the farmer had been reduced by 3%. According to the Government White Paper issued in March, 1958, the average income in 1957-8 from a dairy farm was £865, but from a stock farm £1,267; the income per £100 of rent for the dairy farm was £308, and for the stock farm £706. In the White Paper the Government also dared to suggest that the production of less milk was in the best interests of the nation. Approximately 60% of calves born in this country were produced by artificial insemination, and in 1957-8 there had been an average fall of 10.7% in the use of dairy bull semen, an 18.1% fall in the use of dual purpose semen, but a 45.5% increase in the use of semen from beef herds. Since the publication of the White Paper there had been a further swing of 10% in the direction of beef production. In April, 1958, for the first time since the 'thirties, there had been a fall in the monthly milk gallonage compared with the previous year. The average daily consumption of 0.7 pint in this country compared unfavourably with that in every other civilized country, being 100% below New Zealand, 55% below Canada, 50% below America, 100% below Scandinavia, and 150% below Switzerland; it was also below the amount specified by dietitians, and for children miles below it. He asked the Meeting to do for milk what it had in recent years done for heroin and crash helmets in obtaining a reversal of Government policy.

Dr. J. W. WIGG (St. Pancras) drew attention to the fact that the promotion of milk as a food was still the subject of an intensive public relations campaign by a commercial organization, and said it was not the duty of the Representative Body either to further or to oppose that campaign. There was no evidence of serious malnutrition in the country, and they should not let themselves be used by publicity people. They should express no opinion on the virtues or vices of the motion, and he moved that they pass to the next business.

This was duly seconded, put to the Meeting, and carried.

Egg Products

Dr. W. B. ADAM (Tunbridge Wells) moved:

That this Meeting requests the Government (a) to ban the import of infected egg products; and (b) to control the production of home dried and frozen eggs, to prevent infection.

He said the motion stemmed from an annotation in the *Journal* of March 8, 1958, on the dangers of imported eggs, which quoted a report of the Public Health Laboratory Service, after examining 20,000 specimen eggs, that apart from *Salm. pullorum*, which was non-pathogenic for man, the percentages of imported frozen egg infected were 5% Australian, 10% Chinese, 16% New Zealand, and, worst of all, 29% British. The report showed a close correspondence between the numbers of strains isolated from egg products and those causing human infection. *Salmonella enteritidis* had more than doubled since 1950, when the import started, and it was therefore clearly beyond reasonable doubt that those products were related to human infection. Rather more serious, Chinese eggs were found to contain *Salm. paratyphi B*. There had been a number of outbreaks of typhoid associated with synthetic cream, and the type of organism isolated was the same from human infection as those recovered from egg products in use at local level. While, he said, M.O.H.s had been active at local level, no Government action had been taken. He therefore pressed for a ban on imported eggs and the control of the home product.

Dr. J. B. TILLEY agreed that trouble had arisen from imported eggs of the type in question and supported the motion.

The motion was carried.

Clean Air Act

Dr. I. R. D. PROCTOR (Chesterfield) moved the motion standing on the Agenda in the name of Chesterfield in the following amended form, leave having been given:

That in view of the high mortality rate from bronchitis in North Derbyshire and certain parts of Yorkshire and Lancashire, and the known relationship between bronchitis and air pollution, and the provisions of the Clean Air Act this Meeting considers that the provisions of the Act should be rigidly enforced in these areas forthwith, and that local authorities be pressed to proceed with the establishment of smoke-control areas.

The mortality from bronchitis, he said, was notably higher in the industrial areas mentioned in the motion than in the rest of the country. Taking the overall average death rate as 100, some areas had figures of over 130. There was growing evidence that the incidence of bronchitis, and therefore mortality from it, was increased by air pollution, and especially by high sulphur dioxide levels. The Clean Air Act was a first step in the right direction, but suffered from weaknesses and omissions. The degree of reduction in air pollution depended on the enthusiasm of the local authorities concerned. Only a limited quantity of smokeless fuel, other than coke, was available for householders, and half the air pollution came from domestic chimneys, so that there was a case for increasing the production of smokeless fuels and giving priority in distribution to areas of high air pollution. Industrial concerns were given a seven-year period of grace in which to reduce their pollution by exhaust gases; a subsidy, reduced each year, would encourage early improvement. Many industrial plants came under the Alkali Act of 1906, as amended in 1926, and not under the Clean Air Act. That legislation was out of date, and the permitted level of noxious effluent should be lowered by making use of recent technical advances; the permitted level of 4 grains per cubic foot could be halved. No provision was made to curtail the building of industrial plant in areas already highly polluted. More attention should be paid to medical and meteorological advice in the siting of new plant.

Dr. G. R. OUTWIN (Doncaster) moved as an amendment to add at the end of the motion the words:

and that in all areas within which the enforcement of the Clean Air Act is desirable the initial enforcement shall be directed towards those communities from which the greatest opposition to such enforcement is to be anticipated—namely, the local authority public housing estates.

In his area, he said, the initial enforcement was directed against factories and a section of the private housing area. As the latter was surrounded by municipal housing estates, containing a fair proportion of colliery families, it was not likely to improve appreciably the lot of the community as a whole. The hard areas should be attacked first.

Dr. J. B. TILLEY, while agreeing that a great deal of the pollution came from domestic chimneys, said that the amendment singled out a particular group of houses and implied that on local authority housing estates less would be done than could be done. He did not think that could be supported so far as the country as a whole was concerned. Dr. OUTWIN replied that his intention was not to single out any group but to devise a means by which the scheme could be introduced most effectively.

The amendment was lost.

Dr. TILLEY said that the Public Health Committee welcomed the motion, and it was carried.

Dr. ELIZABETH V. ROHR moved on behalf of Marylebone that the Minister's attention be called to the low level of smallpox immunization throughout the country, and urged that a campaign to rectify it should be renewed at once. It was said that about 40% of the population were effectively immunized, and even that might well be an exaggerated figure. All present were aware of the panic which ensued when a case of smallpox was suspected in the population. Dr. H. B. MUIR (Fife) said that, while he supported what Dr. Rohr had said, he did not feel that the objective

would be attained by the suggested approach alone. The remedy lay in the hands of general practitioners. The National Health Service provided a golden opportunity and a challenge to the profession in the practice of preventive medicine. "I regard vaccination and inoculation as a continuation of post-natal care," said Dr. Muir. "I do not believe that the family doctor should wait until the mother brings the child to him. He ought, in the interest of preventive medicine, to go to her." The motion should encompass general practitioners and public health authorities as well.

Dr. R. LL. MEYRICK (Lewisham) stressed the importance and urgency of the motion. There was an epidemic of smallpox now in Pakistan, which was not very far away in present times, and over 15,000 people had died in recent weeks.

The motion was carried.

ELECTIONS

It was announced that Dr. G. W. IRELAND and Dr. J. C. MACARTHUR had been elected unopposed as members of Council for 1958-9, and Dr. T. W. DAVIES (Swansea) had been elected unopposed by Welsh Representatives.

FINANCE

The Treasurer, Mr. L. DOUGAL CALLANDER, moved that the Annual and Supplementary Reports of Council under "Finance" and the Financial Statement for the year ended December 31, 1957, be received.

He reminded Representatives that when he presented the accounts in the previous year he drew attention to the rapidly diminishing margin between income and expenditure, and pointed out that a situation might arise in a few years' time of a much more serious nature. At that time he stated there was no occasion for undue optimism. Indeed, it was thought at the close of the year that an adverse balance might be shown. Mr. Callander said he was now happy to say that it was found possible to carry forward a small surplus to the accumulated fund; but the result was only achieved by surpluses on publications which were much greater than was then anticipated, and from a number of what might be described as "windfalls" to which reference would be made later.

Referring to the income and expenditure account, it would be seen that revenue from subscriptions, after providing for losses on collection and exchange, amounted to £269,252 as compared with £264,331 the previous year. Membership in 1957 reached a fine figure of 71,141, the highest ever in the history of the Association. It had been achieved by a propaganda drive, initiated by Headquarters, and there had been much help and co-operation from Branches and Local Divisions. There was, however, still room for improvement in the membership, and he urged Divisional secretaries and members of executive committees to devote their energies to improving the membership position.

Mr. Callander stressed—as he had done last year—that the income from subscriptions had, for many years, not been sufficient to deal with the expenditure of the Association. By way of a bright spot on the income side, he disclosed that, as a result of various leases having fallen in, and because it was known that others would fall in the course of the coming year, it had been possible to increase rentals by about £5,000 this year. That figure would increase, during the next two or three years, to something like a further £20,000. B.M.A. House had been one of the finest investments that the Association had ever made. There had been a small drop in the income from investments, owing to the reduction in the Treasury bill rate consequent upon the reduction of the bank rate. The accounts showed a total income of £295,000, as against last year's figure of £287,000.

On the expenditure side, the only item which was less than that of last year was in respect of the secretarial and finance departments, due to a number of "windfalls" from

various sources. *Family Doctor* had paid the Association £3,000 for office expenses, but it had to be borne in mind that next year's contribution from that source would be only a sixth or seventh of that amount. A similar sum had been received from the Hospital Medical Staffs Defence Trust for work done in connexion with their committee. Acknowledgment was due of the continued very substantial assistance given by the National Insurance Defence Trust and the General Medical Services Defence Trust in relieving the Association of all but £500 of the cost of running the General Medical Services Committee—a gift which was very much appreciated. Central meeting expenses had risen from £22,000 to £31,000, this being to a considerable extent due to the cost of the special A.R.M. Furthermore, increased membership meant an increase in capitation grants. In a very generous gesture, the New Zealand Branch had refunded to the Association for 1957 the sum of £750 when they had noticed the financial position of the Association. He extended to them his most sincere thanks. After providing for the third instalment of £5,000 for the joint meeting with the Canadians next year in Edinburgh, a surplus of £6,552 had been carried forward.

A new Clerical Staff Superannuation and Assurance scheme had been set up whereby when a person became entitled to superannuation he could take so much of it as a capital sum and had to pay tax on the interest content only. The funds of the new scheme had been invested in local authority loans at 5½ to 6½% for a period of 20 years. It should be possible in that time to show a surplus which could never have been contemplated three or four years ago; that would make it possible either to reduce the premiums or to pay larger bonuses, as the various insurance companies in the country working in similar circumstances were able to do.

There was still room for considerable increase in the charity contributions.

The auditors had declared that the valuations of the Association's premises in London and elsewhere were nothing like what they should be; as a result of a new estimate, the figure had jumped to £800,000—a very conservative estimate of the value with 160 years of lease still to run. The saleable value of the library had been uplifted to £27,000. A new item on the liability side was the capital reserve. The budget approved by the Council envisaged a net deficit of something like £13,000, provision being made for a full year's cost-of-living bonus to the staff and heavier postage bills as from last October, costing many thousands of pounds, which would have to be met in this full year. The Journal Committee had thought it prudent to make provision for increased cost of printing. The cost of a possible further meeting in connexion with the remuneration claim had also to be considered. However, there was already evidence that it might not be necessary to provide for all those contingencies in the current year, and it was possible that, with care, with an improvement on the budgets of other departments, the year could be closed with a smaller deficit than had been anticipated last December. But the fact must not be ignored that the Association was living on a shoestring. It did not want to accumulate large surpluses, but there had to be reserves which could be called upon to meet inevitable emergencies from time to time.

Dr. O. C. CARTER (Bournemouth) asked whether paragraph 136 of the Annual Report of Council complied with the requirements of articles 52 and 53. He agreed with the Chairman that, in effect, what he was asking for was a full balance sheet.

Mr. CALLANDER said that that had never been done; it would mean a tremendous lot of extra printing and a lot of information included which not one in a dozen would follow. If it was the desire of the Annual Representative Meeting to have that, it would be carried out. Dr. CARTER said that a few years ago details of the estimated income and expenditure had been provided. He did not see how it was possible to discuss matters and for Branches to put down motions when they were not provided with the neces-

sary information, particularly when there was talk of increasing the subscriptions.

The CHAIRMAN said that for several years there had not been a detailed account of the estimated budget. Questions could, of course, be asked of the Treasurer on any items, and he pointed out that the Auditor's Report covered the matter.

On his putting it to the Meeting, the Representative Body decided that there was sufficient information available in the present report, and also that it did not require a more detailed budgetary account next year.

Dr. IAN D. GRANT (Glasgow) moved:

That this Representative Body, recognizing that the steadily increasing expenditure in all departments of the Association will inevitably necessitate increases in the subscription, declares as its policy that the time has now come for some retrenchment in the activities of the Association.

He said that despite the gratitude felt in Glasgow for the new B.M.A. House there, they put forward the motion because they considered it the duty of the Representative Body to formulate the policy of the Association. He felt that Council members were trustees of the Association and had no right to spend money in excess of what was obtained from subscriptions, rents, and investments unless the Representative Body had given full approval. The point had been reached in their financial position when it would be very difficult to maintain the day-to-day activities, and would certainly be impossible to embark on new activities at present income rates, from which he excluded fortuitous gains from the *Journal* and *Family Doctor*, which should be regarded as windfalls and placed to reserve. He emphasized that the motion was intended to be in no way critical of any member of the staff, all of whom carried a tremendous burden of work.

Over the past ten years, he pointed out, there had been established the International and Commonwealth Medical Bureaux costing about £7,000 annually; each year membership of the World Medical Association cost £7,000; the Public Relations Department £14,000, subsistence allowances to members of the R.B., Council, and committees about £7,000 to £8,000; there was the non-recurring item of £20,000 for the Edinburgh Meeting; goodwill visits had been paid to overseas Branches and European countries, which undoubtedly did tremendous and intangible good to the Association; *Abstracts of World Medicine* had been published at a loss of about £14,000 a year, which was a contribution to medicine by the Association and was more than met by the profits made on other journals.

If the present membership was maintained and overseas members were no longer subsidized, he thought that by exercising due economies they could carry on effectively at the present subscription rate. Economies were always unpopular and difficult to suggest, but he tentatively suggested that no new subcommittees or committees be appointed unless absolutely necessary, for they consumed a great deal of Association money, in both the use of clerical staff and the payment of railway fares. It might also be suggested to committee chairmen that for the next year or two they should do what was done when the Association was in financial straits before, and cut down the number of committee meetings. Also, unless the cost of living continued to rise dramatically, he thought the present wage and salary level might be stabilized. The object of the motion, he continued, was not to cut out any of the present activities, but to achieve retrenchment in new activities. To reject the motion and thus give approval to embarking on new projects would, he asserted, necessitate a substantial rise in subscription.

Dr. D. H. ANDERSON (Sheffield), on a point of order, said that Dr. Grant had referred to new activities of the Association, but the motion spoke of "retrenchment in the activities," which presumably meant the present activities. The CHAIRMAN said he had thought of pulling up Dr. Grant on that, but he assumed that Representatives would realize on what they were voting. They would vote on the actual words of the motion.

Message from Sir Arthur Porritt

At this point the SECRETARY announced that a telegram had been received from Sir Arthur Porritt asking that his sincere thanks be conveyed to the Representative Body for the honour they had done him by electing him President for 1960-1.

Deputy Chairman of Representative Body for 1958-9

The SECRETARY also announced that Dr. A. Talbot Rogers had been re-elected Deputy Chairman of the Representative Body for 1958-9.

The Meeting then adjourned for half an hour for tea.

FINANCE (continued)

Dr. O. C. CARTER (Bournemouth) contended that the Association should be able to live within its income, but complained that no document had been submitted showing how the money would be spent and what would be received. The Treasurer said that the income for 1957 was £8,000 more than for 1956, but in paragraph 131 of the Report of Council reference was made to a difference of £18,000. In 1952, when an increase in the subscription had been authorized, an amendment had been carried instructing the Council to consider the possibility of bringing down the subscription rate within two years, but there now seemed no question of its coming down, and it might go up considerably. The income in 1957 was £78,000 more than it had been in 1952, and yet it was said that the Association could not live within it. If a document were submitted setting out the detailed position it might be possible to find some activities which, though desirable, were not strictly necessary. The Treasurer had said that to present a detailed account of income and expenditure would necessitate a great deal of work, but such a document had been before the Finance Committee and the Council, so it was difficult to see what extra work would be involved in sending it to every Division and printing it in the *Journal*.

Dr. E. C. DAWSON (Council) asked the Meeting to reject the motion, in view of its wording. The motion asked for retrenchment in the activities of the Association, and this would compel the Council to reduce its activities and would mean that no new expenditure could be undertaken; yet the question of intraprofessional relationships, with which the Representative Body had already dealt, might mean a great deal of expense, and a crisis lay ahead which might entail spending a great deal of money. The wording of the motion meant that it would be a great embarrassment to the Council.

Dr. R. B. L. RIDGE (Enfield and Potters Bar) asked the Representative Body to reject the Glasgow motion. The meeting had already been given one definition of retrenchment, and he would give another. It was retirement to prepared positions in accordance with a plan—the old story in the communiqué for retreat. The coming year might well prove to be the most momentous in the history of the medical profession in modern times. Was that the time to retreat? Was that the time to think in terms of limiting the expenditure of the Association?

Dr. WAND said he understood that the Glasgow motion was submitted with the object of asking the Representative Body to determine at once whether it felt that the Association should cut its coat according to its cloth, or carry out all the activities which it was asked to do. That was a fair question to put to the Representative Body, and a clear-cut decision on the motion would indicate to Council which way the Representative Body wanted things to move financially. He reminded representatives that all the publications and property of the Association made a contribution towards the activities of the Association. He also reminded the meeting that from 1922 until 1950 the subscription was three guineas for home subscribers. If one added to that the betterment which was appropriate it would be found that the present subscription should not be six guineas but something nearer eight guineas. That allowed only for the

change in the value of money. Yet since that time new regional offices had been opened for the convenience of members, and the Association had done a number of things to which no reference had been made. But, above all, since that time the Association had been involved in a national health service, and that had produced an infinity of problems. In many cases those problems were new and difficult and involved time spent by committees and legal advice.

Even overseas there had been so many changes and suggested changes that it had been necessary for the Association to spend more money than hitherto. If there were retrenchment, it was necessary for the Representative Body to decide whether it retrenched on present spending or future spending. It had been decided that a Review Committee should be set up. It would cost money. Agreement had also been reached in general principle that intraprofessional relationships should be improved. That would cost even more money. What, in the end, did retrenchment mean? asked Dr. Wand. If the subscription went up by four guineas, to the general practitioner it was equivalent to a family of four removing from his list. "I ask this Representative Body whether it is prepared to jeopardize its future simply because each practitioner is involved in a loss of income equal to that of one family of four," he concluded.

Dr. ALEX SMITH (Lanarkshire) wished to correct a misapprehension that Dr. Grant might have created. The Central Consultants and Specialists Committee (Scotland) paid its own expenses and was able to send a contribution to the central fund. That was done because the money was deducted at source. Dr. J. S. McLAREN ORD (Glasgow) said it was unnecessary to make heavy weather of the motion. All it pointed out was that members were faced with an inevitable rise in their annual subscriptions, and, that being so, they should take stock of what was being done and find out if anything could be done to lessen expenditure. "If we continue to spend as we are doing, so, with a small rise in the cost of living, will our expenditure rise and our annual subscription," he said, "and the time has arrived to look to what we are doing and find out if we are spending wisely, knowing that we are the custodians of the purse of the B.M.A."

Dr. J. E. MILLER (Glasgow) said that what concerned him at the present time was not so much a question of retrenchment as that an increase in subscription might cause a marked reduction in the membership of the Association. Those who had the interest of the profession at heart might not object to an increase of three or four guineas, but there were many members who under the slight provocation of such an increase might leave the Association and thus reduce its strength at a time when it needed every possible support. No one liked to retrench if it could be avoided, but there were many who believed that an increase in subscriptions might be the worse of the two evils.

Mr. CALLANDER said that many economies had been effected during the year, but they were lost in the accounts because other expenses had come along and swallowed them up. If the Association was to maintain its position members must be prepared for extra expenditure.

Dr. GRANT, in reply, said he was not making any fervent appeal to Representatives to pass the motion. What Glasgow particularly wanted was that there should be a clear-cut expression of opinion from the Representatives on whether they were willing to go back to their constituents and tell them what the financial situation of the Association was at present, and what would be its financial situation in the very near future.

The Glasgow motion calling for retrenchment in the activities of the Association was lost.

Dr. R. B. L. RIDGE (Enfield and Potters Bar) moved:

That this Meeting prefers an increase in the annual subscription of the Association to a budgetary deficit.

"How can the B.M.A. represent itself as the strong right arm of the medical profession when it is limping on the

border of an overdraft?" he asked. Those who read the story of the development of health services in other countries would find that in those where the profession was united—in particular, Australia and New Zealand—the medical profession had been able to dictate the type of health service which it thought would be in the best interests of the patients and would best preserve the traditions of the profession; in countries where disunity prevailed it had got nowhere. The only things that the ordinary member of the Association could do to promote the strength and unity in the profession were (1) to be loyal; (2) to pay his whack. When a time came such as that which now faced the profession they would be only too willing to pay more.

Dr. D. L. GULLICK (East Herts) commended the motion to the meeting as being no more than Micawber's advice stated in other terms—if the income did not increase by 6d. over the expenditure, result: misery! The budget deficiency was due purely and simply to inflation. The value of the £1 was half what it had been in 1939, when the subscription had been three guineas. It had thus only doubled; no one could complain if it trebled in the course of the next year or two. Dr. W. E. DORNAN (Sheffield) said that about two months ago Council had, by a very narrow majority, decided not to recommend to the R.B. this year that the subscription should be raised, but he believed that there was not one member of Council who did not believe that it would have to go up within the next twelve months or two years. He wished that Council had in fact recommended one.

Dr. C. P. WALLACE (Guildford) asked the R.B. to reject the motion without hesitation, on the grounds that it was untimely. Dr. H. FIDLER (Bradford), appealing to the R.B. to be "logical," said that in the last two or three years a pay claim had been put in for a considerable percentage increase in doctors' pay owing to the altered value of money; the expenses of the Association had risen during that period for the very same reason. Mr. CALLANDER said that the subject had been well debated and he proposed to leave the motion to the wisdom of the R.B.

The Enfield and Potters Bar motion was carried.

A motion by the Treasurer for adoption of a Council Recommendation that, pending a general review of membership subscription rates, there should be a surcharge of one guinea for overseas members, was by leave withdrawn in order to allow for further consideration.

Mr. CALLANDER moved the adoption of the following Council Recommendation:

That the Council be authorized to adjust the concessional rate of £4 4s. paid by certain members in the light of any tax relief that may be allowed to members assessed under Schedule E as a result of the Finance Act, 1958;

and to make the necessary amendment to By-law 16 (1).

An amendment by Dr. WRATHALL ROWE (Harrow) to the proposed amendment to the By-law, which it was argued would avoid future unnecessary alterations of the By-law, was lost.

The Recommendation was adopted.

Motions by Derby, Trowbridge, and Sunderland were, by leave, withdrawn.

Dr. H. B. DODWELL (Consett (with Hexham)) moved:

That, except in the cases of the newly qualified and members retired or of over 40 years' membership, all members shall pay an annual subscription at least adequate to cover the cost to the Association of providing them with their weekly copy of the *British Medical Journal*.

He pointed out that, based on the Treasurer's report to the Council of March 16, the cost of sending the *Journal* to overseas members, namely £3 15s. per annum, was barely covered by their subscriptions.

Mr. CALLANDER pointed out that overseas subscriptions were not being discussed at the Meeting, and that he had himself only a few minutes earlier withdrawn a motion on this subject.

The motion was lost.

Subscription Rates for Newly Qualified

Dr. R. P. HENDRY (Rugby (with South Warwickshire)) moved: "That this Meeting considers the subscription payable by a member for the first 13 months after qualification should be half a guinea." The newly qualified should be encouraged to join the Association at the moment of their triumph over the examiners and should be given a warm welcome to what was probably the most altruistic organization in the world. The actual membership as a proportion of the possible had fallen by 1% in the past year, and since 1951 by 6%, the decline being mainly in the entry of the newly qualified.

Dr. H. G. DOWLER (Gloucestershire), opposing the motion, said that the Organization Committee was working hard to get the newly qualified to join, and subscription rates were constantly discussed. He believed that they had the best possible arrangement at the moment.

The motion was lost.

Husband and Wife Combined Subscriptions

Dr. T. B. ANDERSON (Cambridge and Huntingdon) moved that where a combined subscription for husband and wife was paid to the Association only one *Journal* should be sent.

The TREASURER pointed out that the Association was required by the By-laws to send a *Journal* to each member, as it was the only way of communicating domestic matters to members. But when a husband and wife asked for only one *Journal* between them their request was met. Miss GLADYS M. SANDES (Marylebone) thought that a single *Journal* for husband and wife would not be satisfactory, but if they were being subsidized as a result of their concessional subscription rates they should be told so and asked to make up the difference.

The motion was lost.

The remainder of the Annual and Supplementary Reports of Council under "Finance" was approved.

Subsistence Allowances

Dr. C. HARROWER (Glasgow) moved what she felt would be the most unpopular proposal to come before the Meeting—namely, that in view of the financial position of the Association, subsistence allowances be discontinued. Subsistence for the Representative Body, she said, cost about £4,000, and the total cost of subsistence allowances to the Association, excluding the General Medical Services Committee and the Conference, was about £8,000 a year. She thought it was their public duty to do without subsistence allowance. It was said that more young people had been able to attend the A.R.M. since subsistence was paid, but the older one became the younger other people looked, and what prevented young people from coming was not lack of money but lack of time.

Dr. M. R. SHERIDAN (North Middlesex), opposing the motion, said it was the best possible representatives of Divisions who should attend the A.R.M., and not simply those who could afford to come. Dr. ERIC TOWNSEND (Cornwall), taking the same view, said: "If you want a mediocre Representative Body and Council, pass the motion and save your miserable £7,000." Dr. A. H. GRANT (Trowbridge), on the other hand, said his Division wanted the subsistence allowance withdrawn and felt that Divisions should support their representatives if there was hardship.

Dr. AVIS M. BLUNDELL JONES (Exeter) opposed most strongly, she said, four-fifths of the motion, but supported equally strongly the remaining one-fifth; in other words, the A.R.M. lasted five days and she felt that no subsistence should be paid for the Sunday. That would show that doctors wished to be paid only for an honest day's work.

The motion was lost.

Repair of Books

Dr. R. M. S. MCCONAGHEY (Torquay) moved that, notwithstanding the need for stringent economy, the Council should consider the advisability of setting aside annually

the sum of £150 for the repair of valuable and historic books in the possession of the Association, and supported his plea by producing three volumes from the Library which showed the state which some of the older books had reached. At the suggestion of the TREASURER it was decided to refer the motion to the Science Committee.

The Meeting then adjourned until the following day.

THIRD DAY

Saturday, July 12

The Meeting resumed at 10 a.m., with Dr. A. BEAUCHAMP in the Chair.

MEDICAL FILMS

Moving the reception of the Annual Report of Council under this head, Dr. R. P. LISTON (Chairman of the Film Committee) said that during the past year the number of applications for film showings had increased. Unfortunately, he added, the necessary financial backing had not been obtained for making a film on industrial rehabilitation. The Report was received and adopted.

MEDICAL ETHICS

Dr. S. NOY SCOTT (Chairman of the Central Ethical Committee) moved the reception of the Annual and Supplementary Reports of Council under this head, and the Revised Rules of the Committee. He prefaced his remarks by paying tribute to Dr. Robert Forbes, former Chairman of the Committee, for his long service, who, he said, was absent from the Meeting for the first time in 28 years.

There had, he continued, been prolonged correspondence with the Ministry on the question of professional secrecy about cancer registration. As it was felt that a too strong insistence on that one issue might result in psychological harm to patients, to whom their paramount duty lay, the Council had given way, while reaffirming the principle and making clear it was an exceptional case. Clarifying the powers of the Central Ethical Committee *vis-à-vis* the Council had been, he said, a complicated task. To summarize the revised rules, the Council was made the final arbiter in cases of expulsion, but the Committee was left to investigate the case and establish the facts, which must be accepted. Anyone whose expulsion was recommended could produce evidence or other matter in mitigation to the Council.

CONTRACTUAL VALIDITY OF G.P. SPENS REPORT

Scottish Case

At the request of the Chairman, the Meeting agreed to vary the order of the agenda so that a statement by the Chairman of Council might be interposed.

The CHAIRMAN OF COUNCIL (Dr. S. Wand) then made a statement informing the Meeting that the Secretary of State for Scotland had been asked to give his consent to the presentation of a special case to the Scottish Court of Session raising the question of the contractual validity of the G.P. Spens Report. Dr. Wand's statement setting out the matter in detail is printed in full at page 80.

Dr. Wand told the Meeting that he had sent a letter to the Minister of Health and to the Chairman of the Royal Commission informing them of the action that had been taken. The matter had been laid before the Secretary of State for Scotland, who now held the letter from the Association's solicitors.

MEDICAL ETHICS (continued)

Dr. F. GRAY (St. Pancras) moved that the statement approved by Council, as set out in the resolution in paragraph 108 of the Annual Report, be amended by the omission of the first three lines and the substitution of:

That general practitioners and dentists should, wherever possible, avoid sharing the same premises for professional purposes. The Council, recognizing that such sharing may, in certain circumstances, be unavoidable or even desirable. . . .

Last year's general statement, with which all had been in agreement, had been rather rigid and the Representative Body had asked the Council to safeguard the position of those in exceptional cases. The new statement, as printed, did not appear to set out the main principle. The decisions of the Representative Body on ethical matters, set out in cold print, were of the utmost value for reference and advice for doctors in doubtful cases. During the last month embarrassment had been caused in three cases in London alone through the absence of a statement of policy to which to refer until the Representative Body had taken a decision.

Dr. NOY SCOTT said that he would be willing and happy to accept Dr. Gray's text, which expressed exactly what the Committee had had in mind but in better terms.

The new text was agreed to.

Professional Secrecy

Dr. R. P. HENDRY (Rugby (with South Warwickshire)) moved that minute 281 of the A.R.M., 1952, on the subject of professional secrecy, which provided that a practitioner must refrain from "disclosing voluntarily without the consent of the patient (save with statutory sanction) to any third party information which he has learnt in his professional relationship with the patient," be amended by inserting after the words "statutory sanction" the words "or for approved medical research, such as cancer registration." He asked the leave of the Meeting to omit the words "approved medical research, such as," but this was refused.

The proposal, he said, would nominally involve a change of policy, but it meant no change in what was in fact done; it simply regularized the position. Cancer-registration schemes had the support of all doctors, and information should be given for the purpose; but information must not be divulged without the consent of the patient, and some doctors on some occasions might not want to tell a patient that he had cancer.

Dr. H. GLYN JONES (Bromley) said that the Central Ethical Committee had decided that cancer research was a special matter where disclosure might reasonably take place, but had made it clear that this was to be regarded as an exception and not a precedent. The motion would make it a precedent and not an exception, and he urged the Meeting to reject it. Dr. J. S. McLAREN ORD (Glasgow) said that cancer was generally diagnosed in hospital. In Glasgow the names of the patients were registered at the hospitals which they attended, and they kept in touch with that hospital for many years. He opposed the motion. Dr. A. R. FRENCH (Marylebone) maintained that it could safely be left to the conscience of every doctor to deal with each case in the interests of his patient, and there was no need for rigid rules. Dr. S. NOY SCOTT (Chairman of the Central Ethical Committee) agreed with previous speakers and urged the rejection of the motion. Dr. HENDRY, replying, asked whether it was contrary to the ethical code to give information on cancer, or were they to say one thing and do another? He suggested that the motion be referred to Council. (Loud cries of dissent.)

The motion was lost.

Dr. R. M. WARREN (Southampton) moved:

That the Annual Representative Meeting instructs Council to re-examine the disclosure of information to the appropriate medical authority when a doctor is aware of a disability in a public service official which in his opinion may endanger life.

While fully appreciating that professional secrecy was of fundamental importance in the doctor-patient relationship, he said that his Division recognized a wider sphere of responsibility towards the general public, such as already obtained in the notification of infectious diseases. Every year the lives of millions of people using public transport were in the hands of airline pilots, engine drivers, bus-drivers, guards, and signalmen, yet, he pointed out, permission to disclose an illness rendering any one of these unfit to continue work had been persistently denied. In a recent investigation by Dr. E. C. Dawson, he went on, 84% of a representative cross-section of doctors had been in

favour of notifying the responsible authority of a driver with epilepsy.

Dr. A. M. MAIDEN (Lincoln) pointed out that in Dublin, in 1952, the Central Ethical Committee had made a similar recommendation, feeling that some relaxation of the rigid rule of professional secrecy might, under great safeguards, be considered. It was, he said, terrifying to think that one's own child might be the victim of an accident involving a car driven by an epileptic known to the doctor himself. "By giving the epileptic a motor-car," he added, "we have armed him in this modern world and made him lethal." He supported the motion, which he thought expressed the wish of the majority of the profession.

Dr. R. L. LUFFINGHAM (East Yorkshire), speaking as a doctor employed by a public authority, opposed the motion, which he said was nothing but a proposal to "pass the buck" because the general practitioner was either not efficient enough or not confident enough to deal with the matter himself. An engine driver suffering from epilepsy, he added, had not a hope of staying on the footplate for six months before his condition was brought to the attention of the management, his union, or his mates. Where was the danger when he had either a fireman with him or a "dead man's hand"? It had been said that a man suffering from coronary thrombosis should not drive a car, but, he said: "No person over 50 can expect to get into a car and be absolutely certain he won't drop dead as he drives down the street." But such accidents, he pointed out, happened only about once every six months. The prevention of epileptics driving cars was, he continued, a matter for legislation, and the Minister was at fault in not providing means of ensuring the proper filling up of the driving certificate application form.

Dr. E. C. DAWSON (Council) supported the motion, which he said would give the Committee an opportunity to study the question and produce a report next year. Dr. J. S. McLAREN ORD (Glasgow) argued that the motion would defeat its own object, because if it were accepted any public service employee knowing he had a disqualifying disability would carry on working untreated rather than risk being unemployed. From a long experience of post-mortem examinations in accident cases he could not say that the maintenance of professional secrecy had contributed materially to the cause of fatalities. Dr. NOY SCOTT hoped that the motion would be accepted in order that the problem could be re-examined and reported on next year.

The motion by Southampton was carried.

Rules Governing Procedure in Ethical Matters

Dr. NOY SCOTT moved the adoption of the recommendation that the Revised Rules of the Central Ethical Committee be approved, and in amplification of his former remarks pointed out that provision was made that a practitioner intending to make a complaint against another must inform him of his intention in writing.

A proposed amendment by Lincoln was, by leave, withdrawn.

The Recommendation was adopted.

On the motion of Dr. NOY SCOTT, a Recommendation that a consequential amendment of Rule 7 of the Revised Rules governing procedure in ethical matters was adopted, as was a Recommendation that all Divisions and Branches be urged to adopt the revised wording of Rule 7 before December 31, 1958, after which date the Association would accept no responsibility for any ethical proceedings by a Branch or Division otherwise than in strict accordance with the new wording of Rule 7.

Mr. H. H. LANGSTON (Winchester) moved, as a reference to Council:

That in view of the alterations in the Branches of the Association whereby there will be fewer but larger Branches, this meeting of the Representative Body requests Council to take steps to amend Rule 11 of the Ethical Rules relating to a Branch so that the number of elected members to a Branch ethical committee be increased from seven to nine.

He said the motion concerned matters which were before the Constitution Committee in considering a revised Branch structure, and it would appear probable that some modification of the structure of the local ethical committees would be necessary in the light of recommendations coming up. Upon Dr. NOY SCOTT's acceptance, the motion was carried as a reference to Council.

Remainder of Report under "Medical Ethics"

Dr. DORIS ODLUM (Bournemouth) expressed satisfaction that the Council had deplored the practice of members of the ambulance service on certain occasions reporting to the police cases of attempted suicide when the ambulance had been summoned by the doctor actually in charge of the case, such information being given without the doctor's consent. This was a violation of professional secrecy which, in the present state of the law, might well lead to the patient being taken to court and possibly even sent to prison. The practice of making such disclosures was not universal; it depended entirely on the attitude of the local authority.

Dr. C. P. WALLACE (Guildford) said he had read the report with interest but profound disquiet. Things in the outside world had been moving during the past year; the Association, as represented by its Ethical Committee, had stood still, wasting and dissipating its energies on pettifogging matters. Yesterday the R.B. had wisely decided not to pass any resolution which would interfere with cancer education, yet the Association still intimidated and prevented learned members of the profession from giving information to the public, so that it reached the public behind the screen of anonymity. He could see nothing unethical, immoral, or improper in a well-known and highly respected surgeon addressing the public on cancer; yet, according to the Ethical Rules of the Association, that would be out of order. He then paid a tribute to the excellent chairmanship of Dr. Forbes; his absence was noted with profound regret and doubtless all would wish to send him their best wishes for his speedy recovery.

Dr. NOY SCOTT said that one of the items on the agenda of the next Central Ethical Committee's meeting was to reconsider anonymity in television.

The remainder of the report under "Medical Ethics" was approved.

HOSPITAL AND CONSULTANT SERVICES

Mr. T. HOLMES SELLORS (Council), moving the reception of the report of Council under "Hospital and Consultant Services," said that the most important matter considered during the year by the C.C. & S. Committee and the Joint Consultants Committee had been hospital staffing, mixed up with which was the problem of the time-expired senior registrar and that of the S.H.M.O. The hard core of the time-expired senior registrar occurred mainly in general medicine and general surgery. There were estimated to be between 100 and 110 in each specialty who could not be employed as consultants, although in nearly every case they were fully equipped for consultant work. It was felt that there should be a survey of hospital establishments to find out where in the country there was a deficiency of consultants. That should not be difficult to achieve if it could be done from the periphery, whereby each hospital group would examine its own establishment without fear, let, or hindrance or any parochial feelings, to decide whether or not they were adequately staffed; the findings could then be collected and sent to the Ministry for examination. But the Ministry had persistently refused to accept that principle. It had been hoped that while the review was going on the Ministry might consider giving some of the time-expired registrars a limited period of security of tenure, so that they would not be open to risk of dismissal, and also, very rightly, give them a salary increase. That, too, had been refused.

Finally, the Joint Committee had met the Minister, who said that he was under considerable Parliamentary pressure to find a solution to the problem. But he would not accept

the Association's views and had imposed his own attempted solution, which was to create a special type of post to be determined by regional hospital boards when they felt that there was a vacancy for a man doing such advanced work.

The Central Consultants and Specialists Committee and the Joint Committee had rejected that idea completely as being mere stalling for political expediency. It was impossible to establish such posts until there had been a review to find out where the vacancies existed. The effect would be that the bulge would still exist. The only suggestion of the Ministry which had been accepted as providing a loophole to continue negotiations was the formation of a working party which had as its terms of reference to study the whole of hospital staffing. It was hoped that its meetings would be very frequent and that a wide geographical survey would be carried out, every branch of the country being studied, and that particular attention would be paid to the problem of the time-expired senior registrar and the S.H.M.O. Whether an accurate and successful solution could be achieved remained to be seen, but he could not imagine that a report from such a working party could be produced in less than 12 months.

The Management Side of Whitley Committee B had agreed to consider the cases of S.H.M.O.s doing consultant work of the sort that, when the post was vacated, would require a consultant replacement, and the Staff Side had perhaps been a little optimistic in hoping that this would lead to the possibility of a salary increase. The cases of about 500 S.H.M.O.s had been selected as suitable for placing before the Management Side for discussion. There was, however, the disconcerting feature that it appeared that the Management Side had had no idea that the problem was so extensive, and they had quickly reverted to their original terms—that they would look at such cases and see what the nature and size of the problem was but would not commit themselves. That was as far as the matter could be taken at the present moment. However, consideration of the problem would continue independently of the working party being in action.

With regard to distinction awards, the Chairman of the advisory committee had admitted that the system was not perfect, and had said that if a better one could be suggested he would be happy to examine it. It was the general view that the system was open to criticism, but that at the moment there was no better one, so that it should be allowed to continue. One alternative considered was payment for responsibility, but that should be rejected, as it bore no relation to merit but rather to increasing years.

A number of practitioners had through no fault of their own been relieved of a substantial part of their sessional employment. They had been through the procedure of appeals, but there remained the "moral obligation" clause, and the Minister agreed that there was a moral obligation to find those concerned equal employment. A great number of practitioners had been placed in equivalent employment, but there remained a hard core of a few people who were out of employment and had no access to the Health Service. Two days ago Mr. Holmes Sellors had met the Minister to discuss these cases. The Minister had studied all the cases and agreed that the moral obligation clause existed; he said that his officials were prepared to discuss each case again in detail to see whether or not everything had been done to fulfil the clause, and, if it had not, to see what could be done.

Constitution of C.C.&S. Committee

To the Recommendation of the Council on this subject the Meeting agreed, on the motion of Dr. D. H. ANDERSON (Sheffield), that the following addendum, which Mr. Holmes Sellors accepted, should be added: "these representatives not to be eligible to represent the Central Consultants and Specialists Committee on the Joint Consultants Committee."

Mr. HOLMES SELLORS accordingly moved the adoption of the Recommendation in the following form:

That the constitution of the Central Consultants and Specialists Committee be amended to provide: (1) That the Chairman of

the Joint Consultants Committee be invited to serve as an ex officio member of the Central Consultants and Specialists Committee. (2) That each of the three Royal Colleges in England be invited to appoint a representative on the Central Consultants and Specialists Committee, these representatives not to be eligible to represent the Central Consultants Committee on the Joint Consultants Committee.

Dr. ALEXANDER SMITH (Lanarkshire), as Chairman of the Central Consultants and Specialists Committee of Scotland, moved as an amendment that (2) be amended to read:

That each of the six Royal Colleges and the Royal Medical Corporations in England and Scotland be invited to appoint a representative on the Consultants and Specialists Committee.

They had had in Scotland for a long time, he said, representatives of the Colleges and Royal Corporations on the Scottish Committee, and it meant that the Committee represented the whole of the consultants' profession. Mr. HOLMES SELLORS said that if any matters of Scottish interest were before the Committee they would welcome the addition of Scottish Corporation and College representatives.

The amendment was carried, and the motion, so amended, adopted.

A motion on the same subject by South-west Essex was, by leave, withdrawn.

Hospital Medical Staffing

Dr. C. VIPONT BROWN (Manchester) moved that Council should continue to press for an improved consultant service. They were all aware, he said, of the frustrations of hospital junior staffs and of the difficulties of senior registrars in obtaining consultants' posts. One aspect of this problem was of particular concern to the general practitioner. It was the aim that out-patients' departments should be regarded as consultative clinics, but in many cases the patients were not seen by consultants. Of 13 cases that he had sent for an opinion, six had been seen by consultants, five by a senior registrar, and two by lecturers. It was not suggested that these other members of hospital staffs were not well qualified to give an opinion, but they had been doing work of consultant status, and this emphasized the need for the creation of more consultants' posts.

Mr. J. T. RICE EDWARDS (Council) mentioned that an alteration in the terms of service of a consultant and a S.H.M.O. in Chepstow had arisen as a result of a diminution in the incidence of tuberculosis, and had been made without reference to local committees. It was felt that their services could have been retained by redesignating the hospital as one for general chest diseases. There should be full local consultation in such cases. Mr. HOLMES SELLORS said his Committee would be happy to see the motion carried. They wanted to see the consultant service expanded to its full limit and maximum efficiency.

The motion was carried.

Dr. H. A. WALKER (South-west Essex) moved that the Meeting welcomes the report concerning the staffing of hospitals and asks for the review of hospital medical staffing as a matter of urgency with particular reference to grades other than consultants. Dr. V. COTTON CORNWALL (Liverpool) opposed the motion on the ground that the working party had been set up to review the whole position. Mr. HOLMES SELLORS agreed that the working party had a comprehensive remit, but said that the particular concern of his Committee had been with grades below that of consultants.

The motion was carried.

Mr. R. BREARLEY (Liverpool) moved:

That this Meeting urges the working party in conducting its review of hospital staffing needs to give careful consideration to the present inequalities in the provision of beds and consultant sessions per head of population in various regions, the delays in securing out-patient consultations and the regular holding of out-patient clinics by junior staff; it further urges the working party during its investigations to visit each region and to interview the local representatives of the general practitioners, consultants, and junior hospital staffs.

The appointment of the working party was, he emphasized, of crucial importance, and their report would set the future

pattern of hospital planning for at least a generation to come.

Dr. W. D. GRAY (Liverpool) asked for the insertion of "S.H.M.O.s" after "consultants" in the last line of the motion; this was accepted by the mover, and the motion, so amended, was carried. Further motions on the subject of hospital medical staffing appeared on the Agenda in the names of Birmingham and Liverpool, and the CHAIRMAN announced that their sponsors had agreed on a single motion, which took the form of an amended version of that submitted by Birmingham and read:

That this Representative Body deplores the decision of the Minister of Health to create designated senior registrar posts before the recommendation of the Working Party on Hospital Medical Staffing has been made.

Dr. N. K. SHINTON (Birmingham), proposing the amended motion, said that the Hospital Junior Staffs Group Committee did not like these designated posts or the manner in which they had been set up by unilateral decision. They did not like the posts, because they were not applicable to all senior registrars, and because there had been no prior discussion with the profession on the level of remuneration and no provision for the future of the occupants of the posts. They would not solve the problem of too many fully trained candidates for too few consultant vacancies. Dr. ALEXANDER SMITH (Lanarkshire) supported the motion. The Minister's proposal, he said, would create a new sub-S.H.M.O. grade. His committee in Scotland had passed a resolution in much the same terms. Mr. H. H. LANGSTON (Winchester) asked whether the Hospital Junior Staffs Group Committee would be prepared to advise its members in no circumstances to apply for these new posts. That would show the Minister that he must not introduce posts not agreed with the profession beforehand. (Applause.)

Mr. R. BREARLEY replied that he could give only a personal answer, but he would be prepared to advise such a course of action, and he believed his Executive Committee would endorse it.

Mr. A. LAWRENCE ABEL (Marylebone) suggested that the Meeting should instruct the *Journal* not to accept advertisements for these positions. The CHAIRMAN took the view that the Meeting could not do so directly, but could instruct the Council to do it. The CHAIRMAN OF COUNCIL (Dr. Wand) said the Meeting could determine a policy on advertising of the kind in question and the Council would be bound to endorse it.

Mr. G. E. MOLONEY (Oxford) said that the volume of work done by general practitioners and specialists had greatly increased owing to advances in science. They had not let the public down. In the National Health Service, however, the remuneration of the consultant surgeon for a serious operation and for looking after the patient before and afterwards was about £5. The anaesthetist received about one-third of this. A senior registrar, who might have undergone training for twenty years since entering his medical course, received about £2 for an operation, and could earn more by signing cremation certificates. The answer was to have more consultants and not more overworked and underpaid lower grades.

The CHAIRMAN said he had received from Mr. Lawrence Abel, duly seconded, a proposal to add the words "and that the Council be instructed to refuse advertisements for these posts."

Mr. LAWRENCE ABEL moved this addendum.

Mr. HOLMES SELLORS observed that this matter had been raised rather suddenly, and the opinions of senior registrars were not fully known. To adopt the addendum might not be fair to some senior registrars, whose financial position was unsatisfactory. He would prefer the addendum to be accepted as a reference to Council.

The motion was carried, and the addendum, with the assent of Mr. Lawrence Abel, was accepted as a reference to Council.

Mr. R. BREARLEY (Liverpool) moved:

That this Meeting endorses the principle of filling retirement vacancies in the consultant grade of the N.H.S. some time (ideally

two years) before they occur, whenever suitably trained candidates are available. Besides freeing a number of senior registrars from the uncertainty and insecurity this would enable them, should they so desire, to widen their experience by taking short-term appointments in posts outside the confines of the present training grades.

He pointed out that the principle involved was not new, being followed in most industries and some nationalized industries. Indeed, he understood in the region in which the Meeting was being held it was applied and worked satisfactorily. Under the present promotion system men were frightened to lose their place in the queue by taking short-term appointments overseas, where there was a shortage of fully trained specialists, particularly in the Colonies and some Dominions.

An amendment, duly seconded, to omit the words "(ideally two years)" and to delete all the words after "occur" was moved by Mr. A. LAWRENCE ABEL (Marylebone). He said that they could not know in advance what would be the ideal period for any particular hospital; he believed there would always be suitably trained candidates available; and he regarded the last sentence purely as a talking point. Mr. Brearley had indicated, he added, that he would accept the amendment. Addressing himself to the principle, Mr. Abel said it was well known that young men would not risk going outside the four walls of their hospitals for fear of being overlooked when an appointment became vacant, and he maintained that a system under which no young man could with an easy mind study elsewhere would mean that those in the consultant service in Great Britain would eventually run the risk of being less well trained than those in many places throughout the Commonwealth. He pointed out that many young men coming to this country for postgraduate study from Australia, New Zealand, and elsewhere had the promise of a job on their return home.

The amendment was carried.

Professor D. E. C. MEKIE (Council), addressing himself to the substantive motion, said that the Overseas Committee heartily endorsed the motion. Dr. J. D. LLEWELLYN-JONES (Malaya) also strongly supported the motion, as one who had left the "queue" and saw no hope of getting back. There were, he said, many places in the Commonwealth where there was a shortage of specialists, and which, although they could not offer careers, would willingly accept qualified men from the U.K. on a short-term basis. He said that as members of an Association with Branches in all parts of the Commonwealth they should foster interchange. Acceptance of the principle enunciated in the motion would enable suitably qualified specialists to go overseas and give the people there the benefit of their services and assistance in training local doctors.

Dr. S. WAND said that those at university level found that such an arrangement would be by no means impossible. Doctors and others who had been overseas had expressed the opinion that unless something of the sort suggested were done many other countries would turn elsewhere for medical help. He commended the proposal as well worth trying, at all events on an experimental scale, and said that a pilot survey could easily be devised. Dr. W. WOOLLEY (Council) pointed out that an important section of the community who would benefit from such an arrangement would be the patients who experienced long delay in getting hospital outpatient appointments because of the delay in filling consultant staff vacancies.

Mr. HOLMES SELLORS said the Ministry's objections were, first, that legislation would be required because a vacancy would be made before it actually occurred, but he did not doubt that could be got over easily. Secondly, and more important, the Ministry pointed out that in specialties such as radiology and anaesthetics, which in this country were understaffed, the profession might not be prepared to deprive itself of the services of senior registrars for the necessary time. The Ministry further said that, so far as they were aware, there was in the Colonies at the moment only one vacant post in general medicine, two in obstetrics,

and none in general surgery, though there was a very large demand in some of the super-specialties. They also objected that in appointing a man one, two, or more years before he joined a hospital staff the appointing body would not know they were choosing the best man. He concluded by saying he thought there was a great deal in the proposal if adopted in principle, provided it was not made compulsory throughout the country.

Replying to the Ministry's objections, Mr. BREARLEY said that it was palpably untrue to say legislation was required, because, as he had already pointed out, such a scheme was already in operation without legislation. There was first-hand testimony to make it seem highly dubious whether the statement that there were insufficient vacancies in the Colonies was correct and whether the information on this point was exhaustive. Finally, the argument about not choosing the best man was one of crying over spilt milk, which could be applied whenever any appointment was made.

The motion by Liverpool, as amended, was carried.

Senior Hospital Medical Officers

A motion by Dartford calling for the rectification of anomalies and injustices in connexion with remuneration was, by leave, withdrawn.

Professor P. C. P. CLOAKE (Birmingham) moved:

That this Representative Body is gravely concerned with the situation referred to in para. 57 of the Annual Report of Council relating to S.H.M.O.s in consultant posts. It urges that action be speedily taken so that S.H.M.O.s whose level of work and responsibility in their present posts can be shown to be of consultant standard may be paid as consultants.

In October, 1956, he said, the Management Side of Whitley Committee B agreed to consider cases in which it could be shown that the present level of work and responsibility of S.H.M.O.s was of consultant standard, and reviewing committees had selected over 500 candidates of this standard. The dimensions of the problem thus revealed had shocked the Management Side. In order to bring the problem into manageable proportions, a joint subcommittee with terms of reference was agreed upon after considerable haggling. The subcommittee had been selected as long ago as January, but nothing had been done since. It would seem that the Management Side were rather anxious to shelve their responsibility if they could, and he suggested that the motion would inject stimulus into their proceedings.

Dr. W. D. GRAY (Liverpool and S.H.M.O.s Group), supporting the motion, said his Group was disturbed at the delay in beginning the review of the position of S.H.M.O.s doing consultants' work. Year after year the R.B. had solved that these doctors should be paid as consultants and year after year had asked for such a review. He had nothing but praise for the way the review had been dealt with by the Association's Secretariat and the negotiators on the Staff Side of the Whitley Council, but after nearly two years S.H.M.O.s were impatient. Some of those who had had the best chance of being upgraded had given up hope and had gone abroad.

Dr. K. C. BAILEY (West Somerset) said his Division had put forward a motion each year on behalf of the S.H.M.O.s, believing that they had been very unfairly treated, not only by the Minister but by the profession, and particularly by the consultants. Dr. Guy Dain had warned the profession about the S.H.M.O. grade when it had first been proposed in 1946; shortly afterwards the profession had been amazed when the Minister had broadened it to include not only full-time hospital doctors but others working in different specialties. When the grade had been discussed in his own locality there had been much opposition to it. He was pleased that the Central Consultants and Specialists Committee had changed its view and now fully supported S.H.M.O.s. No indication had ever been given them as to the qualifications or experience required to enable them to qualify for consultant status.

Mr. S. F. LOGAN DAHNE (Council) said that of the original 1,000 S.H.M.O.s who had deemed themselves to be doing consultants' work all had been supported unanimously by their respective medical advisory committees, unanimously in practically every case by their area medical staff committees, and in many cases also unanimously supported by their own area management committees—all being bodies who knew their work, their quality, and their responsibilities. Of that 1,000, 500 had been deemed by those investigating their claims in fact to be doing consultants' work. There was thus a substantial measure of inequity. Then, at that late stage, the Management Side of Whitley Committee B had deliberately backed down on its original undertaking, and this had amounted to a callous, calculated delaying action and was nothing less than a breach of faith. Dr. H. W. DONOVAN (Birmingham) said that that had happened since a very similar action had been perpetrated upon the whole profession last year. He hoped that that would act as an incentive to the R.B. in unanimously carrying the motion. Mr. J. R. NICHOLSON-LAILEY (West Somerset) said it had been an education to members of the C.C.&S. Committee to go through the claims that had been put forward by the many S.H.M.O.s who were suffering such injustice. The trouble lay in the Staff Side's difficulty in trying to persuade the Management Side of the justice of their case.

Professor P. C. P. CLOAKE (Birmingham), replying to the debate, said that the Association had again and again asked the Ministry to review the position of S.H.M.O.s and their grading, and to have, if possible, a central committee to reconsider their grading. Time and time again that had been refused and cases had had to be put up. There were S.H.M.O.s occupying consultants' posts which were definitely assigned as such yet were continuing to be paid and to work as S.H.M.O.s; others, graded as consultants, were working in S.H.M.O. posts and were still paid at S.H.M.O. rates. It had therefore been felt that there was some ground for putting the case forward to the Whitley Committee. There had also been an appeal to the Industrial Court in which the position had been expounded, and some perturbation had been felt by the Management Side because the court had been quite obviously amazed that the situation existed. If it were possible to get consultants' pay for some of those S.H.M.O.s who undoubtedly deserved it, it would certainly not be possible to get consultants' grading for them. It was better to have one of the two than nothing. The Birmingham motion was carried.

Starting Salaries of Consultants and S.H.M.O.s

Mr. R. BREARLEY (Liverpool) moved, as an amendment to para. 58 of the report of Council:

That this Meeting notes with satisfaction that the two sides of Whitley Committee B have agreed to make a submission to the Minister urging that hospital boards should be reminded of their power to increase the starting salary of newly appointed consultants or S.H.M.O.s in certain circumstances, but considers that, owing to the completely changed age pattern of promotion which has come about since this purely permissive provision was first suggested by the Spens Committee, it is desirable that it should now be replaced by a new regulation requiring the automatic crediting of one year's consultant or S.H.M.O. seniority for every year in excess of four spent in the senior registrar grade.

When the Spens Committee had drawn up its report it had pointed out that the pattern of earnings of consultants prior to the N.H.S. had been one in which the income was at a very low level for a considerable period, followed by an income at a much higher level for a short period later in life. It had been the Spens Committee's intention that the situation should be smoothed out to some extent while keeping the whole life earnings at a reasonable level. As a result of the delays which had since occurred the average age of appointment to consultant posts in the major specialties was now about 38, instead of 32 as envisaged by Spens. This meant a loss of six years' earnings at the top figure, normally amounting to over £11,000.

Mr. HOLMES SELLORS asked that the amendment be treated as a reference to Council. The discretion which

boards were entitled to exercise had been brought to their notice very recently by the Ministry, and in more than one case it had been used in favour of the candidate at a much higher level than that which the amendment suggested should be the regular one. Mr. BREARLEY said he assumed that the Council had already considered the matter, as the proposal was contained in the document of evidence to the Royal Commission which had been approved by Council. While he was pleased to hear that the discretion was sometimes more favourably exercised than the amendment suggested, there were many others where it was exercised much less generously than the provisions allowed. It was better to have a cut-and-dried regulation than to continue with a permissive clause.

The motion was carried.

Board-and-Lodging Charges

Dr. R. DERHAM (Liverpool) moved to amend para. 59 of the annual report of Council (dealing with board-and-lodging charges) by the words:

This Meeting deplores the continuing delay in implementing the proposals of Whitley Committee B and urges that the reductions be back dated.

He said that in some cases board-and-lodging charges were in excess of the actual cost, as had been confirmed by regional boards; thus they had been overcharged since 1956 in some cases. The Management Side had agreed to the payment of abatements of £75 to £80 per annum where overcharges had been made, but that agreement had been made last winter and still no abatements had been paid.

Mr. HOLMES SELLORS said he regretted the delay as much as anyone. If any person felt that he had been overcharged he could apply individually to his employing authority for the abatement.

The motion was carried.

Distinction Awards

Dr. C. P. WALLACE (Guildford) moved to deplore the action of Council in rejecting, on the grounds that publication of merit awards would not benefit either the service or the community, the 1957 A.R.M. motion, referred to the Council for consideration, urging that in any revision of the publicly administered medical services there should be no secrecy about any special payments made for merit or other grants. He did not think it was necessary to apologize for bringing the matter up again. The Council seemed unaware of the fact that the present method of award was unacceptable to the profession and contrary to public policy. In any matter affecting medical politics the members of the R.B. had a duty to perform as citizens. He did not feel that the C.C. & S. Committee could approach the matter with that lack of bias it demanded. He realized that the consultants were a bit fearful lest the publication of merit awards should result in an improper use of them and therefore appear to be unethical, but there was no secrecy when a member of the medical profession received a knighthood, baronetcy, or peerage; the whole country knew about it.

ELECTION OF COUNCIL MEMBERS

At this point the SECRETARY announced the following elections to the Council: A. Lawrence Abel, H. Guy Dain, W. E. Dornan, I. D. Grant, F. Gray, E. A. Gregg, H. H. Langston, W. N. Leak, J. S. Noble, A. Dickson Wright.

HOSPITAL AND CONSULTANT SERVICES (continued)

Distinction Awards (continued)

Mr. H. H. LANGSTON (Winchester) asked the R.B. to reject the amendment. In reply to the criticism that the C.C. & S. Committee would have a bias and therefore could not consider the question dispassionately, he said he had never heard it suggested that the G.M.S. Committee or the Public Health Committee could not consider their

remuneration dispassionately and reach proper decisions. The C.C. & S. Committee had on more than one occasion considered the matter and had always supported the view that it was better that merit awards should remain confidential, as at present. He asked representatives to consider what really would happen if merit awards were publicized. Would they welcome a situation where, in a medical directory, somebody was down as an orthopaedic surgeon, Grade B, or psychiatrist, Grade Nothing, and what would be the effect of that on the individual consultants or what advantage would it be to the patients? The Chairman of the Merit Awards Committee had come to the Committee a year ago and explained the whole method of working of his committee and, after a very full and frank discussion, that method had been accepted unanimously. Surely that Committee really had the right to express a view on the way in which consultants received their remuneration and the conditions which governed its receipt. They wished the method to continue as at present. Dr. ALEXANDER SMITH (Lanarkshire) said that they were well satisfied in Scotland, after exhaustive inquiries, that the system operated satisfactorily and equitably and that publicity at this stage would be very wrong.

Dr. H. GLYN JONES (Bromley) said there was some doubt about the consultants' opinions on the matter. In the hospital service at large there was a great deal of dissatisfaction both with the whole system and especially with the secrecy with which it operated. Surely if there were within a State service people of such ability that they merited very special awards, surely, above everything else, they should be known to the general practitioners—the people who would refer cases to them. Dr. J. C. KNOX (Tyneside) said the debate was an exact repetition of last year's debate on the same subject. The R.B. had had no doubt about its decision last year, and the only thing that had occurred meanwhile was that the C.C. & S. Committee had persuaded the Council not to follow the R.B.'s wishes. The consultants in his Division felt quite as strongly about the secrecy as did the general practitioners.

Mr. J. R. NICHOLSON-LAILEY (Council) contended that many of the previous speakers had discussed not secrecy but the general principles of the merit award system. If there was to be a system of this kind, it was possible to carry it out only in the way in which this was being done at present. It would be grossly unfair to pillory those who had not received such an award, because many of them were more deserving than those who had. General practitioners knew perfectly well to whom they wanted to send their patients, and knew better than any merit award committee who were the bad consultants. Mr. HOLMES SELLORS remarked that the year after year this question had been raised. At the start of the Service a form of publicity had been considered, but it had been realized that this would be impracticable. The general practitioner was well able to select the consultant appropriate to his needs. After Lord Moran had explained the position to the C.C. & S. Committee, there had been a unanimous vote to maintain the present procedure. They might not be entirely satisfied with the method, but could find no better way of administering it.

Dr. C. P. WALLACE (Guildford), replying to the discussion, said that they must put out of their minds the envy, wrath, and malice which were often introduced when this problem was discussed. It could not be in the public interest that public money should be disposed of at the instance of secret committees to secret people. If a secret ballot were taken of specialists and consultants on the method of making these awards, it would be overwhelmingly thrown out. Dr. E. C. WARNER (Marylebone) asked whether any decision contrary to that accepted by the Central Consultants and Specialists Committee would be liable to cause a split between consultants and the rest of the profession. Mr. HOLMES SELLORS replied that for several years running the decision of the Committee had been to maintain the present system, even though it included secrecy.

On a vote being taken by show of hands, the Guildford amendment was carried by 96 votes to 91.

The CHAIRMAN, replying to a suggestion that a count should be taken of those who had abstained, said that the Standing Orders did not call for this unless there was a roll-call or card vote.

Dr. G. M. WODDIS (Nottinghamshire) moved that the Annual Representative Meeting noted with surprise the figures quoted by the Minister of Health on March 31 concerning the percentage distribution of merit awards to consultants in general medicine, general surgery, and psychiatry. In the light of those disclosures, the motion asked the Meeting to request that Council obtained the percentage distribution for all specialties and as between part-time and whole-time consultants, and took such action as was necessary to rectify any inequity. The figures referred to showed that out of 822 consultants in general medicine, 57% were in receipt of awards; out of 863 consultants in general surgery, 53% were in receipt of awards; and out of 614 consultant psychiatrists, only 14%. It might be claimed that there were few psychiatrists of distinction, concluded Dr. Woddis, but it could not be claimed that as a body they were so lacking in merit. His Branch was concerned about the deductions which could be made from those figures.

Dr. K. C. BAILEY (Somerset, West) said that psychiatry had come into its own in recent years, and efforts were being made to improve the recruitment into that service. Therefore more encouragement should be given. Mr. J. T. RICE EDWARDS (Council) said that the motion made no reference to the percentage distribution of merit awards between teaching and non-teaching hospitals. There was considerable dissatisfaction in the Welsh area about that. So far as merit awards were concerned, it seemed that a good gimmick was far more valuable than years of conscientious service to the patient, and he asked therefore for the inclusion of regional consultants in any investigation which arose out of the motion.

Mr. HOLMES SELLORS, in reply, pointed out that psychiatry was a specialty which had expanded very rapidly since the inception of the Service, and it might be that a larger number of younger and perhaps less experienced entrants into that branch had occurred proportionately with other branches with which it was compared. His Committee would be prepared to accept the motion as a reference to Council.

The motion was carried as a reference to Council.

An amendment asking that immediate representation should be made for all domiciliary consultations, irrespective of the number involved, to carry the normal fee, was moved on behalf of Southampton by Dr. R. M. WARREN.

He said that it applied mainly to consultant physicians. The labourer was worthy of his hire and the consultant should be paid for the work which he did. There might be some embarrassment to the general practitioner when a consultant had reached the allotted number, which made him reluctant to call the consultant in when he knew that it would carry no fee. The risk was that the patient might be deprived of the opinion which he would desire to have. Dr. W. S. L. GILCHRIST (Bromley) said it appeared from the Sixth Report of the Select Committee on Estimates that the average number of domiciliary visits per specialist in the South-eastern Metropolitan Region worked out at 31.9 per annum. The concession whereby a whole-timer was paid for visits after doing 32 free was absolutely valueless. It was one of the most futile concessions which had ever been negotiated.

Mr. HOLMES SELLORS replied that the matter was at the present time being reviewed, and the points made by the mover had already been incorporated in the Royal Commission evidence. The only point which had not been incorporated was the request for the ceiling to be waived altogether. Domiciliary consultations had been singled out in the Select Committee on Estimates for considerable criticism. There was no doubt that they had been of the greatest value, and it was equally certain that there had been a certain amount of "greyness" concerning the way in which domiciliary visits had been worked.

The amendment was carried as a reference to Council.

Mr. R. BREARLEY (Liverpool) moved by way of amendment that, notwithstanding the decision of the Industrial Court concerning mileage allowances payable to hospital staff, further energetic action should be taken forthwith to secure a special loading for small mileage claims. Those particularly hit were junior members of hospital staffs, because they were full-time. Mr. Brearley pointed out that if a man had a 10 h.p. car and covered a mileage of 5,000 in a year, he received £139 8s. 11d. If he covered a mileage of 500 during the year, he would receive £16 2s. 11d. To cover road tax, insurance, depreciation in value, interest on capital, and garage took well over £100; therefore, if the use of a car were necessary for the Health Service, it meant that the owner who travelled only 500 miles a year subsidized the Service to the extent of £84 per annum.

At the suggestion of Mr. J. R. NICHOLSON-LAILEY (Council) Liverpool asked that the matter should be passed as a reference to Council, and this was agreed to.

Treatment and Rehabilitation of the Chronic Sick

Miss GLADYS M. SANDES (Marylebone) moved:

That this Meeting calls the attention of the Minister, the Ministry, and local authorities to the increasingly great number of chronic sick, especially amongst (a) the aged and (b) the handicapped sections of the populace, particularly young people, and stresses the urgent need for development of all facilities available for their care and welfare.

Referring particularly to young people with congenital defects who were treated in hospitals where they had special schooling and were taught a trade, she pointed out that it was very difficult to place them between the ages of 16, when they were supposed to be turned out, and 18, when they had to be. The local authorities had permissive powers to support them; they were not mandatory. Were more publicity given to this problem, voluntary societies, such as the Cheshire Homes and Shaftesbury Homes, would probably be prepared to do even more than they had done if local authorities would, where necessary, pay for what was after all only hostel accommodation.

Mr. HOLMES SELLORS said that a letter from the Ministry, following a deputation at the end of May, expressed no major disagreement on the geriatric problem, and he thought there would be a great deal of co-operation.

The motion was carried.

Dr. A. ELLIOTT (Stratford) moved:

That this Annual Representative Meeting welcomes the action of Council in bringing to the attention of the Minister the serious position of the treatment and rehabilitation of the chronic sick; and instructs the Council at its meeting with the Minister to press the urgent implementation of the recommendations in the Report of the Geriatric Joint Subcommittee; at the same time bring to the attention of the Ministry the serious position of the mentally infirm who do not require admission to mental hospitals.

He hoped the Meeting would reaffirm that doctors accepted the moral right of old people, as of everybody else who needed it, to medical attention. The Minister was not, he thought, implementing the recommendations of the Geriatric Joint Subcommittee quickly enough, and unless something further was done quickly there would not be sufficient money available, much of which had to go through local authorities, who were having other demands made on them. The Royal Commission Report on Mental Health in 1954, he added, showed that one-fifth of those admitted to mental hospitals in that year were over 65.

Dr. JOAN CHAPPELL (North Middlesex) moved as an amendment to delete the words "to press the urgent implementation of the recommendations in the Report of the Geriatric Joint Subcommittee," substituting the words "to request him to press local health authorities and regional hospital boards to implement the recommendations of the Geriatric Joint Subcommittee as a matter of urgency." North Middlesex was sure that the obstruction was at regional board and public health authority level, and she thought the motion would be strengthened by naming those authorities.

Mr. T. HOLMES SELLORS said the Ministry explained that hospital authorities and local authorities had no power to share the financial responsibility for particular patients or persons in need of care.

Dr. K. C. BAILEY (West Somerset) agreed that the problem of treating old people would not be undertaken satisfactorily unless there was co-ordination between regional hospital boards and local authorities. It was imperative, he said, that the appointment of a geriatrician should be a joint appointment between the regional hospital board and the local authority, and that the local authority should provide more Part III accommodation. Many elderly patients who showed mental symptoms were often admitted to mental hospitals, those being the only places they could get into, and he thought that was quite contrary to the spirit of the National Health Service. Many of such people could be cared for in Part III accommodation if it were available, and if there was supervision at night time.

The CHAIRMAN OF COUNCIL said it might be thought that the Council had done nothing about this, but in fact they were being instructed to do the very things which they had already done. Evidence had been given to the Royal Commission on Mental Illness, and one of the recommendations of that Commission had been in the sense of the suggestion now made. After the deputation which went to the Ministry a few weeks ago, when every point made that afternoon, and many others, had been made, a letter had been received from the Ministry in which it was stated that there was no major disagreement between the views of the Department and those expressed by the Association.

The mover of the motion accepted the amendment, and the motion, so amended, was carried.

Internal Administration of Hospitals

Dr. V. COTTON CORNWALL (Liverpool) moved that, with reference to paragraph 66 of the Annual Report of Council, the Meeting reaffirm its decision of 1956 and 1957 that it was opposed to equal tripartite administration of hospitals and welcomed the statement of the Central Consultants and Specialists Committee that it was quite firm in its policy that in no hospital should there be any interference by lay administrators in clinical or nursing matters.

Professor P. C. P. CLOAKE (Birmingham) said that the system condemned by the amendment was that by which some of the best and largest hospitals in the country were administered. When it did not work it was because there was encroachment on the medical or nursing sides by lay administrators, and therefore not equal tripartite administration.

The amendment was carried.

Dr. LENA W. WILLIAMS (Hampstead) moved that, with reference to paragraph 66 of the Annual Report of Council, hospital administration should be in the hands of medical superintendents. Hampstead, she said, was well served by hospitals, and there was ample opportunity to make comparisons between those run by medical superintendents and those not so fortunate. Such posts would provide for members of the profession who had to retire from the Services in their early fifties, and for general practitioners who wanted a less arduous way of making a living. Dr. COTTON CORNWALL said the amendment was so vague that the Representative Body would not want to pass it, but would also not want to give the impression that it was opposed to medical superintendency as such. He suggested, therefore, that it should be referred to Council for consideration.

Both the mover and the Meeting agreed that the amendment should be treated as a reference to Council.

Dr. K. C. BAILEY (Somerset, West) maintained that the whole question of the internal administration of hospitals and the position of medical superintendents needed reviewing. Those who were medical superintendents, particularly in special hospitals, took this view. The Council might set up a committee on which would be represented the Medical Superintendents Society and other interested bodies. Mr. H. H. LANGSTON (Winchester) invited the Meeting to

reject the amendment, even as a reference to Council. He did not see what the Council could do about it. Was it suggested that every hospital in the country should be in the hands of a medical superintendent? For most hospitals the best scheme was a hospital medical committee or medical advisory committee which, through its chairman, could advise the hospital management committee on administration as it affected medical matters. Dr. G. S. R. LITTLE (Greenwich and Deptford), supporting the amendment, said the medical profession had lost the initiative in hospital administration to lay people, perhaps because doctors had not equipped themselves for the work. He hoped that means would be found to equip medical men to act as administrators.

Dr. H. GLYN JONES (Bromley) said that they had rejected the idea of interference by lay administrators in the treatment of patients, but once medical superintendents were appointed it meant accepting the principle of administrative interference in the treatment of patients. He doubted whether there had ever been a hospital with a medical superintendent in which there had not been administrative interference with the staff of the hospital in their relations with patients. (*Cries of dissent.*) The medical superintendent was an outgrowth of the old Poor Law. Dr. H. G. H. RICHARDS (Central Consultants and Specialists Committee), opposing the amendment, said that in his hospital they had a most satisfactory arrangement whereby the medical advisory committee was permitted by the management committee to send its chairman and secretary as non-voting observers to attend all management committee meetings, and the management committee referred to them on all important medical matters. This worked better than having a medical superintendent.

Dr. C. P. WALLACE (Guildford), who also opposed the amendment, contended that the glories of British medicine had been bound up with the work of the old voluntary hospitals, which had been done without "medical bosses." He would sooner share the responsibility for the administration of a hospital on a great many matters with lay people than put in a boss called a medical superintendent. Army methods were thoroughly unsuited to civil administration.

Dr. ALEXANDER SMITH (Lanarkshire) said that Scotland had always had medical superintendents, even in voluntary hospitals, and the entire consultant body in Scotland was in favour of medical superintendents of the Scottish type. Mr. HOLMES SELLORS said that in this country there were many types of structure, and to attempt to enforce uniformity by putting in a medical superintendent would be a most retrograde step.

The amendment was carried as a reference to Council.

Child Guidance

A motion by Manchester supporting the Council in the views it had expressed and the action it had taken in the matter of child guidance was formally moved and agreed to without debate.

Shortage of Medical Auxiliaries

Dr. J. B. S. MORGAN (Derby (with Derbyshire, West)) moved:

That this Meeting expresses profound concern in the difficulties experienced by hospitals in many areas in retaining the services of senior physiotherapists and radiographers, and requests the Council to examine the situation and take appropriate steps in an endeavour to rectify the situation.

Some senior radiographers and physiotherapists, he said, had been attracted to posts in the United States and Canada or in industry.

The motion was carried.

Dr. W. H. N. ANGUS (Southampton) moved:

That the A.R.M. considers that all student radiographers and other auxiliaries be paid according to the Ministry circular letter of 1957 and not only those in specific training schools, and instructs Council to make appropriate representations.

The Ministry, he said, divided training schools into three categories: (1) established schools where no grant had been paid, but where, if recruitment dropped below 75%, application could be made for permission to make grants; (2) established schools where grants were at present being made, and which could continue to make grants; and (3) new schools, which could pay grants subject to the prior consent of the Ministry. This meant that schools where grants were not at present being paid were at a disadvantage. Student radiographers were necessary for the efficient working of their departments.

The motion was carried.

Medical Membership of Hospital Authorities

Dr. K. D. WOOLAS (Portsmouth) moved that the Representative Body reaffirm Minute 240 of A.R.M., 1957, and urge Council to make further attempts to implement the purpose of this resolution. (A reference to Minute 243 of A.R.M., 1957, which appeared in the motion as printed was deleted by leave of the Meeting.) The purpose of the resolution, he said, was to secure greater medical representation on regional hospital boards and hospital management committees. Of the fourteen regional hospital boards in England, four had less than 25% medical membership. It would seem that anybody, provided he had not a medical qualification, was considered eligible—a doctor's wife, but not the doctor himself. A doctor who had been associated with hospitals in his group for twenty years had been replaced by someone who had rarely been in a hospital in his life.

Mr. HOLMES SELLORS, in reply, said that during the past year six medical members had been lost from regional hospital boards, and now, out of the 14 boards for which there were figures, in 6 there was 25% or less medical representation. In only one was there more than 30%, and a few of the medical members of boards were more noted for political than medical activities. It was a distressing state of affairs and one on which the Ministry had been approached a number of times, but it had not yielded. He was happy to support the motion.

The motion was carried.

A motion standing in the name of Morpeth deploring the reduction in medical representatives on hospital boards was by leave withdrawn.

National Major Casualties Service

An amendment asking the Meeting to express dissatisfaction at the complacency of the Council regarding the National Major Casualties Service was moved by Dr. W. N. LEAK (Mid-Cheshire). It was known that much had been done in recent years to organize rescue work, he said, but apart from the Didcot disaster all major accidents had occurred in well-populated areas where help was readily available. It would be a different matter if a disaster occurred in some remote rural area far from hospital help. In such conditions careful planning beforehand might save lives, but so far general practitioners had not received any indication of such planning. After the Lewisham disaster there was, for the first time, an inquiry into the rescue arrangements. The opinion had been voiced that all that general practitioners needed was morphine and field dressings. Again, it was pointed out in correspondence in the *Journal* that dangers attached to the use of morphine, and that pethidine should be used; but it was known that morphine relieved fear as well as pain.

Dr. R. SMITH (Middlesex, South) said he strongly supported the amendment, speaking as a general practitioner living very near London Airport. Adjoining London Airport were the homes of half a million people who were subjected to the constant menace of disaster in the air. Arrangements for dealing with disasters at the airport itself were probably the best in the world, but what of the arrangements outside? The regional hospital boards had a plan for the London

Airport area, but it ignored almost completely the fact that on the spot there was already a mobile medical force of 200 general practitioners. None of them would know where to start if he found himself suddenly in an area of disaster. The Air Commandant of London Airport would be pleased to integrate all medical services into his most efficient but at present restricted plan. The risk increased all the time, and it was necessary to act at once.

Dr. R. LL. MEYRICK (Lewisham) asked the Meeting to reject the amendment. That might appear to be a somewhat callous attitude, but members would recall the major disaster last year in his area, and he could say without qualification that the arrangements made in that area worked with complete satisfaction. It had been suggested that the general practitioners could take a greater part in life-saving work. But general practitioners did take a part. They were first on the scene at Lewisham, and the hospital arrangements followed rapidly. It was a matter of only a few hours before all the casualties were cleared from the scene and were receiving treatment.

Dr. A. ELLIOTT (Stratford, London) said he was present at the Dagenham train disaster. It was a very foggy night and only a few doctors were able to get through. On arrival there was nobody in charge of the casualty operations. There were in fact two teams from different hospitals on the scene, neither of which knew of the presence of the other. He asked the Meeting to support the amendment. Dr. F. E. GOULD (Birmingham) said that in his view it would not be fair to pass an amendment which accused the Council of complacency in the matter. "If you are not satisfied with the arrangements in your own districts, then I think it is a matter for your local medical committees or local divisions to take it up with your regional hospital boards and get the arrangements made locally," he said.

Dr. LEAK replied that it was not a matter for local medical committees. It was something which the Government alone could do.

The amendment expressing dissatisfaction with the complacency of the Council regarding the National Major Casualties Service was lost.

General Practice for Consultants

Dr. E. C. WARNER (Marylebone) moved: "This Meeting considers that the arrangements for the hospital junior medical staff to obtain experience in general practice during their hospital employment should be left to the individual hospital." It was highly desirable, he said, that not only consultants in training should have experience in general practice, but that anybody who was to play a part in the medical life of the country should have that experience. It was not something which should be left to students or young postgraduates to decide. Arrangements should be made by hospitals, especially teaching hospitals and medical schools, to ensure that all those who were to practise medicine in this country should have a period of training in general practice.

Dr. R. M. S. MCCONAGHEY (Torquay) suggested that to obtain complete harmony in the profession it was necessary to ensure that all its branches understood each other's work. In order to achieve that, no better way could be devised than that each should serve a spell doing the work of the other. If a hospital management group could devise a pilot scheme for the co-operation of the general practitioners in its area, it would be found quite soon how easily that type of interchange of work could be arranged. Dr. G. S. R. LITTLE (Greenwich and Deptford) said it was not sufficient to leave it to the individual. A young doctor would not know the value of obtaining general practice experience. Dr. K. A. WOOD (Portsmouth) said there was no real way for the young man to gain general practice experience without jeopardizing his future. He asked the Meeting to consider the amendment as a reference to Council.

Dr. E. C. WARNER (Marylebone) said he was sure that the Council would keep the matter under continual observation; at the same time, he would like the R.B. to express a

firm opinion on the question in the terms of the Marylebone amendment.

The amendment was carried.

Dr. K. A. WOOD (Portsmouth) moved:

That this Representative Body, having considered the Council's report on Minute 285 of the A.R.M., 1957 [that consultants in training should be encouraged to spend a period in general practice during their training], instructs the Council to keep the matter under continuous review, as this Representative Body feels that the general principle embodied in Minute 285 is right.

The amendment was carried.

Dr. H. W. ASHWORTH (Manchester) moved:

That this Meeting is of the opinion that, when consultant appointments are made, experience of general practice should be considered to be an advantage.

"If you adopt this motion you can improve the National Health Service without the expenditure of one extra penny," he said. In days gone by the consultants climbed the ladder of general practice before they fell off to become specialists. (Laughter and applause.) Thanks to the College of General Practitioners, a start had been made by introducing students to general practice. Of course, passing resolutions in itself meant nothing; the secret of success lay in so raising the standard of general practice that in future consultants would be proud to say, "I, too, was once a general practitioner but there wasn't room for me at the top." (Laughter and applause.)

Mr. G. E. MOLONEY (Oxford) said that university students who had just been doing their two weeks' spell in general practice were delighted with it. It opened their eyes to what general practice meant and helped them to make up their minds perhaps a little earlier as to the branch of the profession that they wished to follow. But two weeks was far too short; there should be at least six months in general practice for everybody, just as it was the period for house officer posts in hospital. He would like the G.M.C. to grant its certificate of practice only when a student had completed a year in house officer posts, in order to gain experience of serious disease and its treatment, and at least six months in general practice, to gain experience of the care of sick people. There was no better way to unite a profession than by each member of it having practical experience of each other's work.

Mr. J. R. NICHOLSON-LAILEY (Council) said it seemed that there were so many considerations that the selection committees had to have in mind when making appointments that they tended to regard experience in general practice as a drawback. That attitude could be altered by passing the Manchester motion. He hoped it would be realized that prolonged experience in hospital resident posts was not altogether undesirable for the general practitioner.

The Manchester motion was carried.

Staff Side of Whitley Committee B

Dr. W. S. L. GILCHRIST (Bromley) moved:

That this Meeting wishes to ensure the continuous direct representation of all grades of hospital medical staff on the Staff Side of the Whitley B Medical Committee.

He said that 15 of the 17 members of the Whitley B Committee—which conducted negotiations on terms and conditions of service for all grades of hospital medical staff—were on the staffs of teaching hospitals, the remaining two being part-time consultants in private practice. Thus there was no whole-time consultant, no S.H.M.O., no registrar or lower grade. It would be admitted by all fair-minded persons that the negotiations had not been conducted very successfully. In the past the committee had not had very good consultation with the various grades of staff, but that position had improved of late, largely owing to the efforts of Mr. Holmes Sellors since he had become chairman.

Dr. N. K. SHINTON (Birmingham) reminded the R.B. of last year's decision which had recommended that in future Whitley Committee B should always consult or co-opt representatives of any group whose terms and conditions of

service were being negotiated. This, he said, remained a policy of the Hospital Junior Staffs Committee. Mr. HOLMES SELLORS said that when dealing with a body such as the Staff Side of Whitley Committee B it was impossible to include all the sectional interests in the profession. He assured the R.B., however, that the interests of individual sections were most carefully studied and that, wherever possible, members were co-opted on to special subcommittees and brought before the Management Side to state their own case. He thought it would be found that the majority of the sectional interests would admit that they had had a fair hearing of their problems.

On the motion of Mr. D. S. PRACY (Nuneaton and Tamworth), it was agreed to pass to next business.

Hospital Building

Dr. H. G. H. RICHARDS (Central Consultants and Specialists Committee) moved a motion standing in the name of Winchester:

That this Meeting strongly supports the view of the Central Consultants and Specialists Committee on the deficiencies of hospital buildings and instructs Council to press the Ministry to allocate substantially greater sums to capital development in relation to Hospital Services.

He said that not two completely new hospitals had been built since the National Health Service began. The substantial majority of provincial hospitals, which performed an ever-increasing proportion of the total hospital work, were outdated Victorian structures, expensive to run and shockingly wasteful of labour, so that the average cost per bed per week had reached excessive proportions. Dr. H. SCOTT-KERR (Gloucestershire) said that the Government's promise of a full medical service when it instituted the National Health Service had not been fulfilled; there were waiting-lists extending from three to 18 months, and occasionally two years.

The motion was carried.

A motion by Oxford, that Council be asked to promote and assist an inquiry into present hospital building and the requirements for the future, was carried.

Dr. E. A. GERRARD (Manchester) moved:

That this Representative Meeting deplores the fact that so little hospital building is being carried out and calls for the setting up of a Select Committee to review the provisions of the Welfare State and the relative distribution of the moneys spent thereon.

He said that present hospital waiting-lists constituted nothing less than a public scandal. In surgery, there were four people waiting for every London teaching hospital bed, and five for every such bed in the provinces. In gynaecology there were 29 patients waiting for every bed, although the position varied from hospital to hospital: at the Middlesex Hospital there were 16 women waiting per bed, at St. Cardiff 19, at Cambridge 21, and at his own hospital, St. Mary's, Manchester, 26. At his own hospital of just over 100 beds, in December last there was a waiting-list of 2,676, with the result that non-urgent cases had to wait three to four years before being admitted. For the Middlesex Hospital the comparable time was two years, for Cardiff three years, and for Cambridge three and a half years. "This," he added, "in a Health Service which is claimed to be the envy of the world. What complacency! What deception! What a scandal it all is!" Not a thing had been done to remedy this; there were no new hospital beds because the money allocated had to go on renovations, yet the building of new houses, flats, and offices, particularly Government offices and music-halls had gone on apace. This had happened, he asserted, because of the miscalculations at the inception of the Service, calculated to cost £200m. a year but now costing £760m. "Who," he asked, "are paying for these miscalculations now? Not the Beveridges. Not the Bevans. Not the planners at that time. Do they wait two or three years for an operation? Of course they don't. The people who are paying are the ordinary folk of our country. How patient and tolerant they are, otherwise heads

in high places would have fallen long ago." The regional boards and boards of governors, he continued, were doing their best, and he believed the Minister probably was hampered for money. Although this Welfare State was desperately short of money, was it fair, in days when flats were being subsidized up to £5 a week, when children were attending new modern schools, for mothers to have to wait three to four years before having a prolapse repaired? The matter should, he concluded, be dealt with at a high level, and the question of capital expenditure removed from the squalor and squabble of party politics.

The motion was carried.

Remuneration of Full-time University Medical Teachers and Research Workers

A motion by Hendon, welcoming the Report under this head and instructing the Council to take appropriate steps to ensure the adoption of its recommendations by the various employing bodies, was carried.

Remainder of Report under Hospital and Consultant Services

Mr. HOLMES SELLORS moved the approval of the remainder of the Report. Miss GLADYS M. SANDES (Marylebone) urged that when changes of hospital user were contemplated the position of the medical staff should be fully protected at the commencement of the negotiations.

The remainder of the Report was approved.

Membership of Hospital Management Committees

Dr. L. B. PALING (South Staffs) moved:

That no member of a hospital management committee should serve for more than six consecutive years. After such a period he should not be eligible for re-election for a further year.

He pointed out that unless there was some form of rotation a number of the official bodies and organizations would Minister could consult before making nominations would never get direct representation on the committees. Acceptance of the motion would, he said, ensure a flow of fresh ideas and new views. Mr. J. T. RICE EDWARDS (Council) opposed the motion on the ground that it would considerably weaken the strength of the medical membership of the committees. Dr. J. O. McDONAGH (Perth), speaking as vice-chairman of a hospital management committee and chairman of an executive council, said that because of such a rule he had lost excellent members from these bodies. It was not until someone had been a member for three years that he became useful. To have a greater turnover of members than that provided by ordinary retirements would put more power into the hands of permanent officials.

Mr. HOLMES SELLORS said that while the desire for new blood was a good principle, the six-year rule would cause a great deal of disorganization and inflict hardship on members of committees, who must have continuity.

The motion was lost.

Constitution of Hospital Group Medical Committees

The Meeting then carried an amended motion by Worcester and Bromsgrove:

That in the opinion of the Representative Body, all members of the senior medical staff of a group, whether whole-time or part-time, should constitute the Group Medical Committee, but when, on account of the size of a group staff, it is considered that this would be impracticable, then the Group Medical Committee should consist of elected representatives from the Consultants, S.H.M.O.s, and G.P.10Bs, plus in either case one member of the junior staff—a registrar or S.H.O.

Constitution of Regional Consultants Committee

The Meeting carried a further motion by Worcester and Bromsgrove:

That, in the opinion of the Representative Body, general practitioners on the staff of hospitals (G.P.10Bs) should have the right

to take part in the election of group consultant and S.H.M.O. representatives on the Regional Consultants and Specialists Committee.

Remuneration of Residents in Smaller Hospitals

Dr. J. G. R. CLARKE (South Bedfordshire) moved a motion standing in the name of Harrogate:

That the system of paying residents in smaller hospitals be reviewed with a view to offering them a larger salary than that paid to residents in teaching and major non-teaching hospitals in order to assist recruitment of staff.

There were, he said, great difficulties in getting residents for many peripheral hospitals which had been accentuated by the increase in the number of resident posts available. Harrogate suggested that the Ministry be asked to return to the pre-N.H.S. salary system, under which residents in the peripheral hospitals were paid a higher salary than those in larger hospitals, including teaching hospitals; the salaries at teaching hospitals would need to be in some ways nominal, as before the Act, the surplus being added to the salaries of those in less fortunately situated hospitals.

Mr. HOLMES SELLORS said there was power to increase the salaries of house officers by up to £50 with Ministry approval when the post could not be filled, but it had scarcely been used. He could not support the proposal if it meant reducing the salaries of some to increase the salaries of others, but added that if the power to pay the extra £50 could be invoked more frequently it was a very suitable proposal.

Dr. CLARKE said that the suggestion that nominal salaries should be paid in teaching hospitals was not being pressed. The motion was carried.

Restrictions on Hospital Expenditure

Dr. R. LL. MEYRICK (Lewisham) moved:

That this Meeting deplores the present restrictions on hospital expenditure as being detrimental to the best interests of medicine.

He pointed out that in one hospital, where over £100,000 had recently been spent on buildings, there were no funds to replace an outdated E.C.G. machine. In another, now replete with its new out-patients' buildings, there was no money to provide the doors with door stops, or to reduce the orthopaedic out-patient waiting-list time from seven weeks. Yet another, because of lack of beds, was unable to admit antenatal patients with complications during pregnancy, despite the fact that it had wards kept empty and unused for lack of the price of a pot of paint to redecorate them.

Mr. HOLMES SELLORS strongly endorsed Dr. Meyrick's remarks. In his own case, he said, in developing one particular branch of intracardiac surgery there were no funds available for the purchase of any new machinery; they had to depend on outside charity for things which ought to be regarded as obtainable out of ordinary working expenditure and development in the evolution of any hospital. In a number of cases the reduction of expenditure was even further retarding the progress of medicine.

The motion was carried.

Board Charges in Hospital

Dr. R. A. G. HAMILTON (Harrow) moved:

That in a reformed National Health Service patients should be required to make a payment for board in hospital according to their means.

He said that patients were called upon to pay various charges, and it was only reasonable that people in hospital should pay for their board, as they would have to do if under treatment at home. Dr. N. NELSON (Dundee City) opposed the motion, saying that it would mean those with known incomes paying through the nose, as they did for most things, while those with unknown incomes would get away scot-free as usual.

A motion that the Meeting pass to next business was duly seconded and carried.

Poliomyelitis Vaccine

Dr. J. B. S. MORGAN (Derby (with Derbyshire, West)) moved that poliomyelitis vaccine be made available for the staffs of general hospitals.

Since cases admitted to hospital in the early stages of poliomyelitis, when diagnosis was indefinite, were looked after by house-physicians and nursing staff in susceptible age groups, he thought they should be dealt with in precisely the same way as general practitioners and ambulance staffs and their families, for whom the vaccine was made available.

Dr. C. W. WALKER (Cambridge and Huntingdon) moved as an amendment the insertion of the words "and students" after "staffs," and this was agreed.

Dr. H. N. ROSE (Stratford) said that the Minister intended to make poliomyelitis vaccine available to the staffs of all hospitals and the families and residents in doctors' houses, and to extend the age group from 15 to 25. The motion was therefore probably unnecessary.

The motion, as amended, was carried.

Home Paediatric Treatment

Dr. L. J. STOLL (Hampstead) moved:

That this Meeting approves of the St. Mary's Hospital home-care paediatric scheme and recommends that this scheme be adopted on a national basis with the support of the Ministry of Health as part of the National Health scheme.

The scheme had been started, he said, when it had been found that nearly a quarter of the children in hospital had been admitted for conditions which could have been dealt with at home if facilities for home management and nursing had been available. Using endowment funds, St. Mary's had set out to discover (1) what conditions could be nursed at home under the care of the general practitioner, supported by a mobile team; (2) whether liaison between the paediatric staff of the hospital and the family doctor could thereby be improved; and (3) how the cost of in-patient treatment compared with that of home care. The team consisted of two paediatricians, a sister, two nurses, and a part-time physiotherapist. The area had a population of 75,000, with a high proportion of poor and overcrowded homes, and was one in which parents tended to take their children direct to hospital. In the first year 206 patients had been treated at home, and in the second 582. The number of family doctors participating was 114. The cost per patient per week with home care had been £4, compared with £26-£30 for in-patients. The scheme brought hospital facilities to the home and gave a new stimulus to team-work outside hospital walls.

Dr. W. WOOLLEY (Council) suggested that the motion should take the form of a reference to Council. The scheme described seemed to be an excellent one, but there were other excellent but rather different schemes elsewhere and the Meeting should not be asked to recommend the adoption of this one scheme as a national scheme. Dr. F. GRAY (St. Pancras) said that the scheme was a pilot one and had already achieved immense results. It would benefit the whole country, but it had to be paid for out of St. Mary's private funds; it would require legislation to make national funds available. That was the intention of the reference to a national basis. The Ministry knew what was going on but did nothing.

The motion was carried as a reference to Council.

Hospital Reports to General Practitioners

Dr. G. S. R. LITTLE (Greenwich and Deptford), with the leave of the Meeting, moved as a reference to Council the following motion which stood on the Agenda in the name of his Division:

That this Representative Body asks that approach be made to the Minister of Health requesting that all hospital reports to general practitioners should be on paper of a uniform size, suitable for filing in F.M.R. holders.

Mr. G. E. MOLONEY (Oxford), as a hospital doctor, supported the proposal but suggested that it should work both ways. If doctors could use a standard form when sending patients to hospital it would be of the greatest help.

The motion was carried as a reference to Council.

At this point Dr. Talbot Rogers took the Chair.

GENERAL MEDICAL SERVICES

Dr. A. B. DAVIES (Chairman, General Medical Services Committee) moved that the Annual and Supplementary Reports of Council under "General Medical Services" be received. In doing so, he said that a few weeks ago he had given a full account of the work of the G.M.S. Committee to the Conference of Local Medical Committees, which had been fully and accurately reported in the *Journal*, and at the present Meeting Dr. Wand had brought this up to date. The G.M.S. Committee had not completed all the tasks given it by the A.R.M. last year or solved all the problems, but the Royal Commission had had an impact on almost everything that it had done.

Dealing with the "full and final settlement," Dr. DAVIES said that by "final settlement" he meant the supplementary payment, because there could be no such thing as a "final settlement" until their claim had been met. On this occasion doctors were being paid capitations on numbers on their total lists which were greater than the total population of this country. When the totals were added together it would be found that in the past year they would have received the highest sum on record. In 1956 the final settlement was received in December. In 1957 it proved possible to bring it forward to September, and this year it had been received on June 30, which meant that six months of the backlog had already been caught up. The Committee had gone much further and had persuaded the Ministry to pay on account for the year 1957-8 the sum of £3m. next December. So that in this year practitioners would receive £7,600,000 in addition to the normal capitation and loading and other payments. The Representative Body approved in the previous year that some of the moneys, particularly the interim award, should be allocated where the shoe pinched most. Inducement payments came from outside the Pool, and an increase in the amount paid of about 10% had been achieved, and also a raising of the ceiling within which payments could be made. The trainee allowance received a 5% interim award, and apart from that an increase of £75 in the allowance was secured. In addition the motoring allowance had been raised from £150 to £200 a year. Although the Committee did not achieve all that it asked for, it did, nevertheless, obtain an increase in the locum allowance for refresher courses from 16 to 17 guineas and an 80% increase in the subsistence allowance.

The question of the discount on priority drugs for the rural practitioners was once again raised, and the Committee had achieved the price allowance of basic price less 20% in place of the former price less 33%. In addition many costly drugs had been added to the special list.

The CHAIRMAN recalled that the Representative Body agreed earlier to defer a motion by Portsmouth and one by Rugby (with South Warwickshire) until the presentation of the G.M.S. Committee's report. By agreement with those concerned, the Agenda Committee now presented the following composite motion:

That this Meeting wholeheartedly supports the Council in making continued efforts to secure a further interim increase in remuneration.

Dr. A. M. READ (Portsmouth) moved the composite motion. He said he did not suppose that there was anyone present who was surprised by the contents of the Minister's letter to Dr. Wand. "We have long since discovered that a gentleman's agreement with politicians is a contradiction in terms," he said, and he urged the Meeting to strengthen the hand of the Council by giving unanimous support to the motion.

Dr. WAND expressed the hope that the Meeting would pass the motion unanimously, and assured Representatives that Council would proceed as soon as it appeared to be the right moment, probably some time in September. Dr. R. P. HENDRY (Rugby (with South Warwickshire)) supported the motion.

The motion was carried *nem. con.*

Central Pool

Dr. A. G. HERON (Bristol) moved: "That the Representative Body requests Council to review the necessity for a change in this or any replanned Health Service in the working of the Central Pool, which is proving to be unjust and discouraging in its effects."

The Central Pool was a Gilbertian affair, he said, containing the elements of tragedy for the profession and comedy for the onlookers. In so far as the Minister could calculate, general practitioners as a whole could not earn any more, however hard they worked, or whatever extra jobs they undertook. There must be a change in the working of the Central Pool. It was levelling down and undermining practitioners' ability to earn their living.

Dr. DAVIES said that there was some misunderstanding about the motion. Was it an attack on the pool system, or a criticism of the distribution of the Pool? He would like to know which it was. Dr. HERON (Bristol) said that his Branch was not opposed to the Pool or to Spens, but as it stood at the present time it was absurd.

Dr. DAVIES said he had been assured that the motion was a criticism of the distribution within the Pool. If that were so, he took exception to the word "unjust." The G.M.S. Committee had always carried out the profession's wishes and had negotiated variations in the distribution of the Pool accordingly.

Dr. J. L. MCCALLUM (Westminster and Holborn) said that a confidence trick was being pulled on the profession by the Government. The Part III services commanded a 50% grant from the Exchequer, the other 50% coming from the rates; the Exchequer got back 100% from the Pool and pocketed the other 50%. Dr. WAND said it did not matter where the money came from, because Spens had said that a general practitioner should earn a certain average and the Danckwerts Award had been based on Spens. Since then the profession had not received the betterment that it felt it justly ought to have. "If you have a pool which allows for an average income for each practitioner, and if, as Mr. Justice Danckwerts determined, every practitioner who comes into the Service provides for the pool a certain amount of extra money to be divided, then we cannot have it both ways," he said. There had to be a distribution of moneys within a global sum. On the question of vaccination nobody had considered the possibility that by vaccinating more people possibly there would ultimately be less work for doctors to do. "On the whole, the pool has done us well," he said. "If you start making alterations you are likely to get into difficulties. Can you imagine a worse time to start altering something which has been useful and satisfactory than while the Royal Commission is deliberating? I can think of nothing worse or more foolish."

It was agreed to pass to the next business.

Schemes for Withdrawal from the N.H.S.

Dr. DAVIES, in a statement preceding the discussion of motions on the above subject, said that the G.M.S. Committee had appointed a special subcommittee which was studying possible schemes of alternative services. Expert advice was being sought and an impartial, non-medical expert of eminence had been engaged. The committee hoped to be in a position to report to the profession in good time before the Royal Commission reported.

Dr. R. L. LUFFINGHAM (East Yorkshire) moved:

That this Representative Body demands that a scheme be prepared for action to be taken in the event of the Government's

offer being unsatisfactory after the recommendations of the Royal Commission are made known.

His Branch had not been pleased to find the motion placed under the heading of "General Medical Services"; any action taken should be a matter for the whole profession, not just one branch of it. It was time that the Association faced hard political facts. The Royal Commission would not be prejudiced, whatever was said. If the report was favourable it would not be implemented; if unfavourable it would be used as an excuse by politicians to discard Spens. The profession had built up a consultation procedure second to none and had established the right to be heard, but implicit faith in the procedure was bound to fail when one side gave fair warning that it would only be used when it suited them. The motion was a call for action in a new form of direct political pressure. All the evidence showed that ministers and politicians were susceptible to political pressure properly applied. His Division believed that the Council should, as a matter of urgency, set up a small subcommittee to be convened in the name of the British Medical Guild. Its purpose would be to investigate the possibilities of action in the political field on lines which included lobbying techniques, methods of increasing the use and value of the present Parliamentary group, and the increased use of distributing information and propaganda to M.P.s and prospective M.P.s. It should report to the Council at the earliest possible moment. The Royal Commission was due to report on a specified date; informed opinion believed that that would coincide with a general election.

Dr. W. WOOLLEY (Bristol) said that most of Dr. Luffingham's suggestions were already being carried out by the Public Relations Committee. Dr. LUFFINGHAM replied that when facing a political fight the Association needed every possible weapon. No harm could result from overhauling the machinery.

The motion calling for a scheme of action to be prepared was carried.

A Harrow motion under the same heading was, by leave, withdrawn.

Dr. G. CORMACK (Newcastle upon Tyne) moved:

That the Representative Body instruct Council to investigate the method of strike action adopted recently by the doctors of Vienna, when they achieved their object in the matter of increased remuneration, yet ensured that the public received adequate medical attention.

The motion was not a direct proposal that the profession should proceed to strike action yet, but suggested that efforts should be made to find out how the Vienna strike had been successful. Such information might well be useful to the Association.

Dr. DAVIES said that the motion could only be interpreted as a reference to Council, which he would be perfectly willing to accept. Dr. G. S. R. LITTLE (Greenwich and Deptford) said that the R.B. should throw the motion out immediately. It should not consider or examine any question of strike action. Strikes were completely outmoded. The recent London bus strike of seven weeks had demonstrated that the public were not in sympathy with people who even talked about strikes. Dr. CORMACK said that any request to reject the motion wholeheartedly was rather prejudging the issue. The time might come when men and women would be driven to desperate measures, when it might be useful to have some idea of how a temporary withdrawal might be organized.

The motion was carried as a reference to Council.

Mileage

A Morpeth amendment on this subject was, by leave, withdrawn.

An East Norfolk motion urging that, in assessing mileage between an area which had no mileage and one which had a mileage grant, the city, borough, or urban district boundary should be the accepted start and finish for calculations was carried as a reference to Council.

Disciplinary Machinery

A City motion asking that no doctor should be required to reply to a complaint unless a breach of terms of service was specified was, by leave, withdrawn.

Dr. A. REZLER (City) moved:

That this Meeting resist the proposal that the Council on Tribunals should have power to supervise and make recommendations affecting the disciplinary bodies set up under the N.H.S., whose procedure has formerly been negotiated direct between the profession and the Ministry of Health.

He said his Branch had wondered how tough things could get. The disciplinary machinery of the N.H.S. resembled that of rent tribunals, agricultural committees, and the like.

Dr. H. GUY DAIN (Council) said that the Association did not wish its machinery to be interfered with, even by the new Council on Tribunals. That body had no power of action; it could recommend and advise different Ministries, and their various procedures and a number of different kinds of tribunal had been listed for their consideration. What consideration they would give them was not yet known, but the Association would certainly resist any attempt to increase the number of tribunals which might be affected.

The motion was carried.

Dr. W. F. JONES (Liverpool) moved that the Meeting record its opinion that a local medical committee, sitting without formal rules of procedure, was not a suitable body to recommend penalties for excessive prescribing. It was, he said, an established principle of British justice that an accused person should be given a fair hearing and the help of an experienced advocate. When a doctor was accused of excessive prescribing the charge was a debatable one to begin with; what was "excessive" in one sphere of medicine was not so regarded in another. The inquiry was conducted in an informal manner, which ruled out any legal procedure or opportunity of experienced help. If when it was held that a case had been made out the matter were remitted to a responsible body following a proper procedure he would be content, but as a result of the informal inquiry a doctor could be fined several hundred pounds. He did not question the right of the Ministry to investigate a case where there was alleged to be excessive prescribing, but there should be a proper trial.

Dr. F. GRAY (St. Pancras) pointed out that this was a professional matter, and they had secured that the investigation of it was entirely in the hands of professional men. The Ministry brought the case and the local medical committee was the judge. It did not as a rule permit lawyers on either side, and if allowed to the doctor the Ministry would also be entitled to legal representation. The local medical committee had two duties. The first was to say whether or not there had been excessive prescribing. If it found that there had not been, only an appeal to independent referees could upset that verdict. If it found that there had been, it had to estimate how much. That was a difficult task, but nobody else could do it. It was then for the executive council to say that something should be taken back from the doctor's remuneration. The local medical committee could also suggest considerations which should be taken into account, such as the youth and inexperience of the practitioner.

Dr. DAVIES supported what Dr. Gray had said and pointed out that on several occasions the Conference of Local Medical Committees had turned down a similar proposal.

Dr. JONES, in reply, said that if a large sum of money was to be taken from a practitioner it should be done only by strict legal procedure. There should be judgment by the man's peers, but they should only say that there was a case to answer.

The motion was lost.

Prescription Charges

In the absence of a representative of Tower Hamlets, the Chairman formally moved the motion standing in their

name, which asked the Meeting to reaffirm its opposition to charges for prescriptions and urge the Minister of Health to abolish them in the interests of economy and the avoidance of hardship.

The motion was carried.

General Practitioners and Hospital Administration

Dr. G. S. R. LITTLE (Greenwich and Deptford) moved that increased representation be given to general practitioners on hospital management committees. He wanted to see at least one general practitioner on each such committee. Dr. DAVIES agreed that the situation was very far from satisfactory and supported the motion. Dr. R. LL. MEYRICK (Lewisham) moved as an amendment the addition of the words "without detriment to present consultant representation." He pointed out that there were still many management committees on which there was no medical representation at all.

The amendment was carried, and the motion as amended agreed to.

General-practitioner Beds

The CHAIRMAN stated that the motions on this subject submitted by Manchester, Kingston-on-Thames, and Harrow had been grouped together and would be taken under the Manchester motion.

Dr. F. S. CATTO (Manchester) moved that the Council should continue to urge the need for more general-practitioner obstetric and medical beds. On behalf also of his colleagues of Kingston-on-Thames and Harrow, he said, he wished to contend that all general practitioners should have access to G.P. obstetric and medical beds in hospitals and specially staffed homes in which they could treat their own patients. Where necessary consultants could be called in for domiciliary consultations and paid as if the consultation took place in the patient's home. In the debate on the Health Service in the House of Lords, Lord Moran had advocated beds for selected G.P.s in the big hospitals, but every G.P. should have access to such beds; otherwise, who was to select them?

Dr. R. LL. MEYRICK (Lewisham) moved by way of amendment the deletion of the words "and medical." He said he did not wish in any circumstances to deny the need for medical beds for general practitioners, but the most important need was for G.P. maternity beds. Dr. L. F. KEENAN (Harrow) urged the Meeting to reject the amendment. "Let us ask for medical beds and get them if we can," he said. Dr. MEYRICK, in reply, stressed the need for general-practitioner obstetric beds, and asked the Representative Body to carry the amendment.

The amendment was lost.

Mr. E. N. CALLUM (Kingston-on-Thames) said that the way in which many doctors had to refer their more interesting cases to hospital or elsewhere, where they lost touch with them, was very discouraging to general practitioners and detrimental to the quality of their work.

Dr. DAVIES pointed out that it was already B.M.A. policy, and Dr. CATTO pressed for medical beds.

The motion was carried.

Dr. R. LL. MEYRICK (Lewisham) moved: "That this Meeting calls upon the Government to provide general-practitioner maternity units in all areas, as being the most satisfactory solution to the maternity problems of the country." In the London area, he said, except for one particular area, there was a constant overflow of mothers who were unable to book for a hospital confinement. He suggested that a 50% saving in the cost of running obstetric beds could be effected by the use of general-practitioner maternity units.

Dr. DAVIES said that the proposition was desirable as a long-term plan, but in the meantime it would be helpful to have more obstetric beds in existing hospitals rather than to wait too long for entirely new units.

The motion was carried.

A motion moved by Dr. J. C. ARTHUR (Gateshead) that the Ministry be pressed to implement its declared policy of providing general-practitioner maternity beds by allocating to regional boards earmarked grants for that purpose was carried.

The Meeting accepted as a reference to Council the following motion moved on behalf of Wandsworth by Dr. M. I. CORNICK: "That this meeting deplores the closure at the inception of the National Health Service of all general-practitioner obstetric beds in Wandsworth and other areas, and calls for their re-establishment in suitable hospitals or hospital annexes."

Dr. F. GRAY (St. Pancras) moved that attention be drawn to the waste of public funds in the use of specialized maternity beds for patients who needed hospital confinement only on social grounds. It was, he said, obvious to every member of the Representative Body, but unfortunately not to any member of the Ministry of Health.

The motion was carried.

An amendment by the City of Dundee calling for the abolition of the Trainee General Practitioner Scheme, and a motion by the City of Aberdeen calling for adequate attention to be paid to the remuneration of trainee assistants, were withdrawn.

Dr. W. N. LEAK (Mid-Cheshire) moved that durable, more suitable envelopes should be supplied for National Health Service records.

The motion was carried.

The remainder of the report was approved.

The Meeting adjourned at 6.20 p.m.

FOURTH DAY

Monday, July 14

The meeting resumed at 10 a.m., with Dr. ARTHUR BEAUCHAMP in the chair.

WELCOME TO OVERSEAS VISITORS

The CHAIRMAN extended a welcome to Dr. A. J. Orenstein, from South Africa—a vice-president of the Association; Dr. C. Jacobsen, of Copenhagen, president-elect of the World Medical Association, who conveyed greetings on behalf of that organization; Dr. Swengen, of the Netherlands; and Dr. H. Grant-Whyte, president of the Medical Association of South Africa, who expressed the thanks of his own association for all that the British Medical Association had done for South Africa.

OFFICIAL VOTE OF THANKS

The Meeting then extended a vote of thanks to:

The Lord Mayor (Alderman D. Johnstone) and City Council of Birmingham; the Vice-chancellor (Dr. R. S. Aitken), Council, and Senate of the University of Birmingham; the Secretary (Mr. G. Barnes), Assistant-secretary (Mr. P. Burton), and staff of the University; the Catering Officer and staff; the Town Clerk (Mr. J. F. Gregg); the Chairman and Board of Management of Queen Elizabeth Hospital; the Permanent Secretary and catering staff of the Union; the Automobile Association; British Railways; of the Union; the Automobile Association; the Midland Branch (Get-together reception); the local executive committee; the Ladies' Committee (for arrangements at the Ladies' Club and floral decorations); the permanent staff of the local B.M.A. regional office; the wardens of the university halls of residence; Messrs. W. R. Warner and Co. (for newsreel films); Dr. A. P. D. Thomson and the medical students who acted as stewards; Professor E. K. Waterhouse (Barber Institute) and Professor A. Lewis (Department of Music, University) for arrangements for chamber music concert and for making the galleries available for inspection; Doctors' Wives Association (for garden party); chairman of the committee of the University Staff Club; chairman of the committee of the Union Club; chairman of the committee of the

Warwickshire County Cricket Club; chairman of the committee of the Edgbaston Golf Club; and all others who have contributed to the comfort and entertainment of the members of the Representative Body and their ladies.

OTHER MOTIONS BY DIVISIONS AND BRANCHES

Dr. J. B. W. ROWE (Harrow) moved:

That this Meeting is strongly opposed to a whole-time salaried National Health Service.

His Division was aware that this was the Association's policy, but felt that, since two or three years had elapsed since its views had been expressed on this subject, time had come for a reaffirmation of such policy. It might assist the deliberations of the Royal Commission if it became aware that the A.R.M. had voted by an overwhelming majority against a whole-time salaried service. Secondly, many young practitioners who had qualified during and since the war had become principals, while others were waiting to do so, and they represented a generation which had never known the practice of medicine under conditions of real freedom with an undisturbed doctor-patient relationship. That generation had a growing feeling that they might be better off under such conditions. "We must save them from themselves," he said. Thirdly, many people influential in the affairs of the Royal Colleges, the B.M.A., and other medical bodies were beginning to feel that the whole trend of events in the last few years revealed an increasing Government inclination towards the establishment of a medical civil service.

Dr. A. J. MACLEOD (Outer Isles) moved to amend the motion by the addition of the words, "for general practitioners for the country as a whole without prejudice to what may be found best in limited areas." No one had full knowledge of everybody's requirements in the Service throughout the country. The Association might be doing a grave injustice to people who were trying to give just as good a service as anybody else if it introduced a limiting clause into its policy. Dr. J. S. NOBLE (Blyth (with Morpeth)) asked the meeting to reject the amendment. The motion as it stood was one of principle. Surely the negotiators and leaders of the profession could be left to handle the ideal of achieving the best service for special areas. In the circumstances, he asked leave to withdraw the next motion, standing in the name of his Division, which was in similar terms to that under discussion.

Dr. A. LAMONT (Inverness) asked representatives not to feel that the word "salary" was a swear-word. Some of those doing the best work in the profession were salaried people, even if they were not general practitioners. The CHAIRMAN OF COUNCIL appealed to the meeting, in view of the shortness of time available for dealing with the remainder of the agenda, not to occupy time on matters which were only restatements of policy, thereby unreasonably limiting the time at its disposal for discussing other important questions.

The CHAIRMAN said that the amendment, as it sought to alter policy, came within the category of those which required six weeks' notice; it was, accordingly, ruled out of order. Dr. LAMONT protested that the amendment did not ask for any change in policy; the agreement between the Government and the Association was that no change for the country as a whole in the state of the Service should be introduced without consultation with the profession.

On the suggestion of the CHAIRMAN, the meeting agreed "that we reaffirm our policy." The Blyth (with Morpeth) motion was, by leave, withdrawn.

Negotiations on Terms of Service

Permission was granted to Dr. R. S. V. MARSHALL (South Staffordshire) to move a motion standing in the name of his

The CHAIRMAN reported that a letter had been received from Dr. R. Forbes in which he tendered his resignation as a member of the Council. Dr. Forbes said that he had had a long run which he had enjoyed to the full, and he had taken his decision before he became ill. "Please convey to the members of the Council my sincere thanks for their comradeship and their recent expression of sympathy and good wishes," he concluded. Dr. WAND said he could recall few members of Council whose services had been so valuable as those of Dr. Forbes, and there were few members of the Association who had done such great work for

the Association as member, member of Council, Deputy Secretary, Secretary of the Medical Defence Union, and, later, Chairman of the Ethical Committee.

Election of Council, 1958-9

It was reported that the voting for the election of members of Council for 1958-9 in Groups where there were contests resulted in the election of the following members:

Group 2	B. Burns, Sheffield, I. G. Innes, Hull, J. A. L. Vaughan Jones, Leeds.
Group 12	A. N. Mathias, London, J. B. W. Rowe, Harrow.
Group 20	J. L. McCallum, London, A. Barker, Whitstable.

Advisory Committee on Dental Publicity

It was reported that the CHAIRMAN, after consultation with the Society of Medical Officers of Health, had authorized the name of Dr. J. L. Patton, Medical Officer of Health for Hendon, to be submitted, on behalf of the Association, for membership of the Committee on Dental Publicity.

Danish Medical Association

The CHAIRMAN reported that an invitation had been received from the Danish Medical Association to send a delegate or delegates as guests of the D.M.A. to its annual meeting to be held at Naestved from September 13 to 15. Council nominated Dr. R. G. Gibson to represent the Association.

Representation of Other Bodies

Dr. C. Metcalfe Brown (Manchester) was nominated as the Association's delegate to attend the National Society for Clean Air's annual conference at Llandudno from October 1 to 3.

Mr. H. H. Langston and Dr. J. G. McDowell were re-appointed representatives of the Association to serve on the Court of the University of Southampton.

Association for the Study of Medical Education

Council agreed that the British Medical Association should become a corporate member of the Association for the Study of Medical Education, and that Dr. Hugh Clegg and Professor W. Melville Arnott should be the Association's representatives at the first annual general meeting of that body.

Annual Clinical Meeting

The Council agreed to hold the annual clinical meeting in 1959 in Norwich.

Proposed Committee to Review the Medical Services

The Council received a report of a meeting with representatives of the Royal Colleges, the Scottish Royal Medical Corporations, the College of General Practitioners, and the Society of Medical Officers of Health for further discussion of the arrangements for setting up a committee to review the provision of medical services to the public, and their organization, in the light of ten years' experience of the National Health Service, and to make recommendations.

Central Pool

The following resolution passed at a general meeting of the East Norfolk Division on May 7 was remitted to the General Medical Services Committee:

"That the present method of calculating the Central Pool, whereby the more extra work we do the less we get for basic N.H.I. duties, should be made less ridiculous."

Geriatric Services

The CHAIRMAN reported that letters had been received from the Deputy Chief Medical Officer of the Ministry of Health, Dr. G. E. GODBER, concerning matters dealt with at the discussion on May 28 between the deputation appointed by the Council on March 26 and officers of the Ministry. Dr. Godber pointed out that the discussion showed that there was no major disagreement between the views of the Department and those expressed on behalf of the Association. The difference lay rather in the degree of emphasis which the Ministry felt it right to put on the various ways in which improvement could be made in the care of the chronic sick and elderly.

COUNCIL MEETING

The Council met at Birmingham on July 12 at 9 a.m. Before proceeding with the business on the agenda, Dr. S. WAND, Chairman of Council, said that Sir Tudor Thomas had written to say that he had decided not to seek nomination again for a seat on the Council. Sir TUDOR THOMAS, who was present, said that he had reached this decision with feelings of much regret, having enjoyed membership of the Council for nine years.

The CHAIRMAN said it would be a matter of regret to all that Sir Tudor would not be at future meetings of the Council. He had been a very distinguished member, and it was a privilege to have him as a colleague. His term of office as President of the Association would not be forgotten. Sir TUDOR THOMAS thanked the Chairman for his kind remarks.

Central Consultants and Specialists Committee

Mr. T. HOLMES SELLORS, Chairman of the Committee, reported that, to ease the work of the Chairman, the Committee had decided to appoint two deputy-chairmen to share the duties of the office. The Committee also recommended that the constitution of the Central Consultants and Specialists Committee be amended to provide that, while any member held the office of chairman or deputy-chairman, the body by which he was appointed to the Committee should be free to appoint an additional representative. Secondly, it recommended that the matter be referred to the Organization Committee to prepare the necessary alteration of the Schedule to the By-laws.

The recommendation was adopted.

Hospital Medical Staffing

Mr. HOLMES SELLORS reported that in the discussions on hospital medical staffing over the past few years the Joint Consultants Committee had had in mind two objectives: (i) to find a satisfactory long-term solution of the present staffing difficulties, and (ii) to deal with the immediate problem of the excessive number of senior registrars. It had always been the view of the Joint Committee that the long-term solution could not properly be determined until there had been a nation-wide survey of hospital staffing needs, and the Committee had been confirmed in that view by the numerous attempts of the Ministry to procure the acceptance of a subconsultant grade in one guise or another. The Committee had therefore repeatedly pressed for a survey of hospital medical establishments, at the same time suggesting that, pending the results of such a survey, time-expired senior registrars should be given security in the grade with an extension of their salary scale.

In July, 1957, continued Mr. Holmes Sellors, it seemed there was some prospect of persuading the Ministry to accept the Joint Committee's view, but at a meeting on July 30 the Ministry again resisted a survey of hospital medical staffing. It did, however, seize upon the Joint Committee's suggestion about the extension of senior registrar appointments. It stated that the Minister was prepared to agree to a number of special posts being allocated for senior registrars with

four or more years' service in the grade, and to extra remuneration for the holders of those posts. It also agreed that senior registrars who were unsuccessful in obtaining one of these special posts might be allowed an extension of their appointments, but without any increase of salary. After further proposals by the Ministry, which appeared, among other things, to involve once more the introduction of a subconsultant grade, the Joint Committee, on two further occasions, endeavoured to convince the Ministry of the desirability of conducting a survey of hospital staffing needs before introducing a change in staffing structure, as was envisaged. The Ministry, however, still resisted a review, but suggested the creation of a joint working party to study, in the light of experience, the principles on which the hospital medical staffing structure should be organized.

The Joint Committee welcomed this, provided a survey of hospital medical staffing was subsequently carried out in the light of its recommendations, and provided also that in the meantime there was no change in the senior registrar structure other than an extension of appointment and salary scale. It became apparent, however, that the Ministry's officers had no authority to move from the position they had taken up, and the Joint Committee therefore sought an opportunity of meeting the Minister.

That meeting was held on March 25, when the Joint Committee's representatives explained their objections to the Ministry's plans, and suggested that the only adequate solution of the present problem was to create more consultant posts where they were needed, and that that could be ascertained only by a survey of hospital staffing. In reply the Minister stated that he was under considerable pressure in Parliament to find a solution of the existing senior registrar problem. He thought it would be of doubtful value to conduct a survey to ascertain the ideal consultant establishment if the country could not afford it. Mr. Holmes Sellors pointed out that it was the first time there had been an admission of that kind, and if there was a financial restriction on the hospital service it was necessary to ascertain what it was. The Minister commended to the Joint Committee the establishment of a joint working party, but stressed that he found it essential, owing to Parliamentary pressure, to make some interim provision for the senior registrars who had completed their training. That could not wait until the working party had reported.

Mr. Holmes Sellors then referred Council to an exchange of letters between the Minister and the Chairman of the Joint Consultants Committee, Sir Russell Brain (*Supplement*, April 26, pp. 216-17), and said that one of the main points giving rise to uneasiness in the profession, particularly among junior staff, had been whether the new designated posts were to be additional to the present establishment of senior registrars, thus increasing rather than reducing the number of candidates for consultant vacancies. It was clear that the special posts would be provided mainly within the existing total number of senior registrars. Pending the report of the joint working party, hospital boards would, however, be able to apply for additional posts to be designated where a clear need existed.

The Central Consultants and Specialists Committee had prepared a statement of its views on the future structure of hospital medical staffing for the consideration and use of the Joint Committee's members of the working party.

Expenses Allowable under Schedule E

The Association had been given an opportunity of elaborating before the Board of Inland Revenue the case for granting relief to doctors in salaried employment and assessed under Schedule E in respect of their professional expenses. The Board's representatives were at great pains to reach a clear understanding of the situation, reported Mr. Holmes Sellors. The Committee was preparing for submission to Council in due course an application to the Commissioners of Inland Revenue that the proposed legislation should apply to the membership subscription of the Association.

In view of the fact that the Chancellor of the Exchequer had taken no steps to allow tax relief in respect of other professional expenses incurred by whole-time hospital medical staff, the Committee was to ask the Staff Side of Whitley Committee B to reopen discussions with the Management Side on the recommendations of the Spens Committee on the reimbursement of expenses.

