The Company acquired, during the year under report, green leaf from the cultivators who had planted on 3,364 acres as against 2,935 acres planted in the previous year. It is gratifying to report that the Company is able to produce 15,96,104 lb. of cured leaf from its barns as against 14,51,712 lb. produced in the previous year; and furthermore it was able to obtain increased out-turn in some of the grades fetching better prices than in the previous year. But there was a noticeable short-fall in the quantity acquired from the private curers as many of the barn owners did not plant during the year and there was competition even for the little output produced from other buyers. However, the quantity of cured leaf acquired during the year was 8,05,421 lb. as against 12,32,324 lb. in the previous year.

Dejoo Valley Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

The season's working resulted in a profit, after providing for depreciation, of Rs. 2,27,184 (Rs. 1,14,388) to which must be added adjustment account amounting to Rs. 1,734 (nil) and balance of profit brought forward from 1957 of Rs. 27,461 (Rs. 33,446) making a total of Rs. 2,56,379 (Rs. 1,47,834). From this amount must be deducted provision for taxation Rs. 94,000 (Rs. 45,000), provision for wealth tax Rs. 2,000 (nil) and amount written off stores for obsolescence, etc. Rs. 91 (nil) leaving a balance of Rs. 1,60,288 (Rs. 76,461) after writing of Rs. 1,627 for adjustment account and providing Rs. 24,746 for depreciation in respect of previous year. From this the directors have set aside to general reserve Rs. 1,00,000 (Rs. 25,000) and to development rebate reserve Rs. 7,000 (nil) leaving an available balance of Rs. 53,288 (Rs. 51,461). This amount the directors recommend, should be dealt with as follows:—

In payment of a dividend of Rs. 3.00 (Rs. 2.00) per ordinary share, free of tax, for the year ended 31st December 1958, on 12,000 ordinary shares, absorbing Rs. 36,000 (Rs. 24,000) leaving to be carried forward Rs. 17,288 (Rs. 27,461).

The saleable crop weighed out at 5,179 (4,045) maunds against the revised estimate of 5,000 maunds and was disposed of at an average price of Rs. 2.49 (2.42) per lb.

The estimate for season 1959 provides for a saleable crop of 5,000 maunds at a total revenue expenditure of Rs. 6,80,810.

Accounts in brief are as under:—

Telojian Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

The season's working resulted in a profit, after providing for depreciation, of Rs. 3,55,851 (Rs. 4,03,144) to which must be added adjustment account Rs. 621 (nil) and the balance of profit brought forward from 1957 of Rs. 78,434 (Rs. 64,681) making a total of Rs. 4,34,906 (Rs. 4,67,825). From this must be deducted provision for taxation of Rs. 1,77,000 (Rs. 1,45,000) and provision for wealth tax of Rs. 8,000 (Rs. 8,000) leaving a balance of Rs. 2,49,906 (Rs. 3,07,834) after providing Rs. 6,991 for adjustment account. The Interim dividend for the year ended 31st December, 1958, at Re. 1.00 (nil) per ordinary share, free of tax, declared by the directors on 20th February 1959, absorbed Rs. 59,800 (nil). The directors have set aside to buildings and machinery reserve Rs. 50,000 (Rs. 50,000) to development rebate reserve Rs. 3,800 (nil) leaving an available balance of Rs. 1,36,306 (Rs. 2,57,834). This amount the directors recommend, should be dealt with as follows:—

In payment of a final dividend of Re. 1.50 (Rs. 3.00) per ordinary share, free of tax, for the year ended 31st December, 1958, on 59,800 ordinary shares, absorbing Rs. 89,700 (Rs. 1,79,400) leaving to be carried forward Rs. 46,606 (Rs. 78,434).

The saleable crop weighed out at 9,945 (10,300) maunds against the revised estimate of 9,800 maunds and was disposed of at an average price of Rs. 2.35 (Rs. 2.25) per lb.

The estimate for season 1959 provides for a saleable crop of 10,000 maunds at a total revenue expenditure of Rs. 13,85,379.

Jutibari Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Gillanders Arbuthnot & Co., Ltd., Calcutta) presented the audited accounts of the Company for the year ended 31st December 1958.

The total crop harvested in 1958 was 12,815 mds. compared with the 1957 crop of 11,377 mds. Given favourable weather conditions the increase in crop would have been larger.

In spite of there being a surplus of tea in the world prices realised in auction throughout 1958 were fairly satisfactory, particularly for quality teas such as are produced by this Company. There is, however, scope for improvement, and this can be brought about by the equating of demand with supply. Vigorous propaganda in India where the market potential is enormous, together with adequate propaganda overseas, particularly in North America, the United Kingdom and countries of Western Europe, would undoubtedly result in increased consumption, a much better way of reducing the gap between supply and demand than any scheme for the regulation of crop.

The teas produced by this Company realised satisfactory prices. A part of the crop was sold in Calcutta and a part shipped to London. The combined average sale price obtained per pound of tea was Rs. 2.42 (Rs. 2.50). The net sale proceeds, realised and estimated amounted to Rs. 22,37,332 compared with Rs. 19,80,884 in 1957; an increase of Rs. 2,56,448.

The working of season 1958 resulted in a gross profit of Rs. 3,62,236 compared with Rs. 3,12,444 in 1957, and after taking into account interest received, leave and passage reserve, depreciation, income-tax and wealth tax, development rebate reserve and adding the balance brought forward from 1957 after adjustment, there remains a balance of Rs. 1,93,022 (Rs. 2,59,471) at the credit of the profit and loss account. The directors recommend that the available balance be distributed as follows:—

To pay a dividend of 10 (17½) per cent. on the issued share capital of the Company without deduction for income-tax payable by the Company absorbing Rs. 90,000 (Rs. 1,57,500), to transfer to general reserve Rs. 50,000 (Rs. 50,000) and to carry forward Rs. 53,022 (Rs. 51,971).

Accounts in brief were as under:—			
LIABILITIES	Rs.	ASSETS	Rs.
Capital ...	9,00,000	Gross block	17,28,122

Profit and loss account (surplus) ...	53,022	Stores, etc. ...	2,76,654
		Debits, deposits and advances ...	2,06,326
		Investments ...	1,336
		Cash ...	7,74,374
	Rs. 34,64,339		Rs. 34,64,339

Hoolungoree Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule and Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

The accounts show a profit, after charging all expenses of Rs. 3,47,160 (Rs. 1,00,485) of which taxation provision requires Rs. 1,56,000 (Rs. 42,000) leaving a balance of Rs. 1,91,160 (Rs. 58,485) to which is added the balance brought forward from last year of Rs. 75,281 (Rs. 95,546) making a total amount available for appropriation of Rs. 2,66,441 (Rs. 1,84,031) including Rs. 30,000 being excess provision for taxation written back. The directors have transferred to general reserve Rs. 50,000 (nil) and to development rebate reserve Rs. 729 (nil) the directors now recommend that a dividend of Rs. 17.50 (Rs. 12.50) per share be paid absorbing Rs. 1,52,250 (Rs. 1,08,750). The directors have forfeited unclaimed dividends in accordance with Article 158 amounting to Rs. 27,142 (nil). Thus there is a balance to be carried forward of Rs. 90,604 (Rs. 75,281). Wealth tax in respect of the year ended 31st December 1958, is estimated to amount to Rs. 9,000 and this has been provided for by transfer from investment realisation surplus.

A record crop of 15,259 maunds was secured and sold at an average price of Rs. 2.32 per lb. This compares with a crop of 13,519 maunds in season 1957, sold at an average price of Rs. 2.29 per lb. Estimates for the current season have been framed for a crop of 15,500 maunds to cost Rs. 25,29,334 but weather conditions at the commencement of the season were unfavourable and the final crop is likely to be a little less than the estimated quantity.

Accounts in brief were as under:—

Anglo-India Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st March 1959.

The accounts disclose a net revenue profit of Rs. 38,19,295 (Rs. 26,45,574) which is increased by sundry credits to Rs. 41,68,219 (Rs. 27,55,497). After providing for depreciation Rs. 12,00,000 (Rs. 12,00,000), wealth tax Rs. 72,000 (Rs. 64,525), income-tax Rs. 18,81,900 (Rs. 78,791) and transferring Rs. 2,00,000 (nil) from contingencies reserve which is no longer required, there stands the sum of Rs. 14,51,061 (Rs. 15,29,812) on profit and loss account. Placing Rs. 3,00,000 (nil) to investment reserve and Rs. 40,000 (Rs. 21,000) to development rebate reserve there remains the sum of Rs. 11,11,061 (Rs. 15,08,812) which the directors recommend should be dealt with as follows:—

In payment of dividend on preference share capital at the rate of 7 per cent. per annum [Rs. 7 (Rs. 7) per share] without any deduction for income-tax paid by the Company absorbing Rs. 2,80,000 (Rs. 2,80,000), in payment of dividend on ordinary share capital at the rate of 12½ (10) per cent. per annum [Rs. 12.50 (Rs. 10.00) per share] without any deduction for income-tax paid by the Company absorbing Rs. 6,15,087 (Rs. 4,92,070) leaving a balance to be carried forward of Rs. 2,15,974 (Rs. 2,36,742) after placing Rs. 5,00,000 to machinery replacement reserve).

Negotiations with the National Industrial Development Corporation continue and the modernisation of the preparing and spinning machinery of Middle Mill is proceeding and should be completed within the current financial year. Both the Company's working mills will thus be fully equipped with silver spinning machinery leading to economies in operation.

The sale of the Upper Mill property will be completed shortly and although final sanctions are awaited a licence under the Industries (Development and Regulation) Act 1951 has been granted by the Government for the establishment of a wool-combing unit in Jagatdal Mill and other negotiations with Government are continuing.

Mysore Chemical Manufacturers Ltd.

The directors of the above Company (Managing Director and Chairman: Mr. S. Ramanathan, Bangalore) submit the audited accounts of the Company for the year ended 31st March 1959.

The working of the Company during the year resulted in a net profit of Rs. 1,98,206 (Rs. 1,08,910) after providing Rs. 74,208 (Rs. 57,790) for depreciation, Rs. 3,20,000 (Rs. 1,20,000) for income-tax, super-tax, and wealth-tax, and Rs. 32,698 (Rs. 6,054) for development rebate. Together with the last year's carry over of Rs. 24,933 (Rs. 1,98,023), the total sum available for distribution is Rs. 2,23,137 (Rs. 3,06,933). The directors recommend the following appropriations of the amount:—

To payment of dividend of 6 per cent. for the year under report on 20,000 6 per cent. cumulative preference shares, free of income-tax absorbing Rs. 12,000 (Rs. 12,000), to payment of a dividend of 20 (20) per cent. for the year under report on 60,000 ordinary shares, free of income-tax absorbing Rs. 1,20,000 (Rs. 1,20,000) and to transfer to dividend equalisation reserve Rs. 50,500 (Rs. 1,50,000) leaving to be carried forward to next year's account Rs. 41,137 (Rs. 24,933).

During the year a total quantity of 3,085 tons Chemicals were produced as against 2,215 tons in the previous year. The total sales amounted to Rs. 30,98,434 including fertilisers, while the sales for the period ending 31st March 1958 were only Rs. 23,35,158.

The output of Chemicals during the year has increased considerably. However, the Company could not maintain full production for want of sufficient supplies of sulphuric acid and copper scrap. The Company has a scheme of installing its own sulphuric acid plant for which application has been submitted to Government for grant of licence.

Kemp and Co., Ltd.

The directors of above Company (Chairman: Mr. Jai H. Mehta, Bombay) submit the audited accounts of the Company for the year ended 31st March 1959.

The net profit for the year ended 31st March 1959, after providing Rs. 62,003 (Rs. 67,562) for depreciation, Rs. 3,900 (nil) for development rebate and Rs. 1,85,000 (Rs. 90,000) for taxation amounts to Rs. 1,25,227 (Rs. 91,122). To this is added the amount brought forward from the last year of Rs. 26,435 (Rs. 15,313) making a total of Rs. 1,51,662 (Rs. 1,06,435) including Rs. 10,000 being excess provision for taxation written back. From this amount the directors recommend payment of a dividend at Rs. 17.50 (Rs. 15.00) and bonus at Rs. 2.50 (nil) per share [Rs. 200 paid up] free of income-tax absorbing Rs. 1,20,000 (Rs. 90,000) leaving a balance to be carried forward of Rs. 31,662 (Rs. 26,435). The directors consider the provision for taxation as sufficient to meet this liability, and the depreciation on fixed assets as adequate.

Aluminium Corporation of India Ltd.

The directors of the above Company (Managing Agents: Messrs. J. K. Industries Private Ltd., Calcutta) present the audited accounts of the Company for the year ended 31st March 1959.

The gross profit for the year after making provisions for bonus for employees, interest on debentures, managing agents' commission, directors' remuneration but before making provisions for taxation and deduction for depreciation amounts to Rs. 35,89,864 (Rs. 27,20,461) to which is added the amount brought forward from the last year of Rs. 92,284 (Rs. 2,33,758) making a total of Rs. 36,82,148 (Rs. 29,54,219). The directors have appropriated from the above sum: For provision for taxation Rs. 16,50,000 (Rs. 3,00,000), for depreciation including provision towards arrears of undepreciated Rs. 10,00,000 (Rs. 14,00,000), absorbed depreciation Rs. 1,00,000 (Rs. 1,00,000) for transfer to general reserve Rs. 4,00,000 (Rs. 4,00,000) and for transfer to development rebate reserve Rs. 14,986 (Rs. 24,435) leaving a balance of Rs. 9,17,162 (Rs. 8,29,784). Out of this

amount the directors recommend payment of dividends for the year ended 31st March 1959, as under without deduction of tax: On 20,000 6 per cent. cumulative preference shares at 7 (6) per cent. absorbing Rs. 1,40,000 (Rs. 1,20,000), on 20,000 5 per cent. cumulative preference shares absorbing Rs. 1,00,000 (Rs. 1,00,000) and on 6,25,000 (5,75,000) ordinary shares at 10 (9) per cent. per annum absorbing Rs. 6,25,000 (Rs. 5,17,500) leaving a balance of Rs. 52,162 (Rs. 92,284) to be carried forward to next year.

The profit for the year has been the best so far achieved by the Corporation, but due to high impact of taxes, the appropriation towards reserves has been reduced.

Share Capital and Dividend:—The Controller of Capital Issues gave his consent on 28th May 1959 to the scheme of conversion of deferred shares into ordinary shares as approved at the general meetings held on 8th August 1958, and as sanctioned by the Calcutta High Court and the scheme has been given effect to. The directors are recommending a dividend at 10 (9) per cent. on all the ordinary shares including those issued in lieu of the deferred shares and an additional dividend of 1 per cent. on six per cent. cumulative preference shares in terms of the Articles of Association of the Corporation, after obtaining the approval of the Industrial Finance Corporation of India.

Repayment of Debentures:—The directors have pleasure to state that further instalments of debenture loan of Industrial Finance Corporation of India were voluntarily repaid in advance during the year and the next instalment is due only on 15th July 1962.

Operations:—The working and production of all departments—bauxite and coal mining, power generation, alumina, carbon electrode plant, metal production and rolling have been satisfactory. More diversified products including different alloys have been manufactured to meet the growing industrial requirements of the metal in the country.

Cost of Operations:—Against the general background of increasing wages and increasing cost of stores, raw materials and maintenance and additional burden in the form of cesses, the directors are glad to report that they have been able to maintain reasonable limit of cost of production.

Sales:—The sales of the Corporation's products have shown a new record. The industrial uses of aluminium in the country are increasing along with the development of Engineering Industry and the total consumption of metal is going up. Still the market conditions throughout the year remained competitive. The State Trading Corporation of India have entered into the field of import and distribution of aluminium metal.

Expansion:—The programme for trebling the metal production capacity of the existing plant of the Corporation, including new facilities for fabrication etc., is well advanced. The Corporation have entered into an agreement with Messrs. Aluminium-Industrie-Aktien-Gesellschaft, Switzerland, for technical collaboration.

COTTON FUTURES FIRM

(From Our Own Correspondent)

The following are the latest available quotations—in tallaris per lb.—from Alexandria, the

figures in brackets being last week's closing quotations:

Karnak: November 70.75 (70.50); January 71.65 (71.00). Ashmouni: October 62.40 (60.50); December 61.60 (60.09).

Cotton futures values in Liverpool suffered a setback during the week. Both American and American type contracts drifted lower, thanks to Commission House selling and liquidation which found buyers reserved. Scattered inter-month switching was a feature of trading. Sudan cotton contracts in Liverpool too eased on light hedge pressure. The latest available quotations—in pence per lb.—are as follows:

American cotton one inch staple contract: October-November 21.70; December-January 21.50; March-April 21.50; May 21.72.

American cotton mixed growth contract: October-November 22.00; December-January 21.90; March-April 22.00; May 22.00.

Sudan: November-December 29.00; January-February 29.00; May-June 28.75.

Price movement in the New York cotton futures market during the week was narrow and negligible. The fourth crop report of the Department of Agriculture, published on the 8th inst., had little effect on the market as the estimate was close to trade expectations. The Department estimated the crop at 14,692,000 bales, as against 14,678,000 bales estimated last month and the 1958-59 crop of 11,512,000 bales. The yield per acre remained at 470 lbs., unchanged from the September estimate.

A noteworthy feature of this season's crop report is that the estimates are surprisingly steady and the month-to-month variations have been very small so far. This is in sharp contrast to past seasons when there were wide variations in the estimate from month-to-month.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

ART SILK YARN IMPORT POLICY MODIFIED

(From Our Own Correspondent)

BOMBAY, 14th October

The Government of India has modified the import policy in respect of art silk yarn. As against the increase in the quota licence from 5 to 7½ per cent in the whole year 1959-60, announced in the Red Book, the Government has now announced a cut in the percentage of quota licence from 5 to 2½. In other words, this means that the quota licence for the six months ending March 1960 will be just 1½ per cent, as against 2½ per cent. Traders are greatly intrigued at the drastic cut in the import quota licence. They do not find any justification for such a cut. They no doubt admit that there has been an increase in the production of indigenous art silk yarn, but they are surprised at the fact that allocations of yarn from indigenous manufacturers have not been made available to them even to the extent to which they were originally fixed. It is, therefore, feared that there will be a heavy shortage of supplies in the local market. This fear has imparted considerable strength to art silk yarns which have registered a marked rise in prices. Staple fibre yarns, however, rule easy, thanks to selling pressure. Even reports of declining stocks in consuming centres would appear to have had no effect on the market. Prices would have suffered a steeper decline but for reports that some spinning mills are not inclined to sell staple fibre yarns. Cotton yarns are dull. Transactions put through are limited with values moving narrowly. It is said that some of the contracts entered into by countries like China and Pakistan have not been fulfilled and that the buyers in foreign countries are covering their requirements against sellers. These reports, it is felt, have improved the chances of India exporting more cotton yarns, but the reports have still not influenced the trend of cotton yarn prices in any way.

Imports of art silk yarn into Bombay port during the month of September 1959 were negligible, being 1,154,788 lbs., as against 2.48 million lbs. in August and 2.12 million lbs. in July. During the same month, 149,907 lbs. of synthetic yarn, 600 lbs. of staple fibre yarn and 43,278 lbs. of cotton yarn were imported. Exports of cotton yarn in September 1959 amounted to 1,184,992 lbs., as against 931,630 lbs. in the previous month.

During the week, Cupressa Bamberg yarn (60×2) December contract forged ahead from Rs. 1,675 to Rs. 1,702. October contract climbed up by Rs. 20 to Rs. 1,702. Spot Cupressa gained 3 nP to Rs. 7.47. Among imported yarns, 150 Japan spurted by 16 nP to Rs. 5.12. 120 Japan advanced by 15 nP to Rs. 5.15. 120 Italy recorded a rise of 13 nP, today's closing rate being Rs. 4.90. 150 Italy improved by 6 nP to Rs. 4.87. Among indigenous yarns, National Rayons 120 bright cones first grade firmed up by 16 nP to Rs. 4.66. 150 bright cones first grade put on 3 nP to Rs. 4.22.

Staple fibre yarns (40×2) October contract came in for selling and dropped Rs. 10 to Rs. 702. December contract receded from Rs. 702 to Rs. 691. Spot Citys declined by 6 nP to Rs. 3.72. Kohnmoors eased by 4 nP to Rs. 3.77 and Centurys by 3 nP to Rs. 3.78. Imported yarns (80×2) moved up, Fujis rising by 12 nP to Rs. 9.06 and Paramounts by 3 nP to Rs. 8.25.

In the cotton yarn section, ten counts Podars shed 13 nP to Rs. 14.37. Twenty counts Moderns advanced by 75 nP to Rs. 19.75. Forty counts Minaxis fell by 50 nP to Rs. 26.25, while Moderns

gained 25 nP to Rs. 26.75. Among sixty counts, Moderns rose by 50 nP to Rs. 56.50. Raghuvamshis were quiet at Rs. 63. Among eighty counts, Moderns improved by a rupee to Rs. 82. Mahendras were steady at Rs. 66. Finlays, however, lost 25 nP to Rs. 73.75.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today as compared with those a week before.

	14-10-59	7-10-59
Art silk yarn—		
60/1 Cupressa Bamberg October (100 Kg.)	1,665	1,645
December	1,702	1,675
60/1 Cupressa Bamberg spot (per lb.)	7.47	7.44
120 Japan (per lb.)	5.15	5.00
150 Japan (per lb.)	5.12	4.96
120 Italy (per lb.)	4.90	4.87
150 Italy (per lb.)	4.87	4.81
Staple fibre yarn—		
40×2 October (per case of 200 lbs.)	702.00	712.00
40×2 December	691.00	702.00
40×2 Kohnmoor (per lb.)	3.77	3.81
40×2 City	3.72	3.78
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	14.37	14.50
20s Modern	19.75	19.00
40s Minaxi	26.25	26.75
60s Finlay	63.00	63.00
80s Mahendra	73.75	74.00

SUGAR SUPPLIES SCARCE

(From Our Own Correspondent)

HAPUR, 12th October

Sugar continues to rule steady to firm, due to tight supply position. In order to check the rising trend in prices, the Central Government is contemplating to build up a reserve of 250,000 tons and the possibility of imports for that purpose is not ruled out. Rationing arrangements are not complete, as ration cards have not yet been issued to all consumers. Since the supplies at 14 seer per unit per month are insufficient, the consumers have to supplement these from the open market where it is being quoted at Rs. 1.25 per seer, as against the controlled price of 97 nP. The wholesale price is Rs. 130 per bag.

Sugar prices are also steady to firm in the Muzaffarnagar market where supplies in the open market are sparse. The latest prevailing prices are Rs. 130 to Rs. 132 per bag, as against the controlled price of Rs. 104. The non-issue of permits to all consumers is responsible for not lifting of all sugar from Government nominees. The open market prices are Rs. 1.25 to Rs. 1.31 per seer, as against the controlled price of 96 nP.

Crystal sugar continues to attract good demand in the Kanpur market where prices have established a new peak at Rs. 138 a bag. Business passing, however, is negligible, due to absence of supplies.

Khandasari, after recording a sharp rise of about Rs. 10 per maund in the last two weeks, eased slightly by about Rs. 2 per maund towards the week-end, owing to buyers' resistance at higher levels. The U.P. Government has now extended the scope of the U.P. Khandasari Manufacturers Licensing Order to the whole of the State, as against the assigned or reserved areas of sugar factories and only those units will be given permission which are established before February 1959. The prevailing prices here are: Rs. 44 to Rs. 52 according to quality, *boora* Rs. 50 to Rs. 52 a maund.

New *gur* arrivals have mounted to an average of 200 maunds daily and prices are steady, due to good demand from consumers. Now with the clearing up of weather, more of *crushers* and *kolhus* will start functioning and *gur* arrivals will further mount. Prevailing prices are: new *gur* Rs. 25 to Rs. 27; old Rs. 21 to Rs. 23.

Gur eased slightly in the Muzaffarnagar market where new arrivals was daily mounting. Prevailing prices are: *gur chaku* new *pansera* Rs. 22.50 to Rs. 23.50; remanufactured Rs. 25; *Shakker dara* Rs. 22.50 to Rs. 23.50; *dana minja* Rs. 25 to Rs. 31; *khandasari* Rs. 44 to Rs. 56 a maund.

Gur fagun moved both ways during the week in bouts of selling and buying. Opening at Rs. 15.84 on Monday and touching the highest at Rs. 15.85 and the lowest at Rs. 15.65, it was quoted today at Rs. 15.79.

In order to increase the production of sugar during the coming month, the Government of India has decided to allow the factories which start crushing on or before 4th November 1959 in Western Uttar Pradesh a concession of 31 nP per maund of cane crushed by them from the date of start up to 15th November. This concession will also be allowed to all such factories in Eastern Uttar Pradesh and North Bihar which start crushing on or before 10th November on hill cane crushed by them from the date of start up to 21st November.

SEEDS FIRM

(From Our Own Correspondent)

BOMBAY, 14th October

In a bid to promote exports of oils, oilseeds and oilcakes, the State Trading Corporation has proposed the establishment of a central organisation for canalising exports. Traders, however, have not been enthusiastic about such a move, though it envisages their association with the S.T.C. in matters concerning trade. Instead, they have decided to suggest the setting up of an Export Promotion Council. The Advisory Committee for Oils, Oilseeds and Oilcakes is currently discussing with exporters and others concerned the desirability of the latter proposal. In the meantime, the Committee which was appointed by the Board of Directors of the local Exchange, to investigate into the alleged delay in communicating to the trade the F.M.C. order to impose margin on groundnut oil December delivery, has submitted its report.

The Board is meeting tomorrow to discuss the subject.

During the week under review, firm conditions were witnessed in the oilseeds market, thanks to disquieting weather reports from the producing areas and fairly active conditions on the export front. Groundnuts were in the limelight. Unfavourable weather conditions in Gujarat and Saurashtra led to pronounced bull support and heavy short covering. Reports of sizable business in groundnut oil and oilcakes, particularly with the U.K. and countries of the Continent, induced further strength. In view of the growing strength of coconut oil, traders expect to realise higher prices for groundnut oil. Groundnuts touched a new peak of the season. February 1960 contract, which had wound up last week at Rs. 177.25, rallied to Rs. 181.37 on Monday. It, however, declined subsequently to close today at Rs. 179.75. Bold ready lost 50 nP over the week to touch Rs. 40 as a result of steady arrivals. Oil ex-mill, however, improved by 13 nP to Rs. 21.50, after fluctuating in a narrow groove over the week.

The linseed section, too, put on cheerful conditions. Linseed advanced, despite the margin, mainly on account of good business in oilcakes and also in oils. Reports of rising trend in world prices for linseed oil also led to some bull support. At the same time, offerings were limited. May 1960 contract rose by Re. 1.12 to Rs. 35.56, after fluctuating between Rs. 34.37 and Rs. 35.19 over the week. Bold ready closed firm at Rs. 35.12, as against Rs. 34.12 last week-end. Linseed oil made a smart rally by a rupee to Rs. 17.69.

The castorseed section moved up in sympathy with other seeds and oils. The undertone remained distinctly strong, particularly at the close of the week. Bright export prospects for castor oil led to good buying support. Some reports indicated that the U.S. will enter the Indian market for castor oil. Brazil, it is said, is not offering much competition in the U.S. market. Castorseed May 1960 contract closed distinctly firm at Rs. 166.62 today, after moving between Rs. 164.12 and Rs. 166.37 over the week. Ready Madras hardened by 38 nP to Rs. 32. Oil Commercial gathered 19 nP to Rs. 17.

The cottonseed section maintained a firm tendency on account of buoyant conditions in the cotton market. At the close, however, values drifted to slightly lower levels. Cottonseed February 1960 rose from Rs. 129.35 to Rs. 131 on Saturday. Although it continued to rule firm thereafter, it developed a sagging tendency today to close at Rs. 129.25.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	14-10-1959	7-10-1959	30-9-1959
Groundnut			
February 1960	179.75	177.25	174.50
Bold ready	40.00	40.00	41.00
Coromandel ready	40.00	40.75	41.00
Khandesh quality	40.00	40.75	41.00
Oil ex-mill ready	21.50	21.50	21.37
Railway receipts	21.15	21.25	21.12
Castorseed			
May 1960	166.62	164.25	163.50
Ready Madras	32.00	30.82	31.62
Ready Kanpur	30.50	30.25	30.40
Oil B.S.S.†	17.68	17.75	17.44
Oil commercial‡	17.00	16.81	16.50
Linseed			
May 1960	35.56	34.44	34.25
Bold ready	35.12	34.12	33.50
Oil ready†	17.69	16.69	16.56
Cotton seed			
February 1960	129.25	129.25	127.50
Niger seed	81.75	81.60	81.50
Kardhi seed	23.25	23.00	23.00

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
‡ All quotations for futures contracts are in terms of candy, except linseed, which is in cwt. A candy is 500 lbs., except in the case of cotton seed, for which it is 750 lbs. Spot quotations of seeds are for per cwt. and those for oil per quart.

FOODGRAINS QUIET

(From Our Own Correspondent)

HAPUR, 12th October

Quiet conditions were noted in the foodgrains market during the week. While wheat and rice were mostly stationary, coarse grains recorded a downward tendency. The pressure of good maize crop had been the main influencing factor. Rains received last week, though belated, were said to have done immense good to late *khari* crops and timely sowings of rabi crops would now be possible. The preparation of land for rabi sowings is in full swing and, in some areas, sowings of gram and peas have already begun.

Wheat at Hapur continued to rule quietly steady to be quoted on Monday at Rs. 17.62 for average quality and Rs. 18.75 for farm produce, while some superior quality was quoted up to Rs. 19.25 a maund. Daily arrivals in the open market were sparse, as, under the wheat levy scheme of the State Government, half of the arrivals has to be delivered to the Government at the controlled price of Rs. 13 to Rs. 15 a maund. Arrivals in the open market were reported to be about 100 maunds daily. Demand for wheat has gone down, as seasonal demand has been shifted to maize. Harvesting of paddy has nearly finished, but *munji* crop is still in the fields.

Rice continued to be steady. The rates were: *sela basmati* Rs. 32 to Rs. 35; *mainpuri* Rs. 24; *raimunia* Rs. 25; *ramajugyan* Rs. 24.50; *gadda* Rs. 22.

After an early fall, gram staged a recovery towards the week-end, due to revival of demand for seed purposes. Local stock was comfortable at about 50,000 maunds. Barley and *bejhar* ruled

(Continued on next page)

NEW PRODUCTS AND PROCESSES

Instant Food Powders

A NEW process, called "foam-mat" drying, for converting foods into high-quality instant food powders has been developed in the U.S. It involves whipping liquid food concentrates into a foam with the assistance of food additives, spreading the foam on a belt or tray, drying it in a stream of warm air, and, finally, compressing and crushing it into powder form. The process has been used to make powders of good colour and flavour from fruit juices, whole and non-fat milk, coffee, beef and chicken broth, and lemonade.

The fine structure of the foam created in the process is said to remain stable even when the dried form is compressed into pellets, so that the powders can be reconstituted readily with water. The foam-dried powders also are said to have the advantage of holding less moisture at a given relative humidity than spray-dried foods (such as ordinary powdered coffee) and, therefore, are less apt to cake than powders dried by other processes.

The amount of food additive needed to develop a satisfactory foam is reported to be equal to about 1 per cent. of the dry solids in the concentrate being whipped, and close control of foam density can be provided by careful adjustment of the quantity of additive and the amount of whipping.

Bottling Unit

Nearly 200,000 bottles of beer a day, equal to 330 thirty-six gallon barrels, can be filled on the new high-speed bottling unit at the Reading Brewery of H. & G. Simonds Ltd. of the United Kingdom. Automation is the keynote of the installation. As soon as used bottles arrive back at the brewery, they are automatically removed from their cases, washed, filled, crowned, labelled and repacked into cases which, in the meantime, have been washed in another section of the unit, without being touched by the machine operators. The new 60-head bottle filler can fill 400 bottles a minute.

Aluminum Trimming Bucket

The first three aluminum trimming buckets for ocean-going ships were recently delivered. They are applied in the loading of fine-coal. These modern aluminum trimming buckets—manufactured by DEMAG-Greiffabrik in Duisburg-Hamborn of West Germany—revolutionize the bucket construction. The main attraction is their extremely light weight: 30 per cent. lighter than the conventional type. This greatly simplifies trimming and searching during unloading operation. An aluminum trimming bucket with 4.5 c.b.m. loading capacity recently demonstrated the advantages in Hamburg harbour. It unloaded 3,270 tons of fine-coal in 26 hours. That means it worked with an average of 126 tons per hour.

Stiff Mesh For Designers

The Expanded Metal Company, Ltd., of Britain, have extended the range of mesh materials available to engineers and designers by introducing a high density polyethylene mesh. Produced in roll or sheet form, similar to metal mesh, it is made from Rigidex polyethylene supplied by British Resin Products and offers many distinct advantages. It has a very low specific gravity (0.96) and is thus only one-third the weight of a corresponding aluminium mesh, and less than one-eighth the weight of mild steel. In all thicknesses the mesh is flexible enough to be handled very easily, and in thicknesses above ½ in. it is sufficiently stiff to be self-supporting. The mesh has a comparatively high strength/weight ratio and is virtually indestructible. It is resistant to water, practically all chemicals, and to most oils, greases and solvents. The inertness of the polyethylene from which it is made means that very few substances will adhere to it even temporarily, and the mesh is thus very easy to clean. It has outstanding electrical properties.

The mesh can be used at temperatures of up to 100°C without significant distortion and can thus be sterilised in boiling water if required.

Electrodes for Resistance Welding

A Netherlands firm manufactures electrodes for resistance welding, both for spot, seam, projection, resistance butt and flash-butt welding. The chief functions of the electrodes during these operations are the supply of electric current and the transmission of pressure to the workpiece to be welded. Their principal properties should, therefore, be electric conductivity, heat resistance and hardness at elevated temperatures. The electrodes should have a long useful life and the purchase price should be economic. Dependent on the method of resistance welding to be used and the nature, shape and composition of the workpiece and the metal it is made of, both straight and bent electrodes of various copper alloys are made from round, square, hexagonal and flat bar material, forged blocks, discs and rings as well as castings. The field of application of these resistance electrodes is said to be very wide and covers cars, refrigerators, stoves, aircraft, metal frames, heating radiators, railway carriages, drums, enamelware, wire pams, tubes, etc. The firm manufactures and supplies on request both standardised electrodes according to British Standard (B.S. 907) or U.S. standard R.W.M.A. (Resistance Welding Manual) and electrodes according to users' own drawings.

Hot Spot Detector

A new device which can find, it is claimed, the hot spots in machinery, or in non-moving plant such as a high voltage cable, or materials carrying pipe line with exceptional sensitivity, has been developed in the U.K.

The device can detect hot localities in equipment which it is impossible to approach, or touch. It can be used in the case of electrical equipment, such as a cable, while the current is still turned on. This is achieved, as in the case of moving mechanical equipment, by focusing the joint, or part to be examined, on the window of the "bolo-meter" device. The equipment can also be used in situations where a high level of radioactive radiation is present.

Its operation depends on the detection of the changes in electrical resistance which are produced in a minute gold leaf strip when it is exposed to infra-red rays.

Heavy-duty Nylon Conveyor Belt

A new heavy-duty nylon-wetted conveyor belting developed by George Angus & Co., Ltd., a British Company, is claimed to be tougher and more damage-resisting than standard cotton belting. Ruptured and torn belt carcasses can be common occurrences for operators of stone and ore conveyors, with consequent loss of time, labour, and costs. The new nylon-wetted belting—the latest addition to a wide range of conveyor belting already being produced—has an exceptional resilience resulting from the strength of the nylon wet yarn. Twice the force that a cotton belt can sustain is needed to tear the new belting material. This means fewer stoppages for emergency repairs, less wastage of running time, with correspondingly high output.

MARKET REPORTS

(Concluded from previous page)

quiet in the absence of ready demand. Although maize arrivals in the market were not heavy—the average was 150 maunds daily—prices eased fractionally in the absence of demand which is being met in villages where large quantity has been retained by producers. Harvesting of *bajra* has also begun. Other grains were quiet to be quoted on Monday at: (in rupees per maund) gram 12.75 to 13; barley 12.75; *bejhar* 11.62; maize 11.12 to 11.75; *jowar* 12 to 14; *guar* 11 to 13; *bajra* 13.12.

Pulses ruled quiet during the week in the absence of new urges. Peas was not attracting good outside demand and local stock ran down by only three *khatties* during the week to 44 *khatties*. *Arhar* prices and local stocks were almost stationary. Crop prospects of *urd* and *moong* have improved following last week's rains. The final report of all-India production—in thousand tons—of *rabi* pulses is as follows:

Gram 6,826; *tur* 1,662; *urd* 172; *moong* 38; *massoor* 245; *peas* 711; *kuli* 73; *kismi* 226; and others 713—total 10,666, as against 8,117 last year.

Prevailing prices (in rupees) here were: *peas* *dara* 11.75; *farm* 12.50; *peas* *dal* 13.25; *arhar* 17; *moong* 16 to 18; *urd* 17 to 19; *massoor* 14.25 to 16; *arhar* *dal* 21.75 to 23.

BRITAIN'S LEADING JOURNAL FOR ASIA AND AUSTRALASIA

For Public Affairs Industry Business

FAR EAST TRADE

Forward-looking Indian concerns are now considering

'What can Far East Trade do for me?'

Every month FAR EAST TRADE brings news of developments in Asia and Australasia to influential readers in Government, in business, and in industry, throughout this vast area, as well as in Western Europe.

Besides being a unique advertising medium, it maintains an exceptionally wide coverage of events everywhere in the economic, technological, and industrial fields.

Confident that we are contributing to better understanding, we warmly welcome new readers.

MARKET GOSSIP

(Concluded from page 631)

individuals. A broad estimate of the position is given below:

	1959	1958
Opening stocks	873.6	990.0
Production (January-September)	3,677.0	3,689.0
Total supply	4,550.6	4,679.0
Exports (January-September)	509.0	455.0
Closing stocks (at the end of September)	3,992.1	3,334.8

The shipments of mill cloth are currently said to be running at an annual rate of 800 million yards. The actual exports from Bombay Port during the eight months ended August 1959 were over 394 million yards, as against 366.5 million yards in the corresponding period of 1958. This Port accounts for more than 90 per cent. of the cloth exported from India. The estimate of total exports of cloth from India for the whole of 1959 is placed at 709 million yards, which compares favourably with the 587 million yards shipped in 1958 but is much lower than the export of 840 million yards effected in 1957.

The slight revival of upward trend in cloth exports is in keeping with the general improvement in the world cotton textile trade. The latest report of the U.K. Cotton Board, released on the 6th inst., contains an encouraging review of the textile activity in several parts of the world. "The cotton industry throughout the world," it says, "is now well out of the recession. Reports from many countries mention better levels of activity, lengthening order books and, in some but not all cases, improved profit margins." According to the Board, the revival of business in cotton goods is underlined by a higher rate of output in Britain, Japan and the U.S. Commenting on the rise in exports from Britain recorded during the months of July and August, it observes that "there is some reason to hope there will be a further modest increase in shipments during the remainder of the year." The Board points to a similar improvement in other textile producing countries also.

Trend of Tea

Tea prices are now generally dearer than last year. In London, plain broken pekoe was quoted last week at 3s. 4d. per lb., as against 2s. 7-3-11d. in the corresponding week of 1958. Doars teas are said to be selling well and good plain teas are in demand. While good quality teas are much in demand, there is a shortage of such teas, because of the general decline in the quality of best Assam C.T.C. At the same time, the prices of the latter teas have fallen and the difference in prices between the top and bottom quality teas has narrowed down, as will be seen from the following table of prices fetched at the Calcutta auctions:

	30-9-1959	1-10-1959
Export sale.		
Clean B.P.	1.98 to 2.02	1.95 to 2.00
Plain B.P.	1.88 to 1.92	1.70
Plain Fanning	2.08 to 2.16	1.80 to 1.86
Medium B.P.	1.92 to 2.04	1.75 to 1.85
Medium Fanning	2.12 to 2.24	1.90 to 1.95
Best Assam C.T.C. B.P.	2.30 to 2.75	2.70 to 2.90
Best Assam C.T.C. Fanning	2.70 to 3.15	2.90 to 3.20

	29-9-1959	30-9-1959
Internal sale (Dust).		
Medium Dust	1.94 to 2.00	1.78 to 1.80
Medium Assam	1.90 to 1.94	1.82 to 1.84
Medium Assam C.T.C.	2.00 to 2.10	2.15 to 2.25
Best Assam C.T.C.	2.50 to 2.70	2.50 to 3.00

The fall in the quality of good teas and the lower prices fetched for them has pulled down the average price fetched for North Indian tea at Calcutta this season (so far) from Rs. 2.64 to Rs. 2.45 per lb. at export sales and from Rs. 2.03 to Rs. 1.99 per lb. at sales for internal consumption.

South India teas have fared well and prices, except of top quality, are ruling higher over the year, as will be noted from the following table:

	29-9-1959	30-9-1959
Export sale.		
Low medium	1.80 to 1.90	1.52 to 1.65
Medium	1.95 to 2.20	1.70 to 1.90
Good medium	2.15 to 2.50	2.00 to 2.20
Quality	2.65 to 4.15	2.75 to 4.25

The crop figures of main tea producing countries so far available indicate that the overall supplies this year may not show any big variation, though, as was pointed earlier, there is a distinct shortage of good quality teas of the kind which blenders need. North Indian tea output (from April to September 1959) is higher by 14.6 million lbs. at 398.9 million lbs. Production in Pakistan (during April to September) is 2 million lbs. more at 39.3 million lbs. British East Africa has also raised its output from 25.7 million lbs. to 28.8 million lbs. (during April to September) and Nyasaland from 16 million lbs. to 18.5 million lbs. The rise in production in all these countries has been more than offset, albeit by a slight margin, by the setback in South Indian output (during January-August) from 108.9 million lbs. to 92 million lbs. and in Ceylon tea from 285.9 million lbs. to 276.6 million lbs. in the same period. Production in Indonesia (during January-June) has also dropped from 49.8 million lbs. to 47 million lbs.

SURVEY

(Concluded from page 635)

vis-a-vis dollar countries; last July, the percentages were raised to 93 and 60, respectively.

And, third, France fully assumed its many obligations under the European Common Market Treaty.

The reforms were no doubt painful to put through. Reduction in the budget deficit to a level that could be financed safely out of savings normally offered on the market was found to be unavoidable. The deficit, estimated at about 1,200 million francs in drafts of the 1959 budget, had to be almost halved, because, in the Commission's estimate, the Government could raise at the most only 600 billion francs without recourse to inflationary financing. In view of the economic recession, the Commission could not recommend any reduction in capital expenditure, and military outlays proved irreducible. Cost of servicing of past loans and civilian expenditures could not be cut. The Commission had, therefore, no other choice than to recommend a drastic slash of economic and social subsidies which it called "the most onerous feature of French finances." And the axe fell heavily on subsidies. Simultaneously, measures were taken to increase Government revenue. Prices of coal, gas and electricity and rail travel were put up. Contributions to social security system were raised. In order to suppress inflation, all arrangements tying income to prices were outlawed, with the sole exception of the basic national minimum wage for the lowest paid workers.

The Commission, in submitting its programme of reconstruction, warned that it would be difficult to carry out and that, though some of its features could be modified, it would not lend itself to partial adoption. "One does not add-rebuild an edifice that is crumbling," it added. The Government summoned enough courage to implement it and it did so quickly.

The Letter draws the conclusion that France's successful economic stabilisation is yet another proof that confidence in a nation's currency can be restored with quick and conclusive results if a Government impresses upon its people that impending dangers are critical and that there is no way out except by exerting great efforts and accepting temporary sacrifices. The French experiment also proves that, to be fully effective, financial reforms should be accompanied by economic reforms.

DEVELOPMENT OF INDIAN RAILWAYS

(Concluded from page 646)

Operation efficiency of railways is also affected by the performance at break-of-gauge points, marshalling yards, terminal goods station yards, operating and engineering restrictions. Efforts have been made during recent years to increase capacities in these respects for quick utilisation of rolling stock and for avoiding transport bottlenecks and line congestion.

It will thus be seen that a number of factors affect operational efficiency and that even a minor factor may vitiate the operating results substantially. Goods traffic being the cornerstone of the nation's economic and industrial life, every effort should be made to foster its development. With a view to obtaining better utilisation, "Smalls" should be discouraged. Extension of nominated loadings will enable the railways to load full wagons, with resultant acceleration in transit and economy in wagon usage. Intensification of supervision and co-ordination of work will secure greater operating efficiency.

The achievements in recent years have doubtless been impressive and encouraging. But this success should not make the railway administration complacent. It should only be considered as the precursor of a new era of greater expansion and efficiency which the growing economy of the country must have for its success. There is still vast room for improving the functional efficiency and making economies. The administration has to work with more vigilance and efficiency to retain the confidence of the taxpayer and to safeguard the ever-increasing heavy capital investment on railways. In view of the vast gap between the demand for, and the availability of, resources, the emphasis on human efficiency and better management cannot be overdone. But then we must not forget one thing. The present capacity of the railways and the present types of equipment of the railways have already reached the point where the law of diminishing returns has begun to operate in certain spheres. Hereafter, much advance in operational efficiency would not be possible, except with a radical change in the methods adopted, such as large-scale electrification, doubling of track, modern systems of signalling, introduction of teleprinters, electronic devices, push-button cabins, centralised traffic control, and so on.

WEEK'S STOCK EXCHANGE TREND

THE following quotations indicate the trend of transactions on the Bombay Stock Exchange during the week ended 15th October, 1959.

other country has given loans repayable in local currency and on terms as favourable as those of the D.L.F.

The argument that, in terms of plant and machinery, know-how, etc., the dollar buys more outside the U.S. than inside can be easily overdone. The fact that India has not been able to use the Export-Import Bank loan to the same extent as the D.L.F. loan is there. At the same time, there are also the facts that the Government of India has not done its best to facilitate the use of this loan and that a similar situation exists in the case of credits given by other countries also, Japan and W. Germany providing striking examples. This country must try to use more of American goods, if it expects large assistance from the U.S. It is possible that the large-scale industrialisation envisaged in the third Plan will provide more opportunities to do so than the schemes under the second Plan. The chances will be better, if the private sector is given a more prominent place than is now contemplated by our policy-makers. There is sufficient evidence to support this view in the recently announced industrial projects as, for instance, the Hindustan Aluminium of Birlas, the Kilachand-Firestone synthetic rubber project, and the Mercks-Voltas pharmaceutical enterprise; quite a few more projects are in the offing. The public sector also can expand in combination with American capital, instead of confining the greater part of its attention and affection to the Communist bloc.

Spokesmen of the U.S. Government in India and Washington have sought to mollify the disappointment caused by the change in the lending policy of the D.L.F. by pointing out that it would help this country to get more aid from Western Europe. This explanation is somewhat far-fetched. As already stated, the U.S.'s desire to lessen its burden of foreign aid and to persuade Western Europe to take a leading part in world economic development is both understandable and justified. But the assumption that a mere tightening up of the conditions of its own aid to underdeveloped countries would induce Western Europe to render liberal aid to these countries is not convincing. It would be more true to say that the non-availability of D.L.F. dollars to be spent in Western Europe would make it difficult for that advanced region to sell plant and machinery and know-how to underdeveloped areas. It does not necessarily mean that the West European nations will try to overcome this difficulty by giving credit on liberal terms. They have not done so up to now. Although, for well over a year, European statesmen have been saying that underdeveloped nations should be helped, they have not matched their words with deeds. On the contrary, the European representatives who attended the Fund-Bank meetings were very lukewarm in their support to the establishment of the International Development Association and wanted the terms of its loans to be less liberal than those contemplated by its promoters. It is obvious that the Western countries need a lot more effective persuasion to be convinced that it is in their own interest to do for the underdeveloped countries what the U.S. did for them for repairing their war-shattered economies.

TARGET FOR STEEL

NOT only in India, but even in the West, the targets for steel industry and estimates of probable expansion in demand for steel do cause some controversy. Frequently, the best framed estimates go wrong, actual demand for steel either exceeding or falling below anticipated requirements. In India, the steel pendulum, after having swung from one extreme to another, is trying to readjust itself. At one time, the Government spokesmen bitterly complained, not justifiably, of course, that the demand for steel had been underestimated by the trade and industry. This was roughly at the time of the commencement of the second Plan. The country was shocked into a sense of new urgency about steel expansion, the second Plan envisaging an increase in steel output to six million tons (ingot). In fixing this target, the authorities seem to have felt that it was the minimum that should be aimed at and that the third Plan would see a more strident increase in demand. A target of 15 million tons under the third Plan was the vision conjured up by some spokesmen. But even steel could prove to be too much of a good thing. Second thoughts have pointed to a less ambitious target. The Government is now willing to set the target lower at 10 million tons.

The whole issue about the steel target for the third Plan and all the allied problems relating to its achievement were succinctly discussed by Mr. Jehangir J. Ghandy, the Director-in-charge of the Tata Iron and Steel Company,

Ltd., in the course of his address to the Rotary Club, New Delhi, last week. Elsewhere in this issue appears an article based on the address. Speaking with a knowledge and an authority which he derives from a devoted service to the cause of the industry, extending over a period of more than four decades, Mr. Ghandy stresses the need for some caution in the fixation of steel targets, for encouragement to self-financing by steel enterprises and for the creation of facilities for the rapid growth of steel-consuming industries in India. It is, of course, undeniable that the case for a larger increase in steel production rests on very solid economic grounds. After all, steel is the basis of industrial expansion. The per capita consumption of steel in India is only about 11 lbs., as compared with 1,237 lbs. in the U.S., 628 lbs. in the U.K. and 540 lbs. in Australia. Even a doubling of India's steel output will not make any appreciable difference to its status among steel-consuming countries. Further, in the last few years, India has had to spend large amounts of foreign exchange on imports of steel which would have been sufficient to establish more than one steel factory; in the past five years, it has spent over Rs. 300 crores on imports of steel. It has been computed that every additional million tons of steel produced in India to meet its growing domestic demand will help save about Rs. 62 crores of foreign exchange. These considerations will serve to indicate the significance of steel production to Indian economy.

It would, however, be wrong to over-emphasise the importance of steel to the exclusion of other equally vital sectors of economy. For it must be remembered that steel is among the most capital-intensive of industries. It has been computed that a steel enterprise will require about Rs. 80,000 of capital investment per worker, as against Rs. 15,000 for a large-scale consumer or producer goods industry and Rs. 3,000 for a reasonably productive small-scale industry. It will require Rs. 200 crores to set up a new steel unit with a million-ton capacity and about Rs. 100 crores to increase the output of an existing unit by one million tons. Obviously, a great deal of care must be exercised before the authorities commit the country to a too ambitious steel target which implies a liberal use of the admittedly limited capital resources. The balance of advantage lies in giving priority to expansion of existing enterprises over the establishment of new units. Since existing units, whether in the public or private sector, can expand only if they are allowed to make and plough back profits—Mr. Ghandy pointed out how 80 per cent. of the steel expansion in the U.S. steel units has been financed by retained profits—there is a case for according liberal treatment to them in the matter of fixing retention prices. Again, in fixing the target for steel, some estimate of the growth of demand for steel has necessarily to be made. It would appear that there is a difference in the estimates made by the National Council of Applied Economic Research and the Government; the former places the demand in 1963-66 at six million tons of finished steel and the latter places it at 7.3 million tons. No one could claim absolute infallibility for any of these estimates. But, if a choice has to be made, it is certainly better to go by a lower estimate, leaving the door open for the acceptance of the higher one at a later date. Mr. Ghandy was inclined to favour a lower target of nine million tons for the third Plan, as against the Government's 10 million-ton target. But, as he emphasised, whichever target is accepted, it will be safer and economically more advantageous not to adhere to it too rigidly but to "maintain an elasticity of approach."

What is, of course, more relevant to steel industry is that facilities must be created for the rapid expansion in steel-consuming industries. Mr. Ghandy doubted whether the engineering industry would be able to use the larger quantities of steel that might be produced, unless "it prepares itself to do so from now." This is, indeed, the crux of the steel problem in the near future. It is true that, if there is a surplus, India could export the surplus steel to foreign countries. But world production of steel is expanding, though there was a slight fall last year when output aggregated 260 million tons, as against 287 million tons in 1957; this fall was mainly due to the stagnation in the U.S. where production fell from 101 million tons to 76 million tons. Surely, India cannot compete with other steel-producing countries which have well-established steel industries and which are also in a position to offer attractive credit terms. Apart from this consideration, there is a real advantage in exporting steel manufactures rather than finished steel, in that the former earns three to four times more foreign exchange. It is, therefore, essential that steel-using engineering industries should be enabled to expand,

in order to meet domestic demand for their products as well as participate more effectively in India's export trade. It may be mentioned here that, in recent years, these industries have given evidence of considerable sense of export awareness. They will receive a powerful fillip if the basic raw material, namely, steel, is freely made available to them at attractively low prices. At present, the selling prices of some semi-manufactured steel products like bars and rods, are much higher than those in the U.S., the U.K. or Japan. A reduction in selling prices for steel would strengthen the economy of engineering industries.

A closely allied issue in determining the pace of expansion of steel production is the availability of technical personnel. It has been computed that a one-million-ton steel plant will require some 650 to 670 supervisory trained staff and about 6,300 operatives and skilled workers. At present, the steel plants in the public sector have undertaken schemes of technical training for their staff; arrangements have been made for their training in the U.S., the U.K., the U.S.S.R. and elsewhere. But it takes nearly ten years to make a tolerably efficient steel man. This consideration calls for two adjustments. In the first place, before new steel plants are planned, a careful assessment about the availability of trained men must be made. Secondly, some means must be found to retain the technological connection which the existing plants have established with their foreign principals until such time as Indians have been properly trained for the positions now occupied by foreign personnel. In the absence of such an arrangement, it may well become extremely difficult to run the enterprises efficiently once the foreign element in the staff is withdrawn after the expiry of the period of agreement which now governs the relationship between India and the foreign steel interests. This calls for early and prompt action.

LATE GENERAL MARSHALL

THE death of General George C. Marshall, in Washington last week, removes from the world scene an outstanding personality of our time. Born 78 years ago, General Marshall, who was the Chief of Staff of the world's greatest army in the world's greatest war, proved to be one of the most farsighted of the statesmen that were destined to leave an enduring mark in world history. Justly regarded as a soldier-statesman, General Marshall had a truly international humanitarian outlook, in keeping with the best traditions in American political philosophy. At the close of the World War II, General Marshall was among those Americans who realised that the war-shattered world economy should be promptly nursed back to normalcy and set on the road to recovery if peace was to have any real significance for the common man. Speaking at Harvard in June 1947, General Marshall said: "Our policy is not directed against any country or doctrine, but against hunger, poverty, desperation and chaos." He stressed that "the goal of American policy should be the creation of conditions in which free institutions can exist." It was in this spirit that he conceived the European Recovery programme, which came to be so appropriately associated with his name as to be known as the Marshall Plan. It may be recalled, not with any sense of fault-finding but out of a sense of loyalty to historical truth, that only the West European countries responded to General Marshall's initiative; the U.S.S.R. and under its influence, the entire Eastern Europe, refused to discuss a co-operative recovery programme.

The Marshall Plan has been the most significant turning point in world economic history. It enabled Western Europe to survive the ravages of World War II which, more than any other war in world history, had thrown world economy into a state of utter disrepair. Begun on 3rd April 1948, the Marshall Plan in four years of its life pumped into Europe over \$12,500 million worth of aid. Europe recovered fast under the economic blood transfusion on which the Plan meant for its economy. Between 1947 and 1957, the output of the countries of the Organisation of European Economic Co-operation increased from \$138 billion to \$234 billion. It is to the fillip given by the Marshall Plan that Europe owes its recovery which, in its turn, has been an important stabilising factor in the economic history of the post-war world.

The tributes paid to General Marshall's memory by the world's Press and leading statesmen are an index of the high regard in which he was held in all countries. Of him, it could be truly said that he was a man who was "first in war, first in peace." Although his war records may be forgotten, successive generations will gratefully acknowledge that the Plan he initiated was a distinctive contribution to the cause of the peace and prosperity of the world.

MARKET GOSSIP

THE upward trend in commodity markets has slackened, due to profit-taking by bulls. Movement of both cotton and groundnut crops has begun, resulting in a rise in supplies in some of the terminal markets. There is a feeling that the earlier estimates of damage to crops on account of floods and excessive rains at the tail-end of the monsoon were rather exaggerated. That may be so, but even the revised estimates of crops are not sufficiently encouraging. They are well below the country's requirements for both domestic consumption and export, so that, as the 1959-60 crop year progresses, the supply of cotton, oilseeds, sugar and foodgrains will fall short of the demand. It will not be wise, therefore, to assume that the coming months will witness an appreciable fall in commodity prices.

Although inflation in many parts of the world is under control, world commodity prices have been gradually moving up in recent months, because of the steady upward curve in industrial production. The West European countries, which, as a group, absorb more than one half of the raw materials and foodstuffs exported by the underdeveloped countries, are free from monetary problems and their recovery from the 1958 recession is being well maintained. The *Financial Times* index number of world commodity prices (base: 1st July 1952=100) stood at 82.33 on the 16th inst., as against 79.43 a year before. Thus, the world position also does not point to any setback in prices of primary produce.

Bullion prices in Bombay have established fresh all-time record high levels this week. Usually, on the eve of *Diwali*, the trend of bullion will be blighty upward, to be followed by a drop after the festival. The busy season for it really begins after the second week of January and ends in May or June, when the prices touch the peak level for the year. While the price curve may follow this pattern in the coming months also, the point to be noted is that prices have already touched very high levels, which are well above the previous highest peaks. This is the result of buying by some operators, who anticipate that, in the busy season ahead, the available supplies of gold and silver alike will not be adequate to meet the demand and that there may, therefore, be a further handsome rise in prices. It would not be surprising, if their surmise turned out to be correct, because all available indicators (vide page 615 of *Commerce* dated 10th October 1959) point in that direction.

There have been no new developments in the share markets. The high levels to which equities have climbed up are being well maintained, despite good profit-taking by bulls in a market believed to be bereft of short-sales. Over the week, the list is dominated by plus signs, even though the closing rates are lower than the highest levels witnessed earlier in the week.

British Bank Rate

The substantial rise in interest rates in the U.S., referred to in these columns last week, have so far had no effect on interest rates in Western Europe. The only effect it has had is to arrest some of the contemplated borrowings by continental countries in the U.S. Sales of foreign bonds in the U.S. amounted to \$1,000 million last year, but in the current year they have been running at less than half of that amount. With the pound sterling ruling firm and with Britain's balance of payments position comfortable, there are no signs that the rise in money rates in the U.S. is causing any strain on the U.K. There has been no outflow of hot money even during Election uncertainties. Now that the Conservative Party has been returned to power by an overwhelming majority, the confidence in the £ has been strengthened further. There is also no reason to believe, according to observers in London, that economic re-expansion in Britain will outpace the available resources. Reduction and reshaping of defence programmes is actually expected to yield surplus capacity in capital goods industries. The boom on the London Stock Exchange has caused no alarm among the authorities and is simply regarded as an index of investors' supreme satisfaction with the Tory victory in the hustings. If at any time consumer expenditure tended to rise to unhealthy levels, such could, it is pointed out, be checked through suitable controls on hire-purchase finance. In view of all this, there is no possibility of an increase in the British Bank rate in the foreseeable future. Even the "defensive increase" in the Bank rate which had been expected some time back, when North American money rates began to move up to levels well beyond those prevailing in London, is now considered as unnecessary.

du Pont-G. M. Alliance

An important decision relating to the ending of monopoly of one company in another by virtue of its shareholding in the latter without selling any of its holdings was given in Chicago recently by the Federal judge. The two companies involved were General Motors Corporation, the biggest manufacturer of automobiles in the U.S., and the E. I. du Pont de Nemours & Co., one of the largest chemical manufacturers. The du Pont Company holds 35 million shares of General Motors, an interest single holding representing a 23 per cent. interest worth \$3.5 billion. It is also the main supplier of paints and upholstery fabrics to the G.M.C. The two main issues before the Court were: (1) whether the du Pont's large holding in G.M.C. violates the Clayton Anti-Trust Act and

(2) whether the monopoly could be ended without asking du Pont to sell its holdings in G.M.C.

The U.S. Government's bid to end this "unholy alliance" between du Pont and G.M.C., both giants in their own fields, dates back to 1949. Its case was that du Pont's ownership of 23 per cent. of G.M.C.'s shares gave it a privileged position in respect of supplying paints and fabrics to General Motors and was, therefore, illegal under the Clayton Act, inasmuch as it tended to create a monopoly. It, therefore, suggested that du Pont should sell 43 million shares out of its holdings to the du Pont shareholders and that the balance should be sold to the public over a ten-year period. The Company (du Pont), however, contended that such large-scale release of shares would disrupt the market and hit many innocent investors in two ways. First, there would be a heavy depreciation in the value of both du Pont and G.M. shares. Secondly, the distribution of shares would be treated by the authorities as ordinary income for tax purposes.

The case was first dismissed by a Federal judge of Chicago in 1954. The Supreme Court, however, overruled the Federal judge's decision in 1957. By a four-to-two majority decision, the Supreme Court held that du Pont's acquisition was illegal under the Clayton Act. It added that, through its ownership of stock in the G.M.C., du Pont obtained an advantage in the market for automotive fabrics and finishes—90 per cent. of the Company's sales to the automobile industry are made to the G.M.C.—and that this tended to create a monopoly. The Court was of the opinion that du Pont did not acquire the position as the main supplier of these products through competition and that the original purchase of stock in G.M.C. was not intended to be a mere investment. The case was, therefore, sent back to the Chicago Federal District Court to order an equitable remedy.

The Supreme Court's decision came as a shock to business men in the U.S., in that it enabled the Government to take power to bring anti-trust suits against acquisition of large holdings of companies many years after it had taken place, if subsequent changes in trading conditions brought about a violation of the Anti-trust Act. In the case of du Pont, it may be noted, the Clayton Act was sought to be applied long after the Company had acquired the shares of G.M.C.

The Federal judge in Chicago, the same individual who had dismissed the Government's suit against du Pont in 1954, has now given the ruling that the du Pont can end its association with the G.M.C., without disposing of its holdings in the latter. The judge accepted the Company's contention that any large-scale sale of G.M. stocks would cause harm to the U.S. economy. He, however, ordered that du Pont should not exercise any voting rights on its holdings and that no du Pont family-holding companies could acquire additional stock interest in the G.M. The voting rights could, however, be transferred to du Pont's shareholders outside the du Pont family. He went further and added that "all preferential trade arrangements or understandings between du Pont and General Motors will be cancelled and they will be prohibited from entering into any such arrangements or embarking on joint commercial ventures so long as du Pont owns General Motors stock." It is stated on behalf of du Pont, that no preferential trade agreement exists between the two companies.

The aforesaid ruling of the Chicago Federal judge may be novel to the U.S., but not so to India, the Government of which also is strongly opposed to the creation of monopolies, albeit in the private sector only. As readers are aware, under the Indian Banking Companies Act, the voting rights of any one shareholder are limited to five per cent. of the total voting rights of all shareholders, even though he may hold more than five per cent. of the total number of shares. A similar restriction existed in the case of the Reserve Bank of India before it was nationalised. In the case of the State Bank of India, the voting right which a person, other than the Reserve Bank of India, can exercise is restricted to one per cent. of the issued capital.

Be that as it may, it would appear that the U.S. Department of Justice is not satisfied with the decision of the Chicago judge, for it is reported that it would go on appeal to the Supreme Court, again, against the ruling of the Chicago Federal Court.

Tokyo Session of G.A.T.T.

Much interest attaches to the fifteenth session of the Contracting Parties to the General Agreement on Tariffs and Trade (G.A.T.T.) which is scheduled to meet in Tokyo next week. Since the session is being held in Tokyo, Japan, which has reasons to feel aggrieved over the treatment accorded to it in recent years in respect of international trade negotiations, may be expected to make an attempt at convincing its visitors how wrong they have been in their estimate of its economy. Thus, it would certainly like to show that its industrial economy is no longer based upon low-paid labour. Again, the U.S. and Canada will certainly advocate the ending of discrimination against dollar goods, for which the rest of the developed countries are perhaps much better prepared now than they ever were in the post-war period.

Further, the circumstance which makes the Tokyo session an important one is that it is meeting against the background of significant developments in world economy, such as the emergence of the European Common Market, the proposed Little Free Trade Area, and the continuing expansion in world economy. There is no doubt that the re-

gional arrangements, like the Common Market, are a source of concern for all underdeveloped countries. The creation of a preferential market for the producers of raw materials who are associated with the Common Market countries is bound to affect the export earnings of the underdeveloped independent nations. The pace of economic expansion in these countries which has not been as rapid as in the industrially advanced countries, may conceivably be retarded by the impact of regional trading blocks. In this connection, it will be interesting to note what the Managing Director of the International Monetary Fund, Mr. Per Jacobsson, had to say on the problem of export earnings of underdeveloped countries. In the course of his statement to the annual meeting of the Board of Governors of the Fund, Mr. Jacobsson said:

"Over the last ten years, industrial production in the Western world has been expanding at a rate of almost 5 per cent. per annum, and the volume of imports of the industrialised countries by 6 per cent. On the other hand, the exports of the primary producing countries have risen in volume by only a little over 3 per cent. per annum, and the real value of these exports—in terms of their power to purchase imports—by just over 2 per cent. In a large measure, these developments have generally been the result of certain technical aspects of recent economic growth. Thus in the highly industrialised countries expansion of output has been heavily concentrated on more complicated manufactured goods, such as machinery, electrical goods, aircraft, etc., with a relatively low raw material content, which has limited the demand for raw materials. The more effective use of materials, perhaps most strikingly illustrated by the tin-saving process of electrolytic plating, has had a similar effect. In addition, the substitution of synthetics for raw materials, which has been rapidly spreading in many of the major branches of manufacturing, has been of great importance—the use of plastics, detergents, synthetic fibres, and synthetic rubber, to mention just a few. The immediate impact of these changes is no doubt unfavourable to raw material exporters, at least during a transitional period, but they are part of the technological progress of our times."

Mr. Jacobsson, of course, did not give way to any defeatist mood over the unsatisfactory trend in export earnings of primary producers. He insisted that these producers should solve the problem by introducing more effective methods of production, so as to retain their share in world markets. At the same time, he felt that the more highly industrialised countries had a contribution to make to the solution of the problem. They could sustain the demand for raw materials by maintaining their own economic programmes. Further, their tariff policy also had a relevance to the economic development of the underdeveloped countries. Referring to the tariff and protectionist policies in the industrialised countries, Mr. Jacobsson remarked:

"Their food production, often highly protected, has risen despite a decline in the agricultural population. Here is a field in which these countries could make an effort to dismantle a number of protectionist measures that are clearly harmful to the interests of the primary producing countries. . . . After all, Europe has benefited so much from the relatively low prices of primary products in the last three years that it might well extend some counter-benefits to the producers of these products."

Clearly, an expansion in the trade of underdeveloped countries will provide the necessary fillip to their development. To the extent the industrialised countries facilitate such expansion, whether through easing tariff restrictions or by other means, they will, therefore, be aiding the economic progress of the world as a whole.

Export Risks

The Export Risks Insurance Corporation, which was established on 4th October 1957 as a Government-owned company, has just completed two years. Export risks insurance, though well established in the countries of the West, is still a novelty in India. Exporters in this country have yet to develop sufficient export risks insurance mindedness to go in for coverage of risks. It is, therefore, too much to hope a pioneering institution like the Corporation to show striking and spectacular results in a short period. Apart from the teething troubles, which any organisation has invariably to face in the initial periods, there are also, in this case, the difficulties arising from the lack of understanding of the Corporation's role or from wrong impressions of its working. The Corporation cannot go out of its way to popularise the service it offers, because it is bound to work strictly on business principles. Moreover, it has to avoid scrupulously competition with general insurers and steer clear of the fields in which private insurers traditionally operate. The nature of the Corporation's business is also such that it cannot, so we are told, seek guidance from established credit insurers in countries like the U.K. or West Germany or draw upon their experience. Credit insurers throughout the world keep their underwriting principles and practices a strictly guarded secret. The Corporation has, therefore, to fall back upon its own ingenuity and keep its policies and methods under revision in the light of experience it gains in the course of its operation.

These factors should be borne in mind as one glances at the performance of the Corporation during the two years of its existence. It is heartening to note that, despite its many limitations, the progress of the Corporation has been very encouraging. In the second year of its working, what is, in the twelve-month period ended 30th September 1959, the Corporation issued 222 policies,

EQUITIES ERRATIC SELLING PRESSURE AT HIGHER LEVELS

(From Our Own Correspondents)

BOMBAY, 22nd October

A TWO-SIDED movement in prices was the main feature of trading on the Stock Exchange during the week under review. Early in the week, equities made further headway on strong bull support and heavy short-covering. End-of-account considerations did not have any dampening effect on the bullish enthusiasm. The cheerful tone was extended to the new account also which opened on Monday this week. Encouraging advices from Calcutta, where the market reopened on Monday after the *Puja* holidays, also aided sentiment and equity prices flared up to fresh heights. At higher levels, however, there was heavy unloading induced by apprehensions that the rules regarding margins on shares might be amended, with a view to checking excessive speculation. There was, therefore, a sharp setback in prices, which wiped out a good part of the earlier gains. Trading also thinned down during the last three days.

The highlight of the week's trading was again provided by Centurys which were very erratic. They shot up to a new high of Rs. 617 before coming down to Rs. 604 today. The earlier rise was a sequel to reports that the Company had plans not only to expand its existing lines of production but also to enter new fields, such as manufacture of tyre yarn, nylon yarn, caustic soda and cellophane paper. The details of the expansion schemes are given on page 680 of this issue. There were also renewed rumours that the Company had obtained sanction for its rights issue. The position was, however, cleared by the Company in the course of a communication to the Stock Exchange. It was stated that the Company had earlier applied for permission to issue new ordinary shares at par in the ratio of one share for every five existing shares. In reply to its application, the Government wrote to the Company to the effect that considering the high market value of the shares and the large financial requirements for its expansion programme, the Company should issue the shares at a premium. Accordingly, the Company revised its application and has sought the Government's approval for issue of rights shares of Rs. 100 each at a premium of Rs. 20 per share on the basis of two shares for every three existing shares.

In the steel section, Tata Ordinaries advanced from Rs. 164.75 *cum-div.* to Rs. 163 *ex-div.* (equivalent to Rs. 169.80 *cum-div.*) before reacting to Rs. 159.25 *ex-div.* today. The closing was done at Rs. 160. The Rights were done at Rs. 75.50. Indian Irons, picked up from Rs. 24.20 to Rs. 24.68, but heavy profit-taking pushed them back to Rs. 24.24 before they closed at Rs. 24.40.

Textile shares presented a mixed pattern. Bombay Dyeings finished with a loss of 30 nP at Rs. 68.90, after scaling up to Rs. 69.80. As stated earlier, Centurys shot up to Rs. 601 to Rs. 617 before drifting lower to Rs. 604. At the close, however, there was a mild recovery to Rs. 608. Kohinoors finished a fraction higher at Rs. 317.50 after fluctuating between Rs. 329 and Rs. 315. Central Indias lost Rs. 2 to Rs. 113, while Finlays held ground at Rs. 306. Indu Ordinaries dipped from Rs. 11.40 to Rs. 10.72 and Khatus from Rs. 271.25 to Rs. 267.59. Morarjees were unchanged at Rs. 270. After a rise from Rs. 176 to Rs. 180, New Greats closed lower at Rs. 178.50. Shree Niwas Cottons were marked up by Rs. 10 to Rs. 238 and Simplex by Rs. 150 to Rs. 160.50.

In the sugar section, Belapurs were erratic moving between Rs. 339 and Rs. 330. The closing was, however, done at Rs. 335, a rise of Rs. 3 over the week. Phaltans gained Rs. 2 to Rs. 183, while Walchandnagars, reacted from Rs. 331.25 to Rs. 326.25 and Maharashtra Sugars from Rs. 269.50 to Rs. 252.50.

Among cement shares, Associated Cements staged a good recovery from Rs. 152.75 to Rs. 158.50, but a part of the gain was shed when the shares closed at Rs. 154.50. Digvijays were lower by Rs. 2.75 at Rs. 144.50. Orissa Cements were placed at Rs. 13.52 *ex-div.*, as against Rs. 16.40 *cum-div.* (dividend Rs. 1.50). Dalmia Cements gained a fraction to Rs. 10.12 *ex-div.*, as also Jaipur Udyogs to Rs. 10.20.

Wide fluctuations marked the trading in Tata Locomotives in the engineering and mining group. After a sharp rise from Rs. 206 to Rs. 211.50, the shares quickly reacted to Rs. 209 at the close. Alcock Ashdowns were marked down by Rs. 2 to Rs. 258. Premier Constructions suffered a fall of Rs. 12 to Rs. 375 on rumours that the capital reconstruction scheme of the Company might be postponed. Larsen and Toubros recorded a rise of 10 nP to Rs. 22.92 and Mahindras looked up by 12 nP to Rs. 22.32 on reports that the Company had received sanction from the Government for its scheme to manufacture British tractors in collaboration with David Brown. Structural Engineering shot up by Rs. 6.25 to Rs. 241.25. Cooper Engineering advanced by Rs. 2 to Rs. 170. Shivajis were steady at Rs. 90 and Indian Coppers at Rs. 394.

Scindias rallied early in the week from Rs. 17.32 to Rs. 17.68, but soon reacted in consonance with the general trend of the market to Rs. 17.36. Great Easterns were quiet at Rs. 19.80, while Bharat Lines gained a fraction to Rs. 30.60. Among automobiles, Hindustan Motors was a shade better at Rs. 13.98 while Premier Automobiles lost Rs. 3.75 to Rs. 122.

In the miscellaneous group, Bombay Burmahs (old) shot up from Rs. 548 to Rs. 565 before reacting to Rs. 551.50 today. At the close, however, there was a mild recovery to Rs. 558. The Partly-paid gained over the week Rs. 4 to Rs. 194. National Rayons fluctuated widely between Rs. 393.50 and Rs. 382 and closed at Rs. 385. Gwalior Rayons gained 30 nP to Rs. 25.30. Chemicals and Dyes continued to be hot favourites. Tata Chemicals were well supported on encouraging reports about the current year's working and shot up by Rs. 1.04 to Rs. 18.36. Alembics added Rs. 2 to Rs. 193. Following the commissioning of the new electrolytic caustic soda factory near Tuticorin, South India, Dhrangadhra Chemicals were keenly sought for. As a result, they soared from Rs. 135.25 to Rs. 178. Polychems scored a smart gain of Rs. 11 to Rs. 174. Dharamsi Chemicals recorded a rise of Rs. 25 to Rs. 175. Amar Dyes rallied from Rs. 231 to Rs. 255 and Colour Chems from Rs. 223 to Rs. 240. Tata Oils were quiet at Rs. 64 and Ceat Tyres at Rs. 180. Khandelwal Ferro Alloys were well favoured and rose by Rs. 4 to Rs. 70. West Coast Papers were done Rs. 8 higher at Rs. 162.50.

Madras Stock Exchange

MADRAS, 21st October

For the third week in succession, the Madras Stock Exchange witnessed distinctly cheerful conditions. The turnover, however, was small, as floating stocks continued to be scarce. Operators were inclined to take an optimistic view of the prospects for industrial expansion. Textiles were in the limelight, with values of selected scrips recording considerable gains. This was mainly the result of encouraging reports from the piecegoods and yarn markets. Tea shares were also well supported on reports of fairly intense activity for teas at Cochin auctions. Coffee shares moved up, particularly in view of the prospects for industrial expansion, the face of higher prices ruling in the market. Sentiment in the rubber section was buoyant. Among miscellaneous industrials, cements, chemicals and paper were quite active. Sugars elicited good support on reports that the Government of India proposed to introduce some incentive schemes for expanding production. Towards the close, however, there was some profit-taking, especially in sugar scrips, and the closing rates were well below the best levels seen during the week.

In the sugar section, Cauverys evoked good enquiries, the net rise over the week being Rs. 5.00 to Rs. 133. E.I.D.s rose by a rupee to Rs. 43.25. At one time it was as high as Rs. 43.50. United Breweries were higher by 50 nP at Rs. 463.50. Travancore hardens by 25 nP to Rs. 12.25. Deccans gathered 10 nP to Rs. 12.95. K.C.P.s were fully steady at Rs. 17, as also Indias at Rs. 13.13.

Among teas, Coonoors made headway by 50 nP to Rs. 23.75. Parkside were marked up by 45 nP to Rs. 25.25 *cum-div.* The Directors of the Company have declared a final dividend of 20 per cent. taxable, making a total of 27½ per cent. for the year ended June 1959, as against 25 per cent. tax-free in the previous year. Oucherionys improved by 10 nP to Rs. 5.55 and Nelliampathys by 9 nP to Rs. 3.09. Blue Mountains picked up 6 nP to Rs. 3.43. Periakaramalais and Chembrus were higher by 2 nP, the former at Rs. 3.97 and the latter at Rs. 3.74. But Nonsuch Teas lost 6 nP to Rs. 28.75. Peermades were unchanged at Rs. 17.50 *cum-div.* The Company has announced an interim dividend of 7½ per cent. taxable for the current year. Among coffees, Coffealands spurred by Rs. 2.00 to Rs. 26.12. Consolidated Coffees scored a gain of a rupee to Rs. 23.50. Anaparas improved by 20 nP to Rs. 9.35. Cowoodys were higher by 15 nP at Rs. 6.35. Ossors, Wartybullys and Balmadies were fancied at Rs. 4.00, Rs. 4.03 and Rs. 3.00, respectively. In the rubber section, Cochin Malabars advanced by 20 nP to Rs. 6.80. Highlands rose by 15 nP to Rs. 14.15. Rajagiris put on 10 nP to Rs. 18.80.

Metalls were the brightest spot in the textile section; they jumped up by Rs. 13 to Rs. 400. Coimbatore Pioneers were Rs. 10 higher at Rs. 340. Buckinghams advanced by Rs. 8.50 to Rs. 205. Vasantas advanced by Rs. 7.00 to Rs. 240. Loyals improved by Rs. 2.00 to Rs. 32. Kotharis were higher by 53 nP at Rs. 11.65. Rajalakshmis by Rs. 1.50 at Rs. 71.50 and Cambodias by 5 nP at Rs. 11.30. Cannanores were unchanged at Rs. 165 *cum-div.*, an interim dividend of 8½ per cent. for the year ending March 1960 has been announced by the Directors of the Company. Maduras gradually improved by 35 nP to Rs. 29.75.

In the miscellaneous section, Western India Plywoods attracted enquiries and rose by Rs. 3.00 to Rs. 240. Mysore Papers improved by 47 nP to Rs. 22.62. Aluminium Industries were marked up by 42 nP to Rs. 22.60. Travancore Cements were higher by 15 nP at Rs. 10.45. F.A.C.T. and Mysore Chemical Fertilisers hardened by 10 nP each to Rs. 9.35 and Rs. 10.80, respectively. Textools, however, sagged by 75 nP to Rs. 198.75. Spencers dropped 5 nP to Rs. 19.85. Ashok Leylands closed steady at Rs. 7.83 and so also Indias Cements at Rs. 6.63.

NEWS IN BRIEF

A BAN on forward trading in camphor has been imposed by the Government of India with effect from the 20th inst.

Exports of copper sheets, circles, strips and plates to all permissible destinations will be licensed freely without any quantitative restrictions till the end of September 1962.

The Government of India has decided to launch a prize bond scheme on the pattern of British Premium Bonds for the purpose of stimulating small savings. The scheme is expected to be introduced with effect from 1st January 1960.

The Government of India has approved of the terms of Rolls-Royce for the establishment of a plant to manufacture Dart aero engines in this country. The Dart engines are expected to power the Avro 748, proposed to be manufactured in India shortly.

A standard agreement has been signed between the representatives of the Government of India and the U.N. Special Fund, embodying the conditions under which the Fund will extend financial assistance for development projects in this country.

The National Newsprint and Paper Mill, Nepalnagar, Madhya Pradesh, is expected to achieve its production target of 100 tons of newsprint per day within the next few months, according to its Managing Director, Mr. S. K. Visvanadhan. Its production in 1958-59 was 22,000 tons of newsprint, as against 14,000 tons in the previous year.

The Union Home Minister, Mr. Govind Ballabh Pant, has asked Government offices not to make recruitment for any additional or new work during the current Plan period. The only exception is to be made in the case of experts and specialists. Otherwise, no further expansion in administrative and ministerial posts should be made.

In order to extend further relief to small-scale producers in the match industry, the Government of India has enhanced the rebate on general excise duty admissible to B, C and D categories of manufacturers by 3 nP, 6 nP and 9 nP per gross, respectively, for the 80s size of match boxes, and by 2 nP, 4 nP and 6 nP per gross, respectively, for 40s size of match boxes.

The joint Indo-American team (Chairman: Dr. M. S. Randhawa) set up by the Government of India to evaluate the progress of work in agricultural education, research and extension, and to submit supplementary recommendations on these for inclusion in the third Plan, held its inaugural meeting in New Delhi on Monday the 19th inst. The team is expected to submit its report by December next.

The Kerala Administration has asked the Registrar of Co-operative Societies in the State to enquire into the complaints of misappropriation of funds of Labour Contract Societies, set up by the Communist Ministry. There are 42 Contract Societies at present almost all of which are said to be Communist-controlled. It is alleged that many of the contracts given to these societies were not executed at all.

According to the export policy announced by the Government for the export of raw wool for the six-month period ending March 1960, licences will be issued to all categories of shippers on shipping bills on a first-come-first-served basis on production of contract and certificate of "Amark" grading. No shipper will be permitted to export more than 100 bales from all ports. Shipping bills will be made valid for 15 days from the date of issue; no extension will be granted for them.

A wool processing centre is expected to be commissioned from early next year at Vinnamangalam, North Arcot district, Madras State. The centre, a joint venture of the State Governments of Madras and Mysore, will cost Rs. 13 lakhs. The plant will have an initial capacity for processing 2,400,000 lbs. of wool per year; the capacity will later be expanded to 3,600,000 lbs. It will supply standard quality wool for the manufacture of druggs, mainly for export.

The Oil and Natural Gas Commission has become a statutory organization, in accordance with the Oil and Natural Gas Commission Act 1959, passed in the last session of Parliament. Mr. K. D. Malaviya, Union Minister for Mines and Oil, has been appointed part-time Chairman with Mr. P. C. Bhattacharya and Mr. A. M. N. Ghosh as members. The Commission, it may be recalled, was set up initially as a Directorate under the then Ministry of Natural Resources and Scientific Research in August 1956.

With a view to promoting exports of art silk fabrics, the Central Government has decided to issue advance licences for the import of yarn for the manufacture of cloth for exports. The licences will be issued up to a maximum value of Rs. 1,000 per registered export loom to be adjusted in four equal quarterly instalments against export entitlements earned by the licences. In case of failure to earn the required entitlements by way of exports of cloth, the yarn imported against these advance licences will be adjusted from the licensee's quota for import of art silk yarn as actual users or from allocations of indigenous yarn.

An official team, led by Mr. D. Sandilya, Managing Director, State Trading Corporation, has left New Delhi for Tokyo. The team will negotiate the price of the current year's supply of iron ore from Japan. Under the contract signed two years

ago, India is to export seven million tons of iron ore over a five-year period and the price is to be negotiated annually. The team will also explore the prospects for augmenting India's exports of manganese ore and coal to Japan. The possibilities of importing fertilisers from Japan in exchange for Indian goods will also be examined by the team.

The entire quantity of 27 million cubic yards of earthburden over the lignite reserves at Neyveli, Madras State, is expected to be removed by the end of March 1961. The earthmoving operations were inaugurated by the Prime Minister in May 1957. The integrated Neyveli Lignite Project envisages the mining of 3.5 million tons of lignite per annum and processing and utilisation for the generation of 250,000 kw. of electricity, the production of nitrogenous fertilisers in the shape of urea with a fixed nitrogen content of 70,000 tons per annum and the briquetting and carbonisation of the remaining output to produce 380,000 tons of carbonised lignite briquettes per annum for domestic and other purposes. The mining part of the integrated project is estimated to cost Rs. 16.90 crores.

A scheme proposed by the Tea Board for the grant of subsidies to the tea gardens in Cachar and Tripura for meeting a part of the cost of transport and fertilisers has been sanctioned by the Central Government. This is expected to reduce the cost of production of common teas and improve their competitive ability. The amount of subsidy will be Rs. 1.58 per maund for transport of teas by rail from Cachar, while for transport by river, the amount will be 61 nP per maund. Tea gardens in Tripura will be given a subsidy of Rs. 3.68 per maund for transport of tea by air. The subsidy sanctioned towards meeting the cost of fertilisers will be Rs. 122 per ton of sulphate of ammonia. The subsidy will be available for tea gardens of 300 acres and below in Cachar and Tripura. The scheme will be initially for a period of one year.

An official Bill, which seeks to fix a ceiling of 30 acres on irrigated land and 90 acres on hilly land for a family of five persons, has been circulated among the members of the Bihar State Assembly. When the number of dependents of the landholder exceeds four persons, an additional one-fifth of the ceiling area will be allotted to each additional member, subject to a maximum of three times the size of the ceiling area. The ceiling will apply to all lands held by a person either as an owner or usufructuary mortgagee or a tenant or in such capacities. The surplus land will vest in Government free of all encumbrances. Compensation will be payable in cash or transferable bonds or partly in cash or partly in bonds, they will carry interest at 2½ per cent. and be repayable after a period of twenty years. Where the surplus land is tenanted, 75 per cent. of the compensation will be paid to the owners, the balance being given to the tenant.

From Abroad

World consumption of natural rubber is expected to exceed production by 60,000 tons to 2,080,000 tons in 1959, according to the U.S. Natural Rubber Bureau.

A team of seven cotton goods importers and manufacturers of West Germany visited Hong Kong last week and signed separate contracts for substantial quantities of garments made there.

The U.K. was the leading exporter of automobiles into the U.S. during the first eight months of the current year, accounting for 148,366 vehicles valued at \$183.5 million.

The English Electric has developed a new automatic transcribed data-processing system, known as KDP 10, which will be ready for delivery by the middle of 1961.

An expert committee appointed by the Government of New Zealand has recommended the adoption of decimal coinage, with an upper unit equivalent to 10s. in that country.

The U.K. International Plastics has completed the delivery of the £14-million Russian contract for two automatic plants, one of the first big Anglo-Soviet trade deals. The plants will manufacture "particled wood"—a man-made wood product converted automatically from timber residue.

The Pakistan Government has appointed a Company Law Commission to examine the existing Act and suggest modifications to safeguard the interests of investors. The move follows the Government's offer of attractive terms to prospective investors in Pakistan.

Steel production in the U.K. rose in September 1959 to a weekly average of 426,400 tons from a weekly average of 337,100 tons in August and 368,800 tons in September 1958. Steel production has now risen to within about three per cent. of the figure for September 1957, which was the highest September figure on record.

The Research Division of the U.S. Atomic Energy Commission has awarded a contract to the Lockheed to conduct basic studies on the properties of atomic nuclei. This is the first nuclear research contract the Commission has granted to an industrial laboratory. It has previously restricted this type of research contract to universities and non-profit concerns.

A contract for an "address reader," an automatic device that can sort more than 10,000 letters an hour, has been awarded by the Postmaster General, Detroit, in the U.S. The device will be

PERSONAL

MR. G. L. Mehta, Chairman of the Industrial Credit and Investment Corporation of India, has returned to Bombay after his visit to the U.S. and West Europe.

Mr. Framroze Jehangir Guzdar has been elected Vice-President of the Bombay Stock Exchange in the place of Mr. Bhaidas Maganlal who passed away recently.

Mr. S. K. Patil, the Union Minister for Food and Agriculture, is scheduled to leave for Rome on the 27th inst. to attend the F.A.O. conference there beginning in the first week of November.

Mr. J. R. D. Tata, Chairman, Messrs. Tata Sons Ltd., returned to Bombay on Tuesday this week, after attending the annual meeting of the International Air Transport Association held at Tokyo.

Mr. A. K. Chanda, Comptroller and Auditor-General of India, returned to New Delhi on the 17th inst. after an inspection tour of Indian Embassies in the U.S.S.R., the U.K., the U.S. and Japan.

Mr. A. S. Rao, Member of the Forward Markets Commission, has been appointed Chairman of the Commission, vice Mr. W. R. Natu whose services have been loaned by the Government of India to the U.N. Food and Agricultural Organisation.

able to recognise, through its character-sensing apparatus, typewritten, printed or imprinted addresses almost anywhere on the facing of envelopes of any size. It sorts the envelopes into separate lots for a minimum of 40 destinations.

The British Board of Trade has announced its plan for disposing of 100,000 tons of rubber from the U.K. stockpile. The maximum tonnage of rubber to be disposed of in any month will follow a scale based on the price realised for the rubber. The minimum price under this scale is 25½d per lb. Meanwhile, the U.S. General Services Administration has also started selling rubber from its stockpile. It is reported that it has plans to sell 12,000 tons of rubber.

The Government of Thailand is reported to have entered into an agreement with the Fuji Company of Japan for the construction of an oil refinery in Thailand, with a daily capacity of 5,000 barrels of refined products. The cost of the refinery is estimated at \$20 million. French banks have granted loans to the Japanese Company, which will import French machinery and equipment for the purpose. On completion, the refinery will be operated by the Thai Ministry for Defence and its cost will be repaid to the Fuji Company at the rate of \$4 million annually.

An important project for research in the economic history of South-East and East Asia has been launched by the London School of Oriental and African Studies. Its object is to expand the knowledge of economic trends in the region over the past 150 years, and also to train a number of Western scholars in this important branch of Asian studies. Dr. D. C. Cowan is directing the project. In 1961, the School hopes to hold a study conference of Western and Asian specialists in this field. The Ford Foundation has made available a grant to cover the first three years' work.

The U.K. Government has decided to abolish the restrictions on the amount of foreign currency British travellers can take abroad, with effect from the 31st inst. Since 1957, British travellers have been allowed to take only £100 in foreign currency when travelling overseas. Under the modified system, everybody will automatically be permitted to take up to £250 in foreign currency abroad. If any additional amount is required, it will be authorised by the Bank of England if an application is made through banks. This check is intended mainly as a protection against unauthorised export of capital. Children, who have been entitled to only 10 per cent. of the basic adult allowance hitherto, will now get treatment as adults for this purpose.

New B.O.A.C. jet services to Australia will start from 1st November. The service will operate five times a week each way—one more service than provided by the Britannias which the Comets succeed. The outward-bound flight to Sydney from London will take 33 hours 15 minutes, a saving of over 15 hours, and to Melbourne 35 hours 40 minutes, a saving of nearly 10½ hours. Among the points served by the services during the week will be Darwin, Djakarta, Singapore, Kuala Lumpur, Bangkok, Rangoon, Calcutta, Colombo, Bombay, Karachi, Bahrain, Teheran, Beirut, Istanbul, Rome, Frankfurt and Zurich. The services are being provided in partnership with Qantas the Australian airlines, which will operate three services with the Boeing 707, making a total of eight jet services a week.

The West German Government proposes to modify the existing company law to prevent concentration of industries. The system of turnover tax is also expected to be changed. A draft Bill on the subject stipulates, among others, that shareholders should be given better information on their company's links with other companies and that detailed reports on the business of the concerns as a whole, and not merely of individual companies, should be published. According to Prof. Erhard, W. German Economic Minister, (i) half the country's coal capacity is at present controlled by the steel industry, (ii) three important oil and carbon chemistry concerns are controlled by coal companies and (iii) the electric power companies control 90 per cent. of W. Germany's lignite capacity.

GRAND OPENING NIGHT
Saturday, 9th Nov. 1878

In the same year when Mr. Dave Carson was touring the country with his amazing company, the famous The "Three Castles" cigarettes were first introduced.

In 1958, they came out in the flip-top 20's packet, changing their looks with the times. The "Three Castles" are as modern today as they were 80 years ago—and as satisfying.

WILLS' "The Three Castles"
famous for over 80 years.

Issued by The Imperial Tobacco Company of India Limited.

ELECTRIC POWER IN E.C.A.F.E

THE pace of economic development in Asia will depend, as in all underdeveloped regions, on the availability of electric power at low rates. In recent years, there has been a commendable emphasis on power development in the region. Last year, about 1,665 megawatts of power capacity were added to the region's electric power supply, bringing the total at the end of the year to 22,029 megawatts. Many new schemes of power generation have been taken in hand. And, when they are completed, power supply will be considerably augmented. It has been estimated that, by 1963, the installed capacity in the region will rise to 35,767 megawatts, at which level it will represent a cent per cent increase over the position in 1955. Since what the region needs is not merely increased power supply but the supply of power at attractively low rates which will stimulate its consumption, the sub-committee on electric power of the U.N. Economic Commission for Asia and Far East (E.C.A.F.E.) has done well to recommend measures which will keep the costs of generation and distribution of power to a minimum. The sub-committee, which concluded its seven-day deliberations in Tokyo last week, discussed such issues as power development in the region, rural electrification, standardisation, voltages and cost of power generation.

Appropriately enough, rural electrification figured prominently in the sub-committee's discussions. After all, the E.C.A.F.E. region consists essentially of villages, where the major portion of the population lives. It is of the utmost importance that they should be encouraged to use power for domestic purposes as well as for irrigation and for setting up small or large industries with agricultural base. The pace of use of electric power in the rural sector is now hampered by the cost of power. The large financial outlay required for rural electrification and the comparatively poor return in the shape of direct revenues have been the chief obstacles in this field. Perhaps, the grant of some subsidy is an inescapable element in any scheme of rural electrification in the initial stages of its development. Only efforts could and should be made to keep down the "subsidy" element. But the fact remains that not all countries are in a position to grant subsidies, though they realise the immense significance of electrification of rural areas to their agricultural economy and living standards. The present uses of electricity in Asian villages are largely confined to the lifting of water from open wells, tube-wells, tanks and rivers for irrigation and to the processing of agricultural produce. It is recognised that, in order to ensure the success of electrification schemes, the rates which can be considered economically acceptable for rural areas will have to be very low, at least in the initial stages.

The problem of reducing the cost of power distribution should be tackled through the use of cheaper materials in the place of heavier and costlier equipment. In this connection, Mr. V. Nyun, Executive Secretary of E.C.A.F.E., did well to point out how the increased use of wood poles for distributing power in place of steel poles will be a great economy and also help conserve the much needed foreign exchange for other essential purposes. The region, as is well known, is rich in timber resources. It should, therefore, be possible to cut down transmission costs through the use of wood poles. The sub-committee generally endorsed the report of the Working Party on rational utilisation of wood poles for power and communication lines and recommended that the Commission should arrange to collect from time to time additional information on the methods of design and construction of transmission lines and other technical data relating to wood poles and make this information available to other countries of the region.

Two other issues which were discussed by the sub-committee were standardisation of voltages and technical personnel. It was recognised that, while standardisation was necessary in all branches of engineering and industry, it was of particular significance to electrical technology. The standards recommended by

the International Electrotechnical Commission, it was stated, could serve as a useful guide in formulating national standards in Asia. In particular, the sub-committee recommended that Asian countries should prefer 220-240 V. single-phase range to 110-120 V. single-phase. As regards technical personnel for the generation and distribution of power, the sub-committee suggested that the E.C.A.F.E. countries should seek the assistance of the U.N. Special Fund for making available expert services. Although the assistance given by the Fund will go a long way towards solving the problem of personnel in some of the more economically backward countries of the region, efforts should be made in the direction of improving and extending the technical education facilities in these countries if a permanent solution is to be found.

THREE SUPREME COURT DECISIONS

The Supreme Court delivered last week three judgments which are of considerable interest to management and labour. One of them related to the question of payment of gratuity and retrenchment compensation to workmen, another to retirement age, revision of gratuity scale and the power of a tribunal to alter a uniform practice obtaining in an all-India concern to suit local conditions, and the third to illegal strikes. In brief, the Court held that workmen were entitled to the double benefit of gratuity and retrenchment compensation, as they were based on two different concepts, that a tribunal was justified in changing a uniform practice obtaining in an all-India concern to suit local conditions, and that illegal strikes, howsoever good and valid the reasons behind them, could never be justified.

The first question, namely, whether a worker was entitled to both gratuity and retrenchment compensation, came up for decision in an appeal preferred by the Indian Hume Pipe Company, Ltd., Bombay, against the decision of the Industrial Tribunal, Bombay. The dispute originated from a notice of the workmen to the Company terminating an earlier agreement of 1951 and demanding gratuity at a higher rate. The Company held that no gratuity was payable to the workmen who would be entitled to receive retrenchment compensation under Section 25f. of the Industrial Disputes Act. This contention was rejected by the Tribunal which held that the workmen were entitled to claim both gratuity and retrenchment compensation.

The Tribunal's award was upheld by the Labour Appellate Tribunal. The Company thereupon went in appeal to the Supreme Court. The principal point for decision by the Court was whether a scheme of gratuity could be framed by Industrial Tribunals for workmen

who were entitled to the benefit of retrenchment compensation. The Court held that the concept on which the grant of retrenchment compensation was based was essentially different from the concept on which gratuity was founded and, therefore, the workmen were entitled to the double benefit of a gratuity scheme as well as the statutory retrenchment compensation.

In the second case relating to retirement age and revision of gratuity, the appellant company, namely, the Dunlop Rubber Company (India) Ltd., contended that it had fixed the age of retirement at 55 and had introduced a gratuity scheme according to an agreement with the clerical staff and other workmen at the Calcutta unit of the Company who formed a large majority of its total staff. It was argued that a scheme enforced under an agreement with a majority of workmen should not be changed at the instance of a small minority of workmen in Bombay who had raised the dispute in the case on appeal. It was also argued that, in an all-India concern, the conditions of service in all its units should be uniform and should not be disturbed in one unit by a tribunal.

In his judgment, Mr. Justice Wanchoo, rejecting the Company's contention, observed:

"Industrial adjudication in India is based on the industry-cum-region principle. However desirable uniformity may be in the case of all-India concerns, the Tribunal cannot abstain from seeing that fair conditions of service prevail in the industry with which it is concerned. If, therefore, any scheme, which may be uniformly in force throughout India in the case of an all-India concern, appears to be unfair and not in accord with the prevailing conditions in such matters, it would be the duty of the Tribunal to make changes in the scheme to make it fair and bring it in line with the prevailing conditions in such matters, particularly in the region in which the Tribunal is functioning, irrespective of the fact that the demand is made only by a small minority of the workmen employed in one place, out of the many where the all-India concern carries on business."

In the present case, the Court examined the judgment of the Industrial Tribunal and found that it had made the alterations in the scheme only after a careful consideration of the practice prevailing in the region. It, accordingly, held that there was no reason to interfere with the finding of the Tribunal.

In the third case, which arose from a dispute between the Indian General Navigation and Railway Company, Calcutta, and its workmen, the Supreme Court negatived the view which commonly prevailed in industrial adjudication that a strike, though illegal, could nevertheless be justified, if there were good and sufficient reasons for the workmen to strike. Under the provisions of the Industrial Disputes Act, a strike is illegal if commenced in a public utility service without giving 14 days' notice to the employer or if it is commenced or continued in any industry during the pendency of proceedings under the Act. Industrial Tribunals and the Labour Appellate Tribunal had, however held, in several cases, that, though a strike would be illegal if undertaken in contravention of the provisions of the Industrial Disputes Act it could be justified if there were good and sufficient reasons.

The appellant Company is engaged in inland water transport. In July 1955, two workers' unions forwarded their demands and also gave notice of strike if the demands were not conceded. In the meantime, the Assam Government started proceedings but, as these failed the workers went on strike from 10th August 1955. The Company treated the strike as illegal and decided to dismiss about 260 workmen and eight others in connection with an incident before the strike. The Government referred the dispute regarding the dismissal of the workmen to an Industrial Tribunal which held that the strike by the workmen, though illegal, was nevertheless justified. It directed the reinstatement of all the workmen except those convicted for criminal offences connected with the dispute. It also directed the workmen to be paid full wages from the day they had abandoned the strike. The management went to the Supreme Court in appeal against the award.

In his judgment, the Chief Justice, Mr. B. P. Sinha, observed:

"It is not permissible to characterise an illegal strike as justifiable. The only question of practical importance which may arise in the case of an illegal strike would be the kind or quantum of punishment and that, of course, has to be modulated in accordance with the facts and circumstances of each case. Therefore, the tendency to condone what has been declared to be illegal by statute must be deprecated and it must be clearly understood by those who take part in an illegal strike that they thereby make themselves liable to be dealt with by their employers. It is not in the interest of the industry that there should be a wholesale dismissal of all workmen who merely participated in such a strike... the punishment of

carefully studied by the authorities. If the Law requires to be amended to stop the mischief of this verdict, they should not hesitate to do so. The third decision of the Supreme Court is highly commendable, as it is conducive to engendering respect for the Law which is very much lacking in our people these days.

INDUSTRIAL RESEARCH

There is a growing awareness in this country of the vital importance of scientific research for industrial progress. This is reflected in the growth and development of a network of national laboratories and other institutions of applied research. Much more, however, remains to be done to enable the tempo of industrial research to catch up with the ambitious programme of industrialisation launched in this country and the immense strides scientific research has made in the West. It is gratifying to note that the Council of Scientific and Industrial Research continues to make efforts in this direction. At the meeting of the Governing Body of the Council last week at New Delhi under the chairmanship of the Prime Minister, it was decided to set up two new research establishments—a central research organisation concerned with scientific instruments and a petroleum research institute at Dehra Dun.

The central scientific instruments organisation is proposed to be constituted under the control of the C.S.I.R. A sum of Rs. 11.72 lakhs for setting up such an organisation has already been provided for in the second Plan. The present decision has been taken in pursuance of the recommendations made by the Scientific Instruments Committee, appointed by the Planning Commission. The Committee, it may be recalled, laid down a ninefold function for the central organisation. These functions of the organisation include survey and assessment of present and future needs, preparation of a phased programme for the development of the industry during the next 10 years, creation of new design and development units and centres of instrument production and the encouragement of the manufacture of scientific instruments on an industrial scale. The organisation will have an overall responsibility in the field of development of scientific instruments in India. The organisation will be managed by an executive council, consisting of representatives of various

Union Ministries, the C.S.I.R., the Indian Standards Institution, the University Grants Commission and instrument manufacturers.

The C.S.I.R. is expected to appoint shortly a director who will draw up a detailed plan for the organisation. It has also been decided to invite foreign collaboration for its projects from the U.N. Technical Assistance Board, the Colombo Plan, the U.S. Technical Co-operation Mission and also from Japan and the U.S.S.R. The organisation will certainly help promote the development of instruments manufacture in this country and enable India to eliminate imports of equipment.

The establishment of a separate institute for specialising in petroleum, proposed by the Central Government, has also been approved by the C.S.I.R. The proposed institute is expected to carry on and extend the work now being done at the Fuel Research Institute. It will be chiefly concerned with research and development of petroleum, both oil and gas, from its crude state. The functions of the Institute will also include oil and gas analysis, refining and utilisation processes, use of oil for industrial purposes and its transportation. Admittedly, the Institute has a vital role to play in view of the unprecedented emphasis now laid on the development of domestic sources of petroleum.

AIR FARES

The way has been paved for "open competition" in air fares, thanks to the failure of the members of the International Air Transport Association (I.A.T.A.) to reach any agreement on fares and rates. The Executive Committee of the I.A.T.A. announced in Tokyo last week, where the annual meeting of the Association was held, that there could be no further conference on fares and rates among the airlines before October 1960, unless there were "unmistakable indications" that a solution on new rates could be reached. The airlines are free to fix their own rates on the expiry of the present agreement on 31st March 1960. Nothing, of course, prevents individual airlines from coming together for reaching mutually acceptable agreements. But this cannot be an effective substitute for an agreement which will regulate fares and rates on a global basis. It is now believed that

NOTES FROM WEST GERMANY

G.A.T.T. AND SOVIET BLOC COUNTRIES FEDERATION OF INDUSTRIES—ADVERTISING OUTLAY

From A Special Correspondent

COLOGNE, 16th October

EUROPEAN integration should be seen as a continuous process, aiming at still further integration, not only of the six nations belonging to the "Common Market," but of all European nations outside the Iron Curtain. Now is the time to find such solutions uniting all nations of Europe in a concerted programme co-ordinating their policies, mainly in the fields of economics, finance, and currencies. The principle of free enterprise and of free competition should be established soon. There should be no more room for governmental interventions, such as subsidies, tax and other fiscal discriminations, and currency manipulations. Any such manipulations and deviations from economic integration and any remnants of economic nationalism that somehow sneak into the network of integration will weaken the possibility of success.

Economic policies of all nations concerned should, therefore, be geared to the requirements of the future. For integration has to become as perfect as possible in order to take a successful stand vis-a-vis the political and economic integration of the communist world. Survival in freedom really hinges upon the efforts and the integrity in achieving integration.

Such an attitude is especially needed in view of the forthcoming competition of Government-directed exports from Soviet Bloc countries. The economic offensive of the Eastern Bloc countries has been going on for some time, with economic dumping attempts directed against all markets. Traders and business men of the West are facing men who think only in terms of politics and of expanding world communism. They hope to do their share in undermining the free enterprise system—and freedom itself—by shaking and disturbing Western markets. To gain a better foothold, they are pressing now for membership within G.A.T.T.

They should in no way be admitted to G.A.T.T., however, unless very strict—and clear—statutes, regulating trade with Government-run economies, are enacted. Such statutes should provide adequate protection against dumping and other political prices manipulated by State trading countries. Precaution against Eastern Bloc dumping should also be taken within the framework of the European Common Market. The dangers of State-directed and Government-subsidised competition on world markets should not be minimised, particularly if the Communist nations were able to step up their economic offensive and, simultaneously, to ask for the most-favoured-nation treatment accorded to all G.A.T.T. members.

The future competition of Soviet Bloc countries on world markets will largely have political goals. To meet such competition is beyond the resources of private enterprise. It has, therefore, to be coped with by clear precautionary measures of the Governments and of G.A.T.T. Such measures should not be delayed any longer.

Objectives of Industries' Federation

In the first years after World War II, the Western Allies had only reluctantly and slowly permitted the establishment of trade associations on a strictly local or—at the utmost—regional basis. (The Soviets did not permit them at all.) But, in 1949 and 1950, along with the birth of the Federal Republic, restrictions of the entrepreneurs' and employers' freedom of association—which had long since been granted to their counterpart, the workers—were gradually removed. This is why quite a number of important and top-level industrial and employers' associations celebrate their tenth anniversary this year. One of the first to do so were the Confederation of German Employers Associations and now it is the turn of the Federation of German Industries.

Industry's associations have sometimes been looked upon with some apprehensions and misgivings. Weren't they, after all, all too powerful bodies trying to unduly influence legislation and administration? But long since German industry has proven that it wants to live up to its self-proclaimed role of a loyal and responsible part of the nation. When the Federation of German Industries was established in 1949, it made

it very clear, from the outset, that "any action to protect industry's interests must keep within the framework of the State and the community of the nation" and that the large industrial associations "must, in pursuing their aims, comply with the common good."

This, in fact, has been the guiding principle governing the work of the Federation which has also seen to it that it never became the spokesman of "big business" only. The Federation has put forth many suggestions to secure small and medium business its proper place within the national economic framework. The Federation has always striven for international co-operation, in general, and for European integration, in particular. It can rightly claim, as it does in its just released Annual Report for 1958-59, that it is "free from protectionism." Indeed, it has constantly been urging economic integration on as large a basis as possible and it now thinks "it is a vital task of European policy to have the European Economic Community of the Six followed by an economic association comprising the other eleven members of O.E.E.C."

There have never been any differences of opinion about basic W. German economic policy between the Federal Government and the Federation of German Industries. Both believe in enlightened free enterprise, though, of course, there have been, and there always will be, differences of opinion on details. On the whole, the past ten years have seen the Federation emerge as a fully respected body which has loyally lent its services to the nation, constantly urging its members not to forget that apart from trying to be successful industrial entrepreneurs, they should always be responsible and active citizens.

The Marketing Era

The idea of marketing and of demand creation is spreading fast in Europe. The art of marketing is being discovered, including merchandising, sales promotion and motivations research. Market research institutions, advertising agencies embracing all fields of marketing, and books about the art of selling, promotion, and display are gaining ground everywhere.

Two important marketing and sales promotion conferences were in W. Germany last month, both on an international scale. The "Congress of Advertising, 1959" was held in Munich from 9th to 12th September. This Congress was sponsored by the "Central Committee for Advertising," founded ten years ago by leading German trade associations, such as the Federation of German Industries, and associations of wholesale and retail trade, of publishers, printers, and advertising agencies. Advertising outlays in the Federal Republic have almost trebled in the last five years. In 1958, they had reached a total of 1,670 million DM. for newspaper, periodical, radio, TV, and poster advertising, and the 937.8 million DM. figure for the first half of 1959 indicates that the upward trend continues strongly.

The second event, the Fourth International Congress of Sales and Marketing in Berlin from 23rd to 26th September, was attended by representatives of Sales Executives Clubs of many countries, including the United States.

The two events symbolise an important trend of business policy in Europe, and particularly in Germany. Shortages and unemployment were the headaches of the twenties and the thirties. Production and supplies were in the forefront of the first post-war decade. Now, however, the "production" of markets and creation of demand are becoming more important. This trend may become even more intense during the sixties, and it is interesting to see how far the emergence of the Common Market in Europe coincides with the growth of attention paid to new channels of distribution, pricing, market research and other ways to reach the consumer.

At the same time, the future of exports is more and more seen in the context of marketing. This holds true of less developed countries, too, which not only need machinery and production know-how, but also modern channels of distribution and ways and means to harmonise the growth of production and the growth of consumption, so that dangerous disproportions may

LONDON LETTER

THE CITY BOOMS REACTION TO TORY VICTORY

(From Our Own Correspondent)

LONDON, 17th October

BEFORE the Election, jobbers on the Stock Exchange were offering very long odds on a Tory victory and investors who put their faith in this judgment sold out and took their profits the following morning. But their selling was immediately swamped by a gigantic wave of more cautious buying which had waited to see the actual results—a wave that threw up an all-time level of Stock Exchange activity for one day. This wave continued during the first two days of the week, then came a setback of only about 1 per cent. and the account finished with prices only one point short of the record on Tuesday. Over the whole fortnight, which covered the Election, prices rose on average 15 per cent., but the most astonishing feature was that the greater part of this rise was made in one day, the Friday following the Election.

Experienced Stock Exchange operators say that they have never known anything like it, for, from the moment the Exchange opened, brokers rushed to do business regardless of the price. They were acting on open instructions to buy on the day following the Election, provided the Government was returned, anything the broker could get and steel shares for preference.

Steel Shares

The result of this extraordinary activity has been that some steel shares (the steel industry had, of course, been marked down for re-nationalisation in the event of a Labour victory) have actually jumped 50 per cent. over the past fortnight and the average run of steel shares has risen over a third. Moreover, after the first speculative rush and the inevitable profit-taking which followed in the middle of this week, the long-term investor has come in, including in this the institutional buyers, so that the rise is no mere flash in the pan. From a price index for industrial shares of around 232 a fortnight ago, the index finished the week at 290. The number of transactions has reached an all-time high; for last week, the figure was 108,000 and for this week 145,000, but these figures are only the bargains marked by brokers, and, on Friday last week, brokers simply did not have time to mark their deals. On that day, 25,000 transactions were recorded but that was no more than the recordings on Thursday, the Election day itself, before any results were known. Thus, the actual number of deals must be very much in excess of even the record figures noted.

But there is another side to this matter of steel share prices. Since the Election results, one motor car firm has revealed that it is having to cut back production because of a shortage of sheet steel. And, of course, this shortage is not confined to one firm alone. The implication drawn by the would-be nationalists of steel is that the industry is back to its old game of trying to keep production just below the level of demand, so that none of the producers will ever be short of orders.

Socialism

But it would be a mistake to assume that the would-be nationalists now represent the Labour Party. That Party is doing some "agonising reappraisal" as to why it lost 50 odds seats, and the leaders of the Party appear to have reached two opposite conclusions. One side, the left wing, led by Mr. Bevan, is convinced that the Party lost because it was ashamed of its own politics and of nationalisation. It not only still wants to re-nationalise steel, but it would like to go ahead on a programme of nationalising other things besides. The right wing of the Party has reached the opposite conclusion. They have rapidly decided that the working class no longer exists and they should drop all talk of nationalisation, including the idea of re-nationalising steel. Since the Party has little to lose at present by arguing out its differences in public, the chances are that the split will get wider.—All Rights Reserved.

be avoided which, in turn, could jeopardise world trade rather than promote it. Most certainly, modern marketing is not only a symptom of highly industrialised nations. It implies as much efficiency and expert knowledge as the art of production itself. It is not surprising, therefore, that numerous representatives of various nations in Asia, Africa, and Latin America decided to attend the two important advertising and marketing congresses in W. Germany.

**From mining to metal—
out of integration
comes strength**

Indian Aluminium Company—pioneer and leader of the aluminium industry in India—has a completely integrated unit with its own bauxite mines, alumina plant, aluminium smelters, rolling mills and extrusion plant.

During the 20 years of its existence in India, Indian Aluminium Company has ceaselessly sought to harness India's magnificent natural resources in the course of expanding its production facilities. And so today Indian Aluminium has plants spread all over the country—each of them playing a vital role in producing aluminium economically and efficiently.

India's vast bauxite and water power resources can support an aluminium industry many times its present size. Indian Aluminium Company has the know-how and the resources—strengthened by close collaboration with its Canadian associates, Aluminium Limited, the world's largest group of aluminium companies—to help translate into reality India's dream of self-sufficiency in aluminium.

I.M.F. TO CONCENTRATE ON NEW TASKS

MR. JACOBSSON FORESEES A LONG PERIOD OF ECONOMIC STABILITY

SPEAKING at the annual meeting of the Board of Governors of the International Monetary Fund held at Washington last month, Mr. Per Jacobsson, Managing Director of the Fund, gave an indication of the possible shift in emphasis of the I.M.F.'s policy hitherto followed, namely, that of bringing monetary stability in member-countries, to the general objective of sustaining economic growth in terms of Article I of the Fund Agreement. This Article lays down that the Fund, while promoting exchange stability, also has, among other things, to facilitate the expansion and balanced growth of international trade and to contribute thereby to the promotion and maintenance of high levels of employment and real income and to the development of the productive resources of all members as primary objectives of economic policy.

During the past few years, the I.M.F. has been following the strict policy of insisting that member-countries seeking the aid of the Fund, following the liberalisation of its lending procedures, should take such steps as the Fund thinks expedient for the achievement of monetary stability. Though, in adhering to this policy, the I.M.F. has even been accused of being partly responsible for the slowing down of economic activity over the world as a whole, it should be said to the credit of the Fund that, in so far as monetary stability is concerned, it has achieved its objective to a large extent. Many of the member-countries, as Mr. Jacobsson testified, have attained monetary stability, leading to the introduction of external convertibility of their currencies. In fact, he expected that the recent strengthening of monetary stability might even reduce demands on the Fund in the period immediately ahead.

General Objectives

Now that the immediate objective of the Fund has almost been achieved, Mr. Jacobsson felt it necessary to remind member-countries of the need for giving greater attention to the general objectives of the Fund. Thus, he said:

"When stabilisation has been achieved by a considerable number of countries, the problems that arise—some old, some new—are likely to be intricate, as regards both economic diagnosis and the finding of proper remedies. How to mitigate booms and depressions; how best to combine economic expansion with reasonable stability; how to ensure proper debt management; how to alleviate, through timely foreign financing, the strain in the balance of payments of countries engaged in development; how to deal with the difficulties which arise when the prices of a country's main exports are declining—these are all matters which require great economic insight, and awareness of political factors. These are problems which fall under Article I of the Fund Agreement, which affirms that the Fund while promoting exchange stability also has, among other things, to facilitate the expansion and balanced growth of international trade, and to contribute thereby to the promotion and maintenance of high levels of employment and real income, and to the development of the productive resources of all members as primary objectives of economic policy." These should not be empty words. Now that the transitional period after the war draws to its close, more attention should be paid to these general objectives of the Fund. Since the decisive measures are generally those taken by the authorities in the individual countries, such influence as the Fund can exert will largely depend on the confidence it is able to inspire as an expert body always ready to consider on their merits the problems that arise, and to find solutions which are in the true interests of the member-countries."

First Stage Over

The introduction of external convertibility towards the close of 1958 is regarded by Mr. Jacobsson as the consummation of the first stage of a process, extending over many years, for strengthening the economic and financial position of countries all over the world. The monetary disturbances brought about by the Second World War could not easily be corrected. Thanks, however, to the increase in national incomes and the effective application of flexible fiscal and credit policies, the excessive liquidity, which had weighed on the economies of many countries, has now been gradually worked off and the monetary authorities of these countries have secured a firm grip on the monetary position. The step to convertibility of currencies has now been fully justified by the quite remarkable rise in the monetary reserves of most of the countries concerned. In Western Europe, monetary confidence has been increasing conspicuously, not only in respect of the external

value of the currencies, as reflected in the firmness of the exchange quotations, but also in regard to the internal value. In most of these countries, neither the wholesale prices nor the living costs have risen appreciably during the last one or two years. The restoration of convertibility has also resulted in a greater freedom from exchange regulations. The restoration of monetary confidence will ultimately mean a reduction in costs and this, in turn, will contribute to the expansion of world trade and facilitate foreign investments. It may be noted, in this connection, that the virtual stagnation of world trade in the 1930's was aggravated by the monetary uncertainty. It is thus clear that the I.M.F.'s policy of restoring monetary stability in its member-countries has had a good effect.

Discriminatory Restrictions

Another welcome result of the convertibility of currencies is the virtual disappearance of the distinction between the "hard" and "soft" currency countries in the sphere of international trade. There are, however, still some discriminatory restrictions and these are considered by Mr. Jacobsson as more in the nature of protectionist devices. He, however, told the member-countries that the time had clearly come when, for many reasons, the practice of discrimination should be abandoned with the least possible delay. For it was his personal conviction that "for the vast majority of countries, there are no longer any balance of payments reason for the maintenance of discrimination."

As a result of the improvement in the balance of payments position, many countries have been raised from the status of Article XIV to Article VIII of the I.M.F. Article XIV provides for "transitional arrangements" under which member-countries are given time to overcome their balance of payments difficulties before they are required to eliminate their existing exchange restrictions. Under this Article, many member-countries have been free from the obligation of obtaining the I.M.F.'s approval for the maintenance and adaptation of their existing restrictions on payments and transfers for current international transactions. During the last few years, however, much progress has been made

In both hemispheres . . .

. . . there are businessmen, and in both hemispheres there are banks. This is all very well as far as it goes, but contact between east and west is a different matter, and one of great and growing importance. That is where The Hongkong and Shanghai Banking Corporation comes in. Providing a complete banking service throughout south and east Asia, we also enable the businessman in that half of the world to contact his opposite number in the other. In both hemispheres you will receive excellent service from the biggest bank established by the Far East for the Far East.

in the removal of restrictions, thus reducing gradually the scope for adapting restrictions under Article XIV in the case of a number of countries. As a result, these countries have reached a position where legally the reintroduction of restrictions (as distinct from the adaptation of existing restrictions) would require the Fund's approval under Article VIII, even though the countries themselves remained formally under Article XIV. The formal assumption of the full obligations of Article VIII would mean that such a country was willing to accept the requirements that it would seek the approval of the Fund for any remaining exchange restrictions and the prior approval of the Fund for the adaptation of any such restrictions or for the introduction of new restrictions, if this should ever become necessary.

Several Issues Involved

With the adoption of external convertibility, many countries have come under the mischief of Article VIII. There are, however, some difficulties in imposing the obligations under this Article on these countries and these are being examined by the I.M.F. Mr. Jacobsson conceded that the application of Article VIII would raise several issues which required clarification. Thus, he said:

"In any examination of this question it will be necessary to consider which members are in a position to assume the full obligations of Article VIII; what should be the procedure and rules for change restrictions, and on any request for the introduction of new exchange restrictions; how regular contact can best be maintained with countries which are under Article VIII, and which, therefore, are not required to participate in the annual Article XIV Consultations. In addition, the change in status of a number of Fund member-countries would bring into force the revised G.A.T.T. provisions dealing with discrimination. These questions require careful examination in all their aspects, and will be taken up by the Executive Directors in the very near future."

On this issue, the U.K. representative, Sir Roger Makins, made some important points. As some of them are of particular interest to this country, it is better to quote him. Here is what he stated:

"In the first place, Article VIII provides for the approval by the Fund of restrictions and indeed of discrimination. In our view, these provisions should be strictly interpreted. H.M. Government would not expect the Fund to approve any such restrictions under this Article, unless there were good reasons to say that they could not have been avoided and that their duration was expected to be temporary. In our view, it follows from this that a country moving to Article VIII should have gone far to eliminate discrimination in its restrictions and reduce the remaining non-discriminatory restrictions, until they affected only a small sector of their trade by the time the move was made. Therefore, in this respect also, the timing of the move becomes a matter of great importance."

Co-operative Effort Needed

"Secondly, I have referred to the way in which the moves to convertibility at the end of 1958 were the outcome of a concerted and co-operative effort. We feel that a similar co-operative effort is most desirable if a move to Article VIII is to promote the expansion of world trade which is our objective."

"Finally, there is the position of the less developed countries. Some of them may be obliged, for some time to come, to retain certain restrictions on current transactions in the interests of their development programmes. Since we should not expect the Fund to approve such restrictions under Article VIII, it seems that many of these countries will wish to remain under Article XIV."

"It is not, of course, the purpose of the Fund to tie up its resources in long-term loans for capital development. But short-term assistance under suitable conditions and on suitable terms can be very useful in helping a developing country to smooth out any awkward corners created by the uneven progress of its development programme."

Mr. Jacobsson finally added that, if member-countries could accept full obligations under Article VIII, there was bound to be a shift in the main occupations of the Fund and in its daily work. This, however, would not mean that the Fund's work would be made easier. He expected that the Fund would be increasingly called upon to help the underdeveloped countries in their task for economic development.

Note of Warning

Mr. Jacobsson affirmed that monetary stability had become a guiding principle for the vast majority of countries. He, however, struck a note of warning against any complacent attitude towards the present expanding trend of economy. Thus, he said:

"In all likelihood, world inflation is over. Now that the excessive liquidity inherited from the war has been worked off, credit policies have become more effective. Output has risen, competition is fiercer, and the resistance to cost and price increases has grown in strength. If we look

PROSPECTS FOR RAYON INDUSTRY CENTURY'S EXPANSION PLANS

RAYON and other synthetic fibres continue to make successful inroads into the field in which natural fibres had until recently held unchallenged positions. These artificial fibres lend themselves to use either separately or mixed with natural fibres, thus facilitating the manufacture of good fabrics which appeal to the taste of a wide variety of consumers. In almost every textile manufacturing country in the world, rayon and synthetic fibres are playing more and more important roles. India, too, is no exception to this world trend. Man-made fibres made their appearance in the world only half a century ago but, in India, their debut occurred much later. But, the progress they have made during the past decade is remarkable and the future holds considerable promise. Manufacture of rayon yarn started in this country only about a decade ago.

Among the man-made fibres, rayon occupies the pride of place in India. In the more advanced countries, however, rayon is rapidly giving way to the more modern synthetic fibres such as nylon, orlon, dacron and terylene, collectively called polyfibres. All these polyfibres are superior in strength and durability to rayon and acetate. As in the past, India is lagging behind the rest of the world and is still going in heavily for rayon, though, from time to time, there have been reports of someone or other's decision to manufacture nylon yarn out of imported raw material. Whether India should continue to invest large sums on a man-made fibre which is losing its hold over consumers in the rest of the world is a matter for expert opinion. There are some who believe that, India being a poor country, the market for polyfibres will not be big enough to warrant the heavy capital investment necessary for establishing a modern synthetic fibre unit. For the same reason, they hold the view that, for several years to come, rayon yarn and fabrics will have an assured market in India as well as in the neighbouring countries. A decade ago, a similar argument used to be advocated against establishment of rayon industry, but subsequent events have falsified it. Perhaps, the Planning Commission will be well advised to consult competent technical persons before sanctioning any further projects for manufacturing viscose rayon, staple fibre and acetate. It may be a good idea to encourage those who come forward to establish facilities for manufacturing polyfibres.

Varied Uses

Be that as it may, rayon filament yarn is put to many uses. It is used for the manufacture of many types of fabrics and is also used in manufacturing hosiery and knitted goods, gas mantles, embroideries, automobile tyres. The internal demand for rayon yarn far exceeds the indigenous production capacity, the gap being filled by imports. In 1958, total consumption of rayon yarn was estimated at 67.28 million lbs. out of which 33.59 million lbs. were produced indigenously and 33.68 million lbs. imported at an estimated cost of about Rs. 11 crores. In 1956, when textile consumption was running at a high level, total consumption and imports were still higher at 79.72 million lbs. and 59.87 million lbs. respectively. But owing to the severe restriction placed on imports since 1957, total supplies have been considerably less. The following table indicates the gap between consumption and production and how it was bridged during the five years ended 1958:

(Quantity in thousand lbs.)				
	Total consumption	Indigenous production	Imports	
	Quantity	Quantity	Quantity	Value (Rs. in crores)
1954	54,134	11,915	42,219	12.85
1955	62,005	15,166	46,839	14.29
1956	79,717	19,548	59,869	17.40
1957	71,546	24,996	46,550	13.00
1958	67,278	33,598	33,680	10.91
1959 (Jan.-June)	—	16,377	28,748*	7.05*

* Approximate.

The consumption of viscose rayon yarn (that is yarn produced by the viscose process) is estimated to reach 80 million lbs. by 1960-61. The production target under the second Plan has been fixed at 60 million lbs. Thus there is a gap of 20 million lbs. to be covered by imports.

Production Half of Consumption

Indigenous production last year, as noted above, was less than 50 per cent. of consumption. The recent drastic cut in rayon yarn imports has further widened the scope for indigenous units. Considering the good scope for expansion, a few new units have been licensed. In addition, all

units producing rayon yarn have expansion plans. Even if the new licensed units and expansion programmes were commissioned by 1960-61, there would still be, it is said, considerable gap between consumption and production of rayon yarn in India.

Vigorous efforts are now being made to raise indigenous production. Outstanding among the units making rapid strides in the manufacture of rayon yarn and plans to expand production capacity further is the Rs. 5-crore rayon factory of the Century Spinning and Manufacturing Company, Ltd., under the management of Birla Bros. This factory, which is situated at Kalyan, produces 13 tons of rayon yarn a day. It was put up in record time of just twenty months and the plant went into production on 15th September 1956. At first, the factory was planned to produce only five tons of rayon yarn per day. Even before the completion of the first stage, it was decided to expand the installed capacity to about 13 tons of rayon yarn per day. The expansion programme was completed by March 1958 and the expanded factory reached its rated capacity of 13 tons of rayon yarn per day in December last.

Viscose Process

The raw materials used in the manufacture of rayon yarn are wood-pulp, caustic soda, sulphuric acid and carbon disulphide. Wood-pulp is being imported at present, but efforts are being made to procure them from within the country by tapping the rich forest wealth of the country. Sulphuric acid and carbon disulphide are manufactured in the factory itself from sulphur and charcoal. The process employed is the world-famous viscose process. Briefly stated, the manufacturing process is as follows:

The wood-pulp is steeped in about 18 per cent. caustic soda solution. This converts it to alkali-cellulose. The excess alkali is pressed off. The alkali-cellulose is directly fed to shredders where it is shredded to floccy, white crumbs. During shredding, it undergoes ageing which breaks up the cellulose molecules to a desired degree.

Century Rayons' is, perhaps, the only plant, where this process of shredding also carries out the ageing along with it. What thus takes normally days together for ageing is effected in this plant in a matter of a few hours.

The alkali-cellulose so shredded and aged is conveyed to a churn where it is made to react with carbon disulphide. After complete reaction, the white alkali-cellulose is transformed into an orange-coloured compound called the cellulose xanthate—a compound which is easily soluble in weak caustic soda. The orange-coloured xanthate is fed into a dissolver where it is dissolved in weak caustic soda solution to form a honey-coloured thick liquid called the viscose.

The viscose is 'matured' and filtered. The maturing is carried out in conditioned rooms till the viscose is just right for good spinning. The viscose properly matured and free of air and other suspended impurities is sent for spinning.

In spinning, the viscose is accurately metered through spinnerettes, made of gold and platinum, at a constant pressure under a spin-bath composed of sulphuric acid and other salts. A reaction between the viscose and the spinbath thus takes place and the cellulose is then regenerated. As soon as it is regenerated, it gets stretched and twisted and forms a thread. This thread is collected in fast revolving pots and, after some six hours, the thread is doffed in the form of cakes. In this cake form, the thread contains considerable amount of acid and other impurities. These are washed off and the thread bleached by carrying out 14 washings with water and other solutions. After removing the extra water by centrifuging, the thread is thoroughly dried by passing it through dryers. On reconditioning it in air-conditioned rooms for some 48 hours, it is ready for winding into cones. After winding and reeling it in the form of cones and hanks, it is inspected for its quality, packed and sent to the market.

The factory manufactures thread of varying thickness, ranging from 75 denier to 450 denier. Within a period of three years from its commencement, the factory has produced 20.5 million lbs. of yarn which has resulted in considerable saving in foreign exchange.

Nylon Yarn

The Company has no intention to rest on the oars of its achievements so far. It has several schemes for expansion. Rayon yarn capacity is planned to be increased to 19 tons per day from the present level of 13 tons. The requisite machinery is expected to be obtained from Japan under the yen credit facilities offered by that country. Government's sanction has also been obtained for the manufacture of tyre yarn and nylon yarn. A five-ton tyre yarn plant and a two-ton nylon yarn plant are proposed to be installed and they are expected to be commissioned in about two years' time provided the negotiations, now under progress, succeed. The capital expenditure on the expansion of rayon plant capacity, the tyre-yarn plant and the nylon-yarn plant is expected to be of the order of about Rs. 8 to 9 crores. There are also plans to manufacture caustic soda and cellophane paper, subject to the Government's approval.

BONUS FOR MILL WORKERS

The Industrial Tribunal, Madras, has directed the management of 50 textile mills in Coimbatore district to pay their workmen bonus and Deepavali allowances aggregating Rs. 32 lakhs. The award was given on a reference to the Tribunal of the question of bonus payable to textile workers for 1957 and 1958, following the failure of high-level Government, management and trade unions to bring about a settlement. Twenty-five mills, employing the order of one to seven months' basic wages as five mills, employing 27,000 workers, have been asked to pay one month's basic wage as Deepavali allowance recoverable in six instalments commencing from March 1960. The disbursements are to be made on or before 24th October 1959.

SELLING WOOL BY AUCTIONS

The Australian Woolgrowers' Council has decided in favour of retaining the present free auction system for marketing the Australian wool clip. The Council strongly opposed any move to interfere with the fundamental principles of the free auction system and said "it would use every blish a reserve price system for wool." The Council also rejected moves aimed at modifying its policy.

PLANS FOR COTTON INDUSTRY WILL BE CARRIED FORWARD

COTTON MILL ACQUIRES HIRE-PURCHASE FINANCE COMPANY

From Our Special Correspondent

MANCHESTER, 13th October

THE return to office of the Conservative Government in the United Kingdom means continuity in the plans for cotton which had already been carried a long way into operation even before the date of the Elections had been settled. A change of Government would have brought a fresh wave of uncertainty to the situation and the future of the redundancy schemes would have been in doubt.

MANCHESTER LETTER

Labour politicians had given a pledge that the position would be investigated to see whether some of the proposed mill stoppages could be at least delayed, if not abandoned.

Prior to the Election results being published, there was widespread speculation on how the voting would go in those Lancashire constituencies which contained a substantial proportion of operatives and others engaged in cotton textile affairs. Popular opinion held that certain aspects of the Government scheme would react unfavourably on the outlook for the Conservatives. In actual fact, it appears to have made little impression on the electorate in the mill towns.

One of the few Labour gains was certainly achieved at Oldham East, where such a change had been anticipated, but, in other divisions, any swing to the Left was insufficient to bring a change of representation and there were also surprises after the count. In Accrington and Nelson and Colne, for example, the Labour majority was reduced, while the Conservatives held the two Preston constituencies with increased majorities.

The overall picture showed no pronounced condemnation in the mill towns of the scheme to eliminate surplus machinery and re-equip the industry on more modern lines. Oddly enough, the chief movement in sympathy with Labour came in Manchester and Salford, whose allegiance is more to the merchandising of cotton goods than to their manufacture.

Unanswered Criticism

In the midst of the political battle of words which precedes any election, statements are made—sometimes out of context—which on subsequent reflection do not justify repetition. For example, the comment made by Mr. Lewis Wright, one of Lancashire's most reputable trade union leaders, to the effect that the Government scheme had been introduced without taking into consideration the people involved, was allowed to pass unchallenged.

One reply surely is that many of the firms now contemplating closure would have, through force of economic circumstances, left the trade

in due course. Their operatives would have received no compensation, any more than those who were displaced in the 350 mills which shut their doors in the period from the beginning of 1955 to March last year.

As a result of last week's developments at the polls, the scrapping scheme will go forward as planned. Machinery will be dismantled by the end of March and already there are reports of suitable mill buildings being sold to outside sources which find them attractive for their requirements.

World Cotton Gains

Encouraging reports of activity in cotton textiles in many parts of the world are featured in the latest summary of conditions published by the Cotton Board. From its Manchester headquarters, the Board declared: "The cotton industry throughout the world is now well out of the recession. Reports from many countries mention better levels of activity, lengthening order books and in some but not in all cases improved profit margins."

The revival in business in cotton goods in Lancashire was underlined by a higher rate of output in all sections. Yarn production per working day, the Board reported, had been consistently greater than a year ago ever since May and, despite a slight falling off in subsequent months, it still showed an increase in August of about 9 per cent. as compared with the January figure. The rate of cloth output was 13 per cent. higher in July than in January.

"It is of some interest that this considerable expansion in the rate of production should occur, despite a decline of some 8,000 in the number of workers on mills' books since the beginning of the year," the Board commented.

Improvement in offtake began in April, according to the report, caused by the low level of pipeline stocks and an upward movement in raw cotton prices. "The excellent summer weather has, of course, helped, but, in order to keep things in perspective, it is worth noting that consumers' expenditure on clothing in the second quarter, corrected for price changes, showed an increase of no more than 6 per cent. as compared with the second quarter last year and retail sales in July seem to have been no more than about 4 per cent. greater than in July 1958," the review added.

The recent situation has been affected by the attitude of buyers who have tried to secure supplies in the face of the prospective withdrawal from the industry of many producers, as a result of the Government's reorganisation schemes. The Board endeavours to quieten fears that insufficient machinery will be left after the redundancy programmes to maintain the requisite level of production. Even after about

13 million spinning and doubling spindles and 105,000 looms have been scrapped, it points out: "In view of the large amount of machinery that has been idle recently, it is clear that relatively modest extension of shift working would be sufficient to maintain production at its present level."

Commenting on the maintenance of the level of exports recorded in the second quarter during July and August, the Board says that there is some reason to hope that there will be a further modest increase in shipments during the remainder of the year.

Cotton Hire-Purchase Deal

Further plans for diversification of one of the big British textile groups were announced last week. The Amalgamated Cotton Mills Trust has acquired all the share capital of Anchor Investment Company, Ltd., the Manchester firm of hire-purchase bankers.

According to the statement, the policy of the investment company will remain unchanged and Mr. N. Jackson will continue as Managing Director. Mr. William Pickles, Chairman of Amalgamated Cotton Mills Trust, has been appointed Chairman of Anchor Investment Company, and Mr. W. H. L. Casson has also joined the Board. Mr. G. Butterworth has been appointed Secretary.

More Scrapping Plans

Full advantage of the Government's financial help in the reorganisation scheme for cotton industry is being taken by Messrs. Barlow and Jones Ltd., the Manchester group with mills in the Bolton area. Sir Thomas D. Barlow, the Chairman, in a circular to shareholders points out that complete scrapping would have thrown away all the assets of expertise and skill in the manufacture of high-quality merchandise and the reputation and goodwill on which the firm's prosperity in the past had been built up. Such a course would have disrupted the employment of nearly 2,000 workpeople. All obsolete or obsolescent machinery has been offered for scrapping, which will temporarily reduce production, but this plant will be replaced with a much smaller quantity of the latest equipment, to be run on a multi-shift basis. A neighbouring mill, much later built and more spacious than any of the firm's existing mills, has been bought in which the new machinery will be laid out to the best advantage.

Challenge of Productivity

In slightly more than a decade at least one aspect of the Cotton Board's work for the industry has received unqualified approval. Even those firms which are inclined to scoff at the idea that their activities could be substantially improved by the intervention of consultants and specialists in such matters as time-and-motion study are prepared to admit that the Productivity Centre has offered the mills at large the opportunity to gain from their services and become more efficient in the process.

From time to time mention has been made in this Service of the courses which the Centre has launched; from the views expressed by individuals who have attended them it is clear that benefit has accrued to the firms involved. The officials of the Productivity Centre themselves, however, are rarely, if ever, satisfied with their

INDUSTRIAL RELATIONS IN JAPAN SOME POST-WAR TRENDS

LIKE its industrial system which represents a unique synthesis of Western and Eastern systems, the pattern of industrial relations existing in Japan is a blend of modern practices borrowed from Western cultures and traditional national features. The most striking aspect of industrial relations in Japan is the fact that most trade unions are constituted, and most of the collective bargaining carried on, at the level of the undertaking. This cannot be explained in terms of existing labour legislation. It is due rather to a partial survival of the paternalistic spirit of the past, side by side with Western production methods in Japanese undertakings. Writing in the August 1959 issue of the *International Labour Review*, Mr. Isao Kikuchi, Professor of Law at Kyushu University, points out that, unlike in the past, negotiations between employers' associations and higher level trade union organisations for fixing wages and other conditions of employment as well as for preventing or settling disputes have become an increasingly common practice now.

Industrial relations in Japan since World War II, according to Mr. Kikuchi, have been placed on an entirely new footing, as compared with that existing prior to it. The Allied powers, under whose control Japan was placed after its defeat in 1945, undertook to revive industrial democracy by encouraging trade union movement. The new constitution promulgated after the war guaranteed the fundamental rights of labour as human social rights. Several labour laws were enacted to regulate industrial relations or bring labour standards into closer conformity with international standards.

Growth of Trade Unions

The growth of trade unions in the post-war period was very rapid, thanks to the Occupation authorities' policy of encouraging the trade union movement and the enactment of the Trade Union Act in 1945. By the middle of 1948, the number of unions and their membership reached a peak. After slackening for some time thereafter, union membership rose again and from 1955 onwards it never dropped below six million. The year 1957 marked a new post-war peak both in economic prosperity, in the number of unions (which was 36,084) and their membership (which reached 8.6 million). Despite the recession which followed, unionisation of workers in medium and small-scale enterprises advanced and, in June 1958, the total number of unions was 37,823, with a total membership of nearly seven million.

A notable feature of trade union movement in Japan is that unions are mostly organised at the level of the undertaking. This tendency, which was already manifest before the war, has become more and more predominant in the post-war period. In a big undertaking, extending over many areas of the country, a union is organised at each plant and these unions form a federation at the company level to carry on collective bargaining with the management. This type of federation is again organised into a national federation by industry. The Japan Coal Miners' Union, the Japanese Federation of Iron and Steel Workers' Union, the Japan General Federation of Private Railway Workers' Union and the National Federation of Textile Workers' Union are the largest national federations set up on an industry-wise basis. These national federations, in turn, are affiliated with the still larger national organisations such as the Japan Congress of Industrial Unions (Sambatsu), Japanese Trade Union Congress (Zenro), National Federation of Industrial Organisations (Shinsanbetsu), and General Council of Trade Unions of Japan (Sohyo).

Employers' Organisations

To cope with the rapid growth of the trade union movement, attempts were made in 1946 to organise employers. But the headquarters of the Supreme Commander of Allied Powers opposed the establishment of a centralised employers' organisation at the national level for fear that it would lead to revival of monopolistic enterprises and the centralisation capital. A start was, therefore, made with employers' organisations at the local and industry levels and these united into the Federation of Employers' Organisations in 1947. However, as the S.C.A.P. gradually changed its policy and began to support the employers, the Japan Federation of Employers' Organisations was formed. It

consists of eight regional employers' associations, made up of local associations in 44 prefectures and other major industrial areas and 24 employers' associations at the industry level. In some cases, industry-wide collective bargaining is conducted between such industrial employers' organisations and a corresponding federation of industrial unions and results in the conclusion of collective bargaining agreements covering the whole industry. In an industry in which the degree of prosperity of undertakings varies widely employers avoid industry-wide collective bargaining and negotiate collective agreements at the level of the undertaking.

Collective Agreements

In the period immediately following the war, that is, from the end of 1945 to August 1946, Japanese trade unions had not yet formed national federations. Collective agreements were, therefore, concluded by unions set up at the level of the undertaking, despite their insufficient knowledge of the problems involved. The employer, for his part, inexperienced in collective bargaining and still suffering from the inertia that had set in after the war, signed the collective agreements as proposed by the unions without much deliberation. As a result, collective agreements concluded during this period were confined to laying down general principles. Later, however, workers' and employers' organisation defined their position towards collective agreements and the Government issued guiding principles for collective agreements. In order to stabilise labour-management relations, the Japanese Labour Ministry issued in 1951 instructions to expedite the conclusion of collective agreements and to provide guidance and assistance for employers' and workers' organisations. The number of collective agreements has increased since 1951. The majority of agreements contain provisions covering such subjects as management prerogatives, rights of labour union security, scope of union activities, joint works councils, grievance machinery, collective bargaining procedures, personnel administration, wages and other conditions of employment, retirement allowance, safety and health, welfare plans, accident compensation, disputes, peace clauses, and period of validity of the agreement.

Some collective agreements in the early post-war period provided for the establishment of a joint works council. The union's intention in establishing these councils was to have a voice in managerial matters or to participate in management. However, as the unions had neither the practical knowledge nor the ability to handle managerial matters, the councils, in some cases, became mere advisory organs or functioned as plant committees for the purpose of labour-management co-operation. In other instances, the joint works council is urged as an instrument for collective bargaining which, in the case of unions organised at that level of the undertaking, is always carried on at that level.

Wages and Welfare

In the devastated, chaotic state of the Japanese economy during the immediate post-war years, the system of wage calculation favoured by the unions was mainly intended to guarantee a living wage and to combat the rising tide of inflation. By 1948, social and economic conditions had become more normal and the pace of inflation had slackened. The Occupation authorities were also tending to support employers and, in particular, to protect them against the unions' demands for wages in excess of the undertakings' capacity to pay. With the outbreak of the Korean war in 1950 and the resulting boom, incentive wage systems began to replace systems based on the living wage. At the end of the Korean war in 1954, the Japanese economy took a deflationary turn and the need to expand foreign trade and to introduce technological innovations sharpened interest in higher productivity and the wage systems best calculated to achieve it.

Throughout the whole of this period, the proportion to total wages of basic wage rose from an average of 62.7 per cent. for manual and clerical workers of all industries in 1949 to 78.4 per cent. in 1956. The proportion represented by cost-of-living allowances, on the other hand, dropped from 15.5 per cent. in 1949 to 8.1

per cent. in 1956. This illustrates how allowances came to be merged with the basic wage. At the same time, the system of wage calculation was simplified by the introduction of a job classification system and of periodical wage increments.

In pre-war Japan, welfare services for workers were provided mostly by paternalistic employers who hoped, by supplementing low wages in this way, to prevent excessive cost of labour. Some companies operated welfare facilities and services directly, while others made financial contributions to workers' mutual assistance associations. As most trade unions in almost every branch of industry were organised at the level of the undertaking, the union members tended to depend upon welfare facilities and services operated by the management. This dependence had, in some instances, gone too far and enabled the management to exert undue influence over the union and its activities. Immediately after the war, however, many collective agreements provided for welfare facilities and services to be operated by the union or jointly by the union and management. The type of welfare services at present operated by trade unions on their own initiative include, among others, mutual assistance in case of accident or sickness, cash payment at the time of retirement of union members, relief to discharged or laid off union members, etc.

Industrial Disputes

As trade union organisations rapidly spread with the revival of the labour movement after the war, labour disputes increased greatly both in number and frequency. And the Government imposed, by legislation, restriction on direct action in case of disputes. Since 1947, the total number of disputes has exceeded 1,000 annually. In 1957, the total rose to 1,674. Of these, disputes involving direct action represented nearly one half. Between 1953 and 1957, one half of the disputes were settled by direct negotiation between the parties while more than 30 per cent. were referred to and solved with the assistance of the labour relations committees. The following table gives the number of disputes classified by methods of settlement:

Year	Total No. of disputes	Methods of settlement			Others
		Negotiation	By labour relations committees		
1953	1,131	861	449	172	
1954	1,181	861	409	161	
1955	1,297	857	406	145	
1956	1,297	740	444	113	
1957	1,608	951	608	140	

Labour relations committees are of a tripartite structure, that is, composed of employer, worker and Government representatives in equal numbers. They have gradually come to play an important role in settling disputes on the basis of a thorough study of the relations between the parties involved. The educational role played by the Central Labour Relations Committee and the local committees was very great immediately after the war, when both labour and management were still inexperienced at collective bargaining and other aspects of industrial relations. As both labour and management became more experienced and gained confidence in their bargaining strength and ability, they tended increasingly to avoid recourse to conciliation or mediation by labour relations committees and to bargain without outside intervention. This, however, has often given rise to protracted labour disputes involving direct action.

The labour relations committees are empowered to function as arbitration bodies through their Government members. However, this device has rarely been used so far, as the practice of referring disputes to arbitration is not yet well established in Japan. Even collective agreements containing peace clauses do not envisage recourse to arbitration. To Japanese employers and workers, acceptance of arbitration awards as binding on both parties is still an unfamiliar concept. This is due at least partly to the lack of a system for selecting arbitrators enjoying the confidence of both labour and management. On the other hand, the quasi-judicial function of labour relations committees, which consists in giving rulings on unfair labour practices, contributes greatly to guarantee freedom of association.

Because you value your car

you should use Mobiloil

A VALUABLE investment — your car! Naturally you want to protect it . . . keep it in top condition for a long, long time.

MOBILOIL gives you full protection. From the moment you start your car, to top operating temperatures, MOBIL OIL separates moving parts with a tough, protective film. Also, MOBIL OIL cuts down on power-robbing friction. All this results in increased power and longer life for your car's engine.

NEW PUBLICATIONS

International Bibliography of Economics. Vol VI. Published by the U.N.E.S.C.O., Paris. Pages: 544. Price: \$9.50.

To the harried business man, bibliography sounds like a dull, dry occupation which, by its very definition, has little to do with the practical aspects of daily life and is, probably, carried on by patient plodders working at dust-covered desks. If he happens to hear of the publication of Volume VI of U.N.E.S.C.O.'s *International Bibliography of Economics*, he will probably consider it an event which does not concern him in the least. But he may be making a mistake. A glance at the classification scheme of the *International Bibliography of Economics* shows that most of the fields it covers coincide perfectly with the problems encountered daily by the men who are the driving force in the world's economic life—business managers, bankers, trade union leaders, etc. In fact, this book offers an impressive sum of references concerning economic events and their interpretation during the period it covers. They refer to facts, theories and ideas. Of course, there are bibliographical listings in the field of abstract analysis, but the book also mentions a large number of highly practical subjects such as oil reserves or credit policy.

The present-day "production" of economists (whether in theoretical or practical work) is enormous. To grasp its main aspects in all countries, a crew of trained specialists would be required. The persons responsible for the compilation of this bibliography used methods which enabled them to make a very severe selection of 7,700 titles and to present them as clearly and as compactly as possible to the reader.

An extremely detailed subject index is another feature of this bibliography. Depending upon the country, the index offers dozens of references (as in the case of Argentina) or hundreds of references (as in the case of India) touching upon all aspects of economic and social life. But the index also shows that all questions of any importance are covered by special headings: taxation, the Common Market, labour productivity, operational research, etc.

This bibliography is of immense practical value to business men. Business management is growing more and more complex. The manager finds that he has to surround himself with more and more technicians and experts capable of giving him advice on the basis of clear and rational knowledge of the problems facing his concern. To help these specialists prepare their reports, companies often set up libraries or documentation centres receiving books, journals and newspapers. But, quite often, the benefits derived from these costly services are low because their users do not have the key they need to be able to refer to them quickly and accurately. This bibliography has been produced to provide exactly such a key—it enables full use to be made of all available material.

O.E.E.C.—A Decade of Co-operation—1948-1958. Published by the Organisation for European Economic Co-operation, Paris. Pages: 187. Price: Rs. 12.

The story of the working of the O.E.E.C. during the last decade is the saga of the post-war economic recovery of the war-shattered nations of W. Europe. The Marshall Plan gave the impetus for this economic revival. The O.E.E.C. has succeeded in securing for its member-countries a perceptible expansion of trade and economic well-being. The role of the O.E.E.C. as also that of the European Payment Union, in this economic reconstruction has been succinctly described in the book under review. Apart from these tangible results, the successful working of the O.E.E.C. has led to the discovery and practice of new ways of enabling sovereign States to co-operate closely and to harmonise their policies, within an agreed programme and in search of agreed objectives. The authors of the book recognise that no one would pretend that the achievements of economic co-operation in Western Europe over the last ten years could not, or should not, have been greater; many problems—some of capital importance—are still unresolved. One of these relates to the need for bringing about a rapprochement between the six countries of the Common Market and the other members of the O.E.E.C. Nevertheless, as they rightly point out, co-operation since the war contrasts strikingly with the often mutually contradictory and self-defeating national policies prevailing before the war, and it is probably no exaggeration to claim that the results achieved have not been rivalled in any other similar period.

Surveys of Indian Industries : Volume 2. By Baditha Srinivasa Rao, Assistant Editor, "The Statesman." Published by Oxford University Press, Madras. Pages: 320. Price: Rs. 20.

The book under review comprises surveys of a dozen major industries of India. A large part of the book is devoted to the study of six staple industries, with a predominantly agricultural base, such as cotton textiles, jute, tea, sugar, paper, fruit and vegetable preservation. This is followed by some of the other important industries, namely, cement, ceramics, glass, ship-building, shipping and films. It may be recalled that the first volume of Mr. Rao's book, which had a fairly good reception, consisted of a wide range of industries, including iron and steel, non-ferrous metals, engineering industries, fuel, power and chemicals. Mr. Rao has dealt with each industry separately. With commendable insight, the author has discussed in detail the problems of, and prospects for, each of these industries, in their proper historical perspective.

Mr. Rao's style is simple and exposition lucid. It bears the impress of a distinguished professional journalist. What is more, much thorough and painstaking study of most of the available reference materials on the subject has gone into the preparation of this book. Appropriate statistical data are also given wherever necessary. It is no exaggeration to say that the author has succeeded in giving a coherent and comprehensive picture of each of these industries.

Principles and Practice Relating to Punishments and Disciplinary Actions in Private Industries. By V. P. Arya. Published by Bhushan Prakashan, Post Box No. 9100, Calcutta. Pages: 45. Price: Rs. 12.00.

Although the modern concept of industrial relations envisages the creation of conditions in which the need for taking disciplinary action in a factory is reduced to the minimum, there is no doubt that occasions do arise in the management of a factory which involve punishments and disciplinary measures. The book under review is an excellent treatise on the subject it deals with. As the author, V. P. Arya, points out, there is little or no specific provision in any statute relating to industrial law in this country prescribing the correct procedure on this subject. However, in recent years, there has been a gradual emergence of a body of principles, as a result of decisions of the labour and

industrial tribunals, indicating the formalities to be observed and the correct procedure to be followed by the management in such cases. These principles are fairly well established. The author has presented them in a simple and non-technical language, and further, to clarify their application, by citing illustrative examples. The book ought to appeal to all industrial establishments.

The Madras Directory and Who's Who 1958. Published by the Madras Directory and Who's Who, 1/3 Lake View Road, Madras 17. Pages: 981. Price: Rs. 15.

The book under review furnishes a wealth of information on a variety of economic and trade matters relating to the four South Indian States, namely, Madras, Andhra, Mysore and Kerala. One section, under the caption "The Republic of India," is devoted to general information on the Indian economy as a whole. A new section on automobile industry and trade in South India is added to the present edition, which is ninth in the series since 1946. The customary sections deal with economic conditions of the States concerned and a classified list of trades and professions in each of them. Some useful notes on the principal business houses in South India form the subject matter of a separate section. A fairly elaborate account of estates and plantations in South India is also given. The section, "Who's Who," gives illustrated short life sketches of important industrialists, business executives, administrators, statesmen, and journalists in South Indian States.

Agricultural Atlas of Madhya Pradesh. Published by the Directorate of Land Records, M.P., Gwalior. Pages: 25. Price: Rs. 5.00.

The Atlas under review is the first of its kind produced by the Directorate of Land Records of the Government of Madhya Pradesh. It covers a wide range of subjects, including general agricultural information, physical features, rainfall, soil conditions, forest types, sowing, harvesting and marketing seasons of the crops, area, average yield and production of crops, index numbers of agricultural production and farm prices, size and distribution of land holdings and land utilisation upto 1956-57. There are also bar charts graphs and pie-charts on production and prices of commodities.

CHEMICALS THAT HELP INDUSTRY TO BRING A BETTER FUTURE CLOSER

Monsanto works constantly both to develop new, better chemicals—and to improve those chemicals already used in every major industry.

PHARMACEUTICALS—acetylsalicylic acid, phenacetin, benzocaine, phenol, phenolphthalein, germicides are but a few of the many Monsanto products in this field.

RUBBER—Monsanto's accelerators help speed vulcanization, add quality. Anti-oxidants improve resistance, prevent early cracking, give increased flexibility.

TEXTILES—Monsanto Syton is widely used in spinning cottons and woolsens, increases yarn strength, allows for reduction in twist.

PRESERVATIVES—Monsanto's pentachlorophenol chemicals help to preserve a wide range of products. Monsanto sodium benzoate helps prevent corrosion.

PAINT—Monsanto's chemicals are used extensively in the manufacture of high-quality paints, varnishes and lacquers.

CHEMICALS FOR EVERY INDUSTRY

STEEL IN THE THIRD PLAN ENLARGING CONSUMPTION POTENTIAL NEEDS URGENT ATTENTION

By Jehangir J. Ghandy

DIRECTOR-IN-CHARGE, TATA IRON AND STEEL CO., LTD.

[What should be the size of steel industry in the third Plan now on the anvil? How is it to be achieved? These two questions figure prominently in this article which is an adaptation of the author's address to the Rotary Club of Delhi last week. The author urges the adoption of a realistic target, as also immediate attention to the question of expanding engineering industries in order to enlarge the potential for consumption of steel. He convincingly shows why a high priority should be given to steel-using industries in the third Plan. He also calls for a revision of the basis for fixing steel prices payable to producers and a reduction in prices charged to consumers.—Ed.]

ALL sections of the private sector are in agreement with the basic goal of the Government's policy to create increasingly better opportunities of life for the Indian people through a rapid rate of economic growth. The task of raising India's standard of living, lower than that even of relatively underdeveloped countries like Libya or Ceylon, poses a tremendous challenge requiring the pooling of resources and efforts on a truly national scale. Everyone, I should imagine, fully accepts that only the most massive effort will enable the country to break through the poverty barrier, and reach the stage of self-sustaining growth.

In conditions such as these, the need for planning and control is self-evident—a fact fully recognised by the private sector. There is also no dispute over the magnitude of investment needed for the next plan. It is generally accepted that, if the momentum of development is to be sustained, an investment of the order of Rs. 10,000 crores will be necessary. There is difference of opinion, however, on the share of the private sector in the total plan outlay. In our view, the division of responsibilities between the two sectors should be based on economic, rather than on doctrinaire considerations.

Expansion of Steel Capacity

In the steel industry, there is complete unanimity on the basic premise that, having completed a fourfold expansion during the second Plan, we cannot afford to rest on our oars. We must, indeed, go forward. Our fortunate position in respect of raw materials, and the paramount need to industrialise, make the need and scope for expansion self-evident. There are differences, however, on the exact quantum of expansion, arising from varying estimates of future steel consumption. The National Council of Applied Economic Research, which undertook an appraisal of steel demand, has issued an interim report in which it assesses demand at the end of 1965-66 at six million tons of finished steel, while preliminary studies made by Government put the figure at 7.3 million tons. In either case, the figure is arrived at by making long-range assumptions involving a considerable element of uncertainty. To a degree this is inevitable, because a mere projection of demand trends will not serve in a period of intensive development, and estimates must, therefore, necessarily be based on the rate of growth assumed for the economy as a whole and for the major steel-using industries, in particular. Since these assumptions must necessarily be very tentative at this stage in the evolution of the third Plan, there is no reliable method of assessing the country's current demand for steel as supplies are severely rationed. The Iron and Steel Ministry estimates this at 4.2 million tons against an estimated consumption of 3.5 million tons in 1957. The figure of actual consumption includes, I understand, the steel content of imported equipment, although I am not sure to what extent this should be taken into account in estimating consumption of steel within the country in the immediate future when facilities for fabrication and manufacture will be very limited.

Lower Selling Prices

I should not worry too much over the disparity in the two estimates of steel consumption. In either case, it would mean a very sharp increase over present levels of consumption. For the last 20 years, steel supplies have been far short of the demand in India. Government had, therefore, to devise a distribution mechanism to restrict the use of steel, as far as possible, to priority needs. Taking advantage of the fact that India produces steel more cheaply than any other country in the world, Government fixed uniform selling prices for imported and Indian steel at levels lower than the prices of imported steel landed in India. The difference between the price paid for imported steel and the uniform selling price was

financed by creating a price equalisation fund, built up from a surcharge levied on the Indian producers. The Indian producers receive, therefore, what is known as the retention price, representing the official selling price minus the surcharge credited to the Government price equalisation fund. At the present time, this surcharge works out to an average of Rs. 115 per ton. As Indian steel production increases and the volume of imported steel is reduced, the need for continuing the price equalisation fund will correspondingly diminish and eventually cease altogether. It should then become possible and desirable to abolish the price equalisation fund by removing the surcharge levied on the producers, and doing away with the present distinction between selling and retention prices. Steel prices could also be brought down further by reducing the excise duty on steel, which was increased two years ago from Rs. 4 to Rs. 40 per ton of steel ingots, or Rs. 5 to Rs. 53 per ton in terms of finished steel. A reduction in selling prices will not only stimulate the consumption of steel within the country, but has also become necessary in consequence of the fact that the selling price, for instance, of bars and rods in India is Rs. 645 per ton, or Rs. 39 more than in the U.S.A., Rs. 76 more than in Japan, and as much as Rs. 119 more than in the U.K. As a matter of fact, the purpose of Government's price equalisation fund is not being fulfilled in the case of these products, because bars could be imported from Belgium or Japan at a landed duty paid cost of Rs. 28 and Rs. 42 respectively lower than the official selling price in India. The position is similar in the case of joists, plates and a few other products.

Secondary Industries

Steel producers like ourselves would, therefore, urge immediate action to enlarge the consumption potential in preparation for the expansion of steel industry in the third Plan. Primarily this calls for the development of steel-using industries to their full stature. This in turn pre-supposes some effort to lower the price of steel, because high raw material costs are definitely inhibiting the growth of demand for the products of these industries. The main emphasis in the second Plan was rightly on the creation of basic steel-making capacity; we should now like to see sufficient resources allocated for the development of secondary industries, which have suffered from want of attention and encouragement. The development of such industries is important, particularly from the employment angle, because they are less capital-intensive. To quote a Planning Commission estimate, the comparative figures are Rs. 80,000 of capital investment per worker in basic industries like steel, fertilisers or heavy electricals, but only Rs. 15,000 for large-scale industry manufacturing consumer or producer goods, and only Rs. 3,000 for reasonably productive small-scale industry. A given quantum of investment will obviously generate far greater employment in these less capital-intensive fields, which is an important consideration when we remember that there will be a minimum of 14 million new job-seekers in the third Plan period, besides which we shall have a carry-over of seven million unemployed from the second Plan period.

There are also certain psychological advantages in developing secondary industries, because their radiational effects will make the impact of industrialisation and economic advance felt in the remotest corners of the country, and thereby help to check the growing feeling of frustration so much in evidence. I would urge, therefore, that concrete steps should now be taken to bring about this development.

In the case of the engineering industry, the difficulties posed by the shortage of steel will have largely disappeared when the planned increase in output materialises. I doubt, how-

ever, if the industry will be able to use these larger quantities of steel, unless it prepares itself to do so from now. There has been a persistent demand from the industry for more generous treatment in respect of allocation of foreign exchange to enable it to import capital equipment that it so badly needs, not only for expanding production but also to make itself competitive in foreign markets. The allocations were understandably meagre at the hump of the second Plan when imports of capital goods went up to Rs. 575 crores, but conditions now seem easier. I should like to suggest that the planning for steel production should logically be extended to cover the engineering industry which will transform the steel into usable products, so that its place in the scale of priorities was assured. The growth of engineering capacity will have the further advantage of cutting down imports of capital goods and machinery, and thus help eventually to reduce the expenditure of foreign exchange. We should also take into account the fact that these industries have an important export potential, particularly in our traditional markets of South Asia and Africa.

Scale of Priorities

Whether consumption of finished steel would rise by 70 per cent. to 7.3 million tons as estimated by the Ministry or by 40 per cent. to six million tons as estimated by National Council for Applied Economic Research, is a point that need not detain us just now. In laying down a target, we need not necessarily be guided by immediate consumption possibilities but can reasonably take a larger view to anticipate future demand. In any case, the actual production in initial years is likely to be nowhere near target capacity, since it takes three to four years to reach the rated output, as is confirmed by experience of steel plants all over the world. I have no serious objection, therefore, to a target of 10 million ingot tons of steel by the end of the third Plan, provided we do not adhere to this too rigidly but maintain an elasticity of approach. The real danger to my mind is that a high target will divert to steel such a large proportion of the total resources that essential development in other fields will be starved of funds. If we remember that each million tons of additional steel capacity will mean earmarking as much as Rs. 100 crores to expand an existing plant or Rs. 200 crores to build one from scratch, the need for a rational scale of priorities between steel and other sectors becomes immediately evident. I would, therefore, urge a more realistic target of nine million ingot tons equal to just under seven million tons of finished steel. This will be ample for demand as we anticipate it and yet leave room for a degree of upward adjustment.

Costly Overemphasis

It was Mr. J. R. D. Tata who first sounded a note of warning against an overemphasis on steel in future planning. He felt that this would be a costly mistake and urged that the rate of steel expansion and the priority accorded to it should be determined not on considerations of prestige but keeping in mind the continued shortages of financial, technical and managerial resources, which will exist for the next 10 or 15 years. Subsequent to Mr. Tata's warning, several responsible economists have also pleaded for slowing down steel expansion on one count or another. This has at least had one tangible effect. Whereas Mr. T. T. Krishnamachari had talked in terms of a target of 15 million tons, and this figure also appeared in a memorandum on the 1958-59 budget, official thinking is now in terms of 10 million tons. A well-known economist, who takes, I believe, a position somewhat left of centre, said, in a recent article, that he would prefer the expansion of industries like steel to be slowed down until the country was in a position to produce fairly large proportions of the machinery required so as to avoid the crisis in foreign exchange resources on which the second Plan was almost foundering.

Export Potential

Nothing would give me, as a steel man of 42 years' standing, greater pleasure than to see this country take its rightful place among the leading steel producers of the world. I look forward, therefore, to the day when the steel works in this country would be selling their products not only at home but also in the neighbouring countries. I think it necessary, however, to warn against any facile assumptions about export possibilities. There is a growing world surplus in steel, and it will not be easy for us to enter world markets in competition with established producers like Japan, Britain and Western Europe and match the attractive

NEW PRODUCTS AND PROCESSES

Fruit Fertiliser

A NEW concentrated granular fertiliser containing 5 per cent. of magnesium is now available which, it is claimed, will meet the requirements of most apple, pear and plum orchards in the U.K. One application of the new fertiliser a year is recommended, preferably in February. Application rates vary from 5 to 6 cwt. per acre for dessert apples under clean cultivation to 8 to 9 cwt. per acre for culinary apples in grassed-down orchards. The nitrogen content is 12 per cent.; the potash content is 10 per cent. and the phosphate content 3.8 per cent. The relatively high level of magnesium will offset existing levels of deficiency and, it is hoped, will make trees less susceptible to mildew attack and spray damage.

Electric Motors

The first range of electric motors, from fractional to 40 horsepower, which incorporate a disc-type electro-magnetic brake as an integral design feature, has been manufactured in the U.K.

Advantages claimed for the new motors are savings in cost and space, and more efficient powerful braking. A 3 horsepower, 1,460 revolutions per minute motor with a maximum braking torque of 15 pounds-feet is only 34 inches longer than an equivalent ordinary motor. A new design of electromagnet is used and a range of torques is available for each horsepower frame size of motor. Two typical applications might be the stopping, by means of a low torque, of a machine spindle where the braking time is not critical and the precise positioning, by means of a high torque, of a machine-tool slide where the braking time is critical.

Cotton Resembling Wool

A new method of manufacturing cotton fabrics resembling woollen ones by means of improving cellulose cotton by special substances containing nitrogen has been suggested by Mr. Hamdam Usmanov, Director of the Tashkent Polymer Chemistry Institute of the U.S.S.R. Surface treatment of fibre gives it many qualities of wool: durability, easy dyeing, resistance to decay and loss of heat. The new fabrics can be used for garments, for very durable fishing nets and for cord fabrics which greatly improve the durability of tyres. Equipment designed by engineers from the Uzbek Academy of Sciences, will manufacture 300 metres of such fabrics made of cotton fibre an hour. The equipment consists of a three-chamber machine which is three metres high. The cotton material will pass through this continuously operating machine in order to be improved.

Rubber-based Paint

A new type of natural rubber based paint should prove a boon to night drivers and night landing pilots. The paint mixed with thousands of tiny beads known as "ballotini" gives a strong reflection to headlights in the dark. The advantages claimed for this type of paint include suitability for brush and spray application, speedy laying, fast drying—which keeps painters a minimum of time on the roads and adhesion strength. This type of paint is by no means restricted to the white line in the centre of the road, kerbs and bollards. Other uses include airports and airfield runways, aprons, etc., loading and parking bays, docksides, tennis courts, school playgrounds, interior traffic lanes in factories, storage spacing, car parks, street and covered markets, exhibition halls, sports stadiums, gymnasiums and the coping of railway platforms.

Electric-powered Cars

Three U.S. manufacturers are now developing advanced types of electric propulsion for automobiles. One uses a powerful light-weight battery borrowed from rockets and jet airplanes. Another firm has plans for perfecting a new type of storage battery, the oxygen-hydrogen fuel cell. The first of the new electric autos called the "Charles Town-About," has already appeared in California. It resembles a small European sports car—a capacious two-seater, with additional room in the back for two small children. The power source of the Charles is a 528-pound unit of selenium batteries that develop 48 volts of electricity, which moves the Charles into a smooth acceleration with no need for shifting gears. The car's top speed is 58 miles an hour. The car's batteries must be recharged after 75 to 100 miles of operation. Each recharge—accomplished by plugging a line into an ordinary wall socket—can be done overnight in seven hours. The cost is about the price of half a gallon of gasoline.

Plastic as Strong as Steel

A tough, resilient new plastic that can be used to replace many metals has been developed by E.I. du Pont de Nemours and Company in the United States. It is called Delrin.

Delrin now promises to be usable for automobile door handles, dashboards of cars, fuel pump and carburettor parts, and showerheads. More than 75 per cent. of its potential uses, which number more than 500, involve replacement of steel, brass, aluminium and zinc.

Delrin is formed from formaldehyde, a relatively simple molecule. The formaldehyde is polymerised, or joined together in long, tightly-packed chains of molecules. These chains form into very dense crystals, giving the plastic its strength and unique ability for long wear.

The manufacturer points out that Delrin cannot replace metals completely, since it cannot be easily cemented and is discoloured by ultraviolet rays. Du Pont scientists note that the costs of developing Delrin exceeded those spent by the company to produce nylon.

Notices

THE LANSDOWNE JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE LANSDOWNE JUTE COMPANY, LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 11 a.m. on Friday, the 20th day of November, 1959, for the following purposes:—

As Special Business

To consider and, if thought fit, to pass with or without modification the following Resolutions which will be proposed as Special Resolutions, namely:—

1. Resolved that the Company may borrow money from time to time from its Managing Agents provided the Managing Agents are agreeable so to lend, bearing interest at a rate lower than the prevailing Bank rate as may be agreed upon between the Managing Agents and the Directors of the Company but so that the money lent shall not at any time exceed Rs. 15,00,000 in the aggregate, which may be repaid by the Company without notice and shall be repaid within three days of demand by the Managing Agents.
2. Resolved that with effect from the first day of March, 1958, the Company agrees to pay the remuneration of such administrative staff that may be placed at its disposal by the Managing Agents in accordance with the terms of employment with such staff and the Managing Agents and in particular to make contribution to a Pool Commission Account maintained by the Jute Mills within the organisation of the Managing Agents and their associates, Messrs. F. W. Heilgers & Co. (Private) Ltd., for disbursement amongst such staff in terms of their agreement based on a percentage of the net profits of each company or a minimum contribution in the absence of or insufficiency of profit as may be agreed upon from time to time between the Directors of the Company and the Managing Agents.

It is further resolved that if at the end of each financial year there is any balance left in the Pool Commission Account after disbursement to the staff, such balances are to be refunded to the Company in proportion to the contribution made by the Company as heretofore.

As Ordinary Business

3. To consider and approve the Audited Accounts of the Company for the year ended 31st March, 1959 and to receive the Directors' and Auditors' Reports thereon.
4. To declare Dividend recommended by the Directors.
5. To appoint Directors in the place of retiring Directors.
6. To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th November, 1959 to 20th November, 1959, both days inclusive.

By Order of the Board,

BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

CALCUTTA, 24th September, 1959.

Note:—(a) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividend, if declared, will be paid on or after 27th November, 1959 to those shareholders so entitled whose names appear in the Company's books on the 20th November, 1959, or to their mandatees. No application for Dividend Warrants will be necessary.

EXPLANATORY STATEMENT

Resolutions Nos. 1 and 2:

The Company may require temporary financial accommodation from time to time and as the Managing Agents of the Company are prepared to lend money to it at a rate of interest lower

than the prevailing bank rate, if and when they have surplus funds so to lend, it is proposed to take advantage thereof. Section 370 of the Companies Act, 1956 as well as relative clauses in the Articles of Association of your Company empower your Company to take loans from the Managing Agents at a rate of interest to be agreed upon between them and the Board. The Auditors of your Company are of the opinion that granting of loans by the Managing Agents constitute a service by them in terms of Section 360 of the Act, and as from the first of March, 1958 such arrangement should be approved by the shareholders by Special Resolution pursuant to the above section. Counsel's opinion on the question is to the contrary but in order to remove any doubt in the matter it is proposed to pass a Special Resolution confirming the arrangement.

With regard to resolution No. 2, which is self-explanatory, the Managing Agents of your Company provide the Company with the whole or part-time services of their administrative staff and the Company pays the remuneration of such staff in accordance with their terms of employment. There is also an arrangement over a number of years between your Company and other Jute Mill Companies within the organisation of the Managing Agents to maintain a Pool Commission Account to which contribution is made by each such company based on a percentage of the net profits of each company and in the event of absence of or inadequacy of profit to make a minimum contribution as may be agreed upon from time to time between the Directors of each Company and the Managing Agents. Commission is distributed to the staff from this Pool Commission Accounts at the discretion of the Managing Agents and in the event of any balance being left over it is refunded to the Company in proportion to the contribution made by it. The Managing Agents retain no benefit out of this arrangement. The Auditors of your Company consider that inasmuch as such commission is paid through the Managing Agents out of monies contributed by the managed companies, it constitutes a service by the Managing Agents attracting the provision of Section 360 of the Act and should therefore receive sanction of the shareholders by Special Resolution. Special Resolution No. 2 is therefore placed before the members for consideration and adoption.

Sir Walter Michelmores, a Director and member of your Company, is also a Managing Director of Messrs. Bird & Co. (Private) Ltd., the Managing Agents of the Company.

To the extent indicated above the Managing Agents of the Company may be deemed to be interested in the business referred to in the resolutions.

UNION JUTE COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of UNION JUTE COMPANY, LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 10-20 a.m., on Friday, the 20th day of November, 1959, for the following purposes:

As Special Business

To consider and, if thought fit, to pass with or without modification the following Resolutions which will be proposed as Special Resolutions, namely:—

1. Resolved that the Company may borrow money from time to time from its Managing Agents provided the Managing Agents are agreeable so to lend, bearing interest at a rate lower than the prevailing Bank rate as may be agreed upon between the Managing Agents and the Directors of the Company but so that the money lent shall not at any time exceed Rs. 15,00,000 in the aggregate, which may be repaid by the Company without notice and shall be repaid within three days of demand by the Managing Agents.
2. Resolved that with effect from the first day of March, 1958, the Company agrees to pay the remuneration of such administrative staff that may be placed at its disposal by the Managing Agents in accordance with the terms of employment with such staff and the Managing Agents and in particular to make contribution to a Pool Commission Account maintained by the Jute Mills within the organisation of the Managing Agents and their associates Messrs. F. W.

Heilgers & Co. (Private) Ltd. for disbursement amongst such staff in terms of their agreement based on a percentage of the net profits of each company or a minimum contribution in the absence of or insufficiency of profit as may be agreed upon from time to time between the Directors of the Company and the Managing Agents.

It is further resolved that if at the end of each financial year there is any balance left in the Pool Commission Account after disbursement to the staff, such balances are to be refunded to the Company in proportion to the contribution made by the Company as heretofore.

As Ordinary Business

3. To consider and approve the Audited Accounts of the Company for the year ended 31st March, 1959, and to receive the Directors' and Auditors' Reports thereon.
4. To declare Dividends recommended by the Directors.
5. To appoint Directors in the place of retiring Directors.
6. To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th November, 1959 to 20th November, 1959, both days inclusive.

By Order of the Board,

BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

CHARTERED BANK BUILDINGS,
CALCUTTA, 24th September, 1959.

Note:—(a) A Member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividends, if declared, will be paid on or after 27th November, 1959, to those shareholders so entitled whose names appear in the Company's books on the 20th November, 1959, or to their mandatees. No application for Dividend Warrants will be necessary.

EXPLANATORY STATEMENT

Resolutions Nos. 1 and 2:

The Company may require temporary financial accommodation from time to time and as the Managing Agents of the Company are prepared to lend money to it at a rate of interest lower than the prevailing bank rate, if and when they have surplus funds so to lend, it is proposed to take advantage thereof. Section 370 of the Companies Act, 1956, as well as relative clauses in the Articles of Association of your Company empower your Company to take loans from the Managing Agents at a rate of interest to be agreed upon between them and the Board. The Auditors of your Company are of the opinion that granting of loans by the Managing Agents constitute a service by them in terms of Section 360 of the Act, and as from the first of March, 1958, such arrangement should be approved by the shareholders by Special Resolution pursuant to the above section. Counsel's opinion on the question is to the contrary but in order to remove any doubt in the matter it is proposed to pass a Special Resolution confirming the arrangement.

With regard to resolution No. 2 which is self-explanatory the Managing Agents of your Company provide the Company with the whole or part-time services of their administrative staff and the Company pays the remuneration of such staff in accordance with their terms of employment. There is also an arrangement over a number of years between your Company and other Jute Mill Companies within the organisation of the Managing Agents to maintain a Pool Commission Account to which contribution is made by each such Company based on a percentage of the net profits of each Company and in the event of absence of or inadequacy of profit to make a minimum contribution as may be agreed upon from time to time between the Directors of each Company and the Managing Agents. Commission is distributed to the staff from this Pool Commission Accounts at the discretion of the Managing Agents and in the event of any balance being left over it is refunded to the Company in proportion to the contribution made by it. The Managing Agents retain no benefit out of this arrangement. The Auditors of your Company consider that inasmuch as such commission is

paid through the Managing Agents out of monies contributed by the managed companies, it constitutes a service by the Managing Agents attracting the provision of Section 360 of the Act and should therefore receive sanction of the shareholders by Special Resolution. Special Resolution No. 2 is therefore placed before the members for consideration and adoption.

Sir Walter Michelmores, a Director and member of your Company, is also a Managing Director of Messrs. Bird & Co. (Private) Ltd., the Managing Agents of the Company.

To the extent indicated above the Managing Agents of the Company may be deemed to be interested in the business referred to in the resolutions.

THE STANDARD JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE STANDARD JUTE COMPANY LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 11.20 a.m. on Friday the 20th day of November, 1959, for the following purposes:—

As Special Business

To consider and if thought fit to pass with or without modification the following resolution which will be proposed as a Special Resolution, namely:—

1. Resolved that the Company may lend money from time to time to its holding company, The Kinnison Jute Mills Co., Ltd., as and when required by the borrower company and provided the Company has surplus money available so to lend, bearing interest at the rate of four per cent. per annum but so that the money lent shall not at any time exceed Rs. 20,00,000 in the aggregate which may be repaid by the borrower company without notice and shall be repaid within three days of demand by the lending company.

As Ordinary Business

2. To consider and approve the Audited Accounts of the Company for the year ended 31st March 1959 and to receive the Directors' and Auditors' Reports thereon.
3. To declare Dividend recommended by the Directors.
4. To appoint a Director in the place of a retiring Director.
5. To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed, from 5th November, 1959 to 20th November, 1959, both days inclusive.

By Order of the Board,

BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

CALCUTTA, 24th September, 1959.

Note: (a) A Member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividend, if declared, will be paid on or after 27th November, 1959 to those shareholders so entitled whose names appear in the Company's books on the 20th November 1959, or to their mandatees. No application for Dividend Warrants will be necessary.

EXPLANATORY STATEMENT

Resolution No. 1:

The Standard Jute Company Ltd., has substantial surplus funds which are at present held on short deposit with its Bankers fetching interest at a rate varying from 3 to 3½ per cent. per annum. It is essential that the money be kept liquid and it is not considered desirable therefore to immobilise the amount by long-term investment. Your Directors therefore consider it desirable that the Company should be authorised to lend such money, up to a maximum of Rs. 20,00,000 in the aggregate at any time, to its holding company, The Kinnison Jute Mills Company Ltd., bearing interest at the rate of 4 per cent. per annum which shall be repayable by the borrower company within three days of demand.

Under Section 370 of the Companies Act, 1956, sanction by Special Resolution is necessary

in view of the fact that the Board of Directors of the Company also form the majority of the Directors of The Kinnison Jute Mills Company Ltd. and although this section specifically mentions that loans by a holding company to its subsidiary do not come within the purview of this section, a Special Resolution would be necessary where the lender company is the subsidiary. Resolution No. 1 is therefore placed before the shareholders for their consideration.

THE KINNISON JUTE MILLS COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE KINNISON JUTE MILLS COMPANY, LTD., will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 10.35 a.m. on Friday the 20th day of November 1959, for the following purposes:—

As Special Business

To consider and, if thought fit, to pass with or without modification the following Resolutions which will be proposed as Special Resolutions, namely:—

1. Resolved that with effect from the first day of March, 1958, the Company may borrow money from time to time from its Managing Agents provided the Managing Agents are agreeable so to lend, bearing interest at a rate lower than the prevailing Bank rate as may be agreed upon between the Managing Agents and the Directors of the Company but so that the money lent shall not at any time exceed Rs. 15,00,000 in the aggregate, which may be repaid by the Company without notice and shall be repaid within three days of demand by the Managing Agents.
2. Resolved that with effect from the first day of March, 1958, the Company agrees to pay the remuneration of such administrative staff that may be placed at its disposal by the Managing Agents in accordance with the terms of employment with such staff and the Managing Agents and in particular to make contribution to a Pool Commission Account maintained by the Jute Mills within the organisation of the Managing Agents and their associates, Messrs. Bird & Co. (Private) Ltd. for disbursement amongst such staff in terms of their agreement based on a percentage of the net profits of each company or a minimum contribution in the absence of or insufficiency of profit as may be agreed upon from time to time between the Directors of the Company and the Managing Agents.

It is further resolved that if at the end of each financial year there is any balance left in the Pool Commission Account after disbursement to the staff, such balances are to be refunded to the Company in proportion to the contribution made by the Company as heretofore.

As Ordinary Business

3. To consider and approve the Audited Accounts of the Company for the year ended 31st March 1959 and to receive the Directors' and Auditors' Reports thereon.
4. To declare Dividends recommended by the Directors.
5. To appoint Directors in the place of retiring Directors.
6. To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th November 1959 to 20th November 1959, both days inclusive.

By Order of the Board,

F. W. HEILGERS & CO. (PRIVATE) LIMITED,
Managing Agents.

CALCUTTA, 24th September, 1959.

Note: (a) A Member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividends, if declared, will be paid on or after 27th November, 1959 to those shareholders so entitled whose names appear in the Company's books on the 20th November 1959, or

to their mandatees. No application for Dividend Warrants will be necessary.

EXPLANATORY STATEMENT

Resolutions Nos. 1 and 2:

As explained in the Directors' Report your Company has the benefit of financial accommodation afforded to it by its Managing Agents who lend money to the Company from time to time as required by it at a rate of interest which is more favourable than the Company could have obtained from its Bankers. Section 370 of the Companies Act, 1956, as well as relative clauses in the Articles of Association of your Company empower your Company to take loans from the Managing Agents at a rate of interest to be agreed upon between them and the Board. The Auditors of your Company are of the opinion that granting of loans by the Managing Agents constitute a service by them in terms of Section 360 of the Act, and as from the first of March, 1958 such arrangement should be approved by the shareholders by Special Resolution pursuant to the above Section. Counsel's opinion on the question is to the contrary but in order to remove any doubt in the matter it is proposed to pass a Special Resolution confirming the arrangement.

Similarly, with regard to resolution No. 2, which is self-explanatory, the Managing Agents of your Company provide the Company with the whole or part-time services of their administrative staff and the Company pays the remuneration of such staff in accordance with their terms of employment. There is also an arrangement over a number of years between your Company and other Jute Mill Companies within the organisation of the Managing Agents to maintain a Pool Commission Account to which contribution is made by each such company based on a percentage of the net profits of each company and in the event of absence of or inadequacy of profit to make a minimum contribution as may be agreed upon from time to time between the Directors of each company and the Managing Agents. Commission is distributed to the staff from this Pool Commission Account at the discretion of the Managing Agents and in the event of any balance being left over it is refunded to the Company in proportion to the contribution made by it. The Managing Agents retain no benefit out of this arrangement. The Auditors of your Company consider that inasmuch as such commission is paid through the Managing Agents out of monies contributed by the managed companies, it constitutes a service by the Managing Agents attracting the provision of Section 360 of the Act and should therefore receive sanction of the shareholders by Special Resolution. Special Resolution No. 2 is therefore placed before the members for consideration and adoption.

Sir Walter Michelmores, a Director and member of your Company, is also a Managing Director of Messrs. F. W. Heilgers & Co. (Private) Ltd., the Managing Agents of the Company.

To the extent indicated above the Managing Agents of the Company may be deemed to be interested in the business referred to in the resolutions.

THE LAWRENCE JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE LAWRENCE JUTE COMPANY, LTD., will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 11-10 a.m. on Friday, the 20th day of November, 1959, for the following purposes:—

1. To consider and approve the Audited Accounts of the Company for the year ended 31st March, 1959, and to receive the Directors' and Auditors' Reports thereon.
2. To declare Dividends recommended by the Directors.
3. To appoint Directors in the place of retiring Directors.
4. To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th November, 1959 to 20th November, 1959, both days inclusive.

By Order of the Board,

BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

CALCUTTA, 24th September, 1959.

Note:—(a) A member entitled to attend

and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividends, if declared, will be paid on or after 27th November, 1959, to those shareholders so entitled whose names appear in the Company's books on the 20th November, 1959, or to their mandatees. No application for Dividend Warrants will be necessary.

THE NORTHBROOK JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE NORTHBROOK JUTE COMPANY, LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 10.50 a.m., on Friday, the 20th day of November, 1959, for the following purposes:

As Special Business

To consider and, if thought fit, to pass with or without modification the following Resolutions which will be proposed as Special Resolutions, namely:—

- Resolved that with effect from the first day of March, 1958, the Company may borrow money from time to time from its Managing Agents provided the Managing Agents are agreeable so to lend, bearing interest at a rate lower than the prevailing Bank rate as may be agreed upon between the Managing Agents and the Directors of the Company but so that the money lent shall not at any time exceed Rs. 15,00,000 in the aggregate, which may be repaid by the Company without notice and shall be repaid within three days of demand by the Managing Agents.
- Resolved that with effect from the first day of March, 1958, the Company agrees to pay the remuneration of such administrative staff that may be placed at its disposal by the Managing Agents in accordance with the terms of employment with such staff and the Managing Agents and in particular to make contribution to a Pool Commission Account maintained by the Jute Mills within the organisation of the Managing Agents and their associates, Messrs. F. W. Heilgers & Co. (Private) Ltd., for disbursement amongst such staff in terms of their agreement based on a percentage of the net profits of each company or a minimum contribution in the absence of or insufficiency of profit as may be agreed upon from time to time between the Directors of the Company and the Managing Agents.

It is further resolved that if at the end of each financial year there is any balance left in the Pool Commission Account after disbursement to the staff, such balances are to be refunded to the Company in proportion to the contribution made by the Company as heretofore.

As Ordinary Business

- To consider and approve the Audited Accounts of the Company for the year ended 31st March, 1959, and to receive the Directors' and Auditors' Reports thereon.
- To declare Dividends recommended by the Directors.
- To appoint Directors in the place of retiring Directors.
- To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th November, 1959 to 20th November, 1959, both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

CALCUTTA, 24th September, 1959.

Note:—(a) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividends, if declared, will be paid on or after 27th November, 1959, to those Shareholders so entitled whose names appear in the Company's books on the 20th November,

1959, or to their mandatees. No application for Dividend Warrants will be necessary.

EXPLANATORY STATEMENT

Resolutions Nos. 1 and 2:

As explained in the Directors' Report your Company has the benefit of financial accommodation afforded to it by its Managing Agents who lend money to the Company from time to time as required by it at a rate of interest which is more favourable than the Company could have obtained from its Bankers. Section 370 of the Companies Act, 1956, as well as relative clauses in the Articles of Association of your Company empower your Company to take loans from the Managing Agents at a rate of interest to be agreed upon between them and the Board. The Auditors of your Company are of the opinion that granting of loans by the Managing Agents constitute a service by them in terms of Section 360 of the Act, and as from the first of March, 1958, such arrangement should be approved by the shareholders by Special Resolution pursuant to the above section. Counsel's opinion on the question is to the contrary but in order to remove any doubt in the matter it is proposed to pass a Special Resolution confirming the arrangement.

Similarly, with regard to Resolution No. 2, which is self-explanatory, the Managing Agents of your Company provide the Company with the whole or part-time services of their administrative staff and the Company pays the remuneration of such staff in accordance with their terms of employment. There is also an arrangement over a number of years between your Company and other Jute Mill Companies within the organisation of the Managing Agents to maintain a Pool Commission Account to which contribution is made by each such company based on a percentage of the net profits of each company and in the event of absence of or inadequacy of profit to make a minimum contribution as may be agreed upon from time to time between the Directors of each company and the Managing Agents. Commission is distributed to the staff from this Pool Commission Account at the discretion of the Managing Agents and in the event of any balance being left over it is refunded to the Company in proportion to the contribution made by it. The Managing Agents retain no benefit out of this arrangement. The Auditors of your Company consider that inasmuch as such commission is paid through the Managing Agents out of monies contributed by the managed companies, it constitutes a service by the Managing Agents attracting the provision of Section 360 of the Act and should therefore receive sanction of the shareholders by Special Resolution. Special Resolution No. 2 is therefore placed before the members for consideration and adoption.

Sir Walter Michelmores, a Director and member of your Company, is also a Managing Director of Messrs. Bird & Co. (Private) Ltd., the Managing Agents of the Company.

To the extent indicated above the Managing Agents of the Company may be deemed to be interested in the business referred to in the resolutions.

THE AUCKLAND JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE AUCKLAND JUTE COMPANY, LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 10.00 a.m., on Friday, the 20th day of November, 1959, for the following purposes:—

As Special Business

To consider and, if thought fit, to pass with or without modification the following Resolutions which will be proposed as Special Resolutions, namely:—

- Resolved that with effect from the first day of March, 1958, the Company may borrow money from time to time from its Managing Agents provided the Managing Agents are agreeable so to lend, bearing interest at a rate lower than the prevailing Bank rate as may be agreed upon between the Managing Agents and the Directors of the Company but so that the money lent shall not at any time exceed Rs. 15,00,000 in the aggregate, which may be repaid by the Company without notice and shall be repaid within three days of demand by the Managing Agents.
- Resolved that with effect from the first day of March, 1958, the Company agrees

to pay the remuneration of such administrative staff that may be placed at its disposal by the Managing Agents in accordance with the terms of employment with such staff and the Managing Agents and in particular to make contribution to a Pool Commission Account maintained by the Jute Mills within the organisation of the Managing Agents and their associates, Messrs. F. W. Heilgers & Co. (Private) Ltd., for disbursement amongst such staff in terms of their agreement based on a percentage of the net profits of each company or a minimum contribution in the absence of or insufficiency of profit as may be agreed upon from time to time between the Directors of the Company and the Managing Agents.

It is further resolved that if at the end of each financial year there is any balance left in the Pool Commission Account after disbursement to the staff, such balances are to be refunded to the Company in proportion to the contribution made by the Company as heretofore.

As Ordinary Business

- To consider and approve the Audited Accounts of the Company for the year ended 31st March, 1959, and to receive the Directors' and Auditors' Reports thereon.
- To declare Dividends recommended by the Directors.
- To appoint Directors in the place of retiring Directors.
- To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th November, 1959 to 20th November, 1959, both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

CALCUTTA, 24th September, 1959.

Note:—(a) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividends, if declared, will be paid on or after 27th November, 1959, to those Shareholders so entitled whose names appear in the Company's books on the 20th November, 1959, or to their mandatees. No application for Dividend Warrants will be necessary.

EXPLANATORY STATEMENT

Resolutions Nos. 1 and 2:

As explained in the Directors' Report your Company has the benefit of financial accommodation afforded to it by its Managing Agents who lend money to the Company from time to time as required by it at a rate of interest which is more favourable than the Company could have obtained from its Bankers. Section 370 of the Companies Act, 1956, as well as relative clauses in the Articles of Association of your Company empower your Company to take loans from the Managing Agents at a rate of interest to be agreed upon between them and the Board. The Auditors of your Company are of the opinion that granting of loans by the Managing Agents constitute a service by them in terms of Section 360 of the Act, and as from the first of March, 1958, such arrangement should be approved by the shareholders by Special Resolution pursuant to the above section. Counsel's opinion on the question is to the contrary but in order to remove any doubt in the matter it is proposed to pass a Special Resolution confirming the arrangement.

Similarly, with regard to Resolution No. 2, which is self-explanatory, the Managing Agents of your Company provide the Company with the whole or part-time services of their administrative staff and the Company pays the remuneration of such staff in accordance with their terms of employment. There is also an arrangement over a number of years between your Company and other Jute Mill Companies within the organisation of the Managing Agents to maintain a Pool Commission Account to which contribution is made by each such company based on a percentage of the net profits of each company and in the event of absence of or inadequacy of profit to make a minimum contribution as may be agreed upon from time to

time between the Directors of each company and the Managing Agents. Commission is distributed to the staff from this Pool Commission Account at the discretion of the Managing Agents and in the event of any balance being left over it is refunded to the Company in proportion to the contribution made by it. The Managing Agents retain no benefit out of this arrangement. The Auditors of your Company consider that inasmuch as such commission is paid through the Managing Agents out of monies contributed by the managed companies, it constitutes a service by the Managing Agents attracting the provision of Section 360 of the Act and should therefore receive sanction of the shareholders by Special Resolution. Special Resolution No. 2 is therefore placed before the members for consideration and adoption.

Sir Walter Michelmores, a Director and member of your Company, is also a Managing Director of Messrs. Bird & Co. (Private) Ltd., the Managing Agents of the Company.

To the extent indicated above the Managing Agents of the Company may be deemed to be interested in the business referred to in the resolutions.

THE DALHOUSIE JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE DALHOUSIE JUTE COMPANY, LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 10.10 a.m. on Friday, the 20th day of November, 1959, for the following purposes:—

As Special Business

To consider and, if thought fit, to pass with or without modification the following Resolutions which will be proposed as Special Resolutions, namely:—

- Resolved that with effect from the first day of March, 1958, the Company may borrow money from time to time from its Managing Agents provided the Managing Agents are agreeable so to lend, bearing interest at a rate lower than the prevailing Bank rate as may be agreed upon between the Managing Agents and the Directors of the Company but so that the money lent shall not at any time exceed Rs. 15,00,000 in the aggregate, which may be repaid by the Company without notice and shall be repaid within three days of demand by the Managing Agents.

- Resolved that with effect from the first day of March, 1958, the Company agrees to pay the remuneration of such administrative staff that may be placed at its disposal by the Managing Agents in accordance with the terms of employment with such staff and the Managing Agents and in particular to make contribution to a Pool Commission Account maintained by the Jute Mills within the organisation of the Managing Agents and their associates, Messrs. F. W. Heilgers & Co. (Private) Ltd., for disbursement amongst such staff in terms of their agreement based on a percentage of the net profits of each company or a minimum contribution in the absence of or insufficiency of profit as may be agreed upon from time to time between the Directors of the Company and the Managing Agents.

It is further resolved that if at the end of each financial year there is any balance left in the Pool Commission Account after disbursement to the staff, such balances are to be refunded to the Company in proportion to the contribution made by the Company as heretofore.

As Ordinary Business

- To consider and approve the Audited Accounts of the Company for the year ended 31st March, 1959 and to receive the Directors' and Auditors' Reports thereon.
- To declare Dividend recommended by the Directors.
- To appoint Directors in place of those retiring, including Khan Bahadur D. E. Avari, M.B.E., who having attained the age of 65 years is not eligible for re-election unless his appointment is approved by a resolution of the Company in General Meeting specifically declaring that the age limit shall not apply to him.

And in this connection to consider and, if thought fit, to pass the following resolution of which special notice as required by Section 281(2) of the Companies Act, 1956, has been received by the Company and the relative explanatory statement concerning which as required by Section 173 of the said Act is appended below:

To be proposed as an Ordinary Resolution—

"That the restriction as to age limit prescribed by Section 280 of the Companies Act, 1956, shall not apply to Khan Bahadur D. E. Avari, M.B.E., and that he be and is hereby re-elected as a Director of the Company, whose period of office as such Director would be liable to determination by retirement of Directors by rotation."

- To appoint Auditors and fix their remuneration.

The Share Transfer Registers of the Company will be closed from 5th November, 1959 to 20th November, 1959, both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

CALCUTTA, 24th September, 1959.

Note:—(a) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself.

A proxy need not be a member of the Company.

(b) The Dividend, if declared, will be paid on or after 27th November, 1959 to those shareholders so entitled whose names appear in the Company's books on the 20th November, 1959, or to their mandatees. No application for Dividend Warrants will be necessary.

EXPLANATORY STATEMENT

Resolution Nos. 1, 2 and 5:

As explained in the Directors' Report your Company has the benefit of financial accommodation afforded to it by its Managing Agents who lend money to the Company from time to time as required by it at a rate of interest which is more favourable than the Company could have obtained from its Bankers. Section 370 of the Companies Act, 1956, as well as relative clauses in the Articles of Association of your Company empower your Company to take loans from the Managing Agents at a rate of interest to be agreed upon between them and the Board. The Auditors of your Company are of the opinion that granting of loans by the Managing Agents constitute a service by them in terms of Section 360 of the Act, and as from the first of March, 1958 such arrangement should be approved by the shareholders by Special Resolution pursuant to the above section. Counsel's opinion on the question is to the contrary but in order to remove any doubt in the matter it is proposed to pass a Special Resolution confirming the arrangement.

Similarly, with regard to resolution No. 2, which is self-explanatory, the Managing Agents of your Company provide the Company with the whole or part-time services of their administrative staff and the Company pays the remuneration of such staff in accordance with their terms of employment. There is also an arrangement over a number of years between your Company and other Jute Mills Companies within the organisation of the Managing Agents to maintain a Pool Commission Account to which contribution is made by each such company based on a percentage of the net profits of each company and in the event of absence of or inadequacy of profit to make a minimum contribution as may be agreed upon from time to time between the Directors of each company and the Managing Agents. Commission is distributed to the staff from this Pool Commission Account at the discretion of the Managing Agents and in the event of any balance being left over it is refunded to the Company in proportion to the contribution made by it. The Managing Agents retain no benefit out of this arrangement. The Auditors of your Company consider that inasmuch as such commission is paid through the Managing Agents out of monies contributed by the managed companies, it constitutes a service by the Managing Agents attracting the provision of Section 360 of the Act and should therefore receive sanction of the shareholders by Special Resolution. Special Resolution No. 2 is therefore placed before the members for consideration and adoption.

Sir Walter Michelmores, a Director and member of your Company, is also a Managing Director of Messrs. Bird & Co. (Private) Ltd., the Managing Agents of the Company.

To the extent indicated above the Managing Agents of the Company may be deemed to be interested in the business referred to in the resolutions.

In the special notice given to the Company of the resolution under item No. 5 of the above notice it has been stated that the services of Khan Bahadur D. E. Avari have proved most useful to the Company and as he has considerable administrative experience, he should continue to remain on the Board of Directors of the Company and that the age limit imposed by Section 280 of the Companies Act, 1956, should not apply to him.

JESSOP AND COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN EXTRAORDINARY GENERAL MEETING of Members of the Company will be held at its Registered Office, 63 Netaji Subhas Road, Calcutta, on Friday the TWENTIETH day of November, 1959, at 11.00 a.m. to consider and, if thought fit, to pass, with or without modification, the following as a Special Resolution:—

THAT the Authorised Capital of the Company be increased, by the creation of 11,00,000 new Ordinary Shares of Rs. 10 each, to Rs. 4,10,00,000, divided as follows:

	Rs.
1,00,000 Cumulative Preference Shares of Rs. 100 each ...	1,00,00,000
31,00,000 Ordinary Shares of Rs. 10 each ...	3,10,00,000
	Rs. 4,10,00,000

EXPLANATORY STATEMENT

1. Equity capital of the Company is Rs. 2 crores, divided into 20,00,000 shares of Rs. 10 each, out of which 10,20,000 shares have been issued. As it is intended to make a further issue of 10,20,000 shares, it has become necessary to increase the authorised capital.

2. The number of authorised shares of Rs. 100 each is 1,00,000, out of which 20,000 shares have been issued as Cumulative Preference Shares. The shareholders' approval is requested to define the unissued 80,000 shares of Rs. 100 each as Cumulative Preference shares.

Dated the Fifteenth day of October, 1959.

By Order of the Board of Management,
D. D. MARKAN,
Secretary.

63, NETAJI SUBHAS ROAD,
CALCUTTA.

Note:—A Member entitled to attend and vote at the Meeting is entitled to appoint a Proxy to attend and vote instead of himself. A Proxy need not be a member of the Company.

GOVERNMENT OF INDIA MINISTRY OF RAILWAYS (Railway Board)

Indian Railways' Requirements of Double Acting Hydraulic and Friction Type Shock Absorbers for Vertical Application for First Class Coaches.

THE MINISTRY OF RAILWAYS (RAILWAY Board), Government of India, propose to obtain from established or prospective and reliable manufacturers supply of Double Acting Hydraulic and Friction Type Shock Absorbers for Vertical Application for First Class Coaches.

2. The relevant tender documents are obtainable from the Research Design and Standardisation Organization, Baroda House Annex, New Delhi, on payment of Rs. 2 per copy.

3. Quotations should reach the undersigned not later than 11 a.m. on 18th November, 1959.

QURBAN SINGH,
Director, Railway Stores,
Railway Board,
State Entry Road,
New Delhi.

RECENT TAXATION DECISIONS OF BOMBAY HIGH COURT

SEVERAL IMPORTANT ISSUES SETTLED

By K. H. Kaji, Advocate (O.S.)

THE recent taxation decisions of the Bombay High Court delivered in June-July 1959 by a Division Bench consisting of Shah and S. T. Desai JJ. seek to resolve some uncertainties and anomalies in the working of taxation laws, and deal with some questions of great public importance. The Income-tax Amendment Act 1959 successfully stood the challenge to its validity. Familiar topics such as Section 23A, Section 15C, and penal interest also came up before the Court, and the decisions throw considerable light on several complicated questions in income-tax law.

Income-tax Amendment Act

The constitutional validity of Section 3 of the Income-tax Amendment Act 1959 by which Section 49EE was incorporated in the Act was upheld by the High Court in the case of *Radheshyam Makhanlal vs. Union of India and Others*. (Mis. Application No. 263 of 1957, decided on 10th August 1959). The petitioner had paid large amounts and deposited certain securities in pursuance of settlement arrived at under Section 8A of the Investigation Commission Act. After several decisions of the Supreme Court which held settlements under Section 8A void, the petitioner claimed a refund of moneys paid and return of securities on the ground that the settlement was void. As the Department did not comply with the requisitions of the petitioner, he filed an application under Article 226 for a writ of certiorari for quashing the settlement and recovery notices and also for a writ of mandamus for refund of amounts paid and return of securities, and for restraining the Union of India and the Income-tax Commissioner and Income-tax Officer concerned from taking recovery proceedings against the petitioner. Two questions arose for decision before the High Court:

(1) Whether the High Court was competent to issue a writ under Article 226 compelling the Union of India to refund the amount of money or return the securities received pursuant to the settlement recorded under Section 8A of the Investigation Commission Act which section since then had been held *ultra vires* the Union Parliament?

(2) Whether the Union Parliament was competent to enact Section 3 of the Amendment Act by which Section 49EE was incorporated in the Income-tax Act prohibiting entertainment of claims for refund of money paid or for return of securities given pursuant to settlement relating to assessment or reassessment and conferring powers on the Department to set off in certain cases moneys in possession of Union against tax found due in proceedings for reassessment under Section 34?

The Union of India raised a preliminary objection that the High Court had no jurisdiction to issue a writ of mandamus against the Union of India for refund of the amount or the return of securities as the Union was not within the jurisdiction of the High Court. Their Lordships referred to the Supreme Court decision in the case of *Election Commission, India vs. Saka Venkata Subbarao*, (1953), in which it was held that there were two limitations on exercise of powers under Article 226: (1) writs cannot run beyond the territories subject to its jurisdiction; (2) a person or authority must be within those territories, i.e., must be amenable to its jurisdiction either by residence or location within those territories; merely because the authority or tribunal, located and normally carrying on its activities elsewhere, exercised jurisdiction within the High Court's territorial limits so as to affect the rights of parties therein, such tribunal or authority could not be regarded as functioning within the territorial limits of the High Court and amenable to Article 226. Applying these tests, the High Court held that even if a writ of mandamus was issued against the Union of India directing refund and the return of documents it could not be enforced within the territorial jurisdiction of the High Court. To be of an effective use the writ would have to run beyond its limits which under Article 226 the High Court was not empowered to do.

Their Lordships, therefore, held that the petition was not maintainable against the Union of India. Regarding the petition against other respondents, their Lordships observed that the claim of the petitioner for refund of the amount and the return of security involved various questions of fact. According to their Lordships, the

petitioner could not get the reliefs asked for without determination of those facts which was not possible in a writ application. Therefore, according to their Lordships, the petition failed on that ground, so far as claim for refund was concerned. It then dealt with the main contention of the petitioner that Section 49EE incorporated by the Amendment Act 1959 was void as violating Articles 14, 19(1) (f) and 31(2) of the Constitution. The main ground for attacking the section was that there was arbitrary discrimination between the tax-evaders whose cases were not referred to the Income-tax Commission or who had not entered into settlements or made payments pursuant thereto and those tax-evaders whose cases were referred to, settled, and payments made. According to their Lordships, the section itself indicated the persons to whom the provisions were intended to apply and the basis of classification was that those persons after accepting their liability and agreeing to pay tax and after making payments or giving securities were seeking to go back upon the agreement on the ground that the settlements were bad. The Court held that the selection of this group was based upon intelligible *differentia* which bore reasonable relation to the object sought to be achieved, viz., facilitating collection of taxes lawfully due by the taxpayers.

According to their Lordships, the object of this legislation was to render principle of set off applicable to the cases of all tax-evaders who had entered into a settlement and discharged their liability in respect of escaped income and after doing so wanted refund on the ground that the settlement was invalid. The object was not to put burden upon one group from which it exempted another group. The object was to bring within the operation of the system employed all tax-evaders in the same relation towards the subject matter of set off. It was a chance incidence of this system that those who had not paid escaped the operation of the system of set off. But the resulting inequality was incidental to the system and arose out of the exigencies of the situation. In this case, there was a nexus between the basis of classification and object of the enactment. Their Lordships also negated the challenge to the section as violating Articles 19(1) (f) and 31(2). Their Lordships, however, granted a writ restraining the officers from taking further steps for enforcing the settlement by adopting recovery proceedings as the settlement was void as a result of the Supreme Court decisions.

Section 23A

A question of considerable practical importance arose in the case of *New Mahalaxmi Mills Ltd. vs. C.I.T.* (I.T. Reference No. 44 of 1958 decided on 17th June 1959) as to the basis on which commercial profits should be ascertained to determine "smallness of profits." In the accounting year 1949-50, the balance-sheet of the assessee showed a profit of Rs. 3,367. The assessee distributed Rs. 12,800 as dividends. The I.T.O. assessed the assessable income at Rs. 1,37,693 by disallowing certain items. As 60 per cent. of the assessable income was not distributed, the I.T.O. passed an order under Section 23A. The Tribunal in appeal held that in considering whether an order under Section 23A should be passed, what should be considered is not the assessable income, but commercial profits. The Tribunal computed commercial profits at Rs. 56,800 and purported to deduct from it a sum of Rs. 19,325 as the liability for income-tax on those commercial profits. Thus Rs. 37,475 were computed as net commercial profits by the Tribunal. The Tribunal held that as 60 per cent. of the net commercial profits were not distributed, an order under Section 23A was justified. The assessee in the course of the reference before the High Court contended that calculation of tax liability by the Tribunal only on the commercial profits was erroneous as the assessee's liability to pay tax had no relation to commercial profits but to the assessable income. The petitioner, therefore, contended that for the purpose of determining net commercial profits, the I.T.O. was bound to ascertain, having regard to the commercial profits, the anticipated amount of tax liability on the assessable income which would have to be

deducted from the commercial profits to find out the net commercial profits and thereafter to determine whether the dividend declared was reasonable or not.

The petitioner submitted that the Tribunal was clearly in error in deducting only Rs. 19,325 as tax liabilities on commercial profits found by it because the actual liability of the assessee for tax was far in excess of Rs. 19,325. Their Lordships accepting the contention of the petitioner held that the expression "smallness of profits" meant "smallness of commercial profits" and that the I.T.O. had to determine what amount of such commercial profits would be actually available for distribution. While ascertaining net commercial profits, the tax deductible was not tax on commercial profits but tax on assessable income. The assessee could not contend that in assessing net commercial profits the whole of the amount set apart for meeting contingent liability should be deducted whereas in assessing tax, which he must have reasonably expected as payable by him, the total amount of tax actually assessed by the Department should be deducted. Their Lordships, therefore, held that the amount of tax which should be deducted from commercial profits for arriving at net commercial profits should be that amount of tax which might have been reasonably anticipated by the assessee as likely to be payable by him on the date on which dividend was declared, i.e., the date of the annual general meeting.

Section 16(3)(a)(iii)

In the case of *C.I.T. vs. Phiroze Shaw Pallonji Mistry* (I.T. Reference 65 of 1958, decided on 1st July 1959), a question arose whether the dividend income deemed to have been distributed to the wife of the assessee, as a shareholder of a company consequent on an order under Section 23A (before its amendment in 1955) against the Company could be included in the income of the husband under Section 16(3) as the shares were purchased by the wife from assets transferred by the husband. The facts were that in the assessment years 1949-50 and 1950-51, the wives of the two assessees, P. S. Mistry and S. P. Mistry, held shares in Shapurji Pallonji Co., Ltd. which were purchased out of the assets transferred by the assessees. An order under Section 23A was passed against the Company and the dividend income deemed to have been notionally distributed to the wives was sought to be included in the income of the assessees under Section 16(3). The assessees contended that the deemed income could not be included under Section 16(3). In a reference to the High Court, their Lordships examined the scheme of Section 23A in co-relation to Section 16 and observed that the liability under Section 23A was the consequence of a fictional distribution of income which in reality had not reached the hands of the shareholders. Section 16(3) introduced another fiction, namely, that income of the wife of the assessee was included in the income of the assessee. But according to their Lordships, under Section 16(3) such inclusion took place only if such income arose "directly or indirectly" from assets transferred to his wife by the assessee. According to their Lordships, such inclusion was permissible only where the income actually arose directly or indirectly. According to their Lordships, the word "indirectly" did not include income deemed to have been distributed under Section 23A.

Section 10(2)(vi) and (vib)

In the case of *Maneklal Vallabhdas Parekh vs. C.I.T.* (I.T. Reference No. 52 of 1958, decided on 23rd June 1959), the question raised was whether a part of the machinery was entitled to initial depreciation under Section 10(2) (vi), para 2. The facts were that the assessee purchased diesel engines to replace petrol engines in lorries belonging to the assessee. The assessee claimed an initial depreciation under the second para of clause (vi), normal depreciation having already been granted. On a reference, their Lordships observed that diesel engines were not "plants" because though plants would include vehicles it would not include a sort of vehicles. Their Lordships further observed that diesel engines could not be called "machinery" as machinery meant a self-contained unit capable of being put to use in business for the benefit of which it was installed. Their Lordships held, therefore, that the assessee was not entitled to initial depreciation.

In the case of *C.I.T. vs. Saraspur Mills Ltd.*, (I.T. Reference No. 39 of 1958 decided on 16th June 1959), a question arose whether an assessee was entitled to development rebate on motor cars and bicycles under Section 10(2) (vib). The assessee purchased motor cars and bicycles for the purpose of his business after 31st March

1954. The Department contended that the word "plant" did not include vehicles as the expressions "installed" and "installation" postulated that plant must be in a fixed position when it is being worked. Their Lordships considered the definition of "plant" in Section 10(5) which included vehicles and therefore held that motor vehicles were plants for the purpose of development rebate, the word "installed" being used in the sense of "inducted" or "introduced" into the assessee's business. Thus, the assessee was held entitled to development rebate on vehicles. In the case of *C.I.T. vs. Lever Bros.* (I.T. Reference No. 43 of 1958, decided on 17th June 1959), a similar question arose before their Lordships as to whether office appliances were included in the word "machinery" for the purpose of development rebate. Their Lordships held that office appliances were included in the word "machinery" and the assessee was entitled to claim development rebate on the same.

Section 15C

A very interesting question as to the conflicting claims of Section 15C and Section 24(2) came up for decision in the case of *C.I.T. vs. National Electric Industries Ltd.* (I.T. Reference No. 63/58, decided on 30th June 1959). The assessee (a newly established undertaking under Section 15(C) had brought forward unabsorbed depreciation and loss from previous years. It was, therefore, entitled to the benefit of Section 15C under which profits upto 6 per cent. of the capital are exempt from payment of tax. In the year of account, the assessee made a profit of Rs. 3,65,000. However, after deducting depreciation and loss brought forward from previous years there was no taxable income left and hence no demand was made. The I.T.O., therefore, did not give the benefit of Section 15C to the assessee. The assessee contended that the I.T.O. was bound to apply Section 15C first, as the assessee would then have been able to carry forward the unabsorbed depreciation and loss to subsequent years. Since the I.T.O. did not apply Section 15C first, the assessee was deprived of its benefit, as the unavailability of exemption under Section 15C could not be carried forward. The question which arose before the High Court on reference was whether the I.T.O. was bound to apply Section 15C first before deducting depreciation and losses brought forward from previous years. Their Lordships examining the scheme of the Act observed that the I.T.O. had to compute the assessable income from all heads of income subject to permissible deductions. Thereafter, loss under Section 24(2) and unabsorbed depreciation had to be deducted and it would only be after the net total income was ascertained and tax payable computed that the benefit of exemption under Section 15C was to be given to the assessee by not requiring the assessee to pay tax on such profits as did not exceed 6 per cent. of the capital employed.

Their Lordships further observed that while proviso to Section 10(2)(vi) provided that effect was first to be given to Section 24(2) before granting depreciation (for carrying forward of which there was no time limit), no similar provision was made for allowing relief under Section 15C first before deducting depreciation or losses. Their Lordships held that exemptions from tax and exemption from total income were not exemptions of the same category but they were available at different stages and there was no competition between them. Therefore, in the absence of any provision in Section 15C similar to the proviso to Section 10(2)(vi) there was nothing to compel their Lordships to put exemption of tax before computation of income. Their Lordships, therefore, held that unabsorbed depreciation and loss must first be deducted before benefit of Section 15C can be availed of by the assessee.

Section 18A

An important question as to the obligation of the assessee to estimate his income for the purpose of Section 18A and to pay advance tax arose in the case of *C.I.T. vs. Purshottamas Thakurdas* (I.T. Reference No. 45 of 1958 decided on 3rd July 1959). In pursuance of a notice under Section 18A(1), the assessee was called upon to make an advance payment of tax on so much of his income in respect of which tax was not deducted at source as was included in his total income of his latest previous year in respect of which he had been assessed. The assessee submitted a statement of his income for S.Y. 2002 and estimated his total income at Rs. 4,64,000. He claimed that, out of that amount, Section 18 applied to Rs. 3,64,000, being income by way of dividends and that Section 18A applied to the balance of Rs. 1 lakh. He then estimated that Rs. 32,940 was payable as income-tax on the income of Rs. 1,00,000 to which Section 18A applied, and Rs. 244,812 payable as super-tax on

the total income of Rs. 4,64,000. After claiming double taxation relief for Rs. 10,000, he estimated Rs. 2,67,752 as payable by him as tax. The assessee did not include super-tax on his dividend income in the advance payment of tax on the ground that Section 18 applied to such income. The question which arose before the High Court was whether the dividend income fell within Section 18 for the purpose of estimating the income under Section 18A, and payment of advance tax.

In dealing with the question, their Lordships, Shah and S. T. Desai JJ. delivered separate but concurring judgments arriving at the same conclusion. Shah J. observed that there was nothing in Section 18(5) to show that dividend income received by the shareholder was income in respect of which provision was made for deduction of income-tax at the time of payment. There was in truth no deduction of income-tax at the time of payment in the case of dividend income, but by a fiction, the Legislature treated the income-tax paid by the Company as paid on behalf of the assessee. According to his Lordship, Section 18(5) did not provide for deduction of income-tax in case of dividends. Therefore, when estimating the income and the advance tax payable under Section 18A(2) the assessee was bound to include all dividend income. S. T. Desai J. observed that under Section 18(5) income-tax paid by the Company in respect of dividend was deemed to have been paid by the shareholder, but this fiction was not extended to super-tax which the shareholder was bound to pay. Examining the scheme of Section 18A, his Lordship observed that, under clause (1), advance payment embraced all income save that expressly dealt with in Section 18 for the purpose of deduction at source. Further, advance payment is to be made both for income-tax and super-tax. According to his Lordship, the substance of the argument for the assessee was that Section 18(5) applied to dividend income and therefore Section 18A (6) did not apply to the assessee as regards dividend income and that he was exempt from making any advance payment even of super-tax on his dividend income.

According to the assessee, what was relevant was only this: Section 18(5) provided for giving credit to the assessee in respect of tax on dividend income. It was immaterial to examine the nature of the provisions of Section 18(5) or the object and effect of it. Examining the scheme of the Act, his Lordship observed that the words "income to which Section 18 does not apply" could only mean that while determining the amount of penal interest and applying 80 per cent. rule to the amount of tax paid in advance and the amount of tax determined at the regular assessment, the I.T.O. must exclude from the tax the amount of tax for which provision was made by Section 18, i.e., tax deducted under Sections 18(2) to 18(3)(d) and the amount of tax which is to be treated as paid by the assessee under Section 18(5). According to his Lordship, the exclusion under Section 18A(6) was not of one category of income on which regular assessment was made but of an amount of tax from the total amount of tax ultimately determined on the basis of regular assessment.

Construing Section 18A(6) thus, it was not the entire amount of tax (income-tax and super-tax) on the dividend income to which the exclusion could relate but only the amount of income-tax for which credit was to be given by Section 19(5). According to his Lordship, the assessee was, therefore, not justified in his contention that the entire category of dividend income was to be excluded from the computation in determining the percentage of 80 per cent. The amount of super-tax on dividend income must, therefore, be included and taken into consideration for the computation necessary for fixing quantum of tax to which the ratio of 80 per cent. was to be applied. Their Lordships, therefore, held that the assessee was liable to pay penal interest under Section 18A(6).

Receipt—Capital or Revenue

In the case of *P. H. Divecha and K. A. Irani vs. C.I.T.* (I.T. Reference No. 51/58, decided on 23rd June 1959), a question was raised whether amount received by the assessee was by way of compensation for loss of a business asset or was by way of a revenue receipt which was taxable. The assessees were partners of Precious Electric Company which had an agreement with Philips India Ltd. Under this agreement the firm was given monopoly rights to purchase electric bulbs manufactured by Philips in the Bombay State which they were to sell to other dealers in their jurisdiction. This agreement was terminable on three months' notice. In 1953, Philips India Ltd. served a notice of termination of the agreement

as they wanted to open a branch in Bombay to sell their products. It was agreed at the time of termination that "as a gesture of goodwill," Philips were prepared to pay Rs. 40,000 per annum to each of the three partners for three years. Further, Precious was allowed to continue as lamp dealers and that profit was in addition to the three years' remuneration referred to already.

On an interpretation of the original agreement and the events leading to the termination of the same and the provision for payment of Rs. 40,000 mentioned above, their Lordships observed that the original agreement brought into existence a monopoly purchase. The relationship between Philips and Precious Electric Company was that of principal and principal and not principal and agent. The firm had carried on, even before this agreement and after this agreement, their business in lamps and electric goods. But under this agreement they obtained their stock-in-trade on favourable terms. After termination of the agreement, the firm continued to deal in Philips bulbs, but they lost their monopoly rights and became regular dealers. Further, Philips offered to compensate for this loss by paying Rs. 40,000 per year to each of the three partners for three years, expressing it as three years' remuneration. Their Lordships observed that the proper test to determine whether a particular receipt was revenue or capital would be whether the receipt was compensation for destruction or sterilisation of the profit-making apparatus. On the facts of the case their Lordships held that the profit-making apparatus was not destroyed or sterilised. The same business (e.g., selling Philips lamps) continued. By the agreement, a specially favourable method of acquiring the stock-in-trade was devised, and the withdrawal of that concession and its substitution by an ordinary arrangement could not be called the loss of a capital asset. Their Lordships further held that the agreement under which the firm had become monopoly purchasers did not constitute a trading asset of the firm but was an agreement entered into in the ordinary course of business. Their Lordships, therefore, held that the receipt by the assessee was a revenue receipt and therefore taxable.

Rectification of Section 35

A question as to the period of limitation for exercise of powers (Section 35) arose in *C.I.T. vs. Seksaria Mills Ltd.* (I.T. Reference No. 47/58, decided on 19th June 1959). The question was whether an action can be taken under Section 35 for levying penal interest under Section 18A(8), if the I.T.O. had not levied it through oversight; if yes, then within what period? On a construction of the section, their Lordships held that the I.T.O. was competent to levy penal interest by exercising powers under Section 35 but that such action must be taken within four years from the date of the assessment order. If, however, after the assessment order action had been taken against the assessee under Section 34 and there was reassessment, then their Lordships held that *qua* the amount reassessed under the section, the period of four years should be calculated from the date of reassessment order under the section and not the date of the original assessment order. However, in the case of other assessed income, the period would be computed from the date of the original assessment order, under Section 23(3).

Director-controlled Company

An interesting question as to what is a director-controlled company arose under the above Act in the case of *C.I.T. vs. Filmistan, Bombay* (I.T. Reference No. 40/58, decided on 3rd July 1959). Under the Business Profit Tax Act, Rule 4(2) first schedule, remuneration paid to directors is liable to be added back to the company if the company is a director-controlled company. The Act did not define "director-controlled" but the "control of a company" was defined by Section 2(6) of the Act as meaning "control, direct or indirect, of more than one half of the voting power attached to the total issued paid-up capital of the company, or control vested by its memorandum and articles otherwise than by reference to such voting power." The I.T.O. passed an order under this rule holding that, though one-half of the voting power was not controlled, there were certain other factors which established the directors' control over the company. Those factors were: (1) ten years' tenure of directors under the agreement, (2) control regarding allotment, forfeiture of shares, etc., (3) exclusive borrowing powers to the directors, (4) absence of powers to shareholders to inspect books of account of the company as of right and (5) the quorum of the general meeting limited to two members both of whom could be directors. In appeal, the Tribunal held that all these factors did not lead to the

CONTROL ON FOREIGN TRADE ANNUAL REPORT OF ADMINISTRATION

A DETAILED account of the nature and extent of controls exercised by the Import and Export Trade Control Organisation, Government of India, is provided in its Administration Report for the year ended 31st March 1959. The major determinants of import policy are (1) the balance of payments situation and (2) the availability of foreign exchange resources. Admittedly, India continues to face serious problems in both respects. It is only natural then that the import policy should continue to be restrictive. Subject to this limitation, import policy continued to be directed towards the twin objectives of maximising indigenous industrial production and conserving foreign exchange for essential imports. Export controls, however, were relaxed considerably in view of the pressing need for earning foreign exchange and the growing competition in foreign markets.

During the first half of the year under review, namely, April-September 1958, import quotas were increased mainly for items required for such industries as textiles and chemicals. New quotas were given to two machinery items, namely, printing machinery and agricultural tractors. Quotas for about 126 items were either abolished or reduced for which the indigenous industry was expected to make good the shortage or usable substitutes for which could be obtained from indigenous sources. These include coal-tar dyes, a few types of motor vehicles parts, P.V.C. compounds and steel files.

A new feature of the import policy for the first half of 1958-59 was the allocation of higher foreign exchange ceilings for raw materials for certain essential industries. An attempt was thus made to sustain higher levels of production at least in these industries and licences for larger values were, therefore, granted on a selective basis. It was also decided to consider applications for the grant of advance licences for the following half-year, in order to ensure uninterrupted supply of certain essential raw materials. In respect of capital goods, a rigid and austere policy was continued. Licences were granted only in those cases where the import of machinery was (a) export earning or (b) import saving or (c) required for balancing industrial undertakings or (d) was financed by foreign aid, loans or long-term overseas investment.

Export Incentive

There were no material changes in the import policy for the second half-year, namely, October 1958 to March 1959. Such changes as there were, were mainly in favour of more imports. Thus, a larger allocation of foreign exchange to raw materials and industrial spares was provided. This was made possible by the expected relief as a result of loans from the U.S. Export-Import Bank, the Development Loan Fund, and imports on rupee payment basis from some of the countries which agreed to bilateral balancing. Another feature of the import policy was the priority given to industries catering to exports. To give an instance, a licensing scheme to help exporting textile mills and handloom co-operatives to import their requirements of dyes, chemicals and machinery was drawn up. Under the scheme, special licences were issued to the exporting mills upto a certain percentage of their export earnings for the import of dyes and chemicals. A substantial amount was also made available to mills for modernising their machinery, provided they were able to obtain the required machinery on deferred payments terms and were prepared to pay for it out of their increased export earnings. It was thus expected that the import policy would help to maintain the economy of the country and at the same time step up the level of exports by providing greater facilities to exporters who have a very important role to play in the future economy of the country. Quotas were reduced in respect of certain items where indigenous production had increased, as in the case of ball bearings, electric motor starters, certain chemicals, engineering items like twist drills, metal working saws, etc. The total number of such items where quotas were either reduced or banned were 95, covering the entire range of the I.T.C. schedule. Aggregate imports fell from Rs. 1,021.92 crores in 1957 to Rs. 859.95 crores in 1958.

Apart from regulating imports, the Government took steps to ensure equitable distribution of imported essential commodities at reasonable prices. In pursuance of the Essential Commodities Act 1955, stock returns were called for from all persons engaged in the supply or distribution, consumption, storage or trade and commerce of the notified commodities. Among other important steps taken by this Organisation towards the control on prices and distribution of goods, mention may be made of (i) channelisation of imports through an agency approved by Government and (ii) fixation of profit margins. Thus, licences were issued in some cases subject to price conditions endorsed on the licences themselves, (iii) limitations on the sale of certain imported goods—in respect of a number of items, quota licences were granted to established importers on condition that sales of imported goods would be made on directions of the particular Government authorities specified from time to time, and (iv) imports through the State Trading Corporation—in the case of certain items which are primarily required for industrial use and whose prices were on the increase due to limited supply or for any other reason. Steps were taken to arrange imports through the S.T.C., with a view to taking advantage of bulk imports at competitive prices and ensure proper distribution of the items at reasonable prices. In the field of imports, the S.T.C. had arranged imports of items such as silk raw, newsprint (both for maintaining buffer stocks and to meet the requirements of small newspapers and periodicals), X-ray films, photographic goods, etc. Under the Linking Arrangements, that is, linking imports of essential items to exports of Indian goods and operating through special Trade Development or Special Rupee Account, a few important commodities such as fertilisers and cinematographic raw films were imported without involving expenditure of foreign exchange.

The licensing procedure was subjected to further streamlining during the year, with a view to simplifying the system of licensing. The licensing policy, as distinct from import policy, continued without any perceptible change. In the case of actual users and export promotion items, the procedure was tightened up to prevent abuses. For small-scale producers, the procedure for submission of applications was revised to avoid delays.

Export Promotion

While imports were subjected to strict control, every effort was made to boost exports. Organised measures for export promotion were undertaken, keeping in view the necessity for encouraging exports of indigenous manufactures, wherever there were surplus over internal demand. The Export Trade Control Schedule was comprehensively reviewed. As a result, over 200 items were freed from control during the year under review. Besides, 30 additional items were placed on the free licensing list. The list of items subject to quota regulation was shortened. The banned list contained only a few items, largely of strategic value. Fresh controls, however, were imposed, but only on three items. These were: certain types of wild life, lac (other than brood lac and any lac containing living insects) and "chanks."

