INDUSTRIAL AND COMMERCIAL FINANCE CORPORATION LIMITED.—An opportunity offers as Management Trainee to Graduates not over 26 years of age. Applications will be treated in strict confidence and should be made on an application form which can be obtained from: The Secretary, Industrial & Commercial Finance Corporation Ltd., 7 Drapers' Gardens, London, E.C.2.

COMMERCIAL OFFICERS required by TANGANYIKA GOVERNMENT Commerce and Industry Department on contract for one tour of 30/36 months in first instance. Commencing salary according to qualifications and experience in scale (including Inducement Pay) £879 rising to £1,617 a year. Gratuity at rate of 13½ per cent. of total substantive salary drawn. Outfit allowance £45. Free passages. Liberal leave on full salary. Candidates, aged 25-40, must possess university degree, preferably in Economics, or be members of one of the recognised accountancy bodies. Write to the Crown Agents, 4, Millbank, London, S.W.1. State age, name in block letters, full qualifications and experience and quote Ref. M3A/52848/E.N.

APPLICATIONS are invited for the following appointments in the Ministry of Finance of the Government of the United Kingdom of Libya.

Federal Chief Accountant

Assistant Federal Chief Accountant

Application is also invited for a post in the Department of the Auditor-General of

Assistant Auditor-General

The original tour of duty will be for a period of two years (probationary period six months) and leave will be granted at three days for each month's resident service in Libya. Contribution to a contributory Provident Fund is compulsory. Quarters are provided at a reduced rental. A knowledge of Arabic would be an advantage. Commencing salary will depend on qualifications and experience.

Federal Chief Accountant.—An appointment in Grade I of the service the minimum salary of which is £LI,800 per annum. Applicants should preferably be in possession of a recognised accounting qualification and have experience in charge of Government accounts. A knowledge of mechanised accounts (keyboard) and of methods survey is desirable.

Assistant Federal Chief Accountant.—An appointment in Grade II of the service the minimum salary of which is £LI,500 per annum. Applicants should have experience in Government accounts and preferably knowledge of keyboard accounting machines.

Assistant Auditor-General. An appointment in Grade II of the service the minimum salary of which is £LI,500 per annum. Applicants should have wide auditing experience and be versed in different types of accounting systems.

Applications, together with copies of references, should be addressed to The Embassy of the United Kingdom of Libya, 58 Princes Gate, South Kensington, London, S.W.7, marked "Appointments." As interviews can be arranged at a very early date, immediate application should be made.

OVERSEAS AND EXPORT CONTROLLER

Applications are invited for the above situation from suitably qualified senior Executives aged 32 to 50. This is a new appointment concerned with the export and manufacture abroad of a specialty range of products of great importance to the Packaging Industry. The Company is a world leader in its field and has its own subsidiaries in the Commonwealth territories as well as a network of licence arrangements in other Industrial Countries. The successful applicant will be required to make periodic visits to different Commonwealth territories and his previous industrial experience should justify earnings in the region of £3,500 per annum.—State age, education, experience and present emoluments, to Box 1229.

THE COUNCIL OF INDUSTRIAL DESIGN, SCOTTISH COMMITTEE

CHIEF EXECUTIVE

Applications are invited for the post of Chief Executive, which will become vacant on February 1, 1960. The position carries complete responsibility to the Committee for the planning and prosecution of its work in Scotland and entails close liaison with the Council in London. Enthusiasm for the task of raising design standards must be supported by drive and initiative as well as a sound and proved understanding of the basis of good modern design over a wide and varied field of products.

Age: 35-45. Salary around £2,000. There is a contributory pension scheme.—Applications, marked "Personal," should be addressed to The Establishment Officer, The Scottish Design Centre, 46 West George Street, Glasgow.

WE WANT YOUNG MEN WHO SET THEIR SIGHTS HIGH

Long-range expansion plans at Burroughs mean we need ambitious young men (22-30) immediately.

If you have Accounting Knowledge (preferably qualified), or are University graduate or successful salesman—and still have an eye open towards a lifetime career that will permit you to use ALL your ability with absolutely no limitation in growth—Burroughs offers you the opportunity you have been looking for.

We will train you and pay you well while we are doing it.

Then, as a Burroughs Sales Representative, you can set your own advancement goals.

Write, giving full details and suggesting a day for interview, to:

PERSONNEL MANAGER—MARKETING,

BURROUGHS ADDING MACHINE LIMITED

AVON HOUSE,
356-366 OXFORD STREET, LONDON, W.1,

or to the Manager of any Burroughs Branch.

A COMMONWEALTH CORRESPONDENT is required for the London Press Service which is sent daily by wireless to all parts of the world as part of the official Overseas Information Services. The CENTRAL OFFICE OF INFORMATION seeks for this post an accomplished journalist or writer with much topical broadcasting experience, whose work has called for a wide knowledge of affairs within the Commonwealth as a whole. The correspondent, who should have a keen understanding of economic and constitutional subjects, must be versatile for reporting on current Commonwealth developments and writing explanatory items and articles on Commonwealth topics. Personal acquaintance with one or more of the member States of the Commonwealth (apart from the United Kingdom) is desirable. The post is graded SENIOR INFORMATION OFFICER (unestablished): salary £1,395 to £1,600 (men); £1,345 to £1,600 (women).—Write, giving age, full details of qualifications and experience, to Manager (P.E.9.44), Ministry of Labour and National Service Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4. Only those candidates selected for interview will be advised.

A LARGE INDUSTRIAL GROUP

with factories in the U.K. and manufacturing and selling companies overseas, has vacancies for Qualified Accountants under 35 years of age, who have experience of or are interested in:—

MANAGEMENT ACCOUNTING
WORKS ACCOUNTING
MANAGEMENT AUDIT

There is considerable scope for advancement.

Applicants should write, giving details of age, experience, qualifications and present salary to Box 1228.

MARKET RESEARCH MANAGER

A leading international company in the computer field requires a Market Research Manager at its U.K. Head Office in London to take charge of a small specialist department under the General Sales Manager. The work includes research into specific problems; assistance in establishing control measurements; and consolidation of information for company distribution. An ability to get on with people at all levels is essential.

Applications will be considered from graduate economists aged under 35 who have had at least 5 years' experience in economics and statistics. Starting salary £1,400 — £1,750; non-contributory pension and life insurance.

This opening should appeal to a young man who wishes to join a dynamic organisation.

Please reply in confidence to:

Robert Clive (Consultants) Limited

Appointments Consultants,
27 ALBEMARLE STREET, LONDON, W.1.

CHIEF ORGANISATION AND METHODS OFFICER

We are co-ordinating organisational investigations into a separate Organisation and Methods Group at our Main Works in the Midlands and we require a departmental head to control its activities.

Experience in organisation and methods is essential and preference will be given to applicants in the 30-45 age group.

Salary level will depend on qualifications, experience and ability and we are prepared to pay up to £1,500 per annum for the right man.

Applications giving full details should be sent to the Personnel Manager, Ericsson Telephones Limited, Beeston, Nottingham, quoting ref. OM/

A LEADING instrument manufacturing group requires an experienced Secretary/Accountant for one of its major units. The position is progressive and the salary attractive. Help on re-housing would be given if necessary. The aim is to fill this vacancy from applicants who have occupied or occupy a corresponding No. 2 position with an existing instrument manufacturer of international renown.—Box 1219.

QUALIFIED ACCOUNTANT

Old-established STOCKBROKERS, about to move into new and larger premises, require a Qualified Accountant to take over the management of the office and staff and to advise the Partners on general accountancy matters. Previous experience of stockbrokers office, either actual employment or audit work, essential, but a detailed knowledge of Stock Exchange procedure is not necessarily required. Applicants must have at least 10 years' experience in accountancy and preference will be given to a sound knowledge of modern office procedure and office machinery.—Please write, in confidence, giving full details, to Box C.783, c/o Streets, 110 Old Broad Street, E.C.2.

MILK MARKETING BOARD

AWARDS IN AGRICULTURAL ECONOMICS

The Milk Marketing Board invite applications for their awards for vocational study and for research in agricultural economics. The awards are open to men and women who are graduates of universities in the United Kingdom in any subject, but preference is given to those whose degrees have been obtained in economics in social or business studies or in agriculture. Candidates are expected to have gained a first-class or good second-class Honours degree but any qualifications of similar status may be accepted.

There are two categories of awards:

(a) STUDENTSHIPS (£660 — £700 per annum) are for post-graduate students qualified to study for a post-graduate degree or diploma or to take up research work in agricultural economics;

(b) FELLOWSHIPS (£800 — £1,200 per annum) are for persons who have already had experience in post-graduate study in some subject connected with agricultural economics.

Applications should be sent not later than December 31, 1959, to the Secretary, Awards in Agricultural Economics, Milk Marketing Board, Thames Ditton, Surrey, from whom further particulars and forms of application may be obtained.

For other appointments see page 458

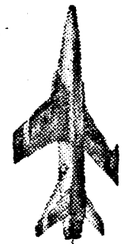
Decision Without Settlement

By upholding the injunction ordering the American steel strikers back to their plants the Supreme Court has done nothing to solve the dispute (page 625)

World Politics and Business

LOOK AT THE FACTS ABOUT THE REPUBLIC F-105



● *Republic's F-105 is the only all-weather strike fighter on order for Europe by the U.S. Air Force.*

● *Republic's F-105 is the only truly complete Weapons System designed for Europe's specific tactical needs.*

● *Republic's F-105 is "the world's most powerful one-man aircraft."*

These facts prove the F-105's air superiority and its ability to accomplish "the mission". To help NATO with its mission . . . there is Republic's "Mission Plan" . . . establishing a prime source of supply in Europe through the production of this supersonic, nuclear armed jet by various industrial firms throughout NATO countries.

We shall be pleased to mail you a copy of our book "Mission Plan"—which fully describes the unique capabilities of Republic's F-105 and the economic means of placing "the world's most powerful one man airplane" in the hands of the freedom loving countries of Europe.

DEFENCE BONDS

pay 5% with 3% tax-free bonus after 7 years

Defence Bonds are a safe and extremely profitable way of saving. As well as the attractive interest of 5% per annum, the Bonds are repayable after 7 years at the rate of £103 for each £100 invested—and this 3% Bonus is U.K. income tax free. The bonds may, of course, be encashed before maturity. The interest, payable half yearly, is not exempt from tax, but tax is not deducted at source. You can have up to £2000 of these Bonds exclusive of holdings of earlier issues. Bonds inherited from a deceased holder or acquired by conversion of earlier issues can be held in addition. *On sale in £5 units. Buy all you can afford.*

IN SEVEN YEARS

5% Defence Bonds yield the equivalent of

£5.12.6

per cent (gross), per annum if you pay tax at the present standard rate of 7/9.

Full information on Defence Bonds from your stockbroker, banker or other professional adviser, and from your local Savings Committee, Savings Centre, Post Office or Trustee Savings Bank.

Issued by the National Savings Committee, London SW7

The EVENING NEWS has more top class readers than any other London Evening Paper

Latest readership figures show that the Evening News has nearly a quarter of a million more readers in the vital AB* class than its nearest rival—the Evening Standard.

	Top Class AB Readership	Loss or Gain since Last Survey	Total Readership
EVENING NEWS	801,000	+ 112,000	3,663,000
EVENING STANDARD	573,000	+ 33,000	1,967,000
STAR	284,000	− 16,000	2,529,000

*The AB Class includes Company Directors, Managerial, Administrative and Professional people.
The figures referred to are from the latest survey of the Institute of Practitioners in Advertising and cover the period from July 1958 to June 1959.

Both in top class readership and total readership

THE EVENING NEWS LEADS IN LONDON

LUSTY INDEPENDENCE

The Standard-Triumph story is one of the most exciting in British industry today.
It's the story of young leaders, of new ideas; of enterprise and ambition.
It's the story of lusty independence in an age of great combines and mergers.
Acclaimed as "Britain's most exciting new car for years",
the revolutionary Triumph Herald has rocked the Press and Public.
More big ideas are brewing under the roofs of the Standard-Triumph organization.
To the world-famous reputation for craftsmanship and reliability and
the vigorous young blood of the Standard-Triumph group is now added new and vital capital.
The opportunities are immense. Standard-Triumph have just the team to make the most of them.

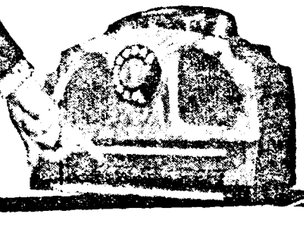
TR SERVICES provide more than

TIME RECORDERS



TR Services provide more than a range of equipment for doing different kinds of jobs. The really important thing about TR Services is their good effect on a business; on its economy, efficiency and on its whole atmosphere. This effect is achieved simply by making it easier for everybody to do things more quickly, more accurately, more promptly. Such diverse things as finding people and speaking to them; encouraging time discipline; costing work more accurately; or showing up an uneconomical machine—and showing *why* it is uneconomical. The climate of business is altogether different in an organisation where TR Services give staff a proper appreciation of the value of their time, and provide the means to make the utmost use of it.

"Something new in partitions, old chap"

"Tell me more."
"Well, these new Stramit 'Movaflush' partitions are ready-made panels with an L-shaped piece at each side and they simply butt up together, one after another. They go up at simply astonishing speed. Knock pounds off the usual erection costs."

"What are they like, when they're up?"
"Oh, excellent, old chap. They're over two inches thick, you know. They're strong and rigid and faced with hardboard. And they deaden sound. What's more, they're surprisingly low in price."

"I must get some further details right away."
"Get your secretary to fill in a coupon, or something old chap."

Please send me, without obligation, full details of Stramit Movaflush partitions

VOLUME CXCIII NUMBER 6064

Understanding Dr Adenauer

As Lloyd George was made to realise by Poincaré, British relations with Germany and with France cannot be kept separate. A prime task that the Government has set itself in its new, post-election span of life is to rescue its relations with continental western Europe from the decay and muddle they sank into during the last Parliament, when British foreign policy was preoccupied first with the Middle East, then with the restoration of Anglo-American friendship, and finally with the effort to open east-west talks. High on the new list of priorities stands the need to restore ordinary trust and confidence between London and Paris and between London and Bonn. Mr Selwyn Lloyd's visit to Paris this week has been a first attempt, under forbidding auspices, at the one; Dr Adenauer's visit to London and Chequers in the coming week will provide the occasion to make a start on the other.

Contemplating President de Gaulle's utterances at his press conference last Tuesday, the British Government cannot but have been painfully reminded how completely, for the moment, the power to influence events in continental Europe has been taken from its hands. President de Gaulle has firmly intimated that the further pursuit of east-west talks must await his judgment. Conceivably Mr Eisenhower, who has one or two other good cards to play, might shift him from this attitude; there is no likelihood that Mr Selwyn Lloyd, or Mr Macmillan, could. To suggest that Dr Adenauer might be asked to intervene is to overrate the weight of the Bonn end of the Bonn-Paris axis; it also overlooks the fact that Dr Adenauer has no interest in speeding the east-west talks, but rather looks upon them as a dangerous gamble in which Germany provides the cash stakes without sharing the hypothetical winnings. Time spent next week on urging Dr Adenauer in this direction would be time wasted.

Britain's earlier and heavier defeat in Paris, that of the free trade area, made the point clearly enough. Germany did have a definite interest in a device to ensure that the common market did not split western Europe into rival trading groups, and a strong party within the west German government was aware of that interest. But when the French turned the free trade area down, none of this counted for anything; the common market was a major German political objective, and Dr Adenauer was not for a moment tempted to allow trade policy to interfere with its attainment. A more subtle, less single-minded man might have seen that the free trade area was in fact more than a mere matter of trade policy. But in treating the British project as he did, the Chancellor was taking it at the face value the British had put on it themselves. That being so, he had no strong motive for pulling the British chestnuts out of the French fire, and no prospect of succeeding if he had tried.

German expressions of friendship for Britain, of the kind Herr von Brentano uttered in the foreign affairs debate in the Bundestag on November 4th, have to be read with the qualifications that the experience of the past year teaches. Herr von Brentano, who was reading a prepared manuscript approved in advance by the Cabinet, said that his government was interested in "a close, friendly relationship between the European Economic Community and Britain." Because he went on to recall Britain's services in connection with west Germany's entry into Nato, he was thought to have made a gesture. In fact, however, he said nothing about any relationships between Germany and Britain. He prefaced these remarks by insisting that the European Economic Community, in making

agreements with outsiders, should always act as a unit; and he stressed the political character of the community, and the "new, I might say revolutionary, concept" which inspired the Treaties of Rome. The gesture was one of civility only; the wall that confronts British ministers in their relations with the Six is left unbreached.

In dealing with Dr Adenauer's Germany, therefore, Britain has to deal with a government that believes itself part of a special grouping, already close and destined to grow closer, to which Britain has chosen not to belong. It does not follow at all that British relations with Bonn need to be bad, suspicious or unfruitful; many Germans see this, and some of them have expressed weighty dissatisfaction with Dr Adenauer's growing inclination in recent years to harp on his differences with Britain. But there are many undigested failures of understanding between the two countries, and the British people is responsible for its share of them.

DR ADENAUER'S authorised biographer, Herr Paul Weymar, has described the Chancellor's first visit to London in December, 1951 (when he was 75), and a conversation he then had with the Prime Minister, Sir Winston Churchill. The account does not read as if it were verbally exact; all the same, the preoccupations which each expressed about the other are representative, and help to explain the persistent failure of Bonn and London to understand each other even when it is the manifest interest of both to do so. Dr Adenauer said that it had disturbed him to be told that Britain wanted to be a "good neighbour" of Europe, but no more.

Sir Winston Churchill, for his part, showed himself preoccupied by France's fear of a resurgent Germany, and dwelt on the duty that this imposed on Britain to keep the balance in favour of France. He urged that Germany and France should "be friends and walk together," and promised that Britain would do all in its power to bring this about. Dr Adenauer turned the conversation to what really worried him, and worries him today: his fear that the British interest in summit talks might lead the West into "a new Yalta," a deal with Russia at Germany's expense.

This was in the middle of the Korean war, and when British diplomacy had long been giving dogged support to the scheme for a German contingent in a European army. Probably the British statesmen thought Dr Adenauer's fear of a new Yalta as far-fetched as Dr Adenauer thought the British idea of a French ally in need of protection from a martial Federal Republic. Dr Adenauer had his moments of bitter disillusionment with France in the years that followed. At times he needed, and got, British support for German rearmament and German sovereignty against French opposition. But the dream of a reconciliation with France had dominated his approach to foreign policy since 1919, and he did not give it up even when things were at their blackest for him. In the upshot, the Germans under Dr Adenauer's rule have carried Sir Winston Churchill's injunction to make friends with France to lengths that nobody in London can have imagined.

Dr Adenauer's two grievances of 1951 are, however, as alive in his mind today as they were then. Whenever ill-feeling has arisen between Bonn and London on one occasion or another—occupation costs, the Suez crisis, the various British schemes for restriction of armaments in Central Europe, Mr Macmillan's trip to Moscow, or the tartness against Germany of the British press—the same two grievances have always been heard from Bonn. The British, in Dr Adenauer's view, let Europe down by remaining aloof from all schemes for integration; yet they continue to assume the right to a disproportionate influence in Europe's affairs. Worse, they persist in exerting their influence in the direction of negotiations with Soviet Russia, which are full of dangers for Germany.

To disentangle the fact from the fancy, the justice from the injustice, in this picture of Britain's role in the history of the nineteen-fifties is more than can be done in a few hours of talks. It is, in any case, something that can most usefully be done by the Germans themselves; since, tiresome as are the imaginary causes of Anglo-German misunderstanding, the real causes are solid enough. One German has made a valuable attack on the subject in an unusual book* about President Heuss's State visit in October, 1958, and the press controversy that followed about the British reception of him; truly a Teutonic undertaking for a book, as the author amiably remarks. Dr Alexander tries to explain to his countrymen the state of British popular feeling about Germany, and the reasons for it.

It is time (twenty years after the beginning of the war, and nearly fifteen years after its end) for the British to disentangle these feelings for themselves, separating the useful lessons of history and experience from the mere mental self-indulgence of living in the past. Perhaps when they have done this, they may have more success in getting the German leaders, in judging the limitations and faults of British policy in Europe since the war, to give credit for what the British have in fact done, at crucial moments, to help. What, unfortunately, the British cannot claim to have done in Europe since the war is to have grasped the significance of what was happening, in certain important fields, until long after it had happened. Their reluctance to join some of the new organisations might have appeared in a different light if only they had shown an awareness that, in refusing to join, they were taking important decisions with important European consequences.

As Dr Alexander points out, the Conservative Government underestimated the common market, just as the Labour Government failed to appreciate the importance of the Coal and Steel Community. Plainly these governments had the right to stay out of these bodies if they pleased; but they ought to have understood in time that those who did join would be establishing a relationship to one another different from their relationship to Britain; therefore, Britain's relative position in Europe could not remain the same. If that had been understood, the successive displays of a rather complacent British empiricism might not have looked like divisive tactics; and the political regrouping that has since gone on among the nations of western Europe might have been less likely than it is today to end in a dangerous split. The truth is that Germany has no more interest in such a split than Britain has; while Britain has no more interest than Germany in a soft east-west settlement likely to put Central Europe in communist hands.

* Zwischen Bonn und London. By H. G. Alexander. Econ-Verlag, Düsseldorf.

The Village that Committed Suicide

Our special correspondent has been visiting the Welsh village of Cwmllynfell

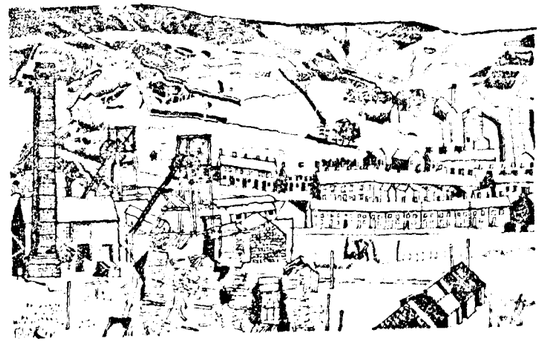
CWMLLYNFELL is a village of some 3,500 people situated in one of the narrow anthracite valleys of South Wales. The long lines of its miners' cottages straggle greyly from the pithead below the bleak Breconshire hills. Such scenery is common to many of the mining villages in the South Wales coalfield; but Cwmllynfell has problems of its own. Its community was built around the pit. The pit had sustained it for more than 50 years. In January this year, the pit was closed.

It was closed because it was involving the Coal Board in a crippling loss. Even between 1947 and 1957, outgoings at the colliery had exceeded revenue by £1,400,000, but this deficit was not then taken particularly seriously, since high grade anthracite was not yet priced at a level where supply equalled demand. But in 1958, things at Cwmllynfell got worse; anthracite which in 1957 had been mined at a loss of £2 19s. 3d. a ton began to lose £4 8s. 10d. a ton. This was not because reserves were exhausted or because the coalface was inconveniently placed. The reserves at the pit were considered by the technical departments of the Coal Board to be sufficient to justify an investment in several expensive gadgets, such as a new electric winder, not long before other departments of the board closed the pit down. The trouble at Cwmllynfell was with labour relations. In the four years between 1954 and 1958 there were seventy reported strikes or restrictions of output at the pit, an average of one every three weeks. The pit was closed because the normal relationship between management and men at work had completely broken down.

One other statistic about Cwmllynfell was calculated to startle the visiting journalist even before he started on the hour-long bus journey up from Swansea. Of the 654 people who were working at Cwmllynfell and the neighbouring Steer colliery at the time of the closures last January, 329—or over half—were still without work ten months later. As Swansea itself is back in moderate boom, the immobility which these figures suggest is remarkable to a Londoner used to people travelling twenty miles or more to work without thought. But the statement that total male unemployment in the village stood at about 20 per cent brought back uncomfortable memories of the 1930s, and one expected to find a hidebound, depressed and bitter Cwmllynfell when one got off the bus.

THE first impression of this tidy little community was therefore a surprise. The houses are brightly painted and television-decked. The people are not at all down at heel. Discussion—as always in Wales—starts easily and the professional gloom reserved for the visitor soon disperses. So far, it seems, the pinch has been slight. One unemployed miner admits that he has not been able to buy the new suit which he had his eye on this summer; another that his hopes of a second-hand car had faded. But for the first six months both had been entitled to draw the £4 a week redundancy pay from the Coal Board plus the minimum of £2 10s. a week unemployment benefit; together with pigs and chickens at the bottom of the garden (a local staple), and pay from occasional odd jobs, they had had quite enough to cover the modest needs of the average miner's family for the first six months at least. The manager of the local co-operative shop (a gleaming self-service one) confirmed these impressions; he had sold few dry goods this year, but his groceries had moved as well as ever. With the winter coming and redundancy pay at an end, he expected harder times ahead; but in cases of hardship personal credit was always available. There is a tradition of being generous with this, and the manager spoke of the social and personal bonds in the village, as so many Welshmen like to do.

How far do these social bonds really exist? Do they explain either the immobility or the recent industrial suicide? The traditional symbols of the cohesiveness of Welsh village life certainly stand proudly in place. The chapels (of which Cwmllynfell boasts three, as well as a church) and the miners' welfare hall have a long story of sturdy independence. The communally-built welfare hall at the village, which houses a cinema to seat 650, a billiards room, a library, a shop and several other amenities, is a remarkable achievement. But, sadly, one soon saw that these were mainly traditions and achievements of the past.



The story that the Welshman is peculiarly loth to leave his valley has never been universally true: for a long time now there has been a steady migration of able boys out of the area. The miner is wonderfully grammar school conscious. Since the 1920s, if he has found that he could get his boy or girl into a good school and into a white collar job in Cardiff, he has done so. This has led to a steady loss of leaders in the community. As the older organisers disappeared, there was none to take their place. Even when good days returned to the mines after the war this migration continued. Now, too, television from London or Cardiff, a powerful engine of new social values even here, is killing the welfare hall. The Welsh language among the younger people is on the wane. The power of the chapel is declining with the growth of the men's Sunday drinking clubs. Finally, the union lodge, whose meetings used to be news and whose influence spread far out into local and even national politics, is now a much less potent force. It was not because of the growth of union strength that

Cwmllynfell showed the wildcat militancy that killed the pit, but precisely the reverse. Union power fell away into the hands of the minority who still bothered to busy themselves with union affairs ; and, as always, this minority included a large proportion of militants and grumblers.

Moreover there was an abiding spark of resentment in the village which militants could easily fan into regularly recurring flame. Cwmllynfell was an anthracite mine, and traditionally the anthracite miner has been among the aristocrats of the industry ; even during the great depression there was a market, and thus a bargaining position, in anthracite. The natural desire of the men to exploit this was heightened by their constant bargaining success during and after the war, when any coal was wanted at almost any price. But, since then, anthracite has proved particularly vulnerable to competition from oil and has lost its export markets. Moreover, the drawing together of the mines under nationalisation has cost the anthracite worker much of what remained of his special position. The logic of such economic forces is hard to understand in an isolated, tightly-knit village. The breakdown of industrial relations at the pit was not primarily due to the incapacity of the managers or the exceptional obstreperousness of the men. These were the effects, rather than the causes, of misfortune.

But why, if men no longer cling limpet-like to the social traditions of the valley, has there not been greater mobility of labour out of Cwmllynfell ? The main reasons seem to be economic rather than social. There is the unavoidable loss that the miner would face if he sold his house in this declining area ; and there is the avoidable stupidity of the terms of the Coal Board's ill-conceived redundancy scheme. Under this, redundancy money is paid for a minimum of 26 weeks—but only on the condition that the miner has not taken another job meanwhile. To pay a substantial sum on the proviso that a man avoids getting any other work is to invite him to do just that. In most coal mining areas, it would be much better to recognise that a man who has acquired skills in mining which are no longer needed deserves compensation as of right—when he moves off to another job, and not just when he stays put and draws unemployment pay.

Another trouble in areas like Cwmllynfell is that the principles embodied in the new Local Unemployment Bill—set up trading estates and bring in the work—do not succeed there. In its narrow valleys, factories would find many disadvantages, and sometimes even a sheer impossibility in getting flat land to build on ; even the union is not hopeful of attracting them. The men's effort to keep the mine going co-operatively (exaggerated by Welsh nationalists) was doomed from the start. The only answer is that the men must get better transport to work or uproot themselves.

In the long run, the second course may be the inevitable one. But, immediately, better transport in the valleys is another problem that needs to be tackled. The local bus transport, which has now almost entirely replaced the railway throughout South Wales, is not properly geared to the needs of village commuters. This, of course, is a familiar dilemma arising from the rigid habits of British transport finance. Railways are allowed to charge only a fixed sum per passenger mile, wherever they run in the country. It is not profitable to run them to isolated parts of the country if only these fixed fares can be charged. The railways are therefore closed down, and buses are put on in their place. These suffer from some of the same fare-charging inhibitions, and the bus service that would be required at commuting hours is larger than could economically be used (without a big subsidy) at other times of the day. So the service is not started, and the community (or the Coal Board) finds itself subsidising the would-be commuters in idleness instead. Economic folly is not a monopoly of the miners of Cwmllynfell.

New Tongues for Old

Sir David Eccles has an opportunity of making his mark in a dangerously neglected part of the educational field

SNAP go the old links which, in the colonial era, bound Europe and the Asian and African world together. Must their parting mean a great alienation between human groups whose destinies are still interdependent? Often it is too complacently assumed that "disimperialism" will usher in a new age of closer friendship. Evidence to the contrary is plentiful. The attitude of Europeans toward peoples who have insisted on freeing themselves is largely "all right, now you've got what you wanted, go paddle your own canoe." This indifference, together with the natural self-assertiveness of Asians and Africans who have still to work off their anti-imperial revulsion, is just the thing to breed a complete lack of understanding.

To understand, one must be able to communicate. Already some of the familiar lines of communication are fraying. The withdrawal of European administrators, many of whom had given their lives to serving and studying a particular area, has been matched by the rise to political leadership of men who, like Mr Dahanayake in Ceylon or Mr Morarji Desai in India, have not had the personal experience of the West that was common to so many of the first echelon of leaders of the newly independent nations. And the westerner trying to keep abreast of what is going on in an Asian or African country becomes increasingly aware that, if he is restricted to his own language, he cannot get the full picture. The "man in the street" there does not speak a European language; the rising generation of politicians does not speak one easily enough to express its thoughts fully and precisely; local opinion is more and more expressed and shaped by newspapers and broadcasts in the language of the country. To make contact only with, or through, a small minority of western-educated people can be perilous, for they may in all innocence present a distorted version of the national mood and intentions.

Yet, while the West's need of linguists is thus increasing, some of the main sources are drying up. In the twilight of the empires, the old type of district officer or army officer, who knew at least one Asian or African language and often gave his children a grounding and interest in it, is vanishing. Commercial firms are bowing to the demand that their overseas offices should be mainly manned by local staff. The great pioneer age of the missionaries, who in Africa and parts of Asia built the first linguistic bridges, compiled the dictionaries, and indeed gave many languages their first written forms, is over.

SOME may say that it is simply not practicable to teach Oriental languages to westerners on any sizeable scale, when this knowledge (unlike, say, Greek, of course) can open up only a very limited range of possible careers. That is a comfortably reassuring argument for doing nothing. It is, however, quite inadequate.

It is a pity that so often, when something urgently needs doing for its own sake, the most effective way of galvanising a sluggish public into demanding it is to point out that others —preferably the Russians—are doing it already. The scale of the Soviet effort in Oriental linguistics should not be exaggerated, though last month's foundation of a new African institute in Moscow ought to be noted as a portent. But it happens to be a fact that good modern Russian-Hindi dictionaries are now on sale, while the English-Hindi ones offered in London bookshops are utterly inadequate.

Lack of textbooks, teachers, and teaching facilities is unquestionably the real limiting factor in this field. There is much evidence that Asian and African languages would be more widely studied in the West if the interested student was not frequently deterred by a system that discriminates heavily against them. The extent of this discrimination is clearly shown by the report of an international study group that met in London this summer.

The dead hand of dead languages lies heavily on the academic world, in this as in other respects. The report shows that there are ample facilities for studying an Oriental language almost anywhere in Europe, so long as it is a dead one. One may study Classical Mongol at Cambridge, Akkadian at Louvain, Assyrian at Geneva, Avestan at Uppsala, Chaldean at Rome, Sumerian at Madrid ; the London School of Oriental and African Studies (SOAS) offers two dozen ancient tongues, including Old Ottoman, Manichean Middle Persian, Sogdian, Khotanese, Khwarezmian and Old Mon. But outside the SOAS, which in the face of many obstacles provides the best centre in the world for modern Asian and African studies, the student of the modern languages is poorly and patchily served. Several European countries confess that their universities treat Oriental languages purely as a classical subject (as do most British and French provincial universities).

The case for the classics, whether Latin, Greek, Old Ottoman or Old Mon, needs no reviewing here. But the disproportion between the academic resources devoted to the ancient and to the modern tongues of Asia and Africa is painfully obvious ; and the dominance of the classics plays its part in surrounding the study of Asian and African languages with an aura of the esoteric, which in turn leads grant-making authorities and other official dispensers of aid to place it low on their lists. Again, the academic mind recoils in horror from the idea of studying or teaching a language that has behind it no mass of printed literature. Yet some of the African languages that are thus dismissed are even now evolving new literary forms, blending modern elements into an inheritance of oral tradition. Would a scientist tamely accept the argument that a subject is not worthy of study when it is just newly budding out under his very nose ?

Scandalous as the idea may seem, modern languages have to be increasingly taught as a technical instrument of communication, not as a rather offhand postscript to the literature of the centuries. Much good will it do mankind to keep perfecting its ability to flash sounds across the world if the sounds are mere gibberish to the listening ear. And this is particularly true of western study of Asian and African languages.

THE SOAS has found that school children are attracted by the idea of choosing Asian or African studies if this idea is presented to them early enough. (The system of deciding what one will read before going up to the university naturally discourages such a choice ; for few school teachers can give advice about these studies, and the unguided youngster tends to choose a familiar field.) Spontaneous enthusiasm can, however, cool rapidly if the student has to batter a way to modern language study through the wall of the classics. Pre-university teaching of Oriental languages being non-existent, the student in any case faces the task of mastering the chosen language more rapidly than the student of, say, German who has already had several years of it at school. And there are often strong arguments for learning more than one language, particularly where Africa is concerned.

The multiplicity of the languages involved no doubt seems disheartening. The London study group listed seventy as "essential." But some of these are in fact of questionable importance, and among the others there are some clear priorities: Japanese, Hindi/Urdu, Swahili, or Yoruba cannot really be equated with Mongolian, Nepalese, Kimbundu or Lingala. And this very multiplicity brings out the need to concentrate resources on what is urgent and practical. The rapid teaching methods devised during the war could and should be widely adopted.

The prospect of anything so down-to-earth may horrify the kind of academic mind that is still forcing Latin into the heads of West Africans who urgently need to learn French ; but, as in the parallel case of science and technology, a bit of blasphemy of this sort is badly needed in the academic world. The new Minister of Education—who, while at the Board of Trade, has had certain opportunities of noting the importance of keeping abreast of the Asian and African tide—can make his mark here if he gives a bold lead. He would be wise to begin by calling for the London study group's revealing report.

NOTES OF THE WEEK

THE SUMMIT

For Two Only?

It is, of course, a famous victory. General de Gaulle has put the summit meeting off until May at the earliest. But will his fabian tactics stop there? Is there any certainty that before May comes round he will not be dragging his feet again? He made no secret on Tuesday of his personal dislike for the methods of negotiation employed at Munich, Teheran and Yalta. But at least he should have his first atomic bombs hatched by the time Mr Khrushchev visits Paris in mid-March, if that is the determining precondition that the general has not seen fit to mention. For the moment, enough is enough. Just over three weeks ago it was still expected in London and Washington (and apparently in Moscow, too) that the summit talks would be held this year; now it is hard to know when they may happen.

This need not be treated as a disaster. The basic negotiation that must be pressed forward next year is the one between the two super-powers themselves. (If Mr Khrushchev had placed much store by an early four-power summit, it is unlikely that he would have played General de Gaulle's game by choosing March for his Paris trip.) The best way to keep up the momentum of east-west exchanges now is to give full priority to Mr Eisenhower's return visit to Moscow in the spring. The longer the four-power summit is put off, the less important it becomes. By his willingness this autumn to delay his visit to Moscow, Mr Eisenhower showed his readiness, as a fond ally, to include General de Gaulle and Mr Macmillan in at least one important session with Mr Khrushchev. Now that General de Gaulle is insisting on consultations of his own first, it would be unnecessarily obliging of Mr Eisenhower to give precedence to the four-power summit over his own next round of Russo-American talks.

What is of real importance is that Mr Eisenhower's initiative towards the Soviet Union should not be obstructed in any way, or by anybody, while the last effective months of his Presidency are ticking past. There will be periods next summer when Mr Eisenhower may be preoccupied with internal politics. And after the American party conventions in July Mr Khrushchev may prefer to bide his time until he can do business with Mr Eisenhower's eventual successor, whoever he may be. None of this need deter Mr Macmillan from pressing for a May summit at the western conference in mid-December, but there should be fewer illusions about the place the four-power summit is likely to have in the diplomacy of 1960.

BRITAIN AND FRANCE

Wading Across

Before Mr Selwyn Lloyd left Paris on Thursday he saw his bridge-building matched by some signs of activity on the French bank. General de Gaulle has agreed to pay a state visit to London from April 5th to April 8th, shortly after his farewells to Mr Khrushchev. But Mr Lloyd did not get such satisfaction on other items in his brief. One of his jobs had been to explain Mr Macmillan's reasons for haste in summit climbing. But General de Gaulle's press conference meant that he was greeted with the announcement of yet another delay. On a second major topic at issue, British relations with the common market, neither side proved to have anything positive to say at this stage. General de Gaulle had not descended to such prosaic matters at his press conference. The French position, as far as one may gather, corresponds to that of the European Commission—the Six are liberalising their external trade, including trade with the dollar area; so Britain cannot reasonably complain of discrimination. Mr Lloyd, for his part, was fully aware that any fruitful economic negotiation could only follow a renewal of political understanding.

When both sides finally come to grips with this matter, much will depend on the state of Franco-German relations. So long as General de Gaulle, despite his heterodox views about the Oder-Neisse line, remains Dr Adenauer's best advocate in the current east-west exchanges, France will be in a position to dictate a stiff policy on the European trading question. To Mr Lloyd's discomfort, rumours were once more circulating in Paris this week that the six common market countries were preparing to set up a joint political secretariat.

Even so, both French and British insisted on the friendly nature of their conversations. The talks were not described as a search for complete agreement but merely as an effort to dispel misunderstandings in general. Mr Lloyd, following the new British fashion, qualified his visit as one of a long series of encounters. The Channel still has to be crossed in waders.

FRANCE AND ALGERIA

Offer Confirmed

General de Gaulle does not call his press conferences lightly (Tuesday's was only the second since he became president), and whatever is said is known to be fully rehearsed and entirely unspontaneous. If this adds to the weight in the world of the general's words on the summit and the French bomb, it gives no less authority to the new, and full, confirmation of his policy statement on September 16th in which he offered eventual self-determination to the Algerians. Before the general spoke on Tuesday this offer had been put in some doubt by interpretations circulating among the authorities in Algeria.

M. Mollet's Socialists had, in fact, complained at what they called the spirit of some of these commentaries, and President Bourguiba of Tunisia, who had been particularly enthusiastic over the general's original remarks, confessed to fresh doubts. In particular, it was suggested by left-wing critics of the regime that the Debré government had deliberately purchased the army's support at the time of the October plot by giving fresh assurances to the officer corps that the army would stay indefinitely in Algeria. Although some observers could see General de Gaulle's performance on Tuesday as a reversion to his unsuccessful offer to the Algerian rebels a year ago, the chief impression in Paris was of renewed belief that talks, either public or secret, would soon be under way.

This opinion seemed to be shared by some circles in Algiers, where on Wednesday there were minor anti-Gaullist demonstrations. These wilder spirits among the European population may have been upset by General de Gaulle's repeated recognition of the bravery of the rebel forces. It was clear that no page was to be turned by what the general described as "the great wind of history" if they could help it. The general has always affected to have history on his side; but the army is still a better friend.

SHADOW CABINET

Giving Mr Gaitskell the Willeys

The Parliamentary Labour party is upset because it voted Mr Philip Noel-Baker off its shadow cabinet last week, and then found immediately afterwards that he was to be awarded the Nobel Peace Prize. But

of course it was right to eject even the worthiest 70-year-old from its shadow ministerial team at this time; the team's main job is to acquire experience for when and if Labour next gets power, which cannot be until 1964 at the earliest. Because Dr Edith Summerskill was voted off the team at the same time as Mr Noel-Baker (cycles of revolt against her are strictly personal things), and because two former members of the shadow cabinet were not standing this time, there were four vacancies to fill. One has at last been filled by the elevation of one of Labour's rising young men in Mr Denis Healey; another, equally wisely, by the return of Mr George Brown, who lost his place last year because he was regarded as a crypto-Conservative in foreign affairs. But the other two newcomers are the Amalgamated Engineering Union's Mr Lee, who spoils his amiability and real ability by being a TUC reactionary ("my-union-right-or-wrong") in most industrial affairs; and the safely unexciting Mr Willey, who probably also had traditionalist support.

All 258 Labour MPs could vote for the twelve places in the shadow cabinet, and the figures suggest that some 236 in fact did so. At the top of the poll Mr Harold Wilson got 167 votes, which suggests that at least 69 MPs in this extraordinary party still think that even he should not be in Labour's higher counsels. Old feuds, though now still waters, yet run deep. The bottom successful candidate was Mr Healey with 90 votes, which means that anybody who can command the active support of just over a third of his fellow MPs can get in. There are 92 trade union sponsored Labour MPs in the new House; theoretically they could swamp the shadow cabinet with their own nominees if the leadership sufficiently annoyed them. They have so far contented themselves with blunt hints that the leadership had better not do so.

It is an odd reflection on the Labour party that only 66 Labour MPs wanted Sir Lynn Ungoed-Thomas in the shadow cabinet; only 87 wanted Mr Crossman there (despite Mr Gaitskell's evident support for him) and only 76 wanted Mrs Castle. The extreme left-wing vote remains stuck at 38 or 39 (Mr Zilliacus, Mr. Swingler and Mr Harold Davies all marked up these scores). Some of these 39 have this week been making subterranean stirrings to get themselves organised as a group.

HORTICULTURE

Cabbage Money

There are two halves to the Government's new policy for the horticultural industry, but they certainly do not add up to a satisfactory whole. The first half consists of a bill, now published, which implements the last Government's promise to provide £8 million in grants to horticultural producers. The subsidy will be spread over five years and will be paid out as grants of one-third of the cost of undertaking any of a long list of capital improvements. Like the small farmers' scheme, which it in some ways resembles, this horticultural scheme attempts to exclude those small growers whose businesses cannot provide them with adequate full-time employment. But these small growers can get some indirect help if they join producers' co-operatives, who will qualify for grants.

It is not too cynical to view the scheme as a sort of danegeld to horticulturists who grumble (like the fishing industry) about the fatter subsidies paid to their agricultural colleagues and competitors. Unfortunately, like danegeld too, the money seems likely to be wasted through being spread too thinly and being applied in the wrong places. It is no good injecting a scattering of new capital into British horticultural production, unless growers act co-operatively to satisfy market requirements in a much more efficient manner than they do now. The Government's decision to establish a Horticultural Marketing Council, for disseminating information and encouraging better standards, is no real solution. The wisest course would have been to gear the new subsidy closely to co-operative efforts for improved grading and standardisation of produce. By opening the road to direct consignments, such grading would have eased the second half of the Government's problem—which is to reduce the congestion at Covent Garden.

The Government's bill for the reorganisation of Covent Garden, in the absence of such encouragement of direct consignments, is to be presented later. The market will not be resited, but its ownership will be transferred to a public authority which will undertake improvements and will develop a site in Old Street as a storage annexe for bulk produce. This is sensible enough—although the City of London, which owns the rival (and equally congested) Spitalfields market, may produce some quaint objections to this "nationalisation" of the Garden. The snag is that it is not nearly sufficient. Why has the Government turned down the Runciman suggestion for a new subsidiary market to serve north-west London?

PRIVATE MEMBERS' BILLS

The Wrong Sort

At a time when private members' bills ought to become a more important method of legislation, a general comment is needed on three of the lucky six such bills which have come out top in the ballot for presentation this session. All of them arise from the fact that their sponsors want to stop certain undesirable but complicated practices. At the top of the ballot Labour's Mr Marsh (a new and admirably young trade union member) is sponsoring a bill which would implement the 1947 Gowers recommendations in enforcing minimum legislative standards of space, heat, lighting, ventilation and cloakrooms for workers in all the offices and shops in the country. Fourth in the ballot the Conservatives' Mr Speir (author of the last Parliament's Litter Act, which in many areas of the country simply is not working) intends to introduce a noise abatement bill; it will seek to put a clamp on all sorts of things from loudspeaker vans to musical ice cream carts. Sixth in the ballot Mr Browne, the victor of Torrington, will seek to safeguard the small investor with a bill to "control the solicitation of money from the public."

When a private member introduces a bill to increase freedom to do something—for example to permit publishers to bring out types of books at present banned—he can gather together representatives of the respectable people who would gain from it and work out what would be their legitimate minimum requirements. But Mr Marsh cannot call a conference of slum office employers, Mr Speir of noisy street vendors, and Mr Browne of city sharks. The result is that private members' cockshies at complicated "banning" bills of this sort are apt either to leave far too many loopholes, or else to become unworkably Prussian; generally speaking, if action is needed in any of these fields, government bills, based on careful inquiry from inspectors and the like, are likely to be far more efficient.

This is not meant to be a shrill attack on any of these three bills. There will be a certain innocent enjoyment in listening to Labour members supporting a bill that will oblige them to say that new office building is a good thing, Tories trying to control low finance, and all politicians attacking people who use loudspeaker vans. But one does wish that MPs would realise that the most successful private members' bills are, almost always, those that seek to use scissors to cut people free from unreasonable restrictions; when MPs try instead to forge great legislative sledgehammers against diffuse things which they happen to dislike, they often run the risk of looking very foolish.

INDIA AND CHINA

Bad Time for Bargaining

India's first reactions to Mr Chou En-lai's latest message about the frontier dispute were cautious. This was not surprising. Nobody will question Mr Nehru's sincere wish to avert further bloodshed and to get a settlement that is satisfactorily clear. In happier circumstances, he would undoubtedly have jumped at Mr Chou's suggestion of a personal meeting. Quite substantial territorial adjustments might have been found possible, particularly in northern Kashmir, where much of the disputed mountain region is virtually empty.

But Indians cannot be blamed if today, with their minds full of China's recent record of deceit, arrogance and unprovoked killing, they take a long and critical look at what Mr Chou has to offer.

His letter of last Saturday, while conceding nothing of substance and rebutting all India's claims and arguments, suggested a pulling back of both countries' military outposts from the line of "actual control"; unarmed police and officials could still operate in the 25-mile wide demilitarised zone. This would certainly help to avert armed clashes. In Kashmir, however, it would amount to India's accepting the fact of China's "actual control" of the 6,000 square miles of Ladakh which its army has stealthily penetrated in recent years. This area is in fact of little interest to India. But the Chinese do not seem to accept Mr Khrushchev's view, expressed on Saturday, that it is of no strategic value. They clearly feel that control of it is a necessary part of their plan for holding down Tibet; any trouble in western Tibet can be more quickly dealt with if their army in Sinkiang can rush troops in through this disputed area along their newly built road.

It would not be such a bad bargain for India if, in exchange for this bit of Kashmir, it extracted from Peking a definitive acceptance of the Assam frontier, which Mr Chou still calls "the so-called McMahon line." But with China's "foot on our chest," as Mr Nehru put it on Tuesday, many Indians are in no mood now for such a bargain. Whether Peking's new move indicates a real readiness to compromise or not, it has come too late to undo all the damage done to Sino-Indian relations.

NUCLEAR TESTS

The Fourth Power

BRITAIN and Italy presumably meant the resolution they tabled in the UN Assembly on Tuesday to serve as a kind of lightning conductor. So it did, after a fashion. Hardly had it been put up when a bolt from the Gaullist firmament struck it. The resolution was offered as an alternative to the one already sponsored by twenty African and Asian governments, who want the Assembly to ask France not to test its atomic bomb at the Reggan oasis in the Sahara. The Anglo-Italian resolution would merely invite France to join an agreement to halt tests if and when the year-old Geneva conference yields such an agreement between America, Britain and Russia. On the same day that it was tabled, however, General de Gaulle declared that there was "no chance" of France agreeing not to develop nuclear weapons as long as the three existing nuclear powers kept theirs.

At almost the same moment, Mr Macmillan in the House of Commons and Mr Ormsby-Gore at Turtle Bay were both restating the argument that the really vital thing was to get a cessation of tests agreed in the three-power talks at Geneva. Such an agreement would unquestionably be of very great value. But General de Gaulle has blown a big hole in the Prime Minister's contention that an agreement would put the three nuclear powers "in a strong position" to ask other nations to adhere to it. This bolt apparently came from the blue, as far as the Foreign Office was concerned; on Wednesday Mr Bevan was able to taunt Mr Allen with being so out of touch with events as not to have even read the press reports of the general's statement.

One may not find it easy to visualise the sombre picture which the French president conjured up—the picture of a world oppressed, partitioned, or largely devastated by the super-powers if France (and others?) did not provide a broader basis for the nuclear equilibrium. But behind the general's baroque imagery lies a simple reality. The same diffusion of power throughout the world that lends strength to the smaller nations' protests against bomb tests also implies that the members of the nuclear club cannot expect universal acceptance of a "freeze" that simply reinforces their exclusive privileges. An agreement to halt tests can be no more than a stage on the road to real disarmament.

RATES

Not Only in Gath

LAST week the Court of Appeal ruled that the London Library in St James's Square, which provides a unique service to writers and researchers in this country, must henceforth pay rates, from which it has been mistakenly exempted for the last eighty years. At the same time the Inland Revenue was claiming that Lords Cricket Ground ought to pay higher rates than it does; some heretic pointed out that the MCC could make more money from Lords if somebody like Mr Jack Solomons was in charge of it and ran stunt cricket matches on August Bank Holiday. These blasphemies have chilled every literary and sporting Englishman to the marrow; *The Times* headed its leader on the library case "Philistines Rejoice" and said angrily that "in St James's Square . . . speculators in real estate will be rubbing their hands."

But the issues are not so simple as this. Of course it is an amenity of civilised life that national institutions like the London Library and (allegedly) Lords should not be run in a way that merely maximises the profitability of their sites. But if a subsidy is required for our continued enjoyment of them as they are, there is little case for saying that other ratepayers of Westminster and Marylebone should be the people who must obligatorily pay it to them for us. Again the fact that a commercial concern can make a hundred times more money out of a site than a library is no proof that it is a hundred times more worthwhile than a library; but in some cases economic forces might rightly dictate that a commercial concern should move in which could increase national and local income from that site, while a respected national library (especially one that served most of its subscribers by post) moved to somewhere less central.