Moral Obligation Clause

Mr. Holmes Sellors recalled that at the beginning of the Health Service the Minister accepted that he had a moral obligation to do everything in his power to try to find alternative employment for a consultant who was displaced or whose sessions were seriously reduced as a result of any reorganization of hospital services. Latterly there had appeared to be an attempt on the part of the Ministry to depart from the spirit of the undertaking which the Minister gave in 1949. The Central Consultants and Specialists Committee had been profoundly disturbed by a recent letter from the Ministry in which the scope of the moral obligation was so narrowed as to be almost valueless, and it had drawn the Joint Committee's attention to the matter.

Applications for Hospital Appointments

The Ministry had accepted the view of the Committee that if a hospital board required a substantial number of copies of an application it should make them itself.

Public Health Committee

Dr. J. B. TILLEY, Chairman of the Public Health Committee, referred to the question of remuneration of public health doctors, and the rejection by the Industrial Court of the claim by the Staff Side of Whitley Committee C for a 5% interim increase from January 1, 1958. The Committee was not yet in a position to ask the Council to approach the Minister requesting an independent inquiry, but that position could not be very far off.

The Committee recommended, however, that all possible steps be taken to establish the principle that the remuneration of public health doctors should be related to the remuneration in other fields of medical practice and not to the salaries of other chief officers of local authorities.

The recommendation was adopted.

Occupational Health Committee

The Council adopted a recommendation, presented by Dr. H. ALEXANDER on behalf of the Occupational Health Committee, that the Lord President of the Council be informed that the Association was not convinced that the satisfactory liaison in the field of occupational health research, which he anticipated in 1956, had yet been established, and urged that steps be taken now with a view to improving the position.

Fees Paid to Appointed Factory Doctors

After representations made by the Association to the Ministry of Labour and National Service over the past year, the Ministry had issued a list of revised fees which, with relatively minor exceptions, corresponded with those recommended by the Association. The Committee recommended acceptance of the proposals, and, as the Department was prepared to arrange the introduction of the new fees as soon as possible, the Chairman of Council approved of the Ministry being so informed.

Office Committee

Dr. S. WAND, as Chairman of the Office Committee, presented the report and recommended that the Council join in the invitation to hold the International Poliomyelitis Congress in London in 1960, and offer all practical assistance possible without, at the present stage, undertaking any financial commitment.

The recommendation was adopted.

Annual Clinical Meeting, 1958

Two recommendations submitted by Dr. R. G. GIBSON on behalf of the Committee of Management of the Annual Clinical Meeting were adopted. The first was that the President of the Association, Professor A. P. Thomson, be invited to open the Meeting at Southampton on December 5, and the second was that each of the following be invited to take the chair at one of the three general sessions: the Chairman of Council, Dr. S. Wand; the President of the College of General Practitioners, Dr. I. D. Grant; and the Medical Officer of Health for Southampton, Dr. H. C. Maurice Williams.

Scientific Programme

The Committee arranged a full programme of three general sessions, four panel discussions, a session of medical films, colour television of surgical operations each day, a transatlantic clinical conference, live clinical demonstrations at the local hospitals and clinics, and visits to centres of medical interest in the area. It was proposed to invite the press to attend only the general sessions, panel discussions, and the transatlantic clinical conference.

Welsh Committee

Sir TUDOR THOMAS reported that the Committee had received a suggestion from the Glamorgan Local Medical Committee that the representatives of Welsh local medical committees on the General Medical Services Committee should be members of the Welsh Committee. The Committee welcomed such broadening of its membership, and considered that to include the Welsh representatives on the Central Consultants and Specialists Committee would be equally valuable. It therefore recommended (i) that the constitution of the Welsh Committee be amended to include in its membership (a) the representatives of Welsh local medical committees on the General Medical Services Committee, and (b) the representatives of the Welsh Regional Consultants and Specialists Committee; (ii) that it be referred to the Organization Committee to prepare the necessary alteration of the Schedule to the By-laws.

The recommendation was adopted.

Membership of Regional Hospital Boards

Council agreed to refer to the Central Consultants and Specialists Committee a resolution passed by the annual general meeting of the East Somerset Division deploring the dwindling of the number of medical men appointed to serve on regional hospital boards.

Candidates for Election

On the motion by the CHAIRMAN, 137 candidates were elected as members of the Association.

Council also received and approved the reports of the General Medical Services Committee, Science Committee, Family Doctor Committee, Rehabilitation Committee, and the Committee on Drug Addiction.

OPENING OF TRADE EXHIBITION

The Exhibition of pharmaceutical products, instruments, appliances, and medical publications was opened by the President-Elect, Professor A. P. THOMSON, in the forecourt of the University, Edgbaston, on July 14.

The pharmacological activity of the drug industry, said Professor Thomson, had probably done as much for medicine of late as any other branch of scientific activity. It had brought back to medicine the realization that there could be no assured progress unless there was precise knowledge of the finer chemical processes involved in biological systems.

In declaring the Exhibition open, Professor Thomson congratulated the organizers on the result of their work.

**CHURCHES' COUNCIL OF HEALING
THE ROLE OF PARSON AND DOCTOR**

"I think this gathering is a great sense of witness," Sir CLEMENT PRICE THOMAS said of the meeting of doctors and clergy organized by the Churches' Council of Healing at the Grand Hotel, Birmingham, on July 11, in connexion with the Annual Meeting. There was a good attendance of both representatives and clergy and ministers. 1958 being the tenth anniversary of the National Health Service, this year's subject was the role of the parson and the doctor in the Welfare State.

The Bishop of Lichfield, Dr. A. S. REEVE, who presided, said that, although "know-how" had never been so much in evidence as to-day, the world had never been so sick. There was sometimes a feeling between various sections of the community which was a *malaise*. The need was for a healing of the spirit. The National Health Service could go on developing in the right way only if it had at its heart a spirit of vocation on the part of all those working in it. "We Christians believe that because we look to God as revealed in the Lord Jesus Christ, we have the perfect ideal at whom to aim," concluded Dr. Reeve.

Dangers of Full-time Service

Sir CLEMENT PRICE THOMAS asked: "Does the Welfare State fare well, and is the National Health Service rendering the service it should? The National Health Service, I think we all have to admit, was the will of the people," he said. "This was a non-political thing. It was something which had to come. I am sure that there are many things in the National Health Service that as doctors perhaps do not know if the lay people would agree—we would like to change, but by and large it has been a success."

The National Health Service, to all intents and purposes, was a full-time service—and as a full-time service it had dangers. From the patient's point of view there was the danger of looking on medical care as merchandise to which he was justly entitled. A little boy, sent to ask the doctor for castor oil, explained it was for his father's boots. Abuse of the service because it was "free" was a serious thing.

Another danger was that in a full-time service the sense of service itself might be lost. "The majority of us were, medically speaking, brought up to the so-called voluntary system, whereby there was a large opportunity of voluntary service without any reward, not only among the physicians and surgeons, but among general practitioners," continued Sir Clement. "That opportunity is apparently getting less and less."

Surgery, and medicine equally, had advanced so much that people were living longer, and the maternity and infant mortality rates had dropped as a result of technical advances. But that was not all.

Beyond Symptomatology

"Medicine is not just giving people medicine," said Sir Clement. "I believe that we as doctors need to go beyond the symptomatology. We need to meet the patient on his own ground." "Tell me, sir," a trainee had asked him, "what do you consider to be the qualities of a good surgeon?" First, Sir Clement defined, a surgeon must have the requisite knowledge and skill. Second, he must have the ability to put himself in the place of the patient, to enter into his feelings and to be able to give him a quiet mind. For any patient to get a quiet mind he must have confidence in the doctor. He must be satisfied that the treatment outlined was correct. And then there was the residual something which the patient had to settle for himself. The quiet mind was achieved most easily and most satisfactorily by people who had faith in God. That was something no money could buy, something which no technological advance could give. What greater ideal could they have than Christ Himself, who gave Himself for His people?

Faith Healing

On faith healing, Sir Clement knew nothing except what he had read. Numbers of his patients asked if they could have someone to come and lay on hands, and he never refused. He had not seen any organic result, but he was quite sure that these patients had a spiritual comfort which he was not able to give them. Sir Clement stressed that he did not mean that there was nothing in spiritual healing; he was certain, from what he had read, that there must be.

New Kind of Man

The Rev. AUSTEN WILLIAMS, vicar of St. Martin's-in-the-Fields, London, spoke of the estrangement of the vast bulk of the population from the Church. "There has been a new kind of man in our present age with a different outlook and different ways of thinking," he said, "and we in the Church, and perhaps not in Medicine, have not caught up with that yet." It could be seen most in the new housing estates where there were communities of men and women living new kinds of lives without the church. Doctors and parsons particularly had the responsibility of taking into that set-up the vital personal element which was lacking.

"Already I believe parsons are changing," continued Mr. Williams. They were being wanted because their contribution to the modern welfare set-up was valuable. The Church was being asked to feel and sympathize in the life that was going on, and not simply in a spiritual way. One could not make poetry without words; one could not take the trinity without the other parts besides the spiritual.

The work of doctors and parsons was interdependent. Both were concerned with human relationships. There was need for the personal approach to these people, as person to person, by parsons and doctors. "I believe that talking about people is prayer, that you don't have to lard it up with a lot of other stuff," said Mr. Williams.

Parsons and doctors were the two key people of the present day in so far as they carried into the present set-up the infinitely precious thing which came from God. No Welfare State could give contentment and self-giving.

IN AND AROUND BIRMINGHAM

A minor heatwave added its warmth to the welcome representatives received as they gathered in Birmingham on July 9 for this year's A.R.M. That the weather reverted to current form later in the meeting was of no great consequence, although Warwick Castle, Coughton Court, and Stratford-upon-Avon, visited on a most enjoyable Sunday excursion, would have looked even more beautiful had the sun shone. Nor was it outdoor weather for the garden party given by the Doctors' Wives' Association on the Saturday. An evening-of-the-meeting reception for representatives and their ladies, given at the Grand Hotel by the Midland Branch, brought old friends and new together. Dr. F. E. GOULD, President of the Branch, and Mrs. GOULD received the guests. Another party, for women representatives and medical women accompanying representatives, was given on Friday, July 11, by the Birmingham and District Association of the Medical Women's Federation. The guests were received by Dr. E. M. NEWHAM, its president, and notable among those present were some women medical students at the University.

Education, Music, and Art

Birmingham's position as the focal point for industry in the Midlands holds good also for education, music, and the arts. The University buildings, in their green surroundings, with the massive blocks of the Queen Elizabeth Hospital and Medical School in the near distance, made a splendid setting for the meeting. There was plenty of room to move inside and outside the Great Hall, and the proceedings were marred only by frequent complaints about the loud-speaker system.

On Sunday evening members had the enjoyable experience of listening to a Symphony Concert by the celebrated City of Birmingham Symphony Orchestra, under its leader, WILFRED LEHMANN. The conductor was RUDOLF SCHWARZ, who recently left the directorship of the orchestra to become Director of Music at the B.B.C., and the soloist was DENIS MATTHEWS. Grieg's Piano Concerto, Brahms' Academic Festival Overture, Richard Strauss's Symphonic Poem, Don Juan, and Dvorák's Symphony No. 4 in G were the items in the programme. For this musical *tour de force* the Association owed its gratitude to the generosity of CIBA Laboratories Ltd., who sponsored the concert.

Another artistic occasion of a high order was a Chamber Music Concert given, by kind permission of the Director, Professor E. K. WATERHOUSE, at the Royal Institute of Fine Arts on Saturday evening, July 12, and arranged by the Midland Branch. YFRAH NEAMAN (violin) and HOWARD FERGUSON (piano) were the soloists, and listeners heard beautiful renderings of César Franck's Sonata in A Major and Beethoven's Sonata in F Major for violin and piano. The programme was arranged by Professor AUBREY LEWIS, Barber professor of music in the University. Afterwards the visitors were able to tour the galleries and admire at their leisure a representative collection of pictures.

These were only two of the many pleasures so generously made available during the first week of the Meeting, and those who had not previously visited "Britain's Second City" came away feeling that in and around it there was more than enough to please and interest every taste.

HOSPITALITY

A German doctor's daughters, aged 15 and 17, would like to make exchange visits of about a month during the summer with a British doctor's daughters. A German doctor's son, aged 17, would like to exchange visits during the summer holidays with a British boy of the same age. Two German boys, aged 15 and 18, would like to stay with British medical families as paying guests during August.

A French doctor's daughter, aged 17, would like to stay for three months in this country as a paying guest or *au pair*. A French girl, aged 16, a doctor's daughter, would like to stay with a family in a university town as a paying guest during the summer so that she could follow a vacation course. A 14-year-old French girl and boy would like to stay as paying guests with British medical families with children of about the same age. A French girl, aged 16, would like to exchange visits with a British doctor's daughter for about six weeks from July.

Would anyone interested please get in touch with Dr. R. A. Pallister, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

NEWS IN BRIEF

RESETTLEMENT OF EX-REGULARS.—The Minister of Health has reminded hospital boards and management committees that they should assist in the resettlement of ex-regulars from the armed Forces by giving special consideration to their applications for employment in jobs for which they are suited. As a result of the Government's defence policy a number of officers and men will have their Service careers prematurely ended during the next few years because of the large reductions in Forces.

NATIONAL INSURANCE CONTRIBUTIONS.—From July 7 the weekly contribution for the National Health Service has been increased by 6d. for men, 4d. for women, and 2d. for those under 18, with an additional 2d. from the employer in the case of employed persons. Full details of the new combined National Insurance and N.H.S. rates are given in leaflet N.I.103 available at Pensions and National Insurance offices. The new stamps have been on sale at post offices since June 30.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Lessons from the Past

SIR.—There is one small but important point which Lord Moran does not mention in his article (*Supplement*, July 5, p. 3). In discussing the 1954 award to consultants and comparing their remuneration with general practitioners, it should be remembered that a G.P.'s N.H.S. income from the central pool is adversely affected if private earnings are increased. This cannot apply to consultants. Another relevant point is that a general practitioner's annual remuneration should include the cost (currently about £150) of a six-weeks locum per annum.—I am, etc.,

Llandrindod Wells.

H. J. HOUGHTON.

Ten Years

SIR.—After reading the sour leading article in the *Journal* of July 5 (p. 33), it was refreshing to see Dr. Fry's letter in the *Observer*, which effectively contradicts several of your points. I agree with him that there is no widespread desire for G.P.s to work in hospitals. Medicine is so specialized nowadays that it would be impossible for us to work with more than one type of consultant. In hospitals, consultants will not look at patients with illnesses outside their own specialty. How then can G.P.s be expected to work with several? Lord Moran talks about picked general practitioners. Who is to do the choosing? No more secret committees, please.

I think it is time we stopped this querulous nonsense about too much form-filling. We do less now than we did in the days of private practice: at least we don't have to keep accounts. All we have to do is to keep notes adequate for treating our patients, filling in E.C.24, and signing our names when new patients come on to our lists (or leave them). Heaven knows how much form-filling there will be if we are paid for items of service. An epidemic of chicken-pox would have more forms than spots.

If, as Dr. Guy Dain (*Supplement*, July 5, p. 1) says, the doctor-patient relationship has been helped by the service, and now Lord Moran (*Supplement*, July 5, p. 3) says that we are not worried financially, what is all the trouble about? Anyone would think, from reading the *B.M.J.*, that troublesome patients, queues in waiting-rooms, and non-payment of bills were unknown before 1948. Insecurity was greater then than now despite what Dr. Dain says.—I am, etc.,

Lincoln.

A. H. FERGUSON.

Cost of Prescribing

SIR.—We keep on hearing about the cost of medicines: a select committee even wants to examine wretched students on the subject. Yet it is absurdly difficult to get data. It is not surprising that at Oxford last year I heard very inaccurate statements about prices of drugs from several senior consultants. When a doctor from the Ministry itself came to rattle our partnership on prescribing costs, the poor chap was hopelessly at sea: he did not even know that many proprietaries are cheaper than their *B.N.F.* equivalents.

What are our sources of information on the subject? (1) The Drug Tariff hardly prices anything less than twenty years old. It mentions dozens of newer drugs, only to put a dash against the price. (2) The Ministry occasionally sends a squalidly produced circular, giving incomplete facts about certain things. (3) *Prescriber's Notes* appears to be moribund, and anyway only a few oddly chosen subjects were mentioned. Unless I am off some official posting list, that is our total official source of information.

On the other hand, we have reams of gorgeous paper from the manufacturers. Price statements in them are of course

suspect, though not necessarily false. One can see through such a subterfuge as "Cost of maintenance may be as little as 6d. a day," when the tablets cost 6d. each. But there must be deeper wiles: one cannot easily believe that a dozen 125 mg. penicillin V tablets by one great British firm cost nearly twice as much as the same thing from another equally famous British firm: yet that appears to emerge from two recent circulars. One's nearest thing to a textbook is *A Prescriber's List of Ethical Products*, published—presumably unofficially—by Unichem Ltd. and given to us by a local chemist. But its prices are retail, plus tax, and it is wholly concerned with proprietaries.

Surely, on a matter of importance, doctors are entitled to a reasonable presentation of facts? On several occasions a few years ago I wrote to the Ministry to advocate a formulary whose sections would be based on the actions of drugs rather than on their shapes. This is now available as the *B.N.F.* alternative edition, and the interleaved version makes a good book, if you pay for it, and if you take the trouble to make copious notes on the interleaves. The monographs are excellent. But what chances have been lost. The layout could be enormously improved. How easy, too, to put prices against the *B.N.F.* preparations and to put proprietaries (and their prices) on the interleaves for immediate comparison. All similarly acting drugs would then be together, and most doctors would use the book for information, entirely apart from any interest in prices. It should, of course, be free, as it would be the only decent counter-advertisement to the wicked proprietaries. Its cost would probably be saved in a day's prescribing. I suggest that the G.P.'s answer to any official about prices should be the schoolboy "I don't know, and nor do you: and soon I shan't care."—I am, etc.,

Sidmouth.

GERALD GIBBENS.

SIR.—In these days of concern over the size of the national drug bill, I think it is only right to draw attention to the discrepancies in the costs of immunizing agents—against typhoid, paratyphoid, cholera, and tetanus—as supplied by different firms. One firm in particular charges twice as much and more than another no less reputable. There may be some reason or other, but surely there can be no appreciable difference in the quality of medical products so important as these.—I am, etc.,

Staines.

S. J. POOTS.

Tax Relief for Higher Education

SIR.—I was interested to read that the Council considers that the consultants are underpaid, and should receive up to £8,000 per annum (*Supplement*, June 14, p. 312). This seems to me to be an inflationary method of dealing with this situation, when the margin of surtax is still at its pre-war level.

One of the main problems confronting the medical profession is that of educating their children. I will not refer to public schools, as it can be argued that a free alternative is provided, but there is no alternative for a university education. A well-established consultant in a high-income group, and therefore not eligible for a grant, will have to pay full fees plus the tax on that cost. It costs at least £600 per annum to keep a son, or daughter, at a university, and if he, or she, happens to be a medical student the education continues for seven years—i.e., £4,000 to £5,000. This is paid out of taxable income, which means that about £10,000 has to be earned.

Would it not be fair to consider such a dependant as a trainee, for which there could be tax relief? Boys in other trades and professions are often apprenticed or articulated to their fathers, when payment is made out of non-taxable income. The number of doctors able to afford to enter their children for the medical profession is diminishing, and will continue to do so as long as higher education is taxed as a luxury.—I am, etc.,

Newport, Mon.

J. T. RICE-EDWARDS.

Poliomyelitis Vaccinations

SIR.—I read in my newspaper that the next stage in the poliomyelitis immunization campaign is to offer injections to all persons up to the age of 25. This is very desirable, but let us suppose a practitioner with a list of 3,000 has 800 patients within this age group and see what it means in terms of "unpaid" work. If we allow three minutes per injection (this time to include sending for the patient, fetching the vaccine, and filling in the forms) and assume, as is likely, that three injections will be given in six months, then $800 \times 9 = 7,200$ minutes = 120 hours. On the basis of a 40-hour week, this amounts to three weeks' work. As we all know, the payment for this is deducted from the central pool, so it is virtually unpaid work. Taking the argument a stage further and supposing that 18,000 doctors give this service, then $3 \times 1,800 = 54,000$ weeks = 1,080 years' work (assuming two weeks' holiday per annum), all unpaid. I should not expect to pass an examination in logic with this exposition, but I do think it is an interesting way of looking at the problem. Do we still want to keep the "solid" advantages of Spens and ignore the hours of work we are putting in to earn our living (see my letter, *Supplement*, February 8, p. 63)?—I am, etc.,

Cosham, Hants.

V. H. MARTINDALE.

M.O.H.s and the N.H.S.

SIR.—Just about a year ago the Association expressed its concern that the public health doctors, though forming an integral part of the National Health Service, had been excluded from consideration by the Royal Commission. Last week you published a special National Health Service *Supplement* (July 5). I have searched it in vain for some review—critical or otherwise—of developments within the local health authority services. Have you forgotten, Sir, that these services exist, or are you under the impression that nothing fresh has happened in their sphere during the last 10 years?

Let me remind you of only some few of these developments: the closer working relationship between family doctors and health visitors, underwritten by a policy decision at the A.R.M. of 1953, the widening scope of mental health education, the increasing deployment of home help not only to support the sick and infirm but also to avoid the splitting up of families and to assist in the rehabilitation of families with social problems, and the ascertainment of severe handicap in early childhood, for which new screening techniques offer increasing scope.

Why then, Sir, was the public health service left out entirely of your so-called National Health Service *Supplement*? Have you, too, ceased to consider us as full members of the Health Service's team?—I am, etc.,

London, N.10.

WILFRID G. HARDING.

H.M. Forces

REGULAR ARMY RESERVE OF OFFICERS

Major-General D. Bluet, C.B., O.B.E., O.H.P., late R.A.M.C., from Active List, to be Major-General. (Substituted for the notification in a *Supplement* to the *London Gazette* dated May 2.)

ROYAL ARMY MEDICAL CORPS

Captain (War Substantive Major) (Honorary Lieutenant-Colonel) D. N. Keys has ceased to belong to the Reserve of Officers, retaining the honorary rank of Lieutenant-Colonel. Captain (War Substantive Major) J. A. G. M. Lynch has ceased to belong to the Reserve of Officers.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Majors J. R. Horler and R. Bennett, T.D., have been granted the acting rank of Lieutenant-Colonel. Captain R. J. O. Catlin, Reserve of Officers, to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel (Honorary Brigadier) J. G. Morgan, C.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Brigadier.

ROYAL AIR FORCE

Air Commodore (Acting Air Vice-Marshal) G. A. M. Knight, C.B.E., to be Air Vice-Marshal. Group Captains W. K. Stewart, C.B.E., A.F.C., and J. F. Dales to be Air Commodores.

Wing Commanders G. D. Campbell, G. R. Gunn, O.B.E., and E. B. Bright, A.F.C., to be Group Captains. Squadron Leaders E. O. Barnes and A. J. K. Gallagher to be Wing Commanders.

Flight Lieutenants H. K. Mason, J. D. Campling, and P. D. W. Wickenden have been transferred to the Reserve, retaining the rank of Squadron Leader.

Flight Lieutenants J. B. Parsons and J. L. Milligan to be Squadron Leaders.

ROYAL AIR FORCE RESERVE OF OFFICERS

Wing Commander G. P. Flew has relinquished his commission, retaining his rank.

Squadron Leaders L. L. Ingram, J. P. F. Whelan, S. G. Gordon, and V. A. F. Martin have relinquished their commissions, retaining the rank of Wing Commander.

Squadron Leaders G. K. Taylor, J. C. Groves, and A. Wardale have relinquished their commissions, retaining their rank.

Flight Lieutenant K. E. Mortimer to be Squadron Leader. Flight Lieutenant F. T. Moore, O.B.E., has relinquished his commission, retaining the rank of Squadron Leader.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Arey, L. B.: *Human Histology: A Textbook in Outline Form*. 1957.
Banks, A. L., and Hislop, J. A.: *Health and Hygiene*. 1957.
Bregat, P.: *L'Œdème Papillaire*. 1956.
Brusch, H. G.: *Rheumatic Diseases, Rheumatism and Arthritis*. 1957.
Cogan, D. G.: *Neurology of the Ocular Muscles*. Second edition. 1956.
Dati, T.: *Endocrinologia Sexuale*. 1955.
Dobson, J., and Wakeley, Sir C.: *Sir George Buckton Browne*. 1957.
Dodson, A. I., and Hill, J. E.: *Synopsis of Genitourinary Diseases*. Sixth edition. 1956.
Eastman, N. J.: *Expectant Motherhood*. Third edition. 1957.
Eeman, N. J.: *Technique of Conscious Evolution*. 1956.
Ewalt, J. R.: *Mental Health Administration*. 1956.

Association Notices

CHANGE OF NAME OF CLEVELAND DIVISION

Notice is hereby given by the Council of the Association that the name of the Cleveland Division of the Tees-Side Branch has been changed to Cleveland and Middlesbrough.

ADJUSTMENT OF AREA OF GATESHEAD AND DURHAM DIVISIONS

Notice is hereby given by the Council to all concerned that it is proposed to transfer the Urban District of Washington from the Area of the Gateshead Division to that of the Durham Division.

Any member affected by this proposal and objecting thereto should write to the Secretary of the Association not later than August 16, 1958.

NIGERIA BRANCH

Notice is hereby given by the Council to all concerned that it is proposed to reconstitute the existing Nigeria Branch, at the present time one without Divisions, into a Branch with three Divisions with the following titles and areas.

- (a) Eastern Division, comprising the eastern region of Nigeria.
- (b) Lagos Division, comprising the Federal Territory of Lagos.
- (c) Western Division, comprising the western region of Nigeria.

Any member affected by this proposal and objecting thereto should write to the Secretary of the Association by Friday, August 29, 1958.

A. MACRAE,
Secretary.

Diary of Central Meetings

JULY

- 23 Wed. Central Ethical Committee.
- 24 Thurs. G.M.S. Committee, 10.30 a.m.
- 24 Thurs. Staff Side, Committee C, Medical Whitley Council (at 14, Russell Square, W.C.), 10.30 a.m.
- 24 Thurs. Full Committee C, Medical Whitley Council (at 14, Russell Square, W.C.), 11.15 a.m.
- 28 Mon. Staff Side, General Whitley Council (at 14, Russell Square, W.C.), 10.30 a.m.
- 28 Mon. Full General Whitley Council (at 14, Russell Square, W.C.), 12 noon.
- 29 Tues. Staff Side, Committee B, Medical Whitley Council, 10.30 a.m.
- 29 Tues. Full Committee B, Medical Whitley Council, 2 p.m.

AUGUST

- 8 Fri. Planning Subcommittee, Occupational Health Committee, 2 p.m.

Meetings of Branches and Divisions

ASHTON-UNDER-LYNE DIVISION

At the annual general meeting on April 23 the following officers were elected:

Chairman.—Dr. J. E. R. Keyms.
Vice-Chairman.—Dr. A. T. Wilson
Honorary Secretary.—Dr. J. E. Morris.
Honorary Treasurer.—Dr. M. J. Twomey.

BROMLEY DIVISION

The annual general meeting was held on April 2. The following officers were elected:

Chairman.—Dr. C. R. G. Bannington.
Vice-chairman.—Dr. R. M. Penny.
Honorary Secretary.—Dr. J. Fry.

CAMBERWELL DIVISION

The annual general meeting was held at Dulwich Hospital on April 1. Thirty members were present. The following officers were elected for 1958-9:

Chairman.—Dr. R. J. Rosborough.
Vice-chairman.—Dr. B. H. Pentney.
Honorary Secretary.—Dr. W. B. J. Pemberton.
Dr. D. P. Stevenson, deputy secretary of the Association, addressed the meeting on "A Review of the Problems Facing the Medical Profession after Ten Years of the National Health Service."

CITY OF DUNDEE DIVISION

The annual general meeting was held in the Queen's Hotel on May 2. The following officers were elected:

Chairman.—Mr. J. F. O. Mitchell.
Vice-chairman.—Dr. J. B. Barnet.
Honorary Secretary.—Dr. J. M. Langlands.
Honorary Treasurer.—Dr. G. M. Grant.

DARFORD DIVISION

At the annual general meeting on April 22 the following officers were elected:

Chairman.—Dr. H. C. Calvey.
Vice-chairman and Honorary Treasurer.—Dr. Wm. Reversion.
Honorary Secretary.—Dr. C. F. Bolton.

KENYA BRANCH

The following officers have been elected for 1958:

President.—Dr. K. V. Adajia.
Vice-president.—Dr. G. C. Dockeray.
Honorary Secretary.—Mr. Andrew Hicks.
Honorary Treasurer.—Dr. A. Hargreaves.
Editor, East African Medical Journal.—Dr. J. A. Carman.

LEWISHAM DIVISION

At the annual general meeting the following officers were elected for 1958-9:

Chairman.—Dr. S. Ida Fisher.
Vice-chairman.—Dr. C. W. Robertson.
Secretary and Treasurer.—Dr. R. L. Meyrick.

NORTH-EAST ESSEX DIVISION

The following officers have been elected:

Chairman.—Dr. T. Brady.
Vice-chairman.—Dr. J. Steeds.
Secretary and Treasurer.—Dr. W. E. Corringham.

SHEFFIELD DIVISION

The annual general meeting was held on March 28. The following officers were elected:

Chairman.—Dr. Andrew Stephen.
Vice-chairman.—Dr. D. H. Anderson.
Honorary Secretary and Treasurer.—Dr. T. Lodge.
Honorary Assistant Secretary.—Dr. I. A. J. Ross-Smith.

SOUTHAMPTON DIVISION

At the annual general meeting held on April 16 the following officers were elected:

Chairman.—Dr. R. S. Russell Smith.
Vice-chairman.—Dr. H. K. Meller.
Secretary and Treasurer.—Dr. J. G. McDowell.
Assistant Secretary.—Dr. W. H. N. Angus.

SUNDERLAND DIVISION

The annual general meeting was held on April 18. The following officers were elected:

Chairman.—Dr. I. M. Jones.
Vice-chairman.—Dr. R. H. Vasey.
Honorary Secretary.—Dr. C. W. Bewick.

TYNESIDE DIVISION

At the annual general meeting the following officers were elected for 1958-9:

Chairman.—Dr. I. O. B. Spencer.
Vice-chairman.—Dr. R. M. S. Parker.
Honorary Secretary.—Dr. J. C. Knox.
Honorary Treasurer.—Dr. Betty Cowling.

WEST SUFFOLK DIVISION

The following officers were elected on March 25:

Chairman.—Dr. J. L. McNeill.
Deputy Vice-chairman.—Dr. J. W. E. Cory.
Honorary Secretary and Treasurer.—Dr. S. Blaxland.

WESTERN AUSTRALIA BRANCH

The annual general meeting was held on March 22. The following officers were elected:

President.—Dr. C. W. Anderson.
Vice-president.—Dr. D. D. Keall.
Honorary Secretary.—Dr. R. L. Leedman.
Honorary Treasurer.—Dr. D. E. Copping.
Honorary Assistant Secretary.—Dr. F. C. Macaulay.
Chairman of Convocation.—Dr. B. W. Buttsworth.
Drs. C. W. Anderson and D. M. Clement were elected Federal Councillors for 1958.

YORKSHIRE BRANCH

The following officers have been elected for 1957-8:

President.—Dr. T. K. Cooke.
President-elect.—Dr. L. V. Broadhead.
Vice-president.—Dr. J. A. L. Vaughan Jones.
Honorary Secretary and Treasurer.—Dr. J. H. E. Moore.

British Medical Association

ANNUAL REPRESENTATIVE MEETING, BIRMINGHAM, 1958*

FOURTH DAY (continued)

Monday, July 14

OTHER MOTIONS BY DIVISIONS AND BRANCHES (continued)

A motion by Marylebone asking the Meeting to instruct Council to convene a mass meeting of all professions to discuss improvements in the presentation of their ideals and methods of service was not discussed. A motion from the floor to pass to next business in view of the impracticability of the Marylebone motion was carried.

Dr. G. D. WILD (Derby (with West Derbyshire)) moved that the Representative Meeting "deplores the difficulty experienced in obtaining locumtenent services for both principals in general practice and the hospital services." The sole purpose, he said, was to advertise the difficulty common to all branches of the profession in the hope that in time some means of circumventing it would emerge.

The motion was carried.
Dr. S. G. BROOK (Barnstaple) moved that the time-table of the Annual Representative Meeting be altered when practicable so that it did not include a Sunday. If the motion were carried it would, he said, effect a financial saving to the Association of some £1,000. Attendance figures showed that, of 387 representatives last year, 101 were not present on the Monday. The main reason for their absence was the difficulty in obtaining locumtenents.

The motion was carried as a reference to Council.
Dr. R. H. MOORE (North Middlesex) moved:
That this Meeting recommends that, when a Chairman of a Committee of Council wishes to withdraw any portion of his report to the Representative Body, all Divisions having motions appertaining to that section of the report should be given prior notice of this fact; that is, on the morning prior to the commencement of business, and not during the actual presentation of the report.

He said that his Division wished it to be clearly understood that the motion was not a reflection on the Chairman of Council or Committees. It was designed to ensure that when any member of any Division or group of members

*The first part of this report appeared in last week's Supplement.

brought a matter before the Representative Body it would have a chance of reaching it.

Dr. WAND said that for years those concerned had conducted the business in a businesslike manner without having instructions of the kind set out. It might well be that new matters would be brought forward which would mean that the Chairman of Council or of a Committee would feel that it was only right and proper that something should be withdrawn. The object of the Representative Body was to make the right decisions and not to be hidebound by regulations.

A motion to pass to next business was carried.

Dr. J. H. STRANGER (North Glamorgan and Brecknock) moved a motion asking the Meeting to express the opinion that free university education should be available to all, irrespective of parents' income, in view of the fact that owing to the present economic position of the profession medical men found it difficult to finance the university education of their children. He said that an increase in the allowance made on income tax and the abolition of the means test by many local authorities could do much to relieve the situation; but his Division felt that free university education was a simpler and more straightforward answer. Mr. J. T. RICE EDWARDS (Council) moved by way of amendment that in view of the present economic position the cost of university education should be relieved of taxation. It cost approximately £600 a year, he said, to have a son or daughter at university, which, with the addition of income tax, meant £1,200 a year. In the case of medical students who took seven years, it means that parents paid £5,000 for the course plus tax, which meant £10,000. The difference between grant-aided students and the people who had to be paid for was far too great.

Dr. W. R. KING (North Glamorgan and Brecknock) said it was interesting to note that for the first time in its long history Aberdeen University this year had failed to obtain its full quota of medical students. It might well be a sign of the times. It was realized that technically there was no such thing as "free education," but it was being urged that the anomaly should be removed whereby some people get their children educated free, and the heavily taxed professional classes had to pay twice.

Dr. WAND said he was not clear what the amendment meant. Did the words "in view of the present economic position" mean that as soon as the Bank Rate went down to 4% there was no further action? he asked. Did it mean that as soon as 6d. was taken off income tax there was no further action? Did it apply only to the medical profession? He suggested that it was a badly thought out amendment.

A motion to pass to next business was carried.

GENERAL MEDICAL SERVICES (continued)

Prescribing in General Practice

The Meeting proceeded to consider the remainder of the report under General Medical Services.

Dr. A. REZLER (Leamington) moved that the Council should inquire into the whole question of prescribing in general practice. Every year hundreds of warning letters were sent to doctors, about 700 doctors were seen by R.M.O.s, and a few doctors were fined heavily. What was the doctor to do when the R.M.O. had visited him and told him that he must reduce his costs? Some doctors removed from their lists those patients who required too much in the way of prescriptions; some doctors cut down their surgery hours and hid so that they were not there to give prescriptions. The Council could look into the matter by means of a questionnaire—with anonymity—to see how much those factors affected practitioners.

Dr. DAVIES, in reply, said, come what may, the Committee always stood for complete freedom for the doctor to prescribe what he thought best for the patient, irrespective of cost; but the G.M.S. Committee was satisfied that the existing machinery was fair, and in fact evidence had been given on the subject to the Hinchliffe Committee. It would be wise, therefore, to await that Committee's report.

Dr. B. BURNS (Sheffield) expressed the hope that the Representative Body would not permit the motion to be flattened by the big guns. "We have a responsibility to avoid waste and extravagance in prescribing," he said, "and few will deny that there is room for improvement in this respect; but if we are to have the full co-operation of the general practitioner in this matter it will be necessary to remove certain absurdities and injustices from the existing procedure." The much-vaunted freedom to prescribe whatever the doctor considered necessary was illusory. The Cohen recommendations imposed a limitation. The general practitioner was theoretically free to prescribe, but if he dared to prescribe a certain list of products he would have the cost deducted from his pay. The junior hospital doctor had *carte blanche*, yet every prescription issued by the general practitioner was subjected to every scrutiny. Dr. R. P. HENDRY (Rugby (with South Warwickshire)) supported the motion. The present position was quite chaotic, he said, and it was time that it was fully investigated. Dr. J. S. McLAREN ORD (Glasgow) opposed the motion, suggesting that Council had enough on its plate already. "I am sure that if a doctor prescribes with common sense he will not get into any serious trouble," he added. Dr. F. GRAY (St. Pancras) said that the doctor was a responsible person and had to make his own decisions at present. He asked the Representative Body whether it wanted that freedom curtailed. The practitioner was free at the moment, subject to justifying what he had done.

Dr. REZLER, in reply, said that it was only when a certain stage was reached above an average that doctors were guilty and were accused of extravagance and incompetence. They were grave charges made by their own colleagues, and an opportunity must be given to change the position.

The motion asking Council to inquire into the whole question of prescribing in general practice was lost.

Dr. R. REID moved a motion on behalf of Nottinghamshire asking the Annual Representative Meeting to consider that calculation and comparison of individual doctor's prescription costs was misleading unless there was also an estimate made of the related cost of sickness benefit and reference to hospital. Dr. DAVIES said that good prescribing

might well save money, but it did not necessarily follow that costly prescribing did so. He had no idea how the G.M.S. Committee should go about obtaining the information to justify or to refute the suggestions made in the motion.

Dr. REID said the implication was that if a doctor prescribed normally he would obtain reasonable costs; but sometimes antibiotics, which were initially expensive, reduced the time off work and hospitalization.

The motion was lost.

A motion by Tunbridge Wells, "That this Meeting deplores the fining of doctors for over-prescribing without an accurate knowledge of what that doctor has saved in public money by (a) keeping people out of hospital, and (b) keeping people at work," was moved from the Chair.

Dr. F. GRAY (St. Pancras) pointed out that under the National Health Service a doctor could be found guilty of unnecessary cost in prescribing only on specific items. He was innocent until he was found guilty. Therefore, whatever he had done about sending people to hospital or not was irrelevant.

In the light of Dr. Gray's explanation, the motion was, by leave, withdrawn.

Dr. W. N. LEAK (Mid-Cheshire) moved that 5-ml. syringes should be allowed for administration of streptomycin for patients. Dr. DAVIES said that injections of streptomycin and similar injections were given by district nurses, and he understood that the 5-ml. syringes were provided by the local authority and were used by the nurses in that way.

The motion was lost.

Dr. E. COLIN-RUSS (City) moved that restrictions on transfer of patients should be abolished. The motion, referred, he said, to transfers where there had been no change of residence. It had been held that the delay which was put upon a patient was necessary to exert some sort of control over prescribing. It was also said that patients importuned young doctors in particular for drugs and dressings to which they were not entitled, and those doctors were unwilling to refuse the prescriptions because the patients would run round the corner and get them elsewhere. That was a wrong point of view. The Government should teach people that they were entitled to drugs and dressings which their doctor considered necessary for their treatment.

Dr. A. REZLER (City) added that the reasons given for the regulations were perhaps good in 1950, but they were not good now. Dr. DAVIES said that if the motion were carried it would clash not only with previous A.R.M. policy but also with the policy of the Conference of Local Medical Committees. The fact that a patient had to write a letter of explanation had undoubtedly stopped very many frivolous transfers.

Dr. COLIN-RUSS said, in reply, that he did not know how one defined "frivolous transfer." At the beginning of the scheme possibly there was a fair amount of coming and going, but it had probably now settled down.

The motion was lost.

Dr. K. C. BAILEY (West Somerset) moved that the Meeting express dissatisfaction with the present system of filling vacancies in general practice in England, which allowed a lapse of a period of up to four months between advertising a vacancy and its fulfilment. He asked that the Meeting recommend as a matter of urgency that the present system be overhauled with special reference to the arrangements in force in Scotland, which worked more rapidly. He pointed out that in England application was made to the executive council; there was one month's wait for appeal to the Medical Practices Committee and another month for appeal to the Minister. In Scotland, on the other hand, application for appointment was made to the executive council and appeal was made to the Medical Practices Committee. Dr. L. F. KEENAN (Harrow) supported the motion.

Dr. DAVIES said that the matter had been taken to the Ministry at the request of the Representative Body many times, and in 1957 both the Representative Body and the Conference of Local Medical Committees accepted the recommendation that the matter should not be pursued any

further. As a result of representations to the Ministry there had undoubtedly been a great improvement, and he understood that the average time taken now was about two months compared with four months some two or three years ago.

The motion was lost.

The following motion by Harrogate was accepted as a reference to Council: "That medical records returned by practitioners to the executive council in respect of patients leaving this country be retained by the executive council concerned for a period of five years for use should the patient return to this country during that period."

Dr. J. C. ARTHUR (Gateshead) moved that municipal dental clinics be liable to pay for the arrest of dental haemorrhage as was a private dentist. He said that it left a gap in an otherwise admirably working scheme. Dr. H. M. COHEN (Birmingham) pointed out that as far as the school health service was concerned payment was made for the arrest of dental haemorrhage. Dr. DAVIES said that in view of the co-operative attitude of the Ministry on the matter he did not feel that it should be pursued any further; but if any difficulty arose in any area the G.M.S. Committee would gladly take it up again.

The motion was carried.

Merit Awards for General Practitioners

The CHAIRMAN moved on behalf of Trowbridge: "That this Meeting considers that 'Merit Awards' should have no place in the method of remuneration of general practitioners in the National Health Service."

Dr. J. G. FREEMAN HEAL (Willesden) moved by way of amendment: "That this meeting considers that there should be no merit award in general practice of the type at present existing in the consultant services." He suggested that the words "Merit Awards should have no place in the method of remuneration of general practitioners" could be interpreted as meaning that the principle of differential payments to general practitioners for distinction or merit should have no place in their future remuneration. The principle of differentials was incorporated in Spens and had been accepted by the profession.

Dr. J. A. PRIDHAM (Dorset) asked the Meeting to throw out the amendment and pass the original motion. The amendment contained a sting in that it suggested that merit awards for consultants were unpleasant. Every general practitioner would probably agree that merit awards of any type were not suitable to general practice. Dr. O. C. CARTER (Bournemouth), speaking, he said, as a member of the Spens Committee, disagreed with the mover of the amendment that the motion, as set out, was contrary to the spirit of Spens. It was nothing of the sort.

Dr. DAVIES said that both the Chairman of Council and himself were in some difficulty, because after giving evidence to the Royal Commission they were specifically asked to go back and prepare some notes about a possible merit award scheme for submission and consideration by the Royal Commission. The Royal Commission was aware of some of the criticisms which had been voiced by the profession about consultants' merit awards, and there was difficulty also about merit awards and the Pool method of payment. Nevertheless, if circumstances arose in which the Royal Commission had met the profession's claim as a whole, and over and above that wished to give money to the profession for a purpose which it might recommend in the form of merit awards, who was he to refuse it? Therefore Dr. DAVIES expressed the hope that the Meeting would keep the door open, because it was necessary to appear before the Royal Commission again and support the amendment in preference to the motion.

Dr. WAND said that the amendment asked the Representative Body to make a clear-cut decision on whether general practitioners would favour what he would call the secret giving of merit awards to general practitioners. The type of award was to take a certain percentage, and to give the

awards by allowing a committee to go round and make decisions, and then for those decisions to be carried out and for the awards not to be known. If the Meeting turned that down he would take it that Representatives would not in any circumstances wish that type of merit award to apply in the general practice field. If the Meeting passed it he would take it that Representatives raised no objection to that type. "We want to know how you would feel about this, particularly as the Royal Commission is asking for evidence on the possibility of applying a merit award scheme," he continued. A scheme could be devised, but Council wanted to know whether a well-devised scheme, complicated as it might be, would commend itself to the Representative Body if Representatives knew the basis on which merit awards were given.

Dr. FREEMAN HEAL said that passing the amendment would not entirely close the door but would leave opportunity for further discussion and agreement. The motion as it stood was much more final and dogmatic.

The amendment was carried in the following form:

That this Meeting considers that there should be no "Merit Awards" in general practice of the type at present existing in the consultant services.

Dr. J. S. MOFFAT (Cumberland) said that the subject seemed to evoke high feeling and a certain amount of muddled thinking. Merit awards were seen as a threat to the overall remuneration of general practitioners, but a properly adjudged and apportioned merit award scheme should never prejudice a proper level of overall remuneration. Brilliance and application ought to be rewarded, especially when remembering the discrepancies which existed in the real incomes of medical practitioners compared with those of other occupations. He felt that a board of consultants in any area could tell in five minutes who should have general-practitioner merit awards, while consultant merit awards could be very nicely apportioned by a board of general practitioners.

Dr. J. E. MILLER (Glasgow) hoped that the Meeting would reject any idea of merit awards for general practitioners. Such schemes in the consultant fields had created great discontent throughout the profession, causing suspicion and alarm in many places. To introduce it to the general-practitioner field would create different grades of practice throughout the country. If a practitioner required a monetary incentive for good work it should reflect itself in the number of patients he would attract to his list by being a good general practitioner.

Dr. R. M. S. MCCONAGHEY (Torquay) said that, with due deference to what the Chairman of Council had said, the last day of the A.R.M. was no time to consider the pros and cons of such a question—one of the most important subjects which the A.R.M. had had to consider during the last four days. The Representative Body, thinly represented and without the mover of the motion, would be wise to refer it back to Council for discussion next year after the Royal Commission had reported.

Dr. WAND said he hoped that the issue would not be dodged in that way. The Council wanted an expression of opinion from the R.B., and he would suggest as a form of words: "That this Meeting can see no objection to a merit award scheme for general practitioners, provided a practicable scheme can be devised and subsequently approved by general practitioners." Dr. FREEMAN HEAL said he would be prepared to move such a wording, and proposed: "That this Meeting can see no objection to a merit award scheme for general practitioners, provided a practicable scheme can be devised and subsequently approved by the Representative Body." That would provide a scheme which general practitioners throughout the country could debate and modify if necessary.

Dr. C. P. WALLACE (Guildford) said that the R.B. was being dragged by the Chairman of Council into deciding a matter of the gravest importance at a moment's notice, whereupon the CHAIRMAN said he could not allow such language to be used against either the Chairman of Council

An East Denbigh and Flint motion asking that practice compensation should be payable at the age of 70, irrespec-

The motion was lost.

Artificial Insemination

Dr. H. G. DOWLER (Gloucestershire) moved:

That this Representative Meeting is opposed to the practice of artificial insemination by donors (A.I.D.).

He regretted that this matter came so late in the Meeting that there was not much time to discuss it. He explained that the motion was only concerned with artificial insemination of human beings and referred only to artificial insemination by a donor and not by the husband. He brought it forward for two reasons. First, it was a matter with which as doctors they were bound to be concerned. Secondly, in a matter of great public importance such as this a learned profession might be expected to bring forward views on the rights and wrongs, the desirability or the undesirability of it. The individual attitude would depend on many different factors. There were those more concerned with the practical angles and those more concerned with the religious and moral angles. On the practical aspect, doctors were the ones who had to carry out the practice, and in doing so they were forced to subscribe to the making of false statements on the register of births and deaths, which was surely undesirable. There were also the legal considerations. It was necessary to think of the effect on the children if or when they found out. There was the remote risk of incestuous marriage. More important was that of the nominal father later turning against the child which was not his own. The religious side was for each individual to decide for himself. Dr. Dowler admitted that he was most concerned with the moral side. He considered that A.I.D. was tantamount to adultery, and that was the view taken in the House of Lords. He knew that there was another side. There were the sad cases of couples who were unable to have children, but he did not think that any reason to condone something which one considered to be wrong. Dr. Dowler said that whatever decision was made by the Representative Body it was only an expression of opinion. The Meeting had no power of compulsion over any doctors. Doctors must decide for themselves.

Dr. L. F. KEENAN (Harrow) moved an amendment to delete the words after "insemination." He explained that his Division did not have an opportunity before the Meeting to form an opinion. He put forward the amendment as a responsible member of the Representative Body. Artificial insemination in any form was an unnatural act. It was the duty of doctors in advising their patients to assist the natural law and not to encourage breaking it for any purpose whatever. If it was accepted that it was wrong to interfere with the natural law, any breach of it must be wrong. He asked the Meeting to support the amendment.

Dr. C. E. G. GILL (Cardiff) said they stood on the brink of the dangers of the "brave new world," of which A.I.D. was typical. It was not only against nature and Christian morals, but against all the best traditions of British medicine. Dr. F. A. BELAM (Guildford) said there were some cases where normal sexual intercourse was not possible and both partners were keen to have children of their own. Why should that be denied? He was against A.I.D. Dr. C. O'DONOVAN (Leicestershire and Rutland), asking the Meeting to support the amendment, declared that once A.I.D. was allowed in any form the door was opened to a very grave sin. Dr. A. A. VICKERS (Worcester and Bromsgrove) described the amendment as absolute nonsense. Ninety-nine hundredths of what doctors did in their practices in the way of therapeutics was "unnatural." Mr. NICHOLSON-LAILEY hoped the Meeting would not accept the amendment, which fogged the issue.

The amendment was lost.

A further amendment was moved by Dr. C. P. WALLACE (Guildford) to make the motion read:

This Representative Body views with grave concern the increase in the practice of A.I.D.

Lord Blackburn had recently stated that there were 7,500 A.I.D. children in this country at present. One doctor had disclosed that she had been responsible for arranging for 69 such births; another doctor had been mentioned as

having arranged for 1,000. It had all been arranged in a secret, undesirable way. He could not recall the leader of any religious body in this country condemning A.I.H., but the question of A.I.D. was totally different. "Here we are depriving the unborn baby of a father," he said. "We have heard in the last 25 years—and rightly so—a great deal about maternity and motherhood; I suggest to this Meeting that we, as family doctors, we, as specialists, who know about the illnesses of mankind, know also about the importance and the influence and responsibilities of a father." Dr. F. A. BELAM (Guildford) said there was the question of the father afterwards finding it extremely difficult to accept a child born in that way. If people wanted children really badly and could not have them themselves, how much better it was to adopt them, when both parties knew what they were doing.

Dr. V. COTTON CORNWALL (Liverpool) preferred the amendment to the original motion. It would be wrong at this stage to say, with any qualification, that in no circumstances at all did the Association believe that A.I.D. was allowable or desirable. "We should not give Council the idea that they should go before any Government committee and say that this is the policy of the British Medical Association," he said. Dr. J. S. McLAREN ORD (Glasgow) agreed wholeheartedly. In so important a matter it was not right completely to close the door.

Dr. Wallace's amendment, "That this Representative Body views with grave concern the increasing practice of artificial insemination by donors," was carried by 101 votes to 84.

Speaking as Doctors

Opening the debate on the amendment as a substantive motion, Dr. DORIS ODLUM (Bournemouth) said the Association was being asked to speak primarily as doctors and not to have regard to the emotional side. If its members were asked to give evidence before the committee of inquiry they would be asked to speak as doctors. The medical point of view would have to be considered first and secondly the medico-social aspect. Medically, the profession had no knowledge whether A.I.D. was good or bad, dangerous or helpful; on the medico-social side the question had not received anything like adequate consideration. "If we condemn A.I.D., any child born by it will be socially handicapped," she said, "a handicap created by us, by our condemnation, just as we do with the illegitimate child. If we disapproved of it we shall certainly drive it underground and lose control of it." The fact remained that it was being carried out by reputable doctors. The Representative Body must therefore have careful regard to the fact that its function was to speak medically and medico-socially; it would make itself look very foolish and undignified if it came down into the arena of personal emotions. It would probably be safer to pass the matter to Council for further investigation.

Dr. K. M. TOMLINSON (Gloucester) said he had been surprised to hear the last speaker say that A.I.D. would be considered socially wrong. No figures were yet available, because the children so born had not yet reached the age of 5. If any mother's desire for her own child was so overwhelming that she would allow A.I.D. in preference to the well-tried method of adoption, did that not suggest to practical doctors that there was some degree of pathological adjustment? he asked. Or had the desire to educate been modified by some unrecognized power of direction? But both those considerations paled before the possible effect upon the child—and that was a matter upon which practitioners could have no doubt. Day in and day out doctors saw tragedies of maladjustment due to emotional conflicts during early life. It was an established practice for children to be told they had been adopted, but was it possible to tell a child at any stage, before or after puberty, that it was of artificial origin? "I say 'No,'" he said. "To help one unhappy woman does not, to my mind, justify our help in the production of an almost certainly unhappy child. Support this motion, and, in its condemnation, encourage the Government to make the procedure illegal."

Dr. H. RYAN (Glasgow) said the R.B. ought not to refer the matter to Council but should make up its mind at once and give the Council some guidance. The way to do that was to carry the motion as amended. Dr. A. BARKER (Council) asked for a reference to Council. The meeting was in danger of being swayed by emotion. He could not believe that at the moment the R.B. could, entirely without emotion or bias, come to a firm decision.

Dr. WAND said that enough had been said so far to give the Council a picture of what was in representatives' minds. "You are worried about this business," he said; "you cannot determine what your lay attitude of mind is towards it. On the purely medical aspect you are probably prepared to give any assistance you can to any committee that may be formed, if requested. On the religious, legal, and emotional issues you are not too anxious to give a firm opinion on this subject." (*Cries of dissent.*) Dr. WAND said that if he had not interpreted the feeling of the meeting correctly, perhaps somebody would produce a motion which would clarify any of those points. He had thought that what would ultimately come from the discussion would be an authorization to Council to give any evidence that might be requested by a Government department on the subject, provided that such evidence was limited to the medical aspect—which included the psychological aspect also.

Dr. H. G. DOWLER (Gloucestershire) said that the Representative Body was quite capable of making up its mind on such a matter, difficult as it was. To argue in favour of A.I.D. because it brought happiness in some cases was false. Doubtless there were many bigamists whose action had brought great happiness; but that was no argument for bigamy. Dr. A. R. FRENCH (Marylebone) pointed out that, while bigamy was illegal, A.I.D. was not, as yet. As to the giving of false notifications, no doctor could be forced to do something illegal, for that would be perjury. The only legal aspect of A.I.D. so far as the doctor was concerned was that he might be placed in a position, under the Notification of Births and Deaths Act, of being under a statutory duty to give information to the Registrar relating to the birth, which would include the name of the father. If the informant of the registrar, who was usually a relative, did give the name of a husband in a case of A.I.D., that would be a perjured statement. The doctor attending the birth might not know the name of the putative father, because he might not have arranged the A.I.D. Obviously, in such a case that doctor would say, "I do not know the name of the father," or "I am not prepared to give it to you." But he could not be forced to perjure himself.

The CHAIRMAN put the motion, "That the matter be referred to Council," and this was defeated.

Dr. J. R. BAKER (Scunthorpe) said he had been willing to accept the elimination of the words "by donor," and that had been turned down; he had then been asked to vote that he "viewed with concern this increasing practice," but to say that would mean that he partially accepted it; to say "I do not view with increasing concern . . ." would mean that he approved of it. The amendment had put a lot of representatives in a quandary, and he associated himself with those who wished to have the matter referred to Council.

Dr. R. LL. MEYRICK (Lewisham) moved, as an amendment to the substantive motion under discussion:

That this Representative Body does not oppose A.I.D. in carefully selected cases and is prepared to support Council in giving evidence to any legitimate body in so far as the evidence is confined to the medical aspects alone.

While he was anxious to avoid any emotional or religious conflicts, it was clear that by confining consideration to the medical aspects the only conclusion which could be reached was that there were indeed cases—few or many, but some cases—where A.I.D. was allowable and acceptable. Dr. G. S. R. LITTLE (Greenwich and Deptford) seconded. He agreed that the emotional aspects should be kept out of the question, for that could be discussed in other quarters.

Incidentally, the "woman"—the person who was most concerned—had hardly been mentioned in the discussion. Dr. KEENAN said that the other day the R.B. had discussed the case of a German doctor being reinstated: was that emotionalism? Was it emotionalism to distinguish between right and wrong? There had been too much talk of emotionalism. "We are either right or wrong. Get on with it," he said.

Dr. E. A. GERRARD (Manchester) opposed the Lewisham amendment, on the ground that there were no cases where A.I.D. was justified. No one, whether wife or doctor, had the right to bring into the world what would in fact be an illegitimate child. Furthermore, it should be asked whether or not there was something peculiar in the mentality of a man who would serve as a donor. "It is contrary to the law of God, and I hope it will soon be contrary to the law of man," he said. Dr. K. M. TOMLINSON (Gloucestershire) thought the amendment was "mucking the meeting about." "Surely we can make up our minds whether we like it or not, say so, and get out of this hall," he said. Dr. F. A. BELAM (Guildford): "I understood that psychiatry was part of medicine? What about the psychological angle to the child born in this way and to the husband of the woman? Is that medical or is it not?" Dr. A. A. COCHRANE (Dartford) said that in view of the tremendous religious and legal importance of the motion, and the fact that over half the seats in the hall were empty, he did not feel that the R.B. should attempt to make any decision on the matter but should refer it to Council.

The CHAIRMAN pointed out that it had already been decided not to refer the matter to Council.

Dr. K. C. BAILEY (West Somerset) said of course it was a psychological question. There really was not enough information about the matter yet. It seemed quite impossible that any body of men, medical or otherwise, could give an unbiased opinion at this stage. Some felt it would be better to set up a committee to inquire into the matter. Obviously there were psychological implications, but nobody knew what they were.

Dr. WAND said the debate was getting to the stage when it would be difficult to vote for or against the motion. He suggested as a new form of wording:

That this meeting, while making no pronouncement on the non-medical aspects of A.I.D., authorizes the Council to submit evidence to the Government committee on this subject from the medical point of view if so requested.

Dr. MEYRICK agreed to withdraw his amendment in favour of the text proposed by Dr. Wand. The latter was then carried as a substantive motion.

"BRITISH MEDICAL JOURNAL"

Dr. J. G. M. HAMILTON (Chairman of the Journal Committee) moved the Annual Report of Council under "British Medical Journal."

Supplement to B.M.J.

Dr. R. H. MOORE (North Middlesex) moved:

That this Meeting deplores the fact that the Annual Report of Council makes no reference to the editorial matter contained in the *Supplement* of the *British Medical Journal*, which in our opinion is not presented in a sufficiently readable condition.

He said that great surprise had been caused in his Division by the Council's failure to make use of the *Supplement* as a means of communicating information to the periphery, particularly for the benefit of those who could not or did not attend Divisional meetings.

Dr. HAMILTON said that the *Journal* and its *Supplement* had always been subject to criticism, and the *Journal* staff were at all times prepared to consider complaints from readers as to the form in which the material was set out; but they were highly expert in their own journalistic field, and the idea that Divisions, or possibly the members of the Representative Body, could edit the *Supplement* or any

other part of the *Journal* had only to be mentioned to be shown to be ridiculous. It would also be remembered that the Tunbridge Wells "Gallup Poll" had disclosed that an overwhelming majority considered the *Supplement* to be adequate. That was not to say that the whole country must necessarily think like Tunbridge Wells, but no other Division had produced any facts. Supposition and opinion were meaningless. If any other Division produced facts and figures relating to the readership of the *Supplement*—fair and good.

Dr. MOORE still felt that the *Supplement* should be used as a means of communication weekly from the centre to the periphery, and he had felt that his motion had been a constructive one.

The motion was lost.

Mr. F. W. SHEPHERD (Huddersfield) moved:

That this Meeting recommends that a short journalistic column of the *Supplement* be devoted each week to summarizing, discussing, and commenting on medico-politics, and not necessarily reflecting official policy in its views, aimed at stimulation of interest in these matters by popular presentation.

The motion was not intended as a criticism of the *Supplement*, but it had been felt that more members would be encouraged to read the *Supplement* and get themselves informed on medico-political matters if there were a bright and breezy column devoted to them each week. Something informal and easily digested was required that would improve intraprofessional relationships.

Dr. S. NOY SCOTT (Council) said he failed to see how anything not reflecting official policy would help intraprofessional relationships in any way. A "bright and breezy" column would be reducing the *Journal* to a popular weekly. "Do you want meetings attended by a song-and-dance act?" he asked.

Dr. HAMILTON said he did not regard the motion as anything but a helpful suggestion of the sort which the *Journal* staff were always content to receive; what they quite rightly objected to was being given instructions. He would be quite content for the motion to be carried.

Mr. SHEPHERD said that if more members of the profession took the trouble to read such a column and learn what was going on, that would improve intraprofessional relations.

The motion was carried.

A Bromley motion suggesting that the R.B. should be informed on the methods of selection and source of information of the "To-day's Drugs" section of the *Journal* was, by leave, withdrawn.

ARMED FORCES

Air Vice-Marshal W. E. BARNES (Chairman of the Armed Forces Committee), moving the Annual Report of Council under "Armed Forces," reminded the R.B. that his Committee included serving, reserved, and retired members of all the three Services. Its greatest effort since the war had been the preparation of the Association's evidence to the Waverley Committee in 1954, the fruits of which were still being gathered.

The report was adopted.

ESTATES

The Report of Council under "Estates," moved by Mr. L. DOUGAL CALLANDER (Chairman of the Estates Committee), was adopted.

"FAMILY DOCTOR"

Dr. O. C. CARTER (Chairman of the Family Doctor Committee) moved the Report of Council under "Family Doctor."

In reply to a criticism of the report on the ground that it did not give a fair representation of a paper's financial position, Dr. Carter said he did not know how that could be said. For four consecutive years *Family Doctor* had

been produced at no expense to the Association and had accrued a surplus over its budgeted figure which had been incorporated in the Association's accounts. This year had been one of success for the enterprise, which had as its object the education of the public in matters essential to health.

The report was adopted.

REFORM OF THE NATIONAL HEALTH SERVICE

Dr. H. H. D. SUTHERLAND (Council) moved the reception and approval of the Report of the Amending Acts Committee, of which he is chairman, and sought the permission of the Representative Body to outline some details which Council had not yet considered. Dr. WAND said that, as the Council had not debated the report to which the chairman of the Committee had referred, it therefore had no recommendations on the subject but would consider the subject-matter in November. While it was proper for a chairman to indicate the lines on which a report would be made, when the Council had not had an opportunity of studying the details it was not proper that those should come from the Committee's chairman.

The report was approved.

A Bournemouth motion viewing with alarm the absence of any proposals for an alternative service was, by leave, withdrawn.

SCOTLAND

Dr. W. M. KNOX (Chairman of the Scottish Council) moved the reception and approval of the Annual and Supplementary Reports of Council under "Scotland." He said that that Committee's main business during the past year had been largely that of arranging the Stated Case on the contractual validity of Spens so far as it applied to Scotland. As Representatives had already been told, it had now been received by the Secretary of State for Scotland.

The report was approved.

OTHER ASSOCIATION ACTIVITIES

The CHAIRMAN OF COUNCIL (Dr. S. Wand) moved the reception and approval of the Annual and Supplementary Reports of Council under "Other Association Activities."

A motion by Morpeth dealing with "Recruitment to the Nursing Profession" and two by Marylebone on the subject of "Catering" were formally referred to Council.

Remainder of Report

Dr. DORIS ODLUM (Bournemouth), speaking as chairman of the Joint Committee of Doctors and Magistrates, reported that, in accordance with instructions, the Committee had considered the question of the legal attitude to attempted suicide and had produced a report. The matter was one on which questions had been asked in *The Times*. There was now a very good chance of securing legislation on it in the coming session, probably in connexion with the legislation on the mental health services. Discussion had also taken place on the subject of medical reports to the courts, on which ill-feeling often existed between doctors and magistrates. The Committee had now drawn up a brief account of what the Committee considered might be acceptable to both sides.

The remainder of the report was approved.

VOTE OF THANKS TO CHAIRMAN

Dr. W. G. HARDING then moved a cordial vote of thanks to the Chairman on behalf of the Meeting for having acted as "guide, philosopher, and friend" during the last four days—the last quality calling for particular emphasis.

The vote of thanks was carried with acclamation, and the proceedings of the Annual Representative Meeting concluded, after the Chairman had paid a tribute to the work of the entire staff of the Association.

COUNCIL MEETING

At the conclusion of the Annual Representative Meeting, the new Council met at the Queen Elizabeth Hospital, Birmingham. Dr. S. WAND, Chairman of Council, took the chair.

The following motion, moved by Dr. A. BEAUCHAMP, Chairman of the Representative Body, was carried by acclamation:

That the period of office of Dr. Wand as Chairman of Council, which terminates immediately after the Annual Representative Meeting at Edinburgh, be extended by one year so that there may be no uncertainty as to the identity of the Officer of the Association who will hold this office during the Joint Meeting with the Canadian Medical Association.

The CHAIRMAN extended a cordial welcome to the new members of Council: Dr. B. Burns (Sheffield), Dr. R. Cove-Smith (London), Mr. J. T. Rice-Edwards (Newport, Mon.), and Dr. F. Gray (London).

Minutes of A.R.M., 1958

Council agreed that a Referendum was not expedient on any resolution of the Annual Representative Meeting, 1958, and on the motion of the CHAIRMAN Council agreed that the Chairmen of the Representative Body and the Council be authorized to refer the resolutions of the Annual Representative Meeting to the appropriate Committees.

Election of Standing Committees

The Council then proceeded to deal with the business of electing its representatives on the standing committees, the appointment or reappointment of many special committees, and the representation of the Association on outside bodies.

Appointment of Deputy Secretary

A recommendation by the Staffing Committee that, with effect from November 12, 1958, Dr. WALTER HEDGCOCK be appointed Deputy Secretary of the Association was adopted.

Medical Director of Medical Advisory Bureaux

The recommendation was also adopted that the appointment of Dr. R. A. PALLISTER as Medical Director of the Commonwealth and International Medical Advisory Bureaux be confirmed.

Appointment of Assistant Secretaries

Council appointed Dr. D. L. GULLICK and Dr. J. D. J. HAVARD as Assistant Secretaries of the Association.

Intraprofessional Relations

The CHAIRMAN recalled that consideration of a recommendation made by the Organization Committee was deferred by Council at its meeting on July 9 to the present meeting. The recommendation asked Council to authorize the appointment of a member of staff of graduate or equivalent status as personal assistant to the Secretary of the Association, with the object of ensuring an efficient interchange of information between the periphery and Headquarters.

At the suggestion of the CHAIRMAN, Council agreed that the Organization Committee should be asked to present the Secretary of the Association with a clear exposition of that which it had in mind and wished to be done. The Secretary could then proceed to devise means of carrying out those wishes.

BRITISH MEDICAL GUILD

The meeting of Council was followed by a meeting of the trustees of the British Medical Guild.

Dr. S. Wand was appointed Chairman of the Board, Dr. C. Harrower was appointed Treasurer, and the other officers, staff, and executive committee were reappointed.

The financial statement was approved.

ANNUAL GENERAL MEETING

The 126th Annual General Meeting of the British Medical Association was held in the Great Hall, University of Birmingham, on July 14, at 12.30 p.m., with the retiring President of the Association, Mr. WELDON P. T. WATTS, in the chair.

The notice of the meeting, published in the *Supplement* of May 31, was taken as read. The minutes of the last Annual General Meeting, held in Newcastle upon Tyne on July 15, 1957, were taken as read and were confirmed as correct. The balance-sheet and income and expenditure account for the year ending December 31, 1957, were approved. Messrs. Price, Waterhouse & Co. were appointed Auditors of the British Medical Association until the next Annual General Meeting.

The PRESIDENT announced that the President-elect, Professor A. P. Thomson (Birmingham), would be inducted into office at the adjourned Annual General Meeting later in the day. It was also reported that H.R.H. Prince Philip, Duke of Edinburgh, had been elected by the Representative Body as President of the Association for 1959-60.

The Meeting then stood adjourned until 8.15 p.m.

Extraordinary General Meeting

At the conclusion of the Annual General Meeting an Extraordinary General Meeting was held, at which the Articles of Association of the British Medical Association were amended in accordance with the Notice which was published in the *Supplement* of May 31, 1958.

ADJOURNED ANNUAL GENERAL MEETING

The Adjourned 126th Annual General Meeting of the Association was held in the Great Hall, University of Birmingham, on July 14, at 8.15 p.m. The retiring President, Mr. WELDON P. T. WATTS, presided, and among the many distinguished guests present were the Lord Mayor and Lady Mayoress of Birmingham and the Vice-Chancellor of Birmingham University (Dr. R. S. AITKEN) and Mrs. AITKEN.

Induction of President

In installing his successor, Professor A. P. Thomson, as President of the Association for 1958-9, Mr. WELDON WATTS said that he was born in British Guiana, the son of a colonial administrator, and it was probable that Professor Thomson had inherited part of his great administrative ability from his father. Educated at Dulwich College, Professor Thomson studied medicine in the University of Birmingham. During his student career he won many prizes and was the first student in the university to obtain a first-class in the examination for Bachelor of Medicine. Qualifying in 1915, he entered the Army as a surgeon, and was awarded the Military Cross. After the war he spent some time working in the Departments of Pathology and Pharmacology, and no doubt there laid the foundations of his interest in therapeutics.

In 1916 Professor Thomson obtained Membership of the Royal College of Physicians, and was elected Physician to the General Hospital and other local hospitals, where he spent his entire active career in medicine. He became a Fellow of the Royal College of Physicians in 1929. All his active life he had taken a special interest in medical administration, and during his hospital career he served on many committees. As a result of that interest he was elected Chairman of the Planning Committee in the Birmingham Region and had therefore been largely responsible for the development of the new university site.

In the University of Birmingham he was Professor of Therapeutics. In 1951 he was elected Dean of the Faculty

of Medicine and soon afterwards became Vice-Principal of the University. As a result of his tenure of the latter office he had taken a great interest in international university affairs and had attended numerous conferences abroad. He was also a member of the General Medical Council.

"Professor Thomson is a man who holds very definite views and is not afraid to press these views in spite of opposition," concluded the retiring President. "He is an excellent and persuasive speaker. He is a man of many outside interests. He is a keen pedestrian, and he is very interested in archaeology and the arts. There is no doubt that he will make a stimulating President of the Association."

Mr. Weldon Watts then inducted Professor A. P. Thomson as President of the Association, and invested him with the President's Badge of Office.

Tribute to Mr. Weldon Watts

Dr. S. WAND, Chairman of Council, in moving a vote of thanks to the retiring President, said that over many years he could remember no President who had attached himself to the job more conscientiously than Mr. Weldon Watts. "He has attended a greater number of central meetings than I can recall in the case of any previous President," continued Dr. Wand, "and he has shown a great interest in the affairs of the Association, and a friendliness and approachability which has endeared him to us all." That, however, was only to be expected, because Mr. Weldon Watts had been a member of Council for many years, and had been known throughout that time as a great friend of the Association.

Mr. Weldon Watts had represented the Association at many functions, and, together with Mrs. Weldon Watts, had added prestige to the Association. All who were present would recall the meeting at Newcastle upon Tyne, where Mr. and Mrs. Weldon Watts had made everyone feel so much at home and made the visit one which would always be remembered.

Perhaps the most interesting comment on Mr. Weldon Watts's character was the fact that he had endeared himself so much to his pupils. They all loved him very much indeed.

The Association was grateful to Mr. Weldon Watts for all that he had done, and was also very grateful to Mrs. Weldon Watts for the part she had played.

The vote of thanks was carried by acclamation.

In a brief reply, Mr. Weldon Watts said he very much appreciated Dr. Wand's kind remarks and the way in which the company had received them. It had been a great honour to serve as President of the Association, and the best he could wish his successor was that he would enjoy his year of office as much.

Delegates and Overseas Representatives

The following delegates from kindred associations were then introduced to the President by the CHAIRMAN OF COUNCIL:

Dr. Charles Jacobsen (World Medical Association and Danish Medical Association); Dr. J. D. Cottrell (World Health Organization); Dr. H. Grant-Whyte (Medical Association of South Africa); Dr. Bruno Maia (Brazilian Medical Association); Dr. K. M. Gyi (Burma Medical Association); Dr. Tapani Kosonen (Finnish Medical Association); Dr. Valtir Albertsson (Icelandic Medical Association); Dr. Ludwig Nelken (Israel Medical Association); Dr. Fe Del Mundo and Dr. Rosita R. Ramirez (Philippine Medical Association); Dr. D. W. Swijman (Royal Netherlands Medical Association); and Dr. Hayati Sevgen (Ministry of Health of Turkey).

The following representatives of Overseas Branches were next introduced:

Dr. John A. Carman and Dr. W. S. Haynes (Kenya Branch); Dr. I. A. Moollan (Mauritius Branch); Dr. E. M. Clark and Dr. A. Kagwa (Uganda Branch); Dr. Leonard Holroyd (Zambesi Branch); Dr. O. Adeniyi-Jones (Nigeria Branch); Dr. A. S.

Valentine (Sierra Leone Branch); Dr. R. C. Geeves, Dr. A. A. Moon, and Dr. K. C. T. Rawle (New South Wales Branch); Dr. W. J. Hamilton, Dr. H. S. Waters, and Dr. A. P. Crawford (Queensland Branch); Dr. M. E. Chinner, Dr. B. S. Hanson, and Dr. Charleton Yeatman (South Australian Branch); Dr. K. J. Friend (Tasmanian Branch); Dr. K. L. Chambers, Mr. J. Leon Jona, and Mr. R. N. Howard (Victorian Branch); Mr. A. Daly Smith (West Australian Branch); Dr. J. A. D. Iverach and Professor J. L. Wright (New Zealand Branch); Dr. Z. Lett and Dr. George Choa (Hong Kong Branch); Dr. J. D. Llewellyn Jones (Malaya Branch); Dr. N. Dolan, Professor E. N. MacDermott, and Dr. Noel Reilly (Branches in the Republic of Ireland); Mr. D. J. Toomey (Gibraltar Branch); Dr. M. G. Constantiniades (Cyprus Branch); Miss Betty Underhill (Middle East Branch); Dr. W. F. Townsend-Coles (Sudan Branch); Dr. N. J. Abbensetts (British Guiana Branch); Dr. Gweneth O'Reilly (Leeward Islands Branch); Dr. Harry A. Munro (St. Vincent Branch); Dr. A. Dunstan McShine (Trinidad and Tobago).

Fellows of the Association

The CHAIRMAN OF COUNCIL presented to the President the following Fellows of the Association admitted to the Roll in 1958, the first year in which awards had been made, and who were present at the Meeting.

Dr. T. Beaton (Portsmouth Division); Dr. A. Beauchamp (Birmingham Division); Dr. J. A. Brown (Birmingham Division); Dr. J. N. Collins (Peterborough Division); Dr. E. W. Goodwin (Leicestershire and Rutland Branch); Dr. I. G. Innes (East Yorkshire Branch); Dr. J. Kerr (South Lancashire and East Cheshire Branch); Dr. P. A. McCallum (Torquay Division); Dr. H. C. Orr (South Staffordshire Division); Dr. J. A. Pridham (Dorset Division); Dr. E. P. Rees (N. Glamorgan and Brecknock Division); and Dr. Mary B. Stone (Birmingham Division).

Other Fellows admitted to the Roll in 1958 were:

Dr. P. V. Anderson (Bishop Auckland Division); Mr. R. H. Balfour Barrow (Winchester Division); Dr. B. E. A. Batt (West Suffolk Division); Dr. H. Brown (Sheffield Division); Dr. R. S. Elvins (Scarborough Division); Dr. S. A. Forbes (Croydon Division); Dr. C. Frier (Lincolnshire Branch); Dr. P. J. Gibbons (Liverpool Division); Dr. J. B. S. Guy (Cleveland Division); Mr. R. W. Knowlton (Southampton Division); Dr. P. Y. Lyle (Southport Division); Dr. W. A. Mackay (Southport Division); Dr. N. W. MacKeith (Southampton Division); Dr. L. A. Parry (Sussex Branch); Dr. I. M. Pirrie (Mid-Essex Division); Mr. E. C. Tamplin (Portsmouth Division); Dr. G. W. Taylor (Leicestershire and Rutland Branch); Dr. J. G. Warnock (Cleveland Division); Dr. J. Wilkie (Lancaster Division); and Dr. A. S. Wilson (Lincolnshire Branch).

Lord Adrian

On November 5, 1957, the Council resolved that the Gold Medal of the Association for Distinguished Merit be awarded to Lord ADRIAN in recognition of his distinguished services to medicine and particularly his research in the physiology of the nervous system.

Before the PRESIDENT presented Lord Adrian with the Gold Medal of the Association, Dr. WAND read the following citation:

Ninth medical man to have been President of the Royal Society; among the youngest to have received that coveted honour, the Order of Merit; Master of the famous Cambridge college that nurtured Isaac Newton, whose rooms by Great Gate you once occupied; successor to Michael Foster, Nobel Prize and Joseph Barcroft in the Chair of Physiology; pupil winner jointly with Charles Sherrington; Vice-Chancellor of Oxford; of Keith Lucas and, to follow Robert Boyle's description of Pascal, "noble experimenter"—you have, Lord Adrian, received so many honours in so many lands that you honour your Association in coming here to-night to receive its Gold Medal for Distinguished Merit.

From your earliest days at Cambridge—where you created a record for the number of subjects in which you gained top marks in the 1st part of the Tripos—you concentrated your finely tempered mind on the behaviour of the nerve impulse as shown by the electrical concomitants of its passage along the nerve fibre and its origin in the nerve cell. The climax to much of your work came when, with your colleagues, you confirmed the work of Berger on those rhythmical changes in potential in the brain which, through the modern practice of electroencephalography,

yield so much valuable information to neurologists and, from time to time, evidence that tends to confuse the judge in the criminal court.

But the laboratory has not been for you, Lord Adrian, a cloister which separates you from the world of affairs. Your great gifts of mind and personality have been put to the service of your country, not least during the war of 1939-1945. You have served on the Medical Research Council and we are now anxiously awaiting the report of the Adrian Committee on the effects of radiation on patients. Your elevation to the peerage in 1955 strengthened in many ways the representation of science and medicine in the House of Lords.

Yet generations of medical students at Cambridge must have had a picture of you that is probably different from that conjured up by these almost overwhelming distinctions of mind and office, up by these almost overwhelming dimensions. It is a picture of a man bicycling from the Great Gate of Trinity to the laboratory and the lecture theatre, where the complexities of the central nervous system were made to seem even attractive by your skilful use of clinical neurology as an aid to understanding: a picture of a man for whom a host of students have felt affection as well as veneration.

In this great city we may be pardoned if we boast that a distinguished daughter of Birmingham—the late Dame Ellen Pinsent—herelf had a distinguished daughter, who is your wife. We rejoice in this, and, too, we rejoice that activities such as yours have been devoted, in Sir Henry Dale's words, "through so many years to the single-minded pursuit of fundamental knowledge concerning the physiology of the central nervous system."

Association Prizes

The PRESIDENT then presented the Association Prizes. The Nathaniel Bishop Harman Prize, 1958, was presented to Dr. Anthony Leonard Woolf, of Smethwick, Staffs; the Sir Charles Hastings Clinical Prize, 1958, was presented to Dr. William Hugh Lyle, of Newton-le-Willows; the Charles Oliver Hawthorne Clinical Prize, 1958, was divided equally and presented to Dr. Douglas George French, of Kildgrove, the Staffs, and Dr. Robert Smith, of Stanwell, Middlesex. The Middlemore Prize, 1958, was presented to Mr. Derek Ainslie, of London. The Provisionally Registered Medical Practitioners Prize was presented to Dr. William Watson Littler.

Scientific Exhibition, 1957

Awards for exhibits at the Scientific Exhibition, 1957, were presented to Dr. D. Geraint James and Dr. A. D. Thomson, of the Middlesex Hospital, London, Institute of Clinical Research; to Dr. R. O. K. Schade and Dr. Ernest W. Walton, of the Royal Victoria Infirmary and King's College, University of Durham; and to Dr. D. A. Pond and Dr. W. A. Kennedy, of the Maudsley Hospital, London, Institute of Psychiatry, Departments of Clinical Neurophysiology, Neurosurgery, and Neuropathology.

President's Address

The PRESIDENT then delivered his Address, which was published in full in last week's issue of the *British Medical Journal* (p. 119).

Dr. A. BEAUCHAMP, Chairman of the Representative Body, proposed a vote of thanks to the President.

The vote of thanks was carried by prolonged acclamation, and the company then adjourned to Nuffield House, Queen Elizabeth Hospital, where members and guests were received by the President.

RELIGIOUS SERVICES

BISHOP'S VIEW ON SOCIAL PROGRESS

A warning against the tendency of welfare schemes to subordinate the spiritual to the material was voiced by the Bishop of Birmingham (the Right Rev. LEONARD WILSON, D.D.), at the official religious service held in Birmingham Cathedral on Tuesday, July 15, for members attending the Annual Meeting.

Speaking of the Welfare State, he said: "The framers of constitutions and social reforms are guided, no doubt, by principles; but what principles are they proceeding on? Is it that the only things that matter are the things which touch the senses, or is it that the things which matter most

are those which are only perceived by mind and spirit? We wish to be fair to the present as well as to the past, but surely it is not unjust to say that most schemes subordinate the spiritual to the material. We often display a spirit which is as self-centred and materialistic as the system that we want to avoid. If our social services and education are leaving out any value which we might call spiritual or of divine origin, then I am not sure that the world that is going to come into being will be very much better than the old."

The utopias which the world sought to build were squalid and would not call forth men's greatest energy or noblest devotion. He was not despising humanistic qualities, nor did he want Christians to separate themselves from enjoyment, but he doubted the value of humanistic endeavours to build a better world if the spiritual qualities were omitted; they would not produce the New Life which God had intended, but rather a continuance of the old ideas which had brought the world near to doom.

"I hope I am not being too pessimistic in seeing little hope of change without a revival and renewal of outpouring of the spirit of God responded to by the spirit of man in creating something which is much more worth while," he said. Singleness of thought, humbleness of spirit, and the worship of God were the things that were needed.

Taking as his text the words of St. Paul, "While we look not at the things which are seen but the things which are not seen; for the things which are seen are temporal but the things which are not seen are eternal," the Bishop went on to describe the contrast between the pagan and early Christian worlds. The pagan world of that time was frankly materialistic, and in many parts it was an age of comfort and personal security; the Christian renounced such privileges, and if he turned his gaze from those things to the vision of eternity it was not because his lot was wretched but because he felt that a deeper and better life was to be found in the things of the spirit. It was a facile generalization which was not true to the facts to say that the Christian found in his religion a refuge from the misery of the world; he had a good deal to enjoy in this world, and if he rejected much he was not running away from its miseries; it was not a religion of "pie in the sky."

"How would St. Paul judge this world of ours," he asked, "with its manifest and absorbing interests, our books and plays, newspapers and novels? Must it not have seemed to him that our view of life was as materialistic as that of the pagan?"

The Inevitability of "Progress"

When contemplating the achievements of the last hundred years in the realm of science and conquests over the forces of nature, it was perhaps inevitable that men's minds should be preoccupied with material things. For more than a century man's inventive genius and skill had been the object of universal admiration, and those things had been relied upon to produce a better world by inevitable and automatic progress. Many were now coming to see that the boasted scientific civilization was in many ways a failure, that the solution to to-day's difficulties lay not in the mastery of the material realm but in the spiritual realm being allowed to master mankind. While to preachers and writers that might sound a commonplace platitude, in fact most people did not believe anything of the kind. Many agreed that the spiritual was important, but they still regarded it as secondary, thinking that the wisdom of this world would solve their problems.

"It is sometimes taken for granted that Fascism and Communism are the only materialistic philosophies," he said, "but our own political aspirations have contributed to the fact that our spiritual vision has become blurred and dim. Democracy has not been all clear gain. In its advance it has swept aside the barriers that impeded the activities of wealth and has assured to wealth a power and influence that it did not have before. All over the world the keenest intellects are enlisted in its service, and most forms of government are made subservient to its ends. Money, from being a measure of value, threatens to become the

measure of *all values*. A library of books, a collection of pictures, these are no longer the standard of the taste and skill of the collector, but rather exhibit the power of his purse."

Where there were so many things worth having that only money could buy, it was not surprising that men should arrive at the conclusion that there was nothing worth having that money could not buy. Students of history were inclined to put everything down to economic causes and physical environments, believing that character was determined only by such external, chemical, and biological matters, forgetting that there had been times in history when other ideals were involved—spiritual ones—the right of conscience, the divine principle of authority.

Jesus Christ had said that He was the Truth. Here, science played its part. Ecclesiastical opposition to the findings of science was a familiar and often-deplored fact. But, after all, it was not so strange, because science was not religion's specialty, and in opposing new scientific findings on their first appearance religious leaders had done what the older scientists themselves had often done. When Harvey had discovered the circulation of the blood it was said that no scientist over 40 years of age had credited his findings. The morals, principles, practices of the scientific life were of the very stuff of religion, and when they moved ahead and religion lagged behind a situation arose which caused religious people desperate concern. One of the major functions of religion was to bestow interior security and steadiness upon individual souls; one of the most mysterious facts about the body was that it would maintain a steady temperature of about 98.4° no matter what weather was outside, from Greenland to the Equator; but man's spirit had no such automatic guardianship against the heats and colds of this feverish and troubled world, and religion endeavoured to supply that need. The need which religion served in giving what St. Paul had called "the Peace of God which passeth all understanding" was real and enduring, but if it merely tried to maintain a steady temperature it would only become a means of establishing the *status quo* and the enemy of all change; so while science went forging ahead and fighting for a definite social order the Church was often lagging far behind the line, trying to give a spiritual temperature to a few individuals at 98.4°.

Science was not only intellectual or inventive; it was a moral matter. Specialization made it impossible to get the whole truth, but there was in science at its best a certain rigorous honesty about facts and the statements made about them which constituted one of the noblest things of to-day, whereas Christians often lagged far behind. That fact hurt. The Churches could sometimes be excused for failing to see behind the achievements of pioneering investigators, but that religions of the times should be less honest than the scientists was deplorable.

"Wherein lies the glory of the life that you help to bring into the world and prolong?" he asked the assembled doctors. "Is it only in its prolongation—keeping alive? Surely not. Behind its disguises of theory and ritual all great religion has one common factor: it sees human life as the adventure of the soul. The most important truth about man is that he has been entrusted with himself, capable on the one hand of dismal failure and, on the other hand, of high adventure in the life which is Life indeed. All great religions set men the task of grappling with themselves, supplying the motive and the driving power, the insight, and the hope, and it is this hope that will lead men to a place where they wrestle not so much with themselves but with the Spirit from whom their spirit came, to be conquered by whom is victory and to serve whom is perfect freedom."

A large congregation of doctors in academic robes occupied the nave of the cathedral.

Accompanying the Lord Mayor of Birmingham (Alderman DONALD JOHNSTONE) were the Association's incoming President (Professor A. P. THOMSON) and the Chairman of Council (Dr. S. WAND).

Evensong was conducted by the Provost (the Very Rev. MICHAEL CLARKE, M.A.), and the cathedral choir was under

the direction of Dr. WILLIS GRANT, F.R.C.O., organist and master of the choristers. The lessons were read by Professor THOMSON and Dr. WAND.

ROMAN CATHOLIC SERVICE

The importance of close co-operation between doctors and priests was emphasized by the Right Rev. Mgr. VALENTINE ELWES, M.A., on Sunday, July 13, when addressing Catholic doctors at the Association's annual Roman Catholic service.

Over 120 doctors, many accompanied by their wives, attended Pontifical High Mass in St. Chad's Roman Catholic Cathedral, Birmingham, celebrated by the Most Rev. Dr. F. J. Grimshaw, D.D., Roman Catholic Archbishop of Birmingham. Those present included the Association's President for the 1958-9 session, Professor A. P. Thomson.

"We priests have the care of souls; you have the care of bodies; body and soul make up the whole man," said Mgr. Elwes. The teacher dealt only with the child, the youth, and the adolescent; the lawyer dealt mostly with people in trouble—such as financial difficulties—but doctors and priests looked after the man all through his life, from birth to death, from baptism until he passed from this life to the fulness of the life to come.

"We must work together and thank God that there are so many magnificent Catholic doctors," he continued. "Any priest who has a really good Catholic doctor in his parish often thanks God for it—and there are many such."

Doctors and priests often had the same battles to fight, the same problems to face. They must fight side by side, on God's side, against the teaching of false prophets.

"You, because you are men of science, really have a greater impact on the world than we," he added. "We priests are regarded so often merely as bigoted men of God. But you are men of science, and if you are not only a man of science but also a man of God your power is greater than ours in influencing people."

The insidious false prophet was like a willowy lamb—charming and attractive, but was really a ravenous wolf—ravenous not for bodies, but for souls; his ideas looked attractive, luscious, delicious, like cherries, grapes; in fact they were deadly nightshade—poisonous to the soul.

"You probably have to face therapeutic abortions," he added. "All right for the body: but what about the soul? You see it wounded, bleeding to death, dying."

Birth prevention, he said, solved a problem so far as the body was concerned, but marriage was a union of two joined together by God, and the cement which joined them was His love; that love, which was a real, deep love of the soul, was the foundation upon which the whole edifice of Christian civilization was built. But with birth prevention that love was seen to be corroding, crumbling, dying. Wherever human love fell away from divine love it was always human love that died. Winston Churchill had described birth prevention as "the most pernicious invention of modern times."

"God has work for you to do and he has work for us priests to do," he said. "We are a little corner of His vineyard where he has placed us. Jesus Christ needs you in that corner of his vineyard and you need him. Without Him you can do nothing."

The mass was sung to the ninth Gregorian setting, "Cum Jubilo," the offertory motet being the plainsong "Christus Vincit."

The green, gold, and purple vestments of the officiating Archbishop and the clergy blended colourfully with the academic robes worn by the doctors assembled in the nave.

A reception and luncheon given by the Midland Catholic Medical Society in the Medical Institute Hall, Harborne Road, Edgbaston, followed the service.

JEWISH SERVICE

The apparent popularity of medicine as a profession among Jews was explained by the Rev. Dr. CHAIM PEARL, chief minister of the Birmingham Hebrew Congregation, at the service at Singers Hill Synagogue on July 12.

The all-embracing concern of Judaism for the whole of man, his physical well-being and his spiritual peace, his material needs and his religious longings, his body and his soul, life in this world and his existence in the next, was one of the unique features of the Jewish religion, he said. "We are not afraid to put man's physical well-being side by side with his spiritual perfection," he explained. "We ask for a life of bodily health as well as one characterized by the love of God and the fear of Heaven."

Connexion Between Religion and Medicine

Dr. Pearl noted that increasing recognition was given to the connexion between religion and medicine, between faithfulness to God and to the laws of health. True health was that state of wholeness in man which was pursued when body and mind were obeying the laws which God laid down as the foundation of this world. Furthermore, medical science had long ago recognized that one of the greatest factors leading to man's recovery to health was the patient's own state of mind, his determination to recovery, his will to live. "Ultimately such a mental state rested on faith. Faith in God, an all-knowing, all-good healer—the source of life."

Turning to the comparative popularity of medicine as a profession among Jews, Dr. Pearl quoted from the *Jewish Encyclopaedia*: "Medicine was an integral part of the religion of the Jews." He commented: "We can see why this should have been so with Judaism, which has something to say on so many aspects of our physical life."

Abraham's Hospital

There was a tradition in Jewish folklore that Abraham set up a hospital at Beersheba for the care of the sick and the needy. Whether there was much historical value in such a legend was not so important as the fact that it was told, not only to praise Abraham, but also to inspire an example in his followers.

"Even God Himself is described in the Bible as 'the great physician,'" continued Dr. Pearl, "and the Jewish religious ethic of *imitatio Dei*—imitating God—would apply here too. As we conceive of God as a healer so we follow His ways in acts designed to bring healing and relief to our fellow men. I think it fits in well with the character of the Jews, who are described as 'merciful children of a merciful father.'"

Maimonides the Physician

In the Middle Ages, otherwise characterized by ignorance, superstition, and plagues, the Jew often brought his wisdom and charity to the act of healing. Perhaps the most famous was Moses Maimonides, the twelfth-century scholar and sage who was court physician to the Caliph in Cairo and whose services were looked for by King Richard I of England. Like many others, Maimonides practised as a physician from the religious point of view, declining to earn a livelihood from his knowledge; he regarded his skill as a way open to him to serve his fellow men.

In a letter describing his day Maimonides wrote: "Patients go in and out until nightfall, and sometimes even, I solemnly assure you, until two hours or more in the night. I converse with and prescribe for them while lying down from sheer fatigue, and when night falls I am so exhausted that I can scarcely speak."

Maimonides was typical of numerous loyal Jews who practised medicine as an expression of the ideal of service. It was more than probable too that their Judaism emancipated them from superstition and from crude or erroneous notions of nature which held the rest of the world in chains for centuries.

The Place of Optimism

"And finally," said Dr. Pearl, "there is an optimism about Judaism which strengthens the work and spurs the efforts of medical men. In Jewish teaching this world is good, very good. But not perfect. Judaism does not teach us to negate, reject, or withdraw from the material world, in spite of its imperfections. God made it. And if in our

eyes it is imperfect, it is a challenge to man to work as a co-partner with God in completing the act of creation—in ridding the world of disease and illness."

A long time ago a great Talmudic sage suggested that God created the remedy before bringing on the illness. What he meant was that in the economy of the universe an antidote existed for every affliction. There was somewhere a cure for all ills. That was perhaps a natural law. All that was required was that the energy, inventiveness, and faith of man should discover what already existed.

God's Will

"That God leaves us to do the discovery is, we believe, God's will in granting man freedom to think and to act," concluded Dr. Pearl. "This then is also an element in Jewish optimism, which looks to the day when, strengthened with knowledge and encouraged by his faith, man will have learned to overcome all powers of evil that afflict the mind and body of human beings—humanity will be at peace and the true Kingdom of God established on earth."

After the service a reception was held in the communal hall of the synagogue.

OVERSEAS CONFERENCE

The Overseas Conference in connexion with the Association's Annual Meeting was held at Birmingham on July 16, Professor D. E. C. MEKIE, Chairman of the Overseas Committee, occupying the chair. Dr. S. WAND, Chairman of Council, and the Secretary attended the conference.

The CHAIRMAN explained that the conference could not be fully representative of all overseas Divisions and Branches and therefore could not have executive power or come to decisions, but the opinions expressed were of the utmost value. Overseas Branches were divided into two groups. The first consisted of those in countries with full autonomy, in which the Divisions and Branches of the Association also possessed such powers; the second consisted of Divisions and Branches in those countries for which the Council of the Association in London had a direct responsibility.

Assistant Secretary's Report

Dr. E. G. GREY-TURNER (Assistant Secretary), presenting his annual report, said he would try to explain how the Association attempted to look after the interests of its overseas members. The overseas Branches were all represented in the Representative Body, which had just met and which was the ultimate controlling authority of the Association. Every overseas Branch formed a constituency in the Representative Body except for the Irish Medical Association—a group of 26 branches of the B.M.A. which together formed one constituency. The overseas Branches were also represented on the Council by seven members. The Overseas Committee, which handled most of the day-to-day affairs of overseas members, consisted of the four chief officers of the Association *ex officio*, the seven overseas representatives on the Council, two members appointed by the Council to act as additional spokesmen for overseas in the Council, two members appointed by the Representative Body for the same purpose, one member appointed by the Organization Committee, and two co-opted members. In London, the Committee negotiated with the Colonial Office, Commonwealth Relations Office, occasionally the Foreign Office, the head offices of big commercial firms, and other authorities, but with the granting of more and more self-government in the British Commonwealth less and less authority and responsibility was retained in London; more and more negotiations on behalf of members were undertaken by the local B.M.A. Branches. The officers of the overseas Branches in nearly all cases were busy practising doctors who had little time to cope with the amount of work required. Yet, if matters were referred to Headquarters in London, the authorities with whom it dealt were no longer the real adversary. The real adversary was some

remote overseas Government. Most overseas Branches could not think of affording full-time officials.

For the next 10 to 15 years the problem would present great difficulties. One solution was that, when a problem arose which could not be handled in London, head office would send an official out to the area in question. Another solution might be the appointment of part-time medical secretaries to do the routine work. East Africa seemed to be a region where the Branches might be thinking along such lines. In due course, it might be that overseas Branches would have to have full-time officials in their areas. Dr. Grey-Turner went on to report on such problems as the supply of information to candidates for overseas appointments, private practice overseas, and salary revisions and gave representatives inside information on the difficulties that had to be surmounted. "We at the head office are very well aware that we had something like 25,000 overseas members," he concluded, "and that they expect us, quite rightly, to take just as much interest in their affairs and trouble over their problems as do the members in the United Kingdom, and I assure you that we try to do so."

Discussion

Dr. LLEWELLYN JONES (Malaya) said that Malaya had recently joined the Commonwealth as a full member. He said how indebted he felt to the Overseas Committee for the reception that they had given him personally and every other member of the meeting. He represented both the Asian and the expatriate members. They worked together with great cordiality and amicability. There had formerly been two separate bodies representing the doctors in Malaya: the Malayan branch of the British Medical Association and the Alumni Association. Since independence great interest had been shown in the formation of a Malayan Medical Association; he thought it was inevitable that that would come about, and it was proper that it should. Many hoped for cordial and continuing links with the British Medical Association. Whether it was to be separate, affiliated, or incorporated would be decided by a meeting to be held in September or October. It was his own hope, and that of the Malaya Branch, that the majority of doctors in Malaya who formed the new association would plump for incorporation. However, he felt that any increase in the Association's overseas subscription would affect adversely the continuation of the Malaya Medical Association as an incorporated body with the British Medical Association. He asked that the matter receive the consideration of the Overseas Committee, and, possibly, of the Council. There were many who did not wish to see the new body separate, but little matters, particularly of finance, might have a greater effect than could be imagined from the United Kingdom.

Dr. Jones said he had been interested in the suggestion of Professor Wells that some registrars and consultants might be seconded from Britain for service overseas; the value to the individual and to the country he went to work in would be immense. There was little in the professional world that Britain could do to-day which was of more importance than such interchanges. It was being found in S.E. Asia, and outside Malaya even more so, that charity was resented but technical help was appreciated. Such a proposal would be technical help in the best possible way.

Great anxiety was being felt about the Overseas Civil Service. He believed that the Commonwealth concept was of the utmost value to the doctors and all others serving in his territory and that the interchange of persons between the countries of the Commonwealth was of the greatest importance. Two great countries, the U.S.A. and Russia, faced each other, but there was also a third force: the moral, political, and intellectual force of the Commonwealth. It was something that should be fostered. He asked that the Association should try to hammer out a scheme of service whereby there could be full interchange

possibly between the National Health Service and the services in the Commonwealth countries. That would be the most valuable thing that the Association would have done on overseas matters certainly over the last 25 years.

Sense of Insecurity

Dr. J. A. CARMAN (Kenya) said that there was throughout the colonial medical service a deep and increasing sense of insecurity and a manifest lack of new recruits for that reason. It was not really very surprising. If he were a young man again he would not go out to the colonies with the same feeling of exuberance as he had done 32 years ago. There was a need for a scheme whereby a man could feel that if his job fell through he would not be "on the beach" for five or ten years. Unless a reasonable answer was found, the chances of continuing to staff the colonial dependencies would grow increasingly remote. Those already there were young men with perhaps 10 years' service, who had wives and children to educate, and they were wondering what would happen to them in ten years' time.

The alterations to salary scales suggested were fairly satisfactory, but there was a feeling that the idea of supplementary pay for those engaged overseas should be retained. If the retirement age were raised a lot of people would complain that it stopped promotion; but they could not have it both ways. The consensus of view was that the age should be raised or that a man should remain in the service until he had earned the maximum pension.

With regard to private practice, said Dr. Carman, people were still allowed, particularly in his own field of anaesthesia, to earn money in private practice, so there was competition with those trying to supplement a Government pension; sometimes that competition was a little unfair when those doing private practice were using Government facilities.

He was absolutely confident that, if the reasons were explained to them, those in the Kenya area would certainly feel that there was every justification for paying the suggested increase in the subscription. It was, after all, much less than those in England were called upon to pay and he thought it was entirely justified.

Dr. O. ADENIYI JONES (Nigeria) said that a lot of attention was being paid in his area to developing the local B.M.A. Branch. While they could not hope to attain the heights achieved in Australia and New Zealand, he thought they might have separate offices, libraries, and funds. The parent body was unable to do anything about negotiating now that Government responsibility had been transferred to local areas, but perhaps they could give some help in such matters as libraries and loans. He appealed to all doctors in colonial countries to realize that they had a special responsibility to take an interest in matters other than purely clinical. They came out to the colonies as men who were trained and educated and must consider themselves leaders and teachers in a much wider sense of the word than would be required in Britain. But even here it was time that all doctors took an interest in the day-to-day life of people among whom they lived. If each doctor did that in his own territory it would resolve many of the differences between Europeans and Africans. He was happy to say that such relations were blossoming in his own country, and he hoped that that would set an example to several other countries, showing that it was possible for people of different races and backgrounds to work together amicably.

The Nigeria Branch's greatest strength lay in the parent body; without it they could not face the Nigerian Government. Nigeria was anticipating independence in two years, but there was no idea of kicking people out. No one with any degree of honesty could say, "We don't want doctors or engineers or anything like that." Politicians merely copied what they imagined the people in power before them had done; often they copied it wrongly. The difficulty could only be dealt with by having people to point things out to them.

It was hoped that in a few years there would be a Nigerian Medical Association which would be an associate member of the B.M.A. Nigeria had everything to gain from the Association and nothing to lose.

Transfer of Officers

The CHAIRMAN, dealing with the problem of security for those entering H.M. Overseas Civil Service, said there were some territories where the rate of development was slow and where they could continue to employ expatriate doctors. For instance, there had been no move to have a local service for St. Helena or Ascension Island. It might be possible to transfer officers from an area attaining its own independent service to other territories which needed them, to have a more widespread Commonwealth service. In the past officers had been able to select their areas; in the future they might be unable to do so.

Dr. Z. LETT (Hong Kong) explained that the reason why Hong Kong was on the "black list" was that the doctors there were subject to the same conditions as all other Government servants and therefore to the policy of the Hong Kong Government of discriminating between male and female civil servants; it was improbable that any exceptions would be made in the case of doctors, so the disparity would be cured only if the discrimination was abandoned throughout the whole of the Government Service. He had received a wire from his Branch stating that the Branch Council in Hong Kong agreed to the increased overseas subscription in the circumstances.

All registered practitioners in Hong Kong were eligible for membership of the Association and could attend all the functions, whether scientific or social. His members very much appreciated visits by B.M.A. officials at any time, but felt it was best that, if possible, such visits should be restricted to the occasions when advice and help on negotiations were specially needed.

Miss B. UNDERHILL (Middle East) said that in her district there was a very active B.M.A. Branch, ranging from Tehran, in the north-east, to Beirut, in the west. Most of the people not living in the city concerned had a journey of anything up to 1,000 miles in each direction in order to attend meetings; despite this, more than 400 had turned up at the annual meeting in Basra last November and December. There had been two eminent guest speakers from England. The members had been wonderfully entertained by their very good friends the Iraqi people. She had had a letter from Dr. Kinsella, the Branch Secretary, saying that the Branch agreed to the increased subscription because it was thought to be only reasonable in view of the postage.

Dr. A. S. VALENTINE (Sierra Leone) also commended the suggestion about consultants being seconded overseas for a short while. He wondered whether the Overseas Committee could produce some sort of scheme ensuring for all some sort of security of tenure. The Colonial Office had given him useful information before going to Sierra Leone; they had put him in touch with two or three people who had been most helpful. He asked whether the Commonwealth Advisory Bureau could do something on similar lines, as there were always doctors on leave from territories to which others were going.

His Branch had decided that they had no objection to the overseas subscription being raised, and he was quite sure it would not result in any reduction of membership there.

Dr. H. A. MUNRO (St. Vincent) expressed his thanks to the Overseas Committee on behalf of "a very tiny Branch in the West Indies." The Branch secretary had written to him saying that the members agreed entirely with the views set out in the letter recently received from the Overseas Secretary on the subject of increased rates and were happy to be able to say that they could pay the additional guinea. He thought private practice would continue in his area until the Governments decided not to pay retaining fees but to give appointees a decent living salary.

Mr. K. C. T. RAWLE (New South Wales) said that Australian subscriptions to their own Branches varied between

12 and 15 guineas, which had to be paid in addition to the Association's overseas subscription; members were "not quite so keen" on paying that extra guinea. They did not wish to be subsidized by the parent body to the extent of some £25,000—having some pride, they wanted to pay their way—but they had to go cautiously. The Australian Branches had considerable autonomy over the question of fees, but the Branch council could not raise the subscription without an annual meeting of members. He thought that his members would not object unduly to the extra guinea if they could be shown why it should be paid, but the matter would have to be decided by a general meeting and he was unable to guarantee anything at the present stage.

Dr. L. H. HOLROYD (Zambesi) also thanked the committee for the entertainment he had enjoyed in Birmingham. In areas where the Government doctor was the only one for many hundreds of miles around or where his only colleagues might be missionary doctors 50 or 100 miles away, there was no question of "selecting" private practice; he just had to do it. It was quite impracticable to do it out of Government hours, because he might be called out at any time, irrespective of his normal hours of duty; in any case, full-time Government practice meant 24 hours a day. He thought the Southern Rhodesian Government had hit upon the best solution—giving doctors a private practice allowance of £200 a year in lieu of private practice. The doctor could do private practice to any extent to which he was called upon for it, and if his earnings from that fell short of £200 the Government would make up his allowance to that amount. That system did recognize that a certain amount of private practice had to be done, but it did not place the doctor who did it in an advantageous position over his fellow-doctors situated in a town area where there were private practitioners.

Transferring doctors from one area to another, as had been suggested, would create considerable difficulties in cases where a doctor had spent many years in a particular part, had his roots there, and was educating his children there.

The CHAIRMAN said that, once again, it had been a most valuable meeting. He reassured members of the interest that his committee took in overseas affairs. Three matters, he explained, were exercising the thoughts of the Overseas Committee at present. First, they wanted to ensure that overseas Branches and Divisions had the necessary mechanism—particularly in the "development" countries—to enable them to talk to the local Governments with adequate powers. Secondly, they were concerned at the difficulty which doctors coming back from abroad experienced in getting employment in the U.K. The Committee felt that the Government which recruited those doctors should take a far greater degree of responsibility for the security of their future careers. Thirdly, the Committee felt that there was still a job for doctors from this country to do overseas; it was part of Britain's great heritage. "We are doing all we can to ensure that that will be possible, but we do not want it to be at the sacrifice of the individual man; we think that is unfair," he said. "You can't tell him to go overseas when you know that in five years' time he will be 'on the beach.'"

Professor MEKIE closed the meeting with the words, "Let us know what we can do for you, but tell us what you want us to do, because we are not going to interfere with affairs which are properly run."

OVERSEAS LUNCHEON

The luncheon to overseas representatives was held at Edgbaston Golf Club on July 11, when some 60 representatives were present. The Chairman of the Representative Body, Dr. A. Beauchamp, welcomed the visitors, and Dr. M. E. Chinner (Adelaide, South Australia) replied.

HONORARY DEGREES AT BIRMINGHAM

At a congregation of the University of Birmingham on July 17 the vice-chancellor, Dr. ROBERT AITKEN, conferred honorary degrees on three medical men, Professor J. S. MITCHELL, Regius Professor of Physic in the University of Cambridge, Dr. IAN GRANT, President of the College of General Practitioners, and Lieutenant-General Sir ALEXANDER DRUMMOND, Director-General of Army Medical Services.

Presenting Professor Mitchell for the degree of Doctor of Science, the Public Orator, Professor O. Hood Phillips, said that, although still in the prime of life, he had long reached a pre-eminent position in English medical science, being in the front rank both as a clinician and as a research worker. He had done more than any other Englishman to further the study of the therapeutic effects of radiation. In all his research he relaxed none of the vigorous discipline that belonged to a Fellow of the Royal Society. Concluding the citation, the Public Orator said: "Achievements of this kind, allied to the qualities of gentleness and humility, are such that the University would be pleased to honour in any man; but when they are found in one of our former undergraduates the University takes a special delight in decreeing that he shall proceed straight to his Doctorate."

After describing the career of Dr. Ian Grant, who received the degree of Doctor of Medicine, the Public Orator said that his genial disposition had made him a successful ambassador of the B.M.A. in various excursions overseas. His reputation was not confined to Western Scotland, where he had been in practice for nearly forty years, but extended throughout Britain and to many Commonwealth and foreign countries. In support of the College of General Practitioners his work had been remarkable, and he had sought to end the divorce between general practitioners and hospitals. Described by his colleagues as "the ideal general practitioner," Dr. Grant had given the whole of his leisure to the voluntary service of his profession.

Presenting General Drummond for the degree of Doctor of Laws, the Public Orator said: "In this diamond jubilee year of the Royal Army Medical Corps it is proper for the University to do honour to the Service in the person of its Commanding Officer." After describing the remarkable progress of Army medicine, he mentioned General Drummond's encouragement of scientific and clinical work in the R.A.M.C. and of improvements in the appearance and atmosphere within military hospitals. An Army doctor was a member of two ancient professions, and General Drummond was a soldier and surgeon who had distinguished himself in both.

Correspondence

Representative Meetings

SIR,—From conversations with other representatives in Birmingham there appears to be general agreement that something should be done to improve the conduct of future meetings. In saying this it should be made clear that there is no criticism of Dr. Beauchamp or Dr. Talbot Rogers, who did everything possible to conduct the business of the recent meeting with dignity and dispatch, but it is felt that the problem must be tackled before the agenda is printed and circulated. The following suggestions are therefore made in the hope that they will be regarded as constructive.

(1) When motions are received from Divisions and Branches which are in agreement with the policy of the Association these should be returned to their sponsors with an explanatory letter. I understand that the Agenda Committee has this power already, and if it were used ruthlessly it would automatically exclude motions commencing "This Meeting reaffirms . . ." (2) The Agenda Committee when the agenda is finally decided should take into consideration

the hours available for the meeting and the number of items to be dealt with, and, if the appropriate stage has not been reached by midday on any day, arrangements should be made to reduce the time of speeches for the rest of that day. (3) Speakers should assume that representatives have read and studied both the agenda and the report of Council, and it should not be necessary to refer to a motion or amendment on the agenda other than by number and it should not be necessary for a chairman of a committee in presenting the committee's report to repeat matter which has already been circulated. (3) Representatives should remember that "brevity is the soul of wit," and that self-explanatory items should be moved formally, and that of the others those commended briefly are far more likely to receive the approval of the Representative Body.—I am, etc.,

Atherstone, Warwicks.

DOUGLAS S. PRACY.

SIR,—The debate on A.I.D., which I had the honour to open at the A.R.M., was a cause of profound dissatisfaction to many of those representatives who were present when it took place. If I interpret their feelings aright, there were two causes for this dissatisfaction.

First, there was strong feeling that the agenda should have been so arranged that the matter came up for discussion much earlier in the meeting. The responsibility for this must rest on the shoulders of the Agenda Committee. Some members of the Committee stated that this had not proved possible, but surely that statement is ridiculous. The purpose of having an Agenda Committee is to ensure that the agenda is satisfactorily arranged, and the plain fact is that in this case that was not carried out. It may be retorted, and with justification, that I, as mover of the resolution, should have asked the meeting to permit a rearrangement of the agenda to enable this motion to be taken earlier and that I failed to do so. Nevertheless, it remains a fact that the Committee placed almost at the end of the agenda a resolution which, it must have realized, was certain to produce a lively debate and to invite the active interest of the press.

The second cause of complaint—in my view the more serious one—was that in the outcome the meeting was prevented from expressing any opinion on the subject of the resolution. This may have stemmed in part from the lack of available time; but it must be admitted that the avoidance of reaching definite decisions and of expressing clear opinions on matters of great moment is becoming all too common, and not only in our profession. It was submitted, and I think widely agreed, that we, as one of the learned professions, have a duty to express an opinion for or against the practice of A.I.D. To our shame we failed to do so. Instead we avoided the moral problem and merely expressed readiness to give evidence before a Government committee if invited to do so. So the public has no means, and will have no means, of knowing what we as doctors think about a matter that is becoming increasingly important, one with which some of us are forced to be intimately concerned. The result of such timidity can only be a loss of respect in the eyes of the public.

If there are any lessons to be learned from this episode, they are that the Representative Body must in future ensure that it has adequate time in which to debate important matters, and that it must not allow itself to be put off facing issues squarely by accepting platitudinous amendments that by-pass the core of matters under discussion.—I am, etc.,

Gloucester.

H. G. DOWLER.

The cost of social security health benefits in New Zealand last year was £478,093 below the estimate, reports Mr. H. G. R. Mason, the Minister of Health. Contrary to expectation the pharmaceutical benefits cost £106,016 less than the previous year, and £510,059 less than estimated. In all other items of health benefits the expenditure was about the same as the previous year, taking into account an increased population and rising costs. In 1956 there had been an increase of more than £500,000 in the drug bill and in 1955 the increase was almost £1m.

MEDICAL STAFFING OF HOSPITALS

The joint working party on medical staffing of hospitals has elected Professor Robert Platt, P.R.C.P., as its Chairman. The working party was appointed by the Minister of Health, the Secretary of State for Scotland, and the Joint Consultants Committee to study, in the light of experience of the hospital service since 1948 and of all other relevant considerations, the principles on which the medical staffing structure in the hospital service should be organized. The members of the working party appointed by the Minister are: Dr. R. R. Bomford, Sir Kenneth Cowan, Mr. H. C. Edwards, Dr. G. E. Godber, Mr. Norman Graham, and Mr. J. E. Pater. The members appointed by the Joint Committee are: Professor John Bruce, Dr. J. D. S. Cameron, Professor Andrew Claye, Dr. T. Rowland Hill, Professor Robert Platt, and Mr. T. Holmes Sellers. The joint secretaries are Mr. N. C. Rowland, Ministry of Health, and Dr. D. P. Stevenson, British Medical Association.

The working party is inviting regional hospital boards, professional organizations, including organizations of specialists, and the associations of hospital authorities to submit evidence. Any other body or person who wishes to submit evidence should notify one of the joint secretaries before the end of October.

APPOINTED FACTORY DOCTORS' FEES

From August 1, fees payable by occupiers of factories to appointed factory doctors for various services under the Factories Acts have been increased.¹ This follows representations made by the B.M.A. to the Ministry of Labour and National Service. The fees are those payable for (1) examinations of young persons as to their fitness for employment in a factory or other workplace covered by the Factories Acts, and (2) periodic medical examinations of persons employed in various processes involving special risks to health. For both (1) and (2) the fee for the first person examined on the occasion of any one visit by the doctor to a factory has been increased from 7s. 6d. to 10s. 6d. Fees for every other examination under (1) have been increased from 4s. to 6s., and under (2) from 2s. 6d. to 3s. 6d. The scales of fees determined by the new order can be varied by agreement between the appointed factory doctor and the occupier of a factory.

The fees payable to appointed factory doctors for which the Ministry itself is responsible (investigations and reports

¹S.I. 1156, 1958. H.M.S.O., London. Price 3d. net.

in cases of notifiable industrial diseases and certain accidents) were increased by the Ministry from June 1. With a few minor exceptions, the new fees payable by employers and by the Ministry are in accordance with the Association's recommendations.

LIFE INSURANCE EXAMINATIONS

Agreement has been reached on a fee increase for certain life insurance examinations as a result of recent discussions between representatives of the B.M.A.'s Private Practice Committee and the Life Offices Association, the Industrial Life Offices Association, and the Associated Scottish Life Offices. When the amount of the proposed sum assured does not exceed £500, and the agreed short form of examination is adhered to strictly, the fee for examination and report on this form will now, from July 1, be £1 1s. The fee for examination and report on an office's ordinary form will continue to be £2 2s.

WAS IT A DRUG?

Whether "complan" was a drug which the executive council was bound to provide was the subject of an appeal to the referees in four cases recently. In two cases they decided that it was, and in two cases that it was not a drug but a food.

For

In the first case, an appeal by the Minister, the patient was suffering from intractable diarrhoea and was being given hydrocortisone and potassium chloride. The full dose of 45 gr. of potassium chloride, however, caused nausea, and 2 oz. of complan was given daily for its potassium content. Under this regime it was possible to reduce the potassium chloride from 45 to 30 gr. a day—a dose which the patient could tolerate. The referees decided that in this case the real purpose of the complan was not to supplement a high-protein diet but to give the patient potassium in a form which he could take, and therefore it was a drug which the executive council was bound to supply—a decision upholding that of the local medical committee.

The other case, in which the referees ruled against the Minister and upheld the local medical committee's decision that complan was a drug which the executive council was bound to supply, was one in which it had been prescribed for a patient suffering from severe nephrosis and other ailments from which he shortly died. For the local medical committee it was contended that the patient's only chance

of survival was to replace protein and vitamins in easily assimilable form, and complan was found to be the only substance of the kind which he could retain. The Minister's representative thought that other preparations would have done as well. The reasons for the referees' decision were not affected by this consideration. It was true, they said, that over a period protein is necessary for human life, that the remedy for protein deficiency is a high-protein diet, and that executive councils had no duty to provide dietary treatment. This prescription, however, they felt could hardly be called dietary treatment. The patient's life was in danger and he needed a rapid accession of strength to meet the crisis. Complan was not given to replace or supplement his ordinary food. They therefore decided that the executive council was bound to provide it.

Against

Of the two cases in which the referees decided that complan was not a drug which the executive council was bound to provide, one was a patient with a gastric ulcer, and the other a patient with a fractured jaw. In the former case it was admittedly prescribed as an addition to a high-protein diet and therefore came under the heading of a food. In the latter case the referees were satisfied that the only reason for giving complan was that the patient had to have his food in a liquid form. It was therefore a food and not a drug which the executive council was bound to provide.

"Johnson's Baby Powder"

A doctor appealed to the referees against a decision of the local medical committee, upholding a decision of the executive council, that Johnson's baby powder was not a drug which it was bound to provide. The patient had an amputation of a leg. The referees upheld the doctor's appeal and decided that in this case the powder was used as part of the treatment for an amputation and not for toilet purposes.

Northern Ireland News

GENERAL HEALTH SERVICES BOARD'S REPORT

The Northern Ireland General Health Services Board has recently issued its report for 1957-8.¹ The Board's principal function (under the National Health Service (N. Ireland) Act, 1948) is to arrange for the provision of and administer the general medical, general dental, pharmaceutical, and eye services in N. Ireland. Not less than one-quarter of its members are medical practitioners. As it is its tenth annual report the Board briefly surveys the ten-year period since the beginning of the Health Service.

Virtually the whole population is now on doctors' lists. The number is now 1,398,250, compared with 1,311,651 in 1949—an increase of over 86,000. The number of general-practitioner principals has also increased, from 704 in 1949 to 737 in 1958. Forty-eight per cent. of the latter are members of partnerships. The average number of patients on doctors' lists in 1950 (the first year for which the figure is given) was 1,890 and to-day it is 1,889. The cost of the general medical services has risen from £881,175 in 1949 to £2,026,751 in 1958.

Prescribing Costs

The demand for drugs, medicines, and appliances is stated to show no signs of lessening, and the cost continues to rise. In the Board's view, one of the obstacles to economy appears to be "the still widely held belief that the National Insurance payment covers Health Services costs and entitles

¹Northern Ireland General Health Services Board, Tenth Annual Report, Year 1957-1958, 1958. Belfast.

the contributor to everything he wishes." During the year 1957-8 doctors whose prescribing averages were high were visited by the Board's medical adviser. No cases, however, were referred to the Central Medical Committee on a complaint of excessive prescribing. The three main factors which, in the Board's view, contribute to the excessive cost of prescribing are (1) the tendency, more marked, apparently, in younger doctors, to order expensive proprietary preparations when there are cheaper official preparations of equal therapeutic value; (2) the ordering of unnecessarily large quantities; and (3) the ordering of a number of items on a form when one or two would suffice.

Complaints Against Doctors

During the year complaints against 11 doctors were investigated, 7 of whom had failed to return with reasonable promptness (as required by their terms of service) clinical records of patients when asked to do so. Two doctors had £25 deducted from their remuneration on this account and the remaining five were warned or reprimanded. One doctor was required by the Committee to ensure that his prescriptions were legible. Only two complaints against doctors came from the public.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Home Confinement Grants

SIR,—I am trying to remedy what I believe to be an injustice in connexion with the non-payment of home confinement grants. A recent case will explain this matter.

A woman wished to have her second baby at home, and this would have been quite in order were it not for the history of some difficulty with the first labour. Clearly it was desirable that she should be confined in hospital, but there was no need for her to lie in there afterwards. I therefore advised hospital delivery, explaining that she would be able to return home a day or so after delivery. At once difficulty presented. She had promised the home confinement grant to those who were going to be her home helps, but if I were to persist with the above arrangements she would not be eligible for this grant even though she would still need almost as much help.

We have here then a situation in which a financial regulation, besides interfering with the proper medical care of a pregnant woman, is encouraging an uneconomic use of precious hospital beds. I have already asked (so far unsuccessfully), and will continue to ask, that the regulation be modified: if all those who agree with me will do likewise then something may be achieved sooner rather than later.—I am, etc.,

Sheffield, 3.

C. SCOTT RUSSELL.

Representative Meetings

SIR,—The Annual Representative Meeting in Birmingham followed what has become a set pattern in recent years in the last-minute rush with which it attempted to complete its business. As usual, on the last day, many items were withdrawn with the permission and evident relief of the meeting, while most others were inadequately and hurriedly discussed by a depleted Representative Body. Two major items and a large number of minor items remained on the agenda on Monday, the last day of the meeting. Although a fair amount of time was spent on each of the major items (merit awards for G.P.s and Gloucestershire's motion on A.I.D.), they were both debated with a sense of hurry which inevitably prevented them being considered as carefully as their importance deserved.

Mr. D. S. Pracy and Dr. H. G. Dowler (*Supplement*, July 26, p. 106) have ably expressed their views on this

subject. I am in full agreement with these except that I do not altogether like Mr. Pracy's suggestion that, "if the appropriate stage has not been reached by midday on any day, arrangements should be made to reduce the time of speeches for the rest of that day." This takes no account of the importance or otherwise of the remaining business for that day. The R.B. often finds it necessary to reduce the time limit for speeches. This is done with the wrong object—namely, to get through more items in a given time. The correct object should be to allocate shorter time limits to speeches on matters of lesser importance in order that the full time may be given to major issues. The following is therefore suggested for the consideration of Council.

(1) That items on the agenda should be designated by the Agenda Committee as "special," "ordinary," and "formal." (2) "Special" items would be those of a policy nature or of major professional or public interest. These would be dealt with early in the meeting and speakers would be given the full time permitted by standing orders. (3) "Ordinary" items would be those reaffirming previous decisions of the R.B., or those of an obvious or simple kind requiring little discussion. It would be necessary to ensure that items in this class were not regarded as unimportant. Some matters of considerable importance do not require lengthy discussion and an example would be the motion on inflammable clothing at this year's meeting. The time limit for speeches on these "ordinary" items would be drastically curtailed. (4) "Formal" items would be those requiring no discussion beyond a formal motion. They would include motions by chairmen of committees to receive and adopt sections of the annual report to which no amendments had been tabled. There should rarely be need for chairmen of committees in such cases to elaborate what has already been said in the annual report. (5) Constituencies putting forward motions and amendments for inclusion in the agenda need not feel that there would be risk of them being stifled by the above procedure. It would be open to the proposer or indeed to any member of the R.B. to move that an item should be redesignated during the meeting, and, provided the meeting approved, that would be done.