Despite numerous incentives to push up the level of export earnings, the performance was not very encouraging—exports at Rs. 568 crores during 1958 registering a decrease of Rs. 51 crores over the 1957 level of Rs. 619 crores. The above figures, however, exclude Rs. 11 crores and Rs. 38 crores of silver bullion bars and demonetised Government of India silver coins exported to the U.S. under lease-lend obligations during 1958 and 1957, respectively. Above 50 per cent. of India's export earnings are accounted for by the traditional items, such as tea, cotton piecegoods and jute manufactures. During 1958, the value of such commodities as pepper, lac, manganese ore, iron ore, castor oil, cotton piecegoods and jute manufactures, recorded appreciable decline. The exports of cotton piecegoods declined from Rs. 64 crores in 1957 to Rs. 45 crores in 1958, while the exports of jute manufactures declined from Rs. 115 crores to Rs. 104 crores. Manganese ore is yet another item in which a decline of Rs. 16 crores was recorded during 1958, as compared

with 1957. Among the commodities which registered an appreciable increase in value were tea, tobacco, cotton raw, linseed oil, etc. The exports of tea increased from Rs. 123 crores during 1957 to Rs. 137 crores in 1958, while those of tobacco, raw cotton and linseed oil showed an increase of Rs. 3 crores, Rs. 2 crores and Rs. 1 crore, respectively, in 1958, as compared with 1957.

Extent of Licensing

The Administration Report includes a brief account of the work done by the licensing authorities all over the country, under the Import and Export Trade Control Organisation. The number of import licence applications received during the year amounted to 315,000. In the licensing period October 1958 to March 1959 alone, the Organisation dealt with 173,834 applications for import licence, the highest figure on record with the exception of the period July-December 1956. We are told that disposals kept pace with the inflow, and the carryover at the close of the year was just 792 applications or 0.5 per cent. of receipts. In the case of applications for export licences, almost all the applications received during the year were disposed of before the end of the licensing period. The total expenditure of the Organisation, it may be noted, went up from about Rs. 68.50 lakhs in 1957-58 to Rs. 69.70 lakhs in the year under review. Fees for import licences credited to the Government also went up during the year under review, while those for export licences naturally declined, as shown in the following table:

	Import Licences Fee	Export Licences Fee
July 1957 to September 1957	Rs.	Rs.
October 1957 to March 1958	8,58,820	8,85,840
April 1958 to September 1958	28,85,930	10,00,515
October 1958 to March 1959	17,78,575	8,96,945
	30,77,875	8,17,285

The expenditure on foreign trade controls is bound to go up, since rules and regulations concerning licensing procedure have, of late, increased and become more complicated, in view of licensing under foreign aid programmes, deferred payment, export promotion and incentive schemes. The work of the Organisation has thus expanded.

IMPORT POLICY FOR BOOKS

During the current half-year, October 1958 to March 1959, licences will be granted to established importers of books on a quota of 100 per cent. General and 100 per cent. Soft on a repeat basis. Licences will be issued subject to the condition that not more than 40 per cent. of their face value could be utilised for import of fiction and permission in the remaining journals and magazines. With licences, it will be permissible to import, inter alia, not be allowed. The obvious purpose of this move is to ensure that import of essential technical books and children's books receive priority in the allocation of our limited foreign exchange resources.

In a Press note issued by the Government on this subject, the established importers are informed that it will not be necessary for them to make quota licences for the current half-year. It will be enough if the basic quota licences issued for import of books in respect of the half-year, April-September 1959 are sent along with a forwarding Treasury challan. Applications for supplementary licences will also be considered by the Government authorities concerned that the basic quota licences utilised at least upto 60 per cent. of their face value. The supplementary licences, we are told, will be granted fairly liberally but these will be valid only for import of standard technical books or references books on law, medicine, scientific research and industrial processes. The last date for receipt of applications for supplementary licences will be 15th February 1960.

Applications from actual users, such as libraries, technical and educational institutions will continue to be licensed on an ad hoc basis.

The first ferro-manganese plant in the Bombay State was inaugurated at Tumkur, in the manganese belt of Nagpur Division, on the 15th inst. by Mr. S. K. Wankhede, the State Minister for Planning and Development. The plant has been set up by the Cambata Ferro-manganese Private Ltd. The annual production of the plant is estimated at 40,000 tons. The plant, when in full production, is expected to earn foreign exchange to the tune of Rs. 4 crores. It may be noted that work in connection with the establishment of a second plant of the same type is in progress at Kankan, about 15 miles from Nagpur.

INDIAN OXYGEN is playing
vital role in building a more powerful and self-sufficient
India in the Second Five-Year Plan.

From transport to electric power, from the steel works to
the oil refinery—every day our technical service
is keeping the nation up-to-date with the
most modern methods of metal
fabrication.

The door is open to greater prosperity

SETBACK IN RESULTS OF AIR-INDIA MARKED RISE IN OPERATING EXPENSES

THE year 1958 was an important landmark in the history of the Air-India International Corporation, in that it marked the tenth anniversary of the Corporation's entry into the field of long-range international air transport operation launched by its predecessor, the Tata-managed Air-India International Ltd., on 8th June 1948, with an inaugural flight from Bombay to London. Starting with a single weekly frequency between Bombay and London via Cairo and Geneva, the Company has grown rapidly during the past one decade. In the first five years up to 1st August 1953, the date of nationalisation of air services in India, the Company's operations were extended to five services a week between India and the U.K., providing direct connections with Delhi and Calcutta, and one service between Bombay and Nairobi via Karachi and Aden. The available ton-miles operated by the Company rose from 669,000 in 1948 to 14,358,000 in 1952, the last full year of its operation before nationalisation. Since then, the Corporation has grown even more rapidly. It now owns a fleet of ten Super Constellation aircraft and, besides providing connections to many new stations on its Bombay-London route, it has opened many new routes. It now occupies the enviable position of one of the leading international airlines of the world, and has established a high reputation for safety, regularity and quality of its service over a route system covering 24,710 route miles and serving 26 cities in four continents.

The progress of the Corporation's operations since 1948 is indicated in the following comparative table:

	1958-59	1952-53	1948
Passengers carried ..	(No.) 83,888	22,185	2,805
Mails carried ..	(lbs.) 1,795,000	480,000	81,170
Cargo carried ..	(lbs.) 4,153,000	1,281,000	83,515
Aircraft owned ..	(No.) 10	4	3
Routes ..	(No.) 26	12	5
Stations ..	(No.) 26	12	5

The good progress made by the Corporation during these ten years has not, however, been crowned with any encouraging results on the financial side during the year ended 31st March 1959. On the contrary, the operating profit has suffered a sharp setback from Rs. 71.67 lakhs in 1957-58 to as low as Rs. 15.85 lakhs in the year under review. This is the second year in succession for which the operating profit has declined; it was Rs. 87.90 lakhs for 1956-57. The operating revenues for the year under review, in fact, show a slight increase of 6.8 per cent., that is, from Rs. 10.82 crores to Rs. 11.56 crores. As the capacity offered over the same period rose by 11 per cent., the average load factor declined by 2.3 per cent. and the operating profit by 77.9 per cent.

The main factors which were responsible for the setback in results during the year under review are:

1. Air travel throughout the world was affected by the economic recession which prevailed for most part of the year in the U.S. and to a lesser extent in Europe.

2. There was increased competition resulting from the entry of additional airlines on some of the Corporation's main routes.

3. Severe restrictions were continued to be imposed throughout the year by the Government of India on the use of foreign exchange for travel purposes.

4. There was a further rise in costs, arising partly from the normal incidence of annual increments to staff and partly from larger payments to staff, as also for goods and services, on account of rising cost of living in India and abroad.

In the circumstances, the members of the Board express a sense of satisfaction that the Corporation has been able to meet its expenses, provide for depreciation and obsolescence on spares on its enlarged fleet and to produce a modest profit.

The non-operating profit for the year under review has also suffered a sharp fall from Rs. 111.68 lakhs to Rs. 2.42 lakhs. This is, however, due to the profit of Rs. 116.03 lakhs earned on assets sold or scrapped in 1957-58, while there was no such earning in 1958-59. The total profit (after providing for depreciation) thus amounts to Rs. 18.27 lakhs, almost the whole of which has been taken to the equipment renewals

reserve, as will be seen from the following comparative table:

	For the year ended 31st March			
	1959	1958	1957	1956
Operating revenue—				
Traffic ..	11,10.12	10,47.59	9,35.66	8,60.18

Additional depreciation ..	—	69.23	—	—
Carry forward ..	0.95	0.92	1.21	0.35

* Other than depreciation and obsolescence.

Commenting on the aforesaid appropriation to the renewal reserve, the members of the Board in their latest annual report observe as follows:

"In view of the fall in the market value of second-hand piston-engined aircraft, to which a reference was made in the previous report, the Board decided during the year under review to write down the book value of the Corporation's fleet as at 1st April 1958, together with the cost of the two new Super Constellations received during the year, to 20 per cent. of the original cost by 31st March, 1964. Since then, the trend of second-hand values of long-range piston-engined aircraft have further deteriorated in the world market. It would now seem that even the revised policy of the Corporation in respect of depreciation will be inadequate to meet the rapidly changing situation and still higher provision for depreciation or equipment renewals reserve will have to be made in the accounts of the subsequent years. As a step in this direction, the Board has resolved to appropriate almost the whole of the disposable profit for the year to equipment renewals reserve. It may be noted that the general reserves and equipment renewals reserve combined, aggregating to a total of Rs. 114.25 lakhs, provides a useful cushion against possible capital losses arising from the disposal of the Super Constellation fleet in the coming years."

During the year under review, the Corporation received a sum of Rs. 297.30 lakhs from the Government of India on capital account, for financing various projects, including payments due for meeting the sterling content of the Boeing project. This raises the total amount so far received to Rs. 13.67 crores. Half of this sum has been converted into equity capital and the other half into loan capital bearing interest at 4½ per cent. per annum. The Government had given a moratorium in regard to interest on capital provided by it for the first five years to the end of July 1958. This has since then been extended to 1st October 1966.

Out of the capital receipt of Rs. 297.30 lakhs from the Government, the Corporation redeemed the ¾ per cent. bonds (1953-58) of the face value of Rs. 254.02 lakhs. Out of the World Bank loan of \$16.8 million (Rs. 8 crores) to meet the dollar content of the Boeing project, the total amount drawn upto the end of the year under review was \$4.27 million (Rs. 203.44 lakhs). The interest and commitment fees accrued and paid during the year amounted to Rs. 14.04 lakhs. The expenditure so far (up to the end of March 1959) incurred on the Boeing 707 project is Rs. 2.74 crores. The other fixed assets of the value of Rs. 14.21 crores stand written down to Rs. 9.72 crores. The reserves and surplus aggregate Rs. 2.58 crores.

The outlook for the current year is more hopeful. With renewed economic activity in the U.S. and Europe, the Corporation hopes that the accounts for the current year will reflect an improvement in load factors, revenues and profit. The Corporation is, however, somewhat pessimistic about the long-term prospects, as will be seen from the following observations of the Board of Members on the future plans of the Corporation:

"Looking further ahead, however, it is necessary to keep in mind that the whole of the world's aircraft industry is in a state of rapid and costly transition from piston-engined to turbine-powered aircraft. In ordering Boeing 707 aircraft, the Corporation has taken the first essential step to ensure the maintenance of its competitive position on its blue ribbon route to the Continent and the U.K. As, however, pure jet and turbo-prop aircraft are introduced by competing airlines on other routes, the Corporation must expect increasing competition and a progressive loss of revenue from next year onwards, unless it also places modern aircraft in operation on all its routes."

"The Corporation has been giving the most anxious consideration to this problem for many months. With the world air transport industry in a state of flux and transition, the Corporation is

faced with the need to exercise its judgments in the choice of new equipment at a time when an uncomfortably large proportion of the commercial and financial elements involved in such a choice are still uncertain. At the same time, because it takes about two years to obtain delivery of any aircraft ordered, it is not possible to wait for another year or two, as a total delay of three or four years would probably result in a catastrophic loss of competitive power and contraction of revenues. A decision must, therefore, be made during the current year and specific recommendations are expected to be submitted to Government shortly."

The Corporation, it may be noted here, has been consistently following the policy of offering the best service with the most modern planes obtainable at any given time. It is convinced that this policy is both sound and essential for the continued success and, in fact, to the economic survival of the Corporation. The continuation of this policy, however, depends on the extent of support which the Government of India extends to the Corporation.

SINGARENI HALVES DIVIDEND

The Directors of the Singareni Collieries Company, Ltd. [Secretaries and Treasurers: Industries (I.F.) Department, Government of Andhra Pradesh, Hyderabad], have recommended a dividend of 7½ per cent. per annum for the year ended 31st December 1958. This is half of that (15 per cent.) paid for the previous year, thus restoring it back to the rate paid for 1955. This sharp cut comes in distinct contrast to the successive increases made in previous years from 7 per cent. for 1954 to 15 per cent. in 1957. The reduction in the distribution to shareholders has been recommended, despite the good progress made by the Company. For the output and despatches have improved substantially and earnings have also shown a marked rise. The gross profit, which had recorded an almost unbroken upward trend since 1953, rising from Rs. 14.67 lakhs in that year to Rs. 64.67 lakhs in 1957, has forged ahead to Rs. 73.91 lakhs in the year under review.

The net profit, after making provision for depreciation and taxation, has also gone up from Rs. 15.50 lakhs in 1957 to Rs. 19.47 lakhs. The provision for depreciation has been cut from Rs. 38.18 lakhs to Rs. 31.31 lakhs, as "it is no longer permissible to contribute additional depreciation, in addition to normal depreciation as per income-tax rules." The provision for taxation has, on the other contrary, been raised from Rs. 8 lakhs to Rs. 20 lakhs. In accordance with the Finance Act, 1958, the Directors have created a development rebate reserve with an initial allocation from the year's profit of Rs. 8.02 lakhs. They have also created a loan redemption reserve with a transfer of Rs. 5 lakhs.

The Company's progress in recent years is well brought out in the following comparative table:

	For the year ended 31st December			
	1958	1957	1956	1955
Sale proceeds of coal ..	6,35.90	6,55.42	8,61.84	8,15.40
Closing stocks ..	9.15	8.71	8.54	1.19
Consumption of stores, power and fuel ..	1,19.28	1,07.87	96.05	84.88
Other expenses ..	8,71.33	2,94.90	2,46.00	1,95.47
Gross profit ..	75.93	64.67	53.64	38.40
Secretarial remuneration ..	3.18	—	—	—
Depreciation ..	21.31	26.18	35.94	32.12
Taxation ..	20.15	8.00	7.75	12.18
Net profit ..	19.47	8.50	8.95	13.78
Transfer to reserves ..	11.02	8.50	8.95	13.78
Other provisions ..	3.62	0.02	0.75	1.75
Bonus ..	2.80	1.08	1.00	1.00
Dividend ..	7.74	0.48	1.75	1.75
Carry forward ..	(75.93)	(15.85)	(10.95)	(73.91)
Production of coal .. (Tons)	2,115,566	1,919,484	1,981,577	1,820,870
Despatches .. (Tons)	2,028,262	1,815,601	1,896,880	1,802,112

The raisings of coal have gone up by nearly 200,000 tons, thus maintaining the upward trend since 1953, when the output amounted to only 1.27 million tons. Thus, in the course of five years, the Company's production has risen by nearly 70 per cent. With the increase in output during the year under review, the Company has almost reached its target of 2.16 million tons set for the year. Despite the progress made in the previous year, thanks to the satisfactory supply position in respect of wagons.

The Company's balance-sheet as on 31st December 1958 shows that its financial position is somewhat strained by the heavy borrowings. The paid-up capital of Rs. 63.21 lakhs is supplemented by reserves and surplus amounting to Rs. 106.81 lakhs. The total borrowings stand at Rs. 231.71 lakhs and current liabilities and provisions at Rs. 184.10 lakhs. The gross block of the value of Rs. 610.3 lakhs (including additions to the tune of Rs. 56.27 lakhs during the year under review) has been written down to Rs. 319.37 lakhs. The fall short of the current liabilities and provisions (including secured and unsecured loans) by Rs. 149.34 lakhs.

The borrowings of the Company include a loan of Rs. 10 lakhs granted by the Government of India in 1956. Since then, the Company had sought further loan assistance from the Centre, to finance its development programme. The provision of additional assistance had long been a subject of dispute between the Centre and the State Government, as the Centre's condition for such equity capital of the Company, was not acceptable to the State. This was, however, settled in March 1959, when the Centre, however, settled in March 1959, when the Centre agreed to give financial assistance to the tune of Rs. 4.15 crores (excluding the existing loan of Rs. 10 lakhs) up to the end of the current Plan period. Of this, 40 per cent. would be in the form of equity capital and the balance would be given as loan.

MYSORE SPINNING TURNS THE CORNER DIVIDEND UNCHANGED

NOTWITHSTANDING the difficult trading conditions which mills, particularly the up-country ones, working on coarse and medium counts had to face during 1958, the results of the Mysore Spinning and Manufacturing Company, Ltd. (Managing Agents: Messrs. N. Sirur & Co. Private Ltd., Bombay), for the year ended 28th February 1959 show an improvement over those for the previous year which was the leanest one for many years. Thus, the gross profit has gone up from a mere Rs. 7,890 earned in 1957-58 to Rs. 5.50 lakhs. After making provisions for managing agency remuneration, depreciation and taxation, the net profit works out to Rs. 4.68 lakhs. This is in refreshing contrast to the net loss of Rs. 4.57 lakhs suffered in 1957-58.

In the previous year, a sum of Rs. 8.82 lakhs was withdrawn from the general reserve to cover the loss and to pay a dividend of 10 per cent.—a sharp cut from 18 per cent. paid for the preceding two years. In view of the improvement in results for the year under review, it has not been found necessary to have recourse to past earnings. No worthwhile addition has, however, been made to the reserves, as the disposable surplus available, after making the usual provision for gratuity and setting aside Rs. 64,055 for development rebate reserve, is just sufficient to pay the preference dividend and to maintain the ordinary dividend at 10 per cent.

The results of the Company's working during the last four years are compared in the following table:

	For the year ended 28th February			
	1959	1958	1957	1956
Sale proceeds ..	1,97.64	1,80.30	1,67.89	1,62.89
Closing stocks ..	34.93	29.32	26.47	40.22
Cotton consumed ..	96.62	1,04.79	1,16.34	95.65
Stores, spares and fuel consumed ..	14.85	14.19	14.44	13.70
Other expenses ..	10.00	58.88	49.05	46.96
Gross profit ..	5.50	0.08	11.56	10.92
Gross profit ..	0.48	0.42	1.58	1.32
Managing Agents' remuneration ..	0.08	—	8.68	8.48
Depreciation ..	0.30	0.50	—	—
Taxation ..	+4.68	—4.57	+6.35	+6.16

Transfer from reserves and provisions ..	1.22	1.23	1.18	1.21
To reserves ..	0.33	0.33	0.33	0.33
Dividends ..	2.08	2.48	4.47	4.47
4½ per cent. preference ..	(D. 10%)	(D. 10%)	(D. 12%)	(D. 12%)
Ordinary ..	—	—	—	—
Carry forward ..	0.34	0.28	0.36	0.19

The small provision of Rs. 5,000 for depreciation made out of the profit for the year under review is on assets other than buildings and machinery, on which no depreciation has been set aside. For, on a review of the provisions made in earlier years, it is found that they are sufficient to cover the normal depreciation upto the end of the year under review. The provision for taxation represents wealth tax. No provision for income-tax is considered necessary on account of the losses and unabsorbed depreciation allowances of previous years.

Notwithstanding the depletion of reserves referred to above, the Company's financial position is still satisfactory. The paid-up capital stands at Rs. 32.28 lakhs, made up of 49,070 ordinary shares of Rs. 50 each and 14,901, 4½ per cent. cumulative preference shares of Rs. 50 each. Of these, 23,835 ordinary shares and the entire preference shares represent bonus issues. Even after such large capitalisation amounting to Rs. 19.37 lakhs in the past, the reserves and surplus aggregate Rs. 40.96 lakhs, of which Rs. 1.44 lakhs represent premium on shares. The borrowings stand reduced from Rs. 87.77 lakhs at the end of 1957-58 to Rs. 48.47 lakhs, while the other current liabilities and provisions are unchanged at Rs. 26.50 lakhs. The gross block of the value of Rs. 117.67 lakhs (including an addition of Rs. 4.73 lakhs during the year under review) has been written down to Rs. 45.81 lakhs. The current assets aggregate Rs. 102.42 lakhs, which exceeds the current liabilities and provisions by Rs. 27.45 lakhs.

Since the close of the year under review, the Company's working, according to the Directors, has further improved and this improvement, they hope, will be maintained, barring any unforeseen circumstances.

The Rs. 50 fully paid-up shares of the Company are being currently quoted at Rs. 74.50 per share. On an ex-dito basis, the shares premium-div. On an ex-dito basis, the shares provide a yield of 7.2 per cent. per annum. This is, however, taxable in the hands of the shareholders, as the Company is not liable to income-tax and super-tax for the year under review.

RUBY GENERAL INSURANCE COMPANY ECONOMIC RATE STRUCTURE FOR MARINE BUSINESS URGED

IN his address to the Twenty-third Annual General Meeting of the Ruby General Insurance Company, Ltd., held at Calcutta on 28th September, Mr. B. M. Birla, Chairman of the Company, reviewed the progress of the Company and drew the attention of the Government and insurance associations to the damage to property caused by fire, to the deplorable state of motor traffic and the heavy incidence of pilferage and theft at ports, all of which adversely affected fire, motor and marine insurance business. He suggested that, in view of the unsatisfactory results of marine business, serious attention should be given to framing an economic rate structure.

The following is the text of Mr. Birla's speech, which, in his absence, was read out by Mr. M. R. Sonthalia, one of the Directors of the Company.

"GENTLEMEN,

"It gives me great pleasure to welcome you to the twenty-third annual general meeting of the Company.

"The report of the Directors and the audited accounts for the year 1958 have been with you for some time and with your permission I take them as read.

"The following net premium figures reveal the progress of the Company:

	1956	1957	1958
Rs.	Rs.	Rs.	Rs.
Fire ..	47,14,000	52,01,000	56,40,000
Miscellaneous ..	—	—	—
accident ..	50,89,000	63,22,000	59,73,000
Marine ..	17,07,000	17,58,000	15,72,000
	Rs. 1,15,10,000	1,32,81,000	1,31,85,000

Fire Department

"More attention has been given to develop the fire business as this department has been comparatively better. The net premium income has increased from Rs. 52,01,000 to Rs. 56,40,000 during the year under review. The reserves have been increased from Rs. 22,10,476 to Rs. 25,09,758. Damage to property by fire is a national loss and it is high time that the Insurance Association took necessary steps in co-operation with the Government to educate the public in fire preventive methods.

Motor and Miscellaneous Departments

"Due to continued adverse claims experience in this department, particularly in the automobile section, which is a world-wide feature, a very cautious underwriting policy is being followed. Attention should be given to check the incidence of claims. The Government should strictly enforce the traffic regulations, particularly for goods carriers on national highways. With a view to improving the working of this department efforts are being made to develop other types of miscellaneous business such as machinery erection and personal accident insurance.

Marine Department

"As mentioned in previous years, a conservative underwriting policy is being pursued in this department. A large amount of national wastage can be avoided by improving the handling of cargo and checking of pilferage and thefts at the ports and during transit by the carriers. The Tariff Commission of the Insurance Association should give their serious attention to fixing an economic rate structure for marine business.

"The overseas business of your Company is being reorganised on the basis of the experience gained in the past and in view of the political changes in some countries in recent years.

"The Code of Conduct in general insurance business has been in operation for some years and it is in the interest of the industry that necessary modifications are made in the Code on the basis of the valuable experience gained so far.

The Year's Progress

"The Company has continued its progress which will be evident from the comparative premium figures of last several years. The net premiums and capital and funds in 1958 stands at Rs. 1,31,84,824 and Rs. 1,19,01,476, as against Rs. 71,80,001 and Rs. 77,86,222 in 1953.

"Before I conclude, I hope, you will join me in expressing our sincere thanks to the execu-

COMPANY MEETINGS AND DIVIDENDS

WEST COAST ELECTRIC SUPPLY CORPORATION LTD. Annual General Meeting, Madras, 28th October 1959. Dividend: 10 per cent. or Re. 1.00 per share, free of income-tax. Transfer books remain closed from 21st to 28th October 1959, both days inclusive.

NORTH WEST COAL CO., LTD. Annual General Meeting, Calcutta, 28th October 1959. Dividend: Re. 1.50 per share on shares of Rs. 10 each and Re. 1.12 per share on shares of Rs. 7.50 each. Transfer books remain closed from 19th to 29th October 1959, both days inclusive.

DHUNSERI TEA CO., LTD. Annual General Meeting, Calcutta, 30th October 1959. Dividend: Rs. 2.00 per share. Transfer books will remain closed from 26th to 30th October 1959, both days inclusive.

PATRAKOLA TEA CO., LTD. Annual General Meeting, Calcutta, 30th October 1959. Dividend: 20 per cent. or Rs. 20.00 per share. (This dividend is payable when funds are available from Pakistan.) Transfer books remain closed from 19th to 30th October 1959, both days inclusive.

RAGHUVANSHI MILLS LTD. Annual General Meeting, Bombay, 7th November 1959. Transfer books will remain closed from 2nd to 18th November 1959, both days inclusive.

CHAMPDARY JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 10th November 1959. Dividend: Rs. 4.00 per share (final), for the year ended 31st March 1959. Transfer books will remain closed from 26th October to 10th November 1959, both days inclusive.

DELHI CLOTH AND GENERAL MILLS CO., LTD. Annual General Meeting, Bara Hindu Rao, Delhi, 12th November 1959.

MYSORE GLASS AND ENAMEL WORKS LTD. Annual General Meeting, Bangalore, 16th November 1959. Dividend: Nil. Transfer books will remain closed from 4th to 18th November 1959, both days inclusive.

INDIA UNITED MILLS LTD. Annual General Meeting, Bombay, 20th November 1959. Dividend: Nil. Transfer books will remain closed from 6th to 20th November 1959, both days inclusive.

DILARAM TEA CO., LTD. Annual General Meeting, Calcutta, 21st November 1959. Transfer books will remain closed from 16th to 21st November 1959, both days inclusive.

NATIONAL INSULATED CABLE CO. OF INDIA LTD. Annual General Meeting, Calcutta, 27th November 1959. Transfer books will remain closed from 14th to 27th November 1959, both days inclusive.

NATIONAL ROLLING AND STEEL ROPES LTD. Annual General Meeting, Calcutta, 27th November 1959. Transfer books will remain closed from 14th to 27th November 1959, both days inclusive.

INDIA STEAMSHIP CO., LTD. Annual General Meeting, Calcutta, 27th November 1959. Transfer books will remain closed from 12th to 27th November 1959, both days inclusive.

CALCUTTA ELECTRIC SUPPLY CORPORATION LTD. Final dividend of £3½ per cent. net (tax applicable at 7s. 9d. in the £), for the year ended 31st March 1959, payable on 16th November 1959.

DAVANGERE COTTON MILLS LTD. Dividend of Rs. 9.00 per share for the year ended 31st March 1959, payable on 9th November 1959. Transfer books will remain closed from 27th October to 9th November 1959, both days inclusive.

COOPER ENGINEERING LTD. Dividend of Rs. 9.10 per share (includes bonus), for the year ended 30th June 1959, payable on 6th November 1959. Transfer books remain closed from 23rd October to 2nd November 1959, both days inclusive.

MACNEILL AND BARRY LTD. Dividend of 7 per cent. on the ordinary shares, for the year ended 31st March 1959, payable on 30th October 195

STEEL IN THE THIRD PLAN

(Concluded from page 688)

credit and deferred payment terms they can offer. In fact, it would be better for us to aim at exporting manufactured products, which would earn us three to four times more than steel as a raw material, quite apart from important benefits like generating more employment in the country. Here is another reason why the secondary and finishing industries using steel need far greater attention than we have given them in the second Plan period. As Mr. Tata said, our aim should be to sell abroad Indian-made trucks, machine tools, fans and sewing machines, because the same capital investment would create much more wealth, earn and save more in foreign exchange, provide more employment and gradually build up a more balanced and productive economy.

Self-sustaining Growth

Ideally, the growth of steel industry should become, as quickly as possible, self-sustaining and not impose fresh demands on national resources. As Prof. Galbraith, the noted Harvard economist, has pointed out in a recent note to the Planning Commission, resources for investment are, in a very large measure, created by the earnings of industrial enterprise in both the capitalist and communist countries. Industry thus assumes the responsibility for its own growth, contributing funds at the same time to the general revenues to finance development in other fields. As Prof. Galbraith says, it is an inefficient and self-limiting procedure to give people income and then remove it by taxation, inflation or appeals to thrift. I urge, therefore, that the idea of profit-making should no longer be regarded as suspect. In fact, everything should be done to facilitate the ploughing back of profits to make growth a self-sustaining process. From this it follows that retention prices for steel, whether produced in the private or the State sector, should be so fixed as to permit ploughing back at a reasonably adequate level. Last time, when retention prices were fixed for the 1955-60 period, this was recognised by including a special element in the price to finance expansion. The yield from this element in our case is expected to be Rs. 14 crores as against the capital expenditure of Rs. 130 crores over the same period on expansion, renewals and replacements, and ancillary schemes.

The price policy in previous years was not conducive to the accumulation of reserves. As a result, our expansion and modernisation has, in a large part, had to be financed through borrowings and issue a fresh capital which will leave the company bearing an enormous burden of debts totalling Rs. 80 crores. I feel, therefore, that there is a strong case for continuing to maintain an element in future retention prices to permit the liquidation of liabilities and also to finance future expansion. The political temptation to cut retention prices to such levels that expansion has to be financed mainly through borrowings must be resisted, because it violates the fundamental principle of self-generating development. In this context, I may point out that the American steel industry has financed its expansion to the extent of 80 per cent. from retained reserves. It is in this perspective that we must judge the economic validity of taxation policies in relation to corporate assets, and the disincentive these constitute in present conditions.

Economy of Expansion

In planning for future expansion of the steel industry, I need hardly emphasise the advantage of expanding the existing plants, because this can be done at a far lower capital cost than starting from scratch at a new site. To quote from our own experience, we have added a million tons of capacity at a capital cost of Rs. 95 crores, whereas the capital cost of the new steel plants is now in the neighbourhood of Rs. 200 crores each, including the cost of townships and ancillary facilities. The social overheads necessary at a new site will certainly be much larger than the expansion of an existing township to take care of the housing and other facilities needed for the net addition to the labour force. The State steel plants were all laid out for an ultimate production capacity of 2 to 2.5 million tons each. It is only common-sense to expand them to their design capacity to get the most economic rate of production. But, since we must also look ahead, beyond the third Plan, it is logical that we should seek to develop new sites such as Bokaro. Considerations of finance may well make it necessary to phase the Bokaro plant over a longer period

than the ones now being built but this could be turned to advantage if preparatory work was commenced for the provision of a transportation network, the building of dams to impound sufficient water, advance planning to meet power requirements and the location and prospecting of raw material sources. These steps are necessary not only for the Bokaro plant itself, but also for the general industrial development of the area. As such, action on these can be initiated even before the final go ahead on the Bokaro plant is given.

Transport Requirements

We would do well to remember that the creation of a further four million tons of capacity would require the movement of 24 million tons of freight traffic, taking both raw materials and finished products together. During the second Plan, we had faced a shortage of wagons and line capacity which is likely to be perpetuated, unless the development of railways is accelerated. I am, therefore, disheartened to hear that no increase in the tempo of railway development is envisaged in the third Plan period. Was it not time that we planned a way out of the uncertainty and shortage of transportation? I do not urge transportation difficulties as an argument against the expansion of the steel industry but would like to see more funds being provided for railway development so that the industry's needs can be adequately met. The planning for power, likewise, must be done sufficiently in advance to avoid the shortage that we now experience in the Bihar-West Bengal area. I would respectfully urge that the decision in respect of additional capacity for power, transport and other essentials should be taken simultaneously with the broad decision on steel targets. And, what is more, the implementation of both sets of decisions should be followed up with equal zeal.

Alloy and Tool Steel

While we are discussing the expansion of the basic steel industry, I feel we should take note of requirements in two allied spheres—alloy steels and ferro-alloys. Alloy steels are needed not only for the cutting and shaping metals by metal-using industries but also in the manufacture of a wide range of products. Although we need relatively small quantities, alloy steels are so high-priced—an average of Rs. 4,000 per ton—that their manufacture in India would result in large foreign exchange savings. In recognition of this, Government have called for a project report for an alloy steel plant of 40,000 tons ingot capacity, with provision for future expansion up to 80,000 tons. This is a step in the right direction, but official planning in this instance, is, in our view, not bold enough. A study of trends abroad indicates an alloy steel consumption of approximately 5 per cent. to 8 per cent. of ordinary finished steel, on which basis our requirements would be in the neighbourhood of 300,000 to 500,000 ingot tons, basing ourselves on the lower figure of six million tons of consumption suggested by the National Council of Applied Economic Research. If we approach the problem in another way by computing the alloy steel content of various industrial targets of the third Plan, we arrive at an estimate corresponding fairly closely to the earlier figure. It would seem necessary, therefore, to plan for a much larger capacity in alloy steel than at present envisaged. Basing upon this view, of future requirements, Tata Steel has communicated to the Government its readiness to put up a 100,000-ton alloy and tool steel plant, in addition to the one projected in the State sector.

In the field of ferro-alloys, used mainly as alloying ingredients in steelmaking, we have got off to a fine start. From no separate plants for ferro-manganese at all, we have now nine completed or under construction which will have a capacity of nearly 200,000 tons per annum. I think we should now follow this up by taking up the manufacture of other ferro-alloys like ferro-chrome, as Tata Steel is planning to do at Joda where its ferro-manganese plant has been in operation since early 1958. We should also think in terms of expanding the production range to make alloys like ferro-tungsten which will be needed for the alloy and tool steel industry.

It is not as yet very clear how the targetted production of 10 million tons is to be achieved. It appears that, in recognition of the advantages of expansion of the existing works, the three new steel works at Rourkela, Bhilai and Durgapur are to be developed to their full design capacity. Another idea under consideration is to set up medium-scale plants, utilising non-metallurgical coal in such areas as Andhra

Pradesh, Madras and Rajasthan, provided a suitable technology can be worked out. These, together with electric furnaces, existing or projected, will, it is hoped, contribute 600,000 tons of steel and 250,000 of pig iron.

Expansion in the Private Sector

Official intentions in respect of the existing steel works in the private sector have not yet been clearly defined. Both ourselves and the Indian Iron and Steel Company at Burnpur, have declared a readiness to expand. In the case of Tata Steel, we have just completed an expansion programme designed to raise our capacity to two million tons. This was undoubtedly a major undertaking, calling as it did for one-fifth of the total outlay on organised industries in the private sector during the second Plan. We are at the moment experiencing teething troubles inevitable in bringing into operation new plant and equipment, and the adoption of new technological processes. I think the worst is now over and things are slowly getting better. If there are no unexpected setbacks, we hope to reach our optimum production rate by the end of the second Plan. But, as I have just mentioned, we shall be carrying an enormous burden of debts, including loans from the World Bank and a group of U.S. and Canadian banks totalling Rs. 51 crores, which have to be repaid between 1959 and 1971. In spite of the serious financial difficulties, Tata Steel is willing to play its part by undertaking a further expansion of the capacity of its works. Since most of the ancillary facilities already exist, we believe we can carry out this expansion at a very economic cost per ton. For example, we have, in our expanded plant, a fairly comfortable surplus of rolling capacity. We propose, therefore, to add on the rolling side only a skelp mill to produce the raw material from which tubes and pipes are manufactured. It is generally recognised that the demand for tubes and pipes will rapidly increase in the coming years because of the growing use made of these lighter materials in structural and mechanical engineering. Needless to say, the expansion programme I have just outlined cannot be possibly brought to fruition without the active sympathy and help of the Government, and I have no doubt that these will be forthcoming.

What I have said now is an attempt to look into the future and to present my views on what needs to be done. I have not attempted to put forward any specific conclusions, because these can only emerge from further consultations and discussions between all sections of the industry.

Notices

THE PEERMADE TEA COMPANY LIMITED
(Incorporated in India)

THE BOARD OF DIRECTORS HAVE SANCTIONED payment of an interim dividend on the Ordinary Shares at 7½ per cent. in respect of 1959 working, from which will be deducted Income-tax in accordance with the provisions of the Indian Finance Act, 1959. This dividend will be paid to those shareholders whose names appear in the register of the Company as on 23rd November 1959, on their mandates, and the dividend warrants will be posted from the said date onwards.

The Transfer Books of the Company will remain closed from the 19th November 1959 to the 23rd November 1959 inclusive.

ASPINWALL & CO. (TRAVANCORE) LTD.,
Secretaries.
ALLEPPEY, 19th October, 1959.

WINGET VIBRATED, MARSHALL'S VIBRO-concrete and V-4 Block-making Machines operated by Motor for Solid or Hollow Concrete Blocks with pallets and Moulds and Structural Bins are available for sale. Copies of tenders with full particulars can be had on application from the Office of the Stores Controller, Tata Locomotive and Engineering Co., Ltd., Jamshedpur-4. Closing date of tender—12th November 1959 at 2.30 p.m.

DEMAND FOR MONEY POOR

(From Our Own Correspondent)

BOMBAY, 21st October

Comfortable conditions continue to prevail in the short-term money market. Though the traditional slack season is drawing to a close, there is yet no sign of revival of demand for bank credit. Banks are, therefore, having a surfeit of funds and this has had a depressing effect on the inter-bank call money rate among the large banks, pushing it down from 2 per cent. to 1½ per cent. In the small banks section, however, funds are in short supply and the rate is, therefore, unchanged at the previous week's level of 2½ per cent. House money at seven days' notice is maintained at 3 to 3½ per cent. and short-term deposits at 3 to 3½ per cent. for one to six months.

The aforesaid conditions are duly reflected in the results of the 91-day Treasury Bill sales this week. The amount offered was Rs. 3.85 crores, that is, Rs. 1.85 crores more than that invited. The discount rate has also come down from 2.40 per cent. to 2.435 per cent. per annum. Notwithstanding the good response, the tenders for next week have not been raised. Presumably, the authorities do not want to take a risk, in view of the fact that the seasonal pressure on funds may come at any moment. In any case, the banks are given the opportunity to divert their surplus funds to Intermediate Bills which continue to be on top. In fact, sales of these bills last week (from 14th to 17th October) aggregated as much as Rs. 4.25 crores. They are being offered this week also at the same rate of 99.406 per cent., which works out to a discount rate of 2.376 per cent. per annum.

There has been a further, albeit small, contraction of Rs. 5.47 crores in notes in circulation during the week ended 16th October 1959. Disclosing this, the Reserve Bank of India statement for that week, shows a rise of Rs. 6.12 crores in total notes issued. There is no change in foreign total notes issued. A sharp rise of Rs. 23.65 crores is noted in deposits of other Governments and of Rs. 13.84 crores in Scheduled banks' deposits. Loans and advances to Governments are lower by Rs. 6.56 crores and other loans and advances by Rs. 5.12 crores. Of the latter, advances to Scheduled banks against usance bills account for Rs. 2.07 crores. There has been a net increase of Rs. 28.59 crores in investments, reflecting the purchase of the second series of Central loans created two weeks ago.

A sharp fall of Rs. 13.77 crores in demand deposits and of Rs. 2 crores in time deposits is disclosed by the Scheduled banks' statement for the week ended 9th October 1959. Of the cumulative decline of Rs. 15.77 crores in total net deposits, the State Bank of India alone accounts for Rs. 7.57 crores. Inter-bank borrowings also are lower by Rs. 3.89 crores, while borrowings from the Reserve Bank have gone up by Rs. 2.32 crores and those from the State Bank by Rs. 1.58 crores. Advances have declined by Rs. 4.39 crores (State Bank's advances are higher by Rs. 1.62 crores), while bills purchased and discounted have risen by Rs. 3.05 crores. There has been a drop of Rs. 8.33 crores in investments, of which the share of the State Bank is Rs. 5.24 crores. Cash balances have shrunk by Rs. 4.95 crores, mainly due to the contraction of Rs. 13.25 crores of State Bank account. Money at call and short notice is also lower by Rs. 5.83 crores.

Barring a demand for a few short-dated issues, there is not much of an activity in the gilt-edged market, which continues to rule dull. Some of the medium and long-dated loans are, in fact, on offer. State loans too are featureless, and the rate of business is small. 3 per cent. 1986 Conversion Loan is being quoted 5 nP lower at Rs. 74.85. Among the short-dateds, 2½ per cent. 1981 has picked up 5 nP to Rs. 98.30. 2½ per cent. 1982 has staged a similar rise to Rs. 97.80. 3 per cent. 1983-85 and 3 per cent. 1984 have gained 5 nP each to Rs. 98.15. 3½ per cent. 1984 is placed at Rs. 100.15 ex-voucher, as against Rs. 100.30 cum-voucher. Other loans disclose no change.

The rupee displayed signs of slight weakness early in the week, after last week's sharp gain, but soon recovered the lost ground. Thus, banks' selling rate for U.S. T.T. rose from Rs. 478.50 to Rs. 476.75 per \$100 before coming down to Rs. 476.50 per \$100. Likewise, there buying rate closed unchanged at Rs. 473.25 per \$100, after an early rise to Rs. 473.50. These fluctuations are in consonance with the trend of sterling abroad. In New York, spot sterling weakened from 280.85-280.88 cents to 280.70-280.73 cents before picking up to 280.80-280.83 cents. Three months' forward were almost unchanged at 281.24-281.29 cents.

RICE PRICES UNCHANGED

(From Our Own Correspondent)

HAPUR, 19th October

Quiet to steady conditions were witnessed in foodgrain prices during the past week. Fresh demand for rabi grains was reported for seed purposes. Rabi sowings have begun in right earnest and most of the land recently vacated from kharif crops would be available for rabi sowings in areas which have had rains early in October.

Wheat prices at Hapur ruled quietly steady to be quoted on Monday at Rs. 17.50 per maund for average quality and at Rs. 18.75 for far superior quality. It was gathered that the Government godowns for seed purposes were being sold in the market, with the result that wheat arrivals have improved to an average of 100 maunds daily. The State Government's wheat levy scheme is being continued, but the supplies reaching the Government were less than the open market prices were much higher than the controlled purchase price at Rs. 13

BOOM IN BULLION

(From Our Own Correspondent)

BOMBAY, 21st October

Boom conditions prevailed in the bullion market during the week under review. Prices of both silver and gold forged further ahead to new high levels—ready silver touching today an all-time peak of Rs. 210.6, which was Rs. 2-10 more than the previous record of Rs. 207-12 touched in June 1951 and forward silver (November settlement) a high of Rs. 211-2. Ready and forward gold knocked at Rs. 125-10, a level not seen in the history of the bullion trade.

The sustained strength of silver is attributed to aggressive buying by a group of bull operators in Bombay and Calcutta, accompanied by hectic short-covering by sellers who had to pay heavy margins as the bull charges in the October settlement, which expired a few days ago, were over Rs. 1 in their favour. The scarcity of floating stocks, absence of arrivals of Tibetan coins and reports of entry of some Chinese troops into Kalimpong were all factors which helped bullish sentiment.

The upward trend in gold was inspired by reports that some leading bull operators had taken delivery of about 65,000 tolas in the last settlement, resulting in a depletion of floating stocks. The absence of any perceptible inflow of contraband metal and the good offtake in the ready section provided additional stimulants.

Forward silver (October settlement) rallied from Rs. 208-11 to Rs. 209-2 on Monday this week, before the settlement ran out at that rate. The November settlement forged ahead from Rs. 207-12 to Rs. 209-15 on Friday last. After a short-lived setback to Rs. 209-6, the forward rate for this settlement soared to touch a high of Rs. 211-2 today. The closing was done at Rs. 211-1.

Ready silver picked up Rs. 3-12 to Rs. 210-5 over the week. The floating stocks of silver are estimated at 600 to 700 tons. The daily average arrivals were 20 bars, while the offtake was no more than 10 bars.

Gold for forward delivery (October settlement) hardened from Rs. 123-12 to Rs. 124-3 before the settlement ran out at Rs. 123-15 on the 17th inst. The November settlement staged a sustained rise from Rs. 124-5 to Rs. 125-10 on Monday at which level there was good profit-taking bringing the rate down to Rs. 124-13 yesterday. Today, however, a fresh bout of buying pushed up the price to Rs. 125-8. The closing was, however, done at Rs. 125-7.

Ready gold advanced over the week by Re. 1-4 to Rs. 125-7. The floating stocks of gold are reported to be 60,000 tolas. The daily average arrivals and offtake are of the order of 2,500 tolas.

In London, spot and forward silver were unchanged at 80½d. and 79½d. respectively. New York silver was also maintained at 91.37 cents. Gold in London, however, slipped from 249s. 11½d. to 249s. 10½d. per fine ounce.

The following comparative table shows at a glance the trend of the market during the week under review:

	21-10-59	Highest	Lowest	14-10-59
GOLD	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready (99 fine Mint)	125 7	125 10	123 9	124 8
Forward	125 7	125 10	123 11	124 8
SILVER				
Ready (999 fine Mint)	210 5	210 6	207 0	206 11
Forward	211 2	211 2	208 2	207 1
1950-59				
London Silver Ready	80½d.	—	—	80½d.
London Forward ..	80½d.	—	—	80½d.
New York Silver ..	91.37½c.	250s. 11½d.	249s. 10½d.	91.37½c.

* 17th November settlement. † 16th November settlement.

to Rs. 15 a maund. Lean period for wheat requirements is yet to follow and it is feared that prices may further improve. The Union Government is seriously thinking of forming larger food zones as a means of removing price disparity between the deficit and surplus States.

Paddy arrivals during the week were heavy, but prices of rice stayed steady on reports of heavy damage to rice crop in West Bengal due to floods and in east U.P. following drought conditions earlier. Week-end prices were: Rice sela Rs. 32 to Rs. 35, mainpuri Rs. 24, ramajwayan Rs. 24.50, gadda Rs. 22, all rates per maund. Gram prices registered gains of about 25 nP per maund due to increased demand for seed purposes. Sowings of gram and peas are in full swing. Gram stock position is comfortable here at about 50,000 maunds. Although new maize arrivals in the market were small, the prices remained depressed, as there had been a bumper crop. But most of the maize is being retained in villages and is meeting rural population demand. Barley and bejhar prices ruled quietly steady. Jowar and guar prices were almost stationary and stocks were meagre. Week-end prices (in rupees per maund) were: Gram 12.87 to 13.25, barley 12.75, bejhar 11.50, maize 11.25 to 11.50, desi 12, jowar 12 to 14, guar 11 to 13, bajra 13; stocks: gram 50,000, barley 4,000, rice 5,000 maunds.

Pulses lacked support. Arrivals of peas were about 100 maunds daily and local stock was unchanged at about 40 khattees. Prices too remained stationary at Rs. 11.50 to Rs. 11.75 per maund for dara quality, while farm quality was being quoted up to Rs. 12.75 a maund, and peas dal at Rs. 13.12 a maund. Demand of arhar is dormant and with arrivals almost nil, local stock is unchanged at 30 khattees. Prices of other pulses were quiet to be quoted on Monday (in rupees per maund): at: Arhar 17, arhar dal 21 to 22, urd 19 to 19, moong 16 to 18, masoor 14.50 to 17.

COTTON FUTURES DECLINE

(From Our Own Correspondent)

BOMBAY, 21st October

The steady upward trend of the cotton market witnessed of late was halted during the week under review and the market took a definite turn for the worse. Report of adverse weather and damage to the crop, which was mainly responsible for the firmness of the market, gave place to news of the return of fair and sunny weather. Earlier fears of damage to the crop turned out to be exaggerated. These factors prompted heavy bull liquidation and extensive speculatory selling. Futures prices consequently suffered a sharp setback. The possibility of the Government permitting imports of cotton during the season on a more liberal scale, and reports that stocks with mills on 1st September was higher than on the corresponding date of the previous season, made bulls nervous. The fall in prices would have been more marked but for the emergence of support by certain leading mills against forward sales of cloth. Short-covering and fresh buying attracted by the low level of prices led to a partial recovery today.

I.C.C. Moglai Jarilla opened the week at Rs. 729.50, as against the previous day's close of Rs. 729.25 and declined steadily to touch the level of Rs. 710.50 yesterday. Opening at Rs. 713 today, the contract gathered Rs. 2.50 before finishing fractionally lower at Rs. 715. The net loss over the week was Rs. 14.25.

The weakness of futures affected the spot section also. Turnover was limited and values receded by ten to fifteen rupees. The drop was more pronounced in the case of cotton spinning coarse and medium counts. Staple styles like Vijay and Digvijay continued to be scarce and prices were well maintained.

Marketing of new crop in the Punjab, Rajasthan and Uttar Pradesh has been gathering momentum. More than 25,000 bales are reported to have been marketed from these areas.

Export demand was poor. Bengal Deshi prices drifted lower, thanks to good crop prospects and slackness of export demand. Bengal Deshi crop this season is estimated at 350,000 bales, whereas in other varieties was subdued. Fresh business done was small.

Demand for foreign cotton was well maintained. Mills continued to show interest in Sudan, Egyptian and East African cotton. Mills were regular buyers of Egyptian Menoufi although Karnak was neglected. Medium and higher Sudan Geziras evoked attention of mills. A. R. Uganda new crop also found buyers, although the tendency was to await the result of the first auctions held yesterday.

The conclusion of the agreement between U.S.A. and India under P.L. 480 has been delayed and the Finance Minister, Mr. Morarji Desai, is expected to have discussed the question with the U.S. authorities. A decision regarding the import of U.S. cotton is expected to be announced soon after the return of Mr. Desai. Meanwhile, the Indian Cotton Mills' Federation, at a meeting held last week, decided to recommend to the Government the release of an additional 400,000 bales over and above the annual quota of 600,000 bales. The Federation felt that the additional imports would greatly relieve the shortage of cotton supplies experienced at present. The Federation is also understood to have recommended the extension of the incentive scheme for textile exports for a further period of six months. The following are the latest available spot quotations in rupees per candy of 784 lbs:

Bengal Deshi 665; Berar Jarilla 785; Hubli Laxmi 990; Vijay 950; Berar 13/16" 825.

The Karachi cotton futures market ruled firm during the week under review. Futures advanced on short-covering and renewed export demand. Domestic mills too supported the market against sales of yarn and cloth. N.T.R.G. January rose from Rs. 62-10 to Rs. 64. The March contract firmed up by Re. 1-3 to Rs. 64-4. The following are the latest available quotations—in rupees per maund of 82 lbs.—for a few popular varieties of Pakistan cotton prevailing at Karachi:

Punjab Deshi 64; 4F Punjab Roller 70-4; S.G. 71-12; L.S.S. Punjab Roller 71-4; S.G. 72-4; N.T. Roller 74-12; S.G. 81-4; 289F Punjab Roller 72-12; S.G. 76-12.

Cotton futures values in Alexandria scored small gains during the week. Renewed export demand from overseas countries, especially India, and good local trade buying led to a hardening of values. Reports of satisfactory crop progress and increasing momentum of new crop movement failed to have any adverse effect on price level. The latest available quotations—in tallars per lb.—are as under:

Karnak: November 71.00; January 71.70; Ashmouni: October 63.10; December 60.97.

Dull conditions prevailed in the Liverpool cotton futures market during the week. Activity was limited as the current level of prices was unattractive. The fear that the U.S. dock strike, which was temporarily suspended for negotiations for settlement, would delay shipment of cotton and better news from the yarn and piecegoods market prompted a limited volume of mill fixation and trade buying. But prices failed to rise perceptibly, thanks to hedge-selling and scattered commission house liquidation. Sudan contracts were quiet. Over the week, prices showed minor gains. The latest available quotations—in pence per lb.—from Liverpool are as under:

American cotton one inch staple contract: October-November 21.75; December-January 21.60; March-April 21.75; May 22.05.

American cotton mixed growth contract: October-November 21.95; December-January 22.00; March-April 22.20; May 22.25.

Sudan: November-December, January-February 29.00; May-June 28.75.

Cotton futures values in New York hardened on trade support and commission house buying influenced by the continued strength of the cloth market. Further rise in price was, however, prevented by hedge-selling and profit-taking. The apprehension that support prices for the next season would be lower than that in this season and Memphis report of an easing of the spot supply position also acted as dampers.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

	(In cents per lb.)	20-10-59	13-10-59	6-10-59
Spot	...	32.75	32.80	32.85
October	...	...	32.55	32.34
December	...	32.33	32.15	32.10
March	...	32.86	32.59	32.54
May	...	33.15	—	—

ART SILK YARN HARDENS

(From Our Own Correspondent)

BOMBAY, 21st October
A divergent trend was witnessed in the yarn market during the week under review. While futures prices declined on speculative selling, spot values advanced, thanks to scarcity of supplies and the approach of the busy Diwali season. Spot prices of art silk and cotton yarns hardened on good support. The rise was more marked in art silk yarns, thanks to the sustained buying. The cut in import quota licence by one half gave rise to fears of acute shortage of supplies after Diwali. The Government's decision to grant advance licence for yarn to actual users for manufacturing cloth for export, though welcome, gave no solace as it was no remedy for shortage of supplies. Nor could mills obtain more licences against shipment of fabrics as exports were meeting with considerable resistance in foreign markets. Staple fibre yarn was in moderate demand. Prices were more or less maintained. Fluctuations were narrow. Cotton yarns were steady with demand centred round medium and lower counts.

The procedure for the issue of advance licence for art silk yarn for the manufacture of cloth for export has been notified. The licences will be issued upto a maximum value of Rs. 1,000 per registered export loom to be adjusted in four equal quarterly instalments against export entitlements earned by the licensees. In case of failure to earn the required entitlements by way of exports of cloth, the yarn imported against these advance licences will be adjusted from the licensees' quotas for import of art silk yarn, as actual users or from allocations of indigenous yarn. The licences will be issued only to excisable powerloom units provided the looms in the undertaking are registered under the Textiles (Production by Powerloom) Control Order 1956. The last date for receipt of applications is 15th November 1959.

Cupressa Bamberg yarn (60×2) October contract declined during the week, from Rs. 1,665 last week-end to Rs. 1,631. The December contract too came under selling pressure, dropping from Rs. 1,702 to Rs. 1,671. Imported spot material met with sustained buying. 120 Japan rose from Rs. 5.15 to Rs. 5.40. 150 Japan hardened by 8 nP to Rs. 5.20. 150 Italy improved by 25 nP to Rs. 5.12.

Staple fibre yarns (40×2) October contract met with selling and declined by Rs. 20 to Rs. 682. December contract shed Rs. 7 to Rs. 684. Spot Rohinoors were a shade easy at Rs. 3.72 while spot City hardened to Rs. 4.50.

In the cotton yarn section, ten counts Podars gained 13 nP to Rs. 14.50. Twenty counts Moderns put on 25 nP to Rs. 20. Sixty count Finlays hardened by one rupee to Rs. 64, while eighty count Mahendras softened by 25 nP to Rs. 73.50.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today as compared with those a week before.

	21-10-59	14-10-59
Art silk yarn—		
60/1 Cupressa Bamberg October (100 Kg.)	1,631	1,665
December	1,671	1,702
60/1 Cupressa Bamberg spot (per lb.)	7.31	7.47
120 Japan (per lb.)	5.40	5.15
150 Japan (per lb.)	5.20	5.12
120 Italy (per lb.)	4.90	4.80
150 Italy (per lb.)	5.12	4.87
Staple fibre yarn—		
40×2 October (per case of 200 lbs.)	682	702.00
40×2 December	684	691.00
40×2 Rohinoor (per lb.)	3.72	3.77
40×2 City	4.50	3.72
Cotton yarn (per bundle of 10 lbs.)—		
10s Poflar	14.50	14.87
20s Modern	20.00	19.75
40s Minaxi	64.00	63.50
60s Finlay	68.00	68.00
80s Mahendra	73.50	73.75

BROWN SUGARS EASY

(From Our Own Correspondent)

HAPUR, 19th October
Sugar prices stayed steady, due to paucity of supplies in the market. With a view to increasing the sugar output, the Government of India has announced a concession on cane crushed early. Most of the sugar factories are preparing to start crushing operations forthwith and some are expected to begin before the end of the month.

The soaring prices of khandasari and gur were the main deterrents hitherto in the way of early start of season. On the whole, sugar prospects for the next season does not indicate any increase in total production, despite the increase in cane acreage according to the first all-India estimate at 4,920,000 acres as against the corresponding adjusted estimate at 4,804,000 acres for 1958-59. At present, sugar is quoted here at Rs. 131 per bag and at Re. 1.25 per seer in retail, as against the controlled price of Rs. 104 per bag and at 97 nP per seer in retail.

After having touched the highest earlier during the week at Rs. 138 per bag, sugar prices in the Muzaffarnagar market eased slightly in the week-end to Rs. 134 per bag due to fresh arrivals coupled with lack of demand. It was reported that about 2,500 bags of sugar received against the quotas of August and September were lying with the Government nominees due to non-issue of permits for the full quantity by local authorities. Here, too, sugar in the open market was being quoted at Re. 1.25 per seer, as against the controlled price of 96 nP per seer. At Kanpur, sugar prices spurted to touch new heights, due to brisk festival demand in the face of poor stocks, and was quoted up to Rs. 140 per bag.

Khandasari prices eased slightly by Rs. 2 per maund in the week-end, due to a fall in demand at the highest level after several weeks' bullish activity since 1st October. The new production has not yet started, since crushers find it more profitable to crush cane for gur than khandasari. Prevailing prices are: inferior Rs. 40 to Rs. 44, medium Rs. 45 to Rs. 48, superior Rs. 52 all per maund.

The new gur arrivals mounted to an average of 2,000 maunds daily all of which are being lifted to the consuming areas. Prices eased by about Re. 1.62 per maund during the week under pressure of arrivals. Demand is brisk from Saurashtra and Punjab. Old stock is reported to have been exhausted and prevailing prices are: gur pansera best Rs. 25.75, dara Rs. 24, inferior Rs. 22, all per maund.

Gur arrivals in the Muzaffarnagar market, also have increased to an average of 500 maunds daily. Consequently, prices registered some fall during the week to be quoted now at: pansera Rs. 23.50 to Rs. 25, chaku Rs. 25 to Rs. 26, shakker Rs. 18 to Rs. 20, dana minja Rs. 25 to Rs. 28, all per maund.

In the futures section, gur prices eased during the week on active bear pressure. After opening at Rs. 15.80 last Monday, gur fagan quoted today at Rs. 15.29, the lowest level for the week.

SEEDS DRIFT LOWER

(From Our Own Correspondent)

BOMBAY, 21st October
The oilseeds market, which had ruled firm during the last week, gave way during the week under review. The values of all oils and oilseeds drifted to lower levels. At higher levels buyers became cautious; fresh buying support was absent. The performance on the export front, although it was not disappointing, gave no evidence of any sizable fresh business. On top of this, arrivals were large. Besides, there was a distinct improvement in the weather, which ruled out the possibility of any marked fall in production, as was believed earlier.

The groundnut section was particularly hard hit, thanks to there were indications of sizable export demand for groundnut oil during last week, no encouraging reports of exports were heard in the market during the week under review. At the same time, there were heavy arrivals which dampened the market. Lower poucunity advices and hesitancy on the part of the vanaspati manufacturers and crushers further pushed down the values. Groundnut February 1960, which had wound up at Rs. 179.75 last week-end, lost ground subsequently and sagged to Rs. 176.12 today. Bold ready lost Re. 1.50 to Rs. 38.50. Oil ex-mill eased by a rupee to Rs. 20.50.

The continuing uncertainty in the prospects for exports of castor oil led to a perceptible fall in values in the castorseed section. At the close, however, castorseed showed signs of some recovery on reports of export business with some countries of the Communist bloc. The U.S. has

not yet made any specific commitments regarding the purchase of Indian castor oil. Castorseed May 1960 contract closed today on an easy note at Rs. 164, as against Rs. 166.02 last week-end. Ready Madras declined by 50 nP to Rs. 31.50. Oil B.S.S. fell from Rs. 17.69 to Rs. 17.37.

The linseed section was easy, in sympathy with other seeds and oils. There was heavy selling in 'insead by North Indian operators in the face of weak commodity advices. There were hardly any fresh export enquiries for oil. Traders, however, hope to secure Australian tenders. Linseed May 1960 fell from Rs. 35.56 to Rs. 35.06 today, after moving both ways between Rs. 35.62 and Rs. 35.12 over the week. Bold ready was unchanged at Rs. 35.12. Linseed oil dropped 44 nP to Rs. 17.25.

In sympathy with major seeds, cottonseeds too developed a sagging tendency. Although cottonseed February 1960 contract improved from Rs. 129.25 last Wednesday to Rs. 129.75 on the following day, it declined subsequently to close today at Rs. 127.50.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	21-10-1959	14-10-1959	7-10-1959
Groundnut			
February 1960	176.12	179.75	177.25
Bold ready	38.50	40.00	40.50
Command ready	38.50	40.00	40.75
Command quality	38.00	40.00	40.75
Oil ex-mill ready*	20.50	21.50	21.37
Railway receipts*	20.12	21.15	21.25
Castorseed			
May 1960	164.00	166.02	164.25
Ready Madras	31.50	32.00	31.62
Ready Kanpur	30.50	30.50	30.25
Oil B.S.S.	17.37	17.69	17.75
Oil commercial	16.50	17.00	16.81
Linseed			
May 1960	35.06	35.56	34.44

Kandi seed	28.00	28.25	28.00

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are in terms of candy, except linseed, which is in cwt. A candy is 560 lbs. except in the case of cotton seed, for which it is 784 lbs. Spot quotations of seeds are for per cwt. and those for oil per quarter.

DECLINE IN PEPPER

(Messrs. Parekh & Co.)

BOMBAY, 21st October
Malabar black pepper, during the earlier part of the fortnight, showed greater activity with wide fluctuations in the wake of alternate speculative buying and selling in ready and in forward sections. Encouraged by the news of the Russian buying of Malabar black to the extent of about 1,000 tons for October shipment, the bulls tried to effect a squeeze. They continued to buy at advancing prices both ready and October delivery. The highest prices paid for ready, October and December deliveries were Rs. 850, Rs. 149 and Rs. 139 respectively.

In the latter part of the week, however, at the time of maturity of October contract, bulls were not able to hold on. They came out to liquidate. Short-covering having been almost finished by that time, prices came down to Rs. 138 for October and to Rs. 129 for December delivery. Exporters having covered their requirements against their sales to Russia and other East European countries and there being no fresh inquiries from U.S.A., the ready moved from Rs. 850 to Rs. 775 at Cochin and from Rs. 875 to Rs. 840 at Calcutt. Sizable purchases by exporters in ready were done at prices ranging from Rs. 800 to Rs. 850 at Cochin and from Rs. 850 to Rs. 875 at Calcutt.

Singapore hardened in sympathy with Malabar black and advanced from Str.\$102 to Str.\$105 for black and from Str.\$166 to Str.\$168 for white owing to broadening of inquiries from Europe.

New York after remaining steady at \$0.32 for spot for some time ruled easy at \$0.31 under pres-advance in India in spite of fair sized repurchases for October from \$0.30 to \$0.30 1/2. Grinders covered their requirements before the dock strike. They are reported to be waiting for new development. The strike is now deferred for at least 80 days. Spot in New York at the time of writing is quoted at \$0.31.

Crop reports are so far good. Good sunshine is being experienced after the recent wet spell in the pepper-growing belt. If fair weather continues areas is likely to come in the market during the first week of November.

The future of the market depends upon U.S. buying. Russia is likely to remain out of the market for some time as it purchased a sizable quantity during this month for shipment by the end of October or early November.

Ready pepper in the local market is quoted at Rs. 105 per Bengal maund.

LESS DEMAND FOR TEA

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]
COCHIN, 16th October
1,350,000 lbs. were offered in sale No. 39 held on 13th October 1959. The quality of high grown teas in quality was well maintained, but a slight decline mediums. There was less general demand and good prices were irregularly easier for everything. Although low mediums met with fair enquiry prices

were about 5 nP lower than last. Mediums and good medium brokers eased by 10 to 15 nP, while similar fannings were upto 25 nP easier. There was a useful enquiry for better liquoring highgrown brokers which were fully firm. However, corresponding fannings met with less support at lower rates. Whole leaf grades are quoted firm. The following are the quotations:—

	1959	1958
Low medium	1.70 to 1.80	1.55 to 1.65
Medium	1.85 to 2.10	1.70 to 1.85
Good medium	2.10 to 2.35	2.05 to 2.30
Quality	2.65 to 4.20	2.90 to 4.45

Dust Sale 'CC':—A quantity of 450,000 lbs. were offered in dust sale 'CC' held on 15th October 1959. There was a good general demand, but prices were irregularly 5 nP easier for all descriptions, with the exception of milled dusts which are quoted fully firm and occasionally dearer. C.T.C. dusts met with fair enquiry at slightly lower rates.

London Market: Sale of 12th October 1959:—Some irregularity. Assams Doors and plain sorts tending dearer.

Sale of 13th October 1959:—No change.

Sale of 14th October 1959:—Rather less demand than on Monday, but prices generally unchanged.

Colombo Market: Sale of 13th October 1959:—Less demand. Uvas considerably lower following decline in quality. Dimbula Dikoya brokers opened 20 to 40 c. lower following quality. Progressively lower lowgrowns strong, demand firm. Price tea dearer.

Sale of 14th October 1959:—Good demand. Best liquoring fannings and dusts steady. Other kinds generally lower.

Calcutta Market:—No sale.

Export Quota:—Our last business has been done at 2 nP. At present there are sellers at 2 nP with probable buyers at this price.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"Sale 40:—1,250,000 lbs. Good but irregular demand. Low medium and mediums 5 to 10 nP dearer, but all black leaf fannings sometimes 25 nP dearer. Best liquoring limited demand and prices lower. Good liquoring whole leaf dearer but others easier."

JUTE GOODS STEADY

(From Our Own Correspondent)

CALCUTTA, 20th October
Fairly steady conditions were in evidence in the jute markets during the week under review. Following the announcement of a satisfactory reduction in the stock of goods with mills as at the end of September, prices recorded attractive additions, but as the week came to a close bearish activity in futures led to closing levels being below the best for the week. Raw jute prices also tended to move higher following lower arrivals caused by the difficult transport situation due to floods.

The market greeted the news of a rise in burlap consumption in the United States in the month of September. The figure was as high as 79.9 million yards, as against 64.5 million yards in the previous month. The news was particularly pleasing, since the market was apprehending a fall in U.S. consumption on account of the nationwide steel workers' strike. Higher consumption, however, did not affect burlap stock which amounted to 24 million yards. During the week, American interest was niggardly, but in view of the good consumption report, market men anticipated revival of purchases on behalf of the United States on a bigger scale. Meanwhile, good results were also anticipated following the I.J.M.A. Goodwill Mission to the U.S.A., Canada and the United Kingdom. Another good news was the decline in the stock of goods with mills. The market was, in fact, apprehending a rise in view of the delay caused to shipments to China. The stock with mills at the end of September amounted to 78,600 tons which represented a fall of 2,600 tons. Construction, heavy goods declined by 3,100 tons and miscellaneous items by 200 tons. The full effect of this reduction could not be had on overall stock, as hessian increased by 700 tons to 25,500 tons. Considering the poor business done with the U.S. in the month, it had been anticipated that hessian stock would rise appreciably. Hence the rise of only 700 tons was ignored; on the other hand, the outlook was considered fair, since hessian stock represented only about three weeks' production and was insignificant considered against the background of the imminent resumption of work by the steel workers in the U.S.A.

It was noted in market circles that September was the first full working month following the unsealing of 2 1/2 per cent. of the looms in August. It was indeed gratifying that the policy of mills to increase production had not led to a decline in demand. Shipments in September were higher. Sacking shipped totalled 54,400 tons, or a rise of 17,400 tons compared to August. Hessian, at 39,700 tons, had increased by 2,800 tons. These figures included coastal shipments, and the market had cause to infer that the internal consumption had shown a rising trend. There are prospects of increased shipments of heavy goods to China. Hence the pessimism caused following lower crop reports in Australia and grain there proved a for lesser bags to pack. Later, the U.S.S.R. has temporary phase only. Late, the U.S.S.R. has appeared in the market as a purchaser of hessian. In the last week, purchases on behalf of Russia related to a fair quantity of hessian for ready and near shipments.

Reports of damage to jute crop consequent on floods were circulated by interested quarters, and these were meant to cause a rise in prices. In fact, damage to crop was little, as before the recent heavy rains had started, most of the crop had

been harvested, and that which remained to be harvested was mostly out of danger. Hence floods meant only delay in further harvesting and lower arrivals in market centres, following the dislocation to road and riverine transport. Ideas of a good crop naturally still held good, and there were reports from Dundee that manufacturers there were anticipating a fall in raw jute prices. An acute shortage for mesta quality was felt. For, following the loss incurred by farmers during last year in this quality, this year's sowing had been considerably restricted. As a result, the price of mesta is about Re. 1 lower than the good quality. During last year, the mesta variety was lower by Rs. 2.

After the Durga Pooja holidays, the market reopened on Monday last on a steady undertone. Ready hessian 40" 10 oz. jumped to Rs. 41.05 from Rs. 40.75 on the eve of holidays, i.e., on 7th October. The rise followed reports of expectations of an early end of the U.S. steel strike, which might mean greater U.S. interest in hessian. B. twills firmed up to Rs. 103.80 from Rs. 103.40. Bear-covering soon followed in the futures market, and on Tuesday, B. twills scored to as high as Rs. 104.25, and hessian 40" 10 oz. continuing the advance reached the highest level of the week at Rs. 41.25. On the following day, B. twills sagged to Rs. 103 and hessian 40" 10 oz. to Rs. 40.85 following profit-taking. On Thursday hessian 40" 10 oz. was unchanged and firm at Rs. 40.85 on the report of satisfactory burlap consumption in the U.S. in September. B. twills, however, sagged to Rs. 102.15 following the bearish trend in the futures market. Trade circles compared the output figures for the month of September with stock and derived considerable satisfaction in the thought that demand had exceeded even the increased production for the month. August-end stock being 92,600 tons, the total availability in the month was 173,800 tons. If the figure of September-end stocks, that is, 78,600 tons was deducted, the demand was in the order of 95,200 tons which surpassed production by 2,600 tons. Output of hessian at 37,500 tons was 100 tons lower than August, and miscellaneous goods were 6,300 tons against 7,400 tons. Sacking increased by 6,900 tons to 48,800 tons, which showed that the process of transfer of hessian looms to sacking manufacture continued. The market remained closed on Friday and Saturday on account of Lakshmi Pooja.

Mills showed more interest in raw jute, and prices rose. Mills were unnerved by the rumours that the jute crop had been damaged badly by the recent floods. All the mills, they desired to make purchases for replacement. This together with the upturn in the goods market resulted in the hardening trend. Northern bottoms rose to Rs. 23 from Rs. 22.50 and Assam bottoms to Rs. 23.50 from Rs. 23.25, while daisies bottoms remained unchanged but fully firm at Rs. 24.50.

KIPS WEAK

(From Our Own Correspondent)

MADRAS, 19th October

Arrivals of kips were on the usual scale and clearances were slow. The undertone of the market was, therefore, weak. U.K. buying was small and tanners have been trying to hold firm to their

SleepAir to Europe?

Sure... as good as a bed.
Tourist class too!

Radar-equipped planes?

Of course. Gaily decorated Super Constellations!

How about connections?

Time-saving. To all major cities in Europe from Amsterdam!

Service good?

Beyond question... it's Golden Circle Service!

Any special attractions?

Many—including tax-free cars etc. at Amsterdam Airport!

Sounds good!

It is—fly KLM!

Fly KLM from Karachi. Choice of 8 weekly services which together serve Rome, Zurich, Geneva, Munich, Frankfurt, Düsseldorf and Amsterdam. Easy connections from Bombay to Karachi by IAC or PIA.

last prices, but with business in hand were likely to take slightly lower prices. Comparatively, top marks were steadier than others. Buff calf skins touched 98d. to 100d. per lb. for certain marks and tanners seem nervous about stabilising these prices for large orders. Market for inferior fifties cow hides was dull.

In tanned skins section, prices of 5 1/2/6 and 8/9 lbs. goat skins good marks ruled firm and others were steady in sympathy. Semi-prime sheep skins were firm; also middle classes.

The October London tanned skins auctions commence today and 50,000 skins will be available for sale.

MANCHESTER LETTER

(Concluded from page 681)

progress. Such work demands constant attention if its sponsors are to keep up to date with developments and maintain their precedence to enable the industry itself to keep in advance of its competitors.

It is, therefore, encouraging to note that, in the midst of this transitional phase in Lancashire, when so many firms are going out of business, the Centre is considering its own future and taking stock of the situation. Coinciding with the introduction of a number of new courses during the coming months, each section is investigating its activities and deciding where improvements can be achieved.

Mr. James Bolton, its Director, is, however, confident about the future value of the organisation to the industry. At a recent Press conference he was adamant that its services would be of as much value to a trade diminished in size as it has been to the firms which it has assisted in the past ten years.

It is perhaps significant that a series of directors' meetings is to be held during the coming winter, under the auspices of the Productivity Centre, on the vexed question of marketing. Amid the continual comment on the reduction in machinery now being tackled by the producing sections it has not escaped notice that the distributing side remains unaffected on the surface.

Suggestions are being made that by the adoption of shift-working the output of the smaller number of mills will be little altered in aggregate. There remains the problem of how these goods are to be sold. Any fresh thinking on this subject should yield stimulating results.

Another aspect of Lancashire's outlook which the Productivity Centre is determined not to ignore is the world outside. British consultants, who have for many years played a notable part in aiding the scientific approach to greater efficiency, are not being abandoned, but foreign experts in the same field are being employed to give a new angle to the problems concerned. Two Americans and a Frenchman are to take part during the coming winter in discussions at which executives of the mills will be able to compare their experience with consultants who have dealt with textile problems in many parts of the world.

Among the advantages gained from participation in the Centre's activities has been the "give-and-take" between representatives of different firms when they have been attending courses together. The old idea of secrecy has gradually crumbled away in recent years and training grounds such as those provided by the Centre have had much to do with this more modern approach.

Maybe it is not entirely a coincidence that the proportion of those firms which have lately decided to leave the industry includes very few of those which have taken advantage of the facilities offered by the Productivity Centre during its existence.

Notice

THE AMALGAMATED ELECTRICITY COMPANY, LIMITED

THE REGISTERS OF MEMBERS AND Transfer Books of the Company will be closed from 23rd November to 6th December, 1959, both days inclusive, in connection with Final Dividend for the second half-year ended 31st March, 1959, payable on or after 7th December, 1959.

STOCK & SHARE QUOTATIONS

Abbreviations:—D.—Deferred shares, P.O.—Preferred Ordinary shares, Y.—Accounts published yearly, H.—Accounts published half-yearly, P.—Company has Preference shares, T.—Company has Debentures, N.—Nominal quotations, x.d.—Ex-Dividend, c.d.—Cum Dividend, I.—Interim Dividend, F.—Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up per share'.

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the

respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provision fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less, if any, and stands for the gross figures except where otherwise indicated.

Dividends:—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

It remains to be seen what action the Labour Party's leadership would take to meet these criticisms and strengthen its chances of success in the next election. Whatever the steps taken, the road ahead would surely be painful as it means tearing down the Party's fundamental beliefs.

20,00,000						

WORLD agricultural situation shows some disturbing signs. In many countries production of agricultural commodities, including food, is expanding faster than the market for them. At the same time, in many of the underdeveloped countries, consumption of food is lower than what would be required at nutritionally appropriate levels and thus economic development is not fast enough to solve their problem of agriculture as a whole. Earnings from agricultural produce determine the living standards and provide

sinews of development programmes, are declining. The immediate prospects are by no means very bright. Agricultural stocks, which have now reached very high levels, are not likely to be reduced soon, for, in the immediate future, a further increase in production is indicated. The F.A.O. Report on the *State of Food and Agriculture, 1959* which, besides being statistically comprehensive, throws much new light on trends and prospects in industrially advanced and economically backward countries and also discusses the factors influencing agricultural policies in different countries, makes the somewhat grim forecast: "It appears that stocks are now so large that only a succession of poor harvests would reduce them materially." No one would, of course, wish so unwelcome a development for the correction of their imbalance. But the fact remains that the world agricultural terrain is singularly uneven, with a few dizzy peaks and many perilous depths; while the haves have so much that they do not know what to do with it, the have-nots are unable to find their way to higher levels of agricultural prosperity.

The volume of world agricultural output, according to the Report, increased substantially in 1958-59, when it was 4 per cent. higher than in each of the two preceding seasons, the bulk of the expansion having taken place in North America, Oceania and the U.S.S.R. And it is likely to increase further in 1959-60. But the increase must be viewed against the background of the rate of growth of world population which averages some 16 per cent. a year. The per capita agricultural production shows some increase over the pre-war and the immediate post-war years. Thus, the index number of per capita agricultural production (Base: average 1952-53 to 1956-57=100) was 106 in 1958-59, as against 103 in 1957-58, 94 in 1948-49 to 1952-53 (average) and 95 in pre-war years. This overall improvement conceals the decline in per capita production in the economically backward countries. In the Far East (excluding China), it was only 101, as against 108 in pre-war years, though in the Near East it was 102 in 1958-59, as against 94 in pre-war years.

The large cereal harvests of 1958-59, especially in the U.S., have led to a sharp increase in stocks of wheat and coarse grain. Prospects for the 1959-60 harvests indicate a still higher level of production and surplus stocks are likely to accumulate further. Wheat stocks in the four chief producing countries (the U.S., Canada, Argentina and Australia), which declined from 47.3 million tons in 1957 to 42.4 million tons in 1958, are likely to rise to 50.8 million tons in 1959. Rice stocks, however, fell from 1 million tons in 1957 to 0.8 million tons in 1958. But there has been a successive increase in coarse grain stocks which will go up this year to 67.2 million tons, as against 58.6 million tons in 1958 and 51 million tons in 1957. Intensified measures of surplus disposal, which have been adopted in the more-developed countries, have not succeeded in solving the problem of burdensome stocks. The Report, however, rightly points out that, though these measures have great value, the final solution of the problems of rural poverty and inadequate food supplies in the less-developed countries must come primarily from improvements in their own agricultural productivity.

There was a slight decline in the volume of world trade in agricultural products last year. But what made the decline particularly difficult for the exporters was that it was also accompanied by a setback in prices. The index of the volume of world trade in agricultural products (Base: 1952-53=100) was 133 in 1958, as against 135 in 1957, 87 in 1948-52 (average) and 66 in 1934-38 (average). Thus, the volume of exports in 1958 was about 3 per cent. less than in 1957; prices in world markets fell by about 7 per cent., thereby depressing total earnings from agricultural exports by about 9 per cent. Raw materials of agricultural origin were severely affected. The volume of world exports of these products in 1958 fell by some 8 per cent. and the average price (unit volume) by some 16 per cent. below the level of the previous year, so that total export earnings were reduced by no less than 23 per cent. The reduction of 7 per cent. in 1958 in average export unit values for agricultural products took them to their lowest level since the war. The terms of trade for agricultural products were also lower than in any post-war year. There is no doubt that this development has adversely affected the development programmes in several underdeveloped countries. But what is perhaps not so widely realised is that the decline in the volume of exports and terms of trade of these countries

also adversely affect the export prospects for manufacturing countries. In 1958, for the first time since the Second World War, there was a decline in both the volume and total value of exports of manufactured goods. There can be little doubt, as the Report points out, that the reduced export earnings of primary producers contributed to this result.

Living standards in the less-developed countries are determined by the level of agricultural production which is still the mainstay of their economy. But world agricultural output is unevenly distributed. Thus, in 1954-58, the four regions of Latin America, the Far East, the Near East and Africa—these regions may be regarded as the major part of the underdeveloped world—accounted for only one-third of world agricultural output, though they have two-thirds of world population. Further, the population in the less-developed countries is increasing at a fast pace. Between 1936 and 1958, the combined population of Asia, Africa and Latin America increased by 500 million to 2,004 million or nearly 40 per cent. and recent estimates foreshadow a further increase of the order of 1,100 million by 1980, when it is expected to reach 3,152 million. Living standards in these regions are now extremely low. There is a pronounced nutritional deficiency in their diet, chiefly because their incomes do not permit larger intake of food rich in proteins. Thus, the per capita food intake in India in 1935-48 was 3,293 calories in urban areas and 2,277 calories in rural areas, as against 4,230 calories and 4,880 calories, respectively, in the U.S. in 1955. From these figures, it will be seen that, in India, not only is the calorie intake lower than in the U.S. but, unlike in that country, the rural worker eats less rich food than the urban resident. Nevertheless, a large part of per capita income in the less-developed countries is absorbed by food articles, leaving little room for expenditure on other items. In India, for instance, out of the per capita annual expenditure of \$90 in urban area, food alone accounts for 53 per cent., the share of clothing being 7 per cent.; the corresponding figures for the rural region are \$80, 66 per cent. and 7 per cent. In the U.S. (urban area), food accounts for only 31 per cent. and clothing for 12 per cent. of the higher per capita annual expenditure of \$1,270; the corresponding figures for farm operators are 35 per cent., 11 per cent., and \$990. A similar pattern is disclosed by family living expenditure in the U.K., where food accounts for 33 per cent. and clothing for 10 per cent. of the total per capita annual expenditure of \$620 in urban area; the corresponding figures for rural area are respectively 32 per cent., 13 per cent. and \$590. Clearly, unless per capita incomes go up in the underdeveloped countries, the overall pattern of expenditure will remain the same as now.

Discussing the major changes in agricultural policies in different countries, the Report draws attention to the fact that, whereas in the more-developed countries, agricultural policies were increasingly concerned with problems of surplus production of certain commodities, the authorities in the less-developed countries were mainly concerned with the removal of obstacles to increased agricultural production. It also points out that the general adoption of price control and price supports in the last two decades has done much to increase the price and income differences between the less-developed and the economically advanced countries; agricultural price policies in the former group of countries are primarily aimed at controlling consumer prices and avoiding inflation, whereas, in the latter group, they are designed to prevent any serious decline in farm incomes.

The Report recognises that increased agricultural production must come primarily from improved methods and better use of existing resources. But it rightly insists that improved technology is only part of the answer. It lists three basic conditions for agricultural improvement—stable prices, adequate marketing facilities and a satisfactory system of land tenure. It is true that, in many underdeveloped countries, the third condition, namely, the evolution of an equitable system of land tenure has received much attention, though, even here, ideological considerations have militated against the adoption of realistic solutions. But what requires greater attention are the achievement of reasonably stable prices and establishment of marketing facilities. Unless farmers have some confidence that prices will bear a minimum relationship to costs, they will be hesitant to incur additional work or expense to increase their output. Surely, pious exhortations and even provision of technical advice and credit will not

induce them to undertake improved cultural practices, unless they are reasonably certain that the larger crops they raise will be protected against some steep fall in prices which would make all their efforts look profitless in retrospect.

RENT CONTROL IN MADRAS

IT is now clear that, on the housing front, the Union Government and the State Governments are working at cross purposes. While the Union Ministry of Housing is keen on promoting housing activity within the admittedly limited means available to it, the State Governments are vying with one another in promoting legislation which must kill all incentive for constructional activity by private builders. In a misconceived mood of aiding tenants, more than one State Government has placed on its statute book legislation which can have no effect other than chase capital and resources away from building industry. An instance in point is the recent legislation in Bombay which accorded legal validity to unauthorised sub-tenancy agreements. Yet another instance of infringement of the rights of landlords, which are respected even in countries with a more avowedly socialistic outlook than India, is furnished by the Madras Building (Lease and Rent) Bill, now referred to the Select Committee.

The Madras Bill is a truly Draconian piece of legislative proposal. The Bill provides that, where a landlord has two or more residential buildings in the same city, town or village, he shall have any one of such buildings for his own occupation and the other buildings, if not already let to any tenant, shall be deemed to have become vacant; the authorised officer can then let out vacant buildings to tenants. The owner has no right to say that he does not want to let out his house to others. He is, of course, not free to ask for vacant possession of any of his houses, even if he requires it for his own use or for the use of members of his family. Fair rents for vacant houses will be fixed by the statutory officer on the basis of rents prevailing in 1939-40. This provision, which is a common feature to all rent control Acts, ignores the vital consideration that the landlord's income cannot be pegged at a particular level, while the incomes of other classes of people are allowed to fluctuate freely.

Eviction of tenants is rendered next to impossible by the provision—that too is a common feature of all rent control Acts—that any demand for it will be rejected if the Controller is satisfied that the hardship caused to the tenant will outweigh the advantage to the landlord. Some of the other restrictive provisions in the Bill include: (1) advance rent is limited to one month's rent; (2) a landlord, intent upon rebuilding his premises, should obtain consent from the Government and demolish it within three months and rebuild it within 15 months in accordance with the plans approved by the authorities; and (3) essential service personnel cannot be displaced from their tenancies. The Bill provides for a five-year period for its life. But this is a pious hope. Since the tenants' greed for low rents and protected tenancy grows on what it feeds on and they have voting power, it is easy to see how rent control enactments will get perpetual leases of fresh life.

It is time somebody cried halt to this merry game of witch-hunting of urban landlords and spoon-feeding of tenants which has been practised in several States for two decades now in open defiance of all canons of economic justice. The concrete ill-effects of unwise rent control legislation—a species of political bribery which democratic Governments find it difficult to dispense with—are unmistakably evident in the large number of houses that are falling into a state of utter disrepair, a tragic national waste. A direct consequence of this movement has been that India continues to face increasingly difficult conditions of housing shortage, while other countries, which suffered virtually complete destruction of housing property in World War II have been able to build their housing economy on firm foundations. The least the Government of India should do is to get the issues raised by housing and rent control measures examined by an expert and impartial body which could hold the scales even as between landlords and tenants and also suggest measures which would help augment the number of houses and thereby eliminate gradually the need for the retention of the present irksome controls on rents and houses.

MARKET GOSSIP

CHINA has falsified the hope, entertained in these columns early this month, that it would commit no more aggression against India. Its occupation of a sizable area of Eastern Ladakh and killing and capture of several members of an Indian police patrol this week show beyond doubt that it is bent upon taking over by force those portions of Indian territory in the Himalayas which it unilaterally regards as its own. Its aggressive designs are now receiving the serious attention of the Government of India. Since persuasion has failed, retaliation and effective vigilance against further encroachment seem to be the only way out. These would require a substantial increase in Defence expenditure and the Government might ask the people to bear additional taxation. It is this prospect, more than the physical occupation of unguarded land in Ladakh by the Chinese armed forces, that has upset the share markets. Shrewd operators have either lightened their commitments by outright liquidation or hedged their investments by selling short some of the forward scrips. Reports from New Delhi hinting at the probability of Mr. T. T. Krishnamachari joining the Government of India, again, has also had a disquieting effect, because there are many who fear that he will actively help the Prime Minister to translate into practice the socialist pattern of society. The heavy taxes imposed by him during his brief regime as the Finance Minister, his introduction of the State Trading Corporation as the Commerce and Industry Minister and his reference to the man-eater in his speech to Parliament just before leaving the Government have left such an adverse impression in the minds of investors that the very mention of the possibility of his returning to power unnerves the markets. There are, however, many in the Bombay market who confidently aver that the chances of his rejoining the Government of India are slender. Whether this is mere wishful thinking or based on inside information, events alone will show.

Anyway, the sudden shake-out in equities early this week has induced a cautious feeling among investors. Consequently, the buying fervour in the cash section also has perceptibly diminished. Further, the spate of new issues that will be coming from the beginning of next week almost right up to the end of December is diverting their attention and resources.

The commodity markets are distinctly on the quieter side. The prices of both cotton and oilseeds have fallen for the second week in succession. The decline is not confined to the futures section alone, but includes the ready also. Ready groundnut, for instance, has dropped by 10 per cent. from the peak level witnessed on 12th October. The fall in other oilseeds and cotton is relatively modest; nevertheless, it has given a feeling of relief among industrialists. It is, however, too early to presume, for reasons mentioned in these columns last week, that the end of the upward trend in commodities has been seen.

Sugar Industry

The last word on the policy for sugar industry has not yet been said. The Government's pronouncement on Sunday the 25th inst., is only a stop-gap arrangement for the new season commencing next week. Its views and decisions on the Tariff Commission's recommendations have not been made known. Will they be adverse to the industry? At one time, there were reasons to feel that the Government might make a doctrinaire approach to the problem of high prices and short supply of sugar. But the statements made by Mr. S. K. Patil, the Union Food Minister, reveal that he is not thinking on those lines. The policy announced for the 1959-60 season is by no means perfect. It may not be as effective as the Food Minister thinks, but it will not make matters worse.

Mr. Patil has made it clear that, normally, the Government does not want to interfere with either the sugar trade or industry. If, however, any of them tried to squeeze the consumer, it could not remain a silent spectator. It would appear from his remarks in Madras and Kanpur last week that he holds very realistic views on controls. He knows that Government machinery is not perfect and that controls breed corruption. He himself admitted in Kanpur that, in Bombay City, there were 700,000 ghost ration cards in a population of 4,000,000 and that crores of rupees worth of sugar are being diverted to the black market with the help of these cards. Despite all that, he is not for immediate abolition of controls, as demanded by the President of the All-India Sugar Merchants Association. He is quite right in holding this view, because, so long as there is not sufficient surplus of sugar to keep the pipelines full and to leave a balance to fall back upon in times of emergency, there will be sufficient room for the trade and industry to boost the prices. When sugar prices shoot up, they become political dynamite, with which the opposition attacks the Government, the industry and the trade and tries to bring them down in the eyes of the public. It is, therefore, not desirable to press for the abolition of controls on sugar now. The real remedy for controls lies in more production.

A section of sugar industry and trade has been advocating imports of sugar to the tune of 200,000 tons, so that supplies could be increased within a short period and controls taken off. Mr. Patil has rightly turned down this suggestion. "I would not spare" he remarked in Kanpur, "even one naye paise for importing sugar, even if the position remained the same for 50 years." Sugar, after all, is not as important as foodgrains. One can easily curtail one's sugar consumption without any ill-

effect on one's health. Indeed, those who are over 40 years will improve in their health if they consume less sweets. Accordingly, in the allocation of scarce foreign exchange, sugar cannot and need not be given the same priority as foodgrains.

Another welcome observation made by Mr. Patil last week pertains to the demand for nationalisation of sugar industry voiced by the socialists in Uttar Pradesh. He said that sugar industry and trade would remain in the private sector, unless they committed the blunder of plundering consumers. The Government, he added, was already saddled with so many heavy responsibilities in the public sector that it would not feel happy if it were saddled with additional responsibility by nationalising a huge industry like sugar. This is, indeed, a reassuring statement and the U.P. Government will do well to save time, labour and money by giving up its decision to appoint a committee for considering the Socialists' suggestion for nationalising this industry.

West German Bank Rate

West Germany has taken prompt measures to curb excessive business expansion. With effect from Friday the 23rd inst., it raised its Bank rate from 3 to 4 per cent. and applied the credit squeeze by raising 10 per cent. the minimum reserves the banks must deposit with the Bundesbank, its central banking institution. Bill and bond rates also have been raised. A new Government loan for DM 300 million (about Rs. 34 crores) to cover a part of the deficit, has been announced. This loan carries interest at 5½ per cent. per annum and, as the issue price is at 96½ per cent., the yield works out to as high as 6.2 per cent. The loan is repayable in eight annual instalments, beginning from 1st November 1964. Explaining the reasons for these measures, the Bundesbank said that they were meant for countering excessive business expansion and that delay could have endangered the price and wage lines and led to recession.

The enhanced Bank rate is the highest since January 1958. Whole of last year, the Bundesbank's policy was in favour of lower interest rates and the Bank rate witnessed a low of 2½ per cent. in January 1959, at which level it stayed until early last month when it was put up by ½ per cent. as a clear-cut warning that sharper measures of credit policy would be taken, if the stability of price level were endangered. This warning has now been carried out. It may be noted, in this connection, that, in the past 12 months, West German industrial production has gone up by 7½ per cent., order books of almost all industries have been lengthening, the building boom has persisted, and labour shortage is acute, there being more vacancies than unemployed. Indeed, labour shortage is so acute that there has been a large influx of workers from Italy.

Outlook for Aluminium

The demand for aluminium in India, as in other countries, is rising by virtue of its merit as a universal metal which can be put to more numerous uses than any other metal. The consumption of primary metal, which was only 11,000 tons in 1946, rose to 20,000 tons in 1955. In the next three years, it rose even more rapidly to touch 30,000 tons in 1958. It is estimated that annual consumption will be anything between 65,000 and 70,000 tons by the end of the third Plan period. This will mean an annual increase of 12 per cent. The rise in aluminium consumption depends on the growth of various industries. It, therefore, follows that, if the growth of the latter is more rapid, the consumption of aluminium will also be at a much higher rate.

As Mr. Lakshminpat Singhania, Chairman of the Aluminium Corporation of India, pointed out in his address at the annual general meeting of the Company held this week (the full text of his speech appears on page 751 of this issue), the pattern of consumption in India has gradually shifted, as in other parts of the world, from domestic use to industrial and transport use. To take a few instances, use of aluminium in utensils dropped from 12,000 tons in 1951 to 8,000 tons in 1955 and was unchanged at that level in 1958, while that in cable manufacturing more than doubled itself from 5,000 tons in 1955 to 11,000 tons. In transport, it rose from 3,000 tons to 4,000 tons and in engineering building and construction, there was a fivefold rise within three years to 2,500 tons in 1958.

In view of the anticipated rise in consumption, there are plans to establish more aluminium plants at various places in India. By way of caution to prospective entrepreneurs in this line, Mr. Lakshminpat Singhania drew attention to some basic factors to be borne in mind by them. "The deciding factor," he said, "should be the competitive value of the metal produced at different stages and at different places, as immediately the metal becomes costlier, the consumption pattern will change. It must be borne in mind that this metal has to compete with many other non-ferrous metals, as well as steel, and here the cost is the most important governing factor. If the cost of production is affected either due to heavy capital expenditure or to higher power cost, the consumption of the metal will also be affected." Mr. Singhania feared that as the cost of power in India is very high—aluminium is a highly power-intensive industry—the power cost would prove to be a heavy burden on this industry.

He also drew attention to the paucity of some important raw materials for aluminium manufacture, such as petroleum coke for electrodes and cryolite for electrolytic process. The former, it is

said, is available only at the Digboi oil refinery, but the quantity available is not sufficient and the cost of transporting it is prohibitive. The new refineries are adopting a different process and as such are not producing petroleum coke. Mr. Singhania, therefore, stressed the necessity for the new refineries producing petroleum coke as a by-product. So far as cryolite is concerned, it is at present mostly imported from Greenland. Since commercial production of aluminium depends on cryolite and dependence of the industry on imports is not always desirable, Mr. Singhania said that due attention must be paid to the manufacture of synthetic cryolite in India.

As readers are aware, Birlas are going ahead with their plans for setting up an aluminium plant near the Rihand Dam in Uttar Pradesh, in collaboration with Kaisers of the U.S. Seven representatives of Kaisers are already in India, preparing the ground for the construction of the project. The prospectus of the Hindustan Aluminium Corporation—Hindalcor, for short—is expected to be released shortly.

Meanwhile, moves are being made by a Bombay industrialist to exploit the rich aluminium-bearing bauxite deposits at Udgr near Kolhapur, estimated at 5.74 million tons. The availability of bauxite in Kolhapur has been known for a long time. It was the ambition of the late Mr. Walchand Hirachand to establish an aluminium plant in that site. He had to give it up, as cheap electric power was not available. This handicap, however, can be overcome when the Koyana power project is completed. The Government of Bombay, too, is keen on including aluminium manufacture in Kolhapur in the third Plan. The Bombay industrialist—Dr. A. G. Tendulkar—is actively exploring the possibilities of getting collaboration of the U.S. and West German firms. The representatives of the Aluminium Company of America—Alcoa, for short—the biggest aluminium manufacturer in the U.S., are already in Bombay to examine the merits of the project, which aims at producing 10,000 tons, initially, and 25,000 tons in a few years. It would appear that the Government of India, too, has given its informal consent to this project.

Air Transport

Since the failure of the International Air Transport Association (I.A.T.A.), at its recent meeting held in Tokyo, to reach an agreement on air fares and rates acceptable to all its members, many international airlines are independently thinking about ways and means of reducing fares. The British Overseas Airways Corporation (B.O.A.C.), which had vigorously, albeit unsuccessfully, campaigned for the extension of the North Atlantic "economy" fares to other routes throughout the world, has now proposed a 20 per cent. cut in fares on its "cabotage" routes over which the I.A.T.A.—through which most international air fares are fixed by agreement—has no control. The reduction will take effect only if the British Government approves of it. The Corporation has decided to place it before Mr. Duncan Sandys, the Minister for Aviation, for approval.

The present international agreement between members of the I.A.T.A. is due to expire on 31st March 1960 and, unless a fresh agreement is signed, airlines will be free to compete openly from 1st April. In other words, they will be free to modify their fares and rates as they please. None will welcome such a development as it might well spark a rate war in air transport.

The fact that the proposed cut in fares by about 20 per cent. will be confined only to "cabotage" routes indicates that the B.O.A.C. is optimistic that an agreement acceptable to all can be reached before the expiry of the one currently in force.

But even in respect of "cabotage" routes, the B.O.A.C. cannot have its own way. For here it has to compete with independent airlines operating alongside the B.O.A.C. on colonial routes. Three such airlines—Airwork, Hunting-Clan and Eagle Aviation—had some time ago approached the British Government for permission to reduce rates by as much as 50 per cent. on colonial routes, including destinations now covered by the B.O.A.C.'s own proposals. The B.O.A.C. had contested these proposals on the ground that they would materially divert traffic from the Corporation to the extent of £5.5 million in the first full year of operation and even more in subsequent years. Many colonial air transport authorities have approved one or other of the independent's proposal, though the U.K. Government does not appear to have taken any action so far.

Be that as it may, the B.O.A.C. is keen on reducing air fares. Cheaper fares alone, it believes, can attract traffic in sufficient quantity to make the operation of giant jet planes economically feasible. And at no time in the past was the B.O.A.C. in a better position to effect a reduction in fares. The financial position of the Corporation has considerably improved of late. While in 1958-59 the Corporation and its associates suffered a loss of as much as £5.2 million, in the first half of the current year alone it has earned a profit of £1.1 million. At the same time, the losses of associate companies have been substantially reduced to a mere £156,000. This was brought about by the cut in engineering cost, higher labour productivity and higher passenger revenue.

Air transportation by its very nature involves heavy capital expenditure. The advent of jet aircraft has called for larger investments. Although the potential market for airlines are virtually inexhaustible, only a fringe of this has so far been tapped. More traffic can be attracted only by making fares cheaper. But the heavy capital expenditure involved makes any marked reduction in fares difficult. The only way, therefore, is to reduce operational costs as much as possible and to pass on the benefit to the passenger. It is this consideration which has prompted even some of the giant airlines to enter into some kind of pooling arrangement with other carriers for sharing overheads.

(Continued on page 752)

Colombia's need for balance of payments assistance arises primarily from the decline in coffee prices, and the heavy burden imposed on the balance of payments by amortization of debts incurred in connection with former import arrears. The Government is carrying out a stabilization program based on policies of fiscal and credit restraint.

WAGE BOARD FOR PLANTATIONS

NOW that the representatives of employers, workers and the Government constituting the Industrial Committee on Plantations, which met in Calcutta this week under the chairmanship of Mr. G. L. Nanda, Union Minister for Labour, has urged the Union Government to set up a national wage board for plantation industry, 'it may not be long before such a body is formed. This will bring the total number of wage boards to four. At present, there are wage boards for the textile, cement and sugar industries. Employers and workers need not entertain any apprehensions regarding the scope and effect of wage boards. For, as long as dissatisfaction over the current wage level exists—and there is dissatisfaction—the choice for both employers and workers lies, as Mr. Nanda pointed out in his presidential remarks, between wage boards and tribunals. By dispensing with the wage board, the industry could not avoid facing the demand for an examination of the wage question. The Plantation Committee has, therefore, done well to decide in favour of wage board. Constituted on a national level, having a tripartite composition with an independent chairman and two independent members, the board is better suited to evolve a wage structure for the entire industry than regional Industrial Tribunals which give widely varying and, at times, conflicting awards.

Nevertheless, in the case of a large industry like the plantations, spread over several parts of the country, regional differences have got to be taken into account in fixing a wage structure. Even so, it is not advisable to have two separate wage boards, as was suggested in some quarters, one for the plantation industry in the South and another for that in the North, as this will give rise to many complicated problems of co-ordination. The Committee decided, as per the recommendations of a sub-committee specially appointed to go into the question, to have two sections for the board, one for the South and the other for the North and North Eastern areas. This seems to be the ideal solution, as it represents a compromise between the regional and the national approach to the question of wage-fixing. Employers and workers would do well to wait for the formation of the wage board and desist from any action that might complicate matters to be dealt with by the board.

Mr. Nanda, in his speech, referred to certain considerations that should govern the Committee's decisions which, we think, should guide the decisions of wage board also. These referred to the cost of welfare measures and their effect on the industry and co-operation between management and workers to improve efficiency. Any increase in payments to workers, on account of housing and other welfare services, added to the industry's costs. If these costs were allowed to rise beyond a point compatible with economic operations of a considerable section of the industry with ordinary efficiency, production and employment would be adversely affected and the workers would be among the worst sufferers. On the other hand, it would harm the industry if workers' basic needs were not complied with and their conditions of service were not satisfactory. The problem is, therefore, one of evolving a wage structure which does not swing too far to either side.

Another issue having a close bearing on labour-management relations is bonus. Mr. Nanda had some suggestions to offer in this regard. The bonus question, he pointed out, was complicated by the existence of plantations which had no substantial reserves, had no profits to show and could not therefore afford to pay a bonus. But this caused much heart-burning among workers of such plantations. An obvious solution to this difficulty, according to him, was the creation of some kind of bonus equalisation fund in which there might be an element of pooling, especially as the bonus rate in Northern areas was settled area-wise and not separately for individual gardens. This suggestion has many drawbacks and requires to be critically examined.

The progress of housing for plantation workers has been quite uneven and unsatisfactory. The Committee, which considered this question, agreed that a central agency should be set up to examine the difficulties experienced by plantation owners in implementing the housing programmes and to suggest measures for facilitating construction of houses by employers. The central agency, it was suggested, should consist of representatives of State housing boards set up under the Plantations Labour Act. It was recommended that the difficulties pointed out by employers in furnishing security to obtain loans from the Government for the construction of such houses should be examined by the Government. The Government's reaction to this suggestion is not known at the time of writing.

OIL PRICES

The reduction in oil prices announced last week is the result of prolonged negotiations between the Government and the three petroleum companies. The present reduction follows the earlier revision of its kind in May 1958. It will be recalled that the oil companies agreed in 1958 to an *ad-hoc* reduction amounting to Rs. 10 crores a year. It was then agreed that the prices would be further reviewed in the light of the examination of the companies' accounts by the Government's cost accountants. Such a review has now taken place and made possible the present reduction in oil prices. An agreement has now been reached between the Government and the companies, covering the period to the end of March 1961. Under the new agreement, the companies will forgo a further sum of Rs. 3 crores for the first seven months of the present financial year. From 1st November 1959 the fresh agreement with the companies provides for reduction at the rate of Rs. 15 crores a year. In addition to this, there will be a further reduction at the rate of Rs. 4 crores a year which is attributed to the drop in landed costs. Thus, the immediate effect of the agreement is that, with effect from 1st November 1959, there will be a total net reduction at the

rate of Rs. 19 crores a year. The concession agreed to by the companies is in respect of distribution charges from the port to the point of delivery. The total value of petroleum products for distribution in India by the companies is roughly Rs. 200 crores. The reduction in oil prices will not, of course, be reflected in consumer prices, since it will be mopped up by the Government of India.

Announcing the agreement reached by the Government with the oil companies, the Union Minister for Oil, Mr. K. D. Malaviya, stated, at a Press conference held last week in New Delhi, that there was still a "disparity" between the reduced prices and what the Government "wanted" by way of further reduction; he did not, however, specify the extent of reduction the Government had in mind. He declared that it was an *ad-hoc* agreement and that the "search for a new formula will continue." The present agreement, according to the Minister, opens the way for "a further examination, further talks and further understanding between the two sides on this matter." Paying a tribute to the oil companies, he said: "There has been an attempt on the part of the distributing companies to appreciate our viewpoint and it will not be fair for us to project any differences that we have regarding the concessions which, we think, they should give at this stage. We shall continue to examine this question. When our distributing company comes into being, they will help in this process." He added: "It is in that spirit of appreciation and co-operation that we have come to this understanding. We are happy over it, though I must say there is still disparity in what we wanted and the agreement arrived at. But the disparity between the two has been minimised."

There will be widespread disappointment among consumers that the benefit of neither the last nor the present reduction in prices will be available to them. Mr. Malaviya argued that, even if a good part of the reduction were passed on to the consumer, the benefit would be "so insignificant that even the consumer would not consider it worthwhile." He said that even a

reduction of one naya paisa in the price of a bottle of kerosene would cost Rs. 3 crores annually; it was not also certain whether the reduction would actually benefit the consumer or be mopped up by middlemen. This argument is by and large correct, for there is no doubt that the transfer of the benefit of the reduction would mean a serious loss to the producer and the Government while it would be of doubtful benefit to the consumer. But there is no reason why a part of the reduction in prices should not be passed on to industrial consumers of petroleum products to whom even a small reduction in production costs could be of some real significance.

WORLD WHEAT POSITION

The most important decision taken by the International Wheat Council, at its twenty-eighth session held in London last week, was to undertake a detailed review of the world wheat situation in April 1960. The Council was meeting for the first time since the International Wheat Agreement 1959 came into force on 1st August last. The review, which the Council has been obliged to undertake under Article 21 of the Agreement, would include appraisal of national production policies, stocks, prices, trade and disposal of surpluses. Surplus disposal is a question which has aroused bitter controversy, as it affects both producers and consumers. While the need to channel surpluses to underdeveloped countries in need of foodstuffs, either to tide over temporary shortages or build up buffer stocks, is recognised, it is also contended that the disposal of surplus stocks should not interfere with normal commercial transactions. This is the reason why agreements to supply wheat on concessional terms stipulate that the receiving countries should procure their normal commercial requirements from members of the Wheat Council. Their inability to do so perhaps explains the slow progress of surplus disposal.

Stocks with the main exporting countries such as the U.S., Canada and Australia, have risen to a record level and are, at present, as much as twice their combined annual exports. In fact, the problem of disposing surplus wheat has now assumed such proportions and such a potential for intensified conflict of interest that exporting countries are urging for new and better co-ordinated surplus disposal methods. For instance, in a statement by the Canadian-American Committee, released by the Private Planning Association of Canada and the U.S. National Planning Association, it has been suggested that co-operative action between Canada and the U.S. should be considered at least in the form of a joint programme for using the wheat surpluses of the two countries for famine relief and special emergency purposes and, possibly, in a broader framework which might envisage the establishment of national reserve stocks of wheat in underdeveloped countries. Pending the development of any such plan for co-operative action, the Committee has proposed various means for improving existing policies and techniques of surplus wheat disposal. These recommendations, too, are based on one main and essential principle, namely, that the disposal of surplus stocks on concessional terms should not interfere with commercial transactions. The Committee emphasises that the programme of surplus elimination should not be a permanent one. The ultimate aim should be restoration of the balance between supply and effective commercial demand and elimination of Government pricing policies that require export subsidies.

It remains to be seen how far this ultimate freeing of the wheat trade from Government controls is practically feasible and how long it will take to materialise. Meanwhile, there is need to re-examine the question whether countries which are unable to fulfil the normal commercial procurement condition should not at all be given wheat on concessional terms. Last year, according to the F.A.O., while the overall food production rose by four per cent, and stocks increased in exporting countries, the underdeveloped countries of the world actually had less supplies. It is to be hoped that the Wheat Council, when it reviews the position next year, will consider this aspect.

COLOMBO PLAN: TECHNICAL AID

The extension of the period of operation of the Colombo Plan beyond 1961 will be considered by the Consultative Committee at its annual meeting scheduled to be held in Indonesia next week. It may be recalled that the period of operation of the Plan, which commenced in 1950 initially for a term of six years, was subsequently extended upto 1961. There is no reason to believe that the Committee will

advocate its termination, since such a step will certainly put a premature end to a very useful form of international co-operation. In any case, there is hardly any room for complacency or a sense of fulfilment on the part of the sponsors of the Plan. For the *raison d'être* of the Plan, that is, the need for enlisting international co-operation to fill the gaps in the national resources for economic development of the South and South-East Asian countries, continues to be as pressing as ever. This is not to say that the Plan has not achieved anything. Quite the contrary. A glance at the *Report of the Colombo Plan Technical Co-operation Scheme 1958-59*, just published, will provide an impressive record of its operation during the comparatively short period of its existence of less than a decade. The technical co-operation scheme is only one of the two component parts of the Colombo Plan, the other part being the capital aid programmes which, since 1951, have accounted for a total expenditure of about £2,000 million on Colombo Plan projects (including the U.S. aid projects) in the countries of South and South-East Asia.

Ever since the inception of the technical assistance programme, over 1,100 Colombo Plan experts in many industrial, agricultural, administrative, and other economic and social fields have come to the countries of South and South-East Asia to help their Governments and peoples to speed up the tempo of development. Besides, more than 8,500 persons from countries

of the area have received training in other Colombo Plan (mainly donor) countries in many techniques and skills—engineering, medicine, education, agriculture, public administration, industrial management and others. Scientific, technical and training equipment of the value of over £2.9 million has also been supplied to the area as part of the Technical Co-operation Scheme in addition to large amounts that have been made available for similar purposes under the capital aid part of the Colombo Plan. As on 30th June 1959, the total value of technical assistance that has been provided to South and South-East Asia under the Technical Co-operation Scheme since its inception comes to over £14 million, as against £11 million at the end of 1957-58. This excludes the contribution of the U.S., for, though it had been a permanent member of the Colombo Plan, the U.S. was brought within the scope of the scheme in January 1959 only. Its expenditure on the scheme upto the end of June last is shown at \$31.7 million (over £11 million).

The *Report* points out that, while the greater part of the assistance being given under the scheme to the developing countries of South and South-East Asia comes from the member-countries outside the area, namely, the U.S., the U.K., Canada, Japan, Australia and New Zealand, an increasingly significant proportion is being contributed in the form of mutual aid by the countries of the region itself. This is a natural corollary of the original concept of the

Colombo Plan as a co-operative effort for economic development.

The technical assistance given under the scheme falls into three categories: provision of training places, experts, and equipments. The total volume of technical assistance given and received under the scheme during the year under review was greater than in any previous year. The number of new training places provided during the year exceeded the previous highest figure in 1955-56 by 165 to 1,717. The number of new experts taking up assignments under the scheme, however, fell from 210 in 1957-58 to 192 in 1958-59, but this is due, at least partly, it is explained, to a change in the system of recording, introduced in the beginning of the year by the Colombo Plan Bureau. The contribution by way of equipments was also higher during the year. The total expenditure on the various schemes by donor countries amounted to £3 million—a record for any previous year since the inception of the scheme in 1950—as against £2.90 million in 1957-58. The total expenditure incurred by the U.K. under the scheme during the year amounted to over a million pounds, followed by, among others, Australia, which supplied £995,845, Canada £505,431, New Zealand £271,083, Japan £163,493 and India £113,184. Among the recipients, India got the largest sum (in the form of experts, equipments and number of training places), amounting to £486,114. Indonesia received £477,380, Pakistan £447,837, Ceylon £285,640 and Burma £256,715, to mention only a few.

It is true that neither the total expenditure involved nor the numerical strength of persons trained is impressive, if taken as an adequate objective measurement of the utility of the scheme for providing an impetus to the economic development of this region and raising the living standard of its people. But there is no doubt that, because of the way in which it can stimulate and guide local effort and help put unused resources to work and also because the skills and knowledge it generates can spread from person to person, it does represent much more to the receiving countries than the production of a specific number of trained people and the direct achievements of the experts. As

LONDON LETTER

MONEY FOR EXPORT SOME IS GOING EVEN TO THE U.S.

(From Our Own Correspondent)

LONDON, 24th October

THE British Treasury has recently published an estimate of the funds made available annually by this country for investment in the Commonwealth. In the first half of this year, the following sums were raised through public (mainly Governmental) channels:

	(In million £s)
Colonial Services Vote	11½
Under Colonial Development and Welfare Acts	12½
Other loans and grants	5
Colonial Development Corporation	7
From World Bank ex U.K. subscription	15

Add—Commercial finance ex Export Credits Guarantee Department	13
---	----

Total from public sources .. 64

This annual rate in excess of £120 million is higher than has been achieved at any time in the past five years, mainly as a result of the new channel of lending for the development of underdeveloped countries opened through the World Bank. On the other hand, the £28 million of private loans made through the City in the first half of this year has been less than the average since 1954. But whether we take the current rate of British loan investment in the Commonwealth (say, £180 million per annum) or the rate for the past five years (say £165 million per annum), the flow of funds is considerable; but it is not the whole story, for

the Report pertinently points out, one of the special virtues of technical assistance, as compared with other forms of technical aid, is its 'multiplier' effect, which may enable a single expert (or returned trainee) to make a more than proportionate contribution to the country's development.

direct investments by British firms must be added. The average for recent years then becomes:

	(In million £s)
From public sources	88
From City loans	77
From direct investment	45
Total	210

This is a very fair proportion of the £300 million per annum which a past Chancellor estimated as the necessary total export of British capital. It also provides the answer to the American demand that the burden of assisting the underdeveloped countries should be borne increasingly outside the U.S.

The answer is also reinforced by the news that the building of the highest ever office block in New York is to be undertaken jointly by American and British finance—with Treasury approval. This may mean the largest single investment of British capital in the United States for a generation.

But the Treasury is not prepared to open the floodgates of sterling to indiscriminate overseas investment—which might take the form simply of the investment of large private nest-eggs. This could follow from the complete convertibility of sterling and the Treasury is prepared to go all the way short of this. This is shown by the freeing of the travel allowances from the £100 per annum per head chains which have hitherto bound them. For six years now the limit for Scandinavian countries has been £250 and this has meant a loophole. Now the notional limit is £250 for anybody per annum anywhere—including the United States, but, in practice, more will be available on direct application to the Bank of England. The need for special permission is the one limit retained against the unauthorised issue of capital. But, if it is a matter of genuine development expenditure or investment—then no limits exist. No—there is still one other limitation: the purchase of dollar goods is still rationed and this anomaly is likely to be the next to go, if only to enable the British Government to take up an untarnished "holier than thou" attitude towards the U.S.A. at the next G.A.T.T. Conference!—All Rights Reserved.

AMERICAN LETTER

STEEL STRIKE INFLECTS HEAVY LOSSES INNOVATION IN TREASURY FINANCING

From Our Special Correspondent

New York, 20th October

ONE glum observation and a cheerful one. Neither the steel workers, nor steel management, made any friends in the last three months, except, perhaps, foreign steel workers and manufacturers who benefited by the longest American steel strike in history. The impact on the United States' economy was far worse than expected.

General Motors, for example, was forced to cut down on its automobile manufacturing operation about the middle of October and it will be another four to six weeks before sufficient steel is at hand for normal operations and pay-rolls. The railroads are hit badly, too. There were operating losses, rather than net profit and considerable unemployment.

Government economists said the prolonged steel walk-out halted and may even have reversed the country's overall economic growth. Tentative estimates are that 1959 national production will probably fall short of the \$500,000 million. This rate was previously considered an outside possibility.

Even feverish economic activity in November and December is unlikely to make up the industrial losses of the last three months and it will take the workers perhaps two years of hard work, abstention of luxuries and savings before their losses can be recouped. Like in modern wars, nobody won. Like in modern wars, everyone seems determined to eradicate the mess which was created. Strikes of that scope are indeed a luxury and a phenomenon of liberty and democracy which seem somehow out of context of modern society, except that they break the monotony of mass production and routine and satisfy egos as heroics in war do.

Interest Rates

The cheerful observation concerns an innovation in U.S. Treasury financing policy and the offering to the public of 5 per cent. notes due in a little less than five years. The response was enormous. Throughout the country, people withdrew from their savings and commercial accounts to subscribe to the new securities, although I am convinced very few people knew that the 5 per cent. rate is obtainable only if the notes are held to maturity and that in the meantime the securities are subject to market fluctua-

tions and, thus, have no resemblance to a real savings medium.

The innovation was significant, though, in many respects. Heretofore, Government securities were designed strictly for institutional investors, commercial banks, insurance companies, trust funds, investment companies and the like. To a considerable extent, that was inflationary financing.

As the *Wall Street Journal* pointed out last month, "the real ghost that stalks the Treasury corridors these days is the spectre of a sudden and wholesale loss of confidence in the U.S. Government's ability to meet its financial obligations without inflation."

Members of the Congress have been obsessed for some years with the conviction that high interest rates are an evil which benefited just lenders. They never realised that savers who may also be borrowers like to get a good return on their nest-eggs. The latter have proved it in their unexpectedly large subscriptions to the new 5 per cent. Treasury notes. At least some of the inhibitions have been shaken off some people in Government who felt exaggerated fears of rising interest rates. These fears kept the Treasury predominantly in the short-term range for its refinancing and kept longer terms out of attractive interest rate ranges.

This interest rate bogey was not confined to the U.S. alone. The British Radcliffe Commission reported, for example, "over most of the period," meaning the post-World War II years, "the authorities have not been prepared to force interest rates on the longer bonds upwards, in order to tempt holders of short bonds to switch to long bonds."

Sounder Debt Management

The offering of the new 5 per cent. U.S. Treasury notes to the public, when all is said and done, can only be regarded as a step toward sounder debt management, even though it involved a relative depletion of private bank deposits. This resulted in substituting a Treasury liability of 1964 for one that was payable on demand.

The U.S. Treasury savings bond programme has been hurt, naturally, by the new 5 per cent. notes. Savings bonds pay only 3½ per cent. and prior to 1st June, only 3¼ per cent., if held to

maturity. Many holders cashed in their bonds to buy the new 5 per cent. bond. But it really does not matter much. Since March, 1955, there was no single month in which Treasury savings bond sales exceeded redemptions and total savings bonds outstanding have now dropped to \$8,600 million.

Appropriately interest rates, large New York City banks charged an average of 5.09 per cent. on short-term business loans in the first half of September, according to the quarterly report of the Federal Reserve Bank of New York. This compares with 4.63 per cent. in the first half of June and with 3.92 per cent. in the first half of September 1958. The average price for long-term money due in more than one year rose to 4.85 per cent., against 4.75 per cent. in June and 4 per cent. in the September 1958 period.

Some Data

Official statistics are always lagging. Figures have to be collected from many parts of the country and by the time they are computed and co-related the picture may have changed. But at the risk of being contradictory, I would like to cite a few indices which may be indicative as of this writing.

Employment in the U.S., as reported on 14th October, was 66.3 million, as compared with 67.2 million in the previous month and with 64.6 million a year ago. Unemployment was 3.2 million, against 3.4 million and 4.1 million, respectively.

Personal income, as reported last on 17th September, stood at a remarkable \$381,400 million, as compared with \$384,100 million in the prior month and with \$362,400 million a year ago. Construction awards, reported weekly, as of 16th October were \$264.3 million, as compared with \$241.5 million in the previous week and only \$248.1 million twelve months previously. It must be remembered that not all construction requires much steel.

Farm prices have remained steady up to mid-September after a three months decline, but the index was still 16 points lower than a year ago. Lower prices received for cattle, hogs and other products were offset by seasonal increases in dairy products and a continued boost in the prices of eggs.

These somewhat conflicting U.S. statistics were interpreted on the New York Stock Exchange as just what they appear on the surface. There have hardly been any price changes. There were some flurries in steel stocks on the basis of good business in the immediate future. There was some selling. There was some profit-taking. On the whole, brokers could not have been disappointed—the trading volume was quite large—in fact, larger than a year ago.—All Rights Reserved.

BRITAIN'S LEADING JOURNAL FOR ASIA AND AUSTRALASIA

For Public Affairs Industry Business

FAR EAST TRADE

Forward-looking Indian concerns are now considering 'What can Far East Trade do for me?' Every month FAR EAST TRADE brings news of developments in Asia and Australasia to influential readers in Government, in business, and in industry, throughout this vast area, as well as in Western Europe. Besides being a unique advertising medium, it maintains an exceptionally wide coverage of events everywhere in the economic, technological, and industrial fields. Confident that we are contributing to better understanding, we warmly welcome new readers.

LONG-TERM FINANCE FOR INDUSTRIES INDIAN MERCHANTS' CHAMBER'S VIEWS

THE problem of long-term industrial finance in India constitutes a curious pattern. While financial institutions like the Industrial Finance Corporation of India are in a position to meet the increasing needs of industries, which are starved of long-term finance, they are not able to utilise fully their augmented resources. Two years ago, it was found that the resources of the I.F.C. were too inadequate to fulfil its task and this had had a restraining effect on its activity. But now the situation has changed completely. While, as stated above, its resources have been considerably augmented, thanks to the increase in its earnings and the favourable response to its bond issues, it has not been able to expand its activity. On the contrary, its business has actually suffered a setback. Not only the total amount of loans sanctioned during 1958-59 declined sharply to Rs. 3.79 crores from Rs. 7.78 crores in 1957-58 and Rs. 11.91 crores in 1956-57, but the actual disbursements too dropped to Rs. 7.48 crores from Rs. 8.34 crores in 1957-58 and Rs. 9.78 crores in 1956-57. The reasons for this phenomenon were explained not long ago by the Chairman of the I.F.C., Mr. K. R. K. Menon, in his speech at the last annual meeting of the Corporation. Nevertheless, the Committee of the Indian Merchants' Chamber, Bombay, which considers this development as an "unhealthy phenomenon" in the process of development, sought further clarification from Mr. K. R. K. Menon, when it held a reception in his honour on Monday this week and had a discussion and exchange of views on the various aspects of industrial finance.

Matter for Concern

Speaking on behalf of the Committee, Mr. Lalchand Hirachand, President of the I.M.C., observed:

"... if there are surplus funds with the I.F.C. or other institutions which have the avowed object of financing industry and, at the same time, these funds could not be utilised, that is clearly an indication of a trend which requires the closest scrutiny and rectification. The quantum of funds that could be made available by the I.F.C. would be only a very small percentage of the total requirements of the private industry and even to this small extent if the I.F.C. is handicapped in the normal function of granting long-term industrial loans, I think, then this should be a matter for concern, from the point of view of the utility of the State financing institutions under planning. I hope, therefore, you would explain to us how the I.F.C. proposes to reorientate its policy and procedure to play an effective role in the development of industry in the private sector, particularly in the third Plan period."

Distribution of Loans

Referring to the pattern of distribution of loans by the I.F.C., Mr. Lalchand complained that "the scope of the loans advanced by the I.F.C. is not sufficiently extensive as to cover a variety of industries which are now being planned for development." For, hitherto, he said, the Corporation had been giving loans mostly to well-established industries. He pointed out that food industries including sugar, textiles, chemicals, fertilisers, cement and paper had figured prominently with substantial assistance in excess of Rs. 5 crores each and between them they shared 74.6 per cent. of the total loans sanctioned. While admitting that the demand for loans should come from the prospective entrepreneurs, the I.M.C. President suggested that, in the period of initial development, it should be the function of the I.F.C. to take the initiative and provide such facilities as would enable new industries to avail themselves of the assistance of the I.F.C. He felt that the I.F.C. should devise a policy which would extend the benefit of the loans to diverse industries.

One of the difficulties in the way of the I.F.C. expanding its business is the serious foreign exchange situation and the consequent severe curb on imports. In this connection, Mr. Lalchand suggested that a procedure should be evolved by which the parties who were eligible for financial assistance by the Corporation and whose applications had been scrutinised and found in order should find priority in obtaining import licences and exchange. "The lack of import licences," he added, "or the delay in obtaining them should be no reason for the non-utilisation of the facility."

The paucity of foreign exchange, Mr. Lalchand added, offered an anomalous situation for the I.F.C., in that "its normal and effective role in financing industries is held up for reasons beyond the purview of the institution, while,

on the other hand, there are foreign credits with the Government which are unutilised." Thus, out of the total credit of Rs. 71.4 crores authorised to India by the Export-Import Bank between April 1956 and March 1959, the actual utilisations aggregated no more than Rs. 1.2 crores. Commenting on this position, Mr. Lalchand said:

"It is a matter of vital importance, to my mind, that when there is so much pressure for foreign assistance, the authorised credits are fully utilised, so that the tempo of industrial development is kept up. This is all the more necessary, when, on account of the restriction of imports undertaken as an inevitable consequence of the foreign exchange difficulties, the rate of industrial production has slowed down significantly. It is imperative under the situation that, in the first instance, the reasons for non-utilisation of dollar credits over this period are fully investigated. I think it would be but appropriate if the I.F.C. requested the Government to clarify the position by stating precisely the quantum of (1) authorised credits that could be drawn upon by private industry through the financing institutions like the I.F.C. and (2) the special conditions and terms that could be offered to make these loans easily available."

Proceeding, Mr. Lalchand posed the following questions to Mr. Menon:

"Why Government themselves have not been able to use this source of credit so far, in spite of the fact that nearly two-thirds of the credits of the Ex-Imp Bank are for the public sector? Why, in the alternative, Government have not taken steps so far to see that the credit is utilised by private industry, through appropriate agencies as the I.F.C.? Are the conditions attached to these loans such that they do not favour utilisation even on the part of the public sector? What are these conditions which have really hampered utilisation? What are the full implications of the scheme of utilisation now suggested by the Government and of which you have hinted in your speech at the annual meeting?"

Ex-Imp Bank Loans

The loans from the Export-Import Bank are more or less earmarked for various specific development projects. In the private sector, as at present, the projects covering engineering, chemicals, textile and automobile and coal mining industries would be financed from the credit. Mr. Lalchand wanted to know whether the rigidity in the allocation of the loans to specific heads of development projects is one of the factors contributing to the non-utilisation of the dollar credits by the private sector. He asked whether the whole or any part of the dollar credits from the Ex-Imp Bank allotted for the public sector could be immediately made available for the private sector.

It may be noted here that, in regard to the utilisation of the Ex-Imp Bank loan earmarked for specific projects in the private sector, the Government of India has just authorised the I.F.C. to reduce the margin on the loans advanced to private industry from 50 per cent. to 40 per cent. and, in some cases for special reasons, even upto 35 per cent. for the rupee finance sanctioned by the Corporation and also underwrite the balance of the amount. This relaxation will, however, be applicable only to those cases where foreign exchange cost of the imported plant and machinery amounts to not less than 60 per cent. of the total capital

cost of the project financed by the I.F.C. and where the import is covered by import licence issued under one or other of the foreign exchange loans taken from foreign Governments or financial institutions. Mr. Lalchand wondered whether the relaxation of margin alone could help private industries to take advantage of the loan. "Only, instead of making the insistence of a down payment in rupees to the Government of the full extent of the value of goods imported," he observed, "the industrialists are now given the facility of obtaining a loan from the I.F.C."

While on this subject, Mr. Lalchand suggested that the I.F.C. should negotiate and obtain directly foreign currency loans from financial institutions like the World Bank and the Development Loan Fund and the Government should view such efforts with favour. He went on to observe:

"If investment effort has to be stepped up in the third Plan period and if private sector has to play a significant part, there is no question that resources will have to be found for industries largely from external sources. It would be, therefore, profitable for the I.F.C. to explore ways and means of obtaining foreign funds directly and working out a scheme by which it could play a more direct and effective part in assisting industrial growth."

Other Suggestions

The I.M.C. President made a few other suggestions. First, the rate of interest charged by the I.F.C. on loans given against Ex-Imp Bank credit should be reduced from 7 per cent. (with a rebate of $\frac{1}{2}$ per cent.) to $5\frac{1}{2}$ per cent., the rate at which the Ex-Imp Bank loan has been made available to the Government. Secondly, the rupee payments should be accepted in instalments. Thirdly, negotiations with the Ex-Imp Bank and other organisations in the U.S. which give credit to India should be conducted for waiver of the condition that purchases out of the credit should be made in the U.S. This, he said, must be left to mutual agreement, subject to the suitability of the prices. Fourthly, the possibility of finding out a workable and mutually advantageous price arrangement by discussions at commercial level with American suppliers of goods should be examined by the I.F.C.

Mr. Lalchand did not view with favour the proposal of the I.M.C. to widen its activities, such as participation in the share capital of approved undertakings, exercise of conversion rights, and participation in the profits of companies to whom loans are advanced, in addition to charging interest. While not underrating the importance of these new spheres of activity, the I.M.C. President felt that, in the present context of development, the I.F.C. should concentrate more and more on providing loan capital and underwriting of new issues. There was good scope for extending the business of underwriting. He was of the view that conditions were "not quite favourable" for breaking new ground.

While the Indian Merchants' Chamber has given us the full text of Mr. Lalchand's speech, it has not provided us with the details of Mr. Menon's replies. All that it has done is a very brief summary of his remarks. It is not, therefore, possible for us to cover Mr. Menon's observations at length. If, however, Mr. Menon did not say much, it would be perfectly understood.

BANK ADVANCES AGAINST REAL ESTATE IN KERALA

SPECIAL CORPORATION FOR TAKING THEM OVER ADVOCATED

By N. K. Narayan Sarma

IT may be seen from the Report of the Travancore-Cochin Banking Enquiry Commission that one of the serious and paralysing defects in the structure of banking business in the Kerala State is the preponderance of the advances granted against the security of real estate over other types of advances. Although the ultimate realisability of these advances may, perhaps, be beyond doubt, the fact remains that such advances have exhibited a strong tendency to be "illiquid" and have, by force of circumstances, proved to be of a "long-term" nature. Accordingly, a high proportion of such advances is an undesirable feature of commercial banking in Kerala. Despite the fact that real estate forms a real security for advances, especially in this part of the country, it has been stated to be the sad experience of banks in Kerala that they are unable to effect any appreciable reduction in the quantum of such advances. It will be seen from the Report of the Commission that, as on 31st December 1955, out of the total advances at Rs. 15.98 crores of the banks in the Travancore-Cochin area, the advances against real estate amounted to as much as Rs. 4.31 crores, working out to 26.9 per cent. of the total advances. Considering the fact that the all-India pattern of such advances stood between 4 and 5 per cent. of the total advances, the seriousness of the above feature of the banks in Kerala can well be imagined.

A practical suggestion for remedying this defect is the creation of a Real Estate Finance Corporation. This body can take over from the banks the entire management and recovery of the advances granted against the security of real estates, leaving with them, if need be, only 4 to 5 per cent. of the total advances under this category. For transferring the "real-estate business" from the commercial banks to the proposed Corporation, no cash payment in lieu thereof need be made. Only, the banks should be paid in the form of bonds to be issued by the Corporation for a value equal in amount to that of the realisable value of the advances transferred to it. The Corporation should be constituted by an Act of the Legislature so as to give its bonds the status of "Trustee securities." This would enable the banks to hold these bonds under their "investment portfolio" and thus increase their liquid assets (the ratio of which is comparatively low with many banks in Kerala); this would also bring about a substantial reduction in the excessive level of their total advances, which again, is another persisting feature in the case of many Kerala banks.

Another major advantage of the above proposal is that:

(a) the Corporation will be in a better position to take effective steps to realise these advances by introducing "easy-repayment system" for the convenience of the borrowers, spread over a long period of years if necessary.

(b) the Corporation will be in a better position to take legal remedies against defaulting borrowers than the banks themselves; and, in the case of borrowers who dodge the banks with delay in the repayment of the dues within reasonable time, the Corporation could be enabled to take the process of "Revenue Recovery Act," if necessary, by providing suitable provisions in the legislation.

Yet another advantage of the proposal is that, being relieved of the deadweight of this "involving business," the banks will be able to concentrate their attention on the regular commercial banking business and thereby effectively serve trade, commerce and industry of the State, especially in the climate of a developing economy of our country. Further, in the immediate context of the various agrarian reforms contemplated by the State, in particular, and the country, in general (having serious repercussions on and values and therefore on the bank loans), it appears that a ray of hope for rehabilitating the banks in this State lies, perhaps, only in the direction indicated above.

It is possible that some doubts may arise about the feasibility and/or desirability of bringing into existence a specialised agency like the one in question, especially in the present set-up of several credit agencies working in the country. It is, therefore, necessary to touch upon

Further, the pattern of advances under this category reveals that there is a strong case for the creation of a specialised agency like the Corporation now proposed. The following figures taken from the Report of the Travancore-Cochin Banking Enquiry Commission make interesting reading:

Advances against Real Estate

	Rs. (crores)
(a) Advances of all the banks operating in the Travancore-Cochin area, according to the nature of security:	
(i) Agricultural lands	1.81
(ii) House properties	2.78
Total advances against real estate ..	4.59
(b) Advances classified according to purpose:	
(i) Seasonal agricultural operations ..	1.14
(ii) Agricultural improvements	0.43
Total agricultural loans	1.57

It will be seen from the above figures that the advances against real estate are granted not entirely or merely for agricultural purposes but also for several trade and commercial pursuits other than agricultural operations. This serves as an additional point to show the unsuitability of land mortgage banks for this purpose.

EXPANSION OF U.K. EXPORTS

The expansion of Britain's exports, which for the past six months have been 6 per cent. higher, on an average, than a year earlier, is likely to be continued, according to the *Bulletin for Industry* published by the Treasury in London. This is suggested by the good prospects in North America and Europe, and the fact that the primary producing markets are now contributing to the general improvement in British exports. The *Bulletin* says it is now possible to form a provisional picture of how Britain's accounts with the rest of the world are moving this year. Thus, the gold and foreign currency reserves have risen by £77 million in the first nine months (including an increase of £40 million in the third quarter, which is normally an unfavourable one for the reserves). While the figures for the reserves are known accurately, they tell only part of the story. To complete it, it is necessary to know what happened to the other monetary items. Taking into account these items—such as overseas sterling holdings and other monetary movements—the overseas monetary position improved by just over £50 million in the first quarter.

In the second quarter there was an adverse movement in the overseas monetary position of £149 million. But had it not been for the payment by the United Kingdom of the additional sterling subscription to the International Monetary Fund of £174 million—which represents no real burden on United Kingdom resources until the sterling is drawn from the Fund—the external monetary position would have improved by £25 million, making more than £75 million for the half-year.

(Concluded from previous page)

standable, for quite a number of the points raised by Mr. Lalchand, as, for instance, the utilisation of foreign credits, does not fall within his purview but that of the Government of India. Again, while Mr. Lalchand was right in saying that the I.F.C. should concentrate on new industries, he was a little wide off the mark when he remarked that this financial institution was helping only the established industries. A glance at the latest annual report of the Corporation will show that it has assisted numerous new units established after independence. It cannot be denied that the Corporation has rendered valuable help to a number of old industrial units which were badly in need of funds for expansion and modernisation. The utility of such finance is no less important than of loans to new industries.

From the Chamber's brief summary of Mr. Menon's reply, it is clear that the suggestion for a reduction in the rate of interest did not appeal to him nor the one in regard to breaking new ground by the I.F.C. On the latter, Mr. Lalchand voiced the feelings of business men, at least of a section of them. These were anticipated by us earlier this month, vide page 542 of *Commerce* dated 3rd October. It is needless to add that, if the I.F.C. is to succeed in this direction, it has to carry the private sector with it. Accordingly, Mr. Menon would be well advised to make the new scheme he has in mind sufficiently attractive to the business community. There is nothing new in Mr. Lalchand's suggestion that the I.F.C. should make direct approaches to the lending agencies in the U.S. The I.F.C. itself has tried it in the past and failed. Its efforts to secure a loan from the World Bank, for instance, did not succeed, because it was regarded as a public sector institution. Even the fact that it has been helping only the private sector was ignored, unjustifiably in our view, by the Bank. It would, indeed, be a good idea if, in his capacity as the President of the Indian Merchants' Chamber, Mr. Lalchand were to take up this issue with the World Bank. He would thereby be strengthening the case of the I.F.C. for direct borrowing facilities from the Bank.

TOBACCO DIRECTORY

Indian Central Tobacco Committee are shortly publishing the Tobacco Directory containing names and addresses of wholesale dealers, commission agents, grower-curers, warehouse-keepers, manufacturers and exporters handling 2,000 brands or more of different varieties of Indian Tobacco, prominent tobacco growers, tobacco growers' and traders' associations and co-operative societies and importers of Indian Tobacco in different countries.

Those who desire their names to be included in the Directory may furnish information immediately in the prescribed proforma which can be obtained on request.

Advertisements are also accepted for publication in the Directory.

Pre-publication price: Rs. 15 per copy (postage Rs. 2 extra)

THE INDIAN TOBACCO ATLAS

Just published by the Committee, the Atlas contains 45 maps, histograms and graphs showing centres of tobacco cultivation, research, marketing, etc. It covers all aspects of Indian tobacco production, industry and trade.

Price: Rs. 17 (postage Rs. 1.50 extra)

For copies and other particulars, write to:

UNIT INVESTMENT TRUSTS HIGH TIME INDIA HAD SOME FOR MOBILISING SMALL SAVINGS

By A. C. K. Krishnaswami

THE Government and the Planning Commission are, indeed, much concerned about the need to induce the general public to save and to mobilise these savings into channels where they will best contribute to national development. The Planning Commission calculated that domestic savings in 1955-56 amounted to seven per cent. of the National Income, a total of Rs. 756 crores. Currently, the figure is likely to be nearer Rs. 1,000 crores per annum, as the National Income has gone up and with it the rate of savings also must have registered an improvement.

Less than a quarter of these savings are invested in Postal and National Savings securities. Insurance premia and provident funds account for another part. But are we sure that the remainder is invested where it will best conduce to the national economy of an underdeveloped country, trying hard to pull itself up to its proper level? And are we sure that the savings of the people, particularly the industrial sections, cannot, with some calculated and planned effort, be increased by something like 50 per cent. and wasteful expenditure on trifles eliminated?

One of the chief incentives to better savings is the advertised availability of attractive savings media. Till now mostly Savings Bonds and Government fixed-interest bearing securities have been sold to the small saver. From the point of view of "safety first," there is nothing to beat them. But the real problem to long-term investors, big and small, is the quest for some safe investment which ensures that their savings are not eaten away by the inflationary price spiral. That is why a security whose value is likely to rise parallel to the rising curve of living costs has an irresistible lure. From the point of view of safety plus inflation hedge plus reasonable dividend, we in this country have no outlets for small savings. I feel that given such investment opportunities and proper educative publicity, small savings can be increased very substantially and deployed much more purposefully.

System Explained

It is quite safe to say that the Unit Investment Trust offers by far the best answer to the problem. This form of mobilising and encouraging small savings has been successfully exploited, notably in the United Kingdom and Switzerland. In Switzerland, one group of Investment Trusts alone, the INTRAG, computed that their total investments, in the middle of 1958, were about 1,000 million Swiss francs or about Rs. 120 crores. In the United Kingdom, an analysis of only one group of six such Trusts showed that, between them, they had invested a total of £26 million by the beginning of 1958. Trusts commanding from Rs. 5 to Rs. 10 crores of investments are quite common and have portfolios in as many as 150 selected companies, with no single investment exceeding a fraction of one per cent. of the total portfolio.

Some features of this type of Trust are novel to this country. A Unit Trust is a voluntary association of investors who come together and invest for mutual benefit. They do not form a company, but organise themselves almost like a family trust, and the terms of association are laid down in a Registered Trust Deed. The Trust property is held by a custodian trustee, who is usually one of the prominent banks.

Not being a company form of organisation, every "unit-holder" is enabled to withdraw his fair share of the assets on adequate notice and by surrendering his unit certificate. And apart from this right of partial liquidation, which, in practice, is rarely exercised, a holder enjoys the right and facility of marketing and transferring his "units," as shares in these associations are called. By holding the "units" and in some case "sub-units," one becomes a part-owner of all the assets of the Trust. The units are generally of small value, say, about a pound sterling; but the market value rises with the prosperity of the Trust. The earnings of the Trust are computed each half-year, and every unit holder receives on fixed days twice a year his share of the earnings. The earnings in practice have risen in step with the cost of living: "Scotbits," a typical trust which distributed on a stated holding ten years ago, 17s. 6d. annually, have lately distributed £2 15s. 6d. per annum on the same holding. Naturally enough, the market

value of the unit records rises as the distributions increase, and during the six-year period, from 1952 to 1958, almost all investment Trusts in the United Kingdom recorded rapid rises in value.

In making distributions half-yearly, the unit-holder only receives the revenues on the Trust investments. Any capital receipts like bonus shares are used to increase the value of the fund. This is another factor which contributes to increased quotations for prices of the "units" in the market. Some Trusts have provisions whereby, where the portfolio contains partly-paid shares, the unit-holder is freed from personal liability when calls are made in respect of those shares. The voting rights on the shareholdings are exercised by the custodian trustee, consistent with the interests of the Trust and the public interest.

Spread of Investment

A trust having been formed, the moneys are invested in accordance with the terms of its Trust Deed by expert managers in concurrence with the custodian trustee. The Trust Deed usually lays down the maximum possible investment in any one company and in any one industry. In FONSA, a typical Swiss Trust, the distribution is as follows:

	Per cent.
Bank and insurance shares	37
Chemicals	13
Machine industries	16
Buildings and constructions	5
Miscellaneous	29

This makes for a comprehensive and yet well balanced holding in the Swiss industry. Additionally, some Trusts also maintain a geographical distribution of portfolio, as in a typical case

	Per cent.
United Kingdom	56
North America	19
International (oil, shipping)	14
Africa	3
Continental Europe	3
India, Pakistan, etc.	2
Australia, Japan, etc.	3

Under present conditions, we cannot for an Indian Trust visualise foreign investments. Nevertheless, the foregoing arrangement is of current interest to us, as we can ensure regionally distributed investments in the country, thereby making for all-round development. Some Trusts do specify proportions of preference shares and debentures to be held, but, in the main, as the accent is on capital appreciation, ordinary shares form the bulk of all portfolios. Needless to add that the investments are under constant scrutiny by the managers and are changed as often as may be necessary.

Thrift Schemes

Some of the Trusts have also successfully introduced "thrift schemes" to benefit the salaried classes; they are enabled by these schemes to make recurring deposits in the purchase of Trust units periodically and also to reinvest dividends of the Trust as and when declared, until, say, their retirement from service. A recently formed Trust, the "Unitrust," has met with great success in its savings scheme specially designed for the small investor and the scheme is proving popular with the workers.

The success of the Unit Trust is largely due to the special features we have noticed. It provides a convenient and easy form of making small and recurring investments in industry, practically without risks, and with a near certainty of capital appreciation. It is able to provide expert financial management, investment advice and care at very low cost, which otherwise are not available except to the largest investors. And, not being a company form of association, it is able to provide for refund of the proportionate share of assets to any unit-holder when required.

Legality of the Trust

Almost soon after 1931, when the Unit Trust first made its appearance in the United Kingdom, its legality was questioned. It was assailed on the ground that it constituted an unregistered business association of more than 20 persons, which the Companies Act prohibited as being illegal. There are corresponding provisions in our Companies Act too. But the British Courts declared the Trusts legal, holding that the "business," if business it was, was being conducted only by the custodian trustees

who certainly numbered less than twenty, and the prohibition contained in the Companies Act did not apply to the Unit Trusts. This position would also obtain in India.

The State encourages and gives facilities to Unit Trusts in the United Kingdom. Apparently, it does not subject to income-tax the earnings of the Trust Fund, as the Trust itself is only an association of persons; instead it obligates the custodian to deduct tax on the distributions shared by each unit-holder and remit it to the Treasury, which will pass on refunds based on the personal tax liabilities of the holders. Adjustments would no doubt have to be made for the taxes paid by the companies in respect of the dividends earned by the Trust Fund, but this is of no current interest to us in this country, as no refunds are possible to shareholders out of taxes paid by Indian companies.

Both the Board of Trade, and the London Stock Exchange enforce certain requirements on the Trusts. The charges for administration are usually limited to about 2 per cent. at the time one subscribes to the Trust as an initial payment, and a recurring charge of three-eighths of one per cent. is made on the annual income of the Trust. Every Trust Deed usually has a life of 20 years but this can be prolonged by consent of the unit-holders. There is a voluntarily formed Unit Trust Council which strengthens the protection given by the Board of Trade and enquires into any complaints made against Trust administrations.

Under Indian conditions, it will be necessary for the State to give facilities and exercise control over the Trusts. It will have to examine and scrutinise the terms of the Trust, before it sanctions the public issue of "capital" by the Trust; it will have to ensure that the custodian trustee is a reputed large bank like the State Bank of India or one of the all-India banks; it will probably have to limit the management expenses permissible; it will have to scrutinise the permissible maxima of investments in any company and industry and prescribe that only quoted shares may be purchased by the Trust; it will also have to insist on State-supervised audit and publication of transactions and accounts; it will have to provide for enquiries into complaints from the unit-holders by a Superintendent of Unit Trusts. It may be expected that, in the matter of income taxation, the Central Board of Revenue will extend the same facilities that the Board of Trade does in the United Kingdom and that in the matter of stamp duties some concessions will be shown.

Conclusion

The L.I.C. is said to invest about Rs. 8 crores annually in the private sector and to sustain the value of industrial investments by its open market operations. It has been remarked elsewhere that this support is not without its disadvantages and that there are sound reasons why the L.I.C. should abstain from open market operations. Be that as it may, it appears that, if the Unit Trust idea succeeds in India, even less fully than it has abroad, we shall have not merely Rs. 8 crores but many times that amount every year from small savers, particularly those who earn their living from industrial units.

It is about time that a start was made to attract and canalise savings in Unit Trusts. It is for one of the larger banks to take the initiative and sell the idea to the public and the State. A modest start can be made with a target of Rs. 5 or Rs. 10 crores and investment may be restricted to inter-market leaders of the stock market, the so-called "industrial blue-chips." It should be possible to canvass the support of the trade union organisations and ask them to demonstrate their faith in free institutions by inducing labour to invest a part of their wages, and a larger part of their bonuses in Unit Trusts. New life will then be infused in the private sector on whose positive success the Five-year Plans importantly depend.

U.S. INDUSTRY INVESTMENTS ABROAD

Capital outlays abroad by U.S. industry in 1958 aggregated \$5,200 million, the U.S. Department of Commerce reported the other day. The total, 14 per cent. lower than in 1957, reflected the absence of large payments for petroleum leases in Venezuela, which were large in 1957, and a drop in the amount put into plant and equipment in a number of countries. Foreign plant and equipment expenditures in 1958 reported by a group of major companies amounted to \$3,000 million.

Britain's exports of office machinery in the first nine months of 1959 amounted to a record £15,172,623, as compared with £14,437,176 in the same period of 1958. Shipments to Australia, traditionally the industry's biggest customer, dropped £244,000 to £2,766,301, but South Africa took £200,000 more at £1,380,385. Exports of accounting machinery led the rise. They amounted to £4.5m. against £3,785,000.

COTTON BOARD'S ANNUAL CONFERENCE REORGANISATION WILL NOT CAUSE SHORTAGE OF SUPPLIES, ASSURES LORD ROCCHDALE

From Our Special Correspondent

MANCHESTER, 20th October

LANCASHIRE cotton employers, whose mills are to close under the Government's £30-million redundancy and re-equipment scheme, have been urged to tell their workpeople of their decision as soon as possible.

MANCHESTER LETTER

This was disclosed at the Cotton Board's annual conference at Harrogate, when the practice of keeping the news of closures quiet was condemned by representatives of both millowners and trade unions.

The Board has written to all firms known to be withdrawing from the trade, telling them that their intentions should be announced to their operatives without delay. Any special reasons for withholding the information should be submitted to the Board.

Millowners, who had decided to close down and then booked further orders, were also criticised. The revival in business during the past few months had tempted action of this kind, it was stated. Many of the orders would not be completed until well into 1960, nearing the deadline on 31st March for the scrapping of plant.

Shocked

Mr. W. T. Winterbottom, a member of the Cotton Board and Chairman of the Fine Spinners and Doublers group, said: "I was shocked to hear that the whole spirit of the scheme was being abused in this way."

"By taking on fresh business it means that more operatives will be thrown out of work together and will be competing for jobs, instead of there being a steady transfer of workpeople from mill to mill over the next six months."

This view was emphasised by Sir Alfred Roberts, Secretary of the Cardroom Workers' Amalgamation, who said: "If firms have booked contracts which may keep them active until, perhaps, February, instead of an orderly contraction, we shall get a flood of people becoming unemployed at the same time."

Another complication arising from the continued running of the doomed mill concerns the machinery. Mr. Winterbottom said: "Many of the closing mills contained good machinery. Under the scheme this could be bought by the firms remaining in business."

"Orders for plant have been completed and the buyers expected to get delivery about Christmas. Now it looks as if some of this machinery will not be available before next April. This is going to present problems to the buyers."

The reorganisation scheme in the Lancashire cotton industry will not give rise to a supply shortage, Lord Rochdale, Chairman of the Board, gave this assurance when he opened the conference.

"A large proportion of the capacity due for scrapping was already idle before the reorganisation schemes were made and more than enough remains to meet requirements if there is a comparatively modest extension of shift-working and re-adjustment of production programmes," Lord Rochdale conceded that reorganisation schemes of the magnitude of those in the cotton industry were bound to throw up problems and difficulties such as misunderstandings about prices, supply fears and the human problems where mills were closing in areas without alternative employment readily available.

These problems were being tackled, he said, and there was no reason why the transition should not be effected with the minimum disruption to supplies and to the industry's relations with its customers.

Unique Opportunity

In a year's time, he hoped the transitional problems would all be out of the way. The industry would certainly have moved considerably nearer to the compact and efficient industry aimed at.

But Lord Rochdale added: "None of us is so optimistic as to think that we shall have made more than a beginning by then. The measures which have been taken this year can only provide the foundation on which a fully efficient and competitive industry can be created."

"This is a unique opportunity and a challenge which I am sure Lancashire will not fail to meet."

It was not enough, said Lord Rochdale, to get production alone on the most efficient basis. To sell Lancashire's cottons both at home and overseas would increasingly call for up-to-date and imaginative selling and marketing methods.

In a brief reference to the progress with the redundancy scheme for the finishing section of the industry, he said it was proving a far more difficult task to arrive at a measure of redundancy in the finishing sections than was the case with spinning, doubling and weaving. There appeared to be no productive unit in the finishing sections equivalent to spindles and looms.

Lord Rochdale warned the conference of a threat to cotton and other European industries far greater than the flood of cheap imports which had been so damaging to the Lancashire cotton industry.

The import problem, he said, was comparable to the "cloud the size of a man's hand" in relation to the larger problem which the growing economic strength of Far Eastern countries, including China, would confront Britain and other Western countries within the years ahead.

Mr. Cyril Harrison's contribution to the conference held four years ago was notable for his blunt division of the merchanting community into those who regarded themselves as buying

agents for their customers and those who acted as sellers of Lancashire productions. In the meantime, the speaker, now President of the Manchester Chamber of Commerce, has altered not a whit in his belief that the gulf which separates these twin systems of distribution harbours danger for the local industry.

Producers, with heavy investments at stake, should have better control over the sale and distribution of their products, he urged, while support should be given to those merchants who were concerned to sell Lancashire's products. Commenting that the existence of a large body of traders "dealing in anybody's products" was harmful to the producing interests, he added: "It would be interesting to know how far the import of Asiatic cloths is damaging Lancashire's trade in industrial and other fabrics."

Exporters Meet Snags

One of the aspects of the current world situation in the production of cotton goods, as emphasised in the latest Cotton Board quarterly review, is the way in which demand for the products of the mills has outstripped supply in virtually every country. As a result, it is no longer possible for distributors to play off one set of producers against another and delivery dates have lengthened appreciably, whether in Lancashire, Hong Kong or elsewhere.

As in most other directions, there is a delay before such a situation is reflected in the statistics drawn up indicating exports from the different countries. The first half of 1959 was not a particularly bright period for the major suppliers of the world, partly due to the increasing rate of indigenous production which former importing nations were able to absorb. In some cases further progress was made in such countries towards becoming net exporters.

The following table, extracted from the review and adjusted to cover the half-year, shows the trend of overseas trade in cotton and synthetic fabrics achieved by the leading exporters:

	1st half 1959			1st half 1958		
	Cotton	Rayon	Total	Cotton	Rayon	Total
U.K.	167.6	55.6	223.2	207.6	49.3	256.9
U.S.	239.9	79.4	319.3	274.4	64.2	338.6
India	309.0	18.2	327.2	325.0	6.6	331.6
Japan	588.1	613.6	1,201.7	688.6	663.4	1,352.0
Hong Kong	103.1	12.1	115.2	101.8	10.6	112.4
Germany	115.7	105.4	221.1	105.9	96.0	201.9
Italy	45.0	57.4	102.4	60.2	54.3	114.5
France	164.0	71.5	235.5	145.9	74.6	220.5
Belgium	103.6	48.4	152.0	99.1	40.7	139.8
Holland	142.8	22.3	165.1	123.3	28.5	151.8
Switzerland	34.0	18.2	52.2	30.8	14.7	45.5
Portugal	58.0	1.1	59.1	60.4	1.8	62.2

As compared with the position a year ago, only the Continental countries had much cause for satisfaction with their performance. The traditional suppliers including Japan, the United Kingdom and the United States all lost ground.

On cotton goods alone, Lancashire retains fourth place in the table by the skin of its teeth. When rayon and synthetic fibre goods are included, both France and Germany have surpassed the shipments achieved by exporters from this country.

Manpower for the Mills

Confirming certain facts disclosed in its quarterly survey, the Cotton Board has now issued production figures relating to August. (Continued on page 752)

INTERNATIONAL TRADE IN COTTON

HIGHER U.S. SHARE IN WORLD EXPORTS PREDICTED

A NOTABLE feature of international trade in cotton during the 1958-59 season, which ended on 31st July 1959, was the extensive substitution by textile manufacturers of U.S. cotton by other growths. Reflecting this trend, exports of cotton from the U.S. declined by as much as three million bales of 478 lbs. each to 2.8 million, as compared with 5.8 million bales in 1957-58. The fall in U.S. exports was much greater than the overall reduction in world trade in cotton of only 1.3 million bales. World exports during the season amounted to 11.3 million bales, as against 12.6 million bales in the previous year. Other cotton exporting countries, in contrast, were able to dispose of virtually the entire production of last season and even liquidate sizable quantities from the carry-over stocks. Aggregate exports from these countries were 8.5 million bales, about one and a half million bales more than in 1957-58. According to the International Cotton Advisory Committee, Washington, this increase in exports in countries outside the U.S., offset, to some extent, a sharp decline in cotton prices last season.

In the case of most countries of Western Europe and Japan, the switch-over from the U.S. to other growths was even more pronounced than is suggested by total figures which include the share of some countries like Spain, Yugoslavia, Korea and Formosa which made larger purchases of U.S. cotton last year, thanks to the special financing made available under P.L. 480.

Shipments from the U.S. to the U.K. during 1958-59 at 202,000 bales, as against 677,000 bales in 1957-58, were the smallest for the entire post-war period. The same was true of exports to the rest of Western Europe. U.S. cotton imports by Japan were less than half the previous season's volume and the smallest since the post-war rehabilitation of the Japanese textile industry.

The major reason for the contraction in U.S. exports, according to the Committee, is the fact that U.S. prices were for the most part uncompetitive in world markets. It is, however, felt that, with the new export policy, the prospects are for a very substantial increase in U.S. exports during the present season.

Mexican exports last season increased by about 400,000 bales or about 28 per cent., as compared with 1957-58. The increase is explained by much heavier shipments to Japan (almost double the 1957-58 volume) and West Germany. Japan probably imported almost as much Mexican cotton as U.S. cotton last season.

Cotton exports from the Central American countries last season are estimated to have reached a record 550,000 bales.

Exports from Egypt are estimated at 1.5 million bales which is higher by about a quarter of a million bales than the 1957-58 level and the heaviest volume for several years. Virtually all the increase in exports was in the extra-long staple group, whose exports were nearly 40 per cent. higher. Another feature of Egyptian cotton trade last season was the continuing high percentage, as much as 60 per cent., of total exports to the Communist countries. Not all of this cotton would appear to have been consumed by these countries. An indeterminate quantity of cotton is reported in storage, pending shipment to Western Europe. It is common knowledge that the Communist countries were able to undersell Egypt in their resale of Egyptian cotton to the rest of the world.

Exports from African Countries

Sudan had the most successful season ever. Exports are estimated to have risen to a record 600,000 bales, as compared with 393,000 bales in the previous season, and the bulk of the cotton available for export has been sold. Exports to almost all destinations were much higher than in 1957-58. Exports to the Communist countries, however, were still relatively small.

Exports from all African countries, including Egypt and Sudan, in 1958-59 are estimated to have reached a record of nearly 3.4 million bales, surpassing the previous high of 3.2 million bales attained in 1955-56. Record shipments were made from Uganda and Nigeria and possibly Tanganyika and French Equatorial Africa.

Despite a smaller crop, exports from Pakistan last season were not much below those of

1957-58, but the trading pattern changed radically. Exports to Japan were fully maintained but, in contrast to the previous season, exports to France declined to a negligible level. Exports from Pakistan to Mainland China were well over double the 1957-58 volume.

Exports from India were about 50 per cent. higher than in 1957-58. Japan itself took well over half of the total shipments and the pattern of trade, therefore, remained substantially unchanged from that in previous seasons.

The following table indicates the trend of free world cotton exports during the three seasons ended 1958-59:

(In '000 bales of 478 lbs. each)			
Country	1958-59*	1957-58	1956-57
U. S. A.	2,790	5,717	7,598
Mexico	1,800	1,411	1,308
Central America	550	334	290
India	310	207	254
Pakistan	400	385	508
Syria	400	450	374
Turkey	300	134	226
Greece	200	124	149
Egypt	1,500	1,262	928
Sudan	600	393	334
Brazil	230	216	381
Peru	540	420	408
Others	1,680	1,547	1,546
Total	11,300	12,600	14,300

* Preliminary.

Although it is too early to make any detailed prediction about cotton trade in the present season, it appears, according to the Committee, that the switch-over from the U.S. growths to others is likely to be reversed. There is a significant increase in total supply in the U.S. this season, and there will, in any event, be a radical change in its disposal. Total supplies in the U.S. this season, made up of an estimated production of 14.6 million bales and stocks of 8.8 million bales, will be 23.5 million bales, as compared with 20.2 million bales in 1958-59. Supplies outside the U.S., in contrast, will be substantially lower, partly because of the reduced carry-over, particularly in the net importing countries, and partly because of a possible decline in production. On present estimates, the supply in this area is likely to be lower than in either of the two previous seasons.

Concentration of Supplies

The greater concentration of supplies in the U.S. can have important implications to international trade and prices this season. The likelihood that export availabilities in other producing countries will decline somewhat, while total trade is expected to expand considerably, inevitably means that importing countries will be obliged to rely more on U.S. cotton, thus reversing the trend witnessed in 1958-59.

The uncertain factor in the trade outlook, at the moment, however, is the demand from Communist countries. In each of the last two seasons, net exports to these countries from the

rest of the world were in excess of one million bales. There is, however, reason to believe, according to the Committee, that not all this cotton has been consumed and that stocks may be available for domestic consumption or for re-export. Assuming little change in the trading relationship between Communist countries and the rest of the world, the minimum level of exports during the current season is expected to be between 12.5 and 13 million bales. But, if account is taken of the probable increase in consumption and of the possibility of stock-building in the net importing countries, the actual trade potential is likely to be even higher.

COTTON PRICES AND MARKETS

In two resolutions submitted to the International Cotton Advisory Committee, Washington, the International Federation of Cotton and Allied Textile Industries, Manchester, which represents about two-thirds of the world's cotton spindles and looms and the members of which consume more than 80 per cent. of the raw cotton that moves in international trade, has once again reiterated its view that cotton prices should be maintained at competitive levels by allowing free play of the laws of supply and demand and that cotton futures markets existing in all consuming areas should be allowed to function freely.

The Federation has urged that producing countries should not attempt to introduce any international arrangements that affect price and supply without full consideration of the views and recommendations of the consuming countries as to their effect on the industry. It, no doubt, recognises that some cotton producing countries have suffered from the recent decline in cotton prices but it maintains that this decline was the logical result of excessive commodity controls and price intervention of the kind now being considered. It is such measures, the Federation maintains, which have kept world cotton prices at an artificially high level over the past few years. They have provoked the recent decline in prices, which, incidentally, was, according to it "not an excessive fluctuation but merely a normal adjustment to more realistic levels."

The Federation has appealed to all cotton-producing countries to direct their efforts and resources into more constructive channels and to consider joint action in the field of cotton textile promotion. It appreciates the efforts made by the U.S. Administration towards a one-price system but desires it to go on record that "it would be in the general interest to hasten that return as much as possible."

Cotton futures markets, the Federation points out, have not been allowed to function freely and to render all the services of which they are capable. Governmental interference in the form of exchange restrictions, price and import controls, arbitrary two-price systems and other forms of governmental intervention continue to dislocate trading in futures.

MAN-MADE FIBRES IN U.K.

Reflecting the increased demand from the clothing and automobile industry, output of man-made fibres in the U.K. in September rose to a record figure of 43.45 million lbs., as compared with 39.66 million lbs. in August and 31.91 million lbs. in the same month last year. The September figure is the highest for that month since 1955. Of the total production, continuous filament yarn and staple fibre amounted to 19.63 million lbs. and 23.82 million lbs., as compared with 18.19 million lbs. and 21.47 million lbs. in August and 14.48 million lbs. and 17.43 million lbs. in September 1958, respectively.

Production during the first nine months of 1959 of man-made fibres adds up to 368.75 million lbs., as against 308.03 million lbs. in the corresponding period last year and 378.25 million lbs. in the same period in 1957. This indicates that, after a setback early this year, output of man-made fibres has recovered to the pre-1958 depression levels. This recovery is also indicated by the sustained activity among woven, knit goods and carpet manufacturers. Many Lancashire manufacturing firms are reported to be having long order books extending well up to the middle of 1960. Large accumulated stocks have also been liquidated and the industry would now appear to have stepped on to the primrose path.

U.K. COTTON INDUSTRY REORGANISATION

More than £16,000,000 will be paid in compensation to Lancashire cotton firms taking part in the reorganisation scheme for the industry. The British Government will pay two-thirds of the bill. The first detailed figures of what mills going out of business, or scrapping part of their plant, will receive in compensation have now been worked out by the Cotton Board. They show that the total compensation allowance to millowners comes to £16,624,000.

The Board has now released figures outlining the shape of the industry after reorganisation has been completed and before the mills start to re-equip with more up-to-date machinery. The following will be the pattern:

Spinning: 6,619,000 ring spindles and 2,973,000 mule spindles will be left; 3,408,000 ring spindles and 7,332,000 mules will be scrapped.

Weaving: 154,497 looms remain; 104,747 are to be scrapped.

Doubling: 1,038,000 doubling spindles are left; 571,000 are to be scrapped.

Commenting on these figures, a spokesman of the industry said: "More than enough capacity remains to meet requirements, with only a comparatively modest extension of the shift working."

PROBLEM OF COFFEE SURPLUS

REVISION OF MARKETING POLICY NEEDED

COFFEE is an important commercial crop of India and a major industry of Mysore State, where it is largely confined. The total annual crop of coffee is worth Rs. 18 crores, of which about Rs. 7 crores are earned by way of foreign exchange. Of the 40,000 growers of plantation crops in the Malnad areas of Mysore and Coorg, coffee crop accounts for the bulk and nearly 100,000 wage earners and salaried employees directly depend on coffee industry. The importance of the industry as a foreign exchange earner has grown in recent years, following the rapid rise in production. In ten years, the crop has grown more than threefold, from 15,800 tons in 1947-48 to over 46,000 tons in 1958-59, to be precise. This can be said to be a remarkable achievement in Indian agriculture, especially for a fruit crop of a perennial plant. The growth is due mainly to the marked rise in the yield per acre from 150 lbs. to nearly 400 lbs. during the ten-year period. The area under coffee, it may be noted, has gone up by only about 20 per cent. from 221,000 acres to 260,000 acres. It will be interesting to note here that, a decade ago, the coffee crop was barely sufficient to meet the internal consumption, not to speak of exports. The position has, however, undergone a change. Thus, in spite of home consumption rising from 15,000 tons in 1947-48 to about 30,000 tons, the country is left with a large surplus, which could be sold abroad.

Rise in Internal Prices

A curious phenomenon is that, notwithstanding the record output of coffee, internal prices have been rising in recent months and that at a time when the prospect of finding profitable disposal of the surplus abroad at reasonable prices is becoming more difficult, consequent on the sharp rise in output abroad and the resultant huge accumulation of stocks and fall in world prices. Much public attention has been drawn in recent months by the sharp rise in domestic price of coffee. An idea of the extent of increase can be had from the following comparative table of prices fetched at the auctions held in Coimbatore:

	(Per 50 kilos)	
	4-9-1959	17-6-1959
	Rs.	Rs.
Plantation "A"	314.94	285.73
" " "PB"	315.92	286.21
Arabica Cherry Flats..	No stock	No stock
" " "PB" ..	No stock	No stock
Robusta Cherry Flats..	170.37	179.12
" " "PB" ..	171.35	175.19
" " "PB" ..	178.17	177.18
" " "PB" ..	177.18	178.15

Source: Indian Trade Journal, based on figures supplied by the Indian Coffee Board.

Since the middle of September, however, there has been a decline in prices. According to the Coffee Board's latest News Letter, a few lots of Plantation "PB", "A", "B" and Triage were sold at Rs. 280, Rs. 270, Rs. 260 and Rs. 250 per 50 kilos (cwt.), while the majority of lots were sold at the following rates:

	(Per 50 kilos)	
	Rs.	Rs.
Plantation "PB"	242.85	247.00
" " "A"	225.00	255.00
" " "B"	205.00	230.75
" " Triage	185.10	224.10

The decline in prices in recent weeks does not appear to be reflected in retail prices yet. It remains to be seen when and to what extent it will do so.

Cornering Activity

Be that as it may, the rise in coffee prices in recent months is attributed by the Coffee Board to the cornering activity of a group of dealers, who jointly bid coffee at auctions at high prices. "The object of such joint bidding," the Board says, "was apparently to see that all plantation coffee was withdrawn by the Board from the sale, the result of which would have been that other dealers would not get any Plantation coffee in that sale and, during the scarcity that would follow in the market, they could liquidate their earlier purchases at high levels." The Coffee Board would appear to have foiled this alleged attempt at cornering by fixing limits on the quantity released to them at the prices bid by them and offering the balance to other bidders. The Coffee Board adds that the dealers were found to have not removed the

Plantation coffee from the Pool agents even after they had paid for the lots declared to them. It concludes that "it is such practices which create artificial scarcity conditions and lead to soaring prices."

These allegations only confirm the inefficiency of the Coffee Board and its failure to take prompt measures long ago to check such activities. Being solely responsible for the marketing of coffee, the Board cannot escape its responsibility for the high prices being paid by consumers for a surplus commodity like coffee. It is all a question of tact in the handling of the situation. The Board ought to know how to defeat the speculators. If it does not know, the least it should do is to take into confidence the responsible sections of coffee producers and traders and evolve policies and procedures which, while ensuring a reasonable return to the grower, will not hit the consumer and the honest middlemen. As Mr. U. K. Lakshman Gowda, Chairman of the Mysore State Planters' Association, rightly admitted, in his address at the first annual general meeting of the Association held in Mysore on the 26th inst., it is in the interest of producers and traders that coffee is made available to the public at reasonable prices. But they are helpless in that they have "little to do with marketing or in the export policy or control over distribution" of coffee. He revealed that the planters had submitted a scheme to the Expert Marketing Committee on Coffee on this important subject, but it is not known what the Committee has done about it. The Committee's report and the Government's decisions thereon are long overdue. One does not know who is at fault, the Committee or the Government. Here is another instance of waste of taxpayers' money; for what good is it if an expert committee meant to solve a critical problem does not submit its report in time or the Government quietly sits on the report? The crux of the coffee problem boils down to this: whether coffee crop rising at such a rapid pace, as it has done in recent years, can be marketed at prices reasonable to consumers and economic to growers.

Rise in Prices Justified

Mr. Lakshman Gowda, however, seems to justify to some extent the recent rise in coffee prices. Commenting on the price situation, he says:

"In recent months, there has been an increase in internal prices of Plantation coffee and public criticism against this trend has become pronounced. It will appear that while, on the one hand, there is a good crop and world surplus, on the other, there is an increase in internal price. The Government policy, with a view to earning the greatly needed foreign exchange, being to export more coffee, in a surplus market, we have to export our best varieties and our best grades were increasingly exported in the early part of the year and the price for the limited stock of Plantation coffee left rose sharply in recent months. But there was plenty of coffee in other varieties and types which the market was reluctant to take and naturally the price of other types remained moderate and the rise taking place in Plantation coffee alone.

"In this connection, it must also be remembered that, although the total production of coffee has gone up, the actual increase in respect of Plantation coffee is not so pronounced as in other types, as Arabica Cherry and Robusta. Plantation coffee, being in greater demand both in the internal market and abroad, the prices of this variety of coffee has in recent months risen, whereas the prices of other grades and varieties which form nearly 65 per cent. of the total production remain around the basic level. What many of the critics of the recent rise in price of Plantation coffee overlook is that rise in price for coffee is not an isolated event in India unrelated to the rise in prices of other commodities in consumption."

The Chairman of the Mysore State Planters' Association is of the view that internal prices will have to rise in coming years, if the return to the growers is not to be affected. His reasoning runs as follows:

"Since 1952, the internal prices are controlled and held at below the minimum return guaranteed to the producers. This has been made possible by the high price realised on the exported coffee. When there is a tendency for the export price to fall below the internal price, as is happening now in the case of Robusta coffee, there will not be any surplus to cover the shortfall in internal sales prices and, consequently, the internal prices will have to rise to make it true to the price paid to the grower. We might very well be faced with this situation in the coming years."

Mr. Gowda's argument seems to be based on the assumption that the minimum price to the producers should not be reduced, even though

production per acre has risen, with a consequent reduction in costs. There does not seem to be much logic in this contention.

There is every indication that the output of crop will grow at a much rapid pace and the industry is, therefore, concerned with the problem of marketing the prospective increase in supplies. Mr. Gowda disclosed that "there is an almost continuous process of regeneration and replacement going on and that well tended coffee can go on producing for many decades." According to some experienced planters, coffee production in India may exceed 80,000 tons within the next ten years. The problem can be solved, according to Mr. Gowda, by raising internal consumption at the rate of 10 per cent. per annum and by increasing exports. From about 3,000 tons in 1950, exports have grown to 16,000 tons this year. The planters envisage that, by 1965, exports will be increased to about 30,000 tons and internal consumption to about 40,000 tons.

Production Trend

A noteworthy feature of the recent trend in coffee production is the lack of uniform growth among the three main varieties, particularly in the case of Arabica and Robusta. Since 1952, there has been an increase of 28,016 acres in the area under Robusta and a 200 per cent. rise in production, from 6,738 tons to 20,284 tons. In the case of Arabica, while production during this period has gone up by 76 per cent., that is, from 14,184 tons to 24,818 tons, the area under cultivation has actually declined by 7,653 acres. Thus, there seems to be shift in cultivation from Arabica to Robusta. This raises the problem of giving suitable incentives to planters for growing those kinds of coffee that are preferred by consumers. The producers, in general, and the Board, in particular, are confronted with the question: should growers be given the actual realisation for their particular variety of coffee in the market or an incentive price which will encourage the growth of a particular variety? Referring to this problem, Mr. Gowda said:

"If there is a strong preference in the market for a particular variety of coffee, the difference should provide an incentive to the grower. But marketed, as they are, through a Board, some of the forces of a free market, preference are lost or not sufficiently expressed in the ultimate price realised and paid to the grower."

So it is the marketing system and the pricing policies that are defective. These have become outmoded, thanks to the transformation that has taken place in the coffee situation. They are badly in need of reorientation. But Government machinery always moves slowly, bringing a bad name for the industry and trade and misery for consumers. The Coffee Board, dominated as it is by officials who have no practical experience and who are too old to learn things quickly or to act promptly, can be no exception.

Fertilisers

There are two other questions, having an important bearing on production and marketing of coffee, to which Mr. Gowda drew pointed attention. The first one is the shortfall in supplies of fertilisers and other equipment. This problem is not beyond the capacity of the Board to solve. For, according to Mr. Gowda, the total requirement of imported material does not exceed Rs. 30 lakhs per annum. It is stated that supply of imported fertilisers has been reduced by 50 per cent. and Mr. Gowda warned that, unless the per-acre yield was further raised, which in turn was dependent upon availability of fertilisers, the industry would not be able to face the future with strength, what with an impending rise in costs and an equally immediate possibility of fall in prices. Surely, an investment of the order of Rs. 30 lakhs on fertilisers and equipment is worthwhile on an industry which grows a crop worth Rs. 18 crores per annum and earns Rs. 7 crores by way of foreign exchange.

The second problem is paucity of curing facilities. Although production of coffee has gone up markedly, there has been no commensurate expansion in curing facilities. This backwardness was attributed by Mr. Gowda to lack of adequate incentive and uncertainties about the future in the field when the same investment in other fields was likely to give greater security to the investor, less annoying controls and better returns. The problems of coffee industry can, in fact, be handled more deftly and solved satisfactorily by the Board by giving larger representation on it to the growers and by listening to their views with a little more consideration. After all, the Board owes its origin and growth to the planters, who have nourished it to its present size and position.

LAND REFORMS AND PLANTATIONS

ORGANISED AND MOST EFFICIENT FORM OF AGRICULTURE IN DANGER OF STAGNATION

KERALA has already posed the Central Government with a question as to the real area of control the Centre can exercise over a controlled industry when at some point the State's right of control intervenes. Plantations provide a case in point. Land is a State subject and the States are about to or have already legislated on limitation of holdings. Plantations are organised agriculture and the three major crops, tea, coffee and rubber are under Central control by virtue of the three Acts, the Tea Act 1953, the Coffee Act 1955, and the Rubber Act 1955, respectively.

Contrary to popular impression, the Kerala Agrarian Relations Bill does not provide exemption to plantations. All it does is to impose a special ceiling on plantation holdings, namely, the actual area under plantation plus 20 per cent. of reserve where such reserve is contiguous to the planted property. In other words, the industry is put under a definite limitation, each unit frozen to its present size, except for the conditional expansion of 20 per cent.

What is Wrong?

The natural question is: what is wrong with a ceiling for plantation when ceiling is applied to all other land? With a certain amount of logical absolutism, this argument is generally used against any move for considering organised plantations on a separate footing. Two public bodies to give any consideration to plantations in relation to ceiling were the Planning Commission and the Plantation Inquiry Commission. The former has argued the case well for leaving the existing units undisturbed. The latter has gone further and suggested that land be reserved for the expansion of the industry apart from exempting existing units.

The Planning Commission's approach to this question was unfortunately conditioned by its limited knowledge of plantation economics. It was, therefore, strong on principles but weak on specific facts. It had no clear idea of what constitutes a plantation and did not quite realise what would happen once planted units are frozen at their present individual sizes. Imagine for a moment that the land Bills prohibiting expansion had come into being in 1900. There would have been no plantation industry as such today. Once it is agreed that plantations form an organised enterprise, consisting of composite and integrated agricultural units, and that for these reasons they are worth having, the arguments for growth are irresistible.

Three Possible Grounds

There are three possible grounds on which the Planning Commission could have recommended exemption to existing units without leaving scope for expansion. One is that, in its opinion, the industry has already reached the desirable overall size. Another is that it cannot recommend expansion for plantations when it proposes ceilings on the rest of agriculture. The third is that it did not really consider the question of expansion and the most it was called upon to do was to save the existing industry from dismemberment.

The plantation industry grew to its present size from small beginnings. The beginning was with small units which in course of time were expanded to sizes which would support modern managerial practices. But there is no recognisable size which could be universally applied to all the units in the industry.

A 1,000-acre tea estate in Peermade yielding 1,000 lbs. per acre may earn only half of what an estate of the same size producing the same quantity may in the Nilgiris or Kanan Devans. This is only one of the instances illustrating the extreme difficulty of fixing any optimum size for plantations. Distance from the selling centre, quality of the product, the prices fetched, the yield per acre and many other factors influence the earning capacity of a unit and any attempt to determine a size applicable to the whole industry would be foolish.

Whatever the merit of imposing a ceiling on agricultural holdings, it is generally conceded that it is destructive to organised semi-industrial enterprise like plantations. If plantations are exempted from the limitations of common agriculture and it is not possible to predetermine the optimum size of a unit from the point of view of economic viability, the obvious course is to allow each unit to expand according to available resources and convenience. In the

South at least it cannot be said that plantation areas will take away any land from common agricultural crops. In hill areas of the west coast where plantations are located, there is hardly any prospect for other economic crops. In other words, plantations would hardly interfere with the scheme to impose ceilings on common agriculture in the plains.

Contribution To Exchequer

Economic development in an excessively agricultural country depends on the diversion of surplus from agriculture to other forms of economic activity. The plantation industry is the largest contributors to this concept. An average tea estate pays to the Central and State coffers an average of over Rs. 500 and in certain cases over Rs. 1,500 per acre!

There is always some confusion as to whether plantations require further expansion. The Plantation Inquiry Commission considered this question and made certain estimates of production and demand. Making its estimate for 15 years from 1956 the Commission calculated as follows:

	Coffee (In tons)		
	Arabica	Robusta	Total
Increase in consumption in 15 years	10,500	4,500	15,000
Estimated Indian consumption in 1956	14,700	6,300	21,000
Total supplies required in 1971	25,200	10,800	36,000
Exports according to 1956 proportion	8,000	1,000	9,000
Production required by 1971	33,200	11,800	45,000

DA59/311

It is obvious that something has gone wrong with these estimates. Within three years of this estimation, the coffee industry produced more coffee than was estimated for 1971! Indian consumption in 1959 is estimated at over 30,000 tons and allocation for export was over 16,000 tons.

Rubber consumption was estimated by the Commission at 40,000 tons by 1960 and 65,000 tons by 1970. Actual consumption exceeded the figure of 40,000 tons last year and the Rubber Board's estimate of demand for rubber in 1959 is over 55,000 tons. Manufacturers estimate next year's consumption at over 60,000 tons, as against 65,000 tons estimated by the Commission for 1970.

Similar errors of estimates were made by the Commission in the case of tea but the reason for such error lay in not recognising the bouncing vitality of the plantation industry against a growing national economy.

Fixed Idea

The planters have shown the way for the most efficient land utilisation in the country; they do not interfere with the reform schemes for rural lands; they pay the largest amount of taxes per acre for any land cultivated, and they are the most valuable earners of foreign exchange for the country. By normal reasoning, they among all should have escaped the scythe of land ceilings. But political slogans have such hypnotic qualities that State Governments and politicians are held, as if in a vice, to the fixed idea that ceiling is an absolute necessity and the decision is immutable.

The Kerala Agrarian Relations Bill, the Presidential assent to which is now a matter of higher politics, contains provisions which make nonsense of any exemption provided. Under certain circumstances, a shareholder of a company owning a plantation could force its fragmentation. The Bill, of course, confers on the Government power to provide exemption to land intended to be planted with plantation crops. But, in actual practice, this will be of no meaning. Any land which is surrendered under the Act—if the objective of the Act is fulfilled—would have been already distributed, occupied and cultivated on by the time the Government would be in a position to exercise its powers of exemption. Probably, more because of the political situation, almost the entire opposition in the Kerala Assembly registered its opinion in favour of total exemption for plantations.

In Mysore, the political situation is different and Congressmen are more royalist than the King-Emperor. Most of them believe that a ceiling must be applied irrespective of all consideration of purpose or effect and a socialistic pattern is the automatic end result of its application. They are not only not prepared to discuss the point but are offended by, and deeply suspicious of, anyone who presents a case for reconsideration.

Mysore Bill

The Mysore Bill differs from the Kerala one in certain particulars that affect plantations. Both the Bills appear to provide for exemptions but the Mysore Land Reforms Bill refers to "plantation crops" and not "plantations". The result will be utter chaos, if the crops are exempted and not the plantations. A plantation is a composite holding, growing a major crop but consisting of approach and inspection roads, water sources, fuel reserves, grazing land, playgrounds, drying or sorting grounds, cattle sheds, housing colonies, school fields, windbelts, jungle reserve and enclaves on which no planting is possible. The size and requirement of each one differs from estate to estate and no practicable norms can be laid down. Clauses 69 and 71 of the Mysore Bill, read with clause 68, would have the effect of first exempting existing plantations and then preventing the exempted plantations from passing from one hand to another. For instance, a 500-acre estate may be exempted under clause 68(a). If the same owner comes into possession of 5 acres newly after the Act comes into force, he shall not only have to give up the additional acreage of 5 but 405 acres, because clauses 59 (1) and (3) and 71 place rigid limit on future acquisition. If it was the concern of the Bill to preserve existing plantations from fragmentation, then it is defeated by placing a prohibition on the transfer of an "exempted" property. The fact is that the blind and compelling motivation is not the preservation of a valuable asset, recommended by the Planning Commission, but the adherence to the idea of a ceiling, come what may. The most that can be hoped for is that wiser counsels will prevail in the legislature.

Progress is the sum of KNOW-HOW plus RESOURCES

Regarded with little favour—even for household uses—by the ordinary man-in-the-bazaar less than 20 years ago, aluminium has today become the engineers' favourite light metal. It is now fast replacing other metals and wood in the construction of railway coaches, bus bodies, aircraft and ships.

The wide acceptance that aluminium has come to enjoy as a structural material is largely due to the ceaseless efforts of Indian Aluminium Company, which today accounts for over 90% of the country's total production. Pioneer and leader of the aluminium industry in India, Indian Aluminium Company has continuously sought to promote new applications of this versatile metal and has frequently expanded its production facilities to meet the increased demand thus stimulated.

To do this two-fold job of promotion and expansion Indian Aluminium has been uniquely well-placed. It has drawn fully upon the technical and research facilities of its Canadian associates, Aluminium Limited—the world's largest group of aluminium companies. And now, Indian Aluminium stands ready to contribute all its know-how and resources towards achieving India's self-sufficiency in aluminium.

NEW PUBLICATIONS

Report on the Administrative Survey of the Surat District. By N. B. Desai. Published by the Indian Society of Agricultural Economics, 46-48, Esplanade Mansions, Mahatma Gandhi Road, Bombay. Pages : 336. Price : Rs. 12.

THE Report on the Administrative Survey of the Surat District contains the findings of a research study of the structure of revenue administration and the working of Government departments and institutions concerned with rural development in the Surat district of Bombay State. The survey was carried out by the Indian Society of Agricultural Economics on behalf of the Research Programmes Committee of the Planning Commission. The report has been divided into three parts, composed of nine chapters. The first part gives a historical review of the district administration in the Moghul and British periods, and of the development of administrative responsibility in the post-independence period and outlines, in general, the present structure and set-up of administration in the district. The second part critically examines the procedures and practices followed in revenue offices, right from the Collector's office at the district to the lowest village unit. The third part deals with the structure and set-up of district development departments and organisations, and also the role of statutory and non-statutory agencies connected with district development activities. It also discusses the problem of co-ordination between departments of district administration and district development agencies. Although the survey relates exclusively to Surat, its findings are of wider applicability.

The author has made some valuable suggestions to streamline and tone up the district administration, consistent with the growing demands of economic development. Dr. Desai is not in favour of any radical changes in the present set-up. Nevertheless, he lays considerable emphasis on the need for a basic change in the spirit, rather than in the form, of the existing system of administration. This book will be read with profit by students of both rural economics and civil administration no less by the general readers and powers-that-be.

Report on an Enquiry into the Working of the Bombay Tenancy and Agricultural Lands Act, 1948 (as amended upto 1953) in Gujarat (excluding Baroda District). By M. B. Desai. Published by The Indian Society of Agricultural Economics, 46-48 Esplanade Mansions, Mahatma Gandhi Road, Bombay-1. Pages: 96. Price: Rs. 4-00.

In no field is the inductive method of arriving at conclusions more necessary than in agricultural economics. For a country of India's continental size and large dependence on agriculture which is the major occupation of the people, the number of surveys which have been conducted is very small indeed. The book under review sets forth the data which were gathered in the course of a research project which was both sponsored and financed by the Research Programmes Committee of the Planning Commission. Mr. M. B. Desai who directed the research has brought together the facts which emerged from the survey and the conclusions which were derived from it. The survey covered 52 villages in both the ryotwari and non-ryotwari districts of Gujarat, the objective of the enquiry being to find out the results of the working of the Bombay Tenancy and Agricultural Lands Act 1948.

It is pointed out that the inferior social status and the low standard of literacy of the tenants appear to be the two important contributory factors impeding the smooth and successful working of the provisions of the Act which, as is well known, is intended to benefit the tenants. There has been extensive voluntary surrender of lands by tenants aggregating about 150,000 acres upto June 1955. In the absence of details, it is stated, it is extremely difficult to precisely indicate how much of the surrender was genuinely voluntary. Eviction of protected tenants during 1951-54 was considerable, involving 27 per cent. of the tenants. Similarly, during 1952-55, 38 per cent. of the evictions arose due to failure by tenants to pay rent. About 6 per cent. of the tenants examined failed to acquire protected tenancy rights due to faulty records. Another 13 per cent. who were mere sub-tenants could not be covered by the legislation.

It is stated that, in general, tenants have not yet grown conscious of the need for an

proving productivity. They are content with traditional farm practices and land improvements. Clearly, the obvious conclusion seems to be that legislation by itself can be of little avail to the agricultural population, unless it is supplemented by educative effort. Again, as Mr. Manilal B. Nanavati, President of the Indian Society of Agricultural Economics, points out in his foreword, by and large, traditional farm practices among the tenants who have not yet grown conscious of the need for improving productivity still characterise a large sector of the farm economy. There is thus a clear case for greater effort in the cause of increased productivity in the rural areas.

The All-India Rural Credit Survey—District Monographs. Published by the Reserve Bank of India, Bombay, (i) Akola District, Bombay. Pages: 174. Price: Rs. 8.00. (ii) Jullundur District, Punjab. Pages: 124. Price: Rs. 6.50. (iii) Monghyr District, Bihar. Pages: 141. Price: Rs. 6.50. (iv) Bhatinda District, Punjab. Pages: 104. Price: Rs. 5.50.

The Report of the All-India Rural Credit Survey (1954), conducted by the Committee of Direction appointed by the Reserve Bank, covered over 130,000 families resident in 600 villages in 75 selected districts spread all over the country. Preliminary monographs had been prepared for each of these districts, which served as background for the Report. The four district monographs under review are selected out of these preliminary studies for revision and publication. While the methodology followed in the monograph is the same as that in the Report, the monographs have been able to focus particular attention on special problems in the districts, besides presenting a review of the detailed economic and credit pattern of the districts concerned.

A similar pattern of investigation is followed in all these monographs. The data presented in each district monograph are based on field investigation in eight villages selected by adopting the stratified random sampling method. The first part of the monograph gives an account of the main features of the agricultural economy of the district concerned and the selected villages, with particular reference to land utilisation, crop distribution, crop rotations and combinations, marketing, land tenures, etc. This is followed by a detailed account of borrowings and credit requirements. Each monograph also gives a description and assessment of the working of the rural credit organisations. These surveys have brought to light a wealth of information on such subjects of vital economic interests as rural indebtedness, sources of finance, family and capital expenditures and current farm operations. The monographs must appeal to students of India's rural economy, co-operators and policy-makers.

Japan Trade Guide 1959—with a comprehensive Mercantile Directory. Published by the Research Institute of Japan, No. 2, Hibiya Park, Chiyoda Ka, Tokyo, Japan. Pages : 811.

A standard reference volume on Japanese foreign trade, the 1959 edition has improved upon its earlier editions both in terms of quantity as well as quality. Readers are relieved of the usual monotony natural to such trade guides by the succinct and stimulating articles included in the volume on major export commodities contributed by experts and also by a few select photographs. One section—a new feature of the present edition—contains detailed information on foreign trade and exchange regulations in Japan, which are particularly useful to overseas traders. The customary sections include those on foreign trade and export commodities, general trade information, Government and trade organisations, industrial resources and vital statistical data. The mercantile directory contains a classified list of manufacturers and traders.

The Law of Income-tax in India. By V. S. Sundaram. Eighth Edition. Published by The Madras Law Journal Office, Madras. Pages : 1,547. Price : Rs. 40.

The book under review is a most comprehensive exposition of Income-tax law. It is a well-known publication and, therefore, hardly needs any introduction. The fact that it is now in its eighth edition is itself proof of its popularity. A welcome feature of the book is that the author, Mr. V. S. Sundaram, traces the history of each section and explains its significance to

the scheme of the Income-tax Act. The other notable features are a table of important cases cited by the author in the course of the exposition of the law and an intelligently compiled index of topics dealt with in the book. The appendix carries the Income-tax Rules, the provisions relating to double taxation relief, notifications relating to companies and several other orders issued by the Government which have a relevance to Income-tax Law. In the course of his critical introduction to the book, the author brings out some of the important principles embodied in judicial pronouncements on cases which have come up before courts. We have no doubt the book will continue to be as popular as it has been so far.

Administrative Problems of State Enterprises in India—Report of a Seminar. Published by the Indian Institute of Public Administration, New Delhi. Pages : 188. Price : Rs. 2.25.

With the rapid growth of State enterprises in India during the last decade, the problems of their administration have assumed enormous importance in this country. In this context, the book under review will certainly be read with interest. The book is a collection of papers read at the seminar held at the Institute in 1957. The Seminar was attended by about 27 experts in the field. Subjects for discussions included parliamentary control of autonomous State enterprises, audit control and workers' participation in management, to mention only a few. The book is a valuable addition to the literature on public administration.

The Wealth of India. A Dictionary of Indian Raw Materials and Industrial Products. Industrial Products, Part IV—F.—H. Connell of Scientific and Industrial Research. Publications Directorate, Old Mill Road, New Delhi-2. Pages: 304.

This volume, which is the fourth in the series, contains 31 articles on the major, medium and cottage industries of India covering alphabets, F, G and H, from ferro-alloys to hydroquinone. Each article provides fairly exhaustive information on the development of the industry dealt with, its present position, the principal raw materials consumed and their sources and availability. Besides furnishing important statistical data on production and trade, a brief account is also included of the manufacturing processes in vogue in this country as well as in some foreign countries.

Cottage Industries and Planning. By R. V. Rao. Published by Vora & Co., Publishers Private Ltd., 1 Round Building, Bombay-2. Pages: 104. Price: Rs. 2.50.

Besides, a description of India's chief cottage industries, including khadi, handloom and cotton woollen industries, the book under review gives a succinct summary of the measures which should be adopted in order to enable these industries to play their part more effectively in national economy. The points the author emphasises in his book include the provision of credit to cottage industries, training of artisans and skilled workers and use of hydro-electric power in small-scale and cottage industries.

Statistical Atlas, Rajasthan. Compiled and published by the Directorate of Economics and Statistics, Rajasthan, Jaipur. Pages : 60. Price : Rs. 7.50.

In sixty beautifully presented and drawn maps, the book under review give the physical traits, the socio-economic conditions and the mode of life of the people of Rajasthan. A common lay-out and pattern has been used throughout this Atlas. A special feature of this useful publication is the use of colour and side illustrations of historical and tourist importance and/or a symbolic representation of the activity illustrated in the main map.

Recent Developments in Housing. By S. C. Aggarwal. Published by Jain Book Agency, Connaught Place, New Delhi. Pages : 175. Price : Rs. 4.00.

This is a useful compilation of what has been said on housing in India, together with an account of the Government's housing schemes. A few chapters are devoted to a discussion of the general questions relating to housing, such as housing research, modern concepts of housing standards and reduction in costs of building

For
thousands
of young men
a new life

begins at Durgapur Training completed, this young apprentice in Durgapur is on his first practical survey job in the field. When he becomes an experienced hand, efficient at his work, he will command a good salary and will have a future ahead, bright with promise.

In Durgapur today, ISCON, who are entrusted with the construction of the giant one million ton steel plant, have already helped to train up a large group of young Indians in the technical field. This is part and parcel of the ISCON scheme of collaboration—to work side by side with Indian technicians and workers, to instruct them on the spot and in steel factories in England so that in the future India will have, not only her steel plants but also technicians to run them.

PROSPECTS FOR SAHARAN OIL

NEW SOURCE OF STRENGTH TO FRENCH ECONOMY

WITH every passing year, the estimates of reserves of oil in the Sahara are being revised upwards. Through French effort, several discoveries of oil and gas have been made in recent years. From a figure of about 1½ million tons this year, the total crude oil production from the two main Saharan areas—the Edjele oilfield and the Hassi Messaoud oilfield—is expected gradually to rise to 10 million tons in 1960. Production is expected to go on rising to 25 million tons in 1962 or 1963 which would be approximately equivalent to the consumption of Metropolitan France. If all goes well, oil output could be doubled to reach 50 million tons in 1965. The discovery of oil and the prospects for its exploitation constitute a new source of strength to French economy inasmuch as the "franc" oil now made possible by the Saharan discovery will save France several millions of dollars every year which that country will otherwise have to spend on oil imports.

Sahara

The Sahara, as is well known, is the largest desert of our planet. From the Nile Valley to the Atlantic, from the southern slopes of the Atlas mountains to the banks of the Senegal river, the Sahara covers more than 2,000,000 square miles, and is the home of nearly 2,000,000 people. The 1,660,000 square miles forming the French Sahara are divided for administrative purposes among three groups of territories: Algeria, French West Africa and French East Africa. As in any desert, two problems are foremost in development plans: water and transport. Except in the bordering areas, the Sahara has an average rainfall of less than 3½ inches per year. No permanent river can thus survive; only wadies, which are swollen during rainy periods and disappear completely after a few days or even a few hours, can exist. Yet the rainfall is not entirely lost in evaporation. It sinks into the ground, and in a large part of the Sahara, hydraulic possibilities exist which simply require drilling to a certain depth in order to get at them.

Nevertheless, the Sahara desert has only very very limited agricultural possibilities. The real interest for the Sahara's future lies in minerals. As prospecting continues, the Sahara reveals more and more of its tremendous mineral wealth, including coal, iron ore, copper, lead and oil. It is the Sahara oil that has attracted world-wide attention. M. Jacques Soustelle, the Minister of State responsible for the Sahara, told the French Senate in July last that the known recoverable reserves of the Sahara could be conservatively estimated at 700 million tons of oil and 750 milliard cubic metres of natural gas. But no one can say what other reserves may be discovered in due course. Reviewing the development of the Sahara oil supplies, the Petroleum Press Service (October issue) observes that the month of October 1959 marks the opening of an "important new chapter" in the long story of French concern with oil supplies because it witnesses the commencement of shipments through the new large-diameter pipeline from the rich Hassi Messaoud oilfield in the Central Sahara to the Algerian port of Bougie, and thence to markets in France and elsewhere. In a year's time, the completion of another big pipeline, this time to Skirra on the Tunisian coast, will make possible the export of oil from Edjele and neighbouring oilfields. The geographical advantage enjoyed by Sahara crude for supplying Europe (which is by far the world's biggest oil importing area) virtually ensures that its offtake will find outlets.

Middle East

Examining the impact of the Sahara oil on Middle East economy, the Petroleum Press Service notes that it is the oil producing countries of the Middle East that will bear the brunt of the competition of Sahara oil in Europe. France is at present drawing nearly nine-tenths of its crude oil supplies from Middle East sources, this being much the same proportion (86 per cent. last year) as for the O.E.E.C. countries as a whole. For the Governments of Persia and the Arab countries, the advent of Saharan oil means the displacement of some of their oil and still sharper selling competition. It, therefore, spells lower incomes—not necessarily in the absolute sense, as oil consumption will continue to expand, but relatively to what they would otherwise have been. These countries must, moreover, face the fact that before many years have passed

room will also have to be found on the world market for oil from the Libyan fields. It seems virtually certain that Libya and the Sahara contain a vast new oil province, the exploitation of which will decisively affect the fortunes of the Middle East. But all the major oil exporting countries will be affected in one way or another.

By the same token, the opening up of these vast new resources near to a big importing area, it is stated, will have its effect on the demand for tanker tonnage and on the volume of traffic passing through the Suez Canal. North-bound shipments through the Canal are now running at over 100 million tons a year, a volume of traffic which may provide continuous employment for 10 to 15 million tons of tankers—or perhaps a quarter of the world fleet of 58.7 million dw. tons. While it is impossible at this stage to assess, with any pretence at precision, how this traffic and that of the pipelines will be affected by the growth of Saharan exports, the effect on tanker traffic will doubtless be considerable.

Oil Economy

It is thus apparent that the oil of the Sahara (and later that of Libya also), according to the journal, will make its presence felt to an increasing degree from now on. For the French the prospect is highly satisfactory; they will be the only major country in Europe virtually self-sufficient in oil. Western Europe will no longer be so dependent on Middle East oil supplies, and the strategic importance of the Middle East will be correspondingly diminished. Against these major considerations, the fact remains that, in the circumstances of today, so large an accretion of new oil in such a short time is bound to cause numerous headaches to oil companies and others engaged in the international oil trade.

SUPERSONIC FLIGHT

The next step in commercial aviation, it is now confidently predicted, will be a transport vehicle, capable of flying from New York to Amsterdam in less than two hours, 116 minutes to be precise. This view was expressed by Dr. Hal Hibbard, Senior Vice-President of the Lockheed Aircraft Corporation, California, U.S., in the course of the Dr. Albert Alesman Memorial Lecture, delivered recently. This revolutionary improvement is likely to be made possible by the pace of progress in supersonic flight. Dr. Hibbard predicted that the transport which will cruise in the Mach 3.0 to 3.5 range (one Mach is roughly 650 miles per hour) would be in operation in 1965, if current plans were implemented. He even forecast the possibility of commercial transport at Mach numbers above 5.0. He disclosed that design studies had been executed on both winged and wingless take-off commercial transport, having a cruising speed of Mach 6.0 to 7.0 and a range of 3,500 nautical miles with reserves. Further research remained to be accomplished to settle the

question of winged or wingless vehicles at Mach 3.0 and higher.

Few people realise the tremendous rate at which experience in supersonic flight is being currently gained. According to Dr. Hibbard, the high speed aircraft of the American Air Force and Navy were doing many thousands of flight hours per day, of which approximately 1,000 were supersonic. With the supersonic flight time of the remainder of the free world, estimated at about 500 hours daily, supersonic flying hours now amounted to an annual rate of nearly half a million. This impressive background, according to Dr. Hibbard, provides a firm basis for the forecasting of commercial air transport in the supersonic area. The other important points made by Dr. Hibbard in his lecture included:

(1) At subsonic speeds, high range and structural efficiencies result in a substantial payload. This corresponds with the known performance of our long-range commercial transports of today. As the cruising speed approaches Mach 1.0, the quantity of fuel required for a 3,500 nautical mile flight rapidly increases, with the result that a speed regime exists in which no payload can be carried.

(2) This highly inefficient flight regime extends from approximately 0.90 Mach number to the Mach 1.5 region. Above Mach 1.5 cruising speed, it becomes possible to carry a payload again, and the magnitude of this payload steadily increases up to the Mach 3.0 region. If dry turbo-jet engines of the type currently being tested are utilised for speeds above Mach 3.0, the payload capability again vanishes at a speed of approximately Mach 3.5.

(3) As the flight speed is increased above Mach 3.5, it is necessary to make a transition from conventional turbojet engines to power plants of the turbo-ramjet or pure ramjet type. The outlook for carrying appreciable payload with dual-cycle power plants of the type based on present state-of-the-art, and at speeds above Mach 3.5 shows promise, but is not yet sufficiently attractive to provide a firm basis for commercial operation in the immediate future.

(4) The longer range attractiveness of this higher Mach number region, however, is clearly indicated when the payload available by use of 1970 ramjet performance is examined. Calculations indicate a payload potential of the same order of magnitude at Mach 5.0 with 1970 ramjet performance that we are currently experiencing subsonically, and will experience in the near future with conventional turbojet engines operating in the Mach 3.0 to 3.5 area.

(5) Despite lack of definite information at the higher speeds, attractive payload will be realised at speeds of Mach 5.0 or above, resulting in practical and economical operation.

In conclusion, Dr. Hibbard felt that the aircraft industry should be prepared to undertake increased research on its own, rather than depend on military initiative. He recalled that jet air transport was primarily the result of military support in research and development. Substantial experience acquired by the military was also responsible for the present development of Mach 3.0 to Mach 3.5 commercial aircraft. But, in future, military research might be almost entirely directed towards areas which had little in common with commercial aviation, such as space programmes. This meant that the development of future air transportation, particularly of Mach 6.0-7.0 transport airplane, might well have to be undertaken by the aircraft industry, without the advantage of military leadership.

KLM AIRLINE

KLM, which celebrated its fortieth anniversary on 7th October 1959, is one of the oldest airlines in the world. It is a non-subsidised, profit-making company, 51 per cent. of the registered capital of which is held by the Kingdom of the Netherlands. It has had a period of remarkable growth in the last 40 years, ranking third at present among the 250 airlines in the world today. In the first year of its birth, it carried an average daily traffic of only one passenger and 150 lbs. of freight and mail. Now it carries an average of 2,700 passengers and 80 tons of freight and mail daily. Its route network is the longest in the world, linking 105 cities in 74 countries. The impressive record of its service will be evident from the fact that, every 44 minutes, one of the 95 KLM airliners takes off or lands at some point on the globe.

The name of Dr. Albert Plesman is inseparably associated with the tremendous development of KLM. Until his death in December 1933, he directed the growth of KLM with his broad vision and indomitable energy. Among the notable achievements of KLM must be mentioned its inauguration in 1938 of a route over the North Pole between Amsterdam and Tokyo, thereby completing its round-the-world circuit. KLM also participated in the London-Christchurch air race in 1933, winning first prize in the handicap section with a DC-6A carrying a full load of emigrants.

With an eye to the new jet age of civil aviation, KLM has ordered not only 12 DC-8s which will be placed in service on the main intercontinental routes in 1960 and 1961 but also 12 turbo-prop aircraft of the Lockheed Electra type, which are specially designed for short and medium hauls. A couple of years ago, KLM introduced nine Vickers Viscount 800s on numerous European routes, so that the airline has already had a lot of experience with turbo-prop aircraft. With this fleet of turbine-engined airliners, KLM hopes to make a good start in the jet age, in which the faithful old piston engine will gradually be superseded by the lighter, more powerful, jet engine. The Electra will be equipped with four Allison 501 propeller turbine engines, which are based on the same principles as the Dart engine of the Viscount and thus offers the same advantages.

NEW PRODUCTS AND PROCESSES

Enamels for Textile Bobbins

WOODEN bobbins used in textile industry are coated with water-proof enamels for increasing their utility. Black enamels based on cashew-nut shell liquid or bhillawan shell liquid are already being produced and used for this purpose in India. For various practical considerations, however, bobbins in different bright colours are in demand. Coloured enamels which will withstand the rigorous use implied in bobbin coating are not known to be manufactured in India. Requirements of such coloured enamels for bobbins are met from imports.

The present annual production of textile bobbins in the country is estimated at 300,000 to 400,000 gross. On an average, one gallon of enamel is sufficient for coating about 3 gross bobbins. On this basis, the requirements of enamels for coating bobbins may be placed at about 100,000 gallons or 400 tons per annum.

A bobbin coating composition based on a mixture of modified urea resin and modified alkylid resin has been developed at the National Chemical Laboratory, Poona. The modified urea formaldehyde resin is prepared by reacting, under suitable conditions, appropriate quantities of formalin, urea and fuel oil. This is mixed in required proportion with alkylid resin modified with fatty acids derived from drying and semi-drying oils. Accelerators and thinners are added in desired quantities. The composition is blended with pigments to obtain the desired colour on application. Bobbins after conditioning are dipped in the unpigmented composition, air dried and baked. This is followed by two more coats, the second coat containing pigments while the final coat is without fillers. The composition has been tested by some of the leading paint manufacturers and is reported to have produced favourable results. The manufacture of the composition can be taken up by firms engaged in the manufacture of paints or urea formaldehyde resins. The equipment required for commercial manufacture consists of two reaction vessels, two ball mills and necessary tanks.

Soda Ash from Sambhar Bittern

A process for obtaining dense soda ash from Sambhar bittern, the liquid residue left over after recovery of common salt from the Sambhar lake water, has been developed at the Central Salt and Research Institute, Bhavnagar. Dense soda ash is used by the glass and dichromate industries. At present, the entire demand of this variety of soda ash, about 50,000 tons per year, is met through imports.

Sodium sulphate and additional quantities of common salt are also recovered in the process. About 150,000 tons of Sambhar bittern, considered so far a waste product, are available every year. Out of these, about 8,000 tons of soda ash, 15,000 tons of sodium sulphate and 40,000 tons of edible common salt can be produced. The process, details of which appear in an article in the September 1959 issue of the *Journal of Scientific and Industrial Research*, consists in adjusting the concentration of the bittern suitably and treating it at 100°C. whereby burkeite, a double salt of sodium sulphate and sodium carbonate, is thrown out from the solution and is separated. The remaining solution is subjected to solar evaporation to recover common salt of edible quality. Burkeite is processed further for the recovery of sodium sulphate and dense soda ash.

Extraction of Vinyl Chloride

The Shri Ram Institute for Industrial Research, Delhi, has developed a process for extracting vinyl chloride from alcohol and chlorine. Vinyl chloride is the starting material for the manufacture of poly-vinyl chloride or "P.V.C." resins which are one of the cheapest thermoplastics available and find wide application both in industrial as well as domestic fields. The technical know-how for the chlorination of vinyl chloride to form trichloroethane, another important raw material for the vinylidene-chloride-based plastics, has also been worked out. At present, the entire requirements of P.V.C. resins in India are met from imports, while about 60 tons of vinyl chloride monomer addition, about 60 tons of vinyl chloride monomer were also imported. The Government of India has already licensed four units for the manufacture of P.V.C. resins. One of these plants, with an annual capacity of 2,980 tons, is expected to go into production by 1961.

Pushbutton Phone

A pushbutton device for making phone calls, which may replace the rotary dial now in general use, is being developed by the Bell Telephone Laboratories in the United States. Manufacture of the new device has been made possible by the development of transistors, says the publication *Science Service*. Transistors are very small devices that amplify electronic signals while using little power and producing little heat. In many fields, they are now replacing the much larger vacuum tubes formerly used. Pushbutton telephones, now being tested, contain transistorised oscillators that generate two coded musical tones for each of the phone's 10 pushbuttons. The tones produced by pushing the buttons required for a call are transmitted to a central switching office, from where the call moves on to the recipient. This routing is similar to that of present switching systems.

The Low Down on Cow Comfort

Encouraged by farmers, cows in the U.S.A. are learning to scorn their traditional straw in favour of something more luxurious—rubber. The rubber bedding is a good deal less expensive than straw and much easier to keep clean. Rubber mats 1 in. thick are installed individually for each cow and bolted into lead anchorages in the concrete stall. A quick sweep down every day is all the attention the mats need and they should last at least ten years without replacing.

BETTER ROADS AND ROAD BEHAVIOUR KEY TO SMOOTH AND SAFER TRAFFIC

THE study week on traffic engineering and highway safety, jointly sponsored by the Indian Roads Congress and the Economic Commission for Asia and the Far East in Bombay this week, should serve to focus public attention on the need for ending the unsatisfactory condition of road traffic in this country. Although the number of vehicles and the density of traffic in India are low, as compared with Western countries, the number of accidents, traffic holdups, and congestions on Indian roads, especially in the bigger cities, are much higher. It has been calculated that, in Bombay City, every fourth private car met with an accident in 1958, every B.E.S.T. bus met with 4.5 accidents, every sixth motor cycle met with an accident, every 10th motor taxi met with an accident, and every seventh lorry met with two accidents. In monetary terms, nearly a sum of Rs. 4 lakhs per day is literally exploded into exhaust fumes alone in the city. This is a matter which should engage the attention of the Government and the Municipal authorities no less than the general public.

As the country progresses economically and the levels of living rise both passenger and goods traffic are bound to increase. Even in Britain, which surely has a far better road and traffic system, the cost of traffic delays and congestion in terms of fuel charges, vehicle wear and tear, etc., has been estimated at about £500 million a year. According to the calculations of the British Road Research Laboratory, costs of traffic congestion are increasing at more than twice the rate of traffic growth. Britain's motor traffic has a density of 36.6 vehicles per road mile or more than two to every hundred yards. If, as some estimate, road traffic doubles in the next ten years, the cost of traffic delays would increase from the present £500 million to £2,000 million a year. We are not aware of any such calculation having been made in respect of traffic in India, but we are painfully aware of the exasperating delays on roads.

Apart from the cost of traffic delays, which itself is an important consideration, there is the more important question of damage to vehicles and danger to life resulting from accidents. The number of accidents is increasing day by day and, unless effective steps are taken to enforce traffic regulations and instil road discipline in the minds of all those who use roads, the situation will deteriorate further. The importance of good road behaviour cannot be over-emphasised. On it depends road safety, rather than on the number of vehicles on the roads, or the pressure or density of traffic, or the state of the roads. Equally important is the state of roads. Bad roads mean more accidents.

Situation in Europe

In Europe, the highest percentage of accidents is to be found not necessarily in countries with the largest number of vehicles or the highest density of traffic or the worst roads. For instance, the highest number of accidents occur in Portugal and Yugoslavia—629 and 550, respectively, per 10,000 vehicles. Strangely enough, neither of these two States has a high number of licensed vehicles. Total number of licensed vehicles was 9.4 million in France, as of 1956, 6.9 million in West Germany, 6.49 million in Great Britain, 4.61 million in Italy, 1.27 million in Holland and 1.12 million in Sweden, while, in Yugoslavia and Portugal, it was 62,227 and 183,281, respectively. Among the nations with more than one million vehicles, West Germany had the highest number of road accidents in 1956, 418 for 10,000 vehicles. Belgium ranked second with 372 accidents, Great Britain third with 330 accidents, Holland fourth with 264 accidents and Italy fifth with 234 accidents per 10,000 vehicles.

In France, which had the largest number of vehicles, there were, in 1956, only 150 accidents per 10,000 vehicles. Sweden had the lowest number of accidents, namely, 140 per 10,000 vehicles. The number of deaths per 10,000 vehicles was the highest in Yugoslavia, namely, 80, followed by 29 in Portugal. Among other countries with high mortality figures are West Germany (18.6 per 10,000 vehicles), Luxembourg (18 per 10,000 vehicles), Switzerland (16.8 per 10,000 vehicles) and Italy (14.6 per 10,000 vehicles). The lowest number of deaths per 10,000 vehicles was in Sweden, being as low as 7.9.

An analysis of fatal road accidents for countries for which figures are available showed that

the most unfortunate road users were pedestrians, although the danger they face, is not graver than that of the pedal cyclist. Motor cyclists show a higher death rate than motorists. The latter enjoy greater protection from the very structure of the vehicle they are driving. Leaving aside Yugoslavia, the most difficult country for motorists is West Germany where the figure of 3.6 deaths per 10,000 vehicles in 1956 represents the highest percentage for those nations with intense motor traffic. Switzerland follows with 1.9, Belgium and Denmark with 1.4, Holland and Sweden with 1.2 and Italy and France with 1.1.

The most important factor in road safety is good road behaviour by pedestrians and motorists. Improvements to roads do not necessarily bring about a reduction in the number of accidents. In fact, countries like West Germany, famous for excellent roads, have the highest accident index. Nor does traffic density seem to have any direct bearing on the accident level. France, with the highest number of licensed vehicles on the European continent, has a lower number of accidents per 10,000 vehicles than countries with slight traffic like Yugoslavia.

Three Factors

There are three factors which came into play in traffic accidents, namely, the road, the vehicle and the road user. The deplorable state of the roads in the major cities of India cannot fail to strike even a casual visitor. More attention should be paid to the maintenance of roads and the check on vehicles put on the roads should be stricter. Vigorous efforts should be taken to instil road discipline through traffic education, not only of school children but of city planners, road builders, traffic control authorities, all types of road users, in fact, everyone who has anything to do with roads. Automobile associations and motor insurance companies, who have a direct financial stake in the condition of road traffic, should take greater interest in promoting better safety climate.

Motor insurance throughout the world is notoriously unremunerative. In India, too, thanks to the high claim incidence and mounting repair costs, the motor portfolio is year after year in red. While automobile owners, already heavily burdened with the high price of petrol and crushing taxes, grumble and protest at the rise in premium rates, insurers complain of continuing losses. The latter have therefore been forced to raise the motor tariff rate from time to time. The latest increase in premium was made last year when private car and motor cycle comprehensive cover rates for risks in Bombay City and the island of Salsette were raised by 40 per cent. It was the third upward revision in premium rates in Bombay since 1949 and automobile owners strongly protested against it. Insurers pointed out that, in spite of the increases, the loss ratio continued to be very high. It was pointed out that the ratio in 1953-55, on which last year's rates were based, was as high as 73.33 per cent, and that there was no other alternative to raising the premium. The solution to the problem lies in reducing the number of accidents involving high claims.

RUBY GENERAL INSURANCE

The Ruby General Insurance Company Ltd. (General Manager: Mr. B. K. Setalvad), which was founded in 1936, has, during the 23 years of its existence, grown into one of the leading insurance companies of the country. Its business has steadily expanded, to yield a net premium of Rs. 1.32 crores in 1958, as against a mere Rs. 2.85 lakhs in 1936, representing a forty-six fold increase in twenty years. To sustain this expanding business and to give it a sound financial basis, the capital and reserves of the Company have been progressively strengthened. Capital and funds, which stood at a modest figure of Rs. 16.76 lakhs in 1936, have increased to Rs. 1.19 crores at the end of 1958.

Reflecting the strain on general insurance business during 1958, the combined net premium income of the Company, according to the audited accounts for the year ended 31st December 1958, showed a slight decline to Rs. 1.32 crores, from Rs. 1.33 crores in the previous year. The fall occurred in the miscellaneous and marine sections, wherein premiums declined from Rs. 63.22 lakhs and Rs. 17.58 lakhs in 1957 to Rs. 59.73 lakhs and Rs. 15.72 lakhs respectively, in 1958. The fire department, on the other hand, received a higher premium income of Rs. 56.40 lakhs, as compared with Rs. 52.01 lakhs in 1957. Despite the lower aggregate net premium the net profits were higher, thanks to the higher return on investments and the reduction of losses in the miscellaneous and marine sections as a result of the cautious underwriting policy followed in these two departments.

The dividend has been maintained at the last year's level of 62 nP per share of Rs. 8 paid-up, free of income-tax.

Net premium in the fire department, as already stated, amounted to Rs. 56.40 lakhs, as compared with Rs. 52.01 lakhs in the previous year. Net claims paid and outstanding aggregated Rs. 23.89 lakhs and commission and expenses Rs. 23.87 lakhs. After maintaining the reserve for unexpired risks, including additional reserve, at Rs. 25.10 lakhs, being 44.5 per cent. of premium, as against Rs. 22.10 lakhs in 1957, a sum of Rs. 5.13 lakhs has been transferred as profit to the profit and loss account.

In the miscellaneous department, net premium aggregated Rs. 59.73 lakhs, as against Rs. 63.22 lakhs in the previous year. Net claims paid and outstanding amounted to Rs. 38.62 lakhs. Commission and expenses were of the order of Rs. 25.19 lakhs. After earmarking Rs. 27.48 lakhs as the reserve for unexpired risks, including additional reserve, being 46 per cent. of premium, a sum of Rs. 4.02 lakhs has been transferred as loss to the profit and loss account.

Net premium in the marine section amounted to Rs. 15.72 lakhs, as against Rs. 17.58 lakhs in the previous year. Net claims paid and outstanding were Rs. 11.21 lakhs and commission and expenses of management amounted to Rs. 5.13 lakhs. The marine fund, including additional reserve, stands at Rs. 10.90 lakhs, as against Rs. 11.35 lakhs in 1957, being 54 per cent. of cargo premium and 100 per cent. of hull premium. The account shows a deficit of Rs. 28,161.

After crediting interest, dividend and rent, less interest thereon, amounting to Rs. 3.82 lakhs and other miscellaneous receipts and crediting the profit of the fire department and debiting the loss in the marine and miscellaneous departments and expenses of management not applicable to any particular account aggregating Rs. 30,559, and foreign taxes amounting to Rs. 82,737, a sum of Rs. 3.67 lakhs has been transferred to the profit and loss account. This, together with the net balance of Rs. 19,103 brought in, makes in all Rs. 3.86 lakhs. Out of this, Rs. 20,000 has been transferred to the reserve for doubtful debts and Rs. 1.10 lakhs to taxation reserve. The payment of dividend of 62 nP per share will absorb Rs. 2.48 lakhs, leaving a balance of Rs. 8,214 to be carried forward.

UNIT TRUST CUM INSURANCE

A new unit trust called British Shareholders International Trust, to which some novel insurance arrangements, have been built-in, has recently been formed in the United Kingdom. The funds of the trust will be invested initially in a minimum of 50 British and foreign Government securities and first class British, Commonwealth and International investments chosen from a list of 83 companies. The Trust has offered five million unit shares at a net price per share of 10 shillings.

The most interesting feature of the Trust offer is the "Executive Saving Scheme" by which the Eagle Star and Guardian insurance companies will issue special endowment assurance policies payable in terms of the trust units. Instead of cash, in this way, policyholders will receive, it is claimed, the benefit of any capital appreciation on the whole number of units assured between the date when the policy is effected and the date when the units become payable on maturity of the policy or on earlier death. It is said that this is the first time it has been possible in Britain to insure one's life for a number of trust units instead of cash.

Policies will be issued in return for an initial premium of 25 per cent. of the commencing value of the units to be purchased, followed by future annual premiums fixed on the same value. As all payments are expressed as premiums for a life assurance policy, these will automatically qualify for income-tax relief up to the normal limits. During the period there will be no distributions but this is taken into account in the premium levels.

Eagle Star and Guardian are now offering similar policies in connection with the existing British Shareholders' Trust.

In addition, the managers of the Trust have arranged a "Regular Saving Scheme" under which one buys a fixed number of B.S.I.T. units each month for a number of years. During this period, the buyer is covered for the outstanding number of units by life assurance at no cost to himself. This scheme is covered by Eagle Star with the premiums borne by the managers.

ROAD TRAFFIC ACCIDENTS IN EUROPE

Statistics of road traffic accidents in Europe in 1957, published by the Secretariat of the United Nations Economic Commission for Europe show that over 44,000 people were killed in road traffic accidents in sixteen European countries during 1957, i.e., nearly 10,000 more than in 1953. This rate of increase (20 per cent.) was, however, much smaller than the rate of increase in numbers of motor vehicles (44 per cent. for cars and 80 per cent. for motor cycles).

The bulletin, which is priced at 2 shillings per copy, indicates that, although numbers of persons killed in 1957 increased at a slower rate than the size of vehicle fleets, the number of persons killed was high: it rose from 42,725 in 1956, to 44,059 in 1957. Preliminary figures in respect of 1958 show, however, that the number of people killed during that year probably fell below 44,000.

The number of persons injured was also high. In 15 countries, it rose from 1,179,714 in 1956, to 1,214,597 in 1957. The number of accidents involving personal injury in these countries was 968,705 in 1956, and 990,488 in 1957. The proportion of drivers and passengers of two-wheeled vehicles (cycles, cycles with auxiliary engine and motor cycles) to the total number of persons killed or injured was still high. The most common type of accident was collision between moving vehicles.

TRADE RELATIONS BETWEEN INDIA AND AUSTRIA

HEAVY GOODS FIGURE PROMINENTLY IN INDIA'S IMPORTS

By A Special Correspondent

FOR an understanding of trade relations between India and Austria, it is necessary to be familiar with the economic system prevailing in either country. While the Indian reader will be familiar with the economic conditions in his own country, it might be worthwhile to make a few comments on the economic and political set-up of Austria.

Politically, Austria has, since October 1955, pledged itself to a policy of neutrality which roughly corresponds to the type of neutrality pursued by Switzerland. This means that Austria does not belong to either of the two major power blocs and that, while taking a firm stand in its concept of the freedom of the individual and of western-style Parliamentary democracy, it successfully strives to be on good terms with all countries. This attitude is being reflected in its export and import trade. Thus, while it is true that the bulk of Austria's foreign trade still goes to and comes from the O.E.E.C. countries, Austria has made continuous efforts to increase the volume of trade with the Americas, the countries of the Soviet bloc, as well as the newly independent countries of Asia and Africa, and Australia.

Like India, Austria has a mixed economy, reflecting the political outlook of the Austrian population, which is, roughly speaking, half conservative and half socialist. Both the right-wing Austrian People's Party and the moderately left wing Socialist Party share equal responsibility in the recently formed cabinet which is presided by a Prime Minister from the Austrian People's Party.

Controls Relaxed

While large sections of the Austrian economy (for example, the major banks of the country, most of the heavy industry, the bulk of the hydro-electric plants, etc.) are in the public sector, all these enterprises are being operated strictly on sound business principles and their prices are dictated exclusively by commercial motives. It should also be mentioned that the Austrian Government has successfully tried to reduce the large number of restrictions which were introduced in the emergency situation that resulted from the Second World War, and the economic boom in Austria which can justly be compared to what is known as the "German economic miracle" has proved this policy correct.

In recent years, a vast number of restrictions on imports and exports have been abandoned and taxation (in particular income-tax) has been somewhat reduced. By a continuous lowering of tariffs and a steady increase in import quotas, the industrial enterprises of the country have been made ready to face competition from their confreres in Europe and overseas in both the domestic and export markets.

Today, Austria has a completely even balance of trade and is able to give its nationals a sound standard of living, without having to rely on any foreign aid. This is the result of a continuous and vigorous export drive, a steadily expanding domestic market and very considerable revenues from tourism. Austria it may be noted in passing, earns about Rs. 80 crores in foreign exchange each year through its tourist industry.

Exports

Having given this summary of some of the more essential features of Austria's economy, I should now like to turn to the practical application of these economic conditions to the trade relations between the two countries. The Indian reader will quite naturally be interested, first and foremost, in the question of Indian exports to Austria. Since the Austrian economy is not Government-regimented, efforts to increase the amount of Indian goods flowing to Austria have to be made by and large on a firm-to-firm basis. This means that, though the competent Austrian authorities sincerely sympathise with the Indian export drive, the procuring of orders will have to be done by the representatives of Indian firms in Austria. Participation in the Vienna Trade Fairs, held in spring and autumn every year, would also be a way to interest

Austrian importers in Indian goods. The development of an efficient system of quality control would also be of great help. In the developing of trade relations between two countries, instances of quality not coming up to the stipulated standard or dates of delivery not being observed, can be quite harmful. It is submitted that efforts in these directions will lead to an increase of Indian exports to Austria.

Imports

As regards the goods which India imports from Austria, they comprise steel, railway equipment, electric machinery, tractors, pumps, turbines, newsprint, fertilisers and high quality magnesite. Of course, Austria also exports a wide range of consumer goods, but, at present, they do not reach India due to import restrictions.

In recent years, Austria's largest locomotive factory, Simmering Graz-Pauker, have supplied about 200 steam locomotives and 2,000 railway carriages to the Indian railways. Now that India has become self-sufficient with respect to these items, the question of the supply of other types of railway equipment is under consideration. I might add that Austria has also supplied bridge girders, cranes and locomotives, boilers and spares to the Indian railways.

Steyr-Daimler-Puch A.G., one of the largest tractor plants on the European Continent, are supplying tractors to India and sharing their technical know-how in the production not only of the tractors but also of cars, motor cycles, scooters, mopeds and bicycles, with Indian trainees working at their plants.

In the field of steel construction, Waagner-Biro and Maschinenfabrik Audritz have parti-

INDO-AUSTRIAN TRADE (Value: In Rs. lakhs)				
Calendar year	Imports from Austria	Exports to Austria	Balance of trade	
1952	165	46	-119	
1953	244	55	-189	
1954	236	29	-207	
1955	233	44	-189	
1956	444	25	-419	
1957	478	28	-450	
1958	213	21	-192	
1959 (January to June)	59	10	-79	

cipated in many of the hydro-electric projects of India by supplying cranes, hoists, sluice gates and pumps.

Rourkela

Austria's biggest steel plant Voest (United Austrian Iron and Steel Works, annual production approximately 2 million tons of steel) has contributed to one of the main objects of the second Five-year Plan, namely, the development of steel production on a large scale, by the delivery and erection of the L.D. steel melting shop of the Rourkela Steel Plant.

The L.D. process of steel production, which was entirely developed in Austria, necessitates smaller initial investment than other methods of steel making and has the additional advantage of lower operating costs. Of a total of one million tons of steel per year to be produced at Rourkela, 750,000 tons will be produced by L.D. Since Voest have given licences for the use of their patent on the L.D. process, know-how and equipment to steel plants all over the world, including the U.S., the Federal Republic of Germany, Japan, Canada, France, Brazil, Spain and the Netherlands, India can justly be proud of sharing with these countries what is considered to be the latest technical development in steel production.

Apart from being busy with the delivery and erection of L.D. plants all over the world, Voest are also supplying penstocks for hydro-electric projects (in India, e.g., Konar, Rupa and Panchet hill projects) as well as Hamilton poles, lathes, locomotive cranes, etc. They are also in a position to design, supply and erect all

types of industrial plants, e.g., steel plants, rolling mills, etc., and they can deliver plate shears, adjustment machines, machine tools, equipment for mining and large construction yards, crushing machines, road construction equipment and equipment for bricks factories.

Austria's Schoeller Bleckmann and Boehler Brothers are highly advanced in production of alloy steel, and high grade alloy steels have been imported by a large number of India's manufacturers, ranging from tool and machine tool factories to such big concerns as the Hindustan Aircraft Ltd., Bangalore, and the Tata Iron and Steel Company, Ltd., Jamshedpur.

Owing to the specific properties of Austrian iron ore, it was possible for several Austrian firms, especially the United Austrian Iron and Steel Works (VOEST), the Boehler Steel Works, and the Schoeller-Bleckmann Concern, to develop steels with a maximum content of cobalt of only 0.003 to 0.005 per cent. This is of extreme importance for the use of such material in the construction of reactors. The best American steels still exceed this maximum permissible content of cobalt by about twenty times.

The Boehler concern has developed a high-boron-content steel alloy, with superior qualities of neutron absorption. The Schoeller-Bleckmann concern has received orders for low-cobalt-content steels from the French Atomic Energy Centre of Saclay, and for German reactors. Another Austrian firm is in a position to supply lead of almost 100 per cent. purity for the first Austrian research reactor soon to be established. Also, this product has begun to attract international attention. The Plansee Metal Works in Reutte, Tyrol, whose sinter metals are exported to all parts of the world, is now producing sintered uranium which is delivered, for instance, for Swedish reactors. Furthermore, the Plansee plant produces radiation-proof containers and vessels. For the Austrian reactor a heavy concrete has been developed on the basis of barite.

Optical Concern

A leading Viennese optical concern has built a microscope for the observation of radioactive substances, which is the first of its kind and is already being exported, for instance, to France. Austrian engineering firms, such as the Simmering-Graz-Pauker A.G., account for about 80 per cent. of the parts for the Austrian reactor, working on a contract basis for a well-known U.S. concern.

Messrs. Alpine Montan A.G., a big mining and steel concern, have also a wide variety of production, ranging from equipment for steel mills, foundries, coal mines, railway tracks to special tools, springs, alloy steels, semi-finished steel, bar iron, strip iron, profile iron, iron sheets, etc.