There is a balance to be struck between accepting a little less economic expansion and having a little more civilisation in every district; in rating matters the right people to strike that balance, under due pressure from civilised voters, are the local authorities. The right course now is not, as some people have suggested, to make a blanket extension of the somewhat ambiguous Victorian act which provides total exemption from rates for voluntary societies whose buildings are instituted for purposes of "science, literature or the fine arts exclusively." The proper remedy, as an investigating committee recently recommended, is to give local authorities greater discretion to make rating concessions to particular sorts of bodies if they themselves wish to. There should also be an obligatory amount of publicity when such concessions are refused, granted or periodically renewed—so that local voters can bring pressure on their councils to be either a little more economical or a little less hard-faced.

CRIME AND PREVENTION

Mr Butler Under Fire

MR BUTLER was under fire from two different quarters last week on two different, but not unrelated, questions. On the one hand some of his own backbenchers, fortified by remarks made by the Lord Chief Justice to the Magistrates' Association, were asking him to restore flogging as a judicial punishment for crimes of violence. On the other hand, the Opposition was, in effect, pressing him to say why no disciplinary action was taken against P.C. Eastmond, on whose behalf the taxpayers have paid £300 in settlement of an action for assault and false imprisonment brought by a senior civil servant. Mr Gaitskell has now put down the first censure motion of the new Parliament on this issue.

The questions are related because the right way to deal with crimes of violence is certainly not by the restoration of judicial violence; on this Mr Butler was admirably firm, fortified for his part by the fact that more constructive alternatives to imprisonment than flogging are now being adopted for violent youths. But it is still a truism that crime should be prevented rather than punished, and that the best way of preventing it is a fully manned police force that has the confidence of the public.

In England and Wales, the police forces are 6,000 below establishment, and the Metropolitan Police Force is nearly 3,000 below. Worse than that, signs of falling confidence are appearing with alarming frequency. It is just not true, as the police claim, that the main

CAMPBELL DISCOUNT COMPANY LIMITED

INDUSTRIAL BANKERS

Paid up Capital £544,000
Assets exceed £3,000,000

Directors: J. B. Campbell, J. W. W. Huntrods
P. H. Russell Smith, A.C.A., P. J. Cannon, G. Keighley

Campbell Discount Co. Ltd. announce that they are able safely and profitably to employ a growing volume of money in satisfying the increasing demand for the Company's services. They, therefore, invite substantial deposits on the terms indicated below. The Company's banking business is conducted in conformity with the strictest canons of banking liquidity, and the proportion of liquid assets to deposits is maintained at 10 per cent. or 30 per cent. of funds at less than one month's maturity, whichever is the greater. The Company is one of the most substantial independent industrial banking houses in the United Kingdom, and is conducting a diversified business over an area stretching from Newcastle-on-Tyne to the south coast.

Funds may be deposited on the following terms:

Money at 1 month's call, 4% per annum, maximum £5,000
Money at 3 months' call, 5½% per annum, maximum £25,000
Money at 6 months' call, 6½% per annum, maximum £50,000

You are invited to write to The Manager, Banking Dept., Campbell Discount Co. Ltd., who will be pleased to send you an Audited Balance Sheet and booklet No. NC7 explaining our mode of operation.

CAMPBELL DISCOUNT COMPANY LIMITED
24/28 Cheapside, London, E.C.2
Telephone: City 6481 (15 lines)
Members of the Industrial Bankers Association

reasons for this lack of confidence are the unpopular laws—to wit, betting—which the police have to enforce. It springs from an uneasy feeling among the law-abiding public that the ordinary policeman is no longer a respected father-figure. Perhaps he never was; but at least he appeared to be, whereas now this same section of the public, which used to tend to side with the police, is now tending to believe every story that appears against them. Even the campaign for the grant of costs to every acquitted person reflects this current feeling of animosity. To restore public confidence will be a long and hard task; but something could be achieved were the public to be convinced that allegations by the public are investigated fully and openly and that disciplinary measures against the police are taken when justified. That is why, even if Mr Butler unexpectedly manages to produce some devastating evidence on his own side in the particular case of *Garratt v. Eastmond*, the Opposition's censure motion should not be simply shrugged off as yet another sledge-hammer with which they risk getting hit on their nut.

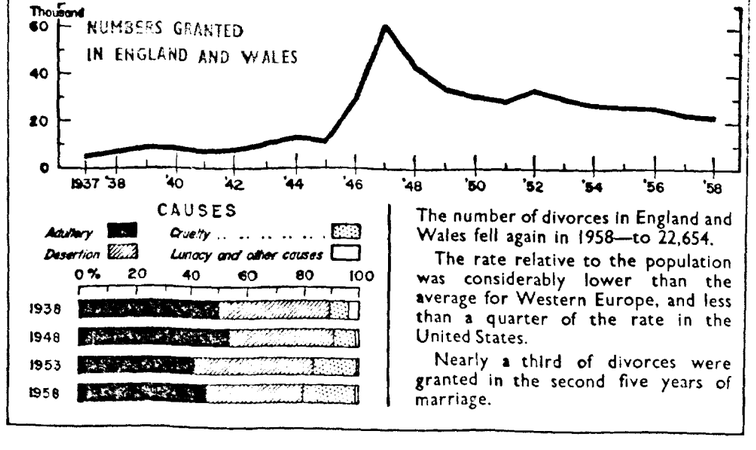
KENYA

Replacing the Emergency

It has long been obvious that the powers wielded by the Government of Kenya, under the emergency which was declared seven years ago to suppress Mau Mau, were being abused. Nobody could feel happy about the restrictions placed on political organisation and on individual liberty, at a time when the British Government and white Kenyan propagandists were trying to claim that Kenya was advancing rapidly both constitutionally and in race relations. True, Kenya has made considerable progress during the emergency, even in the political training of Africans; but an advance to a less totalitarian system of control was a prerequisite to the round table constitutional conference which is to discuss the basic problem of the country's political future in London on January 18.

Mr Macleod and Sir Patrick Renison, both newcomers to their jobs, have made this advance by replacing the old emergency powers by more limited gubernatorial prerogatives; the new system will be watched to see whether it sets a precedent for Nyasaland. In Kenya it still includes powers to keep Mau Mau "irreconcilables" in detention; Mr Macleod is right in deciding that Jomo Kenyatta could not be returned to Kikuyu society without breaking solemn pledges to loyalists and risking new vendettas. A close watch will need to be kept on the governor's powers to continue to exercise controls on political activities—on the registration of political parties, the holding of political meetings and so on. Mr Mboya, it seems, will still not have the right (which his African rivals in the Kenya National party now have) to organise on a colony-wide basis; nor will he be able to organise mass public meetings, unless specially licensed. This naturally modifies his enthusiasm for the amnesty and general de-restriction of Kikuyu life. But he will now be able to publish again the types of party newssheets that were previously banned, such as *Uhuru*, subject only to the normal laws of libel. He and his colleagues of the Kenya Independence Movement have inevitably gained most from the lifting of the emergency in practical political terms; it remains to be seen how he will use this greater freedom of action against the slightly more moderate African elected members and against Mr Blundell's multi-racial New Kenya party, which has now come out frankly against a "one man, one vote" franchise and in favour of extensive racial safeguards.

Divorces on the Decline



The number of divorces in England and Wales fell again in 1958—to 22,654.

The rate relative to the population was considerably lower than the average for Western Europe, and less than a quarter of the rate in the United States.

Nearly a third of divorces were granted in the second five years of marriage.

NORTHERN CAMEROONS

Vote Against Whom?

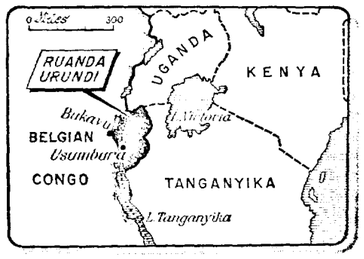
In a plebiscite held under United Nations auspices over 70,000 people of the trusteeship territory of the North Cameroons voted this week to delay a decision about their future, while less than 43,000 voted to remain part of the Northern Region of Nigeria. As a result, when Nigeria becomes independent next October, administration of this territory will remain in British hands. In theory, this unexpected result of the voting may seem a compliment to Britain. In fact, it is a headache. The plebiscite's decision is wildly unrealistic, however democratic. What the United Nations have so ill-advisedly permitted the inexperienced and misguided Northern Cameroonians to do is to vote to be torn bodily from the country of which they are an integral part and—temporarily at least—become a separate entity, a thing they have never been. The Northern Cameroons is not even a continuous strip—it is simply a chain of districts in Bornu, Adamawa and Benue provinces with less than 700,000 inhabitants. It has no government of its own—it is grouped in about five constituencies in the Northern and Federal assemblies; it cannot possibly exist as a separate, even if unviable, unit like the Southern Cameroons. How it can in practice be administered after Nigerian independence is a question which perhaps the United Nations can solve. Mr Macleod will do well to request them to do so. But the voting has this significance for the forthcoming federal elections in Nigeria: it suggests that there may be more subterranean discontent in the Northern emirates than had been realised, and this may go against the powerful Northern People's party (the party of the emirs) at the Nigerian poll in mid-December. This no doubt explains the intemperate attack of Sir Ahmadu Bello, premier of the Northern Region on the unhappy British district officers who unwillingly conducted the plebiscite.

RUANDA URUNDI

Late in the Day

The Belgian trust territory in Africa, Ruanda Urundi, has also erupted into the news this week with reports of inter-tribal fights that have cost many lives. Though this outburst was not directly sparked off by the unrest in the Belgian Congo, it is intimately connected with

Belgium's last-minute efforts to speed up political development in the trust territory to keep it in line with the Congolese programme. As so often happens, the attempt to modernise local institutions in a hurry uncovered deep tribal animosities, which in an atmosphere of relaxed European control burst into flames—as also happened a few weeks ago in a Congo province. In Ruanda Urundi the trouble seems to be that the backward feudal element in the Batutsi tribe, who are traditionally the overlords of the agricultural Bahutu (bantu) people, have turned their spears against a



reformist and popular organisation of the Bahutu (to which some of their own younger people have adhered). This Bahutu group expects to win advantages from the reforms that the Belgians have promised to introduce after requests by the United Nations visiting mission last year.

M. de Schrijver, the Minister of the Congo, has now told the Belgian parliament what these reforms will be—the introduction of constitutional monarchies in both Ruanda and Urundi, under their paramount chiefs, beginning with elected local government bodies in which of course Bahutu votes will predominate. These plans bear some resemblance to the reforms introduced in the neighbouring Uganda provinces four or more years ago. Unfortunately for the Belgians, scant foundations have been laid in their trust territory for this development; yet elections are announced for next year. But it is easily forgotten that Ruanda Urundi, though remote, is a closely populated country of nearly 5 million people, and must be expected to develop politically not too far behind the Cameroons, the Somalilands or Tanganyika.

OCTOBER REVOLUTION

Quiet Anniversary

In tune with the prevailing spirit of "peaceful co-existence," the anniversary parade of the Bolshevist revolution in Moscow last Saturday bore more of a civilian than a military stamp. The emphasis was on Soviet scientific achievements. Even Marshal Malinovsky's order of the day to the troops struck a relatively pacific note.

The major political speech is always delivered on the eve of the parade. This time Mr Aristov was entrusted with the task.

Averkhi Borisovich Aristov was already prominent in Stalin's time, but after Stalin's death he was downgraded and sent to the provinces. He returned to the party secretariat in Moscow in July, 1955, and became a member of the party presidium two years later. His come-back was thus connected with Mr Khrushchev's rise to power. Duly, he praised his benefactor: if the Russians had a better diet, this was due to Mr Khrushchev's wise policies; so was the improved international climate.

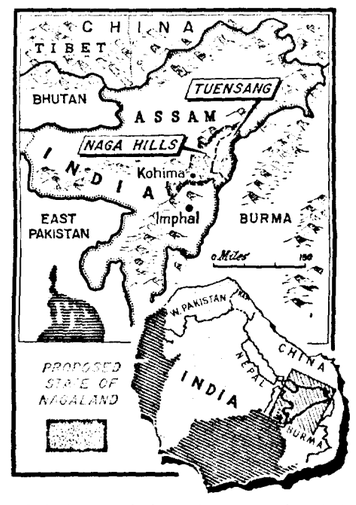
The beneficiary of all these compliments was the star of the Kremlin ball on Saturday. Mr Khrushchev did not actually dance, but he proposed toasts and held an impromptu press conference. Once again he repeated his wish for a prompt settlement of the frontier dispute between India and China, and rejected the idea that the territories involved had any strategic importance. He said the outlook for peace was better because "the Americans are beginning to understand us." A more authentically earthy Khrushchev note was struck in his interview with Major Salah Salem, published in Cairo three days later; in this interview he said that "the policy of strength and brink of war" had died with Dulles, and that the West's new attitude was exactly that of a man grown too old for womanising: "They have a great desire to follow a policy of force and violation of our frontiers, but they no longer have the power."

Peking's Version

In China, two days were set aside for jubilation. The verbal firecrackers let off at the rally in Peking on November 6th

New Line for Nagas

The new tasks which the Indian army faces in the northern borderlands of Assam will be made easier for it if it can now disengage from its long campaign against rebel Nagas in the eastern borderlands. The end of five years' fighting there may now be in sight.



The Naga tribes, about 300,000 strong, are among the largest and the most distinctive of the many hill peoples who inhabit the jagged and jungly mountains that rim the Assam valleys. Their reputation as headhunters may be a thing of the past, but during the second world war they showed their fighting spirit, in irregular operations against the Japanese, whose offensives, pushing past Kohima, left the Naga hills littered with weapons—and with new ideas.

After the war some Naga leaders demanded that an independent state for their people should be carved out of India and Burma. When this demand was rejected, and a new Indian administration failed to appreciate the extent of the tribes' resentment of interference by officials from the plains, unrest mounted. In 1954 a leader named Phizo launched a guerrilla resistance.

At least 10,000 Nagas have fought in this resistance at various times. Recent Indian estimates were that, although more than 7,000 had been killed or captured or had surrendered since 1954, some 2,500 fighting rebels were still at large in the jungle, most of them in the Kohima area, which is Phizo's own home country. Two divisions of Indian troops have been tied up in a campaign which has borne a strange resemblance to other conflicts in postwar Asia and Africa: rebel groups have carved out new settlements in remote parts of the forest, growing their food there and sallying out on raids; whole "hostile" villages have been resettled in areas where the military can keep better watch on them; the frequent announcements of the imminent collapse of resistance have recalled the famous "last quarter of an hour" in Algeria.

Delhi has meanwhile shown itself increasingly ready to take the Nagas' complaints seriously—though not to grant full independence. Moderate tribal leaders have correspondingly shown an increasing readiness to compromise. At the end of October, the third Naga convention held since the conflict began was attended by 3,000 delegates. They agreed, with virtually no dissent, to ask the Indian government to create a new state of Nagaland within the Indian Union, with direct links with the external affairs department in Delhi, and ultimately equipped with its own legislature and council of ministers. Nagaland would embrace the existing Naga Hills and Tuensang divisions.

were certainly worth watching: at least two of the guests, Mr Chervonenko, the newly appointed ambassador, and Mr Fomin, the chief Soviet technical expert in China, were probably wondering whether a more subdued show would have been more appropriate. Mr Peng Chen, the principal speaker, was mainly concerned with relations between his country and Russia; his speech seemed to be inspired by the Chinese leaders' afterthoughts on Mr Khrushchev's visit to Peking six weeks ago. Mr Peng paid Peking's respects to Moscow: he conceded—contrary to the pronouncements that accompanied the setting up of the agricultural communes in China last year—that the building of communism had been inaugurated in the Soviet Union, and that China was following the Soviet example. But he also reminded his listeners that the October revolution represented a victory of orthodoxy over "revisionism" and "rightist opportunism," and that this struggle still continues. The campaign, launched in August, against "right-wing" opposition inside the Chinese party has in fact been intensified.

Mr Peng's pronouncements on foreign policy must have sounded somewhat harsh to the Russians. Starting from the premise that the October revolution had shaken "imperialist rule over the world down to its foundations," he could see no reason why the "imperialists" should be given respite now, when the "policy of war and aggression, headed by American imperialism, is suffering a shameful defeat." Mr Khrushchev's rather different ideas of present world prospects clearly do not sound convincing enough to his friends in Peking.

CARAVANS

Here to Stay

THE regulations governing residential caravans have for long been one of the black spots of British town and country planning. The number of people who live in caravans (as opposed to spending their holidays in them) has been growing rapidly since the war; the best estimate is that they now number 150,000 people, or one in 300 of the total population, living in 60,000 caravan homes. Public policy towards this important group—composed largely of young couples with children—has remained almost uniformly negative. Nobody has really investigated why they live in caravans or what their needs are; there are no effective regulations for the control and improvement of standards of caravan living; and in many people's minds the aims of caravanning and a gipsy life still remain synonymous. Especially in the London green belt, where the demand for caravan accommodation has been greatest, nearly all applications for caravan licences have been turned down. But this has not stopped many unlicensed sites from springing up. It was the furore created by the Egham council's attempt to evict people from such a site that caused the Government to appoint Sir Arton Wilson to make an enquiry. In "Caravans and Homes" (Cmnd 872) he has now made his report.

On the whole it is a sturdily sensible one. After almost a year's work, and with the help of an excellent field survey done by the Central Office of Information, Sir Arton has produced a not unexpected, but certainly authoritative, picture of caravan life. Of the 60,000 caravan homes, he finds that a few are *delightful*, *half* are over-crowded by normal housing standards and an appreciable minority are actually a menace to public health. Many of these last are among the 10,000 caravans now on unauthorised sites. But he found that neither the site operators nor the caravanners were too worried about not having a licence. The wheels of the planning laws grind interminably slowly and most people living in caravans do not intend to live there for long. They have come to be near their jobs or to be on their own, but usually have their eye on a house in the end.

What should public policy be towards these people? Certainly not the rather blind hostility that passes for policy at present. Like it or lump it, caravanning, as Sir Arton says, "is here to stay." The only sensible course is to license caravan sites up to approximately the level of likely demand, and then to control them; so long as this is not done, caravans will simply congregate on unlicensed sites, where nobody is going to improve amenities (because the caravans are liable to be evicted at any time) and where public health controls cannot be enforced. Once there is an increase in licensed sites (and the licences should be for much longer periods than the one or two years which is all that many authorities at present allow), co-operation with the manufacturers over design and with licensed site operators over amenities can get under way. Sir Arton's report should help this forward.

DEFENCE

The Case of General Cowley

SERVING officers in Britain do not normally make speeches which contradict the policies of their ministers. Exceptionally a serving officer who works in a Nato command may be able to talk round the gag a little, as Admiral Sir John Eccles did not long ago; but generally one stores up one's controversial criticisms for one's memoirs when one retires. Last week, however, in a public speech to the United Services Institution, Lieut. General Sir John Cowley very comprehensively criticised the doctrine set out in the defence white papers of 1957 and 1958, and especially the proposition that a massive land attack in Europe would or could be met by the initiation of nuclear war by the West. General Cowley's views are held by a large number of senior officers, but are not normally ventilated beyond the confines of the Army Council, the Joint Planning Staffs or the CIGS conference; even in those circles they are not universal.

The background to the excited stream of parliamentary questions to Mr Watkinson on Wednesday was MPs' curiosity about who authorised the general's fearless frankness. General Cowley's immediate political superior is Mr Soames, the Secretary of State for War. The question humming round Whitehall last weekend was therefore whether the Army, under Mr Soames, had declared war on the Ministry of Defence; and in particular whether Mr Soames was indirectly warning Mr Watkinson that his men were in no mood to take any more Sandysism from Storey's Gate. Mr Watkinson has so far paid full lip-service to Mr Sandys's policy, though he has said that he must study all points of view. But the most important achievement of the Sandys revolution was the subordination of the service ministries to the Ministry of Defence in general planning and—especially—in its political and strategic applications.

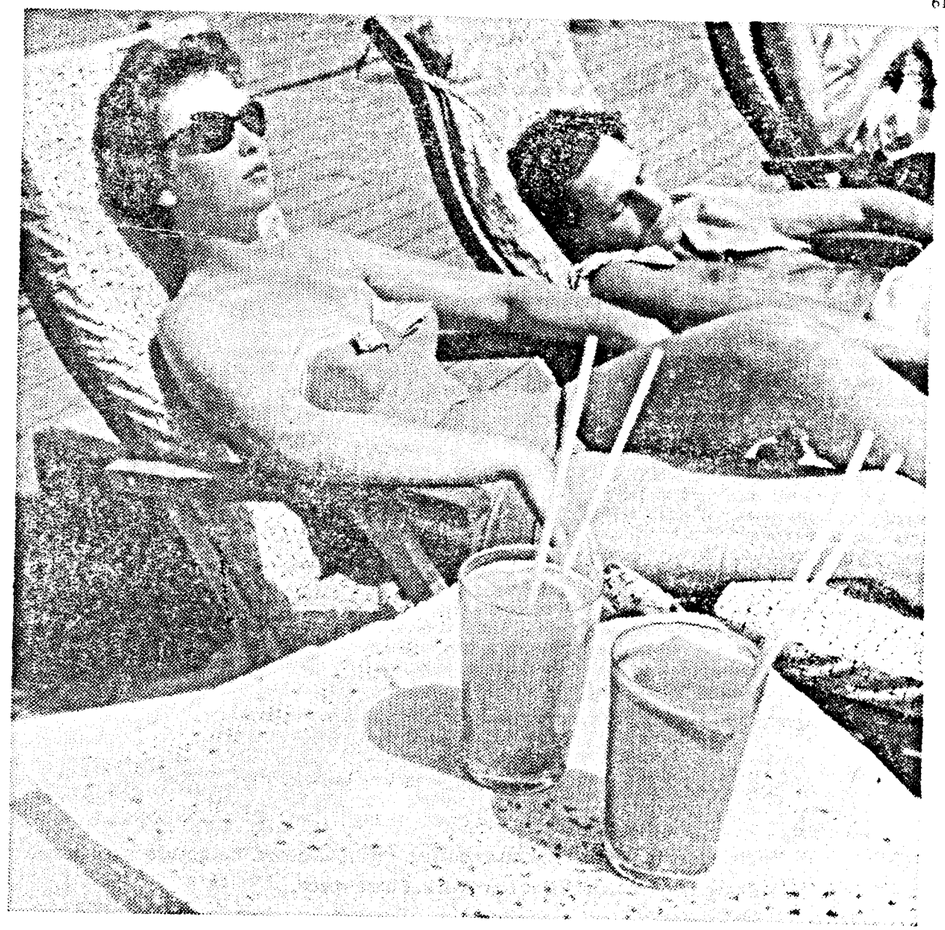
Under political heckling on Wednesday Mr Watkinson was right to uphold this structure. He spoke with moderation, and any reproof in his words was aimed, if it was aimed, more at Mr Soames than at the general. Mr Watkinson is going to insist on censoring such lectures as those of General Cowley in future. He is entitled to do so, but he should not try totally to stifle service criticism of strategic doctrines, especially when (as he pointed out) they are as fairly presented as General Cowley's. The ship of state is not rocked by generals making well-argued if controversial speeches. It is rocked only when there is some suspicion that such speeches are being used not as arguments but as demonstrations.

MIDDLE EAST

No Lion's Share

IN an effort to jog British manufacturers into paying more attention to the Middle East, the Board of Trade has circulated a few shock figures. The advisory council on Middle East trade, a joint venture of officials and senior industrialists, published on Tuesday a pamphlet *Exporting to the Middle East* which mildly chides British companies for allowing so large a share of the trade to slip out of their grasp. Although Britain is still the biggest supplier of manufactured goods to the area, it no longer controls the lion's share of the market as it did immediately after the war. Exports from the twelve principal manufacturing countries (excluding the Soviet Union) rose from £282 million in 1948 to £825 million in 1958, but Britain's share of exports in this period fell from 40 per cent to 24 per cent in 1958; this is a little below the British share in 1938.

British exports to the Middle East have



Her boss was unlucky . . .
he had to race back!

Miss Holt is a much-travelling secretary to a much-travelling business tycoon. Her boss had to go to South Africa recently, and, business completed, was looking forward to a fortnight's well-earned relaxation with his feet up, in Union-Castle comfort all the way home. But London called him and said 'Sorry, you've got to race back, most immediate.' He was *not* in a good temper when Miss Holt saw him off. She took his heavy luggage with her by sea, the restful way, the right way, the Union-Castle way. Sunshine, smooth seas, wonderful food, first class service, swimming, dancing, cinema shows and good companionship. That young man in the next chair is extremely glad Miss Holt didn't have to race back. So is Miss Holt!

the going's good by **UNION-CASTLE**

not kept up with the expansion of British exports to the rest of the world. But the Middle East has more money to spend than ever before; oil revenues are estimated at £500 million a year. Britain's most active competitors are the west Germans, the Japanese and the Russians, and the council hints that British manufacturers have had trade snatched from under their noses while they worried about political unrest or about difficult and unorthodox trading conditions.

In fact, none of these three competitors was in a position to supply much to the Middle East in 1948; this postwar abnormality could not last for ever. The question is whether so much need have trickled away. The outstanding loss, glossed over by the council, is trade with Egypt, where both the Soviet Union and west Germany have been particularly successful. In 1948, Britain supplied Egypt with £34 million worth of goods; ten years later, after events which were not the fault of any manufacturer, this had dropped to £13 million. The council holds out high hopes of increased trading with Persia, Kuwait and Qatar; about Egypt it is guarded.

PIGS

Riding the Pig Cycle

LAST week's adjournment debate on the pig industry produced, not for the first time, a plea from the bacon producers for a separate guarantee and marketing system. They want the Government to insulate them from the inconvenient impact on their market of the fluctuating demand for pork and for manufacturing pigmeat. With the recommendation of the Bosanquet Committee behind him, the Joint Parliamentary Secretary to the Ministry of Agriculture firmly rejected this plea; but he conceded that both producers and curers are having real difficulties at the moment.

From the specialist bacon-pig producer's point of view, the trouble with the existing system is that as pork prices rise—doubly boosted, at present, by the high price of beef and by the scarcity of porkers at the low phase of the pig cycle—the amount of deficiency payment automatically drops. He can, it is true, switch his baconers to the pork market; but the more highly he has specialised the less he likes this expedient. Moreover, any consequent fall in the supply of bacon pigs fails to elicit higher prices, because imported bacon fills the gap—much, be it remembered, to the consumer's benefit. Indeed the moderately reduced throughput since last year (2.7 million pigs going into cure compared with 2.9 million) has raised curers' costs, and so forced them to drive a hard bargain which has played havoc with some farmers' profit margins.

None of this, however, is a sufficient argument for further raising the guaranteed price or for insulating the bacon producers from the pig market in general. At most, it may be an argument for raising the quality premium to encourage those specialists who genuinely need only a few more years' selective breeding and experience to beat the Danes at their own game. Those who cannot do this would be better serving their own interests and those of the consumer—who is not irrevocably wedded to the "Wiltshire cure" and indeed is showing an increasing interest in prepacked bacon "tailored" from fat hogs—by aiming at the qualities which make for versatility between bacon, pork and manufacturing markets. They should stand ready to serve whichever pays best. The pig cycle is a genuine and costly nuisance, but it would be none the less so for being lifted bodily to a higher price level and its swings would become wider still if artificial barriers were set up to stop the flow of pigs between different markets.

EGGS

Good in Parts

THE annual report of the Egg Marketing Board has a patchy story to tell. Total registrations with the board have increased by 8 per cent; throughput by 14 per cent; consumption of eggs in shell is rising, but not at the same pace as production. Because of this, stocks of frozen eggs are considerably larger than last year, and involve the board in some expensive finance.

The frozen-egg market is a grossly unprofitable one; even after processing, itself an expensive business, nobody will buy the frozen product at more than the equivalent of 2s. 6d. a dozen eggs. Experiments with spray-drying are being carried out (with reasonable confidence that the new-style dried egg will be much more satisfactory than its unloved wartime predecessor), but even if they are successful no direct financial gain is expected. The crux is the shell-egg market; and here the board is, so far, just about baffled.

For reasons of economy (surely misplaced) it has no machinery of liaison with the retail trade and is consequently unable to use its strategic position to advise on prices, packing or publicity. It is constitutionally excluded from the determination of grades, which are settled by negotiation between the Ministry of Agriculture and the National Farmers' Union. And to this constitutional difficulty there is added an apparent temperamental aversion from the very idea that as between two eggs of similar size and grade, as determined by candling, one may be better than the other. Taste-buds, it seems, are too idiosyncratic to be catered for: a conclusion which would surprise the producers of almost any other foodstuff (and give the wine business apoplexy) but which, so long as it is accepted, effectively rules out the notion of a premium grade.

The Economist

NOVEMBER 12, 1859

TOO MANY GOVERNESSES

"We are glad to see the lady-philanthropists who have hitherto been chiefly known for rather vague and unprofitable speculations on the true sphere of women, devoting their main energies to the elucidation of a practical point of first-rate economical importance,—the needlessly contracted limits of educated female labour,—the best modes of remedying the evils that will exist so long as those limits are so narrow,—and the surest means of gradually extending them. The paper on this subject, read by Miss Parkes before the Social Science Meeting at Bradford . . . sets forth simply enough the great evils which result from the overcrowded state of what we may call the half-educated-governess market, and the clear obligation under which every parent, who is not rich enough to make any permanent provision for his daughters, lies, to give them such an education as will fit them to practise some fairly remunerative calling,—in short, to put them in a fair way to win their own livelihood, as he already feels that he must do with regard to his sons. . . . Again, Mr. J. S. Mill has pointed out with his usual clearness and ability, that all occupations which can be filled or nearly filled up by what he calls *subsidized competitors*,—that is competitors who do not principally depend on these pursuits for their living, but who are *subsidized* from other sources,—are very apt to be underpaid. Such persons occupy their leisure hours, when they have them, with pursuits which, perhaps, they rather prefer to inactivity, and for labouring at which, therefore, they are willing to take small wages. . . . It is obvious that if *educated female labour in search* of employment is to seek the best market it can have, it must seek one where the rate of wages is determined,—*not* by this subsidized class, but by professional labour;—*i.e.*, it must, so far as possible, avoid flocking into one and the same pursuit, and distribute itself over arts in which the great body of workers are not in any way of the amateur class. . . . The rate of *salary in the lower-class daily-governess market* is almost completely governed by what those are willing to accept who are very anxious to get some addition to their means, who yet have some very narrow means of other kinds, and who can get employment only by underselling others. This is the worst of all kinds of markets for the purpose. Educated female labourers would do well to look to spheres of occupation where the *general rate* is determined by a strictly professional standard. Wood-engraving, lithography, modelling, engraving on gold and watch-dials, and other such occupations which have been suggested, though not so highly remunerated as labours which require the unremitted devotion of a lifetime,—are at least not liable to have their rate of wages depreciated by the wholesale competition of "subsidized" labourers.

LETTERS

Growth versus Income

SIR—Your article last week was interesting, but you were led to some statements and arguments that most actuaries and stockbrokers would regard as unsound.

First, pension funds cannot be classed among "investors who are sensitive to loss of current income." The great majority of pension funds in this country are still growing funds, with income exceeding expenditure by a considerable margin, and with very long term liabilities. In these circumstances pension funds are long term investors and are free to choose the investment that gives the best effective yield, taking into account all payments in the future, and they need not be swayed by a yield based on last year's or this year's dividend alone ("effective yield" in this context has been defined and discussed in several papers read before the Institute of Actuaries). It is also doubtful if "insurance companies on their non-participating life business" would exactly come into this category, but the technical considerations are rather too lengthy to discuss here.

Secondly, your correspondent is concerned only with yield on last year's dividend, when logically with an equity share it is the earnings yield that matters. Put very simply, if a company pays a dividend of 5 per cent out of earnings of 20 per cent, the whole of those earnings are attributable to the ordinary shareholder; if he only receives 5 per cent, then the other 15 per cent is being retained by the company to further its business and should produce additional profits for the benefit of the ordinary shareholder. In the United States, earnings yields (or as they put it "price times earnings") have for a long time been of prime importance. In this country emphasis has been shifted to dividends by political restraints on dividends that one now hopes will not reappear. Increasing dividends in this country are, therefore, likely to come from shareholders receiving a larger share of earnings (as in the United States) as well as from a "growth" of profits.

Thirdly, when discussing capital appreciation for private investors your article omits to mention tax. The average private investor is keenly aware that a £1 of capital appreciation is worth much more than an extra £1 of income (less tax at a marginal rate for unearned income) and bases his assessment of investments accordingly.

Finally, should not tables that extend 19 or 20 years into the future allow for compound interest? —Yours faithfully,

J. G. DAY

Messrs David A. Bevan, Simpson & Co., Threadneedle Street, EC2

Mergers

SIR—Your discussion of "Queensberry Rules for Bids" was astonishing to any American familiar with the history of corporate merger in this country. I appreciate that the Bank of England committee report, which was the subject of your article, dealt with problems of conflict of interest between management and shareholders; but I am dismayed that a liberal journal should comment that "The interest of shareholders is . . . the only criterion." The antitrust laws of the United States embody the concept that it is the *public* interest which should be paramount in mergers. The public interest may well run counter to that of both management and shareholders. This is the case when enterprises are merged to eliminate competition between them or when a dominant enterprise swallows up a chain of distributors whose distribution facilities thereby become unavailable to other sellers. Of what avail your new Restrictive Trade Practices Act, if it outlaws restrictive agreements only to give rise to a more potent and permanent restraint of trade, the concentration of economic power in a few vast combines?

To the list of innocuous objectives of mergers reported by you, it would be well to add those revealed by investigation in this country: suppression of price competition, a kind of sporting rivalry among some industrialists to be "the biggest" (quite independent of demonstrable savings from scale of operations), and profits to investment bankers and other promoters of mergers. Your readers should certainly not be encouraged to accept uncritically the proposition that efficiency or other gain from "*rationalisation*" increases indefinitely in proportion to size.

Moreover, the benefits of rationalisation can be brought about by agreement as well as by merger. Rationalisation by agreement is subject to official scrutiny under the Restrictive Trade Practices Act, which puts the burden of proof on the proponent to satisfy the court that public interest will not suffer. From this side of the water, it is hard to see why rationalisation by merger should not be subject to an equivalent supervision.—Yours faithfully,

LOUIS B. SCHWARTZ
(Professor of Law)

University of Pennsylvania, Philadelphia

American Education

SIR—Your recent article "Going to College?" states that New England lags behind the Pacific and mountain states in the college attendance of its natives "because of the large proportion of comparatively recent immigrants in its Italian, Irish, and Polish minorities."

California is the Pacific state most notable for "universal" attendance. The reason for this is not the Anglo-Saxon make-up of its extremely mixed population, but its tax-supported educational system. I teach at the leading state university ("red brick" in England), that of Massachusetts, and our student body, like that of neighbouring state universities, accurately reflects the ethnic make-up of our state population. Indeed, the majority of our students are of Italian, Polish, Irish, and (what your writer never imagined) French Canadian descent. The Yankee minority is as important as any of these.

The real reason for the lag is that here in Puritan New England—the home of the Ivy League—education is a major "industry." Most of our institutions are supported by endowments of hundreds of millions of dollars and by tuition rates averaging, for leading schools like Harvard, Yale, Amherst and Dartmouth, about $1,000 per year. Even the few tax-supported schools reflect our Puritan parsimony, for they have the highest state university tuitions in the country. Education is expensive in New England. Also to be borne in mind is the fact that the best of our endowed schools are national institutions which must distribute their places to Oklahomans as well as to Vermonters.

By contrast, the Pacific and mountain states, traditionally generous with the use of tax income for "welfare," parks, and the like, have tuition rates ranging from nothing to a few dollars in token fees. Endowed schools are few in number.

Old England, alas, has always misunderstood New England.—Yours faithfully,

MARIO S. DE PILLIS

University of Massachusetts

South Africa

SIR—In your note entitled "Cold Comfort for Dr Verwoerd" you appear to draw conclusions from the results of the South African provincial elections that cannot be justified. Very little, if anything, can be made of the fact that the Nationalists had a minority vote. The 69 Nationalist candidates obtained over 8,000 more votes than the 86 United Party candidates. It is true that candidates of minor groups, who in all cases were very much anti-nationalist, obtained some 25,000 votes, but against this it must be remembered that 52 Nationalists, but only 31 United Party candidates, were returned unopposed. Further, it is not correct to state that the other candidates, although they were anti-nationalist, were associates of the United Party. In fact, with one or two exceptions, they opposed the United Party candidates and not the Nationalist candidates.

An analysis of the 51 seats that were contested by both major parties at the parliamentary general election last year, as well as at the provincial election this year, shows that the Nationalists' share of the poll in these seats increased from 57.4 per cent to 57.8 per cent. It is possible that a larger swing to the Nationalists was expected in view of the many new voters in the 18 to 21 age group but these must have included a substantial number of the war babies, whose parents are probably mainly United Party supporters.

I feel that the only reasonable conclusion that one can make is that the results show no substantial change from the position 18 months ago.—Yours faithfully,

Cape Town H. DE G. LAURIE

The New First Lord

SIR—To any reader in Australia, your reference to the new First Lord of the Admiralty a fortnight ago will seem singularly ungenerous and unjust. Surely it is relevant to his appointment that as high commissioner in Australia, Lord Carrington was outstandingly successful.—Yours faithfully, YOUR CORRESPONDENT

Canberra

Development Areas

SIR—Industries which are likely to be successful in the future will be of two kinds: those in which an ever growing capital investment will lead to a mass-produced product of high quality and low cost, and those in which the highest skill, allied with advanced technology, will produce capital goods of a new kind.

The former industries are unlikely to be great users of labour, in relation to the volume of their production. The latter are practically forced, for reasons of Government policy as much as historic development, to operate in the Greater London area. If any of the attempts now made to place the economy of the development areas on a sound footing are to have any permanent results, the problem cannot be left to the Board of Trade alone. The Minister of Aviation (as a bigger customer of the electronics industry, for example, than all other customers put together) and the Minister of Science could, between them, make a big contribution to the even development of the new capital goods industries over the country as a whole.

While the trading estates have provided useful employment in the development areas, they have not been successful in attracting high-skill industries. What is worse, automation will, before long, end quite a large proportion of the jobs now done in some of the industries established on trading estates, at least in some of the more efficient firms.—Yours faithfully,

HERBERT LOEBL

Joyce, Loebl & Co., Gateshead-on-Tyne

BOOKS

The Unions' Crucial Years

The Growth of British Industrial Relations

By E. H. Phelps Brown.
Macmillan. 451 pages. 42s.

No branch of social studies fares so badly for good literature as industrial relations. Trade unions and collective bargaining seem to inspire neither the author nor the electorate today. But there was a time when they did. The thirty years before 1914, which saw amongst other things the rise of the unskilled workers' unions and some of the bitterest strikes in British history, was such a period. At times industrial unrest was such that the stability of society itself seemed to be at stake. Professor Phelps Brown, in this excellent book, has done his subject justice. His success augurs well for the future of the Cohen Committee on productivity and prices, whose economist member he has recently become.

The best part of the book describes the social background to those troubled, but formative, years. Professor Phelps Brown, as a result of his work as professor of labour at London, has been able to dig up a fund of knowledge about contemporary schooling, diet, medical care, housing, factory conditions and wages; he has then welded all these facts together to give a moving and thoroughly warm-hearted picture of the wage earner's life at the turn of the century. His lot was not then a particularly happy one, though it had been steadily improving; in 1880, the real value of the average pay packet finally passed the previous high point it had reached at the end of the fifteenth century. But the workman's ambition, focused more sharply by the new system of universal education, had been rising as fast as, or faster than, his pay; when real wages stopped their secular rise in 1900 trouble in plenty lay ahead. The railways and the mines were a hotbed of discontent; violence—in Ireland, at home and in Europe generally—began to threaten the Victorian way of life; new trade unions, dedicated to a socialist revolution, were coming to the fore.

One key to the violence of the period lies in the formation of these unions. Before the 1880s discontent with the established order may have been widespread; but, since it was scattered, it was largely powerless. (The strong but exclusive craft unions that had been digging themselves into the industrial scene since the 1850s preached no revolutionary code.) The formation of the new unskilled unions in the 1880s, and their prolonged growth in the years of left-wing government after 1906, served for the first time to bring these discontents together and to channel them into a coherent pattern of protest and action. This position of the union as both the symptom and creator of organised popular discontent is rather underplayed in the book. But this centralising of grievances (and the fact that able union leaders were at hand to exploit them) was one reason for the success of the trade unions' parliamentary campaign; and that in turn was a powerful force behind the great spate of welfare legislation that followed the Liberal victory in 1906.

But even old age pensions and health and unemployment insurance did not stop the trouble in industry. Some employers, like those on the railways, refused to recognise the unions, and this led to many bitter struggles. Finally, and unwillingly, the Government was forced to intervene. Asquith's conciliation boards, combined with the procedures that employers and unions in many industries had worked out for themselves, had already by 1914 shaped most of the machinery of collective bargaining as we know it today. The unions had already assumed their craft—or occupation-based—structure, to the detriment of workshop bargaining; they were already suspicious, as they remain today, of the power of a strong executive. Employers' associations tended then to be the same gatherings of reactionary gentlemen as they are today. And in the centre the Government, as it does now, took as little direct part in industrial relations as was compatible with its belief in a reasonably ordered society.

Professor Phelps Brown is right to emphasise the traditional nature of collective bargaining machinery; his regret that it has changed so little is also well-founded. What we need here is the type of productivity-oriented bargain that is struck in, say, the American automobile industry; but this can never be done as long as half a dozen or more autonomous unions are represented in the average English workplace. In the vacuum left by the craft union organisations in England, work-place groups of shop stewards have naturally formed; but these important and organic bodies, being outside the union branch, have been largely ostracised and allowed to go their own way. Industrial relations have suffered as a result.

The last chapter in this book is, however, the weakest. Professor Phelps Brown suggests here that, apart from a softening of social attitudes, there has been little change in collective bargaining since 1914. This is true of the machinery, as we have

already seen ; but more subtle changes have certainly been going on. The unions, once the management ladder of the able working class boy, are that no more ; while higher wages and the growth of employer paternalism has made the opposition role of trade unionism harder than ever to sustain. The unions may no longer have the internal dynamic to keep themselves abreast of the times. The last election, even if not this otherwise perceptive book, has warned them of what may be the consequences.

When the Moon Was Blood

The City that Wouldn't Die

By Richard Collier.
Collins. 256 pages. 16s.

"THE statutory period of silence having elapsed, it is now permissible to reveal that the editorial and publishing offices of *The Economist* were entirely destroyed in a recent air raid. What made the disaster worse was that the printing works in which the paper has been produced since it was forced to migrate by the Great Fire of London on December 29, 1940, were also completely destroyed in the same night. *The Economist* thus found itself without a home, without a printer, and without any preparation for the next week's issue (with the sole exception of one short galley proof carried away by mistake in a compositor's pocket)."

The quotation is from the issue of *The Economist* dated May 24, 1941. The reference is to one tiny local incident among the violent and fiery happenings in London during the brightly moonlit night of May 10th-11th—much too tiny to find a place in Mr Collier's splendidly evocative and admirably documentary reconstruction of the Luftwaffe's last and heaviest mass fling against the British capital before turning eastward to Russia in the following month. The blitz on London was really over when this devastating assault was, almost whimsically, mounted. This awful night, which Mr Collier so convincingly and so movingly describes by his spot check from person to person on what actually is remembered of what went on in the close ambit of the relentless bombing and fire-raising, had no place in any rational pattern of warmaking.

It was the night when Hess (irrelevantly) came, when the House of Commons as well as the Queen's Hall went up in smoke—and, above all, when the water ran out. "Incredibly," Mr Collier records, "the whole city locked in by a triangle of water was as dry as the Sahara." Bombarded by high explosive which broke the water mains one after another, blanketed by the simultaneous hail of incendiary bombs that started countless fires, guarded by only one fire-watching householder or business firm out of every four that should have been there, and protected by a fire service which was not rationalised and centralised until after this final big blow had been brutally struck (another article in the same issue of *The Economist* of May 24, 1941, dealt with the new Fire Services Bill to bring the fire brigades on a regional basis under national control), London was wide open that night. "Sergeant's Inn, too, had caught, but the caretaker had locked up for the week-end and taken the keys." It was from Sergeant's Inn that *The Economist's* offices in Bouverie Street, beginning with the precious, burnable library, caught fire in the Sunday morning of May 11th, after the raiders had gone.

The tale is one of the ordinary human qualities writ large—unintended great courage, fear among even the bravest, simple good sense and comradeship, cowardice and sheer escapism. It is so well told, from what those in the target areas can now recall, that it could be taken as the epitome of what a community when challenged can, and cannot, do—from the routine, dogged bravery right down to the dodging of the column by the colleagues of the brave to the beastly looting and the febrile celebration of the many more thoughtless ones.

Was it important, strategically? Air Marshal Sir Sholto Douglas, in charge of the fighter plane defence, said that "We should soon have been inflicting such casualties on the enemy's night bombers that the continuance of his night offensive on a similar scale would have been impossible." It was, all the pundits agree, a dead end. But it was, nevertheless, a ruinous and frightening night—more potent in what it did to some Londoners in a few hours than the new attacks three years after, when the allies were on top, with the frightening V-bombs.

It was fashionable then, and still is, to swap bomb stories. Up to, and including, May 10, 1941, Londoners (with bows to Warsaw and Rotterdam) could boast of their bludgeoning. But the war went on. What the RAF did in 1943 to Hamburg or the American Air Force in 1945 to Dresden, to say nothing of Hiroshima or Nagasaki, showed how ephemeral, and ultimately how pointless, such boasts can be.

Attack on Philosophy

Words and Things

By Ernest Gellner, with an introduction by Bertrand Russell.
Gollancz. 270 pages. 25s.

IN the course of his sweeping attack upon the current philosophical movement, which he chooses to call "Linguistic Philosophy," Mr Gellner divides the members of that school into High Churchmen and Low Churchmen. The former pay all their attention to ritual ; the latter confess to insights into higher truths. Oxford philosophy is mainly High Church, the more passionate disciples of Wittgenstein Low Church. On certain criteria the division might have been made the other way round, but on any criterion Mr Gellner is himself an extreme anti-clerical. His attack is caustic, often perhaps malicious, and sometimes amusing ; and the more malicious, the more amusing. He delights in caricature, and he has done everything to expose the iniquities of philosophical gamesmanship as he sees it. Every countermove has thus been already charted, like a ploy in a game of chess: any reply would, for him, only confirm the errors and the emptiness of "Linguistic Philosophy."

Mr Gellner regards the movement as built upon four pillars, four theories about language, all of them false. The first three of these are concerned with forms of argument from our ordinary use of words ; the last is the theory that general assertions about the use of words are impossible since the uses of words are various. This account of the matter is very dubious. Mr Gellner's expositions are sometimes inaccurate ; his criticisms are nearly all on a very general plane. Like the true anti-clerical he is impressed by the form of what he is attacking and pays special attention to the declarations of faith which his opponents make, rather than their good works. In the course of his argument one rarely comes to grip with a discussion of a specific philosophical problem. Even the differences between the members of the movement are regarded by Mr Gellner merely as indications of the silliness of the movement. Linguistic philosophers are thus not allowed that right to differ which even members of Plato's Academy possessed.

It would be quite wrong to compare the iconoclasm of Mr Gellner's attack with, for example, A. J. Ayer's "Language Truth and Logic." For Mr Gellner has no rival theory to put forward. He makes incidental remarks about certain problems about the nature of the world, which Linguistic Philosophers are reputed not to see, but what these problems are he does not specify. Constant repetition of general criticisms without the backing of a rival theory becomes tedious, especially when disguised as sociology.

Many will no doubt greet the book as the long awaited revelation concerning the Emperor's New Clothes. But philosophical movements can be judged only by their results in dealing with specific problems. There is, in fact, nothing so boring as talking about philosophy rather than doing it. To say this is, in Mr Gellner's view, to employ a gambit which he has already noted. It nevertheless remains true. Mr Gellner's work is a brilliant if somewhat patchy and long-winded satire. As a contribution to philosophy its merits are much less obvious.

Watershed of Imperialism

Good-bye Dolly Gray

By Rayne Kruger.
Cassell. 552 pages. 30s.

JINGOISM was not killed stone dead by the Boer War. But it almost was. Within a few years the Act of Union pointed towards the development of an empire that was based on something more than the right of conquest. In this sense "Black Week," when the British army floundered to defeat,

The Economist DIARY

For the good ordering of the busy man's day (and for the comfort and delectation of his secretary) The Economist Diary is unique.

Specially designed diary pages, a week to an opening, enable appointments to be listed in chronological order. A 13th month (January 1961) simplifies the recording of forward engagements at the year end.

The editorial section, 72 pages of facts and figures, is thumb-indexed for quick and easy reference. The principal contents of this section are listed in the panel on the left.

In addition, there is an entirely new map section prepared for the diary by the Oxford University Press, containing 32 pages of world maps in colour.

Bound in red leather, The Economist Diary is a memorandum book, an appointments register and a complete reference book in one volume, measuring 10 × 8 inches.

ILLUSTRATED PAMPHLET AND FULL DETAILS FROM:

WE'RE USING NATIONAL DAILIES

THIS YEAR, BUT FIRST ON OUR

LIST IS RADIO TIMES

Whatever other media we decide to use, we always head our list of publications with RADIO TIMES.

***Our product is sold to** car owning families. By advertising in six National Dailies, we know we can reach 79%* of them.*

***But** RADIO TIMES alone covers 66% of all members of car owning households, a far greater proportion than any other publication. Obviously RADIO TIMES must be first on our list. With RADIO TIMES and even only two National Dailies we can reach 86%* of our market.*

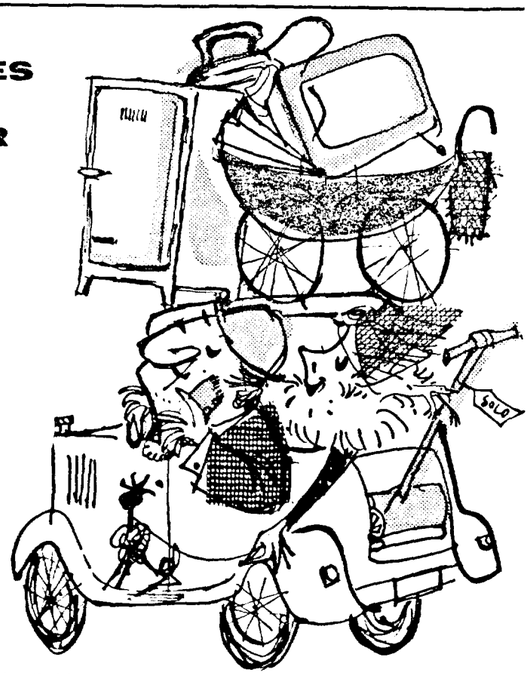
**Figures of unduplicated readership based on special tabulation by IPA. Fieldwork period—January to December 1958.*

YES, IT PAYS TO PUT

RADIO TIMES

FIRST ON THE LIST

Enquiries to: Head of Advertisement Department, B.B.C. Publications, 35 Marylebone High Street, London, W.1



Families that have a car buy not only products like petrol and oil, tyres, car radios, polishes and accessories. They also form an important market for consumer durables and top-quality household goods.

is the watershed of British imperialism. Whatever the poets and the music halls were singing, the idea of empire was being modified and, as the Suez affair did in our generation, the fighting in Africa produced a war of political passion in this country. Among the minor casualties of that war were the windows of the office of *The Economist*, which was at that time firmly in the Little England camp. The Little Englanders were not alone in condemning a war that had its heart in the gold mines of the Rand. It was an unnecessary war. But, given the ambition and thrust of Chamberlain and the conservatism of Kruger, it was perhaps an unavoidable one.