The foregoing, if adopted, would not materially shorten the proceedings of the A.R.M., and it is not in fact designed to do so. It would, however, ensure that the really important issues receive the full and careful attention of an alert, unhurried, and undepleted Representative Body.—I am, etc.,
J. E. MORRISON.
Stirling.

SIR,—I do not think Dr. H. G. Dowler (*Supplement*, July 26, p. 106) goes far enough in his letter on the A.I.D. debate. I should like to point out that, with the Guildford amendment, the Gloucestershire motion passed by 101 to 84 votes. It should then have been put to the meeting as a substantive motion and voted upon as such. The "amendment" put by the Chairman of Council was not a true amendment at all, but a different motion raising a new issue—namely, the question of giving evidence before a committee of inquiry which has not yet been appointed. It is under these circumstances that I maintain that the original motion, as set out and passed as amended, should have been put as a substantive motion and voted upon as such. Many people were very disturbed at the fact that a clear lead from the medical profession on A.I.D., for which Dr. Wand had earnestly asked, was not given, and the public are still in ignorance of what the profession thinks, though 101 to 84 would have told them.—I am, etc.,
Guildford.

F. A. BELAM.

Operating Theatre Technicians

SIR,—Twelve years ago the surgical staff of the Birmingham Accident Hospital, faced with the responsibility of providing an efficient 24-hours-a-day service in its operating theatres, accepted the need for well-trained male operating theatre technicians to work alongside the ever-changing theatre nursing staff. Among the reasons for this decision were: (1) The increasing mechanical complexity of modern surgical and anaesthetic equipment requiring the continuous maintenance attention of well-trained technicians prepared to make this work their life career. (2) The acceptance of the fact that theatre nursing staff are not trained to meet

these engineering maintenance responsibilities, are seldom attracted to theatre work for more than a few months or years, and, relying on them alone, the efficient night-staffing of theatres is extremely difficult if not impossible. (3) Our considered view was that theatre equipment would continue to develop along more complicated mechanical lines and that operating theatre technicians must eventually become "key men" in all modern operating theatres.

For these reasons we concluded that an effort should be made to attract men of the necessary educational standard to this work. Our long-term plan was to provide each of our operating theatres with technicians for both day and night work and finally to appoint a head technician in charge of these men and the maintenance workshop we set up alongside our main operating theatre suite. We welcomed in 1946 the formation of the Association of Operating Theatre Technicians and fully support the need for this Association. With its advice we appointed a senior operating theatre technician in February, 1948, who already had 20 years' previous experience in this work, mainly in the Army.

This appointment has been fully justified. By his maintenance of theatre, resuscitation ward, and surgical ward mechanical equipment he has saved this hospital many hundreds of pounds each year. Further, this service has reduced the number of spares we would otherwise have been forced to stock. Our surgeons and anaesthetists completely rely upon him to keep in first-class condition their expensive equipment (at a conservative estimate its capital cost is in excess of £10,000). In addition to this he assists at major operations requiring power-driven tools. His salary on appointment was that of an ordinary theatre sister. We then told him, as his responsibilities increased, that his salary would eventually bear a reasonable relation to the value of his work. In this respect we promised something that now we have not the power to implement. This senior operating theatre technician, after almost ten years of first-class service, remains at the same salary as that of an ordinary theatre sister—namely, £529 a year. The majority of this sum he returns to the national hospital service by a saving in the maintenance of our equipment. Through loyalty and a love of his job he has stayed with us. Now he can afford to stay no longer. In this unwilling decision he is following the example of many technicians who have trained under him and have subsequently gone to better-paid appointments at hospitals abroad, instrument firms, and the Services.

The Association of Operating Theatre Technicians has, after years of effort, failed to obtain recognition of their graduates by the Professional Council of the Whitley Council. This would give them reasonable remuneration for their vital hospital service. The Whitley Council still restricts their remuneration ceiling to approximately £500 a year and classifies them as theatre attendants class I, a status little different from that of an untrained nurse. The Whitley Council has, so far, failed to appreciate the present and future staffing needs of modern operating theatres. The impending resignation of our senior technician will increase the running costs of our theatres, result in the downgrading of their services, and considerably delay the development of the theatre organization we planned 12 years ago.

This decision of the Whitley Council is yet another example of the planning difficulties experienced by medical men with direct treatment responsibilities. Their efforts to provide an efficient and economic service are completely discounted by such decisions of central councils with executive power but far removed from the quality of treatment responsibilities. Though it is accepted that this is the period of the adolescence of our national hospital service, how long must medical men continue to wait before central councils examine potential improvements in our hospital services *on the spot*, before arriving at decisions that can, and in this hospital have, considerably delayed vital progress?—I am, etc.,
Birmingham, 15.

WILLIAM GISSANE.

Scottish Case

SIR,—The prospect of the B.M.A. and the Secretary of State mutually agreeing to lay their differences before the Court of Session holds out very little hope to the profession of an early settlement. I understand that such a procedure, even with full co-operation from the Secretary of

State—which has not as far as I am aware been so far promised—might drag on for months. If the B.M.A. is as sure of the justice of its case and the contractual obligation accepted by the Government in the Spens Report, why has it not sent up a test case, simply suing for the amount involved?—I am, etc.,

Kinlochleven, Argyll.

S. K. LIVINGSTON.

Professional Unity

SIR,—My excuse for offering these reflections is that the need for unity is now the chief theme of the Association's representatives and all routes leading towards that end may be regarded as worthy of scrutiny.

Up until the moment when action in the campaign for increased remuneration was called for, it had been assumed, with the sanction of long practice, that the opinion of the majority of members present at Branch meetings of the Association represented unanimity in the profession. The reality—that there existed a large gap (sufficient at any rate to preclude the implementation of policy devised at the centre and supported by local Branches) between majority opinion and unanimity of viewpoint—emerged only when the issue at stake was one affecting equally every member of the Association.

Considering the general practitioner only, may there not be a simple but cogent reason for the discrepancy in so far as it affected the G.P. vote? General practitioners can roughly be divided into two groups: (1) those in whose weekly routine leisure is a definite and fixed entity; (2) those who have no assistance in their practice and are committed 24 hours a day. Regular attendance at meetings of the Association, where majority opinion is elicited, presupposes a certain amount of fixed leisure. It follows, therefore, that the doctors in group 2, who cannot with reasonable certainty make engagements days or weeks ahead, are precluded from participation in the business of the Association, from undertaking the responsibilities of an office-bearer, and from investing in tickets for social functions they have little hope of attending. The natural consequences are: (1) It falls upon the members of group 1 to carry the burdens of government and to be in pre-dominance on all occasions, scientific, cultural, business, social. (2) In time the members of group 2, although loyal members of the Association, find their connexions with its policies becoming rather tenuous, limited, more or less, to payment of the annual subscription and receipt of the minutes of their local meetings and the weekly *B.M.J.* Nevertheless, they are still alive and voting members. It requires the magnet of a paramount issue to draw them from backstage. But the impact of their decisions rocks the majority caucus.

If this, the question of leisure, is indeed a factor in the profession's inability to attain unanimity of opinion and action, is it not necessary to look at the situation squarely? Is what has been called indifference really inability to find time, under present circumstances? The interests of the two groups might easily differ widely in many spheres, let alone remuneration. Perhaps one of the easiest ways in which to test the existence of these two groups is to take a census of the members who attend the Annual Meeting of the Association. If, apart from the variation in attendance resulting from the yearly change of site, the turnover of members' attendance does not suggest that once in two or three years every doctor takes advantage of the valuable scientific and cultural opportunities these meetings provide, that, in fact, the same members tend to go, year after year, then, in the midst of a learned profession, we have a depressed class. In such circumstances, expensive fees for counsel's opinion are less likely to make the profession one than attempts to smooth out the inequalities of opportunity and standards of living. From evidence given before the Royal Commission it would appear that some of our representatives are not unaware of the existence of group 2, but prefer to ignore its implications.—I am, etc.,

Crocketford, Dumfries.

LEILA SUTHERLAND.

Cost of Prescribing

SIR,—It was interesting to read the comments of Dr. Gerald Gibbens (*Supplement*, July 19, p. 86) concerning the *Prescribers List of Ethical Products* which is published by Unichem Ltd. on behalf of the Unichem Association of Privately Owned Pharmacies. As your correspondent points out, the prices are retail, plus tax, and this is in accordance with the recommendation in the interim report of the Hinchliffe Committee. In point of fact this gives a clearer indication of the cost than the so-called N.H.S. basic price, because on-cost and dispensing fee have to be added to the latter and the normal retail price approximates the actual cost to the National Health Service.

A limited number of copies of the *Prescribers List* for 1958 are available and will be sent without charge to any doctor who cares to apply for one, and a copy of the 1959 list will be sent when published to any doctor who sends his name and address to us at 3, Broadwater Road, S.W.17.—I am, etc.,

London, S.W.17.

F. LEWIS WATSON,
Managing Director,
Unichem Limited.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Archer, W. H.: *Manual of Oral Surgery*. Second edition. 1956.
Baron, D. N.: *Essentials of Chemical Pathology*. 1957.
Beaumont, O. E.: *Medicine: Essentials for Practitioners and Students*. Seventh edition. 1958.
Bensley, E. H., and Joron, G. E.: *Handbook of Treatment of Acute Poisoning*. Second edition. 1958.
Berg, C.: *Being Lived by My Life: A Sort of Biography*. 1957.
Blacklock and Southwell's *Guide to Human Parasitology*. Sixth edition revised by T. H. Davey. 1958.
Brecher, G. A.: *Venous Return*. 1956.
British Pharmacopoeia 1958. 1958.
Brocq, P., and Beclere, C.: *Précis de Gynécologie*. 2 volumes. 1956.
Burwell, C. S., and Metcalfe, J.: *Heart Disease and Pregnancy*. 1958.
Cazal, P., and Elliott, J.: *Les Groupes Sanguins du Système Rh.* 1955.
Clark, W. E. Le Gros: *Tissues of the Body*. Fourth edition. 1958.
de Coul-Marsch, C.: *Rheumatism and Arthritis: the Conquest*. 1958.
Craig, C. F., and Faust, E. C.: *Clinical Parasitology*. Sixth edition by E. C. Fauster and P. F. Russell. 1957.
Davison, W. C., and Levinthal, J. D.: *Complicat. Pediatrician*. Seventh edition. 1958.
Decourt, J., and Gilbert-Dreyfus (Editors): *Trente Exposés sur des Sujets Actuels d'Endocrinologie*. 1956.
Doell, E. W.: *Hospital in the Bush*. 1957.
Douglas, J. W. B., and Blomfield, J. M.: *Children Under Five*. 1958.
Elbel, H.: *Blutalkohol*. 2 Auflage von H. Elbel und P. Schleyer. 1956.
Florey, Sir H. (Editor): *General Pathology*. Second edition. 1958.
Greenfield, J. G., et al.: *Neuropathology*. 1958.
Hoffmann-Ostenhof, O.: *Enzymologie*. 1954.
Illingworth, R. S.: *Normal Child: Some Problems of the First Five Years and Their Treatment*. Second edition. 1957.
Johnstone, R. W.: *Textbook of Midwifery*. Seventeenth edition revised by R. J. Kellar. 1957.

Yellowlees, H.: *Frames of Mind*. 1957.

Association Notices

PRIZES FOR NURSES, 1959

The Council of the British Medical Association is prepared to consider the award of prizes for essays submitted in open competition by nurses in the following categories: *Category (1)*.—Open to student nurses undergoing a course of training at a hospital. Essay subject: "The nurse's part in the patient's adjustment to a period in hospital." *Category (2)*.—Open to State-registered nurses (within five years of registration with the General Nursing Council) working in hospital. Essay subject: "The qualities and attitudes desirable in the newly qualified nurse." *Category (3)*.—Open to State-registered nurses working outside hospital—for example, district nurses, private nurses, occupational health nurses, public health nurses. Essay subject: "The social services and how to use them." *Category (4)*.—Open to all members of the nursing profession. Essay subject: "The art of delegation and its part in successful nursing administration."

Certificates and prizes will be awarded in each category as follows: 25 guineas for the best essay; 10 guineas for the second best essay. Should the Council decide that no essay entered is of sufficient merit, no award shall be made.

The purpose of this competition is the promotion of systematic observation among nurses. In awarding the prizes due regard will be given to evidence of personal experience. No essay that will be given to evidence of personal experience. No essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize. Previous prizewinners may compete for a second award. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final.

The essay should be typewritten, if possible, but a legibly written manuscript will receive equal consideration. It must be written in the English language, on one side of the paper only, must be unsigned, but have with it a detachable note containing the name, address, and category of the candidate. Essays, which, it is suggested, should consist of 2,000 to 5,000 words, must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1959. Preliminary notice of entry for this competition is required and a special form for this purpose is obtainable from the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

A. MACRAE,
Secretary.

Diary of Central Meetings

- AUGUST
- 8 Fri. Planning Subcommittee, Occupational Health Committee, 2 p.m.
- 13 Wed. Royal Commission Evidence Committee, 2 p.m.
- SEPTEMBER
- 12 Fri. Central Consultants and Specialists Executive, 10.30 a.m.
- 18 Thurs. G.M.S. Committee, 10.30 a.m.
- 18 Thurs. Medical Members of the Editorial Subcommittee. Joint Formulary Committee, 11 a.m.
- 26 Fri. Hospital Junior Staffs Group Executive Committee, 2 p.m.

Meetings of Branches and Divisions

ABERDEEN AND KINCARDINE COUNTIES DIVISION

At the annual general meeting held on May 29 the following officers were elected:

Chairman.—Dr. I. M. Scott.
Vice-chairman.—Dr. W. Sutherland.
Honorary Secretary.—Dr. J. M. Gill.

ARGYLL DIVISION

At the annual general meeting on May 25 the following officers were elected:

Chairman.—Dr. A. B. Fordyce.
Vice-chairman.—Dr. A. S. Hutcheson.
Honorary Secretary and Treasurer.—Dr. A. Crawford Mayer.

BARNSTAPLE DIVISION

At the annual general meeting held at the North Devon Infirmary on May 28 the following officers were elected:

Chairman.—Dr. A. H. Morley.
Vice-chairman.—Dr. W. Ruddock.
Secretary.—Dr. S. G. Brook.
Treasurer.—Mr. K. G. W. Saunders.

BLACKBURN DIVISION

The following officers have been appointed:

Chairman.—Dr. F. C. Simpson.
Vice-chairman.—Dr. C. Royle.
Honorary Secretary and Treasurer.—Dr. T. A. I. McQuay.

BLYTH DIVISION

The annual general meeting was held on May 5. The following officers were elected:

Chairman.—Dr. R. J. P. R. Campbell.
Vice-chairman.—Dr. A. Donaldson.
Honorary Secretary.—Dr. E. B. Ross.

BURNLEY DIVISION

The following officers were elected at the annual general meeting on May 14:

Chairman.—Dr. A. W. R. Eardley.
Vice-chairman.—Dr. D. Heap.
Secretary and Treasurer.—Dr. T. C. Corson.

CITY OF ABERDEEN DIVISION

At the annual meeting the following officers were elected:

Chairman.—Dr. J. S. Finnie.
Vice-chairman.—Dr. R. G. Fullerton.
Honorary Secretary and Treasurer.—Dr. W. H. Galloway.

CITY OF EDINBURGH DIVISION

The annual general meeting was held on April 29. The following officers were elected:

Chairman.—Dr. J. G. M. Hamilton.
Vice-chairman.—Miss Gertrude Herzfeld.
Honorary Secretary and Treasurer.—Dr. R. Traquair Thin.

CONSETT DIVISION

A meeting was held on May 23, at which the following officers were elected:

Chairman.—Dr. W. Jack.
Vice-chairman.—Dr. J. B. Fox.
Honorary Secretary and Treasurer.—Dr. N. E. Wood.

COVENTRY DIVISION

The following officers have been elected:

Chairman.—Dr. J. E. Glasgow.
Vice-chairman.—Dr. G. Vaughan.
Joint Honorary Secretaries.—Dr. G. W. Forrest and Dr. J. R. W. Catto.
Honorary Treasurer.—Dr. J. L. Ballantyne.

EAST MIDLOTHIAN DIVISION

The annual general meeting was held on May 8. The following officers were elected:

Chairman.—Dr. M. M. Scott.
Vice-chairman.—Dr. G. W. Ireland.
Honorary Secretary and Treasurer.—Dr. J. C. G. Mercer.

EAST YORKSHIRE BRANCH

At the annual general meeting on May 14 the following officers were elected:

President.—Dr. C. Groves.
President-elect.—Dr. E. H. Milner.
Vice-president.—Mr. M. S. Campbell.
Honorary Secretary and Treasurer.—Dr. K. W. Beetham.

FOLKESTONE AND DOVER DIVISION

A general meeting was held on May 14 at the Esplanade Hotel, Folkestone. The president took the chair and 10 members attended. Dr. D. W. J. Radcliffe was elected as the Division's representative on the Representative Body.

FURNESS DIVISION

At the annual general meeting the following officers were elected:

Chairman.—Mr. A. W. B. Strahan.
Vice-chairman.—Dr. J. R. Turner.
Honorary Secretary.—Dr. J. W. Rogerson.
Honorary Treasurer.—Dr. H. R. Turner.

GATESHEAD DIVISION

At the annual meeting on May 19 the following officers were elected:

Chairman.—Dr. W. G. A. Riddle.
Vice-chairman.—Dr. W. F. M. Hudson.
Honorary Secretary and Treasurer.—Dr. J. C. Arthur.

HOLLAND DIVISION

At the annual meeting on June 13 the following officers were elected:

Chairman.—Dr. A. S. Wilson.
Vice-chairman.—Dr. W. O. Nowlan.
Honorary Secretary.—Dr. J. E. Darlow.

KENSINGTON AND HAMMERSMITH DIVISION

The annual general meeting was held at St. Mary Abbot's Hospital, Kensington, on April 25. Dr. J. F. L. King took the chair and 19 members were present. The following officers were elected:

Chairman.—Dr. H. S. Pasmore.
Deputy Chairman.—Dr. O. Moses.
Honorary Secretary.—Dr. J. D. W. Whitney.
Honorary Treasurer.—Dr. C. L. Collins.

KESTEVEN DIVISION

The following officers were elected at the annual meeting:

Chairman.—Dr. I. W. S. Gibb.
Vice-chairman.—Dr. G. B. Pimblett.
Treasurer.—Mr. F. J. Jauch.

MERSEYSIDE BRANCH

The annual general meeting was held on June 4 on the premises of Messrs. Cadbury Brothers Ltd., at Moreton, Wirral. Ninety-five members were present. The following officers were elected:

President.—Dr. E. A. K. Hoppins.
President-elect, Secretary, and Treasurer.—Dr. V. Cotton Cornwall.
Vice-presidents.—Dr. T. R. Robertson and Dr. N. S. Walls.
Members were entertained to lunch by Messrs. Cadbury Bros. and toured their chocolate and chocolate biscuit factory in the afternoon.

MOMBASA DIVISION

A meeting was held at the Coast General Hospital on May 12. Mr. S. R. Keating took the chair and 18 members were present. Mr. Kirkaldy-Willis gave an address on "Tuberculosis of the Bone."

NEWCASTLE UPON TYNE DIVISION

The following officers were elected at the annual meeting on May 20:

Chairman.—Dr. R. Wear.
Vice-chairman.—Dr. T. H. Boon.
Honorary Secretary and Treasurer.—Dr. G. W. Anderson.
Honorary Assistant Secretary and Treasurer.—Dr. G. Cormack.
Honorary Students' Secretary.—Mr. Weldon Watts.

NORTH GLAMORGAN AND BRECKNOCK DIVISION

The annual general meeting was held at the Black Lion Hotel, Aberdare, on May 21. The following officers were elected:

Chairman.—Dr. J. W. R. Battaram.
Vice-chairman.—Dr. J. L. Ryce.
Secretary and Treasurer.—Dr. F. J. Doherty.

NORTH STAFFORDSHIRE DIVISION

At the annual general meeting on May 20 the following officers were elected:

Chairman.—Mr. P. J. M. Kent.
Vice-chairman and Secretary.—Dr. J. M. Johnstone.
Joint Secretary.—Dr. W. Livingstone.
Treasurer.—Dr. J. Manuel.

PRESTON DIVISION

At the annual general meeting on May 20 the following officers were elected:

Chairman.—Dr. A. L. Williams.
Vice-chairman.—Dr. D. M. Anderson.
Honorary Secretary and Treasurer.—Dr. W. M. Thomas.
Assistant Honorary Secretary.—Dr. W. H. Tod.

READING DIVISION

The following officers have been elected:

Chairman.—Dr. Harley Stevens.
Vice-chairman.—Mr. G. L. Bohn.
Honorary Secretary and Treasurer.—Dr. P. W. F. McIlvenna.

REIGATE DIVISION

At the annual general meeting on May 20 the following officers were elected:

Chairman.—Dr. L. A. Gibbons.
Vice-chairman.—Dr. H. S. Atkinson.
Honorary Secretary and Treasurer.—Dr. J. R. Partridge.

ST. PANCRAS DIVISION

The following officers have been elected for 1958-9:

Chairman.—Dr. J. Wigg.
Vice-chairman.—Dr. D. Blend.
Honorary Secretary and Treasurer.—Dr. J. Hodson.

SOUTH STAFFORDSHIRE DIVISION

The following officers have been elected:

Chairman.—Dr. L. B. Paling.
Honorary Secretary and Treasurer.—Dr. H. R. Chapman.

SOUTH-WEST WALES DIVISION

The annual meeting was held on May 4. The following officers were elected:

Chairman.—Dr. D. Gwyn Jones.
Chairman-elect.—Dr. D. F. Lloyd.
Honorary Secretary.—Dr. J. E. Crane.

SWANSEA DIVISION

The annual meeting was held on June 5 at the Swansea General Hospital. Dr. H. William Howell was in the chair. The following officers were elected:

Chairman.—Dr. T. Hamilton Anderson.
Vice-chairman.—Dr. Glyn M. Jones.
Senior Secretary and Treasurer.—Dr. T. Oakley Lewis.
Junior Secretary.—Dr. A. M. Revie.

TORQUAY DIVISION

The annual general meeting was held on May 13. The following officers were elected:

Chairman.—Dr. A. Everard.
Vice-chairman.—Mr. J. MacPherson.
Honorary Secretary.—Dr. K. M. Fergusson.
Honorary Treasurer.—Dr. H. W. Thompson.

TYRONE DIVISION

The following officers have been elected for 1958-9:

Chairman.—Dr. J. M. Garvin.
Vice-chairman.—Dr. Eileen O'Kane.
Honorary Secretary.—Dr. Knox Henry.
Honorary Treasurer.—Dr. L. A. Lyle.

WALLASEY DIVISION

The following officers have been elected for 1958-9:

Chairman.—Dr. E. A. K. Hoppins.
Vice-chairman.—Dr. M. J. Conlon.
Honorary Secretary.—Dr. D. W. Townley.
Honorary Treasurer.—Dr. A. Colson Hay.

WANDSWORTH DIVISION

At the annual general meeting on April 29 the following officers were elected:

Chairman.—Dr. G. R. Boyes.
Vice-chairman and Honorary Secretary.—Dr. T. J. Lee.
Honorary Assistant Secretary.—Dr. G. J. R. Clarke.
Honorary Treasurer.—Dr. J. Tudor Lewis.

WEST SOMERSET DIVISION

The following officers were elected at the annual general meeting:

Chairman.—Dr. T. L. H. Shore.
Vice-chairman.—Mr. R. D. Rowlands.
Chairman-elect.—Dr. D. Hague.
Honorary Secretary.—Dr. D. G. Kibblewhite.
Honorary Assistant Secretary.—Dr. L. Fay.
Honorary Treasurer.—Dr. Isabella C. F. Hungerford.

WEST SUSSEX DIVISION

At the annual general meeting on May 11 the following officers were elected:

Chairman.—Dr. T. L. Scott.
Vice-chairman.—Mr. A. G. Ross and Dr. J. Lipsey.
Honorary Secretary and Treasurer.—Dr. T. P. Mulcahy.

WIGAN DIVISION

At the annual general meeting on May 22 the following officers were elected:

Chairman.—Dr. J. E. T. Shirlaw.
Vice-chairman.—Mr. R. L. Hartley.
Honorary Secretary.—Dr. F. G. Ince.

Correction.—The motion by East Denbigh and Flint at the A.R.M., reported as carried under "Compensation at Age of 70" (*Supplement*, July 26, p. 93), was in fact amended, and the resolution adopted by the meeting should read: "That this Meeting considers that practice compensation should be payable at 65 years of age irrespective of retirement, as well as at retirement or death."

B.M.A. SPECIAL GROUPS

There are 12 specialist groups in the Association. Their purpose is to ensure that members of the Association who have special interests, but whose numbers are so few, or who are so distributed that they cannot command anywhere a majority, or perhaps not even an influential minority, are able to make their opinions known. The following is a list of the specialist groups with their membership given in brackets: Dermatologists (174); Ophthalmic (439); Orthopaedic (258); Otolaryngologists (196); Physical Medicine (136); Psychological Medicine (318); Radiologists (337); Tuberculosis and Diseases of the Chest (506); Anaesthetists (705); Consulting Pathologists (251); Venereologists (140); and Full-time Non-professional Medical Teachers and Research Workers (581).

Conditions of Membership

Each group has its own criteria for membership and its own rules. Generally speaking a member must be predominantly employed in the practice of his specialty to qualify for membership of a group. This applies to the first eight groups in the above list. The Anaesthetists Group consists of members of the Association who are under contract as anaesthetists with a regional hospital board or board of governors on either a whole-time or regular sessional basis, or who are anaesthetists on the staff of recognized hospitals outside the National Health Service. The Consulting Pathologists Group likewise consists of members who hold permanent appointments as pathologists in the National Health Service or who, not being in that service, have devoted at least five years to the postgraduate study and practice of pathology and continue to be engaged predominantly therein. The Venereologists Group consists of members of the Association who have been qualified for at least five years and who are—and have been for at least three years—either engaged predominantly in the practice of venereology or are in charge of venereal diseases clinics, though not engaged predominantly in that specialty. Finally, the Group of Full-time Non-professional Medical Teachers and Research Workers consists of those who are full-time members of a university staff or full-time salaried research workers in university departments or other institutes.

"Grade" Groups

In addition to the specialist groups there are two different types of group—the Senior Hospital Medical Officers Group and the Hospital Junior Staffs Group. Any member of the junior staff of a hospital is entitled to participate in the activities of the latter group, which has no formal roll of

members. Their membership is welcomed during the holding of their temporary appointments. They are entitled to attend meetings called in their regions and to take part in the appointment of representatives to serve on the central council of the group.

Group Committees

All the groups appoint their own committees which watch the special interests of members and from which representatives are appointed to sit on the Central Consultants and Specialists Committee.

Application for membership of the specialist groups and the S.H.M.O.s Group should be made on the appropriate form obtainable from the Secretary of the Association.

COMMITTEE OF PUBLIC ACCOUNTS

CHEMISTS' REMUNERATION AND HOSPITALS' SPENDING CRITICIZED

In its third report for the session¹ the Committee of Public Accounts states that it is "disturbed" both by the rates of chemists' profits disclosed in a pilot inquiry in 1957 and by the fact that they have continued to enjoy these profits for such a long period after the Treasury had drawn attention to the matter in 1954. The report also records the Committee's serious concern that the Board of Governors of the Radcliffe Infirmary, Oxford, under "extreme pressure by the university," should have been able to commit the Ministry to considerable extra expenditure for adaptations and new construction at the Infirmary without prior approval.

Chemists' Remuneration

The Committee points out that chemists receive for each prescription a payment to cover the actual cost of the ingredients used in making it up; an addition for "oncosts" of 25%; certain allowances; and a dispensing fee. The payment intended to cover the actual cost of ingredients is determined in accordance with a drug tariff based on wholesalers' price lists. In consequence chemists who can obtain discounts from list prices may make a profit from reimbursement at Drug Tariff rates, although the Departments had assumed when agreeing the terms of their remuneration that no such profit would accrue.

The Treasury brought this possibility to the notice of the Ministry of Health in June, 1954, and early in 1955

¹ *Third Report from the Committee of Public Accounts, Session 1957-58, 1958. H.M.S.O., London. Price 1s 6d. net.*

² See annotation, *Brit. med. J.*, 1958, 1, 332.

expressed the view that vigorous efforts should be made to secure for the Exchequer the benefit of any discounts the chemists might receive, a view fully endorsed by the Committee of Public Accounts for the session 1955-6. A pilot inquiry into actual prices paid by chemists was undertaken in England and Wales in May, 1957. The Ministry reported that the results afforded impressive evidence that the prices paid for most of the 30 drugs inquired into were, on average, well below the Drug Tariff rates, and that for 24 of them the results indicated that the rates afforded chemists a concealed profit averaging 14%. From the results of a similar but smaller-scale inquiry in Scotland the Committee suggests that the chemists made a concealed profit of 19%.

The report goes on to say that, so long as information is lacking on the prices actually paid by chemists for drugs used in Health Service dispensing, there can be no assurance that their remuneration is no more than fair and reasonable. A speeding up of further inquiries is recommended, and meanwhile the Committee considers that some immediate general reduction of the Drug Tariff is justified.

Radcliffe Infirmary

The Committee is severely critical of the Board of Governors, the University of Oxford, and the Ministry of Health for their handling of the scheme for the extension and modernization of the Radcliffe Infirmary.² Early in 1955 the Ministry obtained Treasury approval for an expenditure of £434,390. In August, 1956, the Treasury was informed that the estimate had risen to £815,000 and that the Board of Governors had proceeded with a considerable amount of work without the Ministry's prior authority. The Treasury agreed that the scheme should continue, and Ministry authority was given to proceed with works already begun, together with an instruction that any expenditure in excess of the approved limits was not to be incurred without the Minister's consent. Despite this direction, and owing to what a committee of inquiry reported to be a "genuine misunderstanding" on the part of the administrative staff, the Board subsequently placed a contract for work not covered by Ministry authority. The complete scheme, the Committee of Public Accounts reports, originally estimated to cost £434,390, will now cost slightly more than £1 million.

The Ministry, while not defending the Board's methods, told the Committee that it was satisfied that the scheme had not cost substantially more than it would have done had it been properly planned. The Committee, however, thinks otherwise and has no doubt that substantial economies would have resulted had the work been properly planned in advance and had the various additions during the course of the work been critically examined by the Ministry and the Treasury before being put in hand. That the disregard of the Ministry's instructions did not result in the Exchequer being committed to expenditure which would not have been approved by the Ministry or the Treasury, the Committee believes to be fortuitous. It considers that the Ministry's supervision of their agents, the Board, has been ineffective, and that the conduct of this scheme both by the Board of Governors and by the Ministry has considerably weakened Treasury control over the expenditure.

It recommends that the Ministry's arrangements for financial control of large building projects, particularly of teaching hospitals, where there is a division of responsibility between a board and a university, should be reviewed so as to ensure that in future the Ministry is fully informed of any developments in sufficient time.

MIDDLE EAST BRANCH ANNUAL MEETING

Owing to unforeseen circumstances the annual meeting of the Middle East Branch, which was tentatively fixed for November 3, has had to be postponed. Dr. F. Kinsella, honorary secretary of the Branch, hopes, however, that it will be possible to hold the meeting later in the year. Members will be kept informed of further developments.

AMENDMENTS TO BRITISH NATIONAL FORMULARY

General practitioners will shortly receive a note from their executive council calling attention to amendments to the *B.N.F.*, 1957, which have been made in accordance with the *British Pharmacopoeia*, 1958. The changes will take effect from September 1, the date on which the *B.P.*, 1958, becomes official. The executive council note calls attention in particular to the following amendments.

(1) Since the strength of ipecacuanha tincture has been doubled in the *British Pharmacopoeia*, 1958, the dose of this preparation has been halved in *British National Formulary* preparations containing it.

(2) Streptomycin injection is now the stabilized preparation, and the strength to be dispensed, unless otherwise directed, is altered from 250 mg. per ml. to 330 mg. per ml.

(3) The paragraph on the intramuscular use of aminophylline injection has been deleted. The strength to be dispensed, unless otherwise directed, and the dose now refer only to intravenous use.

(4) The monograph on prednisone acetate tablets has been deleted. The monograph on prednisone tablets states the procedure which pharmacists should follow when prednisone acetate tablets of a stated strength are prescribed. The monographs on prednisone tablets and prednisolone tablets contain revised instructions about the preparations and strengths to be dispensed unless otherwise directed.

(5) The labelling for glyceryl trinitrate tablets has been amended to: "The tablets should be allowed to dissolve in the mouth." The colour of the tablet has been changed as a result of replacing the chocolate base with mannitol to increase the stability.

(6) The amendment lists preparations for which amended statements of dosage are given in the *British Pharmacopoeia*, 1958.

JOINT CONSULTANTS COMMITTEE NEW CHAIRMAN APPOINTED

At a meeting of the Joint Consultants Committee on July 30, Sir RUSSELL BRAIN intimated that he did not wish to continue in the chair. Mr. T. HOLMES SELLORS was elected to succeed Sir Russell Brain as chairman of the Committee, and he will assume office at its next meeting on October 29. Mr. Holmes Sellors is the present chairman of the Association's Central Consultants and Specialists Committee and is one of the B.M.A. members of the Joint Consultants Committee.

N.H.S. ADMINISTRATIVE STAFF'S PAY INCREASE

The Industrial Court has awarded considerable pay increases to the 33,000 lower-paid members of the administrative and clerical staff in the N.H.S. whose 3% increase, awarded by the Whitley Council last autumn, was vetoed by the Minister of Health (*Supplement*, November 9, 1957, p. 145). The Minister's veto of the Whitley agreement led to a deputation of protest to the Prime Minister from all organizations, including the B.M.A., forming the Staff Sides of the Whitley Councils for the Health Service (*Supplement*, November 23, p. 174), who expressed "grave concern" at the Minister's destructive blow at the system of collective bargaining, and it also led to the operation of a ban on overtime by some of the clerical staff unions concerned.

The present pay increases awarded by the Industrial Court vary from £22 to £106 a year (from 4 to 20%) and are backdated to July 1. There will be further increases on July 1 next year, and some of the higher-paid members of the staff will receive further equal increases in 1960 and 1961. The lowest total spread-over increase will amount to about 8%, and in the higher grades to 60% over four years. The estimated cost of the court's award when fully applied is £2,200,000 a year. The new salaries will be attached to a new grading structure along the lines of Sir Noel Hall's recommendations' (*Supplement*, December 7,

¹ Report on the Grading Structure of Administrative and Clerical Staff in the Hospital Service, 1957. H.M.S.O.

1957, p. 188), which were to reduce the present number of grades from eight to five. Negotiations on the pay of some 10,000 senior administrative officers, including hospital secretaries, are continuing. Their increases will be of the same order and will also date back to July 1.

Scottish News

MEDICAL PRACTICES COMMITTEE

The following is a list of districts where, in the opinion of the Scottish Medical Practices Committee, additional doctors are required:

Ayr.—Kilbirnie/Glengarnock; Kilwinning.
Caithness.—Thurso.
Dumfries.—Dumfries Burgh.
Dunbarton.—Clydebank; Vale of Leven.
Fife.—Burntisland; Cupar.
Galloway.—Castle Douglas.
Lanark.—Bellshill; Larkhall; Shotts.
Lothians and Peebles.—Linlithgow/Bo'ness; Prestons/Port of Tranent; Gorebridge/Easthouses/Newtongrange.
Orkney.—Kirkwall.
Stirling and Clackmannan.—Clackmannanshire; Polmont.

NEWS IN BRIEF

MEDICAL LISTS TO DRUG HOUSES.—The Minister has told executive councils that he agrees with the recommendation in the interim report of the Hinchliffe Committee on the Cost of Prescribing (*Supplement*, June 28, p. 382) that the supply by executive councils of medical and pharmaceutical lists to drug houses is undesirable. Those councils who may hitherto have provided lists in this way have been asked to discontinue the practice.

PUBLIC HEALTH SUBSISTENCE ALLOWANCES.—Committee C of the Medical Whitley Council has amended the scheme of subsistence allowances for public health medical officers in England and Wales. The revised allowances, which the Committee recommends should be applied from April 1, 1958, are set out in M.D.C. circular No. 41 to all local authorities in England and Wales.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Royal Commission Questionaries

SIR,—I was interested to read the letter from Dr. Douglas White (*Supplement*, August 16, p. 122) in which he stated that a patient of his, a radio engineer, had received a questionnaire from the Royal Commission approximately one year ago asking for details of his income, a duplicate form six months ago, and a further form four months ago, with a follow-up quite recently. I think that the engineer must be mistaken, at least in the timing of these forms, since the first forms to engineers were sent out only three months ago, that is to say, in May, 1958. The first forms of any kind asking for a reply were to doctors and the first of these went out last November, nine months ago.

The social survey makes great efforts to avoid duplication by using the lists of members of professional institutions. It is almost inevitable that there will be occasional duplication where a man belongs to more than one professional group, and therefore it is possible that someone might have been approached twice in error and that the second time a follow-up might have been issued, but scarcely any such cases have been reported.

Altogether over 36,000 individuals in the medical, dental, and other professions have been asked for confidential details of their earned income in the income-tax years

1954-6 in the course of a more extensive survey of the earnings of the professional classes than has been carried out in any other country hitherto. The response has exceeded expectations in almost every profession; of the doctors and surveyors approached, well over 70% replied; of the architects and accountants, over 80%; of the engineers and dentists, to whom questionnaires were sent out later and are still coming in, between 60% and 70% have already replied; certain other professions are still to come, and very useful information is at present being obtained about graduates in industry. In all cases so far, as far as can yet be judged, the replies are representative.

I would like to take this opportunity, through your columns, of thanking those many members of the medical profession who have so willingly helped by providing these detailed personal figures, and would also ask them to appreciate the public-spirited response of members of the other professions who might well have been reluctant to disclose these personal details since they are not directly involved in the Commission's eventual recommendations.—I am, etc.,

London, S.W.1.

HARRY PILKINGTON,

Chairman,

Royal Commission on Doctors' and Dentists' Remuneration.

Further Interim Adjustment

SIR,—Once again one begins to wonder whether or no the profession has been the victim of a confidence trick. After the Royal Commission had been sprung upon us, with such unseemly haste, with no prior consultation with the profession—or, one suspects (judging by the muddle over the terms of reference), with the Government's own legal advisers either—our leaders very properly expressed doubts as to the prospect of settling our claim within the ensuing year. The Minister reassured us and wrote on May 15, 1957, "I think, however, that should the chairman of the Royal Commission make a statement to this effect [that the Commission's report was unduly delayed] your Council can be assured that I would be prepared to consider any representations they may make." This we then accepted as *bona fide*; it was a material factor in inducing us to accept—on a short-term basis—the miserable 5% interim adjustment, and to co-operate with the Royal Commission. One now wonders was the assurance really given in good faith or was it just a piece of reprehensible quibbling. By events in the next few weeks we shall judge—but the Minister's letter to Dr. Wand received on July 9 (*Supplement*, July 19, p. 42) looks ominous. We must remind ourselves, and impress on the public, that our claim was lodged—after four months' notice—well over two years ago; it was for adjustment from the 1952 level. It has throughout been afforded "top priority procrastination treatment," culminating in the letter of July 9.

It absolutely astounds me that any responsible Minister can labour so mightily for some six months to produce so pitiful a sequence of limp excuses: (1) "A further increase would run the risk of prejudicing their [the Royal Commission's] work." This objection can surely be easily overcome—for what it is worth—by a specific agreement that it be "without prejudice." But an important matter of principle arises—the Government, within a few weeks of setting up the Commission, did make one interim adjustment; was this, by its patently contemptible inadequacy, a deliberate attempt to prejudice our claim? If so, it would have been a most un-British act; if not, by what possible token can the Minister claim that, although the first increase was without prejudice, to honour the spirit of the letter of May, 1957, with a second increment would be prejudicial? (2) "Circumstances since April and May, 1957, to date have not changed so greatly as to justify an increase." This is quite at variance with what the Chancellor stated at Oxford on July 11: "... that our economic

Classification	Total Personal Incomes in £m. (Before Tax)		% Increase
	1952	1956	
Employed Persons:			
Wages	5,455	7,375	35.1
Salaries	2,780	3,715	29.4
Armed Forces	342	398	16.3
Self-employed	1,508	1,697	12.6
Professions	230	253	10.0

Source: Annual Abstract of Statistics, 1957, Table 277.

position was better now than it had been for several years and that the balance between demand and resources had improved" (*The Times*, July 12, p. 6). Our claim should be settled on its merit, without it also having to be lodged at exactly the right moment between one financial crisis and the next. (3) "Moreover, no other people remunerated from the public purse who received a pay increase of 5% in April and May, 1957, have yet received any further award." This ignores the fact that the changes between 1952 and May, 1957, were too great by far to justify so niggardly an increment as was then given. Our forbearance in 1953, 1954, 1955, and 1956 should not be held against us in 1958. Official figures clearly show that a 5% increase between 1952 and 1956 is very much below the average (see Table).

It seems to me that two and a half years (the half-life of a Parliament) is quite long enough to settle a simple claim, clearly set forth with full supporting evidence. If not, then surely in all equity a reasonable interim adjustment should be given forthwith. I hope Council will approach the Minister during the next few weeks, pointing out the fallacies in his arguments, and pointing out that if he is not in honour bound by the spirit of the letter of May 15, 1957, to take action, then no more are we bound to inaction. It may not be quite time to rattle the sabres yet, but we must see that they are sharp and ready, and leave it to the good sense of Council, or the initiative of the Cumberland Division (see *Supplement*, October 27, 1956, p. 172), to take firm action if no reasonable satisfaction be obtained ere this year be out. Even our traditional good will, self-restraint, and patience are wellnigh exhausted; the way we have been exploited, duped, dragooned, and doodled around is deplorable.—I am, etc.,

Rugby.

R. PRESTON HENDRY.

Study for the D.P.H.

SIR,—Dr. J. Browning Alexander's letter (*Supplement*, August 2, p. 114) about part-time study for the D.P.H. examination is welcome, but it does not throw any light on a major problem. Perhaps it is not widely appreciated that it is difficult and often impossible for anyone who does not live in a university city or the surrounding district to attend a course, and thus under the present regulations cannot enter for the examination. Eminent members of the profession have stressed that there should be more candidates for the examination. Is there any good reason why the regulations should not be changed to allow a practitioner of, say, three years' standing to enter for the examination without attending a whole-time or part-time course? Evidence of attendance at a course is not a condition of entry for any other postgraduate degree or diploma.

I endeavoured to draw attention to this problem in a letter to the *Supplement* (July 2, 1955, p. 7), following a comment by Dr. Guy Dain that young doctors were not coming forward to take the D.P.H.—I am, etc.,

Swansea.

G. D. REES.

Representative Meetings

SIR,—As a representative who was present and also took part in the debate on A.I.D., I would like to give my whole-hearted support to the remarks made in Dr. Prosper Liston's wise letter (*Supplement*, August 16, p. 121). I trust that the Council will give serious consideration to the final paragraph, for I am sure that nobody wishes a repetition of the result of Council's previous handling of another matter—namely, marriage and divorce—which also aroused a great deal of emotion in the profession.

The result of the voting in a poorly attended gathering of representatives at the end of a long Representative Meeting, which was particularly tiring because of the appalling acoustics of the hall, cannot be taken as showing the Council that a large majority of members wishes that evidence should be given by the B.M.A. on A.I.D. In conclusion, may I add my plea that motions on the agenda that are controversial and likely to arouse a considerable amount of emotional reaction be placed by the Agenda Committee near the beginning of the agenda, so that they may be adequately discussed, and not at the end as so often happens at present?—I am, etc.,

Liverpool, 9.

V. COTTON CORNWALL.

A.I.D. and the R.B.

SIR.—It is a grievous thing that the discussion on A.I.D. (*Supplement*, July 26, p. 96) should have come at a stage in the Representative Meeting at Birmingham when many representatives had already left and the chairman and the rest of us knew we were pushed for time. In so far as such a subject is suitable for debate by such a body it was highly important that opinion of an Association such as ours should have been quietly and responsibly arrived at. In my view a therapeutic measure such as A.I.D. is a matter for the opinion of each individual doctor and not the proper subject for a body composed of doctors of all branches of the profession, many of whom do not come up against this kind of problem at all.

While the social implications involved in this problem are enormous, it is, surely, as a personal therapeutic measure that each doctor must advise his patient, and as such it is not a subject for the decision of a large body of representatives. It is well that the ultimate result of the debate was to leave the matter to a small body of people who can give considered thought to it.

But the question which must always be uppermost in our minds is, What shall it profit this woman if she has a child and lose her integrity?—I am, etc.,

Scunthorpe, Lincs.

J. R. LAKE.

Working Party on Hospital Staffing

SIR,—Mr. Harold Dodd's letter (*Supplement*, August 2, p. 114) draws attention to the anomalous position in which consultants in non-teaching hospitals now find themselves. More than two-thirds of the consultants in the National Health Service work in non-teaching hospitals where they do 80% of the clinical work, yet they have no representative by right on the important committees which decide such matters as staffing of hospitals, remuneration, and conditions of service. That a committee such as the working party on medical staffing of hospitals could be set up without including any member who has a practical knowledge of running a large clinical unit in a non-teaching hospital is a cause for alarm and misgiving among the thousands of consultants whose life's work is spent in this type of hospital. Mistrust breeds fear, and the gulf between teaching and non-teaching hospitals and the Ministry is, unfortunately, widened by policy of this sort, for it is obvious to all that there must be differences of viewpoint between those who work in these three very different spheres. The only body which can represent the consultants who work only in regional hospitals is the Regional Consultants and Specialists Association, but they need the active support of all those on whose behalf they labour.—I am, etc.,

London, W.1.

H. A. KIDD.

Association Notices

Areas of Gateshead and Durham Divisions

Notice is hereby given by the Council to all concerned that as from August 15, 1958, the area of the Urban District of Washington is transferred from the Gateshead Division to the Durham Division.

A. MACRAE,
Secretary.

Chiropody Service

SIR,—At the A.R.M. an amendment was carried "that this meeting instructs Council to press for implementation of the service of domiciliary chiropody, which should become a facility under the National Health Service, and does not accept the opinion of Council that no useful purpose would be served by pressing the matter at this stage" (*Supplement*, July 19, p. 59). The proposer said that many retired people came to live in rural Hampshire, but that most of them were not well off and their feet did not take kindly to having to walk a mile or two to reach a shop; many of them were in ill-health. In my experience exceedingly few people retiring to rural Oxfordshire are so foolish as to live one mile from a shop, much less two, even if they have cars. Tradespeople and neighbours are wonderfully helpful to the elderly, who become increasingly unable to carry parcels short distances whatever the condition of their feet. There is far too much unrealistic, muddled, and emotional thinking and talking about chiropody.

An official service would have to depend on graduates of the Society of Chiropodists, who alone as a body can give proof of adequate training. Yet these total fewer than 4,000 in private practice in the United Kingdom, scattered irregularly over the country. The nearest qualified chiropodist to this rural medical practice is 10 miles away, in a town of 8,000 people with a dependent rural population of 2-4 times that number, including at least 3,000 people of pensionable age. In my home town, South Shields, in an industrial area with a population of 107,000, of whom at least 14,000 are of pensionable age, there are two qualified chiropodists. One may reasonably expect foot troubles to be at least as frequent in urban areas, with their hard pavements and smart shoes, as in rural ones. If this be so, then on the basis of the survey in my practice¹ on the condition of the feet of 120 elderly people, mostly of the working-class, in this district at least 1,200, and in South Shields 6,000, people of pensionable age could seek treatment under a free service. Relatively few would need it, but they all might want it if it were free (and surely a service would not be restricted to pensioners, because in my experience the people who clamour for chiropody are those in the late 50's and early 60's). To this must be added the "transport" many would require, especially in rural areas with their rapidly diminishing bus and train services.

Chiropodists are good, kindly people, and their earnings are not high. But in practice they can do nothing worthwhile for deformities, arthritis, hallux rigidus and valgus, and bunions, etc.—

the common painful conditions of ageing feet which cause disability and housefastness. Most confine their attentions in the elderly to corns on the toes, callouses on the soles, and the horny toe-nail if they have the equipment. Their usual methods of treatment are to pare and to pad (surely most unhygienic). With these they usually give a week of relative bliss, a fortnight of growing discomfort, and a week of anguish before the next monthly "treatment" is due. There are rare exceptions, but as a group they rarely cure anything except verrucas; and most of their clients are "regulars" who make their appointments for chiropody as they do for having their hair done. A national service would still be impossible under present conditions if every unqualified chiropodist (many of whom learned the art by a postal course) was also pressed into it. But what was asked for at the A.R.M. was a domiciliary service.

Yet late in life few suffer who cannot help themselves or be helped by common sense. In my survey I found that the most comfortable were those who once a week first soaked and then scraped their feet or got someone else to do it, thus removing the hard skin which, if it accumulates, is the usual cause of discomfort. Of the 120 I saw, only 15 visited a "chiropodist," and of the rest only six seemed to have inadequate home treatment. The last group, all aged over 65, were principally among those who lived alone, could not do it for themselves, and had no friend or relative to help. But it is doubtful if it would be possible to attempt to provide a service even for such hard cases, because it would be next to impossible to draw a line.

Chiropody, as an art, can get nowhere until it brings about a large proportion of cures after a limited number of treatments. It is handicapped—surely unnecessarily—by the present denial of the use of local anaesthetics. It seems to me that chiropodists much more than other professions qualify for something the vast majority can never approach practising. If this were altered, they could prevent much unnecessary pain; and if they were as far as possible to attempt and effect cures they could properly ask that the word "chiropodist" might refer only to those trained and qualified to cure as no mere corn-cutter possibly can. A limited national service might then be possible, at least to deal with the horny toe-nail, which is more common than is generally realized, is impossible properly to deal with at home, needs treatment only once or twice a year, and can be a painful and limiting disability (I found 26 cases of varying severity in the 120 people I examined, and 11 in the 55 who were aged over 70).

Suitably salaried and experienced Fellows of the Society of Chiropodists should also be introduced into consultant posts at orthopaedic hospitals and departments as specialists in chiropodeal orthopaedics. Few surgeons are interested in feet other than those which call for a knife or a hammer and chisel, and even then the vitally important "follow-up" treatment is often neglected. There is a great gap between the chiropodist and the orthopaedic surgeon which urgently needs to be filled, especially in prevention of the deformities of the feet of the young and the cure of the middle-aged and elderly.—I am, etc.,

Oxford.

GORDON SCOTT.

Operating Theatre Technicians

SIR,—Mr. William Gissane's letter (*Supplement*, August 9, p. 117) expresses admirably the position of the operating theatre technicians, and I would like to endorse his letter, as we have, like a good many other hospitals, a similar type of problem. Twelve and a half years ago we engaged two excellent nursing orderlies who had 15 and 6 years' previous experience, mainly in the Army. These appointments were fully justified, and we have found them invaluable in the operating theatre, the anaesthetic room, and the plaster room. Both have been faithful to us, and they have been most reliable, both during the day and in the night and during the week-ends, when the theatre staff always seems to be at its minimum.

Our theatre superintendent and nursing staff are made up of part-time staff, and at least one or two of them get married every year, but our two operating theatre technicians are always willing to breach the gap—in spite of the fact that they do not get extra pay for it. Our two senior operating theatre technicians, after 10 years of first-class service, remain on a smaller salary than that of an ordinary staff nurse. As in the case of Mr. Gissane, our two loyal and trustworthy technicians have stayed with us for the love of the job. Neither of them can afford to stay on this pay. Up to eight months ago they were unable to get extra pay for overtime. One of them, however, has gone back in status, of his own free will, and is now theatre attendant class 1. By this means his initial salary, though lower, is increased by overtime and "on call" allowance. He is able to do this as he is now under the National Joint Council and not the Whitley Council.

It is high time that these key men should be appreciated and remunerated accordingly. It is useless to criticize these salaries without making some constructive suggestions. I feel that the men who devote themselves to this type of work, and on whom the surgeons depend, ought to command a salary in the region of £800 to £900 per year. In this way we would be able to retain the services of such men. I am, etc.,

Solihull, Warwicks.

P. QUINET.

SIR,—I would like to thank Mr. William Gissane (*Supplement*, August 9, p. 117) for his letter in support of operating theatre technicians. As a theatre technician in a busy theatre I find it is the love of our work and not the pay that attracts us, but this cannot go on for ever. With the cost of living continually increasing we too have to live, and find it quite a struggle on the present wages.

Our responsibilities are ever increasing in the operating theatre, and the anaesthetists and surgeons rely on us to keep the equipment in tip-top order, and often it is we who in the middle of an operation repair a small defect in the equipment which makes all the difference to saving a patient's life. Our surgeons and anaesthetists fully support our claim for a better status in the Health Service, but are unable to do much against the Whitley Council.

The Association of Operating Theatre Technicians is having a hard fight. May the day soon come when it will be rewarded.—I am, etc.,

Plymouth.

THOMAS R. PERKINS.

Home Confinement Grants

SIR,—I am in full agreement with Professor C. Scott Russell in his protest (*Supplement*, August 9, p. 116) against non-eligibility for this grant in the situation he mentions. It quite frequently happens that a patient, by reason of some possible complication in labour such as previous P.P.H., is safer to be confined in hospital but quite suitable for home puerperium, thus saving hospital beds. Some help must be organized at home for the puerperium, and this costs money when, as so often happens, there is no relation available to look after mother and baby. At times a domesticated husband can stay off work to do this, but this

means loss of earnings (a prearranged fortnight's holiday is usually upset by the baby's unpunctual habits).—I am, etc.,
VERA E. CLAXTON.

Hove, 3.

After-dinner Speeches

SIR,—I have now attended four B.M.A. Annual Dinners. At these functions I have heard only two good speeches (both by Anglican bishops) and a considerable number of frankly bad ones. Let us hope that the standard can be raised higher next year in compliment to our President-elect. We know we shall not be bored by him; we must try to make sure he will not be bored by us.

There must be a better way to propose the health of "Our guests" than the dreary recital of a long list of names which mean very little to most of the hosts.—I am, etc.,

Chesterfield.

H. E. POOLER.

NEWS IN BRIEF

AUSTRALIAN NATIONAL HEALTH SCHEME.—The Australian Government has endorsed the principle of giving Commonwealth assistance to special insurance funds set up by registered health insurance organizations for people who cannot be insured at normal rates because of their age, or pre-existing or chronic illness.

SOCIAL SECURITY CONVENTION WITH YUGOSLAVIA.—The social security convention between the United Kingdom and Yugoslavia ("News in Brief," *Supplement*, June 21, p. 345) has now been ratified and comes into force on September 1.

UGANDA BRANCH.—Dr. A. M. M. Wilson has resigned from the office of president of the Uganda Branch of the B.M.A., and Dr. R. L. Patel has been elected to take his place.

HOSPITALITY

A French surgeon has a daughter, aged 16, and a son, aged 14, who would like to make exchanges with British children next summer holidays. They would prefer somewhere near the sea, and in exchange would take the British children on holiday with them on the Mediterranean coast. Would anyone interested please get in touch with Dr. R. A. Pallister, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Questions Answered

Hire or Purchase?

Q.—Is there any income-tax advantage in hiring as against purchasing a car for general practice use?

A.—The full cost of using a car in general practice, including repairs, general running costs, and depreciation, may be deducted from profits subject to a restriction for any portion of the cost applicable to private as apart from practice use. This restriction would also apply to hire costs, and therefore the only difference between hire and ownership would be the comparative cost. Income tax would enter into the question only in so far as the burden of the extra cost of either method would be reduced by being allowed for taxation, and in the case of a heavy surtax payer might therefore become negligible.

The obvious advantage of hiring is its simplicity, as there is a straightforward allowance of the cost of hire, whereas the special allowances for depreciation for a purchased car have an uneven effect on taxation liability. By reason of the initial allowance and annual allowance approximately one-half of the cost is allowed as an expense in the first

year but only approximately one-seventh in the second year, with reducing allowances each successive year. Should these allowances prove to be greater than the actual loss in value, any excess allowance is recouped by a balancing charge in the year of sale. It may therefore result that a practice with a regular level of income may show considerable variations in its assessments for tax purposes, and in the total tax liability could be affected. In the case of a car bought by hire-purchase the initial allowance is spread over the period in which the payments are made, thus giving a more even allowance.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Adams, J. C.: Outline of Orthopaedics. Second edition. 1958.
Allen, C.: Homosexuality: Its Nature, Causation, and Treatment. 1958.
Andreas-Friedl, R.: Schlank durch Diät. 1957.

A medical officer in Devon (records the County Medical Officer in his annual report, *Devon's Health in 1957*), while discussing diet with the mother of a 7-months-old child at the welfare centre, was told that the child had a bottle of stout every day, prescribed by a "doctor in Ireland" when the baby was 3 weeks old. Further questioning revealed that the doctor had in fact prescribed the stout for the mother, who, assuming that it was doing the child good through her milk, continued to provide it on weaning—one-third stout, two-thirds milk in a bottle. The baby apparently enjoyed the mixture.

Branch and Division Meetings to be Held

ISLE OF WIGHT DIVISION.—At Unity Hall, Newport, Isle of Wight, Tuesday, September 2, 4 p.m., annual general meeting.
NORFOLK BRANCH.—At Cricket Ground, Brooke, Saturday, September 6, 4.45 p.m., annual meeting.
SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Monday, September 1, 9.15 p.m., business meeting.

Meetings of Branches and Divisions

ABERYSTWYTH DIVISION

The following officers have been elected:
Chairman.—Mr. E. Owen Lloyd.
Vice-chairman.—Dr. E. D. Clifford Jones.
Honorary Secretary.—Dr. J. H. Hughes.

BARNESLEY DIVISION

At the annual general meeting on May 30 the following officers were appointed:
Chairman.—Dr. L. Varley Broadhead.
Vice-chairman.—Dr. J. Aitken McEwen.
Secretary and Treasurer.—Dr. D. H. Pick.

BATH DIVISION

At the annual general meeting on July 2 the following officers were elected:
Chairman.—Dr. D. Pugh.
Chairman-elect.—Dr. A. K. Dougall.
Vice-chairman.—Mr. J. M. Sanson.
Honorary Secretary.—Dr. W. B. S. Crawford.
Honorary Treasurer.—Dr. E. Scott White.

BELFAST DIVISION

The following officers have been elected:
Chairman.—Dr. H. J. Cronhelm.
Vice-chairman.—Mr. H. Wilson.
Honorary Secretary.—Dr. R. A. McIlraith.
Honorary Treasurer.—Dr. G. T. C. Hamilton.

CAMBRIDGE AND HUNTINGDON DIVISION

The following officers have been elected:
Chairman.—Dr. A. Brown.
Vice-chairman.—Dr. C. W. Walker.
Honorary Secretary and Treasurer.—Dr. J. A. Sadler.

CITY DIVISION

The following officers have been elected:
Chairman.—Dr. J. Wiseman.
Vice-chairman.—Dr. D. G. Berry.
Joint Honorary Secretaries.—Dr. A. Rezler and Dr. S. Weinstein.
Honorary Treasurer.—Dr. J. M. Alston.

CORNWALL DIVISION

At the annual general meeting the following officers were elected:
Chairman.—Dr. F. D. M. Hocking.
Vice-chairman.—Dr. E. H. Eastcott.
Honorary Secretary and Treasurer.—Dr. E. Townsend.

CROYDON DIVISION

The following officers have been elected:
Chairman.—Dr. P. O'Flynn.
Vice-chairman.—Mr. V. Wilkinson.
Chairman-elect.—Dr. W. D. Glyn James.
Honorary Secretary.—Dr. G. Hirst.
Honorary Treasurer.—Dr. W. Hastings Hardy.

DARLINGTON DIVISION

The following officers have been elected:
Chairman.—Dr. D. J. H. Payne.
Vice-chairman.—Dr. J. W. Cathcart.
Honorary Secretary.—Dr. L. J. Rosin.
Honorary Treasurer.—Dr. L. E. S. Coghlan.

DORSET DIVISION

The annual general meeting was held on June 12. Eight members were present. The Secretary reported receiving a letter from the postmaster stating that delays in delivery of the *Journal* had now been rectified. The following officers were elected:

Chairman.—Dr. E. H. Parkinson.
Vice-chairman.—Dr. E. J. Gordon Wallace.
Honorary Secretary and Treasurer.—Dr. A. N. Blades.
 Three films were shown: "Venepuncture," "Woodpeckers," and "The Bayeux Tapestry."

FIFE BRANCH

At the annual general meeting on May 25 the following officers were elected:

President.—Dr. P. Aitken.
Vice-president.—Dr. D. Macdonald.
President-elect.—Dr. G. F. Cables.
Joint Honorary Secretaries.—Dr. A. M. Girvan and Dr. H. B. Muir.

GLASGOW DIVISION

A meeting was held in the Glasgow Regional Office on June 4. Dr. J. S. McLaren Ord took the chair and 28 members were present. Before the meeting began Dr. Ord drew attention to the new Glasgow Regional Office premises, saying that they were superior in every way to the old and provided excellent accommodation. Dr. R. L. Cormie suggested that in view of the extra accommodation it might be appropriate to start a library, and that members might like to contribute medical books, etc.

GUILDFORD DIVISION

The annual general meeting was held on June 19. The following officers were elected:

Chairman.—Dr. G. I. Watson.
Vice-chairman.—Dr. A. J. Whitaker.
Honorary Secretary and Treasurer.—Dr. F. A. Belam.

HALIFAX DIVISION

The following officers were elected at the annual general meeting:

President.—Dr. K. Marshall.
President-elect.—Dr. M. Goldin.
Honorary Secretary and Treasurer.—Dr. R. I. Lewis.

LANARKSHIRE DIVISION

At the annual general meeting the following officers were appointed:

Chairman.—Dr. G. S. Park Noble.
Vice-chairman.—Dr. R. J. Lumsden.
Honorary Secretary and Treasurer.—Dr. J. C. Macarthur.

LEEDS DIVISION

The following officers have been elected:

Chairman.—Dr. W. MacAdam.
Vice-chairman.—Dr. W. Adams.
Honorary Secretary.—Dr. J. H. E. Moore.
Honorary Treasurer.—Dr. E. C. Benn.

MACCLESFIELD AND EAST CHESHIRE DIVISION

The annual general meeting was held on May 14. The following officers were elected:

Chairman.—Dr. R. O. Payne.
Vice-chairman.—Dr. F. Wemyss Smith.
Honorary Secretary and Treasurer.—Dr. C. Shiers.

MID-GLAMORGAN DIVISION

The following officers have been elected for this new Division:

Chairman.—Dr. D. H. Isaac.
Vice-chairman.—Dr. A. Phillips.
Senior Secretary and Treasurer.—Dr. R. B. Body.
Junior Secretary.—Dr. H. Jones.

NORTH WALES BRANCH

The annual meeting was held on June 7, and the following officers were elected:

President.—Dr. J. Forbes.
President-elect.—Dr. G. Mansell Williams.
Honorary Secretary and Treasurer.—Dr. A. H. Holmes.

NORWICH DIVISION

The following officers were elected at the annual general meeting on July 1:

Chairman.—Dr. R. A. C. Rice.
Vice-chairman.—Mr. J. M. Ridley Thomas.
Honorary Secretary.—Dr. R. H. Scott.
Honorary Treasurer.—Dr. M. H. Clement.

OLDHAM DIVISION

The annual general meeting was held on June 2, and the following officers were appointed:

Chairman.—Mr. E. Henderson.
Vice-chairman.—Dr. M. Strang.
Honorary Secretary and Treasurer.—Dr. C. H. Strachan.

PERTH BRANCH

The following officers have been elected:

President.—Dr. C. J. Swanson.
President-elect.—Dr. W. M. Wilson.
Honorary Secretary and Treasurer.—Dr. J. Kelman.

RICHMOND DIVISION

The annual meeting was held on July 1. Fifteen members attended and the following officers were elected:

Chairman.—Dr. A. G. Manley.
Vice-chairman.—Dr. E. Pereira.
Secretary and Treasurer.—Dr. L. H. Worth.

SUFFOLK BRANCH

The annual meeting was held at Red House, Eye, on June 18. Mr. Derrick Martin presided and 19 members attended. The following officers were appointed:

President.—Dr. J. Shackleton Bailey.
President-elect.—Mr. Leedham Green.
Vice-president.—Mr. G. F. Langley.
Honorary Secretary and Treasurer.—Dr. W. P. Grieve.

SURREY BRANCH

The annual meeting was held on June 11, and the following officers were elected:

President.—Dr. A. G. Manley.
President-elect and Honorary Secretary and Treasurer.—Dr. L. A. Gibbons.
Vice-presidents.—Drs. W. N. Gilchrist and J. H. Lankester.

WARRINGTON DIVISION

The annual general meeting was held on June 27 in the Swan Hotel, Winwick, Warrington. Twenty-two members were present. The following officers were elected:

Chairman.—Dr. W. E. Bowden.
Vice-chairman.—Mr. D. H. Young.
Honorary Secretary and Treasurer.—Dr. A. H. Hollings.

WEST DENBIGH AND FLINT DIVISION

The following officers have been elected:

Chairman.—Mr. A. H. Holmes.
Vice-chairman.—Dr. W. McKendrick.
Honorary Secretary and Treasurer.—Dr. P. M. Anderson.

WEST LOTHIAN DIVISION

At the annual meeting held on June 26 at West Port Hotel, Linlithgow, the following officers were elected:

Chairman.—Dr. I. H. Thomson.
Vice-chairman.—Dr. A. M. Green.
Honorary Secretary and Treasurer.—Dr. M. Gardiner.

WEST NORFOLK DIVISION

At the annual general meeting on June 19 the following officers were elected:

Chairman.—Dr. Gwendolen M. O'Shaughnessy.
Vice-chairman.—Dr. C. R. F. Hewlett.
Honorary Secretary and Treasurer.—Dr. Nora M. Johns.

Corrections.—We are informed that Dr. G. R. Usmar has been elected vice-chairman of the Holland Division, not Dr. V. O. Nowlan as reported in the *Supplement* (August 9, p. 120).

The vice-chairman of the Enfield and Potters Bar Division is Dr. C. A. Birch, not Dr. C. Allan as reported in the *Supplement* (August 16, p. 124).

WORLD MEDICAL ASSOCIATION TWELFTH GENERAL ASSEMBLY

PRESIDENTIAL ADDRESS BY DR. CHARLES JACOBSEN

The Twelfth General Assembly of the World Medical Association was held in Copenhagen, August 15-20, when a large number of delegates from the fifty-five member associations met in the House of Parliament, Kristiansborg Palace. We print below a slightly abridged version of the Presidential address and the address given by the Director-General of the National Health Service of Denmark.

The Danish Medical Association celebrated its centenary last year. The liberal movement with the demand for political freedom which developed throughout Europe towards the middle of the last century resulted in the establishment of the Basic Law in Denmark in 1849 with the introduction of a free constitution and democracy and the maintenance of a constitutional monarchy. This political event was undoubtedly of great significance for the inauguration of the Danish Medical Association, as the liberal movement was in the ascendant, particularly in academic circles. In the proposals for inauguration the Danish medical profession was encouraged to unite "by mutual assistance to produce, develop, and maintain conditions under which the medical calling best can develop."

The most important task of every national medical association is to obtain decisive influence upon the solution of the problems concerned with the health of the community, both general and individual. An essential condition to obtain this influence is that the national medical association be united and that the entire profession be united in one organization. Progress of medical knowledge, particularly in recent years, has divided the profession into groups whose professional interests are not always identical. A central organization is therefore absolutely essential. Such an organization must include not only those who practise outside the hospitals, those who work in hospitals, young doctors during their training, but also research workers and doctors who work within public organizations such as public health administration and military organizations. Only on such a basis can the national medical association speak on behalf of the entire profession and exercise the necessary influence upon the organization of the health services, primarily in the interests of the patients. The Danish Medical Association, which includes practically the entire medical profession in Denmark on a voluntary basis, has achieved such an influence. Without the co-operation of the Danish Medical Association no important law or direc-

tive concerning our health services can be carried out. The Danish Medical Association has an excellent and productive co-operation with the Government and the local authorities, for whom it acts as an adviser on numerous occasions and with whom it has entered into voluntary agreements following negotiations.

International Medical Unity

In order that the World Medical Association can achieve the position and recognition necessary to fulfil its high aims at an international level the same factors must exist as for the national medical associations on a national level. The World Medical Association must include so many national medical associations that it is genuinely representative, and there must be unanimity concerning the general principles, despite the fact that there may be very great differences in the attitudes of the national medical associations towards many problems. We have good reason to assume, in advance, that the medical profession of the world can work together towards a common goal. Few or no professions have an education which is so uniform in its principles as the education of the medical profession. This education never ceases, because development is continuous. The practice of medicine is a lifelong study. For the medical practitioner more than for any other the work is based upon a personal relationship with his fellow men. If the work of the practitioner is to include not only medical science but medical art, he must get to know his fellow men, their environments, their sorrows and joys. Medical work is therefore a privilege. The relationship of mutual confidence between the doctor and his patients is unknown in many other realms. It is guided by ethics which have remained practically unchanged for 2,500 years, since the days of Hippocrates, and will remain as the basis for the practice of medicine for thousands of years to come. It may well be asked that if the medical professions cannot agree, then who can?

It is the right and the duty of the community to work for the maintenance of health and for the fight against disease, but it is also the right and the duty of the medical profession to exert a decisive influence upon this: a decisive influence upon the measures and ways "to assist all the peoples of the world to attain the highest possible level of health," and a decisive influence upon the conditions under which the medical calling can best be developed. The organization of the health services and the position of the doctor in this system will differ in different parts of the world. Opinions on this subject held by doctors and social politicians will also be divided. Geographical, political, economic, cultural, and traditional conditions, naturally, influence this to a varying degree. Arrangements which may be suitable and satisfactory under given conditions in one country may be less satisfactory or entirely unsuitable

in another country with quite other conditions. Certain ideals must, however, be stressed everywhere: the confidential relationship between doctor and patient is based upon the professional secrecy of the medical profession, and the right of the patient to choose his doctor must be defended. The independence of education and research from unrelated factors must be maintained.

750,000 Doctors

Since the first General Assembly in Paris in September, 1947, the World Medical Association has attained ever increasing recognition and prestige. Co-operation with a series of other international and significant organizations has been developed, and the influence of W.M.A. is of enormous significance to-day for 750,000 doctors in 55 member countries. This position would not have been achieved had it not been for a great number of prominent members of council and committees eminently led by our secretary general, Dr. Louis H. Bauer, who have carried out laborious work not least in collecting from and exchanging information with the member countries and overcoming resistance and misunderstandings frequently caused by the difficulty of finding definitions in a foreign language which completely cover the definitions in the original language.

Socio-medical affairs have occupied a great part of the working programme of the council and general assemblies of W.M.A. since its inauguration, and this part of the W.M.A.'s work has been of concrete practical value to national medical associations. It is particularly important that W.M.A., by means of common meetings with and in expert committees with international organizations such as W.H.O., I.L.O., and I.S.S.A., should be able to express the opinions of the medical profession throughout the world. This is important, because these large international organizations inform and advise the governments of the individual countries. It is also of significance that W.M.A. gives support to the International Federation of Medical Student Associations—to the medical students who are thus preparing themselves to carry on the work of the future.

The founders of the Danish Medical Association resolved in 1857 "to keep together, to keep on, and to show moderation; therein must an association such as that of the medical profession seek its strength and therein lies its strength." I see no reason why these words should not serve also as the motto for the activity of W.M.A. I hereby express my wish that the deliberations of the 12th General Assembly may proceed in such a way that this General Assembly will support and further develop the significance of W.M.A. for the medical professions of the world.

THE FAMILY DOCTOR AND THE HOSPITAL*

BY

JOHS. FRANDBSEN, M.D.

Director-General of the National Health Service of Denmark

Technical progress is intervening in industrial life with such force that revolutionary changes are happening before our very eyes almost from day to day, with consequences which not only affect the processes of production themselves but alter both the life of the individual and the entire structure of society. The profession of medicine, too, draws upon the world of physics and chemistry for its great progress in treatment, diagnosis, and prevention. To a certain extent it is subjected to the same evolution, open to radical changes in the daily medical work as well as in the working and living conditions of the individual physician

*The text of an address given at the opening session of the General Assembly of the World Medical Association on August 16, at Copenhagen.

and of the medical profession as a whole. It is justifiable to ask whether the condition for the complete utilization of the possibilities presented by physics and chemistry to the healing of the sick will be a constantly increasing centralization of that work, as in industrial life—a movement away from individual effort to the methods and conditions of modern industry.

Just over a generation ago it was really only surgery that needed hospitals with specially trained doctors. That is not so to-day. At a rapidly increasing rate in these last few decades specialization in our science and art has made demands on the hospitals for accommodation for other branches too—for all that technical apparatus which modern diagnostics and therapy need, and for a corresponding expansion of the specialist medical staff.

Centralization in the hospitals of an ever-growing part of the practice of medicine is an outstanding feature of the developments we are witnessing to-day.

Simultaneously, the costs of examination and treatment are rising. Only exceptionally, and only for well-to-do people, can modern medical treatment be met out of purely private means. Consequently, if the whole population is to be assured access to forms of treatment capable of utilizing all the modern adjuvants, that population must cope with the problem collectively. This is indeed recognized and implemented, or at any rate planned, in various countries, though perhaps on different scales.

Political Implications

Medical treatment is no longer a matter between doctor and patient alone. It is a social matter, whose problems are subjected to society's circumstances and stage of development, subjected, in other words, to various political ideas and ideals: a social matter of high priority everywhere in parliaments and governments.

The question that arises then is this: How is the doctor placed in this new development, and how far can he himself be allowed to influence it? The course of development may take place in different directions and in accordance with different principles. Will it serve the national health best to carry centralization through to the uttermost, or to make a halt on the road and inquire whether we are not running the risk of changing the art of healing so vitally that present developments ought to be checked or, if possible, directed along other paths?

The World Health Organization stands as the dynamic expression of the present-day interest in, and recognition of, the all-important significance of health services in the life of the community. That being so, it must be of the greatest concern to listen to the discussions and the opinions that are voiced when government representatives of 85 member States gather together. In conjunction with the Tenth Assembly in 1957, two days were set aside for discussing "The Role of the Hospital in the Public Health Programme." The great majority of those who took part in that discussion stated the belief that the hospital ought to play the leading role in public health. To many of them the hospital, as the large health centre of both curative and preventive work, was the high ideal. The concept of "the general practitioner" was touched upon, of course, indeed with some respect, but nevertheless as a person who ought to be guided by the "superior" hospital doctors by means of an out-patient department whose domain may even comprise home treatment: in short, the tendency was to greet centralization as the coming thing. I know that there are countries where, because of a shortage of both money and doctors, health centres are still the only means of providing the people with adequate medical attention; and that there are countries which, solely on account of their lack of doctors, are compelled to centralize much medical treatment in hospitals. But if the utmost concentration is not necessitated by such extraneous causes, all of which can be remedied with time, we should carefully weigh the importance and value of the two aspects of medical treatment—

domiciliary by the family doctor, and treatment in hospital—and try to arrive at the proper balance.

Experience in Denmark

My views on this subject of course are based mainly upon my experience in my own country. In Denmark we have one doctor to every 800 inhabitants. About half the doctors work in hospitals and scientific institutions; the other half practise outside the hospitals, the great majority as general practitioners. About 75% of the population are beneficiary members of the government health insurance. Health insurance, which is voluntary, has been since 1892 under statutory public control and subsidized by the public. We have a local-government hospital system, established in 1906, covering the whole country, and embodying the various special departments. Our health insurance covers all medical treatment in and out of hospital, so that pecuniary circumstances are never an obstacle to admission to hospital, which can be arranged only by a doctor.

Large investments in new buildings, rebuilding of hospitals in recent years, and the constantly growing and efficient work at the hospitals have attracted widespread attention to them and consolidated the interest and understanding of the great social value of hospital treatment. When we also consider that the great modern progress in medical science, with its conspicuous results, is always attributable to the work of the hospitals and their staffs, then we realize that extramural medical treatment has not given rise to so many problems and discussions—and perhaps has rather faded into the background. The time has come to draw attention to this in order to avoid a reevaluation of the merits of the two aspects of medical treatment and a consequent disturbance of the present balance. How shall we maintain both elements in the treatment of the sick, in collaboration on an equal footing?

Decentralization

We must realize that a doctor practising outside the hospital cannot, any more than the hospital doctor could, diagnose his case and carry out his treatment without access to the same technical aids as the hospital doctor. If we are to maintain independent treatment both in hospital and outside it, both hospital doctor and general practitioner must have access to laboratories, etc., and to the assistance of their specialists. On the other hand, for economic reasons alone, it would not be feasible to have, so to say, two sets of technical adjuvants and two teams of specialists, one for general practitioners and one for the hospital. The technical examination departments of the hospitals must be made common to both sides, and we are hard at work on such a new arrangement. This means that we are not making an out-patient department but building a bridge over the hospital walls to connect the two equally valuable bodies of doctors. Along these lines we are trying to limit centralization of medical work to what is absolutely necessary, and to maintain the possibility of efficient treatment outside the hospitals. We are doing it not merely because it is imperative to keep hospital expenditure itself down so far as is right and proper, but—and this not least—because it will consolidate the general practitioner's field of activity and his whole position.

The general practitioner, the family doctor, who has not the same training in the various branches of medicine as the specialists, but on the other hand has his own specialty in knowing the person behind the disease and all his circumstances, ought to be the fundamental element in the organization of medical treatment, he being the one who is best qualified to advise the patient as to treatment and the extent of the assistance obtainable from specialists, in or outside the hospitals.

But whatever may be decided in order to maintain the proper balance there remains the inevitable reality that part of the new-won territory in the domain of medical treatment has devolved upon the hospitals and the hospital doctors. The general practitioner's domain and the volume of his

work are being altered. Though this will not detract from his work in the treatment of the sick, these changes may nevertheless open the way for utilizing his knowledge and skills in other tasks, for there is work enough for doctors, even if, as I have said before, there is, as in the case of Denmark, one doctor to every 800 individuals.

Besides working in the service of treating the sick, there is a large field open to medical men in preventive medicine. What I have in mind is solely the section of prevention that is devoted to health control, vaccination, etc., all exclusively the work of physicians. Here again we are up against the choice between centralized and decentralized medical work.

Certain technical and economic advantages appear to be in favour of centralizing preventive work to health officers and specialists. But, having considered these matters, we have chosen decentralization and have placed the greater part of the preventive work of medicine on the shoulders of general practitioners, the part that is inherently associated with the ordinary work of a doctor, vaccination and health control of expectant mothers as well as of children up to the school age, after which the school doctor watches over the health of the children. The general practitioner, the family doctor, is thereby placed as the central figure in the sickness-prevention and health-preservation work in medicine and forms the natural link between curative and preventive medicine.

Conclusion

Medical work nowadays has many facets. It proceeds at the sick bed, in the operating theatre, in the laboratory, in the x-ray department, and so on. The presence of the patient is not always necessary, and not everything requires the presence of the doctor. Specialization and the use of technical adjuvants necessitate a certain amount of centralization and make the practice of medicine correspondingly difficult in its most original form: the meeting between doctor and patient, where one person is trying to help a fellow-being and in return receives his full confidence. It is that relationship of confidence which gives the doctor the feeling of security and the freedom to give of his best, and which is the indispensable foundation of all medical work. If we acknowledge that, then centralization must not be carried further than is absolutely necessary; whereas decentralization, the original form of the profession of medicine, must be strengthened. The family doctor with his many-sided work is so valuable a link in the organization of both treatment and prevention that he cannot be weakened, let alone removed, without great and lasting harm to the profession as well as to society.

The medical profession has a fundamental right to be consulted when the lines for the future development of the health system are to be plotted, not so that he may be drawn reluctantly into a new era with its ideals and forms of social life, but in order to meet developments as they come, receive what is new, and help to mould it with the aid of the old but ever-young ideals which now, as before, should be retained as a reality for doctors and medical work—the ideals of the right and duty to help the sick and safeguard the bonds of confidence between patient and doctor.

HOSPITAL RESIDENTS' ACCOMMODATION

The Ministry of Health has circularized hospital boards and management committees asking them to take note of recommendations on standards of living accommodation for hospital resident junior medical staff submitted by Committee B of the Medical Whitley Council. The recommendations are the outcome of the dissatisfaction expressed by residents in some hospitals at the type of accommodation and services provided. Committee B points out that the resident's room is his temporary home and he should be able to relax and study in it. Furniture and fittings should be reasonable in quantity and quality and it is recommended that if a bed-sitting room is small "consideration should be

given to providing a separate sitting room." Where practicable each room should have hot and cold running water. A telephone by the bed (with a bedside lamp) should be connected to the internal hospital telephone, and external telephones should be readily accessible. Attention is called to the need for adequate, varied, and attractively served and freshly prepared meals for those who, like resident medical staff, work long and irregular hours. There should be arrangements for making any complaints directly to the management committee or board.

NEWS IN BRIEF

PRIVATE PRACTICE BANNED.—The Czechoslovakian Government has decreed that, as from January 1, 1959, private practice by doctors and dentists must cease. A few professors, retired doctors, and invalid doctors already in practice will be allowed to continue private practice, but they will not be allowed to issue sickness certificates, nor will any treatment they advise or medicine they prescribe be paid for out of State health service funds.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Reorganization of General Practice

SIR,—On all sides nowadays one hears complaints from general practitioners about the unsatisfactoriness of their lives as doctors under the National Health Service. Although not a few admit that the social aspects of the Service, both for the patient and for themselves, have much to commend them, it is impossible not to be impressed by the obvious sense of frustration that permeates the whole of their practice. It is not easy to go to the root of this dissatisfaction in a few sentences, but the crux of the matter seems to be a feeling that they are no longer doctors practising an honourable profession but simply office boys, whose main duties are those of filling in forms and of directing the patient into the proper hospital channels when necessary. Although I cannot, as a specialist, honestly or logically object to what is nowadays so horribly described as "hospitalization," I do object most strongly to the general practitioner being cut off from all normal contacts with the high standards of diagnosis, prognosis, and treatment that are inherent to the hospital system.

What is the solution? For I honestly believe that, unless something is done to remove this unsatisfactory state of affairs, things will go from bad to worse. Inevitably, I'm afraid, we shall have not only even more disgruntled general practitioners but in the long run less efficient practitioners as well. For medicine is a practical science that simply cannot be practised in a vacuum, as it were, free from all proper clinical responsibility and continuity. Having thought about this problem for a very long time, I have decided to commit my ideas to paper. They are as follows.

I feel that the time has come when there should be a very drastic reduction in general practice as we now know it. But let me say straight away that this does not mean that I favour any reduction in the numbers of general practitioners. My suggestions, I might add, are intended solely for our large urban areas, and in the outlying country districts some form of practice as it exists to-day must inevitably continue. I suggest that entirely new departments—general practice departments—should be added to our existing hospitals and be an integral part of all new ones. In these departments, doctors who decide to engage solely in general practice would provide the staff. Exact details of such a scheme would require, of course, a very great amount of thought and planning. I can envisage, however, housemen, registrars, S.H.M.O.s, and specialists in the department of general practice. Remuneration would, of course, vary with responsibility but would not be less attractive than it is at present and should keep pace with both the cost of living and the salaries of consultant physicians and surgeons.

What would be the advantages of such a new concept? First and foremost, the general practitioner would have complete clinical charge of his patients in his own sphere, helped and guided at all times by the more senior members of the general practice department. Thus the old doctor-patient relationship would once again be fostered and there would be complete control of clinical continuity. But it would be clinical control with a difference, and, I venture to suggest, with a great improvement. Now the general practitioner would be, in fact, part of the hospital team. He would have every possible hospital facility to encourage him to diagnose, prognose, and treat his patient; and for the first time since he was a houseman would have the complete backing of the hospital as a member of the staff and not as an outsider. In addition he would have proper facilities for time off, reading, and research. He would, furthermore, take his turn on the district rota, to visit patients who were too ill to travel to hospital or who could best be treated at home. Finally, he would have the added incentives of progressing further and further along the general practice side of the hospital, so that energy and ability would take him to the very top of his own specialty—general practice.

Here, then, is the simple outline of a possible alternative to our present general-practitioner service, which would, I am sure, be welcomed by many of our discontented family doctors as offering a fuller and better form of practice than the one to which the present Service has doomed them. I should be interested to learn whether there are others that share my views.—I am, etc.,

Rickmansworth.

D. G. WILSON CLYNE.

Study for the D.P.H.

SIR,—Dr. G. D. Rees's letter (*Supplement*, August 23, p. 128) presents very well only one of the difficulties facing the aspirant to the D.P.H. qualification. The practitioner without private means and with family responsibilities cannot afford the full-time D.P.H. course, which is taken mainly by doctors subsidized by public bodies, and by bachelors. This leaves him with the alternative of the part-time course, which involves two days' study each week over five academic terms. Not all universities run a D.P.H. course. Birmingham, for example, has not run a course for several years, despite the fact that it has an excellent department of social medicine and serves the massive Midland conurbation. Some universities, such as Edinburgh and Glasgow, run only full-time courses. Those universities that do run part-time courses may suffer from lack of support because of a shortage of part-time public health work in the area. Even when part-time work is available, the rates of pay vary considerably. For instance, it may happen that there are two doctors identical in age, experience, and responsibilities working for different local authorities and taking the same D.P.H. course. The doctor working for local authority A receives seven-elevenths of the basic scale for assistant medical officers, regardless of his previous position on the incremental scale; the doctor working for local authority B receives seven-elevenths of his previous public health salary.

The surprising thing is not that there are so few candidates for the D.P.H. course but that, in view of the difficulties, there are so many. The remedy does not lie, however, in Dr. Rees's suggestion that the D.P.H. examination should be open to anyone qualified for three years. Public health is a branch of medicine which, like all others, cannot be learned from books alone. There must be participation in it and repeated association with all others taking part in it. The university course provides in some measure the last of these two conditions. To my mind, what is needed is a closer association between medical officers of health and university departments of public health to provide more posts which can be occupied by D.P.H. students for the duration of the course. Needless to say, there should be uniformity in pay also.—I am, etc.,

Leeds, 11.

ARNOLD SHAW.

Representative Meetings

SIR,—Arising out of the debate on A.I.D. on the last day of the Annual Representative Meeting at Birmingham, strong dissatisfaction has been expressed by several correspondents with the fact that from time to time an important subject

for debate at an Annual Representative Meeting is not reached until so late in the meeting that the subject has to be considered in an atmosphere of haste and in a meeting already depleted of membership by early departures, or that an important subject in some other way is debated at an unsuitable hour. Your correspondents either blame the Agenda Committee (Dr. H. G. Dowler, *Supplement*, July 26, p. 106), or suggest an earlier pruning of the time allowed for speeches (Mr. D. S. Pracy, p. 106), or advocate a form of grading in the importance of the various matters which are to be the subject of debate (Dr. J. E. Morrison, *Supplement*, August 9, p. 116).

The Constitution Committee, composed of an equal number of members of Council and of non-Council members of the Representative Body of considerable experience, examined this matter very thoroughly in the 1956-7 session, and no fewer than 14 paragraphs of its report to Council and the Representative Body deal with this matter. The recommendations of the Constitution Committee subsequently adopted by the Representative Body have considerably enhanced the powers of the Agenda Committee; attention was drawn by the Committee to the need for a strict adherence to standing orders in the conduct of business, and, further, the Agenda Committee has been given the power to give priority to matters of outstanding importance and to arrange for these matters to be debated at a specific time. Any extension of the powers of the Agenda Committee beyond this, the Constitution Committee, after full debate, decided, could result only in the curtailment of the right of a Division to bring any matter which it thought important before the Representative Body, whether it had been previously debated or not. I do not believe the Representative Body would accept any such curtailment of the rights of individual Divisions. I believe, therefore, the suggestions of Dr. Morrison would be unacceptable to the Representative Body and that the suggestion of an automatic curtailment of speeches after a specified hour each day, if a certain stage had not by that time been reached in the Agenda, would be unfair to the movers of motions, possibly of considerable importance, which might come up for debate later in any such day.

There is therefore no easy solution to the problem of securing proper time for the full and adequate debate of important subjects in as large a meeting as the Representative Body, meeting for four days only to consider 300-400 resolutions and amendments, although I am sure the Constitution Committee would be prepared to examine the matter afresh if it were so instructed by Council or the Representative Body. It may be that the new powers granted only last year to the Agenda Committee by the Representative Body were not as fully used by the Agenda Committee this year as they might have been, but, important as the subject of the profession's attitude to A.I.D. is, it is perhaps a matter of opinion as to how high a priority the majority of the Representative Body would have given this subject in relation to the many other important matters on the agenda.

It is my personal view that, without some pruning of the size of the Representative Body (as outlined in the Constitution Committee report and rejected by the Representative Body last year), the volume of debate will always in a four-day meeting result in some items of importance falling for consideration on the last and final day of the meeting, when time is getting short. It is also my personal view that there will never be a satisfactory attendance on the last day so long as it falls on a Monday and the whole A.R.M. is not contained within the same calendar week.—I am, etc.,

Shawford, Hants.

H. H. LANGSTON.

SIR,—Having followed the debates on the fourth day of the A.R.M. and having read the correspondence in your columns, permit me to make a few comments. I deplore the tendency to dub sound arguments based on the medico-social aspects of A.I.D. as emotional. Dr. Doris Odum, who spoke with such clarity, raised this bogey twice in the

course of a short speech (*Supplement*, July 26, p. 96). I am quite satisfied that in a discussion of this kind neither side has a monopoly of the emotions. Now, Sir, Dr. R. P. Liston suggests (*Supplement*, August 16, p. 121) that the Representative Body, being so easily aroused emotionally, is not a suitable body to discuss authoritatively a subject such as A.I.D. Such an argument could be advanced in favour of dispensing with the authority of the House of Commons, particularly when it discusses subjects such as education, capital punishment, corporal punishment, prostitution, and even old-age pensions. I submit, Sir, that the R.B. consisting of medical men—specialists, medical officers of health, and family doctors—is peculiarly well qualified to express an opinion on A.I.D.

It is true that the debates on the fourth day of the A.R.M. were conducted with unseemly haste and without notice of motion on the question of giving evidence on two important and controversial matters, nevertheless the results are fairly clear. (1) Whatever evidence may be submitted to the Royal Commission on the vexed question of merit awards to general practitioners will be governed by an amendment carried by a substantial majority that "there should be no 'merit awards' in general practice of the type at present existing in the consultant services." (2) Whatever medical evidence is submitted to Lord Faversham's committee on the medical aspects of A.I.D., the committee will be aware of the fact that the Representative Body of the British Medical Association, by a majority of 101 to 84, expressed "grave concern at the increasing practice of artificial insemination by donors."—I am, etc.,

West Clandon, Surrey.

C. P. WALLACE.

Part-time Consultants

SIR,—As member of Council for an area which possibly contains more part-time consultants than any other, I must, on their behalf, protest against the unjustified, fanciful, and unsupported allegations made about their work by two of our medical colleagues in the House of Commons in the debate on the N.H.S. on July 30. I refer to speeches made by Mr. John Cronin and Dr. Edith Summerskill (*Hansard*, July 30). I quote: "The opinion of well-informed circles is that the payment of a consultant by the session encourages him to keep his out-patients' department fully occupied and his beds full" (Dr. Summerskill, col. 1483). "Consultants are dependent for their remuneration on the number of patients they see, because the number of patients they see governs the number of sessions for which they are paid. The person who decides, to a large extent, how many patients attend a consultant's clinic is the consultant himself. He merely has to make his patients come more frequently and thus increase the numbers of his clinics. The consultant himself is the person who decides how many operations he does. No one would suggest that operations are done unnecessarily, but it must sometimes be difficult in borderline cases, of which there is a wide range, to decide whether one should do a large number of operations or not" (Mr. Cronin, col. 1476). I have the greatest admiration for our colleagues in the House, but to say these things is tantamount to saying that by writing unnecessary letters a Member of Parliament can keep his postbag full enough to justify his new "expenses allowance" to the Inland Revenue. Neither the one statement nor the other is susceptible of proof. Both are absurd. I am sure that, on mature consideration, damaging statements of this kind should be retracted. To general practitioners like myself, who send the patients to the consultants, they are laughable and merely bring the utterers into ridicule.

I keep wishing that a mechanism may be created whereby Members of Parliament could be informed of what actually happens. Their lamentable ignorance, particularly when they also happen to be colleagues, is a reflection on us.—I am, etc.,

London, W.C.1.

J. L. MCCALLUM.

Association Notices

B.M.A. FILM COMPETITION, 1958

FINAL REMINDER

Intending competitors are reminded that the closing date for receipt of entry forms and films is *September 30, 1958*. Further details may be obtained from the Secretary, B.M.A. House, Tavistock Square, London, W.C.1.

PRIZE ESSAY COMPETITION FOR MEDICAL STUDENTS, 1959

The Council of the British Medical Association is prepared to consider the award in 1959 of prizes to medical students for essays submitted in open competition. The subject of the essay is: "The Playing Field is a better place than the Library for a Medical Student's spare time in the preparation for his life's work."

Prizes of £25 will normally be offered, but the Council will take into consideration the number and standard of the essays received when determining the awards to be made. Any medical student who is a registered member of a medical school in the United Kingdom, Commonwealth and Empire, or the Republic of Ireland at the time of submission of the essay is eligible to compete for a prize. Previous prizewinners are eligible for a second award. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and the medical school of the entrant. Notice of entry for this competition is necessary, and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1959. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

A. MACRAE,
Secretary.

Diary of Central Meetings

SEPTEMBER

- 12 Fri. Central Consultants and Specialists Executive, 2 p.m.
17 Wed. Alternative Service Subcommittee, G.M.S. Committee, 2 p.m.
18 Thurs. G.M.S. Committee, 10.30 a.m.
18 Thurs. Medical Members of the Editorial Subcommittee, Joint Formulary Committee, 11 a.m.
18 Thurs. Charities Committee, 11.30 a.m.
24 Wed. Tuberculosis and Diseases of the Chest Group Committee, 2 p.m.
25 Thurs. Grants Subcommittee, Organization Committee, 11 a.m.
25 Thurs. Organization Committee, 2 p.m.
26 Fri. Overseas Committee, 2 p.m.
26 Fri. Staff Side, Committee C, Medical Whitley Council, 2 p.m.
26 Fri. Staff Side, Committee C, Medical Whitley Council and Public Health Committee, joint meeting, 2.30 p.m., followed by meeting of Public Health Committee.

OCTOBER

- 1 Wed. Private Practitioners Subcommittee, Private Practice Committee, 2.30 p.m.
1 Wed. Film Committee, 4.30 p.m.
2 Thurs. Editorial Subcommittee, Joint Formulary Committee, 11 a.m.
8 Wed. Occupational Health Committee, 10.30 a.m.
16 Thurs. G.M.S. Committee, 10.30 a.m.

Branch and Division Meetings to be Held

BURNLEY DIVISION.—At Sparrow Hawk Hotel, Burnley, Friday, September 12, 8.30 p.m., meeting and hot-pot supper.
STRATFORD DIVISION.—At Board Room, Queen Mary's Hospital, Stratford, E., Tuesday, September 9, 9 p.m., general meeting.

The annual general meeting of the Welsh Region of the S.H.M.O.s Group will be held at B.M.A. House, 195, Newport Road, Cardiff, on Sunday, September 14, at 2.30 p.m.

Meetings of Branches and Divisions

BIRMINGHAM DIVISION

The following officers have been elected:
Chairman.—Dr. E. Bulmer.
Vice-chairman.—Dr. H. M. Cohen.
Joint Honorary Secretaries.—Drs. D. F. Heath and J. K. H. McCullough.
Honorary Treasurer.—Dr. D. F. Heath.

BISHOP AUCKLAND DIVISION

The following officers have been elected:
Chairman.—Dr. F. Robertson.
Vice-chairman.—Dr. J. Clark.
Honorary Secretary and Treasurer.—Dr. F. Lishman.

DONCASTER DIVISION

The following officers have been elected:
Chairman.—Dr. R. W. L. Ward.
Vice-chairman.—Mr. C. F. Eminson.
Honorary Secretary.—Dr. G. R. Outwin.
Honorary Treasurer.—Mr. L. D. Callander.

EAST SOMERSET DIVISION

The following officers have been elected:
Chairman.—Dr. M. C. O'Connor.
Vice-chairman.—Dr. W. H. Hylton.
Honorary Secretary and Treasurer.—Dr. A. B. Kettle.

METROPOLITAN COUNTIES BRANCH

At the annual general meeting on June 10 the following officers were elected:

President.—Dr. Annis Gillie.
President-elect.—Mr. A. Dickson Wright.
Vice-presidents.—Dr. A. French, Dr. F. Gray, Dr. A. Macrae, Dr. L. J. Stoll.
Honorary Secretaries.—Dr. J. Wiseman, Dr. J. W. Wigg.

MIDLAND BRANCH

The following officers have been elected:
President.—Dr. F. E. Gould.
President-elect.—Mr. H. Carson.
Honorary Secretaries.—Dr. A. F. Upton and Mr. A. Gourevitch.
Honorary Treasurer.—Dr. Mary B. Stone.

MONMOUTHSHIRE DIVISION

The following officers were elected at the annual general meeting:

Chairman.—Dr. F. W. Robertson.
Chairman-elect.—Dr. I. Mazin.
Honorary Secretaries.—Dr. J. C. H. Bird and Dr. S. Rosehill.
Honorary Treasurer.—Mr. D. B. Sutton.

NORTH-EAST ULSTER DIVISION

At the annual meeting on June 22 the following officers were elected:

Chairman.—Dr. J. Reid.
Vice-chairman.—Dr. R. J. Kernohan.
Joint Honorary Secretaries.—Drs. C. W. Burns and T. P. McB. Kelly.
Honorary Treasurer.—Dr. S. M. Bolton.

NOTTINGHAMSHIRE BRANCH

The following officers have been elected:
President.—Dr. G. M. Woddie.
President-elect.—Dr. G. M. T. Tate.
Joint Honorary Secretaries and Treasurer.—Mr. J. P. Jackson and Dr. R. E. Frears.

SOUTH AUSTRALIAN BRANCH

At the annual general meeting on June 25 the following officers were elected:

President.—Dr. C. C. Jungfer.
Vice-president.—Dr. G. T. Gibson.
Honorary Treasurer.—Dr. J. M. Dwyer.

STOCKTON DIVISION

The following officers have been elected:
Chairman.—Dr. T. E. Moody.
Vice-chairman.—Dr. Edith Armitage.
Honorary Secretary and Treasurer.—Dr. A. M. Brown.

TEES-SIDE BRANCH

The following officers have been elected:
President.—Dr. R. W. P. Jackson.
Vice-presidents.—Drs. A. Morrison and H. J. Peters.
President-elect.—Dr. J. S. Bow.
Honorary Secretary and Treasurer.—Dr. J. G. Warnock.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 13 1958

CONSULTANT AND OTHER SPECIALIST STAFF IN N.H.S. HOSPITALS

The accompanying tables have been made available by the Ministry of Health and Department of Health for Scotland. All the figures relate to Great Britain.

Table I shows the number of senior registrars in each specialty on September 30, 1957, at the various stages of their training. The column headed "Others" includes those who have completed four years' training and are awaiting higher posts (including transitional appointments) (102); holders of training posts for a 5th or 6th year (12); university staff with honorary posts (108); overseas registrars (6); part-time senior registrars (most of whom hold part-time posts as consultants or S.H.M.O.s) (34); those holding limited tenure or by custom held for a short period only and which were graded as senior registrars following the inception of the N.H.S. (12); and those holding posts of a kind not listed above (31).

Table II shows the numbers of consultants in each of the specialties year by year from 1949. The corresponding figures for senior hospital medical officers are not available.

Table III shows the age distribution at September 30, 1957, of consultants and senior hospital medical officers practising in the various specialties. It shows also the

numbers of paid sessions undertaken by the consultants and S.H.M.O.s in each specialty for each year of birth.

TABLE I.—Senior Registrars in Great Britain on September 30, 1957

Operating Theatre Technicians

SIR,—I would support the plea of Mr. William Gissane (*Supplement*, August 9, p. 117) for recognition of the need for operating theatre technicians and for better terms of remuneration for them. There are several hundred of such persons employed in the hospitals under the National Health Service and in the defence Services; but, although they are qualified for membership of their association and for registration as medical auxiliaries by training and examination of a standard approved by the Board of Registration of Medical Auxiliaries, those employed in the National Health Service are merely classified as theatre attendants, and, though their appointments are of a permanent kind, their remuneration is without increments for length of service. In consequence it seems likely that recruitment of persons of suitable ability and character for this nowadays essential post in theatre staffs will not be maintained.

The present method of staffing of operating theatres in the hospitals of this country is inconsistent with the real needs for the work which has to be done in them. This method of staffing, largely with frequently changing student nurses or nurses acting as staff nurses for six months or so after qualifying, may have been good enough in the past when operations were fewer in number and variety, and the apparatus in the theatre consisted of a few simple articles. But it is quite inappropriate and inadequate nowadays when theatres are working all and every day upon a great variety of operations, some highly specialized, and there are many pieces of complicated apparatus in use. This costly apparatus should be properly maintained, and those employed in the theatre should know how to do so and how to make the pieces work. Changeable nursing staffs cannot and do not do this efficiently, nor can they learn well enough how to prepare for and assist at the many operative procedures. The result is unnecessary strain upon the surgeon, the anaesthetist, and the theatre sister, and delays and errors in various ways which add to the risk to the patient and lessen the prospects of success of operations.

The practice of modern surgery requires permanent theatre teams composed only of persons especially trained for the work. This may be an ideal which is at present not fully realizable in most hospitals. But at least the value and economy of more theatre technicians should be appreciated, together with the need to give them a proper status and a scale of remuneration which will encourage competent men to remain permanently in such posts.—I am, etc.,

Bournemouth.

N. ROSS SMITH.

Home Confinement Grants

SIR,—Professor C. Scott Russell suggests (*Supplement*, August 9, p. 116) that the regulations governing payment of the National Insurance home confinement grant encourage women to seek an unduly long stay in hospital at their confinement. The writer of another letter on the subject, Dr. Vera E. Claxton (*Supplement*, August 30, p. 130), falls into the same error—that the National Insurance contribution towards post-natal attendance is provided by the home confinement grant.

This grant of £5 is, as its name implies, intended for confinements at home. It was introduced "to counterbalance the financial inducement to seek a [free] hospital confinement" (see paragraph 25 of the National Insurance Advisory Committee's Report on the Maternity Benefit Provisions, Cmd. 8446) and as a contribution towards the extra cost of having the baby at home in food, fuel, light, and laundry, etc. A contribution towards the cost of post-confinement expenses, including help in the home, is provided by the greatly increased maternity grant (£12 10s.), which is payable wherever the confinement takes place, and which combines the earlier maternity grant (£4) and attendance allowance (£4).

The changes in the National Insurance maternity benefit provisions effected by the National Insurance Act, 1953, in accordance with the recommendations of the National

Insurance Advisory Committee in their report referred to above, have been generally welcomed as a substantial improvement on the previous provisions.—I am, etc.,

London, W.C.2.

F. HAMER.

Senior Information Officer,
Ministry of Pensions and National Insurance.**H.M. Forces**

Surgeon Commander J. Alexander, R.N.V.R., has been awarded the Royal Naval and Royal Marine Volunteer Reserve Decoration.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: A. D. J. Farquharson, M.R.C.S., L.R.C.P., D.T.M.&H., Specialist (Anaesthetist), Curative Services Division, Northern Nigeria; C. L. Hall, B.M., B.Ch., D.P.H., Assistant Director of Medical Services, Kenya; L. F. E. Lewis, M.R.C.S., M.R.C.P.Ed., D.P.M., Superintendent Medical Officer (Specialist), Mental Hospital, Trinidad; Elaine H. McNeil-Smith-Read, M.D., M.R.C.P., D.C.H., Medical Specialist (Paediatrics), Jamaica; N. G. Sanerkin, M.D., M.R.C.P., D.C.P., Senior Specialist (Pathologist), Cyprus; R. A. J. Webb, M.B., B.S., Assistant Medical Superintendent, Mental Hospital, Barbados; D. E. Brooke, M.B., B.S., Medical Officer, Tanganyika; A. K. Dewar, M.B., B.Ch., Medical Officer, Jamaica; J. J. Huberts, M.D., Temporary Medical Officer, Northern Region of Nigeria; G. S. Humphreys, M.B., B.S., Medical Officer, Trinidad; J. A. M. Martin, M.B., B.S., D.L.O., and J. Spencer, M.B., B.S., Medical Officers, Uganda; C. E. Stroud, M.B., B.Ch., M.R.C.P., D.C.H., Special Grade Medical Officer, Uganda; J. Wolf, M.D., Medical Officer, Brunei.

Association Notices**NIGERIA BRANCH**

Notice is hereby given by the Council to all concerned that three Divisions with the following titles and areas have been formed within the Nigeria Branch:

- Eastern Division, comprising the eastern region of Nigeria.
- Lagos Division, comprising the Federal Territory of Lagos.
- Western Division, comprising the western region of Nigeria.

The remainder of the Branch covers the northern region of Nigeria and the Cameroons Trust Territory.

A.R.M. and Joint Annual Meeting, 1959	143	Correspondence	143
Nuclear Warfare	143	Association Notices	146

A.R.M. AND JOINT ANNUAL MEETING, 1959**ACCOMMODATION IN EDINBURGH**

The Association has received from hotels in Edinburgh a total allocation of rooms for the duration of the Meetings (July 15–24), which in turn is being divided into a proportion for Canadians and a proportion for British. It is hoped that more definite information will be available shortly about the number of Canadians who will be coming, and as soon as this is known a list of hotel and other accommodation available will be published in the *Supplement*. In order to avoid confusion, therefore, B.M.A. members attending the Annual Representative Meeting and Joint Annual Meeting with the Canadian Medical Association are asked to wait until this list appears before applying to hotels in Edinburgh for accommodation.

NUCLEAR WARFARE

A lecture demonstration on the medical implications of the nuclear warfare has been arranged for October 26 by the Metropolitan Counties Branch of the B.M.A. The demonstration, which will be on the same lines as last year, will be given at 2.30 p.m. in the Great Hall of B.M.A. House. Queen Alexandra's Military Hospital, Millbank, and the Army Medical College will present a programme which will include items on (1) collection, treatment, and disposal of "mass" casualties; (2) new techniques of plaster immobilization of fractures—which can be carried out by orderlies, nurses, and first-aid workers; (3) irradiation casualties.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Physiotherapists' Ethical Rules

SIR,—I am grateful to Miss M. J. Neilson, secretary of the Chartered Society of Physiotherapy, for her letter (*Supplement*, August 2, p. 114) correcting any false impression my reference to physiotherapists' ethical rules may have created. I note, however, that her assurance that the proposed change in the society's ethical by-law has not yet been implemented does not extend to the future. Indeed, Miss Neilson's attempt to justify this change suggests that it may yet be implemented and therefore calls for a reply.

The present wording "not to undertake any case except under the direction of a registered medical practitioner" indicates that it is the physiotherapist's duty to follow the instructions given to him or her by the referring doctor. In contrast, the amended wording, "to accept for treatment only those patients who have been referred to him or her by registered medical practitioners with whom he or she will remain in consultation throughout the period of treatment," fails to indicate this duty of the physiotherapist, and its implementation may well, therefore, alter the existing ethical relationship between doctor and physiotherapist *vis-à-vis* the patient, quite apart from any change it may bring about in the medico-legal basis of that relationship.

The reason given by Miss Neilson for the Chartered Society's wish to change the ethical by-law—i.e., because the present wording "has sometimes been interpreted by doctors to mean that they *must* in every case give a detailed prescription for physiotherapy"—implies not only that a significant number of doctors know its exact wording, which is doubtful, but also that they continually interpret it in that way. Miss Neilson adduces no evidence in support of this contention. It is, of course, well known that, while some doctors requiring physiotherapy for their patients indicate their requirements in broad outline only, others supply a detailed prescription. The latter do so not because of the way they interpret the Chartered Society's ethical by-law but because they have a particular knowledge of physiotherapeutic procedures and find it in their patients' best interest to apply that knowledge by prescribing in detail. It may even be that there is an increase in detailed prescribing. If so, this is certainly related to the fact that physical methods are at last being scientifically appraised by doctors, and the results of this work must be applied urgently if we are to maintain adequate medical service in the present shortage of physiotherapists. Unfortunately this work is not always as fully appreciated by physiotherapists as it is by those doctors whose practice particularly involves the use of physiotherapy. A further contributing factor derives from the increasing use of other treatments—e.g., intra-articular hydrocortisone—in combination with physiotherapy. This obviously requires accurate prescribing of the physiotherapy based on the fullest knowledge of the additional medical and surgical treatments, knowledge which is outside the province of the physiotherapist.

Finally, may I amplify the report (*Supplement*, July 12, p. 34) of my comments at the last meeting of the Central Consultants and Specialists Committee, which apparently prompted Miss Neilson's letter? They were intended to support the criticism that the scheme for statutory registration of medical auxiliaries under discussion at that meeting allowed the auxiliaries concerned to change their ethics, training standards, and other conditions against the opposition of the medical profession, and yet impose such changes with the seal of the authority of the statutory registration boards. To illustrate the way in which this power could be used, I referred to the activities of chartered physio-

sion in which there is no incentive to be other than an ordinary general practitioner. Ten or thirty years in general practice with wide knowledge and experience counts for nothing in prestige or remuneration or merit award.

I am not surprised that the conscientious practitioner is disgruntled. He has entered that branch of the profession in which his ability, the quality of his work, and his best endeavours receive no recognition. He knows that he is in a blind alley which leads nowhere. But the general practitioner is still the essential and fundamental part of the Health Service, and something must be done to stop this deterioration in the quality of general practice. In my opinion, a diploma in general practice sponsored by the Royal Colleges and the College of General Practitioners should be instituted. Such a diploma would go a long way to establish and maintain a first-class general practitioner health service, which would ultimately link itself to the hospital service.—I am, etc.,

Aberdeen.

J. ROSS MACKENZIE.

Overseas Conference

SIR,—With reference to your report on my speech (*Supplement*, July 26, p. 105), I should be most grateful to you if you would kindly note that I expressed the Hong Kong delegates' thanks and appreciation of not only the B.M.A.'s fine hospitality to ourselves during the meeting, but for all its good efforts and help on behalf of the overseas branches. This was not reported at all. Regarding the proposed visit of high B.M.A. officials to overseas territories, in reply to a question if we would prefer routine visits or visits at times of difficulty, when their presence might be most needed, I said that we should very much like to see the B.M.A. representatives at any time they wish to come, but particularly when their advice and help on negotiations were specially needed. I did not say, as reported in the *Supplement*, that their visits should be restricted to these occasions. My fellow representative, Mr. George Choa, and I made this quite clear in our subsequent conversation with the Chairman of Council.—I am, etc.,

Z. LETT,

Representative for Hong Kong.

Reigate.

SPECIALLY EXPENSIVE DRUGS

The following are new drugs for the supply of which doctors receive payment over and above their capitation fees:

Chlorothiazide. Hexamethonium salts. Mecamylamine salts. Neomycin preparations. Pempidine salts. Pentolinium salts. Prochlorperazine salts. Promazine hydrochloride. Propantheline bromide preparations. Tolbutamide.

Association Notices**SIR CHARLES HASTINGS AND CHARLES OLIVER
HAWTHORNE CLINICAL PRIZES, 1959**

The Sir Charles Hastings Clinical Prize Competition is established by the Association for the promotion of systematic observation, research, and record in general practice. The Competition has been extended by the addition of a second prize known as the Charles Oliver Hawthorne Clinical Prize. The following are the regulations governing the awards:

1. The Sir Charles Hastings Clinical Prize, consisting of a certificate and £75, will be awarded for the best entry.
2. The Charles Oliver Hawthorne Clinical Prize, consisting of a certificate and £50, will be awarded for the second best entry.
3. Any member of the Association who is engaged in general practice is eligible to compete for these prizes.
4. The work submitted must include personal observations and experiences collected by the candidate in general practice, and a high order of excellence will be required. If no work entered is of sufficient merit no award will be made. Candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations and their conclusions.

5. Entries must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than December 31, 1958.

6. A prizewinner in any year is eligible for an award of either of the prizes in any subsequent year. A study or essay that has been published in the medical press or elsewhere will not be considered eligible for a prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work.

7. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her entry the decision of the Council on any such point shall be final.

8. Preliminary notice of entry for this competition is required, on a form of application to be obtained from the Secretary.

9. Each entry, which should be unsigned, must be typewritten or printed on one side of the paper only and accompanied by a separate note of the candidate's name and address.

10. No definite limits are laid down as to the length of the work submitted, but the Council anticipates that for this competition 3,000 to 10,000 words would be suitable.

11. Inquiries relative to the prizes should be addressed to the Secretary.

A. MACRAE,
Secretary.**Diary of Central Meetings****SEPTEMBER**

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At Debating Hall, Guild of Undergraduates Union, Edgbaston, Tuesday, September 23, 8 p.m., Wine-Tasting Evening.

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, September 26, 8 for 8.15 p.m., meeting. Address by Dr. D. Stern.

EAST HERTS DIVISION.—At County Hospital, Hertford, Thursday, September 25, 8.30 p.m., special general meeting. Address by Dr. R. Ian Milne: "The Doctor and the Coroner." Members of the Hertford Branch of the Law Society and legal friends are invited.

HYDE DIVISION.—At Pack Horse Inn, Mottram, Wednesday, September 24, 8.45 p.m., annual general meeting.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Queen's Hotel, Alderley Edge, Friday, September 26, 8.15 for 8.45 p.m., Inaugural Banquet. All medical practitioners, their wives, and guests are invited.

MANCHESTER DIVISION.—The Manchester Medical Ball, under the joint auspices of the Manchester Division of the B.M.A. and the Manchester Medical Students Representative Council, will be held in the Students' Union, Oxford Road, Manchester, on Thursday, October 23, 8 p.m. to 2 a.m. Music by "The Saints" and "The Squadronaires." Tickets, £2 per double ticket for graduates, 25s. 6d. per double ticket for students and pre-registration graduates.

MID-ESSEX DIVISION.—Wednesday, September 24, all-day visit to Ford Works at Dagenham. Transport will leave Chelmsford about 8.45 a.m. to arrive at Dagenham at 10 a.m. Return to Chelmsford about 6.30 p.m. Wives and teenage children invited.

SOUTH-EAST ESSEX DIVISION.—At Overcliff Hotel, Friday, September 26, 8.30 p.m., meeting, chairman's cocktail party.

SOUTH MIDDLESEX DIVISION.—At Mitre Hotel, Monday, September 22, 9 p.m., divisional general meeting.

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, London, E., Friday, September 26, 3 p.m., meeting. Pathological Laboratory Demonstration with Dr. E. Hardy and Dr. A. W. Foxell.

WEST MIDDLESEX DIVISION.—At Paul's Restaurant, Ealing Broadway, W., Friday, September 26, 8.30 p.m., annual general meeting.

VISIT TO CARDIFF.—Dr. S. J. Hadfield, Assistant Secretary, hopes to be available for consultation at the Welsh House in Cardiff, 195, Newport Road, in the early afternoon of Friday, September 26. Appointments may be made by telephoning Cardiff 25334.

ANNUAL CLINICAL MEETING—SOUTHAMPTON, DECEMBER 4-7, 1958**LOCAL OFFICERS:**

Chairman: R. S. RUSSELL-SMITH, M.R.C.S., L.R.C.P.

Honorary General Secretary: J. G. McDOWELL, T.D., M.D., 64, Langhorn Road, Swaythling, Southampton, Hants.

Honorary Science Secretary: R. P. W. SHACKLETON, M.R.C.S., L.R.C.P., F.F.A. R.C.S., D.A., Department of Anaesthetics, Southampton General Hospital, Shirley, Southampton.

Executive Officer: Miss B. E. MIDDLEMISS, B.M.A. House, Tavistock Square, London, W.C.1. (Euston 4499.)

PROGRAMME

The 1st Annual Clinical Meeting of the British Medical Association will be held in Southampton from the evening of Thursday, December 4, to midday Sunday, December 7, 1958. The following is a résumé of the proposed programme.

Thursday, December 4.—In the evening the Mayor and Corporation of Southampton will hold a reception in the Guildhall, to welcome members attending the Meeting.

Friday, December 5.—There will be a concentrated scientific programme all day in the Guildhall, starting with panel discussions at 10 a.m. and followed by a general session. During the luncheon interval there will be colour television (sponsored by Smith Kline and French Laboratories Ltd.) of surgical operations at the General Hospital, Shirley, Southampton. In the afternoon there will be another general session followed by a Transatlantic Clinical Conference in connexion with the American Medical Association Clinical Meeting in Minneapolis, and medical films. In the evening there will be an informal reception given by the Southampton Division of the B.M.A.

Saturday, December 6.—The morning scientific programme in the Guildhall will be similar to that on Friday, concluding with the colour television showings from 12.40 to 2 p.m. In the afternoon a series of live clinical demonstrations have been arranged at local hospitals. In the evening a dinner has been arranged by the Southampton Division of the B.M.A.

Sunday, December 7.—In the morning a number of visits to places of medical interest in the locality have been arranged.

Ladies

While no special programme is being arranged for them, ladies accompanying members will be welcome to attend the evening social functions and the Sunday morning visits to places of medical interest in the area.

Catering Arrangements

A buffet luncheon and a licensed bar will be available at the Guildhall on the Friday and Saturday.

Advance Registration

In order to assist the local organizers it is requested that members wishing to attend the Annual Clinical Meeting at

Southampton should write as early as possible for a registration form to the Executive Officer, B.M.A. House, Tavistock Square, London, W.C.1. There is no registration fee.

Private Hospitality

Some private hospitality will be offered by members of the Southampton Division. Any members wishing to take advantage of this offer are asked to state their requirements in writing to the Honorary General Secretary, Dr. J. G. McDowell, T.D., 64, Langhorn Road, Swaythling, Southampton, Hants.

Hotel Accommodation

There is adequate hotel accommodation in the district at varying prices. The following is a list of hotel accommodation in Southampton and district. Members wishing to reserve accommodation are asked to write direct to the hotel, stating that they are attending the B.M.A. Meeting. The

Name and Address of Hotel	Tel. No.	No. of Bed-rooms	Tariff B B from

DETAILS OF MEETING

Thursday, December 4

8 to 10 p.m. Reception in Guildhall given by Mayor and Corporation of Southampton.

Friday, December 5

10 to 10.45 a.m. *Panel Discussions*. (1) Hand Injuries: Mr. J. N. BARRON (Salisbury), chairman, Mr. L. W. PLEWES (Luton) and Mr. R. J. PULVERTAFT (Derby). (2) Treatment and Prevention of Deafness: Mr. N. W. MACKEITH (Southampton), chairman, Mr. F. MCGUCKIN (Newcastle upon Tyne), and Miss EDITH WHETNALL (London).

10.50 a.m. Official opening of the Meeting by the President of the Association, Professor A. P. THOMSON, in the Guildhall.

11 a.m. *General Session*. Chairman: Dr. H. C. MAURICE WILLIAMS (Southampton). Professor JOHN BRUCE (Edinburgh): The Choice of Operation for Duodenal Ulceration. 11.30 a.m. Professor L. P. GARROD (London): Prevention of Antibiotic Reactions. 12 noon. Dr. D. M. T. GAIRDNER (Cambridge): Sudden Death in Infancy.

12.40 to 2 p.m. *Colour Television*: Demonstrations of surgical operations. (1) Mr. E. F. CHIN, Thoracic Surgical Unit, Southampton: A cardiac operation. (2) Mr. J. E. LAING, Plastic and Oral Surgery Centre, Odstock: A skin-grafting operation. *Moderator*: Mr. H. H. LANGSTON, Southampton. *Studio Panel*: Chairman: Mr. J. N. BARRON, Salisbury; Dr. D. J. PEARCE, Southampton; Mr. E. T. FRENCH, Southampton.

2.15 p.m. *General Session*. Chairman: Dr. S. WAND (Birmingham). Dr. RAE GILCHRIST (Edinburgh): The Diagnosis of Myocardial Infarction. 2.45 p.m. Professor A. M. CLAYE (Leeds): The Prevention of Severe Toxaemia of Pregnancy. 3.15 p.m. Dr. NEVILLE OSWALD (London): Management of the Pulmonary Complications of Influenza.

4 to 5 p.m. *Transatlantic Clinical Conference* in connexion with the A.M.A. Meeting in Minneapolis.

5.15 to 6 p.m. *Medical films*, with commentary by Dr. R. PROSPER LISTON (Chairman of the B.M.A. Film Committee).

8 to 10 p.m. Informal reception given by the Southampton Division in the Palm Court Restaurant and Ballroom.

Saturday, December 6

10 to 10.45 a.m. *Panel Discussions*. (1) Eye Emergencies: Mr. E. C. ZORAB (Southampton), chairman, Mr. B. W. RYCROFT (East Grinstead), and Mr. A. G. LEIGH (London). (2) The Risks of Therapy: Dr. R. M. S. MCCONAGHEY (Dartmouth), chairman, Dr. RICHARD ASHER (London), and Mr. D. F. ELLISON NASH (London).

11 a.m. *General Session*. Chairman: Dr. I. D. GRANT (Glasgow). Sir RUSSELL BRAIN (London): Acroparaesthesiae. 11.30 a.m. Dr. JOHN T. INGRAM (Leeds): The Restless Skin. 12 noon. Professor E. STENGEL (Sheffield): Common Misconceptions about Suicide and Attempted Suicide.

12.40 to 2 p.m. *Colour Television*. (1) Mr. E. C. ZORAB, Southampton Eye Hospital: Corneal transplant. (2) Mr. J. S. ELLIS, Department of Orthopaedic Surgery, Southampton: A hand operation. (3) Mr. L. A. RICHARDSON, Royal South Hants Hospital, Southampton: Stripping of varicose veins. *Moderator*: Mr. H. H. LANGSTON, Southampton. *Studio Panel*: Chairman: Mr. TOM ROWNTREE, Southampton; Mr. B. W. RYCROFT, East Grinstead; Mr. D. E. MACRAE, Southampton.

PROGRAMME OF LIVE CLINICAL DEMONSTRATIONS AND CLINICS

Saturday, December 6, 2.30-5 p.m.

SOUTHAMPTON GENERAL HOSPITAL

Medicine.—Dr. H. K. MELLER, Dr. P. G. TODD, Dr. T. K. MORGAN: Clinical demonstration of some cases of thyroid disease. Discussion of diagnostic methods and treatment.

Surgery.—Mr. S. N. LYTLE: Clinical demonstration of some cases of Crohn's disease.

Obstetrics and Gynaecology.—Mr. R. W. KNOWLTON, Mr. D. R. KILGOUR, Mr. A. G. W. HILL: Clinical cases.

Anaesthetics.—Dr. D. J. PEARCE, Dr. R. S. WALSH: Some problems arising during the treatment of patients suffering from respiratory insufficiency.

Geriatrics.—Dr. T. RUDD, Dr. R. N. GREENHALGH: Clinical demonstration of various patient hoists showing actual nursing techniques.

Neurology.—Dr. G. S. GRAVESON, Dr. P. K. ROBINSON: Clinical demonstration of patients with angiomas and aneurysms.

Otorhinolaryngology.—Mr. A. RUSSELL, Mr. N. W. MACKEITH, Mr. B. SUGDEN, Mr. E. M. SEWELL: Clinical cases.

Pathology.—Dr. S. C. DOBSON: Investigation of bleeding and clotting defects, and other haematological problems.

Radiology.—Dr. R. B. BOAL, Dr. R. D. CATON, Dr. D. V. RICE: Exhibition of interesting x-ray films.