Austria's major electrical engineering concern, Elin Union, has not only delivered electromotors, transformers, diesel generators, welding sets, switchgear and various other types of electrical equipment to India, but has also made two years' training of Indian engineers at their plant a regular feature.

With industrialisation in India gaining momentum, it is only natural that emphasis should shift from mere imports to technical co-operation. A first step in this direction has been made by the Österreichische Stickstoffwerke A.G. (Austrian Nitrogen Works). This concern had realised years ago that it will not do just to supply their fertilisers to India but that, in the first place, the Indian farmer must be made fertiliser-minded.

This has successfully been achieved in close co-operation with its Indian partners, namely, the International Ore and Fertiliser Company Private Ltd. by establishing what is known as the Nitramon Scheme (Kisan Khad) of India. In this scheme, the necessary market for fertiliser is being created. The Government of India is being assisted in the handling, storing and distributing of Nitramon fertiliser and soil research is being carried on.

Machine Tools

Another venture of Indo-Austrian technical co-operation which has proved successful is manufacturing in India of air compressors by MAW, a Vienna factory producing machine and machine tools, together with their Indian partners, K. G. Khosla Private Ltd., New Delhi. While this may be a comparatively small project, it is a pleasure to visit this new factory and to watch the steady progress which is being made both in increasing production and in lowering costs.

It is felt that there is still wide scope left for similar Indo-Austrian ventures on a small (Continued on page 752)

The Quality that Speaks!

From

Dr. B. L. Sethi, M.Sc., Ph.D. (Wales),
Secretary,
Indian Central Cotton Committee,
14, Nicol Road, Ballard Estate,
Bombay-1.

AKSIR DANDAN Tooth Powder was first recommended to me by Shri Mayadass, I.A.S., Director of Agriculture, Uttar Pradesh, in 1946, when I was the Principal of the Government Agricultural College, Kanpur. Ever since, I have used it with benefit and pleasure so much so that even on my transfer from U.P. to Bombay I have continued to use it and have been getting the required quantity from AKSIR DANDAN CHEMICAL WORKS PRIVATE LTD., Allahabad, as it was not available locally in Bombay. This in itself speaks for its utility and efficacy and my liking for it.

Stephens Ink claims its importance as far back as 1886 and there are authorities enough to prove that STEPHENS INK was used for all important documents.

Stephens Ink is known for its fluidity because it does not clog. Old and new pens 'feel' better and behave better. Use STEPHENS INK and your pen will never fail you.

Every batch manufactured is not bottled until it is tested in the laboratories in England.

The Rs. 10 paid-up (old) shares of the Company are being currently quoted at Rs. 18.25 cum-div. On an ex-div. basis and at the current rate of dividend the yield works out to 4 per cent, per annum, subject to deduction of tax, which is equivalent to a tax-free yield of 2.95 per cent. per annum.

SYNOPSIS OF COMPANY REPORTS

Cooper Engineering Ltd.

The directors of the above Company (Managing Agents: Messrs. Walchand & Co., Private Ltd., Bombay) presented the audited accounts of the Company for the year ended 30th June 1959.

The net profit for the year after providing Rs. 4,00,000 (Rs. 4,80,000) for taxation and Rs. 2,82,697 (nil) for development rebate reserve amounts to Rs. 4,61,242 (Rs. 5,34,108) to which is added the balance brought forward from the previous year of Rs. 63,527 (Rs. 67,219) making a total of Rs. 5,24,769 (Rs. 6,01,327). From this the directors have transferred to general reserve Rs. 1,25,000 (Rs. 50,000) leaving a balance of Rs. 3,99,769 (Rs. 3,15,277) after transferring Rs. 89,660 to special depreciation reserve and Rs. 1,46,140 to development rebate reserve. The directors now recommend a dividend on ordinary shares at 10 (7) per cent. plus 3 (3) per cent. as bonus (subject to tax (free of tax)) absorbing Rs. 3,27,800 (Rs. 2,52,000) leaving a surplus to be carried forward of Rs. 72,169 (Rs. 63,527).

The directors are pleased to inform that there is a considerable increase in the sales of the Company's products during the year under report. There is an increase in demand for oil engines, machine tools and looms.

The Company had taken part in the exhibitions held at Baghdad, Toronto (Canada), Cairo, Saigon, and Sudan where the oil engines, pumps and shaping machines were exhibited in the Government of India stalls. The Company had also taken part in the exhibitions conducted by the Engineering Export Promotion Council held at Singapore.

During the year under report the Company had exported engines and pumps valued about Rs. 1,50,000 to Jeddah, Jordan and Bangkok.

The Company has entered into technical collaboration agreements with Messrs. Scottish Machine Tools Corporation Ltd., Scotland, for assistance in supplying technical know-how for the manufacture of planing machines, and with Messrs. Strojexport Foreign Trade Corporation, Praha, Czechoslovakia, for the manufacture of slotting machines.

As the shareholders were aware, the Company issued ordinary shares worth Rs. 20 lakhs at par and the whole issue was fully subscribed.

The income-tax assessments of the Company are completed upto year ended 30th June 1954, i.e., assessment year 1955-56. The Company has gone in appeal in respect of the assessment for the year ended 30th June 1954.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	35,76,300	Gross block	79,73,950
Reserves	19,61,209	Less—Depreciation	43,30,263

	Rs. 1,23,91,203		Rs. 1,23,91,203

Dauracherra Tea Co., Ltd.

The directors of the above Company (Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

The accounts disclose a working profit of Rs. 3,77,809 (Rs. 1,40,326). On transfer of this sum to profit and loss account, and after providing for taxation liability and sundry adjustments, there is a balance at credit of the profit and loss account amounting to Rs. 1,78,190 (Rs. 78,625) of which the directors have transferred Rs. 50,000 (nil) to revenue reserve and Rs. 10,000 (nil) to development rebate reserve. It is proposed to declare part dividend of 5 (total dividend of 7) per cent. and to provide a sum of Rs. 30,000 (nil) against distribution of balance dividend at the rate of 5 per cent. for season 1958 when funds are available in India, thus carrying forward Rs. 58,190 (Rs. 33,625).

Crop was 4,24,720 lbs. as compared with 3,14,800 lbs. in 1957. The average selling price realised was Rs. 2.32 per lb. as against Rs. 2.15 per lb. in the previous year.

Estimates for 1959 provide for a crop of 4,16,000 lbs. at an outlay of Rs. 6,25,062, including inland freight and sale charges.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	6,00,000	Gross block	9,91,503
Reserves	10,04,531	Less—Depreciation	2,48,236
Provision for taxation	3,90,931	Net block	7,43,267
Liabilities	1,64,527	Stock-in-trade	2,83,612
Profit and loss account (surplus)	58,190	Stores, etc.	81,729
		Loans and advances	2,30,842
		Investments	1,02,833
		Cash	7,76,916
	Rs. 22,18,199		Rs. 22,18,199

New Chumta Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Davenport & Co. Private Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

There was good rains from June onwards and a crop of 7,206 maunds of tea was made during the year against an estimate of 6,500 maunds. Drought conditions prevailing at the beginning of the season and attack of hail of slight severity in April affected the growth and quality of early teas to some extent which was overcome by the welcome rains in June and maintenance of fine plucking and a satisfactory standard of manufacture. The total net average sale price per pound was Re. 1.86 (Re. 1.77) and the working cost per pound of tea produced was Re. 1.58 (Re. 1.59).

Expenses incurred on the compulsory provident fund scheme for plantation labour which was introduced by Government from May 1957 and the high price of concessions on foodstuffs among others increased the cost of production.

The gross profit for the year is Rs. 1,80,698 (Rs. 83,960) and after writing off Rs. 76,368 (Rs. 35,270) for depreciation of assets and allowing for provision for bonus to labour Rs. 10,000 (Rs. 10,000), for taxation Rs. 42,398 (Rs. 12,989), for development rebate reserve Rs. 15,400 (nil) and for other adjustments there is a net profit of Rs. 12,025 (Rs. 38,268) which together with the balance brought forward from 1957 gives a total available on this account of Rs. 89,723 (Rs. 1,15,198) which, the directors propose to deal with as follows:—

To pay a dividend of 10 (12) per cent. for the year absorbing Rs. 30,000 (Rs. 37,500) and to carry forward to 1959 Rs. 59,723 (Rs. 77,698).

Estimates for 1959 have been based on a crop of 6,500 maunds of tea at a total cost of Rs. 78,000.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	3,00,000	Gross block	8,49,733
Reserves	7,79,930	Less—Depreciation	3,58,333
Provision for taxation	52,557	Net block	4,91,400
Liabilities	4,00,970	Land, etc.	1,02,676
Profit and loss account (surplus)	59,723	Stock of tea	3,82,201
		Stores and spare parts	1,30,010
		Debits, deposits and advances	1,70,538
		Investments	1,49,811
		Cash	1,66,514
	Rs. 15,93,150		Rs. 15,93,150

Teesta Valley Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Davenport & Co. Private Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

A severe hail struck the garden in the first week of April resulting in reduction in crop and deterioration in quality and a total of 4,153 maunds of tea was made against an estimate of 5,000 maunds. The total net average sale price per pound was Rs. 2.89 (Rs. 2.83) and the total working cost per pound of tea produced was Rs. 2.92 (Rs. 2.65).

Expenses incurred on the compulsory Provident Fund Scheme for plantation labour which was introduced by Government from May 1957, the high cost of concessions foodstuff and the short crop made, etc., account largely for the increase in the working costs.

As indicated in the directors' report of the 7th August 1958, a loan of up to Rs. 5,00,000 was negotiated from the West Bengal Financial Corporation and the replacement of the Estate Factory taken up at the end of the year is now complete and has been in use since April 1959.

The gross profit for the year is Rs. 25,051 (Rs. 43,873); the directors have written off Rs. 53,404 (Rs. 34,751) for depreciation and provided Rs. 12,400 (nil) for development rebate reserve. After allowing for the above and the other adjustments made there is a net profit of Rs. 10,002 (Rs. 62,905) (net profit of Rs. 10,002) and, after adjusting the previous year's balance of Rs. 54,633 (Rs. 54,831), a final debit balance of Rs. 8,272 (credit of Rs. 54,633) after paying a dividend of 10 per cent. for the year absorbing Rs. 32,000 is carried forward to 1959.

Estimates for 1959 have been based on a crop of 5,000 maunds of tea at a total cost of Rs. 9,80,000.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	3,20,000	Gross block	8,96,438
Reserves	7,96,637	Less—Depreciation	3,08,938
Provision for taxation	1,40,944	Net block	5,87,500
Liabilities	5,39,033	Stock of tea	1,27,508
		Stores and spare parts	53,832
		Miscellaneous	3,82,958
		Debits, deposits and advances	1,23,245
		Investments	1,66,111
		Cash	3,55,460
	Rs. 17,96,614		Rs. 17,96,614

Ranicherra Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod and Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

The season's working resulted in a profit, after providing for depreciation, of Rs. 2,55,570 (Rs. 1,28,378) to which must be added—adjustment account Rs. 3,507 (nil) and the balance of profit brought forward from 1957 of Rs. 28,093 (Rs. 24,662) making a total of Rs. 2,87,170 (Rs. 1,53,040). From this amount must be deduct-

ed—provision for taxation of Rs. 84,500 (Rs. 27,000) and provision for wealth tax of Rs. 6,500 (Rs. 8,430) leaving a balance of Rs. 1,96,170 (Rs. 66,343) after deducting Rs. 14,221 in respect of adjustment and Rs. 37,076 for depreciation for previous year. From this amount the directors have set aside to buildings and machinery reserve Rs. 1,00,000 (nil) and to development rebate reserve Rs. 7,800 (nil) leaving an available balance of Rs. 88,370 (Rs. 66,343). This amount the directors recommend, should be distributed as follows:—

In payment of a dividend for the year ended 31st December 1958, at the rate of 75 (50) naye Paisa (free of tax) per equity share, on 76,500 equity shares, absorbing Rs. 57,375 (Rs. 38,250) and leaving to be carried forward Rs. 30,995 (Rs. 28,093).

The saleable crop weighed out at 12,748 (11,606) maunds against an estimate of 12,750 maunds and was disposed of at an average price of Re. 1.99 (Re. 1.91) per lb.

The estimate for season 1959 provides for a saleable crop of 13,500 maunds at a total revenue expenditure of Rs. 16,25,651.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	7,65,000	Gross block	29,26,219
Reserves	14,51,350	Less—Depreciation	14,43,439
Provision for taxation	4,02,827	Net block	14,82,780
Liabilities	3,61,466	Work-in-progress	889
Profit and loss account (surplus)	30,995	Stock-in-trade	7,57,612
		Stores, etc.	3,26,788
		Debits, deposits and advances	3,06,225
		Investments	54,375
		Cash	82,969
	Rs. 30,11,638		Rs. 30,11,638

Rajabhat Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod and Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December, 1958.

The season's working resulted in a loss, after providing for depreciation, of Rs. 12,220 (loss of Rs. 3,18,765) to which must be added—adjustment account Rs. 2,604 (Rs. 23,553), provision for taxation in respect of previous years Rs. 8,000 (nil), amount written off stores for obsolescence, etc. Rs. 191 (nil), provision for wealth tax Rs. 4,000 (nil), amount set aside by directors to development rebate reserve Rs. 4,615 (nil) and loss brought forward from 1957 of Rs. 3,00,938 (credit of Rs. 41,380) leaving a total balance at debit of profit and loss account to be carried forward to 1959 Rs. 3,32,568 (Rs. 3,00,938).

The saleable crop weighed out at 9,459 (6,235) maunds against an estimate of 1,000 maunds and was disposed of at an average price of Rs. 2.06 (Re. 1.99) per lb.

The estimate for season 1959 provides for a saleable crop of 10,000 maunds at a total revenue expenditure of Rs. 14,47,574.

The heavy short-fall in the crop made in 1958, was mainly due to severe hail damage sustained by the garden in April, 1958. The loss as a result of the hail damage was assessed at 614 maunds of pucca tea and a sum of Rs. 49,081 was realised from the Insurance Company as compensation.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	6,00,000	Gross block	15,21,696
Reserves	7,74,381	Less—Depreciation	6,56,106
Provision for taxation	2,26,494	Net block	8,65,590
Liabilities	3,01,620	Stock of tea	5,23,310
		Stores, etc.	2,54,873
		Debits, deposits and advances	1,55,632
		Investments	53,573
		Cash	49,517
	Rs. 19,02,495		Rs. 19,02,495

*Reserves are shown after deducting Rs. 3,32,568 being the debit balance in the profit and loss account.

Killcoot Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

The accounts disclosed a working profit of Rs. 1,36,245 (Rs. 2,30,620). On transfer of this sum to profit and loss account and after sundry adjustments, including the transfers of Rs. 10,000 (nil) from depreciation reserve and Rs. 4,86,615 (nil) credit of the profit and loss account amounting to Rs. 6,37,908 (Rs. 2,94,052) of which the directors have transferred Rs. 50,000 (nil) to development rebate reserve and Rs. 4,86,600 (Rs. 3,767) to buildings and machinery reserve. The directors recommend payment of a dividend of 7½ (15) per cent. absorbing Rs. 67,500 (Rs. 1,35,000) leaving Rs. 34,408 (Rs. 61,265) after transferring Rs. 50,000 to revenue reserve and Rs. 10,000 to development reserve) to be carried forward.

Crop was 10,10,717 lbs. as compared with 10,79,603 lbs. in 1957. The average selling price realised was Re. 1.85 per lb. as against Re. 1.78 per lb. in the previous year.

Estimates for 1959 provide for a crop of 10,40,000 lbs. at an outlay of Rs. 17,34,165 including inland freight and sale charges.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	9,07,000	Gross block	23,67,451
Reserves	16,81,000	Less—Depreciation	6,96,766
Provision for taxation	2,31,322	Net block	16,70,685
Liabilities	7,08,219	Stock-in-trade	10,54,982
Profit and loss account (surplus)	34,403	Stores, etc.	2,15,993
		Debits, deposits and advances	1,92,883
		Investments	3,06,894
		Cash	95,499
	Rs. 35,36,940		Rs. 35,36,940

Hantapara Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1958.

The total loss for the year amounted to Rs. 4,72,542 (Rs. 5,70,052). Of this loss, Hantapara Estates accounted for Rs. 4,17,894 (Rs. 3,34,704) and Dumchhipara Estates Rs. 54,648 (Rs. 2,35,348). On transfer of this sum to profit and loss account and after sundry adjustments, including the transfers of Rs. 3,25,000 (Rs. 1,75,000) from revenue reserve, of Rs. 13,58,934 (nil) from depreciation reserve, there is a balance at credit of the profit and loss account amounting to Rs. 14,81,842 (Rs. 1,70,092), of which the directors have transferred Rs. 13,59,000 (nil) to buildings and machinery reserve and Rs. 1,00,000 (Rs. 50,000 to development reserve) to development rebate reserve.

The disappointing result is due to shortfall in the crop at Hantapara which was caused mainly by an attack of red spider of unprecedented severity. Statutory amenities and wages for the surplus labour force raised the cost of production to uneconomical levels.

Dividend. The directors recommend payment of a dividend of 8 (8) per cent. on the preference shares for season 1958 leaving Rs. 18,842 (Rs. 1,16,092) to be carried forward.

Tea crop from Hantapara amounted to 12,84,045 (14,54,230) pounds and from Dumchhipara amounted to 12,52,007 (11,74,000) pounds. The average selling prices obtained per pound of tea were as follows:—For Hantapara Re. 1.88 (Re. 1.75) and for Dumchhipara Re. 1.84 (Re. 1.79).

Planted area totals 2,507.82 acres comprising 1,313.37 acres at Hantapara and 1,184.25 acres at Dumchhipara.

Estimates for 1959 provide for a total crop of 28,80,000 lbs. at an outlay of Rs. 54,28,699, including inland freight and sale charges.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	36,50,000	Gross block	68,81,978
Reserves	31,84,800	Less—Depreciation	21,10,964
Provision for taxation	2,74,143	Net block	47,62,014
Liabilities	23,62,814	Stock-in-trade	30,46,543
Profit and loss account (surplus)	18,842	Stores and supplies	5,13,984
		Debits, deposits and advances	3,85,539
		Investments	5,08,042
		Cash	1,93,675
	Rs. 94,69,799		Rs. 94,69,799

North-West Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Rule & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st March 1959.

The accounts show a profit, after charging all expenses, of Rs. 58,861 (Rs. 88,902) to which is added the balance brought forward from last year of Rs. 25,543 (Rs. 17,516) making a total amount available for appropriation of Rs. 84,404 (Rs. 1,06,418). An interim dividend of 7½ (7) per cent. was paid on 16th February 1959, absorbing Rs. 20,438 (Rs. 20,438). The directors now propose a final dividend of 7½ (7) per cent. absorbing Rs. 20,437 (Rs. 20,437) leaving a balance of Rs. 41,629 (Rs. 25,543) after transferring Rs. 40,000 to general reserve. The directors have forfeited unclaimed dividends in accordance with Article 158 Rs. 5,237 (nil). Thus there is a balance to be carried forward of Rs. 46,886 (Rs. 25,543). Wealth tax in respect of the year, estimated at Rs. 1,300, has been provided for by transfer from investment realisation surplus.

Raisings for the year were 1,37,083 tons compared with 1,29,943 tons in the previous year, whilst despatches totalled 1,37,508 tons as against 1,30,848 tons. The installation of a stowing plant for the working of No. 10 Seam is in progress.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	2,72,500	Gross block	13,00,275
Reserves	3,84,524	Less—Depreciation	9,40,919

Liabilities	4,36,618	Debits, deposits and advances	5,18,277
Profit and loss account (surplus)	46,866	Cash	1,69,219
	Rs. 11,62,912		Rs. 11,62,912

N.B.—Figures within brackets relate to the corresponding period of the previous year.

INDIA'S BALANCE OF PAYMENTS
POSITION IN 1958-59

RELIEF IN STRAIN, THANKS TO FOREIGN AID

A LARGE cut in imports, accompanied by an increased inflow of foreign assistance, helped to relieve considerably the strain on India's balance of payments in 1958-59. The decline in the foreign exchange reserves during the year was on y Rs. 47 crores, as against Rs. 260 crores in 1957-58. In fact, for the first time since the start of the second Five-year Plan, there was even a seasonal increase in the foreign exchange reserves; between November 1958 and March 1959 the reserves rose by Rs. 44 crores. The table at the bottom of this article shows the position at a glance.

Imports

Total imports at Rs. 1,046.5 crores in 1958-59 were Rs. 157 crores lower than in the preceding year. While private imports dropped by Rs. 177 crores, Government imports showed an increase of Rs. 19 crores, thus becoming larger than private imports.

The largest fall in private imports was recorded in capital goods (Rs. 65 crores), followed by intermediate goods (Rs. 54 crores) and consumer goods (Rs. 40 crores). Raw materials showed the smallest decline (Rs. 10 crores) as they were rather liberally licensed for the maintenance of the economy.

The biggest item in Government imports was capital equipment for Government projects; these showed a marked rise, over the year, of Rs. 67 crores to Rs. 154 crores. Food imports, which were the biggest item in the preceding year, showed only a nominal decline.

Total machinery imports rose only a little during the year but iron and steel imports recorded a considerable fall, as shown below:

MONEY COMFORTABLE

(From Our Own Correspondent)

BOMBAY, 28th October

Activity in the short-term money market continues to be restricted, in the absence of any worthwhile broadening of demand for funds. Even the little business noted in the last few days is only restricted to small banks. Interest rates are, however, unchanged at the previous week's level. Inter-bank call money is being quoted at 1½ per cent. among the Exchange banks and big Indian banks and at 2½ per cent. among the smaller banks. House money at seven days' notice is being placed at 3 to 3½ per cent. and short-term deposits at 3 to 3½ per cent. for one to six months.

There has been a further dip in the 91-day Treasury Bill rate this week to 2.420 per cent. per annum from last week's rate of 2.435 per cent. The amount offered is, however, a fraction lower at Rs. 3.53 crores (the corresponding offerings last week aggregated Rs. 3.85 crores), as against the week before Rs. 2 crores. Tenders for next week invitation for Rs. 2 crores. The sales of Intermediate Treasury Bills during the period 21st to 24th October amounted to Rs. 4.25 crores a week, as compared with Rs. 4.25 crores a week before. These bills are being offered this week at Rs. 99.411 per cent., which works out to a discount rate of 2.356 per cent. per annum, as against 2.376 per cent. last week.

A further contraction of Rs. 12.82 crores in notes in circulation is disclosed by the Reserve Bank of India statement for the week ended 23rd October 1959. Notes held in the Banking Department are higher by Rs. 14.05 crores, so that the total notes issued show a rise of Rs. 1.23 crores. This is mainly covered by an increase in rupee coin. For the second week in succession, balances held abroad have increased, the rise during the week under review being Rs. 2.69 crores. Deposits of the Central Government have gone up by Rs. 14.38 crores, while those of other Governments show a fall of Rs. 11.74 crores. No notable variations are noted in loans and advances to Governments and other loans and advances. There has been a drop of Rs. 13.46 crores in Government Treasury Bills purchased and discounted.

A sharp rise of Rs. 13.44 crores in demand deposits and of Rs. 6.24 crores in time deposits are noted in the Scheduled banks' statement for the week ended 16th October 1959. Of the cumulative increase of Rs. 19.68 crores in deposits, the State Bank of India's share is Rs. 3.54 crores. Borrowings from the Reserve Bank have been reduced by Rs. 6.61 crores and those from the State Bank by Rs. 1.56 crores. Advances have declined by Rs. 4.55 crores and investments by Rs. 1.84 crores. The rise in deposits is reflected in the increase of Rs. 11.85 crores in cash balances, the State Bank alone accounting for as much as Rs. 9.82 crores.

The gilt-edged market is dull, with very little business passing, in view of the proximity of the busy season. While some interest is still taken in short-dated issues, the medium and long-dated loans are on offer at quoted rates. State loans, too, are having sellers and some of the 4 per cent. 1971 issues are a shade lower over the week. 3 per cent. 1966 Conversion Loan is featureless at Rs. 14.85, while 3 per cent. 1970-75 has shed 10 nP to Rs. 93-10. 3 per cent. 1966-68 has lost 5 nP to Rs. 95-5. There are no changes in other loans, except a 4 per cent. 1973 which is marked up by 10 nP to Rs. 101.65. Among the State loans, Bombay 4 per cent. 1971 is 5 nP lower at Rs. 100.90, West Bengal 1971 has shed 10 nP to Rs. 100, and Madras and U.P. 1971 have each suffered a similar fall to Rs. 100.

The list for public subscription to the Assam Financial Corporation Bonds for Rs. 50 lakhs opened today and may be closed any time before 7th November. The bonds carry interest at the rate of 4½ per cent. and are repayable in 1971. The issue price is Rs. 99.50 per cent.

Another issue which opened for subscription this week is the 4½ per cent. Kerala State Electricity Bonds for Rs. 2 crores. (The list opened on the 26th inst.). The bonds are being issued at Rs. 99.50 per cent. The list will be closed as soon as the issue is fully subscribed, but not later than 5th November.

In the foreign exchange section, the rupee has weakened a little in terms of the U.S. dollar, in consonance with the drop in the pound sterling abroad. Banks' selling rate for U.S. T.T. has gone up from Rs. 476.50 to Rs. 477 and their buying rate from Rs. 473.25 to 473.75 per \$100. In New York, spot sterling has dropped from 280.80-280.83 cents to 280.51-280.54 cents and three months' forward from 281.26-281.29 cents to 280.95-280.98 cents.

HIDES DULL

(From Our Own Correspondent)

MADRAS, 26th October

Business in tanned cow hides was patchy during the week under review, as U.K. importers were holding out for lower prices. Sellers were slightly nervous at the absence of orders for shipment and were willing to take on some orders at 1d. to 2d. lower than their earlier sales. Buffalo hides have been accumulating in the local market, as U.S. importers have not shown any interest for several weeks. Tanned buff calf declined by 10 nP. Tanned cow calf ruled steady as arrivals were small. Enquiries for lower grade kips for inland consumption were poor and the market was weak.

In view of the high prices ruling for tanned goat skins, importers have been less active, and have not followed the last prices established and the market is declining. Tanned sheep middle class is weak, while semi-primers are steady. In the October London public sales, there was a fair attendance of buyers and good competition for goods near to standard and quality. Prices paid were near the level of c.i.f. prices. There were several withdrawals of best parcels in sheep skins before the sales.

BULLION REACTS

(From Our Own Correspondent)

BOMBAY, 28th October

The bullion market was a little subdued during the week under review and prices suffered a mild reaction. Though at one time during the week prices displayed a tendency to shoot up following reports of Chinese occupation of a part of Eastern Ladakh and killing of members of Indian police patrol, weaker advices from the share and commodity markets induced selling pressure. The increasing pace of arrivals, presumably induced by the current high levels, the decline in demand, despite Diwali, had a sobering effect on bulls. The downward trend in prices gathered momentum, particularly in gold, towards the close of the week, with the result that the closing rates in the forward section today were Rs. 2 below the week's peak levels.

Silver for forward delivery (November settlement) dropped early in the week from Rs. 211-1 to Rs. 210-2. After a spurt to Rs. 211-6, which was Rs. 4 above last week's peak, the forward metal retreated to Rs. 209-5 at the close today. The December settlement came up to Rs. 211-11 from Rs. 211-6 before dropping to Rs. 209-7 today.

Ready silver finished the week with a loss of Re. 1-11 at Rs. 208-10 after touching a high of Rs. 210-11, which is a fresh record in the history of the bullion market. The floating stocks are reported to be 900 bars. The daily average arrivals were 45 bars (including unrefined metal), while the offtake was 10 bars.

Forward gold (November settlement) was subdued early in the week with a drop from Rs. 123-7 to Rs. 125. At this level, however, there was fresh bull support to push it to Rs. 125-10 on Monday. Subsequently, prices gave way on renewed selling pressure, the November settlement dipping to Rs. 123-11 at the close today. Business in December settlement began only yesterday at Rs. 125-1. The closing today was done at Rs. 123-14.

Ready gold was quoted at par with the November settlement throughout the week. The floating stocks of gold are estimated at 80,000 tolas. The daily average arrivals were 2,500 to 3,000 tolas, and the offtake was also of the same order on an average.

New York silver was again unchanged at 91.37 cents. In London, while spot silver held its ground at 80½d., the forward gained ¼d. to 79½d. Gold hardened from 249s. 10½d. to 250s. 3d., reflecting the weakness of sterling.

The following comparative table shows at a glance the trend of the market during the week under review:

	28-10-59	Highest	Lowest	21-10-59
	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready Gold (99.99 fine Mint)	123 11	125 10	123 10	125 7
Forward " " " "	123 11	125 10	123 10	125 7
Silver (99.99 fine Mint)	79 8	—	—	79 8
Ready Silver (99.99 fine Mint)	208 10	210 11	208 9	210 5
Forward " " " "	208 10	210 11	208 9	210 5
London Silver Ready	27-10-59	—	—	20-10-59
London Forward	79½d.	79½d.	79½d.	79½d.
London Silver	250s. 3d.	250s. 3d.	249s. 10½d.	249s. 10½d.
New York Silver	91.375c.	—	—	91.375c.

* 17th November settlement. † 16th November settlement.

FOODGRAINS EASY

(From Our Own Correspondent)

HAPUR, 26th October

Slightly depressed conditions were witnessed in the foodgrain prices during the past week, thanks to pressure of new kharif grain arrivals in the market. Rabi sowings are in full swing and it is hoped that they will be finished by Diwali. While average wheat prices ruled quiet but unchanged at Rs. 17.50 per maund at Hapur during the week, superior quality prices eased by 50 nP per maund to Rs. 18.50, thanks to arrivals at an average of 100 maunds daily. These arrivals were mostly out of stocks supplied to cultivators for seed purposes by the Government seed stores. There were no purchases under the wheat levy scheme, as the Government purchasing price at Rs. 13 to Rs. 15 a maund were far below the prevailing market price.

Rice prices continued to be quiet, with inferior quality registering a modest decline following arrival of new paddy in heavy quantity. Harvesting of mungli is also being done and week-end prevailing prices of rice were: *selā basmati* Rs. 32 to Rs. 35 maund; *selā ramayayyan* Rs. 24.50, *gadda* Rs. 21.75 a maund.

Gram prices lost about 25 nP per maund during the week, as demand for seed purposes has subsided and local stocks were heavy at about 50,000 maunds. Barley and *bejhar* prices were depressed, as consumers had switched over their demand to maize, which is attracting good seasonal support. Maize prices, despite good demand, ruled quiet, as the maize crop was fairly heavy in this area. New *juar* and *barja* did not reach the market as yet. Prices of other coarse grains were also quiet. Today's rates (in rupees per maund) are: gram 12.75, barley 12.75, *bejhar* 11.50, maize 11.25 to 11.62, desi quality 12, *barja* 14, *juar* 12 to 14, *guwar* 11 to 13.

Pulses, too, experienced a downward trend during the week, as demand for peas and *arhar* was very poor. Peas lost about 50 nP per maund. Arrivals averaged at about 100 maunds daily and local stock is put at 43 khatties. Prices of *arhar* also ran down fractionally. Prices of other pulses mostly quiet and week-end prices (in rupees per maund) were: peas 11.11, *farm* white quality 12.25, *peas* 13.25, *arhar* 17, *arhar* 22 to 23, *urad* 17 to 18, *moong* 18 to 19, *masoor* 14.50 to 16.

FURTHER FALL IN COTTON

(From Our Own Correspondent)

BOMBAY, 28th October

Cotton futures suffered a sharp break during the week under review. The worsening of the Sino-Indian relations and bearish weather reports prompted fresh selling. Crop position improved following the emergence of clear and sunny weather. The pace of new crop arrivals showed that the damage to the crop due to recent floods and untimely rains was not as large as was earlier feared. Advices from the spot market indicated larger arrivals and slowing down of mill demand. The news that a plea for further liberalisation of imports will be put forward by the Cotton Advisory Board, when it meets on 3rd November, and that the Government might accept it, unnerved bulls. Under the pressure of heavy selling, the Jarilla March contract slumped from the opening level of the week of Rs. 716 to Rs. 707.50 on Saturday, the lowest for many weeks. The low level attracted some fresh buying and short-covering and values partially recovered in the second half of the week. Sentiment was also aided by the outlook for cotton which remained healthy.

I.C.C. Moglai Jarilla March 1960 opened the week at Rs. 716 and steadily declined to Rs. 707.50 on Saturday. It gradually recovered, on fresh support, to Rs. 713.25 yesterday. Commencing at Rs. 709 today, the contract rose to Rs. 710.50 before finishing lower at Rs. 708.25. The net loss over the week was Rs. 6.75.

In the spot section, demand slackened. Values receded further due to lack of support in the wake of larger new crop arrivals. Mills were keeping off the market in anticipation of a further fall in prices. Needy mills purchased new crop Vijay, Berar, Khandesh, Moglai, Old crop Rajpalayam, CO2, Kalyan, Laxmi and Wagad also found buyers.

Export interest did not show any material improvement. Prices of Bengal Deshi declined steadily, following heavy arrival of new crop. Estimates of new crop have been revised upwards to about 400,000 bales. Demand from Japan is likely to improve in the coming weeks, thanks to the fall in prices. Exchange allocation to Japanese importers is expected to be issued next month.

Demand for foreign cotton was well maintained. Sudan, Egyptian, East African, and American cotton found ready buyers. East African B.P. 52 was done at Rs. 1,190 c.i.f. Jan-Feb. shipment. Californian Acala G.M. 1-5/32" for November-December shipment changed hands at Rs. 1,170. Karnak T151 for December delivery was done at prices ranging from Rs. 1,540 to Rs. 1,550 per candy.

Allocations out of the recent import quotas already made are as follows: Of the quota of 140,000 bales stapling 1-3/16" and above, announced on 31st August, 40,000 bales continue to be reserved for needy mills. Of the balance of 100,000 bales, half has been allocated to non-actual-user mills and the other half would also be offered to them at a premium of 20 per cent. Any unabsorbed quantity will be allocated to regular users on consumption basis. A similar procedure is also being applied to the quota of 50,000 bales stapling 1-1/16" and above but below 1-3/16" announced on the 2nd inst. with any unabsorbed balance to be allocated to regular users on the basis of consumption. The 100,000 bales quota of stapling 1-3/16" and above, announced on the 2nd inst. for regular users, has already been distributed on consumption basis. The allotments against the 30,000 bales quota under the export incentive scheme for July-September are expected to be received by the eligible mills early next month.

Spinners are reported to be against the compulsory splitting up of retention quotas. It will be recalled that a trade notice issued by the Joint Chief Controller of Imports, Bombay, on the 6th inst., stated that, in distributing retention quotas against export entitlements for July-September 1959, half the value of the entitlement will be available for cotton of 1-3/16" and above and the other half for 1-1/16" and above but below 1-3/16". It was hitherto left to the exporting mills to choose the type of cotton they wanted. Mills are opposed to this compulsory split up for the following reasons:

(1) Since the retention quota itself is a small quantity, there is hardly any scope for a mill to place its production if the quota is given in two different staple lengths. This, it is said, amounts to denying the facility of retention and forcing the mills to resell the retention portion. (2) A large number of mills earning retention quotas are not equipped to process all types of long staple cotton. It is of no use to them to get cotton of a staple which they cannot process. (3) So far as retention quotas against exports of superfine cloth are concerned, the mills have already utilised cotton of 1-3/16" and above for producing cloth for export, and it is unfair to them if they get only half of their retention quota in that staple.

The following are the latest available spot quotations—in rupees per candy of 784 lbs.—from Sewri:

Bengal Deshi 625; Berar Jarilla 780; Gadag Laxmi 960; CO2 1,055; Surti 880.

Cotton futures values in Karachi moved up during the week under review. Prices improved on speculative support based on expectation of improved export demand. Domestic spinner demand was also good. N.T.R.G. January gained 6 to Rs. 64-6. March contract rose by a like amount to Rs. 64-10. In the spot section, there was brisk demand. The following are the latest available quotations—in rupees per maund of 82 lbs.—prevailing at Karachi:

Punjab Deshi 63; 4F Punjab Roller 71-10; S.G. 72-9; L.S.S. Punjab Roller 72-1; S.G. 73-1; N.T. Roller 75-1; S.G. 80-1; 289F Punjab Roller 78-1; S.G. 77-9.

Despite the prospects for improved demand for Egyptian cotton, the Alexandria cotton futures market ruled easy during the week under review. New

crop arrivals gathered momentum and this exerted a downward pressure on prices. Values were prevented from falling further by the sustained demand from Western Europe, especially U.K. and Germany. East European countries also showed interest. The following are the latest available quotations—in tallars per lb.—from Alexandria:

Karnak: November 70.80; January 71.47.
Ashmouni: October 62.90; December 61.05.

Steady conditions prevailed in the Liverpool cotton futures market during the week. Values moved narrowly in slow dealings characterised by inter-month switchings. A limited volume of long liquidation and hedge-selling was absorbing in mill fixation and commission house buying. Values, consequently, remained practically unchanged. The latest available quotations—in pence per lb.—from Liverpool are as under:

American cotton one inch staple contract: October-November 21.70; December-January 21.65; March-April 21.80; May 22.10.

American cotton mixed growth contract: October-November 21.95; December-January 22.00; March-April 22.25; May 22.25.

Sudan: November-December, January-February 29.00; May-June 28.75.

Dull conditions prevailed in the New York cotton futures market. Business was largely confined to small routine trade buying which absorbed limited hedge selling by Commission Houses and local traders. Movement of new crop gathered momentum and this was reflected in the price level which tended to look down. Encouraging reports from the textile market, however, imparted some strength to the market.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

	(In cents per lb.)	27-10-59	20-10-59	13-10-59
Spot	...	32.70	32.75	32.80
October	...	...	...	32.55
December	...	32.39	32.33	32.15
March	...	32.85	32.86	32.59
May	...	33.14	33.15	...

YARNS LISTLESS

(From Our Own Correspondent)

BOMBAY, 28th October

Yarn prices ruled generally easy during the week under review. With only a few days left for Diwali, there was a customary lull in business. Traders were busy settling their accounts. Fresh business done was, therefore, small. Values declined. Ready prices of art silk yarn came down on profit-taking in the wake of reduced demand, although futures managed to attract some support. Listless conditions prevailed in the cotton yarn section. Only selected counts met with enquiries. Price movements were irregular. Staple fibre yarns, however, proved an exception to the general trend. Prices ruled remarkably steady. Pre-Diwali sales by mills were not as large as was earlier anticipated while demand was better than was expected.

Cupressa Bamberg yarn (80 x 2) October contract was unchanged at Rs. 1.631 while the December contract improved by Rs. 5 over the week on speculative buying to Rs. 1.676. Prices of imported yarn receded, thanks to lack of demand. 120 Japan eased to Rs. 5.25. 150 Japan met with selling and dropped to Rs. 5.12. 150 Italy declined to Rs. 4.84, while 120 Italy scored 25 nP, on stray buying, to Rs. 5.12.

In the cotton yarn section, ten counts Podars were unchanged at Rs. 14.50. Twentys Moderns were in demand and the quotation rose by 50 nP to Rs. 20.50. Sixties Finlays, however, came under selling pressure and dropped one rupee to Rs. 63.

Staple fibre yarn (40 x 2) October contract met with buying. It was quoted Rs. 3 higher at Rs. 690, as against Rs. 682 last week-end. The December contract too was well favoured and gained a like amount to Rs. 692. Spot Kohinoor found buyers at Rs. 3.75, as against Rs. 3.72 quoted last week-end, while spot Citys climbed down to Rs. 3.75.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today as compared with those a week before.

	28-10-59	21-10-59
Art silk yarn—		
60/1 Cupressa Bamberg October (100 Kg.)	Rs. 1,631	Rs. 1,631
60/1 Cupressa Bamberg spot (per lb.)	7.44	7.41
120 Japan (per lb.)	5.25	5.40
150 Japan (per lb.)	5.12	5.20
120 Italy (per lb.)	4.84	4.97
150 Italy (per lb.)	4.84	5.12
Staple fibre yarn—		
40 x 2 October (per case of 500 lbs.)	690	692
40 x 2 December	692	694
40 x 2 Kohinoor (per lb.)	3.75	3.72
40 x 2 City	3.75	3.70
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	14.50	14.50
20s Modern	20.50	20.50
40s Minaxi	27.87	—
60s Finlay	63.00	64.00
80s Mahendra	78.50	78.50

SEEDS DOWN

(From Our Own Correspondent)

BOMBAY, 28th October

For the second week in succession, values in the oilseeds market suffered a serious setback during the week under review. This was due partly to larger arrivals and partly to a pronounced lull in the export front. Groundnuts and castor seeds reacted sharply. So also cottonseeds. Linseed was easy in the initial sessions; but at the close of the week it made a slight recovery, thanks to revival of some export prospects for flaxseed oil and oilcake.

The groundnut section was easy, particularly because of the pressure of arrivals of new crops. The manaspatil manufacturers and crushers were reluctant to extend support in a declining market. Foreign advices were not encouraging. Reports that the U.K. quotation for groundnut oil and oilcake receded further led to sizable drop in values. Groundnut February 1960 contract, which had wound up last week at Rs. 176.12, improved on Thursday to Rs. 176.25, but it subsequently gave way to close today at Rs. 173.50. Spot section was particularly hard hit. Saurashtra came in for heavy selling. Saurashtra Bold and Saurashtra Quality lost Rs. 2.25 each to Rs. 36.50 and Rs. 36.75, respectively. Oil ex-mill closed today, lower at Rs. 19.50, as against Rs. 20.50 last Wednesday. Railway receipts sagged by 87 nP to Rs. 19.25.

Heavy bull liquidation was in evidence in the castorseed section. The continuing uncertainty in the export business for castor oil, particularly exports to the U.S., dampened the activity in this section. There were hardly any sizable reports of export business with the U.K. or countries of the Continent. The perceptible weakness in the spot section also pushed down the values in the futures. Castorseed May 1960 contract reacted by Rs. 5.25 over the week to Rs. 158.75, after moving between Rs. 163 and Rs. 158.87. Madras small fell from Rs. 31.50 to Rs. 30.37. Ready Kanpur eased by Re. 1.25 to Rs. 29.25. Oil B.S.S. moved down by 37 nP to Rs. 17 and oil Commercial by 25 nP to Rs. 16.25.

The linseed section fared better than other seeds and oils. In the beginning of the week, linseed had moved down under the pressure of heavy offerings and lack of export business in oil. At the close of the week, there were reports of improvement in the export business for both oil and oilcake. This pushed up prices. Higher levels, however, led to some profit-taking. Linseed May 1960 contract, which had finished last week at Rs. 35.06, receded to Rs. 34.50 on Saturday. It improved once again to touch Rs. 35 yesterday. Today, it closed lower at Rs. 34.75 on a steady note. Bold ready came down by 50 nP to Rs. 34.62. Oil was lower by 25 nP at Rs. 17.

In sympathy with other seeds, cottonseeds gave way. The reaction in the raw cotton market also led to considerable selling. February contract closed at Rs. 123.50 today, as against Rs. 127.50 last Wednesday, after moving both ways between Rs. 127.75 and Rs. 125, over the week.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	28-10-1959	21-10-1959	14-10-1959
Groundnut			
February 1960	173.50	176.12	179.75
Bold ready	86.00	85.50	40.00
Coromandel ready	86.25	85.50	40.00
Khandesh ready	86.25	85.50	40.00
Oil ex-mill ready*	19.50	20.50	21.50
Railway receipts*	19.25	20.12	21.16
Castorseed			
May 1960	158.75	164.00	166.62
Ready Madras	30.37	31.50	32.00
Ready Kanpur	29.25	30.50	30.50
Oil B.S.S.	17.00	17.87	17.87
Oil commercial	16.25	16.50	17.00
Linseed			
May 1960	34.75	35.06	35.56
Bold ready	34.62	35.12	35.12
Oil ready*	17.00	17.25	17.60
Cotton seed			
February 1960	124.50	127.50	129.25
High seed	81.50	81.75	81.75
Kardi seed	28.00	28.00	28.25

* Rates include excise duty but exclude sales tax.
* Rates exclude both excise duty and sales tax.
* All quotations for futures contracts are in terms of candy, except linseed, which is in cwt. A candy is 560 lbs. except the case of cotton seed, for which it is 784 lbs. Spot quotations of seeds are for per cwt, and those for oil per quart.

PEPPER QUIET

(Messrs. Parekh and Co.)

BOMBAY, 28th October

Malabar black pepper ruled quiet during the week thanks to absence of foreign demand. The U.S. is reported to be interested in November-December-January delivery at about \$0.28. Ready garbled at Cochin ruled fairly steady at Rs. 139 as there was no selling pressure of old pepper, while heavy fluctuations were witnessed both in December and January delivery. Improvement in December and January, which took place after touching Rs. 129 in the last week, proved short-lived. After technical recovery from Rs. 129 to Rs. 133, December and January once again came down to Rs. 127. At the time of writing, however, the market showed some improvement, December and January having moved up to Rs. 129. Ready ungarbled is quoted at Rs. 800 while Calicut is nominally quoting at Rs. 825 but without sellers. The growers raise their selling price when there are foreign inquiries as the floating stock in the primary markets is small and that too, in strong hands. Arrivals of light berries are expanding but garbled quality new crop is not likely to come in the market before the second week of November.

Black pepper in Singapore is firmly held with no change in the prices but white is quoted at Str. \$175 in view of inquiries from Europe.

Spot in New York is reported steady at \$0.31. Dealers there are reported awaiting the crop movement in Malabar. They are said to be willing to pick up any low-priced offers for forward delivery. They expect good improvement and some lively fluctuation during the coming year sometime after the seasonal pressure is over, since production in other producing countries is reported disappointing.

Ready pepper in the local market is quoted between Rs. 95 and Rs. 102 per Bengal maund according to quality. Demand has failed to come up to the level generally expected during this time of the season.

DEMAND FOR TEA GOOD, BUT IRREGULAR

(Messrs. Forbes, Ewart and Figgis (Private) Ltd.)
COCHIN, 23rd October

Sale No. 40, held on 20th October 1959, comprised 1,257,500 lbs. The quality of teas offered in this sale was well maintained. The market met with good, but irregular, demand. Low mediums and mediums were 5 to 10 nP dearer, but all black leaf fannings suitable for the Middle East met with better support and were sometimes dearer by 25 nP. There was only limited enquiry for better liquoring descriptions which generally sold at lower rates than last. Whole leaf grades with improved quality were well contested for and were dearer, while others were easier. There was a useful demand for a small selection of tippy teas. The following are the quotations:—

	1959	1958
Low medium	1.80 to 1.90	1.55 to 1.65
Medium	1.90 to 2.20	1.70 to 1.85
Good medium	2.25 to 2.45	2.05 to 2.30
Quality	2.55 to 4.25	2.90 to 4.45

Dust Sale 'DD'—A quantity of 500,000 lbs. was offered in dust sale 'DD' held on 22nd October 1959. Quality of dusts offered in this sale showed a slight improvement. There was a good general demand and prices were steady for all descriptions. However, C.T.C. dusts met with poor support and were easier.

London Market: Sale of 19th October 1959.—Best Assams Brown Doonars and plain firm others irregular.

Sale of 20th October 1959.—Good demand with prices were changed in sellers' favour.

Sale of 21st October 1959.—Better tone with any changes in sellers' favour.

Colombo Market: Sale of 19th October 1959.—Strong general demand. Uvas lower following quality. Dimbula Dickoyas substantially dearer than last week's closing particularly B.O.P.F. Medium broken very strong. Better sorts up 10 cents, plain sorts up 20 cents. Lowgrowns strong firm to dealer.

Sale of 20th October 1959.—Offgrades strong general demand. About 15 to 20 cents dearer all round.

Calcutta Market: Export.—71,000 chests. Continued strong general demand for commons. Medium B.O.P.s easier, but improved competition for C.T.C.s particularly B.P.

Internal.—23,800 packages dust. Good demand. Orthodox up to 2 nP easier. Medium C.T.C. irregularly easier. Best C.T.C. steady.

Export Quota.—The market has been quite active and a fair amount of business has taken place at 2 1/2 nP. At present there are sellers at 2 1/2 nP with probable buyers at this rate.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd., wire as follows:

"Sale 41.—1,250,000 lbs. Good general demand. Low medium broken irregularly 5 nP easier, but fannings firm. Medium and good medium fully firm. Highgrown broken considerably easier, but similar fannings dearer. Whole leaf irregular."

LINSEED DECLINES

(Messrs. A. Bradley & Co.)

CALCUTTA, 26th October

After the firmness of the previous week, there has been some reaction in the market and prices have declined gradually with small losses recorded in all sections. Enquiries from crushers have continued, but interest has been mainly at lower levels and the weekly turnover, although regular, has been small.

There has been a decline of about Re. 1 in oilcake prices with sellers quoting Rs. 18 and a very poor local offake. Shippers have not been interested above Rs. 15, owing to a decline in U.K. prices to £38.

Activity in the oil market has been rather limited. Overseas prices have been nominally quoted at £115, but little fresh business has been reported. Local shippers have shown very little interest. The latest quotations are as follows:—Ready October Rs. 25.62, November December Rs. 25.75 and May futures Rs. 23.84 per maund.

GUR FIRM

(From Our Own Correspondent)

HAPUR, 26th October

Sugar prices continued steady during the past week. The Government of India is anxious to allow a monetary incentive for starting the crush ing season in early November, prices of cane supplied to factories have also been enhanced for Re. 1.44 to Re. 1.62 per maund for delivery at the gate of the factory and from Re. 1.31 to Re. 1.5 for delivery at purchasing centre for 1959-60 season. A rebate of 50 per cent. in the basic excise duty has also been promised on all sugar produced during 1959-60 in excess of their average production in 1957-58 and 1958-59. Ex-factory controlled sugar price of D-39 has also been increased from Rs. 36 to Rs. 37.85 per maund in U.P. and North Bihar and from Rs. 36.50 to Rs. 38.50 a maund in the Punjab. The reactions to the new announcement are yet to be watched. Sugar prices here are steady at Rs. 131 per bag in the open market and in retail at Rs. 1.25 per seer.

Khandasari prices continued steady, due to brisk demand for Diwali in the form of Boora and Kilohamans. Power-driven crusher owners have been asked to stop crushing and not to resume till they secure a licence. The latest Government policy is not to allow any new licence for new crushers, but licences of all those who had deposited fees before 31st March 1959 will be renewed in the near future. The latest prevailing prices of Khandasari are: inferior Rs. 40 to Rs. 48, superior upto Rs. 52, Boora Rs. 48 to Rs. 52 a maund.

Although new gur prices declined by about Rs. 2 per maund during the week, prices are still steady due to good outside demand. Pressure of new gur arrivals is being felt in the market. Balti quality being much in request from Saurashtra, is quoted about Rs. 3 higher than pansera quality, at Rs. 27 per maund. Daily arrivals have mounted to an average of 3,000 maunds here and the entire arrivals are being lifted for consuming areas. The latest prevailing prices are:—pansera best Rs. 24, dara Rs. 22 to Rs. 23, shakker Rs. 24.25, balti Rs. 26.50 to Rs. 27 a maund.

Ready gur prices eased by about Rs. 2 to Rs. 2.50 per maund during the week in the Muzaffarnagar market, where too arrivals are rising. Demand for shakker is keen from Rajasthan and prevailing prices are:—gur pansera Rs. 23, chaku Rs. 24.50, shakker Rs. 25 to Rs. 27 a maund.

Following the announcement of increase in cane prices, gur fagun prices registered a sharp advance from Rs. 15.29 to Rs. 15.58; it is quoted today at Rs. 15.44.

Notice

JARDINE HENDERSON, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Thirteenth Annual General Meeting of the Members will be held at the Registered Office of the Company, No. 4, Clive Row, Calcutta-1, on Thursday the 26th November, 1959, at 11 a.m., for the following purposes:—

- To receive and consider the Audited Accounts for the year ended 31st March, 1959, the Balance Sheet as at that date and the Reports of the Board of Directors and the Auditors thereon.
- To confirm the Dividends already paid on the Preference Shares and to declare a Dividend on the Ordinary Shares of the Company.
- To appoint Directors in place of those retiring and in this connection to consider and, if thought fit, to pass the following resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company, viz.:—
"That pursuant to the provisions of Section 281 of the Companies Act, 1956, Sir Asoka Kumar Roy, who has attained the age of 73 years and who retires from the Board by rotation, be and is hereby re-appointed a Director of the Company and it is hereby specifically declared that the age limit for directors prescribed by Section 280 of the said Act shall not apply to him."
- To appoint Auditors and to fix their remuneration.
- To consider and, if thought fit, to pass the following resolution which will be proposed as a Special Resolution, viz.:—
"That pursuant to the provisions of Section 314 of the Companies Act, 1956, consent be and the same is hereby accorded to Mr. Surendralal Girdharilal Mehta, a relative of Mr. Girdharilal Mehta, a Managing Director of the Company, holding an office or place of profit as an Assistant to the Company on such terms as to remuneration or otherwise as have been or may be agreed from time to time between such Assistant and the Company."

Notice is also given that the Transfer Books of the Ordinary Shares of the Company will be closed from the 12th November to the 26th November, 1959, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member of the Company.

By Order of the Board,
D. FORDWOOD,
Secretary.

4, CLIVE ROW,
CALCUTTA-1, 26th October, 1959.

Note.—An Explanatory Statement is annexed to the Convening Notice issued to Members.

THE JAY ENGINEERING WORKS LTD.

EXPORTS ALMOST DOUBLED

LALA SHRI RAM REVIEWS PROGRESS

ADDRESSING the shareholders of The Jay Engineering Works Ltd., at its Twenty-second Annual General Meeting held on 23rd October 1959, Lala Shri Ram, Chairman of the Company, said:

"LADIES AND GENTLEMEN,

"The balance-sheet and profit and loss accounts and the Directors' report have been in your hands for some time and these with your permission I will take as read.

"The comparative figures of sales, etc., between the year ended 31st March 1958 and the year ending 31st March 1959, are:

	For the year ending	31-3-1958	31-3-1959
Sales	...	Rs. 4,71,60,120	5,33,24,107
Profit before providing for income-tax	...	Rs. 38,52,326	44,22,192
No. of sewing machines made	...	1,57,945	1,97,126
No. of fans made	...	1,99,073	2,70,807
No. of schools	...	386	547
No. of students	...	30,000	40,000

"These show an all-round improvement.

"I told you last year that we have got arrangements for the sale of our sewing machines and fans at 1,200 places. The arrangement now is at 1,500 places.

Exports Up

"Although we are having stiff competition from Japan, and other countries in exporting our sewing machines and fans, you will be glad to know that our exports up to 31st March 1959, were of the value of Rs. 45,10,776, as compared with Rs. 24,96,270 up to the year ended 31st March 1958, in other words, an increase of over 80 per cent.

"I told you last year that our agents had started showrooms in Singapore and in Bangkok. Both the places, I am glad to say, are doing well. They have also opened new showrooms and offices at Kuala Lumpur and Penang and I hope our sales in those countries, too, will increase much more.

"I take this opportunity of conveying our appreciation of the work done by our staff, in particular Shri Ravindranath, who go out of India to study foreign markets and their needs, and popularise our goods there.

Fan Factory

"During the year, we have been able to produce in the fan factory, air circulators of good quality and performance, and hope this will be a good additional line of our products. The prototypes for exhaust fans are also ready, and we will be able to put them in the market early next year, if not in the current year.

"I am sorry to say that, due to various difficulties, the production of the Zig Zag machines has not been taken in hand. Our staff have been kept busy with the designing and producing the new type of streamlined machines specially for the American market. The first lot of the machines will be despatched by the end of this month, and we hope that they will give satisfaction to our buyers. Once we produce an article to the liking of our American friends, we hope good business would be possible in that country.

"I told you last year how, in a very few years, we brought down the price of our machines from Rs. 220 to Rs. 160 in three stages, but now we find it very difficult to reduce the price any further.

"The high price of foodstuffs, and all the other articles of consumption of the lower middle class, leave very little margin with the poor and middle class housewives, who are

our biggest customers, to be able to buy sewing machines, although these machines help the tailors and poor middle class families in earning their livelihood.

"After all, sewing machines would only be used if there is cloth to sew. In 1950, the cloth consumption per capita was 9.7 yards, in 1951 11.7 yards, in 1952 14.4 yards, in 1953 and 1954 15 yards, in 1955 15.8 yards, in 1956 16.1 yards; since then, it is approximately 16.2 yards per annum for 1957 and 1958. So long as consumption of cloth was going up, our sale of sewing machines was also going up. Now that cloth consumption has become static, so has become the sale of machines and we are finding a little buyers' resistance, which can be well appreciated.

"I told you last year that a beginning has been made in selling machines on hire-purchase system and this is gradually but slowly catching.

"Last year, we held an All-India Sewing and Embroidery Exhibition at Calcutta. Since then, one more was held at Madras which was opened by the Chief Minister, Shri Kamraj Nadar. And another was held in Colombo; this was opened by Mrs. Bandaranaike, the wife of the then Prime Minister of Ceylon. In both places, literally thousands of people saw the exhibition every day, and it has helped a good deal in popularising our machines.

Capacity to Buy

"There is one other point which I made some years back when speaking to you. After all, the people in a country can buy things, made in the country by the people, whose remuneration has some relation with the per capita income of that country. While in 1952 the industrial workers in India got 419 per cent. of the per capita income, it has gone up to 448 per cent. in 1957. On the other hand, in France, it has come down from 116 per cent. in 1952 to 110 per cent. in 1957. In Japan, it was 263 per cent. in 1952 and 255 per cent. in 1957, and, after all, Japan is the country who is our biggest competitor. It will not be out of place to say that, even in 1952, the percentage of wages of an industrial worker in India was almost twice as high as the highest in any country in the world. In 1952, the lowest in France was 116 per cent. of the per capita income and 263 per cent. the highest in Japan, whereas in India the corresponding figure was 419 per cent. of the per capita income. It is also well known that the per hour output in India is lower than in all industrially advanced countries. These figures do not include in our case either the heavy losses we suffer in the food we provide to our workers or the provident fund amount or the payment for the State insurance, etc. The loss on a meal has gone up from 37 naye paise in 1952 to 62 naye paise in 1959 and over 50,000 meals are supplied in a month. The loss, which was less than Rs. 7,000 per mensem, has gone upto almost Rs. 36,000 per month.

An Uphill Task

"Every effort is being made to bring down the cost of production, without affecting the income of the workers, on the one hand, and the quality of the machines, on the other, but it is an uphill task, and while in the past I have always been optimistic, I am sorry to say that, with the buyers' resistance, the high cost of labour and food, etc., I am not sure whether we will be able to sell all our products even at the present low price; and, as I have told you, it is not possible for us to reduce the price further. If, unfortunately, we are compelled to do it, it will certainly affect very highly the limited profits that we have made this year.

in almost every country, whether it be a large producer or small producer. Even in America there is tariff protection. It is felt that in India also this industry may have to seek continuous tariff protection for a long period to come.

"For future development of this industry in India some raw materials like petroleum coke for electrodes and cryolite for electrolytic process are required. Petroleum coke is only available from the oil refinery at Dgbol, but the quantity is not sufficient and the inland carrying cost is high. The new refineries are not using this process and it is necessary that the Government should pay attention to the necessity of production of petroleum coke in the new refineries as a by-product. As far as cryolite is concerned, at the moment it is mostly imported from Greenland. It is necessary to pay attention for manufacture of synthetic cryolite in India. Commercial production of aluminium depends on cryolite, and dependence of the industry on such imports is not always desirable.

"Due to the expanding economy of the country, the price indices have risen and thereby wages have also been necessarily increased. But there is real danger of these wages getting out of proportion to the income of majority of people in India who are either unemployed or under-employed. It is well to remember that the number of industrial workers total only about 7 million out of the total labour force of 154 million in our country. The majority, therefore, are dependent on agricultural income, which is much lower as compared to that of the industrial workers. Such disparity is leading to a vast influx of persons from villages to the cities creating tremendous problems of housing and amenities, apart from unbalanced increased employment load on industries. The solution lies on the betterment of agricultural income and this can be achieved when crop yield per acre goes high. For such high crop yield, more irrigation, more fertilisers and more insecticides have to be provided. This means developing more balancing industries and thus the problem assumes a vicious circle.

Better Facilities Needed

"Therefore, rapid industrialisation also assumes great importance. To facilitate quicker industrialisation in the country and to achieve better and balanced economical conditions and employment, *entrepreneurs* should be accorded better facilities and the procedure for disposal by Government should be more flexible. At present, industrialisation is dependent on the import of necessary equipments from foreign countries. Due to foreign exchange shortage the import of equipments has to be arranged either against loan in foreign countries or against deferred terms of payment from suppliers of equipment. The agencies from whom such loans can be secured are either in the United States of America, like the Export-Import Bank, etc., or in different continental countries who have accorded to India foreign exchange credit, or the different suppliers direct. Whenever help is taken from the Export-Import Bank of America, the plants have to be purchased in the U.S.A. Looking to the smaller size of the requirement of the plants in India in comparison with the U.S.A., in most of the cases, the plants purchased in the U.S.A. cost more than the plants purchased from the continent, and India has to pay this higher price along with high technical collaboration fee for developing such industries or in case of foreign collaboration profits have to be remitted for all time to come.

"In the Continent and other places outside U.S.A. where plant requirements are similar to our requirements, the price of such equipments is lower, but the equipment has to be imported on deferred terms of payment which requires guarantee from suitable institutions in India for the credit extended. Therefore, the whole process of piloting the scheme, viz., obtaining essentiality certificate from Government, fulfilling and negotiating formalities for obtaining bank guarantee and final acceptance are subject to too much delay, thus rendering implementation of the scheme impracticable specially by new *entrepreneurs*. I wish to make a suggestion that suitable procedure be worked out for approving without much delay the scheme for expansion or for setting up a new plant after examination of its soundness, financial as well as technical, so that the necessary guarantee is available as early as possible.

"Especially in a transitory period as the one through which we are passing, the problems have to be handled in a very balanced way, so that while there is an all-round economic equilibrium, there is also a rising economy for the progress of the nation."

MANCHESTER LETTER

(Concluded from page 729)

These show that, in every case except cotton waste yarn, output in Lancashire was higher than in the corresponding month last year and that, despite the holiday season, the industry itself was fully reflecting the sharp increase in demand which had already been proceeding for several months.

The total manpower figure for those on the books of employers has now fallen below 200,000 for the first time for many years past. Historians had to delve into their records to find a comparable position, which took them back far into the nineteenth century. The rate of decline in the labour force, however, has been sharply curtailed for most of the current year. The actual reduction in the number of employees in spinning, doubling and weaving during August was exactly 501, which compares with a fall of 3,500 in the same month in 1958.—All Rights Reserved.

COMMERCE AND INDUSTRY

(Concluded from page 740)

and medium scale, apart from the possibilities of co-operation with large industrial concerns. As business contracts between the two countries are being intensified, Indian businessmen will become increasingly aware of the vast variety of products in which Austrian firms can offer technical know-how and deliver the necessary equipment (and, for the initial stage, parts for assembling in India) at reasonable terms.

It must be pointed out, however, that, while some Austrian firms might be interested in investments in India, Austria is not in a position to accept payment in non-convertible rupees for her goods.

It is hoped that the volume of Indo-Austrian trade which has recently been subject to a certain setback due to import restrictions by India will find new ways of expansion and will thus reflect the very warm and cordial relations which happily exist between the two countries at both political and cultural levels.

PAPER INDUSTRY

The paper industry has been making steady progress during the last few years. The production of paper and paperboard amounted to 106,300 tons during the first five months of the current year, or an annual rate of 255,130 tons, as against 233,011 tons in 1958 and 210,126 tons in 1957. Besides, mills have started manufacturing such specialised superior quality paper as high gloss poster paper, superior varieties of bank and bond and off-set papers, brush coated art paper, vulcanised fibre sheets and butter and greaseproof paper. What is more, the paper industry has been able to utilise not less than 92 per cent. of the installed capacity. Three new units, namely, the West Coast Paper Mills, Dandeli, Mysore; the Western India Match Company, Calcutta, and the Padumjee Paper Mills, Kharpholi, have recently gone into production. Mr. Hariprasad Singh, in his presidential address at the 17th annual general meeting of the Indian Paper Mills' Association, held on the 26th inst., in Bombay, felt confident that, at the present rate of expansion, the paper industry would be able to attain the production target of 350,000 tons, laid down in the second Plan to be reached by 1960-61.

The consumption of paper has been going up in this country, thanks to growth of industrialisation as well as literacy, and rise in general standard of living. The per capita consumption of paper at present in India is, however, no more than 2 lbs., as compared with 42.4 lbs. in the U.S. and 183 lbs. in the U.K. There is every likelihood that consumption of paper in India will go up appreciably in the coming years. Apart from civilian consumption, off-take of paper by Government departments has also increased. The fact remains that despite the lower levels of paper consumption in India, scarcity conditions continue to prevail. Viewed against this background, Mr. Singh's plea to lay down production target of 700,000 tons for the third Plan seems quite justified. In order to attain this objective he considered it necessary to step up installed capacity to 900,000 tons during the third Plan period. Even though licences had been issued to bring up the capacity to 555,000 tons by 1960-61, he anticipated a short-fall of approximately 90,000 tons in the installed capacity of 450,000 tons to be achieved by the end of the second Plan period, owing to the difficulties in the procurement of plant and machinery as a result of restrictions. It was, therefore, essential to install capacity to the tune of over 540,000 tons during the third Plan. Mr. Singh was of the opinion that, unless this additional capacity was installed, scarcity conditions would prevail, and development and educational plans would suffer.

Mr. Singh, however, was not in favour of setting up small units with a capacity of 5 to 10 tons for raising production of paper. Such small units, he observed, would not be integrated plants, since they did not have any pulp plant attached to them. Even now, many of the mills had to import part of their requirements of pulp from abroad. He pointed out that the supply of waste

paper also was not sufficient to meet the requirements of the existing paper mills. He, therefore, felt that the development of small units would necessitate much larger imports of pulp, causing considerable drain on foreign exchange.

Drawing attention to the difficult position of raw material supplies, Mr. Singh observed that Government had not made much headway in formulating a uniform and co-ordinated forest policy, as recommended by the Planning Commission to ensure continued supply of raw materials to the industry at reasonable rates. He, therefore, urged the Central Government to prevail upon the State Governments concerned to lease out forest areas for longer periods and implement the recommendations of the Planning Commission in that regard. He also wanted that the D.G.S. and D. as in the case of purchases of Government requirements of paper, should collect from the various Government departments waste papers arising out of office sweepings and weeding of records and offer the same to the paper mills, at a price to be negotiated mutually by the Government and the mills.

MARKET GOSSIP

(Concluded from page 719)

head expenses. This is more a marriage of convenience than one prompted by desire for mergers.

Smaller airlines cannot remain unaffected by this trend. They too have begun to think along similar lines. For instance, a move is afoot to establish a joint airline, called the United Arab Air Company, by five Arab States, namely, the U.A.R., Jordan, Saudi Arabia, Iraq and Lebanon. In spite of their deep political differences, representatives of these States recently met in Beirut for preparing the way for the formation of the Company. The meeting was sponsored by the Arab League. The main consideration underlying this proposal is that, with the advent of jet aircraft in civil aviation and the prospect of the main European airlines merging or adopting joint policies, some form of merger of the airlines in Arab countries, too, is called for.

Lebanon, which is one of the foremost advocates of the United Arab Air Company, has suggested that each contracting Arab country should assign one of its national companies or a federation of its national companies to take part in the proposed Company which would operate long-distance flights on a co-operative basis. The United Arab Air Company, it is further suggested, need not have a legal personality independent of the companies from which it is formed. Member-companies could be subject to the laws of their own country. But the contracting parties would undertake to unify legislation affecting the air companies, especially laws and regulations covering customs, municipal tax, income-tax, exemptions, etc. The proposal is still in a nebulous stage and it will take some time before anything concrete comes out of it.

Fertiliser Plant at Neyveli

A big step forward in the realisation of the scheme for an integrated lignite project at Neyveli (South Arcot, Madras State) was taken this week when an agreement was signed (on the 27th inst.) between the Neyveli Lignite Corporation and the representatives of two Italian and two German firms for setting up a Rs. 25-crore fertiliser plant at Neyveli. This agreement followed several weeks of negotiations between the Corporation and the representatives of the foreign firms. The production capacity of the plant will be 152,000 tons of urea per annum. The plant was originally expected to go into production by the end of 1960, but it is now anticipated that the erection of the plant would commence in about 16 months from now and production would commence at the end of 1962.

The two Italian firms are Ansaldo, a famous building and engineering concern of Genoa, and Montecatini, a leading engineering firm in chemicals, fertilisers, dyestuffs, plastic and aluminium. The two German firms are Hulschemann and Linde. The Italian firm of Ansaldo has contracted for the design, fabrication of equipment, erection and starting of the five sections, namely, ammonia, urea, process steam, electrical installation and off-site facilities. Montecatini will supply its technical process—total recycle process—for the production of urea utilising 800,000 tons of lignite. The whole project will be technically co-ordinated by Montecatini with the two German firms. The latter two firms have signed the agreement for the production of synthesis gas to feed the ammonia plant and will supply the equipment for the manufacture of ammonia, urea and process steam.

The two Italian firms, of which Ansaldo will be paid about \$22 million (Rs. 10.45 crores) by the Lignite Corporation in Italian lire, the major portion of which will be by deferred payment, have undertaken the necessary technical supervision for the erection and operation of the plant. For this purpose, they will send to India about 200 technicians. They have also undertaken to train Indian technical personnel both in India and in their factories in Italy.

When completed, the urea plant will, it is claimed, be the largest in the world. The estimated lignite production at Neyveli is 3.5 million tons, a part of which will be utilised to produce 250 m.w. of thermal power, 152,000 tons of urea with a nitrogen content of 72,000 tons, carbonised briquettes, and other valuable by-products like tar, phenol, motor spirit and char dust. It is planned to utilise the chinaclay obtained to manufacture refractory bricks, sanitary and domestic ware and electric insulators.

VOL. XCIX. No. 2537

BOMBAY, 7th NOVEMBER 1959

PRICE : Rs. 2

G.A.T.T. SESSION AT TOKYO

THE outcome of the fifteenth session of the General Agreement on Tariffs and Trade (G.A.T.T.), held at Tokyo from 27th to 29th October 1959, is not as disappointing as some commentators in this country have made out. It is true that no specific concessions have been offered by the developed countries to underdeveloped countries, but it must be noted that none was expected. The Tokyo session was not meant for negotiating either tariff or quota concessions. It was mainly intended for securing a general understanding at Ministerial level of the measures necessary for solving some of the problems currently confronting international trade. This purpose was well served. There was thus a frank discussion of trade problems and the member-countries were in an accommodating and co-operative mood. The official *communiqué* issued at the end of the session makes encouraging reading, as it reveals bright prospects for gainful international co-operation, albeit in the free world.

There are four major problems connected with international trade. One is the continuing adverse balance and terms of trade of underdeveloped countries. Another is the growing tendency among the developed countries to place restraints on the imports of simple manufactured or semi-processed goods from the developing countries. The third springs from regional economic groupings, such as the Common Market of six Continental countries, the proposed Little Free Trade Area in Western Europe and the move to form a common market of Latin American countries; the repercussions of such economic blocs on world trade constitute a big problem. And the fourth is the balance of payments difficulties of the U.S., the keystone of free world economy. All the four issues figured at the latest G.A.T.T. session and the Ministers of participating countries were agreed that they should be tackled promptly and realistically. There is good reason to feel that the general agreement reached by them will pave the way for securing positive results at the next round of negotiations due to begin in 1960 for initiating specific measures for the expansion of trade.

The persistence of a substantial deficit in the U.S. international accounts, accompanied by a steady improvement in the balance of payments and reserve positions of the other major developed countries, has led to a new situation in world trade. The U.S. had a deficit of \$3,400 million in 1958; this is expected to be in the neighbourhood of \$4,000 million this year. The reverse side of this coin is provided by a corresponding rise in the gold and liquid dollar assets held by Western Europe, Japan and some of the Latin American nations. Because of this change in its fortunes, the U.S. Government proposes to reduce its foreign economic and military aid programmes. As this move will hit the developing countries further, the U.S. difficulties have a close bearing on their development efforts. They have, therefore, a vital interest in seeing that prompt steps are taken to minimise the drain on U.S. gold reserves. It will be of little help to them if they merely say that the U.S. must continue its economic assistance to them whatever may be its difficulties. The U.S. Government is strongly of the view that the time is propitious for the other industrialised countries to end all the remaining discriminatory restrictions on the imports of goods from the U.S. and other countries. In making this plea, the U.S. has the support of the I.M.F. and other underdeveloped countries as well. On the eve of the G.A.T.T. session, the Executive Directors of the I.M.F. unanimously adopted the following resolution and com-

municated it to the G.A.T.T. and member-countries:

"In some countries, considerable progress has already been made towards the elimination of discriminatory restrictions; in others, much remains to be done. Recent international financial developments have established an environment favourable to the elimination of discrimination for balance of payments reasons. There has been a substantial improvement in the reserve positions of the industrial countries, in particular, and widespread moves to external convertibility have taken place. In these circumstances, the Fund considers that there is no longer any balance of payments justification for discrimination by members whose current receipts are largely in externally convertible currencies. However, the Fund recognises that, where such discriminatory restrictions have been long maintained, a reasonable amount of time may be needed fully to eliminate them. But this time should be short and members will be expected to proceed with all feasible speed in eliminating discrimination against member-countries, including that arising from bilateralism.

"Notwithstanding the extensive moves toward convertibility, a substantial portion of the current receipts of some countries is still subject to limitations on convertibility, particularly in payments relations with State-trading countries. In the case of these countries, the Fund will be prepared to consider whether balance of payments considerations would justify the maintenance of some degree of discrimination, although not as between countries, having externally convertible currencies."

This appeal has gone home. The Ministers who attended the G.A.T.T. session have literally accepted the foregoing resolution. The U.K. has already abolished the restrictions on foreign travel and France has relaxed them. Reports from London suggest that the West European Governments are making preparations for an early end of discriminatory restrictions.

Welcome as these developments are, they cannot, by themselves, solve the imbalance in the U.S. payments situation. There is a lot that the U.S. itself has to do. It has to set its house in order. In saying this, we are fully aware of the fact that the U.S. Government has been trying to balance its national budget, with

a view to achieving financial stability. But the U.S. economy needs something more than this. The prices of its plant and machinery must be brought down. It is paying a heavy price for securing industrial peace. Its method of settling industrial disputes is outmoded. To allow the strike in the steel industry to run for nearly four months, resulting in heavy losses to the nation as a whole, is to make a fetish of respect for free enterprise and workers' rights and liberties. It seems ridiculous to us that a country, which is faced with a balance of payments deficit of \$4,000 million (about Rs. 2,000 crores), should permit a million of its highly productive workers to remain idle for as many as 113 days and there is still no prospect of this pernicious strike coming to an early end. The direct and indirect losses of this strike are stated to have already reached the staggering figure of \$7,000 million (about Rs. 3,500 crores). Surely, a little bit of compulsory arbitration for bringing to an end this crippling strike will do no harm to democracy. After all, the steel workers in the U.S. are the wealthiest among the industrial workers in the whole world. Their incomes are high enough to lead a comfortable life. No amount of liberalisation of restrictions on imports of American goods will solve the balance of payments difficulties of the U.S. if it loses seven billion dollars worth of goods and services. It is surprising that no delegate made this point at the G.A.T.T. session last week.

Economic integration of West European countries is a natural movement, based on political and social considerations. It is only a question of time before Britain and the six other countries that are now out of the Common Market join the latter. The ultimate aim of the proposed Little Free Trade Area, as we all know, is to bring about one market of all the thirteen O.E.E.C. countries. A similar move in Latin America is also understandable. The underdeveloped countries in Asia cannot prevent these moves, but they will be perfectly justified in demanding that such economic unions should not place their legitimate trade at a disadvantage through discriminatory tariff, fiscal and import control measures. It is gratifying to be told that all the Ministers at the G.A.T.T. meeting agreed that "such groupings should take full account of the trade interests of other countries and to pursue outward looking policies in accordance with the principles and objectives of the General Agreement." This understanding will, however, have no value, if it is not followed in actual practice. The G.A.T.T. Secretariat must, therefore, be strengthened suitably to keep a permanent watch over the working of these economic blocs. India, in particular, will do well to take special steps for bringing to light promptly any discriminatory practices that may be followed by the Common Market countries, for instance, and seek redress against them through the G.A.T.T. or the appropriate machinery in the C.M. It is necessary to make this point, as, recently, France was seen bringing pressure on West Germany to buy its requirements of raw materials from the French overseas territories in preference to sources outside the C.M.

The need for adoption of positive measures by the developed countries for expanding the export trade of underdeveloped countries was forcefully stressed by Mr. Nityanand Kanungo, India's Minister for Commerce. He wanted the developed countries, very rightly, of course, to reduce (a) the taxes on consumption of goods originating from the less developed areas and (b) the high tariffs and other restrictions on imports of semi-processed and processed goods from these areas. One of the grounds on which some of the former countries seek to restrain the arrival of manufactured and partially manufactured goods is that they are the product of cheap labour. This argument is not tenable, because the unit cost of wages of goods produced

by the underdeveloped countries is not that low, since the productivity of their workers is not as high as that of workers in developed countries. While the underdeveloped countries have more labour, the developed countries have more machinery, highly automatic ones at that, and all the advantages arising from the tremendous lead in modern industrialisation. Again, the economies of developed countries are in a strong position; their living standards are incomparably high; and they have full employment. They can, therefore, afford to let the manufactured goods from the developing countries come in freely. If these goods are cheaper than their domestic manufactures, it is invariably due to the advantage of proximity to raw materials and others rather than cheap labour.

Another point that requires to be borne in mind, in this connection, is that, as industrialisation of underdeveloped countries proceeds, some of them, as, for instance, India, will have less of raw materials and more of manufactured goods for export. Unless the developed countries are prepared to make room for some of these goods, the problem of repaying the loans taken from them for economic development will become practically insoluble. The Western countries will, therefore, do well to make a beginning from now onwards with the readjustment of their economies suitably. Since they have no problem of unemployment now, nor are they likely to have it for a good many years to come, and since there is unlimited scope for their capital both within and outside, such an adjustment will not be painful. The G.A.T.T. *communiqué* says that "a suggestion was made during the course of discussion that this is a problem which might be usefully studied by a panel of experts to be designated by the Contracting Parties." It, however, does not say what happened to this suggestion, whether it was accepted or rejected. It is to be hoped that it was accepted and that the G.A.T.T. will soon initiate an expert study of this problem.

Agreeing with the view that the present climate of international trade was favourable to press on with the G.A.T.T. programme for trade expansion, the Ministers at the Tokyo session decided: (a) arrangements for the 1960-61 tariff conference should be rapidly completed, due account being taken of the suggestions put forward in the course of the discussion; (b) the examination of the ways and means of expanding international trade in agricultural products and of reducing agricultural protectionism should be energetically pursued; and (c) the search for practical steps to help the less developed countries to increase their export earnings should be intensified. All these three decisions are important and require to be implemented with vigour and promptness. Meanwhile, the underdeveloped countries, most of which have socialist Governments with doctrinaire ideas, must follow realistic policies designed to raise the efficiency of their agricultural and industrial production, so that their goods can be competitive in price and quality, without necessarily having to reduce the income of producers. They have also to reconcile judiciously their need for revenue through import and export duties with the need for selling their goods in a buyers' market. Failure to do so has often cost India many valuable export markets and encouraged its competitors to grow. The developed countries, too, must see to it that their prices for domestic consumption and exports are substantially brought down. This will benefit the underdeveloped countries in two ways; their exports will expand; at the same time, their imports will cost less.

PROBLEMS OF POLICY-MAKING

MANY external observers and not a few Indian spectators of the country's economic scene have often wondered as to where lies the chief source from which policy decisions emanate. In any democratic country, the Government is the source from which all economic policies emanate, the ruling party having made its intention clear in advance before its assumption of power. The situation in India is somewhat different. There are at least four authorities, with ill-defined functions and powers, each making its contribution to the determination of economic policy—the Central and State Governments, the Party in office, the Planning Commission and the National Development Council. It may not be far wrong to state that to these groups of authorities must be added the powerful personality of the Prime Minister himself; although he has often striven to find a compromise between two conflicting points of view, it is known that a view opposed to his seldom gets the hearing it deserves even in the uncertain event of its being expressed. Not always do these sets of authorities think alike, nor does

the authority whose views are the best and most practicable carry the day. Since these authorities do not always meet at one and the same time, and each of them has its own way of looking at problems, the result of their individual endeavour is a certain blurring of Ministerial responsibility, a confusion of aims, a certain demoralisation in the Secretariat and considerable loss of administrative competence.

In recent months, there has been some reappraisal of the roles of these different authorities. It has been held that the Congress High Command often takes snap decisions, the implementation of which then becomes a matter of Party prestige for the Ministers. Since the Party's decisions are seldom taken in the light of administrative experience, they give rise to inconvenient problems for the executive. Apart from the fact that these decisions are taken on purely theoretical and doctrinaire grounds, the criticism has been made that the individual member of the ruling Party cannot always resist the temptation of interfering in the day-to-day administration at local levels. Presumably, they feel that they must function as supervisors charged with the responsibility of ensuring that Party decisions are effectively implemented. This is an additional source of confusion, besides being a wholly undemocratic practice. The chief element of danger, however, lies in the unsatisfactory manner in which far-reaching issues, beyond the knowledge and experience of the rank and file of the political Party, are debated and decisions reached on the basis of imperfect examination of issues. Because the ruling Party today holds power both at the Centre and in the States, it must show a much higher sense of national responsibility than it has shown on certain occasions when profound decisions, affecting the lives and fortunes of millions of people, have been taken with scant regard for their consequences. Whether the issue is socialist pattern of society or ceiling on land or State trading in foodgrains, the decision is reached in less than a day's discussion by members who have frequently not had any opportunity of understanding the sense of the constituencies which they represent. It is this circumstance that justifies the criticism that, in India, policy matters tend to be imposed by the Party executive and do not reflect the considered views of the rank and file of the Party. And, invariably, the Party executive is a one-man affair.

Next in importance to the Congress High Command, and in some cases, even going beyond it, are the two bodies—the Planning Commission and the National Development Council. The precise relationship of these two bodies to the Central and State Governments has never been properly defined. And yet, they loom so large in Governmental decisions that they have earned the distinction or opprobrium of being called super-cabinets. Established in 1950, the Planning Commission, with the Prime Minister as its Chairman, is mainly charged with the responsibility of formulating a plan for the most effective and balanced utilisation of the country's resources, of examining from time to time the progress achieved in the execution of each stage of the Plan and of recommending the adjustment of policy and measures that such appraisal might warrant. There is no doubt the Commission has played a very significant role in the country's economic development. Indeed, it would be difficult to conceive present-day India without its Planning Commission. By and large, no comprehensive planning would have emerged in the absence of this body. To say this, however, is not necessarily to admit that its decisions have been free from ideological bias or to assert that they have invariably been correct.

What is more relevant to this article is that, in a country where long years of political dependence have bred a certain aversion to responsibility, there is a danger that people might easily come to look upon a planning body as some supra-governmental authority. The Estimates Committee, in its report on the Planning Commission, felt that, since the States have to depend upon the Centre for financing a large part of their development expenditure, "very great importance is attached to the approval of the Planning body, as a prerequisite to the release of funds." It added: "In consequence, it is understandable that a feeling could grow that the Planning Commission was not just an advisory body but that it was an additional authority to be reckoned with which, though not part of the ordinary machinery of the Government of India, decided every programme of work and whose decisions were to be carried out by all." This is the danger which Indian administration faces today and had been clearly visualised by the late Dr. John Mathai nine years ago. The fact that the Commission has, on the whole,

functioned with a becoming sense of moderation and fairplay does not detract from the validity of the criticism that it is not in the interests of democratic planning that a body of experts, however able and conscientious they may be, should, whether by accident or design, acquire the status of authority parallel, if not superior, to that of the Government and the Legislature.

Like the Planning Commission, the National Development Council is also a non-statutory body created by executive decision. Besides the Prime Minister, who is its Chairman, it consists of the members of the Planning Commission, the Chief Ministers of States and three Union Ministers (Home, Finance and Defence); other Ministers may attend by special invitation. The Council has no place in the Constitution. But this has not prevented the Council from taking important decisions which have become binding on the Union and State Governments. In the case of the Planning Commission, it could at least be claimed that its decisions are the result of prolonged study undertaken on its behalf by a competent staff. The Council, on the other hand, does not have a staff of its own. To its meetings which are held once every three months, come hard-worked State Ministers who are expected to take decisions without the benefit of the advice of their colleagues or their own Secretariat. If they merely talked and dispersed, leaving the decisions in a tentative stage, there might be some justification for the Council which might then serve as a forum for the representatives of the Central and State Governments. But the fact is that, in actual practice, its conclusions acquire the status of Cabinet decisions.

In the course of his two articles on the food problem, contributed to the *Times of India* this week, the ex-Union Minister, Mr. A. P. Jain, points out how it was the Council that took the two major policy decisions—the increase in the target for food (without fresh allocation of resources) and State trading in foodgrains—which, to quote him, "descended meteor-like from the sky." Mr. Jain concedes that the Council has a certain value in the context of India's federal Constitution, in that it brings the Centre and the States on a common platform. But his point is that the N.D.C. often goes beyond its normal functions. He says: "Grave constitutional issues arise, however, when the N.D.C. arrogates to itself or otherwise impinges upon functions which under the Constitution are assigned to other bodies created by the Constitution or attempts to do what the Council of Ministers, at the Centre or in the States, should do." This is a piece of valid criticism which cannot be lightly dismissed. A less general criticism of its functions is that a Ministry, which is not represented in the Council, can make itself heard only through the Planning Commission. Referring to this aspect of the role of the N.D.C., Mr. Jain says: "The Planning Commission is generally not interested in suppressing the views of Ministers. However, in case of a sharp conflict between the Planning Commission and a Ministry, the latter is left with the disconcerting feeling that its views did not receive full weight." In other words, the Ministry is in the position of a person who is represented in a court by a counsel who does not genuinely believe in the justice of his client's case.

All this indicates that India's economic broth is being brewed by far too many cooks. And what is worse, the recipe is laid down by an imperious master-cook who knows little about the ingredients, relies on borrowed ideas and is overburdened with so many duties that he has little time to reflect on what he is asking his fellow cooks to do or to direct them properly. No wonder the brew is unpalatable and undigestible. An equally deplorable effect of this handling of economic policy by too many bodies is that a conscientious Minister does not know where he stands or who are his masters; his department knows even less than he. Examining this issue in the course of an article to the *Hindu*, Mr. K. Santhanam, also an ex-Minister, said: "A Central Minister is today in the position of a modern Draupadi who has to manage all the time four temperamental husbands, besides dutiful obedience to the supreme chief. It is doubtful if many can be found to possess the virtues of the heroine of the *Mahabharata*." This, as Mr. Santhanam himself pointed out, must lead to blurring of Ministerial responsibilities. Mr. Jain's exit is a striking example showing how under the present set-up even a very tolerant person cannot stand it for ever. Some realistic reappraisal of the political, constitutional and administrative implications of the cavalier manner in which policy decisions of far-reaching importance are taken is called for in the interests of the success of planned economy.

MARKET GOSSIP

THE rapidity with which industrial equities have regained their poise and a large part of earlier losses is amazing, because the two chief factors that had depressed them last week have not lost their validity. At a Press conference on Thursday this week, the Prime Minister admitted that defence expenditure had already increased this year and that a further increase was possible. This enhances the prospects of additional taxation as well as deficit financing. It is possible that some have chosen to be bullish again on the ground that inflationary pressures, arising from larger defence expenditure, would push up equity values, but this is not necessarily a sound view to take, especially when first-class scrips have come to be quoted on a 3.5 per cent. yield basis. Inflation always brings with it several headaches such as more Government interference and controls, heavier taxation, bigger wage and salary bills, not to mention stiff commodity prices. Already industrial labour is getting restive. The wages of workers in sugar, cotton textile and cement industries are awaiting upward revision. We have just had a lightning strike for a day by the workers of the B.E.S.T. on the question of wages. The Pay Commission's recommendations covering Government employees are yet to be implemented.

As for the chances of Mr. T. T. Krishnamachari's return to the Union Cabinet, some knowledgeable circles still aver that they are slender. A leading Union Minister, who was in the city this week, is reported to have discounted the prospects of T. T. K. becoming his colleague again. It would, however, appear that both support and opposition to his inclusion in the Cabinet are strong.

The commodity and bullion markets, too, are distinctly firm. Silver has scaled new heights and so also gold, with professional operators piling up stocks in the expectation of supply falling short of demand in the ensuing busy season. Good offake of oilseeds and cotton have imparted fresh strength to the basically bullish trend of these commodities. The policy of cheap money is assisting the speculators in all the markets.

Hindustan Aluminium

There has been some delay in the release of the prospectus of the Hindustan Aluminium Corporation—Hindalco, for short—which is being sponsored by the House of Birlas in collaboration with the Kaiser Aluminium and Chemical Corporation of the U.S. The release was expected towards the end of September last. Later, it was said that it would be out after the *Pooja* holidays. Subsequently, it was anticipated that the announcement would be made immediately after the Deepavali. Although a week has elapsed since then, the announcement has not yet been made. We now learn that the prospectus would definitely be published within the next two or three weeks. The delay is attributed to the absence of firm agreement over the cost of power to be supplied by the U.P. Government from the Rihand Power House. It would be recalled that there was some criticism by a few members of the U.P. Vidhan Sabha over the rate quoted by the State Government. A final agreement has since been signed between the Hindalco and the U.P. Government. The salient features of the agreement are:

1. The agreement covers a total period of 25 years from early 1962.
2. The rate for power supplied is Rs. 175 per kw. for the first sixteen years on the energy consumed. This rate is a "firm" rate, including all taxes, liable to be enhanced only in the event of a war materially affecting conditions in India. For the remaining nine years of the agreement, the rate of power may be raised, by mutual consent or arbitration, but by not more than 10 per cent. or Rs. 175 per kw. It will be recalled that the U.P. Government had previously quoted Rs. 150 per kw. on the basis of 80 per cent. load factor for eight years. But the Company insisted on a "firm" rate for 16 years on the basis of 100 per cent. load factor. Hence the latest revision.
3. The quantum of power supply to the Company will be up to 35,000 kw. per annum, which accounts for over half of the aggregate power producing capacity of the Rihand Power House. The maximum energy allowed for consumption by the Company every year is fixed at 433.62 million kw. hours, the quantum in any quarter not exceeding 110.00 million kw. hours. If, however, the Company consumes more power than the agreed quantity, additional charges will have to be paid.
4. The minimum charge payable by the Company will be for 100 million kw. hours per quarter, subject, of course, to proportionate reduction whenever major causes occur preventing the factory from consuming power to the agreed minimum.
5. The U.P. Government has agreed to provide 132 kw. metering installation at the Pipri sub-station equipped with all the necessary metering transformers, meters and instruments to measure the power to be supplied to the Company.

The rate for power now fixed, namely, Rs. 175 per kw., is considered rather high. According to preliminary estimates, power is expected to account for as much as 20 per cent. of the total cost of aluminium production, as compared with 12 to 15 per cent. in the U.S. The sponsors of the Hindalco drew the attention of the U.P. Government to this aspect, but the latter would appear to have stated that the rate quoted would work out to just 4 per cent. of the total outlay of Rs. 34 crores on the Rihand Power project plus 1 per cent. for depreciation.

The total capital cost of putting up the aluminium plant with an aggregate annual production

capacity of 20,000 tons is expected to be Rs. 15 to Rs. 16 crores, of which Rs. 7.5 to Rs. 8.0 crores would be in foreign exchange. Negotiations are being held with the Ex-Im Bank of the U.S. for a dollar loan of Rs. 6.5 crores and a rupee loan of Rs. 1.0 crore. The Kaiser Aluminium's interest in the enterprise will be approximately 27 per cent. of the equity capital. Kaisers will draw up the specifications for the factory; help in inviting and accepting global tenders for the supply of machinery and equipment; make available the services of executives and engineers to inspect the equipment, supervise its transport, erect the plant, and start it; train Indian personnel in this country and their works in the U.S.; and permit the Hindalco the use of all their patent rights and secret processes.

The Hindustan Aluminium Corporation is expected to go into production sometime early in 1962, according to Mr. D. P. Mandelia, Special Adviser to the Corporation. The Company, we are told, has already finalised arrangements for the supply of bauxite with the Minerals and Minerals Ltd. from the latter's mines in Lohardaga area in Bihar State. The alumina content of bauxite is placed at 52 per cent., with not more than 2 per cent. of silica. The supply will be at the rate of 4,000 tons per month (5 per cent. more or less), subject to a maximum of 8,000 tons. The rate fixed is Rs. 16.25 per ton f.o.r. Tori or Richughata railway station. It is inclusive of all royalties and taxes.

The Government of India has formally approved of the appointment of Birla Gwalior Private Ltd. as the Managing Agents of the Company for ten years, the remuneration payable being 4 per cent. of the net profit as defined in the Companies Act.

Finance for Export

Credit has always played an important role in facilitating exports. In export trade, situations very often arise when the overseas buyer is unable to pay immediately and the exporter cannot afford to wait for payment either. Banks and merchant houses step in in such situations to help both the parties by temporarily taking upon themselves the financial burden of the transaction for a small consideration. Few would have realised a century ago that such normal, apparently innocuous, arrangement, which was a help for both the buyer and the seller, had such potentialities for export promotion and could give rise to such controversies as was accompanied by changes in the terms and conditions of export credit offered to different countries. Credit facilities have come to occupy such a crucial role in exports that, whenever an exporter loses an export order, he tends to blame the financiers for not allowing the buyer sufficiently long credit. From time to time, in recent years, one has come across references in the foreign Press to credit wars. Even now a credit race is feared by a section of the British Press.

There have of late been repeated complaints by British manufacturers that in respect of export credit facilities, their position is unenviable vis-à-vis their German or American competitors. Exporters in the latter two countries, it has been pointed out, have the advantage of long-term credit facilities made available to them with the help of Government money. In West Germany, a substantial part of export finance is provided through the *Ausfuhr Kredit A.G.* (A.K.A.), a credit institution owned by commercial banks, which give credit up to four years. Recently, some other institutions have sanctioned even longer term credits to India, Ghana, Chile and the United Arab Republic. In the U.S., the wholly Government-owned Export-Import Bank has been financing capital goods exports to a considerable extent.

Several suggestions have been put forward in recent times to increase the credit facilities available to British manufacturers, including the establishment of a new Government finance corporation to undertake financing of export contracts. It was also suggested that foreign trade banks, which hold medium-term export bills, should have the opportunity to rediscount them if and when they needed cash. Not long ago, the Federation of British Industries proposed that the Export Credit Guarantee Department should insure credits up to 10 or 15 years. The Radcliffe Committee had recommended that, if the existing financial institutions failed to meet the demand for adequate export credits, the Government should consider the setting up of an export finance corporation.

The British Credit Insurance Association has now come out with some important suggestions for improving export finance facilities now obtaining in Britain. In a survey entitled *Finance for Exports*, the Association estimates that, at the end of 1958, the amount of British capital and quasi-capital goods delivered and not yet paid for was somewhere between £200 million and £300 million. This figure is expected to rise sharply in 1959 and 1960. In view of this, the Association has urged that the provision of credit should become one of the basic calls on the national income and should take its place, along with Government expenditure and capital investments, as one of the main features of annual forecasting. Export credit, in its opinion, is in the process of becoming a permanent feature of world trade and there is, therefore, need for some reassessment of its place in the economic pattern.

The time has come, avers the Association, to create an adequate private market for the financing of exports and this can best be done by encouraging the establishment of a number of ex-

port finance companies which would operate as profit-making ventures. Detailing the sources of finance for, and the advantages of, such companies, the Association observes:

"Once it is accepted that there is a permanent demand for medium-term financing and that it can operate successfully at market rates, the logical solution would be for banks, insurance companies and big exporters of capital goods to collaborate in providing the share capital for such companies. It would also be an advantage to bring in leading merchant houses as shareholders, since they are already experts in the problem of overseas organisations. Although the greater part of the money required by the finance companies would continue to come from the clearing banks, the banks would no longer have to involve themselves in a number of commercial and merchanting problems which are outside the scope of normal banking and which under present conditions cause them a great deal of inconvenience. The manufacturer would have the advantage that the expertise of the export finance companies would supplement his own activities in negotiating the financial aspects of his export contracts. As they gained experience, the finance companies might be able to adopt the techniques of the French bank which goes out in search of new export business for its customers."

The second main problem of exporters is the growing demand for long-term credit, that is, for periods in excess of five years, the maximum period for which the Export Credit Guarantee Department can now provide cover. The need for this facility has, chiefly because underdeveloped countries, which badly need capital goods, have been pressing for long-term credits and deferred payments.

The Association does not agree with the official view that the balance of payments position, the demands of the Commonwealth and Britain's commitments through international organisations like the World Bank have made the granting of long-term credits impossible. The activities of the U.S. Export-Import Bank, the Association points out, have long been a serious liability of British exporters. Now that the West European countries are employing the same techniques, the Association sees no reason why Britain should not follow suit. Otherwise, Britain will, it feels, lose some important markets, particularly in Latin America.

The aforesaid suggestions will surely be welcomed by the underdeveloped countries, as they will enable them to get capital goods from Britain on easier terms. The financial commentators in London are, however, cautious in their reactions to the Association's proposal. The City Editor of the *News Chronicle*, Mr. Paul Bureau, for instance, remarks:

"The dangers of starting an export credit race are self-evident. The country, as the Radcliffe Committee said, would not be the main beneficiary of such a free-for-all competition."

"It is nonetheless desirable that we should be aware of what other countries are doing and taking appropriate defensive action."

Similarly, the *Economist* observes:

"If market institutions themselves decide that there is scope for such collaboration, on a profit-making basis, that would be a different matter from a similar body using official funds, or official insurance of credits up to ten or fifteen years, as recently suggested by the Federation of British Industries. A private venture might work best if it were limited to a particular industry—for the lines, for example, of Air Finance. For special cases, there will always be an export financing gap. In Britain, it can be met by what are virtually Government loans given by the E.C.G.D. under Section 3 of the Export Guarantees Act. Undoubtedly more development loans will be needed; and the British Government might unfortunately follow others and tie such loans to its own exports. The main need is to keep this finance in the form of the development loan, extended selectively to the borrower. In that way the Government retains some influence in its overseas investment. A lost contract in a Latin American country is better than a bad debt."

A New Tea Issue

Close on the heels of the announcement of several new issues, such as those of Baroda Rayon, Mandya Paper and K.C.P., has come the offer of equity shares by the Hilla Tea Estates Ltd., Calcutta, a newly registered company. The details of the issue are published on page 763. The authorised capital of the Company is Rs. 25 lakhs, made up of 5,000—7½ per cent. tax-free cumulative preference shares of Rs. 100 each, redeemable at a premium of Rs. 5 each on or after April 1968 and 200,000 ordinary shares of Rs. 10 each. Of this, only 125,000 ordinary shares (aggregating Rs. 12.50 lakhs) of Rs. 10 each are proposed to be issued at par. Out of this, 40,000 shares have been reserved for the promoters, Directors and their friends, who have already subscribed to and paid for 20,000 shares and will take up the balance after the issue of the prospectus. Accordingly, only the remaining 85,000 ordinary shares are available for public subscription. The list will open on the 9th inst. and will close on the 14th, or sooner or later as the Directors may decide. Applications are invited for a minimum of 50 shares and the whole amount is payable on application.

The object of the issue is to meet a part of the Company's financial requirements for taking over and managing as a going concern the Hilla Tea Estate, situated in Doorga, West Bengal, and belonging to the Doorga Tea Company, Ltd. of the U.K. The total financial requirements of the Company aggregate Rs. 40 lakhs, made up of a purchase price of Rs. 10 lakhs, preliminary expenses considered in this issue Rs. 75,000 and working capital Rs. 11.25 lakhs. Investors will do well to

EQUITIES BULLISH CENTURYS SHOOT UP

(From Our Own Correspondents)

Bombay, 5th November

THE Stock Exchange regained its buoyancy during the week under review on replacement buying by those who had liquidated their holdings and covering by those who had gone short following the border incidents at East Ladakh. Operators' confidence would appear to have been restored by the Prime Minister's assurance that every step would be taken to preserve India's territorial integrity. There were other factors, too, which helped improvement in the market's morale: (1) There was the news that the Tata Iron and Steel Company's output of saleable steel crossed the 100,000-ton mark to reach 104,600 tons in October, representing an increase of 11,500 tons over the month and of 27,700 tons over the year. (2) The working results of the Century Spinning and Manufacturing Company, Ltd., for the half-year ended 30th June 1959, which were published yesterday, made encouraging reading. Sales aggregated Rs. 5.94 crores, as against Rs. 10.60 crores in the whole of 1958, and gross profit amounted to Rs. 80.91 lakhs, as compared with Rs. 132.57 lakhs in the previous twelve months.

The Moort session on Saturday last, with which the business for the Hindu New Year began, was devoid of its traditional gaiety, but the undertone was steady with small rise in prices all round. In the regular session on Monday, however, there was a sizable reaction on bull liquidation. Sentiment again turned for the better from Tuesday onwards and the previous day's losses were more than made good in the last three days, with the result that leading counters finished today with handsome gains over the week.

There were a few more announcements of rights and new issues during the week. The Dunbar Mills Ltd. of Calcutta has decided to issue right shares in the ratio of one new ordinary share of Rs. 100 each for every two ordinary shares, at par. The present paid-up capital of the Company is Rs. 19 lakhs, made up of 19,000 ordinary shares of Rs. 100 each. The rights issue will provide an additional capital of Rs. 9.50 lakhs and will be utilised for renovation and expansion of the mills.

J. K. Agents (Private) Ltd., Managing Agents of the Madhya Pradesh Industries Ltd., will shortly offer for sale 50,000 ordinary shares of Rs. 10 each of the latter Company at a premium of Rs. 5 per share. The offer is being made with a view to getting the Company's shares listed on the Calcutta and Bombay Stock Exchanges. The shares that are to be offered will rank for any final dividend that may be declared for the year ended 31st March 1959. An interim dividend of Rs. 1 per share has been paid. For 1957-58, the Company paid a dividend of Rs. 3.50 per share. The present paid-up capital of the Company is Rs. 15 lakhs, all in ordinary shares of Rs. 10 each.

Under the scheme of reorganisation approved by the shareholders and sanctioned by the High Court, the Bhartia Electric Steel Company, Ltd., has formed itself into a new company, known as Calcutta Steel Company, Ltd., with an authorised capital of Rs. 1 crore, made up of 1,000,000 ordinary shares of Rs. 10 each. Out of this, it is proposed to issue for the present 500,000 shares of Rs. 10 each to the shareholders of the Bhartia Electric Steel in the ratio of one equity share of the new company to one equity share of Rs. 10 each in the Bhartia Electric Steel, at par.

To revert to the trend of the market. Tata Ordinaries, after hardening from Rs. 154.50 to Rs. 156.50 in the Moort session, reacted to Rs. 152.75 on Monday. Thereafter, they regained to close at the week's peak of Rs. 158. The rights were done Rs. 3 higher at Rs. 73. Indian Irons were relatively

less buoyant on account of the lower production during October. The output of saleable steel shows a decline from 49,428 tons in September to 48,863 tons in October. Despatches were, however, higher at 53,069 tons, as against 47,490 tons. The shares came up to touch Rs. 24.28 from last week's closing of Rs. 23.84. Mukund Irons were active and were done at Rs. 18.16 ex-right, as against Rs. 22.36 cum-right a week ago.

The buoyancy in textile shares was inspired by good offtake of cloth for Diwali and was led by Centurys. The following table presenting the price variations of leading scrips gives an idea of the trends in the markets:

Scrips	Today's closing Rs.	Closing on 28-10-59 Rs.	Gain over the week Rs.
Century	622.00	600.00	22.00
Bombay			
Dyeing	69.60	67.60	2.00
Kohinoor	325.00	310.50	14.50
Central			
India	113.00	110.00	3.00
Finlay	305.50	293.00	12.50
Khatana	263.75x.d.	266.25x.d.	8.70
Shree Niwas	237.00	231.00	6.00
Standard	647.00	635.00	12.00
Svadeshi	264.50	257.00	7.50
Tata	47.00	46.00	1.00

Sugar shares returned to favour. Belapurs were marked up over the week by Rs. 11 to Rs. 342. Phaltans by Rs. 2 to Rs. 186. Walchandnagars by Rs. 3.75 to Rs. 328.75. Ravalgaons by Rs. 2 to Rs. 153.

Cement shares moved up in consonance with the general trend. A.C.C.s recorded a gain of Rs. 3.50 to Rs. 155.25 and Digvijays Re. 1.25 to Rs. 145.25. Orissa Cements put on 48 nP to Rs. 13.92.

Gains in shipping shares were less marked. Scindias moving up from Rs. 16.92 to Rs. 17.12 and Great Easterns from Rs. 19.32 to Rs. 19.60, whereas automobiles were in the forefront. On keen buying induced by hopes of a substantially higher dividend, Premier Automobiles shot up from Rs. 131 to Rs. 145.50. Hindustan Motors were done at Rs. 13.72 ex-div., as against Rs. 13.36 cum-div.

Engineers were well supported. Tata Locomotives, after a dip to Rs. 196.50, rallied to Rs. 205.50 at the close, thus recording a gain of Rs. 5.25 over the week. Alcocks were marked up by Rs. 4 to Rs. 255. Premier Constructions by Rs. 2.50 to Rs. 368. Larsen and Toubros by Re. 1.10 to Rs. 25.10 and Mahindras by 28 nP to Rs. 23.16.

Dyes and chemicals continued to soar. Amar Dyes improved by Rs. 9.50 to Rs. 256. Indian Dye-stuffs by Rs. 32.50 to Rs. 360 and Polychems by Rs. 5 to Rs. 185. Alembic Chemicals hardened by Rs. 2 to Rs. 195. Dhrangadhars by Rs. 3.50 to Rs. 159.50 and Tata Chemicals by 40 nP to Rs. 18.08. Among miscellaneous shares, Bombay Burmahs (old) were prominent with a rise of Rs. 11.50 to Rs. 547 and National Rayons with a gain of Rs. 9 to Rs. 384.50.

Calcutta Stock Exchange

CALCUTTA, 4th November

The Calcutta Stock Exchange reopened, after the Diwali holidays, on Monday last week on an easy note influenced by lower Bombay advices. Earlier in the week, trading still bore the impact of the then week-old news of the Chinese aggression in Ladakh, and rumours denoting the strong possibility of Mr. T. T. Krishnamachari joining the Central Government in a high capacity. Conditions were then dull and drab as operators were extremely cautious in extending commitments. However, as the week progressed, buying support was in evidence at the lower levels which were considered attractive. In the transactions that followed on Thursday and Friday, handsome gains were recorded in selected industrials. The news of inclusion of Rohas Industries, Dunlop Rubbers, Shree Gopal Papers and Hindustan

Motors in the clearing list was greeted with enthusiasm. With this, the number of shares in the clearing list is now thirteen. This measure on the part of the exchange authorities demonstrates the optimism entertained by operators. In recent weeks, there had been hectic activity in these four shares, and a section of the market sadly inferred that the imminent action on the part of the Stock Exchange authorities had leaked out and was put to good use by those better placed for sources of information. Conditions were better yesterday.

A feature of this week's trading was the keen interest which selected teas evoked, following increased offtake of tea for internal consumption. The export trend also showed a definite improvement, but prices were still low. In the miscellaneous section, interest in the four shares now added to the clearing list was a feature, while sugars looked up on the possibility of mills increasing output. Coals were firm, and the report of increased interest shown in the export market by a few countries provided the incentive for buyers. Jutes improved or were held around previous levels following reports that earlier fears of damage to the crop were unfounded. Earlier in the week, Indian Irons were affected, but operators were awaiting the announcement of increased retention prices as well as publication of the Company's annual report.

Madras Stock Exchange

MADRAS, 4th November

Equities on the Madras Stock Exchange generally tended to move up during the week under review, thanks to speculative support. Tea shares were quite active, as were coffees and rubbers. The miscellaneous section, too, presented fairly cheerful conditions. Sugar shares ruled steady, though there was no marked rise in prices following the scheme of incentives for higher production recently announced by the Union Government. Textiles, however, lacked support.

Deccans provided a bright spot in the sugar group, the quotation rising by 47 nP to Rs. 13.87. Indias improved by 10 nP to Rs. 13.10. Cauverys were fully maintained at the last week's level of Rs. 137 and Mysore at Rs. 54. But Travancore fell by 75 nP to Rs. 11.70 for want of follow-up support. E.I.D.s shed 25 nP to Rs. 42.75.

Among teas, Kil Kotagiris spurred by 15 nP to Rs. 8.90. Peermades rose by 10 nP to Rs. 18.10. Twyforwards were well fancied at Rs. 13. United Nilgiris at Rs. 20.30 and Haileyburias at Rs. 16.35. Nonsuch Teas lost Re. 1.25 to Rs. 27.50, reflecting the disappointment of operators over the announcement of the final dividend of 10 per cent., making a total of 20 per cent. for the year ended June 1959, as against 35 per cent. for the previous year. Blue Mountains declined by 10 nP to Rs. 3.30. Ouchterlony and Chembras lost 2 nP each to Rs. 5.52 and Rs. 3.86, respectively. Among coffees, Consolidated Coffees forged ahead by Re. 1.75 in anticipation of good dividend. Coffealands were marked up by Re. 1.12 to Rs. 26.25. Cowcoodys were higher by 10 nP to Rs. 6.45. In the rubber section, Cochinn Malabars gained 18 nP to Rs. 7. Highlanders were firm at Rs. 14.25, so also Teekays at Rs. 7.50.

Textiles came in for selling and drifted lower. Coimbatore Pioneers were marked down by Rs. 5 at Rs. 335. Buckinghams declined by Rs. 3 to Rs. 205. Rang Vilas eased by Rs. 2 to Rs. 47. Loyals were lower by 50 nP at Rs. 31. Metturs and Premiers were neglected, the former at Rs. 407 and the latter at Rs. 204.

The feature of the trading in the miscellaneous section was the sharp rise of Rs. 4.50 to Rs. 88 in Rallis. Travancore Chemicals and Mettur Chemicals improved by 25 nP each to Rs. 14.25 and Rs. 12.25, respectively. F.A.C.T.s were higher by 10 nP at Rs. 9.30. Indian Steel Rollings hardened by 20 nP to Rs. 13.40. Aluminium Industries gathered a like amount to Rs. 22.65.

NEWS IN BRIEF

THE Tariff Commission has taken up for investigation the question of revising raw rubber prices. The Commission has already started issuing questionnaires in this connection.

An agreement for the avoidance of double taxation in respect of incomes was initiated between the representatives of the Governments of India and Japan at Tokyo on 28th October 1959.

The Jammu and Kashmir Government has decided to set up shortly a cement factory with a capacity to produce 100 tons per day. The factory is expected to cost Rs. 1 crore. The Government has also decided to establish a paper factory.

The annual general meeting of the Associated Chambers of Commerce of India, Calcutta, will be held on Saturday, 5th December 1959, at the Royal Exchange. The Union Finance Minister, Mr. Morarji R. Desai, will be the chief guest.

The cost of repairing the left bank power house at Bhakra Nangal, which was flooded recently as a result of the mishap to the hoist chamber, is now estimated at about Rs. 25 lakhs, much less than what was expected earlier. The flow of water was stopped last week and the water in the power house has been drained off completely.

Under an agreement signed between the Indian Trade Delegation (leader: Mr. K. B. Lal, Director-General of Foreign Trade) and the representatives of West German Government, a commission will be set up to explore the possibilities of stepping up Indian exports to West Germany. The proposed Commission is expected to work at New Delhi and Bonn alternately.

The scheme providing for the democratic decentralisation of powers on the lines of the Panchayat Raj, recently introduced in Rajasthan and Andhra Pradesh, is proposed to be extended by April next in six other States, namely, Mysore, Madras, Orissa, Assam and Kerala. The State Governments of the Punjab, Madhya Pradesh, U.P. and Bombay are considering the question of bringing legislation for the implementation of the scheme.

An official team, led by Mr. Nagendra Bahadur, Joint Secretary, Union Ministry of Commerce and Industry, will shortly leave for France to discuss the details of help offered by France for the establishment of a prototype production-cum-training centre for the manufacture of scientific and high precision instruments in Madras. Another Indian team, led by the Minister for Industry, West Bengal, will leave for Japan to hold talks on details of assistance offered to set up a similar centre at Calcutta.

An agreement has been reached between India and Bhutan on the Jalbhaka hydro-electric project to be set up by the Government of West Bengal. Under the agreement, Bhutan will receive 250 kw. of power free of cost, besides an annual royalty of Rs. 8 per kw. for the rest of the power generated from the first stage of this project. The firm power potential of the first stage is put at 18,000 kw. at 50 per cent. load factor. The work on this stage, which will cost Rs. 290 lakhs on power generation and Rs. 146 lakhs on transmission equipment, is expected to be completed within three years.

India heads the list of recipients of the U.N. Special Fund allocations, recommended by its Managing Director, Mr. M. Paul Hoffman. It will receive a sum of \$3,012,800, which will be spent on the establishment of a central mechanical research institute at Durgapur in West Bengal, three labour institutes (one each at Calcutta, Madras and Kanpur) and two power engineering research institutes (one at Bangalore and the other at Bhopal). The total allocations recommended include 31 development projects located in 19 different countries and territories, with an aggregate cost of \$23 million. The recommendations will come up for consideration at the conference of the Governing Council of the Fund scheduled to be held on 8th December.

With effect from the 1st inst., the Government of India has extended sub-section (4) of Section 8 of the Payment of Wages Act, 1936, in regard to payment of wages to mine workers. Consequently, there will be a limit on the fine that an employer can impose on a worker for such acts and omissions on his part as may be specified by notice. The Payment of Wages Act seeks to ensure that wages are disbursed to workers within the prescribed time limit and that employees get their full wages without any deductions which are not authorised. With the exception of sub-section (4) of Section 8, all provisions of the Act were made applicable to mines some time ago. While Section 8 provides for the imposition of fines, sub-section (4) of that section restricts the limit of fines to an amount not exceeding half anna in a rupee of the wages payable.

A new trade and payments agreement has been entered into between India and Poland. The agreement envisages considerable increase in the present level of trade between the two countries. It will be in force for a period of three years commencing from 1st January 1960, when the current agreement will expire. Under the terms of the new agreement, payments between India and Poland will be in non-convertible Indian rupees and trade will be on a balanced basis. The Indian rupees which Poland will earn by its exports to India will be utilised for buying Indian goods of equal value. Poland will supply to India, among other things, industrial raw materials, pharmaceuticals, ships and tankers and complete machinery plants like coal mining, machinery, machine tools and

PERSONAL

MR. R. T. Sinha, Deputy Commissioner of Singhbhum district, Bihar, has been appointed Secretary to the Heavy Engineering Corporation, a Central Government undertaking.

Mr. Livingstone T. Merchant has been nominated by President Eisenhower for the post of U.S. Under Secretary of State, vice Mr. Robert P. Murphy, who has resigned to enter private industry.

Mr. Harishwar Dayal, alternative delegate to the current session of the U.N. General Assembly and formerly a Minister in the Indian Embassy at Washington, has been appointed India's Ambassador to Nepal.

Mr. S. G. Pothan, until recently Financial Adviser and Chief Accounts Officer, Western Railway, has taken over charge as acting General Manager in the place of Mr. M. M. Khan, who has been transferred to the Eastern Railway as General Manager.

A material claimed to be of fantastic strength—1,330 kilograms per square millimetre—has been obtained from metal processed in a special way by Soviet scientists. (The strength of standard machine steel equals 30-50 kilograms per square millimetre.) The scientists are said to have succeeded in closing the gap between the atoms of the substance and to arrange them in a steady chain without the empty places usually found in metal.

France has substantially relaxed its discriminatory quantitative restrictions on imports from many countries which do not belong to the Organisation for European Economic Co-operation and the dollar area, but excluding Communist countries. The countries benefited include India, all Latin American countries, Australia, New Zealand, Pakistan, Ethiopia, Indonesia, Iran, Israel, Japan, Liberia, Libya, South Korea, the Philippines, Nepal, South Africa, Burma and Formosa.

India was the leading buyer of British aircraft and parts over the nine-month period January to September 1959. During this period, total British aviation exports amounted to £121.3 million—an increase of 7 per cent., as compared with the corresponding period last year. The main overseas purchasers were: India (£13.2 million), Switzerland (£7.4 million), West Germany (£5.5 million) and Argentina (£4.5 million), followed by the U.S. and Australia, each of which accounted for over £4 million.

BEST VALUE FOR YOUR MONEY

A cheap battery may seem a bargain, but it is really costlier in the long run. The cheapest battery in the end is the one that gives the most in months of reliable service. The long-lived CB 95 alloy plates, the virtually indestructible Porvic separators and the shock-resistant

hard rubber container all add up to make Silver Exide the cheapest battery in the long run. You get the best value for your money when you buy Silver Exide, the battery manufactured under strict Quality Control at every stage of production.

SIR NORMAN KIPPING

NOW on a ten-day business tour of India is Sir Norman Kipping, Director-General of the Federation of British Industries (F.B.I.). Since his arrival in New Delhi on 31st October, Sir Norman has been holding discussions with Central Government officials and industrialists on problems of Indo-British trade, in general, and the question of assistance by the U.K. private sector to India's third Five-year Plan, in particular. He has already had talks with the Prime Minister, the Finance Minister, the Ministers concerned with economic and industrial affairs, the Planning Commission, and other senior economic officials, as well as with many representatives of the F.B.I. member-firms associated with the Indian industrial projects. He is arriving in Bombay today and, after meeting the Governor of the Reserve Bank, the Chairman of the Industrial Credit and Investment Corporation, and several business men and industrialists, he will leave for Ceylon on Monday next.

The visit of Sir Norman Kipping is of special significance, especially in the present context when the financial and other aspects of the draft third Five-year Plan are being actively examined. The discussions between him and the planners will doubtless give an idea of the prospects that exist for the greater inflow of British capital into this country. Incidentally, it may be noted that the F.B.I. which Sir Norman heads is quite a powerful institution, with more than 7,500 individual firms and nearly 300 trade associations as members, 12 regional and district offices, and representatives in about 400 centres overseas. The F.B.I. has direct contacts with the British Government and acts as a spokesman for the industry in the international field. The impression which Sir Norman carries to the U.K. will go a long way towards shaping the attitude of both the authorities and private industrialists there in regard to economic assistance to India. It is gratifying to note that the F.B.I. President attaches utmost importance to the need for aiding the economic development of the underdeveloped countries. Shortly before leaving for India on a world tour, he told a gathering in London:

"The real menace of Communism is the menace of success. Damnable though Russia's record is in the political and human fields, yet, in the economic field, her achievement commands respect which lies within her own borders. Now the Chinese experiment is getting under way, and so, on the other hand, is the Indian. If we must vie with one another, let it be by all means to see who can most speedily improve the lot of the people in all the newly developing countries."

It is to be hoped that Sir Norman's visit to India will facilitate a larger inflow of British private capital. The pace of this inflow would appear to have slowed down a little in recent years. During 1957, for instance, fresh U.K. private investments in India aggregated no more than Rs. 6.3 crores, as against Rs. 15.7 crores in 1956. The rate of capital inflow from the U.S. seems to have been increasing at a faster pace than that from the U.K., though the U.K. still maintains its overwhelming lead in respect of outstanding foreign private non-banking investments, the total of which at the end of 1957 was Rs. 412.7 crores, or 74 per cent. of the aggregate investments amounting to Rs. 555.57 crores.

SMALL SAVINGS

India's planners have set much store by small savings, as an essential part of mobilising internal resources for economic development. In one sense, the small savings scheme has been in operation in India for over half a century. The scheme came into prominence particularly during the past two world wars. The scope of the scheme, however, had been limited; it hardly permeated to areas other than urban centres. The times have now changed, and with it the object of the scheme. Democratic planning presupposes purposeful and willing co-operation of the people. External assistance or other Government measures for financing the Plan are, no doubt, essential. But the small savings scheme serves not only to increase the resources

for development but also ensures mass participation in the great national endeavour.

In the second Plan, out of the original total outlay of Rs. 4,800 crores, the small savings scheme was expected to provide Rs. 500 crores. The target of small savings scheme was, however, reduced to Rs. 384 crores when the Planning Commission undertook an appraisal of the resources position of the current Plan last year. There is now some indication of the growing popularity of the scheme in the country but the progress is still below expectations. In 1958-59, net collections reached a record figure of Rs. 79.70 crores, as against about Rs. 70 crores in the previous year and about Rs. 30 crores in 1951-52. Concerted efforts, however, are necessary to enable the scheme to reach every village in India.

As Mr. Morarji Desai, Union Finance Minister, stressed last week, while inaugurating the first meeting of the National Savings Central Advisory Board at New Delhi, the important task facing the authorities is to educate the masses in such a way that they recognised the necessity for more and more savings even at the cost of self-denial. He wanted the Board to take up this task in good earnest to enable small savers to contribute a larger share to finance the third Plan. He pertinently pointed out that the measure of the effectiveness of the Board would be seen in the gap between gross and net collections. The experience of the last few years has shown that some small savers, particularly the rural folk, hasten to encash their savings certificates. This is due partly to the present high cost of living and partly to lack of sufficient education of the public regarding the benefit of investments in the small savings scheme. The National Savings Advisory Board will have to carry on propaganda work, as Mr. Morarji Desai pointed out, not merely for getting more money but also for educating the people into consciousness about India's economic problems and their responsibilities.

Dr. Sushila Nayyar, Chairman of the Board, in her report presented at the meeting, emphasised that publicity for the Plan and national savings should go hand in hand as an integrated campaign. According to her, a sub-committee could be set up in the States in order to Plan and execute the work of National Savings by linking it with development plans, especially the Plan of each State.

The Board made many useful suggestions. In order to discourage premature encashment, it recommended that sufficient publicity should be given to the loss involved in such a practice. Other important recommendations made by the Board were the introduction of a new non-encashable five-year certificate, payment of interest on certificates not claimed for encashment after maturity, measures for extending the pay-roll savings scheme and simplifying its procedure, introduction of a two-rupee deposit account in the case of the cumulative time deposit scheme and appointment of agents other than the post office for sale of savings certificates.

Both official and non-official bodies could help ensure a steady expansion of small savings. This is particularly compelling in the context of ambitious investment projects launched in the country. For, apart from swelling the savings stream, small savings have considerable disinflationary potential, which will add to the strength and stability of a dynamic economy. At the same time, it cannot be too strongly stressed that, in the absence of a certain measure of price stability, the small savings campaign can never become a mass movement.

ASIA'S FOOD PROBLEM

To those who thought that once Asia was freed from Colonial domination the way would be automatically paved for economic prosperity, recent developments must come as a somewhat painful disappointment. It is not, of course, as if political independence has done these countries no good. But the point is that the countries have generally utilised the new opportunity to ride their favourite political horse of leftist ideologies rather than address themselves to the more vital task of economic betterment. The result is that in the post-independence era, these countries have faced some of the most acute food crises in living memory. The latest issue of the *National and Grindlays Review* observes, in the course of an illuminating article on Asia's food supplies, that "it is a sobering thought that, with the possible exception of Burma, all the South Asian countries have experienced food shortages of varying dimensions in the decade that has passed since they achieved political independence."

These recurring food deficits, as the *Review* rightly points out, are not due to the dislocation of wars or passing political events but spring from "deeper and more fundamental causes." It would be easy to dismiss the whole matter by saying that the present situation is the outcome of generations of neglect of agriculture. But this view ignores the patient toil and the considerable skill of the average Asian farmer. The truth is that while the Asian peasant "has been making the best of his exiguous resources, his land has been required to sustain a population which has multiplied at a rate unknown in any part of Europe." Citing the instances of Burma and India, the *Review* recalls how the population of Burma has quadrupled since 1824, the year of British annexation—it has increased from 4 million in that year to 18.8 million in 1952—and the Indian population has increased from 235 million in 1901 (undivided India) to 356.9 million in 1951 (divided India). The problem in India is to achieve a rapid increase in production, in order to feed the added millions and to build up a margin of safety for poor crop years which "experience has shown recur with depressing regularity." In greater or less degree, all the nations of Asia—and certainly all the South Asian group—are faced with the Indian predicament, namely, the problem of feeding, at a rising level of nutrition, an increasing population, whilst at the same time pressing on with new and in some cases very ambitious schemes of industrialisation.

The *Review* recognises that the measures of land reform, which have been adopted in Asian countries, represent the "biggest agrarian revolution in the whole of recorded history." But it pertinently points out that it remains to be proved that redistribution of ownership or new forms of land tenure have added a "single iota" to the production of the soil. Food crises, which have occurred in the recent past, might have proved disastrous but for the availability, on special terms, of agricultural surpluses mostly from America and to a lesser degree from Australia and Canada under the Colombo Plan auspices. But it rightly insists that no nation can be truly independent, unless it can feed itself out of its own production or by purchases abroad. The real solution of the problem is, therefore, to "get more out of the land." And, this is a challenge as much to Asian farmers as to Asian Governments and scientists.

LATE DR. JOHN MATTHAI

It is with profound regret we record the death of Dr. John Matthai, at Bombay, on 2nd November 1959, at the age of 73. He was a great scholar, painstaking administrator and a perfect gentleman. It is rarely that a man combines in himself the qualities of a scholar with those of an administrator, for seldom is a man of scholarly temperament attracted by, and if attracted ever makes a success at, the administrator's desk. Dr. Matthai, however, was both a distinguished professor and able administrator. As a Professor of Economics in Madras University and a Vice-Chancellor of the Bombay and Kerala Universities, he won the esteem of students. In his varied career, he filled many difficult positions; he was the Chairman of the Tariff Board and the Director of Commercial Intelligence and Statistics.

Here is a brief record of the different positions held by him during five decades of his active life:

Officer on Special Duty, Co-operative Department, Government of Madras—1918-20.
Professor of Economics, Presidency College, Madras, 1920-25.
Professor of Indian Economics, University of Madras, 1922-25.
Member, Madras Legislative Council, 1922-25.
Member, Indian Tariff Board (1925-31) and Chairman of the Board (1931-35).
Director-General, Commercial Intelligence and Statistics, Calcutta, 1935-40.
Director, Messrs. Tata Sons Ltd.
Member for Finance in the Governor-General's Executive Council, 1946.
Central Government Minister for Railways in 1947-48 and for Finance during 1948-50.
Chairman of the Taxation Enquiry Commission, 1953.
Chairman of the State Bank of India, 1955-56.
Vice-Chancellor of Bombay University during 1955-57 and of Kerala University during 1957-59.
Chairman of the National Book Trust for a brief period.

Dr. Matthai's period of office as the Union Finance Minister synchronised with some critical years in world financial history. It fell to his lot to commit the country to a devaluation of the Rupee in September 1949, following a similar decision in the U.K., an action on which there was considerable difference of opinion.

There were many in this country, who felt that it was not necessary to have devalued the rupee to the full extent of devaluation of the pound sterling, as the former was then in a stronger position than the latter in almost every aspect. In the House of Tatas, with which he was connected for nearly 15 years, Dr. Matthai was intimately associated with their two large enterprises, the Tata Chemicals and the Tata Iron and Steel Company, to the building up of which he made a notable contribution. But it is his work as the Chairman of the Taxation Enquiry Commission that will be deservedly remembered by all chroniclers of India's economic history. The Commission's report bears the impress of his unbiased mind and practical outlook. When the report of the Taxation Enquiry Commission was published, many of his erstwhile colleagues in the business community felt that he had allowed himself to be influenced by the socialists. But the more recent fiscal developments have taken the country much farther in the direction of the left than that document visualised for the country. There is no doubt that Dr. Matthai will be long remembered as a man who brought to bear on his many tasks prodigious energy, besides an impartial attitude and rich experience of men and affairs.

One of the great qualities of Dr. Matthai was integrity of a high order. While he was prepared to make adjustments, as all sensible statesmen usually do, he would not compromise himself on fundamental principles and beliefs. Clear evidence of this is provided by his resignation from the Central Cabinet in 1950 owing to differences with the Prime Minister on planning and certain aspects relating to control over public expenditure. When the Planning Commission was set up in March 1950, Dr. Matthai had his own misgivings about its composition and powers which have very largely proved correct. Similarly, Dr. Matthai resigned his position as the Chairman of the State Bank of India in 1956, on a point of principle; he did not like the imposition by the Centre of an indirect restriction on the freedom of the Bank's directors to criticise the Government in public.

BRITISH ECONOMY

The present state of the British economy and its future prospects should be a matter for general satisfaction to all sterling area countries. Increased industrial production, which in September was 7 per cent. higher than in the same month last year, the encouraging export trade and improvement in the balance of payments position, the expansion of personal savings and capital investments, and the overall fall in unemployment are a reflection of the buoyancy of British economy. The outlook is also very encouraging, as can be judged from the Government's first appraisal of the economic situation after the election presented to Parliament by Mr. Maudling, President of the Board of Trade. Mr. Maudling pointed to the growing consumer demand, expansion of private investment and increased production which indicated "definitely encouraging" prospects for the economy. The Government, Mr. Maudling said, felt that there was still room for the growth of demand and employment within the capacity available to the industry. Britain now had the industrial equipment to sustain further expansion, there were no artificial controls on production and its industries had access to raw materials throughout the world on the best possible terms.

While the stage is thus favourably set for further expansion, stable prices, according to Mr. Maudling, are a necessity to sustain the growth. Without stable prices exports would suffer. But could prices remain stable when production and employment expanded? It was possible, said Mr. Maudling, provided increase in wages did not outstrip the increase in the general rate of productivity.

As a direct result of this improvement in the economic situation and in pursuance of its policy of removing all obstacles to expansion of world trade, the Government proposes to liberalise imports and eliminate discriminating quotas on dollar areas goods. Another result has been the repayment of the \$250 million loan which the U.K. had drawn two years ago under the \$500 million line of credit granted by the U.S. Export-Import Bank in 1957. Repayments were not due until October 1960 and, even then, were to be spread over five years. It may be noted that this is the second major loan repayment made by Britain in the current year of the loans taken during the post-Suez weakness of sterling and the payments crisis in 1957. In March last, the Government repaid \$200 million of the \$561 million drawn from the I.M.F. in December 1956. It was also decided not to draw the \$250 million still available under the Export-Import Bank line of credit and not to renew the draw-

ing facility. Apart from the fact that the external position of the U.K. warranted repayment and that it would save Britain a not inconsiderable interest payment (the loan carried interest at 4½ per cent.) there were other considerations which influenced the Government to make the repayment in advance. The chief of these seems to have been the desire to help the U.S., which had lent a helping hand in time of need, to ease the present strain on its balance of payments.

The repayment of the loan at this time has been much appreciated in Washington. Commenting on this, Mr. Waugh, President of the Export-Import Bank, stated that it would materially assist the Bank in contributing its share towards a balanced budget for the U.S. Government in the fiscal year 1961. He also said that the Bank would be prepared to reinstate the advance at any time before April 1965. This means that the U.K. will continue to be able to draw such part of the \$250 million as would still have remained outstanding under the terms of the original agreement. Since the loan has been repaid, the \$300 million of securities pledged by the U.K. Government as collateral have been released by the Bank.

Now that Britain has successfully tidied over its financial difficulties, improved its position both as a debtor and creditor, and the prospects for the future are bright, the Government has set itself to the task of effecting some much-needed reforms. This was indicated in the Queen's address to the opening session of Parliament.

Among the economic measures proposed to be taken, three deserve special mention. First, the Bill which seeks to permit wages to be paid by cheque. This indicates that there is now in Britain a large body of weekly wage earners whose actual income rises well into the salaried class. The second is the reform of the Companies Act and the Building Societies Act to bring them in line with the changed business structure and practices and to protect the interest of millions of small investors. The third is a Bill to replace the Distribution of Industries Act by an enactment, which, apart from consolidating previous statutes in this respect, will give more powers to the Government to promote the growth of new industry and the expansion of existing industries in the Development Areas, that is, areas where employment opportunities require to be expanded.

Under the Technical Co-operation Scheme of the Colombo Plan, a British mining expert, Dr. J. W. Whitaker, has been assigned to India. He will advise the Indian Council of Scientific and Industrial Research on mining research and allied subjects and on the establishment of the Central Mining Research Station at Dhanbad. He will also advise on the creation of facilities for research into and development of Indian petroleum resources. Prior to this Colombo Plan assignment, Dr. Whitaker served in India with the Council of Scientific and Industrial Research for some 13 years. During that period, he was Director of the Central Fuel Research Station and of the School of Mines and Applied Geology, both at Dhanbad. He has also served as Deputy Director-General of Scientific and Industrial Research.

Twice Weekly—

Wednesdays & Saturdays at 6 p.m.

Fly by LUFTHANSA German Airlines

DIRECT TO GERMANY!

Connecting India with the very heart of Europe, Lufthansa, German Airlines, forges yet another link in its world-wide net-work of routes.

Twice weekly, Lufthansa flies from Calcutta to the main cities of Germany—Frankfurt, Düsseldorf, Hamburg.

Whether you're an industrialist, a businessman, a student, a government official or an educationist—you'll appreciate the traditional, generous German hospitality of Lufthansa, aboard the swift Super-G constellations.

Lufthansa, German Airlines, directly connects Germany with Bangkok, Calcutta, Karachi, Cairo and Rome. Coordinated flight schedules provide convenient connections with Air France and Alitalia.

FIRST CLASS OR TOURIST

INDO-GERMAN ECONOMIC RELATIONS

REASONS FOR TRADE IMBALANCE—SOME VALUABLE SUGGESTIONS FOR IMPROVEMENT

By W. von Pochhammer
GERMAN CONSUL GENERAL (RETD.)

GERMANY—we understand under this name rather prominent position in India's economy not only as a supplier of industrial goods, but also as a creditor, and both—I may say—to the surprise of the German business community which, after the end of the Second World War, had no chance to foresee such a development. Neither have they been aware that India would present such a huge market for investment goods, as she does now under the second and third plan, nor did Germany, after the immense losses caused by the war and the many destructions which had hit her, dream of the possibility that other foreign nations would apply to her for credits and loans. This post-war development may be recalled, in order to enable the Indian readers to appreciate what a surprise for the average German it was to follow this trend, and that it was not a small difficulty for them to adjust themselves to this new rôle.

Let us remember that the first great public undertaking which Germany accepted was the Rourkela steel plant. When the Indian Government suggested this idea for the first time, it was considered by the experts in Germany as a venture. Certainly they knew or could find out that India possessed already a steel plant, that is, the Tata Iron and Steel Works which, for the last 50 years, had already succeeded in making steel to a moderate extent. But it had needed years before it could reach the actual size, and it was directed by a private concern which was known for its experience and skilled labour. It appeared to them, indeed, as a venture to deliver a complete steel plant to the Indian Government which, so far, had no experience in this particular line, and evidently lacked a staff of skilled workers or trained engineers, and to build it amidst a desert region, where not even the most elementary conditions for a heavy modern industry existed. Moreover, the decision to undertake it and to run the risk of a failure weighed heavily on their minds.

Technical Personnel

Another difficulty, which soon became apparent, was the scarcity of technical personnel which could be sent to India. The construction of the Rourkela plant coincided with full employment in Germany's heavy industries, and, consequently, all the qualified men—engineers, foremen, skilled workers—who were needed for such an undertaking, were in the happy position to find attractive and well-paid jobs very easily in their home country, so that they did not show much eagerness to be sent to Rourkela, which, in spite of many attractive features qualifying it as an appropriate place for steel manufacture, was by no means noted as an attractive summer resort. Many who accepted the order to go there had been dreaming of India's lure and beauties, and found themselves, of course, bitterly disappointed, when they arrived at this lonely place, lacking in all the features of India's wonder world.

There was no "rush" for Rourkela in Germany. It was indispensable to make the jobs there, if not attractive, at least tolerable for the men who were supposed to work there for several years instead of enjoying the amenities of their home places. And it was, therefore, hardly possible always to select people who had a particular inclination or adaption for the work in an "underdeveloped" country, as it would have been desirable from a general point of view; for it goes without saying that the leading men, responsible for this enterprise, knew very well what it meant to give the "technical know-how" also in the form of a suitable know-how from the psychological point of view.

Kandla—A Vital Difference

On a smaller scale, we have had a precedent in the construction of the port of Kandla, but there was a rather significant difference as compared with Rourkela: at Kandla, there was one German firm in charge, and its leading man was superior to all other men employed there. He could direct and advise them how to behave and how to avoid the many small trickeries and tensions which arise, when people of two different nations, of different languages and different customs have to work together. At Rourkela, the leadership at the spot is represented by the Hindustan Steel Corporation,

while the Germans are either consulting engineers—and as such they sit mostly at Calcutta or New Delhi—or mere representatives of the 36 firms which are engaged in the different tasks, each for his own section. There is no leading man at the spot who would be qualified to supervise the whole body and to secure harmonious co-operation between all of them and their Indian partners. If, finally, we take into consideration the fact that most of the Germans who work there are young men without special training for working amongst foreigners, we will be able to visualise the whole situation and appreciate it properly.

As compared with the two other steel plants, it may be said that the British have had a better experience, since they have been working in India for generations. As for the Soviets, they had the advantage of their economic and social system which enabled them to arrange everything by orders and by commands. But the experiences which we gained at Rourkela are of the highest value for the future and will be used for the coming enterprises which might be entrusted to German firms.

Small Industries

The same problem of psychological experience may be felt, when now the German assistance is used for the development of small-scale and village industries. Technically, Germany is highly qualified for this kind of job, as Germany has developed, for decades, her small industries, particularly in the basin of the Wupper and in Wuertemberg, where a great number of such firms have attained a very high level in their production and are manufacturing not only goods of average quality, but also of top quality which, even in foreign markets, command a dominant position. Scientific instruments constitute a typical example to be quoted in this connection. The heads of such firms belong to the industrial middle class. They have hardly any knowledge of foreign countries and find themselves in a delicate position, when they are called upon to work amongst foreigners. It is highly gratifying that an Indo-German Association has been founded, in order to bring such firms in close contact with the Indian small industrialists, but it will require some effort and a good deal of time before they can go on smoothly with their new partners in new and unknown surroundings.

There is, however, certainly a good chance for happy and promising co-operation between Indian and German industrialists, both having many features in common: they are both striving their best, on their own private account, for the benefit of their families or for a joint family; both possess zeal and diligence; both like to stand and work on their homely ground; both know the great help which results from the traditional skill and inherited knowledge which leads them to make their sons their successors and enable them to plan beyond their lifetime. What is supposed to have often handicapped the progress of Indian industrialisation—the caste system—can even be of advantage in fostering the steady development of smaller enterprises within a family concern.

The problem is, what sort of goods they should produce. In Germany, these kinds of industrial enterprises prefer such types as are not fit for mass-production either because they require great personal skill and minute care, or, when machine-made, depend on a few simple machines. But it should be understood that, in all cases, their aim is to produce first class goods which can compete with the best ones of their class. This should be the aim of Indian small-scale industries, too. May be that at the beginning they might be contented with producing minor qualities at cheaper prices which adapt themselves to the purchasing power of the villagers. But this should be considered only as a temporary stage, whereas goods of high quality should remain the ultimate aim. Products of small-scale manufacturers should gain the reputation of being superior in quality to mass-production, at least in certain aspects, with regard to personal taste or ingenious varieties. It should also be the ambition of any small industry to become a competitor at the international market, that means to work for export, as the shoe industry at Agra has successfully tried.

The beginning of the German assistance in this sphere is the Prototype Workshop at Okhla, where not only young men are trained, but—what is considered as the most important task—also new and simple machines are designed fit for being used by such small Indian enterprises. There has been a good deal of criticism about the too luxurious equipment of this institute. But, when we consider its aim and task from a wider point of view, we understand that, from the very beginning, the planning must include a rather ambitious goal to train the smaller industrialists for quality, even with simpler means and machines.

Trade Imbalance

The surprising success which the German industry has found in the Indian market with regard to investment goods and other ways of helping in the establishment and extension of the Indian industry, has caused the figures of the German exports to India to rise so quickly that Germany's purchases from India could not keep pace with them. In the old "colonial" times, Germany was amongst India's best customers, as she bought annually huge quantities of raw materials, that is, oilseeds, hides and skins, raw jute and raw cotton. The old importers of Indian commodities remember even today this state of affairs, when they are consulted as to how to raise the figures of their purchases in India. Of course, they have to adapt themselves to the new conditions under which India refuses to sell her raw materials. In order to stimulate India's exports to Germany, new links have to be built up for which, however, many basic elements are still lacking.

Trade in bulk commodities during the British days had chiefly been carried on by European firms, and by a comparatively small number of houses, specialised in certain lines and equipped with great capital and long experience. As Germany, after the first war, had consciously abstained from establishing trading firms of her own on Indian soil (the aftermath of the war with its anti-German measures and the difficulties for Germans to settle in British India played a great part in it), the German importers got accustomed to buy the goods needed in London from British firms who had an easy access to the Indian market. Thus, tea, jute, cotton and many other things were purchased in London or through British mediation. The number of Indian export firms, which were equal to the standard of these London firms, was rather restricted. Even now, their number is small. On the other hand, attempts made by the Germans to establish export agents of their own in India, failed, as the Indian authorities did not consider them as "technicians" but only as merchants, and refused to extend their residential permit.

Trade in Private Hands

Whoever wishes to increase India's export to Germany must start with allowing or even inviting the representatives of established German importers to come to India, in order to select the goods and control their quality before shipping. At the same time, it will also be equally necessary to train a set of Indian exporters, who are prepared to go to Germany often, in order to study the market conditions and to acquire the confidence of their German partners and buyers.

The import trade of Germany lies exclusively in the hands of private firms. That is a basic truth which should never be overlooked in India. The German Government has nothing to do with it. The Government may conclude commercial treaties, perhaps fix therein certain quotas which should serve as maximal limits, but Government cannot buy a single ton nor guarantee the purchase of a single ton, unless a private buyer will do it. And these private importers are mostly at the ports of Bremen and Hamburg.

The majority of German industrialists, who need imported goods of the quality which India delivers, are still accustomed to approach the experienced import firms. That is why a personal visit to a big importer's office at Bremen or Hamburg may yield a more effective business than a show at Frankfurt which may attract the public, but certainly not the big importers. They are, under the present terms of trade, a spoiled lot of people. Nowadays we have a "buyers' market." There is not a single commodity which India offers that could not be bought in another country, and often at terms even more favourable than from India. Here lies the real difficulty for India's export trade. What Germany really wants to buy from India, she refuses to export, namely, raw materials. And what India offers, even the raw materials which are still on the export list, can easily be

(Continued on page 788)

WORLD'S MOST POWERFUL TURBINE GENERATOR

U.K. PLACES ORDER WITH A.E.I.

THE Central Electricity Generating Board of the U.K. has placed an order for two turbine generators each of 300,000 kw. capacity with the A.E.I. Company. The order includes the condensing plant and feed water heating plant, as well as various auxiliaries associated with this equipment, the value of the order being about £5 million. The machines are to be installed in a power station which will be located at West Thurrock near Tilbury. This power station has a planned capacity of 1,000 M.W. and, when in full operation, the coal consumption will be in the order of three and a quarter million tons per year. The outstanding feature of the generators is that they constitute the world's largest turbine-generator unit producing all the output in one single line machine at 3,000 r.p.m.

There are many other generating units of larger capacity which are already in manufacture, but the output of these units is divided between two single-line machines which work together on the same steam circuit and generate the electrical output by two generators in parallel. In such units, therefore, the output of each turbine generator is about half of the total output of the whole unit. It is a remarkable fact that this turbine generator of 300-M.W. capacity is about equal in size to those which were produced a decade ago, but which gave only a fraction of the output. As a measure of the advance in generating efficiency, it may be noted that in the twelve months ended 31st March 1952, the 396 steam power stations in Great Britain generated 4,733 million units of electricity and consumed just over 6½ million tons of coal. The two new machines alone will be capable of generating 5,256 million units in a year, and their boilers will consume about two million tons of coal.

These machines will incorporate a number of advanced design features. One of these is the water cooling of the generator stator which en-

ables the maximum electrical output to be derived from a given dimension of machine. A.E.I. is the first firm in the world to experiment successfully with water-cooled stators, one machine having been in commercial operation since 1956 with an over 99 per cent. availability. Cooling water for the steam condensers, which is required in large quantities for a machine of this size, will be taken from the Thames estuary.

It may be said that this achievement of producing the most powerful generator has also been made possible by very advanced methods of quality control in the construction of turbine generators. It will be realised that the parts subject to the highest mechanical stresses are the turbine and generator rotors. These rotors are machined out of special forgings, and subjected to very careful tests. In this field again A.E.I. was the first to introduce the method of trepanning a core piece out of the rotors to enable tests to be carried out on material representative of the centre of the forging. The first effective system of checking rotors for hair cracks was also introduced by A.E.I.

AEI to build Britain's most powerful generators

An order worth nearly £5 million is being placed with AEI for two 300,000 kw. turbine generator units which will be installed at West Thurrock power station, near Tilbury. Each of these generators will have the greatest single-shaft output at 3,000 r.p.m. in the world; each will, in fact, be capable of generating 2,628 million units in a year.

These generators represent important advances in design. Though no larger than those built a decade ago, they are several times more powerful. And their increased efficiency means that they will use less fuel for the electricity they produce.

FACTS FOR THE TECHNICAL. Each unit, which will have the greatest single-line output in the world at 3,000 r.p.m., will consist of a four-cylinder turbine directly coupled to the two-pole a.c. generator. The excitors are gear-driven from the generator shaft. The equipment provides seven stages of feed-water heating, giving a final feed temperature of 485°F. Inlet steam conditions are 2,300 psig, 1,050°F at the turbine stop valve. After expansion through the high-pressure stages, the steam is reheated to 1,050°F before entering the intermediate-pressure cylinder, from which the steam is conducted through four overhead pipes to the two double-flow low-pressure cylinders.

The generator will produce 50-cycle, 3-phase alternating current at 16,500 volts and operate at 0.85 power factor. The stator windings will be water-cooled, a system first introduced by AEI engineers, and the rotor windings will be direct-cooled by hydrogen at a gas pressure of 30 psig. To keep the overall dimensions and weight within the limits dictated by transport, the end-bells containing the coolers will be shipped separately from the core, and assembled on site.

Other AEI contributions to electrical progress

Did you know that:

- * AEI made Britain's first electron microscope,
- * the world's first gas turbines for ships,
- * the world's first water-cooled generator,
- * the world's first water-cooled cable
- * AEI operate Britain's first privately owned reactor.
- * AEI-John Thompson are building the Berkeley Nuclear Power Station.
- * AEI built ZETA.
- * And they make the electrical power system for the Comet.

PATTERN OF BANK DEPOSITS AND ADVANCES

SEASONAL FALL IN CREDIT SLOWS DOWN

NOW that the traditional slack season has almost come to an end—the last Friday of October is usually taken, for statistical purposes, as the termination of the slack season—an analysis of the seasonal variation in Scheduled banks' data will provide a useful study to students of money market. The statistics relating to the week ended 30th October 1959 are not available at the time of writing and, consequently, those relating to the previous week are taken for the purpose of this analysis, but it is believed that the general pattern of seasonal variations will not suffer on account of this.

While the general picture conforms to the traditional pattern, namely, a rise in deposit resources of banks, a reduction in banks' borrowings from the Reserve Bank, a contraction in bank credit and an enlargement of liquid assets of banks, the 1959 slack season discloses some distinct features, as compared with the corresponding season of 1958. The most noteworthy feature is the substantially larger accretion to bank deposits than in the previous slack season. Thus, the total net deposits of banks show a rise of over Rs. 126 crores, which is nearly double that (Rs. 65 crores) witnessed in the 1958 slack season. This is on top of an increase of Rs. 116 crores during the busy season 1958-59. It may also be noted that, barring 1957, the rise in deposits during the 1959 slack season is perhaps the largest in any slack season. In 1957, it was of the order of Rs. 143 crores. The rise in total (net) deposits is mainly accounted for, as in previous years, by time deposits which have gone up by Rs. 159 crores, as against an increase of Rs. 134 crores in the 1958 slack season. It is also noteworthy that the larger accretion to time deposits of banks has occurred during the period under review, despite the ceiling fixed on interest rates with effect from 1st October 1958 under an inter-bank agreement. Demand deposits have, however, declined by Rs. 33 crores, the decline being less than half of the contraction (Rs. 68.6 crores) in the corresponding season of 1958.

State Bank's Share

Of the rise of Rs. 126 crores in total net deposits of all Scheduled banks, the share of the State Bank of India is about Rs. 49 crores, which is, however, less than that (Rs. 54 crores) in the 1958 slack season.

Over the year, the total net deposits of Scheduled banks show an increase of Rs. 242 crores to Rs. 1,819 crores, the highest level touched so far in the history of Scheduled banks. The rise in deposits reflects (a) the counterpart funds of P.L. 480, (b) the shrinkage in the activity of the private sector, and (c) the rapid expansion of the public sector financed, to a considerable extent, by created money. The improvement in Government borrowings this year is itself inflationary to a considerable extent, as the loans raised are quickly spent and adds to the liquidity of commercial banks.

Though there is a net rise of Rs. 9 crores in inter-bank borrowings of banks during the slack season that has just ended, it is very much less than that noted in the corresponding season of 1958, thanks to the improvement in resources of individual banks themselves. Also, the outstanding borrowings at the end of the season, at Rs. 56 crores, are lower by Rs. 6 crores as compared with those a year before. For the same reason, banks have been able to reduce their borrowings from the Reserve Bank and the State Bank to a greater extent than in the corresponding season of 1958, as will be seen from the comparative table in the next column.

Bank Credit

The second notable feature is the slower pace of seasonal fall in bank credit, despite the continuation of restrictive credit policy of the Reserve Bank. The decline in bank advances during the 1959 slack season is Rs. 89.6 crores, as compared with that of Rs. 117.8 crores in the corresponding season of 1958. Consequently, the outstanding bank credit at the end of the season, at Rs. 931 crores, is Rs. 92 crores more than that a year before. However, in view of the much sharper rise in deposits, as shown above, the credit ratio has declined from 53.2 per cent. at the end of October 1958 to 51.2 per cent., the lowest level of credit ratio at the close of a slack season in recent years. The corresponding rates for 1957 was 63.6 per cent. and for 1956, 70 per cent. This gives a better indication of

the effect of the official credit policy during slack seasons. Even at the beginning of the slack season, the credit ratio (60.3 per cent.) stood at a lower level than a year before, when it was 63.3 per cent. More than half of the reduction in Scheduled bank advances is accounted for by the State Bank of India, the advances of which, as will be seen from the table, have fallen by Rs. 45.6 crores.

Addition to Investments

Notwithstanding the slower pace of reduction in advances, banks have been able to add a larger amount to their investment portfolio than in the 1958 slack season; this is because of

the sharper rise in deposits. Thus, during the past six months, the investments of banks have risen by Rs. 179.5 crores to Rs. 795 crores, as against an increase of Rs. 174 crores to Rs. 618 crores in the corresponding season of 1958, thus raising the investment ratio from 39.2 per cent. at the end of October 1958 to 43.7 per cent. The major part of the increase in investments is, however, accounted for by the State Bank of India, the investments of which have grown by no less than Rs. 103.6 crores, an increase that compares very favourably with the addition of nearly Rs. 78 crores in the 1958 slack season. Cash balances have, however, shrunk by Rs. 15 crores to Rs. 169.5 crores, in contrast to the rise of Rs. 7.5 crores in the corresponding period of 1958, the whole of which is accounted for by the State Bank of India. Over the year, the cash balances of Scheduled banks show a contraction of Rs. 39 crores, bringing down the cash ratio from 13.2 per cent. at the close of October 1958 to 9.3 per cent.

	Slack season 1959			Slack season 1958		
	As on 23-10-59	As on 24-4-59	Seasonal change	As on 31-10-58	As on 25-4-58	Seasonal change

AMARTHOLS FAST BASES OPTICAL WHITENERS

Forward to self-sufficiency

AMAR DYE-CHEM LIMITED

"Rang Udyan", Sitadevi Temple Road, Mahim, Bombay 16.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS.

This announcement is not an invitation to subscribe for shares but is issued for the purpose of giving information concerning the Company. The formal Prospectus dated 29th October, 1959, has been delivered to the Registrar of Companies, West Bengal, for registration as required under Section 60 of the Companies Act, 1956. Copies thereof can be had from the Registered Office of the Company or from the Bankers and Brokers named below.

THE HILLA TEA ESTATES LIMITED

(INCORPORATED UNDER THE COMPANIES ACT, 1956)

Issue of 1,25,000 Equity (Ordinary) Shares of Rs. 10 each at par Payable in full on Application

The Subscription List will open at the commencement of banking hours on 9th November, 1959, and will close at the close of banking hours on 14th November, 1959, or sooner or later as the Directors may decide.

SHARE CAPITAL

Authorised

Rs. 5,00,000 divided into 5,000—7½% Tax-free Cumulative Preference Shares of Rs. 100 each, redeemable at a Premium of 5% on or after the 1st April, 1968 at the option of the Company, either in whole or in part.

Rs. 20,00,000 divided into 2,00,000 Equity (Ordinary) Shares of Rs. 10 each.

Rs. 25,00,000

Issued

Rs. 12,50,000 divided into 1,25,000 Equity (Ordinary) Shares of Rs. 10 each.

Rs. 12,50,000

No Shares will be issued for consideration other than Cash.

Of the above Issue, 40,000 Equity Shares of Rs. 10 each are reserved for issue to the Promoters, Directors and their friends and associates at par, out of which 20,000 fully Paid-up Equity Shares at par have already been subscribed and paid for by the Directors and their friends being more than 15% (Fifteen per cent.) of the present issue of 1,25,000 Equity Shares. The balance 20,000 Equity Shares of Rs. 10 each are agreed to be taken up at par by the Promoters, Directors and their friends and associates following the issue of this Prospectus.

LOAN CAPITAL

The Company has created no Mortgages, Debentures or other Loan Capital.

FINANCIAL REQUIREMENTS

The Financial Requirements of the Company are comprised of:

(1) Purchase price of the Lands, Plantations, Buildings, Machinery, Motor Vehicles, etc. of Hilla Tea Estate including the earnest money of Rs. 1 lakh	Rs. 10,00,000
(2) Preliminary expenses including Commission, Brokerage and expenses of this Issue	75,000
(3) Working Capital	11,25,000
Total	22,00,000

MINIMUM SUBSCRIPTION

The minimum amount which, in the opinion of the Directors, must be raised by the issue of Shares in order to provide the sums required to be provided as per paragraph 5 of Schedule II to the Companies Act, 1956, upon which the Directors will proceed to allot shares offered by this Prospectus is 80,000 Equity Shares of the nominal value of Rs. 8,00,000 being only a part amount of this Issue, out of which Rs. 7,25,000 shall be the part purchase price of the Lands, Buildings, Plantations, Machinery, Motor Vehicles, etc., of the Hilla Tea Estate including the earnest money of Rs. 1 Lakh (Rupees One Lakh) paid in cash by Shri B. N. Sen Gupta, Director, and adjusted against subscription of 10,000 fully paid up Equity Shares of Rs. 10 each in the Capital of the Company in favour of the said Shri B. N. Sen Gupta as hereinafter mentioned, and Rs. 75,000 shall be for preliminary expenses including commission and brokerage and expenses of this Issue.

CHAIRMAN

Mr. DHIRENDRA NATH MITRA, of 7, Ballygunge Circular Road, Calcutta-19.

Director, Central Board, The Reserve Bank of India.

Director, Central Board, Life Insurance Corporation of India.

Director of Hantapara Tea Co. Ltd., Mahindra & Mahindra Ltd., Aeronautical Services Ltd., Air Survey Co. of India Ltd., Airways (India) Ltd., Angelo Bros. Ltd., Central India Coal Fields Ltd., Hindustan Motors Ltd., Indo-Asahi Glass Co. Ltd., National Fire and General Insurance Co., Ltd.

DIRECTORS

1. Mr. RANADEB CHAUDHURI, Barrister-at-Law, of 34, Ballygunge Circular Road, Calcutta-19.

2. Mr. C. P. WALLIS, Tea Broker, 3, Clive Row, Calcutta-1.

3. Mr. BIRENDRA NATH SEN GUPTA, Merchant, of 17, Lake Road, Calcutta-20.

4. Mr. SANTI SEN GUPTA, Merchant, of 20, Aswini Dutta Road, Calcutta-29.

5. Mr. GERALD ROBERT SQUIRE STAPLETON, Consulting Engineer and Tea Planter, of 9/A, Short Street, Calcutta-18.

PROPOSED MANAGING AGENTS

Messrs. PLANTERS (INDIA) PRIVATE LIMITED, a company incorporated under the Companies Act, 1956, Merchants of 5/1, Lower Circular Road, Calcutta-20.

OBJECTS

The main objects of the Company are set forth in detail in its Memorandum of Association.

The Company proposes to acquire lands, buildings, plantations, machinery, motor vehicles and other assets mentioned below of the tea garden known as "Hilla Tea Estate" situate in Dooars in West Bengal, belonging to Messrs. Dooars Tea Company Limited, a Company incorporated in England and having its registered office at King William House, 2A, Eastcheap in London, Merchant.

(a) Leasehold lands, Police Station Nagrakata, and Mouza Hill, in Dooars comprising a total area of 1040.29 acres more or less exclusive of 4.72 acres reserved for public roads and all tea gardens, nurseries, tea bushes, seedlings, plants and trees, standing and growing thereon.

(b) The buildings and other structures with fixtures and fittings therein erected thereon as on 1st January, 1958.

(c) The right to use the private roadway leading to the said Hilla Tea Estate through the Nagrakata Tea Estate and to lay pipes, cables, etc.

(d) Plant, machinery, appliances, electric and other equipments, motor lorries and other transport vehicles, tractors, tools, utensils, implements, furniture, articles and things in the said Tea Estate.

(e) The export quota rights and internal quota rights in relation to sale or production of tea which have been or may be allotted or granted to or in respect of the said Tea Estate.

The crop manufactured from Hilla Garden leaf during the years are as follows:

	Lbs.
1954	6,50,326
1955	6,67,850
1956	7,05,402
1957	6,49,553
1958	5,96,242
1959 (upto 14th October as per report submitted by Mr. Crowley, Manager of the Garden)	5,17,776
Expected yield at the end of this year	6,40,000 approx.

REPORT ON THE GARDEN

The Garden has a total area of 1,640.29 acres of which 783 acres are licensed for tea and the balance acreage utilised for grazing, khets, thatch, bamboos, fuel and buildings. Rainfall averages about 160" annually.

Some 550 houses accommodate the settled labour force and there are 14 Staff Quarters as well as Managers' and Assistant's Bungalows, also a Dispensary and nine creches. All buildings are in good repair.

The Factory is a pucca structure of adequate capacity with ample withering accommodation and is run by water power with a stand-by steam plant.

Six 36-inch Rolling Tables and three Legg Cutters together with necessary sifters are sufficient to deal with the leaf plucked on the peak days and two 6' and one 4' oil-fired dryers can easily cope with the output. The sorting arrangements were reorganised this year and teas are now graded by Middleton Sorters fed by Conveyors from the Cutters, which gives a very high percentage of Pekoe Fannings and a minimum of Broken tea. The Factory is generally well found for machinery which has been maintained in very good condition.

The planted area consists of an Upper Division of about 400 acres and a Lower Division of about 260 acres. The tea is well drained, fairly well shaded, green cropped as necessary and annually manured. Average outturn over the past three years was 15.18 maunds per acre on the Upper Division and 10.15 maunds per acre on the Lower Division, giving an overall 12.54 maunds per acre. The replanting and improvement programme is

now coming into effect and a crop exceeding 6,40,000 lbs. is anticipated this year, and it will increase to an optimum of about 8,00,000 lbs. when the young tea is in full bearing.

The Garden produces Legg Cut teas of a good standard which are classified by the Brokers as above average for the District, and the Directors feel that at the present price level, the Company should earn substantial profits and can expect to pay dividends from the very first year if there be no unforeseen circumstances and the present yield of this garden can be increased further in the early future.

AUDITORS

Messrs. PRICE, WATERHOUSE, PEAT & CO., Chartered Accountants, Gillander House, Calcutta-1.

SOLICITORS

Messrs. FOX & MANDAL, 12 Old Post Office St., Calcutta-1.

BANKERS

1. THE STATE BANK OF INDIA, 1, 2 & 3, Strand Road, Calcutta-1.
2. THE CHARTERED BANK, 4, Netaji Subhas Road, Calcutta-1.
3. THE NATIONAL & GRINDLAYS BANK LTD., 19, Netaji Subhas Road, Calcutta-1.
4. THE PUNJAB NATIONAL BANK LIMITED, 18A, Brabourne Road, Calcutta-1.

MANAGING BROKERS

Messrs. PLACE, SIDONS & GOUGH (PRIVATE) LTD., 6, Lyons Range, Calcutta-1.

BROKERS

1. Messrs. LEWIS & JONES, Bank of Baroda Building, Apollo Street, Fort, Bombay-1.
2. Messrs. HARBANS SINGH MEHTA & COMPANY, 33 Regal Buildings, Parliament Street, New Delhi-1.
3. Messrs. PATERSON & COMPANY, 22, Errabalu Chetty Street, Madras-1.

LONDON SELLING AGENTS

Messrs. OGILVY GILLANDERS & CO. LTD., King William House, 2A, Eastcheap, E.C.3, London.

PROSPECTUS AND APPLICATION FORMS

Copies of the Prospectus, on the terms of which alone applications will be considered, and Application Forms may be obtained from the Registered Office of the Company or from the Company's Bankers at their Calcutta, Bombay, Madras, Delhi, Kanpur and Patna Offices or the offices of the Brokers. Also from the Branch Office of the State Bank of India, at Darjeeling, Siliguri, Jalpaiguri, Dibrugarh, Jorhat and Gauhati.

COTTON TEXTILE INDUSTRY IN CHINA

PROGRESS MADE IN THE PAST DECADE REMARKABLE

INDIA'S cotton textiles continue to encounter serious competition in world markets especially in the South-East Asian region not merely from a traditional exporting country like Japan or a relatively new-comer like Hong Kong but also from Communist China. Textile exports from China to Asian countries during the calendar year 1958 aggregated as much as 400 million square yards, which compare very favourably with 242 million square yards in 1957, 115.4 million square yards in 1956 and just 2.3 million square yards in 1953. How severe has been the competition offered by China is well described by Mr. Kayser Sung, in the course of an interesting article published in a recent issue of the *Far Eastern Economic Review* (Hong Kong). Mr. Kayser Sung says:

"Japan's exports of cotton goods to Asia dropped from 70 per cent. of her total cotton exports in 1953 to 51 per cent. in 1958. India feels Chinese competition most keenly in unbleached fabrics. The sharpest effect was in Malaya, though losses also occurred in other traditional Indian markets—Indonesia, Hong Kong, Thailand and Ceylon. Hong Kong has felt the force of the Peking trade drive both ways, since it is a principal supplier as well as a heavy importer. Only 2 per cent. of Hong Kong's cotton piecegoods imports were from China in 1953, but these rose to 30 per cent. by 1958. The Chinese export of textiles also made itself felt in Britain, in Western Europe, in Africa, Latin America and Canada."

The success of Chinese textile export drive has been rendered possible by the remarkable improvement in production, both quantitatively and qualitatively. Thus, as compared with the position obtaining before the Chinese Communist Party took over the reins of administration ten years ago—in October 1949—the production of cotton yarn has gone up by 355 per cent., from 1.8 million bales (of 400 lbs. each) in 1949 to 8.2 million bales (estimated) in 1959. Following the marked rise in yarn output, there has been an appreciable increase in the quantity of fabrics woven. At present, the production is believed to be running at an annual rate of 7,200 million metres (one metre=1.0936 yard), as against a bare 855 million metres in 1949, representing a rise of over 740 per cent. The following table indicates the trend of cotton textile output since 1949:

Year	Yarn (Thousand bales)	Cloth (Million metres)
1949	1,800	855
1952	3,620	3,330
1953	4,104	4,600
1954	4,598	5,216
1955	3,968	3,485
1956	5,246	4,600
1957	4,850	5,050
1958	6,100	5,700
Jan.-June 1959	4,147	N.A.
1959 (planned)	8,200	7,200

N.A.—Not available.

The above table reveals two striking features. First, the very first three years of Communist rule in China witnessed a spectacular improvement in the production of both cotton yarn and fabrics. Secondly, the trend of output has been most erratic, with violent fluctuations from year to year.

Government's Efforts

The substantial rise in cotton textile output in China must be attributed to the Communist Government's devoted persistent efforts to develop the industry. One of the first steps taken by the Government was the setting up of a special Ministry of Textile Industry. The number of cotton spindles actually installed at the end of last year was 8.5 million, as against 5.0 million in 1949, or an addition of 3.5 million spindles over nine years. The number of looms in place during 1957 (the latest year for which statistics are available) was 180,000, a rise of 120,000 looms as compared with the end of July 1952. The second Five-year Plan (1958-62) envisages the installation of 40,000 more looms.

Great priority was accorded to the development of the textile industry during the first Five-year Plan (1953-57). The capital investment in this industry amounted to £235 million, or 6.4 per cent. of the total industrial investment of £3,672 million. During these five years, more than 70 new mills, of which two-thirds represented cotton mills, were built.

Due attention has been paid to the need for augmenting the productivity of textile industry. An idea of the results achieved was given by the Minister for Textile Industry, Mr. Chiang Kuang-nai in the course of his address to the National People's Congress in April last. According to him, the national average unit production of 21 counts cotton yarn has increased from 25 kilograms (one kilogramme=2.2046 lbs.) per 1,000 spindles per hour to 30 kilograms, that is, a rise of 20 per cent. The production of cloth covers many kinds of popularly-priced and durable products, including 16-count and 18-count cross-woven and intricately-woven fabrics. Measures have been taken to make colours and designs last longer and to reduce shrinkage. High-grade goods such as "Hongee" of over 200 counts as well as woolen cloth for overcoats and "East Wind" brand silk piecegoods have been produced on a trial basis.

It is claimed by the *Handbook on Current Affairs*, a semi-official magazine, that cotton yarn of Grade A, Class I accounts for 95 per cent. of the total production in several principal Provinces and cities and 100 per cent. in a few areas. Last year, over 120 new textile products were successfully trial-produced in Shanghai, the centre of light industries.

Incidentally, it may be noted that China produces high-grade serge, fancy overcoat woollens and woolen fabrics of different designs which, in 1958, reached or even surpassed the standards of similar British products of well-known brands. On the side of silk production, China is said to have regained the position as the world's leading producer which it held before the Second World War but was captured later by Japan. Raw silk production in China during 1958 is put at 21,000 tons, as against 20,000 tons in Japan. The output of silk cocoons has risen three times in the past ten years, the actual production in 1958 being 162,000 tons, that is, 45,300 tons more than what was produced in Japan in the same year.

Decentralisation

At the very early stage of textile expansion, the Chinese Government adopted a policy of redistribution of units on a regional basis which later proved to be a practical one. Before 1949, the majority of spindles was concentrated in the coastal ports like Shanghai, Tsingtao and Tientsin which are far away from the cotton-growing regions. But the Government set up almost all the new mills in the interior cotton-producing areas. Nevertheless, Shanghai still remains the leading textile industrial centre in China, accounting, as it does, for one-fourth of the total cotton goods output. Under a Government-sponsored reorganisation scheme in 1957 costing £940,000, all worn-out machinery and equipment in the City's mills have been replaced by new ones manufactured within the country. These include spindles (numbering 130,000), cleaning machines, combers, drawing and slubbing machinery, and spinning machines. Commenting on the progress achieved by the textile machinery industry, Mr. Kayser Sung observes:

"Traditionally, most of the textile machinery in the Chinese mills was imported. But this situation changed in 1950, when most of the former repair shops were reorganised into textile machinery manufacturers, turning out products for domestic consumption. Later, the State-owned Chingwei Textile Machinery Works was set up in the North China Province of Shansi, and this now supplies most of the textile machinery to the new mills. The Chingwei Works, which occupies some 500 acres, produces the full range of spinning equipment. The large-scale enterprise was equipped with the latest types of machine tools from Soviet Russia, Czechoslovakia and East Germany. Other leading textile machinery manufacturers in China include the Shanghai No. 2 Textile Machinery Works and the China Textile Machinery Works.

At the end of the first Five-year Plan, China had not only one and a half times as much cotton textile manufacturing capacity as in 1952, but she also began receiving orders from abroad for complete textile plants. In 1956, a total of 20,000 spindles and 190 looms with all accessories were exported to Burma, and 10 wet spinning machines and 200 looms to Egypt. Before accepting the Burmese order, the Chinese gave much consideration to it. Burmese cotton is a short-staple type and the Chinese machines had to be specially adapted to the processing of the cotton. The Burmese order was followed by similar orders from Yemen, Cambodia and Ceylon. Indonesia is the latest customer, sending a mission to Peking in April to negotiate for the purchase of three tex-

tile mills from China, with some 160,000 spindles and 1,000 automatic looms. Peking has extended a credit of U.S. \$30 million to Indonesia for this purpose. In the past decade, China had manufactured 3.8 million spindles and more than 90,000 looms."

Cotton Output

Alongside the efforts to expand the production capacity of the textile industry and to develop textile machinery manufacture, steps have also been taken to step up raw cotton output and these have met with great success. The production of ginned cotton in 1958 is estimated at 2.1 million metric tons (one metric ton=2,204 lbs.), as against 1.64 million tons in 1957 and a mere 446,800 tons in 1949. The target fixed was 3.35 million tons. The shortfall in output was due to damage to the crop caused by drought. The target for the current year has been revised downward from 5.0 million tons to 2.3 million tons. Although cotton production has increased, China continues to import cotton from abroad. The total imports in 1957 were 83,500 metric tons.

Thanks to shortage of raw cotton and to the anxiety of the authorities to maintain a high level of export trade in textiles, the people in China have had to reduce cloth consumption. The ration of cotton textiles was actually cut by one half in the summer of 1957. During the twelve-month period beginning from 1st September 1957, each person could buy no more than 6.30 yards of cloth. This quantity has been raised to 8.75 yards in 1959. Recently, the Textile Minister assured that the per capita consumption of cotton cloth would soon exceed 8.75 yards.

HONG KONG TEXTILE INTERESTS' PLEA

Since the final understanding in regard to the volume of cotton piecegoods shipments from India and Pakistan to Britain was reached towards the end of September last, several textile interests of Hong Kong have been contemplating to urge Lancashire to concede the following three demands:

1. An increase should be accorded to the Hong Kong ceiling of 164 million square yards, as the ceilings for India and Pakistan are in excess of their actual performance in recent years.
2. If, by the end of 1960, the actual exports of cloth from India and Pakistan were to be lower than the ceilings fixed (namely, 175 million square yards and 38 million square yards, respectively), the shortfall should be made available to Hong Kong.
3. There should be no illusion of possible renewals at the end of the three-year agreement in January 1962, when India and Pakistan will still have another year to go.

The above demands are on the ground that the ceilings now fixed for India and Pakistan are higher by 25 per cent. as compared with those yards for India and 30 million square yards for Pakistan. These were the figures, it is pointed out, that were mentioned by Lord Rochdale, Chairman of the Cotton Board, when he visited Hong Kong.

Since no approach has still been made to the Cotton Board, official sources in Lancashire are reluctant to comment on the aforesaid demands. The general reaction of millowners and traders there seems to be this: the original limits suggested for India and Pakistan were raised during the course of the protracted discussions mainly because of the figure agreed with Hong Kong. When industries learned of the Indian and Pakistan negotiators of the ceiling agreed with the ceilings for their own goods, they demanded higher continue this process of leap-frogging, the situation will never become stabilised. It is considered restart talks so soon after the completion of voluntary arrangements with the three countries concerned. Some even feel that the pace of Lancashire cotton industry's reorganising months to the extent of Hong Kong ceiling pact a year ahead of its originally fixed expiration, 31st January 1962.

Meanwhile, the Hong Kong Government has announced the allocation of the British quota of 115 million square yards (for retention in the home market) for the year commencing from 1st February 1960, thereby ending the two-month-old argument over the method of allocation between the millowners and traders. The allocation will be on the basis of past performance during the first nine months of the current year (1st February-31st October 1959), the quantities in million square yards—to be allotted among the different sections being: shippers of grey cloth, 83; shippers of finished piecegoods: 23; new entrants: 5; exporters of yarn-dyed piecegoods and cotton towelling: 4. Out of the total quota of 115 million yards, the share of manufacturers is expected to be 60 per cent., the balance of 40 per cent. being the share of exporters.

The Government of India has decided to extend the procedure under Rule 191-A of the Central Excise Rules, 1944, for export out of India excisable goods under claim for rebate of duty on the ton handkerchiefs as well. It is already applicable to ready-made apparel, tents, sugar products, table covers and shawls, chaddars, pillow cases, garment has also decided to permit the manufacture in bond of cotton handkerchiefs for the purpose of export, under Rule 191-B of the said Rules.

MORE ABOUT REDUNDANCY STATISTICS

FINISHERS, TOO, WANT REORGANISATION

From Our Special Correspondent

MANCHESTER, 27th October

SOME people might say that there has never before been such a spate of figures concerning the cotton industry since the reorganisation scheme got under way. We can only hope that readers will not feel dizzy if we add further comment on the latest batch provided by the Cotton Board.

MANCHESTER LETTER

These, at least, should mark the completion of the redundancy statistics, as they cover the final returns showing the quantity of machinery to be scrapped and the estimated compensation payable to those millowners involved. There may be minor variations arising from later developments, but the general trend of the industry's shrinkage can now be accurately assessed.

Earlier figures were based entirely on the mule equivalent spindleage scheduled for disposal. This amounted to 12,444,000. Actual spindles for scrapping total 3,408,000 rings and 7,332,000 mules. After deducting those figures from the number of spindles installed either running or stopped as on 24th April, the machinery remaining before re-equipment consists of 6,619,000 rings and 2,973,000 mules.

Big Shut-down

The analysis breaks down the machinery for scrapping into different categories according to whether the mills are to continue running. It is thus disclosed that, out of approximately 10,700,000 actual spindles which are to be scrapped, nearly 7 million are in mills which propose to shut down completely. In some cases, these are controlled by firms, such as the combines, which are retaining their connection with the trade, but one of the most interesting facts emerging from the survey is the response to the tempting terms offered to close down entire units. This applies no less to spinning than to the weaving branch. The total number of looms to be scrapped is 104,747, of which 82,308 are in sheds which are to be completely shut. In some cases, the parent firms will continue in being, but the particular mills will finally close their doors before the end of March.

In the weaving section, the preponderance of looms to be scrapped are those of up to 48 inches in width, numbering 68,597. A further 31,997 machines for dismantling are between 48 and 72 inches wide. Total loomage installed at the effective date of the launching of the scheme was 259,244 of which 182,745 machines were running. After the scrapping but before re-equipment, there will be 154,497 looms available for work.

The amount of doubling machinery to be scrapped in the mills controlled by firms remaining in the industry is almost exactly half the total, in contrast to the other sections. After the disposal of 571,000 doubling spindles as

planned, the quantity remaining before re-equipment will be 1,038,000 spindles.

Included in the analysis is an estimate of the compensation payable for the dismantled plant, excluding any additional scrap value which can be obtained by millowners. In the spinning section this amounts to £9,329,000, made up of £2,134,000 for rings, £3,044,000 for mules and £4,151,000 for carding engines. The average cost per mule equivalent spindle works out at 15s.—showing how remarkably accurate some forecasts were before the details of the scheme were ever published. Doublers who are scrapping their plant will receive approximately £382,000, made up of £106,000 for twiner spindles, £123,000 for rings under 2 inches and £137,000 for rings of 2 inches and over, plus a further £16,000 representing the 5 per cent. bonus for applications received before the end of August. The cost per doubling spindle averages 13s. 4½d.

Payment of compensation for weaving plant scheduled for the scrap-heap will total £6,913,000, including £310,000 under the bonus arrangements. For looms up to 48 inches wide, the compensation will be £4,090,000 and, for those between 48 and 72 inches, £2,199,000. The average estimated cost per loom is £66. Full cost of the compensation for scrapping will, therefore, amount to £16,624,000. The Government will contribute just over £11,000,000 and the remaining firms in the industry face a bill of £5,541,000, to be obtained by means of a levy on their plants.

One slightly surprising aspect of the outcome of the scrapping is the fact that nearly 3 million mule spindles will remain in operation in the industry. Before the scheme began, about 5 million of these spindles were stopped and 5,236,000 were running. The number of ring spindles in operation in April will be reduced by rather less than one million by the scrapping programme. There will be a reduction of about 28,000 looms as compared with those running when the plan was first proposed.

Gap Wider Still

Traders may well be getting tired of the continual comment that exports are "disappointing." As month follows month, it is equally depressing to record that shipments are slipping, while imports continue to rise. The fact remains, however, that the Board of Trade returns do not disguise that unpalatable situation. In September, the quantity of cotton cloth shipped abroad, at 24,771,000 square yards, was lower than in any month since the end of 1945 when overseas trade was still suffering from the aftermath of the war. On the other hand, foreign cloth arrivals last month reached a total of 45,078,000 square yards, which has only once before been exceeded.

With nine months of 1959 gone, the gap between Lancashire exports of cotton cloth and corresponding arrivals of foreign goods has widened to nearly 120 million square yards. Shipments of all types of cotton cloth to the

end of September amounted to 251,811,000 square yards, while imports were 370,680,000 square yards. The decline in exports was almost 44 million square yards as compared with 1958, while arrivals increased by 94 million square yards. Earnings from cloth exports at £23,900,000 compared with the cost of imports of £27,600,000.

So far as exports are concerned, only eight countries are now taking Lancashire fabrics at an average rate of more than 1,000,000 yards monthly. Significantly, it is among this number that the major declines in business have occurred, notably with Australia and South Africa. In both these cases, the quantity of cloth absorbed has fallen by over 10 million yards in the first nine months this year. The only areas where a little ground has been gained are Ghana and Rhodesia and Nyasaland.

Whereas the Commonwealth countries show the largest declines in takings, the rising tide of arrivals also comes from Commonwealth sources. Out of grey cloth imports amounting to 320 million yards in the nine months, 243 million yards were supplied from India, Hong Kong and other Commonwealth countries. Imports from India during the period increased from 87,467,000 square yards to 121,371,000 square yards; from Hong Kong from 76,663,000 square yards to 102,034,000 square yards; and from unspecified Commonwealth countries from only 951,000 square yards to 20,263,000 square yards.

Shipments of cotton yarn in the nine months declined from 20,669,000 lbs. to 16,987,000 lbs. Larger supplies were sent to Canada, but a substantial fall occurred in trade with India, Australia, the Irish Republic and Western Germany. Meanwhile, imports of yarn went up from 9,912,000 lbs. to 14,809,000 lbs.

More Plant for Scrap

Firms in the textile finishing trade are becoming increasingly restive at the absence of redundancy proposals similar to those drawn up for the producing branches. At the Cotton Board conference, the subject was raised in open meeting and drew a response from a Board of Trade representative who promised early action to deal with this vital matter. Inability to find an effective basis for providing compensation without standard machinery such as spindles and looms is at the root of the problem, and much time is being spent in trying to evolve a suitable system. In the meantime, the pressure of demand for cloth and rising prices is resulting in a "squeeze" on the finishing branches between producers and the merchants, who are trying to avoid passing on the dearer rates to their customers.

Mr. Roger Lee, Chairman of the Calico Printers Association, added an appeal to the Government to complete the reorganisation job by launching redundancy schemes for textile finishing, when he spoke at the annual meeting last week. At the same time, he gave a somewhat glowing picture of current conditions, indicating that the printworks had booked orders during the last few weeks at a very high level. Contracts obtained in the merchanting group of the Association, especially since the beginning of last month, were over half as much again as at the same time last year, and were the highest recorded since the war for the third quarter.

WAGE BOARDS FOR INDUSTRIES MUST THEY BE MADE STATUTORY?

THE suggestion of the Union Ministry of Labour to introduce legislation to provide for the establishment of Wage Boards on a statutory basis for industries and making their decisions legally binding on employers and workers has sparked off a keen controversy over the concept of statutory fixation of wages and its effect on collective bargaining and trade union movement. The proposal, which has been communicated to employers' and workers' organisations, along with a draft note on the contemplated legislation for eliciting their views, has come as a surprise to many employers. None of the three Wage Boards at present functioning (all of which are non-statutory bodies) has submitted its final report and there has, therefore, been no way of ascertaining employers' and workers' reactions to their recommendations and judging whether or not the Wage Boards are a success.

The proposed legislation, according to the draft note, will apply to factories, plantations, and mines and such other establishments as may be notified. Persons receiving wages exceeding Rs. 400 per month will not be included in the definition of the term employee whose wages will be fixed by the Wage Board. It will apply to establishments in both the private and public sectors. The Wage Board will be appointed by the "appropriate Government" by a Gazette notification. The "appropriate Government" is defined as the Central Government in the following cases:

(1) mines, oilfields and major ports; (2) railways; (3) any industry or employment carried on by or under the authority of the Central Government; (4) any statutory corporation or other authority constituted by the Central Government; (5) any banking or insurance company having branches in more than one State; (6) industries included in the first schedule to the Industries (Development and Regulation) Act, 1951.

The State Government will be the appropriate Government in respect of the remaining industries and employments.

Besides an independent chairman, the Wage Boards will have six members—two each to represent the employers and workers and to independent members. The Boards, it is proposed, will be given powers to co-opt members for considering regional matters whenever necessary.

Functions of Wage Boards

The functions of the Wage Board will be: (1) to fix fair rates of wages; (2) to determine such other matters allied to the question of wages as may be specified in this behalf in notifications constituting the Wage Board or may be referred to it by the appropriate Government; and (3) to discharge such other functions as may be assigned to it by or under legislation.

In fixing fair rates of wages, the Wage Boards are to follow the principle of fair wages set forth in the Report of the Committee on Fair Wages. The award of the Boards will be binding on all employers of the class of establishments for which the Board is set up and all the employees to which the proceedings relate, whether they were employed at the time of making the award or subsequently become so employed.

An award, as is now proposed, will remain in operation for a period of three years. But the "appropriate Government" has the power to extend the period of operation by any period not exceeding one year at a time. The total period of operation of an award, however, should not exceed five years from the date on which it comes into operation. The draft also provides for penalties being imposed on employers for breach of terms of awards.

The award of the Boards fixing fair rates of wages will, it is said, be final and cannot be questioned in any proceedings under any other law for the time being in force; it will have effect, notwithstanding anything inconsistent therewith contained in any award of any Labour Tribunal. The Government, however, will have power to modify or reject the award of a wage board on such public grounds as affecting national economy or social justice.

Federation's Criticisms

The employers are strongly opposed to the aforesaid scheme on the ground that it is unsound in principle and unworkable in practice. For instance, the Employers' Federation of India, in a memorandum submitted to the Secretary, Union Ministry of Labour, has strongly criticised the proposed legislation as unnecessary and premature. The Federation is of the view that any statutory regulation of wages at this juncture would amount to a negation of the principle of collective bargaining which has been accepted by all the parties concerned, as the basic pre-requisite for sound and healthy industrial relations. The Government according to it, should have awaited the final outcome of the deliberations of the Wage Boards currently functioning and assessed the effectiveness of this machinery for the settlement of wage disputes in a manner acceptable to the parties concerned before taking any action.

The Federation also apprehends that, once the Wage Boards are given statutory status, the discussions will revert to the type of adjudication proceedings, which it was clearly the intention of Government to avoid. Moreover, the creation of statutory Wage Boards, it feels, will give rise to a great deal of confusion in the field of industrial relations arising from the simultaneous working of two compulsory systems. There may well be a good deal of overlapping, particularly because the

Wage Boards are supposed to concern themselves with wages and "allied matters." The term "allied matters" is capable of many interpretations.

Drawing attention to the experience of the working of the Minimum Wages Act of 1948, which is intended to afford protection to workers in sweated industries, the Federation points out that, even after 11 years, it has not been possible for most of the State Governments to give the benefit of that enactment to those engaged in the biggest sector of economic activity in the country, namely, agriculture. Again, in some of the industries covered by the Act, workers have had to agree to rates of wages lower than the statutory minimum, for the simple reason that the particular industry could not afford to pay the rates of wages fixed by the authorities. This further proves, according to it, that wages should be settled by mutual negotiation between the parties concerned rather than by legislative measures.

Millowners' Association's Stand

The Bombay Millowners' Association, in a letter addressed to the Employers' Federation of India, has also strongly opposed the proposal. Legislation of this type, according to it, is objectionable in principle, has no warrant of actual experience and, where alternative machinery exists for implementation, is unnecessary in practice. The grounds on which the Association opposes the legislation may be summarised as follows:

There is a real apprehension that the contemplated legislation might make negotiations and collective bargaining unreal. It may happen that, as both the employers and the workers are equally represented on Wage Boards at present, its recommendations will be generally acceptable to both the parties; and, in that event, it should be possible to implement them through the existing machinery of tribunals and industrial courts, without any difficulty. Even if this happy state of affairs does not obtain, the normal machinery established by Industrial Relations and Industrial Disputes Act is available to either party and the recommendations of the Board will not fail to influence the final decision by these bodies.

The principal function of the proposed Wage Boards is to fix fair rates of wages. It is obvious that fixation of wage rates would involve consideration of a number of matters, many of which are not specifically included in the functions of the Board. To that extent, the normal machinery of industrial tribunals have to be invoked. There is little point in dividing the work between two separate authorities.

The Association agrees with the views expressed by its Labour Officer in a separate note appended to the letter. In this note, the Labour Officer points out that, when representatives of employers and employees agreed to the formation of the Central Wage Board for the cotton textile industry, they had no idea whatever that the decisions of such boards would be made enforceable under law. The Government should not have, therefore, proposed to bring in legislation to make the decisions of the Wage Board legally binding without consulting the parties concerned. He makes the following further criticisms of the proposal:

"If the decisions of the Wage Boards were not statutorily binding and unanimous decisions were

available to the parties, it would then be open to either party to go to the Tribunal or to the Industrial Court under the State Legislation and secure the implementation of those decisions, as there is no doubt that the unanimous decisions of Wage Boards will certainly weigh with the Tribunals or Industrial Court. It would thus appear that it is open to the workers to secure what the Wage Boards have unanimously decided and to make it enforceable under law, when a defiant employer is not willing to adopt the unanimous decisions voluntarily. If such a remedy was not available to the parties, there was some argument for making the decisions of the Wage Boards statutorily binding.

Different Complexion

"If the Wage Boards function as bodies statutorily set up, their working will take a different complexion than when the Wage Board is functioning on a voluntary basis whose decisions are not binding on the parties. In the latter case, the central idea is collective bargaining and not 'compulsory arbitration'. We are indirectly encouraging the latter (compulsory arbitration) which is not the real intention of the Ministry of Labour or the Indian Labour Conference. The present trend is not for adjudication but for voluntary arbitration, failing collective bargaining. If this is the real trend, the proposed legislation cuts at the very root and must be considered as a retrograde step in the field of labour legislation relating to wage fixation.

"If Government really want to make Wage Board statutory and their decisions binding, they may consider limiting the scope of other Tribunals and Courts to all disputes bearing wages and thus avoid duplication and make Wage Board a specialised body to deal with the complex question of wage fixation. It would be wrong to confine the functions of the Wage Boards to fixation of fair wages and leave the evolution of wage structure to Tribunals. Such a division would be arbitrary, impracticable and least conducive to industrial peace."

The aforesaid note also points out that it would be difficult to divorce fair wages from other methods of remuneration or even kindred matters such as dearness allowance, hours of work, overtime, holidays, leave with wages, or for that matter, bonus. As it would not be possible to dislodge fair wages from the gamut of disputes between workers and employers, Wage Boards cannot be treated as statutory bodies for fixation of wages. It only means that the Wage Boards should be maintained as fact-finding and advisory bodies helping the decisions of parties and the Tribunals. They are, by the nature of their duties and functions, bodies whose unanimous recommendations have always a great value in narrowing down the differences between the parties and helping mutual settlement of disputes.

The Labour Officer of the Bombay Millowners' Association further maintains that the Fair Wages Bill of 1950, which was not enacted into law, and a far better legislation, in its modelled, was Tripartite Wage Boards constituted under that Bill Tribunal whereas no such appeal is possible under the proposed legislation.

Objection Academic

It will be seen from the foregoing account that the employers' organisations have made certain very pertinent criticisms, especially in regard to the practical difficulties the legislation will give rise to. Their objection to the proposal in principle is, however, academic. The issue should be examined not in the light of abstract principles but in the context of the circumstances obtaining in the country. The employers' contention that the proposed legislation will cut at the root of collective bargaining is perfectly true. All true lovers of democratic trade unionism will agree with it. But it must be viewed from the practical angle. The contention proceeds on the assumption that trade unions in this country are as much in favour of collective bargaining as the employers are. Are the trade unions in this country really so? So far as our information goes, they do not seem to have objected to the Government's latest move. If this is true, an important question that arises is this: Why is it that the trade unions in this country are willing to agree to a proposal which will, in due course, weaken their position by taking away from their hands one of the most potent method of securing higher wages? The unfortunate fact is that in this country, the powers-that-be and trade union leaders pay only lip service to collective bargaining. If they are staunch believers in it, the move under discussion will not have been made at all. So, what is the point in employers trying to knock against granite? A more sensible approach would be to put forward suggestions that would make the Government's proposal workable.

Why Collective Bargaining Failed?

It is common knowledge that, except in a few cases, collective bargaining in this country has not succeeded in evolving an acceptable wage structure. The Government is as much to be blamed for this as employers, for its efforts to build up trade union movement on sound lines were at best half-hearted. On the employers' side, some at least were, and still are, against workers organising on trade union lines. Even if this be incorrect, the fact remains that the vast majority of employers have miserably failed in winning over trade union leaders for collective bargaining. The political parties, which sponsored and supported trade unions, have their eyes on the political gains to themselves than on the benefits workers could get from organisation.

Statutory regulation of wages, when other methods have failed to give satisfactory results, should not be regarded as offending the canons of economic or social justice so long as it is done in a sensible manner. Statutory wage-fixing (minimum) is not limited to countries where general

Safe Custody and Management of Shares and Securities

To those who buy and sell securities and shares, their safe-keeping and management is often a source of worry.

For a very small cost the State Bank of India undertakes to relieve you of this burden and to provide you with (a) safe custody for your Government securities and share and debenture scrips, (b) a prompt and efficient service for the collection of interest and dividends, and (c) other services connected with the buying, selling and transfer of the scrips.

This Safe Custody service of the State Bank is one of the many banking services the Bank renders to its clients. It may be worth your while to know how the Bank can be useful to you by calling on any of the local head offices or branches of the Bank.

FARM ORGANISATION AND CREDIT SOME REVEALING FOOTLIGHTS

By Prof. S. Kesava Iyengar

STATE farms, collective and co-operative farms, farms worked by communes, have all this in common: land is pooled and a labour force cultivates the area. There are several common features as between Soviet and Indian agriculture. Seasons are uncertain in both countries: "like the little girl in the nursery rhyme, the weather, in its effect on agricultural production in the U.S.S.R., when it is good, it is very, very good, but when it is bad it is horrid." And the cultivators are highly conservative, requiring one decade to forget and another to learn. In the U.S.S.R., the acreage under crops was 450 million in 1954. Ninety million acres were added during the next two years, making a total of 540 million acres. Area under corn was particularly increased, because Premier Khrushchev attached special importance to this crop which serves both as food and feed. Quite a large area of marginal land was brought under the plough. Holdings comprise State farms, collective farms and private farms of small sizes. Foodgrain production was of the order of 375 million tons in 1958, and the estimate is 525 million tons for 1959. Mr. Khrushchev has been devoting special attention to agriculture: he is popularly known as the "corn enthusiast" and his schemes are known as "corn giantism." In fact, "gigantomania" characterises plans and implementation in Russia. In 1957, agriculture in the U.S.S.R. was further supplied with large quantities of machinery. It got 257,000 tractors (in 15 h.p. units), 126,000 lorries, 131,000 grain harvester combines, many hundreds of thousands of various farm machines and implements. Almost complete mechanisation has been effected in ploughing and in sowing grain crops, cotton, sugar beet and some other industrial crops. The harvesting of grains (exclusive of maize) is mechanised to the extent of 93 per cent.

The Khrushchev Reforms

His first reform was to raise prices of compulsory deliveries to the State, as also of supplementary deliveries and of private farm produce. His general policy has been to encourage private farms and to upgrade the collective farms in efficiency: the idea of converting collective farms into State farms has been shelved for the present. Mr. Khrushchev is now out for more and more consumer goods. The table below shows the rate of improvement, achieved and targeted:

Annual Soviet Output of Foodstuffs Per Head

	Unit	1953	1958	1965 planned
Meat	lb.	66	84	158
Milk and dairy products	lb.	420	645	1,000
Butter	lb.	5.7	8.4	11.2
Vegetable oils	lb.	N.A.	13.2	19
Eggs	units	90	115	165
Sugar	lb.	40	57	93

N.A.—Not available.

The average agricultural working family gets about 2,100 roubles per annum which, in real terms, means about Rs. 200 per month. Rural incomes have become larger, but there was no outlet for the additional purchasing power, because the production of consumer goods in the U.S.S.R. progressed at a pedestrian pace in the past. In view of this and other reasons, Premier Khrushchev decided on a progressive decentralisation of powers of the collective farm managements. The closing down of the machine tractor service stations as Government agencies was decided on 22nd January 1958, the intention having been to hand over the equipment and paraphernalia to the collectives, for direct management. By December 1958, 81 per cent of M.T.S. stations had been sold over to the farms nearby. This served as an anti-inflationary measure, because the additional purchasing power among the rural masses came to be invested in capital equipment thus transferred to them. It was felt that there was no longer any need for a third party to supervise the working of the farms and to collect the levies: the Communist Party position had become stronger, and the dual management of farms was ended. The multiplication of "cow palaces" (complexly built barns) gave way to investment in efficient machinery and equipment.

All this was for the good, because Mr. Khrushchev found that the collectives had degenerated in efficiency, as compared with the directly State-owned farms in the U.S.S.R. or the average farm in the U.S.A. The following table (compiled by Mr. Lazar Volin) shows man-hours

required for the production of one unit of agricultural produce in the U.S.A. and on State farms and in collectives in the U.S.S.R., and also percentages as among the three with the U.S. man-hours as unit:

Labour Requirements for Crops and Milk in U.S.A. and U.S.S.R.

	Man hours per centner*		U.S.S.R. as percentage of U.S.A.	
	U.S.A.†	U.S.S.R.‡	State farms	Collective farms
Grain ..	1.0	1.8	7.3	180
Potatoes ..	1.0	4.2	5.1	420
Sugar beets ..	0.5	2.1	9.1	420
Seed cotton ..	18.8	29.8	42.5	160
Milk ..	4.7	9.9	14.7	210

* Centner equals one-tenth of a metric ton or 220.46 pounds.

† In 1956.

‡ Average for 1956-57.

The moral of these figures is very far-reaching: while Indian enthusiasts imagine the dawn of a higher level of productivity under joint farming, Russian experience has been quite the other way. In the words of the Economist: "Collectivisation wrought more damage in the countryside than any armed conflict had done." Two glaring causes for the growth of this serious inefficiency were (1) lack of incentives and (2) low technical skill. In State farms in the U.S.S.R., salary proved a good incentive, closer checking was possible, and higher technical skill available. The poor performance by collective farms was despite the fact that investment in such farms rose from less than 10 billion roubles in 1952 to more than 23 billion roubles by 1957 and that "the indivisible fund" had risen from 63 billion roubles in 1952 to 102 billion roubles in 1957. In 1956, the Government investment in collective farms stood at 20.9 billion roubles.

Communes in China

Within a few years after the establishment of the Chinese Peoples' Republic, small farms were co-operativised with a view to augmenting agricultural outturn. This did not give satisfactory results and therefore Chinese agriculture was reorganised with communes about two years ago. At present, about 500 million Chinese are members of such communes (about 24,000 in number) in urban as well as rural areas, with half a million basic accounting units, each covering 200-300 households. Even this arrangement did not add much to productivity: foodgrains outturn in 1958 was at 250 million tons, as against an expectation of 375 million tons. The Chinese Government realised this a few months ago and two important changes were brought about in the status and wages of communes: "To each according to his work" is the latest criterion for wage payment in the place of the previous ticket system according to which there was one flat rate of remuneration in kind for all. The other reform, and the more important, is that the communes have been declared part-owners of the land in the three-level ownership. Thus, here again, as in the U.S.S.R., joint farming has proved much less effective than anticipated in outturn, and measures have been adopted with a view to stimulating individual incentive. For comparison, figures are given in the table below with regard to outturn of four principal crops in China and in India between 1950 and 1958: in spite of obstacles and difficulties, the Chinese pace was quicker in adding to agricultural production than the Indian.

The target for 1959, after the pruning down a few months ago, is 275 million tons foodgrains, and 2.31 million tons of cotton (a later estimate puts the 1958 cotton production at 2.1 million tons).

Agricultural Output: Major Commodities

Year	Foodgrains (million tons)		Cotton (thousand tons)		Jute (thousand tons)		Sugarcane (million tons)	
	India	China	India	China	India	China	India	China
1950 ..	53.80	122.72	509	681.5	586	77.6	56.2	3.1
1951 ..	55.06	132.02	548	1014.3	835	245.7	60.7	4.0
1952 ..	62.45	151.96	650	1283.1	820	300.7	50.2	7.0
1953 ..	74.68	154.42	690	1154.2	852	135.7	44.2	7.1
1954 ..	69.76	157.90	740	1048.1	828	134.5	56.9	8.5
1955 ..	69.95	174.81	700	1494.4	749	252.7	50.3	8.0

1957 ..	67.10	185.00	835	1640.0	730	305.0	64.0	10.2
1958 ..	72.50	225.00	825	2500.0	750	325.0	65.0	13.0
Change over 1950 ..	+35.5%	+98.0%	+62.7%	+267.0%	+28.0%	+304%	+16%	+320%

Let us now see what the position is in the U.S., where agriculture is privately owned and a competitive enterprise. Under the U.S. Agricultural Adjustment Act, the Soil Bank makes a grant of \$12.40 per acre left fallow, and under the Farm Price Support Programme, the American farmer gets \$1.78 as subsidy per bushel of wheat grown. But the economic framework is competitive. Mechanisation has advanced to the optimum point, and the present situation is that 7.5 million persons on the land not only feed and clothe 180 million United States' citizens, but also contribute to stockpiling and distribution of agricultural products among 38 countries as grants and loans under P.L. 480. At present, the value of such stockpiles of about 40 agricultural products is \$8,965 million. The latest inventory includes items like these:

Wheat ..	749 million bushels
Corn ..	1,116 million bushels
Cotton ..	1,280 million bales
Butter ..	8 million lbs.
Dried milk ..	119.6 million lbs.

Another estimate is that the U.S. Government has, in terms of wheat content, 64,720,000,000 loaves of bread it does not want and cannot get rid of. It also has money tied (as advances through the Commodity Credit Corporation) up in about 31,755,000,000 additional loaves. Up to March 1959, \$3,500 million worth of agricultural products have either been exported or contracted since 1954 when Public Law 480 was put on the Statute Book: so much so that wheat is nowadays more potent than the dollar in international negotiations.

Land Ceilings and Joint Farms in India

It is most unfortunate that persons with little or no farm experience assume the role of advisers and planners for Indian agriculture. Prime Minister Nehru began with a directive that the Congressmen who did not agree on co-operative joint farming should quit: he fore-shadowed economic restrictions on non-members (those who did not join co-operative farms). But, of late, he has watered down his proposals. Joint farms might be introduced gradually. He has gone further; if cultivators do not want it, they need not take to it. Membership would be optional, carrying with it the right to withdraw. He seems to forget that joint farms, with personal farms in between, would be more uneconomic than personal farms without joint cultivation. He is, however, supported by voices from many quarters. Mr. Sri-man Narayan, a member of the Planning Commission, has further expounded the scheme for co-operative joint farms, but has not succeeded in simplifying the problem. One timely warning he has given is that political leaders and social workers should not try to quicken the pace of progress in this respect. Otherwise, his ideas are all urban, with no relation to farm economics. He says that a member may leave after some years but does not say after how many years. According to him, a farmer who wants to withdraw should give a year's notice, and also pay compensation for improvements made on his land. Further, the farmer should pay up all obligations. He should take back some other land if his own land cannot be returned. Does all this amount to freedom to withdraw? Mr. Sri-man Narayan thinks that joint farms should take to intensive cultivation and not to mechanisation. Intensive cultivation and joint farming are poles apart, unless it be that the participants are a few brothers who partitioned paternal property but informally carry on joint cultivation and division of yield. Mr. Sri-man Narayan is not for any rigid pattern: he wants ample flexibility. In the meantime, what will happen to agricultural production, particularly of foodgrains?

Russian collective farms and Chinese communes are a standing warning to this country. Our third Plan target itself is very tame (110 million tons of foodgrains), but even this may not be attained with cross-currents and whirlpools like land ceilings and joint farms. It is still a mystery that no one has come forward to explain the contradiction between the two slogans which blow hot and cold at the same

INSTRUMENTATION

Modern methods of measurement and automatic control can help you raise output by improving operating techniques. The results—economical operation, increased profits, and high product quality.

Whether you're building an entire new plant, bringing your present plant equipment up to date, or just modernizing a single production unit, Honeywell instrumentation can show the way to greater productivity ... more profits for you.

Honeywell, a pioneer in automatic controls, offers the most comprehensive line in the industry, engineered and serviced in India by BLUE STAR.

Ask a Blue Star representative to advise you on the profitability of modern instrumentation for your plant.

JAPAN SETS UP SYNTHETIC RUBBER PLANT

OUTPUT NEXT YEAR WILL MEET 30 PER CENT. OF ITS RUBBER CONSUMPTION

THE rapid expansion in production of automobiles, aircrafts and other vehicles, as well as of ordinary and foam rubber goods, has pushed up the demand for rubber since the end of World War II. The total world consumption of rubber (natural and synthetic) has, for instance, grown from 2.32 million metric tons in 1950 to 2.98 million metric tons in 1958. Almost the entire rise in consumption during this period is accounted for by synthetic rubber, the use of which has gone up from 589,000 metric tons in 1950 to 1,247,000 metric tons in 1958. While the annual trend of consumption is not uniform in all the industrialised countries—in the U.S. and the U.K. the pattern has been somewhat erratic—over the beginning of this decade all of them show a marked increase. This is true of Japan also. The annual consumption of rubber in Japan has grown by more than 50 per cent. in the last five years alone, that is, from 92,000 metric tons in 1953 to 145,000 metric tons in 1958. The use of natural rubber, which had risen from 90,000 metric tons in 1953 to 132,000 metric tons in 1957, declined slightly to 129,000 metric tons in 1958, while the consumption of synthetic, which was no more than 2,000 tons in 1953 and 1954, rose to 16,000 tons in 1958. Japan is currently importing over 130,000 tons of natural rubber and well over 10,000 tons of synthetic rubber per annum. The present rate of increase in synthetic rubber consumption in that country indicates that it will gain momentum in the coming years.

In order to meet this situation, Japan has been taking steps to establish a synthetic rubber industry in collaboration with the U.S. manufacturers. A company called the Japan Geon Company has set up a plant at Kawasaki, an industrial city south-west of Tokyo, in technical collaboration with Goodrich Chemicals Inc. of the U.S., with an annual productive capacity of 8,400 tons of synthetic rubber, of which 40 per cent. will be ordinary rubber known as G.R.S., the balance being accounted for by special types of rubber including those highly resistant to oil. Another company, the Japan Synthetic Rubber Company, which is a joint venture of the Japanese Government and private manufacturers, is now building a factory in Central Japan. When the factory is completed in December this year, the Company will commence production under a contract for technical assistance with Goodyear Synthetic Rubber Company and three other American manufacturers. This Company plans to produce 30,000 tons of ordinary synthetic rubber by 1960. The production will be increased in the succeeding years and, by 1954, the plant is expected to turn out 45,000 tons per annum.

It may seem surprising that, despite the several advantages of synthetic over natural rubber and the advance Japan had already made in the field of chemicals, it had not developed this industry earlier. The reason for this late start lies in the fact that Japan did not have a large petrochemical industry. This difficulty has now been overcome with the setting up of a number of giant oil refineries in Japan, following the sharp rise in the demand for oil. Petroleum has now become a more important source of energy in that country, gradually replacing coal. In consonance with the startling increase in production of automobiles, the consumption of petroleum in Japan has also been soaring. The petrochemical industrial is a child of petroleum refining. The exhaust gas produced at the oil-refineries furnishes the raw material to the petrochemical industry.

Japan started its petrochemical industry in 1957. A huge petrochemical centre was recently built at Kawasaki near Tokyo and another is under construction at Yokkaichi in Central Japan. These plants are supplied with sufficient quantities of raw materials directly from adjacent oil refineries. Thus, the development of petrochemical industry paved the way for the establishment of the synthetic rubber industry.

From next year, Japan will produce 40,000 tons of synthetic rubber, a quantity equal to nearly 30 per cent. of its total rubber consumption today. Being a new industry, it may have to face a number of difficulties which require further study. It is, however, confidently expected that the advanced Japanese technology will enable the country to overcome these difficulties. It is, therefore, anticipated that Japan will before long be able to get a large part of its requirements of rubber from its synthetic

rubber industry and that the Japanese people will be using a greater variety of home-made synthetic rubber goods. It is also likely that Japan will be able to produce synthetic rubber at a much lower cost than other countries.

OUTLOOK FOR COFFEE

The prospect of world coffee production touching a new record level of 57-58 million bags (that is, 3.4 to 3.5 million tons) in 1959-60 is indicated by the F.A.O. in its annual report on *The State of Food and Agriculture, 1959*, provided the Brazilian crop turns out to be as large as forecast, that is, 30-31 million bags or 1.8-1.9 million tons. The growing conditions in Brazil have so far been good and, if these are maintained, the chances of the forecast coming true cannot be ruled out. "In these circumstances," the F.A.O. observes, "no large-scale buying for stocks is likely and the possible increase in consumption alone will not suffice to dispose of the huge exportable surplus." It, therefore, concludes that, on the whole, it would seem that prices have not yet found their long-term equilibrium level.

The F.A.O. goes on to point out that imports are likely to rise substantially during 1959, because of the lower prices and the need in importing countries to replenish stocks which at present cover only a few weeks' requirements. It adds:

"So far, in 1959, Brazilian exports have been relatively high. Domestic consumption in producing countries is also likely to improve as more and cheaper coffee is being made available from the retained quotas. Stocks, however, will be higher at the beginning of the 1959-60 season than a year earlier and will probably be around 28 million bags (1.7 million tons), which is 70 per cent. of annual world requirements. Brazilian stocks were 13.9 million bags (0.8 million tons) on 1st July 1958 and are likely to reach 21-22 million bags (1.3 million tons) at the beginning of the new crop year."

Discussing the main features of the world coffee economy during 1958, the F.A.O. says that, for the second year in succession, there was a rise in production, the volume of trade was stationary, its value showed a decline, there were heavy stock accumulations in producing countries and prices gradually declined, as will be seen from the following comparative table:

ing comparative table:

	1958-57	1957-58	1958-59 (Prelim.)
World Production	2,510	3,090	3,410
Of which:			
Brazil	979	1,409	1,730
Total Latin America	1,870	2,420	2,710
Africa	517	530	560
Asia-Oceania	118	133	133
World Imports†	2,264	2,259	2,270
Of which:			
U.S.	1,274	1,253	1,212
Western Europe	748	755	800
Opening Stocks‡			
Brazil—Columbia	670	565	935
Prices:			
Santos No. 4	58.1	56.9	48.4
Columbia Mains	74.0	63.9	52.3
Ivory Coast Cointant	31.0	34.2	36.5

† Calendar year—first year indicated.
‡ On 1st July of the first year indicated.

The world production in 1958-59, estimated at 55 million bags (3.4 million tons), was 10 per cent. higher than in the previous year, because of an increase of 19 per cent. in Brazil. African production also rose by about 6 per cent., the largest increases having been noted in the Belgian territories, the Ivory Coast and Uganda. The expansion in production was not fully reflected in the volume of imports, which, at 2.3 million tons, was only a shade higher than in 1957. This was due to the reluctance of buyers to take up more than their immediate consumption requirements, in anticipation of a further decline in prices. The U.S., the leading consuming country in the world, imported during 1958 1.2 million tons, which was 3 per cent. less in quantity and 15 per cent. less in value than in 1957. Imports by West European countries, at 800,000 tons, were, however, higher by 7 per cent.

Exports of mild and robusta coffees were maintained, but Brazilian exports declined by 11 per cent. in volume and by 19 per cent. in value. The value of the Latin American coffee exports which had declined from U.S. \$1,952 million in 1956 to \$1,788 million in 1957, fell further to about \$1,400 million in 1958.

Referring to the trend of prices, the F.A.O. says that the downward trend in prices continued throughout 1958 and early 1959, particularly for Brazilian coffee, for which prices declined by 33 per cent. between early 1958 and March 1959. In consonance with this trend, the retail prices in the U.S. declined by about 11 per cent. during 1958 and there were gradual downward revisions in some European countries as well. With this recession in prices, consumption showed a tendency to rise. In the U.S., for instance, roastings increased by 3 per cent. to the highest level since 1949.

LARGE INCREASE IN WORLD CRUDE STEEL CAPACITY FORECAST

TRENDS REVIEWED BY E.C.E.

A SIGNIFICANT increase in world capacity for crude steel production by 1965 is indicated by the statistics compiled by the European Economic Commission (E.E.C.). The Commission, in its report entitled *European Steel Market in 1958*, estimates world crude steel (ingots) capacity in 1965 at 529 million tons, as compared with 369 million tons in 1958 and 136 million tons in 1939. Last year, world crude steel production fell by 7 per cent. to 273.5 million tons. A major part of the decline was accounted for by the U.S., where production declined by about 25 million tons to 77.2 million tons and also by the decline in the output of the U.K. (by 9.8 per cent.) and of the countries of the European Coal and Steel Community (by 3.1 per cent.). Crude steel production in Eastern Europe continued to rise and reached 54.9 million tons in the U.S.S.R. In the Far East, the main contribution to an increase of 5 million tons has come from Communist China. Crude steel output in Japan fell by 450,000 tons; this is the first time production has fallen since the war.

The following table gives the trend of world crude steel production in 1939, 1957, 1958 and estimated capacity in 1959 and 1965:

Country	1939	1957	1958	Estimated 1959	Capacity (a)

(a) At the beginning of the year.
(b) Burma, Hong Kong, Republic of Korea, and Thailand.
(c) Expected production.
(d) For the United Kingdom the year 1958 covers 53 weeks.

Despite evidence of a general recession in most countries, influenced in some degree by a decline in economic activity in the United States which started in an earlier period, there was little change in the activity of the metal-using industries in domestic markets. This, however, was in contrast with rising activity in these industries in most countries in preceding years. The upward trend in the metal-using industries was markedly affected by buoyant conditions in the motor-vehicle and shipbuilding industries. As a result, actual steel consumption in western Europe was well maintained or even increased slightly, the principal exceptions being the United Kingdom, Belgium and Luxembourg, where there was some fall. This contrasted with a decline in apparent consumption in most western European countries, the fall for western Europe as a whole being 5 per cent. The difference between actual and apparent consumption can be accounted for by de-stocking on the part of merchants and consumers. This in turn was reflected in falling deliveries by the steel industry, varying according to the different sectors of the economy and by a greater fall in new orders. Thus order books fell sharply between the beginning and the end of the year.

The general conclusion would appear to be, says the report, that there was no real recession in the European steel market in 1958 since downward tendencies in the economy as a whole bore lightly if at all in most countries on the steel-consuming industries. It is true that the rising output in these industries, witnessed over a number of years, was checked, but there was little or no fall in activity. Consequently, the weaknesses in the steel market are to be explained largely in terms of the mechanism of supply and demand in the market itself; in other words, excessive stock movements, which were in turn accounted for by the sensitivity of steel merchants and consumers. It may well be argued that steel producers operated too long at a very high percentage of capacity and that if they had been prepared to reduce production at an earlier stage in the light of the actual market situation, the excessive build-up of stocks and subsequent de-stocking on the part of merchants and consumers might have been partly avoided.

Discussing the prospects for crude steel production, the Report recalls how, last year, production capacity continued to be built up though actual production showed a decline. The latter development (that is, the decline in output) is attributed to the slackening of economic activity. Actual consumption in W. Europe was, as stated above, well maintained, the difference between apparent and actual consumption being accounted for by widespread reduction in consumers' and merchants' stocks. The Report brings out the fact that European steel production capacity is continuing to increase, particularly in the U.S.S.R. and the rest of Eastern Europe and in the smaller Western producing countries. Actual production will, of course, be determined by the trend of demand. In Eastern Europe, metal-using industries are fast expanding in accordance with national economic plans. There is also tangible evidence of the upturn in economic activity in Western Europe which is expected to increase by 4 per cent. this year as compared with 2 per cent. last year.

To turn to the prospects in the different steel-consuming sectors in western Europe, private industrial investment appears in the main to have responded rather slowly so far to the general relaxation of credit and other restrictions. This may mean that there will be little immediate revival in demand by the machinery industries, though the prospects in the electrical machinery industry are probably better. The prospective levels of building activity differ from country to country. The level of house construction may be slightly greater in 1959 than in 1958. Measured by unfilled vacancies in the building industry, there is an upward movement of activity in construction generally in Western Germany, the Netherlands, Switzerland and Sweden. Demand by the coal-mining industry and from railways may tend to fall; that from the shipbuilding industry is likely to remain largely unchanged. Consumption is rising with the steady growth of consumers' real incomes; with a continuation of the past tendency for a greater proportion of rising incomes to be devoted to consumer durables, a further marked expansion in the activities of the motor-vehicle and other durable consumer goods industries can be expected. The outlook in the canning industry may be one of some expansion. The revival of general economic activity in the world, markedly influenced by present conditions in the United States, is likely to lead to an increased export demand for steel, both direct and indirect. In terms of individual steel products, demand for sheet, strip and light sections should increase; demand for heavy products is likely to remain stable or may fall, for example, demand for railway-track material.

In the first half of 1959 in the E.C.S.C. countries, as a whole, the upward trend in the activity of the steel industry is illustrated by a marked increase of new orders. During the first four months of 1959 these exceeded one million tons per month, with a peak of 1.55 million in March. In Western

Germany, it seems likely that steel production will be maintained throughout the year at at least its level in the spring. Delivery dates are tending to lengthen. In France, steel production during the first four months of 1959, 4.95 million tons, approached the record output of the corresponding period of 1958. In the United Kingdom, industrial activity recovered rather later than in other western European countries, with a corresponding effect on the demand for steel, but by the middle of the year incoming orders were increasing. In Sweden, crude steel output in the first quarter of 1959 was more than 5 per cent. higher than in the corresponding period in 1958. In the United States, iron and steel output during the first five months of 1959 reached a record level of 47.6 million tons. It is difficult, however, to predict the total output for the year, owing to the stoppage in the steel industry.

It was already fairly clear by the end of 1958 that, in most western European countries, a revival of steel demand was to be expected in the early part of 1959. At the time of writing, says the report, there are clear signs of this and it seems reasonable to expect that, in the second half of 1959, steel production will have resumed the steady upward movement characteristic of most of the post-war period. Capacity also is being expanded at a rate to make this possible and in the immediate future there are no signs of raw material difficulties.

FUTURE SPACE SHIPS

Space ships that utilise sun-rays to "fly" indefinitely and to send messages back to earth are within the realm of possibility. The free, unlimited energy given off by the sun may prove to be the cheapest, simplest and lightest source of power for both manned and unmanned vehicles exploring distant planets and the moon. United States scientists, eager to tap the sun's heat and radiation, have developed solar devices that may lead to fuel-less space flight. Their research indicates that space ships continuously propelled by solar power would be more versatile and manoeuvrable than ships that have no power after being thrust into space by man-made fuel.

One of the most promising new devices is a "solar sail" that would use sunshine like a sailboat uses wind, which has been designed by scientists at Los Alamos Scientific Laboratory in New Mexico. The sail, folded in a space vehicle, would be "shot" into orbit by a rocket. Out in space, the sail—a thin plastic disk coated with evaporated aluminium—would unfurl and begin its propulsion task. Gradually, it would propel the attached satellite into an increasingly larger orbit and finally into an area beyond the gravitational pull of the earth and other planets.

By means of radio signals to adjust gyroscopes at the control of the sail, the space ship could be manoeuvred on trips anywhere in the solar system, including orbits around the sun, moon or planets. Since outer space is almost a perfect vacuum, the sail would encounter no resistance and, therefore, would remain serviceable for years. Los Alamos scientists estimate that a 1,000-pound sail one-fourth of a mile wide could propel a space vehicle to Mars and back to earth in 2½ years.

The United States is already utilising solar power to explore space. The Explorer VI now circling the earth is transmitting information from 23,000 miles out in space on power collected by 1,000 solar cells mounted on the satellite's four "paddle wheels." Sun-energy collected by the cells is converted into power which recharges the batteries operating the radio transmitter.

Direct conversion of sunshine into power is a comparatively new scientific development, and various types of conversion equipment may be tested in space. One that shows promise is a solar-powered thermo-electric generator developed recently by Westinghouse Electric Corporation and Boeing Aircraft Company. The generator uses a reflective device—a mirror or sheet aluminium—to collect and concentrate sunlight, which is converted into a continuous flow of electricity when different temperatures. When perfected, the generator is expected to be light weight, compact, reliable and long-lived. These advantages, plus the fact that no maintenance would be required, make this power-producer extremely valuable during space flights of several years' duration.

Solar power for propelling space ships and for operating instruments necessary to explore the universe is in its infancy, but its future looks promising. Solar devices cost much less than man-made fuel, operate on a continuous dependable basis and can "fly" in space. Utilising these advantages, engineers may eventually build solar ships as fantastic in appearance and achievement as the most imaginative artist could conceive.

GAS TANKERS

Plans for big new tankers to import liquefied gas from America are shortly to be put before the British Minister of Fuel and Power, said Sir Harold Smith, Chairman of the Gas Council, in London. Sir Harold said that the experiment of importing liquefied gas to Thames Haven in a tanker carrying 2,000 tons was "perhaps the most many years." They were sufficiently encouraged to go into details of the design of a larger ship carrying 20,000 tons, he said, "is one tanker carrying 10,000 tons." He added: "I hope that, position to the Minister, I do not think there is any doubt that the ships will be built in British yards." Sir Harold said Britain's share of the cost of the present experiment amounted to £1,200,000. The gas carried by a 20,000-ton tanker operating on a normal schedule of 13 or 14 voyages a year would be equivalent to that made from 2,000,000 tons of coal—sufficient to supply for more than 1,000,000 of the Council's 12,000,000 domestic consumers.

NEW PRODUCTS AND PROCESSES

Cotton Maturity Fineness

THE selection and blending of cotton according to maturity fineness is widely prevalent in the U.S. and some other countries. The determination of maturity fineness can now be done quickly with the help of instruments such as the Micronaire Portar and WIRA fineness tester. For a given cotton (or for different cottons having the same average fibre perimeter) a higher value as obtained on the Portar or the Micronaire denotes a more mature and hence a coarser cotton. Studies made at the Ahmedabad Textile Industry's Research Association so far show that, with the variations generally existing within lots blending of eight or ten bales is quite sufficient to ensure a uniform fineness in blend, so long as the relative proportions of different cottons in the blend are the same. The number of bales to be mixed would, of course, vary according to the variability in the lots. The object of this project is twofold: (1) to determine, for the major types of cottons used in the industry, optimum maturity fineness values which will lead to the best quality and performance, and (2) to help industry to have a practical plan for selecting and blending cottons from the fineness point of view. A start has also been made to determine the optimum maturity fineness of different cottons. In the first experiment with one variety of cotton one bale each with extreme micronaire values was processed identically to 30s warp. Interesting differences were observed in yarn quality and performance of the two bales. The finer cotton gave a slightly stronger yarn with less end-breaks in reaping and winding frames than the coarser variety. The general weaving performance of the finer cotton was also good.

Porcelain Enamelling

The Small Industries Service Institute, New Delhi, has introduced a new process in porcelain enamelling industry which is expected to lead to considerable improvement in the quality of wares. Already an enamel works in Shandara, near Delhi, has adopted this process with great success.

According to the old practice in enamelling sheet iron wares are first treated with sulphuric acid to remove rust etc. They are then washed in water and neutralised by sodium carbonate solution and washed again in water. If not enamelled immediately the metal got rusted again. Even after enamelling various other defects would appear. Under the new process, the wares are treated with sulphuric acid as before, but after washing in water they are put in 2 per cent. hot solution of sodium or potassium dichromate. The temperature of the solution is kept at about 80°C and the wares are kept in it for 5 to 10 minutes. They are then taken out, dried and stored in a dry place. By using this process the wares do not rust again and the adherence of the ground coat to the metal is much improved. Thus the chipping off defect is eliminated and the wares get a very good finish without any defect.

Ductile Ceramics

A new ceramic material that has a melting temperature of more than 4,700 degrees Fahrenheit and yet will be, according to the scientists responsible for developing it, the first ductile ceramic material to become available to industry is being developed.

The compound, which is already being used in a non-ductile form for trial applications, is based on magnesium oxide. It has a very high density and is said to have unusually high electrical resistance at elevated temperatures.

Already in its present form it could be used, it is claimed, for the manufacture of crucibles for melting materials such as nickel, cobalt, and uranium alloys where contamination must be kept to a low level. Experiments have, however, shown that ductile forms of the ceramic can be produced. This can be done, it is claimed, because of the structure of the magnesium oxide crystal used in the manufacture of the ceramic. These ductile forms of the material are now being developed for future commercial application.

Resilient Pads from Bamboo Waste

The Forest Research Institute, Dehra Dun, has developed a method for the preparation of resilient pads from bamboo shavings. Resilient pads are used for packing motor transport batteries and their demand at present is met through imports. It is estimated that at present about 108,000 pads are required in India annually. Bamboo shavings are obtained as waste material during the manufacture of bamboo boards. Under the new process, bamboo shavings are cut to a uniform size of about 2 to 3 inches in length and mixed well with 4 per cent. acid condensed cashewnut shell liquid adhesive containing paraformaldehyde. The shavings are then pressed in a wooden mould under moderate pressure. The pads are taken out of the moulds after 24 hours and allowed to condition for a week. The pads thus obtained are comparable both in cost and performance to the imported ones.

Opaque Glass

A novel form of glass which will turn, it is claimed, milky, or opalescent when it is exposed to strong sunlight and regain its original transparency when the sunlight ceases to shine on it at more than a certain strength, has been developed in East Germany. The transparency of the glass is said to be equal to that of normal glass. At the same time, the sensitivity of the glass to sunlight, and consequently the exact pattern of its behaviour, are said to be controllable within fairly precise limits. Although the glass was developed in the first instance for certain special applications, it is expected to come into more general use in certain types of building construction.

This is your Heritage

Motoring from Delhi to Kashmir, you cross the famous Banihal pass, and there in front of you is the valley of Kashmir, with its scenic grandeur, its rivers and lakes. Kashmir is full of interest to the tourist, and here we see the road to Pahalgam, noted for its beautiful pine forests, with a background of perennial snows.

Wherever you motor in India, your trip will be more pleasant, and free from car troubles, when you drive on Caltex Petroleum Products.

INFLATION AND ECONOMIC DEVELOPMENT MANY MISCONCEPTIONS DISPELLED

[It will be recalled that, in some of our issues in August and September last, we carried a series of articles on "Creeping Inflation," prepared by the Research Department of the Federal Reserve Bank of New York and published in the Bank's June and July 1959 issues of the Monthly Review. In these two articles, the authors had dealt with certain aspects of the problem of inflation in economically advanced countries. They have followed up this series in the August issue of the Monthly Review with a third article examining the problem in the underdeveloped countries of the world, including India. In republishing the article in these columns with acknowledgements to the Federal Reserve Bank of New York, we would like to invite the attention of readers that India is included by the authors in the list of countries which have had economic growth with relatively stable prices. This conclusion is based on data up to 1957. Since then, there has been a substantial rise in cost of living, accompanied by a relatively slower rate of industrial growth, a marked fall in foreign exchange to vitiate the conclusion reached in the article, it should serve as a warning to the authorities in this country that there is precious little room now for continuing to indulge in deficit financing on the same scale as in the past two or three years. It is necessary to sound this note of caution, lest the observations contained in the article should make the authorities feel that, after all, they have not done so badly as their critics have made out, a feeling that would engender among them complacency towards inflationary pressures and soon take this country to the list of nations included in Chart II of the article.—Ed.]

SINCE World War II, inflation in its various forms—open or suppressed, creeping or galloping—has taken its toll in virtually all countries, regardless of their stage of economic development. The extent of the problem is dramatised by the fact that, since 1950, only sixteen of the sixty-three countries for which data are available have succeeded in confining the advance of the domestic price level to an annual average of 1.5 per cent. or less. And, while there were only a few countries in which the price level remained virtually unchanged, several suffered the ravages of hyperinflation that pushed its victims to the brink of economic and political collapse.

Contrary to common belief, the incidence of inflation in economically underdeveloped countries appears to be no greater than in the more advanced economies. In fact, viewing the post-war period as a whole, there were proportionately fewer developed than underdeveloped economies that managed to escape sustained inflationary pressure. On the other hand, there is good evidence that, where inflation has occurred in the less-developed countries, it has often been more intense, has affected the economic and social environment more profoundly, and generally has been checked neither early enough nor energetically enough to avoid more painful later adjustments. A particularly disturbing aspect of inflation in these less-developed regions is the frequent inclination to regard it as an inevitable by-product of the growth process, if not indeed a positive element promoting productive advance.

Inflation and Underdeveloped Economic Structure

It is somewhat hazardous to define an economically underdeveloped country, mainly because there is no absolute standard or criterion against which the degree of development or underdevelopment can be measured. Perhaps the best basis for defining such a country is in terms of its relatively low levels of per capita income and productive efficiency. These conditions, in turn, generally reflect other structural characteristics of the underdeveloped economy: the national income is derived largely from subsistence farming, the industrialised sector is small, exports are relatively undiversified, and capital resources, technical skills, and entrepreneurship are scarce. In most underdeveloped countries, moreover, financial institutions and markets tend to be rudimentary.

One of the basic causes of inflation in underdeveloped countries is that the investment effort regarded as necessary in order to raise productive capacity to a desired level is usually far in excess of what is feasible on the basis of available savings. In the majority of these countries, private savings probably represent, on the average, no more than 4 to 6 per cent. of national income; by comparison, gross investment averages at least twice that amount. Although foreign capital is usually counted upon to fill at least a part of any shortfall in domestic savings, such expectations are only rarely fulfilled—partly because foreign investors tend to shun countries where severe pressures on prices and exchange rates seem likely to develop. Quite apart from this, the availability of external funds offers no assurance that inflationary pressures can thereby be wholly avoided; to the extent that such funds are spent on local resources, rather than on imported goods, upward pressures on prices emerge.