Another Kruger, whose name derives from a family relationship with "Oom Paul," has now written of this war. His book is not partisan; his account of the battles, skirmishes and actions is good—as, indeed, given the wealth of material written at the time it should be; and the choice of illustrations is excellent. Unfortunately, both style and content suggest hasty writing. In an attempt at profundity, Mr Kruger turns many conventional judgments on their heads. He succeeds in being little more than superficial. His researches into the political background do not appear to have been very deep: he is much too kind to Chamberlain, whose complicity in the Jameson Raid is deeper than Mr Kruger seems to believe. He castigates the British army, without showing much awareness of why it was such a blunted instrument of policy and why the Boer War led to the Esher Committee, the Haldane reforms and finally to one of the best trained armies Britain ever put into the field. He makes the odd mistake: Buller did not win the VC twice. He makes the rash misjudgment: Sir Evelyn Wood was not examining the boots of his men during the Zulu war to see if they were well polished (as Mr Kruger implies he was) but to see if they were strong enough to stand up to the long marches that campaign involved. He is much too lenient to Kitchener, even finding some excuse for his blundering tactics at Paardeberg.

Justifiably, Mr Kruger criticises Buller, but does not show much evidence that he understands why Buller failed in the field. Buller was not simply a champagne-swilling fool. Like many in the Wolseley ring, he was quite a good administrator, but, again like many who were Wolseley's men, he lacked moral courage (though not physical bravery) in the field. A reading by Mr Kruger of Sir Ian Hamilton should have shown him why Buller with all his blunders remained popular with his troops and might have suggested to him that the curse on Buller as a general was his tender-heartedness.

Without putting too fine a point upon it, these judgments (and in this reviewer's opinion misjudgments) do not make Mr Kruger's argument that Lord Roberts failed and, in fact, "gulled" the British public readily acceptable. The points that Mr Kruger seems to have missed are that Pretoria had to be taken; that against the background of rivalry between the Wolseley and Roberts rings Roberts had to move very carefully in his handling of Buller; that the delay at Bloemfontein was at least partly the fault of Kitchener's hurried attempt to re-organise the transport system; that whatever tactics Roberts pursued the Boers were not going to wait to be surrounded and "bagged" as was Cronje; and that whatever campaign Roberts had planned and fought it could not possibly have prevented the Boers, once they had a mind to do so, from adopting guerilla tactics. Those tactics, as Napoleon discovered in Spain, are most costly to counter and any attempt by Roberts to counter them before they actually occurred would have been equally costly.

From Baton to Pen

Frederick Delius

By Thomas Beecham.
Hutchinson. 228 pages. 30s.

SIR THOMAS, in characteristic form, called this "a horrid book" at its celebratory launching this week. This is not at all the right word. It is in some ways a dutiful book, written in fulfilment of a promise made to Jelka Delius thirty years ago. It is also a mixed book. But its great merit is to put into much better perspective the whole character and achievement of Delius, which Philip Heseltine and Eric Fenby by no means managed in their books. Aided by a long account from Jelka about her life with Delius and a store of documents from Delius's house in France, Sir Thomas has produced a work of considerable patient research—perhaps this was what he found the "horrid" part, for there are plenty of pages on which he is enjoying himself hugely.

Sometimes, indeed, rather too much, as when simple ideas lose themselves in language of weighty ceremoniousness. There is a hideous arch-delicacy about his first reference to Delius's physical affliction. But there is also some splendid pate-rattling when he turns to the artistic relations between Philip Heseltine and Delius ("Upon me the letters from both sides have always made an impression that is far from agreeable") and a shrewd comment about Delius's responsibility for seeking to impose on Heseltine a too demanding discipline for a mind unfitted for it. These diversions, however, are not the essence of the book, even though they are splendid Beecham. That Sir Thomas, the incomparable interpreter of Delius's music, should reveal himself to be so devoted and honest a biographer shows him as a master of combined talents. The two "almost different personalities" of Delius in his seventy-two years are clearly portrayed. The young man "handsome, open-hearted, loquacious, amorous and gay" gives place to "the last great apostle in our time of romance, emotion and beauty in music." It is perhaps a slightly excessive assessment, but if Sir Thomas holds this view, it would take a froward spirit to gainsay it.

Personal Approach

The Novels and Plays of Charles Morgan

By H. C. Duffin.
Bowes & Bowes. 221 pages. 21s.

THAT a study of the works of Charles Morgan should be undertaken is reasonable, if only because his continental reading-public is large and enthusiastic. His admirers in this country will no doubt welcome this book by a devotee, who explains just what it is that he likes about Morgan's romantic idealism.

Mr Duffin's approach is unashamedly personal, and he appears to regard the characters of the novels and plays as having an autonomous life. Of Mary Terriford in "The Burning Glass" he remarks, "She only once puts a foot wrong, and that is Morgan's fault, not hers." Those who day-dream about what fictitious character they would like to marry will enjoy his method.

His contention that Morgan is an important writer could be established only by comparison of his works with that of some other twentieth-century novelist; but this Mr Duffin avoids. From the index, one would conclude that he does not so much as mention D. H. Lawrence or E. M. Forster, though in fact their names do occur in passing references, as do those of Conrad and James—Joyce, not unnaturally, is ignored completely. But it is useless to complain that critics neglect or are unfairly condescending about Morgan's work unless it is measured against that of writers who have positively contributed to the development of the English novel during the last forty years.

Disaster at Sea

Collision Course

By Alvin Moscow.
Longmans. 252 pages. 18s.

WHAT is the fascination in these accounts of sudden disaster at sea—in which this excellent firm of publishers seems to have established something of a private corner? The Greek unities control and intensify the drama. There is the abrupt contrast between the regularly ordered voyage and discipline and the chaos and irresolution of disaster. There are the neat misses—the missed radio call, or the good luck that kept X out of his bunk just before the collision. There are the human errors—and the pathetic covering and admission of errors—in sailing a wrong course and extricating passengers from catastrophe. There are mothers separated from babies, old ladies trapped in wreckage whom devoted seamen spend hours trying to free, the sudden collapse of sea-going careers and of the reputations of ships' architects.

All this would have gone for the *Titanic*—as we all know from Walter Lord's "A Night to Remember." But this one was different. As some cynic has said, the collision between the *Andrea Doria* and the *Stockholm* in July, 1956, near the

THE ECONOMICS OF MONEY

A. C. L. DAY A concise and fully up-to-date introduction to the subject, with a freshness partly due to originalities in presentation. It is intended for both student and general reader.

OXFORD UNIVERSITY PRESS

Nantucket light was the first radar-assisted collision in shipping history. Mr Moscow's account of the makings of this collision in the quarter of an hour before it happened has the right quality of suspense, built up rather more circumstantially from the bridge of the *Stockholm* than from what was happening on the *Andrea Doria*. The rescue operations in the early hours of a providentially calm morning and the ignominious capsizing of the Italian liner are told with that striving for synoptic quality common to these accounts. The concluding chapters, based on the law suit between Italian Lines and Swedish Lines in the New York Court, are more firmly based on testimony—as far as it went. For early in 1957, three and a half months after the hearing started, the Italians were at the point of having to explain how the *Andrea Doria* capsized. They did not have to do so because the case was settled out of court. The two lines pooled the third-party losses of nearly $6 million and withdrew their counterclaims.

Radar has since been extended to give a true perspective of all objects within range. But the most disquieting section of this book is in its final pages. A further conference on marine rules, says the author, is overdue, and he makes some telling suggestions for making navigation safer. If it is true, as he asserts, that there are about three "near-misses" at sea a day, it seems high time that work on revising the rules started.

OTHER BOOKS

FOREIGN TRADE AND FINANCE. Edited by William R. Allen and Clark Lee Allen. *The Macmillan Company, New York.* 512 pages. 42s.

This is a collection of essays in academic journals on international trade, the balance of payments and the role of exchange rates. The selection is a good one, though it includes only one paper published since 1955. The editors have contributed helpful introductions and commentaries on the main sections.

CASSELL'S SPANISH DICTIONARY. Edited by Edgar Allison Peers, Jose V. Barragan, Francesco A. Vinyals and Jorge Arturo Mora. *Cassell.* 1491 pages. 36s.

The late E. A. Peers started work on this new Spanish dictionary well over twenty years ago; because of the war, the work suffered interruptions and setbacks, and extensive revision was needed before it could finally be published. The result is a thoroughly modern dictionary for Latin American as well as Spanish use, well printed and legible, and exceptionally comprehensive for its price.

FAO'S ROLE IN RURAL WELFARE. By Herman Santa Cruz. *Food and Agriculture Organisation of the United Nations.* 196 pages. 10s. This report is the outcome of a resolution passed by the conference of the Food and Agriculture Organisation of 1957, calling for a review of the social welfare, as against the technical aspects of FAO's activities.

THE CO-OPERATIVE MOVEMENT IN INDIA. By E. M. Hough. 4th edition, revised by K. Madhava Das. *Oxford University Press.* 523 pages. 35s.

SCIENTIFIC RESEARCH IN BRITISH UNIVERSITIES, 1958-59. Department of Scientific and Industrial Research. *Her Majesty's Stationery Office.* 446 pages. 25s.

A PROSE ANTHOLOGY. By Bernard Shaw. *Longmans.* 319 pages. 8s. 6d.

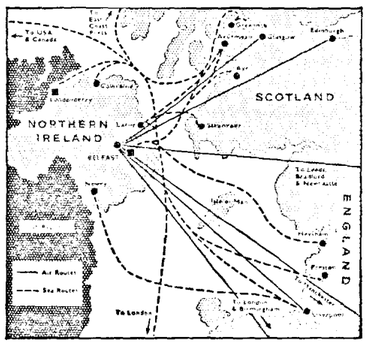
HOW NORTHERN IRELAND WORKS FOR PROGRESSIVE INDUSTRIES

Plentiful trainable labour—Factory buildings at low cost—Generous financial assistance

SINCE 1945, 140 British and American manufacturers, after a thorough investigation of alternative locations in the United Kingdom, have established themselves in Northern Ireland. Over one third of these have already expanded beyond their original needs. The list embraces many firms – small, medium and large – to whom Northern Ireland has provided a vigorous fast-moving alternative to restricted factory output – output shackled by lack of trained or trainable manpower or hampered by insufficient space.

Extensive range of manufacturers

The range of products emerging from these new Northern Ireland factories will stand comparison with those of any wide-ranging centre of manufacturing skills. And it is significant that across so many different fields of industry Northern Ireland has been able readily to meet, not merely the basic problems of siting, manpower and services that face any manufacturing company taking new factory premises but – even more important – the vital individual problems of finance, special services, and factory design.



Abundant available manpower

To expanding industry Northern Ireland has much to offer. By far the most important of the many advantages is the wealth and variety of available manpower – men and women who have consistently earned the very highest praise from experienced company executives for their capacity, in working or in training, to apply their knowledge and skills, their minds and their hands to the jobs before them. Three-shift working is possible and all the companies have found labour-turnover and absenteeism are usually below the mainland average. It takes only a short visit to Northern Ireland to see and learn, in far greater detail than can be attempted here, how thoroughly Northern Ireland works for progressive industries, and *in particular, what special financial and other advantages are available.*

New factory buildings at low cost

See the Northern Ireland Government's *Advance Standard Factories* (from 2,000 to 73,000 sq. ft.) on the current building programme; some now ready to walk into and as complete, well-designed and up-to-date as you could find anywhere. They are excellently sited, with all services laid on, and with at least 100% expansion room available. Learn how the Ministry of Commerce is able to provide a *Standard Factory built-to-order* on a site of your own choice, or a *Special-purpose factory* to meet precise individual structural requirements. Learn how factories can be made available at special low rental rates and many with option to purchase. Special-purpose factories can be provided on an advantageous long-term repayment basis.

Generous financial assistance

For projects recognised as being of particular value to Northern Ireland, the Ministry of Commerce can make available; *grants* towards the cost of factory premises and of plant and machinery; *loans* to help with capital requirements; factories to rent, or on long-term repayment terms; *grants* towards the cost of basic services, labour-training and housing; rebates on fuel and power costs. Alternatively, new firms are eligible for the standard annual capital grants to which all manufacturing firms in Northern Ireland are entitled. Grants of 33⅓% are available towards capital expenditure on new building work and on new and second-hand plant and machinery. The top limits of grants in any one year are £70,000 for new building work and £130,000 for plant and machinery.

Ready accessibility

In a visit to Northern Ireland you will find how near it is to you in time – you can be there in two hours by air, and a one-day business visit is at least as simple as to most principal business centres on the mainland. You will find, too, that Northern Ireland is well served by sea-freight services operating from Belfast, Larne, Londonderry, Coleraine and Newry. Drive-on-drive-off vehicle ferry services, Container services and Air Freight services bring Northern Ireland to your doorstep anywhere in the United Kingdom.

THE ADVANTAGES—IN A NUTSHELL

1 Plentiful trainable labour.
2 Possibility of multiple shifts.
3 Little absenteeism: low labour turnover.
4 High output per man.
5 33⅓% capital grants for plant, machinery and new buildings.
6 Grants towards transfer of machinery to Northern Ireland.
7 Government factories to meet your needs on rental or repayment.
8 Grants for training and services.
9 Concession rents.
10 Industrial fuel rebate.
11 Housing priorities.
12 Active help by Government departments.

AMERICAN FIRM'S SUCCESS IN NORTHERN IRELAND

Largest of nine factories outside U.S.A.

Mr. Thun, reviewing his company's progress in the Board of Trade Journal, says:

"The day that we decided to start our first foreign mill in Northern Ireland was a lucky day for us. Since that time we have started hosiery mills in eight other countries and we have long since learned that doing business abroad can be a very aggravating as well as a very gratifying experience.

We did not, at the beginning, realise how much foreign operation is involved with government. We have found some governments quite expert at putting difficulties in the way of a foreign manufacturer who intends to set up a mill, and at the other extreme we found the government of Northern Ireland which has at all times gone out of its way to help us solve our problems. This is not to say that everything was cheerful and rosy right from the start, because we had our share of discouraging moments, but both at the Board of Trade in London and in the offices of the government of Northern Ireland we always had the feeling of friendly assistance.

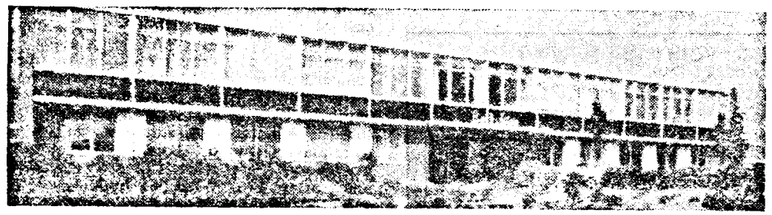
Complete co-operation

We can say without any hesitation that our experience in Northern Ireland has convinced us that there are few places where a manufacturer can build a factory on foreign soil with such complete assurance of local co-operation. When we reached the decision to go ahead in 1948 we and our Scottish associates proceeded with caution, building a relatively small factory of 70,000 square feet floor area with an employment target of 320 by 1951.

While the first factory was being built on a former hill farm near Newtownards, looking over the swift waters of Strangford Lough, we recruited key personnel for training at our parent works in Reading, Berks County, Pennsylvania. They, in turn, trained others in a temporary plant set up in rented premises in Newtownards. The new factory, like the extensions that have been added since, was not built by the government but with our own money and it belongs to us, but we have of course through the years taken full advantage of the provisions of the Northern Ireland Government's aid towards the capital cost of industrial premises and machinery, and their fuel and power rebates. We have also become tenants in recent months of an additional factory they built for us at Dundonald and which we hold at a low rental with an option to buy.

Ferdinand K. Thun, Chairman, Berkshire Knitting (Ulster) Ltd., a subsidiary of Berkshire Knitting Mills, Reading, Pennsylvania

It was Berkshire's desire from the first to minimise the executive and administrative responsibility of the parent company by building up a complete Ulster organisation with administration, technical direction, production and selling being carried out by Ulstermen. That has proved possible. Today, Berkshire Knitting (Ulster) Ltd. is manned almost entirely by Northern Ireland men from the managing director down. So far as I know there is only one American in the concern, a technician who went there from our Reading works as part of a routine round of overseas factories and liked the country so much he married and settled in County Down. Now he manages the Dundonald plant.



Plentiful trainable labour

It is widely known that there is plenty of labour in Northern Ireland and that it is of good quality. Instruction is an expensive process and in stocking manufacture depends on mechanical knowledge and manual dexterity. The low turnover of labour at Newtownards saves us money by keeping down the numbers being trained at any one time. The quickness and adaptability of the local people help to limit the training time and with the fact that Ulster labour can achieve a high degree of skill ensures that a good level of productivity can be maintained. We measure productivity, of course, not just in units produced but in terms of quality as well. There is a training school at Newtownards now, which has indeed been useful to us in training people for some of our other factories.

The floor area of the main Newtownards works, after a number of extensions, is now 120,000 square feet and employs 793 including 458 men. The new Dundonald factory, in which production is just starting, adds another 30,000 square feet to our production space, bringing it to a figure over twice that with which we started, and will add another 150 (half of them men) to the labour force.

Our confidence in the Northern Ireland company's future can be measured to some extent in terms of money invested. Since 1951, when the experimental phase was concluded, about £1,250,000 has been spent on machinery and equipment, and over £100,000 on extending the buildings. Berkshire Knitting (Ulster) Ltd. is today the largest of our nine factories outside the United States and it is one of the six largest plants for making nylon hosiery in the United Kingdom."

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Decision Without Settlement

WASHINGTON, DC

THAT exhilarating sense of the great occasion which is so often felt when the Supreme Court of the United States hands down its decision on a subject of vital public interest was curiously absent from last week's decision on the appeal of the steel workers against the injunction sending them back to their plants. Superficially, the ingredients for drama were there. The case involved a strike of 500,000 workers which had closed a basic industry for almost four months. On one side was the government, on the other the powerful steelworkers' trade union. The union's lawyers had unlimbered their ultimate weapon, an attack on the constitutionality of a statute. And the Court abandoned the relaxed pace which usually means that many months pass before it reaches a decision: it formally accepted the appeal on a Friday, demanded printed briefs by Monday, heard arguments on Tuesday, decided on Saturday.

Now the Court has spoken. The government has won its injunction against the strike, the men are returning to work, steel production is slowly being resumed and everywhere there is a sense of anti-climax, of letdown. From the legal point of view this was a spurious "great case": the Supreme Court made it clear that the legal issues were really thin. Beyond that the decision did nothing to settle the great underlying disputes about steel in particular and labour policy in general. Perhaps, then, the case is a happy reminder that even in America there are controversies which cannot be resolved by the courts.

The statute before the Court was the Taft-Hartley Act, to which the trade unions pinned the highly political and highly inaccurate label "slave labour law" after its passage in 1947. The provision being questioned permits the President, when he believes that a strike, if continued, "will imperil the national health or safety," to move in the appropriate federal court for an injunction sending the men back to work for no more than eighty days.

The union's counsel, Mr Arthur Goldberg, had a three-pronged argument against the injunction. He suggested firstly that there was not yet sufficient peril to the nation's health or safety to justify it. He read "health" narrowly, in the sense of physical health rather than economic well-being; as for "safety," he conceded that some military projects might be short of steel, but said that they needed so small a proportion of total production that only a few plants should be ordered to reopen, not the whole industry. Secondly, he argued that, even if the statutory peril existed, the Court should in its discretion refuse the injunction. The President had less painful remedies, said Mr Goldberg, and an injunction might delay a settlement between the steel industry and the union by removing the economic pressure of a strike. Finally, Mr Goldberg claimed that the provision for an emergency injunction was unconstitutional because it put non-judicial duties upon the courts which the American concept of the separation of powers forbade them to assume.

By an 8-to-1 majority the Court put these arguments aside almost curtly. The judgment said that the Court need not define "national health" because the government had clearly proved the peril to the nation's safety. Nor could the courts require the government to "formulate a reorganisation of the affected industry" so that its needs might be met from only a few plants. As for withholding an injunction because other remedies existed or because there might possibly be an adverse effect on collective bargaining, "we do not believe that Congress . . . intended the issuance of injunctions [to] depend upon judicial inquiries of this nature." The constitutional question was dismissed in a paragraph: it was well-established practice for the courts to issue injunctions in support of programmes carried on by the executive branch of government. The dissent, by Mr Justice Douglas, was only on the ground that the government should be required to prove its need for the reopening of more than a few selected plants.

The language of the majority was restrained. Congress had determined "the policy factors involved in the difficult problem of national emergency disputes," and that determination was "of course binding on the courts." With the exception of Mr Justice Douglas, even those members of the Court most ready to override the political branches of government on matters of individual liberty were determinedly deferential here, as the Court has usually been lately on issues of economic and social policy. Indeed, the Justices may have been especially cautious because of their most notable recent divergence from that prevailing course—the decision which held in 1952 that President Truman's seizure of the steel mills was unconstitutional, a decision which, whatever its legal merits, resulted in a damaging steel strike during the Korean war.

THE Court has left the important matters unsettled: the dispute between labour and management on wages and working conditions in the steel industry; and the developing controversy about how strikes causing a national emergency should be handled. At the moment the outlook for the steel negotiations could hardly be worse. The industry is determined to make its point that it is "fighting inflation" by resisting a large wage rise, and it is serious in its demand for changes in work rules that in its view hold back production. The trade union is more than ever determined to have some substantial gains to show for such a lengthy fight and, with the injunction freezing everything for eighty days, no one seems in a hurry to bargain at all. The reckoning will come late in January, when the eighty days will run out and the steelworkers will be legally free to strike again.

At the moment virtually no one regards the Taft-Hartley injunction as an adequate device for dealing with emergency strikes. The unions are bitterly opposed to it, in part because of a memory of injunctions used in the past by unfriendly judges to break trade unions, and in part because the Taft-Hartley provision forces the employees to work without a contract and under the old conditions. The steel companies are unhappy because the mills will just about have had time to return to full production when the threat of a renewed strike materialises. Government officials have made no secret of their belief that the remedy of an injunction is inept because it tends to discourage, rather than to encourage, the final settlement of disputes. The Secretary of Labour, Mr James Mitchell, said as much publicly a month before President Eisenhower invoked the statute. Of the thirteen emergency strikes halted by Taft-Hartley injunctions since 1947, only two are said to have been finally settled as a result of the Act's procedures.

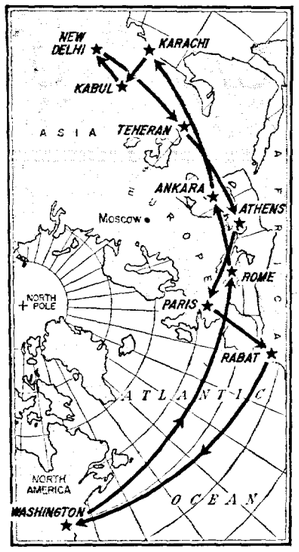
The provision reflects, and suffers from, the circumstances in which it was passed. A Republican Congress, the first in fourteen years, acted just after the initial postwar wave of strikes, the worst in the country's history. Employers then felt that during the war the government had used seizures of industry and other compulsions to advance the demands of the trade unions. The Republicans were suspicious of the Democratic President, Mr Truman. As a result the principal drafter of the Bill, Senator Taft, limited the President's powers narrowly: the seizure of plants was not authorised and boards appointed by the President to investigate disputes were specifically forbidden to make recommendations—a restriction which Senator Taft himself tried later and unsuccessfully to remove. Experts on labour relations are generally agreed that it is folly thus to limit the government to only one course of action, because all sides then expect that action and plan accordingly. The experts would prefer to let the President choose among a variety of remedies for a strike—mediation, seizure, injunction, recommendations, compulsory arbitration.

The difficulty is that this means committing the government to an intervention in labour-management relations which would make a sharp break with the existing ideal of collective bargaining uninfluenced by the government. The Secretary of Labour, commenting on a proposal for compulsory arbitration, has asked "how can you determine wages by government edict without determining prices? And if the government determines wages and prices, we are getting on the road to socialism." Certainly the Eisenhower Administration will move most cautiously in the direction of intervention. The congressional feeling is not yet clear, but a number of Democrats and Republicans with no known love for socialism have called for stronger devices than the Taft-Hartley Act provides. The fact is that the American dream of managers and trade unionists reaching their decisions in private is running up against a growing realisation that there is a public interest in the outcome of the great labour disputes and that the contestants cannot always be trusted to protect that interest.

Grand Tour

UNTIL the addition of Madrid upset the calculations, President Eisenhower's December tour around the periphery of the Communist world was very neat numerically—nine countries, nineteen thousand miles, nineteen days. The inclusion of Spain may be awkward in more important ways, for it suggests to critical observers that the President's trip—officially intended only to encourage better understanding of, and good will for, the United States—is to be followed by demands for more concrete co-operation in the strategy of the cold war; the visit to Spain can be linked with possible future discussions on the establishment of missile bases there. Moreover, there are dangers for the general morale of the North Atlantic Treaty Organisation, and for the propaganda value of the tour itself, in overdoing the courtship of General Franco.

Nevertheless, the rest of the trip has been arranged most tactfully, with everyone on the way to and from India (the place Mr Eisenhower really wants to visit and the place where his visit can do most good) getting at least a few hours of his time, except for the Middle Eastern countries which he presumably does not mind offending. The fact that this is the first time that a President of the United States has been to Asia and that he is coming with the full ceremonial of jet aircraft, motorcades, helicopters and a hundred journalists in attendance, coupled with the attractiveness of Mr Eisenhower's personality, should ensure that his impact and publicity value rival those of Mr Khrushchev's Asian travels. The journey is no easy one for a man of nearly seventy, particularly when at the end of it he must conduct difficult negotiations with



his allies at the western summit meeting in Paris. The trip can only have been undertaken now because important gains are expected from this personal diplomacy—and perhaps also because the President realises that he may not have another suitable opportunity before he leaves office early in 1961.

His excuse that never before has he been able to spare the time is a thin one since governmentally this is the busiest season in Washington, with next year's Budget estimates and legislative programme being drawn up. The President's departure at the beginning of December thus means that two months' hard work is being squeezed into one. This is probably a good thing as far as the most important part of the Budget is concerned, for it cuts short the inter-service battle over the division of the $41 billion or thereabouts allowed for defence. Although spending on missiles is going up, this is the same total as last year and no increase is considered possible if the Budget is to be balanced, as for political reasons it must be. For these reasons it is also expected that appropriations for foreign aid will be reduced. When the President returns to Washington it will be almost, if not entirely, too late for him to reverse this decision, even should his travels have convinced him that it is a mistaken one.

Last Week's Losers

THE state and local elections which took place on November 3rd defied even the party chairmen seeking to identify a trend; the most that can be said is that the Democratic tide so much in evidence in last year's congressional elections does not seem to have receded. In both Indiana and Connecticut, where cities were electing new Mayors, Democrats held their gains and made new ones; the Republicans found some consolation in Ohio; while in New York the score was fairly even. But local eddies washed at the foundations of some of the possible—and impossible—candidates for next year's presidential nominations. To take the latter first, in Kentucky Governor "Happy" Chandler's perennial ambitions collapsed when his arch-enemy in the Democratic party, Mr Combs, won the Governorship by the biggest majority in Kentucky's history. Mr Chandler could not succeed himself and the Republicans had hoped that their man, Mr Robsion, could win through the split in the Democratic ranks. Mr Chandler's disappointment is as keen as theirs, for the Kentucky delegation to the Democratic nominating convention will now support the candidacy of Senator Lyndon Johnson or, if he fails, that of Senator Symington.

In Philadelphia, another ever-blooming candidate, Mr Harold Stassen, who is a Republican, lost ignominiously to Mr Richardson Dilworth in the mayoral election. The ignominy lay less in Mr Stassen's being beaten 2 to 1 than in his unworthy appeal to dislike of the Negroes flooding into the city and to distaste for the higher taxes which Mr Dilworth bravely says will be needed to complete the city's regeneration. Mr Stassen could hardly

DOW PLASTICS *for better products*

Impact! A steel ball falls on a sheet of plastic in a Dow laboratory and leaves no mark. High impact resistance or the ability to absorb shock is just one of the features of Dow plastics. Some of the others are heat and chemical resistance, excellent moldability and wide color range. Extensive research and many years of experience make Dow thermoplastics the most versatile, high quality material for plastic products throughout the world. Whether used in refrigerator or automobile parts . . . cabinets, containers or wrappers . . . colored or clear . . . molded or extruded, Dow can supply the proper formulation. Dow plastics are at work in countries all over the world helping to increase production and quality while cutting costs.

For complete information please contact your local Dow representative or the Dow office in your area.

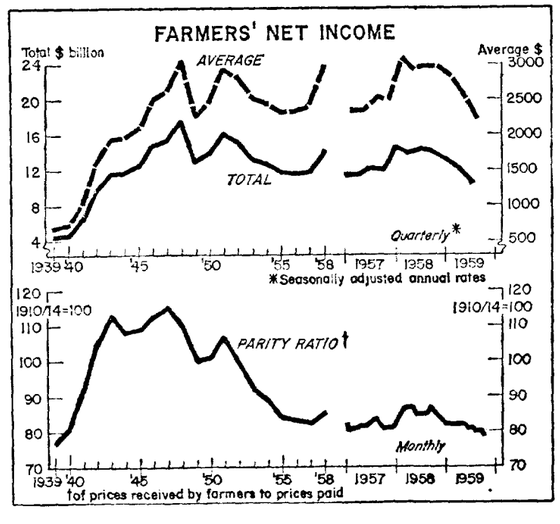
have expected to defeat the popular Mayor, who stands for good government, but it is said that he accepted the almost worthless nomination as a means of ingratiating himself with the Republican organisation and of securing a place on the delegation which will help to choose the Republican presidential candidate next year.

Next door, in New Jersey, Governor Meyner, a possible but improbable Democratic presidential candidate, became a horse of an even darker hue when, for almost the first time, he failed to get his way in the state. The voters turned down his proposal to tap the revenues of the New Jersey Turnpike in order to keep the distressed railways running and the Democrats lost 7 seats in the State Assembly, although they still control it. The real blow to Governor Meyner, however, was the failure of the Democrats to wrest control of the State Senate from the Republicans, particularly as they so nearly succeeded. New Jersey has no Lieutenant Governor and if Mr Meyner, whose second (and, under the law, last) term expires in 1961, were to win a political future in Washington in 1960, either as President or Vice President or as Senator from New Jersey, the Governorship would pass for a year to the Republican President of the State Senate. The Democratic organisation will do its best to prevent this because the Governor has large powers of patronage ; under a Republican many faithful Democrats would lose their jobs.

Down on the Farm

AMERICAN farms may be producing more than ever before this year and American taxpayers may be investing more than ever before in surplus commodities in order to support farm prices, but American farmers are profiting less from this than in any year since 1942 ; in 1960 their total income is expected to decline still more, to only about $10 billion. This is the result partly of increased costs of operation, partly of lower prices especially for maize, hogs, poultry and eggs. Furthermore, the value of what the farmer does earn is declining: the parity ratio, which relates the prices of things he sells to those of things he buys, was lower in October than at any time since August, 1940.

It is against this unfavourable background that President Eisenhower and his determined Secretary of Agriculture, Mr Benson,



are proposing to launch one last full-scale attempt to put American agriculture on a sounder economic basis. The programme is apparently only an expansion and intensification of existing schemes—more land withdrawn from crop production, more research into new uses and markets for farm products, more exports of surpluses, more assistance for low-income farmers and a more realistic basis for price supports. In the last, and most important, field Mr Benson's efforts will probably be concentrated on wheat, still the most troublesome of the surpluses although production this year is about 25 per cent lower than it was last.

But he will find it even more difficult than usual to convince Congress that he has the right answer since the solution he offered for the maize problem has led to a large increase in the surplus and thus to the low prices for maize, and for animals fed on it, which are the chief causes of the fall in farm incomes. This is particularly the case in the Middle West, the region in which Republicans and Democrats compete most closely for the rural vote—and next year is an election year. Mr Benson hopes to mobilise an effective protest among city voters against the high food prices and heavy taxes which result from the present agricultural subsidies. But it will be surprising if such pressure can overcome Congress's customary preference for farmers, particularly when they are doing less well than other people.

Airways Paved with Gold

FROM A SPECIAL CORRESPONDENT

EAST is east, West is west, and the Civil Aeronautics Board has now officially decided that the twain meet in India and Pakistan. But this is only one of many knotty issues to be settled by the CAB in the investigation of air services in the Pacific which was started last February when President Eisenhower ordered it to "present its recommendations to me at the earliest possible date." The earliest date now appears to be about a year away. The first hearings before the examiner did not begin until this month in Honolulu ; more are being held in San Francisco and Washington.

The board's elaborate administrative procedures make for delay, as the British Overseas Airways Corporation found recently ; moreover, the trans-Pacific investigation is only one of a pair of far-reaching route cases now being dealt with. The other, which concerns air service across the southern part of the United States, from Florida to California, is taking much of the already limited time of the board's experts as well as placing a double demand on those airlines which are participating in both sets of hearings.

Each of the cases involves a problem of long-range air policy as well as a large and aggressive airline which has much to gain from a favourable decision. The company which is pushing the board the hardest on the southern transcontinental route is Eastern Airlines. For twenty years the ambition of its founder, Captain Eddie Rickenbacker, has been to see Eastern become the major carrier on this route. After hearings in 1949, a CAB examiner recommended that Eastern be authorised to serve it. But the board over-ruled its examiner and decided instead that service should be provided by interchanges between various carriers. Three of these are still in operation, making the route the last long one in the United States not to be served non-stop or by a single airline.

When the hearings were resumed in September there was added to Captain Rickenbacker's direct testimony, which alone filled nearly 100 pages, the evidence of other witnesses for Eastern Airlines and of spokesmen for five of the other nine airlines applying for the new route—National, TWA, Western, the Flying Tiger Line and a small supplemental company, Universal Airlines ; American, Capital, Continental, Braniff and Delta Airlines had already presented their direct testimony. The record in this case now fills

more than 50 volumes and it promises to be the longest in the history of the CAB.

The chief reason for this exhaustive examination is the great economic value of the routes involved. Four of the carriers estimate that they will gain more than a billion passenger miles if their applications are successful. Six airlines are seeking authority to operate over the whole route; three are asking only that their present services should be extended in part of the area. The six applicants for the long haul estimate that it would add from $35 million to over $128 million a year to their revenues. Interest on the part of cities to be served has also been higher than in any other case that has come before the board. At hearings held in Houston, Los Angeles, and Miami, as well as Washington, 330 community, state, and regional witnesses presented some 4,000 pages of evidence.

TESTIMONY in the Pacific route case is likely to be as detailed and the cross-examination at least as meticulous. So far there are the same elaborate maps of good things to come if the board rules favourably, the same optimistic forecasts of new travellers to be attracted to the air as a result of improved service, and the same insistence by each applicant on its primacy of interest in the area to be served. One difference is that in the southern route case it was the request of the city of Houston, Texas, for a study of its growing need for air transport which prompted the investigation. In the Pacific case it was an unprecedented request from the President. Until now the White House has contented itself with the task of approving or disapproving the decisions of the CAB on international routes, and some legal experts wonder whether the President's letter, and the board's prompt response, may not have settled the long-standing question of whether the CAB is a completely independent agency, or part of the executive branch of government. It is even possible that some disappointed applicant may challenge the board's decision on the ground that it was "improperly" influenced by the White House.

Fourteen airlines have filed applications for Pacific routes and fifteen states and cities have asked to be heard. Pan American Airways, the only carrier authorised by the United States to serve the South Pacific, submitted three thick volumes of evidence in addition to the results of a detailed study of the potential traffic to the Orient. The study, which was compiled by the Stanford Research Institute, indicates that a combination of jet service and economy class fares in the Pacific would lead rapidly to an increase of 47 per cent in air travel. Many travellers going to Europe—who were questioned at Idlewild Airport—confessed to a stronger interest in a trip to the Orient, but felt that it takes too much time and too much money today.

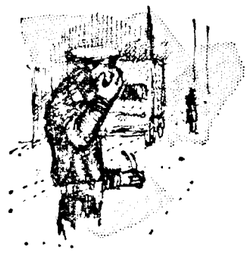
Pan American's testimony, which has been used in press releases although it has not yet been admitted to the record, is intended to support applications both for additional routes in the Pacific and for authority to pick up passengers for such flights in a long list of American cities. The airline points out that it carried 78 per cent of the traffic moving between the United States and the South Pacific in 1948, but that its share has now declined to 34 per cent; to remedy this it wants its routes extended across the United States to the principal cities of the east, connecting there with the line's transatlantic operations. Pan American is particularly concerned over competition by British Commonwealth carriers, which it insists is for all practical purposes a single threat. Both Qantas, the Australian airline, and BOAC offer service across the United States, which Pan American is forbidden to do. Pan American complains

Smog Under Control?

THE recent announcement that a simple and effective device has been developed for eliminating fumes from automobile exhaust pipes may have brought some cheer to the residents of Los Angeles who were then suffering from their first bad smog since mid-April. For climatic and topographical reasons the city is particularly subject to this unpleasant and irritating mixture of smoke and fog and has been struggling to get rid of it for years. Experts now claim that almost 70 per cent of the remaining, and often still serious, smog is caused by unburned petrol vapour from the exhausts of the city's 3 million motor vehicles.

Developed, appropriately, by a local manufacturer of automotive equipment, the new device burns up waste materials in the exhaust and thus gets rid of the hydrocarbons and carbon monoxide which are among the most troublesome air pollutants. Less complicated to make and instal than earlier "afterburners", the invention is also comparatively cheap; it costs between $100 and $200, but even this is probably more than most car owners are prepared to contribute to smog control. However, city officials are expected to press for state legislation making it mandatory to put the device on all cars sold in California.

Among the measures already adopted by Los Angeles are strict regulations to prevent air pollution by oil refineries and other industrial facilities and by private individuals and a law, coming into effect next July, to limit the amount of olefins (contained in high-test fuel) in all petrol



sold in the county. Olefins are supposed to be particularly irritating to the eyes, but the petroleum refiners complain that the new requirement will involve them in a capital investment of $25 million and that equally satisfactory results could be obtained by insisting on the proper maintenance of car engines.

Another recent measure is Operation Fuel Switch: under this scheme industrial users of fuel oil (which has a high sulphur content) change over to natural gas between April and October, the period of hot weather during which Los Angeles is particularly prone to smog—and during which it had no smog this year, the first time the switch was in effect; in the winter months fuel oil can be used except when there is a threat of serious smog.

Los Angeles's experience is being drawn upon by other American cities which are facing similar, even if not such acute, problems of air pollution; it has been estimated that there are 9,500 such communities and that only about 2,000 have ordinances dealing with the difficulty. Attempts at regulating air pollution centre mainly on smoke abatement but they range from control of incinerators in apartment houses in New York to perfume used to mask diesel fumes from buses in Cleveland.

The United States Public Health Service takes samples of air to determine where it is dirtiest and several private groups are studying the effects of pollution, not only on the health of people and animals but also on plants. The chemical industry shares with oil refineries the onus of being the principal culprits, according to popular opinion at least, and in common with other industries is spending large sums on research and control, partly as a public relations project. Altogether it is calculated that damage from air pollution costs the country anything from $4 billion to $7.5 billion a year.

TWA NEW LONG-RANGE INTERCONTINENTAL BOEING 707

On November 24 TWA introduces the new Long Range Boeing 707 Intercontinental — the world's fastest and largest Jetliner — only 7½ hours non-stop London to New York. Leave London 5 p.m., arrive New York 7.30 p.m. Cocktails with your friends in Mayfair — dinner in Manhattan! Just a few restful, luxurious hours in the air and you're *there*, non-stop. Your return flight New York - London takes only 6 hours 25 minutes! And if you're going beyond New York fly on TWA's mighty Jet fleet, again non-stop, coast to coast or to America's major cities. Choose De Luxe or Thrifty Economy Service.

For Reservations see your Travel Agent or call TWA

200 Piccadilly, London, W.1. TRAfalgar 1234 or Manchester, BLAckfriars 4649

Burroughs make a full range of business equipment—that's why, whatever the size of your business, there's a Burroughs system exactly fitting your needs.

Burroughs forward-looking design and precision engineering ensure that each machine, in each class, has all the versatility and the advanced automatic features required by today's modern accounting methods.

Whether your business calls for an adding machine, an accounting machine, or a large electronic computer, you can be sure that a Burroughs machine will give you the right answers—faster, easier, and at a big saving in operating cost.

Your local Burroughs man is available now to demonstrate how you can streamline your accounting with Burroughs data processing equipment. Or write to:

Burroughs Adding Machine Ltd.,
Avon House, 356-366 Oxford Street,
London, W.1. Tel: HYDE Park 9861

Burroughs

1. **New Burroughs Shuttle-Carriage Adding Machine**—for vertical and shuttle listing work on tape or wide forms—easy, speedy, flexible.
2. **New Burroughs Sensitronic with Automatic Reader**—electronic accounting machine providing ledger-keeping with visible record and magnetic storage. Trial balancing made completely automatic when linked to auto reader with individual form handling.
3. **New Burroughs 220 Electronic Computer System**—the most complete electronic data processing system in production today.

that it is the only carrier operating across the Pacific, domestic or foreign, which has been confined to the far western gateways.

Secondly, Pan American wants permission to operate to western as well as eastern Australia, in accordance with the bilateral agreement between the United States and Australia. Pan American reports that it has had difficulty routing its passengers to the west of Australia, and therefore has not been able to sell all the space available on its existing route; it contends that Australian favouritism toward Qantas and BOAC can be overcome only by giving Pan American access to western Australia.

Caribbean Fever

IN two successive weekly press conferences the President has confessed to being puzzled and concerned by new outbreaks of anti-Americanism in the Caribbean—last week in Panama, which celebrated its Independence Day by attacking the American Embassy, before that in Cuba, where Señor Castro, the revolutionary leader, whipped up feeling by accusing the United States of complicity in the "bombing" of Havana. The United States is the mainspring of both countries' economies: it pays Panama nearly $2 million a year in return for rights over the Canal Zone, less than the Panamanians want but almost ten times the amount originally agreed, and it buys about a third of its sugar from Cuba at a premium price; the so-called "sugar subsidy" amounts to about $190,000 a year. Yet it is American policy to turn the other cheek, partly because it does not want to chill relations with Latin America as a whole, which have been growing warmer, partly because retaliation might lead to economic and political chaos.

The United States cannot afford to placate Cuba by withdrawing the embargo on the shipment of arms to the Caribbean imposed in March, 1958, when General Batista was still in power, or by relaxing its efforts to persuade European countries not to allow such shipments. There is too much risk of quite small consignments encouraging Cuba and the Dominican Republic to leap at each other's throats and thus to set the Caribbean ablaze. But Washington has ordered a firm watch to be kept on the 200 airports and airstrips in Florida which, at its southernmost point, is less than 100 miles from Cuba. Arms running from Florida was a commonplace when the Castro forces were battling their way to power and the United States, after this experience, might have moved sooner to prevent political refugees from the Castro regime—not all of them Batista men by any means—from using the same springboard. The United States has also arrested Major Diaz Lanz, the former head of the Cuban Air Force, whom Señor Castro wishes to bring back to face a charge of murder growing out of the leaflet raid on Havana and has warned Cuban refugees that a government-in-exile will not be allowed on American soil.

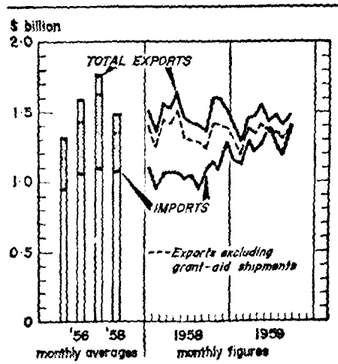
Such concessions may ease the important discussions which must take place soon on compensation for American property now being seized in Cuba. The Institute of Agrarian Reform, which is trying to break up large holdings, has seized about 75,000 acres of land on which American companies (including the Bethlehem Steel Corporation, the largest concessionaire) had mineral or oil rights; sugar properties are also threatened. But unless Cuba pays adequate compensation for seized property, Congress may respond by transferring part of the Cuban sugar quota to friendlier Latin American countries or to domestic producers—although it is plain enough that economic hardship would only strengthen the influence of the Communists in Cuba which Congress fears so much. Unfortunately by his own extravagant language and by the revival of his notorious military courts Señor Castro is fast destroying the remains of the sympathy which American liberals once felt for his cause.

Featherbeds on Rails

BEHIND the suspended strikes in steel and on the docks looms a third, on the railways, which employ in all 800,000 men, far more than the 500,000 involved in the steel strike. A three-year moratorium on changes in wages and working rules ended at the beginning of this month. Long before then the carriers began to take their case to the country in big advertisements which charge that featherbedding, payment for work either not done at all or not needing to be done, costs the railways $500 million a year which ought to be spent on overdue capital improvements. Unlike the steel companies the railways are not riding high on record profits. The steel strike has prevented them from bettering last year's earnings—the lowest in a decade because of the recession—and the competition from road and air transport, which has robbed the railways of so much of their business, prevents them from passing higher costs on to the consumer. None of the other industries now making a stand against wasteful work rules has a sharper incentive for doing so.

Among the horrible examples given by the carriers is a nine-hour run for which the fireman and engineer earn over four days' basic pay because the standard "basic day" was fixed at 100 miles for goods trains and 150 miles for passenger trains in 1920 when speeds averaged 20 miles or less an hour. Other targets are the fireman, who on most trains has no fire to tend, the men who must stand by idle while self-propelling machinery is being used, and other restrictive practices. Such anachronisms affect only the 200,000 operating employees, but for some men and some unions—the firemen for example—they are a matter of economic life or death. Once the aristocrats of labour, the railwaymen have seen 500,000 jobs disappear in the last decade. The unions contend that the examples chosen to make the employers' case are exceptional and that, if the rules need modernising, so do methods of fixing wages; operating employees receive no expenses when they have to spend nights away from home, no holiday or overtime pay.

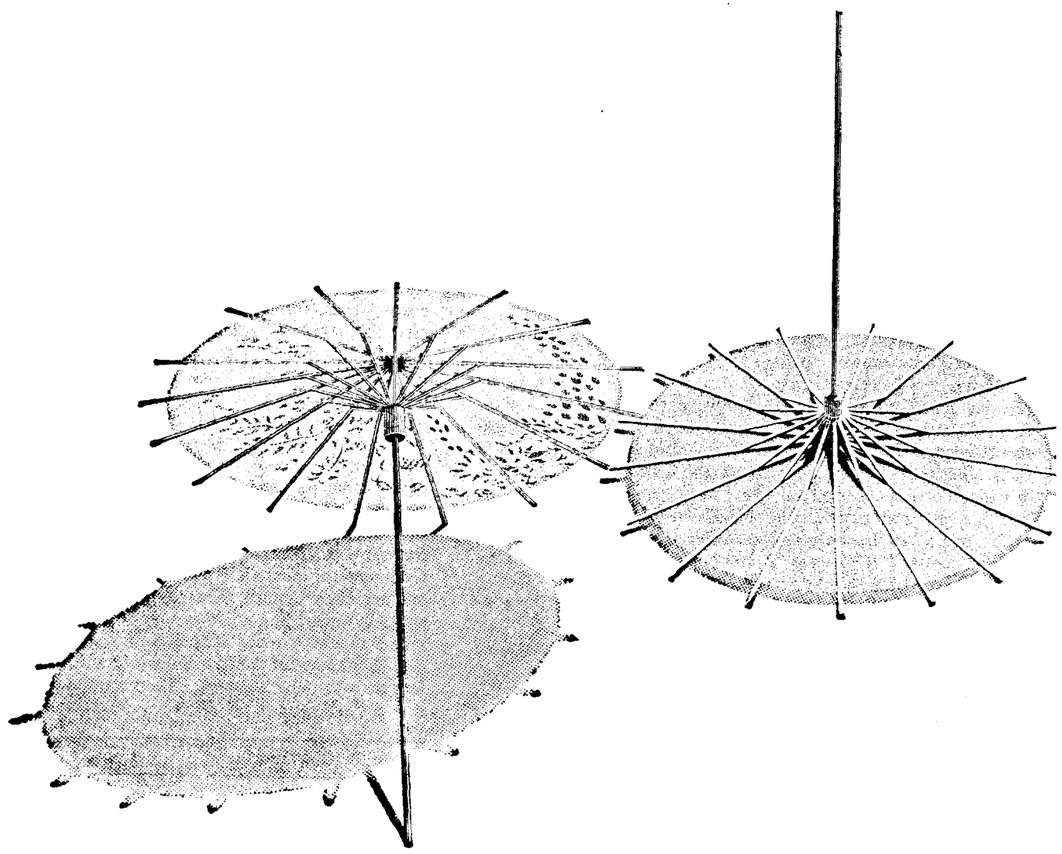
The railways have met the demands of the 23 operating and non-operating unions for a rise in pay with a proposal for a cut of 15 cents an hour, but relief from onerous work rules would be worth a rise. There is likely to be plenty of time, if there is the will, for negotiation. The Railway Labour Act, which until the war was regarded as a model of its kind, contains no provision for the use of injunctions against strikes and is capable of spinning out negotiations until February or March. By then, if the steel strike is settled, the railways may be too busy making up for lost profits to want a strike of their own. But if they are still standing firm they have, for the first time, insurance against strikes affecting less than half the industry. They reason, correctly, that a larger shut-down would bring decisive intervention from Congress.



FOREIGN TRADE OF THE UNITED STATES

In September imports, continuing this year's rising trend, reached an all-time high. But these figures were somewhat inflated, as were those for exports, by advance shipments in anticipation of the dock strike which was then expected in October.

YOU CAN HAVE IT BOTH WA



Think of a product in steel and there's almost certainly a GKN company that makes it. Think of a service to do with steel and there's very probably a GKN company that can provide it. Many companies in the Group offer both—products and services. G.K.N. Reinforcements Ltd., is one of them.

As its name implies, this company produces high tensile reinforcing bars and fabrics. And, in addition to supplying the steel for reinforced concrete structures, it also designs them.

For the largest shell concrete dome in Europe and, more exotically, for the dome over Baghdad Railway Station, G.K.N. Reinforcements carried out the designs and produced the steel.

Products need people to make them; services need people to provide them ; people with intelligence, initiative and individuality. For them, the opportunities within the GKN Group are not merely exceptional, they're virtually limitless.