ROYAL SOUTH HANTS HOSPITAL

Medicine.—Dr. K. M. ROBERTSON, Dr. R. J. MCGILL: Clinical demonstrations.

Surgery.—Mr. L. A. RICHARDSON: Peripheral vascular disease and its treatment.

Children's Surgery.—Mr. TOM ROWNTREE, Dr. G. ORMISTON, Dr. D. A. J. WILLIAMSON, Dr. J. GUY: Symposium on Diseases of the Urinary Tract in Infancy and Childhood.

Dermatology.—Dr. A. J. GRIMSTON: Clinical demonstrations.

Orthopaedic Surgery.—Mr. H. H. LANGSTON, Mr. J. S. ELLIS, Mr. D. E. MACRAE: Clinical demonstration of orthopaedic cases and treatment.

Pathology.—Dr. E. S. DUTHIE, Dr. R. A. GOODBODY: (1) Demonstrations of routine examinations of general interest in biochemistry, haematology, and bacteriology. (2) Morbid anatomy: miscellaneous conditions—e.g., renal and liver disease.

Physiotherapy.—Dr. J. R. PRESTON, Dr. G. SAVILLE: Demonstrations of electromyography. Demonstration of methods of traction used in treatment of prolapsed intravertebral disk.

Radiology.—Dr. R. B. BOAL, Dr. R. D. CATON, Dr. D. V. RICE: Exhibition of interesting x-ray films.

Radiotherapy.—Dr. A. G. C. TAYLOR: Demonstration of the Rotating Caesium Telecurie Treatment Unit.

SOUTHAMPTON EYE HOSPITAL

Mr. E. BACON, Mr. A. B. MOFFATT, Mrs. JANET SIMPSON, Mr. E. C. ZORAB: Demonstration, with clinical cases and colour slides, of (1) The type of cases which are worth while referring to ophthalmic surgeons, including cases showing acrylic lens after cataract extraction, plastic operations, dacryocystorhinostomy, glaucoma. (2) The type of case which can be safely and satisfactorily treated by the general practitioner.

SOUTHAMPTON CHEST HOSPITAL

Pathology.—Mr. E. F. CHIN, Dr. W. M. MACLEOD: Clinical demonstration of patients with diseases of the heart, lungs, and oesophagus. Dr. R. V. GIBSON: The spectrum of mitral valve disease. Dr. J. GUY: Identification of tubercle bacilli and testing for drug sensitivity. Dr. E. S. MACHELL: The anaesthetist in relation to thoracic surgery.

Transport will be provided from the Guildhall to the various hospitals between 2 and 2.30 p.m., and between hospitals during the afternoon, returning to the Guildhall at 5.30 p.m.

Tea will be provided in each hospital during the afternoon.

7.30 for 8 p.m. Dinner at the Pier Pavilion. Ticket 25s. (including aperitifs but excluding wine). (Dinner jackets.)

Visits to Places of Medical Interest in the Wessex Area Sunday, December 7, Morning

1. The Department of Daily Living, Winchester (Dr. RUSSELL GRANT).

2. The Plastic and Oral Surgery Centre, and the Nuffield Rehabilitation Unit, Odstock, Salisbury (Mr. J. N. BARRON, Dr. H. GLANVILLE).

3. The Medical Services of Fawley Oil Refinery (Dr. A. WARD GARDNER).

4. The Veterinary Artificial Insemination Centre, Lyndhurst, by invitation of Mr. G. N. GOULD.

5. County Borough of Southampton, Department of Health and Welfare. Visit to the Ocean Terminal for port health organization. Visits to Welfare Clinics and Old People's Homes. By invitation of the Medical Officer of Health, Dr. H. C. MAURICE WILLIAMS, O.B.E.

NOTE: The Winchester Division is arranging a reception for those visiting the Department of Daily Living. This visit is timed so that members and their wives may attend Matins at the Cathedral beforehand.

The Salisbury Division is arranging a reception for visitors to the Plastic and Oral Surgery Centre, Odstock.

REGISTRARS OPPOSE MINISTER'S PROPOSALS

NEW POSTS CRITICIZED

Reports received from various regions at a recent meeting of the Hospital Junior Staffs Group Executive Committee showed that hospital medical staffs (both senior and junior) are very largely opposed to the Minister's proposal to appoint a limited number of special posts for time-expired senior registrars. The Executive Committee's view was that, however attractive the rate of remuneration, registrars should not accept these new posts, and it decided to advise hospital junior medical staffs to resist their establishment.

Such a system, even if said to be on a temporary basis, would be a retrograde step, the Committee thought, for it would mean a new grade of senior registrar with duties of a highly responsible nature. Furthermore, it would be invidious to select posts to be occupied by only some of the time-expired senior registrars. It has always been the policy of the Group that, pending a permanent solution of the registrar problem, all time-expired senior registrars should be given security of tenure and an increase of salary above the present maximum. The Minister's proposal virtually introduced another grade into the hospital staffing structure and might well tempt boards to establish special posts when an additional consultant appointment would be more appropriate. There appeared, too, to be a danger that if a senior registrar, through financial exigency, were to apply for one of the special posts he would risk being stigmatized as "a failed consultant" and might well find himself in an appointment with no prospects of promotion.

Finally, the Group Executive Committee pointed out, the Minister's proposal in no way solved the immediate or the long-term problem of senior registrars. A fresh generation of senior registrars would very shortly be seeking consultant appointments, and the desperate situation in which many present senior registrars found themselves would be extended to many now in their early years in the grade. The Group Executive is circulating its views to other committees.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham.

Non-County Borough Councils.—Crewe.

JOINT ANNUAL MEETING, 1959

PRINCE PHILIP UNABLE TO ATTEND

In reply to an inquiry recently addressed to Buckingham Palace, the Association has been informed that the President-Elect, His Royal Highness the Prince Philip, Duke of Edinburgh, is very sorry that he will be unable to attend the Joint Annual Meeting of the British and Canadian Medical Associations in Edinburgh next July, as His Royal Highness will be with the Queen in Canada during the whole of that month.

COMMITTEE TO REVIEW MEDICAL SERVICES

CHAIRMAN APPOINTED

Sir Arthur Porritt has agreed to act as chairman of the committee to review the medical services which is being set up under the joint sponsorship of the Royal Colleges, the Scottish Royal Medical Corporations, the British Medical Association, the College of General Practitioners, and the Society of Medical Officers of Health. The sponsoring committee, on which each of these bodies is represented, will meet shortly to discuss with the chairman the constitution of the new committee.

CONTRACTUAL VALIDITY OF SPENS

MINISTER REJECTS SPECIAL CASE

The Secretary of State for Scotland has rejected the B.M.A.'s suggestion that he should join with it in the presentation of a special case to the Scottish Court of Session for its opinion on the contractual validity of the G.P. Spens Report. The Chairman of Council, Dr. S. Wand, announced to the Representative Body at Birmingham on July 12 that the Secretary of State for Scotland had been asked to consent to the presentation of such a special case (*Supplement*, July 19, p. 80). The procedure of a "special case" is peculiar to Scottish law, and differs from the usual type of contentious litigation in that the parties amicably agree to present their differing views to the Court for objective decision. The difference of opinion between the Association and the Secretary of State for Scotland, as the Minister responsible for the Health Service in Scotland, which the Association sought the Minister's consent to raise in this case was on the interpretation of the contractual obligations of the Government resulting from its acceptance of the Spens Report and the Danckwerts Award. It has always been the Association's contention that the Government was under a contractual and moral obligation, whether or not it could be enforced by legal proceedings in the ordinary way, to implement the promises which were made to the profession when they entered the National Health Service, and the Association's view has been that a proper interpretation of the Spens Reports was that remuneration should be adjusted from time to time in accordance, among other things, with changes in the value of money. The Government refused to admit any contractual obligation when the profession lodged its claim for an increase in remuneration in 1956, and in a letter to Dr. Macrae, Secretary of the Negotiating Committee, the Permanent Secretary to the Ministry of Health wrote: "If the Committee are not prepared to accept the Ministers' views as to this, no doubt the matter can be brought before the courts for adjudication" (*Supplement*, December 1, 1956, p. 201).

The text of the letter from the Permanent Secretary to the Department of Health conveying the Minister's refusal is as follows:

I am directed by the Secretary of State to refer to your letter of 10th July regarding the interpretation of certain documents relating to the remuneration of general practitioners in the National Health Service.

As you will know this question of interpretation was the subject of discussion and correspondence between the Ministers and the British Medical Association some time ago and the Association were informed in November, 1956, that Ministers were of the opinion that no contractual obligation such as was alleged by the Negotiating Committee of the British Medical Association existed and that no action based on such a claim could succeed.

Subsequently a Royal Commission was appointed under the Chairmanship of Sir Harry Pilkington which is at present considering among other things the remuneration of general practitioners.

With this in mind and after careful consideration of the whole circumstances the Secretary of State has decided that he cannot accept the B.M.A.'s suggestion that he should join with them in the presentation of a Special Case to the Court of Session.

Copies of this letter are being sent to the Secretary, Ministry of Health, and to Sir Harry Pilkington.

B.M.A.'S COMMENTS

The Scottish Council of the B.M.A. held a press conference in Edinburgh on September 23, at which were present Dr. W. M. Knox, Chairman of the Scottish Council, Dr. C. Harrower, Dr. J. G. M. Hamilton, Dr. A. Macrae, Secretary, and Dr. E. R. C. Walker, Scottish Secretary. The B.M.A. spokesmen commented that the Secretary of State had rejected the B.M.A.'s offer without asking to see the Association's draft of the stated case and that he had been "less than candid" in his reference to the Ministers' letter of November, 1956, in failing to mention the statement in it that if the B.M.A. was not prepared to accept the Ministers' view the matter could "be brought before the courts for adjudication." Despite the fact that the suggestion of obtaining a legal decision on the disputed question came originally from the Government, the Secretary of State had now rejected this approach, and it might be assumed, the B.M.A. spokesmen pointed out, that the Government was now less confident about the probable result of the suggested legal proceedings. It was further pointed out that the Secretary of State's reference to the Royal Commission was irrelevant in this context, since it had been made clear that the Commission would not adjudicate on the legal issue, which was therefore not *sub judice*.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

The Wrong Meaning

SIR.—After 10 years of the Health Service one is almost every day coming across instances where members of the public in general and quite a high proportion of patients persist in thinking that the whole of the weekly insurance contribution goes towards payment for the Health Services, and this notion often finds expression in the good-humoured jibe—"I may as well have my money's worth, doctor!" Of all remarks made by the contemporary patient, and they are many, this is one with the more serious implications, totally misconceived, and, as it happens, pregnant with the wrong meaning.

The latest instance I have noticed of this widespread impression is to be found in a leading daily paper dated September 9. In the article headed "Cost of Living in London for Young People" we read that "She (Susan) finished at her secretarial college six months ago and her weekly salary after deductions for income tax and National Health insurance amounts to £7 5s." Well, well, here we are again. All the poor girl's insurance contribution is apparently paid to the Ministry of Health towards the cost of doctors, medicine, and hospitals. This is exactly the interpretation which will be put on such statements by thousands of readers.

Is it not high time, Sir, that the Ministry of Health and the B.M.A. again organized adequate publicity through

radio, TV, press, and posters to tell the people the facts? This matter would be comparatively unimportant but for one big topical phenomenon of the greatest significance to every doctor in the country—viz., the Royal Commission. If official bodies and important persons, including lay people in responsible positions, all think that a more than adequate sum is being contributed each week by every wage earner to pay for drugs and to keep the Health Services and the doctors going, then indeed we are not going to invite much sympathy or congratulation when the great day arrives and the doctors get—or do not get—more pay. Most people think that they are already paying more than enough—to the Health Services. Please may we have an urgent resolution of this utter muddle and obtuseness of thought in public circles, which one fears may be causing and will cause indirectly a great deal of harm, by inference, to the medical profession now standing pilloried and inert, awaiting the verdict.—I am, etc.,

Hailsham, Sussex.

P. A. HUBBARD.

Study for the D.P.H.

SIR.—Dr. Arnold Shaw (*Supplement*, September 6, p. 136) has stated perfectly the economic facts of the D.P.H. I agree with him on most points, but I believe that Dr. G. D. Rees (*Supplement*, August 23, p. 128) shows greater realism when he states that the D.P.H. examination should be open to anyone qualified for a few years. There are many assistant medical officers, with ten years' or more experience of the public health service and the R.A.M.C., who have found it an economic impossibility to combine family responsibilities with a career in social medicine.

Surely a study of the questions set in a typical D.P.H. paper reveals that they can be answered without the necessity of attending a university course. Take an example, "Discuss the value of fluoridization of water," or another, "Describe the facilities provided by a local authority for the care of the elderly," and it is apparent that the subject could be accomplished from textbooks and local experience in public health work. The highest medical administrative post of the country, that of the Minister of Health, has been held by an ex-miner, an ex-lawyer, an ex-stockbroker. Did any of them have a D.P.H.? Yet they were the leading group healers when they held their appointments.

This is the age of the "economic mean." Those below the mean are pulled up to it, and those above are depressed down to it. It is damaging to the cause of group healing no less than individual healing when the medical profession itself joins hands with social forces to further depress the "economic mean" of its members.—I am, etc.,

Wolverhampton.

GARETH R. DAVIES.

Operating Theatre Technicians

SIR.—As secretary of the Association of Operating Theatre Technicians I would like to express, on behalf of the executive council and all our members, our grateful thanks and appreciation to Mr. William Gissane (*Supplement*, August 9, p. 117), and the subsequent support by the other correspondence that has appeared in the *British Medical Journal*, to his plea for recognition of the important service rendered by the operating theatre technicians.

The aims and objects of the association have for the past twelve years been to promote a better service in this field of hospital employment by a system of educational training in theatre duties, and later by examinations, whereby the surgical and nursing staffs in the theatre will have a qualified technician as part of the theatre team; added to this, a salary comparable to such as those who hold important offices in other fields of the hospital service.

The association has in the past met with considerable opposition, but this has so diminished to be practically nil with regard to the hospitals, for by the information and requests received concerning the acquisition of a qualified theatre technician it is evident that they are much sought

after. The armed Services of the Crown educate and train their operating theatre technicians. Why not, then, the hospitals controlled by the National Health Service?—I am, etc.,

London, N.9.

F. C. RADFORD,

Secretary.

Association of Operating Theatre Technicians.

Interim Payment

SIR.—Surely by now it must be obvious to everyone that the recent statement of the Ministry that the economical state of the country would not allow an interim payment to doctors is sheer nonsense. One sees and hears of nothing but prosperity in every direction, and it is high time that the profession who have done their best with the National Health Service for 10 years should share in the nation's apparent success.—I am, etc.,

London, S.W.16.

D. G. ALLEN.

Grants for Postgraduate Courses

SIR.—In my article on Postgraduate Education for the General Practitioner (*Journal*, September 6, p. 580) I said that "the Ministry will not pay for a locum when a doctor in partnership attends an intensive course." I am now informed that this statement is not completely true. In approved cases the Ministry will pay the fees for a locum, provided that he is specifically engaged to carry out the work of the partner who is attending an intensive refresher course of one or two weeks.—I am, etc.,

Winchester.

G. SWIFT.

Cost of Prescribing

SIR.—We thought you would be interested to hear that our reply (*Supplement*, August 9, p. 118) to a letter on cost of prescribing brought response from well over 300 doctors. You will also be interested to hear that we have personally written to each of these doctors, sending a copy of our *Prescribers List* where applicable.

This response, to our way of thinking, underlines two fundamental points—first, the interest that medical men show in your correspondence columns, and, secondly, the need for a "comprehensive list of medical products with prices." The need has become so obvious to us that early next year we shall be issuing a 1959 list, suitably enlarged, to over 30,000 doctors and consultants concerned with the National Health Service.—I am, etc.,

London, S.W.17.

F. LEWIS WATSON,

Managing Director, Unichem Limited.

Reorganization of General Practice

SIR.—May I be allowed to reassure Mr. D. G. Wilson Clyne (*Supplement*, September 6, p. 136) that, among urban general practitioners, what are interpreted by an unfortunate few as the overwhelming evils of the National Health Service fortunately assume their proper perspective in the minds of the majority as minor irritations? There is certainly no material factor inherent either in the N.H.S. or in any urban environment which need be allowed to impair the family doctor's ability to maintain high clinical standards. Let all would-be reorganizers of general practice remember, however, that a considerable part of the general practitioner's work concerns many matters of a para- and non-clinical nature, and to supplant him from among his patients and place him in the relatively impersonal atmosphere of the hospital would certainly deter patients from seeking his help in such matters.

Close co-operation between the hospital and the general practitioner is, of course, becoming increasingly essential. It is, however, not a question of reorganization but simply of mutual good will.—I am, etc.,

Widnes, Lancs.

DOUGLAS MILLINGTON.

Paying for Medical Care

SIR,—I think the time has come for the profession to give notice to the country that the Government's refusal to consider the doctors' claim for increased remuneration may lead to them taking only patients in a low income group on their lists. Unfortunately, this may lead to two types of treatment—utility and "proper." This is a state of affairs which the profession has been trying to avoid since 1920. Both Government and country must face the fact that they spend far less on medical care in proportion to population than, for example, the Scandinavian countries. Cheeseparing on the provision of hospitals and the remuneration of qualified professional men will do a grave disservice to the N.H.S. and treatment of the sick generally in the near future. The advances in medical and social science over the last 10 years have increased the work demanded of all branches of medicine so that, for example, the general practitioner cannot be expected to deal with more than 2,750 patients properly, as opposed to the 3,500 he may have now. Forty-eight million pounds are regarded as essential expenditure on a rocket, so let us all come down to earth and realize that the Treasury must free a greater sum from its coffers for the N.H.S. in all its branches.—I am, etc.,

Ipswich.

ROY WEBB.

H.M. Forces

ROYAL NAVY

Surgeon Rear-Admiral E. T. S. Rudd, C.B., C.B.E., has retired. Surgeon Captain T. B. Lynagh has retired. Surgeon Commanders T. F. Davies, S. H. R. Price, M. A. Rugg-Gunn, and I. C. Macdonald to be Surgeon Captains. Surgeon Commander T. A. Turnbull has retired. Surgeon Lieutenant-Commander (Acting Surgeon Commander) W. H. B. Ellis, A.F.C., to be Surgeon Commander. Surgeon Lieutenant-Commander W. Cullen to be Surgeon Commander. Surgeon Lieutenant-Commander P. R. Morgan has retired. Surgeon Lieutenant P. F. Toal to be Surgeon Lieutenant-Commander.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commanders J. A. Shepherd, V.R.D., and P. de B. Turtle, V.R.D. and Clasp, to be Surgeon Captains. Surgeon Commander A. R. Harper, V.R.D., has retired. Surgeon Lieutenant-Commanders J. F. McHarg, H. R. Gray, C. F. Cooper, D. C. Lillie, and W. P. Small to be Surgeon Commanders. Surgeon Lieutenant-Commander S. D. Moss has been removed from the Active List. Surgeon Lieutenant-Commander L. V. Gimson, V.R.D., has retired. Surgeon Lieutenants B. Concannon, P. R. French, J. S. Campbell, and J. B. MacMillan to be Surgeon Lieutenant-Commanders.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel T. McG. McNie, O.B.E., has retired on retired pay. Captains M. M. Whiteley, J. D. Hughes, N. W. J. England, W. P. Maclay, and D. F. Conway to be Majors. Captain (Temporary Major) T. S. Hart to be Major. Short Service Commissions.—Major H. T. Chiswell, O.B.E., has relinquished his commission on completion of service, and has been granted the honorary rank of Colonel. Captain (Honorary Major) C. R. Harris to be Captain, and has been granted the acting unpaid rank of Major.

REGULAR ARMY RESERVE OF OFFICERS

Major-Generals T. Young, C.B., O.B.E., and F. R. H. Mollan, C.B., O.B.E., M.C., late R.A.M.C., having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers. Colonel A. McMillan, late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major (Acting Lieutenant-Colonel) F. S. Mooney has resigned his commission. Captain (Acting Lieutenant-Colonel) A. Murphy to be Major. Captains (Acting Majors) R. C. King, P. Stuart, and T. B. Boulton to be Majors. Captain B. W. Rhodes to be Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel E. H. P. Smith, T.D., has retired, and has been granted the honorary rank of Lieutenant-Colonel.
Captains W. Davison, F. P. Cassidy, G. A. Hanks, E. W. Walton, D. St. J. Murphy, and J. A. R. Parker to be Majors.
Captain T. M. Dauncey has been granted the acting rank of Major.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: E. E. Bassey, L.S.M., Medical Superintendent, Federal Medical Department, Federation of Nigeria; N. R. E. Fendall, M.B., B.S., D.T.M.&H., Assistant Director of Medical Services, Kenya; A. J. McKendrick, M.B., Ch.B., D.P.H., D.M.R.D., Specialist Radiologist, Tanganyika; Ng Nen Ling Teckham, M.B., F.R.C.S., Assistant Orthopaedic Surgeon, Health Department, Mauritius; J. R. H. Humphreys, M.B., B.S., Medical Officer, North Borneo; A. D. Sinclair, M.B., Ch.B., D.A., Medical Superintendent, Barbados; J. F. Tattersfield, M.B., B.S., Medical Officer, Uganda; H. M. Williams, M.B., B.S., Medical Officer, S.P.H.S., Fiji.

Association Notices

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1959

The Council of the British Medical Association is prepared to consider the award, in 1959, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "To what extent are experiments on animals essential for medical progress?"

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1959. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

A. MACRAE,
Secretary.

Diary of Central Meetings

OCTOBER

- 1 Wed. Consulting Pathologists Group Committee, 2 p.m.
- 1 Wed. Film Committee (following showing of rehabilitation film at Hercules House at 2 p.m.).
- 1 Wed. Private Practitioners Subcommittee, Private Practice Committee, 2.30 p.m.
- 2 Thurs. Editorial Subcommittee, Joint Formulary Committee, 11 a.m.
- 3 Fri. Executive Subcommittee, Science Committee, 11.30 a.m.
- 3 Fri. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
- 3 Fri. Science Committee, 2 p.m.
- 8 Wed. Occupational Health Committee, 10.30 a.m.
- 8 Wed. Private Practice Committee, 12 noon.
- 10 Fri. Ophthalmic Group Committee, 2 p.m.
- 16 Thurs. G.M.S. Committee, 10.30 a.m.

NOVEMBER

- 5 Wed. Welsh Committee (at George Hotel, Shrewsbury), 2.15 p.m.

Branch and Division Meetings to be Held

BROMLEY DIVISION.—At Beckenham Hospital, Wednesday, October 1, 8.15 for 8.30 p.m., meeting. Professor A. P. Thomson: "Education of Doctors in England." Guests are invited.

DARTFORD DIVISION.—At the Chest Clinic, Dartford, Thursday, October 2, 8.45 p.m., address by Dr. H. C. Calvey: "The Chest Clinic, Past, Present, and Future."

GLASGOW DIVISION.—At Glasgow Regional Office, 9, Lynedoch Crescent, Glasgow, Thursday, October 2, 8.30 p.m., meeting.

GREENWICH AND DEPTFORD DIVISION.—At St. Alfege's Hospital, Vanbrugh Hill, Greenwich, S.E., Wednesday, October 1, 8.30 p.m., meeting. B.M.A. Lecture by Professor P. Beaconsfield (Chicago University): "Recent Advances in the Surgery of Coronary Heart Disease." All medical practitioners in the area of the Division and in Lewisham and Woolwich are invited.

HOLLAND DIVISION.—At White Hart Hotel, Boston, Tuesday, September 30, 8 for 8.30 p.m., dinner. Mr. D. Wynn-Williams: "Plastic Surgery" (illustrated).

MANCHESTER DIVISION.—(1) At Fallowfield Hotel, Wilbraham Road, Manchester, Thursday, October 2, 8.30 p.m., annual meeting. (2) The Manchester Medical Ball, under the joint auspices of the Manchester Division of the B.M.A. and the Manchester Medical Students Representative Council, will be held in the Students' Union, Oxford Road, Manchester, on Thursday, October 23, 8 p.m. to 2 a.m. Music by "The Saints" and "The Squadronaires." Tickets, £2 per double ticket for graduates, 22s. 6d. per double ticket for students and pre-registration graduates.

MID-GLAMORGAN DIVISION.—At Twelve Knights Hotel, Margam Road, Port Talbot, Friday, October 3, 7.30 for 8 p.m., dinner, followed by address by Dr. Donald Isaac.

NORFOLK BRANCH.—At Samson and Hercules House, Norwich, Friday, October 3, 8 for 8.30 p.m., autumn ball. Dinner at 9 p.m.

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, September 30, 7.30 for 7.45 p.m., supper: 8.30 p.m., valedictory lecture by retiring Chairman, Dr. E. S. M. Merry: "Milestones in Anaesthesia." Wives of members are invited.

SOUTH MIDDLESEX DIVISION.—At Mitre Hotel, Hampton Court, Thursday, October 2, 8.30 p.m., meeting. Lecture by Mr. C. Naughton Morgan: "Treatment of Minor Rectal Conditions in the Light of the Modern Conception of the Anatomy of the Anorectal Region" (illustrated).

WEMBLEY DIVISION.—At Board Room, Wembley Hospital, Tuesday, September 30, 8.30 p.m., meeting. (1) Address by Mr. John Shirley Callcutt: "A Visit to Brussels and the International College of Surgeons" (illustrated). (2) A short résumé of A.R.M., 1958 (Birmingham), by Dr. Philip H. Addison. Members of Harrow Division are invited.

WEST SUFFOLK DIVISION.—At Everard's Hotel, Tuesday, September 30, 8.30 p.m., B.M.A. Lecture by Dr. Francis Camps: "Medical Aspects of the Investigation of Homicide" (illustrated). Legal friends are invited.

Meetings of Branches and Divisions

BRISTOL DIVISION

The following officers have been elected:

Chairman.—Mr. A. Palin.

Chairman-elect.—Dr. W. J. S. Cameron.

Honorary Secretaries.—Dr. A. S. Anderson and Dr. Sarah Walker.

Honorary Treasurer.—Dr. C. Dix.

CHESTERFIELD DIVISION

The following officers have been elected:

Chairman.—Dr. J. F. Hanratty.

Vice-chairman.—Dr. R. T. Gaunt.

Honorary Secretary and Treasurer.—Dr. I. R. D. Proctor.

CLEVELAND DIVISION

The following officers have been elected:

Chairman.—Mr. J. C. Clark.

Vice-chairman.—Dr. W. P. Dunn.

Honorary Secretary and Treasurer.—Dr. J. N. Stirling.

DUMFRIES AND GALLOWAY DIVISION

The following officers have been elected:

Chairman.—Dr. F. T. Ingram.

Vice-chairman.—Dr. P. M. Kerr.

Honorary Secretary and Treasurer.—Dr. J. B. Wilson.

GOOLE AND SELBY DIVISION

The following officers have been elected:

Chairman.—Dr. E. Cretney.

Vice-chairman.—Mr. D. L. Shaw.

Honorary Secretary and Treasurer.—Dr. W. Wintersgill.

HARTLEPOOL DIVISION

The following officers have been elected:

Chairman.—Dr. R. Martin.

Honorary Secretary and Treasurer.—Dr. H. W. Bisset.

ENTRY INTO GENERAL MEDICAL PRACTICE

BY

L. S. POTTER, M.B., Ch.B.

Medical Director, B.M.A. Medical Practices Advisory Bureau

In 1955¹ and 1956² I published the results of inquiries into the incidence of unemployment and underemployment in the medical profession. The object of these surveys was twofold. First, to try to estimate the amount of real unemployment in the medical profession, and, secondly, to verify or refute the opinion I had expressed that too many would-be general practitioners were in posts which offered no prospects of advancement—that is, in what are colloquially described as "dead-end jobs."

In the spring of this year I undertook a third survey on similar lines. A questionnaire was addressed to all those registered with the Medical Practices Advisory Bureau, the great majority of whom were seeking to establish themselves as principals in general practice. On this occasion the scope of the inquiry was widened. It has been possible to analyse that section of the returns which included the so-called "permanent assistant," and, in the light of the Bureau's experience, to comment on the problem of entry into general practice about which so many different views are held.

It must again be emphasized that these inquiries have definite limitations. In the first place they comprise a selected group which cannot be regarded as a representative cross-section of the profession as a whole or even as a random sample of a particular section of the profession. Secondly, the Bureau has no monopoly, and there are many seeking to establish themselves who have not registered with the Bureau or who have withdrawn their names temporarily because they are, for the time being, in appointments. Thirdly, the Bureau cannot nominate candidates for vacancies which are advertised, and this excludes from the scope of the inquiry the majority of single-handed practices—that is, Executive Council vacancies. With these reservations, however, it can be claimed that those registered with the Bureau form a group representative of those seeking to establish

themselves in practice or trying, through exchange or other methods, to improve their circumstances.

Comparison of Figures

The total number circularized this year was 908. This is less than the number circularized in 1956 (947) and in 1955 (1,075). It is doubtful whether this difference has any significance, as the number registered with the Bureau at any one time varies considerably.

		Analysis of Returns		1958
1955	1956	Total circularized	Returned form "unemployed"	908
1,075	947	Returned form asking to be removed from list because satisfactorily settled	150	
82 (8%)	87 (9%)	Did not reply	201	
265	153	Returned form "employed"	494	
248	179			
480	526			
		Unemployment		
1955	1,075	Unemployed	82 (8%)	
1956	947	Unemployed	87 (9%)	
1958	908	Unemployed	63 (7%)	

These figures speak for themselves and support the view that of a selected group of doctors all seeking to establish themselves in their chosen field of practice rather fewer than 10% are unemployed at any one time, and that this figure is likely to vary only slightly. I do not regard the lower percentage in 1958 as indicating a trend any more than the slightly higher figures in 1956 indicated a deterioration in the position. Since of the 63 who were unemployed when they received the questionnaire only 10 placed no restriction on the type of appointment or area they would accept, it may be stated with some confidence that the amount of involuntary unemployment in the profession as a whole is very small indeed.

I should like at this stage to add two further comments arising from criticisms of the two previous reports. First, it has been suggested that these inquiries have been made at a time when unemployment would be at its lowest. In fact, April was chosen deliberately as the month in which the seasonal demand for locums would be unlikely to affect the result. Secondly, it has always been difficult to decide how to deal with the number who did not reply to the questionnaire. On a previous occasion I gave figures to show that the great majority of these could be regarded as satisfied. On this occasion it was plainly stated in the questionnaire that those who did not reply would be regarded as satisfied and, in accordance with our usual practice (a twice-yearly check of the register), would be struck off the list of the Bureau. Including those who replied saying that

they were satisfactorily settled and wished to be removed from our list, the total of those excluded from analysis is about 40%, as in previous years.

Establishment in General Practice

Of the 494 who answered the inquiry "Employed" in 1958, 55 were not seeking posts in general practice; 38 others were principals in established practices seeking alternative work or part-time appointments to supplement their incomes. These can therefore be excluded from the analysis, leaving 401 seeking principal status.

1955	1956		1958
48	526	Total	494
30	43	(1) Registered with the Bureau but not seeking general practice posts	55
20	30	(2) Principals in general practice seeking alternative work or part-time appointments to supplement their incomes	38
50	73		93
430	453	Net total	401
37	46	(I) Trainees	44
27	26	(II) In house posts or on national service and seeking first G.P. post	18
33	31	(III) Assistants with view to partnership who have asked to remain for the time being on the books of the Bureau	29
64	57	(IV) Principals seeking change of practice (exchange)	59
161	160	Total	150
136	152	(V) Assistants without view	144
58	62	(VI) Locums or temporary appointments	47
75	81	(VII) Appointments with no prospects—e.g., registrars	60
269	295	Total	251

Note. Groups I-IV not regarded as in dead-end jobs. Though all those in categories V-VII may be in dead-end jobs, only 35 (14%) place no restrictions on the area or type of appointment they are seeking.

Analysis of Assistantships Without View

Out of the total of 144, 69 had done traineeships, and of these 48 were in their first subsequent assistantship, 21 had done more than one year as assistant, 19 (27%) had been in general practice for more than three years.

Seventy-five had not done traineeships. Of these, 45 were in their first G.P. posts, 30 had had more than one assistantship, 12 (16%) had had more than three years' G.P. experience.

It is usually accepted that a doctor who has completed his pre-registration house appointments and his national service and who may have done a further period in hospital posts must have at least two years' experience in general practice, either as trainee or assistant, before he is likely to be considered for an Executive Council vacancy. Experience suggests that at least a year's experience is also needed before a doctor seeking an assistantship with view to partnership can compete on equal terms for the more attractive openings. There are, of course, exceptions. There are partnerships which are "kept warm" for sons or other near relations; there are also assistantships where no view is offered but which result, after a varying length of time, in partnership. On the other hand, there are those who are content with the security of an assistantship without prospects which enables them to wait for an opening in a particular area or one giving opportunity for special clinical interest. If it is justifiable to assume that a doctor seeking to enter general practice must expect to serve for two years either as trainee or assistant before he can obtain the status of a principal, either in single-handed practice or in partnership, then it is reasonable to regard those with three or more years' experience who have still no expectation of attaining principal status as having been too long in dead-end jobs. It would

also be true to say that during the first year no probationary post in general practice should be regarded as a dead-end job, and it is probable that this would be true also of the second year. The analysis of those in assistantships without view suggests that rather fewer than 25% have been too long in this interim stage of their careers. This figure should be increased by an indeterminate number who, though in appointments without prospects, have either withdrawn their names from the register of the Bureau for the time being or have restricted, within a narrow field, the type of appointment they will accept or the area in which they will work. It is interesting to compare this estimate with the conclusion I published in 1955 that, out of a group of 1,075 doctors seeking to establish themselves in practice, 269 (25%) were in posts which offer no immediate advancement or permanent security and which deny them the status of principal, to which, by reason of age, qualifications, and experience, they may well feel entitled.

Further evidence on the time normally taken to attain principal status is provided by the "turn-over" of the Bureau. It is significant that although the number registered with the Bureau remains constant within fairly narrow limits—that is, between 900 and 1,000—few remain on the books for more than two years. The number circularized in 1958 who replied, and were therefore retained on the register, was 557. Of these the number who were also included in the 1956 survey was 129 (approximately 23%) and the number included in the 1955 survey was 26 (approximately 4%). Of the 129 who could be assumed to be still searching for openings, 42 are not seeking posts in general practice. In the Bureau's experience the difficulty of obtaining an assistantship with view to partnership increases from about the age of 35 onwards, becoming a real handicap in the forties. Taking 35 as the borderline, it is interesting to note that, of the 129 included in the 1956 survey and still seeking posts in 1958, 80 (60%) were over 35. Of those included in the 1955 inquiry and still on the books in 1958, 21 out of 26 were over 35.

Discussion

To discuss entry into general practice in terms of tables and statistical analysis is to oversimplify the problem. This approach ignores many important factors and takes no account of individual circumstances, qualifications, ability, and personality. For instance, given the requisite experience, age may prove a handicap when seeking a junior partnership but may even be an advantage when applying for an Executive Council vacancy. Again, if a doctor can accept the obligation to buy a house or to purchase a share in the capital assets of a partnership without having to devote too much of his expected income to the repayment of loans, he is in a much stronger position and has a much wider field of opportunity. Lastly, no counting of heads or the equation of the number of openings to the number of possible applicants will answer such questions as these: why a practitioner in a successful partnership with what seems to be an adequate income will suddenly decide to emigrate; why a doctor with family commitments and little or no capital fails even to investigate introductions which would seem to answer his needs; why a doctor will face debt and years of frustration rather than the "bogy" of the city or industrial practice, which in some cases amounts to almost an obsession.

The Bureau is continually faced with anomalies which are very hard to explain unless one is prepared to accept the fact that the difficulties of entry into practice are very greatly exaggerated. Though many could be quoted, two examples will suffice to illustrate this:

(1) Owing to the retirement of a partner an assistant with view was required in a practice in an outer London suburb. N.H.S. list 5,000 plus. The new partner was required to purchase a share in surgery premises valued at £1,500 (alternatively the partnership would rent them). Salary as assistant £1,250 gross, commencing partnership share one-third, increasing to 49% over eight years. Particulars of this vacancy were sent to 220 possible applicants.

There were only seven applicants and the vacancy was subsequently filled after a private introduction.

(2) An assistant with view was required in a rural practice based on a small town in south-east England. N.H.S. list 3,000 (mainly dispensing) and some appointments. Salary as assistant £1,250 gross, commencing partnership share of one-third with rights to increase "as may be agreed." Particulars were sent to 250 possible applicants, of whom 50 applied in three days.

A few months ago a firm of two partners in a country town some 20 miles from London asked the Bureau to introduce an assistant with view. The salary offered during the probationary period was £1,050, with rent-free, unfurnished accommodation above the surgery premises. A commencing share of one-fifth was estimated to bring a net income of £1,500 per annum, with increases to approximately one-third after eight years. The new partner was required to purchase a share in the capital assets of the practice, which included freehold surgery premises, at an initial cost of just over £2,000. As there was scope for an increase in the amount of midwifery undertaken, preference would be given to applicants with experience in obstetrics.

The terms of this appointment as set out in the circular issued by the Bureau could be described as average. We should regard the area as "much sought after." Particulars were sent to 220 possible applicants, but only 25 applications were received. In spite of the deterrent—the need to find capital—we were puzzled by this small response, and, with the permission of the partners, I wrote to those who had not applied, asking for their reasons. About 80 replies were received.

The main inference to be drawn from the replies was that there was no sense of urgency, and though most of those who received the circular were in assistantships offering no prospects, and though many had expressed a preference for London and the home counties, they failed to investigate this offer of a partnership because *it was not quite what they wanted*. Many were deterred by the need to find some capital, others by the implication that for a time they would be required to reside on surgery premises though there was no indication that this was other than a temporary arrangement. A few jumped to conclusions which could not be justified either by reading the circular or by facts known to the Bureau. There may be good reasons for these suspicions, but if the need to attain principal status were pressing one wonders why so many did not even trouble to follow up the introduction or to make further inquiries. One doctor, in his reply, was frank enough to say that he had come to the conclusion that, because the midwifery was increasing and because an applicant experienced in obstetrics was required, this was evidence that the partners intended to pass all midwifery to the incoming man.

Many considerations influence a doctor seeking a practice or partnership. In the experience of the Bureau, by far the most important of these is locality. The need to find time in which equality will be reached seem to be of lesser importance, though, as suggested above, these may give rise to suspicions which, though not justified, will deter the would-be applicant from even investigating the offer. If one accepts all that has been said and written about the difficulty of getting established in general practice, it is hard to explain why so many refrain from investigating good opportunities and the great reluctance of doctors to go to the large towns and industrial areas.

There is no doubt that one of the main deterrents is the widespread conviction that once a doctor attains principal status in general practice he is tied to that practice for the rest of his life. There is, of course, good reason for this. It is well known that the scheme for exchange of practices, though admirable on paper and sponsored by the Medical Practices Committee and the majority of Executive Councils, breaks down in practice because most of those seeking to exchange practices are looking for the same thing—a similar income in a more attractive area. The picture, however, is not entirely dark. A client of the Bureau has been success-

ful in moving from the North of England to Somerset by means of three exchanges over the years. Nevertheless, the problem of restricted mobility remains.

Summary and Conclusions

Of 908 doctors who replied to a questionnaire circularized in the spring of 1958, 63 (7%) were unemployed at the time. Since this group comprised those who were looking for posts in their chosen field of practice, the amount of enforced unemployment in the profession as a whole is very small indeed.

Of those in appointments offering no prospects of advancement, 144 were assistants in general practice. Of these some 22% had been assistants (or trainees) for more than three years. If this figure is corrected to take into account those who had temporarily withdrawn their names from the Bureau, there are probably between 25 and 30% of those trying to establish themselves in general practice who have been too long in attaining principal status. The position is roughly the same as it was three years ago.

The experience of the Bureau suggests that the first steps are easy and there is no lack of appointments for trainees or assistants. Ordinarily, provided he is prepared to consider any good opening in any part of the country, a doctor should expect to attain principal status within three years of commencing his first general practice appointment.

Lastly, in the opinion of those dealing with the problem day by day, the position has been stable over the past three or four years, with recently a slight improvement in the number of the introductions made by the Bureau. As this coincides with the end of the first ten years of the N.H.S., it is impossible to say whether it represents a definite upwards trend.

GENERAL MEDICAL SERVICES COMMITTEE

A meeting of the General Medical Services Committee was held at B.M.A. House on September 18. Dr. A. B. DAVIES was in the chair. There was a lively discussion on the Sheffield Local Medical Committee's invitation to other local medical committees to submit independent evidence to the Royal Commission.

Having introduced and extended a cordial welcome to Dr. J. D. J. HAVARD, one of the newly appointed Assistant Secretaries of the Association, the CHAIRMAN referred to the continued illness of Mr. R. CURRER, Clerk to the Committee. The Committee sent a message to Mr. Currer conveying its best wishes for a speedy recovery.

Drs. F. GRAY and R. B. L. RIDGE were nominated by the Committee to serve on an *ad hoc* subcommittee set up by the Central Ethical Committee to inquire into the problem of the disclosure of information from chest clinics to industrial medical officers. The Committee appointed Drs. W. MORGAN EVANS and D. C. BOWIE as representatives to attend a one-day conference, to be held on November 14, dealing with the filling of medical appointments overseas.

Remuneration

The Committee's attention was drawn to a letter from the Birkenhead Local Medical Committee dealing with the payment of the final settlement. The letter recalled the announcement made at the Annual Conference of Local Medical Committees that £3m. of the final settlement for

the financial year ending March 31, 1958, would be paid at the end of December next, and continued: "My committee, whilst appreciating the considerable improvement in time of payment, would like to be assured that even nine months' delay in payment of such a proportion of the final settlement for 1958-9 is not envisaged, and that some similar amount will be paid at March 31, 1959, and in subsequent years even earlier, by an appropriate addition to the capitation fee." The Birkenhead Local Medical Committee felt that the profession should very strongly resist the continuation in any degree, however small, of delay of payments which would never be tolerated in the commercial world, and which had cost the general practitioner in the past very substantial amounts of money.

The CHAIRMAN pointed out that the Committee was always endeavouring to shorten the delay in paying the final settlement, and it would do everything possible in that connexion so far as future years were concerned.

Compensation

A letter from the Medical Practitioners' Union asking the Committee again to give consideration to the possibility of pressing the Ministry to increase the rate of interest payable on doctors' money held on account of compensation was referred to the Compensation and Superannuation Committee.

The Medical Practitioners' Union also asked that the terms under which advances might be obtained against sums held should be liberalized. It had particularly in mind the possibility of a practitioner wanting to spend money on his surgery and being unable to obtain the necessary advance.

Tribunals and Inquiries Act

The Committee received and accepted a letter from the Ministry of Health pointing out that the Government had not felt that it would be right to exclude executive councils and their service committees from the list of named tribunals in the Tribunals and Inquiries Act. However, the function of the Council on Tribunals (established under the Act with certain defined responsibilities for the constitution and working of named tribunals, etc.) would be advisory, and any advice it might wish to give would come to the Minister. Should the Minister, as a result of such advice, wish to propose any alteration in the existing arrangements, there would be no change in the present practice under which the professional associations were brought fully into consultation.

Royal Commission on Doctors' and Dentists' Remuneration

Evidence by Sheffield Local Medical Committee

The action of the Sheffield Local Medical Committee in inviting other local medical committees to submit independent evidence to the Royal Commission was the subject of a lively discussion. The matter was brought to the attention of the Committee by the London Local Medical Committee. Dr. F. GRAY pointed out that, although the right of the Sheffield Local Medical Committee to send independent evidence to the Royal Commission was not questioned, his committee deprecated the action of the Sheffield Committee in inviting all other local medical committees to do likewise. "I do not think I need stress what the result might be if a large number of local medical committees accepted the Sheffield invitation," added Dr. Gray.

In its letter the Sheffield Local Medical Committee suggested that if other local medical committees sent their views to the Royal Commission the concerted efforts should be more effective. The headings under which its own memorandum was constructed were those of the Executive Council's Association—namely, entry into general practice; position of assistants and partners; method of remuneration; size of list; load of work on general practitioners; and relationship between hospital staff and general practitioners.

The CHAIRMAN agreed with Dr. Gray that every local medical committee had the right to write to the Royal Commission expressing views, but in the past the General Medical Services Committee had advised local medical committees that it would be wise if their views were channelled through the former.

Dr. B. BURNS said there was strong feeling in Sheffield that the evidence given by the Association, both in writing and orally, did not represent the views of the profession locally on certain points which were regarded as fundamental to the future of the National Health Service. As there were no other means of communicating the views held by Sheffield to the Royal Commission, his local medical committee decided to submit a memorandum. In view of the fact that his committee felt that other local medical committees might hold similar views, it was decided to notify all other local medical committees that such action had been taken by Sheffield.

Dr. S. WAND (Chairman of Council) said he had a number of questions to ask Dr. Burns. For instance, when it produced its evidence did the Sheffield Committee realize that the evidence which had already been presented to the Royal Commission and published was only a portion of the total evidence that was to be given? Secondly, was the profession in Sheffield consulted before the evidence was given? Thirdly, had the Sheffield Committee evidence of the names or numbers of the "less scrupulous" members of the profession in that district, because there was a reference in the memorandum to "less scrupulous" colleagues? Fourthly, where did Sheffield obtain the information that "a medical assistant commands a salary of approximately £1,100 per annum out of which he must provide and run a car"? That was contrary to the evidence obtained from the Medical Practices Advisory Bureau and submitted to the Royal Commission.

Again, Dr. Wand asked whether the Sheffield Committee realized that a committee to review the Health Service was being set up which was to discuss these problems. He also asked what the question had to do with the terms of reference of the Royal Commission. "Finally," said the Chairman of Council, "did Sheffield send in this evidence in the full knowledge of the embarrassment which it is likely to cause those who are trying to speak on behalf of the profession through the organized channels, of which this Committee and the Association are one, and did Sheffield realize that before the evidence was given to the Royal Commission it might have been politic in the interests of the whole profession to have let an organized body such as this have an opportunity of seeing it?"

The CHAIRMAN ruled that any discussion on the rights and wrongs and validity of the contents of the Sheffield memorandum would be out of order.

Views of Majority

Dr. BURNS, in reply, said that the views of the profession in Sheffield had been obtained over the last two or three years in general meetings, in groups, and by every democratic means. The views expressed in the memorandum were those of the vast majority of general practitioners in Sheffield.

On the question of "unscrupulous doctors," the matter arose from oral evidence given by Dr. Wand to the Royal Commission in which he stated that the badge of merit of the general practitioner was the size of his list. "With that view the doctors in Sheffield profoundly disagree," said Dr. Burns. They agreed that in many cases the large-list doctor was worthy of his large list, but there were other methods of obtaining a large list which were not particularly meritorious. "I do not know how other areas are affected," continued Dr. Burns, "but we have a goodly proportion of them in Sheffield, and I have fair reason to suppose as a result of conversations I have had in this building that similar examples are recognizable in other areas of the country."

The figures quoted in the case of assistants were obtained from the chairman of the executive council. So far as the review committee was concerned, Sheffield saw no evidence that there was the slightest possibility of any decision on the matters outlined from the review committee in time for the report by the Royal Commission. As to the terms of reference of the Royal Commission, the Commission had asked almost every person and every collection of persons interviewed to explain why doctors were dissuading their sons from entering medicine. Sheffield was attempting to explain that.

On Dr. Wand's final point, Dr. Burns said he felt sure that his committee would wish him to apologize for any embarrassment which might have been caused to any other body, but, at the same time, Sheffield insisted on the right to convey views to the Royal Commission and to anybody else it pleased.

Dr. WAND asked Dr. Burns whether he was not guilty of a little divergence from fact so far as his statement about less scrupulous doctors was concerned. Dr. Wand recalled what he had said to the Committee—namely, "The Chairman of the Royal Commission said to me: 'How to-day is merit assessed?' and I said, 'The only way in which merit is assessed to-day is by the sizes of lists,' and that was a fact. He did not say that he agreed or disagreed with it. It was necessary to consider the atmosphere in the Royal Commission at the time, and the fact that the answers were given in the context of the original question."

Dr. BURNS replied that he appreciated the atmosphere in which the Chairman of Council had to answer the questions put to him. All that he could comment on was the impression that Dr. Wand's words, as reported in the *Journal* (Supplement, February 1, p. 39) and in the press generally, was conveyed to the Sheffield Committee. That impression was that merit was measured by the size of a list, and that therefore the size of a list was necessarily a measure of merit. With that view the Sheffield Committee profoundly disagreed.

Dr. R. J. T. GARDINER asked the Committee to look at the matter not as an argument between London and Sheffield, but rather to look at the broader issues—namely, why had anybody in the country thought fit to submit independent evidence to the Royal Commission? Frankly, the only answer would appear to be that there was a body of medical opinion in the country which did not feel that the evidence submitted by the G.M.S. Committee had truly represented its views. But for an accident of geography, Sheffield would not have been alone in submitting independent evidence to the Royal Commission, because in Northern Ireland there was a fairly substantial body of medical opinion which felt that the evidence submitted by the G.M.S. Committee did not truly represent its views. That body of medical opinion attempted to submit independent evidence, but, unfortunately, the Royal Commission ruled that its jurisdiction did not extend to that part of the country. "Therefore, instead of laying the blame at the door of those who have found it necessary to submit independent evidence, we should be more introspective and find the cause within this Committee," concluded Dr. Gardiner.

The CHAIRMAN reminded the Committee that at the outset of the oral evidence the representatives of the Association made their position clear as representatives of a democratic body. They did not claim to speak for every individual member of every local medical committee in the country, and were fully conscious that there might have been a minority view. In fact, they had admitted it to the Royal Commission and were asked whether they disagreed with the views of other people who had submitted alternative evidence. Dr. GRAY referred to Dr. Burns's statement that he had obtained the figures in connexion with the remuneration of assistants from the chairman of the executive council, and said that those figures must of necessity be inaccurate. They referred to cash payments. Anything paid in kind could not count for superannuation, which was the figure with which the executive council was concerned.

The Committee, having heard the debate, decided to take no further action other than to receive the item.

Registration of Stillbirths

The Committee considered a letter from the Registrar-General about obtaining information on the causes of stillbirths. The present position in England and Wales was that when a stillbirth was registered information on the cause or causes was not obtained, but in Scotland such information had been collected since January 1, 1939. The information would fill a gap in the national vital statistics and would also assist in important genetic studies. The Medical Research Council was anxious to foster the development of the study of human genetics, and the subject was of growing importance in relation to radiation hazards. The Registrar-General pointed out that the number of stillbirths in England and Wales totalled less than 17,000 annually, or about 22.5 per 1,000 total births, and the certification would not be for the medical practitioners to do in all cases.

The Committee saw no objection to furnishing the information.

Procedure on Appeal

With reference to recent criticism from local medical committees of the procedure which was adopted by appeals tribunals, a letter was received from the Ministry of Health in reply to the Deputy Secretary, Dr. D. P. STEVENSON. The point at issue had been the fact that local medical committees, although represented at the appeal, could take no part whatsoever in the proceedings. The letter from the Ministry indicated that the wording of the letter in which local medical committees were advised that a hearing was to take place would be revised. It would continue to say that the Committee might wish to send representatives to the hearing, but it would add that, as the procedure was a matter entirely within the discretion of the referees, it would, of course, be appreciated that it would be for them to determine what part, if any, any such representatives should take in the proceedings.

Remuneration of G.P. Cottage Hospital Staff

It was recalled that the Committee had referred to the Liaison Committee the question of the staffing of cottage hospitals with particular reference to the need for special arrangements for casualty work. In many hospitals, it was pointed out, there was no special payment for casualty work, and the only available fund was the bed fund, the use of which for out-patients was illogical. In the Liaison Committee it was suggested that there should be some scheme for payment on an "item of service" basis or for special attendance for emergencies, but before any recommendation was made it was felt necessary to have further information about the probable number and nature of emergencies in different areas. Some information had been furnished by Dr. H. S. Howie Wood and Dr. J. A. Pridham, to whom the Committee was indebted, and it was agreed that the matter should be explored with the Ministry, and that members of the G.M.S. Committee be asked to collect evidence in their own areas.

Maternity Medical Services

Fees

The Committee considered a resolution by Middlesex, which was carried at the Annual Conference of Local Medical Committees, instructing the General Medical Services Committee to negotiate immediately for an increase of fees in respect of maternity medical services.

The CHAIRMAN reminded members that the annual cost of the maternity fees was somewhere between £3m. and £3½m., and if, for example, the present scale were doubled, it would take another £3m. from the pool. Dr. F. E. GOULD

suggested that it would be premature to discuss any alteration in maternity fees until the Cranbrook Committee reported.

Dr. R. B. L. RIDGE opposed any suggestion of deferring a decision. Middlesex, he said, had been fighting the issue for some five or six years, and he reminded the Committee that the fees were exactly the same as they were in 1948. His committee took the view that maternity work was an essential part of general practice and that there should be an immediate increase in fees for such work. Dr. A. TALBOT ROGERS said he was against the Committee ignoring an instruction from the Conference. There was a clear instruction from the Conference, and it should be carried out quite irrespective of the Cranbrook Committee's report. Dr. BURNS suggested an increase in the total fee for full maternity service and a decrease in the fee for the minimal service which was provided by some doctors at present.

The Committee agreed finally to recommend to the Ministry that the present maternity fees of 5 and 7 guineas be increased to 7 and 10 guineas respectively.

Advice to the Public

The Ministry of Health informed the Committee that it accepted the Committee's suggested amendments to the advice to the public on the use of the general medical services which the Ministry proposed to issue. The Ministry submitted two additions. The first reminded patients that many drugs and tablets were dangerous to small children and should be kept out of their reach, and the second was that it would help to reduce the costs of the National Health Service if patients could always quote their National Health Service number when it was required.

Receipt Forms for Prescription Charges

The Committee considered a letter from the Ministry of Health on the proposed special receipt forms for dispensing doctors. The General Post Office was anxious to help dispensing doctors provided there were adequate safeguards in the method adopted, and the Ministry had been consulting the Post Office about a form with boxes printed for 1s., 2s., and 3s., and an additional box for entering a higher amount, the doctor to be required to initial the printed amount to be paid or to write some other amount in words and figures and to strike out unused boxes. After the most detailed and careful consideration it appeared that, however willing the Post Office might be in principle to handle a new form on the lines suggested, it had reluctantly come to the conclusion that it could not do so satisfactorily in practice.

The Committee agreed that the matter be pursued with the Ministry of Health and, if necessary, with the Postmaster-General's department.

List of Appliances

Nylon Hypodermic Syringes

The Committee had before it a letter from the Norfolk Local Medical Committee indicating that the latter had endorsed a suggestion from a member that nylon hypodermic syringes should be prescribable on form E.C.10 for diabetics and others. They were said to be slightly more expensive than glass but much more durable.

Dr. BURNS pointed out that objections to nylon syringes were that they became discoloured, they were not calibrated accurately for purposes of diabetics, and they could not be kept in spirit, which might present difficulties from the point of view of sterilization.

The Committee did not support the suggestion of the Norfolk Local Medical Committee.

Calculation of Central Pool

A resolution from the Liverpool Local Medical Committee urging the G.M.S. Committee to publish in a suitable form the items making up the total figure of the Central

Pool for each year was considered. The Liverpool Committee felt that there was widespread ignorance of exactly how the total figure was arrived at.

The CHAIRMAN informed members that he was preparing an aide-memoire on the subject for members of the Committee to consider.

Payment of Home Confinement Grant

The Sheffield Local Medical Committee's attention had been drawn to an anomaly in the National Health Service Regulations on the payment of the home confinement grant.

As things were at present, a mother could be admitted as an emergency to a maternity hospital for a period not exceeding three days, during the puerperium, without forfeiting the grant for home confinement. If, however, it was desirable for the safety of the mother—e.g., previous history of post-partum haemorrhage or retained placenta—that she be confined in hospital by prearrangement and sent home within two days, no grant was payable.

The Committee agreed to raise the matter with the Ministry of Health.

Defence Trusts

Meetings of the Trustees of the General Medical Services Defence Trust and of the National Insurance Defence Trust were held at B.M.A. House on September 18.

The officers of the Trusts were re-elected and the CHAIRMAN, Dr. Kate Harrower, gave details of the financial position of the Trusts.

Tax Appeals

Dr. HARROWER reported that the Trustees had decided to contribute the sum of £710 towards the expenditure of £3,250 involved in preparing the test case in connexion with the assessment of the income of part-time consultants under Schedule E. The Trustees agreed that within the next two meetings a document should be prepared setting out complete details in respect of money which had been spent and what were likely to be future commitments. Authority was given to Dr. Harrower to spend up to £2,000 on behalf of the Trust, it having been reported that further expenditure would be involved when the case referred to earlier was taken to appeal.

ORGANIZATION COMMITTEE

ASSOCIATION'S RECORD MEMBERSHIP

The Organization Committee of the B.M.A. was set up to advise upon all matters relating to the organization of the Association, upon rules of organization of Divisions and Branches, and upon grants to the local units. Its first instruction is "to organize systematic endeavours to maintain and increase the membership." Following the Annual Representative Meeting's resolution, requesting Council "as a matter of urgency" to consider specific arrangements to improve intraprofessional relationships and solidarity, the Organization Committee had been asked to set out detailed proposals for an efficient interchange of information between the periphery and Headquarters.

At its first meeting of the session, at B.M.A. House on September 25, the Committee re-elected Dr. R. G. GIBSON as its chairman, and welcomed two new members, Dr. J. S. ROSS and Dr. J. T. Warnock, to what the CHAIRMAN thought would be "a very hard year's work." The following subcommittees were appointed: Medical Students and Newly Qualified Practitioners; Forum; and Propaganda.

Membership of the Association is higher than ever, the Committee was told. It stood at 71,785, including 520 newly qualified practitioners. This compared with 70,808 a year ago, when only 450 newly qualified practitioners joined. Dr. L. S. POTTER, Assistant Secretary, drew attention

to the fact that the number was approaching 72,000, "which, of course, will be an all-time high."

Periphery and Centre

For nearly two and a quarter hours the Committee considered all aspects of intraprofessional relations and how they could be improved. Particularly the Committee considered means of increasing the to-and-fro flow of information between the periphery and Headquarters. Dr. E. C. DAWSON, a member of Council, who had been specially invited to attend the meeting, in an hour-long speech introduced a memorandum which he had prepared on what he preferred to call "intraprofessional co-operation," thinking that "relations" had a static implication. Among other things, Dr. DAWSON called for a propaganda campaign by all methods. Dr. S. WAND said that, although many would disagree with some of the details of Dr. Dawson's memorandum, there would be agreement with its general aims.

At the end of the discussion it was decided to reconsider the matter at the Committee's next meeting in a month's time. It was hoped then to frame recommendations for submission to the Council on the more urgent aspects of the question and to refer matters needing more detailed study to the Propaganda Subcommittee.

Junior Members' Forum

A letter was received from Dr. P. B. Bailey, Bristol, vice-chairman of the Forum for 1959, requesting help in financing the local young doctors' group. The Committee agreed in principle to furnish help. It was stated that there would be an early meeting of the Forum Subcommittee, responsible for arranging the next Forum. The Committee also decided to increase the grant for the 1959 Forum.

Budget for 1959

The Committee's estimated budget for 1959 for submission to Council was approved. It totalled £18,725. Out of this total would come the capitation grants to home and overseas branches, the cost of the secretaries' conferences in London and Scotland, the cost of the *Year Book*, and the cost of the Junior Members' Forum.

Criteria for Fellows

"The criteria for admission to the Roll of Fellows of the Association are woolly and can be stretched very far," declared Dr. J. S. ROSS. "If we want to maintain the standard we shall have to look at these criteria." The CHAIRMAN reminded him that the "back log" had not yet been finished. Commented Dr. J. S. NOBLE: "What we have to bear in mind is that this is supposed to be a signal honour and not just a pat on the back."

The Committee approved a further list of nominations for the Fellowship, sent by Branches and Divisions.

ANAESTHESIA BY HYPNOSIS

MINISTER SANCTIONS FEE

The Minister of Health has agreed to the payment of a fee for anaesthesia by hypnosis in maternity medical service cases provided the practitioner called in to carry it out is accustomed to use hypnosis as part of his professional practice. The fee paid will be as if an ordinary anaesthetic had been used. The Minister's decision was in answer to an inquiry from the London Executive Council. In January, 1957, a general practitioner submitted a claim for a fee for the attendance of a second practitioner for the purpose of procuring anaesthesia by hypnosis for suturing the perineum. The doctor was informed that there were no arrangements which allowed for the payment of a fee under these circumstances, and the executive council suggested that he should ask the opinion of the local medical committee. The latter, in turn, referred the matter to the General Medical Services Committee of the B.M.A. The

G.M.S. Committee quoted the view of the B.M.A.'s Anaesthetist Group Committee that "hypnotism induced by a medical practitioner should be regarded as an anaesthetic," and advised that the question of the payment of a fee should be pursued with the executive council. The executive council therefore sought the Minister's view, who replied as already stated. The appropriate fee (£1 15s.) will be paid.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Royal Commission Questionaries

SIR,—Dr. C. P. Lowther in his letter (*Supplement*, September 13, p. 141) raises a point in connexion with allowances and the advantages which would stem from these. He hopes the Royal Commission will take cognizance of them and our professional organization press for them. I trust they will do no such thing.

As to the Royal Commission, I hope it may restrict itself to broad principles and thus facilitate its invidious task. In the first instance, it might state whereabouts in its opinion the status of medical men features in the pattern of society. Of the greatest value would be its views on whether, say, a consultant should rank with civil servants—junior or senior—or men-of-law—struggling or well established—with their respective attributes. The point once settled, the Commission's labours would be vastly simplified. It could then decide whether a consultant should buy clothes off the peg, and take them to the local launderette, or have them tailor-made in Savile Row and valeted; whether he should travel tourist or first class; live in a bed-sitter or in a luxury apartment with all mod. con.; roll his own cigarettes or smoke Churchillian cigars.

I concede, Dr. Lowther, that some consultants, by reason of their position, their special interests, their renown, their academic standing, the nature of their work, and sundry other commitments, incur exceptional expenses—travelling, entertaining, and striving to keep up the prestige of the profession—while at the same time burdened with numerous unrewarded calls on their time. Again, there is a vast difference between the cost of living, entertaining, and keeping up with the Joneses in London and other big cities and that in provincial towns. It would therefore seem that some differential remuneration and weighting is desirable and fair, but perish the thought that this ever be achieved through a multiplicity of allowances with the unavoidable tedium of form-filling and inquisitions. When the Royal Commission has collated all the evidence, digested this, and knows all the answers, perhaps it could give proof of having grasped the situation and done its work diligently by submitting to the B.M.A. two typical, detailed budgets—one for a consultant of international repute in a London teaching hospital, and the other for a consultant in a provincial hospital. This might prove edifying.—I am, etc.,

London, W.1.

P. BAUWENS.

SIR,—Dr. C. P. Lowther in his letter (*Supplement*, September 13, p. 141) quite rightly pointed out that the Royal Commission should take account of the various expense allowances enjoyed by many professional men and women, but which are not available to doctors in the N.H.S. I was aware that in industry and commerce the allowance he quotes—e.g., for car, telephone, removal expenses, post-graduate course fees, and expenses, etc.—were much more easily obtainable, but I had always associated this with the fact that the officers concerned were not employed by the State. However, the examples he quotes are State employees of about equivalent rank to registrars in the N.H.S.

In my last post as registrar it was specified in my contract that I must provide a telephone in my house so that I could be on call, yet I could not even obtain any income-tax

allowance for the rental, let alone have the rental itself paid (as applies in the case of the scientific officer and the graduate engineer mentioned by Dr. Lowther). This is a relatively trivial matter, but the cost of running a car, taking postgraduate courses, and moving house can represent a considerable proportion of one's (taxed) income.

I find great difficulty in understanding why State-employed doctors should be so differently treated in this respect than other State-employed professional persons. Dr. Lowther states that we are the most recent addition to public service, but this cannot be the only explanation for the fact that we are also the most under-privileged—after all, the N.H.S. has been in existence now for over 10 years.—I am, etc.,

Warrington, Lancs.

W. J. STANLEY.

Chiropody Service

SIR.—In his efforts to establish a greater awareness of the existence of his association (in addition to that of the Society of Chiropodists) the Secretary of the Institute of Chiropodists (*Supplement*, September 20, p. 145) has failed to mention one very important point.

After prolonged negotiations the chiropodists succeeded, in 1938, in persuading the medical profession, as represented by the Representative Body of the B.M.A., that chiropody was a branch of medicine, and merited the active co-operation of the medical profession in the interest of the patient. Thus the B.M.A. deputed to the Board of Registration of Medical Auxiliaries the task of investigating and recognizing appropriate courses of training, coupled with adequate training schools and facilities and ethical standards. There were at that time at least 10 chiropody organizations seeking recognition, one of which was formed as early as 1912. Five of these bodies were eventually approved by the Board and now form the Society of Chiropodists. The Board insisted on a single portal of entry with a common examination standard, and, while it is true that not all those chiropodists who were eventually admitted to the chiropodists' section of the National Register of Medical Auxiliary Services had undergone a two years' course of training (now increased to three years), it was on production of evidence that such a course was in operation, and on the recommendation of eminent medical inspectors, that the qualifying bodies were approved by the Board.

The Institute of Chiropodists, founded in 1938, has never applied to the Board for the recognition of its qualification and ethical standards. It cannot therefore complain of the lack of awareness. As Mr. Shipper has pointed out, in regard to the Minister of Health and the National Health Service (Medical Auxiliary) Regulations, 1954, the mere existence of an organization does not necessarily confer on its members the right of recognition with all that implies.—I am, etc.,

London, W.C.1.

A. E. VINCE,
Secretary and Registrar,
Board of Registration of Medical Auxiliaries.

SIR.—I am glad to see that Dr. Gordon Scott (*Supplement*, August 30, p. 129) has raised the matter of a chiropody service in your columns, for the National Corporation for the Care of Old People has for almost three years now been assisting by grant-aid about 130 voluntarily run schemes of chiropody for aged people, and we have studied the subject closely through these schemes and in other ways.

There are two related points I would refer to in Dr. Scott's letter. First, that if by "graduates" of the Society of Chiropodists he means those who have taken a two- or three-years course, the number of chiropodists available would be far less than he mentions, for the large majority of members of the society have not had such a training, which has not been long available. Dr. Scott does not mention the Institute of Chiropodists, which is the other professional association acknowledged for Hospital Service purposes by the Minister of Health, but many members of the institute would equally be ruled out on the same

grounds. It is not my province to discuss whether the quality of what chiropodists do could be improved or whether cures could be effected where now there are palliatives. I am, however, convinced by considerable experience that much of what is done for old people in the schemes I have referred to above is distinctly worth while if only because of the relief and comfort achieved: to say that "nothing worth while" is being done because no permanent cure is effected strikes me as a somewhat cold and inhuman approach. I know too that many schemes are adequately served by chiropodists who are members neither of the society nor of the institute, let alone "graduates" of the sort Dr. Scott mentions, but I am convinced that many of these who have been in full-time practice for a number of years could be properly included in any national chiropody service.

If this is accepted, my second point is to dispute Dr. Scott's contention that "a national service would still be impossible under present conditions if every unqualified chiropodist . . . was also pressed into it." On Dr. Scott's own figures it seems that about 20% of old people might ask for treatment, and our information would confirm this: this implies, in round figures, about 1,400,000 patients, and, if patients average six treatments per annum, 8,400,000 treatments in a year. One full-time chiropodist averages perhaps 80 treatments a week or 4,000 per annum, and 2,100 chiropodists would, on these figures, therefore be needed. Things would not work out so neatly, because the distribution of chiropodists varies from one area to another, but there are available, I estimate, at least three times the total number required, and I would therefore suggest that it appears to be practicable to introduce a service, at least for old people—whose need is proportionately the greatest and whose means to pay for it are least.—I am, etc.,

M. R. F. SIMSON,
London, N.W.1.

Secretary, National Corporation
for the Care of Old People.

Interest-free Loans

SIR.—I have noticed little correspondence in your columns on the problem of stimulating G.P. spending on equipment and ancillary help. Would it be possible to press for more interest-free loans and/or partial grants towards the cost of equipment and surgeries and payment or part-payment of ancillary help? The details would be complicated, but at least we would have the sympathy of the public.—I am, etc.,

Broxbourne, Herts.

D. Y. SHARPLES.

Operating Theatre Technicians

SIR.—We have read with interest and we agree with Mr. W. Gissane's letter (*Supplement*, August 9, p. 117) concerning operating theatre technicians. We work in a very busy operating theatre unit, the staff of which consists of two trained sisters, twelve trained staff nurses, two student nurses, and five operating theatre technicians. The last group are permanent appointments. Since this theatre gives a six months' theatre course for trained nurses, it is inevitable that there is a constant change of theatre nurses. The technicians, then, are the mainstay of the theatre team, and they are chosen with care. We demand from them a high standard. They are all men of kindness and strict integrity, willing always to give their services. They know their duties are of a highly responsible nature, and it is our wish and aim to appoint men of a higher educational standard.

The technicians in our theatre unit replace the anaesthetic nurse; a replacement by the permanent of the temporary. They lay out in excellent order everything required for the anaesthetist. They clean, sterilize, and maintain all anaesthetic and most surgical equipment, and in no hospital is this better or more economically done. It is, of course, true that surgery and anaesthesia become ever more complicated mechanically. They require mechanical knowledge. They are absolutely trustworthy in the correct placing of the patient on the operating table and in such things as putting on of a diathermy pad, and they are fully trained to be

Association Notices

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows: an Ernest Hart Memorial Scholarship, of the value of £300; a Walter Dixon Scholarship, of the value of £300; four Ordinary Research Scholarships, each of the value of £200.

The scholarships are given to candidates recommended by the Science Committee of the Association as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease. In addition, applications are invited for the award of the following research scholarship: the Insole Scholarship, of the value of £250, for research into the causes and cure of venereal disease.

Each scholarship is tenable for one year, commencing on October 1, 1959. A current scholar may apply to be reappointed for a further year, though no scholarship will be renewed more than twice. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships, including renewals, must be made not later than March 1, 1959, on the prescribed form, a copy of which will be supplied by me on application. Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

KATHERINE BISHOP HARMAN PRIZE

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman prize in the year 1959. The value of the prize is £75. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing. It will be awarded for the best contribution (not previously published) submitted in open competition, competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any registered medical practitioner in (a) the British Commonwealth and Empire or the Republic of Ireland and (b) any member of the British Medical Association, wherever resident, is eligible to compete.

Should the Council of the Association decide that no contribution submitted is of sufficient merit, the prize will not be awarded in 1959 but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each contribution must be typewritten or printed in the English language, and must be accompanied by a detachable slip bearing the candidate's name and address. The Council anticipates that contributions should be between 3,000 and 10,000 words, although no definite limits are laid down. Preliminary notice of entry is required and a form for this purpose can be obtained from the Secretary. Essays must be forwarded so as to reach the Secretary, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1959. Inquiries relative to the prize should be addressed to the Secretary.

OCCUPATIONAL HEALTH PRIZE

The Occupational Health Prize was established by the Association for the purpose of encouraging interest and research in the field of occupational health. The Council of the British Medical Association is prepared to consider the award of this prize, which consists of a certificate and £50, in the year 1959. Any member of the Association who is engaged in the practice of occupational health, either whole-time or part-time, is eligible to compete for the prize. Candidates may select their own subject. Entries should be

aware of the dangers of the latter, which might cost the National Health Service thousands of pounds. They help to fetch and carry and lift patients, help with intravenous infusions, check blood bottles, and are in fact invaluable in their services.

It would appear that members of the Professional Council of the Whitley Council are unaware of the services rendered by these men. They have turned down their claim for reasonable status and thus for reasonable remuneration, and we feel that in doing so they have made a grave error and have rendered a severe disservice to the National Health Service, and ultimately to the patients whom we treat. Theatre technicians are usually good chaps and unselfish; but the labourer is worthy of his hire, and the skilled labourer is worthy of "higher" hire.—We are, etc.,

DONALD BARLOW,
J. ALFRED LEE,
A. E. BROHIER.

Southend-on-Sea.

Estimating Merit

SIR.—A lot has been written about merit awards, incentives, and the need to stimulate and reward the good doctor. Let us, then, imagine a series of medical boards investigating a random sample of all deaths, whether within or without hospital, to the extent that each G.P. could expect to face four such boards every year. Each board, half a consultant and half G.P. in membership, could conduct a detailed academic inquiry into the treatment of the patient starting from his first complaint to the G.P. and ending at the necropsy. Every doctor involved, consultant, registrar, houseman, or G.P., having stated his case, would be assessed as "above average," "average," or "below average." His merit, or demerit, award in any year would be based on the record of the medical boards he had attended during the previous five years and expressed as a percentage addition to, or subtraction from, his N.H.S. salary.

A terrifying prospect? Possibly, but it has these advantages. It is just and honest. A doctor is rewarded on a basis of clinical facts rather than personal fancy, social charm, medico-political importance, or showmanship. He is judged openly by his peers and can understand the reasons behind the judgment. The system could stimulate interest in, and care of, the patient. I do not like "merit" awards at all, but if they are to come let us steer clear of secret committees which can only breed competition, feed envy, and reward "empire builders" and doctor-politicians. If it is real merit that is to be rewarded let it be done openly, honourably, truthfully, and justly.—I am, etc.,

Holywell, Flintshire.

DAVID L. WILLIAMS.

H.M. Forces

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Brevet Major (Honorary Lieutenant-Colonel) J. A. Chapel, O.B.E., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, retaining the honorary rank of Lieutenant-Colonel.

Major (Honorary Lieutenant-Colonel) V. St. G. Vaughan, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, retaining the honorary rank of Lieutenant-Colonel.

Major (Honorary Lieutenant-Colonel) E. J. Bowmer, M.C., has relinquished his commission on appointment to the R.C.A.M.C. (M).

Captain (War Substantive Major) S. C. H. Lane, O.B.E., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, and has been granted the honorary rank of Lieutenant-Colonel.

Class III.—Captain (Acting Lieutenant-Colonel) C. W. S. F. Manning, from A.E.R.O., to be Captain, relinquishing the acting rank of Lieutenant-Colonel. Captain (Acting Major) A. R. H. Vorssam, from T.A., to be Captain, relinquishing the acting rank of Major. Captain (Honorary Major) O. Jordan, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, retaining the honorary rank of Major. Captain (Honorary Major) B. Wilson-Kay, from Reserve of Officers, to be Captain (Honorary Major).

submitted in a form suitable for publication and must include personal observations and experiences collected by the candidates in the course of their work. If no entry is of sufficient merit no award will be made. Candidates should confine their attention to their own observations rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.

Entries must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1959. No study or essay that has been published in the medical press or elsewhere will be considered eligible for the prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A previous prizewinner is not precluded from entering. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay, the decision of the Council on any such point shall be final.

Preliminary notice of entry for this competition is required on a form of application to be obtained from the Secretary. Each entry must be typewritten or printed on one side of the paper only, and accompanied by a note of the candidate's name and address. The Council anticipates that contributions should be between 3,000 and 10,000 words, although no definite limits are laid down. Inquiries relative to the prize should be addressed to the Secretary.

A. MACRAE,
Secretary.

Diary of Central Meetings

OCTOBER

- 7 Tues. Amending Acts Committee, 2 p.m.
- 8 Wed. Occupational Health Committee, 10.30 a.m.
- 8 Wed. Private Practice Committee, 12 noon.
- 9 Thurs. Joint Committee of B.M.A. and T.U.C., 3.15 p.m.
- 10 Fri. Ophthalmic Group Committee, 2 p.m.
- 15 Wed. Central Ethical Committee, 12 noon.
- 16 Thurs. G.M.S. Committee, 10.30 a.m.
- 17 Fri. Radiologists Group Committee, 2 p.m.
- 23 Thurs. Office Committee, 1 p.m.
- 23 Thurs. Arrangements Committee (Edinburgh, 1959), 2 p.m.
- 23 Thurs. Catering Committee, 3.30 p.m.
- 24 Fri. International Relations Committee, 2 p.m.

NOVEMBER

- 5 Wed. Welsh Committee (at George Hotel, Shrewsbury), 2.15 p.m.
- 19 Wed. Public Relations Committee, 2 p.m.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Queen's Hotel, Farnborough, Hants, Tuesday, October 7, 8.30 p.m., annual general meeting. Film: "The Medical Witness."

BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, North Shore, Blackpool, Wednesday, October 8, 7.15 p.m., dinner; 8.30 p.m., Dr. I. McD. G. Stewart: "A Touch of Blood Pressure."

CHESTERFIELD DIVISION.—At the Ashover County Hotel, Ashover, Friday, October 10, 7.30 for 8 p.m., chairman's address by Dr. J. F. Hanratty: "A Problem to Solve." 9 p.m., buffet supper.

DARLINGTON DIVISION.—At Darlington Memorial Hospital, Tuesday, October 7, 8.30 p.m., lecture by Mr. L. P. Lassman: "Role of Surgery in the Treatment of Epilepsy." Members of the Tees-side Branch are invited.

EAST YORKSHIRE BRANCH.—At Hull Medical Society, 68, Park Street, Hull, Wednesday, October 8, 8.30 p.m., lecture by Professor A. J. E. Cave: "The Birthplace of Medicine."

GOOLE AND SELBY DIVISION.—At "White Elephant," Snaith, Thursday, October 9, 7.30 p.m., address by Dr. W. Whitaker: "Pulmonary Heart Disease."

GRIMSBY DIVISION.—At Scarthoe Road Hospital, Tuesday, October 7, 8 p.m., film: "Key Questions in Coronary Disease." 9 p.m. (approx.), annual general meeting. All medical practitioners in the area of the Division are invited.

GUILDFORD DIVISION.—At Board Room, Royal Surrey County Hospital, Guildford, Thursday, October 9, 8.30 p.m., special meeting, followed by lecture by Dr. Philip Ellman: "Essentials in the Management of Diseases of the Chest in General Practice."

HARROW DIVISION.—At Tithe Farm House, Eastcote Lane, South Harrow, Tuesday, October 7, 8.45 p.m., A.G.M.

HASTINGS DIVISION.—At Lecture Room, Nurses' Home, Royal East Sussex Hospital, Tuesday, October 7, 8.15 p.m., Dr. A. F. W. Hall: A.R.M. Report; Dr. Samuel Oram: "Present Indications for Surgery in Heart Disease."

MID-ESSEX DIVISION.—At Out-patient Hall, Chelmsford and Essex Hospital, Sunday, October 5, 10.30 a.m., annual general meeting, followed by short address by Dr. Robert Smith: "Huntington's Chorea."

MID-HERTS DIVISION.—At St. Michael's Manor Hotel, Fishpool Street, St. Albans, Friday, October 10, 8.45 p.m., meeting.

MONMOUTHSHIRE DIVISION.—At Tredegar Arms Hotel, Newport, Thursday, October 9, 7.45 for 8 p.m., dinner meeting. Symposium on the Corticosteroids. Speakers, Dr. Grahame Jones, Dr. Bernard A. Thomas, and Dr. Michael Wade.

NORTH STAFFS DIVISION.—At North Stafford Hotel, Monday, October 6, 8 p.m., joint meeting with North Staffordshire Branch, Pharmaceutical Society. Lecture by Dr. Spinks, Ph.D.: "Drugs Affecting the Brain—A Laboratory View" (illustrated).

NOTTINGHAMSHIRE BRANCH.—At 64, St. James's Street, Nottingham, Thursday, October 9, 8.30 p.m., meeting.

REIGATE DIVISION.—At Reigate Hill Hotel, Tuesday, October 7, 8.30 p.m., meeting, followed by film: "Investigation of Female Sterility." A discussion will follow.

SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Tuesday, October 7, 8.30 p.m., annual general meeting. Films: "Cardiac Arrhythmias"; "Action of the Human Mitral and Aortic Valves."

SOUTH-WEST ESSEX DIVISION.—At Sir James Hawkey Hall, Woodford Green, Thursday, October 9, 7.30 for 8 p.m., annual dinner and dance. Principal guest, Dr. S. Wand (Chairman of Council, B.M.A.).

SUFFOLK BRANCH.—At Cathedral Church of St. James, Bury St. Edmunds, Sunday, October 12, 3 p.m., special St. Luke's-tide Service. All doctors, nurses, and their families are invited to attend.

SWANSEA DIVISION.—At Langland Bay Hotel, Swansea, Thursday, October 9, 7.30 for 8 p.m., dinner. Chairman's address.

WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.—At County General Hospital, Friday, October 10, 8 p.m., lecture by Dr. S. J. Hartfall: "The Corticosteroids and the Chronic Rheumatic Diseases."

WEST DERBYSHIRE DIVISION.—At Peacock Hotel, Rowsley, Saturday, October 11, 7 p.m., dinner-business meeting.

Meetings of Branches and Divisions

KENT BRANCH

The following officers have been elected:
President.—Dr. B. A. Hoogewerf.
Vice-President.—Dr. J. Pickford Marsden.
President-elect.—Mr. W. E. Heath.
Honorary Secretary.—Dr. J. O. Murray.
Honorary Treasurer.—Mr. W. E. Heath.

MAIDSTONE DIVISION

The following officers were elected at the annual general meeting on July 22:

Chairman.—Dr. A. L. R. Mayer.
Vice-chairman.—Dr. E. Scott.
Honorary Secretary and Treasurer.—Dr. R. G. McLaren.

NORTH OF ENGLAND BRANCH

The following officers have been elected:
President.—Dr. T. S. Blaiklock.
President-elect.—Dr. W. Hunter.
Vice-presidents.—Dr. S. Weldon Watts, and Dr. J. N. Swainston.
Honorary Secretary and Treasurer.—Dr. J. S. Noble.

RUGBY DIVISION

The annual general meeting was held at the Grand Hotel on March 27. The following officers were elected:

Chairman.—Dr. E. F. S. Morrison.
Vice-Chairman.—Dr. R. C. Hill.
Honorary Secretary and Treasurer.—Dr. R. P. Hendry.

SOUTHERN BRANCH

The following officers have been elected:
President.—Dr. F. Caldecott.
Vice-presidents.—Dr. Joan H. Norris and Mr. N. Cridland.
President-elect.—Dr. J. G. McDowell.
Honorary Secretary.—Dr. R. Gibson.
Honorary Treasurer.—Dr. R. H. Balfour Barrow.

STIRLING BRANCH

The following officers have been appointed:
President.—Dr. A. P. Russell.
President-elect.—Dr. A. S. Biggart.
Vice-president.—Mr. R. G. Main.
Honorary Secretary.—Dr. J. E. Morrison.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH

The annual general meeting was held on July 17 at Worcester and was attended by over 80 members. The following officers were elected:

President.—Dr. C. W. Walker.
Honorary Secretary and Treasurer.—Dr. J. R. Bulman.

PUBLIC HEALTH COMMITTEE

NEGOTIATIONS FOR INCREASED SALARIES

The next step in the negotiations for a radical revision of the remuneration structure of public health doctors was decided at a joint meeting of the Public Health Committee and the Staff Side of Medical Whitley Council Committee C at B.M.A. House on September 26. It had been agreed with the Management Side of Committee C that details of the negotiations should not be published, but the meeting reaffirmed the policy laid down at the last meeting of the Public Health Committee, and since approved by the Council of the Association, "that all possible steps be taken to establish the principle that the remuneration of public health doctors should be related to the remuneration in other fields of medical practice and not to the salaries of other chief officers of local authorities."

The Public Health Committee re-elected Dr. J. B. TILLEY as its chairman for the session, and he welcomed Dr. E. Grey-Turner, Assistant Secretary, who had been appointed to the Committee as its secretary.

Dr. Kelynack Elected to Committee C

Dr. Agnes Kelynack, Staff Side secretary of Whitley Council Committee C until her retirement from the staff of the Association in July, was elected a member of the Staff Side; in 1946 she was joint secretary to the Spens Committee on General Practice. The other members of the Staff Side appointed at the meeting were: Dr. H. D. Chalke, Dr. E. Hughes, Dr. J. Stevenson Logan, Dr. J. B. S. Morgan, Dr. Gladys Stableforth, Dr. D. P. Stevenson (Secretary-Elect of the B.M.A.), Dr. J. A. Stirling, Dr. J. B. Tilley, and Dr. Elspeth Warwick. Additionally three Scottish representatives will be nominated by the Scottish Council.

Milk

The Ministry of Agriculture, Fisheries, and Food had invited the Association to give evidence to a Government committee on the composition of milk, and the Science and Public Health Committees were asked by Council to consider jointly arrangements for the preparation of evidence. The Public Health Committee thought there should be liaison with the British Veterinary Association.

A similar request from the Department of Health for Scotland for evidence to a committee on new model dairy by-laws was referred to the Public Health Committee (Scotland). Of the Department's action in setting up the inquiry, Dr. J. KILMAN, a Scottish representative, remarked: "We have been agitating for this for 20 years."

Causes of Stillbirths

Dr. KILMAN also told the Committee that there had been no difficulty over the certification of causes of stillbirths in Scotland, where it has been compulsory since 1938. The Registrar-General for England and Wales had proposed that

there should be similar legislation for England and Wales, and the General Medical Services Committee has already expressed approval of the proposal. The Public Health Committee did likewise.

Professional Co-ordination

Hearing that there had been a request from the Society of Medical Officers of Health for a further meeting, the Committee deferred until its next meeting consideration of the Society's proposal that the Public Health Committee should be given a measure of autonomy similar to that of other autonomous committees and of the relationship between the Association and the Society under the revised agreement between the two. The matter came before the Committee in the form of the minutes of a meeting of the B.M.A.'s Committee on Professional Co-ordination.

Also postponed until the meeting on October 31 was the question of representation of county borough medical officers on the Public Health Committee. Dr. W. R. Martine had written a letter about this. Dr. W. G. HARDING pointed out that the hour was late for a discussion on a number of points of principle which he wished to raise.

It was agreed, at Dr. Harding's suggestion, that the whole matter of membership of the Public Health Committee be discussed at the next meeting.

OVERSEAS COMMITTEE

SHORT-TERM OVERSEAS CONTRACTS

The Secretary of the Overseas Committee is to point out to medical officers who ask the Association's advice on short-term overseas contracts that one of the greatest problems is that of re-establishment in Britain at the end of the contract.

This decision was reached at a meeting of the Overseas Committee at B.M.A. House on September 26, when the Committee considered some notes by the ASSISTANT SECRETARY (Dr. E. Grey-Turner) on points which should be included in short-term contracts. The CHAIRMAN suggested that it should be explained to those who sought advice that the contract did not bind anyone to find them employment afterwards. "The attitude of the Colonial Office is that it has no responsibility whatever," he said.

Points which it was felt should be covered in short-term contracts included term of engagement; description of duties; salary and allowances; gratuity, and taxation of it; passages; living accommodation; leave; medical attention; private practice; termination of contract by the employer; resignation by the employee; arbitration about the interpretation of the contract; local taxation; and the chain of command.

Appointments

Professor D. E. C. Mekie, who presided, was re-elected Chairman of the Committee. Dr. G. Macdonald and Dr. G. M. M. Menzies were again co-opted to the Committee

to represent areas not otherwise represented. The Chairman was appointed the Committee's representative on the Organization Committee, with Major-General J. C. A. Dowse as deputy, and Dr. C. J. C. Britton was again nominated for appointment to the Central Medical Recruitment Committee.

The Chairman welcomed Dr. E. E. Claxton as the new Secretary of the Committee in place of Dr. E. Grey-Turner, who had been assigned to new duties at the end of 10 years' association with the Committee. Dr. Grey-Turner had done outstanding work, and the Committee placed on record their sincere appreciation of it.

Overseas Subscription Rate

It was reported that there had been general agreement among the overseas members attending the annual meeting at Birmingham that they did not wish to be subsidized by home members and that some change in the overseas subscription was inevitable. Four suggestions had been made. The first was that the overseas rate should be raised, probably to 50% of the standard home subscription, the relationship which had prevailed between 1922 and 1950. This had encountered opposition in Australia and was unlikely to be popular in the Irish Republic. The second was that the receipt of the *Journal* overseas should be optional; that an overseas member opting to receive the *Journal* would pay a substantially higher subscription than at present—even £5 5s.—whereas a member not receiving the *Journal* would pay, say, £2 2s., or even less. This suggestion might involve amendments to the Articles and By-laws of the Association. The third suggestion was that the receipt of the *Journal* overseas should be optional in areas where there was a local B.M.A. journal which could be regarded as the official journal of the Association. The fourth suggestion was that a special overseas edition of the *Journal* should be produced, omitting advertisement pages. An overseas member receiving this special edition would pay a lower subscription than a member who received the full *Journal*.

Since the Finance, Journal, and Organization Committees were also interested in this problem, it was suggested that a conference of the four committees should be held. The Chairman, Mr. Myles Formby, and Dr. G. M. M. Menzies were appointed representatives of the Overseas Committee.

Overseas Conference

A report on the 1958 Overseas Conference held at Birmingham was received, and it was agreed that it should be recommended that the 1959 Conference in Edinburgh should last a full day. It was also agreed that the Association Secretary should write to Branches pointing out that the power of Headquarters in negotiations with newly autonomous territories was limited and urging Branches to act as fully responsible bodies and to negotiate themselves with local governments.

It was stated that the Memorandum on Conditions of Service in H.M. Overseas Civil Service, revised in the light of comments by overseas Branches, the Overseas Conference, and the Overseas Committee, had been recirculated to overseas Branches prior to submission to the Colonial Office.

Invitations had been sent out for the one-day conference on the filling of medical appointments overseas, to be held on November 14.

Private Consultations

It was reported that doubt had arisen in practice about the precise meaning of the words "called into consultation" in paragraph 9 of the Committee's circular on private practice. Were they intended to mean called into consultation to give advice only, or was it intended that the specialist concerned should also assist in treatment? The Chairman reminded the Committee that the original policy dealt essentially with the rights of doctors in overseas territories where there were no, or few, doctors in private practice to be called into consultation, but no special consideration had been given to the problems of consultants and specialists in

Government hospitals. There was a particular problem for anaesthetists: whereas a pathologist might receive a consultation fee for advice given, he would probably be working in a Government laboratory where the service would be carried out, for which a charge might be made. The anaesthetist, on the other hand, would carry out the service outside the Government hospital.

The CHAIRMAN suggested the following expression of policy:

Consultant and Specialist Practice.—Where facilities exist for the treatment of private paying patients outside the Government hospital, and where exceptionally, for the benefit of the patient, a private practitioner considers it desirable that the services of Government officers should be available, not only in consultation but also in the treatment and management, such practice should be recognized and permitted by the Government and the officers entitled to receive fees for the service.

The Chairman stressed the word "exceptional," because there would be objections to a member of the Government's staff habitually running a private practice. He emphasized that the right would be permissive and could be withdrawn in the case of abuse, and he pointed out that it would not prevent a D.M.S. from permitting it more than exceptionally when he felt it necessary.

It was agreed that observations of overseas members would be welcomed and that the matter should be further discussed at the next meeting.

The Committee also discussed the right of officers in Government service to receive fees, or an allowance in lieu of fees, when patients were called upon to pay for the service. The question arose following the receipt of a letter from an officer who claimed that the Singapore Government had altered his terms of employment by prohibiting him from taking consultation fees.

The Chairman said the type of case he had in mind was where the patient paid limited hospital fees which were collected by the hospital authorities and a proportion paid to the officers. There was a tendency for directors of medical services to get rid of all fees and to replace them by an allowance or nothing at all. The question was whether official Association policy should favour a whole-time service overseas.

Dr. C. BELFIELD CLARKE said that in Ghana the Government policy was to pay fixed allowances instead of fees, and he had no doubt that this would be the policy of other territories as they attained independence. The older doctors, who had been accustomed to certain privileges, would resent this movement of the modern age, but the younger doctors probably would not resent it as strongly. He believed that where exceptional skill was required payment should be made for it, and he believed that the abolition of fees might mean that the best possible treatment was not available in some places.

It was agreed to obtain the opinion of overseas Branches on whether there should be a wholly salaried service or one in which fees were paid for services, in order that the Association could consider what its policy should be in the various areas.

Other Business

A white paper, "Her Majesty's Overseas Civil Service: Statement of Policy regarding Overseas Officers serving in Nigeria," was considered, and the Assistant Secretary was instructed to obtain a legal interpretation of it.

A letter was received from the Honorary Secretary of the Council of the Caribbean Branches of the B.M.A. following the suggestion that this council needed permanent or semi-permanent secretarial assistance, and asking that, instead of the biennial grant of £400 for the travelling expenses of delegates, the Association should make an annual grant of £200 to provide some kind of permanent secretariat. Dr. BELFIELD CLARKE emphasized the need to continue assistance to the Caribbean Council, and it was agreed to recommend the Finance Committee to agree to the suggestion, with a review after five years.

The Committee thanked Dr. Belfield Clarke for his report on his recent visit to some of the West Indian Colonies.

DISCLOSURE OF MASS RADIOGRAPHY UNITS' FINDINGS

At a recent meeting of representatives of the B.M.A.'s Central Ethical, General Medical Services, Occupational Health, Tuberculosis and Diseases of the Chest Group, and Public Health Committees, it was decided that the findings of mass miniature radiography units should not be communicated direct to industrial medical officers. The following resolution was passed without dissent for submission to the Central Ethical Committee with a view to transmission to the Council of the Association:

It is desirable that the closest possible liaison should be maintained between chest physicians, directors of mass miniature radiography units, general practitioners, industrial medical officers, and medical officers of health. The results of mass miniature radiography, nevertheless, should not be communicated to the industrial medical officer. The chest physician, having reached a firm diagnosis should send a communication to the general practitioner in duplicate to enable him, with the patient's consent, to send a copy to the industrial medical officer.

The matter arose from a proposal made to the Ministry of Health by the Association of Industrial Medical Officers that, with the patient's consent, industrial medical officers should be notified directly of the findings of mass miniature radiography units.

LONG-TERM MEDICAL CERTIFICATES

FEWER ISSUED

According to the Ministry of Pensions and National Insurance, doctors are issuing fewer certificates covering a period of 13 weeks than they used to. These special intermediate certificates may be given to patients who have been unfit for work for at least six months. At the beginning of 1954, 460,000 of these certificates were in current use, but recently the number has fallen sometimes to as low as 413,000. Thirteen-week certificates were originally introduced to help doctors, but they also reduce the work of the local offices of the Ministry of Pensions and National Insurance. The latter has stated that an increase of 1% (just over 4,000) in the use of these certificates would be equivalent to a saving throughout the country of the work of 16 clerks.

Severely Disabled

The Ministry also states that when it appears from medical evidence already obtained that severely disabled war and industrial injury pensioners are permanently incapacitated they will be told that they need not send any more medical certificates of unfitness for work. Contributions and credits under the National Insurance scheme will be recorded automatically for these patients.

LESS MONEY FOR CHARITY

URGENT NEED FOR FUNDS

The amount of money received for distribution by the Association's Charities Committee was considerably less last year than in former years. Meeting on September 18, the Committee expressed disappointment at the poor response to the appeal for covenanted subscriptions to the Charities Trust Fund. It decided to make the urgent need for funds more widely known in Divisions. Dr. H. M. GOLDING was re-elected chairman of the Committee and Dr. R. COVE-SMITH deputy chairman.

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. James Joseph O'Reilly (Risca, Mon.) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations, 1953, apply.

BOARD-AND-LODGING CHARGES TO CONSULTANTS AND S.H.M.O.s

The Minister has asked hospital boards to review the standard of board and lodging provided for consultants and S.H.M.O.s and to refer to him any cases where they think a reduction in charges is warranted because the accommodation, food, and services provided, taken as a whole, fall substantially below the general level of the region. If the Minister agrees to any reduction of charges it will be of a standard amount of £85 for a consultant and £75 for an S.H.M.O. The charges for board and lodging are standard charges and take into account variations, which are now all in one direction, from case to case. For this reason the Minister says he would not regard a difference in the standard of the services provided at one hospital when compared with another as warranting in itself a reduction in the standard charge. He will entertain a proposal for a reduction only when in an individual case the board and lodging falls substantially short of the overall standard.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

Mr. H. H. LANGSTON has been elected chairman of the Central Consultants and Specialists Committee in the place of Mr. T. HOLMES SELLORS, who relinquished the chairmanship on his election to the chair of the Joint Consultants Committee. Dr. T. ROWLAND HILL and Mr. J. R. NICHOLSON-LAILEY have been elected deputy chairmen of the C.C.S. Committee. The Committee met on October 2, and a report will appear in next week's *Supplement*.

Scottish News

EXECUTIVE COUNCILS ASSOCIATION'S EVIDENCE TO ROYAL COMMISSION

Entry into practice, employment of assistants, the method of remuneration of general practitioners, and the optimum size of list are matters dealt with in a memorandum of evidence to the Royal Commission on Doctors' and Dentists' Remuneration from the Scottish Association of Executive Councils. The memorandum was prepared in answer to the Royal Commission's invitation to the association to give its views on certain points.

Entry into Practice

At the beginning of the Service, the memorandum states, it was believed that succession to an advertised vacancy would be the most usual means of entry into general practice. With the growth of partnerships (of which the witnesses approve, and suggest might be further stimulated by paying doctors who take partners a part of the compensation money owing to them) the number of advertised vacancies is now small and is likely to be smaller in the future. Facts and figures are given about applications for vacancies for the three years ending March 31, 1958. The number of applications received during this time for 84 vacancies was 2,403. The number of applicants, however, was 867. Of this number 433 applied for one vacancy only, 160 applied for two vacancies, and 74 for three. At the other end of the scale one applied for 25 vacancies and one for 28. Eighty-eight of the applicants had graduated 20 or more years previously, and one had completed 47 years since graduation. Those who had graduated from 1 to 6 years previously numbered 420.

Of the 84 successful applicants, 28 were making their first application, 12 their second, and 14 their third. Two were making their thirteenth, one his sixteenth, and one his seventeenth. Ten successful applicants had graduated 20 or more years previously (one 39 years) and 28 six or fewer years.

Further examination of the statistics shows that by no means all the 867 applicants were unestablished, since 331 were already principals in practice. Of the 84 successful applicants, 43 were principals and 24 were assistants (two trainees).

Assistants

Two hundred and twenty-one full-time assistants were employed in Scotland at March 31, 1958, and 188 of them were aged from 25 to 35; 101 had completed fewer than one year's employment as assistants and 92 between one and three years. The Scottish Association of Executive Councils believes that a period of assistantship is "a most desirable preliminary to entry into full general practice." To prevent abuse of the arrangements for training assistants, it thinks that "it might be desirable" that normally a principal should not continue to be recognized as a trainer under the trainee scheme for more than two years without a break. The association's memorandum also states that there should be stricter control over the employment of assistants other than trainees. The additional number of patients permitted to a doctor employing an assistant should be limited so as to lessen the possibility of an assistant being employed solely as a means of enabling the principal to make a large increase in his list. On the other hand, in approved cases the employment of assistants should be facilitated, and as one way of doing this it is suggested that the appointment of an assistant should not decrease the amount of the principal's income calculated for superannuation purposes. The association also thinks that a grading of assistants' salaries might be appropriate.

Remuneration

The Executive Councils Association finds it difficult to defend the capitation method of payment, since there is no direct relationship between the remuneration paid and the standard of professional work done. But, since it can find no yardstick with which to measure skill in diagnosis and treatment, it cannot suggest an alternative method. At present, the evidence continues, the doctor with the largest list and lowest expenses gains most, and the witnesses believe there should be a financial incentive to improved services by the provision of special premises and the employment of nurses or ancillary staff.

The maximum numbers now allowed on doctors' lists are considerably in excess of the average, and, in the Scottish Executive Councils Association's opinion, are excessive. The proper size of list for single-handed urban doctors should be 2,000-2,500 patients, it thinks, and for a rural doctor 1,500-2,000. The increase allowed when an assistant is employed should be in the region of 1,000 patients. A limitation in the size of a doctor's list on reaching the age of 70 is also advocated, together with the proviso that he should not be allowed to have an assistant.

All executive councils in Scotland are members of the Executive Councils Association, which is recognized by the Secretary of State and consulted by him on all matters affecting the work of executive councils in the Health Service.

The National Health Service Tribunal for England and Wales has directed that the name of Dr. Theodotus John Sumner, of 274, New Road, Porthcawl, be removed from the medical list of the Glamorgan Executive Council and that his name should not be included in any corresponding list kept by any other executive council under Part IV of the N.H.S. Act, 1946. The tribunal found that, in spite of repeated requests and warnings and the withholding of money on four occasions for similar failures to comply with the regulations, the respondent had returned no medical records to the executive council since 1953.

Correspondence

In this column we publish from time to time authoritative notes on a selection of drugs in current use.

Drugs for Private Patients

SIR,—I have just been rereading your account of the proceedings of the A.R.M. In the discussion on the provision of drugs for private patients at State expense (*Supplement*, July 19, p. 47), Dr. A. B. Davies is reported as having said that if this facility were approved it might involve circumstances which could "cost every general practitioner £50 a year." The very circumstances which he outlined are those which would enable private G.P.s to earn more. The greater part of the profession is, rightly in my view, very sensitive at the moment about the remuneration of G.P.s in the N.H.S.; but surely the earning opportunities of those in private practice have suffered a great deal more.

If the granting of drugs for private patients were to receive Government approval there might or might not be a considerable increase in private practice. If there was it would be possible for a large proportion of doctors to share in this increase. Those who did this would recoup themselves financially; those who did not want to be bothered with private patients would have only themselves to blame for any loss of income. Undoubtedly there would remain a group who practise in areas where private practice is, and would remain, non-existent; the income of these doctors might be reduced in the way Dr. Davies mentions, but, however many of these there might be, their number would not be anything like "every doctor."

So far from issuing a warning to every doctor, Dr. Davies was, wittingly or unwittingly, showing only a sectional interest. This, I am sure, is far removed from the thought of the Representative Body as a whole, which has passed eight resolutions in the last nine years, each by an enormous majority, in favour of this very important change. The R.B. represents the whole profession, and in this matter it has, I believe, not been concerned with the income of this or that group of doctors but has taken its action in the interest of certain patients whom it considers to have been misused.

I think there is shortly to be a meeting between Ministry of Health representatives and the B.M.A. on this subject. I am sure those who represent the Association will submerge partisan interests in their efforts to achieve the wish of the R.B. I am, etc.,

Eastbourne.

R. HALE-WHITE.

Psychological Medicine Group

SIR,—Two sets of figures which you have published recently bring out very forcibly the point made by Drs. A. Harris, J. G. Howells, J. T. Hutchinson, and C. Tellow in their letter which appeared in the *Supplement* of August 2 (p. 112). In the *Supplement* of August 23 (p. 125) you give the membership of the Psychological Medicine Group as 318 and in the *Supplement* of September 13 (p. 139) the numbers holding posts as consultants in mental health in the National Health Service as 687, with 139 senior registrars. With the S.H.M.O.s and the doctors in university posts the number of psychiatrists sufficiently senior to be eligible for membership of the Group is almost certainly well over a thousand, so that the actual membership of the Group is only about a quarter of the potential membership. When one considers what other bodies representing special points of view have achieved—for example, the Medical Superintendents' Society with a membership of 250 out of a possible 400, as reported in their evidence to the Royal Commission on Doctors' and Dentists' Remuneration in the *Supplement* of July 12 (p. 30)—it is obvious that the lack of interest in political matters among psychiatrists is quite remarkable.

I sincerely hope that psychiatrists will bestir themselves to join the Group, take an interest in its proceedings, and use it as a forum for discussion of their views and difficulties. Such a forum is badly needed at the present time.—I am, etc.,

Taunton.

M. F. BETHELL.

Reorganization of General Practice

SIR,—Mr. D. G. Wilson Clyne's letter (*Supplement*, September 6, p. 136) realizes that divisions should not occur in the medical profession, and indicates a bridging from the hospital side. It could also be bridged from the G.P. side. The present organization of the so-called health service in relation to the enemy disease, physical and mental, is parallel to that of the armed Forces before the war and before the realization of the value of combined operations. We have the absurdity of at least three individual services—public health, physical only; hospital; and general practice. The mental public health is largely ignored, apart from the psychiatric and other Maginot lines. The one and only bar to the elimination of artificial divisions is the ostrich-like attitude of the B.M.A. and the bulk of the profession. Regardless of the fact that it is in a salaried service, with no advantages and all its disadvantages, the profession chooses to pretend it is not. Tactfully, he does not mention it, but inevitably I believe Mr. Clyne's plan leads to salaries supplanting the sacred pool; in which case few will share his views—less than 10% probably.

In the same number of the *Supplement*, for those whose heads are above the sand, Dr. Johs. Frandsen (p. 134) also writes of the family doctor and the hospital.—I am, etc.,

Rochdale.

L. MCASKIE.

Altruism in the Young G.P.

SIR,—“An assistant with view to partnership in a Midland housing estate—full list for second doctor within five years.” Several years ago few doctors would have spurned such an opportunity. Yet recently such an advertisement produced only six inquiries from one medical journal and one inquiry from a paper. Five of these were considered. Two dropped out before the interview, and the remaining three in turn declined the appointment after interview, having prospects elsewhere (a country practice for one, and practices in the south for the other two). To me, it would appear that the ideal of practising among the needy has vanished.—I am, etc.,

Birmingham, 34.

D. S. CRANSTON.

Professional Unity

SIR,—The refusal of the Government to allow us access to the courts is surely the final proof that we can expect no justice until we can negotiate from strength. Having been refused negotiation, arbitration, and now law, can we possibly regard the Royal Commission as anything but a time-occupying manoeuvre?

No other body of employees has been treated in this manner for many, many years, and to submit meekly yet again is to yield more power to our overlords and accept the will of dictatorship. This is no idle phrase. Since the lodging of our claim 2½ years ago two steps only have been taken: the setting up of the Commission, and the 5% increase. Both of these decisions were entirely dictatorial; the profession was not consulted, the merits of the case not considered, and past promises disregarded. We acquiesced, and the power of the Government over us grew with each submission, so that when we claimed that last bastion of democracy, a court of law, that too was denied us.

Where do we go from here? One thing is certain—we divided we fall. Yet so divided have we been that our leaders feel unable to take any major step without special conferences, referendums, etc., wasteful in time and money, and giving ample warning of our intentions. But if our leaders could be assured of our support, could have our

unqualified pledge to take such action as they might recommend, then indeed they could negotiate as equals. In the end we must choose: either we trust those we elected to lead our erstwhile great profession or we abandon ourselves and all who come after us to the mercies of the politicians.

Will our leaders ask for such a pledge? Should they do so I believe the response would be overwhelming, and, given that, they assuredly have the ability to restore justice and fair dealing, and we have never looked for more.—I am, etc.,

Northampton.

J. LEAHY TAYLOR.

H.M. Forces

Lieutenant-Colonel R. I. Mitchell, M.B.E., R.A.M.C., has been appointed O.B.E. (Military Division) in recognition of distinguished service in Malaya for the period January 1 to June 30, 1958.

Captain J. S. Withey, R.A.M.C., has been mentioned in recognition of gallant and distinguished services in Malaya for the period January 1 to June 30, 1958.

Colonel C. M. Marsden, Staff, late R.A.M.C., has been appointed C.B.E. (Military Division) in recognition of distinguished service in Cyprus for the period January 1 to June 30, 1958.

The Army Emergency Reserve Decoration has been conferred upon Major J. A. Ward, R.A.M.C.

A *Supplement* to the *London Gazette* has announced the following awards:

First Clasp to the Territorial Efficiency Decoration.—Colonel H. K. Meller, M.B.E., T.D., and Major R. H. Moore, R.A.M.C.

Territorial Efficiency Decoration.—Major R. H. Moore and Captain (Honorary Major) D. M. Cathie (now T.A.R.O.), R.A.M.C.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel W. H. D. Patterson, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Colonel.

Major (Honorary Lieutenant-Colonel) E. A. R. Berkley, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Captain (Honorary Major) T. H. Hobbes, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

Captain (Honorary Major) E. M. K. Jellicoe has ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

ROYAL AIR FORCE

Air Commodore G. P. O'Connell has retired.

Group Captain D. J. Sheehan has retired.

Wing Commanders H. C. Thomas and S. Paul have retired.

Squadron Leader R. C. Rylance to be Wing Commander.

Flight Lieutenants P. Mestitz, F. M. Low, B. G. Dooley, R. M. A. McClelland, J. H. Dines, H. G. Pledger, P. D. Arnold, J. M. Titmas, C. M. Stevenson, and N. R. Sales have been transferred to the Reserve, retaining the rank of Squadron Leader.

Flight Lieutenant J. S. Cardwell to be Squadron Leader.

P. H. Drake to be Squadron Leader.

ROYAL AIR FORCE RESERVE OF OFFICERS

Squadron Leader J. M. Clark has relinquished his commission, retaining his rank.

Flight Lieutenant D. J. E. Cheshire to be Squadron Leader.

ROYAL AIR FORCE VOLUNTEER RESERVE

Squadron Leaders E. B. Davies, J. C. Davidson, J. Sutcliffe, and D. M. Wallace, O.B.E., have relinquished their commissions, retaining the rank of Wing Commander.

Squadron Leaders I. S. Buchanan, C. H. George, P. A. Gimson, B. S. Kent, D. S. Pattison, W. M. Ritchie, and A. G. Turner have relinquished their commissions, retaining their rank.

Flight Lieutenant R. J. Rutherford has relinquished his commission, retaining the rank of Wing Commander.

Flight Lieutenants G. Clayton, A. E. A. Cordin, J. A. Ward, H. Cantor, A. L. Collins, A. Everard, E. G. Fox, R. G. Griffiths, F. J. Hallinan, M.B.E., T. H. Lawton, A. F. Pearson, T. C. Corson, W. E. Coutts, A. C. Smerdon, N. B. Atkin, J. A. Bailey, P. S. Cheshire, P. J. Connolly, and B. J. O. Winfield, A.F.C., have relinquished their commissions, retaining the rank of Squadron Leader.

20	Thurs.	G.M.S. Committee, 10.30 a.m.

Branch and Division Meetings to be Held

ABERYSTWYTH DIVISION.—At Bronpadarn, Llanbadarn, Saturday, October 18, 8 p.m., films: (1) "Cancer of the Stomach"; (2) "Some Aspects of Accessible Cancer—Cervix and Uterus."

BLACKBURN DIVISION.—At Moorcock Inn, Waddington, Thursday, October 16, 8 p.m., annual dinner dance.

COVENTRY DIVISION.—At Keresley Parish Church, Sunday, October 19, 6.30 p.m., annual church service. It will be Evensong, conducted by the Reverend Edward J. Bastin.

CROYDON DIVISION.—At 45, Wellesley Road, Croydon, Tuesday, October 14, 8.30 p.m., general meeting. Films and lecture by Dr. Michael Wood: "Recent Advances in Radiology."

DEWSBURY DIVISION.—At Batley Hospital, Friday, October 17, 8.30 p.m., clinical meeting.

EAST NORFOLK DIVISION.—At 63, Thorpe Road, Norwich, Wednesday, October 15, 7.30 p.m., annual general meeting.

ENFIELD AND POTTERS BAR DIVISION.—At Nurses' Recreation Room, Chase Farm Hospital, The Ridgeway, Enfield, Thursday, October 16, 8.30 p.m., lecture by Dr. G. Melton: "Diabetes in General Practice."

ESSEX BRANCH.—At Officers' Club, Colchester, Saturday, October 18, 3.30 p.m., annual general meeting.

HALIFAX DIVISION.—At Old Cock Hotel, Wednesday, October 15, 8 for 8.30 p.m., annual dinner.

HENDON DIVISION.—At Hendon Hall Hotel, Ashley Lane, N.W., Tuesday, October 14, 8.45 p.m., Dr. Letitia Fairfield: "The Case of Madam Heinheil."

KINGSTON-ON-THAMES DIVISION.—At Kingston Hospital, Tuesday, October 14, 7.45 p.m., clinical meeting and general discussion.

LAMBETH AND SOUTHWARK DIVISION.—At Antenatal Clinic, Lambeth Hospital, Sunday, October 19, 11 a.m., clinical meeting.

LEIGH DIVISION.—At Waterfield's Restaurant, Leigh Road, Leigh, Friday, October 17, 7.30 for 8 p.m., annual dinner. Male guests are invited.

LEWISHAM DIVISION.—At Lewisham Hospital, Friday, October 17, 8.30 p.m., B.M.A. Lecture by Mr. Norman Cook (Curator of the Guildhall Museum): "Unearthing London." All medical practitioners in Greenwich and Deptford, Lewisham, and Woolwich Divisional areas are invited, together with wives and friends.

LIVERPOOL DIVISION.—At Exchange Hotel, Wednesday, October 15, 8.30 p.m., annual general meeting. Short address by Mr. C. C. Stevens, LL.B.: "Common Law Problems of the Medical Practitioner."

NORTH-EAST ESSEX DIVISION.—At Out-patient Department, Essex County Hospital, Tuesday, October 14, 8 for 8.30 p.m., clinical meeting.

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle upon Tyne, Thursday, October 16, (1) 7.15 p.m., clinical demonstration in Out-patient Department and demonstration by Department of Dermatology. (2) At Medical School, 8.30 p.m., address by Dr. J. D. Allan Gray: "Rational Use of Antibiotics."

RICHMOND DIVISION.—At Reception Room, Watney's Brewery, Mortlake Green, S.W., Friday, October 17, 9 p.m., talk by Dr. D. Stark Murray about his recent journey to Russia.

ROCHDALE DIVISION.—At Nurses' Lecture Theatre, Birch Hill Hospital, Monday, October 13, 8.30 p.m., clinical meeting. Dr. A. W. Frankland: "Allergic Diseases of the Chest."

SCARBOROUGH DIVISION.—At Board Room, Scarborough Hospital, Thursday, October 16, 8.30 p.m., meeting. Lecture by Mr. J. E. Wilson: "Blood in the Sputum of the Adult."

SOUTHAMPTON DIVISION.—At Conference Room, Civic Centre, Southampton, Wednesday, October 15, 8.30 p.m., ladies' night. Talk by Mr. and Mrs. Hiscock: "Their Trip Around the World in Wanderer 3." A social meeting will follow.

SOUTH-WEST ESSEX DIVISION.—At Board Room, Langthorne Hospital, Wednesday, October 15, 8.30 p.m., lecture by Mr. P. D. Trevor-Roper: "The Influence of Eye Disease in Pictorial Art." Wives of members and guests are invited.

STRATFORD DIVISION.—At Board Room, Queen Mary's Hospital, Stratford, Tuesday, October 14, 8.45 p.m., annual meeting.

SUNDERLAND DIVISION.—At Orthopaedic and Accident Hospital, Sunderland, Friday, October 17, 8 p.m., clinical evening.

SWANSEA DIVISION.—At St. Andrew's Church, St. Helen's Road, Swansea, Sunday, October 19, 11 a.m., St. Luke's Day Service.

Meetings of Branches and Divisions

CLEVELAND AND MIDDLESBROUGH DIVISION

The following officers have been elected:

Chairman.—Mr. J. C. Clark.

Vice-chairman.—Dr. W. P. Dunn.

Honorary Secretary and Treasurer.—Dr. J. N. Stirling.

DEWSBURY DIVISION

The following officers have been elected:

Chairman.—Mr. P. H. Merlin.

Vice-chairman.—Dr. J. L. Sharp.

Honorary Secretary.—Dr. G. F. Green.

EDINBURGH AND S.E. SCOTLAND BRANCH

The following officers have been elected:

President.—Dr. E. A. Cormack.

President-elect.—Dr. J. C. G. Mercer.

Vice-presidents.—Dr. R. T. Thin and Dr. B. C. Hamilton.

Honorary Secretary.—Dr. W. N. Darling.

Honorary Treasurer.—Dr. J. Riddell.

GLASGOW AND WEST OF SCOTLAND BRANCH

The annual general meeting was held on July 4 in the Glasgow Regional Office. The following officers were elected:

President.—Dr. G. M. Currie.

President-elect.—Dr. J. A. C. Guy.

Honorary Secretary.—Dr. W. W. Fulton.

Honorary Treasurer.—Dr. A. R. Miller.

GRIMSBY DIVISION

The following officers have been elected:

Chairman.—Dr. E. A. Robertson.

Vice-chairman.—Dr. J. Lanny.

Honorary Secretary and Treasurer.—Dr. F. M. MacDonagh.

LAMBETH AND SOUTHWARK DIVISION

The following officers have been elected:

Chairman.—Dr. W. K. Fargett.

Vice-chairman.—Dr. F. Summers.

Honorary Secretary and Treasurer.—Dr. S. Brest.

LEEWARD ISLANDS BRANCH

The annual general meeting was held in St. Johns, Antigua, from March 11 to 13. The following officers were elected:

President.—Dr. C. E. S. Bailey.

Vice-president.—Dr. B. Ross.

Honorary Secretary.—Dr. A. R. Walwyn.

Honorary Assistant Secretary.—Dr. Margaret O. Garra.

Honorary Assistant Secretary for St. Kitts.—Dr. G. D. McLean.

LEICESTERSHIRE AND RUTLAND BRANCH

The following officers have been elected:

President.—Mr. E. R. Frizelle.

President-elect.—Dr. L. Reuviv.

Vice-president.—Dr. G. Waring-Taylor.

Honorary Secretary.—Dr. G. L. Ward.

NORTH LANCASHIRE AND WESTMORLAND BRANCH

The annual meeting was held on May 29 at Samlesbury Hall, Blackburn, and the following officers were elected:

President.—Dr. H. Southworth.

Vice-presidents.—Mr. D. K. Lennox and Dr. Y. J. Burke.

Honorary Secretary and Treasurer.—Dr. J. Wilkie.

OPHTHALMIC GROUP COMMITTEE

MINISTRY STRONGLY CRITICIZED

"We have got nowhere after 10 years." This was the verdict at the Ophthalmic Group Committee when it heard the attitude taken by the Ministry of Health officials at a meeting to discuss the B.M.A.'s report on the future of the ophthalmic services—a report which had the support of the Faculty of Ophthalmologists. Also discussed at the meeting of the Committee, held at B.M.A. House on October 10, was the provision of eyes for corneal grafting and fees for school ophthalmic work. It was pointed out that the present Education Act provided for treatment, and therefore clinics for schoolchildren could not be regarded as merely refractive.

Mr. O. GAYER MORGAN was re-elected chairman of the Committee. He welcomed Mr. W. E. Heath as a new member. Mr. F. O. Walker, whom Mr. Heath replaced on the Committee, was thanked for his many years' service. The Committee decided to send a letter to Mr. R. Ramsay Garden wishing him a speedy recovery from his illness. Dr. W. Hedgcock, future deputy secretary of the Association, was welcomed as the new secretary of the Committee. Eighty-two new members were elected to the group.

Future of Ophthalmic Services

Following two years of discussions the Committee had produced, early in 1958, a report on the future of the ophthalmic services. At a recent meeting between a deputation from the Ophthalmic Group Committee and officials of the Ministry of Health, the recommendations in the report were discussed. A report on these discussions was given to the Committee.

On the matter of qualifications a point was gained. The deputation had given two examples of applicants who, though otherwise well qualified for work in the supplementary ophthalmic service, had not served six months in a resident ophthalmic appointment or equivalent whole-time non-resident appointment and would find it difficult now to do so—applicants in general practice and those who had been distinguished ophthalmic surgeons abroad. The Ministry had agreed to refer the recommendation for more detailed discussions between the Ministry and the Ophthalmic Qualifications Committee.

The Ministry had stated that it was concerned about the waiting-time for in-patient treatment. Difficulties in some areas, particularly in the north-west (Liverpool and Manchester), seemed to be caused by too much centralization. If members knew of areas where there was particular difficulty, the Ministry would be glad to hear of them.

The principle of employing opticians in the hospital eye service—endorsed in the report—had not been questioned

by the Ministry, but the difficulty, it had thought, was to get them to work in hospital. The CHAIRMAN thought there might be a different attitude among opticians to working in hospital after registration under the Opticians Act.

Staffing Difficulties

The B.M.A. report had referred to the "undoubted advantages" of employing more general practitioners in appropriate posts in hospital eye departments. It had further suggested that, as a condition of entry to the central professional list, practitioners other than retired consultants should be required to give an undertaking to do part-time (paid) hospital work. The deputation had pointed out that there were some ophthalmic medical practitioners who were content to restrict their work to the supplementary ophthalmic service even though hospital ophthalmic departments locally were urgently in need of assistance. A Ministry representative had said that, although it was right to try to secure assistance for ophthalmic departments, it could be done only by persuasion in some way through the profession. He had thought the Committee's proposal would not be acceptable to the profession, as it would be regarded as a form of direction. He had said he would approach regional hospital boards through senior administrative medical officers to encourage them to make use of suitable general practitioners as clinical assistants. He had referred to the difficulty of filling registrar vacancies, and said this would be looked at by the working party on hospital medical staffing structure.

The deputation had stated that too few doctors were taking up ophthalmology to-day. Before the National Health Service a considerable number of practitioners had had an interesting life working part-time in ophthalmology, but fewer and fewer were going in for this type of practice and something should be done to make this branch of ophthalmology more attractive.

Prescribing Drugs

Recommendations that ophthalmic medical practitioners should have the right to advise general practitioners on diagnosis and make suggestions for the disposal of cases, and to prescribe cycloplegic drugs for the purpose of examination, had brought a reply from the Ministry that there were no powers under the Act and that there was very little chance of getting the Act amended. The only functions laid down in the National Health Service Act for the supplementary ophthalmic service were the testing of sight and the prescription and supply of spectacles, it had been pointed out, and also the only section in the Act which dealt with dispensing was restricted to dispensing for general medical services. Thus an ophthalmic medical practitioner could prescribe only if he was a general practitioner, and

then only as a general practitioner. Would it be in order, the Ministry had been asked, for the practitioner to write a prescription and for the patient to pay, though not under the National Health Service? The Ministry representatives' reply had been that it might well constitute a breach of the terms of service. The Ministry spokesman had agreed that it was an advantage that patients, particularly children, should be able to go to an ophthalmic medical practitioner for refraction.

O.S.C. 1's for Every Sight Test

It had been recommended in the report that an O.S.C. 1 should be required for every sight test. It would enable general practitioners to encourage medical eye examinations in children up to 15 years of age and persons over 50, "though it is appreciated that considerable propaganda may have to be used to achieve this aim."

The Ministry spokesman had appreciated that the object was to reduce the incidence of blindness. He had pointed out, however, that an O.S.C. 1 form for every sight test would involve some 3½ million visits annually to doctors, and he could not see that there was much chance of this being accepted. Though he had felt the medical eye examination for children and persons over 50 was right in principle, how far it would achieve the desired results, and how far it would be acceptable to the public was another matter. Opticians would certainly not be in favour of it. He had also been very doubtful whether it would be practicable because of the limited number of ophthalmic medical practitioners available.

Of the Ministry's claim that "there was not much chance of this being accepted," Mr. E. G. MACKIE pointed out that the Representative Body, the Conference of Local Medical Committees, and the General Medical Services Committee had approved this. Mr. V. PURVIS, however, warned of the reaction of patients, who objected to wasting time waiting for an O.S.C. 1. Mr. BLACK thought they would all opt for it if they realized there was a risk of blindness.

Side-tracking the General Practitioner

Dr. D. P. STEVENSON, Secretary-Elect of the B.M.A., said the view taken by the General Medical Services Committee was that it would take exception if a member of the public could go straight to a consultant, side-tracking the general practitioner, and it saw no reason for an exception in this case. The Committee had had three attempts to secure this and it was going to continue in its attempts.

The B.M.A. report had recommended that although, ideally, the whole range of ophthalmic work for schoolchildren should be conducted solely by ophthalmologists under the hospital service, when this was not practicable arrangements should be made to ensure that refraction was at least in the personal charge of ophthalmologists, and this policy should be rigidly enforced.