Another element in the special sensitivity of underdeveloped countries to strong inflationary influences is the large extent to which domestic money income is determined by export receipts. Sustained increases in export prices, such as have occurred on several occasions since World War II, generally lead to an immediate swelling of the domestic money supply and the demand for goods, driving prices upward and putting

pressure on imports. Attempts to keep the domestic repercussions of an export boom from getting out of hand generally meet broad public resistance, with the result that the authorities—often against their better judgment—are induced to yield to the inflationary tide.

The vulnerability to acute inflationary pressures in underdeveloped countries results not only from the volatile nature of demand but from the supply side as well. In these countries, productive capacity is relatively small and limited in variety. Consequently, output is unresponsive over the short period to an increase in demand, and immediate pressure is placed on prices whenever money income expands. Moreover, poorly developed distributive channels and the inadequacy of transportation, communications, and other basic facilities aggravate the problem of achieving an adjustment between demand and supply at stable prices.

In addition to these factors, there are several others which, if not among the initiating causes of inflation, at least play a major role in allowing it to accelerate. The regressive tax structure characteristic of underdeveloped countries, and its dependence on specific rather than *ad-valorem* taxes, often results in a tendency for budgetary receipts to lag behind the rising cost of Government services during periods of advancing prices. Budget deficits consequently tend to widen, rather than to narrow, during such periods. Another deterrent to price stability is the relatively small number of savers, which limits public support for policies intended to keep the purchasing power of the currency intact. At the same time, the narrowness of financial markets not only impedes the effective mobilisation of savings, but to some extent also restricts the field of action for credit policy. More important, however, political instability and a history of inflation in many underdeveloped countries create an atmosphere in which the public is ever poised to speculate on a depreciation of the currency and thus to add fuel to inflationary pressures whenever they arise.

The Illusion of Growth Through Inflation

While the disruptive economic and social impact of hyperinflation is generally acknowledged, there still exists in many underdeveloped countries a tendency to regard some inflation, not only as tolerable, but indeed as necessary to promote economic development. This view rests on the belief that rising prices, by stimulating investment and capital formation, spark the economic development process.

Thus the argument is advanced that inflation, by raising business profits, increases the returns on investment and induces enterprises to expand their scale of operations or to undertake new productive ventures. The proponents of economic development through inflation go on to assert that, in countries where the savings habit has not yet fully developed, the resources necessary for new investment often can be obtained only by enlarging the share of national income that goes to profit recipients, who save a higher proportion of their income than wage earners.

The point is also frequently made that inflation creates money income where little or none existed previously. This is supposed to stimulate the movement of previously underemployed resources, notably labour, into more productive employment and to help widen the market economy. Another thesis, not often espoused openly, is that inflation dramatises a country's development effort and, to the extent that it leads to balance-of-payments difficulties, tends to bring forth "distress loans" from abroad which furnish investment funds that otherwise might not be forthcoming. Such inflation-induced balance-of-payments strains also enable countries

to justify the imposition or maintenance of exchange restrictions, which can be employed to protect domestic industries against foreign competition and to control the allocation of domestic economic resources.

The various claims in favour of inflation have, in practice, proved largely illusory. One of the main reasons is that this line of argument ignores the economic waste and the social costs of inflation, which are an excessive price to pay for gains that are generally small, irrationally distributed over the economy, and unsustainable.

The social costs inherent in inflation must be a particularly important consideration in underdeveloped countries, where most of the population lives at a bare subsistence level and social inequities are already very pronounced. The rise in profits and the lag in wages that accompany the process of inflation in its early stages aggravate the maldistribution of income and intensify these social inequities. The claim that such a redistribution of income may be necessary to bring forth new savings is particularly difficult to justify, for it means that, for any additional amount of savings that might be obtained by transferring income to the high-saving group, a larger amount of real income has actually to be shifted from the low-savings group; the reason is that only a part—and during inflation a declining part—of increments to profits is saved, the remainder being spent on consumption. One of the important effects of such a redistribution of income from the poor to the wealthy is to retard the growth of a large and vigorous middle class which is so important not only in promoting self-sustaining economic progress, but also in fostering democratic institutions and a politically stable society.

Not Essential

Not only are the social costs of inflation intolerable but there are no grounds for believing that inflation is essential to break the vicious circle of poverty and to help set in motion a cumulative process of capital formation and economic growth. On the contrary, the expectation of continually rising prices engendered by inflation often leads to economic decisions that would be considered wholly irrational under conditions of price stability. Investment in new plant, machinery, tools, research facilities, power projects, and the like, all of which are essential to balanced economic development, are usually discouraged because they are amortisable only over long periods and do not promise quick inflation profits. This is illustrated by the case of Chile where prices rose more than ten times from 1950 to 1957 while investment in fixed capital declined sharply over the same period.

Along with the deterrent effects on productive investment, inflation usually enhances the attractiveness of investment in the kind of real assets that can be turned over rapidly and assure high capital gains yet add little to the expansion of productive capacity. In the underdeveloped countries, where the range of industrial investment opportunities is characteristically small and the inclination to trade and speculate strong, inflation generally leads to an immediate build-up of inventories. For example, in Brazil, inflation was accompanied during 1950-54 by a more-than-sixfold increase in the flow of goods into stocks. Such inventory accumulations, in addition to diverting resources from more productive undertakings, are often also a principal cause of the balance-of-payments difficulties that accompany inflation. Inflation provides a similar stimulus to investment in real estate. This stimulus is generally magnified in underdeveloped countries by the social prestige that attaches to the ownership of land or dwellings, by the fact that real estate is often the type of collateral preferred by lenders, and by the mistaken view that the management of real estate requires no special aptitude.

Similarly, inflation militates against investment in fixed-interest securities, thus undermining the development of capital markets. In underdeveloped countries this affects mainly Government bonds and severely restricts the Government's capacity to finance in a non-inflationary manner various types of "social overhead" projects, notably schools, health centres, and basic utilities. Such projects are often unsuited to private investment but represent the foundation on which any broad and balanced economic development effort must rest.

Deterrent to Exports

A particularly disturbing aspect of inflation in underdeveloped countries is its deterrent effect on exports, which often constitute the prime source of private domestic investment funds and Government revenues. To the extent

that inflation raises production costs while export prices remain determined by world market conditions, export income is often drastically reduced and output discouraged. In recent years, this has represented a particularly serious problem in Argentina and Uruguay. The fact that inflation also gives rise to exchange rate instability and to exchange restrictions, thus discouraging the inflow of private foreign investments, requires no elaboration.

Because inflation undermines exchange rate stability, it also results in a tendency—particularly strong in underdeveloped countries—to speculate against the currency by moving funds abroad or hoarding gold or foreign exchange. Such "investments" represent an obvious waste of financial resources, put heavy pressure on the balance of payments, and thus help bring about the expected devaluation. In Mexico, for example, the sustained rise in the price level during 1950-57 was at various times accompanied by massive movements of liquid funds abroad, including a substantial expansion in Mexican commercial bank deposits denominated in United States dollars.

One of the basic weaknesses of the "economic-development-through-inflation" thesis is that it fails to take account of the adverse effects of rising prices on the capacity and willingness to save. It is evident that, unless an economic system can generate a high and rising volume of internal savings, economic growth cannot be maintained. Perhaps the decisive argument against inflation as the path to economic development is that eventually it either becomes cumulative or leads to crippling economic controls—or both. The experience of many underdeveloped countries suggests that, where inflation has been permitted to continue unbridled for any length of time, the application of corrective measures has become progressively more difficult. The usual outcome has been the adoption of elaborate economic controls, which have concealed the symptoms of inflation without attacking its basic causes. Such controls, which generally take the form of price ceilings, the linking of wages to the cost-of-living index, import quotas, exchange controls, or multiple exchange rate systems, have in many underdeveloped countries led to the growth of an administrative machinery that has promoted the emergence of vested interests, a swollen bureaucracy, and corruption. The intensification of such controls, moreover, as rising prices become ever more difficult to curb without fundamental adjustments, tends to hasten the economic paralysis to which inflation leads in its final stages.

Inflation Vs. Price Stability

Any attempt to show statistically the relationship between economic growth and price stability or inflation is necessarily difficult. The reasons are not merely technical—notably lack of comparability, or even absence, of data—but conceptual as well. The process of economic development is highly complex and involves not merely quantitative but far-reaching qualitative changes. These changes, which sometimes represent a transformation of the economic system and the social structure of a country, are not capable of effective statistical measurement. Moreover, mere quantitative additions to an economy's total output of goods and services may signify little over the longer run if they are accomplished largely at the cost of exhausting international reserves, mortgaging future production to repay sizable external obligations, or fostering an increasingly unequal distribution of income. Economic growth on that basis is not likely to be lasting and, therefore, cannot be regarded as satisfactory.

With these cautions, Charts I and II depict the growth of real output and price movements in sixteen underdeveloped countries. The selection of the particular countries is partly determined by the availability of data and partly by the fact that they represent a cross section of economies at various stages of development and with differing structures. While the data do not purport to offer conclusive evidence of any causal links between inflation or price stability and economic growth, they do lend support to the arguments set forth earlier.

The principal generalisation they suggest is that the countries where prices advanced moderately or not at all from 1950 to 1957 (Chart I) experienced rates of economic expansion which by and large were steady and which clustered around an average of close to 6 per cent. annually. In contrast, the countries where sustained inflationary pressures developed during this period have shown widely varying and somewhat sporadic growth; the average rates of growth have ranged from less than 1 to more than 7 per cent, with an average of about 4 per

cent. for the whole group. These data lend no support to the contention that price stability in underdeveloped countries is incompatible with rapid economic expansion. On the contrary, they confirm the view that, while stable prices tend to promote an orderly and fairly rapid expansion in output, inflation tends to lead to uneven and, in many cases, lagging rates of overall growth.

Chile

Chile represents, of course, a classic case of chronic inflation exploding into hyperinflation. During the three years from 1953 to 1956 the cost of living advanced nearly fivefold; at the same time, the output of goods and services not only stopped expanding, but actually declined. This contraction coincided with a marked curtailing of productive investment and a sharp drop in productivity. However, after the inflation had been brought under some degree of control in 1957, output once again began to expand. Similarly in Bolivia, which experienced one of the most violent inflations ever recorded, the near collapse of the price mechanism was accompanied by stagnation of production and the complete disruption of the economic system.

But even in countries where inflation was somewhat less extreme, the growth of output appears to have suffered as the price level climbed. For example in Argentina, where the cost of living advanced threefold during 1950-57, aggregate output actually declined during the years when the inflation was most intense. The sluggish recovery in the more recent period is presumably far below the country's capacity for growth; even so, it has been achieved mainly by running down international reserves and incurring heavy external liabilities. Similarly, in such countries as Pakistan and Thailand, mounting inflationary pressures have been accompanied by lagging output.

The cases of Brazil, Turkey, and Mexico reveal vigorous rates of economic expansion side by side with fairly intense inflationary pressures. In the Brazilian case, the expansion in output was sustained largely at the cost of incurring a huge and mounting external debt. This debt is likely to place a heavy burden on the balance of payments in the years ahead, making present growth rates difficult to maintain unless inflation is curbed and new stimuli are thereby provided for domestic savings and foreign investment. Turkey's impressive economic expansion under inflationary conditions also has been

underpinned by a massive inflow of external funds, mainly foreign aid. In the case of both Brazil and Turkey, moreover, inflation has tended both to distort the pattern of economic growth and to prevent the expansion from reaching the point where it can continue on its own momentum. Mexico is perhaps the only case where rapid—and on the whole reasonably well-balanced—economic expansion has occurred during a period of substantial inflationary pressures. Many factors, notably Mexico's fairly well-developed basic utilities, its productive agriculture, a large internal market, heavy foreign investments, and an expanding tourist industry, all contributed to this expansion in output. That even rapid growth with inflation has had its drawbacks is suggested by the necessity of several devaluations of the peso in recent years and by the maldistribution of income. In fact, the Mexican authorities have in recent years devoted considerable effort to curbing inflation and thus establishing a sounder foundation for economic advance.

India

Turning to the group of countries shown in Chart I, the relative price stability that characterises them reflects, to a considerable extent, the pursuit of financial policies intended to confine the demand generated by development efforts to proportions that could be satisfied by domestic and imported goods and services. This is particularly true in Ecuador, Ceylon, the Philippines, and India, where various kinds of monetary and fiscal measures have been applied to minimise any strong upward pressure on the price level. The confidence in the stability of the currency engendered by such measures, in turn, has helped to promote voluntary savings, notably in India; it has also induced a more rational investment pattern than that in countries where inflation has been permitted to develop, and has encouraged—particularly in India, Ceylon, and Cuba—the growth of a broad capital market. In most of these countries, the absence of strong inflationary pressures was partly attributable to their capacity to finance a rising volume of imports, by aid or investments from abroad or by rising export income. Exchange inflows from such sources were not, however, unique to these countries and occurred also—and perhaps to an even greater extent—in the countries that experienced marked price advances.

The test of a sound economic development (Continued on page 777)

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

THE K. C. P. LIMITED

(INCORPORATED ON 3RD JULY 1941 UNDER THE INDIAN COMPANIES ACT, 1913)

Issue of 20,000 6½ per cent. Tax-free Redeemable Cumulative Second Preference Shares of Rs. 100 each

Consent of the Government of India has been obtained to this issue by an order of which a complete copy is available for public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

The First Preference and Equity shares of the Company are at present being officially quoted on the Madras Stock Exchange.

The Company has issued a Prospectus in which it has stated that the subscription list will open on 16th November 1959 and will close on 30th November 1959.

SHARE CAPITAL

Nature of Shares	Authorised Capital		Subscribed & Paid-up Capital	
	No. of shares	Amount Rs.	No. of shares	Amount Rs.
(a) 5% Tax-free Cumulative Redeemable First Preference shares of Rs. 100 each	3,287	3,28,700	3,287	3,28,700
(b) 6½% Tax-free Cumulative Second Preference shares	96,713	96,71,300		
(c) Equity shares of Rs. 10 each	20,00,000	2,00,00,000	3,92,410	39,24,100
		3,00,00,000		42,52,800

The Company has no Debentures. It has a mortgage loan of Rs. 87 lakhs under a Mortgage Deed dated 5th August 1957 executed in favour of the Industrial Finance Corporation of India on which Rs. 70 lakhs are outstanding.

PRESENT ISSUE

Out of the Authorised Capital, as per the resolution of the General Body dated 30th March 1959, the Directors decided on 20th May 1959 to issue 43,287—6½% tax-free Redeemable Cumulative Second Preference shares of Rs. 100 each at par. 3,287 shares out of them were reserved to the holders of the 5% tax-free First Preference shares, who were given the option to convert their 5% tax-free First Preference shares into 6½% tax-free Second Preference shares. To the extent that the holders of the First Preference shares opt to convert in such manner, the number of First Preference shares having priority over the Second Preference shares, including the present issue thereof, will diminish.

Out of the balance of 40,000, 6½% tax-free Redeemable Cumulative Second Preference shares, the Life Insurance Corporation of India, Bombay, and the Central Bank of India Ltd., Bombay, have agreed to subscribe for 10,000 shares of the total value of Rs. 20 lakhs. The balance of 20,000 shares are now offered to the public for subscription at par.

Terms of Payment
Payment for the shares issued hereunder should be made at the rate of Rs. 50 per share along with the application. The balance of Rs. 50 is payable within a month of the allotment of the share. If it is not so paid, the balance will have to be paid with interest thereon at 10% per annum from the date of allotment to the date of its receipt by the Company and the shares will become liable to be forfeited after notice.

The said Preference shares shall be entitled to the payment of the Cumulative tax-free dividend of 6½% per annum on the capital paid up for the time being proportionately for the period commencing from the date of allotment of each share.

Terms of Redemption of the Shares Issued Hereunder

The Board may redeem at their discretion on the 1st July of any year commencing from 1st July 1970 to 1st July 1974 (both dates inclusive), the

whole or any part of the said Preference shares for the time being issued and outstanding, out of any moneys which may lawfully be applied for the purpose, at par, together with the fixed dividend due thereon down to the date of redemption, thereof, upon giving to the holders of the shares to be redeemed not less than 3 months previous notice in writing.

Any of the Preference shares not previously redeemed under the foregoing provisions shall be redeemable on 1st July 1974.

History and Development of Business

The Company was registered under the Indian Companies Act, 1913, on 3rd July 1941. It obtained its certificate of commencement of business on 21st September 1942 and has been doing business ever since then.

The Company took over the sugar factory of the Vuyyuru Co-operative Agricultural Industrial and Credit Society Ltd., (V.C.A.I. & C.S. Ltd.) at Vuyyuru, by purchase under a sale deed dated 9th March 1943 for Rs. 22,74,000.

The original Authorised Capital of the Company was as follows:—

6,000 5% tax-free Cumulative Redeemable Preference shares of Rs. 100 each	Rs. 6,00,000
13,000 7½% tax-free Ordinary shares of Rs. 100 each	13,00,000
30,000 Deferred shares of Rs. 10 each	3,00,000
Total	22,00,000

Out of the above, Rs. 16,68,090 was subscribed and paid up as under:—

3,287 5% tax-free Cumulative Redeemable Preference shares of Rs. 100 each of which 3,000 shares were allotted as fully paid up pursuant to the sale deed dated 9th March 1943 mentioned above)	Rs. 3,28,700
10,522 7½% tax-free Ordinary shares of Rs. 100 each	10,52,200
26,719 Deferred shares of Rs. 10 each	2,67,190
Total	16,68,090

The Company, at its class Meetings and Extraordinary General Meeting held on 30th March 1959, cancelled the 2,713 Cumulative Redeemable Preference shares not taken up and increased its Authorised Capital to Rs. 3,00,00,000, which was reorganised as under:—

(a) 3,287 5% tax-free Cumulative Redeemable First Preference shares of Rs. 100 each	Rs. 3,28,700
(b) 96,713 6½% tax-free Cumulative Second Preference shares of Rs. 100 each	96,71,300
(c) 20,00,000 Equity shares of Rs. 10 each	2,00,00,000
Total	3,00,00,000

Under the above reorganisation, the subscribed and fully paid up 3,287, 5% tax-free Cumulative Redeemable Preference shares were termed as 5% tax-free Cumulative Redeemable First Preference shares. The Ordinary shares and Deferred shares became Equity shares with equal rights from 29th July 1959 and for this purpose, the 13,000 Ordinary shares of Rs. 100 each were sub-divided into shares of Rs. 10 each in the proportion of ten shares for every one old Ordinary share and the provision for a fixed Preferential tax-free dividend of 7½% per annum in respect of those shares was abolished. To equate the Deferred shares with the Ordinary shares which were being quoted at about the same in the share market, Rs. 25,34,710 from out of the General Reserves was capitalised and applied in payment in full for 2,53,471 Equity shares of Rs. 10 each of the Company which were allotted to the holders of Deferred shares in the proportion of nine Bonus Equity shares of Rs. 10 each fully-paid up for every Deferred share and the Deferred shares, after the above allotment of Bonus shares, were termed Equity shares. After the said re-

organisation of the Capital structure, the Company has recently issued 1,96,205 Equity shares of Rs. 10 each which have been offered as 'Right' shares to the existing holders of Equity shares in the ratio of 1 : 2 increasing the total Equity Capital of the Company to Rs. 58,86,150. The shares so offered are due for acceptance by the Equity shareholders on or before 14th December 1959.

Development Programme and Prospects

The Company is engaged in the business of manufacture of (1) Sugar, (2) Spirits, (3) Confectionery, (4) Cement, and (5) Heavy Industrial Machinery. When the Company took over the Sugar Factory of V.C.A.I. and C.S. Ltd., at Vuyyuru as mentioned above, its crushing capacity was 800 tons of sugarcane per day. The crushing capacity was increased to 1,200 tons in 1951 and 1,800 tons in 1952. It has now been further expanded to 2,500 tons of sugarcane per day. The Board have under consideration plans for further expansion of the sugar factory to a crushing capacity of 3,000 tons per day.

For the utilisation of the by-products of the Sugar Factory, a distillery with a capacity of 1,500 gallons of Industrial Alcohol per day was erected in 1945 where Industrial Alcohol is being produced. A Confectionery section was started in 1951 and equipped with modern automatic machinery and confectionery of high quality is being manufactured.

For the manufacture of most of the items of plant and machinery required for the Sugar Factory at Vuyyuru and for other industries, a Central Workshops was established at Tiruvottiyur near Madras. This Workshop is manufacturing Heavy Industrial Machinery and is now being expanded and equipped with up-to-date machinery for the manufacture of four complete sugar plants of 1,000 tons daily capacity each and two complete cement plants of 300/600 tons daily capacity each per annum, as also superphosphate and sulphuric acid plants.

The Company has completed the first stage of a Cement Factory at Macherla in Guntur District with an annual capacity of one lakh tons of cement which is supplying cement to the Nagarjunasagar Project. It is now being expanded so as to manufacture 2,50,000 tons of cement per annum in the second stage, which is expected to be completed in 1960.

The Industrial Finance Corporation of India has already advanced to the Company two loans amounting to Rs. 87 lakhs covered by a Mortgage Deed dated 5th August 1957 for the expansion of the Sugar Factory at Vuyyuru and the Cement Factory at Macherla under which Rs. 70 lakhs is now outstanding.

When all the above projects are completed, the total fixed Assets of the Company will be over Rs. 400 lakhs as against the outstanding mortgage loan of Rs. 70 lakhs. Preference Capital of Rs. 43,28,700 (inclusive of the present issue) and Equity Capital of Rs. 58,86,150.

The Company with its Sugar Factory at Vuyyuru, a Cement Factory at Macherla and the Central Workshops at Tiruvottiyur is estimated to earn a profit of not less than 50 lakhs per year from 1960 onwards. The total amount required for payment of dividends on the entire Preference share capital is about Rs. 4 lakhs as against the estimated annual profit of Rs. 50 lakhs. The Preference shares may therefore be considered well covered both as regards capital and also earnings.

Underwriting

The present issue has been underwritten by the following for the amounts set out against them at an underwriting commission of 2½% on the value of the shares underwritten by them respectively:—

1. The Andhra Bank Ltd., Masulipatam.	Rs. 5.0 lakhs
2. Messrs. P. R. Subramanyam, Stock and Share Brokers, 70-A, Stock Exchange Buildings, Apollo St., Fort, Bombay-1.	7.5 "
3. Messrs. Somayajulu & Co., Stock and Share Brokers, 337 Thambu Chetty Street, Madras-1.	7.5 "
	20.0 "

FARM ORGANISATION AND CREDIT

(Concluded from page 768)

time: "Land to the tiller" and "Land for the joint farm." Again and again, Prime Minister Nehru has affirmed that no ceiling on incomes is intended by land ceilings: a man who holds and cultivates 20 acres of dry land would be left undisturbed although he might get Rs. 10 lakhs per annum from a cotton mill he owned. If this be so, it follows logically that the bottom is knocked out of the case for land ceilings: once co-operative joint farming is accepted as the monolithic type on the pooled land, the big and the small landowners would all be workers with the same status, and every cultivator in the area would participate in the processes of joint farming, with incomes according to contributions. There is no point in dispossessing a substantial landholder of his surplus lands now and taking over the balance of his lands to the pool later: we could as well wait till the latter stage came. In the meanwhile, agricultural production would remain undisturbed, perhaps improve on account of enterprise and capital still continuing on the land.

The situation is more confused by an active furtherance of overlapping and superficial credit schemes. For example, the Mysore Conference in July voted for a revolving fund of Rs. 1,000 crores for the purpose of covering the entire 45 or 50 million agricultural families (including cultivating owners big and small, tenants and agricultural labourers), at an average rate of Rs. 200 per family, for crop financing, overlooking for the moment the fact that quite a good number of such families can themselves find seasonal requirements, and that an equally good number prefer to continue with traditional moneylenders, as they find that course more convenient and economical. The authors of this plan also forgot the fact that landless labourers earning wages on the land do not need any seasonal or medium-term advances at all.

The Rural Department of the Government of India has launched a huge experiment on a national scale, with 200 pilot blocks in 4,000 villages, with 400,000 cultivators (not necessarily members of co-operatives), setting the ball in motion with Rs. 8 crores for short- and medium-term credit to be based on personal

character and capacity to repay, not on owned capital or other tangible assets. Even here, premature claims are being made about punctual repayments by individual borrowers. All this would be irreconcilable with the concept of joint farming which is sure to be fully and finally ratified at the Bangalore session of Congress in the ensuing winter. It passes one's imagination as to why and how such contradictory and superficial management and credit schemes are being rushed even when it is almost certain that personal farming will be superseded by pooling lands for joint farming in the course of the next few years. If, however, joint farming is dropped as the sole type of cultivation, personal credit schemes may be proceeded with, but on realistic scales and on modest and cautious estimates of results.

INFLATION AND ECONOMIC DEVELOPMENT

(Concluded from page 775)

programme is that the growth in output and productivity strike a sustainable balance among the different economic sectors, that the process be socially equitable, and above all that it be self-propelling, leading to greater and greater real income and not to an early stagnation. Inflation as a part of the growth process does not help to fulfil any of these requirements. It directs financial and real resources to the least productive segments of the economy and favours particular economic sectors at the expense of others. It is likely to be accompanied by gross social inequities that impair the basis of economic progress and undermine political stability. And it leads to balance-of-payments difficulties and heavy international reserve losses that eventually bring the economic development process to a grinding halt.

Reasonable price stability, by contrast, provides much more favourable conditions for sound economic development. First, it permits investors and entrepreneurs to plan rationally for the future, thus promoting the kind of long-term capital formation on which continuing productive advance is based. Secondly, it sustains confidence in the currency, thus permitting money to perform its proper function in the economy and encouraging the growth of savings. Finally, stable prices minimise the possibilities for sudden shifts in income distribution that lead

to social frictions, intrusive Governmental controls, and political instability.

Once inflation has been permitted to get out of hand, as it tends to do most quickly in the underdeveloped countries, stabilisation involves adjustments that are immeasurably more painful than any initial policy of preventing inflation could be. In practice, as many countries have found, restoration of price stability is difficult to achieve merely by stimulating production through increased investment, in the hope that the rise in output will eventually catch up with money income and offset the price pressures that may have been tolerated at the start. Moreover, once prices have been rapidly on the move, stabilisation programmes require much more than merely stopping further expansion in the money supply or braking the wage-price spiral. Inflation will usually have already distorted the whole pattern of production and relative incomes and prices. Correction of these distortions involves difficult adaptations on the internal and external front, including austerity measures that often are not readily accepted by the public. Nor can stabilisation on necessarily be accomplished rapidly, by the mere act of resolutely adapting a "tough" programme. The restoration of confidence in the currency and the reallocation of resources, once inflation has worked its havoc very long, requires in some form all the stern measures just described, and even then takes time.

Economic development through inflation has repeatedly turned out to be a chimera. It is unacceptable as a conscious economic policy. Price stability, as the record shows, is not a luxury that only a few selected countries can afford; nor is it an unattainable goal in a country attempting to achieve a breakthrough that will launch the economy on the road to cumulative economic growth. If it were, there could be no balanced or lasting economic development.

The limitation of general movements in prices is never easy; no single formula to that end has been suggested here. But the effective resolution of any problem, great or small, depends first upon a recognition of the nature of the problem. And the first step in the design of any framework of public policy on economic growth, in the unique conditions of any country, is to recognise that reasonable price stability is not an alternative to economic development but an essential condition for its achievement.

Managing Agents

V. Ramakrishna Sons Private Ltd. are the Managing Agents of the Company under an Agreement dated 1st January 1955 for a period of ten years therefrom. The said Managing Agency, however, expires on 15th August 1960, by virtue of Section 330 of the Companies Act 1956. An Extra-

ordinary General Meeting of the Company has been convened to consider the renewal of the said Managing Agency for a further period of ten years from 15th August 1960, subject to the approval of the Central Government. The remuneration payable to the Managing Agents under the said Managing Agency agreement

is 10% of the net profits, subject to modification by the Central Government.

Voting Rights

The holders of Preference shares issued after 1st April 1956 shall have such voting rights as are prescribed and limited by Section 87(2) of the Indian Companies Act 1956.

Application for Allotment

The application for shares must be made in the official form accompanying the prospectus and is liable to be refused if not so made. The application form duly filled in together with the remittance of Rs. 50 payable per share along with the application must be forwarded to as to reach the Registered Office of the Company at 38, Mount Road, Madras-6. Cheques and Drafts must be made out in favour of the Company and crossed "A/c Payee only." Cheques and Drafts drawn on a Bank outside the City of Madras must include Bank collection charges. A separate cheque or draft must accompany each form.

Applications must be for a minimum of five shares.

The allotment will be notified by the despatch of an allotment letter, but the Directors reserve the full and uncontrolled right of accepting or rejecting any application in whole or in part. Where no allotment is made, the entire application money and where the number of shares allotted is less than the shares applied for, the balance of the application money will be returned to the applicant by a cheque on a Madras Bank without any interest thereon.

Copies of the Prospectus and forms of application can be obtained from the following Offices:—

1. The Registered Office of the Company at 38, Mount Road, Madras-6.
2. The Factory Office of the Company at Vuyyuru, Krishna District.
3. The Branch Office of the Company at Buckinghampet, Vijayawada.
4. The Central Bank of India Ltd., Bombay, Madras and Vijayawada.
5. The Andhra Bank Ltd., Madras, Masulipatam and branches.
6. M/s. P. R. Subramanyam, Stock and Share Brokers, 70-A, Stock Exchange Building, Apollo Street, Fort, Bombay.
7. M/s. Somayajulu & Co., Stock and Share Brokers, 337, Thambu Chetty Street, Madras-1.

For THE K. C. P. LIMITED,
V. RAMAKRISHNA,
Chairman.

WORLD AGRICULTURAL TRADE BOTH VOLUME AND VALUE SHRINK

INTERNATIONAL trade in agricultural products has a significant bearing on the tempo of world economic development. Consisting as it does of essential foodstuffs and industrial raw materials, agricultural exports have a vital role to play in determining world industrial activity as well as the standard of living of the people, particularly in exporting countries. It must be admitted, however, that the trend in agricultural exports not only conditions but also is conditioned by the general world economic activity. This fact has been clearly illustrated by the repercussions of the 1957-58 industrial recession in the U.S. and the countries of Western Europe on the exports of primary products. According to the State of Food and Agriculture 1959, published by the Food and Agricultural Organisation of the United Nations, both the volume of, and the earnings from, agricultural exports suffered a perceptible setback—by 3 per cent. and 9 per cent., respectively, to be exact—in 1958, primarily owing to the impact of recession. Raw materials of agricultural origin in particular were worst hit; their volume of exports fell by about 8 per cent. and their average price by about 16 per cent. in 1958, so that total earnings from the commodities of this group were, as compared with 1957, lower by no less than 23 per cent. At the same time, the index of average prices of manufactured goods in world trade showed no change from 1957 to 1958. Consequently, the terms of trade for agricultural products, which has been falling ever since the Korean boom, further gave way by about 7 per cent. over the year to the lowest level in the post-war years.

Production and Exports

The following table gives the world production and exports of major commodities in the pre-war period 1934-38 (av.), 1948-52 (av.) and also in the two latest years for which information is available:

(In million metric tons)					
	Average 1934-38	Average 1948-52	1957-58	1958-59 (Prelim.)	
Production*					
Wheat	95.0	118.6	126.0	138.6	
Barley	28.5	36.0	40.9	51.5	
Oats	27.5	43.0	49.9	48.3	
Maize	94.1	119.9	138.5	148.4	
Rice (milled equivalent)	70.2	74.8	80.8	94.1	
Sugar	20.0	25.8	34.4	38.0	
Vegetable oils	8.2	12.0	14.8	15.0

Rubber	1.0	1.8	2.0	2.1	

* Excluding U.S.S.R., Eastern Europe and Mainland China.
† Including exports from the rest of the world to the U.S.S.R., Eastern Europe and Mainland China.

In distinct contrast to the increases recorded in the past few years, the volume of agricultural trade fell by about 3 per cent. in 1958. It may be recalled that the volume of trade (average of exports and imports), which had remained more or less stable until 1954, rose successively in subsequent years, by 7 per cent. in 1955, 8 per cent. in 1956 and 4 per cent. in 1957. These increases, it may be added, reflected largely the intensified surplus disposal operations of the U.S. rather than any rapid improvement in the basic structure and pattern of agricultural exports and its production. The decline in the year under review was the result of a fall in the U.S. exports, especially of cotton. The other factors included lower cereal harvests in 1957-58 in the rice exporting countries in the Far East and in Australia and a reduced output of cocoa and copra. The impact of the recession, however, was uneven on the different commodity groups. Foodstuffs and beverage crops, in general, fared better than agricultural raw materials. The following table shows the selected annual

indices of the volume of world agricultural trade by commodity groups:

	1958 (Prelim.)	1957	Average 1948-52	Average 1934-38
(Base 1952-53 = 100)				
Total trade (agricultural and non-agricultural)	133	135	87	66
All agricultural products*	113	121	94	99
Food and feeding stuffs	123	128	91	92
Food and feeding stuffs	127	129	93	98
Cereals	117	117	93	100
Sugar	118	119	89	79
Oilseeds and vegetable oils (edible)	143	145	96	120
Fruits, fresh and dried	120	122	83	89
Livestock and livestock products (edible)	135	133	94	97
Beverages and tobacco	113	116	95	86
Agricultural raw materials	106	117	97	110

* Includes exports to and imports from the U.S.S.R., Eastern Europe and China, but excluding trade within this group of countries.

Although there were marked variations in the trends in the different regions, they do not modify substantially the post-war trend towards a considerable fall in net exports of food and feeding stuffs from the less-developed regions to the more-developed regions of the world. Since food production in the less-developed regions in general did not keep pace with their requirements, some countries have had to curtail exports, while others have become substantial net importers of foodstuffs. Net exports of beverage crops, on the other hand, have expanded fairly steadily, as the domestic markets for these products in the less-developed countries are still too small to absorb them in appreciable quantities. Net exports of raw materials have fluctuated at roughly the pre-war average, in accordance with the level of economic activity in industrialised countries, and export outlets have been limited by synthetic substitutes and by the more economic use of raw materials in industry. Another factor limiting the world trade in agricultural products has been increased domestic production in the more developed countries of all commodities except those which can be produced only in tropical zones.

Among the main regions of the world, Western Europe and Africa slightly increased their gross exports of agricultural products in 1958. In Latin America, there was a fairly substantial recovery from the low level of 1957, when exports of cereals, cotton, and coffee had fallen sharply. The volume of exports from North America fell by 10 per cent. and was somewhat less than in 1956. There were declines of some 6 to 9 per cent. in Oceania and the Far East (excluding China) and a small reduction in the Near East. Gross agricultural imports increased in North America, Latin America, and Oceania in 1958. The major decline was inevitably in Western Europe, which accounts for more than half the world's imports of agricultural products.

Export Prices

The setback in 1958 was in evidence not only in the volume of agricultural exports but also in their value, as already mentioned. As with the volume of trade, the main decline in average export unit values during the year was in the agricultural raw materials group. Average unit values for this group of products has been falling since the beginning of 1957, but the pace of decline was accelerated during the first nine months of 1958; consequently, the average for the year was 16 per cent. less than in 1957. For the first few months of 1959, however, price series show some recovery for both wool and rubber.

Average unit values for the food and feeding stuffs group fell by 4 per cent. in 1958, after rising slowly over the previous two years. Prices for cereals were again more or less unchanged, as lower maize prices were counterbalanced by increased prices for rice, following the poor 1957-58 harvests in most Far Eastern countries. Sugar prices, which had climbed in 1957, fell substantially. Trends for the different edible oils and oilseeds varied considerably, but, for the group as a whole, there was a further slight decline in prices. While prices rose for all types of meat (except mutton and lamb), heavy supplies on the main Western European markets for butter and cheese brought about a rapid fall of 14 per cent. in prices of dairy products. The decline in food and feeding stuff prices appears to be continuing, for, during the early months of 1959, only price series for some oilseeds, butter, and cheese have shown much recovery. In spite of a rise of more than 50 per cent. in prices for the small cocoa crop, average unit values for the beverages and tobacco group fell

slightly in 1958. Coffee prices fell by 16 per cent. and there were small declines for tea and tobacco. From the beginning of 1959 prices of cocoa have also joined in the general downward movement. The reduction of 7 per cent. in 1958 in average export unit values for agricultural products as a whole took them to their lowest level since the war. The indices of the average export unit values (average prices) of the various agricultural products in world trade is shown in the following table:

	1958 (Prelim.)	1957	1948	1947
(Base 1952-53 = 100)				
Food and feeding stuffs	87	91	117	106
Beverages and tobacco	99	100	76	72
Agricultural raw materials	79	84	88	71
Forest products	90	94	93	83
All agricultural products taken together	87	94	99	88
Manufactured goods	105	105	101	97
Terms of trade	83	90	98	90

Note: The data exclude those relating to the U.S.S.R., Eastern Europe and China.

Terms of Trade

The terms of trade for agricultural countries, in other words, their purchasing power for the manufactured goods which are the main imports of agricultural exporting countries, were also lower in 1958 than in any post-war year; but they were still about 30 per cent. higher than in 1934-38. The report has highlighted the fact that the main significance of changes in the terms of trade for agricultural products lies in their influence on the earnings of foreign exchange of agricultural exporting countries. The latter, in turn, will obviously depend on the particular products exported. Export earnings of many of the less-developed countries are very narrowly based and depend heavily on one or two agricultural products, for example, cocoa in Ghana or coffee in Colombia.

The total real value of agricultural exports declined by 9 per cent. to approximately the level of 1952-53. The volume of exports in 1958 was about 19 per cent. larger than in 1952-53 and 25 per cent. larger than in 1948-52, but these increases in volume have brought virtually no improvement in total earnings from agricultural exports. Indeed, since the figures for 1958 include a considerable proportion sold under special terms in the course of various schemes of surplus disposal, earnings from commercial exports must have been substantially less than in 1952-53. In comparison with the pre-war period, however, whereas the 1958 volume of exports was only about 20 per cent. larger, the real value still showed an increase of nearly 60 per cent.

Earnings Vary

The situation regarding export earnings is seen to have varied considerably from region to region, and data for single countries would certainly show still greater variation. Thus, in Oceania, the volume of exports in 1958 was about 8 per cent. less than the year before, and the corresponding export earnings in real terms some 23 per cent. less, indicating a fall of around 17 per cent. in the terms of trade. In Latin America, an increase of 4 per cent. in the volume of exports was accompanied by a decline of 7 per cent. in export earnings, so that the terms of trade fell by some 12 per cent. In the Far East, earnings from agricultural exports fell by 11 per cent. in 1958, but about half of this movement reflected a decline in the volume of shipments. Both the Near East and Africa maintained about the same volume of agricultural exports in 1958 as the year before, but, while export earnings in the latter region were at about the 1957 level, those in the Near East fell by some 10 per cent.

The F.A.O. Report has devoted a separate section to the exclusive study of imports from and exports to the U.S.S.R., Eastern Europe and China, with particular reference to trade among themselves. The Soviet imports of such products as fruit, beverages, tobacco, wool, and rubber have expanded sharply in recent years with the increased emphasis on consumer needs. Increased domestic production has led to larger exports of many products, including cereals, cotton, hemp and flax, and reductions in net imports, especially of vegetable oils and some animal products, while the country has become a net exporter of butter and cheese to Eastern Europe. The U.S.S.R.'s grain exports fell sharply in 1957-58 as a result of lower harvests, but, in 1958-59, they are expected to have risen to 8 million tons. Exports from Communist China, which is the U.S.S.R.'s largest supplier of agricultural imports, appear to have increased sharply in 1958, especially those of rice. While the agricultural trade of the U.S.S.R., Eastern Europe, and China with the rest of the world is now much greater, it seems likely, according to the F.A.O. Report, that the bulk of their trade will continue to be among themselves.

FAVOURABLE YEAR FOR INDIAN CABLES

DIVIDEND MAINTAINED ON HIGHER CAPITAL

THE year ended 31st March 1959 proved to be a favourable one for the Indian Cable Company Ltd. (Chairman and Managing Director: Mr. B. J. Woodley, Calcutta). The copper market turned in its favour and the first fruits of expansion schemes were harvested during the year, unlike in the previous year when world prices of copper suffered a landslide and there was an unavoidable cut in output during the final phases of factory reorganisation. The turn in the Company's fortunes during the year under review is reflected in the expansion of Rs. 40 lakhs in sales and the rise of Rs. 7.23 lakhs to Rs. 118.38 lakhs in gross profit. This increase in gross profit is in refreshing contrast to the drop of Rs. 49.04 lakhs to Rs. 111.15 lakhs in 1957-58. It must, however, be noted that the gross profit for the year under review has been arrived at after writing off bad debts to the tune of Rs. 26.30 lakhs. Had it not been for this, the gross profit for 1958-59 would have been of the order of Rs. 144.68 lakhs, representing an increase of Rs. 33.53 lakhs over the year. Nevertheless, it would have been well below the profit earned in 1956-57.

The net profit for the year under review amounts to Rs. 50.62 lakhs, which compares favourably with that of Rs. 36.94 lakhs for the previous year. But for the large bad debt written off, the year's net profit would have even exceeded the previous high of Rs. 61.17 lakhs touched in 1956-57 by a handsome margin of Rs. 15.75 lakhs. The relatively larger rise in net profit is due to the cut in the provision for taxation from Rs. 55 lakhs to Rs. 48 lakhs.

Explaining the unavoidable step taken by the Directors to write off a large portion of bad debts, the Directors observe, in their latest report, that the Company had taken all steps possible to recover the debts considered doubtful, which as on 31st March 1958 had aggregated Rs. 38.42 lakhs. "Of that amount," they add, "certain debts aggregating Rs. 26.30 lakhs have proved to be irrecoverable, despite the orders of the High Court, and the Company has been advised to write off these debts from the profits of the year." This is covered by a sum of Rs. 13 lakhs transferred from the provision built up in previous years for bad and doubtful debts and the income-tax relief secured in respect thereof.

Thanks to the sharp rise in net profit and the provision for doubtful debts written back, the Directors have been able to strengthen the reserves considerably, even after adding Rs. 12.75 lakhs to the development rebate reserve (as against Rs. 1.25 lakhs transferred last year). Thus, a sum of Rs. 5 lakhs (as against Rs. 3.75 lakhs) has been added to the general reserve, Rs. 5 lakhs (same as in the previous year) to the reserve for replacement of fixed assets and Rs. 3.05 lakhs (Rs. 3 lakhs) to the debenture sinking fund. The distribution to shareholders has been maintained, albeit on a higher paid-up capital, at 15 per cent. per annum (free of income-tax), made up of a dividend of 12½ per cent. and a cash bonus of 2½ per cent. on ordinary, as well as participating preference shares. The distribution on ordinary shares, it may be noted, is on a bigger capital following the rights issue of 828,848 ordinary shares of Rs. 10 each during the year under review.

The salient features of the Company's profit and loss account for 1958-59 are presented against the background of those for the previous three years in the following comparative table:

(In lakhs of rupees)				
	1959	1958	1957	1956
Sales and internal consumption of goods	730.12	689.06	708.42	614.55
Closing stocks of finished goods and work-in-progress	77.77	72.29	78.97	65.54
Other income	7.88	9.77	11.53	4.04
Raw materials consumed	371.28	356.22	396.36	348.43
Other expenses including purchases of goods	253.83†	280.67	186.83	140.09
Gross profit	118.58	111.15	180.19	139.18
Depreciation	2.81	2.60	2.85	1.47
Directors' Commission	17.15	16.99	15.67	14.07
Taxation	48.00	55.60	79.50	68.00
Net profit	50.62	36.94	61.17	55.59
Excess provisions written back	13.00	13.00		
To reserves and provisions	27.62	15.58	26.58	25.06
Dividends:				
6% participating preference	1.93	1.93	1.93	1.93
Ordinary	35.37	22.93	22.93	22.93
	(D.12½% + B.2½%)	(D.12½% + B.2½%)	(D.12½% + B.2½%)	(D.12½% + B.2½%)
Carry forward	40.00	41.90	35.10‡	32.04

† Includes Rs. 20.30 lakhs written off as bad debts.
‡ After paying Rs. 6.63 lakhs as extraordinary dividend at 4 per cent. on ordinary as well as participating preference shares in respect of the year 1956-57.

There has been a substantial rise of Rs. 13.99 lakhs in salaries, wages and bonus paid during the year, of Rs. 2.72 lakhs in cost of repairs and renewals and of Rs. 1.26 lakhs in selling expenses. But these increases have been offset, to some extent, by a saving of Rs. 4.08 lakhs in duty, dock clearance and freight, of Rs. 2.54 lakhs in sub-contractors' expenses and of Rs. 2.40 lakhs in bank charges and interest.

As stated at the outset, the first fruits of the Company's expansion schemes were harvested during the year. Referring to the progress of these schemes, the Chairman, Mr. B. J. Woodley, in his statement accompanying the Directors' report, says:

"Although it necessarily takes time to bring new plant into full operation, we have already made substantial progress in that direction. The new paper cable division has reached 80 per cent. of planned full production, rubber insulated wire output is running at 75 per cent. of planned capacity, while synthetic enamelled wires are being manufactured at a rate considerably in excess of the quantity originally envisaged. An added cause for satisfaction is that current production is rising steadily and continuously towards fulfilment of planned targets."

During the year under review, the Company received a number of valuable orders from the new steel plants at Bhilai, Durgapur and Rourkela, the Neyveli Lignite Corporation, the Heavy Electric Plant at Bhopal and the Eastern Railway Electrification Project. The Company's contracts department has also had a busy and successful year. Alluding to the progress of this department, the Chairman observes:

"They have completed the commissioning of two of the three 30 M.W. turbo alternator sets at the Korba thermal station which will feed the Bhilai steel project, and have made considerable progress on the electrical transmission system at the Barsua Iron Mines which will supply power to the Rourkela steel project and in connection with which an extension to the original order has recently been awarded to us. Other construction orders received during the year include the cabling of two 30 M.W. sets for the extension to the Kharakheda power station and the new thermal station at Akola both in Bombay State; also the complete electrification of the large extension to Messrs. Guest, Keen Williams Ltd. factory in Calcutta."

The Company has been fortunate in continuing to receive the utmost consideration from the licensing authorities in respect of import of essential raw materials and machinery components. However, the increasing delays in the issues of licences have, the Chairman points out, "created great difficulty in planning forward factory production and on occasion resulted in temporary stoppage of machinery while awaiting permits to import the spare parts required for repairs." The coal and coke position is said to have eased considerably, while the issue of steel quotas and the corresponding receipts of supplies from the manufacturers are seriously in arrears. The congestion in the port of Calcutta, coupled with the shortage of railway wagons, has prompted the Company to make greater use of road transport services for moving essential supplies to the factory in order to maintain speed and efficiency. The shortage of power is also a problem, as the Company is not receiving its full requirement from the Damodar Valley. However, by mutual agreement with other factories in Tatanagar area and by adopting staggered working hours, it has been able to avoid loss of production.

The working of the Company during the current year so far is said to be encouraging with a full order book for all its products. The Company is, however, conscious of the prospect of increased competition in the years to come. Two new cable factories of appreciable size are to commence production shortly and two further major factories are planned to come into operation in the near future. It is, however, confident of meeting this competition. The demand for its products is also bound to expand.

The Company's financial position is quite impressive. As stated earlier, the paid-up capital has been raised from Rs. 165.77 lakhs to Rs. 248.65 lakhs and this is supplemented by reserves and surplus aggregating Rs. 224.80 lakhs. Thanks to the improvement in cash position, the Company has been able to wipe off its loan liability to banks, which at the end of the previous year had stood at Rs. 45.79 lakhs. It has also redeemed Rs. 2.20 lakhs worth of 5½ per cent. 1964-69 debentures, the outstanding liability on this account now being Rs. 97.80 lakhs. The other current liabilities and provisions stand at Rs. 229.42 lakhs, which are more than adequately covered by current assets aggregating Rs. 644.63 lakhs. Of these current assets, a sum of Rs. 11.23 lakhs represent outstanding doubtful debts, as against which the provision made in the accounts is Rs. 7 lakhs. In the Chairman's opinion, this provision is "more than adequate, as securities are lodged with the Company in respect of the major portion of the amount shown as doubtful and payments are being received in the form of regular instalments." There has been an addition of Rs. 21.03 lakhs to the block account during the year bringing its gross value to Rs. 276.17 lakhs at the end of the year under review. This has been written down to a book value of Rs. 156.04 lakhs.

The Rs. 10 fully paid-up shares of the Company are being currently quoted on the Calcutta Stock Exchange at Rs. 30.62 cum-div. On an ex-div. basis and at the current rate of dividend, the yield works out to 5.1 per cent. per annum, free of tax.

PENCH VALLEY COAL HALVES DIVIDEND

The Directors of the Pench Valley Coal Company, Ltd. (Managing Agents: Messrs. Shaw Wallace & Co., Ltd., Calcutta), have recommended a 50-per cent. cut in dividend for the year ended 31st March 1959, that is, to Re. 1 per share of Rs. 10 each from Rs. 2 paid for each of the previous two years. This follows a setback in earnings, despite a rise in production and despatches of coal. The earnings have gone up from 490,042 tons (in 1957-58) to a high of 500,161 tons and despatches from 474,880 tons to 503,180 tons. It will be noted that despatches during the year under review even exceeded production, resulting in a reduction in stocks. Nevertheless, the gross profit has declined from Rs. 12.20 lakhs to Rs. 10.02 lakhs. This is due to a sharp rise of Rs. 11.92 lakhs in expenses.

With the setback in earnings, the Managing Agents' remuneration has been reduced from Rs. 1.11 lakhs to Rs. 77,185 and the provision for taxation from Rs. 4.54 lakhs to Rs. 4.23 lakhs. The provision for depreciation is also lower at Rs. 2.29 lakhs, as against Rs. 3.74 lakhs set aside a year ago. These essential appropriations leave a net profit of Rs. 2.63 lakhs, as compared with Rs. 2.81 lakhs for 1957-58. A sum of Rs. 2.26 lakhs, representing excess provisions made in previous years, has been written back; the corresponding transfer in 1957-58 was Rs. 2.33 lakhs. After taking this into account, the Directors have raised the transfer to the development rebate reserve from a mere Rs. 4,800 to Rs. 1.35 lakhs and that to the general reserve from Rs. 70,000 to Rs. 2 lakhs. The larger allocation to the general reserve is in replenishment of the withdrawal made in 1957 and has been made with a view to providing finance for the Company's development plans. The proposed dividend will absorb Rs. 1.57 lakhs, as against Rs. 3.15 lakhs a year ago, leaving a surplus of Rs. 32,085 to be carried forward, as against Rs. 36,465 brought in.

The Directors point out that the recommendations of the Coal Prices Revision Committee (which have been accepted by the Government of India) will not be applicable to the Company until its coal has been graded. "Every endeavour is being made to allow the new prices to be effective at an early date," the Directors add, as the present prices are considered uneconomic and stand in the way of further development. Disputes arising out of the Labour Appellate Tribunal have been submitted to arbitration which is in progress now, but the Directors cautiously warn that "it is not unlikely that some burden may be thrust on the industry as a whole."

The Company has made a capital expenditure of Rs. 8.79 lakhs during the year under review (excluding capital work-in-progress) of the value of Rs. 1.93 lakhs, bringing the total expenditure so far to Rs. 68.60 lakhs. In order to maintain the improvement in production and despatches, the Directors observe, considerable expenditure will be necessary in the years to come. The gross block has been written down to Rs. 23.76 lakhs. The other assets aggregate Rs. 45.45 lakhs, as against which the current liabilities and provisions amount to no more than Rs. 34.87 lakhs. The excess of all assets over current liabilities is Rs. 36.47 lakhs and this is represented by a paid-up capital of Rs. 15.75 lakhs and reserves and surplus amounting to Rs. 20.72 lakhs.

(Incorporated in England)
Liability of Members Limited

DIVIDENDS

THE FOLLOWING FINAL DIVIDENDS have been recommended in respect of the year ended 31st March 1959, payable on the 27th November, 1959:—

On the Preference Shares 5 per cent. (Five Shillings per share) less U.K. Income-tax of seven shillings and nine pence in the £ Sterling.

On the Ordinary Shares 10 per cent. (Ten Shillings per share) less U.K. Income-tax of seven shillings and nine pence in the £ Sterling.

Payment of any Dividend declared will be made only to those Members whose names are registered in the Books of the Company on the 17th November, 1959 or to their Mandatees.

Dividend Warrants to Members on the Calcutta Register will be made payable in Calcutta.

No applications for warrants will be necessary. Claims on behalf of holders of shares on blank transfer will not be entertained.

The Share Transfer Books will be closed from the 4th November, 1959, to 17th November, 1959, both days inclusive.

By Order of the Board,
JARDINE HENDERSON, LIMITED,
D. FORDWOOD,
Secretary,
Agents.

4, CLIVE ROW,
CALCUTTA, 27th October, 1959.

BHARTIA ELECTRIC STEEL COMPANY, LIMITED

CIRCULAR

To
THE SHAREHOLDERS.

PURSUANT to the Scheme approved by you in the Extraordinary General Meeting of the Company held on the 23rd July 1959 and sanctioned by the Hon'ble High Court at Calcutta on the 11th August, 1959, a new company called "CALCUTTA STEEL CO. LTD." has since been promoted with an authorised Capital of Rupees One crore divided into ten lakhs Equity Shares of Rs. 10 each. As envisaged in the scheme, 5 lakhs Equity Shares of Rs. 10 each will be issued at present. The sanction of the Controller of Capital Issues for issue of the above capital has also been received by the new Company.

In terms of the scheme, each holder of one Equity Share of Rs. 10 each, fully paid up, in this Company as on the date of issue of capital by the new company shall be offered one Equity Share of Rs. 10 each in the new company at par with a right to renounce the offer in favour of his or her nominees, the offer to remain valid for acceptance for a period of 30 days from the date of offer.

The Directors of the new company have informed this company that they propose to make an offer of the said issue on the 16th November, 1959. Prospectus will be published by Messrs. Calcutta Steel Co. Ltd. in due course. The holders of shares in this company, particularly those holding shares on blank transfer deeds, are, therefore, hereby advised and requested, in their own interest, to get their holdings in this company registered in the books of the company, before the 15th November, 1959.

By Order of the Board,
R. L. BHARTIA,
Director.

4, OLD COURT HOUSE STREET,
CALCUTTA-1, 30th October 1959.

Note: The Share Transfer Register of the Company will be closed from 16th November to 16th November, 1959, both days inclusive.

DUNBAR MILLS LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the shareholders of Dunbar Mills Limited will be held at the Registered Office of the Company, 21 Strand Road, Calcutta, on Thursday the 26th November, 1959 at 3 p.m., to consider and if thought fit to pass with or without modification the following resolution:

(As a Special Resolution) "That the Company hereby authorises the Board to issue 9,500 new Ordinary Shares of Rs. 100 each and to offer them for subscription on the following terms and conditions:

(a) The new Ordinary Shares shall rank pari passu with the existing Ordinary Shares of the Company in all respects.

(b) The shares shall be offered for subscription for cash at par to the persons whose names appear in the Company's Register of Members on the date of passing of this resolution as nearly as circumstances admit, in the proportion of one new Ordinary Share for every two Ordinary Shares held by each such member on the said date.

(c) The offer aforesaid shall be made by the Board by notice specifying the number of shares offered and limiting a time not being less than 15 days from the date of the offer within which the offer, if not accepted, will be deemed to have been declined.

(d) The offer aforesaid shall include a right exercisable by the person concerned to renounce the shares offered to him or any of them in favour of any other person.

(e) After the expiry of the time specified in the notice aforesaid or on receipt of earlier intimation from the person to whom such notice is given that he declines to accept the shares offered, the Board may dispose of them in such manner as it thinks most beneficial to the Company.

(f) The issue, offer and allotment of the new Ordinary Shares aforesaid shall be made in such manner and on such terms, consistent with this resolution, as the Board may in its absolute discretion determine and without prejudice to the generality of its powers given under this resolution the Board is hereby explicitly authorised to decide and settle all questions relating to the issue and allotment to non-resident members of the Company and all questions relating to the fractional allotments of the said shares."

The Register of Members and the Share Transfer Books of the Company will remain closed from 19th November, 1959 to 26th November, 1959, both days inclusive.

By Order of the Board,
KETTLEWELL BULLEN & CO. LTD.,
Managing Agents.

21 STRAND ROAD,
CALCUTTA, 27th October, 1959.

N.B.—A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

(2) An Explanatory Statement relating to the above resolution is annexed to the Notice convening the Extraordinary General Meeting sent to the members individually.

THE SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LIMITED

TIRUCHIRAPALLI, 17th October 1959.

LABOUR

(Concluded from page 766)

wage levels are low or labour unorganised but is also found in some highly industrialised countries like the United Kingdom, the U.S., New Zealand and Australia.

As collective bargaining, desirable though it is, has not taken firm roots in this country, disputes relating to wages tend to be increasingly settled by adjudication. Industrial Tribunals, presided over by judges with little or no knowledge of industrial economics, are surely not the ideal agency for settling wage disputes, especially because in fixing a wage rate for a particular industry or unit, a vast complex of economic factors have got to be taken into account. A body like a Wage Board, presided over by an independent chairman and two independent members and an equal number of representatives of workers and employers fully conversant with the various aspects of the wage question, is certainly better qualified to decide wage questions than a purely judicial or quasi-judicial tribunal where the issues are presented and argued by professional lawyers. In fine, if the Wage Boards are manned by competent persons and maintain an atmosphere of a petent number of representatives of workers and employers fully conversant with the various aspects of the wage question, is certainly better qualified to decide wage questions than a purely judicial or quasi-judicial tribunal where the issues are presented and argued by professional lawyers. In fine, if the Wage Boards are manned by competent persons and maintain an atmosphere of a petent number of representatives of workers and employers fully conversant with the various aspects of the wage question, is certainly better qualified to decide wage questions than a purely judicial or quasi-judicial tribunal where the issues are presented and argued by professional lawyers. In fine, if the Wage Boards are manned by competent persons and maintain an atmosphere of a petent number of representatives of workers and employers fully conversant with the various aspects of the wage question, is certainly better qualified to decide wage questions than a purely judicial or quasi-judicial tribunal where the issues are presented and argued by professional lawyers. In fine, if the Wage Boards are manned by competent persons and maintain an atmosphere of a petent number of representatives of workers and employers fully conversant with the various aspects of the wage question, is certainly better qualified to decide wage questions than a purely judicial or quasi-judicial tribunal where the issues are presented and argued by professional lawyers. SYNOPSIS OF COMPANY REPORTS

Hind Cycles Ltd.

THE directors of the above Company (Chairman: Mr. R. D. Birla, Bombay) submit the nineteenth annual report with the audited accounts of the Company for the year ended 31st March 1959.

The loss for the year before charging to depreciation and development rebate amounts to Rs. 4,91,637 (profit of Rs. 6,97,890). Adding there to provision for development rebate of Rs. 64,600 (nil) there is a total debit of Rs. 5,56,237 (credit of Rs. 52,992 after providing Rs. 5,47,000 for depreciation including development rebate and Rs. 33,500 for wealth-tax and provision for taxation for previous years of Rs. 64,398). Deducting therefrom the excess provision for taxation of previous year Rs. 6,209 (nil) and the balance brought forward from previous year of Rs. 67,978 (Rs. 14,986 there remains net loss of Rs. 4,82,050 (Rs. 67,978) to be carried forward. Further the directors have drawn from dividend equalisation fund Rs. 46,234 (Rs. 2,62,802) which is proposed to be appropriated for payment of dividends for the year as under: To dividend at 5 per cent. on 5,000 taxable redeemable cumulative preference shares of Rs. 100 each absorbing Rs. 17,125 (Rs. 17,125), to dividend at 5½ per cent. on 7,000 taxable redeemable cumulative preference shares of Rs. 100 each absorbing Rs. 26,373 (Rs. 26,373), to dividend at 5½ per cent. on 1,926 taxable redeemable cumulative preference shares of Rs. 25 each absorbing Rs. 1,814 (Rs. 1,814) and to dividend at 6 per cent. on 2,242 free of income-tax redeemable cumulative preference shares of Rs. 100 each absorbing Rs. 922 (nil).

For the year ended 31st March 1958 the directors also paid a dividend on ordinary shares at Rs. 7.00 per share, free of tax, absorbing Rs. 2,17,490. This amount was drawn from the dividend equalisation fund. The directors have to state that during the year under report no provision for depreciation of Rs. 5,35,300 is made. No provision for wealth-tax is made as the Company has been advised that no wealth-tax will be payable by the Company as the Company has incurred losses and has not declared dividend on equity capital during the year.

As in the last year the main contributing factor for the unsatisfactory results for the year under review is the increase in the labour cost. During the course of the year the seriousness of the situation had been pointed out to the workers through their Works Committee and the Union. They have been explained how the unusually high labour cost in the factory has resulted in the loss during the year. The directors however regret that efforts with the Union leaders did not bear any fruit but on the contrary, production went down by about 10 per cent. and wages and salaries cost went up instead of going down. The workers have been finally warned about the ultimate result.

It seems that the matter has now been taken seriously by the Union. They have agreed to refer the question of labour cost to arbitration. The directors hope that, through the proposed arbitration labour cost will be revised to a reasonable level so that optimum production at reasonable labour cost will be achieved in near future.

As the shareholders are aware that the Company had received last year the consent of Controller of Capital Issues for the issue of capital of Rs. 30,00,000 in preference shares. In terms of that consent the Company had first offered the said preference shares to the then existing shareholders and the balance not applied for by them was then offered to the public by prospectus. Out of the above, capital of Rs. 20,00,000 was subscribed partly by the shareholders, partly by the public and the rest by underwriters.

Accounts in brief are as under:—

	Rs.	Assets	Rs.
Capital	45,81,265	Gross block	1,17,36,431
Reserves*	8,13,024	Less—Depreciation	72,51,407
Liabilities	1,16,73,375		
		Net block	44,85,024
		Stock-in-trade	56,34,963
		Stores and spares	16,61,786
		Loose tools, etc.	9,53,113
		Debts, deposits and advances	39,04,347
		Investments	4,000
		Cash	5,24,431
	Rs. 1,71,67,664		Rs. 1,71,67,664

*Reserves are shown after deducting Rs. 4,82,050 being the debit balance in the profit and loss account.

India United Mills, Ltd.

The directors of the above Company (Agents: Messrs. Agarwal & Co., Bombay) submit the audited accounts of the Company for the year ended 31st December 1958.

The working results of the Company have in the year in question continued to be unsatisfactory and show a loss for the year of Rs. 66,74,156 (Rs. 31,52,513). After adjustments in the accounts in respect of the provisions for development rebate Rs. 1,16,525 (nil), taxation in respect of previous years Rs. 1,00,494 (Rs. 7,42,146), providing for managing agents' minimum commission (including adjustment of directors' fees) Rs. 50,000 (Rs. 40,000) and effecting an ad hoc reduction in the value of stock-in-trade Rs. 10,00,000 (nil) the total loss amounts to Rs. 79,41,175 (Rs. 60,13,081 after providing Rs. 14,18,422 for depreciation and Rs. 6,50,000 for bonus for the year 1957). Against this item of Rs. 79,41,175 (Rs. 60,13,081) the directors have adjusted the following:—The balance of general reserve after transfer this year as ex-

plained in 1(e) below Rs. 20,43,164 (nil), unutilised balance from provision for bonus in the past year Rs. 56,709 (nil) and the balance out of the last year's provision of Rs. 5 lakhs for stores after deducting Rs. 4,28,692 written off during the year Rs. 71,308 (nil) leaving the unabsorbed portion of loss for the year of Rs. 57,69,994 (Rs. 58,83,112 after taking into account the credit balance of Rs. 1,29,969 brought forward from the previous year. This whole amount was adjusted against reserve) to be carried forward to the next year's account.

There being no profit for the year, provision has been made in the accounts as per Section 198(4) of the Companies Act, 1956, for payment to the directors and the managing agents by way of minimum remuneration the sum of Rs. 50,000. Rs. 31,050 having been paid to the directors as their fees for attending the Board and/or the committee meetings, the balance of Rs. 18,950 only is proposed to be paid to the managing agents, for the year, subject to the approval of the Company.

Depreciation: The statutory development rebate in respect of additions to plant and machinery has been debited in the accounts under report. The normal depreciation for the year amounting to Rs. 12,23,545 has, however, not been charged in the accounts.

Value of closing stock: On account of the existence of large quantities of old stocks at the close of the year the question of their proper valuation was directed to be carefully considered by Shri S. A. Kher and following his report, the directors have directed an ad hoc reduction of Rs. 10,00,000 to be made in the total value of stock-in-trade, as shown above. The true value, however, of the old stocks can be ascertained only after they are disposed of and the price realised.

General reserve: The accumulated credit balances of Rs. 2,34,393 in the forfeited dividend account and Rs. 6,73,083 in the workmen's benefit fund have been transferred to the general reserve thus making a total reserve of Rs. 20,43,164 as the general reserve at the end of the year. This total amount as explained above, has been set off against the loss.

Taxation: The Company's income-tax assessments have been completed upto the accounting year ended 31st December 1953. Appeals, however, have been made against the assessment orders for the assessment years 1949-50 to 1954-55 (both inclusive). In respect of the assessment years 1955-56 to 1958-59 returns have been submitted by the Company on the basis of the published accounts.

The committee of directors appointed as mentioned in the last year's report has been meeting regularly almost invariably once every week and scrutinises the day to day working of the Mills, as per reports submitted to it by Shri S. A. Kher. In regard to the stock position, the Committee is particularly careful as until the accumulated old stocks were disposed of, it was difficult to improve the financial position of the Company. The efforts to dispose of the stocks have slowly been gathering momentum and the stocks are now moving reasonably fast. In the year in question the results were however disappointing. The stock at the commencement of the year was 53,785 bales comprising 43,594 bales unsold and 10,194 bales sold but not taken delivery of. The position as at 31st December 1958 was that the stock was 39,288 bales made up of 19,011 bales unsold and 20,277 bales sold but not delivered.

Accounts in brief are as under:—

	Rs.	Assets	Rs.
Capital	2,50,00,000	Gross block	5,09,02,595
Reserves	1,16,525	Less—Depreciation	3,68,18,422
Liabilities	4,28,92,136		
		Net block	1,40,84,173
		Capital expenditure unallocated	7,25,320
		Stock-in-trade	3,97,47,042
		Stores, etc.	44,14,258
		Debts, deposits and advances	24,68,802
		Investments	2,95,542
		Cash	5,03,630
		Profit and loss account (deficit)	57,69,994
	Rs. 6,80,08,661		Rs. 6,80,08,661

Amalgamated Coalfields Ltd.

The directors of the above Company (Managing Agents: Messrs. Shaw Wallace & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st March 1959.

The Company's profit for the year is Rs. 16,10,855 (Rs. 9,47,462). And after providing taxation on profits for the year of Rs. 11,04,891 (Rs. 5,56,395) there remains a balance of Rs. 5,05,964 (Rs. 3,91,067). To this is added provision for liabilities no longer required Rs. 5,00,961 (Rs. 2,61,288), provision for taxation no longer required Rs. 30,265 (nil) and the amount brought forward from the previous year of Rs. 40,639 (Rs. 29,730) making a total of Rs. 10,77,829 (Rs. 7,89,498 including Rs. 1,07,413 being items relating to previous periods). From this amount is to be deducted: transfer to development rebate reserve of Rs. 1,06,200 (Rs. 30,000), transfer to general reserve of Rs. 3,50,000 (Rs. 1,70,000) and transfer to contingencies reserve of Rs. 2,00,000 (nil) leaving an available sum of Rs. 4,21,629 (Rs. 3,59,389 after provision for Labour Appellate Tribunal Award of Rs. 2,30,109). Out of this amount the directors recommend a dividend of 15 (12½) per cent. payable without any deduction for income-tax paid by the Company Rs. 3,82,500 (Rs. 3,18,750) leaving a credit balance to be carried forward of Rs. 39,129 (Rs. 40,639).

Output and despatches of steam and other grades of coal for the last three years are as follows:

Year ended	Raisings	Despatches
	Tons	Tons
31st March, 1959	9,46,564	9,38,545
31st March, 1958	8,61,267	8,59,453
31st March, 1957	8,53,379	8,55,642

Heavy capital expenditure was necessary for development and fitting out new collieries to replace some of the exhausting mines. Capital expenditure during the year was Rs. 6,68,811 excluding work-in-progress Rs. 6,64,980.

An amount of Rs. 1,06,200 (Rs. 30,000) has been transferred to development rebate reserve in compliance with the provisions of the Finance Act representing 75 per cent. of the development rebate allowable on plant and machinery installed. Rs. 3,50,000 has been transferred to general reserve in replenishment of the withdrawals made in 1957 and also to finance development plans. Rs. 2,00,000 has also been transferred to contingencies reserve to meet possible liabilities.

The Coal Prices Revision Committee have submitted their report, but unfortunately the recommendations which have been accepted by the Government of India, will not be applicable to this Company until its coal has been graded. Every endeavour is being made to allow the new prices to be effective at an early date. Present prices must be considered as uneconomic and are standing in the way of further development.

Accounts in brief are as under:—

	Rs.	Assets	Rs.
LIABILITIES		Gross block	1,09,35,072
Capital	25,50,000	Less—Depreciation	77,39,072

MANCHESTER LETTER

(Concluded from page 765)

On prices, Mr. Lee referred to the sharp rise in quotations in grey cloth, coupled with the scarcity of supplies. "How long conditions of shortage may continue depends on the rate at which the distributing sections seek to refill their empty pipelines," he said, "but I see no reason to expect this condition of shortage to be of any great duration."

Machinery Exports

Although shipments of British-made textile machinery this year have not suffered to the same extent as the fall in exports of cotton goods generally, overseas trade has been dwindling. For the nine months to the end of September, exports amounted to 813,236 cwts., as against 844,998 cwts., last year and 1,237,267 cwts. at the same stage in 1956. In view of the dearer prices ruling, earnings at £29,947,000 are a little higher than in the same period last year, but are over £4 million lower than in 1956.

Variations in the quantity of plant shipped abroad are more frequent than in the trade done in textile products. India remains the chief consumer, with virtually unchanged takings, but Egypt has risen to second place with 46,905 cwts. and Soviet Union is third at 44,751 cwts.

Egyptian Cotton Supplies

A delegation representing Lancashire spinners and raw cotton interests will fly out to Egypt on 31st October to discuss the possibilities of more extensive use of Egyptian cotton in Lancashire mills. Following approaches from Egypt through the Board of Trade, the spinning section of the industry has nominated a mission of five members, made up of two spinners and three merchants—two from the Liverpool Cotton Association and one from the Manchester Cotton Association—to visit Egypt for discussions with cotton interests there. The talks will last about a week.

Imports of Egyptian cotton have shrunk from a post-war peak of 380,000 bales to a mere 3,500 bales in the season which ended in July. Since the Suez crisis interrupted supplies, Lancashire mills have turned to alternative growths which, in many cases, have proved very satisfactory substitutes. More widespread use has been made of Sudan cotton; imports from the Sudan at 223,000 bales last season were second in volume only to those from America. American cotton grown from Egyptian seed has also helped to fill the gap in Egyptian qualities. —All Rights Reserved.

MORARJEE GOCULDAS SPINNING AND WEAVING CO., LTD.

SPEECH OF CHAIRMAN, MR. GOPIKISAN PIRAMAL, AT ANNUAL MEETING

TEXTILE INDUSTRY MORTGAGED TO IDEOLOGICAL EXERCISES IN ECONOMIC PLANNING

AN appeal to the authorities concerned not to hamstring the cotton textile industry in its efforts to make its legitimate contribution to national welfare was made by Mr. Gopikisan Piramal, Chairman of the Morarjee Goculdass Spinning and Weaving Company, Ltd., in the course of his forceful speech at the Eighty-eighth Annual General Meeting of the Company held at Bombay on Tuesday, 3rd November 1959. The industry, Mr. Piramal declared, was today sandwiched between the misunderstanding and unsympathetic attitude of the Government and the ruthless operation of economic and technological forces. He stressed the vital importance of rationalisation and automation in mills by saying that "not to undertake them is to put Tiger-moths against Jets."

The following is the full text of Mr. Piramal's speech at the meeting:

"GENTLEMEN, "It gives me great pleasure to welcome you all here to the 88th annual general meeting of our Company. The Directors' report and the audited statements of accounts have been in your hands for some time now and, with your permission, I shall take them as read.

"We are now approaching the fag-end of the second Five-year Plan and the draft of the third Plan is in the process of being drawn up. It is time, therefore, to make an appraisal of the deal that the cotton textile industry has received under the previous Plan dispensations and the outlook for the next five years, commencing 1960-61.

"You are by now well aware of the step-motherly treatment the industry has received at the hands of the Government. The interests of one of the most strategic sectors of the Indian economy have been mortgaged to ideological exercises in economic planning. As a vital foreign exchange earner and a major contributor to the national income, the industry has been mulcted of its revenues in order to shore up and spoon-feed handlooms and Ambar Charkhas whose technology and economics are dubious in the modern context. I shall remind you of only one instance of the inept approach of the Government to the industry. I am referring to the excise duty muddle of 1956 and the hasty retreat that Government had to back subsequently.

Margin of Survival

"The industry today is sandwiched between the misunderstanding and unsympathetic attitude of the Government and the ruthless operation of economic and technological forces. Indeed, when one takes into account the increasing rate of mortality of the units in the industry, one is inclined to feel that the margin of survival is encroaching dangerously upon the industry.

"I have no intention of appearing before you as a prophet of doom and I have a deep and abiding confidence in the inherent vitality of the industry. But, at the same time, I desire to call your attention to the open facts of the case and to appeal to the quarters concerned not to hamstring the industry in its efforts to make its legitimate contribution to the national welfare.

"As far as the ensuing Five-year Plan is concerned, one can only hope that the sins of omission and commission of the previous Plans are not repeated and that the necessary corrective measures are taken. The third Five-year Plan, let us not forget, will have to face the blast of the borrowing indulgences of its predecessors in the shape of interest and service charges and repayments that fall due. These international commitments can be met ultimately only through exports. The urgency to export arises not only from the exigencies of international indebtedness but is also underlined by the scarce availability of foreign exchange to implement the long-term developmental programmes and to finance the current demands of the economy in general.

"The problem of exports, as far as our industry is concerned, is intimately linked with deeper problems affecting the industry. To export is to compete both in price and quality.

"It would be my duty to refer here to the considerable broadening of active interests evinced by foreign private and public investment, aid and technical collaboration in India, thanks to the farsighted and strenuous efforts and personal tours abroad of our worthy Finance Minister, Shri Morarjibhai Desai. I shall also express here my fervent hope that, under the new set-up that will emerge from the proposed bifurcation of Bombay State, the industry in Bombay will receive the same encouragement from our respected Chief Minister, Shri Y. B. Chavan, that he has been giving us so far.

"There are signs that our exports this year have been given a leg-up by the international revival from the 1957-58 recession and the recent export incentives in the form of import entitlements in respect of cotton, machinery, and dyes and chemicals. But such incentives are in essence piecemeal and temporary palliatives when basic forces are still at work thwarting the existence and progress of the industry. The domestic market, too, has looked up this year, thus leaving the mills with lesser unsold stocks on hand to reckon with than last year.

Taxation

"Prior to the Finance Act of 1959, the taxation of dividends and company profits was already a complicated procedure and the situation was further aggravated by the imposition of wealth tax and excess dividends tax. The chief feature of the 1959 Finance Act is the substitution of a simpler system of taxation of corporate profits and the introduction of a scheme for deduction of tax at source. While the tax on companies has been reduced under the new system, the total taxes which companies and shareholders will together pay between them on profits and dividends respectively in a normal year will be substantially higher than under the existing tax system, as relief from income-tax will no longer be available to shareholders on their dividends.

"Your Company is being gradually switched over to the manufacture of superior varieties of cloth. Under our modernisation programme, we have, over the past few years, made substantial additions to plant and machinery worth over rupees twelve millions and the pace is likely to be maintained in the future. During the year under review, we have installed a number of Japanese combers and some more are expected to arrive in 1960. In addition, we have secured a licence for some automatic looms for replacement and an application is pending with the Textile Commissioner in respect of automatic looms for expansion which is likely to be decided in the current month. Moreover, a sanforising machine which is awaiting shipment is expected to be installed at the mills in early 1960. Over the next few years, we have plans for modernisation of machinery to the tune of five to six million rupees depending, of course, on the Government's sanction for the necessary import licences.

Company's Overseas Business

"Your Company's products are becoming popular overseas. The exports which were below 10 per cent. of the total sales in the past have reached over 20 per cent. in the year under review. It is hoped that, during the current year, exports will reach over 25 per cent. of the total sales of the Company. Your Company is, therefore, playing its part in helping to earn more foreign exchange which we so badly require.

"I am glad to inform you that our relationship with labour was most friendly and, bearing in mind the importance of smooth industrial relations, we are maintaining a spirit of cordiality with labour.

"I have also to extend my sincere thanks to my colleagues on the Board and the officers, staff and workers of the Company for the ungrudging co-operation displayed by them.

"I shall finally conclude by thanking you all, gentlemen, for making it convenient to be present here today. I now move that the Directors' report and the audited balance-sheet and profit and loss account for the year ended 30th June 1959, already sent to the shareholders, be and are hereby adopted."

N.B.—This does not purport to be a report of the proceedings of the annual general meeting of the Company.

DEMAND FOR MONEY PICKS UP

(From Our Own Correspondent)

BOMBAY, 4th November

Conditions in the short-term money market have turned a little tight, consequent on the broadening of demand for bank credit. There was a sudden revival of demand on the eve of Diwali and this has persisted since then. It is, however, too early to say whether this marks the onset of the traditional busy season. Be that as it may, there has been a hardening of inter-bank call money rate, from 1½ per cent. to 2½ per cent. among the Exchange and big Indian banks and from 2½ per cent. to 3 per cent. among the smaller banks. House money at seven days' notice, however, continues to be bid at 3 to 3½ per cent. and short-term deposits for one to six months at 3 to 3½ per cent.

The downward trend in the 91-day Treasury Bill rate, noted in the previous two weeks, has been halted, the average rate of accepted tenders at yesterday's sales being unchanged at 2,420 per cent. per annum. The amount offered was no more than that invited, namely, Rs. 2 crores. Tenders for next week are again unchanged at Rs. 2 crores. There were no sales of Intermediate Treasury Bills during the period 28th to 30th October, but they are being offered this week at the self-same rate of Rs. 99.411 per cent. The negative response to the Intermediate Treasury Bills during the week under review is in striking contrast to the sale of Rs. 6.05 crores in the previous week and Rs. 4.25 crores in the week before it, that is, a total of Rs. 10.30 crores in a fortnight.

The Reserve Bank of India statement for the week ended 30th October 1959 discloses an expansion of Rs. 17.96 crores in notes in circulation. Notes held in the Banking Department are, however, lower by Rs. 19.96 crores, so that the fall in total notes issued is Rs. 2 crores, which is covered by a similar decline in rupee coin. There is again no change in foreign balances held abroad have gone up, the rise during the week under review alone being Rs. 10.33 crores. The aggregate increase during the last three weeks is of the order of Rs. 20.99 crores, thus lifting the total foreign assets to Rs. 198.20 crores. This represents an increase of Rs. 19.77 crores over the year. Deposits of the Central Government have declined by Rs. 12.39 crores, presumably due to transfer of funds to the State Governments which is reflected in a rise of Rs. 12.07 crores in deposits of "other Governments." Deposits of banks, too, have shrunk by Rs. 7.47 crores. Loans and advances to Governments have gone up by Rs. 1.69 crores and other loans and advances by Rs. 11.85 crores. Of the latter, advances to Scheduled banks against usance bills account for Rs. 1.70 crores. Investments have declined by Rs. 5.89 crores and Government Treasury Bills purchased and discounted by Rs. 6.80 crores.

The upward trend in Scheduled banks' deposits is being maintained with a rise of Rs. 2.09 crores in demand deposits and of Rs. 9.04 crores in time deposits during the week ended 23rd October 1959. Of the aggregate rise of Rs. 11.13 crores in deposits, the State Bank of India alone accounts for Rs. 7.10 crores. Advances have declined by Rs. 3.04 crores, the whole of which is accounted for by the State Bank, while bills purchased and discounted have gone up by Rs. 2.78 crores, the State Bank's share in this being Rs. 1.43 crores. There has been an addition of Rs. 14.99 crores to investments, of which Rs. 9.76 crores is due to the State Bank. This growth in investments apparently reflects the purchases of Intermediate Treasury Bills referred to above. While cash balances have shrunk by Rs. 6.37 crores, money at call and short notice is higher by Rs. 3.64 crores.

There has been no worthwhile development in the Gilt-edged market, which continues to be dull and devoid of support. There has, however, been no selling pressure. Barring 3 per cent. 1986 Conversion Loan which has shed 10 nP over the week to Rs. 74.75, the entire list is unchanged. State loans, too, are neglected, but the price-lines are well maintained. The volume of business is at a low ebb.

The persistent weakness of sterling abroad has affected the rupee also in terms of the U.S. dollar. Banks' selling rate of U.S. T.T. has gone up from Rs. 477 to Rs. 477.50 and their buying rate from Rs. 473.75 to Rs. 474 per \$100. In New York, spot sterling has receded from 280.51-280.54 cents to 280.40-280.44 cents and three months' forward from 280.95-280.98 cents to 280.89-280.93 cents.

FOODGRAINS QUIET

(From Our Own Correspondent)

HAPUR, 2nd November

Quiet conditions prevailed in the foodgrains market during the week, following slack demand which was being met mostly in local areas following good kharif crop. Sowings of rabi grains was still in full swing, but was likely to be finished by the week-end. Harvesting of munji crop was nearing completion and new paddy and munji crops were reaching the market in heavy quantity.

Wheat at Hapur eased by about 25 nP per maund during the week to be quoted on Monday at Rs. 17.25 per maund for average quality and upto Rs. 18.50 for farm produce. Daily arrivals of wheat in the market were reported to be about 100 maunds and demand for seed purposes was also subsiding. Arrivals in the market were still in private on fears of Government purchases under the wheat levy scheme to the extent of 50 per cent. at Rs. 13 to Rs. 15 a maund.

Following increased arrivals of munji and paddy crops in the market, there was a modest decline in rice during the week. Quotations were: *sela basmati* Rs. 32 to Rs. 35; *mainpuri* Rs. 24; *ramajayvan* Rs. 24.50; *gadda* Rs. 21.75.

Gram registered a fall of about 37 nP per maund during the week, as demand was poor and

BULLION UP AGAIN

(From Our Own Correspondent)

BOMBAY, 4th November

The Moorat trading in bullion for the *Sambat* year 1970, which took place on Saturday, 31st October, was a colourless affair. Operators did not show much interest in fresh business. Transactions put through were, therefore, on a reduced scale, with values moving narrowly.

Taking the whole week under review into account, however, it is seen that both silver and gold have registered handsome gains to the extent of Rs. 3-10 and Re. 1-7, respectively. The rise in silver followed good support lent by a bull syndicate. Even slackness in demand and large arrivals failed to have any significant effect. Gold ruled firm, in sympathy with the white metal and on reports that one prominent operator alone had taken delivery of a large quantity in October settlement.

In silver, November settlement steadily advanced from Rs. 209.4 on Wednesday last to Rs. 212.5 today, before finishing an anna lower. The net gain over the week was Rs. 3. December settlement spurted from Rs. 209.7 to Rs. 212.7, after being higher still at Rs. 212.8 today. Business in January settlement commenced today at Rs. 212-10. Towards the close, it stood higher at Rs. 213-2.

Ready silver began the week at Rs. 208-11, as against Rs. 208-7, and firmed up to touch a high of Rs. 211-11 today, a fresh record peak for the metal, and compares with Rs. 210-11 touched last week. The daily average arrivals of silver were as much as 27 bars, while the actual offtake was six bars per day. The floating stocks of silver are estimated at 900 bars.

In the gold section, November settlement advanced in the course of the week from Rs. 123-10 to Rs. 125-2, though the closing rate today was half an anna lower at Rs. 125-1-6. December settlement recorded a net increase of Re. 1-9, today's closing price being Rs. 125-7-6, as against Rs. 123-14-6 on Wednesday last week.

Ready gold met with good enquiries and rallied from Rs. 123-7-6 to Rs. 124-15 today before finishing at Rs. 124-14-6. The daily average arrivals and offtake of gold were 2,750 tolas and 3,000 tolas, respectively. The floating stocks of gold are reported to be in the neighbourhood of 80,000 tolas.

Both spot and forward silver in the London bullion market were maintained at the last week's levels of 80½d. and 76½d., respectively. Silver in New York was also unchanged at 91.375 cents. Ready gold in London improved from 250s. 3d. to 250s. 2d., owing to a slight weakness of the pound sterling. The latest available world price for gold in London is \$35.08-\$35.10 per ounce.

The following comparative table shows at a glance the trend of the market during the week under review:

	4-11-59	Highest	Lowest	28-10-59
GOLD				
Ready (99 fine Mint)	124 14 1/2	124 1/2	123 8	123 11
Forward	125 1 1/2	125 1/2	123 12	123 11
SILVER				
Ready (99 fine Mint)	212 10	211 11	208 10	208 10
Forward	212 14	212 5	209 8	208 10
London Silver Ready	80 1/4	—	—	80 1/4
London Forward	79 3/4	—	—	79 3/4
London Gold	250 3/4	250 1/4	250 1/4	250 1/4
New York Silver	91 3/8	—	—	91 3/8

* 17th November settlement.

† 16th November settlement.

local stocks were heavy at about 50,000 maunds. Barley and *bejhar* also sought lower levels in sympathy. Maize continued to attract good consumer demand, but prices differ lower, due to easy supply position, following good crop in this area. There were also some arrivals of new *bajra* in the market. *Juar* and *guzar* ruled steady. The week-end prices (in rupees per maund) were:—gram 12.62; barley 12.62; *bejhar* 11.75; maize 11.25 to 11.50; dest 11.75; *bajra* 13.12; *jowar* 12 to 14; *guzar* 11 to 12.50.

Pulses registered a downward trend. Peas lost about a rupee per maund. Arrivals were at an average of 100 maunds daily and local stock was unchanged at 43 khatties. *Ahar* also tended to recede, as demand was dormant and stock was heavy at about 30 khatties. Other pulses ruled quiet. The week-end prices were:—peas *dara* Rs. 10.25; *farm white* Rs. 13.25; *peas dal* Rs. 12; *arhar* Rs. 16.50; *arhar dal* Rs. 20 to Rs. 21; *urd* Rs. 16 to Rs. 19; *moong* Rs. 16 to Rs. 18.50; *masoor* Rs. 14.50 to Rs. 16.

KIPS WEAK

(From Our Own Correspondent)

MADRAS, 2nd November

The tanned cow and buffalo hides market is weak, and prices are sagging, due to inactivity in the shipment business section. Importers seem to be keeping out of the market with a view to buying at lower prices. Tanners are slightly nervous at the trend of the market and are willing to book orders at lower levels. Meanwhile, stocks are accumulating in the bazaar and the tone is bearish. Demand for tanned buff calf is patchy. Arrivals of cow calf have been poor.

In the tanned goat skin section, the market is weak, except on top marks 8/9 lbs. average. Inquiries for sheep skins are small.

COTTON FUTURES SUBDUED

(From Our Own Correspondent)

BOMBAY, 4th November

The Moorat session of the cotton futures market on Saturday failed to extend the gains made in the earlier two sessions of the week. In fact, after displaying a steady undertone, the market staged a retreat on profit-taking and renewed selling attributed to the worsening of the Sino-Indian relations. Reports of good demand and fairly large turnover in piecegoods induced some fresh buying but it failed to lift values. The closing rate was consequently three rupees lower than the opening rate which was also the highest.

The market, however, again gathered strength on Monday following reports of unfavourable rains in Khandesh and Berar tracts and the expectation (which materialised) that the Cotton Advisory Board, which met yesterday, would recommend a fresh export quota of 75,000 bales of Bengal Deshi, although its recommendation regarding imports disappointed the trade as the quantity recommended for import, namely, 100,000 bales, was below expectation. Advances from the spot market indicating a slow-down of new crop arrival and brisk mill demand imparted strength to the market. The Jarilla March contract firmed up to Rs. 721.50 yesterday. This level attracted profit-taking and values receded to Rs. 719.25 at close. The market was closed today as a mark of respect to the memory of the late Mr. Nandalal Madhavdas Amarsey, a member of the E.I.C.A. The trend in *kerb* was subdued, with the quotation hovering round Rs. 718.

In the Moorat session in spot, held on Saturday, trading was dull. Business done was moderate in volume. Turnover was placed at eight to ten thousand bales. Demand in subsequent sessions, however, improved on reports of reduced arrivals. The mills were, therefore, eager to purchase available lots of good quality cotton, although sellers were hesitant to sell. Old crop Kalyan, 1954 and 197/3 attracted attention. New crop 320F Vijay, Digvijay, Wagad and Jarilla, etc., evoked good demand.

The export front presented a better appearance. The decline in Bengal Deshi prices were halted, thanks to inquiries from Japan. A moderate volume of business was done in Bengal Deshi. Hopes of fresh quota for Bengal Deshi have been strengthened, following the reported recommendation of the Cotton Advisory Board for the release of 75,000 bales of Bengal Deshi.

Demand for foreign cotton was brisk. Some Bombay mills were keen buyers of East African cotton. B.P. 52 was done at Rs. 1,170 c.i.f. and Busogo at Rs. 1,145. Good business was also reported in selected Egyptian and Sudan cotton.

There was disappointment in some quarters over the Cotton Advisory Board's reported recommendations that the Government should permit import of 100,000 bales of cotton stapling below 1-1/16" but not below 1-5/16" from any area. It was expected that the Board would recommend an import quota of at least 300,000 bales of cotton.

The following are the latest available spot quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Bengal Deshi 615; Berar Jarilla 775; Gadag Laxmi 940; Punjab 216F 970; Mathia 681.

Karachi cotton futures market ruled fully steady during the week, with no changes over the week being nil. A limited volume of hedge selling and profit-taking was absorbed in mill buying. Values moved either way in a narrow range in limited trading. N.T.R.G. January, after declining to Rs. 63-11, improved to Rs. 64-10 before closing at Rs. 64-6, the same as the week-end quotation. The March contract fluctuated between Rs. 64-15 and Rs. 64-2 and finished at Rs. 64-10.

Cotton futures in Alexandria ruled firm during the week. Improved export demand from India and European countries and firm spot advances imparted strength to the market. Futures prices consequently hardened.

Actual exports from the commencement of the season till 14th October aggregated 19,682 bales. Of this 8,830 bales were shipped to the Continent of Europe and 11,052 bales to India, China and Japan.

Cotton futures in Liverpool scored handsome gains during the week on active trade and mill buying. Both the American and American type contracts were quoted higher. Sudan contracts were, however, neglected, and values remained practically unchanged. The following are the latest available quotations—in pence per lb.—from Liverpool:

American cotton one inch staple contract: December-January 21.80; March-April 21.90; May 22.20; July 22.05.

American cotton mixed growth contract: December-January 22.15; March-April 22.40; May 22.40; July 21.85.

Sudan: November-December, January-February 29.00; May-June 28.75.

New York cotton futures market reflected a steady undertone during the week. There was a moderate volume of liquidation and local selling which were absorbed by Commission Houses and mill buyers. The near deliveries were well favoured while the distant ones were neglected.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	2-11-59	27-10-59	20-10-59
Spot	32.70	32.70	32.75
December	32.42	32.39	32.33
March	32.88	32.85	32.86
May	33.13	33.14	33.15

YARNS DULL

(From Our Own Correspondent)

BOMBAY, 4th November

There has not been any development of import to the yarn market in the past week. Enthusiasm among traders to enter into new commitments is lacking, as they prefer to await the emergence of a clear picture regarding offtake. Stray reports indicate resumption of working of several power-looms in Surat and other areas which had been seriously affected by the heavy floods. But these reports have not resulted in any marked rise in prices of rayon yarns. Staple fibre yarns also rule quiet, thanks to unsatisfactory enquiries from consuming centres such as Bhagalpur, Amritsar and Ludhiana. It is feared that many mills which are not showing any eagerness to sell at present may make offerings in the next few weeks. Cotton yarns, too, are depressed, thanks to tapering off of export demand, owing to the present high level of prices. Nylon yarns, however, have registered a notable rise of about Re. 1.25 per lb., following encouraging demand from consuming interests.

Cupressa Bamberg yarn (60 x 2) December contract dropped Rs. 2 to Rs. 1,674. Spot Cupressa was quiet at Rs. 7.44, same as last week. Among imported yarns, 120 Japan and 150 Italy rose by 3 nP each to Rs. 5.28 and Rs. 4.97, respectively. 150 Japan and 120 Italy both rose from Rs. 5.12 to Rs. 5.15. Among indigenous yarns, National Rayons 120 bright cones first grade stood at Rs. 4.75, as against Rs. 4.72 last week. 150 bright cones first grade gained a naya paisa to Rs. 4.35.

Staple fibre yarn (40 x 2) December contract put on Rs. 3 to Rs. 695. Spot Citys dropped 3 nP to Rs. 3.72. Kohinoors declined from Rs. 3.75 to Rs. 3.74. Century were unaltered at Rs. 3.75. Among imported yarns (80 x 2), Paramounts were unaltered at Rs. 8.87.

In the cotton yarn section, ten counts Podars gained 6 nP to Rs. 14.56. Twenty counts Hinds and Moderns were both dull at Rs. 19.75. Forty counts Minaxis had some buyers, the quotation spurring by 19 nP to Rs. 26.94. Moderns were quiet at Rs. 27. Sixty counts Raghuvamsis and Finlays were dull, the former being quoted at Rs. 56.50 and the latter at Rs. 61.50. Among eighty counts, Citys dropped 31 nP to Rs. 64.69. Moderns Mahendras fell by 25 nP to Rs. 73.25. Moderns were neglected at Rs. 79, as also Finlays at Rs. 81.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today as compared with those a week before.

	4-11-59	28-10-59
Rayon yarns		
40 x 2 Cupressa Bamberg December (100 Kg.)	1,674	1,674
40 x 2 Cupressa Bamberg spot (per lb.)	7.44	7.44
120 Japan (per lb.)	5.28	5.28
150 Japan (per lb.)	5.15	5.12
120 Italy (per lb.)	5.15	5.12
150 Italy (per lb.)	4.97	4.94
Staple fibre yarns		
40 x 2 December (per case of 200 lbs.)	695.00	692.00
40 x 2 Kohinoor (per lb.)	3.74	3.75
40 x 2 City	3.72	3.75
Cotton yarns (per bundle of 10 lbs.)		
10s Podar	14.56	14.50
20s Hinds	19.75	19.75
40s Minaxis	26.94	26.76
60s Finlay	61.50	61.50
80s Mahendras	73.25	73.50

CASTOR IMPROVES

(From Our Own Correspondent)

BOMBAY, 4th November

The Moorat session, held on Saturday, commenced on a buoyant note, thanks to good overseas enquiries. But the strength tapered off subsequently on upcountry selling. Groundnut oil, however, continued to be steady. Castor and linseed futures were quiet, as a result of corrective profit movements in the Moorat session are indicated below:

	Opening	High	Low	Close
Castor seeds May	160.25	160.25	159.25	159.31
Groundnuts February	176.00	176.00	175.12	175.12
Linseeds May	35.21	35.37	35.12	35.12
Cottonseeds February	125.83	126.25	125.50	125.50

Over the week, the market presented quietly steady conditions. While there were heavy offerings, there was a notable improvement in the prospects for exports, particularly in the context of some export promotion measures announced by the Government of India. The Government has released a quota of two thousand tons of H.P.S. groundnuts in-shell for export to the United Kingdom and the Netherlands up to the end of March 1960. Established shippers of H.P.S. groundnuts will be granted quotas of H.P.S. groundnuts in-shell equal to ten per cent. of their basic year exports of H.P.S. ordinary groundnuts made to the U.K. and Netherlands only during any one of the calendar year 1949 to 1955. This measure did not make much impression on the market, since the quantities released for export is limited. Not only that, exports are restricted to only two countries, namely, the U.K. and Holland.

On Monday the Joint Chief Controller of Exports announced in Bombay that established shippers of groundnut oil will be given fifth repeat allotment for export up to the end of December 1959, equal to 15 per cent. of their basic year exports after they have completed shipments of groundnut oil against all the existing quotas to which they are entitled at present. At the same time, news regarding freights were rather discouraging. The Conference Lines have announced an increase of 10s. per ton in freight rates for groundnut oil and oilcakes which will come into force with effect from January 1960. This had a rather bearish influence on the market.

In the groundnut section, while futures presented cheerful conditions, the spot section remained dull. The strength in futures is mainly induced by good export outlook. Larger arrivals, particularly from Hyderabad and Bombay State, pushed down the values in the spot section. There were encouraging overseas advices for oil and oilcakes during the week under review. Oil, however, gave way at the close of the week mainly on account of proposed increase in freight rates. Groundnut February 1960, which had closed at Rs. 173.50 last week-end, moved up to Rs. 176 on Friday. During the Moorat session on Saturday, it came down to Rs. 175.12. Subsequently, it again recovered to close at Rs. 175.87—an increase of Rs. 2.37 over the week. Coromandel ready lost 75 nP to Rs. 36.25. Khandesh quality, however, was steady at Rs. 36.25. Oil ex-mill fell to Rs. 19.31 on Monday but improved to Rs. 19.50 yesterday. Today, however, it closed lower at Rs. 19.37.

The castorseed section elicited good support and firmed up, thanks mainly to better prospects for exports of castor oil to the U.S.A. Brazil is said to have been reluctant to export castor oil to the U.S. There were reports of export enquiries for sizable quantities for castor oil from the U.S. and the countries of the Communist bloc. Castor seeds May 1960, which had finished at Rs. 158.75 last week, hardened to close today at Rs. 162, after moving between Rs. 159.31 and Rs. 160.50 over the week. Ready Madras rose by 15 nP to Rs. 30.87, after moving in a narrow range during the week under review. Oil B.S.S. rose by 25 nP to Rs. 17.23. Similarly, oil commercial gained 12 nP to touch Rs. 16.37.

The linseed section was active, thanks to reported business in linseed oil with the U.S. Traders entertained hopes of better performance on the export front. Linseed May 1960 contract rallied from Rs. 34.75 to Rs. 35.37. Bold ready was marked up by Re. 1 to Rs. 35.62. Linseed oil was higher by 37 nP at Rs. 17.37.

Although raw cotton market was subdued, cottonseeds forged ahead on speculative support. Cottonseeds February 1960 contract, which had wound up last week at Rs. 123.50, rose gradually to close today at Rs. 126.50, after moving both ways in a narrow groove over the week.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	4-11-1959	28-10-1959	21-10-1959
Groundnut			
February 1960	175.87	173.50	172.12
Bold ready	35.75	36.00	36.50
Coromandel ready	36.25	36.25	36.50
Khandesh quality	36.25	36.25	36.50
Oil ex-mill ready	19.37	19.50	20.50
Hallway receipts	19.12	19.25	20.12
Castorseed			
May 1960	162.00	158.75	164.00
Ready Madras	30.87	30.37	31.50
Ready Kanpur	29.50	29.25	30.50
Oil B.S.S.	17.23	17.00	17.50
Oil commercial	16.37	16.25	16.50
Linseed			
May 1960	35.40	34.75	35.06
Bold ready	35.62	34.62	35.12
Oil ready	17.37	17.00	17.25
Cotton seed			
February 1960	126.50	124.50	127.50
Niger seed	31.50	31.50	31.75
Kandi seed	22.60	23.00	23.00

* Rates include excise duty but exclude sales tax.

† Rates exclude both excise duty and sales tax. ‡ All quotations for futures contracts are in terms of candy, except linseed, which is in cwt. A candy is 500 lbs., except in the case of cotton seed, for which it is 784 lbs. Spot quotations of seeds are for per cwt. and those for oil per quarter.

SUGAR PRICES RAISED

(From Our Own Correspondents)

BOMBAY, 4th November

Following the increase of Re. 1.85 per maund in the ex-factory prices of sugar in North India, announced by the Union Government on 24th October, the Government of Bombay has notified a corresponding increase of Rs. 5.08 per bag in the price of sugar of Decatur mills, effective from 25th October 1959. Accordingly, all stocks taken out from the factories from this date onwards will be subject to the special excise duty. The wholesale issue price in Greater Bombay has been fixed at Rs. 116.08 for D-29 grade, as against Rs. 111 which will apply to all stocks taken out of the sugar factories before the issue of the above orders by the Government of India. Consequent on this upward revision, the retail rates of sugar sold by fair price shops in Greater Bombay have been raised by 5 nP per seer, with effect from the 1st inst. The following are the revised rates per seer as compared with those prevailing before:

Grade	Revised Rates	Old Rates
A 29	1.13	1.08
B "	1.12	1.07
C "	1.10	1.05
D "	1.09	1.04
E "	1.08	1.03
B 28	1.11	1.06

The fair price shops continue to make available the stipulated supplies of sugar to consumers against ration cards at the officially fixed prices. But the open market prices of sugar are

INDO-GERMAN ECONOMIC RELATIONS

(Concluded from page 760)

purchased from other countries. The best intention of the German Government or of German bankers cannot change this situation.

It has been said in certain Indian quarters that Germany had concluded a commercial treaty with China and had fixed therein quotas of goods to be purchased, and that this agreement had been made by private firms. This is not quite correct. The agreement was made by a group of private business men who, however, acted as agents of the Government which could not appear directly, as Germany has no relations with China. But in either case, it is left to the private German firms whether and to which extent they wish to make use of them. It is easy to get a list of all reliable and experienced import firms in Germany and to contact them. This appears to be the simplest and the only efficient way to come to contracts.

Main Commodities

Let us now pass on to a review of the different branches which form part of India's exports to Germany.

Jute: The German industry needs raw jute which, however, cannot be bought in India, but chiefly in Pakistan. In order to meet India's wishes, the German Government has liberalised the importation of *jute yarns* as from 1st July 1958 and, in accordance with a waiver which the G.A.T.T. has granted to Germany, the annual global quota for the import of jute fabrics, jute sacks and bags, has been increased in such a way that the quota will rise in the five years' period, 1960 to 1964, from a value of 475 million D-Marks to 850 million D-Marks. But, so far, the Indian exporters have not been able to make full use of this opportunity. During the period 1955-58, jute fabrics valued at 23 million D-Marks have been set free, but only for 3 million marks worth have been used by India. The sacrifice which it means from the German point of view to allow jute fabrics to enter the German market at all, in detriment to the German jute industry, has opened a chance, but only a closer study of the terms of trade will lead the Indian exports to a practical success.

Raw Hides and Skins may, of course, be imported into Germany without any restrictions. In spite of the objections of the German leather industry, a certain number of manufactured goods have been liberalised, that is, goat-skins leather and metis leather tanned, but not curried. Curried ones are allowed if imported for further processing in leather dressing plants. Further, also for neat leather undressed, certain global quotas are granted, the amount of which will increase annually. But the difficulty here is that the German importers are accustomed to buy them via London. If India wants direct trade, she must admit German buyers to come to India and settle down there. Besides, the price of goat-skins, one of the best items, has been raised by large purchases from the U.S.S.R., which did not insist on the same strict sorting standard, as the German users have to do, and by that the price for such consignments was raised beyond the world market price, cutting down further German purchases. Lately, even China has offered goat-skins cheaper than India.

The Germans are not a *Tea*-drinking nation, as England is. Nevertheless, owing to good propaganda, a great amount of tea is already being imported into Germany. It is true that tea and coffee are heavily burdened by excise and customs duties which form a source of revenue which the German Government cannot waive. Of course, the burden is carefully equalised for both sorts of beverages; but the trouble is that medium and low grade tea from India is burdened by an Indian *export* tax which makes these grades dearer than tea from other countries, that is, from East Africa which is becoming a serious competitor for India as well as for Ceylon. Furthermore, it has been noted by German importers that, often, the same quality is offered at the London auction on more favourable terms than at Calcutta, notwithstanding the cost of transport, re-export and auction fees. The reason may be that, at Calcutta, many consumers buy with rupees and grant higher prices than the customers can afford who will have to pay in free foreign money.

All these difficulties will have to be studied by Indian exporters as well as by the Government of India. It will be worthwhile doing so, because the German market is quite inclined to buy tea from India, and will be able to absorb more Indian tea than hitherto.

Easy is the trade in Indian *Coffee*, and it is known that, in 1956, Germany bought 4,500 tons, that is, almost 10 per cent. of the Indian coffee production. But India's harvest is relatively small; and, in view of the abundance of the world production of coffee, it might not be advisable to raise coffee cultivation in India.

The import of knotted coconut fibre carpets is liberalised from 1st July 1959. Restrictions on the import of woven coconut carpets might be withdrawn by mutual agreement with India. The import of coconut oil—highly detrimental for the German oil mills!—has been disturbed by export restrictions which the Government of India has introduced without considering previous contracts. It will not be easy to renew this trade.

Raw Cotton can easily be imported into Germany. Cotton fabrics are manufactured by the German industry in sufficient quantities and in qualities which meet the taste of the German customers. The German cotton industry suffers from a grave crisis. It will not be advisable, therefore, to render its position more difficult by imports from abroad. Nevertheless, the German Government is prepared to enter into bilateral negotiations with the Government of India in order to grant more facilities to Indian cotton goods, but it will require a closer study of the German market. We may remember that India has agreed to a ceiling on its cloth exports to the United Kingdom.

The products of the Indian *Handicrafts*, which please the German customers by their taste and their original appearance, have undoubtedly a good chance. Here the German buyers have complained that very often the deliveries of ordered goods did not correspond to samples. They were sometimes by no means inferior, but not identical. The Indian handicraft is evidently too much decentralised and therefore unable to work up to samples. A better organisation will help here, and will win more friends in Germany too. A direct contact with German department stores may perhaps prove to be the most efficient way for better sales.

But all these items will in the best event yield a moderate financial result compared to the trade balance. The only commodities which India could export to Germany in huge quantities will be *Ores*: iron ore and manganese ore. But here great difficulties present themselves. The ores of India are situated far remote from the ports. The cost of transport, and the difficulties which arise, when they are to be loaded at the ports, cause prices to rise, often even above the world market prices. There is no Indian port with loading facilities which are equal to the big ore-export centres in other countries. It has been suggested that India should export not iron ore but *pig iron*; but every expert knows that, in the steel manufacturing process, the big iron passes directly from the blast furnace to the steel plant, and it will not be easy to change this old-established chain of production by introducing pig iron from outside. Therefore, we need a far-reaching modernisation of the inland ore transport and of the loading facilities in special ports before ores will be able to be exported to Europe in huge quantities.

Personal Visits Essential

This review may not evoke enthusiastic feelings with regard to a sudden rise of India's export to Germany, but there are good chances which are worthwhile to be studied and tried with zeal. What is needed first of all are business-like men who know the market: either Germans domiciled in India, or Indians domiciled in Germany, who understand their respective branches and visit the partners personally, thereby creating the foundation of a lasting business contact. In no other branch of trade, personal confidence and long-established relations play such an important rôle as in the trade of the commodities which form the bulk of Germany's purchases in India. No casual contract-hunters are welcome there.

The other condition is a sharp control of the goods before they are shipped. This can be done either by an impartial company, for instance, the Controll Company, or a Chamber of Commerce, or, preferably, by an attorney of the purchaser. At any rate, it should be guaranteed that the shipment conforms with the sample. Any disputes which may arise after arrival will be a nuisance, and should therefore be avoided.

Finally, the Government of India should appoint a special official, whose duty it would be to defend the interest of India's export trade against any interference from whatever side it might come, in order to secure the *continuity* which, in this sort of trade, is more urgently required than anywhere else.

* In progress during the month. † Figures in brackets show the number of cases for which the relevant information is not available.

* Figures relate to all states and centrally administered areas as after reorganisation.

It will certainly take some time before the Indo-German trade balance can be levelled.

The deficit in India's foreign trade results from the fact that an "undeveloped" country is bound to import goods in huge quantities, without any consideration of the state of its exports. The balance will be made by term credits and loans. In this respect, Germany is doing her best, so that the greater part of her exports to India is delivered without payment. The balance of payments between both countries is much more favourable to India than the statistical position of the trade balance. The real problem is how India will repay the credits and loans which she is now receiving. Should her present exports prove to be insufficient, the only way would be to make a special offer in those raw materials which every creditor can take like cash, and which, for instance, in the case of Germany could be oilseeds, hides and skins as well as ores.—All Rights Reserved.

STOCK & SHARE QUOTATIONS

Abbreviations: D.—Deferred shares. P.O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. B.—Company has Debentures. N.—Nominal quotations. X.D.—Ex-Dividend. C.D.—Cum. Dividend. I.—Interim Dividend. F.—Dividend for first half of the year.

Share.—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up per share'.

Accounts.—Figures in the 'Accounts Closed' column represent the months of the year in which the

respective companies close their accounts: 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provision fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciations is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

gratifying to hear that, pending the work of the Commission, the German Government is prepared to allow imports of certain specified goods and also some quantities of non-specified goods for the purpose of testing the German market.

The most important point to be borne in mind in regard to export of Indian goods to Germany is the fact that trade in Germany is exclusively in private hands. The significance of this point was impressively brought out by Mr. von Pochhammer in the last issue of *Commerce*. His observations deserve careful study by both business men and the officials concerned in this country. The German Government may conclude trade treaties, liberalise quotas and reduce taxation, but it does not itself indulge in any trade. The actual business is done by German traders. And they will naturally buy from the cheapest market in the world. It must be recognised that, if India bought German goods and technical services in preference to others, it was not out of any special love for Germany but because their terms were favourable as compared with others. Similarly, it would be unrealistic to expect German business men to buy our goods in preference to others, if they are not competitive. Mr. Pochhammer's article clearly shows that India has not done all it can to promote the sale of its raw material, semi-manufactured and processed goods in Germany. He has given quite a few instances to substantiate his remarks. They are no exaggerations, in our opinion. Exports of cotton and jute textiles have been well below the quotas allotted to India. Coffee and tea from this country suffer from price disadvantage. Indian exporters have not been successful in establishing adequate contacts with Germany and the Indian Government has not been encouraging German importers to open offices in this country. The result is not only insufficient exports, but direction of a part of existing exports to Germany through London. Mr. Heller gave an example to show how direct contacts between Indians and Germans would lead to a larger offtake of Indian goods. Germany needs a particular type of tobacco which India can produce but has not been growing. With the guidance of German experts, India has, however, now begun to grow that particular type of tobacco and, in a few years, exports of tobacco to Germany are expected to be sizable. There is room for similar endeavours, particularly in the sphere of ores. It is, therefore, welcome news that Germany has expressed its readiness to assist this country in stepping up the extraction of ores and in arranging for its expeditious movement to points of export.

ARE advocates of co-operative farming more sinned against than sinning? Is it true that they have been mischievously misrepresented by their interested opponents? These questions deserve notice, because, if co-operative farming were an innocuous experiment and their advocates did not envisage it as a violent break with the past, it would be wrong to give it a bad name and hang it. Mr. Nehru, in the course of his speech inaugurating the co-operative week at New Delhi last week, admonished the critics of co-operative farming, asking them to "play the game" and tell the people the truth about co-operative farming. He said: "Our concept of co-operatives is that of a free association of free farmers." Mr. Nehru did not want Government officials or important local leaders to impose themselves upon co-operatives in any manner; in fact, he did not want them to be in the picture at all. In saying so, he is shutting his eyes to the facts as they are even now. There is not a single co-operative society worth the name which is not dominated by Government officials and/or party bosses. Let Mr. Nehru find out for himself as to who is actually running the sugar co-operatives, to give only one instance.

If co-operative farming is to be nothing more than a free association of free farmers, from which all compulsion is ruled out, there could, of course, be little opposition to it. But the fact is that there is a widespread fear that in the name of co-operative idealism, party or official pressure in a sinister form will manifest itself in the rural areas. In any case, the question will be asked as to why the ruling party should make co-operative farming a burning national issue if it is nothing more than to persuade people

it. Why should not the Government and the party concentrate themselves on educative work, leaving it to the good sense of the farmers to choose this way of life or deny themselves the benefits of co-operative farming? The practical test as to whether the Government means any compulsion in its co-operative farming policy or not is its preparedness to treat both co-operative farms and individual farms alike, for purposes of granting special facilities like seeds, credit and other requirements of agriculture. On this question, there has been some mental reservation on the part of the Congress Party and the Government which have never declared in unequivocal language that there will be no discrimination in favour of co-operative farms.

The argument that the modern critics of co-operative farming had themselves formerly acquiesced in this policy to which the Congress had committed itself a quarter of a century ago does not hold water. The fact is that the Congress was an entirely different organisation in the thirties. It was the spearhead of the movement of national liberation. It would have seemed a petty-minded quarrel over inconsequential details for anybody to question the validity of the resolutions on co-operative farming at a time when the really important issue was the maintenance of unity and discipline in the Congress ranks, so vital to the cause of winning the country's independence. In the altered political and economic conditions of today, it is surely permissible for the erstwhile supporters of the Congress to voice their honest differences of opinion over co-operative farming. Further, it would not be very wide of the mark to suggest that it is the Prime Minister's known personal predilections in favour of co-operative farming that provide much of the motivating power for the movement. Only, many impartial observers feel that a great deal of national energy is being wasted on the discussion of the pros and cons of a measure which, whatever its much-publicised, though little-examined, benefits in totalitarian countries, is not likely to appeal to the average Indian farmer too much attached to his plot of land to surrender it to a co-operative. Nobody could, of course, object to co-operation in agriculture as such. There is room and need for service co-operatives which can place at the disposal of farmers such agricultural prerequisites as tractors, pump-sets, motors, seeds and credit. But it is undeniable that even the organisation of service co-operatives, which will serve 60 million peasant households scattered in 500,000 villages, is by no means an ordinary problem.

So pervasive has been the impact of co-operative farming on public opinion that its twin brother, the ceiling on land, has apparently ceased to attract public notice. The fact is that, in one sense, the ceiling on land is a more dangerous enemy of free institutions than even co-operative farming. For, if a ceiling on land were conceded and if appropriations of surplus land by the State on terms which approximate as closely as possible to expropriation were permitted, it could not be long before the substantial rural sector in this country demands the imposition of ceiling on all property. That could be the beginning of a new era of expropriatory legislation. And yet, it looks as though public opinion is not completely alive to the sinister significance of the ceiling on land. This is a pity, for silence on this issue by other property holders will come to be interpreted as tacit approval.

HOUSING INDIA'S MILLIONS

THE acute shortage of housing in India's towns and villages is too real and apparent to need any special emphasis. The fact that India will begin its third Five-year Plan with a backlog of five million houses must serve to convey some idea of the immensity of the problem. Urban housing requirements by 1976, it is computed, will be of the order of 43.6 million dwelling units, requiring the construction of about 26 million new units between 1961 and 1976. A major problem in the expansion of housing facilities—that is, apart from the issues connected with housing finance and availability of constructional materials—is the paucity of well-developed plots. Appropriately enough, this problem figured prominently in the deliberations of the fourth Housing Ministers' Conference, held at Hyderabad last week. The Union Minister for Works and Housing, Mr. K. C. Reddy, who inaugurated the Conference, admitted, with refreshing candour, that the expenditure on housing under the second Five-year Plan was not very satisfactory; upto the end of March 1960, only about Rs. 54 crores out of the allocated sum of Rs. 84 crores will have been disbursed. He urged the State Governments to

become more alive to the need for expediting the housing programmes.

The chief housing schemes now in operation, as is well known, are: the subsidised industrial housing scheme, the low-income group housing scheme, the middle-income group housing scheme, the village housing projects scheme, the slum clearance scheme, the rental housing scheme for State Government employees, the land acquisition and development scheme, and the plantation labour housing scheme. Under the subsidised industrial housing scheme, which was introduced in September 1952, loans and subsidies are given by the Central Government to State Governments, housing boards, co-operative housing societies and industrial employers for the purpose of housing industrial workers. During the first three years of the second Plan, the amount utilised under the scheme was Rs. 10.87 crores, as against a provision of Rs. 27 crores. In the first Plan, a sum of Rs. 22.60 crores had been provided, but the expenditure actually incurred was Rs. 13.29 crores. Till 30th September 1959, the number of houses constructed under the scheme (since the date of its inception) is 80,000. The low-income group housing scheme, introduced in November 1954, provides for long-term loans for construction of houses by persons with an annual income not exceeding Rs. 6,000. It was modified in 1957 with a view to assisting State Governments to provide houses for their employees whose income was below Rs. 500 per month. During the first Plan, a sum of Rs. 10.89 crores was drawn by State Governments under this scheme. The second Plan provides for a revised sum of Rs. 35.60 crores. The total number of houses completed under this scheme upto 31st July 1959 is 42,663, while 14,669 houses are under construction.

The middle-income group housing scheme, introduced in February last, is intended to assist people with an income between Rs. 6,000 and Rs. 12,000 per year. The scheme is financed by the Life Insurance Corporation of India which will provide loan assistance to the tune of Rs. 3 crores per year for three years ending 1961 to State Governments which, in their turn, will advance the loans to eligible individuals and co-operatives. It would appear that the L.I.C. has now agreed to increase its assistance for the implementation of the middle-income group housing scheme from Rs. 3 crores to Rs. 5.25 crores and for rental housing scheme for low-paid employees of State Governments from Rs. 1 crore to Rs. 1.75 crores. An important recommendation made by the Conference was that, under the middle-income group housing scheme, a person might be given a loan upto a maximum of Rs. 20,000, even if he has a building plot in his possession, as against the loan of Rs. 16,000 which is admissible now.

The village housing project scheme, introduced in 1957, envisages the establishment of housing projects in 5,000 selected villages; loans not exceeding Rs. 1,500 or 50 per cent. of the cost of construction, whichever is less, are provided. The revised plan provision for this scheme is Rs. 5 crores. Under the slum clearance scheme, which came into operation in May 1956, loans and grants are made to State Governments for slum clearance projects undertaken by them or by agencies approved by them. The second Plan limits the expenditure under this scheme to Rs. 15 crores, the target being 52,000 units. Till the end of September 1959, the State Governments and Union administration had sanctioned 131 slum clearance projects for an approved cost of Rs. 9.64 crores. The total number of housing units completed since the inception of the scheme is 2,916, and the number under construction is 12,282. The plantation labour housing scheme, introduced in 1956, is intended to enable planters to build houses for their workers.

The chief contribution made by the Housing Ministers' Conference is the emphasis it laid on the need for a certain element of flexibility in the working of the housing schemes. This was reflected in a series of resolutions which were adopted by the Conference. These, it is reasonable to hope, will form the basis for action at the Central and State levels of administration in relation to housing projects. On the subject of industrial housing, the Conference stated that, in cases where the cost of construction exceeded the prescribed ceiling, there might be no objection to the State Governments utilising the savings from other housing schemes on which the cost of construction had been less than the prescribed ceiling cost. Again, in order to enable the State Governments to repay conveniently the Central loan from out of the rent receipts, the period of repayment may be increased from 25 to 40 years. The Confer-

ence recommended that immediate steps might be taken by the Central Government to amend the Employees' Provident Fund Act, with a view to enabling industrial workers to withdraw from their accumulations in the fund to meet 10 per cent. of the cost of tenements required to be contributed by them under the scheme. It also suggested that State Governments might be given greater discretion in fixation of rents as long as they adhered to the no-profit-no-loss principle.

The Conference did well to recommend that special attention should be paid to the housing of scavengers and that liberal subsidy should be given for the construction of houses for them. It also urged the need for extending the scope of the slum clearance schemes to all towns, instead of limiting it to the six major towns (Calcutta, Bombay, Madras, Delhi, Kanpur and Ahmedabad). The implementation of this suggestion will obviously depend on the availability of finance. As regards the village housing projects scheme, the Conference felt that the maximum amount of loan admissible under the scheme should be Rs. 2,500 or 50 per cent. of the estimated cost of the house, whichever was lower, as against the present ceiling of Rs. 1,500.

While these recommendations are commendable for the reason that, when they are implemented, they will stimulate building activity, it is difficult to appreciate the stand taken by the Conference on the question of the use of compulsion in the execution of industrial housing schemes and plantation workers' housing schemes. The Conference expressed disappointment over the progress of the scheme for housing industrial workers and recommended measures, including legislative compulsion, to meet the situation. It is true that the number of houses built by employers for their workers is small. Thus, out of the total of 80,000 houses constructed upto 30th September 1959 since the inception of the industrial housing scheme, the shares of State Governments and co-operative societies are 70,000 and 1,000, respectively, while the employers have constructed only 9,000 houses. But it is undeniable that employers, who are already working under the difficult conditions imposed by heavy taxation, scarcity of resources, high wage bills, import restrictions and other controls, cannot be expected to implement a scheme which only serves to swell their costs of production and overhead charges.

In any case, it is not the responsibility of employers—although employers in certain well established and relatively prosperous industries have always shouldered it even before the Government had any scheme for housing workers—to provide housing for the workers which is at best the responsibility of the State, Local bodies and private initiative. To impose hard and fast conditions on employers in the matter of providing housing facilities for workers is to retard the pace of industrialisation. This is clear from the experiment tried by the Government in the early post-independence period. All the new industries that have sprung up in Greater Bombay in recent years would not have materialised had not the Bombay Government relaxed the condition on providing housing for workers. Housing requires large investments and the return on them is next to nothing. This unremunerative burden cannot be borne by industrial managements, especially when they already find it difficult to raise the finance they need for establishing and running their enterprises.

The Conference might have done well to consider the reasons why private enterprise is not coming forth in sufficient measure to eliminate housing shortages. It is no doubt acted pertinently in recommending the establishment of housing finance corporations/boards in the States. But it is not lack of finance alone that prevents private enterprise from doing its best in the cause of creation of additional housing facilities. Mr. Bhimsen Sachar, Governor of Andhra Pradesh, rightly pointed out, in the course of his address, that private enterprise had begun to shrink in the field of housing activity on account of scarcity of housing materials. He was candid enough to concede that the enactment of laws on control of rents and the requisitioning of premises had also adversely affected private initiative. It is to be hoped that these issues will be examined at the Central and State levels and will form part of the agenda of the next Conference at least. The Government could do much to relieve housing shortage. But, in the sphere of housing, the creation of adequate facilities and provision of the necessary incentive will enable private initiative to do more than what it has done so far, and certainly more than what the Government could accomplish.

MARKET GOSSIP

A SOMEWHAT quiet trend has come to prevail in the share markets. The revival of bullish fervour noted last week has failed to gather momentum. This is not surprising, because there was really no reason for the past week's spurt in prices. The tightening of margins on the Ahmedabad Stock Exchange seems to have had an indirect effect on the Bombay Stock Exchange also. The substantial fall in the prices of Ahmedabad shares, including Atul Products, from the high levels to which they had moved up earlier has brought about a sympathetic reaction, especially in textile shares. There would appear to be no move by the authorities of the Bombay share market to follow the example of Ahmedabad. In Mr. K. R. P. Shroff, this market has a staunch free enterpriser and a believer in the adage that "old is gold." There is no need to fear that he will initiate any new move, unless forced by the Government. Stock Exchanges in Britain and the U.S. have been modernised in regard to both the method of operations and public relations. But the Bombay share market goes on as in the past. Apparently, Mr. Shroff takes pride in keeping his market as a show-piece of oriental antiquity. If there is any institution in our economy which has no plan for its future, it is our Stock Exchange.

We are sorry for this digression from the trend of the share market. The most significant feature is the inability or the unwillingness of the bulls to scale new heights. The occupation of our strategic heights in the Himalayas by the Chinese bears has definitely upset their enthusiasm. Occasionally, they may pull up the market, but only to wriggle out of their commitments as best as they can. Genuine investors are concentrating their attention on the new issues of both old and new companies. At the same time, there is not much liquidation by them. This must be attributed to two reasons: (1) lack of suitable sources for reinvestment; not all investors are mad after capital appreciation to such an extent as to liquidate all or most of their existing investments in order to take up the new shares; and (2) existence of heavy capital gains tax. As for the professional bears, they appear to be more anxious than the Indian Communists to display their patriotism! Initially, they looked as though they were happy at the appearance of the Chinese bears at N.E.F.A. and Ladakh, but they have quickly withdrawn from the ring and are quietly biding their time.

The increases in the retention prices of pig iron and finished steels have not helped the steel shares, because they do not increase the margin of profit of steel companies. They are barely sufficient to cover the rise in cost of production and fall short of the manufacturers' idea of fair price. The consumer, however, is not being asked, for the present at any rate, to bear the increase in retention prices as it is being met out of the price equalisation fund. In other words, he has already paid for this addition to the manufacturers' price.

The reduction in the net dividend of the Belapur Company Ltd. for the year ended 30th September 1959 is undoubtedly sharp, but it will not be surprising if it turns out to be strictly in accordance with the trend of profit, when the details of the financial results are made known. It was common knowledge even months ago that the profits of most of the Deccan sugar companies for 1958-59 would not compare favourably with those for 1957-58, as production was less and sales realisations did not increase to an extent sufficient to offset the fall in output. If still some operators went on boosting the shares of these companies, they were either ignorant or clever enough to anticipate the prospects for the current sugar season. If the latter, they surely can have no grouse over Belapur's proposed dividend.

Straw Products

The terms of the rights issue by the Straw Products Ltd., a company belonging to the J. K. Group, have touched off a lively controversy. The Directors of the Company, now engaged in the manufacture of straw paper, duplex, triplex and corrugated boards in their factory in Bhopal, have embarked upon a new paper mill project in Orissa. And with this object in view, they have decided to increase its capital of Rs. 15 lakhs (in 150,000 shares of Rs. 10 each) by Rs. 2 crores through the offer of 25 new ordinary shares of Rs. 10 each for every three shares held and also a preference share of Rs. 100 (7 per cent. cumulative, tax-free) for every two ordinary shares held. The issue does for a shareholder with a modest holding of 100 shares in his possession is now called upon to find money to the tune of Rs. 13,330. It is, of course, open to the shareholder to deny himself the benefit of the rights issue either partly or wholly. But the question is asked whether it is right that the small shareholder should be compelled to bear so heavy a burden of new investment.

On a closer look at the problem of the Company's rights issue, it is difficult not to appreciate the Directors' stand. It is true that a vast new enterprise is growing out of a modest undertaking, so that the whole process appears as a case of a tiny little ant of a company bloating itself into a corporate elephant. But instances of such growth and expansion are not entirely unknown to the history of corporate enterprises, though it is true that such expansion used to take place over a long period of time. In the present instance, the Directors might easily have formed a new company to run the paper factory in Orissa. But that would have denied the existing shareholders an opportunity for profitable association with a potentially prosperous enterprise. It may be noted, in passing, that the shares of

well established paper companies are today worth their weight in gold; they are not merely gilt-edged but gilt all over. If it is conceded that the Directors' decision to allow the small enterprise to grow into a big one is not unsound in principle, neither the issue of right shares—this is obligatory under the Company Law—nor the terms of that issue can be called into question.

If the Company deserves to be criticised, it cannot be on the score of the proposed new issue; a really pertinent ground for criticism is provided by the revaluation of all its assets, including plant and machinery, which has enabled an artificial boosting of reserves to the tune of Rs. 60.40 lakhs, a thoroughly unsound practice notwithstanding the fact that several companies had done so in the past. The only difference between this Company and others is that it did the revaluation as late as in December 1955, long after the practice had ceased to be respectable. This issue is, however, besides the point now.

It cannot, of course, be contended that the shareholders were completely taken unawares by the Directors' decision. For two years now, the paper mill project has been in the air. In the report for the year 1956, the Directors revealed that the Company had been granted a licence for establishing a paper mill of 18,000 tons capacity per annum in Orissa and that negotiations for the purchase of machinery and plant were being finalised. Further, in the report to Rs. 5 crores. All this was sufficient evidence for shareholders to realise the magnitude of the tasks ahead of the Company. The new mill, which is likely to go into production by the end of 1961 or early 1962, is to be set up in Orissa where raw material (bamboo), power and transport facilities are readily available. It has secured the technical collaboration of the well-known W. German firm, Messrs. J. M. Voith.

The essential soundness of the new enterprise is illustrated by the fact that the Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India have, between them, agreed to underwrite Rs. 1 crore, of the Rs. 2-crore issue. Subscription for the balance has been guaranteed by the Managing Agents. The State Bank of India has agreed to guarantee, on behalf of the Company, a sum of Rs. 3.53 crores for covering deferred payments. It may be mentioned here that the present issue covers less than half the cost of the mill project, estimated at Rs. 4.67 crores; the balance will come from other resources of the Company and deferred payments facility.

The trend of prices of the Company's shares shows that the scrip has, on the whole, been a back-bencher, except for the jolt it suffered for a brief interval following the announcement of the rights issue. In Bombay, it was for some time quoted at Rs. 14 (nominal) and was last quoted (on 25th August 1959) at Rs. 16. The scrip touched Rs. 16.50 in Calcutta, reflecting speculative buying. When the terms of the rights issue were announced, it receded to Rs. 12; since then, it has recovered to Rs. 12.62. But it is unlikely that genuine investors have suffered through this decline, for those who know the prospects for paper mill companies would not rush to sell at any modest rise in prices, nor would they be dismayed by temporary declines. The Company has a good dividend record. Besides issuing a bonus share in 1949 in the ratio of one share of Rs. 10 for every such share held, it has consistently paid dividends since 1948—20 per cent. (1948), 10 per cent. (1949), 7½ per cent. (1950), 10 per cent. (1951 and 1952), 5 per cent. (1953 and 1954), 10 per cent. (1955), 12½ per cent. (1956, 1957 and 1958). It is, however, true that, in the context of the large new increase in its capital, it will not be able to maintain this record for some years. But those who can afford to wait may conceivably find that the dividends are worth waiting for. When the paper mill starts production, it will still have a ready market for its products, for, in the foreseeable future, Indian production can never expand faster than the demand for paper.

"Eurofinas"

Economic thinking among West European countries is cutting across national boundaries. While nothing so far has indicated a desire for political integration, there is ample evidence to suggest that there is readiness among these nations to make common cause in the economic field. This may be because there is more to gain from economic co-operation than from political integration. Whatever the reasons, the trend is obvious. Eleven years ago, the Marshall Plan gave the European countries an opportunity and an incentive to tackle their post-war problems in common. The formation of the European Common Market and the move to establish a free trade area of "Seven" are steps towards greater economic cohesion.

The latest instance of this co-operation among West European countries is provided by the relatively new institutions, namely, the hire-purchase finance companies. Thus, the leading hire-purchase finance houses in Austria, Belgium, Britain, Federal Republic of Germany, France, Holland, Sweden and Switzerland have jointly founded an Association of European finance houses called "Eurofinas" at a meeting held in Amsterdam on the 5th inst. "Eurofinas" is primarily intended to serve as an information and documentation centre. Its wider objective is said to be the promotion, protection and co-ordination of members' interests. The secretariat of the Association, to be established in Holland, will collect and disseminate particulars concerning consumer credit in Europe. Documentation will cover the legislative as well as commercial field. The secretariat will collect the balance-sheets and other data of various finance companies for

compiling information. The terms of credit ruling in various countries will also be gathered, collected and made available to members.

Representation of members on an international level is another objective. Experience during the preparatory period is said to have shown that international exchange of staff between member-firms are growing. "Eurofinas" may further stimulate such exchanges.

Preliminary studies have indicated that the total hire-purchase credits outstanding in the eight countries covered by "Eurofinas" was of the order of £500 million as at the end of 1958. More than two-thirds of this was provided by finance houses which have become the founder members of "Eurofinas."

With the founding of "Eurofinas," consumer credit financing across national frontiers may well grow quickly. Already some of the leading hire-purchase finance companies have entered into agreement with some of their confreres in other countries for co-operation in hire-purchase finance. The United Dominions Trust of Britain and the Kundenkreditbank of West Germany, for instance, have agreed to offer hire-purchase facilities for each other's goods sold in the other's country. "Eurofinas" is also a centre for information and co-ordination for finance houses wishing to extend activities abroad. It is noteworthy that members of both the "Six" and the "Seven" are represented in the Association. It is so apparently because the originators of "Eurofinas," the father of the scheme, is a Dutch consumer credit expert—also strong advocates of the wider European economic idea.

U. K. Towards Freer Trade

What may be described as practically the final contribution of Britain to the establishment of a truly multilateral payments system in accordance with the objectives of the International Monetary Fund is its latest bid to remove a large part of the remaining import restrictions. Thus, with effect from the 9th inst., most of the controls on imports from the dollar area, Western Europe and a number of countries other than those in the Communist bloc and Japan have been swept away. The list of items now permitted to be imported freely is too long to be quoted here. The most important ones are motor cars and commercial vehicles, scientific and optical instruments, many types of machinery, electrical equipment, photographic materials, meat, glass, jewellery, textiles and clothing. With this measure, Britain has eliminated dollar discrimination over its entire import trade, excepting 5 per cent. of dollar imports and less than 2½ per cent. of other non-sterling imports. The goods that are still subjected to quota restrictions include coal, dyestuffs, watches, munitions, basketware, seeds, feathers, jute, tobacco and certain foodstuffs (including some kinds of fruit, milk, ham and sugar), pharmaceuticals, aircraft, a few alcoholic beverages, fish, pigmeat and synthetic rubber; the last six items apply only to the dollar area. The continued retention of import control on these goods is, perhaps, due to considerations of defence, protection to certain "sensitive" U.K. industries and safeguarding of Commonwealth interests.

Within 24 hours of the aforesaid action by Britain, the Government of France came out with an announcement lifting all import restrictions on a wide range of goods from the dollar area and the eighteen O.E.E.C. countries. The goods included among others, textiles and clothing, electrical and photographic equipment, agricultural machinery and tractors, Chinaware, electric razors, household heating appliances and buttons.

By taking these measures, both Britain and France have earned for themselves the credit for having boldly implemented the I.M.F.'s earnest plea for an early end of discriminatory restrictions, a plea which was widely echoed at the Tokyo session of the G.A.T.T. The moves of the two countries are certainly commendable and it is to be hoped that they would be followed soon by the other developed countries also. The lumping of Japan with Communist countries, however, strikes a jarring note. Similarly, France has not been fair to the underdeveloped countries in the free world, by confining the relaxation only to the dollar and O.E.E.C. countries. It ought to have extended the facility to all G.A.T.T. members.

The trade liberalisation measure announced by Britain last week is the fourth major step towards the total removal of the war-time restrictions on trade and payments. The three steps preceding this were: (1) non-resident convertibility of the pound sterling towards the close of 1958 (along with thirteen other West European countries), (2) abolition of all restrictions on imports of a wide range of foodstuffs, and consumer goods from the dollar area countries (effective from 8th June 1959) announced on 28th May 1959, and (3) increase in allowance to British tourists abroad from £100 to £250, with assurance of further amounts for genuine foreign travel; this concession was announced towards the close of last month. With these four measures, Britain has almost brought about the *de facto* convertibility of the pound sterling within the meaning of Article VIII of the International Monetary Fund Agreement.

The U.K.'s move towards freer trade, together with the full repayment (with interest) of the \$250-million U.S. Ex-imp Bank loan on 29th October last—the repayment had not been due to be completed until April 1960 or even to begin until October 1960—reflects the growing financial strength of Britain, though it has stemmed partly from the anxiety of this country to help the Administration in its endeavours to maintain the present parity of the dollar. Britain continues to enjoy a high level of industrial production and surpluses in its external payments, the total of the surpluses during the eighteen months ended June 1959 being £121 million on merchandise account

EQUITIES REACT SHARP FALL IN BELAPURS

(From Our Own Correspondents)

BOMBAY, 12th November

AFTER a week of bullish sentiment, the share market witnessed an erratically lower trend during the week under review. While at times equities displayed a tendency to rise, the higher levels attracted profit-taking, as operators were in no mood to extend their long positions, in view of the forthcoming settlement this week-end. Towards the close, a heavy selling pressure set in to push down equity values in many leading counters to the lowest levels of the week, inspired by the heavy fall in the Ahmedabad market.

Two developments of importance to the market during the week under review were: (1) the announcement of dividend by the Belapur Company, Ltd., for the year ended September 1959 and (2) the increase in retention prices of steel for T.I.S.Co. and I.I.S.Co. Both the news had a bearish effect on the market. The Directors of Belapur Company have recommended a dividend of Rs. 21 per share, subject to deduction of tax, which works out to a net dividend of Rs. 14.70 per share, as against the distribution of Rs. 20 (including a bonus of Rs. 2) per share, free of tax, made for 1957-58. Reflecting the disappointment over the distribution, the shares suffered a sharp fall of Rs. 22 over the week.

The Central Government has increased the retention prices of steel for T.I.S.Co. and I.I.S.Co. by Rs. 5 per ton for the period 1955-56 to 1959-60. This is the third interim increase, pending finalisation of the Tariff Commission's enquiry, granted for the five-year period 1955-56 to 1959-60, bringing the aggregate increase to Rs. 31 per ton. So far as the T.I.S.Co. is concerned, the latest rise does not fully cover the Company's mounting costs. Further, the Company had already taken credit provisionally for about this sum in its 1958-59 accounts and as such the latest increase does not bring any additional benefit to it. Earlier in the week, the Government of India granted an increase in the retention prices of pig iron produced by the two Companies.

Tata Ordinaries moved erratically between Rs. 158.25 and Rs. 155.50 before closing at the latter level. Their rights were done a rupee lower at Rs. 72. Indian Irons were marked up early in the week from Rs. 24.28 to Rs. 24.56 before reacting to Rs. 24.12 yesterday. After improving for a short while to Rs. 24.24, the shares moved down again to Rs. 24.12.

The highlight of the week's trading in textiles was the wide movements in Centurys. After spurring from Rs. 622 to Rs. 635 on Monday this week, the shares gave way to Rs. 624.50. Despite this fall, they showed a gain of Rs. 2.50 over the week. Bomoay Dyeings were marked down from Rs. 69.60 to Rs. 68.10 and Kohinoors from Rs. 325 to Rs. 321. A decline of Rs. 3 to Rs. 110 was recorded in Central Indias. Finlays dropped by Rs. 3.50 to Rs. 302. Gokaks by Rs. 7 to Rs. 197 and Khataus by Rs. 13.75 to Rs. 250. While Morarjees provided one of the exceptions with a rise of Rs. 2 to Rs. 272, Shree Niwas Cottons shed Rs. 3 to Rs. 234 and Svadeshis Rs. 4 to Rs. 260.50.

Bank shares ruled quiet with an all-round drop in prices. Barodas declined by Rs. 4.25 to Rs. 97. Centrals were lower by 75 nP at Rs. 43.25 and Bank of Indias by 50 nP at Rs. 107. Bank of Indias 'A' were done at Rs. 109, which represented a decline of Rs. 3.50 from the previous business done. United Commercials, however, gained 50 nP to Rs. 62.

Sugar shares were weak following the declaration of a lower dividend by Belapurs. Belapurs fell headlong from Rs. 342 to Rs. 317.50 before closing at Rs. 320. Phaltans shed Rs. 6 to Rs. 180 and Walchandnagars Rs. 8.75 to Rs. 320.

Cement shares were fairly steady. Associated Cements moved between Rs. 156.75 and Rs. 153.75 before closing at Rs. 154.50. Digvijays advanced by Rs. 4.75 to Rs. 150. Ashoka Cements by 60 nP to Rs. 9.80 and Dalmia Cements by 40 nP to Rs. 10.48.

Shipping shares were featureless and quiet, Scindias drifting down from Rs. 17.12 to Rs. 16.84 and Great Eastern Shippings from Rs. 19.60 to Rs. 19.44. Automobile shares followed the general trend of the market, with an abatement of buying interest. Premier Automobiles dropped Rs. 5 to Rs. 140.50 and Hindustan Motors 16 nP to Rs. 13.56.

Engineering and mining shares lacked strength, Alcock Ashdowns shedding Rs. 5 to Rs. 250 and Premier Constructors Rs. 6 to Rs. 362. Tata Locomotives receded from Rs. 205.50 to Rs. 200. Larsen and Toubros, however, continued to attract attention and rose by 80 nP to Rs. 25.50. Mahindras lost 16 nP to Rs. 23. Shivrajputs were marked down by Rs. 3 to Rs. 88 and Indian Copers shed 6 nP to Rs. 3.96.

In the miscellaneous section, Bombay Burnahs (old) suffered a reaction from Rs. 547 to Rs. 537.50 and their new shares were lower by Rs. 1.75 at Rs. 183.25. Some hectic movements were noted in National Rayons, which after a recession early in the week from Rs. 384.50 to Rs. 381.75, shot up to Rs. 388 and closed at Rs. 377.50. Gwalior Rayons lost over the week 48 nP to Rs. 24.48. In the face of a general setback of the market, chemicals and dyes continued to gain strength. Alembic Chemicals were marked up by Rs. 5 to Rs. 200. Amar Dyes by Rs. 19 to Rs. 275. Colour Chems (new) by Rs. 2 to Rs. 242 and Indian Dyestuffs by Rs. 40 to Rs. 400. Polychems, however, drifted lower by Rs. 3 to Rs. 182. Dharmal Chemicals by Rs. 11 to Rs. 164 and Tata Chemicals by 52 nP to Rs. 17.58. Tata Oils suffered a loss of Rs. 2.20 to Rs. 61.80. Volcas fell by Rs. 5 to Rs. 177.50, while Hindustan Levers picked up Re. 1.25 to Rs. 33. Khandelwal Ferro Alloys were unchanged at Rs. 83.50.

Madras Stock Exchange

MADRAS, 11th November

Steady conditions prevailed on the Madras Stock Exchange during the major part of the week under review, thanks to fairly good professional and investment buying. There was, however, a distinct setback towards the close of the week, following profit-taking. Nevertheless, today's closing rates for several scrips were higher than those at the end of last week. In contrast to the general trend, textile shares came in for selling, despite encouraging reports from yarn and cloth markets. For it was feared

that the continuously rising production cost might lead to a reduced return from investments in mill shares. Tea scrips were cheerful on hopes of good prospects for tea exports. Coffees and rubbers met with moderate support. Among miscellaneous industrials, cements and chemicals ruled firm, while engineering were somewhat subdued. Sugar scrips were generally steady.

A feature of trading in the sugar section was the increase of Rs. 3 to Rs. 21 recorded by K.C.P.s. Mysore advanced by Re. 1.50 to Rs. 55.50. E.I.D.s rose by a rupee to Rs. 43.75. Andhras were fully maintained at Rs. 23. Travancors at Rs. 11.70 and United Breweries at Rs. 465. Kirlampudis and Cauverys, however, declined by a rupee each to Rs. 77 and Rs. 136, respectively. Deccans were active in the initial sessions on expectations of higher dividend, but it closed lower by 34 nP at Rs. 13.60 following the disappointment of operators at the announcement of a final dividend of 18½ per cent. (taxable), making a total of 25½ per cent. for the year ended May 1959, as against 18 per cent. paid in the previous year.

Among teas, Coonoors were marked up by 35 nP to Rs. 24.35. Parksides were 25 nP higher at Rs. 25.62, following the declaration of a final dividend of 20 per cent. (taxable), making a total of 27½ per cent. for the year ended June 1959, as compared with 25 per cent. for the previous year. Neelamalais put on 23 nP to Rs. 4.88. Kil Kotagiris gathered 5 nP to Rs. 8.95. Periakaramalais and Blue Mountains picked up 3 nP each, the former to Rs. 3.73 and the latter to Rs. 3.33. Ouchterlonyas at Rs. 16.35 and Nelliampathys at Rs. 3.05. Among coffees, Cowoodys improved by 10 nP to Rs. 8.55. Anaparaais were fully steady at Rs. 5.25, as also Balmadies at Rs. 2.95, and Ossoors at Rs. 4.10. Consolidated Coffees were firm at Rs. 25.35 at the beginning of the week but gave way to Rs. 24.59 subsequently. Coffeeands declined by 50 nP to Rs. 25.75. In the rubber section, Cochins Malabars scored a gain of 10 nP to Rs. 7.10. Midlands picked up 3 nP to Rs. 12.40. Kallias gained a like amount to Rs. 4.96.

A setback to values was witnessed in the textile section. Coimbatore Pioneers were marked down by Rs. 5 to Rs. 330. Dhanalakshmis fell by Rs. 3 to Rs. 227. Coimbatore Cottons and Rajalakshmis moved down by Re. 1.50 each to Rs. 162 and Rs. 66.50, respectively. Coimbatore Spinnings eased by a rupee to Rs. 48.50. Rang Vilasas treated by a similar amount to Rs. 46. Loyals lost 75 nP to Rs. 30.25 and Kotharis 25 nP to Rs. 11.60. Cambodias were dull at Rs. 11.10.

Western India Plywoods provided a bright spot in the miscellaneous section, its quotation rising by Rs. 3 to Rs. 243. Mysore Papers put on a rupee to Rs. 24. Among cements, Orissas went up by 48 nP to Rs. 13.88, Dalmias by 45 nP to Rs. 10.40, Travancors by 10 nP to Rs. 10.55, and Indias by 2 nP to Rs. 6.52. Andhra Cements were fully steady at Rs. 9.25. Among chemicals, Mettur Chemicals improved by 17 nP to Rs. 12.62 and F.A.C.T.s by 12 nP to Rs. 9.42. Mysore Chemicals Manufacturings were fancied at Rs. 22.55. Mysore Chemicals and Fertilisers were unchanged at Rs. 10.50. The Company has maintained its dividend for the year ended March 1959 at 5 per cent. Textools, however, suffered a fall of Rs. 6.50 to Rs. 191. Kallias eased by 50 nP to Rs. 87.50 and Spencers by 20 nP to Rs. 19.50. Aluminium Industries shed 15 nP to Rs. 22.50. Ashok Leylands lost 5 nP to Rs. 7.70.

NEWS IN BRIEF

THE outlay on Kerala's third Five-year Plan is tentatively fixed at Rs. 180 crores, as against the second Plan's outlay of Rs. 87 crores.

The Panchet Dam, the last of the four Damodar Valley Corporation dams, is scheduled to be opened by the Prime Minister on 6th December.

Exports of cigarette paper, including filigranated ones, will be licensed freely without any quantitative restrictions up to the end of 1962.

A six-man study team has been sent by the Government of India to study co-operative farming and marketing in Yugoslavia and Israel. The team is likely to take about three months to complete the study.

After completing the consideration of the controversial Kerala Agrarian Relations Bill, the Planning Commission has recommended it to the Union Government with its own recommendations. The Government's decision is expected shortly.

A proposal for the establishment of a large-sized sulphuric acid and superphosphate plant in collaboration with a West German firm has been submitted by a private industrialist to the Madras Government.

Air-India International will be introducing the giant Boeing 707 Intercontinental jet, powered with Rolls Royce Conway engine, early in 1960. It will have five scheduled flights to London a week and one flight to Tokyo commencing from April 1960.

It has been decided to allow import of copra and such chemicals, spare parts, components and machinery as are required for replacement purposes or for improvement of the vanaspati industry to achieve the export target of 10,000 tons of vanaspati or hydrogenated oils annually.

The Union Government proposes to amend the Drugs Act so as to make imprisonment compulsory in case of conviction for the manufacture and sale of spurious drugs. It is also intended further to amend the Act to enable the Union Government to issue directives to State Governments for bringing about uniformity in its implementation.

The Government of Madras proposes to acquire an additional 150 acres of land for expanding the Guindy Industrial Estate during the third Plan period. Work in the Estate is proceeding ahead of schedule. So far, 97 small units have been located in the Estate and the Government has sanctioned the construction of 31 more units.

Rolling of steel ingots in the blooming mill of Bhilai steel factory commenced on the 8th inst. Actual steel production started a month ago. So far, 4,000 tons of steel ingots have been produced. The blooming mill is the first of the four mills to be set up in the factory. The mills are designed to handle in all one million tons of steel ingots annually.

The new 42-mile Chandrapura-Muri railway line on the Eastern Railway has been opened for traffic. The new line is part of a bigger 184-mile broad-gauge line extending from Chandrapura to Ranchi and from there to Bondamunda, which, when completed, will link up the rich coal-belt of South Bihar with the steel plants at Rourkela and Bhilai. The line will also serve the heavy machine building plant and the forge foundry at Hatia, near Ranchi.

The West Bengal Government has urged the Centre to set up a wage board for the jute industry. Disclosing this, Mr. Abdus Sattar, the State's Labour Minister, stated recently that the existing level of emoluments in the jute industry was low. He added that twelve jute mills had been closed down in the State during the past three years owing to rationalisation. The number of persons employed by the industry has fallen from 281,000 in 1951 to 230,000 at present.

The Government of India has decided to constitute an Iron and Steel Advisory Council, with the Union Minister for Steel, Mines and Fuel as Chairman, to advise on all general matters relating to production, distribution, transport, research and trade of iron and steel. The Council will consist of Presidents or their nominees of both the Federation of Indian Chambers of Commerce and Industry and the Associated Chambers of Commerce of India. The Government will nominate not more than 21 members representing the different industrial and trading interests.

The Government of Bombay has set up a 14-member advisory committee to assist it in the smooth and efficient administration of the sales tax law. In pursuance of the recommendation made by the Sales Tax Enquiry Committee, the advisory committee, of which the Secretary to the Government of Bombay in the Finance Department is the Chairman, will make suggestions generally in regard to the removal of procedural defects and of inconveniences caused to the trade and the public in other ways. It will also assist the Government in devising suitable measures to prevent and minimise the evasion of tax.

With the arrival in Calcutta last week of the first consignment of steel pipes from the U.K., work will shortly begin on the preliminary stages of the 720-mile-long Assam oil pipeline project for Oil India Private Ltd. The first phase of the project is to connect the oilfield in upper Assam by a 16-inch diameter crude oil pipeline to the site of a refinery to be built at Noonmati, near Gauhati, at a distance of about 260 miles. The second phase of the project will be the extension of the pipeline system, using a 14-inch diameter pipe, from a point

PERSONAL

MR. B. Gopala Reddi, Union Minister for Revenue and Civil Expenditure, left New Delhi for Jakarta, Indonesia, to attend the annual ministerial meeting of the Colombo Plan which commenced there on the 11th inst.

Mr. Jef Rens, Deputy Director-General of the International Labour Organisation, has arrived in India on a short visit, as part of his study-tour of Asian countries.

Sir Norman Kipping, Director-General of the Federation of British Industries, has left India for Ceylon, en route to Australia, after his brief study and contact tour.

Mr. L. B. Soman, Sales Manager of Biddle Sawyer & Co., left for New York to explore the possibilities of promoting exports of Indian pharmaceuticals and chemicals abroad. He will also visit Canada, the U.K. and the Continent.

Dr. H. R. Ambler, O.B.E., F.R.I.C., a senior Principal Scientific Officer in the United Kingdom Department of Scientific and Industrial Research, has been appointed to the newly created post of Scientific Adviser to the High Commissioner for the United Kingdom in India. In addition to advising the High Commissioner on scientific matters, he will be responsible for stimulating the exchange of information between Indian scientists and their counterparts in the United Kingdom.

Mr. William Loris Mather, who is to succeed his father next year as Chairman of the Board of Directors of Messrs. Mather and Platt Ltd., of Manchester, has left London on a 32,000-mile world tour which includes India. He will be in Bombay from 20th to 29th November, and in Calcutta from 30th November to 3rd December. Messrs. Mather and Platt are general engineers producing electric, hydraulic, and fire-fighting equipment, and machinery for the food and textile industries.

wool technologists on a three weeks' Australian tour. By 1965, Russia is expected to have at least 200 million sheep, or double the present total and four times the sheep population at the end of the Second World War. The anticipated number, it is said, will be 50 million more than Australia's present sheep population.

The United Arab Republic and Sudan have signed an agreement for the division of waters of the river Nile between the two countries, following President Nasser's assurance to raise the compensation payable by the U.A.R. to Sudan for its lands which will be submerged when the Aswan High Dam is built on the Nile. This ends the two-year old dispute between the two countries over the question. The two countries have also signed another agreement on customs, trade and payments.

Since the introduction of the West German export credit guarantees scheme ten years ago, payment of a sum of £30.2 million has been made so far, while £15.9 million have been recovered. The outstanding amounting to £13.6 million are expected to be recovered from abroad. During the last ten years, cover aggregating £1,930 million has been given. In other words, about 10 per cent. of the country's exports during this period was given Government insurance. At present, there are export orders under the scheme worth £782.3 million, the major part of which will be shipped to underdeveloped countries.

A leading British hire-purchase company, the United Dominions Trust, and its West German counterpart, Kumdencreditbank of Dusseldorf, have decided to enter into an agreement to co-operate in hire-purchase finance with a view to taking advantage of the growing Anglo-German trade. The former company will offer hire-purchase facilities for West German goods sold in the U.K. and the latter will extend the same facilities to British goods sold in West Germany. The scheme is designed to make possible instalment plan buying of both consumer and capital goods. Similar contracts have been made with hire-purchase houses in the Netherlands and Austria to extend the scheme to those countries.

The pace of economic expansion in Western Europe is exceeding the previous expectations and the prospects for continued development in 1960 are excellent, according to the Economic Policy Committee of the O.E.E.C. which met at Paris last week. In a few countries, however, there are signs of inflationary pressures. There has also been a significant disequilibrium in the international balance of payments. Western Europe's gold and foreign exchange holdings have risen by over \$4,000 million in the last 2½ years. The Committee has urged the West European countries to eliminate discrimination against dollar goods, to facilitate the flow of capital from West Europe to underdeveloped countries, and reduce the heavy protection which they give to home industry and agriculture.

Two British firms are to collaborate in designing and selling small nuclear power stations with a capacity ranging from 1½ to 30 megawatts. Their object is to develop nuclear power systems which will operate economically in such areas of the world as India, Australia, and North America, it was stated in London. The firms are Humphreys and Glasgow Ltd. and Babcock and Wilcox Ltd. The new plants will be initially of the pressurised water-cooled type, in which ordinary water is used to draw the heat from the reactor furnace for power generation. It is planned to design units with a capacity as low as 10 megawatts later on. The reactor units are being designed by Babcock and Wilcox on the basis of adapted versions of the reactor for civil ship propulsion which the firm proposed to the British Admiralty earlier in the year.

London Cries and London buys air-spiced goods from India!

7 flights each week

TAKE advantage of seven flights a week, to London to get your goods to London fast. Transport and insurance costs are reduced; warehousing charges cut; turnover is quicker; markets are satisfied. And Air-India are such experienced cargo handlers! Remember, only Air-India offers you seven flights a week to London, via 8 cities—plus a special weekly cargo service for heavy and bulky wares.

BOMBAY PORT TRUST

THE importance of Bombay Port to the Indian economy arises from the fact that it serves as a chief port of entry for a wide range of goods, including plant and machinery, and an outlet for the country's exports, including manufactured goods like textiles. In recent years, the volume of traffic handled by the port has grown sizably. In 1958-59, according to the Administration Report of the Bombay Port Trust, the weight of cargo handled by the docks and bunders in the port aggregated 11.75 million tons, made up of imports of 8.42 million tons and exports of 3.33 million tons. Although this is somewhat lower than the volume handled in the previous year, 1957-58, when it was 13.11 million tons, made up of imports of 9.30 million tons and exports of 3.81 million tons—the decline is to be attributed mainly to the sharp fall in imports reflecting import curbs—it is noteworthy that the volume of traffic now handled is much larger than in the early post-war years when it was about six million tons, or in the pre-war year 1938-39 when it was some five million tons.

The problem which has engaged the attention of the authorities of the Port is the urgent need for improving the port facilities to a level at which the Port can meet effectively the demands that are being made on its services. Clearly, it is a national problem, for if the Port fails to come up to international standards, it will affect adversely India's position in world economy. The Bombay Port Trust authorities, on their part, have no doubt been alive to the problem of improvement of the Port. The scheme for the modernisation of the Prince's and Victoria docks, which has come to be known as the "minimum" scheme, is expected to cost Rs. 20 crores. It is of the utmost importance that at least this minimum scheme should be implemented. But the report records that when a deputation of the Trustees met the Union Minister for Transport and Communications and urged that the Government should meet 50 per cent. of the cost of the minimum scheme, the latter suggested that, inasmuch as the scheme was very expensive, an endeavour should be made to devise "a financially practicable and revenue-earning phased programme and that it was not possible to give a grant for the purpose." The Government's attitude is somewhat disappointing. If the importance of the Bombay Port is recognised and its significance to national economy conceded, the way would be cleared for the allotment of a higher priority for the development of the Port. It will be conceded that the development of Bombay Port is far more important than the bifurcation of the Bombay State on linguistic lines. Yet, the Centre is prepared to find money for the construction of a new capital for Gujarat and put up with the economic waste involved in linguistic reorganisation but not for a revenue yielding and wealth producing scheme like the development of Bombay Port. This makes nonsense of planning and the Centre's conception of economic priority.

OILSEEDS TRADE

The need for special incentives for exports of vegetable oilseeds and oils and measures for increasing the production of oilseeds was stressed by Mr. Ramdas Kilachand, President, the Bombay Oilseeds and Oils Exchange Ltd., in his speech at the annual meeting of the Exchange, held on Wednesday this week. Vegetable oilseeds and oils, as is well known, form an important item of India's exports. Last year, they earned Rs. 7.8 crores, as against Rs. 11.6 crores in 1957. But India could certainly export more oilseeds and oils, if Indian prices could be held at competitive levels. Further, the Government has had to steer clear, on the one hand, of liberal exports, which would reduce domestic supply and push up prices, and excessive restrictions on exports which would reduce the country's foreign exchange earnings, on the other. Clearly, this situation is best remedied by increased production. As Mr. Kilachand pointed out, the "real solution lies in increasing production of oilseeds." He added: "It is heartening that the Government has accepted the need for stimulating and augmenting inter-

nal production in the country and we hope that all steps will be taken by the Government for increasing the production of all oilseeds, especially groundnuts, because it is only increased production which will ultimately help us in increasing exports."

In the context of the continuing urgency for augmenting India's foreign exchange earnings, the specific suggestions which Mr. Kilachand made for increasing exports of vegetable oils and seeds deserve special notice. In the first place, he urged the Government to decide the export policy for a whole season, instead of announcing it for short periods. It is true that the Government has already relaxed or abolished several restrictions which formerly prevailed in the sphere of oilseeds exports. It has, for instance, decided to license freely exports of nigerseed, kardiseed and sesameseed, their oils, salad oil, nigercake, kardicake and other oilcakes (excluding groundnut oilcake). Liberal quotas are being issued for H.P.S. groundnuts, groundnut oil and groundnut oilcake. Nevertheless, the permission for exports is applicable for brief periods at a time. If export policy is determined in advance and announced for the whole season, it will encourage the exporters to plan their trade, ensure prompt delivery to overseas buyers, and also introduce a certain element of stability in their operations. Secondly, Mr. Kilachand stressed the need for some incentives for exports on lines similar to the incentive scheme for exports of textiles. At present, the incentive scheme for groundnut oil exports takes the form of export entitlement for 3½ tons of oilcakes for each ton of groundnut oil exported. He wanted this scheme to be replaced by some scheme which would permit imports of copra, chemicals, etc., against exports of groundnut oil.

In conclusion, Mr. Kilachand referred to the credit restrictions on oilseeds trade, the increase in freight rates and the proposal for State trading. He felt that, since the credit curbs make it difficult for exporters to get finance, at least they should be exempted from such restrictions. Referring to the increases in freights on oilseeds, oils and cakes by the Karmahom Conference, he urged the Government and shipowners to give their attention to the problems created by these increases. "The least that the Government can do," he said, "is to bring pressure on the Conference to do away with the system of deferred rebates." Finally, he pleaded for setting up an export promotion council for oilseed and oils. Surely, the move for entrusting export trade in these commodities to a State-sponsored body, as suggested by the State Trading Corporation, is neither desirable nor practicable.

PROMOTION OF TOURISM

In the thinking on development of tourism, the emphasis should henceforward be on implementing the policies and programmes already adopted rather than on enunciating new policies or fruitless debates on the place that should be assigned to home and foreign tourism. By now, the broad outlines of the country's tourist development policy should have been finalised and agreed upon. The importance of tourism both from the point of view of earning foreign exchange and goodwill for the country has been sufficiently stressed. The advantages of home or "social tourism" for greater understanding among the people and their emotional integration are also obvious. What is lacking, however, is vigorous efforts to make these advantages materialise.

What is not so readily recognised, or even if recognised does not receive sufficient attention, is the basic prerequisite of a vigorous tourist trade. As Mr. Raj Bahadur, Union Minister of State for Transport, pointed out, at the third meeting of the Tourist Development Council held at Trivandrum this week, "publicity" and "facility" are the two pillars on which the whole edifice of tourism stands. Just as home and foreign tourism should develop hand in hand, publicity and facility should move in step. While attempts are being made to publicise the attractions of India for the foreign tourist, and this is reflected in the steady increase in the flow of foreign tourists into the country during the past few years, efforts at building tourist facilities have lagged far behind. Greater emphasis should, therefore, be laid on meeting the requirements of the foreign tourist. To start with, attention should be concentrated on providing for the basic amenities of the tourist such as board and lodge and travel facilities, including good roads. Suitable and sufficient hotel accommodation is still lacking. Even in the big cities, which alone at present have the right type of hotels (though not in sufficient

numbers) that can cater to the needs of foreign tourists, the progress in this respect has been very slow and there has hardly been any improvement in the availability of suitable accommodation. In fact, the situation would appear to have deteriorated.

If the Government's tourist development plans is to make any sense, utmost importance should be given to the hotel industry. The Chaman Lall Committee had rightly emphasised the need for an increase in hotel accommodation throughout India, especially in cities like Calcutta, Bombay, Agra, and Cochin, where the accommodation problem is acute. The fact that hotel accommodation at present is short of requirements is no reflection on the ability of the private sector. It is because sufficient encouragement and facilities have not been given so far and it is high time the question was accorded top priority. If, however, what the private sector can do with Government help and assistance proves insufficient to provide for the expanding tourist traffic, there should be no hesitation in allowing and even encouraging foreign capital to enter the field of hotel industry, alone or in collaboration with indigenous capital. Many international hoteliers will be ready to set up hotels in India if they are permitted to do so. Attempts made in the past by a few leading hoteliers in this direction have met with resistance from the Government, perhaps under pressure from the leaders of the indigenous industry. There should not be any objection to welcoming foreign capital to the hotel industry when domestic capital alone has not been able to cope with the increasing requirements. The loss to the country resulting from transfer of profits out of the country will be more than compensated by the enlarged tourist earnings. The Government decided recently, and rightly, that where there were clear and obvious advantages in permitting foreign collaboration in the setting up of any hotel, such collaboration would be permitted. But the condition attached to the grant of permission, namely, that foreign capital does not ordinarily exceed 49 per cent. of the total capital invested, does militate against the policy of encouraging the flow of foreign capital into this industry.

SOME OBSTACLES TO DEVELOPMENT

It is often said that Kerala is a problem State. This is as much true of its economic conditions as of its politics. For political instability is obviously a source of constant threat to economic development. The business community, in particular, runs a great risk in such a situation. Apart from the burden of taxation and other obstacles to capital formation in the private sector which are true for the country as a whole, business men in Kerala are put to many other difficulties of local origin. The latter include those problems arising from the frequent changes in the various policies of the State Governments decided by political parties of differing, and sometimes conflicting, ideological loyalties. Law and order situation, as also labour relations, are other factors affecting the business community. It was only natural then that Mr. W. E. Northey, M.B.E., Vice-President of the Cochin Chamber of Commerce, should have drawn pointed attention, in his speech at the annual general meeting of the Chamber held at Cochin on the 6th inst., to the political developments during the last one year in the State and "the unfortunate repercussions" they had on normal commercial activities in the State. He was, for understandable reasons, reluctant to dilate on this aspect of the problem. He, however, hoped that Kerala would shortly have a responsible and stable Government, which, among other things, would give proper consideration to the commercial community and consult it before committing itself to legislation on matters of vital importance to established industries or trades.

According to Mr. Northey, there were three major problems of all-India interest affecting members of the Cochin Chamber. These were the increased burden of corporate and personal taxation, consequent on the enforcement of the 1959 Finance Act, the unsatisfactory food supply position and the rising labour costs and their effects on productivity and exports. He disclosed that the Associated Chambers of Commerce of India, of which the Cochin Chamber is a member, was reviewing the position in regard to corporate taxation with the object of securing a reduction in the net incidence and more reasonable treatment in such matters as the rates of tax on income from inter-corporate investment, the differential tax rates paid by foreign companies and accumulated tax credits. Mr. Northey also referred to the difficulties experienced over the interpretation of section

18(3B) of the Income-tax Act and its application to companies with establishments in India but classified as non-resident as a result of the amendment made to Section 4A(C) of the Act. It would appear that the Chamber has already taken up the matter with the Union Ministry of Finance.

Mr. Northey also brought out the difficulties experienced by foreign personnel employed in India, following the withdrawal of the exemption from tax of the first Rs. 4,500 of foreign income in pursuance of the Finance Act 1959. He pertinently pointed out that, if the foreign personnel working in India could not live in conditions which were reasonably acceptable to them, both from the aspect of physical comfort and general amenities and from that of their remuneration after taxation, the situation was in effect a deterrent to investment. Admittedly, this question deserves careful study, since it has a direct bearing on the flow of foreign capital and dissemination of foreign technical know-how in the country.

The difficult food situation in the country poses another serious problem to economic development of Kerala. Mr. Northey observed that this was largely the cause of the steep rise in the cost of living in that part of India. He called for a vigorous approach to the problem of increasing food production and proper arrangements to ensure the free movement of food throughout the country. He also referred to the growing indiscipline among labour and political activities of rival trade unions. There had also been considerable increases in wage rates in almost all industry and, at the same time, employers' expenditure on amenities for workers had risen. He rightly held that higher labour costs, without any proportionate increases in productivity, coupled with heavy internal taxation, were liable to have serious effects on industries which were competing in world markets. Appropriately enough, he suggested the adoption of a general policy of linking wages to productivity.

The business community in Kerala has also had to face difficulties arising from periodic congestion in the Port of Cochin and serious delays in the movement of goods to and from it. In order to solve this problem, Mr. Northey urged (a) the speedy execution of the work on the four new wharfs

the commissioning of which has been delayed by a year, (b) the diversion of foodgrain ships to the ancillary ports in West Coast during fair weather, (c) the development of road and rail communications from the port to the hinterland, (d) the adoption of a more flexible policy regarding the centralisation of customs examination, and (e) the quick movement of Government foodgrains to departmental storage sheds without holding them up in the transit sheds. It is to be hoped that these suggestions will receive the attention they deserve.

"FREEDOM FROM HUNGER"

The keynote of the various speeches made at the plenary session of the tenth biennial conference of the United Nations Food and Agriculture Organisation (F.A.O.) held at Rome this week was that, unless energetic worldwide action is taken to remove hunger from every part, lasting international peace and goodwill cannot be ensured. This aspect was most forcefully brought out by Prof. Arnold Toynbee, the noted English historian, who delivered the first McDougall Memorial Lecture instituted by the F.A.O. in honour of the late Frank L. McDougall, a leading figure in the creation of this body, and by Mr. B. R. Sen, the Director-General. Prof. Toynbee urged the need for a mass educational programme and political action to keep world population growth under control and the people free from the menace of famine, while Mr. Sen proposed the launching of a "Freedom from Hunger" campaign. He said: "The new dimension being added to the food problem by an increasing population is one that must challenge all our intelligence and our energy.... The familiar paradox between surplus production in some countries and hunger in large parts of the world continues."

Mr. Sen's proposal evoked excellent response and unstinted support from practically all the delegates. In the course of his inspiring speech, Mr. S. K. Patil, Union Minister for Food and Agriculture and leader of the Indian delegation to the F.A.O. conference, rightly observed:

"This is, in my view, a basic responsibility from which none can flinch.... It is for the member-countries now to concentrate their efforts on this constructive campaign and to pursue it relentlessly until the scourge of hunger disappears from this planet of ours. Someone very wisely said that poverty anywhere is a menace to pros-

perity everywhere. There can be no real peace or happiness in the so-called surplus countries as long as there is food deficit leading to hunger in any country."

The success of the "Freedom from Hunger" campaign will depend to a considerable extent on the extent of co-operation forthcoming from all the countries, both surplus and deficit. Mr. Patil certainly struck a note of realism when he declared that it was not enough to rush to the help of a needy country where an acute food shortage had occurred; it was equally the responsibility of the surplus countries to take preventive action in time to avoid conditions of scarcity. "This," to quote him, "raised the question of maintaining adequate food reserves in deficit areas until these areas are able to look after themselves."

In the opinion of Mr. Patil, an experiment of a World Food Bank is not only feasible but also essential. The most salutary effect of such a bank, according to him, would be its undoubted impact on food prices. Along with the adequacy of food, precautions must be taken to see that food prices are kept in reasonable check. Conditions of scarcity lead to other evils like hoarding, black-marketing and price fluctuations. These have to be avoided by timely action. Surely, a World Food Bank "can supply an effective answer to all these evils from which millions have to suffer," provided, of course, the scheme envisaging its establishment is a realistic and practical one. To quote Mr. Patil again: "It is not beyond the competence of experts to work out a practical scheme for a World Food Bank which can hold food deposits at places where they can produce immediate results.... It is not mere proximity of food that can drive away hunger; food at a reasonable price is the obvious remedy."

The plea for setting up a World Food Bank is a very timely one and deserves the utmost attention of the F.A.O. Since the implementation of the scheme involves solution of many complicated problems, it will naturally have to be preceded by an expert study of the different aspects of the scheme. Meanwhile, the F.A.O. can consider the suggestion of the Canadian delegate, Mr. D. S. Harkness, for creating a working committee to serve as a clearing house for information, to keep a watch over the world food situation and to facilitate action wherever possible.

U.S. ECONOMY IN GOOD SHAPE, DESPITE COSTLIEST STEEL STRIKE PAYROLL LOSSES ALONE EXCEED ONE BILLION DOLLARS

SURVEYING the latest business and economic conditions in the U.S. with particular reference to the impact of the 116-day strike of steel workers on the economy, the November issue of the *Monthly Letter* of the First National City Bank of New York, observes as follows:

The steel strike reached a critical stage by late October. Heavy inventories at the start enabled steel users to keep going through August and September, but, in recent weeks, secondary unemployment has been mounting. Nearly 200,000 persons were put out of work during October by steel shortages. By month-end, an estimated 865,000 persons (including half a million strikers) were without work, because of the steel situation, and many thousands more had been hit by other strikes. Prospects of still greater disruption of production and employment led President Eisenhower on 19th October to request an injunction under the Taft-Hartley Act, calling off the steel strike for 80 days. A Federal Court issued an injunction on 21st October but its effect was stayed until 2nd November to give the union time to appeal to the Supreme Court.*

No matter how soon the strike is halted, the most acute pinch in steel supplies is yet to come. Once a settlement is reached, or an injunction becomes effective, it will take several days for furnaces to be reheated, and several weeks before a balanced flow of finished products is achieved. Steel men fear a shutdown as protracted as this may have caused extensive damage to furnaces and other steelmaking facilities. Unless iron ore shipments on the Great Lakes are resumed soon, some blast furnaces may have to be shut down early next year.

Kaiser Steel has signed a contract with the union at an estimated cost of 22½ cents per hour in wages and fringes spread over two years. The money differences between the union and the other 11 major producers have narrowed, aided by mediation efforts of the President's Board of Inquiry, headed by Dr. George W. Taylor. The industry has raised its offer to 2.6 per cent. of payroll costs—equivalent to the industry's average annual productivity gain. The emphasis in the negotiations has been more in the direction of increased fringes than wages, the men evidently preferring tax-free benefits, though sometimes erroneously construing fringes as without cost to the employer.

A Matter of Principle

The main stumbling block remains the same as before—the issue of local work rules, work schedules, and wildcat strikes. Management's insistence on the right to manage more efficiently has become a deep-set matter of principle, as well as an economic issue. Union proposals for joint committees to study the problem, accepted by Kaiser, have been rejected by the other companies, while employer offers to submit work rule questions to binding arbitration have been rejected by the union.

Dr. Taylor noted in his report to the President that: "The Board cannot point to any single issue of any consequence whatsoever upon which the parties are in agreement." Bargaining has continued during the legal struggle over the injunction, spurred by admonitions by the Board of Inquiry, the President, and the Court. Both parties are well aware that a settlement arrived at through free collective bargaining without outside pressure is far better for their own interests and those of the nation than one dictated by Government. Taft-Hartley offers temporary relief, but does not settle anything. In a way, it may be said that free collective bargaining is on trial.

The President also resorted to a Taft-Hartley injunction in early October to halt the strike of longshoremen on the East and Gulf Coasts. The impact of the steel strike has overshadowed labour unrest in other lines, including meatpacking (now settled), glass containers, copper, and zinc (currently out on strike), and aluminum and railroads (negotiations under way).

*Appeal since rejected. See footnote on the next page.

Not surprisingly, the same matter of principle which has been the critical issue in steel negotiations is at the heart of many of these other disputes. Whether negotiators refer to featherbedding, automation, technological progress, or improved materials handling, the basic issue is the same—the insistence of management on its right to introduce more efficient methods and equipment. At a time when American industry is facing a difficult challenge in maintaining exports, business has become more sensitive to union rules which waste manpower. Excessive labour costs can no longer be easily offset by higher prices, and greater efficiency is management's major weapon in maintaining adequate profits to provide for growth.

When all the losses in wages, profits, and disruption of business are added up, this steel strike has probably been the costliest in the nation's history. Payroll losses of strikers alone are figured to exceed a billion dollars. If the industry settlement, like Kaiser's, boosts wage rates 9½ to 12½ cents an hour in the second year of the contract, the steelworker, with a wife and one child, would need 9 to 11 years of full-time work to make up for the wages he lost during the strike.

Reports received so far from 32 leading steel corporations show a net loss during the third quarter of \$108 million, and fourth quarter prospects worsen every day the shutdown continues. Profits have also been reduced in various metal fabricating companies which have had to pay premium prices or incur extra costs to procure steel or have lost business because of material shortages. Federal, State and Local Governments are sharing the burden in the form of curtailed tax collections, as well as in increased relief outlays for needy strikers and unemployment insurance payments to those suffering secondary layoffs.

Underlying Economic Strength

It is remarkable how well the economy generally withstood the consequence of labour disturbances of this magnitude through September. Industrial production in September was within 5 per cent. of its June record. Overall metal fabricating activity had dropped only 2 per cent. since June, and that was due more to the cut-backs for automobile model changes than to shortages of steel. Despite the heavy layoffs, non-farm employment was estimated as the highest for any September on record. Personal income receded only 1 per cent. from its June record. Retail sales—down 3 per cent. from July through September—might have made a better showing had it not been for unseasonably warm weather and the desire of some prospective auto buyers to wait to see the new "compact" models. Construction activity slipped off 5 per cent. from its record-high second quarter level, reflecting the pinch of tight money on home building and some slowing in the pace of highway construction.

Gross national product receded less than 1 per cent. during the strike-ridden third quarter. Total output of goods and services was estimated at an annual rate of \$481 billion, as compared with the record \$484.5 billion in the second quarter. Consumer spending, business fixed investment, and Government outlays continued to rise; the only major declines were in home building and inventory demand. Overall inventory accumulation was at the annual rate of \$10.4 billion in the second quarter, but dropped to only \$1 billion in the third, when steel inventories fell and automobile dealers were cleaning out 1959 models.

Inventories Need Rebuilding

The economy is in good shape for the upsurge which will inevitably follow the settlement of major labour disputes and the resumption of full-scale steel production. Inventories of steel, automobiles, and many other types of goods will need to be rebuilt. The return to work of strikers and others who were laid off will boost payrolls and purchasing power, while other consumers who held back for fear that spreading layoffs might affect them will be in a mood to spend more freely. Relieved of uncertainties and stimulated by expanding sales, many businessmen may make more optimistic

reappraisals of their capital expenditure programmes.

It is expected that most of the business postponed because of the strike will be pushed forward into early 1960. Because of steel shortages, for example, passenger car output may fall 300,000 or 400,000 short of original fourth-quarter schedules, tending to keep assembly lines busy early in 1960. General expectations are that the initial upsurge in business activity—based largely on the temporary stimulus of recovery from the strike—will give way to a high-level plateau, or more gradual advance, for the rest of 1960.

An Unemployment Problem

The direct and indirect effects of strikes kept more than one million persons off their jobs during October. This involves a large wastage of skilled manpower as well as hardships and deprivations for the people affected. Most of this unemployment will never be reflected in the official unemployment statistics. One of the curiosities of the labour force figures is that strikers (unless seeking other work) are classified as employed, even though most of them are idle and some of them become entitled to unemployment benefits.

There is proof of the financial resources of the workman, as well as of the generous provisions for public assistance, in the fact that so many can make do without gainful employment for so long. Nevertheless, the loss to him and to the nation is very real. The idle moment can never be recaptured and put to work.

Trade unions often have been in the forefront demanding Government actions to reduce unemployment. It was ironic that the Steel Union, opposing Government action to get men back to work and check spreading unemployment, argued that the economic effect of the steel strike was so slight that it did not imperil the national health or safety. A strike intended, according to the Union's advertisements, to add a billion dollars to payrolls has already subtracted more than that.

It is worthwhile recalling the assertion, at the A.F.L.-C.I.O. convention in Puerto Rico last February, that Congressional approval of President Eisenhower's programme for balancing the Federal budget would condemn the United States to a permanent pool of five or six million jobless workers and would bring about national "economic collapse." Then, as well as later in the "march of the unemployed on Washington" rally in early April, the A.F.L.-C.I.O. urged Federal intervention to relieve unemployment, namely, by easy money and increased Government outlays for housing, education, and all sorts of public works. Yet none of these things would have dealt with the present unemployment due to strikes.

The Hat Trick

At the time of the Puerto Rico convention, the official unemployment figure, swollen as usual by the effect of cold winter weather on construction and agricultural work, was reported at 4.7 million. Secretary of Labour, James P. Mitchell, recognising the strong recovery under way in business and job opportunities, predicted that, by October, the unemployment figure would drop to three million, getting down toward a practical minimum in an unregulated peacetime economy. Accused by union officials of "talking through his hat," the Secretary reportedly offered to eat the hat he was accused of talking through if he did not prove right.

The October unemployment figure, due for publication in mid-November, may exceed three million. But every unbiased observer will agree that unemployment could have been below three million if the strike had not arrested steel production. By mid-October, about 280,000 persons in related industries had been laid off because of the steel strike and were counted among the unemployed. Indeed, as far back as April, the A.F.L.-C.I.O.'s *Economic Trends and Outlook* conceded that the Secretary's "prediction will probably prove to be correct, on the basis of present trends." Since he was not talking through any hat, there is none to eat.

A special Senate Committee, appointed as an outgrowth of trade union complaints over lack of job opportunities, is now studying "the problem of unemployment." It is to be hoped that the Committee will note that unemployment has many reasons and facets. It is an expression not only of immobilities, such as those that keep people from leaving depressed areas, but also of treasured freedoms, such as those of people to work part time or intermittently if they prefer, to quit in search of something better, and strength against another valued right—the right of the citizen to protection from continuous wage and price inflation.

AMERICAN LETTER

AGREEMENT TO REMOVE DOUBLE TAXATION COMMENDED DROP IN STEEL MILLS' PROFIT—CONSUMER SPENDING STILL HIGH

From Our Special Correspondent

NEW YORK, 5th November

THE Treasury Department at Washington has finally recommended the adoption by the United States of an income-tax agreement with India, designed to eliminate double taxation and to promote the flow of private investment between the two countries. There are similar agreements in force with 21 other nations, but the proposed convention with India is unique in containing a U.S. credit for tax exemption granted by India.

Under existing U.S. laws, a credit is granted against income-tax only for taxes actually paid to the country where the income is earned. If a foreign country gives tax exemption to encourage new investments, no credit is allowed against U.S. tax liability. The proposed convention with India would allow a credit against U.S. tax, even for the exemption from tax granted by India. It is anticipated here that the credit provision of the convention might be an important stimulus in generating interest in private investment opportunities in India.

The Treasury has transmitted the convention to the State Department with the recommendation that it be signed. The proposed treaty will not become effective until it is signed by both Governments and the Senate gives its consent to ratification. That means that the agreement cannot become effective until early next year when the Congress reconvenes. While the convention may not be the first point on the Senate agenda, it is reasonable to assume that relatively speedy action will be given to the approval, since India has had a good Press here recently, especially *vis-a-vis* Red Chinese aggression.

The solid front of management against labour has finally been broken in the steel strike which has now been running for more than 110 days. Several steel companies headed by Kaiser Steel have made separate agreements with the United Steel Workers of America. As this is being written, the U.S. Supreme Court is taking up possible enforcement of a Government-sponsored injunction which would end the walkout for at least 80 days.*

The break in the solid front has psychological rather than economic implications. Only about 6 per cent. of all steel-making capacity so far is affected by the back-to-work movement. Negotiations between labour and managements of the big steel companies for more than three months have been an exercise in futility.

All things being relative, the following may be of interest. The United States Steel Corporation reported a \$31.1 million loss for the third quarter of 1959 and the first since 1938. The deficit was the Company's largest. Yet, the directors voted the regular quarterly dividend of 75 cents a share. In spite of the third-quarter loss, nine months' earnings were still ahead of the recession year 1958. Net income was equivalent to \$3.80 a common share, as against \$3.56 for the first nine months of last year. This, however, was well below the \$5.77 a share reported for the first nine months of 1957.

Within the last week or so, the U.S. has also been feeling the first strike-caused shortages of copper. About 75 per cent. of this country's copper production has been halted by walkouts of members of the International Union of Mine,

*Since writing, the Supreme Court judges have, by a majority of eight to one, upheld a lower court injunction ordering the 500,000 striking steel workers back to their jobs. The Supreme Court held that the provision of the Taft-Hartley Act to send the strikers back to the mills for an eighty-day cooling-off period was not unconstitutional, as was contended by the United Steel Workers Union, and the Court did not uphold the Union's contention that some steel plants, but not all, should be reopened to meet specific defence needs, on the ground that it had no powers to do so. It felt that the Union's suggestion was tantamount to the Union seeking to impose its wishes on the Government. The President of the Union remarked that, while the Court's order had to be obeyed, the workers might strike again at the end of the 80-day cooling-off period, if no agreement was reached by then.

LONDON LETTER

STILL SET FAIR

U.K.'S PAYMENTS POSITION

(From Our Own Correspondent)

LONDON, 31st October

A STUDY of the detailed figures for Britain's Balance of Payments in the first half of this year gives every hope that, although the favourable balance will not be as high as in 1958, it will nevertheless be substantial and on a scale comparable to the average of the past three years. Further, it indicates that Britain is having a greatly improved balance with the dollar area—the country's main source of external weakness hitherto—and relying for a large amount of its current surplus on this area instead of on the sterling countries; thereby enabling the latter to spend outside the sterling area more freely without weakening the central reserves.

In the first half of this year, imports on f.o.b. basis at £1,727 million were £23 million below exports. Thus, for the second year since the nineteenth century Britain has a surplus on visible account. The surplus, however, was £70 million less than in the first half of 1958, because, while imports rose by £99 million, exports rose only £29 million; but exports were improving this year after their lull last autumn and there is no reason why the surplus should be anything like as diminished for the second half of the year.

The surplus on invisible account was also £25 million lower this half-year at £119 million. Government expenditure cost £10 million more, shipping brought in £8 million more, interest on loans, dividends, etc., brought in £16 million more, but on all the rest of the items (banking services, travel, etc.), we lost £39 million. The combined surplus of £142 million was thus £95 million less than in the first half of 1958.

Capital Movements

It is now possible to see what capital movements took place which, supplementing or reducing the surplus, accounted for the additions to the gold and currency reserves:

	First half	
	1958	1959
Surplus on current account ...	237	142
Capital exports (identified) ...	104	36
Balance remaining to be settled by monetary movements ...	133	106
Unidentified capital inflow ("hot money" balances, etc.) ...	130	31
Miscellaneous money transfers including changes in internationally held sterling ...	24	132
Increase in gold reserves ...	287	269
Less U.K. subscription to I.M.F. ...	...	232
Net increase ...	287	37

The miscellaneous monetary transfers for 1959 include, in the total of £132 million, no less than £107 million increase in the sterling holdings of the I.M.F.—which becomes a contingent liability materialising when the money is spent by any I.M.F. beneficiary. In the meantime, while Britain subscribed to the I.M.F. the sum of £232 million, she only had to find £125 million (£232 million less 107 million) in gold and this sum can, of course, be drawn upon by this country as if it were an international bank deposit in case of dire need. The true comparable position with 1958 is, therefore, that, without the I.M.F. transactions, Britain's gold and dollar reserves would have gone up by £162 million in the half-year against an actual increase the previous year (first half) of £287 million. Not a bad comparable result—most of the difference being due to a less good commercial outturn.

Coming back now to the commercial figures, in the current account, history is again being made with a surplus achieved with the non-sterling area of £50 million in the half-year. This is the most significant item in the whole study. (Last year, there was a six-month deficit of £5 million, but, in earlier years, the deficit had been far larger.) This surplus of £50 million was, oddly enough, compounded of a dollar surplus with North America of no less than £117 million and a deficit with other non-sterling countries of £67 million. The surplus with sterling countries amounted to £92 million, which is less than the surplus with the dollar countries. Will this new pattern continue to develop?—All Rights Reserved.

PATTERN OF INTEREST RATES ON DEPOSITS AND ADVANCES OF BANKS

MARGIN OF PROFIT LOW DUE TO CHEAP CREDIT

IT is common knowledge that the working of Scheduled banks during the calendar year 1958 did not prove to be as remunerative as was warranted by the expansion in their business. In fact, their profits suffered a fall of nearly 25 per cent. during the year and it was for the first time since 1953 that they showed a downward trend. The main contributory factors, it is said, were the large accretion of high-interest-bearing deposits—thanks to the keen competition among banks for attracting deposits by offering higher rates of interest—without a corresponding increase in advances and the rate of interest thereon, and the mounting level of expenses. This resulted in a considerable shrinkage in profit-margin of banks, which had no relation to the expansion in business. In the first half of the current year, the position improved a little, in that some of the banks were able to earn fractionally higher profits, as compared with the corresponding half-year of 1958, and others experienced a slackening in the pace of fall in profits. This was due, to a large extent, to the voluntary ceiling on interest rates on deposits and the slightly higher rates of interest earned on advances as compared with the corresponding periods of 1958 and 1957.

The spread between the rates of interest on deposits and advances is an important factor in determining the profit-margins of banks, inasmuch as a large part of it is taken away by administrative and other expenses. No doubt, banks have other sources of income, such as commission and discount earned on bills, drafts, etc., but these form a relatively small proportion of their total income and even this has tended to decline, thanks to the fall in import bills following the drastic curb on imports and the decline in exports too, owing to increase in competition in overseas markets. The expenses have kept on mounting up, in view of the sharp rise in cost of living, as well as in other items. A study undertaken by the Reserve Bank of India on interest rates on deposits and advances covering the years 1957 and 1958 and the first half of 1959, the results of which are published in the October issue of the *Reserve Bank Bulletin*, shows that the spread between the two sets of interest rates is less than 3.5 per cent. This is due to the low rate of interest at which credit is being made available by banks; this is only a little more than 5½ per cent. which should be considered very low as compared with that in many other Western countries. Even the World Bank does not now lend at less than 6 per cent. per annum and the International Finance Corporation's lending rate is even stiffer at 7 per cent., though these are for long-term credits.

The average rate of interest paid on all classes of deposits by Scheduled banks was 1.751 per cent. in the half-year ended June 1957. This rose to 2.104 per cent. in the following half-year, and further to 2.229 per cent. in the first half of 1958, mainly as a sequel to the keen competition among banks to attract deposits. In the second half of 1958, too, there was a further increase to 2.273 per cent., but the pace of rise was slower. In the six months ended June 1959, however, there was a decline to 2.183 per cent., "reflecting the high liquidity position of banks and the impact of the October (1958) inter-bank agreement on interest rates."

The following comparative table gives the weighted average rates paid/charged on deposits and advances by Scheduled banks for the five half-years under review.

	For the half-year ended				
	June 1957	December 1957	June 1958	December 1958	June 1959
Current deposits ..	0.156	0.151	0.184	0.179	0.184
Savings deposits ..	1.556	1.582	1.582	1.552	1.906
Fixed deposits ..	3.885	3.665	3.611	3.620	3.451
Other deposits ..	3.805	3.678	3.782	3.405	3.417
All deposits ..	1.751	2.104	2.229	2.273	2.183
Loans and advances ..	5.198	5.688	5.505	5.685	5.579
Spread between average rates on deposits and advances ..	3.447	3.584	3.276	3.412	3.396

The variations in interest rates on current deposits are of a nominal nature. The rise in interest rates on savings deposits is mainly accounted for by the progressive stepping up of

the rate by several banks from 1½ per cent. to 2½ per cent. during the two years 1957 and 1958. The slight decline during the half-year ended June 1959 may be attributed to two factors. Explaining them, the Reserve Bank's study says:

"In the first place, as the amount of interest paid on savings deposits is dependent on the lowest balances maintained during a month, it is quite possible that variations in these balances might have affected somewhat the interest paid on the deposits. Secondly, an analysis of information obtained on the usual rates—rate of interest paid on the largest portion of the deposits—of interest paid on savings deposits by the banks shows that the total amounts outstanding with the banks carrying interest at rates higher than 2½ per cent. have steadily declined at important centres, while amounts contracted at rates between 2 per cent. and 2½ per cent. have shown significant increases during the period June 1958-June 1959. At Bombay centre, for instance, the total amount outstanding with Scheduled banks at rates higher than 2½ per cent. declined from Rs. 2.3 lakhs on 30th June 1958 to Rs. 1.8 lakhs on 30th June 1959, while the amount outstanding at 2-2½ per cent. rose during the same period from Rs. 18 crores to Rs. 22 crores."

The hardening of the average rate of interest on fixed deposits during 1957 and 1958 is attributed to the competitive bidding by banks and

the average rate of interest both on deposits and advances. Also, since the average rate of interest on advances of smaller banks is much higher than that charged by big banks, the spread between the advances rate and the deposits rate or the "margin of gross profits" of smaller banks is greater than that in the case of big banks. It must, however, be remembered that the "margin of profit" of smaller banks for the past half-year was the lowest in the last five half-years under review, while it is not so in the case of the other two groups. It will be noted from the table that the average rate of interest allowed on deposits by larger banks showed a decline of 0.093 per cent. in the half-year ended June 1959, as compared with the first half of 1958, while that of medium and small banks recorded an increase of 0.142 per cent. and 0.066 per cent., respectively.

The Reserve Bank's study also covers the earnings of banks from bills and other services. The average rate of interest (discount) earned on inland bills rose successively from 5.550 per cent. in January-June 1957 to 6.432 per cent. in July-December 1958. It, however, dropped to 6.343 per cent. in the first half of 1959. Barring a rise in the half-year ended June 1958, the average rate of interest earned on foreign bills declined successively from 10.766 per cent. in the first half of 1957 to 8.887 per cent. in the corresponding period of this year. A feature of the earnings on foreign bills is that the rate of discount on import bills, on an average, was 3 per cent. more than that charged on export bills.

TABLE I

	Average rates paid/charged by groups of banks					
	Banks with deposits of Rs. 25 crores and above		Banks with deposits between Rs. 5 crores and Rs. 25 crores		Banks with deposits below Rs. 5 crores	
	Rate	Change over the period	Rate	Change over the period	Rate	Change over the period
Total deposits :						
January-June 1957 ..	1.618	..	2.163	..	2.332	..
July-December 1957 ..	2.003	+0.385	2.407	+0.244	2.498	+0.166
January-June 1958 ..	2.132	+0.129	2.466	+0.059	2.757	+0.259
July-December 1958 ..	2.130	+0.002	2.683	+0.217	2.927	+0.170
January-June 1959 ..	2.039	-0.091	2.608	-0.075	2.823	-0.104
Advances :						
January-June 1957 ..	5.016	..	5.678	..	6.048	..
July-December 1957 ..	5.563	+0.547	5.876	+0.197	6.568	+0.518
January-June 1958 ..	5.364	-0.199	5.746	-0.130	6.455	-0.111
July-December 1958 ..	5.488	+0.124	6.078	+0.332	6.639	+0.561
January-June 1959 ..	5.386	-0.102	6.040	-0.038	6.490	-0.349
Spread between average rate of interest on advances and deposits :						
January-June 1957 ..	+3.398	..	+3.515	..	+3.716	..
July-December 1957 ..	+3.560	+0.162	+3.468	-0.047	+4.068	+0.352
January-June 1958 ..	+3.232	-0.328	+3.280	-0.188	+3.698	-0.370
July-December 1958 ..	+3.358	+0.126	+3.395	+0.115	+3.912	+0.214
January-June 1959 ..	+3.347	-0.011	+3.432	+0.087	+3.667	-0.245

the drop in the rate during the first half of the current year to the ceiling on interest rate on fixed deposits of three months and over at 4 per cent. under the inter-bank agreement. This resulted in a considerable decline in outstanding deposits with banks at rates higher than 4 per cent. at important centres. In Bombay, for instance, the amount outstanding in respect of fixed deposits for three months and six months contracted at rates above 4 per cent. declined from Rs. 29 crores and Rs. 15 crores as on 30th June 1958 to Rs. 10 crores at Rs. 4 crores, respectively, on 30th June 1959.

The average rate of interest on advances shows an erratic trend, though it was higher at 5.579 per cent. by 0.388 per cent. in the first six months of the current year than in the corresponding period of 1957. An interesting feature disclosed by the trend of interest rates on advances is that the rate tended to decline in the first half of 1958 and 1959, though one would normally expect it to be higher during this part of the year which normally coincides with the greater part of the busy season. One possible explanation given for this trend is that "a few of the banks might have been charging concessional and lower rates on advances extended to their customers who approach them for seasonal requirements than on credit of a non-seasonal nature."

The spread between the average rates on deposits and advances (which may be deemed as the gross profit-margins of banks), which was 3.442 per cent. in the half-year ended June 1957, widened to 3.584 per cent. in the following half-year. It, however, narrowed down to a low of 3.276 per cent. during January-June 1958, following the decline in advances rate and the rise in deposits rate. It again widened to 3.412 per cent. in the second half of 1958 before declining to 3.396 per cent. in the first half of 1959, on account of the relatively greater fall in the advances rate than that in the deposits rate.

An analysis of the rates of interest on deposits and advances according to the size of the banks, given in Table I, shows that the smaller the size of the banking unit the larger is

The rate of interest (commission) earned on all other services comes to less than one per cent. per annum.

HONGKONG BANK TO TAKE OVER ANOTHER BANK

An agreement has been reached, subject to formal contract, between the Boards of the Hongkong and Shanghai Banking Corporation and the British Bank of the Middle East, under which the former will make an offer to the shareholders of the latter to acquire their shares in exchange for new shares of the Hongkong and Shanghai Banking Corporation, to be issued, credited as fully paid, on the basis of one new share of HK\$125 of the Hongkong and Shanghai Banking Corporation for every fourteen shares of £1 each ex-interim dividend declared on 10th November 1959 of the British Bank of the Middle East. The new shares of the Hongkong and Shanghai Banking Corporation will rank pari passu in all respects with the existing shares and will be registered on the London Register.

The Directors of the British Bank of the Middle East have agreed to recommend to the shareholders this offer for acceptance. Such of those shareholders of the British Bank of the Middle East who do not wish to receive shares of the Hongkong and Shanghai Banking Corporation are to be given the option of taking cash at the rate of 7½ pence per share (ex-interim dividend declared on 10th November 1959). The offer is subject, *inter alia*, to acceptance in respect of 90 per cent. (or such less percentage as the Hongkong and Shanghai Banking Corporation may decide) of the shares of the British Bank of the Middle East and upon permission of the Hongkong and Shanghai Banking Corporation to be issued in exchange being granted by the Council of the Stock Exchange, London.

If the offer is successful, it is the intention of the Hongkong and Shanghai Banking Corporation to retain the separate identity and management of the British Bank of the Middle East operating in accordance with its Royal Charter which provides for its Board meetings to be held in England.

If the above proposal goes through, the British Bank of the Middle East will be the second bank to be taken over by the Hongkong and Shanghai Banking Corporation in recent months. The first was the Mercantile Bank Ltd., which was acquired in March last by exchange of one new share of HK\$125 for every twenty shares of £1 each of the Mercantile Bank. The shareholders of cash their holdings at the rate of 44s. per share ex-div.

CALCUTTA ELECTRIC SUPPLY CORPORATION

GREATER FLEXIBILITY IN GENERATING CAPACITY

SIR HARRY BURN REVIEWS RESULTS AND OPERATIONS

THE Sixty-second Annual General Meeting of the Calcutta Electric Supply Corporation, Ltd., was held on 12th November 1959 at Victoria House, Vernon Place, Bloomsbury Square, London, W.C.

Sir Harry Burn, K.B.E., A.C.A., the Chairman, presided.

The following is his statement, which had been circulated with the report and accounts:—

"It is with deep regret that I have to record the death on 9th February 1959, of Mr. J. H. Waters, who had been a member of the Board since 1952. He had served with the Company in India for 28 years, and was Chief Engineer when he retired from Calcutta. He was a valued colleague, and his experience and knowledge enabled him to give sound opinions and advice on many aspects of the Corporation's activities. We shall greatly miss his kindly presence. For some time prior to his death he had suffered from ill health, but this did not deter him from fulfilling his duties on the Board.

"In April last, Mr. I. A. Macpherson joined the Board. He has been with the Company for 24 years, and retired from Calcutta at the end of last year, after completing six years as our Agent, an office which he filled with outstanding ability. We are happy to welcome Mr. Macpherson as a member of the Board, and thus have available his wide knowledge and experience.

Distribution and Demand

"There is attached to the accounts a map of the Company's area of supply which shows that two important sections of the distribution system have been commissioned during the year. First, a third 33kV feeder from Mulajore to Barrackpore and two 33kV feeders from Barrackpore to Agarpara; this has resulted in greater flexibility of our generating capacity; secondly, two further feeders from Howrah Receiving Station to Fort Gloster in the Bauria Area, thus fortifying our system in that new and important area. I would again emphasize that the high tension industrial load is not confined to Calcutta and Howrah, but covers the whole of the licensed area in which industry continues to expand.

"During the year ended 31st March 1959, there were increased sales of energy to all classes of consumers with the exception of traction, to which reference is made later in this review. For the most part the increased demand was from industrial consumers. The total energy sold increased from 1,501 million units to 1,677 million units, an increase of 176 million units which compares with an increase of 107 million units during the previous year.

Power Sales

"Sales for power purposes are, mainly for industry, but also include public water works and domestic power, such as air-conditioning and refrigeration. Industrial demand covers 80 per cent. of these sales which, with a few small exceptions, have increased with every class of consumer. The principal consumer is the jute industry whose consumption during the year increased by 50 million units to 412 million units. Trading conditions for the jute industry still continue to be difficult, but for the season 1958-59—July to June—the off-take for both export and internal consumption of jute products has improved, the increase in the former being mainly accounted for by hessian. Sales of energy have been helped by a better load factor resulting from the policy of rationalisation and modernisation of mill machinery and by the benefit of a full year's consumption from the mills fed by the Bauria Electrification scheme to which reference was made in my last review. Next in importance are rolling mills and engineering workshops; sales increased by 25 million units to 211 million units. Their consumption should expand further when the steel projects sponsored by the Government of India come into production. Cotton mills, chemical works, and paper mills are also large consumers and it can be said that our high tension power consumers cover almost every type of industry.

"There was again an increased demand for low tension industrial power, sales increasing from 91 million units to 99 million units and the number of consumers increasing by over 1,000 to more than 14,500. Of these consumers, the most important are engineering workshops manufacturing components for the larger concerns and here again their demands have been depressed by the shortage of steel. Public water works and sewage pumping stations consumed 82 million units, an increase of nine million units. Half of this increase came from the Calcutta Corporation and the remainder was equally divided between the Howrah Municipality and the State Government's Sonarpur/Arapanch Drainage Scheme. Domestic power sales showed a further large increase, rising from 50 million units to 56 million units. Much of this is due to air-conditioning units reflecting an improved standard of living of many middle-class families.

"Sales of energy for lights and fans again showed a satisfactory increase of 14 million units, consumption rising from 213 million units to 227 million units. Increased demand is in general due to an improvement in the standard of living resulting in greater use of fans and more plentiful illumination.

"Public lighting consumption increased by two million units; this was almost entirely due to the Calcutta Corporation, which continues to improve its street lighting.

"The Calcutta Tramways Co. Ltd., is the sole consumer for traction purposes. The large decrease in sales is due to the six weeks' strike by tramway employees in August and September, 1958.

"Bulk supplies are given to seven distributing undertakings; sales to these consumers increased by 19 million units from 44 million units to 63 million units. The most important supply is to the North Calcutta Grid of the West Bengal State Electricity Board, which takes more than three-quarters of the total sales under this head.

"Of the sales under special contracts, some 65 per cent. is at our special tariff for owners of large buildings. Sales under that tariff increased by six million units. The remaining consumers under special contracts are the Central and State Governments, the Calcutta Port Commissioners, and the Calcutta Corporation; consumption improved in each case.

Revenue Account

"Reference to the revenue account shows how the growth in demand is reflected in the receipts from the sales of current which rose by nearly £800,000 to over £8,000,000. Miscellaneous receipts declined by £40,000; hire charges for one of our jety cranes unloading steel for the extensions to the Tata Iron and Steel Company, an exceptional item of income, ceased in the early part of the year now under review.

"The cost of generation and distribution and larger purchases of power from the Damodar Valley Corporation by reason of the higher demand on the system are reflected in an increase in expenditure of £776,000 under these heads. Generation and distribution cost over £4 million and of that sum more than £2,250,000 was spent on coal, which cost £315,000 more than in the previous year. This major item of expenditure represents 72 per cent. of the total generating cost. Coal prices and railway freights were further increased though not to the same extent as in the previous year and the average cost of coal per ton delivered to our stations showed an increase of 4 per cent. Additional power purchased accounted for over £200,000. Increases in basic pay and dearness allowances and higher costs in respect of materials and various services affected generation, distribution, and administration expenditure. The depreciation charge also rose by £57,000. Finally, I must mention the wealth tax of £109,000, which was £38,000 greater than for the previous year. I am glad to say that the Government of India has decided to abolish this tax and no charge will arise under this head in the accounts for the year ending 31st March 1960.

"The net revenue, after taking into account the depreciation charge, is £82,000 less than that of the previous year which included the item of £43,000 for the hire of one of our jety cranes to which I have already referred. I am glad to report that sales of energy for the current year show a satisfactory expansion and conform with our forecasts of future demands.

Net Revenue Account

"I will now deal with the net revenue account. In so far as the Indian tax position is concerned considerable progress has very recently been made towards a settlement of the appeals which were pending a year ago and to which I made a reference in the 1958 review. In consequence of this the Board are now enabled to adjust the Indian tax element as it affects the preference dividend for the year ended 31st March 1959, and a payment in the form of a supplementary dividend will shortly be made. This payment will bring the dividend for the year up to 5 per cent. (net) and provision in respect thereof has been made in the net revenue account. In view of the Indian income-tax position, it cannot be assumed that the rate of the preference dividend for the current year will be the same as that now being paid for the year ended 31st March 1959.

"The charge for Indian taxes appearing in the net revenue account covers tax on the items of expense still remaining under appeal and conforms with the provisions of the Electricity (Supply) Act. The charge for United Kingdom tax of £150,068—as affected by double taxation relief—to which I also made a reference in last year's review has also been adjusted to meet the United Kingdom and Indian tax position as it rests at present pending the final outcome of the appeals which I trust may soon be resolved.

"The statutory allocation to development reserve of £11,412 takes into account the current Indian tax position and the reasonable return of 6 per cent. permitted on the capital base.

"The clear profit for the year falls short of the reasonable return to which the Company is entitled by the sum of £106,247, and this has been made good by a transfer from the tariffs and dividends control reserve as permitted by the Electricity (Supply) Act, 1948.

"The allocation for the contingency reserve fund has been made as required by the Act and it is proposed to make the usual contribution to the retiring gratuity fund. Provision has been made for the interest and sinking fund charges in connection with the debentures. In order to conserve our finances for the continued expansion of the Company's operations, the Board have deemed it advisable to appropriate a sum of £525,000 to special appropriations for plant expansion and replacements. Dividends on the preference stock amounting to £68,075 have been paid and, as I have already indicated, a further payment of £29,925 will shortly be made bringing up the dividend to 5 per cent. (actual) for the year. It is proposed to pay a final dividend of 3½ per cent. (actual) on the ordinary stock making 7 per cent. (actual) for the year. The balance left to be carried forward on net revenue account is £122,137.

Balance-sheet

"It will be seen from the balance-sheet that the bank overdraft has been cleared. Capital expenditure during the year amounted to £1,365,000 and was again almost entirely for our distribution system. More than half the expenditure was on mains and service connections. As a provision for capital expenditure during the year, and pending at 31st March 1959, there was available the sum set aside for depreciation of £900,000 and the allocations to special appropriations for plant expansion and replacement and development reserve amounting to £535,000, thus making a total provision of £1,435,000. Between 1st January 1951, and 31st March 1959, capital expenditure amounted to £10,765,000 and the depreciation provision, together with revenue reserves and special appropriations during the same period, amounted to £10,635,000. I give these figures—which follow on those given in the 1958 review—to demonstrate what has been done during recent years within the limits permitted by the reasonable return on the capital base to provide internal finance for the expansion of the Company's undertaking.

"During December and January last I visited Calcutta and went over all sections of

EXPORT TRADE IN COTTON TEXTILES

PROSPECTS FOR INDIAN CLOTH IN SOME FOREIGN MARKETS EXAMINED

ALTHOUGH export demand for Indian cotton piecegoods has slackened a little of late, trade circles feel that actual exports of cloth during the second half of 1959 will be quite substantial. One estimate of the total for this half-year is 400 million yards, as against 309 million yards in the previous half-year (January-June 1959) and 278 million yards in the corresponding period last year (July-December 1958). The aggregate exports for the whole of 1959 are estimated at 709 million yards, which compare favourably with 581 million yards shipped in 1958 but are nearly 140 million yards lower than the exports in 1957.

The bulk of mill cloth exported by India consists of grey (unbleached) varieties. The quantity of these varieties actually shipped in the first six months of 1959 was 176.52 million yards, representing as much as 58 per cent. of the total shipment amounting to 303.76 million yards. During the same period, India exported 57.65 million yards of white bleached cloth, 35.88 million yards of dyed fabrics, 19.04 million yards of woven coloured goods, and 14.68 million yards of printed goods. The corresponding export figures—in million yards—relating to the different categories for the January-June 1958 period were 175.74, 61.59, 35.54, 22.28 and 10.79, respectively.

Country-wise Exports

The most important customer for Indian mill piecegoods continues to be the United Kingdom. The actual purchases made by this country during January-June 1959 aggregated 63.76 million yards, of which grey (unbleached) cloth alone accounted for more than 61.21 million yards. The other important markets buying cloth from India include Kenya, Zanzibar, Australia, Aden, Ethiopia, Burma, Afghanistan, Singapore, Tanganyika, Canada and Sudan. The following table indicates the trend of exports from India to the different destinations during the first six months of 1959 and 1958, as well as in the whole of 1958 and 1957:

Countries	January-June		Whole of	
	1959	1958	1958	1957
United Kingdom	63.8	49.2	101.6	150.4
Aden	17.2	16.0	34.6	39.1
Burma	14.1	3.2	4.8	39.4
Ceylon	7.7	7.7	16.3	21.3
Singapore	12.0	6.6	18.6	24.7
Nigeria	4.4	4.0	39.4	48.9
Kenya, Zanzibar	20.6	14.3	35.6	43.8
Tanganyika	11.3	8.5	19.4	25.4
Sudan	8.3	48.6	54.9	95.2
Australia	19.1	22.6	47.1	50.2
Saudi Arabia	8.6	5.3	12.4	21.7
Indonesia	5.3	4.3	13.4	51.3
Canada	8.2	6.3	14.8	17.7
Afghanistan	12.2	11.5	19.0	12.9
Ethiopia	17.0	10.4	22.9	41.9
Denmark	2.3	1.4	2.8	4.0
Sweden	0.4	0.5	1.1	0.5
Other countries	80.5	85.5	125.7	157.7
Total	309.0	305.9	581.4	840.0

Aden has been meeting about 75 to 80 per cent. of its cotton goods requirements through imports from India. The imports consist mainly of grey sheetings. It is reported that Japan is rather well placed in printed and dyed piecegoods and in bleached goods like poplin and voiles. If Indian exporters are to retain the Aden market, it is emphasised, due attention must be paid to the study of the tastes and peculiarities of the Aden market. To quote the report: "The people of Aden, as those of the neighbouring countries in the Middle East, are, as in the case of rayon fabrics, fond of bright colours. They would like the designs to be changed from time to time in accordance with changes in fashion. What is popular today, particularly in regard to prints, may easily become out-of-date tomorrow."

East African Market

In the case of cloth exports to the East African market, the Government of India Commercial Representative at Mombasa has urged the Indian exporters to adapt themselves to changing needs. According to him, the Indian textile industry knows that the trend is away from greys towards processed goods, but nothing has been done to place what the African wants within his reach. His assessment of the outlook for Indian textile exports is as follows:

Owing to an increase in local production and a shift in consumer preference to dyed and printed goods, prospects for imports from India of grey cloth are not bright. Since competition from Japanese spun rayon materials is keen, the prospects for coloured piecegoods—coating, bed-

ticking, gablepet, striped and check shirting, lungis, kikyoys, etc.—are likely to be on a diminishing scale. Cotton prints, the largest items in the import of textiles, have virtually gone out of India's hands. Here, again, attractive designs and Japan's colours of fancy prints find favour. However, as discriminating buyers still ask for cottons, this trade may revive. In respect of dyed cottons, except in the case of khaki drill in which the U.K. and the growing local producers are competitors, India continues to be the largest supplier of cotton blankets. Lately, competition has emerged from Japanese cheap and attractive mixed blankets which are becoming increasingly popular. The Indian exporters will do well to take to this line of export."

Exports to Burma

There has been a marked improvement in cloth exports from India to Burma, the total of these exports in the first half of 1959 being over 14.0 million yards. This figure is quite encouraging, considering that purchases of Indian cloth by Burma last year suffered a distinct setback, the total being not more than 4.8 million yards, as against 39.4 million yards in 1957. The prospects for a further rise in exports to Burma are considered to be reassuring as a result of the agreement entered into between Burma and the U.S. for the supply of textiles. Under the P.L.480-104D scheme covered by this agreement, textile exports from India to Burma are financed by the International Co-operation Administration (I.C.A.). The Indian exporter receives payment in rupees from the I.C.A. authorities in New Delhi. Under P.L.480, another part of the agreement, the Government of India receives payment for textiles exported to Burma partly in cotton made available by the U.S. to Burma and partly in sterling to be determined by a formula mutually agreed upon by the countries concerned. The value of textiles exported from India to Burma during the current calendar year

under P.L.480-104D and P.L.480 is estimated at Rs. 4.0 crores.

Australia

Australia purchases a fairly large quantity of Indian textiles every year. There is stiff competition in this country from Japan, China (which is lately doing better) and the U.K. Indian textiles compete in a limited sector which represents about one-fourth of the total range of cotton piecegoods imported by Australia. India has a very small share of crimped piecegoods, negligible quantity of printed cloth and very little of dyed or coloured fabrics. It has practically no share of the whole range of other cotton textiles such as blanketing, mosquito netting, velvets, velveteen, book-binding cloth, pillow cases, quilts, handkerchiefs and tablecloth. The overall demand of Australia for cotton piecegoods is said to be expanding day by day and Indian exporters should strive to compete more effectively in this country by offering quality cloth at a reasonable price.

The major portion of cotton cloth exported by India to Canada consists of grey (unbleached) sheeting which is used in that country straight or processed into coloured material. While considering the prospects for cotton textiles in the Canadian market, two factors must be taken note of. One, the indigenous industry there is making vigorous efforts, by suggesting tariff protection or other methods, to combat competition from whatever source and maintain its hold on the domestic market. Two, competition from Japan is becoming keener and keener year by year in respect of both price and quality. Despite such competition, there would appear to be still room for Indian textiles in Canada, so long as prices are competitive and terms of business, as well as deliveries, are favourable.

Scandinavian Demand

The Scandinavian countries—Sweden, Denmark and Finland—do not figure prominently among India's customers for cotton textiles. This is due to the stiff competition offered by a number of European countries, as also Japan and

COMPENSATION FOR MILL WORKERS

UNION LEADERS URGE A SQUARE DEAL

From Our Special Correspondent

MANCHESTER, 3rd November

IN spite of the more exuberant mood which largely extends over the cotton industry in Lancashire at the moment, there are still "Jeremiahs" who cannot regard the future as anything less than catastrophic. The trade union attitude towards the reorganisation plan has perhaps been coloured by the fact that their leaders were not directly consulted throughout the early negotiations. From comments which are made from time to time, it is clear that this factor rankles. Mr. Ernest Thornton, M.P., in his capacity as Rochdale Weavers' Secretary, has, for example, lately stated: "The prospects of expansion from our low levels of production of recent years are remote. The best we can expect seems to be to hold on to what we have or a substantial slowing down of the rate of contraction of the last few years."

It so happens that, within the past few days, your correspondent has had the opportunity of seeing an example of the type of improvement and modernisation which is going on in many parts of Lancashire. In a well respected and widely known Preston mill, the mule frames are being ripped out and replaced with the most up-to-date ring spinning machinery. Gone are the dingy interiors, the wooden floors and the dark paint of bygone days. In the new spinning rooms, the machinery, electrified and gleaming, is moving swiftly on to the production line, with the engineers setting up new frames day by day. This scene is symptomatic of the trend in many areas of Lancashire today and it will be increasingly found in the mill centres, as the outmoded machines are scrapped and re-equipment gathers momentum. Granted such extensive modernisation schemes require finance, but the forward-looking managements know that only by producing the best goods most efficiently, will they be able to secure a place in world markets and even compete successfully at home.

More Night-shift Working

Lancashire's 94,000 cotton weavers have agreed on a new policy towards shift working which will help the industry to streamline and fight off foreign competition. Up to now, they have refused to allow night shifts, except in weaving mills already working two day shifts—from 6 a.m. to 2 p.m. and from 2 to 10 p.m.

Now, the Northern Counties Textile Trades Federation, representing all seven unions, has decided to allow the introduction of night shifts in weaving mills at present working one shift—but only where it is impossible to recruit enough operatives to work round the clock, or where mill workers refuse to operate two day-time shifts. But the unions lay down strict conditions. Mr. Lewis Wright, General Secretary of the Weavers' Amalgamation, the largest of the unions in the manufacturing section, said that they were ready to allow a 3½-hour night shift, in addition to a single day shift of 45 hours, provided the night workers got a 44 per cent. premium on ordinary piece rates. This would give them the same pay-rates as night workers in mills operating round the clock.

And the weavers are insisting that where firms switched from two shifts to round the clock working, which involves a reduction in working hours of from 38½ hours a week to 37½ hours, it must be done without any cut in pay. Said Mr. Wright: "Cotton weaving unions are anxious to do all in their power to help to rehabilitate the industry, but at the same time, they want a square deal for the workers."

Telling the Workers

Meanwhile, union leaders of all the county's cotton spinning and weaving workers have had a lengthy discussion in Manchester about aspects of the compensation arrangements for workers who become redundant under the reorganisation scheme. Afterwards, it was announced that renewed representations are to be made to the Cotton Board. Alderman Harold Chorlton, President of the United Textile Factory Workers' Association, said: "We are very concerned about the action of some firms in notifying the Cotton Board of their decision to close down, but failing to tell the workers

which have occurred in cotton yarn prices in Lancashire:

Prices and Supplies

Price factors are an integral part of trading in any commodity; in the past, they have played a vital role in stimulating or depressing the mood of customers interested in cotton goods. Stability in values is a goal towards which many plans have been aimed, but it has never been found possible to reach a satisfactory solution. Even now, there are those who are campaigning for the introduction of an international cotton agreement on the lines of the system established for wheat.

Early estimates of the American cotton crop have often proved unreliable in previous seasons and, because the forecasts so far have indicated a high yield and a probable production of little short of 15 million bales, it does not mean that the final figures will confirm these predictions. Weather conditions, however, have been reasonably favourable and, unless there is a sharp deterioration in the progress of the plants, the crop should be among the highest during the past decade.

The table below offers comparisons between future and spot rates in Liverpool since the beginning of the year, together with the changes

Under the repressive influence of the two-price system in the United States, the functions of futures trading have been almost completely eclipsed. Only isolated transactions have taken place from week to week in Liverpool, no less than in New York and New Orleans. The movements in values have been accentuated by the absence of contracts and have frequently failed to reflect the time-honoured laws of supply and demand. Revisions in yarn prices in Lancashire have been relatively narrow since the sharp adjustment in values which followed the abandonment of the price regulations in the spinning section. Some weeks elapsed before prices were fully stabilised, but, since early May, there has been a much steadier trend.

Examples of weak selling have been recorded from time to time and, some weeks ago, when mills were decided whether or not to close, such developments would not have been unusual. While firms were hanging on in the hope of compensation this trend was to be expected, but the improvement in demand over the past three months has been sufficient to cause a firmer undertone to develop.—All Rights Reserved.

Beginning with only a small machine shop in 1939, NSE expanded rapidly and today it operates three major engineering factories, each engaged in producing vital equipment, covering the gamut of the country's

developmental needs. Through engineering skill and technical knowledge garnered over the past two decades, NSE has earned the confidence of the various industries it serves.

EXTRA-LONG STAPLE COTTON SURPLUS SITUATION STILL PERSISTS

EXTRA-LONG staple cotton, that is, cotton having a staple length of over 1½", being in a class by itself and subject to influences different from those affecting other staples, does not necessarily move in step with the general trend in world cotton. This is illustrated by the marked decline in production of this variety of cotton in the 1953-54 season when production of other cottons showed a substantial rise, the failure of extra-long staples to share in the general expansion of cotton consumption in recent years, lower exports in 1956-57 when trade in other staples was at a maximum and the marked rise in prices of extra-long staple varieties in 1956-57 when cotton prices were generally declining. According to the International Cotton Advisory Committee, Washington, these divergent movements between extra-long staples and other cottons reflect differences in supply and demand. But the influencing factors, it feels, may be, to some extent, autonomous by virtue of the greater concentration of production and consumption of extra-long staples in a relatively small number of countries.

Trade with Communist Bloc

The situation in the extra-long staple cotton continues to be one of surplus supplies. Stocks at the beginning of last season, which ended on 31st July last in producing countries represented over seven months' supply. The season, however, turned out to be better than expected earlier. This, according to the International Cotton Advisory Committee, Washington, can be attributed to two main factors, namely, increased trade with communist countries and rising consumption elsewhere. Consequently, total offtake from the producing countries during last season reached 1.8 million bales, as compared with 1.2 million bales in 1957-58. Of these two factors, the increased demand from the communist countries was quantitatively the most important. Exports to communist countries during last season rose to 650,000 bales which was almost double the 1957-58 exports. The main increase occurred in shipments from

Egypt to U.S.S.R. which amounted to no less than a quarter of a million bales, as against only 37,000 bales in the previous season. Total exports from Egypt to communist countries aggregated 585,000 bales, as against 316,000 bales in 1957-58.

Consumption of extra-long staple cotton last season, excluding consumption in communist countries, was around a million bales, representing an increase of about 200,000 bales or 20 per cent. over that of 1957-58. This was in sharp contrast to the decline in consumption in many countries in the previous year when consumption aggregated only 770,000 bales. The increase in consumption last year was fairly widespread, but in some countries at least this did not reflect any noticeable broadening of the demand for fine quality textiles. This indicated that there was some degree of substitution of extra-long staples for other cottons.

Stock Distribution

Though perhaps not as obvious, a third factor, namely, rebuilding of stocks in exporting countries, contributed to the improvement in the extra-long staple cotton situation. This, of course, had no effect on the total stock position. It represented merely a change in the location of stocks, that is, a more even distribution of stocks between exporting and importing countries. Prices fell to bargain levels around March this year and consumers were induced to make heavy purchases during the last four months of the season.

The improvement in the extra-long staple cotton situation that occurred last season was, however, only relative. The tendency for production to exceed disappearance was again in evidence and there was a further addition to total carryover stocks in exporting countries. Thus stocks on 1st August last amounted to 800,000 bales which was 150,000 bales higher than the figure on the corresponding date of the previous season.

The increase occurred entirely in Egypt where stocks are estimated at half a mil-

lion, as against only 305,000 bales a year ago. Stocks in Sudan, however, declined to their lowest levels in many years.

It is as yet too early to make any precise estimate of the prospects for long-staple cotton during the current season, namely, 1959-60. The Committee, however, anticipates that production of extra-long staple cotton during the current season will be slightly lower than in last season. Supplies in producing countries may, however, set new records, thanks to the higher opening stocks. Little could, however, be said now of consumption during the season. Trade prospects would depend primarily on consumption but a further important consideration will be demand from communist countries and here the situation, according to the Committee, is "enigmatic."

COTTON QUALITY

The International Federation of Cotton and Allied Textile Industries, Manchester, has forwarded a resolution on modern harvesting and ginning practices, adopted at its annual meeting held in Vienna from 24th to 25th September, 1959. To Governments and cotton-growing organisations in all cotton-growing and exporting countries. In this resolution, the Federation expresses grave concern over the detrimental effects some of the mechanical harvesting and new ginning methods introduced in the U.S. produce on the spinning properties of the raw cotton fibre. The Federation points out that cotton spinners throughout the world continue to be hampered in their production by the occurrence of foreign matter of all description in raw cotton bales. In order to keep cotton competitive with the man-made fibres it is essential, the Federation emphasises, that the highest standards of quality should be maintained.

The efforts of the U.S. Administration to make American cotton more competitive in world markets might well be adversely affected by the deterioration in the quality of the cotton caused by the irresponsible use of the new equipment. The Federation strongly recommends that measures should be taken, as already indicated by the National Cotton Council of America, to ensure that such equipment is used in such a way as to reduce as much as possible these detrimental effects. Farmers and ginners in all cotton-producing countries should be advised to consider the possibility that any advantages which may be claimed for the new picking and ginning methods may be offset by the decline in the spinning and consequent market value of the cotton. The Federation endorses the recommendations on this matter made by the National Cotton Council of America and is of the opinion that all raw cotton-producing countries would be well advised to take cognizance of them.

WORLD SUGAR STOCKS CONSIDERABLE PRICES CONTINUE TO BE LOW

THE unsold stocks of sugar hanging on the world market continue to be very considerable. The total of these stocks is now believed to be of the order of as much as 11.45 million metric tons (raw value), as compared with 10.1 million tons a year before and 10.30 million tons two years before. The previous record peak level of stocks was 11.80 million tons at the end of the 1953-54 season (that is, 31st August 1954). The persistence of huge surplus of sugar has been due to the marked expansion of 8.77 million tons in production during the past two seasons—the rise being from 41.83 million tons in 1956-57 to 50.60 million tons in 1958-59—or a rise of nearly 21 per cent., whereas sugar consumption has increased by a little over 15 per cent. only, from 41.93 million tons in 1956-57 to 48.47 million tons in 1958-59.

Following the failure of consumption to keep pace with production thus, world prices of sugar have suffered a distinct setback. As against a high of 6.70 cents per lb. in 1956-57, Cuban raw sugar at New York now stands at 3.00 cents per lb. (f.o.b. Cuba). At one time, on 21st July 1959 to be precise, it had gone down to as low a level as 2.55 cents. The quotation had no doubt risen to as high as 3.17 cents during the first week of last month, but this was due to the unexpected purchase of 330,000 tons of Cuban sugar by Soviet Russia and lower ideas of European beet sugar crop for the current season (1959-60) as revealed in the latest estimate of Mr. F. O. Licht. Similarly, spot sugar at London now stands higher at £27½ per ton (Rs. 363)—it was higher still at £28½ (Rs. 383) a month ago—as against the low of £24½ (Rs. 323) on 21st July 1959.

Sugar Supply Position

The following table gives an idea of the world sugar supply position in the past three seasons:

	(In million tons—raw value)		
	1958-59	1957-58	1956-57
Opening stocks	10.10	10.80	10.40
Production ..	50.60	45.19	41.83
Total supply ..	60.70	55.99	52.23
Consumption ..	48.47	45.89	41.93
Closing stocks (at the end of Aug.)	12.23	10.10	10.80

The marked rise in sugar supply position during 1958-59, as noted above, is the result of the appreciable increase in production of 5.41 million tons to 50.66 million tons. The increase was accounted for by both cane sugar and beet sugar. The total world output of cane sugar was 28.96 million tons, as against 26.49 million tons—a rise of 2.47 million tons—that of beet sugar being 21.64 million tons, as against 18.70 million tons or a rise of 2.94 million tons. The improvement in sugar output was witnessed in practically all the major producing countries with the exception of Indonesia and Mauritius. The trend of sugar production in the different countries during the seasons 1956-57, 1957-58 and 1958-59 is indicated in the table appearing in the third column.

Many factors contributed to the sharp rise in sugar production in 1958-59, according to the F.A.O. publication, *The State of Food and Agriculture 1959*. Weather conditions, it is said, were favourable in most of the principal producing areas and probably accounted for about half the increase. The balance of the rise is attributed to economic and technological changes. With the substantial increase in world prices at the end of 1956 and in the first half of 1957 (from 3.70 cents to 6.70 cents per lb.), the prices paid to beet and cane farmers, as well as factory prices, were raised in many countries during 1957 and 1958, leading to larger areas under sugar. Lower prices for some competitive crops also made sugar relatively more profitable. In Western Europe, the beet area rose by 10 per cent. and sugar output by 15 per cent. In many countries, the increase in sugar production for domestic consumption, and to some extent for export, was the consequence of deliberate national policies and programmes designed to promote agricultural and industrial diversification. A part of the increase in sugar production was also due to higher productivity through improved varieties, greater and more widespread use of fertilisers, irrigation, better agricultural practices, and improvements in transport and milling efficiency.

Stabilising Sugar Market

The uncertain political situation in Cuba helped for a time to maintain world sugar prices, but encouraging production prospects in that country suggested that sugar supplies in 1959 would be ample to meet all foreseeable import demand and prices, therefore, weakened. The decision of the International Sugar Council (taken in February 1959) to reduce the free market export quotas by 7.5 per cent. had little effect on the market and, during the first half of 1959, prices remained 5 to 7 per cent. below the Agreement minimum of 3.25 cents per lb.

Prompted by the slump in prices and in its anxiety to strengthen the marketing position of exporting countries, the International Sugar Council announced, on 18th August 1959, its decision to relieve the exporting countries of the obligation to market the entire balance of 1959 quotas before the end of December 1959. This was done not only by exempting countries from penalties but also by allowing them to carry forward into 1960 upto 60 per cent. of their 1959 export tonnages regardless of market conditions.