THE WORLD OVERSEAS

M. Sekou Touré's Democracy

FROM A CORRESPONDENT LATELY IN GUINEA

M. SEKOU TOURÉ, President of the new west African republic of Guinea, is making his first state visits since his country broke with France a year ago, and it is significant that he should have chosen Washington, London and Bonn. (He is in London now.) He heads one of the most unpredictable of the "uncommitted" Afro-Asian states. In the elaborate west African pattern of possibilities, ideals and conflicts, in which almost nothing is impossible, the success of his little country may well be crucial.

In terms of administrative and technical manpower, and of the development of resources, Guinea was totally unprepared for independence. The French had pursued no concerted policy of Africanisation either of the administration or of private trade, and when they left they withdrew practically everything. There were, for example, no magistrates or judges, no meteorological experts, and scarcely any arms. Nevertheless, Guinea did have one very important asset—a highly efficient party structure. The *Parti Démocratique de Guinée* (PDG) is the Guinea section of the old *Rassemblement Démocratique Africain,* which until comparatively recently united African nationalist movements throughout French Africa. In Guinea, the PDG developed a distinctive dynamism of its own; and this was reflected in the fact that Guinea, alone in French Africa, chose independence when it was offered by General de Gaulle in September, 1958.

Guinea is by design a one-party state. In the words of M. Sekou Touré: "The party is higher than the state." Government policy is ultimately decided by a 17-member politbureau, elected every five years by delegates from regional committees. These regional committees are in turn elected by delegates from the 4,300 village committees into which the country is divided. Thus the politbureau, the supreme organ of the party, is indirectly elected by the party membership. The National Assembly, regional councils and local councils are elected directly, but the ministers or heads of departments are appointed by the president in his capacity as secretary-general of the party, and they are therefore primarily responsible to the party. The minister of the interior appoints to each region an executive officer known as a commandant. Thus policy is decided by the politbureau, enacted by the legislative assembly and executed by the ministers.

It is clear that the real power in Guinea rests with the party. In effect, the elections in which non-party members may vote are no more than a formality, since it is only the PDG that puts up candidates. This system of "*centralised democracy*" is inevitably likened to the political regimes of eastern Europe. The impression is strengthened by frequent use of Marxist language and dialectics by party officials everywhere. M. Sekou Touré's four and a half-hour address to the last party congress clearly revealed his Marxist training, though his analysis was by no means orthodox. Judged by these features alone, the system seems dangerously intolerant of opposition or deviation.

On the other hand, there is at present no sign of opposition to the party, nor is there any sign of suppression of opinion. The police are very much in the background, there is no imprisonment without trial, and the only court empowered to deal with political offences has never been used. At the moment there appears to be both genuine consent and firm authority. How is it achieved? The official answer is that while the party itself cannot be changed, both its policy and its personnel are the creatures of the people. Every major decision of the politbureau is derived from the discussions and resolutions of party committees and congresses. Thus the public execution of thieves is said to have been introduced in response to popular pressure, and is justified by the government almost entirely on this ground. In theory, therefore, the party is democratic in its internal management. The practice remains an open question.

At the moment, however, the overwhelming impression in Guinea is of enthusiastic unity. In face of dire shortages of trained manpower and capital last year, improvisation was essential. Barristers practising in Conakry were immediately made magistrates in place of departed French officials. The only capital that could be mobilised was that latent in the under-employed population. Roads were constructed to connect villages, trees planted to prevent deforestation, schools and dispensaries planned and built—all by the local people and all of it unpaid. This became known as the programme of *investissement humain,* and it is now being organised by the party on a regional and even a national scale.

THE government is following a policy of economic development through the strict control of resources. The *Comptoir Guinéen du Commerce Extérieur* was set up after independence as a state trading organisation with the sole right of import and export. In addition, it has the monopoly of such commodities as rice, flour, sugar, cement, beer and matches, most of which are sold at a controlled price throughout the country. The government claims that these steps were necessary in view of the uncertainty threatened by political and price speculation by the large expatriate trading organisations. Whether or not this is justified, the effect is that private trading is very much on the defensive. As more and more commodities are made the subject of trade agreements by the government, the trading companies have less and less choice as to where they will buy their goods. Most of them continue to operate apparently only in the hope that the *Comptoir* will prove too expensive an experiment, since it is reputed to be working at a heavy loss.

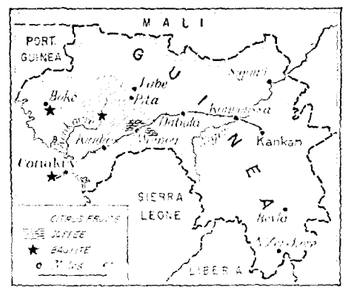
Large companies exploiting the country's mineral resources are still mainly unaffected by the new regime. Agreements with the government guarantee their conditions of operation, and imports are not interfered with. At present this is a convenient arrangement for Guinea. For instance, the big international bauxite consortium, known as Fria (in which the capital is held in the following proportions: USA 48.5 per cent, France 26.5, Britain 10, Switzerland 10 and Germany 5), pays in taxes of various kinds the equivalent of roughly a quarter of the annual budget. And when the alumina comes into production in January, it will provide a valuable source of foreign exchange.

The official economic policies are being pursued everywhere with vigour and an almost puritanical self-sacrifice. A self-imposed

wage freeze by the trade unions is matched by a total lack of ostentatious spending by ministers and officials. The wife of one minister is an over-worked midwife in the crowded hospital at Conakry. Corruption is severely punished at all levels in the party and the government. Nevertheless, these programmes for development and control require resources of both capital and manpower far greater than Guinea can muster on its own. It has had to look beyond its borders.

Trade agreements have been signed in the following chronological sequence: East Germany, Czechoslovakia, Poland, Russia, Hungary, Bulgaria, Morocco and Britain. Signed in principle, but not yet arranged in detail, is an agreement with France covering trade, cultural relations and technical assistance. The sequence of agreements tells its own story: the East stepped in with alacrity to fill the gap left by the French withdrawal. But trade agreements presuppose something to trade in. Some of those with east Europe represent little more than an undertaking to buy as much as possible up to a certain figure. But at present Guinea's needs far outstrip its capacity to export. It has little to offer the East apart from comparatively small quantities of coffee, groundnuts, bananas, diamonds and citrus fruits. Bauxite will be an important export when the Fria scheme comes into operation, but its entire output is in private western hands.

Like many newly independent countries, Guinea is suspicious of outright gifts. "There are no *gifts in the* world—everyone expects a price, and we would rather pay it in cash" was the view of a senior official in the department of external trade. Only three outright gifts have been accepted. The Czechs provided such basic necessities as arms, medical supplies and agricultural implements which had been withdrawn by the French. The Americans sent flour and rice, and the Chinese rice, when famine was threatened by crop failures and trade dislocation. Both these shipments arrived on the same day. Two large loans have been negotiated. The first, a loan of £10 million from Ghana, is repayable at 2 per cent over ten years. The second, from Russia, was for 140 million roubles at 2½ per cent, repayable over 12 years. Long-term agreements have been signed with Czechoslovakia, Poland and Hungary for the construction of factories, flour mills and other small projects, all of them partly credit-financed.



Guinea's greatest need is perhaps for technical and administrative assistance. Yet foreign experts are accepted with the utmost caution. Both western and eastern missions complain of suspicion and reserve. There seems to be little foundation for the belief that Guinea swarms with experts, technicians and officials from eastern Europe; and the only foreigners working within the government administration are two or three Frenchmen. On the other hand, two out of every three Guineans studying overseas are in eastern Europe.

It is difficult to assess the political significance of the economic ties that Guinea has built up. But two things are clear. First, in the position in which it found itself after independence, Guinea had either to be reconciled to stagnation if not chaos, or to seek aid where it could get it. The West offered little or nothing; the East offered as much as Guinea was prepared to take. Secondly, under M. Sekou Touré Guinea is highly unlikely to fall under the dominance of the Soviet block. Independence is still a new and shining asset and Guinea is not prepared to relinquish it. Furthermore, M. Sekou Touré knows that if he were to align himself with Russia he would lose all hope of influence with his west African neighbours. The question, of course, is whether he can hold his position in the face of growing contact with east Europe and China. There are signs that some of his lieutenants are not as firmly uncommitted as he is. His difficulties could be considerably eased by more generous treatment from the West.

Sudan's Divided Army

FROM A CORRESPONDENT LATELY IN KHARTOUM

SOMETHING spectacular was needed to rouse public confidence in the Sudan's military junta before it celebrated its first birthday in power next week. The signing of the Nile waters agreement in Cairo on Sunday seemed to fill the bill, but within 24 hours there were armed clashes in Khartoum as a young officer, Lieutenant-Colonel Ali Hamid, led yet another mutiny.

This is the fourth attempted coup—the first two in March were successful—in a year of army rule and it shows all too clearly the dangers of military meddling in politics. Once the generals start and the brigadiers follow, when will the colonels and the captains move on the capital? While the Sudanese junta has economic recovery and the Nile agreement to its credit, the army's ranks are sadly divided and there is little public confidence in the regime, either among the townsmen who hoped for reform or the tribesmen who sought stability.

Ali Hamid, this week's rebel, is no hotheaded revolutionary. He was one of the most favoured young officers when Generals Abboud and Abdel Wahab came to power in the original November take-over. Sent as military representative in the ministry of information, he hoped to rally popular support from the press, but soon found official policy was to view the press with suspicion. He clashed with his civilian chief who, moving from parliament clerk to military propagandist, had all the abilities of the Vicar of Bray. Since then Ali Hamid, who is pro-British and plays a good game of polo, has nursed his grievances as an instructor at the Infantry School in Omdurman from which he emerged early on Monday at the head of mutinous troops. The strict censorship which has been in existence for a year has not allowed much news of Monday's clash to filter out, but there is no reason to believe that the rebels aimed at anything more than a reshuffle of the junta, the removal of its strongest figure, Brigadier Hassan Beshir, and some freedom of speech, assembly and association.

The army first came to power a year ago at a time when one coalition was collapsing and another was about to be formed. The new one, between Umma, the political expression of the Mahdi's tribal following, and the National Unionist Party led by a former prime minister, Ismail el-Azhari, was likely to give the stability which the old one had failed to provide. Instead the generals took over and the pad of parliament, which softens the blows of sudden change, was lost. In March and again in May sudden changes were attempted within the army but, at the sacrifice of discipline, matters were settled without a shot being fired. In March two brigadiers forced their way into the junta and expelled the former strong man, General Abdel Wahab.

In May another march on Khartoum, this time led by colonels, was called off at the last minute. After the brigadiers and the colonels involved had been brought to trial, a trial of great dignity and full publicity, and had been imprisoned or dismissed, Brigadier Hassan Beshir emerged as the army's new strong man. It also became clear that he would not tolerate any more indisciplined moves and that the next coup, if it came, would be resisted.

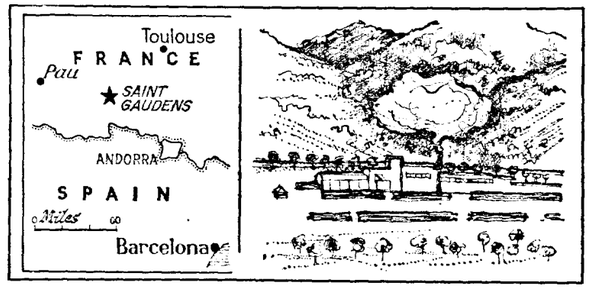
This has now happened and the army celebrates its first anniversary in power with blood on its hands. It also has widespread civil disaffection to face. Only last week a request for the restoration

of trade union rights led to the dismissal of over 200 railway workers and an expression of student opinions caused the university to shut down. Detention without trial, a muzzled press and the ever-present special policeman have alienated what good will there might have been towards the regime among the vocal elements.

Despite this lack of sympathy for the regime as a whole, there is respect for General Abboud who, fifteen years older than the other senior officers, has done his best to keep the army together by conciliation and compromise. Now he is faced with the difficult task of leading the army back to barracks and allowing for some form of popular participation in government. Neither he nor many of his colleagues seek power for its own sake, but the first step away from power, hard to make even from strength, has been made much harder by this week's upsets. Yet only by broadening the base of rule can General Abboud avoid more military upheavals.

The Odoriferous American

FROM A CORRESPONDENT IN THE PYRENEES



EVER since the intrusion of railway sidings and a gasworks into the famous Pyrenean panorama at Pau, described by Lamartine as "*la plus belle vue de terre*," Saint-Gaudens, fifty miles to the east and precisely halfway between Atlantic and Mediterranean, has been grooming itself, if not for the succession to that royal city, at least for viceregal status. Its smart tree-lined boulevards offer a balcony view of a parade of peaks ranging from Bigorre to Ariège. The town's brochures wax lyrical over its unspoiled views, limpid waters and pure, invigorating air. They were printed before the summer of 1959.

France is short of wood-pulp for both civil and military purposes* and in 1955 was urged by its allies to increase its output; the central Pyrenees, blessed with abundant beech forests, water, natural gas and hydro-electric power, seemed the obvious place to put a pulp mill. American capital, governmental and private (Parsons & Whittemore), was made available and a company was formed—*La Cellulose d'Aquitaine.*

A British "Formica" factory had brought new life and prosperity to Quillan, in the eastern Pyrenees; a pulp mill seemed likely to do as much for the central-Pyrenean town lucky enough to acquire it—and battle was joined for the privilege. At first, the gods favoured Muret, home of the socialist ex-President Vincent Auriol. But the people of Muret had recently disgraced themselves by putting an end to twenty somnolent years of Socialist municipal rule and electing a right-wing town council headed by a dissident Radical, M. Jacques Douzans; and the Radical and Socialist party hierarchies—influential, respectively, at the defence ministry and in the departmental (county) council—appear to have decided to punish Muret by supporting the claims of its nearest rival, Radical Saint-Gaudens.

The merchants and municipality of Saint-Gaudens (pop. 8,000) rejoiced; property values soared. A high-powered American cellulose expert came to live in the town, and the mill** took shape.

A few disloyal spirits grumbled that it need not have been sited in the lovely valley beneath the town's main boulevard, but municipal supporters saw no harm in having so magnificent an electoral asset conspicuously in view. The villagers of Miramont, down in the valley, got little sympathy when they complained that the mill was noisy. "*Paysans!*" sniffed the bourgeois Saint-Gaudinois. It was an ominous white cloud, at first no bigger than a man's hand, that wilted the prevailing euphoria. It squatted in the still air over the mill like a visitor from deep space, and grew. One afternoon it obscured the smog-free town's favourite peak and angry voices were raised in the boulevard cafés. Then someone noticed that the majestic Garonne was discoloured below the mill, and fishermen reported that thousands—indeed (they were, after all, fishermen) tens of thousands—of trout were being poisoned. Local *sociétés de pêche* resounded with insurrectionary talk. Villagers whose water supply comes from the Garonne were advised by their mayors to drink nothing but Vichy and wine and send *La Cellulose* their bills. At this point *La Cellulose* played its ace.

An English teacher at the high school excitedly called his pupils to the open classroom window and urged them to take a deep breath. "This," he explained, "is what England smells like on a Sunday morning when ten million open fires are smoking and ten million housewives are boiling cabbage." A little later, to the English smog-and-boiled-cabbage smell were added a seasoning of hydrogen sulphide and a *soupçon* of rotting garlic. The resultant potpourri imposed itself on an area twenty miles across.

Tourists in four declining spas in the district hurriedly paid their bills and fled. Property values plummeted. Municipal supporters urged that more trees be planted to make the mill less conspicuous. In Muret, Mayor Douzans expressed sympathy with the wretched Saint-Gaudinois and drew attention to his own foresight in having avoided attracting the mill to that town. Anti-Americanism, never far from the surface, raised its head. ("The Americans imposed the mill on us because they don't want to poison their own towns.") The Socialists, disunited and dormant since M. Mollet's conversion to *Gaullisme,* pounced on the "scandal" with pathetic glee and defeated the Radical mayor of Saint-Gaudens, who would otherwise have had a walkover, in a departmental council by-election. Warming up, they pointed out that under the Fourth Republic they could at least have ventilated the region's grievance in parliament; under the present system citizens might be forced to take direct action and attack the mill with "plastic."

This was a telling blow. On October 15th the Prefect of Haute-Garonne threatened *La Cellulose* with all the fury of the Fifth Republic if, within three months, it had not solved its pollution problems and surrounded itself with soundproof screens. *La Cellulose* informed the local press hopefully that it might be possible to transform the "boiled cabbage" part of the smell into "some kind of toilet-soap odour." "*Autrement dit,*" commented the general public, "*ça sentira comme un bordel.*" The mill's American expert shook his head sadly. "It's not such a bad odour, surely. In my old firm we called it the bread-and-butter odour."

* France imports 700,000 tons of wood-pulp annually, chiefly from Scandinavia.
** Cost of the mill, $11 million. Projected output 45,000 tons of wood-pulp a year.

Picture on silk

The *tatami*-maker, cross-legged, weaving his sweet-smelling rush mats. The lantern-painter, plying a bright-charged brush. Quaint wooden *kokeshi* dolls—and rich-costumed Kyoto puppets. Pottery and painted fans. Lacquer work and *satsuma*. Even in modern, industry-teeming Japan, the traditional arts apply. And not least in the manufacture of silk . . . the heavy, natural silk of the East. Despite the competition of synthetic fibres, silk production is still an important industry in Japan—and the production of mulberry leaves, sole food of the silkworm, is important for many farmers. Field after field is fringed by its row of mulberry bushes, and the crop ranks eighth in order in Japanese agriculture.

But what is food for one wanted insect is food also for the unwanted: mulberry leaves are equally as attractive to destructive pests as they are to silkworms, and until recently it was estimated that some 10% of the entire crop was lost annually to a variety of insects, particularly the voracious larvae of the mulberry pyralid moth (*Margaronia pyloalis* Walker). Many of these leaf-eating pests attack right up to harvest-time, and for fear of destroying the silkworms also, insecticides which might leave toxic residues cannot be used. '*Shikata ga nai*', the Japanese farmers used to say philosophically. 'There is nothing one can do about it.'

Today, however, the picture on silk has changed. Tests with Phosdrin, Shell's important and new systemic insecticide, have shown that not only can a complete and rapid kill of the pyralid moth be obtained with concentrations as low as 0.025% to 0.05%, but that the mulberry leaves can be fed perfectly safely to the silkworms *within five days of application.* Phosdrin not only kills quickly—it is itself quickly dissipated into harmless compounds. This new Shell pesticide has a vast potential use on crops in all parts of the world threatened with close-to-harvest infestation.

Phosdrin
Trade Mark

Have you a pest problem? Between them, Phosdrin, endrin, aldrin, dieldrin, D-D and Nemagon offer control of virtually every significant pest.

IN AGRICULTURE . . . YOU CAN BE SURE OF SHELL CHEMICALS

Issued by Shell International Chemical Company Limited and Bataafse Internationale Chemie Mij. N.V. For further information consult your Shell Company (in the U.K. apply to Shell Chemical Company Limited)

Cat's lick

Not every kind of dirt can be dissolved—or licked away—by traditional methods of cleaning. Nor, where garments are concerned, is wet cleaning always the answer. Many common forms of 'soil'—such as oil and grease—are *insoluble* in water and so cannot be removed by water alone. But hydrocarbon solvents *will* remove them. And solvents of this sort are the basis of modern dry-cleaning techniques. Each year, many thousands of tons of Shell-produced, high-quality hydrocarbon solvents are used by dry-cleaners throughout the world.

Yet, strange as it may sound, even in dry-cleaning, water is still wanted. To cope with water-soluble stains which hydrocarbon solvents cannot disperse, Shell-produced dry-cleaning 'aids' are now in general use in the industry. These 'aids' enable a trace of water to be dispersed throughout the solvent, with the result that the cleaning process can cope with all kinds of 'soil', both soluble and insoluble in water.

Have *you* a chemicals problem, a chemicals need? Call on Shell. Solvents are only one group in a vast and diverse range of industrial chemicals which meet virtually every need. Ask your Shell Company about Shell plastics, detergents, resins, glycols. Base chemicals and additives, synthetic glycerine, synthetic rubber. Shell chemicals serve every industry.

Shell Solvents

The Shell solvent range covers not only the hydrocarbon series serving many extraction industries, dry-cleaning, paints, polishes, printing-inks and rubber—to name only a few—but a wide series of chemical solvents embracing ketones (acetone, methyl ethyl ketone and methyl isobutyl ketone), alcohols and ethers. In each and every case—as you would expect from Shell—purity and chemical stability are exceptional, and the products are manufactured to extremely close specification limits.

IN INDUSTRY . . . YOU CAN BE SURE OF SHELL CHEMICALS

Issued by Shell International Chemical Company Limited and Bataafse Internationale Chemie Mij. N.V. For further information consult your Shell Company (in the U.K., apply to Shell Chemical Company Limited).

Ceylonese out for Blood

FROM OUR CORRESPONDENT IN COLOMBO

HAVING narrowly survived the no-confidence motion in parliament last week, Mr Dahanayake returned to "Temple Trees," the prime minister's residence, where a protective wall is now being hurriedly built and where army pill-boxes blot the green lawns, to announce that he would not advise a dissolution a day earlier than April, 1961. This was more a pathetic act of defiance than a sign of self-confidence. He is badly trapped and he knows it.

He called the previous night's debate a "terrible indictment." He was right. He and a group of his ministers were accused of a political conspiracy against their murdered leader, Mr Bandaranaike. Cunningly, the Opposition left it in doubt where conspiracy ended and murder began, but the public promptly provided the necessary mental inter-connections. The debate was no debate but a trial, and when it was over the public had given their verdict. For this Mr Dahanayake has only himself to blame.

Mr Bandaranaike died on September 26th. Overnight, he was deified; and even today, hundreds of peasants visit his grave every day, burning incense and offering flowers as if it were a Buddhist shrine. Mr Dahanayake expected to inherit this tremendous fund of sympathy and good will. He played the role of the humble heir. Feigning awe at the greatness thrust upon him, he sang the praises of the man he had once described as a "fascist born and bred." (His favourite designation for Bandaranaike today is "Bodhisatva," that is, a saint on the way to Buddhahood.) But the people soon wearied of his verbal extravagances and apparent reluctance to act firmly in investigating the murder. They were in a mood for blood. The delay in making arrests bred suspicion and doubt, and within a week the country was convulsed with rumour.

The government got panicky. Mr Dahanayake clamped down, upon a press which had given him a fairer deal than it had ever given Mr Bandaranaike, a draconian censorship under which it was not possible to comment, even favourably, on a central school or the public works department. He tried to speak to the nation through Radio Ceylon, but it served him ill. When it broadcast a truncated version of a Manchester *Guardian* leader which contained a few lines favourable to the government, the press openly flouted the censorship and published the article in full. Radio Ceylon was never believed again. The two weeks of censorship encouraged scurrilous pamphleteers and ballad writers, and confirmed the belief that the new prime minister had something to hide. He quickly capitulated, but the damage had already been done.

He has temporarily contained the dissatisfaction within the government's own ranks over the conduct of the murder inquiry. He has said that it would be improper to take any action against Mr de Zoysa, the finance minister, because he is now representing Ceylon at the Commonwealth parliamentary conference in Australia. But in the face of an aggressive opposition, a divided Cabinet, an unfriendly press and a suspicious public, Mr Dahanayake's chances of survival seem poor.

Elections now would favour the leader of the Opposition, Dr N. M. Perera, and his Trotskyist party. Handling the situation with uncanny skill, Dr Perera has stolen the initiative from the rejuvenated right-wing United National party led by the ex-prime minister, Mr Dudley Senanayake. His agitation has been so beautifully timed that many people believe every step taken by the government and every concession to public opinion was the result of his efforts. He, too, has chosen to wear the mantle of Bandaranaike, and it seems to sit so well on his respectably socialist shoulders that he can claim to be the legitimate heir and denounce Mr Dahanayake as a usurper. The present ministers are not Mr Bandaranaike's caretakers, he says, they are his undertakers.

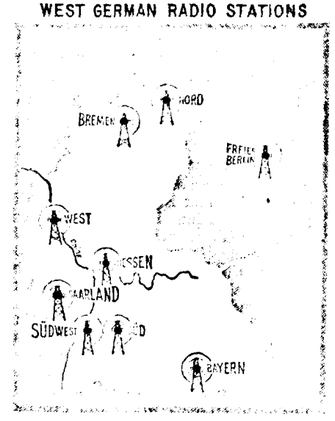
The reaction against political priests that has followed the assassination of Mr Bandaranaike by a Buddhist priest has also benefited Dr Perera. These priests had spearheaded the campaign against his party when it opposed the bill to make Sinhalese the only official language. His party is also the only Sinhalese-led one in which the minorities have any confidence; and it is the best-disciplined party in Ceylon, with great influence over the working class and an intellectual appeal to the youth.

The German Voice

FROM OUR BONN CORRESPONDENT

IT is now the turn of broadcasting to undergo the reappraisal to which the sovereign west Germans are subjecting most of the arrangements once made for them by more or less avuncular occupying powers. It is an agonising reappraisal all right, and may yet go all the wordy way to the constitutional court at Karlsruhe. The combat in parliament was due to open on November 13th with the submission to the Bundesrat (the upper house, composed of representatives of the ten Land governments) of the draft of a federal radio law that would end the present broadcasting monopoly of the Länder. The Land governments contend that the innovations contained in the draft law would infringe the cultural sovereignty allotted them under the Federal Republic's basic law. The ghost of a regimented *Reichsrundfunk*, swaying compliantly to a master-mind's tune, has not been altogether laid.

WEST GERMAN RADIO STATIONS



Nobody seriously disputes that the time has come to make some changes. Although the present system is not without its merits, it is in general cumbersome, complacent, and nationally inadequate. As many as nine companies cater for the fifteen million listening and three million television sets in western Germany. Two operate in what used to be the British zone—the West German Radio and the North German Radio; the first is directed from Cologne, the second from Hamburg. In the former American zone there are four—the Bavarian (Munich), the South German (Stuttgart), the Hesse (Frankfurt), and Radio Bremen. The French-born station at Baden-Baden still operates as the South-West Radio. Radio Saarland is a comparative newcomer. Lastly, there is Radio Free Berlin.

Except for Radio Free Berlin, which is subsidised on the strength of its outpost duties, all these companies pay their way wholly out of the licence fees of 2 and 5 marks collected monthly by the postman from owners of listening and television sets. After they have paid the federal post office for its various technical services, the companies have a total sum of DM 400 million (£34 million) a year between them to work with. But since each company's revenue is determined by the populousness of the Land it is serving, some companies are much richer than others. The West German Radio, for instance, tightly clutching the Ruhr plum in the

licensing pie, is in the gratifying position of being reproached for "hoarding" unspent income that it is estimated to have accumulated to a sum in the region of DM 80 million (£6.8 million). As far as sound broadcasting is concerned, complaints of insufficient competition would probably be unjustified if all the programmes transmitted were audible everywhere. They are not. As for television, the broadcasting companies are at present sworn to joint production. They transmit virtually the same programme, passing the viewer in the course of an evening from one Land studio to another. A system that maintains studios, transmitters and all necessary staff at nine different headquarters in the Republic, to produce only a single programme, is obviously extravagant and unlikely to be working with the maximum of efficiency, either on the stage or behind the scenes.

A much more deeply felt objection to the present dispensation is raised by those who see in it a cause of further attrition of the damaged German national entity. Which of the nine stations can be expected to accept the responsibility of speaking not only for Federal Germany but also for Germany as a whole? The question is considered to be all the more pressing in face of the vigorous, centrally directed broadcasting of the east German Democratic Republic, whose sound and television programmes are beamed evangelically to the uncommitted countries, as well as westward. In the circumstances, it is scarcely surprising that advocates of change like to quote the dictum of Professor Charles A. Siepman, of New York University, on the subject of German broadcasting:

> It is questionable whether anyone other than Germany's worst enemy would wish the present system to continue.

Under the system envisaged in the government's draft law, the existing nine companies in the Länder would be as free to broadcast in future as they have been in the past; and it is expected that they would continue to do so. In addition, there would be three federal broadcasting organisations:

1. The services of **The German Wave** (Deutsche Welle), the long-wave station that is already transmitting on a modest scale under the joint direction of the West German Radio, the Foreign Office, and the Federal Press Office, are to be greatly expanded at the public cost. In vindication of this development much is being made of the Democratic Republic's five-hour daily transmissions to the Arab countries, compared with the German Wave's present twenty minutes daily.
2. **Radio Germany** (Deutschland-Funk). A long-wave station with the responsibility for broadcasting to the whole of Germany and Europe. To be financed partly from a share of the radio licensing revenue. Prospective headquarters: Berlin.
3. **Television Germany** (Deutschland-Fernsehen). A station of all-German range, which will provide the public daily with an alternative programme. Programmes to be produced by contracting companies, with revenue from advertising.

Reasonable as on the whole they sound, these plans, particularly those for television, have evoked suspicion and misgiving in many quarters. The Land broadcasting companies are as unhappy at the prospect of losing part of their income and their audiences, as are their governments at the prospect of having their sovereignty nibbled at. Uneasiness at the possible transgressions of commercial advertising is widespread. But, above all, it is the possibility of exerting political influence through federal broadcasting that is arousing the liveliest controversy. Had not the Christian Democrats been more than ten years in power, and had their egocentric leader shown more inclination to let some of the business of running the country be shared by men of other opinions, the government's intentions would not be quite so suspect as they are now. The draft law promises "non-party" supervision of federal broadcasting through boards a third of whose members would be appointed by the federal government, a third by the Land governments, and a third by politically "neutral" bodies such as the churches and some of the learned societies.

But the Social Democrats, who have been left so much out of things at the top for so long, are not satisfied. They want both federal broadcasting and federal television to be run jointly by the existing companies, in which they have an important say through their representation in Land governments. They concede the federal government's right to have a commanding voice only over the rollings of The German Wave. Apparently they are resolved to fight it out; and in the Bundestag they can muster enough strength to prevent the government obtaining the two thirds majority required for legislation involving changes in the basic law. Confident that by hook or crook it will eventually get its way, the government instructed the minister of posts and communications as long ago as last January to start building the installations. They are already going up.

Laos: The Elusive Wolf

MR HAMMARSKJÖLD has gone to Laos to see things for himself, having made it plain that he is travelling on his own initiative as secretary-general of the United Nations, and not at anyone else's request. His journey cannot do any harm and will probably yield some quiet but constructive suggestions. But it would be foolish to expect too much of it, if only because Russia continues to oppose UN intervention in Laos, on the ground that two of the interested governments—China's and north Vietnam's—are not members.

Mr Malik, the Soviet ambassador in London, called on Mr Profumo, Minister of State, this week, to reiterate this view and to repeat the familiar Soviet argument that the best way to deal with the Laotian situation would be to recall the international commission for Laos. This three-nation body (Poles and Canadians under Indian chairmanship) was set up under the 1954 Geneva agreements that ended the Indo-China war; it adjourned *sine die* sixteen months ago. Mr Profumo replied that the commission could not be recalled since it had adjourned at the request of the Laotian government; and he pointed out that there was nothing in the Geneva agreements to oblige Laos to act as host to the commission against its will. There is nothing new in these positions, and their iteration merely draws fresh attention to the deadlock between the British and Russian foreign offices, as "co-chairmen" of the 1954 Geneva conference and custodians of the agreements.

Mr Hammarskjöld left New York a few days after the publication of the report of the fact-finding sub-committee sent to Laos—against a Soviet veto—by the UN Security Council. To anyone who remembers the feverish atmosphere early in September, when the Laotian government complained to the council that Laos was being invaded from communist north Vietnam, the sub-committee's report must have come as an anti-climax. Those State Department officials who swallowed Laotian intelligence reports at the time must have blushed as deeply as the Laotian officials who passed the reports on (the Foreign Office remained healthily sceptical throughout). In the event, the sub-committee failed to find evidence that Laos had been invaded. It did, on the other hand, find evidence that "various degrees and kinds of support have been accorded to hostile elements from sources on the north Vietnamese side of the border."

Mr Phoui Sananikone's government now finds itself in the position of having cried "wolf" without a beast in sight. But it still faces a formidable internal communist challenge backed from outside. The previous government of Prince Souvanna Phouma was inclined to neutralism, although it sent the international commission packing. Mr Phoui, strongly backed by the new king of Laos, favours near-alignment with the United States, and will shortly bring the communist leader, Prince Souphanouvong, to trial. This course, although it can be defended, is certainly fraught with perils.

Boots

formula for power – Coal

THERE'S MORE TO BOOTS, the chemists, than a tradition of impeccable service and faultless efficiency. There's a great industry with giant factories to turn the best obtainable raw materials into the enormous variety of goods that Boots sell in their 1310 branches.

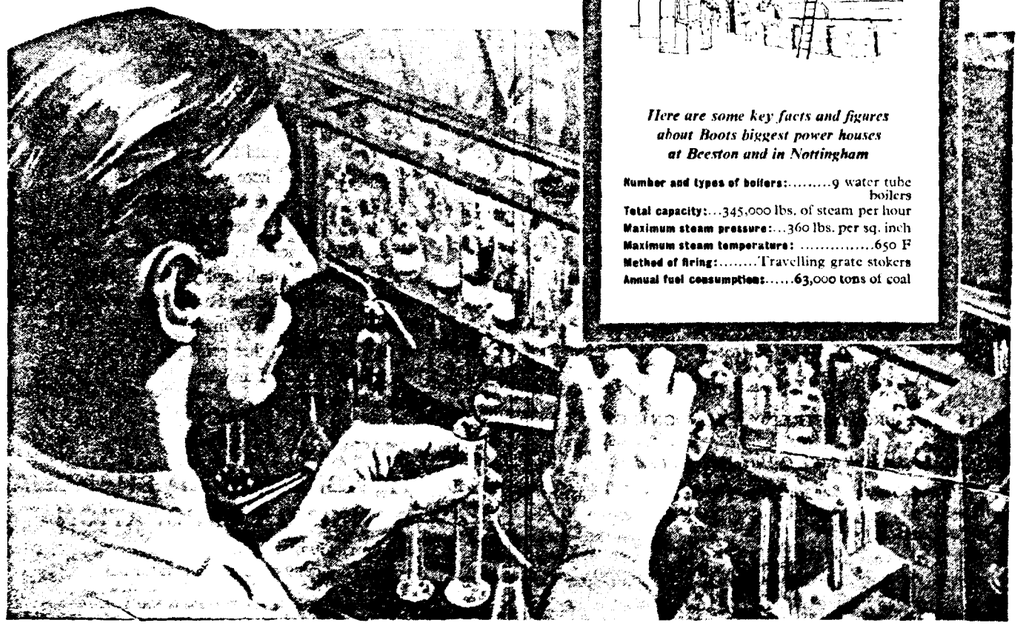
To produce the most effective results at the most economical cost, Boots begin with coal. At their powerhouses in Nottingham, Beeston, and at Airdrie in Scotland, coal is the fuel chosen for firing the boilers. Using the most modern methods of mechanical stoking and heat conversion, coal provides steam for works processes, for generating electric power and for office and factory heating.

Boots know that coal gives them maximum efficiency with minimum waste. They know that coal—mechanically stoked—burns smokelessly. They know that because coal is home-produced, supplies are assured, for Britain's coalfields can supply all the coal that British industry will need for generations to come.

When the question of fuel for your factory next comes under examination, remember Boots formula for power. It could mean a healthy improvement in your running costs.

Progressive industry is going forward on **COAL**

ISSUED BY THE NATIONAL COAL BOARD



Here are some key facts and figures about Boots biggest power houses at Beeston and in Nottingham

Number and types of boilers: .....9 water tube boilers
Total capacity: ...345,000 lbs. of steam per hour
Maximum steam pressure: ...360 lbs. per sq. inch
Maximum steam temperature: .....650 F
Method of firing: .....Travelling grate stokers
Annual fuel consumption: .....63,000 tons of coal

THE BUSINESS WORLD

Euratom's Diminishing Target

Europe is going cautiously on atomic power—for understandable reasons

THE eclipse of Western Europe as a market for nuclear power on the British pattern tends to be blamed on the formation of Euratom and the close ties it has established with the United States. But this implication largely ignores the difficulties of Euratom itself in selling atomic power from any source, and at any price, to sceptical electricity undertakings in the organisation's six member countries. Euratom inherited an ambitious target, put forward by the three wise men in mid-'57, of 15,000 megawatts of nuclear generating plant to be in commission by 1967; in practice it would not have been easy to get the plants up in a decade. As an economic assessment of Europe's need for nuclear power it has in any case been overtaken by the shift from world shortage to world surplus of fuel in much the same way and for the same reasons as Britain's own nuclear programme, which was drawn up six months earlier. Realism has taken a bigger toll there than here; though Euratom's target still formally stands, its own staff does not count on more than 2,000 megawatts of nuclear plant being commissioned by 1965, with 3,000 megawatts as an outside chance.

This revised estimate includes, first, the 1,000 megawatts of nuclear plant already built, building or about to be built—that is, the French equivalent of Calder Hall at Marcoule, the two nuclear power stations of *Electricité de France* at Chinon, the British-built Italian station at Latina and two nuclear power stations scheduled for Germany and Italy. To this it adds 1,000 megawatts of nuclear plant to be commissioned, with American help, between 1963 and 1965 under the agreement between the United States and Euratom signed last year. The figure of 2,000 megawatts ought to be fairly firm, though there are question marks hanging over some of the bids submitted last week under the US-Euratom scheme. The third block of 1,000 megawatts is, at this stage, the expression of a pious hope that curiosity and the urging of a new technique will induce some public utility concerns to co-operate in putting up stations that they would never be able to justify on purely commercial grounds.

Since the first 1,000 megawatts of capacity is already on order, and the second 1,000 megawatts will be filled out by American suppliers, the further export prospects in Europe for the British atomic groups arise only in this third 1,000 megawatts. They are bound to depend on wider consortiums that bring in continental manufacturers of many items of plant. Even if fuel in Western Europe were suddenly to change back from surplus to shortage, British and American makers of nuclear plant would still face stiff competition from Western Europe's own engineering industries. The speed and skill with which heavy engineering companies with no previous experience are mastering the intricacies of atomic design has come as a big surprise to observers on the continent—and is still almost wholly ignored by those outside it.

Euratom has very extensive powers on paper. Yet it neither buys nor sells nuclear power. It is a hybrid of mixed parentage; it reflects both the quest for political integration in Western Europe and also the economic aim of spreading the cost of nuclear research among a number of countries that could not afford it alone. But this is no trouble-free formula. Scientists sometimes feel that Euratom's political inspiration gets in the way of its practical work. And the politicians are critical because of its lack of visible progress in promoting atomic energy. But it was the politicians that hung round Euratom's neck a contentious treaty that frightened this country out of participating in Euratom and makes so many provisions for special agencies buying, selling, controlling, keeping track of, and generally interfering with nuclear fuels that scientists are impatient and lawyers in despair. France, pursuing its own tough line about atomic development, is refusing to join schemes such as those for fuel distribution which are not now necessary for economic reasons but which were anchored mainly for political reasons in the Treaty of Rome.

WHEN Euratom came into being at the beginning of last year, Western Europe was importing American coal at $20 to $22 a ton. It now costs about $15 a ton landed in Europe—and is competitive still, for although Ruhr coal costs $14 at the pithead, if it has to be carried any considerable distance, the freight makes it uncompetitive with imported American coal. The six countries now hold more than 60 million tons of solid fuel against a "normal" holding of 25 million tons. Few people see much prospect of shifting these massive stocks while fuel oil is so cheap. At a moment when mineral fuels are competing toughly with each other, the Euratom headquarters at Brussels calculate that nuclear power on the American pattern is now probably 40 per cent dearer than electricity from a modern, well-sited thermal power

station ; because of higher capital charges, nuclear power on the British pattern would probably be even more expensive. These findings are in line with similar comparisons made about the cost of nuclear power in Britain for the Select Committee on Estimates. There may be parts of Europe where the high cost of transporting fuel might make atomic energy competitive, even given its high cost. The difficulty is to find them and as the power network spreads across Europe, they will become fewer.

GIVEN high coal stocks and low fuel prices, Europe's need for atomic energy, which seemed so urgent at the time of the Suez crisis, has now receded into the 1970s. It is asserted in Britain that atomic energy may have become competitive with the best thermal stations by 1970 ; on the Continent this is regarded as the date by which a steady 2 per cent compound increase in energy demand will make recourse to atomic energy necessary whether it is competitive or not. Euratom is noticeably more reluctant than the Atomic Energy Authority here to commit itself to estimates of the cost of nuclear power ten years from now.

It follows from this that the nuclear power stations to come into commission on the Continent during the next decade will be largely experimental ones from which experience can be gained. There are three ways of gaining experience. One is to buy direct from Britain or America as the Italians have done. Their British-designed Latina plant is already under construction and early this month the Export-Import Bank finally decided to advance $34 million of the $64 million needed to build the much discussed, frequently postponed plan for a Shippingport-type pressurised water reactor giving 165 megawatts of electricity. This project is being shared between Westinghouse in America and a group of Italian public utilities. The second way is to make use of the US Euratom agreement under which the Export-Import Bank will provide credit up to 40 per cent of the cost, and the Atomic Energy Commission will provide fuel virtually free, for nuclear power stations ordered from the United States. The difficulty here is that the plants must be completed in 1963, which means an immediate start on construction, except for advanced designs where the date for completion is 1965. The closing date for bids was mid-October.

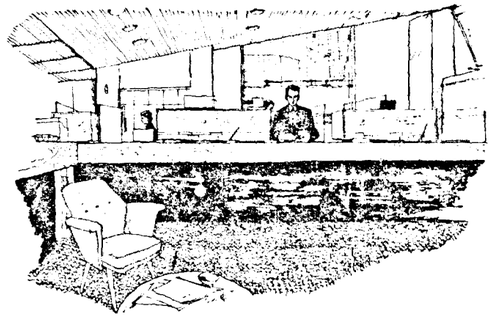
The third way is to go it alone, and it is the one that Euratom's member countries seem to find the most attractive—with France well in the lead. Certainly they have not fallen over themselves to take up the generous American offer. The one cut-and-dried project in by the deadline was for a station ordered from the American General Electric Company before the American offer was made—this is the nuclear power station in Southern Italy to be financed by the World Bank, but brought into the American scheme to get the advantage of cheap nuclear fuel. A firm scheme was put forward from Germany for a power plant designed by North American Aviation and built by its German associates, but the sponsors still have to get the remaining 60 per cent of the money to build it. The French and Belgian electricity authorities who proposed a jointly-owned power station on the Meuse had the money to put it up, but had not agreed on the type of reactor they wanted to build. The other two proposals, for a nuclear power station in West Berlin and for one in Holland are even vaguer ; neither could meet the 1963 deadline and probably not 1965 either. These five projects account for 750 megawatts of the 1,000 megawatt Euratom-US joint programme, so there is some doubt about how much will be built. It will be a great disappointment both to Euratom and to the American sponsors if the American offer is not taken up in full. Yet public utilities can hardly be blamed if they are reluctant to build nuclear power stations when thermal stations give them electricity at 40 per cent lower cost. Left to themselves, they would more probably decide that experience could be bought too dearly, especially with a second generation of nuclear power stations already around the corner.

EURATOM did not exist when the first generation of atomic stations, the Calder Halls and the Dresdens, the Marcoules and the Shippingports, went on the drawing board. One of the main objects in bringing it into being was to see that Western Europe played some part in the development of the second generation. This is a tricky assignment because the organisation must avoid duplicating work already being done in other countries. Yet if it were deliberately to pick reactor types not under development elsewhere, Euratom might find itself with a portfolio of esoteric designs that conceivably were scientifically interesting but remained hopelessly uneconomic. Euratom's research director, M. Guéron, has already expressed concern about duplication and waste in research programmes of the six members—between them they have as many research centres as the United States. He has managed to reduce them by one by taking over the newly opened Italian centre at Ispra to become the Euratom research headquarters. Where possible, he has sub-contracted work to existing laboratories in Holland, France and Germany and seems to be following the same policy in reactor development. That is, he has bought shares for Euratom in the UK Atomic Energy Authority's Dragon project for a Mark III version of Calder Hall at Winfrith Heath and has sent a team to study the AEA's breeder reactor at Dounreay. He is giving a small measure of support to the very advanced type of homogeneous reactor under study in Holland (which Britain and America have both rejected as too hazardous) and the only reactor type that Euratom is likely to develop under its own initiative is one combining heavy water and organic materials like diphenyl.

The significance of this research policy is that it appears to throw out a bridge between Euratom and the Atomic Energy Authority which other men have tried and failed to establish at the diplomatic level. If M. Guéron invests in a British experiment at Winfrith Heath and shows more than polite interest in goings-on at Dounreay, should the AEA return the compliment by buying shares in Euratom's experiment in a heavy water reactor? The AEA believes the expensive organic materials used in moderating this type of reactor decompose at a rate that makes the reactor uneconomic but many Americans think otherwise. But the British atomic power groups should have no illusions that a rapprochement between the AEA and Euratom—desirable as that may still be in itself—would greatly improve their chances of selling atomic plant in Europe. When so generous an offer as the Americans made was such a narrow success, it is surely proof that the only way to sell nuclear power is to make it cheap.

A New Face for Banking

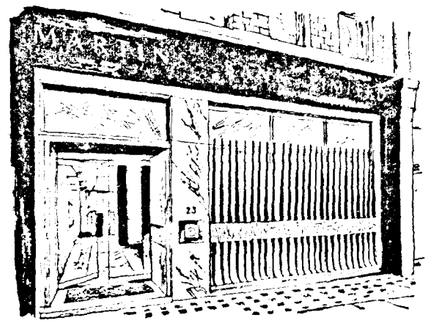
An architectural correspondent finds that the banks have made virtually no attempt to translate their new image into their own housing



National Commercial Bank of Scotland; West End branch, Curzon Street.

THE new banking is with us, and so apparently is the new bank architecture; but there is so far practically no connection between the two. The new identity that the banks are trying to establish in their advertising and publicity is poorly reflected in the more progressively designed bank premises beginning to appear in London and a few favoured sites in the provinces. The reason for the appearance of new bank architecture at this interesting juncture in banking history is simply that no new banks were built in the forties, and practically no repairs done either ; it is only now, as the fifties are drawing to a close, that the back-log of maintenance work has been sufficiently overtaken for new work or major alterations to go ahead. A generation of bank architecture has been missed, and what appears to be a revolutionary change in design actually represents twenty years of natural evolution with the intermediate stages left out.

The only significant exception has been at Martins Bank, which has followed a conscious and deliberate policy of modernisation of architectural design for more than five years. There are men scattered through the hierarchies of the Big Five who insist that Martins should be given credit for starting a trend, and freely admit their admiration for what Martins has done. But employees with views are not the same thing as boards with policies. The present situation is only superficially encouraging. Barclays is still capable of commissioning a mausoleum-like new headquarters ; and there is a general failure among responsible bank executives to appreciate the help they could get from architects abreast of the times if they would only formulate their own needs as bankers in a less hide-bound manner. Much more than merely face-lifting is needed to bring bank premises somewhat more up to date. The whole plan and section of what other trades might call the "point of sale" is under pressure. That may precipitate a genuine revolution in bank design—or an unworkable muddle.



Martins Bank, Garrick Street, Covent Garden.

To start with the obvious problem of mechanisation. Electronic accounting and cheque-handling are surely not far away. This may mean more machinery at the branch bank or less, since expensive lumps of electronic capital equipment may be centralised at head office. In either case, there will be less visible machinery at the branch, since the public banking room is no place for tackle that can be as noisy and heat-producing as some accounting machines. A separate machine room would be desirable. And since the best way of delivering a discontinuous dribble of papers to another room is by using gravity, always at your service and needing no salary or maintenance, the right place for the machine room is underneath the banking hall. So the first lesson is that electronic accounting seems likely to go with multi-level planning.

This conclusion is matched and reinforced by another independent argument for multi-level planning. There is nothing in the natural order of things that requires a bank to stand flat-on to the street at pavement level. The economics strongly urge that the ground-floor frontage of banking premises should be let off as shops. If there is an impressive entrance what more does a bank need ? Martins has already experimented with a bank set back behind shops; Barclays has two "escalator" banks in service with first-floor banking halls. An auxiliary pressure here is the tendency of modern town-planners to abhor a vacuum of darkness in an otherwise brightly lit shopping parade. And since banks are apparently so horrified at the thought of keeping their premises on display after dark, they are that much easier to talk out of their custom-mummified kerb-side location.

There is indeed one world-famous bank that is on illuminated display after dark—the Manufacturers Trust branch in midtown New York, with its all-glass facade disclosing an interior (including the bank safe) that is fabulous even by Madison Avenue standards. Such a building is a very special case, only really suitable for the places where a metropolis puts itself on show. There is good sense in the proposal of one of the big five to create such a branch in Sloane Square, but one hopes that it will profit by the example of the Midland's Mardi-Gras-in-Middlesboro' effort on Piccadilly Circus, and learn how not to do it.

But the special case is a vitally important one, since buildings on central sites of this kind have a far bigger effect on the general public's idea of the bank than any number of ritual fighting displays of classical ornamentation in the comparative secrecy of the City or Wall Street. And the idea of the bank as a progressive institution could be the psychological gold-reserve behind the other new aspect of banking, as a domes-

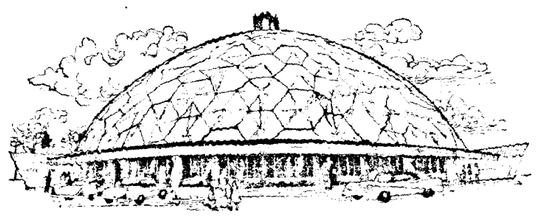
tic service. This aspect of the new banking seems not to be directed at the cloth-cap saver; so far as this mythical survivor from the pre-Welfare state still exists, he is well catered for by the savings banks and the Yorkshire Penny whose Edwardian styling gives the necessary atmosphere of timeless security.

The new domestic banking, with the bank manager as a friendly father-figure, is clearly after the new wage-earning middle class, which finds that its pockets cannot cope with its pay-packet, even when paid out in fivers. Tele-sophisticates, car-owners, Continental holidaymakers, contemporary furnishers, supermarket shoppers—all these are unlikely to warm to a bank that furbishes itself with brass barricades and mahogany, riot-proof counters. They are looking for a smart bank, smart by the standards of the international mass-media, smart like Television House or the Columbia Cinema, smart like Manufacturers Trust.

Contemporary decor may be part of the necessary attraction for this class of client, but it may not be enough. The argument comes back to planning considerations. For clients of this kind, the bank will be a more convenient place to handle wages and hire-purchase, with a general advisory service on financial matters included. The amount of loose money that crosses the counter will hardly be large enough to justify the fortification between the clerk and the customer. Next to the bank door, ritually placed on the corner of two streets almost as if to facilitate get-aways, a girl from one of the big dress-shops may be paying in the previous day's takings, which would be well worth any bandit's trouble. This is not how everybody uses a bank. Why is she doing it there, and not in some private place farther in from the street?