The official reply had been that this had been the policy of the Ministry of Education for many years, and was also the policy of the Ministry of Health in so far as school ophthalmic work was being done through the hospital service. "It was understood that most regional hospital boards had now taken over this work." The deputation had asked that the Ministry should ascertain the extent.

The Ministry had been surprised by the result of an inquiry it had made, the CHAIRMAN commented. It showed that the big cities of the north had not taken over the school clinics, except for Leeds, where the school clinics had been transferred.

Shortage of Ophthalmic Nurses

Mr. NIGEL CRIDLAND, noting that the Ministry had been concerned about the waiting-time for in-patient treatment, said: "There is the greatest difficulty in getting ophthalmic-trained nurses, and I gather the number of entrants for the ophthalmic nursing diploma are dropping." Some years ago the Ophthalmic Nursing Board met with a refusal by the Ministry to pay extra to nurses holding the diploma. He was sure this was the reason for the shortage of nurses, and

why many who had the diploma reverted to general nursing. The shortage of ophthalmic nurses was becoming very serious, concluded Mr. CRIDLAND. He was supported by Mr. H. V. INGRAM.

Mr. MACKIE raised a further point that there was a present endeavour to put all children into paediatric departments. He recognized that there was a case for this where the child was sick, but where a child was well and had been admitted for a congenital cataract it ought to have ophthalmic nursing. He favoured a specialist ophthalmic unit of 20-25 beds, with male, female, and children's sections. The British Paediatric Association, he reminded the Committee, had laid claim to all children in July, 1957. At Dr. PURVIS's suggestion, it was decided to put this matter on the next agenda.

The Future

Of the meeting with Ministry officials to discuss the report on the future of the ophthalmic services, Dr. D. P. STEVENSON said: "They listened to what we had to say—and what are they prepared to do?" If the Committee just received the report of the meeting at the Ministry nothing further would happen. If it wished to press its views it would have to ask to see the Minister. "No one has ever seen a Minister of Health on the question of the eye services of this country," added Dr. STEVENSON. Dr. TENNENT, a member of the deputation to the Ministry, supported what Dr. STEVENSON had said.

Mr. L. H. SAVIN, president of the Faculty of Ophthalmologists and also a member of the deputation, said the Faculty was preparing another document which would be sent to the Committee for comment. It would be necessary to bombard the Minister again.

The Committee, on the proposition of Dr. TENNENT, passed a resolution expressing itself very dissatisfied with the Ministry's replies and indicating that it was the intention to bring the matter again to the Ministry's attention.

Fees for School Ophthalmic Work

The differential in fees paid for ophthalmic school work by local authorities and regional boards was again raised in a letter from Dr. TENNENT. In the whole of Scotland school ophthalmic work is the responsibility of regional boards, as it is in parts of England. In some cases a doctor able and willing to do the work might not have a hospital appointment, and in that case he is paid the rate for general-practitioner sessions—£3 17s. 3d., including the recent increase. In those areas where the local government authority was responsible the fee is 6 gns. per session (no recent increase). "It is generally admitted that school eye work should be under the hospital boards, but in this case it means a financial sacrifice on the part of the oculist," wrote Dr. Tennent.

Mr. SAVIN suggested a "no detriment" clause. It was agreed to take the matter up with the Ministry.

Also on the subject of fees for school clinic work, Mr. MACKIE drew attention to the fact that under the present Education Act there was a duty not merely to examine but to treat. Mr. CRIDLAND decried a statement that in a considerable number of cases where children returned for routine recheck all that needed to be done was for the doctor to satisfy himself that the present spectacles were satisfactory "without the necessity of doing a complete refraction."

The CHAIRMAN referred to the fact that the question of N.O.T.B. clinics in industrial premises was to be discussed with the Chairmen of the Occupational Health, Central Ethical, and Ophthalmic Group Committees and the executive of the Central Consultants and Specialists Committee. Dr. TENNENT said there was another point of view to the decision of Council in 1950 that existing facilities, ophthalmic and other, should be regarded as temporary and should not be extended, and that it was not in the public interest for hospital specialist services to be established in factories as part of the permanent provision of the National Health Service. "I think there is something to be said for

facilities in factories," he continued. "Under the old National Eye Service a good job of work was done under this service."

Dr. MACKIE pointed out that the objection was to clinics being inside a particular factory.

Corneal Grafting

A letter from the secretary of the medical committee, Manchester Royal Eye Hospital, referred to "considerable difficulty" in obtaining material for corneal grafting. "Various general hospitals have been approached, and one has requested that a suitable poster be designed for display in the hospital in the hope that this will produce more donors. My Committee has asked me to write to you to ask whether such a request has been made before and if you have such a poster. If not, do you think this would be a feasible suggestion?"

Mr. SAVIN said the matter had been discussed at the faculty. It felt that a poster would be macabre. Mr. A. MCKIE REID said that the Corneal Grafting Act was a simple one, but the Ministry of Health had sent out a circular which said it was desirable to obtain the consent of the relatives.

Mr. JOHN PRINGLE, Public Relations Officer to the Association, said his department received requests from the public at the rate of 500 a year for factual information on the procedure on leaving a body for medical research, and they had prepared a leaflet which had been agreed with the inspector of anatomy. This leaflet contained a section on corneal grafting, which he read:

Under the terms of the Corneal Grafting Act, 1952, anyone who wishes his eyes to be used for corneal grafting purposes after his death may give a written notice of his wish or a spoken expression in the presence of two witnesses, to his relatives or the people with whom he lives or (if he is in hospital) to the hospital authorities. He should also inform his doctor.

If this has been done, the person lawfully in possession of the body after death (which will include the hospital authorities if death has occurred in hospital) may authorize the removal of the eyes. As it is essential for the eyes to be removed as soon as possible after death, it should be appreciated that practical difficulties may occur in isolated or country areas which may make it impossible to carry out the wishes of the deceased. The hospital authorities in any area will be able to state whether facilities for corneal graft surgery exist in the district.

Sir TUDOR THOMAS said that he had a long list of future donors to the eye bank at Cardiff. This, however, did not solve the immediate problem. When a person died the relatives were usually on the spot or waiting, and it was often extremely tactless to press the question of removal of the eyes. But there were others who would respond to a request. He thought that the public were on the whole well informed on this matter in broad outline. "I think the Ministry was right in clamping down a little on this Act which gave us enormous powers," he said. "It was a human touch." In regard to the list of future donors, he had drafted some very simple instructions. The individuals returned a postcard, which he filed.

Mr. A. G. CROSS said that at St. Mary's Hospital, Paddington, they got the nursing sisters to make the approach to relatives. They also had to ask for permission for necropsies, and the sisters did the jobs at the same time. The sisters knew the relatives.

The feeling of the Committee was that arrangements for securing eyes for corneal grafting were best made locally and that a poster was not favoured.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham.
Non-County Borough Councils.—Crewe.

OCCUPATIONAL HEALTH COMMITTEE

Dr. H. ALEXANDER was re-elected Chairman of the Committee at its first meeting of the session on October 8. He welcomed the new members—Dr. H. Southworth (Blackburn), Dr. R. L. Luffingham (Hull), Dr. J. Stevenson Logan (Southend-on-Sea), and Dr. H. G. H. Richards (Winchester). It was agreed that letters of thanks should be sent to the retiring members, Dr. I. G. Davies, Dr. Peter Edwards, and Dr. D. L. Gullick. It was reported that Dr. Gullick, a member of the Committee since 1952, had been appointed an Assistant Secretary of the Association and, under a re-assignment of Assistant Secretaries to Committees, would now become Secretary of the Occupational Health Committee.

The CHAIRMAN paid tribute to Dr. S. J. Hadfield, assistant secretary, who had been secretary of the Committee, saying that his ceasing to be its secretary would be a source of regret to all members. Dr. J. A. L. VAUGHAN JONES associated himself with this.

The Committee recorded its appreciation of Dr. Hadfield's services.

Plight of the Young Handicapped

When the Committee considered the Representative Body's resolution stressing the urgent need for development of facilities available for the care and welfare of the aged chronic sick and young handicapped, Dr. H. G. H. RICHARDS said the latter seemed to be accepted completely by neither the local authorities nor the regional boards. They were not adequately treated by the welfare authorities. Dr. VAUGHAN JONES thought more could be done not only by the local authorities and hospitals but by the Ministries and by industry. The CHAIRMAN: "It is true that with these youngsters often a long time elapses between leaving school and their being placed in an occupation. That is very important psychologically."

Dr. J. STEVENSON LOGAN said that the North-east Metropolitan Regional Hospital Board had just completed and published a survey of young gravely handicapped and chronic sick. An appalling thing was there were too few specialized institutions who would study their proper treatment, and there were not the places to put them. The Shaftesbury Society had just opened a place for young adolescents in Dorset and there was some development of the El Alamein home. It took three years to put a boy with spina bifida into a place, and then he was found somewhere only through the Shaftesbury Society.

The CHAIRMAN referred to the problem of the aged. There were people who were supposedly "welfare" cases, in local authority homes, "who could not be more chronic sick if they tried." They were urgently in need of treatment.

The resolution was referred to the Committee's Planning Subcommittee and will be debated again.

First Aid in Factories

Another A.R.M. resolution considered that, "in the case of a factory where more than 50 persons were employed, the person in charge of the first-aid box or cupboard should hold a current certificate of first-aid issued by one of the recognized examining bodies for first-aid treatment (St. John Ambulance Association, British Red Cross Society, etc.)." Dr. M. E. M. HERFORD stressed that what it was desired to ensure was that the person in charge held a current certificate. "Even general practitioners and doctors in industrial medicine are urged to have refresher courses; it is only right that lay people should be asked for the same," he remarked.

I.L.O. and Occupational Health

The International Labour Office has drawn up proposals for the organization of occupational health services and sent a questionnaire on it to member governments. Dr. VAUGHAN JONES told the Committee that he had been

appointed chairman of the World Medical Association's Occupational Health Services Subcommittee. The secretary-general of the W.M.A. thought that, as a medical organization, it ought to submit comments before anything definite was determined by I.L.O. The American member of the W.M.A. Committee criticized the action of I.L.O., a lay body, saying this was a matter for the World Health Organization. Dr. Vaughan Jones, however, said he failed to see anything of the danger which the U.S. representative thought was inherent in I.L.O.'s action. I.L.O. was an old-established organization accepted by governments, employers, and employees. It was true that it had tended to become lay dominated, but, as chairman of the W.M.A. subcommittee, Dr. Vaughan Jones had had the utmost co-operation from I.L.O. The government replies to the questions on the organization of occupational health services were to be received by I.L.O. in January. Dr. Vaughan Jones said he was concerned with how the United Kingdom Government's reply would be prepared, having regard to the fact that there was no medical representation on the United Kingdom delegation when the matter was discussed at Geneva.

Dr. R. L. LUFFINGHAM pointed out that had it not been for the W.M.A. and Dr. Vaughan Jones's appointment, the Occupational Health Committee would not have known anything about a *fait accompli* by I.L.O. Dr. VAUGHAN JONES said that W.H.O. filled him with even more concern than I.L.O. Representation at I.L.O. was tripartite—representing governments, employers, and labour—but W.H.O. was concerned only with government representation. Dr. J. ROGAN thought the W.M.A. should urge that W.H.O. should change its constitution. The Committee agreed to reply to the questionnaire; to urge that W.H.O. be more representative of the non-governmental medical point of view; and to request medical representation on the United Kingdom delegation to I.L.O.

The Planning Subcommittee had considered the I.L.O.'s proposed conclusions on the organization of occupational health services and suggested a few amendments to them. "We talk quite a lot about health services for workers; we ignore management," was Dr. ROGAN's comment; he added that they were in need of medical services, too. The Committee agreed that the term "worker" should "include all those engaged in the organization."

New Salary Scales

Dr. ROGAN, reporting from the Committee's Remuneration Subcommittee, noted that the assimilation clause had been adopted by the A.R.M. (This states: "These salary ranges approved in 1957 supersede those previously in operation. It is expected that doctors of all grades already in employment will have their salaries raised to the point in the new range which corresponds with their length of service, as is the practice, for example, in the hospital service.") Said Dr. Rogan: "It leaves the employer with a clear obligation to assimilate."

Occupational Hygiene Laboratory Service

The principal item of business to be discussed by the Joint Committee of the B.M.A. and the T.U.C. the day after the Committee's meeting was the need for an occupational hygiene laboratory service, and the Committee had a short debate on this. (The B.M.A. had called for such a service in its memorandum on "The Future of Occupational Health Services" submitted to the Ministry of Labour and National Service in 1953.)

Dr. L. G. NORMAN said that there were a few arrangements by which one could get research done, but nowhere which would undertake routine investigations. What was needed was one laboratory on a proper scale to start with, and, if the scheme was as good as they thought, it would grow until there was one laboratory in each region. "Unless the people who run it are free from the dead hand of top-level civil service administration," warned Dr. LOGAN, "it will not give us what we need."

Morphine Administration

The Home Secretary had informed the Association that he would be greatly assisted in considering the representations of the Association that State-registered nurses in industry should be allowed to administer morphine if he could be furnished with any evidence of serious difficulties experienced in industry under the present arrangements, which officially precluded a nurse from giving morphine in the absence of a doctor. Dr. ROGAN said that in mines scheduled by the Ministry of Fuel and Power morphine could be administered by first-aiders.

The matter was referred to the Committee's Nursing Subcommittee, and it was decided to make further inquiries in which the Association of Industrial Medical Officers is to be asked to co-operate.

The Committee was informed of the conclusion, at a recent meeting of representatives of the Central Ethical, General Medical Services, Occupational Health, Tuberculosis and Diseases of the Chest Group, and Public Health Committees, that the findings of mass miniature radiography units should not be communicated direct to industrial medical officers (*Supplement*, October 11, p. 165).

Occupational Diseases

The Committee received a reply from the Industrial Injuries Advisory Council to its representations that tenosynovitis of the ankle should be included in the Prescribed Diseases Schedule. If the Association knew of any more conclusive evidence showing that certain ankle conditions were commonly caused by occupational factors, the letter stated, the Advisory Council would be glad to consider this at a subsequent review of diseases not prescribed. The letter added: "Before a disease can be prescribed under the Industrial Injuries Act it is necessary to show that individual cases of the diseases can normally be attributed to the nature of the employment with reasonable certainty."

The Ministry of Pensions and National Insurance regretted that an earlier promise given to the Association that an opportunity would be provided to comment on the draft of the new booklet, *Notes on the Diagnosis of Occupational Diseases*, had been overlooked. After consultation with the chairman of the Committee the Ministry was informed that, in the circumstances, the Association did not wish to make any immediate observations on the "Notes," but that the Association also greatly regretted that there had been no opportunity for it to comment on the draft.

Advisory Councils on Occupational Health

It was reported that "The Health of Married Women in Industry" had been chosen as the principal subject for the 1959 conference of Advisory Councils on Occupational Health. Advisory Councils had been invited to consider this subject during the coming session, and to submit, not later than the end of January, 1959, any motions for inclusion in the conference agenda.

"If it is a good idea to have Advisory Councils on Occupational Health," said Dr. ROGAN, "they really ought to be viable now. Yet only in a few areas do you get them set up." He noted the paucity of them in areas of heavy industry.

The CHAIRMAN agreed it was true that there were no councils in Glasgow, Liverpool, Birmingham, or Cardiff, but it was B.M.A. policy that they should be initiated by local B.M.A. Divisions. "Dr. Rogan is right," he said. "We have reached the stage when we ought to make a critical examination."

At Dr. LUFFINGHAM's suggestion it was decided that the assistant secretary should again circularize some Divisions, this time in selected industrial areas, about setting up Advisory Councils on Occupational Health.

There was support for a suggestion, originating from Dr. J. VALENTINE, who attended the 1958 Conference as an

observer from the Psychological Medicine Group Committee, that it would be advantageous if each Advisory Council could include in its membership, in addition to other medical representatives, a psychiatrist who would be able to advise on the mental health aspects of problems which came up for consideration.

INTERIM INCREASE DEPUTATION SEES MINISTER

At the request of the B.M.A. the Minister of Health received a small deputation to discuss the possibility of a further interim pay increase pending the report of the Royal Commission on Doctors' and Dentists' Remuneration. Following the discussion the Minister promised to consider what the deputation had said, and informed them that he would communicate with them within the next few weeks. The Association's deputation consisted of Dr. S. Wand (Chairman of Council), Mr. H. H. Langston (Chairman, Consultants and Specialists Committee), Dr. A. B. Davies (Chairman, General Medical Services Committee), and Dr. D. P. Stevenson, Deputy Secretary.

"Intransigent" Minister of Health

A resolution passed by the Lancashire County Local Medical Committee and supported, Dr. J. J. DEVLIN told the Committee, by other local medical committees in Group E (?), deplored "the intransigent attitude of the Minister of Health on the profession's claim—consideration of which was promised by his predecessor in 1957—for a further interim adjustment of remuneration pending completion of the Royal Commission's prolonged and extensive task." The resolution did not consider that the Minister had given proper and sufficient reason to account for his inability to agree to a further adjustment, and requested the General Medical Services Committee "to make strong representations to the Minister of Health for him to reconsider his attitude in this matter."

Dr. Devlin said that in the industrial north doctors saw engineers and everybody else getting additional money. They felt that the Minister's reasons for refusing a further interim adjustment were quite insufficient. As to his statement about the "state of the nation," Dr. Devlin referred to the Prime Minister's speech at Blackpool.

It was announced that a B.M.A. deputation was seeing the Minister of Health the next day, and the Committee unanimously supported the Lancashire Medical Committee's resolution.

The Scottish Case

Reporting on the reaction of the Scottish Council and the General Medical Services Subcommittee (Scotland) to the Secretary of State for Scotland's refusal to join with the Association in the presentation of a special case on the contractual validity of Spens to the Court of Session, Dr. W. M. KNOX said that the Government was obviously taking the attitude that the medical profession as a whole must accept the dictate of the Department of Health for Scotland and the Secretary of State, whatever these did, and Dr. KATE HARROWER described the decision as a high-level one. Dr. C. J. SWANSON pointed out that it was almost unprecedented to refuse even to examine a Special Case; it was customary to receive the Case first. "I think it is the grossest affront to the profession," he said. A section of the community had been refused access to the courts.

In the discussion which followed, English members of the G.M.S. Committee underlined the feelings of the profession on the fact that the Government, having issued a challenge to the profession to go to the courts, should back out when the challenge was taken up. It was decided to await the reply of the Secretary of State to the resolution of the Scottish Council (*Supplement*, October 18, p. 174) calling on him to reconsider his decision.

Dr. HARROWER reported the request of the Subcommittee that it should be called the General Medical Services Committee (Scotland), in the same way as there is a Central Consultants and Specialists Committee (Scotland) and a Public Health Committee (Scotland), emphasizing that it was a question of title and nothing else. Dr. HARROWER said the title had been selected to be in line with the practice of the other committees. Dr. A. TALBOT ROGERS recalled that he had proposed the change four years ago. The request was acceded to.

Statistics of Professional Earnings

The Board of Inland Revenue said they had often been asked for a breakdown of professional earnings. It was their practice not to disclose the earnings or profits of narrow groups of individuals without the consent of the group concerned, and this was what the Board now requested. They had in mind an analysis showing separately the professional earnings of five divisions, one of which would be "medicine (including dentistry)."

"What advantage would there be in this breakdown?" asked Dr. TALBOT ROGERS. "In all the divisions there is a very heterodox population. What value is there in saying, 'The average earnings are so and so,' when you have no idea what the average represents?"

GENERAL MEDICAL SERVICES COMMITTEE DISQUIET OVER SCOTTISH CASE

"Grossest affront to the profession" was how the refusal by the Secretary of State for Scotland, Mr. John MacLay, to allow the Association to test the contractual validity of Spens in the courts was described at a meeting of the General Medical Services Committee at B.M.A. House on October 16. At the same meeting general practitioners were urged to try to get more pregnant mothers to take polio-myelitis vaccinations; the response has been poor so far. There was disappointment at the sample of an expanding medical record card envelope which was sent by the Ministry of Health.

The CHAIRMAN, Dr. A. B. DAVIES, welcomed Dr. Walter Hedgcock, who, on becoming Deputy Secretary of the Association, will be the new secretary of the Committee.

It was reported that the Assistants and Young Practitioners Subcommittee had appointed Dr. F. G. Tomlins, an unestablished principal, as its chairman (*Supplement*, October 18, p. 172). Dr. DAVIES referred to the "long, patient and sterling service to the committee and to young members of the profession rendered by Dr. F. Gray in his capacity as chairman of the Subcommittee."

How the Central Pool is Calculated

As he had promised, the CHAIRMAN had prepared a memorandum explaining what the central pool is, how it originated, and how it is calculated and distributed. This seven-page document tracing the position from the National Health Insurance Act of 1912 was welcomed by members of the Committee. Some suggestions were made as to details of the treatment of the subject, and it was agreed that members should submit any comments to Dr. Davies. A revised document will be considered at the November meeting, when it will be decided what shall be done with it.

The Committee previously decided that, if evidence of hardship was forthcoming in any instance where a practitioner decided to change from quarterly to monthly payments, his case could be taken up on an *ad hoc* basis with the Board of Inland Revenue. The Board had agreed to consider such individual cases. A letter was received from a practitioner where the position arose that in one year he would have to pay tax on what was 14 months' income.

This case is to be taken up with the Board of Inland Revenue, with whom, if necessary, a further meeting is to be requested to discuss the situation. The CHAIRMAN asked if further examples were known.

The Committee were not in favour of the suggestion, but decided to await the decision of the British Dental Association, to whom their views will be conveyed.

Of the decision at a meeting of representatives of the Central Ethical, General Medical Services, Occupational Health, Tuberculosis and Diseases of the Chest Group, and Public Health Committees, that the findings of mass miniature radiography units should not be communicated direct to industrial medical officers (*Supplement*, October 11, p. 165), Dr. S. NOY SCOTT said the resolution stressed the importance throughout of doing everything via the general practitioner. The Committee endorsed the decision of that meeting.

Allocation Scheme "Conundrum"

Attention was drawn by the Ministry of Health to "a slightly awkward conundrum" arising out of the Allocation Scheme. It was that a patient could be left without treatment and without any knowledge of his reasonable rights if, when the executive council notified him that a doctor wished his name to be removed from his list, it did not at the same time inform him of the actual provisions contained in paragraph 7 (i) and (ii) on pp. 78-79 of the *Handbook for General Practitioners*.

It was stated that there was a case where a man had had a first certificate from his doctor and was told he need not attend any more and he was not receiving any treatment. A day or two later the man received notification that he was off the doctor's list but no indication that the doctor was responsible until another doctor had been allocated.

Dr. F. GRAY agreed there was no objection to the patient being informed of the allocation scheme, but he did not accept the statement by the Ministry: "We also believe that doctors would agree generally that a continuing incapacity for work, necessitating certification, normally implies that the patient is receiving treatment." It might, in some cases. If a doctor was only visiting a patient to give a certificate, that was not treatment.

The Committee approved a draft letter for clerks of executive councils which the Ministry proposed to send provided that words were added to make it clear that continuing incapacity for work did not always imply a need for treatment.

It also accepted a conference resolution, proposed by West Bromwich, that the Conference of Local Medical Committees would like to be consulted by the Local Government Boundary Commission, particularly in regard to the "special review areas" under the Local Government Act, 1958, so that it could give evidence of the effect of reorganization on the health services, and that there should be consultation with local medical committees in the "special review areas" before giving any evidence. The CHAIRMAN said that a meeting of representatives of the General Medical Services Committee, dentists, pharmacists, and other professions had conveyed their feelings of opposition to the Ministry.

Home Care of Seriously Ill Children

In August the Ministry of Health wrote that they were giving the question of the home care scheme for seriously ill children run by St. Mary's Hospital, London, "most careful consideration." This month, in reply to a further letter, the Ministry stated they could not go beyond what was said in the previous letter, although they were "fully seized of the need for coming to some firm arrangement in good time."

This "usual unsatisfactory reply" from the Ministry, said Dr. GRAY, was even worse than it appeared. The Ministry had done nothing for four years because St. Mary's had paid for the scheme out of their own funds. He had been informed that the county medical officer of health for London undertook that he would be prepared to help by arranging to take some of St. Mary's nurses on to the district nursing staff and seconding them to the hospital; in other words the L.C.C. would pay these nurses. The Ministry

had stated that they understood the proposition was that the nursing should be done by the district nurses. That was not what was suggested. It was what the Ministry had proposed and what had been rejected. They were nurses specially trained in the paediatric wards of St. Mary's.

The Committee agreed to support London over this matter. Dr. GRAY described the St. Mary's scheme for the home care of seriously ill children as a pilot one which was going to help everybody.

Hospital Management Committees

The way general practitioners are appointed to and receive advice of vacancies on hospital management committees came up in two items on the agenda.

Yorkshire (West Riding) Local Medical Committee were faced with the refusal of Sheffield Regional Hospital Board to add local medical committees to the list of organizations to be consulted every time a vacancy occurred in the medical membership of the hospital management committees, although they "might be prepared to consult with local medical committees" in cases where the vacancy was one that could, with advantage, be filled by a general practitioner. At the same time the Board had expressed the opinion that there was advantage in a general practitioner serving on each management committee.

Dr. G. D. W. ADAMSON, however, said that at one hospital for 10 years there had been no general practitioner. Dr. R. W. McCONNEL reported that in the Oxford region local medical committees and executive councils were consulted, and Dr. TALBOT ROGERS confirmed that this had been the position in his area for a very long time. The executive councils had taken it on themselves to suggest any lay member, whereas the local medical committees could look to the whole of their membership and indeed outside to get someone who was suitable. Dr. GRAY said that the arrangements for nomination described applied to all the Metropolitan regions. It was wrong that nominations of doctors should be made only by a body which was half lay. It was agreed to take the matter up with the Ministry.

The other hospital management committee matter concerned the action of Plymouth, South Devon, and East Cornwall General Hospital Management Committee in sending clinical advice to doctors over the signature of a member of the office staff. "It is the principle that we object to," Dr. NOY SCOTT told members. "It has been dealt with locally but not with very great success." A medical officer of health signed letters himself, and they would like all consultants to do the same thing.

The matter was referred to the Central Consultants and Specialists Committee.

Expanding Medical Record Envelopes

Samples of the limited supply of expanding envelopes for medical records which the Ministry has agreed, at the request of the representatives of the profession, should be made available to general practitioners were shown to the Committee. "Poor" was the verdict given on them. "I thought it was going to be something like a concertina," commented the CHAIRMAN. "I have a number of patients whose hospital reports, pathological reports, and other notes could not possibly go into this." The Ministry are to be informed accordingly.

Yorkshire (East Riding) Local Medical Committee were perturbed to learn that the American and Canadian poliomyelitis vaccines would continue to be supplied in 10-ml. or 9-ml. containers and that only about 40% of the English vaccine would be available in 1-ml. ampoules. The Committee were convinced that it would not be possible for practitioners in scattered rural practices, of which there were a number in the East Riding, to co-operate fully in the arrangements for vaccination unless they could be supplied with vaccine in 1-ml. ampoules. Dr. A. D. STOKER said that the fact that once the rubber cap had been pierced by the needle the ampoule had to be used up resulted in some instances in a wastage of 40%.

Another speaker explained that experts had said it would be unwise to use the vaccine after it had been opened, because poliomyelitis vaccines formed an exceptionally good medium for the growth of other bacilli. He pointed out that the American and Canadian supply had been an emergency one and the manufacturers had declined to put it up in other than 10-ml. ampoules. It was hoped to have enough British vaccine. The question of the 1-ml. ampoules is to be taken up with the Ministry of Health.

Expectant Mothers Not Taking Polio Vaccine

Dr. TALBOT ROGERS said that throughout the country, whereas the take-up of poliomyelitis vaccine had been very good in children, this had not been the case with expectant mothers, and in view of the severe complications if a pregnant mother contracted the disease there should be more propaganda. If every doctor impressed on his pregnant patients the desirability of having poliomyelitis vaccination, it would be in the interests of clinical medicine.

As usual proposals for inclusion of items on the list of appliances were considered. A consultant complained that paraplegics who had to empty their bowels by introducing suppositories or by digital removal of faeces had to travel some 60 or 70 miles to get a consultant's signature for finger-cots. The Ministry are to be approached on the matter.

The Committee also gave support for the inclusion of "carbonet" tulle, waterproof adhesive plaster, metatarsal pads, and polythene ring pessaries.

A question about payment of loadings on notional lists was raised in a letter. Dr. GRAY explained that before loading could be paid the partnership must be in existence and all the partners must be on the list. If a partnership started on July 8 they would not be entitled to loading that quarter.

Birmingham Local Medical Committee wanted the inclusion of copper sulphate (of a specific gravity of 1048) in the list of chemical reagents for testing for anaemia in pregnancy. Dr. F. E. GOULD described the test as well known and thoroughly accepted by haematologists. Dr. R. B. L. RIDGE, however, said that surely what they were agitating for was a laboratory investigation for all pregnant women. Dr. GOULD replied that it was hoped that initially the general practitioner would be able to obtain the haemoglobin estimation at the same time that he obtained blood for rhesus testing, to avoid repeated venepuncture and having to send the patient to hospital. Dr. B. BURNS suggested that this was as accurate as any haemoglobin test done in hospital.

It was decided to discuss with the Ministry the provision of copper sulphate as a reagent.

The Committee are to take no action on the Minister of Health's approving the temporary use of two wards at the Princess Louise Hospital for Children for maternity patients of St. Mary's Hospital.

General-practitioner Maternity Beds

A quarterly précis of General Medical Services Committee activities was advocated by Durham County Local Medical Committee, which also wanted the number of allocated general-practitioner and general-practitioner maternity beds per head of population in each local medical committee area or regional hospital board area published quarterly in the *Journal*, which would show whether there had been an increase or decrease on the preceding quarter.

Dr. TALBOT ROGERS declared that a quarterly report would be confusing and useless and would not tell them more than they can glean from the reports of our Committee meetings.

The CHAIRMAN said the Committee had been constantly pressing the Ministry for figures on general-practitioner beds and general-practitioner maternity beds, and had obtained something on a national basis.

At a previous meeting the Committee thought that the time was appropriate for a review of the reports of the Definition of Drugs Joint Subcommittee, in particular the

first report dealing with foods. Dr. TALBOT ROGERS reported that the Standing Advisory Committee in England agreed there was need for revision in respect of food and cosmetics, and suggested that the standing committee which dealt with drugs and which had four general-practitioner members should have this included in its remit.

The CHAIRMAN said that the Cohen Committee's proposals for a numerical tabulation of drugs were considered by drug houses and many general practitioners to imply a stigma. A report of the Standing Joint Committee, to be published in due course, would propose a new categorization using letters. "It underlines the complete freedom to prescribe provided we can justify it," said Dr. DAVIES.

Referendum on Trainee Scheme

Rochdale Local Medical Committee sees no reason to alter its opinion that the general-practitioner trainee scheme is "bad, is unfair in operation, and is wide open to abuse," the Committee was informed. The decision was reaffirmed at a long debate this month. But since the committee's decision in advising the executive council to discontinue operating the scheme in Rochdale appeared to have caused concern it was decided to seek the views of all local general practitioners. The G.M.S. Committee decided to await a further letter giving the result of this referendum.

The Committee, following a request from the Private Practice Committee, is recommending to Council that the reel film of the Birmingham Annual Meeting, sponsored by the Private Practice Committee to appoint one direct representative. The G.M.S. Committee is represented on the Private Practice Committee.

FILM COMMITTEE

Dr. R. PROSPER LISTON, re-elected chairman of the Film Committee at its first meeting of the session, reported that it had not yet proved possible to obtain the necessary financial backing to make the proposed film on rehabilitation. A film on rehabilitation, made for the Ministry of Labour and National Service, was viewed before the meeting, and later the Committee had a preview of a news-reel film of the Birmingham Annual Meeting, sponsored by William R. Warner and Company.

Dr. S. J. HADFIELD, Assistant Secretary, reported that a short programme of films had been sent for showing in Central and West African Branches and that an effort was being made to extend this service, in the first place to the East African Branches. Meanwhile a further programme is being prepared for Central and West African Branches.

New Films

The following films have been added to the Film Library: *The Action of the Human Mitral and Aortic Valves*; *The Foramen Ovale in Calf and Foal*; *Lymphangiography: Bits and Pieces* (Gynaecological); *First-aid for Aircrew*; *Treatment of Paraplegia due to Fracture Dislocation* (1st prize, B.M.A. Film Competition, 1957); *Rehabilitation of a Double Leg Amputee*; *Vertebral Angiography* (presented by Dr. Eric Batley); *Cardiac Arrest* (presented by Imperial Chemical Industries); and *One Man's Challenge* (presented by Lloyd Hamol Ltd.). It was agreed to purchase copies of the following films: *The Treatment of Sports Injuries*; *Nan—The Recovery of a Girl from Severe Head Injury*; and *Cine-Radiography of the Intestine*.

It was reported that 33 entries had been received for the 1958 Film Competition, and that arrangements for judging were in hand.

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. Walter Allan Todd (London, S.W.) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations, 1953, apply.

NATIONAL INSURANCE DEFENCE TRUST TAX APPEALS

There was a meeting of the trustees of the National Insurance Defence Trust at B.M.A. House on October 16 to consider a letter from Hull Local Medical Committee criticizing the reported gift of £750 and the offer of a further £2,000 towards the expenditure involved in preparing the test case in connexion with the assessment of the income of part-time consultants under Schedule E (*Supplement*, October 4, p. 158).

The DEPUTY TREASURER, Dr. C. Harrower, said the £2,000 was to be made available "if required." It had been agreed that more detailed figures would be available in November, and she was certain that the amount required would not be so much. "You will find that the Central Consultants and Specialists Committee are taking their share of things," she added.

The Central Consultants and Specialists Committee, sitting as trustees of the Hospital Medical Staffs Defence Trust, decided (*Supplement*, October 18, p. 172) to make a further substantial contribution to this case so that the costs to date could be paid.

Scottish News

SCOTTISH ASSOCIATION OF EXECUTIVE COUNCILS

The Eleventh Annual Conference of the Scottish Association of Executive Councils was held in Rothesay on October 2 and 3 under the chairmanship of its president, Dr. JAMES M. GILL (Aberdeen and Kincardine).

Presidential Address

Dr. GILL, reviewing the progress in the first ten years of the Health Service, said it was a service of which the country could rightly be proud. Defects and imperfections were inevitable, and it was the duty and privilege of executive councils to help to minimize and overcome these whenever possible. It was unfortunate that the Service had never been free from disputes over remuneration. Executive councils were not directly concerned with the rates of remuneration, but they were concerned to see that the services provided to the public were adequate, and there was a clear connexion between remuneration and adequacy of services. Financial uncertainty and a sense of insecurity must affect the intake and quality of students to the professions in the Service.

Dr. Gill welcomed the statement in the interim report of the committee on prescribing that no evidence had been found of excessive or extravagant prescribing by doctors. That also was the general view of the Association of Executive Councils. At its last conference it had been suggested that in some areas there was a habit or tradition of expensive prescribing. It was, however, dangerous to attempt to draw conclusions from comparisons of the limited statistical information available. Epidemics, which could seriously affect the drug bill, did not strike the whole country simultaneously. Before any reasonable attempt at comparison could be made, full statistical information would be needed for a minimum period of one year, and variations in the incidence of disease in different areas would have to be taken into account.

Dr. Gill was concerned at the denigration of general practice. The consultant and hospital were extolled on television and in sound broadcasting and the work of the general practitioner disregarded. All this tended to undermine the confidence of the public in the family doctor, and it was not to be wondered at that patients demanded to be sent to hospital for treatment and investigations that were well within the competence of the general practitioner.

Under-Secretary of State's Address

The conference was addressed by Mr. J. NIXON BROWNE, M.P., Joint Parliamentary Under-Secretary of State for Scotland. He expressed the Government's appreciation of all that had been accomplished by executive councils during the first decade of the National Health Service. It had been a time of real achievement. There were three major problems which must be the concern of everyone at the beginning of the second decade. First, the mentally ill person: secondly, the old person in need of care; and, thirdly, the patient who had been seriously ill or seriously injured and, although largely recovered, was not yet back in circulation.

In the care of the elderly, the family doctor would have an ever-increasing part to play. He could lighten his work by being ready to call on other willing helpers and to direct their efforts. An interesting and important stage had been reached in the mental health services. New legislation was in preparation which it was hoped would take the best of the old and combine it with what is best of the new. The importance of the rehabilitation services had been emphasized in the report of a Government committee under the chairmanship of Lord Piercy. Hospitals would have to make long-term plans for being able to treat their patients further into the rehabilitation stage than at present. Whatever hospitals might do, there was again an essential place for the family doctor. He was often the first person to appreciate the need for rehabilitation and was in touch with the many services available to help him and his patient.

The Under-Secretary of State welcomed the general practitioners' wish for direct access to hospital diagnostic facilities. The report of the Scottish Health Services Council in 1951 on the general practitioner and the hospital service had emphasized the need for this. Much had been done since 1951 to carry out the spirit of the recommendations in this report, but much still remained to be done. Where direct access had been introduced it had proved a great success. Hospitals had long been known for their "ever-open door." The door should now be opened wide for general practitioners as well as for patients.

CONFERENCE OF HONORARY AND PUBLIC RELATIONS SECRETARIES

A very successful Conference of Honorary and Public Relations Secretaries of Branches and Divisions in Scotland was held in Scottish House on October 15 under the chairmanship of Dr. J. C. MACARTHUR, Honorary Secretary of the Lanarkshire Division. Twenty-five secretaries were present and the following also attended by invitation: the chairman of the Scottish Council; the chairman and secretary of the Central Organization Committee; the Secretary of the Association; the Scottish and Assistant Scottish Secretaries; and Dr. F. M. Martin, of the Department of Public Health and Social Medicine of the University of Edinburgh.

Intraprofessional Relations

The main items of discussion were intraprofessional relations and information. The discussion on intraprofessional relations was opened by Dr. J. E. MILLER, Glasgow, who dealt with the central aspects of the subject, and by Dr. A. F. CATTO, Dundee, and Dr. W. E. SMITH, Inverness, who addressed themselves to its local aspects. There was an exchange of views on how best to counteract the apparent deterioration of relations between the different groups in the profession. From the central organization aspect there was agreement that the informal "Between Ourselves" type of letter from Headquarters, distributed as widely as possible, did much to disseminate information important to the whole profession and so to counter apathy and separatist tendencies.

From the local viewpoint, it was felt that Branches and Divisions should include as often as possible in the programmes functions of a semi-social, semi-medical nature

where all sections of the profession could come together in an informal atmosphere and discuss matters of interest to them all.

The discussion on "Information" was opened by the SCOTTISH SECRETARY and Dr. F. M. MARTIN, and dealt mainly with the value of random sampling as a means not only of ascertaining what the general body of members of the profession were thinking, and thus aiding two-way communication of opinion, but also of helping to foster the development of informed opinion throughout the Association. The particular subject under discussion was the pending initiation of a pilot scheme in Scotland which will give the Association an indication of how useful this method of obtaining information can be.

Quality of Service

Those attending the Conference expressed to Dr. Macrae, on behalf of the Branches and Divisions in Scotland, their warm appreciation of his services to the profession and of his particular interest in Scottish affairs. They wished him every happiness in his retirement. Dr. MACRAE'S parting message was the advice that, while acknowledging its duties towards its members in the betterment of their terms of service, the Association should not lose sight of its fundamental principle of ensuring the highest quality of service rendered by the profession to the community.

It was resolved that it be recommended to the Scottish Council that a similar Conference should be held in the autumn of 1959.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Entry into General Medical Practice

SIR,—Again this year a most important fact and figure in Dr. L. S. Potter's article (*Supplement*, October 4, p. 153) is that at any one time 30% of those seeking entry into general practice have been in dead-end assistantships too long. Unfortunately, Dr. Potter utilized more than half of the discussion section of his article in dealing with anomalies, and did not address himself to the cause of this high figure. It is one thing to be puzzled over the anomalies described, but another to feel forced to infer from them that more than a hundred men who have been in dead-end jobs too long would not accept a reasonable prospect of attaining principal status if they were offered it. The very fact that there are a hundred such men is more reliable evidence that difficulties of entry into general practice are *not* greatly exaggerated than anomalies which are probably few in proportion to the whole, and may well have a good individual explanation.

As one who has recently attained principal status after more than three years in dead-end jobs and who has also represented assistants on the G.M.S. Committee, may I comment on both this figure and the anomalies? It is still, regrettably, the experience of assistants that all too many practices up and down the country, whose income would justify a partner, in fact employ recurrent assistants. While the supply of assistants remains at the high figure of the bureau, there will continue to be some principals who utilize assistants in this way. And, by like token, many views to partnership will continue not to materialize for ostensibly feeble excuses. Having experienced all this myself as an assistant, I feel the bureau could assist by the Council of the Association giving permission for advertisements for assistants to be refused where the declared size of the practice justified a partner or for an assistant with view where a previous offer of a view did not materialize, unless the desire not to go ahead with partnership was mutual on both sides. This would certainly reduce the number of recurrent assistantships, and make a real incentive on *both* sides to build a successful partnership during a probationary period. It would most likely reduce the 30% to a very small figure indeed.

So far as the anomalies are concerned, they do not represent the common experience of assistants anxious to settle. I have been to some thirty interviews for positions with view, and in nearly all cases have learnt that there were several score of suitable and keen applicants. If this fact is now becoming well known men will realize if geographical distance, medical school allegiance, race, or religion in relation to the principal's make them very unlikely to be regarded as suitable and will not bother to apply, however attractive as such the position is. Such a consideration may well explain the paucity of applicants in two of Dr. Potter's examples of anomalies.

Dr. Potter has described the position over entry into general practice as "stable." One hopes that he will use his esteemed offices as director of the bureau to improve the position in the future, and I hope, too, that the Council of the Association may consider the method which I have suggested to attain that end.—I am, etc.,

Leicester.

D. S. CRAIG.

Professional Unity

SIR,—There can be few in the profession who do not agree wholeheartedly with Dr. J. Leahy Taylor's sentiments (*Supplement*, October 11, p. 167). I am afraid that they are only sentiments which we have heard almost *ad nauseam* at the A.R.M. and elsewhere. We must acknowledge that

ORGANIZATION COMMITTEE

"The shamble" of business at last July's A.R.M. led to criticism of the Agenda Committee at the meeting of the Organization Committee at B.M.A. House on October 23.

Miss M. Brookes, clerk to the Committee for many years and a familiar figure on the A.R.M. platform keeping the minutes, is retiring after 47 years with the B.M.A., and the meeting included a graceful tribute to her from the CHAIRMAN, Dr. R. G. GIBSON.

Membership of the Association, 900 up on the corresponding period last year, is now 71,940, the Committee was told.

Intraprofessional Relations

The Council had already approved in principle the Committee's proposals for the reorganization of Divisions into smaller groups as a necessary prerequisite to the establishment of an effective two-way information service between the periphery and the centre. The Committee now intends to seek the authority of Council to proceed immediately, and in consultation with the Divisions concerned, with the establishment of machinery for this reorganization.

Two informal "study groups" are to consider other suggestions on intraprofessional relations, and from their deliberations a plan will be put to the Propaganda Sub-committee. "We are trying to put the scaffolding up," said Dr. JOAN CHAPPELL.

Roll of Fellows

The Committee considered a suggestion that a limit should be put on the number of Fellows of the Association. So far 120 nominations for admission to the Roll have been received, "in an Association of nearly 72,000," the CHAIRMAN said. "I feel," said Dr. J. A. PRIDHAM, "that if the Fellowship is to be an honour it must be one that does not become so common that people no longer regard it as an honour." Some kind of an honour had been in the mind of the Association for 25 years; therefore there was a "back the log" and it would be difficult to impose a limit at the moment. But he felt there should be eventually, and that Divisions should be asked to restrict nominations voluntarily.

Dr. L. S. POTTER, Assistant Secretary, said that Divisions or Branches with two or three members of equal merit were likely to put them up for nomination together and then probably would not make any more recommendations for a number of years. Dr. J. S. NOBLE did not think the Committee should restrict nominations from Divisions but should itself be the arbitrator. He suggested there should be a set number of Fellows created each year.

Dr. J. S. ROSS thought all were agreed that they wanted to keep the number limited. But he believed that to lay down

hard-and-fast rules or limit the numbers would make a rod for the Committee's back. "We must try first of all to impress on Divisions the importance of keeping this limited to people only of exceptional merit," Dr. ROSS declared. One means of doing this would be to tighten up the criteria for nomination for admission to the Roll. Dr. CHAPPELL agreed with altering the criteria, and with the idea of not recommending more than a certain number of Fellows in each year.

Dr. H. G. DOWLER thought that for the next year or two there would be more people nominated for the Fellowship who had given many years of service, and therefore a limit now would be wrong. He hoped also to see people with 10 to 20 years' service, in active participation in Association work, being nominated.

The Committee agreed to stiffen further the wording of the objects of and criteria for admission to the Roll of Fellows, using the phrase adopted by the Conference of Honorary Secretaries, "only a very high standard," and to invite the next Conference to debate whether there should be a limit on the number of Fellows elected in any year. The matter will be reconsidered in the light of this debate. A suggestion that there should be an overall limit on the number of Fellows at one time did not find favour. Dr. J. H. E. MOORE warned that it would lead to Fellows being all men over 60 elected by seniority.

A further list of nominations for Fellowship, sent by Branches and Divisions, was approved.

Conference of Honorary Secretaries

April 24 was provisionally fixed for the 1959 Conference of Honorary Secretaries. Of the last Conference the CHAIRMAN remarked: "I think we did not give the floor enough time to talk." On this occasion, he added, there would have to be much discussion on the information service. Dr. NOBLE described the last Conference as "probably the largest and best most of us have ever attended" and congratulated those responsible for the arrangements.

A.R.M. Resolutions

In a letter from the Rugby Division, amplifying its A.R.M. resolution for the alteration of Article 40, which covers the procedure for dealing with resolutions passed by the A.R.M., it was stated that the present constitution had been tried and found wanting. The amendment proposed by Rugby would provide, among other things, that, when there was a delay in implementation by the Council of an A.R.M. resolution, a notice should be published in the *Journal* giving the reasons.

Branch and Division Meetings to be Held

ASHTON-UNDER-LYNE DIVISION.—At Broadoak Hotel, Tuesday, October 28, 8.45 p.m. Consideration of action to be taken regarding additional facilities for domiciliary medical consultations in the area, etc.

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, October 31, 8.15 p.m., address by Mr. Kenneth Walker: "Fertility and Potency Problems in Marriage."

BRADFORD DIVISION.—At Medical Societies' Room, Bradford Royal Infirmary, Wednesday, October 29, 8.15 p.m., address by Dr. H. R. Sparrow: "Home or Hospital."

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Tuesday, October 28, 8.30 p.m., B.M.A. Lecture by Professor R. Rothblat: "Electrons in Medicine." Members of St. Pancras Division are invited.

CLEVELAND AND MIDDLESBROUGH DIVISION.—At Hinton's Café, Corporation Road, Middlesbrough, Thursday, October 30, 7.30 p.m., supper; 8.30 p.m., lecture by Mr. F. McGuckin: "The Management of Deafness."

DORSET DIVISION.—At King's Arms Hotel, Dorchester, Wednesday, October 29, 8 for 8.30 p.m., annual dinner. Guests are invited.

DUNDEE BRANCH.—At Queen's College, Dundee, Friday, October 31, 8.30 p.m., B.M.A. lecture by Professor D. M. Dunlop.

EASTBOURNE DIVISION.—At Esplanade Hotel, Seaford, Tuesday, October 28, 7.15 for 7.30 p.m., dinner; 8.30 p.m., talk by Dr. A. C. Sommerville: "The Coroner."

EAST YORKSHIRE BRANCH.—At Royal Station Hotel, Hull, Thursday, October 30, 8 for 8.30 p.m., annual dinner.

GLASGOW DIVISION.—At Glasgow Regional Office, 9 Lynedoch Crescent, Glasgow, Friday, October 31, 8.30 p.m., meeting.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Royal Oak Hotel, Alderley Edge, Wednesday, October 29, B.M.A. Lecture by Dr. Francis Camps: "Things Are Not Always What They Seem." Preceded by buffet supper at 8.30 p.m.

NORTH WALES BRANCH.—At Ruthin Castle, Saturday, November 1, 3 p.m., autumn meeting. B.M.A. lecture by Dr. W. N. Mann: "On Getting Fat and Getting Thin."

ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Wednesday, October 29, 8.30 p.m., Dr. David Morris: "We and Our Patients," a discussion on new trends in paediatrics. Members of the City and Hampstead Divisions are invited.

SALISBURY DIVISION.—At Royal Military Hospital, Tidworth (C Block), Friday, October 31, 8 p.m., clinical meeting and discussion to which all medical practitioners in the area of the Division are invited.

SOUTH BEDFORDSHIRE DIVISION.—At Board Room, Luton and Dunstable Hospital, Wednesday, October 29, 9 p.m., Dr. Alistair Marshall: "Impressions of American Medicine—1958."

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devons Road, Bow, E., Friday, October 31, 3 p.m., meeting. Mr. L. M. Green: "Ophthalmology in General Practice."

WANDSWORTH DIVISION.—At South London Hospital for Women and Children, Clapham South, S.W., Wednesday, October 29, 8.15 for 8.45 p.m., South London Hospital Lecture by Sir Russell Brain, Bt.: "Recent Advances in Neurology."

WEMBLEY DIVISION.—At Board Room, Wembley Hospital, Tuesday, October 28, 8.30 p.m., joint meeting between clergy and doctors of Wembley, to which all medical practitioners in the area of the Division are invited. Discussion to be opened by the Reverend H. Cooper: "The Archbishop's Report on Healing."

WEST SUSSEX DIVISION.—At Burlington Hotel, Worthing, Thursday, October 30, 6.30 p.m., Dr. H. H. O. Wolff: "Psychosomatic Medicine in its Impact on General Practice." 8 p.m., dinner.

Headquarters and our leaders (who are at present unable to lead) should in all fairness be made aware of the amount of support which they can expect from the periphery. Could Dr. Taylor let us have something more concrete? Goodness knows, we need it.

We became aware at the time of the Guild not only that the profession had no mind of its own, but that the majority did not seem to care whether it had or not. Certain influential members of Council are known to be strongly averse to a questionnaire, and anyway it is unlikely that more than a third of the profession would trouble to answer one.

I am afraid that I am a defeatist. I see no way out of our struggle while we continue to pursue the "every man for himself" attitude. Supine we shall remain and so deservedly trampled upon. It would seem that the first essential is that we should learn to be loyal to each other and to a previously honoured profession, and that the bogey of 1913 and the attitude of former heads of colleges should be killed. How? I don't know.—I am, etc.,

Topsham, S. Devon.

F. E. GRAHAM-BONNALIE.

Regional Hospitals' Consultants and Specialists Association

SIR,—The Royal Commission on the Remuneration of Doctors and Dentists is still sitting and more evidence has to be considered. The findings will probably be published next year, and may be acceptable. This will probably be two years from the time of the inception of the Royal Commission, and the situation is changing. The joint working party on the medical staffing structure in the hospital service is now collecting evidence. This inquiry must mainly concern the non-undergraduate hospitals and their staffs. Recently we have heard of the new hospital costing system which has materially increased the charges for private wards, which many of us thought were already too heavy. Many are aware of the delays in making new appointments and appointing successors to retiring consultants in some areas, causing impairment of hospital service and delaying younger men in their promotion. These are a few of the items which concern the almost inarticulate but greater proportion of the consultants and specialists in Britain.

The Regional Hospitals' Consultants and Specialists Association exists to promote and safeguard the interests of consultants and specialists employed by the regional hospital boards, and as we increase our membership so will our authority and negotiating power be strengthened.—I am, etc.,

London, W.C.2.

HAROLD DODD,
President, Regional Hospitals' Consultants
and Specialists Association.

Psychological Medicine Group

SIR,—I should like to support the critical letter from Drs. A. Harris, J. G. Howells, J. T. Hutchinson, and C. Tetlow on this topic (*Supplement*, August 2, p. 112). I originally sought membership of the Psychological Medicine Group because I thought it would necessarily be the means by which the B.M.A. exerted its influence on the vital decisions at present affecting psychiatry in this country. In effect, however, the only result has been a request once per year to nominate and vote for elections to the Committee.

It would be helpful to have an explanation of the policy of the Group, or the establishment of some method by which individual members of the Group can influence more directly the activities of their Committee. It is perhaps specially important to know what recommendations, if any, are being put forward in the name of members and the reasons.—I am, etc.,

London, W.1.

R. W. CROCKET.

Sir Russell Brain, Bt., has intimated that, owing to pressure of work, he regrets he is unable to accept co-option to the B.M.A.'s Central Consultants and Specialists Committee (*Supplement*, October 18, p. 169).

The CHAIRMAN said the proposed amendment would do away with any possibility of dictatorship, but there were times when it might be impractical, or even dangerous, to publish reasons. "Otherwise it is a good idea," said Dr. J. E. MORRISON. Dr. CHAPPELL said: "I hope it will get over to the members that we are overhauling our machinery so as to speed action if we need it."

The Committee decided to take legal advice on the drafting of the amendment to Article 49.

Time-table for A.R.M.

Another A.R.M. resolution wanted the time-table of the A.R.M. altered as soon as possible so that it did not include a Sunday.

The ASSISTANT SECRETARY recalled that when this matter was discussed by the Constitution Committee a major argument in favour of the present arrangement was that unless there was an overlap with the scientific meeting the Representatives would be away for the President's address. Now the two groups were together for one or two days. "I think a lot of the dissatisfaction could be laid at the door of the Agenda Committee," declared Dr. PRIDHAM. "It was very unfortunate that the debate on A.I.D. came on the last day." The CHAIRMAN agreed with Dr. Pridham's sentiments. The Constitution Committee had agreed to have "priority motions" as well as common form motions, but this had not been implemented. If there had been such motions, what happened would not have occurred. The Agenda Committee, under Standing Orders, was also supposed to meet from day to day during the Meeting to advise the Chairman on the progress of business.

Dr. MOORE thought there could be a time-table, and from Dr. NOBLE came the proposal that motions which were reaffirmations of policy could be taken *en bloc* unless there was prior notice of opposition.

"There is," said Dr. DOWLER, "increasing feeling that we ought to avoid Sunday. It does not keep the representatives there for the President's address on Monday night. In the A.I.D. debate the hall was one-third empty." Monday, added Dr. NOBLE, had become by reputation "such a shambles."

The Committee agreed to suggest to the Constitution Committee:

(1) That the A.R.M. should be held on Wednesday, Thursday, Friday, and Saturday.

(2) That the attention of the Agenda Committee be drawn to the standing orders providing for "priority motions" (these should be placed, with a time-table, on a separate sheet, on the Agenda, the Committee thought, and Dr. MOORE spoke in favour of a general time-limit).

(3) That the Agenda Committee should be asked to review the general conduct of business in view of the conditions prevailing at the last A.R.M.

(4) That the Agenda Committee be reminded of the standing order that it should meet and advise the chairman on the conduct of business during the meeting.

(5) That motions which were formal reaffirmations of policy should be moved formally by the chairman of the Representative Body unless notice of opposition had been given or it was desirable to allow a statement.

Assistants and Young Practitioners

The General Medical Services Committee referred to the Committee for sympathetic consideration the recommendation of the Assistants and Young Practitioners Subcommittee that it should have a procedure for appeal to Council similar to that obtaining for groups. "I think it is very bad in principle," commented Dr. DOWLER. "A subcommittee should be a subcommittee." Dr. PRIDHAM, however, recalled that the assistants and young practitioners asked originally to form a group and were persuaded to have a subcommittee. He felt the Committee should help them over this; the subcommittee considered that they should have what the Hospital Junior Staffs had as a group. The recommendation was supported.

Hospital Residents' Hours of Work

The A.R.M. recommended "that sufficient hospital residents should be appointed so that each hospital resident doctor shall work less than 168 hours a week." The Executive Committee of the Hospital Junior Staffs Group felt that the arrangement of the duties of junior medical staff was a local matter, and where there was any difficulty this should be discussed locally before any approach was made to Headquarters. The Medical Staffing Subcommittee of the Central Consultants and Specialists Committee expressed the view that the shortage of junior medical staff was in many hospitals the primary reason for the lack of adequate off-duty time. Nevertheless it considered that the obligation rested with the consultant to see that the off-duty periods of his junior staff were as liberal as the circumstances would permit.

"We have not had any particular success in obtaining evidence of real difficulty here," said the CHAIRMAN.

The Committee concurred with the views of the Hospital Junior Staffs Group.

Supporting Group for W.M.A.

The Executive Committee of the British Supporting Group for the World Medical Association asked the Organization Committee to reconsider the possibility of members of the Association being invited to pay subscriptions to the supporting group with their B.M.A. subscriptions and the inclusion of a reference to the group in the B.M.A. subscription demand form. Members were sympathetic and endorsed the importance of the support group of the W.M.A., but were apprehensive of the effect of the inclusion with the subscription demand of yet another appeal which might affect the response to the charities of the Association. "Our medical charities are badly supported," said Dr. NOBLE.

It was agreed to consider the inclusion of a leaflet describing the supporting group in the envelope with the B.M.A. subscription form for next year.

N.O.T.B. ASSOCIATION

The 16th meeting of the council of the National Ophthalmic Treatment Board Association was held on October 9, with Dr. J. N. TENNENT in the chair.

After discussion on the use of mass visual screening instruments, the council resolved that it took no exception to the encouragement of mass visual screening in industry by any means deemed to be desirable. Reference was made to the statistical survey of new patients examined in the Supplementary Ophthalmic Services, which is being undertaken by members of the association and which started on October 1. The council was pleased at the excellent response to its request for voluntary help. The council noted that 38% of the association's total medical membership relied entirely on the N.O.T.B.A. to represent their interests. Dr. VICTOR PURVIS referred to a new leaflet which he was preparing for health exhibitions.

The minutes of the public relations and finance committees noted a widening of the activities undertaken by the public relations section and an increase in inquiries at the head office about many aspects of ophthalmology.

HOSPITALITY

A German doctor's daughter, aged 14, would like to contact a British doctor's daughter of a similar age to arrange an exchange visit for next year.

Would anyone interested please get in touch with Dr. R. A. Pallister, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

SUNDAY AT SOUTHAMPTON

VISITS TO PLACES OF MEDICAL INTEREST

On the last day of the Annual Clinical Meeting at Southampton (Sunday, December 7), a selection of visits to various places of medical interest has been arranged (see *Supplement*, September 27, p. 149). For the convenience of those attending the meeting further details are given below.

Department of Daily Living, Winchester.—A demonstration at the physical medicine department of the Royal Hampshire County Hospital (Dr. W. RUSSELL GRANT) will show how people with hemiplegia, rheumatoid arthritis, the after-effects of poliomyelitis, and other disabilities can live useful lives in spite of them. In the department of daily living they learn how to overcome their difficulties with the help of inexpensive pieces of apparatus which are already being mass-produced. Gadgets for the living-room, kitchen, bedroom, bathroom, and lavatory will be demonstrated. The department also has a mobile service based

FIG. 1.—Part of Esso refinery, Fawley. (Photo: William Martin Ltd.)

FIG. 2.—"Queen Elizabeth" alongside Ocean Terminal. (Photo: British Transport Commission.)

on peripheral clinics and a metal and woodwork shop for training and assessment. The timing of the visit will allow visitors to attend Matins at Winchester Cathedral beforehand, and the Winchester Division has arranged a reception.

Nuffield Rehabilitation and Plastic and Oral Surgery Centres, Odstock, Salisbury.—The rehabilitation centre at Odstock Hospital (Mr. J. N. BARRON, Dr. H. GLANVILLE) provides a planned recovery system in a general hospital where all aspects of rehabilitation from surgery to final resettlement are available. Demonstrations and a tour of

the specially designed Nuffield workshops will be a feature of this visit. The Salisbury Division has arranged a reception.

Esso Refinery, Fawley.—The Esso Petroleum Company's refinery at Fawley (Fig. 1) is the largest in the Commonwealth. There will be a conducted tour of the refinery which will include a visit to the medical department and casualty treatment rooms (Dr. A. WARD GARDNER).

Veterinary Artificial Insemination Centre, Lyndhurst.—This is the main insemination centre of the Hampshire Cattle Breeders' Society. It comprises administrative and laboratory buildings, a bull barn housing 29 bulls, and ancillary buildings. In a separate unit there are a laboratory for boar semen and another for the examination and deep-freeze storage of semen from farmers' bulls. Service is provided for all British breeds of cattle. There is also an experimental A.I. service for two breeds of pig. The techniques of handling, evaluating, and storing bull semen will be demonstrated.

Health Department, Southampton.—The Southampton County Borough Council is responsible for the Port Health Service (Dr. H. C. MAURICE WILLIAMS). This service covers an area which includes the docks and Southampton Water and extends as far as Cowes, Ryde, and Portsmouth. Over 2,000 ships from foreign ports are boarded each year. The tour of the Port of Southampton will include a visit to the Ocean Terminal (Fig. 2) and the King George V graving dock. The Millbrook Health Clinic, opened this year and providing maternity and child welfare and school health services for a new housing estate, will be open for inspection, as will also be a residential home providing accommodation for the elderly infirm.

NURSES' DUTIES

COLLEGE OF NURSING'S STATEMENT

A nurse's primary function is to nurse, the Royal College of Nursing said in a recent statement. The College has for some time past been concerned at the general and rapid increase of duties allocated to nurses, and it has had two main causes for anxiety on this score. First, additional duties are making inroads into the time which nurses should more properly give to their true function, and, secondly, the need to safeguard the nurse's professional position when, in the interests of the service, she is called upon to undertake duties outside the routine scope of nursing.

The College feels that certain duties are wholly outside the province of the nurse and should be undertaken only in a grave emergency. There are other techniques which appear to it to fall outside normal nursing duties and which it considers should be allocated to nurses only after all relevant circumstances have been considered and with adequate safeguards for the nurse's professional position. The College acknowledges that the scope of the trained nurse's duties is not necessarily circumscribed by the syllabus of the General Nursing Council, but it wants to ensure that special arrangements are agreed and safeguards established when it is necessary for a nurse to carry additional responsibility. It thinks that the position of the health visitor, the domiciliary nurse, and the nurse in industry should be safeguarded no less than that of the nurse in hospital.

In the College's view, discussions between the medical and nursing professions are of vital importance in establishing understanding in this matter. A document prepared by the Royal College of Nursing on the duties and position of the nurse is now being studied by the B.M.A., and some views on it by the Central Consultants and Specialists Committee were reported in the *Supplement*, of October 18 (p. 169).

The Medical Practices Committee has reclassified Ross-on-Wye, Herefordshire, from an intermediate to a designated area, with effect from May 31.

HOSPITALS AND THE STATE

ACTON SOCIETY'S PAMPHLET

The Acton Society Trust has published the fifth in its series of research papers on hospital organization and administration under the National Health Service. The series began in October, 1955, with a paper ("Background and Blueprint") describing the hospital services before and after nationalization. This was followed by "The Impact of the Change"—a series of case studies to discover the effects of the change to national ownership on those who run the hospitals. The third and fourth papers in the series examined hospital management committees and regional hospital boards. The Acton Society Trust is a non-profit-making trust set up to promote economic, political, and social research. It has no political ties and derives its income mainly from funds made available by the Joseph Rowntree Social Service Trust.

Top Management

The Society's fifth and latest paper on hospital organization and administration is an investigation into "The Central Control of the Service." The investigation was carried out by Professor T. E. Chester, professor of social administration at Manchester University, assisted by Miss S. N. Joy. It soon became clear, the paper states, that decision-taking in the hospital service is not located tidily in the Ministry of Health—in other words at the top, as in other big organizations whether privately or publicly owned. In the hospital service, the investigator points out, there are at least two levels of "top management," Ministry and Treasury, and the relationship of the Health Departments to the Treasury, as the central organ of Government financial control, is examined. The Treasury, it is further pointed out, is closely scrutinized by the Public Accounts Committee and the Select Committee on Estimates, which are organs of parliamentary financial control.

The paper assesses the degree of influence of these elements of top-level control on hospital administration, and the analysis is said to be undertaken as a preliminary to a discussion on the central strategical direction of the hospital service, which will be the subject of the sixth and last pamphlet of the series. Must ministerial responsibility be preserved? Is an ordinary Government department an appropriate directing authority for an operating service like the hospital service? If an ordinary Government department does not meet all requirements how could the deficiencies be corrected? By making the advisory committees to the Minister more active and less unwieldy? Or by the appointment of a board, like the National Coal Board, to which the Minister could delegate supervisory responsibility? Alternatively, if the departmental apparatus is to be maintained how can the present departments be better organized for discharging their duties as top-level management organizations? Do they even see their task in these terms? Does the Act permit them to do so?

Factual Information

These, it is stated, were the sort of questions in mind when the present investigation was made, and an answer will be attempted in the next paper. The present paper is largely concerned with factual information and inferences derived from it. It examines the historical background and organization and work of the Ministry of Health and Department of Health for Scotland. It then has a section on "where the Treasury comes in" and one on "Parliament and its committees." There are a series of appendices, 11 in all, giving in detail such things as the headquarters organization and staffing of the Health Department, hospital service organization in Northern Ireland, and analyses of hospital circulars, parliamentary questions, and parliamentary debates.

Under the heading "Where Does Policy Come From?" the paper discusses the part played by the Government and

¹ Hospitals and the State: Hospital Organization and Administration under the National Health Service, No. 5, The Central Control of the Service, 1958. Acton Society Trust. Price 4s.

its advisory bodies, the Central Health Services Councils; the policy decisions which are taken as a result of consultations with interested parties; and, finally, policy decisions based on surveys, reports, and inquiries. It then asks, "Is all this enough? Has the Minister got a sufficient thinking machine at his disposal to enable him to interpret the lessons of experience in the field and to give the inspiring guidance which a central directing authority should give to the whole service?"

In its analysis of where the Treasury comes in, the paper states that, in the search to find where final policy decisions are taken, the place to look is the Treasury; "for the expenditure and policy of the Ministry of Health are submitted to the same type of control from the Treasury (despite disclaimers, the word 'control' describes their activity most accurately) as all Departments of State." The Treasury, it concludes, acts on behalf of the executive, and to see where the ultimate power of decision on hospital policy really lies "it will be necessary to press the inquiry back to Parliament." This the paper does, and looks at the Public Accounts Committee, the Select Committee on Estimates, and the influence on policy of parliamentary questions and debate, and party politics. In general conclusion the question is posed, "What does it all mean in terms of practical results? Has the G.H.Q. of the service done enough in the way of constructive planning of strategy and given enough guidance in the tactical work of execution?" These questions will be considered in the next pamphlet as part of a general review of the first ten years of the Health Service.

Scottish News

GENERAL MEDICAL SERVICES
SUBCOMMITTEE (SCOTLAND)

The first meeting of the session of the General Medical Services Subcommittee (Scotland) was held in Edinburgh on September 25. Dr. C. HARROWER, Glasgow, and Dr. R. C. HAMILTON, Kilmarnock, were reappointed chairman and vice-chairman respectively.

Minister's Refusal

The Chairman recounted the events which had taken place since the last meeting in connexion with the special case on the contractual obligation inherent in the Government's acceptance of the Spens Report and the Secretary of State's refusal to agree to the presentation of a case in the Court of Session. An animated discussion made it clear that the Subcommittee was bitterly disappointed at the Secretary of State's decision, and it was finally agreed to recommend to the Scottish Council:

That the Secretary of State be informed that the profession is bitterly disappointed that he has declined even to examine the special case; that, in view of the fact that he had been associated with the original suggestion that the matter could be tested in the Courts, it is surprised at his present attitude; that it has been repeatedly assured that the Royal Commission is in no way a court of adjudication and that accordingly his remarks regarding it are irrelevant; that his present action shakes what confidence the profession has in the Government as an employer and that it is hoped he will reconsider his decision.

Dental Haemorrhage

The Subcommittee considered correspondence seeking its observations on fees for arresting dental haemorrhage. It appeared that the Department of Health's policy was to pay only one fee in respect of two visits to arrest a bleeding in one socket. It was explained by the member of the Subcommittee representing the Scottish General Dental Services that the question of payment rested really between the general practitioner and the dentist. It was accordingly agreed to advise the doctors concerned to pursue the matter with the dentists, and also that the Department's attention

should be drawn to the doctors' complaints, which seemed to the Subcommittee to be quite justified.

It was also decided that the Scottish General Dental Services Committee should be asked to raise the matter with the Scottish Dental Estimates Board.

Change of Address and Form E.C.1(c)

This subject was again discussed, and it was agreed that even although there were many anomalies it would be desirable to adhere to the present procedure for notifying change of address. It was felt that executive councils should make a special effort to act on the information given by general practitioners on Form E.C.1(c). In the Subcommittee's opinion the completion of this form should be regarded as one step towards curbing inflation, and it was decided to point this out to the Department, and also that the attention of general practitioners should be drawn to the importance of completing Form E.C.1(c).

Cancer Research

The Subcommittee agreed to proposals submitted by the South-eastern Regional Hospital Board for setting up a regional advisory committee on cancer research, as recommended by a special committee of the Scottish Health Services Council. The Subcommittee also considered a request from the Regional Board that two general practitioners should be nominated to serve on the Regional Advisory Committee on Laboratory Services. It was felt, however, that the Edinburgh Local Medical Committee should be approached so that they might consult with the other local medical committees in the region. The Subcommittee could not agree that two general practitioners would be adequate, and it agreed to ask the Department of Health to consider increasing the general-practitioner representation on the advisory committee.

Diagnostic Facilities in Glasgow

The Subcommittee considered a letter from the Department of Health on the vexed question of direct access to diagnostic facilities by general practitioners in Glasgow. The Department, it appeared, held that arrangements had been made for access to laboratory services—although this was not known to the Subcommittee—and that, in the Department's opinion, the main difficulty was with radio-diagnostic facilities. The Department had apparently been informed by the Western Regional Hospital Board that it had been impossible to provide even experimental arrangements. The Department wrote that it was still considering how best this question could be advanced. The Subcommittee expressed strong dissatisfaction with the lack of developments and agreed that the Department should be urged to press the Western Regional Hospital Board to ensure that official policy was implemented.

Questions Answered

Death Certificates

Q.—Is a doctor in contract with an executive council obliged, under his terms of service, to provide a death certificate?

A.—A death certificate is not included in the list of certificates which a doctor is required to give under the National Health Service arrangements. In England and Wales, under the Births and Deaths Registration Act (1953), however, the doctor who was in attendance during the deceased's last illness has a statutory duty to give a certificate of death stating to the best of his knowledge and belief the cause of death, and must deliver it forthwith to the registrar. Failure to comply, without reasonable excuse, is punishable on summary conviction with a fine of 40s.

Under the Registration of Births, Deaths, and Marriages (Scotland) Acts, 1854 and 1860, the medical person who was in attendance during the deceased's last illness shall, within seven days after the death, transmit to the registrar the

death certificate in the prescribed form. If a certificate is not received by the registrar within seven days after the death he must send to the doctor a death certificate form together with a request that the doctor completes the certificate and returns it to him within three days after receipt of the request. There is a penalty not exceeding 40s. provided for failure to transmit a certificate to the registrar.

NEWS IN BRIEF

YORKSHIRE BRANCH DISCUSSION GROUP.—The Yorkshire Branch of the B.M.A. has reconstituted its Occupational Health Subcommittee as a discussion group. Meetings will be held at Wakefield on the third Wednesday of each month until May, and the topic for discussion will be "The Duties and Functions of the Industrial Medical Officer." Dr. J. L. Vaughan Jones will sum up at the last meeting. All members of the profession will be welcome, and further information may be obtained from Dr. R. McL. Archibald, Treeton Colliery, Treeton, near Rotherham, Yorks; telephone Woodhouse 2321.

HOSPITAL STAFFING.—A meeting of the Hospital Junior Staffs Group of the Midland Region, at which all hospital junior staff in the region are entitled to be present, will be held on November 6. The main business will be to prepare a report for the annual meeting of the regional consultants and specialists in Birmingham on November 19, when hospital medical staffing will be discussed.

STIMULATING INTEREST.—Any member of the South Staffordshire Division of the B.M.A. who wishes to may attend the meetings of its executive committee in a non-voting capacity. This decision was taken at the annual general meeting of the Division.

ROYAL COMMISSION PUBLIC HEARING.—The Royal Commission on Doctors' and Dentists' Remuneration has invited representatives of the Executive Councils' Association (England) to give evidence at a public hearing on November 4. Representatives of the Joint Consultants Committee gave evidence to the Commission on October 31.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Registration of Medical Auxiliaries

SIR,—The report of the Central Consultants and Specialists Committee meeting (*Supplement*, October 18, p. 169) brings to light a position which closely affects a very large body of specialists. Though the question of the training, ethics, and registration of medical auxiliaries has never been very clearly defined, until the advent of the National Health Service the B.M.A. maintained a register of medical auxiliaries comprising such branches as were willing to accept certain ethical and educational standards. Many medical auxiliaries did not appear on this register. With the advent of the N.H.S., the State became far and away the largest employer of medical auxiliaries, and it was not unreasonable that the State should seek to put the registration of these medical auxiliaries on a more rational basis. With this in view, Sir Zachary Cope was asked to form a committee, examine the situation, and present a report to the Minister on this subject.

This report was presented in 1951, but was unacceptable to the medical practitioners concerned because of a basic weakness in that the bodies which it was proposed should control the education and examination of the various auxiliaries had only a very small medical representation. It committed, too, the error of trying to apply the same principles to all medical auxiliaries, which, by implication,

Branch and Division Meetings to be Held

ASHTON-UNDER-LYNE DIVISION.—At Regis Suite, Alma Lodge Hotel, Stockport, Thursday, November 6, 8.30 p.m., annual dinner dance.

CHESTERFIELD DIVISION.—At Walton Sanatorium, Friday, November 7, 8.45 p.m., lantern lecture by Mr. A. Jefferson: "Neurosurgery in 1958."

CORNWALL DIVISION.—At Royal Cornwall Infirmary, Truro, Thursday, November 6, 8.30 p.m., B.M.A. Lecture by Mr. H. Osmond-Clarke: "Pain in the Neck and Arm."

DEWSBURY DIVISION.—At Three Nuns Inn, Mirfield, Thursday, November 6, 7.45 for 8.15 p.m., annual dinner.

DONCASTER DIVISION AND DONCASTER MEDICAL SOCIETY.—At Danum Hotel, Doncaster, Thursday, November 6, 7 for 7.30 p.m., Annual "Ladies Night" Banquet and Ball.

EAST YORKSHIRE BRANCH.—At Hull Medical Society, 68, Park Street, Hull, Wednesday, November 5, 9 p.m., general meeting. Address by Dr. A. B. Davies: "Remuneration."

GOOLE AND SELBY DIVISION.—At North Eastern Hotel, Goole, Thursday, November 6, 7.30 for 7.45 p.m., annual dinner-dance.

GREENWICH AND DEPTFORD DIVISION.—At the Yorkshire Grey, Eltham Road, Eltham, Saturday, November 8, 6.45 for 7.15 p.m., dinner and dance. All medical practitioners in the Greenwich and Deptford, Lewisham, and Woolwich Divisional areas are invited.

HARROW DIVISION.—At Tithe Farm House, Eastcote Lane, South Harrow, Tuesday, November 4, 8.30 p.m., clinical meeting. Film: "Key Questions in Coronary Disease." Dr. C. G. Barnes will open a discussion.

HARTLEPOOL DIVISION.—At Staincliffe Hotel, Seaton Carew, Thursday, November 6, 8.30 p.m., Professor W. F. Gaisford: "Abdominal Pain in Children."

HUDDERSFIELD DIVISION.—At Huddersfield Royal Infirmary, Monday, November 3, 8.15 p.m. Ordinary meeting.

LEEDS DIVISION.—At Littlewood Hall, General Infirmary at Leeds, Friday, November 7, 8 p.m., lecture by Dr. William Whitaker: "Pulmonary Heart Disease."

LEWISHAM DIVISION.—At Committee Rooms, Lewisham Hospital, Friday, November 7, 8.30 p.m., Mr. Kenneth Walker: "Fertility and Sexual Problems of Marriage."

MAIDSTONE DIVISION.—At Royal Star Hotel, Maidstone, Thursday, November 6, 8 for 8.30 p.m., B.M.A. Lecture by Mr. A. Lawrence Abel: "Recent Advances in the Diagnosis and Treatment of Cancer."

MID-ESSEX DIVISION.—At Hutton Masonic Hall, Shenfield, Wednesday, November 5, 8 p.m., dinner-dance.

MIDLAND BRANCH.—At Grosvenor Rooms, Grand Hotel, Colmore Row, Birmingham, Saturday, November 8, 7 for 7.30 p.m., annual dinner. Guest of Honour, Lord Cohen of Birkenhead, who will deliver the B.M.A. Lecture.

MONMOUTHSHIRE DIVISION.—At St. Mellons' County Club, Thursday, November 6, 8 for 8.30 p.m., annual dinner.

NORTHERN IRELAND BRANCH.—At Whitla Medical Institute, College Square North, Belfast, Thursday, November 6, 8.30 p.m., Presidential address by Mr. W. S. Braidwood: "In Home Waters."

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, November 4, 8.30 p.m., Professor A. P. Thomson: "The Development of British Schools of Medicine."

Preceded by supper at 7.30 for 7.45 p.m.

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, November 4, 8.30 p.m., Dr. R. A. Shooter: "The Changing Face of Bacteriology."

SCUNTHORPE DIVISION.—At Angel Hotel, Brigg, Thursday, November 6, 8.30 p.m., Dr. D. Stark Murray: "A Whole-time Salaried Service for the Nation."

SWANSEA DIVISION.—At Swansea Hospital, Thursday, November 6, 8.15 p.m., special general meeting.

TEES-SIDE BRANCH.—At Staincliffe Hotel, Seaton Carew, Co. Durham, Thursday, November 6, 8.30 p.m., Professor W. F. Gaisford (Manchester): "Abdominal Pain in Children."

TUNBRIDGE WELLS DIVISION.—At Elizabethan Barn, Tunbridge Wells, Thursday, November 6, 8 for 8.30 p.m., dinner-dance.

WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.—At Castleford, Normanton, and District Hospital, Friday, November 7, 8 p.m., Dr. C. Stewart: "The Bulbous Eruptions."

WEST SUFFOLK DIVISION.—At Everard's Hotel, Bury St. Edmunds, Saturday, November 8, 7.30 for 8 p.m., 32nd "Doctor's Armistice" Dinner.

Meetings of Branches and Divisions

OXFORD DIVISION

The following officers have been elected:

Chairman.—Dr. Alice B. Carleton.
Vice-chairmen.—Dr. F. V. Squire and Dr. F. H. Kemp.
Honorary Secretary and Treasurer.—Dr. W. S. Holden.

ROTHERHAM DIVISION

The following officers were elected at the annual meeting held at the Crown Hotel on July 18:

Chairman.—Dr. J. O'Hara.
Vice-chairman.—Dr. C. Levey.
Honorary Secretary.—Dr. T. V. Griffith.
Honorary Treasurer.—Dr. F. C. L. Agnew.

SUSSEX BRANCH

The following officers have been elected:

President.—Dr. R. Green.
President-elect.—Mr. S. S. Freedman.
Vice-presidents.—Dr. C. Gibson and Dr. L. H. Booth.
Honorary Secretary.—Dr. P. Hall-Smith.
Honorary Treasurer.—Dr. S. J. Firth.

WEST COAST DIVISION (NEW ZEALAND)

The following officers have been appointed:

President.—Dr. B. M. Dallas.
Vice-presidents.—Dr. D. H. Symes and Dr. A. G. Couston.
Honorary Secretary.—Dr. J. R. Presland.

WEST WIGTOWNSHIRE DIVISION

The following officers have been elected:

Chairman.—Dr. R. C. Nimmo-Smith.
Vice-chairman.—Dr. I. Gilfillan.
Honorary Secretary.—Dr. D. M. Hastings.
Honorary Treasurer.—Dr. J. M. E. Turner.

YORKSHIRE BRANCH

The following officers were elected on June 11 for 1958-9:

President.—Dr. L. Varley Broadhead.
President-elect.—Dr. R. H. Sunderland.
Vice-president.—Dr. T. K. Cooke.
Honorary Secretary and Treasurer.—Dr. J. H. E. Moore.

ROYAL COMMISSION ON DOCTORS' AND DENTISTS' REMUNERATION

JOINT CONSULTANTS COMMITTEE'S FURTHER EVIDENCE

Further oral evidence to the Royal Commission on Doctors' and Dentists' Remuneration, some of it *in camera*, was given by the Joint Consultants Committee on October 31. The Commissioners asked particularly about the relative advantages and disadvantages of whole-time and part-time consultant service, suggesting by their questions that the medical profession could not be placed in a "more favourable" position than other professions in respect of expenses, and about the negotiating machinery wanted by the profession. In a new memorandum of evidence the Joint Consultants Committee recommended that the salaries of hospital medical staff should now be further increased by 29% to offset the fall in the value of money between 1951 and 1957, and to maintain the economic position of doctors in relation to other professions, and that the three distinction awards should be increased by 60%. The effect of the recommendations would be that a pre-registration house officer would receive £550 and a second-year house officer £650 to £700, a registrar £1,096 17s. 6d. to £1,244 17s. 6d., a consultant on the basic scale £2,709 to £3,999, and a consultant with an "A" distinction award £6,709 to £7,999.

Those giving evidence on October 31 were: Mr. T. Holmes Sellors, chairman of the Joint Consultants Committee, Sir Harold Boldero, Dr. J. D. S. Cameron, Dr. T. Rowland Hill, Mr. J. P. Cocker, and Dr. D. P. Stevenson. In addition to the further written memorandum of evidence, the Royal Commission had received from the Committee a document setting out definitions of posts in the hospital service and a supplementary memorandum which dealt with a number of points that arose in the course of the Committee's oral evidence on December 18, 1957.

S.H.M.O.s Doing Consultant Work

Sir DAVID HUGHES PARRY said that in their definitions the Joint Committee stated that "a consultant grading is a personal one depending on the possession of appropriate qualifications or training and ability," but that in the memorandum it referred to "an S.H.M.O. post doing work of consultant quality and responsibility." They emphasized the personal aspect and then dealt with the post. Mr. HOLMES SELLORS pointed out that in the second case they used the words in connexion with S.H.M.O.s, and what they were saying was that an S.H.M.O., who was of consultant quality by virtue of qualifications and experience and so on, ought to be graded as a consultant, particularly when he was doing work of that character.

After he had explained how most consultants held a higher qualification of one of the Colleges, Mr. Holmes Sellors was asked by the CHAIRMAN, Sir HARRY PILKINGTON, about the Central Consultants and Specialists Committee.

He told how it was democratically elected and represented the whole of the hospital staffing structure. In answer to a question about psychiatrists, Mr. HOLMES SELLORS said they were represented on the Central Consultants and Specialists Committee and a high proportion were members of one of the Colleges.

The memorandum stated that the young doctor, after his pre-registration appointments and National Service, was about 27 before he could take any decisive step in his professional career. Sir DAVID HUGHES PARRY said National Service would soon be disappearing, "and we really ought to be planning on 25." But Mr. HOLMES SELLORS replied that it appeared that qualification was a little later now, and it might be 26, without National Service.

Expenses

"Every consultant should be encouraged to take some part in the meetings of his specialist body, and it is a justified grievance of whole-time consultants that they are refused income-tax relief for subscriptions to these organizations," stated the Joint Committee's memorandum. Sir DAVID HUGHES PARRY: "Part of that has gone?" Mr. HOLMES SELLORS: "Part of it, but not all, by any means." Sir DAVID: "No, I quite appreciate that."

The memorandum also stated that every hospital should maintain an adequate library or source of reference for its staff. This applied particularly to provincial or peripheral hospitals where the staff did not have ready access to medical libraries. At present the grants made to hospital management committees for this purpose were inadequate. "It applies particularly to the whole-time person and the young man working whole-time in the hospital where his income is not sufficiently large to let him subscribe to a number of journals which are important to him," amplified Mr. HOLMES SELLORS. The Joint Committee felt strongly that hospitals should provide the main structure of what he should read, "because, as you will appreciate, the medical literature at the present time is voluminous."

Registrars

A section of the memorandum was devoted to difficulties encountered by registrars. It stated that an increase in the salaries of both registrars and senior registrars was urgently needed. "And then," added Sir DAVID, "on the very next line you state: 'Senior registrars are too numerous, in relation to the number of consultants.'" To his suggestion that if the salaries of senior registrars and registrars were made so attractive there would be still more attraction to the posts, Mr. HOLMES SELLORS pointed out that the competition for senior registrar posts was extremely severe, bringing

up to 15 or 20 applicants who might all be considered very suitable for the post; also the number of these posts was governed by the establishment, which was agreed between the Ministry of Health and the profession. The registrar, below the level of the senior registrar, was in difficulties economically also, and in regard to future prospects. The CHAIRMAN: "Is there a very sharp distinction between registrar and senior registrar?" Mr. HOLMES SELLORS: "Very sharp."

Whole-time and Part-time

The next section was devoted to the relative advantages and disadvantages of different forms of service. "We regard that as a very important matter, naturally," commented Sir DAVID HUGHES PARRY. The advantages of part-time service seemed to be of two general kinds. There were the advantages resulting from the conditions of service and those resulting from being in a better position against the exactions of the Inland Revenue. The Joint Committee had also emphasized that the part-time person had advantages in independence of outlook; and there was some private practice.

"Can we take conditions of service?" Sir DAVID asked. "Would it be right that the part-timer is better off as regards travelling time?" "That is certainly so," replied Mr. HOLMES SELLORS. Mr. Holmes Sellors went on to explain about the sessional basis of payment. The sessional basis was never intended to be an exact computation of the number of hours spent at the hospital. The profession resisted the idea of being "clocked in" and "clocked out." It was essentially what a man gave in half a day which was to be the unit, "without having to go into hours and fractionizing into minutes, which is what finance officers do." The original contract was made on the assumption that the work the man would be doing would be roughly split into half-days; it was impossible to compute the amount of work which an individual did in the unit of time.

Dr. D. P. STEVENSON said he was not clear why Sir David Hughes Parry thought the sessional basis of payment was an advantage to the part-timer. Sir DAVID: "One advantage is that the hours are rounded up a little." Mr. HOLMES SELLORS explained that time had to be allowed for emergencies and extra visits. The CHAIRMAN said that in the terms and conditions of service there was a prescribed method of determining the number of hours which did involve rounding up. Mr. HOLMES SELLORS agreed, but pointed out that the terms did say that this was a general guide. The CHAIRMAN: "On the whole that works not too badly?" Mr. HOLMES SELLORS: "Yes, not too badly." Dr. T. ROWLAND HILL said that the "rounding-up" worked both ways. If a man had six sessions, in 99 cases out of 100 he never hesitated to work 10 or 11 if his patients needed it. "I think that is appreciated," replied the CHAIRMAN. Sir HUGH WATSON: "You do not work to rule?" Dr. HILL: "We do not want to be forced to."

When Dr. J. D. S. CAMERON mentioned that the part-time consultant had a continuing responsibility, it was pointed out that the whole-time consultant had his also. Sir DAVID: "You would agree that the weighting is rather in favour of the part-timer?" Mr. HOLMES SELLORS: "It was a great deal more before the last award, but that weighting includes a number of imponderable things."

Independence of Action

Many men chose to be part-time to give them that extra freedom, Mr. HOLMES SELLORS continued. It gave them freedom to engage in private practice. Some doctors were quite convinced that they would work better on part-time; others felt that they would do better if they worked full-time. The CHAIRMAN asked whether there were part-timers who would like to be whole-timers, but could not, or who would like more sessions than they could obtain? Mr. HOLMES SELLORS said a number would want to get more sessions for economic reasons, particularly young men.

In answer to Sir DAVID HUGHES PARRY, Dr. HILL agreed it was quite true that the full-time consultant had more security than the part-timer. He said that another point was that, in the case of a part-time consultant doing a good many hospital sessions, the stress and strain, if there was a considerable demand for him in private practice, could be very great. Lord Moran had said that many men chose to be whole-time for the more undisturbed nature of their professional work, particularly if they were interested in some kind of research. Another disadvantage of part-time work was that of the young consultant—and the Committee could give many examples—who began with perhaps two sessions and had no private practice yet. Still another disadvantage was that part-time consultant sessions were often spread over a number of hospitals, involving much travelling time. Professor J. JEWKES, a commissioner, pointed out that the superannuation scheme for part-time consultants was not quite so attractive as that of the full-time consultants.

Dr. STEVENSON said that a part-time consultant on maximum sessions might be doing far more than that for which he was paid. Secondly, if a hospital had to be reorganized through a change of use, a part-time man might have the number of his sessions reduced. These were examples of disadvantages in part-time service.

Trend to Part-time

In answer to the CHAIRMAN, Mr. HOLMES SELLORS said he thought that, when regional boards had given consultants the choice, the trend had been to choose part-time. A number of those who before the National Health Service Act were full-timers had become part-timers. Sir DAVID: "Private practice is with the doctor, as with the lawyer, a matter of great risk?" Mr. HOLMES SELLORS: "Very great at the present time." Sir DAVID said, however, that the man on nine sessions and with private practice had the security of the State behind him, as well as his private practice. Mr. HOLMES SELLORS replied that the young man was not likely to have the private practice.

Recalling that the Joint Committee had stated in written evidence that, when a whole-time consultant transferred to maximum part-time, he invariably gave his employing authority an undertaking to continue to fulfil all the duties of the appointment "as hitherto," Professor JEWKES said he was thus getting a smaller salary for the same work. "It is a worth-while disadvantage," replied Mr. HOLMES SELLORS. "It is like an act of liberation." He mentioned a radiologist and a pathologist who were applying to go maximum part-time "in order to get out of the whole-time atmosphere." The CHAIRMAN: "Do you know of any case where a man has gone to maximum part-time and another consultant has been appointed for the additional two sessions?" Dr. HILL: "I have never known it happen." Mr. HOLMES SELLORS said he was maximum part-time, and his rough estimate was that he put in 12 to 15 sessions. He emphasized what might be called the spiritual side of independence, to which many attached importance.

On this point the memorandum stated: "The great disadvantage of the whole-time consultant's position is that he lacks the sense of professional independence that is felt by a consultant not wholly dependent upon his salaried appointment." Sir DAVID asked: "Does that affect his work in any way in the National Health Service with the patient?" "No," replied Mr. HOLMES SELLORS. A full-time consultant and a part-time consultant were two people giving the same service professionally. The difference was in their outlook.

Advantage Over Other Professions

Sir DAVID said that on the question of allowances for travel, instruments and journals, and conferences, the Commission's difficulty was that it could not alter the income-tax law. Mr. HOLMES SELLORS replied that if it was agreed in the terms of a man's contract that he should have certain things available for the performance of his work, that would overcome the difficulty. "That would give advantages over

other professional people," declared Sir DAVID. "The telephone is a universal object, but it is essential for the medical man," said Mr. HOLMES SELLORS. Dr. STEVENSON drew attention to the paragraph in the Joint Committee's memorandum which stated: "The Consultant Spens Committee stated that it presumed that the Inland Revenue authorities would be prepared to consider favourably as legitimate allowances for income-tax purposes any items of expense which had been approved by a public hospital authority." "We thought that the full-timers never had the intentions of Spens implemented," he said. A whole-time consultant was required to be on the telephone. His board would pay out-going expenses for calls but not the rental.

The Spens Committee also recommended that all specialists engaged whole- or part-time in the Service should be paid, in addition to their remuneration, any sums representing expenses necessarily and reasonably incurred in the course of their work. Said Dr. ROWLAND HILL: "Time and again we have asked the Ministry and the Management Side of the Whitley Council to instruct hospital authorities to embody that clause in their contracts, but they do not do so." "Perhaps," suggested Sir HUGH WATSON, "Spens should not have said what he did. This affects many other professions than yours. I do not think you should blame the Inland Revenue for this."

Professor JEWKES asked whether he would be right in thinking that the most important of the differences between whole-time and part-time was that of domiciliary visits. Mr. HOLMES SELLORS told him that was probably the least important. He thought the question of car expenses and travelling time was the most important; travelling for the medical man was a matter of a car.

Importance of Freedom

The CHAIRMAN: "We have understood—from Dr. Rowland Hill particularly—that having freedom is the most important thing." Dr. HILL: "That is the paramount one—that is the thing that compensates for all the disadvantages of being a part-timer. The disadvantages are accepted disadvantages." The CHAIRMAN: "You are saying that it is worth while having a little bit less remuneration to have your complete freedom?" Dr. HILL: "I agree; I would like to emphasize that with great force." The CHAIRMAN: "On the whole the whole-timer should not earn less because he has the disadvantage, I think you said, of 'being a galley slave'?" Dr. HILL: "No. If no such thing as private practice existed and if there were no differences in income-tax law, it would still be the case that the great majority would want part-time. The great majority of the present generation—I cannot speak for future generations—do not want to be whole-time salaried officers of a public body." Sir DAVID HUGHES PARRY suggested that the maximum part-timer had the maximum security under the system. Dr. STEVENSON said that the weighting in favour of the part-timer was intended to compensate for some of the disadvantages inherent in part-time service.

Mr. S. WATSON, a commissioner, asked whether the person employed full-time in the Health Service should have a higher form of remuneration than those who got spiritual release—and private practice. Mr. HOLMES SELLORS replied that *pro rata* the remuneration for the hospital service doctor should be the same. Mrs. K. M. C. BAXTER, a commissioner, was not clear why the category of whole-time consultant had to be continued. Why could it not be abolished, thus releasing everybody from income-tax problems and from the galley? Mr. HOLMES SELLORS replied that there were some circumstances in which the full-time could not dictate to the man who wished to work full-time. Sir HUGH WATSON: "There are some Britons who prefer to be slaves?" Dr. HILL said that there was a limiting clause in the agreement that consultants should be offered the choice of part-time, which stated that if the hospital authority felt that for medical reasons the post should be whole-time the choice should not be given.

Emigration

The Joint Consultants Committee's memorandum described as "alarming" the high proportion of doctors attracted by the prospects overseas in comparison with those available in this country. "The fact that so many members of the profession are driven to emigrate reflects dissatisfaction with the present conditions of medical practice in the United Kingdom," the memorandum stated. Sir HUGH WATSON asked "whether this was a reference to finance or other things?" Mr. HOLMES SELLORS said finance was a very considerable cause. Another was that those who emigrated did not want to work in what people felt was becoming a State monopoly, and they thought the prospects of promotion were better overseas. "We have lost a great many very well trained registrars and senior registrars to the North Americas and other countries, and they have not come back."

Mr. WATSON: "Do you think a useful purpose could be served by retiring consultants earlier so that the line of promotion would be easier for the young men?" Mr. HOLMES SELLORS: "No, I do not think so." Mr. WATSON suggested that the question of emigration was nothing to do with the Health Service; it was just that there was no possibility of promotion within it. Mr. HOLMES SELLORS replied that there were people who felt strongly that they did not want to work under a State monopoly. "Would there be any advantage in raising the retiring age?" asked Professor JEWKES. "It is now 65, and that is lower than in some other professions where energy is supposed to count," he said. Mr. HOLMES SELLORS said that if the age was raised it would make more difficult the position of the younger members of the profession.

Private Practice After Retirement

The CHAIRMAN asked whether a consultant retired from private practice at the same time as retiring from the Service. Mr. HOLMES SELLORS said he continued private practice, but a man who severed his connexion with hospital became "run down" so far as private practice was concerned. Mr. GUNLAKE said it had been pointed out that it was difficult to carry on practice after retirement because of the difficulty of obtaining access to diagnostic and therapeutic apparatus. Mr. HOLMES SELLORS said that the retired consultant had theoretical access to private beds. "Which are very expensive?" queried Mr. GUNLAKE. He pointed out that, although the retiring age was normally 65, a consultant could be kept on up to 70. Mr. HOLMES SELLORS thought on the whole this was not done extensively. They felt that, in fairness to the younger men, they should not continue.

Negotiating Machinery

The Joint Consultants Committee witnesses were closely questioned on their proposals for negotiating machinery. "We have had a number of proposals on negotiating machinery," said Sir DAVID HUGHES PARRY, "and we are going into each one of them as deeply as we can."

The Joint Committee's memorandum stated that there were strong arguments in support of direct negotiation when major matters of finance or other questions of national importance were involved. In addition the Committee recommended that there should be a small advisory committee of eminent lay persons, appointed by the Prime Minister in consultation with the profession, to keep under continuous review the general level of remuneration of doctors engaged in the National Health Service in order to maintain their proper economic and social status; it should have the continuing duty of tendering advice to the Government on its own initiative, but also consider issues specifically referred to it by the profession or the Government.

Mr. HOLMES SELLORS explained that they had no wish to alter the machinery by which they had direct talks with the Ministry officials and even the Minister of Health himself on questions of policy. But they were entirely dissatisfied after 10 years' experience of the Whitley machinery for deal-

ing with major matters of finance. Mr. Holmes Sellors referred to the "inverted Micawberism" of the Management Side ("they are always waiting for something to turn down, rather than something to turn up"). Nearly everything a consultant did was governed by his terms of service. Dr. STEVENSON explained, and under the present system no amendment to the terms of service could be made without ratification by the appropriate committee of the Whitley Council. The present claim was a major matter of finance which was unsuitable for the Whitley Council.

The Committee had based its suggestion for a small advisory committee on the Coleraine Committee for the Civil Service, explained Dr. Stevenson. Mr. WATSON suggested that there was a very different employer/employee relationship there. Would this proposed body, set up only in consultation with the medical profession and which would be without any responsibility whatever, financial or otherwise, within the Health Service, bring forward recommendations? Dr. HILL said they were attracted by the suggestion in the report of the Royal Commission on the Civil Service in respect of the managerial staff. Mr. HOLMES SELLORS underlined that they did not think that the new body should have a say in settling staffing structure. The idea was to stop this interminable wrangling and definite ill-feeling which resulted from the present situation. The profession, he added, would prefer to work out any question of distribution of money themselves.

"Have you a fairly clear dividing line between those things which should be dealt with by Whitley and those things which should be dealt with by direct negotiation?" asked the CHAIRMAN. Mr. HOLMES SELLORS replied that in Whitley "bread-and-butter, day-to-day matters" could continue to be discussed. On matters of policy, such as pay beds, they believed that direct negotiation with the Minister was the best way of dealing with it.

The CHAIRMAN noted that the Joint Committee called for a "drastic overhaul" of Whitley. Mr. HOLMES SELLORS said this referred to the whole atmosphere; the Staff Side felt it was Treasury controlled. Mr. WATSON: "Of course that is really inevitable?" Mr. HOLMES SELLORS: "We agree, but it does not make for a well-lubricated machine." Mr. WATSON: "Do you recommend that the Management Side should be composed of Government officials with real authority?" Dr. STEVENSON said this was what happened in general practitioners' negotiations. Mr. WATSON: "If that is so, what is the need for the new advisory body?" Mr. HOLMES SELLORS: "Because 10 years of bringing many national issues to Whitley does not give us encouragement."

"Some of us," said Mr. WATSON, "are very anxious to find a medium of negotiation." He asked whether it was envisaged that the advisory committee would go through the whole of the Health Service from A to Z and make all sorts of recommendations, such as, for instance, on retirement, capitation, a State medical service, "and other reforms." Mr. HOLMES SELLORS said that remuneration was what they had chiefly in mind. The reference to its consideration of "other questions of national importance" involved such matters as inflation. Professor JEWKES: "You are suggesting for the reviewing advisory body one task only—to give advice on the total sums that should be made available for the payment of consultants and general practitioners in the National Health Service?" Mr. HOLMES SELLORS: "Yes." The CHAIRMAN: "The only drastic overhaul of Whitley you are asking is that Whitley should be composed of people who can give an answer?" Mr. HOLMES SELLORS agreed. Mr. GUNLAKE: "You have also said that you would like people to come with open minds." The CHAIRMAN: "Is it possible that your side goes with its mind made up?"

The rest of the evidence of the witnesses from the Joint Consultants Committee was taken in private.

The public hearing by the Royal Commission on Doctors' and Dentists' Remuneration of evidence from the Executive Councils Association (England), which was to have taken place on November 4, was postponed at the association's request.

EXECUTIVE COUNCILS ASSOCIATION (ENGLAND)

LOOKING TO THE FUTURE

The eleventh annual meeting of the Executive Councils Association (England) was held in Torquay on October 23 and 24, with the president, Mr. H. W. TOWNLEY, in the chair. Dr. T. M. MONTFORD, of Castle Donington, near Derby, was installed as president for the year 1958-9. Dr. Montford is chairman of the Leicestershire and Rutland Executive Council.

President's Address

Mr. Townley, in his presidential address, agreed with those who, judging by the health of the nation, regarded the National Health Service as having been an unqualified success. He looked to the future and found no room for complacency. The Service was costing about £2m. a day. As a result of the National Health Service Contribution Act of 1957 about £60m. a year was now compulsorily contributed by the people towards this cost. The possibility of further increases in contributions could not be ignored, and the president suggested that the effects of this "drastic departure" from the original scheme should be carefully scrutinized by all who were interested in the social services. The gross cost of the executive council part of the Service was about £172m. annually, and against this £21m., or 12% of the gross cost, was charged to patients. Dental service charges amounted to £7,828,000; ophthalmic service charges to £5,241,000; and pharmaceutical services charges to £7,869,000. There was a danger, Mr. Townley thought, that the direct costs to individuals might well get out of balance in relation to the costs borne by the general finances of the country through the Exchequer.

The president paid tribute to Mr. J. A. Speed's 45 years' service to insurance committees and executive councils and in other spheres of the Health Service. Mr. Speed has retired from the secretaryship of the Executive Councils Association.

Minister's Address

The MINISTER OF HEALTH, addressing the conference, said that the 10th anniversary of the National Health Service could be celebrated not with extravagant claims but with satisfaction at progress made. It was long enough to have established a sound record of performance but short enough for there to be no doubt that the future was more important than the past. His policy was to pursue the highest common factor of efficiency and economy in the Service.

The gross cost of the Service in 1957 was £740m., which represented about 3½% of the general national product. The cost to the Exchequer was £530m., or 10% of the budget. Lower costs did not necessarily follow improved efficiency and increased productivity in the N.H.S. as they did in most activities. The Health Service was the victim, economically speaking, of its own success. Science and medicine prolonged human life with the result that there was a larger proportion of old people, vulnerable to disease and chronic sickness.

The Minister went on to outline what he thought should be the approach in face of these facts. Without belittling the importance of better treatment and cure, he thought that more emphasis should be given to prevention of illness. He then went on to review the state of the preventive health service, other than environmental services and the part played by sound diet. He referred to the key position of family doctors in furthering preventive measures, and noted that representatives of the profession had agreed that it would be helpful if G.P.s were to receive some of the advice on social and preventive aspects of medicine prepared by standing advisory committees of the Central Health Services Council.

The Minister then reviewed the facilities for home care, especially for the aged and mentally handicapped, as being

another contribution to economy with efficiency. Happily there was no conflict between economic and social desirability in home care. It was economically good because it eased pressure on hospitals and it was socially desirable because most people preferred to stay at home. The successful operation of domiciliary services depended very largely on co-operation between local authorities and general practitioners. The proportion of the population living in under-doctored areas had decreased from about 60% to about 18%. In 1948 there was an average of 2,500 patients per doctor and in 1958 the average was 2,250. The number of G.P.s had increased from 17,500 to over 20,000. Partnerships and group practices had increased significantly, and already £4m. had been allocated in interest-free group practice loans.

Practice Vacancies

On the report of the management committee on last year's resolution urging the Minister to review the arrangements for filling practice vacancies a keen debate ensued. Some speakers urging a compromise arrangement between the Scottish and English methods of appointing candidates. The conference would have none of it, and again overwhelmingly voted in favour of the Scottish principle: that executive councils should be the appointing bodies and the Medical Practices Committee should be the appeal body. The management committee was instructed to urge this on the Minister with all vigour. A proposal to "freeze" a practice list until a successor is installed as a trial scheme for a period of two years was defeated.

The conference overwhelmingly supported a proposal that the numbers of hospital beds available to general practitioners should be increased and that the beds should be available for both medical and dental general practitioners. The proposer made it quite clear that specialist and laboratory cover should be implied in the scheme and that such beds would be acceptable either in "G.P. hospitals" or in "full facility hospitals." The management committee was instructed to investigate the matter and prepare a scheme for implementing the resolution.

On the scope of benefits under the N.H.S., a proposal that comparable facilities should be available to British nationals temporarily abroad met with unanimous support, but the practicability of implementing the actual wording of the motion was doubted by some. In the end it was referred to the management committee to interpret the obvious wishes of the conference and to bring forward a scheme to achieve the object.

The management committee undertook to explore the feasibility of arranging one session at future conferences to be devoted to a lecture-discussion on one or more matters of special importance in the N.H.S.

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Quality in Medicine

SIR,—Quality of medical service must depend on academic training, personal experience, and an ability to apply both in a manner acceptable to the patient. Quality of service in general practice, given average ability, will depend therefore on the standard of academic achievements in hospital medical subjects plus the length of experience in hospital and in general practice. Under the present scheme the greatest financial reward is given to quantity, and the largest income goes to the most efficient sorter. Specialization in hospital is regarded as a bar to appointment to a practice vacancy, and there seems to be very little or no incentive to obtain higher qualifications, or gain extra experience in hospital, or to spend time doing things which a good G.P. could do. Prior to 1948 every incentive was provided to

give this kind of service because "better-class practice" brought higher fees for a smaller number of patients and payment was for work done. G.P. hospital appointments were available, and many specialists supplemented their income by general practice.

In hospital service emphasis nowadays is placed on academic and technical efficiency rather than on the personal quality of the service rendered. Under the voluntary system a satisfied hospital patient meant a satisfied G.P., and therefore more private patients for the consultant concerned. Now the consultant gets his salary independently of the G.P. Prior to 1948 there was greater interdependence of hospital and G.P. services, whereas to-day the gulf between them is very wide and getting wider. Not only was the consultant anxious to please both patient and G.P. but he was also concerned in placing his best students in the best practices from which the private patients came. It was to his financial advantage to consider quality in general practice, added to which these doctors did not waste his unpaid hospital time in unnecessary diagnosis and treatment, which they were able to do for themselves and for which they were paid. The gulf is widened also because, since it is exceptional for a G.P. to hold consultant sessions, the highest-paid hospital appointment open to him—i.e., S.H.M.O.—is remunerated at a lower rate than National Health general practice. A G.P. has now no financial advantage whatsoever from gaining higher academic qualifications or experience.

It is wise to stick to basic principles when suggesting methods for solving these problems. The first would be to provide a satisfactory reward for extra time and effort spent in acquiring greater knowledge and experience by staying on after the pre-registration year in hospital, and to ensure that payment while doing so is at least as good as, if not better than, the income that could be earned by the same doctor if he did not stay on. The second would be to eliminate all dead-end jobs, such as S.H.M.O.s, by absorbing them into the scheme as junior or senior consultants, and in future insisting on senior registrars passing through this grade. A safeguard against over-use of a junior consultant grade would be to arrange reasonable ratios of all grades to ensure adequate opportunity for all to advance to the top. This solution would seem to be far more practical for non-teaching hospitals. The delays or wastage of effort which are the lot of many senior registrars to-day could be overcome by regulating the numbers waiting for promotion in proportion to probable vacancies and by lessening the number of senior registrars by replacing them by junior consultants in non-teaching hospitals, thereby again improving the ratio.

The third would be to integrate G.P. and hospital work more closely by offering inducements in general practice to candidates with higher training and experience and also by making available to G.P.s hospital appointments where such extra qualifications could be suitably rewarded. Consultants with three to six sessions could be allowed to supplement their income with part-time general practice, and this, with its added local interest, would probably be far better than insisting on full part- or whole-time consultants having two or three sessions at widely spread hospitals. Some way should be found of making G.P. remuneration compare favourably with that of the specialist without depending on abnormally high numbers on the State list.

Fourthly, the greatest shortages of staff are being experienced in the non-teaching hospitals whose consultant staff outnumber that of the teaching hospitals by 4 or 5 to 1. Also the personnel suffering the greatest frustrations and injustices of the present system are to be found mainly among S.H.M.O.s, senior registrars, and other junior officers. While the profession welcomes the setting up of a working party on this urgent matter, to arrive at a permanently satisfactory solution it might be wise to give the fullest weight to the first-hand opinions of those who can speak with authority for these groups, who number 9,000 to 10,000. It is possible that the present difficulties are owing in some measure to the inadequate representation of non-teaching hospital consultants and G.P.s on the original planning committees.

Finally, the health centre idea flourished and died because practically all the emphasis was on elaborate and expensive buildings and equipment, rather than on forming the right kinds of teams and then housing them. No authority seems to have conceived the idea of teams of well-qualified medical experts working together in general practice. Such a team, based on a district hospital, could raise the standard of general practice and get the

British Medical Association**ROYAL COMMISSION ON DOCTORS' AND DENTISTS' REMUNERATION****FOURTH SUPPLEMENTARY MEMORANDUM OF EVIDENCE****INTRODUCTION**

1. In its Preliminary Memorandum of Evidence (*Supplement*, November 23, 1957, p. 157) the Council dealt with the general principles involved in its dispute with the Government and with its claim for an overall increase of not less than 29% in the remuneration of both general practitioners and doctors in the hospital service. Subsequently, in its Second and Third Supplementary Memoranda of Evidence (*Supplement*, June 14, pp. 311 and 324), sent to the Commission on June 16, the Council put forward detailed proposals for the remuneration of all grades of hospital medical staffs. In this Fourth Supplementary Memorandum the Council deals with a number of questions on general practice which the Royal Commission itself posed in the course of oral evidence on January 23 and 24 and emphasizes some other aspects of general practice which it considers should be brought to the notice of the Commission.

MATTERS UPON WHICH THE COMMISSION HAS INVITED THE ASSOCIATION TO SUBMIT FURTHER EVIDENCE**(1) The Spens Recommendation for an Augmented Capitation Fee for an Abnormal Number of Aged Patients or Chronic Invalids (Recommendation 6)**

2. This recommendation has been carefully re-examined in the light of present circumstances and having regard to the practical considerations involved if such a scheme is to operate fairly. First, it would be necessary, as far as the aged are concerned, to prescribe an arbitrary age limit. Secondly, it would be necessary to define precisely the term "chronic invalid," and this would necessitate the very difficult task of setting out a list of diseases or infirmities which vary widely in severity and chronicity. Thirdly, some formula would be necessary to determine the basic percentage of those in these categories on each doctor's list above which the augmented capitation fee would apply. The administrative difficulties involved are obvious. The fluctuations in doctors' lists would necessitate a continuous review and recalculation in the case of the vast majority of general practitioners who might qualify under any scheme of this kind.

3. The Council feels that such a scheme would be useful only if it could be shown that in the above categories there is considerable unevenness of distribution as between one practitioner and another.

4. For these reasons, and primarily because of the administrative difficulties, the Council does not feel that it would be possible to achieve a scheme of this nature which would work equitably in practice. Nevertheless, whilst it doubts whether any special action on these lines would be justified, it is always prepared to discuss the matter with the Ministry in the light of any evidence which would appear to justify a modification of the existing distribution scheme.

(2) "Merit Awards" in General Practice

5. During the course of oral evidence the Commission asked the Council's representatives to comment upon the possibility of introducing a scheme of merit awards in general practice. The suggestion is by no means new, but bristles with difficulties. It has been considered by other bodies, including the Cohen Committee on General Practice, which made no recommendations on the subject.

6. It was also debated by the Representative Body of the Association at Birmingham in July of this year, when the following resolution was passed:

That this Meeting can see no objection to a "merit award" scheme for general practitioners, provided a practicable scheme can be devised and subsequently approved by the Representative Body.

7. The following paragraphs embody various criteria to each of which proper weighting should be given in the consideration of any scheme of this kind in general practice. The Council considers that the title of any award based on such criteria is important and it feels that "commendation" or some other term would be a more acceptable title than "merit."

1. To qualify at all a general practitioner would need a minimum period—for example, 10 years—in N.H.S. general practice with a minimum average list (the number varying according to the type and location of practice) over the period

2. Due regard could be paid to post-registration hospital appointments.

3. Postgraduate clinical qualifications or diplomas approved for the purpose could be taken into account.

straightforward jobs of treatment and investigation done near the patient's home. Application of these principles might be not only more acceptable to the public and profession alike but possibly provide a better service at a lower cost.

Thus, improving the quality of the National Health Service depends enormously on a satisfactory solution of the future hospital staffing problem. Such a solution could ensure (1) a continuous flow of candidates for all hospital junior appointments, instead of 770 or more vacancies; (2) a satisfied personnel, sure of reasonable opportunities and rewards, instead of disgruntled and disillusioned highly qualified doctors in dead-end jobs; and (3) it could help to raise the status of general practice—and general practice is still the foundation of medicine. In fact, it could supply just the right incentive needed to make British medicine the finest example of team-work of its kind in the world.—I am, etc.,

Tiverton, Devon.

GEORGE LOWE.

Association Notices**ELECTION OF A MEMBER OF COUNCIL**

The following candidates have been nominated for election to fill the vacancy in the Council announced in the *Supplement* of October 18 (p. 176):

G. F. Burnell, Truro, Cornwall.
O. C. Carter, Bournemouth, Hants.
R. P. Liston, Tunbridge Wells, Kent.
H. B. Muir, Auchtermuchty, Fife.
R. W. L. Pearson, Birkenhead, Cheshire.
W. B. J. Pemberton, London, S.E.1.
J. A. Pridham, Weymouth, Dorset.
C. M. Scott, New Barnet, Herts.

Voting papers will be issued on November 8, 1958, to the representatives of the constituencies and of Public Health Service members and members of Council representing the medical branches of the armed Forces, and must be returned not later than November 22.

A. MACRAE,
Secretary.**Diary of Central Meetings**

Branch and Division Meetings to be Held

ABERYSTWYTH DIVISION.—At Feathers Royal Hotel, Aberystwyth, Saturday November 15, 8 p.m., dinner-meeting. Lecture by Mr. Roderic Bowen, Q.C., M.P.: "The Medical Man as a Witness." Wives of members, and guests, are invited.

ALDERSHOT AND FARNHAM DIVISION.—At Queen's Hotel, Farnborough, Wednesday, November 12, 7.30 for 7.45 p.m., dinner; 8.45 p.m. B.M.A. Lecture by Colonel R. A. Smart: "The Royal Society International Geophysical Year Antarctic Expedition." Guests are invited.

BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, North Shore, Blackpool, Wednesday, November 12, 7.15 p.m., dinner; 8.45 p.m., lecture by Professor J. D. Hay: "Diagnosis and Treatment of Congenital Pulmonary Stenosis." (With film.)

BOURNEMOUTH DIVISION.—At the Prince Charles Suite, Royal Bath Hotel, Bournemouth, Friday, November 14, 7.30 for 8 p.m., annual dinner. Guests, including ladies, are invited.

BRIGHTON AND MID-SUSSEX DIVISION.—At Dudley Hotel, Hove, Thursday, November 13, 8.30 p.m., combined meeting with Brighton and District Section of B.D.A.

BROMLEY DIVISION.—At Nurses' Home, Beckenham Hospital, Wednesday, November 12, 8.15 for 8.30 p.m., clinical meeting. Discussion to be opened by Dr. R. F. L. Logan and Dr. Bruce Cardew: "General Practice—Past, Present, and Future." Guests are invited.

COVENTRY DIVISION.—At the Chace Hotel, Tuesday, November 11, 7.30 for 8 p.m., supper, followed by B.M.A. lecture by Professor Douglas Hubble: "Diagnosis and Treatment of Thyrotoxicosis."

CROYDON DIVISION.—At 45, Wellesley Road, Croydon, Tuesday, November 11, 8.30 p.m., general meeting. Address by Dr. Bruce Cardew: "The Next Ten Years."

DORSET DIVISION.—At King's Arms Hotel, Dorchester, Wednesday, November 12, 8.30 p.m., general meeting. Symposium by Mr. J. M. Jewers, Mr. P. I. Hywel-Davies, and Dr. T. V. Cooper: "Injuries and Infections of the Hand."

DUDLEY DIVISION.—At Guest Hospital, Dudley, Tuesday, November 11, 9 p.m., annual general meeting. Election of officers, etc.

DUMFRIES AND GALLOWAY DIVISION.—At Cresswell Maternity Hospital, Sunday, November 9, (1) 3 p.m., special meeting; (2) 3.5 p.m., address by Mr. W. Gissane: "Lessons in First Aid Based on Experience in an Accident Service."

EAST KENT DIVISION.—At Chez Laurie, Thanet Way, Herne Bay, Thursday, November 13, 7.30 p.m., dinner; 8.45 p.m. B.M.A. Lecture by Dr. G. F. Vaughan: "Child Psychiatry." Ladies are invited.

GLOSSOP DIVISION.—At Station Hotel, Glossop, Monday, November 10, 8.45 p.m., annual general meeting.

GLOUCESTERSHIRE BRANCH.—At Gloucestershire Royal Infirmary, Thursday, November 13, 5.30 p.m., clinical meeting, followed by ordinary meeting and supper at New County Hotel, Gloucester.

GOOLE AND SELBY DIVISION.—At White Elephant, Snaith, Thursday, November 13, 7.30 p.m., films: (a) "Diuretic Therapy with 'Saluric'"; (b) "Gout and Gouty Arthritis."

GUILDFORD DIVISION.—At Board Room, Royal Surrey County Hospital, Thursday, November 13, 8.30 p.m., Dr. E. C. Warner: "Hypertension."

HASTINGS DIVISION.—At Royal East Sussex Hospital, Tuesday, November 11, 8.15 p.m., clinical meeting.

HENDON DIVISION.—At Hendon Hall Hotel, Ashley Lane, N.W., Tuesday, November 11, 8.45 p.m., clinical meeting. Talk by Mr. Patrick Clarkson: "The Burnt Child in London."

KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Tuesday, November 11, 8 for 8.30 p.m., address by Mr. A. Lawrence Abel: "The Acute Abdomen."

LANCASTER DIVISION.—At Grosvenor Hotel, Morecambe, Saturday, November 15, 7.30 p.m., annual dinner. Guest of honour, Dr. John Wilkie, of Lancaster.

LEIGH DIVISION.—At Courts Hotel, Church Street, Leigh, Tuesday, November 11, 8.30 p.m., annual general meeting. Address by Mr. W. S. Johnston: "Some Observations on the Abdomen" (Illustrated by slides.)

MONMOUTHSHIRE DIVISION.—At 1A, Waters Lane, Newport, Thursday, November 13, 8.15 p.m., extraordinary general meeting.

NORTH-EAST ESSEX DIVISION.—At the Albert Hotel, Cowdray Avenue, Colchester, Tuesday, November 11, 8 for 8.30 p.m., film meeting. "The General Practitioner and Rheumatic Disease." A discussion will follow. A special meeting of the Division will follow the film meeting.

PRESTON DIVISION.—At Preston Royal Infirmary, Tuesday, November 11, 8.30 p.m., clinical demonstration.

READING DIVISION.—At Phyllis Court, Henley-on-Thames, Wednesday, November 12, 7.30 for 8 p.m., annual dinner-dance.

ROCHDALE DIVISION.—(1) At Nurses' Lecture Theatre, Birch Hill Hospital, Rochdale, Monday, November 10, 8.30 p.m., clinical meeting. Address by Dr. Samuel Falk: "Psychiatry and General Practice." An extraordinary general meeting will follow.

(2) At Birch Hill Hospital, Rochdale, Sunday, November 16, 11 a.m. to 1 p.m., clinical demonstration and discussion.

SOUTH ESSEX DIVISION.—Sunday, November 9, 11 a.m., visit to Severalls Hospital, Colchester. Meet at hospital, 10.30 a.m.

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Wednesday, November 12, 8.30 p.m., proposals for adoption of new rules of organization, followed by a lecture by Dr. Raymond Daley: "Angina Pectoris."

SOUTH-WEST ESSEX DIVISION.—At Wanstead Hospital, Tuesday, November 11, 8.45 p.m., Dr. E. Frankel: clinical demonstration on medical cases, with special reference to recent advances.

SWANSEA DIVISION.—At Langland Bay Hotel, Thursday, November 13, 7.15 for 8 p.m., annual dinner.

WANDSWORTH DIVISION.—At South London Hospital for Women and Children, Friday, November 14, 8.15 for 8.30 p.m., Mr. R. W. Raven: "Advances in the Diagnosis and Treatment of Cancer."

WEST BROMWICH AND SMETHWICK DIVISION.—At Sandwell Hotel, West Bromwich, Thursday, November 13, 8 for 8.30 p.m., annual general meeting. Informal supper meeting, followed by a discussion and an address by Dr. H. Tabbush: "The Duties of an M.O.H."

WEST DERBYSHIRE DIVISION.—At Physiotherapy Department, Whitworth Hospital, Darley Dale, Wednesday, November 12, 8.30 p.m., meeting. Professor G. M. Wilson: "Antibiotics."

The annual general meeting of the Liverpool Region Hospital Junior Staffs Group will be held at the Liverpool Medical Institution on Monday, November 10, at 8.30 p.m. The meeting is open to all hospital junior staff in the Liverpool Region.

4. A further criterion could be evidence of "approved" post-graduate study.

5. Due weight could be given for special services and abilities not already taken into account under the previous headings.

8. The Council wishes to emphasize that these criteria are extremely tentative and there are many practical difficulties involved. Partnership agreements, for instance, frequently require earnings from all sources to be paid into the partnership's accounts and distributed in accordance with the partnership's shares. Again, general practitioners work under very different conditions from consultants and specialists, and, although the criteria set out above are important, the attachment of special weight to them will not necessarily identify the doctor who is worthy of special recognition.

9. The fundamental difficulty is to distinguish the doctor who is outstanding, and the nature of general practice is such that it is doubtful if any one person or body of persons can accurately assess the value of the services of the individual practitioner to the community. The Council is, in fact, in some doubt whether it is possible to devise any scheme of merit awards in general practice which the profession would accept as affording proper recognition, and it must emphasize that the profession's reaction cannot be anticipated until a detailed scheme is available for consideration.

(3) Assistants in General Practice

10. During the course of oral evidence the Council's representatives were invited to comment upon a number of points in connexion with the remuneration and terms of service of assistants in general practice.

11. First, the Council would like to place on record its view that an assistantship provides the best possible introduction to general practice. It enables the young practitioner whose experience of medical practice is confined to a hospital environment to gain an insight into the problems that arise in general practice and to acquire experience in the care of patients and the general administration of a form of practice which is quite different from his previous experience. The young doctor fresh from hospital has little knowledge of the sociological and legal aspects of general practice and may need to reorientate his views on prescribing for his patients. A period of assistantship provides such an essential training and also affords both principal and assistant the opportunity of working together and deciding whether from all points of view both are desirous of making the introduction permanent by way of a partnership.

12. It has frequently been said that the advantages of an assistantship lie wholly with the principal. This is not so, for the assistant is gaining his experience in the practice of the principal, who has the full responsibility for the practice. Whilst such a position is not peculiar to medicine, in general practice the principal's responsibility is specific, for under para. 8(8) of his Terms of Service he is responsible for the acts and omissions of the assistant.

13. Again the principal must accept a reduction in net income until such time as the size of his list approaches the maximum allowed by virtue of the employment of an assistant.

14. Some assistants wish merely to have a trial period in general practice to see if they like it. Others want an opportunity to look around so that they can determine the type of practice they desire, and where they want to settle down.