After the above decision was announced and following large purchases of Cuban sugar by Soviet Russia, the world prices staged a handsome recovery, Cuban raw sugar at New York touching a high of 3.17 cents early last month. Since then, however, the prices have again softened, as mentioned at the outset, the latest available quotation being 3.00 cents. It is true that beet sugar production in the European countries and cane sugar output in Cuba, the world's largest producer and exporter of sugar, are expected to be markedly lower in the current season (1959-60) than in 1958-59, but the chances of any appreciable rise in sugar prices are not bright, because the world surplus of sugar is considerable.

Mr. F. O. Licht's first estimate of the European beet crop for 1959-60 places the total sugar production at no more than 17.00 million tons, as against 18.67 million tons in 1958-59 and 16.00 million tons in 1957-58. Commenting on the estimate, Messrs. Czarnikow & Co. of London recently made the following observations:

"It was well known that a belt of countries stretching from France in the west to Russia in the east had suffered severely from drought this year, and it is not surprising that the six countries in which Licht anticipates crop reductions in excess of ten per cent., namely, France, Belgium, Holland, Denmark and West and East Germany, are all within that group. In Denmark, the area sown has been substantially cut down, which accounts in part for that country's inclusion. Poland is only just outside and is shown with a reduction of almost ten per cent. Russian production is reckoned to be down by 380,000 tons, but that country's output is so high these days that this represents a fall of only about six per cent. on the 1958-59 estimate."

"In all other countries, estimates are within ten per cent. of last season's figures, but the tendency generally within this group is downwards. Also issued by Licht are new estimates of the area devoted to beet in this Continent. There are no remarkable changes from earlier figures, but it is worth noting how completely Russia now dominates the picture. Of a total of 5,832,276 hectares in Europe this year, no less than 48 per cent. is in Russia. The country with the next largest area is Poland with only 6.3 per cent. On the basis of Licht's estimates, if Russia could raise her output of sugar per hectare to the average of the rest of Europe, she would produce more than ten million tons this season, as against the 5,880,000 tons actually forecast."

The trend of world sugar market in the coming months will, however, be influenced not so much by the production performance in Europe as by the sugarcane crop harvested and sugar produced in Cuba. It is too early to assess the exact size of Cuba's 1960 sugar output. But preliminary estimates place the production around 5.5 million tons. Although this is smaller than the actual quantity of 5.95 million tons produced in 1958-59, the aggregate supply of sugar in Cuba is expected to be of the order of 6.70 million tons in 1959-60, as against 6.65 million tons in 1958-59. This quantity, it is said, will be more than adequate to meet the requirements of the U.S., the world market and the domestic market, and also to provide a carryover for shipment early in 1961.

Sugar Output in Different Countries (In thousand tons—raw value)

TEA PRODUCTION IN INDIA HIGHER EXPORTS, HOWEVER, SHOW A SHARP FALL

TEA prices at the Calcutta and Cochin auctions have started looking down, though the setback is not pronounced. This trend is not surprising, as usually at this time of the year, a decline sets in with the increase in the quantity of offerings and the fall in the standards of quality. Nevertheless, the prices of all varieties are above those which had prevailed at this time last year. Even the C.T.C. varieties, the demand for which had remained dormant for long, are quoted slightly above last year's prices. The average price of all teas fetched at the export auctions in Calcutta during the current season so far (up to 27th October) is, however, lower at Rs. 2.41 per lb. as compared with that of Rs. 2.58 per lb. in the corresponding period of last year. The average price at the sales for domestic consumption also shows a decline from Rs. 2.03 to Rs. 1.99 per lb.

In Cochin, too, despite the setback in prices lately, the current prices are well above those fetched a year ago, but the average price for the season so far (up to the end of October) is, unlike that in Calcutta, a shade higher at Rs. 2.13 per lb. as against Rs. 2.10 a year ago, for export sales and at Re. 1.75, as against Re. 1.53 per lb., for internal consumption.

The drop in average price realised this season for North-East Indian teas is perhaps due to the larger offerings and the poorer quality thereof. Thus, upto 27th October, 902,709 chests have been offered in export auctions at Calcutta, representing an increase of 92,092 chests over the quantity offered in the corresponding period of 1958. The quantity of dust tea sold for internal consumption is also higher at 300,722 chests, as compared with 271,638 tons in the corresponding period of 1958. At the Cochin auctions, sales for exports upto 20th October show a rise from 27.87 million lbs. to 29.74 million lbs., while domestic sales of dusts have declined from 14.37 million lbs. to 12.57 million lbs.

Output Higher

The increase in offerings at the Calcutta auctions is only in consonance with the rise in production of North Indian tea, which, up to the end of September, amounted to 398.9 million lbs., representing an increase of 14.6 million lbs. and 20.9 million lbs. over that in the corresponding periods of 1958 and 1957, respectively. This rise has been offset to a large extent by the drop in South Indian crop from 119.2 million lbs. in the first nine months of 1958 to 107.5 million lbs. in the corresponding period of the current year, so that the total tea production in India up to the end of September amounts to 506.4 million lbs., or 2.9 million lbs. more than that in the corresponding period of last year. Till the end of August, Indian output was running below last year's level, on account of the lower production in South India, but the sharp rise in September production in the South has converted the deficit into a surplus over last year. There has also been an increase in output from Pakistan and British East Africa, but this is more than offset by setback in production in Ceylon and Indonesia, as will be seen from the following table:

(In million lbs.)				
Countries	Period	1959	1958	1957
N. India ..	Apr.-Sept.	398.9	384.3	378.0
S. India ..	Jan.-Sept.	107.5	119.2	104.8
Pakistan ..	Apr.-Sept.	99.8	97.8	81.0
Ceylon ..	Jan.-August	276.6	285.9	288.2
Indonesia ..	Jan.-July	53.9	57.8	58.8
British East Africa*	Jan.-Aug.	47.8	41.7	40.1
Total ..		928.5	926.2	897.4

* Including Nyasaland.

Along with the overall decline in prices fetched, exports of Indian tea have also shrunk, resulting in a fall in foreign exchange earnings. During the first six months of the current year, India exported 146.96 million lbs. of tea valued at Rs. 36.71 crores, as against 190.53 million lbs. of the value of Rs. 47.42 crores in the corresponding six months of 1958. Though the trend of exports in the subsequent months from North India has been very encouraging thus reducing the shortfall in exports from that part of the country, the exports of South Indian tea continue to maintain the downward trend, so that the overall exports of Indian tea are still lower

than those in 1958. India is not, however, the only country, the exports of which have suffered a setback, as will be borne out by the following comparative table:

(In million lbs.)				
Countries	Period	1959	1958	1957
N. India ..	Jan.-Sept.	233.4	236.9	237.2
S. India ..	Jan.-Aug.	49.8	64.9	48.5
Pakistan ..		2.5	4.8	6.2
Ceylon ..	Jan.-July	205.3	226.5	228.1
Indonesia ..	Jan.-May	28.6	31.8	33.8
East Africa ..		43.3	36.1	38.3
Total ..		562.9	601.0	592.1

Exports to U.K.

A common feature of the exports from the main producing countries is the fall in shipments to the U.K. Thus, North Indian exports to Britain, which had fallen from 163.3 million lbs. in the first nine months of 1957 to 145.5 million lbs. in the corresponding period of 1958, have further shrunk to 132.8 million lbs. in January-September 1959. Similarly, South Indian tea exports have declined from 39.2 million lbs. (in January-August 1958) to 27.9 million lbs. in the same period of 1959. This is in distinct contrast to the rise of 8 million lbs. in the first eight months of 1958. Exports from Pakistan, too, have fallen from 4.5 million lbs. to 1.8 million lbs. and those from Ceylon (during January-July) from 95.7 million lbs. to 78.6 million lbs. This shows that imports of tea from all sources into the U.K. have been on a lower scale than in the previous year. Thus, imports upto the end of August into the U.K. amounted to 299.1 million lbs., as compared with 342.2 million lbs. and 408.5 million lbs. in the corresponding periods of 1958 and 1957, respectively.

The fall in exports to the U.K. from India has been made good to a large extent by the rise in shipments of North Indian tea to the following countries:

(In million lbs.)				
Countries	1959	1958	1957	
Europe ..	7.7	4.8	3.9	
U.S.S.R. ..	12.4	9.6	8.4	
Turkey ..	7.1	5.0	5.2	
Persian Gulf and Iraq ..	6.9	4.8	4.4	
Sudan ..	15.7	13.7	3.9	
Egypt ..	16.3	16.4	8.9	

Shipments of South Indian tea to U.S.S.R. during the first eight months have also gone up from 3.2 million lbs. to 4.4 million lbs. The countries where India has lost some ground during the year are Canada, U.S., South American countries and Australia.

BONUS FOR TEA GARDEN WORKERS

Representatives of the tea industry and workers' organisations have agreed to follow the Delhi agreement of 1956 in regard to payment of bonus to tea garden workers in North India for 1957 and 1958, subject to any modifications that may be mutually agreed upon. This was decided at a meeting of the Bonus Sub-Committee of the Industrial Committee on Plantations, which met in Calcutta a few days ago. The Union Minister for Labour and Employment, Shri Gulzarilal Nanda, presided.

The Delhi agreement signed by employers and workers in January 1956, laid down a formula for payment of bonus to workers for 1953 and 1954. Bonus was paid at the rates specified for different regions in the formula. The same formula was adopted for payment of bonus for 1955 and 1956. As regards bonus for 1957 and 1958 it had been decided to appoint a sub-committee of the Industrial Committee with an equal number of representatives of employers and workers' organisations on it, to determine the quantum of bonus. The Sub-Committee, which has had several meetings, has now decided to follow the formula set out in the Delhi agreement.

SKF

Manufacturing
the most comprehensive range of
ball and roller
bearings...

In every division of India's industry—in heavy steel plants, in large textile mills, and in small workshops—wherever Ball and Roller Bearings can make operations smoother and production cheaper, there you will find SKF. SKF has its own organisation in India with a technical staff always at hand to help you select the most suitable and economical bearing from a range so complete that the correct bearing-type for any application can be supplied and installed.

TRAVANCORE SUGARS AND CHEMICALS LTD.

CHAIRMAN'S SPEECH AT ANNUAL MEETING

FUTURE OF SUGAR INDUSTRY WILL DEPEND ON REASONABLE FREEDOM FROM CONTROL

THE Twenty-second Annual General Meeting of the shareholders of the Travancore Sugars and Chemicals Ltd. was held at Madras on Tuesday, 3rd November 1959. In the absence of the Chairman, Mr. G. N. Noel-Todd, Mr. P. Hadfield presided over the meeting and read the Chairman's speech. In the course of the speech, the Chairman made it clear that the future of any sugar company would depend on reasonable freedom from control and that it was this belief which had prompted the Directors of the Company to sell sugar at prices voluntarily agreed with the Government in the hope that the imposition of control (as introduced in North India in 1958) might be avoided. The two special aspects to which the Chairman drew attention related to the enhanced tax burden and the uncertainty regarding the Government's decision on the cane price-linking formula.

The following is the full text of the Chairman's speech at the annual meeting:

"GENTLEMEN,

"It is, first, my happy duty to welcome you to this, the 22nd annual general meeting of this Company. The accounts and Directors' report for the year ended 30th April 1959 have been in your hands for the statutory period and, with your permission, I shall take them as read.

"The Directors' report has already made a specific reference to the falling off in profit during the year under review, and the principal reasons therefor. I shall, therefore, say no more on this subject, except to illustrate with one or two figures the points made in the Directors' report.

"The increase in taxes per ton of sugar sold in 1958-59 worked out to Rs. 77 and the additional payment for cane purchased in 1957-58 cost, on 1958-59 production, to Rs. 21 per ton of sugar. There were some compensating factors, notably a reduction in manufacturing costs during the year under review as compared with the previous year, owing to the greater tonnage of cane crushed. It is hardly necessary for me to say that constant vigilance is exercised by your Directors and the management staff to ensure that the most economic operation is maintained. On balance, the result was that the trading profit on sugar dropped by Rs. 59 per ton, which, on a turnover of about 10,000 tons, adds up to a substantial figure.

Payment for Cane

"I, myself, personally took part in the early stages of the negotiations with Government regarding the additional gratuitous payment to cane growers for cane purchased during the year 1957-58, and I can remember pointing out on more than one occasion to the then Minister of Industries that, however strongly Government might feel that the cane growers had had, for climatic or other reasons, a bad season and merited some bonus, such bonus would be at the direct expense of both labour and the shareholders, and that I could not see that the Company had prospects of making up in other directions this additional item of expense. The loss to labour arises from a necessary reduction in the quantum of their annual bonus roughly proportionate to the reduction in profits, and the loss to Government is twofold: a reduction in their commission on the profits and a reduction in dividend on their holding of ordinary shares. It is, to my mind, most regrettable that, in a Company of this nature, in which a number of different categories of persons have a direct or indirect interest in the operation of the Company, such as the cane growers, the boatmen who bring the cane to the factory, the employees of all grades, the Government, and the shareholders, an abnormal advantage should ever be given to one of these categories at, inevitably, the expense of others. May I express the hope that any Government that may in future be in power in Kerala will bear these considerations in mind and support your Directors in their policy of distributing the income available as fairly as may be possible between the parties involved, having regard to the role of each?

"You will have observed from the Directors' report that the tonnage of cane and the sugar produced during the year ended 30th April

1959 were both on the whole satisfactory, and came very close to the record figures produced in the 1956-57 season. Since rather more sugar was carried forward in stock at 1st May this year, as compared with 1st May last year, there will be some small benefit to be derived from this during 1959-60, subject, of course, to our operations during this year being maintained at a satisfactory level.

Labour Strike

"In this connection, the crushing season started on 27th September and the results to date are not unsatisfactory. We hope to achieve a total crush of 120,000 tons of cane, with a recovery not substantially worse than last year. The season started unduly late, for the very same reason that has caused a late start in previous years, namely, that, in spite of their assurances to which I made reference in my speech at the 20th annual general meeting in November 1957, that they would enter into negotiations to arrive at a formula under which bonus in future years would be paid, the labour and staff unions had not, up to the projected time for the start of this season, which was the end of August, put forward proposals for such a formula that were in any way acceptable to your Board. Shortly before the proposed starting date of the season, a strike notice was issued by the unions and, in spite of conciliation proceedings presided over by Government, it was not until 24th September that an agreement was finally reached. In the intervening period, an attempt had been made to start the crushing season in the hope that the unions would not implement their strike threat while negotiations were still proceeding. This hope was ill-founded, the strike was called, and some direct loss to the Company was sustained thereby.

"Additionally, there may be some further and more substantial loss due to the adverse effect of the late start on the overall recovery. Losses incurred in this manner are much to be deprecated, but I would like to assure shareholders that every possible effort was made by your Board to reach an agreement on this bonus issue, even though on terms which might not be fully justified in the light of the scale of bonus and the general level of remuneration obtaining in other factories. It was particularly distressing that one effect of the strike was that no sugar could be moved out of the Company's godowns for sale in the State, and this at a time when there was an acute shortage of sugar. One could not wish for a clearer example of the use of coercion on the part of the unions to force an agreement from your Board that would have been extremely onerous on the Company. Unfortunately, Government did not see fit to refer this dispute to adjudication, which might well have had the effect of terminating the strike at an earlier date than it actually finished. However, in the end it was, rather belatedly, possible to reach an agreement which, while definitely favourable to the unions, is of such a nature that the Company should be able to continue to operate with reasonable profits. Moreover, this agreement provides for a formula linked with the profit for the year, for the calculation of bonus due to labour and staff for the years 1959-60 and 1960-61, and it is, therefore, to be hoped that we shall have a breathing space from these vexatious disputes, and thus also have an opportunity to produce the best manufacturing results which is so necessary in view of the current shortage of sugar in the country. I should like to take this opportunity of assuring the labour and staff unions that the Board will spare no pains to implement the agreement reached and, in return, ask for the maximum co-operation on the part of all workers and clerical staff, so that we may go forward in amity and with greater efficiency to our mutual benefit.

Sugar Supply Position

"Those of you who are consumers of sugar as well as shareholders will expect me to say something about the shortage of sugar which must necessarily cause inconvenience. Some of you will perhaps expect to see inflated profits next year, in view of the high prices at which sugar is sold in retail. Your Directors, in common with others in the Parry Group and a

majority of the members of the South Indian Sugar Mills Association, believe that the future of any sugar company depends on reasonable freedom from control, and they have, therefore, sold sugar at prices voluntarily agreed with the Government in the hope that the imposition of control (as introduced in North India in 1958) may be avoided. We have had no share of the black market prices that have been in evidence throughout the State. The prices we have realised for sugar sold in the current year are not inflated but are what your Directors consider fair and reasonable, and we have Government's approval for the line we have taken.

"Before leaving the subject of sugar, I must bring to your notice the fact that the Government of India has not yet announced the final factor in the cane price-linking formula which is to determine the final price of cane to be paid by the Company in respect of purchases made during the year under review. That a Company should, by a policy of Government, be obliged to manufacture a product and sell it before it can know the true cost thereof, and close its books of account still without this knowledge must be a unique circumstance. Since it is possible to know the exact nature of this future liability, if any, it is equally impossible to assess any sum which might be put in reserve against it and, therefore, should the cane price-linking formula result in a further payment having to be made for cane purchased in the year under review, the cost thereof will have to come from the profits of 1959-60.

"This factor itself justifies an attitude of caution on the part of your Directors towards the quantum of dividend to be paid. Apart from this and the lower margin of profit on sugar, you will see from note 4 of the accounts that credit has been taken for Rs. 140,000, resulting from recalculating the taxation equalisation reserve, so as to bring it to a figure sufficient to meet taxes on the Company's profit at 45 per cent. It is much to be hoped that Government will not increase this rate, but you are no doubt aware that they have powers to do so, with retrospective effect.

Pharmaceutical Section

"Before concluding my remarks, I should like to refer briefly to the operations of the pharmaceutical section of your factory. The turnover in the year under review was maintained at nearly the figure of the previous year and the profits, though also small, did not suffer. For this year, in accordance with our revised agreement with Government, we have received Government's order for fifty per cent. of their requirements and, for the balance fifty per cent. we have tendered in open competition, the result of which tender is still awaited. It may be that on considerations of price alone we may not secure any substantial part of the order, but I am sure that shareholders will support the Board's policy of refusing to lower prices by accepting a lower standard of quality. We must await the results of this year before we can decide whether, on the basis of receiving only fifty per cent. of Government's order, the pharmaceutical works can be maintained as a profit-making unit.

"The unusually large figure of Rs. 70,000 appearing in the profit and loss account, as an adjustment of tax relating to previous years, arises from the fact that the Income-tax Department has now refused to permit sugar factories to reserve in one year of account for the expenses that will be incurred in the following year in overhauling machinery. It has previously been argued and accepted by the authorities that such a reserve was legitimate, inasmuch as the overhaul is necessitated by the operation of the machinery in the year of account and, therefore, the cost of the overhaul should appear in the same year of account in the shape of a reserve. This reversal of previous policy which, so far as I know, has been universally applied, must have resulted in a considerable windfall to the tax gatherers in this year, but it will not, of course, be a recurring item.

Dividend

"Finally, may I express the regret of myself and my colleagues that, for the year under review, we are not able to maintain the ordinary dividend at the previous rate of ten per cent. free of tax, but in all the circumstances shown in the accounts and mentioned by me in this speech, I am sure it will be agreed that

BRITISH COMPANIES WORKING FOR INDIA

FREE-OF-TAX AND LESS-TAX PREFERENCE DIVIDENDS

THE MEANING OF THE 1959 AMENDMENT

By R. K. Dalal, B.Com., F.S.A.A., F.C.A.

THE most controversial piece of legislation in the 1959 Finance Act is the section dealing with free-of-tax dividend to preference shareholders. Section 18(3E), as amended, reads as under:

"Where any share held by a shareholder carries as respects dividends a preferential right to be paid a fixed amount or an amount calculated at a fixed rate free of tax, then, notwithstanding such preferential right, tax shall be deductible under sub-section 3D, and for the purposes of such deduction the amount payable to the shareholder as dividend shall be taken to be such amount as would, after deduction of a sum equal to thirty per cent. thereof, be equal to the net amount of dividend receivable by the shareholder free of tax."

Section 18(3D), as amended, reads as follows:

"The principal officer of an Indian company or a company which has made the prescribed arrangements for the declaration and payment of dividends within India shall, before making any payment in cash, or before issuing any cheque or warrant in respect of any dividend or before making any distribution or payment to a shareholder of any dividend within the meaning of sub-clause (a) or sub-clause (b) or sub-clause (c) or sub-clause (d) or sub-clause (e) of clause (6A) of Section 2, deduct on the amount of such dividend, income-tax and super-tax at the prescribed rates.

Provided that where, in the case of any shareholder, not being a company, the Income-tax Officer gives a certificate in writing (which certificate he shall give only in accordance with the rules made in this behalf) that to the best of his belief the total income or the total world income of the shareholder will be less than the minimum liable to income-tax, the principal officer responsible for paying any dividend to such shareholder shall, until such certificate is cancelled by the Income-tax Officer, pay the dividend without deduction."

There is a keen controversy now as to the actual connotation of these provisions. Lawyers are also set thinking (or rather scratching their heads) as to what exactly is the scope, effect and purpose of these new sub-sections in the context of the amendment of Section 16(2) which abolishes grossing up of dividend from the assessment year 1960-61.

The issue is what is the effect of the amendment of Sections 18 (3D) and (3E) on the "free-of-tax" and "less-tax" dividends on preference shares.

The above amendments do not affect the agreement of shareholders with the company. In other words, preference shareholders, whether with the right of "free-of-tax" or "less-tax" dividend, will continue to receive the same dividend quantitatively from the company as before the amendment. The difference mainly lies in the process to be applied for deduction of tax under Section 18(3D).

Various Views

Various views have been set afloat. Let us examine a few of these.

One view is that, by the insertion of this sub-section, the Government has provided that, notwithstanding the abolition of grossing up of dividends, the company shall be bound to give to the shareholders an amount by way of dividend which will compensate him for non-grossing. In other words, you assume that the preference shares carried a dividend right of 7 per cent. free of tax. Before the present provision, this dividend of Rs. 7 was entitled to be grossed up with the result that it became Rs. 10. From this, it is argued that the shareholder, under the new set-up, is entitled to Rs. 7 in cash as hitherto and Rs. 3 statutory deduction is also to be borne by the company, to make Rs. 7 free of tax. Therefore 7 per cent. free of tax meant an actual cash dividend of Rs. 10. They read in the section a meaning which would result in compelling the company to declare hereafter Rs. 10—in order to satisfy the agreement of 7 per cent. free of tax. Shareholders receiving free-of-tax preference dividend had, according to the view, earned a right to larger dividend from the company.

Another view propounded is this. Sub-section 3E (as amended) does not affect the agreement of the preference shareholders with the company. The preference shareholder will even after amendment continue to receive Rs. 7 as free-of-tax dividend, but, when the company has to make a deduction under sub-section 3D, the dividend shall be deemed to be increased by Rs. 3 the tax thereon and, instead of deducting 30 per cent. on Rs. 7, the company shall deduct

30 per cent. on Rs. 10, the dividend which the shareholder hitherto received before the amendment by Finance Act, 1959, namely, Rs. 7 cash and Rs. 3 by way of grossing up with the tax thereon. The company is not obliged to declare anything more than what it did prior to the amendment, namely, Rs. 7, but, in order to compute 30 per cent. tax deduction at source 30 per cent. will be based on Rs. 10 (Rs. 7 plus immunity for tax Rs. 3) as dividend, instead of bare Rs. 7 that the shareholder received.

Before the abolition of grossing up of dividends, 7 per cent. less tax meant an actual payment of Rs. 4 (being Rs. 7 dividend and less Rs. 3 tax thereon at company's rate). But the shareholders got grossing up. So that he returned dividend income as Rs. 7 and got credit for Rs. 3. After the amendment, one view is that the company, in the absence of grossing up rights, has no right to deduct Rs. 3. It will, therefore, pay to the shareholder Rs. 4.90, after deducting income-tax at 30 per cent., that is, Rs. 2.10 for payment to Government.

These interpretations do not seem to be correct. Sub-section 3E has nothing to do with the right of the company to continue to declare 7 per cent. free-of-tax dividend to its preference shareholders in pursuance of their agreement. It certainly does not affect, *inter se*, the contract at all. The wordings do not suggest it. Therefore, we must find a logical basis for the meaning and purpose of sub-section 3E. Again, why does sub-section 3E speak of only tax-free preference dividend and leave severely alone similar question affecting less-tax preference dividend? It cannot be the intention of the Government to prefer one class of preference shareholders against another. Any interpretation that raises a question of discrimination between less-tax preference shareholders and free-of-tax preference shareholders must, therefore, be ruled out. The reason for providing a section for tax-free preference dividend and omitting a provision for less-tax dividend must be found and it must be a tenable one. And the only solution that suggests itself to a practical mind is this.

Three Questions

There are three questions involved in this problem. These are:

- (1) What is the exact significance in law of the words "free of tax" and "less tax"?
- (2) Does the amendment of sub-section 18(3E) give a right to shareholders to demand that, in the case of a free-of-tax dividend, the statutory deduction will be borne by the company?
- (3) Does "less tax" and "free of tax" to be so interpreted after the abolition of grossing up of dividends as to mean the same? In other words, is "less-tax" dividend placed on a par with "free-of-tax" dividend?

Let us consider each separately.

What is the exact significance of the words "less tax" and "free of tax"? Does free of tax for instance, mean an indemnity to the shareholder by the company to pay his own tax on dividend or does it mean that, in declaring free-of-tax dividend, the company simply does not pass on its incidence of tax to the shareholder? Where it chooses to pass on its tax incidence to the shareholder, the dividend becomes "less tax." The company's tax is a tax on the profits made by it as an entity. There is no agency between the company and its shareholders. Therefore, the question of the company agreeing to reimburse the shareholder's individual tax liability cannot arise. Such a suggestion in practice would be unworkable indeed. How will the company know the individual rate of tax of each one of its hundreds of shareholders and why should the company so reimburse a person for his personal liability? On the other hand, it is reasonable and perfectly logical to say that, in distributing its profit, the company may either pass on its incidence to the shareholders or it may not. If it does, then the dividend to that extent gets reduced by the company's rate of tax. If it does not, the dividend remains free of such incidence and consequent reduction. "Free of tax" therefore in common parlance means "free of the company's incidence of tax" and "less tax" means after deducting from the dividend the tax incidence of the company. It is the company who either deducts the tax from the shareholder's dividend

tax paid or payable by it, or not. It does not stipulate reimbursement by the company to its shareholders.

The above view is supported by the Calcutta High Court in the case of *Angus Co. Ltd., Calcutta vs. The Commissioner of Income-tax, West Bengal*, 1954, I.T.R., Vol. 25, where his Lordship has observed, on page 437, as under:

"When a dividend is declared tax-free, it does not mean that the dividend is totally immune from tax in relation to the Treasury, but it means that the declared percentage of dividend is paid by the company to the shareholders in full without any deduction therefrom on account of tax. It is tax-free in the sense that, as between the company and the shareholder, it is not diminished by any retention of tax by the company out of it, so that the actual net amount received by the shareholder is the full percentage declared. When, however, a dividend is paid less tax or subject to tax, it means that the company does not pay to the shareholder the declared percentage of the dividend in full, but deducts from it an aliquot part of the tax paid or payable by it on the whole of its profits, so that the shareholder receives the declared percentage, less such deduction. It will be obvious that, when a dividend is declared tax-free, the whole of the divisible fund will be exhausted by the distribution since the full percentage declared is paid out; but, if a dividend of the same percentage is declared less tax, a portion of the fund will remain in the hands of the company. In the first case, the company will have to pay tax on its total profits including in them the divisible fund from other funds in its hands, but in the second case it will be able to apply to such payment a portion of the divisible fund itself. This, however, can happen only when a divisible fund is first created merely on the basis of a certain percentage of the share capital and a dividend of that percentage is declared tax-free in one case and less tax in the other."

Quantum of Dividend

Bearing this in mind we must now approach Section 18(3E). This section provides for determining the quantum of dividend for purpose of deduction under sub-section (3D). Let the person receiving dividend from the company may not argue that 30 per cent. deduction at source must be based on what the company actually gives to the shareholder, the section provides a warrant by creating a fiction of what the tax-free dividend quantitatively is deemed to be in order to measure 30 per cent. deduction under Section 18 (3D). It in no way alters the contract *inter se* between the company and its shareholders. That is to say, notwithstanding this, the company can only be called upon to pay to its shareholders under the agreement the same amount as it did before the abolition of grossing up provision. If 7 per cent. less-tax dividend was satisfied by paying the shareholder Rs. 4 (i.e., Rs. 7 less Rs. 3 tax at company's rate) it shall continue to pay the same amount after 1959 amendment. Similarly, 7 per cent. free of tax meant that Rs. 7 without any deduction of the company's rate of tax. So the shareholder will continue to get from the company the same Rs. 7 as dividend and no more. On the basis of Rs. 4 as dividend in one case and Rs. 7 on the other, the company will make deduction of tax at source on behalf of the shareholder under Section 18(3D) and hand over the proceeds to the Government like tax deducted at source from "salaries."

The enactment of sub-section 3E is necessitated, because, factually, 7 per cent. free-of-tax is a larger dividend than the 7 per cent. less-tax dividend, even after the amendment in 1959, and, therefore, for the purpose of statutory deduction of tax at source, the same must differ. It cannot remain the same and hence a specific provision as to how the free-of-tax dividend is to be grossed up for purpose of statutory deduction under sub-section 3D is made in the Act.

Under the Income Tax Act, before the 1959 Amendment, both "free-of-tax" and "less-tax" dividends were regarded as eligible for grossing up. In other words, "free-of-tax" dividend was regarded as "less tax" with a larger amount of dividend. For example, 7 per cent. less-tax dividend was equivalent to Rs. 7 less Rs. 2.10 tax, i.e., the actual dividend was Rs. 4.90. And it was this Rs. 4.90 which was grossed up. In the case of 7 per cent. free-of-tax dividend, there was no deduction, but it was deemed to be equivalent to 10 per cent. less tax; in other words, the basic dividend, although it was Rs. 7, was regarded as Rs. 10 for the purpose of grossing up. The same scheme is stipulated now under sub-section 18(3E), namely, a base is determined for the purpose of deduction under sub-section 18(3D).

The amended sub-section 3D provides for deduction at 30 per cent. in the case of individual shareholders and 45 per cent. in the case of company shareholders. Whereas the base deduction is furnished in the case of "less-tax" dividend (for it is already determined by the company giving the shareholder dividend after

deducting the company's rate of tax), for the purpose of "free of tax" dividend, there is no such determination. A 7 per cent. free-of-tax dividend under sub-section 3E is to be regarded as equivalent to 10 per cent. less tax. This furnishes a base, namely, 30 per cent. higher than the base for less-tax dividend. The Act computes fictionally, the tax burden not shifted to free-of-tax shareholders at 30 per cent. It is to be noted that 30 per cent. is incorporated into sub-section 3E not as actual rate of company's tax, but as an absolute standard. The company's rate may vary; yet, so long as sub-section 3E is not amended, the "free-of-tax" dividend quantitatively will be regarded as 30 per cent. better off. Sub-section 3E furnishes an artificial base for deduction of tax under sub-section 3D so far as free-of-tax preference dividend is concerned; so far as less-tax dividend is concerned, the base is already furnished by the actual dividend being received after deduction of company's rate of tax. There is an actual shifting of its tax burden on to the shareholders. The problem is only in regard to free-of-tax dividend, for, here, the company does not shift its tax burden to the shareholders, but itself bears the tax. Hence an artificial quantification of this burden is furnished by sub-section 3E.

As a result of the amendment to the Income Tax Act, abolishing grossing up of dividends, there may be a detriment to the shareholder, but this detriment cannot be passed on to the company in contravention of the terms of its agreement which remain inviolable. The relevant section in the Income Tax Act does not say, as it should, if the above argument were right, something to this effect: "Notwithstanding anything to the contrary contained in any agreement, resolution or Articles of the Company." The section does not deliberately refer to such things about the Company's internal management.

Too Absurd A Suggestion

Grossing up has been abolished by an Act of Parliament. Therefore, all shareholders whose dividend was grossed up must put up with the resulting disadvantage, if any, by this abolition. The Government has no intention and constitutionally is prohibited from enacting discriminatory legislation. The sub-section 3E is found necessary because 7 per cent. free-of-tax quantitatively really meant more dividend than 7 per cent. less tax. Seven per cent. free of tax only means that the shareholder gets 7 per cent. net dividend from the company, without any deduction of the company's rate of tax paid by the company on its profits. Seven per cent. less tax, on the other hand, means that the company has agreed to pay the shareholder 7 per cent. dividend on the capital only after deducting the company's rate of tax. In short, in free of tax, the shareholder does not directly bear any incidence of the company's tax. In the less tax, the company passes on the incidence to the shareholders. In the case of company and shareholders, there can be no question of reimbursing the preference shareholder the individual tax on dividend payable by him. Such a suggestion is too absurd to need any elaboration. A company, however, may, by agreement, agree to pass on its own incidence of tax to its shareholders or may not. When it does, the dividend becomes less tax. When it does not, it becomes free of tax.

In the light of the above, the *raison d'être* of sub-section 3E becomes crystal clear, namely,

that, for the purpose of deduction, the amount payable to the shareholder as dividend shall be taken to be such an amount as would, after deduction of a sum equal to 30 per cent. thereof, be equal to the net amount receivable by the shareholder "free of tax." This means that, in computing statutory deduction under sub-section 3D, the net amount of free-of-tax preference dividend shall be taken as not what the shareholder receives after deduction but before deduction of tax. In other words, 30 per cent. shall be of Rs. 10, a figure under sub-section 18(3E), and not of Rs. 7 receivable by him.

A Doubt

Someone may raise a doubt that, if what we say is right, the deduction under sub-section 3E contemplates in all cases deduction of 30 per cent. Whereas in the case of an individual shareholder it is 30 per cent.; in the case of a company being a shareholder of another company, the deduction is 45 per cent., 30 per cent. income-tax plus 15 per cent. super-tax. It may, therefore, be contended that the interpretation fails to convince one of its cogency. At first sight, this seems to be a formidable objection, but, on further thought, it is not, especially when the purpose of sub-section 3D and sub-section 3E is taken into consideration. Sub-section 3E attempts to determine the gross dividend for income-tax purposes only. Sub-section 3D provides the authority to deduct income-tax in the case of an individual and income-tax plus super-tax in the case of a company, the dividend figure determined under sub-section 3E remaining constant for both. Sub-section 3E does not provide for 30 per cent. deduction. That is done by sub-section 3D. What sub-section 3E provides is merely the addition of tax in the actual dividend received by the shareholder after the 30 per cent. statutory deduction of tax at source on behalf of the shareholder.

Further, if Rs. 7 is to be grossed up to Rs. 10 for the purpose of deduction under sub-section 3D, then it leads to this anomaly, namely, why should the Government collect at source more than the maximum rate of tax applicable to the dividend of Rs. 7? One can understand this deduction if the taxable dividend were to be Rs. 10. This it can never be, for grossing up provisions have been repealed. In short, therefore, there is no case for compelling the company taken for example to declare anything more than Rs. 7 in the case of 7 per cent. free-of-tax preference dividend in spite of sub-section 3E. It does not contemplate any addition to the dividend hitherto declared in favour of free-of-tax preference shareholder.

A word about "less-tax" preference shareholder will not be out of place, for the view taken in this article also explains the conundrum raised by some in regard to this class of shareholders. In the example taken above, 7 per cent. less dividend to preference shareholders meant Rs. 7 less company's rate of tax, say, Rs. 3. A preference shareholder before the 1959 amendment received Rs. 4 (i.e., Rs. 7 less Rs. 3 tax thereon). Now every dividend must bear a statutory deduction at 30 per cent. The question is 30 per cent. of what? Is it 30 per cent. of Rs. 4 or is it 30 per cent. of Rs. 7? Those who contend that the latter view is correct, argue that Rs. 4 less tax really means a dividend of Rs. 7, for the shareholder receives a credit of Rs. 3 in income-tax. Now, since this grossing up is abolished, the question of deducting Rs. 3

from Rs. 7 does not arise. Therefore, the company can only deduct 30 per cent. on Rs. 7; that is what it is entitled to do under sub-section 3D.

This contention is, in my opinion, very anomalous, for it places, strangely enough, "less-tax" preference shareholders on a par with free-of-tax preference shareholders which is really absurd. Even after the amendment of Section 16, abolishing grossing up, there is, indeed, a quantity difference between the two dividends, that is, 7 per cent. free of tax and 7 per cent. less tax.

Here the company's tax burden is shifted to the shareholders. And that is not altered by the amendment. It remains the same, namely, the company shall be deemed to have declared 7 per cent. less tax, if it pays the shareholders Rs. 4.90 (i.e., Rs. 7 dividend less Rs. 2.10 tax thereon at the company's rate, assuming the rate of company's tax is 30 per cent. income-tax). Now this dividend is the base for deduction under sub-section 3D and the company, while paying Rs. 4.90 to the shareholder, will still be entitled to deduct, under sub-section 3D, Re. 1.47 as tax, giving him only Rs. 3.43; Re. 1.47 which it has deducted will be given to the Income-tax Department as deduction of tax at source. The tax, namely, Rs. 2.10 that the company has retained will be refundable to the shareholders in the light of Lalitabai's judgment, if the company in that year, eventually pays no tax by reason of its assessable income being nil or there being an actual loss for that year as per computation.

The Only Reasonable Interpretation

The only reasonable interpretation, therefore, is that where it is 7 per cent. less tax, the company must continue to pay Rs. 4 (i.e., Rs. 7 dividend less Rs. 3 company's incidence of tax) less a further 30 per cent. statutory deduction for the Government. This is one of the terms of agreement with the company, the fulfilment of which is not dependent on the right of grossing up. The company never has or can even contemplate reimbursing the shareholder for his personal tax liability. Free-of-tax dividend, by common usage and practice, has always meant that the company will not deduct anything from the dividend by way of tax payable by it on its profits. "Less tax," on the other hand, clearly stipulates passing on the company's incidence of tax to the shareholders. That being so, even after the 1959 amendment, less tax preference shareholders shall continue to get quantitatively only Rs. 4 and, out of this Rs. 4 payable to the shareholder under the agreement, 30 per cent. or Re. 1.20, shall be deducted, so that they will be given only at the rate of Rs. 2.80. Notwithstanding anything stated in sub-section 3E and sub-section 3D aforesaid, the Company still retains the right to pass on the tax incidence to shareholders in the case of less-tax preference dividend.

The above interpretation leads to no conflict or anomalies, for it harmonises both sub-sections 3D and 3E with deletion of grossing up under Section 16(2), keeping at the same time the contractual agreement with the shareholders untouched, intact and unaffected by reason of this new amendment of the Income Tax Act. Nowhere in sub-section 3E, there is any warrant for altering any existing contract of the company with its preference shareholders as regards payment of dividend.—All Rights Reserved.

NEW PUBLICATIONS

Modern Fishing Gear of the World. Edited by Hilmar Kristjansson. Published by Fishing News (Books) Ltd., Ludgate House, 110, Fleet Street, London, E.C. 4. Pages: 678.

PISCICULTURE plays an important part in world food economy. Fish farms do not require any manuring, nor do they raise difficult land problems. They help augment food output. In many countries, fishing constitutes a major industry, providing a source of livelihood for thousands of families. The U.N. Food and Agricultural Organisation (F.A.O.) has consistently devoted much attention to fishing problems. *Modern Fishing Gear of the World* is a most authoritative and comprehensive publication of its kind. Edited by Mr. Hilmar Kristjansson, Chief, Fishing Gear Section, Fisheries Division of the F.A.O., the book deals with several aspects of fishing industry. It covers net materials, rational gear design, description of fishing gear and its operations, as well as the strategy and tactics of finding and attracting fish.

Modern fishing is a far cry from ancient and unscientific methods of fishing which still prevail in many underdeveloped countries. Dr. D. B. Finn, Director, Fisheries Division of the F.A.O., once declared that progress in fisheries has been greater in the past 30 years than in the previous three thousand years! Three developments have been mainly responsible for technological revolution in fishing. They are: mechanisation in fishing vessels, use of electronic echo-sounding and echo-ranging equipments and the advent of synthetic fibres.

The oceans, seas and other waters cover more than 70 per cent. of the earth's surface. They occupy about 90 million sq. miles but produce less than 10 per cent. of humanity's food. How much food could eventually be taken by man from the sea cannot be assessed. From time to time, estimates are made of how much fish we might expect to catch. Only a few years ago, it was thought that sustained catch would hardly exceed some 25 million metric tons per year. But already, fish production is reaching 30 million metric tons (1957). Biologists and other experts now suggest this catch might be increased to some 60 million tons a year from known stocks, without taking into account the possible discovery of new fisheries. It must, however, be remembered that there is a wide difference between the per capita fish catch in developed countries and that in underdeveloped countries. In more-developed fishing countries, each fisherman produces over 80 tons of fish per year but there are more than two million fishermen in less-developed countries who catch only about one ton of fish per man per year.

The contributors to the book are all experts in some aspect or other of fish industry and pisciculture. Although some of the articles are highly technical, many authors have made a special attempt to explain the fundamental concepts in simple and non-technical language. There is no doubt that the book will for long remain a classic on the subject.

Tax Planning with Precedents. By D. C. Potter and H. H. Monroe. Published by Sweet and Maxwell Ltd., 2 and 3 Chancery Lane, London. Agents in India: N. M. Tripathi Private Ltd., Princess Street, Bombay. Pages: 471. Price: £2 10s.

To Indian readers, the title of this book may not convey an adequate idea of its contents. The book is intended to enable a man to understand the incidence of tax when he makes any disposition of his properties to members of his family. It also provides the legal draftsman with a large number of precedents relating to conveyancing. The topics covered by the book include deed settlement, separation deeds, family settlements, discretionary trusts, marriage settlements, partnerships, pension schemes, and wills. Under each section of the book, a model deed of settlement is given. Written in a manner that must appeal to a layman, the book will be of great value to those who are called upon to deal with the disposition or management of property which bears a heavy burden of tax and estate duty. It will also be of great value to the legal draftsman.

A Comparison of National Output and Productivity of the U.K. and the U.S. By Deborah Paige and Cottfried Bomach. Published by the O.E.E.C., Paris. Pages: 245. Price: 21 shillings.

This is a joint study undertaken by the authors, on behalf of the O.E.E.C. in collaboration with the Department of Economic Affairs

of the University of Cambridge. Its object is to provide statistical comparisons of the national products and productivity per worker of the U.K. and the U.S.A. not only for the two economies in the aggregate but also for the various industries that contribute to total output. It attempts to measure the various industries so that they can be aggregated and made to yield estimates that will reveal the comparative industrial structure of the two countries.

The introductory chapter gives a brief outline of the procedure followed, the second is a comparative study of national products in the two countries and its composition. Chapters three and four deal with the manufacturing and non-manufacturing sectors in both the countries. A comparison of labour productivity in both countries is presented in chapter five. The last three chapters deal with some statistical and theoretical problems of international comparisons of productivity and output. In addition, there are also several appendices on technical methods and literature.

This is a painstaking and scholarly study. It is not a mere exercise in statistics but a purposeful inquiry which has yielded interesting results.

The Agricultural Register (New Series), Changes in the Economic Pattern 1956-57. Published by the Agricultural Economics Research Institute, University of Oxford. Pages: 234. Price: 21s.

Most issues of agricultural policy, as pertinently pointed out in the preface of the book by Mr. Colin Clark, Director of the A.E.R. Institute, are controversial and differing opinions may be held on them. In the book under review, however, the authors have concentrated on presenting a set of "indisputable facts," relating to the developments in the agricultural sector in the U.K. The book might well be called a compendium of developments in the British primary sector in recent years. It gives a description of the recent changes in Britain's rural economic pattern. These include the legislative measures designed to improve upon the system of annual reviews of policy by providing long-term assurances to farmers, and also the renewed emphasis laid on production grants as distinct from price subsidies—two major changes in the agricultural policy of the U.K. The book also deals with a wide range of related topics, such as marketing and prices, foreign trade, labour, land and capital and economics of agricultural production and sales in the U.K.

India—A Reference Annual 1959. Compiled by the Research and Reference Division, Ministry of Information and Broadcasting, Government of India. Published by the Director, Publications Division, Union Ministry of Information and Broadcasting, New Delhi. Pages: 562. Price: Rs. 6.50.

A reference volume, officially brought out every year since 1953, the publication under review has come to be looked upon as an authoritative source of general information on the diverse aspects of India's national life and activities. A fairly detailed account is given in this publication of land and people in India, the economic structure, planning, co-operative movement, agriculture, industries, trade, transport and communication, scientific research, etc. One chapter deals with India's role in such international organisations as the United Nations. Another chapter provides a chronological account of important events that took place in 1958. A fairly exhaustive bibliography is also included at the end of the book. A veritable mine of information on India's economic, social and political life, the book contains much useful data on a wide range of subjects of educational, cultural and scientific interest.

Business Education, A Dossier. Edited by L. R. Dasgupta. Published by Research Board, City College Commerce Department, 13, Surya Sen Street, Calcutta-12. Pages: 270.

In the context of the great strides of progress which Indian trade and industry are making there is need for a wider diffusion of commercial education. *Business Education*, as its editor, L. R. Dasgupta, Professor of Business Organisation, City College Commerce Department, Calcutta, points out, is not a complete treatise on commercial education. Even so, the book covers a wide ground. Among the articles contributed to this book, mention must be made of A. K. Sen's article on "Aims of commerce education," L. R. D. Gupta's on "Experiment in training commerce teachers," and S. R. Sen's on "Reorganisation of commerce education." There are useful appendices which deal with such subjects as the facilities for commerce education

in India, and analysis of concepts and terminology in business education. It is on the whole a readable book on the problems of commercial education which are treated against the background of the progress made in such education in Western countries.

The Cotton Industry in a World Economy. Published by the International Federation of Cotton and Allied Textile Industries, 567, Royal Exchange, Manchester 2, England. Pages: 286.

The book under review comprises papers presented by textile experts at the International Cotton Conference held under the auspices of the International Federation of Cotton and Allied Textile Industries in Italy in September 1957. Of particular interest to Indian readers is a study entitled "The scope of the cotton and allied textile industries in India," prepared by the Millowners' Association, Bombay. Among the other articles of lasting interest, mention may be made of "The cotton and allied textile industries in a world economy" and "A general survey of the cotton and textile industries of the world," contributed by the President and Vice-President, respectively, of the International Federation. The book will be of interest to students of industrial economics and business men concerned with cotton textiles.

The Twelfth Year. Published by The Director, The Publications Division, Ministry of Information and Broadcasting, Old Secretariat, Delhi-8. Pages: 352. Price: Rs. 1.50.

The book under review, succinctly outlines the important achievements attained in the economic, political and social spheres by the Central and State Governments and Union Territories. The period covered in this publication is between April 1958 and March 1959. The book has been divided into three main parts. The first part deals entirely with the activities of the Central Government. The second and third parts take stock of the developments of States and Union Territories, respectively. The publication will serve as a ready reference to developments during 1958-59 though the treatment is necessarily brief.

Britain—An Official Handbook, 1959 Edition. Prepared by the Reference Division, Central Office of Information, the Government of the U.K., London. Published by Her Majesty's Stationery Office, P. O. Box 569, London, S.E. 1. Pages: 538. Price: 10s. 6d. Cloth-bound Edition, 21s.

An established work of reference, *Britain: An Official Handbook, 1959*, seeks to give a factual account of the Government of, and the administration in, the U.K. and of the part played by the Government in the life of the community, thus presenting a continuing picture of the pattern of life in the country and a record of recent developments. The present edition, fully indexed, well illustrated by photographs, maps and diagrams and 81-page bibliography, covers events upto September 1958. This is a very valuable reference volume on Britain's social, economic and political life.

Typical Problems in Statistics. By R. S. Sabnis. Published by A. R. Sheth & Co., Princess Street, Bombay-2. Pages: 228. Price: Rs. 6.00.

The science of statistics, as is well known, cannot be mastered by a student, unless he works out a large number of examples. In the book under review, the author, R. S. Sabnis, has worked out more than 200 typical problems in statistics. He has covered all the portions which are generally included in an elementary course in statistics. Thus, examples have been provided under measures of location and of dispersion, skewness, time series, co-relation, regression, interpolation, index numbers, probability and tests of significance. Each example has been neatly worked out, so that an average student will have no difficulty in understanding the methods of working out the problems. We commend this book to all students of statistics.

Elements of Indian Income-tax. By R. N. Lakhotia. Published by Asha Publishing House, Ahmedabad-14. Pages: 160. Price: Rs. 2.80.

Although the book under review is primarily meant as a text book for B. Com. and LL. students of Indian universities, it is bound to appeal to a wider section of readers who are interested in acquiring for themselves a working knowledge of the subject. By cutting a few details, and giving greater importance to concrete examples, the author, Mr. R. N. Lakhotia, has succeeded in producing a simple and readable book on the subject of income-tax.

PROGRESS OF BOMBAY STATE ROAD TRANSPORT CORPORATION RISING TREND IN OPERATION COSTS

ESTABLISHED in December 1949 as a statutory body with the Bombay State and the Union Governments as partners, the Bombay State Road Transport Corporation has grown from strength to strength with every passing year. Indeed, it now ranks as the largest nationalised motor transport undertaking in the country. With a capital investment of over Rs. 16.71 crores and a fleet of 2,972 buses, this vast enterprise provides automobile transport for nearly 550,000 passengers a day. A large enterprise of this kind must necessarily face many and intricate problems. But it is a tribute to its management that it has striven hard, and often very successfully, to find solutions for its problems which range from unsatisfactory physical conditions of roads on which the Corporation's vehicles operate to the paucity of spare parts which they need for their being kept in a state of preparedness. In particular, the Corporation has had to face the problem of rising trend in costs of operation which has accompanied the growth of the Corporation.

Traffic

In the course of his interesting and comprehensive speech at the eleventh anniversary of the Corporation, held at Bombay on 28th October, 1959, Mr. R. G. Saraiya, Chairman, observed that the "history of the progress of this organisation is one of rapid expansion from small beginnings and of surmounting formidable difficulties, one by one, as they came up." Besides the problem of rising costs, there are three specific problems to which Mr. Saraiya drew special attention. In the first place, there is an uneven distribution of traffic. Thus, in the summer months, the traffic is at its highest and it requires an all-out effort to cope with the traffic. But in the monsoon months, there is a great fall in traffic, some roads become unmotorable. The overall fall in traffic is 25 per cent., though in some regions it is as high as 70 per cent. A large number of buses has necessarily to remain idle. Secondly, the Corporation is rapidly extending its services to rural areas where roads are particularly bad. Out of a total road mileage of 21,521 on which it operates, 1,220 miles are of cement concrete, 2,991 miles of asphalt and tar, 8,329 miles of water-bound macadam and 8,981 miles of earth roads. It has been computed that 57 per cent. of the road mileage operated by the State Transport is either *katcha* earth roads or roads the surface of which have deteriorated. Thirdly, the Corporation finds it increasingly difficult to procure spare parts, assemblies and equipment needed for the upkeep of the vehicles and workshops. But it is gratifying to note that this is not an entirely unmixed evil, for the authorities are doing their best to encourage the use of indigenous materials and have launched a drive in their workshops for retrieving some of the worn out parts. In this connection, Mr. Saraiya said: "It would be useful if I take this opportunity to impress upon the manufacturers of vehicles in India the need for standardisation of as many parts as possible, and as many assemblies as possible for the various vehicles. This will not only add to the convenience of operators but would also help in making easily available spare parts components and small assemblies and reduce the prices at which they are available." We commend this suggestion to the attention of the automobile manufacturers, in general, and of the Development Council for Automobile Industry, in particular.

Route Mileage

To turn now to developments during 1958-59. The total route mileage at the end of the year was 65,375, as against 54,481 in the previous year. This mileage is served by a fleet of 2,972 buses. The total number of schedules at the end of the year was 2,215. The Corporation carried 202,900,000 passengers, as compared with 184,400,000 passengers in the previous year; the daily average number of passengers increased from 550,000 to 556,000. In view of the bad condition of the roads on which the Corporation operates and the difficulty in procuring adequate equipment, it is hardly surprising that there has been some increase in the rate of breakdowns. Thus, during the year under review, the rate of breakdowns was 1.53 per 10,000 miles, as against 1.28 in the previous year. The rate of accident per 100,000 miles was 1.47 as compared with 1.23 in 1957-58.

It is a pity that the report and accounts for the year 1958-59 have not yet been made available to the public. It would certainly be a good practice to synchronise the publication of accounts with the Chairman's speech. But some figures relating to the working of the Corporation in 1958-59 were mentioned by the Chairman. It would appear that, during 1958-59, the Corporation's receipts aggregated Rs. 12.38 crores, as against Rs. 11.49 crores in the previous year. Working expenses increased from Rs. 8.14 crores to Rs. 9.38 crores. The increase is partly explained by the levy of tax on passenger fares with effect from 15th October 1958 (Rs. 51 lakhs) and additional benefits granted to workers involving a recurring expenditure of Rs. 25 lakhs. After making the usual provision for depreciation, sinking funds, etc. the Corporation is left with a net surplus of Rs. 76.12 lakhs (subject to taxation), the comparable figure for 1957-58 being Rs. 100.90 lakhs. It may be mentioned here that the net surplus is arrived at after payment of interest paid on capital advanced by the participating Governments. Although it is not known how much this item will absorb in 1958-59, it is known from the report and accounts for 1957-58 that it absorbed Rs. 51.6 lakhs. As at the end of that year, the Union Government and the State Government had given Rs. 8.03 crores and Rs. 4.06 crores respectively by way of capital contributions. On this basis, the return on capital contribution works out to about 4 per cent. But, it is not clear whether the Corporation would have been left with sizable net surpluses in the past if, like other corporate enterprises, it had been subject to income taxation. Nor is it clear whether the Central Government's recent decision to subject the Corporation to income-tax will have retrospective effect.

Reserves

The balance-sheet of the Corporation, as on 31st March, 1958, shows that, besides the capital contribution of Rs. 12.09 crores from the Union and the State Governments, to which reference has been made above, it had borrowings to the tune of Rs. 4.01 crores, made up of State Government loan (Rs. 32.85 lakhs), Government of India Canadian aid (Rs. 1.42 crores) and two debenture loans of the total value of Rs. 2.27 crores. It had reserves aggregating Rs. 1.88 crores and a debenture sinking fund of Rs. 80.95 lakhs. Its fixed assets aggregated Rs. 20.87 crores, as against which a depreciation fund of only Rs. 6.05 crores has been built up. The Corporation would have done well to give a separate schedule, setting forth the details of assets. No estimate has been made of the expectation of the life of the existing fleet which would give some idea of the adequacy of depreciation provisions for purposes of replacement.

In the near future, the chief problem for the authorities of the Corporation would be how best they could hold down expenditure. There are a few circumstances which indicate that operating expenses are bound to increase further in the current year (1959-60). In the first place, the Income-tax Department has held that the Corporation is liable to pay income-tax. Secondly, the Corporation paid the tax on passenger fares (imposed by the State Government) only for part of the year 1958-59, whereas the tax will apply for the whole of the current year. It has been computed that of the sum of Rs. 1 to 1.5 crores which the passenger tax may yield in a full year, the Corporation will have to bear some 40 per cent. Thirdly, the recent increase in excise duty on diesel oil and on tyres and tubes will mean an additional expenditure of about Rs. 37 lakhs annually. Fourthly, the State Government has recently converted the loans granted under the Canadian aid into redeemable preference shares; this, in effect, has meant an increase in the rate of interest from 4 to 4½ per cent. These factors will impose a further strain on the Corporation's finances. It is, therefore, of very great importance that the Corporation should not relax its efforts designed to ensure utmost economy in costs of operation and administrative expenses.

GOODS TRAFFIC SURVEY

A survey of goods traffic carried by road in the Union Territory of Delhi, conducted by the Roads Wing of the Union Ministry of Transport and Communications, suggests that there is scope for organising motor goods transport on a co-operative basis. Out of a total of 1,269 owners of

motor vehicles in the Territory, as many as 1,081 own only one vehicle each. The survey, which is a prelude to similar surveys to be conducted in the rest of the country in pursuance of a recommendation of the Inter-Departmental Study Group on Transport Planning, revealed that motor goods vehicles in Delhi remain idle for about 30 per cent. days in a year; 50 per cent. of this idleness is attributed to want of repairs. There is scope for reduction in idleness through better organisation of transport.

As regards agricultural cart, it carries about 90 maunds of goods a week; the average distance over which a maund of goods is carried is about three miles. Paddy and cattle food constitute nearly 33 per cent. of the goods lifted by rural agricultural carts, sugarcane 24.8 per cent. and cereals 18.3 per cent. These carts, it is stated, do not compete with any other form of transport.

The annual quantity of goods lifted by the average agricultural cart is about 1/40th of the average public carrier, though the extent of maund-miles performed by the village cart is nearly 1/20th of that of the public carrier. An agricultural cart has a high idle capacity. For 218 days in a year, the bullock is used for agricultural purposes. With the development of small-scale industries and all-weather rural roads, the survey finds that the huge transport potentialities of these carts could be better utilised.

Dealing with municipal carts, the report states that a good proportion of them are iron-tired and are likely to do considerable damage to the roads. If fitted with rubber tyres, they are likely to reduce maintenance charges on roads appreciably. The quantity of goods lifted by the average municipal bullock-cart is about 1/10th of that carried by the average public carrier but the maund-miles performed by the average cart are about 1/30th of that performed by the average public carrier. Municipal carts act as feeder to the railways and distribute finished products from the railways and markets to near-about localities. Strictly speaking, they do not compete with heavy motor trucks, since trucks cannot profitably be used to lift small quantities on short-distance traffic.

ALL-PURPOSE TRANSPORT PLANE

A Swiss firm manufacturing aircraft, has just presented to the public a new type of all-purpose small transport machine, the "Porter," which is admirably suited to the mountainous terrain of Switzerland and to the manifold uses to which a really rational transport plane can be put, namely, the conveyance of passengers, of sick or injured persons, of goods and also for topographical surveys in both flat and mountainous country, etc. A machine capable of carrying out such diverse tasks has got to possess a large number of various qualities and, what is more, it must be economical in use. Equipped with an engine of 275 or 340 h.p., the "Porter" has not got an aesthetic appearance; it is angular, which makes it possible for it to be built at a very moderate price, and its shell is massive, thus endowing it with a powerful capacity for transportation, whilst the doors are wide enough to allow for the loading of heavy and cumbersome goods. The wings are vast and powerful, whilst the landing gear, which is also provided with a pair of skis, is adapted to any kind of ground. This aircraft can carry six passengers, two of whom lie down, or else 940 pounds of freight, over a distance of 800 kilometres, at a cruising speed of 200 kilometres per hour. It can take-off at 220 yards or even 140 with the more powerful engine; its landing speed is 70 kilometres per hour. Moreover, its servicing costs less than that of a helicopter. The best possible reference for this new machine consists in the fact that the famous glacier pilot, H. Geiger, immediately acquired one.

IBM 1620

A small, transistorised scientific computer which was developed to meet the technological need for a compact computer with the operating capabilities of much larger systems was announced today by I.B.M. World Trade Corporation. The I.B.M. 1620, which can perform more than 100,000 calculations a minute, takes up little more space than the average desk or drafting table and is particularly adaptable to problems such as highway cut and fill and bridge design, oil pipeline transmission and product inventory, petroleum blend evaluation, lens design, and power requirements, analysis for utilities. The system operates under the direction of an internally-stored programme of instructions and can perform complex engineering and scientific computations on a continuous or production basis. With its 20,000-digit core memory, high-speed operation and advance programming systems, the new system, it is claimed, is the most powerful computer in its price class ever offered on a commercial basis.

EUROPE'S LARGEST TURBO-GENERATOR

Europe's first 200,000 kw. steam turbo-generator unit was successfully put into service by the British Central Electricity Generating Board at High Mainham Power Station. This 1,000 m.w. station, when completed, will contain five sets of 200,000 kw. generating equipment manufactured by the English Electric Company, Ltd. The new turbine and alternator are the largest of their kind manufactured by the Company.

With a running speed of 3,000 r.p.m., the 200,000 kw. steam turbine is of the horizontal three-cylinder design having a double casing impulse type high-pressure cylinder. Steam enters the turbine stop valve at 2,350 p.s.i.g., 1,050 deg. Fah.—the highest steam conditions so far attained in any British power station. The steam from high pressure turbine exhaust is taken to the reheater and then returned to the intermediate-pressure cylinder at 475 p.s.i.g. and 1,000 deg. Fah. The intermediate-pressure cylinder is combined with one section of the three-flow low-pressure cylinder and has impulse stages up to the point of exhaust to the low-pressure stages.

TRENDS IN BRITISH LIFE INSURANCE

HOME-SERVICE SCHEME GETTING INCREASINGLY POPULAR

BRITISH insurance, famed for centuries as the very hub of international business, took one more step in 1958 towards consolidating its pre-eminent position in world insurance. New ordinary life assurance business in 1958 broke all previous records. Premium income for the first time exceeded £100 million to reach £102 million for new assurances and annuities, as compared with £89 million in 1957. Aggregate net premium amounted to £459 million, as against £419 million in 1957. Ordinary life assurance accounted for £302 million of new net personal savings, which together with the £65 million contributed by industrial (home-service) assurance, resulted in new personal net savings through life insurance of £367 million in 1958.

Benefits paid to ordinary life policyholders last year included £53 million on death claims, £99 million on maturing policies and £26 million on annuities, as compared with £46 million, £96 million and £23 million, respectively, in 1957. The amount added to life and annuity funds aggregated £299 million, as against £250 million in 1957.

Benefits Paid

Home-service insurance men, calling on 10 million U.K. households, collected £177.9 million of industrial life premium, as compared with £170.4 million in the previous year. The sum assured by new industrial business reached a new record of £361.6 million. Claims on death under this category aggregated £40.2 million and claims on maturity amounted to about £49 million. The greater part of new industrial branch business written consisted of endowment assurances, reflecting the continuing public appreciation of this type of policy which combines provision for the policyholder's own future with protection for his dependents.

Commenting on this, Mr. Geoffrey Kitchen, Chairman of the Industrial Life Offices' Association, says: "This picture of continued expansion of industrial life business emphasises the practical assistance which the regular and timely visit of the insurance man gives to a wide cross-section of the nation in its efforts to provide for the future. Since the war, the resulting net saving through industrial assurance alone has added over £600 million to the pool of investment capital."

The 1958 figures are clear proof that home-service insurance continues to provide an effective and attractive channel, in many homes, the only channel, for long-term voluntary savings.

Thus, in 1958, life insurance in the U.K. continued to maintain its position as the leading source of new personal savings in the country. Life and annuity funds in the ordinary branch alone reached the record level of nearly £3,400 million, an increase of £300 million as compared with 1957. This is a reflection of the awareness of the public that life assurance provides family security combined with a convenient form of regular savings.

Comparison with America

Although these figures are satisfactory in themselves, they indicate that there is still considerable scope for further expansion. A comparison with the U.S. and Canada shows that the average family in those countries enjoys a much greater degree of insurance protection than the average family in Britain. Premium income in Britain, expressed as a percentage of the national income, is roughly equivalent to the American level, yet, at the same time, a comparison based on the average of sums assured shows that they are twice as large in America as they are in Britain.

One reason for this, according to Mr. J. B. H. Pegler, Chairman of the British Life Offices' Association, is the people's preference for the endowment policy. Over 75 per cent. of new ordinary life assurance policies in Britain are in this form. As a result, a larger proportion of premiums in Britain represents saving for old age than in America where whole life assurance is more popular.

Another interesting trend in life assurance in Britain is that a large part of the new business transacted in 1958 was in occupational pension schemes. These schemes, together with the special contracts for the self-employed under the

provisions of the Finance Act, 1956, have continued to provide a growing proportion (47 per cent.) of all new premium income.

The increase in total invested funds during the year under review, once again, emphasised the important part the life offices play in providing capital for industry and thus aiding economic progress. By their investments, insurance companies are providing an ever-growing flow of new capital for developments all over the world. They finance British and Commonwealth Government projects and a variety of private enterprise schemes and, indeed, they have become the main source of long-term capital in the City. Invested assets of the member companies of the British Insurance Association aggregated £5,500 million at the end of 1958 of which the bulk, namely, £4,500 million, represented life funds made up largely of the savings of millions of policyholders which the insurance companies hold as trustees until the policy matures.

Investments

A substantial proportion of investments of the life offices are in Government and other fixed interest securities but an increasing share has been finding its way of late into equities. Investments at the end of 1958 in ordinary stocks and shares of both ordinary and industrial life funds aggregated £860 million, as compared with £500 million in 1954. There was a net addition during last year alone of £120 million in equity holdings. By the end of 1958, the combined total of debentures, preference shares and ordinary shares amounted to some 40 per cent. of the total invested life funds of over £4,500 (ordinary and industrial combined). The following table indicates the percentage of life funds (both ordinary and industrial) going to the different classes of investments.

Types of Investment	1958	1957
Mortgages	15.5	15.5
Government and Municipal Securities	26.5	28.0
Debentures, Loans, preference and Gilts	21.0	22.0
Ordinary stocks and shares	19.0	17.5
Real property, ground rents, others	18.0	17.0

This enlarged flow into ordinary shares obviously stems from a definite change in the investment policy of many offices. Whatever may be the fluctuations in economic conditions, a well-diversified portfolio of ordinary shares will, it is now recognised, produce an average return significantly higher than that obtainable from fixed-interest investments. Further, in a continuously expanding economy subject to pressures of creeping inflation, the advantages of ordinary shares as an investment and a hedge against inflation may prove substantial indeed.

EXPORT CREDIT GUARANTEE IN BRITAIN

Business declared under the British Export Credit Guarantee Department's commercial insurance facilities during the third quarter of 1959 was

a record for that quarter, although it was slightly below the all-time record of the previous three months. Declarations for the third quarter, at £153.5 million, were 8.6 per cent. higher than those during the corresponding period last year when £141.3 million were declared as shipped. This compared with the record £155.2 million for the second quarter of 1959.

Contracts for an oil refinery plant, a steel works plant, refrigeration plant and for steam turbo sets were included in new medium-term policies which aggregated £17.8 million during the third quarter, as against £34 million in the previous quarter and £26.9 million in July-September 1958.

The face value of short-term policies current remained virtually unchanged at £631.2 million, although the number of short-term policies increased from 4,669 to a new record figure of 4,743.

Among the new short-term policies issued from July to September were three valued at over £1 million each. They were offset, however, by some reductions in face value on renewal of several other large policies. Claims aggregating £1.8 million under "commercial" policies were paid during the quarter.

MOTOR ACCIDENTS CLAIMS TRIBUNAL

The Government of Bombay has constituted, as an experimental measure, a Motor Accidents Claims Tribunal, with jurisdiction over the area comprised within the limits of the Municipal Corporation of Greater Bombay for the purpose of adjudicating upon claims for compensation in respect of accidents involving death of, or bodily injury to, persons arising out of the use of the motor vehicles in that area.

The Tribunal, which consists of Mr. T. P. Ghogale, Judge, City Civil Court, Bombay, will consider claims for compensation in respect of accidents occurring within the Municipal Corporation limits of Greater Bombay.

With the establishment of the Tribunal from 1st December 1959, the civil courts in Greater Bombay will, in view of the provisions of Section 110F of the Motor Vehicles Act, 1939, be barred from entertaining any claim for compensation except in respect of claims, cognizance of which has already been taken by these courts.

An application for compensation has to be made to the Tribunal within sixty days of the occurrence of the accident by the person sustaining the injury or by the legal representatives of the deceased where death has resulted from the accident or by any agent duly authorised by the person injured or the legal representatives of the deceased, as the case may be.

EXPORT RISKS: A CORRECTION

Some inaccuracies have crept into our article on export risks insurance which appeared in Commerce, 24th October 1959. The Export Risks Insurance Corporation was established on 30th July 1957 and not 4th October as was stated therein. In the second year of its working, that is, the twelve-month period ended 30th September 1959, the Corporation issued 222 policies with a maximum liability of Rs. 6.49 crores, as compared with 146 policies with a maximum liability of Rs. 7.50 crores (and not Rs. 1.30 crores, as is wrongly stated in the article) in the previous year.

In regard to jute goods, which are shipped mostly on D.P. (Document against Payment) terms, the risks involved are mostly political risks. Therefore, where the exporters so desire the Corporation has agreed to cover only political risks. This concession is available to exporters of other traditional goods as well.

At the time of writing the article, the amount of claims settlement was not available. Figures made available subsequently show that the Corporation has so far received four claims amounting to Rs. 34,431.45. Three claims of the total value of the fourth claim, which is for Rs. 40,000, is awaiting the receipt of completed papers and the finalisation of other formalities.

ORIENT EXPRESS TRAVEL SERVICE

Through its 3 offices in India and 350 correspondents in all principal cities throughout the world, Orient Express Travel Service places at the disposal of its clients a complete Travel Service.

WORKING TOGETHER to help build Durgapur for India

A PARTNERSHIP of Indian and British skills is building a great new steelworks where sparse jungle lay at Durgapur. It is a project that will produce more than a million tons of steel for the nation every year.

Helping to build this giant of concrete and steel are the men of CEMENTATION-PATEL—13,500 Indian and 75 British engineers, technicians and workers. Together they have laid the foundations

for most of this project's buildings and plant. Together they are building one hundred and forty miles of roads, railways and pipelines.

CEMENTATION-PATEL, the project's civil engineers, were first to arrive at Durgapur. In three years, they have moved enough earth and used enough concrete to raise a small city—three years that crown THE CEMENTATION COMPANY'S 30 years of service in India.

INDO-GERMAN TRADE HEAVY IMBALANCE—RESULTS OF LALL MISSION

THE bonds of co-operation between India and West Germany in the economic and commercial fields have of late been steadily strengthening to the mutual benefit of both the countries. W. Germany has been helping the economic development of this country. The Rourkela steel plant is only an instance in point. The other projects undertaken in collaboration with W. Germany include the manufacture of Mercedes-Benz trucks by T.E.L.Co. at Jamshedpur, the production of automobile components in partnership with the Bosch and schemes for producing chemicals, cables, sugar machinery and textile machinery. It is, therefore, natural that India's imports from W. Germany, consisting mainly of capital goods and industrial raw materials, have gone up rapidly during the last six years. India's imports of W. German goods rose every year successively from no more than Rs. 25 crores in 1952 to Rs. 123 crores in 1957. As a result of subsequent restrictions imposed by India to tide over foreign exchange difficulties, these imports fell to Rs. 93 crores in 1958. During the seven months ended July 1959, the imports from W. Germany, however, recovered to over Rs. 72 crores, or a record annual rate of Rs. 124 crores. In contrast to this trend, exports from India to W. Germany have failed to keep pace with imports. In 1958, India's exports to W. Germany were about Rs. 15 crores, or about one-sixth of its imports from that country, as against Rs. 13 crores in 1952, or about 50 per cent. of imports. Consequently, India continues to have an adverse balance of trade with W. Germany, which has rapidly widened from Rs. 12 crores in 1952 to Rs. 107 crores in 1957. It was, however, lower at Rs. 79 crores in 1958; but is likely to touch the 1957 level once again during the current year.

To take an overall picture, India is West Germany's most important buyer, second only to the U.S., while India occupies the eighteenth place among the countries from which W. Germany buys. Again, among the countries exporting to India, West Germany has come to

hold the third place, after the U.K. and the U.S.

The following table shows India's exports to and imports from West Germany during the period 1952 to 1959:

(Value—Rs. lakhs)			
Year	Imports	Exports	Balance of trade
1952	25.15	12.54	— 12.61
1953	29.54	10.46	— 19.08
1954	38.60	14.75	— 23.85
1955	53.06	15.79	— 37.27
1956	81.54	14.54	— 67.00
1957	122.82	16.22	— 106.60
1958	93.95	14.82	— 79.13
1959 (January to July)	72.37	10.11	— 62.26

The main reasons for the large adverse balance of trade with W. Germany were explained by Mr. Satish Chandra, Union Deputy Minister for Commerce, at the third annual meeting of the Indo-German Chamber of Commerce held at Bombay on the 6th inst. India's need for industrial goods, such as plant and machinery, iron and steel, non-ferrous metals, basic chemicals, etc., he said, had been increasing fast. And the post-war economic recovery in W. Germany had made it possible to cater to these requirements. India mainly supplied primary commodities or secondary goods which did not occupy a particularly high place in the import bill of W. Germany. Besides, sufficient contacts between the trading interests in the two countries had not yet been made. Further, quantitative restrictions imposed by W. Germany on the commodities, particularly cotton textiles, jute and coir goods, from India stood in the way of boosting India's exports to that country.

Of late, the Government of India has been trying hard to step up India's exports to W. Germany with a view to reducing the gap. A Trade Centre has also been set up at Frankfurt with the object of studying the specific requirements of the German market and to foster closer contacts between the industrial and commercial organisations in the two countries. Indian exporters have also been encouraged to participate in trade fairs in W. Germany.

An official delegation, led by Mr. K. B. Lall, which visited W. Germany during its tour of Western Europe last month, held some useful discussions with the Government as well as industrial and trade interests there. Giving an account of the progress made by the Lall Mission, Mr. Satish Chandra disclosed that the W. German Government had recognised the need for correcting the imbalance by a better utilisation of the opportunities offered by the German market and affirmed its determination to improve the two-way trade. Some of the specific understandings reached by the Lall Mission, as described by the Deputy Minister, are as follows:

"The W. German Government has agreed that, pending final decision in respect of the programme for liberalisation of trade, facilities will be afforded for the import of specified goods from India. Import of goods other than those specifically agreed upon will be considered by W. Germany with the object of testing the German market. Indian and W. German trading organisations, industrial enterprises and banking institutions will work out mutually beneficial arrangements. Possibilities for setting up projects for more efficient utilisation of the resources available in India, with a view to augmenting Indian export surpluses and sales to W. Germany will be examined. Projects for collaboration between Indian processing industries and W. German finishing industries for extraction and processing of raw materials in India for sale to W. German industry will be considered. The possibilities of collaboration between the Indian mining, ore processing, textiles and tanning industries and the German manufacturers of the corresponding products will be explored. The scope of technical co-operation already existing between the two countries is to be widened. W. Germany will be prepared to assist Indian export promotion organisations by providing technical advice on market intelligence with the aid of German Technical Assistance Funds. The exchange of visits by Indian and German experts and collaboration in industrial undertakings producing goods in India for the export market will be facilitated. In order to manufacture Indian products to suit the tastes of German people, the Federal Republic will promote contacts with best German designers, stylists and fashion experts. Facilities will also be provided for the training of Indian executives in business administration and relative fields of activity."

"A commission consisting of the representatives of the two Governments will endeavour to take such steps as may be necessary and possible to expand trade between the two countries and facilitate the development of fruitful co-operation (Continued on page 827)

SHAKESPEARE IN MADRAS

... There was a marvellous and grand dramatic performance of "Merchant of Venice" which was celebrated by the members of the Triplicane Hindu Literary Society on the night of Sunday, the 29th September 1878... the place was over-crowded by very many audience... at every fall of the curtain the applause was great..."

The year 1878 also threw the limelight on another notable introduction—The "Three Castles" cigarettes.

In 1958, they came out in the flip-top 20's packet, changing their looks with the times. The "Three Castles" are as modern today as they were 80 years ago—and as satisfying.

BIRD-HEILGERS JUTE COMPANIES SHOW IMPROVED RESULTS

OUTLOOK FOR CURRENT YEAR GOOD

THE financial results of jute companies for the year ended 31st March 1959 published so far indicate that they all had a satisfactory year of training, despite the depression in prices of gunnies and accumulation of stocks, particularly those of sackings due to lower offtake from overseas in the closing months of 1959. Many of the mills were able to earn better profits than in the previous year, as simultaneous business in raw jute and manufactured goods proved to be profitable, thanks to the bumper jute crop. The fall in offtake from overseas countries, which was only due to delayed purchases in anticipation of a decline in prices, was almost offset by the expansion in internal consumption. The corrective measures taken by the I.J.M.A. early in 1959, namely, the withdrawal of minimum prices and the sealing of a part of the looms, went a long way towards improving the position and foreign buyers also stepped into the market to buy as much as possible before prices shot up.

A typical instance of the better performance during the year under review is provided by the Bird-Heilgers group of companies. All of them have earned sizable profits which are either markedly higher than those for the previous year, except in the case of the Union Jute, or in refreshing contrast to the losses suffered in 1957-58. Three of them—Auckland, Kinnison and Union—have stepped up the dividend. Another two, namely, Lawrence and Northbrook, have returned to the dividend list after a break of two or three years. Yet another two, Dalhousie and Lansdowne, have been able to reduce their accumulated losses and pay a part of the arrears of preference dividends. Almost all of them have reduced their drawings from the past reserves; in fact, a few of them like Auckland, Kinnison, Lawrence, Northbrook and Union have even ploughed back sizable sums to the various reserves. In the case of the Union Jute, however, the gross and net profits are lower than those for the previous year, but it has stepped up the dividend, as will be seen from the following comparative table:

	(Amount in lakhs of Rs.)					
	Gross profit (+) or loss (-)	Net profit (+) or loss (-)	Ord. Div.			
	1958-59	1957-58	1958-59	1957-58	1958-59	1957-58
Auckland	+24.23	+15.73	+14.63	+ 6.87	20%	5%
Dalhousie	+13.99	+ 7.75	+ 7.46	8.40		
Kinnison	+59.19	+10.75	+ 9.94	0.30	10%	6%
Lansdowne	+ 7.27	+ 5.10	+ 1.85	0.75		
Lawrence	+19.20	+ 6.50	+13.90	8.82	25%	
Northbrook	+15.56	+ 8.45	+ 8.44	2.58	13%	
Union	+26.08	+35.41	+15.35	+20.53	20%	15%

The Auckland Jute had entered into an agreement with the Lawrence Jute for the utilisation of the loom-hours of the latter. This agreement pertained to 317 looms up to 28th February 1959 and 309 looms thereafter following the sealing of 1½ per cent. of the looms on 2nd March. This agreement is reported to be working smoothly for the benefit of both the Companies. The demand for the Company's carpet backing cloth is said to have improved markedly and, in order to meet this demand, the Company's wide looms operated on triple shift.

The Lawrence Jute Mill was closed in May 1958, because of the uneconomic working of the mill and the persistent labour trouble. Since then, the work of scrapping the old machinery has been completed and arrangements have been entered into with the Government of India, Ministry of Food, to lease the main mill buildings and certain godowns for storage of foodgrains. It also entered into an agreement with the Lansdowne Jute Company, Ltd. for the manufacture of the Company's goods. Thus, the Company derives its income from the sale of loom-hours, hire of machinery and the lease of its premises and this, in fact, proved to be more profitable during the year under review, as is borne out by the table above. The Directors are confident that, with these arrangements, the Company would continue to operate at a regular monthly profit.

The Dalhousie Jute has been operating as a 100 per cent. hessian unit by purchase of loom-hours, with a view to increasing production to an economic level. This arrangement has proved to be satisfactory and has resulted in a considerable reduction in cost.

Under a scheme of arrangement approved by the High Court, the Kinnison Jute Mills Company, Ltd., purchased, on 30th March 1959, the shares of the Standard Jute Company Ltd. (under the same management) and allotted 12,098 ordinary shares to the shareholders of the Standard Jute in the ratio of one ordinary share of Kinnison of Rs. 100 each for every two ordinary shares of Rs. 70 each of the Standard Jute. Thus, the Standard Jute has become a wholly-owned subsidiary of Kinnison. The final dividend of Rs. 5 per share recommended by Kinnison for the year under review is on the increased capital raised by the issue of new shares to the shareholders of Standard Jute. The Company's results would have been far more encouraging but for the none too satisfactory labour situation throughout the year under review. It was only towards the end of August this year that the situation showed signs of reverting to normalcy.

The Lansdowne Jute entered into an agreement with the Lawrence Jute for the purchase of loom-hours of the latter, on similar terms as those of Auckland mentioned above, and this proved beneficial to both the Companies.

The Northbrook Jute introduced a reorganisation scheme in May 1958, under which the mill became an entirely sacking plus speciality fabric unit. This change in the line of production necessitated working the factory 96 hours per week with a reduced loom complement and proved beneficial, inasmuch as a considerable reduction in costs has been achieved. There was a marked improvement in demand for the Company's carpet backing and in order to meet this demand the wide looms of this Company also operated on triple shift.

The outlook for the current year is encouraging, with despatches from mills on a higher scale than in the previous year both for exports and internal consumption. The unexpected entry of China into the market for heavy goods, coupled with a fair business in cornsacks from Australia, had brought about a tightness for goods for delivery up to the end of September 1959. In order to ease the situation, the I.J.M.A. unsealed 2½ per cent. of the looms with effect from 24th August 1959, on top of the release, on 22nd June, of 1½ per cent. of the looms sealed earlier in February. The confidence of investors in the prospects for the industry is reflected in the rise in value of jute shares in recent weeks, as is borne out by the jump in the Reserve Bank of India index number of security prices for jute textiles (base 1952-53=100) from 96.8 in the final week of October 1959 to 99.7 for the week ended 31st October 1959. A year ago, it had stood at 87.5.

(Concluded from next column)

The following comparative table shows the progress of the Company in recent years:

	(In lakhs of rupees)			
	For the year ended 30th April			
	1959	1958	1957	1956
Sale proceeds	180.52	125.58	109.95	58.76
Closing stocks of finished goods and work-in-progress	45.08	37.53	41.87	27.30
Trade debt	31.98	25.52	17.87	10.89
Manufacturing and other expenses	95.39	92.41	78.27	37.89
Gross profit	19.05	16.45	19.57	11.43
Gross profit—Commission	1.04	1.95	1.67	0.77
Provision for depreciation	3.05	2.96	2.78	2.64
Taxation	2.86	7.72	2.85	6.80
Net profit	6.08	15.15	15.27	6.02
To reserves and provisions	2.91	2.10	8.20	3.36
Dividend	1.22			
5% preference	0.781	0.75	0.75	0.75
Ordinary	(7.51)	(10%)	(10%)	(10%)
Carry forward	1.07	1.07	0.77	0.45
Cane crushed (in tons)	139,210	100,844	134,387	87,323
Sugar produced (in tons)	11,057	8,825	11,908	7,981
Sugar recovery	8.50%	8.51%	8.50%	9.07%

† After deduction of tax.

The Rs. 10 fully paid-up shares of the Company were last quoted at Rs. 12.40 cum-div. On an ex-div. basis and at the current rate of dividend, the yield on them works out to 6 per cent. per annum, free of tax. As for the outlook, readers' attention is invited to the Chairman's speech published on page 814 of this issue.

TRAVANCORE SUGARS CUTS DIVIDEND

MARKED FALL IN EARNINGS

FOR the second year in succession, there has been a setback in the financial results of the Travancore Sugars and Chemicals Ltd. (Managing Agents: Parry & Co., Ltd., Tiruvalla, Kerala State). What is more, it is more pronounced in the latest year under review (the one ended 30th April 1959) than in the previous year. Thus, the gross profit, which had dropped from Rs. 19.57 lakhs (in 1956-57) to Rs. 18.48 lakhs in 1957-58, has further declined to Rs. 13.05 lakhs in 1958-59. This steep fall in earnings has occurred under circumstances beyond the control of the management. While the manufacture and sale of molasses, spirit, foreign liquor and pharmaceuticals have been maintained generally at the previous year's levels, "it was the manufacture and sale of sugar," the Directors say, "that has accounted almost entirely for the drop in profit compared to the previous year."

Even in the case of sugar, it is noted, the quantity of cane crushed and sugar produced recorded a distinct improvement and this, in fact, contributed to a reduction in manufacturing charges per ton. The Directors' explanation of the two circumstances which have accounted for the disappointing performance of the year, makes rather disquieting reading. Thus, they say:

"First, the year under review had to bear the full incidence of increases in excise duty that were introduced during the course of the previous year, and the additional cost to the Company occasioned thereby was not fully reflected in the selling price. Secondly, the Government of Kerala insisted on the Company making a gratuitous additional payment, during the year under review, for cane purchased and crushed in the previous year, although all such cane had been fully paid for at the rates previously agreed between the Company and the growers, which rates afforded a premium for good quality cane, and although the average of such payments exceeded the minimum price laid down by the Government of India, this, in spite of the fact that the average recovery of sugar from cane grown in the Company's area is lower than the all-India average recovery, your Directors could see no justification whatsoever for the making of this additional gratuitous payment, but the pressure brought to bear by the Government was such that it was impossible to withhold it."

The net profit is, however, only a shade lower at Rs. 6.08 lakhs, as compared with that of Rs. 6.15 lakhs for 1957-58. The relatively smaller decline in net profit is due to the lower rate of tax under the Finance Act 1959 and the provision of part of it from the taxation equalisation account. In the absence of any announcement as to the rates of income-tax and super tax applicable to companies for the assessment year 1960-61 (which apply to the Company's profits for the year ended 30th April 1959), the Directors have calculated the provision for taxation in respect of the year under review at 45 per cent. as provided under the latest Finance Act for the purpose of advance payments of tax. At this rate the tax liability works out to Rs. 4.55 lakhs and, with the adjustments relating to previous years, it comes to Rs. 5.25 lakhs, of which a sum of Rs. 2.40 lakhs has been drawn from the tax equalisation reserve. This transfer has been done "to compensate income-tax depreciation being lower than book depreciation (Rs. 1 lakh) and in respect of re-calculating the balance of the reserve required at 45 per cent. instead of 51.5 per cent. (Rs. 1.40 lakhs)."

After adding Rs. 16,000 to the capital reserve and Rs. 50,000 to the general reserve as in the previous year, and making a provision of Rs. 1.35 lakhs (as against Rs. 1.44 lakhs) for current repairs, the Directors have recommended a gross dividend of 10 per cent. which is the same as that paid for the previous three years, but, unlike in the previous years, it is subject to deduction of tax at source at the rate of 30 per cent. This works out to a net tax-free distribution of 7 per cent. per annum. The 5 per cent. preference dividend is also subject to tax, but in order to make the distribution free of tax in the hands of the shareholders, the Company has borne this burden.

The Company's financial position is quite satisfactory. The paid-up capital of Rs. 45 lakhs is supplemented by reserves and surplus amounting to Rs. 21.74 lakhs. The gross block of the value of Rs. 67.37 lakhs has been well assets, at Rs. 74.30 lakhs, exceed the current liabilities and provisions (Rs. 44.44 lakhs) by Rs. 29.86 lakhs.

(Continued in previous column)

D.C.M. FARES WELL

NET RETURN TO SHAREHOLDERS IS, HOWEVER, LOWER

A MARKED improvement in financial results is disclosed by the accounts of the Delhi Cloth and General Mills Company, Ltd. (Managing Agents: Messrs. Bharat Ram Charat Ram & Co., Private Ltd., New Delhi) for the year ended 30th June, 1959. The gross profit, for instance, shows a rise of Rs. 23.15 lakhs over the year, that is from Rs. 227.39 lakhs (in 1957-58) to Rs. 250.54 lakhs. The net profit, however, is lower by Rs. 7.10 lakhs at Rs. 61.85 lakhs, as a result of the substantial increase in the provision for taxation from Rs. 56.92 lakhs to Rs. 105 lakhs, of which that on Pakistan's account has been raised from Rs. 16 lakhs to Rs. 50 lakhs (including arrears to the extent of Rs. 10 lakhs). This is on account of Pakistan's withdrawal of the rebate granted earlier this year and the consequent increase in taxable income. This, the Directors say, would offset the expected tax refunds, following the successful appeals made by the Company over the income-tax assessments in Pakistan. While the withdrawal of the rebate will be contested by the Company, the Directors have thought fit for the time being to make provision for this liability.

The provision for depreciation has been reduced from Rs. 88.91 lakhs to Rs. 65.53 lakhs. It may be noted, in this connection, that the depreciation in respect of 1957-58 had been calculated in the expectation that additional depreciation allowance would not be discontinued. This hope, however, did not materialise. The excess provision of Rs. 30.03 lakhs has accordingly now been written back. This has been utilised to provide Rs. 10 lakhs towards taxation, Rs. 1.90 lakhs towards managing agents' remuneration and add Rs. 18.13 lakhs to the general reserve. In addition, from the year's profit, a sum of Rs. 11 lakhs has been transferred to the development rebate reserve, which had received Rs. 16.10 lakhs a year before, Rs. 10 lakhs (as against nil) to the debenture redemption reserve and Rs. 16 lakhs to the development reserve (Rs. 20 lakhs). The distribution to ordinary shareholders has been raised from 8 per cent. per annum paid for each of the previous two years to 10 per cent. per annum, thus restoring it to the level for 1955-56. But the proposed distribution for 1958-59 is subject to deduction of tax at the flat rate of 30 per cent., so that the net return to shareholders is actually less at 7 per cent. per annum. In order to maintain the tax-free return on the preference shares, the Directors have utilised a large sum from the profit, as will be seen from the following comparative table:

	(In lakhs of rupees)			
	For the year ended 30th June			
	1959	1958	1957	1956
Sale proceeds	80,08.00	59,41.80	27,94.38	29,61.13
Other income	16.90	15.08	11.90	12.84
Closing stocks of finished goods and work-in-progress	3,91.04	4,68.05	4,84.43	4,64.06
Trade debt	15,94.72	14,69.70	14,57.43	11,64.94
Raw materials consumed	5,85.94	2,78.42	3,11.46	1,70.28
Excise duty, cane tax, etc.	10,81.89	9,70.63	10.58	5,04.85
Other expenses	2,50.54	2,27.39	2,27.00	2,58.28
Gross profit	18.15	12.61	11.62	15.84
Managing Agents' remuneration	68.89	97.18	78.67	78.67
Provision for depreciation	1,00.00	56.08	60.68	62.70
Taxation	61.85	55.95	57.68	94.57
Net profit	30.08	66.10		57.30
Income tax deduction provided	55.15			
To reserves and provisions	0.50		6.00	
Dividend	4.27	2.99	2.99	2.99
5% preference	25.54	27.15	27.15	35.34
Ordinary	0.85	(6%)	(6%)	(10%)
Carried forward	0.85	0.81	0.76	1.36

The aforesaid improvement in results is due to the satisfactory performance of the Company's three sections. The textile units in both India and Pakistan did well during the year, despite the difficult trading conditions. In order, however, to maintain its competitive capacity, the Company will, according to the Directors, have to make large-scale renovations and modernisation of plant during the next few years. In the sugar section, while prices continued to be controlled at the factory level, the supply of cane was affected, as in the previous year, "due to the Government's discriminatory tax and price policy in favour of khandsari and gur." "This situation," the Directors warn, "will persist to the detriment of white sugar industry, so long as no effective change is made in that policy." Programmes of modernisation and expansion are being steadily followed. The chemical section maintained steady progress during the year. The new high pressure water tube boilers and the new superphosphate plant have gone into production. Further plans for increasing production and plant capacity for

other products are under consideration. The *vanaspati* unit worked satisfactorily during the year.

The Company's paid-up capital is unchanged at Rs. 4.11 crores, which is supplemented by reserves and surplus aggregating Rs. 4.12 crores. In addition to the 5½ per cent. (1962-66) mortgage debenture loan of Rs. 1 crore, the borrowings aggregate Rs. 6.12 crores. The other current liabilities and provisions amount to Rs. 3.02 crores. The capital expenditure during the year was of the order of Rs. 73.28 lakhs. This was on top of Rs. 111.48 lakhs spent in the previous year, bringing the gross value of the block account to Rs. 13.51 crores. The book value of the same is Rs. 5.70 crores. The current assets amount to Rs. 12.69 crores, which exceed the borrowings, current liabilities and provisions by Rs. 3.55 crores.

The Rs. 25 fully paid-up shares of the Company are being currently quoted at Rs. 35.31 ex-div., at which rate and on the basis of the latest dividend, they offer a yield of 7 per cent. per annum, subject to deduction of tax, which is equivalent to a tax-free return of 4.95 per cent. per annum.

THE TRAVANCORE SUGARS AND CHEMICALS LTD.

(Concluded from page 814)

a ten per cent. dividend, subject to tax, is the best that can be managed this year.

"May I take this opportunity of thanking the management and staff for their co-operation and hard work during the year under review?"

The report and accounts for the year ended 30th April 1959 were unanimously adopted and dividends for the year ended 30th April 1959 were declared, payable on 4th November 1959, at the rate of 5 per cent., free of income-tax, computed in accordance with Section 18(3)(E) of the Income-tax Act on the preference share capital and at the rate of 10 per cent. (gross) subject to deduction of tax at the rates prescribed in Part III of the First Schedule to the Finance Act, 1959 on the ordinary share capital.

The retiring Directors, Mr. P. Hadfield and Mr. K. A. Sivasankaran, were re-elected and the retiring Auditors of the Company, Messrs. Lovelock and Lewes, were re-appointed on the same remuneration as for the previous year.

N.B.—This does not purport to be a report of the proceedings of the general meeting.

COMMERCE AND INDUSTRY

(Concluded from page 824)

between trade and industrial organisations on either side. The quotas for the import of Indian cotton textiles, staple fibre fabrics, sewing machines, coil manufactures, vegetable oils, hand-loom and handicraft articles will be discussed in the first meeting of the Commission."

The Lall Mission's discussion with W. German industrial interests brought out the need for ensuring better contacts between exporters in both the countries as well as a greater degree of industrial collaboration to improve the quality of Indian products to find a ready market in that country. It was found that it would be possible for W. German industry to utilise Indian products, such as grey cloth for further processing and final finishing in their country for purposes of internal consumption and re-export to other countries. The question of importing semi-industrial products from India for further processing and re-export back to India was also considered. In order to take necessary steps for arbitration and also to exchange requisite commercial information, it was suggested that the Federation of Indian Chambers of Commerce and Industry and the Central German Chambers of Industry and Commerce should co-operate by entering into a service agreement.

The Indo-German Chamber of Commerce has a distinct role to play in promoting trade and goodwill between the two countries. The Chamber, through its central office in Bombay and its offices in Delhi, Calcutta and also in Frankfurt, has already been doing commendable work in this direction. This is clear from the brief annual report of the Chamber for 1958-59. Mr. Satis Chandra's reference to this subject in his speech showed that the Government of India recognised the useful part played by the Chamber and expected it to do a lot more work for the promotion of Indo-German Chamber of Commerce. This the Chamber can certainly do, provided it has sufficient financial resources. A spokesman of the Chamber suggested that the

COMPANY MEETINGS AND DIVIDENDS

BARNAGORE JUTE FACTORY CO., LTD. Annual General Meeting, London, E.C.3, 17th November 1959. Dividend: 10 per cent. or 10s. per share (less U.K. income-tax of 7s. 9d. per £ sterling). Transfer books remain closed from 4th to 17th November 1959, both days inclusive.

BLUE MOUNTAIN ESTATES LTD. Annual General Meeting, Madras, 15th December 1959. Dividend: 12½ per cent. (taxable), payable on 16th December 1959. Transfer books will remain closed from 1st to 15th December 1959, both days inclusive.

WATERFALL ESTATES LTD. Annual General Meeting, Madras, 15th December 1959. Dividend: 12½ per cent. (taxable), payable on 16th December 1959. Transfer books will remain closed from 24th November to 15th December 1959, both days inclusive.

ARMEDABAD ADVANCE MILLS LTD. Annual General Meeting, Bombay, 16th December 1959. Dividend: Rs. 4.90 per ordinary share, payable on and after 17th December 1959. Transfer books remain closed from 2nd to 30th November 1959, both days inclusive.

Government should help the Chamber in this respect in the same way as the W. German Government has done. It is, however, not clear how the Government could provide financial assistance to a chamber of commerce which is purely an association of business men.

THE AHMEDABAD ADVANCE MILLS LIMITED**NOTICE**

THE FIFTY-SEVENTH ANNUAL GENERAL Meeting of THE AHMEDABAD ADVANCE MILLS, LIMITED, will be held at the Registered Office of the Company, Bombay House, Bruce Street, Fort, Bombay, on Wednesday, the 16th December, 1959, at 4-30 p.m. (S.T.), to transact the following business:—

1. To adopt the Directors' Report and the audited Profit and Loss Account of the Company for the year ended 30th June, 1959, and the audited Balance Sheet as at 30th June, 1959.
2. To declare dividends on Preference and Ordinary shares.

3. To appoint a Director in place of Mr. T. V. Baddeley, C.B.E., who retires by rotation and is eligible for reappointment, and to consider and, if thought fit, to pass the following resolution as a special resolution of which a special notice, as required by Sections 190, 261 and 281 of the Companies Act, 1956, has been received by the Company:—

"RESOLVED, pursuant to the provisions of Sections 261 and 281 and other applicable provisions (if any) of the Companies Act, 1956, that Mr. T. V. Baddeley, C.B.E., a Director of the Company, who retires by rotation and who is also a Director, member, officer and associate of Tata Industries Private Ltd., the Managing Agents of the Company (which Managing Agents are authorised by the Articles of Association and the Managing Agency Agreement to appoint two Directors to the Board), and who has attained the age of 70 years, be and is hereby reappointed a Director of the Company, and it is hereby specifically declared that the age limit for Directors prescribed by section 280 of the said Act shall not apply to him."

The reasons which make this special resolution necessary are that the Managing Agents of the Company are authorised by the Articles of Association of the Company and the Managing Agency Agreement to appoint two Directors to the Board, and as Mr. Baddeley is a Director, member, officer and associate of the Managing Agents and has also attained the age of 70 years, his appointment can only be made by a special resolution of which a special notice has been received by the Company.

4. To appoint a Director in place of Mr. Jal H. Mehta, who retires by rotation and is eligible for reappointment.
5. To appoint Auditors for the current year and to fix their remuneration.

Notes:—(a) The relative Explanatory Statement, pursuant to section 173 of the Companies Act, 1956, in respect of the special business under item No. 3 set out above, is being posted to all Shareholders.

(b) A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

(c) The Transfer Books of the Company will remain closed from Monday, the 2nd November, 1959, to Monday, the 30th November, 1959, both days inclusive.

(d) If dividends on shares, as recommended by the Directors, are passed at the meeting, payment will be made on and after Thursday, the 17th December, 1959, to those members whose names are on the Register of the Company on the 30th November, 1959.

By Order of the Board of Directors,
TATA INDUSTRIES PRIVATE LIMITED,
Managing Agents,
D. R. D. TATA,
Director

PROSPECTS AND OBJECTS OF THE COMPANY

The Company has been promoted with the object of acquiring fixed assets, lands, buildings, railway siding, machinery, furniture, fixtures, stores and stocks of raw and finished materials, rights, privileges, quota rights, etc., appertaining to the business of steel re-rollers and manufacturers now carried on in their Khardah Works by Messrs. Bhartia Electric Steel Company, Ltd.

As is well known, Bhartia Electric Steel Company, Ltd., is the owner of two Engineering factories, one situate at Ballygunge and the other at Khardah, both in the District of 24-Parganas near Calcutta in the State of West Bengal. The factory at Ballygunge produces steel castings and ingots and the factory at Khardah is a Rolling Mill. The Khardah factory started operation in April, 1955. Both the units are more or less independent of each other. The Khardah factory is situate on land comprising about 24 acres with permanent rights. By a scheme of arrangement sanctioned by the Calcutta High Court on 11th August 1955 the fixed and other assets of Bhartia Electric Steel Company, Ltd., appertaining to and/or located at its Khardah factory, including land, buildings, machinery, furniture and fixtures together with the railway siding, etc., stocks of stores, raw materials and finished or semi-finished goods situated at Khardah and all other rights, privileges, including quota rights and benefits of existing contracts and pro-

perties whatsoever of the Company situated in or appertaining to Khardah Works and the tenancy rights in respect of the Head Office and the furniture and fixtures are to be transferred to and vest in this Company for payment in cash at book value.

The Re-Rolling Mills plant of Messrs. Bhartia Electric Steel Company, Ltd., which is proposed to be acquired by this Company is well equipped and modern. The products of this plant are in great demand and the demand is continuously growing and is also expected to continue to grow for a long time. Increased supply of billets from the major Steel Works will help greater utilisation of the capacity of the plant.

TOTAL OUTLAY AND MINIMUM SUBSCRIPTION

The total outlay required in terms of the said scheme is estimated at about Rs. 70,00,000 as follows:—

	Rs.
1. Land	3,40,000 approximately
2. Building	11,50,000 "
3. Plant and machinery	25,00,000 "
4. Stores, etc.	10,00,000 "
5. Working capital	20,00,000 "
6. Preliminary expenses	10,000 "
	Rs. 70,00,000

In the opinion of the Directors Rs. 30,00,000 is the minimum amount which must be raised by issue of shares hereby offered. The balance amount required will be met out of the balance of the said shares if subscribed and credit facilities from Directors and their friends and from the Company's Bankers.

STATUTORY AND GENERAL INFORMATION**UNDERWRITING AND BROKERAGE**

The shares offered have not been underwritten. The Company will not pay any brokerage on this issue.

MANAGEMENT

The Company has no Managing Agents and will be managed under the supervision of Board of Directors. One or more of Directors may be appointed as Managing Director or Managing Directors at a later date.

CONTRACTS

The Company has not entered into any contract except that this Company will implement the terms of the scheme above referred to sanctioned by the Calcutta High Court.

INTEREST OF THE DIRECTORS

Sri R. L. Bhartia and Sri B. P. Khaitan are also Directors and Shareholders of Messrs. Bhartia Electric Steel Company, Ltd., the proposed vendors of the assets of business. Being Shareholders in Messrs. Bhartia Electric Steel Company, Ltd. they are entitled to allotment of shares in this Company. Sri R. L. Bhartia is also a Managing Director of Messrs. Bhartia Company Ltd. who are entitled to

allotment of shares in this Company as Shareholders in Messrs. Bhartia Electric Steel Company, Ltd. He is also a Director of and a Shareholder in Messrs. Ranken & Co. Private Ltd., landlords of the premises No. 4, Old Court House Street, Calcutta, where the Registered and Head Office of the Company is situated. Sri B. P. Khaitan is also a Partner of Messrs. Khaitan & Co., the Solicitors to the Company.

DIRECTORS' QUALIFICATIONS AND REMUNERATION

The qualification of a Director shall be the holding in his own right Equity Shares of the Company of the nominal value of not less than Rs. 5,000.

Each Director will be paid out of the funds of the Company Rs. 100 for every Board Meeting he attends and shall also be paid his share of 1 per cent. commission on net profits payable every year to all Directors jointly.

EXPENSES

Preliminary expenses payable by the Company inclusive of stamp duty, printing charges, law charges, registration fees, are estimated at Rs. 10,000. Part of this amount has been paid by Messrs. Bhartia Electric Steel Company, Ltd., which is recoverable from this Company.

APPLICATION FOR SHARES

Each application other than an application in terms of the said Scheme must be for a minimum of 100 Equity Shares or in multiples thereof.

The full value of shares applied for is payable with application.

Applications for shares must be made on the application form specified for the purpose and available from the Registered Office of the Company. Applications and money payable with them should be delivered at the Registered Office of the Company. Letters of renunciation (executed in favour of another person, if any) should also, together with the application, be sent to the Registered Office. Cheques and Drafts should be crossed "Account Payee" only and made payable to Messrs. Calcutta Steel Company, Ltd., or order. All cheques and drafts must be payable by a Schedule Bank in Calcutta. Any non-resident persons, firm or company applying for shares must first of all apply for and obtain sanction of the Reserve Bank of India.

If no allotment is made, the full amount received on application and if a partial allotment is made the unutilised balance of the application money will be refunded to the applicant within 2 months of the date of application, through Registered Post at the risk of the applicant and the Company will not pay any interest on the amount so refunded.

INSPECTION

Copies of the Memorandum and Articles of Association of the Company, and the Consent Order of the Controller of Capital Issues and the Scheme sanctioned by the Calcutta High Court may be inspected at the Registered Office of the Company during usual business hours until subscription list has been closed.

Copies of the prospectus and forms of application, etc., can be obtained from the Registered Office of the Company.

MONEY TURNS EASY AGAIN

(From Our Own Correspondent)

BOMBAY, 11th November

The tightness in the short-term money market noted last week has proved to be a short-lived affair and conditions have once again turned comfortable with a surfeit of floating funds. This is duly reflected in the good response to this week's Treasury Bill sales, when offerings amounted to more than double the sum invited and the discount rate recorded a perceptible fall. This sudden change in conditions indicates that the seasonal pressure of demand for bank credit is yet to commence. The inter-bank call money rates have dropped from 2½ per cent. to 1½ per cent. among the Exchange banks and big Indian banks and from 3 per cent. to 2-3 per cent. among the smaller banks. The relatively small decline in the case of smaller banks is due to the persistence of some demand among them. House money at seven days' notice and short-term deposits continue to be bid at 3-3½ per cent. and 3-3½ per cent. respectively.

As stated above, the response to the Treasury Bill sales has been striking, in that the amount offered aggregated Rs. 4.50 crores, as against Rs. 2 crores invited. The average rate of discount has, therefore, declined from 2.420 per cent. to 2.405 per cent. per annum. Tenders for next week are unchanged at Rs. 2 crores. For the second week in succession, there were no sales of Intermediate Treasury Bills during the period 4th to 7th November; nevertheless, their sales have not been suspended.

There has been a further expansion of Rs. 18.07 crores in notes in circulation during the week ended 6th November 1959. This is on top of an increase of Rs. 17.96 crores in the preceding week. A fractional rise is noted in notes held in the Banking Department also and the consequential increase of Rs. 18.19 crores in total notes issued is covered by a rise of Rs. 20.01 crores in *ad hoc* securities and a contraction of Rs. 1.82 crore in rupee coin. While foreign securities are again unchanged, balances held abroad show a further rise of Rs. 1.76 crore. Loans and advances to Governments have gone up by Rs. 4.58 crores, while other loans and advances have dropped by Rs. 2.48 crores; of these, the outstanding advances to banks against usance bills amounting to Rs. 1.70 crore have all been repaid. Investments stand reduced by Rs. 11.08 crores and Government Treasury Bills by Rs. 8.24 crores.

A sharp fall of Rs. 19.04 crores in demand deposits is disclosed by the Scheduled banks' statement for the week ended 30th October 1959. Time deposits are, however, higher by Rs. 1.84 crore. Inter-bank borrowings have declined by Rs. 4.83 crores, while borrowings from the Reserve Bank show a marked rise of Rs. 10.82 crores and those from the State Bank Rs. 1.54 crore. An increase of Rs. 3.67 crores is noted in advances and of Rs. 5.43 crores in bills purchased and discounted. Investments are lower by Rs. 1.04 crore, cash balances by Rs. 6.18 crores and money at call and short notice by Rs. 3.61 crores.

The gilt-edged market is extremely dull and the volume of business passing is small. Despite the comfortable conditions in the money market, institutional investors are keeping out of the securities market, as the seasonal demand for funds may pick up at any time. There is, however, no selling pressure and the undertone is steady. 3 per cent. 1986 Conversion Loans has, however, recorded a fall of 25 nP to Rs. 74.50. State loans are also featureless.

There has been a hardening of the rupee in terms of the U.S. dollar during the last few days, after an earlier setback in continuation of last week's downward trend. Thus, banks' selling rate for U.S.T.T. after a rise from Rs. 477.50 to Rs. 477.75, has dropped to Rs. 477.25 per \$100 and their buying rate is unchanged over the week at Rs. 474. After going up to Rs. 474.25. This is only in consonance with the trend of sterling abroad. In New York, for instance, spot sterling closed yesterday at 280.40-280.42 cents after a fall from 280.40-280.44 cents to 280.18-280.21 cents early in the week. Three months' forward recovered to 280.96-280.99 cents after reacting from 280.89-280.93 cents to 280.74-280.77 cents.

KIPS WEAKER

(From Our Own Correspondent)

MADRAS, 9th November

The kip market is weaker. Stocks are accumulating and tanners are not happy at the trend of the market, as they are processing in their tanneries high-priced raw stocks bought at peak levels. Importers in the U.K. and the U.S. have not shown interest in booking orders, and the tone continues to be weak. Tanners, however, expect that a decline of 7½ to 10 per cent. on September levels would stimulate importers buying en long.

Tanned goat and sheep skins are also easy and shipment trading has been poor. Tanners are likely to book orders at 6d. to 9d. less than the top prices ruling early in October, but sellers are keeping out of the market anticipating further decline in prices. In the mean time, stocks of middle class sheep are accumulating.

Shipments during October 1959 were: To the U.K.: 3,872 bales tanned cow hides, 242 bales cow calf, 67 bales buff hides, 222 bales buff calf, 799 bales goat and 742 bales sheep; to the Continent: 368 bales cow hides, 81 bales cow calf, 87 bales buff calf, 750 bales goat and 373 bales sheep; to the U.S.: 79 bales buff, 18 bales buff calf and 177 bales goat; to Japan: 75 bales sheep skins.

HEAVIER MARGINS IN BULLION

(From Our Own Correspondent)

BOMBAY, 11th November

An outstanding event in the bullion market this week has been the imposition of heavier margins in both silver and gold with effect from yesterday. The imposition followed the Bombay Government's approval of the decision taken by the Board of the Bullion Association at an emergency meeting held on Saturday. The margins fixed are—silver: Rs. 1,000 per bar in November settlement and Rs. 500 in December settlement on all outstanding purchases exceeding 50 bars; gold: Rs. 10 per tola in November settlement and Rs. 7 in December settlement on all outstanding purchases exceeding 2,500 tolas. This decision was a sequel to the requisitions by certain members of the Board and a memorandum submitted by about 23 members. The requisitionists pointed out that "unhealthy conditions" had persisted in the market owing to content bull squeeze and urged the Board to take steps against unwieldy speculation. Simultaneously with the announcement of the new margin regulations, the President of the Bullion Association warned against any undue speculative tendency and made it clear that the Board would take stricter measures with the help of the Government, if the regulations failed to restore normal conditions in the market.

It is possible that there have been heavy speculative transactions, but the fact cannot be disputed that it takes two to make a deal. None can go long, unless someone is prepared to go short. Further, the supply position in both the precious metals is tending to become tight, while the demand for them from people who want to hedge against inflation is on the increase. Ever since the declaration of Indian currency as illegal tender in Tibet by the Chinese authorities and the Chinese aggression on the north-eastern borders, arrivals of silver coins from Tibet have completely stopped. With regard to gold, there has been a marked fall in arrivals of contraband metal following stricter vigilance exercised by the Customs Department and the issue of special notes for circulation in certain territories outside India. It is not surprising that silver and gold have gone up markedly since the beginning of this year, the former rising from Rs. 192-11 to Rs. 212 per 100 tolas and the latter from Rs. 114-8-6 to Rs. 125-1 per tola.

Be that as it may, the imposition of enhanced margins would appear to have had no perceptible effect on the market, except yesterday when prices tended to decline, owing to some bull liquidation. Today, again, the market ruled bullish, with both silver and gold staging a notable recovery.

In the silver section, November settlement moved up on renewed bull support from Rs. 211-10 on Wednesday last week to Rs. 213-1 on Monday. After declining to Rs. 211-13-6 yesterday following margin considerations, it recovered to Rs. 212-8 today before finishing at Rs. 212-6. December settlement opened at Rs. 212-1, as against Rs. 212-7, and advanced to touch a high of Rs. 213-3 on Monday. It, however, eased to Rs. 211-5-6 subsequently, but rose again to close at Rs. 212-7. January settlement also rose, at Rs. 213-5 today, as against Rs. 213-2 last week-end.

Ready gold was well favoured in the initial sessions, the quotation spurring from Rs. 211-6 early on Thursday to Rs. 212-8 on the 9th inst. After declining to Rs. 211-5-6, it recovered to Rs. 212-1. The closing rate was an anna lower. The daily average arrivals and offtake of silver were 23 bars and 9 bars, respectively. The floating stocks of silver are reported to be in the neighbourhood of 900 bars.

In gold, November settlement advanced from Rs. 125-1-6 to Rs. 125-6 and, after retreating to Rs. 124-8 on Monday, recovered to Rs. 125-2-6 today. It was an anna and a half lower towards the close. December settlement was firm at Rs. 125-11 on the opening day, as against Rs. 125-7-6, but was taken down in the subsequent sessions to Rs. 124-12 on Monday. After recovering to Rs. 125-6 today, it finished a shade easy at Rs. 125-5. Business in January settlement commenced at Rs. 125-4 yesterday. Today's closing rate was Rs. 125-10.

Ready gold began the week at Rs. 124-12 and, after improving to Rs. 125-4, declined to Rs. 124-6 on the 9th inst. It, however, recovered to Rs. 125-2 today before finishing at Rs. 125-1. The daily average arrivals of gold were 3,500 tolas, while the actual offtake was 2,300 tolas. The floating stocks of gold are estimated at 25,000 tolas.

Spot silver in the London bullion market was fully maintained at the last week's level of 80½d. while the forward gained ¼d. to 80½d. Silver in New York continued unchanged at 91.75 cents. Ready gold in London rose from 250s. 2d. to 250s. 2½d. early in the week, but eased to 250s. 1d. yesterday. The latest available world price for gold in London is \$35.05-\$35.07, as against \$35.08-\$35.10 per ounce.

The following comparative table shows at a glance the trend of the market during the week under review:

	11-11-59	Highest	Lowest	4-11-59
GOLD				
Ready (90 fine Mint)	125 1	125 4	124 6	124 14
Forward*	125 1	125 6	124 8	125 11

COTTON FUTURES RALLY

(From Our Own Correspondent)

BOMBAY, 11th November

The firm trend witnessed at intervals in the cotton futures market last week gathered momentum during the week under review. Re-Punjab, resulting in rains in Berar, Gujarat and quantity of the crop, touched off a wave of buying. Encouraging news from the yarn and cloth markets and firm advices from the spot section where prices hardened further following keen mill buying in the wake of reduced arrivals, imparted further strength to the market. Operators appeared to have discounted the recommendation of the Cotton Advisory Board that an import quota for the current season, including the quota of 140,000 bales issued on 31st August 1959. Under pressure rallied. The Jarilla March contract firmed up from the opening level of Rs. 721.25 on Thursday to Rs. 734.50 on Monday. Profit-taking induced by the high prices and the news that the weather had taken a turn for the better induced a mild easiness today. Nevertheless, the trend gathered momentum. Rs. 11.25 higher than last week-end quotation.

I.C.C. Moglai Jarilla March 1960 commenced the week at Rs. 721.25. After rising to Rs. 734.50, the contract declined to Rs. 730.75 yesterday. Opening at Rs. 732.50 today, it improved fractionally to Rs. 733, before finishing lower at Rs. 730.50.

In the spot section prices ruled firm, thanks to sustained demand. Short staples spinning 10 to 20 counts were becoming increasingly scarce. There were very few sellers for popular short staples like Kalyan, Wagad, Kala, etc. These varieties were not available even at ceiling prices. Staple styles were comparatively less favoured. Varieties like Rajapoleiyam 62, 197/2, etc., evoked mill attention. Mill demand slackened towards the close on account of the high prices. The rise in price consequently halted.

Export interest was subdued. Prices of Bengal Deshi went up early in the week on speculative buying in anticipation of a revival of foreign demand. Towards the close of the week there was a mild reaction in prices induced by the news that the weather had improved. Japan is expected to enter the market as soon as the Japanese Government issues the foreign exchange allocation.

Following rumours that an import quota was in the offing, there was keen demand for East African bad and Southern mills purchased large quantities of East African cotton. This proved to be a favourite. It was done at Rs. 1,045-1,050 per candy. B.P. 52 changed hands at Rs. 1,175. Busoga found buyers at prices ranging from Rs. 1,155 to Rs. 1,560. Towards the close, however, interest subsided. Higher grade Egyptian and Sudan cotton also met with moderate demand.

The Cotton Advisory Board, at its meeting held in Bombay last week, made the following important recommendations in respect of import and export of cotton:

(1) Import quota for 600,000 bales (400 lbs. each) should be issued for the season in the traditional staple categories 1-1/16" and above but below 1-3/16" and 1-3/16" and above. Out of this under P.L. 480 programme.

(2) A special quota of 100,000 bales should be issue for 15/16" to 1-1/16" cotton for import from any area.

(3) An export quota of 75,000 bales of Bengal Deshi should be issued.

The aforesaid import quotas are in addition to the 140,000 bales comprising 115,000 bales of 1-3/16" staple and above and 65,000 bales of 1-1/16" and above but below 1-3/16" released on 31st August 1959. The Committee recommended to permit import of 100,000 bales of 15/16" to 1-1/16" staple cotton is a new departure from traditional staple categories which has been attributed to the expected shortage of these staples.

Contradictory reports that the Cotton Advisory Board recommended for import only a smaller quantity than suggested by the Indian Cotton Mills' Federation, Mr. a. statmath Podar, Press, said that there was no difference between the recommendations of the Federation and the Board in regard to import of foreign cotton and the current season. The Federation was of the view that it was absolutely essential to import a minimum of one million bales, if not more, if a crisis in the cotton supply position was to be avoided. When the Federation considered the matter in October, the estimate of the domestic cotton crop was placed at 4.5 million bales. The revised estimate now was about 4.8 million bales. The Cotton Advisory Board has suggested that 100,000 bales of cotton of stapling between 15/16" and 1-1/16" above should be imported. These imports would be exclusive of 140,000 bales, the import of which was announced on 31st August last and the receipt year," Mr. Podar stated.

The following are the latest available spot quotations—in rupees per candy of 784 lbs.—from Sewri:

Bengal Deshi 632; Wagad 735; Laxmi: Gadag 905; Dharwar 920; CO2 950; 320 F 940; Kalyan 830. Distinctly firm conditions prevailed in the under review. Values firmed up on export demand and keen mill buying prompted by fears of damage to crop in Punjab. Inquiries from foreign buyers, especially Japan, broadened from foreign January spurred by Rs. 4 to Rs. 68-4. N.T.R.G. contract gained Rs. 3-9 to Rs. 64-10. The Marci section was active. Values hardened.

The Alexandria cotton futures market ruled firm during the week under review. Prices advanced

on good buying support. The medium-staple Ashmouni contracts, in particular, met with sustained buying, thanks to firm spot advice. Export demand was also very well maintained. Export price discount was reduced by ½ per cent. to 21 per cent. on Monday.

The following are the latest available quotations—in talaris per lb.—from Alexandria:

Karnak: November 72.20; January 72.75. Ashmouni: December 63.35; January 62.86.

The prospects of increasing cotton trade between U.K. and Egypt were discussed by a British cotton delegation which recently visited Egypt. Some of the important points considered related to the conditions of sale which are now regulated by the Egyptian Government instead of by the Cotton Exports Association as formerly, and the venue of quality arbitration. The delegation is reported to have expressed the view that Egyptian cotton was too expensive, about 1½ pence per lb. more than what British buyers were paying for equivalent Sudan varieties.

Cotton futures values in Liverpool made small gains during the week. Increased mill buying against forward sale of yarn and cotton was the main influencing factor. Although scattered liquidation provided the contracts early in the week later offerings dried up. Both the American and American type contracts moved higher. Sudan contracts were neglected. Values, however, remained unchanged. The following are the latest available quotations—in pence per lb.—from Liverpool:

American cotton one inch staple contract: December-January 21.80; March-April 21.90; May 22.20; July 22.10.

American cotton mixed growth contract: December-January 22.50; March-April 22.50; May 22.40; July 21.90.

Sudan: November-December, January-February 29.00; May-June 28.75.

The New York cotton futures market ruled fully steady both before and after the Government crop forecast published on the 9th inst., though the estimate was slightly higher than market expectation. This was because most traders were inclined to think that larger crop meant only that more cotton would move into the Choice "B" programme or into the loan.

The Crop Reporting Board of the U.S. Department of Agriculture, in its November forecast, has estimated the U.S. cotton crop at 14,801,000 bales (of 500 lbs. each). This compares with the 14,892,000 bales estimated a month ago and the 1958-59 harvested crop of 11,512,000 bales and the ten-year (1947-56) average of 14,133,000 bales. The yield per acre is put higher at 474 lbs., as against 470 lbs. estimated last month. Yield per acre last year was only 388 lbs. The ten-year (1947-56) average yield worked out to 317 lbs. per acre.

Ginnings prior to 1st November aggregated 9,718,000 bales, as against 7,316,000 bales during the same period last season.

The following are the latest available quotations from New York as compared with those a week and a fortnight before:

	(In cents per lb.)	10-11-59	2-11-59	27-10-59
Spot				
December	...	32.70	32.70	32.70
March	...	32.64	32.42	32.39
May	...	33.05	32.88	32.85
	...	33.30	33.13	33.14

RAYON YARNS WELL SUPPORTED

(From Our Own Correspondent)

BOMBAY, 11th November

The yarn market ruled firm during the week under review. Rayon yarns were well supported despite advance satisfactory offtake. Traders would appear to feel that demand would soon increase and large business would be put through when the harvesting of the new season's agricultural crops is in full swing. Staple fibre yarns tended to move up, thanks to encouraging reports from consuming centres. It was reported that no forward business worth noting had been put through by any mill either in the north or in the south. Only small lots were being offered and sold by mills from time to time because buyers were not forthcoming at the present high level of prices. It was reported that a section of the trade had arranged to take delivery of yarns against November purchases. It was, therefore, feared that some scarcity in supplies might develop in the next few days. Cotton yarns were dull, transactions put through being on a small scale. The market was closed today on account of Kartik Ekadashi.

Cupressa Bamberg yarn (60 x 2) December contract met with considerable speculative support and forged ahead from Rs. 1,674 to Rs. 1,713. Spot Cupressa recorded a rise of 15 nP, yesterday's closing rate being Rs. 7.59. Among imported yarns, 120 Italy rose by 7 nP to Rs. 5.22. 150 Italy was fully maintained at Rs. 4.87, as also 150 Japan at Rs. 5.15. 120 Japan gained a naya paise to Rs. 5.22. National Rayons 120 bright cones first grade were done at Rs. 4.75, same as last week. 150 bright cones, however, lost 3 nP to Rs. 4.28.

Staple fibre yarn (40 x 2) December contract moved up from Rs. 693 to Rs. 704. Spot Citys were quoted at Rs. 3.76. Robinsons at Rs. 3.71 and Centuria at Rs. 3.76. Among imported yarns (80 x 2), Paramount came in the selling and declined by 6 nP to Rs. 4.81.

In the cotton yarn section, ten counts Podars found buyers at Rs. 14.52, as against Rs. 14.56. Twenty counts Moderns picked up 6 nP to Rs. 19.31. Forty counts Moderns spurred by 31 nP to Rs. 27.31. While Milnaxs eased by 7 nP to Rs. 26.87. Sixty counts Milnaxs were firm at Rs. 61.50, but Nehruvams lost 50 nP to Rs. 54. Eighty counts were unchanged at Rs. 79, as also Finlays at Rs. 81 and Citys at Rs. 64.60.

The following table gives the prices of rayon,

staple fibre and cotton yarns quoted yesterday as compared with those six days before:

	10-11-59	4-11-59
Art silk yarn—		
60/1 Cupressa Bamberg December (100 Kg.)	Rs. 1,713	Rs. 1,674
60/1 Cupressa Bamberg spot (per lb.)	7.59	7.44
120 Japan (per lb.)	5.29	5.28
150 Japan (per lb.)	5.15	5.15
120 Italy (per lb.)	4.87	4.87
150 Italy (per lb.)	4.87	4.87
Staple fibre yarn—		
40 x 2 December (per case of 200 lbs.)	704.00	695.00
40 x 2 Robinson (per lb.)	3.71	3.74
40 x 2 City	3.70	3.72
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	14.62	14.56
20s Modern	19.31	19.75
40s Milnax	26.87	26.94
60s Finlay	61.50	61.50
80s Mahendra	73.75	73.25

BLACK PEPPER RISES FURTHER

(Messrs. Parekh & Co.)

BOMBAY, 11th November

Malabar black pepper improved further during the week in sympathy with Singapore and New York where spot rose from \$0.31½ to \$0.33, with grinders buying.

Cochin firmed up in both ready and forward under pressure of short covering and fresh buying. Ungarbled at Cochin climbed to Rs. 900 from the last week's price of Rs. 850. Ready garbled rallied from Rs. 147 to Rs. 155. December delivery on the ring made further headway by advancing from Rs. 136-50 to Rs. 145. January rose in sympathy with December and the spread between December and January widened from Re. 1 to Rs. 2½. January delivery is quoted at Rs. 142½.

The Singapore syndicate was able to sell afloat a large parcel of its consignments of Lampong to New York at \$0.31½. This afforded the Syndicate an opportunity to manipulate the prices in Singapore as well as in Djakarta. Singapore speculators are also reported to be buying Malabar black pepper for shipment to New York through their New York agents. This is also likely to have its reflection on the New York dealers and grinders who were all the while apathetic and were buying hand-to-mouth because almost all of them burnt their fingers in pepper trade in the past. The Syndicate is said to be more after pushing up the prices of white pepper as they have no competitors. It is stated that the Syndicate is intending to boost prices of white pepper to a high level of 4s. as against 3½s. per lb. c. and f. London and/or basic Continental ports.

Calicut improved to Rs. 925. Arrival of new pepper has started and, every day, about 100 candies are arriving at the terminal markets of Cochin and Alleppey. Arrivals are sure to expand with the advance of the season.

The prices being too rapid, the trade in general is expecting reaction. Further, it expects a setback in prices when new crop arrivals begin to exert pressure on the market which is very likely unless America is a continuous buyer at sellers' price. The rise at the beginning of the transitional month ending the old season and beginning the new one is always in most cases deceiving, particularly when the crop is expected to be a bigger one.

Ready pepper is nominally quoted at Rs. 110 to Rs. 115 according to quality, but the demand is not up to expectation.

SEEDS STEADY

(From Our Own Correspondent)

BOMBAY, 11th November

The oilseeds market ruled steady during the week under review, thanks to good export demand, particularly for castor oil and groundnut oil. The proposed increase in freight rates on oils and oilcakes announced by the Karmahom Conference Lines—a reference to which was made in these columns last week—however, has caused much disappointment among traders. The Bombay Oilseeds and Oils Exchange, in a communication addressed to the Government of India, has stated that the decision of the Conference Lines is arbitrary and would be extremely prejudicial to India's export trade. It has urged the Government to intervene and see that the decision is revoked. It has also been pointed out in the communications that exporters cannot help feeling that freights have been increased deliberately as the Conference Lines knows that there are large outstanding sales for oils and oilcakes for shipment in January and beyond and that they cannot take advantage of non-Conference competition due to the vicious system of deferred rebates.

The market was closed yesterday on account of general elections. It closed today earlier at 2 p.m. on account of the annual meeting of the exchange. Coming to the trends in the market during the week under review, the groundnuts section presented cheerful conditions. This was induced mainly by the good overseas enquiries for groundnut oil, particularly from the U.K. and Burma. Crushers and *vanaspathi* manufacturers also extended fairly good support. Arrivals were sizable but they were absorbed. Groundnut February 1960 contract, which would up last week at Rs. 175.87, rose to Rs. 179.12 on Monday, but it receded today to Rs. 177.62 on profit-taking. Saurashtra bold improved over the week by Rs. 1.50 to Rs. 38.25, as also Saurashtra quality by Re. 1.25 to Rs. 38.25. Oil ex-mill rose from Rs. 18.37 to Rs. 18.87 on Monday but declined later to Rs. 18.69. Railway receipts picked up 89 nP to Rs. 18.90.

The castorseed section ruled firm. There was revival of hopes of U.S. interest in Indian castor oil. Besides, traders expect that the countries of the communist bloc will sooner or later enter the Indian market for castor oil. Castorseed May 1960, which had finished last week at Rs. 162, improved to Rs. 166.25 on Saturday but came down subsequently to close at Rs. 163.37 today. Ready

Madras was done by 50 nP up to Rs. 31.37. Oil B.S.S. gathered 44 nP to Rs. 16.75.

The linseed section, in contrast, was subdued despite some reports of export enquiries for linseed oil. Linseed May 1960 rose from Rs. 35.37 to Rs. 35.44 on Monday but closed slightly lower at Rs. 35.37. Bold ready lost 37 nP over the week to Rs. 35.25. Linseed oil was lower by 6 nP at Rs. 17.31.

Cottonseeds moved up in sympathy with raw cotton. Cottonseed February 1960 contract improved from Rs. 126.50 to Rs. 129.50.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	11-11-1959	4-11-1959	28-10-1959
<i>Groundnut</i>	Rs.	Rs.	Rs.
February 1960	177.62	175.87	173.50
Bold ready	37.50	35.75	36.00
Coromandel ready		38.25	
Khandesh quality	38.00	39.25	
Oil ex-mill ready*	19.69	19.37	19.50
Railway receipts*	19.50	19.12	19.25
<i>Castorseed</i>			
May 1960	163.37	162.00	158.75
Ready Madras	31.37	30.87	30.37
Ready Kanpur	29.87	29.50	29.25
Oil B.S.S.†	17.69	17.25	17.00
Oil commercial†	16.75	16.37	16.25
<i>Linseed</i>			
May 1960	85.37	35.40	34.75
Bold ready	35.25	35.62	34.62
Oil ready	17.31	17.37	17.00
<i>Cotton seed</i>			
February 1960	129.25	123.50	124.50
Niger seed	81.75	31.50	81.50
Kardi seed	22.50	22.60	23.00

10 oz. was lower at Rs. 40.55. There was profit-taking at this stage and, over the week-end, B. twills settled around Rs. 103.45 and hessian 40" 10 oz. at Rs. 40.50. Yesterday, on better report from the futures market, ready B. twills advanced to Rs. 103.90 and, following expected U.S. interest, hessian 40" 10 oz. hardened to Rs. 40.72. The higher trend also reflected the rising raw jute market.

In raw jute also, there was bear-covering in futures. Although actual business with mills was small, sellers were reserved, and prices gained. The report of a small decline in output and the official view that there was unlikely to be any excess after meeting demands gave rise to the hardening trend. Northern bottoms at Rs. 23.25 added 50 nP. A similar gain was recorded in Daissee bottoms at Rs. 25. Assam bottoms moved up from Rs. 23.50 to Rs. 23.75. The latest quotations for November-December delivery of the 1959-60 crop are:

	Middles	Bottoms
White:		
Selected Assam	26.50	24.00
Ordinary Assam	26.25	24.00
Northern	26.00	23.50
Desal	24.75	22.25
Cuttack	28.00	25.00
Murshidabad	24.50	22.00
Bihar, Jungli and U.P.	24.25	21.55
Tossa:

Bimbi f.a.q.	Rs. 22.50	
Pucca bales:		
1st Mark	Rs. 175.00	
	per bale ready.	

SUGAR QUIET

(From Our Own Correspondent)

HAPUR, 9th November

Sugar prices rule quiet during the week, thanks to better supply position in the market. With the latest release of 175,000 tons for sale, the old stocks of sugar are reported to have been exhausted, but, following new incentive provided for starting crushing season earlier, most of the factories in west U.P. have begun their new production. But cane supplies to khandasari units continue to be very heavy, as manufacturing of gur by crushers is still being found very profitable. The increase in cane prices will not have the desired effect of increasing sugar production unless the conditions in which cane is supplied to factories are very much improved. Apart from reports of weight shortage, the system of cane supplies to factories through co-operative societies is not at all working satisfactorily. The latest prevailing prices of sugar here are Rs. 125 per bag; retail Rs. 1.25 per seer.

Sugar prices at Muzaffarnagar displayed an easy trend during the week, as festival demand for the commodity was over and supply position was easy. Most of the factories in the region have started functioning. Sugar touched a high of Rs. 134 to Rs. 135 per bag, but subsequently eased to be quoted at Rs. 123 to Rs. 124 per bag. In retail, sugar was quoted at Rs. 1.25 per seer.

Sugar prices were quoted lower in the Kanpur market, as demand was reported to be on the decline.

Khandasari ran down sharply by about Rs. 3 to Rs. 4 per maund, as the stockists were anxious to sell old stocks before new production starts by the end of the current month. Prevailing prices were:—Rs. 38 to Rs. 42; superior Rs. 43 to Rs. 46; boora Rs. 46 to Rs. 49 a maund.

Ready gur stayed steady on good support from consuming areas. Daily arrivals were at about 4,000 maunds and are likely to increase next week when the Kartik annual Ganges Fair is finished. Most of the crushers are preparing gur, as they are in a position to buy cane at Re. 1.25 to Re. 1.37 per maund, as against the purchasing prices by factories at Re. 1.50 to Re. 1.62 per maund. Balfi quality of gur is much in demand and is being quoted up to Rs. 3 to Rs. 3.25 per maund higher than the pansera quality. Prevailing prices are:—pansera Rs. 21 to Rs. 22.25; balfi Rs. 25.25; shakker Rs. 23 a maund.

Ready gur also stayed steady in the Muzaffarnagar where demand from consuming areas was fair. Prevailing prices are:—pansera Rs. 23 to Rs. 23.75; khurpapur Rs. 24 to Rs. 24.50; shakker darsa Rs. 25 per maund.

Gur futures registered a strident advance on continued bull support. Opening at Rs. 15.21 last Monday, futures touched a high of Rs. 15.93 on Thursday and, after touching the lowest at Rs. 15.61, is quoted today at Rs. 15.75.

COMMON TEAS DEARER

(Messrs. Forbes, Ewart and Figgis (Private) Ltd.)

COCHIN, 6th November

Sale No. 42 held on 3rd November 1959 comprised 1,160,000 lbs. The quality of medium and good medium teas offered in this sale was well maintained. There was a useful selection of high grown teas on offer. The market met with a good general demand. Common descriptions and low mediums met a strong enquiry and are quoted fully firm to dearer. There was a useful support for medium and good medium teas which were about steady. Demand for better liquoring teas were rather irregular with broken grades under this category meeting a better support from the buyers than fannings which were distinctly easier. Whole leaf grades were in less demand and were

slightly easier. The following are the quotations:

	1959	1958
Low medium	1.80 to 1.90	1.55 to 1.65
Medium	1.95 to 2.20	1.70 to 1.95
Good medium	2.15 to 2.35	2.10 to 2.40
Quality	2.40 to 4.10	2.90 to 4.75

Dust Sale 'FF'—400,000 lbs. were offered in Dust Sale 'FF' which was held on Thursday, 5th November 1959. A useful selection of dusts were offered in this sale. There was strong general demand and prices were fully firm to dearer for all descriptions. Buyers showed keen interest for colour medium sorts which sold at dearer rates. Black, clean, grainy descriptions continued in demand and sold at higher rates than last. There was a useful enquiry for a small selection of C.T.C. Dusts on offer.

London Market: Sale of 2nd November 1959.—Assams little irregular following quality. Others mostly dearer with Concertina closing further.

Sale of 3rd November 1959.—Good demand at appreciably dearer rates.

Sale of 4th November 1959.—Unchanged.

Colombo Market: Sale of 2nd November 1959.—Strong demand. Highgrown broken irregularly lower following quality. Good mediums steady. Coloury sorts below best dearer. Small leaf bright liquoring lowgrowns slightly dearer. Leafy gulf types slightly lower. Tea for price advanced 5 cents.

Sale of 3rd November 1959.—Active demand. Generally dearer, particularly useful liquoring fannings and dusts.

Export Quota.—A fair amount of business has gone through at 2 nP and at the time of writing there are sellers at 2 nP with probable buyers at this price.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd., wire:

"Sale 43—1,200,000 lbs. Very strong general demand, particularly for common and low medium which are 10 nP dearer. Medium and good medium irregularly 15 to 20 nP. Best liquoring highgrown broken irregular and easier."

(From Our Own Correspondent)

CALCUTTA, 10th November

With greater demand a further improvement in prices of quality teas was recorded in the export sale held yesterday, as well as at the internal auctions of last week. However, the trend in common teas was quiet. Shipments to the United Kingdom were again satisfactory, but a feature was the greater interest displayed by Egyptian and other buyers.

It was reported that the U.K. stocks were only 113.65 million lbs. in the week ended 30th October, as against 112.40 million lbs. in the previous week. This is usually the time when the U.K. stocks go up. That this had not happened was a far as taken here as an indication of the likelihood of the London auction trend hardening further.

Meanwhile, India's Consul General in New York has reported that, despite increased consumption in the U.S., Indian tea exports to that country have been failing which has caused concern in trade circles here. He thinks that the Tea Council, in the maintenance of which in the U.S. India has a share, should change its methods of advertising. Costly advertisements should give place, he says, to public relations and publicity. Traders here would suggest to the Council to take to distribution of good made-tea in mobile canteens in industrial areas.

The news of the week was the lifting of price control on tea in Pakistan, according to an announcement made in Dacca on the 7th November by Mr. A. K. Khan, Pakistan Minister for Industries. An export sale was held at Chittagong on the 4th inst. when offerings aggregated 14,740 packages. The hardening trend at the opening petered away as the sale progressed, and prices gave way to reach valuations.

In the internal auctions held here last week, dusts offerings amounted to 21,798 chests. There was good demand, leading to a gain in prices. Leg-cut teas were fully firm and exportable teas were dearer. Orthodox teas were steady. An irregular demand was recorded by medium C.T.C.s which declined by 10 to 15 nP. There was good support to the very best C.T.C. on offer. The quotations, exclusive of excise duty, were: best Assam C.T.C. Rs. 2.50 to Rs. 2.80; medium Assam C.T.C. Rs. 2.00 to Rs. 2.10; medium Dooars Rs. 1.95 to Rs. 2.02; and medium Assam Rs. 1.94 to Re. 1.98.

Leaf on offer amounted to 894 chests. The rates were irregular.

Offerings during yesterday's export sale, amounting to 72,114 chests, met with strong and general demand. The low medium B.O.P.s were well supported, while, with a definitely better trend in the better liquoring, medium Assam broken and fannings, B.O.P.s showed an added modest gains. However, in an irregular trend in the fannings and plain broken, some of the poorer lots recorded small losses. C.T.C.s reached near-buoyancy. On keen competition, secondary broken grades rose 20 nP above valuations, while best C.T.C.s evoked good interest. Leg-cut teas were in good form on modest support. Darjeelings were firm, and leaf grades tended to be fully steady. The quotations were: best Assam C.T.C. fannings Rs. 2.60 to Rs. 2.80; best Assam C.T.C. B.P. Rs. 2.60 to Rs. 2.80; clean black pekoe Rs. 2.04 to Rs. 2.10; medium fannings Rs. 2.12 to Rs. 2.20; plain fannings Rs. 2.04 to Rs. 2.10; medium B.P. Rs. 1.90 to Rs. 2.08; and plain B.P. Rs. 1.86 to Re. 1.90.

Export quota was quoted by sellers at 2 nP. Buyers offered only 1 nP. No business was done.

"KHARIF" CROP ARRIVALS

(From Our Own Correspondent)

HAPUR, 9th November

Quiet conditions prevailed in the foodgrains market during the week, thanks to pressure of

good kharif crop. The sowings of rabi grains have again been hampered by untimely rains and hail-storm received during the week-end and it is feared that the recent sowings would be adversely affected on that account. As the land vacated from kharif crop and sugarcane is available for rabi sowings, it is hoped that there would be an increase in rabi grains production as compared with last year.

Wheat at Hapur ruled almost stationary during the week to be quoted on Monday at Rs. 17.25 per maund for average quality and up to Rs. 19.50 for farm produce. Daily arrivals were at an average of 50 maunds which were being lifted by local consumers and demand from rural areas was slack. Sales through fair-price shops were being continued. The State Government's purchases under the wheat levy scheme were sparse, as the official purchasing price was unchanged at Rs. 13 to Rs. 15, which is substantially lower than the market prevailing price. Inferior quality eased by about Re. 1 to Rs. 2 per maund during the week under pressure of arrivals of new grains in the market. Despite the damage caused to rice crop by floods in West Bengal and some districts of Orissa, as well as drought conditions in East U.P., it is hoped that the rice crop might not fall short of last year's record crop of just over 30 million tons. The Government has begun purchases of rice at last year's price level and it is reported that response in some States is encouraging. The prevailing prices of rice here were:—basmati Rs. 30 to Rs. 33; mainpuri Rs. 23; ramajwari Rs. 23.50; gadda Rs. 20 a maund.

Gram ruled quiet during the week, as demand was slack and local stock was comfortable. Barley and bejhar were also quiet in the absence of new urges. Maize attracted good consumer demand and bajra arrivals were also increasing. But the price ruled steady and it was feared that an easing tendency had subsided. Jowar and gujar were listless during the week. The prevailing prices on Monday (in rupees per maund) were:—gram 12.75 to 13; barley 12.50; bejhar 11.50; maize 11.12; desi 11.75; jowar 12 to 14; gujar 12 to 13; bajra 13 to 13.25. Stocks (in maunds): Gram 50,000; barley 4,000; bejhar 100; rice 5,000 maunds.

IMPORT LICENCES FOR COPPER

(From Our Own Correspondent)

CALCUTTA, 10th November

The metal market ruled quiet during the week under review. Clear wire scrap was firm at Rs. 232 per cwt. and utensil scrap at Rs. 225. Some supplies of the virgin metal were received during this week. Meanwhile, there was a further increase in the price of copper on the London Metal Exchange. The rate there touched as high as £265 a ton, before declining to £258.

Import licences for copper have now been issued, but market circles are greatly critical of the delay occurred in issuing these licences. For, with the strike in the U.S. and Chilean mines, world supplies have been considerably depleted, and the abnormal rise in prices in London is thus explained. If only the Government of India had issued the licences in time, the country could, it is said, have saved avoidable foreign exchange by the present position when the price was lower. The present position is that there is no knowing whether, with the world supplies bordering on shortage, the country would be able to import all it wants. Market circles wonder if the authorities would take a lesson from this episode and avoid delays in action when once the policy was decided.

On the L.M.E., tin was quoted steady at £793 1/2 per cwt. Locally, there were fresh arrivals, and the price sagged from Rs. 569 to Rs. 587 per cwt. The good demand on world supplies was friction on export placed on the belief that the restriction by the Tin Council would be removed. If this restriction were removed, world supplies would increase by 7,500 tons to 47,500 tons per year. The penning indicates that the U.S. steel strike has not contributed to any lessening of demand. The considerable sales from the Buffer Stock have been on the whole, with the lower offerings by the trade, the Buffer Stock Manager is bound to release in order to keep up the price equilibrium.

Lead was quiet at Rs. 72 per cwt. and the softening tendency was attributed to the receipt of import licences by consumers. Electrolytic zinc was also quiet at Rs. 110 per cwt.

LINSEED FIRM

(Messrs. A. Bradley and Co.)

CALCUTTA, 9th November

A firm tone prevailed in the linseed market throughout the week, but business was very restricted, with both buyers and sellers pausing. Both ready and forward seed prices moved steadily upwards touching Rs. 86.50 and Rs. 28.62 by mid-week, but, with diminished interest from crushers at those rates, the tone eased somewhat towards the close. April-May new crop delivery was transacted at Rs. 24.50.

The oilcake market was dull with little interest from buyers and sellers were generally reserved. There was no change in foreign advices and little business was reported.

The oil market remained very firm. Fresh Australian business was done at £121 and further enquiries were reported. Local prices at Rs. 56 for parity with this level, whilst values in the U.K. market were lower still.

The latest quotations per maund are: Ready Rs. 26.58, November-December Rs. 26.50 and May futures Rs. 24.60.

MARKET GOSSIP

(Concluded from page 799)

and £142 million on "invisibles" account. Thanks largely to these surpluses, Britain's reserves of gold and convertible currencies rose by £77 million to £1,173 million in the first nine months of 1959, despite (a) the payment of £58 million in gold to the I.M.F. as part of the additional subscription, (b) the repurchase from it of £71 million with dollars, (c) the repayment of £91 million in dollars to the Ex-imp Bank and (d) the settlement of debts (£4.5 million) outstanding from the European Payments Union.

What exactly will be the effect of Britain's latest move to scrap most of the quota restrictions on dollar and Indo-British trade, in general, and on Indo-British trade, in particular? It is difficult to give a categorical answer to the poser. By and large, however, it may be expected that many countries in the free world, more particularly those in North America, will enlarge their sales in the British market which at present is expanding on a tide of prosperity. So far as India is concerned, the abolition of special dollar quotas on textiles and clothing will not affect exports of its textiles to Britain, for two reasons. One, the bulk of these exports consist of grey varieties in which there is no competition from the U.S. Two, the textiles and clothing imported into Britain from the U.S. are of special varieties—they are either specially produced to cater to the "fashion" market in Britain or woven from a blend of cotton and other synthetic fibres—which do not figure in India's exports to Britain. But in the case of jute goods, their imports into Britain continue to be controlled, though a control in the jute trade feels that some relaxation in control may be announced in the light of the discussions held by the Indian Jute Mills Association delegation with the President of the Board of Trade last week. There is now hardly any justification for continuing this control.

NEW ISSUES

The spate of rights and new issues continues. The Standard Motor Products of India Ltd., Madras, has decided to raise its capital of Rs. 42 lakhs by the issue of 220,000 ordinary shares of Rs. 10 each and 20,000—84 per cent. tax-free cumulative 'B' preference shares of Rs. 100 each. The consent of the Controller of Capital Issues has been obtained for the issue, the proceeds of which will be utilised for financing the Company's expansion programme. Out of the 220,000 ordinary shares to be offered, 25,000 shares have been reserved for the Standard Motor Company, Ltd. of U.K., the Company's collaborators. The balance of 194,000 ordinary shares are to be offered to the existing holders of ordinary and deferred shares in the ratio of seven new ordinary shares for every Rs. 100 worth ordinary and/or deferred shares. The 20,000 'B' preference shares will be offered to the holders of the existing preference, ordinary and deferred shares in the ratio of one 'B' preference share of Rs. 100 for every sum of Rs. 290 paid on the existing ordinary, preference and deferred shares held by them as on the date of offer.

Shri Prithvi Cotton Mills Ltd. has announced the issue of 8,500—7 per cent. tax-free cumulative preference shares of Rs. 100 each. Of these, 3,500 shares have been taken or agreed to be taken by the Directors and their friends and the balance of 5,000 shares is available for public subscription. A sum of Rs. 10 per share is payable on application, Rs. 15 on allotment and the remaining Rs. 75 by such calls as may be determined by the Directors. The issue will be utilised to finance in part the cost of the Company's rehabilitation programme. The Company was incorporated in April 1954 in Broach and purchased the mills of the Broach Fine Counts Spinning and Weaving Mills Ltd.

The Indian Aluminium Company, Ltd., will shortly enter the capital market for a debenture loan of Rs. 3 crores. The debentures, which will carry interest at the rate of 6½ per cent. subject to tax, will be issued at Rs. 102 per cent. They are redeemable within 15 years and the Company will retain the option to redeem them after ten years. The funds will be utilised to finance the Company's expansion programme. The issue is subject to the sanction of the Government.

The Kesoram Cotton Mills proposes to issue 400,000 new ordinary shares of Rs. 10 each to the existing shareholders in the proportion of one new share for every four held. This issue, too, is subject to Government sanction.

TEXTILES

(Concluded from page 808)

China. A recent official review of the conditions obtaining in the Swedish textile market, for instance, makes it clear that there is no prospect of India making headway in this market unless energetic steps are taken in the following directions:

Prices will have to be competitive.

Since Sweden is a very fastidious market, the types of cloth sent to it should conform to the latest fashion in vogue thus regarding designs, colour, finish, texture, etc.

Exporters must adopt the strictest modern business methods to which the Swedish market is accustomed through its dealings mainly with the highly industrialised countries of Europe.

It is absolutely important to make individual studies of the specific requirements of the markets and send only the required patterns and designs. It is said that the ready-made clothing factories

which consume most of the cloth, are always looking for new materials, colours, designs and patterns.

So far as Denmark is concerned, the chances of any considerable improvement in exports of textiles from India are not very bright. The consumption of cloth in this country has tended to decline of late, the consumer preference being more and more for fabrics woven from synthetic fibres. As regards Finland also, the conditions obtaining there are stated to be "so peculiar that they are not propitious for any large-scale attempt to be made to get a share of the market for Indian textiles." In order, however, to cultivate and retain the market, one has to be very vigilant and adaptable to changes in fashion.

NOTICES

THE BRITISH BURMAH PETROLEUM COMPANY LIMITED

(Incorporated in England)

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Forty-eighth Annual General Meeting of the Company will be held at Noble Chambers, Parsi Bazar Street, Fort, Bombay, on Thursday the 17th December, 1959, at 4-30 p.m. (S.T.), for the following purposes:—

- To receive the Balance Sheet and Statement of Accounts for the year ended 31st March 1959 together with the Reports of the Directors and Auditors thereon.
- To elect a Director in place of H.H. Sir Jiwajirao M. Scindia, Maharaja of Gwalior, who retires by rotation, and being eligible, offers himself for re-election.
- To elect a Director in place of Mr. Tricundas Dwarkadas, who retires by rotation and being eligible, offers himself for re-election, and if thought fit, to pass the following Resolution as an ordinary Resolution, of which special Notice, as required by Section 185 of the English Companies Act, 1948, has been received by the Company:—

"RESOLVED THAT Mr. Tricundas Dwarkadas, who has attained the age of 72 years and who retires by rotation, be and is hereby re-elected a Director of the Company and it is hereby specifically declared that the age limit for Directors prescribed under Section 185 of the English Companies Act, 1948, shall not apply to him."

(d) To appoint Auditors and fix their remuneration.

(e) To transact any other ordinary business of the Company.

A Member of the Company entitled to attend and vote at the above meeting is entitled to appoint a proxy or proxies to attend and speak and on a poll vote in his stead. The person so appointed need not be a member of the Company.

By Order of the Board,
THE BRITISH BURMAH PETROLEUM COMPANY LTD.,
F. S. PANTHAKI,
Acting Secretary.

NOBLE CHAMBERS,
PARSI BAZAR STREET, FORT,
BOMBAY, 6th November, 1959.

Transfer Books will be closed from 5th to 12th December 1959 (both days inclusive).

THE BELAPUR COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Transfer Books of the above Company will be closed from the 23rd day of November, 1959 to the 22nd day of December, 1959, both days inclusive.

By Order of the Board of Directors,
W. H. BRADY & CO., LTD.,
Managing Agents.

To the Shareholders of the Belapur Company, Limited, and in particular to:

Mr. William Abel,
M/s. Rajabali Hazam Paroo & Sons Ltd.

this ancient country to learn from the young United States in regard to soil conservation.

There is a widespread impression not only in this country but also in many parts of the old hemisphere that the U.S.'s agricultural prosperity is due to the fact that most of the land is virgin, having been brought under the plough in less than 100 years. This, to say the least, is an exaggeration, as anyone who tours the U.S. widely can testify. The U.S. farmers had to put in a tremendous amount of effort and capital to win from the land the prosperity they now enjoy and share it with others not only in the U.S. but also in the rest of the world. Even a 50-year-old virgin soil can become unproductive if it is not properly cared for. Likewise, a soil, which was once fertile but had become barren later due to neglect of man, can be brought back to prosperity, as the story of the T.V.A. has amply testified and as India's own river valley projects will prove, if they are wisely implemented and managed. Investments in American farms today aggregate \$200,000 million and most of it are owned assets, in the sense that agricultural indebtedness is no more than \$11 to each \$100 of assets. Apart from the immense growth of farm mechanisation, especially after 1948, the onward march of American agriculture is the result of intelligent handling of the soil, adequate irrigation, cross breeding to produce better species of grain or plant, development of disease-resistant plants and more extensive use of fertilisers which have been greatly improved without price increases.

Another misconception of American farming in this country is that farm holdings are of giant size. Actually, only 2.7 per cent. of farm holdings numbering 4.7 million in 1958 are of the size of 1,000 acres and above, 4 per cent. between 500 and 999 acres, the rest being as follows:

Under 10 acres 10.1 per cent., 10 to 20 acres 14.9 per cent., 20 to 40 acres 10.4 per cent., 40 to 99 acres 18 per cent., 100 to 179 acres 20 per cent., 180 to 259 acres 9.7 per cent., 260 to 499 acres 10.1 per cent.

It will thus be noted that 53.4 per cent. of farm holdings are of the size of less than 100 acres each.

A feature of American agriculture not widely known in India is that much of its spectacular progress took place in a shorter period than is generally realised, in the last two decades to be precise. Today, the American farm worker is able to provide enough food and fibre for himself and 22 others—two of them living in foreign countries. In 1945, he was able to supply for only 13 persons and in 1938 only 11 persons. The farm output per man-hour is more than twice as great as it was 20 years ago and more than three times the level before World War I. In 1958, American farmers produced 60 per cent. more wheat and 35 per cent. more corn than in 1938, though the area of cultivation for both crops had been reduced by more than 25 per cent. For 28 major field and fruit crops, the yield has advanced 40 per cent. in 10 years and 70 per cent. in 20 years. And, what is more, about 75 per cent. of the crop varieties grown in the U.S. today were unknown 20 years ago.

There have been comparable advances in both quality and quantity of livestock production. In the last 10 years, the output of livestock products expanded by 21 per cent. and today two-thirds of farmers' revenue comes from livestock. The output of dairy and poultry products also has increased. In 1958, American dairymen had three million fewer cows than in 1940, but each cow produced about two-thirds of a metric ton more milk, with production per cow exceeding 2,700 kilograms. As a result, today they account for one-third of the world's milk production. In the sphere of poultry, for every two eggs a hen laid in 1940, her descendant today is laying about three, with an annual average of about 200 eggs per hen. All this growth in farming is the result of remarkable technological advances and mechanisation. Between 1950 and 1958, the number of field tractors rose from 3.39 million to 4.68 million, an advance of 48 per cent., motor trucks from 2.20 million to 3.00 million, an increase of 36 per cent., grain combines from 714,000 to 1,040,000, that is, plus 46 per cent., mechanical corn pickers from 458,000 to 745,000, an increase of 63 per cent., and garden tractors from 216,000 to 390,000—a rise of 81 per cent. Great strides have been made in rural electrification; today 95 per cent. of American farms have electricity, whereas 20 years ago only 19 per cent. had it.

Such in brief are the achievements of agriculture under a free enterprise system in a short span of two decades. But all this has

been possible, thanks largely to the active support of the State. It is a moot point whether U.S. agriculture today would have attained the prosperity it has but for the Agricultural Adjustment Act of 1933 and the New Deal of the Roosevelt Administration. The American farmers' performance has helped them to double their expenditure on education and medical care and to increase food and clothing outlay between 50 and 70 per cent. A better picture of the living standards of American farm families can be had from the fact that 52 per cent. of them have telephones, 89 per cent. automobiles, 90 per cent. refrigerators, 39 per cent. home freezers, 84 per cent. power washers, 53 per cent. television and 64 per cent. running water. The high productivity of U.S. farms has enabled America to share its prosperity with other countries. Out of the total of Rs. 944.30 crores of U.S. Government assistance to India, no less than Rs. 665 crores have been in the form of food, fertilisers and technical knowledge useful to agriculture. No other country has helped, or could help, India on such a large scale when its own farms have been unable to feed its growing population.

It is now recognised by the powers-that-be that India can become a strong industrial power only if its agricultural base is substantially widened and strengthened. But the development of agriculture itself requires certain basic industries, including fertilisers and motor vehicles. In other words, the plan for industrialisation must adequately provide for the needs of a modern agriculture. This is a point that does not seem to have received adequate attention at the hands of our planners and policy-makers. If the World Agriculture Fair, in general, and the U.S. exhibition, in particular, open their eyes to the weak points in their approach to agricultural development, they will have more than served their purpose.

MR. G. D. BIRLA LOOKS AHEAD

It is a measure of the man that Mr. G. D. Birla seldom speaks without making people sit up and think. Indeed, it is a pity—or perhaps, it is not—that he does not speak more often. And when he addressed the Indian Chamber of Commerce, Calcutta, last week, he was again at his best. It is rather difficult to assess this doyen of Indian business men. There are apparently two strains in him—the practical industrialist, who has given this country some of its finest industrial enterprises, and the philosopher-statesman who, in a spirit of detachment, can look beyond immediate gains and losses into a somewhat distant future and bring to bear upon economic problems a serenity of outlook that reflects the best in India's traditions. In his Calcutta address, he allowed himself to think aloud. As was only to be expected, he made many thought-provoking observations which merit notice.

Advising business men to develop a broad outlook and look beyond their immediate problems, as any sound business man ought to do, Mr. Birla reminded them that the world was changing so fast that assumptions made yesterday had become out of date today. As an instance, he referred to the implications of Chinese incursions into India's borders to economic development plans. This development had, he said, made some assumptions in the third Plan out of date. The country now needed a plan which would lead to not only prosperity but also security. This discussion led him to consider the basic assumptions of socialism in Indian planning. In a rapid survey of modern economic history, he pointed out how the Russian revolution had served to spread the ideas of socialism. This revolution was followed by a fascist system in Germany and Italy, which was not very different from the Russian system, in that the authority in both systems was centralised. Britain too went socialist after World War II. But the British, a shrewd and prudent people, had given up socialism. One could not help feeling that the "verdict that is being given in foreign countries is against socialism." Russia itself was changing. For one thing, it had become a "bourgeois among the Communist countries." For another, it had not been happy with China. Above all, it was giving increasing importance to consumer goods. Mr. Birla said: "When people have enough to eat, when they have enough clothes to put on, when they have more consumer goods, the ultimate result is that there will be better appreciation of the importance of private initiative."

A great point Mr. Birla made was that underdeveloped countries tend to import not

only discarded goods but also discarded ideas. The U.K. had discarded socialism. The U.S. had achieved a high level of prosperity without it. W. Germany had built up its economy without recourse to socialism. Mr. Birla, however, recognised that, if the idea of socialism was dying, the idea of welfare state was growing. The U.S. today was the greatest welfare state in the world. If these countries had made rapid headway without treading the socialist path, or having travelled it some way, had given it up, the question was whether India should "take a route which is being discarded or may be discarded." At this stage of his argument, Mr. Birla chose to examine the plea, put forward by some Indian leaders, for an entirely different Indian approach. They said: "We have to devise our own methods, our own pattern, our own economics." This line of argument has a certain patriotic ring about it. After all, this ancient country, with its centuries of wisdom, could strike out a different path for itself. But does it work? As Mr. Birla put it, "In actual practice, it is not happening like this. We have put up big plants, including steel plants. . . . We may not admit it, but we are doing the same thing" which the Western countries have done for raising their living standards. The fact is that this country cannot hunt with the hounds of modern machines and also run with the hares of antiquated methods of production. Whether in the realm of ideas or social or economic set-up, a nation cannot be half modern and half prehistoric. This country would be indulging in a strange form of self-hypnotism, if it thought that it could somehow harmonise medieval methods of production with the highly integrated devices of automation. The future pattern of Indian economy, as Mr. Birla rightly said, "is bound to take the route which has been taken by other countries that have become prosperous."

An assessment of economic prospects for this country formed the concluding portion of Mr. Birla's speech. Here, he showed his robust optimism. He felt that the number of public companies, which was now about 30,000, would increase to one million in another five or ten years. He had no apprehensions about the availability of foreign exchange. If the U.S. and the U.S.S.R. cut down their defence expenditure, the money saved thereby would be available for underdeveloped countries. He said: "I have heard from a reliable source that there will be a steady inflow of help to this country, not just for the second Five-year Plan or the third Five-year Plan but a continuous and guaranteed inflow of assistance coming from all countries." He added: "It is upto the people with brains, initiative and enterprise to utilise this opportunity."

The chief difficulty for this country, according to Mr. Birla, will be not foreign exchange, but lack of technical personnel, and even more than that, it will be faulty administration. Explaining the administrative hurdles in the way of rapid pace of industrialisation, Mr. Birla pointed out that, if one wanted to start a new venture, one had to go to nearly 40 departments before one got the application processed and to another 30 departments before it was finalised; it "takes about 8 or 10 months before you are out of the woods." It was not the fault of the officials but of the system. He warned: "With this kind of administration no third, fourth or fifth Five-year Plan can succeed. . . . The whole administration is cracking." These, he it noted, are the remarks of a person who ought to know, for Mr. Birla has had to deal with this administration every day of his long and strenuous industrial career. He is also a staunch supporter of the party in power, so that none can say that these are the criticisms of Opposition levelled against the Government with a political motive. Surely, then, the defects in administration call for immediate attention by the Government. The entire administration should be streamlined. The real test of an administrator is not how many holes he has picked in an application but how many applications for industrial expansion he has processed. The men who deal with industrial blue-prints need more than a mere passion for official routine. They need imagination and foresight and, what goes with it, a helpful constructive attitude. It is true that such men are not trained in a day. But it is also true that, unless a determined and conscious effort is made to end the present system, which flies grow faster than mushrooms, a better one may soon come when the system will end as hopes of rapid industrial progress. Here, Mr. Birla has given something which must reach the Government, in general, and the Union State Ministries which deal with industrial particular, sit up and think.

MARKET GOSSIP

THE trend of the share market has become irregular. But for the slight recovery today, caused by speculative buying by some interested parties, it would have finished on a distinctly weak note. But, unmistakably, the market is wobbling, as the bulls are getting tired. Investment buying has slackened, apparently because the yields are unattractively low even for those who have made easy money in certain sectors of business, such as dyes, chemicals and papers. Rumours of a supplementary budget are rife, but they are unlikely to prove correct. The regular budget day is only 100 days ahead and very soon the budget officials of the Finance Ministry will start gathering data for the 1960-61 budget. Between now and February next, the increase in defence expenditure on account of Chinese aggression will not be so heavy as to necessitate a supplementary sanction from Parliament. Further, informed sources feel that the disposition of defence forces to meet the Chinese threat can be secured in a way without involving any large increase over the current level of expenditure. There is also no need to present a budget either for levying fresh excise duties or for increasing the existing ones. The Government has enough powers to do so, if it so desires.

A more important reason for the fall in equities this week is the reported directive of the President of the Stock Exchange to a few of the speculators, who had accumulated, in his opinion, heavy purchases in shares such as Indian Irons, National Rayons and Centurys, to reduce their commitments to a more reasonable level or face the risk of having to pay heavy margins. It is said that the President of the Exchange is now regularly collecting returns of outstanding business in the leading speculative counters, thereby keeping a close watch satisfactory way of dealing with excessive speculation. The proper thing to do would be to evolve and implement such controls as would automatically restrain, if not prevent, unhealthy speculation. The present system of margins on the Bombay Stock Exchange, as this journal has ere now pointed out, is ineffective, because it is mild and full of loopholes. What is the point in allowing operators to overtrade first and then try to subject them to penalties? A regulation of this nature tantamounts to handing over the bulls, with their tails and feet severely tied, to the bears. A stringent system of margins on daily outstanding business was long overdue.

L. I. C.'s Mode of Investment

It will be recalled that, some four months ago, a brief reference was made in these columns to the resignation of Mr. A. Subbiah from the then Investment Committee of the Life Insurance Corporation. It is regrettable to learn that not much has been done by the Government of India to look into the causes that led to his resignation which we know was not for his personal glory. We have sufficient evidence to believe that he took great pains to ensure that the L.I.C.'s investments were made in an appropriate manner and at appropriate time. It is a great pity that the reforms suggested by him to improve the L.I.C. have been ignored and that the Corporation continues to follow the same old ways. It would be a good thing, therefore, if the Finance Minister were to appoint a small Parliamentary Sub-Committee, consisting of experienced members such as Mr. Mahavir Tyagi, Pandit Kunzru, Mr. P. N. Saprui, Dr. A. Krishnaswami, Mr. M. R. Masani, Mr. Balvansray G. Mehta, and Mr. R. R. Morarka to enquire into the manner in which the L.I.C. is making investments. He can refer the report to him to this Committee as part of the material for enquiry.

The following are some of the defects which Mr. Subbiah is said to have found during his brief (honorary) service for a period of eight months as a member of the Investment Committee:

There is too much uncontrolled concentration of power without responsibility in the hands of top executives.

The Board of the L.I.C. is not in a position to check the abuses in the L.I.C. Nor is the Investment Committee given sufficient time to be effective. Several investments have been made in a slipshod manner. Both bodies are presided over by the same person who plays the dual role of Chairman and Chief Executive of the Corporation.

The Government, which owns the institution, has fettered itself with the policy of non-intervention, more so after the Mundhra episode; apparently, this is a case of once bitten, twice shy. Accordingly, the chief executives have powers of dealing with enormous funds and of patronage on an unprecedented scale.

The policies and procedures actually adopted by the Corporation for investing its funds are contrary to recognised business principles, against all sound canons of insurance investment and weighted heavily in favour of outside interests to the detriment of the interests of policyholders.

The administrative machinery is none too efficient to handle the complicated task of investing the shares of hundreds of companies engaged in a number of different industries.

It would appear that Mr. Subbiah has given in his report to the Finance Minister quite a number of examples to illustrate the points made above, and also supporting evidence to justify his criticisms. His report is a comprehensive one, covering all the investment aspects of the Corpo-

ration, not merely investments in shares of joint-stock companies.

The greatest defect in the procedure for making investments is that the Corporation is liable to be misled by interested parties who want to get rid of their investments at higher prices. This has happened before and that, too, after the Mundhra episode. The Investment Committee meets once in a few weeks for a couple of hours to consider the offers from brokers; invariably these number a couple of hundreds. The executive in charge of the Corporation's investments simply presents the offers without scrutinising them or making any recommendations. He does not even provide the necessary background information pertaining to the scrips included in the offers. The members of the Committee are not given any advance information by the Corporation about these offers, so that before going to the meeting they do not know (unless some of them have been informed earlier by the brokers who have offered the shares) what shares they would be asked to consider and buy. In this way, even the best investment brains cannot take a judicious decision on anything between 150 and 200 offers. It is a wonder, therefore, how the Committee has been passing a verdict on these offers within such a short time.

Further, this procedure means that the Corporation has scores of investment advisers and has no mind of its own. It would be interesting to know whether the Corporation has at any time bought any shares as a result of its own investigations and selection. It does no original thinking of its own in regard to its investments in shares. This was not the way in which insurance companies before nationalisation were investing their funds. If this wrong practice is kept up, the Corporation will be loaded with all sorts of shares and miss some of the right ones. There is, therefore, an urgent need for changing this practice in favour of one under which the Corporation will invest not on the basis of offers to sell but on that of its expert study and selection. In fine, the initiative should come from the Corporation and not from the brokers who decide well in advance what they should sell to the Corporation and manipulate the market to suit their decision.

Denationalisation in Germany

A further step towards "people's capitalism" is likely to be made in W. Germany by the autumn 1960. After long and weary negotiations, a plan has now been shaped partly to denationalise the famous Volkswagen Works. They are one of the largest automobile plants in the world, having reached an annual production of 557,000 cars, and a turnover of 2,720 million DM. last year. Since its beginning, the plant has been Government-owned. It now seems to be agreed that the plant will at least in part be sold to private shareholders, thus making the Volkswagen plant a real "people's plant."

The real value of the enterprise is presently estimated at 1,500 million DM. Its total capitalisation, however, still amounts to a mere nominal 60 million DM. The Government plans to transform the plant into a joint-stock company and then to raise its share capital to between 600 and 750 million DM.

The plan provides that 80 per cent. of the increased share capital will be offered for sale to the public by issuing small shares of 100 DM. nominal value, to be sold at some 200 DM. each. The sale of these shares is, however, at first to be reserved to persons with an annual income of not more than 18,000 DM. Small wage or salary earners, in addition, are likely to be given an attractive "social discount" of 12 to 20 per cent., according to their income and family status, with the condition not to sell their stock within the next two years. The remaining 40 per cent. of the future share capital will equally be divided between the Federal Government and the Lower Saxony State Government, in whose jurisdiction the Volkswagen plant is located. The receipts from the sale of the shares to the public as well as future dividends of the 40 per cent. remaining State property are to be transferred to a Foundation for the promotion of science and research.

People's Capitalism

An impressive increase in the share-owning population from the present 12,500,000 to 20,000,000 in the U.S. in the next decade was forecast by Mr. Keith Funston, President of the New York Stock Exchange, in a speech at Chicago last week. The U.S., which has the largest property-owning population in the world today is likely to expand its national income still further in the years to come. Mr. Funston estimated that in 1970, corporations might be distributing \$20,000 million in dividends, as against last year's \$12,400 million. By the end of the next decade, the U.S. could witness a 35 per cent. increase in dispensable personal income per family, an annual production of 10 million cars and a gross national product of \$700,000 million. The Stock Exchange President stressed that the country was "also up against stupendous stumbling blocks" to future progress. He listed these as inflation, unrealistic tax structure, and an "apparent unwillingness to eliminate feather-bedding and high cost production."

All this increase in national wealth and production would, of course, mean more activity on the stock exchanges in the U.S. Mr. Funston predicted an increase in stock exchange work-force

from the present 67,000 to 100,000. Turning to the technical aspects of the working of the exchange, he said that, because of development of electronic equipment, it might be possible to flash instantaneously the latest prices of stocks to the world of investors from the exchange floor. High-speed computers might also determine the high and low prices of the day and automatically transmit complete data to quotation boards across the country. Transactions also might be handled faster, with orders by voice on one end of a phone wire apt to appear as a printed message on the other.

A Novel Credit Scheme

The well-known British house of travelling agents, Messrs. Thomas Cook and Son Ltd., London, has introduced a novel credit scheme which will facilitate travel by British business men in any part of the world. The scheme provides for the issue of what is called a "Cook's Letter of Authority" to a business man in the U.K. at the request of his company. Any traveller possessing this Letter need not pay individual bills for items like rail, road, sea and air services, hotel accommodation and car hire, the charge for such services being passed back to Britain for payment in sterling by the traveller's company. No extra charge will be levied for the credit facility which can be availed of by all Cooks' account customers. Besides this scheme, Cooks propose to offer shortly individual travellers' cheques in denomination of £50 and to include in cheque books a blank "booster cheque" through which the traveller can obtain further supplies of currency. These new facilities, together with the virtual ending of currency restrictions for British travellers by the U.K. Government, will doubtless go a long way towards ensuring better personal contacts between the U.K. business men and their confreres in other countries.

Two Good Speeches

Investors in equities will be well advised to read the speeches of Dr. A. Ramaswami Mudaliar and Lala Bharat Ram, published elsewhere in this issue. Dr. Ramaswami has clearly brought out the effects of the new system of company taxation on dividends. He has shown that it is more disadvantageous to investors, especially small investors, than the old one with all its obnoxious principles. His remarks are borne out by the dividends of several companies in recent weeks. Even a well-established and financially strong company like Belapur could not maintain its status quo in regard to dividends. Now that there is growing evidence that the assumptions made by the Finance Minister have not been borne out by facts and that the Treasury is taking away much more from tax payers than it gave by abolition of excess dividends tax, and wealth tax and reduction of income-tax, the Government ought to modify the tax system in an equitable manner.

The speech of Lala Bharat Ram is valuable for its frank and correct assessment of the Government's policy in regard to sugar and cotton textile industries. His observations are supported by several other millowners whose speeches we have published in some of our previous issues. The medium and coarse count mills are faced with the problem of dearer cotton. The high levels at which the equities of several leading cotton mills are now standing are giving a misleading picture of the industry's position. Lala Bharat Ram has also brought out the point that sugar mills have not been making the large profits they are alleged to be doing.

No More Sugar Exports

The categorical declaration by Mr. A. M. Thomas, Union Deputy Minister for Food, in the Lok Sabha on Tuesday this week that the Government does not intend to export any more sugar, is an important policy statement. If this wisdom had dawned on it two years ago, the sugar situation would have been a little easier and one of the factors that helped prices to go up would not have existed. It must be noted here that it was not so much the actual quantity of sugar exported that influenced the prices in an upward direction as the Government's intention to export 100,000 tons to 200,000 tons. What is more, the Government insisted on this policy, even when the facts were clear that there was no sugar for export. The virtual abandonment of this policy came only after all possible damage had been done.

From the market point of view, Mr. Thomas's statement is of no practical significance for two reasons. One, it cannot influence the trend of sugar markets in any way, because the commodity has been brought under practically complete official control over distribution and prices. Two, world sugar prices continue to rule depressed in view of a surfeit of supplies, so that the chances of India selling sugar are extremely slender even if it wants to. It will be recalled that, during the season 1958-59, the actual exports of sugar from India aggregated no more than 19,000 tons (as against the original quota of 50,000 tons which was later reduced to 28,000 tons) even after the full remission of excise duty and cane cess, together, amounting to over Rs. 342 per ton, and the subsidy of about Rs. 55 per ton on export sales given in the form of higher internal prices.

The weakness of the world sugar market persists, despite a series of "block sales" reported to have been arranged during the first ten days of this month. Cuban raw sugar at New York now stands at 2.98 cents per lb. (f.o.c. Cuba), that is, 19 points below the best level of 3.17 cents reached early last month. Similarly, spot sugar in London is lower at £274 per ton (Rs. 367), as against the high level of £283 (Rs. 383). Sugar observers are inclined to feel that the prospect of a revival is

(Continued on page 879)

EQUITIES ERRATIC GOOD RECOVERY AT CLOSE

(From Our Own Correspondents)

BOMBAY, 19th November

EQUITIES on the Stock Exchange presented a highly erratic trend during the week under review. Earlier in the week, the market displayed a tendency to regain part of the ground lost in the previous week and the new account which opened on Monday also reflected the revival of sentiment. From Tuesday onwards, however, the enthusiasm was subdued and a reactionary trend set in, due to the postponement of the rights issue of the Century Mills to 1960 and fears of an interim budget and imposition of further tax levies. There were widespread rumours that the heavy military expenditure to guard the Indo-China frontier and the heavy cost of implementation of the Pay Commission's recommendations might necessitate the levy of additional taxation. Reports of the encouraging position in respect of cloth stocks with mills failed to arrest the downward trend. Towards the close, again, there was a recovery on heavy covering by those who had sold short in the past two days. On balance, some of the leading scrips more than made good the earlier losses.

The Century Spinning and Manufacturing Company, Ltd. has announced that it is not possible for it to issue the rights shares during the current year, for want of sufficient time to fulfil the necessary formalities. The Company has, therefore, sought the permission of the Controller of Capital Issues for issuing the shares early in 1960, as required by the C.C.I. in his earlier order sanctioning the issue.

The recent issue of the Baroda Rayon Corporation Ltd. has received an overwhelming response, the number of applications received by it being 53,000 for over 840,000 shares of Rs. 100 each. The amount offered was Rs. 1.59 crore. The Company is said to have drawn lots for the purpose of allotment, in consultation with the Stock Exchange. Details of allotment are not yet known.

The Mukand Iron and Steel Works Ltd. has received permission for increasing substantially its steel-making capacity. The estimated capital investment on this project is Rs. 12 crores, of which Rs. 60 lakhs in the required currency will be provided by the I.C.I.C. as loan to meet the foreign exchange cost. A part of the rupee finance will be raised by the issue of fresh equity capital.

The Amar Dye-Chem is expected to issue right shares early next year to provide part of the rupee finance for its expansion programme, estimated to involve an outlay of Rs. 50 lakhs. The I.C.I.C. has agreed to provide the Company with a loan for financing the foreign exchange cost of the scheme.

To revert to the trend of the market. In the steel section, Tata Ordinaries moved up early in the week from Rs. 155.50 to Rs. 156.75, at which level there was heavy unloading bringing the shares down to Rs. 152.75 yesterday. Today, however, they regained to close at Rs. 154.75. The rights were done at Rs. 2 lower at Rs. 70. Indian Irons finished at Rs. 23.85 with a loss of 24 p to the week; they had touched a low of Rs. 23.68 earlier. After a dip from Rs. 17.60 to Rs. 17.40, Mukand Irons firmed up to Rs. 18.16 on reports of encouraging results for the year ended March 1959 and on news that the Company had received sanction for its expansion programme.

Notwithstanding the setback in the past two days, textile shares made a good show with an all-round rise in prices over the week. Wide fluctuations marked trading in Centurys, which, after firming up from Rs. 624.50 cum-div. to Rs. 630.50 ex-div., staged a retreat to Rs. 610 yesterday. Today, however, the shares gained ground to Rs. 625. Bombay Dyings closed at Rs. 65.60 (as against Rs. 65.10 a week ago) after receding to Rs. 67.70. Kohinoors rallied from Rs. 321 to Rs. 333.50 before giving way to Rs. 323. At the close they regained to Rs. 329. Central Indias gained Rs. 2 to Rs. 112, while Finlays shed Rs. 2 to Rs. 300 and Gokaks Rs. 3 to Rs. 164. At Rs. 2.50 ex-div., Morarjees showed a loss of Rs. 6.95. Shree Niwas Cottons lost Rs. 2 to Rs. 232. In line with the general trend, Simplex recorded a gain of Rs. 7 to Rs. 168 and Standards Rs. 31 to Rs. 678.

Barring a rise of Rs. 9 to Rs. 329 in Belapurs, sugar shares were quiet. Walchandnagars were down by Rs. 5 to Rs. 315, Kesar Sugars by Rs. 3.50 to Rs. 66.50 and Maharashtra Sugars by Rs. 9 to Rs. 255.

Cement shares were featureless with fluctuations confined to a narrow range. Associated Cements were a shade lower on balance at Rs. 154.25. Digvijays lost a rupee to Rs. 149. Orissa Cements were listless at Rs. 13.64, and Jaipur Udyogs at Rs. 10.60.

Fears over dividend prospects brought down Scindias from Rs. 17 (to which level they had risen early in the week from Rs. 16.84) to Rs. 16.72, but in today's rally, they came up to Rs. 16.92. Great Easterns lost over the week 36 p to Rs. 19.08. In the automobile group, Premier Autos were steady at Rs. 141 and Hindustan Motors at Rs. 13.52.

The highlight of the miscellaneous section was provided by Bombay Burmahs. After sharp rise from Rs. 537.50 to Rs. 550.50, the old shares gave way to Rs. 540. The publication of the accounts for the year ended May 1959, which disclosed encouraging results, pushed them up to Rs. 552 today. The Partly-paid gained over the week Rs. 3 to

Rs. 191.25. National Rayons hardened early in the week from Rs. 377.50 to Rs. 385, but fears of an increase in excise duty in case of an interim budget being presented caused a setback to Rs. 363. At the close, however, they recovered partially to Rs. 369. Gwalior Rayons were steady at Rs. 24.52. Barring Amar Dyes, which recorded a further rise of Rs. 15 to Rs. 290, the dyes and chemical shares presented a reactionary trend. Colour Chems lost Rs. 7 to Rs. 235, Indian Dyestuffs Rs. 30 to Rs. 370, Poly Chems Rs. 14 to Rs. 168 and Dhrangadbras Re. 1 to Rs. 158.50. Tata Chemicals were lower by 28 p to Rs. 17.28. Tata Oils shed Re. 1.30 to Rs. 60.50. Coat Tyres Rs. 6.50 to Rs. 164.50 and Khandelwal Ferro Alloys Rs. 850 to Rs. 75. Voltas were Re. 1.50 higher at Rs. 179 and Wameos gained Rs. 3 to Rs. 231.

Calcutta Stock Exchange

CALCUTTA, 18th November

Irregular conditions were in evidence on the Calcutta Stock Exchange during the week under review. Earlier in the week, after a period of hesitancy, fair support was accorded to jutes and teas, which recorded fair gains. A spell of dullness soon overshadowed the market and trading was on a restricted scale. Quiet advices from Bombay had their impact on local sentiment.

The announcement of increased retention prices for pig iron and steel was noted, but this in itself could not lead to an improvement in sentiment in the speculative counters. For this announcement was only anticipated for some time now. Other engineering shares were also quiet, but teas commanded good attention and several features followed. This was due to the steady rise in tea shipments and improvement in local and London auction trends. The low level of tea stocks in the U.K. was also a favourable factor. The decline in the stock of finished goods with mills lent cheer to trading in jutes.

Jutes were earlier steady following the announcement of a sound statistical position of goods, but anxiety following unrest among jute mill workers caused diminishing of interest as the week progressed. Following interested support, Lawrences spurred to Rs. 153 from Rs. 146.50 previously. At Rs. 214, Kinnisons gained 4 points. Nuddas gained to Rs. 62.50 from Rs. 61.75 before closing at Rs. 60. Birlas were taken up to Rs. 26 from Rs. 25.44, to close at Rs. 25.95. At Rs. 6.75, Presidencies were fractionally higher on balance. From Rs. 186 previously, Barnagores receded to Rs. 180.

Tea shares were earlier fully steady, but subsequently there was profit-taking. The details of the more important gains registered over the week are as follows:

	Opening Rs.	Closing Rs.	Gain Rs.
Banarhat	227.00	219.00	8.00
Hoolungoorle	182.00	202.00	20.00
Hantapara	141.00	147.00	6.00
Birpara	162.00	187.00	25.00
New Dooars	206.00	228.00	22.00
Patrakola	170.00	175.00	5.00
Ranicherra	17.25	19.75	2.50
Bedian	28.00	24.02	1.62
Hudibari	22.44	25.12	2.68
Gungaram	148.00	150.00	2.00
Methodi	22.81	23.62	0.81

Among engineering, Indian Irons opened at Rs. 24.18 and, after being better at Rs. 24.28, gave way to close at Rs. 23.85. Texmacos were quiet at Rs. 24.75, while Guest, Keen Williams hardened to Rs. 40.12 from Rs. 39.50. Jessop & Cos. were fractionally higher at Rs. 34, while Braithwaites changed hands at Rs. 26.75, as against Rs. 26.62 previously.

A fair number of features were recorded in the miscellaneous industrial section earlier in the week under review. Angelo Bros., on unsatisfied demand, gained to Rs. 21 from Rs. 19.87 to close at Rs. 20.19 on profit-taking. Despite maintenance of dividend at 10 per cent, India Steamships were quiet at Rs. 13.44. This was attributed to the note of caution as regards prospects in the Directors' report. Hindustan Levys were fractionally higher at Rs. 33.75. Dunlop Rubbers were steady at Rs. 36.25. From Rs. 4, Indian Coppers fell to Rs. 3.92. Orient Papers opened at Rs. 38 and after giving way to Rs. 37.40 closed at Rs. 37.75. Hindustan Motors after being higher at Rs. 13.81 receded to Rs. 13.56. At Rs. 22.81, Indian Aluminiums were higher by a few p, while Indian Cables gave way to Rs. 30.87 from Rs. 31. At Rs. 26.50, Rohtas Industries disclosed a loss of 31 p.

Madras Stock Exchange

MADRAS, 18th November

Barring rubber and tea shares, which elicited good investment support, the Madras Stock Exchange ruled easy during the week under review. The volume of business put through was limited. In particular, textiles suffered a distinct setback owing to persistent profit-taking. Even reports indicating continued high level of offtake had no effect. Coffees also came in for selling. Miscellaneous industrials, too, were subdued, as buyers were scarce. The sugar section ruled irregular. Thus, some shares were subjected to selling pressure and staged a retreat, while a few selected scrips met with support.

Among sugars, Cauverys climbed down from Rs. 136 to Rs. 132.2. Similarly, K.C.P.s fell by

Rs. 3.32 to Rs. 17.68. Travancore shed 10 p to Rs. 11.60. Indias were neglected at Rs. 12.90, as also Kirlampudis at Rs. 77. Mysore at Rs. 53.50. E.I.D.s, however, rose by 80 p to Rs. 44.55. Andhras gathered 50 p to Rs. 23.50. Deccans put on 14 p to Rs. 13.67.

Tea shares tended to move up. Blue Mountains advanced 12 p to Rs. 345. United Nilgiris hardened by 10 p to Rs. 20.40. Chembras and Coonoors improved by 5 p each to Rs. 3.85 and Rs. 24.40, respectively. Periakaramalais were a shade better at Rs. 3.74. Nonsuch Teas were fully steady at Rs. 27. Neelamalais at Rs. 4.88 and Ouchterlons at Rs. 5.50. Nelliampathys and Parkside were firm, the former at Rs. 3.05 and the latter at Rs. 25.60. But Halleyburys sagged by 10 p to Rs. 16.25. K.R. Kottagiris lost 3 p to Rs. 8.92. In the rubber group, Rajagiris spurred by 25 p to Rs. 19.25. Kailasas strengthened by 15 p to Rs. 5.10. Cochin Malabars hardened by 10 p to Rs. 7.20. Midlands improved by a like amount to Rs. 12.50. Pullangodes gained 4 p to Re. 1.82 and Thirumbadis 3 p to Re. 1.92. Malankaras were fully maintained at the last week's level of Rs. 17.65. Travancore Rubbers at Rs. 14.62 and Teakys at Rs. 7.50. Peninsulars were unaltered at Rs. 23. The Directors of the Company have announced a final dividend of 7½ per cent, making a total of 20 per cent, for the year ended February 1959, as against 15 per cent for the previous year. Coffee shares, however, generally drifted lower. Coffeelands lost 65 p to Rs. 25.10. Consolidated Coffees declined by 41 p to Rs. 24.18. Wartyhulls receded by 5 p to Rs. 3.72. Anaparis were dull at Rs. 5.25 and Balmadies at Rs. 2.75.

Textiles as already mentioned, moved downwards. Bangalore Woollens fell by Rs. 7.50 to Rs. 198.50. Buckinghams dropped Rs. 6 to Rs. 200. Coimbatore Pioneers declined by Rs. 5 to Rs. 325. Coimbatore Cottons and Dhanalakshmis receded by Rs. 4 each at Rs. 158 and Rs. 223, respectively. Rajalakshmis eased by Re. 1.50 to Rs. 65. Rang Vilas lost a similar amount to Rs. 44.50. Cambodias shed 20 p to Rs. 10.90. Kotharis 10 p to Rs. 11.50 and Trichinopolys 5 p to Rs. 11.

In the miscellaneous section, Textools were marked down by Rs. 4 to Rs. 187. Rallis lost 50 p to Rs. 87. Orissa Cements eased by 13 p to Rs. 13.75. Spencers and Ashok Leylands were lower by 10 p each at Rs. 19.40 and Rs. 7.60, respectively. Dalmia Cements decreased by 9 p to Rs. 10.31. Mysore Chemicals and Fertilisers shed 7 p to Rs. 10.43. Indian Steel Rollings were quiet at Rs. 13.40. Mettur Chemicals at Rs. 12.62 and Western India Plywoods at Rs. 243. Travancore Chemicals, however, elicited special enquiries and advanced by 38 p to Rs. 16.25. Parrys gained 23 p to Rs. 4.30.

Notice

THE SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LIMITED

(Registered Office:

Power House, Tennur High Road, Tiruchirappalli)

NOTICE

Issue of 1,40,000 Equity Shares of Rs. 10 each at par

(Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinion expressed with regard to them.)

THE Directors have sanctioned the issue of 1,40,000 Equity shares of Rs. 10 each at par. This issue is offered to the holders of Equity shares registered in the books of the Company as on 26th November 1959 in the proportion of 1 (one) new share for every 4 (four) Equity shares held on that date. Last date for receipt of applications with remittance will be 7th January 1960. Circulars and forms of application are being posted to the shareholders at their respective addresses recorded in the Company's books.

The Equity shareholders are requested to intimate to the Registered Office of the Company in case of non-receipt of circulars and forms of application on or after 2nd December 1959.

First or Second Preference shareholders are not entitled to participate in this issue unless they hold letters of renunciation from Equity shareholders.

The Register of Members and Share Transfer Books of the Company will be closed from 26th November 1959 to 5th December 1959 (both days inclusive).

(By Order of the Board of Directors)

SESHASAYEE BROTHERS (PRIVATE) LIMITED

Managing Agents & Chief Engrs.

TIRUCHIRAPPALLI, 9th November, 1959.

NEWS IN BRIEF

THE final report of the Wage Board for Sugar Industry is expected to be submitted in September 1960.

Imports of dried and fresh fruits, asafetida, cumins seeds and medicinal herbs from Afghanistan have been stopped with effect from the 17th inst.

Negotiations for the supply of one million tons of iron ore from India to Czechoslovakia have been completed, according to Mr. Satish Chandra, Deputy Minister for Commerce and Industry.

The Government of Mysore is currently considering a proposal to set up an aluminium plant and a rayon pulp factory in Belgaum district, according to the State's Chief Minister, Mr. B. D. Jatti.

The Assam Oil Company has announced that two more oil wells, below depths of 10,000 feet, have proved successful at Nahorkatiya. The drilling of one well was completed in the first week of September and the other early last month.

India had an adverse balance of trade to the tune of Rs. 9.12 crores during September 1959. Exports of merchandise (excluding overland trade with Nepal, Tibet, Sikkim and Bhutan) amounted to Rs. 60.11 crores and re-exports Rs. 16 lakhs. Imports aggregated Rs. 69.33 crores.

Walnut, hopea, Indian elm and Himalayan pencil cedar are among the important timber plants dealt with in the fifth volume of the *Wealth of India*, an encyclopaedic work, recently published by the Council of Scientific and Industrial Research.

The Government of India has decided that supplementary licences for import of dates should be granted to established importers on an ad hoc basis during the current half-year. Established importers are already given licences for import of dates on the basis of 7½ per cent. quota.

A three-man technical sales team, representing the Westland Aircraft Ltd., of Yeovil, England—the largest helicopter producers in Europe—has arrived in India for discussions with the Government of India. The purpose of the visit is to show how British helicopters can meet the varied operational requirements of the Indian armed forces.

The Enforcement Directorate in the Union Ministry of Finance adjudicated 36 cases of contraventions under the Foreign Exchange Regulation Act during the months of September and October 1959. An aggregate penalty of Rs. 24,951 was imposed on various parties, including proprietors and partners of firms, companies, etc.

The Leather Export Promotion Council will continue to be the controlling authority for the grant of Essentiality Certificates to the tanning industries located in the Madras State for the period October 1959-March 1960. In the case of other areas, the States' Directors of Industries concerned will continue to certify the requirements of tanning industry.

The Government of India has decided to issue licences for the import of copper and zinc ingots on weight basis against export of brass semis. Registered manufacturers-cum-exporters are required to export within six months of the importation of the licensed articles, finished brass goods equal to one ton in weight for every 1.05 ton of materials licensed under this scheme. Out of this total of 1.05 ton, a maximum of upto 70 per cent. in weight may be permitted for copper ingots and the balance for zinc ingots.

The number of cars produced by the different automobile manufacturers during the first nine months of 1959 was 8,080. The number of jeeps and trucks (including buses) produced was 3,942 and 13,672, respectively. The percentage of indigenous content ranged from 48.4 in the case of Standard 10' car to 83.4 in the case of Hindustan Ambassador car. These percentages are worked out by comparing the c.i.f. price of the imported components with the ex-factory cost of the vehicle in the country.

The Central Warehousing Corporation has tentatively fixed the target for storage capacity in the third Plan at 1.5 million tons, as against the capacity of 200,000 tons expected to be achieved at the end of the current Plan. The fulfilment of this capacity is estimated to entail a total outlay of Rs. 154 crores. Apart from meeting the routine demand for foodgrains from traders and the Government, it is proposed to set up about twenty specialised warehouses for cold storage and for handling products, such as gur and tobacco, in different parts of the country.

Co-ordination between the Central and State Governments for the purpose of having a single system of motor vehicles taxation and regional permits to enable people to travel more freely within the country were stressed by Dr. P. Subbarayan, Union Minister for Transport, while inaugurating the Federation of Indian Automobile Associations at New Delhi on the 12th inst. Meanwhile, it is reported that as suggested by the Centre, most of the State Governments have agreed to the principle of levying a single-point tax in the matter of motor vehicles taxation. The U.P. Government, however, has not accepted the proposal. While the Madras Government has no objection, the levy is allowed on vehicles entering the State. Bombay has agreed to the suggestion, but in regard to public carriers.

The total value of minerals produced during first half of 1959 is estimated at Rs. 72 crores, against Rs. 72.3 crores in the corresponding period of 1958. The decrease of Rs. 20 lakhs was

PERSONAL

MR. B. R. Sen, Director-General of the U.N. Food and Agriculture Organisation, has been re-elected for another term of four years.

Mr. P. Dasgupta, First Secretary, Indian Embassy at Peking, has been re-assigned to the Indian Embassy in Belgrade, Yugoslavia.

Mr. S. Ramachar, General Manager, Hindustan Ideal Insurance Company Ltd., Madras, has returned from a business tour of the U.K. and the Continent.

Mr. H. N. Robinson and Mr. S. N. Banerjee have been elected President and Vice-President, respectively, of the Advertising Agencies Association of India for the ensuing year.

Mr. S. K. Patil, Union Minister for Food and Agriculture, has returned after attending the recent annual session of the Food and Agricultural Organisation held at Rome, Italy.

Dr. Nabagopal Das, Director-General of the Employers' Federation of India, has left for Cologne to attend a meeting of the International Labour Organisation's advisory body on salaried employees and professional workers to be held there on the 23rd inst.

Mr. S. B. Warder, Chief Electrical Engineer, British Transport Commission, will arrive in Bombay on the 27th inst. He has been invited by the Indian Railways to give lectures on the U.K. Railways' electrification techniques. He is scheduled to leave India by the middle of December.

Prof. Norman Hunt, who holds the Chair of Organisation of Industry and Commerce at Edinburgh University in the U.K., will arrive in India at the end of next month for a seven-week study tour at the invitation of the Government of India. He will be a member of an expert committee now being set up by the Government to consider the reorganisation of education for commerce in this country.

The world's first major scientific conference on problems of disposal of radioactive waste was held at Monte Carlo, U.S., from the 16th to 21st inst., under the joint auspices of the International Atomic Energy Agency and the U.N. Educational, Scientific and Cultural Organisation. More than 200 experts from about 30 countries attended the session. They included geologists, oceanographers and fisheries experts, as well as scientists from the I.A.E.A., the U.N.E.S.C.O., the Food and Agriculture Organisation, the World Health Organisation and the World Meteorological Organisation. They discussed the problems of disposal into the sea and land of radioactive waste resulting from the peaceful uses of atomic energy.

The General Electric's research laboratory at New York has evolved a process for manufacturing synthetic diamonds, called synthetic 'sparklers,' on a commercial scale. These diamonds are claimed to be better suited for some industrial uses than natural diamonds, which are pure carbon crystallised in the bowels of the earth under enormous heat and pressure. The laboratory used a molten metal catalyst which acted as a thin film between the carbon and the growing diamond crystal and by employing a new machine capable of producing superpressure (upto 1.8 million lbs. per square inch) and high temperature (upto 4,400° F.). The General Electric Company commenced the production of synthetics in 1957, but actual information was not disclosed until recently, when a Government security ban was lifted.

Several measures designed to stimulate private savings in the Netherlands have been outlined in a White Paper, published by the Government. One of the measures pertains to the grant of tax-free premium of 20 per cent. over a five-year period to be paid from public funds on savings with a maximum of Fls. 400 (about £37) per person per annum. This will be in addition to normal interest. The other measures cover profit-sharing schemes in industry, tax concessions and abolition of stamp duty as well as registration duty for special new investment companies which spread share-owning among the public. Together with the Government savings scheme for young people, already in operation, and the Civil Service savings scheme, now being prepared, the new measures are estimated to cost the Exchequer about Fls. 65 million (£6.1 million).

The World Bank has granted two loans amounting to \$44 million to assist in the modernisation and expansion programme of the two largest steel companies in Japan. The loans have been made to the Japan Development Bank, which will re-lend the proceeds thus: \$24 million to the Fuji Iron and Steel Company, Ltd., and \$20 million to the Yawata Iron and Steel Company, Ltd. Private banks in the United States participated in both the loans without the guarantee of the World Bank. The World Bank loan will cover about 32 per cent. of the total cost of the project which is estimated at the equivalent of \$75.5 million. Both loans are for a term of 15 years and bear interest of 6 per cent. per annum including the 1 per cent. commission which is allowed to the Bank's special reserve. Amortisation of the loans will begin on 15th January 1962. The loans are guaranteed by the Government of Japan. The Bank has now made 18 loans aggregating \$298 million for the development of electric power, agriculture and industry in Japan. Earlier loans for the steel industry amounted to \$100.9 million and financed a portion of the expansion programme of five of the largest companies; among them, the Yawata Company is now borrowing for the second time.

From Abroad

The U.K. is planning to lay a telephone-cum-television cable round the world in co-operation with other Commonwealth countries. A second transatlantic cable to Canada is also proposed to be laid in 1961.

The steel industry in Britain is now working at nearer to capacity—that is, at about 92 per cent.—than at any time in the past eighteen months. Its output went up by 20 per cent. last month, as compared with the corresponding month in 1958.

A private member Bill which seeks to amend the existing Companies Act 1948 so as to protect the small investor by controlling the solicitation of money from the public and other measures has been presented in the British House of Commons.

The British Iron and Steel Board plans to reduce by halfpenny a ton the levies payable on the industry's production. These levies provide the Board with the funds necessary to meet its own expenditure. The new rate will be 2½d. a ton on steel ingots and 2d. a ton on leviable iron.

Pakistan and the U.S. have signed a treaty of friendship and commerce. The treaty is the eighteenth of its type entered into by the U.S. since the last war. It, however, differs from the previous treaties, in that it does not include provisions covering shipping navigation.

The State of Singapore has been unanimously admitted a full member of the Colombo Plan, it was announced from Jogjakarta, Indonesia, where a ministerial conference of the member-nations took place last week. Singapore was proposed as a full member and was accepted by the United Kingdom, and seconded by Indonesia and the Philippines.

Talks have begun on the proposed Asian Highway linking Saigon and Singapore in the east with Teheran in the west. This was disclosed by Mr. U. Nyum, Executive Secretary of the U.N. Economic Commission for Asia and the Far East, while speaking at the Colombo Plan Conference held at Jogjakarta, this week.

The U.N. Food and Agriculture Organisation has approved of a budget of \$21,536,850 for the year 1960-61, which is 10 per cent. higher, as compared with the budgets for the last two years. Over three quarters of the budget will be contributed by the 88 member-States of the F.A.O., the rest being provided by the U.N. and other sources.

The number of new automobiles sold in the U.S. in the first nine months of 1959 was 4,635,946, which is far greater than that for any similar period since 1935. Of these, Chevrolet sold 1,145,882 cars. Ford was second with sales of 1,104,774. By leading companies, General Motors accounted for 43 per cent. of the market, Ford for 27 per cent. and the Chrysler Corporation for 10 per cent.

The U.S. Agricultural Department has reported that the economic outlook both in the U.S. and abroad is favourable to expand world agricultural trade. It has also predicted that the U.S. agricultural exports in the year ending 30th June next will be about 8 per cent. higher than those in the year ended 30th June, most of them because of heavier exports of raw cotton. Foodgrain exports, which set a new record in 1958-59, may even be higher this year. The movement of rice overseas also is expected to increase. But shipments of wheat flour and tobacco are likely to decline.

The Commonwealth Development Finance Company has announced the establishment of a new investment concern, called the Investment Company of Nigeria Ltd., in Lagos, at the request of the Nigerian Government. The new company, which enjoys the support of the C.D.F.C., the British Colonial Development Corporation and the established Nigerian and U.K. companies, will promote the flow of industrial development capital by mobilising private capital and applying it to schemes in all parts of the country. Its authorised capital is £5 million, of which £1 million is to be issued shortly.

COMMUNITY PROJECTS

IN its report, in which praise is combined with criticism, the U.N. Evaluation Team on Community Projects, after a three-month study, has made a comprehensive and critical assessment of the community development programme in the country. The Team, which consisted of three experts, Mr. M. J. Coldwell (Canada), Prof. R. F. Dumont (France) and Dr. Margaret Reed (U.K.), was asked by the Government of India to evaluate the community development programme, its basic objectives, its impact on the process of general development and of changing attitudes in the villages, its capacity to contribute to the economic advancement of the country and the results so far achieved. While it had nothing but praise for the ideal enshrined in the programme and its potentialities for the social and economic regeneration of India's country-side, the Team was not blind to the defects and shortcomings of the programme and its administration nor to the difficult problems of bringing about a change in the outlook and approach of the villagers. The Team hails the programme as "one of the major experiments of the twentieth century," the results of which are of "world-wide interest" and as an effort of unprecedented magnitude to establish a progressive system of agriculture in a land of impoverished soil and a more democratic social structure in a hierarchical society.

On the credit side, the Team noted that the programme was bringing about a change in the people's attitudes in areas covered by it. The shackles of the age-old bondage of superstition and fatalism were being loosened. Wasteful expenditures on ceremonies like weddings and funerals were being frowned upon and more money was put to improvement of lands. A refreshing feature which struck the Team was that, though the programme was fathered and implemented by the Congress Party, all parties, irrespective of political colour, had accepted it in principle. Criticism was only in respect of its shortcomings and inadequate implementation. It also found that the programme had been integrated with the general administration, taking care not to create a separate administrative machinery or hierarchy. It did not agree with the criticism that the cost of staff was excessive. Block funds spent on staff salaries, it points out, cannot be regarded an overhead administration charge, because most of the staff is not involved in administration but engaged in the programme of assistance and guidance to rural people.

By far the most valuable part of the report relates to criticisms and suggestions. The Team feels that more importance should be given to programmes that can produce an immediate impression on production. Investments made so far have tended more in the direction of building up social capital such as roads, wells, schools, rather than in the direction of agricultural improvements. It recommends that investments on social projects might be delayed and the money and labour channelled to more productive operations. For this purpose, there should be greater concentration of staff and funds in areas where irrigation facilities have been provided, or where new lands have been reclaimed, than in others. The formation of an emergency task force in such areas by increasing the number of village level workers and strengthening the agricultural extension staff by the addition of crop and irrigation experts is also recommended. The task force might be moved from one place to another whenever economic or agricultural conditions warrant such an intensive programme.

The Team noticed that soil conservation had been neglected. From now on, according to it, the main task should be to protect the soil from destruction and to increase its productive capacity. There has also been a total failure to use the additional water made available to grow two or three crops. Little had been done, the Team points out, to educate the farmer to do so. It recommends that this should not be delayed any more and that the staff in such areas should be strengthened to do intensive propaganda. Emphasising the need for efficient and experienced staff, the Team proposes that undesirable

and incompetent persons, who in some States are estimated at 25 per cent. of the total staff, should be weeded out. For the rest, better supervision and more in-service training should be given.

One of the most pertinent points made by the experts is that the concept of village self-sufficiency should be gradually changed and that rural development programmes should be related to the industrial development of the country under the Five-year Plans. Although this line of approach has been accepted by all, to its surprise, the Team did not find many community development projects in the village industries sector with a definite link with the urban markets. In the few that existed, excessive importance was attached to hand industries even where machines were freely available. The Team found that the khadi programme was overstaffed and expensive. It feels that plans and training for small-scale industries in the rural areas should be made in the light of anticipated future developments, especially of new sources of power that may become available in the next few years.

The present grant-in-aid policy is criticised by the Team. This, according to it, very often weighs so heavily on the whole programme that the fulfilment of the targets by Block Development Officers and other staff is measured by the amount of money spent.

The Team found that the project administrators were performing a useful role. More and more villagers were anxious to contact project officials and seek their advice on agricultural co-operation, health services, irrigation, etc. It, however, felt that, at the block level, more specialised technical experts were needed to advise farmers on local agricultural problems.

In short, the Team has made an objective and unbiased assessment of the programme. This adds weight to its findings and recommendations. The suggestion that attention should be concentrated on increasing agricultural production should receive immediate support, considering the urgency of the food problem. It requires a different order of priorities in which the plans for stepping up production should rank, in the order of importance, above the more showy, though not less useful, programmes. The Team's emphasis on slower but more intensive progress is supported by the recommendation of the Estimates Committee that, instead of trying to cover the whole country under the programme by 1961, as is planned at present, the date may well be extended to 1963. A too fast and unrealistic rate of expansion, as the Team rightly points out, can only multiply existing difficulties and cover illusory achievements.

INDUSTRIAL PRODUCTION

Those who heard Mr. Manubhai Shah, Union Minister for Industry, at the meeting of the Standing Committee of the Central Advisory Council of Industries, held at New Delhi on Monday this week, must have felt happy to learn that the current calendar year has witnessed not only a reversal of the steep decline in the rate of increase in industrial production noted in the past two years but a distinct improvement. The index of industrial production (base: 1951=100) for the whole of 1959 is expected to stand markedly higher at 148.0, as against 139.7 in 1958, 137.3 in 1957 and 132.6 in 1956. The percentage increase thus comes to as much as 6, that in the previous two years being 1.8 and 3.6, respectively.

The encouraging overall rate of growth on the industrial front is attributed partly to the substantial expansion in the production of machine tools, industrial machinery and machine building in the engineering sector, as well as in that of chemicals, synthetic fibres, ceramics, cement and pharmaceuticals, and partly to the recovery in some major fields like cotton textiles, steel and automobiles. The following is the assessment of the progress made in specific industries as made by Mr. Shah:

"Production has increased in machine tools, sewing machines, diesel engines, electric motors, electric fans, bicycles, caustic soda, sulphuric acid, paper and paper board and tyres and tubes. The cement industry has recovered from last year's stagnation and the rate of production shows an increase of about 600,000 tons, 10 per cent. over last year's production. The consumer goods industries are also showing better performance all round. Excepting soling items like bleaching powder, refractories, oil pressure lamps, enamelled ware and twist drills, practically all the other industries have shown a rise from mild to a very rapid rate of increase. In the case of sugar, while production has not fully recovered from the loss sustained in the previous year, it is hoped that, with the new measures now being taken, sugar production will catch up with the general trend."

The Minister was confident that the second Plan targets in practically all the industries would be fully reached and even exceeded. In support of this view, he pointed to the present tempo of licensing and import of capital goods. The number of pending applications for licensing industries, we are told, is only 600-700, as a result of the speedy disposals following simplification of procedure. In regard to agreements with foreign firms for technical collaboration, 467 cases have already been finalised and just 90 cases are pending examination at present.

Mr. Shah, however, stated that foreign exchange difficulties, especially in respect of raw materials, components and producer goods imports, were continuing. He recalled, in this connection, that the foreign credits made available in the technical and economic co-operation programmes entered into with foreign countries covered only import of capital goods, machinery and equipment and not expenditure on raw materials and components. In the opinion of Mr. Shah, the only solution to the continuing foreign exchange difficulties lay in the promotion of exports to be undertaken by the manufacturing industries. "The industries should," to quote him, "endeavour to export at least so much as to meet the cost of imports of raw materials and components required by them. Unless this is done, it would be difficult to finance the import of these raw materials out of our traditional exports which do not have a very elastic market abroad."

Few would underrate the importance of export promotion activities on the part of industries. But these activities will not be of any avail so long as the industries are handicapped by the continuously rising production costs. If the industries are to weather the growing competition in world trade, it is imperative that the authorities should moderate deficit financing, reduce tax burdens, relax production controls designed to prop up uneconomic units, relate wages to productivity, and give all possible encouragement to fulfil modernisation and rationalisation programmes.

OUTLOOK FOR WORLD SHIPPING

The outlook for world shipping industry is by no means very bright. It is true that tramp freight rates have moved up slightly in recent weeks. But they are still only 7 per cent. above the depressed level of a year ago. Reflecting the somewhat sombre outlook for the industry is the heavy weight of unemployed tonnage which now aggregates some eight million or about 6 per cent. of world tonnage. The genesis of the trouble in world shipping could be traced to the Suez "boom" which saw shipowners place large orders for new tonnage, induced by over-optimistic appraisal of expansion in world trade. World fleet expanded from 99.4 million g.r.t. at the end of 1956 to 114 million g.r.t. last year. This is regarded as an unprecedented rate of expansion in any peace-time period.

There is bound to be some slowing down in the pace of expansion of world fleet which is now placed at some 9 million g.r.t. per annum. But a mere decline in expansion is not likely to prove sufficiently effective in stemming the tide of depression. In this connection, it is significant that Sir Nicholas Crayzer, President of the U.K. Chamber of Shipping, has made an appeal for world-wide co-operation among shipowners in the scrapping of old tonnage. Addressing the annual meeting of the Chamber, held at London last week, Sir Nicholas deplored that, in contrast to the generally prosperous situation of most industries, shipping was "in the midst of one of the worst depressions in memory." Referring to the decline in Britain's share of world shipping, he said: "At the end of the last century, Great Britain owned half the tonnage of the world. Even 50 years ago, we owned 40 per cent. Now the figure has fallen to 17 per cent. When does this decline stop?" The industry, he said in an obvious reference to flag discrimination, looked to the Government to protect it against "arbitrary action" by other governments. It also expected the Government to do everything in its power to increase world trade. He added: "I have no doubt that the pattern of shipping will change as the country goes on. Some fleets will grow and others wane, but for this country (the U.K.) the mercantile marine and a Royal Navy mean survival."

Sir Nicholas's emphasis on world co-operation in scrapping old tonnage seems to express the considered opinion of the shipping industry in the leading maritime nations of the world. It is generally felt that, until the weight

surplus ships, now laid up for want of cargo, is removed, and there is some international control over it, there can be no hope of early recovery from the continuing depressed conditions in the industry. Most shipowners also feel that the huge volume of war-built tonnage must be eliminated before laid-up tonnage can be reduced to what can be regarded as a reasonable proportion of world tonnage.

There are, however, a few shipowners who seem to have doubts about the practicability of any scheme for scrapping old tonnage. Thus, Mr. J. P. Philipps, Chairman of the Court Line, says, in the course of his statement to shareholders, that a Government-sponsored "scrap and build" scheme is unlikely to be of real benefit, in view of the great disparity in scrap price and new building costs. He expects competition for freight to grow still fiercer in the future, especially as many large new tankers are now being employed to carry grain. From this point of view, the only remedy for the troubles of the U.K. shipping lines, in the opinion of Mr. Philipps, lies in a revision of the taxation policy as it affects shipping industry. This, however, is a problem that is common to shipping industry in all parts of the world, except to that section of the industry which operates under flags of convenience and thereby earns large untaxed profits.

U.S. AID TO INDIA

One more solid indication of the continued co-operation and assistance of the U.S. in India's task of economic development is provided by the latest P.L.480 agreement signed between the two countries at Washington on Friday, 13th inst. The agreement provides for the supply of \$238.8 million (Rs. 113.67 crores) worth of American farm products to India, the payment for it being in rupees. The products include 2.94 million tons (110 million bushels) of wheat or wheat derivatives valued at \$182 million (Rs. 86.63 crores), 100,000 bales of cotton at \$14 million (Rs. 6.64 crores), 104,155 tons (3.9 million bushels) of feed grains at \$4.7 million (Rs. 2.24 crores), and 500,000 lbs. of tobacco at \$500,000 (Rs. 23.80 lakhs). The balance of \$37.6 million (Rs. 17.90 crores) represents partial ocean transportation costs.

The new agreement is the fourth of its kind to be concluded by India with the U.S. under the U.S. Surplus Farm Products Disposal Act, commonly known as Public Law 480 which became effective in 1954. The first agreement was signed in August 1956 and was intended to run for three years, with a total market value of \$362.4 million (Rs. 172.50 crores). This included 3.8 million tons of wheat, 200,000 tons of rice, 247,000 bales of cotton and other agricultural commodities. A supplemental agreement was signed in June 1958, for additional commodities valued at \$57 million (Rs. 27.13 crores). This included 580,000 tons of wheat and 200,000 tons of coarse grains. The agreement followed unexpected food deficits in India. A new Public Law 480 agreement was signed in September 1958 for \$238 million (Rs. 113.67 crores), including 2.8 million tons of wheat and 300,000 tons of coarse grains. A supplemental agreement of \$11.4 million (Rs. 5.43 crores) was signed in October 1959 which provides for an additional 160,000 tons of wheat.

With the latest agreement, the total value of foodgrains, cotton and other surplus agricultural commodities received by India from the U.S. under P.L.480 since the second Five-year Plan began comes to as much as Rs. 432.40 crores (\$908.40 million), covering altogether 10.28 million tons of wheat, 200,000 tons of rice, 600,000 tons of coarse grains, 347,000 bales of cotton and 500,000 lbs. of tobacco. It is claimed that India has been the largest recipient of U.S. farm products under Title I of P.L.480.

The aid given by the U.S. thus has been of immense benefit to India in more than one direction. It has, for instance, enabled the country to meet the growing demand for foodgrains arising from the rising trend of population and purchasing power in the hands of people, to tide over shortages created as a result of droughts and floods, and to augment the country's grain storage capacity; a part of the aid proceeds is utilised for the construction of grain storage and handling facilities. Further, as much as the payment for the farm products applied to India is in rupees, no heavy expenditure of foreign exchange, on which there are already so many demands, is involved. What is, about 80 per cent. of the counterpart is—the local currency which is being generated from the sales of farm products covered

under the P.L.480 agreements—is made available for use in India, one half in the form of grants and the remaining half in the form of loans.

It is, indeed, gratifying to be told by Mr. Benson, U.S. Secretary for Agriculture, that "all of us (the Americans) support the efforts of India in its development plans to improve living standards and use more efficiently its economic and natural resources" and by Mr. Thomas C. Mann, Assistant Secretary of State for Economic Affairs at the Department of Agriculture, that "the U.S. Government has always had a deep, abiding and sincere interest in the independence and territorial integrity of the Indian people and their prosperity and economic progress." While expressing its deep appreciation and gratitude to the U.S. for the very liberal assistance, India is, as Mr. D. N. Chatterjee, India's Charge d'Affaires, stated after signing the latest agreement, "optimistic" in looking forward to continued American co-operation and assistance in achieving the objectives of building up its food reserves and insuring economic progress.

COLOMBO PLAN

The eleventh Colombo Plan Conference, which ended its three-week session at Jogjakarta, Indonesia, on the 14th inst., has decided to extend the period of operation of the Plan for five years beyond 1961. The Plan was initially drawn up in 1950 for a period of six years and was subsequently extended upto 1961. The Colombo Plan has come into being in response to the ever-increasing need for external aid to supplement the limited national resources of South and South-East Asian countries for economic development. As observed in the *communiqué* issued at the closing session of the Plan's Consultative Committee, the countries of this region continue to require external aid and the pressing demand for long-term capital will not be met in full by Government-to-Government arrangements. It also noted that many of the member-countries of the region had been taking positive steps to encourage the flow of foreign private capital.

The South and South-East Asian countries, covering about 750 million people, are engaged in the great task of fighting poverty to raise the standard of living of their peoples. Since poverty anywhere is a danger to prosperity

everywhere, the advanced countries have recognised the need for coming to the aid of the underdeveloped countries of the region. The Colombo Plan has Australia, Canada, Japan, New Zealand, the U.K. and the U.S. as members from outside the region. The members belonging to this region are Burma, Cambodia, Ceylon, the Federation of Malaya, India, Indonesia, Laos, Nepal, North Borneo, Pakistan, Philippines, Sarawak, Singapore, Thailand and Viet-Nam. Since the inception of the Plan, aid amounting to about \$6,000 million (about Rs. 2,880 crores) has been made available to finance the development of these countries. In addition, the International Bank for Reconstruction and Development has extended loans to the tune of \$935 million (about Rs. 445 crores) to countries of this region.

A reference to the encouraging evidence of the quickening pace of economic activity in the countries of the region is made by the *communiqué* issued by the Consultative Committee. It is also observed that large-scale expenditure incurred by these countries has led to considerable increases in internal money supplies and that inflationary conditions persisted. The *communiqué* points out that the Colombo Plan, inaugurated by the British Commonwealth about a decade ago to aid the underdeveloped countries of non-communist Asia, has become a symbol both in and outside its area of the economic aspirations of hundreds of millions of people. It stresses that large population increases in the countries of the region pose a serious problem to economic development and employment. Difficulties arise because of the problem of keeping the rate of increase of gross national production higher than the rate of population growth, as also because the numbers in the age-group seeking employment in many countries are outstripping the increase in employment opportunities.

The task ahead of the Colombo Plan countries remains essentially the same as recognised at the time of the foundation of the scheme. In a chapter entitled "Tasks Ahead," the annual report of the Consultative Committee for 1958-59 observes:

"The goal is to enable free nations of the area to achieve a momentum of economic progress which will make it possible for them to go forward in self-reliant growth. In general, the economies of the countries have been at subsistence level and only now are beginning to move ahead. Immediate demands on their resources are growing and will expand further. In meeting these problems, many countries of the area find it appropriate to consider their problem on a well defined and integrated basis, not only considering economic advance but balancing these with requirements for such matters as health and sanitation, literacy and education, scientific research and social service."

It is a matter for gratification that the representatives of all countries met and discussed the various aspects of the Colombo Plan in an atmosphere of complete goodwill and understanding. The delegations of the donor countries were unanimous in deciding to extend the period of the Plan and to provide further aid to the countries of this region. While such assistance will be much appreciated by the peoples in this region, it is a matter of compelling urgency that equal emphasis should be given to ensuring stability in the prices of agricultural exports from these countries. Most of the countries in the region depend exclusively on the exports of a limited range of industrial raw materials for the major part of their export earnings. Any setback in the prices of such products restricts the pace of economic growth of these countries. A solution to the problem could be found through the sustained co-operation of the industrially advanced nations and the primary producers. While the former can help by maintaining stable economic conditions, the latter have to do a lot more to help themselves by raising the productivity of their agriculture.

The economics of commercial production of ethylene from different starting materials is surveyed in an article in the October 1959 issue of *Research and Industry*. According to the article, the use of ethyl alcohol as the starting material has a few special advantages including lower investment on plant, possibility of having plants of lower capacities, availability of know-how, latitude in the selection of site and high purity of the product. Another advantage is that it would provide a convenient outlet for the increasing amounts of ethyl alcohol being produced by the fermentation industry from molasses. Ethylene is a basic raw material for a variety of organic chemicals. With the implementation of the expansion programmes of existing industries and establishment of new industries envisaged under the Five-year Plans, increasing quantities of ethylene would be required in India in the coming years. By 1965, the demand for ethylene, it is estimated, will be 55 to 60 million pounds.

We are rather proud of ourselves

TODAY, banking is almost a public utility. Its success depends on its ability to give friendly and helpful service.

We modestly believe that our progress shows that our clients, whether they are industrialists, exporters or just men who want to deposit Rs. 5/- in a Savings Bank account, realise that in IOB they have an institution that has made friendly service the basis for all their activities.

STIMULATING WORLD-WIDE FLOW OF VENTURE CAPITAL

SUCCESS HERE WILL VITALLY INFLUENCE FATE OF ALL FREE PEOPLE

By G. Keith Funston

PRESIDENT, NEW YORK STOCK EXCHANGE.

THERE is a man from Moscow who toured the United States recently—and the attention of the world was riveted on his visit. Before his arrival, and while problems of protocol were being worked out, President Eisenhower summarised one impression he thought would register on the traveller: "I want him (Premier Khrushchev) to see a happy people. I want him to see a free people, doing exactly as they choose, within the limits that they must not transgress the rights of others." This capsule definition of "democracy" has struck me forcibly.

I would like to discuss here one broad facet of economic growth—a subject we have studied with great interest at the New York Stock Exchange. And I regard it not in a strictly national sense, but rather with an eye towards the further economic development of free nations throughout the world.

At the outset I should say that the ability to move venture capital across national boundaries will undoubtedly have a decisive influence on the fate of all free people. But I must emphasise equally, that I have no easy solutions to the problems that exist. Nor do I have any startling proposals that have not been considered carefully in the past. In preparing these remarks, in fact, I thought of a small sign a friend keeps on his desk for the benefit of his staff. It reads: "Do you come with a solution or are you part of the problem?" I am afraid I am a little of both!

I would start, though, with at least four assumptions with which I think we can agree. The first is that regardless of the outcome of recent discussions in the United States, we are faced over the next several years with a Russian challenge that is nothing short of all-out economic warfare. In most competitions of this kind, a free people generally operate under certain competitive disadvantages, at least at the start. This Russian challenge, moreover, ignores capitalism's enormous contributions for good, and seeks to paint it in the most evil terms possible. And the Russian barrage is aimed primarily at areas of the world that are vital to us both—areas that are engaged in a passionate and justified search for economic progress. So, no matter where we look on the globe, we are bound by the closest moral and economic ties. France's President de Gaulle put this very succinctly a few weeks ago. "The only quarrel worthwhile is that of mankind," he said. "It is mankind that must be saved, made to live and enabled to advance."

Financial Capabilities

The second thing we can agree on is that the financial capabilities of our own and other free Governments are unequal to the world-wide demand for growth money. Thus, if the flow of private international investments can be stepped up, we will be taking one of the most important steps for good that it is within our power to take. And we would agree further that such capital has to be creative in the most literal sense. That is, it must serve to increase productivity, raise living standards and still return a fair profit to investors. These are prerequisites which, perhaps, only a free people can understand.

The third and fourth points which must shape our thinking about the flow of international funds are a great deal more immediate and closer to home.

Most underdeveloped countries are in the midst of ambitious economic development programmes. And having assessed their long-range needs, they want overseas capital to fill an important role. For its part, the United States economy has grown enormously in recent years. Yet with each step forward we have become more dependent on other nations. There are, in fact, American economists who insist that increasingly we are becoming a "have not" country. "Export or die," they say, may never be our slogan. But "export or decline" is not far from the mark. And one of the things we may well be able to export more effectively in the years ahead is private venture capital.

Thus, given these factors—our joint concern over the Russian economic challenge, an appreci-

ation of the effective job that private capital can do, and the needs of our respective economies—there is good reason to hope that the flow of private capital between the U.S. and other countries will play an increasingly important role.

I should mention that, in America today, a new kind of investor stands ready to back his confidence in overseas countries with venture capital. And it is this new investor who mirrors one of the great changes which has taken place in America, and who reflects, also, the brightest promise for the future.

A Quiet Economic Revolution

In America, recently, we have experienced a quiet economic revolution. Stock ownership, once the province of the wealthy few, has broadened to include millions of people from every walk of life. Seven years ago, by way of illustration, only one out of 16 adults was counted among our shareowners. Today, inspired in part by a long-range Stock Exchange educational programme, one out of eight adults owns stock. Most of them are in the middle-income ranges—and most of them are in the market for the long-term. The American people have, in fact, demonstrated a far greater enthusiasm for becoming partners in corporate enterprises than many of the experts had expected. And the results could well make totalitarian Governments ponder the old truth that "democracy is based upon the conviction that there are extraordinary possibilities in ordinary people."

In addition, powerful financial institutions—investment companies, pension funds and banks, which represent the savings of 100 million people—have become potent forces in the securities markets and an important source of venture capital.

The implication of this shareowner growth for both capital exporting and importing countries is clear. As the pool of U.S. capitalists grows, more and more investment dollars will be available to help create the plants and products that free countries are determined to develop.

But recognising this possibility is no guarantee that such a flow of funds will automatically develop. The competition for the investor's dollar is keen. He must be wooed long and hard. He need not be attracted, I might add, by promises of special privilege. He requires only fair treatment, and the recognition that he is, perhaps, undertaking greater than average risks. And it is precisely at this point that the average U.S. investor, as he looks abroad, is often faced by the most baffling and discouraging circumstances.

Let us view this problem for a moment through the eyes of the average investor. He observes, on the other hand, countries like the Philippines, that offer exciting new markets for successful enterprise. He sees, in the face of rising U.S. stock prices, the shares of companies abroad that are plainly "good buys." And if he is adventure-minded he enjoys, although without expressing it, the boldness of a foreign investment.

Another Side

But there is another side to the coin. The U.S. investor looking abroad sometimes finds that he has no corporate vote. Periodic financial reports, complete with balance-sheets for subsidiary as well as parent companies, are often hard to come by. Thus, he lacks the detailed data he has come to expect. This problem was summed up recently by a security analyst who visited Europe and remarked of a particular corporation: "It was a fascinating company. But I would have trouble explaining its balance-sheets to our clients."

One of the reasons American investors regard both their corporate vote and detailed financial reports with such high regard undoubtedly stems from efforts of the New York Stock Exchange. We heartily believe that, if ownership is to expand on a sound basis, the rights of ownership must be protected. As a

LONDON LETTER

BRITAIN'S PROSPERITY

TOO GOOD TO LAST?

(From Our Own Correspondent)

LONDON, 13th November

ON top of the excellent trade figures that the Government produced for the first half of the year (which not only showed a favourable balance on visible trade account but an overall favourable balance of £142 million), we now have phenomenally good autumn trade figures.

Indeed, in October, exports reached a record level for the year. Their total of £306 million, if used to offset the relatively low September figures, still gives an average for the two months of £276 million, which is nearly as high as the average for the second quarter of this year. Re-exports were also exceptionally high at nearly £15 million and not surprisingly, in view of the current boom in trade, imports were the highest for any month this year at £360 million. All in all, it was a month of record figures.

How do these figures look when translated into balance of payments terms? First of all, the total of exports and re-exports is about £320 million. Secondly, imports, if converted from the c.i.f. basis given above which is the basis on which monthly figures are quoted to an f.o.b. basis, also came down to about £320 million. Thus, in this month of high trade, we find that the country balanced its payments of visible account, so that the income earned on invisibles represents the true payments surplus.

Looking at the picture a little more broadly and seeing how the country has fared in the four months of the second half-year, we find that exports and re-exports totalled £1,140 million and imports (f.o.b.) totalled about £1,200 million. There does seem to be a slight deficit which accumulated over the third quarter of the year but this will have been more than offset by the invisible earnings which are unlikely to run at less than £20 million per month. Overall therefore a conservative estimate of the current balance of payments for the ten months of the year to date must be of the order of £200 million.

Equity Yields

With this active level of trade, there has also been a steady appreciation of stock exchange securities after the sorting out process which followed the election results. The outcome is that the Financial Times ordinary share index has hit a new high level for the year of 303. It is extraordinary to consider that this represents an appreciation of nearly 50 per cent. over the lowest market level early in the new year and a doubling over the general level ruling early in 1958. Together with this steady rise in the ordinary index has come a relatively sharp fall in average yields. At the beginning of the year, the average earnings on ordinary shares was of the order of 5½ per cent. and during the summer it was still between that and 5 per cent. Since that time, the fall in yields has been continuous save only for a brief period preceding the election and now on good class ordinary securities one cannot hope to earn much more than the Bank Rate level of 4 per cent.

Clearly, on this basis, shares are overpriced. There is an active market in them, because investors accept that they will go on "having it good" and they are much more interested on the whole in capital gains than in tax earnings, but it is certainly an odd commentary on the situation that one should be able to get about 4½ per cent. on Government long-term stock and little more than 4 per cent. on industrial equities! It would not take much shaking of confidence to tumble down this structure. On the other hand, there is no reason to anticipate that, should such a shaking of confidence come, it will cause a landslide in share values while the basic economic indices remain as sound as they are.—All Rights Reserved.

The high activity in retail trade in Britain noted in the second quarter was well maintained in the third quarter of this year. The boom in sales by durable goods shops also continued. Retail trade in September recovered from the slight slackening in August and was 5 per cent. above the level a year ago, as compared with an increase of 4 per cent. in August and 5 per cent. in July. Sales in the third quarter were also 5 per cent. higher over a year earlier—an increase similar to that shown in the previous three months. Prices in September (covering retail trade) practically unchanged from those a year earlier so that the increased turnover was wholly attributable to a greater volume of sales.

This expert has won the trust of millions in the label 'Sanforized'

Meet our American-trained expert who makes sure that any fabric marked 'Sanforized' won't shrink. Every day, all through the year, he tests fabrics bearing this international label; so that your clothes won't shrink out of fit—even after many, many washings!