When the function of the counter has become so diversified that it needs more than fortification in some places, and much less than fortification in others, it is time for drastic re-thinking of the planning of public rooms—as well as for a disentanglement of the bank's personal and commercial services, more planned security measures (not just noisier alarms), re-appraisal of the siting and planning of managers' offices, and a lot more besides. The whole architectural conception of "a bank" is due for pulping down and re-fashioning in mid-century terms. In this, accumulated experience is not going to be much help to the banks, because it is based, still, on an early nineteenth-century mercantile dialogue between parties that were financial and social equals, for whom the traditional banking-hall on the kerb was a splendid answer.

Now that the branch bank is the point of delivery of world-wide service and expertise which the client, large or small, cannot hope to command, this concept of the banking hall is no longer adequate. The time seems ripe for outside design talent to come right in, not merely for restyling the lettering, and proposing alternatives to mahogany for the counter tops. Architects may not be as clever as they corporately claim to be, but their revolutions in school and hospital design (in both cases, the clients claimed to know all



Citizens State Bank, Oklahoma City.

the answers, just like bankers) suggest that the application of at least some architectural talents to problems of bank design could prove salutary. Which banking house, big or small, will be the first to realise the magnitude of today's architectural problems and the opportunities they present?

BUSINESS NOTES

STEEL

Stocks on the Turn?

Since motors and the other consumer goods industries are the main elements of the boom now developing in the British economy, it would be in these industries that one would expect to see the first signs of any heavy rebuilding of industrial stocks. In steel that may already be happening, though the evidence as yet does not suggest any very abrupt rise—partly, perhaps, because these industries need all the thin flat steel they can get for day-to-day consumption.

The Iron and Steel Board estimates, from preliminary returns, that total stocks of steel held by steel users and merchants fell by about 150,000 tons in the third quarter of this year. This is the lowest rate of stock reduction during any quarter over the past twelve months; it took place almost entirely in the heavier capital goods industries, shipbuilding, construction, and general engineering, and in basic industries like coal and the railways. Stocks held by motors and other consumer goods firms, and their suppliers appear to have risen just slightly over the three months—as did stocks held by some of the machinery makers.

Merchants and consumers still had 3½ million tons or so of steel in stock at the end of September, about three months' supply. But at the start of the recession eighteen months ago, the total was nearly 4½ million tons, enough for four months' consumption. If consumers in general were to turn over to building their stocks towards that level—which they held to support a lower total level of production of metal goods—the industry might expect a rapid inventory boom. But the variegated pattern of recovery in the economy, so far, has prevented that.

As far as current consumption is concerned, motors and durables are certainly mainly responsible for the sharpening revival in steel production. Output is fast moving towards the highest levels that British steel makers have ever achieved. Last month, at a rate of 441,400 tons a week, it was 3½ per cent higher than in September, nearly a sixth more than in the first half of this year, and more than in any October yet. It was only fractionally below the industry's record month, May 1957. But at that time the steel industry was working at about or just over 100 per cent of capacity—defined as the level the industry prefers to operate at rather than what it could, if pressed, actually achieve—whereas last month its operations had risen to only 92 per cent of capacity that must now be nearing 25 million tons a year.

Despite the teething difficulties that are preventing the industry bringing in extra

capacity at the strip mills as fast as it had hoped, deliveries of sheet steel rose by some 30 per cent over last year in September and there was another substantial increase in October. Deliveries of ferro-concrete bars, light sections, and strip have been rising as fast or more so. But demand for plate has been lagging and the industry may now be doubtful about its earlier forecasts of plate needs. Total consumption of steel in Britain in the third quarter of this year, with the rising rate of home deliveries and imports and the further, though much smaller, drawing down of stocks, must have been well up on last year, perhaps by about 5 per cent, though still a shade or two below the same months of 1957.

IN THE MARKETS

Return to Strength

Equity prices have quickly recovered from the setback they suffered just over a week ago. When prices weakened, buyers came back into the market with the result that by the close on Wednesday the *Financial Times* ordinary index again stood at over 300. Within the week to Thursday's close it had risen from 294.7 to 309.6, passing the previous peak of 302.6 reached at the beginning of the month. *The Economist* indicator also rose to a new peak, gaining 10.8 points to 352.7. The ability of the market to recover so quickly from a so-called technical reaction demonstrates the strength of belief that many investors still have in equities, despite the low yields that many of them offer.

The market, however, now appears to be on a more even keel than at any time since the election: the daily movement in prices is not quite so violent and the number of bargains marked not so large. This return to more normal trading conditions perhaps weakens the case for opening the "House" for another half an hour until 4 o'clock, though clearly it is easier and better to deal on the floor than by telephone. The point stressed by the Stock Exchange Council in turning down a request for an extension of dealing hours was that the problem facing members is not of actual dealing but of coping with the paper work which results from the striking of a bargain.

Both the principal sectors of the market seem to be in good heart: industrial equities have recovered their poise and so, too, have gilt-edged stocks (with the exception of undated issues where speculation on the ludicrous idea that War Loan should be given a definite redemption date was finally scotched by a statement in the House of Lords by Lord Dundee, Minister without Portfolio). This creates a favourable climate in which overseas borrowers can look to the London market for funds. The Australian government, it has been hinted from Melbourne, may come back in the queue. Of more immediate consequence, the Investment Company of Nigeria, one of the rare ventures that the Commonwealth Development Finance Company has found to back, is to place one million of its £1 ordinary shares at par next week. The shares of this company, which is to provide finance and advice to small and medium-sized businesses in Nigeria and which may eventually form the nucleus of a domestic capital market in Nigeria, will be taken up by the institutions, by companies with a special interest in Nigeria, by CDFC and by the Colonial Development Corporation.

In the Balance

A Correspondent cables from Wall Street:

The suspension of the steel strike has not brought any fresh buying wave to the equity market in the United States. The market is evenly balanced, with individual investors and mutual funds still buying common stocks but with banks and tax exempt institutions lightening their equity portfolios a little in favour of high yielding fixed interest stocks. It thus seems most unlikely that equity prices will do anything more than climb slowly and the market could suffer quite sharp setbacks in the event of any unfavourable economic developments.

The Ford Foundation, it has been rumoured, is anxious to diversify its portfolio still further, and it is expected to sell another two million of its Ford Motor shares to the public. Because of the rules of the Securities and Exchange Commission on advance publicity, the Foundation and its underwriters (who were criticised for their handling of the publicity when the very first offer of shares was made to investors) have refused to make any comment on the rumour. But the rumour has been so strong that the price of the Ford Motor stock has been brought down from its peak of $85 to $77. Last March, when the Foundation sold two million shares, the price stood at $56½. The issue of another two million shares may bring as much as $150 million into the Foundation's funds and it is a sign of the times that some of this money is likely to be re-invested in fixed-interest bonds.

LOCAL UNEMPLOYMENT

Major or Marginal?

It was by no means easy, from the debate on the second reading of the Local Employment Bill this week, to judge how important the Government really intends this "major measure" to be. Mr Maudling was not to be drawn into promising early disclosure of even an initial list of the places that the Board of Trade thinks may deserve Government help in attracting industry. He did say that the present Development Areas covered about 20 per cent of the population. That if one took away areas that had been "administratively descheduled" (where the Board of Trade had in practice decided not to offer help), and added the "unemployment places" covered by the 1958 Act that amended earlier legislation on the distribution of industry, it came to about 14 per cent of the country as a whole. And that he would be surprised if the new list departed far "in global terms" from this present percentage. He thought that "no doubt we shall be providing in future estimates more money than at present for these purposes," but was not prepared to guess how much.

He described the bill, which consolidates and slightly extends the Government's powers under existing legislation on the distribution of industry, as "providing a new framework for dealing with the problem of local unemployment." This, reflecting the change in title, led some Opposition speakers to suspect that a change in emphasis had taken place, from interest in the general social and economic pattern of industry throughout the country to concern merely for silted-up inlets from which the tide of industrial change has ebbed. It is true, as Mr Rodgers said, that the bill rejects the possibility once mooted by Professor Cairncross of taking power to promote developing areas as well as declining ones—occasionally "accentuating the positive." But in doing so it is entirely in line with the way that this policy has worked in practice since 1945. The Government's powers have always in fact been exercised to influence industry to move towards places where unemployment was relatively high; the new bill accepts that fact, and abandons the unworkable concept of promoting some ideal distribution of industry throughout Britain's changing economy.

Mr Maudling's enthusiasm for the bill was not very marked. Mr Rodgers assured the House that "the Board of Trade intends to use both its negative and positive powers to the maximum and with the utmost energy and vigour." Mr Heath, on the second day of the debate, was at pains to emphasise that this was a limited bill, not concerned with "the great problem of the movement of industries, of technical training, or of technical developments." The chorus was thus not entirely in tune. Mr Heath, who had the last word, emphasised that this was a marginal problem—and was able to point out that while work is sometimes, by such persuasion, taken to workers, a very large number of people are constantly moving to different places of work (446,000 each year, for example, migrating between the different regions of the Ministry of Labour).

VOTING SHARES

Voluntary Action

Non-voting ordinary shares have a good deal of point for a company in its first period of rapid growth when it is fair to give special defences to the management in order to repel boarders. But what is the

solution when big and long-established companies, often the creation of the abilities of one man or a small group of men, still retain them? Some say an outright ban, on the ground that they are an affront to the basic idea of a property-owning democracy. But there is a short-circuit in this argument too, because the people who hold non-voting shares acquired them knowing their limitation. Opposition to non-voting shares has grown more vocal in the City as the years have passed; it is doubtful if underwriters could be found today for an issue of new non-voting shares. But it is difficult to distinguish between companies where there is any case for preserving the non-voting share and those where it is exploited as a device for disenfranchising the holders of a substantial part of the equity. Yet something needs to be done. The chairman of the Investment Protection Committee of the British Insurance Association, Mr J. F. Bunford, has contended in a letter to *The Times* that

> non-voting shares are something of an anachronism in these days . . . there must be terms fair to both classes of shares upon which the voters and non-voters could be combined in one class, all being entitled to vote on matters affecting the welfare of the company of which they are proprietors.

Mr Bunford will not be alone in supporting the plea made last week by Mr Lionel Fraser that the President of the Board of Trade or whoever is the right authority should

> invite the leaders in the non-voting field to meet him and to see whether they would agree to enfranchisement, if not at once, say progressively over a period of five years.

As Mr Fraser has said, there is a good deal of talk among these men that "If he'll do it, I'll do it," and if the directors of such concerns as Great Universal Stores and Marks and Spencer were to enfranchise all their equity shareholders the days of non-voting ordinary stock would certainly be numbered.

VOTERS AND NON-VOTERS

Ordinary shares	Present equity structure £000s.	Percentage voting*	Jan. 1, 1958	Oct. 8, 1959	Nov. 11, 1959
Daily Mirror:					
Voting	4,002	49·1	22/10½	23/3	27/11½
Non-voting ..	4,150	(50·0)	22/9	22/9	26/7½
GUS:					
Voting	1,361	5·9	33/5	45/–	57/10½

Less votes ...	9,000	...	9/10½	11/6	13/9¾

* Proportion of voting stock in ordinary capital, with the percentage in brackets showing what it was five years ago.

Enfranchisement has tricky problems. Voting stock normally commands a premium over non-voting stock (bitter experience shows that a vote is often worth paying for quite dearly) and the practice (marked in such recent cases as the House of Fraser and Pye) has been to give some compensation to voting shareholders in return for their loss of votes or control. This has usually been done by giving the voting shareholders an allotment of free scrip. In the past the amount of scrip has borne some relation to the difference in market values—though the logic of this way of calculating the "compensation" is not clear beyond all doubt. The point is important since there are numerous instances where the voting shares are much higher than the non-voting and enfranchisement with compensation on the basis of these values would imply sizeable scrip issues.

MONETARY POLICY

Lords on Radcliffe

INEVITABLY, the debate on the Radcliffe report in the House of Lords on Wednesday was in the nature of a preliminary skirmish. The Government's view will be stated by the Chancellor of the Exchequer in a Commons debate in a few weeks' time, before the Christmas recess — and the Government ought to make sure that the volumes of evidence are made available some days before that debate. It would be a mercy if the level of MPs' debate reached this week's performance in the Lords. Individual reactions were largely predictable; Labour peers and Lord Boothby rubbed their hands at the committee's equivocation about the value of monetary policy, while Lord Brand and Lord Robbins ("They believe in monetary policy, but they do not believe in it very much") shook their heads. But many good points were made, and Lord Pakenham, the ex-Labour minister who is chairman of the National Bank (operating mainly in Ireland) made a welcome appeal to his own party and to the City to tone down their mutual suspicions.

Lord Robbins of Clare Market in his maiden speech as a life peer, expressed many people's doubts about the report, with the telling aid of his characteristic oratory. "I do not know a single economist since the 17th century who has argued that the supply of money is the only factor determining the volume of spending . . . "; The Radcliffe Committee's rather artificial battle against an Aunt Sally has made its mainly sensible points about liquidity harder to follow. Lord Robbins agreed that one should not attach too much value to the spot evidence taken by the committee from businessmen about the influence of interest rates; it might have been better to look to the wealth of proved experience of history or of other countries in recent years.

The influence of 7 per cent Bank rate, naturally and rightly, was stressed by Lord Robbins; and he shares other people's doubts about the recommendations on the Bank of England. His distrust of the proposal that "puts upon the unfortunate Chancellor of the Exchequer the humble functions" of announcing changes in the rate of discount sets the matter in a good perspective. But foreign observers should note that Lord Robbins shares the general view in Britain that "there can be no place for complete independence of the Bank of England"; there cannot be two sovereign states in the economic administration.

URANIUM

Shortage into Surplus

THE understanding between the American and Canadian governments on the supply of uranium offers each side a way out of an awkward poser. Fear of shortage of uranium at first lent urgency to the development of uranium mines in western countries. Even as recently as a year or so ago, world reserves of ore were not believed to exceed 500,000 tons. The opening up of uranium mining in remote and inhospitable places all over the world was then encouraged by high guaranteed prices spread over a term of years long enough to allow the capital cost to be written off. Under this stimulus, proven reserves of high grade ore have been trebled to 1½ million tons and a further 20 million tons of low-grade ore are available as a backstop. Production has risen from about 11,500 tons of uranium oxide a year at the end of 1955 to an estimated 42,000 tons this year. Consumption has increased more slowly, as nuclear power programmes are phased out in Britain and sharply cut elsewhere.

The world price of uranium can be put at about £11,000 a ton, though the price received by each mine varies with its costs and with the bargain it was able to strike at the start of production. The price today in a free market would probably come down to between £5,000 and £6,000 a ton, at which large numbers of mines would be put out of business, especially in the United States. The long-term contracts which support the artificial price expire mainly by 1963; but a few persist to 1966—most of them made by Britain to guarantee fuel supplies for the British nuclear power programme at a time when a uranium shortage was genuinely feared.

Canada is one of the world's three big uranium producers (the others are Australia and South Africa) and its main customer is the United States. But the United States government also has responsibility for large numbers of local producers who were encouraged by generous prices to scratch out every meagre vein. The United States long ago informed Canada that it would not renew its uranium contracts after 1962-63 and was doubtless told that it could not ditch in this way an industry that had been hewn out of the tundra solely to meet American needs. The plan announced during the weekend provides for the phasing out to 1966 of uranium deliveries which should have been completed by 1963. The tonnage remains unchanged as under existing contracts; so does the price; but the mining companies can, if they choose, claim

The last ten years have seen the new industry of petroleum chemicals well and truly established on Scottish soil. This great new enterprise owes its origin and development to the foresight, capital resources, scientific skill and management of two leading companies—The British Petroleum Company Limited and The Distillers Company Limited. The organisation jointly formed by them to produce basic raw materials for industry—British Hydrocarbon Chemicals Limited—has already successfully accomplished a major programme of expansion, extending both its output and the diversity of its products. Today petroleum chemicals produced at Grangemouth are basic raw materials in scores of products ranging from drugs to dye-stuffs, fabrics to footwear, paints to plastics . . . assisting industrial development in many fields, and helping everyone to achieve higher standards both in work and in leisure.

B. H. C. Products . . . . . and some of their end uses

Ethylene Styrene monomer and Polystyrene (Synthetic rubbers and rubber-like plastics; electrical equipment; toys; piping). Polyethylene.

Ethyl Alcohol Raw materials for textiles; synthetic fibres; plastics; paper; leather and food processing industries; pharmaceuticals and fine chemicals. Solvent for industrial finishes. Methylated spirits.

Diethyl Ether Solvent for extraction of oils and alkaloids in the pharmaceutical industry. Anaesthetics.

Isopropyl Alcohol Acetone (solvent for rayon, explosives, lacquers, aircraft dopes, and adhesives.) Intermediate for pharmaceuticals and other fine chemicals.

Tetrapropylene Household and industrial synthetic detergents.

Butadiene Synthetic rubbers and rubber-like plastics. Boot and shoe soles.

*** Polyethylene** Sheet, film and monofilaments: household, medical and laboratory articles.

***Cumene/Phenol** Phenol (resins; insecticides; herbicides; synthetic fibres; lubricating oil additives). Intermediate for dye-stuffs, pharmaceuticals and other fine chemicals.

* PLANTS NOW UNDER CONSTRUCTION AND DUE FOR COMPLETION THIS YEAR

British Hydrocarbon Chemicals Ltd
GRANGEMOUTH · STIRLINGSHIRE

the special $2.50 a lb. amortisation allowance now, six years before they actually deliver the uranium. This thick sugar coating has sweetened the pill for the mining companies, of which Rio Tinto is the biggest. The Canadian government is allowing the companies to shuffle contracts round among the most suitable mines; this ought to give the Canadian uranium industry a chance to rationalise its production before it faces the cold realities of the market in 1966. Canadian ore is of higher grade than American, and some Canadian producers should be able to show a profit even if the price were as low as £5,000 a ton.

THE EXCHANGES

Help for the Dollar

THE drain of gold from the United States was checked last week with the help of the International Monetary Fund. The Fund converted $100 million of its own gold reserve into short-term US Treasury securities. This swap, which is not unprecedented and puts the Fund's reserves to profitable use, was also diplomatic for the sustenance it gives to the US gold reserve. It provides an interesting example of the working of the scarce currency clause in conditions quite other than those for which it was designed. Sales of gold by the IMF to a member country were envisaged when the currency of the country in question became scarce and supplies of it available to the Fund could be reinforced in this way. There is no scarcity of dollars today and the dollars that have been obtained by the Fund are in the form of high-yielding securities. Another special prop for America's gold reserves (standing at a mere $19½ billion) will come from Britain's advance repayment of its credit of $250 million from the Export-Import Bank.

With the passing of the seasonal peak in commercial offerings of sterling, there has been a modest though general recovery this week in the rate against most currencies. There has been evidence this week of considerable and persistent commercial demand for sterling; at the same time, withdrawals of funds from London as a result of higher interest rates in New York and Frankfurt appear to have come to an end. The recent high level of exports from the United Kingdom provides one explanation of the demand for sterling. Another is the sharp rise in the prices of such staple sterling area commodities as rubber and tin.

Sterling against the dollar has strengthened over the past week from $2.80¼ to $2.80 7/16. Against the D-Mark there has been an improvement from 11.69 to 11.69½. There has been considerable activity and fluctuation in the market for the Swedish kroner following the decision of the Swedish authorities at the end of last week to widen the tolerance of permissible fluctuations against the US dollar; hitherto these were exceptionally small. This caused a widening of the margin against sterling, which previously was 14.37¼ to 14.59¼ and has now spread to 14.27½ to 14.70. Within this, the rate on Stockholm has come to rest at around 14.52.

UNILEVER

Confusion Worse Confounded

BOTH the ordinary shares of Unilever Limited and Unilever NV are among the growth stocks of the international capital markets. The half-yearly report of the diarchy, revealing higher profits, strongly suggested that the warning given a year ago by the directors—that the total dividends of 17½ per cent for Limited and 15½ per cent for NV paid in 1957 would not necessarily be declared for 1959 on the capital as increased by a 25 scrip issue—had lost much of its potency. The dividend prospect was further confused by the addition of special interims (3½ per cent for Limited and 3 per cent for NV) to the "normal" dividends for 1958 which were at the same rates as for 1957. These special interims were designed to provide some compensation for the fact that the NV scrip issue was taxable in Holland.

Confusion has now been worse confounded by the declaration of bigger interims for 1959 of 8 per cent for Limited and 7 per cent for NV on the capital as increased by the scrip issue. In the past, the directors have indicated what the final payments would be before the end of the financial year had been reached—and have been criticised for doing so. This time, when there would have been a better case for doing so, they have not prejudged the final payments. The market in its present state of mind is not likely to err on the side of caution and the least optimistic assumption it is now making is that the final payment will be 9½ per cent for Limited and 8½ per cent for NV on the enlarged capital. The more optimistic are arguing that, as in 1958, the final dividend will be half as much again as the interims: on that assumption, the final payment of Limited would be 12 per cent, making 20 per cent in all, and for NV 10½ per cent, making 17½ per cent in all. It is anyone's guess, but the market which was bullish before the dividend announcement, with Limited jumping from 131s. to 139s. before a reaction to 135s., remained so on Thursday, when Limited rose to 136s. 3d.

OIL

Competition from North Africa

THE new 22/24-inch pipeline along which Saharan oil from the Hassi Messaoud field is now being pumped to the port of Bougie in Algeria for shipment to France is about 410 miles long: the line under construction from the Edjélé oilfield to the port of Skirra in Tunisia, due for completion next October, will be nearly 485 miles long. Zelten in Libya, where Esso has brought in two highly productive wells and is now surveying possible pipeline routes, is only 100 miles from the nearest point on the coast: and most of the discoveries of Libyan oil, now reported by several of the companies exploring there, have been at depths between 3,000 and 5,000 feet, as against the 11,000 ft. of Hassi Messaoud. This autumn, which will finally bring Saharan oil in the large quantities so long promised to Western Europe, has also signalled the advent of a powerful competitor. The first Libyan pipeline, over so much shorter a distance, may not be long behind that from the Saharan Edjélé field (where the oil is at least at comparable depths) in coming into commission.

However, French plans for the Sahara are firmly committed to a production rising from, say, 1½ million tons this year to 9 million tons next and 23 million tons by 1962. Extra pumping stations will be installed to increase the initial capacity of the two pipelines, from 5 million tons to 14 million tons a year for the line from Hassi Messaoud and from 8 to 17 million tons for that from Edjélé: these would cover the further expansion to "the order of 30 million tons a year" by the middle sixties on which the French are pinning their hopes.

Fulfilment of those hopes depends not upon capacity to supply the oil—proved reserves in the Sahara fields are now put at 475 million tons, plus 800 billion cubic metres of natural gas—as upon the exploiting companies' success in finding markets for it. Since those mainly concerned are owned partly or wholly by the French government, which makes no bones about its intentions to see that refineries operating in France take as much Saharan crude as possible, very substantial markets obviously can be found; but unless consumption in France and in other markets that it can penetrate rises even more sharply than of late, much of this incursion must be at the expense of crude from other sources.

MIDLAND BANK

Term Loans

FOLLOWING its introduction last August of long-term loans to farmers, the Midland Bank has implemented another recommendation of the Radcliffe committee by offering term loans to small businesses generally. In both cases the main difference between term loans and existing credit facilities is one of form. In practice neither farmers nor business men financing buildings or equipment on a bank overdraft would expect to have their overdrafts called in on demand, though the bank is entitled

to do so. There is something to be said from the point of view of the bank itself for recognising a long-term loan for what it is ; and some borrowers may be prepared to pay a little more for the formal assurance that they are not liable for sudden repayment.

The term loans now being offered by the Midland are so far matched by no other bank ; United Dominions Trust has offered similar facilities for many years, though at higher rates. The Midland's loans will be for three to five years for plant and equipment, according to the life of the asset, and up to ten years and possibly longer for acquisition of business premises ; the maximum for farm loans, it may be recalled, is 20 years. Interest will be at 2 per cent over Bank rate, or 6 per cent at present ; this is one per cent more than the normal rate for overdrafts. But the basis of charging will be as favourable to the borrower as is the overdraft system ; interest will be calculated on the actual amount outstanding from day to day. The loans may be recalled only if the borrower fails to keep up his agreed instalments ; this goes a little further than the scheme for farm loans in which the bank retains the right of recall but will exercise it only if it finds that the farm is being mismanaged.

ROADS

The Battle of Staines Bridge

THE controversy surrounding the design of the new Staines bridge took a new—and in some respects more curious—turn this week. Originally Mr John Dayton, a director of the company that built the Chiswick flyover, sharply criticised the design of the flyover as out of date and too expensive. Then the firm submitted an alternative design prepared by an associate company for the Staines bridge, making use of pre-stressed concrete, which would be completed in fifteen months at a cost of £285,000. This design was rejected by the Ministry of Transport, which chose to preserve a twenty-year old design of Sir Edward Lutyens' in a bridge costing £485,000 and taking 21 months to build. The Ministry—and the consulting engineers retained by it—asserted that Mr Dayton's alternative design contained serious defects which made it unsuitable, and added that, even if it had found the design to be sound, it would in fairness have had to invite all the firms tendering for the bridge to submit alternative designs.

Mr Dayton promptly submitted his design to two Danish professors for "evaluation" ; their report, published last week, stated that it was up to date and displayed skill and imagination. In Parliament, the Minister of Transport, Mr Marples, stubbornly defended the choice of the Lutyens design, stating that it was retained on grounds of amenity owing to the historic nature of the site. Finally, Mr Dayton's partner, Mr Eric Ingerslev, who designed the unsuccessful alternative, was accused this week of "unprofessional conduct" by the consulting engineer to the Ministry of Transport, Mr C. W. Glover, on the grounds that the rules of the Institute of Civil Engineers forbid its members to submit designs without disclosing that they are members of contracting firms, and forbid one member from criticising another's work.

Several questions remain to be answered. First, the external Lutyens design was retained, but is now to be built with a steel frame, instead of the original reinforced concrete, which seems bound to have put the cost up. Second, if reopening tenders for the bridge and allowing alternative designs might have saved £200,000, why was this not done ? In rejecting the alternative design, the Ministry stated that "it is important that the consulting engineer

Dots and the Pound

EVERYONE has his own ideas about reforming Britain's money, and Mr James of the Royal Mint has stirred them up again. It is worth looking at the experience of countries that have recently gone through the agonies, and notably that of South Africa. This example suggests that it might be awkward—though it would not be impossible—to keep the pound in a decimal system. One hundredth of a pound would be worth 2.40d., which is too big a unit for the smallest needs. Yet anything smaller would involve complicated fractions, or going to three places of decimals. The South Africans, who are introducing decimal money from February 2nd, 1961, decided that both alternatives are too unwieldy and (reluctantly, they say) will drop the pound in favour of the Rand, worth 10s. Their commission noted that if people could go on talking about the guinea generations after it had gone out of existence there was no reason why the same should not happen with the pound.

In its coinage at least, South Africa will therefore come in step with other countries. Of 48 members of the International Monetary Fund, only five have highest money units worth £1 sterling or more and only one other (Australia) has a unit worth more than 10s. The rest range from the US dollar (7s.) down to Japan's farthing-yen. In the Commonwealth, India, Canada, Ceylon and East Africa already have a decimal system, South Africa is in transition, and New Zealand and Australia are thinking seriously of it.

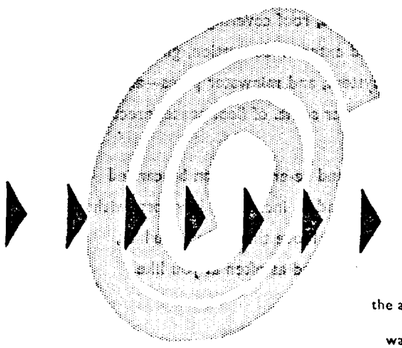
Commissions and committees have been talking about decimal money in South Africa ever since Mr Havenga (then Minister of Finance) drafted a bill in 1932. (In Britain it began a century earlier with Sir John Wrottesley's motion to the Commons in 1824.) In 1952, 1953 and 1956 Mr P. A. Moore, opposition member in the Union Parliament, tried his best and in 1956 the government decided to take the plunge itself, appointing Mr Moore to the commission it set up to find out the best way of doing it.

It decided on the 10s.-cent system. The Rand will be divided into 100 cents, each worth 1.2d. and will include half and quarter cents to keep official price controllers happy. Matches and other goods previously selling for a penny or less may go up 20 per cent in price but, the commission says, "penny-line sweets, for example, would be made bigger and sweeter."

Most of the present coins will stay in use for a period of dual coinage. £1 and 10s. notes will be worth R2 and R1 respectively; new 5s. crowns will be minted to represent 50c ; florins, shillings and sixpences will become 20c, 10c, and 5c ; and 2½c will be represented by the South Africans' much-loved "tickey" which is slim and streamlined compared to the threepenny bit. Only the bronze coins will have new values and need to be replaced. The half-crown is to be dropped.

A decimal coinage board is supervising the change-over. Schools must get new arithmetic books, shops have already been persuaded to mark prices in Rands and cents as well as £ s. d.; public institutions and services will fall into line quickly; and the Minister of Finance is looking around for the £9 million he says it is all going to cost him. The opposition says it will cost the community in all £30 to £40 million. The biggest item in compensation will be payment for the adjustment of 100,000 machines dealing with money—calculators, cash registers and petrol pumps. Old machines will be scrapped, newer ones will be converted: in both cases, unless the cost involved is less than £7 10s., the government will pay. No new companies may import machines. Banks will convert their machines overnight, using special machines now being installed. Other businesses will wait in a queue for the services of mechanics whose training started at the beginning of this year, but whose work will not start until 1961. Machines with more than eight £ columns will not be converted: they can be used for decimals anyway.

But the most important conclusion by South Africa's Decimal Coinage Commission is that the sooner the change is made the less it will cost: once you decide to do it, in this age of machine accounting, it becomes urgent.



Confidentially...

The latest thing in quality time-keeping is a piece that combines all the advantages of the elegant fob watch and the practical travelling clock . . . in fact, the Movado Ermeto. The Ermeto is not only a precision-made, Swiss watch, but a shock-protected, upright clock for desk or bedside table.
The rolled gold Ermeto, at £46 18s. 6d., is just one of the wide range that includes the Automatic Ermeto, the Ladies' Ermeto and the special alarm Ermetophon. Consult your nearest Movado Jeweller.

should be completely independent of the contractor"—but this is far from being proved. Mr Ingerslev and Mr Dayton have made no secret of their collaboration, which appears to have produced a sound design at low cost; by contrast to the civil engineers, the Royal Institute of British Architects has long recognised the advantages of such collaboration. As for the rule that one member should not criticise another's work, it seems merely a restrictive professional practice that can do harm to the public interest. Mr Dayton's criticism—as yet unrefuted—may not have won him the Staines bridge contract; but it might get the country more modern and cheaper bridges in the future.

AIR FARES

War on the South Atlantic

UNDER the stress of intense competition, the internationally agreed structure for air fares on the South Atlantic has broken down with the nine airlines flying to South America bidding for traffic by offering discounts of between 40 and 50 per cent of the standard fare. There has never been enough traffic to justify the number of air services on these routes and any airline proposing to fly to South America from Europe must be prepared, it is said, to lose up to £2½ million yearly on the service. The reopening by BOAC a few months ago of the direct air link to South America in suspense since British South American Airways disappeared in the late forties seems to have been too much for the rules regulating international fares. BOAC reopened its South American services to find work for aircraft, including Comets, that would otherwise have stood idle at London Airport. None of the British independent airlines had been prepared to operate there, even though it would have been theirs for the asking. The Argentine government is now threatening to take action against airlines offering discounts, but the only long-term solution is the withdrawal of some of the services that are offered.

OVERSEAS TRADE

Exports a Record

BRITISH exports were a record last month, jumping up to £306 million fob, almost £60 million above the low September level. Imports rose by £30 million to £360.2 million cif, the highest total this year. With re-exports also rising by nearly £3½ million to £14½ million fob, the apparent visible trade deficit fell sharply to £39½ million from £72½ million the previous month. This last item is no longer included in the provisional trade figures. The Board of Trade points out—as anyone who takes the trouble to study the figures knows—that the apparent deficit is a misleading guide to the visible balance of payments on current account. Now that the Treasury publishes quarterly estimates of the balance of payments the Board feels justified in dropping the apparent visible deficit from its returns.

UNITED KINGDOM TRADE

* Provisional.

Another innovation appears this month: the publication of seasonally adjusted figures for overseas trade. After eliminating normal seasonal variation, the Board calculates that British exports in the three months August to October were 3½ per cent higher in value than in the three previous months, while imports showed a rise of four per cent over the same period. On the same basis the average value of exports during the first ten months of the year was four per cent higher than the average for the whole of 1958, and imports were five per cent higher. Those not immovably sceptical of the usefulness of this kind of exercise can find a full explanation of the seasonally adjusted series in last week's *Board of Trade Journal*.

HIRE PURCHASE

European Business

"IN this trade," one of the leading delegates said privately to an inquirer at last week's meeting to found the Association of European Finance Houses, "we never meet except to do business"; and indeed the first indications of business co-operation among founder members were evident before the first meeting. In other ways, too, this venture has characteristic touches. Present members from Britain, Austria, Belgium, France, Germany, Holland, Sweden and Switzerland include both national associations and individual finance houses (United Dominions Trust and Lombard Banking from Britain). A number of the smaller finance houses apparently feel that this is unfair; they would prefer the European body to be simply for the exchange of views and information, and membership confined to the national associations. The trouble here is that while Britain is well supplied with three hire purchase associations some other countries so far have none.

A constitution has apparently been drawn up for Eurofinas (as it has inevitably been called) and a committee appointed with Mr T. J. M. van den Ende, the association's pioneer, as chairman and Mr J. R. T. Gibson Jarvie, joint deputy chairman of UDT, as deputy chairman. But much has still to be decided. There will probably be one vote for each country—what happens if the British associations cannot agree?—and membership fees may also be by country—another matter that will lead to interesting debate. It has not been stated whether fees will be payable by instalments.

Apart from the exchange of views, of which there were already signs in Amsterdam—"Yes, old boy, in America they've introduced instalment financing for bail"—this association is openly intended to lead to new business. The first such arrangement to come to light is an ingenious one. United Dominions Trust has arranged with Kundenkreditbank of Dusseldorf, the largest hire purchase house in Germany, to offer hire purchase facilities in Britain for German goods sold here: Kundenkreditbank will do the same for British goods sold in Germany, and the companies will act as each other's correspondents for this purpose. UDT is arranging similar co-operation with leading houses in other Continental countries. The arrangement can be amicable between the finance houses because it involves new competition not with each other but with other institutions such as merchant banks. Also, no element of foreign exchange is involved. But few people would be surprised to see big United Kingdom houses take the bigger and more venturesome step of acquiring their own stake in a European country on the Continent, particularly in one of the countries in which hire purchase is still underdeveloped. In Holland, for example, the total HP debt is no more than one per cent of national income.

IMPORTS FROM AMERICA

Not Very Much More?

THE widespread removal of restrictions on imports last week has given the country almost complete freedom to buy what it pleases from Western Europe and the dollar area. How much it uses this new freedom, however, is another question, particularly with respect to imports from the United States. US Commerce Department officials have estimated that the maximum increase in exports to Britain next year will be about £18 million, compared with a total last year of £293 million—and it may be much less than that. One of the biggest increases is expected to be in ready-made clothing, in particular the lower-priced lines of women's and children's clothing: these are not only fairly competitive in price (despite import duties ranging from 17½ to

30 per cent) but are often superior in styling and quality to British-made goods.

Imports of American cars and domestic appliances are less likely to rise. Not only are there import duties on these products of 20 to 30 per cent (to which purchase tax must of course be added) but their basic cost is too high to be competitive. In general British toasters, steam irons and coffee percolators cost about half as much, in this country, as do American ones. There is some demand for waffle makers, sandwich toasters and other kitchen gadgetry for which there is no British-made counterpart. This is also true of major appliances, such as giant refrigerators, deep freezes, dishwashers and automatic washing machines. One London department store has been importing these under the token import scheme for several years, and reports that it has lately been unable to meet the demand, even at prices ranging up to £363 for a 16 cubic foot refrigerator-cum-deep-freeze, with automatic defrosting. Where large numbers can be sold, however, it probably remains more economic to manufacture American appliances under license.

In industrial plant and equipment, the high cost of run-of-the-mill American products, makes them generally uncompetitive, both with British and Continental—especially West German—products. Where American designs could not be matched in Europe, there have always been arrangements by which it could be imported—at times in very large quantities. American chemical plant, for example, is now made in Britain by licensees or subsidiaries of American firms; though fewer of these subsidiaries may be formed in the future, it is unlikely that many of those now existing will close.

BUILDING SOCIETIES

Withdrawals Going Up

THE reduction in the rate of interest paid on shares has had some effect on the rate of withdrawal of savings from the building societies. This is apparent in the figures for the third quarter of the 197 member societies of the Building Societies Association. But the table does not show that the rate of withdrawal has been going up, month by month, to an appreciably higher figure in the last few weeks.

DEPOSITS AND ADVANCES

197 Members—Building Societies Association (£ million)

	1959 I	1959 II	1959 III
Shares & deposits			
Gross receipts	117·8	111·7	107·9
Gross withdrawals	56·9	66·5	71·4
Net receipts	60·9	45·2	36·5
Advances	68·5	94·0	112·0
Repayments	68·3	78·4	81·8
Funds			
Liquid assets	336·7	347·3	337·0
Total assets	1,992·5	2,047·3	2,098·1
Liquidity ratio	16·9%	17·0%	16·1%

The slump boom has attracted some savings from the societies and the echoes of the Jasper affair have also prompted a certain amount of withdrawals. Similar trends are revealed in the figures of the Halifax which, not being a member of the association, announced a reduction in its rates a year ago. In the nine months to October 31st it lent £60½ million on advances, with the result that its liquidity ratio fell slightly to 17.4 per cent, and its net receipt of funds at £9 million in the October quarter was slightly down on the £9.3 million net received in the July quarter.

The lending of a record sum of £112 million by members of the Association in the third quarter has made many societies, and especially those whose reserve ratios need attention if they are to retain trustee status, rather more restrictive in their lending. They are also making increasing use of the facilities under the House Purchase Act. Advances under this scheme do not affect their financial condition in qualifying for trustee status. In the third quarter of this year about £5 million was lent by the societies to house purchasers on houses built before 1919 and advances of this character are now running at between £3½ and £4 million a month.

Tightening Up the Law

MEMBERS of the building society movement are now putting their ideas together on the new law promised by the Government, and the association is busy warning investors about "unsound" societies. On one point there seems to be general agreement: the advantages of the title of building society should be enjoyed only by those who keep a strict limit on advances to other than owner-occupiers. Very few societies lend only to owner-occupiers but almost all societies are careful to limit the proportion of other types of advances to a prudent level. Much depends on the quality of the mortgage as well as on the status of the borrower. Only this year the City and Metropolitan, which over the last ten years has lent money to the Chamberlain group of property companies, became a member of the association. The death of Mr W. E. Chamberlain attracted press comment to this fact. Its chairman, Mr F. E. Cleary, has said that these mortgages were "more than amply secured" and that the early repayment of some of them was made not at the request of the society but at the request of the Chamberlain group itself.

The State Building Society, which lent heavily to the Jasper group of companies, has for some time been subject to a "stop order" on its advertising for money and withdrawals by shareholders are limited to a nominal sum. This week the Chief Registrar of Friendly Societies, at the necessary request of a group of shareholders, has appointed an inspector to investigate the affair of the society. The inspector is Mr W. H. Lawson, a past president of the Institute of Chartered Accountants and a chief architect of the merger between the Institute and the Society of Incorporated Accountants.

This is the second investigation which has sprung from the Jasper affair. The first is being conducted by Mr Neville Faulks, QC, into the affairs of the Jasper group of companies; the latest move here is that he, with Mr R. K. Lochhead, a director of Commercial Union Assurance, has been asked to investigate the affairs of Pilot Assurance, an insurance company taken over by H. Jasper and Company in October, 1958. This is the first inquiry into the affairs of an insurance company on the grounds that the company's assets fail to exceed its liabilities by £50,000 or more since provision for such an investigation was made in 1935.

Prosperity in Rubber

IN the last eighteen months the price of the top grade of sheet rubber in London (for three months' delivery) has risen by two-thirds to about 37½d. a lb—leaping up several pence in this week alone. The average cif price for the first ten months of this year, at 2s. 4¼d. a lb, is nearly 5d. above the average for the whole of 1958. Spot still commands a high premium of about 2d. a lb, but the rubber grower does not sell spot. Sales of natural rubber from the American and British strategic stocks have not ended the shortage of spot rubber, and supplies available in the Singapore market have become increasingly light.

World consumption will reach a new record this year of something over 2.1 million tons; though production is not matching consumption it will also reach a record at nearly 2.1 million tons. World consumption includes an estimate of imports into the communist countries of about 475,000 tons, which would be roughly 50,000 tons larger than last year because Russia and China have been buying more.

Efficient estates in Malaya are on velvet at these prices, and the less efficient are also making good profits. As the commodity has risen, so have the prices of rubber shares; the *Financial Times* index has gone up from 124 to 216 in the last year. The favourable outlook has stimulated fresh thinking among both producers and investors. Producers have been merging into larger groups, for example Highlands and Lowlands and Seafield Amalgamated. This has not only brought economies in administration; it has also made their shares more marketable and therefore more attractive to investors, especially the institutions.

Political risks in Malaya have diminished, and hence investors have been willing to accept lower yields. But yields are still high, ranging from 8 to 13 per cent, and even now may not fully discount the increase in profits and dividends to come. Since replanting in Malaya got into its stride the most profitable companies are those which have the highest proportion of their acreage under mature high-yielding trees, and a goodly portion of new trees becoming mature. Some areas of high-yielding trees in full production could show a profit even if prices fell as low as 1s. a lb.

	Total planted acreage	Under new trees Mature %	Under new trees Immature %	Price, Nov.11, 1959	Dividend Times covered	Dividend Yield %

FOR THE PACIFIC

The Canberra Partner

WHEN the Orient passenger liner *Oriana* was launched at Barrow-in-Furness this month, her partner was on a berth at the Belfast yard of Harland & Wolff Ltd. This vessel, the P & O liner *Canberra*, is due to be launched next March, and both she and the *Oriana* should be in service by the beginning of 1961. There are seven major passenger liners in the fleets of the P & O and Orient, its subsidiary, all of between 22,000 and 30,000 tons gross, and with a speed of 22 knots. The two new ships, designed to meet similar traffic specifications, are, so to say, "two sizes larger and two speeds faster." The *Oriana* is 40,000 tons gross and the *Canberra* 45,000 tons gross; their service speed will be 27½ knots.

This considerable jump is by no means typical of the building programmes of shipping companies. Advances tend to be made from ship to ship by easy stages. But P & O and Orient realised that their seven major liners, all built in the first decade after the war, were proving profitable only because they were bought at prices that shipyards can no longer offer. The conception of the next ships to be built could not, therefore, be developed directly from that of their predecessors: it had to be thought out afresh. The price of the *Canberra* is expected to be about £15 million. Compared with the £6½ million cost of the *Iberia* in 1954, this is an increase of about 50 per cent in cost per ton.

The fresh thinking started with the prospects of developing the trans-Pacific passenger trade, into which the Orient Line made a promising entry in 1954. A joint service in the Pacific, operated by the two companies, was given the name "Orient and Pacific Lines" in 1958. Added to the two companies' existing services to Australasia and the Far East via the Suez Canal, and to North America via Panama, this gave a flexible triangle of Pacific services—North America/Australia/Japan—that could gain in frequency as the traffic grew.

To fit in with these new services and meet the problem posed by present shipbuilding costs, the companies decided to go for larger and faster ships to get the improved economy that results from larger size and the passenger "appeal" attracted by higher speed. These two qualities are linked, since the speed that is practicable without excessive fuel consumption goes up with the length of the ship, and hence with its size. The size chosen gives a draught of 32 ft. 6 in., fully loaded, which is comfortably below the limit of the Suez Canal; and the higher speed allows the voyage from the United Kingdom to Sydney to be done in three weeks instead of nearly four.

New Ideas in Design

THE *Canberra* will have air-conditioned accommodation for 600 first-class and 1,650 tourist-class passengers, as well as for a crew of about 1,000. Provision has also been made for a small amount of cargo. The design of the ship is remarkable, as it incorporates a large number of ideas which are either completely new, or new enough to be described as novel; the chief credit for it is due to a naval architect in his early thirties, Mr John West, who is assistant to the management and technical adviser of the P & O Company. The interior has been designed by Sir Hugh Casson—his first venture in commercial shipping.

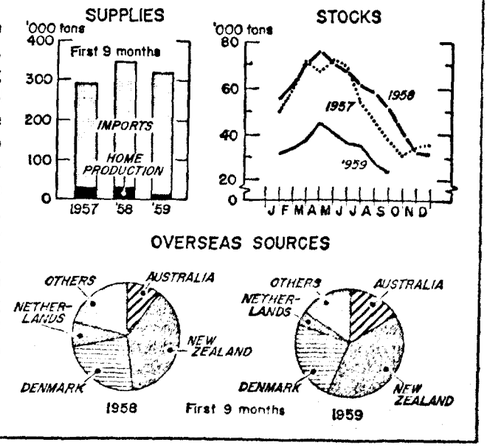
Externally, the most notable feature is the arrangement of twin funnels near the stern. This has been achieved by siting the propelling machinery aft, leaving the midships entirely free for passenger accommodation—which is the best place for it, for convenience of layout and for comfort. This has been done before in only one other British passenger liner, Shaw Savill's *Southern Cross*, and abroad only in liners of a much smaller size. But the appearance of the *Canberra* is also notable in that the lifeboats have been sited three decks lower than usual. They are recessed into the sides of the ship, and are handled by specially designed davits. Placed there, they give the ship a lower centre of gravity and improve the view from the promenade and sports decks. The twin funnels—a controversial feature from the point of view of appearance—also improve amenities because they are slim enough to avoid the downdraught that often blows smuts on to the decks.

The new liner will also have a number of notable structural and internal features. A great deal of weight has been saved by the adoption of a welded aluminium superstructure. More than 1,000 tons of aluminium were used, giving the *Canberra* the biggest superstructure in all-welded aluminium. The saving in weight makes possible an extra cabin deck, which completely offsets the extra cost of this more expensive material. The extensive use of plastic-covered surfaces will virtually eliminate internal painting—which will reduce maintenance costs. And a good deal of scientific research has gone into the development of a soundproof design of bulkhead that will cut down extraneous noises in cabins.

Two sets of ship stabilisers are being fitted. These are now a standard fitting in modern passenger liners. Less common,

The Butter Situation

Last year butter was in surplus, this year it is scarce, owing mainly to the long drought in Europe. Total imports so far this year have fallen by 5¼ per cent to 308,000 tons, though shipments from Australia have risen by more than one-half, and shipments from New Zealand show little change. A relatively small fall in supplies has brought a big rise in prices; New Zealand butter now costs 430s. a cwt. wholesale, 150s. more than a year ago.



however, is the transverse bow propeller which allows the bows of the ship to be moved sideways when manœuvring or berthing. This idea was developed for ferries some time ago, and the *Canberra* and *Oriana* are the first large liners in which it has been used. The propelling machinery of the *Canberra*, which develops a maximum power of 85,000 shp on twin propeller shafts, is unusual in being turbo-electric. This form of drive was popular with the P & O between the wars, but has seldom been used by other lines for ships of this type. The machinery is heavier and more expensive than geared turbines, but by avoiding the need for astern turbines it allows more efficient turbine design, is more flexible, makes the ship more manœuvrable, and reduces the risk of mechanical failure.

TIN MARKET

Speculators Take a View

When American steel and tinplate workers were sent back to work this week tin cost slightly more than it did nearly four months ago, before they came out; throughout the strike it remained steady at about £792 a ton. Yet during this period American consumption of tin dropped by nearly 10,000 tons, while exports from the producing countries were increasing. The manager of the International Tin Council's buffer stock has not had to buy tin to support the market; he has in fact been selling substantial quantities to keep prices steady. Consumption of tin outside the United States has been growing, and some of the big American steel companies did not completely withdraw from the market during the strike. No one outside the council knows exactly how much tin remains in the buffer stock. Private guesses range from well under 10,000 tons to about 11,000 tons. As the maximum stock is 23,200 tons of metal or the equivalent in cash, it would seem prudent that the manager should not be left with much less than 10,000 tons. The council has so far refused to disclose its interpretation of article VII of the agreement—the question whether exports can still be restricted under the scheme even when the buffer stock is less than 10,000 tons, or may fall below it by the end of this year, when the current control period itself ends. There is no justification for this obscurantism, and the council will be expected to make its intentions clear after its meeting on December 1st.

If it were to take the highly questionable view that exports can be controlled, irrespective of the size of the buffer stock, or if the stock is still comfortably above 10,000 tons, it will probably increase export quotas in the first quarter above the current level of 30,000 tons. But it may move cautiously, taking the view that much of the fall in American consumption during the strike will never be made good, and that it will probably be asked to dispose of the remaining 2,500 tons in the British Government's strategic stock from January 1st. The market is evidently less timid; many people believe that tin is going to be short. Tin for three months' delivery touched £803 a ton this week, the highest price for nearly three years, though it fell back later to close on Thursday at £798. The earlier rise followed buying by consumers and the end of the American steel strike; but speculators were also taking a view.

CABLES

Competition Bites Deep

The inroads of the price war in the cable industry upon profit margins can be seen in the half-year results of British Insulated Callender's Cables to last June. Though the price ring was finally abandoned only in April, BICC's rate of profit on turnover was 7.6 per cent compared with 8.5 per cent in the second half of 1958, and 7.5 per cent in the first half—but that was a bad year for the cable industry. Sales rose to £63 million from £57 million and £53 million in the two preceding half years. The latest figures include, however, the sales of Telegraph Construction and Maintenance from January 1, 1959, and of Scottish Cables from April 1st. The interim dividend is being maintained at 4 per cent. The price cut made by the members of the ring, including BICC, in November, 1958, in face of competition from non-member firms may account for much of the fall in margins. The next half-yearly figures should show how much further BICC has had to pare its profit margins: it announced a further round of price cuts at the beginning of June, following those which were made when the ring broke up.

Suggestions that the large companies are in fact now selling below cost were made by Mr L. S. Hargreaves, the chairman of Aerialite, one of the smaller cable makers, in his annual statement this week. He accused the big companies of pushing prices below cost—at least on the bread-and-butter cables—so that the smaller firms would be weakened and perhaps taken over, and present losses could be recouped in a less competitive market. He urged that under-cost selling designed to reduce competition should be made illegal, and added that discussions were now taking place between the big groups and the rest of the industry. Presumably any new agreement on prices would have to be registered under the Restrictive Trade Practices Act. But it appears that no such new agreement can be expected for the present.