15. A good deal of criticism has been directed against the employment of assistants without a view to partnership. There are circumstances in which the help of an assistant in a practice is necessary. Yet to take the assistant into the practice as a principal would not be in the best interests of the assistant. Indeed, the offer to do so would be misleading and lead to frustration in the future. For example, the principal may have a prolonged illness (such as tuberculosis), or he may be engaged in a long period of post-graduate study. There is also the situation in which the list of the principal just exceeds the permitted maximum. It cannot be known at this stage if the practice will continue to

grow and support two principals. Again, a practice may have more than the permitted maximum number of patients, but the future is uncertain because of anticipated re-development in the area with a considerable reduction in population.

16. In all these examples some help is necessary to enable practice obligations to be carried out, and the Council believes that, provided the circumstances are made known in advance to the assistant and subject to the safeguards now in the hands of Executive Councils, such free association between principal and assistant is unobjectionable.

(4) Remuneration of Assistants

17. The Council has undertaken further inquiries into existing salary levels in this field and has endeavoured to ascertain the extent to which the salary of £500, recommended by the Spens Committee as being appropriate to the assistant's initial appointment, is being implemented.

18. After taking into account the Danckwerts betterment factor the figure would be £1,000, and allowing for a further 5% increase in respect of the interim adjustment made in net remuneration on May 1, 1957, the present-day figure would be approximately £1,050.

19. From the inquiries which it has made, the Council believes that present-day salaries, when combined with the emoluments which are attached to many posts, reach at least this figure and, in many cases, exceed it. In London, for instance, where a review of all assistants is taking place, of the first 51 whole-time assistants of principals interviewed during the period January 1, 1957, to April 1, 1958, the average gross remuneration at that time, including emoluments, was £1,245.

20. The car allowance in these cases averaged only £150, for in a number of instances no car was necessary. Thus the assistants concerned were on average receiving salaries well in excess of £1,050 even before May 1, 1957.

21. The Council would at this stage like to acknowledge the help of the London Executive Council in making this information available.

22. These facts are in line with the experience of the Association's Medical Practices Advisory Bureau, where, since April, 1958, doctors requiring assistants have offered salaries and emoluments ranging from £1,100 to £1,400 per annum—the average being £1,260 per annum.*

23. On a number of occasions in the past the Council has considered the possibility of laying down a standard minimum salary for assistants and enforcing such a policy by restricting advertisements for assistants in the *British Medical Journal* to those which conform to that minimum.

24. There are, however, considerable difficulties. In the first place the *British Medical Journal* has no monopoly, and the rejection of an advertisement by the *Journal* does not exclude its publication elsewhere. Secondly, many assistantship agreements are concluded privately and without advertisement of any kind. These factors undoubtedly reduce the effectiveness of action on these lines.

25. In addition there are practical considerations. Not infrequently the cash salary which is advertised for a particular post carries additional emoluments such as a rent-free flat or house, or free board and lodging. The difficulties of assessing the value of emoluments in different circumstances will be obvious. Then again the assistantship may not be full-time (the London inquiry, for example, showed that nearly 50% were engaged for less than full-time) or may carry other advantages to the assistant which may not be disclosed in the advertisement. Indeed, even full-time posts can give rise to anomalies, for the term covers a widely differing range of duties and responsibilities. It is such questions as these which have led the Council to refrain from attempting to impose a minimum salary by such means in the past.

*A memorandum on Entry Into General Practice, by Dr. L. S. Potter, medical director of the B.M.A.'s Medical Practices Advisory Bureau, and published in the *Supplement* of October 4 (p. 153) was attached as an appendix to the evidence.

26. Such evidence as is available, however, indicates that, in general, the salaries now paid to assistants exceed the Spens figure revised in the light of increases in the remuneration of established general practitioners.

27. Remuneration apart, the Council takes the view that the regular review of assistantship arrangements now being undertaken locally by Executive Councils in consultation with local medical committees as a result of suggestions already made by the Association in this field should prove the most effective check to such abuse of the assistant system as may exist. A full knowledge of all the circumstances of both principal and assistant is essential, and it is only at local level that the full facts of a particular case can be established.

28. The penalty of withdrawal of the right to employ an assistant or a reduction in the size of the additional list of patients allowed is likely to prove an effective deterrent to abuse.

(5) Practice Expenses

29. Several other bodies, in particular the Medical Practitioners' Union, in giving evidence to the Commission have criticized the present method of distributing practice expenses, and the suggestion has been made that these moneys should be separated from the Central Pool and paid out independently by a method which, it is contended, would result in a more equitable reimbursement of the individual doctor.

30. In the Council's view, the present system, in spite of its defects, affords at least rough justice and protects both the profession and the Treasury. By viewing the varying expense ratios of different sizes and types of practice at one particular moment in time, which is the effect of the Inland Revenue inquiries, the picture is distorted, for no practice remains static during its lifetime. As in other professions, the newcomer building up a practice will expect to face relatively heavy expenses during his initial years; the ratio will gradually diminish as he becomes established and then rise again in later years as his list and the volume of work which he can undertake falls. The pattern of expenses, viewed over the lifetime of most general practitioners, is not dissimilar, and in the long run some approach to equality is achieved.

31. Special provision is already made for the new entrant who commences practice in an area where more doctors are needed—i.e., areas designated by the Medical Practices Committee, whilst at a later stage in the doctor's life when his list is below certain levels he may be eligible for other payments from the Pool such as a Supplementary Annual Payment or a Hardship Payment.

32. These and similar arrangements make a valuable contribution towards the expenses of a small-list doctor who is practising in an area where his services are needed by the community.

33. Whilst the actual amounts of these allowances may require review from time to time, the Council is convinced that this is the best method of meeting a difficult problem. The division of practice expenses into groups as is done in the Inland Revenue inquiries does not of itself provide an accurate picture, for even in these groups there will be considerable variation. From the Government's point of view, the present system provides an incentive for the individual doctor to exercise reasonable economy. First, all expenses are subject to scrutiny by the Inland Revenue, and, although there is an element of choice, this fact in itself ensures that only such expenses are incurred as are likely to be accepted as valid. Secondly, whilst the profession as a whole is reimbursed its total expenses (although in part not until some 18 months later), the individual doctor's share is not directly related to his own personal expenditure. Any scheme involving the reimbursement of actual personal expenditure would not carry this incentive to economy. It is not conceivable that the Government would accept the principle of paying actual expenses unless it imposed at the same time a control of standards and direction over the expenses of such rigidity

as to be highly undesirable in a profession where a high degree of individuality is essential, and, from the Ministry's point of view, costly administrative procedures would be involved.

34. There are defects in the present system, if it is regarded as having as its object the repayment to the individual doctor of each item of expense which he incurs. Short of requiring each doctor to submit detailed and individual claims for practice expenses to the Ministry, for which it is presumed he would be reimbursed, no scheme of distribution could achieve this result. The Council regards this as impracticable.

OTHER MATTERS AFFECTING GENERAL PRACTICE IN THE NATIONAL HEALTH SERVICE

35. The Council would now like to refer to a number of other questions in the field of general practice which, in its view, have a direct bearing on the issues now before the Royal Commission.

(1) The Relationship Between General Practice and the Hospital Service

36. There is a clear distinction between the position of general practitioners and hospital medical staffs which is reflected in methods, as distinct from levels, of remuneration in the two fields. General practitioners are independent contractors, whilst hospital medical staffs, whether serving on a whole- or part-time basis, are salaried officers employed under contracts of service with the hospital authorities.

37. It is a comparatively simple matter to recommend detailed salary scales in the hospital service which will give effect to the Spens recommendations in present-day money values and restore proper differentials between consultants and other hospital medical staff. Very different considerations apply in the field of general practice, and the Council, in its Preliminary Memorandum of Evidence, has made it clear that it regards the Pool method of payment as the appropriate means of remunerating general practitioners, who, as a group, have undertaken collective responsibility for the population as a whole. The situation in this field is entirely different from the hospital service, where it is possible to devise a salary structure which reflects the varying degrees of responsibility involved in the different grades.

38. The Council would like to take this opportunity of emphasizing that general practitioners are opposed to a salaried service in N.H.S. general practice. Indeed, so strongly did the Association feel on this issue that at its instigation the Minister of Health embodied a proviso in the Amending Act of 1949 which states:

"Provided that the remuneration to be paid under such arrangements to a practitioner who provides general medical services shall not, except in special circumstance, consist wholly or mainly of a fixed salary which has no reference to the number of patients for whom he has undertaken to provide such services."

Now, as then, the Association holds firmly to the view that a salaried service in general practice would be detrimental to the interests of public and doctors alike.

39. The Council does not propose to submit detailed recommendations involving the distribution of the total sum made available for general medical services. Indeed, the Commission itself in its published statement of April 12, 1957, made it clear that its duty to recommend current levels of remuneration "calls for recommendations covering, for example, average incomes and the desirable spread between extremes, but it does not call for the construction of detailed schemes of distribution," and the Council assumes that the Commission intends to leave it to the profession and the Ministry of Health to discuss and agree upon a detailed scheme of distribution.

40. Apart from the difficulties of legislating in detail for remuneration in general practice, there are advantages to both the Government and the profession in maintaining

some degree of flexibility. It has, for instance, been found necessary in the past to facilitate the entry of newcomers to general practice, and to provide interest-free loans to encourage group practice. The Council submits that these and similar arrangements are best left flexible and determined from time to time by those concerned with the day-to-day running of the Service in the light of the circumstances obtaining and with the detailed knowledge of both the medical needs of the community and requirements in general practice.

41. Whilst, for the reasons given above, the Council is making no detailed proposals on distribution in the general-practitioner field, it nevertheless wishes to draw attention to the need for a proper relationship between the remuneration of general practitioners and that of hospital medical staffs. That relationship was in fact determined by the Reports of the two Spens Committees which sought to ensure that these two important branches of the profession would secure their appropriate share of recruits of the right calibre.

42. The Council hopes that the Royal Commission will see fit to recommend steps which will result in the establishment of the differentials which the Spens Committee envisaged. In the proposals made for the remuneration of hospital staffs in the Council's Second Supplementary Memorandum of Evidence, it suggested measures which, apart from restoring proper differentials within the hospital service itself, give effect to the profession's claim for an adjustment to take account of changes since 1951, and, at the same time, seek some measure of redress for consultants holding merit awards. The Council believes that the implementation of its general claim would, to a large extent, meet the need for proper relationships between the hospital service and general practice in terms of global sums of money. Whilst at the individual level no direct comparison is possible, the Council is nevertheless anxious that the financial expectations of at least a proportion of general practitioners should compare favourably with those of practitioners holding the more senior posts in the hospital service. It is also anxious that the gap in total life earnings of the average doctor in the two fields should be properly related, for this is a vital factor in determining the choice of a career.

43. The Council believes that in general practice, no less than in other spheres, there is a real need for proper incentives if the best doctors are to be attracted to this important section of the National Health Service. It has been said that it is a serious disadvantage of the Pool method of payment that it does not provide sufficient incentives to the more able general practitioners, and that the knowledge that additional earnings from outside sources and hospital appointments make no difference to their total earnings is not conducive to the additional efforts which the extra work entails. The Council feels that this situation can, nevertheless, be met by equitable distribution and without any radical departure from the general concept of the Pool method of payment. As in other walks of life and other sections of the profession, incentives are necessary. The Spens Committee in Paragraph 13 emphasized this, and it is essential that sufficient additional money should be made available to ensure a proper relationship between general practitioners and consultants to be effected.

(2) Recruitment

44. One of the major objectives of establishing a proper range of remuneration in general practice is the maintenance of an adequate level of recruitment. As the Commission is aware, this question has recently been reviewed by the Willink Committee, who have recommended that the scale of admissions to medical schools should be curtailed for a period in the near future. As yet, the Association has not discussed the Willink Report with the Ministry, but it would like to emphasize that the steps suggested by the Willink Committee cannot in its view be taken to imply either that there are too many doctors or that the level of recruitment to the N.H.S. in the future is properly safeguarded. The recommendations of the Willink Committee were necessarily

based on the situation as it was at the time of its investigation and on official estimates of the needs of the National Health Service in the future. In the hospital service, for instance, the Council has already shown, in its Second Supplementary Memorandum, that the position in the registrar and senior registrar grades has been brought about by an insufficient expansion of the consultant establishment in hospitals throughout the country where a comprehensive consultant service was promised before the Appointed Day.

45. The continuing acute shortage of junior hospital staff, another factor which is causing considerable anxiety at the present time, indicates clearly that the problem is by no means solved. Furthermore, there must always be some "reserve" of doctors to meet the expanding needs of the community and who are available to augment the medical services when extra help is necessary.

46. As far as the quality of present-day recruits is concerned, the Council has noted the views given to the Commission by such authoritative bodies as the Royal College of Physicians and the Royal College of Surgeons of Edinburgh. It feels that they are more competent to comment on this particular question.

47. The fact that the medical schools have expanded in recent years is of itself no real indication that the financial rewards of general practice are sufficiently attractive to achieve the Spens Committee's objective of maintaining recruitment to the profession. At the time that the Spens Committee investigated the financial incentives of medical practice, new entrants to medical schools, and particularly their parents, were prepared to undertake the expense of medical training and the long deferment of earning power which is entailed not merely because of its vocational aspect but also because of the prospects which a career in medicine offered. To-day, the majority of medical students receive substantial grants towards university fees and subsistence, and in this way the Government has been able to ensure the maintenance of an adequate supply of new entrants to the profession. The Council, therefore, wishes to emphasize that the present level of recruitment to the medical schools does not provide a true basis upon which to examine the adequacy of present levels of remuneration.

48. The Council would like to refer to the question of emigration amongst doctors in general practice. Clearly, there has always been a certain amount of emigration, and, provided that it is kept within reasonable limits, it is to the advantage of all concerned and of particular value to the Commonwealth. The Council is, however, anxious that the trend should not grow to the point where an undue proportion of the more able doctors are attracted by better prospects outside this country. It is difficult to obtain detailed information on the subject, for there are no official figures available, but evidence already submitted to the Commission from other organizations suggests that there is an increasing tendency among students to look overseas for a career in the future. In addition, the Council has been provided with a factual memorandum by the Medical Practices Committee on the subject as it affects general practice, which suggests that even among established doctors there has been a significant rise in the numbers going abroad. This memorandum appears in an Appendix.

(3) Comparison with Other Professions and Occupations

49. In the preliminary Memorandum of Evidence the Council referred in general terms to the scope, responsibility, and rigours of the life of a general practitioner.

50. The Council believes that the difficulties and responsibilities, the hours of duty, and the other factors in the general practitioner's life are so well known to all members of the community that it is unnecessary to go into detail. Nevertheless, comparisons have been drawn between the life of the doctor, notably the general practitioner, and that of others whose work entails long training and great responsibility. The Council does not dispute that there are other men and women who have long and difficult courses of preparation, long hours of continuous duty, and heavy responsi-

bility. It firmly believes, however, that no other group shares with the doctor, particularly the general practitioner, all the burdens which the practice of medicine entails continuously throughout the doctor's working life and in which his family is usually involved.

51. Throughout his life as an established practitioner, the doctor has to make vital decisions affecting his patients. Although the number of patients allowed to each general practitioner is limited, the demands that can be made are unlimited as to time and number. These demands, sometimes irresponsible and unreasonable, are subject only to the whim of the patient, who, in making them, is under legal protection. This does not apply in any other comparable profession. Considerations of this nature must be borne in the mind in any attempt to compare the remuneration of the general practitioner with that enjoyed by other professions and occupations.

(4) The Government's Memorandum

52. Finally, there are certain statements in the joint memorandum submitted by the Treasury and the Health Departments to the Commission which cannot be allowed to pass without comment.

53. In paragraph 29 of that Memorandum it is suggested that between 1948 and 1951 the number of "consultations" per patient increased from 5 to 5.5. The Council believes, although it cannot adduce statistical evidence, that with the increasing use of the National Health Service by the public the figure has further increased since that time.

54. In the same paragraph the average time per "consultation" is assessed at 10 minutes.

55. The Memorandum does not define the "ten minute average consultation." It is difficult to believe that it gives full weight to a night call, a call asked for late in the day (and these calls have increased), a maternity case (and midwifery forms only a small proportion of the late and night calls), a specialist consultation, or the considerable (and increasing) time spent in making telephone calls to hospitals and in writing reports.

56. *Pari passu* with the increased work in the hospitals, as described in paragraph 35 of the Memorandum (and in particular the last part of the paragraph), the time taken for each consultation has increased. It would appear, therefore, that the figures relating to 1951, if accurate for that time, are likely to be an underestimate in 1958.

57. The Council regards the dogmatic statement that the "more dangerously ill patients are admitted to hospital" (paragraph 89) as a misrepresentation of the work of the general practitioner, who, with the modern therapeutic measures at his disposal, is able to (and does) keep more of his "more dangerously ill patients" at home than hitherto.

58. In paragraph 76 the Memorandum refers to the comparable burden of work in summer and winter. The experience of general practitioners is that the difference between the amount of summer and winter work has diminished since the inception of the Health Service. The work is usually somewhat lighter in the summer months, but the influenza epidemic of 1957 readily comes to mind as an example that this is by no means always the case.

59. A simple arithmetical calculation will indicate, even if the Departments' figures are used as the basis, the long intensive hours of work of the general practitioner, including, for example, an evening surgery (for the benefit of the worker) often lasting to a late hour; hours of work that are not consecutive but spread through the whole of the 24 hours of the day.

60. The Council also wishes to emphasize that the figures given in the Memorandum exclude work done for other forms of practice which are remunerated outside the central pool, but which form part of the calculation of a general practitioner's income, as well as the time spent necessarily on the business and administrative sides of the practice and on keeping abreast of current advances in medicine.

61. In paragraphs 177-194 the Memorandum refers to the repercussions on the earnings of other groups which it is

claimed would follow any increase in medical remuneration. The Council believes that this argument has been greatly overstressed. The repercussions of the Danckwerts Award in 1952 were not widespread, and, although the consultants' award in 1954 may have had some influence on university salaries, its effect can be overstated. Indeed, the later increase in university salaries in 1957 was quite unrelated to medical remuneration.

62. At times when incomes are rising generally, as during recent years, the rise is effected simply by repercussions of increases awarded to one group on the incomes of other groups. The Council cannot accept the argument that medical remuneration—or, indeed, increases in any part of the "public service"—should be exempt from this natural (and economically necessary) process. The main professional groups (civil service, doctors, teachers) have a monopoly employer, and the argument that the Government expects those in the "public service" to accept income limitation even when it is obvious that wage-earners and salaried and self-employed persons in business and industry are not accepting it implies that all professional incomes are to be depressed by the exercise of the Government's monopoly powers.

63. The arguments adduced in the Government's Memorandum are, in the Council's view, quite indefensible, and this policy has already failed in the nationalized industries, where the higher management are no longer compared with civil servants but receive instead something approaching the proper market rate of remuneration.

64. The argument is equally indefensible in the case of the medical profession, which has a right to expect that the remuneration it receives in the public service in this country shall be on a par with what it receives under the freer conditions of other countries such as the Dominions or the United States.

65. The Council is certain that the Commission will wish to take all these factors into account when determining levels of remuneration for general practitioners in the future.

APPENDIX

MEMORANDUM BY THE MEDICAL PRACTICES COMMITTEE ON EMIGRATION OF ESTABLISHED GENERAL PRACTITIONERS

This memorandum deals with the emigration of doctors who, up to the time of emigration, were principals in established general practice within the National Health Service in England and Wales since July 5, 1948.

These doctors were, it is emphasized, men of middle age, with a substantial stake in the country, working in comparatively remunerative general practices, who for some reason preferred to abandon this and their homes in order to practise abroad, mostly in other parts of the Commonwealth.

The figures we believe are reasonably accurate. They are derived from the returns of 124 of the 139 Executive Councils in England and Wales.

In the areas from which returns have been made just over 15,000 doctors practise. In those from which no return was obtainable just over 4,000 doctors practise.

The figures in the following Table reasonably represent the fluctuating rate of this emigration.

Year	1948	1949	1950	1951	1952	1953	1954	1955	1956	1957	Total
England	14	31	41	69	50	26	27	40	53	72	423
Wales	2	1	4	6	6	3	—	1	2	4	29
Total (for six months)	16	32	45	75	56	29	27	41	55	76	452
Rate per thousand doctors per year	2.13	2.13	3.00	5.00	3.73	1.93	1.87	2.73	3.67	5.07	3.13 Average

For those who prefer a graphic presentation of statistics the one below may be of assistance.

Members of the Royal Commission will be aware that the Danckwerts arbitration was in 1951 and the working party's report deciding the agreed new distribution of the moneys which came to the profession following the arbitration award was published in the summer of 1952.

It is submitted that the rise in the rate of emigration in the "pre-Danckwerts" period was significant of great unrest among established doctors. The subsequent fall to an average which we would submit can be regarded as a normal figure is equally significant, as again is the fact that mounting unrest has caused the figure to rise once more to a new high level in 1957.

When it is realized that many of those concerned in the 1957 exodus were within one year of their minimum pensionable period of 10 years in the Service, the figure becomes even more impressive. A rise to a figure of more than 2½ times greater than that of the immediate two "post-Danckwerts" years (1953-4) in these circumstances, must not be disregarded. It is true also that this occurred despite the fact that the opportunities for a man to establish himself abroad have become progressively less in number during the past decade.

In addition a far greater number of unestablished doctors engaged in hospital practice up to the range of senior registrar and also some of higher status and even of consultant rank have emigrated. The number of unestablished general practitioners who have also left this country is far greater, both relatively and absolutely, than their more fortunate established colleagues. There are, however, no reliable figures by which these can be classified.

PUBLIC HEALTH COMMITTEE

At its meeting on October 31 the Public Health Committee found it necessary, owing to insufficient time, to defer some important items in a very full agenda until the next meeting of the Committee to be held on December 12.

Constitution of Committee

One important matter which was not reached until late in the day was the constitution of the Public Health Committee, about which Dr. W. G. HARDING had said he wanted to speak. In view of the hour, Dr. Harding said he was prepared not to proceed to discuss the question. "At the same time," he added, "I am unhappy about a situation in which more and more business is being transacted in less and less time."

Dr. H. D. CHALKE suggested that the question could be solved quite simply by asking the Council to agree to the Public Health Committee doubling its membership in order that there could be representation of more types of public health work.

The CHAIRMAN (Dr. J. B. TILLEY) said that one of the criticisms made about the Committee was that as at present constituted it was not democratically composed. In his view there was some substance in that criticism. Another criticism was that there was not a sufficient preponderance of those engaged purely in public health work.

Dr. HARDING pressed for a much larger representation on the Committee of members of the Society of Medical Officers of Health nominated by the Society. He had hoped that the Council representation would act as a balancing factor, but it did not. "I think that as an Association we should be deeply ashamed that for two years the representative of the largest fraction of public health members has stood for election, both through the Representative Body and through the Council, and has not been elected," he concluded. That was not democracy.

The CHAIRMAN said that in his opinion the method of election by Council was outdated, and that some other method should be adopted. At the same time, he agreed that the number of representatives from the Society should be increased. It was only fair to remind the Committee, he added, that when the Public Health Committee was asked by Council some little time ago whether it was satisfied with its constitution the Committee said that it was.

The Committee finally agreed that Dr. Chalke should inform the Committee on Professional Co-ordination, which was meeting shortly, that the Public Health Committee felt that it should be enlarged, and should have larger representation from the Society of Medical Officers of Health, and that it was considering proposals on these lines.

It was reported that Dr. A. Barker and Dr. M. E. M. Herford had been reappointed as the representatives on the Committee of the Private Practice Committee and the Occupational Health Committee respectively. It was also reported that Dr. J. Alun Evans, Dr. Gladys Stableforth, and Dr. Nora Wattie had agreed to serve as co-opted members.

A.R.M. Resolutions

The Committee then proceeded to consider various Resolutions of the A.R.M., 1958.

One Resolution, which gave rise to some comment, requested the Government (1) to ban the import of infected egg products; (2) to control the production of home dried and frozen eggs to prevent infection. Dr. HARDING thought that (1) was an unrealistic suggestion and he did not agree with it. If pasteurization in this country was effective it could be applied just as well to foreign as to home-produced egg products.

"Why should not the pasteurization be done before the products come into this country?" asked Dr. J. W. PICKUP. Dr. HARDING pointed out that infection could develop to a recognizable level in transit. In his view the distribution of safe eggs from whatever source should be urged, but no policy should be favoured which might be unrealistic, without more investigation into the problem.

A suggestion by Dr. J. STEVENSON LOGAN that the Ministry should be asked what the present position was was agreed.

Smallpox Immunization

It was agreed to report to the Council that in the Committee's view the time was not opportune for a national campaign for smallpox immunization. All energies for the present should be given to encouraging poliomyelitis immunization. The Committee arrived at that decision after considering an A.R.M. Resolution calling the Minister's attention to the low level of smallpox immunization throughout the country, and urging that a campaign to rectify it should be renewed at once.

Amalgamation of Health and Welfare Services

The Committee considered whether it should recommend to the Council that it should be the Association's policy to seek the amalgamation of the health and welfare services. Members of the Committee had before them copies of a report on the subject which had been prepared by the Society of Medical Officers of Health, and a letter from the Medical Officer of Health for Eastbourne pointing out the advantages of a combined service.

Dr. STEVENSON LOGAN said that, while public health was good for welfare, it did not follow that welfare was good for public health, and, unless care was exercised, welfare

would swallow up public health and medical officers of health would see themselves as "glorified and more effective descendants of the old Poor Law administrators." He advocated caution.

The Committee finally resolved to advise Council that, while it felt that complete co-ordination of the health and welfare departments was desirable, and that the medical officer of health was in a key position for achieving this, it was not thought that the Association should undertake the authority which particular committee should undertake the responsibility. At the suggestion of Dr. Chalke it was further agreed that there should be added, by way of a rider, that there were certain specific matters in the welfare field which were the direct responsibility of the medical officer of health.

"Combined" and "Mixed" Appointments

Dr. F. J. G. LISHMAN, the author of a memorandum on "combined" and "mixed" appointments in the public health service, attended in person before the Committee. Dr. Lishman informed the Committee that there were two serious anomalies under the present salary agreements, one of which was due to defects in the Industrial Court awards, and the other to an informal arrangement, which had since been formalized but not published, made within Whitley Committee C. The first anomaly resulted in instances when a medical officer of health, if he were a medical officer of health without being an assistant county medical officer and health was later asked to take on additional work for the county council, must lose some salary in the process. The second anomaly arose from an arrangement which had not been published. When a medical officer of health for multiple authorities—who was also an assistant county medical officer—had a formal contract, and there was a joint sanitary committee for a combination of multiple districts, he received a salary supplement for the combined appointment. He did not receive it if he had not the advantages of a single contract and there was not a joint sanitary committee. The Committee agreed to send the matter to the Staff Side of Committee C, Medical Whitley Council, for consideration.

Presentation to Dr. Agnes V. Kelynack

Before the meeting of the Public Health Committee began the CHAIRMAN, on behalf of present and former members of the Committee and members of the Council of the Society of Medical Officers of Health, presented a cheque to Dr. Kelynack, who was secretary to the Committee until her recent retirement on the grounds of ill-health. It was said Dr. Tilley, a tangible witness of the Committee's regard for Dr. Kelynack, to whom a great debt of gratitude was owed for her help and advice through many years. Speaking as President of the Society of Medical Officers of Health, Dr. J. A. STIRLING supported what the Chairman had said. The Society very much appreciated the work which Dr. Kelynack had done in cementing the good relations between the Association and the Society.

Dr. KELYNACK thanked the Committee for their very generous gift. She had, she said, spent 14 very happy years serving the Committee.

Deferred Business

Among the matters deferred until the next meeting were items on the duties and position of the nurse, specialist services, and public health clinics under the Middlesex County Council, psychiatrists employed by local health authorities, bacterial rodenticides, delegation of health services to non-county boroughs, A.T.S. injections, and inspection of meat at slaughterhouses.

PUBLIC HEALTH SERVICES DEFENCE TRUST

The trustees of the Public Health Services Defence Trust met at B.M.A. House on October 31. The present officers were reappointed for the Session 1958-9.

Financial Statement

In presenting the financial statement, the Treasurer, Mr. L. DOUGAL CALLANDER, thanked the medical officers of health for their response to the appeal for funds made in February last.

The Trustees agreed that a new appeal for funds should be issued in 1959.

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

SIZE OF LISTS

The debate on a proposal that the maximum permitted size of N.H.S. lists be reduced (*Supplement*, October 18, p. 172) was continued by the Assistants and Young Practitioners Subcommittee of the General Medical Services Committee at its meeting on October 30. Dr. F. G. TOMLINS was in the chair.

In addition to a document prepared by the office, setting out certain statistics sought by the Subcommittee at the previous meeting, letters from Dr. R. T. Jones and Dr. J. L. Williams, supplementing their earlier arguments, were placed before the Subcommittee. Dr. Jones suggested that his proposal to reduce the maximum permitted size of N.H.S. lists would result in great benefit to the community as patients, and perhaps as taxpayers, and would help most members of the profession collectively and individually. It would reduce the overwork of the large-list practitioner and save him from having to subcontract out his highly personal work to a permanent assistant, and it would help the small-list practitioners and permanent assistants to become established.

In his letter Dr. Williams reiterated some of the points which he had made at the previous meeting. It seemed reasonable to infer, he pointed out, that a reduction of the maximum list was necessary to make room in a relatively static population for the increase in the number of general practitioners. A reduced maximum list would also offset the method of accountancy which, in his opinion, protected the established practitioner (especially the large-list practitioner) against a falling value of money to a greater extent than the unestablished practitioner.

While agreeing that the lists should be reduced to 3,000, Dr. T. H. ENGLISH said it was largely a question of remuneration. Dr. W. HUGHES said he sympathized with the end which Dr. Jones was seeking, but he wondered whether a flat reduction in the size of the permitted list was a sufficiently flexible method of reorganizing the state of practice.

Create Division

Dr. Williams wrote that fears had been expressed that the proposal, if adopted, might restrict those who wished to have lists above 3,000; but the maximum had already been brought down to 3,500 and there was not a greater loss of freedom in bringing it down to 3,000 if there were good reason for so doing.

Dr. H. N. ROSE suggested that nothing could do more harm and create more division among general practitioners than the proposal before the Subcommittee. Large-list practitioners who had already suffered a reduction of 500 were being asked to suffer another reduction of 500 with a loss of income and no compensation. The proposition was put forward ostensibly in the interests of the patient, whereas, to be quite honest, it was an effort to try to improve the position of assistants and unestablished practitioners and to facilitate their entry into practice. Robbing Peter to pay Paul was not the right way to do that, and what was required was an increase in the level of remuneration of the whole profession.

Dr. G. D. W. ADAMSON said he wondered whether it was true to say that a practitioner with 3,500 patients was overworked. It had been said that the Service instilled in the

general practitioner the attitude of doing as little as possible for as much as possible. It would be interesting to know how many practitioners with 3,500 patients on their lists were carrying on outside appointments, added Dr. Adamson. "You cannot measure the capacities of doctors by regulations," observed Dr. F. GRAY. Doubtless there were many doctors who looked after 3,500 patients better than many of their colleagues looked after 2,000 of the same type of patients. A danger to be avoided was that of throwing off the extra from the efficient man who could deal with a large list to an inefficient man who could not deal adequately with a medium-size list.

At the suggestion of Dr. D. R. SIM, the Subcommittee agreed again to defer the matter for further discussion.

Filling of Vacancies

The CHAIRMAN reported that Dr. T. H. English (Bartley, Southampton) had been elected to represent assistants in Region 1; Dr. E. F. D. Gawne (Cambridge) in Region 2; Dr. C. A. Rushton (Stockport) in Region 3; and Dr. W. Hughes (Sheffield) in Region 4.

The CHAIRMAN (deputy Dr. R. T. Jones) was nominated for co-option to the General Medical Services Committee to represent unestablished principals, and Dr. R. E. Hancock was nominated to represent assistants.

The remaining items on the agenda, including those on entry into practice, remuneration of assistants, trainee general-practitioner scheme, and the integration of hospital and general practice, were deferred until the next meeting.

S.H.M.O.s GROUP COUNCIL

Mr. G. WARING ROBINSON was appointed Chairman of the S.H.M.O.s Group Council at its meeting held in B.M.A. House on November 3. He cordially welcomed the appointment of Mr. J. M. Milloy and Mr. J. R. Nicholson-Lailey as representatives of the Central Consultants and Specialists Committee. Mr. A. Staveley Gough deputized for Mr. Nicholson-Lailey, who was unable to be present.

Mr. D. W. Lamb was appointed to fill the vacancy on the Group Executive Council's Committee caused by the death of Dr. J. F. Swan. The CHAIRMAN paid tribute to Dr. Swan's service to the Group Council and its various committees. Dr. W. Griffel (Manchester) was appointed a member of the Executive Committee to succeed Dr. McCarthy, who had resigned as the Manchester representative on leaving the region.

Dr. W. D. Gray, Dr. T. Reeves, Mr. G. Waring Robinson, and Mr. Vernon Jones were also appointed to serve on the Group Executive Committee. It was agreed that a representative of Northern Ireland should serve on the Executive Committee, and Mr. J. W. S. Wilson was appointed.

Executive's Annual Report

The Council proceeded to consider the annual report of its Executive Committee. The present membership of the Group, which, at 1,140, was slightly lower than that of the previous year, was described by the CHAIRMAN as "disquieting," because in his view it should have increased. He urged representatives to try to increase the membership in their regions. All S.H.M.O.s who did not belong to the Group should be invited to apply for membership.

S.H.M.O.s and Consultant Work

Dr. E. E. CLAXTON, Assistant Secretary, reported on the progress of the review of applications by S.H.M.O.s who claimed to be doing consultant work. He said that the name of every applicant who had been considered by the special panels had been sent to Committee B of the Whitley Council. Some 900 names had been sent, and Committee B was now making inquiries in the regions. The appointment by the Minister of a working party on hospital staffing would inevitably modify the procedure for the examination

of the problem. A subcommittee of Whitley Committee B, however, was to meet in December to look at illustrative cases of S.H.M.O.s carrying out consultant duties. Dr. Claxton added that 538 out of the 936 cases were considered by the panels to be doing consultant work. The CHAIRMAN said that he served on one of the panels and he was present at the meeting of the chairmen of all the panels. He was very impressed by the amount of consideration given to all the applications.

A motion moved by Mr. G. LOWE in the following terms was carried:

That this S.H.M.O.s Group Council is grateful for the support already given by the Staff Side of Whitley B to the claims of over 900 S.H.M.O.s, 500 of them upheld by their own specialist selection panels, and begs them to stand firm and compel the Management Side to acknowledge the justice of these claims, and so right some of the wrongs done to S.H.M.O.s during the last ten years. They feel sure that the Committee will realize that they owe this to themselves and their selection panels as well as the long-suffering S.H.M.O.s.

On the motion of Dr. W. J. WILSON, a vote of thanks was accorded to Dr. Claxton and the staff for the work which they had done in connexion with the claims.

Hospital Medical Staffing

Dr. T. F. MCCARTHY reported that hospital medical staffing was at present very much tied up with the formation of the working party. The Executive had already produced a document which was to be sent to the Working Party. The Central Consultants and Specialists Committee—and, it was hoped, the Joint Consultants Committee—had come round to the view that there should not be any grade between senior registrar and consultant, and this was helpful to the S.H.M.O.s' case. It was hoped that, if a new staffing structure was introduced, a senior registrar's position would be reviewed after two years, and, if he was regarded as worthy of consultant status, he would not have any further hurdles to pass and increments in the scale would automatically be up to the top range of consultant remuneration.

Remuneration of S.H.M.O.s

Dr. N. STRANG reported that at a recent meeting of S.H.M.O.s in the Newcastle Region dissatisfaction was expressed at the delay in implementing the proposed 80% salary ratio between consultants and S.H.M.O.s. It was pointed out that the Royal Commission and the working party on hospital staffing might not report for some time, and there was no guarantee that their findings would benefit S.H.M.O.s. Therefore the Newcastle meeting felt that steps should be taken to press the matter as an entirely independent item.

Dr. MCCARTHY pointed out that it was B.M.A. policy, and, in any event, it was doubtful whether the Government would discuss the matter while the Royal Commission was sitting. Dr. G. M. L. JAMES suggested that the Executive Committee did not wish to be tied down to figures. Dr. R. DERHAM said that the Liverpool Region wanted a minimum of 80%. Mr. A. STAVELEY GOUGH pointed out that there was a possibility that the ratio would be 100%. Dr. DERHAM added that it would satisfy the Liverpool region if those S.H.M.O.s who were retiring in the very near future had their pensions calculated on the adjusted 80% figure, and that the adjustment was made later if retirement had taken place before the increase had been granted. The CHAIRMAN assured Dr. Derham that he had that point in mind. He had every confidence that the negotiators would secure the best possible terms.

Working Party

Dr. W. J. WILSON asked for further information about the working party. He said he understood that a questionnaire was being presented to regional committees in the near future, and he wanted to hear something about it, and whether the working party intended to visit regions.

Correspondence

Time-expired Senior Registrars

SIR,—We, time-expired senior registrars, were surprised and disappointed at the comments of Mr. R. Brearley representing the Hospital Junior Staffs Group at the Central Consultants and Specialists Committee (*Supplement*, October 18, p. 170). He said that his group "vehemently" opposed the Minister's proposal to create a limited number of posts for time-expired senior registrars. One has the impression from his remarks that registrars are turning up their noses at the offer of these jobs. We do not think this is a fair picture. Certainly in our own region this is not the case.

The non-teaching hospital senior registrar has, in our view, not had a fair deal. Appointments committees for consultant posts are under the overwhelming influence of the teaching hospitals and the Royal Colleges, and so it comes about that he is seldom short-listed and practically never appointed to a consultant post. These men have been considered good enough for responsible work in their own hospitals for anything up to eight or nine years. They have deputized for consultants on leave and seen out-patients without supervision. Yet none are promoted. It is surely impossible for all these experienced men to be unsuitable for consultant posts, and so one can only assume that the method of promotion has gone astray. While this position is being put right it seems desirable to give the time-expired senior registrar security and a higher rate of pay. We therefore consider the Minister's proposals to be fully justified and urgently necessary.

The Minister's proposals are intended to correct the present injustice to time-expired senior registrars. They do not offer a long-term solution to the problems of hospital staffing, which is the responsibility of the working party. Therefore, there need not be any outcry against the creation of a limited number of posts not of consultant status. Of course, if it were financially possible, an immediate increase in the consultant establishment might be preferable; but already regional boards are unable to afford the additional consultant sessions which have been sanctioned. And, further, this step, as has already been pointed out, would in itself not be of any help to the non-teaching hospital senior registrars, who would be bypassed by the appointments committees.

We have experienced uncertainty and financial difficulty for nearly ten years and have seriously undermined our chances of entry into other branches of medicine. The Ministry is the only body which has put forward concrete proposals, and these should be accepted unless the profession can produce better ones.—We are, etc.,

A. POTELIAKHOFF.
P. L. WATTS.
T. C. P. WILLIAMS.

London, W.8.

Merit in General Practice

SIR.—The Chairman of Council, Dr. S. Wand, has created confusion by his remarks at the G.M.S. Committee meeting on September 18. In the *Supplement* of October 4 (p. 157) it is reported: "Dr. Wand recalled what he had said to the Committee—namely, 'The Chairman of the Royal Commission said to me: "How to-day is merit assessed?" and I said, "The only way in which merit is assessed to-day is by the sizes of lists," and that was a fact. He [Dr. Wand] did not say that he agreed or disagreed with it."

The disingenuous disclaimer in the last sentence is not borne out by the *Supplement* report (February 1, p. 42) of the proceedings of the Royal Commission on January 23, which reads as follows: "The CHAIRMAN: 'How is ability assessed at present—the ability to attract patients?' Dr. WAND: 'The ability to attract patients.' The CHAIRMAN: 'So the more patients you have on your books the more able

Dr. CLAXTON replied that the working party had already begun its work. Three meetings had been held, and a questionnaire was being issued which would be sent to regional consultants committees and specialists groups. When the questions were drawn up they would be submitted to the S.H.M.O.s Group Council and would be dealt with by its Executive Committee. The working party would visit regions and each region should begin to prepare its evidence to the working party on the arrangements in its area.

Northern Ireland News

HOSPITALS IN N. IRELAND

The tenth annual report, for the year 1957, of the Northern Ireland Hospitals Authority records that the hospital and specialist services made further progress and cost even more than in 1956. The number of hospital beds available increased from 15,150 to 15,578; admissions went up from 128,129 in 1956 to 132,762 in 1957; and the number of operations from 122,742 to 125,012. There was, however, a slight overall reduction in the demands on out-patient and radiological departments. At the end of the year the number of people awaiting admission to hospital (excluding those requiring operations for tonsils and adenoids) was 12,036, compared with 12,142 at the end of the previous year. The waiting-list for tonsils and adenoids operations increased from 5,367 to 6,889, owing to curtailment of operative work because of a poliomyelitis outbreak in 1957.

The Authority reports good progress with the extensive building programme, and at several hospitals new premises were brought into use. The foundation stone of the new Ulster Hospital was laid on October 25; and the building of four new hospitals commissioned by the Authority made good progress.

Capital payments in the financial year 1957-8 increased by £466,519 to £2,302,426, net revenue payments totalling £8,695,017 compared with £7,928,300 in 1956-7.

NEWS IN BRIEF

B.D.A. SUBSCRIPTION INCREASE.—The British Dental Association is to increase its annual subscription from 6 guineas to 9 guineas. The *British Dental Journal* reports that the decision was taken by an (November 4, p. 329) that the decision was taken by an overwhelming majority (87 votes to 11) at an extraordinary general meeting of the B.D.A. on October 24. The B.D.A.'s chairman of council, Mr. L. BALDING, said the increase was being asked for to readjust income to the general all-round rise in prices.

SIGHTHILL HEALTH CENTRE.—The fifth year's work of the Sighthill Health Centre, Edinburgh, has seen an increase in the use of the premises. The medical and dental services have continued as before, states the annual report, with 10 general practitioners and local authority medical and dental staff and ancillary services. New activities included a weekly clinic run by the Edinburgh Marriage Guidance Council; a cerebral palsy centre, staffed by speech and occupational therapists from the Scottish Council for the Care of Spastics; a diabetic group; and steps to form a Red Cross centre within the health centre. The old people's health club had a successful year and the chiropody clinic proved most beneficial to members. Another activity in the local authority part of the premises was an occupational therapy class under the auspices of the Edinburgh Cripple and Invalid Children's Aid Society. The number of patients attending for physiotherapy was greater than in any previous year. General practitioners, district midwives, and health visitors met regularly in the antenatal clinics.

you are? Dr. WAND: "I think it can be said, on the whole, that that is so." When a man reached his maximum it should be possible for him, by having an assistant, to spread his ability over a still larger number of patients."

It appears to us quite clear that the Royal Commissioners understood Dr. Wand to equate merit with size of list, irrespective of what Dr. Wand now thinks he intended to mean. Thus, when the General Practice Reform Association gave oral evidence, the Chairman of the Royal Commission said, "But when the British Medical Association were here they said quite definitely that the test of ability of a doctor was the number of patients he had on the books—I am paraphrasing what they said."

If the Chairman of the Royal Commission has so seriously misunderstood Dr. Wand, it is surely for the latter to clarify what he meant, unequivocally and publicly. This is no mere debating point, because it involves a very serious assessment of a most important facet of evidence to the Royal Commission by the Chairman of Council of the British Medical Association.—We are, etc.,

London, N.W.6.

A. C. J. SAUDEK,
Chairman of Executive Committee,
General Practice Reform Association.
L. RUSSELL.

Entry into Practice

SIR,—As a young doctor who until recently had been on the Medical Practices Advisory Bureau's list for nearly two years, and has now achieved principal status through an executive council vacancy, I was very interested in Dr. L. S. Potter's article on entry into general practice (*Supplement*, October 4, p. 153). Although not successful in obtaining a suitable appointment through the Bureau, I have the highest regard for its efficiency, and very many established doctors must be grateful for its existence.

It would seem that Dr. Potter wishes to refute the allegation that entry into general practice is too difficult. While sympathizing with anyone who has the unenviable task of placating those militants on the Bureau's list, many unestablished doctors will feel that he is more critical of them than of the difficulties with which they are faced. This is most unfortunate in that it is bound to lend substance to accusations of complacency. Many must feel that their senior colleagues have no idea what it feels like to write out several applications every week for years, and to travel all over the country for interview (often at one's own expense) only to find that there are hidden snags, or to suffer the demoralization of repeated rejections. It is little wonder that the mind gradually becomes poisoned with suspicion.

The task of achieving principal status is for most of us exceedingly complex. It is only too easy to jump from the frying-pan (an assistantship without view) into the fire (a post with a poor view or one that does not materialize). Discretion has to be exercised in choosing vacancies for which application is made, and no doubt many would-be applicants become over-cautious after a while, when the telephone and petrol bills have mounted up and one's employer becomes exasperated at repeated absences. Anomalies such as Dr. Potter mentions are bound to occur from time to time, just as a busy surgery one day may be followed by a very quiet one the next. I can confirm Dr. D. S. Craig's experience (*Supplement*, October 25, p. 185) that at interview the principal often discloses that there have been scores of suitable applicants, and that he has far more choice than he requires or even desires.

There can be no doubt about the basic cause of this intolerable situation—it is the almost complete impossibility of changing one's area of practice after achieving principal status. Although Dr. Potter mentions this, I am greatly surprised that he does not stress it more. There are far too many young doctors trying to acquire their ideal practice at the outset, meanwhile inflicting upon themselves long assistantships and incidentally playing into the hands of the unscrupulous minority of principals who capitalize out of

their dilemma. Few of us wish to spend the whole of our lives and those of our dependants in industrial areas, and it is not surprising that the avoidance of those areas becomes an obsession.

It is to be hoped that as the restoration of freedom of movement affects all of us in practice, established and unestablished, strong support will be forthcoming to force a solution to this formidable problem.—I am, etc.,
C. A. SHARPLES.
Leicester.

Occupational Hygiene Service

SIR,—My attention has been drawn to the report of the Occupational Health Committee meeting under "Occupational Hygiene Laboratory Service" (*Supplement*, October 25, p. 180). It was stated that "there were a few arrangements by which one could get research done, but nowhere which would undertake routine investigations."

You are probably aware that in 1950 the London School of Hygiene and Tropical Medicine and the Slough Industrial Health Service initiated an occupational hygiene service with laboratories at the London School of Hygiene. This was an experiment designed to explore the need for investigation of environmental conditions in the 180 member firms of the Slough Industrial Health Service. However, during the first five-year period a certain number of investigations were carried out in factories outside Slough, and two of these have been very fully reported in the *British Journal of Industrial Medicine*.^{1,2}

Because this service undoubtedly proved its worth, a year ago it was decided to extend its facilities on a consulting basis to industry generally. The association with the London School of Hygiene and Tropical Medicine was amicably severed, and the laboratories have been moved to new and larger premises at Slough. Accommodation and equipment is available for investigating health hazards from exposure to toxic gases and fumes, dangerous dusts, and noise, and for studying working conditions in which the heating, ventilation, and lighting are inadequate. The laboratories are staffed by a physician, an engineer trained in industrial hygiene engineering in the U.S.A., and a graduate chemist. Technical assistants are available to carry out audiometric and haematological investigations. This out audiometric and haematological investigations. This consulting service is under the general administration of the Council of Management of the Slough Industrial Health Service, and is "free from the dead hand of red tape," and therefore fulfils the need mentioned in the report in your *Supplement*.—I am, etc.,

Slough.

Registration of Medical Auxiliaries

SIR,—The recent reports of the Ministry of Health's latest proposals for the constitution of the registration boards and of the co-ordinating council must indeed be very disturbing to many doctors and specialists the world over. It is probable that the medical profession is largely to blame for the present state of affairs, as it appears that it has not been able to put forward any widely accepted plan since it rejected the Ministry's earlier proposals.

A serious objection to both sets of proposals is the incredibly small medical representation. This can only have one intention: to remove from medical hands the control of the standards required for qualification and registration in the auxiliary "professions." This is probably a democratic intention with a political appeal, and it undoubtedly will delight the majority of the members of the so-called auxiliary professions. The medico-legal aspects of the Ministry's proposals will certainly need to be studied carefully, particularly if any registration standards which may be set should fall short of those required by the medical profession. Why should any doctor accept any responsibility for the work or conduct of a medical auxiliary whose basic qualification, though accepted as adequate by the Ministry, has been rejected as inadequate by the doctors?

It seems to me unlikely that the Ministry will concede at this late hour a medical majority on either the boards or the council, but this should not stop the medical profession from voicing its displeasure in no uncertain way. We should spare no effort to ensure that such medical representation is obtained in the right type in the right place—e.g., radiologists on the board for radiographers, physical medicine experts on the board for physiotherapists, etc. We should, at least, ensure a majority for doctors and auxiliary professions combined on the board and a very substantial representation on the co-ordinating council.

Let us remember that the medical profession has not been blameless in the past, nor has it been able to express itself with any degree of unanimity. The general state of apathy about anything in particular or any other thing in general is such that a Divisional meeting attended by some 90 members out of a possible 700 is regarded as an enormous success. Even a *nem. con.* vote in such circumstances need not be taken very seriously by a Ministry which scans the pages of this *Journal* more carefully than we do ourselves. A letter to this or any other journal from every doctor in the country would impress upon the Ministry the nature of our views more effectively than a large number of poorly attended meetings could ever hope to do.—I am, etc.,

Haywards Heath.

B. S. H. STORR.

Higher Medical Degrees

SIR,—As far as I am aware no figures are ever published of the proportion of successful candidates in any medical examination, either university or college, but neither does any regulation stipulate more than that a candidate shall satisfy his examiners of his proficiency in any subject. Nothing hints at any competitive standard. It is not therefore possible to quote statistics, but it appears to me that the examiners for the higher medical degrees are passing only an arbitrary percentage of candidates. If this be so, the colleges are being most unjust.

In the past these degrees have never been subject to a competitive examination, but have been awarded to any candidate who reached the necessary standard. Nor used the mere possession of a higher degree to ensure employment in a consulting capacity; many a G.P. possessed such degrees to the great benefit of his patients and to the prestige of the family doctor. Is all this to be lost, and are candidates to be disheartened and dissuaded from higher study because in the eyes of the examiners there may not be sufficient so-called suitable posts for all the proud possessors of a higher degree? This policy would put a premium on the acquisition of knowledge, and must react greatly to the detriment of our profession.—I am, etc.,

London, N.W.1.

CELIA CULVER EVANS.

Towed-away Cars

SIR,—Quite recently I had the experience of having my car towed away by the police, while attending a patient in a West End hotel, although my car was causing no obstruction (it was the only one in the road). It was clearly marked "Doctor" on the windscreen and also carried the B.M.A. badge, and the porter at the hotel told the police that I was visiting a patient. On a very busy morning I had to rush to Tottenham Court Road to retrieve it. On remonstrating with the superintendent of police I was courteously told that the police wished to co-operate with the doctors as much as possible but were unable to alter the regulations issued to them by their superiors.

This morning I received a warning notice because again I had to leave my car outside the same place. Sir, would it not be possible for the B.M.A. to take some stronger action than heretofore? Could not we be treated with the same indulgence as, say, the municipal refuse collectors—who, with their enormous vans, during the busiest time of the day block the street without any harassing or molesting by the police?—I am, etc.,

London, W.1.

H.M. Forces

Air Commodore G. H. Morley, O.B.E., has been appointed Honorary Surgeon to the Queen, in succession to Air Commodore D. A. Wilson, C.B.E., A.F.C., on the latter's retirement from the R.A.F.

ROYAL NAVY

Surgeon Captain W. P. E. McIntyre, Q.H.P., to be Surgeon Rear Admiral.

Surgeon Commanders J. Carlton and F. G. V. Scovell have retired.

Surgeon Lieutenant B. Waters to be Surgeon Lieutenant-Commander.

ARMY

Colonel M. R. Burke, O.B.E., late R.A.M.C., having attained the age for retirement, is retained on the Active List Supernumerary to Establishment.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Major G. J. Cunningham, M.B.E., has resigned his commission, and has been granted the honorary rank of Major.

Captains (Acting Majors) S. Mattingly, W. Lees, G. L. Brown, and W. J. D. Bradfield to be Majors.

Captain (Acting Major) D. E. Argent, from A.E.R.O., to be Captain, retaining the acting rank of Major.

Captains W. I. N. Kessel and T. D. H. Gray to be Majors.

Captains J. M. Pirrie and K. S. Bailey have been granted the acting rank of Major.

Association Notices

NORTH SHORE DIVISION OF THE NEW
ZEALAND BRANCH

Notice is hereby given by the Council to all concerned that a new North Shore Division within the area of the New Zealand Branch has been formed. The boundaries of the new Division are:

In the South, the Southern Coast of the North Shore Peninsula, from Devonport to Riverhead; in the North, the Southern Boundary of the Otamatea County; in the East, by the sea; and in the West, by a line drawn from Riverhead to the Eastern Boundary of the Kumeu Riding and thence along the Eastern Boundary of the Kaipapakapa Riding and above that by the sea. with consequential alteration to the boundaries of the Auckland Division.

CLAIRE WAND FUND

Travelling Scholarship

The Trustees of the Claire Wand Fund propose to award a Travelling Scholarship to enable a general practitioner to study methods of postgraduate education of general practitioners in Canada and the U.S.A.

The successful applicant must be prepared to spend six to eight weeks in the U.S.A. and Canada, and to attend the Second World Conference on Medical Education in Chicago from August 31 to September 4, 1959, held under the auspices of the World Medical Association, with the theme "Medicine, a Lifelong Study." The Scholarship, of a maximum value of £600, will be paid from the Fund as a contribution towards the expenses of the selected general practitioner, who will be expected to submit a report of his tour to the Trustees.

Applicants should submit full particulars of previous experience and of the research project they propose to the Secretary of the Fund at B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1959.

Branch and Division Meetings to be Held

BARNET DIVISION.—At Barnet General Hospital, Thursday, November 20, 8.30 p.m., Dr. Oliver Garrod: "Uses and Abuses of the Newer Steroids, or, How to Withstand the Assaults of the Commercial Representatives."

BIRMINGHAM DIVISION.—At Birmingham Medical Institute, 36, Harborne Road, Edgbaston, Tuesday, November 18, 8.30 p.m., lecture by Professor A. W. Woodruff: "Tropical Disease Encountered in Britain." (Illustrated.) Discussion to be opened by Dr. Gerald Knight.

BRADFORD DIVISION.—At Out-patient Department, Bradford Royal Infirmary, Tuesday, November 18, 8.15 p.m., clinical meeting.

BRIGHTON AND MID-SUSSEX DIVISION.—At Dudley Hotel, Hove, Thursday, November 20, 8.30 p.m., combined meeting with Sussex Veterinary Society.

BRISTOL DIVISION.—At The Bristowe, Deanery Road, College Green, Bristol, Friday, November 21, 8 p.m. to 1 a.m., annual dance. Guests invited.

CHESTERFIELD DIVISION.—At Walton Sanatorium, Thursday, November 20, 5.30 p.m., lecture by Professor J. Gough: "The Pathology of Pulmonary Fibrosis."

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Tuesday, November 18, 8 for 8.30 p.m., films: (a) "Doctor Defendant"; (b) "Medical Witness." Talk by Dr. J. A. Gorsky. Members of St. Pancras Division are invited.

CITY OF DUNDEE DIVISION.—At Queen's Hotel, Nethergate, Dundee, Friday, November 21, 8.30 p.m., scientific meeting. Film: "Diuretic Therapy with Chlorothiazide." A discussion will follow. Time permitting, an additional film will be shown: "Gout and Gouty Arthritis."

EAST HERTS DIVISION.—At Lister Hospital, Hitchin, Thursday, November 20, 8.15 p.m., papers by Dr. A. P. H. Randle, Mr. J. J. Shipman, Dr. P. J. W. Mills, and Dr. N. Macdonald. Film: "Haemorrhoids and the Early Detection of Cancer." Members of South Bedfordshire Division are invited.

EAST SOMERSET DIVISION.—At Red Lion Hotel, Shepton Mallet, Saturday, November 22, 7.30 for 8 p.m., annual dinner and dance. Wives of members and friends are invited.

ENFIELD AND POTTERS BAR DIVISION.—At Robin Hood Hotel, Potters Bar, Thursday, November 20, 8.30 p.m., lecture by Dr. R. Cedric Simpson: "The Criminal Population." Members of North Middlesex Division are invited.

HALIFAX DIVISION.—At Board Room, Royal Halifax Infirmary, Wednesday, November 19, 8.30 p.m., address by Professor J. C. Goligher: "Diagnosis and Treatment of Carcinoma of the Rectum and Colon."

HUDDERSFIELD DIVISION.—At Whiteley's, Huddersfield, Friday, November 21, 8 for 8.30 p.m., dinner dance.

KENSINGTON AND HAMMERSMITH DIVISION.—At Hammersmith Hospital, W., Tuesday, November 18, (1) 8.15 p.m., short special business meeting; (2) 8.30 p.m., Symposium by Professor Russell Fraser, Dr. A. St. J. Dixon, Dr. C. L. Cope, and Dr. P. Hugh-Jones: "Uses and Abuses of Cortisone and other Steroids."

LEWISHAM DIVISION.—At Committee Rooms, Lewisham Hospital, Friday, November 21, 8.30 p.m., wine party with public health and local authority staff.

MID-GLAMORGAN DIVISION.—At Seabank Hotel, Porthcawl, Thursday, November 20, 7.30 for 8 p.m. Supper, followed by an address by Mr. Emyln E. Lewis.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, November 18, 2.30 p.m., clinical meeting.

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle upon Tyne, Thursday, November 20, (1) 7.15 p.m., clinical demonstration in Out-patient Department. (2) At Theatre No. 1, Medical School, 8.30 p.m., address by Mr. H. Thornton: "A Veterinary Officer Looks at the World."

NOTTINGHAMSHIRE BRANCH.—At Portland Building, Nottingham University, Wednesday, November 19, 7.30 for 8 p.m., annual dinner. Principal guests, His Worship the Lord Mayor and the Lady Mayoress of Nottingham, Mr. Justice Elwes, and Dr. D. P. Stevenson (Secretary, B.M.A.).

OLDHAM DIVISION.—At Oldham Hotel, Rhodes Bank, Monday, November 17, 9 p.m., Mr. P. C. Steptoe: "Vaginal Hysterectomy and Repair," with film made specially for presentation to the Second World Congress of the International Federation of Obstetrics and Gynaecology in Canada.

REIGATE DIVISION.—At Burford Bridge Hotel, Boxhill, Friday, November 21, 7.30 for 8 p.m., annual dinner and dance.

SHROPSHIRE AND MID-WALES BRANCH.—At Raven Hotel, Shrewsbury, Thursday, November 20, 7.30 for 8 p.m., biennial dinner. Principal guest, Mr. Bill Yates, M.P.

SOUTHAMPTON DIVISION.—At Conference Room, Civic Centre, Southampton, Wednesday, November 19, 8.30 p.m., general meeting. Address by Mr. Ludwig Koch: "Songs of Wild Birds and How I Record Them." Members are invited to meet the speaker at dinner in the Royal Hotel at 7 p.m.

SOUTH ESSEX DIVISION.—At Golden Lion Hotel, Romford, Wednesday, November 19, 8 for 8.30 p.m., dinner meeting. Lecture by Dr. G. Marsh: "Experiences with the British Antarctic Expedition." (Illustrated.)

SOUTH STAFFS DIVISION.—At Victoria Hotel, Wolverhampton, Thursday, November 20, 8.30 p.m. to 1 a.m., annual dance.

SUNDERLAND DIVISION.—Thursday, November 20 (1) At Royal Infirmary, Sunderland, 3 p.m., Address by Dr. J. G. M. Hamilton: "Uses and Abuses of Some Modern Drugs in the Treatment of Cardiovascular Disorders." (2) At Seaburn Hotel, 7.30 p.m., annual dinner.

TROWBRIDGE DIVISION.—At the Lansdown Grove Hotel, Bath, Friday, November 21, 8 for 8.30 p.m., dinner dance.

WEST MIDDLESEX DIVISION.—At Paul's Restaurant, Ealing Broadway, W., Tuesday, November 18, 8 p.m., joint meeting with B.D.A. (Ealing Section). Dr. L. Forman: "Lesions of the Oral Mucosa and Lips."

WEMBLEY DIVISION.—At Century Hotel, Forty Avenue, Wembley, Tuesday, November 18, 8.30 p.m., Mr. P. Clarkson: "The Breast in Art, History, and Religion, with a Note on the Plastic Contribution to Surgery of the Breast." Members of the Wembley, Harrow, Hampstead, and Willesden Divisions, and guests, are invited.

WIGAN DIVISION AND WIGAN LAW SOCIETY.—At Haigh Hall, Thursday, November 20, 8 p.m., joint meeting. Buffet supper, followed by address by Miss Rose Heilbron, Q.C.

PAYMENT OF PRACTICE COMPENSATION
MONEY

NEGOTIATIONS WITH MINISTER

Dr. A. N. Mathias, chairman of the Association's Compensation and Superannuation Committee, told the Council at its last meeting (Supplement, November 22, p. 219) that the Minister of Health had flatly refused an application for payment of practice compensation money, except for a minor exception which affects only about twelve doctors. A report of the Association's representations to the Minister on this subject and his replies are published below.

LETTER TO MINISTER OF HEALTH DATED
NOVEMBER 14, 1957

"The British Medical Association has watched with increasing concern the fall in the value of the sum set aside in 1948 to compensate practitioners giving General Medical Services for the loss of the right to sell the goodwill of their practices.

"The effect of inflation and the fall in the value of money has, in the opinion of the Association, produced an entirely new situation which could not have been foreseen but which justifies a review of the position as a matter of urgency, and without prejudice either to existing legislation or to previous representations which have been made to the Ministry of Health from time to time.

"The sale of the goodwill of his practice was one of the main ways by which a practitioner could provide for his retirement. He possessed an asset which he could increase by his own efforts, the value of which would have been protected in two ways. Either the general level of fees would have been raised, thereby increasing the annual value on which the price (expressed in so many years' purchase) would have been based, or the general level of premiums paid for goodwill would have increased to compensate for changed economic circumstances.

"General practitioners have been deprived of these compensatory adjustments. The Act of 1946 had the effect of freezing the capital value represented by goodwill, and the Association is advised that the depreciation of this value, in terms of purchasing power, since 1948 is between 25% and 30%.

"I am instructed to urge, therefore, that you, Sir, will receive representatives of the Association at an early date, in order that there may be a full and frank review of the unprecedented situation that has arisen.

"There can be no doubt of the growing feeling of frustration, amounting, indeed, to a sense of injustice, among general practitioners. Emphatic resolutions have been adopted both by the Conference of Local Medical Committees and by the Representative Body of the Association and also by a large number of local medical committees and units of the B.M.A., acting independently. The profession,

of which general practitioners form the largest group, speaks with one voice in demanding an assurance that the compensation promised in the Act of 1946, and on which many rely for their retirement, shall be safeguarded and its value maintained.

"The Association does not submit at this stage suggestions as to how this difficult problem should be solved, feeling that ways and means are better discussed round a table than by correspondence, but it may be helpful to summarize the exchanges which have taken place between the Government and the profession. The Association confidently hopes that you, Sir, will be able to reconcile opposing points of view and find means of resolving the impasse that has been reached.

"When the method of compensation was discussed between the Ministry and the Negotiating Committee of the profession it was appreciated by both sides that a special procedure would be needed, and it was agreed as a matter of principle:

... that compensation should be paid when a practitioner would ordinarily have sold the goodwill of his practice.

"The Act of 1946 (section 36) provided, therefore, that payment should be made on retirement 'as a practitioner giving part IV services' or on death.

"This principle might have been acceptable to the profession had there been consistency in its application. Section 35 of the Act of 1946 makes it illegal to sell the whole or any part of the goodwill of a practice, but section 36 provides for compensation only when the whole practice is surrendered. It follows that when a practitioner relinquishes part of his goodwill by taking a partner he receives no compensation.

"If a practitioner wishes to reduce his commitments or to change from one area to another (in both of which instances he would have sold part or the whole of his goodwill) he is denied compensation because he has not, in the strict sense of the word, retired from practice.

"These instances of departure from the principle on which the Negotiating Committee relied have been the subject of repeated representations by the Association, the last occasion being in 1953, when the Ministry of Health gave three main reasons for its refusal to concede any of the points made.

"(1) *The general financial position of the country . . . makes it necessary to rule out any expenditure not essential to the maintenance of a service or vitally important for its development.*

"In other words it is suggested that the liquidation of the global sum would cause inflation. The Association submits that a degree of inflation exists which has the effect of discriminating against general practitioners as a class, and that relief of the undeserved hardship caused by the reduction in the value of their capital assets should be treated as a matter of priority.

"(2) We are quite clear that the original settlement was intended as a once-for-all settlement which would stand irrespective of any changes in the level of values.

"This refers to the amount of the global sum and to the rate of interest payable. The Association emphatically dissents from the suggestion that the word 'settlement' should be applied to a rate of interest which was not negotiated but was imposed in relation to rates obtaining in 1948, which are no longer realistic. Nor does the Association accept that 'settlement' in this context precludes changes when circumstances have arisen which were not foreseen when it was made. In an evolving service there should be no such thing as a once for all settlement.

"(3) It would not be possible under the provisions of the 1946 Act, which embodies the principle that it is reasonable to pay compensation normally only on retirement or death.

"For the reasons stated above the Association cannot accept this limitation of the principle, nor that it is impossible to change provisions, intended to apply in normal circumstances, when circumstances are no longer normal.

"It is appreciated that an amendment of the 1946 Act might be necessary, but it is submitted that the principle of adjustment to special circumstances was conceded in the Amendment Act of 1949, and that the necessary changes to secure an equitable solution of the present problem are both possible and reasonable.

"To sum up, the Association requests the Minister of Health to receive a deputation, as soon as possible, to discuss an amendment of the provisions of the National Health Service Act, 1946, relating to compensation, in the light of the circumstances now obtaining."

AGREED NOTE OF DISCUSSION WITH MINISTER ON MARCH 19, 1958

On March 19 the Minister met a deputation from the British Medical Association about compensation for the loss of the right to sell the goodwill of a practice. The deputation put forward the following proposals.

(1) Since 1946 the purchasing power of the compensation money has declined by one-third. Doctors were in a particularly unfavourable position in that the compensation, unlike that due to people affected by industrial nationalization, was frozen so that it was not even theoretically open to doctors to take any kind of action to try to maintain the value of the compensation due to them. The position was particularly hard in relation to older doctors, who could look forward only to a fairly small pension. It was noteworthy that the Government had already accepted the principle of the pension betterment—for example, in the case of medical officers in the Armed Forces.

There seemed to be four possible ways, which could be used singly or in combination, of dealing with the general problem:

(a) To apply a betterment factor, which would be determined at the actual time of payment, to the sum of money which had not yet been paid out.

(b) To fund the outstanding money and issue negotiable scrip with a life of say 25-30 years at a reasonable rate of interest.

(c) To increase the rate of interest payable. Payment of interest had been an integral part of the original agreement and the rate had now become quite unrealistic.

(d) To pay out the compensation money now, on demand, thus settling the matter once and for all. Course (c) could be offered as an alternative choice.

Commenting on these suggestions, the Minister said that they appeared to have far-reaching implications in an inflationary period like the present, and would therefore need to be examined extremely carefully.

(2) The term "hardship" should be interpreted more widely. At present the Ministry took a very strict line and authorized advance payments almost entirely only in respect of loans raised before 1948 for the purchase of a practice. This was a change which could be made without legislation.

The Minister said that he would be glad to consider any general principles or any suggested definition of hardship which the British Medical Association cared to submit, and the deputation said that they would let him have proposals.

(3) The appropriate proportion of the compensation due should be paid in advance in suitable cases to a doctor who wished to move to another practice. Such moves were frequently necessary owing to genuine hardship—illness, increasing age, etc.—but were extremely difficult to arrange, largely for financial reasons. Before 1948 a doctor had been able to finance a move of this kind by selling the goodwill of his original practice, which would normally be more valuable than that of the practice to which he moved. This was now not possible.

(4) An appropriate part of the compensation due should also be payable in advance to the doctor taking a partner. It was true that the notional loading arrangements had led to an increase in the number of partnerships formed since 1954, but the numbers would have been greater, and doctors would have taken partners earlier, if the financial arrangements had been more satisfactory. At present the doctor who took a partner suffered a definite financial loss for the first few years, and this definitely served to discourage partnerships. It might perhaps be argued that the figures were at present showing a satisfactory trend, but this might well be partly due to the fact that pensions would shortly be becoming payable for the first time, and in so far as this was so, the effect would be temporary.

The Minister said that he would carefully consider all the proposals that had been put to him and would send a considered reply in writing to the Association.

SUPPLEMENTARY MEMORANDUM, MARCH 31, 1958

Memorandum on Compensation for Loss of Right to Sell Goodwill of Medical Practices

At the request of the Minister of Health, the British Medical Association submits the following memorandum which deals in detail with certain points discussed with the Minister on March 19, 1958.

The three points which we submit could be covered by an interpretation of the word "hardship" in the context of Regulation 13 in the Compensation Regulations are:

(1) The hardship suffered by a doctor who transfers a share of his practice to a partner.

(2) The hardship suffered by a doctor when he changes the area of his practice, in that he is deprived of a capital sum which he would have received on disposing of the first practice and which would have enabled him to establish himself in the other area.

(3) Financial difficulties arising through debts incurred in connexion with the purchase of practices which cannot, on the narrow interpretation hitherto applied by the Ministry, be regarded as the purchase of goodwill—e.g., the purchase of surgery premises or practice house.

It is submitted that a wider interpretation of the word "hardship" would enable the present situation to be greatly improved without the necessity of new legislation. At most an amending regulation might be required. We are advised that Section 36(3)(c) of the N.H.S. Act, 1946, gives the Minister sufficient latitude. The relevant paragraph is as follows:

Regulations shall . . . prescribe the manner in which and the times at which the compensation is to be paid and secure that except in such circumstances as may be prescribed, it shall not be paid until the retirement or death of the medical practitioner concerned, whichever first occurs.

(1) The principle of payment to a practitioner of a capital sum in respect of a share of his practice which he has transferred to a partner needs little further elaboration. This principle is recognized in the Amendment Act of 1949, but only in respect of partnership agreements in existence before the appointed day. This limitation has caused much hardship. It has, in our view, acted as a deterrent when all are agreed that an increase in the number of partnerships should be encouraged, and finally it is, in our submission, quite illogical. The Compensation Regulations, and indeed Section 36(3)(c) of the Act, are based on the assumption that compensation should be paid when goodwill would ordinarily have been sold. It is not always appreciated that, in addition to giving up part of his income, the senior partner may face capital expenditure in finding additional accommodation or enlarging practice premises. Why should he borrow money (even if he can) at the high interest rates

now obtaining for lack of the capital represented by the share transferred which he would ordinarily have received?

Following representations by the Association in 1953, the Ministry agreed to make advances of compensation in individual cases of hardship where an elderly doctor, or one whose health was failing, found it necessary to take a partner in order to prevent the complete disintegration of his practice. This concession, though it may sound generous, is unrealistic. A doctor faced with the complete disintegration of his practice cannot afford to take a partner. In those cases where a doctor whose health is failing has proposed taking a partner in order to ease his burden, appeals have been refused because the practice could not be said to be disintegrating in the strict sense of the word. Recently a doctor applied for an advance payment on the grounds that he had had to take a partner because, on medical grounds, he had been forced to reduce his commitments considerably. The following quotation from the Ministry's letter in reply to his appeal illustrates the emphasis which has been placed on disintegration:

"Your application . . . has received careful consideration but, on the information at present before the department, there is no evidence to suggest that your practice is, in fact, disintegrating."

We submit that there are many cases in which it is necessary to take in a partner to prevent disintegration.

(2) Before the appointed day a doctor who wished to reduce his commitments could sell his practice and purchase a smaller one. The balance of the capital he received could be devoted to the expenses necessarily incurred in the process of re-establishment. At present he cannot purchase another practice by private negotiation, but must compete with others for vacancies. He dare not take this risk, and the limitation of mobility is one of the consequences of the National Health Service which has caused very great hardship to individual practitioners. The Association has instituted and is operating the scheme for the exchange of practices, and it has the goodwill of the Medical Practices Committee and executive councils. Though in theory satisfactory, this scheme has proved most disappointing in practice, because of the difficulty experienced by the doctors concerned in financing the exchange. We submit that a doctor who arranges to transfer from one executive council area to another should be deemed to have retired within the meaning of Regulation 13(3) for the short period involved and should not be required to prove individual hardship. In the interests of the National Health Service as a whole and general medical services in particular, the increase of mobility rendered possible by this measure would be of great value.

(3) The Practices Compensation Committee (established under Regulation 8 of the Compensation Regulations) was consulted by the Department on the criteria which should guide the Minister in the exercise of his power under Regulation 13. It was agreed *inter alia* that, where the purchase of goodwill and a practice house formed one transaction, an advance of compensation should cover up to one-third of the debt incurred through the purchase of the house. This agreed procedure has only been implemented to a very small extent, and a very narrow definition of goodwill has been imposed. For instance, in lending money to purchase goodwill, it was the custom of the bank concerned to open a special loan account and require regular quarterly repayment. If, for any reason, an instalment was overdue, the outstanding amount was transferred to a current overdraft. On numerous occasions an appeal for an advance of compensation has been refused on the grounds that the loan had been paid off and that no advance could be made to liquidate an overdraft without regard as to how this had been incurred.

Furthermore, there was a period during which only limited advances could be made because the final assessment of compensation was not known. Many of the amount of compensation was not known. Many advances made during this period did not cover the debt incurred through the purchase of goodwill, but a further advance has not been granted either because of the conditions mentioned above or because it was held that the

amount outstanding no longer constituted hardship. We maintain that under these circumstances advance payments should have been paid in connexion with the original appeal.

We ask that a more liberal approach should be made to this problem and that in particular a debt or mortgage on a house used for the practice, the goodwill of which was purchased before the appointed day, should be treated in the same way as a debt on the purchase of goodwill. Both were expenses incurred in the purchase of a practice.

Lastly, the position of elderly practitioners was mentioned at our interview with the Minister on March 19. We ask that special provision should be made for the hardship suffered by these doctors without regard to the formula that payment should be made only when goodwill would have been sold—i.e., on retirement or death. Circumstances have changed and there are cases where strict adherence to this rule has caused hardship to some doctors merely because they were past middle age in 1948. For example, the effect of the Act was to reduce significantly the income of the practice of one doctor who was in his early sixties in 1948, though his work remained much the same. Some years later he had a coronary attack and was warned that he must do less work. He could not receive his compensation nor could he afford to retire. Being a widower with no dependants, he could gain no satisfaction and no relief from pressing financial anxiety from the thought that a capital sum would be available after he had died. We submit that any practitioner who was unable to look forward to a reasonable return from the superannuation scheme should be able to claim his compensation on reaching retiring age, whether or not he retires "as a practitioner giving Part IV services." It has always been accepted that compensation should be regarded as one of the means by which a doctor provided for his old age, and special provision on the lines suggested would merely implement this assumption.

Summary of Recommendations

It is suggested that the word hardship, in the context of Regulation 13(2)(a), should be given a wider interpretation than at present so that the Minister, in the exercise of his powers under Regulation 13(2)(e), shall make advance payments of compensation:

- (1) When a doctor transfers a share to a partner.
- (2) When a doctor changes the area of his practice.
- (3) When there is an outstanding debt or mortgage on a practice house purchased (together with the goodwill of the practice) before July 5, 1948.
- (4) When any practitioner who was over 55 years of age in 1948 reaches retiring age of 65 and requests payment, whether or not he continues to practise.

LETTER FROM MINISTRY OF HEALTH, SEPTEMBER 26, 1958

"Compensation for Loss of Right to Sell Goodwill of Medical Practices"

"1. The Minister has now been able to consult his colleagues about the Association's proposals, set out in their letter of November 14 last and subsequently amplified in a meeting with him and in a further memorandum submitted after that meeting, for modifying the current arrangements for paying compensation to general medical practitioners who suffered loss as a result of the prohibition on the sale of practice goodwill imposed by the Act of 1946.

"2. He has asked me to let you know that, after the most careful consideration, he regrets that he cannot accept these proposals.

"3. It is clear that the provision for compensation made in the Act of 1946 and in the subsequent regulations was intended as a once-for-all settlement. In their original letter the Association contended that there should be no such thing as a once-for-all settlement in an evolving service. The Minister cannot accept this contention and does not consider that the changes in the service since 1948 have any relevance to this particular settlement.

"4. The settlement, as you know, took account of the views of both sides. The Government's total liability was limited, as was also the rate of interest payable; and there was provision for the compensation not normally to be paid out until retirement or death. On the other hand the profession benefited from the fact that interest was now to be paid in respect of an asset which previously would have earned none (so far we have paid out, as interest, over £7½m. after deduction of income tax at the standard rate), and from the provision for 'hardship' payments, which again was a new feature and under which some £9m. has so far been paid out compared with the £5m. originally estimated by the Association. Altogether, apart from interest, a total of nearly £26m. has now been paid out, or nearly 40% of the total amount provided for in the Act; and some payment—either in full or in part—has been made in rather more than half the cases which qualified for compensation.

"5. Apart from the fundamental objection to reopening a once-for-all settlement of this kind, there are other comments that the Minister feels he must make on the Association's proposals.

"6. Certain of the proposals—those which would involve legislation—were directed, *inter alia*, towards adjusting the outstanding amount of compensation for the fall in the value of the money, and to carrying the fixed rate of interest payment. Such proposals would represent a major departure from the normal rules of public finance which could have widespread economic repercussions.

"7. Of the Association's other proposals, the most important was the proposal that the appropriate part of the compensation due should be paid whenever a share of a practice was transferred to a partner. The Association pointed out, in support, that, before 1948, a practitioner did in fact receive a capital payment from the partner in these circumstances. While this was so, the fact remains that there was no provision made in the 1946 Act for compensation to be advanced in these circumstances; had there been any intention to provide for this as part of the settlement, the Act would surely have done so. While technically (as the Minister is now advised) it might be possible to amend the regulations now to do what the Association propose, the Minister does not, as I have said, feel that the settlement can be reopened. The Association have suggested that the absence of provision for part-payment of compensation has discouraged the formation of partnerships. Although this is bound to be a matter on which opinions may differ, the Minister does not think that there is any real evidence of this. The number of doctors practising in partnership has in fact risen steadily—in England and Wales from 9,745, or 56.6% of the total number of principals in July, 1952, to 12,962, or 67% of the total number of principals in July, 1957. No doubt this trend has been helped by the provision for 'notional loadings' of partnership lists, which helps considerably to offset the loss of income on transfer of a share to a partner.

"8. The Minister is sorry that he cannot meet the Association's wishes in this matter. He has, however, asked me to conclude by saying this. The Association have expressed their dissatisfaction with the practical working so far of the arrangement for an advance payment of compensation on hardship grounds in those cases where an elderly doctor or one whose health is failing finds it necessary to take a partner in order to prevent the complete disintegration of his practice. The Minister has, therefore, asked us to review once more all those cases in which application for an advance payment has been made on these grounds and has so far been refused, and to consider whether there are cases where the circumstances do not on further examination justify such a payment. I cannot, of course, make any promises about the outcome of this review, but we will do our best to carry it out—and to consider any new applications on these grounds—in a constructive spirit."

Dr. D. Gullick has resigned from the secretaryship of the East Hertfordshire Division on his appointment as Assistant Secretary of the B.M.A. Dr. J. M. W. Sedgwick succeeded Dr. Gullick as Division secretary on September 30.

FELLOWSHIP FOR FREEDOM IN MEDICINE

ANNUAL GENERAL MEETING

The annual general meeting of the Fellowship for Freedom in Medicine was held at Caxton Hall, Westminster, on November 15, with Dr. R. HALE-WHITE in the chair. It was the tenth anniversary meeting and the ninth annual general meeting.

Dr. E. C. WARNER, honorary secretary of the Fellowship, stated in his report that the medical membership was 2,011, and that it was necessary to recruit at least 100 new members a year to maintain the membership.

Cost of Private Beds

Dr. C. P. WALLACE (Guildford), commenting on a reference in the report to a weekly fee of 35 guineas for private beds in certain hospitals, said it was one of the greatest scandals existing under the National Health Service. Recently he had visited a hospital which he had found to be an old-fashioned residence converted into a form of private nursing-home under the National Health Service, without lifts and without many of the most ordinary amenities, and he was told that the fee was £36 10s. If they raised the problem they were told that an amending Act was required, but he was satisfied that there was a good deal of jiggery-pokery in the matter. He complained of the method of calculating the cost, including overheads, and the costing.

Dr. D. M. BAKER said the matter would never be put right while the present fantastic form of accounting continued. It was something which would not occur in industry or any other competitive system.

Independence and Service

In an address entitled "Independence and Service," Brigadier N. SKENTELBERY said that in respect of policy and administration the present nationalized health system was wasteful and ineffective and was increasingly falling short of the known requirements for hospitals and hospital beds. Hospitals should be independent in policy and in the management of their own affairs, for they had to be individual. He was thinking particularly of the small general hospital serving a limited area, but there was no reason why the same argument should not apply to the specialist or teaching hospital. Governing bodies must be local. At present local management committees had no autonomy and were rubber stamps for the regional boards. Their creation was a cynical piece of lip-service to the democratic idea. They had no power or influence, and were never intended to have any, and for what they did they might just as well not exist. An organization responsible to Parliament must be established. A hospital which was completely independent would be more effectively run at less cost than one subject to the restrictions and extravagance of centralized administration.

The present system would only decrease the ability of the hospitals to give the service which they might do. The National Health Service sought to apply Civil Service methods of centralized control, but the Civil Service was unfitted by training, official aptitude, and organization to solve the problems of hospitals. The inevitable diversity of the hospitals of the country made them an intractable problem for a service such as the Civil Service, but the hospitals had been forced into such a mould and were the worse for it.

"Why a free service?" he asked. "If free health, why not free food, free drink, free travel, or free entertainment?" The proper solution was the relief of economic crises by insurance. Hospitals should be given independence in policy and administration. Their main support should come from those they served, and there should be grants-in-aid from State funds where that support fell short.

"We must repeat these ideas in season and out of season until those in high places eventually think they have thought

of them themselves. Then perhaps we shall once more have hospitals which are free to serve, free to look after their own affairs, and free to forge their own destiny."

Encouraging Private Practice

The meeting passed a resolution recording its strong disapproval of the principle of merit awards for general practitioners, in the form of a direct and secret increase in remuneration, and its belief that an item of service method of payment in the N.H.S. and an increase in the opportunities for private practice would secure a proper financial reward for merit.

A resolution was carried welcoming the announcement by the British United Provident Association of a general practitioner scheme which would provide benefits to help private patients to pay their doctors' fees.

Another resolution which was passed called upon the Government to remove the unfair discrimination against private patients whereby they had to pay for their drugs and appliances in spite of making their full contribution to the N.H.S.

The meeting also carried a resolution deeply regretting the refusal of the Secretary of State for Scotland to join with the B.M.A. in the preparation of a special case to go before the Scottish Court of Session and urging the B.M.A. to persist in its efforts to test the contractual validity of the Spens recommendations.

Chairman's Address

In an address entitled "The Tide is Turning," the CHAIRMAN said that the Fellowship had spoken repeatedly of the defects of present-day medicine and how the National Health Service was lowering standards with ever-increasing speed each year. He could say without hesitation that it was very largely due to their efforts that at last there was a gradually spreading a belief that all was not well, that medicine was indeed a patient, that if permanent paralysis was to be prevented something drastic must be done and done soon. A dreadful error in diagnosis had been made by a great many doctors. What they thought to be teething troubles of a passing nature had turned out to be widespread dental sepsis with decaying roots which required drastic extraction—some might say a clean sweep—if the patient was to regain any real health.

Stating that the stage had been reached when external evidence and the views of others was more important than their own, he referred to recently expressed views by Sir Hartley Shawcross on the need for private practice, and again on the Welfare State, when he said we are "tending to abdicate the responsibility for looking after ourselves." The *Times* had published a long leader critical of the central pool and the capitation fee, and had given space to correspondence.

In a questionnaire circulated in the Tunbridge Wells Division of the B.M.A. doctors were asked whether they thought that the B.M.A. should be concentrating on the formation of an alternative Health Service, and the answer was "Yes" 80, and "No" 26.

Even the Government in their new pensions scheme were allowing opting-out. In the early days when they talked about the possibility of opting-out of the National Health Service the answer always came with a patronizing smirk, "You cannot opt out of State education, so how can you be so silly as to think of opting out of the National Health Service?" That was always a ridiculous argument. Now it ceased to be that, and perhaps there was a chink of light.

For private practice the outlook was more encouraging than at any time since 1948. They must continue to press upon the Government and the B.M.A. that drugs for private patients was an issue which if solved favourably would prove an even greater stimulus, specially to private practice in the poorer areas. They would also be wise to ensure that private practice was brought more to the notice of medical students, who tended to be so immersed in National Health Service methods that many of them scarcely realized that private practice existed.

Better National Health Service medicine and increased opportunities for private practice were both in sight; and it was largely due to the work of the Fellowship that it was so. They could not relax their work; indeed, it was time for even more strenuous efforts, otherwise the slightly more encouraging conditions, for which they had worked so hard, could easily disappear overnight.

The meeting carried a resolution, moved by the CHAIRMAN, welcoming the fact that the Royal Commission was considering issues other than purely remuneration, especially methods of raising standards of doctoring within the National Health Service.

GENERAL MEDICAL SERVICES COMMITTEE

At a meeting of the General Medical Services Committee on November 20, Dr. A. B. DAVIES, Chairman, reported that Dr. W. MORGAN EVANS had regretfully tendered his resignation from the Committee in view of his many other obligations. The Committee accepted his resignation with reluctance and regret, and appointed Dr. C. M. SCOTT and Dr. S. NOY SCOTT respectively to fill the vacancies thereby created on the Assistants and Young Practitioners Subcommittee and the Private Practice Committee.

Interim Remuneration Increase

For a large part of the morning the Committee concerned itself with the recent further interim increase of 4% in basic remuneration. Having recounted the background and details of interviews with the Minister of Health, the CHAIRMAN invited the Secretary, Dr. D. P. STEVENSON, to read a letter from the Minister of Health informing the Association that an interim adjustment of 4% had been awarded by the Government. In view of statements which had appeared earlier in the national press forecasting the award, Dr. S. WAND, Chairman of Council, urged the Secretary to reassure the Minister of Health that no disclosure of the terms of the award had been made by members of the profession. The Committee expressed disappointment that the interim increase was not to be applied from an earlier date, but agreed to accept it as a belated action on the Government's part, without prejudice to the findings of the Royal Commission, whose report was now expected in the summer of 1959. The Committee appointed some of its members to discuss the distribution of the new money with officials of the Ministry.

Maternity Fees

The Committee, at the suggestion of Dr. A. TALBOT ROGERS, considered maternity medical service fees.

The CHAIRMAN reported that on October 21 the Committee's representatives discussed the question of raising the maternity medical service fees with officials of the Ministry of Health. The latter pointed out that the report of the Cranbrook Committee on the maternity services was expected in December, and that it would be inopportune to raise the fees before the Committee's recommendations were known. The Ministry's attitude could not be changed in spite of very firm representations, and it was agreed that the matter would be discussed again in January, immediately after the publication of the Committee's report, when an interim decision could be reached in the light of its recommendations, pending final agreement following the findings of the Royal Commission.

Dr. TALBOT ROGERS said that, whatever was in the Cranbrook Report, it could not be implemented for at least another year, and possibly another two years. Something should be done to implement the decision of the Conference of Local Medical Committees before the next Conference, and, that being so, whatever alterations were made in the terms of the fee should not be tied up with the final agreement on the recommendations of the Cranbrook Committee. Secondly, in his view, the money should come

from the total Central Pool. It should not form part of any new money that might come. Dr. Talbot Rogers suggested that the question of maternity medical service fees should be considered as a separate item.

Dr. H. N. ROSE suggested that obstetric work was unevenly divided over the country. Many general practitioners, he said, would like to do maternity work, but did not have the opportunity. In Essex a great amount of maternity work was done which was not taken into account by the Medical Practices Committee. That Committee should look into the matter and tie it up with medical manpower in those areas before any final distribution of the money was settled.

Remuneration

Calculation of Central Pool

The CHAIRMAN referred to the Committee's decision to give further consideration to the memorandum on the Central Pool which he had prepared in the light of comments which members were asked to send in. He said that he had received several comments which the Committee agreed should be incorporated in a revised memorandum which should be sent to all local medical committees.

Supplementary Payments for 1957-8

The Committee approved the Chairman's action in agreeing to the issue of a letter from the Ministry to executive councils on November 7, which gave the latter time to distribute the agreed advance payments to doctors at the end of December.

Correspondence in "The Times"

After a short discussion the Committee decided to take no further action on a number of letters and a leading article on the subject of the distribution of the Central Pool and the method of payment of general practitioners which had appeared in *The Times* recently.

Compensation

Dr. A. N. MATHIAS reported that representatives of the Compensation and Superannuation Committee met the Minister of Health on March 19, 1958, and urged him to increase the interest rate on practice compensation money. A reply was received at the end of September, and, except for one small concession (to review certain cases of hardship in a "constructive spirit"), the answer to the Committee's representations was an unqualified "No." Dr. Mathias said that representations would again be made to the Minister when the Committee considered the moment opportune.*

Drugs for Private Patients

Reporting on the meeting on October 28 between a Council deputation, consisting of Drs. S. Wand, I. M. Jones, L. W. Batten, and himself, and officials of the Ministry of Health, the CHAIRMAN said that, in his view, considerable progress was made on the question of drugs for private patients. The issue had been appreciably narrowed. "The ball is now at the feet of the Private Practice Committee," he said. The differences between the Ministry and the private practitioners were now purely on the question of the registration of the patients of doctors entitled to participate in the scheme. The Ministry officials considered it essential to have a list of private patients entitled to drugs, each from his nominated doctor. Dr. WAND added that the remainder of the Association's memorandum (*Supplement*, February 15, p. 67) on the subject was accepted by the Ministry.

The Committee agreed to receive the item and await the comments of the Private Practice Committee.

*A full report on the negotiations on practice compensation money is printed in the opening pages of this *Supplement*.

Hinchliffe Committee's Interim Recommendations

The CHAIRMAN reported that a meeting was held at the Ministry of Health on October 30 to discuss the interim recommendations of the Hinchliffe Committee on the cost of prescribing. The G.M.S. Committee was represented by himself, and representatives of the Ministry of Health, the British National Formulary Committee, and the pharmacists were also present. It was agreed, said Dr. Davies, that a copy of the *British National Formulary, Alternative Edition, 1957*, should be supplied to every general practitioner in the Service about next February, when copies would be available after reprinting. The standard edition of the *Formulary* would remain official until October 1, 1959. During the intervening period practitioners would have an opportunity of studying the *Alternative Edition*. Shortly before October, 1959, it was proposed to ask the G.M.S. Committee to indicate which edition it preferred, so that requirements could be assessed for the next edition, due for publication early in 1960.

The meeting agreed on a type of two-sided loose-leaf folder, specimens of which would be available at a later date, on one side of which would be a pocket for the *National Formulary*, and the other side a pocket to contain reprints of all the appropriate documents on prescribing, which in future would be of a standard size and shape. A list of the documents proposed for inclusion in the folder was set out and an invitation extended to the Committee to say whether it considered that any documents should be added to or subtracted from the list.

On behalf of the Committee, the Chairman thanked Dr. B. BURNS for his help and for the constructive suggestions which he had made.

Home Confinement Grant

The Committee decided to continue to observe the situation with regard to the payment of home confinement grants, and to get advice or indications from all parts of the country about what was happening. At the appropriate time and in the light of the information received, the Ministry of Pensions and National Insurance could again be approached.

The matter was originally raised by the Sheffield Local Medical Committee, which pointed out that, as things were at present, a mother could be admitted as an emergency to a maternity hospital for a period not exceeding three days during the puerperium without forfeiting the grant for home confinement. If, however, it was desirable for the mother's safety that she be confined in hospital by pre-arrangement and sent home within two days, no grant was payable. Admissions of this kind would make the best use of maternity beds, but the mother would incur the same expenses as if she were confined at home. As the regulations stood she had no grant to meet expenditure at home, and the financial sacrifice involved might well decide her against the one- or two-day stay in hospital which might be essential for her safety.

G.P.s on Boards of Governors

Following a report that local medical committees had been invited, in co-operation with Branches and Divisions of the Association, to consider the nomination of general practitioners for appointment to the boards of governors of teaching hospitals, the CHAIRMAN drew attention to a letter from the Essex Local Medical Committee. This stated that the Essex committee shared the Association's view that the Minister ought to consult the B.M.A. on the matter, and the comments of the General Medical Services Committee were requested on a suggestion that the Essex Local Medical Committee should write to other local medical committees and Branches and Divisions of the Association in the North-east Metropolitan Regional Hospital Board area not only asking them if they wished to put forward any names, but

also suggesting that they should make representations direct to the Minister that general-practitioner representation should be granted.

Dr. TALBOT ROGERS said that the matter was bound up with the question of getting general practitioners on to regional hospital boards. If an adequate number of general practitioners were on regional boards the position would right itself. Dr. F. GRAY asked whether it would not be appropriate to send a letter to the Ministry urging that when there was no general-practitioner representative one should be appointed.

Mr. T. H. DOCKRELL pointed out that the Minister had always taken the view that he did not put anybody on any committee as a direct representative. Mr. Dockrell did not consider it would be advisable to press for direct representation for any one section of the medical profession. Dr. H. N. ROSE said that all that was being asked was that one general practitioner should be on the board of governors of the teaching hospital. Dr. F. M. ROSE suggested that it was not just any general practitioner, because general practitioners had been selected by the Ministry who did not command the respect or support of their own colleagues.

The Committee agreed that a further approach should be made to the Ministry, and approved of local medical committees taking action individually.

General-practitioner Consultations

The Committee considered a letter from the College of General Practitioners enclosing a communication from a practitioner in which he pointed out that one of the major disadvantages in general practice at present was that there was very little contact between general practitioners living in adjacent areas, and that the technique and experience developed by outstanding general practitioners was not passed on to others who were younger and less experienced. The correspondent suggested that an excellent method of remedying this would be for general practitioners to be encouraged to bring each other into consultation by the institution of a scheme whereby every general practitioner could do 20 domiciliary visits per annum to the cases of another general practitioner within a reasonable radius who was not in his own partnership at a fee of, say, one guinea per visit. The increased cost to the Service would be small but the dissemination of information would be great, and the rivalries and dislikes between neighbouring general practitioners would tend to be broken down to the benefit of the profession as a whole. The Committee agreed to refer the matter to the liaison committee with the College of General Practitioners.

B.U.P.A. General Practitioner Scheme

It was reported that the British United Provident Association would shortly introduce a scheme whereby benefits would be available to contributors who obtained treatment from a private general practitioner. For the time being membership of the new scheme would be limited to subscribers to the existing B.U.P.A. scheme covering treatment in hospitals and nursing-homes. It was understood that other provident associations might also introduce similar schemes.

Injury Compensation

The Committee received, with thanks to the Compensation and Superannuation Committee, information on the general practitioner's position under the Superannuation Regulations if he suffered injury or death while participating in a scheme made by a regional hospital board for dealing with major accidents.

An injury allowance was payable if a general practitioner ceased to be employed in consequence of his being permanently incapacitated by an injury sustained by him in the actual discharge of his duty, and specifically attributable to the nature of his duty. The allowance would be of such amount as the Minister of Health considered reasonable, having regard to all the circumstances. It might not exceed

two-thirds of the doctor's average remuneration over the three years preceding the injury. In the event of death, the Minister might grant an annual allowance or gratuity to the widow of a person who died as the result of an injury sustained in the course of duty. The amount would be what the Minister might consider reasonable, and his discretion was not limited by the Regulations. A widow was also entitled to a death gratuity provided the practitioner had completed 5 years in the N.H.S. at the date of death. The death gratuity (which was tax-free) was equal to the greatest of (1) 4% of his remuneration as a practitioner, plus 3/80ths of his average remuneration as an officer (i.e., whole-time hospital appointments); (2) a return of contributions; and (3) his average annual remuneration over the three years before death (or before retirement if death occurred after retirement). If death occurred after the practitioner had become entitled to an injury allowance the amount of benefit paid to him before death was deducted from the death gratuity payable to his widow.

Assistants and Young Practitioners Subcommittee

Dr. F. G. TOMLINS, Chairman of the Assistants and Young Practitioners Subcommittee, presented the Subcommittee's report.

The CHAIRMAN informed Dr. TOMLINS that the Council had approved the Assistants and Young Practitioners Subcommittee's recommendation on the procedure for appeal.

Mileage

The Committee considered a letter from the Yorkshire (North Riding) Local Medical Committee, copies of which had been sent to the Ministry of Health, members of the working party of the Mileage Committee, Mr. A. M. F. Palmer, Sir T. L. Dugdale, Sir Alexander Spearman, and Mr. R. H. Turton. In the letter the Local Medical Committee made known in advance its strong objections to the proposals implicit in the interim report of the Mileage Committee and in the recommendations of that Committee that in future (1) mileage should be calculated from the main surgery of the doctor of choice; and (2) that no doctor should be entitled to any payment unless at least 10% of the patients on his list lived in areas designated as mileage areas.

Dr. C. F. R. KILLICK said that the Yorkshire (North Riding) Local Medical Committee had chosen an extraordinary way to try and press those concerned into something which the Conference of Local Medical Committees had not seen fit to accept. Neither the Conference nor the Mileage Committee had accepted the recommendations. It was a case of one particular area stressing a large number of particular difficulties when, in fact, the difficulties experienced over the country as a whole were being investigated. It was an unfair method of putting its points over.

Dr. D. L. S. JOHNSTON said that his recollection was that Dr. T. K. Cooke, who spoke on the subject at the Conference, stated that the substance of the North Riding resolution had been passed at a previous Conference, and there was some argument for his saying, "Why was it not implemented then?" The CHAIRMAN replied that the G.M.S. Committee, having sought the guidance of its Rural Practices Subcommittee, decided to advise the next Conference not to support the decision of the previous Conference.

Dr. JOHNSTON asked whether the Rural Practices Subcommittee was not bound to implement resolutions of the Conference. Dr. KILLICK replied that it was at the request of the Ministry that the G.M.S. Committee and the Rural Practices Subcommittee reconsidered this particular matter. Dr. TALBOT ROGERS said that if the Conference passed a resolution, the G.M.S. Committee did its best to implement it. But if it were found to be impracticable or unwise, or circumstances changed, it must always be possible for the Committee to go back to the next Conference and ask it to change its mind.

Personal Medical Card

The Committee agreed in principle to the introduction of a personal medical card to contain important medical data, such as blood group, liability to disease such as diabetes, epilepsy, and haemophilia, etc., the details of which would be discussed.

Supply of Insulin

The Committee decided to refer to the Central Consultants and Specialists Committee a letter from the Southampton Local Medical Committee complaining that hospitals of the Southampton group no longer issued insulin to their out-patients, except in token quantities. It was felt that it was an unnecessary hardship on diabetics to make a special journey to consult their doctor solely to obtain a prescription for insulin and, furthermore, to have to pay a separate shilling for it. It would appear to be an extravagant way of dispensing insulin.

DEFENCE TRUSTS

A meeting of the trustees of the General Medical Services Defence Trust and the National Insurance Defence Trust was held on November 20, at which Dr. CATHERINE HARROWER, Deputy Treasurer, presented the income and expenditure accounts for the nine months ended September 30, 1958, together with the balance sheet.

Income Tax Appeal

The trustees considered a letter from the Hull Local Medical Committee expressing alarm felt locally at the gift of £710 and the offer of a further £2,000 from the Defence Trust towards the expenditure of preparing the test case in connexion with the assessment of the income of part-time consultants under Schedule E. This information was contained in the report of the meeting of the Trustees published in the *Supplement* of October 4 (p. 158). The Hull Local Medical Committee felt strongly that the capital of the Defence Trusts should be kept intact to meet the purpose for which it was designed.

Dr. HARROWER pointed out that the commitments of the Trust would not exceed £835, and that the only call on the £2,000 would be the balance of £125, as the Hospital Medical Staff Defence Trust had accepted responsibility for the recent costs.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Time-expired Senior Registrars

SIR,—I am sorry that my remarks to the Central Consultants and Specialists Committee (*Supplement*, October 18, p. 170) surprised and disappointed Dr. A. Poteliakhoff and his colleagues (*Supplement*, November 15, p. 209). The opposition to the Ministry's proposed new grade which I reported was strongly and almost unanimously expressed by the members of the Hospital Junior Staffs' Group Council last May, and this attitude has been endorsed by further local meetings of H.J.S. groups and of the executive committee, by the Annual Representative Meeting of the B.M.A., by the Central Consultants and Specialists Committee, and by the Joint Consultants Committee. If the Ministry's proposals are all that Dr. Poteliakhoff says they are, why do they find so little favour?

The policy consistently advocated by the H.J.S. Group (and its antecedent, the Registrars Group) is that, pending the achievement of a long-term solution of the hospital staffing problem, all senior registrars kept on after four years in the grade should be given security of tenure and further salary increments, at least up to, and possibly over-

lapping, the starting figure for consultants. This proposal is simple, it treats all alike, it entails no permanent sub-S.H.M.O. grade, it does not further inflate the numbers competing for consultant posts or handicap some with an unfavourable label, and it has already gained widespread support. By contrast, the Ministry's proposals, set out in circular H.M. (58) 58, are for a limited number of "designated posts" to be filled ordinarily by advertisement and application, open to time-expired senior registrars and carrying a higher rate of pay (increments are not mentioned). The remainder of those continued beyond four years do so at the fourth-year rate as at present. No criteria are laid down to distinguish between the duties or the individuals which are to be considered appropriate to these differing states, but the definition of the scope of the designated posts ("responsible work commensurate with that which is normally expected of a fourth-year senior registrar") hardly leaves room for any difference at all.

Does the rejection of our simple and fair solution and the offer of this tortuous, inequitable, and dangerous alternative really seem to be intended, as Dr. Poteliakhoff asserts, "to correct the present injustices of time-expired senior registrars"? Even the Ministry's circular does not make this claim. It stipulates that the basis for creating such posts is to be "the demonstrable needs of the hospital service" not the demonstrable needs of the senior registrars. Pausing to compare what we have asked for with what we have been offered, can anyone utterly dismiss the suspicion that the Ministry is determined to obtain specialist services outside the consultant grade, and that to this end it wishes, before the working party reports, to divert a number of senior registrars into a blind alley out of which promotion will be impossible, and, by exploiting this situation, force the acceptance of a sub-consultant career grade as a permanent feature of the service? Surely we must continue to advocate the policy we know to be right and not yield to this wily gambit. I am, etc.,

ROGER BREARLEY,
Chairman,
Hospital Junior Staffs' Group.
Liverpool, 12.

SIR, I am grateful to Drs. A. Poteliakhoff, P. L. Watts, and T. C. P. Williams for their letter (*Supplement*, November 15, p. 209). Their comments, I am sure, embody the views of most senior registrars: that, far from spurning the Minister's proposal for granting security of tenure and a higher rate of pay for a selected number of senior registrar posts, we welcome it as a practical interim measure. And, as it has been pointed out in the Minister's circular, such upgraded senior registrars would still be free to apply for higher positions. One must face realities. It is inevitable that many senior registrars will not attain consultant status. And their training, habit, and temperament are such as to render many of them unsuitable for entering another avenue of medicine, be it general practice, industrial medicine, or the pharmaceutical industry.

The labourer may be worthy of his hire, but money, Sir, is not everything. Most of us are in medicine because we love it. And most of us are senior registrars because we find the occupation intellectually, emotionally, and spiritually satisfying. But without security of tenure we cannot be happy in our love for medicine. And, as an Indian philosopher has said, "We cannot all ride high horses and some of us must walk"; so must some of us remain in humbler positions. But do let us have, please, security of tenure. I am, etc.,

Cottingham, Yorks.

PAUL CROSBY.

Costing of Private Beds

SIR,—My committee is gravely disturbed by the recent increase in the already high cost of beds in private wards of hospitals, by the wide variations in the costs as between comparable hospitals, and by the apparent lack of correlation between the services offered and the charges made. An important consideration is that some hospital admissions, for example, maternity cases, are booked in advance, so that the recent sudden imposition of increased charges of as

much as £7 per week bears hardly upon patients who were unprepared at the time of booking.

The variation in costs—in Surrey the charges in some hospitals are £20, in others £36, per week—is due to a costings system based on local conditions, and might well be modified by a more regional costings system. The high charges to private patients, who pay additionally their medical and surgical fees, and who are already contributing to the cost of the Service in their rates and taxes, are calculated by adding a percentage to the average cost per bed in the hospital concerned. These patients are therefore charged extra for making their voluntary additional contribution to the reduction of the overall cost of the Health Service.

Is it too much to ask that the whole question of the costing of private beds in hospitals should be reviewed as a matter of urgency?—F am, etc.,

F. T. BURKITT.

Secretary,
Surrey Local Medical Committee.

London, S.W.19.

Telephone Charges

SIR,—With the proposed timing of local telephone calls at 2d. for three minutes, the majority of doctors are going to find their telephone bills considerably increased. In many cases it is inevitable, when phoning a hospital to speak to a doctor or to make an appointment for a patient, for there to be a delay while the doctor is found or the appointments office is free. Admittedly other sections of the public will be similarly affected, but surely some consideration could be shown by the Postmaster-General to subscribers who are paying a rental for the telephone service, and the timing of local calls could be restricted to call boxes.—I am, etc.,

London, N.15.

MARTIN KINGSLEY.

Partnership in General Practice

SIR,—I read and hear much about the desirability of general practitioners with large lists taking a partner in place of an assistant. It should be clearly understood that a medical partnership is never a purely professional one. It demands, above all, a satisfactory personal relationship and a state of harmony between the respective doctors' wives. A partnership will not fail because one doctor prescribes oxytetracycline to a patient when a Seidlitz powder would suffice, but because one doctor's wife thinks that her husband is doing more than his share of the work, or wants her annual holiday when it is inconvenient for the other.

I can imagine no greater purgatory than a miserable partnership, and I have good reason to believe that there are an appreciable number of these. The extent of this could easily be estimated by asking a competent body to circularize individually all doctors in partnership and ask them whether they are satisfied, or whether they would prefer, without loss of income, to become single practitioners. I feel myself qualified to write such a letter because I have in turn practised as an equal partner, a single-handed doctor, and a doctor with an assistant. I would unhesitatingly say to any doctor contemplating partnership—"Think carefully, and don't."—I am, etc.,

Chatham.

N.I. Contributions during Postgraduate Study

SIR,—A recent Ministerial change of heart may be of interest to those of your readers who undergo full-time postgraduate education. During such a time contribution for National Insurance may normally be allowed to lapse. However, leaflet N.I.30, section 10, states that a person under full-time training at an approved course will be credited with contributions for weeks of training after his 18th birthday only if three conditions are fulfilled. I quote the first and third, which are relevant to the subject of this letter: "First: The training is not intended to last for more than one year. . . . Third: The Minister is satisfied that if the trainee had not taken the course he would have remained or become unemployed."

An application was recently made that attendance, without outside employment, at the full-time course in basic medical sciences at the Royal College of Surgeons, with a view to taking primary F.R.C.S., should qualify on these grounds. The application was refused on the grounds that condition (3) was not satisfied. Representation to the Minister was made by Mr. Richard Nugent, Conservative M.P. for Guildford, that, as the F.R.C.S. or equivalent is a *sine qua non* for a senior surgical appointment, condition (3) was in fact satisfied. As a result the position was reviewed, and full contributions are now to be credited for this course (provided, of course, that the other conditions are satisfied—e.g., no liability to pay contributions as a self-employed or (part-time) employed person).

Although this has only been agreed in one specific instance, I feel sure that the principle will apply to other postgraduate courses which are (1) full-time, and (2) leading to a qualification without which a given specialty cannot be pursued. Failure to take advantage of such an arrangement seriously affects the amount of sickness or other benefit which a contributor may need then or later. Application is made on form C.F.55.C and the explanatory leaflet is N.I.30, dated November, 1957.—I am, etc.,

London, W.C.2.

C. N. HUDSON.

Hospital Staff Mileage Allowance

SIR,—It would seem that Committee B of the Whitley Council has recently been discussing the Staff Side's claim for an increase in the mileage allowance. The Management Side has suggested that a scheme similar to the new Civil Service claims for motor mileage allowance (E.C. No. 19/58 of June 26, 1958) would be basically suitable for adoption in the Health Service. This suggestion seems remarkable in that it would provide for a reduction and not an increase in the mileage allowance.

We think it is fair to say that most whole-time medical officers in the Health Service regard the present scheme as very unsatisfactory and the mileage allowance inadequate. They feel, too, that the distinction made between whole-time and part-time officers is invidious and would seem to be weighted in favour of those who are already relatively favoured from the income tax point of view. There can be little doubt that, by and large, the Health Service obtains very considerable advantages from the fact that most whole-time officers find it convenient to use their own cars for travelling to work—since a large proportion of these are obliged to move from one place to another during their work, or in the course of it. Obviously the Ministry would not be willing to pay for journeys to and from work on a regular basis, but in view of the foregoing it would seem reasonable that it should pay a fully adequate mileage for those few journeys which come within the scope of the mileage allowance. We therefore feel that the whole question of mileage allowances, including the distinction between part- and full-time employees, should be thoroughly reviewed and any question of reduction of the present miserable allowance vigorously opposed.—We are, etc.,

Medical Auxiliaries

SIR,—A considerable amount of correspondence has appeared in your columns on the subject of medical auxiliaries, and several consultants have taken up cases of unfair treatment of medical auxiliaries with whom they are associated. Attention has been called to the very low salaries paid by the National Health Service to medical auxiliaries compared with the wages paid in industry for such skilled workers. With regard to the registration boards, which the Minister proposes to set up, the medical representation is small, as it is on all boards connected with the management of the National Health Service.

I am interested myself in the welfare of my orthoptists, who seem to get very little help from their own boards, and

a very raw deal from the Whitley Council. I have two part-time orthoptists working in my department—one who does six sessions and the other four sessions. The orthoptist who was doing the four sessions, and who was a married woman, resigned recently and a new orthoptist was engaged in her place. Both her predecessors had done only four sessions a week, and they were paid 24s. per session. My new orthoptist was engaged on the same terms, and her engagement was confirmed in writing, but when she came to be paid at the end of the first week she was paid only at the rate of 13s. 6d. per session. The reason given for this was that she was already doing six sessions at another hospital, and that orthoptists were paid only 24s. per three-hour session provided that their work did not exceed 12 hours per week. I am aware that the short-time orthoptists on the higher rate per session do not get superannuation or holidays with pay, but a bird in the hand is worth two in the bush. I do not think that any comment from me is necessary on an arrangement such as this which puts a premium on idleness.

There is no unemployment among medical auxiliaries, in the way that there is among doctors, and I should have thought that the remedy was in their own hands, provided that they were united, and would support one another. I took the matter up with our group secretary, who genuinely regretted his inability to help, as he was bound rigidly by Whitley Council agreements in matters of pay.—I am, etc.,
Camberley, Surrey. **LESLIE HARTLEY.**

Entry into Practice

SIR.—Dr. C. A. Sharples (*Supplement*, November 15, p. 210) states that few of us wish to spend the whole of our lives, together with our families, in the industrial areas. This attitude is regrettable. It is not fair to that section of the population who keep this country's economy ticking over by its work in the pits and the mills. The doctor in the industrial area has a far more pleasant job than the man underground at the coal face. These men risk their lives, and deserve in return a solidly settled medical service, not a transitory one. Doctors have also brought up their families in far worse places. Some of us who settle permanently in these districts neither bemoan our lot nor wear a halo. We happen to like it, and get satisfaction from it.—I am, etc.,
Whitwell, Notts. **JOSEPH MAIZEL.**

Midwifery and Hypnosis

SIR.—At last the medical hypnotist is deemed worthy of his hire and is to be paid for his service at confinement (*Supplement*, October 4, p. 159). Glad we are indeed for any fee, but there here arises a problem. Merely to induce hypnosis for the first and only time during the actual parturition is not only poor technique but, except in the case of an unusually good subject, mainly useless. Before labour the woman must be an adept at attaining at least the lighter stage of trance. This means that she has to pay several visits to the hypnotist for training and at the final rehearsal be capable of inducing the state in herself at a given sign. The hypnotist need not be present at the confinement but he usually is, and should be if he is keen on a first-class job. It would seem then that the remuneration is somewhat small.—I am, etc.,

Branch and Division Meetings to be Held

ABERYSWYTH DIVISION.—At White Lion Hotel, Machynlleth. Saturday, December 6, 8 p.m., dinner-meeting. Lecture by Mr. John Howkins: "Criminal Abortion." Wives of members, and guests, are invited to the dinner only.

ALDESHOT AND FARNHAM DIVISION.—At Physiotherapy Department, Farnham Hospital, Thursday, December 4, 8.15 p.m., clinical meeting.

BROMLEY DIVISION.—At Farnborough Hospital, Wednesday, December 3, 8.15 for 8.30 p.m., meeting. Sir Francis Walshe: "Medicine Now and 30 Years Ago." Guests are invited.

COVENTRY DIVISION.—At Hotel Leofric, Thursday, December 4, 7.15 for 7.45 p.m., Ladies' Night.

CROYDON DIVISION.—At Selsdon Park Hotel, Sanderstead. Thursday, December 4, 7.30 for 8 p.m., annual dinner and dance.

EAST HERTS DIVISION.—At County Hospital, Hertford, Thursday, December 4, 8.30 p.m., clinical meeting. Members of the Hertfordshire Branch and members of Hertford Medical Society are invited. A special general meeting will follow.

FURNESS DIVISION.—Saturday, December 6, visit to Calder Hall Power Station. Doctors should meet at 3 p.m., at Calder Operations main police gate.

GUILDFORD DIVISION.—At Board Room, Royal Surrey County Hospital, Thursday, December 4, 8.30 p.m., Mr. Charles Keogh: "Disorders of the Pharynx."

HARROW DIVISION.—At Rest Hotel (West Room), Kenton Road, Kenton, Tuesday, December 2, 8.30 p.m., meeting: 8.45 p.m., Dr. G. S. C. Sowry: "Diabetes Mellitus—Its History and Present Position in Hospital, Clinic, and Practice."

LEWISHAM DIVISION.—At Committee Rooms, Lewisham Hospital, Friday, December 5, 8.30 p.m., Mr. C. F. Critchley: "Treatment of Cancer."

MIDLAND BRANCH.—At Jubilee Room, Grand Hotel, Colmore Row, Birmingham, Saturday, December 6, 12.30 for 1 p.m., luncheon to newly qualified graduates.

MONMOUTHSHIRE DIVISION.—At St. Mellons' County Club. Thursday, December 4, 8 p.m., annual dinner and dance.

NORTHERN IRELAND BRANCH.—At Orpheus Ballroom, Belfast. Thursday, December 4, dinner, 8 for 8.30 p.m.; dancing, 8 p.m. to 1 a.m.

NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Tuesday, December 2, 8 p.m., supper meeting. Talk by Dr. M. J. Cochran: "Mountaineering" (illustrated by lantern slides). Ladies are invited.

REIGATE DIVISION.—At Out-patient Department, Redhill County Hospital, Tuesday, December 2, (1) 8.30 p.m., special meeting: (2) 8.40 p.m., lecture by Mr. D. V. Balls: "Veterinary Science Relationships in Human Welfare."

SUNDERLAND DIVISION.—At Royal Infirmary, Sunderland, Friday, December 5, 8 p.m., joint meeting with Sunderland Law Society. Address by Dr. G. A. Fitzpatrick: "Legislation and Mental Health."

SUTTON COLDFIELD DIVISION.—At Town Hall, Sutton Coldfield. Thursday, December 4, 9 p.m. to 1 a.m., annual dance.

SWANSEA DIVISION.—At Brangwyn Hall, Swansea. Friday, December 5, 8 p.m. to 1 a.m., annual ball (9 p.m., dinner).

WANDSWORTH DIVISION.—At the Grove Hospital (St. George's Teaching Group), Tooting Grove, Tooting, S.W. Tuesday, December 2, 8.30 p.m., Grove Hospital Clinical Evening in conjunction with South London Faculty of College of General Practitioners. Supper will follow clinical demonstrations and discussion.

WEST DENBIGH AND FLINT DIVISION.—At Old Deanery Hotel, St. Asaph, Saturday, December 6, 7.15 for 7.30 p.m., dinner: 8.45 p.m., B.M.A. Lecture by Dr. George Marsh: "Trans-Antarctica, 1958." (Illustrated with slides.) Members' wives and friends are invited.

WEST MIDDLESEX DIVISION.—At Oldfield Hotel, Greenford Road, Greenford. Thursday, December 4, 8 p.m., annual ball.

WEST NORFOLK DIVISION.—At Wenn's Hotel, Thursday, December 4, 8.30 p.m., address by Squadron Leader D. Sturrock. R.A.F.: "Problems of Radiation for Doctor and Patient."

BRITISH MEDICAL GUILD

Meeting to be Held

BIRMINGHAM.—At B.M.A. Regional Office, 36, Harborne Road, Edgbaston, Tuesday, December 2, 8.30 p.m.

GENERAL MEDICAL COUNCIL

CENTENARY SESSION, 1958

A special Centenary Session of the General Medical Council was held on Thursday, November 27, with the President, Sir DAVID CAMPBELL, in the chair.

Appointments

Professor T. POMFRET KILNER was appointed a member of the Council, representing the University of Oxford, for the period of five years from August 1, 1958.

Notice was also given of the reappointment of the following members of Council: Dr. MACDONALD CRITCHLEY, representing the Society of Apothecaries of London, for the period of five years from August 20, 1958; Dr. A. TREVOR JONES, representing the University of Wales, for the period of three years from September 1, 1958; Mr. R. A. STONEY, representing the Royal College of Surgeons in Ireland, for the period of one year from October 14, 1958; and Dr. E. T. FREEMAN, representing the Royal College of Physicians of Ireland, for the period of one year from October 18, 1958.

B.M.A.'s Centenary Gift

Before delivering his Presidential Address, Sir DAVID CAMPBELL was asked by the President of the British Medical Association, Professor A. P. THOMSON, to accept, on behalf of the Association, a piece of inscribed silver.

Professor Thomson said it was a source of considerable satisfaction and real pride to members of the Association to be able to reflect that soon, after Charles Hastings at Worcester in the year 1832 founded the Provincial Association of Physicians and Surgeons, which later became the British Medical Association, a reform committee was established within the Association, and that committee took a considerable part in what might be called the "Battle of the Bills" and in the negotiations which were a prelude to the Act of 1858 establishing the General Medical Council.

"For that reason," concluded Professor Thomson, "the Council of the Association have asked me to invite your acceptance of this piece of silver which we have had inscribed, not only with the hope that there may be many happy returns of this occasion, your hundredth birthday, but also as a token of the appreciation of all members of the Association of the way in which this Council has discharged the difficult duties that were imposed upon it by Act of Parliament."

In response, Sir David Campbell said he felt sure that he was expressing the minds of every member of the Council

when he stated how highly the action of the British Medical Association was appreciated in helping the General Medical Council to celebrate their centenary by presenting such a beautiful gift.

"The British Medical Association has often been confused with the General Medical Council," continued the President, "and whether you regard that as complimentary or not I leave to you as President of the Association to decide! But I do know this, that since we have had direct representatives on the Council we have had the great good fortune to number among them many distinguished members of the Association who have given splendid service to the Council. I ask you as President of the Association to convey to your members our warmest thanks for this splendid gift."

Sir David Campbell then read a letter from the Wellcome Foundation Ltd. in which it was stated that the Librarian of the Wellcome Historical Medical Library, Dr. F. N. L. POYNTER, had prepared an album of portraits with brief outlines of the careers of all the Past Presidents of the General Medical Council. The Wellcome Library was part of the Wellcome Foundation Ltd., and the Chairman of the Board of the Foundation, Mr. M. W. Perrin, by whom the letter was signed, said it gave him great pleasure to present the album to the General Medical Council as a centenary tribute from the company and library.

The President expressed most cordial thanks to the Wellcome Foundation and to Dr. Poynter for the superb and historical album.

President's Address

At the 197th Session of the Council the President, Sir DAVID CAMPBELL, began by recording with deep regret the death of Professor G. M. Wishart, Lieutenant-General Sir Bennett Hance, and Professor J. A. Gunn, who had each helped the Council in various ways. He expressed the grateful acknowledgments of the Council to Sir Arthur Ellis, who had retired "after 15 years of devoted service" as the representative of the University of Oxford, and welcomed his successor, Professor T. P. Kilner, "the distinguished professor of plastic surgery in that University."

Their meeting in June, he continued, saw the completion of two important tasks on which the Council and the Disciplinary Committee had been engaged. The first was the adoption of a completely revised Notice for the Guidance of Medical Practitioners* in place of the Warning Notice which had formerly been issued. The second was the making of new Rules of Procedure to replace the original Rules made in 1951 before the

**Supplement*, June 14, p. 333.

Committee had acquired experience of the actual hearing of cases. The new Rules were in general shorter and simpler than the old. Their substance differed only in minor respects. The most important change was in the Rule relating to reception of evidence. This had been clarified and revised in accordance with the views expressed by the Judicial Committee of the Privy Council in the case of *Ong Bak Hin*. As required by the Medical Act, the new Rules were submitted to the Privy Council and were approved by them on October 30. They were then laid before Parliament, and came into operation on November 6. The proceedings of the Committee at their meeting earlier this week were accordingly conducted under the new Rules.

The Medical Act, 1956, by which all the earlier Medical Acts were consolidated, had itself been amended by the passage on August 1 of a further Act. This short but useful measure, said the President, made three welcome changes in the law. The most important of these simplified the procedure for obtaining provisional registration by providing that an applicant need no longer produce to the Council evidence that he had been selected for employment in a hospital. The effect of the change had been to expedite the process of provisional registration and to reduce administrative work on the part of hospitals, medical schools, and licensing bodies.

Another section of the Act related to the experience required for full registration in certain exceptional cases. These were of two kinds. The first comprised those few practitioners who qualified in the United Kingdom or in the Republic of Ireland before January 1, 1953, but did not then seek registration. The second, and more numerous, group comprised those practitioners who, before obtaining a British or Irish qualification conferring a right to provisional registration, had at an earlier stage in their career obtained in some other country a reputable medical qualification which (owing usually to the absence of reciprocity between that country and the United Kingdom) in itself conferred no right to registration in this country.

The section now enabled the Council for the first time to assess as a whole the professional experience of the applicant in both categories, and, if they thought fit, to register the applicants. These provisions, with which the Council fully concurred, had removed some anomalies which caused hardship. They had already registered twenty applicants under the new provisions.

The third change effected by the Act provided that the approval of the Treasury should no longer be required to the fees, expenses, and allowances payable to members of the Council. Since no expenditure of public funds was involved, the Treasury concluded that it was now unnecessary for their approval to be required.

The President then welcomed visitors from Commonwealth countries, and from one foreign country (Burma), with which we have reciprocity.

Greetings from Overseas Visitors

Dr. JOSEPH GALEA brought greetings from the Medical Board of Malta. The chief aim of the Medical Board of Malta was, he said, to follow the rules, regulations, and examples given by the General Medical Council.

On behalf of the Uganda Medical Board, Dr. D. G. SNELL said that the rising standards in the medical service of Uganda had been due in very large measure to the advice and encouragement given by members of the Council. It gave great pleasure to his African colleagues when formal recognition was given to the qualifications of the East African College of Makerere.

Professor G. A. ELLIOTT, in bringing greetings from the South African Medical and Dental Council, said that registration in South Africa followed very much the line of the General Medical Council.