Travelling from mill to mill, he takes at random several samples from their godowns as well as off the processing machine. These samples are first measured, and then given a standard wash test.

These tested samples are sent to the New York office for re-checking, and with them goes the expert's detailed report. These documents record the progress and prosperity of each individual mill.

The New York office checks thousands of samples from all over the world. This is your assurance that fabric labelled 'Sanforized' is of a uniformly high standard, and is welcomed everywhere in the world!

BRITAIN'S ECONOMY IN A HEALTHY STATE CHANCELLOR WARNS AGAINST RETURN OF INFLATION

THE Lord Mayor's annual dinner to the bankers and merchants of the city of London, familiarly known as the Bankers' Dinner, provides an opportunity to the three main personalities who guide the destinies of the British economy, namely, the Chancellor of the Exchequer, the Governor of the Bank of England and the Stock Exchange Chairman, to take stock of the nation's economy and to express their views on the relevant current problems. Happily this year, the Bankers' Dinner was held (last week) under more propitious circumstances than last year or in 1957 which was a crisis year for Britain. For the state of Britain's economy is, as Mr. Heathcoat Amory, the Chancellor, testified, "healthy, with production and exports rising, unemployment low, prices stable and balance of payments showing a substantial surplus on current account."

Over the last seven months of the current financial year, the net deposits with Britain's clearing banks have risen by about £490 million. There has been an increase of over £190 million in banks' lending to the Government and of about £370 million in bank credit to the private sector. The expansion in bank credit is only in consonance with the revival of the economy. There was an addition of £300 million to the national savings last year and this year the results are expected to be even better. The budgetary position also has improved much more than anticipated by the Chancellor of the Exchequer when he presented the last Budget. He had estimated that Government expenditure "above the line" (that is, in the revenue budget) would be £120 million more than last year and the experience of the first half of the current financial year has shown that it is consistent with the estimate. "Below-the-line" expenditure, too, that is, capital expenditure, is said to be running close to estimates. On the revenue side, the position is actually better and, according to the Chancellor, the financial year is likely to close with an "above-line" (revenue) surplus a little larger than he had estimated.

On the external front, the U.K. had greatly strengthened its monetary position during the first half of 1958. It could not expect then, as the Chancellor put it, that the exceptionally favourable circumstances which it then enjoyed would continue indefinitely; but over the year, that is from the middle of 1958 to the middle of 1959, Britain continued to have a surplus on current account, which matched the net outflow of overseas investment, leaving the balance of reserves and liabilities virtually unchanged. In the second half of 1958, which is seasonally the worst half of the year, the external monetary position worsened by £60 million, but it improved by about £80 million (excluding the sterling part of Britain's increased subscription to the I.M.F.). The Chancellor saw no reason why Britain's balance of payments should not continue to be favourable provided its exports remained competitive in price and delivery in world markets. "As the economy grows, imports will inevitably expand," he added, "but provided that our exports too grow, we have nothing to fear." The growth of the economy, he averred, must be flexible and adaptable, because it had to take place against the background of a rapidly changing world.

Following the improvement in its economy, Britain has taken three important steps in recent months. It has repaid the £250 million debt to the Export-Import Bank. More recently (earlier this month), it decided to remove most of its remaining import restrictions, especially those on imports from dollar sources. Britishers can now not only buy North American goods more freely but also travel freely abroad without any restrictions on foreign exchange. Earlier in the year, Britain and many other countries made their currencies convertible for non-residents. Though some had raised their doubts about the wisdom of this decision, events would appear to have more than justified the move. The third step was the taking over of its full share of the burden of aid to the underdeveloped countries. Besides associating itself with international institutions giving aid to underdeveloped countries, Britain has also acted independently, through Commonwealth Assistance Loans to less developed Commonwealth countries and Exchequer loans to Colonies. Taken all together, Britain's expenditure from its public funds on economic and technical assistance to all overseas countries

and territories rose from £75 million in 1957-58 to about £100 million in 1958-59, an increase of about a third. These figures do not include military assistance, certain emergency expenditure, relief funds, etc., which amount to £30 million per annum. During the current year, 1959-60, a further substantial increase in expenditure on economic and technical assistance is taking place. Britain's private investments in other countries, mostly Commonwealth, have been running at the rate of £300 million per annum gross or £200 million if allowance is made for foreign investments in Britain. To a large extent this flow of funds, private and public, has not been tied to U.K. exports. Commenting on this policy and the future of Britain's aid to underdeveloped countries, Mr. Heathcoat Amory said:

"We believe that this policy, so long as others will follow it, too, is the best policy, both for the recipients of capital who can thus buy in the cheapest market and for the exporting countries who will benefit from free and healthy competition. But if we are to go on playing our part in this way we must see to it that our economy is strong. We cannot lend abroad, unless we meet the call which that makes on our resources and on our balance of payment. To overstrain our resources would merely undermine our capacity to provide help in the future. Goodwill alone is not enough. Our object, therefore, remains to continue our good record of helping the less developed countries within the practical limits of our resources."

Reverting to the domestic field, the Chancellor of the Exchequer drew attention to the fact that expansion had been achieved with stability of prices. He, however, added that the year ahead was going to be a year of challenge. "World trade is expanding and we are well set to take full advantage of it. If we succeed, we will be able to fulfil the obligations to the Commonwealth and our Allies which we are proud to bear as well as to continue with a rising standard of living at home." Enumerating the conditions which will make this possible, Mr. Amory added a note of caution against returning to inflationary conditions. Thus, he observed:

"What are the conditions which will make this possible? First, we must never forget that our national livelihood comes from overseas trade. It must, therefore, be our first concern to see that we are vigorously competitive. We need a high rate of domestic investment to ensure steadily increasing efficiency. We must keep costs low and steady. This is a challenge to every section and every interest in the country."

"If each section seeks only to exploit the present buoyant situation without remembering that a return of inflation is and will remain the greatest threat to the objectives we all desire, then price stability will be in jeopardy and the rate of expansion would have to be curtailed."

"Our expansion must be a safe expansion. If we can achieve it—and I believe that with past experience in our minds we can—then the rewards of success for our country will be great indeed."

The continued strength of sterling was attributed by the Governor of the Bank of England, Mr. C. F. Cobbold, to some extent, "to the convertibility of currency, to a marked and sometimes slightly disquieting boom in equity prices on the stock exchange and to a rapid rise in bank lending." While admitting that the rise in bank credit has been helpful to industry and commerce as far as it has gone, Mr. Cobbold underlined the need for watching if the bank credit should continue much longer at the same pace.

Commending the achievement of stability, domestically and internationally, and the restoration of the freedom of markets, after the distortions and controls of the war and post-war periods, the Governor uttered a note of warning against going back to the old order, in these words:

"But no greater mistake could be made than to suppose, or to hope, that this simply means going back to something which existed before. The shape of the national and the international economy is quite different from before the war. Some industries have fallen away, others have won new prosperity. Some overseas markets have disappeared; some new ones have to come to the fore. Some former methods of financing have gone out of use; others are taking their place. Above all, there has been a great increase in the number of people who are, directly or indirectly, investors and savers."

"The City of London has always prided itself on being forward-looking. Many adjustments have already been made to changes during the post-war period. But with, as I believe, a new shape of things emerging, the City can usefully take a really good look at itself and make sure that it is equipped to do all the business and provide all the services which new conditions offer and require."

The Bank of England Governor welcomed the Government's decision to review the laws governing financial transactions. He, however, added that there was no cause for sudden alarm or for any conclusion that the existing arrangements were all wrong or out of date. He vouchsafed that, in general, they compared very favourably with those in other parts of the world. Nevertheless, he was not against giving a "new look" to them and seeing what more could be done to protect the widening circle of investors and depositors against fraud or mismanagement.

The Governor also accepted the Radcliffe Committee's recommendation that financial institutions, in general, and the Bank of England, in particular, should go further and faster in the compilation, particularly in the publication, of financial information and in explaining to the public what they were about. He admitted the contention that, in modern conditions, the Bank of England should develop research and information as a service to the public. While disclosing that the Bank had already taken steps in this direction, the Governor desired to go ahead a little gradually, preferring quality to quantity of output and avoiding waste of manpower by unnecessary multiplication of statistics.

LOANS TO SMALL-SCALE AND COTTAGE INDUSTRIES

The Government of Bombay has entered into an agreement with the Bombay State Financial Corporation under which the Corporation can sanction and disburse, without reference to the Government, loans from Rs. 10,000 to Rs. 75,000, and in exceptional cases up to Rs. 1 lakh, to individual industrialists and companies under the State Aid to Small Scale and Cottage Industries Rules. An amount of not less than Rs. 5 lakhs will be placed, at a time, at the disposal of the Corporation for the purposes of distribution of loans. The amount would be replenished from time to time subject to the overall provisions made in the budget estimates.

Under the agreement, the Corporation, as an agent of the State Government, will consider all applications for loans, inclusive of applications for additional loans, from small-scale concerns from Rs. 10,000 to Rs. 75,000 and in exceptional cases up to Rs. 1 lakh, and arrange to sanction and disburse them in all the areas without reference to the Government. Though the Corporation would be competent to modify the terms of the loans sanctioned, it would be required to follow the principles and policies adopted by the Government in general in regard to the assistance to small-scale industries.

While considering applications for financial assistance, the Corporation has been asked to fix up the priority on the following basis: (1) loan applications below Rs. 40,000; (2) loan applications from areas outside highly industrialised towns of Greater Bombay and Ahmedabad; (3) loan applications from parties which are relatively needy and short of means; (4) loan applications asking for funds mainly for creating fixed assets; (5) loan applications from parties which will be able to fulfil the stipulated conditions in short time.

The rate of interest chargeable to loanees will be 2 per cent. on loans above Rs. 10,000 and up to Rs. 50,000 and five per cent. on loans above Rs. 50,000 and up to Rs. 1 lakh.

According to the terms of agreement, the work of recovery of the loans is the responsibility of the Corporation, while in most cases the borrowers can make payments of the instalments and interest to Government treasuries and send cheques to the Corporation. In Bombay, the instalments and interest will be recovered by the Corporation. The Corporation will also be entrusted with the work of recovery of loans amounting to Rs. 8,75,000 already disbursed by the Government departmentally and also the recovery of the loans of the value of Rs. 13 lakhs about to be disbursed.

The applications for loans are to be addressed to the Bombay State Financial Corporation, agent of the Government of Bombay.

I.F.C. TO INVEST IN PERU

The International Finance Corporation has announced a commitment to invest \$300,000 in Durisol del Peru S. A., a new Peruvian company, being formed to manufacture Durisol, a precast, lightweight building material made of chemically treated vegetable fibre and cement. The enterprise is sponsored by a group of Peruvian industrialists and investors. Durisol, A.G. of Zurich Switzerland, which developed and owns the Durisol process, will be licensor and furnish technical assistance and also be a shareholder in the company.

Construction of the plant is expected to start in the next few months with production to begin by the end of 1960. Capacity will be about 630,000 square meters annually of Durisol products use for walls, partitions, ceilings and roofs. Durisol products have good acoustical and thermal properties, and strong resistance to decay, fire and termites. The density of Durisol material is about one-third that of ordinary clay brick and cement blocks. Durisol material possesses sufficient strength for a wide range of structural applications.

The total cost of the project is estimated approximately \$800,000 of which \$500,000 will be subscribed by the sponsors. The I.F.C.'s investment of \$300,000 will be in U.S. dollar notes maturing by 1969 and bearing interest at 7 per cent. additional interest, payable in Peruvian soles, tinging on earnings. In addition, the I.F.C. receive a right to subscribe to shares of the company. The I.F.C.'s commitment is subject to completion of the necessary legal formalities.

Now—a 55% increase in India's aluminium production

INDALUCO'S Hirakud Smelter—its capacity is being doubled to 20,000 tons

Indian Aluminium announces fully integrated expansion plans

	Today	1962
Ingot	15,600 tons	25,600 tons
Alumina	18,000 tons	54,000 tons
Rolling Mill	9,000 tons	16,500 tons
Extrusions	1,200 tons	3,700 tons

IN EARLY 1960, Indian Aluminium Company proposes to launch the biggest integrated expansion scheme it has yet undertaken. A comprehensive programme to increase production of aluminium ingots by 10,000 tons a year will be initiated... within a year of the opening in February 1959 of the Company's Hirakud Smelter which, at one stroke, more than doubled India's production of aluminium. The 1960 Expansion will increase the country's ingot production by another 55% and make substantial increases in semi-fabricating capacity.

This rapid expansion in a vital sector of the aluminium industry is based on the mounting importance of this metal in modern everyday life. Barely 16 years ago India produced no aluminium, and its consumption was restricted to diffident users of domestic utensils. Ever since Indian Aluminium installed their first aluminium smelter in 1943 at Alwaye, the rise in demand has been little short of phenomenal... today it is estimated at over 50,000 tons a year, or nearly three times the country's present production of 17,500 tons.

NEW EXPANSION IS IN GOOD HANDS

Appropriately enough, the present effort to catch up with demand is being made by India's pioneer in the aluminium industry—Indian Aluminium Company—which has done the most to give the country a reliable and vigorous aluminium industry. Indian Aluminium has extended its facilities almost continuously since it began operations and today produces over 90% of the country's ingot output. It is by far the largest manufacturer of sheets, circles and extrusions.

INDIA MUST PRODUCE MORE ALUMINIUM

India's developing economy warrants a substantial expansion of the aluminium industry—and the country's large bauxite and water power resources makes this a practical proposition. The sanction for Indian Aluminium's 1960 Expansion Scheme is as much an evidence of Government's recognition of the country's needs as it is an expression of faith in the Company's resources and know-how. Indian Aluminium is fully geared to meet the challenge of the years ahead when India will find a position on the world map of major aluminium producers.

Indian Aluminium Company Limited

A CANADIAN-INDIAN ENTERPRISE

RAISING COTTON MILLS' PRODUCTIVITY CENTRE EVOLVING A "LOCK-STOCK-AND-BARREL" MODERNISATION SCHEME

THE increasing emphasis laid by the powers-that-be on the need for a thorough modernisation of the cotton textile industry is a belated realisation of wisdom. The failure to recognise in time the inevitability of modernisation has cost this country dearly. Declaring open the new building of the South Indian branch of the Textile Association of India at Singanailur near Coimbatore on Tuesday the 10th inst., Mr. Manubhai Shah, Union Minister for Industries, disclosed that the Government of India was drawing up plans for modernising the textile industry "lock, stock and barrel." He declared: "If you have to cut down costs, improve production and quality, and meet the external challenge, you have to modernise the industry." During the third Five-year Plan, the textile industry, Mr. Shah said, would have to face the challenge of modernisation squarely and see to it that every unit in the country pulled together and drew up plans for the purpose: the industry had to reach the levels of production claimed by Japan, China, the U.S. and the U.K. And he added: "The engineering industries manufacturing textile machinery must form groups in different areas and offer to the various textile units a 'package deal' for the modernisation of every bit of machinery. We cannot modernise depending on imported machinery."

The continued active interest evinced by Mr. Manubhai Shah in the modernisation of mill industry is commendable. It is due largely to the efforts of Mr. Shah that the Central Government's decision to permit the installation of automatic looms has taken concrete shape. Of the 13,500 automatic looms already allowed, it will be recalled, 6,000 looms are covered under the export promotion scheme (3,000 allowed in October 1958 and the balance in July 1959). The remaining 7,500 looms, or 2,500 looms per annum during the years 1959, 1960 and 1961, are covered under the pilot project announced early in December 1958. No information is yet available as to how many automatic looms have, in fact, been installed. After the installation of all the 13,500 looms permitted, the total number of automatic looms will come to about 27,612. It is not known how long it will take for these additional looms to be installed. We have our own doubts whether this part of the programme will be completed by March 1961—the end of the second Plan period. Even if it is finished, the percentage of automatic looms to the total loomage will be no more than 13.4, whereas the proportion of automatic looms to the total is almost 100 per cent. in the U.S. and 87 per cent. in Japan.

The Handicaps

If the cotton mill industry is to meet adequately the challenge of the world markets and also to give to the Indian consumer cloth at a price which he can afford and which will enable him to increase his standard of consumption, it is imperative, as Lala Bharat Ram, Chairman of the Delhi Cloth and General Mills Company, Ltd., very pertinently pointed out in his speech at the annual meeting of the Company last week, that the industry equips itself with the latest machinery. The capacity of the industry for doing so, however, has gone down considerably, thanks to the heavy incidence of taxation, particularly since 1956 onwards, continuously rising tendency of cotton prices, enhanced wages and dearness allowance, and increase in prices of machinery and spare parts. Since cotton accounts for half of the total production cost of mills, every 2 per cent. rise in its price leads to a rise of 1 per cent. in cost of production. Lala Bharat Ram did well to highlight the fact that the prices of several varieties of cotton had risen by 20 to 22 per cent. as compared with last year, so that not only had the Indian mills lost whatever advantage they once had in the shape of cheaper cotton but they had also come to a position where prices of Indian cotton were completely out of parity with world cotton prices.

To revert to Mr. Manubhai's speech. He made an interesting review of the progress made by the cotton mill industry since independence. The review brings out the following points:

During the past ten years, the production of cloth has increased from 4,000 million yards to 9,200 million yards and that of yarn from 1,200

million lbs. to 1,800 million lbs. Very few countries can claim the same rate of growth in a decade as the Indian industry has done. Qualitatively, the progress is much more phenomenal. More than 30 per cent. of cloth produced in India ranks among the best quality produced in the world. The production of cotton, the basic raw material for the industry, has increased from 2.8 million bales to over 4.5 million bales, including several varieties of long-staple cotton in which, ere long, the country will be self-sufficient. Before independence, India was importing 600-700 million yards of cloth. Today, the country is exporting to the tune of 750 million yards. At this rate, the industry can achieve the very desirable export target of 1,000 million yards, if, of course, it succeeds in combining the manufacture of the highest quality with maximum productivity. In the field of synthetic fibres, the country has made spectacular progress; the actual annual rate of production is expected to rise from 70 million lbs. to 100 million lbs. in a year or two.

Official Controls

The progress of the cotton mill industry as noted above is certainly quite impressive, but it is difficult to agree with Mr. Shah when he says that "the industry is now well poised to meet the challenge not only of internal needs but also of external needs of foreign exchange." For the industry is at present reeling under the serious impact of a cost inflation and an official policy based on ideological considerations. How the textile industry is subjected to a wide range of Government intervention and regulations has been well brought out by Prof. B. R. Shenoy in a paper entitled "A Free Market Economy," read before the annual conference of the Mont Pelerin Society held at Christ College, Oxford, in September last, Prof. Shenoy observes:

"The import goods content of the industry (machinery, accessories and spare parts, dyes, chemicals, cotton, and so on) hangs on the Government's import licensing policy. Calculations of costs, and of availabilities of supplies to maintain a programme of production, may get out of control and eat into profit margins with an adverse turn in the import licensing policy; a tightening of imports may involve a nasty (and costly) search for substitutes. Progress of modernising equipment is conditioned by, in addition to the availability of import licences, the policies on rationalisation and the attitude of trade unions. The introduction of automatic looms beyond a certain quota is condi-

tional on the output being all exported, the failure to do so being subject to penalties.

"Production units, which are below the optimum size for full economy in management and efficient functioning, cannot add to the number of their spindles or looms, in an effort to reach the optimum level, if they are located in the larger textile centres (surplus States). The closing down of inefficient units involves a heavy penalty of compensation to the disengaged workers, at the rate of 15 days' wages for every year of service. This penalty plus trade union pressure stand in the way of retrenchment of surplus labour; it is also one of the difficulties confronting full progress of rationalisation. Governmental resistance to closing down inefficient units has reached the point of the State taking over these units for operation. In the surplus States, the more efficient units are unable to expand production to replace the reduced output ensuing from the closed down inefficient units.

"The production of dhotis and of prints is subject to upper limits; the production of dyed saris is banned; white saris produced by the mills must satisfy specifications of the size of their borders; there are limitations on the counts of the yarn to be used in the warp and the weft and on the quantities in the reed and pick. The disposal of the output of yarn is subject to control."

This is, indeed, an impressive summing up of the whole position. Unless the authorities give more freedom to the cotton textile industry to set its house in order and the labour unions extend their co-operation to the management of mills in the efforts to augment productivity through modernisation of equipment and rationalisation of production methods, Mr. Manubhai Shah's claim that the industry has "turned the corner" is an exaggeration. It is still very much in the woods of Government controls and its basic foundations are weak. There are also no signs that labour has changed its attitude. Only the other day, Mr. S. R. Vasavada, the I.N.T.U.C. leader, said, after a tour of the modern textile mills in the western world, that automatic looms and high speed modern spindles were not suited to Indian conditions.

Synthetic Fibres

Mr. Manubhai Shah's description of the synthetic fibres industry in India is also an exaggeration. India is producing only the traditional type of rayon and not the modern chemical fibres. Even the former is based only on imported pulp, so that there is heavy drain on our foreign exchange. How backward India is in this branch of textile industry must surely be well known to Mr. Shah, for it was only recently he had made a tour of the U.S. and Western Europe. An instance can also be given to illustrate the point. In the western world, rayon cord yarn used in the manufacture of rubber tyres is being fast replaced by nylon cord yarns. But, in this country, a beginning with the manufacture of rayon cord yarn is yet to be made. And, what is more, the Government of India has, we learn, given an assurance to the manufacturer who has come forward to make the rayon cord yarn that, for 10 years, no superior types of synthetic fibre yarn would be allowed to be manufactured in this country. The fact is that India is being beaten hollow by the textile giants of the world in the sphere of synthetic fibres.

Mr. Shah's claim that few countries in the world have made as much progress as India in the last 10 years is, apparently, only rhetoric, meant for the consumption of laymen, for it is not backed by facts. Readers will have noted from an article in our issue of 7th November 1959 that China has made far greater all-round progress than India. Even Pakistan has made tremendous progress in cotton textile industry, though it started from scratch. Mr. Shah will have to show a little more regard for facts if his observations are not to lose their force of authenticity.

HIGHLIGHTS OF COTTON TRADE

In spite of two Five-year Plans and the various efforts made by the State Governments and the Indian Central Cotton Committee to bring more acreage under irrigation and evolve weather-resistant cotton varieties, cotton production in this country continues to depend largely on the vagaries of monsoon for its success. Last year, that is, during the 1958-59 season, cotton output, which was estimated at 5.5 million bales at the start of the season, turned out to be as low as 4.8 million bales which was 200,000 bales more than the aggregate mill consumption of indigenous cotton. During the current season (1959-60), the crop was estimated at as low a figure as 4.5 million bales a month ago, though the estimate has been subsequently revised upwards to 4.8 million bales.

It is, therefore, not surprising that the question of stepping up cotton production received pride of place in the speech of Mr. Madanmohan Ruia, President of the East India Cotton Association, delivered at the thirty-seventh annual general meeting of the Association last week. Mr. Ruia said that the setback in production had caused a

SET-UP OF COTTON INDUSTRY CHANGING MORE RING SPINDLES AND AUTOMATIC LOOMS BEING INSTALLED

From Our Special Correspondent

ALTHOUGH the major tumult and shouting has died in the redundancy schemes affecting spinning, doubling and weaving, it can hardly be expected that substantial repercussions will not be felt within the Lancashire cotton industry during the next few months.

Had it not been for the sharp revival in business which has gathered momentum since the summer, there would probably have been reports week by week of mills shutting their doors and machinery already going under the hammer. By the end of the year, this trend may develop, but, owing to the present size of order lists, many of the closing firms will continue operating until early into 1960.

Some critics, notably in trade union circles, have complained about the secrecy surrounding the intentions of individual firms in closing down their mills. The Cotton Board has been dragged in and blamed for not issuing a full list of those whose decisions have been taken. It should be obvious, however, that the details of the returns received by the Board concerning production and numerous other statistics must remain confidential, as use could easily be made of them by rival mills, if they were widely published.

Diligent Questioning

Diligent questioning of Ministers in the House of Commons is one way of obtaining information and, already in the new Parliament, the cotton trade has had its share of attention. A series of queries from Lancashire M.P.s has provided further background to the progress of the elimination of surplus capacity. It should not be thought, however, that because 500 firms have applied for compensation in their scrapping programmes, the same number of mills will be closed down. In some cases, one firm may be shutting more than one individual unit, but, in others, the compensation will be payable on scrapped machinery in mills which are to continue running with respect or additional plant.

The original proposals stipulating that all machinery registered under the scheme must be physically dismantled by the end of March included an escape clause by which special dispensation could be granted to firms which, for particular reasons, want to run a little longer. Applications to continue working have, it now appears, been submitted in four cases, of which one has been granted and the others are still being considered.

It would not be surprising if the number of such claims was sharply increased early next year when the future position of orders and deliveries becomes clearer. The special committee of the Cotton Board administering the plant has the last say on whether these applications are justified.

Empty cotton mills are being eagerly sought by firms bringing new industry to Lancashire. Seventy firms—making from cigarettes to chocolate biscuits have taken over one-time mills, the Lancashire and Merseyside Industrial Development Association was told in Manchester last week. The inducements include lower costs and the minimum hold-up in production.

Said Mr. G. W. Allen, Director of the Association: "The cost of building a new factory is nearly £3 a square foot. Firms can buy a mill at from 3s. to 15s. a square foot, according to condition. That means, they can spend money on adapting it and still get it cheaper than a new factory." Another advantage is that production can start quickly. "One firm bought a mill in July and were in production in October," said Mr. Allen. "With a new factory there would have been a delay of at least twelve months." Firms moving into cotton areas where mills have closed are also finding a pool of labour available.

Retraining in Transition

Reorganisation in Lancashire is not only a case of cutting out the deadwood among machinery which has long been a burden; it also involves the retraining of operatives in processes to which they are generally unaccustomed. The transfer of work-people from one job to another is a delicate task and the movement of manpower in the months ahead is a problem well in the minds of those responsible for the overall conception of the redundancy schemes.

A lot of loose talk has gone on during the past two or three months about the eventual effect of the plan on the labour force in the industry. It will be quite impossible to give any true assessment of the position until at least the middle of next year when the dust will to some extent have settled on the transformation and the remaining machinery will be in place and, in all probability, working to capacity.

It will then be apparent how many firms intend to introduce shift-working, whether by day, evening or night operation of the plant. Transference of manpower between mill and mill should by then have been completed and individual managements will have drawn up their own systems of efficient labour utilisation.

Throughout these coming months of transition, a vital factor will be the extent to which operatives can be retrained to work on other machinery. Mule spindles are giving place to rings and Lancashire looms to automatics. Many other changes are taking place in the ancillary processes and there will be a constant need for readjustment.

The problem of retraining is already being tackled by the Productivity Centre of the Cotton Board. Recently, a number of mule spinners have been trained to operate rings by analysing the ring spinner's job into small parts. These were practised separately until they could be performed with the rapidity of an expert. Each section was then progressively combined

until the whole task was satisfactorily performed.

The retraining course lasted for five weeks and has satisfied both the managements and men concerned. A similar revision of ideas is needed in the case of automatic machinery in the weaving branch, where both loom overlookers and weavers need new skills and procedures to adapt themselves to the different machinery. In this case, the course lasts three weeks for weavers and up to nine weeks for overlookers.

Harvesting "Pure" Cotton

The urgent need for the elimination of impurities in raw cotton if cotton is to remain competitive with the man-made fibres, is emphasised in a resolution sent to Governments and cotton growing organisations in all the world's cotton growing and exporting countries by the International Federation of Cotton and Allied Textiles Industries. A letter accompanying the resolution points out that cotton spinners throughout the world continue to be hampered in production by foreign matter of all descriptions, such as jute and other fibres, hessian and dirt, in bales of raw cotton. In order to keep cotton competitive with the man-made fibres, says the message, it is essential to maintain the highest standards of quality, and particularly to avoid all impurities.

The resolution expresses the Federation's concern about the "detrimental" effect which some of the mechanical harvesting and new ginning methods introduced in the United States are having on the spinning properties of raw cotton. "The efforts of the United States Administration to make American cotton more competitive in world markets might well be adversely affected by the deterioration in the quality of the cotton caused by the irresponsible use of the new equipment. The Federation strongly recommends that measures should be taken, as already indicated by the National Cotton Council of America, to ensure that such equipment is used in such a way as to reduce as much as possible these detrimental effects. Farmers and ginners in all cotton producing countries should be advised to consider the possibility that any advantages which may be claimed for the new picking and ginning methods may be offset by the decline in the spinning and consequent market value of the cotton."

One of the most likely repercussions of a Socialist victory at the recent general election would have been the re-introduction of an organisation on the lines of the Raw Cotton Commission, to control the importation and distribution of the raw material in this country. This threat to the industry has now been removed and those vitally concerned are breathing freely again, but the raw cotton situation contains few crumbs of comfort for the merchant and broker.

Stagnation, arising from the continued reluctance of Governments in producing countries to lift restrictive regulations from the flow of cotton, has settled the futures markets to an overwhelming degree. From time to time, official complaints are raised about this unsatisfactory state of affairs and the International Cotton Federation has lately urged that the fibre should be freed from its chains.—All Rights Reserved.

POSITION AND PROSPECTS OF INDIAN TEA DANGER OF COMPETITION FROM NEW PRODUCERS REAL—REPLANTING PLAN URGENT

By K. Murti

WITH over three-fourths of undivided India's raw jute production and the best quality of cotton being concentrated in Pakistan, tea now constitutes the most important commodity in India's export list. As an earner of Rs. 137 crores in foreign exchange during 1958 and as an employer of over a million workers, the tea industry has undoubtedly assumed a place of vital importance to the Indian economy.

Since the beginning of the present century, tea acreage in India has increased by nearly 60 per cent, and production has more than doubled. Although production has witnessed a remarkable increase from 394 million lbs. for undivided India in 1935 to 711 million lbs. in 1958 for India alone, the expansion in tea area between these years was negligible. Whatever large-scale expansion occurred in acreage, took place before 1933, when the International Tea Regulation Scheme came into force providing for the regulation of exports from and the control of extensions in India, Ceylon and what was then the Netherlands East Indies, for a period of five years from 1st April 1933. The agreement was extended from time to time till 31st March 1955, after which it was not renewed. The result of the Regulation Scheme is that the acreage in India at present remains at 8 lakhs. While Ceylon also maintains her area at 5.7 lakh acres, the Indonesian tea industry suffered considerable damage in the war years and thereafter. Destruction on plantations was enormous, being estimated at 25 per cent. in Java and 35 per cent. in Sumatra. There are indications, however, that more estates have been rehabilitated. Nevertheless, considering the very heavy damage suffered during the war and due to internal unrest thereafter, it is too optimistic to expect Indonesian tea to reach, in the near future, either in quality or quantity, its pre-war standards.

The disappearance of Indonesian tea from the world market gave a fillip to other tea producing countries to bring in more area under tea. Argentina and Brazil, where no commercial tea was produced in the pre-war period, took to the cultivation in right earnest in the post-war period. Private capital has opened new areas in the British East African territories. *Entrepreneurs* who were formerly operating estates in India and Ceylon have started plantations in Nyasaland and Tanganyika. In the latter, climatic and soil conditions are most favourable and have resulted in the area under tea spurring from about 3,000 acres in 1935 to 13,700 acres in 1957. In Mozambique, both the tea area and production have been on the increase since the end of the war. The expansion of tea area in Mozambique from just over 2,000 acres in 1935 to nearly 35,000 acres at present is spectacular, indeed. Thus, an analysis of the trend of the area under tea in different countries of the world reveals that the decline of about 3 lakh acres in Indonesian tea area has been more than offset by East African and

South American countries and also to some extent by Japan, Iran, Turkey and the U.S.S.R.

Not only has expansion in tea area taken place in many countries except in India, Ceylon and Indonesia, but also intensive cultivation methods have been adopted. China, Japan and Formosa have launched programmes for expanding tea production. In Japan, the yield per acre went up by over 50 per cent., from 905 lbs. to 1,414 lbs. during the decade 1948-58. Likewise, in Kenya and Tanganyika, it increased from 588 lbs. to 758 lbs. and 179 lbs. to 452 lbs., respectively, during the same period. The yield per acre has been progressively rising in Argentina and, in the course of the next ten years or so, the South American countries may be expected to produce 75 million lbs. more than their present output.

Although Indian production and yield per acre show an increase, the economic position of the industry is far from satisfactory. According to the Plantation Inquiry Commission, over 2 lakh acres or 40 per cent. of the tea acreage in India is as old as fifty years requiring replanting without any delay. Of this area, a substantial portion belongs to sterling companies and non-Indian rupee companies. The percentage of tea bushes planted before 1900 is highest in the Darjeeling region, accounting for 80 per cent. of the total area under tea in that region. In regard to replanting also, the progress has been rather tardy. The area replanted totalled only 8 per cent. of the area covered by estates which responded to the Plantation Inquiry Commission's questionnaire. In case the entire area under tea is taken into account, the share of replanting should be much less, as the estates which did not furnish information were marginal ones having no finance to undertake replanting schemes. A constant process of renewal of old plants is absolutely necessary to keep an estate in good condition. With proper selection of improved plant material for replanting, experiments have shown that increasing yields are possible, a factor of considerable importance for the future of the industry.

Further, since the end of the last war, a good number of estates in the ownership of foreign companies and individuals have been purchased by Indians and it has been reported that, in the majority of the estates sold which included also marginal ones, replantings were overdue at the time of sale for which buyers made no provision. The gardens thus purchased by Indians have become uneconomic. Nearly 32,000 acres of land under tea belonging to foreign ownership were purchased by Indian nationals between 1946 and 1954 and if the estates whose ownership or control changed hands thereafter are also taken into account, the acreage of such lands should be considerable. In the case of a few estates where there were changes in ownership or management between 1948-58, it is observed that the yield per acre had declined in respect of half of such gardens while in the other half the increase was only nominal. Indeed, in

respect of a company having a few estates, the disposal of a garden which was obviously uneconomic has resulted in the average annual yield increasing to 984 lbs. per acre from 900 lbs. before the sale was effected. As compared with the acreage which remains more or less constant, the production of Indian tea is increasing every year and the Indian production at 711 million lbs. in 1958 shows that the industry is capable of exceeding the second Plan target of 710 million lbs. without any increase in acreage. The production in 1959 is likely to exceed 1958 production by a few million pounds.

A disquieting feature about the increased production in India, however, is the excessive supplies of common teas. Common teas are low grade teas which fetch low prices in the auctions. It is estimated that about 60 per cent. of the Indian production are common teas. Areas like Cachar, Tripura and Dooars, where the tea estates are in financial distress, produce more of common teas. More than production prospects, what should really worry the tea interests in India is the likelihood of a further fall in quality in case no effort is made to resort to good quality production. As the Union Minister for Commerce and Industry observed some months ago, "the future of our common tea producing areas in a highly competitive world market lies in the success of our effort to convert the greater part of our common tea production into quality tea production." But this is easily said than done.

While the Indian production in 1959 is slightly ahead of last year, the output in other countries is much higher. During 1958, the production by other main producers stood at about 800 million lbs., comprising 56 million lbs. by Pakistan, 413 million lbs. by Ceylon, 102 million lbs. by Indonesia, 80 million lbs. by East African countries and 164 million lbs. by Japan. The figure relating to China is not available. The trend of production during 1959 so far reveals that, in Pakistan, Ceylon and Indonesia, the output may remain either steady at 1958 level, or rise slightly, in East Africa and Japan it will be markedly higher. The following table gives the comparative figures of tea production and yield per acre during 1948 and 1958 in the principal tea producing countries of the world (excluding China) as also in countries where tea cultivation has been introduced in recent years.

Country.	Production (In million lbs.)			Yield per acre (In lbs.)		
	1948	1958	Change over 1948	1948	1958	Change over 1948
India	568	711	+143	786	884	+148
Pakistan	44	56	+12	600	787	+187
Ceylon	299	413	+114	539	721	+182
Indonesia	15	98	+83	84	500	+416
East Africa (Estates only)	10	25	+15	588	758	+170
Kenya	4	8	+4	671	641	-30
Tanganyika	1	6	+5	179	452	+273
Nyasaland	14	23	+9	681	652	-29
Mozambique	5	18	+13	227	382	+155
Japan	57	164	+107	192	577	+385
Formosa	18	31	+13	905	1,414	+509
Iran	10	19	+9	500	587	+87
Turkey	10	19	+9	45	169	+124
U.S.S.R.	NA	21	+21	60	384	+324
Argentina	1	2	+1	381	180	-201
Brazil	1	2	+1	381	180	-201
Peru	1	2	+1	381	180	-201

N=Negligible. NA=Not available.
*1957 or latest available figure.
†Estimated.
N.B.—The yield per acre figures relating to Uganda and Iran are misleading. Large areas have been recently brought under cultivation in these countries, and have not yet started full yield. The yield per acre worked on total planted area (both bearing & non-bearing) shows a decline. Owing to the same reason, the figure in per acre yield does not reflect the actual increase per acre which must be much larger.

PRODUCTION OF TEA

AREA UNDER TEA

An outstanding feature of the Indian tea plantation economy is that a very large proportion of tea has, from the commencement of the industry, been sold in an international market. Production, therefore, runs in sympathy with export trends. The exports of tea from India has almost doubled since the beginning of the present century. In the pre-war years 1936-38, India's average annual exports amounted to about 330 million lbs. The outbreak of hostilities in the Far East cut off supplies from Indonesia, Japan and Formosa and the system of bulk purchase of tea was introduced by the U.K. Government. This gave a stimulus to Indian exports which went up to 454 million lbs. in 1944. At the beginning of the post-war period, the recovery made by Indonesia and Japan in the rehabilitation of their war devastated tea plantations was rather slow so much so India faced hardly any competition in the world markets. Since the beginning of 1950, however, India's virtual monopoly has been increasingly threatened by the rising tempo of world production. The Indian exports which reached the peak of 526 million lbs. in 1956 declined by 85 million lbs. to 441 million lbs. in the next year. During 1958, there was some recovery, the exports amounting to 503 million lbs. The export trend in 1959, however, causes much concern. The average monthly exports during January-May 1959 were 23 million lbs. only as compared to 33 million lbs. for the same period last year and 42 million lbs. for the whole year (1958). Ceylon, our main competitor in world markets, was steadily increasing her exports. From about 300 million lbs. in 1950 her exports reached 411 million lbs. in 1958. Her average monthly exports during January-May 1959 stood at 31 million lbs. as against 26 million lbs. for the corresponding period in 1958. Likewise, shipments from other countries, particularly East African territories and China, are in the up-trend.

The United Kingdom has always been the best customer of Indian tea. From 272 million lbs. in 1948 her imports of Indian tea increased to 348 million lbs. in 1957. There was some decline in 1958 when her imports from India totalled 326 million lbs. The United States of America augmented her supplies of Indian tea by 3 million lbs. from 27 million lbs. in 1957 to 30 million lbs. in 1958. The year 1954 witnessed the highest recorded supplies of Indian tea to U.S.A., the imports amounting to 40 million lbs. In recent years, the offtake of Indian tea by the U.S.S.R., Iran, Afghanistan, Turkey, Egypt and Sudan has been on the increase. The fall in the imports into Australia and New Zealand portends a bleak future for Indian tea in these markets. Australia is the third largest importer of tea in the world and New Zealand's per capita consumption is higher than any country except the United Kingdom. Yet these countries diverted their source to Ceylonese blacks. In absolute figures, India's exports to these markets show a sharp contraction from 18 million lbs. in 1947-48 to 7 million lbs. in 1958 in respect of Australia and from 1.8 million lbs. in 1947-48

to 1.2 million lbs. in 1958 in respect of New Zealand. Not only proximity of the Island to Australia and New Zealand but also better publicity methods which Ceylon is maintaining are chiefly responsible for the popularity of Ceylonese tea in these countries. The set of statistics in columns 1 and 2 brings into bold relief the position of Indian tea vis-a-vis teas of other important producing countries in some of the principal importing countries.

Quality and price are the two main factors which determine the level of imports into the main tea consuming countries. As stated earlier, a disconcerting factor is that supplies of common tea or low grade tea in India are at present unduly excessive. Perhaps, the overanxiety of tea interests to fulfil the second Plan target of 700 million lbs. is responsible for this state of affairs. If production is to rise, it should not be effected by resorting to coarse plucking or by manufacturing low grades. With such high production of low grade teas, there is little prospect of improvement in the value of common teas. Particularly, the competition in common teas is likely to intensify in the world markets when the tea bushes planted in East Africa begin producing their full yield of nearly 100 million lbs. a year in the course of the next seven to ten years. The landed cost of East African tea is reported to be about 2 shillings a pound which is somewhat below even the cost of production in many estates in India. Tea exports from African territories need not pay any export duty and can be landed in London at a shilling cheaper than Indian tea. This is reflected in the following comparative figures of annual average prices per lb. of tea sold at London during the last few years.

	1957	1958	27-7-1959
North Indian tea	4. 4	4. 4	4. 4
South Indian tea	4. 4	4. 4	4. 4
Ceylonese tea	3. 9	3. 10	3. 3
African tea	4. 10	4. 11	4. 3
Kenya	3. 5	3. 10	
Tanganyika	3. 8	4. 0	
Nyasaland	3. 1	3. 3	2. 11
Mozambique	3. 0	3. 1	

Good quality teas are always sought after. In fact, the discriminating trend in favour of quality teas is now clearly established in foreign markets. Indeed, the latest trade reports indicate that the demand for better qualities have risen sharply in London as it is expected that supplies of good qualities will be much smaller than anticipated. In consequence, their prices are reported to have spurted by a shilling in recent weeks.

Prospects

The rapid expansion taking place both in area and production in other producing countries should be an eye-opener to the Indian tea interests, as also the Government of India, to the fact that the outlook for their tea in the world market is not as rosy as painted by many and that they should not rely too much on exports to traditional markets alone. The Ceylon

Government had recently prepared a seven-year scheme to rehabilitate and develop their tea industry. The scheme, estimated to cost Rs. 100 million, was to be financed by a 4 per cent. cess on every pound of tea exported from Ceylon. The U.S.S.R. has granted 689 million roubles for the development of tea industry which would enable the country to raise its production by 50 per cent. over the present level. Likewise, the East African territories and South American countries, Japan, Formosa and China have all launched programmes for expanding production. Teas from new producing countries like Argentina, Brazil and Iran have already started pouring into the world markets. The additional production envisaged by the East African and South American countries alone may be in the neighbourhood of 100 million lbs.

In the coming years, India will face keen competition in the American markets. The annual consumption of tea in the U.S.A. and Canada amounts to about 150 million lbs., of which India and Ceylon account for 50 million lbs. and 60 million lbs., respectively. When the additional area brought under cultivation in Argentina, Brazil and Peru begins to yield, which is likely to be about 75 million lbs., the South American supplies will lead to a triangular contest in the American market and result in India and Ceylon being priced out of the American Continent, as the South American tea will cost less, particularly owing to the proximity of the source of supply to the U.S.A. and Canada. The young plantations of Africa and South America will have the advantages of lower cost and better quality over Indian tea.

In the context of the above foreboding, the Union Minister for Commerce and Industry's following observations, made some months ago when he addressed the Indian Planters' Association, are most relevant: "To my mind, the most important point which has to be considered is in regard to the vital need for a programme of replanting. This has been neglected in the past. If the backlog in replantation is not made up, it will threaten our pre-eminent position in tea production in the world."

The scheme of replanting is estimated to cost Rs. 60 crores; and, if the work is phased over ten years, the annual cost will come to Rs. 6 crores. A greater rate of progress in replanting would, therefore, appear necessary to prevent the Indian tea industry from gradually running down in vitality and productivity owing to progressive ageing of plants. Any amount incurred on replanting is, therefore, undoubtedly worth the investment. A good portion of the estates which changed hands since the end of the last war are in dire need of replanting and owing to financial stringency could not undertake it. Besides the lack of financial resources, the new owners in many cases are new to the industry and lack knowledge of production and manufacturing methods, with the result that the cost of their products is higher and quality poorer.

The Union Food and Agricultural Ministry was considering recently the report of the team sponsored by the Ford Foundation for increasing agricultural production by adopting a "package programme." The essence of the scheme is to make available to the farmer in selected districts all his needs in terms of credit supplies, including fertilisers and seeds and extension facilities including demonstration farms. A scheme on somewhat similar lines with an emphasis on supervised credit for the purpose of replanting may be tried under the aegis of the Central and State Governments for the

ANNUAL AVERAGE PRICES OF TEA SOLD AT LONDON

TEA PLANTS ACCORDING TO AGE-GROUPS

SUGARCANE GROWERS' THREAT IN U.P. DEMANDS UNREALISTIC AND UNJUSTIFIED

IT is indeed a great misfortune that the sugar economy of Uttar Pradesh continues to be subjected to the sway of political opportunism. How else is one to explain the latest threat of the U.P. Sugarcane Growers' Sangh to stop cane supplies to all the seventy mills in the State with effect from 10th December next, if the price of cane delivered at the gate of a factory is not raised from Re. 1.62 to Rs. 2 per maund? At its second session held at Ghughli in Gorakhpur district the other day, the Sangh, which is predominantly controlled by the Socialist Party, called upon the cane growers all over the State to prepare for a strike in case it became inevitable by the obstinacy of mill-owners and the Government. The Sangh also put forward four other demands. First, the cane growers must get a share in the excess profits made by sugar millowners last year (1958-59) by selling sugar at "sky-high" prices. Secondly, all restrictions on *khandsari* production, *kolhus* and power crushers should be removed forthwith. Thirdly, the impositions in the form of licence fee on *kolhus* and excise duty on *khandsari* must be immediately abolished. Fourthly, the revenues derived from sugarcane cess, as well as 25 per cent. of the sugar excise duty proceeds, must be spent on cane development.

Barring the last mentioned demand which is quite reasonable, the rest of the suggestions are all highly unrealistic and unjustified. The plea for a steep rise in cane price from Re. 1.62 to Rs. 2 per maund is particularly retrograde in character. Only four weeks ago, the Central Government conceded the cane growers' plea to a considerable extent by enhancing the minimum price by exactly 12½ per cent., that is, from Re. 1.44 to Re. 1.62 per maund. Although the sugar mills are compensated for this increase by a corresponding upward revision in the ex-factory price of sugar (D29 grade) from Rs. 36 to Rs. 37.85 per maund in the U.P., the cane price of Re. 1.62, together with the cane cess of 19 nP per maund and the co-operative commission of 4.6 nP, accounts for as much as 50 per cent. of the revised ex-factory price of Rs. 37.85 per maund. It will be higher still in the case of canes of less than 10 per cent. sucrose content as is actually the case with the bulk of sugarcane grown in North India. If the demand for a further rise in cane price to Rs. 2 per maund were conceded, the proportion of the cane cost in the total price of sugar will be higher at about 60 per cent.

A Preposterous Suggestion

The U.P. Committee of the Socialist Party is not satisfied even with this plea, for it has urged not only an increase in cane price to Rs. 2 per maund but also a reduction in the price of sugar to Rs. 32 per maund. In other words, the Committee wants the cane cost to account for 70 per cent. of the sugar price! How preposterous is this suggestion will be evident from the following table which gives the breakdown of the different elements constituting the ex-factory price of sugar:

	Existing formula	U.P. Socialist Party's formula
Duration of season (days)	135	135
Recovery (per cent)	9.85	9.85
Cane price (per maund)	Rs. 1.62	Rs. 2.00
Structure of sugar price		
Cane price per maund of sugar	16.38	20.22
Cess at 10 nP per maund of cane	1.94	1.94
Co-operative societies' commission	0.46	0.46
Total cane cost	18.78	22.62
Sugar manufacturing expenses	4.80	4.80
Excise duty	10.00	10.00
Extra interest	0.25	0.25
Wage Board's interim award	0.06	0.06
Extra insurance	0.08	0.08
Total	34.66	38.50
Less for molasses	0.09	0.09
Total cost of production	34.57	38.41
Ex-factory price	37.85	32.00
Profit margin (+) or loss (-)	+3.28	-6.41

* On the basis of the formula adopted by the Government for fixing ex-factory price for the 1957-58 season. The manufacturing expenses have been assumed to remain unchanged.

It will be seen from the above figures that the acceptance of the U.P. Socialist Party's plea would mean a considerable loss to sugar industry, leading to the closing down of a large number of mills and the substantial curtailment of production operations in several others. The repercussions of this development on the country's economy will be serious. Apart from the loss to investors, there will be a fall in employment and production. Lower production would mean higher prices for consumers. While the increase in the price of sugarcane will bring

about a rise in the supply of cane, the demand for it will be adversely affected as a result of decline in mill crushing. This will ultimately hurt the sugarcane producers themselves. Meanwhile, the diversion of land to sugarcane will lead to a drop in production of foodgrains which in turn will impart an upward trend to the prices of foodgrains. Thus, the whole economy will be caught in a spiral of inflation, of which the worst sufferers will be the masses. Is this the way in which the U.P. Socialist Party wants to serve the country?

Other Absurd Proposals

Equally preposterous are the suggestions relating to the abolition of all restrictions and removal of taxes on *khandsari* sugar. As it is, the manufacturers of *khandsari* are offering stiff competition to white sugar mills for the available supplies of cane, in view of the fact that the prices of *khandsari* are ruling very high and that this commodity enjoys a distinct tax advantage over white sugar to the extent of Rs. 8.52 per maund. It must be pointed out in this connection that every hundred tons of cane utilised for producing *khandsari* result in a loss of 3.33 tons of sugar, because the sugar recovered from cane in the form of this brown sugar is nearly a third less than that when the same cane is used for making white sugar. It is thus obvious that, by putting forward the aforesaid suggestion, the Socialist Party is only anxious virtually to starve the sugar mills of cane supplies, an anxiety which has stemmed entirely from political considerations and ignorance of economics.

The U.P. Sugarcane Growers' Sangh was, however, perfectly right in principle when it urged the utilisation of cane cess proceeds and 25 per cent. of excise duty on sugar for cane development work. It is a moot point whether any part of excise duty should be used for this purpose. What is relevant to the point is that

sugarcane development deserves a larger slice of revenue than it has had so far. Our support to this demand of the Sangh is based on this general consideration. It does not necessarily mean that we endorse that demand in detail. The U.P. Government collects every year crores of rupees by way of cess on cane crushed by sugar mills. The total of the collections for the past eight years is of the order of Rs. 35 crores. Since the amount of cess realised continues to be credited to the general revenues of the State, it is difficult to estimate the amount actually spent on cane development. The general complaint by sugar millowners is that a large part of the cess collections is utilised for purposes other than cane development. What is worse, the results of development work have not been satisfactory, as witness the following Press version of the observations made by the U.P. Assembly's Estimates Committee on cane development work.

Considering the considerable sum of money spent on cane development work, the return has been wholly inadequate. There is lack of co-ordination among the various departments. The figures for cane production per acre for the six years ended 1956-57 as supplied by the Cane Development Department and by the Department of Economic Intelligence and Statistics do not at all agree. Thus, while the former has furnished figures which point to a drop in yield from 463 maunds in 1952-53 to 433 maunds in 1956-57, the latter has claimed an improvement from 272.80 maunds to 311.06 maunds.

Whatever may be the exact position, it must be stressed that the Government of Uttar Pradesh, as, indeed, the Governments of all the States, should reorient the sugarcane cess collection and utilisation policy. There are two alternatives: one, to spend the entire proceeds of cess on intensive cane development work so as to bring about a rapid reduction in the cost of cane (or to reduce, as soon as practicable, the rate of cess to a more reasonable figure) and, two, to transfer the responsibility for cane development to the sugar factories themselves. The latter course seems to be more desirable and deserves to be given a trial.

STATISTICAL POSITION OF JUTE MILLS

RAW JUTE SUPPLY MAY FALL

THE month of October was the second complete month when jute mills worked with 10 per cent. of the looms sealed, following the decision of the I.J.M.A. to unseal 1½ per cent. of the looms with effect from 22nd June last and another 2½ per cent. from 24th August. The latest unsealing, coupled with an increase in the number of hours worked, had resulted in a sharp rise in output during September. The upward trend in production was, however, not maintained during October; even the September level of production was not kept up. On the contrary, there was a drop, on account of the fall in the number of working hours apparently due to *Puja* holidays. Thus, in contrast to the increase of 5,700 tons (to 92,600 tons) during September, the production in October was down by 4,700 tons at 87,900 tons and the number of hours worked by mills was 200.5, as against 209 in the preceding month.

The decline in production was shared by all varieties of goods, hessian accounting for 1,100 tons (at 36,400 tons), sacking for 2,800 tons (at 46,000 tons) and others for 800 tons (at 5,500 tons). It is noteworthy that the drop in production is larger in sacking than in others, notwithstanding the fact that the unsealing of 2½ per cent. of the looms was confined to heavy goods. The decline in hessian has taken the production to the lowest level since November 1958. For the fourth month in succession, production of miscellaneous goods has shrunk, bringing it down from a peak of 9,200 tons in July to 5,500 tons, the lowest since October last.

Over the year, the total production of mills in October shows a rise of 6,100 tons. This is accounted for by the fact that the sealed complement of the looms was lower (at 10 per cent.) than that (12½ per cent.) in October 1958. Also, the number of hours worked last month (at 200.5) was higher than that (192) in October of last year.

The following comparative table shows the trend of production during the last three months, presented against the background of that in October 1958:

Production of Jute Goods
(In tons)

	October 1959	September 1959	August 1959	October 1958
Hessian	36,400	37,500	37,600	33,300
Sacking	46,000	48,800	41,900	43,000
Others	5,500	6,300	7,400	5,500
Total	87,900	92,600	86,900	81,800

Along with the decline of 4,700 tons in production, there has also been a shrinkage in stocks of goods with mills at the end of the month. As the fall in stocks is much more than that in output, offtake from mills must have been encouraging, though less than that in the previous month. The stocks at the end of the month show a drop of 6,200 tons to 72,500 tons, thus maintaining the downward trend since January this year, which takes them to the lowest level since November 1957. Over the year, the stocks show a contraction of 34,900 tons, as will be borne out by the following comparative table:

Stocks of Jute Goods
(In tons)

	As on 31st Oct., 1959	As on 30th Sept., 1959	As on 31st Aug., 1959	As on 31st Oct., 1958
Hessian	29,200	25,500	24,800	17,800
Sacking	32,900	42,700	45,700	77,500
Others	10,400	10,500	10,700	12,100
Total	72,500	78,700	81,200	107,400

It will be noted that the decline in stocks is mainly accounted for by sacking which has gone down by 9,800 tons to a low of 32,900 tons, a level not seen since November 1955. Over the year, stocks of heavy goods show a reduction of 44,600 tons. Last month's sharp fall in this category has been due to good shipments to the Far East, particularly to China, which has been the main buyer of sacking from India almost throughout the current year. The substantial improvement in the statistical position of heavy goods in recent months is well indicated by the fact that their stocks now represent no more than 45.4 per cent. of the total, as against 72.1 per cent. a year before. They also amount to less than three weeks' output, whereas, this

How banking helps the COCONUT OIL INDUSTRY

India ranks second among the coconut growing countries of the world. During the Second Five Year Plan, the Coconut Oil Industry, which is almost exclusively South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a comprehensive banking service at each office.

Banking has greatly helped in the rapid growth of this industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the industry.

We at Palai are proud that so many leading coconut oil producers of South India employ the complete banking service we offer.

LABOUR LEGISLATION AND PEACE IMPORTANCE OF HUMAN RELATIONS

THE increasing volume of labour legislation in the country, which is growing in range and complexity year after year, has provoked many to think about the future of collective bargaining. The recent proposal of the Union Ministry of Labour to convert the tripartite wage boards for industries into statutory bodies and make their decisions legally binding on the parties, has brought the issue into the focus of public attention. While the labour unions would appear to welcome the proposal, organisations of employers have stoutly opposed it on the ground that statutory regulation of wages, other than fixation of minimum wage, will cut at the root of collective bargaining. Whatever may be the fate of the proposal, it has attracted the critical attention of those interested in labour problems and set many minds thinking.

The conference on industrial relations, organised by the Indian Institute of Personnel Management at Bombay this week, was, therefore, of some topical interest. The subject of discussion was "The future of collective bargaining in the context of increasing labour legislation and tripartite consultation." A workers' representative, Mr. D. K. Kunte, Vice-President of the Bombay Provincial I.N.T.U.C., an employers' representative, Mr. Murarji Vaidya, a well-known industrialist, and Mr. S. R. Mohandas, a journalist, were called upon to give their views on the subject. On a subject like this it is natural to have wide differences of opinion and the speakers did differ with one another. But all of them were agreed on the following points:

1. The interest of the community was supreme and employers and workers had to look at specific questions at issue not merely from the point of view of their own sectional interest but also from that of the community as a whole.

2. The Government, representing the interests of the community cannot, in the event of a clash between workers and management, remain a passive spectator, taking a ringside seat and enjoying the whole show.

3. Collective bargaining is a desirable thing and, if both parties genuinely believed in it, could be instrumental in promoting healthy labour-management relations and ensuring industrial peace. But it has not sufficiently developed in this country to obviate the necessity of having recourse to adjudication.

Mr. Murarji Vaidya held that political leadership of trade unions and the absence of a stake for trade union leaders in the undertaking were responsible for the lack of a genuine desire for settlement by mutual negotiation and the consequent failure of collective bargaining. Mr. Kunte did not find anything wrong in outsiders leading trade unions, provided trade union work was not made subservient to political activity and workers' interests were kept above those of political parties. In the situation obtaining in the country, he found that political leadership had even some advantages. He believed that, when workers were sufficiently educated and enlightened and became conscious of their rights and responsibilities, they themselves would take over the leadership of unions. This conclusion, according to him, was borne out by the trend currently noted in the case of white-collared workers.

Management Training

All the speakers were agreed that, irrespective of the provisions of law, it was possible to reach mutually satisfactory solution to disputes, provided there were goodwill and understanding between the parties. Such goodwill and understanding could be fostered only through good human relations in industry. It was precisely this point that was repeatedly emphasised by speaker after speaker at a seminar organised jointly by the Tata Institute of Social Sciences, and the British Information Services. The seminar, which was inaugurated by Mr. Shantilal Shah, Bombay's Labour Minister, was aimed at focussing attention on the "lamentable lag" between technological progress and the pace of social skills of human adjustment in the exciting adventure of applying scientific discoveries to the means of production. In his inaugural address, the Minister observed that legislation alone was no answer to the problems of industrial relations. In their approach to labour problems, labour and personnel officers, he said, should lay emphasis not on the enforcement of law but on the mitigation of workers' hardships. Mr. John Marsh, Director, Industries Welfare Society, London, in his remarks on new trends in human relations and labour welfare in industry, emphasised the importance of management edu-

cation and training of personnel and labour officers in creating better labour-management relations. He advised personnel and labour officers that they should frequently attend workers' conferences and try to feel their pulse. Courtesy and politeness in their approach to workers, he pointed out, went a long way towards establishing happy labour relations. Mr. Marsh also averred that such relations could not be fostered through mere legislation. Human relations were a complement of industrial relations and formed a vital aspect of industrial progress.

The importance of human relations in the maintenance of industrial peace was recently emphasised by Sir Alexander Fleck, Chairman of Imperial Chemical Industries, in his address at the annual conference of the British Institute of Directors. In Britain, according to Sir Alexander, industrial relations were not nearly as good as they could be. Where something was wrong with the tone of an organisation the fault was frequently traceable either to a failure at the top or to a failure in the communication from the top downwards. Difficulties at the top arose, because industry had become big, complex and remote and was likely to become more so. Elucidating this point, Sir Alexander said:

"Those of us at the top all too frequently think in terms of monolithic groups, the factory or the trades union, when we should be thinking more of the individual men and women who compose them. My experience firmly convinces me that the solution to the problem lies not in any new subtle conception, but in the well-tried recipe of joint consultation sincerely and wholeheartedly applied. Hard, solid and, above all, persistent cultivation of good relationship at all levels is required all the year round if the effort is not to be wasted."

The approach, he averred must cover both dealings with the factory people direct and with the trade unions. "The most potent factor for success" in his opinion, "is that managers and

trade unionists should know their opposite numbers at all levels. They should know each other not singly as officials in their hierarchy but as individual personalities."

Emphasising the importance of individual contact at all levels, Sir Alexander observed:

"Good relations with the Unions were complementary and not a substitute for direct dealings with the men on the plant. More important than the content of the discussion was the fact of individual contact between the factory people and their local management at works level and the Chairman and Board. . . . In this way, the men get to know what the top management of the company is thinking and, equally, the top management gets to have a very good idea of what the factory people are thinking."

We commend this approach to management in this country which, barring a few exceptions, have yet to show evidence of having realised its importance.

JURISDICTION OF WAGES AUTHORITY

Has the Authority, under the Payment of Wages Act, jurisdiction to decide a worker's claim in respect of deduction from his wages or delay in payment of wages, even though decision of that question involves pronouncing a verdict upon the legality or illegality of a strike or lockout. This question, which very often arises these days of action before a Division Bench of the Bombay High Court in a dispute between the management of Richardson and Cruddas Ltd., and one of its workmen. The fact of the case are as follows:

The petitioner worker had applied to the Authority under the Payment of Wages Act for an order directing the management to pay delayed wages and compensation on the ground that he had been prevented by the employers from working and that he was locked out because it was alleged that he had gone on an illegal strike. The management contended that the Authority had no jurisdiction to entertain the claim for wages because that claim depended on the decision whether the strike or the lockout was illegal, an issue that could not be decided by the Authority but only by the Industrial Tribunal. The Authority agreed with this contention and disclaimed jurisdiction. Thereupon the worker went in appeal to the High Court.

Delivering the judgment, their Lordships observed that exclusive jurisdiction had been (Continued on page 879)

HYDRAULIC MACHINES INDUSTRY GREAT HEADWAY MADE IN RECENT YEARS

A NOTABLE feature of industrial progress in recent years is the sizable improvement recorded in the production of hydraulic machines. The importance of these machines to agriculture, irrigation, sanitation and generation of power can hardly be exaggerated. Under the impetus provided by the emphasis on growth-food campaign and the curbs on imports, the hydraulic machines industry, in general, and the manufacture of centrifugal pumps, in particular, have made much headway. The quality of the products too has improved, so that the prejudice against domestic products has now been eliminated.

In the course of his speech at the symposium on hydraulic machines, held at Bangalore last week, under the auspices of the Indian Institute of Science, the Union Minister of Industry, Mr. Manubhai Shah, made a rapid survey of the centrifugal pumps section of the hydraulic machines industry. In India, the organised production of centrifugal pumps commenced in 1925. At that time, the pioneers in the industry had to struggle hard in order to find a place in the domestic market, thanks to competition from pumps of foreign origin. The Second World War and subsequent industrial programmes gave a new fillip to the industry. By 1950, there were eight units with a capacity of 35,000 pumps and the value of their production was placed at Rs. 1 crore. The number of manufacturers rose to 27 by 1956 and installed capacity to 68,000; by the end of 1959, the number of firms is expected to go up still further to 55 and capacity to 130,000 with production valued at Rs. 4 crores per year. Of these firms, five manufacturers are producing deepwell turbine pumps which are required for developing the underground resources in certain areas of the country. The output of power-driven pumps alone in the current year is placed at 85,000, valued at Rs. 2.46 crores.

In the manufacture of pumps, Indian manufacturers have derived considerable benefit from their association with well-known foreign firms such as Fairbanks Morse of the U.S., Johnstons of the U.S., Worthington of the U.K. and Sulzers of Switzerland. India has also been able to export pumps to Middle Eastern and Far Eastern countries. This is an indication of the reasonably high standard of quality achieved by the manufacturers. Pumps for special chemical applications and of large sizes are, however, still being imported by India. In this connection, Mr. Manubhai Shah said: "With the expansion and diversification of the industry, I hope we would achieve not only self-sufficiency in the next two or three years but also export a large number of pumps and hydraulic machines to meet practically the entire requirements of the export markets in the neighbouring countries."

The manufacture of hydraulic machines used for power generation is planned in the Heavy Electrical Project at Bhopal, with a capacity of 0.35 million kw. per year on double-shift basis, and the biggest turbine will be 50 mega watts. A further capacity of 0.3 million kw. is under consideration for turbines between 10,000 and 100,000 kw. in another project. Hydraulic turbines upto 100 kw. capacity are being made by another Indian firm. Gates of all categories, such as sluice and flood penstock, are also under regular production.

In the sphere of hydraulic machines, as, in fact, in that of the engineering industry as a whole, progress depends upon continuous research. Mr. Manubhai Shah, therefore, did well to stress the importance of research. He said:

"While the indigenous manufacture is proceeding satisfactorily very little attention is being paid by most of the manufacturing concerns to research and development which alone can, in the ultimate analysis, make the indigenous industry meet the challenge of their counterparts in other countries. The lead given by the Institute of Science in arranging this symposium on hydraulic machines is, therefore, in the right direction. I hope it will be a forerunner of many such gatherings to be held periodically in different parts of the country so as to stimulate wide interest in the problems that confront the manufacture, operation and maintenance of hydraulic equipment. The industry in our country should bestir itself to more and more research in all these important lines, in addition to the development and research taking place in a national institute such as yours and our national laboratories."

In conclusion, Mr. Shah referred to the target of 10 million tons of steel for the third Five-year Plan, now under consideration. He felt that the apprehensions that consumption of steel might not come up to this level were groundless. He recalled that, during the second

Plan period, the development of all engineering and secondary industries had suffered considerably due to the non-availability of steel, the import of which had been restricted on account of shortage of foreign exchange. Further, industrial production was going up. The index number of production in machine building industries (Base: 1951=100) stood at 433 in the current year, of production in electrical industries at 302, of machine tools industry at 888 and of general engineering industries at 273. Mr. Shah added: "This only demonstrates the capacity and growth of steel consuming industries. If during the second Plan period, iron and steel were more freely available, production in the main steel consuming industries like machine building, machine tools, engineering and structural and secondary industries would have been much greater than even the very happy performance that we are witnessing today." After referring to the fact that engineering industries suffered heavily through non-availability of steel and large amounts of foreign exchange had to be diverted to imports of steel, Mr. Shah said: "Even if there is a risk in planning for a somewhat higher target, I feel it is better to err on the side of a higher practicable target like 10 million tons of crude steel because any shortfall in production of steel in relation to demand would have very wide repercussions on the pace of development of the vital machine building industries, heavy engineering industries, basic industries and vital light engineering consumer goods industries."

No infallibility, as we have maintained in the past, can be claimed for any particular figure about the demand for steel in the next few years. It will be wrong to underestimate the demand for steel, for experience in the second Plan period suggests that shortage of steel could become a great national handicap.

At the same time, in a capital-intensive industry like the steel industry, it is best that there is a certain element of flexibility in the programme for steel expansion. Above all, what is clearly indicated—irrespective of whether a slightly higher or a slightly lower target is accepted—is that efforts should be made to stimulate the expansion of steel-consuming industries to levels at which they can absorb the steel that may actually be produced. Another vital factor to be taken into consideration is the availability of managerial and technical personnel. These problems deserve all the attention that the Government can give them.

RETENTION PRICES OF T.I.S.CO. AND I.I.S.CO.

An increase of Rs. 5 per ton in the retention prices (for all categories of steel taken together) payable to the Tata Iron and Steel Company, Ltd. (T.I.S.Co.) and Indian Iron and Steel Company, Ltd. (I.I.S.Co.) for the period 1955-56 to 1959-60 was announced by the Government of India last week; the present retention price of the two companies is Rs. 419 per ton, excluding the excise represented to the Government that their costs had risen as a result of increases in wages, freight, coal prices, etc. The cost accounts branch of the Ministry of Finance, which examined the representations, recommended that the average retention prices payable to the companies for the period 1955-56 to 1959-60 should be raised by Rs. 7 per ton, if a negotiated labour settlement were accepted and Rs. 5 per ton if such a settlement were not accepted. It also recommended that the 1954-55 retention price of the I.I.S.Co. should be increased by the same amount and the average amount per ton to be credited by the Company to its development fund during the period 1955-56 to 1959-60 should remain unchanged. As the 1954-55 retention price for T.I.S.Co. had been increased only by Rs. 4 per ton, the average amount to be credited by the Company to its development fund during the period 1955-56 to 1959-60 should be increased by Rs. 3 per ton if negotiated settlement were admitted and by Rupee one if they were not accepted. The Government, it is stated, is examining separately the question of admitting increases in labour costs due to negotiated settlement.

The present increase in the retention price will enable the T.I.S.Co. to increase its contribution to its development fund by Re. 1 to Rs. 50 per ton. It will enable the I.I.S.Co. to maintain its contribution of Rs. 7 per ton.

A tale of Twenty-two Cities

From Tunis to Bombay, from Aden to Iraq are the Cities, twenty-two of them—in fifteen states. They all have this in common: every one is in an area where a dramatic transformation is taking place, a transformation from a traditional past to modern statehood. Every one, too, contains a branch of The British Bank of the Middle East, a Bank dating back to

1839 and closely associated with the rapid development taking place today.

India, Aden, Dubai and Sharjah and Abu Dhabi, Oman and Muscat, Qatar, Bahrain, Kuwait, Saudi Arabia, Jordan, Iraq, The United Arab Republic (Syrian Region), Lebanon, Libya, and Tunisia: these are territories where The British Bank of the Middle East operates. It has

intimate knowledge and experience of their political, economic and financial affairs. If you are interested in new markets and the limitless possibilities of development in this vast area, The British Bank of the Middle East can give you the reliable help and advice you need.

THE BRITISH BANK OF THE MIDDLE EAST

Incorporated in England by Royal Charter 1889 with Limited Liability.

NEW PRODUCTS AND PROCESSES

Sodium Street Lamp

WITH an efficiency of 100 lumens a watt, a 200-watt sodium linear lamp produced by the A.E.I. Lamp and Lighting Company will, it is claimed, provide street lighting of twice the intensity with fewer columns at only 38 per cent. greater cost. The lamp has a straight arc tube formed into a crescent section which alternates to either side of the tube over short lengths. Loss of efficiency through the migration of sodium, which clings inside the small radius bends in the horns of the crescent, has thus been reduced. The design also provides a directional output of light a third greater sideways than downwards, making the lamp particularly suited to street lighting. Starting and operating from 320V, the lamp can be controlled with equipment which is no bigger than that required for a 140-watt lamp. The lamp will work in all weathers, since it runs at low pressure, which means that delay in starting while still warm from use is avoided. Designed for use with the new lamp is a perspex lantern, called the Amberline, which gives a medium angle beam that is not cut off and can be mounted at heights between 25 ft. and 35 ft. and spaced at intervals of from 120 ft. to 200 ft. according to the amount of light required. The lantern is totally enclosed with a Perspex canopy and refractor bowl carried on a silicon aluminium die casting, containing a spigot entry. The light is controlled by refractor plates which are sealed on to the inside of the bowl.

Decimal Desk Calculator

A decimal desk calculator known as the Unical from the Swiss firm of Bergmann (Frauenfeld) has recently been made available. It consists of 99 printed tables which can be used for multiplication and division, and certain other calculations, the results of which have been worked out up to a point beyond which it becomes necessary to make additions or subtractions to obtain more complex answers. The tables are prefixed by an index digit from 1 to 99. This index is followed by the same series of figures in every table: from 00 to 95 and intermediates from 1 to 4. Each horizontal column, therefore, runs over the range 00 to 99, in effect, so that page 1, for example, will show all the figures from 1.00 (or 100) up to 1.99 (or 199). The vertical column covers 1 to 99, and its lower portion shows the common fractions as sixths, eighths, twelfths, sixteenths, and thirty-seconds, which can be employed to make up the larger fractions. It is therefore possible to see at the points of intersection all multiplications of the order 1 to 9.99 multiplied by 1 to 99, and 1 to 9.99 by fractions.

Electronic Refrigerator

A new type of refrigerator—an electronic one that operates silently and has no moving parts—has been patented for the Philco Corporation of Philadelphia.

The operation of the refrigerator is based on the principle that an electric current passed through materials known as semi-conductors produces a cooling effect. In one example cited in the patent, waters of germanium, together with small quantities of antimony and indium, are used. The wafers are set in a plate made of a metal such as nickel, which is a good heat conductor. Either direct or alternating electric current may be used. Philco regards the new refrigerator as a potentially useful one, but that further development is said to be required before it can be put into production. Meanwhile, Philco engineers are also working on other techniques of electronic cooling. The company has been making refrigerators of the conventional compressor-evaporator kind since 1938.

Portable Contamination Monitor

A British firm, E.M.I. Electronics Ltd., has produced a new, compact, all-transistor monitor which offers unique facilities for detecting radioactive contamination. The instrument employs a dual phosphor technique, and can be used for monitoring radioactive contamination on benches, clothing, and similar objects. All-transistor circuitry enables the instrument to be battery-operated for long periods. The dual phosphor technique makes possible the monitoring of either Alpha or Beta contamination separately, or both simultaneously. Distinctive separate tones (high-pitched for Alpha, low for Beta) are provided, audible on headphones worn by the operator or through a built-in loudspeaker. The new monitor provides high accuracy over a wide range of temperature (0° to 45°C). Information in the form of counts per second is displayed on a meter covering the range 0-5000. Weight of the unit is approximately 11 lb., and power consumption ½ watt.

Cheap Cast Aluminium

Cheaper cast aluminium stock is said to result from a new continuous casting process developed in the U.S. by Kaiser Aluminium Corporation. Slab aluminium can, by the new process, be rapidly cast in thicknesses from ½ to 2 inches, in widths between 6 and 12 inches, and lengths from 12 to 240 inches in the 1,100 series of alloys and the higher purity grades. The dimensional control available in the system is said to be unique in continuous casting operations. Development work is in progress on casting various alloys and on processes permitting casting of thicknesses down to ¼ inch. The stock produced by the process is known as "K-slab" and is said to be suitable for the manufacture of a wide variety of thin and heavy wall tubes, containers and many electrical, motor-vehicle, aircraft and industrial parts by impact extrusion.

New Traction Battery

By using plastics and "Terylene" Chloride Batteries Ltd., Swinton, Manchester, England, claims to have made the most important advance

in traction battery construction in half-a-century. The new battery is approximately of the same size and weight as its predecessors, but is said to give 35 per cent. more power and a livelier performance. The plastic is responsible for keeping the battery's weight down in relation to its output, and the use of a multi-tubular "gauntlet" of resin-impregnated "Terylene" cloth gives the plates greater durability and longer life. Users of industrial trucks, say the makers, should benefit from the new battery because, with the increased power, trucks can do more work in a shift, or longer shifts. Alternatively, trucks can be worked with the same battery-power as before but have a smaller housing compartment, giving them greater manoeuvrability.

Nylon Postal Envelope

A new type of postal envelope made from lightweight nylon fabric proofed with P.V.C. plastics material is claimed to offer substantial savings in stationery costs. The economies of the envelope introduced by Envelopak of London, are said to be particularly attractive to firms using manilla or similar envelopes of greater than foolscap size. The envelope which is stated to be waterproof, is supplied with a patent seal and zip fastener which are said not to require the use of special tools for opening or closing. It is provided with two "windows," one for a reversible address card and the other for a card bearing stamps or a franking label.

Bonding Plywood

Weatherproof plywood can be successfully bonded at Press temperatures of 230 to 240 degrees Fahrenheit, and will require no further treatment, it is claimed, by the use of a new reactive phenol-formaldehyde aqueous resin-syrup now available. Under such conditions, and using a special filler supplied by the manufacturers of the resin, flat, blister-free boards are said to be obtained. With veneers of low moisture-content, where press temperatures of 275 to 285 degrees Fahrenheit are possible, a filler such as coconut shell flour is said to give excellent results with the resin, which is known as Laxite P.F. 517. The resin bond is strong and unaffected by boiling water, fungi or wood-destroying insects.

Detecting Water in Plane Fuel

A new "pill" method for detecting minute traces of water in jet plane fuels has been developed by the Esso Research and Engineering Company in the United States. The method is said to provide a quick and reliable last-minute check during fuelling at an airport. The method uses a chemical powder that changes colour in the presence of microscopic amounts of water. The powder, in capsule-type pills, has been extensively tested at major international airports.

Quick-drying Paint

A Holden and Sons, of Bordesley Green Road, Birmingham, Britain, has produced a quick-drying primer which is said to be suitable for a variety of metal and other surfaces. It is claimed to dry for handling purposes in ten minutes and to be able to receive an overcoat in an hour. The primer is designed to be applied by spraying, brushing or dipping and to accept as a second coat most industrial finishes including heat-resisting stoving enamels.

RETENTION PRICES FOR PIG IRON

An increase of Rs. 17.23 per ton, with effect from 8th July 1957, for pig iron produced by the Indian Iron and Steel Company, Ltd. (I.I.S.Co.) and of Rs. 12.92 per ton for pig iron produced by the Tata Iron and Steel Company, Ltd. (T.I.S.Co.) for 1958-60 was announced by the Government of India on 6th inst.; the existing retention prices for pig iron produced by the two companies are respectively Rs. 141.5 and Rs. 128 per ton. The Government has further decided that the prices of pig iron manufactured at the Burnpur Works of I.I.S.Co. will provisionally apply to the corresponding grades of pig iron produced by the Hindustan Steel Ltd.

The Tariff Commission had recommended a price increase of Rs. 10.84 per ton on a weighted average basis for the period from 1st August, 1954 to 31st March, 1960 for pig iron produced by the Indian Iron and Steel Company. The Government of India, while accepting the recommendations of the Tariff Commission in regard to the actual increases in costs, does not consider that the increases should be given a weighted average basis. Accordingly, an increase of Rs. 17.23 per ton has been granted from 8th July 1957. Since the pig iron production at Burnpur Works has not been separately costed, the Government has decided that the increase in prices recommended by the Tariff Commission and accepted by the Government should be applied to the Kulti pig iron till the Kulti plant ceases to operate and to the corresponding grades of pig iron produced at the Burnpur Works up to the end of March 1954 finally, and thereafter provisionally, with the intention that the prices of pig iron produced at Burnpur after 1st April 1958 should be examined separately and adjustments based on costings made later.

An increase of Rs. 12.92 per ton in the retention price of the pig iron produced by Tatas for the period 1958-60 has been granted by the Government. The T.I.S.Co. had represented to the Government that they were incurring increases in costs in the manufacture of pig iron. The Tariff Commission recommended a price increase on a weighted average basis of Rs. 9.54 per ton for the period 1955-56 to 1959-60. The Government accepted the recommendation on the basis of actual increases instead of on a weighted average basis.

Commands the HIGHEST sales to-day

LOMA is not only a perfect hair darkener, but an excellent hair dresser too! That's why more and more people, young and old, men and women, all alike, go for Loma than any other hair darkener in the length and breadth of India and abroad.

DELHI CLOTH AND GENERAL MILLS CO., LTD.

CHAIRMAN, LALA BHARAT RAM, URGES IMMEDIATE IMPORT OF FOREIGN COTTON

SPEECH AT ANNUAL GENERAL MEETING

ADDRESSING the shareholders of the Delhi Cloth and General Mills Company, Ltd., at their Annual General Meeting held at Delhi on 12th November 1959, Lala Bharat Ram, Chairman, expressed satisfaction at the improvement in exports of cotton textiles this year. He, however, drew attention to the fact that the mounting prices of cotton held a threat to the export trade. In order, therefore, to make Indian textiles more competitive in the export field and more attractive to domestic consumers, Lala Bharat Ram urged that a quantity of 300,000 to 400,000 bales of cotton of staple length $\frac{7}{8}$ inch to 15/16 inch, over and above the normal quota for import of long-staple cotton, should immediately be licensed to be imported.

The following is the full text of Lala Bharat Ram's speech:

"LADIES AND GENTLEMEN,

"With your permission, I will take the accounts and Directors' report as read.

"As you will notice, the profits of the Company have been better than last year, which is a matter for some satisfaction.

"The cotton mill industry seems to have turned the corner and our textile mills have shared in this general improvement. But even so, the textile situation, as a whole, has some disturbing aspects to which I would like to draw your attention.

Exports Improving

"In the first place, I should refer to the export situation, which as you know, has been showing this year distinct signs of improvement over the preceding year. On the basis of present trends, exports for the whole year are likely to reach 700 million yards. Incidentally, I might mention with some pride that your Company continue to hold their pre-eminent position as the second largest exporter of textiles in the country. I am glad about the revival and the industry has cause to be thankful to the Government for the export incentive schemes which have been an active factor in the increase in exports. But perhaps we should not miss sight of the fact that even at 700 million yards, the exports for 1959 will fall short of the average during 1954-57, namely, 805 million yards. This, in turn, is considerably short, as you will recall, of the second Plan target of 1,000 million yards of export.

"As a matter of fact, even as I speak to you today, a circumstance has appeared which holds a threat to our export trade. The prices of raw cotton have been rising rapidly, and currently in several varieties they are 20 to 22 per cent. more than the prices prevailing this time last year. As a result, Indian cotton mills have not only lost whatever advantage they once had in the shape of cheaper cotton but they have also come to a position where the prices of Indian cotton are completely out of parity with world cotton prices.

"The problem of rising cotton prices has an urgency about it also from another angle. The rise in raw material prices is bound to be reflected, sooner or later, in the prices of cloth paid by consumers in India.

Import of Cotton

"In these circumstances, I feel justified in suggesting to the Government of India to license immediately the import of 3 to 4 lakh bales of cotton of the staple length $\frac{7}{8}$ to 15/16", over and above the normal quota for import of higher staple cotton. Only then we will have a balance between the supply of and the demand for Indian cotton this season at prices which are fair to mills and to the consumers of cloth.

"While I am on the subject of the cotton mill industry, I should like to emphasise the great need of the textile industry to equip itself with the latest machinery. This is inevitable if the industry is to meet adequately the challenge of the world markets, and also to give to the Indian consumer cloth at a price which he can afford and which will enable him to increase his standard of consumption.

"It will not be out of place for me to say a word here about the indigenous manufacture

of textile machinery. I am all in favour of the encouragement and development of machinery manufacture in India. But it is necessary to realise that extensive renovation and modernisation do not mean merely having new machines. It is equally necessary to ensure that the machinery supplied is also of the latest kind, if our textile industry is to stand in world competition.

Renovation Needed

"In this connection, it should be unnecessary to point out that your Company too will have to spend large amounts in the next few years in the renovation and modernisation of their textile mills, both in India and in Lyallpur.

"Speaking to you last year, I had referred at some length to the progress made in our chemical industries. This progress, I am glad to state, has been maintained, and I am sure, we will continue to do so in future years.

"Our sugar factories have shown satisfactory working and results, although the problem of *khandasari*, to which I had made reference last year as well, continues to be a worrying factor. I cannot help reiterating, even at the risk of repetition, that the present policy of the Government is not only unfair to the sugar mill industry but it also amounts to a national waste of food resources since the *khandasari* producer recovers only seven-tenths of the sugar from cane that the sugar mill industry recovers. In addition, the State and Central Governments continue to lose revenue, by way of cane cess and excise, which they would otherwise secure from sugar mills.

"I might also point out in this connection that the scale of these many-sided losses has been expanding rapidly. Up to 1956-57 the production of *khandasari* was stable around a lakh of tons per season. In 1957-58, the latest season for which Government estimates are yet available, *khandasari* production is placed at 225,000 tons, or two and a quarter times as much as the output before 1956-57. This situation has led to the diversion of cane supplies from sugar factories, and it has been at least one factor in the lower output of sugar during 1958-59.

Unjustified Blame

"While I am on this subject, I would like to say that the industry is being unjustifiably blamed for the present state of high sugar prices for the consumer. This charge against the industry is somewhat difficult to understand in an industry where ex-factory prices are fixed by the Government and the releases are entirely controlled by the Government. As a matter of fact, sugar mills have no control over virtually 88 per cent. of the constituents that enter into the ex-factory price of sugar.

The Pioneers of the Precision Grinding Wheel Industry in India

"Till recently, as you will recall, the ex-factory price of sugar used to be Rs. 36 per maund, with some adjustments for different varieties. Of this price, 43 per cent. went to the cultivator; some 34 per cent. went to the Government for cane cess, excise duty, etc., and 11 per cent. went into the payment of wages. Of the remaining 12 per cent., 9 to 10 per cent. went into other manufacturing expenses, leaving the sugar industry with some 3 per cent. of the price as its share. In the light of these details of the cost structure, I cannot help feeling that criticism directed against the industry looks like an attempt at misguiding the public and diverting the consumer's natural resentment of high prices on to the sugar mill industry.

"At the moment, the coming third Five-year Plan is in the news. Various estimates have been already offered, although the official document on the subject will probably not be available till sometime next year. In any case, I do not want to argue here about the relative merits of the various estimates, but would like to draw your attention to one aspect of all estimates. There cannot be two opinions on the need for quick industrialisation if living standards are to be decisively improved. But I would only like to say that the effectiveness of any planning in our country, which is and will remain for quite some time a predominantly agricultural country, will depend largely on the success we achieve in agriculture. This is so even from the point of view of many sectors of Indian industry which are agriculture-based.

Greatest Failure

"The greatest failure of our planning has hitherto been in the field of agricultural production, in the matter of ensuring adequate agricultural supplies from year to year. The central problem, it will be generally agreed, is not one of adding to the land under cultivation. It is also not a problem solely of absolute levels of production of particular crops. It is more basically the problem of breaking through the stagnation which confines Indian agriculture to the vicious circle of low productivity per acre. As a matter of fact, a study of available data shows that this stagnation is all-pervading in Indian agriculture and covers not merely food crops like wheat, rice, maize and barley, but also other crops like cotton, tobacco, sugarcane and groundnuts.

"As I understand it, only increases in agricultural productivity can provide a socially acceptable solution of the poverty of the Indian peasantry. Only rises in the productivity of their own labour can provide the agricultural masses with increases in income which are not accompanied by self-defeating price rises.

"I also feel that the entire success of our third Plan will depend on our capacity to contain and limit the inevitable pressure on prices when investment becomes very brisk. And there will be little chance of our being able to do so if agricultural productivity does not increase with our growing needs.

Share Transfer Fee Reduced

"Before I close, I would like to refer to one matter of more domestic concern. At the last annual general meeting, several shareholders expressed a desire that some reduction be made in the fees charged by the Company for the registration of share transfers. Accordingly, the Board of Directors have decided that, from 18th October 1959, the charge per transfer will be reduced to half the existing rate. The rate will thus be 3 nP per transfer, subject to a minimum of 25 nP per share of eight or less number of shares.

"It has also been decided by the Board of Directors that as a further facility to shareholders, our scrips, which are at present in units of 11, will be made into units of 10, so that calculations become easy. It has, therefore, been decided to change the unit of the scrips from 11 to 10, and new scrips in terms of these units will be issued free of charge in the course of this year.

"In the end, ladies and gentlemen, let me convey my thanks to all my colleagues who form a part of this organisation—the D.C.M.—and whose efforts have been responsible for the satisfactory working of the Company."

NOTE:—This does not purport to be a record of the proceedings of the annual general meeting.

TUBE INVESTMENTS OF INDIA LIMITED

CHAIRMAN, DR. RAMASWAMI MUDALIAR, ON PROGRESS OF NEW SCHEMES

"FUTURE HOLDS GREAT POTENTIALITIES"

THE Tenth Annual General Meeting of the Tube Investments of India Limited was held at Madras on 12th November 1959. Speaking to the shareholders on the occasion, Dr. A. Ramaswami Mudaliar, Chairman, gave a brief history of the Company, formed by the amalgamation of T.I. Cycles of India Ltd. and Tube Products of India Ltd., and reviewed the progress of the various schemes of manufacture and expansion. He also struck an optimistic note about the future of the Company, though he sounded a note of caution that, while expansion was taking place and production was enlarging, there was need for building a reserve as much as possible out of the Company's resources.

The following is the full text of Dr. Ramaswami Mudaliar's speech:

"LADIES AND GENTLEMEN,

"I have much pleasure in inviting you to this, the tenth annual general meeting of the shareholders of Tube Investments of India Limited. The Directors' report, the balance-sheet and audited accounts have been in your hands for some time and, with your permission, I shall take them as read.

"The year under review has been marked by substantial progress in various directions. Much of this progress has been intimated to you from time to time through the general meeting and extraordinary general meetings that have been held during the period. I shall briefly recount them, so that both the old and the new shareholders will have a conspectus of the directions in which such progress has been made. In my speech at the last annual meeting, I expressed the hope that, with the co-operation of our foreign Directors we might find it possible to open new sections and add to our productive capacity, the manufacture of various parts of the cycle still necessary to produce a complete cycle, as far as is essential in our works. You are aware that tubes were being produced for the cycles by another company whose factory is situated close to the cycle factory, and which fortunately was under common management. The Directors proposed to amalgamate the two Companies and with your approval this amalgamation was carried out after sanction was obtained from the High Court of Judicature, Madras.

Manufacturing Programme Sanctioned

"The programme of manufacturing chains, saddles and bottom brackets and adding a second mill to the tube factory, as well as a cold rolled strip mill, was submitted to the Government for approval. This programme necessarily involved expenditure of a very large amount of foreign exchange. It was obvious to your Directors that under present conditions, the Government of India would not be in a position to sanction the necessary foreign exchange, even if they accepted the programme in principle. The Indian Directors approached Tube Investments of Birmingham with the suggestion that the necessary foreign exchange might be found by them, partly in the form of equity capital and partly in the form of loans. I am happy to state that our British Directors showed a very sympathetic understanding of the problem and were readily forthcoming in finding the necessary foreign resources. With this assurance from our British collaborators we approached the Government of India for the fulfilment of this large programme and I am glad to inform you, as indeed you have heard at the general meeting convened for the purpose, that the Commerce and Industry Ministry, the Finance Ministry and all other concerned departments of the Government of India, showed ready understanding of our scheme and gave full approval to it. We cannot be sufficiently thankful to all the Ministries concerned and, in particular, to the Ministry for Commerce and Industry, for the sanctions that have been given and the licences that have been issued for the import of the necessary plant and machinery. I must also gratefully acknowledge the expeditious manner in which the Secretaries of the various departments and the special officers disposed of our applications.

"The necessary consequence of having this programme sanctioned was to increase the capital of the concerns by finding a certain proportion of foreign capital and supplementing it with local capital for import of plant and machinery and for erecting the necessary buildings to house the expanded units. The first step taken was, therefore, to double the capital of T.I. Cycles of India Limited, that is, raise it from Rs. 70 lakhs to Rs. 140 lakhs. As you are aware, this was approved by you and the rights issue was readily and fully subscribed. Thereafter the scheme of arrangement for amalgamation sanctioned by the High Court, whereby Tube Products of India Limited were merged with T.I. Cycles of India Limited, was taken up and your approval having been equally readily granted, the scheme came into effect from 22nd January 1959. I may also remind you that this merger involved the grant of shares in T.I. Cycles of India Ltd., to the shareholders of Tube Products of India, both to those who had fully paid-up shares and to those who owned partly paid-up shares. The proportion in which T.I. Cycles shares could be given to Tube Products shareholders was suggested by the Directors and the suggestion was approved by you at an extraordinary general meeting.

"After the amalgamation the authorised share capital of the amalgamated Company was, with the approval of the Government of India, raised to Rs. 7 crores and the Directors issued 250,000 of the shares of Rs. 100 each, making the issued capital Rs. 2,50,00,000. One final adjustment had to be made in the accounting year for the convenience both of the Indian shareholders and of the British shareholders. The accounting year has now been changed to 1st August to 31st July inclusive. As the Directors' report points out, the present financial accounts, therefore, represent the period of 13 months from 1st July 1958 to 31st July 1959, in the case of T.I. Cycles of India Limited, and from 22nd January 1959, the date of merger, to 31st July 1959, in the case of Tube Products of India. Finally, it was considered desirable to give the Company a wider and more comprehensive nomenclature and your Directors recommended that the Company might be called Tube Investments of India Limited, which will have separate units functioning as T.I. Cycles of India, Tube Products of India, the Wright Saddles of India, etc.

Progress of Various Schemes

"I would like now to mention the actual progress that has been made in the various schemes and expansions that I have referred to above. The second tube mill is in the process of erection and it will start functioning very shortly. A cold rolled strip mill to convert hot rolled strip into cold rolled strip has been ordered and parts of the machinery will be arriving next year. The chain factory which is essential for our cycles, and which requires great precision in manufacture, is also in the course of being set up. I may mention that the chain factory will produce not only cycle chains but also industrial chains, the production of which will possibly be undertaken for the first time in India by your concern. We have also acquired a site and necessary buildings are being erected to install the plant and machinery, which are necessary for the chain factory.

"The manufacture of saddles for our cycles is also being undertaken and the Wright Saddles, a well-known brand of saddles, will, we hope, be available to our dealers in the next year.

Phillips Cycles to be Produced

"We have begun the manufacture of one of the well-known brands of cycles widely used in India and hitherto imported. You may have seen quite recently a notification in the papers that we are now manufacturing the well-known Phillips bicycles and the equally well-known fittings called 'Brampton' fittings. It was felt by your Directors that, instead of having all the cycles manufactured of a single type, it would help marketing and meet the taste of the consumers better if another well-known brand of cycle was also manufactured by your concern. After prolonged negotiations, we have now been able to acquire the right to manufacture the

Phillips bicycles and we are thankful to all those concerned who have not only agreed to our manufacturing these cycles but have felt so confident in our technical capacity as to allow the name of 'Phillips' bicycles to be used by us. I may say the same of the 'Brampton' fittings, which we shall be manufacturing.

"I would now like to refer briefly to the operating results during the last 13 months. The Directors' report and the balance-sheet show that there has been a falling off in the manufacture of our cycles. This is explained in the report as due to the fact that the factory had practically to close down for a considerable period owing to the non-availability of imported raw materials. This factor is also reflected in the decrease of profit which was further due to the increase of the cost of production, owing to the cost of raw materials and wages having risen. We have kept to our policy enunciated over several years and consistently maintained that the bicycle being the comparatively poor man's necessity, its price should be kept as low as possible and, therefore, in spite of factors which raised the cost of production, the bicycle prices have been kept at the same figure. You will now see from the financial accounts the results of the operations during the 13 months and I trust you will agree with the Directors, who in their report say that the operating results of T.I. Cycles and of Tube Products of India for this period has been fairly satisfactory.

Dividend

"With the caution that has characterised this concern, we have set apart from the surplus profit certain amounts to the general reserve and to the dividend equalisation reserve. After providing for the normal depreciation on a straight line method and for income-tax, we have also set apart a substantial amount as directed by law, as Development Rebate Reserve. The consequence is, that the dividend to the shareholders will be at the same rate as before, namely, Rs. 10 on fully paid-up shares and Rs. 2.50 on partly paid-up shares. This, however, is subject to deduction of tax on dividends, a proposal which was adopted by Parliament in the last Financial Act.

"The actual amount that the shareholders will receive on fully paid-up shares will be Rs. 7. The dividend tax works out at 43 per cent. of the actual amount received by the shareholders. I have expressed my view elsewhere that the new proposal is much more onerous than the previous proposal of a dividend tax paid direct by the Company. The new dividend taxation proposal was stated to be necessitated because of the complexity of grossing up the income earned in this respect before giving relief to the assessee. It was also stated that, in view of the relief given to the Company by reduction of income-tax, this proposal would not in any way seriously affect the payment of dividends nor would it bring additional revenue to the Government. It has now been realised by every company which has had to declare a dividend in a financial year which ended after the 31st March 1959, that these forecasts (the accuracy of which was even then doubted) were completely mistaken. Under the previous law, the declaration of a dividend of 6 per cent. did not attract any tax on the dividend. Under the present law, the declaration of a 6 per cent. dividend will mean that the shareholder will receive only 4.2 per cent. on his shareholding. The refund to an assessee, in the case of the smaller investors, is in most cases an illusory relief. It has been calculated that the Central Revenues get a substantial additional income by the newly proposed dividend tax. But apart from that, I should like to put in a plea for the small shareholders who have, for many years, been dependent on the earnings from dividends on their share capital. A payment of nearly 43 per cent. as tax on the amount received as dividend by them is certainly a very serious imposition on such shareholders. I do trust that the matter will be further examined and that, if the complexity of grossing up the earnings is to be avoided, at least a smaller percentage of tax may be decided upon as fair and just.

Outlook

"As I see it, the future of the Company holds great potentialities. I take an optimistic view regarding its financial prospects, and I feel a certain glow of pride when I consider the expansion that is taking place and the production at a high level of efficiency and techni-

(Continued on page 866)

TREND OF WORLD OIL PRICES IN POST-WAR YEARS

RISE CONSIDERABLY LESS THAN IN GENERAL WHOLESALE PRICES AND COAL

LOOKING back over the course of prices in the recent past, oil marketers would have no hesitation in claiming that their products are cheap. The outsider, however, is entitled to ask the claimant to define his terms. By what criteria is one to judge whether a particular product is cheap or dear? To this question a threefold answer may be suggested. In the first place, cheapness or dearness may be assessed by comparing current prices with those ruling at some date in the past. Secondly—since we live in an inflationary age when the general movement of all prices is upward—one can inquire how the rise in the price of the product in question compares with the increase in others. Finally, one can examine whether the increase in the selling price of the particular product is greater or less than the increase in the prices of the materials, labour, etc., which go to make it.

It is proposed in the present article to examine the claim that oil is cheap from the standpoint of each of these criteria in turn. But it must be pointed out in the beginning that a high degree of precision is not possible in such a study as this. Because of the inadequacies of the available price data, we must, perforce, paint with a broad brush.

Historical Criterion

Beginning with the historical criterion, current prices for the principal products on the U.S. Gulf/Caribbean market—which are still widely accepted as significant indicators for the international oil trade as a whole—may be compared with those ruling in the earlier post-war years. (It goes without saying, of course, that Gulf/Caribbean product prices are now much below the peaks reached during the Suez emergency.) For this purpose, the index numbers published every month by the *Petroleum Press Service* based on the average for 1936-38, provide a ready reckoner. Taking first the annual averages for 1958 (to eliminate seasonal influences) and comparing these with the averages for 1947-49—which is the base period for nearly all U.S. official index numbers—we find that the index for regular trade gasoline has fallen by about 3 per cent. from 183.1 in 1947-49 to 178.1. Our index for kerosene, which averaged 207 last year, was only 7 per cent. above the 1947-49 average of 192.7. Gas/diesel oil, demand for which, in most markets, is rising faster than for any other major product, showed a rise of 20 per cent. over the whole period, from 214.1 to 257.0. Residual fuel oil recorded a rise of 9 per cent., from 261.9 to 285.5.

Over these post-war years, therefore, the movement of product prices on the world market has varied from a fall of 3 per cent. to a rise of 20 per cent. This gives a weighted average (the four prices have been weighted according to the pattern of world consumption in 1958) increase of about 7 per cent. for the major products as a whole, which seems a very moderate advance judged by the inflationary standards of the modern world. Moreover, petroleum products in general are cheaper now than they were a year ago. On the Caribbean market, regular grade motor gasoline is 9.5 cents per U.S. gallon against 9.00 cents last November, but kerosene is 8.875 cents, as against 9.375 cents; gas/diesel oil 48/52 is 8.375 cents, as against 8.875 cents; while bunker "C" fuel oil is unchanged in price at \$2.00 a barrel. On the basis of our first criterion, therefore, it would seem fair to claim that oil is cheap.

Second Test

The second test is to compare the movement of oil prices, with that of wholesale prices in general, or with the prices charged for competing fuels. Rough comparisons of this sort can be made for a number of Western countries for which price indices are available, and the results are broadly similar in all cases. For the U.S., for example, there are the official indices of the Department of Labour. Since the 1947-49 base period, wholesale prices in general have risen 19 per cent. and those of petroleum and its products by 16 per cent. This is a somewhat larger increase in oil prices than that which has occurred on the U.S. Gulf Market, because the official "petroleum" index includes crude oil, prices of which have risen by something like 25 per cent. over the period in question. Thus, an index for

of one kind or another, including tubular goods, most of which have a high steel content, it is clear that steel prices afford one good pointer to the industry's costs. How have these moved since 1947-49? In the U.S., the Department of Labour iron and steel index has risen by 69 per cent; in the U.K., the Board of Trade index has just about doubled, while for Germany the representative prices used by the United Nations have more than doubled since 1948. It is obvious therefore that, in these important producing countries, steel prices have risen much more than oil prices.

For the U.S., a more sophisticated comparison is available. Last May, the Independent Petroleum Association of America published the results of a careful study of the costs of finding, developing and producing oil, based almost entirely on the price indices of the Department of Labour. This showed that the prices of the labour and materials used by the industry had risen as follows since 1947-49:

Average hourly earnings by 65 per cent; steel casing by 91 per cent; special contract services by 24 per cent; rock bits by 34 per cent; general equipment by 54 per cent; drilling mud by 33 per cent.

Combining these figures into a weighted average, the I.P.A.A. concluded that the prices of oil industry labour and materials in general had risen by 57 per cent. in the period under review. This compares with the 16 per cent. increase in petroleum and products as measured by the official index or the rise of roughly 25 per cent. for crude alone. These figures stand out in striking contrast, though it is not claimed that they are necessarily representative for the international petroleum trade as a whole.

Key to the Mystery

How has this relative cheapness of oil been achieved? The key to the mystery is to be found mainly in improvements in overall efficiency. The drive to reduce costs, which is always being pursued, has lately been intensified. Oil companies have economised by improving their techniques of exploration and production; by raising the percentage of oil recovered from the ground; by enlarging the scale of their refineries; by the widespread application of automation and the growing use of electronic computers; by the increased employment of large tankers to cut transport costs; and in many other ways.

As a result of the normal play of competitive forces, the benefit of these improvements in overall efficiency (including the economies made possible by a rapidly growing turnover) are reflected in relatively low prices to the consumer. Recently, indeed, the consumer (in most parts of the world, but not in India—Ed.) has been benefiting from price cuts which go farther than this, because the competitive struggle for markets has been intensified, with the result that company earnings per unit of sales, and the return on investment, have been declining. In view of the abundance of producing and refining capacity in the world today, the consumer seems likely to continue to enjoy the advantage of cheap oil for some time to come.—By arrangement with *Petroleum Press Service*.

INDIA STEAMSHIP FACES ADVERSE WEATHER

DIVIDEND REPEATED BY DRAWING ON RESERVE

THE general recession in international trade which began early in 1958 with its adverse effect on the world freight market both in volume and value would appear to have affected the earnings of Indian shipping companies for that year. If, however, they have been able to enlarge their freight earnings, it is because of the increase in the number of voyages and the consequent rise in the cargo handled. But, at the same time, the increase in the number of voyages has brought with it a sharp rise in port and other expenses, quite out of proportion to that in voyages, and this has reduced the profits of shipping companies appreciably.

A typical instance of this state of affairs is provided by the results of the India Steamship Company, Ltd. (Managing Agents: Messrs. Lionel Edwards Private Ltd., Calcutta) for the year ended 31st March 1959. The Company's freight earnings have gone up from Rs. 7.75 crores in 1957-58 to a record level of Rs. 8.04 crores, but the gross profit has dwindled from a high of Rs. 2.54 crores to Rs. 1.43 crores. This setback in profit is in distinct contrast to the successive improvement noted in previous years, that is, from a low of Rs. 26.87 lakhs earned in 1954-55 to Rs. 253.63 lakhs in 1957-58, or nearly a tenfold rise within three years.

In consonance with the fall in gross profit, the managing agency commission has shrunk from Rs. 19.29 lakhs to Rs. 6.59 lakhs. The provision for depreciation has been raised from Rs. 59.37 lakhs to Rs. 75.56 lakhs, following the substantial additions to the fleet during the year. This leaves a net profit of Rs. 60.67 lakhs, which is only a little more than a third of that (Rs. 174.97 lakhs) for the previous year. There is no tax liability, in view of the large additions to the fleet resulting in heavy accelerated depreciation allowances.

While last year, the Directors had added as much as Rs. 143.58 lakhs to the various reserves (including a sum of Rs. 53.37 lakhs to the development rebate reserve), this year they have been able to plough back no more than Rs. 60.67 lakhs, the whole of the net profit, all to the development rebate reserve. In fact, the development rebate allowable for income-tax purposes is as much as Rs. 153.91 lakhs, but, since the year's net profit falls short of the statutory requirement, the Directors have transferred the entire net profit to this reserve. This leaves no distributable sum, except the surplus of Rs. 8.09 lakhs brought in from 1957-58. The Directors have, therefore, decided to draw Rs. 20 lakhs from the dividend equalisation reserve and this, together with the previous year's surplus, has enabled them to recommend the usual 5 per cent. tax-free preference dividend and a distribution of Re. 1 per share or 10 per cent. on ordinary shares, the same as that paid for 1957-58 on the increased capital raised by the capitalisation of Rs. 22.50 lakhs from the share premium account in 1957-58, as will be borne out by the following comparative table:

(In lakhs of rupees)				
	For the year ended 31st March			
	1959	1958	1957	1956
Freight earned	804.04	775.04	600.17	528.12
Other income	5.97	12.08	4.87	2.22
Port expenses	281.09	209.85	185.82	192.37
Other expenses	390.01	324.19	222.88	244.28
Gross profit	142.92	253.08	187.08	89.14
Managing Agents' commission	6.59	19.29	11.50	8.91
Depreciation	75.56	59.37	105.38	41.50
Net profit	60.67	174.97	169.88	88.73
To reserve	60.67	143.58	81.01	16.00
Transfer from reserve	29.00			
Dividend:				
5 per cent. preference	1.25	1.25	1.25	1.25
Ordinary	24.75	24.75	22.50	22.50
(10%)	(10%)	(10%)	(10%)	(10%)
Carry forward	2.09	8.09	2.71	6.36

* On the increased capital of Rs. 247.50 lakhs raised by the capitalisation of Rs. 22.50 lakhs from the share premium account during 1957-58.

The large sum of development rebate that has been carried forward will tend to restrict the sum available for distribution from the current year's profit as well. The rise of Rs. 29 lakhs in freight earnings during the year under review has been more than offset by the increase of Rs. 71.24 lakhs in port expenses and of Rs. 65.82 lakhs in other expenses. The latter includes a sum of Rs. 14.68 lakhs paid as charter hire, as against nil in the previous year, as a result of the employment of four ships on time charter agreements to maintain the schedules which would otherwise have been disturbed on

the usual routes, owing to the opening of a new route and to the dry-docking of some of the Company's ships for special survey during the year. The other items of expenses which show a marked rise are: (1) cost of insurance by Rs. 6.16 lakhs, (2) stores and victualling by Rs. 7.70 lakhs, (3) miscellaneous expenses by Rs. 2.44 lakhs, (4) freight commissions, brokerage and rebates by Rs. 17.59 lakhs and (5) interest on Government loans by Rs. 4.49 lakhs.

During the year under review, the Company employed 15 vessels in the liner service in the India-U.K.-Continent run and the India-Black Sea route. In addition to employing one vessel in the coastal trade, the Company carried coastal cargo in its overseas vessels. For the first time, the Company entered the liner trade between India and South America serving the River Plate ports in that Continent and employed four ships on time charter agreements for reasons stated above.

In pursuance of its policy of constant expansion of fleet, the Company added two new ships in November and December last and will add three more new ships in the course of the current financial year. This is reflected in the capital expenditure of Rs. 7.50 crores during the year (including cost of ships under construction), on top of a sum of Rs. 5.75 crores spent in 1957-58 bringing the total capital expenditure made so far to Rs. 18.77 crores. The depreciation provided on this amounts to Rs. 4.01 crores, leaving the net block at Rs. 14.76 crores. The current assets aggregate no more than Rs. 4.56 crores; as against these, there are borrowings and other current liabilities and provisions amounting to as much as Rs. 12.98 crores. The paid-up capital of Rs. 2.75 crores is supplemented by reserves and surplus aggregating Rs. 3.59 crores.

The outlook for the current year does not appear to be promising, in view of the fact that the general recession in international trade continues to have its effect on the freight market. Though the Directors do not take an unduly pessimistic view of the freight earnings during the current year, they feel that "conditions still continue to cause some anxiety." This note too encouraging note has depressed the Company's shares (Rs. 10 paid-up) from Rs. 13.76 early this month to Rs. 13.40 cum-div. On an ex-div. basis and at the current rate of dividend, the shares offer a yield of 8 per cent. per annum. Unless the freight earnings go up substantially the chances of the Company even maintaining the dividend at the current level without recourse to the dividend reserve are slender. Moreover, as stated above, there is a large sum of development rebate in arrears to be provided for in the current year's accounts.

MAHINDRA-SINTERED PRODUCTS PRIVATE LTD.
As a result of negotiations, which have been conducted in this country and in England, an agreement was reached early this year between Messrs. Mahindra and Mahindra and a prominent U.K. engineering group represented by Messrs. Birfield Industries Ltd., covering participation in the formation of a new Indian company, to be known as Mahindra-Sintered Products Private Ltd.

The main production objective of the new company, Mahindra-Sintered Products Private Ltd., will be to manufacture a wide range of self-lubricating bearings in a factory, which is to be installed in Pimpri, Poona. According to the Mahindra-Birfield agreement, the British group will supply the necessary machinery, tooling, and technical "know-how" and the U.K. contribution will comprise 49 per cent. of the new company's capital.

The project is of special interest, inasmuch as the production of self-lubricating bearings is representative of advanced manufacturing techniques in Western Europe and these items are utilised by a substantial number of engineering industries in India. Generally speaking, these oil retaining bearings have been evolved for applications under which it is difficult or undesirable to utilise the standard types of externally lubricating bearings. Some typical applications are connected with the manufacture of electric motors, generators, drilling machines, motors, motor cars, motor cycles, cycles, electric fans, tractors, agricultural machinery, aircraft, sewing machines, textile machinery, railway signal equipment, etc.

Approval has been received from the Ministry of Commerce and Industry, Government of India, covering the Mahindra-Birfield collaboration proposals, and licensing the manufacture of the self-lubricating bearings.

The project is now being actively implemented and it is anticipated that manufacture will commence by the latter half of 1960.

G. E. SHIPPING'S PROFIT SHARPLY DOWN

Mr. GHOLAP DIFFERS ON DIVIDEND POLICY

THE Directors of the Great Eastern Shipping Company Ltd. (Managing Agents: Messrs. A. H. Bhiwandiwalla & Co. (Bombay) Private Ltd., Bombay) have recommended a sharp cut in the ordinary dividend for the year ended 30th June 1959 from 18 per cent. paid for 1957-58 to 15 per cent. on fully paid shares as well as on partly paid ones. What is more, this is subject to deduction of tax at 30 per cent., as per the provisions of the Finance Act 1959, so that the net dividend in the hands of individual shareholders will be 10.5 per cent., as against 18 per cent. for the previous year. Even to pay this reduced dividend, the Directors have had to draw a sum of Rs. 15 lakhs from the general reserve, but this proposal of the Directors has, it is stated, not been approved by the Government Director, Mr. L. T. Gholap, who is a whole-time Director representing the Government of India in all private shipping companies, which have taken loans from the Government of India.

The grounds on which the Government Director is opposed to the idea of running down the general reserve for the purpose of paying dividend when circumstances do not otherwise permit it at all are not given in the Directors' report. It may be noted, in this connection, that the proposal of the India Steamship, a competitor of the Company under review, to draw a large sum from the reserves does not seem to have been objected to by Mr. Gholap. This is presumably because in that case the dividend is proposed to be paid out of the specific reserve, namely, the dividend equalisation reserve. The Great Eastern Shipping Company also has a dividend reserve, but it is not more than Rs. 10 lakhs. If the Directors were to confine themselves to drawing on this reserve alone, it would mean a much drastic cut; the dividend would be no more than 11.1 per cent. (subject to deduction of tax).

Be that as it may, the cut in dividend follows the disappointing results of the Company for the year under review. The freight and charter hire earned have dropped from Rs. 3.60 crores to Rs. 2.75 crores and the gross profit has dipped from Rs. 121.66 lakhs in 1957-58 to Rs. 86.49 lakhs. The net profit, too, has declined from Rs. 64.97 lakhs to Rs. 31.58 lakhs. While the provision for depreciation has been raised from Rs. 36.91 lakhs to Rs. 61.32 lakhs, there is no tax liability, in view of the allowance of development rebate on the purchase of ships; for 1957-58, however, a sum of Rs. 10.50 lakhs has been set aside for taxation. Out of the net profit, the Directors have transferred Rs. 29.50 lakhs to the development rebate reserve, as against Rs. 28.65 lakhs in the previous year. No other addition to the reserves has been possible, whereas a year ago, the general reserve was strengthened by Rs. 14 lakhs and the dividend equalisation reserve was created with an allocation of Rs. 10 lakhs.

The following comparative table shows the progress of the Company in recent years:

(In lakhs of rupees)				
	For the year ended 30th June			
	1959	1958	1957	1956
Freight and charter hire earned	275.80	359.68	368.08	222.80
Other income	37.91	15.46	10.28	11.76
Operating expenses	107.50	222.80	262.36	192.01
Other expenses	29.82	22.38	28.47	14.48
Gross profit	66.49	130.06	108.59	48.29
Managing Agents' commission	3.20	9.80	8.61	2.77
Depreciation	61.92	36.91	56.06	18.47
Net profit	31.58	82.95	42.92	24.96
Transfer from reserve and provision	29.50	28.65	28.65	28.65
Capital less expenses	13.38	8.40	3.00	0.22
Under provision for foreign loan	0.02	8.20		
To reserve of previous year	25.90	25.08	27.59	25.40
Dividend:				
15 per cent. preference	1.80	1.80	1.80	1.80
Ordinary	13.50	13.50	11.97	11.97
(10%)	(10%)	(10%)	(10%)	(10%)
Carry forward	2.28	1.74	1.88	0.94

* Subject to deduction of tax.

To those who are familiar with the conditions in the world freight market, the disappointing results of the Company may not have come as a surprise. For, while there was a general slump in the freight market, which brought about lay-up of many a ship in a number of foreign countries, tramp shipping, in which the Company specialises, was hit harder than liner shipping. The year's results would have been worse still but for the receipt of Rs. 25.41 lakhs being an insurance claim which became due

during the year. There has also been a decline of Rs. 32.35 lakhs in operating expenses, which is mainly accounted for by a saving of Rs. 7.48 lakhs on income-tax at foreign ports, of Rs. 6.48 lakhs on repairs and maintenance, Rs. 11.55 lakhs on hire of chartered steamers, Rs. 12.83 lakhs on freight paid to owners of chartered vessels, Rs. 6 lakhs on coal, fuel oil and water and Rs. 3.41 lakhs on commission, brokerage, etc.

During the year under review, the Company received delivery of a large ship of 10,145.90 g.r.t., the largest ship on the Indian registry, and a medium-sized vessel of 3,553.24 g.r.t., the first of a series of medium-sized vessels built by the Hindustan Shipyard. With these additions, the Company's fleet has a strength of 16 with a g.r.t. of 92,490.90. While the cargo lifted on the coastal trade has declined during the year from 592,021 tons to 514,009 tons, that on the overseas trade has gone up from 251,257 tons to 361,148 tons, raising the total cargo to a peak of 875,157 tons.

The Company's paid-up capital of Rs. 1.15 crores is supplemented by reserves and surplus aggregating Rs. 2.08 crores. The total borrowings stand raised from Rs. 3.62 crores to Rs. 4.49 crores. The other current liabilities and provisions amount to Rs. 1.31 crore. The additions to the fleet account for Rs. 2.74 crores and additional capital expenditure on the old fleet for about Rs. 15 lakhs bringing the total capital expenditure on fleet up to the end of the year to Rs. 8.72 crores, on which the depreciation provided so far is Rs. 1.73 crores. The other fixed assets stand written down from Rs. 4.23 lakhs to Rs. 2.61 lakhs. The current assets aggregate Rs. 1.98 crore, which fall very much short of the current liabilities (including loans) and provisions by Rs. 3.82 crores.

The Rs. 10 fully paid-up shares of the Company are being currency quoted at Rs. 19.44 cum-div. On an ex-div. basis, the yield works out to 8.3 per cent. per annum, subject to deduction of tax, and 5.7 per cent. per annum, free of tax.

BARNAGORE JUTE RETURNS TO DIVIDEND LIST

In consonance with the improved trading conditions in jute industry during the past year and over, the Barnagore Jute Factory Company, Ltd., a company incorporated in the U.K. has done exceedingly well during the year ended 31st March 1959. It has earned a trading profit of £287,952, £40,394 in 1957-58 and a loss of £121,539 in 1956-57. In fact, the profit for the year under review is the highest since 1947-48. In addition to the availability of raw jute in adequate quantities and at cheaper prices, an important factor which has contributed to the better results of the Company is the installation of new modern machinery and the concentration of production in East Mill only on a shift basis. Though this entailed an outlay of about £200,000 and that too at a time when the industry as a whole was going through an adverse period and suffering heavy loss, the Company's decision to go ahead with this programme has been well justified by the results of the year under review.

After providing £55,154 (as against £61,676 in 1957-58) for depreciation and adding refunds of U.K. and Indian taxation relating to past years amounting to £54,234 (£750), the Directors have set aside £5,800 for Indian wealth tax and £1,815 for development rebate reserve, wiped out the accumulated debit balance of £175,587 brought in from previous years and paid off the arrears of preference dividends for the three years ended March 1959. The ordinary shares, too, have returned to the dividend list after a lapse of three years. For the Directors have recommended a distribution on these shares of 10 per cent. per annum, less tax, as against the previous dividend of 15 per cent. paid for 1954-55. The dividends absorb £22,969 leaving a surplus of £67,968.

While production was concentrated in the East Mill, the Company had contracted to sell its South Mill for Rs. 29.25 lakhs prior to 30th September 1958 and had received an earnest money of Rs. 2.25 lakhs. Subsequently, however, a dispute arose over the terms of the agreement for sale and the matter is now before the Calcutta High Court.

The Company's financial position is quite satisfactory, as will be seen from the following synopsis of its latest balance-sheet:

LIABILITIES		ASSETS	
£	£	£	£
Capital	475,000	Gross block	1,403,824
Reserves and surplus	694,787	Less—Depreciation	1,028,550
Current liabilities	448,961	Net block	375,274
		Net machinery under installation	13,194
		Investments	16,708
		Current assets	1,013,572
			£1,618,748

Though the industry has turned the corner, the Directors have uttered a note of warning that it is particularly vulnerable to any general recession in international trade. So far as the Company is concerned, the results during the current year so far, they add, are being maintained at as satisfactory a level as last year.

COMPANY MEETINGS AND DIVIDENDS

WESTERN BENGAL COALFIELDS LTD. Annual General Meeting, Calcutta, 25th November 1959. Dividend: 40 nP per share. Transfer books remain closed from 9th to 25th November 1959, both days inclusive.

HINGIR-RAMPUR COAL CO., LTD. Annual General Meeting, Bombay, 25th November 1959. Dividend: Nil. Transfer books remain closed from 6th to 25th November 1959, both days inclusive.

JARDINE HENDERSON LTD. Annual General Meeting, Calcutta, 26th November 1959. Dividend: Rs. 5.00 per ordinary share. Transfer books remain closed from 12th to 26th November 1959, both days inclusive.

INDIA STEAMSHIP CO., LTD. Annual General Meeting, Calcutta, 27th November 1959. Dividend: Re. 1.00 per share. Transfer books remain closed from 12th to 27th November 1959, both days inclusive.

ASSAM PROPER TEA CO., LTD. Annual General Meeting, Calcutta, 27th November 1959. Transfer books remain closed from 11th to 27th November 1959, both days inclusive.

KARAFURA COLLIERIES LTD. Annual General Meeting, Calcutta, 30th November 1959. Dividend: 5 per cent. or Rs. 5.00 per share, payable on or after 6th December 1959. Transfer books remain closed from 16th to 30th November 1959, both days inclusive.

BRITANNIA ENGINEERING CO., LTD. Annual General Meeting, Calcutta, 30th November 1959. Dividend: 6 per cent. or Re. 0.60 per share, payable on or after 15th December 1959. Transfer books remain closed from 16th to 30th November 1959, both days inclusive.

GILLANDERS ARBUTHNOT & CO., LTD. Annual General Meeting, Calcutta, 1st December 1959. Dividend: 10 per cent. or Re. 1.00 per share. Transfer books remain closed from 16th November to 1st December 1959, both days inclusive.

INVESTMENT TRUST OF INDIA LTD. Annual General Meeting, Madras, 2nd December 1959. Dividend: 5 per cent. or Rs. 5.00 per share (taxable), payable on 3rd December 1959. Transfer books remain closed from 21st November to 2nd December 1959, both days inclusive.

MIDLAND RUBBER AND PRODUCE CO., LTD. Annual General Meeting, Alleppey, Kerala State, 7th December 1959. Dividend: 10 per cent. or Re. 1.00 per share, free of tax. Transfer books will remain closed from 25th November to 7th December 1959, both days inclusive.

RAMPUR DISTILLERY AND CHEMICAL CO., LTD. Annual General Meeting, Rampur, U.P. 9th December 1959. Dividend: 3 per cent. or Re. 0.30 per share, payable on or after 26th December 1959. Transfer books will remain closed from 1st to 15th December 1959, both days inclusive.

MUKAND IRON AND STEEL WORKS LTD. Annual General Meeting, Bombay, 10th December 1959. Dividend: Re. 1.00 per share (includes bonus), payable on or after 15th December 1959. Transfer books remain closed from 21st November to 10th December 1959, both days inclusive.

GREAT EASTERN SHIPPING CO., LTD. Annual General Meeting, Bombay, 10th December 1959. Dividend: Re. 1.05 per ordinary share and Re. 0.525 per new ordinary share, payable on and after 15th December 1959. Transfer books will remain closed from 23rd November to 10th December 1959, both days inclusive.

BENGAL ELECTRIC LAMP WORKS LTD. Annual General Meeting, Calcutta, 11th December 1959. Transfer books will remain closed from 27th November to 11th December 1959, both days inclusive.

CENTRAL INDIA COALFIELDS LTD. Annual General Meeting, Calcutta, 11th December 1959. Transfer books will remain closed from 23rd November to 11th December 1959, both days inclusive.

EAST INDIAN COAL CO., LTD. Annual General Meeting, Calcutta, 16th December 1959. Dividend: Re. 0.75 per share (final), less income-tax. Transfer books will remain closed from 2nd to 16th December 1959, both days inclusive.

BRITISH BURMAH PETROLEUM CO., LTD. Annual General Meeting, Bombay, 17th December 1959. Dividend: Nil. Transfer books will remain closed from 5th to 12th December 1959, both days inclusive.

BEJAPUR CO., LTD. Dividend of Rs. 21.00 per share less income-tax (this works out to a net dividend of Rs. 14.70 per share) for the year ended 30th September 1959. Transfer books will remain closed from 23rd November to 22nd December 1959, both days inclusive.

SOUTH KARAFURA COAL CO., LTD. Interim dividend of 37 nP per ordinary share (subject to tax), for the year ended 31st August 1959, payable on or after 7th December 1959. Transfer books remain closed from 13th to 23rd November 1959, both days inclusive.

NUDDA MILLS CO., LTD. Interim dividend of 2 per cent. or Re. 1.00 per share for the year ended 31st March 1960, payable on 30th November 1959. Transfer books will remain closed from 23rd to 30th November 1959, both days inclusive.

GOUREPPE CO., LTD. (Jute company) Interim dividend of 10 per cent. or Rs. 10.00 per share, for the year ended 31st March 1960, payable on 30th November 1959. Transfer books will remain closed from 23rd to 30th November 1959, both days inclusive.

CLIVE ROW INVESTMENT HOLDING CO., LTD. Final dividend of 12 nP per share (making a total of 37 nP per share), for the year ended 31st March 1959. The shareholders also received an additional dividend of 46 nP in respect of the two years ended 31st March 1958.

TEXTILES

(Concluded from page 848)

lot of anxiety to the entire cotton trade. The main hope of achieving the third Plan target for cotton, which had been proposed as 7.2 million bales, lay in improved method of cultivation, in bringing more areas under irrigation and increased use of fertilisers. If nature were not unkind, it was possible to reach the target or at least come near it. In view of the likely expansion of textile activity, it was necessary, Mr. Ruia emphasised, that production should be increased substantially.

Welcoming the recommendation recently made by the Cotton Advisory Board to permit import of 100,000 bales of 15/16" to 1-1/16" staple cotton, in addition to the usual import quota of 600,000 bales and the 140,000 bales announced on 1st September against last season's balance quota, Mr. Ruia urged immediate action by the Government in accordance with the recommendation, as, otherwise, according to him, it would lose its value and effect.

Mr. Ruia expressed satisfaction over the behaviour of the futures market which gave cause for no special anxiety during the past year. In the light of the experience gained over a period of years, the hedge schedule has been modified, the important innovation being that the actual stations from which cotton could be tendered against the hedge contract are enumerated instead of the mention of mere areas. The standard and tenderable descriptions had also been shown separately. It is expected that the changes would clarify uncertainties which occasionally arise at the time of tendering of cotton. Some modifications have also been introduced in the by-laws governing the delivery contracts. These contracts can be entered into now for any description of Indian cotton included in the hedge schedule, but certain descriptions, which will be announced in advance and permitted by the Board, will be subject to clearing settlements which are now to be made on weekly, instead of fortnightly, basis.

Certain significant developments took place during the year within the jurisdictional sphere of the Association. They are: (1) the passage of by-laws regarding c.i.f. c. & f. and f.o.b. contracts for foreign cotton and the contracts for cotton imports to arrive and for forward delivery and their approval by the Central Government in January last under the provisions of the Forward Contracts (Regulation) Act, 1952. (2) The East India Cotton Association became a signatory to the Universal Cotton Standards Agreement in pursuance of the agreement between the U.S. Department of Agriculture and the Association in February 1952. Consequently, the Association has to provide machinery for quality arbitration on American cotton under its own auspices. The by-laws referred to above provide for this machinery. There is also a provision made for quality arbitration on other foreign growths imported into India. In course of time, this machinery will also be completed and all procedural details fixed. As India imports quite a substantial quantity of foreign cotton, it was necessary that the Association should provide for imports with arbitration on quality by the Association itself, and these by-laws fill a long-felt need.

Pursuant to the authority conferred by the U.S. Cotton Standards Act and the agreement between the U.S. Department of Agriculture and the Association, all the six sworn surveyors of the Association have been designated as cotton examiners by the Department. These examiners will be constituted as a Board of Examiners in accordance with the by-laws of the Association, with powers to issue final certificates of classification by comparison of samples of imported cotton with types or other samples or as to the grade and colour with the universal standards for United States cotton, replicas of which are furnished to the Association.

Mr. Ruia again drew the attention of the trade to business outside trading hours. Although, by and large, members of the trade were observing the regulation regarding trading hours, the irresponsible activities of a few, according to him, were spoiling the fair name of the trade. The Board of the Association and the Forward Markets Commission were very anxious to see that trading was done within the prescribed hours of trading. He appealed to members to refrain from illegal trading, lest the Board should be forced to take strict action which might be detrimental to the whole trade.

PERUVIAN COTTON

The 1959-60 Peruvian cotton crop is presently estimated at 493,000 bales of 500 lbs. each, as compared with 505,000 bales during last season. The decline in production is attributed mainly to crop damage caused by insects. This, coupled with a smaller carryover at the beginning of the season and a probable increase in domestic consumption, is likely to reduce export availability this season. Exports during 1959-60 are, therefore, expected to be lower than in 1958-59 when they reached a record of 511,000 bales. This was 27 per cent. higher, as compared with 1957-58, when exports amounted to 402,000 bales.

Stocks on 1st August 1959 were estimated at 229,000 bales, as compared with 300,000 bales at the beginning of the previous season. Total supply during the season will, therefore, aggregate 722,000 bales comprising a carryover of 229,000 bales and a crop of 493,000 bales as against 805,000 bales in the previous season.

SYNOPSIS OF COMPANY REPORTS

Britannia Engineering Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. McLeod & Co. Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December 1958.

The results of the Works show a profit of Rs. 19,16,511 as compared with Rs. 14,99,220 for the preceding 12 months. After making the usual provisions and adjustments including interest, commission, depreciation, taxation and forfeited dividends and taking into account the amount brought forward from 1957, there remains at the credit of profit and loss account a balance of Rs. 5,05,124 (Rs. 4,85,907); out of which, the following provisions have been made:

To provision for wealth tax Rs. 45,000 (Rs. 43,000), to development rebate reserve Rs. 1,06,000 (nil) and for miscellaneous adjustments Rs. 425 (nil) leaving a balance available for disposal of Rs. 3,53,699 (Rs. 4,42,907).

During the year a further 5,206 preference shares of Rs. 100 each were subscribed and allotted. By a special resolution passed at an extraordinary general meeting of the shareholders held on 30th May 1958, the rate of interest payable on the preference shares was increased from 6 per cent. per annum to 7 per cent. per annum with effect from that date, and the directors now recommend payment of dividend at the appropriate rates on 6,948 preference shares, and on 4,00,000 ordinary shares at 6 per cent. per annum which absorbs Rs. 2,75,647 (Rs. 2,45,197), leaving a balance at credit of profit and loss account of Rs. 78,052 (Rs. 1,97,710), to be carried forward to the next year.

Every effort is being made to increase the scope of the Company's activities. A collaboration agreement with Messrs. Dawson Pyne Elliot Ltd., Olney, England for manufacture of printing machinery in India has been finalised and approved by the Government of India. Planning has already been taken in hand and production is expected to commence in the near future.

Manufacture of Road Rollers, Steel Structural and Railway Signalling Equipment, etc., has been maintained at a satisfactory level. The directors are pleased to report that the plant and equipment for the wagon building factory at Mokameh has arrived and construction of the factory is in progress.

Accounts in brief are as under:—

Amalgamated Electricity Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. N. C. Javeri & Co. Bombay) submit the audited accounts of the Company for the year ended 31st March 1959.

The gross profit for the year amounts to Rs. 20,85,874 (Rs. 17,59,278). After appropriating Rs. 7,20,027 (Rs. 6,55,767) to depreciation, Rs. 9,415 (Rs. 18,346) to arrears of depreciation, Rs. 51,135 (Rs. 59,513) to Contingencies Reserve, Rs. 1,15,698 (Rs. 1,25,500) to staff retiring gratuity fund, Rs. 2,930 (Rs. 392) to consumers' benefit reserve) each to tariffs and dividends control reserve and consumers benefit, Rs. 28,441 (Rs. 40,398) to development reserve, Rs. 31,315 (Rs. 61,716) to wealth tax, Rs. 1,41,515 (nil) to income-tax and Rs. 4,001 (Rs. 887) to agents' commission for previous year and after writing off Rs. 19,962 (Rs. 19,963), Rs. 3,500 (Rs. 14,750) and Rs. 6,469 (Rs. 9,523) from purchase consideration, electric license expenses, preliminary, amalgamation and new share capital issue expenses respectively and with the addition of Rs. 15,26,326 (Rs. 15,48,223) brought forward from the last account and of Rs. 741 (Rs. 3,690) and Rs. 4,652 (nil) received as refund of tax deducted at source on securities and against purchase of energy respectively, there is a balance of Rs. 24,82,255 (Rs. 23,76,971). Deducting from this ad interim dividend, free of income-tax, of Rs. 2,75 (Rs. 2,75) nP per share on 5½ per cent. preference shares, Rs. 2,50 (Rs. 2,50) nP per share on 5 per cent. preference shares and 45 (43) nP per share on ordinary shares, absorbing Rs. 4,43,447 (Rs. 4,28,948), there is available Rs. 20,38,808 (Rs. 19,48,023) which the directors recommend to appropriate as follows:

To payment of a final dividend, free of income-tax, for the second half year ended 31st March 1959, at the rate of Rs. 2.75 (Rs. 2.75) nP per share on 24,150 preference shares (making 5½ per cent. for the year) absorbing Rs. 66,412 (Rs. 66,412), at the rate of Rs. 2.50 (Rs. 2.50) nP per share on 20,314 preference shares (making 5 per cent. for the year) absorbing Rs. 50,785 (Rs. 50,785) and at the rate of 45 (42) nP per share on 7,25,000 ordinary shares [making 8.5 per cent. for the year] absorbing Rs. 3,26,250 (Rs. 3,04,500), leaving balance to be carried forward of Rs. 15,95,361 (Rs. 15,26,326).

Four of the six used generating sets purchased last year have been put into commission and the remaining two sets of 450 B.H.P. each are under

installation at Malegaon. Further to augment the plant capacity at Malegaon, two used sets of 570 B.H.P. each have been ordered from U.K. and import licence thereof has been very recently received. Transmission lines are being extended to meet the growing demand.

The following table indicates the development of the sale of energy since April 1956:

Year	Units generated and purchased	Total load in kW	Consumers
1956-57	4,04,80,991	26,882	55,772
1957-58	4,35,38,561	28,576	62,455
1958-59	4,95,06,673	31,821	67,450

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	1,16,96,400	Gross block	2,18,23,158
Reserves	17,54,523	Less—Depreciation	52,04,167

	Rs. 2,08,01,929		Rs. 2,08,01,929

Velimalai Rubber Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Oopoottil Kurian & Co., Private Ltd. Kottayam, Kerala State) submit the audited accounts of the Company for the year ended 28th February 1959.

The total area under rubber is 1,015.17 acres. The area under tea is 121.84 acres. 40 acres under ordinary rubber have been replanted during the current year with budded rubber under the Rubber Board's Subsidy Scheme.

Crop, Cost and Prices: A rubber crop of 4,16,721 lbs. was harvested at an estate cost of 92.40 nP per lb. against 4,58,328 lbs. at an estate cost of 84.99 nP per lb. for the previous year. The tea crop harvested was 44,698 lbs. at an estate cost of 145.63 nP per lb. against 56,572 lbs. at an estate cost of 117.20 nP per lb. for the previous year. The net average prices realised were 156.03 nP per lb. for rubber and 150.87 nP per lb. for tea, against 153.95 nP per lb. for rubber and 136.44 nP per lb. for tea for the previous year. The maximum controlled price for No. 1 sheet rubber remained at 155.75 nP per lb.

The estimate for the current year is for a crop of 4,10,000 lbs. of rubber at an estate cost of 91.54 nP per lb. and 55,000 lbs. of tea at an estate cost of 114.46 nP per lb.

The net profit for the year is Rs. 1,77,781 (Rs. 2,25,630) after providing for all charges including depreciation and debenture interest but before providing for taxation. The profit has been lower due to a decrease in the crop and an increase in the cost of production. Together with the previous year's balance brought forward of Rs. 21,001 (Rs. 12,871) the amount available for appropriation is Rs. 1,98,782 (Rs. 2,38,501) which the directors propose to appropriate as below:

To reserve for taxation Rs. 75,000 (Rs. 1,00,000), to transfer to debenture redemption fund Rs. 40,000 (Rs. 40,000), to transfer to preference dividend account (dividend already paid) Rs. 17,500 (Rs. 17,500) and to pay a dividend of 10 (10) per cent. on the equity shares absorbing Rs. 60,000 (Rs. 60,000) leaving a balance to be carried forward of Rs. 6,282 (Rs. 21,001).

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	8,50,000	Gross block	17,45,808
Debitures	3,97,000	Less—Depreciation	1,02,210
Reserves	4,56,000		
Provision for taxation	1,48,759	Net block	16,43,598
Liabilities	2,36,013	Stock-in-trade	1,90,483
Profit and loss account (surplus)	6,282	Stores etc.	30,802
		Debits, deposits and advances	1,33,137
		Investments	1,000
		Cash	95,034
	Rs. 20,94,054		Rs. 20,94,054

Western Bengal Coal-Fields Ltd.

The directors of the above Company (Managing Agents: Hindusthan Investment Corporation Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st March 1959.

The profit for the year before charging depreciation and taxation amounts to Rs. 6,40,122 (Rs. 7,54,442). From this amount is to be deducted provision for income-tax Rs. 2,45,000 (Rs. 1,25,000), provision for cess charges Rs. 35,000 (Rs. 1,04,500) and provision for depreciation Rs. 2,78,000 (Rs. 3,06,115) leaving a balance of Rs. 2,82,122 (Rs. 2,18,828). This together with the balance brought forward from last year's account of Rs. 7,951 (Rs. 11,543) makes a total of Rs. 2,90,073 (Rs. 2,30,371). Out of this, after transferring to development reserve Rs. 82,171 (Rs. 22,500) there remains a balance of Rs. 2,07,902 (Rs. 2,07,871). The directors recommend payment of dividend at 40 (40) nP per share, free of tax, absorbing Rs. 1,99,920 (Rs. 1,99,920) leaving a balance to be carried forward to the next year's account of Rs. 7,982 (Rs. 7,951).

Raisings and Workings: Total raisings for the year were 2,54,969 (2,27,205) tons and despatches 2,49,458 (2,14,421) tons; consumption was 9,179 tons. Depillaring operations continued at the Moira Colliery with satisfactory results. Workings

at this colliery of the company were and continue to be satisfactory.

Working at the Samla Manderboni Colliery, however, continued to be difficult, primarily because of various troubles in sand stowing. Pitt No. 4 was reopened and resumed production from early this year. However, the impact of the loss in production due to closure of this mine and cost of its reopening and reclamation was felt during the year under review with its consequent result on the profits.

Immediate alternate arrangements are being made to restart the sand gathering operations; but such arrangements, it will be appreciated, naturally take time and it may not be before December 1959 that full normal working at that colliery can be resumed. The directors regret that this is the third natural catastrophe at the Samla Manderboni Colliery during the past three years and these have new pits which had been sunk at the Samla Manderboni Colliery were commissioned by the roof conditions having been met in this particular seam. It was decided to deepen the pits to a lower and production is expected to commence from these pits Nos. 5 and 6 by the end of this year.

In further development programmes, the directors have included the opening up of the Jambad scheme is satisfactory so far; the progress of this to report that sinking has reached a very advanced stage and they hope that initial production from middle of next year. In view of these developments, in spite of the setback at Samla Manderboni, the directors hope to be able to show similar results this year.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	49,98,000	Gross block	78,61,905
Reserves	1,68,505	Less—Depreciation	29,89,423
Provision for income-tax	4,23,928		
Provision for wealth tax	25,000	Net block	48,62,482
Liabilities	22,22,300	Stores and spare parts	7,09,433
Profit and loss account (surplus)	7,982	Stock of coal	27,701
		Other assets	1,710
		Debits, deposits and advances	20,34,590
		Investments	1,49,956
		Cash	59,834
	Rs. 78,45,715		Rs. 78,45,715

Tycoon Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co. Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December 1958.

The season's working resulted in a profit, after providing for depreciation, of Rs. 4,38,302 (Rs. 3,91,352) to which must be added adjustment brought forward from 1957 of Rs. 36,844 (Rs. 86,908) making a total of Rs. 5,01,949 (Rs. 4,78,260). From this amount is to be deducted loss on farming Rs. 18,309 (Rs. 13,718) leaving a balance of Rs. 2,98,500 (Rs. 2,42,644) after providing for depreciation in respect of previous year and Rs. 59,581 on adjustment account machinery reserve Rs. 1,50,000 (Rs. 50,000) and to development rebate reserve Rs. 10,000 (nil) leaving an available balance of Rs. 1,38,600 (Rs. 1,92,644). This amount the directors recommend, should be dealt with as follows:—

In payment of a dividend for the year ended 31st December, 1958, at the rate of Re. 1.50 equity shares, absorbing Rs. 78,000 (Rs. 1,56,000) (Rs. 36,844), to be carried forward Rs. 60,600

The saleable crop weighed out at 15,467 (16,082) maunds against the revised estimate of price of Rs. 2.47 (Rs. 2.16) per lb.

The estimate for season 1959 provides for a saleable crop of 17,500 maunds at a total revenue expenditure of Rs. 23,74,093.

The smaller crop made in 1958, as compared with the crop of the preceding year, was due to adverse weather conditions experienced early in the season.

Accounts in brief were as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	5,20,000	Gross block	41,57,562
Reserves	23,10,415	Less—Depreciation	14,88,789
Provision for taxation	9,12,310		
Liabilities	12,50,171	Net block	26,68,773
Profit and loss account (surplus)	60,600	Work-in-progress	3,77,679
		Stock of tea	9,08,792
		Stores	5,71,070
		Other stocks	36,650
		Debits, deposits and advances	2,86,823
		Investments	53,070
		Cash	1,50,839
	Rs. 50,53,496		Rs. 50,53,496

NEW PUBLICATIONS

Administrative Problems of Public Enterprises in India. By M. C. Shukla. Published by S. Chand & Co., Asaf Ali Road, Delhi. Pages: 232. Price: Rs. 10.

MUCH attention has been devoted in recent years to the problems of administering public enterprises. The growing interest in this subject is due to the fact that the Government, in keeping with its declared aim of enlarging the public sector, continues to set up large public enterprises. The essence of the problem of management of public enterprises is to combine the broad social purposes of nationalisation with private enterprise efficiency which one associates with private enterprise. Among the recent books which have appeared on this subject, M. C. Shukla's treatise deserves a high place indeed. He commences the book with a discussion of the basis of Government ownership and goes on to describe the objectives and scope of public enterprises in India. These chapters are followed by separate chapters on forms of organisation, parliamentary control, ministerial control and board of directors of public enterprises. The task of management is treated in two chapters. The last two chapters of the book are devoted to the policy of public enterprises and training of managers. Each section is complete in itself, and yet leads on to the next section.

The author offers no ready-made solution for the vexed problems connected with the organisation and management of public enterprises, though he indicates, in certain places, how a particular problem could be tackled. He rightly eschews dogmatic statements. For instance, on the important question of the right type of organisation for the management of public enterprise, he says:

"The search for suitable pattern or patterns of organisation is yet in its initial stages in India, although preference is being given to private limited company and public corporation, in the same order as stated. . . . Furthermore, when a Government undertakes an industrial or commercial activity in which it may have to compete with the private sector, it is necessary to establish reliable standards of comparison in order to secure maximum productive and competitive efficiency. This can be secured if the enterprises are managed on commercial lines, adopt commercial forms of accounting and are operated as enterprises in the private sector. The general policy of the Government of India is to confer the largest measure of financial and administrative autonomy on the management. The content of autonomy would, however, vary in different enterprises according to their nature and purposes. Whether there should be formed a new company for each new enterprise or many plants should be administered by one company is still an open question. Trial and experiment will determine the final choice."

No elaborate review of the working of individual State-owned enterprises in the country has been attempted by the author. But he states that he proposes to make such studies. The results of such a study should be a welcome contribution to the literature on India's public enterprises.

The Indian Market. Compiled by Messrs. J. Walter Thompson Company. Published by McGraw Hill Book Company Inc., New York.

This is the latest brochure of the "World Market Series" published by Messrs. J. Walter Thompson Company, the well-known advertisement agents, for the benefit of its present and prospective clients. It is a descriptive and statistical survey of this country, which is inhabited by 400 million people and thereby provides the largest potential free market in the world. J. Walter Thompson have already published similar surveys covering Canada, Western Europe, Latin America, Japan, Philippines, Portugal and Peru. The brochure contains statistical data regarding land, population, agriculture, industry, mining, transport and communication, energy and power, imports and exports, income and standard of living, consumption and investment, etc. The market classification by trading centres, with the population in each centre and consumer market indicators, contained in the publication will give an idea of the location of the prospective customers, their buying power and consumption propensities. This brochure will enable intending advertisers to have a broad statistical picture of the market in which they wish to push and publicise their products.

Advertising Agency Success. By Kenneth Greenback. Published by Harper and Brothers, New York. New York 16. Copies can be had from Messrs. Higginbotham (Private) Ltd., Mount Road, Madras-2. Pages: 259. Price: Rs. 60.

There is a tendency in this country to start an advertising agency with just one or two accounts. Sometimes an advertiser with a large budget himself starts an advertising agency as an allied undertaking to which he extrudes his advertisements. This is by no means a very commendable practice. After all, an advertising agency cannot grow with one or two accounts, however large they may be. It is only an agency which has several accounts to its credit and a large and trained staff that can really deliver the goods. This does not, of course, mean that men with sound ideas and flare for advertisement work should not start new agencies of their own. Only, it is necessary for them to know that they cannot serve their clients well if they do not continuously grow. To such men, as also to all men in the profession, *Advertising Agency Success* will make a special appeal. The author deals with this subject under two main sections—principles and management, and functions and performance. Beginning with a chapter on how to start an advertisement agency, he goes on to describe the management problems and several general issues connected with the running of an advertising agency business. The more technical section is the one which deals with the functions and performance of an advertising agency. There are excellent chapters on copy writing, use of psychology, and marketing and research. There is a very good bibliography on advertising which should satisfy the more specialist readers. If a key sentence must be given in order to sum up what will make for success in advertising business, one cannot do better than quote the author who observes:

"The technique of the advertising agency business is not difficult to learn. Mechanical procedures and sending out materials to the various media, watching the correctness of their appearance, billing the advertiser—these are largely clerical operations. What is not so easily learned is the advertising attitude. Just as a reporter needs a nose for news, so the advertiser must have a keen and readable form what he has learned, so the advertising man or woman must have basically a feel for selling and intensive knowledge of how various promotional devices work in affecting the client's sales."

This sums up, as neatly as it can be summed up, the essential factor that governs success in the increasingly competitive business of advertising.

Trade-Industry in Gujarat, Saurashtra and Kutch. Published by the Gujarat Publicity Bureau, Railwaypura, Ahmedabad 2. Price: Rs. 25.

This is a valuable directory which vividly brings out how prominent is the place occupied by the region of Gujarat, Saurashtra and Kutch in the economic map of Bombay State. It is bound to be read with interest in the context of the impending break-up of the bilingual Bombay State. It contains a wealth of statistical data and information relating to the resources position and the potentialities for developing new industries in the region. Even a cursory glance through the pages of the directory will reveal that the region could become one of the most highly developed regions in India, with its extensive coastline of over 800 miles, abundance of mineral, power and other resources and men with industrial and business acumen.

A special chapter has been devoted to an assessment of the possibilities of starting new industries. The utility of this chapter has been enhanced by the inclusion of (1) the formalities to be complied with for establishing new industries in Bombay State, (2) the appropriate sponsoring authorities for allocation of steel for industrial use, and (3) organisations giving financial assistance to large- and medium-scale industries. Also included in the directory are list giving the names of different factories existing in 1957 and a catalogue of trading firms dealing in various goods and commodities in Gujarat, Saurashtra and Kutch. There is, however, one lacuna in the directory, namely, absence of details regarding rail and road transport facilities, labour, small-scale industries, and the like. It is to be hoped that the publishers will incorporate these details in the next edition of the directory.

In the course of an interesting introduction, the editors and compilers have summed up the geographical and economic position of the region, highlighting, in particular, the immense scope that exists for further economic development. They have urged special attention to the need for diversification of industries in the region, co-ordinated programme of rail-road-sea development, and multipurpose and comprehensive geological survey.

Colour Planning for Business and Industry. By Howard Ketcham. Published by Harper and Brothers, New York. Agents in India: Higginbotham (Private) Ltd., Mount Road, Madras-2. Pages: 274. Price: Rs. 55.

This book by America's leading colour and lighting expert reveals how effective use of colour can contribute to success in business and industry. The author is a pioneer in introducing professional colour planning to American business. "Creative colour engineering," in his own words, "is the ability and art of increasing the impulse and appeal of a product. It is the intangible ingredient which, when well engineered, creates visual value and lasting satisfaction with the merchandise product or environment." In the highly competitive field of modern business, as profit margins decline on older products manufacturers in nearly all industries place more and more reliance on new product colours to increase sales and earnings. Here is a book which tells how a more effective and skilful use of colour can well convert losses into profits.

This is not a treatise on colour theory but a practical guide book for colour planning. It is based on the experience gained by the author during three decades of practical work with colour. Proceeding on the theory that constructive colour planning makes dollars-and-cents sense, for nearly every branch of business and industry, Mr. Ketcham demonstrates that colour has more than an aesthetic value. Used with skill, it has an emotional impact that can enhance the utility as well as the appeal of innumerable products.

Opening with a few prefatory remarks on how colour sells, the book deals, in successive chapters, with uses of colour through the ages, how one can benefit from colour research, colour and lighting in display, factory, colour in men's and women's wear, colour in advertising, in interior decoration, etc.

This book will give the reader some suggestions applicable to his own business problems related to colour. It may also convey a workable idea of what colour engineering means or can mean to business.

Practical Book-keeping. By Nanabhai S. Davar. Published by The Progressive Corporation Private Ltd., 51, Mahatma Gandhi Road, Bombay-1. Pages: 640. Price: Rs. 8.25.

The book under review is in its fourth edition. It has been revised and enlarged, with an addition of new chapters on Packages, Goods on Sale or

Return, Contract Accounts, Hire Purchase Agreements, Instalment System of Payment and Indian System of Book-keeping. This edition completes the whole syllabus in intermediate accountancy of various professional diploma courses and university degrees. Hence it has now been prescribed as a textbook in various university degree colleges, including the Bombay University. Unlike other books on this subject, this book is written in a unique conversational style which relieves students from technical difficulties in understanding the subject proper. The book is a useful guide not only to students of commercial diploma courses and degrees but also to business men and even laymen in this subject.

Recorder Survey: Recording Surfaces and Marketing Methods. By George Keinath, National Bureau of Standards. Published by Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C. Pages: 41. Price: 30 cents.

This publication surveys and compares the characteristics of continuous traces, dotted traces, and printed characters produced by ink, incision, impression, indentation, deposition, heat, light, electric discharge, electron beam, magnetism, chemical action, or fluid streamlines. Descriptive and reference materials are included on three physical components of the recording system—the reservoir of material or energy, the marking point or the chart surface which preserves the record. Recently to supervise industrial processes and to test of materials and products. This survey was undertaken to bring together available information on the various methods and problems of recording some of the physical principles either currently or potentially available for recording variable material production.

TUBE INVESTMENTS OF INDIA LIMITED

(Concluded from page 866)

cal skill of the products of the factory. It certainly is encouraging for your Directors to find that distinguished visitors and Ministers of the Government have recorded that this Concern is one of the best equipped, and the best run in the country. This is no small credit for a factory situated in the sequestered plains of Madras, away from the hub of industrial activity in other parts of India. For these results, I join with the Directors in paying my tribute to our Associates, Messrs. Tube Investments Limited of the U.K., and other companies in that group, for their wholehearted and unfailing co-operation and for the invaluable help and advice they have given us. I have already expressed our thanks to the Government of India for their advice, support and ready understanding of our problems. I should also like to thank the Government of Madras, who have taken keen interest in this venture and have always guided us with advice and help.

"Whilst I have taken an optimistic view of future prospects and believe that the Company as a whole and the various units which are comprised therein, will grow from strength to strength, I must sound also a note of caution that during the next two years, while the expansion is taking place and production is enlarging, the need for building a reserve of as much of our resources as possible, is great and will be obvious.

Relationship with Employees

"The relationship between us and our employees in all our units has been satisfactory and we, on our part in the management, have tried to look after the welfare of our employees. An industrial welfare housing scheme has been started, on a co-operative basis, and we trust that the full scheme will be implemented in the next few years. Other amenities to help either our staff and workers or their children, have been provided partly by this Company, with the full co-operation of our British Directors and partly by the help given by the A.M.M. Charities Trust, controlled by your Managing Directors. This has resulted in the establishment of a polytechnic, on the site with the financial assistance of the Central and Local Governments. The raising of a primary school in the locality to the status of a higher secondary school under their management, has fulfilled a long-felt want. Lastly, with the co-operation of the State Government, a hospital in the area will, we trust, shortly be established. These are in addition to the amenities provided directly to the workers in the factory.

"Finally, I must emphasise the appreciation the Directors have recorded, of the wholehearted co-operation which the Company has received from the dealers and distributors, and of the good work that has been done by all the employees of the Company both in the factory and in the office."

N.B.—This does not purport to be a report of the proceedings of the annual meeting.

LACK OF DEMAND FOR MONEY

(From Our Own Correspondent)

BOMBAY, 18th November

Conditions in the short-term money market continue to be comfortable. While banks are having a surfeit of funds the seasonal demand for credit is at a low ebb and whatever little demand there is easily met by them from their own resources. Activity in the inter-bank call money section, is, therefore, dull and interest rates are unchanged at last week's levels, that is 1½ per cent. among the Exchange banks and big Indian banks and 2½ to 3 per cent. among the smaller banks. House money at seven days' notice is being maintained at 3-3½ per cent. and short-term deposits at 3-3½ per cent.

A good indication of the state of the money market is provided by the results of this week's Treasury Bill auctions, at which the amount offered was Rs. 5.45 crores, as against an invitation for Rs. 2 crores, the corresponding sum offered last week was Rs. 4.50 crores. Consequent on the large offerings, the average discount also dropped, for the second week in succession, from 2.405 per cent. to 2.388 per cent. per annum. While there were no sales of Intermediate Treasury Bills in the previous week, such amounted to Rs. 1.60 crores in the week under review. Tenders for next week's sale of regular Treasury Bills are unchanged at Rs. 2 crores and sales of Intermediate bills are being continued.

The Reserve Bank of India's statement for the week ended 13th November 1959 shows a contraction of Rs. 8.25 crores in notes in circulation and a rise of Rs. 8.83 crores in notes held in the Banking Department. There is no change in foreign securities, but balances held abroad maintain their upward trend with a rise of Rs. 2.93 crores, so that the total foreign assets now stand at Rs. 202.89 crores, as against Rs. 183 crores a year ago. There has been a fall of Rs. 2.41 crores in deposits of the Central Government and an increase of Rs. 4.92 crores in deposits of other Governments. Deposits of banks are higher by Rs. 12.94 crores. Loans and advances other than those to Governments show a decline of Rs. 8.81 crores, while investments have moved up by Rs. 13.73 crores and holdings of Government Treasury Bills by Rs. 3.69 crores.

A rise of Rs. 8.84 crores in demand deposits of banks is disclosed by the Scheduled banks statement for the week ended 6th November 1959. Time deposits have, however, fallen by Rs. 2.15 crores. Of the net rise of Rs. 6.69 crores, the State Bank of India accounts for Rs. 2.26 crores. Inter-bank borrowings are also higher by Rs. 1.59 crores, mainly due to the borrowings of the State Bank of India to the tune of Rs. 4.50 crores. Borrowings from the State Bank are lower by Rs. 1.09 crores. Advances have declined by Rs. 6.37 crores, the share of the State Bank being no more than Rs. 66 lakhs. Investments have been reduced by Rs. 1.34 crores, while cash balances have swelled by Rs. 3.62 crores, balances with other banks by Rs. 1.41 crores and money at call by Rs. 1.14 crores.

Notwithstanding the persistent comfortable conditions in the short-term money market, the gilt-edged market shows no sign of activity. Barring scattered enquiries for some short-dated issues, the prices of which are well maintained, the market is devoid of any support from institutional investors. 3 per cent. 1986 Conversion Loan has declined by a further 15 p to Rs. 74.35, 3 per cent. 1970-75 by 5 p to Rs. 93.08, 3½ per cent. 1964 by 5 p to Rs. 110.10 and 4 per cent. 1973 by 15 p to Rs. 101.50. State Loans, too, are listless.

In sympathy with the slight weakness of sterling abroad, the rupee has suffered a setback in terms of the U.S. dollar. Thus, the banks' selling rate for U.S.T.T. has gone up from Rs. 47.25 to Rs. 47.75 and their buying rate from Rs. 47.4 to Rs. 47.45 per \$100. In New York, spot sterling has been marked down from 280.40-284.3 cents to 280.23-280.28 cents and three months' forward from 280.96-280.99 cents to 280.83-280.86 cents.

ELECTROLYTIC ZINC BUOYANT

(From Our Own Correspondent)

CALCUTTA, 17th November

The features of trading in the metal market during the week under review were the state of buoyancy in electrolytic zinc on speculative support and the hardening price-trend in tin following higher advices from Penang.

During the week, the price of copper in both London and New York recorded a modest decline. On the London Metal Exchange, early in the week, the price of spot copper hardened to £266½ per ton from £264, due to good offtake by the United States. Selling pressure soon followed as a result of profit-taking which led to a fall in rate to £258½ towards the week-end. Locally, demand for copper scrap abated thanks to issue of permits. Reflecting this, berry quality scrap gave way from Rs. 232 to Rs. 230, but utensil was unchanged at Rs. 220.

Tin here hardened from Rs. 565.50 to Rs. 569 per cwt. in the wake of strong advices from the Far Eastern markets. Demand at the higher level was insignificant, as consumers thought that the upturn was only a passing phase. Contrary to higher reports from overseas markets, in view of good stock position in the western centre. However, any view that Bombay would divert stocks to Calcutta owing to higher price level here was not entertained, as demand here was low. On the L.M.E., the price closed higher at £277 per ton, as against the opening of £274. Buffer stocks were now believed to be as low as 3,000 tons only.

From Rs. 11.25 per cwt., electrolytic zinc gained to Rs. 11.90 here, following keen speculative attention which the offers received. However, consumer demand was insignificant in view of

BULLION EASY

(From Our Own Correspondent)

BOMBAY, 18th November

The bullion market ruled easy during the major part of the week under review. The easiness was due to the imposition of heavier margins with effect from Tuesday, the 10th inst. The aggregate margins deposited till the afternoon of Saturday were Rs. 20 lakhs in silver and Rs. 3 lakhs in gold. The margins led to selling, especially by weak holders, which brought about a fall in values. Some bulls who deposited margins as required under the new provisions were, of course, reluctant to liquidate their holdings. A few even made fresh purchases yesterday in anticipation of a marked rise in demand for both gold and silver. But for these purchases and the bullish fervour fanned by the continued none too happy Indo-Chinese relations, the two precious metals might have suffered a sharper setback.

The Bullion Association has informed the members that, so long as margin money continues to be payable under By-law 33(c) in respect of outstanding transactions in a particular settlement, the operation of By-law 33(F) remains suspended in respect of transactions in that settlement.

In silver, December settlement came in for selling and receded from Rs. 212-7 to Rs. 209-7 on Monday. After recovering to Rs. 211-1 yesterday, it fell again to Rs. 209-15 today before finishing at Rs. 210-2. The net loss over the week was Rs. 2-5. January settlement declined from Rs. 213-5 to Rs. 210-5 and, after improving to Rs. 211-3 today, closed at Rs. 210-4. November settlement ran off the board at Rs. 211-1 yesterday, as against Rs. 212-6 on Wednesday last week. The number to December settlement which was an anna against bulls last week turned in their favour to the extent of As. 3 yesterday, while that for December to January settlement was against bulls throughout the week, though it narrowed down from As. 14 last week to As. today.

Ready silver began the week at Rs. 211-12, that is, As. 5 lower than the previous day's closing rate, and moved down to touch a low of Rs. 209-3 on Monday. At this level, some support was forthcoming and the rate rose to Rs. 210-15 yesterday. Today, however, it eased again to Rs. 209-7 before finishing at Rs. 209-10. The daily average arrivals of silver were 45 bars, while the actual offtake was 12 bars. The floating stocks of silver are estimated at 900 bars.

In the gold section, November settlement went off the board at Rs. 123-13 on Monday, as against the last week's closing rate of Rs. 125-1. The bears in this settlement were obliged to pay a margin at the rate of Rs. 10 per tola, as the carryover charge from this settlement to December settlement widened from As. 6 to As. 8 in their favour. December settlement eased from Rs. 125-5 to Rs. 124-1 and, after recovering to Rs. 125-1-6, declined again to Rs. 126-11-6 today. January settlement suffered a loss of As. 9-6 over the week, today's closing rate being Rs. 125-0-6.

Ready gold was subjected to selling and retreated from Rs. 125-1 to Rs. 123-12 on Monday. After recovering to Rs. 124-13-6 on the following day, it declined again to Rs. 124-6 before finishing at Rs. 124-7-6. The daily average arrivals and offtake of gold were 2,800 tolas and 2,400 tolas, respectively. The floating stocks of gold are reported to be in the neighbourhood of 25,000 tolas.

Both spot and forward silver in the London bullion market were unchanged during the week, the former at 80½d. and the latter at 80½s. Silver in New York was also unaltered at 91.375 cents. Ready gold in London improved from 250s. 1d. to 250s. 3d. The latest available world price for gold in London is \$35.05-\$35.07, as against \$35.08-\$35.10.

The following comparative table shows at a glance the trend of the market during the week under review:

	18-11-59	Highest	Lowest	11-11-59
GOLD				
Ready (999 fine Mint)	124 7/8	125 2	123 12	125 1
Forward	124 11/16	125 6	124 1	125 5
SILVER				
Ready (999 fine Mint)	209 10	211 7	209 3	212 0
Forward	210 2	212 8	209 7	212 7
London Silver Ready	17-11-59			10-11-59
London Forward	80 1/2			80 1/2
London Gold	250s. 3d.			250s. 3d.
New York Silver	91.375	250s. 3d.	250s.	250s. 12 1/2

* 16th December settlement. † 16th December settlement.

availability of the material through permit system. In London, the price spurted from £254½ to £27 per cwt. Virgin lead here was quiet at Rs. 71 per cwt., as against Rs. 72 earlier in the week. Demand was conspicuous by its absence. The London price closed lower at £71 per ton, as against the opening of £73½.

LINSEED DULL

(Messrs. A. Bradley and Co.)

CALCUTTA, 16th November

Although linseed prices were firm, the market was dull, the volume of trading being very limited. Crushers showed meagre interest in seeds and sellers were rather reserved.

The oil market ruled firm, but business was scarce, with buyers showing virtually no interest except at lower prices. Local rates were out of line with foreign markets which were dull.

The latest quotations per maund are: Ready Rs. 26.25; November-December Rs. 26.25 and May Rs. 26.25.

COTTON FUTURES REACT

(From Our Own Correspondent)

BOMBAY, 18th November

The cotton futures market, after ruling firm during the first half of the week under review, turned easy in the second half. The firmness was due to an extension of the buying spree witnessed last week. A slow-down in the arrival of new crop, encouraging offtake of yarn and cloth, declining stocks with mills and trade and the news that mill consumption of cotton during the first month of the current season, namely, September, was substantially higher than in the corresponding month of the previous season strengthened the sentiment of operators. The Jarilla March contract firmed up from the week's opening of Rs. 731.50 to Rs. 738.75 on Saturday. This level, however, could not be sustained for long. Profit-taking and speculative selling prompted by the improved prospects for imports of foreign cotton during the current season, the increased arrival of new crop in upcountry centres and the consequent easing of spot values, resulted in a sharp break in prices on Monday. There were also rumours that a special margin would be imposed on delivery contracts in the spot section which caused considerable nervousness. The downward trend gathered momentum yesterday. It was, however, halted today, thanks to short-covering.

I.C.C. Mogli Jarilla March 1960 opened the week at Rs. 731.50 and, after rising to Rs. 738.75 on Saturday, declined to Rs. 728 yesterday. Commencing at Rs. 730.50, the contract gathered Rs. 2 before finishing lower at Rs. 729.50. The net loss over the week was one rupee.

The spot section was fairly active. There was good demand for both new and old crop cotton. Mills continued to be keen buyers. But prices were a shade easy, thanks to the increased arrivals. Staple styles like Kalyan, Laxmi, Rajapalayam and CO 2 attracted attention. Short staples such as Kalagin, Wagad and Bengal Deshi also found buyers. Rumours of the likelihood of margins being introduced on delivery contracts acted as a restraining influence.

The export front was featureless. The expected revival of demand from Japan has yet to materialise, despite the fact that prices have recorded a sizable drop, following the improvement of the weather situation in the Punjab. Indian prices are still out of parity with those of Pakistan.

Encouraging progress has been made in the utilisation of the share of 67,500 bales allotted for shippers out of the recent quota of 75,000 bales of Bengal Deshi. Sales registered up to 14th inst. amounted to 59,087 bales. Only a small quantity is thus left. In sharp contrast to this, out of 4,800 bales set apart for co-operative societies, not a single bale had been passed for shipment. The Government would do well to bear this performance in mind when making future allocations.

Demand for foreign cotton was well maintained. East African and Sudan varieties attracted attention. Sudanese XGSS was done at Rs. 1,360 and K3S at Rs. 1,460. Mills were interested in new crop Sudan but sellers were hesitant in anticipation of the new marketing policy announcement by the Gezira Board. There was a sharp increase in the price of East African cotton on hectic short-covering and fresh purchases following news of large-scale buying of East African cotton by Japan. B.M.F. 52 spurted to Rs. 1,271 today, a rise of as much as Rs. 101, as compared with the quotation on the 11th inst. Other East African varieties also recorded similar gains in prices.

The following are the latest available spot quotations—in rupees per candy of 784 lbs.—from Sewri:

Bengal Deshi 640; Berar Jarilla 840; Hubli Laxmi 925; Punjab 216F 990; 320F 940; Vijay 945.

In contrast to last week's strident advance, cotton futures in Karachi market sharply reacted downwards during the week under review. Prices fell a precipitous fall on heavy selling. Selling was prompted partly by encouraging news from the growing regions in the Punjab where the weather, which was adverse of late, took a turn for the better. In the light of the improved crop outlook, last week's rise, it was feared, was too sharp. 'Longs' rushed to get out of their commitments. Part of the selling was also attributed to profit-taking brought about by the previous high level of prices. N.T.R.G. January contract declined from Rs. 88-6 last week-end to Rs. 66-9. The March contract dropped Rs. 1-10 to Rs. 66-9.

A mixed trend was witnessed on the Alexandria Cotton Exchange during the week. While the long-staple Karnak contracts were subdued the medium-staple Ashmouni contracts firmed up on trade and professional buying. Export demand was slack and overseas inquiries few and far between. Over the week, Karnak contract recorded a net decline of 0.05 to 0.15 talars per lb. and the Ashmouni contracts a net rise of 0.65 to 0.75 talars per lb. The export price discount remained unchanged at 2½ per cent. The following are the latest available quotations—in talars per lb.—from Alexandria, the figures in brackets being last week's closing rates:

Karnak: November 72.15 (72.20); January 72.80 (72.75).

Ashmouni: December 64.00 (63.35); February 64.00 (62.86).

Liverpool cotton futures market was active during the week. There was fairly large-scale buying by American interests in Liverpool on expectation of a probable reduction in U.S. cotton export subsidy rate, and a fair volume of mill fixing and trade covering. Demand was on the whole stronger and prices moved up in consequence. The possibility of early arrival of U.S. cotton, which had been delayed for the past two months, acted as a restraining influence. The latest available quotations—in pence per lb.—from Liverpool are as under:

American cotton one inch staple contract: December-January 21.95; March-April 22.15; May 22.50; July 22.40.

American cotton mixed growth contract: December-January 22.75; March-April 22.75; May 22.75; July 22.45.

Sudan: November-December, January-February, May-June 29.00.

Cotton futures values in New York hardened during the week under review. A small volume of scattered liquidation, prompted by fears of a lower support price for the 1960 crop, was partly absorbed in trade buying. Mill buyers also picked up part of the offerings against sale of forward sale of yarn and cloth extending well into the second quarter of next year.

The payment-in-kind export programme is reported to be making encouraging progress. Registrations under the programme up to the 6th inst. covered commitments for shipment abroad of 3,163,585 bales. Actual shipments from the beginning of the season till the 5th inst. aggregated 562,158 bales, as against 657,023 bales during the same period last season.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

	(In cents per lb.)	17-11-59	10-11-59	2-11-59
Spot	...	32.85	32.70	32.70
December	...	32.75	32.64	32.42
March	...	33.17	33.05	32.88
May	...	33.35	33.30	33.13

YARNS DULL

(From Our Own Correspondent)

BOMBAY, 18th November

Dull conditions prevailed in the yarn market during the week under review. Art silk yarns were generally easy, thanks to poor off-take from consuming centres and declining tendency in prices of nylon yarns. There was also some selling by stockists who had earlier bought in expectations of better demand. In sympathy with art silk yarns and on reports of large stocks with weaving interests, staple fibre yarns also tended to move down. Cotton yarns, however, attracted some support, owing to good enquiries from hand-looms and powerlooms.

Imports of art silk yarn into Bombay port continue to be small. The total of these imports during October 1959 was 1,154,788 lbs., as against 1,665,847 lbs. in the previous month. During the same month, 98,556 lbs. of synthetic yarn, 6,990 lbs. of staple fibre yarn and 26,075 lbs. of cotton yarn were imported. Exports of cotton yarn from Bombay during October amounted to 1,388,563 lbs., as against 1,184,994 lbs. in September.

Cupressa Bamberg yarn (60x2) December contract was subjected to heavy selling pressure and climbed down from Rs. 1,713 to Rs. 1,675. February 1960 delivery was quoted at Rs. 1,700 to-day. Spot Cupressa declined by 3 nP to Rs. 7.56. Among imported yarns, 120 Japan lost a naya paissa to Rs. 5.28. 150 Italy was dull at Rs. 4.87. 150 Japan, however, picked up 8 nP to Rs. 5.23. 120 Italy gathered 3 nP to Rs. 5.25. Among indigenous yarns, National Rayons 150 bright cones first grade shed 3 nP to Rs. 4.25. 120 bright cones first grade were done at Rs. 4.76.

Staple fibre yarns (40x2) December contract dropped Rs. 8 over the week, today's closing rate being Rs. 696. February 1960 delivery changed hands today at Rs. 689. Spot City fell by 1 nP to Rs. 3.59. Kohinoors lost 4 nP to Rs. 3.67 and Centurys 3 nP to Rs. 3.72. Among imported yarns (80x2), Paramounts receded from Rs. 8.81 to Rs. 8.75.

In the cotton yarn section, ten counts Podars improved by 13 nP to Rs. 14.75. Twenty counts Hinds advanced by 50 nP to Rs. 19.75 and Moderns by 19 nP to Rs. 20. Forty counts Minaxis were firm at Rs. 26.87, as also Moderns at Rs. 27.31. Among sixty counts, Raghuvarshis put on 50 nP to Rs. 56.50 while Finlays were fully maintained at Rs. 61.50. Eighty counts Moderns and Finlays were steady at Rs. 79 and Rs. 81, respectively. Cities, however, shed 19 nP to Rs. 64.50 and Mahendras 50 nP to Rs. 73.25.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today as compared with those eight days before:

	18-11-59	10-11-59
Art silk yarn—		
60/1 Cupressa Bamberg December (100 Kg.)	1,675	1,713
60/1 Cupressa Bamberg spot (per lb.)	7.56	7.59
120 Japan (per lb.)	5.28	5.25
150 Japan (per lb.)	5.23	5.15
120 Italy (per lb.)	5.25	5.22
150 Italy (per lb.)	4.87	4.87
Staple fibre yarn—		
40x2 December (per case of 200 lbs.)	696.00	704.00
40x2 Kohinoor (per lb.)	3.67	3.71
40x2 City	3.59	3.70
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	14.75	14.82
20s Modern	20.00	19.81
40s Minaxi	26.87	26.87
60s Finlay	61.50	61.50
80s Mahendra	73.25	73.75

CASTOR FIRM

(From Our Own Correspondent)

BOMBAY, 18th November

Active conditions prevailed in the oilseeds market during the week under review. Castor-seed, in particular, moved up as a result of encouraging advices for castor oil from abroad. Groundnut displayed an erratic trend, but the undertone was steady. Linseed and cottonseed were, however, subdued.

A sharp increase in the values of castorseed and oil was a feature of trading in this week. It

is reported that the U.S. and the U.K. and also France are interested in Indian castor oil. Shippers are reported to have booked substantial quantities of castor oil. The revival of U.S. interest in Indian castor oil imparted particular strength. It is believed that Brazil is not in a position to meet the demand of the U.S. buyers. At the close of the week, however, there was some short-covering and the values drifted lower. Under these conditions, castorseed May 1960 contract, which had wound up at Rs. 163.37 last week-end, rose gradually to Rs. 168.62 yesterday, but came down to close today at Rs. 167.75. Ready Madras rose from Rs. 31.37 to Rs. 32.44 yesterday, but declined to close today at Rs. 32.12. Oil B.S.S. improved from Rs. 17.69 to Rs. 18.50.

The groundnut section also put on a cheerful appearance, thanks mainly to reports of good enquiries for groundnut oil, particularly from the U.K. Besides, crushers and vanaspathi manufacturers extended good support. Values in the groundnut section would have gone up further, but for the larger arrivals and also some up-country selling. The declining strength in overseas prices of groundnut oilcake also acted as a damper. Groundnut oilcake 1960 contract, which had wound up at Rs. 177.62 last week-end, rose to Rs. 179 on Saturday. Subsequently, it came down to Rs. 178.12, but recovered to close today higher at Rs. 179.12. Khandesh quality improved by 25 nP to Rs. 38.25. Oil ex-mill, however, lost 7 nP to Rs. 19.62.

There was hardly any encouraging development in the linseed section. Prospects for exports of linseed oil continued to be dull in the face of lower foreign prices and also freight difficulties. Linseed May 1960 contract closed today unchanged at Rs. 35.37, after moving in a narrow range over the week. Bold ready which had finished at Rs. 35.25 last week-end gathered 37 nP to close at Rs. 35.62, after remaining subdued during the major part of the week. Linseed oil gained 13 nP to touch Rs. 17.44.

In sympathy with raw cotton market, cottonseed developed a sagging tendency. Although it improved from Rs. 129.25 to Rs. 130.25 on Saturday, it moved down later to close at Rs. 128.75 today.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	18-11-1959	11-11-1959	4-11-1959
Groundnut			
February 1960	179.12	177.62	175.87
Bold ready	38.25	37.50	36.25
Khandesh quality	38.25	38.00	36.25
Oil ex-mill ready*	19.62	19.09	19.37
Railway receipts*	19.37	19.50	19.12
Castorseed			
May 1960	167.75	163.37	162.00
Ready Madras	32.12	31.37	30.57
Ready Kanpur	31.37	29.87	29.50
Oil B.S.S.	18.50	17.69	17.25
Oil commercial†	17.50	16.75	16.37
Linseed

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for future contracts are in terms of candy, except linseed, which is in cwt. A candy is 560 lbs., except in the case of cotton seed, for which it is 754 lbs. Spot quotations of seeds are for per cwt. and those for oil per quarter.

JUTE GOODS WEAK

(From Our Own Correspondent)

CALCUTTA, 17th November

Earlier in the week under review, fairly steady conditions were in evidence following the announcement of lower stock figures. For the decline in stock was contrary to market expectations. Subsequently, a downward trend in prices set in, following the publication of the output statistics for October and the report of a decline in U.S. consumption of burlap during October. Prices in both heavy goods and hessian sagged. During the week, the demand for shipping space for gunny was poor, and lifting by the U.K., the Argentine and the U.S. was restricted to insignificant quantities. Despite weakness in the goods market, raw jute prices were firm at previous levels. This was attributed to persistent trade reports of a decline in output in this season, which also received official stamping during the week.

It is considered unfortunate that the unrest among jute mills' workers is gaining momentum, and a token strike on 11th December is more than a possibility now. Market circles are gravely concerned about this. For, in the event of mills' working being affected, it is certain that prices would move up. Such increase in prices may be considered by overseas buyers as a case of exploitation in the present phase of increased demand. There is no confirmation of the reports that Pakistani mills might place orders on Indian mills to fulfill the former's commitments in the November-December delivery position. The absence of any further news on this is thought here as being due to an attempt on the part of the Pakistani mills for extension of delivery date. Meanwhile, according to a Dacca report, Pakistani mills would be permitted to increase their loomage from 7,750 to 12,000 in the course of the next five years.

Following the announcement of a decline in stocks of goods, ready B. twills remained fully firm at Rs. 103.90 on Tuesday last. The

price rose above this in the course of the day, but profit-taking intervened to bring it down to the opening level. Ready hessian 40" 10 oz. declined to Rs. 40.48 from Rs. 40.74. At the close of the week, however, there was some short-covering and the values drifted lower. Under these conditions, castorseed May 1960 contract, which had wound up at Rs. 163.37 last week-end, rose gradually to Rs. 168.62 yesterday, but came down to close today at Rs. 167.75. Ready Madras rose from Rs. 31.37 to Rs. 32.44 yesterday, but declined to close today at Rs. 32.12. Oil B.S.S. improved from Rs. 17.69 to Rs. 18.50.

Mills showed only sparse interest in raw jute. However, sellers were offering freely. Despite this, the undertone was steady and the fall in rates, if any, was only fractional. Such a trend was due to reports of lower crop estimate in this season. Thus, daisies bottoms hardened to Rs. 25.50 before closing at Rs. 25.25. However, Assam bottoms declined to Rs. 23.75 from Rs. 24.50.

BLACK PEPPER RISES FURTHER

(Messrs. Parekh and Co.)

BOMBAY, 18th November

Malabar black pepper continued to rise by leaps and bounds during the week, in sympathy pushing up prices every day to more than Rs. 310 for the last two sessions, Lampong black having reached the record price of Rs. 314 and Muntok white at Rs. 3216.

Garbled at Cochin established a new record at Rs. 180. December and January delivery also sky-rocketed to Rs. 165 and Rs. 163, respectively. To forestall the possible payment difficulties following such hectic rise in the forward market, the India Pepper and Spice Trade Association at Cochin called an emergency meeting and unofficially requested the members to square up all outstanding business for December delivery at Rs. 162½ and January delivery at Rs. 160½. Pending payment at these ceilings and squaring of business, the market remained closed. Ready ungarbled at Cochin is quoted at Rs. 1,050. Calicut is quoted at Rs. 1,050.

New York, which was moving sluggishly during the past, became active and spot was done at as high as \$0.39. Grinders who were refusing to follow the advance became nervous and scrambled for ready at advancing limits.

The future of the market depends upon the attitude of Singapore speculators who are now reported to be trying to take control of the New York market, following their successful manoeuvre in Singapore. The rise in the prices being too rapid, the trade is expecting reaction, which is not very likely until the pressure of arrivals in India is felt, and Singapore dealers are coming out to liquidate their holdings of Malabar pepper.

Ready pepper in the local market is nominally quoted at Rs. 125 per Bengal maund.

SUGAR SUPPLY POSITION TIGHT

(From Our Own Correspondent)

HAPUR, 16th November

Sugar prices have improved by about Rs. 2 per bag in the past week, following tight supply position. The incentives provided by the Government have induced most of the sugar factories to start crushing and cane supply to them is reported to be adequate. But it is considered doubtful whether the Government will be able to achieve its aim, as cane at Rs. 1.25 to Rs. 1.37 per maund, as against the enhanced price of Rs. 1.50 to Rs. 1.62. The latest prevailing prices here are: Rs. 126 per bag, retail Rs. 1.25 per seer, as against the controlled price of 97 nP per seer.

A steady tendency prevailed in the sugar market at Muzaffarnagar during the week on brisk demand from consuming areas. Demand for crystal boora was very brisk with the result that prices advanced by Rs. 10 per bag. Stocks of crystal sugar with the trade were meagre. Crushers, too, were buying cane at Rs. 1.12 to Rs. 1.31 per maund and are manufacturing gur. Prevailing prices of sugar here were Rs. 136 to Rs. 137 per bag; retail Rs. 1.25 to Rs. 1.31 per seer.

Sugar was not quoted in the week-end at Kanpur due to lack of supplies.

Kandsari, after an early fall, improved towards the week-end on good demand. The new production would begin in early December and prevailing prices were: inferior Rs. 38 to Rs. 42; superior Rs. 45 to Rs. 48 a maund.

Ready gur ruled steady, due to good demand from consuming areas. Arrivals were fairly heavy at an average of 5,000 maunds daily, which were all being lifted for outside despatch. Baiti quality was much in demand from North Gujarat. Baiti was quoted at a premium of over Rs. 2.50 a maund over pansera. The latest prevailing prices were: pansera Rs. 21 to Rs. 22; baiti Rs. 26; shakker Rs. 24 a maund.

Gur prices at Muzaffarnagar registered all-round advance, owing to brisk demand from consuming areas. Pansera quality was much in demand from Gujarat, Punjab and Madhya Pradesh, while chaku quality was in request from Gujarat side. Ladu quality was being sent to Eastern Uttar Pradesh and Nagpur side. Prevailing prices were: pansera Rs. 23 to Rs. 23.25; chaku Rs. 24

to Rs. 25; Ladu Rs. 23 to Rs. 24; khurpapur Rs. 22 to Rs. 22.50; shakker dala Rs. 25 to Rs. 26; masala Rs. 28 to Rs. 29 a maund.

Future gur prices moved both ways during the week. Fagun opened at Rs. 15.71 last Monday, advanced to be quoted at highest in mid-session at Rs. 15.94 and then eased to Rs. 15.88 and closed at Rs. 15.70 on Saturday.

TEA PRICES HARDEN

(From Our Own Correspondent)

CALCUTTA, 17th November

Tea prices during last week's internal auctions hardened following a further improvement in demand. The exportable types were absorbed at advancing prices. Of the dusts on offer amounting to 29,945 chests during the auctions, which generally met with strong demand, the exportable types were favourites of buyers. Prices of these gained. Other orthodox teas also were firm, but planter liquors were quiet with a fall of 2 nP. Darjeelings were about steady, and Legg-cut teas recorded a rise in prices. In C.T.Cs, the exportable types were taken at higher rates and the very best C.T.Cs were firm, but the mediums eased by 6 to 10 nP. The quotations, exclusive of excise duty, were: best Assam C.T.C. Rs. 2.50 to Rs. 2.80, medium Assam C.T.C. Rs. 2.00 to Rs. 2.12, medium Assam Re. 1.94 to Rs. 2.00, and medium Doora Re. 1.98 to Rs. 2.04.

Leaf on offer were only 241 chests, which were steady.

A sale for internal consumption was held in Chittagong on the 11th inst., when dusts offered amounted to 3,995 chests including a supplement of 54 chests. Leaf on offer amounted to 13,246 chests. There was good support in both the sections. Prices of dusts advanced by As. 6 to As. 8, plain Syihet quality being quoted at Rs. 2-13 to Rs. 2-13-6.

In the leaf section, the strongest feature was Legg-cut fannings, the price of which recorded an advance of As. 8 to Rs. 3-3 to Rs. 3-4. All other kinds gained As. 5 to As. 8.

Green teas on offer amounted to 1,092 chests which met with keen competition. The polished grades gained As. 4 to As. 5.

RICE DECLINES

(From Our Own Correspondent)

HAPUR, 16th November

A mixed trend prevailed in the foodgrains market during the week. While rice eased following higher production reports and increased arrivals of new grains in the markets, other grains were steady. The last week's rains over a wide area of west U.P. has done more than good to the recently sown rabi grains. There are reports of pests which are eating rabi grains just after germination, with the result that the farmers are engaged in large-scale resowing operations.

Wheat at Hapur was stationary during the week to be quoted on Monday at Rs. 17 a maund for average quality and upto Rs. 18.25 for farm produce. Daily arrivals in the markets were small at 50 maunds. Since the market rates were higher than the Government procurement prices at Rs. 13 to Rs. 15 a maund, no purchases could be made on behalf of the Government.

Rice eased by about Rs. 2 per maund during the week under pressure of heavy arrivals of new paddy and mung in the market and many State Governments have started purchase of rice at last year's price level when coarse rice was quoted at Rs. 15 a maund. Monday's prevailing prices were: sella basmati Rs. 30 to Rs. 32; ranajuwari Rs. 23; mainpuri, Rs. 22; gadda Rs. 19 a maund.

Gram ruled quietly depressed during the week, due to slack demand. The local stock ran down by only 2,000 maunds during the week to 48,000 maunds. Barley and bejar also brought lower levels in the absence of ready demand, but maize and bajra registered a fully steady trend on good seasonal consumer support. Jowar and guwar were listless and prevailing prices on Monday (in rupees per maund) were: gram 12.75; barley 12.25; bejar 11.50; maize 11.12 to 11.50; deshi 11.87; bajra 11.50; jowar 12 to 14; guwar 12 to 13.

In the pulses section, peas and arhar attracted some demand in the form of dal at almost unchanged price level. Arrivals were almost nil and local peas and arhar stock ran down by one khatti each during the week to 39 khatties and 27 khatties, respectively. Other pulses were quiet during the week. Prevailing prices on Monday (in rupees per maund) were: peas dala 10.75; farm white 11.25; peas dal 12.10; arhar 17.25; arhar dal 21 to 22; urd 18 to 19; moong 17 to 19; masoor small 14.25; bold 18.

Germination reports of peas sown recently are quite satisfactory.

KIPS LISTLESS

(From Our Own Correspondent)

MADRAS, 16th November

The kip market ruled listless during the week. Importers kept out of the market, buying occasionally a few bales to satisfy their specific requirements. Arrivals were moderate and clearance slow. Demand for buff hides was poor and stocks were accumulating. Arrivals of cow calf and buff calf were small and prices steady.

There were several inquiries from the Continent for superior goat skins 5½/6 and 8/9 lbs. and a few orders were booked at a shilling below peak levels. Shippers were active buyers of middle class sheep skins, and most of the accumulated stocks in the market were cleared. Semi-prime sheep skins ruled steady. Raw markets were a shade easier.

Notices

THE BOMBAY BURMAH TRADING CORPORATION, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Ninety-sixth Annual General Meeting of the Shareholders of the Corporation will be held at Sunderbhai Thackersey Hall, Nathibai Thackersey Road, Bombay 1, on Tuesday, 15th December, 1959, at 4 p.m. (S.T.), for the purpose of transacting the following business:—

1. To receive and adopt the Directors' Report and audited accounts for the year ended 31st May, 1959.
2. To sanction the declaration of a Dividend.
3. To elect a Director in place of Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., who retires by rotation and is eligible for re-election, by passing the following resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Corporation.

"Resolved that Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., who has attained the age of 80 years, and who retires by rotation, be and is hereby re-elected a Director of the Corporation and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."

4. To elect a Director in place of Mr. E. S. Vernon-Jones who retires by rotation and being eligible offers himself for re-election.
5. To appoint Mr. James Alexander Ewen Macpherson a Director of the Corporation.
6. To appoint Auditors for the period until the next Annual General Meeting of the Corporation and to fix their remuneration.
7. To appoint Branch Auditors at a remuneration to be fixed by the Board.
8. To consider and if thought fit to pass the following ordinary resolution:

"That the Corporation hereby approves of the appointment and consents to the continuance of Messrs. Jacobus F. Frank of 120, Wall Street, New York, U.S.A., as the Sole Selling Agent of the Corporation's Teas in the U.S.A. for a period of one year commencing from 1st October, 1959 and thereafter for such further period or periods as may be deemed fit not exceeding in the aggregate five years from the 1st October, 1959, on a commission of 2 per cent. on the c. & f. value of the Teas sold through them."

By Order of the Board,

WALLACE & CO.,
Secretaries and Treasurers.

BOMBAY, 13th November, 1959.

N.B.—A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself, and a proxy need not be a member of the Corporation.

Warrants for the dividend, if declared, will be posted to Shareholders on 4th January, 1960, and will be payable on and from that date.

The Transfer Books of the Corporation will be closed from 23rd November, 1959 to 30th November, 1959, both days inclusive.

EXPLANATORY STATEMENT

As required by Section 173 of the Companies Act, 1956

1. The Resolution set out under item 3 is required as Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., has attained the age of 80 years and hence cannot be re-appointed a Director except by a resolution in respect of which special notice has been given in accordance with Sections 190 and 281 of the Companies Act, 1956. Special Notice has been received that this Resolution will be proposed.

Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., has been on the Board of the Corporation for over 28 years. In view of his wide and varied experience in the business life of the country and the valuable services he has rendered to the Corporation, it is most desirable that the Board should continue to receive the benefit of his services.

2. Resolution No. 5: Mr. J. A. E. Macpherson is a Manager of Messrs. Wallace & Co., the Secretaries and Treasurers of the Corporation. He has served the Corporation for many years and is thoroughly acquainted with the business of the Corporation. His advice will, therefore, be of great value to the Board.

3. Resolution No. 8: The Corporation, seeking to increase its Tea Sales in the U.S.A., has appointed Messrs. Jacobus F. Frank of New York as its Sole Selling Agent in that country for a trial period of one year, which may be extended if considered desirable. The Companies Act requires the approval of the Corporation for this appointment.

A copy of the relative Letter of Appointment may be inspected during business hours at the registered office of the Corporation in Bombay.

THE TITAGHUR PAPER MILLS COMPANY, LIMITED

NOTICE OF FINAL DIVIDENDS

THE BOARD OF DIRECTORS OF THE above Company has recommended payment of the following Final Dividends in respect of the Company's Financial year ended 31st March, 1959, without any deduction for Income Tax payable by the Company:—

- On 1st Cumulative Preference Shares—8% per annum.
- On 2nd Cumulative Preference Shares—4½% per annum.
- On Preferred Ordinary Shares—10% per annum.
- On 'A' and 'B' Ordinary Shares—Dividend—87 nP. per Share and Bonus—50 nP. per Share.

By Order of the Board,

F. W. HEILGERS & CO. (PRIVATE) LTD.,
Managing Agents.

CHARTERED BANK BUILDINGS,
CALCUTTA, 12th November, 1959.

THE BENGAL FLOUR MILLS COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN Interim Dividend on the shares of the above Company of 1½ per cent. for the year ending 31st December, 1959, was declared by the Board of Directors on 13th November, 1959, payable on or after 7th December, 1959, to those members whose names are registered in the Register of Members of the Company on the 7th December, 1959. Dividend Warrants will be despatched to Members and no application to the Company is necessary.

Tax will be deducted from this Dividend in accordance with the provisions of the Finance Act, 1959.

 ‡ General Industrial Society Ltd.—The dividends for 1956 and 1957 are on shares of Rs. 200 each which have since been sub-divided into shares of Rs. 10 each.

William Blake.

PRICE : Rs. 2

THERE are doubtless certain encouraging features in Indian economy; at the same time, there are also some disquieting features. Exclusive stress on either set of conditions will give a distorted picture. A balanced view of both is necessary to get a correct picture. This was precisely what Mr. J. D. K. Brown did in his presidential speech at the annual general meeting of the Associated Chambers of Commerce, Calcutta. He drew attention to the increase in both food and industrial production, to the Government's success in stabilising the foreign exchange position and to the welcome signs of improvement in export trade. He acknowledged the fact that, "throughout the current year, things have gone reasonably well" and that "encouraging progress has been made in the mobilisation of resources and production which it is the object of Government policy to achieve." Simultaneously, he also referred to certain weaknesses in the private sector for which a remedy can be found only through a proper adjustment of Government's economic policies. The most disturbing weakness is the inadequacy of profit level of Indian industries, but it is not quite apparent because of the misleading air of prosperity that has pervaded the stock exchanges since the commencement of the year. No wonder, Mr. Morarji Desai, who addressed the aforesaid meeting as the chief guest, sought to silence Mr. Brown's criticism by pointing to the continued buoyancy of equities, despite the fall in yields to unattractively low levels. There are many reasons for the boom in share markets and these are explained on the page following the next, but the points made by Mr. Brown are not irrelevant just because the stock exchanges have chosen to be lively. One of the main factors for the boom in equities is sentiment influenced by a view of the future and market sentiment changes as quickly as the colour of a chameleon.

Corporate profits for 1959 will undoubtedly show an improvement over those for 1957 and 1958, a point conceded by Mr. Brown himself, but it must not be forgotten that the level of profits in recent years was downward; a comparison with the previous years will, therefore, be misleading. The issue whether profit levels are adequate or not has to be determined from the industry's need to compete effectively in world markets, to allow a reasonable return to investors which will sustain their enthusiasm for investing their savings more and more in industrial expansion, and to enable industry to plough back sufficient sums to take care of replacement of their assets with modern equipment. Judged by these criteria, there is no exaggeration in Mr. Brown's contention that profit ratios in most of the Indian industries are inadequate. It gains added strength when it is remembered that borrowings and other debt obligations have been the main source of finance for industrial development during the past five years, if not longer, and that these have to be repaid. This feature of industrial finance is the result of partly shortage of funds for long-term permanent investment and partly defective tax policy. Both the incidence and structure of taxation have been such as to encourage financing of capital expenditure through borrowings instead of equity and preference capital, a trend which is unhealthy both financially and socially. Financially, this development impairs the soundness of industrial concerns and is conducive to laxity and inefficiency in corporate management. Socially, it leads to concentration of economic power, a trend contrary to the Government's declared objective. Indeed, if any one should be anxious to check this unhealthy trend, it is the Government. Unfortunately, however, it is not prepared to recognise the point even when its attention is drawn to it, as witness Mr. Morarji

Apparently, the Finance Minister was anxious not to concede the point, lest his recognition of it should be quoted in support of the demand for relief in taxation. He is, however, very shortsighted in thus stalling the issue. It will be to the ultimate benefit of the country as a whole, including the Exchequer, to encourage internal financing by corporations and equity financing whenever external finance is necessary. While a company has to avoid overcapitalisation, it must also avoid undercapitalisation and excessive reliance on borrowed funds. Borrowing should be resorted to only when conditions for raising equity and/or preference capital are not favourable and should be replaced with additional capital when conditions improve. When more capital is issued, the ownership of the company invariably gets dispersed over a larger number of investors, thereby enhancing the democratic character of the joint-stock company system. Issue of new shares tends to restrain the inflationary impact on equity values. It also contributes to a dispersal of corporate earnings over a wider sector. And it brings larger revenue to the Exchequer in more ways than one. Even from the short-term point of view, it will be advantageous to the Exchequer, in that interest on borrowed funds is a charge on profit, whereas dividends actually yield more tax to the Government. Indeed, when one thinks deeply of the issue of borrowings *versus* equity and/or preference capital, the conclusion that it is the State, rather than business men that ought to be concerned over the recent trends in corporate finance becomes irresistible.

It must, however, be conceded that, in the last two years, the Government has effected certain welcome changes in the fiscal policy pertaining to corporate taxation. Credit for this must be given to Mr. Morarji Desai. The abolition of compulsory deposit system, wealth tax on companies and excess dividend tax, and

the simplification of income-taxation on corporate profits are moves in the right direction. They have gone a long way towards restoring confidence among investors and enabled several companies to raise additional capital to repay their borrowings or to fund their short-term liabilities into long-term debentures. They have also helped the formation of several new industrial companies. It will be no exaggeration to say that this modest reform has yielded far more gains to the country than seemed possible at one time. But this should not be taken to mean that more has been given away by the Government than was necessary or that nothing more remains to be done. On the contrary, a lot more remains to be done in this direction, as will be seen from pages 1005 and 1006 of this issue, where we have published *in extenso* the suggestions made by Mr. Brown and Mr. N. Dandekar on behalf of the Associated Chambers. It is unnecessary to repeat their arguments here; suffice to say that we fully agree with them. The case for removing the remaining inequities and certain anomalies has been ably stated. The most glaring inequity is provided by the tax on bonus shares. The abolition of this tax is long overdue. Further, it has been found that the Government has sought to simplify the direct taxes on corporations at a heavy price to shareholders. Although it is not the intention of the Government to place any foreign investor at a disadvantage *vis-à-vis* the Indian investor, there is, in actual practice, some discrimination against certain types of foreign-owned companies. The least the Government should do in the forthcoming budget is to rectify these meaningless anomalies and mischievous inequities and thereby pave the way for speedier economic development. We have not the least doubt that the resulting gain to the country, in terms of employment and employable resources will be immense.

Reform in corporate taxation on the lines mentioned above will not by itself bring about an increase in the profit-margin of industries, for the main object of this reform is not to reduce the burden of direct taxation on companies but only to enable the corporate sector to finance development on sound lines, to rectify the lopsidedness that has already taken place and to encourage the flow of foreign private capital. The availability of such capital, particularly in the U.S. and Western Europe, has distinctly improved. Apart from direct participation by foreign capital in both management and control, there is, as Mr. Brown rightly highlighted, a new development in the capital markets abroad which will be quite useful to this country, if an appropriate approach is made. This is what is known as "portfolio investment," that is, funds seeking profitable investment in the shares of sound foreign companies. Explaining the scope for such investment in the shares of companies in India, Mr. Brown observed:

"I believe that the highly developed system of financial and investment institutions centred on London and New York is capable of providing this country with not inconsiderable sums by way of portfolio investment over the next few years. For this to come about, it will be necessary to bring the tax rates payable by foreign companies having minority interests, or at any rate foreign investment companies, roughly into line with the rates payable by Indian companies. All this will involve some departure from the selective approach to foreign investment heretofore adopted by the Government of India. We know that the view has previously been expressed by Government spokesmen that the country must be careful in permitting foreign investment, to see that obligations to repatriate profits annually and, ultimately, the capital itself are not assumed to an extent which would cause difficulty in future years by its subsequent effect on the

overall balance of payments position. While all will support the Government in their unwillingness to assume further foreign exchange obligations, bearing in mind existing commitments covering the next decade, I put it that it is at least arguable that the flow of foreign exchange from such portfolio investment over the next five years would itself go some way to assist in avoiding the very situation which is to be guarded against. . . . Such investment would bring into the country free foreign exchange, available for the import from the cheapest source of capital goods or raw materials as might seem best to Government. It may be argued against this proposal that the field for investment of this sort is very limited. I do not accept this as a valid objection. I have already referred to what I regard as the unhealthy increase in the proportion of development which is being financed by borrowings and to my mind a flow of funds from abroad could undoubtedly help to restore the proportion of equity investment in some of our developing industries or at least arrest the trend."

In the aforesaid quotation, there is not only an account of the scope for attracting portfolio investment, but also a concise description of how and why this country should try to get it. There are also a few other things to be done for inducing portfolio investments into this country and these pertain to the private sector. One of them is modernisation of company managements and practices on lines prevailing in Western countries, particularly in the U.S. Another is reform of stock exchanges. A third is the development of better regard by company managements for the interests of shareholders. It will be a good thing if this country takes the expert advice of the New York, London and some of the Continental Stock Exchanges on the measures necessary for effectively implementing the idea canvassed by Mr. Brown. Consultations with the President of the New York Stock Exchange, in particular, will, perhaps, prove very useful.

To revert to the question of profit ratio of Indian industries. Besides the points discussed thus far, there are two more: one, determination of ex-factory prices of commodities controlled by the Government and, two, cost of production, under which come raw materials and labour. In both respects, there is room for considerable improvement. By withholding timely and adequate increase in the prices payable to manufacturers, the Government is only compelling the investors to bear a part of the cost of inflation. The result is a vicious circle that aggravates inflationary pressures. Inadequate supply of raw materials due to either a shortfall in domestic production or non-availability of imports also reduces the profit ratio. Similarly, if productivity of labour does not keep pace with increase in wages as well as in capital expenditure, the profit ratio is adversely affected. In a partially developed economy such as India, which is trying hard to raise living standards in a few years, it is, of course, easier to state these handicaps than to remedy them. But, if the Government and labour co-operate with industrial managements by giving up their present practice of learning only after seeing and feeling the deleterious effects of their unwise policies, the progress could be speedier and cheaper than it has been hitherto.

PAPER INDUSTRY

THE Government's decision to fix, with effect from 1st January next, prices of paper at levels somewhat lower than those prevailing now will be widely welcomed. Based on the recommendations of the Tariff Commission, which inquired into the fair ex-works and fair selling prices of paper and boards, the Government's decision will bring not a little relief to the vast and growing section of consumers of paper, the chief beneficiary being the Government itself, the single largest consumer of paper. The new schedule of prices will help correct the somewhat disturbing situation, characterised, as it had been, by a significant increase in prices which not even the strident increase which has taken place in the industry's output could arrest. When the Government referred the whole issue of paper prices to the Tariff Commission in September last, there was a general sense of relief that this vexed issue would receive the impartial examination which it called for. Although price control is always an irksome measure to undertake and implement, the report of the Commission, by and large, deals out even-handed justice to all the interests concerned.

The increase in prices of paper could be traced to the fact that supplies have failed to keep pace with the demand. This is to be largely attributed to the cut in imports. The increase in domestic production could not entirely restore the balance. Between 1956 and 1957, the overall supply declined from 266,402 tons (production 190,294 tons and imports 70,108 tons) to 253,214 tons (production 212,830 tons and imports 40,384 tons). Last year, supplies were somewhat larger at 264,862 tons; production touched a record 250,638 tons, but imports were a mere 14,224 tons. The following figures give the quality-wise breakdown of the overall production of paper and paper boards in 1957 and 1958, the figures in brackets representing imports:

(Quantity in tons)

1957: Printing and writing 131,364 (13,638); packing and wrapping 35,112 (15,257); special types 4,770 (6,633); paper boards 41,584 (4,856)—Total 212,830 (40,834).

1958: Printing and writing 157,191 (3,826); packing and wrapping 34,889 (4,647); special types 7,563 (3,978); paper boards 50,995 (1,773)—Total 250,638 (14,224).

The Commission's verdict on the supply position is clear. It avers that the "supply position is at present acute and will be so for some time to come." During the current year, total production is not expected to exceed 300,000 tons. This will be 30,000 tons short of the total demand which is placed at 330,000 tons. Realising that the position can be corrected only by increased production, the authorities have permitted expansion in the existing units and establishment of new ones. The Planning Commission envisaged a target capacity of 450,000 tons by the end of the second Five-year Plan. There are now 22 units with an annual capacity of 329,200 tons. If the scheduled expansions in paper industry materialise, its annual capacity will rise to 359,800 tons next year and to 417,700 tons in 1961 (inclusive of output by a new unit which is expected to go into production by then). It must be remembered that the demand for paper will also go up every year. It is likely to be of the order of 350,000 tons in 1960, 400,000 tons in 1961 and 520,000 tons in 1962. Several new companies have been licensed for the establishment of capacity for the manufacture of paper. They will augment the capacity by 114,060 tons, but will go into production only after 1961.

In planning for paper industry, one must necessarily take into account the demand for different varieties of paper. What is necessary is that not only the overall production should go up but the higher output must be balanced in respect of the kinds of paper which go to make up the total demand. The Commission observes: "We believe that, as a result of increased industrial activity and improvement in the standard of living, there is likely to be a progressively increasing demand not only for larger quantities of paper and paper boards but also for qualitative diversification in both." At present, the total demand for paper is distributed among printing and writing paper (67 per cent.), packing and wrapping paper (14 per cent.), paper boards (16 per cent.) and special types of paper (3 per cent.). The Commission rightly emphasises that, unless the production of indigenous mills is planned in such a way as to ensure that they together produce different varieties of paper in the proportion indicated by the demand pattern, the "present serious imbalance in the supply and demand will be aggravated." Accordingly, it suggests that a technical assessment of the capacity of each unit in terms of the several types of paper and paper boards should be made and measures adopted in order to see that the overall output reflects the pattern of demand for different varieties of paper. The Government will do well to implement this suggestion which will make the task of maintaining prices relatively less difficult.

For purposes of fixation of fair prices, the Commission has classified 24 varieties of paper under four broad groups—printing and writing paper (14 varieties); packing and wrapping paper (4 varieties); blotting paper (1 variety); and paper boards (5 varieties). A notable point made by the Commission is that any attempt on the part of manufacturers to cut across this classification by placing on the market varieties of paper which cannot be brought under these groups should not be encouraged. This advice is based on the experience gained in the past when some manufacturers, under the guise of introducing improved varieties of paper, increased the prices of these varieties; in several cases, it was found that the claims to superior quality or distinctiveness were without substance. In insisting that the classification it has made must be adhered to, the Commission does not, of course, rule out

all possibility of further diversification of varieties in future. Only, it rightly stresses that, at present, it is necessary to "balance the need for conforming to a well-defined and clear-cut price structure against the need for free recourse to diversification." The Commission's emphasis on conformity, rigid as it may appear, must be regarded as the *sine qua non* of price control on paper.

In aiming at the schedule of fair prices for paper, the Commission has taken into account the fact that considerable expansion and fresh investment have to take place in the industry in the course of the next few years. Large expansions have no doubt been made in the past by utilising internal resources. The Commission has recognised that "some measure of this tempo of investment requires to be maintained and incentives provided for." It has arrived at the decision that profit at the rate of 12 per cent. on capital employed will provide the necessary incentive. "Working capital" element in capital employed has been assessed at an amount equivalent to four months' cost of production, less depreciation. A contingency allowance of 5 per cent. has been allowed, in order to provide for possible increases in the costs of raw materials and stores. Depreciation has been calculated at normal income-tax rates. The Commission has also provided for the distinctive feature of the manufacture of paper in which a small percentage of defective or odd sizes of papers and paper boards (known as "retree") has necessarily to be marketed at a discount; one per cent. of works cost has been allowed on this account. Provision has been made for selling expenses at 1.5 nP per lb., for freight allowance at 4 nP per lb., and wholesalers' and distributors' commission at 7½ per cent. on the f.o.r. destination prices; no account has been taken of excise duty and State Government or local levies. It may be mentioned here that, under the existing practice, Government purchases of paper are effected at fair ex-works prices which do not include selling expenses, freight or selling commission. The schedule of prices worked out by the Commission represents a marked reduction from the prices which now prevail in the market. Thus, the Commission has fixed the price of white printing paper at 68 nP per lb., whereas it is now selling at 73.5 nP per lb.

If shortage of paper persists and the demand continues to grow faster than available supplies, it is bound to be difficult to implement the control on prices. It should be remembered too that there is no adequate machinery for the enforcement of controls. Further, it remains to be seen whether the new units that are being set up will be able to produce paper at costs which are within the range envisaged by the Commission and still make a reasonable profit. It is to be hoped that the controls now announced will not stifle the growth of industry which has been particularly encouraging in recent years.

Worthy of notice are two important suggestions made by the Commission for the development of paper industry. In the first place, it has stressed the need for establishing pulp-making units. Pulp production, according to the Commission, should be established in units with as large a capacity as possible and they should be set up at or near sources of supply of raw material. The establishment of pulp-making units, independently of paper mills, will ensure economic utilisation of raw material. This will relieve paper mills of pulp making and allied organisational arrangements connected with maintenance and exploitation of forests. It will also cut down freight charges on the transport of raw materials; transport of pulp to paper mills will cost less than transport of raw materials in bulk. Secondly, the Commission has made a plea for long-term leases of bamboo forests to paper mills. Clearly, the grant of lease rights for brief periods, as the Commission itself points out, deprives the lessees of the initiative required to preserve the forests for continued and scientific exploitation. The Commission has also urged that attention should be paid to the possibility of avoiding frequent increases in royalty rates which have a "disturbing effect on the even development of the paper industry." These suggestions deserve prompt implementation. At the same time, it cannot be too strongly emphasised that, in the context of the great scope for the increase in the demand for paper—per capita consumption in India is 2 lbs., as against 183 lbs. in the U.K. and 412 lbs. in the U.S.—there is urgent need to evolve and carry through appropriate afforestation policies which will ensure that the raw material needs of the industry are adequately met. The use of alternative sources of raw material, such as bagasse, should also be actively encouraged and explored.

MARKET GOSSIP

IN refreshing contrast to the fears about a supplementary budget entertained by the share markets during the past three weeks, there is now optimism that the Central budget for 1960-61 will contain some relief to the corporate sector. This has led to brisk short-covering and fresh bull buying. Speculative support is, however, so selective and confined to a few scrips that it justifies the inference that interested parties are rigging up the market. As the data on the pattern of trading are scanty and as only the President of the Exchange knows about the exact position of each broker in the leading scrips, it is not possible to prove that, in the last budget, the relief given by the Finance Minister has been more than offset by the abolition of grossing and the insistence that companies should deduct tax on dividends before giving them to shareholders. While the new proposals involve a degree of hardship to some and benefits for others, a study made by the Chamber shows that "there are likely to be far more losers than gainers." But all this does not necessarily mean that the Government will concede this point in the next budget. Nevertheless, there are some who feel that Mr. Morarji Desai will not be so heartless as to ignore his own promise.

There is, of course, a good case for further reform in corporate taxation and it has been well argued at the annual meeting of the Associated Chambers of Commerce, Calcutta, this week. Sufficient evidence has been adduced by the Chamber by the Finance Minister has been more than offset by the abolition of grossing and the insistence that companies should deduct tax on dividends before giving them to shareholders. While the new proposals involve a degree of hardship to some and benefits for others, a study made by the Chamber shows that "there are likely to be far more losers than gainers." But all this does not necessarily mean that the Government will concede this point in the next budget. Nevertheless, there are some who feel that Mr. Morarji Desai will not be so heartless as to ignore his own promise.

While the common impression is that Mr. Desai's speech at Calcutta does not warrant any optimistic inference, there is a minority section that does not share this interpretation. In support of its view, the minority section mentions two arguments: one, the whole tenor of the Finance Minister's speech is one of friendliness to investors. He has not said anything adverse to share markets. On the contrary, he has stressed the need for reconciling judiciously the interests of both the exchequer and the investors by remarking that "one has to consider the adequacy of corporate taxation in all its aspects, as much from the point of the growing requirements of the public exchequer as from the point of view of incentives to business and industry." Secondly, the minority section is inclined to take seriously the Finance Minister's remark that he shall "always be prepared to consider these questions (corporate taxation) on merit and to see, to the extent I can, that there is no avoidable hardship or inequity." Since no Finance Minister can say anything worthwhile in advance on matters which have a bearing on the budget, one can only try to understand his mind from the spirit of his pronouncements. A careful reading of the full text of his speech clearly shows no signs of antagonism towards the private sector.

In his attempt to refute some of the contentions of the retiring President of the Associated Chambers of Commerce, Mr. Morarji Desai, however, made certain untenable observations. One of them at least deserves to be exposed, as it may give rise to a misleading conclusion. Replying to Mr. J. D. K. Brown, he said: "You seem to think that the level of profits is unsatisfactory, but when I look at equity prices and the downward trend in yields, I wonder whether the investor feels the same way as you do." This is not the first time that Mr. Desai has tried to read more into the rise in equity values than is justifiable. He did so at least once before, in Madras about four months ago. It will, therefore, be quite pertinent to record the main reasons for the stable appreciation in equity values that has taken place since Mr. Desai became Finance Minister.

Reasons for Boom in Equities

A good part of the rise in prices represents recovery of the ground lost in 1958-59 on account of the adverse pronouncements by the then Finance Minister and the additional taxes imposed by him. This recovery followed an improvement in the psychological atmosphere brought about by the present Finance Minister through abolition of some of the irksome measures, through minor relief in direct taxation on companies and substantial reduction in excise and export duties. Fears of nationalisation, ceiling on incomes, and more restrictions on the private sector have been set at rest by both the Prime Minister and the Finance Minister. There has, of course, been some improvement in the profit margin of such industries as jute, cotton textiles and tea, but it is from practically nil or very low levels to modest levels. Only a part of the rise in share values can be attributed to this improvement. The other causes for the boom in shares are:

Buying by the L.I.C., inflation, uncontrolled speculation, import restrictions and easy money in scarce commodities, shortage of good scrips, capital gains tax, progressive fall in interest rates following P.L. 480 deposits and bank deposits generated by inflation, inspired staging in new issues by interested parties, exaggerated notices about the profits of certain new industries, manipulation by certain powerful interests to create a favourable atmosphere for their new capital issues, non-availability or great scarcity of consumer durables, expenditure tax, high prices of bullion and jewellery, influx of capital belonging to Indians abroad, reduction in managing agency commission, decline in the power of Communists in certain parts of the country, improvement in Indo-Pakistan relations, better prospects for

receiving foreign aid, and defeat for socialism in many parts of the world.

Quite a few of the aforesaid factors may sound unimportant when considered individually, but, collectively, their impact on equity prices has been tremendously bullish.

Cotton Dilemma

Elsewhere in this issue are printed details of the announcement made by the Textile Commissioner introducing fresh controls on purchase by mills of cotton and kapas (unginned cotton). These controls have a twofold objective: to hasten the supply of cotton by early ginning of kapas and to ease the pressure on prices by prohibiting mills from buying cotton in excess of their three months' consumption requirements. Stabilising prices and regulating supplies are at present highly essential. But how are the new measures going to be enforced? Has the Government the requisite machinery? It is significant that the Textile Commissioner has not applied the control to traders. This loophole will permit mills to collude with traders and through them with growers and hold as much cotton as they want. After all, the Government has neither the intention nor the machinery to compel the growers to bring kapas to gins for ginning. The farmers' tendency to withhold the crop is already said to be a major factor inhibiting speedy ginning. These are questions for which answers are yet to be given. The enforcement of the controls is not easy and will surely be a major headache to the Government.

But the official spokesmen are of the view that the steps taken by them are only the thin end of the wedge and that, if they do not have the desired effect, the Government will not hesitate to go to the extent of clamping down full control on distribution of cotton. They are too optimistic and are only postponing the evil day. We have had enough experience to show that partial controls do not serve the purpose; they only aggravate the position by helping those who can command sufficient resources to take advantage of the loopholes. Let the Textile Commissioner study the history of cotton controls, as well as the measures that followed one after another in sugar in the past one year. There is no half-way house between complete control and free market. In any case, it is not clear why futures trading in cotton is still being allowed. Who is using the hedge contract now?

The greatest mistake the Government has made is the delay in taking remedial measures. It has waited too long to make sure that millowners and cotton traders, who had expressed fears of shortage of cotton sufficiently early, were not crying wolf when there was none. Even now, the Government feels that the sharp rise in the price of cotton is only a temporary phenomenon, arising from delay in crop movement and that, "on an overall view of situation of the crop and imports of foreign cotton, supplies would be adequate." In support of this view, it argues thus: The domestic crop will be at least 4.7 million bales. Exports hitherto allowed are only of the order of 150,000 bales plus some varieties of yellow pickings whose exports may amount to just over 50,000 bales. On the other hand, under the textile incentive scheme, imports of not less than 700,000 bales are likely to be linked with the export of cloth as they are now proceeding. In addition to this, about 20,000 bales of medium-staple cotton of 15/16" to 1-1/16" will be imported from Pakistan under a special agreement. Thus imports during the current season will be higher than the last season's figure of 600,000 bales, while exports would be lower. Actually, therefore, there is no shortfall in supplies.

Unfortunately, however, shortages cannot be statistically explained away. Promises of plenty in future cannot make good current deficiency. The crop is not only late but it is also sure to be very much smaller than the last season's. Even the most optimistic estimate now does not put the crop at more than 4.5 million bales; according to some, it will be somewhere between 4.3 million and 4.5 million bales. This is not only not sufficient to meet mill requirements during the season but actually falls short by a wide margin. Consumption of Indian cotton by mills during last season aggregated 4.6 million bales. On the basis of current trends in cloth production, mill consumption is likely to be higher in the 1959-60 season.

Since controls cannot be successfully enforced, it is on prompt imports that reliance has to be placed for ensuring adequate supplies. Government, no doubt, seems to have realised the need for more liberal imports. But the delay in making quota announcements and their improper timing have already cost the country dearly. To take only a recent instance, if the latest import quota had been announced a month earlier, the country could have obtained substantially more foreign cotton with the same foreign exchange allocation. During the one and a half month, prices of East African cotton, a favourite with Indian mills, have gone up by one-third. For every two bales of cotton that is now obtainable, one could have obtained three a month ago for the same amount of money. The result of the delay is higher raw material cost and, consequently, higher price of the finished product, less competitive capacity in foreign markets and, therefore, the possibility of a decline in exports of cloth. Governmental machinery is proverbially slow-moving and, when business planning and execution are made to hinge on bureaucratic decisions, some delay is inevitable. But it can be minimised, if not completely eliminated, if the powers that be are vigilant and care to look beyond their nose. If they do not have sufficient foresight, they should at least have the good sense to be guided by the advice of business men who are better judges. One would like to

know as to what the cotton adviser to the Textile Commissioner was doing all along. Did he go round the cotton tracts to get a firsthand picture of the conditions of crop? Has he any machinery for ascertaining the status of the crop from time to time? Why does not the Government of India learn something from its counterpart in the U.S.?

The cotton mill industry does not share the optimism of the Textile Commissioner that, with the steps already taken, everything will be all right. The Committee of the Indian Cotton Mills' Federation, for instance, has urged the Government to declare straightaway that at least one million bales of cotton would be imported during the current season. It has also asked the Government to announce forthwith the procedural details for the import of cotton. The Committee feels that, unless this is done, much serious impediment will be created in the working of mills, because mills are currently functioning on a hand-to-mouth basis, consuming cotton directly from the gins and presses. It, too, estimates that the Indian crop this season is not likely to exceed 4.5 million bales and that it may possibly be somewhere between 4.3 and 4.5 million bales.

Cloth Scarcity Ahead?

Meanwhile, there are fears is heading for scarcity of cloth. The statement of the Committee of the Mills' Federation is not clear on the relevant para merely reads as follows:

"At its meeting held in Bombay on Wednesday, the 9th inst., the Committee of the Indian Cotton Mills' Federation reviewed the cloth supply position in the country and noted the aggregate monthly rate of production by the mills, the handlooms and the powerlooms in the current year was higher than the average monthly output in 1956 and 1958 and very slightly lower than in 1957. This is borne out by the following average monthly production figures: 1956: 591 million yards; 1957: 605 million yards; 1958: 588 million yards and 1959: 594 million yards. Similarly, the average monthly delivery of mill cloth for civilian consumption during the current year has been much higher than the monthly rate of deliveries since 1956, the relevant figures being: 1956: 348 million yards; 1957: 340 million yards; 1958: 366 million yards; 1959: 373 million yards."

This is too brief a picture to remove the fears referred to above. By lumping the production figures for handlooms and powerlooms with those for the mills, the Committee has only caused confusion. Nor has it explained the significance of delivery figures, which apparently include exports also. Do these deliveries only mean that stocks have only moved from the mills to the dealers or that they reflect increased consumption? What exactly is the position of pipeline? Does the Committee feel that there will be enough mill-made cloth in the coming 12 months to take care of the needs of those who prefer such cloth to that made on handlooms and powerlooms? It is obvious that, if there were not sufficient mill cloth to go round, the history of 1955-56 would repeat itself. In order to avoid misunderstanding in future, the Committee should explain the position fully and take the consumers into confidence. It would also be desirable to have an authoritative picture of the trend of forward sales by mills for both export and domestic consumption.

Interest Rates Abroad

The upward trend in interest rates abroad does not seem to have halted. Following the increase in West German Bank rate on 23rd October last from 3 to 4 per cent., two more countries have stepped up their official discount rates. The Netherlands Bank raised its interest rate on all transactions by ½ per cent. bill discount—3½ per cent., the new rates being: bill discount—3½ per cent., interest on current account advances—4 per cent., discount rate for promissory notes—4 per cent., private loans—5 per cent., and on other loans 4 per cent. This was the first increase in the Dutch Bank rate since 15th August 1957. Between that date and 21st January 1959, it had been reduced in five stages from 5 per cent. to 2½ per cent. Last month's rise was taken as a measure of credit restraint. In view of the vigorous and continued expansion of bank credits over the past few months, the Netherlands Central Bank considered that there were no longer any reasons for maintaining the (then) Bank rate, which was low in comparison with other countries. Even the enhanced rate is much lower than that in many overseas countries.

The Netherlands Bank's action has been followed by the Bank of Japan, which has raised its discount rate from 6.95 to 7.30 per cent. with effect from the 2nd inst. In Japan, it may be noted here, the connotation of discount rate of the Central Bank is not the same as that in India and in many other countries. In fact, the structure of Central Bank lending rates is somewhat complex. The rate varies with the type of loan. Rediscounts of commercial loans and loans secured by import bill are done at a basic rate and it is this rate that is taken as the Bank rate. Rates that are lower by certain specified amounts, irrespective of the level of the basic rate, apply to loans and discounts secured by export bills. Higher rates apply to other loans. The lending rates for each bank varies with the total borrowing by the bank. Each bank has a specific limit within which it can borrow at the basic rates. Borrowings beyond these limits carry fixed surcharges that vary with excess over the limits. Hence, the actual rate at which the Bank of Japan lends varies with the level of the loans given, as well as with the level of its published rates.

There has been a further rise in short-term rates in the U.S. and the U.K. The 91-day Treasury Bill rate in New York rose last week to a new peak of 4.501 per cent. as against 4.279 per cent. in the previous week, 4.022 per cent. a month (Continued on page 1012)

EQUITIES BUOYANT

BURMAHS AND CENTURYS SHOOT UP

(From Our Own Correspondents)

BOMBAY, 10th December

EQUITIES shook off their lethargy and made a strident advance during the week. Activity was brisk and widespread and leading speculative counters, under the leadership of Bombay Burmahs and Centurys, scored handsome gains. The Indo-China problem, which Pandit Nehru described in the Rajya Sabha in the course of his reply to the debate on border policy as "the gravest problem that a country can face," did not seem to scare away the bulls. Nor did the latter appear to be worried over the growing scarcity of raw materials for industries, the rising costs thereof and the consequent effect on cost of production and profits. Those who had looked forward to Mr. Morarji Desai making a statement of policy in regard to taxation at the annual meeting of the Associated Chambers of Commerce and Industry were somewhat disappointed at the Finance Minister's vague and non-committal statement that he would have to be necessarily reticent on these questions which had a clear bearing on the next year's Budget. "This does not, of course, prevent me," he added, "from restating what I had said on various occasions, namely, that I shall be prepared always to consider these questions on merit and to see, to the extent I can, that there is no avoidable hardship or inequity." He, however, reminded the business men that "there are sacrifices to be made by all sectors," in order to help improve an economically weak nation.

The trend of the whole market shows that operators preferred to ignore the fundamentals and to follow merely the prices.

In the steel section, Tata Ordinaries moved up from Rs. 154 to Rs. 157.75 before closing at Rs. 156.25. The Rights were done at Rs. 72, as against Rs. 69.50. Indian Irons advanced from Rs. 23 to Rs. 23.80, but finished a shade lower at Rs. 23.72. Mukand Irons hardened by 84 nP to Rs. 18.96.

Despite the sharp rise in raw cotton prices and the Textile Commissioner's directive to mills not to hold stocks exceeding three months' consumption, textile shares gave a lead to the whole market. Centurys shot up from Rs. 618 to a new high of Rs. 649. Bombay Dyeings were done up to Rs. 70.30, before they closed at Rs. 69.70 which represented a gain of Rs. 2 over the week. Kohlnors were erratic, moving between Rs. 328 and Rs. 320.50, but the closing was done Rs. 5 higher over the week at Rs. 324. Central Indias changed hands Rs. 2 higher at Rs. 109. Finlays gained Rs. 3 to Rs. 296. Indu Ordinaries 24 nP to Rs. 11.08 and Shree Niwas Cottons Rs. 7 to Rs. 232. Simplex were less active and scored a rise of no more than a rupee to Rs. 160. Standards boomed to Rs. 780, an increase of Rs. 83 over the week.

Electricity shares provided an exception to the general trend, with an all-round setback in values. Ahmedabad Electrics shed Rs. 2 to Rs. 88. Bombay Suburbans Rs. 3.50 to Rs. 98.50 and Surat Electrics Re. 1.50 to Rs. 100.50. While Tata Hydros were unchanged at Rs. 109.50, Tata Powers declined by Rs. 5 to Rs. 1,072.50 and Andhra Valleys by Rs. 2.50 to Rs. 1,062.50.

Cements were listless, A.C.C. moving between Rs. 151.25 and Rs. 149.50. Digvijays gained Re. 1.50 to Rs. 146, while Orissa Cements shed 24 nP to Rs. 13.56.

Sugar shares ruled firm, in consonance with the general trend. Belapurs scored a handsome gain of Rs. 7 to Rs. 330. Walchandnagars Rs. 4.75 to Rs. 315 and Mahasistras Re. 1 to Rs. 243.50. Phaltans were steady at Rs. 174.50, following the Director's recommendation of a dividend of Rs. 13.50 (subject to tax) per share for the year ended 30th September 1959, which will mean a net dividend of Rs. 9.45 per share, as against Rs. 10 for the previous year.

The engineering section provided a bright feature, with marked gains in leading counters. Alcoek Ashdowns recorded a rise of Rs. 4 to Rs. 247. Tata Locomotives returned to favour and improved by Rs. 8.25 to Rs. 203. Premier Constructions advanced by Rs. 9 to Rs. 357, while Texmacos were maintained at Rs. 24.44 as also Mahindras at Rs. 26.30. Among minings, Shivrajpurs changed hands Re. 1.50 higher at Rs. 86.50 and Indian Coppers were 4 nP better at Rs. 3.90.

Automobiles were picked up at higher rates. Hindustan Motors at Rs. 15.96, as against Rs. 14.92 a week ago, and Premier Automobiles at Rs. 154.50, as against Rs. 140. Among shipings, Scindias improved by 60 nP to Rs. 17.20, as the dividend for the year ended 30th June 1959, despite the cut, proved to be beyond the market expectations. The Directors have recommended a dividend of Re. 1.30 per share, subject to deduction of tax, which is equivalent to a net distribution of 91 nP per share, as against Re. 1.25 paid for the previous year. Great Easterns gained 28 nP to Rs. 19.52.

The highlight of trading in the miscellaneous section was provided by the hectic rise of Rs. 35.50 to Rs. 584 in Bombay Burmahs (old) and of Rs. 9 to Rs. 199 in their new shares. National Rayons shot up from Rs. 361.50 to Rs. 378 before closing at Rs. 377.50. Gwalior Rayons hardened by Re. 1.20 to Rs. 26. Upward trend in dyes and

chemicals gathered fresh momentum during the week. Amar Dyes picked up Rs. 12 to Rs. 252, Colour Chems Rs. 5 to Rs. 245, and Indian Dye-stuffs Rs. 25 to Rs. 405. While Polychems were down by Re. 1.50 to Rs. 172.50, Tata Chemicals gathered 28 nP to Rs. 16.60. Tata Oils came to the limelight with a rise of Rs. 7.50 to Rs. 67. Wincos were well favoured at Rs. 236, a rise of Rs. 4.50 over the week, while Voltas were marked down by Rs. 3 to Rs. 180.75. Khandelwal Ferro Alloys picked up Re. 1 to Rs. 75 and Hindustan Levers Rs. 2.25 to Rs. 36.25.

Madras Stock Exchange

MADRAS, 9th December

Equities on the Madras Stock Exchange continued to rule steady during the week under review, thanks mainly to investment buying. Tea shares generally moved up following encouraging reports from auction centres. Coffee shares also met with good support induced by prospects of stable prices. Rubbers, too, were fairly active. Despite renewed reports regarding good offtake of yarn and piecegoods for domestic consumption as well as export, the textile section was rather dull, excepting for a few select shares. Operators were a little apprehensive about the tight supply position and high prices of raw cotton. Among miscellaneous industrials, engineering recorded handsome gains.

Buying enquiry in the sugar section was selective. United Breweries were keenly bid, the quotation forging ahead from Rs. 525 to Rs. 575. Mysore advanced by 50 nP to Rs. 56.50. Deccans gathered 10 nP to Rs. 13.90. Kirlapudis and Indias were fully steady, the former at Rs. 77 and the latter at Rs. 12.60. Travancore were maintained at Rs. 11.

Among teas, Peermads spurts by 50 nP to Rs. 19. Parkides hardened by 12 nP to Rs. 25.70. Kil Devasholas picked up 10 nP at Rs. 31.50. Kil Kotagiris put on 7 nP at Rs. 4.75. Oucherionys and Chembrus put on 5 nP to Rs. 5.52 and Rs. 4.05, respectively. Coonoors were fully steady at Rs. 25.25, as also Haileyburias at Rs. 16.25. Nelli-Ras at Rs. 3.03, Highlands at Rs. 14.50. But Nonsuch Teas eased by 20 nP to Rs. 25.60. Peria-karamalais by 3 nP to Rs. 3.63 and Blue Mountains by 2 nP to Rs. 3.47. In the coffee group, Consoli-dated Coffees advanced by 60 nP to Rs. 25.60. Coffee Lands rose by 45 nP to Rs. 18. Cowcoodys strengthened by 20 nP to Rs. 6.50. Wartyhullis gathered 7 nP to Rs. 3.62 and Ossours 2 nP to Rs. 3.70. Balanors were fancied at Rs. 18.75 and Anaparis at Rs. 5.20. Among rubbers, Midlands were marked up by 20 nP at Rs. 12.90 ex-div. Be Bes were steady at Rs. 2.85. The Directors of the Company have maintained the dividend at 5 per cent. for the year ended 31st March 1959.