TELEVISION

The ITA's Profits

The Independent Television Authority is still smarting under the criticisms made by the Public Accounts Committee of its business arrangements with the programme companies. The PAC thought that these should be charged higher rents; in its accounts for 1958-59 the ITA explains why it is not prepared to do so. The rents charged for the use of the eight transmitters that were working by March 31st this year came to nearly £3 million. This is three times the size of the ITA's outgoings, including payments to the Post Office for the use of its various land lines. When its charter expires in 1964, the ITA will have capital assets, all financed out of current income, worth £5 million, on which it will have provided £2¼ million depreciation; it will hold cash reserves of £4 million ready for the construction of the second network that it is always demanding; it will have passed on £7 million to the Exchequer by way of tax. The terms of the Act that brought it into being, the ITA told the Public Accounts Committee, oblige it to finance its own construction and create a reserve fund—but not deliberately to milk the programme contractors of their profits, however high these may soar.

The ITA's demands for a third channel, or for an ending of restrictions on the number of hours' television that can be transmitted each day, are really part of this same problem. It has had to rebuke contractors for crowding too many advertisements into peak hours (individual transgressions of the "six minutes of commercials per hour averaged over the day" rule were more flagrant than appears in the average figures printed in the ITA's report). The only result is that the contractors, faced with too many advertisers clamouring for an inelastic supply of peak-hour advertising, have simply jacked up their advertising rates—and their profits along with them. The answer to unhealthily inflated profits is an alternative outlet for advertisements—that is a third commercial channel. But whether this would be in the best interests of television in this country and of the viewing public is another matter entirely.

BILL MARKET MERGER ?

Cater-Ryder Talks

Negotiations have recently been started to explore the possibilities of a merger between two old-established discount houses, Cater Brightwen & Co. and Ryders Discount Co. Both are medium-sized houses ranking, by the test of capital resources, fourth and fifth among the twelve houses that are members of the London Discount Market Association. If a satisfactory basis for merger can be found and is duly approved by the shareholders of the two companies, the resultant house would rank as the third largest member of the market—displacing Alexanders from the position among the "Big Three" that it has occupied for many years. At the latest balance sheet dates Cater Brightwen showed capital resources totalling £2.87 million and Ryder showed £2.93 million. But it is

Estate Manager tells how . . .

Sitting tenants were sitting targets

Yes, they were sitting targets for the burglar — the tenants of my company's flats.

I'll tell you how we realised this. Apart from flats—and offices—we also own a hotel. Now, when we bought the place, it didn't occur to us to check the locks.

Inevitably, I suppose, there came a series of small thefts from rooms. Prodded by the police, we found that the locks were simple to pick, and that keys were going astray.

So we got rid of the lot. Chubb put in a beautiful master key system for us. Every key is different; the chamber-maid can open her own group of rooms; and only the manager's key will unlock every room in the hotel.

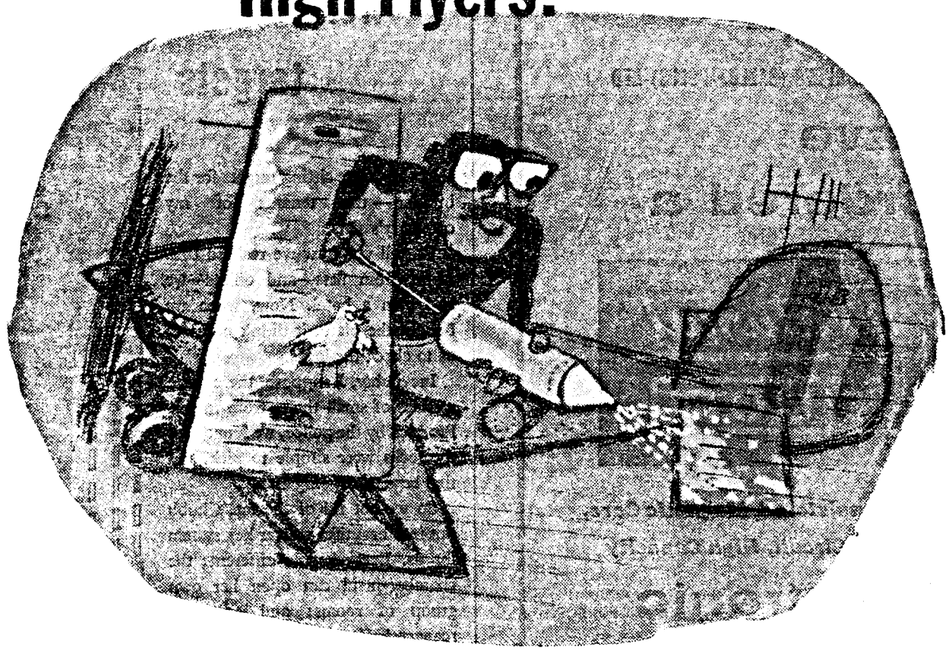
After that, we started to worry about our offices and flats. And it was obvious that we'd been 'pound-foolish' with security. So with Chubb's help we surveyed the locks and window fittings—and our sitting tenants no longer present a sitting target to the burglar.

Does that sound expensive? I assure you that it is not. And I happen to have discovered the cost of poor security. Believe me, it is worth anyone's while to hand their security problems over to Chubb. Here is the address . . .

CHUBB & SON'S LOCK AND SAFE COMPANY LTD.

175-176 TOTTENHAM COURT ROAD, LONDON, W.1

Good News for Hi-Fi High Flyers!



For high-flying hi-fi fans, a splendid vista stretches endlessly ahead. Those twin bugbears of stereo in the stratosphere—ice outside the aircraft and overcrowding inside it—have surrendered to a massed attack from the scientists who work on chemicals from oil. As ever, the Esso Chemicals Division took a keen interest in the fray.

High flying is all right—the sun's usually out and you're clear of the main roads—but it gets a bit parky up there. Ice tends to form on the wings and things. One solution is to spray on a fluid called iso-propyl alcohol, which de-ices the aeroplane. It's made from propylene, of which Esso Chemicals have plenty.

Hi-fi-ing is all right, too, although you used to need a small airship to carry all the necessary equipment. Then transistors came along. Open any transistorised gubbins and you'll probably find the parts embedded in a plastic potting compound. This is an epoxy resin, which also starts out as propylene—of which Esso *still* have plenty. And so stereo in the stratosphere flies slowly into the sunset, de-iced and uncrowded. Yet, it's a rich, full life for hi-fi high flyers. (And Esso Chemicals *still* have lots of propylene. Want some?)

Note to Manufacturers

Besides propylene, we can offer you many other chemicals from oil; they are listed below. If YOUR *business uses chemicals, ask your secretary to contact the Esso Chemicals Department, 50 Stratton Street, London, W1. Telephone: Hyde Park 7030.*

BUTYL RUBBER · AROMATIC SOLVENTS (Solvesso 100 and 150)
ETHYLENE · BUTADIENE · PROPYLENE · NAPHTHENIC ACIDS · 'C' OIL
POLYISOBUTYLENE · OXO ALCOHOLS · HIGHER OLEFINS
DICYCLOPENTADIENE · SULPHUR · HEPTENE · AROMATIC TAR

ESSO MEANS BUSINESS IN CHEMICALS

understood that the combined true capital resources, on the basis of present values, would well surpass £7 million. The combined books, at the balance sheet dates, comprised £36½ million of bonds and £131½ million of bills. The aggregate of £168 million was substantially larger than that shown by Alexanders at end-December last; but comparisons of portfolios based on balance-sheet dates are apt to be misleading, and it is thought that the merged portfolios would not generally be significantly larger than Alexanders'.

A merger of this kind would evidently meet the point that Sir John Musker, Chairman of Cater Brightwen, had in mind when, in his last annual statement, he emphasised the need for the discount houses—and for his company specifically—to command additional capital in order to permit them to function to a greater extent as jobbers in bonds (as distinct from mere holders of them).

WOOL TEXTILES

A Record Year?

JUDGED by volume of output, the British wool textile industry is enjoying its second best postwar year. The recovery started in the autumn of 1958, gathered pace at the beginning of the year, and now shows signs of levelling out. Consumption of raw wool in the first nine months of this year rose to 383 million lb, 16 per cent more than in the same period of 1958, and for the whole year it may reach, or perhaps exceed, the 528 million lb consumed during the Korean boom year of 1950. The worsted and woollen sections have broadly shared in the recovery. Consumption of wool in topmaking, where the worsted process begins, rose by 17 per cent in the first nine months, compared with a year ago, while consumption in woollen spinning was 14 per cent up. The sharp rise in sales of carpets has helped the woollen side, while worsted spinners are benefiting, at the weavers' expense, from the continued vogue for knitted jersey outerwear. In an effort to prevent the Leicester knitting industry from encroaching even further into the outerwear business, some weaving firms in Bradford are now installing knitting machinery. Retail sales of wool textiles, after a late autumn start, now seem to be doing well.

The sharp rise in raw wool prices during the summer, and anticipation—only partly fulfilled—of still higher prices to come, stimulated business throughout the industry. Most firms became well sold forward, and a few have order books longer than ever before. Some topmakers are apt to complain because business has been quieter since then, and because selling margins are low. If their remarks are taken at face value they would be turning wool into tops for nothing, and making a profit solely by their acumen in buying and selling at the right time. In recent weeks, with wool prices fluctuating in a narrow range instead of moving reassuringly upward, that would not have been easy.

Lancashire's old complaints—of the power of big groups of clothing makers and retailers, of weak selling by some firms, and the expansion of Asian textile industries—find muted echoes on the other side of the Pennines. Topmaking certainly seems a crowded occupation, and no doubt the day will come when India and China, now two of our biggest customers for tops, are largely self-sufficient in these products as well as in yarn and cloth. And the move towards larger groups, horizontal or vertical, within the industry is becoming more pronounced. The most recent example is the long drawn-out battle, now won by Lister & Company, for control of the Huddersfield woollen firm, Joseph Hoyle.

RADIO SETS

Competition from Shannon

TRANSISTOR radio receivers are sold in this country for nearly twice the price of a comparable receiver using thermionic valves, the main reason being the cost of the transistors. In Eire, the government has announced that an Irish registered offshoot of the Japanese Sony Corporation is to begin at Shannon the assembly of radio receivers using transistors imported from Japan. Since the rest of the components will be supplied either in Eire or imported from Britain, the finished sets will be able to enter this country duty free, and thus provide the British industry with its first mild taste of the kind of Japanese competition in the home market under which the American radio industry has been squirming for years.

The Eire government has been trying for some time to offset the economic consequences caused by the fact that longer range aircraft overfly Shannon Airport and are threatening it with the same fate that overtook the nearby seaplane base at Foynes. Two years ago it decided to set up a trading estate inside Shannon's free port boundaries and six standard factory bays are under construction, each providing 16,500 square feet, of which 11,000 square feet is assembly space. The factory rented by Sony will be in production early next year, employing 200 people and building up during the next three years to 250,000 sets a year. This is not far short of a quarter of the output of radio sets for the whole British industry.

It is not certain that all these sets will be shipped to Britain. The object of the trading estate is to provide cheap accommodation (at 1s. 3d. a square foot) and a pool of local labour for industries whose products are suitable for air freighting anywhere in the world. Other companies interested in the Shannon experiment make pianos, fabric marking machines, electronic controls for bowling alleys and breed chinchillas. The type of industry that can go to Shannon is obviously limited by the size of accommodation offered, but if the experiment succeeds the free port zone could well be enlarged to take in larger factories. In that case Shannon might become an impressive springboard into the British home market.

TEA PRICES

Plain Tea Costs More

FORTUNE is at last smiling gently on producers of plain tea in North India and Ceylon. The surplus has disappeared, and in the last three months the prices of plain tea in the London auctions have risen by about 1s. to 3s. 8d.-4s. 4d. a lb. If this improvement is maintained most producers will make a fair profit this season, though it will not go far towards reducing past losses of a few producers. The Dooars and Nedeem companies in North India, to take an extreme example, lost £179,000 and £72,000 respectively last year—partly because both suffered from short crops—bringing their accumulated losses to £290,000 and £147,000. While plain tea has been rising, prices of better teas have fallen recently, mainly because of the seasonal decline in the quality of the North Indian crop and partly, perhaps, because buyers are apt to trim their bids for good tea when they have to pay more for the plain tea that is used to cheapen the cost of their blends. The "concertina," as the trade calls it, is thus closing.

This recovery in plain tea has taken many people by surprise. So far world production is only nine million lb smaller than last year, when output for the whole year was 60 million lb larger than in 1957; and Pakistan has fixed its exports this year at a minimum of 20 million lb, which compares with 12 million lb actually exported last year. Yet in Britain, which drinks about one-third of the world's tea, stocks have dropped by 28 million lb, compared with a year ago, to 123 million lb.

Evidently people are drinking more tea. Several countries in the Middle East have bought more tea from India this year, and consumption in India itself has probably risen. But there is still time for world production to catch up, and supplies of plain tea from some African countries are now increasing as their production rises seasonally.

COMPANY MEETINGS

HARRISONS & CROSFIELD LIMITED

SATISFACTORY RISE IN PROFITS

The annual general meeting of Harrisons & Crosfield Limited, will be held on December 8th in London.

The following are extracts from the circulated statement by the Chairman, Sir Leonard Paton, CBE, MC, for the year to June 30, 1959:

Group profit attributable to the Parent Company (after minority interests £1,179) is £1,257,110. Taxation required £632,862 and, adding the amount brought forward from last year, £452,834, makes the balance available £1,077,082. It is proposed to appropriate £248,269 for Capital Reserve and £71,393 to General Reserve, a total of £319,662. Preferential and Management Dividends take net £82,995 and Deferred Ordinary dividend and bonus net £183,751, a total of £266,746, leaving to be carried forward £490,674.

The Directors recommend a Final Dividend of 10 per cent on the Deferred Ordinary Stock, repeating last year's total of 15 per cent for the year. In addition, they recommend the payment of a Bonus of 5 per cent on the Deferred Ordinary Stock. Under the Articles the Directors would have been entitled to draw additional remuneration in respect of the payment of this Bonus, but have waived their right.

GROUP TRADING PROFIT

It is satisfactory to report a rise of £84,000 in profits, after tax, from a year's operation in conditions no more favourable than a year ago. This year the Eastern offices have contributed to the increase and we continue to trade intensively there except where government intervenes.

It is a disturbing manifestation of nationalism when attempts are made to divert certain spheres of trade either to the local government itself or to its own nationals. This checks the normal flow of commerce and in the result tends to retard rather than advance the rise in the standard of living which all of us ardently desire to see the Eastern peoples enjoy.

There are some interesting changes. Group Reserves themselves have increased by £376,052 to £5,030,455.

The Directors consider that out of this £1,463,000 transferred to the parent company's Capital Reserve, £1 million should be made available to Deferred Ordinary Stockholders by way of increase in capital. It is therefore proposed to make to existing holders a free scrip issue of one million fully paid Deferred Ordinary Shares of £1 each (to be converted upon issue into stock) in the proportion of two new £1 shares for every £3 stock held.

After dealing with events in the countries in which the Company has interests, the statement continues:

TEA

Prices.—For the past three years the tea markets of the world have been relatively stable. The average price of all tea sold on the London market during 1958 was slightly over 4s. 7d. per lb compared with 4s. 5¼d. during 1957. Up to the end of October, 1959, the average price has been a little over 4s. 5¼d.

Retail prices in this country were last changed in June, 1957, and the average household packet currently retailing in the region of 6s. to 7s. per lb affords scope for a satisfactory margin to the packer and the retailer. The producer is less fortunate, and in many cases these average prices allow him little if any profit.

Government Imposts.—Export duties and taxes continue to be a burden on producers, but in India some small amelioration has been granted by the reduction of export duty from a flat 7d. per lb to an export duty of 4½d., plus a sliding scale of excise duty on a zonal basis ranging from ¾d. for Cachar, the Terai, Lower Assam and much of South India, to 2½d. for Upper Assam and the Nilgiris. In Ceylon also the export duty has been reduced to 6¼d. plus an *ad valorem* sales tax ranging up to a maximum of 1s. 0⅝d. This is of some advantage to producers of plainer teas but penalises good quality which now bears export duties of 1s. 7d. per lb.

Prospects.—As things are, there seems little cause for the British housewife to fear an increase in the retail price of tea at present. In times of advancing markets, packers are reluctant to increase retail prices owing to the dislocation in their channels of distribution. Understandably, when the market reverses the trend, there is sometimes reluctance to match the fall promptly with a cut in retail prices. Present indications are that any change in the foreseeable future would be downward.

RUBBER

The background to rubber in 1959 has been the improving economic climate in the USA and Western Europe, bringing increased demand, reinforced with strong buying by Communist countries. The general result has been higher prices, and at times a scarcity of supply for near delivery.

Prices.—Prices have continued upwards for the last 18 months with few serious interruptions. Up to October, 1959, No. 1 RSS averaged 29d. per lb compared with 23½d. for the whole of 1958. The premium for spot London over forward positions has been as much as 6d. per lb due to special market factors.

Prospects.—Demand for natural rubber continues satisfactory. Certain countries, notably Japan, have indicated increased requirements and potential demand elsewhere is good. Production of natural can only be increased marginally each year and supplies from the largest producer, Indonesia, are unpredictable. So far as can be seen there should be an outlet for all the natural rubber likely to be produced in 1960.

GENERAL

Profits for the year now current are fully comparable with those at this time last year, but it would be imprudent to suggest now that the pattern will persist until June 30th next. Our operations cover many territories and in each we have to live with the Government of the day. Governments now intervene in all aspects of business more than ever before and action by any one can easily make even established sources of remuneration precarious.

The Company has never been stronger or more ready to grasp new opportunities than today.

MONTAGUE L. MEYER LIMITED

CONSIDERABLY IMPROVED RESULTS

The annual general meeting of Montague L. Meyer Limited was held on November 11th in London.

The following is the circulated statement of the chairman, Mr Montague L. Meyer:

The Accounts for the year ended March 31, 1959, show a net profit before tax of £180,138 and the balance after taxation amounts to £83,275. In addition there is a capital profit of £3,314.

This time last year, for taxation reasons, we did not pay a final dividend on the Ordinary Shares, but on the other hand a first interim dividend of 10 per cent in respect of the year now under review. This was followed by a second interim dividend of 5 per cent, and we now propose a final dividend of 10 per cent, which will bring the average for the two years to the 15 per cent we have paid in recent years.

There has previously been included in the Group Balance Sheet credit for tax relief in respect of trading losses incurred by an overseas subsidiary but the Special Commissioners have held that this cannot be allowed in the particular circumstances. An appeal is being made to the High Court against this decision but it is considered prudent to write off from Profit and Loss Account Balance the amount involved, and also, as this business is being liquidated, the remainder of the investment.

Although the profit for the year under review shows a considerable improvement it is not as good as I expected when I presented last year's accounts, largely because softwood prices fell more than was anticipated, and more than was necessary, during the second half of our financial year. Since then prices have recovered.

I reported to you last year that we had purchased the balance of the Government Strategic Reserve Stock of softwood. Part of this remained unsold at March 31st and has been taken into stock, but I am pleased to inform you that since then it has practically all been disposed of and the whole transaction can be considered as eminently satisfactory.

CURRENT SALES INCREASE

Since the date of the Balance Sheet we have purchased a company which can usefully be run in conjunction with our own and will be a valuable addition to the Group. The markets for all the commodities in which we deal are now very firm; also our purchasing has been good and the volume of sales during the first half of this financial year shows an increase over the same period of last year. Unless therefore something extraordinary occurs I expect to report a further improved position next year.

With these accounts the First Preference and Ordinary Shareholders will be receiving notice of a meeting called to double the Ordinary Capital by means of a scrip Issue. For the reasons I have set out above, the Directors anticipate being able to pay 10 per cent on the doubled Ordinary Capital (equivalent to 20 per cent on the existing Ordinary Capital) for the year we are now in.

The report and accounts were adopted and at the subsequent extraordinary general meeting resolutions increasing the capital of the company to £1,345,000 by the creation of 1,800,000 5s Ordinary shares and capitalising £450,000 for the purpose of a one-for-one scrip issue were approved.

BLYVOORUITZICHT GOLD MINING COMPANY LIMITED

NEW RECORDS ACHIEVED

MR T. REEKIE'S STATEMENT

The Twenty-second Ordinary General Meeting of shareholders will be held in Johannesburg on November 17, 1959. The following is an extract from the circulated statement by the Chairman, Mr T. Reekie, dated November 11, 1959:

WORKING RESULTS

With the improved supply of non-European labour, it was possible to expand operations generally and the results obtained constituted some new records for the Company. The tonnages of ore mined and milled were the highest achieved since the commencement of milling operations in February, 1942, and the production of 877,250 ounces fine of gold exceeded the previous highest output in 1952 by 58,074 ounces. An improvement in yield per ton, following on a further reduction in the underground stoping width and an increase in waste sorting on the surface, contributed to this achievement. The working revenue during the year derived from gold at £10,994,105 was also a record and compares with the previous highest figure of £10,587,604 in 1952, when the net amount received for gold was 7s. 3d. per ounce higher. In line with the increased tempo of operations, however, the working expenditure increased sharply to £4,618,068. Nevertheless the working profit from gold was £6,376,037, an improvement of £1,164,422 on the profit for the previous year.

The increased amount of slime from current gold mining operations was all treated in the uranium plant, but, due to the limitations of the Company's sales quota, the quantity of slime drawn from surface accumulations had to be reduced. The tonnage of slime treated and the uranium output at 668,985 lb was slightly higher than that for the previous year. A reduction in the unit cost of production was achieved as a result of further improvements in operational techniques in the plant, and the working profit from uranium at £1,704,211 exceeded that of the previous year by £123,863. Sales to the Combined Development Agency through the Atomic Energy Board were maintained in terms of the sales quota arrangements. The sulphuric acid plant operated satisfactorily throughout the year and earned a profit of £161,273, which was a small improvement on the previous year's figure.

The total working profit from gold, uranium and acid amounted to £8,241,521, which was an increase of £1,290,596 on the corresponding figure for the previous twelve months, and is the highest annual working profit recorded by the Company.

ACCOUNTS

The total profit before taxation and lease consideration was £8,291,405. The total appropriation of profits for the year amounted to £7,791,141, made up of provisions for taxation and lease consideration totalling £4,559,092, payments in respect of the capital portion of the uranium and acid loans amounting to £514,744, a transfer of £217,305 in connection with expenditure on mining assets less realisation of investments, and £2,500,000 in respect of the two dividends declared during the year. This left £509,264 to be added to the unappropriated balance brought forward from the previous year, and the balance of the Income and Expenditure Account was accordingly £2,990,986 at June 30, 1959.

The Company's loan indebtedness in respect of the amounts borrowed to finance the erection of the uranium and sulphuric acid plants was reduced to £2,583,334 at June 30, 1959. This sum will be repaid in equal quarterly instalments until December 31, 1963, when the cost of both plants will have been fully redeemed.

Net expenditure of a capital nature on mining operations amounted to £246,264. It is estimated that approximately £850,000 will be spent during the current financial year on the sinking and equipping of the new No. 4 Vertical Shaft and its ancillary services, and approximately a further £450,000 on the remainder of the mine and the reduction works.

The gold mining formula tax continued to be levied on the taxable income derived from gold mining, uranium extraction and the production of sulphuric acid. Due mainly to the increase in the working profit for the year, the necessary provision for taxation and mineral lease consideration was £9,29,778 higher at £4,559,092.

Two dividends, of 1s. and 1s. 1d. per share respectively, were declared during the year.

DEVELOPMENT

A considerable increase was achieved in the footage developed in opening up the mine, more particularly in the areas served by the "A" series of sub-incline shafts and to a lesser degree in the north-western zone of undeveloped ground above the 6th level haulage.

The Directors' Report for the year ended June 30, 1959, deals fully with the changed pattern of development work during the year and with the consequential change in the development results obtained. It will, no doubt, be realised that the increase in the footage of exploratory reef development in the lower grade western portion of the mine and the decrease in the amount of reef development in the higher grade central and eastern areas have adversely affected the combined percentage payability and average grade of reef exposed. This change in the pattern underlying recent results is likely to continue as long as the different methods of development referred to above are in operation and, in the circumstances, it will be appreciated that current development results should not be regarded as being of great significance in assessing the position and prospects of the mine.

ORE RESERVE

The payable ore developed increased by approximately 14½ per cent, the values for both gold and uranium being slightly lower mainly due to the inclusion of certain payable, although lower than average grade, blocks in the western portion of the mine. Compared with the ore reserve estimate made a year previously, the available tonnage at June 30, 1959, increased by 5,000 tons to 4,665,000 tons, the stope width was reduced still further from 43.5 to 42.5 inches, and the gold and uranium values were higher by 0.4 dwt per ton and 0.013 lb per ton at 14.7 dwt and 0.529 lb respectively.

THE ENGLISH, SCOTTISH AND AUSTRALIAN BANK

SATISFACTORY OUTCOME OF OPERATIONS

The sixty-seventh annual general meeting of The English, Scottish and Australian Bank, Limited, was held on November 11th in London. The Honourable David F. Brand (the Chairman), presiding.

The following is an extract from his circulated statement: The Australian economy in 1958-59 continued to show the steady rate of expansion which it has evinced over recent years. Twelve months ago the economic outlook was not very promising in the light of falling world prices for many items of Australia's production, but, in the result, the operations of the year can be reported with some satisfaction. A particular and welcome feature had been the high volume of capital sent from overseas for investment in Australia.

The principal changes from last year to be observed in the Bank's balance sheet are an increase of nearly £5 million in Deposits, Current Accounts, etc., and a fall of over £2 million in the Special Account with the Commonwealth Bank of Australia. These additional resources have allowed us to increase our Advances to customers by over £1 million, our investments in British and Australian Government securities by £4 million, and our cash in hand, balances due from other Banks and money at call and short notice by £3 million the balance being offset by a compensating reduction in the combined figures for Cheques in course of collection and Bills Receivable in hand and remittances in transit.

SUBSIDIARY'S GRATIFYING PROGRESS

In the Consolidated Balance Sheet I draw your attention to the rise in the outstanding balances under Hire Purchase agreements to over £12½ million. This is a measure of the progress made by the subsidiary, Esanda Limited, and is reflected on the other side of the Consolidated Balance Sheet by an increase to over £10 million in that company's borrowings from the public by issues of Debenture Stock and Unsecured Notes. I feel the results of the company's operations are satisfactory and the growth of that section of the business has been gratifying when it is recalled that slightly less than six years have passed since it was started as a department of the Bank.

The Consolidated Profit and Loss Account shows the profit dealt with in the books of the Bank at £333,227 and a further £81,766 of subsidiaries' profits retained in their accounts. The Group profit for the year is, therefore, £414,993 and appropriations have been made of £45,000 for the Officers' Provident Fund and £122,500 in payment on May 30th last of an interim dividend of 4 per cent, less tax, on the Bank's paid up capital.

The Directors recommend the payment of a final dividend of 5 per cent, less tax, to cost £153,125. If this recommendation is approved there will remain £94,368 of Group profit to be carried forward which, with the amounts brought forward from last year, will make a total of £904,344.

Having regard to the difficulty of increasing revenue to meet the continuing higher costs of operation, I believe we may regard the year's results as reasonably satisfactory.

The report and accounts were adopted.

REVIEW

In 1958 our turnover rose by 10·6 per cent above that of 1957. About 80 per cent of this turnover came from products we manufactured since 1944. Intense **Research Activities**, on which we expended about DM 25 million during the year under review, as well as capital investments, will enable us to bring out a range of new products before long. The market situation called for an **Expansion of Capacity** in a number of our Products, including an increase in the capacity of our Styrene Monomer production which rose to more than 80,000 t.p.a. Our Company thus became the largest Styrene Monomer manufacturer in Europe. Operation of the distillation columns with air-cooled condensers (shown in the accompanying picture) was taken up at our Styrene plant. For the next few years it is proposed to further the expansion of the production of plastic materials. The **Number of Employees** rose to a total of 11,406. A further 3,032 workmen were employed full time by sub-contractors for the erection of new plant, and for maintenance and repairs. During 1959 the production capacity of **Bunawerke Hüls GmbH**, a subsidiary in which we have a 50 per cent holding and which brought out new types of Synthetic Rubber in the past year, will be expanded to reach an annual production of at least 70,000 tons of Synthetic Rubber sold under the trade mark 'BUNA Hüls'.

PRODUCTS

Plastics, Plastic Auxiliaries and Plasticisers, Solvents, and Synthetic Resins (Lacquer raw materials) — Chlorinated Hydrocarbons — detergent raw materials and intermediates — intermediates for textile auxiliaries — Glycols and Glycol derivatives — other organic products — inorganic products and Carbon Black — technical gases — Ethyl Alcohol.

HARMONY GOLD MINING COMPANY LIMITED

OPERATIONS AGAIN SATISFACTORY

MR P. H. ANDERSON ON DEVELOPMENT PROGRAMME

The Ninth Ordinary General Meeting of shareholders will be held in Johannesburg on November 16, 1959. The following is an extract from the circulated statement by the Chairman, Mr P. H. Anderson, dated November 9, 1959:

OPERATIONS AT THE MINE

Operations during the year ended June 30, 1959, were again satisfactory and the tonnage milled was built up steadily from 85,000 tons per month at the beginning of the financial year to 141,000 tons in June, 1959. The average yield per ton milled for gold at 7.962 dwt was lower by 0.061 dwt than the figure for the previous year, while the yield per ton treated for uranium was very slightly higher at 0.504 lb. Largely as a result of the expansion in the scale of operations the working profit from gold increased to £2,120,974, while that from uranium and pyrites increased to £1,891,712, making a total working profit of £4,012,686. This working profit was adversely affected by the necessarily heavy development programme which was planned not only to decrease the back-log from the period when development was restricted by lack of hoisting capacity but also to cater for the further expansion of production. Excluding shaft sinking, there was in fact an increase of 92.5 per cent in off-reef development during the year under review compared with the figure for the previous year. This placed an additional burden on working costs and, in spite of the increased tonnage milled, unit costs increased by 4s. 10d. to 67s. 5d. per ton milled. The usual full analysis of working expenditure is given in the Annual Report for the year under review. A substantial footage in haulages, ore-passes and airways remains to be done, but steady progress has been made since the close of the financial year; 5,265 feet and 5,450 feet of off-reef development have been accomplished on 21 and 25 levels, respectively, and the 25 level twin-haulages had been advanced to a position 3,700 feet west of No. 2 Shaft by September 30, 1959. Nevertheless during the three months ended September 30, 1959, unit working costs decreased to 62s. 10d. per ton milled largely as a result of the higher tonnages now being sent to the mill. Additional long-wall faces are being established in preparation for further expansion and, as Shareholders are aware, this method of stoping has many advantages, not the least of which is improved ventilation on the working face—an important factor in the Orange Free State mines where the geothermic gradient is steeper than on the Rand. The presence of the "Khaki Shale" not far above the reef in the No. 2 Shaft Area has given rise to difficulties in controlling the hanging wall and the average stoping width is higher than it might otherwise have been. Every effort is being made to reduce this width.

EXPANSION IN THE SCALE OF OPERATIONS

The fourth 50,000 ton per month unit of the gold reduction plant is on the point of completion. The sulphuric acid plant, with a rate capacity of 120 tons per day, was completed a few days ago and test-running has commenced. Based on the existing demand it is estimated that profits arising from the sale of acid will be of the order of £150,000 per annum. Foundations for the second rock hoist at No. 2 Shaft have been completed, and it is anticipated that this unit will be commissioned during the first quarter of 1960. The normal hoisting capacity of the mine will then be in excess of 300,000 tons per month.

URANIUM

While the nominal capacity of the uranium plant is 120,000 tons per month it is in fact capable of handling tonnages in excess of this figure, and a monthly throughput of 144,000 tons has already been attained. On the commissioning of the fourth unit of the gold reduction plant it will become necessary to store separately any surplus slime for possible treatment for the extraction of uranium at some future date. The mine is well placed to produce uranium at competitive prices after the expiry of the present contracts.

FINANCE

At July 1, 1958, the balance of the Income and Expenditure Account was £1,566,971; the profit made by the Company during the financial year ended June 30, 1959, after deducting the small tax liability, was £3,844,796, while £500,000 was drawn on loan account from Central Mining Finance Limited, making a total of £5,911,767. Against this, a net amount of £2,531,709 was spent on capital account and £51,292 on trade investments; £1,912,500 was appropriated for dividends and £363,629 was repaid on account of the capital portion of the uranium and pyrites loans, thus leaving a balance of £1,052,637 on the Income and Expenditure Account at June 30, 1959. The Central Mining Finance Limited loan of £2 million which has now been fully drawn is repayable half-yearly in four equal instalments commencing on June 30, 1960.

In my Statement to Shareholders last year, I mentioned that it was considered that capital expenditure during the year under review would approximate £3 million and that a somewhat similar amount would be spent on capital account during the year ending June 30, 1960, in order to complete the expansion programme. In fact, £2,500,000 was spent during the last financial year and a re-assessment of the position indicates expenditures of £2,500,000 and £1,500,000 during the current and following financial years respectively.

TAXATION AND LEASE CONSIDERATION

No Union of South Africa taxation or lease consideration is as yet payable by the Company. The assessed loss for Tax purposes at June 30, 1959, was estimated at £10,285,000, which is some £1,400,000 less than the figure at the end of the previous year.

DIVIDENDS

Since the close of the year Dividend No. 7 of 1s. 3d. per share was declared on September 14, 1959, payable to Shareholders registered in the books of the Company on September 30, 1959.

Groupement de l'Industrie Sidérurgique

G.I.S.

Paris, France

(Iron and Steel Finance)

The Annual General Meeting of G.I.S. was held in Paris on June 20th, and the following are details of the report presented by the Board of Directors:

REVIEW

In spite of deteriorating conditions in world markets, the development rate of the French iron and steel industry remained satisfactory during 1958. In contrast with that of the industries of most other Western countries, French steel output increased by 3.6 per cent as against 1957 (14.6m tons as against 14.1m tons). Turnover increased by 9.5 per cent (Frs 755,000m as against Frs 690,000m). Finally, France's share of the total of the European Coal and Steel Community output increased appreciably and rose from 23.6 per cent to 25.2 per cent last year.

INVESTMENTS

Whilst output continued to increase, the industry once again consolidated its position. The highest level of investment was reached with a total of Frs 94,500m. Rolling equipment accounted for an expenditure of Frs 29,200m, representing 30.9 per cent of total capital investments. The industry also spent Frs 27,300m on the construction and modification of blast furnaces and ore grading and sintering plants (28.9 per cent of total investments) and Frs 11,400m on coking plants and power stations (12.06 per cent of total investments).

LOANS AND GUARANTEES

During the last quarter of 1958, G.I.S. floated a new debenture loan of Frs 29,000m which enabled sums of from Frs 145m to Frs 3,600m to be put at the disposal of 22 member companies. In addition, during the year, G.I.S. gave its guarantee for one loan amounting to Frs 200m which had been granted to a member by the Crédit National. Since it was evident that the investment programme of the French iron and steel industry would require further capital support in the near future, the Meeting was asked to authorise the Board to float further debenture loans to the extent of Frs 50,000m.

PROFIT AND DIVIDEND

The Profit and Loss account showed a net profit of Frs 318,169,679, the profit available for distribution amounting to Frs 307,249,784. It was accordingly proposed to transfer Frs 30m to the general reserves, to distribute Frs 243,589,743 in the form of a net dividend of Frs 125 per share and to carry forward the resulting balance of Frs 33,660,041.

The report, the accounts, and the proposals put forward by the Board of Directors were adopted.

MORPHY-RICHARDS LIMITED

The following is an extract from the Statement of Mr F. P. Bishop, MBE, MP, the Chairman of Morphy-Richards Limited, circulated with the Report and Accounts to be presented to the Annual General Meeting on November 25, 1959:

GROUP TRADING

Group sales, after adjustments for inter-company transactions, were just over £9 million, an increase of 15 per cent on 1958. Trading profit, at £851,000 against £656,000, showed an increase of nearly 30 per cent. Net profit (to which I will refer later) represents this year 7.3 per cent of group sales against 6.1 per cent last year. These figures reveal a definite and welcome change in the trend to which I referred in my last annual statement, and your Board regard them as very satisfactory.

The sales of all your Company's products were well maintained throughout the year. Relaxation of the credit restrictions last autumn has greatly stimulated the demand for refrigerators and spin dryers. But even before that we were producing these items to capacity. Still the pressure of demand continues, and we look forward to obtaining possession of the new factory which, as I reported last year, is being built for us and which we hope will be in production by 1961.

OVERSEAS SUBSIDIARIES

Of the overseas Companies our subsidiary in the United States did very well and has paid a substantial dividend this year. We have acquired the minority interest in Morphy-Richards (Canada) Ltd.

On the other hand we have disposed of 10 per cent of the equity in our South African Company to our South African associates, and this Company also is doing well. I am sorry to have to add that the Australian Company made a loss.

In Europe we have added during the year another wholly owned subsidiary to promote our sales in Holland. Our associated Company in Germany has done well and has paid a dividend on our investment.

BALANCE SHEET

The Balance Sheet reveals that the capital employed now for the first time exceeds £2 million, an increase of £422,000 over 1958.

Most of this increase is due to the conversion of Loan Stock at December 1958, and to the resultant issue of shares and to the premium relating to them. Only £6,762 of our original issue of £500,000 of Loan Stock now remains unconverted, and there are further conversion options at December 31, 1959, and December 31, 1960.

Taxation has again hit us very hard, requiring £352,000 net compared with £266,000 net last year. It would have been more, but for the welcome reduction in the standard rate of income tax in the last Budget, and for this we express our gratitude to the Chancellor.

NET PROFIT AND DIVIDEND

This brings me to the net profit for the year, which is £325,809 after deducting minority interests, as compared with £217,996 in the previous year. Your Board declared an interim dividend of 10 per cent last March, and now recommend a final dividend of 15 per cent. This will make a total distribution of 25 per cent compared with 20 per cent last year.

The increased dividend is payable upon a share capital raised from £713,732 to £845,028 by the conversion of Loan Stock to which I have already referred. It will require £129,395 and will leave a balance to be carried forward in the Consolidated Balance Sheet of £415,991 as against £319,577 last year.

THE OUTLOOK

At this time last year I felt it necessary to be very cautious in my forecast because of the many uncertainties in the outlook. Some of those uncertainties have been removed, and there is undoubtedly a general feeling of optimism about the economic outlook at the moment. That feeling is reflected in our order books, and our sales in the first quarter of the current financial year again show a substantial increase over those in the same period last year.

If these conditions continue, your Board have good reason to hope that the Group net profit may continue to increase while the Company maintains its well-established policy of keeping prices to the consumer at the lowest possible level.

Our Export Department is active in every field, and we are confident that, given reasonably stable conditions, they will not be denied the reward of their efforts.

JOKAI (ASSAM) TEA COMPANY LIMITED

The seventy-ninth annual general meeting of The Jokai (Assam) Tea Company Limited was held on November 6th in London, Mr G. A. Rainey (the chairman) presiding.

The following is an extract from his circulated statement:

Despite early misgiving, shared generally throughout the industry, the result of the 1958 season shows an increase in profit over that for the previous year. The adverse climatic conditions which so badly affected the 1957 crop were not repeated in 1958 and as a result the outturn of tea rose by nearly a million pounds, yielding £164,000 in additional proceeds.

In view of the average drop in London of 5½d. per lb for Assam teas during the season, the fact that the average price obtained for our company's teas was only 2.35d. per lb down is a sure indication that our reputation for good quality was maintained, and that there is always a market for quality tea in London. Calcutta prices too were satisfactory, averaging 36.55d., as against 36.71d.

The profit for the year amounts to £531,766, which, with an adjustment in respect of over-provisions on previous years, amounting to £32,232 gives a gross profit of £563,998. A final dividend on the Ordinary shares of 7 per cent free of tax is recommended making 10 per cent for the year.

In reviewing your Nyasaland interests, I am pleased to say that the year to June 30, 1959, is expected to show a satisfactory result, the crop at some 2,600,000 lb being approximately 800,000 lb more than for the previous year.

The report was adopted.

BRITISH ASSETS TRUST LIMITED

REMOVAL OF POLITICAL UNCERTAINTY WELCOMED

MR ALASTAIR C. BLAIR'S REVIEW

The Sixty-Second Annual General Meeting of British Assets Trust Limited will be held on December 3, 1959 at the registered office of the Company, 9 Charlotte Square, Edinburgh.

The following is the review by the Chairman, Mr Alastair C. Blair, CVO, WS, which has been circulated with the Report and Accounts for the year ended September 30, 1959.

During the past year our thoughts have been affected continually by politics and our actions have always had the Election in the background. It is a great relief to us, as it must be to industry, to know that we can now plan for five years ahead, and I hope that industry will progress as much during the next five years as it has during the past five. Investing for a Company as large as ours must be a long-term affair and it becomes very difficult when one can only look ahead for a few months. Although there were many uncertainties during the year, we had to continue making decisions, and in these we have been guided by our belief which we have held for a year or two that British Ordinary Shares have been undervalued in relation to earnings and prospects as compared with American Equities. We also took the view that the dangers of steel renationalisation were not as serious as many thought. Now that the Election is behind us we feel confident that we have been right along both these lines and we are hopeful that in consequence our income may continue its upward trend.

SATISFACTORY INCREASE IN INCOME

The Accounts show a small but satisfactory increase in our income in this past year which would have looked bigger but for the reduction in the rate of Income Tax. This was most welcome but as our Dollar income is now grossed up at a lower rate our total income was inevitably affected downwards.

Our Valuation at £26,040,000 is higher than ever before. On current post-Election prices it would be a good deal higher still. In particular our UK Steel holdings, which stand in our books at £782,000, totalled in value at October 14th, £1,875,000 which is very satisfactory, and we look for increased income from this source as the years go on. The Dollar proportion of our Valuation is now only 35.4 per cent as against last year's figure of 38.6 per cent. This is not due this year to our bringing money back to this Country but to the larger appreciation that has taken place in the British holdings. Canadian Stock Markets have had a very disappointing year and Canada still has many problems to clear up before the economy can go ahead again as it doubtless will do before long.

DISTRIBUTION OF INVESTMENTS

On page 11 of the accounts we give a table showing the number and size of our investments in ordinary and common stocks, and their spread between different industries. Of our total of 214 holdings, 75 were in the USA, 19 in Canada, and the remaining 120 in the Sterling area. Of the 15 largest holdings, only 1 was in America. This reflects our view that there has been more to go for in British Ordinary Shares, and our 14 largest British holdings have certainly proved to be dynamic investments. But you will see that not all our holdings are large and we are quite prepared to invest in smaller Companies provided we obtain information and co-operation on matters which interest us.

MIDLAND INDUSTRIES LIMITED

SCRIP ISSUE APPROVED

The thirteenth annual general meeting of Midland Industries Limited was held on November 10th at Wolverhampton. Mr J. H. Bean, CBE (the chairman), presiding.

The following is an extract from his circulated statement:

I am pleased to report an increase in the net profit of the organisation for the year ended June 30, 1959. The general trading recession with which industry had to contend for the greater part of last year, continued throughout the whole of the year. In spite of this, both your Company and Bettles & Sons Limited increased their total turnover, though in certain manufactures, at reduced profit margins.

New subsidiaries, Boston Marine and General Engineering Co. Ltd., and Boston Marine Patents Co. Ltd., were acquired with effect from October 1, 1958, but control of operations began only in March, 1959, and the contribution to profits for their nine months trading period was comparatively small.

Group trading profits have increased by over £9,000 to £131,701 and net profits after taxation have also increased from £57,346 to £68,027. Your Directors recommend a final ordinary dividend of 4½d. per share less tax making a total of 7d. per share less tax for the year.

The financial position of the Group remains strong and the capital employed in the business has again increased. Your Directors have accordingly decided to recommend for the third year in succession a further bonus issue of Ordinary Shares by way of capitalisation of reserves of four new Ordinary Shares for every twenty-five held.

The lingering effects of the Government's tight money policy and consequent limiting of industrial expansion calling for the use of our 'MIL' steam fittings, has had some effect on this division and the anticipated increase in turnover on this equipment has not been fulfilled. Indications during the past month show a gradual recovery and it is anticipated that last year's turnover in this section will be maintained and possibly increased during the current year.

The sales of the Agricultural Loader with its existing range of attachments have increased substantially over last year. The Industrial Loader has gained some popularity overseas, particularly in Scandinavia. The Buckrake mentioned in my last Statement has been well received by the farming community and we have experienced an increasing demand for this versatile implement. It is proposed during the year to introduce a patented Spring Tine Cultivator which has undergone extensive trials both at home and overseas.

The report was adopted and at the subsequent extraordinary general meeting the proposed scrip issue was approved.

MIDHURST WHITES
(BRICK MANUFACTURERS)

The twenty-second annual general meeting of Midhurst Whites Ltd., was held on November 5th at Midhurst.

Mr E. Macartney, FCA, chairman, in the course of his speech said: I have pleasure in presenting the annual accounts together with the Directors' Report for the year ended March 31, 1959. It is a source of some gratification that despite the unfavourable conditions prevailing during most of the year under review, your Directors are able to report a modest increase in turnover and profit on the year's trading.

Our Brick sales kept to a reasonable level and Agricultural Lime sales, bearing in mind conditions, contributed their fair quota to the year's trading. The sales of Hi-Duty Load Bearing Bricks are increasing year by year and as time goes on your Directors expect to attract a continuing increasing market.

The net profit for the year before taxation amounts to £25,689, an increase of £1,284 over the figure of the previous year. There is an available sum of £64,593. Your Directors recommend a dividend of 22½ per cent, less Income Tax (an increase of 2½ per cent).

The fixed assets have been kept up to date with modern requirements and the Plant maintained in a high state of repair to enable it to meet the heavy working conditions with which it has to contend.

The current year's trading so far is most encouraging. Turnover has reached a high level and the weather having provided remarkable conditions, the Company's trading is showing to advantage. The report was adopted.

JOHN I. THORNYCROFT & CO.

The Fifty-Eighth Annual General Meeting of John I. Thornycroft & Co., Limited, will be held on December 2nd in London.

The following is an extract from the circulated statement of Sir John E. Thornycroft, KBE, Governing Director and Chairman, for the year to July 31, 1959:

It is very disappointing that the Company has made an overall loss. The Southampton organisation made a profit, as did the Singapore Branch.

Your Board during the year decided as a policy to intensify efforts for maximum capacity chassis in the 4, 6 and 8 wheel classes, and specialist vehicles for home and overseas use. This has necessitated making a realistic valuation of stock and work in progress, and writing off special tools, jigs and fixtures which it had been thought could have been done over a much greater number of units during the next four or five years. The total value of tools, jigs, patterns and fixtures carried in the balance-sheet value of the stock and work in progress item now only amounts to approximately £50,000. Implementing this policy, with the losses on sales during the year, accounts for the unsatisfactory results of Transport Equipment (Thornycroft) Limited.

The Transport Equipment Company has a number of basic chassis types in their Mighty Antar, Big Ben, Nubian and Trusty classes, whose technical specification and performance is competitive and planned to meet future operator requirements on the new motor-ways at home, and off the road performance in export markets. The latter are finding favour with oil and transport companies overseas, and orders have recently been received from Argentine, Libya and Kuwait, and we are hopeful of obtaining an increasing number of orders during the year.

Very few ship orders are being placed, and competition can only be described as "cut throat." Shipowners are now expecting fixed prices, and until all our sub-contractors are prepared to accept fixed prices from us for periods covering the building period of a vessel, it must mean that serious risks are taken if main contractors accept contracts on this basis. Continental and Japanese competition for the smaller classes of vessels, not necessarily built to the same standard as our usual practice, makes orders very difficult to obtain.

DALGETY AND COMPANY LIMITED

INCREASED PROFIT IN FACE OF DIFFICULTIES

The Annual General Meeting of Dalgety and Company Limited will be held on December 3rd in London.

The following are extracts from the circulated statement of the chairman, Lieutenant Colonel C. P. Dawnay, CBE, MVO:

The year has been a difficult one as a result of lower wool prices and adverse seasonal conditions in certain parts of Australia and New Zealand. These factors caused a very substantial rise in Advances which necessitated the raising of additional capital. I am glad to report, however, that in spite of the difficult trading conditions we have had to face, the net profit for the group after taxation increased by £27,660 to £853,495.

DOMESTIC

Mr K. R. Elder, the General Manager for Australia, retired in March on reaching the age of sixty-five, having served the Company for over forty-eight years, and since 1947 as Chief Executive Officer in Australia. The past twelve years have been years of exceptional progress both in the expansion of the Australian economy and in the growth of our business. The number of our staffed offices in Australia has increased from 78 to 190 and our staff by over 1,000; a quarter of a million more bales of wool are now passing through our wool stores; the average number of livestock handled has risen by some two million annually and the value of our merchandise turnover has quadrupled.

On his retirement Mr Elder accepted a seat on the Board in London and has taken up residence in this country. He has agreed to help us at London Office in an Executive capacity for a short while, and his wisdom and experience will be of great value to us in this connection.

DEVELOPMENT

The Company has continued to expand its business in all the territories in which it operates and now has 17 wholly-owned subsidiaries. A number of these have been formed to undertake the control and development of the Group's premises, but two recent acquisitions require to be mentioned.

In January we purchased all the capital of Henry Franklin Limited

England. This small Company, operating in Huntingdonshire, Cambridgeshire, Bedfordshire and Hertfordshire, trades as Grain and Seed Merchants and manufacturers and distributors of concentrated animal foods. These activities are similar in many respects to those performed by our branches overseas and we are confident that, in conjunction with our principal UK subsidiary, Dalgety London Limited, this business will continue to expand and will contribute useful profits.

We have also taken steps recently to acquire a majority shareholding in The African Mercantile Company, Limited, a business similar in many respects to our own in East Africa. With eleven branches and sub-branches throughout Kenya, Tanganyika, Uganda and Zanzibar, African Mercantile handles merchandise and represents a number of the leading shipping companies whose vessels serve East Africa.

TRADING ACTIVITIES

Following the substantial drop in wool prices reported last year, the market continued to fall steadily until January, and although there was a welcome revival in the last quarter of the wool selling season which lifted prices above those ruling at the opening of the season, the average price in both Australia and New Zealand was 22 per cent below 1957-58. The effect of this was partly offset by an increase in the size of the clip, and the Company handled an additional 75,000 bales of wool.

FINANCE AND ACCOUNTS

I referred last year to the probability that we should soon find it expedient to raise further capital, and in the event your Directors decided to raise some £6 million by the issue of 1,650,000 Ordinary Shares at 24s. per share; £3 million 6 per cent Debenture Stock 1979-84 at par, and £A1,500,000 7 per cent Australian Secured Notes at par.

These issues have all been completed and the proceeds thereof, as will be seen from the Balance Sheet, have enabled us materially to reduce our Bank Overdrafts, and generally to improve our liquid position.

OUTLOOK

Except for South Australia and South-West Queensland, which are very dry, seasonal conditions are generally satisfactory, and with an encouraging start to the Wool Selling season, prospects can be said to be reasonably promising.

The Company is now in a strong financial position and, with the wider spread of our interests, we look forward with renewed confidence to the future.