One matter which had caused some difficulties in the past, but which it was hoped would be remedied in the near future was the "domiciliary clause." Under that clause a person holding a degree which was registrable with the South African Medical and Dental Council had to indicate, before he could be registered, that he intended to be domiciled for a period in South Africa. At the present

time the South African Council was trying to arrange for that term "domiciled" to be excluded, in order that there could be true reciprocity between the degrees registrable with the General Medical Council and those registrable with the South African Medical and Dental Council.

The Medical Council of Canada and the College of Physicians and Surgeons of British Columbia were represented by Dr. L. H. A. R. HUGGARD, who said that the Medical Council of Canada enjoyed its authority by virtue of an Act which was now over 50 years of age. "In a real sense we are young as a profession," he added, "for it was your Act which gave us professional status as compared with more senior professions, notably the Law and the Church."

Greetings were brought from the Medical Council of New Brunswick by Dr. H. STANLEY WRIGHT. The strength of an organization was, he said, the strength of its individual members, and it was gratifying to note the youthful vigour of the members comprising the General Medical Council.

Professor J. G. ALDOUS brought greetings from Dr. D. B. Stewart, the dean of the medical school of the University of Dalhousie, and warmest greetings were conveyed to the Council by Dr. W. G. D. RITCHIE on behalf of the College of Physicians and Surgeons of Manitoba.

THIRI PYANCHI Dr. U MIN SEIN, of the Medical Council of Burma, informed members of the General Medical Council that a small booklet was being published in his country on the history of medical education in Burma, and in one section for which he was responsible he had indicated that modern medical education in Burma was entirely due to the activities of a few British medical officers.

Dr. U Min Sein also stated that a new medical school had been opened at Mandalay, and he expressed the hope that eventually the General Medical Council might be gracious enough to accept their degrees.

Sir GORDON GORDON-TAYLOR offered the General Medical Council congratulations on behalf of the "great, keen, and enterprising" Royal Australasian College of Surgeons. Dr. K. C. YEO, who brought greetings on behalf of the Hong Kong Medical Council, said that the Hong Kong Medical Council registered only doctors with degrees or diplomas recognized by the General Medical Council.

The ethical standard of general practitioners in Hong Kong was on the whole good, but it was difficult to maintain a high ethical code when they were practising side by side with the native Chinese herbalists who were not subjected to disciplinary action or disallowed by law to practise. There were also refugee Chinese doctors who were unregistrable. The presence of over 300 refugee doctors from China presented a difficult problem for the Colony. Two lines of action had so far been taken. First, the employment of as many of those doctors as possible by the medical department of the Hong Kong Government, and, secondly, a special arrangement with the Society of Apothecaries for holding examinations in Hong Kong to enable the refugee doctors to obtain a registrable diploma recognized by the General Medical Council and Hong Kong Medical Council.

Finally, Sir WILFRED FISH, President of the General Dental Council, recalled that the Act which gave birth to the General Medical Council 100 years ago also contained within it the germ of the emergence of the General Dental Council as a legal entity. "We recognize that for 80 out of these last 100 years you have acted *in loco parentis* to us with such wisdom and understanding as could not have been bettered," he concluded.

The special centenary session then terminated.

Ordinary Business of the Council

Professor J. H. F. BROTHERSTON was elected to fill the vacancy created on the Disciplinary Committee, and Dr. H. S. MORLEY and Dr. G. W. IRELAND were elected to fill two vacancies on the Pharmacopoeia Committee.

Pharmacopoeia Committee

Dr. H. GUY DAIN, chairman of the Pharmacopoeia Committee, reported that the new edition of the *British*

Pharmacopoeia was selling well, but not so well as previous editions so far.

The new chairman of the British Pharmacopoeia Commission, Professor E. J. WAYNE, had reported that all the necessary arrangements for the work of preparing for the next *Pharmacopoeia* had been made, and an interim *Pharmacopoeia* would be published in 2½ years' time.

MEDICAL DISCIPLINARY COMMITTEE

The Medical Disciplinary Committee of the General Medical Council met on November 25 and 26 under the chairmanship of Sir DAVID CAMPBELL, President of the Council.

For Postponed Judgment

The Committee gave further consideration to a charge, on which judgment was postponed in November, 1957, against WILLIAM DAVID SMITH, registered as of 118, Marlborough Park Central, Belfast. Dr. Smith had been convicted on January 31, 1956, at Belfast Petty Sessions of being in charge of a motor-car when under the influence of drink or drugs. He had also been charged with having been convicted of a similar offence on May 15, 1957. The Committee was not satisfied that the evidence so far received would warrant it in discharging the case at the present time and postponed judgment for a further six months.

Further consideration was given to a charge, on which judgment was postponed in November, 1957, against ROBERT CREMONA, registered as of Westminster Bank Ltd., 1, Bath Road, Hounslow, Middlesex. Dr. Cremona was convicted in May, 1957, of obtaining with intent to defraud 30 tablets of "dicodide" and 100 tablets of "suavitil" by means of a forged National Health Service prescription and of contravening the Dangerous Drugs Act.

In view of the very satisfactory reports on Dr. Cremona's conduct, the PRESIDENT announced that the Registrar had not been directed to erase Dr. Cremona's name from the Register.

JOHN MILLER HUNTER MITCHELL, registered as of 96, Spottiswoode Street, Edinburgh, 9, made an interim appearance after having judgment postponed, in November, 1957, for two years on a charge that in July, 1957, he was convicted at the Portsmouth Magistrates' Court, after pleading guilty, of unlawfully and persistently importuning for immoral purposes, and that in August, 1957, he was convicted at the Sheriff Court of Lothians and Peebles at Edinburgh of committing acts of gross indecency with another male person.

Mr. P. BAYLIS, of Messrs. Hempsons, told the Committee that Dr. Mitchell had been receiving medical treatment. He had improved in health and there had been no repetition at all of the sort of conduct for which he was charged. But he had been unable to obtain professional work of any sort.

The PRESIDENT said he wished to make it perfectly clear that no ban whatever had been placed on Dr. Mitchell doing professional work. Mr. BAYLIS said that he appreciated that, but submitted that the only way in which Dr. Mitchell could be given an opportunity of resuming his professional work, although he was perfectly free as a matter of law to do so, would be for the Committee to conclude the case at the present stage, which he earnestly asked them to do.

The Committee directed that Dr. Mitchell's name should not be erased from the Register.

Further consideration was given to charges—on which judgment had been postponed in 1954 and on five occasions since—against WILLIAM FRANK CRUICKSHANK, registered as of Broxy Cottage, Westmuir, Brechin, Angus, first of having been convicted on March 13, 1954, of being drunk and disorderly; and, secondly, of neglecting his duties as a medical practitioner under the National Health Service and disregarding his personal responsibilities to the patients he had accepted on his list. In May, 1956, the Committee had been informed of a conviction in 1956 of driving a motor-car when under the influence of drink. In June, 1958, the

Committee had decided that it was once again not satisfied that the evidence concerning Dr. Cruickshank's habits and conduct warranted it in discharging the case and had given him a further opportunity to satisfy it.

Mr. G. J. K. WIDGERY, solicitor, read two testimonials to Dr. Cruickshank.

The Committee decided that Dr. Cruickshank was not guilty of infamous conduct in a professional respect in relation to the matters alleged against him in the second charge, and determined not to direct the Registrar to erase Dr. Cruickshank's name by reason of the conviction proved against him.

Erasures

Procuring Abortion

The Committee inquired into a charge against JOSEPH ADEWUNMI ADEMILUYI, registered as of 195, Harrow Road, London, W.2, that on December 9, 1957, at the Central Criminal Court, he was convicted on indictment of using an instrument with intent to procure an abortion, and was sentenced to four years' imprisonment, which was reduced, on appeal, to eighteen months' imprisonment. In June, 1958, the Committee considered a medical certificate stating that the practitioner was unfit to attend, and decided to adjourn the inquiry until the present session.

In presenting the facts, Mr. G. J. K. WIDGERY, solicitor, told the Committee that Dr. Ademiluyi was 44 years of age and at the time of the offence was in practice at 137, Seven Sisters Road, London, N.7. When he appeared at the Old Bailey he stated in his defence that the girl in question was in a state of melancholia, and that her health would have suffered if he had not terminated her pregnancy.

Mr. T. O. ELIAS, counsel, appearing for Dr. Ademiluyi, said that his client qualified in Nigeria in 1940, and between that time and 1948, when he came here to pursue his medical studies, he practised in Nigeria and held a number of responsible posts in gynaecology and obstetrics. Finally he was placed in charge of the general hospital in Ibadan. He acquired his British qualifications after that. The wide experience which he gained in Nigeria had enabled him to be of great service to Nigerians in this country. The Western Nigerian Commissioner and a number of important persons from Nigeria gave evidence testifying to the quality of Dr. Ademiluyi's practice and the high standards which he had always set himself. In the Court of Criminal Appeal, the Lord Chief Justice, in reducing the sentence from 4 years to 18 months' imprisonment, said he was quite sure that Dr. Ademiluyi was not a practising abortionist.

The PRESIDENT announced that, by reason of the conviction which had been proved against him, the Committee had directed the Registrar to erase from the Register the name of Joseph Adewunmi Ademiluyi. Dr. Ademiluyi has 28 days in which to appeal to the Privy Council.

Credit by Fraud

The Committee then inquired into a charge against WILLIAM RONALD PITT, registered as of 69, Hollyfield Road, Sutton Coldfield, Warwickshire, that on July 1, 1958, at the Assizes at Warwick, he was convicted (after pleading guilty) of obtaining £135 by false pretences between August 1 and September 10, 1957, and obtaining credit by fraud. He was sentenced to twelve months' imprisonment.

Mr. WIDGERY, solicitor, said that Dr. Pitt practised at Sutton Coldfield, and in July of last year he was adjudicated bankrupt with a deficiency of some £4,700. At his public examination it was said that drinking and gambling had been the two main causes of his failure. After his bankruptcy Dr. Pitt continued his practice, and in August last year he was consulted by a young man who had been suffering from a form of stomach disorder. After examining the patient, the doctor then told him that he had to take a film to the local hospital for developing. The patient thought that he had had an x-ray examination, since a number of electric wires had been placed round his body and the doctor had appeared to press various switches on and off during the examination. When the patient returned to the surgery later, Dr. Pitt told him that the examination

showed a serious liver disorder which, if not treated immediately, would cause the patient's death before he reached the age of 40.

Dr. Pitt recommended a course of injections of a certain drug which, he told the patient, was expensive and could not be obtained on the National Health Service: 135 injections would be needed at £1 per injection. The following week the patient paid Dr. Pitt £135 in cash. No receipt was given. After about seven injections the doctor said he was going on holiday for three weeks, and he gave the patient a number of tablets to take in lieu of the injections while he was away. During this time the patient consulted another doctor, who assured him that there was nothing wrong with his liver and that he was a fit and healthy man. Dr. Pitt eventually told the patient that he did not intend to charge him at first, but, as he put it, he was "stuck for money" and did not like to ask for a loan. Dr. Pitt handed the patient a cheque for £135, post-dated to November 14, 1957. The cheque was returned endorsed "Account closed, drawer adjudged bankrupt." Subsequently the doctor admitted to the police that the examination by wires and switches was a bogus one, that the injections he gave consisted merely of calcium, and that the tablets could be purchased by anyone at a chemist's shop. Dr. Pitt admitted that he got the money from his patient because he was absolutely desperate.

Another charge of obtaining credit by fraud arose out of an unpaid taxi fare of £5, said Mr. Widgery.

Dr. Pitt told the Committee that when he was adjudicated bankrupt the Warwickshire Executive Council took away all his patients. When the patient referred to came to see him, Dr. Pitt told him that at that time he was not a registered practitioner and the only patients he could have were private patients. He denied saying that the man might die. With the bankruptcy, drinking, and losing his house, Dr. Pitt said he got to the stage where he did not care what happened. In reply to the PRESIDENT, Dr. Pitt said he pleaded guilty to the offences at the Warwick Assizes on advice from his solicitor.

The Committee directed the Registrar to erase from the Register the name of William Ronald Pitt. Dr. Pitt has 28 days in which to appeal to the Privy Council.

Unlawful Killing

The Committee then proceeded to inquire into the case of LOUIS AIMÉE NEWTON, registered as of 40, Shoot-up Hill, London, N.W.2, who had been convicted on May 19, 1958, at the Central Criminal Court of unlawfully using an instrument with intent to procure a miscarriage, and unlawfully killing Jean Josephine Florence Cook, and was sentenced to imprisonment.

At the old Bailey trial the defence was that Miss Cook, an Australian nurse, had been sent to Dr. Newton by a psychiatrist, who said she was depressed because of her pregnancy, and accordingly Dr. Newton decided to terminate it. Mr. WIDGERY, solicitor, pointed out to the Committee that the prosecution had suggested that there was really no suicidal risk at all, and that it was just a case of a woman who was embarrassed by an unwanted pregnancy. Mr. Widgery reminded the Committee that Dr. Newton's name was erased from the Register in November, 1942, and remained off for five years. In 1940 Dr. Newton had engaged in what could be described as some sort of conspiracy to enable young men to evade military service, and his part in it was to issue false certificates.

Mr. N. J. L. BRODRICK, counsel appearing for Dr. Newton, stressed to the Committee that at the trial the jury had specifically acquitted Dr. Newton of any criminal negligence. Secondly, the view held by the Lord Chief Justice on appeal was that there was no justification whatever for considering Dr. Newton a professional abortionist.

The Committee directed the Registrar to erase Dr. Newton's name from the Register.

Dr. Newton has 28 days in which to appeal to the Privy Council.

Case from Hong Kong

YEOK KIN NG, registered as of 436, Nathan Road, Kowloon, Hong Kong, was struck off the Register after the Committee had heard a charge that he had committed adultery in his consulting-room on August 28, 1954, with a patient on an occasion when she had consulted him professionally; and that in respect of this conduct he had been subsequently convicted of rape in the Supreme Court of Hong Kong and sentenced to five years' imprisonment. Dr. Ng did not appear before the Committee and was not represented.

Mr. G. J. K. WIDGERY, solicitor, said that Dr. Ng had been consulted by a Chinese girl, Miss Tam Shun, aged 24, who had complained of stomach pains, and in the course of the examination the offence had occurred which had resulted in the charge of rape. The defence had been that the girl had consented to sexual intercourse. The Medical Board of Hong Kong, he said, had in November, 1955, held an inquiry into a charge similar to that before the Committee. In Dr. Ng's absence the charge had been found proved and his name had been removed from the Medical Register of Hong Kong.

The Committee found Dr. Ng to have been guilty of infamous conduct in a professional respect in relation to the facts alleged against him and directed that his name be erased from the Register. Dr. Ng had 28 days in which to appeal to the Privy Council.

Judgment Postponed

Influence of Drink

A charge against THOMAS PATRICK JOSEPH SINNOTT, registered as of the Surgery, Aberbargoed, Monmouthshire, that he had been convicted on three occasions of driving a motor-car when under the influence of drink was the subject of the next inquiry.

Mr. N. LEIGH TAYLOR, of Messrs. Hempsons, solicitors to the Medical Defence Union, acting on behalf of Dr. Sinnott, produced a number of testimonials showing that his client was in good standing with his colleagues locally. He told the Committee that the doctor was not a person who drank regularly, and pointed out that there was an interval of three years between the first two offences and the third.

The Committee decided that Dr. Sinnott's three convictions indicated habits which were not only discreditable to himself and to his profession but might well be a danger to his patients. To give him an opportunity of overcoming his tendency to drink to excess, the Committee decided to postpone judgment in the case for one year.

Mr. N. LEIGH TAYLOR, of Messrs. Hempsons, appearing for JOSE JAN LABNO, registered as of 84, Cloughton Road, Birkenhead, produced a petition containing the signatures of some 600 "grateful patients" of Dr. Labno, and read a number of testimonials from his colleagues.

Dr. Labno appeared before the Committee on a charge that on August 8, 1955, he was convicted at Birkenhead Magistrates' Court, after pleading guilty, of driving a motor-car when under the influence of drink, and was fined and disqualified from driving for twelve months, and that he was also convicted on July 24, 1958, at the Birkenhead Borough Quarter Sessions of a similar offence and was sentenced to three months' imprisonment and disqualified from driving for five years.

Mr. TAYLOR informed the Committee that his client was 44 years of age, married, and had four children. He was born in Poland and at the outbreak of war was a medical student at Cracow University. He was mobilized as an assistant surgeon, and was subsequently captured by the Russians, by whom he was "interrogated." He escaped and joined the Polish forces in France. When France fell, he went with the rest of the Polish force to Scotland. In 1941 Dr. Labno went to the Polish School of Medicine, Edinburgh University, and graduated in 1943. It took him two years, which, bearing in mind that he had to learn

English, showed aptitude and resolution, said Mr. Taylor. Dr. Labno went back into the Polish army, and served as the medical officer to a tank battalion in Normandy. He lost the sight of one eye and was seriously wounded. He had 65% disability pension and held decorations for bravery.

Dr. Labno found it difficult to find an opening in practice after the war, and finally, in 1950, in desperation he set up his plate in Birkenhead, and his present practice, consisting of 800 patients, had been built up entirely by himself with all due regard for the ethics of his profession. Although by no means addicted to alcohol, Dr. Labno had resolved that his drinking should not continue.

The Committee determined to postpone judgment for one year in order to give Dr. Labno an opportunity to overcome his admitted tendency to drink to excess.

The Committee also postponed judgment for one year in the case of GEORGE THOMAS ALEXANDER HASTINGS, registered as of 142, Robin Hood Lane, Hall Green, Birmingham, 28, to give him an opportunity of overcoming his admitted tendency to drink to excess, as evidenced by three convictions of being in charge of a motor-car when under the influence of drink.

Mr. P. BAYLIS, of Messrs. Hempsons, appearing for Dr. Hastings, said that Dr. Hastings had had medical treatment, and since September he had had no alcohol. Mr. Baylis read three reports from medical practitioners who had treated Dr. Hastings, and placed thirteen testimonials before the Committee, nine of which came from general practitioners in the Birmingham area.

The Committee gave further consideration to a charge—on which judgment had been postponed in 1956 and 1958—against JAMES WATSON RICHMOND, registered as of Culsamond Old Manse, Inch, Aberdeenshire, of having been convicted on January 23, 1956, of assault and of conducting himself in a disorderly manner and committing a breach of the peace.

Mr. G. J. K. WIDGERY, solicitor, reported that Dr. Richmond had written to say that he was receiving National Assistance and had no means to travel to London.

The Committee decided that they were still not satisfied that the evidence received warranted their discharging the case. They postponed judgment for a further six months.

Inquiry Postponed

Inquiry into a charge against THEODOTUS JOHN SUMNER, registered as of 172, New Road, Porthcawl, Glamorgan, that he was convicted on July 11, 1958, at the Assizes at Swansea, of manslaughter and was sentenced to four years' imprisonment, was postponed until a later session. Mr. WIDGERY, solicitor, said that he had received a medical certificate from the prison medical officer certifying that Dr. Sumner was an in-patient in the prison hospital and was unfit to attend the inquiry.

Names Restored

The Committee consented to two applications for restoration to the Register after disciplinary erasure.

The first was Mr. KENNETH LEOPOLD GEORGE NOBBS, G.M. He had been erased from the Register on July 1, 1957, on the grounds of his adultery with a patient.

Mr. N. L. TAYLOR, of Messrs. Hempsons, solicitors, on behalf of the applicant, read a number of testimonials. He produced a petition organized by Dr. Nobbs's former patients containing over 700 names, and stressed his fine war record, included in which was the award of the George Medal. He stated that Mr. Nobbs had since married the patient in the case and they had a 5-months-old baby.

The second application was that of EBENEZER FRANCIS THOMAS. Mr. G. J. K. WIDGERY, solicitor, said that Mr. Thomas's name had been erased from the Register in June, 1955, by reason of the applicant's adultery with a woman patient.

Mr. R. E. G. HOWE, counsel, stated that Mr. Thomas's liaison with the patient had come decisively to an end. He read a number of testimonials.

The Committee decided to restore both names to the Register.

DISTRIBUTION OF 4% INCREASE DISCUSSIONS WITH MINISTRY

A deputation from the General Medical Services Committee consisting of Dr. A. B. DAVIES, the chairman, and Drs. R. J. T. GARDINER, F. GRAY, C. F. R. KILLICK, and A. TALBOT ROGERS had a preliminary discussion with Ministry of Health representatives on December 3 on the way in which the further interim increase of 4% in the remuneration of general practitioners in the Health Service is to be distributed. The G.M.S. Committee, when it was informed at its meeting on November 20 (*Supplement*, November 29, p. 229) of the interim increase, and that the method of its distribution was to be discussed with the profession, decided that the new money should be applied, so far as possible, as a percentage addition to all those payments to general practitioners by executive councils which rank for superannuation. The Committee appointed the above-named members to form a working party to negotiate this proposal with the Ministry officials. Broadly speaking, the proposed distribution, if the Ministry accepts it, means that every general practitioner will receive approximately a 4% increase in his net remuneration—that is, excluding that part of his remuneration which represents payment for practice expenses—as from the end of the first quarter of 1959.

NOW WE ARE SEVEN

One of the smallest Branches of the B.M.A., the Seychelles Branch, held its first annual general meeting on September 26. Mr. T. M. J. OFFAY was re-elected president, and Dr. B. H. G. COLLIE was re-elected honorary secretary and treasurer. The Branch, which covers the Seychelles islands, currently has 11 members. Last year, since only three members were present at any one time on the main island of Mahe, it was not possible to hold any clinical meetings or conferences, but there are now seven members permanently on Mahe, and the Branch council is preparing a programme for the coming year.

St. Vincent, in the British West Indies, has a current membership of 10, and the St. Lucia Branch, also in the West Indies, has 11 members.

ANNUAL MEETING NEWSREEL

The B.M.A.'s 1958 Annual Meeting at Birmingham was recorded in a film made for the Association by Messrs. William R. Warner and Co. Ltd. The film looks in on the ceremonial occasions, scientific sessions, and exhibitions, the Representative Meeting, and social functions, formal and informal. The film, which is 16 mm., partly in colour and with sound commentary, runs for 15 minutes and is available for showing to Branches and Divisions, both home and overseas. Application should be made to the Film Library at B.M.A. House.

HOSPITALITY

A German doctor has a 15-year-old son who would like to make an exchange visit with a British doctor's son during next summer holidays. Two 13-year-old German boys would also like to make an exchange.

Would anyone interested please get in touch with Dr. R. A. Pallister, International Medical Advisory Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

HOSPITAL JUNIOR STAFFS GROUP COUNCIL

Mr. R. BREARLEY was elected Chairman of the Hospital Junior Staffs Group Council at its meeting in B.M.A. House on November 28. Dr. A. PATON was elected Deputy Chairman. The CHAIRMAN extended a welcome to the new members of the Council, and particularly to Dr. E. R. CULLINAN, who was attending for the first time representing the Central Consultants and Specialists Committee.

A proposal by the CHAIRMAN that the Chairman of the Junior Members' Forum, Dr. R. M. S. MATTHEWS, be invited to join the Group Council as a member was adopted.

Time-expired Senior Registrars

The CHAIRMAN reported that the Council of the Association approved on November 12 (*Supplement*, November 22, p. 217) a recommendation of the Central Consultants and Specialists Committee that in the event of the establishment of special designated posts for senior registrars in accordance with the Minister of Health's proposals, advertisements for such posts be not accepted for the *British Medical Journal*, and that, if necessary, the posts be made the subject of an "Important Notice."

In reply to Mr. W. J. ATKINSON, who asked what was the official reason for making this decision, the CHAIRMAN said it was feared that the proposed designated posts would prove to be dead-end appointments without prospects. For a long time it had been the policy of the Group Council that senior registrars' positions should be reviewed at the end of their fourth year, or during their four years' service. Those considered suitable for consultant posts ultimately should be confirmed in office, and thereafter they should have security of tenure and some sort of rising incremental salary scale. That seemed to be a simple way of solving the immediate difficulty facing many who were already in that position, but when the matter was discussed between the Joint Consultants Committee and the Ministry the latter would not agree to it. Dr. HAMISH WATSON expressed the view that it was necessary to put an "Important Notice" in the *Journal*. Those who were likely to be offered the new posts were the registrars who were faced with unemployment, and their fear would be that if they did not take a designated post someone else would be appointed and they would find themselves out of work. If they had the courage to refuse, very few regional hospital boards would go ahead and appoint someone else.

In conjunction with the question of time-expired senior registrars, the Group Council spent some time discussing two motions proposed by the North-west Metropolitan Region hospital junior staffs group, which were finally adopted in the following form:

(1) That the Hospital Junior Staffs Group Council approves the principle of salary increments for time-expired senior registrars, confirmed in office after the fourth year, with security of tenure, but without prejudice to their chance of future promotion, pending the working party's report.

(2) The Hospital Junior Staffs Group Council notes with anxiety that patients are frequently dealt with only by inexperienced medical staff as opposed to consultants, as a result of the present unsatisfactory staffing structure, and the deplorable effect of this on the Health Service.

Mr. D. E. BOLT, in presenting the first motion, said it was an expression of a feeling bordering on panic among the time-expired senior registrars. Their financial problems were becoming very acute, and they were inclined to feel that there had been a certain unreality about the discussions on a problem which affected them personally. Secondly, if a man was a time-expired senior registrar, and in a post which by any manoeuvre was made designated, he would be an archangel if he did anything other than accept it. The CHAIRMAN added that the choice was between accepting a little more money or unemployment. If such a situation arose, the man had little choice but to accept the post. On

the second motion, in reply to some doubt raised by Dr. WATSON, Mr. ATKINSON maintained that there was a loss of experienced senior registrars under the present system.

The CHAIRMAN pointed out that, when the evidence of the Royal Commission was being prepared, several bodies, including the Joint Consultants Committee, tried to obtain statistical information about emigration, but nobody was able to collect very convincing figures. Dr. D. J. O'SULLIVAN said that, from figures gathered in Birmingham, the loss was found to be less than had been thought. Mr. ATKINSON said that the really important point was that in some peripheral hospitals there was a shocking lack of experienced medical staff, and this was a deplorable state of affairs.

The Group Council agreed that both motions should be submitted to the Public Relations Committee and to the Working Party on Hospital Medical Staffing.

Evidence to Royal Commission

Dr. J. E. FORSTER submitted a resolution from the Liverpool Region hospital junior staffs group noting with concern that oral evidence had so far not been given to the Royal Commission on behalf of hospital junior staff. The CHAIRMAN assured Dr. Forster that the executive committee had not been sleeping on the matter. The Group Council could not demand to give oral evidence. It could only remind the Royal Commission that only one memorandum had been submitted on behalf of the Group Council and that it wished to give oral evidence.

The Council agreed that this should be done and that the Royal Commission should be informed that the Group Council would like to give oral evidence.

Constitution of Group Council

The Council considered a resolution from the South-western Region hospital junior staffs group seeking an increase in the number of regional group representatives on the Central Group Council from two to three, at least one of whom should be a house officer or senior house officer. At the same time consideration was given to a suggestion made at the Junior Members' Forum that the representation of senior house officers and house officers on the Hospital Junior Staffs Group Council was inadequate.

The CHAIRMAN said that, while he would welcome more house officer representatives, they should not be appointed members of the Group Council by some artificial means, but as the result of local demand.

The Council agreed to pass to next business. It was reported that a suggestion made at the Junior Members' Forum, that the pre-registration housemen's representation on the Medical Students and Newly Qualified Practitioners Subcommittee should be expanded, was being referred to that subcommittee. Another suggestion made at the Junior Members' Forum was that the relevant committee be asked to consider the possibility of the committees and subcommittees concerned with the welfare of young practitioners meeting on a Saturday.

The Group Council did not support the suggestion.

Standards of Accommodation

The following resolution from the South-western Region hospital junior staffs group was considered:

That the recommendations of Committee B of the Medical Whitley Council regarding standards of accommodation of hospital junior medical staff, as set out in the circular H.M. (58) 68, be made official terms of service.

Dr. E. E. CLAXTON, Assistant Secretary, pointed out that it would not be practicable to make the recommendations official terms of service. A request could be made that in the letter of appointment the hospital should undertake to carry out the provisions of circular H.M.(58) 68.

Removal Allowance

A resolution from the Western (Scotland) Region hospital junior staffs group was considered in which a request was

MEDICAL PRACTICES COMMITTEE

PROCEDURE IN SELECTING APPLICANTS

The Medical Practices Committee has made a statement on the procedure it follows when representatives of an executive council are present during the interviews of applicants for medical practice vacancies.

When the Committee interviews applicants for advertised medical practice vacancies it invites the executive council to send representatives to advise the Committee and to be present during the interviews. A meeting with the executive council's representatives is fixed for ten minutes before the time set for the interviews of candidates, and the representatives are invited to give the Committee the views of their council, and any information which will help to provide the members of the Committee with as complete a background as possible. The executive council's representatives are invited to question the applicants during interviews, and when these are ended a full discussion takes place in which every opportunity is afforded the representatives to state their views. The executive council's representatives then withdraw while the Committee selects the applicant for the vacancy. The council's representatives are invited to return to hear the decision.

The statement adds that executive councils who have sent representatives have frequently expressed satisfaction that their views had been fully taken into consideration by the Committee.

Scottish News

OPENING OF GLASGOW OFFICE

The new Glasgow office of the B.M.A., into which Dr. J. M. McCutcheon, Assistant Scottish Secretary, and his staff moved on May 22, was officially opened by the President of the Association, Professor A. P. THOMSON, on November 28. "An Association such as ours," said Professor Thomson, "is nothing without a home—a place where people may meet and talk." In his view the new headquarters in Glasgow would provide such a place and was admirable for its purpose. Dr. G. IRELAND, Chairman of the Scottish Council, presided at the opening ceremony and was supported by Mr. L. DOUGAL CALLANDER, Treasurer of the B.M.A., Dr. D. P. STEVENSON, Secretary, Dr. E. R. C. WALKER, Scottish Secretary, Dr. I. D. GRANT, Vice-President, Dr. W. M. KNOX, Immediate Past-chairman of the Scottish Council, and Dr. J. M. McCutcheon, Assistant Scottish Secretary. Many guests and members of Divisions served by the Glasgow office were present, and refreshments prepared by the staff were provided. Since the staff had taken a large share in furnishing and decorating the house, it was natural that they should show a pride in their new home, and the occasion had the air of a hospitable family gathering.

The office was described in a previous issue of the *Supplement* (May 17, p. 257). The address is 9, Lynedoch Crescent, Glasgow, C.3, and it is a nineteenth-century terrace house of ample proportions. Meals are not served, but there is a coffee-room where members and their wives may meet for light refreshment. It is hoped shortly to provide a small reference library.

Some Aspects of Medical Education

In the evening of November 28 the Glasgow Division met at the Glasgow office, with Dr. J. S. McLAREN QRD in the chair. Professor A. P. THOMSON gave a lecture on some aspects of medical education in which he reviewed the social and religious influences which governed the growth of British hospitals and medicine and the part they played in the education of doctors.

made that some form of disturbance allowance should be paid to hospital junior staff who were required to circulate within the region under their terms of contract, or who were required to move on promotion or change of appointment. Apparently removal allowances were given to some people in the Service. Dr. FORSTER suggested that it might prove an additional incentive to medical staff if they were able to obtain removal expenses.

The CHAIRMAN said that, according to the relevant circular, two points arose. One was that the scheme was not really for medical staff, but might, at the discretion of the Minister, be applied to them. Secondly, the discretion would be in their favour if the transfer were compulsory. Dr. WATSON suggested that the matter ought to be pursued.

Members of the Group Council agreed to collect specific instances, together with figures, so that a case could be prepared for submission to the Staff Side of Committee B.

Representation on Hospital Committees and Boards

A resolution from the South-western Region hospital junior staffs group asking the Group Council to press for direct representation of hospital junior medical staff on hospital management committees and boards of governors of teaching hospitals was not carried. Dr. CLAXTON pointed out that it would need an Amending Act in Parliament, and the chance of it succeeding would be small. On the other hand, when matters of concern to hospital junior staffs were discussed, hospital management committees could be asked to invite members of the junior staff to express their point of view.

Interviews for House Appointments

Mr. MYLES GIBSON described as "dangerous" a resolution submitted by the North-east Metropolitan Region hospital junior staffs group. The resolution called on the Group Council to disapprove of the practice, when making house appointments, of asking numerous candidates to attend for interview, even from great distances, in those instances where the future holder of the appointment had unofficially been already chosen.

The CHAIRMAN pointed out that regulations were also involved.

The motion was lost.

Publishing Speakers' Names

A resolution moved by Dr. B. McConkey, on behalf of the Welsh Region hospital junior staffs group, that the names of speakers in Group Council meetings should not be published in the reports in the *Supplement* to the *British Medical Journal* was lost. Dr. McConkey said that the resolution was not prompted by any particular incident, but at the last meeting of his regional group it was suggested that the publication of names could lead to unfortunate results.

Mr. D. E. BOLT said that in his view members should have the courage to support in public and in print what they said at meetings.

THE PRESIDENT-ELECT

As was reported in the *Supplement* of September 27 (p. 149). His Royal Highness the Prince Philip, Duke of Edinburgh, President-elect of the Association, regretted that he would be unable to attend the Joint Annual Meeting of the British and Canadian Medical Associations in Edinburgh next July, as he will be in Canada with the Queen all that month. It is now understood that, if it is humanly possible, His Royal Highness will attend a function of the British Medical Association in London in November or December next year. He also hopes that it will be possible for a meeting of the Canadian Medical Association to be included in the programme of next summer's visit to Canada.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Voice of Medicine

SIR,—For members of hospital staffs, the reports of the meetings of the Central Consultants and Specialists Committee seldom make cheerful reading; yet an examination of the report in the *Supplement* of July 12 (p. 32) suggests that a new nadir has been reached. According to the report, after years of consideration the Minister has made a unilateral decision to create special posts for time-expired senior registrars "in the teeth of our opposition." Doubtless it might be claimed that this would ease one aspect of the staffing position, but, as Professor G. I. Strachan correctly pointed out, "the fact that the designated posts seemed to be additional to the registrar establishment aggravated the position." Whether one agrees with the idea or not, one can scarcely be blamed for the suspicion that this may be the embryo of a sub-consultant grade, and, even though the present Minister may not regard it as such, his successor may not take the same view. In fact we see about to be put into action a plan to which our official policy is entirely opposed, and we are powerless to prevent it.

Eighteen months have passed since the commencement of the professional review of S.H.M.O.s undertaking consultant duties. 456 cases were selected for immediate review by the Management Side of Whitley Committee B, but when presented with this number they replied with a characteristic delaying action—the setting up of yet another committee. On lesser matters, such as delay in advertising vacant hospital posts, the fact that hospital authorities have no responsibility for the belongings of an employee, and the new suggestion that the Minister himself has no moral obligation to find other employment for displaced consultants and S.H.M.O.s, much dissatisfaction has been expressed by the Staff Side to the Management Side. In two major and three minor items, the Management Side have apparently been almost wholly uncooperative, and, by means of (1) unilateral action, (2) procrastination, (3) delay, (4) legal argument, and (5) assertion, have in fact defeated the Staff Side's expressed or implied intentions.

An important point emerges from the decision on the S.H.M.O. problem, for, according to Mr. Holmes Sellors, "it appeared that the Management Side had had no idea that the problem was so extensive." This is by far the most serious criticism which has ever been made of the Management Side, because, if it is true, then there must be doubt as to whether that side of the Committee is sufficiently informed on other matters of serious import to discuss them competently and responsibly. Decisions at present taken may affect the service for many decades. Is it possible that other problems which have been unsatisfactorily disposed of were in the same category and that the implications of their decisions escaped the Management Side? It is indeed a sobering thought. Do the Committee know, for example, that the late '70s and early '80s will see the retiral of a disproportionate number of consultants and that many of the men who may subsequently fill these posts have already begun their medical studies? In a few years many will hear of the senior registrar and S.H.M.O. problem and will take care that they do not personally aggravate the situation. Failure to arrive at a reasonable solution will almost inevitably affect the quality of subsequent hospital staffing in the latter part of the century. The eventual future staffing of the hospital services is in jeopardy, while there is no guarantee that sufficient heed will be paid to advice of hospital staffs, who are virtually powerless to have their carefully considered plans enacted, either through the central committees or medical advisory machinery, which has no statutory authority.

It appears possible that members of the Staff Side are becoming mesmerized by the consistently negative attitude of their opposite numbers. It may even be that through constant repetition the former regard the Management Side's attitude as correct. May I quote conclusion (2) from the Sixth Report of the Select Committee on Estimates, "Running Costs of Hospitals"? "The Committee have been impressed by the devotion and enthusiasm that prevails throughout the Service, but they have also been

depressed by the apparent lack of vigour with which some fundamental problems are being faced by the Ministry." Here we have a condemnation of this same negative attitude which the profession continually experiences.

Such problems as I have outlined will, of course, not be solved by the Royal Commission. That is not its purpose. They are essentially due to the fact that we are paid almost exclusively by the State. This appears to me to be the root of our lack of power to make our voices heard in the development of the Service and of our inability to influence decisions affecting our present and future conditions of service. Joint committees have become a burlesque and some advisory committees are not heeded by regional boards; not to mention the way in which the Ministry and Ministers ride roughshod over professional decisions and appeals. The present dispute in Scotland is typical, where the Secretary of State, after being associated with the invitation to the profession to seek a decision in the courts *re* the validity of Spens, refuses to take part in the special case proceedings. The only possible protest by the profession is the usual impotent document "without teeth," expressing disappointment and lack of confidence. How utterly pathetic.

The simple fact is that 10,000 consultants, specialists, and other hospital medical staff could very easily make their voices heard if they wished to do so, but there remains the suspicion, already voiced in a Council meeting (*Supplement*, April 12, p. 153), that there is "some faint-heartedness and dragging of feet somewhere." If this is not the case then there is work to be done. If, as in many other countries, doctors were paid in part by the patient, State, and private insurance or provident society, then we would be on the way to re-establishing our independence and our voice in Service counsels. It is time representatives of the hospital staffs, the large insurance companies, and the provident institutions, a rising power among us, met to thrash out the financial side of this. What annual fee is required per head of the population to cover the present sickness rate, and pay the hospital staffs, on an item-for-service or other agreed basis? The amount of our salaries is important, the method of payment even more so. Before we can have an adequate voice in the lay administration of the hospitals we must re-establish a degree of financial independence. That is the root of our problem.

Between 1952 and 1956 the British United Provident Association increased its registrations almost fourfold—to 252,000 by June 30 of that year. On the average each registration included one dependant in addition to the subscriber, so that the total is now presumably well over half a million. "The Australian Government has endorsed the principle of giving Commonwealth assistance to special insurance funds set up by registered health insurance organizations for people who cannot be insured at normal rates because of their age, or pre-existing or chronic illness" (*Supplement*, August 30, p. 130).

This surely removes one of the great objections to the introduction of a partly voluntary and privately organized health service—namely, its inability to pay its way. It is imperative that consultations be held as outlined so that we may have some idea of the workability of such alternative schemes in the near future. The Government are about to reorganize the pension side of the National Insurance scheme in order to save the taxpayer from extortionate demands in another decade. There is no guarantee that such a scheme might not be welcomed by a future government faced with ever-rising Health Service demands and costs. But the hour is late; it is time our constructive proposals for an alternative organization were formulated and circulated to the profession for discussion. Otherwise, as in the past, the decisions will be taken for us.—I am, etc.,

Worcester.

JOHN C. WOOD.

Fee for Service

SIR,—In the fullness of time there will be a Pilkington report on doctors' and dentists' remuneration, and in the negotiations that follow, whether amicable or more probably acrimonious, the question of distribution as well as total remuneration will undoubtedly be well to the fore. Recent leading articles and correspondence in *The Times*

Junior Specialist Staff

SIR,—A possible way of coping with the junior staff of hospitals would be to inaugurate the following system. After a period of training, with a specialist degree, and having regard to any particular work or papers published, a candidate from any post is allowed to apply to a committee set up by the Royal Colleges for grading as a specialist. Once the candidate is graded his pay automatically rises annually to that of a consultant, but not beyond, provided he stays in hospital employment. The starting salary could be fixed at registrar level and increased by annual increments of, say, £125 to £2,000 a year.

If a doctor who has received a general training wishes to specialize further, say, in chest surgery, and to do so becomes a houseman, he would continue, once having been graded, to receive the same salary and its increments. It would also provide the young trainee, who usually has a family to support, with a living wage while he awaits consultant status. It would also, of course, give him a security of tenure because of the innumerable jobs that exist in the State scheme, some of which are always vacant. It would also relieve the terrible anxiety of not knowing if employment could be found at the end of the senior registrar post. It would also allow the young men who wish to leave a teaching hospital to continue work as registrars. In this way the doctors awaiting consultant status could obtain employment anywhere at a living wage with a security which under the National Health Scheme is denied solely to this type of doctor.—I am, etc.,

Hitchin.

J. J. SHIPMAN.

Four Per Cent.

SIR,—I think the "holus bolus" acceptance of the 4% increase for the medical profession in the National Health Service is a bad decision. An 8% increase to those with salaries under £2,000 per year would have been of some benefit. The increase will mean very little to the consultants and it is one which I, personally, could easily have forgone for the less fortunate colleagues. All that will happen is that it will antagonize the public, and one gets very tired of refuting the charge "how grossly overpaid the consultants are." From the doctors' point of view, and particularly the consultants', the more I see of the administration side of the National Health Service, the less I like it.—I am, etc.,

Irvine.

RICHARD DE SOLDENHOFF.

Medical Appointments Overseas

SIR,—At the B.M.A. conference on medical appointments overseas (*Supplement*, November 22, p. 220), some of the solutions offered to the problem of filling vacancies seemed to me to bear a remarkable resemblance to some of those which have been tried for filling vacancies in regional hospitals at home. Professor J. H. F. Brotherston is reported (p. 223) as saying: "The moment it was known that a senior registrar who had one or two years' experience overseas stood a better chance of a consultant appointment, the authorities would be troubled with riches rather than poverty." For "overseas" substitute "in regional hospitals at home" and one of the most pressing problems of the N.H.S. is solved in a flash—except, of course, for the small matter of turning a pious hope into reality.—I am, etc.,

Shenfield, Essex.

I. M. LARKIN.

TRADE UNION MEMBERSHIP

The following local authorities are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham.

Non-County Borough Councils.—Crewe.

A. M. GOLDTHORPE.

Leigh on Sea, Essex.

Association Notices

ELECTION OF A MEMBER OF COUNCIL

The voting to fill the vacancy in the Council announced in the *Supplement* of October 18 (p. 176) has resulted in the election of Dr. R. P. Liston, Tunbridge Wells, Kent.

D. P. STEVENSON,
Secretary.

Branch and Division Meetings to be Held

BARNET DIVISION.—Friday, December 12, visit to Houses of Parliament. Assemble in Palace of Westminster at 6.30 p.m. Dinner in House of Commons.

BATH, BRISTOL, AND SOMERSET BRANCH.—At Wessex Room, Mermaid Hotel, Yeovil, Thursday, December 11, 8.30 p.m., annual general meeting. Presidential address by Mr. J. C. McMaster: "A Different Viewpoint."

BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, North Shore, Blackpool, Wednesday, December 10, 7.15 p.m., dinner; 8.45 p.m., Mr. P. S. London: "Treatment of Wounds and Internal Fixation of Open Fractures." A special meeting will follow.

BORDER COUNTIES BRANCH.—At Station Hotel, Carlisle, Thursday, December 11, 4 p.m., annual general meeting.

BRIGHTON AND MID-SUSSEX DIVISION.—At Royal Alexandra Children's Hospital, Thursday, December 11, 8.30 p.m., clinicopathological conference.

BURTON-ON-TRENT DIVISION.—At Stanhope Arms, Bretby, Tuesday, December 9, 7.45 p.m., Dr. John Malins: "Diabetes Mellitus." Preceded by informal dinner.

CHELSEA AND FULHAM DIVISION.—At St. Stephen's Hospital, Fulham Road, S.W., Tuesday, December 9, 8.30 p.m., general meeting. Lecture by Dr. J. B. Harman: "New Drugs for Old." A discussion will follow. Members of the Kensington and Hammersmith Division are invited.

CHESTERFIELD DIVISION.—At Walton Sanatorium, Friday, December 12, 8.45 p.m., B.M.A. Lecture by Mr. A. Lawrence Abel: "Common Diseases of the Rectum and Anal Canal" (illustrated with lantern slides and films).

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Tuesday, December 9, 8 for 8.30 p.m., debate: "The National Health Service has rendered the profession of medicine less attractive." Proposer, Mr. A. Lawrence Abel; seconder, Dr. J. L. McCallum. Opposer, Dr. H. Jules; seconder, Dr. D. Kerr. One of the most important meetings of the year. All B.M.A. members invited.

DEWSBURY DIVISION.—At Board Room, Dewsbury General Hospital, Friday, December 12, 8.30 p.m., lecture by Dr. Rex Tattersall: "Recent Advances in Therapeutics."

EAST KENT DIVISION.—At Ballroom, County Hotel, Canterbury, Thursday, December 11, 7.30 p.m., dinner; 8.45 p.m., address by Dr. D. P. Stevenson (Secretary, B.M.A.): "Looking Ahead." Members of Maidstone and Rochester, Chatham, and Gillingham Divisions are invited.

EAST YORKSHIRE BRANCH.—At Hull Medical Society, 68, Park Street, Hull, Wednesday, December 10, 8.30 p.m., B.M.A. lecture by Dr. Brian Russell: "Dermatology and the Inner Man."

ENFIELD AND POTTERS BAR DIVISION.—At St. Michael's Hospital, Chase Side Crescent, Enfield, Friday, December 12, 8.30 p.m., "Doctors' Hobbies." Speakers will include Dr. C. A. Birch: "Bees"; Drs. J. Dalziel, G. S. Moore, and R. B. L. Ridge: "Sailing" (illustrated).

FURNESS DIVISION.—At Old England Hotel, Windermere, Friday, December 12, 8 for 8.45 p.m., annual dinner and dance.

GLOUCESTERSHIRE BRANCH.—At Cheltenham General Hospital, Thursday, December 11, 5.30 p.m., clinical meeting, followed by supper at Moorend Park Hotel.

HASTINGS DIVISION.—(1) At Royal East Sussex Hospital, Tuesday, December 9, 8.15 p.m., Dr. D. F. Ross: "X-ray Investigation of Abdominal Pain." (2) At Queen's Hotel, Hastings, Friday, December 12, 7.30 for 8.15 p.m., annual dinner and dance.

HENDON DIVISION.—At Hendon Hall Hotel, Ashley Lane, N.W., Tuesday, December 9, 8.45 p.m., Dr. Macdonald Critchley: "The Language of Gesture."

KENSINGTON AND HAMMERSMITH DIVISION.—At West London Hospital, W., Tuesday, December 9, 8.30 p.m., film show: (1) "Case of Scurvy"; (2) "Gait"; (3) "Medical Hobbies"; (4) "Infections of the Hand."

KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Tuesday, December 9, 8 for 8.30 p.m., address by Dr. Peter Bishop: "Modern Endocrine Therapy."

LAMBETH AND SOUTHWARK DIVISION.—At Antenatal Clinic, Lambeth Hospital, Wednesday, December 10, 8.15 for 8.30 p.m., Miss Lois E. Hurter: "Haemorrhage in Obstetrics." A discussion will follow.

LEIGH DIVISION.—At Courts Hotel, Church Street, Leigh, Tuesday, December 9, 8.30 p.m., Dr. V. T. Lees: "The Retina in Health and Disease" (illustrated by slides).

MID-HERTS DIVISION.—At Hill End Hospital, St. Albans, Friday, December 12, 8.30 p.m. to 1 a.m., annual dance.

MIDLAND BRANCH.—At Birmingham Medical Institute, 36, Harborne Road, Edgbaston, Birmingham, Thursday, December 11, 3 p.m., 97th annual meeting. Illustrated account by retiring President, Dr. F. E. Gould: "A Trip to Denmark."

NORTH-EAST ESSEX DIVISION.—At Red Lion Hotel, Colchester, Thursday, December 11, 7.45 p.m., dinner meeting in conjunction with Colchester Medical Society. Dr. Peter Bishop: "Endocrines and Cancer."

NUNEATON AND TAMWORTH DIVISION.—At Newdegate Arms Hotel, Tuesday, December 9, 7.30 p.m., supper; 8.30 p.m., B.M.A. lecture by Dr. Ian Grant: "Preview of South Africa." Wives of members are invited.

PRESTON DIVISION.—At Sharoe Green Hospital, Tuesday, December 9, 8.30 p.m., lecture by Mr. A. McDowall.

READING DIVISION.—At Library, Royal Berkshire Hospital, Reading, Thursday, December 11, 8.30 p.m., Dr. W. G. Tait: "The College of General Practitioners—Past, Present, and Future." Members' wives are invited.

ROCHDALE DIVISION.—At Nurses' Lecture Theatre, Birch Hill Hospital, Rochdale, Monday, December 8, 8.45 p.m., clinical meeting. Mr. H. A. Maslowski: "Selected Practical Neuro-surgical Problems."

ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Thursday, December 11, 8.30 p.m., Dr. Geoffrey Parker: "Some Experiences of a Surgeon in the French Resistance." Members of City and Hampstead Divisions are invited.

SCARBOROUGH DIVISION.—At Pavilion Hotel, Scarborough, Thursday, December 11, 7.45 for 8.15 p.m., annual dinner.

SOUTH BEDFORDSHIRE DIVISION.—At Warden Tavern, Wednesday, December 10, 8 p.m., annual general meeting.

SOUTH-EAST ESSEX DIVISION.—At Garon's Banqueting Hall, Southend-on-Sea, Friday, December 12, annual dinner and dance.

SOUTH ESSEX DIVISION.—At Harold Wood Hospital, Sunday, December 7, 10.30 a.m., clinical meeting.

SOUTH MIDDLESEX DIVISION.—At Mitre Hotel, Hampton Court, Monday, December 8, 8.30 p.m., annual general meeting.

STOCKPORT DIVISION.—At Alma Lodge Hotel, Buxton Road, Stockport, Tuesday, December 9, 8.30 p.m., Mr. Harold Bolton: "Common Orthopaedic Problems in Practice." Non-members, B.M.A., are invited.

STRATFORD DIVISION.—At Queen Mary's Hospital, Stratford, E., Tuesday, December 9, 8.45 p.m., talk by Miss Margaret McEwen: "The Treatment of Asthmatic Children at La Bourboule" (with film).

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tuesday, December 9, 8.30 p.m., clinical meeting, followed by special meeting.

WEST HERTS DIVISION.—At Board Room, Watford Peace Memorial Hospital, Rickmansworth Road, Thursday, December 11, 9 p.m., general meeting. B.M.A. Lecture by Dr. E. E. Pochin: "Clinical Value of Radioactive Isotopes."

WEST NORFOLK DIVISION.—At Grosvenor Hotel, Saturday, December 13, 7 to 8.30 p.m., wine and cheese party for members and guests.

WEST SUSSEX DIVISION.—At King's Head Hotel, Horsham, Thursday, December 11, 6.30 p.m., general meeting. Film demonstration by Mr. W. E. Tucker: "Athletic Injuries." 8 p.m., dinner; 9.30 p.m., special general meeting.

A meeting of S.H.M.O.s in the four Metropolitan Regions will be held at B.M.A. House, Tavistock Square, London, W.C., on Saturday, December 13, at 11 a.m. Dr. T. F. McCarthy will address the meeting.

ANNUAL REPRESENTATIVE MEETING—EDINBURGH,
JULY 16-20, 1959JOINT ANNUAL MEETING WITH CANADIAN MEDICAL ASSOCIATION
EDINBURGH, JULY 18-24, 1959JOINT ANNUAL SCIENTIFIC MEETING—EDINBURGH,
JULY 20-24, 1959

President-Elect: His Royal Highness the PRINCE PHILIP, DUKE OF EDINBURGH, K.G., K.T.

Local General Secretary: E. R. C. WALKER, B.A., M.D., F.R.C.P.Ed., B.M.A. Scottish House, 7, Drumsheugh Gardens, Edinburgh, 3

Assistant Local General Secretary: R. TRAQUAIR THIN, F.R.C.S.Ed., 31, Heriot Row, Edinburgh, 3.

Science Secretary: Professor G. I. SCOTT, F.R.C.S.Ed., 20, Heriot Row, Edinburgh, 3.

Assistant Science Secretaries: (Science Exhibition) Professor D. E. C. MEKIE, O.B.E., F.R.C.S.Ed., Royal College of Surgeons of Edinburgh, Nicolson Street, Edinburgh, 8; (Colour Television) J. INNES, M.D., F.R.C.P.Ed., Department of Medicine, University of Edinburgh.

Executive Officer: Miss B. E. MIDDLEMISS, B.M.A. House, Tavistock Square, London, W.C.1.

PROVISIONAL PROGRAMME

The 127th Annual Representative Meeting of the British Medical Association will be held in the McEwan Hall, Edinburgh University, on Thursday, July 16, 1959, and will continue on Friday, Saturday, and Monday, July 17, 18, and 20.

The Joint Annual Meeting with the Canadian Medical Association will be held from Saturday, July 18, to Friday, July 24, inclusive. The Joint Annual Scientific Meeting will be held from Monday, July 20, to Friday, July 24, inclusive.

On the evening of Wednesday, July 15, there will be a welcome party for Representatives and their Ladies, arranged by the City of Edinburgh Division, to be held in the Assembly Club, George Street.

A combined Dinner for Representatives and their Ladies will take place at the Assembly Club on Thursday, July 16, followed by a Dance.

The Association will welcome the members of the Canadian Medical Association and their Ladies at an evening Reception to be held in the Corn Market on Saturday, July 18.

The official Religious Service will be held in St. Giles' Cathedral on Sunday, July 19, at 3.30 p.m. There will also be a Roman Catholic Service.

On Sunday, July 19, there will be a choice of all-day tours to the country and also afternoon excursions and tours of the city. In the evening a concert will be given in the Usher Hall by the B.B.C. Scottish Orchestra.

An Adjourned Annual General Meeting will take place in the Usher Hall on the evening of Monday, July 20.

The Annual Dinner, at which the Canadian visitors will be the guests of the Association, will be held in the Waverley Market on Tuesday, July 21.

The Annual Breakfast of the Christian Medical Fellowship will be held in the North British Hotel on Tuesday, July 21, at 8.15 a.m.

There will be an Overseas Conference and Luncheon.

Special visits and excursions to places of interest are being arranged for ladies accompanying members of both Associations.

Arrangements for the usual Golf Competitions are being made.

The Reception Bureau for Registration of members of the B.M.A. will be open in the Entrance Hall of the Edinburgh College of Art, Lauriston Place, on Monday, July 20, at 9 a.m. Members of the Canadian Medical Association will register at the Assembly Club.

Two Plenary Scientific Sessions will be held in the McEwan Hall, Edinburgh University, one on Wednesday morning, July 22, and the other on Friday morning, July 24. A General Session will be held on the morning of Thursday, July 23.

In addition Round-table Conferences will be held at 9 a.m. on Wednesday, Thursday, and Friday, July 22, 23, and 24, in Adam House, Chambers Street.

Details of some of the Scientific Sections which will hold meetings are given below. Arrangements for some Sections are not yet complete, but these will be published later.

Both the Scientific Exhibition and the Annual Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications will be held in the Edinburgh College of Art, Lauriston Place, where there will also be an Exhibition of Art by Medical men. There will be a Historical Exhibition in the Museum of the Royal College of Surgeons of Edinburgh, Nicolson Street.

On each day of the Scientific Meeting there will be a programme of surgical operations and clinical demonstrations from the Edinburgh Royal Infirmary, shown by colour television on a closed circuit to two studios, one in the Infirmary itself and the other at the Edinburgh College of Art. Details of the programme will be published at a later date. The technical arrangements are sponsored by Smith Kline and French Laboratories Ltd.

HOTEL ACCOMMODATION

The following is a list of hotel accommodation (exclusive of that reserved for members of the C.M.A.) reserved for B.M.A. members attending the Meeting. Members wishing to book accommodation are asked to write direct to the hotel, stating that they are attending the B.M.A. Meeting. The prices given are the tariffs ruling at the moment and are subject to alteration without notice. The Association therefore cannot accept responsibility for any of the prices stated below, and applicants should verify the tariffs when making their reservations. Early application is recommended.

Hotel	Single	Twin	Double	Total Persons	1958 Tariff B/B
*Braid Hills Hotel, Edinburgh, 10 (Edinburgh 54748)	4	2	—	8	35-
*Caledonian Hotel, Edinburgh, 2 (Caledonian 2433)	5	30	—	65	45-

*Royal Abbey Hotel, 4, Carlton Terrace, Edinburgh, 7 (WAVerley 1189)	4	10	—	24	18 6

* Licensed.

Further reservations have also been made in smaller hotels, University hostels, and private houses where Edinburgh Festival visitors are accommodated. Should members prefer this type of accommodation they are asked to apply to the Local General Secretary, B.M.A. Scottish Office, 7, Drumsheugh Gardens, Edinburgh, 3, giving details of their requirements.

CARAVAN PARK

Arrangements are being made to reserve sites for members who wish to bring their caravans to Edinburgh during the Annual Representative Meeting and/or the Joint Annual Meeting. Applications for space should be made as soon as possible to the Local General Secretary, B.M.A. Scottish House, 7, Drumsheugh Gardens, Edinburgh, 3.

TICKETS

No tickets for functions and excursions can be issued in advance, with the exception of the Annual Dinner (details of which are given below).

All tickets for functions up to Sunday, July 19, will be available for Representatives at the A.R.M. Inquiry Office, McEwan Hall, Edinburgh University, on July 15, 16, 17, and 18, and for ladies at the Assembly Club, George Street.

Tickets for all other functions and excursions after Sunday, July 19, will be available from Monday, July 20, at the Assembly Club.

ANNUAL DINNER

The Annual Dinner will take place on Tuesday, July 22, in the Waverley Market, Princes Street. Arrangements for advance booking will be announced later.

GRADUATES' DINNERS

Details of arrangements for the various Graduates' Dinners will be announced later. It is anticipated, however, that the following Graduates will hold Dinners on Friday, July 17: Edinburgh, Glasgow, Welsh, and Irish.

ASSEMBLY CLUB

In view of the large numbers who will be attending the Joint Annual Meeting, it has been decided not to have a separate Ladies' Club but to have a general Club in the Music Hall and Assembly Rooms, George Street, during both the Annual Representative Meeting and the Joint Annual Meeting.

The Club will be open daily from 9.30 a.m. to 11.30 p.m. from Thursday, July 16. All ladies accompanying B.M.A. members and all the Canadian visitors will register at the Club.

Tickets for functions, tours, and excursions will be issued at the Club and there will be a general Information Bureau.

Fully licensed catering facilities will be available at the Club, which will provide morning coffee, lunch, afternoon tea, and dinner. It is hoped to make the Club the focal point of all the social activities connected with the Meetings, and it is proposed to have dancing there each evening during the Joint Meeting.

ENTERTAINMENT OF LADIES ACCOMPANYING MEMBERS

A very full programme is being arranged for the entertainment of the ladies accompanying both B.M.A. and C.M.A. members. Details of the actual programme will be published later. It is planned to have daily excursions to places of interest both in Edinburgh and in the surrounding countryside. It is also hoped to arrange visits to various industries and factories which should be of interest to the visitors. A mannequin show of Scottish tweeds and woollens is to be held in the Club on the morning of Tuesday, July 21.

ENTERTAINMENT OF YOUNG PEOPLE

As it is known that many young Canadians are accompanying their parents to the Joint Annual Meeting, special arrangements are being made for their entertainment.

FAREWELL TO MEMBERS OF THE C.M.A.

It is planned to hold a farewell party for the Canadian visitors in the Club on the evening of Friday, July 24.

MEDICAL ART EXHIBITION

From July 20 to 24 there will be an exhibition of paintings by Members of the British and Canadian Medical Associations. By courtesy of the governors and principal of the Edinburgh College of Art this exhibition will be held in the Andrew Grant Gallery of the College throughout the Meeting. Accepted work will be limited to approximately 150 exhibits, and should be either oil or water-colour paintings. A prize has been offered for the most outstanding exhibit. Members who wish to exhibit examples of their work on this occasion are invited, in the first instance, to communicate with Professor B. G. MAEGRAITH, School of Tropical Medicine, University of Liverpool, Pembroke Place, Liverpool, 3; Dr. A. M. RACKOW, Cleve Cottage, Hawk's Hill, Leatherhead, Surrey; or Professor D. E. C. MEKIE, Royal College of Surgeons, 18, Nicolson Street, Edinburgh, 8.

SCIENTIFIC EXHIBITION

The closing date for entries for the Scientific Exhibition, which will be held in Edinburgh from July 20 to 24, is December 31, 1958. Application forms for space at the exhibition are obtainable from the Secretary of the B.M.A.

TRAVEL RESERVATIONS

Accommodation on trains and on aircraft between London and Edinburgh during July is booked at a very early date. It is advisable to make reservations as soon as possible.

SCIENTIFIC MEETING, JULY 20-24

It should be noted that this programme is provisional and subject to alteration. All Scientific Meetings will be held in University premises.

PLENARY SESSIONS

Wednesday, July 22, 10.30 a.m. to 12.30 p.m. (McEwan Hall): "Trends in Modern Medicine"

Chairman: Dr. NORMAN H. GOSSE (Halifax, N.S.).

Speakers: Dr. ANDREW J. RHODES (Toronto), Dr. K. J. R. WIGHTMAN (Toronto), Dr. C. GORDON STEWART (Deep River, Ontario), Dr. R. O. JONES (Halifax, N.S.).

Friday, July 24, 10.30 a.m. to 12.30 p.m. (McEwan Hall): "Problems of an Ageing Population"

Chairman: Professor A. P. THOMSON (Birmingham).

Speakers: Professor P. L. KROHN (Birmingham), Dr. J. H. SHELDON (Wolverhampton), Professor M. ROTH (Newcastle upon Tyne), Dr. W. F. ANDERSON (Glasgow), Dr. T. N. RUDD (Southampton).

GENERAL SESSION

A General Session will be held in the McEwan Hall from 10.30 a.m. to 12.30 p.m. on Thursday, July 23.

Chairman: Dr. R. F. FARQUHARSON (Toronto).

Speakers: Dr. CHARLES BEST (Toronto), Diabetes Mellitus since Insulin; Dr. LLOYD G. STEVENSON (Montreal), The Contribution of Edinburgh University to Medical Education in Canada; Lord COHEN OF BIRKENHEAD, The Present Status of Collagen Disease; Professor JOHN BRUCE (Edinburgh), Some Reflections on the Treatment of Breast Cancer.

ROUND-TABLE CONFERENCES

Twelve Round-table Conferences will be held in Adam House from 9 to 10.15 a.m. on Wednesday, Thursday, and Friday, July 22, 23, and 24.

SCIENTIFIC SECTIONS

SECTION OF MEDICINE

Joint Presidents: Professor R. F. FARQUHARSON, M.B.E., M.D., F.R.C.P., F.A.C.P.(C.) (Toronto); Professor D. M. DUNLOP, M.D., F.R.C.P., F.R.C.P.Ed., F.R.S.Ed. (Edinburgh).

Joint Vice-Presidents: J. R. LEMIEUX, M.D. (Quebec); Professor Sir GEORGE PICKERING, M.D., F.R.C.P. (Oxford); Professor A. KEKWICK, M.A., F.R.C.P. (London).

Hon. Secretaries: W. I. CARD, M.D., F.R.C.P., F.R.C.P.Ed. (Edinburgh); J. BISHOP HARMAN, M.D., F.R.C.P., F.R.C.S. (London).

Monday, July 20.—2.30 p.m. Adam House, 1st Floor. Diet and Atherosclerosis.

Wednesday, July 22.—2.30 p.m. Adam House, 1st Floor. Health Education of the Patient.

Thursday, July 23.—2.30 p.m. Adam House, 1st Floor. Series of short papers.

Friday, July 24.—2.30 p.m. Adam House, 1st Floor. Abnormalities of Adrenal Cortical Secretion.

SECTION OF SURGERY

Joint Presidents: Professor JACQUES BRUNEAU, M.D. (Montreal); Professor C. F. W. ILLINGWORTH, C.B.E., M.D., Ch.M., F.R.C.S.Ed., F.R.F.P.S. (Glasgow).

Joint Vice-Presidents: Professor WALTER C. MACKENZIE, M.D., F.A.C.S., F.R.C.S.(C.) (Edmonton, Alberta); B. N. BROOKE, M.D., M.Ch., F.R.C.S. (Birmingham); A. GOUREVITCH, M.C., F.R.C.S. (Birmingham); T. McW. MILLAR, M.B., F.R.C.S.Ed. (Edinburgh); IAN ORR, O.B.E., M.D., Ch.M., F.R.C.S.Ed. (Preston).

Hon. Secretaries: C. W. A. FALCONER, M.B., F.R.C.S.Ed. (Edinburgh); SELWYN TAYLOR, B.M., M.Ch., F.R.C.S. (London).

Monday, July 20.—Morning, Adam House, 2nd Floor. Symposium: Diseases of the Small Intestine, Dr. W. I. CARD (Edinburgh), Professor DREW KAY (Sheffield). Short Papers: Treatment of Tumours of Salivary Glands, Dr. ERIC M. NANSON (Saskatoon); The Value of Electrogastrography, Dr. H. S. MORTON (Montreal).

Wednesday, July 22.—Morning, Adam House, 2nd Floor. Symposium: Prevention and Treatment of Hand Injuries, Professor J. H. F. BROTHERTON (Edinburgh), Mr. R. G. PULVERTAFT (Derby). Short Papers: The Facial Smash in Automobile Accidents, Dr. F. M. WOOLHOUSE (Montreal); A Method of Treatment of Compound Fractures of the Lower Limb, Dr. V. O. MADER (Halifax, N.S.).

Friday, July 24.—Morning, Adam House, 2nd Floor. Symposium: Reappraisal of Indications for Operation in Sigmoid Diverticulitis, Dr. WALTER C. MACKENZIE (Edmonton, Alberta), Mr. T. McW. MILLAR (Edinburgh). Short Papers: Problems Involved in Resection of the Liver, Mr. RODNEY SMITH (London), Dr. SHEILA SHERLOCK (London); Surgical Management of Diabetic Foot, Dr. ANGUS D. MCLACHLIN (London, Ontario).

SECTION OF OBSTETRICS AND GYNAECOLOGY

Joint Presidents: W. G. COSBIE, M.D., F.R.C.S.(C.), F.R.C.O.G. (Toronto); JOHN PEEL, F.R.C.S., F.R.C.O.G. (London).

Joint Vice-Presidents: Professor ELINOR F. E. BLACK, M.D., F.R.C.S.(C.), F.A.C.S., F.I.C.S., F.R.C.O.G. (Winnipeg); E. A. GERRARD, V.R.D., M.D., F.R.C.O.G. (Manchester); Professor R. J. KELLAR, M.B.E., F.R.C.P.Ed., F.R.C.S.Ed., F.R.C.O.G. (Edinburgh).

Hon. Secretaries: Professor A. S. DUNCAN, D.S., F.R.C.S.Ed., F.R.C.O.G. (Cardiff); J. STURROCK, F.R.C.S.Ed., F.R.C.O.G. (Edinburgh).

Monday, July 20.—2.30 p.m. Adam House, 3rd Floor. Anaesthesia for Obstetrical Manoeuvres and Operations. Professor IAN MORRIS (Manchester), Dr. W. D. WYLIE (London).

Tuesday, July 21.—2.30 p.m. Adam House, 2nd Floor. Management of the Third Stage of Labour and Its Complications, Mr. DONALD B. FRASER (London), Dr. J. K. FEENEY (Dublin), Dr. C. W. WALKER (Cambridge).

Thursday, July 23.—2.30 p.m. Adam House, 3rd Floor. Dysfunctional Uterine Bleeding, Dr. ARTHUR SUTHERLAND (Glasgow), Dr. T. N. MACGREGOR (Edinburgh). The Contribution Made by Maternal Mortality Study Committees, speaker to be announced later. The Problem of Prematurity, speakers to be announced later. The Early Diagnosis of Cancer in the Female Reproductive Organs, Dr. W. G. COSBIE (Toronto).

SECTION OF ANAESTHETICS

Joint Presidents: R. A. GORDON, M.D., F.R.C.P.(C.), F.F.A.R.C.S., D.A., F.A.C.A. (Toronto); JOHN GILLIES, C.V.O., M.C., F.R.C.P.Ed., F.R.C.S., F.F.A.R.C.S., D.A. (Edinburgh).

Joint Vice-Presidents: M. W. BOWERING, M.D. (Regina); H. R. YOUNGMAN, M.D., F.F.A.R.C.S., D.A. (Cambridge).

Hon. Secretaries: JAMES D. ROBERTSON, M.D., F.R.C.P.Ed., F.F.A.R.C.S., D.A. (Edinburgh); W. N. ROLLASON, M.B., F.F.A.R.C.S., D.A. (Hull).

Tuesday and Wednesday, July 21 and 22.—2.30 p.m. King's Buildings, Chemistry Lecture Room. Observations on the Combined Use of Hypotension and Hypothermia in the Dog, Dr. S. L. VANDERWATER (Toronto). The Physiology of the Cardiac Sphincter—Anaesthetic Implications, Dr. J. G. ROBSON (Montreal). Epidural Anaesthesia for Lumbar Spine Fusion and Laminectomy, Dr. DONALD MATHESON (Vancouver). Paper by Dr. ALAN B. NOBLE (Montreal). New Methods of the Analysis of Respired Gases, Dr. R. WOOLMER (London). Spreading it Thinner, Professor E. A. PASK (Newcastle upon Tyne). Role of the Anaesthetist in the Conservative Care of Head Injuries, Dr. A. R. HUNTER (Manchester). Avoidance of Hypoxia in Anaesthesia for Ambulatory Dental and Casualty Type of Operations, Dr. ARTHUR TOM (Cheltenham). Investigations into Rhythmicity of Electrical Output of the Human Cortex During Very Light Anaesthesia, Dr. J. CLUTTON-BROCK (Bristol). Paper by Dr. G. S. W. ORGANE (London).

SECTION OF ANATOMY AND PHYSIOLOGY

Joint Presidents: Professor J. C. B. GRANT, M.D., F.R.C.S.Ed. (Toronto); Professor R. WALMSLEY, M.D., F.R.C.S., F.R.C.S.Ed. (St. Andrews).

Joint Vice-Presidents: Professor D. H. COPP, Ph.D., M.D. (Vancouver); Professor D. SLOME, Ph.D., M.B., Ch.B. (London).

Hon. Secretaries: G. R. HERVEY, M.B., Ch.B. (Sheffield); J. B. KING, M.D., F.R.C.P.Ed., F.F.R. (Edinburgh).

Tuesday, July 21.—2.30 p.m. University West Lecture Theatre. The Regulation of Blood Calcium, Professor HAROLD COPP (University of British Columbia). Paper by Professor J. W. A. DUCKWORTH (Toronto). Anatomy of the Newborn, Professor ROBERT WALMSLEY (St. Andrews). Details of further subjects will be published later.

SECTION OF CARDIOLOGY

Joint Presidents: H. N. SEGALL, M.D., F.A.C.P. (Montreal); A. RAE GILCHRIST, M.D., F.R.C.P., P.R.C.P.Ed. (Edinburgh).

Joint Vice-Presidents: WM. GREENWOOD, M.D., F.R.C.P.(C.) (Toronto); Professor D. M. DOUGLAS, M.B.E., Ch.M., M.S., F.R.C.S., F.R.C.S.Ed. (Dundee).

Hon. Secretaries: FRANCES V. GARDNER, M.B., F.R.C.P. (London); R. M. MARQUIS, M.B.E., M.B., F.R.C.P.Ed. (Edinburgh).

Tuesday, July 21.—2.30 p.m. Adam House, 3rd Floor. Symposium on Coronary Artery Disease. Chairman, Dr. IVAN BEDFORD (London). Differential Diagnosis of Angina Pectoris, Dr. A. RAE GILCHRIST (Edinburgh); Errors of Electrocardiographic Interpretation, Dr. HUGH STANSFIELD (Vancouver); Diet in Prevention and Treatment, Professor W. F. CONNELL (Ontario); Panel discussion. *Short com-*

munications: The Need for Surgical Closure of V.S.D. in Infancy, speaker to be announced later; Lung Changes (X-ray) in Heart Disease, Dr. PETER KERLEY (London). Discussion.

Wednesday, July 22.—2.30 p.m. Adam House, 3rd Floor. The Treatment of Hypertension, Chairman Dr. JACQUES GENEST (Montreal); Panel: Professor MAX ROSENHEIM (London), Professor Sir GEORGE PICKERING (Oxford), Professor E. PATON (London), Dr. J. A. LEWIS (London, Ontario). Presentation of Problem Cases, Chairman, Dr. A. RAE GILCHRIST (Edinburgh); Panel: Dr. R. W. D. TURNER (Edinburgh), Professor I. G. W. HILL (Dundee), Dr. PAUL WOOD (London), Dr. A. J. KERWIN (Toronto), Dr. H. N. SEGALL (Montreal), Dr. JACK MERRIMAN (Saskatoon).

SECTION OF CHEST DISEASES

Joint Presidents: Professor J. D. ADAMSON, M.D., M.R.C.P.Ed., F.R.C.P.(C.) (Winnipeg); Sir RUSSELL BROCK, M.S., F.R.C.S. (London).

Joint Vice-Presidents: FERNAND S. GREGOIRE, M.D., F.C.C.P., F.R.C.P.(C.) (Montreal); Professor PHILIP R. ALLISON, Ch.M., F.R.C.S., D.P.M. (Oxford); Professor JOHN CROFTON, M.D., F.R.C.P., M.R.C.P.Ed. (Edinburgh).

Hon. Secretaries: I. W. B. GRANT, M.B., F.R.C.P.Ed. (Edinburgh); MAXWELL TELLING, D.M., F.R.C.P. (Leeds).

Thursday, July 23.—2.30 p.m. King's Buildings Zoology Lecture Room. The Management of Chest Infections, introduction by Professor JOHN CROFTON (Edinburgh); The Treatment of Pneumonia, speaker to be announced later; The Management of Bronchitis, Dr. BRIAN TAYLOR (Birmingham); The Problem of Anoxia in Chest Infections, Dr. THOMAS SIMPSON (London); The Management of Empyema, Professor F. G. KERGIN (Toronto).

Friday, July 24.—2.30 p.m. King's Buildings, Zoology Lecture Room. Sarcoidosis, Dr. ADRIAN ANGLIN (Toronto). The Epidemiological Aspects of Lung Cancer, Dr. C. R. LOWE (Birmingham). The Present Position of the Surgical Treatment of Bronchiectasis, Mr. R. J. M. MCCORMACK (Edinburgh). Chronic Cough and Carcinoma of the Lung, Professor J. D. ADAMSON (Winnipeg).

SECTION OF CHILD HEALTH

President: Professor STANLEY G. GRAHAM, LL.D.(Hon.), M.D., F.R.C.P.Ed., F.R.F.P.S. (Glasgow).

Vice-Presidents: Professor R. W. B. ELLIS, O.B.E., M.A., M.D., F.R.C.P. (Edinburgh); Professor J. HAY, M.A., M.D., F.R.C.P., M.R.C.S., D.C.H. (Liverpool); Professor J. L. HENDERSON, M.D., F.R.C.P.Ed. (Dundee).

Hon. Secretaries: N. R. BUTLER, M.D., F.R.C.P., D.C.H. (Salisbury); J. O. FORFAR, M.C., F.R.C.P.Ed., D.C.H. (Edinburgh).

Monday, July 20.—2.30 p.m. King's Buildings Zoology Lecture Room. Neonatal Hyperbilirubinaemia, Dr. A. E. CLAIREAUX (London), Dr. WILLIAM WALKER (Newcastle upon Tyne), Dr. J. P. BOUND (Blackpool). *Occasional Papers:* A Reappraisal of School Health Examinations, Professor HARRY MEDOVY (Winnipeg); The Prognosis of Asthma in Children, Dr. C. COLLINS WILLIAMS (Toronto).

Wednesday, July 22.—2.30 p.m. King's Buildings Zoology Lecture Room. Staphylococcal Infection in Newborn Infants, Dr. J. O. FORFAR (Edinburgh), Dr. F. J. W. MILLER (Newcastle upon Tyne), Dr. ISABELLA FORSHALL (Liverpool). The Diagnosis and Management of Speech Disorders in Childhood, Miss EDITH WHEINALL (London), Dr. T. T. S. INGRAM (Edinburgh), Dr. W. N. BOOG WATSON (Edinburgh).

Friday, July 24.—2.30 p.m. University West Lecture Theatre. Psychoses in Infancy and Childhood, Dr. W. A. HAWKE (Toronto), Dr. MILDRED POTT (London), Dr. F. H. STONE (Glasgow), Dr. KENNETH CAMERON (London). The Dawson Williams Lecture, Mr. DENIS BROWNE (London).

SECTION OF DERMATOLOGY

Joint Presidents: Professor H. A. DIXON, M.D., F.R.C.P.(C.) (Toronto); Professor G. H. PERCIVAL, Ph.D., M.D., F.R.C.P.Ed., D.P.H. (Edinburgh).

Joint Vice-Presidents: L. P. ÉREAUX, M.D., D.A.B.D. (Montreal); T. E. ANDERSON, M.D. (Aberdeen).

Hon. Secretaries: P. W. HANNAY, M.B., F.R.C.P.Ed. (Edinburgh); A. ROOK, M.D., M.R.C.P. (Cambridge).

Thursday, July 23.—2.30 p.m. University Biochemistry Lecture Room. Cutaneous Porphyria, Dr. A. LYALL (Aberdeen), Dr. GUNTER HOLTI (Birmingham), discussion to be opened by Dr. R. R. FORSEY (Montreal). The Local Use of Hydrocortisone Acetate in Dermatological Practice, Dr. G. CRAIG (Montreal). Cutaneous Manifestations of Reiter's Disease, Dr. R. C. SMITH (Toronto).

SECTION OF GENERAL PRACTICE

Joint Presidents: JACK MCKENTY, M.D. (Winnipeg); G. W. IRELAND, M.B., Ch.B. (Ford, Midlothian).

Joint Vice-Presidents: H. G. HALL, M.D. (Toronto); J. W. BROWN, T.D., M.B., B.Sc. (Sutton Coldfield); A. C. HOUGHTON, T.D., M.B. (Birmingham); J. H. HUNT, D.M., M.R.C.P. (London).

Hon. Secretaries: ANNIS GILLIE, M.B., B.S., M.R.C.P. (London); RICHARD SCOTT, M.D., D.P.H. (Edinburgh).

Thursday, July 23.—2.30 p.m. Adam House, 2nd Floor. The Ageing Population and the Community, opening remarks by Dr. JACK MCKENTY. The Early Diagnosis of Hypertension in General Practice, Dr. H. GIBSON HALL (Toronto). Geriatrics in the Setting of General Practice, speaker to be announced later. The Evaluation of the Physical, Psychological, Social, and Economic Factors in the Patient's Illness, Dr. C. J. HOUSTON (Yorkton, Saskatchewan); Dr. RICHARD SCOTT (Edinburgh), Dr. IAN GRANT (Glasgow).

SECTION OF HISTORY OF MEDICINE

Joint Presidents: Professor LLOYD G. STEVENSON, Ph.D., M.D. (Montreal); DOUGLAS GUTHRIE, M.D., F.R.C.S.Ed. (Edinburgh).

Joint Vice-Presidents: ARTHUR L. MURPHY, M.D., F.A.C.S., F.A.A.S.T. (Halifax); E. ASHWORTH UNDERWOOD, M.D., D.P.H. (London).

Hon. Secretary: H. P. TAIT, M.D., F.R.C.P.Ed., D.P.H. (Edinburgh).

Tuesday, July 21.—Hall of the Royal Medical Society. Programme to be announced later.

SECTION OF NEUROLOGY AND NEUROSURGERY

Joint Presidents: J. C. RICHARDSON, M.D., F.R.C.P., F.R.C.P.(C.) (Toronto); Professor N. M. DOTT, C.B.E., M.B., F.R.C.S.Ed., F.R.S.Ed. (Edinburgh).

Joint Vice-Presidents: CLAUDE BERTRAND, M.D., F.R.C.S.(C.) (Montreal); A. M. G. CAMPBELL, D.M., F.R.C.P. (Bristol).

Hon. Secretaries: F. J. GILLINGHAM, M.B.E., M.B., F.R.C.S. (Edinburgh); JOHN MARSHALL, M.D., M.R.C.P., D.P.M. (London).

Friday, July 24.—2.30 p.m. Adam House, 3rd Floor. The Results of Medical Treatment of Epilepsy, Dr. FRANCIS McNAUGHTON (Montreal), Dr. JOHN SIMPSON (Edinburgh), Dr. DENIS WILLIAMS (London). The Surgical Treatment of Parkinsonism, Mr. F. J. GILLINGHAM (Edinburgh), Dr. CLAUDE BERTRAND (Montreal), Dr. MACDONALD CRITCHLEY (London). Tissue Reaction (Allergy) in the Nervous System, Dr. HENRY MILLER (Newcastle upon Tyne), Dr. ALLAN BAILEY (Saskatoon), Dr. JOHN STANTON (Edinburgh). Modern Experience with Bacterial Meningitis, Dr. H. H. HYLAND (Toronto), Dr. THOMAS MORLEY (Toronto).

SECTION OF OCCUPATIONAL HEALTH

Joint Presidents: GRAHAM ROSS, M.D. (Montreal); Professor R. C. BROWNE, M.A., D.M., M.R.C.P. (Newcastle upon Tyne).

Joint Vice-Presidents: GORDON SINCLAIR, M.D. (Toronto); T. O. GARLAND, M.D., D.P.H. (London).

Hon. Secretaries: HUGH MILLER, M.D. (Edinburgh); JAMES A. SMILEY, O.B.E., M.D., D.I.H. (Belfast).

Thursday, July 23.—2.30 p.m. King's Buildings Chemistry Lecture Room. A Morbidity Study in an Active Working Population, Dr. G. A. SINCLAIR (Toronto). The Place of the General Practitioner or Family Doctor in Industrial Health, Lord TAYLOR (Harlow). Control of Occupational Dermatitis in an Aircraft Industry, Dr. GIBSON E. CRAIG (Montreal). The Role of the Industrial Medical Officer in the Education of Management and the Workers in Health and Safety, Dr. IAN RICHARDSON (Aberdeen). The Role of the Doctor in Vocational Guidance, Dr. M. E. M. HERFORD (Slough). A.T.S. Reactions and Their Effect upon Passive Immunity, Dr. L. J. MAHONEY (Toronto). The Allocation of Time in Planning the Duties of the Industrial Medical Officer between Clinical and Environmental Work, Dr. T. O. GARLAND (London). Readjustment in Industry of the Worker with Heart Disease, Dr. H. N. SEGALL (Montreal).

SECTION OF OPHTHALMOLOGY

Joint Presidents: M. R. MARSHALL, M.D., F.R.C.S.(C.), F.A.C.S., D.L.O. (Edmonton, Alberta); T. KEITH LYLE, C.B.E., M.D., M.Ch., M.R.C.P., F.R.C.S. (London).

Joint Vice-Presidents: J. V. V. NICHOLLS, M.D., D.A.B.O. (Montreal); Professor G. I. SCOTT, F.R.C.S.Ed., F.R.S.Ed. (Edinburgh).

Hon. Secretaries: C. R. S. JACKSON, F.R.C.S.Ed., D.O.M.S. (Edinburgh); K. C. WYBAR, M.D., Ch.M., F.R.C.S. (London).

Thursday, July 23.—2.30 p.m. Adam House Theatre. Modern Treatments of Detachments of the Retina, Mr. L. G. FISON (London). Differential Diagnosis of Vitreous Haemorrhage, with Special Reference to the Treatment of Eale's Disease, Dr. A. J. ELLIOT (Toronto). Displacements of the Orbital Floor and Traumatic Diplopia, Dr. ROSS TILLEY (Toronto), Mr. T. KEITH LYLE (London).

SECTION OF ORTHOPAEDICS

Joint Presidents: Professor F. P. DEWAR, M.D., F.R.C.S.Ed., F.R.C.S.(C.) (Toronto); Professor Sir WALTER MERCER, F.R.C.S., F.R.C.S.Ed., F.R.S.Ed. (Edinburgh).

Joint Vice-Presidents: J. G. PETRIE, M.D. (Montreal); N. CAPENER, F.R.C.S. (Exeter).

Hon. Secretaries: G. A. POLLOCK, M.S., F.R.C.S.Ed., F.A.C.S., D.P.H. (Edinburgh); R. GUY PULVERTAFT, F.R.C.S. (Derby).

Tuesday and Wednesday, July 21 and 22.—2.30 p.m. Adam House Theatre. Neurological and Vascular Factors in Upper Limb Dysfunction, Dr. W. S. WATSON (Edinburgh). Dr. C. C. BURT (Edinburgh). Tumours of the Hand, Mr. GRAHAM STACK (Brentwood). Treatment of Hip Conditions in Cerebral Palsy, Dr. DOUGLAS LAMB (Edinburgh). Carpal Tunnel Syndrome, Mr. KARL NISSEN (London). Papers on Abduction Treatment of Legg-Perthes Disease, The Gallie Ankle Fusion, Fractures of the Os Calcis, and Injuries to the Articular Disk at the Wrist, speakers to be announced later. *Panel Discussion:* Healing of Fractures.

SECTION OF OTO-RHINO-LARYNGOLOGY

Joint Presidents: Professor P. E. IRELAND, M.D., F.R.C.S.(C.) (Toronto); I. SIMSON HALL, M.B., F.R.C.P.Ed., F.R.C.S.Ed. (Edinburgh).

Joint Vice-Presidents: G. A. HENRY, M.D., F.A.C.S. (Toronto); E. G. COLLINS, M.B., F.R.C.S.Ed. (Aberdeen).

Hon. Secretaries: A. DAUNT BATEMAN, O.B.E., V.R.D., F.R.C.S., D.L.O. (Bath); G. D. McDOWALL, M.B., F.R.C.P.Ed. (Edinburgh).

Monday, July 20.—2.30 p.m. Adam House Theatre. Dysphagia, Dr. D. B. KELLY (Glasgow). Facial Pain, Mr. DAVID MIDDLETON (Edinburgh), Mr. KENNETH HARPISC (Manchester). Twenty-one Years' Experience of Surgery for Otosclerosis, Dr. JOSEPH A. SULLIVAN (Toronto). Methods of Shrinking the Inferior Turbinate, Dr. G. E. TREMBLE (Montreal). Carcinoma of the Larynx, Dr. FERNAND MONTEUIL (Montreal).

SECTION OF PATHOLOGY AND BACTERIOLOGY

Joint Presidents: WM. BOYD, M.D., F.R.C.P., F.R.C.S.(C.), D.Psy. (Willowdale); AGNES R. MACGREGOR, M.D., F.R.C.P.Ed. (Edinburgh).

Joint Vice-Presidents: Professor C. E. VAN ROOYEN, M.D., D.Sc., M.R.C.P., F.R.C.P.(C.) (Halifax, N.S.); Professor C. P. BEATTIE, M.B., Ch.B., D.P.H. (Sheffield).

Hon. Secretaries: J. H. BOWIE, M.B., F.R.C.P.Ed. (Edinburgh); W. H. H. MERIVALE, M.B., M.R.C.P. (London).

Tuesday, July 21.—University New Buildings, West Lecture Hall. Staphylococcal Infections in the Home and Hospital, Dr. HUGH STARKEY (Montreal), Dr. DONALD CRUIKSHANK (Edinburgh), Dr. J. SMITH GARDNER (Calgary, Alberta), Dr. K. S. MACLEAN (London), Professor JOHN W. MACGREGOR (Edmonton, Alberta), Professor ROBERT CRUIKSHANK (Edinburgh).

SECTION OF PLASTIC SURGERY

Joint Presidents: FULTON RISDON, M.D., D.D.S., F.R.C.S.(C.) (Toronto); A. B. WALLACE, M.Sc., F.R.C.S.Ed. (Edinburgh).

Joint Vice-Presidents: JOHN W. GERRIE, M.D., D.D.S., D.L.O., D.A.B.P.S. (Montreal); J. N. BARRON, F.R.C.S.Ed. (Salisbury).

Hon. Secretaries: A. D. R. BATCHELOR, F.R.C.S.Ed. (Edinburgh); L. M. ROUILLARD, F.R.C.S.Ed. (Norwich).

Friday, July 24.—2.30 p.m. Adam House Theatre. The Problems of Acute Skin Destruction, Mr. J. KIRK (Edinburgh), Dr. HOYLE CAMPBELL (Toronto), Dr. JOHN GERRIE (Montreal), Maxillofacial Injuries in Childhood, Dr. W. D. MACLENNAN (Edinburgh), Dr. HOYLE CAMPBELL (Toronto), Dr. JOHN GERRIE (Montreal), Oedema, Professor J. B. KINMONTH (London), Mr. J. S. TOUGH (Glasgow). A New Approach to the Operation for Dupuytren's Contracture, Dr. R. LANGSTON (Vancouver).

SECTION OF PREVENTIVE AND SOCIAL MEDICINE

Joint Presidents: Professor C. B. STEWART, M.D., F.A.P.H.A., D.P.H., Dr.P.H., M.P.H. (Halifax); Sir KENNETH COWAN, Q.H.P., M.D., F.R.C.P.Ed., D.P.H., F.R.S.Ed. (Edinburgh).

Joint Vice-Presidents: Professor JOHN WYLLIE, M.D., D.P.H. (Kingston, Ontario); Sir JAMES KILPATRICK, K.B.E., C.B., M.B., D.P.H. (London).

Hon. Secretaries: Professor J. H. F. BROTHERSTON, M.A., M.D., D.P.H., Dr.P.H., F.R.C.P.Ed., F.R.S.Ed. (Edinburgh); WILFRID G. HARDING, M.R.C.S., L.R.C.P., D.P.H. (London).

Monday, July 20.—2.30 p.m. University West Lecture Room. The Aftercare of the Hospital Patient, Professor T. FERGUSON (Glasgow), Professor A. MAIR (St. Andrews), Dr. I. RICHARDSON (Aberdeen), Professor J. H. F. BROTHERSTON (Edinburgh).

Wednesday, July 22.—2.30 p.m. University West Lecture Theatre. A Study of the Comparative Mortality Index as Applied to Cancer Mortality in Canada, Professor JOHN WYLLIE (Kingston, Ontario). Canadian Experience in the Prevention of Communicable Disease Through Immunization Programmes, Professor R. J. WILSON (Toronto). Some Observations on the Applied Epidemiology of Tuberculosis, Dr. JOHN NELSON (British Columbia). Observations on the Canadian Sickness Survey, speaker to be announced later.

SECTION OF PSYCHIATRY

Joint Presidents: Professor A. B. STOKES, C.B.E., M.D., F.R.C.P., F.R.C.P.(C.), D.C.H., D.P.M. (Toronto); T. P. REES, O.B.E., M.D., M.R.C.P., D.P.M. (London).

Joint Vice-Presidents: Professor R. O. JONES, M.D., F.A.P.A. (Halifax, N.S.); Professor G. R. HARGREAVES, O.B.E., M.R.C.S., L.R.C.P. (Leeds).

Hon. Secretaries: MARGARET M. METHVEN, M.B., D.P.M. (Edinburgh); D. STAFFORD-CLARK, M.D., M.R.C.P., D.P.M. (London).

Tuesday, July 21.—2.30 p.m. Adam House, 1st Floor. Psychological Crises in Family Life, Dr. H. V. DICKS (London), Dr. G. E. HOBBS (London, Ontario). Brief Methods of Psychotherapy, Dr. STAFFORD CLARK (London). Professor D. MCKERRACHER (Saskatoon). The Person and the Family in Medical Education, Professor G. R. HARGREAVES (Leeds), Professor A. B. STOKES (Toronto).

SECTION OF RADIOLOGY

Joint Presidents: Professor A. C. SINGLETON, M.D., F.F.R., F.A.C.R., F.R.C.P.(C.) (Toronto); Professor R. McWHIRTER, F.R.C.S.Ed., D.M.R.E., F.F.R., F.R.S.Ed. (Edinburgh).

Joint Vice-Presidents: HENRI LAPOINTE, M.D. (Quebec); W. H. BOND, F.R.C.S., D.M.R.T. (Birmingham); HUGH DAVIES, T.D., D.M., D.M.R.E., F.F.R. (London).

Hon. Secretaries: A. P. BOOTH, M.B., D.M.R.E. (Tottenham); K. A. MACKENZIE, M.B., D.M.R. (Edinburgh).

Monday, July 20.—2.30 p.m. Western General Hospital Theatre. Supervoltage Radiotherapy in the Treatment of Malignant Disease: (1) Cobalt-60 in the Treatment of Malignant Disease, speaker to be announced later. (2) The Linear Accelerator in the Treatment of Malignant Disease. Dr. RALSTON PATERSON (Manchester); (3) Cobalt-60 in the Treatment of Malignant Disease in a Selected Site, speaker to be announced later. (4) The Linear Accelerator in the Treatment of Malignant Disease in a Selected Site. Professor B. WINDEYER (London).

SECTION OF RHEUMATIC DISEASES

Joint Presidents: A. W. BAGNALL, M.D., F.R.C.P.(C.), M.R.C.P. (Vancouver); G. D. KERSLEY, T.D., M.D., F.R.C.P. (Bath).

Joint Vice-Presidents: WALLACE J. GRAHAM, M.D., F.R.C.P.(C.), F.R.C.P. (Toronto); J. J. R. DUTHIE, M.B., F.R.C.P.Ed. (Edinburgh).

Hon. Secretaries: J. H. H. GLYN, M.D., M.R.C.P., D.Phys.Med. (London); R. J. G. SINCLAIR, F.R.C.P.Ed. (Edinburgh).

Thursday, July 23.—2.30 p.m. University West Lecture Theatre. Symposium on the Polyarthritic Syndrome: chairman, Dr. W. S. C. COPEMAN (London). (1) Acute Polyarthritis, Professor E. G. L. BYWATERS (London); (2) Chronic Polyarthritis, Professor J. H. KELLGREN (Manchester); (3) Spondylitis, Dr. D. C. GRAHAM (Toronto); (4) Soft-tissue Rheumatism, Dr. SIMON DWORKIN (Montreal). *Occasional Papers:* chairman, Dr. JOHN WOODBURY (Halifax, N.S.). (1) Rehabilitation of the Arthritic Patient, Dr. JOHN S. CRAWFORD (Toronto); (2) The Problem of Painful Feet, Dr. F. P. DEWAR (Toronto); (3) Diagnostic Problems in a Rheumatism Clinic, Dr. R. J. G. SINCLAIR (Edinburgh); (4) Current Views on Gout and its Treatment, Dr. G. D. KERSLEY (Bath); (5) Laboratory Tests and Prognosis in Rheumatoid Arthritis, Dr. A. G. S. HILL (Stoke Mandeville).

SECTION OF TROPICAL MEDICINE

President: Sir ALEXANDER BIGGAM, K.B.E., C.B., M.D., F.R.C.P., F.R.C.P.Ed., D.T.M.&H. (Edinburgh).

Vice-Presidents: Professor P. C. C. GARNHAM, M.D., D.Sc., D.P.H. (Farnham Common, Bucks); Sir GEORGE McROBERT, C.I.E., M.D., F.R.C.P., D.T.M.&H. (London).

Hon. Secretaries: Professor W. E. KERSHAW, V.R.D., M.D., D.T.M.&H. (Liverpool); F. J. WRIGHT, M.D., F.R.C.P., D.T.M.&H. (Edinburgh).

Thursday, July 23.—2.30 p.m. Surgeons' Hall. Anaemia in the Tropics, with special reference to Abnormal Haemoglobins: Anaemia in the Tropics, Dr. R. H. GIRDWOOD (Edinburgh); The General Problem of Abnormal Haemoglobins, Professor A. W. WOODRUFF (London); The Nomenclature and Diagnosis of Abnormal Haemoglobins, Dr. H. LEHMANN (London); Clinical Aspects of Abnormal Haemoglobins, Dr. A. B. RAPER (Kampala, Uganda); Chronic Sick-cell Anaemia, Professor G. M. EDINGTON (Ibadan, Nigeria).

Friday, July 24.—2.30 p.m. Surgeons' Hall. The Importance of Tropical Diseases Occurring Outside the Tropics: Malaria, Professor B. G. MAEGRAITH (Liverpool); Amoebiasis, Sir GEORGE R. McROBERT (London); Filariasis, Professor W. E. KERSHAW (Liverpool); Intestinal Helminths, Dr. F. J. WRIGHT (Edinburgh).

SECTION OF UROLOGY

President: A. JACOBS, P.R.F.P.S. (Glasgow).

Vice-President: DAVID BAND, F.R.C.S.Ed. (Edinburgh).

Hon. Secretaries: J. D. FERGUSON, M.D., F.R.C.S. (London); W. SELBY TULLOCH, F.R.C.S.Ed. (Edinburgh).

Monday, July 20.—2.30 p.m. Western General Hospital. Calcium Metabolism in Renal Calculi, Dr. J. BALFOUR (Vancouver). The Classification of Testicular Tumours, Dr. R. C. B. PUGH (London). Percutaneous Needle Biopsy of the Kidney, Dr. G. N. RANKING (Toronto). Experiences with Supervoltage X-ray Therapy for the Treatment of Bladder Tumours, Mr. DAVID BAND (Edinburgh). Prognosis in Genito-urinary Tuberculosis, Dr. W. H. KERR (Toronto); Dr. G. GALE (Toronto).

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

EVIDENCE TO ROYAL COMMISSION CRITICIZED
A motion expressing complete dissatisfaction with the evidence relating to assistantships and entry into practice given by the British Medical Association to the Royal Commission was carried by the Assistants and Young Practitioners Subcommittee of the General Medical Services Committee at its meeting on November 28. Dr. F. G. TOMLINS was in the chair.

In the course of the debate, which arose out of a discussion on the Association's preliminary memorandum of evidence (*Supplement*, November 23, 1957, p. 157) and of the fourth supplementary memorandum of evidence (*Supplement*, November 15, p. 201), the CHAIRMAN explained that, although the subcommittee had not been consulted about the preparation of either document, he, as its chairman, had been invited by the Royal Commission Evidence Subcommittee of the G.M.S. Committee to attend its July meeting, but had, unfortunately, been unable to do so.

Dr. R. E. HANCOCK said he did not regard the preliminary memorandum as evidence but as a "statement" amounting to a complete defence of principals in general practice. Dr. J. L. WILLIAMS described the fourth memorandum as a defence of the evidence given at the oral hearing (*Supplement*, February 1, p. 39), particularly of that given on assistants' salaries; as such, it was very inadequate.

Dr. W. HUGHES thought that the oral evidence failed to establish that Spens was being implemented in respect of assistants. The figure of £1,245 gross, which the fourth memorandum quoted as the average yearly salary offered to assistants, would be consistent with the Spens recommendations; but he understood that, in the Sheffield area at any rate, the common figure lay between £1,050 and £1,100. Dr. E. F. D. GAWNE asked that a short questionnaire should be sent out to those on the subcommittee's electoral roll seeking more facts from assistants about their salaries and hours and conditions of work. Dr. D. M. CRUIKSHANK said that the figures quoted in the evidence seemed to be ludicrously high.

Dr. F. GRAY said that the figure of £1,245 stated in the memorandum related to the London area and did not pretend to do otherwise. He had explained to the Evidence Committee how he had arrived at the figure and it had accepted it as accurate.

After further discussion the resolution referred to was passed. It was decided to appoint a special subcommittee, consisting of Drs. Tomlins, R. T. Jones, and Hancock, to produce a memorandum of additional information before the next meeting.

Procedure for Appeal

The CHAIRMAN announced that the suggested procedure for appeal by the subcommittee direct to the Council, in certain circumstances, had been approved by the latter body, following the recommendation of the Organization Committee, to whom the subcommittee's request for the grant of this right had been referred. He said it was a right which ought to be used with considerable discretion. It would not do any good if invoked frivolously; on the other hand, it could be a most valuable thing when employed in the right circumstances.

Calculation of Central Pool

The subcommittee considered that there was no objection to general disclosure of the information contained in a memorandum prepared by Dr. Davies for the G.M.S. Committee on the method of calculation of the Central Pool. It was felt, however, that if it was to be communicated to every general practitioner on the list it ought to be in a more popular form and be sent to assistants as well as to principals. To save the expense of sending out the original document to everyone, it was urged that it should be available at Headquarters for any doctor who was genuinely interested in it.

Elections to Subcommittee

The subcommittee then discussed a letter received from Dr. D. B. HAWKINS (Romford) suggesting that more information about candidates for election to the subcommittee should be given on the voting papers.

The CHAIRMAN said it looked as though Dr. HAWKINS wanted a sort of electoral address sent out. The question of expense then arose. Dr. GRAY explained that in elections to the Council of the Association a description of qualifications limited to 20 words was sent out free. Dr. GAWNE thought that the voting papers should state when the candidate qualified, from what hospital, how many years he had been a trainee or assistant in general practice, and how many years' experience he had.

The CHAIRMAN suggested that, for the time being, the principle of 20 words should be accepted but that the subcommittee should recommend that a note should be incorporated in the preliminary notice to candidates, which was sent to the *Journal*, explaining the nature of the procedure required; that the office should then be asked for information on the amount it would cost the candidate to send out an electoral address of, say, one foolscap sheet.

Entry into Practice

Following a suggestion by Dr. WILLIAMS that unestablished principals should be asked to collect some information on entry into general practice, the CHAIRMAN suggested that members might send in their ideas for a suitable proforma which unestablished principals could be asked to complete.

Dr. GRAY, however, pointed out the danger of duplicating some of the information on the subject which the Royal Commission was collecting. He suggested that the Association be asked to request the Royal Commission to make the information it received known in advance so that the Association's representatives could consider it before giving further evidence.

The subcommittee agreed to inquire into the feasibility of Dr. GRAY's suggestion and to consider further action at the next meeting.

Membership of Subcommittee

A report was received that Dr. W. MORGAN EVANS had resigned from the G.M.S. Committee and that Dr. C. M. SCOTT had been appointed by that committee to serve on the subcommittee in Dr. Evans's place.

It was decided to recommend to the G.M.S. Committee that the holder of the office of chairman for the time being of the Junior Members' Forum should be invited to be an *ex officio* member of the subcommittee.

It was agreed that the gross figure of £1,650 should, as a temporary measure and without prejudice to its further consideration, be proposed as a reasonable income limit to apply to unestablished practitioners in determining the subcommittee's electorate.

The subcommittee appointed Dr. HUGHES as deputy to Dr. HANCOCK as representative of assistants on the G.M.S. Committee.

The CHAIRMAN announced that he had accepted an invitation to become a member of the Medical Services Review Committee (*Journal*, December 6, p. 1401). He felt that the invitation was a compliment to the subcommittee.

FEES AND MILEAGE

Emigrants to Australia

The B.M.A.'s Private Practice Committee has negotiated the following fees for examinations of assisted-passage emigrants to Australia with effect from January 1, 1959.

(1) For each person 16 years and over and any unaccompanied child: not exceeding £2 2s. sterling; (2) for each child examined at the same time as its parents: not exceeding 15s. sterling.

At present the maximum fees for such examinations are £1 1s. and 7s. 6d. respectively.

Mileage and National Service Medical Boards

Also as a result of representations by the Private Practice Committee the Ministry of Labour and National Service has agreed that chairmen and members of National Service medical boards may claim mileage allowance in respect of two return journeys made on the same day, provided that:

(1) the doctor attends two sessions of a medical board on the same day and there is an interval of more than two hours between the sessions; (2) during the interval the doctor returns home to attend to his practice; (3) the interval between the two sessions be defined as the period beginning when the last man is dealt with by the chairman at the first session until the scheduled commencement of the second session; and (4) the mileage allowance in respect of the second return journey be subject to the usual rate per mile and to a maximum of 16s.

This new arrangement came into operation on November 3.

COMPOSITION OF MILK

The Association has submitted evidence to a Committee on the Composition of Milk which has been set up by the Minister of Agriculture, Fisheries and Food with the following terms of reference:

To consider the composition of milk sold off farms in the United Kingdom from the standpoint both of human nutrition and animal husbandry, and to recommend any legislative or other changes that may be desirable.

The Food Subcommittee of the Association's Public Health Committee has decided to submit no observations upon draft regulations relating to skimmed milk with added fat which the Minister proposes to make jointly with the Minister of Health under the Food and Drugs Act, 1955. The Public Health Committee (Scotland) has considered a corresponding proposal from the Secretary of State for Scotland, and has decided to submit no observations.

Sealed Churns

The Food Subcommittee of the Public Health Committee has also considered a proposal from the Ministry of Agriculture, Fisheries and Food to withdraw the requirement that churns of raw milk, consigned under the designation "T", should be sealed, and has informed the Ministry that it cannot support the proposal.

The Lord Chancellor's Office has agreed that fees for part-time members of pensions appeals tribunals should be 10 guineas for full-days' sittings and 5 guineas for half a day.

Scottish News

GENERAL MEDICAL SERVICES COMMITTEE (SCOTLAND)

Previously known as the General Medical Services Subcommittee (Scotland) the General Medical Services Committee (Scotland), as it is now named, met at Edinburgh on November 27, with Dr. C. HARROWER in the chair. The CHAIRMAN gave a report of the views of the General Medical Services Committee on the Government's further interim increase of 4% in the basic remuneration of doctors and of the Committee's decision to appoint a working party to discuss with the Ministry of Health the distribution of the new money (*Supplement*, December 6, p. 239).

Change of Address

The Committee was told that, as a result of discussions with representatives of the Department of Health, executive councils were now acting on the information they received from completed forms E.C.1(c). It regarded this as satisfactory and as one step towards correcting inflation. It was agreed to send a circular to local medical committees asking them to encourage doctors to complete these forms as a method of keeping lists up to date.

Diagnostic Facilities in Glasgow

The Chairman reported that the representations which had been made to the Department on the inadequacy of the facilities directly available to general practitioners in Glasgow for laboratory and radiological examinations were the subject of discussion at a recent meeting with the Department. The Committee hoped that a satisfactory solution might be forthcoming in the not-too-distant future.

Air Ambulance Service

The Committee considered a draft circular from the Department about the Air Ambulance Service and with particular reference to the use of helicopters. It recorded its thanks to those who were concerned in the arrangements for the operation of the Air Ambulance Service and agreed that the proposals seemed to be very satisfactory.

Dental Services in Remote Areas

Representations from the Highlands and Islands Practitioners' Subcommittee about the difficulties in obtaining dental services in the remote parts of Scotland were considered. While appreciating the general shortage of dentists, the Committee felt that the special problem of patients in the Highlands and Islands areas in Scotland merited consideration, and it was agreed that Dr. C. J. Swanson and Dr. J. T. McCutcheon should meet representatives of the General Dental Services Committee (Scotland) to discuss the matter and report back.

Personal Medical Record Card

The Committee considered a letter from the Edinburgh Local Medical Committee pointing out the need for a patient's personal medical record card. It was reported that this matter was under consideration centrally, but the Committee felt it was advisable in the meantime to ask the Public Health Committee (Scotland) for its observations on the proposal.

Doctors' Houses in Highlands and Islands

It was reported that representatives of the Highlands and Islands Subcommittee had again discussed with the Department of Health the question of the maintenance of practitioners' houses in the Highlands and Islands and also the question of providing other accommodation in those cases where the house was particularly unsuitable. It was learned that the Department is considering the representations, and it is hoped that in the near future it will submit proposals for the Subcommittee's consideration.

PUBLIC HEALTH COMMITTEE (SCOTLAND)

Two meetings of the Public Health Committee (Scotland) have been held in recent weeks. At the first meeting Dr. J. RIDDELL, Midlothian, was reappointed Chairman for the session 1958-9, and Dr. J. KELMAN, Perth, was appointed Vice-chairman.

Dr. I. C. MONRO, Lanarkshire, and Dr. J. G. THOMSON, Edinburgh, were welcomed by the CHAIRMAN as new members of the Committee.

The Committee appointed Dr. Nora Wattie to represent them on the Maternity Services Committee of the Association's Scottish Council, Dr. B. R. NISBET to represent them on the G.M.S. Committee (Scotland), and Drs. Riddell, Nisbet, and Kelman to represent them on the National Health Service Review Committee (Scotland).

Medical Referees at Crematoria

The Committee had under consideration the obligations of Medical Officers of Health in Scotland who are asked to become medical referees at crematoria, and a special subcommittee was appointed to examine the position.

Model Dairy By-laws

It was reported that evidence on proposed new by-laws, which was prepared in conjunction with the Scottish Branch of the Society of Medical Officers of Health, had been submitted to the Model Dairy By-laws Committee.

The Committee also considered proposals from the Department of Health for regulations concerning skimmed milk with added fat, and had no observations to make on them.

Road Accidents

A small subcommittee was appointed to consider some aspects of the increasing number of road accidents and in particular the facilities available for dealing with them. The subcommittee consists of two medical officers of health (Dr. J. A. C. GUY and Dr. J. G. THOMSON), two medical superintendents (Dr. S. G. M. FRANCIS and Dr. G. H. SCULAR), and one general practitioner (Dr. C. J. SWANSON).

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Tax Relief on Defence Society's Subscriptions

SIR,—Prior to the coming into operation of the Finance Act, 1958, a doctor or dentist whose professional remuneration was assessable to income tax under Schedule E (remuneration by salary) was not normally allowed relief for his annual subscription to his defence society. The Commissioners of Inland Revenue have now approved the Medical Defence Union, the Medical Protection Society, and the Medical and Dental Defence Union of Scotland for the purposes of Section 16 of the Finance Act, 1958, and the whole of the annual subscription paid by a member who qualifies for relief under that Section will be allowable as a deduction from his emoluments assessable to income tax under Schedule E. Practitioners assessed under Schedule D already enjoy this concession, but a member of a medical defence society who holds a salaried appointment should apply to his tax office without delay for form P.358 on which to make a claim for adjustment of his "pay as you earn" coding.—We are, etc.,

ROBERT FORBES,
Secretary, Medical Defence Union.

ALISTAIR FRENCH,
Secretary, Medical Protection Society.

C. C. MILLAR,
Secretary, Medical and Dental Defence Union of Scotland.

London and Glasgow.

Merit Awards for General Practitioners

SIR,—We, the undersigned practitioners, have recently had the feeling from articles in the press that there is a strong move being made behind the scenes to introduce a merit award scheme to general practice. To introduce such a scheme would, in our opinion, be a retrograde step designed to disrupt what unity there is in the profession and would be no remedy for the inadequacy of the present method of payment. Could it be that the Minister, recognizing our dissatisfaction, has decided that the cheapest method of dealing with it would be to "buy off" those of us who are in a position to give a lead? What criterion would be accepted for the award? Length of service, size of list, or the possession of higher degrees is no indication of true merit in practice, and no award based on these would be a substitute for what is really required—payment for work done.

We are afraid that we may waken some morning to discover that a merit award system has been foisted upon us, and, since we believe that such a system would be contrary to the best interests of the profession and to the wishes of the majority, we appeal to all practitioners who agree with us to make their opinion known now by letter or at local B.M.A. meetings.—We are, etc.,

W. T. C. ADAMSON.

Partnership in General Practice

SIR,—When Dr. H. COOPER (*Supplement*, November 29, p. 233) offers advice against an accepted method of entry into general practice, one cannot help feeling that he should suggest another practical method to replace it. As it stands, it is difficult to see how his advice of "don't" to a partnership can be taken seriously.

Of the three ways into general practice, two of them (executive council vacancies and putting up one's plate) can accommodate only a proportion of doctors seeking permanent posts. If, as Dr. Cooper says, the assistantship followed by a partnership is inadvisable, how else does one enter practice as a principal? Unless Dr. Cooper has a sensible alternative, I suspect that when the opportunity arises most doctors will disregard his advice, just as many people have disregarded Mr. Punch's concerning matrimony, without regret.—I am, etc.,

Clive, Shropshire.

DEREK D. GRIFFITHS.

Private General Practice

SIR,—Many general practitioners will deeply resent the implications of your annotation entitled "Private General Practice" (*Journal*, November 29, p. 1343). If "some old-fashioned socialists" dislike the idea of family doctoring being dependent on financial privilege they are in good company. The decision to provide a comprehensive general practice service for the whole community was taken by a coalition government of all parties. In 1954 the committee on general practice of the Central Health Services Council, under the chairmanship of Lord Cohen, endorsed this concept and "decided that it is right to regard prescribing as an integral part of general medical services, and therefore does not recommend that doctors be allowed to use National Health Service prescription forms for their private patients." The report was signed by such men as Guy Dain, E. A. Gregg, and W. N. Pickles, men with a lifetime of service in the interests of the family doctor, and therefore cannot be lightly disregarded.

During the first 10 years of the N.H.S. the vast majority of family doctors have sought to give the best available service. We are quite capable of meeting the reasonable demands of busy people among our patients. Most of us have evening surgeries for those who wish to consult us after working hours—a service which no other profession consistently provides. A growing number find no difficulty

in running efficient appointment systems for N.H.S. patients. We may not have Prime Ministers on our list, but who among us has not frequently gone out of his way to suit the convenience of those who serve or entertain the public in humbler capacities? Most of us have few or no private patients. No insurance schemes or the right to N.H.S. prescriptions will bring them to our surgeries. It is true that a significant increase in private practice "will lessen the heavy burden now borne by the State," but it will inevitably result in a reduction of the Central Pool and therefore reduce the remuneration of every general practitioner who has no private patients nor the possibility of getting them. This seems a heavy price to pay for the freedom of the minority to do more private practice.

Moreover, any general impression that we wish to divide family doctoring into first- and second-class compartments would be disastrous to the profession at the present time. Our case to the Royal Commission, the Government, and the public must be that we seek adequate pay and the time and tools to allow us to give a first-class service to all our patients irrespective of income. Many of us will feel that operating such a service, seeing our patients, and prescribing for them without financial considerations will give us a greater sense of freedom than selling our services to the individual patient or his insurance company.—I am, etc.,

London, N.W.5.

H. C. FAULKNER.

Dispensing Capitation Fee

SIR.—The dispensing capitation fee has remained unaltered since 1952. Since that time the final settlement money has risen from a few thousand to nearly five million pounds. The dispensing doctor receives no added share of this staggering amount for his dispensing in spite of his grossly increased drug bills. Similarly the 5% interim award of last year brought no addition to the dispensing capitation fee.

The G.M.S. Committee is committed "to review the position in the light of the discussions which are taking place on the redistribution of the final settlement moneys" (para. 138, Report of the G.M.S. Committee to the Annual Conference of Representatives of Local Medical Committees, 1958). There is so far no sign that it has done this, though a further supplementary payment is due on December 31, 1958. I fear the worst. Is it too much to hope that, when the 4% award is distributed, the G.M.S. Committee will at last do the right thing, the honest thing, by dispensing doctors?—I am, etc.,

Airesford, Hants.

JOHN S. HAPPEL.

H.M. Forces

Surgeon Captains T. G. B. Crawford and J. G. Gent, R.N., have been appointed Honorary Physicians to the Queen, in succession to Surgeon Captain C. B. Nicholson, R.N., and Surgeon Rear-Admiral R. L. G. Proctor, C.B., respectively. Lieutenant-Colonel F. G. Wood-Smith, R.A.M.C., has been awarded the Army Emergency Reserve Decoration. Lieutenant K. G. Melish-Oxley, R.A.M.C., has been awarded the Territorial Efficiency Decoration.

ROYAL NAVY

Surgeon Rear Admiral R. L. G. Proctor, C.B., has retired. Surgeon Captain P. B. Jackson has retired. Surgeon Commander G. L. Hardman has retired. Surgeon Lieutenant W. B. Wright to be Surgeon Lieutenant-Commander.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commander A. F. M. Barron, V.R.D., has retired. Surgeon Lieutenants C. D. Peters, R. A. J. Baily, J. G. Gill, and P. M. Kinloch to be Surgeon Lieutenant-Commanders.

ARMY

Colonel J. H. Anderson, late R.A.M.C., having attained the age limit for retirement, has retired on retired pay (Reserve Liability). Colonel M. A. Rea, O.B.E., late R.A.M.C., has retired on retired pay (Reserve Liability).

Association Notices

CLAIRE WAND FUND

Travelling Scholarship

The Trustees of the Claire Wand Fund propose to award a Travelling Scholarship to enable a general practitioner to study methods of postgraduate education of general practitioners in Canada and the U.S.A.

The successful applicant must be prepared to spend six to eight weeks in the U.S.A. and Canada, and to attend the Second World Conference on Medical Education in Chicago from August 31 to September 4, 1959, held under the auspices of the World Medical Association, with the theme "Medicine, a Lifelong Study." The Scholarship, of a maximum value of £600, will be paid from the Fund as a contribution towards the expenses of the selected general practitioner, who will be expected to submit a report of his tour to the Trustees.

Applicants should submit full particulars of previous experience and of the research project they propose to the Secretary of the Fund at B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1959.

Diary of Central Meetings

DECEMBER

17 Wed. Council, 10 a.m.
18 Thurs. G.M.S. Committee, 10.30 a.m.

JANUARY

7 Wed. Occupational Health Committee, 10.30 a.m.
8 Thurs. Assistants and Young Practitioners Subcommittee (G.M.S. Committee), 2 p.m.
15 Thurs. G.M.S. Committee, 10.30 a.m.
20 Tues. Committee on Drug Addiction, 3 p.m.

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At Birmingham Medical Institute, 36, Harborne Road, Edgbaston, (1) Tuesday, December 16, 8.30 to 11 p.m., annual Christmas reception and sherry party for members, their ladies, and friends. (2) Thursday, December 18, 8.30 p.m., joint meeting with British Dental Association. Dr. J. L. Hardwick: "The Englishman's Diet Through the Ages."

BRIGHTON AND MID-SUSSEX DIVISION.—At Hotel Metropole, Brighton, Friday, December 19, 8.30 p.m. to 2 a.m., annual ball.

CAMBERWELL DIVISION.—Wednesday, December 17, visit to Albion Brewery, Whitechapel Road, London, E.1. Meet at main gate of Brewery, 12.30 p.m., luncheon at 1 p.m.

DARTFORD DIVISION.—At Railway Hotel, Dartford, Wednesday, December 17, 8.30 p.m., social meeting and clinical "quiz."

LANCASTER DIVISION.—At Grosvenor Hotel, Morecambe, Friday, December 19, 8 p.m. to 2 a.m., annual medical ball.

NORTH MIDDLESEX DIVISION.—At Committee Room, North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, December 16, 8.45 p.m., paper by Dr. Una C. Ledingham: "Thyrotoxicosis."

OLDHAM DIVISION.—At Oldham Hotel, Rhodes Bank, Oldham, Monday, December 15, 9 p.m., special meeting, followed by ordinary meeting.

RICHMOND DIVISION.—At Watney's Brewery (Reception Room), Mortlake Green, Friday, December 19, 9 p.m., films: "Atrial Septal Defect" (in colour) and "The Doctor Defendant."

STRATFORD DIVISION.—At Board Room, Queen Mary's Hospital, Stratford, Tuesday, December 16, 9 p.m., special meeting.

SWANSEA DIVISION.—At Langland Bay Hotel, Swansea, Thursday, December 18, dinner, and lecture by Professor A. P. Thomson (president, B.M.A.): "Some Aspects of Medical Education in England."

WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.—At Arthur Guinness Son and Co., Ltd., York House, Drury Lane, Westgate, Wakefield, Friday, December 19, 8 p.m., Mr. E. M. Warren: "The Brewing of Stout."

WIGAN DIVISION.—At Lewis's Restaurant, Wallgate, Wigan, Thursday, December 18, 8.15 p.m., Mr. J. G. Gow: "Recent Advances in the Treatment of Renal Tuberculosis."

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. Marcus Gershon Lucas (Shirley, Warwickshire) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations, 1953, apply.

CENTRAL CONSULTANTS AND
SPECIALISTS COMMITTEE

Medical Superintendents' Evidence to Royal Commission

It was a great mistake for the medical profession to "down-grade" medical administration, Dr. J. B. S. MORGAN told the Central Consultants and Specialists Committee at its meeting on December 4. Under discussion were the Executive Committee's comments on the evidence submitted to the Royal Commission by the Medical Superintendents' Society in which it had expressed the fear that, owing to the inadequacy of medical superintendents' salaries, doctors might accept such posts with a view to achieving consultant status. The Executive Committee's opinion had been that while such a possibility might exist in relation to mental hospitals, it did not apply to the hospital service generally. Speaking against this view, Dr. MORGAN said: "There is a dead set against medical administration. It is a pity. I have a lot of sympathy with the medical superintendents in this. A little levelling up would help the whole medical profession in the long run." The paragraph was deleted.

A proposal by the CHAIRMAN (Mr. H. H. Langston) that the document setting out the Executive Committee's views on the society's evidence should go forward to the Royal Commission *en bloc* was objected to by Dr. J. VALENTINE, whose motion that the items be considered separately was carried.

The Committee supported the Executive's rejection of the suggestion that the work of the part-time consultant was the poorer because he was exposed to an alleged conflict of loyalties between hospital and private practice, and that consultants working only in hospital might develop a "parochial" outlook. It was considered undesirable that the Committee should be drawn into any controversy on whether part- or whole-timers gave better value for their services.

The Executive's comment, agreeing that local advice on the selection of recipients for special distinction awards was desirable but opposing any suggestion that the awards should be made by local committees, was deleted as being inappropriate criticism of the Medical Superintendents' Society's argument, which was directed only to the seeking of advice from such bodies.

The Committee rejected the Society's proposal that merit awards should not be confined to clinicians, and agreed with its Executive's view that they should continue to be awarded "on the basis of outstanding clinical ability," in accordance with the relevant recommendation in the Spens Report.

Dr. F. STEEL criticized the Executive's suggestion, in a paragraph headed "Remuneration of Medical Superintendents," that the "exact nature of a medical superintendent's duties can be said to apply equally to the

chairman or other member of the medical staff committee charged with medical administration," and this was accordingly deleted.

After further discussion it was decided that the Executive's document, as amended, should be sent to the Council for approval with the following modified form of preamble suggested by Mr. J. M. MILLOY:

The Council has considered the evidence submitted to the Royal Commission by the Medical Superintendents' Society, and, while in general agreement with its recommendations, desires to offer its comments on certain statements.

Professor G. I. STRACHAN, urging support for this wording, described the medical superintendents as "a worthy body of men who carry large responsibilities which they often discharge very effectively."

Working Party on Hospital Medical Staffing

The CHAIRMAN hoped that regions would stress to their local committees the importance of filling up carefully and accurately the questionnaire which the Executive Committee was about to issue in connexion with the impending review of the medical staffing of hospitals. In reply to Dr. I. RANNIE's criticism that the working party had not yet seen any specialists apart from those in general medicine and surgery, the CHAIRMAN explained that its visits to hospitals had so far been on an experimental basis and that attention would doubtless be given to other specialties in due course. It was hoped that the questionnaire would be distributed before Christmas.

Resolutions of the Representative Body

The Committee accepted its Executive's recommendations on A.R.M. resolutions on remuneration of residents in smaller hospitals. It was felt that no useful purpose would be served by approaching the Ministry for an increase in remuneration over that paid to residents in major and teaching hospitals, as urged by the A.R.M. The Executive had noted the A.R.M.'s condemnation of restrictions on hospital expenditure, but offered no particular observations. The Executive Committee was asked to give further consideration to a resolution on the subject of schemes for withdrawal from the National Health Service after Professor P. C. P. CLOAKE had reported that the G.M.S. Committee had set up a subcommittee to make proposals on the subject in due course. After discussing the Executive's comments on the A.R.M. resolution deploring the difficulty experienced in obtaining locumtenens for principals in general practice and for the hospital services, the Committee adopted a proposal by Professor CLOAKE that the Joint Consultants Committee be asked to suggest to the Minister that regional boards should keep a register of available locums acceptable to the boards.