In the textile section, Premiers advanced by Re. 1.50 to Rs. 202.50. Coimbatore Cottons rose by a rupee to Rs. 164. Metturs, Vasantas and Vijayeswaris gained a like amount to Rs. 408, 239 and Rs. 196, respectively. Rajalakshmis gained 50 nP to Rs. 65. Buckinghams were unchanged at Rs. 197.50. Coimbatore Pioneers at Rs. 322. Dhanalakshmis at Rs. 223. Loyals at Rs. 30.50 and Radhakrishnas at Rs. 28.

A spurt of Rs. 6.25 to Rs. 189.50 in Textools was the feature of trading in the miscellaneous section. Western India Plywoods climbed up by Rs. 6 to Rs. 232. F.A.C.T.s hardened by 35 nP to Rs. 19.50. Spencers improved by 20 nP to Rs. 19.50. Ashok Leylands and Aluminium Industries picked up 5 nP each to Rs. 7.25 and Rs. 22.70, respectively. Dalmia Cements gained a like amount to Rs. 10.35. Orissa Cements came unchanged at Rs. 13.30, as also India Steel Rollings at Rs. 13.40. Mysore Chemical Fertilisers at Rs. 10.63 and Standard Motors at Rs. 13.68. Mysore Papers shed 12 nP to Rs. 23.75.

Calcutta Stock Exchange

CALCUTTA, 9th December

In the absence of fresh incentive, the Calcutta Stock Exchange trod a dull and dreary path during the week under review. However, a late, but slow and fractional, recovery followed in speculative counters, while most other counters gave way on account of offerings. Budget anxieties, as well as fears that the new taxation on dividends for the working period falling in the current financial year would adversely affect the net return to shareholders, largely contributed to the caution exercised by investors and operators. Also, there was a tendency to set apart funds for some of the attractive issues just as Premier Automobiles, Premier Tyres, and Kaiser-Birla Aluminiums, expected to be offered very shortly. The Finance Minister, Mr. Morarjee Desai's statement in the course of his address at the annual meeting of the Associated Chambers of Commerce of India held here last week, that taxation questions would be examined on their merits in order to free them from avoidable hardship or inequity to the assesseees was considered vague; all the same, this statement contributed to prepare the market for increased taxation in the Budget.

The late recovery in Indian Irons followed clarification that the Government would charge interest on its advances to the steel companies from 1960-61 and not effective from this year as

was originally supposed. On behalf of the I.I.S.Co. Ltd. it was stated that the payment of interest would not affect present resources, but that the payment would be made from a special element to be introduced in the retention prices over and above the normal retention prices. The rapid increase in raw cotton and jute fibre prices restrained trading in the respective sections, while the cut in paper prices, as announced by the Government, led operators to think that the recent rise in shares of paper mills had been overdone. The Food Minister's firm denial of any proposal to nationalise the sugar industry as well as the steep increase in the price of the sweet commodity during the week failed to draw any favourable reaction in trading, on account of the general apathy.

Coals, after being quiet, tended to recover slightly. Butrakurs opened at Rs. 17 and after recovering to Rs. 17.31 gave way to close at Rs. 17.08. At Rs. 21.56, East Indias recorded a fractional improvement, while New Beerhrooms were unchanged at Rs. 21.75. Raneeunges recorded a late recovery to Rs. 16.50 from Rs. 16.37 with Bengals at Rs. 296 scoring one point.

Jutes sought lower levels in the absence of support and the volume of business also fell. From the previous rate of Rs. 130 Alliances dropped to Rs. 113. Anglo-Indias, after sagging to Rs. 215 from Rs. 223, closed at Rs. 218.50. Champ-danies were as low as Rs. 127, as against Rs. 130 previously and Gourepores at Rs. 422, as against Rs. 542. Lawrences shaded to Rs. 138 from Rs. 140, deas, at Rs. 57, were fractionally lower, as were Nelli-marlas at Rs. 12.75. Cheviots were hammered Rs. 190 from Rs. 194, and Lansdownes to Rs. 139 from Rs. 145. On a good working report and doubling of dividend to 5 per cent. for the year ended March 1959, Agarparas hardened to Rs. 11.81 from Rs. 11.44.

Engineering, after being easy, staged a recovery. Indian Irons opened at Rs. 23.14 and in the recession that followed lost to Rs. 22.75. A recovery soon set in and the closing was higher on balance at Rs. 23.69. Texmacos opened at Rs. 24 and after hardening to Rs. 24.35 and giving way to Rs. 24.20 closed higher on balance at Rs. 24.40. From Rs. 6.16 Kumardhubis recovered hands at Rs. 6.44, while Indian Standard Wagons changed hands at Rs. 94 against Rs. 95 previously, and Indian Galvanizing at Rs. 20.75 against Rs. 21.81. Shares of paper mills gave way for the reason also indicated. Despite a good working report and increase in dividend to 25 per cent. from 23.4/5 per cent., Titaghurs eased to Rs. 40.25 from Rs. 40.87. Ballarpurs closed lower at Rs. 44.25 after hardening from Rs. 44.37 to Rs. 44.75. India Pulp closed 50 nP lower at Rs. 21.37. Orientis, for which a dividend of 15 per cent. has been maintained, opened at Rs. 36.10, improved to Rs. 36.35 and closed lower on balance at Rs. 35.85.

Teas were quietly steady. The trend of prices in the more popular counters that changed hands this week is indicated below:

	WEEK'S		
	Opening	Closing	Gain or loss
Hantapara	Rs. 150.00	Rs. 151.00	+1.00
East India	24.31	24.31	+0.00
Nandurao	177.00	178.00	+1.00
Dufflachur	37.75	38.12	+0.37
Isimnath	29.81	29.82	+0.01
Brooke Bond	18.69	20.62	+1.93
Pattakola	165.00	167.50	+2.50
Methodal	23.75	23.75	Nil
Durgach	30.56	32.50	+1.94
Tezpur	18.87	18.82	-0.05

Among miscellaneous industrials, Hindustan Motors recorded a high of Rs. 15.07 to give way to Rs. 14.87. Rohtas Industries closed lower at Rs. 24.31 after recovering to Rs. 25.19 from Rs. 24.81. Indian Cables sagged to Rs. 29.87 from Rs. 23.37 returned to Rs. 23.25. Indian Cop-pers were quiet at Rs. 3.88 while Dunlop Rubbers at Rs. 35.19 were better fractionally.

Notice

BALMER LAWRIE & CO. LTD.

NOTICE IS HEREBY GIVEN THAT AN Interim Dividend on the Ordinary Shares of the Company of 5 per cent. for the year ending 31st December, 1959, was declared by the Board of Directors on 7th December, 1959, payable on or after 30th December, 1959, to those Members whose names are registered in the Register of Members of the Company on the 30th December, 1959. Dividend Warrants will be despatched to Members and no application to the Company is necessary.

Tax will be deducted from this Dividend in accordance with the provisions of the Finance Act, 1959.

The Register of Members of the Company will be closed from 17th December, 1959 to 30th December, 1959, both days inclusive.

By Order of the Board,

D. MANSON,

Secretary.

21, NETAJI SUBHAS ROAD,
CALCUTTA, 7th December, 1959.

NEWS IN BRIEF

A PROPOSAL to set up a floating dock at Visakhapatnam is under the consideration of the Central Government.

The Working Group on Co-operative Farming (Chairman: Mr. S. Nijalingappa) has finalised its draft report which is expected to be submitted to the Union Government before the end of this month.

An official Bill seeking to provide for the imposition of a special excise duty on certain varieties of sugar has been introduced in the Lok Sabha. This Bill is intended to replace the Ordinance issued earlier.

As a measure of export promotion, the Centre has decided to allow drawback of customs and central excise duty paid on materials used in the manufacture of gaskets and mixed fabrics containing terylene.

The Government of India has decided to re-allot the total existing printing quotas in such a manner as to enable the granting of limited quotas to some of the needy cotton mills, in pursuance of the recommendation made by the Textile Enquiry Committee (1958).

India and the U.S. have signed an agreement under which the U.S. Government guarantees to American investors dollar compensation for losses in case of expropriation in India. The agreement is a supplement to the convertibility guarantee agreement between the two countries, signed in 1957.

For the first time, lignite from the Nichhama mines in Kashmir State has been used for baking bricks for which purpose firewood was being used hitherto. The use of lignite is expected to result in a saving of about 300,000 maunds of firewood in Srinagar city alone, besides lowering the price of bricks.

The Tariff Commission's recommendation to extend the period of protection to the phenol-formaldehyde moulding powder industry at the existing rate of 35 per cent. ad valorem upto the end of 1962 has been accepted by the Union Government. Plastic buttons industry will, however, be deprotected from next month onwards.

There has been a decline in the level of production at the Calcutta silver refinery owing to certain technical defects, according to Mrs. Tarakeshwari Sinha, Deputy Minister for Finance. Some German experts are trying to remove the defects. If these cannot be set right, the proposal for converting the refinery into a copper refinery will be considered.

Copper, copper sheets, lead sheets for tea chests and lead strips will cease to receive tariff protection after the 31st of this month. The other types of lead sheets, zinc sheets, zinc strips, copper rods (other than electrolytic), brass rods, copper pipes and tubes will, however, continue to enjoy protection for a further period of three years from the beginning of next month, at the existing rate of protective duties.

The Government of India is expected to place a substantial order for helicopters for defence purposes with a British firm, the Westland Aircraft Company. A technical sales team of this company had come to India recently. Westland is the biggest manufacturer of helicopters outside the U.S. producing four main types, namely, Whirlwind, Wessex, Widgeon and Westminster.

The Government of India has decided to set up machinery for close and continuous consultation between the private and public sectors in the fields of refining and distribution of petroleum products. The proposed machinery, consisting of a steering committee and three sub-committees, will examine common problems and evolve solutions in the best interests of the country.

An agreement, covering the establishment of prototype training centre at Howrah in West Bengal with Japanese aid, was signed by the representatives of the Governments of India and Japan at Tokyo on the 7th inst. Japan will give 400 million yen (about Rs. 23 lakhs) for the project, besides supplying the necessary machinery and technical staff. The Government of India will provide the required land and administrative personnel.

The proposals for the manufacture of diesel locomotives put forward by three private firms—the T.E.L.Co.—the National Engineering Company and the Texmaco—have been scrutinised by the Union Ministry of Railways. The question of placing the order, however, is still under consideration. While the T.E.L.Co. proposes to manufacture metre-gauge diesel locomotives, the other two wish to take up broad-gauge locomotives. The foreign exchange component of the scheme will be 80 per cent. in the beginning and 30 per cent. subsequently.

A sulphuric acid plant, the first major chemical plant of the Bhilai steel works, was commissioned on the 5th inst. The plant, one of the biggest and most modern in India, has a capacity of 12,000 tons of acid per annum which may be raised to 18,000 tons in terms of monohydrate. It has a number of automatic devices, with a central control room which can be operated by a single man. The sulphuric acid will be used in the preparation of ammonium sulphate from coke oven gas. Construction of the ammonium sulphate plant has also been completed and is expected to commence production shortly.

The production of the multi-channel V.H.F. equipment, including radio terminals, repeaters and ancillaries, is expected to commence in the Bharat Electronics Factory in about two years, under an agreement reached between the Government of India and the Marconi Telegraph Company. Disclosing this in the Rajya Sabha, the Union Minister for Defence stated that the first stage would be the assembly of the imported parts which would be followed by complete manufacture within the country. The production will initially be for meeting domestic demand and, subsequently, there will be export of manufactured equipment to a number of neighbouring countries.

The Group Laboratories (India) Private Ltd., the makers of such popular products as Brylcreem, Macmans, and Ennos fruit salt, has renamed itself as Beecham (India) Private Ltd., after the parent company, Beecham Group Ltd., an internationally operating British concern. The Beecham Group, which is known the world over for its patent medicines and toiletry products, has recently expanded the range of its manufactures which now embraces, among others, food and food drinks, confectionery, soft drinks and pharmaceuticals. The Indian unit has a modern, well-equipped factory at Mahim, a suburb of Bombay, which has been recently enlarged to increase production and to commence manufacture of new products.

Considerable progress has been made in the manufacture of sugar mill machinery in the country. In terms of value, indigenous production has increased from Rs. 32 lakhs in 1956 to an estimated total of over Rs. 3 crores in 1959. During 1958-59, foreign exchange worth Rs. 64.3 lakhs was released to import component parts for the fabrication of sugar machinery. It is expected that, after 1961-62, by which time the existing manufacturers are expected to achieve full production, the industry will be in a position to supply 14 complete sugar plants per annum. This will meet the needs of the country except in regard to turbo-alternators and mill engines.

The annual rate of iron ore exports from India is expected to go up from about 2 million tons at present to 12 million tons by 1966. Negotiations are in progress with Italy, West Germany and other countries for the export of an additional quantity of 1.5-2.0 million tons of iron ore to Europe per annum from the west coast of India. The Japanese steel mills are already under contract to buy two million tons of iron ore per year for ten years from Kiriburu (near Rourkela) from 1964. Japan is also interested in importing a further 1 million tons per annum for the same period from the Bailadila mines in Bastar, Madhya Pradesh. In connection with the latter proposal, a Japanese delegation is expected to come to India next month.

The Government of India has amended the Non-ferrous Metals Control Order 1958, specifying the principles governing the issue of permits. Accordingly, in issuing permits, the Controller will take into consideration (1) the requirements of the industries for a period of six months based on their consumption of non-ferrous metals in the previous year or years, (2) the requirements of small-scale industries in the States, based on the recommendations of the Development Commissioner, Small-scale Industries, Government of India, or of the Director of Industry of the States, and (3) the quantity of the non-ferrous metal imported and available for distribution. The revision followed the judgment of the Supreme Court delivered on the 3rd inst. to the effect that Clause 4 of the Non-ferrous Metals Control Order 1958 was void and that, in order to make the clause effective, the principles governing the issue of permits under the order should be specified.

From Abroad

The World Bank has granted a loan of \$12.5 million to Pakistan for financing an interim programme of railway reconstruction and development.

Eleven U.S. banks have decided jointly to establish a \$40-million revolving credit for the South African Government. The new credit super-sedes an existing \$20 million loan.

An American company, the Minnesota Mining and Manufacturing Company, has opened a factory in Johannesburg, its first plant in Africa. The present investment in the new factory is £250,000, which is expected to expand further.

The United Arab Republic airline, Misrair, is expected to place an order for three Comet airliners with the British firm, de Havilland Aircraft Company. The payment will be made from the proceeds of Egyptian cotton sales in Britain.

The British Cellophane has developed a series of new polypropylene, nylon, polyvinyl alcohol, polystyrene and plasticised polyvinyl chloride films for packaging which, it is claimed, have many advantages over the existing packaging materials.

The Shell of Singapore proposes to set up a petroleum refinery in Singapore at a cost of about £4.6 million. The refinery is expected to meet Shell's current and future local requirements of petroleum products. Shell has applied for "pioneer status," involving tax concessions from the Government.

The International Tin Council has fixed the total export quotas of producing members at 36,000 tons for the first quarter of 1960, representing over 95 per cent. of the total capacity of the producing members. This compares with the quota of 30,000 tons for the current quarter and 25,000 tons for the last quarter.

PERSONAL

MR. Dwight D. Eisenhower, President of the United States of America, arrived at New Delhi on Wednesday the 9th inst. on a four-day goodwill visit to India.

Mr. P. Das Gupta, until recently First Secretary to the Indian Embassy in Peking, has returned from China. He will shortly take up the post of First Secretary to the Indian Embassy in Belgrade.

Mr. B. N. Adarkar, India's Executive Director on the International Monetary Fund and Economic Minister at the Indian Embassy, Washington, has arrived in India for routine consultations with the Government.

Mr. Chinubhai Kilachand has been re-elected President of the Indian Roads and Transport Development Association. Dr. F. P. Antia and Mr. B. V. Vaughn have also been re-elected Vice-President and Executive Vice-President, respectively.

Mr. J. S. E. Riddle, who for the past three years has been Representative, Calcutta, for The Marconi International Marine Communication Company, Ltd., has now completed his tour of duty there and is returning to the United Kingdom. The opportunity has, therefore, been taken to re-organise the Company's services in India, with a view to centralising contractual and business matters to the benefit of Indian shipowners and others whose vessels trade into Indian ports. Mr. P. W. Webster, at present Representative, Bombay, now becomes Representative, India, and, in addition to having charge of the Bombay depot, will also take over general responsibility for the Calcutta service depot. Under the new arrangement, the day-to-day running of the Calcutta service depot, with responsibility for its technical service to shipping, will now be in the hands of Mr. John Lumsden, who is promoted to the post of Calcutta Service Manager.

The U.S. Monsanto Chemical Company has been allowed to participate on a fifty-fifty basis in a new Spanish chemical concern, the Aceorgon, to be formed under the new Spanish foreign investment law. The participation will be in the form of subscription to the 10-million pesetas new company. The Monsanto will grant a credit of \$1.8 million to the Company.

A new "highway code" has been formulated by the British Ministry of Transport with the object of reducing the number of accidents. It is estimated that 6,000 people die in the U.K. annually by road accidents. The Code contains a new section on motor driving and also fresh rules for lane discipline, use of headlights in fog, and "double white line" system.

Industrial output in the U.K. touched a new peak during the month of October, 7.8 per cent. higher than at the beginning of the year and 9 per cent. more than in the corresponding month last year. The rise in output has been over a wider front throughout the economy than in the first half of the year, being particularly marked in heavy industry sections.

An official Bill has been introduced in the Cambodian National Assembly to nationalise insurance business in the country. The present plan is to establish a joint-venture corporation which will handle all insurance and will invest its profits in building and other activities which help the economic development of the country.

The Italian Government has decided to introduce anti-trust legislation, as required by the Common Market Treaty. The proposed legislation seeks to ban all agreements, written or verbal, among business concerns or trade associations which may hinder or limit competition on the internal markets and provides for the setting up of a special committee to investigate restrictive practices.

It is reported that attempts are being made in Kuwait to replace the Indian rupee now in circulation by a local currency. Three companies (American, British and Pakistan) have offered to undertake the minting of Kuwait's coins and printing of its bank notes. The offers have not yet been accepted. Kuwait is the richest of Persian Gulf sheikhdoms, with oil royalties amounting to over £100 million annually.

The French Government has decided to remove half of its remaining quantitative restrictions on imports from next month onwards. The percentage of liberalisation will thus be increased from 81 (on the basis of all imports in 1957) to 90 (on the basis of all current imports). Even after the proposed liberalisation, France will still be more protective than the other members of the Common Market. France proposes to catch up with them by regular six-monthly measures of liberalisation.

World steel production in 1959 will probably break the record of 293 million tons set up in 1957, according to estimates prepared by the West German Industrial Institute. Production of steel in Japan rose by 33 per cent. to 11.9 million tons during the first three quarters of the current year, as compared with the corresponding period in 1958. Even in the U.S., despite labour strike, crude steel production was 27 per cent. higher. Production in Russia is put at 44.4 million tons and that in the European Coal and Steel Community at 45 million tons.

FOREIGN AID

TWO hours of precious time were wasted in the Rajya Sabha on Thursday the 3rd inst. on account of Mr. Bupesh Gupta, a Communist member, who initiated a discussion on the Union Finance Minister's statement regarding his tour of Europe, the U.S. and Japan. There was no need for the discussion at all, for the statement was placed in the House merely to appraise the members about the country's latest foreign exchange resources position and the prospects for external aid. What is more, the statement did not contain any controversial points such as would evoke criticism. The only consideration which prompted Mr. Gupta to initiate a debate on the statement was, perhaps, the unhappiness over the fact that the countries visited by the Minister are free and friendly with India. "He (that is, Mr. Gupta) would like to see," as the Minister said, "that they (the Western countries) are not friendly and that only Communist countries are friendly." Mr. Gupta miserably failed to prove his objections to the Minister's statement, as witnessed the following extracts from his speech as reported in the daily Press:

"The Finance Minister is adding to the liabilities or preparing the ground for the accretion of such liabilities... India is the only country whose Finance Minister is annually touring, seeking economic assistance in the western world. In Mr. B. K. Nehru, we have a roving financial ambassador wooing the Western capitalists almost the year round... Every time the country is in financial difficulties, we rush to Washington. This does not speak well of the state of affairs in India's economic field... the Finance Minister must arrest the process of drain on the country's resources resulting from foreign private investment. Foreign investment in India has gone up from Rs. 288 crores in 1948 to over Rs. 558 crores now. The total profits in 1954-57 amounted to Rs. 164 crores, out of which just Rs. 52 crores were ploughed back in the industries and the balance taken out of the country. This is a drain on our resources... My charge against the Finance Minister is that he is throwing the doors wide open to foreign private investors to exploit India's resources and strengthen their stranglehold."

There is little logic in this criticism. At the very outset, it must be emphasised that India need not at all be apologetic about seeking the financial assistance of friendly countries, irrespective of whether they are in the free world or the Communist bloc. Considering the woeful shortage of internal capital resources, no underdeveloped country, like India, can make rapid progress by its own effort. This aspect was impressively brought out by Mr. Morarji Desai. He rightly pointed out that not only democracies but even dictatorships obtained help from other countries. In the earlier days, Russia had to rely mostly on the help of the Americans. China is developing rapidly, because the Soviet Union is helping it liberally. The U.S. could not have come up, if capital had not flowed from England and other countries. Yet none of these countries has become dependent on account of the help they have taken.

The debate, though it was unwarranted, at least provided another opportunity to the Finance Minister to put India's attitude towards foreign aid in its correct perspective. He emphatically declared that India would not become dependent just because it took loans and aid from other countries which had given out of friendliness and regard for its needs without attaching any strings. Mr. Desai made it clear that India did not want aid with strings and observed: "I must say to the credit of the friendly countries that they have shown no inclinations to attach any strings to aid. We have to acknowledge this attitude frankly." Elaborating his viewpoint, the Finance Minister said:

"... It will not be possible for the country to depend only on the earnings from exports and not seek loans. We are trying to change the pattern of exports, so that we can increase them and make up for some retrogression in some of the fields, and we have every hope that exports will go on increasing. But, until we reach the stage of a self-generating economy, it will be necessary for us to import more and more capital goods and even raw materials. Until then, it is necessary to have loans. If they are not given, it is not as if we are down and out. It will only mean that our progress will be slower. Private foreign invest-

ment does not make the country dependent. It is only that capital which will be useful to us and which will be helpful to our development that will come. We will allow only such foreign investment as fits into our plan. I cannot also make a distinction between Indian and foreign capital in regard to profits. Profits cannot be cut down to an extent where the industry cannot work."

This is, indeed, a realistic assessment of the whole issue pertaining to foreign loans and private investments. It is gratifying that, barring Mr. Bhupesh Gupta, all the other members who participated in the debate expressed themselves in favour of seeking foreign aid for India's development.

AIRLINES' PACT

The agreement between three leading international airlines, namely, Air-India, B.O.A.C. and Qantas, for pooling revenues and co-ordination of operations, announced last week-end, is in keeping with the trend observed in international air transportation. The advent of the jet age has no doubt made air travel a pleasant experience. But the heavy capital investment involved in acquiring and operating jet aircrafts has imposed so severe a financial strain even on giant airline companies that they have been compelled to explore the possibilities of fuller utilisation of the enlarged passenger haulage capacity. In a bid to attract larger traffic, a number of European and American airlines have already effected reduction in fares.

The object of the agreement between Air-India, B.O.A.C. and Qantas is to expand their collective share in international air traffic in the jet age. Both B.O.A.C. and Qantas have already jet fleets in operation. Air-India will introduce its Boeing jets in April 1960. Together, they have a network of routes, extending from London eastward to India, Australia, Hong Kong, and Japan and westward to New York, thus covering the major part of the world's air transport system.

The agreement was signed in Bombay by Mr. B. R. Patel, Vice-Chairman and General Manager, Air-India International Corporation, Mr. Basil Smallpeice, Managing Director, B.O.A.C., and Mr. C. O. Turner, General Manager, Qantas Empire Airways, Ltd. The details of the agreement have to be ratified by the respective Boards and Governments of the three airlines. The pact provides for the joint planning of operations and co-ordination of reservation systems. The sales staff will work as though they belonged to one airline. Tickets of the three airlines will be freely interchangeable and each will sell the services of the others. At the same time, each will retain its own identity and individuality and will be free to develop itself along independent lines. They will also continue to exercise their right to choose the kind of aircraft they will put into operation.

The executive heads of the three airlines believe that the agreement is "one of the most historically significant developments in commercial aviation." There is no doubt that the travelling public stands to gain from the agreement, as it will provide them an unrivalled airline service through the great travel centres of the world.

INDIAN SHIPPING

It will require much national, and not inconsiderable international, effort before Indian shipping comes into its own. Indian ships now carry less than 9 per cent. of the country's overseas trade, a far cry from the 50 per cent. level envisaged by the Government in 1947. There are many obstacles to a rapid increase in the proportion of foreign trade that is carried in Indian bottoms. The chief of them is, of course, the lack of adequate tonnage. But even if the country acquired it, there might well be other obstacles to the achievement of a reasonable share in overseas trade. To one such difficulty Mr. A. Ramaswami Mudaliar, Chairman of the India Steamship Company, Ltd., drew the pointed attention of the shareholders in the course of his speech at the annual meeting of the Company, held at Calcutta last week. He revealed that the Company had not been allowed by the Conference lines to call at the wayside ports on the direct route from India to the U.K. and the Continent. He added: "On the other hand, quite recently, while we were calling occasionally at other ports in Ceylon like Trincomalee and Galle, the Colombo Conference extended its sphere to all the ports in Ceylon and announced that, as the Indian lines were not members of that conference, they could not call at any of the ports of Ceylon, a supreme example of the freedom of the seas and

non-discrimination of flags which some of the lines constantly speak of!" This is the kind of attitude which Indian shipping has to contend with in its efforts to build up a mercantile marine which can acquire for itself a reasonably larger share of the country's foreign trade. The countries, the ships of which have established themselves in carrying world trade, should realise that an aggressively partisan attitude on their part is not calculated to further the cause of economic development of the free world.

Nearer home, there are a quite few obstacles to the development of Indian shipping. The first obstacle is financial. Tentative targets for the third Plan envisage a tonnage of 1.6 million, as against the target of 900,000 tons fixed under the second Plan. It is now confidently predicted that the second Plan target will be reached. The achievement of the target under the third Plan will imply an investment of about Rs. 100 crores. It is necessary that while the Government should continue its present policy of generous aid to shipping, the shipping companies should be enabled to increase their internal resources. Further, facilities should be provided for the profitable operation of ships. In this connection, two notable suggestions were made by Mr. A. H. Bhiwandiwalla, Chairman of the Great Eastern Shipping Company, Ltd., in the course of his speech at the annual meeting of the Company, held this week in Bombay. In the first place, Mr. Bhiwandiwalla suggested that, inasmuch as the coastal movement of coal by ships was cheaper than transport of the commodity by rail, the railways should not encroach upon this field. It may be recalled that the Rail-Sea Co-ordination Committee recommended reservation of movement of coastal coal for Indian shipping. The Government will do well to accept this recommendation in principle, though it may make such modifications in its policy as will ensure that the railways are not denied all access to coal. A similar policy should also be pursued in respect of certain other cargo—salt, for instance—but care must be taken to ensure that shipowners do not exploit the monopoly given to them by such reservation. If necessary, the Government may even hold an enquiry into the efficient working of shipping companies before granting this demand, an enquiry in which manufacturers and the railways may be given an opportunity to state their points of view. Secondly, the Government should co-ordinate effectively the cargoes belonging to itself and ensure that they are generally carried in Indian ships.

EXPORTS OF MANGANESE ORE

In recent years, exports of manganese ore have declined greatly. They aggregated only 700,000 tons in the first ten months of 1959, as against 900,000 tons in the corresponding period of 1958 and 1.6 million tons in the whole of 1956. Although the fall in export trade has synchronised with the entry of the State Trading Corporation (S.T.C.) into it, it may be unfair to establish any casual connection between the two developments. For the decline in export trade must be attributed to the fact that several countries, which have recently developed their manganese ore mines, are geographically in a more convenient position to supply the requirements of importing countries. But this criticism does not in any way invalidate the criticism made by private traders that the S.T.C. is trying to secure an unfair advantage at their expense and it hinders, rather than helps, India's export trade. This, in fact, was the substance of the criticism made by Mr. S. J. Kajaria, President of the Western India Minerals Association, in the course of his speech at the annual meeting of the Association, held last week in Bombay.

It seems correct to say that the S.T.C.'s actual performance on the export trade front is disproportionately small as compared with the role assigned to it by the Government. In this connection, Mr. Kajaria pointed out how, out of the reported commitments of 1.12 million tons of manganese ore for 1959-60 by the S.T.C., only 75,000 tons were sold by it; the balance represents export transactions concluded by private exporters and barter deals and routed through the S.T.C. It may be mentioned here that no private exporter is allowed to conclude bulk deals with foreign buyers for deliveries extending upto three to five years, unless he first agrees to become an associate of the S.T.C. Commenting on this arrangement, Mr. Kajaria rightly wondered in what way the interests of the country's manganese ore trade would be better served through the stipulation that export deals should be finalised in the name of the S.T.C. only. On the contrary, he feared that such a procedure would increase the

cost of Indian manganese ore to foreign buyers. He went on to state that it had been reported that "before one could become an associate of the S.T.C., he should agree to pay a certain amount of commission to this organisation, despite the fact that this organisation renders no service whatsoever other than that of transferring its quota."

Inscrutable are the ways of the Government and the S.T.C. Apparently, the Government's aim is to make the S.T.C. a grand trade Mughal who, having acquired a monopoly or near-monopoly in certain commercial lines, will dispense favours to its business associates and frown upon those who like to carry on trade on their own. Only, it is not clear how all this will serve the country's export trade. Already, there is a growing feeling that the S.T.C.'s business profits constitute not only unearned income but invisible taxation. If it must engage itself in trade, whether internal or foreign, the least that should be done is to ensure that it does not compete on unequal terms with private traders. By utilising its privileged position to beat down its rivals, the S.T.C. may cover itself with glory. But it will be a Pyrrhic victory.

POSTS AND TELEGRAPHS BOARD

A notable step towards toning up 'the administration of the Posts and Telegraphs Department has been taken with the Government's decision to set up a new body, similar to, if not identical with, the Railway Board. The Posts and Telegraphs Board is scheduled to be inaugurated early next week. One of the oldest and the biggest State undertakings in India, next only to the Railways, the Posts and Telegraphs account for a capital outlay of Rs. 111 crores and employ over 300,000 persons. No doubt, the Department has an impressive record of growth and expansion. Postal facilities are being extended to rural areas, thereby expanding the already vast network of communication system. Nevertheless, there is a growing public impression that the Department has become somewhat lethargic and slow. There have been many complaints of delay in the delivery of letters, telegrams and postal packages. This has caused much public concern. The new Board, it is to be hoped, will bring about speed, efficiency and, above all, economy in administration. It is true that a mere organisational change at the apex will not necessarily ensure better administration. Much will depend on the way the new body utilises its powers and how the rank and file in the Department respond to its call.

An outline of the Board's functions was given by Dr. P. Subbaroyan, Union Minister for Transport and Communication, in the Lok Sabha last week. He observed that the proposed Board would have some autonomy. It could not, however, be put on the same basis as the Railway Board, at least for the time being. Unlike the Railway Board, the P. and T. Board would have no separate budget. It would, however, be a policy-making body and its decisions would be subject to the approval of the Minister. The Director of the Board would act through the Minister in some cases. Dr. Subbaroyan announced that he would not interfere in the day-to-day work of the Board. The policy decisions of the Board would be conveyed to the Minister through the Secretary. Alluding to the functions of the Financial Commissioner, he observed that the Finance Department did not unreasonably interfere with the work of other departments. The Minister did not accept the suggestion for having the Chairman of the Board as the Secretary to the Ministry, as in the case of the Railway Board.

It would appear that the Minister would like to make changes in the constitution of the Board, after watching the functioning of the Board for five or six months. For the present, it looks as though a nominal change has been made in the administrative set-up without making an earnest effort to leave the necessary initiative and power of decision-making with the Board. The autonomy of the Board will not be statutorily recognised, though it may well acquire an independent status by convention in course of time, if it functions well. The working of the Board will be watched with interest.

Replying to the allegation that the Posts and Telegraphs were running at a loss, Dr. Subbaroyan pointed out that this was not quite correct. Last year, the Posts made a profit of Rs. 130 lakhs and Telephones as much as Rs. 523 lakhs. The Telegraphs, however, suffered a loss of Rs. 6 lakhs and Radios Rs. 5.5 lakhs. The Board will do well to run these essential services on commercial lines and strengthen their

LONDON LETTER

CRISIS AND THE LABOUR PARTY

MR. BEVAN'S TELLING ARGUMENT

(From Our Own Correspondent)

LONDON, 2nd December

NO one who attended the historic conference at Blackpool of the defeated British Labour Party could have failed to be moved by the high priority given in the consideration of future policy to the needs of the underdeveloped countries. There were two great issues at this inquest which the Party held after its own defeat. Firstly was the part that might have been played by Labour policy over nationalisation, or rather the part played by the misrepresentation in the course of the election of what Labour's nationalisation policy was, and, secondly, the moral issue that, just as the Labour Party had been formed to look after the interests of the underdog, the unemployed, the underpaid, the aged, so, now that these domestic problems have been largely resolved, it was the duty of the Party to carry its contributions and its material help to this country's neighbours overseas. The Indians, the Africans and the Indonesians were cited time and time again as the peoples the problem of whose welfare had replaced the old-time problems of the unfortunates at home.

But the crisis which the Labour Party faced after its third successive defeat was exactly how it was to translate into terms of policy, readily understood by the electorate, the actions which it considered necessary to achieve its aims—those aims, of course, being the achievement of power in order to carry out the developments at home and abroad considered necessary. But so committed is the party now on the question of overseas development that, should it be returned to power in five years' time, it will, indeed, have to give the topmost priority to this matter.

Nationalisation

The conference has been widely reported as revealing deep divergence of views between a Right Wing, which wanted to play down the issue of nationalisation, and a Left Wing, which wanted to keep public ownership in the forefront of the programme; but, of course, the issue was not as simple as that. The Right Wing does not want to drop nationalisation altogether; it is simply saying that, through a combination of apparent inefficiency on the part of some of the nationalised industries and the propaganda of the Party's opponents, the public have had the wrong idea of where the Party stands. So the Right Wing does not want to talk about nationalisation now but to concentrate on other matters and simply reserve the right to turn its attention to industries which might be failing the country.

Nor does the Left Wing want to nationalise everything. Indeed, the word nationalise is itself misleading. They want public ownership to embrace the "summits of economic power." That public ownership might be in the form of State control, in the form of public boards, or in the form of co-operative or municipal undertakings; but, if the industry affected the livelihood of a large number of people, then it should be amenable to public control. However, even this is to understate the problem, because the Left Wing does not believe that it will be practicable to have a society conforming to socialist principles in which greed takes a big place, as they claim it would if private enterprise remains the dominant force in industry.

But both Right and Left used their attitude towards "nationalisation" to indicate the fate of the country's neighbours overseas under one or the other policy. Thus, one had those who said that, if the Party continued to follow doctrinaire socialism, they would remain out of power, and the consequences would be the suffering of people at home but "the slavery of Africans and the starvation of Indians and Indonesians." This proved a very popular line of approach, but it was countered by the Deputy Leader of the Labour Party, Mr. Bevan, in his masterly conclusion to the debate with the words that, unless the Party held the "summits of economic power," unless they were able to impose their own priorities on the economy, they would not be able to help India and Indonesia or the peoples of Africa. And his argument was the more telling, in that he said that

(Continued in previous column)

(Concluded from next column)

the challenge to Britain's external economic position would not come from America or from the other Western countries, but would come from Russia and it would be Russia, which year by year, as a result of its own internal economic planning, would be the country called upon to assist the development of the more backward territories. If Britain wanted to play her part, therefore, she had to meet that challenge, and do it by gaining power in a society organised to give the right priorities not only for Britain's domestic economy but for the economy of the whole world.—All Rights Reserved.

Agreement has been reached between the Leeson Corporation of America and George Hattersley and Sons of Keighley, for Leeson's Unifil loom winder to be built in to the Hattersley filament rayon loom. The work, which entails close co-operation between the American and British engineers, is expected to be completed in the spring. This is the first application of the Unifil loom winder to a filament rayon loom in the United Kingdom. The Unifil winds weft yarn on to pirns at the loom, from large package cones, thus eliminating the need for a separate pirn winding department. Demand for Unifil loom winders in the United Kingdom is so heavy that delivery dates in 1961 are now being quoted for new orders.

WORLD BANK TO BORROW IN LONDON

TERMS OF ISSUE YET TO BE SETTLED

THE International Bank for Reconstruction and Development will shortly be entering the capital market in London to borrow "more" money. This was disclosed by Mr. Eugene Black, President of the Bank, in the course of an address to the Institute of Bankers, London, last week. He did not, however, commit himself regarding the amount to be borrowed and the date of borrowing; he merely said that the Bank hoped to return to the London market for more money "as soon as circumstances are favourable." The raising of new issues by the World Bank in London requires, as in the case of other overseas borrowers, the permission of the Capital Issues Committee and the timing and other terms have to be approved by the Bank of England.

The World Bank has so far made two issues in the London market, but they were small ones, each for no more than £5 million (\$14 million) in twenty-year stocks carrying interest at the rate of 3½ per cent. per annum. The first issue was made in 1951 and the second in 1954. In fact, when the first issue was made, the U.K. was the first country outside the U.S. to open its market to a public issue by the World Bank. Till then, the Bank had been borrowing only in the U.S., not by design but by expediency. While the U.S. was then the chief market for the Bank's bonds, the Bank, nevertheless, had explored the possibilities of raising funds elsewhere also. This was because the Bank had from its inception felt that, as an international lender with a long-term need for capital, it would need as broad a market as possible. That this principle has been followed by the Bank as far as circumstances permitted is evident from the following statement of funded debt outstanding as on 30th June 1959:

Payable in	Rate of Interest	Maturity	Amount (in million U.S. \$)
United States Dollars ..	2 to 4½%	1 to 30 years	1,591.24
Belgium Francs ..	5%	10 to 15 "	10.00
Canadian Dollars ..	3½ to 4½%	10 to 15 "	34.69
Deutsche Marks ..	3 to 5%	5 to 15 "	22.41
Netherlands Guilders ..	3½%	15 to 20 "	21.05
Pounds Sterling ..	3½%	20 "	28.25
Swiss Francs ..	3½ to 4%	5 to 20 "	159.92
Total ..			1,905.16

Since the close of the last fiscal year, the Bank privately placed two issues aggregating \$130 million, and after taking into account the maturities and the increase in debts under delayed delivery arrangements, the outstanding funded debt of the Bank stood raised to \$1,963 million as on 30th September 1959.

The World Bank President availed himself of the opportunity offered by the Institute of Bankers to refer, in great detail, to the contribution made by the Commonwealth countries as a whole and by Britain, in particular, to the Bank's resources and the benefits these countries had received from the Bank. "An important element of Commonwealthship," he declared, "is the ability to obtain large loans from the World Bank." In this respect, according to Mr. Black, the Commonwealth countries have been successful. The total Commonwealth borrowing from the Bank so far is £530 million, which represents nearly one-third of the total loans made by the Bank. Of this, £460 million have been granted to the self-governing countries, such as Australia, India, Malaya, Pakistan and South Africa.

Mr. Black also referred to the indirect benefit received by Britain out of the World Bank loans. According to him, British companies have received orders worth £140 million from the projects financed by the Bank. This sum represents 50 per cent. more than the British Government's own contribution to the Bank's capital. "As you know," Mr. Black added, "the Bank encourages international competitive bidding and British industry has been increasingly successful in the past few years in obtaining orders from our borrowers—and many of these orders were paid for in dollars."

Adverting to Britain's own contribution to the World Bank's resources, Mr. Black said that, besides the two small market issues in 1951 and 1954, the U.K.'s official contribution came to about £93 million, including the gold and dollar subscription. In addition, the Bank expected to receive another £60 million or so from the self-governing members of the Commonwealth. "With the exception of Canada,"

the World Bank President said, "we had to wait a very long time before we could use the local currency component which made up most of that total." Indeed, in the case of some Commonwealth countries, the Bank was still waiting. In this connection, Mr. Black was very critical of the provisions of the Bank's constitution, according to which 18 per cent. of its original nominal capital—by far the largest part of the available Government funds—was paid in local currencies and could only be used with the consent of the member-country concerned. He cited the instance of the U.K., where the Bank had to wait for thirteen years after the end of World War II before being able to use all of the paid-in subscriptions from the Bank's second largest member-country. This feature of the Bank's capital structure has not commanded Mr. Black's admiration.

Mr. Black also discussed at length the difficulties experienced by many underdeveloped countries in attracting overseas capital, especially the new independent countries which had lost the credit of the "mother country." Unfortunately, the present difficulties in the U.S. balance of payments, as Mr. Black reminded his audience, have come to coincide with, and therefore aggravate, the world-wide shortage of capital which has come about as a result of the unprecedented economic growth throughout the world during the last fifteen years. Mr. Black's statement implies that Britain and other European countries have to take the burden of development of the underdeveloped countries and one way of doing so is to lend to the World Bank. It is, however, pointed out by a spokesman of Britain that its lending for Commonwealth development since the war has been "pushed to the limit of financial prudence and sometimes beyond it." But the fact that the World Bank looks forward to raise "more" money in London seems to suggest that, in Mr. Black's view, Britain's capacity as a big supplier of capital has not been fully used up.

There is considerable speculation in London about the proposed borrowing by the World Bank. While one's guess is as good as another's, the general impression is that it will be much more than on the last occasion. The real problem of borrowing in London will centre round the rate of interest. It is pointed out by some that the Bank will have to pay a little more than the current yields on gilt-edged. This will mean borrowing at the rate of 5½ to 5½ per cent. The point is whether the World Bank can afford to borrow at this rate when its lending rate is 6 per cent. It may be noted in this connection that, earlier this year, the Bank had borrowed in Belgium and West Germany at 5 per cent. per annum. As it has secured the bulk of its resources at much lower rates of interest, it will not be a great hardship for the Bank to pay a fraction more than 5 per cent., if the sum sought to be raised is only modest, say, £25 to £50 million. In any case, with interest rates in the U.S. remaining high and with international hunger for capital growing, it seems clear that the cost of borrowing from the World Bank will tend to be higher than hitherto. This is a point which the planners in this country will do well to bear in mind.

I.M.F. HELPS ARGENTINA

The Government of Argentina has entered into a one-year \$100 million stand-by arrangement with the International Monetary Fund as a means of carrying forward its programme of economic stabilisation. The arrangement with the Fund is to be supplemented by additional credits which the Argentine Government is negotiating in other quarters.

Argentina recently paid \$32.5 million in gold to the Fund in fulfilling conditions for an increase in its Fund quota from \$150 million to \$280 million. As the new stand-by arrangement goes into effect, Argentina's outstanding drawings from the Fund total \$117.5 million, of which \$75 million was drawn in 1957 and \$42.5 million under a stand-by arrangement announced in December 1958. These drawings were made in United States dollars. The Argentine Government has indicated that, if any drawings are made under the new arrangement, it will request approximately 50 per cent. of the amounts drawn be made available in U.S. dollars and the rest in European currencies.

Since the beginning of this year, the Argentine Government has succeeded in reducing inflationary pressures and in strengthening the country's reserve position. To accomplish this, it removed subsidies and price controls, reduced Government spending, adopted a single fluctuating

exchange rate in place of a complex multiple rate structure, and took steps to encourage foreign investment and the revival of the local capital market. This programme will be continued in 1960 and will be accompanied by a greater liberalisation of the country's foreign trade and payments. The stand-by arrangement with the Fund will provide general balance of payments support and will help the Government to maintain an orderly foreign exchange system.

JAPAN RAISES BANK RATE

The Bank of Japan has stepped up its official discount rate by 0.365 per cent. to 7.30 per cent., with effect from 2nd December 1959, thus restoring it to the level which prevailed prior to 19th February when it was last lowered to 6.935 per cent. Since 1950, Japan has altered its Bank rate eight times, as will be seen from the following table:

Date of change	Rate Per cent.	Date of change	Rate Per cent.
5th July 1942 ..	5.11	8th May 1957 ..	8.395
1st Oct. 1951 ..	5.84	18th June 1958 ..	7.665
10th Aug. 1955 ..	7.20	5th Sept. 1958 ..	7.30
20th March 1957 ..	7.065	19th Oct. 1959 ..	6.935
		2nd Dec. 1959 ..	7.30

The latest rise in the Japanese Bank rate has been taken as a "hedge against a possible revival of inflationary tendencies." The recent steady rise in commodity prices, the increase in the demand for funds from industry and the growth of the number of bank notes in circulation appeared to indicate, according to a spokesman of the Bank of Japan, that the present favourable equilibrium in economic development might be endangered unless precautionary measures were taken in time. The Finance Minister of Japan said in an interview that he hoped the commercial banks would operate by raising their own interest rates and restricting loans.

STERLING AREA'S RESERVES DECLINE

The sterling area's gold and convertible currency reserves suffered a decline of £18 million during November to £1,082 million. This is on top of a drop of £93 million which occurred in October, but due to different factors. The October decline was mainly the result of the accelerated repayment of the U.S. Export-Import Bank loan by Britain and small special payments to European institutions. There were no such special factors in November. The fall in that month is mainly attributable to normal commercial and financial transactions. This is the first time in the last two years and over that a decline in reserves has occurred on account of normal transactions.

The fall was not unexpected and is, therefore, not considered as "unhealthy." It mainly arises from the flight of short-term funds, which had earlier been attracted to London by higher interest rates. These funds have now moved to other centres as a result of the hardening of the interest rates there. Such movements of funds are a normal feature of international capital markets, which are now freed from almost all exchange controls, and are, therefore, not unusual.

U.N. COMMISSION FOR INDUSTRIAL DEVELOPMENT

The United Nations General Assembly has unanimously recommended the establishment of a United Nations Commission for industrial development. The resolution was among the twelve passed by the Economic Committee aimed at accelerating economic development in "poorer" countries, expanding international trade and helping to stabilise commodity markets. Brazil, which initiated the move, said, in the Committee stage, that the Commission should decide the priority for industrial projects being assisted by the U.N. in underdeveloped countries and ensure continuity. The resolution, which called on member-states to reappraise their positions with regard to a working capital fund, was supported by 87 countries, while 15 of the more highly developed countries, including the U.S., Canada, Australia, France, Belgium, Italy, Portugal, Spain and Sweden, abstained from voting. These countries contended mature to establish another fund to channel capital machinery could not meet its financial targets and especially now that a new affiliate of the World Bank, the International Development Association, had been established in principle.

VALUE OF RUPEE IN HONGKONG

The Government of India does not consider it necessary to take any steps to arrest the fall in the value of the rupee in the Hongkong market. This was stated by Mr. Morarjee Desai, Union Finance Minister, in reply to a question in the Lok Sabha last week-end. Mr. Desai told the members that the enormous volume of authorised foreign currency transactions was in no way affected by the decline in the unofficial rate. The fall in the official value was due to measures taken by the Government to prevent leakage of foreign exchange for the purpose of smuggling out of Indian commodities overseas and smuggling into the country. The official value of the rupee, which was HK \$120 per Rs. 100, remained unchanged all authorised transactions. It was only in the free market value of Indian rupee notes used for unauthorised transactions that had declined since June last, Mr. Desai added. On 23rd November HK\$80 per Rs. 100.

At the end of a journey, another begins. Where the road ends at the foot of a rugged mountain, the muleteer takes over, transporting to scattered homesteads the products that will satisfy newly awakened needs. Some day, a road will be built, perhaps over the very track which has been beaten by his faithful beast. As new roads are laid, more and more vehicles are rolling into the interior, bringing remote villages closer to the twentieth century. Helping to keep the wheels moving are some 90 million tyres produced by Dunlop in India since their Sahaganj factory was opened in 1936. Many more are needed and Dunlop have established a second tyre factory at Ambattur, while greatly expanding production capacity at Sahaganj.

DUNLOP

ORISSA CEMENT LIMITED

P. O. RAJGANGPUR (Dist. Sundergarh, Orissa State)

Managing Agents: DALMIA AGENCIES PRIVATE LTD.,

are now ready to serve your needs with all types of high class

"DALMIA REFRACTORIES"

for

IRON, STEEL & METALLURGICAL WORKS, CEMENT KILNS, CERAMIC & OTHER INDUSTRIES

In all qualities of

Fireclay, Silica, Magnesite, Chromite, Chrome Magnesite and Insulating

In all sizes and intricate shapes with different types of

MORTARS

Manufactured in collaboration and under guidance of

Dr. C. OTTO & COMP. G.M.B.H., BOCHUM-DAHLHAUSEN, WEST GERMANY

WORLD COTTON SPINNING CAPACITY CONTINUES TO EXPAND LOOMAGE, HOWEVER, SHRINKS

THE cotton spinning capacity of the world continues to expand, in spite of reductions taking place in individual countries. The pace of this expansion accelerated considerably during the five months ended December 1958. The actual addition of spindles was of the order of 4,453,000, which was more than double the addition of 2,222,000 spindles recorded in the two-year period from August 1956 to July 1958. The total number of spindles (with a reed space of 16" and above) as on 31st December 1958 was 134,546,000, as against 130,093,000 at the end of July 1958 and 128,871,000 on 31st July 1956, according to the International Federation of Cotton and Allied Textile Industries, Manchester.

The Federation, it may be noted here, is the only organisation to collect and compile world statistics on machinery and raw material consumption in the cotton industries; these statistics are officially recognised by the United Nations Organisation. The Federation, which has been publishing data relating to world cotton spindles (since 1905) and looms (since 1930) in the different countries, has endeavoured to improve the method of compilation and publication. Thus, the surveys for the spinning and weaving sections are published at the same time, instead of at different times. Again, the data for spindles, looms and raw material consumption are collected for the calendar year, and not for the U.S. cotton crop year (August-July) as was the case before. Further, the quantity of cotton consumed in mills is expressed by weight, that is, in metric tons (of 2,205 lbs. each), instead of in running bales. Additional data have been collected from weaving firms showing the consumption of the various yarns. The number of spindles and looms at any time during the calendar year is shown in addition to those in place in the mills.

The increase in the number of spindles noted in 1958 would have been more marked but for the scrapping of over 1.30 million mule spindles, of which the European countries alone accounted for 1,194,000 mule spindles. This scrapping was more than counterbalanced by a sharp rise of nearly 5.76 million in ring spindles, the actual number of which increased from 118.47 million on 31st July 1958 to 124.23 million five months later. Consequently, the percentage share of ring spindles in the world total improved from 91.0 to 92.3, whereas that of mule spindles receded from 9.0 to 7.7. The following table indicates the Continent-wise variations:

Continent	(In thousands)		
	July 1958	December 1958	Increase or decrease
Asia	35,540	40,070	+4,530
Europe	64,006	64,099	+ 93
South America	5,810	5,730	- 80
North America	29,330	29,183	- 147
Africa	1,607	1,484	- 123
Total	130,093	134,546	+4,453

The above figures show that the major portion of the rise in spindles—4.53 million—took place in Asia. The increase in the number of spindles in Europe may seem somewhat surprising. It took place in several countries in both Western and Eastern Europe. The expansion in Western Europe is attributed mainly to re-equipment and modernisation after the scrapping of obsolete spindles in some countries.

Contrary to the trend in the spinning section, the number of cotton looms in place in the world continues to decline; the number at the end of last year stood at 2,589,917, as against

2,640,876 on 31st January 1958, or a net drop of 50,959 looms over eleven months. The drop was accounted for by both ordinary looms and looms with automatic attachments which decreased from 1,579,541 and 67,683 to 1,531,716 and 60,525, respectively. The number of automatic looms, however, rose by 4,024 to 997,676.

The table at the end of the article shows the distribution of spindles and looms—in place and active—in the world's largest cotton goods producing countries as on 31st December 1958. The number of spindles in the world known to have been idle throughout the year 1958 was 13.53 million, representing as much as 10.06 per cent. of the total spindleage. Many countries, it is said, did not submit figures showing idle spindles, so that it is considered quite probable that this figure should be higher. The number of mule spindles not in work was 2,114,000, out of the 10,315,000 in place, the idle capacity being thus of the order of 20.49 per cent. The ring spindles lying idle numbered 11,415,000, accounting for 9.19 per cent. of the 124,231,000 in existence.

Ten per cent. of ordinary looms were idle during the whole of 1958. The utilisation of the capacity of automatic looms, however, was higher, the share of idle looms being only 6 per cent.

An idea of the consumption of raw materials and hours worked per spindle and loom in the world's eleven biggest textile producing countries during 1958 can be had from the table given below:

Countries	Raw cotton (metric tons)	Man-made fibres (metric tons)	Average hours worked per active spindle	Average hours worked per active loom
India	892,847	34,549	6,756	5,338
Japan	402,703	290,192	4,851	5,294
U. S. A.	288,937	35,801	4,771	5,218
U. S. S. R.	1,841,896	206,203	5,546	5,947
W. Germany	293,732	76,075	3,488	3,102
France	280,638	35,004	3,309	3,102
Belgium	77,948	9,147	3,796	N.A.
Italy	184,050	34,071	3,681	3,133
Netherlands	236,638	5,409	4,029	4,090
U. S. S. R.	1,259,701	35,000	N.A.	N.A.
China	1,517,712	—	N.A.	N.A.
World total	9,232,191	837,912	5,015	4,602

N.A.—Not available.

The active spindles worked an average of 5,015 hours during the calendar year 1958. But here again, a number of countries did not reply to the question asking for the number of spindle-hours. The hours worked by active looms in the cotton weaving sections were considerably fewer than those worked in the spinning section of every Continent.

The table below indicates the trend of cotton yarn and cloth production in the nine major producing countries in the free world:

Countries	Cotton yarn (in million lbs.)		Cotton cloth (in million yds.)	
	1958	1957	1958	1957
India	1,658	1,780	7,056	7,300
Japan	986	1,039	3,039	3,705
United Kingdom	681	727	1,425	1,827
U. S. A.	3,217	3,489	10,147	10,979
U. S. S. R.	721	784	2,424	2,508
W. Germany	675	582	2,071	1,895
France	178	223	604	761
Belgium	263	377	1,030	1,050
Italy	162	160	589	604
Netherlands	—	—	—	—
Total	8,508	9,170	28,388	29,733

No complete world's total of cotton yarn consumption has been given, since several countries do not yet collect these figures. The total quantity of all yarns consumed by weaving mills in the reporting countries in 1958

amounted to 5,033,041 metric tons. The bulk of this, 4,351,223 tons, or 86 per cent. of the aggregate, were accounted for by cotton yarns. During the same year, the mills consumed a total of 334,889 tons of staple fibre yarn (7 per cent. of the total), 149,466 tons of man-made filament yarn (3 per cent.) and 197,463 tons of other yarns (4 per cent.).

COTTON TEXTILE EXPORTS

How serious has been the impairment of the strength and resiliency of cotton textile and other export industries resulting from heavy taxation and increasing labour costs was well brought out in the course of a resolution adopted by the Associated Chambers of Commerce of India at its annual meeting held at Calcutta this week. Supporting the resolution, the representative of the Bombay Chamber of Commerce and Industry made the following interesting observations:

"... As far as the textile industry is concerned, it can surely be claimed that, following the introduction of the textiles export incentive scheme, sponsored by the Indian Cotton Mills Federation and accepted by Government, promise for export figures and bookings indicate that, after a fall from 839 million yards in 1957 to 582 million yards in 1958, the export performance for which 60 per cent. would be in the second six months. This heartening trend, however, has been widely commended, they should not be allowed to obscure certain fundamental disadvantages from which our industry suffers and which may threaten the increase or even the maintenance of the present level of exports.

"In the first place, competition not only from Japan and Hongkong but also such relative newcomers as Pakistan and China has increased of modern machinery and an initially rationalised labour force to operate it. The need, therefore, installation of modern machinery was never greater than it is at present. There is, however, no machinery, if, at the same time, mills are not allowed to reduce production costs by the introduction of rationalised workloads and, in this respect, it is regrettable that the co-operation received from labour so far has been sadly lacking. While this Chamber has been sadly lacking in favour of fair wages, it has always been that the Indian textile industry pays higher wages than those paid by its counterparts abroad, if account is taken of the comparative workloads, that is to say, the density of labour relative to against overseas competition, therefore, there is a strong case not only for arresting the continuing rise in wage costs but actually for lowering them, not by effecting cuts in existing wages but by inducing the productivity of labour and thereby reducing the overall wage-bill.

"Government, moreover, must also play its part and share the burden, for if mills are to re-align the ability to do so must be there, and Government's policy in regard to depreciation allowance must be on a liberal scale. It is no coincidence that much talk is devoted to loans from official and semi-official agencies to the textile industry, but the same result could be achieved more simply by allowing conditions under which it could provide for its own rehabilitation.

"Secondly, another serious obstacle to the expansion of the export trade in textiles is the inability to keep Indian cotton prices at reasonable levels. At one time, India had practically a world monopoly of cheap medium-staple cotton, but this is no longer the case. Pakistan cotton at present levels is considerably cheaper than Indian equivalents and the acreage under cotton in India is increasing every year. And, while there has been a considerable drop in world cotton prices generally last year, there has been no similar reduction in the prices of Indian cotton. Unless, therefore, something can be done to bring down the price of Indian cotton to a level at least comparable with world parity, there is every likelihood that India's export trade will be further affected. Under the second Five-year Plan, the production target for cotton for the season 1960-61 was set at 65 lakh bales, but, due to circumstances, some beyond the control of the authorities and some not, last season by some 16.50 lakh bales. In order to achieve the necessary figure and stabilise internal prices, age under cotton or yield per acre, and until such Government should adopt a liberal policy regarding import of cotton from other countries.

"Thirdly and last, it is a truism of any country essential prerequisite to a satisfactory export trade. In spite of an excise duty of some severity, borne for practical purposes by the industry and not the consumer, in spite of an unchecked increase in unauthorised powerlooms which avoid any contribution to the national exchequer, the Indian mills have succeeded in supplying the home customer with goods of which the price has remained notably constant amid general inflation. It is placed on the industry as a whole, particularly as it is the less specialised, and, therefore, least profitable units that are contributing the most, and port performance."

DIFFICULTIES OF COTTON INDUSTRY MR. WINTERBOTTOM'S LUCID ANALYSIS

From Our Special Correspondent

MANCHESTER, 1st December

IN spite of the response by firms wishing to discard machinery under the reorganisation scheme for the Lancashire cotton industry, the scrapping programme is not big enough, Mr. William T. Winterbottom, Chairman of Fins Spinners and Doublers, the giant spinning combine, told a meeting of the Manchester section of the Textile Institute

MANCHESTER LETTER

last week. More spindles would have to disappear, he said, before the spinning industry reached the right size.

After scrapping and before re-equipment, a total of 8,601,000 ring equivalent spindles would remain. This was 70 per cent. of the number actually running in April this year. Mr. Winterbottom's estimate was that six million ring spindles, working two shifts of 38½ hours, were sufficient to meet all foreseeable demands on the industry. He observed: "The required single yarn output could be obtained from the 8,601,000 ring equivalents which remain, if only two and a half million of them worked double-day shifts of 38½ hours, with the rest on single shifts of 45 hours. If half of them worked the two shifts and the other half single shifts, production would be about 14 per cent. greater than the foreseeable demand."

No ring spindles installed before the war, Mr. Winterbottom said, would match up to modern requirements. A considerable amount of re-equipment would, therefore, be necessary, with further scrapping of obsolete plant before the ideal of a modern, compact and fully competitive spinning industry in Lancashire was arrived at. In the weaving section, the position was basically similar. About 100,000 looms were needed to meet all foreseeable demands on a two-shift system, against the 154,000 which would be left when scrapping was completed.

The Labour Facts

Mr. Winterbottom pointed to the fall in manpower, from 98,750 in spinning at the end of 1957 to 79,210 at the end of October this year, and from just over 100,000 in weaving to 82,880. To quote him: "In the long run, when the transition period is over, this decline will have to be arrested. Although there is to be substantial reduction in machinery, there will be no reduction in the volume of production. If anything more, not fewer, operatives will be required because of the shorter working week on a shift system. I do not think the industry has any grounds for apprehension about this. Any shortage of workers in the future will be either local and temporary, or due to the failure of individual firms to maintain themselves in line with the latest ideas."

Weakness of Price Fixing

The adverse verdict on the Yarn Spinners' Agreement, on mature consideration, was not altogether surprising. Mr. Winterbottom referred to the greatest weakness of the system, saying: "It reflected a pre-war mentality and obscured the real obstacles to progress." The pressure on prices was so great that it became a price-fixing rather than a minimum-margin scheme and so a high degree of artificiality crept in.

In contrast with the outcry which arose early this year when the system was abrogated, Mr. Winterbottom now looks back and says of the judgment: "It was fair, accurately assessing the faults of the scheme, and more important, pointing out a better approach to the industry's problems." The verdict, it will be remembered, expressed the opinion that excess capacity would not be eliminated unless the scheme was abandoned. The view that the industry ought to be made smaller and more compact has now been almost universally accepted.

The third contributory factor to the difficulties of the cotton industry, according to Mr. Winterbottom, was the lack of significant technological development since the beginning of the century. Machines then installed were still capable of turning out good yarn and cloth in the 1930's, and many of them were still in operation today. But the position changed quite suddenly at about the beginning of the last war,

down, the pressure on those remaining to maintain production and meet supply needs, is going to be pretty terrific. They are going to need all the labour they can get." A problem, however, may be that, while there are vacancies in some areas, there may be unemployment in others because of the impracticability of workers travelling long distances to alternative jobs because of family and other commitments.

Synthetic Yarn Output

Fresh records for the month of September were established by the British man-made fibres industry. Output during the month was 43,450,000 lbs., as against 39,660,000 lbs. in August and 31,910,000 lbs. in September 1958. The breakdown into continuous filament yarn and staple shows filament yarn at 19,630,000 lbs. and staple at 23,820,000 lbs., as compared with 18,190,000 lbs. and 21,470,000 lbs., respectively, in August and 14,480,000 lbs. filament and 17,430,000 lbs. staple in September last year. Because of the increasing output of staple, the combined figure was clearly a record for the month of September, the previous record having been established in September 1955, when the total was 41,200,000 lbs., though, in that month, filament production slightly exceeded that for September 1959.

After the comparatively poor statistical showing of the early months of the year, the cumulative total is gradually catching up to the pre-1958 depression levels. The nine months figures for 1959 for yarn and staple aggregated 368,750,000 lbs., as compared with 308,030,000 lbs. in the corresponding period of 1958, and 378,250,000 lbs. in the first nine months of 1957.

The healthy increase in output in September is reflected by widespread activity among woven, knitgoods and carpet manufacturers. In the Lancashire weaving trade, for example, which is the largest outlet for man-made fibres of all types, many firms have long order books now extending into the second quarter of 1960 and activity among users of man-made fibres in Yorkshire, the Midlands and Northern Ireland is at a strikingly more active level than it was earlier in the year.—All Rights Reserved.

From the Statesman and The Friend of India
January 5, 1878

"We notice that a new theatre is about to be opened at Bombay on the Esplanade near the Crawford Markets. Madame Tasca's Company appears there this evening in LEGOCQ'S new piece entitled THE SEA NYMPHS"

While the first-nighters crowded to the theatre to see Madame Tasca's "Sea Nymphs" the year was marked by a notable world event—the introduction of the famous "Three Castles" cigarettes.

In 1958, they came out in the flip-top 20's packet, changing their looks with the times. The "Three Castles" are as modern today as they were 80 years ago—and as satisfying.

U.S. COTTON EXPORTS RISING WILL SUBSIDY BE CUT?

PRESENT indications are that cotton exports from the U.S. during the current season, namely, 1959-60, may well amount to almost double the volume shipped last season. Exports by other countries, too, may increase appreciably. Most of the factors affecting U.S. cotton exports, according to a study made by the Foreign Agricultural Service of the U.S. Department of Agriculture, are favourable. In the first place, the trend of cotton consumption abroad is upward, especially in the importing countries as a result of the recovery in textile activity and the improvement in economic conditions. Secondly, cotton prices are maintaining a steady trend at lower levels, reflecting confidence in the trend of markets. Thirdly, cotton's competitive position vis-a-vis man-made fibres has strengthened, price-wise. Fourthly, stocks of cotton outside the United States are lower than those a year ago in both exporting and importing countries. Finally, production in the free world outside the U.S. is expected to show a slight decline to about 17 million bales (of 478 lbs. each), as compared with 17.3 million bales during the last season. The possibilities, therefore, are that the U.S. share in world trade during the season may increase substantially to 5.5 million bales, as compared with 2.8 million bales in 1958-59.

This conclusion is already borne out by the increasing export demand for U.S. cotton. The payment-in-kind sales registrations have of late been increasing at a rate of nearly 200,000 bales a week. Registrations began in early May 1959 for export after 1st August 1959. Under the payment-in-kind programme, the U.S. exporter obtains the subsidy in the form of dollar credits which can be used to purchase cotton from the C.C.C. stocks. The payment-in-kind rate currently in effect is 8 cents per lb., as compared with 6½ cents last season. Total registrations by mid-November aggregated 3.34 million bales. At the current rate, sales registered by the end of December may amount to 4.5 million bales, these are only half a million bales below the minimum level of 5 million bales and the desired level of 5.5 to 6 million bales for the season.

The U.S.'s traditional customers are expected to account for the largest share of its exports during 1959-60. Thus, Japan and Western Europe will again be major destinations of U.S. cotton shipments. Among Asian countries, the shares of India, Hongkong, Korea and the Philippines are expected to rise. Financing under special U.S. Government programmes will continue to be of substantial aid to exports in 1959-60. At the beginning of November, funds available under the various programmes were sufficient to finance sale of about 700,000 bales for foreign currencies under Title I of P.L.480, 200,000 bales under P.L.605, 300,000 bales under Export-Import Bank loans and a small quantity in the International Co-operation Administration's relief shipments under Title II of P.L.480, aggregating in all over 1.2 million bales during the fiscal year 1959-60. It may be noted that funds allocated thus far in the current fiscal year are less than those at the same time last year and, consequently, total exports financed under these programmes may be lower. Additional funds, however, would probably be made available under the assistance programmes during the remainder of the year. Exports under these programmes are part of, and not in addition to, exports under the payment-in-kind programme. In addition to the above, some cotton may also be exported under the C.C.C. barter programme, although indications are that the volume may be smaller than in recent years. Barter contracts for export of cotton in the 1958-59 fiscal year amounted to 396,000 bales, as compared with 405,000 bales in 1957-58 and 970,000 bales in 1956-57.

Since, in all probability, U.S. cotton exports during this season will reach, or even exceed, the 5-million-bale mark, traders are wondering whether the current payment-in-kind export subsidy rate of 8 cents per lb. will be cut or whether it will be maintained throughout the season. The consensus of opinion is that a reduction in duty is likely. A prominent U.S. shipper expressed a commonly held view, when he said:

"It is true that the Department of Agriculture would like to maintain the present subsidy throughout the season, making an adjustment with the start of the new season, in order to maintain stability of price not only this season but also next

But the final determination will not be made by the Agriculture Department alone. Other producer nations have made vigorous and persistent protests against the size of the subsidy, while agreeing, grudgingly, that the United States should have a fair share of the world market. Domestic mills have protested that the 8-cent subsidy gives foreign mills an unfair advantage in domestic markets. The Federal Tariff Commission is holding studies at the moment to determine if some special tariff should be placed against cotton imports to offset the price advantage of raw cotton. The pressure both at home and abroad is mounting to a point that cannot be resisted for long. Agriculture must yield to the insistence of the State Department that other producing countries be aided and to the demands by the Commerce Department that the pressures on the domestic mills be eased somewhat. We obviously cannot forestall the future, but it seems to us this mounting pressure must be recognised."

He, therefore, visualised the possibility of a cut in subsidy rate when the payment-in-kind export sales registrations reached the 4.5-million-bale level. Beyond that, according to him, "one might look for possibly an additional 50-point reduction with each additional registration of 500,000 bales."

FRESH CONTROLS ON COTTON

In a determined bid to curb the rising price of raw cotton, the Textile Commissioner has issued orders for controlling mill buying of cotton and kapas (unginned cotton) and speeding up ginning of kapas. By one order, mills have been prohibited from buying or possessing stocks of cotton exceeding the quantity equal to their three months' consumption. Mills which might have already purchased or have in possession cotton in excess of this quantity have been allowed to retain it. But they are prohibited from adding to them by further purchases except when they can do so within the prescribed limit. By another order, mills have been prohibited from purchasing or otherwise acquiring kapas. But, if a mill is the owner or lessee of a cotton ginning factory, the Textile Commissioner may permit it, subject to

such conditions as he may specify, to purchase such quantity of kapas as is capable of being ginned at that factory. By a third order, cotton in the States of the Punjab, Rajasthan and Uttar Pradesh is required to be ginned on or before 15th February 1960 and in the Maharashtra areas of Bombay State and certain districts of Madhya Pradesh by 31st March 1960.

Giving reasons for taking these measures, a statement issued by the Textile Commissioner says:

"These measures have become necessary, as in the immediate short-term period, prices of Indian cotton have risen abnormally. On an overall view of the situation of the Indian crop and imports of foreign cotton, supplies of cotton to the textile industry would be adequate. Even taking the local crop at 4.7 million bales, exports hitherto allowed are only of the order of 150,000 bales plus some varieties like yellow pickings, etc., whose exports may amount to just over 50,000 bales. On the other hand, under the Export Incentive Scheme (already declared to continue till 30th September 1960), imports of not less than 700,000 bales are likely to be linked with the exports of cloth as they are now proceeding. The Government of India has also under consideration imports of cotton below 1.1/16" in staple and an agreement with Pakistan to cover part of such imports has already been reached."

Explaining why cotton prices have spurted, the statement observes:

"The situation of short-supply of Indian cotton is mainly due to the season having been late this year. Unfortunately, unhealthy practices have been introduced in the cotton trade with a view to circumventing the orders regarding ceiling prices for Indian cottons. Cotton of one variety is apparently passed under another name and invoices of kapas are made at higher prices, when, in fact, the lint cotton prices would be higher than the ceiling prices. It is under these circumstances that the orders have been issued, in order to assist the industry and trade to stabilise the position. On the one hand, the supplies of cotton will be hastened by the order requiring early ginning and, on the other, the pressure of mills for purchasing would be reduced."

These measures, announced late on Saturday the 5th inst., have not so far made any impression on cotton prices. Spot prices are as firm as ever and the demand for popular varieties keen. They, however, have affected upcountry markets, where the volume of business is reported to have dwindled considerably. Buyers are said to be hesitant to make fresh purchases.

RAISING SUGAR OUTPUT IN U.P. AND BIHAR

MR. K. K. BIRLA URGES DECONTROL

IT is not far from truth to say that, when controls over any commodity exist, the scope for anti-social trading practices like hoarding and black-marketing is always very wide. This is especially so in the case of an essential item of consumption such as sugar. How else is one to explain the soaring prices of sugar prevailing in many parts of the country, particularly in Uttar Pradesh and Bihar? According to one report, sugar is being sold in some places at as high as Re. 150 per seer, as against the controlled rate of 97 nP. The high level of prices is bound to persist, until adequate supplies are made available to consumers. Such supplies can be ensured only if sugar production is increased. But how will this be possible when the industry has no control whatever on the supply of sugarcane, when it is not allowed to compete effectively with gur and khand-sari manufacturers who are not subject to price control and when its cost structure has tended to become very rigid, thanks to the heavy incidence of raw materials, taxes, wages and other manufacturing expenses?

Certainly, Mr. K. K. Birla was quite correct when he declared, in the course of his speech at a conference of the representatives of sugar factories and cane growers held at Patna a few days ago, that control on sugar had stifled production in the past and rendered no benefit to the industrialists, the cane growers and the consumers. Mr. Birla urged the authorities to remove the controls on sugar industry in Uttar Pradesh and Bihar, for he said: "When the industry in other parts of the country can function without any control, there is no justification for imposing control over the factories in U.P. and North Bihar." And he was fully confident that, if control was lifted, "the production of sugar would increase, resulting in the smashing of the black markets where sugar is selling at prices ranging between Rs. 60 and Rs. 100 per maund."

Tax Burden Heavy

While decontrol of sugar will give an incentive to mills to step up output, there is also the urgent need for reducing the heavy tax burden on the industry. Out of the ex-factory price of Rs. 37.85 per maund fixed for Uttar Pradesh and North Bihar sugar, the share of taxes alone comes to more than Rs. 13, or as much as 34 per cent. of the total price. Equally urgent is the need for alleviating some of the difficulties confronting the sugar industry. It is here that Mr. Birla threw the pertinent suggestion for the establishment of a Development Council at State level, under the chairmanship of the Industries Minister, consisting of cane growers and millowners. He did well to

stress that the proposed Council should enjoy autonomy in the matter of its administration and budget so as to render maximum assistance in the shortest time. Instances are not wanting to prove that several bodies, though the purpose for which they are set up are laudable, have not been of any utility merely because of undue official interference in their working.

It is, however, not so much on the aforesaid factors as on the availability of plentiful cane supplies at reasonable prices that will depend the prospects for increasing sugar production. Indeed, the sheet-anchor of the development programme for sugar industry in the coming years should consist of energetic measures designed to secure the highest possible yield of cane with maximum sucrose-content from each unit area devoted to the crop. How disquieting has been the progress achieved so far in this direction was indicated in these columns only two weeks ago, so that it is unnecessary to refer to it now. Alluding to this subject, Mr. Birla asserted that the sugar industry in Bihar was doing its best for the development of cane and that it was no less anxious than the Government, but, unfortunately, it was handicapped by paucity of funds. He revealed that in order to encourage the growers to plant more cane, the sugar factories were making large advances to cultivators to the extent of Rs. 125 to Rs. 150 lakhs every year.

Mr. Birla made special reference to the purchase of cane through co-operative societies and said: "The societies might have been necessary to safeguard the interests of growers when the industry was born in Bihar over two decades ago. But, under the existing conditions, they are unnecessary and only add to the cost of production." He went on to add that the Bihar Sugar Factories Act was functioning properly, a minimum cane price was guaranteed to growers, and a thorough check over cane weight was being maintained. Where, then, is the need for a separate body for marketing sugarcane such as the co-operative societies?

Co-operative Societies' Commission

The co-operative societies in both Uttar Pradesh and Bihar, it will be recalled, collect every year lakhs of rupees by way of commission on sugarcane supplied by them to the mills. The average commission is 4.6 nP per maund of cane, which works out to 46 nP or 1.33 per cent. of the cost of manufacturing one maund of sugar. Over the past nine years (1950-51 to 1958-59), the sugar mills have paid as co-operative societies commission a total of over Rs. 10 crores in Uttar Pradesh and Rs. 1.30 crore in Bihar. Surely, one would like to know how

such colossal sums of money have actually been spent. Since in no State other than these two are sugar mills required to pay this Commission to co-operative societies, there is no reason why the mills in the two States alone should be required to pay. Moreover, since the main function of the co-operative societies is development and marketing of cane, which is also largely the business of the Government Cane Development Departments, the funds required by these societies for cane development should be provided out of the money raised from cane cess. It, therefore, follows that no separate commission for the co-operatives must be charged from the mills.

Although this was one of the specific recommendations made by the former Tariff Board as far back as January 1950, it is regrettable that it has still not been implemented by the Governments of Uttar Pradesh and Bihar. Instead of allowing the societies to continue to charge commission on cane supplied through them, the Government will do well to transfer that part of the cane development work which the societies are doing at present to the sugar mills themselves. There is no doubt that the mills can do this job better than the co-operative societies have cared to do.

SUGAR RELEASE

The Government of India has released 175,000 tons of sugar. There will be no release for free sale from the factories in Uttar Pradesh, North Bihar and the Punjab, except a small quantity which will be released to each factory for sale to its employees.

Allotments of sugar to the States of Madhya Pradesh, Rajasthan, Uttar Pradesh, Bihar, Orissa, Madras, Kerala, Bombay, Himachal Pradesh, Assam, Manipur and Tripura from factories in the controlled region will be made only to nominees of State Governments. In the case of the Punjab and Jammu and Kashmir, allotments will be made direct to State Governments or to their nominees, while in respect of West Bengal, allotments in the districts will be made to nominees of State Governments. As regards Calcutta, applications for allotment will be considered by the Directorate of Sugar and Vanaspathi on the existing system or according to the arrangements which may be indicated by the State Government. Allotments to Delhi will continue to be made on the existing basis.

Allotments will be made at prices fixed on 25th October 1959. The controlled ex-factory price for U.P. and North Bihar factories is Rs. 37.85 per maund and for factories in Punjab Rs. 38.35 per maund for ISS D-29 grade with the prescribed price differentials for other grades. The fixed f.o.r. destination prices in respect of allotments made to Kanpur and Calcutta will be Rs. 38.60 and Rs. 39.85 per maund, respectively, for sugar of ISS D-29 grade.

SUGAR PRODUCTION AND STOCKS

The total sugar production during the season 1958-59 was 1,917,000 tons, as against 2,028,000 tons in the previous season. The total offtake of sugar from factories, including despatches for export, was 2,105,000 tons, as against 2,075,000 tons. The closing stocks of sugar with factories as on 31st October 1959 aggregated 150,000 tons, as against 329,000 tons on the same date last season. This, however, does not include the new season's sugar produced prior to November 1959.

ASP/UCAS-12A

Second Valuation Soon

The second valuation of the Life Insurance Corporation will be made as at 31st December 1959. All eligible with-profits policies in force on the valuation date will be entitled to participate in profits disclosed as a result of that valuation.

The first valuation of the Corporation made as at 31st December 1957 disclosed a surplus large enough to support bonuses at the following rates on with-profits policies issued by the Corporation:-

Endowment Assurances: Rs. 14 per thousand sum assured per annum

Whole Life Assurances: Rs. 17½ per thousand sum assured per annum

Important: Policies which are converted into reduced paid-up policies or lapsed before 31st December 1959 will not qualify for bonus.

Preserve your policy, keep it up-to-date by regular payment of premiums and make sure that your policy qualifies for bonus to be declared as a result of the second valuation.

Remember 1959 is the Bonus Year

RAW JUTE PRICES HARDEN ARRIVALS DWINDLE—EXPORT PROSPECTS DIM

THE raw jute market is ruling firm and prices have hardened considerably in recent weeks. Thus, Assam Bottoms (December delivery) have gone up from Rs. 24.20 per maund in the middle of November to Rs. 26.76 yesterday and March delivery from Rs. 25.64 to Rs. 28.70 per maund, the highest levels touched so far this year. Such a sharp rise within a span of three weeks has occurred, despite the fact that mills have generally been reserved, with only a few of them being keen buyers. At the same time, sellers also are somewhat reluctant to do business in anticipation of still higher prices. All this has been due to the heavy fall in arrivals of fibre in upcountry centres and at Cossipore.

Although there was an increase in receipts during October, as compared with those in the previous month, the total arrivals of raw jute during the first four months of the current season are said to be not only lower than those in the corresponding period of the previous season but also very much short of the mills' consumption. Thus, the total arrivals during July-October this year aggregated 1,530,300 bales, as compared with 1,768,850 bales in the corresponding four months of 1958, while consumption during this period amounted to 1,977,800 bales, as against 1,956,000 bales. It will also be noted that the shortfall in arrivals as compared with consumption is higher, at 447,500 bales, than that in the previous year when it was only 187,150 bales. Since most of the current year's crop has already been sold by farmers, it is quite possible that the pace of arrivals may pick up during the coming months, as is usually the case, and the deficit may be more than made good.

There is, however, one difficulty, which has, in fact, been one of the factors responsible for the slow pace of arrivals. This is the wagon shortage, following the railway authorities' decision to divert a large portion of the wagons available for carrying essential goods such as coal. The mills' reluctance to increase their purchases is attributed to two factors: (1) the present prices are too high and (2) there is paucity of storage space.

The fall in arrivals has also strengthened the general belief that there will be a sharp fall in the current year's jute crop. Estimates of the extent of decline differ widely, and the official estimate is still not available. The first estimate of the area under jute, however, shows a decline from 1,633,000 acres to 1,546,000 acres. The decrease of 87,000 acres has been shared mainly by Bihar and West Bengal and is attributed to diversion of land to other crops in view of the low prices fetched by jute in the last season. A shortage of mesta is certain, as a result of the lower acreage sown in 1959, so that the total output of fibre will be very much below that in the previous season. But it must be remembered that production last year was unusually high, necessitating adoption of special measures for supporting prices. Usually, a bumper crop is followed by a lean one. The drop in the current year's production is, however, compensated by a large surplus, amounting to 2.17 million bales, brought in from the previous season. Exports have been small, being no more than 158,000 bales up to the end of October 1959. In spite of all this, some are said to be doubtful whether the supplies available this season will be sufficient to meet the requirements of mills and also leave a surplus sufficient for building up reasonable stocks. On the face of it, this doubt appears to be the work of speculators who want to take advantage of the present situation. The authorities must study the position carefully and, if they find that there is unhealthy speculation in raw jute, take prompt measures to curb it.

It is interesting to find, in this connection, that a less pessimistic assessment of raw jute supply position during the current season is made by Mr. Tulsidas Kanoria, Chairman of the Jute Balers' Association, Calcutta. In his presidential address on the occasion of the Association's golden jubilee celebrations held at Calcutta last week, he examined the position at some length. According to him, the carry-over of the 1958-59 crop was 2.4 million bales and about 300,000 bales would be imported from Pakistan. This, together with the current year's crop (Mr. Kanoria did not give the estimate of the crop), would make available much more than 8 million bales during the current season. He estimated the mills' requirements at 6 million bales and other domestic requirements (consumption in villages) at 500,000 bales. If

the mills keep a stock of two months' requirements, namely, 1 million bales, he said, there would still be a surplus of more than 500,000 bales.

Mr. Kanoria's figure of stocks brought forward from 1958-59 is rather on the high side, for after allowing for exports of 116,000 bales since the close of the 1958-59 season, the previous season's surplus is only 2 million bales. His estimates of internal requirements are conservative, as the previous year's total consumption by mills and at villages had aggregated 6.7 million bales. If, therefore, the private estimate of a crop of 5.1 million bales (including mesta) proves correct, it is doubtful whether there will be any surplus at all after allowing for carry-over stocks, unless the final crop turns out to be beyond expectations.

Mr. Kanoria welcomed the recent announcement in Parliament by the Minister of Commerce that a reasonable quantity of raw jute must be exported after studying the requirements of the jute industry. The exports of raw jute, it may be noted, remain suspended since the end of October. Despite the Minister's aforesaid clarification, the Government has not yet announced the quantity to be exported and the time when this will be allowed. Mr. Kanoria, however, requested Mr. Nityanand Kanungo, who inaugurated the jubilee celebrations of the Association, that the Government's policy in regard to exports should be announced well in advance, so that the balers could make arrangements on that basis. He also submitted that exports of raw jute through the State Trading Corporation caused unnecessary hardship to the balers. He, however, added that export of raw jute might be regulated in various ways and under these regulations free trade in this commodity should be allowed. In view of the tight

supply position for the current season, as explained above, it is doubtful whether export of raw jute in any quantity will at all be possible, unless it be against more liberal imports from Pakistan.

MODERNISATION OF JUTE MILLS

The ad hoc Committee appointed by the Government of India to assess the requirements of modern jute mill machinery and spare parts and the manufacturing capacity for them has recommended that the jute industry should take up modernisation of the weaving section also, including the installation of shuttleless looms from the commencement of the third Five-year Plan period. For all practical purposes the present programme of modernisation, which is mainly confined to the spinning section, will be over by the end of the second Plan. The Committee's report, now being considered by the Government of India, also envisages a gradual unsealing of the looms, now sealed under the Working Time Agreement.

The industry is said to have spent Rs. 15 crores on modernisation during the last ten years, of which the expenditure on modernisation of the spinning section alone is Rs. 10 crores. The so far granted Rs. 4.55 crores as loans to 22 mills for modernisation upto the spinning stage. Of this, a sum of Rs. 2.64 crores has already been paid to 15 mills. The N.I.D.C. has also approved a scheme of short-term loans to jute mills for purchase of indigenous machinery upto a limit of Rs. 5 lakhs. No loan has, however, been sanctioned so far under this scheme. It is claimed that the mills which have modernised their machinery have shown better results than before.

The Government of India has, it may be noted, provided Rs. 2.3 crores of foreign exchange for import of jute machinery during 1959-60, as against Rs. 2.5 crores in 1958-59.

Imports of raw jute into Dundee during the first nine months of 1959 amounted to 562,095 bales costing £9.75 million, as compared with 451,210 bales (£7.83 million) in the corresponding period last year; imports of jute yarns amounted to 43,246 cwts. and 20,778 cwts., respectively; jute fabrics 142,297,000 sq. yards and 103,291,000 sq. yards and new jute sacks and bags 315,451 cwts. and 285,206 cwts. Exports of jute fabrics for the nine months to 30th September from U.K. were 18,196,000 sq. yards, (£1.31 million), as against 16,402,000 sq. yards (£1.15 million) same time last year.

"Dressing up a scarecrow, Mrs Banerjee?"

This isn't a scarecrow. It's my husband.

"A thousand apologies. But it is obvious your husband has not heard of BINNY'S cloth. BINNY'S Quality Control" their production you know...

"Quality Control? Never heard of it! What does it do?"

"Modern machines process yarn and cloth so fast that often defects, invisible to the naked eye, creep into the cloth. Quality Control is laboratory testing to root out defects at every stage of production. That's why BINNY'S suitings stay smart so long."

"That's wonderful news. We shall dash to the nearest BINNY'S shop the moment I can fix this tie and my husband is able to breathe again."

HIGHER FREIGHT EARNINGS—MORE VESSELS PUT INTO SERVICE

DR. A. RAMASWAMI MUDALIAR PLEADS FOR IMPROVEMENT OF CALCUTTA PORT

THE Annual General Meeting of the India Steamship Company Limited was held at Calcutta on 27th November 1959. Addressing the shareholders on the occasion, Dr. A. Ramaswami Mudaliar, Chairman of the Company, referred to the deterioration of the conditions in the Port of Calcutta, inasmuch as draft restrictions were much more serious during the year ended 31st March 1959 than in the previous year. He added that, since Calcutta was the most important port in India, it was necessary to take measures to improve the port expeditiously.

Before taking up the agenda, the Chairman referred to the irreparable loss that the Company has sustained in the untimely demise of one of its Directors, Mr. Gopi Krishna Khemka. Mr. Khemka was virtually the originator and the promoter of the India Steamship Company. It was during the last war that he floated this Company and the robustness of his optimism, his courage and the spirit of indomitable adventure could be realised from the fact that he intended from the outset that the ships of the Company should be utilised for overseas trade. It was an act of great faith that at a time of intense competition, when even coastal shipping was not reserved for national lines, Mr. Khemka should have decided on this great venture. During the last fifteen years, he devoted himself wholeheartedly to the service of the Company and his advice and co-operation was of immense value to the Chairman and other Directors of the Company. He promoted various other industries, some of them pioneering industry so far as Indian venture was concerned, like the cable factory. But his memory will ever be associated with the progress that Indian shipping has made in the wide seas of the world during the past decade. The Chairman then moved a resolution of condolence to be communicated to his wife and other members of the family. The motion was adopted, all members standing. The Chairman then resumed consideration of the agenda and in moving the adoption of the Directors' report, the audited accounts and the balance-sheet, made the following speech:

Audited Accounts

"The audited accounts and Directors' report for the period ended 31st March 1959 have been in your possession for some time. With your permission I shall take them as read.

"The Directors' report shows that the freight earned during the year was Rs. 8,04,04,160, as against Rs. 7,75,04,245 in the previous year and Rs. 6,00,17,168 in 1956-57. The total number of liner voyages during the year was 39, as compared to 30.5 in the previous year. Though the amount of freight earned was the highest so far, the figure does not reflect a comparable net profit for the Company. The increased earning was partly due to the number of ships in service, but there are other factors which continue to increase the expenditure side and to reduce the net profit of the Company.

"The net profit earned by the Company after deducting all charges and setting apart a sum of Rs. 75,55,777 towards depreciation, amounted to Rs. 60,66,726. Though, in comparison with last year's figures, these results may not appear striking, I venture to state that having regard to the conditions prevailing in the shipping industry during the period, the results are not unsatisfactory.

Freight Rates

"I stated last year that it is the experience of all shipping companies that, while boom periods are comparatively rare, lean years, when the quantity of freight falls and the rates are brought down sharply, are more common. International shipping is peculiarly susceptible to world conditions, economic or political. These anticipations were unfortunately literally fulfilled during the year. Freight rates were sharply cut down to meet the competition of tramps and the over-tonnage of some of the shipping companies has led to unhealthy conditions and further reduction in freights in some of the important commodities. The declining trade has also contributed to some extent to the fall

in the profits earned. The ships had to call at many more ports both for loading and for unloading cargo than in the previous year, owing to scarcity of cargo—the ports called at during the year being 768, as against 496 in the previous year.

Port Conditions

"The conditions in the port of Calcutta further deteriorated, inasmuch as draft restrictions were much more serious during the year than in the previous period. The obvious effect of such restrictions is that less cargo can be loaded at the port of Calcutta and very often ships have to remain for long periods waiting for favourable drafts. I have emphasised on more than one occasion that the port of Calcutta is the most important port in India from the point of view of the volume of traffic both inwards and outwards. It is also the port, through which the largest amount of foreign exchange can be earned by the export cargo available at the port. On its functioning satisfactorily depends in the main the economic life of West Bengal. I trust that these factors have been fully realised and measures will be taken by the Government expeditiously and the assistance that the World Bank is giving for the reconstruction and proper navigability of the river will enable a more rapid improvement of the port.

Progress

"During the year under review, two more ships, the *Indian Success* and the *Indian Strength* were added to your fleet; and three ships were under order, one at the Visakhapatnam Shipyard and two at the German shipyard of Messrs. Howaldtswerke. During the current year, the *Indian Industry*, built at Visakhapatnam, was delivered and is now on her maiden voyage to the United Kingdom and the Continent. Two more ships, the *Indian Tradition* and the *Indian Trust*, have been launched and their delivery is expected, the first, in the last days of the year and the second early in February. With these additions, your fleet will consist of 18 ocean-

Weighing
the
world
up...

...even just from a financial point of view, is a pretty big operation. It requires a very extensive knowledge and understanding of business conditions. It requires an organisation like The Hongkong and Shanghai Banking Corporation. The biggest bank established by Banking Corporation. The Far East provides a banking service not only in South and East Asia—which is our primary concern—but has offices in Europe and America as well, surveying the whole of the business world, considering, weighing up.

BRANCHES IN INDIA

BOMBAY — CALCUTTA

Offices in Europe and the United States and throughout the Far East

going vessels including the *Indian Industry* and one coastal vessel, the *Indian Commerce*. All these vessels, as I stated at the last annual meeting, have been ordered on the basis of immediate foreign exchange payment which the Government of India allotted in 1956 when this programme was approved and for which one cannot be sufficiently grateful to the Government. One more ship has been ordered from the German shipyard on the basis of deferred payment, the necessary foreign exchange being found over a period of years. The system of deferred payment has not proved attractive as it involves a larger capital outlay for a ship which, after all, has to compete in international waters with shipping of other companies which are not handicapped in the same way. It is hoped that by the combined efforts of shipping companies and of the Governments, both Indian and foreign, at whose yards ships are built, a fairer and a more natural solution of the foreign exchange problem may be found shortly.

New Routes

"I referred last year to the new routes that have been opened up by the ships of your Company to facilitate the export and import trade of the country and to establish connections with shippers in other parts of the world. The establishment of these new routes enables your Company to get the support of more shippers not only for the freight which will be carried by the new routes but also for freight which has to be carried by the old established route. Shippers, especially those who have connections in several parts of the world, desire to have facilities to ship to different places and will seek companies which are in a position to carry freight not to one destination only but to more than one destination. We have now opened our shipping to trade with the ports in the Black Sea and along the Levantine Coast of the Mediterranean. We have also opened a direct service to the Eastern ports of South America and our ships are calling regularly at the ports of Argentine and Brazil. These services call for a larger number of ships, while the existing routes also require a fair number of ships to keep regularity of service and thereby satisfy our regular shippers. These are the considerations which weighed with your Directors in increasing the fleet—an increase which was planned and programmed as early as 1956.

Dividend

"I have already referred to the fact that, after providing over Rs. 75 lakhs towards depreciation, the net profit earned by the Company amounted to over Rs. 65 lakhs. The whole of this amount has been set apart as 'development rebate reserve' in accordance with the law promulgated on the subject. I would, however, like to mention that this development rebate reserve, which with the present addition amounts to Rs. 1,14,00,000 is not available for the payment of dividends, but is available for such expenditure as payment of interest and instalments due on loans from the Government. While we have received loan from the Government for the construction of ships, your Directors have had constantly under review the financial resources of the Company for repayment of these loans. You will, therefore, find from the balance-sheet that in addition to payment of over Rs. 19 lakhs as interest on these loans, the Company has also paid the instalments on the loans due. I may finally state that, as the financial year under review ended on 31st March 1959, the new dividend tax is not applicable to the dividend that is now paid and, therefore, the shareholders will receive the same amount as in the previous years.

Dividend Tax

"I have expressed my view elsewhere that the new proposal of a dividend tax is much more onerous than the previous proposal of a tax on dividend paid direct by the Company. The new dividend taxation proposal was stated to be necessitated because of the complexity of grossing up the income earned in this respect before giving relief to the assessee. It was also stated that in view of the relief given to the Company by reduction of income-tax and abolition of wealth tax, this proposal would not in any way seriously affect the payment of dividends nor would it bring additional revenue to the Government. That these forecasts, whose accuracy was even then doubted, were mis-taken, has been realised by every company

which had to declare a dividend in a financial year which ended after 31st March 1959. Under the previous law, the declaration of a dividend of 6 per cent. did not attract any dividend tax. Under the present law, the declaration of a 6 per cent. dividend will mean that the shareholder will receive only 4.2 per cent. on his shareholding. The relief by way of refund to such an assessee is in most cases illusory. I would put in a plea for the small shareholders who have, for many years, been dependent on the earnings from dividends on their share capital. A payment of nearly 43 per cent. as tax on the amount actually received as dividend is certainly a very serious imposition on such shareholders. I do trust that the matter will be further examined and that, if the complexity of grossing up the earnings is to be avoided, at least a smaller percentage of tax may be declared as fair and just.

Foreign Companies and Restrictive Practices

"It is no pleasure to me to once more draw your attention to the fact that we have made no progress by negotiation and argument in the claim that we have advanced, that Indian shipping should be allowed into the Conferences at least of the way-side ports on the direct route from India to the U.K. and the Continent. We have not been allowed even to participate in the freight from Colombo to the U.K. and back. On the other hand, quite recently, while we were calling occasionally at other ports in Ceylon like Trincomalee and Galle, the Colombo Conference extended its sphere to all the ports in Ceylon and announced that as the Indian Lines were not members of that Conference, they could not call at any of the ports in Ceylon; a supreme example of the freedom of the seas and non-discrimination of flags which some of the lines constantly speak of! This communication was considered by the two Indian Lines as adding insult to injury and they have now both definitely declared that they will call at all the Ceylon ports including Colombo as necessity demands and that they will not be bound by any rules of that Conference except that, in the first instance and in the absence of any other action by the Conference, they would observe the freight rates laid down by the Conference. I must confess that the decisions of

the Conference, even in the India-U.K. Continent trade, have surprised Indian Lines and, with all the desire to co-operate with the Conference, they have found it difficult to see eye to eye with some of the members of the Conference. These decisions have been sometimes wanting in logic and sometimes clearly aimed at Indian Lines. Matters have come to a head, and unless a reasonable attitude is taken, the Conference system itself is likely to be endangered. I may mention that recently, during my last visit to England, I have had frank and full discussion with the two Chairmen of the Conferences of which we are members, and I hope that there will be a better understanding of the position of the Indian Lines and their requirements very soon.

Shipping Board

"During the year under review, a National Shipping Board has been constituted to look after the promotion and development of Indian shipping, with Mr. G. L. Mehta, who has long been associated with Indian shipping and who has held the high position of Ambassador in the United States, as its Chairman. I trust that the activities of the National Shipping Board will help in fostering the growth and development of Indian shipping, the need for which is more apparent today than ever before. The Ministry of Transport has a new Head in my esteemed friend, Dr. P. Subbarayan. The Minister of State, Mr. Raj Bahadur, continues to be in direct charge of Shipping. We are thankful to both of them for the interest they have taken in the expansion of Indian shipping and in the development of Indian ports. We have had throughout the period, consistent and valuable help, assistance and advice from the Director-General of Shipping and his Deputies and from the Secretary to the Ministry of Transport. The Departments of Government, who are placing large orders for the import of various kinds of commodities, plant and machinery from abroad, are, I am glad to state, realising the important part that Indian shipping can play in the economy of the country and we are also thankful to them for this increased awareness of the position.

Tribute

"As I have already stated, the financial year has been a year of great difficulty in a falling freight market and it required the wholehearted and devoted services of all its officers afloat and ashore, and all its employees of every rank to enable the Company to achieve the results that it did. I must also convey the thanks of the Board and of the shareholders to the shippers who have given their firm support to us and to the brokers and forwarding agents who have shown confidence in us and in the excellence of our shipping services. Your fleet is one of the fastest in cargo service from India to the U.K. and the Continent and, taken as a whole, I venture to state that it is the fastest existing. It has established a record for its reliability and for the reasonably careful handling of the cargo entrusted to it. Every year brings new problems to the shipping world and your Company is determined to keep in step with all the progress that has been made either in regard to shipping itself, or in regard to the services which are ancillary to carrying freight by your ships.

"Over ten years have now passed since I took direct interest in your Company as its Chairman. More than a decade of strenuous and sustained work has been possible by the enthusiastic co-operation of my colleagues and of all the staff in the service of the Company, and by the generous support which you, as shareholders, have given. I trust I may have your continued confidence in the full hope that whatever the results may be, there will be nothing lacking in thought, in attention and in devotion to the affairs of your Company. I hope also that the Government will realise that a shipping company such as yours is more than a mere commercial organisation and that with your encouragement, it will play its part not merely to earn profits but to be of the foremost service to the economic and political life of the country."

N.B.—The above statement is not a report of the proceedings of the annual general meeting referred to.

12,50,000 Equity (Ordinary) Shares of Rs. 10 each	Rs. 1,25,00,000
	Rs. 2,00,00,000

The shares now being issued are available for subscription at par payable as follows :

	Preference Shares	Equity (Ordinary) Shares
On Application	Rs. 50 per Share	Rs. 5 per Share

The balance due on the shares will be called up at the discretion of the Directors not earlier than six months from the date of allotment.

All the shares under the present issue have been offered in the first instance to existing shareholders on the basis of ONE 7% Tax-free Redeemable Cumulative Preference Share of Rs. 100 for every two Equity (Ordinary) Shares of Rs. 10 each and TWENTY-FIVE new Equity (Ordinary) Shares of Rs. 10 each for every three Equity (Ordinary) Shares of Rs. 10 each held by them, ignoring fractions, if any, with liberty to renounce in favour of any other person. Shareholders may also apply for additional shares which will be allotted at the discretion of the Directors. If acceptance is not received by the Company on or before 23rd December, 1959, the offer shall be deemed to have been declined.

Applications from the public will be considered by the Directors for such number of shares only as may be available in consequence of the existing shareholders declining to take them.

UNDERWRITING

All the shares forming the present issue have been either underwritten or the subscription thereof is guaranteed by the Managing Agents and three of the Directors.

The details of the shares that have been underwritten from out of the present issue and the names of the underwriters are as stated below :

	7% Tax-free Redeemable Cumulative Preference Shares of Rs. 100 each.	Equity (Ordinary) Shares of Rs. 10 each.	Total Value
Industrial Finance Corporation of India	50,000	..	Rs. 50,00,000
The Industrial Credit and Investment Corporation of India Limited	25,000	2,50,000	Rs. 50,00,000
	75,000	2,50,000	Rs. 1,00,00,000

In the opinion of the Directors, the resources of the said underwriters are sufficient to discharge the underwriting obligation.

10,00,000 Equity (Ordinary) Shares of Rs. 10 each that are not being underwritten or so many thereof as are not subscribed have been guaranteed to be subscribed by the Managing Agents and Sir Padampat Singhania, Kt.,

Shri Lakshmi Pat Singhania and Shri Hari Shankar Singhania, three of the Directors. In the opinion of the Directors, the joint resources of the Managing Agents and Directors are sufficient to discharge this obligation.

RIGHTS OF PREFERENCE SHARES

The Redeemable Preference Shares confer the right to a fixed Cumulative Preferential Dividend at the rate of 7% per annum free of Income-tax and the right in a winding-up to be paid all arrears of Preferential Dividend earned whether declared or not, down to the commencement of the winding-up and to be repaid the amount of capital paid up or credited as paid up in priority to any payment in respect of Ordinary Shares but no other rights to participate in surplus profits or assets.

REDEMPTION OF PREFERENCE SHARES

The shares are redeemable on the expiry of not less than five nor more than twelve years from the date of allotment and if not all redeemed at one time those to be redeemed shall be determined by drawings.

RIGHTS ATTACHED TO THE NEW EQUITY (ORDINARY) SHARES

The new Equity (Ordinary) Shares shall rank *pari passu* with the existing Equity (Ordinary) Shares of the Company except that they shall not confer any right to dividend declared in respect of the year ending 31st December, 1959.

OBJECTS

The Company was incorporated on the 6th August, 1938 with the objects mentioned in its Memorandum of Association and in particular with a view to set up a Straw Board Industry and to own Paper Mills, etc.

PRESENT BUSINESS

The Company has been carrying on the business of manufacturing Strawboard from Straw and Grass and marketing the products since its inception. By adding a new Cylinder Mould Machine the Company has recently extended its activities to other types of Boards such as Simplex, Duplex and Triplex Boards and Straw Paper for corrugation. Due to this extension the capacity of the factory has been increased from 4,500 tons to 10,500 tons per annum.

NEW PROJECT

The Company has been granted a licence under the Industries (Development and Regulation) Act, 1951, for the establishment of a new Paper Mill at Singhpur Road, Orissa, with a manufacturing capacity of 18,000 tons per annum of high grade Writing and Printing Paper.

LOCATION OF PAPER MILL

A site in the vicinity of Singhpur Road Railway Station (near Rayagada) in the State of Orissa has been selected.

RAW MATERIALS

Bamboo, the raw material for manufacture of pulp and paper, is available in abundance from the forests adjoining the mill. The Government of Orissa has already allotted forests to the Company which will yield enough bamboos. Some forest development work has already been undertaken for the last three years and recovered bamboos are being marketed.

LAND

An agreement for the acquisition of adequate land for the Paper Mill has been entered into with

the Government of Orissa and the required land is expected to be handed over to the Company at an early date.

WATER SUPPLY

Water for the Mill will be taken from the River Nagavali on which the Mill site is situated. This is a perennial river and will supply the required amount of water.

ELECTRICITY

The Government of Orissa will supply necessary electrical power from the Machkund Grid. Power necessary for erection will be made available to the Company by March, 1960 and thereafter power necessary for operation of the Mill as required.

TRANSPORT FACILITIES

Singhpur Road is situated on Raipur-Vishakhapatnam Broad-Gauge Railway Line and is also connected by road directly with the Vishakhapatnam seaport which is an additional advantage for the transportation of goods by sea route. Suitable road transport facilities also exist with other important commercial towns. The distance by rail from Singhpur Road to Vishakhapatnam and Calcutta is 123 and 593 miles respectively.

PLANT AND MACHINERY

The Company has entered into an agreement for supply of pulp and paper mill machinery with J. M. Voith, G.M.B.H., of Heidenheim Brenz, West Germany. Machineries other than pulp and paper mill machinery have also been arranged through Messrs. J. M. Voith to be supplied from renowned manufacturers in West Germany, such as Siemens for Electrical equipments, Steinmuller for Boilers and Recovery Furnace, Dorr-Oliver for Recaulsticising plant, etc., etc. Messrs. Voith are manufacturers of pulp and paper mill machinery and enjoy a world-wide reputation in this line. They are also well known in India and have supplied pulp and paper mill machinery to various paper mills in India, specially based on bamboo as raw material, which have been found very satisfactory in working. Messrs. Voith are also engaged as Engineers for the complete Project. They will be responsible for erection and bringing into operation of the Mills and the training of the Company's personnel.

GUARANTEE FOR DEFERRED PAYMENTS

The State Bank of India have agreed to give necessary guarantee to the foreign suppliers for the deferred payment of the plant and machinery amounting to Rs. 3,00,00,000 with interest amounting to approximately Rs. 53,50,000 thereon. The Company will create security by way of mortgage of its complete assets in favour of the State Bank of India in consideration of the guarantee and the Managing Agents and Sir Padampat Singhania, Kt., Shri Lakshmi Pat Singhania and Shri Hari Shankar Singhania, three of their Directors, will also execute personal guarantees in favour of the Bank.

CAPITAL REQUIREMENT

The total cost of the project is estimated as under:

	Rs.
1. Land and Building	60,00,000
2. Plant and Machinery, including freight and duty	3,20,00,000
3. Erection, Preliminary and Miscellaneous expenses	34,00,000
4. Interest on Deferred Payments	53,50,000
Total Rs.	4,67,50,000

SOURCE OF FUNDS

The total sum will be provided as under:

	Rs.
1. New Issue of Capital	2,00,00,000
2. Other Resources including those of the Company	80,00,000
3. Deferred payments balance	2,67,50,000
Total Rs.	5,47,50,000

The excess provision will be available as a contingency margin and for meeting a part of the working capital requirements, the balance of which will be arranged through Banks by hypothecation of stocks and stores.

PROSPECTS

The production of Paper in the country is not sufficient to meet even the present demand which, in view of the rapid industrialisation of the country and increase in literacy and general standard of living envisaged in the Five-Year Plans, is bound to rise considerably in the coming years. In consequence, the demand of paper will be in excess of supply for some decades to come so that the Company's prospects in this line are bright.

PROFITS

The Paper Industry in India has shown a reasonably high potentiality for profit earning. The Mill will be equipped with up-to-date plant and machinery incorporating latest methods of production. The Company has reasonable scope for earning profits.

FINANCIAL INFORMATION

The following is condensation of the Auditors' Report by the Company's Auditors, Messrs. Lodha & Co., as published in the Prospectus:

STRAW PRODUCTS LIMITED			
Year ended 31st December	Sales	Profit before Depreciation and Taxation	Net Profits after Depreciation and Taxation
	Rs.	Rs.	Rs.
1954	19,52,719	2,73,315	48,708
1955	22,86,124	5,15,616	2,73,078
1956	32,84,197	9,78,901	4,43,607
1957	35,89,482	11,61,266	1,08,306
1958	65,46,013	11,16,275	89,208

Assets and Liabilities as at 31st December, 1958 :

Fixed Assets (at original cost less depreciation), Capital expenditure and Investments at cost	Rs. 1,01,02,382
Current Assets	46,49,365
Total Assets	Rs. 1,47,51,747
Less Liabilities	Rs. 37,80,777
Net Assets as at 31st December, 1958	Rs. 1,09,70,970

Dividends on Paid-up Capital :

Dividends paid by the Company in respect of the five years ended 31st December, 1958, were as follows:

Year ended	Rate of Dividend Per cent.
1954	5
1955	10
1956	12½
1957	12½
1958	12½

MINIMUM SUBSCRIPTION

In the opinion of the Directors it is not necessary to fix any minimum amount of subscription.

EXPENSES OF THE ISSUE

The expenses of the issue including underwriting commission and brokerage are estimated not to exceed Rs. 5 lacs and are payable and will be defrayed by the Company.

UNDERWRITING COMMISSION

Underwriting commission at the rate of 1½% and 2½% on the nominal value of the Equity (Ordinary) and Preference Shares respectively underwritten will be paid to the underwriters.

BROKERAGE

Brokerage will be paid at the following rates on allotments made in respect of applications for Preference or Equity (Ordinary) Shares bearing the stamp of the underwriters, any bank, or any brokers of a recognised stock exchange.

On Preference Shares—Brokerage will be paid at the rate of 1%.

On Equity (Ordinary) Shares—Brokerage will be paid at the rate of 15 nP per share.

The Managing Brokers will be paid an additional brokerage of 5 nP per share on Equity (Ordinary) Shares not exceeding 2,50,000. No Managing brokerage will, however, be paid on the Equity (Ordinary) Shares allotted to The Industrial Credit and Investment Corporation of India Ltd. or against the applications bearing their stamps on which The Industrial Credit and Investment Corporation of India Ltd. will be entitled to 5 nP per Equity (Ordinary) Share in addition.

INSPECTION

Copies of the Memorandum and Articles of Association of the Company, audited Balance Sheet and Profit and Loss Account for the last five years and the Auditors' Report, the original consent order of the Controller of Capital Issues, Licences issued by the Government of India for establishment of new Industrial Undertaking and copies of contracts, can be inspected at any time during the usual office hours at the Registered Office of the Company for a period of fourteen days from the date of publication of the PROSPECTUS or until the Subscription List closes whichever is earlier.

APPLICATION FOR AND ALLOTMENT OF SHARES

Applications for Preference and Equity (Ordinary) shares must be made on the Form accompanying the PROSPECTUS, copies of which may be obtained from the Registered Office and Calcutta Office of the Company, from the Brokers and from the Offices of the Bankers mentioned hereinabove.

The Form of Applications accompanied by the necessary remittance being Rs. 5 per Equity (Ordinary) Share and Rs. 50 per Preference Share, should be delivered to any of the following addresses on or before the date of closing of the Subscription List. Cheques drawn on banks at places other than those mentioned hereunder must include bank charges at the rate of 1/8% with a minimum of 75 nP.

Cheques or drafts should be made payable to "STRAW PRODUCTS LTD. — Share Application A/c" and should be crossed "Account Payee only." A separate cheque or draft should accompany each application form.

1. Straw Products Ltd., Chola Road, Bhopal.
2. Straw Products Ltd., 2, Mango Lane, Calcutta.
3. State Bank of India, Bombay, Calcutta, Madras, Delhi, Bhopal, Bangalore, Cuttack, Indore, Nagpur and Patna.
4. The Central Bank of India Ltd., Bhopal, Bombay and Calcutta.
5. The Bank of Baroda Ltd., Calcutta and Bombay.
6. The Hindustan Commercial Bank Ltd., Calcutta, Kanpur, Bombay, Amritsar, Jaipur, Delhi and Ahmedabad.

Where no allotment is made the deposit will be returned in full and where a partial allotment is made, the unutilised balance will be returned, without any interest by a cheque on the Bombay branch of the Company's Bankers. The Directors reserve the right to refuse any application wholly or in part without assigning any reasons.

The shares when issued shall be subject to the Memorandum and Articles of Association of the Company. The Share Certificates will be issued within six months of the date of allotment.

NEW PUBLICATIONS

Tenth International Conference of Agricultural Economists—Studies in Indian Agricultural Economics. Edited by Dr. J. P. Bhattacharjee. The Indian Society of Agricultural Economics, Bombay. Price: Rs. 18.00. Pages: 326.

THE book is a souvenir volume brought out on the occasion of the tenth International conference of Agricultural Economists held at Bangalore from 24th August to 3rd September last year. The volume comprises nine research studies relating to some of the important branches of India's rural economy. Consisting as it does of contributions from the distinguished centres of study and research in social sciences in India, this volume broadly represents the current level of thinking on some of the vital problems confronting the primary sector in the country's economy. The methodology adopted here is in general historical-cum-analytical, with particular reference to the current problems of, and trends in, terms of trade, output, prices, marketing, employment, food consumption and investment and finance in Indian agriculture. Among the many interesting articles in the volume, mention may be made of "Prices, Trade and Marketing of Agricultural Commodities in India" by Dr. R. N. Podaval and Mr. Prayakar Sen (Directorate of Economics and Statistics, Union Ministry of Food and Agriculture). Against the background of the changing position of agriculture in the national economy, the authors seek to provide a detailed analysis of the movement of prices, terms of trade between the agricultural and industrial sectors of the economy, of the pattern of foreign trade and the structure of marketing of agricultural commodities. The analysis has been supplemented by data obtained from farm management investigations which throw light on the role of economic calculation and strength of economic incentives in the organisation and management of agricultural enterprises.

Another article, "Investment in Agriculture in the Two Plans," contributed jointly by Dr. D. T. Lakdawala, Dr. M. B. Desai, Mr. V. S. Vyas and Mr. S. H. Deshpande (Department of Economics, University of Bombay), serves to bring out a comparative assessment of the nature and adequacy of the investment in agriculture in the first and the second Plans. The paper on "India's Rural Economy and Its Institutional Framework: A Re-examination," prepared by Mr. Tarlok Singh, Planning Commission, evaluates the changing economic and social ethos in the rural economy, in the wake of community development projects, land reforms, co-operation and industrialisation, particularly in the context of the emphasis given to cottage and small-scale industries. In the course of a paper on "Progress in Research in Agricultural Economics in India," Prof. M. L. Dantwala makes a retrospective survey of the growth of re-

search in agricultural economics as an academic discipline in India, which, of course, is of comparatively recent origin in this country. The volume will be genuinely welcomed by students of advanced agricultural economics.

Formation of Private Companies. By Douglas Barker and A. P. Halberstam. Published by Sweet and Maxwell Ltd., 2 and 3 Chancery Lane, London. Sole Agents in India: N. M. Tripathi Private Ltd., Princess Street, Bombay-2. Pages: 236. Price: £1 15s.

Company formation is now a specialised job. It requires not only a good knowledge of the Companies Act and regulations but also many other statutes like income-tax, profits tax, wealth tax and estate duty. Only a person conversant with these vast subjects will be in a position to advise and help in the formation of companies. Douglas Barker and Halberstam have made the job of persons desirous of forming companies easy to a certain extent. Businessmen and lawyers in the company field will find this book a good guide. The authors have briefly discussed in Part I the various statutes affecting companies, the different types of companies, the advantages and disadvantages of their incorporation. The second part of the book contains a detailed account of the formation of companies and their registration. Part III deals with the conversion of a private company into a public company. Though the book is essentially meant for the formation of private companies in England, it is quite useful in India too as the Indian Companies Act is based on the English statute. It will, however, serve only as a broad guide.

A Grammar of Indian Planning. By S. Ambirajan. Published by the Popular Book Depot, Lamington Road, Bombay, 7. Pages 185. Price: Rs. 5.00.

The author, S. Ambirajan, has discussed in this book the growth and development of planning in India in its proper perspective. While he has recognised the merits of democratic planning, he has also pointed out its limitations. The book also contains an analytical study of the basic framework of India's first and second Plans. Commenting on the prospects for the third Plan, the author has warned that the second Plan had certain advantages which the third will not have, for instance, the cushion of foreign exchange reserves and the optimistic outlook for food supply at the end of the first Plan. The need for repayment of foreign loans will also tell upon the resources position of the next Plan. On the question of mobilising internal resources, the author says that, if anything, there is need to give tax concessions rather than impose fresh tax burdens. He has, therefore, called for a realistic approach towards planning. Written in simple and non-technical language, the book will be read with interest by general readers and students.

A Foredoomed Committee and Fuss, Sham and Intrigue in the Income-Tax. By N. Nandini. Published by the Author, 127, Bananani Naskar Road, Behala, Calcutta-34. Pages: 146. Price: Rs. 5.00.

The first phrase of the intriguing and provocative title of the book refers to the author's verdict on the Direct Taxes Administration Enquiry Committee. Here is a good case for improvement of the income-tax administrative machinery presented by one who has himself worked in the Department for a number of years. The author, N. Nandini, has utilised his knowledge and experience in laying bare some of the chief defects of the income-tax administration. There are also a number of suggestions for reform, many of which emerge more by implication than by direct statement. Thus, the author deprecates the inadequate training given to income-tax officers. Perhaps, by a too liberal use of overworked adjectives, he spoils a really good case for reform. There is also much repetition and adoption of such unimpressive devices of attracting readers' attention as black letters. The author, however, seems to have a missionary zeal in the reform of the Department.

Industrial Relations in India. By T. N. Rastogi, 33, Havelock Road, Lucknow. Pages: 24. Price: 50 nP.

But for the words printed in brackets under the title, there is nothing in this booklet to bear out the author's claim that it is an advanced, critical study of industrial relations in India. At best, it is a loosely knit essay with a dozen quotations grafted on to it for no other reason than the author's love for quotation. After a perusal of the booklet, one is still left in doubt as to what is "fresh and rational" in it and in what way the author's "methodological approach" is different from that of other students of labour economics. Nevertheless, in view of the fact that there are even today numerous industrial managements who are too short-sighted to understand the essence of sound industrial relations, the author's emphasis on the essentially "human" aspect of these relations is to be welcomed.

Economics and Economy. By Kenneth Rivett. Published by Harold Laski Institute of Political Science, Ahmedabad. Pages: 61. Price: Rs. 2.00.

This booklet contains three lectures delivered by Dr. Kenneth Rivett of Melbourne University, at the Harold Laski Institute of Political Science, Ahmedabad. Their main theme is the scope and philosophy. The first lecture deals with the scope and definition of economics, the second with the logical methods of economics and the third with the relation between economics and ethics. All the three lectures are eminently readable in print, thanks to the informal style and sparkling contents.

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS AND NEITHER AN INVITATION TO THE PUBLIC OR ANY SECTION OF THE PUBLIC FOR SUBSCRIPTION OF SHARES.

NEW STANDARD ENGINEERING CO. LTD.

(INCORPORATED UNDER THE INDIAN COMPANIES ACT, 1913)

AUTHORISED CAPITAL:

1,00,000 Shares of Rs. 100 each	Rs. 1,00,00,000
---------------------------------	-----------------

CAPITAL ALREADY ISSUED, SUBSCRIBED AND PAID UP:

22,277 Equity Shares of Rs. 100 each fully paid up otherwise than in cash	Rs. 22,27,700
---	---------------

NOW BEING ISSUED:

27,723 Equity Shares of Rs. 100 each	Rs. 27,72,300
and	
25,000 6.3% (Tax-free) Cumulative Redeemable Preference shares of Rs. 100 each	Rs. 25,00,000
Total	Rs. 52,72,300

OUT OF THE SHARES NOW BEING ISSUED:
The Directors and their friends have agreed to take up 3,223 Equity shares of the nominal value of Rs. 100.

BOARD OF DIRECTORS

SRI RAMANLAL G. SARAIYA (Chairman), Businessman, Navsari Chambers, Outram Road, Fort, Bombay-1.

How many elephants do you see in a day?

TITAGUR PAPER frequently carries the famous Elephant watermark. The Elephant is also our registered trademark, and whenever you use paper, in reading, writing, typing or filing, you are probably handling the Titagur Elephant in one of its many forms. For many years the Titagur Elephant has been a symbol of quality and it now represents the widest range of quality paper made in this country. Today, the Titagur Mills produce more bamboo pulp and paper than any other mills in the world.

CHARTERED BANK BUILDINGS, CALCUTTA 1.

PROTECTION FOR AUTOMOBILE LEAF SPRINGS WITHDRAWN

FURTHER CUT IN PRICES URGED

THE automobile leaf springs industry, which has been enjoying protection for the last four years with a protective duty of 50 per cent., will lose this shelter from 1st January 1960, for the Government of India has accepted the recommendation of the Tariff Commission that protection to the industry need not be continued beyond 31st December 1959. The Commission, after a thorough inquiry into the progress of automobile leaf spring manufacture, is satisfied that the industry has reached a stage where it is no longer in need of tariff protection to overcome the competition in price offered by foreign products. This, however, does not mean that the industry will have to face stiff competition from foreign manufacturers, as imports are greatly restricted.

The Commission has noted that, in the last four years, the industry has made considerable progress and has consolidated its position in the domestic market. The major units in the organised sector have installed modern machinery and have acquired equipment for testing raw materials and finished products. The estimated fair ex-works prices are in each case lower than the landed costs (ex-duty) of corresponding imported springs and main leaves. The industry produces a wide range of springs, including the heavy types required for commercial vehicles. The quality of the product is satisfactory and compares favourably with that of imported springs.

The present capacity of the industry, together with the additional capacity already sanctioned, is adequate to meet the requirements of leaf springs and loose leaves both for original equipment as well as for replacement. The Commission is, therefore, of the view that, even if the demand for automobile springs of any type were to increase in the next two or three years, the industry should be in a position to supply them at reasonable prices. What it needs most, according to the Commission, is adequate supply of raw material, namely, spring steel flats. For a couple of years more, the industry will have to depend mainly on imports, but the position is likely to improve thereafter when spring steel from indigenous sources becomes available in a progressively increasing volume.

The Commission has also recommended that the manufacturers of leaf springs and spring leaves should immediately effect a further reduction in their selling prices and maintain their prices in fair relation to the cost of production. From an estimation of the fair ex-works prices, the Commission concludes that, in the case of springs, the price advantage of indigenous products vis-a-vis the imported ones ranges from 17.19 per cent. to 30.08 per cent. in the case of springs and from 43.30 per cent. to 69.97 per cent. in respect of main leaves, although it is likely that, in the case of a number of items not taken for the purpose of price computation, the advantage enjoyed by the domestic industry may not be as high, and in some cases, there may even be a positive disadvantage. On the whole, the Commission feels that there is a strong case for a reduction in selling price. The Government has drawn the attention of the manufacturers to this recommendation.

Rated Capacity

The present rated capacity of the industry, on single shift basis, is 9,530 tons, as compared with 8,000 tons in 1957 and 5,200 tons in 1954. The Development Wing of the Ministry of Commerce and Industry has, however, put the present rated capacity at only 7,450 tons. When the schemes of expansion, now under contemplation, materialise, the annual rated capacity of the industry will increase from the present 7,450 tons (Development Wing's estimate) to 17,395 tons per single shift. The aggregate annual capacity of 28 small-scale units is estimated at 11,824 tons on single shift. Actual production by the six major units in the industry aggregated 7,047 tons in 1958, as against 5,945 tons in 1957.

In its 1957 report, the Commission estimated the then demand for leaf springs at 406,450 Nos., exclusive of the requirements of Defence Services. On the basis of 30 springs per ton, the demand for leaf springs, in terms of tonnage, worked out to 13,550 tons. As regards the future demand, the Commission had expected it to increase by about 15 per cent. in the subsequent two years. This estimate seems to hold good even now. The estimates of demand received in

connection with the present inquiry from the main producers and the Development Commissioner, Small-scale Industries, however, showed wide variations. They ranged from 16,123 to 34,477 tons for 1959 and from 21,173 to 42,200 tons for 1961.

Present Demand

The present demand for leaf springs for original equipment is 24,000 for passenger cars, 22,000 for jeeps and 70,600 for commercial vehicles, making a total of 116,600 springs. The demand for replacement is normally both for complete springs as well as for loose leaves but the overall demand is expressed in terms of complete springs. The current replacement demand works out to 5,954 springs for passenger cars, including jeeps, and 314,428 springs for commercial vehicles making a total of 320,382 springs. The total current demand for springs, exclusive of the Defence requirements, both for original equipment and replacement, is thus estimated at 436,982 springs. On the basis of a conversion rate of 30 springs to a ton, the current demand for leaf springs, in terms of weight, works out to about 14,550 tons, as compared with 13,550 tons in 1957. Imports of leaf springs and spring leaves in 1958 were of the order of 562.5 tons valued at Rs. 5.30 lakhs.

Raw Material

The main bottleneck in increasing production is short supply of basic raw material, namely, spring steel. The other materials required are mild steel flat bars or strips and plates, phosphoric bronze bushes, tubes for bushes, centre bolts, clip bolts, nuts and rivets. Apart from spring steel, all other raw materials are available from indigenous sources and manufacturers experience little difficulty in obtaining their requirements. With regard to spring steel, there was no material improvement in the supply from indigenous sources in the past two years. The bulk of the requirements for the manufacture of leaf springs was, therefore, met from imported spring steel flats. Guest, Keen, Williams Ltd., which alone has the capacity to manufacture spring steel in the country, supplied a small quantity of 690 tons in 1957 and 806 tons in 1958 to automobile leaf spring manufacturers. It was unable to supply additional quantities, because, on the one hand, there was acute shortage of silico manganese steel in the form of billets and, on the other, it had to meet priority orders from railways and other important projects. Its new rolling mills are expected to come into operation early next year and, provided sufficient quantity of spring steel billets is available, it would be in a position to roll 4,000/5,000 tons of spring steel bars in 1960 and 6,000/8,000 tons in 1961 for automobile leaf spring manufacturers. The company expects to provide from its two electric furnaces approximately 3,600 tons of special spring steel billets per year.

A new 12-ton electric furnace is under installation in the Metal and Steel Factory, Ishapore, which could supply 4,000/6,000 tons of spring steel billets per year from the middle of 1960. T.E.L.Co. can also produce silico manganese steel to meet its own demand. Thus, there is a likelihood of an improvement in the supply of spring steel from indigenous sources in future. Manufacturers in the organised sector of the industry obtained in 1957 a supply of steel both from indigenous sources and imports to the

extent of 7,916 tons against their production of 5,945 tons of leaf springs and leaves. Supplies were thus adequate. But, in 1958, total supplies aggregated only 4,925 tons, as against their production of 7,047 tons. The position was, however, better in the first half of 1959.

Small-scale Units

Referring to the plea that liberal supplies of imported spring steel should be ensured to small-scale units, the Commission states:

"The quality of springs manufactured by small-scale units is poor, on account of inferior materials used and the poor technique of manufacture adopted by them. The products are mostly good for replacement of loose leaves, but complete springs produced by such units do not have the right degree of elasticity or finish. We have given this matter our careful consideration and feel that, at present and have to be largely imported, their distribution should be governed by a proper sense of priorities. The manufacture and assembly of leaf springs for the automobile industry involve a highly technical process in which hardening, tempering and shotpeening are of considerable importance. The precautions that have to be taken in employed require technical skill and competence of a degree that is not normally available in small-scale units. Automobile springs are functionally in the front suspension of a vehicle, especially in disastrous consequences both to life and we are of the view that, in order to ensure proper utilisation of scarce raw material, spring steel flats units as have the necessary equipment for manufacturing leaf springs and loose leaves in accordance with the specifications laid down by the I.S.I."

This is doubtless the right attitude to take. The consensus of opinion among the consumers was that the quality of the indigenous leaf springs had shown further improvement and was comparable to that of imported ones. The manufacturers had taken steps to improve quality by the installation of modern equipment and maintenance of quality control, including testing of finished products and raw materials.

Price Comparison

For estimating the fair ex-works prices for comparison with the c.i.f. prices and landed cost (ex-duty) of imported products, the Commission examined the cost of production of leaf springs and leaves manufactured by Metropolitan Springs Private Ltd. All the relevant factors were taken into account in estimating the fair ex-works price. Production was estimated at 1,000 tons per annum. Cost of raw materials was calculated on the basis of the latest prices of imported raw material. Increase in dearness allowance and basic wages, cost of power, stores, repairs, maintenance, etc., were taken into account in computing manufacturing charges. Depreciation was provided for at the normal income-tax rate and the return on capital employed was fixed at 10 per cent.

On this basis, the Commission found that the estimated fair ex-works price was in each case lower than the landed cost (ex-duty) of corresponding imported springs and main springs. While in the case of springs the advantage in favour of the industry ranges from 17.19 per cent. to 30.08 per cent., in the case of main leaves, it ranges from 43.30 per cent. to as high as 67.97 per cent.

In pursuance of the Commission's recommendation in 1957, all units in the organised sector effected a reduction in their prices. These reductions, however, applied only to leaf springs and spring leaves so'd for replacement and not to those supplied for original equipment. The Commission examined the selling prices of major producers in relation to the fair ex-works prices of leaf springs and spring leaves estimated by it at the time of the last inquiry and has found that the wholesale prices are higher levels ranging from 1 per cent. to 49 per cent. in the case of leaf springs and 11 per cent. to 104 per cent. in the case of main leaves. The prices in the retail market are much higher. In contrast to this, since 1957, prices of imported spring steel flats, En-45, which are mainly used as raw material by the automobile leaf spring manufacturers, have shown a persistent downward tendency which continued in the first quarter of 1959. The Commission, therefore, feels the reduction which reflects only partially the decline in raw material prices and that the prices charged by some units are still excessive. It is of the view that, as imports have been curtailed to a bare minimum, the industry has taken full advantage of a sheltered market. There is, according to the Commission, scope for further reduction in the prices of leaf springs and spring leaves both for original equipment and for replacement. It has, therefore, recommended a cut in prices, so as to

COTTON AND HAIR BELTING DEPROTECTED SCOPE FOR EXPANSION LIMITED

IN pursuance of the recommendation of the Tariff Commission, the Government of India has decided to discontinue protection to the cotton and hair belting industry, with effect from 1st January 1960. It has, however, been decided to continue to extend the customs duty concession to hair and woollen yarn used exclusively for the manufacture of hair belting. The industry, it may be recalled, has been enjoying protection since 1948. The Tariff Commission has now felt that there is no longer any case for protection to this industry because the price of the indigenous products compares very favourably with that of the foreign products. The landed costs ex-duty of imported cotton beltings are higher by 35 per cent. and that of hair beltings by 6 per cent., as compared with ex-works prices of domestic products. Besides, the industry has a virtually protected market in view of the severe restriction on imports. It is, however, disconcerting to note that production by this protected industry is declining. In fact, it would appear that the industry has accepted the position that bituminous cotton belting has no future. But it is felt that good quality hair belting will be in demand for another 15 to 20 years. In its report, the Tariff Commission has pointed out that the technological changes which are taking place in advanced countries and are slowly penetrating into this country, are not conducive to the development of flat woven beltings.

Installed Capacity

The installed capacity of the industry is considerably in excess of indigenous demand. There are at present nine units engaged in the manufacture of cotton and hair beltings. Of these, eight units are located in Calcutta, all of which manufacture bituminised belting. The other unit, Fenner, Cockill Ltd., Madurai, Madras, manufactures rubber impregnated cotton and hair beltings in accordance with a process patented by its principals in the U.K. The overall production of cotton and hair beltings has improved from 713 tons in 1957 to 777 tons in 1958, largely due to a rise in production of cotton beltings by Fenner, Cockill Ltd. The production had, however, been gradually declining since 1954, when it touched 868 tons. Again, during January-June 1959, the total production was no more than 329 tons, or an annual rate of 658 tons. The industry, as a whole, did not work to full capacity even on a single-shift basis. Its output represented no more than 62.5 per cent. in 1957 and 68 per cent. in 1958 of its present capacity on a single-shift basis. The following table shows the capacity and production of the various units in 1957 and 1958:

Name of Manufacturer	Capacity	Production	
		1957	1958
Asia Belting and Spinning Mills Ltd.	86	78.50	81.31
Bengal Belting Works Ltd.	102	140.71	102.44
Birkmire Bros. Ltd.	180	44.68	54.36
Eastern Belting and Cotton Mills Ltd.	84	81.21	85.94
Fenner, Cockill Ltd.	96	66.02	112.17
Hindustan Belting and Spinning Mills	240	114.94	141.70
India Belting and Cotton Mills	264	67.58	91.71
Lachminarayan Jute Manufacturing Co., Ltd.	21	N.A.	N.A.
Serampore Belting Works Ltd.	57	118.95	107.49
Total	1,140	712.59	777.32

The setback in the industry is evident from the gradual slackening of sales and increase in unsold stock. According to the Tariff Commission, bituminised cotton beltings have no chance of survival against competition from cheaper rubber ply beltings. As regards hair belting, it is said that, though for pulleys of small diameter, rubber ply belting is preferred, hair beltings had specific advantages in factories where drives involve arduous duties under hot, steaming, wet or oily conditions, horsepower in excess of 200 or very heavy shock loads. The decline in the off-take of hair belting is said to have resulted from the low quality of indigenous yarn and also because of a shift in demand from flat belts to V-belts, following the conversion of group driving system in some of the big industries to individual driving system. As a consequence of this trend, the units in W. Bengal have a large number of idle looms. In contrast, Fenner, Cockill Ltd. is making good progress, according to the Tariff Commission. The Company is of the view that rubber ply belting has no technological superio-

rity over rubber-impregnated solid woven beltings in view of the inherent tendency of the former type to come apart between the plies. It claims to have arrested the tendency to change over to rubber ply beltings by producing good quality solid woven beltings within the limits of its production capacity. This unit is also optimistic about exporting its products to neighbouring countries, provided it is allowed to import from abroad its entire requirements of hair belting yarn containing 75 per cent. long-staple wool and 25 per cent. animal fibre other than wool.

Domestic Demand

In 1957, the Tariff Commission had estimated the domestic demand at 350 tons for cotton beltings and 650 tons for hair beltings for the next three years. The total consumption of cotton belting in 1958, however, was lower than this estimate at 302 tons, as against 254 tons in 1957 and 289 in 1956. The consumption of hair belting was 451 tons in 1958, as compared with 483 tons in 1957 and 575 tons in 1956. The demand for V-belts is expected to increase in future. Solid woven beltings, cotton or hair, and rubber ply beltings are flat belts used in those industries operated on the shaft driving principle. And since modern equipment with individual drives is prepared in new undertakings on the ground that it saves factory space and power, the demand for V-belts for power transmission will increase. The Commission has pointed out that this is a development which has already taken place in Europe and the U.S. and will take place in India as industrialisation goes on. Again, as already pointed out, there is no future for bituminised cotton beltings, which are hard and not sufficiently flexible. There are, however, good prospects for rubber-impregnated cotton belting. Taking all these factors into consideration, the Tariff Commission has estimated that the annual domestic demand during the next three years will not exceed 200 tons for cotton beltings and 450 tons for hair belting.

The principal raw materials required by the industry are cotton and hair yarns. Good quality cotton yarn is available indigenously in adequate quantities. There have been complaints from the belting industry as regards the quality of indigenous yarn and the supply position of both imported and indigenous yarn. The Commission has recommended that Jay Shree Textiles Ltd. should bring down the price of its yarn and that import of hair yarn should be liberalised. It has also asked this unit to supply the belting industry with only properly conditioned belting yarn spun on its modern spindles. On the question of quality,

the Commission is of the view that it is satisfactory in the case of indigenous solid woven, rubber-impregnated cotton and hair beltings. As regards bituminised beltings, both standard and sub-standard products are manufactured in the country and the sales of sub-standard products have created considerable prejudice against indigenous products. The cotton and hair belting industry has necessarily to devote its utmost attention to the quality of its products without which it will not be able to stand on its own and compete effectively with its substitutes.

STEARIC AND OLEIC ACID

The stearic and oleic acid industry has been making fairly steady progress under the shelter of protection it has been given since 1948. Production has gone up. The industry has now plans to diversify its production by producing different types of derivatives. Besides, it has been making every effort to improve the quality. Though the quality of the domestic product has improved much remains to be done to enable it to produce cosmetic grade of stearic acid. The Government has now decided to extend the tariff protection granted to the industry beyond the current year for a further period of three years. The rate of protective duty will be maintained at the existing level of 35 per cent. ad valorem or 50 NP per lb., whichever is higher. The Tariff Commission, while recommending protection to the industry, has called upon the manufacturers to desist from charging excessive prices and also to bring their selling prices in fair relation to their cost of manufacture.

In all, there are seven important manufacturers of stearic and oleic acids. The total installed capacity of these units for stearic acid has gone up by 70 per cent. to 6,494 tons, as compared with 1957. This expansion is mainly due to the increased capacity of the Navsari Oil Products from 600 tons to 3,120 tons. At the same time, the capacity for producing oleic acid, has increased by 28 per cent. to 1,142 tons. This improvement was also contributed mainly by the Navsari unit. Production, however, has remained substantially below its capacity, thanks to restricted demand. In this connection, the Commission has observed that it is not desirable to set up new units in this industry. The total output of stearic acid went up from 1,828 tons in 1957 to 1,980 tons in 1958 and that of oleic acid from 189 tons in 1958 and 215 tons in 1958, as compared with 121 tons in the previous year. This is, however, much below the present installed capacity for stearates estimated at 425 tons.

The domestic demand for stearic acid in 1959 is estimated by the Commission at about 1,900 tons, as against 1,600 tons in 1957. The demand for oleic acid is placed at 250 tons, as against 240 tons in 1959. The current demand for stearates is estimated at 150 tons. The demand for stearic acid, oleic acid and stearates is expected to go up to 2,700 tons, 600 tons and 250 tons, respectively, by 1962.

INDIA'S FOREIGN TRADE IN SEPTEMBER

India had an adverse balance of trade in merchandise of Rs. 9.06 crores in the month of September 1959, in distinct contrast to a favourable balance of Rs. 15 lakhs and Rs. 42 lakhs in the previous month and the corresponding month of 1958, respectively. Exports were Rs. 60.27 crores, as against Rs. 58.52 crores in August 1959 and Rs. 59.02 crores in September 1958, and were the highest to be seen in any month in the past two years. But imports, too, rose sharply, from Rs. 58.37 crores in August 1959 and Rs. 58.60 crores in September 1958 to Rs. 69.33 crores.

During the first three quarters of the current year, India had a total adverse balance of trade to the tune of Rs. 200.55 crores, a gap bigger by as much as Rs. 54.42 crores, as compared with the corresponding period in 1958. A major contributory factor for the widening of the trade gap was the increase in imports, by over 11 per cent. to Rs. 636.72 crores. Exports, too, moved up, but at a slower pace than imports, that is, by about 2 per cent. to Rs. 436 crores.

The following table shows the trend of merchandise trade, month by month, during the nine months ended September 1959, as compared with that in the corresponding period of 1958:

(In crores of rupees)			
	Imports	Exports (including re-exports)	Balance of trade
1958			
January	58.58	45.34	-13.24
February	59.79	42.90	-16.89
March	65.60	47.03	-18.57
April	59.98	41.73	-18.25
May	66.12	44.49	-21.63
June	77.18	43.54	-33.64
July	62.94	51.46	-11.48
August	58.37	58.52	+0.15
September	69.33	60.27	-9.06
Total*	636.72	436.17	-200.55
1959			
January	66.05	54.77	-11.28
February	66.21	41.93	-24.28
March	70.54	40.08	-30.46
April	59.98	41.73	-18.25
May	63.29	44.71	-18.58
June	63.29	28.12	-35.17
July	66.79	54.31	-12.48
August	55.02	49.91	-5.11
September	59.60	59.02	+0.58
Total*	571.37	425.24	-146.13

* The total does not tally with the aggregate of monthly figures. The total incorporates periodic corrections reported by the Customs authorities.

SYNOPSIS OF COMPANY REPORTS

Apollo Mills Ltd.

The directors of the above Company [Managing Agents: The Rajputana Textiles (Agencies) Private Ltd., Bombay] submit the audited accounts of the Company for the year ended 31st December 1958.

After meeting all working expenses for the year, the result of this year's working shows a loss of Rs. 21,94,602 (Rs. 16,33,137) to which should be added a sum of Rs. 1,74,201 (nil) paid towards compensation to weavers for the past years and Rs. 1,10,462 (Rs. 1,06,045) being amount of provision made for payment of bonus to workers and staff for the year 1957, making a debit balance of Rs. 24,79,265 (Rs. 17,39,182). To this is added the debit balance brought forward from last year of Rs. 12,80,327 leaving a total debit balance of Rs. 37,59,592 after adjusting credits for the previous years of Rs. 4,136 (nil) to be carried forward.

The directors extremely regret the huge loss incurred by the Company during the year under review as compared to last year.

The prices continued to be most unremunerative particularly as far as grey qualities are concerned, which form the bulk of the production of the mills. Excise duties hit hard the lower and cheaper varieties of cloth and the quantum of excise duty paid comes to nearly Rs. 34 lakhs. Besides, there were other factors which have played no minor role in enhancing the cost of production, viz., higher cost of raw materials, stores, heavy incidence of D.F.A. and certain compensations which the Company had to pay during the year consequent upon some awards. A substantial amount towards compensation and gratuity had to be borne by the Company during the year under report.

The directors consider that the particular reason for the loss is lack of processing facilities with the Company, to obtain the same efforts are being made. Since people's choice has been shifting to fancy varieties and since the mills manufacture only grey medium cloth, the Company has been more particularly adversely affected.

Due to the financial stringency, payments relating to recoveries from workers and staff Co-operative Society and Employees' Provident Fund Scheme could not be made to the respective institutions in time. However, certain arrangements have been fixed in order to liquidate the same and the directors hope to discharge these liabilities according to the arrangements. In view of the arrangement arrived at, there is no contravention of Section 418 of the Companies Act.

The income-tax assessments of the Company are over upto the assessment year 1954-55 but the appeals are pending for the assessment years 1953-54 and 1954-55.

In view of the trading lots, depreciation for the years 1957 and 1958 has not been provided and also the development rebate reserve has not been created for the year 1958 for the same reason.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	50,00,000	Gross block	1,47,32,620
Provision for taxation	1,472	Less—Depreciation	44,03,340
Liabilities	1,09,67,182		
		Balance	1,03,29,280
		Less—Assets lost in fire	33,77,226
		Net block	69,52,054
		Stock-in-trade	34,33,425
		Stores, etc.	5,71,293
		Other assets	1,397
		Debits, deposits and advances	8,62,364
		Investments	9,31,921
		Cash	13,244
		Profit and loss account (deficit)	32,02,956
	Rs. 1,59,68,654		Rs. 1,59,68,654

Bengal Luxmi Cotton Mills Ltd.

The directors of the above Company (Managing Director: Mr. D. N. Bhattacharjee, Calcutta) submit the audited accounts of the Company for the year ended 31st March 1959.

As in the previous year, the Company could not make any profit during the year under report also which shows a net loss of Rs. 3,97,014 (Rs. 8,50,605). Providing Rs. 37,000 (Rs. 13,200) for development rebate reserve and accounting for Rs. 4,38,296 (nil) being compensation from ex-managing agents for loss of assets by fire in 1949, transferring Rs. 2,43,005 (Rs. 6,56,935) from general reserve and making some adjustments of bad debts out of reserves set aside for this purpose in earlier years the profit and loss account of the Company shows at the end of the year a debit balance of Rs. 1,68,477 (credit balance of Rs. 48,319 from which a dividend of 5 per cent. on the preference shares was paid absorbing Rs. 26,176 leaving a credit balance of Rs. 22,143 to be carried forward) against reserve of Rs. 1,56,980, not available for distribution. In view of the adverse results as aforesaid the directors very much regret that they are unable to pay any dividend on ordinary as well as preference shares. Dividend on the preference shares for the year will, however, accumulate and will be paid from the future profits prior to any distribution on ordinary shares.

In addition to the full impact of the duty on electricity mentioned in the last report the Company had to meet with a heavy increase in wages and other amenities to the workers as a result of the Tribunal Award with effect from the 10th July

1958. The prices of Cotton became higher with the progress of the year due to poor crop and the prices of colours, chemicals and some items of stores also grew higher due to import restrictions. While the cost of production was higher due to these factors and also to old machinery the sale prices of medium and coarse varieties of cloth, which form the bulk of the Mill's production, continued to remain unsatisfactory as in the previous year. In order to improve the condition the directors have replaced some of the machineries with a view to bring down the cost of production, but the steps taken so far with the limited resources of the Company are not enough to meet the situation.

The directors feel that modernisation of the plant and machinery of the Mills is a very urgent necessity. The Company have, therefore, prepared a scheme of modernisation and effective steps have already been taken to secure financial assistance for implementing the scheme from the National Industrial Development Corporation Private Ltd., a Government of India undertaking. The directors hope to get this loan within the next two or three months' time.

The Company have also begun for the first time to export cloth with a view to avail of the advantages of the export incentive scheme for cloth recently formulated by the Government of India.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	15,35,450	Gross block	85,52,765
Reserves	1,56,980	Less—Depreciation	62,49,897
Liabilities	57,67,017		
		Net block	23,02,868
		Stock-in-trade	35,08,499
		Stores and spares	5,72,947
		Debits, deposits and advances	8,72,032
		Investments	20,144

Ranegunge Coal Association, Ltd.

The directors of the above Company (Managing Agents: Messrs. B. N. Elias and Co., Private Ltd., Calcutta) present the audited accounts of the Company for the year ended 31st March 1959.

	Year ended 31-3-57	Year ended 31-3-58	Year ended 31-3-59
Raisings	4,31,402	4,53,767	4,59,649
Despatches	4,09,316	4,10,888	5,06,436
Stocks	43,127	86,006	39,219

Raisings increased by 5,882 tons and despatches increased by 95,548 tons.

Coke Manufacture: The Company manufactured during the year under review 6,272 tons of hard coke. 6,085 tons were despatched and 1,342 tons remained in stock.

Development and Prospects: Development in all sections of the collieries is progressing favourably. Relationship between the management and labour has been very satisfactory.

The Company's profit for the year ended 31st March 1959 after inclusion of Rs. 3,803 (Rs. 29,060) brought forward is Rs. 15,41,938 (Rs. 11,06,950). And after making provision for taxation of Rs. 9,00,000 (Rs. 5,50,000) there remains a balance of Rs. 6,41,938 (Rs. 5,56,950). From this balance the directors have placed to machinery replacement and development reserve Rs. 2,90,000 (Rs. 1,70,000) and to development rebate reserve Rs. 1,06,499 (Rs. 1,43,197). The directors now recommended the payment of 80th dividend at Rs. 1.00 (Rs. 1.00) per share absorbing Rs. 2,39,950 (Rs. 2,39,950) leaving a balance to be carried forward of Rs. 5,489 (Rs. 3,803).

Accounts in brief are as under:—

Hingir-Rampur Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Killick Industries Ltd., Bombay) submit the audited accounts of the Company for the year ended 30th June 1959.

Output:—The year's output of 124,475 tons, i.e. an average monthly output of about 10,370 tons, was won entirely from No. 9 Pit. The output for the preceding year was only 70,653 tons, during 7 months of production, as the lockout declared on 17th June 1957 was lifted on 31st October 1957 and production recommenced on 20th November 1957, i.e., an average monthly output (for 7 months' production) of about 10,090 tons per month.

Sales:—The total sales for the year amounted to 115,895 tons (averaging about 9,660 tons monthly), as compared with 53,424 tons for the preceding year (averaging about 9,080 tons monthly, during 7 months of production). Despatches in the previous year only started on 25th November 1957, after the lifting of the lockout.

Coal Prices:—The Coal Price Revision Committee appointed by the Government of India to examine and report on the cost of production of

coal has duly submitted its report to Government, and while an increase of Re. 0.50 per ton has been granted for coal from the Bengal and Bihar Fields from 25th August 1959, no increase has been granted for the outlying fields including the one in which the Company's Colliery is situated. However, grading of coal from the latter fields is to be undertaken by the Coal Board, after which it is hoped that the Government would sanction an increase for these areas also. In the meantime the controlled prices for the Company's steam and slack coals continue to be Rs. 21.58 and Rs. 20.56 per ton respectively.

Development Work:—About 4th August 1958, the Colliery Steam Generating Station was shut down and since then electrical energy has been supplied from the Hirakud Grid. Consequent on this changeover, 2 Lancashire Boilers, being part of the Generating Station, have now been dismantled and erected at a site adjacent to Pits 9 and 11 thus effecting a much needed improvement in the system of raising and lowering of men and material at these 2 pits.

It is also the Company's intention to modify the Colliery siding so as to make it capable of handling about 40 wagons per day (instead of the present capacity of 25 wagons daily), in which connection an application has been submitted to the South Eastern Railway authorities in Calcutta for sanction.

The results of the year's working, after setting aside Rs. 1,83,603 (Rs. 1,35,483) for depreciation and amortisation and Rs. 36,130 (nil) in respect of development rebate reserve (as required under the income-tax Act), show a profit of Rs. 17,155 (loss of Rs. 6,34,206 (Rs. 4,391) brought forward from the previous year and deducting from the balance Rs. 49,874 (nil), credited back in respect of excess provision made for taxation for the years ended 30th June 1955 and 1956, there is left a balance of Rs. 5,70,177 (Rs. 6,34,206) which is carried forward. Consequently, the directors consider that no provision for taxation is necessary for the year under review.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	20,00,000	Gross block	43,53,854
Reserves	1,01,130	Less—Depreciation	27,66,116

Rajagiri Rubber and Produce Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. A. V. Thomas & Co., Ltd., Alleppey, Kerala State) present the audited accounts of the Company for the year ended 30th June 1959.

The total estimated crop for the year under report was 5,70,000 lbs. rubber from Rajagiri and 8,00,000 lbs. from Shallicary (total 13,70,000 lbs.) to be produced at an average cost of 80 nP per pound. The actual crop harvested was 14,34,881 (14,10,177) lbs., viz., 6,34,700 lbs. on Rajagiri estate cost of 78 (77) nP per pound. The average sale price realised was Rs. 1.50 per pound as compared to Rs. 1.81 for the previous year.

After providing Rs. 4,30,000 (Rs. 4,50,000) for taxation and after adjusting Rs. 4,35,600 (Rs. 1,35,600) towards the dividend of 6 per cent. on preference shares for the year, there is left a balance of Rs. 2,74,280 (Rs. 2,03,080). This together with the carry forward of Rs. 40,666 (Rs. 40,666) transferred from reserve for Kuthalam pattam land amounts to Rs. 3,14,946 (Rs. 3,25,664) which the directors recommend be disposed of a under:—

To pay a dividend of 20 (20) per cent. on equity shares, subject to deduction of tax, absorbing Rs. 2,70,000 (Rs. 2,70,000) and to carry forward Rs. 44,946 (Rs. 40,664) after providing Rs. 15,000 for the rehabilitation reserve).

The directors have paid the preference dividend for the year 1958-59 after deducting tax in accordance with Section 18(3)(d) which would appear to them to be the proper procedure to be adopted.

A total crop of 13,80,000 pounds of rubber (Shallicary) is estimated to be harvested during 1959-60 season at an average cost of 83 nP per pound. The capital expenditure for the year 1959-60 is Rs. 1,37,702.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.

Sijua (Jherriah) Electric Supply Co., Ltd.

The directors of the above Company [Managing Agents: Messrs. Bird and Co. (Private) Ltd., Calcutta] present the audited accounts of the Company for the year ended 31st March 1959.

The profit and loss account, after providing for all charges and making provisions of Rs. 1,55,000 (Rs. 1,60,000) for taxation on income, Rs. 13,500 (Rs. 14,000) for wealth tax and Rs. 1,44,956 (Rs. 1,35,726) for depreciation and writing back provisions in respect of previous years of Rs. 18,655 (nil) for taxation, shows a profit of Rs. 1,74,556 (Rs. 2,68,634). To this amount is added the balance brought forward from the last account of Rs. 717 (Rs. 2,346) and the amount transferred from tariffs and dividend control reserve Rs. 55,795 (nil) making a total of Rs. 2,31,068 (Rs. 2,70,930). The directors have transferred to reserve for contingencies Rs. 36,866 (Rs. 35,872), to general reserve—forefeited dividends Rs. 1,040 (Rs. 934), to debenture redemption reserve Rs. 60,000 (Rs. 60,000) and to reserve for doubtful debts Rs. 200 (nil) leaving a balance of Rs. 1,32,962 (Rs. 1,14,957) after transferring Rs. 2,000 to capital reserve. Rs. 11,435 to tariffs and dividend control reserve. Rs. 11,435 to provision for rebate to consumers and Rs. 34,347 to development rebate reserve. The directors propose to dispose of this amount as follows:—

By payment of a dividend on the ordinary shares for the year ended 31st March 1959, at the rate of 75 (68) naye Paise per share without any deduction for income-tax payable by the Company, absorbing Rs. 1,26,000 (Rs. 1,14,240) and by carrying forward Rs. 6,962 (Rs. 717).

General.—The Undertaking operated satisfactorily during the year under review. Total units sold during the year amounted to 106.7 million compared with 103.8 million in the previous financial year. The Undertaking generated 79.3 million units, the same figure as in the previous year, while 35.6 million units were purchased from the D.V.C. against 31.7 million units purchased in the previous year.

Labour continued to be restive during the year under review. A number of disputes were referred to Conciliation and Arbitration and a major dispute concerning the method of calculating certain allowances was eventually referred to Arbitration, the results of which are still awaited.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	16,80,000	Gross block	81,60,958

Blue Mountain Estates Ltd.

The directors of the above Company [Managing Agents: Messrs. Kothari and Sons (Agencies) Private Ltd., Madras] present the audited accounts of the Company for the year ended 30th June 1959.

The result of the Company's working for the period under review after providing a sum of Rs. 1,40,564 (Rs. 1,32,498) for depreciation and Rs. 21,071 (Rs. 47,000) for development rebate is a profit of Rs. 7,45,658 (Rs. 18,47,026) to which is added the amount brought forward from last year of Rs. 2,79,391 (Rs. 88,615) making a total of Rs. 10,25,049 (Rs. 19,35,641). Out of this amount the directors have provided for taxation Rs. 1,80,000 (Rs. 4,00,000) leaving a balance of Rs. 8,35,049 (Rs. 15,35,641). The directors recommend to dispose of this amount as follows:—

To pay a dividend of 12½ (12½) per cent. on the equity share capital absorbing Rs. 6,56,250 (Rs. 6,56,250) leaving a balance of Rs. 1,78,799 (Rs. 2,79,391 after transferring Rs. 6,00,000 to general reserve) to be carried forward to next year.

Ten: There has been a decrease in tea crop, particularly in Glendale Estate, due to the severe drought conditions which prevailed during the latter part of the year.

The tea crop for the year 1958-59 amounts to 12,76,814 (18,15,095) pounds which includes 2,47,264 pounds manufactured out of purchased leaf. The all-in cost per pound works out to Re. 1.81 (Re. 1.62). Net price realised per pound was Re. 1.95 (Re. 1.93). The yield per acre comes to 781 (1,020) pounds.

Coffee: The Company has harvested a crop of 5,78,508 (7,26,643) Kilos or 11,388 (14,301) cwt. which is more than the estimate of 5,74,000 Kilos or 11,300 cwt. The all-in cost per cwt. comes to Rs. 143 (Rs. 113) or Rs. 2.85 (Rs. 2.50) per Kilo. 1 cwt.—50.8 Kilos.

Coffee Pool Payment Received During the Year: 1954-55 Crop: A bonus payment of 2 nP per point amounting to Rs. 6,731 was received, which is credited in this year's account. 1956-57 Crop: A further payment of Rs. 30,041 was received and credited to this year's account. 1957-58 Crop: The Company has received during the year, 18 nP per point over and above Rs. 2.12 per point valued on this year's crop and an amount of Rs. 1,98,609 is credited in this year's account. The

final payment of 21 nP per point announced in June, making a total payment of Rs. 2.51 per point was received in July 1959. 1958-59 Crop: This year's crop, as usual, has been valued at Rs. 2.12 per point or Rs. 167 per cwt. or Rs. 3.28 per Kilo though a higher return is expected as in previous years.

The tea crop, excluding purchase leaf, has been estimated at 13 lakhs lbs. to be manufactured at an all-in cost of Re. 1.65 per lb.

A crop of 6,73,600 Kilos or 13,260 cwt. of coffee at an all-in cost of Rs. 2.40 per Kilo or Rs. 122 per cwt. has been estimated for this year.

Labour and Staff Agreements: By an Industry-Wide agreement, the Maistry System was abolished during the year by paying them compensation.

Under the good offices of the Ministry of Labour and Industries, an agreement has been reached settling the labour bonus for each of the years 1957 and 1958 at 81 per cent. for Tea and 64 per cent. for Coffee on an ad hoc basis in Madras State. A similar agreement has been reached in the Mysore State settling the labour bonus for each of the years 1957-58 and 1958-59 at 7½ per cent.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.
Capital	52,50,000	Gross block	75,86,425
Reserves	21,68,071	Less—Depreciation	12,17,718
Provision for taxation	9,31,089		
Liabilities	12,34,994	Net block	63,68,707
Profit and loss account (surplus)	1,78,799	Stock of tea...	2,03,402
		Stores	2,13,803
		Debits, deposits and advances	16,99,194
		Investments	12,773
		Cash	12,65,084
	Rs. 97,62,963		Rs. 97,62,963

Indian Plastics Ltd.

The directors of the above Company (Managing Agents: Messrs. Birla Gwalior Private Ltd., Gwalior) present the audited accounts of the Company for the year ended 31st March 1959.

The profit for the year including the amount brought forward from the last year, but before charging depreciation, development rebate and wealth tax amounts to Rs. 2,87,670 (Rs. 2,92,490) deducting therefrom depreciation amounting to Rs. 1,49,775 (Rs. 1,50,283), transfer to development

rebate reserve Rs. 15,468 (Rs. 3,824), provision for wealth tax Rs. 24,304 (Rs. 49,722) and provision for income-tax Rs. 10,841 (nil) there remains a balance of Rs. 87,282 (Rs. 88,661). The directors propose to appropriate this amount as under:—

To pay a dividend at 5½ per cent. (less tax) on 22,500 preference shares of Rs. 100 each for the year ended 31st March 1959 absorbing Rs. 84,825 (Rs. 84,825) and to carry forward a sum of Rs. 2,457 (Rs. 3,836).

The directors regret to report that the working result for the year under review was not satisfactory for want of import licences for radio components and raw materials. The prices of raw materials have been showing an upward trend while the prices of plastic goods showed a downward trend due to heavy competition.

The development work is going on satisfactorily. Production of Urea powder has already started, though on a small scale which has been sold in the market to the full satisfaction of the customers. Arrangements are under way to increase the production to a large extent keeping pace with the requirements. Production of phenol formaldehyde moulding powder could not be increased substantially for want of enough licence for raw materials such as phenol and formalin. However, licence has been given for a little higher quantity for raw materials in the

GREAT EASTERN SHIPPING COMPANY LIMITED

FRESH EXPANSION PLANS SUBMITTED TO THE GOVERNMENT

MR. A. H. BHIWANDIWALLA'S SPEECH AT ANNUAL MEETING

ADDRESSING the shareholders of the Great Eastern Shipping Company, Ltd., at their Eleventh Annual General Meeting held in Bombay on 10th December 1959, Mr. A. H. Bhiwandiwalla, Chairman of the Company, disclosed that the Company had submitted proposals to the Government of India for expansion of its fleet by 70,000 to 80,000 g.r.t. during the third Plan period at a cost of Rs. 14 crores. He, however, added that these proposals could materialise only if the general and special problems, to which he made an extensive reference in his speech, were solved satisfactorily.

The following is the full text of Mr. Bhiwandiwalla's speech:

"GENTLEMEN,

"At the outset, I would like to refer to the great loss sustained by the Company in the death of the founders of the Company, viz., Mr. Maneklal Ujamshi and Mr. Jagjiwan Ujamshi Mulji. These two brothers were men of courage and foresight and your Company owes its present position and status, in great measure, to their business acumen. They lived a full life and blazed many a trail in the industrial and commercial life of the country. Although they passed away at ripe old age, your Company has become the poorer by their demise. You will no doubt wish me to record our deep sense of sorrow at the death of these two stalwarts.

"We are most fortunate in having our Board strengthened with three new Directors. Mr. L. T. Gholap joins as a Government nominee. We have all known Mr. Gholap for many years. Mr. Gholap has had varied experience as an outstanding administrator, and joins us after very close experience in the Indian shipping field, both as Controller of Indian Shipping and as Chairman of the Bombay Port Trust. You all also know Mr. Mohamed Hussein Hasham Premji, past President of the Rice Merchants' Association and Indian Merchants' Chamber. Mr. Madanmohan Mangaldas, who comes from Ahmedabad, has also very wide business and industrial interests. He was President of the Ahmedabad Mill-owners' Association. On your behalf I welcome all these gentlemen and have no doubt that they will contribute significantly in the future deliberations of the Board and vital decisions that your Company will take from time to time.

"The Directors' report and the audited accounts have been in your hands for some time now and, with your permission, I shall take them as read.

Brief Review of Results

"Last year, I had referred to the crisis faced by tramp shipping. The freight rates continued to be low during the year under review and a considerable part of the tramp and tanker tonnage in the world was laid up. It is no wonder, therefore, that, in spite of larger tonnage under operation and higher liftings of cargo at 8,77,000 tons, as compared with 8,43,278 tons lifted during the previous year, the freight and charter hire earnings fell from Rs. 3.59 crores in 1957-58 to Rs. 2.75 crores in the year under review. The fall in the net profit is, therefore, attributable, among other things, to the depression in the freight market, and higher depreciation provision.

"In order to maintain a steady and stable rate of dividend at 15 per cent. to equity shareholders, your Directors decided to transfer an amount of Rs. 15 lakhs from the general reserves of the Company to the profit and loss appropriation account. The necessity for drawing on the general reserves of the Company for purposes of payment of stable dividends to shareholders arose because of the statutory requirement that out of the profits of the year an amount equivalent to 75 per cent. of the development rebate on ships to be claimed for tax purposes must be earmarked and set aside as development rebate reserve. An amount of Rs. 29.50 lakhs has been set aside out of the profits as development rebate reserve. Therefore, in spite of the depletion of the general reserves by Rs. 15 lakhs, the total reserves of the Company have gone up from

Rs. 1.91 crores in 1957-58 to Rs. 2.08 crores in the year under review. The development rebate reserve will be frozen for a period of 10 years and thereafter could either be merged with the general reserves or utilised freely in any way deemed fit by your Directors.

Tankers

"Although your Company was the first to acquire and operate an Indian-owned commercial tanker, it is a matter of regret that the National Shipping Board has recommended reservation of the tanker trade for public sector Corporations. The main incentive underlying our acquisition of the first tanker was serving of national interests. I am convinced that in the tremendous task of building an adequate and balanced merchant navy, active co-operation and participation of all Corporations, whether public or private, are essential and restrictive policies are least desirable.

"The tonnage moved on the coast in 1958 was about 1.5 million tons. It is expected that an upward trend in the coastal traffic of oil products would continue at least until the establishment of the Gauhati and Barauni refineries in the public sector. Although one cannot forecast accurately as to how this movement will be affected after 1962 when the two public sector refineries go into production, it has been estimated by the Government that even for catering to the total coastal movement of 1.5 million tons we would require about 12 tankers aggregating about 120,000 to 144,000 d.w.t. It is, therefore, quite certain that the present fleet of two Indian tankers on the coast will have to be stepped up at least to eight, if not twelve, tankers. I am, therefore, not able to follow the oil companies' statement that three coastal tankers will cover the entire oil movement on the coast. I would request the oil companies to reassess correctly the coastal tanker requirements, with a view to ensuring self-sufficiency of Indian tankers on the coast by 1962. The goal of self-sufficiency in Indian coastal tankers is legitimate and the responsibility for achieving this goal rests squarely on the shoulders of the Fuel and Oil, Transport and Finance Ministries and oil companies and shipowners. Each of them has to discharge their part of responsibilities, so that the blame of continuous foreign exchange drain after 1962, at least for domestic oil movement, is not attributable to any of them.

Coastal Dry Cargo Trade

"A very disquieting feature for coastal dry-cargo trade is the policy pursued by the Indian railways in respect of carriage of coal on the coast. The Government should broadly demarcate fields for various modes of domestic transportation as a national policy. About 40 per cent. of the total movement of dry cargo on the coast consists of coal, and for coastal movement of coal sea transport is definitely cheaper than rail transport in actual cost. The railway freight rates on coal have been artificially kept down. The Rail-Sea Co-ordination Committee, consisting of high officials of only the railways and the Government, recommended reservation of movement of coastal coal for Indian shipping. However, the Railway Ministry have not complied with this recommendation, and are endeavouring to divert part of the coastal coal movement to railways, because of their spare wagon capacity. It is high time that the Government, who are so keenly desirous of developing Indian shipping, will stop the encroachment of the railways upon the legitimate field of shipping, and ensure the acceptance and implementation of the Rail-Sea Co-ordination Committee's recommendation.

Last Year's Expansion Proposals

"In my speech last year I had referred to your Company's rupee four-and-a-half-crore expansion plan under which four overseas dry-cargo ships were to be built. The continued deterioration in the freight market and the frittering away of Government cargoes by Government Ministries and autonomous organisations, such as the State Trading Corporation, in foreign ships, in spite of the accepted Gov-

ernment policy of patronising Indian ships on a preferential basis, made your Board of Directors drop that expansion plan.

Co-ordination of Government Cargoes

"It is a matter of gratification that a historic decision has been taken by the Government to co-ordinate effectively the Government cargoes belonging to various Ministries and Government organisations and achieve a saving in their total freight bill and the foreign exchange element of it. This decision will have a far-reaching effect on the development of Indian shipping after the scheme is put into effective working and will enable the shipowners to embark on expansion with an element of security. The Indian shipowners will also have the figures and statistics of cargoes readily available. It is a general feeling that the decision has been taken by the Government at a very propitious time. I am sure the Indian shipowners will reciprocate fully and extend their co-operation in achieving the national objective. It is hoped that a Chartering Committee or Corporation would soon be formed by the Indian shipowners, who will make available their expert knowledge in the fixing of Government cargoes in Indian ships as well as foreign ships.

Future

"Since the Middle of 1957 the freight market has been declining continuously. In view of the considerable excess tonnage, no one could foresee any improvement in the freight market. However, since October this year we have seen resistance and, in fact, a slight improvement in the international freight market has been registered. The laid-up war-built tonnage is getting older and some shipowners are mustering courage to foresee a brighter future by end 1960-61. It is reasonable to expect an improvement.

"The gross freight and charter earnings for the five months ended 30th November 1959 are expected to be about Rs. 1.60 crores, as against Rs. 1.12 crores during the first five months of the year under review. In view of the increased tonnage owned by your Company and its more active operation, the freight earnings in the current year, seven months of which are still to go, may, in the absence of unforeseen circumstances, well exceed Rs. 3.00 crores, as compared with Rs. 2.75 crores during the year under review.

Third Five-year Plan

"The National Shipping Board has recommended a target of 16 lakhs g.r.t. to be achieved by the end of the third Five-year Plan. It also appears likely that the Government will include shipping in the core of the third Five-year Plan. The problem, however, bristles with the difficulty of finding gainful employment for expanded Indian shipping. The problem can be solved if the Government accept and implement the recommendations of the Rail-Sea Co-ordination Committee and take the other necessary steps for making increased quantities of coal, salt and other cargoes available for carriage by sea on the coast and arrange channeling of all Government cargoes in the overseas trade through the proposed Chartering Committee. Besides these general problems, your Company has the special problems of operation and development of tramp tonnage and entry in the India-U.K.-Continent Liner trade.

"Last year, I dealt at considerable length with the question of freedom of operation to tramp operators and the urgent need for enunciation of a suitable and dynamic policy with regard to the operation of the tramp wing of shipping. I am glad that there is better understanding and appreciation in Government quarters of the special problems of tramp shipping. Permissions and licences required by us for voyage and time charters are being freely given from time to time. However, it is essential for the Government to enunciate and announce their policy in order that operators of tramp shipping are certain about the Government policy and proper climate for the expansion of tramp shipping is created. It is also hoped that the Government and the two Indian Liner Companies in the India-U.K.-Continent Liner trades will actively support our entry in the India-U.K.-Continent Liner Conference and secure our participation in this liner trade. In view of the progressive execution of our country's economic plans and consequent expansion in trade, there is scope as well as necessity for another Indian participant in this liner trade. If these general and special problems are solved, your Company will be able to add, inclusive of

requirements for scrapping and replacement of old units, 10 to 11 ships of a total tonnage of 70,000 to 80,000 g.r.t. on the Indian Register during the third Plan period, at an approximate cost of Rs. 14 crores. It is assumed that the Government will grant loans to meet the usual 85 per cent. cost of new buildings or acquisitions and the 15 per cent. balance fund will be found out of our own resources. We have already submitted these expansion proposals to the Government and have made clear to them that these expansion proposals can materialise only if the general and special problems mentioned above are solved satisfactorily.

Fresh Capital Issue

"Very broadly speaking, considering our Company's role and responsibility during the third Plan period, this very large expansion will have to be equally well shouldered by you by way of subscription to further capital, let us hope, at the beneficial par basis. I know, in the meantime, partly-paid shareholders have been wondering why the call of Rs. 30 lakhs has not been made. I may state the reasons:

"First, we have over Rs. 1.4 crores in liquid resources and funds are actually unrequired since our second Plan target has already been achieved long ago.

"Second, the depressed condition is still continuing in the freight market. Therefore, it appears unwise to load the Company with greater dividend liability.

"I can assure you a very close watch will be maintained and at the earliest opportunity my colleagues and I will consider the question of making the call.

"Shipping industry has been fortunate in having popular, fine and highly respected political leaders as their Union Minister almost all of whom are continuing in the Cabinet. Are we not, therefore, placed in the envious position of being understood better than many other industries?

"We welcome Dr. P. Subbarayan, an elder statesman from Madras with very quick grasp and charming manners. He has fast been assessing the challenges that are faced by the transport system as a whole. We wish him all good luck and assure our closest co-operation in achieving the common objective, that is, speedy growth of Indian merchant marine.

"I express our sincere appreciation and thanks to the Minister for Shipping, the Transport Secretary, the Director-General of Shipping and the Senior Deputy Director-General of Shipping and their officers and staff for their active assistance and encouragement. I must also pay our sincere tributes to our valued shippers for their ever-growing support and to our staff ashore as well as afloat and agents at the various ports for efficiently shouldering their heavy responsibilities.

"I now move for the adoption of the audited accounts and the Directors' report."

Note: This does not purport to be a record of the proceedings of the annual general meeting.

BOMBAY, 26th November 1959.

CORPORATE TAXATION NEEDS FURTHER REFORM

ASSOCIATED CHAMBERS' PLEA FOR REMOVAL OF INEQUITIES AND ANOMALIES

AT the annual general meeting of the Associated Chambers of Commerce held at Calcutta this week, the subject of corporate taxation figured prominently. In his presidential speech, Mr. J. D. K. Brown observed that, while the new system of taxation, announced in the last budget was welcome, the rate of taxation at 45 per cent. was still high and should be brought down to 40 per cent. Urging that further consideration be given to the position regarding taxation of dividends on inter-corporate holdings, he observed:

"One of the most significant trends in this country since Independence has been the growth, halting at first, of institutional financing methods to supplement the efforts of the managing agencies and to some extent supplant them, and I submit that, for these new institutions to be enabled to fulfil adequately their purpose in the industrialisation of the country, their own efforts must be supplemented as far as possible by the free flow of corporate funds. I know there is, in some quarters, a prejudice against all inter-corporate investment, but I think that to seek to limit its scope and extent by taxation measures is the wrong way to cure any undesirable practices in this field. And so we would urge that taxation of inter-corporate dividends should be on the lines of American practice, whereby, I understand, a very substantial tax rebate is allowed in respect of dividends received by one company from another."

Another point made by Mr. Brown related to the effect of the new system on foreign companies holding minority interests in Indian companies. In their case, the impact of the new system is more severe, unless the dividends which they receive rank for relief under Section 56A of the Income-tax Act. Mr. Brown thought that the time had come, in the altered circumstances obtaining today, when the whole question of the justification for differential rates of tax on the profits of foreign companies should be re-examined. The abolition of differential rates would, he believed, be regarded abroad as a real earnest of India's desire to attract and retain the foreign capital which the country so badly needed.

Bonus Tax

Commenting on the continued retention of bonus tax and its extension to cover issues made out of premium account balances, Mr. Brown remarked:

"We have tried to see the justification for such taxation, but I confess we seem to have failed. We are, however, in good company, since such august and authoritative interpreters of the canons of taxation as the Taxation Enquiry Commission in India, the Royal Commission on Taxation of Profits and Income in the United Kingdom, and, indeed, Professor Nicholas Kaldor himself seem also to be opposed to the levy of this tax. At the present time, when so much industrial expansion is being financed out of borrowed funds, which can only ultimately be repaid out of retained profits, it is clear that every inducement must be given to companies and their shareholders to plough back profits into their businesses. Now that we have the position where tax at 30 per cent. has to be deducted from a dividend payable to an individual shareholder, whereas the same percentage has to be paid by the company on eventual capitalisation, it seems to me that shareholders are going to question more frequently the wisdom of placing large sums to reserve out of profits on the grounds that they can themselves make just as good use of the money which they would receive as additional dividends under deduction of tax."

Clarifying the object of his pleas, Mr. Brown added:

"... this is not a plea for a reduction in taxation. What we seek is the removal of what appear to us to be certain anomalies and inequities, so that the system is rendered more adequate for its purpose. The additional contribution to the country's resources which can come from increased rates of tax on the corporate sector cannot be more than marginal at best; on the other hand, we believe that there is considerable scope for progressively increasing yields from that source, arising from its natural expansion, given a favourable investment climate. I am sure that, in this field, as in others, positive incentives will produce more rapid and beneficial results than will follow from measures based on penalties for failure to conform to policies of restriction. The revised structure now being introduced is some recognition of the validity of this view; our plea is for further progress along the same road."

Resolution

The resolution on this subject adopted at the meeting urged that "in the interests of accelerating capital formation, Government should so adjust the rates of tax payable as to ensure that the overall burden of taxation on companies and their shareholders will not be in excess of what it was prior to the coming into force

of the Finance Act of 1959." It also submitted that, having regard to the urgent need to implement without delay the country's development plans, it is particularly necessary that action should be taken on the following lines, namely: (1) the rates of tax on income from inter-corporate investment holdings should be effectively reduced by the grant of an adequate rebate in respect of such income; (2) in the interest of attracting further foreign investment, foreign companies should henceforth be assessed at the same rates as Indian companies; (3) the taxation of bonus share issues, whether out of accumulated past profits or from share premiums, should be abolished."

Mr. Dandekar's Arguments

The aforesaid resolution was moved by Mr. N. Dandekar, President of the Bombay Chamber of Commerce. In his speech on the occasion, Mr. Dandekar observed as follows:

"The structure of our corporate taxation has been considerably simplified. The imposition of taxes on companies is now at a uniform rate, without surcharges, and that cumbersome system of corporation tax rebates, or withdrawals of reliefs, has gone. The theory that income-tax paid by the company was deemed to be paid by the shareholder, with the consequent system of grossing-up dividends with an equivalent tax credit to shareholders, has been replaced by the theory that the company does not pay tax on behalf of anybody but itself, with the consequence that, far from getting any credit for any tax paid at source, the tax payable by the shareholder on dividends is now to be deducted by the paying company at source and paid over to Government on behalf of the shareholder. This arrangement is not without its difficulties, to two of which I shall refer later; but, generally speaking, the trend towards simplicity in calculation and procedure is very much in the right direction. For all this we must, in an ungrateful world, be truly grateful. From the point of view of those who spend much of their time on either side of the tax officers' tables, the new structure of corporate taxation envisaged by the Finance Act 1959 is the most workmanlike we have had in many a year.

"These alterations in the structure of corporate taxation were so far-reaching that comparison between the net total of the taxes payable by companies before and after these changes was a matter of the utmost complexity needing careful calculation. In place of different rates of corporation tax effective in varying circumstances, an income-tax coupled with a surcharge, the wealth tax and the excess dividend tax, we now have revised rates of income-tax and super-tax and a new system of tax deduction at source in the case of dividend payments. Inevitably, the incidence of total taxation on individual concerns under the new system was likely to vary when compared with the net amount of tax retained by the Government before these readjustments. It was this fact which induced the Chambers to embark on an unusual and ambitious statistical experiment, the purpose of which was to obtain by a study of representative data a comparative estimate of the effect of the new tax measures on the corporate sector.

Treasury Takes Away More

"We found, without surprise, that the Central Board of Revenue had endeavoured to ensure that when the Finance Minister, in the last budget speech, had said that 'the overall tax rate is to be applicable to Indian companies will be as fixed that the yield will be equal to the present annual gross yield, less the annual credit now given to the shareholders,' he was well and truly covered by the advance tax rates at 20 per cent. for income-tax and 25 per cent. for super-tax. There was, in fact, a clear margin in favour of revenue which would ensure that the gross yield would be slightly higher rather than any lower. Out of 187 companies we examined, the tax liability of 43 would be reduced by more than 2 per cent.; but in by far the majority of cases—89 to be exact—the net tax liability would be increased by 2 per cent. or more. It was also significant that the total taxable profits of these 88 amounted to 60 per cent. of the total taxable profits of all the companies included in the analysis.

"It was at once clear that the simplification of the structure had thus resulted in an increase in the net burden of tax on corporations in the majority of cases; and our pleasure at the sight of the simplification of the structure, the uniform rate of corporation tax, and the departure of wealth tax and excess dividend tax, had to be qualified by the fact that most of us would have to dig deeper into profits for the payment of taxes, and even deeper still, if the growing demands from shareholders (whose position I shall consider later), were to be met even to the minimum extent of maintaining the rates of tax-free dividends. This might not have been so serious if the profits of our members today were generally up to the level of those for the accounting year relevant to the assessment year 1957-58. It is this assessment year which, if we were to obtain a true picture, we had to consider as the base year (for our statistical study) for a number of technical reasons, which it is unnecessary to elaborate. But the fact is that

since that accounting year, many of us have had cause to endorse the statistics published by the Reserve Bank of India with regard to the profits in the subsequent year of 1,001 companies. The findings of the Reserve Bank are worth quoting:

"With the slowing down of the rate of increase in industrial production and with slackness in certain sectors of industry, notably cotton textiles, the rate of increase in sales also slowed down and profits before tax recorded a steep fall, for the first time since the post-Korean recession in 1952, from Rs. 129 crores in 1956 to Rs. 104 crores in 1957; the largest decline of Rs. 20 crores occurred under cotton textiles. The amount distributed, however, was maintained around the previous year's level, partly by substantial cuts in appropriations to reserves, and partly through withdrawal from reserves."

"This means that the average net tax retention by Government, over 1957 and 1958 taken together, may well be only about 40 per cent. of the taxable profits or even less, calculated according to the structure of taxation as it existed before the 1959 Finance Act."

What is Needed

"It was, and I believe it still remains, the express wish of the Finance Minister not to increase the overall net rate of tax from the corporate sector. If so, our conclusion on the data available must be that, under the new structure of corporate taxation, the overall rate of corporate taxation on Indian companies, which would correctly interpret that wish, would not exceed 40 per cent. of the taxable profits. In other words, 40 per cent. and not 45 per cent., is the aggregate rate of income-tax and corporation tax which we consider would be fair and accurate if our burden and the burden of the shareholder—in terms of overall rate of gross yield of tax from the corporate sector—are not to be increased. In moving this resolution, therefore, we seek to urge upon the Finance Minister, when he will be concerned with legislating the rates of tax on companies for the assessment year 1960-61, the necessity to make comparison of the future tax incidence on the corporate sector, with the incidence for the 1957-58 assessment year, only if the figures for that year are appropriately qualified and modified by the decline in profit trends since that year up to the present time. Thus, we entirely support the Finance Minister's decision not to increase (or decrease) the overall net yield from the corporate sector under the new system, as compared with what it would be under the old system and at the old rates. We are merely trying to see that it is exactly this decision which will be reflected in the rates of the tax prescribed for companies in the Finance Act 1960."

Grossing

"I will now deal with the two major difficulties to which I referred earlier. One of these relates to the abolition of grossing up and the consequent withdrawal of the tax credit to shareholders when dividends are distributed out of past accumulated profits, even where these are shared profits. Many prudent companies, by following a very conservative policy in past years, have ploughed back large amounts of taxed profits to reserves with a view to augmenting their financial resources for utilisation in their future rehabilitation and expansion programmes, instead of distributing all the available profits to their shareholders as dividends. By adopting such a policy, these companies have not merely strengthened their own positions but have also made substantial contributions to the economy of the country as a whole by increasing their productivity and productive capacity. But with what results now, in the new context? The Finance Act 1959 has virtually confiscated the benefits which should have accrued to shareholders of these companies years before, but which were voluntarily withheld from them for the time being. To say the least, this is inequitable and unfair to the shareholders for they had hoped very legitimately that the policy of ploughing back profits would not only lead to higher returns in future years, but they had always believed that the tax credit due to them would be available whenever the reserves were distributed."

Double Taxation

"Government's action in withdrawing this tax credit will inevitably result in double taxation—for the amounts distributed to shareholders hereafter out of past accumulations of taxed profits will already have borne income-tax once in the hands of the distributing company at a time when such tax was deemed to have been paid by the shareholder, and they will be taxed again in the hands of the recipients at the time of distribution. This will mean discrimination in favour of the shareholders of companies who had followed a conservative policy in dividend distribution. We therefore feel very strongly that, in equity and justice, the whole question should be given serious consideration at the time of framing the financial policy of Government for the next year's budget, and that adequate provision should be made therein for appropriate relief. Omission to do this will, quite apart from any question of equity, be a matter of some concern to the managements of those concerns who have followed sound conservative financial policies in the past."

Inter-corporate Holdings

"I turn now to the second major problem, namely, the incidence of the new structure and rates of corporate taxation on inter-corporate holdings. I may say at once that, in our opinion, the heavier burden now placed on those receiving income from inter-corporate investments needs special consideration. The provisional aggregate net rate of 45 per cent. which has been decided upon for the taxation of companies in 1960-61 and which is, indeed, already in force for deduction of tax at source from dividends paid to companies, is plainly excessive so far as the taxation of inter-corporate holdings is concerned, particularly because, in addition to a net basic rate which is in itself so high, there is involved the loss of credit for income-tax that was hitherto available at every stage of the taxation of dividends from

inter-corporate holdings. I refer to the credit for income-tax to which the investing company was entitled in respect of the dividends received by it out of the taxed profits of the operating company and to the further tax credit to which the shareholder of the investing company was also entitled in respect of the dividends received by him out of the taxed profits of the investing company, both of which tax credits have now been lost under the new procedure."

"For the convenient consideration of this important problem, inter-corporate holdings can be divided into four categories:

- (1) Holdings by Indian or foreign companies in Indian operating companies to which Section 56-A of the Income-tax Act applies;
- (2) Holdings by Indian or foreign companies in Indian operating companies to which Section 56-A does not apply, but which are subsidiaries of the holding companies;
- (3) Holdings by Indian companies in Indian operating companies to which Section 56-A does not apply and which are not subsidiaries of the holding companies;
- (4) Holdings by foreign companies in Indian operating companies to which Section 56-A does not apply and which are not subsidiaries of the holding companies.

"It is true that, so far as the investing companies themselves are concerned, no substantial hardship is likely to occur under the new system in regard to the first three categories of companies, because the net income (after tax) remaining with the investing company in such cases out of the dividends received by it from out of the taxed profits of the operating company will be somewhat, but not appreciably, lower than under the old system. But the shareholders of such investing companies will, however, encounter very serious hardship, because there will occur a substantial reduction in their gross dividend income from the investing companies. In other words, the loss to the shareholders of investing companies resulting directly from the loss of tax credit at two stages will be substantial; and there is, therefore, a strong case for some specific relief to ease the burden in such cases."

"The type of inter-corporate holdings which, however, will be the worst affected under the new system is that described in category (4) above, namely, minority holdings by foreign companies in Indian companies to which Section 56-A of the Income-Tax Act does not apply. This is a serious matter, because, in our view, foreign companies, whether operating in India directly or through other companies, have always been rather more heavily taxed than was warranted by a proper appreciation of all the facts and circumstances; and the position will now be further aggravated under the new system. This is a subject of a considerable importance, both directly as well as in the unfortunate effect it could have upon the future volume of investment (and disinvestment) in India by foreign companies."

BRITISH COMPANIES WORKING FOR INDIA

INTEREST RATES HARDEN

(From Our Own Correspondent)

BOMBAY, 9th December

The stringency in the short-term money market continues. The growing pace of demand for bank credit has brought more banks to the market, which is bereft of funds. Consequently, there has been a further hardening of interest rates in the inter-bank call money section from 2 per cent. to 3 per cent. among the Exchange banks and big Indian banks, though the bulk of the business is being done at 2½ per cent. The corresponding rate among the smaller banks has gone up from 3 per cent. to 3½ per cent.

In tune with the market trend, the Treasury Bill discount rate also has hardened from 2.338 per cent. to 2.370 per cent. this week. Even the response to the tenders has not been encouraging and shows that the Bills have been taken up by special quarters. For the amount offered at Rs. 2 crores is no more than that invited. Nevertheless, the authorities have invited tenders for a similar sum for next week. The sales of Intermediate Bills during the period 2nd to 5th December were also poor at Rs. 5 lakhs, as against Rs. 2.20 crores in the previous week. Sales of these bills are, however, being continued this week at Rs. 99.426 per cent., giving a slightly higher discount rate of 2.298 per cent., as against 2.276 per cent. last week.

There is no change in term money rates. House money at seven days' notice is fetching 3 to 3½ per cent. and short-term deposits 3 to 3½ per cent. for one to six months.

After a break of three weeks, during which period there was an aggregate contraction of Rs. 25.05 crores in notes in circulation, there has been an expansion of Rs. 31.05 crores in active notes during the week ended 4th December 1959. Notes held in the Banking Department of the Reserve Bank have declined by Rs. 13.35 crores. The net rise of Rs. 17.70 crores in total notes issued is covered by an increase of Rs. 20 crores in rupee securities and a fall of Rs. 2.30 crores in rupee coin. The Central Government's deposits are higher by Rs. 3.43 crores, while deposits of other Governments and banks have dwindled by Rs. 12.55 crores and Rs. 3.19 crores, respectively. There has been no change in external assets which stand at Rs. 204.20 crores. Loans and advances to Governments have risen by Rs. 3.71 crores and other loans and advances by Rs. 5.42 crores. Investments are lower by Rs. 5.74 crores and Treasury Bill holdings by Rs. 2.38 crores.

The Scheduled Banks' statement for the week ended 27th November 1959 shows a rise of Rs. 3.93 crores in time deposits, while demand deposits are almost unchanged. Inter-bank borrowings are up by Rs. 1.58 crores. A decline of Rs. 2.87 crores is noted in advances, while bills purchased and discounts show a rise of Rs. 1.24 crores. Investments have gone up by Rs. 6.18 crores. While cash balances have dwindled by Rs. 4.50 crores, money at call and short notice is higher by Rs. 4.22 crores.

The gilt-edged market has again turned dull. Though there has been a rise in a few counters over the week, the demand from institutional investors has slackened, on account of the stringency in the money market. 3 per cent. 1986 Conversion Loan continues to rule weak, with a further drop of 25 nP during the week to Rs. 73.60. 3 per cent. 1963-65 shows a rise of 5 nP to Rs. 98.20 and 3 per cent. 1966-68 has gained 10 nP to Rs. 95.10. 3 per cent. 1970-75 has moved up by 5 nP to Rs. 93.15, while 3½ per cent. 1981 has shed 5 nP to Rs. 100.20. State loans, too, are dull and some of the 4 per cent. 1971 loans have been slightly marked down.

The downward trend in £ sterling noted for some time past persisted during the earlier part of the week under review, when the spot rate in New York dropped from 279.96-280.00 to a low of 279.62-279.65 cents on Thursday last. Since then, it has staged a recovery to 279.97-280.00 cents yesterday. The three months' forward rate closed yesterday at 280.51-280.54 cents after having fallen earlier from 280.53-280.57 cents to 280.14-280.17 cents. In consonance with this trend, the rupee also recovered its earlier loss. Banks' selling rate for U.S. T.T. (ready) closed at Rs. 478 per \$100, after rising from Rs. 478 to Rs. 478.50. Their buying rate rose from Rs. 474.50 to Rs. 475.25 before declining to Rs. 474.75 per \$100.

ACUTE SHORTAGE OF COPPER SCRAP SUPPLIES

(From Our Own Correspondent)

CALCUTTA, 8th December

A further gain in price was recorded by electrolytic zinc in the metal market during the week under review. From Rs. 128, the quotation moved up to as high as Rs. 137.50, which was incidentally the highest level touched so far this year. Towards the week-end, a recessionary tendency was in evidence and the closing rate stood at Rs. 135. Demand was good and a few bigger consumers, having found their supplies against actual user licences which were lower than their requirements, turned to the market for meeting their further needs. The supply position became tighter. On the London Metal Exchange, the price hardened from £95½ to £95¾ per ton, following a widening in backwardation. Subsequently, the price eased to £94½.

There was an acute shortage in copper scrap and, although the ingot supply position improved due to the availability of the metal against permits, copper clean wire scrap rose by a rupee to Rs. 234. In London, spot copper advanced from £235½ to £250 per ton, thanks to the recession of the possibility of an imminent strike in the U.S. Japan, West Germany and the Continent displayed greater interest. For the same reason, the price in New York rose to as high as \$32.26 cents per lb. from 31.90 cents earlier.

BEARS PAY MARGIN ON SILVER AND GOLD

(From Our Own Correspondent)

BOMBAY, 9th December

The bullion market ruled distinctly easy during the week under review, on account of reports that floating stocks in the local market had increased, the latest estimates being 36,000 tolas of gold and 1,650 bars of silver. There were, besides, rumours of some contra-bank arrivals. At the same time, the demand for both the metals was poor. The daily average offtake of silver was just 7 bars, while arrivals were 13 bars. The offtake of gold, too, was low, averaging 2,800 tolas per day, as against the average daily arrivals of 3,600 tolas.

The rise in the carryforward charges also adversely affected the sentiment of the market. The rate for transferring commitments in silver from December to January settlement, which was against bulls throughout, widened from As. 15 early in the week to Re. 1 on Saturday, so that the bears were obliged to pay a margin of Rs. 1,000 per bar. Notwithstanding the margin, the rate widened further to Re. 1-3 on Monday and Re. 1-4 yesterday and today. The carryforward rate for December settlement in gold stood at As. 8 on Monday against bulls, as against As. 7 in the earlier sessions, and a margin at the rate of Rs. 10 per tola became operative on bears. Yesterday, however, the rate reverted to As. 7 only to widen again today to As. 11, with the result that the margin became operative again.

Bullion traders have noted the interesting judgment, given by the Bombay High Court on Monday, to the effect that the offence of smuggling is completed when the gold crosses the customs barrier, and whatever is done with reference to the gold after the offence of smuggling is completed cannot be considered as an act of importation into India contrary to the prohibition and restriction.

In the silver section, December settlement encountered selling and moved down in the course of the week from Rs. 211-1 to Rs. 207-1 today. At lower levels, there was some support and the closing rate was better at Rs. 208. January settlement receded from Rs. 212 to Rs. 208-4 before finishing at Rs. 209-4.

Ready silver began the week As. 8 lower at Rs. 209-10 and drifted lower to touch a low of Rs. 206-10 today. Towards the close, it evoked support and recovered to Rs. 207-10.

In gold, December settlement, which stood at Rs. 125-2 on Wednesday last week, retreated to Rs. 123-8-6 at one time today. It, however, finished higher at Rs. 123-14. January settlement fluctuated between Rs. 125-13 and Rs. 124-4-6 before closing at Rs. 124-9.

Ready gold came in for selling, the quotation declining from Rs. 124-13 to Rs. 123-9-6 today. At this level, it elicited enquiries and recovered to Rs. 123-14. The rate was on a par with that for the December settlement, whereas the spot was quoted at a discount of As. 5 last week-end.

Both spot and forward silver in the London bullion market were unchanged during the week under review also, yesterday's quotations being 80½d. and 80½d., respectively. Silver in New York, too, was unaltered at 91.375 cents. Ready gold in London firmed up from 250s. 3½d. to 250s. 8½d. on the 4th inst., on account of the persistent easiness of the pound sterling vis-a-vis the dollar. Subsequently, however, it eased to 250s. 7½d., following recovery in pound sterling. The latest available world price for gold in London is \$35.04-\$35.06 per ounce, as against \$35.04-\$35.06 last week.

The following comparative table shows at a glance the trend of the market during the week under review:

	9-12-59	Highest	Lowest	2-12-59
Gold	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready (99 fine Mint)	123 14	125 01	123 01	124 13
Forward	123 14	125 01	123 01	125 2
Sovereign	81 0	—	—	81 0
Silver				
Ready (999 fine Mint)	207 10	211 9	206 10	210 2
Forward	208 1	210 8	207 1	211 2
London Silver Ready	80½d.	—	—	80½d.
London Forward	80½d.	—	—	80½d.
London Gold	250s. 7½d.	250s. 7½d.	250s. 8½d.	250s. 3½d.
New York Silver	91.375c.	—	—	91.375c.

* 16th December settlement. † 16th December settlement.

LINSEED EASY

(Messrs. A. Bradley and Co.)

CALCUTTA, 7th December

Owing to the poor demand, linseed and linseed oil ruled easy during the week. Availability was still scarce and, with only limited enquiries from local crushers, business was negligible. In the oil market, with no appreciable stock held by either manufacturers or dealers, prices did not show much decline. The tendency, however, was quiet.

The latest available quotations per maund are: Ready-December Rs. 24.75, January Rs. 25 and May futures Rs. 23.94.

In London, tin eased from £792 to £790 a ton. Locally, the price gave way from Rs. 564 to Rs. 562 per cwt. However, the quotation in Bombay was as low as Rs. 550 per cwt. Consequently, Calcutta orders were diverted to that end. Lead eased from Rs. 73.50 to Rs. 72.25 per cwt. Demand fell much below what was offered. In London, however, a firmer tendency developed on account of greater consumer demand. Reflecting this, the price closed better at £71½ per ton as against the opening of £70½.

COTTON FUTURES FIRMLY STEADY

(From Our Own Correspondent)

BOMBAY, 9th December

The imposition by the Forward Markets Commission of heavy margins in the futures section on the purchase and introduction of fresh controls on the purchase of cotton and kapas (unginned cotton) by mills in the spot market announced by the Textile Commissioner this week failed to have any perceptible, adverse effect on the cotton futures market. Although the Jarilla March 1960 contract declined immediately after the announcement on Saturday to Rs. 751.50 in kerb trading from the day's official closing of Rs. 757.75, it recovered in subsequent sessions to quote at Rs. 759.60 yesterday. Operators were inclined to think that, in view of the reduction in crop estimate to 4.5 million bales, the keen demand for cotton and the persistent firm trend of spot prices, the outlook for cotton futures was bullish. Even after the recent steep rise in price, futures were considered cheap vis-a-vis spot cotton. But the prohibitive margin of Rs. 75 per bale that becomes payable when the contract price rises to Rs. 770 even ready to pay the heavy margin and, if necessary, accept delivery against the contract. But not the contract fluctuated between Rs. 750 and Rs. 760.

A section of the trade is strongly critical of the heavy margin which, according to it, is unwarranted in view of the scarcity of ready cotton. This section points out that, normally, the trade covers its sales to mills by purchasing forward hedge contract. If this legitimate cover is denied to them by the imposition of deterrent margins, normal function of pre-season sales to mills and, therefore, strongly urged that genuine hedging, that is, purchases of forward contract against sales to mills, should be exempted from the payment of the enhanced margin. They point out that the Forward Markets Commission has granted such exemption in the case of other commodities like groundnut.

I.C.C. Moglai Jarilla March 1960 opened the week at Rs. 754.50 and after having improved to Rs. 758.50 on Saturday receded to Rs. 752.50 on Monday. The contract rose to Rs. 759.75 yesterday, improved fractionally to Rs. 758.50 today, the contract at Rs. 757.25.

In the spot section, after the announcement of fresh controls, mills showed a cautious buying policy. Needy mills, however, purchased sizable quantities of CO2, Rajapala, Laxmi, Kalyan, had begun stocktaking with a view to assessing their stock position. The Textile Commissioner's indication that, on an overall view of the situation of the Indian crop and imports of foreign cotton, adequate, failed to impress the trade, although his assurance that the Government would see to it that no scarcity of cotton occurred was welcomed. Some traders thought that the Government might put of fresh purchases. There were also fears that and that the Government might and of the wedge induce distribution control in respect of at least such varieties of cotton as are in short supply.

In the export section, Bengal Deshi evoked good inquiries. Prices hardened further. Export of 75,000 bales of Bengal Deshi up to export quota aggregated 4,850 bales. The payments agreement concluded between India and Pakistan was officially announced on the 4th inst. Under this stand of 15/16" to 1-1/16" staple. An announcement permitting import of this cotton is expected soon.

Prices of all foreign cotton hardened further. Consequently, turnover was limited. At the auction held at Kampala yesterday, East African cotton fetched still higher prices. The following are the prices—in rupees per candy—of some select East African cottons:

B.P. 52 1,527; Busoga 1,480; Jinja 1,405. These prices are up by Re. 60, as compared with those prevailing a week ago.

The purchase authorisation favouring India for 100,000 bales of U.S. cotton under P.L. 480 has been issued. The contracting period for import of this cotton is between 15th December 1959 and 31st May 1960. The shipment period extends up to 30th June 1960. The following are the latest available quotations—in rupees per candy of 784 lb.—from Sewri:

Bengal Deshi 670; Berar Jarilla 840; Punjab 216F 1,020; Vijay 940; Hubli Jaydhar 950.

Fully firm conditions prevailed in the Karachi cotton futures market during the week under review. Keen local demand and good export enquiries pushed up prices. N.T.R.C. January firmed up from Rs. 69-1 last week-end to Rs. 71-1. The March position improved from Rs. 68-12 to Rs. 70-10 yesterday. The market was closed early yesterday under an emergency order. The spot section too was active. Prices ruled firm.

Cotton futures values in Alexandria hardened further during the week under review. Good demand from overseas countries and firm advice from values, consequently, moved up. Export price discount was reduced further from 20.5 per cent. to 20 per cent. for the week which commenced on Monday last. Spot market was active and premium of almost all varieties advanced further.

Shipments from Egypt from the beginning of this season till 25th November aggregated 157,526 bales (720 lbs. each), as against 145,818 bales priced 17,418 bales of Karnak, 66,839 bales of Menoufi, 12,984 bales of Giza 30, 9,502 bales of Dendera, 48,282 bales of Ashmouni and 2,501 bales

of other varieties. The following are the latest available quotations—in tallaris per lb.—from Alexandria:—

Karnak: January 76.50; March 76.55.

Ashmouni: December 67.55; February 66.62.

Modest gains were recorded by cotton futures in Liverpool during the week under review. Operators were inclined to await the September crop report of the U.S. Department of Agriculture. Scattered selling by American interest in Liverpool were absorbed in mill fixation and local trade covering. The bullish tone of the yarn and piece-goods market prompted further buying which found offerings limited. Values consequently moved up. Sudan contracts were firm on higher Khartoum advices. The following are the latest available quotations—in pence per lb.—from Liverpool, the figures in brackets being the last week-end closings:

American cotton one inch staple contract: December-January 22.90 (22.70); March-April 23.25 (22.90); May 23.55 (23.05); July 23.50 (22.90).

American cotton mixed growth contract: December-January 23.65 (23.45); March-April 23.75 (23.40); May 23.80 (23.45); July 23.55 (23.95).

Sudan: January-February 31.75 (30.65); May-June 31.25 (30.15); July-August 31.15 (30.15).

In anticipation of the Government's crop forecast on the 8th inst., trading in the New York cotton futures market was slow early in the week. The report, published on the 8th inst., estimated the crop at 14.70 million bales, as compared with last month's estimate of 14.80 million bales and the last season's final output of 11.51 million bales and the 10-year (1947-56) average of 14.14 million bales. The yield per acre was estimated at 465 lbs., 9 lbs. down, as compared with last month's estimate of 474 lbs. and last season's final yield of 466 lbs. The crop report had little or no effect on the market as an estimate lower than last month's was generally expected. Activity continued to be slow even after the announcement, but prices ruled steady.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

	8-12-59	1-12-59	24-11-59
Spot	32.85	32.85	32.85
December	32.63	32.68	32.82
March	33.00	33.08	33.28
May	33.26	33.27	33.43

IMPORTS OF ART SILK YARN LARGE

(From Our Own Correspondent)

BOMBAY, 9th December

Barring coarse and medium counts cotton yarns which were somewhat well supported, the yarn market presented a quiet trend during the week under review. Art silk yarns were subdued, owing to slackness in demand from consuming centres. Offtake of art silk cloth was no doubt good, but this did not have any effect on yarns, because the weaving mills were making purchases only on a restricted scale, in view of lower profit margin as a result of the allegedly high yarn prices. There would indeed have been a sharp fall in art silk yarn prices but for reports of scarcity in floating stocks, due to the fact that the indigenous producers of yarn were not supplying yarn in sufficient quantities against quotas in the hands of dealers and customers. Staple fibre yarns were depressed. Enquiries for important markets like Bhagalpur, Calcutta and Delhi were not encouraging. In the cotton yarn section, coarse and medium counts, as stated at the outset, ruled firm. The firmness was engendered by the spurt in raw cotton prices and the tendency among several spinning mills to hold on to their stocks and some were quoting higher prices.

Imports of art silk yarn into the Bombay port have increased of late. The total of these imports during November 1959 was 3,02,926 bales, as against 1,154,788 bales in the previous month. During the same month, 96,934 lbs. of synthetic yarn, 3,025 bales of staple fibre yarn and 38,231 lbs. of cotton yarn were imported. Export of cotton yarn from Bombay during November amounted to 1,324,385 lbs., as against 1,388,563 lbs. in September.

In the course of a communication addressed to the Government of Bombay, the Yarn Merchants Association and Exchange Ltd. has pleaded for the postponement of the enforcement date for the new Sales Tax Act from 1st January 1960 to 1st April 1960. Such a postponement, it is pointed out, will avoid the unnecessary hardship caused to yarn traders who will otherwise have to apply for registration licences twice a year to the present State Government and subsequently, that is, after the break-up of the bilingual State, to the new Governments of Maharashtra and Gujarat as the case may be.

Cupressa Bamberg yarn (80 x 2) December contract climbed down from Rs. 1,672 to Rs. 1,658. February contract fell by Rs. 9 to Rs. 1,700. Spot Cupressa was neglected at Rs. 7.50. 150 Italy declined by 3 nP to Rs. 4.97. 120 Italy was dull at Rs. 5.31, as also 120 Japan at Rs. 5.50. 150 Japan, however, gained 3 nP to Rs. 5.65. Among indigenous yarns, National Rayons 150 bright cones first grade eased from Rs. 4.37 to Rs. 4.34. 120 bright cones first grade was quiet at Rs. 4.91.

Staple fibre yarn (40 x 2) December delivery receded by Rs. 4 to Rs. 694. February position was dull at Rs. 691. Spot Kohnors was shed 3 nP to Rs. 3.69. Citys and Centrys were unchanged at Rs. 3.59 and Rs. 3.69, respectively. Among imported yarns (80 x 2), Paramounts were in keen demand and rose by 14 nP to Rs. 9.20.

Ten counts cotton yarns met with excellent buying support. Citys jumped up by 87 nP to Rs. 15.62. Podars spurred by 50 nP to Rs. 15.50. Twenty counts Moderns improved by 6 nP to

Rs. 20. Hinds were firm at Rs. 19.50. Among forty counts, Minaxis advanced by 19 nP to Rs. 27.44. Moderns were fully maintained at Rs. 27.37. Sixty counts Moderns were steady at Rs. 66.50, while Raghuvarmshis eased by 75 nP to Rs. 68.75. Eighty counts Moderns were firm at Rs. 79 and Finlays at Rs. 81. Mahendras, however, shed 25 nP to Rs. 73 and Citys 19 nP to Rs. 64.50.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today as compared with those a week before:

	9-12-59	2-12-59
Art silk yarn—		
60/1 Cupressa Bamberg December (100 Kg.)	Rs. 1,658	Rs. 1,672
February	1,700	1,700
60/1 Cupressa Bamberg spot (per lb.)	7.50	7.50
120 Japan (per lb.)	5.50	5.50
150 Japan (per lb.)	5.65	5.62
120 Italy (per lb.)	5.31	5.31
150 Italy (per lb.)	4.97	5.00
Staple fibre yarn—		
40 x 2 December (per case of 200 lbs.)	694.00	698.00
40 x 2 February	691.00	691.00
40 x 2 Kohnors (per lb.)	3.69	3.72
40 x 2 City	3.59	3.59
Cotton yarn (per bundle of 10 lbs.)—		
10s Yodas	15.50	15.00
20s Modern	31.50	31.50
40s Minaxi	27.44	27.25
60s Finlay	60.75	61.50
80s Mahendra	73.00	73.25

BLACK PEPPER ERRATIC

(Messrs. Parekh & Co.)

BOMBAY, 9th December

Movements in Malabar black pepper during the fortnight were erratic, the highest and the lowest being Rs. 1,400 and Rs. 1,000, respectively. Bears at Singapore having been squeezed, the market there reacted from Str.\$279 to Str.\$231 for white and from Str.\$200 to Str.\$155 for black.

New York spot, after touching the highest at \$0.59, slowly came down to \$0.45, as grinders refused to follow. Arrivals of new crop having augmented, the selling pressure of Malabar black at lower prices had a salutary effect on both New York and Singapore. Daily arrivals in the primary markets at Cochin and Alleppey are now averaging 500 candelas. With the advance of the season in Alleppey area and with the commencement of harvesting in Tellicherry area, arrivals are likely to expand still further. At that time, if foreign inquiries fail to keep pace with arrivals, the market is likely to go down. Singapore speculators have played their game and now is the turn of Indian dealers who should cushion the impact of heavy arrivals by making purchases at every decline. If they want to keep up the morale of New York dealers and grinders who are accustomed to buy in the upsurge, they should be steady at Str.\$185 for black and at Str.\$236 for white. News of increase in export duty by the Sarawak Government by Str.\$13 per picul proved a stabilising factor.

The important news of the fortnight is the resumption of forward business in black pepper at Cochin, which was effected from the 8th inst. Forward trading remained closed since 18th November 1959, owing to sudden rise in the future prices consequent on heavy fluctuations. The Forward Markets Commission has permitted the Association at Cochin to reopen the futures market in pepper with the additional safeguards—a daily clearance and a deposit of Rs. 25 on the transaction of every cwt. of pepper.

Ungarbled and garbled at Cochin are moving irregularly according to the inquiries or otherwise from overseas. Ungarbled, after touching Rs. 1,000, is now hovering round Rs. 1,100 on news that offers for December shipments are accepted at \$0.42.

Ready pepper in the local market is quoted at Rs. 145 per Bengal maund.

GROUNDNUTS FIRM

(From Our Own Correspondent)

BOMBAY, 9th December

Buoyant conditions prevailed in the oilseed market during the week under review. Groundnuts made an impressive rally, following the release of export quota for 20,000 tons of H.P.S. groundnuts, referred to in these columns last week. At the close, however, groundnuts were a little subdued, partly owing to the decision of the Government to postpone the validity of the export quota from the end of March till the end of June 1960. Of particular importance to the market is the decision of the Board of Directors of the local Exchange to commence futures business in groundnut oil, for the first time. Another development of importance is the enhancement of rebate of central excise duty on non-essential oils. The Government of India has decided that the rate of rebate of Central excise duty in respect of vegetable non-essential oils, other than cottonseed oil, used in the manufacture of vegetable product, exported out of India will be Rs. 110 per ton of such vegetable product, as against Rs. 105.60 per ton admissible hitherto, with effect from the 5th inst.

The groundnut section ruled distinctly firm, thanks to good export demand and pronounced strength in the spot section. Offerings were relatively small. Sizable support was extended by local crushers and varaspathi manufacturers. Shippers covered against their previous commitments. Export outlook, too, was good, particularly in the case of groundnut oilcakes, which were keenly sought after by countries in the Continent. Groundnut February 1960, which had wound up last week at Rs. 183.87, rose sharply to Rs. 190.75 by Tuesday. It, however, receded to close today at Rs. 189.87. Nizam bold spurred by Rs. 2 to

Rs. 38.75. Coromandal advanced by Re. 1.75 to Rs. 39.

Cheerful conditions were in evidence in the castorseed section. This was due mainly to the reports of sustained U.S. interest in Indian castor oil. Castorseed May 1960 contract, which had finished at Rs. 171.12 last Wednesday, improved to close today at Rs. 172.12, after fluctuating over the week between Rs. 170 and Rs. 173. Ready Madras hardened from Rs. 32.37 to Rs. 33. Oil B.S.S. closed higher at Rs. 18.87 today, as against Rs. 18.50 last week-end.

The linseed section was quietly steady. While it derived some strength from the other seeds and oils, operators were somewhat unnerved by the reports that the U.S. Commercial Credit Corporation would release a substantial quantity of linseed oil. Linseed May 1960 contract improved from Rs. 34.62 to Rs. 35, after moving in a narrow range over the week. Bold ready closed steady at Rs. 34.50, as against Rs. 34.12 last week-end. Linseed oil gathered 13 nP to Rs. 17.

Firm conditions prevailed in the cottonseed section, partly because of speculative support and partly because of the pronounced strength in the raw cotton market. Cottonseed February 1960 contract was marked up by Rs. 6.25 at Rs. 144.50.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	9-12-1959	2-12-1959	25-11-1959
<i>Groundnut</i>	<i>Rs.</i>	<i>Rs.</i>	<i>Rs.</i>

publicised traditions of Indian hospitality. Indian scriptures, the most ancient of their kind, insist that the guest, along with parents and preceptor, is a "god." But popular expressions of goodwill are not governed by scriptural injunctions. Nor is the reason to be found in diplomatic propriety which determines how the head of a great State should be honoured. As Mr. Nehru, addressing Mr. Eisenhower, said: "You are a great person in your own right. You are leader of a great nation.... But there is something greater than the head of a State or even a great man. That something is that which appeals to the heart of man and not merely to the mind." This describes, rather than explains, India's attitude towards the great guest. Perhaps the reason why Mr. Eisenhower was so joyously welcomed by this country should be sought apart from the personal eminence of the American President—in certain associations, in the massive moral support which the U.S. lent India in the hour of its struggle for political emancipation, and in the fact that, after the achievement of this objective, the U.S. has been the most distinguished supporter of India's economic development. But, above all, notwithstanding the unkind criticisms by a small band of detractors, there is the thought that the U.S. interest in this country stems from no desire to dominate, or determine, its political or social life. Some of these unconscious promptings in the people lie at the root of the incredibly spontaneous and warm reception which Mr. Eisenhower received. As Mr. Nehru put it, the "hearts of two big countries were opened to each other."

There is no doubt that Mr. Eisenhower himself was greatly impressed by what he saw of this country and of its attempt at economic improvement. With singular appropriateness, he quoted from Gandhi; he said: "One of the clearest voices of all time, proclaiming the priority and supremacy of freedom, is your own sainted Mahatma Gandhi. Speaking of freedom, Mahatma Gandhi said: 'freedom is the gift of God—the right of every nation.' And to his words, America replies: so also we believe." He added: "Between the largest democracy on earth, India, and the second largest, America, lie ten thousand miles of land and ocean. But in our fundamental ideas and convictions about democracy, we are close neighbours. We ought to be closer." Mr. Eisenhower's visit has served precisely this purpose. It is to be hoped, that the two nations have really been drawn to each other more closely than before and that impressive evidence of this understanding will be forthcoming in the coming years. In any case, Mr. Eisenhower's visit to India will go down as a major development in post-war history.

It is now widely realised both in this country and other parts of the free world that freedom will come to have a meaning for the common man, only if it means something more tangible than mere absence of dictatorship or foreign domination. It ought to mean the acquisition of a larger share of the good things of life. Even those who acknowledge that liberty is too heavy a price to pay for material prosperity will concede that any prolonged failure to achieve economic well-being constitutes a threat to freedom itself. As Mr. Eisenhower put it: "A free society of nations can continue to exist only as it meets the rightful demands of people for security, progress and increasing opportunity for the betterment of themselves and their children." After describing what an economically strong India could contribute to world progress, he rightly stressed that India could not achieve its "full potential without acquisition of more capital." He added: "The best means for a nation, determined to maintain its independence, are private investment from outside, governmental loans from others, and where necessary, grants from other free and friendly nations."

Clearly, there is a wide field for mutually profitable association between India and the U.S. It is gratifying to note that Mr. Eisenhower has agreed to throw the weight of his great personality on the side of beneficial partnership between the two countries. He declared: "One thing I assure you, from now on, I shall be quick to assert on every possible occasion that India is becoming one of the greatest investment opportunities of our time—an investment in the strengthening of freedom, and in the prosperity of the world." It is undeniable that a reasonably prolonged period of association between the two countries will, besides making a marked difference to the pace of India's economic progress, advance the cause of democratic way of life to which the entire free world is pledged.

DEVELOPMENT OF PORTS

THE opinion is gaining ground in the country that, as compared with the resources devoted to industrial and agricultural programmes, the allocations to development of ports are inadequate. It is true that the authorities realise that, in the absence of well-developed ports, India's foreign trade will receive a severe setback, which, in its turn, will retard the pace of progress of several development projects. Despite this realisation, which has found expression in ministerial pronouncements, the fact remains that work even on major ports continues to be less brisk than what one would expect on a front where speed of execution is of the very essence of development and progress. Appropriately enough, the Associated Chambers of Commerce, in the course of a resolution adopted by it at its annual meeting held at Calcutta last week, while commending the action so far taken by the Government, regretted that the "results so far achieved have not been commensurate with the requirement of the situation." It urged the need for vigorous and resolute action with special emphasis on the improvement and modernisation of equipment and amenities at ports, including road and rail communications and river training, development of ancillary ports, rationalisation of dock and stevedoring labour arrangements, and improvement in customs procedure.

Moving the resolution, Mr. M. R. Das recalled how committee after committee had examined the problems of ports in the past; yet nothing had been done to implement the recommendations of these expert bodies. He deplored that the "carefully considered recommendations made by these bodies have, largely

postpone the disappearance of Calcutta as a port for ocean-going vessels, unless steps are taken immediately to institute a long-term solution." Finally, he insisted that, unless the existing marshalling yards were modernised, delays and misdeliveries could not be avoided.

The case for the improvement of the Bombay port was ably put forward by Mr. C. H. Campbell, who recalled that it had been recognised for a long time now that the berthage of the port should be increased. The 70-year-old Prince's and Victoria docks were, "to put it bluntly, quite obsolete." It may be mentioned here that the delay in carrying out what has come to be known as the "minimum scheme" for the modernisation of these docks has increased the original cost of the scheme (Rs. 44 crores) by 100 per cent. It is imperative that the implementation of the scheme should not be delayed any longer. Kandla also should receive urgent attention. The two disabilities of this port are lack of adequate rail connection with the hinterland and the damage caused by steady silting of the entrance channel.

The development of Madras port too has suffered through inordinate delay in the execution of plans. Although development work has been taken in hand, the work on the coal and ore berths, according to Mr. E. F. G. Hunter, has been "painfully slow." Mr. Hunter expressed the hope that the construction of the new wet dock in Madras port would be carried out without delay. As for the Vishakapatnam port, he admitted that much had been done by way of port development, but "it is considered that the harbour administration is taking an unrealistic view of representations that are being made by the trade for more economic charges."

The problems of the Cochin port were dealt with by Mr. P. Hadfield, who said that the port, which was still in the process of development, would not reach its full capacity before 1960-61. Developments in the next 18 months would greatly increase the port's handling capacity. Although a large part of the traffic handled at the port would move to the interior by the extensive backwaters which serve the area, the problem of rail and road traffic would remain acute. The factors which militate against the proper functioning of the port, according to Mr. Hadfield, are the provision of only one broad-gauge track to the north and of only one rail connection (a metre-gauge track) to the south. There is no road outlet at all to the north and little progress has been made in the construction of bridges on the northern outlet. It would appear that the National Highway, which these bridges serve, is "inadequate and poorly maintained, and, in the event of the bridges materialising in the near future, the increase in heavy traffic that will ensue will require that the highest priority be given to the improvement and maintenance of this highway."

It now appears certain that the target of increasing port capacity to 40 million tons, set in the second Plan, will not be achieved, thanks to the slow pace of implementation of development programmes. During the first three years of the Plan, actual expenditure on port development aggregated only Rs. 24 crores out of a total provision of Rs. 78 crores. As a yardstick for measuring the progress of any development project, the amount of expenditure incurred is, of course, unsatisfactory; invariably, it will show much greater progress than is actually the case in terms of physical achievement. But even on the basis of this defective measure, the progress made in the sphere of port development has been poor. It is also clear that there will be a substantial carry-over of port development projects from the second to the third Plan.

The authorities will do well to accord the highest possible priority to improvement, expansion and modernisation of ports in the third Plan so that port facilities are augmented to a level at which they are adequate for purposes of meeting the anticipated increase in India's foreign trade. In any case, inadequate port facilities are themselves a form of invisible taxation on ships and will retard the growth of a day's delay in ports will mean unearned depreciation which, in respect of a modern cargo vessel, will aggregate Rs. 2,500 per day; to this loss must be added the cost of manning, provisioning and working the vessel. In considering the question of financial allocation for ports, the authorities, as Mr. Campbell stressed, will do well to bear in mind that it is wrong in principle to regard port development as a commercial venture. After all, good ports are part of the basic structure of national economy. To stint expenditure on it on the ground that it may not yield immediate returns is to practise unwise economy.

MARKET GOSSIP

BULLISH fervour in share markets continues to be strong and most of the equities have registered further gains. A feature of this week's trading is the attention given by speculators to select scrips such as Hindustan Motors, T.E.L. Cos., Gwalior Rayons, India Dyestuffs, Colour Cos., and Standard Mills. Some of these have gone up too rapidly and to unexpected levels. Even blue chips, considered as having been fully priced, G.K.Ws and Indian Oxygens, to mention two instances, have moved up appreciably. Only steel, sugar and cement shares have been relatively neglected. The bulls are not paying much attention to them, apparently because the dividend prospects for these are, it is now fairly clear, not very promising. Whether or not the increases in the values of the aforesaid equities are justified is a question on which it is possible to have two opinions. But every rise that now takes place only adds to the possibility of a landslide at a later date, should any unpleasant developments take place.

President Eisenhower's remarks at New Delhi early this week supporting foreign investment in India have strengthened the earlier hopes that substantial aid would be forthcoming to implement the third Plan. This has given rise to the further hope that the Government of India would not be forced by circumstances to tax further the already heavily taxed people of this country. The U.S. President's emphasis on the importance of private capital may have given rise to the feeling that the private sector in this country will be encouraged and that individuals and corporations will not be asked to pay more direct taxes than they are doing now. This inference may or may not turn out to be true. But it would turn out to be mere wishful thinking, if the suggestions contained in the Working Paper prepared by the Planning Commission on raising resources for the third Plan were to be accepted and implemented by the Government. Very shortly, a panel of senior economists will be meeting at New Delhi for considering the Working Paper and also come up with the paper on resources which will also come up for discussion. The suggestions are believed to be drastic, aiming as they do to raise an additional sum of Rs. 500 crores by way of new direct taxation. It is understood that they fully reflect the thesis of Dr. Raj that the upper middle class, that is, those in the income range from Rs. 1,000 to Rs. 4,000 per month, is not paying as much as they ought to for the economic development of the country. They are also said to reflect the contention of some that even corporations should be taxed at higher rates, though their requirements of resources for development and modernisation may be met by allowing suitable rebates.

Apparently, New Delhi has not yet given up fanciful ideas of raising resources for the Plan. The Planning Commission is still very much dominated by leftist elements. It is, therefore, premature to think that the sweet reasonings of the private sector for relief in direct taxation will be listened to by the powers-that-be or that there will be no more taxation shocks.

India To Make Bemberg Yarn

While the traditional varieties of rayon yarns manufactured under viscose process are losing ground elsewhere in the world to the more later varieties of man-made fibres, in India they are still popular. If the short-term fluctuations in production and consumption of rayon are excluded, there seen that the basic trend has been upward in India for at least four reasons for which the trend by which is being contrary to the world trend. One of the reasons is the trend in the developed countries of the West. One of the main reasons for the newer man-made fibres (collectively termed as polyfibres) is very much higher than that of the older rayon fibres, they are beyond the reach of the vast majority of the people of this country. They are, therefore, unlikely to find a very large market in India for several years to come and the older fibres continue to be competitive. Two, the older fibres are more suited to ladies' wear in India than the newer ones. The great bulk of rayon yarn goes into the manufacture of material for saris and blouses. If the quality of rayon yarns now being made in India is improved and their cost brought down, they will certainly be able to retain their hold over consumers of textile fibres. Three, the habits and mode of dress in India are still far different from Western countries. In the latter countries, nylon, for instance, is used in considerable quantities for ladies' underwear. The climate in India, excepting in some of the hill stations, is hardly suitable for using nylon underwear. And four, in the furnishing of a large and growing carpeting and furniture market, these outlets are of a very limited nature in this country, being confined chiefly to big cities.

The time is gone when rayon industry (both spinning and weaving) can be considered as a producer of luxury goods. In view of the growing volume of purchasing power, rayon goods, together with cotton textiles, are serving the purpose of essential consumer goods. They thus perform an anti-inflationary function. It can, of course, be argued that they are not as essential as cotton goods and that they should, therefore, be given a low priority or no priority at all over other vital industries. But consumers' tastes have changed and only in a totalitarian economy can this factor be completely ignored. Again, the art silk weaving mills, the powerlooms and the handlooms have all been providing sizable employment, and their requirements of raw material have to be taken care of. Manufacture of rayon yarns in the country even out of imported pulp is certainly preferable

to the import of finished yarn, in that it will provide more employment opportunities, technical experience in chemicals and chemical fibres, and some saving at least in foreign exchange. Thirdly, the creation of manufacturing facilities for rayon yarn will encourage the growth of chemical and pulp industries. And, fourthly, some of the developed countries are now willing to collaborate with Indian entrepreneurs in the establishment of rayon spinning units. In fine, this branch of textile industry offers scope for speedy establishment of additional employment opportunities and also for ensuring existing employment in the weaving section. The indigenous investors, too, are in a good mood to spare their savings for this industry. In view of all this, the Government is, therefore, right in not curbing the enthusiasm of entrepreneurs to put up new units for spinning the various types of rayon yarns in large demand, as well as to expand the existing ones.

The current calendar year saw the flotation of three new rayon spinning units: the South India Viscose, the Indian Rayon and the Baroda Rayon. It also witnessed the coming into full production of the rayon spinning sections of the Century and Kesoram Cotton Mills belonging to the Birla Group. The growth of rayon spinning has thus been in the form of both exclusively rayon companies and extension of the activities of existing cotton mills. There is already a firm indication that the new year, 1960, will see the coming into existence of at least one more rayon spinning unit. It is reliably understood that the Sirur Group has been given a licence to establish a factory near Mysore City for manufacturing Bemberg (cuprammonium) rayon yarn. This type of yarn is not being manufactured by any of the existing units; nor is it scheduled to be manufactured by the new units that have been licensed and are being set up. The initial capacity of the Bemberg unit of the Sirur Group will be 7½ tons per day, or five million lbs. per annum, on 60 denier basis. The present estimate of the investment on this project is Rs. 2.50 crores. It is further understood that the promoters have been assured of foreign technical collaboration as well as of the requisite foreign exchange. Both the I.C.I.C. and the I.F.C. are willing to underwrite equity capital and provide loan finance.

It is said that, of the total imports of about 34 million lbs. of rayon yarn in 1958, Bemberg yarn accounted for about 8 million lbs. The Sirur project, when it fructifies, will, therefore, account for a very substantial portion of the domestic requirements of this type of rayon yarn which is said to be very popular with weavers in Mysore and Madras, as it is very much like natural silk and, therefore, serves as a real substitute for silk.

Since the proposed Bemberg yarn is of cuprammonium type, the capital investment required will be somewhat less than that for putting up a continuous filament viscose plant of identical capacity. Further, the principal raw materials are cotton linters, ammonia and a small quantity of copper which is recoverable. The first two will be readily available near the proposed factory by the time it commences production. As quite a few cotton oil extracting units are coming up in the country, adequate supply of cotton linters is expected. Ammonia will be made available by the Mysore Chemicals and Fertilisers. Thus, from the point of view of both raw materials and the demand for the finished yarn, the Sirur project seems to be well placed.

Control on Paper Prices

The absence of any vocal reaction to the recommendations of the Tariff Commission on fair prices for paper and the Government's decisions thereon in either the paper industry or the trade is, indeed, surprising. There is no dearth of organisations representing both the sides to voice their feelings. Yet none of them has to our knowledge issued any communication, either welcoming the decisions or criticising them. This silence may be due to a fatalistic resignation to what has happened or a sense of satisfaction. But neither seems likely; probably the interests concerned are still studying the report.

The main features of the Tariff Commission's report were analysed in our last issue. The Commission has no doubt done a commendable job. It has fixed the prices and thereby carried out the task assigned to it. But neither the Commission nor the Government has cared to bestow thought on the question whether the price control could be effectively enforced. As the largest consumer of paper, the Government can, of course, get its requirements at the prices fixed by the Commission. But what about the other consumers? Not all of them are in a position successfully to insist on getting their needs at the controlled prices. The Commission itself has received complaints that some quantities in excess of their requirements, corner the stocks and sell them at premium prices. It has also recognised the existence of scope for creation of artificial scarcity of paper through collusion between printers, publishers and distributors. It has, however, offered no remedy, beyond saying that the provocation for complaints of exploitation should be eliminated.

Reports from paper markets received after the Government's decisions on the Commission's report suggest that the free or grey markets have now become black markets. Since it will be next to impossible to eradicate them, the Government must think of a more effective solution than mere paper controls. The present system only penalises the honest manufacturers and traders, in that it brings discredit to the whole industry and the

trade. The Government, too, is losing valuable revenue and the shareholders in paper mills which are not scrupulous are also losing their share of profit, as the difference between the controlled price and the black market price is pocketed by the managements. Some experienced persons in paper trade feel that the more realistic thing to do would be to let the industry charge what the traffic can bear and to mop up the difference between the fair ex-mill price, as fixed by the Tariff Commission, and the ruling market price by stepping up the excise duty. This will bring in a sizable revenue to the Exchequer and greatly minimise the scope for making money by paper mills and merchants, money on which no tax is paid and which is not given to shareholders. There is a lot of force in this suggestion and it is to be hoped that it will receive the prompt attention of Mr. Morarji Desai who must now be busy thinking of ways and means of finding additional revenue. But an important prerequisite for implementing this proposal is Government's readiness to reduce the excise duty promptly, as and when the supply of paper increases, and to abolish altogether the additional excise duty when supply becomes adequate to meet the demand.

Night Allowance

In our issue dated 5th September 1959, we published a letter from Mr. S. N. Mubayi, Central Provident Fund Commissioner, clarifying the position regarding the inclusion of night allowance in the wages of workers for the purpose of deduction of provident fund contributions. He had pointed out in the letter that night allowance formed part of the "basic wage" as defined in the Employees' Provident Fund Act, 1952, by virtue of the Government's decision on the question of night allowance paid by the Western India Match Company, Ltd., Ambar Nath, referred to it in 1957. The Government had directed that the decision should be made applicable to all factories with effect from 4th December 1957. But this date was later changed to 31st August 1959.

In another letter addressed to us this week, the Provident Fund Commissioner intimates us that this decision has now been revoked, as, on reconsideration, the Government of India has decided that night allowance does not form part of the "basic wage" for the purpose of provident fund deduction.