APPOINTMENTS

PARTNERSHIP OPENING exists on the statistical side of one of the larger and well-established member firms of the London Stock Exchange. Applicants must have considerable experience and other qualifications inherent to the position which affords an exceptional opportunity. Replies will be treated with the strictest confidence.—Write Box NV/56, c/o 95 Bishopsgate, E.C.2.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for two LECTURESHIPS or ASSISTANT LECTURESHIPS in Social Administration (one particularly concerned with industrial relations). Salary scale for Lectureships £900 x £50-£1,350; then, subject to review, £1,425 x £75-£1,650; plus £60 London Allowance; for Assistant Lectureships £700 x £50-£850; plus £60 London Allowance; with superannuation benefits and family allowances in both cases. In assessing the starting salary consideration will be given to age and experience. Candidates are invited to indicate their special fields of interest.
Applications, with the names of three referees, should be received not later than November 27, 1959, by the Secretary, The London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, from whom further particulars may be obtained.

Large Oil Company centred in London requires a

RESEARCH MATHEMATICIAN

for the study of flow of compressible, viscous fluids through porous media. Familiarity with heat transfer theory and boundary value problems desirable. Interest in pure mathematics helpful. Qualifications: preferably Ph.D. but First Class Honours degree might be considered. This is intellectually challenging work with attractive financial prospects.—Write in detail, quoting No. 855, to Box No. 2982, c/o Charles Barker & Sons, Ltd., Gateway House, London, E.C.4.

UNIVERSITY COLLEGE LONDON

Department of Political Economy requires ASSISTANT LECTURER or LECTURER, with special reference to Money and Banking. Duties to commence as soon as possible. Salary ranges: Assistant Lecturer, £700-£850, plus £60 London allowance, p.a.; Lecturer, £900-£1,650, plus £60 London allowance, p.a. Initial salary according to qualifications and experience. Superannuation and family allowance. Applications, to be received by December 14, 1959, should be sent to the Secretary, University College London, Gower Street, W.C.1, from whom further particulars may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER or ASSISTANT LECTURER IN GOVERNMENT with special reference to public administration). Salary scales: Lecturer £900-£1,650 per annum, initial salary according to qualifications and experience; Assistant Lecturer £700-£850 per annum. Membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than December 14, 1959, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF ABERDEEN
DEPARTMENT OF POLITICAL ECONOMY

Applications are invited for a LECTURER IN ECONOMIC HISTORY. Salary scale £900 to £1,650, with appropriate placing. F.S.S.U. and child allowance.
Particulars from the Secretary, The University, Aberdeen, with whom applications (8 copies) should be lodged by November 28, 1959. Applicants outside the British Isles may submit one copy of application.

LEADING firm of Stockbrokers requires experienced INVESTMENT STATISTICIAN preferably, but not necessarily with professional or academic qualification. Good prospects and working conditions.—Write giving details of age, qualifications, experience and previous employment to Box TE.421, c/o 191 Gresham House, E.C.2.

BEECHAM GROUP LIMITED

has a vacancy for an

ACCOUNTANT,

under age limit 35 years, having passed Final examinations of recognised accounting body for advanced accounting duties. Experience of machine accounting procedure preferred. The applicant should be prepared to serve in an Overseas Subsidiary after a minimum of two years.
Profit participation and non-contributory pension schemes in operation.
Apply, giving full details of age, education and experience, and quoting reference A.44, to The Personnel Controller, Beecham Group Limited, Beecham House, Great West Road, Middlesex.

UNIVERSITY OF WESTERN AUSTRALIA

SENIOR LECTURER IN GOVERNMENT (PUBLIC ADMINISTRATION)

Applications are invited for this newly-created position in the Faculty of Economics in the University of Western Australia. The person appointed should have proficiency in the field of government, with special interest in Public Administration.
Salary scale: £A2,150 to £A2,500 p.a.
Conditions of appointment and general information are obtainable from the Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.
Applications close on December 15, 1959.

WOLVERHAMPTON & STAFFORDSHIRE COLLEGE OF TECHNOLOGY

LECTURER required as soon as possible for Management Studies. Candidates should have recent executive experience in industry and possess appropriate academic and/or professional qualifications. Salary within scale £1,370 to £1,550.
For further information write (enclosing stamped addressed envelope) to G. W. R. Lines, Esq., Clerk to the Joint Education Committee, Education Offices, North Street, Wolverhampton. Closing date for applications November 23, 1959.

For further appointments and other classified advertisements see pages 680 and 681

UNIVERSITY OF ADELAIDE
READER IN BIOMETRICS

Applications are invited for the above appointment at the Waite Agricultural Research Institute.
Salary scale: £A2,600-£60-£2,800, with provision for superannuation on the F.S.S.U. basis. The initial salary is fixed within the scale in relation to the successful candidate's qualifications and experience.
General terms of appointment and a statement about the post may be had from the Secretary of the University or from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1. The University Calendar may be consulted in the Library of any University which is a member of the A.U.B.C.; housing help is available; further information about the University or the post will gladly be supplied on request to the Registrar.
Applications, in duplicate, giving the information listed in the last paragraph of the general conditions, should be lodged with the Registrar, The University of Adelaide, Adelaide, South Australia, not later than *December 7*, 1959.

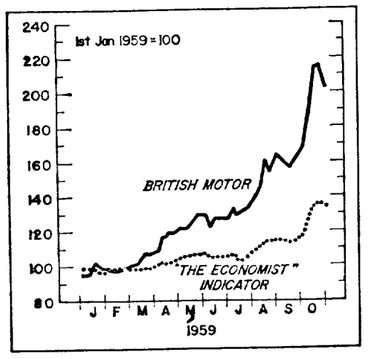
COMPANY AFFAIRS

Stepping on the Gas

IT seems that the motor boom will have a delayed-action effect on the **British Motor Corporation.** On the heels of record profits from Rootes and Standard the fall in trading profits from £24,549,239 to £20,315,465 may at first sight seem surprising. But the decline in earnings is entirely due to the fall in production from 504,712 to 486,048 vehicles, caused by the change over to "an unprecedented number of new models." At the time of the 30 per cent scrip issue last May the directors forecast a final dividend of "not less than 10 per cent." In the event, the final dividend of 12½ per cent, which makes the total payment 18¼ per cent, compared with an equivalent of 13½ per cent, shows that the directors are confident that in the current year BMC will earn big profits from its new models.

Current production figures certainly suggest that this will be so. Since August 1st 147,309 vehicles have been produced, against 118,304 in the same period last year. This represents an increase of no less than 25 per cent. Moreover the current production rate is now around 14,000 a week, which if it is maintained points to an annual rate of around 700,000 vehicles. The directors' declared intention is to raise production to 1 million vehicles a year by 1961.

Net earnings — £8,732,417, against £9,413,651—have not fallen so sharply as trading profits because the tax charge has declined from £11,459,650 to £8,392,567. The depreciation charge has risen from £3,853,439 to £4,664,064, reflecting the heavy installation of new plant and machinery for the group's new models. The market now hopes that a dividend of 20 per cent is the least that can be expected in 1959-60; this would put the 5s. ordinary shares at 21s. 9d. on a yield basis of 4.65 per cent, compared with 4.3 per cent offered on the actual 1958-59 dividend, covered 1½ times by earnings. As the chart shows, BMC's ordinary shares, along with other motor equities, have risen more steeply than the average run of blue-chips. Investors in motor equities, even though the industry is booming, must now consider whether this rate of advance can possibly be maintained.



★

IN raising the effective ordinary dividend from 10 per cent to 12½ per cent for the year to July 31st the directors of **Joseph Lucas** appear, at last, to be loosening the purse strings. Gross profits before tax advanced by about 5½ per cent, from £6,873,545 to £7,258,619, and net profits have risen from £2,241,956 to £2,527,437. Earnings of 38 per cent (against 35 per cent) still cover the dividend about three times. The £1 ordinary shares at 68s. 6d. yield 3.7 per cent.

Like **Birmid,** whose gross profits went up from £1,953,080 to £2,129,465 and which raised its ordinary dividend from 17½ to 20 per cent, Lucas has recently been forced to face the fact that orders from one of its main customers, the aircraft industry, are dwindling and shareholders will no doubt be particularly interested in the directors' plans for diversifying the business more widely—plans which Mr A. B. Waring, the chairman, said were "in progress" in his last report. Clearly the advance in the group's earnings is almost entirely due to the prosperity of its chief customer, the motor industry. Production of motor cars as well as commercial vehicles is running at record levels and, at the same time, the growing popularity of mopeds and scooters (as underlined by BSA's results) should also have helped to boost the group's sales.

★

LIKE Joseph Lucas, **S. Smith and Sons,** as a maker of electrical accessories, depends for much of its profits on the motor business. Profits in the year to August 31st advanced—before tax by 6½ per cent, from £3,382,306 to £3,603,977, and after tax from £1,603,101 to £1,907,730. The ordinary dividend of 12½ per cent paid in 1957-58 (including a special profits tax interim of 2½ per cent) was covered about 3¾ times by earnings and in buying the 4s. shares up to 21s. 6d. investors were anticipating much more liberal dividends this year. They have not been disappointed, for the total payment has been raised to 17½ per cent. It is still covered over three times by earnings and gives a yield of 3½ per cent on the 4s. shares at 20s. 9d.

BSA

ON the news of the increase in BSA's ordinary dividend from 11½ per cent to 12½ per cent and of the advance in its trading profits from £2,261,707 to £2,469,819, its £1 stock units were marked up by 3s. 9d. to 56s. 3d. On Monday, however, some investors apparently thought a yield of 4½ per cent was on the high side for a firm whose immediate prospects are likely to be better than its 1958-59 trading experience, and came in to buy, pushing the price up by 3s. 3d. to 59s. 9d. and bringing the yield down to 4.2 per cent.

Clearly, the machine tool section of the business, in common with the rest of that industry, has had a slack period, but there are now some signs of a recovery. The outlook for the steel section is also more encouraging: the £1,500,000 development programme in Sheffield, which is now nearing completion, will mean that this division of the business will become less dependent on the aircraft industry, to which it supplies high-quality steel for jet engines. Daimler's new V 8 sports model has been doing well in America and is to be introduced to the home market early next year. The hire purchase boom has brought in its train bigger sales of motor cycles and motor scooters.

ANGLO-AMERICAN SHIPPING

A NEW Anglo-American joint shipping venture was announced this week with the formation of the Anglo-American Shipping Company, incorporated in Bermuda as a subsidiary of Norness Shipping Inc. The total capital of £7,500,000 will comprise £5 million of 7 per cent redeemable loan stock (repayable at par in 18 equal half-yearly instalments between 1968-77) and £2,500,000 of £1 (Bermudan) ordinary shares. M. Samuel and Co is to place, through the brokers, Hoare and Company and Joseph Sebag, 50,000 newly created units (each unit representing £90 of the loan stock and 10 £1 ordinary shares) at a price of £100 a unit. Only a nominal amount is expected to be available in the market when dealings begin and about 30,300 units will be taken up by two American institutions.

Of the company's fleet of five ships, four are still under construction, two oil tankers in Japan, one bulk carrier in West Germany and another tanker in Holland. Delivery dates range from 1960 to 1962. The completed vessel, which was built in Sunderland in 1957, is now trading and long-term charters of up to fifteen years have been arranged for the rest of the ships. The new £5 million issue will help to finance the cost of these new vessels, expected to be in the region of £13,335,000. The directors say that the net annual income from the

fleet after depreciation should be adequate to meet the servicing charge of the stock now being issued, and that by 1968 the written down value of the fleet will be around £9 million; from then on they say the company should be able "to accumulate substantial reserves."

For the first few years the group's income will therefore be applied to paying interest on the loan stock, repaying any bank overdrafts, and in redeeming and servicing the £6 million note issue which is also eventually to be made to help finance the building programme. The directors expect that when the accounts include income from all the ships they will be able to pay a dividend of 6 per cent on the ordinary capital.

It was originally intended to register Anglo-American Shipping in London. Certainly the 40 per cent investment allowance for new ships is attractive enough. But in order to secure the help of the two American institutions it was decided to register the company, whose ships are registered in London and carry British crews, in Bermuda. Although American investors can offset tax deducted in the United Kingdom against their liability in the United States this facility is not of much attraction to institutions which do not have to pay high taxes in the United States. Thus, since there is no income tax in Bermuda (and the company has secured an undertaking from the Government that even if income tax is introduced, it will be exempt from it at least until 1986) the American institutions will receive their interest payments free of tax. The reason for American participation is apparently that it was impossible to raise all the necessary funds on the London market; at the same time, as Mr Naess, a director of the new company and chairman of Naess Shipping, has pointed out, to operate a shipping company under a British flag which was financed entirely by American capital would invite the criticism of using the Red Duster as a flag of convenience.

MARKS AND SPENCER

PROGRESSIVE dividend increases and steadily rising profits have kept the "A" ordinary shares of Marks and Spencer among the growth stocks of the British market. The yield on them has been low for a good number of years but never quite so low as it is at the moment, for the shares have been active in the post-election boom. This week the interim dividend was left unchanged at 12½ per cent but it is payable on the ordinary capital as increased by a 20 per cent scrip issue. In 1958-59, the final dividend was 25 per cent and the total payment was covered just under twice by earnings. The least optimistic assumption that can be made for 1959-60 is that the total payment will be 37½ per cent on the enlarged capital. On that assumption the 5s. "A" shares at 76s. yield 2½ per cent.

Earnings must continue to grow to justify a yield as low as this. Unfortunately, Marks and Spencer does not publish any interim profit figures, the directors contenting themselves with the statement that turnover at £67,637,000 in the six months to September 30th was up by 4½ per cent on the turnover of £64,707,000 in the same period last year. The growth in sales in the face of further price cuts is a good omen. But the important question is whether profit margins have improved, as they did last year, even though prices have been reduced. The directors might surely give some indications of the half-year's results.

COURTAULDS

ALTHOUGH it was generally expected that Courtauld's first half-yearly statement would reflect the recovery in the textile trade the market was taken by surprise by the exceptionally strong recovery in profits revealed by this statement. On this satisfactory showing jobbers immediately marked the £1 ordinary shares up 7s. 6d. to a new peak of 59s. 3d. In the six months that ended on September 30th the group trading profits rose from £5,427,000 to £9,154,000: trading profits in the preceding six months were £8,112,000. The interim dividend has been raised from 7.2d. to 1s. 4d. per share (or from 3 per cent to 5 per cent).

The half-yearly profit figures suggest that in 1959-60 earnings should be in the region of 28 per cent, compared with 18 per cent in 1958-59. On this basis the market's hope is for a 10 per cent final payment (against 6⅔ per cent) and this would put the £1 ordinary shares at 59s. 3d. on a prospective yield of around 4 per cent, covered just over twice.

The directors say that profits from all the group's products have risen—including those of British Celanese. Obviously, this year's wonderful summer has helped the textile trade out of the recession which hit it in 1958, but other factors have made their contribution. The ending of the credit squeeze which sparked off the boom in the motor trade led to bigger sales of Courtauld's viscose rayon to the tyre manufacturers, and the carpet makers, who have been sharing in the boom in consumer durables, have bought more rayon staple. At the same time, a ceiling on imports from the Commonwealth and ending of uncertainty over the yarn price agreement earlier this year have done much to restore confidence to the textile trade. The Government's rationalisation plan for the cotton industry meant that most merchants stocked up heavily, while the cut in the price of rayon staple from 24d. a pound to 22d. a pound last Spring has apparently stimulated sales appreciably.

An important factor in considering Courtaulds' future earning potential is the success of its diversification plans. So far Group Developments has only spent some £3 million—its latest bid, for National Plastics, was announced last week—and clearly it is too early yet to judge what contribution to the group's earnings can be expected from these plans. The last balance sheet showed liquid resources of about £29 million, so that the directors have plenty of elbow room to plan and to carry through further acquisitions in their quest for a more diversified business.

The Sky and the Limits

OF recent new issues two have raced far ahead of the field. From the stable of Neville Industrial Securities came an offer by **Henry Wigfall and Sons**, retailers of radio, television and domestic electrical equipment in the North East and the Midlands, of 1,200,000 ordinary shares of 5s. each at 10s. per share. At that price the yield was 7½ per cent on a forecast dividend of 15 per cent. Since the issue the price of the shares had risen almost without pause, bringing the yield down to 1½ per cent. The business is no doubt expanding, but there seemed to be nothing to warrant a rise as rapid as this, particularly as the directors said in the prospectus that they did not expect the unusually high demand in the early months of this year to be maintained. Last week the shares fell back to 32s. 7½d., only to rocket up again to 47s. 1½d. following a broker's report that the company's basis of depreciation for goods out on hire is to write off the cost in three annual instalments. If the more normal basis were used the broker estimated that earnings would be four times as high as they are shown in the books. It is a mark of the hold that speculation now has on the market that when a conjectural calculation about what a change in accounting methods might bring should produce such a big rise in the market price.

Ordinary shares in **Minet Holdings** were placed at 6s. 3d. each less than a month ago and within a fortnight they were quoted at 34s. 6d. The company was recently formed to acquire the entire share capital of J. H. Minet and Company, a leading firm of Lloyds brokers, for one million 4s. ordinary shares (of which only 150,000 were placed) and a loan of £800,000. Of this sum £130,000 carries interest at the rate of 10 per cent per annum while the rest is interest free. In view of this loan commitment the directors have said that "a conservative dividend policy must be followed for some years." At 6s. 3d. the shares offered a yield of 6⅓ per cent on the forecast dividend of 10 per cent; at 34s. 6d. the return was just over one per cent. Although it is covered over fourteen times by earnings, investors buying at this high level seem likely to have to wait at least five years (until the loan is repaid) before they can hope to receive a fair return on their investment. It is hardly surprising that the price has since fallen back to 31s. 9d.

IND COOPE

IN raising the ordinary dividend from 14 per cent to 15½ per cent the directors of Ind Coope are distributing to shareholders what may seem like an "exceptional summer" bonus. Nobody doubts that the brewers have done well this year with the fine summer arresting, at least temporarily, the secular decline in beer consumption. The Chancellor's reduction in beer duty has also helped.

The directors of Ind Coope say that in the first eight months of the financial year trading profits were below those of the previous year and it was not until the spring that conditions improved considerably. They add that they hope this improvement will continue. The yield of 4.1 per cent on the 5s. units at 18s. 7½d. suggests in fact that investors are confident that, whatever happens to the smaller breweries, the big and well-managed ones such as Ind Coope will retain and possibly increase their share of the market. But brewing is a competitive industry in which almost all the companies, big and small, are seeking to hold on to their share of the market by making their public houses more attractive and by trying to push the sale of bottled beers. Almost all of them are trying to cut costs by rationalising and modernising their production and distribution facilities. Much will therefore depend upon the success of the rationalisation policies Ind Coope has adopted in absorbing other breweries. The merger with Taylor Walker earlier this year, the sale of some 159 public houses to Phipps Northampton Brewery and the launching of "Skol" lager and "Long Life" canned beer show how thrustful the directors of Ind Coope have been and the thoroughgoing methods of reorganisation they have adopted show how willing they are to tackle the problems now facing the industry.

The group's trading profits for the year ended August 29th rose from £4,627,361 to £5,588,881, the latter figure including £802,468 from the Taylor Walker group for eight months from January 1st. Net earnings at £2,122,853 compare with £1,678,562, and after the payment of dividends of £158,821 to former shareholders of Taylor Walker and of £90,332 to minority interests, the net surplus is £1,873,700, compared with £1,639,576.

BEAVERBROOK NEWSPAPERS

NEWSPAPERS are growing in size rather than circulation and this is reflected in the narrowing of the gap between advertising revenue and total sales revenue for Beaverbrook Newspapers. In spite of the increase in the selling price of papers in 1957, its net income from advertising is now approaching the net income from sales. After deducting the discount to newsagents and the commission paid to advertising agents, the company's accounts show a rise in net sales income of 16.9 per cent, from £10,690,350 to £12,502,121, over the year ended June 30, 1958. In the same period net advertising revenue rose by 7.2 per cent, from £9,504,483 to £10,186,871. In the latest year total sales revenue rose by only 4.8 per cent, to £13,046,634, while revenue from advertising rose by 9.2 per cent to £12,633,402. The latest figure takes account of a full year at higher prices for newspapers, compared with only eight months in 1957-58. The bigger papers have come at a time when the price of newsprint is only slightly lower.

Circulation:	Daily Express	Sunday Express	Evening Standard	Evening Citizen
Sept., 1958	4,106,247	3,426,402	592,944	220,201
Sept., 1959	4,133,842	3,489,248	581,327	222,220
Advertising Revenue:				
1957-58 (£'000)	7,867	2,473	2,367	660
1958-59 (£'000)	8,539	2,754	2,627	674

The effect on profits has been that before tax profits have risen from £1,244,062 to £1,554,515 and after tax from £556,040 to £814,948. The company's policy has been to pay for new plant, buildings and machinery out of earnings and over the past three years £2,342,941 has been spent in this way. The board is considering a new expansion programme; to provide against this possible contingency the company's authorised capital is to be raised to £3,275,000 by the creation of 1 million new 5s. ordinary shares. At 25s. the Beaverbrook ordinary shares yield 5 per cent on a dividend of 25 per cent.

ROADS RECONSTRUCTION

THE directors of Roads Reconstruction have now made a full and convincing reply to the partial bid by Thomas Roberts (Westminster) for one half of the preference and ordinary capital of the company. They point out that, if the bid were successful, shareholders would be left simply as minority shareholders in an exempt private company. The price of 32s. 6d. offered for the shares, they say, is inadequate as, following the revaluation of fixed assets, the net asset value of the shares is now equivalent to 40s. per share and profits for the year are expected to be a record.

The directors propose to back up their arguments with action, promising a one-for-three scrip issue and a subdivision of the ordinary 10s. shares into 2s. 6d. shares, each with a vote. In addition, preference shareholders are offered an increase in the rate of dividend from 6 per cent to 7½ per cent together with the issue of one 2s. 6d. ordinary share as compensation for the proposed alteration of their voting rights (at present they hold a full vote) to the more usual ones for preference shares. Existing ordinary shareholders would then hold 88.9 per cent of the total votes and the preference holders 11.1 per cent. The directors hope to pay a final dividend of 6 per cent on the increased capital, thus making the total ordinary dividend on the present capital equivalent to 14 per cent, compared with 10 per cent paid last year. It now seems unlikely that the bid will be successful, but at least shareholders can be pleased that—presumably as a direct result of this bid—the directors have decided upon a more generous policy.

London Stock Exchange

FIRST DEALINGS:	Oct. 28	Nov. 11	Nov. 23
LAST DEALINGS:	Nov. 10	Nov. 20	Dec. 4
ACCOUNT DAY:	Nov. 17	Dec. 1	Dec. 17

OVER the week to Wednesday's close both industrial equities and gilt edged stocks advanced on a broad front with private and institutional demand strong enough to absorb the small amount of profit-taking which developed at the end of the account on Monday. At the beginning of the new account (which ends on Friday, November 20th) jobbers marked up prices before dealings began in anticipation of a fair amount of speculative demand and over the week to Wednesday's close *The Economist* ordinary share indicator rose by 10.8 points to a new "high" of 352.7.

Some switching to equities on Wednesday combined with the Government's decision not to give a definite redemption date to War Loan made for a quieter gilt-edged market. Although the War Loan decision caused some selling by speculators over the week 3½ per cent War Loan actually gained ⅞ net to 67⅛. Throughout the week short-dated stocks have been in demand but selling developed on Wednesday so that over the week 4½ per cent Conversion 1964 made a net loss of ¼ at 100 1/16. In medium-dated stocks 4 per cent Gas (1969-72) put on 1/16 at 91 7/16. Among home corporation loans the premium on the new 5¼ per cent Middlesex loan fell from 1 1/16 to 1⅛.

A spate of satisfactory company results helped most of the leaders in the industrial equity market to show good gains over the week. Steels were particularly strong with some institutional buying on yield considerations. Colvilles improved 4s. 1½d. to 61s. 7½d. Stewarts and Lloyds put on 1s. 10½d. at 53s. 7½d. and Steel Company of Wales closed on Wednesday the same amount better at 46s. 1½d. Dorman Long showed the biggest gain at 60s. 10½d.—a rise of 4s. 1½d. on the week. Stores shares were also active on the latest buoyant retail trade figures with Marks and Spencer "A" 3s. 6d. better at 77s. and House of Fraser 2s. up at 48s. Gamage made the biggest rise, jumping 10s. 9d. to a new peak of 106s. GUS "A" improved 2s. 10½d. to 57s. 10½d. In motors, American buying helped Ford to put on 7s. to 105s. 6d. and in electricals EMI improved 9s. 9d. to 69s. 6d. and GEC were 9d. higher at 42s. 9d. ICI jumped 3s. 3d. to 56s. 3d. Shipping shares were one of the dullest sections but, exceptionally, Cunard advanced 1s. to 19s. 6d. and Furness Withy improved 2s. 6d. at 38s. 9d.

Oils were also dull and weakened further on rumours that Russia had offered Iran a 85 per cent participation for oil exploration rights. British Petroleum lost 4s. to 51s. 9d., Burmah dropped 2s. 9d. to 45s. 6d. and Shell eased 4s. 3d. to 142s. 3d. Gold shares lost ground on the Paarl rioting. Even so, buying from the Cape was sufficiently strong to raise "Johnnies" 2s. 3d. to 78s. 3d. Among diamond shares, De Beers put on 2s. 6d. at 199s. 4½d.

THE MONEY MARKET

At last Friday's Treasury bill tender the syndicate raised its bid for 91-day bills by 1d. to £99 3s. 2d. and the average rate on the whole allotment dropped by almost 4d. to £3 7s. 4.62d. The offer of £290 million again included £50 million of 63-day bills for which the discount market raised its bid by 2d. to £99 8s. 2d., and the average rate of discount for these bills fell by just over 1s. to £3 8s. 5.31d. The market was allotted 53 per cent of its applications for the 91-day bills and 75 per cent of those for the shorter dated maturities; the total allotment rate was about 57 per cent.

The discount rate on the United States Treasury's 91-day bills dropped from 4.137 per cent to 4.089 per cent; the rate on 182-day bills rose from 4.437 to 4.534 per cent.

Credit has been generally short in the money market and on Monday and Tuesday the authorities gave fairly large special aid. Although calling was lighter on Wednesday credit was still scarce and with no official help being given one or two houses had to borrow very small amounts from the Bank. Rates for fresh money have ranged up to 3⅜ per cent with January maturities at 3 5/16 per cent.

APPOINTMENTS

ICT

CAREERS FOR YOUNG MEN

I.C.T., the largest British manufacturer of data-processing equipment, offers permanent and progressive careers in the Sales Division to young men who, after training, will carry out liaison and consultative work with the Company's customers.

Offices are located throughout the British Isles but special consideration will be given to applicants from the North East of England, from the Industrial Midlands and from Scotland. Later there may be opportunities for service overseas.

Applicants, aged 20-26, must be bachelors and have had a sound general education. They must have completed, or be exempt from, National Service. In particular they must have initiative and powers of leadership, as shown by their school record and by the part they have taken in social, sporting and recreational activities.

Previous experience of accountancy and commerce will be an advantage but is not essential.

Training lasts for one year and covers the application and operation of the Company's punched card equipment. Further training on computers will be given later. Full salary is paid during training and free board and lodging is provided at the Company's residential training school.

Applications giving details of education, career and outside interests, should be sent to The Manager, Personnel and Training Division (P.D. 149 Park Lane, London, W.1.

INTERNATIONAL COMPUTERS AND TABULATORS LIMITED.

(Please quote reference SITA on letter and envelope.)

UNIVERSITY OF OXFORD. INSTITUTE FOR RESEARCH IN AGRICULTURAL ECONOMICS. Vacancies will exist January 1, 1960, and subsequently for research workers, possibly with some teaching duties. Economics degree with knowledge of statistical methods desirable, but applications will be considered from other graduates in associated fields. Applications are specially invited from those with qualifications or experience in (a) markets for farm products, (b) agricultural land use and theory of location. Appointment in first instances will be until June, 1961, but if work is satisfactory may be extended to a term not exceeding six years in all. Salary £950-£1,150 according to qualifications and experience. Applications to be submitted to the Secretary of the Institute before November 25, 1959.

Leading international manufacturing organisation requires for its English subsidiary a

GENERAL ECONOMIC PLANNING EXECUTIVE

Applicants (men or women) should be under 35 years of age, and possess a recognised degree in Economics, Statistics, or Mathematics. Previous experience in a similar capacity in a large company is essential, and University research experience would be a distinct advantage. The selected candidate will be expected to provide the general economic background for Management decisions and to advise the Marketing Division on secular trends. This is a new and most responsible position and is remunerated accordingly. The prospects are excellent. A pension scheme and the usual large company facilities are in force. Please send applications and curriculum vitae to Box 1232.

MIDDLESEX COUNTY COUNCIL
EDUCATION COMMITTEE

HARROW TECHNICAL COLLEGE
NORTHWICK PARK, WATFORD ROAD, HARROW

Required as soon as possible:—
LECTURER in COMMERCE DEPARTMENT to teach professional subjects to final level. Applicants should be able to offer work study and business methods.

The person appointed will be expected to undertake some administrative responsibility in this rapidly expanding Department.

Salary within the range £1,408-£1,601 (men).
Application forms from the Principal (S.E.C.).
C. E. GURR, M.Sc., Ph.D.,
Secretary to the Education Committee.

UNILEVER LIMITED

ECONOMIST—STARTING SALARY £1,500-£2,000

Unilever Limited are looking for someone to join a small team of Economists and Statisticians working on some of the management decision-making problems that arise in a large concern.

They would prefer a person of 30-35 years who started as an Economist and is now interested in and capable of using statistical techniques in processing commercial and accounting information.

Starting salary in the range £1,500-£2,000, with prospects of £3,000, and opportunities for further promotion.

Applications in writing to Personnel Division (ES/3), Unilever Limited, Unilever House, Blackfriars, London, E.C.4.

AEI

A.E.I.-HOTPOINT LTD.

This NEW APPOINTMENT arises from a planned expansion of the Company's business.

INFORMATION OFFICER (FEMALE) MARKET RESEARCH DEPARTMENT

DUTIES: Shall be responsible to the Economic and Statistics Manager for:—
IN GENERAL
(1) Controlling and developing a library and information service, etc.
SPECIFICALLY
(2) Classifying, cataloguing and circulating books and journals.
(3) Scanning of periodicals for relevant information, and undertaking searches.
(4) Supply commercial data from published sources as requested.
EXPERIENCE: Candidates may at present be Information Officers/Technical Librarians within an up-to-date commercial or industrial research library, with experience of 3-5 years in operating within a comprehensive information service.
Although Graduate or Diploma candidates are preferred, actual A.L.A. qualification is not essential in this post.
LOCATION: London Headquarters at S.W.1. AGE RANGE: 25-35 years.
SALARY: The Company expects a high standard of performance from its staff and is prepared to pay above average salaries to personnel with ability and initiative. A first-class contributory pension scheme and other benefits are provided.
Applications, giving details of work history and training, should be sent to:—
EMPLOYMENT OFFICER (REF. 12/5/E), A.E.I.-HOTPOINT LTD.,
33, GROSVENOR PLACE, LONDON, S.W.1

PRESTON AND CHORLEY HOSPITAL MANAGEMENT COMMITTEE

Applications are invited for the appointment of DEPUTY FINANCE OFFICER to the Committee.

Candidates should possess a recognised accountancy qualification and experience in hospital or public service financial administration will be an advantage.

The salary scale for the Group is that applicable to 50½-60 points.

Applications, stating age and full particulars of qualifications and experience, together with the names of three referees, should be sent to the Group Secretary, Royal Infirmary, Preston, Lancs, not later than November 30, 1959.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the posts of LECTURER IN SOCIAL ANTHROPOLOGY and LECTURER IN GENERAL SOCIOLOGY in the Faculty of Economic and Social Studies. Salary on a scale £900 to £1,650 per annum with membership of F.S.S.U. and Children's Allowance Scheme. Initial salary according to qualifications and experience.—Applications should be sent, not later than December 12, 1959, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

SEVERALLS HOSPITAL MANAGEMENT COMMITTEE, COLCHESTER, ESSEX

Applications are invited for the post of SENIOR ADMINISTRATIVE ASSISTANT at the above mental hospital. Candidates must have a wide experience of hospital administration and finance, as the duties include preparation of final accounts. Possession of a recognised professional qualification essential.

Salary scale £1,000 × £40(6) to £1,240.

Applications stating age, experience, qualifications, etc., together with the names of two referees, should be received by the Group Secretary not later than November 25, 1959.

BRITISH TRANSPORT COMMISSION

BRITISH TRANSPORT COMMISSION is extending its Operational Research activities and offers appointments in London at salaries between £1,500 and £1,800. Candidates must be well versed in the mathematics of the special techniques used in Operational Research, and have considerable experience in putting them into practice.

Superannuation scheme. Certain travel facilities. Medical examination. Write, stating age, qualifications and experience, to Director of Establishment, British Transport Commission, 222 Marylebone Road, London N.W.1, within 14 days. Addressed envelope for acknowledgment.

NOTTINGHAM UNIVERSITY

Applications are invited for the appointment of ASSISTANT LECTURER IN ECONOMICS to take up duty, if possible, by April 26, 1960. Salary scale £700 × £50 to £850, with membership of the Universities Superannuation Scheme and children's allowances. Conditions of appointment and form of application from the Registrar.

A YOUNG GRADUATE with statistical ability is required for a new appointment concerning animal ration formulations. A knowledge or background of agriculture or biology desirable. Extensive training will be given to selected candidate—Please write for application form to Personnel Manager, Vitamins Group, Upper Mall, Hammersmith, W.6.

SHOULD THE "OLD MAN" TAKE YOUR ADVICE?

All major progressive Companies are concerned to determine the influence of general economic trends on their own business so as to enable them to formulate objectives and make long-term estimates.

Our business happens to be food manufacturing and marketing in most countries of the world, and our large English organisation is looking for a man or woman who is qualified to collate and interpret the basic data for this purpose. To do so they will need to have had post-graduate research experience and/or held a post of some influence in this aspect of business. They will thus know how to present effectively the practical implications of their findings as well as to make full use of such facilities as operational research to arrive at them. They should be under 35 and the prospects and scope can be very extensive. Applications, which may be supported by any suitable articles, should be sent to our City of London Head Office marked

"ECONOMIST."

through Box 1233.

CENTRAL ELECTRICITY GENERATING BOARD

MIDLANDS AND EAST MIDLANDS REGION
APPOINTMENT OF PRINCIPAL ASSISTANT (MECHANISATION)

Applications are invited for the above superannuable position in the machine accounting section of the regional accountants department. The salary for this post will be in accordance with Grade of the National Joint Council Scales, i.e. £1,070 to £1,160 per annum.

This is a new appointment and the successful applicant will be required to programme all mechanised accountancy work under the supervision of the Assistant Regional Accountant in charge of the Section.

Candidates should have a detailed technical knowledge of Hollerith Punched Card Machines and experience in preparing programmes for a 555 Electronic calculator.

Applications giving details of age, education, qualifications, experience and present position and salary should be submitted to the Assistant Regional Secretary (Personnel) at 53 Wake Green Road, Moseley, Birmingham 13, to arrive not later than November 23, 1959.

GRADUATE IN ECONOMICS OR STATISTICS, man or woman, living in the vicinity of London or Oxford, wanted for 12-18 months to assist in Transatlantic study of the economics of medical services. Full-time or part-time worker, but must be available, if necessary, for travel in the United States.—Write to The Professor of Economic Organisation, Merton, place, Oxford.

CARBON VANES ARE DIFFERENT!

Light as aluminium, non-hygroscopic, readily machineable, highly resistant to wear and requiring no lubrication—these are some of the special properties of MORGANITE CARBON VANES. They are especially suitable for use in rotary pumps and compressors where non-contamination is essential.

MORGANITE CARBON VANES resist chemical atmospheres and corrosive conditions; withstand high temperature, immersion in liquids; are suitable for inaccessible positions and completely eliminate maintenance.

MORGANITE CARBON VANES are solving the specific problems of many manufacturers—maybe they will solve yours. Please write or telephone for leaflet SD 69, or for one of our Technical Advisers to call.

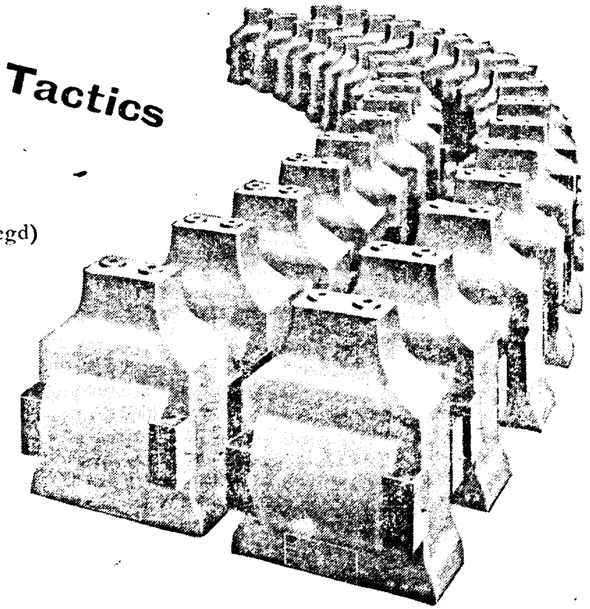
ANNUS MIRABILIS

In 1836 Callan, inspired by the work of Faraday, invented the induction coil, ancestor of the transformer of today. His instrument consisted of two separate windings on an iron core, and by means of an interrupter he induced a current of very high e.m.f. in the secondary circuit. Callan paid great attention to insulation, using a paste made from wax and gutta percha.

Shock Tactics

Insulation was a major problem of the early pioneers, and one that persisted until recent years. The introduction of Araldite (regd) made available an insulating material combining resistance to corrosion, durability, immunity from the effects of humidity and temperature changes, toughness combined with flexibility —in addition to excellent electrical properties.



Araldite epoxy resins

Transformers potted in Araldite casting resin by A. Reyrolle & Co. Ltd.

The Kellogg organization has a reputation for speed and efficiency in the construction of all projects, whatever their magnitude or degree of complexity. Behind this reputation is a unique appreciation of design problems and the possession of outstanding skill in engineering refinery and process plants.
When Kellogg handles the job, closely co-ordinated activities and comprehensive technical resources bring forward quickly and smoothly the final spectacular stage of plant erection.

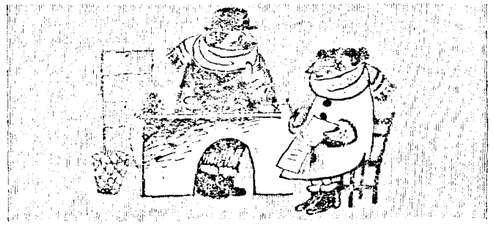
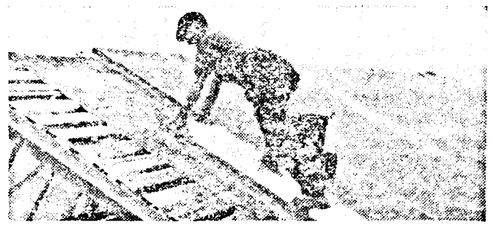
Ever since the Ice Age . . .

uninsulated buildings have made it seem . . .



that the Ice Age is still here.



This assures you it isn't!

Fibreglass Roof Board provides first-class insulation and provides it permanently. It will not rot, warp or swell and, over the years, its thermal resistance stays as high as when it was first installed—which is very high indeed! For more general applications, there's the new Fibreglass CROWN which has the greatest insulation value ever and a host of other advantages besides; including very great advantages in cost. Remember that name—Fibreglass Crown.

Lively minds like THE GUARDIAN

As a man grows, so his tastes grow. Once he was content to read about day-by-day trivialities and gossip. Now his eyes are set on wider horizons. He wants to know what is going on in the world—and to appraise it intelligently. He is no fogey: he doesn't want a stuffy or a pompous newspaper. He wants one that is brisk, to the point, well informed.

The Guardian meets his wishes. It is a lively paper for people with lively minds. It costs you threepence, but in every other way it is magnificently free.

THERMOTANK IN AMERICA

Now they can give of their best

in a Detroit Research Laboratory

In a climate which is often uncomfortably hot in summer and cold in winter, administrative workers and scientists in this Detroit plant now enjoy temperate inside conditions right through the year. Careful control of the atmosphere for the work itself is provided in the cold-vaccine laboratory. This air conditioning installation is one of many important contracts secured in the United States by Thermotank. Others include the supply of 4,800 high velocity units to the New State Department Building in Washington.

Thermotank can plan, design and instal air conditioning equipment for any requirement in any part of the world.

A WORLD OF BETTER CLIMATES WITH THERMOTANK

Here are a few more examples of world-wide service from Thermotank :
UNITED STATES Contracts for Texas Instruments, Standard Oil, American Telephone and Telegraph Company, John Hopkins University, Ford Motor Company and General Motors.
BRITAIN Full conversion of the liner s.s. 'ORCADES' carried out, providing an installation with a capacity of 11,000,000 B.t.u's per hour.
MIDDLE EAST Installations include the Fao Port Control and Wireless Station Building and the Iraq Spinning and Weaving Company's mills near Bagdad.
SOUTH AFRICA Thermotank installation for the new ten-storey headquarters of the United Building Society in Johannesburg, South Africa's largest office building.

Now—a **PERMANENT** polyethylene softener for all your fabrics

A-C Polyethylene, another new Allied Chemical product, means good news for both consumers and textile manufacturers. Write for free brochure, "A-C Polyethylene for Textiles."

For consumers, it means fabrics with the soft, pleasant feel you like . . . quality you can't wash out.

Wash-and-wear finishes containing emulsifiable A-C Polyethylene can be applied to any fabric—cotton, wool, silk, synthetics, blends. And there's no limitation on color either. They're going into ladies' dresses, sportswear, housecoats, suits . . . men's suits, slacks, shirts.

Emulsifiable A-C Polyethylene for wash-and-wear fabrics isn't the only Allied Chemical product for the textile industry. NATIONAL ANILINE dyes have been world-famous since 1879. Our new polyamid fibre, CAPROLAN, is already widely used in rugs, rope and auto tires.

The capitalized names are trademarks of Allied Chemical

Tests at Allied Chemical's National Aniline laboratories prove permanence of new textile finish.

For more information about A-C Polyethylene or our chemicals for the textile and other industries, write the nearest office of Allied Chemical International.

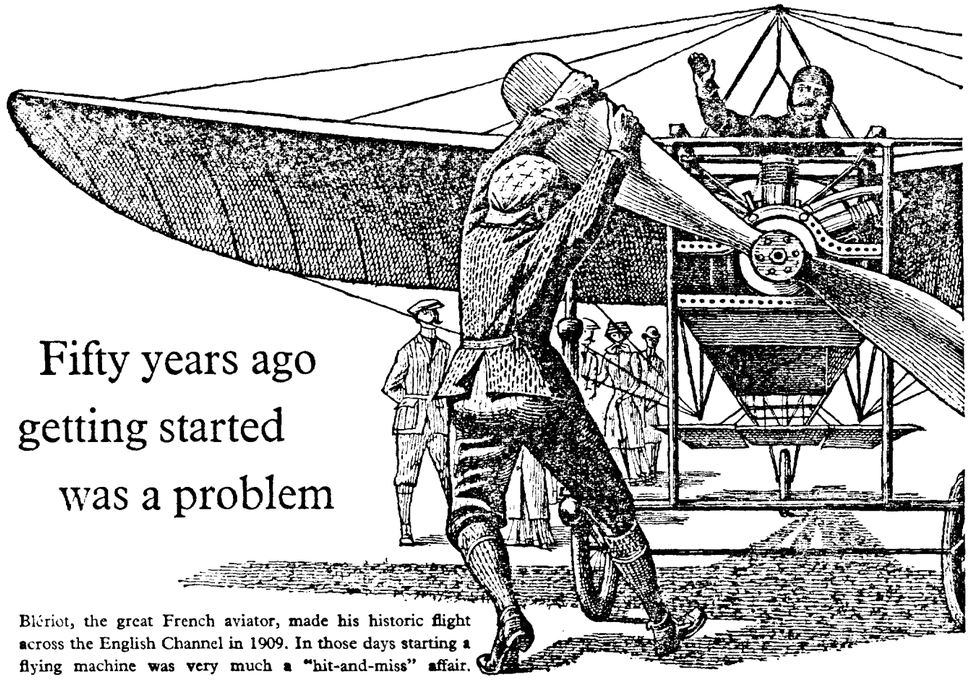
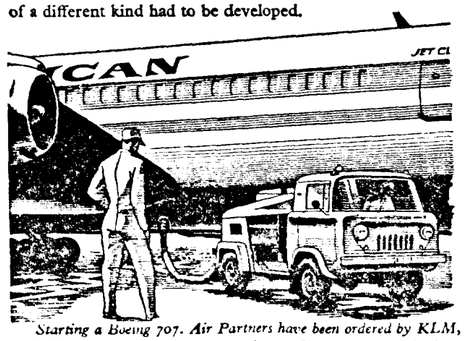
Call your Travel Agent or **PAN AMERICAN** WORLD'S MOST EXPERIENCED AIRLINE



Fifty years ago getting started was a problem

Blériot, the great French aviator, made his historic flight across the English Channel in 1909. In those days starting a flying machine was very much a "hit-and-miss" affair. Somebody had to swing the propeller—and get out of the way when the engine fired.

The first World War established the importance of the aeroplane beyond all shadow of doubt. As aircraft and engines became bigger and more powerful, the problem of starting them developed into a highly specialised subject; and with the introduction of jet and turbo-jet engines, starting devices of a different kind had to be developed.



Starting a Boeing 707. Air Partners have been ordered by KLM, SAS, Sabena, Air India, Canadair, and Tasman Empire Airlines.

As the world's largest manufacturer of compressed air equipment Atlas Copco designed the Air Partner—a mobile rotary screw compressor—to service the giant jet airliners now coming into service. The Air Partner is both simple and safe and has eliminated all starting difficulties.

HOW THE AIR PARTNER WORKS

With a steady flow of hot air, completely clean and oilfree, the Air Partner starts the main jet engines in a few seconds by way of an air-driven turbine starter. The Air Partner can also be used for air-conditioning the passenger cabin and cockpit, and for de-icing wings and fuselage. Simplicity of design means that airline personnel anywhere in the world can maintain and service this unit. In addition, overhauls are kept to a minimum. With this type of compressor—where the screws which compress the air never touch—10,000 hours is the average running period between overhauls.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

The Show Must Go On

THE Lancers are very well in their way. Ritual and rhythm seem self-perpetuating; and men take comfort from their very continuity. It is when the music stops, when the circumnavigating and circumlocuting cease, that diplomacy becomes urgent again. The last time the music stopped was just a year ago: on November 10, 1958, Mr Khrushchev demanded the withdrawal of allied troops from west Berlin. This is the uncomfortable memory that Mr Macmillan's dancing phrases at Guildhall on Monday night could not conceal; nor is it in the interest of the British endeavour to secure as early a summit as possible that it should be hidden. It has been the Government's contention all along that the search for an agreement on Berlin's future should be the proper and immediate purpose of east-west exchanges. This purpose remains, and Moscow's latest blast against Dr Adenauer suggests that Mr Khrushchev does not mean to let go lightly. It is the real reason why, as the Prime Minister has put it, we are "doing the Lancers" now.

This year's diplomatic visiting has spared Berlin, and by so doing has spared the West the pain of making up its mind on a positive, and agreed, policy on the city's status. One price that was paid for this temporary moratorium was the invitation to Mr Khrushchev to visit Washington. The invitation was, in itself, a necessary and commendable stroke in east-west relations; on the encouragement of direct Russo-American talks the world's best hopes of a general detente depend. Even so, the fact that it was plainly extracted from the United States as a result of Soviet pressure on Berlin means that it must be seen as a concession: the price for buying time. Nor is Mr Khrushchev likely to forget this. The danger now is of losing time unnecessarily, or delaying or hesitating until some unexpected crisis arrives, perhaps in Iraq or the Formosa Strait, that would, almost involuntarily, impel East and West to fall back again for a period into their accustomed rigidity and distrust.

Not everything can be insured against. Not every dispute outside Europe can be pressed into service, as General de Gaulle has seemed to suggest, as a test of Mr Khrushchev's good will by making him restrain his Chinese allies or adhere to a policy of live and let live in the Middle East. So long as Mr Khrushchev is personally content to visit Paris as late as mid-March, the momentum of the east-west detente cannot be said to be in serious danger. But the timetable for useful exchanges next year is restricted. Even with the best will in the world the great powers still cannot pretend that they can ensure the most favourable constellation of events for a summit meeting six months ahead. Would President Eisenhower, or Mr Khrushchev for that matter, be able to talk sanely and realistically at the summit on Berlin if the Caribbean countries were then on fire? There is a point where the deliberation on which General de Gaulle and Dr Adenauer insist becomes a gamble on everyone else's good behaviour.

Even so, Mr Macmillan has again found it politic to bow to certain of the demands from Bonn and Paris. The necessity may be explained by the current effort to improve the mood of British relations with the Continent. After his experiences across the Channel, Mr Selwyn Lloyd was even moved this week to rebuke Mr Bevan for his inconvenient questions on the imminence of east-west talks: "I would only say to the right hon. gentleman that the purpose is not to have a summit meeting just for the sake of having a summit meeting."

This is exactly what General de Gaulle has been saying. But just what the summit is intended to do is still an open question inside the alliance ; and it may take more than the western preparatory talks in Paris next month to resolve it. General de Gaulle persists in envisaging a conference on the apocalyptic plane of Munich and Yalta. In this sense, his desire for massive preparation is entirely explicable. Dr Adenauer, too, has argued that if the new summit turned out to be like the one of July, 1955, things would be much worse afterwards than before. For this reason, apparently, he has publicly suggested that the allies should prepare for it " as the American trade unions prepared for their meeting with Mr Khrushchev."

From this to Mr Macmillan's musings aloud at Guildhall on the leisurely pace and protracted confabulations of the Congress of Vienna seems an impossibly wide step in outlook and intention. But this time Mr Macmillan is likely to have his way in the end, because it is the practicable way. The argument for a series of summits is bound to become more attractive as the limited possibilities inherent in a single meeting emerge. The best way to end an indecisive conference is, as Mr Macmillan said on Monday, to arrange for another. To settle for a single conference is to settle for failure in advance. The series idea may appeal to Mr Khrushchev all the more in view of the fact that, whenever the summit may be next year, it must be the last major conference of Mr Eisenhower's effective presidency. The need to ensure a continuity of exchanges into 1961, when Mr Eisenhower's successor must take on his responsibilities, if not his policies, is evidently desirable.

If this continuity is assured, the exact agenda for the first summit need not be unduly precise. Dr Adenauer has argued flatly that Berlin should not be on the agenda at all. While he now appears to have agreed that it could be included in a composite item on the German question as a whole, west German policy must still be expected to try to steer the allies away from this issue and towards general disarmament. The emphasis on disarmament is not an illogical approach to the general German problem, but the first admitted aim of the summit series must be to reach an accommodation on Berlin itself, preserving the western position there against threats like that of a year ago. It may be easier to do this without tying it to other complexities.