N.O.T.B.A. Clinics at Industrial Premises

The Committee also accepted its Executive's recommendations (1) that it would not be in the public interest for ophthalmic or other specialist services of a type customarily obtained through the National Health Service to be provided at industrial premises and that the proposal of the N.O.T.B. Association on this subject should not be supported; (2) that it should be suggested to the Occupational Health Committee that the possibility of using visual screening machines operated by a layman under the supervision of the industrial medical officer be explored.

Superannuation on Domiciliary Fees

After some criticism had been made of the existing arrangement whereby the income from domiciliary visits was included in the average income for pension purposes—particularly on the ground that if the number of visits undertaken in the last three years of service were less than in previous years the contributions paid earlier would be lost—it was decided that more information should be sought from regional committees on the subject generally and passed on to the Association's Compensation and Superannuation Committee.

Dr. STEEL said he did not agree with the calculations so far arrived at by the Compensation and Superannuation Committee, and thought that the whole matter needed looking into on an actuarial basis. He thought that the existing arrangement was perfectly satisfactory and certainly would benefit 95% of the whole-time consultants who proposed to do domiciliary visits during the last three years, but there should be some compensation for consultants who, for some reason, were unable to do so.

Filling of Retirement Vacancies

The Committee accepted its Executive's support for the A.R.M. resolution endorsing the principle of filling retirement vacancies in the consultant grade of the National Health Service some time before they occur, the Executive having added the qualification "where practicable and wise."

Regional Committee Conference

The CHAIRMAN said that the conference of chairmen and honorary secretaries of regional consultants committees, held on November 28, had proved a most useful and helpful meeting and would probably become an annual event. A report was to be circulated in due course.

Professor S. J. HARFALL agreed that it had been extremely valuable, enabling those attending to learn in detail of the difficulties of others.

Joint Consultants Committee

The CHAIRMAN, presenting his report on the work of the Joint Consultants Committees, explained first that information was being obtained from all parts of the country on the recent increased charges for hospital private beds, and said that information on any instances of particularly steep rises would be welcomed.

He proposed that the Council's resolution expressing opposition to the scheme for the statutory registration of professions supplementary to medicine should be sent to the Joint Committee for information, pointing out that the Council had adopted the wording "that no scheme would be acceptable which did not give the medical profession a greater influence in the training and ethical standards of supplementary professions." Dr. J. D. ALLAN GRAY, emphasizing the importance of the words in the report, said it had been agreed that the medical representatives should be chosen solely from names suggested by the appropriate medical organizations, said it was sometimes felt that other representatives might not have quite the same acute interest in the matter. The CHAIRMAN explained that that principle had been agreed by the Ministry.

Mr. E. N. WARDLE expressed apprehension about the Joint Consultants Committee going no further than "making strenuous efforts to persuade the Ministry." It ought surely to be abundantly clear to all that such schemes were unworkable. The CHAIRMAN said he did not think the Joint Committee had been left in any doubt at its last meeting about the views of members of the Orthopaedic, Pathologists, Radiologists, and other groups, which had been expressed very forcibly. They would be reinforced by the Council's resolution.

The remaining items of the report covered the subjects of S.H.M.O.s in consultant posts, payment of whole-time consultants for teaching duties, serological tests for V.D., designated posts for time-expired senior registrars, board-and-lodging charges, and income-tax relief in respect of professional expenses.

Working Party on Hospital Staffing

The Committee discussed a protest from the Sheffield Regional Committee about the non-inclusion in the working party of a representative of the staff of a non-teaching hospital and urging that such omission be corrected by co-option. Dr. D. H. RANDALL said that dissatisfaction about the representation had been expressed by the staffs of certain provincial hospitals. Professor CLOAKE pointed out that Dr. Rowland Hill had no appointment at a teaching hospital. Before such criticisms were levelled the facts ought to be ascertained. The ASSISTANT SECRETARY said he believed that the working party, which was appointed by the Minister, had no powers of co-option.

Professor G. I. STRACHAN said that "representation" was not the point; if so, the numbers could be extended to thirty or forty when pathologists and others were taken into account. The matter had been discussed by the Joint Consultants Committee, which had reached the conclusion that it was a very carefully chosen team likely to represent the interests of the profession to the best advantage. The CHAIRMAN said that, now that the working party had started its task, he did not believe that the Ministry would agree to any additional members being appointed. Mr. J. R. BLACKBURN protested that 70% of the country's hospital beds were in provincial non-teaching hospitals and that the major staffing difficulties were found in such places; it was curious that they should not have been asked either to state their views direct to the working party or to send a representative to state them. The CHAIRMAN said that their views would be stated by the evidence that others would give.

Professor CLOAKE said that a great deal of Dr. Rowland Hill's work was at Southend—a provincial non-teaching hospital—and that he had been chairman of a hospital management committee. The CHAIRMAN said the Committee would be on thin ground in saying that provincial non-teaching hospitals were not represented.

It was agreed that no action should be taken on this item.

Remuneration

On the question of the recent Government proposal to make a further interim increase of 4% in the current basic remuneration of doctors and dentists in the National Health Service, Dr. RANNIE said it represented a further addition to differentials. The CHAIRMAN agreed that it would upset one or two differentials, such as those between consultants and S.H.M.O.s, but said he felt quite certain that, for an interim award affecting a few months, the Ministry could not be expected to have regard to differentials.

Mr. J. M. MILLOY asked for an assurance that the increase would be automatically granted to hospital superintendents as well as others; this had not happened on the last two occasions until representations had been made from Committee B.

Princess Louise Hospital for Children

Mr. A. STAVELEY GOUGH said that for more than two years the North-west Metropolitan Board had discussed the

decision of the Board of Governors of the above hospital to convert two of its wards for the treatment of maternity cases. It was agreed that there was an urgent need for obstetric and adult beds.

The CHAIRMAN said it would be necessary to have the views of the regional committee before the matter could be taken further. The item was deferred until the next meeting.

Alternative General Medical Service

It was agreed to refer to the Executive Committee the principles formulated by the Amending Acts Committee for an alternative General Medical Service. The CHAIRMAN said they were straightforward principles of the type which had been previously accepted both by Committee and by the Representative Body. Dr. A. B. DAVIES (Chairman of the G.M.S. Committee) added that a number of the recommendations conformed to recognized Association policy, but two of them were directly contrary to it. As such policy had been the basis upon which evidence had been given to the Royal Commission, both orally and in writing, it would be disastrous if the Association at this juncture, while the Royal Commission was sitting, should alter completely its policy.

The CHAIRMAN pointed out that the two principles Dr. Davies had mentioned specifically concerned general medical services. Dr. WAND, asking that the document be referred to the Executive Committee, said it was clear that the Association would at some future time present the Medical Services Review Committee (*Journal*, December 6, p. 1401) with evidence on many of the points raised in the principles, and it might be that Council would ultimately decide the form of that evidence.

Advice to General Practitioners from Hospital Management Committee

The view that specialists wishing to give professional instruction to their professional colleagues should do so under their own signature and not through the medium of a hospital management committee's staff was expressed by several members when a complaint on this subject was discussed.

Mr. J. R. NICHOLSON-LAILEY said he understood it was the method of conveying the advice that was objected to and not the advice itself. Dr. DAVIES (Chairman of the G.M.S. Committee) said that unless such communications came under the personal signature of the consultant there was no evidence that the consultant had seen them. Professor STRACHAN said that the particular instance referred to had arisen because the obstetricians in charge had said that, for uniformity, they would like a certain line of treatment adopted. They themselves should have advised their general-practitioner colleagues on the matter.

It was decided that further information should be sought.

Membership of the Venereologists Group

A recommendation of the Venereologists Group Committee that the criteria for admission to membership be amended by the deletion of the words "in charge of venereal diseases clinics, although not engaged predominantly in the specialty," and the substitution of "if not engaged predominantly in the specialty, are graded as consultants or senior hospital medical officers in venereology" was agreed to.

Dr. WILCOX said that the change lessened the possibility of admitting consultants engaged in other specialties but who happened to be in charge of a V.D. clinic on a part-time basis. There was no suggestion that any present members should be removed.

Personal Medical Card

The Committee agreed in principle with the view that a form of personal medical card should be devised for the public.

Mr. NICHOLSON-LAILEY said that any doctor faced with the problem of treating an unconscious patient he had never

seen before would appreciate the extreme difficulty involved in diagnosis. The Science Committee considered that, if the profession agreed that it was desirable for such a card to be carried, a suitable form should contain information under the headings of: blood group; transfusions carried out; sera or inoculations received; treatment required (doses of penicillin, cortisone, or insulin); sensitivity or allergy (e.g., penicillin, iodine). "People are getting accustomed to carrying cards," he said. Pregnant women carried them, and he thought certain other classes too, such as haemophiliacs. Under the blood group heading there should be a reminder to all doctors that no matter what group was given it was advisable, before doing a transfusion, to do a direct cross-match if possible.

Mr. T. H. DOCKRELL said that the principle was good enough, but he thought that it was very doubtful whether the free citizens of this country could be persuaded to carry such a card on them. He was not at all sure that they were as used to carrying cards as Mr. Nicholson-Lailey seemed to suggest. Professor H. W. RODGERS said that for such positive points as the indication of a blood group it would be a good thing if people could be persuaded to carry a card, but he did not think that anything like a "medical book" as used in the Army would be appropriate.

Dr. MORGAN said that the medical profession ought to educate the general public in such a matter and also doctors. If the profession thought it a good thing, the proposal ought to be pressed. He thought, however, that the idea should be confined to those cases where it was really needed, the onus being on the patient's own doctor, who had found out that hypersensitivity or some other condition existed, to pass on any information of value to his colleagues. The first step to success was to say, "We will try it because it may be of value." Dr. E. R. CULLINAN said that if cortisone were mentioned it should be indicated whether it had been given recently.

Professor CLOAKE said it was a defeatist policy to assume that any suggested step forward would not work. It seemed that the obligation about such a card—the patient could not be compelled to carry it—was on the doctor, who knew facts of importance to the patient. If the idea could be got over to hospital staffs and general practitioners there would at least have been a step in the right direction. If it saved the lives of half a dozen people, or even of one, it would be worth while.

Dr. E. BERESFORD DAVIES agreed with Professor Cloake, but, as a psychiatrist, he saw people bringing all kinds of things into hospital—interesting if one had time to study their psychopathology but extremely misleading if one was a young and inexperienced house officer. The document should be drawn up in an authoritative way by a properly qualified doctor, whose signature should appear on the appropriate part of the card.

The CHAIRMAN said it appeared that the Committee had given general approval to the idea and had drawn attention to several difficulties which the Science Committee would no doubt examine further.

Advisory Appointments Committees

It was reported that the only instances of dissatisfaction so far expressed over the way in which boards appointed members to advisory appointments committees had come from the Manchester and Eastern Region. The CHAIRMAN said that no action could be taken at present. If other regions had similar complaints they were asked to send their information in.

Telephones for Hospital Staff

It was agreed to refer to Whitley Committee B an anomaly whereby a first-year registrar received a telephone allowance but a second-year registrar did not.

Co-option

It was reported that Mr. A. M. A. Moore had accepted an invitation to serve on the Committee as a co-opted

member. The CHAIRMAN said it was to be regretted that Dr. Russell Brain had felt unable to accept co-option as he was no longer a member of the Joint Consultants Committee, but members would doubtless understand his reasons.

Representation of Royal Colleges

The CHAIRMAN drew attention to the replies, contained in the agenda, which had been received from the Royal Colleges in response to an invitation to be represented on the Committee. Neither the Royal College of Physicians nor the Royal College of Surgeons wished for representation, but the Royal College of Physicians, Edinburgh, and the Royal Faculty of Physicians and Surgeons of Glasgow had accepted. The Royal College of Obstetricians and Gynaecologists had replied that, while appreciating the wishes of the Association and the courtesy of the invitation, it considered that the present liaison through the Joint Consultants Committee was adequate. A reply was still awaited from the Royal College of Surgeons, Edinburgh.

Dr. H. G. H. RICHARDS said that these replies merely indicated how the Royal Colleges, finding that they had considerable power on the Joint Consultants Committee, were quite prepared to leave things as they were. This emphasized how important it was that the Central Consultants and Specialists Committee should try to achieve better representation on the joint body. He hoped that the matter would be taken up with some urgency before the Royal Commission reported.

Representatives in the R.B.

The Committee agreed to accept nominations for the appointment of four members to represent the Committee in the Representative Body, of whom one should be from Scotland. It was decided that the election should be made at the next meeting.

HOSPITAL MEDICAL STAFFS DEFENCE TRUST

It was agreed by the Central Consultants and Specialists Committee, meeting on December 4 in its capacity as Trustees of the Hospital Medical Staffs Defence Trust, that an appeal against the decision of the Lord Chief Justice of Northern Ireland in the case of *J. Norris Whyte v. The Northern Ireland Tuberculosis Authority* should be entered.

Remuneration Claim

Payment of £1,301 in connexion with the preparation of the joint remuneration claim for general practitioners and hospital medical staff was authorized by the Trustees without discussion.

Part-time Consultants and Income Tax

It was reported that the Trustees of the National Insurance Defence Trust had agreed to make £2,000 available as a contribution to the additional expenditure involved in conducting the test cases on the assessment of the hospital income of part-time consultants under Schedule E.

Dr. MORGAN said it was another instance where the general practitioners were being, in a sense, perhaps a little generous towards the consultants and specialists. Professor CLOAKE moved that a vote of thanks be passed for the provisional assistance offered, and this was agreed to. He said he hoped the day might come when the consultants and specialists could reciprocate or perhaps pay back the money.

Publication of Financial Statement

AN ASSISTANT SECRETARY said that the non-appearance of published accounts had been questioned. While it was true that nobody who had asked for a copy would have been denied one, there had in fact been no such applications. After further discussion it was agreed that in future the accounts should be published in the Committee's *Bulletin*.

RADIOLOGISTS GROUP

A meeting of the Radiologists Group was held at B.M.A. House on December 6. Dr. A. ROBINSON THOMAS was in the chair.

"Points" System

The present "points" system for recording the work of x-ray departments came in for a good deal of discussion, and was much criticized. Dr. F. H. KEMP said that the Faculty of Radiologists had achieved some success in an attempt to simplify the system, but had not yet got complete agreement. Dr. E. E. CLAXTON, Assistant Secretary, said that the pathologists had found that the differences in the assessment in different types of laboratories made the whole thing quite impracticable. Dr. H. R. C. HAY moved that radiologists should abandon the scheme, and this was seconded by Dr. J. W. D. BULL.

It was then pointed out that, even though the points system was not greatly admired, the Ministry would nevertheless insist on some system of costing in x-ray and other departments, and that if the present method was turned down the Group would have to suggest something in substitution. Dr. KEMP agreed, adding that, if it wished, the Ministry could work the present system without the co-operation of the radiologists. Even though his own superintendent radiographer might agree with him, she had to take administrative orders from the administrative officer concerned. A cautious policy, therefore, was advisable. Dr. S. D. SCOTT PARK said that a plan had been put to the Department of Health for Scotland for another method, which would give a uniform system of keeping records and with which the points method would tie up. Nothing had since been heard about it.

Dr. B. S. H. STORR did not think it fair to say that the figures were entirely meaningless, but they meant something only if it was known in what conditions they were made. He thought that any basis or comparison for costing was better than none. Although the present system was probably not the best, he was not altogether convinced that a points system was not the most suitable. The present method was wrongly loaded, but if it was overhauled it would probably disclose a great deal about the comparative costs of departments. Rather than abandon the present system, it might be better to try to adjust the loading.

Dr. H. HOWELL remarked that in some departments the system was worked out by a secretary or a clerk, who put "the most fantastic interpretation on the figures." Dr. SCOTT PARK said that when he was a member of the council of the Scottish Radiological Society it had kept records based on the returns of the leading hospitals in Glasgow, Aberdeen, and Edinburgh, the idea at that time being that the figures would be available to the Department of Health for Scotland, which could then have allocated the points in a uniform way. Whether or not that was being pursued he could not say. Dr. KEMP informed the Group that three or four members of the Faculty had reported some favourable progress towards simplification of the points system, following meetings with Ministry representatives. They had also had in mind the incorrect weighting of the present system, and problems arising from the actual recording. It was generally believed, he was sure, that some system of costing had to be accepted, and that there was something to be said for a points system as such.

Dr. HAY, having withdrawn his motion, proposed "That the points system be reconsidered and adjusted to reflect values more fairly."

This was agreed to.

Fees for Examinations

The CHAIRMAN pointed out that there had been one or two complaints that when a fee of two guineas was paid to the hospital for, say, an x-ray examination prior to emigration the hospital deducted one-third for the use of the apparatus and handed only the balance to the radiologist. It had been suggested that the Ministry be asked that the

terms and conditions of service should be modified and that the hospital should collect its own fee for use of equipment and hand the two guineas to the radiologist. He agreed that this would mean a total payment of three guineas. Dr. CLAXTON pointed out that it would entail an alteration in the general fee scale, which was laid down in the regulations. A reconsideration of fees might follow the report of the Royal Commission, and if they tried to do anything at present they would only be told to wait for the Royal Commission's Report.

Dr. KEMP said that it had been represented to the Faculty that the fees were out of date and should be reviewed. He thought that now was the time to examine the various schedules and have ready a reasoned statement for increases and adjustments. When the Royal Commission reported they would then have to be ready with proposals of what they thought their services were worth. All outside costs had gone up, and this alone was a reason for a review of fees. He suggested referring the matter to the Group Committee. It was not only the fees under discussion; the schedule of private fees was also out of date.

It was agreed that the Group Committee should look into the question of increasing the fees generally.

Training of Radiographers

When the meeting came to the training of radiographers, Dr. BULL said that at a special meeting held earlier in the year he had found those representing radiographers not particularly worried about recruitment. Their chief complaint was insufficient pay. Dr. CLAXTON added that the problem was not now that of intake so much as of newly qualified radiographers being attracted elsewhere after entry.

A good deal of objection was taken to a paragraph in the Group Committee's report on the training of radiographers, on the grounds that it tended to give the impression that it recommended a lowering of the technical standards required in favour of somebody who was "nice and handy" with patients. Dr. STORR said that radiographers had the idea that the medical profession did not want a high standard of radiographer but would rather see the basic standard lowered. "I don't think that that is true," he continued. "The Membership of the Society of Radiographers is a good, sound basic qualification, and radiographers generally do not want to see it lowered. Although it is important that radiographers should be trained in handling patients and in minor nursing techniques, the most important thing in their training is that they should be good technicians."

The CHAIRMAN thought that the paragraph had been misunderstood. The "scientific subjects" referred to such things as too much physics and medical photography, and in the new syllabus the time allotted to them had been drastically cut. "Apparatus construction used to be an awful bugbear, and apart from knowing how it worked, there seemed to be no point in students knowing all the intricate technicalities." That, too, had been cut, and a paper inserted on the handling of patients. The whole point of the report was to find reasons for the shortage, and the paragraph merely mentioned what, in the Committee's view, was one of the reasons for the shortage.

The general feeling of the meeting was that, while it approved the underlying reasons given in the paragraph, it felt that the wording was perhaps rather unfortunate. The paragraph was referred back for rephrasing.

Doctors' Secretaries

The status of secretaries to medical staff in hospital departments was then discussed. The CHAIRMAN said that, following the Hall Report on the administrative and other staffing structure of the Health Service (*Supplement*, December 7, 1957, p. 188), attention had been drawn to the need for a career structure on the clinical administrative side, but the report said nothing about departmental secretaries and the like. The Group Committee had

therefore drawn up a memorandum which, he thought, would be favourably considered by Whitley Committee B.

Dr. KEMP said that the subject was one that concerned them all. There had recently been a complete regrading of the clerical staff, which did not include shorthand-typists and the various personnel classified as personal secretaries. They might find girls employed in filing films and the like being graded higher and paid more than the radiologists' secretaries. It was necessary to press the administrators to do something. Although the industrial tribunal had not yet published its findings on secretarial staff, it was known that they would be in a lower grade.

The CHAIRMAN said that the situation had arisen as a result of the Government's implementation of the Hall Report. If it was possible to persuade administrators not to categorize staff at present—and they were not under compulsion to do it yet—it was probable that in the meantime the Whitley Council Report on career structure on the clinical administrative side would have been thrashed out. There certainly was a case for a career structure for secretaries on the clinical side of hospitals, apart from those on the administrative side.

Dr. KEMP expressed his doubts about whether people really had the present situation clearly in their minds. Whatever might or might not be done at Whitley Council level, events had marched ahead of them. For instance, there was already confusion about the meaning of "clerk." Clerks were, in future, to be the higher grade, and he had had definite warning that when the next part of the Report was published it would be found to put secretarial staff on a lower basis than clerks. Secretaries, typists, and the like were not to be included in the clerk category, and it was of vital importance to examine the position at once.

The CHAIRMAN said that it would have to be taken on a very broad basis, as it concerned not only their own secretaries but those in other departments. However, it must be remembered that the Group Committee had started work on this before anyone else had. The co-operation of other Groups could be sought.

Registration of Medical Auxiliaries

A lively discussion followed on the statutory registration of medical auxiliaries. Giving a summary of the history, the CHAIRMAN said that, after a previous report, to which the Group Committee had made recommendations, had not been accepted, the whole thing appeared to be dead. However, some weeks ago the Consultants and Specialists Committee had had a report from the Joint Consultants Committee of a revised provisional scheme by the Ministry for the statutory registration of "professions supplementary to medicine" (*Supplement*, October 18, p. 171). That was the first that the Group Committee had known of such a scheme, and when they had seen a copy of it it looked "very unacceptable." The Ministry scheme envisaged a series of registration boards, one for each of the specialties, with a council governing them all. The radiographers' registration board would consist of seven radiographers, four doctors, one educationist, and one "expert in fields allied to radiography"—probably a physicist. Not only would that result in the doctors being in a minority of four to nine, but not one of the four need be a radiologist. As a specialty they would have absolutely no say on training and on registration. The Chairman felt such a scheme to be wholly unacceptable, but wanted the views of the Group.

Dr. KEMP's immediate reaction was that they should not discuss the matter at all, but just give the Group Committee the meeting's wholehearted support and leave it at that. Dr. PIGOTT felt that the matter could not be dismissed so summarily. There should be registration. At present it was difficult to find from the Society of Radiographers whether or not a radiographer held his diploma. Holding the diploma was not the same as being a member of the Society. Only for holders of the diploma was there a current record. Intervening, the CHAIRMAN said that Dr. Pigott had just put forward one principle with which they might all agree. "Do we want a register of

radiographers?" All were agreed on that. Continuing, Dr. PIGOTT said that the next point was who was to maintain the register, and what was to be the function of the registering body. He thought that control of the register would be largely formal, except for ethics and for discipline. A person satisfying the examiners would be eligible for registration. What should be strongly pressed was that the doctors on the proposed registering body should be radiologists. Their views would then be heard on matters of ethical practice after registration. Though the doctors would be in a numerical minority, he was sure that the registering body would be loath to override medical members on matters of principle in relation to practice.

In the CHAIRMAN'S view doctors should have parity with the radiographers on the registration board. It had been suggested to the Joint Consultants Committee that it would be enough to leave the present constitution of the registration board as it was and merely insist on having a majority of doctors on the co-ordinating council, but he did not think that that would give them the authority where they wanted it.

It was agreed to submit a report to the Joint Consultants Committee.

PRIVATE PRACTICE COMMITTEE

Drugs for Private Patients

Dr. I. M. JONES, Chairman of the Private Practice Committee, explained that the main reason for calling a special meeting of the Committee, held on December 10, was to consider further the question of drugs for private patients. He reported on a meeting between Dr. S. Wand, Dr. A. B. Davies, Dr. Lindsey W. Batten, and himself and Ministry officials on October 28. The Committee also had before it a letter from the Ministry setting out points which arose at the October meeting, and a memorandum on the subject from Dr. O. C. Carter.

Registration of Patients

Dr. Jones said that the Ministry envisaged registration of the private patients on identical terms, broadly speaking, with those of National Health Service patients. Apart from the question of registration, there was more or less agreement between the Ministry and the Association. Therefore the Committee must decide whether it agreed to some form of registration of private patients.

Dr. A. V. RUSSELL (Wolverhampton) said he found difficulty in understanding why registration should be necessary at all. Figures and statistics could be compiled from the use of E.C.10's of a special colour for private patients. Dr. O. C. CARTER said it appeared that the only remaining issue between the Ministry and the Association was the insistence by the former on some sort of registration of private patients, and some agreement or contract to be entered into by doctors with the executive council. He thought that the Ministry's requirements were quite unacceptable. Any agreement with the proposed strings attached would lead to strangulation of private practice. Since this was a matter which mostly concerned those doctors who were purely in private practice, the question could only be settled fairly and satisfactorily by those members exclusively or almost exclusively in private practice. The Private Practice Committee, whose members included a number whose main interest was in N.H.S. practice, was not competent to make a recommendation to Council on it, said Dr. Carter. He proposed that a special meeting of private practitioners be called.

The CHAIRMAN reminded Dr. Carter that the Private Practice Committee was elected by the Representative Body, and constitutionally it had the right and duty of doing what it thought fit. Dr. Carter suggested it should not do. Further, at the request of the purely private practitioners, a subcommittee had been set up, called the Private Practitioners Subcommittee, of 12 members, 3 of whom were nominees of the Private Practice Committee, and the remaining 9

nominees of the purely private practitioners group, with no more influence brought to bear upon them in their selection of who should represent them than that they should have some regard to a reasonable geographical distribution over the country.

Dr. RUSSELL suggested that the interests of the patient should not be lost sight of in standing too much on the rights of the doctor. Dr. L. A. GIBBONS said he was opposed to complete registration of private patients in the same way as in National Health Service lists. Dr. R. HALE-WHITE pointed out that the Ministry wanted to ensure that nobody obtained drugs from more than one doctor, and he would be agreeable to some system of an absolutely minimum nature which gave the Ministry that assurance. That did not mean any kind of list at all, he added, because it was obviously impossible for a private doctor to provide such a list. They would be deceiving themselves if they thought they had this "buttoned up with the Ministry." It would necessarily mean an Amending Act.

Dr. R. GREEN said that the first object was fair treatment for all patients, and that might mean forfeiting some of the jealously held independence of the purely private practitioner. The attitude which might be adopted towards the Ministry and towards the Government was that every patient had a right to use the Health Service, or as much or as little of it as he liked, and those who preferred to pay their doctor a fee should be allowed to do so without any form of financial penalty. If tackled from that angle, it might well be that the private patient, whether his doctor had a State list or not, could get his drugs free if he so wished. Dr. Green was doubtful whether any scheme would be successful which depended on a patient himself making application to the executive council for free drugs. On the other hand if the doctor sent in a card to the effect that the patient wished to receive his drugs free of charge, it would, technically, be registration and the patient would be put to no trouble at all.

Dr. L. W. BATTEN said that in his view the principle of registration must be accepted.

On the motion of Dr. J. O. M. REES, seconded by Dr. RUSSELL, a vote of thanks was accorded to the deputation, which met the Ministry officials, on having achieved a very substantial measure of success.

Dr. CARTER drew attention to his proposition that a special meeting of private practitioners be convened, but as the proposition was not seconded there was no further discussion.

The Committee accepted, with one dissentient, a proposal that the general principle of executive councils maintaining a list of those private patients authorized to receive drugs and appliances on Form E.C.10 be adopted. This was in accordance with the recommendation to the Committee of its Private Practitioners Subcommittee.

The Committee also agreed to recommend to the Council that a letter be sent to the Ministry suggesting that, since agreement had been reached that a scheme was administratively possible, the matter should now be taken up with the Minister.

After some further discussion on administrative details, a suggestion that cards should be issued to private practitioners by executive councils for signature by patients who desired to obtain their drugs through the National Health Service was adopted.

Part-time Prison Medical Officers

The CHAIRMAN recalled that a deputation, consisting of Dr. R. D. Summers, Dr. A. Barker, and himself, was appointed to meet the Prison Commissioners to try to obtain an improvement in the remuneration of part-time prison medical officers. Before the meeting could take place, however, the Prison Commissioners produced a new scale which was to have been put into force on January 1, 1959. Dr. Jones said that the new scale fell short of the scale which the Committee and the prison medical officers agreed was desirable.

It had been indicated to the Prison Commissioners that there would be objections to the new scale, and they had suggested that, since the Treasury was involved, a meeting should be arranged at the Treasury at which both the Association and the Prison Commissioners would be represented. The Association could then put forward its claim.

The Committee agreed to that course.

Cremation Certificates

The Committee received a letter from the National Association of Funeral Directors which gave an assurance that the National Association had never tried nationally to fix the fees for the completion of cremation certificates B and C (see *Supplement*, October 18, 1958, p. 174). "Our Dundee Association has been informed of this and publicity is being given in the National Association of Funeral Directors' publications to this point," concluded the letter.

A.R.M. Resolution

The Committee further considered a resolution from the A.R.M. that hospital medical officers should receive a fee for the completion of Certificate B of the cremation form. At the previous meeting the matter was referred to the Committee's Cremation Subcommittee, it being pointed out that the Joint Consultants Committee had already made unsuccessful representations on this matter.

The Committee agreed to refer to the Central Consultants and Specialists Committee some suggestions which had been made by the Cremation Subcommittee for a new approach to the Ministry.

Membership of Committee

At the beginning of the meeting the CHAIRMAN welcomed Dr. R. Hale-White, who had accepted an invitation to serve as a co-opted member, and Dr. S. Noy Scott, who had been appointed to take the place of Dr. W. Morgan Evans as the representative of the G.M.S. Committee. The Committee unanimously agreed that a letter should be sent to Dr. Morgan Evans expressing gratitude for the invaluable help he had given the Committee in the past.

HOSPITAL SUPPLIES

In its final report¹ the Central Health Services Council's Committee on Hospital Supplies recommends more use of joint contracting arrangements between hospital groups and, in some instances, with local authorities. The committee is against central contracting by the Ministry of Health except on the present limited scale, and it thinks the Ministry should review the scope of its purchase of domestic supplies with a view to devolving part of this work. In matters of importance, national policy should outweigh other considerations, although hospital authorities should be told of the policy reasons for decisions in central supply arrangements. In favouring joint contracting the committee says that the organization must be adopted to serve the needs and resources of the authority concerned and must not be limited by hospital group boundaries or interests.

The committee was set up by the Central Health Services Council in January, 1955, "to investigate and report on the organization of all forms of hospital supplies, including their purchase, storage, and issue throughout the National Health Service." It issued an interim report in June, 1956. The chairman was Sir Frederick Messer, M.P., and the medical member was Lord Cohen of Birkenhead.

WEEKLY INSURANCE STAMP

PROPORTION GOING TO N.H.S.

At its meeting on November 19 the Association's Public Relations Committee (chairman, Dr. H. Guy Dain) considered the following table showing the changes during the past 10 years in the proportion of the weekly insurance stamp of a male employed person which is contributed to the National Health Service.

Owing to the numerous changes in the contribution rate, the Committee decided that the display of posters and leaflets in doctors' surgeries was an impractical method of publicizing the facts.

	Male Employee				Employer				Total Cost of Stamp for Employed Person	Amount of Total Cost Going to N.H.S.
	National Insurance	Industrial Injuries	National Health Service	Total	National Insurance	Industrial Injuries	National Health Service	Total		
From:	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
July 5, 1948	3 10½	4	8½	4 11	3 8½	4	1½	4 2	9 1	10
October 1, 1951	4 0½	4	8½	5 1	3 10½	4	1½	4 4	9 5	10
June 6, 1955	4 8½	4	8½	5 9	4 5½	5	1½	5 0	10 9	10

* From this date a separate National Health Service Fund has been in existence.

Scottish News

SCOTTISH NUFFIELD PROVIDENT SOCIETY

GROUP SCHEME FOR B.M.A. MEMBERS

The Scottish Council of the B.M.A. has arranged with the Scottish Nuffield Provident Society for the formation of a Group scheme for members of the B.M.A. resident in Scotland which will enable members of the group to obtain the benefits offered by the Provident Society at a reduction of approximately 20% in annual subscriptions. A circular giving details of the scheme will be sent to all members in Scotland in January.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Association for Research in Nervous and Mental Diseases Publication No. 36: *The Brain and Human Behavior*. 1958.
- Blackburn, G., and Lawrie, R. (Editors): *Textbook of Surgery*. 1958.
- British Medical Association: *Medical Practitioners' Handbook*. 1958.
- Britten, J. D.: *Practical Notes on Nursing Procedures*. 1957.
- Calder, R.: *From Magic to Medicine: The Wonderful World of Medicine*. 1957.
- Campbell, J. M.: *From a Trade to a Profession: Byways in Dental History*. 1958.
- Carstairs, G. M.: *The Twice-born: A Study of a Community of High-caste Hindus*. 1957.
- Christensen, P. A.: *South African Snake Venoms and Antivenoms*. 1955.
- Cohen, J.: *Humanistic Psychology*. 1958.
- Council for International Organizations of Medical Sciences: *Bibliography of International Congresses of Medical Sciences*. Prepared by W. J. Bishop. 1958.
- Cramer, H.: *Die Kolposkopie in der Praxis*. 1956.
- Crile, G.: *Cancer and Common Sense*. 1957.
- Crook, F.: *Integration of Science*. 1958.
- Davis, J. E.: *Recovery from Schizophrenia: The Roland Method*. 1957.
- De Rudder, B.: *Kinderärztliche Notfallbibel*. 4 Auflage. 1958.
- Ferguson, A. B.: *Orthopedic Surgery in Infancy and Childhood*. 1957.
- Fordham, M.: *New Developments in Analytical Psychology*. 1957.
- Gelvin, E. P., and McGavack, T. H.: *Obesity: Its Cause, Classification and Care*. 1957.
- General Council and Register of Osteopaths: *Osteopathic Blue Book: The Origin and Development of Osteopathy in Great Britain*. 1958.
- Greenhill, J. P.: *Surgical Gynecology: Including Important Obstetric Operations*. Second edition. 1957.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Fee for Service

SIR.—Your correspondent, Dr. A. M. Goldthorpe (*Supplement*, December 6, p. 242), advocates the payment of general practitioners by a fee per item of service, and cites *The Times* as his champion. Recently (November 8) that paper gave prominence to the views of a Dr. Erich Geiringer, who deplored the capitation fee method of payment and suggested that the public is increasingly unwilling to trust itself to the care of its National Health Service practitioners. Dr. Geiringer's only remedy for what he believes to be the present state of affairs was the abolition of the capitation fee and its replacement by some form of payment for service. Such a suggestion implies that the practitioner in private practice, who is in fact paid on an item of service basis, gives better care. Apparently Dr. Goldthorpe shares these views. In any system of payment there may be an abuse by a minority, but it is no more reasonable to assume that the doctor paid on a capitation fee basis neglects his patients than it is reasonable to assume that one paid on an item of service basis over-visits and over-treats his patients for monetary reward.

It is well to remember that the N.H.S. is intended for patients as well as doctors. The greatest volume of criticism is from doctors themselves: the reason for this would appear to lie not in the method but in the amount of payment. As Dr. Goldthorpe pointed out in these columns earlier this year (*Supplement*, April 19, p. 209), the N.H.S. practitioner's remuneration per item of service under the present system averages about 2s. 6d. This may be a paltry fee, but altering the method of distribution will not increase the amount available, just as cutting a cake into small slices will not make it any bigger.

If Dr. Goldthorpe has so little faith in his profession that he believes that better work will result from a different method of payment, then he must believe that the financial incentive is what really moves the family doctor. If so, let us at least have a financial incentive that reacts to the good of the patient too. If there is an item of service payment, then there is an incentive to do more than is necessary, and the doctor has a vested interest in disease. As it is, the emphasis in general practice to-day has shifted from treatment to preventive medicine and health education. The family doctor still has his patients' best interests at heart, and has in fact a vested interest in their good health. Under the capitation fee system he is encouraged to look after as many patients as possible as well as possible, and in so doing is offered scope for the practice of medicine of the highest standard of which he is capable.—I am, etc.,

London, N.W.1.

J. MARK HODSON.

SIR.—I read with great interest the letter of my old friend, Dr. A. M. Goldthorpe (*Supplement*, December 6, p. 242). It struck me that if a fee were paid to G.P.s for circumcision, be it only ten bob a time, in a few years foreskins would be as rare as snow in the desert.—I am, etc.,

Shoreham-by-Sea, Sussex.

T. H. HARRISON.

Private General Practice

SIR.—Having failed to make an impression on our legislators of either party as to the merits of encouraging private general practice, you now produce further arguments which are compounded of the stale and the revolutionary (*Journal*, November 29, p. 1343). For the first time we hear that "any increase in private practice will lessen the heavy burden now borne by the State and its compulsory taxpayers." Since, by coincidence, the bodies you quote as most clamant for private work are also most vocal for

"free drugs" for private patients, it is difficult to imagine under what conditions you envisage such a saving will be effected. Will the B.U.P.A. not attempt to join the agitation for free drugs; and have the other organizations dropped this claim? Or do you propose a cut in the central pool if the number of private patients increases? I think that the majority of doctors would consider this a rather high cost merely to encourage the "strong individualists," however much we sympathize with them.

It is noteworthy that not even Mr. Bevan tried to legislate against private practice. The possibility has always existed for those who would commit their skill and fortunes to the vagaries of the money market. There is no move to abolish this. The argument against an extension of private practice is not that those with available cash would hog all the national resources of medical manpower and hospital beds, though an extension of individual privilege is always at the expense of the community. In this instance the danger is more sinister. Already too many people are encouraged to believe (and even your article tends to foster this view) that the National Health Service is a second best. It is unfortunately becoming a commonly held view that by paying one can get better medical attention and even jump the queue (*Birmingham Post*, November 15, headlined its report of the West Bromwich Health Executive Council meeting—"10 Years' Wait for Tonsil Operation: 'Easier if You Pay' Allegation").

Where privilege is earned or is sustained on other good grounds (be it age, service to the community, hardship), let the medical profession so arrange and organize its priorities (we already do this in many important fields) that need is the yardstick, and not merely make plans to encourage privilege for cash customers. The "majority of conformists in the N.H.S." (whom you quite gratuitously snub) are equally concerned with the best treatment and the best doctor-patient relationship, and the encouragement that you advocate for private practice can only undermine such relationship for the bulk of the doctors and the bulk of our patients.—I am, etc.,

Birmingham, 11.

B. BARNETT.

Locums and Assistants

SIR.—I am a retired general practitioner, retired on medical grounds, but still vital enough to be able to help colleagues in the town who on account of illness are in extreme difficulty. I often receive appeals from neighbouring districts, especially for holiday locums, but have regretfully to say that I do not do locums but merely help locally for illness.

I am something of a fee problem for those who require my services. The difficulties are primarily that I have to pay income tax on my fees at standard rate; that I provide my own board and lodging; that I must have two telephones; and that my car is too costly to loan at the fee of 3 guineas a week (*Medical Practitioners' Handbook*, £2 2s.). I appreciate their difficulty, for hitherto they have been able to buy a locum (allowing for the rebate claimed on practice expenses) for a little over 36s. a day (and night), inclusive of car allowance of from 3s. 6d. to 5s. a day and board and lodging of 5s. a day.

The principals' difficulties in obtaining locums are very real. I have heard the distress in their requests for help, not only in cases of illness, but when holidays are needed. Other nationalized workers claim holidays with pay, and no worker needs holidays more than the G.P., who works overtime most days. I find the short spells of general practice enjoyable, though I am glad when they end. The work of a locum is very difficult even in a familiar town. In these days of thousands of proprietary drugs he has to turn up the record card of every patient seen. Legibility is not the doctors' strong point and dosage is not always entered. The locum runs a risk in copying the entry which he may be called upon to justify.

The *Medical Practitioners' Handbook* is not very helpful about fees. It says: "No standard fee can be laid down; as in the case of assistantship the rate varies and is governed

to some extent by supply and demand." This is something like the market price of turnips. The *Handbook* is very helpful in its compiled lists of the salaries and increments in many services, but no mention is made of increments for locums and assistants, who appear to have to go on year after year at the same fees. I have read the letters of Dr. D. S. Craig (*Supplement*, October 25, p. 185) and of Dr. C. A. Sharples (*Supplement*, November 15, p. 210) with their tales of a multitude of application letters, journeys and expenses, and wear and tear of cars for interviews, often so futile. This is something the Royal Commission must alter. The whole profession has always rebelled against the position of employer and employee and a salaried service, and yet it allows this for the flotsam and jetsam of locums and assistants. When an application becomes almost a supplication there is something radically wrong. Sometimes unreasonable requests are made. One came to my notice where it was suggested that calls be put through to where the locum was staying, by arrangement with the G.P.O., which implied the provision by him of somebody being always on call, day and night, to take messages. The *Medical Practitioners' Handbook* says that arrangements for the reception of calls is the responsibility of the principal. A pool of locums and assistants should be kept by the B.M.A. and all applications made direct to it. A record will thus be made of principals applying and locums and assistants applied for. Principals should pay according to their use of the service, and locums and assistants should be paid according to their years in circulation, and board and lodging and car allowances should be put on a realistic basis.—I am, etc.,

ALLEN GLENN.

Bradford.

H.M. Forces

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. A. G. Carmichael has retired, and has been granted the honorary rank of Colonel.

Lieutenant-Colonels A. Bennett and R. D. Bell have retired on retired pay, Reserve liability. Captains R. G. Robinson, J. W. M. Stone, T. W. Brown, B. D. J. Leary, F. C. Shelley, D. H. McFerran, G. C. Wilson, C. G. B. Downie, T. B. Stephens, and L. Tippet to be Majors. *Short Service Commission*.—Captain R. D. H. Parker to be Major.

REGULAR ARMY RESERVE OF OFFICERS

Major-General E. A. Sutton, C.B., C.B.E., M.C., late R.A.M.C., has ceased to belong to the Reserve of Officers. Colonel C. A. Levy, late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, and has been granted the honorary rank of Colonel.

ROYAL ARMY MEDICAL CORPS

Major O. C. Dobson, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, and has been granted the honorary rank of Major.

Major W. J. Gourley, from Active List, to be Major. Captain (Honorary Major) T. O. McKane has ceased to belong to the Reserve of Officers, retaining the honorary rank of Major. *Class III*.—Captain (Honorary Major) E. A. Donegan, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, retaining the honorary rank of Major.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Colonels H. K. Meller, M.B.E., T.D., and A. McC. Campbell, D.S.O., O.B.E., T.D., have resigned their commissions, and have been granted the honorary rank of Colonel.

Lieutenant-Colonel (Acting Colonel) J. A. Simons to be Colonel.

Majors (Acting Lieutenant-Colonels) J. G. Reid, M.V.O., and G. S. Crockett to be Lieutenant-Colonels.

Major (Acting Lieutenant-Colonel) A. R. Currie, from T.A., to be Major, relinquishing the acting rank of Lieutenant-Colonel. Major R. C. King has been granted the acting rank of Lieutenant-Colonel.

Captains J. M. Brudenell, P. J. Roffey, R. I. Keen, and E. H. Cooper have been granted the acting rank of Major.

TERRITORIAL ARMY
ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel (Brevet-Colonel) E. H. P. Smith, T.D., has retired.

Lieutenant-Colonels (Acting Colonels) E. H. Hanson, T.D., M. I. Silverton, O.B.E., T.D., and T. P. Sewell, T.D., to be Colonels.

Lieutenant-Colonel E. H. P. Smith, T.D., to be Brevet-Colonel. Majors (Acting Lieutenant-Colonels) D. R. Urquhart, R. B. McConnell, A. L. Stalker, and J. H. Orr to be Lieutenant-Colonels.

Major J. H. Pattison, T.D., having attained the age limit, has retired and has been granted the honorary rank of Major.

Major W. E. Hurford has retired.

Captain (Acting Major) R. J. Howat has been granted the acting rank of Lieutenant-Colonel.

Captains (Acting Majors) R. W. Hutchinson and R. J. Howat to be Majors.

Captains A. E. Wright, G. D. Teague, M. R. Anderson, P. Roberts, and S. R. Wraith to be Majors.

Captains G. Lipp, C. A. Holborow, F. S. Grebbell, T. L. Hobday, J. A. G. Graham, and H. Brown have been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel A. T. B. Dickson, O.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., and has been granted the honorary rank of Colonel.

Lieutenant-Colonel R. S. Taylor, O.B.E., T.D., from Active List, to be Lieutenant-Colonel.

Majors (Honorary Lieutenant-Colonels) W. H. M. Jones, O.B.E., T.D., and R. O. Brooks, T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Majors R. Rutherford, T.D., and D. S. Valentine, T.D., having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers, and have been granted the honorary rank of Major.

ROYAL AIR FORCE

Air Commodores D. A. Wilson, C.B.E., A.F.C., Q.H.S., and A. Harvey, C.B.E., have retired.

Squadron Leader P. F. King to be Wing Commander.

Squadron Leader K. E. Falkner has relinquished her commission, retaining her rank.

Flight Lieutenants W. E. McCready, H. E. Lewis, R. A. Risley-Prichard, R. T. B. Jones, A. B. Goorney, P. L. Mulrooney, R. F. Stark, R. F. Lowe, and A. J. Lawson to be Squadron Leaders.

Flight Lieutenants W. M. Bond, N. Clarkson, J. Cleland, Y. M. Currie, D. Davies, M. I. H. Isaac, M. S. L. Logan, A. B. Lorne, M. E. MacFetridge, K. E. A. Scott, E. D. L. Simpson, D. Smith, W. J. Symington, and R. M. Taylor have relinquished their commissions, retaining the rank of Squadron Leader.

Flight Lieutenant D. R. Morris has been transferred to the Reserve, retaining the rank of Squadron Leader.

HER MAJESTY'S OVERSEAS CIVIL SERVICE

The following appointments have been announced: E. R. Asregadoo, M.D., D.O., Junior Ophthalmologist, British Guiana; G. K. Cheng, M.B., Tuberculosis Specialist, Hong Kong; E. W. K. Kredel, M.D., M.P.H. (U.S.A.), Medical Officer of Health, British Honduras; M. K. C. Lu, M.D., Thoracic Surgery Specialist, Hong Kong; G. B. Ong, M.B., F.R.C.S., Surgeon, Federation of Nigeria; B. L. C. Phillips, M.B., B.S., M.R.C.P., Medical Specialist, Hong Kong; Yee Kit Poon, M.B., B.S., F.F.A.R.C.S., Specialist in Anaesthetics, Hong Kong; H. L. Wen, M.D., M.C.P.&S., Specialist in Neurosurgery, Hong Kong; W. L. Wong, M.D., D.M.R.D., Specialist in Radiology (Diagnostic), Hong Kong; D. A. Cox, L.M.S.S.A., D. R. Crouch, M.B., B.S., S. C. Naidoo, M.B., B.S., and M. M. Hills, M.B., Ch.B., Medical Officers, Jamaica; I. A. A. de Coutere, M.B., B.S., F. W. Yates, L.M.S.S.A., and F. G. Hunter, M.B., B.S., Medical Officers, Northern Region, Nigeria; V. Clarke, M.B., Ch.B., and Officers, Northern Region, Nigeria; J. R. H. Berrie, M.B., Ch.B., and Chandy, L.M.S.S.A., D.T.M.&H., Medical Officer, British Guiana; B. E. Heine, M.B., Ch.B., D.C.H., Travelling Medical Officer, Sarawak; D. Helbert, M.D., Medical Officer, Hong Kong; L. Massiah, M.B., Ch.B., Medical Officer, Grade C (Inst.), Trinidad; J. P. Stewart, L.R.C.P.&S.I., Resident Medical Officer, Uganda; R. F. Tuckett, M.B., B.Ch., Medical Officer, Tanganyika; J. C. Whitlam, M.B., Ch.B., Medical Officer, Sarawak; G. B. Wylie, M.B., Ch.B., Medical Superintendent, Cunningham Hospital, St. Kitts, Leeward Islands; J. R. H. Berrie, M.B., Ch.B., D.P.H., D.I.H., and J. H. Gerber, M.D., Senior Medical Officers (Admin.), Northern Region, Nigeria; G. R. Benett, M.B., F.R.C.S., Assistant Surgeon, Health Department, Mauritius; Haworth, M.B., Ch.B., D.T.M.&H., D.P.H., Senior Medical Officer, Somaliland; W. L. R. Kenyon, M.B., Ch.B., M.R.C.P., Specialist Officer, Health Department, Zanzibar; J. R. M. Miller, M.B., F.R.C.S., Surgical Specialist, Kenya; P. C. Murray, M.D., M.P.H., D.I.H., Principal Medical Officer, Jamaica; M. A. Rajbally, M.D., Medical Officer, Mauritius; K. E. Schmidt, M.D., D.P.M., Specialist Alienist, Medical Department, Sarawak.

Association Notices

KATHERINE BISHOP HARMAN PRIZE

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman prize in the year 1959. The value of the prize is £75. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing. It will be awarded for the best contribution (not previously published) submitted in open competition, competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any registered medical practitioner in (a) the British Commonwealth and Empire or the Republic of Ireland and (b) any member of the British Medical Association, wherever resident, is eligible to compete.

Should the Council of the Association decide that no contribution submitted is of sufficient merit, the prize will not be awarded in 1959 but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each contribution must be typewritten or printed in the English language, and must be accompanied by a detachable slip bearing the candidate's name and address. The Council anticipates that contributions should be between 3,000 and 10,000 words, although no definite limits are laid down. Preliminary notice of entry is required and a form for this purpose can be obtained from the Secretary. Essays must be forwarded so as to reach the Secretary, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1959. Inquiries relative to the prize should be addressed to the Secretary.

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1959

The Council of the British Medical Association is prepared to consider the award, in 1959, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "To what extent are experiments on animals essential for medical progress?"

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1959. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1

OCCUPATIONAL HEALTH PRIZE

The Occupational Health Prize was established by the Association for the purpose of encouraging interest and research in the field of occupational health. The Council of the British Medical Association is prepared to consider the award of this prize, which consists of a certificate and £50, in the year 1959. Any member of the Association who is engaged in the practice of occupational health, either whole-time or part-time, is eligible to compete for the prize.

Candidates may select their own subject. Entries should be submitted in a form suitable for publication and must include personal observations and experiences collected by the candidates in the course of their work. If no entry is of sufficient merit no award will be made. Candidates should confine their attention to their own observations rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.

Entries must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1959. No study or essay that has been published in the medical press or elsewhere will be considered eligible for the prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A previous prizewinner is not precluded from entering. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay, the decision of the Council on any such point shall be final.

Preliminary notice of entry for this competition is required on a form of application to be obtained from the Secretary. Each entry must be typewritten or printed on one side of the paper only, and accompanied by a note of the candidate's name and address. The Council anticipates that contributions should be between 3,000 and 10,000 words, although no definite limits are laid down. Inquiries relative to the prize should be addressed to the Secretary.

D. P. STEVENSON,
Secretary.

Diary of Central Meetings

JANUARY

- 7 Wed. Dermatitis Subcommittee, Occupational Health Committee, 10 a.m.
- 7 Wed. Occupational Health Committee, 10.30 a.m.
- 8 Thurs. Executive Subcommittee, Science Committee, 10 a.m.
- 8 Thurs. Medical Members of Editorial Subcommittee, Joint Formulary Committee, 11 a.m.
- 8 Thurs. Assistants and Young Practitioners Subcommittee (G.M.S. Committee), 2 p.m.
- 8 Thurs. Science Committee, 2 p.m.
- 9 Fri. Overseas Committee, 2 p.m.
- 14 Wed. Tuberculosis and Diseases of the Chest Group Committee, 2.15 p.m.
- 15 Thurs. G.M.S. Committee, 10.30 a.m.
- 16 Fri. Pharmaceutical Members of Editorial Subcommittee, Joint Formulary Committee, 11 a.m.
- 20 Tues. Committee on Drug Addiction, 3 p.m.
- 30 Fri. Medical Members of Editorial Subcommittee, Joint Formulary Committee, 11 a.m.

Meetings of Branches and Divisions

CAMBRIDGE AND HUNTS BRANCH

The annual meeting was held on July 23, and the following officers were elected:

President.—Dr. S. H. Pritchard.
President-elect.—Dr. D. H. Fulton.
Vice-presidents.—Dr. J. K. Paterson and Dr. E. V. Bevan.
Honorary Secretary and Treasurer.—Dr. T. B. Anderson.

DERBY DIVISION

The following officers have been elected:

Chairman.—Dr. E. C. Dawson.
Vice-chairman.—Dr. A. W. P. Haine.
Honorary Secretary and Treasurer.—Dr. R. G. Cooke.

EAST SUFFOLK DIVISION

The following officers have been elected:

Chairman.—Dr. P. F. H. Dawney.
Vice-chairman.—Dr. I. S. Staddon.
Honorary Secretary and Treasurer.—Dr. R. A. Leader.

NORTH WALES BRANCH

The following officers have been elected:

President.—Dr. J. Forbes.
President-elect.—Dr. G. Mansell Williams.
Honorary Secretary.—Mr. A. H. Holmes.

NORTHERN COUNTIES BRANCH

The following officers have been elected:

President.—Dr. W. I. A. Fell.
President-elect.—Mr. H. Miller.
Vice-president.—Dr. C. S. Sandeman.
Joint Honorary Secretaries and Treasurers.—Dr. G. F. F. Sinclair and Dr. J. E. Tillotson.

ROYAL COMMISSION ON DOCTORS' AND DENTISTS' REMUNERATION

FURTHER SCOTTISH EVIDENCE

Although the Scottish Medical Practices Committee and the Scottish Association of Executive Councils in written memoranda to the Royal Commission on Doctors' and Dentists' Remuneration considered that the maximum permitted list should be reduced, their witnesses at the Commission's public session in Edinburgh on December 12 agreed that the number a general practitioner could efficiently provide for in fact varied greatly with the individual, some of the best doctors having the maximum list. A number of questions were put on allegations of exploitation of assistants, but from statements made by members of the Commission it was evident that the commissioners appreciate that the relationship of partners is a delicate human one, and that it would be inappropriate to compel anyone to take a particular person as a partner.

SCOTTISH MEDICAL PRACTICES COMMITTEE

Oral evidence on behalf of the Scottish Medical Practices Committee was given by Dr. J. T. Baldwin, its chairman, who works in a partnership of four, Mr. A. I. Millar, a member of the Committee and former Assistant Secretary in the Department of Health for Scotland dealing with general medical services, Mr. A. B. Fairweather, an officer of the department who was formerly secretary of the Committee, and Mr. J. McCallum, its present secretary.

The Committee had been asked by the Commission whether they had formed any impression as to the quality of applicants, particularly as to any changes. On this the Committee did not feel competent to make any comments, since the selection of doctors to succeed to vacant practices in Scotland was a matter for executive councils and it was only when an appeal was made that they were required to consider the merits of any applicants. "It can be stated, however," the memorandum of evidence added, "that generally the doctor selected by the executive council is well qualified and has had good experience both in hospital and in general practice."

Sir HUGH WATSON asked: "What is the Committee's view of the value of hospital experience in general practice?" Dr. BALDWIN, who explained that he was also a member of an executive council and of a local medical committee, replied: "We attach a considerable amount of value to it." They felt that as well as the compulsory pre-registration year in medical and surgical house appointments, it would probably be even better if the doctor had more hospital

experience. "On the other hand, we feel he could have too much hospital experience before entering general practice," Dr. Baldwin explained that too narrow a specialization, such as in neurosurgery or thoracic surgery, would not help, but an additional appointment in obstetrics would be of value. Commented Sir HUGH: "I think we have had exactly the same expression of opinion elsewhere."

Hospital Experience "Undervalued"?

"Would your experience as a member of an executive council lead you to suppose that executive councils undervalue hospital experience?" asked Sir HUGH. "I do not think they do," answered Dr. BALDWIN. "We have had a lot of evidence to the effect that it is difficult to go from one branch of the profession to the other, except in the very initial stages," explained Sir HUGH. "You accept that that is the position?" Dr. BALDWIN did—and that having once obtained a post in general practice it was difficult to obtain another one. "We have had evidence that there is a certain rigidity almost as between the two branches of the profession," Sir HUGH went on. Dr. BALDWIN thought there was too much rigidity.

"How would you suggest it could be improved?" Sir HUGH wanted to know. Dr. BALDWIN replied: "One thing which would be of advantage would be if general practitioners had opportunities to take hospital appointments as clinical assistants, where they would have the opportunity of working with consultants in order to obtain experience which would enable them to take additional qualifications."

The Chairman of the Commission, Sir HARRY PILKINGTON, asked whether there were any factors of remuneration that made it difficult to pass from one branch of the profession to the other. Dr. BALDWIN said there was no theoretical reason why a general practitioner should not undertake an appointment in hospital and still act as a general practitioner, but he had no knowledge of it working in the opposite direction. The CHAIRMAN asked: "Are the levels of remuneration near enough in the two branches not to be a great deterrent to move?" Dr. BALDWIN said he was not competent to give an opinion.

Trainers and Trainees

The procedure for choosing trainers under the trainee scheme in general practice is different in Scotland from that in England and Wales, Dr. BALDWIN told Sir HUGH WATSON. In each Scottish National Health Service Region there was appointed a committee to select trainer practitioners. In

the South-east Region this consisted of a lay chairman and members who were general practitioners appointed by the Secretary of State for Scotland but nominated by local medical committees and representatives of consultants. It met twice every year. A memorandum had been prepared which laid down the criteria which the committee used in considering whether a doctor should be a trainer. Broadly speaking, it was if he had a practice of a size large enough to enable him to devote time to training the trainee assistant—up to 2,500 in an urban practice and 2,000 in a rural one. "Each applicant, I can safely say, is known to several members of the committee personally," added Dr. Baldwin. Valuable help was also obtained from the consultants, who were very well aware of his competence.

It was the practice in the S.E. Region, and he believed in other Scottish regions, that after a period of four or five years it was considered that a trainer should have a rest from training. In any case, a trainer was not appointed for several years in succession if there were others who were capable. The CHAIRMAN: "Is it a mark of being rather a good doctor to be chosen as a trainer?" Dr. BALDWIN agreed that it was.

Dr. Baldwin said that in his practice a partner was a trainer. "We have found it stimulating to us to be trainers. We learned a lot from the trainees, and I understand they learned something from us." He added that when there came their turn not to be trainers they found that they were in fact less busy than when the trainee was there.

Difficulty in Getting Trainees

To Sir HUGH's question: "Is the scheme largely taken advantage of?" Dr. BALDWIN replied that in the S.E. Region there were almost more applicants to be trainers than there were vacancies. But the scheme was not used as much by potential general practitioners as one would have thought. It was well known that there had been difficulty in getting trainees over the last year or two; this was more evident in some parts of the country than in others.

"Do you think the scheme is a good scheme?" asked Sir HUGH. "I do indeed," replied Dr. BALDWIN. There was no doubt in his mind that the standard of work which the assistant found influenced his professional practice throughout his life.

Mrs. K. M. C. BAXTER, a commissioner, pointed out that entering general practice as a trainee assistant ensured that a young man had experience of at least two practices. Dr. BALDWIN told her that at the end of his training an assistant would not get a practice right away. Some thought that they would like to undertake a period of assistantship after their trainee assistantship; others felt a lack and went back to hospital for six months or so. He told of an able man who wanted to practise in the Edinburgh area and had difficulty in obtaining a partnership. Another, who was prepared to go anywhere, obtained an appointment in a North of England industrial practice very soon.

Setting Up in Single-handed Practice

The number of new single-handed practices set up in Scotland has declined, particularly since 1952, Mr. FAIRWEATHER told the Commission. It was pointed out that there was no information as to the number of doctors who before the Health Service set up new single-handed practices.

Areas in Scotland which, in England, would be designated areas are very few. (The memorandum of evidence, stating that the Committee had never deemed it necessary or expedient to "close" particular areas as the English Medical Practices Committee had done, explained: "They have taken the view that every application to enter an area should be individually considered by them, in the light of its own circumstances, and of the conditions prevailing in the area at the time the application is made.") There were very few areas which the Committee considered

to be adequately doctored, but the witnesses pointed out that there was a difference between this and one which was much under-doctored. Figures showed that, generally speaking, the likelihood of a doctor who "put up his plate" being able to build up a practice in three years that would enable him to earn a living in an already developed area (compared with a developing area) was remote. "The average person is not prepared to change his or her doctor." A graph was produced which showed that applications for single-handed practices never rose to more than about 10 in a year, and in 1953 the applications to practise in partnership rose to nearly 60, although generally it appeared that such applications ran at the rate of about 25 to 30 a year.

Dr. BALDWIN gave his personal opinion that the initial practice allowance was sufficient only in those cases where the practitioner was entering a newly developing area. In order to achieve its purpose in other areas it needed to taper off much more slowly. The third-year allowance was very meagre if the doctor had not got many patients.

Each application was considered on its merits. As well as the average number of persons per doctor, other considerations taken into account in determining whether a particular area should attract one or more initial practice allowances were such factors as the type of practice (that a woman's practice should be maintained in that area, for instance), age of doctors, size and geography of district, total population, and distances to be travelled by doctors. "Not many are refused," said Dr. Baldwin.

Exploiting Assistants?

"We have had some suggestion," said Sir HUGH, "without anything very definite put before us, that in some quarters there is a tendency to exploit assistants. Naturally that evidence has come mostly from the assistants' side of the profession. You do sometimes refuse permission for the employment of an assistant? "Very rarely," answered Dr. BALDWIN. "It has not been done since I have been chairman of the Committee."

On what grounds would an application be rejected? Mr. MILLAR said a reason why executive councils refused consent to the employment of an assistant often was that they thought the practitioner should have another partner, rather than an assistant, so they tried to exercise pressure on him to take in a partner. "Of course it is difficult," said Mr. MILLAR, "since we have no power to force him to take a partner. If he refuses he is left with no assistance, and that is not so good for the patients. One has to take the interests of the patients into account, and if one is going to be swayed by that aspect, one gives consent to the employment of an assistant as being better than nothing."

Sir HUGH: "What you are saying is that there are quite a number of cases in which the executive council think a practitioner should not have an assistant but a full partner, which would almost confirm the view that assistants, if not exploited, are made use of in circumstances in which they should not be made use of?" Mr. MILLAR: "Yes, I should think that is a correct statement of what the executive council feels in the matter." Dr. BALDWIN: "My personal view is that if the doctor thinks he should employ an assistant and is prepared to pay his salary out of his own pocket, there is no reason why we should intervene."

Pointing out that there was no scale laid down for assistants, Sir HUGH asked: "Do you think that, circumstances being as they are, there is any reason to suppose that there ought to be such a scale laid down, or does the market find its own level?" Generally speaking, the market found its own level, thought Dr. BALDWIN. The scale for the trainee assistant, which was laid down, acted as a guide, the salary for the assistant being at a rather higher level. "Generally speaking, I think the assistant's salary is fair, at least in the initial stage," Dr. Baldwin said. There should always be a place for an assistant in general practice. It had been recognized for a long time that the best way to get into general practice was to become an assistant with a view.

Mr. J. H. GUNLAKE, who is an actuary, said that the relationship of partner and partner was a human one, and that a person who was acceptable as an assistant was not necessarily acceptable as a partner. Dr. BALDWIN agreed with the commissioner. There were single-handed practitioners who did not wish to have partners, and there were assistants who were content to be assistants, although there were not many of these.

Partnership Agreements

"One has seen agreements which are quite shocking," said Dr. BALDWIN, in the course of answers about the question of fair partnership agreements. He agreed, however, that the practice of going into partnership was now becoming more general, and that by and large doctors were becoming accustomed to the adjustment of reasonable partnership agreements. "It would be to the advantage of junior partners, on the whole, if all agreements were submitted to us." On this the memorandum stated that the probable result of the Committee having power to see all proposed partnership deeds and to grant or refuse certificates in respect of them (which the Committee believed would be an advantage) would be that "in more partnerships than at present the interests of the junior partner would be adequately safeguarded." Of the 85 proposed agreements submitted to the Committee during the five years to June 30, 1958, many received a certificate without question; others received a certificate after certain matters prejudicial to the junior partner had been altered; in the remainder certificates were refused.

Mr. MILLAR pointed out that the statutory provision for the submission of agreements was not to protect the junior partner but to protect the senior partner from being charged with an offence under the Act in regard to the sale of goodwill, "and it might be thought a little illogical to force our services on people who thought they could quite well get on without them." On the other hand, if it was thought a good thing that the junior partner should be protected, it should be stated. It might be arranged that an agreement could not be legal unless submitted. Dr. BALDWIN agreed that the advantage to the junior partner under the present arrangement was incidental, "but we have intervened to prevent an agreement contravening the Act, and by so doing it has been to the advantage of the junior partner."

"When your committee considers the number of doctors in an area and whether it is under-doctored, what information do you have about the private commitments of doctors outside the National Health Service?" asked Sir HUGH. Dr. BALDWIN said there was a column in the form on which executive councils reported to the Committee which asked for hospital and other commitments. In many executive council reports this was left blank. The Committee did not really know what other commitments general practitioners had and therefore paid no attention to it, because such information as they had was not reliable. "It is extremely difficult to obtain this information, I may say," commented Dr. Baldwin.

Size of Lists

Sir HUGH then turned to that part of the memorandum of evidence which he described as "somewhat controversial," that in which the Committee dealt with the size of the maximum permitted list.

"The Committee do not regard the present permitted maximum of 3,500 patients as any proper indication of the number who can be adequately served—with justice to both patient and doctor," it stated. "Even in compact industrial areas such a large commitment represents too heavy a burden. The Committee would stress that a reduction to a lower figure should be regarded as a step which must be taken (a) if a satisfactory standard of service is to be provided by practitioners and (b) if the medical profession is to be allowed a reasonable amount of leisure. . . . At present, the Committee consider as under-doctored any area where the average number of patients is over 2,500, or 2,000 in

areas where other commitments are large, or where a large amount of travelling is undertaken. This leads to the conclusion that the present maximum of 3,500 patients for an individual practice is too high—in any type of area whatsoever."

Sir HUGH: "It is very difficult to be dogmatic about the size of list?" Dr. BALDWIN: "Yes." Sir HUGH: "Is the position that so much depends on the ability, the personality, and the methods of the doctor himself, and naturally on the area, that it is almost impossible to generalize?" Dr. BALDWIN: "I think it probably is." One practitioner with 2,000 patients had asked for an assistant. Another with a list of 3,500 was recognized as having one of the best-organized practices.

Asked about the inducement payments to practise in remote areas, Dr. BALDWIN thought the arrangement was working extremely well indeed. There were 47 inducement payments in Scotland under the National Health Service, and there was no doubt that in many areas there would be no general practitioner were it not for these inducement payments.

Practice Expenses Exceed Income

The Committee asked the Secretary of State to make an inducement payment if it was necessary for a practice to be maintained and where, because of the small number of available patients, it would be impossible to do so without such a payment. Dr. Baldwin mentioned a practice the expenses of which exceeded the income; it was therefore necessary for a substantial sum to be given in order to enable the doctor to live at all. This was one of the Scottish islands on which there must be a doctor and where there were only 170 patients on the list.

The CHAIRMAN asked whether a particular net figure was aimed at? Dr. BALDWIN said it was difficult to justify a substantial amount when a man had only about 200 patients, but the figure of £1,600 was regarded as a net income which it was desirable to achieve. He agreed that in the case of the doctor whose expenditure was greater than his income he would have to be paid more than £1,600; it was an exceptional case.

The CHAIRMAN: "As a system, you have no alterations to suggest so far as remuneration is concerned?" Dr. BALDWIN: "No. So far as I am aware, it is working very well."

SCOTTISH ASSOCIATION OF EXECUTIVE COUNCILS

For the Scottish Association of Executive Councils, whose memorandum, the CHAIRMAN stated, contained a great deal of factual information and figures "and in some cases information we have not otherwise obtained," there appeared Dr. J. M. C. Gill, president of the association and vice-chairman of Aberdeen and Kincardine Executive Council (who works in a partnership of three), Colonel R. S. Weir, vice-president of the association, Mr. T. Hunter, former president, and Mr. A. R. Howie, secretary of the association.

Dr. GILL said the association thought the scheme for initial practice allowances had been successful. "We did think that perhaps the allowances would be a little more generous and perhaps last a little longer than three years," he added. The association had not considered the suggestion made by the witnesses for the Scottish Medical Practices Committee that the allowances should taper off over a longer period.

Single-handed Practice and Partnerships

The association's information about doctors setting up in practice on their own was largely based on the report of the Scottish Medical Practices Committee. Sir HUGH WATSON: "We gather that the average number entering practice in that way is about 10 in Scotland each year. Would you expect that number to be much improved?" Dr. GILL: "We had not considered that, and I really do not know. I

think that would be a fairly good average." The CHAIRMAN: "What do you have in your own district?" Dr. GILL: "Practically no doctors start up on their own in the north-east area." The CHAIRMAN: "Is that because you do not have new towns and rapidly developing suburbs?" Dr. GILL: "That has a lot to do with it, and also in the north-east the average lists are lower."

The association's memorandum, pointing out that, with almost 100% of the population already on doctors' lists, the new doctor must attract patients from his established colleagues, added: "The more ethical his approach, the more difficult his task tends to be."

Mr. A. R. HOWIE said that Dr. Baldwin, for the Scottish Medical Practices Committee, had given the same general indication. If a doctor set up his plate he simply had to wait for patients to come to him. He did not think there was anything the association would say more than was in the memorandum.

The association believed that some consideration should be given to measures to stimulate further the introduction of more "additional" partners. "This might be done," stated the memorandum, "by arranging for the payment to pre-1948 practitioners assuming additional partners of part of their compensation for loss of right to sell goodwill." Mr. GUNLAKE pointed out that that suggestion had been made officially and turned down.

The CHAIRMAN: "You have in Scotland a number of practices which, because of distances, would be difficult to run as partnerships?" Dr. GILL agreed. The CHAIRMAN then noted that if something was paid from the Central Pool as an inducement to form partnerships it was almost inevitably to some extent at the expense of the single-handed practitioner.

Did the association think that the move towards partnerships had not gone fast enough? No, replied Dr. GILL. Figures showed that the movement had gone fast; but the association thought partnership was a good method of doctors helping each other and therefore of improving the service to the public, and so should be encouraged. Mr. HOWIE mentioned that before the Health Service came in the reduction of income following the taking on of a partner was offset by the increase in capital.

Decrease in Advertised Vacancies

At the beginning of the National Health Service, stated the memorandum, it was generally believed that succession to an advertised vacancy would be the most usual means of entry into general practice. With the growth of partnership practice and existing arrangements for the filling of partnership vacancies by consulting with the remaining partners, the number of advertised vacancies was small and apparently would be smaller in the years ahead. What was not contemplated at the beginning of the Service, explained Mr. HOWIE, was that there would be so many partnerships. Dr. GILL thought it a good thing. So far as a partnership was concerned it would be very difficult to practise amicably with someone thrust on one. The CHAIRMAN indicated that both Mr. Gunlake and Sir Hugh Watson, who had partnerships in other professions, would think it essential that a partner should be acceptable.

Supervision of agreements had caused a division of opinion in the association, Mr. HUNTER stated. Certain members thought it would be a good thing; others thought it should be left to the parties themselves to make their arrangements—"that we must assume that the agreement would be a fair agreement."

Employment of Assistants

The association wanted stricter control over the employment of assistants other than trainees introduced. The additional number of patients permitted to a doctor employing an assistant should be considerably limited so as to reduce the possibility of an assistant being employed

solely for the purpose of permitting a large increase of the principal's list. On the other hand, the employment of assistants in approved cases should be facilitated, and consideration might be given to the possibility of providing that the appointment of an assistant should not decrease the amount of the principal's income as calculated for superannuation purposes.

So far as the employment of assistants for a considerable number of years was concerned, the association felt that there might be practices of such a size that they could afford an assistant and not be sufficient to pay two principals.

Commenting on the figures given by the association of sums paid to assistants—which showed that of 221 assistants, 149 were being paid £750-£1,000 a year—Sir HUGH WATSON asked: "Have you any reason to believe that there is anything unfair about the present remuneration of assistants to general practitioners?" "I do not think we have," replied Dr. GILL. Sir HUGH: "On the whole you think that assistants are reasonably well paid?" Dr. GILL: "Yes, I think they are." The CHAIRMAN commented that the average remuneration shown from the appendix to the association's memorandum was less than that stated by the British Medical Association, but Sir HUGH WATSON said that all the B.M.A. was able to tell the Commission was the result of a review of figures in advertisements. The Scottish Association of Executive Councils, in their memorandum, set out a classification of applicants for advertised medical vacancies for the three years to March 31, 1958, classified by completed years since graduation and post held at the time of application.

"Trainer" Practitioner

The arrangements under which practitioners are recognized as "trainer" practitioners were approved in principle, "but there is probably a case for a detailed inquiry as to whether these arrangements are serving the purpose for which they were introduced." And "in order to prevent any abuse," the association was of opinion that it might be desirable to provide that the recognition of a principal as a trainer should not be continued for a period of more than two years without a break, unless it appeared that there was no other suitable trainer available.

Dr. GILL, amplifying this, said the association felt that if a practitioner had a trainee assistant he geared up his work to working with an assistant, and it might be that, if he went longer than two years, when the break came he found it difficult to adjust himself to working single-handed.

"Why does a doctor apply to have a trainee?" the CHAIRMAN asked these witnesses, as he had those from the Scottish Medical Practices Committee. Dr. GILL said there was the trainee grant, and the fact that he had a trainee allowed him a little more leisure. "Also having a trainee is a very stimulating experience—I had a trainee myself for a year, and I found it very good experience for myself as well as for the trainee."

The memorandum of the association, after stating that the association was not directly concerned with rates of remuneration, which should be determined by appropriate negotiating machinery, went on to express the opinion that there were obvious doubts as to the fairness of the present system of remuneration by capitation payments. "It is a convenient method but difficult to defend, as there is no direct relationship between remuneration paid and the standard of professional work."

"Merit Awards" for General Practice

The association would not object to a different system "if some means could be found of recognizing special skill and experience." But as there appeared to be no yardstick with which to measure the skill of a doctor in diagnosis and treatment the association could not suggest a method.

There had been discussion, Dr. GILL reported, on merit

awards, and loading the capitation rates for very old and very young patients, but the association had not devised any system of this sort. It believed that there should be some financial incentive to improved services by the provision of special premises and the employment of nurses or ancillary staff. "At present the doctor with the largest list and the lowest expenses gains most," the memorandum declared.

Sir HUGH: "At the moment, putting it quite crudely, the present system in regard to expenses is an incentive to the doctor with the large list to spend less on expenses, as a result of which he gets his remuneration largely net?" Dr. GILL: "We did think there was something to be said for paying practice expenses separately." What they had in mind was the removal of the present disincentive to expenditure.

The CHAIRMAN asked whether the experience was that the doctor who skimmed on expenses, providing the minimum, lost patients to those with better standards. Mr. HOWIE said: "When one doctor improves his surgery, the others fairly soon follow on." Even really adequate clerical assistance would seem to enhance the actual medical service which a doctor gave.

Desirable Size of List

The desirable size of a list of a single-handed practitioner in an urban area, in the association's opinion, was in the region of 2,000/2,500 and in a rural area 1,500/2,000. Dr. GILL agreed that there was great variation in what a doctor could do. He knew one with an existing maximum list who was known to be first-class; on the other hand, he had a doctor with a list of only 1,300 phoning to say he did not know how he was going to get through his work. There were so many variable factors that it was impossible to lay down a hard-and-fast rule. The CHAIRMAN asked whether the man to whom Dr. Gill had first referred should be compelled to take a thousand less patients than now. Dr. GILL: "That was the view of the association." Mr. HOWIE: "At the moment they have a maximum, and if a maximum is to remain there will be hard cases."

Returning to the question of merit awards, Sir HUGH WATSON asked: "Is it possible, in your view, to evolve a system of merit awards?" The association had not been able to think of any one at all. "Whatever the solution might be," said Mr. HOWIE, "it was quite clear that there was general and quite strong objection against merit awards as these at present operated in the hospital service. The objection seems to be lack of information and a feeling that it might not operate equitably."

Load of Work on General Practitioners

The load of work falling on general practitioners has considerably increased since the National Health Service, stated the association. It was thought that in rural areas the load was probably almost double, and in urban areas, despite readier access to hospital facilities, the increased load was almost as great. Some of the work falling on practitioners might be done by qualified almoners or social workers, and generally a closer co-operation between the medical and social services might be desirable.

The statement about the increased load was described by Sir HUGH WATSON as "the most forthright expression of opinion we have had on this matter." "We have no actual figures," admitted Dr. GILL, "but that was the impression of our constituent councils." Mr. HOWIE said that they had made many unsuccessful attempts to get comparable figures for pre-Health Service days. "It would seem we possibly erred in expressing the opinion that the load of work had almost doubled," continued Mr. Howie. "It now seems that there is little change in the number of items of service that a doctor gives to his National Health Service patients to-day as compared with his panel patient." There had been an increase, which was substantial, in regard to those who prior to 1948 were dependants of insured persons. Dr. GILL

spoke of the increased work which had resulted from the development of scientific medicine. Patients who formerly would have been sent off to hospital were now treated at home. The antenatal work was greater, and nowadays, so far as items of service were concerned, there was a greater responsibility attached to the doctor.

Sir HUGH WATSON, saying he was thinking aloud ("which perhaps I should not"), wondered whether that increased responsibility might be appropriately remunerated on an item-of-service payment. "Yes," agreed Dr. GILL. "I think that would be a good idea."

Prolonged Hospital Experience "Undesirable"

Discussing the relationship between medical practice in hospitals and general practice, the association stated that a minimum of one year's hospital experience was desirable and that hospital midwifery experience was of particular importance. "When considering applications (for vacancies in general practice), care has to be taken to find out what kind of work the applicant has been doing in hospital. Prolonged hospital experience is probably not desirable. After one or two years as a house-surgeon or house-physician, hospital experience tends to become too specialized and less valuable than experience in general practice itself."

Dr. GILL said that in Aberdeen the house-surgeon for malignant diseases also looked after the dental patients and the skin patients: he was explaining that after the pre-registration posts it was possible perhaps for a doctor to look after several of the smaller specialties, and thus broaden his experience.

The association strongly commended the scheme for combined training in general practice and hospital work introduced in Scotland in 1956. It did not seem to have received the support it deserved, but Dr. GILL thought it a good idea, which was working very successfully in Inverness.

Inducement payments were essential, the witnesses thought. The association had not considered whether they were sufficient, because executive councils merely passed over the inducement payment which had been arranged by the local medical committees with the Department of Health.

More Patients with Assistance

The association in written evidence asserted that the permitted increase in a doctor's list in respect of the employment of an assistant should be in the region of 1,000 patients. "I take it that when a doctor first has an assistant he does not immediately get the full list—it takes some years to work up?" queried the CHAIRMAN. Dr. GILL agreed. The CHAIRMAN: "If the maximum he can have is 1,000 you realize that the maximum he can get will probably be just about what he pays out. Would any doctor take an assistant on this basis?" Dr. GILL thought he would, "because it enables him to practise better medicine and take time off." To look after 3,500 probably means devoting one's whole time to work. The man whom he had instanced previously started at eight in the morning and finished at nine at night. It was his sole interest and only hobby. Not all were so hard-working.

After hearing the witnesses from the Scottish Medical Practices Committee and the Association of Executive Councils in Scotland, the Royal Commission went into closed session to hear evidence from the Scottish regional board chairman and senior administrative medical officers.

The Midland Branch of the B.M.A. gave, as is its custom, a luncheon for newly qualified graduates on December 6. Dr. F. E. Gould, president of the Branch, was in the chair, and 18 graduates attended. Dr. L. S. Potter, assistant secretary of the Association, gave a short talk on the functions of the B.M.A. A similar function was held on June 23, and was attended by about 80 graduates, who heard an address by Dr. D. P. Stevenson.

British Medical Association

PROCEEDINGS OF COUNCIL

A.I.D. was again discussed by the Association's Council at its meeting on December 17, when the Chairman of the Science Committee reported on the evidence so far obtained by his committee. The matter of drugs for private patients was taken a stage further. The Council decided to ask the Minister of Transport to meet a Council deputation for a full discussion on the parking problems of practising doctors and on ways and means of overcoming them.

Still a "Difficult Problem"

At the suggestion of the CHAIRMAN, Council deferred again consideration of the A.R.M. resolution that in future negotiations on terms of service within the National Health Service the B.M.A. should take the lead in forming a single negotiating body for the whole profession. "The general feeling among those I have spoken to is that if such a committee could be formed it should be very small, and I think it may be possible to reconsider the matter in January," said Dr. Wand.

Charing Cross Hospital

Dr. F. GRAY, reporting on the conference held under the chairmanship of the Chairman of Council to discuss the proposed transfer of Charing Cross Hospital and Medical School to Fulham, said that the representatives of Charing Cross Hospital, the London Local Medical Committee, and the Chelsea and Fulham, Kensington and Hammersmith, and Westminster and Holborn Divisions of the Association were united against the proposals put forward by the Ministry. The Ministry representative gave an assurance that before any firm decisions regarding the new Charing Cross Hospital were reached a further opportunity for the bodies represented at the conference to discuss the matter would be given. He hoped that the necessary information would be available for such a conference to be arranged in the early part of 1959. He gave an undertaking to discuss the position in the Charing Cross area at the appropriate time.

Southampton Meeting

The CHAIRMAN OF COUNCIL said that a great deal of the credit for the success of the Southampton Clinical Meeting redounded to Dr. R. G. Gibson. Dr. GIBSON, thanking the Chairman, suggested that the Council should record its thanks to Drs. R. S. Russell-Smith, R. P. W. Shackleton, and J. G. McDowell, who pioneered the clinical meeting. He also added a warm word of praise to the Deputy Secretary, Dr. Walter Hedgcock, for his unremitting efforts to make the meeting a success. It was planned to have clinical meetings at Norwich in October, 1959, at Canterbury in April, 1961, and at Sheffield in July, 1961.

Money Matters

Following legal advice, the Council authorized an application to the Commissioners of Inland Revenue for relief from tax in respect of the membership subscriptions of persons assessed under Schedule E, in accordance with the Finance Act, 1958.

The Capital Issues Committee, the Treasurer informed the Council, has again refused to authorize the arrangements which the Association had made with an insurance company to finance the new building programme. The Committee refused the Association's request for an interview nor would it give its reasons. But the Estates Committee was informed that it was possible to borrow money to the extent of

£50,000 without the consent of the Capital Issues Committee, and this avenue was being explored.

Morbidity Statistics

The G.M.S. Committee recommended that the Association should not participate in a project suggested by the National Disease and Therapeutic Index, U.S.A. Dr. A. B. DAVIES, the Committee Chairman, explaining that it involved recording, on a special form, details of all patients seen during a 48-hour period once a quarter, pointed out the work which would be entailed and the difficulty if, for instance, it coincided with an influenza outbreak. The Committee was also influenced by the great volume of work already done in this field by the College of General Practitioners.

Mr. J. R. NICHOLSON-LAILEY suggested deferring a decision on the recommendation until the chairmen of the G.M.S. Committee and the C.C. and S. Committee had discussed the matter. Dr. GIBSON supported this. Dr. J. G. M. HAMILTON thought, reading between the lines of the far from clear memorandum from the American organization, that the object of the exercise was to provide the American pharmaceutical industry with statistics of morbidity in this country. Dr. I. D. GRANT suggested reference to the liaison committee with the College of General Practitioners.

Dr. DAVIES said he would be happy to consult with the chairman of the C.C. and S. Committee and see if some agreement could be achieved. He was equally sure that the G.M.S. Committee would be willing for this to go to the liaison committee with the College of General Practitioners. It was agreed further consultations should take place along those lines.

A.I.D.

Mr. NICHOLSON-LAILEY reported on the evidence already considered by the Science Committee on artificial insemination by donor, including the oral evidence of two practitioners of A.I.D. The Committee proposes to meet again in January. Meanwhile the Committee recommended "that the Association do submit evidence to the Departmental Committee on Artificial Insemination within the terms of the resolution of the Annual Representative Meeting, 1958, and that the Science Committee be authorized to continue to hear evidence and to prepare a memorandum of evidence." (The A.R.M., while making no pronouncement on the non-medical aspects of A.I.D., authorized Council to submit evidence "from the medical point of view.") After the CHAIRMAN had pointed out that what Council had wanted was to have the evidence before they decided whether to submit it or not, Mr. Nicholson-Lailey withdrew the first part of his Committee's recommendation, and the amended recommendation was approved.

Dr. S. F. LOGAN DAHNE moved a rider that the Science Committee should consider the ethical, moral, and medico-legal evidence. The CHAIRMAN said he could see that "ethical" and "medico-legal" came within the terms of the A.R.M. resolution, but he thought "moral" was something which the Representative Body wanted left alone. Dr. DAHNE explained that the purpose of his resolution was that the Council should have all the relevant evidence, and not simply the purely scientific or medical. "If we are going to decide to give evidence it must be based on all the evidence we can obtain from the profession, even if some of it comes in the form of a minority report, although I am doubtful whether the doctors who object on moral, ethical, and religious grounds are in a minority—I think they are in the majority," said Dr. Dahne. "Despite this being a

medical question it does bear on the law, and the law does bear on our patients, and we as doctors must give medico-legal evidence. I know the lawyers are in a turmoil over this."

Dr. A. V. RUSSELL supported the rider. In any inquiry, examination should be made of the ethical, the psychological, and the legal aspects. The mere fact that among practitioners who performed A.I.D. some appeared to make strenuous efforts to preserve secrecy seemed to indicate that they were not altogether happy in their own minds. One of the most important of the psychological effects was that upon the impotent husband. He could imagine that circumstances might arise in which A.I.D. might not only wreck the marriage but wreck the man's mentality.

Mr. NICHOLSON-LAILEY said his committee had already had regard to the medico-legal aspect and was prepared to discuss the ethical, but if the moral was added it would take a long time.

Dr. GRAY pointed out that it would also be a specific alteration from the decision of the A.R.M., which had been carefully considered.

On a vote, Dr. Logan Dahne's rider was lost.

The CHAIRMAN said he took it from the debate that the vote did not mean that the Science Committee must not have regard to the ethical and medico-legal aspects.

There was a resolution before Council in which the Executive Committee of the Liverpool Division asked Council to submit any proposed evidence to Divisions for information. Dr. J. A. L. VAUGHAN JONES, commenting on the fact that this resolution, like that from Liverpool taken at the previous meeting of Council, had come from the Executive, suggested that in a matter of this importance there should be a meeting of the Division. Dr. A. TALBOT ROGERS: "A very valid comment."

Drugs for Private Patients

From the Private Practice Committee came recommendations on drugs for private patients. Dr. I. M. JONES, the Chairman, recalled that discussions between the Association and officials of the Ministry, begun following the statement of Mr. Turton, the then Minister of Health, in 1956, had been to find whether a scheme was administratively possible whereby private patients could obtain drugs under the National Health Service, having regard to the disciplinary procedure on prescribing. When representatives of Council and officials of the Ministry met in October, the latter conceded all the points in the Association's memorandum save one. Indeed, the greater part of the discussion centred round the demand of the Ministry that they should be able to maintain a list of private patients authorized to obtain drugs. It was pointed out to the Ministry representatives that registration would be anathema to private patients and that the administrative cost of maintaining the list would far outweigh any advantage. The Ministry, however, remained adamant. The Subcommittee of the Private Practices Committee composed mainly of practitioners engaged solely in private practice, although supporting the view taken about registration, agreed to the Association's delegation accepting the terms if necessary; this had been endorsed by the Private Practice Committee.

"We believe that it would be to our advantage to concede this point in so far as we agree to the maintenance of a list of private patients authorized to obtain drugs," said Dr. Jones. "If we were to refuse to meet the Ministry on this point, they would be able to put all the blame on us for a failure to implement a scheme for drugs for private patients."

On the recommendation of the Committee the Council decided to accept the Ministry's condition that those private patients authorized to receive drugs and appliances on N.H.S. terms be listed by executive councils. Agreement having thus been reached that a scheme for supplying private patients on E.C.10s was administratively possible, it was further resolved that the Council would welcome an early opportunity to discuss with the Minister the introduction of the necessary legislation. The Chairman of Council, the

chairmen of the Private Practice and G.M.S. Committees, and Dr. L. W. Batten were appointed to be the representatives at the meeting with the Minister and in any subsequent discussions with his officers.

Another recommendation from the Private Practice Committee, which was passed, again requested the Minister of Transport to meet a Council deputation for a full discussion on the parking problems of practising doctors and on ways and means of overcoming them.

Autonomous Bodies: New Proposal

The Professional Co-ordination Committee has no doubt that effective co-ordination was hampered by duplication of discussion in numerous standing and special committees. The Committee did not propose that there should be any change in the present procedure whereby the Liaison Committee of the C.C. and S., G.M.S., and Public Health Committees reported back to the three parent committees. But to avoid the unnecessary establishment of special committees the Committee recommended, and Council agreed, that standing committees be empowered to co-opt additional members to consider matters which would otherwise have been referred to a specially constituted committee. The Committee also made a recommendation in regard to the autonomous committees, where, the report said, "duplication of discussion may be a real handicap to progress and an embarrassment to leaders of the profession at times when speed of action is important." The proposal was that it be referred to the Organization Committee to "examine the possibility of defining the circumstances in which the Representative Body should debate matters within the province of the autonomous committees."

"We have always been a little reluctant to grasp this nettle," said Dr. WAND, as chairman of the Professional Co-ordination Committee, "but we feel the time has come when we must do so." The Organization Committee should be asked to see whether it was possible to avoid spending so much time in the Representative Body discussing minor domestic matters affecting the autonomous bodies.

Dr. VAUGHAN JONES felt the recommendation to be "a thin end of a very dangerous wedge." Doubts about the autonomous bodies had increased through the years, and it had been said that they were tending to become separate organizations subject to the jurisdiction of nobody but themselves and certainly not to the jurisdiction of Council. Anything which limited the extent to which the Representative Body, as the parliament of the profession, had control gave more autonomy to the autonomous bodies and less authority to the Representative Body.

Supporting the recommendation, Dr. GRAY asked whether anything could be more cautious. Dr. A. V. RUSSELL said the autonomous bodies worked well in their present sphere, but it should never be forgotten that the Representative Body was, and should remain, the policy-making body of the Association. "Diarchy is always said to be dangerous," declared Dr. LOGAN DAHNE. "Triarchy would be three times as dangerous."

Dr. WAND replied that the whole point was that there were the autonomous bodies and there was overlapping, which could be dangerous. "What we are trying to do is to flatten out the thick end of the wedge," he said. "The thin end of the wedge is already in." The Committee thought that the time had come to face squarely up to this problem.

The recommendation was carried.

Having reported on the main object of its terms of reference, the Committee on Professional Co-ordination considered that the implementation of its recommendations, and the consideration of any outstanding matters should be referred to the Organization Committee. Council agreed.

Remuneration of University Teachers

The Council left to the Chairman of Council and the Chairman of the C.C. and S. Committee the appointment of a deputation which the University Grants Committee, the Vice-Chancellors' Committee, and the Medical Research Council are to be asked to receive to discuss the report

on the remuneration of whole-time medical teachers and research workers. The Council approved changes recommended for the qualification for membership of the Venereologists Group.

Following the approval of the reconstitution of the C.C. and S. Committee to include representatives from the Royal Colleges and Scottish Corporations, these bodies were invited to appoint members. The Royal Faculty of Physicians and Surgeons of Glasgow and the Royal College of Physicians of Edinburgh were doing so. But the London colleges and the Royal College of Obstetricians and Gynaecologists had declined, on the grounds that membership of the Joint Consultants Committee was adequate.

In Brief

The Council agreed that a deputation jointly with the Trades Union Council should ask to see the Prime Minister to ask the Government to accept responsibility for establishing an occupational hygiene laboratory service as part of a comprehensive health service.

Out of the employee's 9s. 11d. a week for his insurance stamp, 1s. 10d. goes towards the cost of the National Health Service. But Council agreed with its Public Relations Committee that a poster or leaflet campaign to publicize the proportion going to the Health Service was impracticable at the moment. The matter is to be kept under review.

Some results of research on the relation of alcohol to road accidents are now available, and the Alcohol and Road Accidents Committee is revising the Association's report on the subject of alcohol and accidents published in 1935.

The following are the results of the B.M.A. Film Competition, 1958: First prize in the non-commercial category: "The Treatment of Cardiac Arrest"—medical authority, Sir Russell Brock; production authority, Department of Medical Illustration, Guy's Hospital Medical School. First prize in the commercial category: "The Management of Twins in Pregnancy and Labour"—medical authority Professor W. C. W. Nixon and Mr. W. G. MacGregor; production authority, Wellcome Film Unit.

The Central Ethical Committee disapproved of a gummed "Prevent Polio by Immunization" label sent to doctors by Middlesex County Council with a request that it be displayed on their cars, because it might imply that a doctor displaying the label had a special interest in polio.

Australia and New Zealand have issued revised instructions to migrants on the fees which they may expect to pay for medical examination in this country. These come into force as from January 1, 1959.

The Central Consultants and Specialists Committee has proposed to the Joint Consultants Committee that hospital boards should maintain a register of doctors available to undertake locum duties.

Closing the meeting, the last of 1958, the CHAIRMAN OF COUNCIL wished members "a happy Christmas, a prosperous New Year—and a good Royal Commission report."

PUBLIC HEALTH COMMITTEE

MOVE FOR SEPARATE SESSIONS DEFEATED

A proposal to split the Public Health Committee's meetings into two sessions so that matters concerning conditions of service might be discussed separately from those purely concerning public health was rejected at the meeting held on Friday, December 12.

This suggestion was contained in a letter from Dr. E. HUGHES complaining that the Committee spent a great deal of time considering the difficulties of individual medical officers, thus preventing adequate discussion of important matters in the field of preventive medicine. He claimed that the difficulty could be solved by appointing a separate day for the discussion of all matters affecting conditions of service and payment, and that possibly the members who comprised the Staff Side of Whitley Committee "C" might be suitable persons to deal with various individual problems

about salary gradings, etc., even though they might not be sitting officially as the Staff Side of that body at the time in question.

The CHAIRMAN (Dr. J. B. Tilley) said that those who put up their cases to the Public Health Committee did so in the belief that all the members of the Committee were there and not just the Staff Side of Committee C. He disagreed with the view expressed by Dr. H. D. CHALKE that longer and more frequent meetings would provide a solution.

Dr. HUGHES's proposal was rejected, but the Committee agreed to consider whether there would be any advantage in setting up a general purposes subcommittee to which such questions could be referred.

Constitution of the Committee

A full discussion was devoted to a report prepared by Dr. E. GREY-TURNER (Assistant Secretary) since the last meeting, on the subject of the reconstitution and enlargement of the Committee, including increased representation from the Society of Medical Officers of Health. As against the existing total of 25 members, Dr. Grey-Turner's proposal increased the number to 31, providing for 10 *ex-officio* members (4 chief officers, 2 public health members of Council, 4 public health members of the Representative Body); 16 appointed members (2 by the Representative Body, 2 by the Council, 8 by the Society of Medical Officers of Health, and 1 each by the Central Consultants and Specialists, the General Medical Services, the Occupational Health, and the Private Practice Committees), and 5 co-opted members. This would increase the number representing the Society of Medical Officers of Health from 2 to 8. The changes were designed to meet the three main criticisms of the constitution: (a) that it was not sufficiently democratic; (b) that too low a proportion of members were engaged in the Public Health Service; (c) that a balanced representation of all grades and categories of public health medical officers was not obtained. The new proposals, if accepted, would ensure that 20% of the membership was directly elected by those in the Public Health Service, that 70% would be engaged whole-time in that service, and that there would be ample scope for the representation of all grades and categories of public health medical officers, it was claimed in the report.

The CHAIRMAN welcomed the proposals as a better solution than he had thought it would have been possible to find.

Dr. J. KELMAN, asking for the inclusion of a specific number of Scottish members, said that the present representation from Scotland was largely a matter of chance; he thought it should be laid down that three out of the total of 31 should come from Scotland.

Dr. J. T. McCUTCHEON (Assistant Scottish Secretary) pointed out that the C.C. and S. Committee (Scotland) appointed 10 members direct to the corresponding committee in London; the G.M.S. Committee had eight members from Scotland, all of whom were *ex-officio* members of the corresponding Scottish body, but the Public Health Committee (Scotland) had not so far had any particular representation on the main body in London.

Dr. MARY ESSELMONT said that, although a Scot, it was by the purest chance that she happened to be a member of the Committee.

Concern was expressed by several members over the possibility of the increased membership including a large proportion of non-members of the Association. The fear was also expressed that the Society of Medical Officers of Health might represent too large a block in the Committee.

After the ASSISTANT SECRETARY had reminded the meeting that the Association's by-laws provided that all standing committees could include persons who were not members of the Association, Dr. W. G. HARDING expressed strong objection to the use of the term "block." It was inconceivable that there should be any "ganging-up" of non-members of the Association within the Council of the Society, he said, and the "non-membership" point was to be regarded as something of a red herring.

Dr. J. W. PICKUP said that, before approving so large an increase in the number of members from the Society, the Committee should insist on a provision that all such nominees should be members of the Association.

Dr. J. STEVENSON LOGAN said that on a matter of so much importance to the Society it was only proper that their views should be sought. The medical officers of health in the Society had felt that their impact was not large enough.

Sir SELWYN SELWYN-CLARKE said that consultation was provided for under the new agreement between the Society and the Association.

Dr. KELMAN said that one of the reasons for asking the Society to appoint members was because it was a fair and convenient method of selecting the kind of members that the Committee wanted—far better than having regional selections in different categories.

"Although the B.M.A. sometimes falls over backwards to be able to say that it is representing the interests of all doctors," he said, "there are many occasions when we have to remember that we have banded ourselves together in the B.M.A. for certain purposes. The representatives coming from the Society, in my opinion, ought all to be B.M.A. members."

The CHAIRMAN pointed out that it might be embarrassing for the Society to have to ask its nominees whether they were members of the Association.

Dr. PICKUP: "I hope it is embarrassing to them, if necessary."

After further discussion it was decided to accept the proposed figure of 31 as the maximum membership and that the Assistant Secretary should approach the Society for their views before the February meeting of the Committee, with the suggestion that, of the eight Society representatives, one should come from Scotland; that two members should be appointed by the Scottish Public Health Committee; and that to provide for this readjustment the number of co-options be reduced to three.

Medical Examination of Immigrants

A motion by Dr. CHALKE that immigrants should be medically examined either before leaving their country of origin or before arrival in this country was carried after the reception of a document prepared by the Assistant Secretary setting out reports on the subject in connexion with the 1958 A.R.M. resolution calling for a vigorous campaign directed thereto.

Yellow Fever Vaccination

After discussion of a draft circular from the Ministry of Health inviting local health authorities to make arrangements for vaccination against yellow fever under Section 28 of the National Health Service Act and providing for the making of a charge to the individual receiving it, the Committee decided to express strong aversion to any such charge being made.

Psychiatrists Employed by Local Health Authorities

The Committee then considered a report by the Psychological Medicine Group Committee deploring the fact that salary scales for psychiatrists employed by local health authorities were considerably lower than those obtaining in the hospital service, and suggesting that local authority psychiatrists should be transferred to regional hospital boards.

The CHAIRMAN explained that this document had already been before the C.C. and S. Committee, which had requested the views of the Public Health Committee on it. He said the hope might be expressed that the alterations in the salaries of those in the Public Health Service would result in whole-time psychiatrists receiving a salary comparable to that received by those in the hospital service. On the other hand, it was difficult to see how the medical profession could dictate to local authorities as to how they should employ their staff.

Dr. HARDING objected to the proposal on the ground that its acceptance might hamper developments in progressive local health authorities which desired to launch mental

health programmes in areas where the regional hospital boards' psychiatric cover was quantitatively and qualitatively not suited to such developments.

Dr. S. C. GAWNE said that if local health authorities wanted to start a service with people trained in child psychiatry it was up to them to attract such people by paying the proper rate.

Dr. STEVENSON LOGAN said that when a job was of a clinical nature and of consultant status it should be paid for at the proper rate; but the appointments under discussion were primarily administrative posts within the hierarchy of the Public Health Service and the rate was appropriate in relation to the other salaries paid therein.

The Committee agreed: (i) to express the hope that public health salaries would be so increased as to bring them into line with the hospital service; (ii) that where local authorities employed clinical consultants they should pay them at the appropriate rate, and that in some circumstances this was done; (iii) that in view of the expansion that might be expected in the local authorities' mental health services, they should not have to depend on regional hospital boards for the provision of psychiatrists.

School Health Service and Handicapped Pupils Regulations

The Committee examined the Ministry of Education's new draft regulations to replace the School Health Service and Handicapped Pupils Regulations, 1953, and decided to express a preference for the existing wording in certain paragraphs.

Medical Referees of Crematoria

The Committee discussed a note from the Cremation Subcommittee of the Private Practice Committee expressing the view that there was no reason for departing from existing Association policy. This is that cremation should be authorized by independent practitioners, who need not necessarily have any connexion with local authorities. The Cremation Subcommittee further recommended that the medical referee should be a practitioner of at least 10 years' standing and should possess some special qualifications such as experience in forensic medicine.

After discussion the Committee opposed the 10-year provision on the ground that it had no evidence that the existing arrangement was proving unsatisfactory.

INCREASED REMUNERATION OF GENERAL PRACTITIONERS

The following statement has been issued by the Ministry of Health about the distribution of the additional money made available for the payment of general practitioners as a result of the general increase in the basic pay of doctors in the National Health Service by 4%:

1. In reply to a written Parliamentary Question on November 20, the Minister of Health announced that the current basic remuneration of doctors would be increased by 4% from January 1, 1959.

2. The distribution of the additional money made available by the increase in the net remuneration of general medical practitioners has been the subject of discussion between the Ministry of Health and the Department of Health for Scotland, and the representatives of the profession, and it has been agreed that the increase should be effected as follows:

(a) The capitation payment, which doctors receive for each person on their lists, is to go up from 17s. 6d. to 18s. per annum.

The loading, which is an additional payment for each person on the list between 501 and 1,500, is to go up from 11s. 6d. to 12s. per annum.

(b) The fee for the treatment of temporary residents (those patients who are not on a doctor's list and are staying in the area for less than three months) is to go up from 17s. to 18s. (There is an increase from 8s. 6d. to 9s. in the fee paid where the patient is temporarily resident in a convalescent home or

similar institution.) It is proposed to make Regulations to provide for this increase.

(c) The special capitation payment which is paid to some doctors who undertake dispensing for their patients in rural areas is to be increased from 9s. 9d. to 10s. (There is no change for those doctors who are paid, in the same way as retail chemists, for each prescription dispensed; they have received the increase given to retail chemists, whereas the dispensing capitation fee has not been recently changed.)

(d) Initial practice allowances paid to doctors while they are establishing themselves in single-handed practice in areas short of doctors; and other supplementary annual payments and hardship payments are also to be increased by amounts in the order of 4%. These and other details are to be discussed further with the profession and the decisions reached will be announced as soon as possible.

(e) By the payment of a further sum representing 3% of payments under the mileage and for maternity medical services.

3. The intention has been to distribute the increase widely over the different types of payments the general practitioner receives.

4. The present average net income—that is, net remuneration from all professional sources—for general medical practitioners is £2,333. The 4% increase will bring this up to £2,426.

5. Doctors and local executive councils will shortly be receiving copies of notices about the new interim increase.

6. Doctors in general practice last received an increase in their remuneration in May, 1957, when an interim increase of 5% on net remuneration was given. Most of this increase was given by the raising of the capitation payment from 17s. to 17s. 6d. and the "loading" payment from 10s. to 11s. 6d.

7. Steps are being taken to notify hospital authorities of the new rates of salary for various grades of hospital medical and dental staff, and arrangements for distributing the increase to general dental practitioners are being made after consultation with the profession.

8. The total cost of the increases to doctors and dentists will be about £5m. a year, of which nearly £2m. will go to general medical practitioners.

Scottish News

HOSPITAL COSTS IN SCOTLAND

The average weekly cost of a patient in a general hospital in Scotland for the year ended March 31 last was:

	£	s.	d.
Up to 50 beds	17	2	8
51-300 beds	19	4	1
Over 300 beds	19	8	10

Variation according to type of hospital is shown below (out-patient costs excluded):

	£	s.	d.
Teaching hospital	20	12	11
Chronic sick	10	6	1
Maternity	24	4	3
Mental	7	0	3

Each £1 on average went as follows:

	s.	d.
Salaries and wages	11	7
Provisions	2	6
Drugs, dressings, bedding	1	4
Domestic repairs, heating, lighting	2	2
Overheads	2	5

The average weekly cost of provisions per person fed in hospital (taking patients and staff together) was £1 3s. 11d.

The analysis includes this year for the first time a table showing examples of the costs of certain departments and services in a number of hospitals. It has been distributed to all hospital authorities in Scotland, who have been asked to investigate differences in costs of comparable hospitals and to report the results of their investigations.—*Analysis of Running Costs of Hospitals, Year Ended March 31, 1958*, Department of Health for Scotland, H.M.S.O., Edinburgh, 10s. 6d.

Correspondence

Rural Practitioners' Remuneration

SIR.—I note in the press a report that a deputation from the B.M.A. is to propose to the Minister of Health that future increases in doctors' remuneration should be distributed in a manner that takes account, in part at least, of the fact that country doctors' incomes are made up of payments other than capitation fees. I rather think this deputation will find it is pushing at an open door, but it was not the B.M.A. that opened it.

No country doctor should, however, lose sight of the fact that in the past, whenever a retrospective payment has been made, from the Dankwerts Award onwards, it has been distributed on a capitation basis only, and thus he has been denied a part of what was due to him. Furthermore, this injustice has been perpetrated by the Ministry, in agreement with the representatives of the profession, in spite of the fact that the B.M.A. and the G.M.S. Committee have been aware for some years that it was unjust.

I would ask every country doctor to consider very seriously whether his interests are adequately represented.—I am, etc.,

Richmond, Yorks.

A. F. T. ORD.

Distribution of New Money

SIR.—From your report in the *Supplement* of December 6 (p. 239), it would appear that the General Medical Services Committee does not intend to follow established precedent in the distribution of new money.

After the Dankwerts award and the 5% interim award, the new money was largely applied to that part of any given list lying between 501 and 1,500. This was done at the request of the majority of general practitioners, as in this way the small- and medium-list doctors received the greatest possible benefit. As they were the ones most in need of it, this was just and equitable. Now it would appear that a more complicated and less equitable distribution is going to take place.

We in Northern Ireland having, on average, 400-500 less patients than our colleagues in England will be particularly victimized by the present proposed method of distribution, and I wish to protest against the G.M.S. Committee's action, more especially as it departs from the expressed wish of the mass of the profession. Let them think again.—I am, etc.,

Ballywalter, Co. Down.

JOHN R. BRYARS.

- Falls in the elderly (C. A. Boucher, M. Critchley, and L. Z. Cosin), 313
- Sections of Geriatrics and Psychiatry:
- Confusional states in the elderly (M. Roch, P. D. Bedford, L. Z. Cosin, and R. G. Gibson), 314
- Section of Medicine:
- The physician and hospital planning (G. E. Godber, L. F. Brown, T. McKeown, and J. Fry), 223
- Poliomyelitis: the present position (W. R. Russell, G. W. A. Dick, J. F. Galpine, and J. Knowelden), 222
- See also Sections of Surgery, Medicine, and Gastro-enterology
- Section of Neurology and Neurosurgery:
- Neurological disorders in childhood (L. van Bogaert, P. Sandifer, J. Walton, G. H. Macnab, and R. C. Connolly), 235
- Neurological disorders in pregnancy and the puerperium (J. P. Martin, Helen Dimsdale, P. C. P. Cloake, J. M. Small, and J. E. A. O'Connell), 315

- BRITISH MEDICAL ASSOCIATION: ANNUAL MEETING, BIRMINGHAM: PROCEEDINGS (continued):**
- Section of Obstetrics and Gynaecology:**
Dyspareunia (A. M. Clay, A. Agnew, and Sylvia M. Dawkins), 305
- Sections of Obstetrics and Gynaecology and Child Health:**
Problems of the neonatal period (Frances Braid, T. P. Mann, R. J. K. Brown, and I. Donald), 228
- Sections of Obstetrics and Gynaecology and General Practice:**
Brandt-Andrews technique for delivery of placenta (N. Kimbell), 155
Epistomy and methods of perineal repair (J. D. S. Flew), 155
Significance of speculum appearances of the cervix (H. C. McLaren), 155
Use of pessaries in general practice (W. G. Mills), 155
- Section of Occupational Health:**
Assessment of the value of routine medical examinations in industry (R. E. Smith, P. A. B. Raffle, and O. B. Schreuder), 237
- Section of Orthopaedics:**
Artificial limbs for children (D. S. McKenzie), 316
Treatment of congenital dislocation of the hip in adults (P. A. Ring), 316
Treatment of tuberculosis of the spine (M. C. Wilkinson, R. Roaf, and D. E. Macrae), 316
See also *Sections of Surgery, Accident Surgery, and Orthopaedics*
- Section of Pathology and Bacteriology:**
Neoplasia induced by radiation (G. M. Wilson, Alice Stewart, and A. W. G. Goulden), 318
Neuropathy associated with carcinoma (W. T. Smith), 318
Preparation and use of virus vaccines (C. H. Stuart-Harris, G. W. A. Dick, and T. H. Flewett), 317
Use and abuse of the hospital laboratory by hospital and general practitioners (J. D. A. Gray and P. Kidd), 317
- Section of Psychiatry:**
Drug trials in chronic mental patients (A. D. Harris and A. Model), 319
Periodic psychosis (J. L. Crammer), 319
See also *Sections of Geriatrics and Psychiatry*
- Sections of Psychiatry and Social and Preventive Medicine:**
Home, hostel, or hospital? The care of the mentally ill (A. Querido, T. P. Rees, C. R. Lowe, and C. A. H. Watts), 236
- Section of Social and Preventive Medicine:**
Alcohol and road accidents (W. S. Walton), 320
Effects of diagnostic radiography in adults (B. MacMahon), 320
Effects of diagnostic radiography in children (Alice M. Stewart), 320
Exercise and health (H. M. Sinclair), 320
Food and the individual (J. Yudkin), 320
See also *Sections of Psychiatry and Social and Preventive Medicine*
- Section of Surgery:**
Advanced carcinoma of the breast (A. C. Crooke, L. N. Pyrah, J. M. Small, and H. J. B. Atkins), 225
Carcinoma of the oesophagus (J. L. Collis and Sir S. Cade), 227
Carcinoma of the rectum (E. C. B. Butler), 226
Cold legs in young people (G. W. Taylor), 227
Fractures of the jaw (R. O. Walker), 227
Hiatus hernia (R. H. Franklin and A. M. Desmond), 226
Pilonidal sinus (A. J. H. Rains), 226
- Sections of Surgery, Accident Surgery, and Orthopaedics:**
Treatment of accidents in small communities (Sir H. Platt, F. A. R. Stammers, W. C. Gissane, W. S. Lewin, T. G. Lowden, D. L. Crombie, and C. T. Maitland), 304
- Sections of Surgery, Medicine, and Gastroenterology:**
Peptic ulcer (F. A. Jones, C. N. Pulvertaft, H. Taylor, R. L. Holt, and F. A. R. Stammers), 238
- Section of Thoracic Medicine and Surgery:**
Complications of cortisone treatment (S. Gold), 154
Cortisone in asthma (W. Brockbank), 154
Cortisone in pulmonary fibrosis (A. G. W. Whitfield), 154
Cortisone in pulmonary tuberculosis (N. W. Rumball), 154
Cortisone in sarcoidosis (H. Smellie and C. A. Rumball), 154

- Barber v. Manchester Hospital Board; cost to public funds, 171 (P)
Blood transfusion, infected, 334; 689 (C)
Broadmoor patients, 174, 450 (C), 1111
— treated as sane, 1111
Cancer, error in diagnosis, 1363
Certification without seeing patient, 1111 (correction, 1364)
Chivers Cancer Association in lottery trouble, 804
Compensation for injury, 1209 (L)
Deaf-and-dumb driver fined, 1237
Diminished responsibility rejected, 1051
Doctor's death in attempting rescue; £12,000 damages, 335
Driver's unsuspected diabetes, 864
Drowned in nine inches of water, 55
"Fair comment," 110
Feminine behaviour not ground for divorce, 394
Forensic Medicine, 6th ed. (D. Kerr), 1207
Hazards of practice, 794
"Incurably of unsound mind," 1169
Indecent assault under pretence of medical examination, 1480
Inquest quashed; infant not suffocated, 255
Interdepartmental committee on procedure in criminal courts, medical member, 258
Law and Ethics for Doctors. With a Section on General Practice in the National Health Service (S. J. Hadfield), 31
Maintenance where spouses part for medical reasons, 1539
Malpractice Liability of Doctors and Hospitals (Common Law and Quebec Law) (W. C. J. Meredith), 211
Mother's adoption of illegitimate child, 1539
Munchausen syndrome, 696
Negligence; compensation paid by hospital authorities since 1948, 1599 (P)
"Novalgin," fatal agranulocytosis after, 644
Prescription misunderstood, 518
Professional statutes, 1297
The Sanctity of Life and the Criminal Law (G. Williams), 898
Selling of proprietary medicines; Restrictive Practices Court inquiry, 925, 985, 1049; judgment, 1236
Sexual offences as seen by a woman police surgeon (Nesta H. Wells), 1404; 1538 (C)
Suffocation in infancy, 111
Swab; forgotten; surgeon's legal duty; a correction, 462
Trauma and sarcoma, 922
Tuberculosis; claim against Northern Ireland Tuberculosis Authority, 1363
Unexpected baby, 54; 250 (C)

MEDWAY, A. J. See BARBER, Mary, 1377

"Megalove," 1530

MEGAW, Sir John Wallace Dick, obituary of, 1166; 1480

MELANOTIN, pineal gland hormone, 151 (A)

MELLANBY, MAY, MARTIN, W. J., BARNES, D., and NEAL, Gwyneth: Teeth of 5-year-old London schoolchildren (1957); with comparison of results obtained from 1929 to 1957, 1441 (O)

MELLICK, Alexander, obituary of, 1233

MELROSE, D. G. See CLELAND, W. P., 1369

MELVIN, Moray, obituary of, 109

Membranes, premature rupture, diagnosis, 108 (C)

MENDEL, D. See APHORP, G. H., 476

Meningitis, tuberculous, as cause of mental deficiency (B. H. Kirman), 1515

— following B.C.G. vaccination (Mary R. Kerr and J. M. Dunbar), 1019 (O); 1292 (C), 1356 (C), 1594 (C)

Meningococci, risk in successive children, 1116

Meningococcal infection, graphs (vital statistics), 176, 335, 645, 865, 1052, 1170, 1365

Meningo-encephalitis, isolation of E.C.H.O. virus type 9 during outbreak (P. B. Stones), 1514 (O)

Menopause: Action of methallenoestril on postmenopausal endometrium and vaginal epithelium; a comparative study (W. K. Sutton and D. B. Brown), 1450 (O)

METABOLISM: Hormonal Regulation of Energy Metabolism (Editor: L. W. Kinsell), 291

Methallenoestril, action on post-menopausal endometrium and vaginal epithelium; a comparative study (W. K. Sutton and D. B. Brown), 1450 (O)

Methoxypyrrolone as skin tanning agent, 1212 (A)

Methylpentanol, 966

— and methylpentanol carbamate, susceptibility to (E. Marley), 493

Methypyrrolone and quinalbarbitone as hypnotics, clinical comparison; sequential analysis (T. J. Thomson), 1140 (O)

— in insomnia, 1349

MEYER, A.: Medical war crimes, 247 (C)

— See GREENFIELD, J. G., 211

MEYER, R. DE. See SALTER, J. M., 5

MICHIE, W. See MAVOR, G. E., 534

Microscopy, electron, 1099

— interference, 1099

— phase-contrast, 1099

Microwaves, are they dangerous? 1030 (A)

Middlesex Hospital Medical School, 614; future plans, 925

Midwives: Central Midwives Board, new headquarters opened, 1241

— Textbook for Midwives (Margaret F. Myles), 1277

Migraine, treatment with ergotamine tartrate; bilateral thrombophlebitis after single dose (E. R. Carter), 1452 (O)

MILLS, R. A. See HENNESSY, R. S. F., 893

Military medicine: Australia in the War of 1939-1945. Series 5, Medical. Vol. III, The Island Campaigns (A. S. Walker), 432; 1536 (C)

Milk consumption in the United Kingdom, 1481 (P)

— two cases of cow's-milk allergy (B. D. Bower, D. G. Stanley-Roose, and O. H. Wolff), 195 (O); 635 (C)

MILLAR, J. H. D. See ASHENHURST, E. M., 415

MILLER, Arthur Alfonso, obituary of, 1232

MILLER, H. See WILSON, G. M., 929

MILLER, James, obituary of, 861

MILLER, R. A.: Value of penthiolate methobromide in lenteric diarrhoea and encopresis in childhood, 1393

MILLIGAN, Hugh, obituary of, 696

MILLIGAN, W. L.: "Stelazine" in psychiatry, 328 (C)

MENTAL DISEASE:

Attitudes of general public to mental illness (G. M. Carsairs and J. K. Wing), 594 (O)

Care of the mentally ill, 236

Divorce for incurable insanity (medico-legal note), 1169

MENTAL DISEASE (continued):

- Minds Matter: A New Approach to Mental Health, 1143
Psychological medicine in general practice; report prepared by working party of Council of College of General Practitioners, 585 (O); 602 (A); 795 (C)
Puerperal; follow-up study of 75 cases (Mary E. Martin), 773 (O)
Research programmes, 1598 (P)
Research projects, 1540 (P)
Scottish lunacy law, 1236 (P)
Treatment without restraint, 1150 (L); 1294 (C)

MENTAL HEALTH:

- An African's mental outlook in Britain (W. I. B. Onuigbo), 1085 (O); 1359 (C)
Local authority services, 1540 (P)
Mental Health Legislation, 830
Mental Health Manual (D. Stafford-Clark), 1423
National Association of Mental Health, post-graduate courses, 626; annual report, 1334
Parliamentary programme, 1168 (P)
Visit of Nigerian Minister of Health, 699
World Federation for Mental Health: Annual meeting, Vienna, 686; tenth annual meeting, 1525

MENTAL HOSPITALS:

- Beds out of commission, 255 (P)
Open doors, 1150 (L); 1294 (C)
Patients, 295 (L); 450 (C)
— statistics for England and Wales, 1957, 924
Role in treatment of mental illness, 236
St. Clement's Hospital, Bow, 370

Mepacrine, toxic effects, 872

Mephensin and chlorpromazine in management of tetanus (J. Hutchinson and G. D. Hurrell), 429

— thrombocytopenic purpura apparently due to tablets containing salicylamide and mephensin (R. Platt), 1577

Mephentermine, 102

"Mepilin" tablets and elixir, 324

Meprobamate, 632, 914 (C), 966, 1095

— hazards of use, 1586 (A)

MEREDITH, W. C. J.: Malpractice Liability of Doctors and Hospitals (Common Law and Quebec Law), 211

Merit awards; amounts paid since 1948, 333 (P)

MERLIS, R. R.: Chloroquine in rheumatoid arthritis, 1595 (C)

Mersalyl, toxic effects, 808

MERTON, P.: Nervous gradation of muscle contraction, 230

MERTON, R. K., READER, G., and KENDALL, Patricia L.: The Student-Physician, 599

Mesenteric artery, superior, occlusion causing chronic mesenteric ischaemia (G. E. Mavor and W. Michie), 534 (O)

Metabolism: Hormonal Regulation of Energy Metabolism (Editor: L. W. Kinsell), 291

Methallenoestril, action on post-menopausal endometrium and vaginal epithelium; a comparative study (W. K. Sutton and D. B. Brown), 1450 (O)

Methoxypyrrolone as skin tanning agent, 1212 (A)

Methylpentanol, 966

— and methylpentanol carbamate, susceptibility to (E. Marley), 493

Methypyrrolone and quinalbarbitone as hypnotics, clinical comparison; sequential analysis (T. J. Thomson), 1140 (O)

— in insomnia, 1349

Death Rates by Age and Sex for Tuberculosis and Selected Respiratory Disease, England and Wales 1911-1954 (R. A. M. Case and J. L. Harley), 1580
Digest of Statistics Analysing Certificates in Incapacity, 1385
 Diphtheria, graphs, 336, 519, 805, 1052, 1112, 1170, 1240, 1364, 1543
 — notifications, 1051; 1294 (C)
 Dysentery, graphs, 57, 114, 256, 459, 519, 697, 865, 988, 1112, 1240, 1421, 1543
 England and Wales: Registrar-General's Statistical Review for 1957, Part I, Tables, Medical, 1420
 — vital statistics, 335, 989, 1051, 1112
 Enteric fever, graphs, 57, 335, 519, 749, 865, 1301, 1421
 Gastro-enteritis in Yorkshire, 1364
 Gonorrhoea, increasing incidence, 1365
 Industrial accidents and diseases, 398, 697, 864, 1170, 1481
 Infectious diseases, notifications, 58, 114, 176, 256, 336, 398, 459, 519, 571, 645, 697, 750, 805, 865, 924, 989, 1051, 1112, 1170, 1240, 1301, 1365, 1420, 1482
 — weekly tables, 58, 113, 176, 255, 336, 399, 459, 520, 572, 646, 698, 750, 806, 865, 924, 988, 1052, 1113, 1171, 1239, 1301, 1365, 1421, 1482, 1543, 1601
 Ireland, Republic of, statistics for first quarter of 1958, 175; second quarter, 989
 Measles, graphs, 114, 256, 458, 645, 750, 923, 1112, 1239, 1364, 1481, 1600
 Meningococcal infection, graphs, 176, 335, 645, 865, 1052, 1170, 1365
 Mental hospitals, patient statistics for England and Wales, 1957, 924
Morbidity Statistics from General Practice, Vol. I (General), 1459 (A)
 Ophthalmia neonatorum, graphs, 58, 176, 399, 571, 697, 805, 1300, 1482
 Pneumonia, graphs, 114, 399, 645, 865, 1052, 1300, 1482
 Poliomyelitis, acute, graphs, 58, 114, 175, 256, 336, 399, 459, 519, 571, 645, 697, 750, 805, 865, 924, 988, 1052, 1112, 1239, 1421
 — vaccine; distribution and use since 1956, 923
 Royal Air Force: Diseases and injuries in 1954, 864
 Scarlet fever, graphs, 175, 399, 571, 749, 923, 988, 1170, 1301, 1481, 1543, 1600
 Scotland: *Annual Report of Registrar-General for 1957*, 1420
 Scotland: Vital statistics, 256, 923
 Typhoid outbreak; oysters suspected, 1239

VITAL STATISTICS (continued):

- Veneral diseases, notifications, 335, 697, 1365
Whooping-cough, graphs, 256, 458, 571, 697, 805, 923, 989, 1170, 1365, 1600

ABSTRACTS OF WORLD MEDICINE

*A monthly survey of periodicals
in Medicine and its allied sciences*

COMPREHENSIVE A single journal which will keep you informed of developments throughout the whole field of medicine.

SELECTIVE Bringing you, from over 1,600 medical periodicals, the significant contributions to the sum of medical knowledge and experience in every part of the world.

EASY TO USE The Abstracts are grouped in sections which bring together material collected from widely differing sources. They contain sufficient information to give a bird's-eye view of work done and results achieved.

AUTHORITATIVE More than 400 abstracters, each an expert in his field, work under the guidance of an experienced editorial staff.

YEARLY SUBSCRIPTION £4.4.0 U.S.A. AND CANADA \$13.50 SINGLE NUMBER 8/6