This decision would surely be welcomed by employers, as it will save them much unproductive paper work involved in the computation of night allowance which is neither a regular nor a permanent payment to workers. The Government deserves to be complimented for having realised the practical difficulties which its earlier decision would have imposed on employers and allowed wiser counsels to prevail. But one could not help asking why the Government took a hasty decision earlier without considering all aspects of the question. It is needless to add that, if the authorities care to develop a habit of prior consultation with competent persons before making up their mind, such things can be avoided in future. Incidentally, it must be said, in fairness to Mr. S. N. Mubayi, Provident Fund Commissioner, that he was ever alert and responsive to the representations made in this regard and was always willing to clarify promptly the Government's stand.

World Bank Loan in London

In a little over a fortnight after the World Bank President disclosed the Bank's intention to borrow in the London market "as soon as circumstances are favourable," the Bank completed its borrowing programme. The list was opened on Wednesday this week and closed on the same day. The terms of the issue were: amount: £10 million in sterling stocks; interest: 5 per cent; issue price: £96½ per cent, of which 25 per cent. was payable on application, another 25 per cent. on 17th February and the balance of 46½ per cent. on 12th April; maturity: at par in 1977-82.

A consortium of six leading banking firms in London, headed by Baring Brothers & Co. Ltd., acquired the entire stock and offered it for sale to the public.

This is the World Bank's third loan in the London market. The first one was in May 1951 when £5 million of 3½ per cent. stock, 1966-71, was offered at 97 per cent. The second was in July 1954, when a like amount was issued in 3½ per cent. stock, 1969-74, but at a higher price of 98 per cent.

The terms of the latest issue are thus dearer from the point of view of the Bank, but they are more or less in line with the current yield pattern on British Government securities of like maturity. For, at the issue price of £96½ per cent., the World Bank stocks give a gross flat yield of 25 3/8 % and gross redemption yield, at later maturity, of 25 5/8 % dd. There are also additional advantages attached to the issue. It is a relatively small amount for the London market. Interest is payable gross, without deduction of British income tax, which is a natural attraction to non-resident investors. Another favourable factor is that an annual sinking fund of £278,000 will be created starting from the year ending 15th August 1965. This will enable the Bank to redeem at least 50 per cent. of the stock by the date of final maturity in 1982. The Bank has, however, the option to redeem the stock or any part thereof at any time after 15th August 1977.

This is the seventh open market loan to be issued by the World Bank during 1959 so far. All the other six loans raised earlier this year do not, however, require any sinking fund to be created. The highest rate of interest offered on loans other than the latest one in London was 5 per cent. on the 10-year bonds issued in Belgian francs for £10 million and on the 6-15 year bonds issued in Deutsche marks for £47.62 million.

EQUITIES STEADY

STANDARD MILLS SHOOT UP

(From Our Own Correspondents)

BOMBAY, 17th December

THANKS to the keen interest in selected counters on the forward list and in the cash section, which soared to new high levels, the general undertone of the Bombay share market remained very steady during the week under review. There was, however, a hesitancy on the part of operators to follow last week's rise in several counters, despite the fact that there were no adverse factors to affect the general sentiment. On the contrary, President Eisenhower's visit to India was generally interpreted in bullish light as it was expected to pave the way for a greater flow of American capital to this country.

Trading during the week under review was highlighted by sharp rises in Standards (in the textile section), engineering scrips, automobile shares, rayons and dyes and chemicals. Steel shares were docile. Tata Ordinaries after an initial rise from Rs. 159.25 to Rs. 157.50, gave way to Rs. 155.75. Indian Irons moved down to a low of Rs. 23.08 from Rs. 23.72, but gained some ground to Rs. 23.28 at the close.

In the textile section, Standards soared to a new high of Rs. 896 from last week's closing of Rs. 780, on renewed hopes of a new issue, and finished at Rs. 888. Centurys were listed ex-right in the new account on Monday and from the ex-right high of Rs. 468 they drifted lower to Rs. 458.50 today. Bombay Dyeings moved narrowly between Rs. 70.20 and Rs. 69.20 before closing at Rs. 69.80. Kohinoors, however, gained Rs. 3.50 to Rs. 327.50 and Khataus looked up by Rs. 16.25 to Rs. 261.25, while Simplex shed Rs. 3 to Rs. 157.

Cement and sugar shares were featureless. A.C.C.s were done between Rs. 149.75 and Rs. 148. Digvijays were lower by a rupee at Rs. 145. Belapurs drifted down from Rs. 330 to Rs. 326 before recovering to Rs. 331 at the close. Phaltans were marked down by Re. 1.50 to Rs. 173, while Walchandnagars rose by Rs. 2.50 to Rs. 317.50.

Alocks provided a bright feature in the engineering group with a jump from Rs. 247 to Rs. 280. Premier Construction added Rs. 10.50 to Rs. 367.50. Larsen and Toubros hardened by Re. 1.10 to Rs. 27.40 and Mahindras by Re. 1.76 to Rs. 24.76. Automobile shares were in keen demand, on expectations of good outlook for the industry. Hindustan Motors advanced by Re. 1.52 to a new high of Rs. 17.48. Premier Automobiles gathered Rs. 6 to Rs. 160.50 and Tata Locomotives advanced from Rs. 203 to Rs. 214 before closing at Rs. 212.

In the miscellaneous group, Bombay Burmahs (old) staged a spurt in the earlier part of the week from Rs. 584 to Rs. 599, but subsequently gave way to Rs. 574, on pessimistic interpretation of the Chairman's statement that the Company had no plans for the time being, to expand its activities in this country. National Rayons were erratic moving between Rs. 385 and Rs. 374.50 before they closed at Rs. 379, a rise of Rs. 1.50 over the week. Their new shares shot up by Rs. 16 to Rs. 367. Gwalior Rayons picked up Rs. 3 to Rs. 29. Tata Oils suffered a setback from Rs. 67 to Rs. 65 and Wimcos from Rs. 268 to Rs. 252. Dyes and chemicals were again in the forefront. Amar Dyes shot up by Rs. 20 to Rs. 272, Colour Chems by Rs. 75 to Rs. 320, Dharamsi Chemicals by Rs. 33 to Rs. 155 and Indian Dyestuffs by Rs. 91.25 to Rs. 496.25,

while Polychems provided an exception with a drop of Rs. 2.50 to Rs. 170. Anil Hardboards put on Rs. 30 to Rs. 370 and Ceat Tyres Rs. 20 to Rs. 185.

An indecisive trend was noted on the Calcutta Stock Exchange during the week. The steep rise in raw jute prices and the one-day token strike by jute mill workers on Monday last restrained activity in jute shares, which after an initial rise reacted. Thus, Howrah's hardened from Rs. 23.87 to Rs. 24 before closing lower at Rs. 23.25. Kelvins finished at Rs. 136 after improving from Rs. 157 to Rs. 161. Tea shares were steady on reports that the North India crop for the current season might turn out to be lower than in the last season. In the engineering section, Indian Irons finished lower on balance at Rs. 23.04, after moving up from Rs. 23.59 to Rs. 23.82. Texmacos gained from Rs. 24 to Rs. 24.60 before closing at Rs. 24.05. Jessops improved from Rs. 22.75 to Rs. 28, but finished lower at Rs. 26.12.

The Madras Stock Exchange presented a mixed show. Plantation shares were generally firm, with selected coffee, tea and rubber shares coming in for good attention. Profit-taking in some of the counters in the forward list marked trading in an otherwise steady textile section. Madras were quiet at Rs. 29.75. Lakshmi Mills moved down from Rs. 151 to Rs. 144. The main feature was provided by sugar shares which ruled distinctly easy. Travancore Sugars were marked down from Rs. 47.75 to Rs. 45.75. Kirilampudis declined from Rs. 79 to Rs. 75. Miscellaneous shares attracted very little interest. F.A.C.T.s had sellers at Rs. 10.10 and India Cements at Rs. 6.25. Aluminium Industries were steady at Rs. 22.30.

GANNON DUNKERLEY REPEATS DIVIDEND

The Directors of Gannon Dunkerley and Company, Ltd. (Chairman, Board of Directors: Mr. Mahaviprasad R. Morarka, Bombay) have recommended a dividend of 6 per cent. per annum for the year ended 31st March 1959. This is the third year in succession for which the dividend is to be repeated, after it had been raised to this level from 4½ per cent. paid for 1955-56. The performance of the Company as a whole during the year under review has been fairly satisfactory, in that the gross profit has been nearly maintained at the previous year's level, such having amounted to Rs. 7.35 lakhs, as against Rs. 8.25 lakhs for 1957-58. The provision for depreciation has been raised from Rs. 90,679 to Rs. 1.26 lakhs, while that for taxation is lower at Rs. 2.20 lakhs, as compared with Rs. 4.75 lakhs set aside last year. These essential provisions leave a net profit of Rs. 3.89 lakhs, which compares very favourably with Rs. 2.60 lakhs for the previous year. A sum of Rs. 2.66 lakhs has been added to the development rebate reserve, which had received Rs. 38,350 last year. The larger absorption by way of development rebate reserve, bonus to employees and depreciation have, however, necessitated the withdrawal of Rs. 55,000 from the dividend reserve (which was created last year with an allocation of Rs. 72,000) to maintain the dividend as stated above.

The profit would have been higher but for the setback in turnover in the general departments on account of the stringent import restrictions. The civil and mechanical engineering departments have, however, maintained their turnover and have, in fact, a "reasonable volume of contracts still to be completed." The engineering workshop for the manufacture of liquefied petroleum cylinders went into production in December 1958. The full impact of its working will, therefore, be reflected only in the current year's results.

Referring to the outlook for the Company, the Directors observe:

"Our trading departments have a difficult time to face, in view of the present import policy of the country and the prospects cannot be considered to be too bright. The change-over to civil and mechanical engineering and the establishment of leum cylinders are factors on which the Company is putting a great reliance and your Directors feel confident that we shall be able to maintain our progress in years to come."

The Company's balance-sheet as on 31st March reserves considerably. For they amount to no more than Rs. 5.70 lakhs, including the development rebate reserve of Rs. 3.05 lakhs, as against a other current liabilities aggregate Rs. 76.66 lakhs, which are more than adequately covered by curramge of expansion, the Company has made a capital expenditure of Rs. 19.16 lakhs during the year under review. The gross block of the value of Rs. 37.74 lakhs stands written down to Rs. 29.07 lakhs.

THE TATA IRON AND STEEL COMPANY, LIMITED

NOTICE

Submission of Coupons in respect of "A" Second Preference shares and New Ordinary shares

NOTICE IS HEREBY GIVEN THAT THE last date for submission of coupons in respect of the "A" Second Preference shares and the new Ordinary shares in terms of the Company's Circular dated the 12th October 1959 expires on the 15th December, 1959. However, for the convenience of the shareholders, the Directors have resolved that the Company's bankers be authorised to receive applications on and after 16th December 1959 upto but not later than the 15th January 1960 in respect of such coupons Provided that along with each such application with the required coupons and the moneys to be received with such application interest at the rate of 9 per cent. per annum thereon (which the Directors have decided to charge) from the 16th day of December 1959 until payment shall be paid to the Company's bankers. No application in respect of coupons received on and after the 16th December 1959 will be entertained by the Directors unless interest is paid as aforesaid. No application will be entertained after the 15th January, 1960.

Dated at Bombay this 15th day of December, 1959.

By Order of the Board,
TATA INDUSTRIES PRIVATE LIMITED,
Managing Agents,
J. D. CHOKSI,
Director.

ASPLACAS-12A

NEWS IN BRIEF

THE Government of India is currently considering a proposal submitted by a foreign firm to produce ovaline in India.

The Government of India has announced a further export quota of 2,000 tons of rice bran of West Bengal origin and 4,000 tons of Andhra origin for shipment upto March 1960.

India is among the twenty-five countries elected to the new Council of the International Telecommunications Union, which will direct the organisation until the next conference, due to be held at Geneva in 1965.

A fisheries research institute, the first of its kind in South-East Asia, is expected to be established in Cochin by the Government of India. The State Government has already been asked to make available five acres of land for the purpose.

The sales tax authorities in Andhra Pradesh will be vested with powers to verify the cash held by dealers in their business premises, in addition to the existing powers to enter and search offices, shops and places of business and inspect accounts, registers and documents.

The Lok Sabha has passed the Mines (Amendment) Bill with some minor amendments. The Bill seeks to tighten up certain safety regulations, liberalise provisions relating to overtime and leave with wages for workers, and enhance penalties for the contravention of the provisions of the Mines Act.

A representative of the Associated Electrical Industries Ltd. in the U.K., which is collaborating with the Government in setting up the heavy electrical equipment plant project in the public sector at Bhopal, is expected to arrive in India next month in order to discuss the possibility of expanding the capacity of the project.

Production of pig iron in the Bhilai steel plant reached 300,000 tons by the middle of this month. The blast furnace of the plant, commissioned on 4th February last, is now producing about 1,000 tons of pig iron a day. So far, over 246,000 tons of pig iron have been despatched from Bhilai, including 20,000 tons exported to Japan.

The Union Ministry of Commerce and Industry has prepared a project report on the fertiliser plant to be set up in Assam. The proposed plant is expected to produce 50,000 tons each of ammonium sulphate and urea per year. The Ministry is also preparing another project report on a power plant with a capacity of 30,000 kw. to be located in the State.

A six-member delegation from the U.S.S.R., led by Mr. Skachkov, Chairman of the Study Committee for Soviet Economic Affairs, has come to India for discussions with the Central Government on economic and trade matters of mutual interest. It is expected that the delegation will have talks with the Planning Commission and the Union Ministries regarding the third Plan.

A small quantity of radio-active material has been collected from the uranium deposits in Salem district, Madras. Disclosing this in the Lok Sabha, Mr. Sadath Ali Khan, Parliamentary Secretary for External Affairs, stated that some prospecting work by trenching at the deposits had recently been carried out, in addition to exploratory drilling work already in progress.

The metric system will be adopted in four more industries, namely, vanaspati, paint, biscuits, and soap, with effect from 1st April next. The transition period, that is, when the new system will be in operation side by side with the old, will be six months in the case of the vanaspati and soap industries, one year in respect of the paint industry and two years as regards the biscuit industry. Eighteen industries, including jute, cotton and cotton textiles, iron and steel, non-ferrous metals, engineering, heavy chemicals, cement, salt, paper and coal have already adopted the metric system. Metric system will be adopted in the levy and collection of customs duties from August 1960.

The Posts and Telegraphs Board was inaugurated by Dr. P. Subbarayan, the Union Minister for Transport and Communications, on the 14th inst. The Board is expected to ensure administrative flexibility, with the object of implementing expeditiously the various schemes for improving the posts and telegraphs services. Mr. V. Shankar, Director-General of Posts and Telegraphs, is the Chairman of the Board. The Board will be an autonomous body, having all the administrative powers of a Ministry, though its policy decisions will be subject to the approval of the Minister. The Financial Commissioner, who is a member of the Board, will enjoy large powers, including the right to refer important decisions, involving financial implications, to the Ministries of Finance and of Transport and Communications.

There are about 305 factories, including those in the public sector, which can manufacture metric weights and measures. The State Governments of Andhra Pradesh, Bombay, Kerala, Madras, Mysore, the Punjab and the Union Territory of Delhi have so far licensed 108 factories for the manufacture of metric commercial weights. The other State Governments and Union Territories are expected to grant licences to factories in their jurisdictions shortly. According to a survey conducted by the National Sample Survey, there are 54 million weights and one million measures in use in the country. These will have to be replaced by an equal number of metric weights and measures in the next two or three years. Weights and measures

will be produced by manufacturers licensed by the State Governments and sold to the public through licensed dealers. There is enough capacity in the country to meet the demand.

The recent acquisition of the m.v. *Statensingel* of 8,355 tons by the Eastern Shipping Corporation Ltd. brings the total number of ships acquired by Indian shipping companies since the beginning of 1959 to 21, with a total gross tonnage of about 104,000 and 150,000 dw. tons. Of these, seven ships, aggregating 47,000 tons, are new ships and five aggregating 36,000 tons, near-new (under five-years old). All these twelve ships are motor vessels. With the acquisition of these vessels, Indian tonnage has now reached the figure of 739,000 gross tons. In addition, the Indian shipping companies have about 80,000 gross tons of shipping under construction or on order in India and abroad expected to be delivered before the end of the second Plan period. Besides, they are negotiating for the purchase of nine second-hand vessels aggregating about 20,000 gross tons. When all these vessels are delivered, the Indian tonnage will go up to 839,000 gross tons, leaving some 61,000 tons to be acquired for attaining the second Plan tonnage target of 900,000 (excluding replacements).

From Abroad

Steel production in the U.K. in November was running at a record rate of 458,000 tons per week, as compared with 441,400 tons in October and 351,900 tons in November 1958. The steel industry is thus working to 95 per cent. of its installed capacity, thanks to a rise in demand from almost all types of consumers.

China has moved up from the twenty-second to the eleventh place among the world's trading nations between 1950 and 1958, according to the December issue of *China Trade and Economic Newsletter*, just published in London. The total value of China's foreign trade during this period rose by more than three times.

The U.S.S.R. is understood to have tentatively offered a \$25 million credit to Turkey for a new water-supply project in Ankara. A new glass works is also being built near Istanbul with Soviet assistance. Turkey has, however, turned down many other Soviet credit offers, including the one for \$25 million worth of road-building equipment.

A 70,365-ton tanker, called the *Oriental Giant*, the biggest ship ever built in Japan, has been handed over to the Liberian-registered company, the Tanker Services. Built by Sasebo Ship Industry Company, the tanker has a bar and a swimming pool for the crew and air-conditioned accommodation.

The London County Council has organised a three-month course on trade with the U.S.S.R. Besides teaching Russian languages along with its social, political and economic life, the course seeks to provide instruction on Russian industry and commerce, as also its procedures concerned with trade.

The Chairman of the International Tin Council has announced that the Council's buffer stock will consist of 10,000 tons or more by the end of 1959. He claims that the tin producers are now near freedom, since the 36,000 tons allowed in 4½ years export quotas for the first quarter of 1960 are near the quarterly production rate of 38,350 tons before control.

Soft drinks continue to win customers in West Germany. The total consumption in 1959 is expected to pass the 176 million-gallon mark, 22 million gallons more than in 1957. Beer, however, still sells some six times better. In 1958, the total beer sales amounted to more than 1,000 million gallons, a rise of 5 per cent. as compared with 1957.

Diamond output in Soviet Russia is expected to increase sixteenfold by 1965, as compared with 1958. Two major diamond centres will be developed in East Siberia, one around mir pipe and the other around *Udachnaya*. The mir deposits are already yielding industrial stones in large quantities. The other pipe will be completed only by 1970.

The British concern of Jardines has put into operation in Hong Kong one of the largest and most modern dyeing and finishing mills in the Far East. Highly mechanised with £400,000 worth of latest British plant and machinery, it will employ only 220 workers when it goes into full operation. The mill has an initial capacity to produce 3 million square yards of cloth per month, which will be raised to 4 million later on.

Under a set of new foreign trade rules for regulation announced by the Government of Turkey, payments for foreign-trade transactions with the dollar area will be effected in U.S. dollars and in countries outside that area in currencies convertible into dollars. Exports other than those payable in dollars or convertible currency are subject to licensing under definite quotas. Barter deals in any form are banned.

Atomic Energy of Canada has announced that construction of the first Canadian nuclear-electric generating station has reached the halfway mark. This \$32-million project is to begin delivery of power to the Ontario Hydro-Commission by the middle of 1961. The reactor will use natural uranium as a fuel and heavy water as a coolant and moderator. It will be contained in a concrete vault 50 feet below ground.

The first major order for a passenger liner to be placed with a British shipyard for over two

PERSONAL

MR. Dwight D. Eisenhower, President of the U.S., left New Delhi on Monday the 14th inst., after a historic visit to this country lasting 4½ days.

Mr. Sevantalil M. Seth and Mr. Jagdishraj Seth have been elected Chairman and Vice-Chairman, respectively, of the Western India Minerals Association, Bombay.

Mr. K. P. S. Menon, India's Ambassador in Moscow, who will also be India's first Ambassador to Hungary, presented his credentials to the President of the Presidium of the Hungarian Peoples' Republic in Budapest last week.

Mr. Leonard J. Saccio, Deputy Director of the International Co-operation Administration, has arrived in India to take part in the five-day annual conference of the U.S. Technical Co-operation Mission in India, which commenced on the 15th inst.

Mr. Bertil Fredriksson of the Sandvik Steel Works in Sweden will serve as an instructor at the School of Forestry, Dehra Dun, during the next six months. The assignment forms part of the F.A.O. programme for technical assistance to less developed countries. Mr. Fredriksson will conduct the theoretical and practical training of Indian forestry instructors in the handling of saw equipment.

years has been won by Vickers-Armstrongs. It is for the construction of a 22,000 gross ton vessel for the Shaw Savill Line, to be used on its round-the-world service. The vessel, which will be built at a cost of about £6 million, is expected to be delivered in 1962. It will carry 1,400 passengers.

West German exports to the U.S. rose by 45 per cent. during the first nine months of the current year due mainly to larger supplies of steel products to meet the shortage caused by the U.S. steel strike, and bigger sales of cars, while its imports from the U.S. were lower by 10 per cent. Nevertheless, the balance of trade continued to be in favour of the U.S., German imports from the U.S. being \$674 million and exports \$635 million.

Group Developments, the wholly owned subsidiary of Courtaulds of Britain, has signed a know-how agreement with the Glidden Company of Cleveland, U.S., with a view to expanding its paint manufacturing section. The agreement, which is on a royalty basis, gives Group Developments and its subsidiaries the exclusive right to use the U.S. company's development and manufacturing technology and its paint formulations in the U.K.

A Soviet trade delegation is currently negotiating with the Japanese Government and industry the question of replacing the existing one-year trade agreement by a three-year agreement. The U.S.S.R. is interested in exporting such items as coal, oil, iron ore and timber to Japan in exchange for ships, mining machinery, machine tools and textiles. The Soviet delegation is also seeking for deferred payment arrangements with regard to machinery imports.

A new portable taperecorder, claimed to be the smallest of its kind in the world, has been completed and put on sale in Japan by the Kowa-Koki Company of Nagoya. The transistor taperecorder weighs only 780 grams, including battery. It is 143 millimetres in length, 95 mm. wide and 33 mm. thick. It is able to record continuously for 30 minutes. The operation of the recorder has been simplified and its microphone is extremely small. The price of the recorder is ¥58,500 for a regular set and ¥85,000 for a deluxe model.

Vickers and Bookers Ltd. of Britain has secured a £500,000 contract for the supply of sugar-beet factory equipment to Russia. Vickers and Bookers is a joint company, formed by Vickers-Armstrongs (Engineers) Ltd. and Bookers Engineering Holdings Ltd., for developing the sales and supply of machinery for sugar-beet factories to the U.S.S.R., Eastern European countries and China. Duncan Stewart & Co. Ltd., of Glasgow, Scotland, a member-company of the Bookers group, will act as technical co-ordinators for the contract.

Direct West German private investments abroad amounted to 120.6 million DM in the third quarter of 1959. The Americas received total investments of DM68.2 million, of which Canada accounted for DM28.8 million, the U.S. for DM5.0 million, Central America for DM1.5 million and South-American countries for DM35.9 million (Brazil DM31.1 million and Argentina DM3.6 million). Private investments amounted to DM6.0 million in Africa, DM4.9 million in Asia and DM4.2 million in Australia. The balance of DM37.3 million was spent in the European countries.

A scheme for abolishing restrictions on capital movements inside the European Common Market will be taken up for consideration by the Common Market Commission next month. The scheme provides for internal freedom but lays down different types of capital transfers. It is learned that first priority will be given to direct investment transfer, including purchase of real estate. Meantime, the O.E.E.C. Council has approved of a code designed to liberalise capital movements. This is the first time such a code has been prepared and accepted by member-countries. The new code seeks to establish rules for controlling the formalities relating to capital movements. It contains lists of specified capital transactions that member-countries have undertaken to liberalise.

LIFE INSURANCE

— the day you insure you are secure

Second Valuation Soon

The second valuation of the Life Insurance Corporation will be made as at 31st December 1959. All eligible with-profits policies in force on the valuation date will be entitled to participate in profits disclosed as a result of that valuation.

The first valuation of the Corporation made as at 31st December 1957 disclosed a surplus large enough to support bonuses at the following rates on with-profits policies issued by the Corporation:-

Endowment Assurances: Rs. 14 per thousand sum assured per annum
Whole Life Assurances: Rs. 17½ per thousand sum assured per annum

Important: Policies which are converted into reduced paid-up policies or lapsed before 31st December 1959 will not qualify for bonus.

Preserve your policy, keep it up-to-date by regular payment of premiums and make sure that your policy qualifies for bonus to be declared as a result of the second valuation.

Remember 1959 is the Bonus Year

WORLD AGRICULTURE FAIR

AGAINST the background of the primitive agricultural practices still followed in India, the progress made by agricultural science and technology in the advanced countries of the West, as revealed at the World Agriculture Fair, New Delhi, presents a remarkable study in contrast. For those of us to whom the sight of a peasant, moving behind a wooden plough drawn by a pair of famished bullocks, much as his forefathers did through the centuries, is familiar, the array of farm machinery displayed at the U.S. and U.S.S.R. pavilions is at once a source of pride and disappointment; pride because of the spectacular advance agriculture has made in other parts of the world from which we too can benefit, and disappointment because tractors and harvester combines are a far cry from the wooden plough.

But India and the Indian farmer can learn much from the experience of other countries. This precisely is one of the principal objectives of the Fair. It is true that the number of participants is small—there are only fourteen countries and two international organisations—but the Fair is said to be unique, in that it is the first time that an exclusive international fair of agriculture is held in this country. The U.S. pavilion, a star attraction of the Fair, presents a picture of the American system of family farming. It shows how science and technology have combined to make U.S. agriculture one of the most productive in the world. The impressive U.S.S.R. pavilion presents a snapshot of Soviet agriculture in which mechanisation and collective farming play an important role.

While neither of the methods and practices followed in these countries lend themselves to wholesale adoption in India, both have many lessons for the Indian farmer. Particularly impressive is the role research has played in boosting agricultural yields in the U.S. Research studies have revealed ways of making soils more productive. In the past 20 years, U.S. farmers are said to have almost tripled their use of chemical fertilisers. The role of minor plant nutrients like zinc, cobalt, and copper has been established in the U.S. and more light has been thrown on the use of crop rotation, legumes and green manures in maintaining soil fertility. Hybrid maize is said to have raised output by 25 per cent. Hybrid cottons are said to possess 50 to 75 per cent. more fibre strength. Pesticides of great effectiveness have been developed and applied on wide area, thus minimising the incidence of crop-killing infections. Breeding, feeding and management of dairy and poultry have been developed into a science and an art.

The Indian farmer who visits the Fair will ask himself as to when he will be in a position to put science and technology to his service the way his American, British or Russian confreres do. He can himself do little in the matter. What does the Government propose to do in popularising the techniques and adapting some of the machines on display to suit Indian conditions? The answer of course rests with the Government and industrialists and on them depend whether the vision of a prosperous agriculture which the Fair might have inspired in the minds of many Indian farmers will ever be realised.

POWER SUPPLY

More than one State is now apprehensive that power deficiency will be with them for a long time to come, unless effective measures are taken to step up power production. This is not a groundless fear considering that, in the past, industrial establishments have had to work under serious handicaps arising from power cuts. To rely on massive hydro-electric projects as a solution for the power problem is not altogether safe, in view of the fact that the working of these projects in tropical countries, like India, is dependent upon the proverbially unpredictable monsoon. Clearly, there is need for not only augmenting power supply but striking a balance as between the two sources of power—hydro-electric and thermal. The

resolution adopted by the Associated Chambers of Commerce, at its last annual meeting, rightly stressed the "necessity of proper planning and speedy implementation of plans, so as to ensure that the availability of electrical power is in excess and remains in advance of requirements and a proper balance between thermal and hydro-electric stations to ensure uninterrupted supplies."

The fact that power shortage continues to be a major bottleneck in regional economic development is now widely recognised. Indeed, Mr. F. C. Badhwar of the Punjab and Delhi Chamber of Commerce, estimated that there is acute shortage of power in over 80 per cent. of the country. A suggestion, which he made and deserves the immediate attention of the authorities, is that medium capacity thermal power plants within the 10,000-30,000 kw. range should be set up in India; they could be conveniently standardised and speedily erected. If this suggestion were implemented, there would be greater sense of security among industrial managements who could plan their progress on the assurance that power supply would continue to be available. At present, industrial concerns suffer from memories of grievous power shortage. Among the States which have suffered such cuts in power supply, the Madras State deserves special mention. Last year, many industries in the State had to cut their power consumption by 75 per cent. It is not likely to be out of the power woods, though the outlook this year is good. For, as Mr. P. Hadfield pointed out, even with the advent of the Periyar and Kundah projects and those foreshadowed, the State "will remain sadly deficit and sadly out of balance as between hydro-electric and thermal power, inadequate provisions having been made for new projects and expansions." The authorities will do well to plan well ahead in anticipation of demand for power, for, as Mr. Hadfield himself pointed out, it takes about five years to translate a blue-print into a project.

Exclusive reliance on hydro-electric power will certainly increase the uncertainties in the supply of power. Apart from the hardship arising from any possible failure of the monsoon, there is the additional difficulty of arranging for transmission over long distances. This point was made by Mr. H. Mackay Tallack of the Bengal Chamber of Commerce. Referring to the problems of supply of power from the multi-purpose projects in the Bengal-Bihar region, he said: "We have had some experience of reliance on power from these projects and have already been involved in power stoppages that have dangerously affected the continuity of pro-

duction. Apart from the uncertainties of the monsoon, there is the great danger in planning to distribute large volumes of electric power by overhead transmission systems in an area where wind forces and climatic conditions are as extreme as in any part of the world." This consideration underlines the need for supplementing hydro-electric by thermal power. Finally, since industrial consumers and electricity undertakings alone are in a position to help arrive at correct decisions on power development, they should be increasingly associated with policy-making bodies, such as State Electricity Boards. In the past, the country has often had to pay heavily for ignoring the advice given by these interests. It would be wrong to deny them opportunities for participating in the deliberations of bodies or institutions which are charged with the responsibility of assessing the power requirements of the country and of devising the means by which they could be met.

FOOD SITUATION

It was with refreshing candour that Mr. S. K. Patil, Union Minister for Food and Agriculture, replied to the debate on food situation in Rajya Sabha on Monday this week. If the same candour had been exhibited by his deputy, Mr. A. M. Thomas, who initiated the debate, the tenor of the debate would, perhaps, have been quite different. Mr. Thomas merely claimed that the food situation had registered an "all-round improvement" and highlighted some of the measures taken in the sphere of foodgrains distribution, but did not explain adequately what exactly were the steps the authorities were taking to boost food production. Even in his references to the distribution aspect, he was rather vacillating. It was not surprising, therefore, that some members, not excluding those belonging to the Congress Party, regretted that the food situation was still in the same state of chaos as it was two or three years ago. declared: "This half-hearted zonal system and quarter-hearted State trading and the slogan for going to give us food or bring down the prices." Dr. H. N. Kunzru (Independent) pointed out million tons—in 1958-59 was due more to good weather than to any special effort by the Agriculture Departments of the Government of India or the States. He could not agree that he said: "As in previous years, the prices may come down for the present, but they would go up again after a few months."

The general consensus of opinion of members who participated in the debate would appear to be that, if the consumer is to be assured of adequate supplies of foodgrains at reasonable prices, the powers-that-be should reorient the food policy on rational lines free from ideological considerations. Four notable suggestions were thrown by members in the course of the debate. One, the Government must give up State trading in foodgrains. For even if it has full control over State trading, it will not be able to supply quickly the needs of millions of people as private traders are able to do at present. Two, if the Centre and the States can pool their efforts so as to take care of the food required by a deficit State, then it will not be necessary to form these zones. Three, there must be one uniform food policy applicable to the whole country and price stabilisation should apply to all commodities—foodgrains and other non-food crops. Four, greater emphasis must be laid on the need for ensuring adequate irrigation facilities, supply of good seeds, and chemical and non-chemical manures. There is, of course, nothing new in these suggestions, inasmuch as they have been repeatedly stressed ere now. But, by drawing attention to them again, the Rajya Sabha members have indicated that the measures are being implemented by the authorities in a haphazard way.

In his reply, Mr. Patil made a categorical declaration that the proposed five-million-ton foodgrains buffer stock (mostly of wheat and rice) would be built up "in less than a year." He disclosed that the friendly surplus countries had given "good assurances" of help and administered properly, will help stabilise foodgrains prices at economic levels. Apart from its psychological impact, the operation of the buffer stock will control foodgrains markets effectively, since it will involve selling grains at reasonable prices when prices tend to rise and purchasing grains whenever prices tend to fall. The buffer stock will thus create, as Mr. Patil rightly said, a salutary effect on the

people, the farmers and especially those merchants who are prone to take advantage of temporary shortages or regional scarcities.

The Food and Agriculture Minister made special reference to his proposal for reorganising the zonal system. He stated that, for the present, he was aiming at linking deficit with surplus States, in order to create more or less balanced zones, but stressed that his ultimate objective was to achieve a single zone for the entire country. The Minister hoped that Orissa and West Bengal would shortly unite into one zone. He also proposed the formation of "an absolutely natural zone" consisting of Madhya Pradesh and Bombay. He expressed his readiness to give all safeguards desired by the Madhya Pradesh Government, including the responsibility to cordon off Bombay City from the proposed zone and feed it out of the Central stocks.

While the establishment of a buffer stock and reorganisation of the zonal system will impart stability to foodgrains trade, the permanent solution to the food problem lies in maintaining a rate of output which is commensurate with the population growth. It is indeed gratifying to note that Mr. Patil devoted the major part of his speech to the question of augmenting production. Reiterating that his main task would be food production rather than food distribution, he observed:

"I am very optimistic about prospects in the field of production. I do not agree that last year's output of 73.5 million tons was in the nature of a record or even a bumper crop. In view of our poor yield which, at an average of 1.5 ton per acre, compares badly with 2 to 6 tons elsewhere, there are vast possibilities of increased production. Factors in favour of this are our large cultivable area and equally large irrigation resources. What is needed is the application of modern scientific methods to agriculture, including fertilisers, improved seeds, plant protection measures, credit and other service facilities. I am addressing myself to all these, as well as to the need for co-ordinating the efforts of the various agencies at the Centre and in the States, including the Union Irrigation and Power and the Community Development Ministries."

This is certainly a realistic approach to the whole problem of foodgrains production. Equally realistic is Mr. Patil's approach to the question of co-operatives and joint-farming which differs considerably from that advocated by the die-hard socialists (or communists?) of the Congress Party. None would dispute the statement of Mr. Patil: "I am in favour of the system adopted in France, West Germany, and America itself, under which cultivators pool their land for specific purposes like ploughing, plant protection and land improvement, retaining intact the ownership of their land; service co-operatives for this and other purposes will be needed." The setting up of such co-operatives will doubtless remove one of the most serious handicaps to scientific farming, namely, smallness of holdings.

Mr. Patil made a reassuring statement when he declared that food and agriculture would be given predominance in the third Five-year Plan and that the instances of the past would not be allowed to be repeated in future. In particular, Mr. Patil stressed the importance of chemical fertilisers which, in his opinion, represented a better investment in foreign exchange than food imports. He said: "I am, therefore, fighting for larger imports of fertilisers and am hopeful that the total availability in the current year would be of the order of 1.5 million tons, or nearly equal to the likely demand." In this connection, he revealed that the Government was planning to provide one fertiliser factory for each State, though the new plants would be smaller than that at Sindri or Nangal, the cost being about Rs. 5 crores, as against Rs. 25 crores for the existing factories and those already approved.

That the provision of adequate and timely supply of fertilisers to farmers is of the utmost urgency cannot be emphasised too strongly. The existing level of productivity from land compares very unfavourably with that in several other countries. This is due to the negligible quantities of fertilisers used per acre of land which, on an average, come to no more than 1.1 lb., as against 193.26 lbs. in Japan, 177.45 lbs. in Belgium and 174.90 lbs. in the Netherlands. The use of fertilisers, as was mentioned in these columns only two weeks ago, is a quick and sure method of increasing food production, but an essential condition for the use of fertiliser in a tropical country like India is an assured supply of water. Irrigation, too, therefore requires to be given high priority. If Mr. Patil were to succeed in ensuring the continued availability of both water and fertilisers to farmers, he would have rendered a signal service to agriculture.

TEAM SPIRIT helping to build Durgapur for India

A partnership of 30,000 Indian and British people is completing a jigsaw of concrete and steel at Durgapur—building a vast new steelworks for the nation.

By their team spirit, the men of CEMENTATION-PATEL are helping this partnership—and the plan to make over a million tons of steel every year for India.

Together, they work on a site the size of a small city: 13,500 Indian and 75 British engineers, technicians and workers.

Together, they have built foundations for the greater part of the project's seven square miles of buildings and plant. Together, they are laying a network of roads, railways and pipelines.

CEMENTATION-PATEL, Durgapur's civil engineers, were first to get to work at Durgapur. In three years, they have moved mountains of earth and concrete to a strict schedule—three years that crown THE CEMENTATION COMPANY'S 30 years of service in India.

TRENDS IN WESTERN EUROPE

THREE MAJOR CHALLENGES

DISCUSSING the long-term problems of growth facing Western Europe, which has had a remarkable recovery in the current year, the Chase Manhattan Bank's Economic Research Department observes, in its latest *Report on Western Europe*, as follows:

Now that business activity is moving ahead again, concern in Western Europe is shifting away from the problems of dealing with recessions to the longer-range problems of maintaining sound and rapid economic growth.

Industrial output is up sharply in Germany, Holland and Italy, reflecting increases in nearly all industries. The advance is only slightly less marked in Britain. Even in France (where the 1958 recession arrived late) and in Belgium (where heavy coal stocks are still a burden) production is starting to show moderate gains over 1958.

In the Common Market as a whole, the rate of expansion has picked up momentum throughout 1959. Official forecasts are that industrial production in the fourth quarter will run some 7 per cent. above fourth quarter 1958. This compares with an increase in the first three months of this year of only 1.8 per cent.

Throughout Europe, the pattern is more or less the same. Exports for the first half of the year were strong, particularly to the United States. Last year's laggards in industrial production (steel and textiles) are sharing in the recovery. Inventories are being rebuilt.

Finally—and this is perhaps the most significant development of recent months—capital investment is picking up in most European countries.

So far, then, it has been a normal recovery. All signs point to resumption of substantial economic growth in Western Europe that could carry over well into 1960 at least. And this will direct attention to some fundamental problems—including the long-term problems of growth—which will come into sharper focus as the European economy moves ahead.

The Challenges

The major challenge facing Western Europe is to achieve a rapid rate of growth without inflation. As in the U.S., this calls for effective use of monetary and fiscal policies. It means keeping wage increases in line with gains in output per worker. It means resisting the temptation to encourage short-run gains in consumption, at the expense of long-term growth.

A second challenge for Europe is to expand rather than contract the scope of international trade. There is always the danger that the current differences between the Common Market "Six" and the emerging Little Free Trade Area could evolve into a permanent split. The simple fact is that, until the movement towards freer trade embraces the whole of Europe, the framework for maximum economic growth is lacking.

Thirdly, there is the new problem of aid to underdeveloped countries. This involves assistance not only for the overseas territories of European countries, but for Europe's more immediate neighbours. As it now stands, the Continent is ringed by countries in an earlier stage of economic development: Iceland, Ireland, Spain, Portugal, Morocco, Algeria, Libya, Turkey and Greece. Growth and stability within the developed areas depends on encouraging economic expansion in these peripheral countries. In this regard, recent developments—Spain's membership in O.E.E.C., the proposal of Greece and Turkey to join the Common Market as associate members, the discovery of oil in North Africa—take on special significance.

In addition, the European nations may have to shoulder a larger share of the burden of aid to other less developed areas of the world—a burden that until now has been carried mostly by the United States.

These are major challenges that will confront Europe for some time, for they reflect the long-term growth problems of the area. However, not all countries are likely to have the same difficulty in moving ahead rapidly. Germany, France, Italy, and Holland, for instance, have come far toward a solution, with high levels of investment relative to income. On the other hand, Belgium and the U.K. have yet to gain rapid economic momentum.

Labour Shortage

For the first time since the end of World War II, Germany has more jobs being offered than workers seeking employment. The immediate cause is the building boom along with the general pick-up in economic activity. More important is the slow-down in the flow of refugees from the East, which in the past has added some 12 million to Germany's post-war population. The tight labour market may have two important results:

First, German industry may draw on the labour surplus in other countries. In 1959, more than 220,000 Italian workers moved into Germany, and the number could increase substantially in future years.

Second, labour costs relative to other costs are likely to rise. Wages have been rising in Germany, but they might well have risen faster had it not been for the pool of unemployed—mainly refugees—ready and able to step in at existing wage rates.

A rise in German wage costs on this account could reduce somewhat the extremely favourable foreign trade position of German exporters.

France has had a chronically tight labour market for several years. While some labour migration into France has taken place—and may be expected to continue—there is another source of industrial labour in the less efficient and highly subsidised branches of the French economy. The best example of this is in agriculture. Workers are being drawn from farms into the cities, as indicated by the reduction in farm labour from 36 per cent. of the total labour force in 1946 to 26 per cent. in 1957. The drop in farm subsidies starting in 1959 could accelerate this movement.

Need for Capital

Holland's major problem is that she is a small country with large capital requirements. The Common Market stresses the need for further industrialisation. There is the added pressure of population growth, which is the fastest in Western Europe. On top of this, there are the old programmes to reclaim land from the sea and the new transportation programmes, most important of which is to develop Amsterdam's port facilities to accommodate Common Market trade. It is not surprising that the Dutch, perhaps more than their Common Market partners, have been so receptive to foreign capital.

In Italy, the major problem is to use existing capital more effectively and get a larger number of business men to invest in the underdeveloped South. As it now stands, the Mezzogiorno accounts for almost 40 per cent. of Italy's total population, some 20 per cent. of national income, and less than 10 per cent. of electric power consumption. This last figure has become particularly important in 1959. In June of this year substantial deposits of natural gas were discovered at Matera. It is hoped that development of a natural gas industry can offset the lack of resources and high power costs in the centrally located region of the South.

Lack of Expansion

The problem in Belgium is how to modernise a small, but heavily industrialised economy. In the past, the Belgians have offset the disadvantages of stable population, lack of natural resources and relatively high cost labour by strengthening export industries. These industries are now serving Belgium less well than in the immediate post-war years.

To compete more efficiently in the Common Market, Belgium needs greater diversification into such growth fields as chemicals, metal-working and engineering. The Belgians have taken three steps in 1959 to solve this problem. They have started to rationalise their high cost coal industry, they have just announced new incentives for foreign investors, and they have made it easier—by exempting receipts from the sale of assets that are reinvested from the capital gains tax—to shift capital from Belgium's stagnant industries into more promising fields.

As with Belgium, the problem in the U.K. is the lack of long-term growth. Actually, the record in 1959 has been more favourable. If Britain could sustain the current rate of industrial expansion now estimated at 5.6 per cent.—she would come close to matching her Continental competitors.

To do this, however, Britain needs a higher rate of investment than she has had in the past. In 1958, for example, capital formation in the U.K. was only 16 per cent. of G.N.P.—compared to over 20 per cent. in Germany, Holland and Italy. The most sobering aspect of the current pick-up in Britain is that it is heavily weighted with consumption, and lightly weighted with capital investment.

(Concluded from next column)

should not assume that the general terms of commerce are not stiffening against the U.K. one ought not to be led by all the current fluctuations around to assume that Britain's honeymoon is over.—All Rights Reserved.

CORRIGENDUM STRAW PRODUCTS LIMITED

(J. K. Paper Mills)

IN THE ANNOUNCEMENT OF THE aforesaid Company, pertaining to issue of additional capital, published on pages 990 and 991 of *Commerce* dated 12th December 1959, the name "Bank of India" was erroneously mentioned under the subtitle "Bankers". It should have been the "State Bank of India".

It may also be noted by the applicants to the new capital issue under reference that cheques and drafts should be made payable to "Straw Products Ltd.—Share Application A/c" and should be crossed, "Account Payee only." A separate cheque or draft should accompany each application form.

LONDON LETTER

TAKING THE SHORT VIEW

(From Our Own Correspondent)

LONDON, 12th December

AFTER ten months of steadily improving trade, it came as a shock to find that, in November, the trade gap had widened substantially. In October, the excess of imports over exports plus re-exports was about £40 million and in November it was about £50 million. This comparison must be taken as it stands, because the language in which the Board of Trade issues these figures is always confusing: that is, imports for this purpose is on a c.i.f. basis, while exports and re-exports are on an f.o.b. basis. If allowance is made for insurance and freight on the imports, then the gap is dramatically narrowed. On the other hand, if the comparison is made on what the Board of Trade term a "seasonably adjusted" basis, it appears to be even wider. The idea of the "seasonably adjusted" basis is novel, but is designed to iron out purely seasonal movements and no doubt gives a much clearer picture, once the public, to whom the picture is addressed, knows what it is about.

For the rest of the assessment in this letter the "seasonal adjustments" will be ignored, as they are not so far sufficiently familiar. Before abandoning them more completely, however, one should comment that the "seasonably adjusted" average of exports in the first eleven months of this year was 4½ per cent. greater than the average for the whole of 1958, and the "seasonably adjusted" exports for the last three months September-November were 6 per cent. more than in the preceding three months. On the same basis, "seasonably adjusted" imports were 7 per cent. more in September-November than in June-August and the average for the first eleven months for this year was 6 per cent. more than the average for the whole of last year. If anyone is able to make any better sense out of that than out of the ordinary export-import figures, their views should be attended to with interest.

Coming back to the actual recorded values of trade, we find that, while, in the first quarter of the year, the gap on the usual c.i.f. and f.o.b. basis was £39.1 million per month, in the second quarter it was £35.3 million per month; in the third quarter it had worsened to £54.8 million per month. In October, it was £39.4 million and in November it was £49.3 million. For the year as a whole, the average monthly "gap" has been just over £43 million.

Thus, the worsening in November set in perspective without any "seasonal adjustments" is not worse than it should be and one can sympathise with the London brokers, who, in order to stop their clients selling, are reported as circulating a report that Britain is sailing her "barque upon a placid lake on which everything looks lovely." They do go on to say that, should anyone do anything obvious, the placidity might be rudely disturbed and, indeed, the sort of stone which could ruffle the surface might be a disequilibrium between short-term rates at home and abroad.

Not that the brokers have very much need to worry. After history had been made in the middle of November, when the *Financial Times* equity index had risen to over 311, it is true there was a recess. But the index at the end of this week is up again to over 312. Nothing seems able to keep down the ebullience of investors—not even the optimism of their brokers!

But even the more sober commentators have to attempt that, if this country persists in running along indefinitely with short-term money rates way above those ruling in the United States, then the intended result is bound to happen: hot money and gold will flow from the low rate countries such as the U.K. and Germany to the high rate countries. After all, the difference between the U.S. bill rate and the British Treasury rate is now more than 1 per cent. and a drop of £18 million in the gold reserve is a very modest figure in the circumstances. Similarly, the slight cheapness of sterling against the dollar (even so, the cross rate is only one-eighth of a cent below parity) is also no more than one should expect. The lesson of all this is that, while one

(Continued in previous column)

A spark has become the flame which will give light and warmth to her humble home. So it is with ideas. A glimpse enlarges into a vision: a development in the laboratory is translated into a benefit for millions... The search for ideas is constant in the fifty laboratories of the Dunlop Research Centre in the U.K. Its staff of scientists and technologists press into service the resources of modern science to deepen our knowledge of rubber—knowledge that is used by Dunlop factories the world over, including those at Sahaganj and Ambattur in India, to make things better for everyone.

OUTLOOK FOR U.S. ECONOMY BRIGHT INFLATION STILL IN EVIDENCE—INTEREST RATES HARDENING

By Our American Correspondent

THE beginning of a new decade, this time the 1960s, is always a milestone. The United States population now at about 179 million is growing steadily and at an unexpected high rate. By 1970, there will be 12 million more families than there are today, barring national or international disasters.

This means many things to many people. There will be need for more housing, for more schools, for transportation, for more furniture and appliances, for virtually everything one can think of. The explosion of the American population at this juncture began after the end of the last war. The baby crop of that era is about to become of marriageable age, at least in the ensuing decade.

Nearly everybody is quite optimistic for 1960, particularly the first half of the year. There is no unanimity about the second half of the year. The year 1960 is a Presidential election year which is always a period of uncertainty. In other words, there is apt to be a certain hesitation in business spending and expansion which is traditional.

Buying Spree

In the meantime, one of the biggest retail buying sprees during the current holiday season is in process. It usually lasts until after New Year. It could be the biggest season in history in terms of current dollars. For it must not be forgotten that, despite all efforts to stem inflation, price rises are a continual feature of the U.S. economy. So far, they have been small enough to elicit no articulate popular protest, although Washington has voiced official concern.

There has been considerable pressure to settle the steel wage-labour dispute on a non-inflationary basis. In effect, all this is wishful thinking. Inflation has been the bedfellow of all large nations and empires, as they were forced to engage in social services of all sorts. The trend of rising wages and prices is still very much in evidence. They will keep on climbing in 1960. In a recent survey, the U.S. Department of Labour found that at least 6 million workers in major industries are in line for wage boosts in 1960.

The Administration is not against wage increases *per se*, but it is opposed to raises which would outstrip productivity gains and force companies to raise prices. This is not very realistic; it is pure guesswork. Forecasts at this point are that wage increases in 1960 will hit close to the wage pattern in the steel industry. Federal economists claim the economy can absorb this without price boosts. It is highly doubtful to me and everyone else outside of the circle of "Federal economists."

Productivity

Productivity gain is a big word. The U.S. has always prided herself of her great industrial capacity and growth, but the fact of the matter is, as Allan W. Dulles, Head of the Central Intelligence Agency, told Congress the other day, that the American growth rate in the last years has been between 3 and 4 per cent., while the Russian productivity has grown 8 per cent. and more a year. Thus, the boast of Soviet Premier Nikita Khrushchev that his country would overtake the U.S. in industrial production might become a reality, even though Russian production today is just about half that of America.

Productivity contains many input and output factors. Labour costs are a major item on the input side. In the U.S., they are going up constantly as in no other country in the world. While there has been an increase in efficiency of production, it has not been sufficient to compensate for the incessant demands for a higher standard of living.

An Illusion

Much of this higher standard of living is an illusion, of course. New gadgets and appliances require repairs in not too infrequent intervals which causes anxiety and frustration. No matter how automated an operation is or becomes, there is always a chance of errors. Not only human errors, but electronics tubes may

blow and cheques supposed to read \$4.59 may read \$4,590,000. It has happened many times and it is a subject manufacturers of automation machinery do not like to talk about, except those who recognise that there is no perfection in humans.

The immediate outlook for the first quarter of 1960 is that both industrial sales and profits will exceed the levels of the comparative 1959 period. Business men's expectations are that the January to March volume will be ahead of last year. At least 65 per cent. of them think so, according to a recent survey. About 30 per cent. see no change from last year, while the remaining 5 per cent. expect a decline.

A bare majority of 51 per cent. believe that net profits in the first quarter will be higher than in the first three months of 1959. This is not too optimistic and is unadjusted for inflation, but it is, nevertheless, significant, since the views expressed seem to have been judicious and not as buoyant as previously.

Soaring Sixties Or Sad Sixties?

In retrospect, it may be interesting to note that the editors of the U.S. United Press International news service considered the following events as the top 1959 news stories:

Included in the list was the movement of Communist Chinese troops into Tibet, President Eisenhower's visit to India, Africa and Europe, the Soviet moon hit with a rocket, as well as Premier Khrushchev's tour of the U.S. in September, and Queen Elizabeth's visit to Canada, during which she formally opened the St. Lawrence Seaway together with President Eisenhower.

Looking ahead, there is talk of the "soaring sixties," of the "surging sixties" and the President of American Motors Corporation referred to the period ahead as the "sensible sixties." There are others who call it the "sad sixties."

The latter are the sceptics among the economists who have a clear recollection of what happened in the late 1920s when the American economy was in a previous boom. Although there are significant differences such as built-in stabilisers, unemployment insurance and others, there are also similarities and one of them is the complacency of the public mood.

The pessimists warn of the "sad sixties," unless inflation is not better controlled, unless global spending is reduced realistically, unless the U.S. Federal Budget is balanced on a real basis. Moreover, the U.S. industry, they suggest, must hold costs down and keep increasing its production if American products are to maintain their world markets. There has been a considerable loss of markets to overseas competition recently. For example, in the last ten years, the import of foreign automobiles has increased ten times.

The Farm Problem

The Washington Government spends 1.5 million dollars every day just to store surplus grain which has been abundant for years in the plains of this country. It is one of the greatest anomalies which must be understood overseas.

When the farm support programme started, the American farmer was one of the underdogs. The farm vote was a considerable factor in national election. It still is to a certain extent, except that many members of farm families work in nearby towns and can no longer be regarded as farmers.

The surplus wheat, purchased by Washington as part of the farm price-support programme, would fill a train 5,335 miles long. About 65 per cent. of America's farm population is almost completely excluded from farm price supports. The large commercial farmers, representing only 27 per cent. of the farm total, get nearly 80 per cent. of crop-price benefits.

About 87 per cent. of the farmers polled in a nation-wide survey wanted less Government farm support and fewer crop controls. As a matter of fact, 83 per cent. of U.S. cotton farmers derive no substantial benefit from the price-support programme. This cotton price-

support programme guarantees a loss to the Government of up to \$15 on every bale purchased.

This is one of the reasons why most of the cotton future traders have been driven out of business, because the Government has a permanent "corner" on the cotton market. When there is a fixed price, there is not much need for trading.

Wheat Surplus = 470 Loaves Per Person

The farm price-support programme and the payments to farmers under it will take at least 20 cents out of every tax dollar collected by Washington for non-defence purposes this year. It is an anomaly which is difficult to understand here and abroad. The problem can be grasped only by remembering that the whole support plan was born of a national emergency—the great depression of the early 1930s.

It was never changed, because a very large number of voters and taxpayers were benefited and no politician had the courage to take these benefits away or temper them as the depression turned into periods of inflationary boom. Farm price supports will cost every American, man, woman and child about \$30 in 1959.

There is enough wheat surplus stored in taxpayer-supported Government warehouses to provide 470 loaves of bread for every inhabitant. That is approximately a four-and-a-half-year supply at present living standards here. It is a sad commentary of human reasoning that such conditions are permitted to exist in the face of millions of people in other parts of the world suffering from undernourishment.

Unless the wheat price-support programme is changed—and there is no indication that it will—surpluses will continue to pile up at the rate of 200 million bushels a year. Said Secretary of Agriculture Benson, "this could end in a disaster such as we have not seen before in American agriculture." And the cotton situation is almost as serious. One of the most incongruous aspects of the U.S. farm programme is that people are paid for not growing things in order to alleviate surpluses. This is generally regarded as an illogical approach.

Tighter Money in Sight

The U.S. Treasury bill rate is a very sensitive barometer. It mounted this month to 4.5 per cent. and it may go higher before this appears in print. Interest rates have been on the upgrade since September. There was a temporary slackening in the demand for money, owing to the steel strike, but this has given way to a new boom psychology.

If the steel mills do not shut down again after the Supreme Court injunction runs out in January, the chances are that inventory accumulations will accelerate. Automobile sales are likely to increase. Spending on new plant and equipment which is badly required might increase and the gross national product might move into new high ground.

All this may mean peak demands for money. Corporations will be borrowing more and so will Governments on all levels. Construction is still a bit of a question mark, but volume in 1960 is certainly going to be as large as in 1959. Residential building may even be higher.

The big problem is the adequacy of savings and the money supply available from commercial banks, mutual savings banks, savings and loan associations and insurance companies. Authoritative estimates are that supply of funds will fall short of the demand. This means a higher premium for money. Commercial banks have been hit by the Treasury issue of 5 per cent. notes, due in 1964. This compares with interest in various types of savings accounts of between 3½ and 4 per cent.

Overall Forecast

For the past eight years, remarkably accurate economic forecasts have been made by Prudential Insurance Company of America under the tutelage of Dr. Gordon W. McKinley. It may, therefore, be of interest to summarise them for the benefit of Indian readers.

The gross national product is likely to break through the \$500,000 million mark. Employment will be rising. Unemployment should be less than 4 per cent. of the working force, "well within a practical definition of full employment."

DECCAN SUGAR AND ABKHARI COMPANY LTD.

MR. C. R. SRINIVASAN'S ANALYSIS OF SUGAR POSITION IN SOUTHERN REGION

"DEFICIT COULD BE MET BY EXPANSION OF EXISTING UNITS IN MADRAS STATE"

THE Sixty-third Annual General Meeting of the Deccan Sugar and Abkhari Company Ltd. was held at Madras on 18th December 1959. Addressing the shareholders on the occasion, Mr. C. R. Srinivasan, Chairman, said that the anticipated deficit of 15,000 tons of sugar in the southern region could be more than met by expansion of the existing units in the deficit Madras State at a cost much lower than that of new and independent units. If, however, new factories had to be set up, he pleaded, they should be located at such places as would prevent them from encroaching on the cane areas developed by existing factories.

The following is the full text of Mr. Srinivasan's speech:

"GENTLEMEN,

"The report of the Directors and the statement of accounts for the year ended 31st May 1959 have been in your hands for sometime and I hope you have found them interesting. I propose, with your permission, to take them as read.

"I am glad to say that the results of the financial year have enabled your Directors to propose payment of dividends on the Company's ordinary share capital totalling 25½ per cent. gross for the year equivalent to 18 per cent. after deduction of income-tax at the rate applicable to resident individuals.

Taxation

"Reference has been made in the Directors' report and in note 7 on page 14 of the printed accounts to the provision for taxation and the tax deducted or deductible from dividends, but there are two further points relating to taxation upon which I should like to comment briefly.

"The first relates to the unusually large figure of Rs. 2,62,500 included in the provision for taxation in the profit and loss account under the description 'adjustments relating to previous years.' It has been the practice of the Company to reserve in one year of account for the expenses that will be incurred in the following year in overhauling the machinery, because the overhaul is necessitated by the operation of the machinery in the year of account and, therefore, the cost of the overhaul should appear in the same year. Such reserves have hitherto been allowed as a deductible expense for income-tax purposes in each of the years in which they have been set up, but the Income-tax Department are now seeking to revise past assessments of the Company, so as to postpone the allowance of the reserves from the years in which they were set up to each of the following years when the expenditure was actually incurred.

"The matter is under reference to the Income-tax Appellate Tribunal and, pending its disposal, it is obviously necessary that we should provide for the tax involved, should the decision go against us and this is the Rs. 2,62,500. It will be appreciated from what I have said that this additional tax provision required out of the profit of the Company's year 1958-59 is not for tax which ought to have been provided for in earlier years, but is to antedate by one year payment of tax on a reserve for expenditure which will be allowed for tax purposes in the following year.

"The second point is the practical doubling of the advance payment of income-tax and super-tax shown under note 10 of the accounts at Rs. 14,50,643, as against the corresponding figure last year of Rs. 7,31,630. The reason is that the income-tax officer's demand for advance payment of tax during a particular accounting year is based upon the tax actually paid by the Company against its last completed assessment which, in the case of this Company, generally relates to the profits of the accounting year two years ago. Thus, the advance tax of Rs. 7,31,630 paid during our year ended 31st May 1958 was based on the assessable profits for the year ended 31st May 1956 which were relatively low, because we were able to set off against the book profit

of the proposal. Meantime, we have asked Mr. Parkes, who is now Technical Adviser to the Managing Agents, to examine the possibility of a still larger expansion. I hope that when I address you next year I shall have something favourable to report on this matter.

"Shareholders may remember what I said last year, that the minimum price for cane will in future be merely an advance payment and that the final price will represent a percentage—as yet unpublished—of the price realised for sugar after adjustment of a number of factors. In the context of this price linking formula, which is more far-reaching in its consequences than the well-known S.I.S.M.A. formula, we can no longer confidently count on benefiting from the upward trend in sugar prices. There will be virtually a fixed margin for manufacture between costs and profit. It is in this context, apart from contributing to sugar production in the country, that we have to consider seriously our expansion plans with the aim of bringing down costs.

"The Samalkot factory crushed in the 1958-59 season 95,617 tons of cane, as against 111,567 tons in the previous season, and produced 9,134 tons sugar. The shortfall was due to lower yields and diversion of some contracted cane for jaggery. The recovery was, however, better at 9.55 per cent., as against 8.98 per cent. in the previous season. The net shortfall in production over 1957-58 was 881 tons sugar.

"At Pugalur, production during the 1958-59 season and 1958-59 main seasons was 18,359 tons of sugar on a crush of 193,044 tons of cane, the relative figure for the 1957 special and 1957-58 main seasons being 20,888 tons of sugar on a crush of 227,207 tons cane. Here again the recovery was better than in 1957-58, though cane which ordinarily would have come to the factory was diverted by growers to jaggery.

The all-India production in 1958-59 was 19.17 lakh tons, compared with 19.76 lakh tons in 1957-58.

Sugar Scarcity

"You will doubtless want me to dwell on the present sugar situation, the more dramatic developments of which occurred after the close of the year under review. It was not so long ago that the country decided on export of sugar on the ground that there was a sizable surplus after meeting the internal demand. What has happened in the interval to affect production to the point that exports ceased and supplies failed to meet the internal demand? It seems to me that the answer is twofold. Undoubtedly, there has been a spurt in consumption. In an expanding economy with progressive inflationary pressure, not easy to control, food is the first item of the family budget to absorb part of the increased money income. It was generally hoped that with a carryover of 3.59 lakh tons at 31st October 1958 and a production of about 20 lakh tons in 1958-59 the country would be wise to build up an export market after meeting the internal demand, estimated at 21 lakh tons. As the season progressed, however, it was clear that production would not exceed 19.25 lakh tons. In actual fact, the production in 1958-59 was about 60,000 tons less than in the previous season whereas consumption showed a distinct rising trend. Speculative elements were not slow in taking advantage of the indications that the carryover into 1959-60 would only be about half the normal quantity and there was no prospect of any substantial increase in production in 1959-60.

"The reasons for production not rising to the level of consumption are not far to seek. The Finance Act of 1957 had done considerable damage earlier, with the doubling of duty on vacuum pan sugar, on the one hand, and no taxation whatever on jaggery or *khandasari*, on the other. The consequences followed as speedily and to as great an extent as they were obvious and predictable. Jaggery and *khandasari* manufacturers invaded factory areas and bought cane which would otherwise have gone to factories, at prices the factories could not afford to pay at the controlled price of sugar. There are no exact statistics, but it is generally accepted that the manufacture of *khandasari*, which up to the 1956-57 season had been steady at 1 lakh tons, increased by 250 per cent. in the cold weather of 1957-58 and has been maintained at this level.

"In the 1959 Budget an attempt was made to correct the imbalance. A tax of Rs. 126 per ton was proposed on all *khandasari* compared with Rs. 291.20 on factory sugar, but in April (Continued on page 1050)

Pugalur Factory

"In Pugalur, we have the best cane that is milled in the group of sugar factories under the management of Parry and Company Limited, only five factories in the Southern group having a better recovery. In contrast to Samalkot, we work at Pugalur 250 days in the year, while the all-India average is 141 days and the Southern Zone average 153 days. It is obvious that, within reasonable bounds, money spent on the expansion of Pugalur will show a better return. It is incumbent upon us to examine all possibilities.

"The balancing of certain sections of the Pugalur factory was completed in July 1959 at a cost of Rs. 8 lakhs. The factory is currently crushing at the rate of 1,000 tons per working day. You will probably recall that a few months ago the Government of India invited applications for expansion of existing units and for establishing new factories in the context of requirements of sugar at the end of the third Plan. We have sought permission of the Government to increase Pugalur's capacity to 1,250 tons. With the sugar policy for the third Plan still not formulated, the Government has presumably not seen its way to sanction individual applications, but we can confidently expect approval

TRADING IN OPTIONS THE CASE FOR AND AGAINST IT

COMMENTING on the suggestion made by Mr. Madanmohan Ruia, President of the East India Cotton Association, in the course of his address to the annual general meeting of the Association, in November 1958, that *teji-mandi* or option business should be legalised and regulated, we had pointed out that Mr. Ruia, despite the fact that his plea was based on practical grounds, was treading on controversial ground. Nine months after Mr. Ruia made the suggestion, the *Forward Markets Bulletin*, issued by the Forward Markets Commission, carried an article by Mr. G. W. Kshirsagar containing a discussion of the nature and implications of option business and its merits and demerits. His conclusion was that, though permitting options in normal conditions might not involve any excessive risk, conditions in India today were not suitable for the revival of option business. At a time when the country was experiencing the stresses and strains of development, he argued, a revival of options might make the commodity markets more vulnerable to speculative pressure and that legalising options might not make the problem of their regulation any simpler.

Writing in the December 1959 issue of the *Forward Markets Bulletin* in his personal capacity, Mr. C. M. Parikh, the veteran Secretary of the East India Cotton Association, Bombay, has made a realistic examination of the question whether options should be legalised or not. The core of his argument for legalising options is that, in certain circumstances, options not recognised and controlled, can prove to be a great menace to the trade than otherwise, whereas, if properly regulated, they can be a source of strength to the trade and yield larger revenues to the Government.

It is common knowledge that an option, known as *teji-mandi* in India, is a right to buy or sell a specified quantity of goods on a certain specified future date at a price agreed upon when the bargain is struck. To acquire this right, the buyer of the option (the option applier) has to pay the seller of the option (option eater) a cash consideration known as premium. A *teji* or a call option is the right to buy and a *mandi* or put option is the right to sell, while a *teji-mandi*, or double option, gives the buyer the right to sell or buy as the market suits him.

The advantages attributed to options are: (1) they afford protection by limiting losses due to variations in the price of futures contracts; (2) they make possible speculation in futures on very little capital; (3) option prices serve an economic purpose as indicators of future price level; and (4) they have a stabilising influence on the price of futures.

The disadvantages are: (a) They are waging transactions; (b) they have a distorting influence on futures prices; and (c) options develop an unsound market. Mr. Kshirsagar points out that, while in the U.S., option business of any kind is banned both in the commodity and stock markets, in the U.K. there is no statutory prohibition on option trading in commodities. There is no legislative enactment in the U.K. to regulate and control forward trading either. The question of permitting or not permitting option trading is, therefore, a matter for the commodity exchanges themselves to decide. While some of the exchanges have framed elaborate rules to control option trading, the principal commodity market, namely, the Liverpool Cotton Exchange, does not officially recognise option transactions, although they are not prohibited. The ban on option business on the London Stock Exchange introduced during the war was lifted in October 1958. But option business in bank shares is still prohibited.

Mr. Parikh, in his article mentioned above, points out that, if the different aspects of option business discussed by Mr. Kshirsagar, especially its disadvantages, were seen in their true perspective, one would come to a positive conclusion in favour of permitting options even on merits. But the instinct and desire for doing options are so deep-rooted among those business men who participate in futures trading and help make the futures markets in this country that it has not been possible to eradicate it even under the penal provisions of legislation. In spite of warnings by the Forward Markets Commission and the East India Cotton Association, option business still continues, though

stealthily, which shows that legislation is not the proper remedy to stop this so-called evil. Strict measures may, perhaps, drive options underground for some time, but its existence cannot be suppressed for all times. Mr. Parikh, therefore, contends that "it is upto all concerned to forget the phases this question has passed through in the past and to consider it with an open mind," so as to bring such business under regulation and thereby prevent the wastage of money and energy involved in attempting to root it out by force. This has so far had only the effect of driving such business to other forms of illegal activities which have lately cropped up throughout the country and have already assumed dangerous proportions.

The advantages of options, Mr. Parikh points out, are ignored while so much is said about its disadvantages. These advantages are summed up by him thus:

"1. Option dealers have developed a form of price insurance market. In fact, option business is a kind of stop-loss business for the buyer. The premium charged is extremely reasonable and cheapest in the world. In normal circumstances, it might be called ridiculously cheap, but for the fact that, in spite of the low premium they charge, failures amongst option dealers have been rare. These low premia are rendered possible due to the recognised intelligence of the operators in working options. Option premia, like insurance premia, depend upon the nature of the risk just as war-risk insurance in times of war.

"2. In options, as in all other transactions, there are buyers as well as sellers. The possible loss to the seller (eater) in the event of the market going against his calculations is unlimited. Options have this advantage that the buyer knows when he starts the transaction that his loss is limited.

"3. The cotton trader has found that options provide a peculiarly useful cover. Cotton is mar-

keted in about five months by the growers, while its use and sales are distributed over the entire year. The main use of the hedge contract is to relieve the pressure and consequent forced depression during the marketing period by growers and help to hold and carry the cotton to later months, so that the pressure may be distributed evenly throughout the year. *Teji-mandi* business helps this holding and carrying of cotton by bringing into the cotton trade the resources of traders and merchants and the mass selling or buying acts as a brake to prevent violent fluctuations in the cotton prices. Even the exporters find it advantageous to utilise the medium of option for their long-range commitments.

"4. The option business has worked well in normal times and its popularity and gradual enlargement proves its usefulness to the trade. Option rates are on the whole cheap because of the peculiar genius of the few operators who eat *teji-mandi* and if *teji-mandi* operations are not to be brought under regulation, the specialised knowledge which only a few possess and which has proved a valuable asset to the cotton trade would not only be lost but may lead to dabbling in unauthorised business which may be more harmful to the trade.

"5. *Teji-mandi* operations help to augment the supply of the contracts so that thousands of bales can be bought and sold with minor fluctuations. This helps to reduce brokerage charges also and large-scale operations are possible at minimum rates and the reduction of these charges reflect in a better price to the grower."

It is clear from what has been stated so far that, if a balance-sheet of the pros and cons of options is drawn up, the credit and debit sides are equal. Whether the former outweighs the latter can only be said from actual experience. In any case, law has not been able to suppress options and option business continues to be done illegally. Such flagrant violations of law, have a very demoralising effect on the trade in general. What then is the way out of this that suggested by Mr. Parikh and Mr. Ruia, namely, regulating option business through enactment of suitable by-laws. It is true that control of options by law is difficult. But the

CHANGING STRUCTURE OF COTTON INDUSTRY

WAGES AND WORK CONDITIONS NEED REVISION

From Our Special Correspondent

MANCHESTER, 8th December

STILL the dominant topic in the market as a whole, and one which is likely to remain so for some months at least, is the effect of the redundancy schemes on supplies and distribution of Lancashire cotton goods in the interim period, while mills are closing up to the end of March. Already the anomalies seem to be multiplying, as different aspects

MANCHESTER LETTER

of the plan affect individual firms and sections in different ways. It will be difficult to escape more of this confusion in the weeks to come.

The lengthy statement made by Mr. W. T. Winterbottom, to which attention was drawn in considerable detail last week, included a section devoted to the outlook. After the end of March, Mr. Winterbottom predicted an erratic pattern of output which might cause temporary shortages of certain types of goods. Commitments running too far forward should be avoided at this stage, he warned. A firm finding itself in the early months of 1960 with an order book solid up to the end of the year will have no manoeuvrability and will not be able to play its part in the readjustment of channels of supply which will be necessary.

Unless a fair return on the capital employed and fair wages for those who work in the industry can be guaranteed, no amount of re-equipment will do any good in the long run, Mr. Winterbottom continued. "Modernisation, streamlining, redeployment, are not going to be of the slightest use unless the minds of our managements and salesmen are also changed to the realisation that we simply cannot afford to accept prices which do not cover all the factors of production."

The Trade Cycle

One of the main handicaps which has invariably hampered the textile trade, particularly in its ability to retain an adequate labour force and attract new workpeople, has been the violent fluctuations which have characterised the industry, particularly in recent years. This trade cycle is not a post-war phenomenon, as Mr. Winterbottom pointed out, but it does appear to have become rather more severe since the war.

The progressive stocking and de-stocking movement is "amplified" as it passes down the train of production from the retail shop to the spinner. The way this is magnified by a small reduction in demand from the consumer to the original producer is illustrated in Mr. Winterbottom's statement, in which he observed that, in 1952, a reduction of over 60 per cent. in spinners' activity occurred when the final offtake fell by only 5 per cent. The process is reversed when demand revives as a result of severe pressure on all stages of production culminating in the spinner, who is pressed to give

quick deliveries at a time when his labour force has been seriously reduced.

While it may be true, as Mr. Winterbottom suggests, that an adjustment from a horizontal to a vertical structure in the trade would ease this situation, such a development on any scale can only be achieved by slow degrees. A more practical line of approach, he says, is the wider dissemination among the industry of detailed knowledge of what is happening in the way of changes in demand, changes in stocks at various stages of the production chain and the state of order books. In the field of synthetic fibres, such statistics have already proved a useful guide to producers, thereby influencing many traders in their stock programmes and encouraging them to refrain from price-cutting at times of bad trade. Mr. Winterbottom said:

"I believe the same kind of work can be done with advantage in cotton and, given a willingness on the part of all sections to provide the necessary information in the first place and to give intelligent attention to the results of the analysis, a useful contribution to this stock cycle problem can be made. With the industry poised at the right size and efficiency for the markets it has to supply following the redundancy and re-equipment schemes, it would be a tragedy, if everything were to be wrecked by a continuation of these morale-destroying alternations between slump and boom."

Filling the Gaps

Articles and commentaries on the present highly complicated stage of development in the Lancashire cotton industry follow thick and fast. In the latest issue of the *District Bank Review*, Mr. W. G. Pilkington, whose daily commercial column is widely read by all connected with cotton trading, makes some forecasts as to the changed structure of the industry, with particular reference to the part which re-equipment will play after the scrapping has been completed. "It is as well," he says, "that managements have been given an appreciable period in which to decide what they will do. It may well prove that the haphazard scrapping has left some unexpected gaps in productive capacity which it will be considered desirable to fill. It may be that demand will evolve a new pattern which offers opportunities for machinery of particular types, the need for which is perhaps not yet apparent."

Mr. Pilkington joins the ranks of those who believe that labour problems will centre not on unemployment but on the provision of adequate manpower to staff the remaining machinery. "Some assessments of the prospects for labour are being distorted by emotion," he observes. Proceeding, he says:

"Attention must be given to such matters as union restrictions on the movement of workers from one job to another and from type of job to another—the whole basis of wages and hours for shift-working—and the appropriateness in present circumstances of the Cotton Manufacturing Commission list for weaving and the Evershed and Aronson lists for spinning. Unless there is a realistic revision of the whole hotch-potch of agreements on wages and conditions of work, the incentive to re-equip on a large scale will be lessened and the benefits from such re-equipment as is

carried out may prove to be trivial and transitory."

Importance of Marketing
The importance of marketing the goods supplied by Lancashire firms is being increasingly realised. Producers, according to Mr. Pilkington, are anxious to ensure that demand comes forward to the mills in a form and at a rate which helps them to maintain their maximum economy and efficiency.

The owners believe that their heavy capital investment entitles them to have a hand in directing their output into the most satisfactory channels. They also contend that they should have a voice in the discussion where decisions are reached about the quantities and qualities which shall be bought and about the times when the orders shall be placed. On this assumption, it is likely that vertically integrated forms of organisation will be more widely adopted, but such a development cannot be expected overnight.

Selling the Goods

Increased promotional work by the Cotton Board in British Commonwealth markets to follow up the current campaign to sell British cottons is likely to be undertaken by the Cotton Board. On his return from an eight-week tour of Australia and South Africa to survey the progress and results of the existing programme, Mr. Donald Tomlinson, Director of the Board's Colour Design and Style Centre, said in Manchester that the response had been encouraging. He referred to the growing importance of the maker-up of garments, particularly in Australia. He believed that it would be well worthwhile for Lancashire firms to "court" the garment makers in the Commonwealth in order to stimulate the use of British cloths in the manufacture of dresses, shirts and other made-up goods. Whereas the big retail stores still dominated the major cities in Australia, smaller shops were now making a greater impact and offered opportunities for exporters of Lancashire fabrics.

The public in Australia, said Mr. Tomlinson, was very well informed on fashion trends, mainly because they were able to scan the fashion magazines arriving from Europe and America before their own season started. He believed that there was scope for bigger trade in Lancashire shirts to Australia, if men in that country could be "educated" to wear better and more stylish shirts.

In South Africa and Rhodesia, he found much goodwill for British products. In particular, traditional British furnishings were much in demand, but people there seemed to be quite unaware of contemporary patterns and there was clearly an opportunity to increase business in that field.

No important development took place in the Manchester market, although yarn and cloth sales were again on an extensive scale. Pressure for supplies was unabated and the length of delivery terms did not deter customers from operating freely. Most of the orders under review were in speciality constructions and the movement of standard cloths was hampered by the ability of overseas producers to offer comparable fabrics at highly competitive rates. Export buying was negligible, but further replacement lines were put through in fashion styles and heavy industrial goods for home distribution. More yarn contracts were arranged, especially in the finer qualities, while prices generally were well maintained.—All Rights Reserved.

WORLD TEXTILE FIBRES CONSUMPTION MAN-MADE FIBRES MAKE MUCH HEADWAY

MAN-MADE fibres are becoming increasingly popular as a raw material in the textile industry the world over. Out of every ten pounds of all fibres that go into the manufacture of clothing goods now, more than two pounds consist of man-made fibres. Over the past decade, the percentage share of man-made fibres in the total world production of all fibres has gone up perceptibly, from 14.8 in 1949 to as high as 20.5 in 1958; it was higher still at 21.4 in 1957. As a result of the marked incursion of man-made fibres, the percentage share of natural fibres, that is, cotton and wool, has suffered a distinct setback; cotton from 72.7 to 70.1 (68.8 in 1957) and wool from 12.5 to 9.4.

Quantitatively, the aggregate world consumption of man-made fibres has recorded an appreciable increase; it was 12.56 million bales (1 bale: 478 lbs.) in 1958, as against 5.98 million bales in 1948, representing a rise of over 110 per cent. over ten years. The consumption of cotton and wool has also gone up, but the extent of rise is not so appreciable. Thus, world consumption of cotton in 1958 stood at 43.15 million bales, as against 29.40 million bales in 1948, or a rise of 47 per cent., and that of wool amounted to 5.80 million bales, as against 5.07 million bales, a rise of just 14 per cent.

Polyfibres

The marked improvement in world consumption of man-made fibres in the past decade is accounted for by all the sub-groups, namely, rayon, staple fibre and the newer man-made fibres, also called polyfibres (nylons, acrylics, polyesters, and fibres based on vinylidene chloride, polyethylene and other chemicals). The improvement is particularly marked in the case of the latter two groups, so marked that they have, to some extent, replaced rayon as the raw material, as the following table shows:

(In million bales of 478 lbs. each)

Fibres	1958	1957	1956	1949
Natural:				
Cotton	43.15 (70.1)	43.40 (68.8)	41.80 (69.3)	29.40 (72.7)
Wool	5.80 (9.4)	6.17 (9.8)	6.00 (9.9)	5.07 (12.5)
Man-made:				
Rayon	4.26 (8.9)	4.77 (7.5)	4.65 (7.7)	3.44 (8.5)
Staple	6.06 (9.9)	6.40 (10.5)	6.10 (10.4)	2.31 (5.7)
Other man-made ..	2.25 (20.5)	2.12 (21.4)	1.62 (20.8)	0.23 (14.8)
Man-made fibres (total)	12.56 (100.0)	13.49 (100.0)	12.36 (100.0)	6.98 (100.0)
Total	61.51 (100.0)	63.06 (100.0)	60.38 (100.0)	40.45 (100.0)

Note:—Figures in brackets relate to percentage proportion to the total consumption.

It will be seen from the above table that, over the period 1949 to 1958, the proportion of staple fibre in the total world consumption of all fibres has advanced from 5.7 to 9.9 per cent and newer man-made fibres from 0.6 to 3.7 per cent., while that of rayon has actually declined from 8.5 to 6.9 per cent. That more and more interest is centering on the newer man-made fibres is evident from a recent estimate which places the present aggregate world capacity of this sector at 3.4 million bales, as against 2.5 million bales in March 1958, with most of the expansion having taken place in the U.S., Japan and the U.K. It is said that hardly any new capacity for producing rayon is being added in most non-communist areas. Some additions have been reported in Spain, Japan, India and the U.S.S.R., but the rayon industry is reported to be generally operating below existing capacity in most of the developed countries. The statement at the foot of the page indicates the consumption of different fibres in the largest textile producing countries in the free world and of the communist bloc as a whole during the year 1958, as compared with that in 1949.

While the newer man-made fibres (polyfibres) have made a distinct inroad into the world textile fibres markets thus, there is a section of opinion which is somewhat sceptical about the aforesaid pace of progress being maintained in the coming years. To this section belongs Mr. J. L. Martin of Sales Divisions, Textiles Fibres Department, E.I. du Pont de Nemours and Co., Inc., U.S.A. In the course of an interesting review and forecast of textile fibres markets made before the Chemical Market Research Association at Williamsburg, Virginia, recently, Mr. Martin indicated how natural fibres and cellulose fibres were lately offering increased resistance, resulting in slower growth in polyfibres. He was no doubt confident that further progress would be made in polyfibres, but stressed that "it is the kind of progress achieved by keen organisations working hard and focussed on clear objectives."

The review made by Mr. Martin reveals that the use of polyfibres in the U.S. mills is still not large relative to the total fibre consumption; in 1958, they accounted for slightly less than 8 per cent. of the total consumption of all fibres. This is, perhaps, because of the high prices of these fibres. Very little of these fibres, we are told, sells for less than a dollar (Rs. 4.76) per lb. and much of it sells for prices in excess of \$2 (Rs. 9.52) per lb. Only small quantities of silk and some wools have sold for prices such as these. The popularity of polyfibres despite such high prices is, therefore, attributed to the markedly different characteristics offered by them. Thus far, the difference in characteristics has been most evident in aspects pertaining to the physical performance of the fibre but, now, aesthetic aspects of superiority are beginning to emerge and, naturally, the future of these fibres will depend increasingly upon improving their aesthetic qualities.

Blends and Combinations

A significant factor in the growth of newer fibres has been the development of many blends and combinations. The percentage of these fibres in the total value of products at retail in the U.S. during the first half of 1959 was 75 or more in women's hosiery and slips, 50 to 75 in women's sweaters, gowns and pyjamas, comforters and curtains, 75 to 50 in men's suits, sweaters, slacks, socks, knit sport shirts, intimate apparel, ex-slips, girls' sweaters, children's snowsuits, bed pillows, blankets, and replacement passenger tyres, 10 to 25 in carpets and rugs, women's blouses, ladies' dresses, and men's outer jackets, and 6 to 10 in men's dress shirts and blouses.

An idea of the expansion in the production capacity of non-cellulosic man-made fibres now taking place in the U.S. can be had from the figures cited below:

Yarn:	November 1950	November 1958
Nylon	426	402
Others	82	59
Staple:		
Nylon	50	44
Acrylic	221	186
Others	117	66
Grand total ..	886	757

* For 1957. † For 1956. ‡ For 1955. a. For 1956.

The end-1960 capacity figures plus the live extensions, Mr. Martin says, "are realistic measures of future business and eventually will be saleable, although not as rapidly as the capacity itself is being created." This view is based on the following four grounds:

1. The industry will be operating in a total situation not quite as restricted as some have thought. The broader range of garments offered via newer fibres replaces older fibres used in some other form. The new fibre producers can take business somewhat on their own terms other than by directly meeting the economics or performance of existing fibres. What is more, the newer fibres have changing population, consumer preference and habit working for them. Again, business volume in polyfibres is being floated upward by rising consumer incomes.

2. The massive technology which brought these new fibres into being continues to operate on improvements having real market consequences. Mention is made of the contribution of tri-acetate, colour-sealed product and manipulated yarn forms (textured yarn development) to the acetate business.

3. The fibre producers are rapidly learning the importance of how things are presented in contrast merely to what they are. They are getting that follow-through to consumer acceptance which is the vital consequence of good product engineering and merchandising effort.

4. There are many specific markets in which continued progress is substantially assured. Nylon will, in the next few years, make further and substantial inroads against rayon in the important tyre market. The carpet market is swinging very strongly to these newer fibres. There is an excellent possibility that all of the suit and slack business will follow in the paths charted by newer fibres in lighter weight, summer fabrics. These probably are the big ones, but there are many smaller ones as well. There are also many gleams in-the-eye potentials, such as synthetic fibre papers, on which much work is being done.

As against all these favourable factors, Mr. Martin points to the possibility of an upward trend in the prices of polyfibres. He observes:

"Whereas there can be no argument with the generality that increasing production usually brings lower costs, it is quite possible to have higher costs with increased production, if capacity is increasing at a faster rate than production—and this is precisely what is and has been going on in polyfibres. Furthermore, new capacity comes in at steadily increased construction costs, which increases may or may not be offset by technology. These increasing construction costs are just one aspect of the inflationary economy in which we must do business under the pressure of persistently rising costs of practically every variety. Finally, let me point out also that mounting marketing costs also must be covered in some way. But, perhaps, we can gain more insight by looking at the price question in a different way—apart from specific cost considerations—and think in terms of the incentives for and consequences of price reduction. Obviously, if significantly more business could be had over time at reasonably lower prices, it might be worth a temporary sacrifice in profit to achieve a larger volume for the future."

In the opinion of Mr. Martin, a reduction in the prices of polyfibres may encourage enhanced consumption, but there are some indications that the substitution of polyfibre-rayon blends is already occurring at a pretty rapid rate. It is in cotton-type fabrics that polyfibres today suffer the greatest price handicap. Mr. Martin, therefore, emphasises the need for greater and sound marketing effort in cotton-type fabrics in order to encourage blends.

COTTON

(Concluded from page 1024)

way in which it is going on at present puts an honest trader at a disadvantage vis-à-vis one who does not observe the law. Another consideration is that prohibition of options has led to other forms of illegal business which are more pernicious in effects and which are even more difficult to control.

There is no harm in trying to find out through experiment whether option business can be harnessed to the benefit of the trade. Mr. Parikh's observation to the effect that, with so many restrictions on the futures market and so many watchful authorities having full powers over the markets, including even the power to close them, there is little risk in starting this experiment, sounds attractive on the face of it. But it is a moot point whether the experiment should be initiated in cotton futures this season, as the crop situation is not comfortable enough to permit the continuation of even the present attenuated form of hedge contract. The supply and demand position in regard to other commodities also is not conducive to this form of speculation. In fine, the present time is not propitious for successfully experimenting with cotton business in commodity markets.

In both hemispheres . . .

... there are businessmen, and in both hemispheres there are banks. This is all very well as far as it goes, but contact between east and west is a different matter, and one of great and growing importance. That is where The Hongkong and Shanghai Banking Corporation comes in. Providing a complete banking service throughout south and east Asia, we also enable the businessman in that half of the world to contact his opposite number in the other. In both hemispheres you will receive excellent service from the biggest bank established by the Far East for the Far East.

NOTES FROM WEST GERMANY

WORKERS TO GET MORE HOLIDAYS WITH PAY

INVESTMENT CONVENTION WITH PAKISTAN

From Our Special Correspondent

COLOGNE, 12th December

LONGER vacations with pay are claimed by W. German trade unions at present, and a Bill has been prepared to raise the legal vacation minimum for wage and salary earners from twelve to eighteen days a year. The whole problem is under discussion by representatives of employers and workers.

According to I.L.O. figures, the W. German legal minimum of two weeks per year, or of one working day per month, is the same as that for Australia, Canada, Austria, and Holland, and double the length in Switzerland, Portugal, Belgium, and the United States. Paid vacations of up to 18 days and more, however, are provided in the Federal Republic by some 80 per cent. of all collective agreements. Such "fringe holidays" are individually scaled by seniority and by age. About 85 per cent. of the collective agreements in force tie them to seniority, and about 45 per cent. to age, one often overlapping the other. Although detailed figures are not available at present, the maximum vacation is officially estimated to be reached at a seniority of not more than fifteen years or at an age not higher than forty. The Labour Ministry estimates that 40 per cent. of all male and 25 per cent. of all female production workers are already enjoying 18 vacation days per year.

It is interesting to note that, last year, about one-third of Germany's vacation travellers were production workers, and that every other holiday-maker was a wage and salary earner. Also, the average household's expenditure for travel and recreation is constantly rising. This indicates that the workers are benefiting to an increasing extent from the results of higher productivity. Longer paid vacations, in fact, must be seen as a special "pay-out" of rising productivity. They reflect the growing share of workers in the new ways of life developing within the modern "affluent societies" in highly industrialised countries. But the "pay-out" of working time reduction in the form of extended vacations does not lend itself to generalised and uniform solutions by law. In the interest of mutually acceptable solutions, the extension of paid vacations should basically remain a matter of collective bargaining. The same line of thought applies to further cuts of the working week. The proper place for working out new time schedules in this field should be the round table rather than Parliament.

German employers want to improve the living standard of all workers without endangering currency stability and without weakening the purchasing power of money. To attain that goal requires, however, the unrestricted autonomy and independence of the partners of collective bargaining. Only they can discern and decide what further progress can be made in view of the development of productivity which is the source of all and any improvement in the closely interrelated fields of straight wages, fringe benefits and working time.

Convention With Pakistan

A bilateral "convention to protect and promote foreign capital investments" has just been agreed between Pakistan and the Federal Republic of Germany and is awaiting ratification by the Parliaments of both the countries. The convention stipulates on a reciprocal basis the protection of all capital invested in either country since September 1954, for 20 years to come. It grants the free transfer of profits and protects the capital against expropriation without compensation.

The private property of Mr. Smith in Germany is linked with his inalienable right to enjoy it. Private investments abroad, one might think, follow that same line of thought. But, unfortunately, violations of private foreign investments have been experienced by many capital-exporting countries both in highly and less developed countries in the past as well as in the present. Sudden nationalisation moves, restrictions in the transfer or re-investment of profits from foreign capital, refusal of import

licences, excessive taxation or limits in foreign financial participations in national industries are but some of the notorious measures to infringe upon foreign capital and, hence, make investments abroad rather unattractive.

The bilateral convention with Pakistan, the first of its kind, is an important step to promote mutual trust in international economic relations. It meets a W. German Government's requirement of mid-1959, that W. German private capital exporters can have their outlays abroad covered by a Government guarantee against political risks only if the capital-receiving country agrees to a convention of the type now signed with Pakistan. Without such a convention, eventual losses would have to be covered by the W. German tax payer. He would have to pay for unlawful measures of countries unwilling to recognise the rights and interests of foreigners who provide means and funds to promote the economy of that country.

International Convention

International law, as well as the constitutions and trade agreements of many countries, embodies the principle that foreign property cannot be seized or otherwise infringed upon without prompt and fair compensation. The same principles are embodied in an International Convention for the Mutual Protection of Private Property Rights drafted by the Society to Advance the Protection of Foreign Investments in 1957. This draft was thought as pilot-scheme to international agreements.

Some countries even with good intentions may belittle the "mania" of private investors to look for protection. But from the capital exporters' point of view, some of the developing countries still have to convince them of their due respect for foreign property rights. These considerations are not confined to the Federal Republic. Some time ago, a proposal had been advanced in the U.S. Senate to exclude all countries from further American foreign assistance, which seize American property without due compensation.

The Pakistan example is the very first convincing move towards a closer financial and economic co-operation. It is hoped to set the pace for such agreements with other capital receiving nations. Investments from abroad are attractive, as seen from receiving countries. Investments abroad should be attracted by showing respect for foreign property rights. If attractive funds are attracted by legally sanctioned rights, more money will flow to the nations who need it.

COMPANY INFORMATION IN W. GERMANY

Company reporting and accounting in West Germany has an excellent standing by international standards. This is the conclusion of a detailed study on international company reporting issued by the Institute for Finance and Taxation (Institut Finanzen und Steuern) in Bonn. The study reveals that company reporting by a combination of profit and loss accounts, reports on explanatory statements to the accounts of West German joint-stock companies "is in no country possible, in Austria. The strictness of West German laws governing company reporting is matched only by the legal provisions in Austria.

Although U.S. companies publish their accounts more often, the Institute says, the Federal Republic's industry releases as much information conferences and by the right of shareholders to demand information.

MARGINS IMPOSED ON JUTE CONTRACTS FALL IN GUNNY STOCKS PUSHES UP PRICES

THE bullish activity in raw jute and gunnies has gathered fresh momentum during the past one week and the spurt in prices has been somewhat very sharp. The reimposition of margins by the East India Jute and Hessian Exchange on the 10th inst. and the subsequent enhancement thereof on the 12th inst. on all outstanding purchases if the closing price of the hedge contract was at or above a specified level, do not seem to have checked the rise in prices. For, at the time of writing, prices are far above the levels at which the margins become operative.

The margin system, it may be recalled, was first introduced in September 1958 after the East India Jute and Hessian Exchange was recognised as the official agency for futures trading in raw jute and jute goods. At that time, this step was taken to arrest the depression in raw jute and gunnies. Margins were imposed on all outstanding sales when prices tended to fall below certain fixed minimum levels. In December of that year, the margin amounts were raised and this was followed by increasing the "floor" prices for jute goods for attracting margins. In February this year, however, the margins on sales were withdrawn. Within a period of ten months, the complexion of the market has so changed that it has now been found necessary to impose margins on outstanding purchases of both raw jute and finished goods when their prices exceeded a specified level. The following are the margins introduced last week and subsequently raised and the levels at which they come into operation:

	Price at or above which margins operate	Margin	
		First fixed on 10-12-59	Then raised on 12-12-59
	Ra.	Ra.	Ra.
Raw jute (per maund) ..	29.00	2.00	7.00
Hessian cloth (per 100 yards) ..	41.00	2.50	3.00
Sacking (B. Twills) (per 100 bags) ..	105.50	5.00	6.00

The step was taken by the E.I.J.H. Exchange with a view to curbing the "excessive speculative activities" in futures trading. It also suspended trading in all hedge contracts for a day, on the 11th inst. Finding that the imposition of margin and the suspension of trading failed to check the upward trend in prices, the Exchange raised the margins on Saturday. This also has not had the desired effect, as will be seen from the following comparative table of prices:

	14-12-59	9-12-59	30-11-59	14-12-58
	Ra.	Ra.	Ra.	Ra.
Assam bottom (per maund) ..	31.00	28.50	26.60	21.50
Hessian (40" x 10 oz.) (per 100 yds) ..	42.60	41.45	40.25	40.15
B. twills (per 100 bags) ..	110.25	107.00	105.50	94.80

Stocks Move Down

Although the current bullish trend originated in raw jute, for reasons outlined in these columns last week, it soon spread to the jute goods, too. The rise in prices of the latter gathered fresh momentum last week from the announcement of lower stock figures as at the end of November. It had generally been expected that the stocks of gunnies with mills would show a decline, but the actual shrinkage was surprisingly larger than anticipated. The total stocks have fallen by 6,800 tons to 65,200 tons, the lowest level seen since December 1955. This is the tenth month in succession for which the stocks have shown a downward trend, having fallen from 113,800 tons at the end of January this year to 65,200 tons—a drop of 48,600 tons. The decline has been shared by all the three main groups of jute goods, as will be seen from the following comparative table:

Stocks of Jute Goods (In tons)

	As on 30th Nov., 1959	As on 31st Oct., 1959	As on 30th Sept., 1959	As on 30th Nov., 1958
Hessian ..	28,800	29,100	25,500	17,800
Sacking ..	28,700	32,500	42,700	75,500
Others ..	9,900	10,400	10,500	12,600
Total ..	65,200	72,000	78,700	105,400

Heavy goods account for the largest share, with a fall of 3,800 tons to 28,700 tons, a new low since December 1949. At this level, they represent only two and a half weeks' output and form 44 per cent. of the total stocks, as against 71.6 per cent. a year ago. Such a low level of

stocks in heavy goods has been brought about, despite the transfer of a part of the mills' looms to this variety and the unsealing of 2½ per cent. of the looms in August last which was mainly confined to heavy goods. The unsealing of the looms was resorted to in order to meet the rising demand for sacking and the then level of stocks with mills and the pace of production was considered inadequate for this. But, since then, there has been a further substantial drop in stocks of these varieties. In the circumstances, it is considered highly unlikely that the 2½ per cent. of the looms would be resealed on 2nd January 1960, as was originally intended.

The stocks of hessian, too, have declined by 2,500 tons to 26,600 tons, at which level they constitute 40.8 per cent. of the total stocks, as against 16.4 per cent. a year ago, and represent less than three weeks' production. The downward trend in stocks of "other varieties" noted since April last has been maintained, with a further reduction of 500 tons to 9,900 tons during the month under review.

The sizable reduction in stocks of gunnies during November is not due to any setback in production. For the output, at 88,000 tons, has been well maintained at the previous month's level, as will be seen from the following comparative table:

Production of Jute Goods (In tons)

	November 1959	October 1959	September 1959	November 1958
Hessian ..	36,800	36,400	37,500	35,800
Sacking ..	45,700	46,000	48,800	44,900
Others ..	5,700	5,500	6,300	6,300
Total ..	88,000	87,900	92,600	87,000

Variety-wise variations are negligible. The downward trend in production of hessian since July last has, however, been arrested. The

same is the case with "miscellaneous varieties." But, for the second month in succession, sacking output has declined.

WAGE BOARD FOR JUTE INDUSTRY

The Industrial Committee on Jute has decided to recommend to the Government of India the immediate establishment of a wage board for the jute industry. The decision was taken at a meeting of the Committee held in Calcutta on the 11th inst., and presided over by Mr. Gulzarilal Nanda, Union Minister for Planning, Labour and Employment. The wage board will consider the wage structure in the jute industry and all other questions on lines similar to other wage boards set up for different industries so far.

RISE IN U.S. BURLAP CONSUMPTION

Burlap consumption in the U.S. during November 1959 rose to 79.6 million yards, as compared with 69 million in October and 64.5 million in November 1958, according to the Textile Bag Manufacturers Association and the Burlap Council of the Indian Jute Mill Association. United States end-November stocks aggregated 287 million yards, comprising 146.6 million spot stocks and 120.4 million yards afloat. End-November 1958 stocks were 253.8 million yards and end-November 1958 stocks 222.9 million yards.

PLANTING BRIEFS

The total receipts of coffee into the Pool in respect of 1958-59 crop up to the end of November 1959 amounted to 48,200 metric tons, as compared with 44,046 metric tons in the corresponding period of last year. These consisted of 17,822 tons of Arabica Cherry and 20,913 tons (14,557 tons) of Robusta.

The Pool release to the internal market during the first eleven months of 1959 aggregated 27,640 metric tons, representing an increase of about 11 per cent. over that (24,924 metric tons) in the corresponding period of 1958.

A total quantity of 15,047 metric tons has been sold for export out of the 1958-59 crop till the end of November, comprising 8,168 tons of Plantation, 3,100 tons of Arabica Cherry and 3,779 tons of Robusta. Out of the balance to be sold against the allocation of 17,000 metric tons for export, 894 tons are covered by tenders due this week and 235 tons by offers made to Italy, Sweden and Nepal.

Arrivals of 1959-60 crop, mainly of the Pulneys, have started and up to the end of November, 199 metric tons (as against 295 metric tons) have been received. The smaller receipts as compared with last year are attributed to heavy rains during the last two or three months.

FIFTY YEARS AGO, Sardar Pratap Singh Bhumra, now 87, was assembling cranes and electrical equipment as India's first steel works was taking shape in the wilderness of Chhotanagpur.

His son, Jwala Singh, joined the steel works his father helped to build. Drawing upon his mature technical skill, he suggested an improvement to soaking pit cranes which won him a reward from Management and appreciation from the American manufacturers.

Hari Singh, Jwala Singh's son, imbibed the family tradition early in life. A young electrician in Tata Steel's Skelp Mill, he was recently sent to Japan to study advanced crane maintenance.

Thus, a tradition of skill is being laid at Jamshedpur, where industry is not merely a source of livelihood but a way of life.

AMERICAN LETTER

NEW TRADE AREAS IN WESTERN EUROPE WORRY U.S.

BUDGET SURPLUS LIKELY—PLEA FOR TAX RELIEF

From Our Special Correspondent

New York, 10th December

AS the year 1959 comes to a close, there is much soul-searching. The trade deficit of the United States is one area of concern. As outlined in previous despatches, there are many reasons for it. U.S. foreign aid, since the end of the war, has helped in industrialising other nations which can now successfully compete in America and in the world markets because of brand new equipment and lower labour costs.

The U.S. has not been in this position since Colonial times. There are two new trade groups, comprising 13 countries, which are unlikely to make it easier for America to regain its former foreign trade position easily. One is the Common Market group, including France, West Germany, Italy, Holland, Belgium and Luxembourg. The other is the new free-trade group of Britain, Sweden, Norway, Denmark, Austria, Portugal as well as Switzerland. They have general trade-tariff agreements among themselves.

Tariff Talks

These 13 nations of Europe are participants, with more than 20 other countries, in the General Agreement on Tariffs and Trade (G.A.T.T.). Tariffs concessions are against G.A.T.T. rules and participating nations have not yet voiced their consent to the procedure, although it must be taken for granted that a majority will be on hand for this at the next Geneva conference. At that time, there may be expected strong bargaining by the U.S. It will be a tariff bargaining to hold markets rather than to gain new ones.

Nations of the European trade groups account together for some 20 to 25 per cent. of U.S. exports, or about \$4,000 to \$5,000 million a year. Although there has been some improvement in U.S. exports in recent months, there has been a long term major decline. As could be expected, this has resulted in a drop of U.S. gold stocks. Early in December, they stood at \$19,568 million, as compared with \$20,609 million twelve months previously. At this point, this is not alarming, because they are still the largest gold stocks of any nation in the world, but the trend has to be recognised.

There are two related factors in this picture. Foreign investments by American manufacturers have been expanding rapidly because of lower production costs overseas than in the U.S. and there has been also a considerable increase in tourism. Owing to the U.S. prosperity, travelling has become a national pastime.

It is particularly interesting to note that people in small towns, say in the Middle West, who, owing to their very location, lead humdrum and unsophisticated lives, are in the top echelon of those who travel overseas consistently. The airplane has a lot to do with this development, of course.

Previously, there was no point in contemplating a two-weeks holiday either in Europe or in the Far East because it took too long to get there. Today, one can fly across the oceans in a matter of half a day, money permitting, and see and enjoy other countries.

Hard Bargaining Ahead

Under the three-year extension of the Reciprocal Trade Agreements Act of 1958, Congress granted the Administration the authority to reduce tariffs up to 20 per cent. in the new G.A.T.T. bargaining. At this writing, this authority appears to this writer adequate to match the provisional reductions of the European trade groups.

Its real adequacy, however, can only be determined when the list of commodities on which the U.S. will negotiate is determined. There will be prolonged hearings before such a list is finalised. Among others, domestic producers will be heard and expectations are that hearings will begin next month.

Said the *New York Times*, the other day, "hearings and study will be required to determine just how much some tariff rates should be reduced. The outcome of these investigations may not permit full use of the authority to re-

duce tariffs 20 per cent. It may also restrict the list to less than the broad range of commodities on which the European groups have extended provisional 20 per cent. reductions."

"Combined with the adverse psychological position in which the U.S. will find itself in the Geneva bargaining, restriction of its bargaining," the paper added, "is likely to prove a handicap."

Surplus Budget?

While everything in this life is in flux, President Eisenhower, before he left on his trip visiting 11 nations, was advised that Federal revenues may jump \$4,000 million in the fiscal year, ending 30th June 1961, to \$83,000 million.

If this forecast by Government sources holds up in a final review later this month, the President is expected to send Congress a Budget in January calling for spending of about \$81,000 million which would produce a surplus of \$2,000 million. This would be the largest surplus Mr. Eisenhower's Administration would roll up in his two terms at the White House. Up to this point, the Administration has produced four Budget deficits and two surpluses.

There are constant drives for a cut in taxes. The latest one came from the Chamber of Commerce of the U.S. Along with the National Association of Manufacturers, the Chamber backs a Bill in Congress which aims at an immediate income-tax reduction at a graduated scale over a period of years. The Bill would also reduce estate and gift taxes and place depreciation rates on a realistic basis.

In its Washington Newsletter, the Chamber suggests that the tax cut be offset by a temporary sales tax applied across the board at a "low uniform rate" so that the U.S. Treasury may not lose any revenue. The letter added that the tax cut "would actually increase the amount of Government revenue in a short time, distribute the tax burden more equitably, promote the stability of the dollar, provide both the means and incentive for business to expand going enterprises and create more jobs for our growing population."

The trend of reasoning here is quite interesting, since it follows the assumption that incentives are needed. Other countries have reduced taxes and their Governments have found it quite profitable in the long run. My prediction is that, when Congress returns next month, the tax committees of both the House of Representatives and the Senate will not dare to introduce legislation which, according to the slide rule, would produce less revenue than before. Tax incentives in the future will have to be reckoned with, though, because continually rising taxes have proven that they are not the answer.—All Rights Reserved.

MODERN COWBOYS USE A TRUCK

Cowboys in Guanacaste, the cattle territory of Costa Rica, have quickly adapted themselves to exchanging their saddles for seats on the roof of the truck's cab. The change in the cowboy's traditional method of operation is reported by Leyland Motors' agents in Costa Rica, Almacén Electra Super Comet truck there on this type of work. The Super Comet is equipped with a special cattle-cowboy can watch the cattle and provide them with water when necessary from a tank mounted at the side of his seat.

The 16 ft. 11 in. wheelbase truck's first test was to carry 18 head of cattle from Liberia to San José, 150 miles away. More than half of this journey was at sea level over the Pan-American Highway. High speeds were maintained on this stretch of road, but the average speed for the overall journey was reduced by the mountainous territory which the Super Comet had to negotiate. Further axle ratios.

AVOIDANCE OF DOUBLE TAXATION

SALIENT FEATURES OF RECENT FISCAL AGREEMENTS ANALYSED

By Vinod Sood and Rahul Bajaj

ECONOMIC development of any country, especially that of an underdeveloped country like India, is greatly dependent on the tax policy of the country. A heavy burden of tax tends to curb private initiative and enterprise. Furthermore, tax considerations often determine the flow of foreign investment, how much, and for what purpose. This note concerns itself mainly with double taxation of corporate earnings. It presents a clear picture as to the status of foreign nationals doing business in India as it is quite rare that an Indian company goes and collaborates with a foreign company in a foreign country. In this respect, the note is slightly one-sided.

The problem of international double (or multiple) taxation may arise whenever an enterprise extends its operations across national boundaries; then its income is likely to become taxable both in the country in which it arises (that is, the country of the source of the income) and in the home country of the enterprise. The recipient is liable to be taxed in the former country on the ground that income derived from source located in a country should be taxed in that country. At the same time, the recipient is also liable to be assessed in the latter country on the ground that the residents of a country should be assessed therein on the whole of their total world income. Thus, the same income is liable to be taxed in two countries and in these days of universal high taxation such a double impost may result in so high a burden as to discourage active participation of the residents of any country in business ventures in other countries. Such a situation will be particularly unfortunate for a country like India which wishes to attract foreign capital for the purposes of accelerating her industrial development.

Tax Treaties

Bilateral tax treaties have come increasingly into use, especially since the end of World War II, to eliminate or at least reduce multiplication of tax burden. These treaties operate either by assigning mutually exclusive tax jurisdiction to one or other contracting country over specified categories of income (for example, business profits, earned income, salaries) or by reducing the tax ordinarily due in one or both countries on the doubly taxed income. Tax treaties thus supplement and adjust the general tax rules prevailing under the domestic laws of contracting countries.

Last year, the Government of India began a series of negotiations with many Western countries for concluding double taxation avoidance agreements. In negotiating these agreements, India being an underdeveloped country, the Government kept two principles in the forefront. One was that the country in which the source of income arose should have the right to tax; and the other that the taxation incentives available under the Indian Income-tax Act should not be frustrated. The delay in reaching final agreements with certain countries is due to the opposition by certain sections in these countries to the acceptance of the above principles.

Double taxation avoidance agreements were signed with Aden, Pakistan (in 1947) and Ceylon (in 1957). The latest agreement to come in force is the one with Sweden. With no other country such an agreement has yet been finalised. Negotiations, however, are going on with France, Switzerland, the U.K. and the Netherlands amongst other countries, and it is expected that, in the near future, some more agreements will be concluded.

The agreements with the U.S., Japan and W. Germany have been signed by the representatives of the respective countries but are yet to be ratified by the respective legislatures.

Arrangements for double taxation relief (as distinguished from avoidance) have been in force for some years with the Governments of Kenya, Tanganyika, Uganda, Zanzibar, etc. Section 49A of the Indian Income-tax Act empowers the executive to conclude an agreement with another country either for the grant of reciprocal relief in case the same income is taxed both in India and that other country or for avoiding the taxing of the same income in

both countries. Furthermore, under Section 49D, relief is provided to the resident whose income arising in another country is charged to tax in that country and there is no convention whereby the double taxation is relieved. The relief is to be afforded by deducting from the Indian income-tax payable, the tax on the doubly taxed income either at the Indian rate or at the foreign rate, whichever is the lower.

Agreement with Sweden

Tax shall not be levied in India on the industrial or commercial profits of an enterprise of Sweden unless the profits are derived in India through a permanent establishment of the said enterprise situated in India. If profits are so derived, tax may be levied in India on the profits attributable to the said permanent establishment. Royalties derived by a resident of Sweden from sources in India may be taxed only in India. Dividends paid by a company which is a resident of India to a resident of Sweden may be taxed only in India. Interest on bonds, securities, notes, debentures or any other form of indebtedness, derived by a resident of Sweden from sources in India may be taxed only in India. Income from immovable property may be taxed only in the territory in which the property is situated. Capital gains derived from the sale, exchange or transfer of a capital asset, whether movable or immovable, may be taxed only in the territory in which the capital asset is situated at the time of such sale, exchange or transfer.

Profits or remuneration for professional services or for services as an employee (including services as a director) performed in India by an individual who is a resident of Sweden may be taxed only in India. An individual who is a resident of Sweden shall not be taxed in India on such profits or remuneration if: (a) he is temporarily present in India for a period or periods not exceeding in the aggregate 183 days during the relevant previous year, (b) the services are performed for or on behalf of a resident of Sweden, (c) the profits or remuneration are subject to Swedish tax and (d) the profits or remuneration are not deducted in computing the profits of an enterprise chargeable to Indian tax.

The rate of Swedish tax to be imposed on residents of Sweden may be calculated as though the income which under this agreement is not subject to Swedish tax was included in the amount of the total income.

West Germany

The agreement with West Germany has been signed at ministerial level but has yet to be ratified by the respective legislatures. The text of the agreement is, however, as follows:

1. (a) Subject to the provisions of paragraph (b) below, tax shall not be levied in India on the industrial or commercial profits of an enterprise of West Germany unless profits are derived in India

through a permanent establishment of the said enterprise situated in India. If profits are so derived tax may be levied in India on the profits attributable to the said permanent establishment.

(b) For the purposes of this agreement the terms "industrial or commercial profits" shall not include income in the form of rents, royalties, interest, dividends, management charges, remuneration for labour or personal services.

2. Dividends paid by a company which is a resident of India to a resident of West Germany may be taxed in both countries if the German company owns less than 25 per cent. of the voting shares of the Indian company. The German company will, however, be allowed a credit against the Federal Republic tax payable on an amount of thereon but in any case at least 50 per cent. of the Federal Republic tax. If, on the other hand, the German company owns more than 25 per cent. of the voting shares of the Indian company, there shall be excluded from the income upon which the Federal Republic tax is imposed, the dividend received by the German company. The Federal Republic, however, retains the right to take into account the dividend so excluded, for the determination of its rate of tax.

3. Interest on bonds, securities, notes, debentures or any other form of indebtedness, derived by a resident of one of the territories from sources in other territory may be taxed in both territories. However, a credit would be allowed against the Federal Republic tax payable to the extent of the Indian tax levied thereon, but in any case at least 50 per cent. of the Federal Republic tax.

4. Income from immovable property may be taxed in the territory in which the property is situated.

5. Capital gains arising from the sale, exchange, or transfer of a capital asset, whether movable or immovable, may be taxed in the territory in which the capital asset is situated at the time of such sale, exchange or transfer. For this purpose, the situs of the shares of a company shall be deemed to be in the territory where the company is incorporated.

6. (a) Profits or remuneration from professional services (including services as a director) or from services as an employee derived by an individual who is a resident of West Germany may be taxed in India only if such services are rendered in India.

(b) An individual who is a resident of the Federal Republic shall not be taxed in India on the profits or remuneration referred to in paragraph (a), if:

(i) he is temporarily present in India for a period or periods not exceeding in the aggregate 183 days during a relevant "previous year"; (ii) the services are rendered for or on behalf of a resident of the Federal Republic; (iii) the profits tax, and (iv) the profits or remuneration are not deducted in computing the profits of an enterprise chargeable to Indian tax.

7. (a) The laws in force in either of the territories will continue to govern the assessment and taxation of income in the respective territories except where express provision to the contrary is made in this agreement.

(b) There shall be excluded from the income upon which Federal Republic tax is imposed, any item of income from source within India which, India. The Federal Republic, however, retains the right to take into account in the determination of its rate of tax the items of income so deducted.

United States

The agreement with the U.S.A. has been signed at ministerial level but has still to be passed by the respective legislatures. The present position, however, is as follows: Unless the U.S. investor has the prior approval of the Commissioner of Internal Revenue, and he alone or along with other investors owns 80 per cent. or more of the stock of the foreign subsidiary when they complete the investment, he will have to pay a U.S. tax on his paper profit.

even though he has not received these profits in U.S. Capital losses on foreign investments can generally be deducted only against capital gains. Effective Indian tax rate on the locally incorporated subsidiary of a U.S. corporation is 61.5 per cent. of taxable income.

After foreign tax is taken from profits, the remaining profits are distributed as dividends. The dividend is subject to taxation at 52 per cent. on the U.S. parent corporation, but the foreign tax credit system as applied to foreign subsidiaries provides, in effect, that the rate of foreign tax is deducted from the rate of U.S. taxation, with only the remaining rate of U.S. tax being applied. It is noteworthy that this provides relief twice. First, the rate of foreign tax is deducted from U.S. rate and the difference, if any, is levied on these dividends. Obviously, no U.S. tax is payable if foreign tax rate is higher than the U.S. rate. Secondly, in case U.S. tax is levied, it is on the net amount of dividend received or the dividend after deduction of foreign tax and not gross dividend. This double relief often has the effect of making the combined incidence of foreign and U.S. tax less than 52 per cent. An example will illustrate this. Suppose the Indian rate is 50 per cent., the gross amount of dividends received in the U.S. is Rs. 20,000, net amount of dividends received in U.S. is Rs. 10,000 and the U.S. rate of tax 52 per cent. Now, in this case, in the U.S. 2 per cent. (difference between U.S. and Indian rate) will be on Rs. 10,000 (net dividend), that is, Rs. 200. Total tax paid in U.S. and India will be Rs. 200+Rs. 10,000 or Rs. 10,200. Total income on which above tax is paid is Rs. 20,000. Hence, the combined incidence is 51 per cent.

England

There is no agreement for the avoidance of double taxation between the U.K. and India. Negotiations started a long time back but it appears that there are certain fundamental differences between the viewpoints of the two countries. However, in view of the unilateral relief available in both the countries, a satisfactory position prevails to a great extent. One thing, nevertheless, must be borne in mind; whereas in India, the unilateral relief given under section 49D of the Income-tax Act (as stated above in this note) is clear and unambiguous, the U.K. Government is not so clear about its policy. A certain vagueness and ambiguity exists as regards the unilateral relief given by the British Government to its residents against the tax they have to pay on their overseas profits.

In essence, the system now prevalent is that a company managed and controlled in the U.K. but operating wholly overseas will not be liable to the U.K. tax on its trading profits unless or until these are remitted to the U.K. when remittances made out of trading profits will be charged to income-tax. The investment income of such a company, on the other hand, will remain liable to income-tax and profits tax in the normal way.

The above system, however, was only brought about by the Finance Act of April 1957. Previously, a company managed and controlled in the U.K. was subject to U.K. tax on its total profits wherever they arose and irrespective of whether any profits earned abroad were brought in the U.K. or retained overseas for reinvestment there. For a company to benefit by the provisions of the 1957 Finance Act, it must qualify as an overseas trade corporation. A company may rank as an O.T.C. for any tax year in which the whole of its trade or business is carried on outside the U.K., provided it can also satisfy certain detailed tests and requirements as to the nature of its business and the method by which that is conducted.

Income-tax

Investment income is liable to income-tax in the normal way. Trading income is exempt from income-tax unless remitted to the U.K. A remittance may be either a dividend, a grant or a loan. In charging remittances to tax, credit will be given for any overseas tax suffered. If the rate of overseas tax is higher than the standard rate of income-tax, the excess overseas tax may be carried over for set off against profits tax payable, if any, by the recipient of the dividend. Investment income is subject to profits tax in the normal way, that is at 30 per cent. Relief will be granted at 27 per cent. on the part which is not remitted. Trading income is exempt from profits tax.

Some European Countries

No agreement has been signed with Switzerland, Netherlands, France and Italy. Negotiations, however, are going on. Nothing definite can, therefore, be said. If a firm from one of the above countries wants to invest in India,

it does so at its own risk as far as relief for double taxation is concerned. It may or may not get relief; and the relief, if any, may be complete or partial. The concerned Government will consider each case on its merit. Some salient features, however, stand out. According to the Swiss Trade Commissioner's office, the fundamental reason as to why no agreement has been signed between the two countries is this. The Swiss Government wants to tax its residents on their total world income; the Indian Government wants to tax income in the country of its source of origin. At present, no unilateral relief is available to Swiss residents.

In France, corporate income tax is unrelated to the citizenship or residence of the corporate entity. The only fact that is of any consequence is where the corporation conducts the activities which result in the production of income, that is, whether in France or not. However, there is no assurance by the French Government whether relief will be given or not for the profit earned in India by French residents.

Netherlands

The Netherlands reduces its tax on certain categories of foreign income which have been taxed abroad, but the amount of this reduction is not dependent on the amount of the foreign tax. Reduction is equal to the amount of Netherlands tax which would be due on the foreign income if it were the recipient's only income.

There are two types of taxes on companies in Italy—one is known as proportional schedular tax which is levied on inland income and the other is known as personal complementary tax which alone extends to foreign income. Italian firms, which operate abroad through established concerns having separate managements and separate balance-sheets, are not liable to pay income-tax in Italy on the profits earned abroad by the aforesaid established concerns, i.e., no personal complementary tax is payable. Where the abovementioned conditions do not exist, no fiscal relief is granted to Italian firms that operate in those foreign countries with which

no agreements for the avoidance of double taxation is in force. Hence, even royalties originating from such countries are subject to usual taxation in Italy, i.e., both proportional schedular tax and personal complementary tax are payable. If taxes are paid abroad, the amount of tax so paid is allowed to be deducted for purposes of assessment of the taxable income.

Recently, an agreement between the Japanese and Indian Governments for granting relief from double taxation has been signed at ministerial level but the text of the same is not known, as the agreement has yet to be ratified by the respective Parliaments. At present, there is no provision whereby Japanese Government grants unilateral relief as granted by the Indian Government under Section 49D of the Indian Income tax Act. However, the Japanese Government does take notice of any foreign tax paid by any of its residents but there is no certainty to this effect.

How to Solve Your Income-tax Problem. By B. D. Nagpal. Published by Kitab Mahal, Publishers, Allahabad-3. Pages: 352. Price: Rs. 7.50.

The book under review has been written primarily from the point of view of an average assessee, who is mainly concerned with the amount of tax he has to pay on his income rather than with the intricate problems of income-tax law. The author deals with such aspects of the subject as income that is liable to tax, the treatment accorded by the law to income from property, dividends, etc., and of Hindu undivided families. Super-tax, capital gains tax, wealth tax and expenditure tax have also been dealt with. A feature of the book is the large number of illustrative examples which have been worked out in an easily understandable manner. Since the book is meant for the layman, no elaborate discussion of the income-tax law is to be found in it. Nevertheless, the book will be found useful by the average assessee who continues to contribute an increasingly larger share of the tax revenue of the Central Government.

A tale of Twenty-two Cities

From Tunis to Bombay, from Aden to Iraq are the Cities, twenty-two of them—in fifteen states. They all have this in common: every one is in an area where a dramatic transformation is taking place, a transformation from a traditional past to modern statehood. Every one, too, contains a branch of The British Bank of the Middle East, a Bank dating back to

1889 and closely associated with the rapid development taking place today.

India, Aden, Dubai and Sharjah and Abu Dhabi, Oman and Muscat, Qatar, Bahrain, Kuwait, Saudi Arabia, Jordan, Iraq, The United Arab Republic (Syrian Region), Lebanon, Libya, and Tunisia: these are territories where The British Bank of the Middle East operates. It has

intimate knowledge and experience of their political, economic and financial affairs. If you are interested in new markets and the limitless possibilities of development in this vast area, The British Bank of the Middle East can give you the reliable help and advice you need.

For
thousands
of young men
a new life

begins at Durgapur

Training completed, this young apprentice in Durgapur is on his first practical survey job in the field. When he becomes an experienced hand, efficient at his work, he will command a good salary and will have a future ahead, bright with promise.

In Durgapur today, ISCON, who are entrusted with the construction of the giant one million ton steel plant, have already helped to train up a large group of young Indians in the technical field. This is part and parcel of the ISCON scheme of collaboration—to work side by side with Indian technicians and workers, to instruct them on the spot and in steel factories in England so that in the future India will have, not only her steel plants but also technicians to run them.

BRITISH COMPANIES WORKING FOR INDIA

THE SOUTH INDIA INSURANCE COMPANY LTD.

THE South India Insurance Company, Ltd., was sponsored by the Textile Mills Owners of Coimbatore in December 1934. The Company has now completed 25 years of existence and celebrates the Silver Jubilee on 21st December 1959. It is customary on such occasions to look back and cast a cursory glance at what transpired in two and a half decades. From small beginnings the Company has now grown into a fairly large and established institution enjoying a good reputation for stability, efficiency and progress on sound financial lines. In 1941 the New India Assurance Company, Ltd., acquired a controlling interest in this Company and since then this fruitful affiliation to the leading Insurance Company of the country continues.

With a view to commence operations on a wider scale and to establish an independent and profitable business organisation, the Company's Head Office was shifted from Coimbatore to Bombay in January 1948. The paid-up capital of the Company was increased from Rs. 3,30,540 to Rs. 10,00,000. The Company has shown encouraging progress in the last 10 years. It has acquired a substantial volume of business in all the departments and the patronage and support of a large and valuable clientele throughout India. The total direct gross premium written by the Company in 1948 was Rs. 9,80,214 whereas it has now increased to over Rs. 40,00,000. The Company is fortunate in having a competent and influential Board of Directors comprising of prominent indus-

trialists and business men of repute. Their foresight and business acumen are reflected in the fact that the Board has devoted special attention to build up a strong financial foundation for the Company and to see that the expanding volume of business is backed by progressive strengthening of the capital and reserve position of the Company. At the end of 1958, the Company had Capital and Reserves aggregating Rs. 38,95,000 as against Rs. 12,93,000 at the end of 1947. The dividend record of the Company has been good. Last year a dividend of Rs. 2.20 per share of Rs. 20 was declared.

General insurance in this country today is beset with many problems. In spite of these it is gratifying to note that the "South India" has shown steady progress. Above all, it has endeavoured with success to offer excellent service to its clients and has earned a good name for efficient after-sale service to its policyholders. This has enabled the Company to attract a considerable volume of business all over India. In a highly competitive business like insurance, the Company's all-round progress is commendable.

With a fine record of solid achievement behind it, the Company faces the future with full confidence and it will be of greater service to the nation in the years that lie ahead.

We complete twenty-five years of Insurance Service to Indian Trade, Commerce and Industry as well as to the Insuring Public on 21st December, 1959. During this period, we have ceaselessly endeavoured to render the most efficient service, backed by financial stability and security.

On this happy occasion of our Silver Jubilee Celebration, we sincerely thank all our patrons, friends and well-wishers to whom we owe our very growth and progress.

LABOUR COST AND PRODUCTIVITY

VIEWS OF ASSOCIATED CHAMBERS OF COMMERCE

NO aspect of industrial production, or for that matter agricultural output, has received so much attention in recent times as productivity. In Parliament and the Press, debating forums and discussion groups, in fine, wherever economic development problems are discussed, productivity figures prominently. This is a good augury, for the essence of productivity improvement consists in creating a new psychology by allaying fears, overcoming hesitations and breaking with routine. In fact, the idea of productivity must become not a formula in industrial engineering, but a habit of the mind with workers, employers, Government and the consumers.

To countries like India, which are late comers to the industrial arena of the world, productivity has a special significance. In the words of Mr. G. L. Nanda, Union Minister for Labour, Planning and Employment, "productivity is a synonym for progress. For us, it means not merely progress but survival."

The employers' awareness of the importance of productivity is fully reflected in a resolution on labour costs and productivity unanimously adopted at the annual meeting of the Associated Chambers of Commerce held at Calcutta last week. The resolution reads:

"The Associated Chambers of Commerce are convinced that, at the present time, Indian industry's greatest need is increased productivity. The steady and widespread improvement in the wages and amenities of labour over the last ten years having failed to bring about a proportionate increase in output, the Chambers would urge that, in the interests of the country's economic progress, it should be accepted as a national objective that future wage increases can only be effected by linking such increases to increased productivity and that, with the same object, further efforts should be made to allay concerns to reduce losses of output through industrial disputes and labour indiscipline."

Give and Take

This resolution gives, in capsule form, the two most important aspects on which efforts should now be concentrated to increase production and productivity. They are: (1) productivity and the linking of wage increases to productivity, (2) minimising industrial disputes and indiscipline. Moving the resolution on behalf of the proposer, the Upper India Chamber of Commerce, Mr. J. K. Srivastava, made a convincing plea for an attitude of give and take between employers and workers. He said that productivity was a cumulative result of the operation of a large number of factors such as technological improvement, rate of operation, degree of efficiency, availability of raw materials and components, labour relations, skill and effort on the part of the workers as well as managerial ability. The management was not unmindful of the factors other than the effort of workers contributing to productivity. After emphasising that employers in general had not only fully realised their duty to workers but had given to the general body of workers more than what they and the country had received in return, he said that it was now for the worker to repay what had been given to him by way of increased wages, better amenities and the benefits of a mass of labour legislation, which, for the rapidity of its enactment and enforcement, was probably without precedent in any other part of the world. He added: "And the repayment can be made only by the workers agreeing to link up any further rise in wages with a corresponding increase in productivity, and further to implement in action as well as in words that portion of the recent Code of Discipline that relates to strikes without any justifiable cause and to indiscipline in general. There must, in short, be co-operation from the side of labour in return for all that has been done for it in the course of the last decade."

A Disturbing Feature

One of the most disturbing features of Indian economy, Mr. Srivastava rightly pointed out, was the high cost of production of most of the manufactures. The constant demands for higher wages and for what were known as fringe benefits, according to him, had loaded the cost structure with burdens which the industry could not bear if it were to be in a position to compete in international markets. High cost, and the consequent high price, met with consumer resistance in the internal markets also.

Referring to the Labour Minister's statement in Parliament, in April last, that neither the ratio of labour cost to total production nor that to the value added by manufacture had increased and that, therefore, the workers' share was not one of the factors that stood in the way of industrial progress, Mr. Srivastava said that

these conclusions were challenging ones which were contrary to the experience of all industrialists which was that productivity of the worker had not risen in proportion to the increase in income. He, however, could not give any figures in support of his contention, but felt that, if a comprehensive review of the cumulative effect of the legislation enacted in the last decade granting wage increases and fringe benefits were made, it would reveal that the rate of real earnings had outstripped the rate of increase in industrial production.

Productivity in Agriculture and Industry

Citing the sugar industry in the North as presenting an astonishing number of anomalies, Mr. Srivastava observed:

"In 1958, the controlled price of sugar was 95 p per seer. Out of this, 37 p or nearly 40 per cent., went to the grower, 33 p to the Government in taxation, and 7 p to the worker. This accounted for 81 per cent. of the cost of production and left only 18 p per seer with the manufacturer. In this case, the grower can also be treated as a worker, since India's largest industry is agriculture. Although the cultivator comes off very much the best in this combined industry, his productivity has certainly not increased, a fact which the Government are prepared to admit. The average production per factory worker in India is 11 tons per annum, as against no less than 144 tons in Australia. In the same way, the average production of the raw material per acre is about 400 maunds, which is far below that in any other cane producing country, and the quality is, on international standards, poor. I may add that it is anomalous that, while the Government admits that, in agriculture, as a whole, prices are high in relation to individual productivity per acre, which is for the most part the lowest in the world, it is unwilling to make the same admission in regard to the wages of industrial labour and its productivity."

Dealing with the second point embodied in the resolution, namely, strikes and general indiscipline, Mr. Srivastava stressed that strikes, legal or illegal, had considerable impact on the problem of productivity and production; the man-days lost could never be made good. Although a Code of Discipline had been adopted after considerable discussion, it was not observed by workers in their individual capacity or by their unions. He urged the Government to adopt a really realistic labour policy by which he meant "one less heavily overpainted with their nebulous and rather meaningless concept of social justice."

Litigation

Much concern has been expressed of late about the increase in labour litigation and, in particular, the frequent reference of industrial disputes to the Supreme Court. Mr. Srivastava made some pertinent observations regarding the causes of such litigation. To quote him:

"An objective study of this problem would show that the forces that have led to this state of affairs from the point of view of both employer and employee are the inconsistencies in decisions at the adjudication stage. It is to the interest of all that references to adjudication should be reduced to a minimum and should be sparingly used and reserved for important disputes. Establishment of proof for reference or non-reference and their practical application by executive action would greatly strengthen the process of negotiations, conciliation and agreement. However, the crux of the problem is the practical application of norms, standards and guiding principles which will ultimately depend on the calibre, sense of justice and fair play and independent outlook of the men in authority. Industrial Tribunals, indeed, have been so enamoured of this modern doctrine of social justice that, recently, two of them came to the curious decision that a strike that was otherwise illegal under the ordinary industrial law of the land became justifiable according to the dictates of what they considered to be socially just. It is satisfactory to note that the High Courts of the States concerned reversed, in due course, these astonishing decisions with some mildly eardonic reflections on their makers. Nevertheless, it is surprising that Industrial Tribunals, which are staffed with presumably reasonable men, should be able to arrive at decisions which are not merely palpably perverse, but which clearly stand in the way of an increase in productivity."

Trade Union Law

Trade union laws have a direct impact on industrial relations. According to Mr. Srivastava, defective laws have, to a significant extent, encouraged indiscipline and unhealthy unionism. The provisions of the Industrial Disputes Act in particular which allowed seven or more persons to apply for registration of unions, according to him, were directly responsible for the mushroom growth of trade unions. He urged the Government to amend the Act, so that, instead of a number being fixed as the minimum, the criterion for membership for registration should be on a percentage basis, say, for example, 33-1/3 per cent. of the workers employed in a particular unit. As the Act is now being applied

to all sorts of enterprises, big and small, it will also be necessary to qualify this percentage by specifying a minimum in number, too, subject to the condition that the higher of the two should prevail.

Seconding the resolution on behalf of the Bengal Chamber of Commerce and Industry, Mr. H. M. L. Williams stated that, given sufficient raw materials, no one single factor did so much damage to the prosperity of an industry as a machine which was idle when it should be producing. He said that just as a grounded aircraft was of use only to the enemy, an idle machine was of benefit only to India's competitors. He suggested that, in the interest of higher production, the slogan should be "Keep the wheels turning."

State Governments' Attitude

Mr. H. C. Mahindra, who supported the resolution on behalf of the Punjab and Delhi Chamber of Commerce, observed that the most distressing feature which continued to contribute to loss of output was the attitude of State Governments—the approach they brought to bear on the administration and implementation of labour legislation. As an example, he cited the conciliation machinery provided under the Industrial Disputes Act which, according to him, more often than not served merely as a reporting organisation, resulting in discriminate reference of even frivolous points for adjudication. This tended to undermine efforts to stabilise conditions conducive to industrial peace. There was, therefore, an immediate need for not only expert study at Governmental level of cases, precedents and practices already established by law but also determination on the part of State Governments to establish industrial peace on the basis of mutual rapprochement and understanding between labour and employers.

The aforementioned points have been made time and again by the leaders of industry and responsible politicians and administrators. But they have yet to find practical reflection in the day-to-day conduct of industry. What is required is, therefore, more vigorous efforts to educate workers and the public on the importance of productivity and industrial peace. Employers have a crucial role to play in driving home workers the point that their own prosperity and security are essentially dependent on the prosperity of the industry or the firm in which they work. They should take workers into confidence, tell them the problems confronting the industry and seek their help to solve them. Factors which prevent their being given higher wages and better amenities should be explained to them intelligibly and balance-sheets and such other disclosable information should be placed at their disposal, so that they can have a better understanding of the position of the firms in which they work. It is the absence of this kind of exchange of information that enables interested parties to sow the seeds of suspicion and disaffection among workers against their employers. Studies of productivity trends on an industry basis should be organised by employers themselves. It is noteworthy that Mr. Srivastava, or for that matter other employers or their organisations, could not produce any data to contradict the Minister's statement regarding the relative rise in productivity and wages. Why should not employers and their organisations sponsor the necessary studies without depending on the Government or other official or non-official bodies?

Moreover, within the limitations imposed by their capacity to pay, employers should, as far as possible, take a strictly legalistic but a human attitude to workers' demands for wage increases and better amenities. For, as Mr. John Marsh, Director of the Industrial Welfare Society of Britain recently observed, "a successful employer (manager) is one who could look at the wholeness of a problem, take quick decisions and, on the whole, err on the side of humanity."

EFFICIENCY AND WELFARE

Measures for stepping up efficiency and welfare in industry were discussed at the fifth meeting of the Sub-Committee on Workers' Participation in Management and Discipline in Industry, held in New Delhi on the 8th inst. Initiating the discussion, Mr. G. L. Nanda, Union Minister for Labour, stressed the need for a change of attitude on the part of management as well as labour. In tackling problems such as efficiency, he said, it was not so much a question of drawing up a Code of right attitude that was required.

The Sub-Committee agreed to formulate broad guiding principles, which could be applied on pilot light of experience. It was also pointed out that discussions could be more fruitful if data on the operation of incentive schemes for promoting efficiency could be systematically collected and disseminated.

FORWARD MARKETS BULLETIN (Monthly)

Published by Forward Markets Commission Government of India, Bombay

REGULAR FEATURES

- A "General Review" presenting an assessment of trading conditions in the futures markets during the month
- Special articles on technical aspects of forward trading
- Extensive information relating to developments in futures markets
- Detailed commodity market review
- Comprehensive and up-to-date statistical supplement relating to crop estimates, production and consumption trends, price movements, trading against future contracts, etc.
- About 200 pages in print in crown & slip
- Attractive get-up

Annual subscription: In India .. Rs. 12.00 / In India .. Rs. 2.00 / Abroad .. Rs. 26.00 / Abroad .. Rs. 6.00

PROTECTION TO BAKELITE EXTENDED PLASTIC BUTTONS, HOWEVER, DEPROTECTED

PLASTIC is a young and fast developing industry in India. One of the major segments of this industry, namely, the phenol formaldehyde moulding powder (bakelite), and also plastic buttons, have been making steady progress under the umbrella of protection given to them since 1950 and 1951, respectively. The Government has now decided to extend the period of protection granted to the p.f. moulding powder beyond this year till 31st December 1962, as recommended by the Tariff Commission. The protective duty will be maintained at 35 per cent. *ad valorem*. The button industry, however, will cease to receive protection beyond 1959, since it is considered to have come of age and is in a position to expand further without outside help. The Government has also decided to withdraw the existing concession of refund of duties on phenol, formaldehyde and hexamine to those manufacturers of p.f. moulding powder, whose production is not less than 200 tons per annum.

This has been done in response to the Tariff Commission's view that the continuance of duty concession, in the existing circumstances, is not justifiable. With the abolition of this duty, the protective duty required to equate the fair ex-works price of the indigenous p.f. moulding powder is no more than 1.93 per cent. *ad valorem*, as against 32 per cent. *ad valorem* estimated by the Commission at its previous enquiry in 1956. Many considerations, however, weighed with the Commission in suggesting a protective duty of 35 per cent. In the first place, the p.f. moulding powder continues to depend entirely on imports for its essential raw materials—a disadvantage, as compared with its foreign competitors who obtain raw materials at much cheaper prices. Secondly, the industry has plans to expand and diversify production. At present, the industry mainly manufactures G.P. grade moulding powder. But it proposes to undertake the manufacture of superior grades with foreign collaboration. The cost of production of superior grades will be higher in the initial stages. Thirdly, the industry has been asked to improve quality of its products in conformity with the standards specifications, which will involve investment in suitable laboratory equipment for testing raw materials and finished products.

Installed Capacity

The total installed capacity of p.f. moulding powder is estimated by the Development Wing to have gone up to 1,500 tons on single-shift basis, from 1,135 tons at the time of last enquiry in 1956. There are four units at present in this industry. They are the Industrial Plastics Corporation Ltd., Bombay, the Indian Plastics Ltd., Bombay, Rawji Amarsi, Satara (formerly Plastics Products of India Ltd.), and the Saurashtra Electrical and Metal Industries (Private) Ltd., Sihore, Saurashtra (formerly Bharat Electrical Manufacturing Company, Ltd.). The Industrial Plastics has been making steady progress. It installed a modern plant in 1958 for the manufacture of wood flour from sawdust. It has also commenced production of G.X. grade of p.f. moulding powder. This unit has entered into an agreement with M/s. N. V. Philips Gloeilampenfabrieken, Netherlands, for the manufacture of all grades of p.f. moulding powders by next year. The Indian Plastics has expanded its annual capacity from 128 tons to 300 tons on single shift basis. It is also seeking foreign collaboration for further development. The third unit, which had stopped production since 1954 as a result of financial difficulties, has been taken over by Rawji Amarsi. This unit resumed production in May 1958. The fourth unit had also been out of production for some time, but has recently started functioning under the new management.

The following table shows the production of each of the three units in operation during the last few years:

(In tons)				
	1956	1957	1958	1959 (Jan.-June)
The Industrial Plastics Corporation Ltd.	606.51	614.93	714.44	380.92
Indian Plastics Ltd.	377.90	560.40	601.05	330.48
Rawji Amarsi	...	...	35.69	92.50
Total	984.41	1,174.73	1,351.18	803.90

The domestic demand for p.f. moulding powder is estimated at about 1,800 tons in 1959

and is expected to increase by 20 per cent. per annum in the next three years. In 1958, the actual consumption of this material amounted to 1,585 tons (domestic production 1,346 tons and imports 239 tons), which compares favourably with 1,482 tons (1,181 tons and 301 tons) in 1957 and 1,285 tons (1,066 tons and 219 tons) in 1956. In view of the severe restrictions, imports have been relatively small. The import of p.f. moulding powder of G.P. grade is banned. In order to eliminate the possibility of importing this grade on licences issued to superior varieties, the Commission has asked the Government to issue necessary instructions to ensure that every consignment of p.f. moulding powder imported into the country is accompanied by a certificate of analysis from an independent and reputed Testing Laboratory in the exporting country, specifying the grade and quality of the contents.

Quality

The quality of the indigenous p.f. moulding powder has been improving. The Development Wing has stated that there has been "slight improvement" in the quality of general purpose moulding powder. Some of the consumers, manufacturing general purpose and utility plasticware, have expressed the view that the "quality of the indigenous powder has improved, but is not yet upto the standard." There were, however, many complaints relating to "the lack of uniformity in quality, poor flow characteristics and poor finish of the moulded article." The Tariff Commission has called upon the industry to give adequate importance to ensure better quality of their products. It has also urged the manufacturers to equip themselves quickly with complete facilities for testing their moulding powder according to standard methods. The manufacturers have

been further asked to fix their selling prices in fair relation to their cost of production.

The principal raw materials used in the manufacture of p.f. moulding powder are phenol, formaldehyde, hexamine, wood flour and small quantities of sulphuric acid, stearic acid and lime. Phenol is produced in the country in small quantity by the process of coal tar distillation but is consumed by the manufacturing units. Consequently, the entire requirements of p.f. moulding powder industry are met from imports. The production of phenol from benzene on a commercial scale is expected to be undertaken in this country along with that of other intermediates for meeting the requirements of dyestuffs and other organic chemical industries. Formaldehyde is not produced at present in the country. However, two units are understood to have been licensed each for the manufacture of 6,000 tons of formaldehyde per annum. Hexamine is also imported at present. An annual capacity of 300 tons of hexamine per year has been licensed recently to an indigenous firm. The Tariff Commission considers it essential that these raw materials should be produced in the country and suggested that the Government should extend the necessary assistance for establishing the manufacture of these articles as early as possible. Wood flour is obtained from indigenous sources. One of the manufacturers has installed equipment for producing fine powder of the required mesh from sawdust. Wood flour is generally used as a filler; in addition, asbestos, mica and cotton flour are also used as fillers for the manufacture of special grades of moulding powder. It is claimed that the quality of wood flour made from imported timber is superior. The Commission has, therefore, recommended that manufacturers should obtain from the Forest Research Institute, Dehra Dun, proper advice on suitable Indian timber for this purpose.

To take the plastics button industry now. From a comparison of the landed cost without

man's
faith

Faith that makes man aspire, strive ...
awakening him to tasks in the early-glow of dawn.
That melts rock, shapes granite; transforms
still waters to surging power.

A faith in the living future:
in a world that offers a little more—
a little less of the care, a little more of the joy.
Faith that gives meaning to life.

Today, as in the past, our products help to make homes
cleaner, healthier, happier. But today we are also working for...
Tomorrow, when the evergrowing urge for better living
will demand still greater efforts. And we shall be
ready with wider service, new ideas, new products...

Today and Tomorrow... Hindustan Lever serves the home

PR. 6-X52

IMPRESSIVE RESULTS OF TITAGHUR PAPER

SALES EXCEED RS. 9 CRORES—SHARP RISE IN PROFIT

IN consonance with the general trend of performance of paper mills, the Titaghur Paper Mills Company Ltd. (Managing Agents: Messrs. F. W. Heilgers & Co., Private Ltd., Calcutta) also has done well during the year ended 31st March 1959. Thanks to the working of the mills to full capacity and as a result of additions to plant, the Company's production has recorded a rise over the year and sales have crossed the Rs. 9-crore mark to touch Rs. 9.42 crores, an increase of Rs. 1.32 crores over those in 1957-58. Though the increased production and sales have been followed by a rise in the cost of raw materials, stores, power and fuel, excise duty and other expenses, the gross profit has still improved by Rs. 33.58 lakhs or 28.9 per cent. to Rs. 149.77 lakhs, probably a record in the history of the Company. This is in refreshing contrast to the slight setback noted in the previous year, when the gross profit had shrunk from Rs. 121.13 lakhs to Rs. 116.19 lakhs.

The net profit, too, is higher, at Rs. 46.01 lakhs, as against Rs. 34.43 lakhs for the previous year, but the rise is less marked than that in gross profit, consequent on the larger provisions for taxation Rs. 62.56 lakhs (Rs. 48.05 lakhs), depreciation Rs. 29.06 lakhs (Rs. 24.62 lakhs) and managing agency commission at Rs. 12.14 lakhs (as against Rs. 9.08 lakhs). In fact, the net profit for the year under review falls short of that (Rs. 59.93 lakhs) earned in 1955-56. This is mainly accounted for by the substantial increase—nearly 100 per cent.—in the provisions for depreciation and taxation, as is borne out by the following comparative table:

	For the year ended 31st March			
	1959	1958	1957	1956
Sale proceeds	9,42.44	8,10.43	7,03.92	6,44.86
Other income	3.38	7.00	4.77	3.96
Closing stocks of finished paper and goods in process ..	11.78	12.76	18.50	25.08
Raw materials, stores, etc. consumed	3,09.48	2,94.62	2,18.83	1,90.68
Power and fuel	84.82	78.97	60.51	54.39
Excise duty	1,24.36	1,11.02	65.20	62.21
Other expenses	2,76.40	2,43.87	2,27.34	2,22.61
Gross profit	1,49.77	1,16.19	1,21.13	1,16.01
Managing Agency commission ..	12.14	9.08	9.51	8.02
Provision for—				
Depreciation	29.06	24.62	24.15	15.56
Taxation	62.56	48.05	46.00	32.50
Net profit	46.01	34.43	41.11	59.93
Provisions written back	0.66	9.77	38.84	..
Disbursements out of provisions written back	0.66	0.05	22.36	..
To reserves and other funds ..	16.12	16.21	29.25	33.75
Dividends—				
Preference and preferred	2.03	2.03	2.03	2.03
Ordinary	28.01	26.07	26.61	23.80
Carry forward	1.01	1.77	0.92	1.23

More than a third of the net profit has been ploughed back—Rs. 9.12 lakhs to the statutory development rebate reserve which had received Rs. 3.46 lakhs last year, and Rs. 7 lakhs, same as in the previous year, to the reserve for new mill project. In addition, a sum of Rs. 4.75 lakhs had been set aside a year ago for reserve for taxation contingencies, while no such addition has been made out of the profit for 1958-59. It may be noted here that, while a part of the additions to the reserves made last year had come from the pension fund (Rs. 9.72 lakhs), the entire amount ploughed back this year is out of the year's profit.

In consonance with the higher earnings, the distribution on ordinary shares is also to be raised to 25 per cent. from 23½ per cent. after maintaining it at the latter level for two years. This is being done by increasing the bonus part of it from 6½ per cent. to 7½ per cent., while the dividend as such is unchanged at 17½ per cent.

The Auditors' report contains a reservation on the interest paid to the Managing Agents on loans taken from them by the Company. The outstanding amount of the loan is Rs. 10 lakhs and the amount of interest paid during the year is Rs. 10,805. Adverting to this in their report, the Directors observe:

"Section 370 of the Companies Act 1956, permits the Managing Agents to make loans to any Company under their management. Clauses 60 and 62 of the Articles of Association of the Company empower your Company to take loans from the Managing Agents at the rate of interest to be agreed upon between them and the Board and it is also specifically mentioned that such interest shall not be deemed to be remuneration in respect of their services as Managing Agents.

"The Board considers that it is in the interest of the Company to borrow moneys from time to

time from the Managing Agents, if the Managing Agents are agreeable to loan such moneys at a rate of interest lower than the prevailing Bank rate. Further, counsel's opinion on the subject is also definite that a loan from the Managing Agents at interest does not come within the purview of any of the sections in Chapter III (inclusive of Section 360) of the Companies Act, 1956. The auditors are of the opinion, however, that the approval of shareholders, in terms of Section 360 of the Companies Act, 1956, is necessary to entitle the Managing Agents to receive interest on such loans. In order to remove any doubt in the matter, it is proposed to secure the concurrence of the shareholders on the subject."

The Directors are, accordingly, seeking the approval of the shareholders at the forthcoming annual meeting of the Company.

The Company has made a capital expenditure of Rs. 57.96 lakhs during the year under review, in pursuance of its scheme of renovation and expansion, bringing the total value of the block account to Rs. 726.92 lakhs, on which the depreciation provided so far is Rs. 402.88 lakhs, leaving the net book value of the fixed assets at Rs. 324.04 lakhs. The value of the block account includes a sum of Rs. 10 lakhs added on capital reorganisation in 1937 and of Rs. 76.30 lakhs added on revaluation of assets in 1948. The latter amount has, however, been set apart as revaluation of fixed assets reserve, which will be utilised specifically for the purpose of making adjustments in the future value of the fixed assets. The depreciation is now being calculated on the actual cost only and that, if a lower valuation of the fixed assets is called for in future, a suitable adjustment will be made by utilising the above reserve.

In addition to the net block account mentioned above, capital work-in-progress amounts to Rs. 194.93 lakhs and jobs in Choudwar mill completed but not in operation Rs. 4.93 lakhs. The other current assets aggregate Rs. 559.92 lakhs. The loans and current liabilities amount to Rs. 537.53 lakhs, leaving a net asset of Rs. 546.29 lakhs, represented by a paid-up capital of Rs. 142.92 lakhs and reserves and surplus of Rs. 403.37 lakhs.

The eighth stage of the renovation at the two mills of the Company has been virtually completed and the Directors will take up shortly the question of a further programme, aimed at reducing the cost of production. The major part of the land for No. 3 mill at Choudwar has been acquired and this mill is expected to reach production in the early part of next year. While such expansion programmes are of long-term benefit to the Company, the outlook for the current year has been somewhat dimmed by the cut in paper prices with effect from 1st January 1960. Another adverse factor which is likely to affect the current year's profit is the directive given in May 1959 by the Supreme Court in its judgment on the Company's appeal against the Appellate Tribunal's reversal of the Industrial Tribunal's award on production bonus and profit sharing bonus, to pay the workers of the Company profit bonus to the extent of one month's basic pay for 1951-52 over and above the production bonus entitlements. The scale of production bonus has also been revised upward and this takes retrospective effect from September 1956.

The Rs. 10 fully paid-up 'A' ordinary shares of the Company are being currently quoted at Rs. 41.12 ex-div. At this rate and on the basis on the latest dividend the yield on the shares is 6.1 per cent. per annum, free of tax.

(Concluded from next column)

lakhs spent in 1957-58 and Rs. 10.10 lakhs in 1956-57. The total gross value of the block account at the end of the year stands at Rs. 151.68 lakhs, as against which the depreciation written off is Rs. 35.94 lakhs, so that the net book value of the fixed assets amounts to Rs. 115.74 lakhs. The other assets aggregate Rs. 109.70 lakhs, exceeding the current liabilities and provisions, at Rs. 70.79 lakhs, by as much as Rs. 38.91 lakhs. The paid-up capital of Rs. 90.30 lakhs is supplemented by reserves and surplus aggregating Rs. 64.35 lakhs.

The Rs. 10 fully paid-up ordinary shares of the Company are being currently quoted at Rs. 26 cum-div. On an ex-div. basis, the yield works out to 10.6 per cent. per annum, subject to deduction of tax, and 7.2 per cent. per annum, free of tax.

CONSOLIDATED COFFEE

EARNs MORE

NET RETURN TO SHAREHOLDERS IS, HOWEVER, LESS

A SUBSTANTIAL improvement in coffee output and a better price realisation have enabled the Consolidated Coffee Estates (1943) Ltd. (Managing Director: Mr. R. C. Paterson, Polibetta) to show a larger profit for the year ended 30th June 1959. The coffee crop has gone up from 2,462 tons (in 1957-58) to 2,758 tons. Though this is in line with the general trend of coffee crop for the 1958-59 season, it is by no means a record for the Company. Indeed, it falls short of the record output of 3,179 tons reached in 1956-57. It is, however, the second largest crop harvested in the last sixteen years of the Company's history. The crop has been valued at Rs. 2.37 per point, as against Rs. 2.25 in the previous year, and the final payment may be still higher.

The value of other crops has also gone up from Rs. 6.08 lakhs to Rs. 11.88 lakhs, but this is more than offset by the drop in profit earned on previous season's stocks.

The gross profit shows a sharp rise from Rs. 38.74 lakhs to Rs. 51.49 lakhs, thus making good, to some extent, the drop in the previous year from the record of Rs. 78.26 lakhs earned in 1956-57. The net profit, which had declined from Rs. 39.75 lakhs to Rs. 15.88 lakhs in 1957-58, has jumped up to Rs. 25.61 lakhs. In consonance with the upward trend in earnings, the addition to the reserves has also been raised from Rs. 1.50 lakhs (added to the general reserve last year) to Rs. 6.06 lakhs, made up of Rs. 6 lakhs to the general reserve and of Rs. 6.52 to the development rebate reserve. The distribution to ordinary shareholders has been raised from 20 per cent. to 25 per cent. (gross). As the dividend for the year under review is subject to deduction of tax at 30 per cent., the net return to the shareholders will be only 17.5 per cent., as against 20 per cent. for the previous year. Thus, the enhancement in the rate does not fully cover the loss to shareholders on account of the abolition of grossing up procedure.

The progress of the Company during the last three years is pictured in the following comparative table:

	For the year ended 30th June			
	1959	1958	1957	1956
Value of coffee crop	49.46	75.07	113.92	67.58

† Subject to deduction of tax.

There has been an increase in the total cultivated area of the Company from 7,951 acres to 8,086 acres, of which that under coffee shows a rise from 7,052 acres to 7,173 acres. The increase in crop produced has been shared by both arabica (from 31,662 cwt. to 35,293 cwt.) and robusta (from 17,582 cwt. to 19,861 cwt.). It may be noted here that the robusta coffee output is the highest in the history of the Company, while the arabica crop is 13,772 cwt., below the peak of 49,065 cwt. harvested in 1956-57. The output per acre of arabica has improved from 7.12 cwt. to 7.72 cwt., and that of robusta from 6.75 cwt. to 7.63 cwt.

The revised estimate of current year's coffee crop is placed at 2,805 tons, which represents a slight decline of 50 tons from the blossom estimate, but a rise of 47 tons over the actual crop for 1958-59.

The Company's curing works at Kushalnagar cured 2,205 tons of coffee, as against 2,743 tons in the previous year, while the actual receipts of 1958-59 crop for curing amounted to 3,149 tons.

The Company has made a capital expenditure of Rs. 10.63 lakhs during the year under review, of which labour and staff quarters account for Rs. 5.75 lakhs. This is on top of Rs. 18.46 lakhs (Continued in next column)

PREMIER AUTOMOBILES

GROSS PROFIT EXCEEDS ONE CRORE

THE recent hardening in the value of ordinary shares of the Premier Automobiles Ltd. (Managing Agents: Messrs. Aero-Auto Private Ltd., Bombay)—from Rs. 131 on the eve of Diwali to Rs. 158.50 at the time of writing—appears to be justified, to some extent, by the encouraging performance of the Company during the year ended 30th June 1959 and the prospects of an expansion programme being taken up shortly. The Company has earned a record gross profit of Rs. 104.51 lakhs for the year under review, which is more than double that (Rs. 50.49 lakhs) earned in the previous year and is higher than the previous high of Rs. 82.80 lakhs in 1956-57. The profit would have been higher still but for some adverse factors, over which the management had no control. The net profit, after providing larger sums for depreciation and taxation, shows a rise from Rs. 15.36 lakhs (in 1957-58) to Rs. 40.98 lakhs. After writing back excess provisions, and writing off expenses and taxes relating to previous years, as well as debenture issue expenses (as shown in the table below), the Directors have added Rs. 13 lakhs to the development rebate reserve, which had received Rs. 8 lakhs last year. They have also recommended a dividend of Rs. 9 per share, subject to deduction of tax. Even so, the tax-free return to the shareholders, at Rs. 6.30 per share, compares very favourably with Rs. 4 per share paid for 1957-58 and Rs. 6 per share for 1956-57, as will be seen from the following comparative table:

	For the year ended 30th June			
	1959	1958	1957	1956
Sale proceeds	17,42.80	14,47.32	18,08.67	14,29.43
Other income	12.25	17.38	5.66	8.55
Closing stocks of finished goods and work-in-progress	2,65.92	1,06.26	1,73.99	1,33.11
Expenses	16,60.55	14,14.05	17,31.53	13,54.22

† Subject to deduction of tax.

The Company is said to have produced about 8,400 vehicles—5,200 trucks and 3,200 cars—during the year, but the Directors' report does not make any mention of this. It is also reported that the Company hopes to raise the production to 11,000 vehicles during the current year. The production of indigenous contents of trucks and cars is making satisfactory progress. The indigenous contents of Fiat cars is expected to go up from the present level of 50 per cent. to 55 per cent. next year and those of trucks from 60 per cent. to 75 per cent. As regards the sheet metal components for the body of cars, the Directors report that plans for the manufacture of the same in the factory have reached an advanced stage. It is reported that the Company proposes to set up a body-building shop for cars at a capital outlay of Rs. 2 crores, but the Directors have not disclosed any details of this project in their report.

The Company's paid-up capital stands increased from Rs. 220.26 lakhs to Rs. 227.65 lakhs, on account of the conversion of 7,387 debentures issued during the year. The reserves and surplus aggregate Rs. 87.13 lakhs. During the year, the Company issued 6½ per cent. convertible redeemable (1968-73) debentures of the value of Rs. 1.60 crores, from the proceeds of which the outstanding loan of Rs. 45 lakhs (as on 30th June 1958) from the I.F.C. of India was repaid. The outstanding debentures at the end of the year under review, after conversion referred to above, amount to Rs. 152.61 lakhs. Other borrowings aggregate Rs. 361.33 lakhs and other current liabilities and provisions Rs. 362.23 lakhs. The gross block of the value of Rs. 477.85 lakhs (including additions to the tune of Rs. 90.74 lakhs made during the year) has been written down to Rs. 296.60 lakhs. The current assets amount to Rs. 934.35 lakhs, which exceed borrowings and other current liabilities (excluding debentures) by Rs. 210.79 lakhs.

The Rs. 100 paid-up ordinary shares of the Company are being currently quoted at Rs. 158.50 cum-div. On an ex-div. basis, and at the current rate of dividend, the shares offer a tax-free yield of 4.1 per cent. per annum.

\$aved
Rs. 4,00,00,000 worth of foreign exchange!

To-day, electric power is the motivator behind industrial development, increased agricultural output, and the sweetness and light of the home! From whatever source electricity may be obtained, and wherever it may go, in this vast land of ours, you'll find Alind conductors taking this power.

But Alind's contribution reflects itself not merely in the material welfare and progress of the country...it's seen in other ways, too.

For instance, in the last eight years, savings in foreign exchange should have amounted to something like Rs. 4 crores. And with our Hirakud plant now "on stream", and using indigenous metal, these savings bid fair to be as high as Rs. 1-5 crores a year!

SYNOPSIS OF COMPANY REPORTS

Ashoka Cement Ltd.

THE directors of the above Company (Chairman: Mr. S. P. Jain, Calcutta) present the audited accounts of the Company for the year ended 31st March 1959.

The year's working after providing interest amounting to Rs. 7,61,444 (Rs. 7,40,909) shows a surplus of Rs. 12,78,954 (Rs. 2,65,037). From this amount provisions have been made for bonus Rs. 74,870 (Rs. 70,508), for development rebate reserve Rs. 2,98,880 (Rs. 23,620) and for depreciation Rs. 6,51,733 (Rs. 21,936) leaving a balance of Rs. 2,53,471 (Rs. 8,415) after writing off Rs. 1,42,558 for bad debts, preliminary expenses and brokerage on shares, etc.). To this is added the balance brought forward from last year of Rs. 19,343 (Rs. 12,928) making available for appropriation a total of Rs. 2,72,814 (Rs. 19,343). From this the interim dividend at 3 (nil) per cent. (paid on 24th February 1959) absorbed Rs. 1,80,000 (nil) leaving a distributable sum of Rs. 92,814 (Rs. 19,343). The directors recommend a final dividend of 15 (nil) p per share, thus making a total of 45 (nil) p per share or 4½ (nil) per cent. on paid-up capital for the year. The balance of Rs. 2,814 (Rs. 19,343) is proposed to be carried forward.

It has been decided to spread out the incidence of depreciation evenly by adopting a flat rate of 4 per cent. of the original cost on plant and machinery and installations and 2½ per cent. on buildings. On this basis the total cost of plant and machinery and installations will be written off in 25 years and that of buildings in 40 years. At income-tax rates, 96 per cent. of the cost of plant and machinery and 87 per cent. of the cost of buildings would have been written off during the same period.

Production has been gradually improving. The following figures are indicative of the trend:

Calendar year	Clinker made	Cement made	Cement despatched
	(Tons)	(Tons)	(Tons)
1957	85,082	90,297	86,957
1958	1,14,013	1,17,850	1,16,617
1959 (upto November)	1,26,922	1,33,288	1,31,245

Cement production was affected at times due to the inability of the State Trading Corporation to provide despatch orders. The Steel Foundry installed by the Company for the manufacture of steel castings and grinding balls required by the cement industry worked for about six months in the year under review.

The retention price allowed for this Company's cement has been found to be unremunerative. The price of coal and stores has been on the increase. Railways have also enhanced their freight rates. Such increases have been found to be much higher than those assumed by the Tariff Commission in their estimates of future cost and have far exceeded in the very first year the contingency allowance of Rs. 2 per ton allowed by the Tariff Commission to cover exigencies extending over a period of three years. The actual production cost is also higher than that estimated by the Tariff Commission on account of their computing the costs on higher production basis which was not possible of achievement. This erroneous assumption by the Tariff Commission also resulted in the calculation of a lower profit element per ton allowed to this Company in the retention price. The Company has represented to the Government for a suitable increase in the retention price with effect from 1st July 1958. The Government could reasonably be expected to consider the Company's case sympathetically and not allow the industry to suffer on account of the increase in cost over which it has no control.

It is understood that the Wage Board for Cement Industry appointed by the Government of India has submitted its report. Implementation of the recommendations of the Wage Board as reported in the Press will lead to a substantial increase in production costs. The Wage Board has also recommended that there should be at the same time a corresponding increase in the retention price allowed to the manufacturers. Since the margin of profit allowed to the industry is already so meagre, the industry has no capacity whatever to bear any additional burden.

Accounts in brief are as under:—			
	Rs.	Assets	Rs.

	Rs. 2,22,98,407		Rs. 2,22,98,407

Hooghly Mills Co., Ltd.

The directors of the above Company (Calcutta) present the audited accounts of the Company for the year ended 31st March 1959.

The accounts before charging for depreciation, reveal a profit of Rs. 11,25,070 (Rs. 6,49,641). From this amount has to be deducted provision for depreciation of Rs. 1,76,947 (Rs. 2,08,780), develop-

ment reserve Rs. 5,936 (Rs. 1,43,671), provision for taxation Rs. 4,84,829 (Rs. 1,55,582), provision for wealth tax Rs. 26,379 (Rs. 21,245), proposed dividend at 10 per cent. on preference shares Rs. 1,17,600 (Rs. 1,17,600), proposed dividend at 6 (nil) per cent. on ordinary shares Rs. 1,00,800 (nil) and proposed transfer to general reserve of Rs. 1,78,165 (nil) leaving a balance of Rs. 35,314. To this amount is added the balance brought forward from the previous year of Rs. 14,440 making a total of Rs. 49,754 to be carried forward.

In accordance with working time agreement of the Indian Jute Mills Association the Mill worked 48 hours per week with 12½ per cent. of the total looms sealed and from 2nd March 1959, a further 1½ per cent. of the looms were sealed, which were subsequently unsealed from 22nd June 1959. A further 2½ per cent. looms were unsealed as from 24th August 1959.

No progress towards the modernisation of the Preparing and Spinning Departments has been made this year as the machineries ordered for have not yet arrived, but the scheme is expected to be completed in the near future.

Accounts in brief are as under:—

	Rs.	Assets	Rs.
LIABILITIES			
Capital	28,56,000	Gross block	72,60,481

National Iron and Steel Co., Ltd.

The directors of the above Company (Directors: Messrs. B. D. Agarwalla; Ranglal Bagaria and five others, Calcutta) present the audited accounts of the Company for the year ended 31st March 1959.

The net profit for the year amounts to Rs. 4,01,806 (Rs. 4,22,338) after providing Rs. 6,48,230 (Rs. 6,09,789) for depreciation, Rs. 2,72,000 (Rs. 1,80,000) for income-tax for the year 1958-59, Rs. 34,886 (Rs. 36,450) for wealth-tax for the year 1958-59 and Rs. 38,500 (Rs. 29,300) for development rebate reserve. The balance to the credit of the profit and loss account after making last year's adjustments and liabilities, together with this year's profit is Rs. 12,72,208 (Rs. 12,20,132) which the directors recommend to be dealt with as under:—

An amount of Rs. 3,74,700 (Rs. 3,09,752) in payment of a dividend at Rs. 0.75 (Rs. 0.62) per share free of income-tax, Rs. 5,00,000 (nil) to be transferred to create a dividend equalisation reserve, Rs. 1,34,000 (nil) to be transferred to general reserve, Rs. 1,30,000 (nil) to be transferred to create an investment depreciation reserve and Rs. 1,33,508 (Rs. 910,380) to be carried forward to the next year. The directors also report that Rs. 564 have been paid out of Rs. 1,16,627 brought forward in the general reserve account for unclaimed liabilities. The balance of Rs. 1,16,063 added with Rs. 1,34,000 being the amount proposed to be transferred from profit and loss account as aforesaid, makes a net balance of Rs. 2,50,063 (Rs. 910,380) which has been carried over to the next year.

As stated earlier a sum of Rs. 1,30,000 is proposed to be transferred to the investment depreciation reserve account in respect of the shares held in Messrs. Britannia Construction Co. Private Ltd. It is expected that the total realisable value of the said investments will not fall below Rs. 70,000. A representation has been made to the Government of India for the increase in the retention price of the Electric Furnace Billets due to increases in the cost of production. A provisional adjustment has been made in the accounts in respect of the dues to equalisation fund on the basis of the said representation.

The working of the year under review has not been satisfactory due to various reasons. As a result of the slow down while new ones could not be taken up at all due to various import restrictions, shortage of finance and other factors. The directors regret to report that the working of the development schemes taken up earlier had to be slowed down while new ones could not be taken up at all due to various import restrictions, shortage of finance and other factors.

Accounts in brief are as under:—

	Rs.	Assets	Rs.
LIABILITIES			
Capital	49,94,000	Gross block	1,30,32,992
Debitures	2,00,000	Less—Depreciation	75,25,700
Reserves	15,78,502		
Provision for taxation	6,93,076	Net block	55,07,292
Provision for wealth-tax	34,886	Stock-in-trade	26,37,570
LIABILITIES	71,55,545	Stores, etc.	22,37,802
Profit and loss account (surplus)	1,33,508	Tractors and cranes, etc.	10,20,000
		Goods-in-transit	2,52,235
		Debts, deposits and advances	25,89,911
		Investments	3,05,806
		Cash	2,40,901
	Rs. 1,47,91,517		Rs. 1,47,91,517

Shree Bhawani Cotton Mills Ltd.

The directors of the above Company (Chairman and Managing Director: Mr. S. M. Mohita, Calcutta) submit the audited accounts of the Company for the year ended 31st March 1959.

The year's working shows a surplus of Rs. 4,73,148. Out of this provision has been made for depreciation upto 31st March 1958, of Rs. 2,78,704 leaving a sum of Rs. 1,94,442. From this amount has to be deducted the debit balance brought forward from the last account of Rs. 1,86,471 leaving a credit balance of Rs. 7,971 which the directors propose to carry forward.

The directors regret that it has not been possible to provide for depreciation for the year nor to pay the dividend on cumulative preference shares due to insufficient profit. The trading conditions continued to be difficult throughout the year and while cotton yarn rates tended towards lower levels, raw cotton remained proportionately high about the 1958-59 cotton crop, which were placed as high as 55 lakh bales, the actual output was only 48.50 lakh bales. Punjab was the worst sufferer of unfavourable weather conditions and the State's estimate of 5.66 lakh bales against the earlier mills have to depend almost entirely on Punjab adversely affected its working. The levy of purraw materials also added to its burdens. The Project, though better than previous year, was still power cuts from time to time. Considering the adverse factors noted above, the working results are considered quite satisfactory.

Although cotton yarn fetched lower rates during the year under report it continued to have a steady demand. The stocks with Indian mills are reported to have decreased from about 1.12 lakh bales in March 1958 to 55,000 bales in March 1959 and to only 27,000 bales in October 1959. The offtake position is therefore quite healthy and the rates have also satisfactorily improved since the last closing of accounts.

Accounts in brief are as under:—

	Rs.	Assets	Rs.
LIABILITIES			
Capital	30,00,000	Gross block	50,68,704
Provision for taxation	908	Less—Depreciation	2,78,704
LIABILITIES	53,55,730		
Profit and loss account (surplus)	7,971	Net block	47,90,000
		Stock-in-trade	29,91,536
		Stores, etc.	2,74,235
		Debts, deposits and advances	2,56,158
		Investments	4,000
		Cash	45,680
	Rs. 83,64,809		Rs. 83,64,809

Rajendra Coffees Ltd.

The directors of the above Company (Managing Agents: The Associated Planters Private Ltd., Madras) present the audited accounts of the Company for the year ended 31st March 1959.

The result of the Company's working for the period under review is a profit of Rs. 1,76,231 (Rs. 1,87,508). After deducting depreciation written off on buildings, machinery, etc., Rs. 9,179, Company's contribution to provident fund and Rs. 2,011 (Rs. 1,948) and loss in investment and Rs. 2,011 (Rs. 250) the net profit amounts to Rs. 1,94,791 (Rs. 1,57,792). To this is added the amount brought forward from last year of Rs. 34,432 (Rs. 31,341) making a total of Rs. 1,99,424 (Rs. 1,89,133). From this amount has been transferred to agricultural income-tax and Central income-tax reserve Rs. 46,000 (Rs. 43,000) leaving for appropriation the sum of Rs. 1,53,424 (Rs. 1,26,133) after transferring Rs. 20,000 to general reserve. The directors recommend to make the following appropriation:—To pay a dividend at 6 per cent. free of agricultural income-tax and Central income-tax on 10,000 cumulative preference shares absorbing Rs. 6,000 (Rs. 6,000), to pay a dividend at 5½ per cent. free of agricultural income-tax and Central income-tax on 10,000 redeemable cumulative preference shares absorbing Rs. 5,500 (Rs. 5,500) and to pay a dividend at 50 (40) per cent. free of agricultural income-tax on 40,000 ordinary shares absorbing Rs. 1,00,000 (Rs. 30,000) leaving a balance of Rs. 41,924 (Rs. 34,633) which the directors recommend to be carried forward to next year.

Crop:—The crop realised for the year under review was 185 (129) tons of robusta and 1 ton of arabica as against the estimate of 147 tons robusta and 1 ton arabica.

The coffee crop estimate for the year 1959-60 is 147 tons of robusta and 1 ton arabica. The estimated cultivation cost per acre of coffee works out to Rs. 434.23.

Accounts in brief are as under:—

	Rs.	Assets	Rs.
LIABILITIES			
Capital	4,00,000	Gross block	3,50,496
Reserves	1,05,983	Less—Depreciation	35,174
Provision for taxation	1,36,449		
LIABILITIES	2,59,307	Net block	3,15,322
Profit and loss account (surplus)	41,924	Stock of coffee	3,26,456
		Stock of cardamom	3,694
		Stores, etc.	28,361
		Debts, deposits and advances	1,15,999
		Investments	1,00,000
		Cash	1,14,000
	Rs. 10,03,643		Rs. 10,03,643

N.B.—Figures within brackets relate to corresponding period of the previous year.

Notices

THE NATIONAL NEWSPRINT AND PAPER MILLS LIMITED

NEPANAGAR

NOTICE

IN CONTINUATION OF OUR NOTICE DATED 17th September, 1959 postponing the Annual General Meeting fixed for 28th September, 1959, Notice is hereby given that the Twelfth Annual General Meeting of the Shareholders of the National Newprint And Paper Mills Limited will now be held at Nepanagar on Wednesday the 6th January, 1960, at 3.30 p.m., to transact the following business:—

- To receive and adopt the Directors' Report, the Audited Profit and Loss Account for the period from 1st April, 1958 to 31st March, 1959 and the Balance Sheet as on 31st March, 1959, together with the comments of the Comptroller and Auditor General of India, with the observations of the Board of Directors thereon.

- To consider and, if deemed fit, to pass the following Resolution:—

"RESOLVED that the strength of Board of Directors inclusive of Managing Director and the Chairman be increased from 9 to 12 Directors."

- To consider and, if deemed fit, to pass the following Resolution with or without modifications:—

Special Notice of the intention to move the following Resolution has been given by a shareholder of the Company.

To be moved as an Ordinary Resolution:

"RESOLVED that sanction be and is hereby accorded to Sir A. Ramaswami Mudaliar to be re-elected as and continue to be the Director of the Board of Directors, notwithstanding that he has passed the age of 65, and the age limit prescribed under Section 280 of the Companies Act shall not apply to him."

- To elect a Director in place of Sir A. Ramaswami Mudaliar who retires under Article 140 of the Articles of Association and who is eligible for re-election.

- To elect a Director in place of Major Raja Bahadur Birendra Bahadur Singh who retires under Article 132 of the Articles of Association and is eligible for re-election.

- To elect a Director in place of Shri G. K. Moghe who retires under Article 132 of the Articles of Association and is eligible for re-election.

- To elect a Director in place of Shri Ashfaq Hussain who retires under Article 132 of the Articles of Association and is eligible for re-election.

- To elect a Director in place of Shri S. P. Mushran who retires under Article 132 of the Articles of Association and is eligible for re-election.

- To transact such other business as may be placed before the meeting by the Managing Director with the permission of the Chair.

By Order of the Board of Directors,

S. L. VISVANADHAN,

Managing Director.

Nepanagar, 3rd December, 1959.

The Share Transfer books of the Company will remain closed from 23rd December 1959 to 6th January 1960 (both days inclusive).

Shareholders desirous of having at the Annual General Meeting any information concerning the Accounts of the Company are requested to send a written requisition to the Managing Director so as to reach him seven (7) days before the meeting.

A member entitled to attend and vote at the meeting is entitled to appoint a proxy to

attend and vote instead of himself and a proxy need not be a member.

EXPLANATORY STATEMENT

Of Items 2 and 3 as required by Section 173 of the Companies Act 1956.

(1) Item No. 2.—The present strength of the Board of Directors as approved at the last Annual General Meeting is 9 including Chairman, Managing Director, 3 nominees of Union Government, 3 nominees of Government of Madhya Pradesh and 1 Director representing the shareholders. At the last Annual General Meeting it was expressed by the shareholders that the shareholders should have more representation on the Board. One more Director has therefore been co-opted to represent the shareholders. In addition, both the Union Government and the Madhya Pradesh Government have nominated one more Director each. This will therefore increase the strength of Board of Directors from 9 to 12.

(2) Item No. 3.—Sir A. Ramaswami Mudaliar retires under Article 140 of the Articles of Association and offers himself for re-election. Since his date of birth is 14th October 1887, the provision of Section 280 of the Companies Act is applicable in his case. It is therefore necessary to have the approval of the Annual General Meeting under Section 281 for his re-election and for his continuing to hold office as Director of the Company. Special Notice of the intention to move a Resolution to that effect has been given by a shareholder and accordingly the Resolution is submitted to the Meeting.

N.B.—Since the National Newprint and Paper Mills Limited is a Government Company within the meaning of Section 617 of the Companies Act, 1956, the Auditors of the Company will be appointed by the Central Government on the advice of the Comptroller and Auditor General of India under Section 619(2) of the Companies Act 1956.

MACHINERY MANUFACTURERS CORPORATION LIMITED

NOTICE

THE THIRTEENTH ANNUAL GENERAL MEETING OF THE MEMBERS OF MACHINERY MANUFACTURERS CORPORATION LIMITED will be held on Thursday, 14th January, 1960, at 5.00 p.m., at the Registered Office of the Company, Gateway Building, Apollo Bunder, Fort, Bombay-1, to transact the following business:

- To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31st March, 1959.

- To appoint a Director in place of Mr. K. C. Mahindra who is a Director and associate of Mahindra & Mahindra Ltd., the Managing Agents and who retires by rotation and offers himself for re-appointment and to consider and if thought fit to pass, with or without modification, if any, as may be agreed upon at the meeting, the following Special Resolution of which special notice has been duly received by the Company and is hereby given:

"RESOLVED that the age limit specified in Section 280 of the Companies Act, 1956, shall not apply to Mr. K. C. Mahindra who is now 65 years of age and that Mr. K. C. Mahindra who is a Director and associate of Mahindra & Mahindra Ltd., the Managing Agents, be and is hereby appointed a Director of the Company whose period of office is liable to determination by retirement of directors by rotation."

- To appoint a Director in place of Mr. M. A. Chidambaram who retires by rotation and who, being eligible, offers himself for reappointment.

- To appoint Auditors for the current year and fix their remuneration.

By Order of the Board,

K. S. IYENGAR,

Secretary.

BOMBAY, 19th November, 1959.

(1) A MEMBER ENTITLED TO ATTEND AND VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY

TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

(ii) The Transfer Books of the Company will be closed from 28th December 1959 to 14th January 1960, both days inclusive.

Annexure to the Notice dated 19th November 1959.

EXPLANATORY STATEMENTS

Item No. 2 of the Notice:

Mr. K. C. Mahindra, Director and Chairman of the Company, attained the age of 65 on 15th March 1959. Mr. K. C. Mahindra, Mr. D. N. Bhattacharjee and Mr. A. K. Mitra were appointed Directors of the Company on the same day and it has been agreed among themselves that Mr. K. C. Mahindra should retire by rotation at this meeting.

Mr. K. C. Mahindra is also the Chairman, Director, member and associate of Mahindra & Mahindra Ltd., the Managing Agents of the Company. The proposed resolution seeks to have Mr. K. C. Mahindra reappointed as a Director of the Company and the necessary declaration of the members is also sought that the age limit specified in Section 280 of the Companies Act, 1956 shall not apply to him. Your Directors are of opinion that it is in the interest of the Company that the Board should continue to receive the benefit of Mr. K. C. Mahindra's long experience and able guidance.

Mr. K. C. Mahindra, Mr. Jal H. Mehta and Mr. A. K. Mitra are interested in this item of business as Directors and members of Mahindra & Mahindra Ltd. The Managing Agents, Mahindra & Mahindra Ltd., are also interested therein as members of the Company.

To the shareholders of the Company and in particular to:

Mrs. Maryam Akhund, Bai Bachubai Sorabji Anklesaria, Messrs. British Cotton Growers Association Ltd., Mrs. Tehmina Hormasji Dalal, Mr. C. De Souza, Mr. Nadarshaw M. Dinshaw, Mr. R. C. Fernandes, Mr. Sorabji Hormusji Shahookar, Dr. (Miss) Shaikh Amna, Mr. Zaka Rahmatulla, Mr. Barkatullah Khan, Mr. Andrew Dollar Gillespie, Mr. Donald Gladding, Major Alastair Cameron, Mr. Mirza Ahmed Isphani, Sir William Roberts, Major General Shura Shum Shere Jung Bahadur Rana, Mr. Nootan Deb Pant, Mr. Mahendra Prasad, Sardar Soma Prasad Upadhyaya, Senior Comdg. General Baber Shum Shere, Mr. Pitamber Prasad Pantha, Messrs. John Inglis Company Limited, Rokla Sultan, Sogra Sultan, Khatija Begum, Robaba Khanum, Mr. John Lees, Mr. G. B. Gilby, Mono Shum Shere Jung Bahadur Rana, Major General Nara Shum Shere Jung Bahadur Rana, Rani Jagdamba Kumari Debi, Padma Narsingha Rana, Mohamed Khalil Serage, Bahadur Shum Shere Jung, Maj. General Krishna Shum Shere Jung Bahadur Rana, H. H. Maharani Gamvir Kumari, Bibudhendra Prasad, Mr. Keshava Ram Bhandary, Mr. Din Mohammed Malik, Mercantile Bank (Agency) Private Ltd., Mr. Piyusha Raj Sharma, Mr. Shivendra Prasad, Mr. Ramchand Khushiram Advani, Rani Beda Bhakta Laxmi Devi, Commanding General Ugni Shum Shere Jung Bahadur Rana, Mr. Toya Prakash Shum Shere Jung Bahadur Rana, Mr. Shambhu Shum Shere Jung Bahadur Rana, Mr. Surya Prakash Shum Shere Jung Bahadur Rana, Mr. Tej Prakash Shum Shere Jung Bahadur Rana and Mr. Karna Prakash Shum Shere Jung Bahadur Rana.

DECCAN SUGAR AND ABKHARI COMPANY LTD.

(Concluded from page 1023)

this was reduced to a figure which still accentuated the disparity. If it is politically undesirable to tax gur and khandasari, what the industry needs is a reduction in the Central excise duty sufficient to restore the relative positions prevailing prior to the 1957 Finance Act.

Sugar in Madras

"In May last, the position in Madras reached a stage where the ordinary channels of trade could no longer function. Your Board is firmly convinced that the long-term interests of the sugar industry, in general, and of this Company, in particular, are better served by avoiding the extension of control than by grasping the temporary and illusory profits that could have been made these last few months, had we sold at the highest prices obtainable. In the event, in common with other members of the South Indian Sugar Mills Association, we imposed a voluntary control on ex-factory prices at levels agreed with the Sugar Directorate and opened fair-price shops, no less than 6,000 in the Madras State, throughout the Southern Zone.

"Thus, the price of sugar was kept in reasonable bounds until early October when, with Deepavali looming ahead, the demand reached a stage where Government intervention could alone cope with the situation.

"Since October retailers have been given their quotas by District Collectors acting under the supervision of the Commissioner of Civil Supplies throughout the Madras State and, knowing something of their difficulties, I would like to say that these officials have done very well. This can only be a short-term measure. I hope that, in the near future, the distribution of sugar can be returned to the traditional and well-tried channels of factory to wholesaler, wholesaler to retailer and thence to the public.

"I referred a little while ago to our expansion plans for Samalkot and Pugalur against the background of larger production and lower costs.

"So far as Madras State is concerned, production in the existing five factories in a normal year is about 75,000 tons. The three new co-operatives under construction are together likely to contribute in the course of the next two or three years about 30,000 tons per annum. The consumption hitherto has been of the order of 120,000 tons. Granting that this will rise to 150,000 tons by the end of the third Plan, the deficit will be some 45,000 tons. Before aiming at self-sufficiency I submit that the authorities should consider the pattern of development that has evolved in the course of the last few years in the Southern region as a whole.

Andhra Pradesh

"It so happens that more factories came into being in that part of Andhra which, before separation formed part of the Madras Province, than in the Southern districts. When Telengana was added to the new State to form Andhra Pradesh, the State as a whole became surplus in sugar with an average annual production of 130,000 tons and a consumption between 80,000 and 85,000 tons. In the subsequent drive for increased sugar production and eagerness for co-operative factories some new units also were sanctioned. When these materialise, production in Andhra Pradesh will rise to about 170,000 tons. Assuming that in common with other Southern States consumption rises by 25 per cent.—though Andhra has the lowest per capita consumption among them—there will still be a surplus of 60,000 tons which should normally find its way into Madras and to a lesser extent Kerala.

"Kerala is presently deficit by 40,000 tons and this may grow to 50,000 tons when consumption increases. The State which has now only one sugar factory producing 10,000 tons is reported to have plans for two co-operative factories together capable of producing 20,000 tons.

"Mysore is more or less self-sufficient with possibly a small surplus easily absorbed by Kerala.

"Thus, the net deficit in the Southern region will be about 15,000 tons. This could be more than met by expansion of the existing units in the deficit Madras State at a cost—both in terms of rupees and foreign exchange—much lower than that of new and independent units. If, on the other hand, new factories have to be set up, not for economic reasons but to placate local interests, I appeal to the authorities to ensure that the locations are at such distances as will prevent the new units from encroaching on

the cane areas developed by existing factories at considerable expense and trouble. An irrational distribution of new units can neither be in the interests of the growers nor the industry.

New Sugar Policy

"The new sugar policy increases the price of cane by Rs. 5 per ton and offers an inducement to factories to make more sugar by offering a rebate of 50 per cent. of the excise duty on any sugar made in excess of the average production of the last two seasons. What the Government has now done is certainly a step in the right direction, and if it is continued, may produce marginal results. The concession of half the duty which can, at best, be earned on a small percentage of the crop, represents in effect a halting and hesitant reversion to the pre-1957 conditions. A little more courage and the position can be retrieved. Without in any way begrudging the cane growers their extra Rs. 5, I am still disappointed that this has been introduced as a flat rate and without giving any thought to the possibility of retaining a comparatively low minimum price and arriving at a system whereby factories pay a bonus for good cane, that is, cane that contains a high percentage of sucrose. Obviously, the higher the minimum price, the less can be the inducement that can be offered for the growing of good cane. It is particularly disappointing that this should have happened at the beginning of the first season in which the Pugalur factory was to distribute any bonus due under the S.I.S.M.A. or Price Linking Formula on a quality basis.

"Generally speaking, our relations with labour have been cordial, but I must refer here to a disturbing factor which is not confined to our industry. I refer to the Code of Discipline which, the unions having agreed to abide by is violated in the form of lightning strikes and 'go-slow' methods. These tactics can be very detrimental when they are employed in public utility services. It is regrettable that a close analysis of these methods should reveal that they often arise from political manoeuvring or inter-union rivalry.

Outlook for Current Year

"There is reason to believe that we shall have another satisfactory year. At Samalkot, we expect to crush this year 110,000 tons. Jagery prices have declined from the pre-Deepavali levels, but are still sufficiently attractive to cause some diversion of cane from the factory. Indications, however, are that supplies are adequate to take care of requirements for jagery. In Pugalur, we expect a total crush of 189,000 tons in the financial year ending 31st May 1960. The 1959 special season ended on 5th November. Usually there is an interval of three to four weeks between the close of the special season and the beginning of the main season, but this year because of the necessity for making sugar available early, the two seasons were linked with only a few hours' interval. I am glad to say that the recovery has not been affected by this early start, and is indeed better than that recorded at the start of the 1958-59 main season. It may be necessary to close for ten days in February for boiler cleaning and a quick overhaul.

"Sales of carbonic acid gas from the Samalkot factory continue to be satisfactory, though there is keen competition in this line in coastal Andhra. We are equipped for production of spirit to the extent of utilising all the molasses that the factory can produce, but here again the total output of the distilleries in Andhra is more than the alcohol-based industries in the State are able to absorb.

"I would like to take this opportunity to thank the staff and labour for their loyal co-operation during the year."

The report and accounts for the year ended 31st May 1959 were adopted and a final dividend at the rate of 18½ per cent. gross for the year ended 31st May 1959 (making a total of 25½ per cent. gross for the year, equivalent to 18 per cent. after deduction of income-tax at the rate applicable to resident individuals) was declared on the ordinary share capital of the Company, the dividend being payable on 19th December 1959. The dividends already paid on the preference share capital of the Company for the year ended 31st May 1959 were confirmed.

The retiring Directors, Mr. C. R. Srinivasan and Mr. V. Ramakrishna, were re-elected and the retiring auditors, Messrs. Lovejoy and Lewes, were re-appointed on the same remuneration as for the previous year.

N.B.—This does not purport to be a report of the proceedings of the General Meeting.

MUKAND IRON AND STEEL WORKS LTD.

CHAIRMAN, MR. KAMALNAYAN BAJAJ'S SPEECH

ADDRESSING the shareholders of the Mukand Iron and Steel Works Ltd. at their Twenty-first Annual Meeting held in Bombay on 10th December 1959, Mr. Kamalnayan Bajaj, Chairman of the Company, observed that the Company's efforts towards diversification of steel castings had met with success. He also disclosed that the Government had approved of the scheme to expand the Company's steel-making capacity by 30,000 tons per annum at a cost of Rs. 1.20 crores.

The following is the full text of Mr. Kamalnayan Bajaj's speech:

"LADIES AND GENTLEMEN: "I have great pleasure in welcoming you all to this twenty-first annual general meeting of the Company. The Directors' report and the accounts for the year ended 31st March 1959 have been in your hands for some time. With your permission I shall take them as read.

"The Indian economy, during the last year, has revealed a certain amount of sustained progress, but this has been offset to some extent by basic inflationary factors. The severe curtailment of imports and a large inflow of external assistance made it possible to hold on to the existing level of foreign exchange reserves. The cut in imports which was expected to reduce the adverse balance of payments had the effect of curtailing production due to the shortage of imported raw materials, which in turn affected the growth of the national income. However, there is a slight improvement in recent months.

"The target of Rs. 10,000 crores for the third Plan, while ambitious, is within our reach. It is reassuring to find that more realistic targets of production, especially of steel, are being considered. The imbalance in the economy developed in the early years of the Second Plan must be borne in mind. We should be conscious that these investments should be made in such a manner and programmes which would yield optimum returns, consistent with the defence, economic and social needs of the country and should ensure that these returns will be sustained and continuous.

"It should be possible for us to mobilise enough of our internal resources and supplement it with adequate foreign aid for the implementation of the third Plan. The immediate anxiety is with regard to the repayment of accumulated foreign loans, for the country's economy has not so far produced a favourable balance of payments surplus.

"Foreign loans can only go to a certain extent towards alleviating the needs of a developing economy. What India requires is more and more foreign capital on easier terms participating in selective enterprises as an alternative and also as a complement to borrowings. Secondly, technical collaboration on royalty basis should also go a long way in helping to develop our industries. At present, the rates of tax on non-resident companies and investors continue to be high. Royalties are taxed heavily, hampering many schemes of technical collaboration from materialising. Favourable conditions will have to be created for the inflow of foreign private investments and technical know-how, since we have to offer incentives in competition with other capital-hungry countries.

"It is encouraging that draft agreements for the avoidance of double taxation between India and other countries like the U.S.A., West Germany and Japan have been recently concluded, which are expected to be ratified in due course. This should serve to remove some of the inhibitions of foreign investors and stimulate especially the import of U.S. capital to India.

"Our efforts for the diversification of steel castings have met with considerable success. We have entered into agreements with the National Malleable and Steel Castings Company, Ohio, U.S.A., and the English Steel Castings Corporation Ltd., Sheffield, U.K., for the manufacture of automatic centre buffer couplers for the railways. These couplers are required for the larger type of wagons which the railways propose to introduce to cope with the huge transport potential. We have secured substantial orders for these automatic couplers which, like roller bearing axle boxes, are being manufactured for the first time in India.

STRINGENCY IN MONEY GROWS

(From Our Own Correspondent)

BOMBAY, 16th December

There has been a broadening of demand for bank credit this week and conditions in the short-term money market have turned a little more stringent than a week ago. The floating funds have shrunk appreciably. Banks are said to be finding it difficult to get their immediate requirements from the market. Consequently, there has been a hardening of interest rates in the inter-bank call money section, from 3 per cent. to 3½ per cent. among the Exchange banks and big Indian banks and from 3½ per cent. to 4 per cent. among the smaller banks. The rates for one week deposits and other short-term deposits are unchanged at the levels mentioned in this column last week. The bank's preoccupation with financing seasonal requirements of trade and industry is reflected in the results of Treasury Bill tenders this week. The total amount offered at Rs. 2 crores was the same as that invited, thus indicating once again that the subscriptions to these bills must have come mainly from special quarters. In the absence of competition, the average rate of discount remained unchanged at 2.370 per cent. per annum. Tenders for next week are again unchanged at Rs. 2 crores. Sales of Intermediate Bills between 9th and 12th December amounted to Rs. 18 lakhs at a discount of 2.296 per cent., as against Rs. 5 lakhs in the previous week at 2.276 per cent. Sales of these bills will be held this week at Rs. 99.426 per cent., which means a discount of 2.296 per cent. per annum.

A further expansion of Rs. 21.11 crores in the circulation was disclosed by the Reserve Bank of India statement for the week ended 11th December 1959, bringing the aggregate increase in the last two weeks to Rs. 52.16 crores. Notes held in the Banking Department are lower by Rs. 6.04 crores and the consequent rise of Rs. 14.26 crores in the total note issue is covered by an increase of Rs. 15 crores in rupee securities and a small decline of Rs. 73 lakhs in rupee coin. Foreign securities are unchanged, but balances held abroad show a rise of Rs. 97 lakhs, lifting the total foreign assets by that amount to Rs. 205.19 crores. Central Government's deposits have gone up by Rs. 7.17 crores, while those of other Governments and banks have dropped by Rs. 5.32 crores and advances to Governments have gone up by Rs. 4.35 crores. There has been a fall of Rs. 15.59 crores in investments, but holdings of Treasury Bills are higher by Rs. 10.27 crores.

The Scheduled banks' statement for the week ended 4th December 1959 shows a fall of Rs. 9.21 crores in demand deposits, but this has been partially made good by the rise of Rs. 3.43 crores in time deposits. Inter-bank borrowings have dropped by Rs. 4.93 crores and borrowings from the Reserve Bank by Rs. 5.17 crores, while those from the State Bank of India are up by Rs. 3.11 crores. A sharp rise of Rs. 11.89 crores is noted in advances and bills. Investments have gone down by Rs. 1.26 crore, cash balances by Rs. 1.18 crore, and balances with other banks by Rs. 2.16 crores and money at call by Rs. 5.01 crores.

The gilt-edged market is dull, thanks to the growing stringency in the short-term money market, though the pressure of demand for credit has not so far had any adverse effect on securities. The undertone is fairly steady, on account of scattered enquiries for short-dated loans which are at a considerable discount, 3 per cent. 1986 Conversion Loan is weak with a further drop of 20 NP to Rs. 73.40 2½ per cent. 1962 has, however, hardened by 10 NP to Rs. 98. 3½ per cent. 1962 by 5 NP to Rs. 99.85 and 3½ per cent. 1964 by a similar extent to Rs. 100.25. 3 per cent. 1964 is placed at Rs. 98.15 ex-voucher, as against Rs. 98.25 cum-voucher a week ago. Proximity of the year-end has attracted some attention to 3½ per cent. 1969 and 4 per cent. 1979, which have gone up by 5 NP each to Rs. 99.45 and Rs. 100.15, respectively. State loans were listless with little variations in prices.

The rupee displayed some weakness in terms of the dollar earlier in the week, but soon regained its ground, in sympathy with sterling. After a rise from Rs. 478 to Rs. 478.25 banks' selling rate for U.S. T.T. (ready) moved back to Rs. 478 per \$100. Their buying rate is unchanged over the week at Rs. 474.75 per \$100, after moving up to Rs. 475. In New York, spot sterling receded from 279.97-280.00 cents to 279.86-279.89 cents before regaining to 280.05-280.09 cents on Monday. Yesterday, however, there was again a slight setback to 279.96-279.99 cents. Three months' forward suffered a loss over the week from 280.31-280.54 cents to 280.32-280.35 cents the premium over the spot having narrowed down from 0.54 cents to 0.36 cents.

KIPS IMPROVE

(From Our Own Correspondent)

MADRAS, 14th December

There were more inquiries for kips from the U.K. and sellers were able to obtain one penny increase, on light weights, medium run and fourths and inferior fifths 5½ lbs. It looked as though the bottom had been reached and prices were likely to look up, if sellers were not weak and nervous. There was good demand for cow calf, but stocks were small. Buffalo hides and calves were a shade firm. Demand for inland trade for lower grade kips was good and prices registered an increase of 5 per cent. over U.K. buyers' ideas.

In the tanned skins section, tanned goat 1½ lbs. ruled firmer, as also middle class sheep lower ends. Other lines remained steady.

In the last tanned skins London auctions which took place on the 30th ultimo, light weight kips remained unchanged to 6d. advance, while sheep skins were unchanged to 6d. down, while sheep skins, which were weak, met with limited inquiry.

BULLION RECOVERS

(From Our Own Correspondent)

BOMBAY, 16th December

The bullion market continued to rule easy during the major part of the week under review. The easiness was due to reports that a large number of silver coins (equivalent to about 400 bars) had arrived in Calcutta from Bhutan and that sizable quantity (estimated at 25,000 tolas) of unauthorised gold stocks had arrived in Bombay City. Further, some Calcutta interests were said to have sold forward about 25,000 tolas of gold on fears of large arrivals from Nepal. Consequently, prices tended to move down. Today, however, the market picked up considerable strength, thanks to the support lent by the spot houses. Not only were the previous losses fully made good but the closing rates were actually higher than those at the end of last week.

At its meeting held on Friday, the Board of the Bullion Association decided to permit business in February settlement in both silver and gold with effect from Saturday the 12th inst. It also warned the members against entering into transactions in March position before permission for that *vide* was granted by the Board.

In silver, December settlement encountered selling and receded from Rs. 209-8 on Friday to Rs. 206-11 on the following day. After recovering to Rs. 208-2 on Monday, it declined again to Rs. 207-2, but moved up to Rs. 208-4 today at which rate it went off the board. January settlement fluctuated between Rs. 210-11 and Rs. 207-14 before finishing today at Rs. 209-11. The rate for transferring commitments in silver from December to January settlement continued to be against bulls throughout the week, so that the bears had to pay a margin of Rs. 1,000 per bar on their outstanding positions. The carryforward charge today was higher at Re. 1-7, as against Re. 1-4 on Wednesday last. No transactions were put through in February settlement on Saturday, Monday and yesterday. Today, it opened at Rs. 210-9 and, after gaining As. 3, reverted to the opening level.

Ready silver began the week at Rs. 208-1, as against the previous day's closing of Rs. 207-10, and firmed up to Rs. 209-4 on Friday. Thereafter, it declined and touched Rs. 206-7 on Saturday. After recovering to Rs. 208-6 today, it finished As. 2 lower. The daily average arrivals of silver were 11 bars, while offtake was 13 bars. The floating stocks of silver are estimated at 1,500 bars.

In the gold section, December settlement ran off at Rs. 123-7 yesterday, as against Rs. 123-14 on Wednesday last week. January settlement, which had risen from Rs. 124-9 to Rs. 125-1-6 on Friday, eased to touch Rs. 123-8 on the 12th inst. After recovering to Rs. 124-9-6 subsequently, it retreated to Rs. 123-12-6, but rose again to Rs. 124-11 today. The carryforward rate for December settlement was against bulls to the extent of As. 11 till Tuesday when it widened to Rs. 14. The bears had to pay margin at the rate of Rs. 10 per tola on all the days. No business has so far been done in the February settlement.

Ready gold was somewhat well supported in the first two sessions and the quotation improved from Rs. 123-14 to Rs. 124-6-6. After declining to Rs. 122-15 on Saturday, it recovered to Rs. 123-14-6 on Monday, it declined again to Rs. 123-8-6 today, but finished higher at Rs. 124-3. The average daily arrivals and offtake of gold were 3,200 kias and 3,000 tolas, respectively. The floating stocks of gold are reported to be around 36,000 tolas.

Silver in the London bullion market ruled quiet during the week under review, with no change in spot and forward quotations; the former stood at 80½d. and the latter at 80d. Silver in New York was unaltered at 91.375 cents this week. Following the recovery in pound sterling vis-à-vis dollar, ready gold in London eased from 250s. 7d. to 250s. 3½d. The latest available world price for gold is \$35.044-\$35.061 per ounce, as against \$35.04-\$35.06 last week.

The following comparative table shows at a glance the trend of the market during the week under review:

	16-12-59	Highest	Lowest	9-12-59
Ready Gold (per fine Mint)	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Forward	124 11	124 6	122 15	123 14
Sovereign	81 0	81 0	80 12	81 0
Ready Silver (per fine Mint)	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Forward	209 11	209 4	206 7	207 10
16-12-59	210 11	210 11	207 14	209 4
London Silver Ready	80 ½	—	—	81-50
London Forward	80 ½	—	—	80 ½
London Gold	250s. 3½d.	250s. 5½d.	250s. 3½d.	250s. 7d.
New York Silver	91.375c.	—	—	91.375c.

* 15th January settlement. † 15th January settlement.

LINSEED STEADY

(Messrs. A. Bradley and Co.)

CALCUTTA, 14th December

Steady conditions prevailed in the linseed market throughout. Arrival of seeds from up-country was very poor and turnover was small. The oil-market was stagnant, with very little business done during the week, but prices remained steady. The oilcake market was steady, some shippers were buying for ready deliveries to cover up previous sales, as the London markets were slightly better.

The latest quotations per maund are:—Ready-December Rs. 24.75, January Rs. 25, and May futures Rs. 25.94 per maund.

COTTON FUTURES DULL

(From Our Own Correspondent)

BOMBAY, 16th December

Limited turnover and narrow price movements characterised trading in the cotton futures market during the week under review. The series of measures taken by the Forward Markets Commission and the Textile Commissioner to curb the rising trend in cotton prices and the fear that further measures, possibly distribution control, would be introduced, made operators cautious. Prices, however, were firmly steady, with the Jarilla March contract fluctuating between Rs. 750 and Rs. 760. The declining trend in cloth stocks and rising mill consumption in the wake of a sharp reduction in crop estimate—the latest estimate varies from 4.3 to 4.5 million bales—indicated that the outlook for raw cotton was bullish. With the prospects of importing one million bales of cotton, as was recommended by the Indian Cotton Mills Federation, still remaining uncertain, the market preferred to be guided by the bullish pointers. Traders were eagerly awaiting the outcome of the meeting of the Cotton Advisory Board, scheduled to meet tomorrow, to assess the impact of the steps already taken and further measures necessary to check the rise in prices.

I.C.C. Moglai Jarilla March 1960 contract opened the week at Rs. 755.50 and after fluctuating between Rs. 758 and Rs. 750 closed at Rs. 757 yesterday. Commencing at Rs. 756 today the contract improved fractionally to Rs. 756.50 before closing lower at Rs. 753.50. The net loss over the week was Rs. 3.75.

In the spot section, following the uncertainty regarding the possible steps that will be taken by the Government in controlling the trend of prices, mills were hesitant to enter into large commitments. Consequently, prices of ready cotton and delivery contracts tended to ease. Upcountry advances also indicated a tendency for prices to look down. Mill demand for such varieties as CO2, Rajapalan and Laxmi was well maintained. Business, however, was reported in 197/3, Berar, Khandesh and other popular new crop varieties. The news that certain By-laws of the East India Cotton Association have been amended with a view to empowering the Forward Markets Commission to impose and vary margin on delivery contracts, besides hedge contracts, acted as a restraining influence.

Export business was moderate. Demand was reported in Bengal Deshi from Japan, but the volume of business done was not much. Export sales registered against the recent quota of 75,000 bales of Bengal Deshi up to the 12th inst. aggregated 16,599 bales. Among foreign cotton, U.S. growths, being the cheapest at present, evoked considerable interest. Californian GM 1-5/32" staple was done at prices ranging from Rs. 1,270 to Rs. 1,280. Mills also showed some interest in Pakistani cotton, following the announcement of the Government on the 10th inst., permitting import of 20,000 bales of Pakistani cotton of 1" staple and below for a value of Rs. 1 crore. This quantity, it has been notified, will be available for import by cloth exporting mills on a certain basis related to their entitlements for July-September 1959 quarter under the export incentive scheme. The trade notice outlining the basis of allotment and details of procedure in licensing of this cotton has yet to be issued.

The following are the latest available spot quotations—in rupees per candy of 784 lbs.—from Sewri:

Bengal Deshi 870; CO2 1,160; Laxmi 1,090; Kalyan 860; B.P. 52 1,475.

Cotton futures advanced further in the Karachi market during the week. Export demand was well maintained. Japan and Continental countries showed interest in Pakistan cotton. Local mill demand was fairly good. Paucity of offerings in the wake of keen demand pushed up prices. N.T.R.G. rose from Rs. 71-1 last week-end to Rs. 72-9. The March contract was quoted As. 13 higher at Rs. 71-7.

A mixed trend was witnessed on the Alexandria Cotton Exchange during the week. While the long-staple Karnak contracts eased, thanks to hedge pressure and speculative selling, the medium-staple Ashmouni contracts firmed up on keen buying following news that the Government had decided to suspend exports of Ashmouni grades up to Good plus 4 and Giza 30 and Giza 47 and Dendera grades Good and below. The export price discount during the week which began on last Monday remained unchanged at 20 per cent.

In its second estimate of the 1959-60 crop, the Egyptian Ministry of Agriculture has placed cotton production, less Scarso, at 9,881,000 kantars of ginned cotton (approximately 1,372,360 bales of 720 lbs.). The first official estimate in October had envisaged a crop of 9,819,000 kantars (about 1,363,750 bales). During the last season, production was 9,893,119 kantars (about 1,346,266 bales).

Dull conditions prevailed in the Liverpool cotton futures market during the week. Better activity in the yarn and piecegoods market tended to make trading active but rumours of a possible reduction in U.S. export subsidy had an unsettling effect. Operators were inclined to defer large-scale transactions. Trading was consequently thin and price movements narrow. Over the week, gains and losses were more or less evenly spread in both the American and American type contracts. Sudan contracts advanced further. The following are the latest available quotations—in pence per lb.—from Liverpool:

American cotton one inch staple contract: December-January 22.90; March-April 23.20; May 23.55; July 23.60.

American cotton mixed growth contract: December-January 23.65; March-April 23.70; May 23.70; July 23.65.

Sudan: January-February 32.50; May-June 32.00; July-August 32.00.

Cotton futures in the New York market ruled firm during the week under review. Mill and Commission House buying and trade support imparted strength to the market. Rumours of a possible change in subsidy acted as a restraining influence. The payment-in-kind export programme for the current season continues to make encouraging showing. Registrations under the programme upto the 4th inst. covered a quantity of 4,142,464 bales for shipment abroad.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

	(In cents per lb.)	15-12-59	8-12-59	1-12-59
Spot	...	33.20	32.85	32.85

ART SILK YARN ALLOCATION

(From Our Own Correspondent)

BOMBAY, 16th December

The important announcement of the week in so far as the yarn market is concerned is the allocation of indigenous art silk yarn to the powerloom weaving units for the quarter January-March 1960 announced by the Textile Commissioner. The allocation, it is said, will be made on the basis of the average number of looms worked during the quarter July-September 1959 at the rate of 250 lbs. per working authorised and reported powerloom. It has been made clear that the allocation will be made only to such units as have been submitting their monthly production returns regularly in the prescribed form to the Textile Commissioner. The weaving units are required to apply for their necessary endorsement on the allocation card already issued in the preceding quarter or for the issue of fresh allocation card in respect of applicants who have not obtained any allocation card. The members of the associations are required to apply through their respective associations.

The above announcement did not have any effect on the market. Art silk yarn continued to rule distinctly quiet, as the operators preferred to await the emergence of a clearer picture regarding offtake from consuming centres. Staple fibre yarns tended to look up on hopes of enlarged demand from powerlooms. Cotton yarns were dull in the absence of any encouraging development.

Cupressa Bamberg yarn (80 x 2) December contract encountered selling and dropped Rs. 7 to Rs. 1,651, while February contract was somewhat favoured, the quotation rising from Rs. 1,700 to Rs. 1,704. Spot Cupressa eased by 3 nP to Rs. 1,472. Japan was dull at Rs. 5.50, but 150 Japan gathered 3 nP to Rs. 5.68. 120 Italy and 150 Italy were unchanged at Rs. 5.31 and Rs. 4.97, respectively. Indigenous yarns came in for selling. National Rayons 150 bright cones first grade declining by 16 nP to Rs. 4.18 and 120 bright cones first grade by 10 nP to Rs. 4.81.

Staple fibre yarns (40 x 2) December contract firmed up from Rs. 694 to Rs. 706. February contract advanced by Rs. 7 to Rs. 698. Spot Kohinoors put on 2 nP to Rs. 3.71. Centurys were fully maintained at Rs. 3.69. Among imported yarns (80 x 2), Paramounts hardened by 5 nP to Rs. 9.25.

In the cotton yarn section, ten counts Podars were quiet at Rs. 15.50, as also twenty counts Hinds at Rs. 19.50 and Moderns at Rs. 20. Forty counts Minaxis rose by 6 nP to Rs. 27.50. Moderns, however, receded from Rs. 27.37 to Rs. 27.31. Sixty counts attracted some support, Raghu-vamshis advancing by 50 nP to Rs. 57 and Finlays by 25 nP to Rs. 61. Eighty counts Mahendras picked up 75 nP to Rs. 73.75. Moderns were dull at Rs. 79 and Finlays at Rs. 81.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today as compared with those a week before:

	18-12-59	9-12-59
Art silk yarn—		
60/1 Cupressa Bamberg December (100 Ks.)	1,651	1,658
60/1 Cupressa Bamberg spot (per lb.)	1,704	1,700
120 Japan (per lb.)	5.50	5.50
120 Italy (per lb.)	5.31	5.31
150 Italy (per lb.)	4.97	4.97
Staple fibre yarn—		
40 x 2 December (per case of 200 lbs.)	706	694
40 x 2 February	698	691
40 x 2 Kohinoor (per lb.)	3.71	3.71
40 x 2 City	3.68	3.69
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	15.50	15.50
20s Modern	20.00	20.00
40s Minaxi	27.50	27.44
50s Finlay	61.00	60.75
80s Mahendra	73.75	73.00

SEEDS FIRM

(From Our Own Correspondent)

BOMBAY, 16th December

Barring linseed, which remained subdued in the absence of fresh support, the oilseeds market presented distinctly firm conditions during the week under review. Groundnuts, castor seeds and cottonseeds touched new peaks of the season. Consistent support, both by shippers and crushers, led to the rally in values. In the case of the week, however, the market turned slightly easy, owing particularly to larger arrivals and some profit-taking. In order to curb the rapid rise in prices in the groundnut section, the Reserve Bank of India has issued a fresh directive to all scheduled banks prescribing a new limit of advances against groundnut and other oilseeds. The directive says: Every scheduled bank (1) shall maintain in respect of each credit limit against the

security of groundnuts whether granted before or after the date of receipt of this directive, a margin of not less than 45 per cent. of the value of the relative stocks; (2) shall increase in respect of each credit limit against the security of other oilseeds granted before the date of receipt of this directive, the existing margin stipulated or kept to not less than 40 per cent. of the value of the relative stocks; (3) shall maintain in respect of each credit limit against the security of other oilseeds whether granted before or after the date of receipt of this directive, a margin of not less than 40 per cent. of the value of the relative stocks. This measure did not have any appreciable effect on the market.

The groundnut section witnessed cheerful conditions. In the beginning of the week, arrivals were rather limited and local crushers and vana-pati manufacturers extended good support which pushed up the values in this section. The spot section continued to be distinctly steady until almost the close of the week. Shippers made substantial purchases of groundnut oil and cake in order to meet their export commitments for December shipments. In these conditions, groundnut February 1960 contract, which had wound up last week-end at Rs. 189.87, gradually rose to Rs. 191.75 yesterday. It, however, closed a shade easy at Rs. 190.50. Nizam Bold gained 50 nP to Rs. 38.50 over the week, after fluctuating between Rs. 37.62 and Rs. 38.37. Groundnut oil ex-mill which had closed at Rs. 20.75 last week-end hardened by Rs. 20.87 yesterday. It closed lower today at Rs. 20.62.

Similarly, firm conditions prevailed in the castorseed section as well, thanks mainly to hectic short-covering by shippers induced by speculative support. Traders, however, seem to be rather optimistic about the export prospects for castor oil to the U.S. Castorseed May 1960 contract, which had finished at Rs. 172.12 last week-end, subsequently rose to touch Rs. 174.12 yesterday; but today it suffered some setback to close at Rs. 172.50. Bold ready was higher by 12 nP at Rs. 33.12. Oil B.S.S. picked up 13 nP to close at Rs. 19 yesterday, but lost some ground today to wind up the week at Rs. 18.

The linseed section was quiet, partly because of lack of fresh enquiries for linseed oil and partly on account of reports regarding the release of linseed oil from the U.S. stockpiles. The sustained disparity in Indian prices, as compared with foreign prices for linseed oil, continued to dampen the enthusiasm of traders. Linseed May 1960 contract lost 50 nP over the week to Rs. 34.50, after fluctuating between Rs. 34.89 and Rs. 34.87. Bold ready closed at Rs. 34.25, as against Rs. 34.50 last week-end. Similarly, linseed oil also shed 25 nP to close today at Rs. 16.75.

In sympathy with groundnut and castorseed, cottonseed staged a smart rally. Upcountry operators figured as prominent buyers. Cottonseed February 1960 contract closed today at Rs. 147, as compared with Rs. 144.50 last week-end.

The following table shows the closing prices of oilseeds and oils today, as compared with those of the two previous weeks:

	16-12-1959	9-12-1959	2-12-1959
Groundnut			
February 1960	190.50	189.87	189.87
Kandi bold	38.50	38.75	38.75
Command Ready	38.75	38.62	38.75
Kinnow quality	20.80	20.75	20.87
Oil ex-mill ready*	20.62	20.75	20.75
Railway receipts*	20.37	20.50	19.69
Castorseed			
May 1960	172.50	172.12	171.12
Ready Madras	33.12	33.00	32.37
Ready Kanpur	31.69	31.50	30.87
Oil B.S.S.†	18.00	18.37	18.50
Oil commercial†	18.00	17.37	17.50
Linseed			
May 1960	34.50	35.00	34.62
Bold ready	34.25	34.50	34.12
Oil ready†	16.75	17.00	16.87
Cotton seed			
February 1960	147.00	144.50	138.25
Nizam seed	31.25	31.00	31.25
Kandi seed	22.50	23.00	22.50

* Rates include excise duty but exclude sales tax.
† Rates exclude both excise duty and sales tax.
N.B.—All quotations for futures contracts are in terms of candy, except linseed, which is in cwt. A candy is 60 lbs., except in the case of cotton seed for which it is 70 lbs. Spot quotations of seeds are for per cwt. and those for oil per quart.

BLACK PEPPER STEADIER

(Messrs. Parekh and Co.)

BOMBAY, 16th December

Despite heavy arrivals, Malabar black pepper ruled steadier during the week, in the wake of sizable buying by New York which was said to have accepted almost all offers for December and Jan-Feb-March shipments at progressively high prices ranging from \$0.42 to \$0.46. Singapore from Str. \$236 to Str. \$250 for white under specific arrivals from Indonesia and Sarawak. Singapore is reported to be under the full control of Chinese June when the assessment of the outlook of the new crops of Sarawak, Lampong and Muntok can be had more clearly. New York spot, after going down to \$0.45, jumped up to \$0.50 under manipulation by speculators who were said to be holding a greater part of the spot stock in the port. They seem to have adopted the tactics of buying from India in rising market with a double motive of exiting Malabar and for maintaining the prices, however temporary. In the face of a larger new crop and in view of the proximity of the new

season, India is not likely to be misled by such tactics unless foreign countries are prepared to buy almost daily about 200 tons from now onwards, as the arrivals from the last week of December to the end of February are likely to average more than 250 tons daily. The months of January and February are considered to be the peak months of the season. Unless there are big inquiries during these months to relieve the pressure of arrivals, the market is not likely to maintain its present level which is said to have been overdone by the speculators from both New York and Singapore.

Calicut is quoted at Rs. 1,200, where arrivals have just started and are averaging about 100 candies daily. Garbled at Cochín and Alleppey is quoted at Rs. 200, and ungarbled at Rs. 1,150, with buyers holding off for lower prices.

Business in the forward ring at Cochín is reported to be poor, though it is officially opened since the 8th inst., as the terms of margin and the daily clearance are very stiff. The forward ring is established for affording hedge facilities to growers and to exporters. If the forward market is not run properly as it should, it is high time the F.M.C. should look somewhere else for establishing a forward ring for its smooth running. The bulls in the market are reported to be banking upon bulk buying by Russia sometime in January. It is, however, problematical whether Russia will buy in time to relieve the pressure of incoming arrivals, particularly in view of the recent change in their buying policy which is to buy only in a dropping market. Following the recent heavy arrivals, the analysts are now anticipating the final outcome of the new crop to reach a mark of 30,000 tons. As such, they do not expect higher prices unless export from India averages 1,500 tons per month, as inland consumption is likely to show decrease because of the higher prices.

Ready pepper in the local market is quoted at Rs. 150 per Bengal maund, with poor demand.

PLAIN TEAS WELL SUPPORTED

(Messrs. Forbes, Ewart and Figgis (Private) Ltd.)

COCHIN, 11th December

Approximately 15 lakhs pounds were on offer in sale No. 47, which was held on Tuesday, 8th December. Quality again showed a slight seasonal decline, particularly from the medium grown districts. The sale opened to a very strong general demand which was maintained throughout. In particular, plain and low medium teas were well supported and can be quoted irregularly dearer. Medium sorts met with a useful enquiry, but a slightly better demand for high grown teas, but buyers followed quality closely. Whole leaf grades teas were steady. The following are the quotations:—

	1959	1958
Low medium	2.05 to 2.15	1.35 to 1.50
Medium	2.15 to 2.25	1.50 to 1.70
Good medium	2.25 to 2.40	1.80 to 2.10
Quality	2.50 to 4.10	2.20 to 3.65

Dust Sale "KK"—Approximately 500,000 pounds were offered in dust sale "KK" held on 10th December 1959. A useful selection of dusts was on offer. There was a strong general demand, but prices were irregularly 5 to 10 nP easier for all descriptions, particularly the colour mediums. However, there was keen competition for high quality. A small selection of clean, black, grainy dusts which sold at dearer rates following descriptions sold well and was the strongest feature of the sale. C.T.C. dusts met with useful support at last week's rate.

London Market: Sale of 7th December 1959.—Firm on last week.

Sale of 8th December 1959.—Fully firm with dearer tendency up to 4s. 3d.

Sale of 9th December 1959.—About steady on Monday with Plain tea strongest feature.

Colombo Market: Sale of 9th December 1959.—Active demand. Dimbula brokers generally dearer. Uvas irregular. Brighter sorts dearer. Mediums opened barely steady closed dearer. Low grown and commons firm to dearer. All fannings easier.

Sale of 8th December 1959.—Off grade fannings broken mixed fully firm to slightly dearer. Better sorts dearer. Poorer sorts easier.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd., wire:—

"Sale 48.—150,000 lbs. Strong general demand, particularly for low and low medium, which are dearer. Medium and good medium fully firm. Best liquoring highgrown dearer with quality. Whole leaf very strong and dearer."

KEEN DEMAND FOR TEA FROM U. K.

(From Our Own Correspondent)

CALCUTTA, 15th December

A feature of the export auctions held yesterday was the unsatisfied demand shown by British buyers. This was not surprising in view of the low stocks in London. Shipments during the week indicated that bookings to the United Kingdom continued to be satisfactory. Interest on Russian account was on the decline, with Turkey and Egypt showing nominal interest only.

The North-east Indian production of tea up to the end of November comes to 545.1 million lbs., showing a rise of 1.9 million lbs. over that in the corresponding period of 1958. However, taken alone, the November output was lower by 2.5 million lbs. at 54.5 million lbs. compared to November of last year.

Conditions during yesterday's export sales were irregular, as demand was less general than

last week. Offerings amounted to 71,661 packages. While fanning grades recorded an irregular trend, plain and medium broken were firm to steady. Whole leaf grades, on increased support, added some gains, and tippy teas were fully firm. Darjeelings were quiet. Medium Assam B.O.P.s and O.P.s. were about easy. Best C.T.C.s gave way by 20 nP. Non-wither Doorgas were irregular. The quotations, exclusive of excise duty, were: best Assam C.T.C. fannings Rs. 2.55 to Rs. 2.75, clean black pekoe Rs. 2.18 to Rs. 2.24, best Assam C.T.C. B.P. Rs. 2.55 to Rs. 2.75, plain B.P. Rs. 2.04 to Rs. 2.12, medium fannings Rs. 2.16 to Rs. 2.24, plain fannings Rs. 2.10 to Rs. 2.18, and medium B.P. Rs. 2.02 to Rs. 2.12.

No business was done in export quota. Sellers were demanding 14 nP but buyers were willing to pay only 14 nP.

Dusts on offer during last week's sales amounting to 21,493 packages met with good general demand at easier rates. Darjeelings were fully steady on keener demand, and the flavour teas added 20 nP. In orthodox varieties, the poorer types gained, while others lost up to 4 nP. Leg-cut teas exhibited a similar trend. The quotations, exclusive of excise duty, were: best Assam C.T.C. Rs. 2.60 to Rs. 2.90, medium Assam C.T.C. Rs. 2.10 to Rs. 2.24, medium Doorgas Rs. 2.10 to Rs. 2.18, and medium Assam Rs. 2.06 to Rs. 2.12.

Leaf offerings amounting to 915 chests met with a good general demand.

At the internal sale held in Chittagong on 9th December, there was strong demand for the offerings of leaf amounting to 15,236 chests, and those of dusts 5,699 chests and supplement of 76 chests. In leaf, fannings hardened by As. 5 a lb. and other varieties by As. 3 to As. 4. Among green teas, offerings of which were only 280 chests, the polish grades added As. 5 to As. 6. Dusts also improved by As. 5 to As. 6 with plain Syihet being quoted at Rs. 3-7-6.

JUTE GOODS SOAR

(From Our Own Correspondent)

CALCUTTA, 15th December

Against the background of a sounder statistical position following the announcement of a decline in stocks of jute goods with mills surpassing earlier expectations, handsome gains were recorded in the prices of gunnies during the week under review. Genuine business passing was restricted, as buyers were not inclined to follow the higher levels. Speculative manipulations led to overactivity in futures trading, and as a result the margin deposits were again introduced and also increased during the week. Gunny during the week was clear that the Argentine had week, but it was clear that the Argentine had entered the market in a big way. Buoyancy prevailed in the fibre market, and very high levels were reached, although buying by mills was limited.

The rise in prices of goods was alarming and considered harmful in the long-term interests of the industry. There was the realisation on the part of the authorities of the East India Jute and Hessian Exchange Ltd. that speculation in futures had received the upper hand and that it was necessary to curb the manipulations by bulls. That this was so was indicated when on the 8th December the Exchange reimposed the margin deposit system should the price of gunny trading go beyond a certain level which was also fixed. The margin deposits were: Rs. 5 per 100 bags in B. twills if the price moved up beyond Rs. 105.50, Rs. 2.50 per 100 yards of hessian 40" 10 oz. for price above Rs. 41, and Rs. 2 a maund of raw jute for price above Rs. 29. This had a sobering effect, but as a protest against the action of the Exchange, the futures market remained closed on Wednesday following refusal by local operators to operate. Ready B. twills declined fractionally to Rs. 107 from Rs. 107.30, and hessian 40" 10 oz. to Rs. 41.45 from Rs. 41.80. On the following day, that is, Thursday, prices began rising again. There were wide fluctuations in prices following keen activity in futures. Ready B. twills surged to Rs. 108.75 and hessian 40" 10 oz. to Rs. 41.80. The E.I.J.H.E. took a serious view of the rapid rise in prices and the complete failure of the reintroduction of the margin deposit. Futures trading was suspended by the Exchange authorities on Friday to enable the exchange to reassess the changed situation. Meanwhile, ready B. twills advanced to Rs. 108.70 and hessian 40" 10 oz. to Rs. 41.70. On Saturday, the Exchange announced increased margins in order to arrest the up-trend. Accordingly, the margin on B. twills was raised from Rs. 5 to Rs. 6, that on hessian 40" 10 oz. from Rs. 2.50 to Rs. 3, and that of raw jute from Rs. 2 to Rs. 7, on outstanding purchases at prices above Rs. 105.50, Rs. 41 and Rs. 29, respectively. However, in spite of this the up-trend could not be arrested and over the week-end new high levels were touched for the week with ready B. twills at Rs. 109.50 and hessian 40" 10 oz. at Rs. 42.35. Mills remained closed yesterday following on-day strike by workers in order to push forward their demands. A Government of India tender for 30,000 bales of B. twills provided additional pep and zest to the rising trend yesterday. B. twills after opening at Rs. 109.50 rose as high as Rs. 110.90. Heavy selling pressure in futures intervened to arrest the up-trend and, in fact, a decline set in. At the close of the day the quotation dropped to Rs. 109.75. Ready hessian 40" 10 oz. closed lower at Rs. 42.10.

In raw jute, the bullish trend was so strong that new high levels were reached. However, the theory of scarcity was exploded when with the quantity on offer increased. Despite the imposition of heavy margin on futures trading, prices began moving up all the time and closing levels for the week were higher than those of the previous week. The market was in a state of confusion for December-January delivery, as the quotations of a week ago in brackets were not applicable in view of increased

import quota for Pakistani cuttings, forward delivery cuttings were shown much interest by mills. Daisse bottoms at Rs. 32 scored Rs. 4. Assam bottoms jumped to Rs. 31 from Rs. 27.50 and northern bottoms to Rs. 30.50 from Rs. 26.75. At Rs. 195, pucca bales 1st mark hardened by Rs. 10 per bale.

	Middles	Bottoms
WHITES:	Rs.	Rs.

ELECTROLYTIC ZINC FIRM

(From Our Own Correspondent)

CALCUTTA, 15th December

Thanks to acute shortage of floating stocks, electrolytic zinc in the metal market forged ahead from Rs. 136.50 to Rs. 154 per cwt. during the week under review. There was an attempt on the part of speculators to locate as much supplies as possible. Fresh arrivals were required immediately to ease the situation, and market circles felt that the trade should be allowed to import more. In London also, tightness in supplies was a feature, the price hardening from £94 early in the week to £96 per ton. A further widening in backwardation was reported.

A quiet trend was in evidence locally in other metals. This followed the Supreme Court judgment holding clause 4 of the Non-ferrous Metals Control Order as void. However, steadiness slowly set in when the Government took necessary executive action in order to get over the legal difficulty. Referring to the new procedure for the import of copper and zinc against export of semis, trade circles considered that the fixation for export of one ton semis against import of 1.05 ton of the virgin metal was inequitable. Considering the melting loss and processing scrap, a greater difference should have been permitted. There was no comment available with regard to the rule according to which import against export of brass semis would be 70 per cent. copper and 30 per cent. zinc.

During the week, some arrivals of virgin copper were reported. There was less demand for copper scrap. Clean wire scrap sagged from Rs. 234 to Rs. 83 per cwt. On the London Metal Exchange, the price opened at £255 1/4 per ton and, after rising to £258 1/4, closed at £256 1/4. The hardening tendency was attributed to the firmer trend in New York, where the price shot up from 31.03 cents to 34.50 cents per lb.

Tin here declined by Rs. 2 to Rs. 560 per cwt., following improvement in supply position and subsequent slackness in demand. In London, tin opened at £766 per ton and improved to £794 before closing at £790. Lead eased from Rs. 73.25 to Rs. 73 per cwt. In London, the price was unchanged at £71 1/2 per ton.

FOODGRAINS DEPRESSED

(From Our Own Correspondent)

HARUR, 14th December

The foodgrain market was depressed during the week, following slack demand locally and easy advices from other States where prices have fallen. The Deputy Minister for Food informed the Rajya Sabha that State trading in foodgrains with such modifications as circumstances warranted would be adopted for maintaining reasonable price levels and that the Government was thinking of some modifications in the zonal system.

Wheat at Harpur was almost unchanged during the week, average quality being quoted on Monday at Rs. 17.25 and for farm produce at Rs. 18.50. Arrivals of wheat in the open market were small on fears that 50 per cent. of arrivals would be taken over by the State Government at the controlled price of Rs. 13 to Rs. 15 a maund. In private, wheat was reaching here at an average of 100 maunds daily, to be lifted by consumers at above prices.

Rice eased further during the week, by 25 nP to 50 nP per maund, thanks to better supply position of new grains in the market. It was estimated that rice production this year would not fall far short of last year's record production of 3

STOCK & SHARE QUOTATIONS

Abbreviations: D—Deferred shares; P—Preferred shares; A—Accounts published yearly; H—Accounts published half-yearly; B—Balance sheet published yearly; C—Company has debentures; N—Nominal quotations; X—As at; Dividend—C—Cash dividend; A—Accounts dividend; F—Dividend for first half of the year.

Share—If a company has different classes of shares, as for example, A and B shares, these are indicated by the same letters 'A' and 'B' under the column 'Paid-up Ordinary Capital' and 'Paid-up per share'.

Accounts—Figures in the 'Accounts Closed' column represent the months of the year in which the

respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have, land, buildings, machinery and all other items on which depreciation is allowed, less sales. If any, and stands for the gross figures except where otherwise indicated.

Dividends—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period, in the case of those companies which close their accounts yearly dividends shown are for their financial year.