FOR the moment, Mr Khrushchev himself is not insisting on an immediate settlement of Berlin's status, or on a fixed date for the actual summit. He may have preoccupations of his own over China ; Poland, too, is now in uncertain evolution under Mr Gomulka's new team. But he may also calculate that if he is ultimately to confront all the western leaders in full fig at the summit, it is in his own interest both to take the measure of the redoubtable General de Gaulle and to give the West time to mull its own differences over. But it is the confrontation with the American leader that matters most to him, and Mr Khrushchev must be aware of how soon the vortex of domestic politics must claim Mr Eisenhower's energies. It would be rare in a retiring president not to attempt to secure the continuance of his policies under his successor. The pressure on Mr Eisenhower to join in the battle will be strong. It might be possible, and could even be considered politically astute, for him to attend a summit meeting after the party conventions in July. But no one could be sure what weight Mr Eisenhower's word could then carry in the world.

The longer the summit is put off, the less reliance Mr Khrushchev is likely to put on any understanding reached with any American except the next president. This danger equally affects the value of Mr Eisenhower's personal visit to Moscow next spring. When the time of this visit was arranged, it was assumed that the summit would be held this year. Mr Eisenhower would thus have been assured of two separate opportunities to press his diplomatic initiative home. Now both run the danger of coming on top of each other at a time when the end of his authority is in sight.

These considerations argue powerfully for Mr Eisenhower's arrival in Moscow to be brought as far forward as possible. The real diplomatic priority is to ensure that this initiative does not run to waste while British, French and Germans jostle for a place, or a say, in the inner directorate of world affairs. While the summit for four hangs fire, the advantages of the summit for two become even more self-evident. It does not seem to be indecently hasty or appeasing to suggest that Mr Eisenhower might consider a visit to Russia immediately after he has dealt with the resumption of Congress next January.

He may not, in that case, see the countryside, and he may not be able to take his grandchildren. But he would ensure that contact was being maintained, that new difficulties and tensions could be tackled early on, and that a steady momentum was kept up in other negotiations. Such a visit would have a particularly powerful effect on the opening of the ten-nation disarmament talks at Geneva. If everything is left to the early summer, the clock may beat us all.

Now We Are " Visiting " . . .

THE diplomatic dance card is filling up rapidly, with the American elections looming large after mid-July, and neither May nor June has been left wholly free for a summit conference. The chief dates (unconfirmed arrangements in *italics*) are :

December 1-2 : Dr Adenauer in Paris.
December 1-3 : Signor Segni (Italian prime minister) in London.
December 4-22 : President Eisenhower's tour of eleven states in Asia, north Africa and western Europe.
December 15-17 : Nato ministerial council in Paris.
December 19-21 : Western summit meeting in Paris, followed by resumed Nato ministerial council meeting.
January : Mr Macmillan in Ghana, Nigeria, Rhodesia and South Africa.
January : President Gronchi of Italy in Moscow.
January or February : Ten-power disarmament commission at Geneva.
March 15-27 : Mr Khrushchev in Paris.
April 5-8 : President de Gaulle in London.
Late April (25th suggested) : President de Gaulle in Washington and Ottawa.
Early May : Commonwealth premiers in London.
Mid-May : Nato ministerial council at Istanbul.
May 18-26 : Seato ministerial council in Washington.
May or June : President Eisenhower in Moscow.
July 11-15 : Democratic party convention at Los Angeles.
July 25-29 : Republican party convention at Chicago.
November 8 : United States presidential election.

The Liberals' Next Steps

The Liberals' prime tactical need now is to replace Labour as the main left wing party in suburban, light industrial and some rural constituencies

THE Conservatives and Labour have had a lot of advice thrown at them by armchair strategists since the election. The Liberals have been rather neglected. Yet the future of British politics will be greatly affected by whether they make the right decisions about their next steps.

The Liberals' great gain from the recent election is that it looks as if they can now expect to get between 15 and 20 per cent of the vote in most constituencies that they contest, and a little more than that in perhaps thirty or forty constituencies which are particularly favourable for them ; this is a considerable advance on the 8 to 12 per cent of the vote which was all they seemed able to expect ten years ago. If they could now improve their expectations to between 25 and 30 per cent of the vote in most constituencies, and to rather over 30 per cent in particularly favourable ones, their status as a national party would be transformed. They would come to be widely regarded as serious national contenders for parliamentary representation, instead of remaining still mainly a receptacle for protest votes. In a close-fought three-cornered contest, any candidate who might get over 33⅓ per cent of the vote has a chance of getting in.

To get the extra tithe of the electorate that they need the Liberals will have to fish successfully in two streams. The first stream will contain the shoal of former Conservative voters who, to judge from all past experience, will soon be swinging away from the government of the day. With the Labour party in its present state, these should be fairly easy fish for the Liberals to catch at by-elections. But the last Parliament suggested that they are not very permanent catches ; in general elections—if the Liberals follow the same tactics as last time—many of them are only too likely to go back to the Conservatives again.

The second stream from which the Liberals need to draw support contains those people who voted Labour last time, but might now be looking for a better hole to go to. The present Labour party is quite capable of continuing to lose 2 or 3 per cent of its voters every five years, unusual though this is for a party to do while in opposition, and the Liberals should be well placed to pick up some of them. But the only circumstances in which defections from Labour to the Liberals would be likely to be really large would be if people came to see that in some areas the Liberals have a much better chance than Labour of turning a Tory MP out. The Liberals' prime tactical need now is to beat down Labour in suburban, light industrial and some rural constituencies—in order to get into a better position to fight the Conservatives there.

If this analysis is broadly right, it has relevance to the decisions the Liberals will have to make about where and on what issues to fight by-elections in the new Parliament. It happens that the first by-election to fall due will be in Harrow West, where the Conservatives had a majority of 18,000 last time. If any semblance of a local Liberal organisation can be drawn together, this would seem to be just the sort of constituency that the Liberals ought to fight, and to do so with one principal message. To the largely Tory people of this comfortable suburb the Liberals should emphasise that the purpose of early by-elections in this Parliament will not be to elect a new government ; if these by-elections have any national purpose at all, it will be to elect a new Opposition. Nobody is going to interpret any fall in the Conservative majority at West Harrow as a sign that the new Government has lost a lot of popularity in its first few weeks ; what people are going to look for most eagerly is who comes second. If Labour could be driven down to the bottom of the poll in this sort of constituency as a matter of course, then people would quickly come to look upon the Liberals as the natural party to whom to give an anti-Conservative vote.

The Liberal image, when Liberals themselves do not blur it, is that of a party which is to the left of the Tories, but which does not believe in socialism, is not tied hand and foot to the trade unions, and does not need to support protectionism for vested interests. This is the sort of image that a large majority of the country's (and Harrow's) Tory voters would prefer to Labour's as the principal opposition ; a respectable minority of them would actually like to see it having more influence on the government of the day. It is also the sort of force that a sizeable proportion of Labour's voters of last month would, at heart, prefer to socialism, if only they thought that it could be made an effective instrument. There is here a sound and comprehensible argument for Liberals to plug: to help build up this new sort of opposition might be the best contribution that could be made at Harrow by those Conservatives who believe that a permanent Conservative government is neither a desirable nor possible thing, as well as by those anti-Conservatives who feel this even more strongly. But if the Liberals' main aim is to replace socialism in this way, they should be explicit about it. They should say:

> We have not come here to propose a marriage to the present Labour party. We have come here to invite the people of West Harrow to attend with us at its obsequies, and to dance with us upon its grave.

THERE are two possible reasons why this sort of campaign might not at all accord with some Liberals' plans. One would be if they believed that, provided they are not too rude to Labour, some sort of Lib-Lab pact about not fighting each other in particular constituencies might consequently emerge. This idea is an intellectuals' delusion ; there is no prospect of a major " compact of the left " because Liberal leaders have nothing to deliver to Mr Gaitskell in it. While Labour stays in its present unpopular state, most Liberals who have no candidate of their own to vote for proceed to vote for the Tory ; it is clear that this is what happened in most of the constituencies last month where Liberal candidates dropped out compared with 1955. Admittedly, this would no longer be true

if Labour itself became more liberal and more attractive to the floating voter—but, if it did, Labour could and would get back to power without needing help from Mr Grimond.

The second possible argument against the tactics suggested above is that the Liberal leadership may feel that their main effort now ought not to be directed towards making a dramatically controversial impact in hopeless seats, but towards making a "responsible" impact in immediately winnable ones. If Mr Grimond were asked what he regards as his party's principal need for 1960, he might say that it is to recruit just enough voters in one or two particularly favourable constituencies to get one or two more Liberal MPs into Parliament. The present Liberal parliamentary party of six is a desperately small band, especially as only three (at most) of the six are particularly effective in the House ; and, of course, if a by-election falls due in any winnable seat, the Liberals should enthusiastically fight it. But there would be grave dangers in making it the main focus of Liberal attention to pick up one or two more seats, instead of concentrating on trying to advance along a broad front. Any close student of the last election could fairly readily see why some of the seats in which the Liberals did most disappointingly were the seats they had had most hope of winning.

The trouble is that when a Liberal candidate is trying to win a marginal seat, his emphasis turns fatally easily from preaching a distinctive faith towards trying not to annoy small local groups of people, from leading a protest movement against the other two parties to flattering them by imitation ; he is apt to compromise himself with promises of local protectionism, or by pretending that he would strive to divert a disproportionate share of national expenditure to his particular constituents (although those constituents know quite well that he could not deliver it).

The supreme examples of this mistake by the Liberals were in the Rochdale and Torrington by-elections in 1958, when the eyes of the country were suddenly on them, and the Liberals (with promises of cotton protectionism and agricultural protectionism) undoubtedly drifted towards giving the impression that they were ready to be all things to all men ; the result was that they came to mean nothing very distinctive to anybody. Many votes that were easy to come by in these circumstances were bound to be easy to go away again later. Something of the same mistake of excessive opportunism was repeated in some western constituencies during the general election ; certainly the Tories think that one reason why their candidates did well there was because the Liberals (like Mr Gaitskell with his income tax pledge) promised too much.

The strategy for the broad front advance, for recruiting the extra ten per cent of support in every constituency, would be altogether different. Its recipe would be not to placate, but to attract attention ; its best tactics would be to emphasise the anti-protectionism in Liberalism (which could now have a remarkable resurgence of popularity in urban areas), the refusal in it to kow-tow before any instances of trade union tyranny, the sharp insistence in it on some things that the other two parties dare not say. The proper way of enunciating the policy of a small but barnstorming party (as also, incidentally, of writing a leading article) is to simplify and then exaggerate ; the easy temptation for a defensive politician, who is trawling for a few hundred votes, is to obfuscate and then water down.

Throughout their history, from the days of Bright and Cobden to the early days of Lloyd George, the Liberals have been most successful when they have followed the first or barnstorming tactics. In the last Parliament they slowed down the pace of their advance when they slid back for a time, and in some places, to the second or trawling tactics. In this Parliament, the single most important determination of the Liberal party should be not to make that mistake again.

Redressing the Balance

American reluctance to go on carrying almost alone the burden of general economic aid, and the pressing needs of the under-developed countries themselves, put a new obligation on new-rich Europe

THE strength of the American economy, as of American arms, is something that Europeans have come to take for granted. To hear of American requests for aid has therefore been something of a shock. True, the Americans are not asking for aid for themselves. What is wanted is that the European countries should shoulder a bigger share of the burden of helping the undeveloped world. But the ground for their plea is very much an American one. The United States, they point out, is running up a net payments deficit of $4-5 billion in the current year.

The appeal plainly demands a dual response: first, demonstrative acts from European countries to help the American administration through its present problem (the British liberalisation of dollar imports has made a start on this); and, secondly, a steady growth in the European contribution to the undeveloped countries, with the objective not simply of making good any American cuts, but of increasing the total. For fifteen years the United States has carried almost all the burden. In the next decade some of the responsibility for leadership, as well as for providing cash, will fall on Europe. It seems worth while to start discussing some of the suggestions on how to set about it.

A FIRST principle is that any new effort by the Europeans should be made collective at the giving end. A joint demonstration of the will to co-operate would have a valuable impact in America. It would also have a value of its own. Earlier this year the commission of the European Community proposed that co-operation in helping the undeveloped countries might be one of the ways in which the Six and the outsiders in western Europe might work together. In March President de Gaulle spoke at length on Europe's mission in the young countries. In the efforts that London is now making to

establish better relationships with Paris and Bonn, the time will be spent more profitably in discussing a collective effort in the undeveloped countries, where a real common interest is apparent, than in picking over old differences which offer no hope of improvement.

Any really massive increase in collective European aid would probably imply a much greater merging of "sovereignties" between the European states. But the immediate problem is to see what can be done within the political limitations of today. There are plenty of institutions already. One useful step might be to make the Organisation for European Economic Co-operation, at present languishing for want of a job, the setting for a confrontation of aid policies. The aim would be to divert to a new purpose the familiar OEEC "shame mechanism" that has been so effective a lever of trade liberalisation in the past. One useful possible gesture from Britain might be a proposal to allocate a certain percentage of national income to certain specified forms of aid, if other European countries do the same. A small increase by some countries might win a large response from others.

One necessary concession here would be for Britain to allow OEEC to judge how much of the investment we undertake in the Commonwealth can justly be counted as aid, and not to insist that the British Chancellor's classification of this must be taken at its face value. It may be inevitable that the ex-colonial powers—France and Britain—do more for countries in their old spheres of influence than for others ; but, if they hope to get the Germans or the Swiss to join in a collective effort, they must expect to see their own efforts scrutinised to ensure that these are designed to promote development not to preserve spheres of influence.

HOW can the undeveloped countries best be helped ? There are powerful arguments for the view that the most useful single step that could be taken to help the developing countries through the "take-off" period would be an enlargement of the size and functions of the International Monetary Fund to enable it to help bridge both the chronic and special payments "gaps" of the young countries. If development really gets going in these countries, one must expect the combined balance of payments deficits of free Africa and Asia to expand, especially in years when raw material prices are low. As the creation of new industries in developing countries creates new demands for foreign materials, equipment and consumer goods, or diverts supplies from exports, it would not be surprising, even in a well-ordered world, to see their combined deficits growing by, say, £1,000 million or so a year at the worst stage of the raw material cycle.

If developing countries that were following financial policies of which the IMF approves were allowed special stand-by credits in excess of their statutory drawing rights, the burden of these deficits would in effect be borne by piling up to £1,000 million a year of extra inflationary pressure on the world economy when raw material prices are low ; at such times a dose of international Keynesianism would not be intolerable in a world whose total of national incomes is many hundred times this amount. One snag is that IMF is at present designed to deal only with short-term difficulties. But some form of increase in international liquidity may be a pre-condition for a major increase in orthodox capital exports.

Another technique that might be used more can be called the consortium approach. Twice in the last three years a group of creditor countries has got together to help out India when its reserves have been approaching exhaustion ; a third operation seems on the cards. But these have all been emergency operations. Could not the same group approach be used before the development plans get under way, and before trouble is at hand, so that the creditor nations could discuss and analyse the plans with the receiving countries ? They might have to suggest that the plans be cut down ; but they could guarantee that the more limited targets agreed could really be achieved, both in terms of foreign exchange and of investment capital. Once again, OEEC, where the developed industrial countries of Europe as well as the United States and Canada meet together, might well be, on occasion, an appropriate setting for such collective enterprises.

JUST as in Europe a happy combination of aid and trade liberalisation in OEEC helped to generate postwar recovery, so in the less developed world a regional approach using some of the same tools could be made to contribute to economic growth. In Latin America a free trade area is to start operations in February. The new Latin American Bank provides a way of channelling North American capital into the area in a form where there are, demonstrably, no strings and where it is made to back a co-operative effort. Conceivably, the European community could be got to contribute to another regional development by joining in the Colombo plan.

Ambitious regional development arrangements may soon be even more urgently needed in Africa. At present, as the African states pick their way down the rocky path to independence, they still tend to depend for development capital on their former imperial rulers. But the European community as a group is now beginning to play a part in African development. As the states of black Africa form new groupings, as they may well do, the case may grow stronger for a regional organisation which covers the whole, with an African development bank at its heart. The new United Nations Commission for Africa may be the right body to see to this.

None of these possible approaches provides a blueprint for Europe's aid effort ; private investment has a crucial part to play as well ; the work of a great many valuable institutions—the World Bank, the new International Development Association—must be expanded and pushed forward too. And, all the time, it has to be understood that trade, or the readiness to open markets to the produce and the goods of the developing countries, is the indispensable complement and sequel to western aid in development, however it may be given. Europe needs to be very careful that its advance towards freer internal trade does not lead to greater protectionism against the outside world ; it should have a special concern to discourage the spread of another sort of illiberalism now evident in the United States: that of tying aid and loans to purchases in the donor country.

The responsibility which Europe, no less than America, has now to recognise to the poverty-stricken outside world is the simplest self-interest as well. With six-sevenths of the world's population enjoying only half its income, the biggest fissure in the world is not between East and West ; it is between rich and poor.

A Tax on London?

More and more people are travelling longer distances every day to more and more jobs in London. How should the congestion be relieved?

EVEN before the war many thought that the limit had been reached for daily travel into central London. They were wrong. Since 1952 nearly a quarter of a million people have moved their homes out of the main built-up area of Greater London, but nearly a quarter of a million new jobs have been created there. Within the smaller area of the County of London, the latest and very comprehensive planning survey conducted by the London County Council estimates that office employment has been increasing by 15,000 jobs a year (about 2 per cent), and that projects already in hand will maintain this rate of growth for at least some more years. By contrast, population within the county is declining by 20,000 a year and is expected to go on doing so.

Cumulatively, these trends are producing a steady increase in the length of journeys to work. More and more London workers are moving out beyond the green belt to places between 20 and 60 miles from Charing Cross. Probably, on present trends, another 100,000 families will do so in the next decade. But, in addition, there is the further problem that the suburban supply of typists and clerks has been virtually exhausted. London now has brimfull employment, so that the large extra office staffs that will be needed must be recruited from distant points. In the near future everything points to a further and truly dramatic increase in the volume of long-distance commuting.

Can public transport hope to handle it? Those who forecast that it will collapse under the strain may be mistaken as they have been in the past. For a start, railway electrification will help to open up new areas to the north and east of London (British Railways are already cheerfully exhorting London workers to travel 1¾ hours each way each day to the Essex coast). Much more dramatic innovations may be around the corner—such as helicopters and monorails to carry commuters from key points at the edge of London (where they could park their cars) directly to the centre. It is not the technical problems that should cause grave anxiety so much as the broader effects of these developments.

They would scatter suburbia throughout the whole of south-east England and beyond. They would commit a large army of workers to spending a quarter of their waking lives on travel. Moreover, while the extended transport system might work technically, it would produce still more crowding and fatigue, noise and inconvenience, while time-wasting breakdowns would become more frequent. Enormous capital investment would also be necessary; and even if it were not subsidised from the outset there is a strong possibility that it would become so through commuters' resistance to paying the full economic fares that would be necessary.

HERE is a situation that calls for some urgent public thinking. Can anything be done to encourage more people to live in London instead of merely working there? The present exodus from the area is caused primarily by housing pressure. In the County of London alone there are still more than 200,000 families who share accommodation, and there are very many more families who (as living standards rise) will want a better house in pleasanter surroundings. How are they to get them? It is true that some houses and flats in London are still grossly underoccupied by elderly retired people, who would have moved out long ago if they had not exercised uneconomic squatters' rights under the Rent Restriction Acts; a further measure of rent decontrol could have helped existing accommodation to be used more efficiently, had the Conservatives in their election manifesto not foolishly ruled this out. But the new dwellings which are also required on a large scale could be built in Greater London itself only by a massive redevelopment of existing properties. And any such programme must somehow overcome two formidable snags.

First, there is the problem of density. Redevelopment will bring more Londoners closer to their work only if the number of new dwellings provided substantially exceeds the number of families who are displaced from the old properties. Since the war most housing developments in London have been public projects, which have dealt mainly—and rightly—with highly congested areas; in consequence, they have generally reduced, instead of increasing, the local population. The exceptions to this rule have not been particularly commendable on economic grounds. The skyscraper flats being built by the LCC and some boroughs are unpopular with many working families and involve inordinate subsidies, amounting currently (in the case of the LCC) to over £100 a flat per year. Only a prodigal government and a wealthy local authority could contemplate increasing such sums.

In the case of private projects, the problem is rather different. These projects do increase total accommodation, and the advantages of living in a flat somewhere near central London are being increasingly appreciated. Not only is the tiring journey to work avoided, but the magnificent amenities of central London—the shops, the theatres, and the parks—can be easily enjoyed. This way of life has a special appeal to the growing number of couples whose children have grown up. As in America, an increasing number of two-house families, who split their time between a London flat and a country house or cottage, will also appear. In line with these possibilities, the LCC is sensibly considering re-zoning the residential areas adjacent to the Royal Parks at higher densities.

The basic snag is cost. Sites are expensive in London, and flat construction in England as a whole is far too costly. Only this week the Barbican scheme has been finally approved by the City of London; the economic rent for a one-room flat in the Barbican is estimated at nearly £200 a year. This is much the same as that for an entire unsubsidised house in Hemel Hempstead. Such figures help to explain why only about 1,000 new dwellings a year are being built by private enterprise in the County of London.

Thus new housing within London caters at present for only two groups. There are luxury flats for the relatively rich, and heavily subsidised flats for the relatively poor. The great majority of Londoners fall in neither group. Even most of those on public housing lists cannot now hope for a dwelling in London because neither sites nor finance are available. The only way for any of these people to get a new dwelling is to move out 20 miles—which is what they are doing.

Clearly, something more should be done to clear old properties and build new dwellings that are within the financial reach of this vast middle-class. Equally clearly, that something is bound to be rigidly limited by the continued factors of cost and density. Any action will require an easing of the legal restrictions (including remaining rent controls) which at present inhibit private developers from acquiring and clearing sites of a reasonable size. Probably, some new injection of public subsidy for particular types of development should also be considered. The best results, though not spectacular ones, are to be had not from tall flat projects near the centre (which can and should remain in the unsubsidised luxury category), but from the replacement of decayed Victorian properties and their large gardens by modern houses, maisonettes and small blocks of flats.

IT is possible that by such means the exodus from London might eventually be slowed down. It is inconceivable that it can be reversed. The urbanites who advocate such things are living in an ivory skyscraper of their own making, oblivious to the realities of costs and tastes. But this conclusion emphasises the need for a different line of action—action to check the further growth of employment within London.

The Government has promised to take a "sterner view" of future applications for industrial development in London. The Labour party is right in saying that it is quite as necessary for the functioning of London, as for the needs of the depressed areas, that these words should be made good. But the office boom is a harder nut to crack. Any wholesale prohibition of new office development would be quite absurd. What is needed is to bring home to employers the very real advantages of shifting all or some of their activities at least to the suburbs, and preferably to new or provincial towns. An increasing number of firms are seeing this point—quite a number, for example, are going to Hemel Hempstead. Warnings and exhortations can speed up this movement, and it is right for Mr Brooke to help the LCC in this respect. But more is needed, and the time is ripe for a new suggestion.

Instead of relying on a further tightening of planning controls—which tends to be economically arbitrary—might not the best weapon be something like the local payroll tax levied in many American cities? A supplement might be added to the national insurance contribution which employers have to pay, whenever the insured employee concerned is obliged to work in central London. This would deliver to the right address the bill for the rising indirect costs of congestion in the city, and it would gradually induce a shift of some economic activity out of the central area. That would be very much to the good. Unless unpalatable and unorthodox measures are taken soon, megalopolis may seize up.

NOTES OF THE WEEK

BRITAIN IN EUROPE

From Adenauer to Stockholm

AS a means of damping down some of the more extreme misconceptions and resentments about each other, the Anglo-German encounter this week can be counted a success. Dr Adenauer has had a fairly good press in Britain this week and a not unfriendly welcome. He himself has evidently made an effort to be courteous to Britain both before and during his visit. It is less certain how much progress was made in narrowing differences. Dr Adenauer was glad to find that Britain has dropped disengagement from its current policies, but he continued to push for the exclusion of Berlin from the summit talks, or at least for minimising discussion about it. He made clear to Mr Macmillan that he would do everything he could, short of a break with France, to ensure that the six-nation European Economic Community's external policies were liberal ones; but he held out no hope at all of any special commercial relationship between Britain, the other "outsider" Europeans and the community.

The timetable of his visit, indeed, presented certain ironies. On Tuesday morning the Cabinet took a number of final decisions on the new Free Trade Association of the "outer seven." Mr Macmillan left the meeting to meet Dr Adenauer at Victoria. Next day, after Herr von Brentano and Mr Selwyn Lloyd had settled down to talk over specific points, Mr Maudling and Mr Amory were off to Stockholm. Just when the British government is making genuine efforts to improve relations with the Six, ministers have been putting finishing touches to the rival grouping of the Seven.

The drafting of the EFTA convention in so short a space of time is a remarkable technical feat. True, the bulk of the work had already been done, for the draft follows very closely the earlier free trade area plan. The current meeting of ministers has only to tie up some relatively minor points; a decision on fish fillets—probably a British concession; a decision on the site of the new group's headquarters—probably (and ironically) Paris.

The Finnish parliament has responded to the situation by a decision to seek commercial access to the grouping but not formal membership. When Mr Mikoyan visited Helsinki he made plain Russia's dislike of all such western groupings, but showed a certain tolerance for Finland's economic plight. Ways of giving Finnish goods free trade area treatment without an institutional tie-up can be devised. They would have the added advantage of not inhibiting any later political deal between the Seven and the Six. But at present even the approach to such a deal is nowhere in sight.

UNITED ARAB REPUBLIC

Winds that Blow Softly

ALTHOUGH manifestly inconvenient to both governments, the three-year estrangement between London and Cairo still drags on. On a visit to Cuba earlier this month, the UAR foreign minister, Dr Fawzi, said that the resumption of diplomatic ties was "in the wind", and on Sunday one of his spokesmen in Cairo cheerfully predicted diplomatic relations at chargé d'affaires level before the end of the year. The British, for their part, have long made it clear that they would like the small property commission that is working in Cairo under Mr Colin Crowe transformed

and enlarged into a diplomatic mission But while British diehards have by now accepted the inevitability of an official reconciliation with President Nasser, in Cairo the ground has been less well prepared for bypassing their Egyptian counterparts.

No doubt with this in mind, President Nasser keeps up his stance of being wooed and not wooing; last week *Al Ahram* impressed on its readers how busy the Canadians have been in putting forward the British case for resumption of official relations. But the president has made it more difficult to effect any real change in the situation by continuing to project the image of the British government as the sinister grey eminence behind the "anti-Arab" activities of General Qasim.

Now that there is a lull in anti-American propaganda, and the useful dichotomy between international communism and the Arab communist parties has been re-established, the British stand out once more as the chief villains in Cairo's picture of the Middle East. The wind felt by Dr Fawzi and his henchmen has not yet blown into the radio station. Cairo radio has made no suggestion that diplomatic relations are desirable; on the contrary it is still portraying Britain as the most implacably hostile of imperialist powers.

Egyptian suspicions and susceptibilities, coupled with British *insouciance*, have imposed a lethargic tempo. One hope of acceleration lies in the rather different mood in Alexandria, where the cotton community has been putting out feelers for the recovery of its British markets. Last season, British purchasers returned to the market, although in a relatively small way, and more recently a group of Lancashire spinners and merchants have been in Egypt to talk about the future. The pull of trade may sooner or later hurry the politicians towards the goal that they are approaching with such circumspection.

IRAQ

The Fertile Crescent Again

GENERAL QASIM seems to have forgotten that his gaols are full of people accused of plotting an Iraqi takeover of Syria. On Monday he joined company with a long line of distinguished, but dead, Arab rulers by reviving their "fertile crescent" scheme for uniting Iraq, Syria and Jordan.

If the late King Abdullah of Jordan had been allowed a free hand, the union would have been brought about a dozen years ago. His part was to unite Syria and Jordan, but he failed because his British mentors feared, rightly, that such a move would outrage the already bruised sensibilities of the French. In 1949 Nuri es-Said and President Hashim al-Atasi signed an agreement to unite Syria and Iraq; but Syrian army officers objected to the terms. In 1957, when Syria appeared to be falling into communist hands, there were stories of an Iraqi plan to invade it. That plan, if it ever existed, came to an end when Syria gave up its independence in February, 1958, and became President Nasser's northern province.

The Egyptians and Saudis have long been against the fertile crescent scheme. The Egyptians wanted no strong competition for the position of leading Arab state, and the Saudis were afraid of a resurgence of Hashemite power. Long before President Nasser was ever heard of there were Egyptian agents, often paid for with Saudi money, operating in Syria with instructions to kill anyone who made too much noise about the fertile crescent scheme.

In the past, opponents of the scheme have always been able to damn it as a creation of western imperialism—inspired by the British or the Americans in order to keep the Egyptians in their place. Now it has been proposed by an Arab leader who cannot, for all the Egyptian allegations to the contrary, be accused of being in league with the West. The Egyptians and Saudis will have to find another reason why the scheme is an evil one. For his part, General Qasim will have to prove that he is actually in control of Iraq before he is likely to gain many followers in Syria or Jordan.

PARLIAMENTARY PENSIONS

Westminster Wildcats

IT seems a great shame that Lord Dunrossil, who has earned the traditional Speaker's pension every bit as much as his predecessors, should have been made the butt of Labour backbenchers' resentment at the inadequate provision for MPs' pensions. It is gratuitously offensive to imply that Lord Dunrossil accepted a great ceremonial office like the Governor-Generalship of Australia in order to get extra money. In actual fact, according to the Australians, he will have little or nothing left out of his gubernatorial salary of £8,000 (or £10,000 in Australian money) by the time he has met his expenses.

Nevertheless Labour backbenchers do have a legitimate and long-standing grievance, which they have evidently decided to plug on every available occasion. (A group of them have also put down a motion opposing the increase in judicial pensions.) By far the best course now would be for the Government to ask Parliament to pocket its pride and refer to an expert outside inquiry the question of formulating and recommending any MPs' pension scheme. Any outside committee would almost certainly agree that MPs' salaries are not adequate to permit private saving, and that there is a positive public interest in making it possible for some parliamentary veterans to retire earlier than they do. But a straight pensions entitlement —say of £750 a year after ten years of "service," and more after fifteen years— is not necessarily the right solution; it could induce some MPs to build up extra years in the House, and occasionally (e.g. in May, 1955, which was nine years and eleven months after the 1945 election) it could even give rise to an undesirable source of pressure on a Prime Minister in deciding when not to go to the country.

Other technical complications arise from MPs' peculiar terms of employment, their insecurity of tenure and the fact that they may be deprived of their source of income, without the right to draw unemployment pay, at a time of life when they find it difficult to get any job where a private pensions plan is in operation. Sometimes what an ex-member needs after an electoral defeat in middle age is a lump sum to help him in his resettlement; special arrangements should probably be made to enable him to commute all or part of any parliamentary pension. Again, the actuarial cost to the nation of any non-contributory pensions plan for MPs ought to be publicised, even though it should not be begrudged; a select committee of MPs themselves would not be well equipped to work this out. The politicians have been so invariably ham-handed about their pay, and the general public so invariably wrong-headed, that it is high time for the problems to be calmly weighed and recommendations presented, by an expert neutral committee outside the House.

BETTING

Liberty by Licence

SADLY, the second reading debate on the Betting and Gaming Bill was not a good advertisement for the efficiency of an unwhipped Parliament as a legislative body. It is long odds that the least workable sections of the bill will be its rather unctuous provisions about gaming, but few MPs chose to talk about them. Instead attention was almost wholly—and very muddledly—concentrated on detailed criticisms of the new provisions for cash betting. But this is the one part of the bill that, administratively speaking, the Government has surely got just about right.

The agreed aim of a majority of the House and the country is to bring cash betting into the open, in order to control it; the best way to do that is to license bookmakers and cash betting shops, so that undesirable tendencies in this mugs' (and sometimes thugs') business can be checked by the effective threat of taking licences away. A feature of the debate was the large number of MPs who wandered down a blind alley with arguments about how bets were to be taken to the shops. Most bets will obviously be taken there by people who collect orders in factories and other work places; the bill specifically allows the betting shops to pay commissions to these agents. The suggestion by some MPs that these factory runners should be licensed would be quite unworkable; the licence would merely become a black market counter in a business where black markets could lead straight to violent

crime. It should be much easier to control shops by licences than to control tens of thousands of runners, some of whom could justly claim that they were merely collecting bets for their friends. Some liberal-minded MPs argued that if the Government is to allow bets to be collected by runners in the factories and on housing estates, it should allow them also to be collected by runners waiting on the street corners. But two royal commissions have agreed that the streets are not the right place for betting; the runners who gather on the streets—some of them obvious undesirables—control the illegal trade at present, and it will be much better to clear them away as the new system starts. Another complaint was that restaurants and other places with television sets or press agency tapes near betting shops may become congregation points for regular gamblers; it is better that they should congregate there than in the shops themselves, where they would make the police's task of controlling the shops much more difficult. On all of these points, Mr Butler should stick to his guns.

PENSIONS

The Cost of Not Earning

FOR the second time this year the Government is to raise the amounts which pensioners and widows can earn without having their pensions reduced. Henceforth old age pensioners and childless widows can earn £3 10s. a week from a part-time job before suffering any deductions from their pension, and £6 10s. a week before their pension is totally extinguished; the equivalent permitted earnings for widowed mothers will be £5 a week before suffering any deductions and £8 a week before their personal pensions (as distinct from special child allowances) are extinguished. The reason why the Government has not gone any further in its relaxations is presumably that some people in Whitehall still cling to the principle that people who have a normally-paid full-time job should not draw these pensions.

Yet the economic justification for retaining the earnings rule at all needs to be constantly re-examined. The only old age pensioners affected by it are those in the first five years after reaching normal retirement age; after 70 for a man or 65 for a woman, one can draw the pension as of right. There are now some 400,000 women between the ages of 60 and 65 and men between 65 and 70 who are still in full-time employment; it is almost entirely because of the expense of allowing these 400,000 people suddenly to draw their pension that the Government says that the "cost" of abolishing the earnings and retirement rules would be a full £100 million a year.

But this would be the "cost" to the national insurance fund. The cost to the economy of the country would be this amount *minus* the addition that would be made to the national income if more pensioners were attracted back into employment. It is difficult to say what this addition would be. During the recent recession it might not have been great, because the laying off of old people on to the retirement pension was one way (although socially not necessarily a desirable way) of "absorbing" unemployment. But during a period of industrial re-expansion such as the present, the re-attraction of some pensioners into active employment might be very valuable. Could not one small and humane experiment to test the real working of the earnings rule now be made? A backbench Labour MP has put down a private member's bill which would abolish the earnings limit altogether for widowed mothers. One would like to see the Government support it.

CYPRUS

How Many Pilots?

CYPRUS'S progress towards independence continues to be patchy; but is a good deal more promising than it was a month ago, after Archbishop Makarios had suspended the constitutional commission in protest against the discovery of a Turkish caique full of arms just off the coast. The British appeal, supported by the Greek and Turkish leaders, for the surrender of arms by both sides was not a great success; but at any rate confidence between the two communities was sufficiently restored for the commission to resume early this month. Moreover, last week the commission pulled a welcome and unexpected rabbit out of its hat—an agreement on the long disputed question of the powers of the Turkish vice-president.

On the other hand, the British and the Cypriots are still negotiating over the exact size of the British bases. The military have scaled down their original requirements a good deal, but not enough for Archbishop Makarios, who unfortunately has committed himself to the stand that not a single Cypriot must remain under British sovereignty. His ability to compromise will not be improved by the development of open opposition to him among the Greek Cypriots. Last Sunday, at a public meeting in Nicosia, it was decided to form a new party, the Democratic Union. Its joint sponsors are Dr Dervis, the extreme right wing mayor of Nicosia, and Mr John Clerides, QC, a respected "elder statesman"; its backers seem to be a very mixed bag with, one suspects, very mixed motives. The new party will be pledged to support a presidential candidate in opposition to the "dictatorial" Makarios. For his part, the archbishop believes that if he can unite all shades of opinion behind him the launching of the new republic in February will be reasonably smooth, whereas to have several pilots contending for the helm might be disastrous. He may well be right.

CHINA

Mao Stays Put

THERE is plenty of evidence of an "opposition" within the Chinese Communist party, but none to suggest that it has imperilled Mao Tse-tung's leadership. It would indeed have been surprising, even in a communist country, if last year's formidable economic and social undertakings had not aroused misgivings. To "leap forward" while simultaneously communising peasants by the hundred million—all within the framework of an economy that remains primitive—evidently sounded adventurous to many Chinese communists when it was first proposed. Undaunted, the leadership kept widening the ditch to be leaped over, claimed that the "great leap" had nevertheless been made, then ignominiously admitted that it had fallen short.

In a democracy, at any rate on the eve of elections, this kind of situation would have strengthened the opposition. In a communist country, it does nothing of the kind. The "opposition" was wrong to point out the dangers, and still wrong when events justified its apprehensions. Nor should it be assumed that its policy is being adopted by the main body of the leadership. The staggering admissions of statistical errors made by the party's central committee in August were followed by scaled-down economic targets for 1959, but the basic policy remained unchanged: the commune system is to be consolidated, with only minor concessions to individualism and the desire for privacy, and the second five year plan, which ends in 1962, is still meant to be fulfilled ahead of schedule.

The present drive against "right-wing opportunists" needs to be seen against this background. A recent article in *Red Flag* denounced these "opportunists" for opposing the "socialist road" and praised Mao Tse-tung's leadership. The Peking *People's Daily* said that Mao's "correct line" had made possible an even bigger leap forward this winter than last.

The ban now imposed on the export of all communist China's newspapers except the *People's Daily* suggests that internal dissensions may be embarrassingly visible, But Mao is still boss; and he will presumably be able to preserve his Mona Lisa silence rather longer than, say, Mr Gaitskell.

JUDICIAL PENSIONS

More Room on the Bench

UNDER the Act of Settlement of 1700, high court judges have hitherto held office during their good behaviour and have been removable only by a joint address of both Houses of Parliament, This principle is technically altered by the new Judicial Pensions Bill, which, among other things,

will set a limit to the activity of judicial limpets who remain in office long after their powers—and what is worse, their tempers—have failed them.

To do this, a somewhat arbitrary retirement age of 75 is set for all holders of high judicial office (the Lord Chancellor, who is essentially a political appointee, excepted). A reform advocated by two past commissions has thus been brought about; and judges of the supreme court have been brought more into line with county court judges and magistrates (whose retiring age is 72). For puisne judges a rigid upper age limit is certainly sensible. But it might be worth discussing in committee whether a discretionary extension might not sometimes usefully be made in the more academic atmosphere of the Court of Appeal, in order to avoid the loss of valuable legal services. Existing judges are not affected by the 75 year limit, but if they were, Viscount Simonds (76), Mr Justice Cassells (82), and Mr Justice Vaisey (82), would all be serious losses. Mr Justice Wallington (84) and Mr Justice Hilbery (76) would also be obliged to retire.

The second object of the bill is to increase judges' pensions. This will be only the second increase in judicial emoluments in 125 years, the former increase being in 1954. High court judges will become eligible for a maximum pension of £4,000 a year, compared with the present £2,625. Another improvement is the introduction of a graduated pension scale. Formerly, judges could draw a pension only after fifteen years of service; the obvious danger of incapacitated judges remaining in office solely to acquire pension rights was met by a provision—unique to this department of state—that permanent infirmity entitled a judge to a full pension, irrespective of years of service. Present judges who become permanently infirm may still take advantage of this provision, but it will not apply to new judicial appointments. New and old judges may now retire at seventy if they wish, and draw a pension proportioned to their years of service.

POLICE

Quis Custodiet . .

THE Opposition was completely justified in staging Wednesday's important debate on the relations between the police and public. The answer to those who objected to the debate's form is that only a censure motion could have forced the Government to give adequate time with sufficient urgency; and the motion had to concentrate on the narrow issue of the spending of £300 of public money to settle the case of *Garratt v Eastmond* because that was the only point in the chain at which a Minister could be held responsible. Indeed the difficulty of establishing the responsibility of anyone who will answer publicly for questionable actions by the police is the essence of the whole problem.

Very wisely, Mr Butler elected not to treat the issue narrowly. Acknowledging the

Toying With Christmas

WITH only a month to go until Christmas, the great commercial machine that sells the presents is now beginning to hum. Many consumer goods industries are highly geared to Christmas, but none more so than toys. British toy manufacturers sell about 40 per cent of their output in the four weeks before December 25th. Recently, in a London hotel, their trade association held a preview of their wares.

The most striking thing about the toys on view was their conservatism. Gone were the space-suits and X-ray guns of two years ago; even plastic sten guns, revolvers and flame-throwers, the industry's former answer to the war craze among schoolboys, were not much in evidence. Instead, displays centred on teddy bears, dolls, snakes and ladders, scale models and electric trains—items that remain the staples of the industry. The manufacturers say that this reflects the conservatism of the average child: market surveys have found that most British children are just not interested in the moon. Some critics will say that it also reflects the conservatism of the average British producer, who prefers to give face lifts to traditional toys rather than to produce new ideas; such novelties as there are are very often imported from places like Hongkong or Japan.

But beneath the surface, toys, and the industry with them, are changing fast. The materials used reflect this. A teddy bear which used to be made of cotton cloth and wood shavings now comes in rayon with a foam rubber inside. The latest version can be put through a mangle. Plastic is gaining steadily in use and is now the basic material of nearly a third of all toys, compared with less than a sixth in 1949; it may be more easily breakable than some traditional materials, but the modern child is said to break anything. Some of the dolls have changed almost out of recognition. Instead of being the coy, even retiring, creatures of prewar years, they now come dressed to current fashion, Gina Lollobrigida hair-dos, emphasised bosoms, high-heeled shoes, short skirts and all. There has also been an increase in do-it-yourself kits, as long as no more remains to be done oneself than glue a few parts together. Regrettably, the market for real modellers seems almost as thin as ever.

The changes in the industry itself have been even more profound. The day of the backroom manufacturer seems to be nearly over; lucky breaks, like the hula-hoop boom which made a fortune for a few people in the plastic tubing business, are few and far between. Instead, industrial concentration, hard headed programming and assembly-line production lie behind the tinselly products on the toy-shop counter. Competition from abroad, however, is increasing—a fact that some British producers find hard to bear. Their counter-offensive was proclaimed in the hand-out: their display, they said, was "designed to show the advantages of the buying of British toys in preference to those from abroad."

With this rationalisation in production has come a great increase of sales. At home, sales are now running at over £60 million a year; exports are doing well too. The status of children in the home is changing from underdog to aristocrat; the lavish mutual presentation of gifts at children's parties brings a sparkle to any toy manufacturer's eye. The average child now seems to have about £6 a year spent on his toys, more than twice as much in real terms as before the war. But less than half of this money ever reaches the manufacturer. A small toy for which he might get 30s. a gross (2½d. each) sells, after the wholesaler has taken 33⅓ per cent, purchase tax 25 per cent, and the retailer 50 per cent on the wholesale price, at 70s a gross (6d each). The gradual elimination of the wholesaler which is at present taking place may lower these enormous margins a little, but not much.

The main reason for the growing sales of toys has been the great growth of the working class market. Some toy producers say that the average working-class child is actually given more toys, as well as being pushed in a smarter pram, than one in the middle classes. A really expensive doll is liable to sell as well in a dock area as in Harrods. By contrast, of course, the middle class parent spends much more on things like children's books and gramophone records, not to mention schooling.

Visiting "Down Under"

for business or pleasure?

You have thousands of informative friends there already when you use . . .

. . . the Bank of New South Wales. This, the largest commercial bank 'down under', has well over 1,000 branches all over Australia and New Zealand at all of which the staff takes a pride in providing the most friendly and courteous banking and other services. Whatever your need—banking services, travel bookings, or commercial information—you will find the managers and other senior officials of the Bank willing and able to assist.

Bank of New South Wales

MAIN LONDON OFFICE: 29 Threadneedle Street, E.C.2.
HEAD OFFICE: Sydney, Australia.
(Incorporated in Australia with limited liability)

The Bank publishes many informative leaflets and booklets, among which is "Establishing a Business in Australia", free on request. "Australia for the Visitor" is 1/6, including postage.

CAMPBELL DISCOUNT COMPANY LIMITED

INDUSTRIAL BANKERS

Paid up Capital **£544,000** · Assets exceed **£3,000,000**

Directors: J. B. Campbell. J. W. W. Huntrods. P. H. Russell Smith, A.C.A. P. J. Cannon. G. Keighley.

Campbell Discount Co. Ltd. announce that they are able safely and profitably to employ a growing volume of money in satisfying the increasing demand for the Company's services. They, therefore, invite substantial deposits on the terms indicated below. The Company's banking business is conducted in conformity with the strictest canons of banking liquidity, and the proportion of liquid assets to deposits is maintained at 10 per cent, or 30 per cent of funds at less than one month's maturity, whichever is the greater. The Company is one of the most substantial independent industrial banking houses in the United Kingdom, and is conducting a diversified business over an area stretching from Newcastle-on-Tyne to the south coast.

Funds may be deposited on the following terms:
Money at 1 month's call, 4% per annum, maximum £5,000
Money at 3 months' call, 5¼% per annum, maximum £25,000
Money at 6 months' call, 6¼% per annum, maximum £50,000

You are invited to write to The Manager, Banking Dept., Campbell Discount Co. Ltd., who will be pleased to send you an Audited Balance Sheet and booklet No. 1 explaining our mode of operation.

very worrying increase of scepticism about the wonderfulness of the British police, he proposed an independent inquiry to cover the whole field of police organisation. Whatever may be the other matters, such as the difficulties of police recruitment, that it investigates, the quality of this inquiry's work will be judged by its ability to grasp one central constitutional nettle. As police authority for the Metropolitan Police Area, Mr Butler, like local authority watch committees elsewhere, has strictly circumscribed powers. He has no more right to interfere with the way Sir Joseph Simpson, the Metropolitan Police Commissioner, does his job than the Nottingham watch committee had to interfere with Captain Popkess. It is said, plausibly, that if Mr Butler—or, still worse, local authorities—could interfere (and could therefore be questioned) this would be a start on the road to a political police.

But who then can require Sir Joseph Simpson (or any chief constable) to explain himself if his actions seem on their face difficult to understand? Apparently no one. An aggrieved citizen can, as Mr Garratt did, bring a civil suit against the particular constable involved (not against the police force, or the commissioner). But in a civil suit all the pressure is, usually rightly, in favour of settlement out of court; the public interest in having the facts of a disturbing case established once for all may therefore not coincide at all with the private interest of the two parties. It might well be thought, as Mr Silverman argued cogently in the debate, that a policeman whose private interest would (on the best legal advice) be best served by a settlement out of court, would almost automatically attract to himself a disciplinary inquiry.

African Personality

PRESIDENT SÉKOU TOURÉ of the Republic of Guinea gave a good account of himself in London last week. His first visit was advantageously timed—just ahead of his first visit to Moscow. To some people, M. Sékou Touré's lack of acquaintance with the Russians came as a slight surprise; for since Guinea voted overwhelmingly "non" to General de Gaulle's proposals for a Franco-African community, news from Guinea has persistently built up the impression that it was becoming a one-party people's democracy, in essentials organised as Africa's first communist state—whether fairly may be judged from a correspondent's account of it published in *The Economist* last week.

The engineer of it all, the trade union leader selected by M. Félix Houphouet-Boigny to organise Guinea, revealed himself as an engaging figure, leading his entourage of ministers and newly accredited ambassadors through the measured round of receptions and parties with a modest dignity which won him effortlessly the respect which he specifically demands for *la personalite africaine*. His speeches and pronouncements disclosed to his hosts a very different type of African mentality from that which emerges as a rule from a British colony passing through the last stages of its metamorphosis into an independent state in (or outside) the Commonwealth. M. Sékou Touré was happy to lecture at length (though even an hour's discourse is short compared with what his fellow Guineans expect and enjoy from him) on the theory of African political evolution with a facility for abstract concepts which may well be called marxist, and a feeling for poetic generalisations which are very French. This provided a very different flavour from the constitutional and economic pragmatism which is the cast of thought of an Awolowo, a Nkrumah or a Mboya; the nearest comparison on the Commonwealth side is not African at all, but Asian. There were moments reminiscent of Mr Nehru in M. Sékou Touré's moralisings.

Perhaps M. Sékou Touré found himself as startled by blunt Anglo-Saxon inquiries as to whether he hoped to get a loan and for how much; what his relation with the Commonwealth was through the union with Ghana; how he stood with the West; what he wanted to buy and sell and whether he would stay in the franc zone. He patiently returned again and again to the point that his basic policy was to win respect for the African personality emergent after centuries of cultural and colonial disintegration; it was to that, not for more obvious political ends or for economic self-interest, that Guinea had chosen the abrupt, hard path of total independence. (By all accounts, the Guinean government reinforced the point in a practical way by sticking out for the last inch of protocol on the visit, and won its arguments in a way that President Tubman never has.) It is a point to take, since it was made so strongly: an exordium to Foreign Office dealings with the newly independent African states which do not rate for the now-you're-an-insider, top clubman treatment of the Commonwealth Relations Office.

In his marxist training, M. Sékou Touré has a common background with Dr Nkrumah, M. Houphouet-Boigny (whom he never criticises personally, though over de Gaulle and the community they are irreconcilably opposed) or Mr Nehru; and all these have made their own terms with their education. M. Sékou Touré is firmly non-committal, with a French articulateness, about his future relations with East and West. But, as the first French African leader of an independent west African state, his attitude provokes the question whether the real division in Africa is going to be between French and English states. M. Sékou Touré denied it. He tried to make a point out of his own very limited French education. He prefers to be called "Mr President" when in Britain, not "M. le President." He evidently fears that French culture can box the new Africa in; he wants to reach out to the world, and his chosen instrument is English, both as a world language and the most widely spoken European language in Africa. He is having it taught as a second language in Guinean schools—which will have the effect of further annoying General de Gaulle, who is, of course, convinced that what shapes Africa today, as at the time of Fashoda, is Anglo-French rivalry.

But M. Sékou Touré's choice is certainly right for French Africa, and the wider federal groupings he hopes for. It is not a case of the general's folly being England's opportunity (though M. Sékou Touré was obviously impressed by seeing Dr Nkrumah living in a British governor's residence exactly as the last governor did—"even the ashtrays are the same"—compared with the French walk-out from Guinea—"taking even all the copies of the *code*"). But it is entirely right for the Foreign Office to offer help through the British Council in teaching English. (Can Dr Charles Hill also supply some paperback classics, and the universities find some places for Guinean students?) The Foreign Office should gently press for a separate Guinean embassy in London as soon as possible to facilitate these exchanges—M. Sékou Touré urged people to visit Guinea, but perhaps does not realise the present complications of getting a visa in London. And undoubtedly the personal link with the president must be maintained: for very clearly his leadership in Africa will not be confined to Guinea.

The commissioner thought otherwise. Is there any proper constitutional way in which the commissioner can be required to account to the public for such a decision (which, for all one knows, may be soundly based)?

RHODESIA AND NYASALAND

African Explorers

It looks as though the Prime Minister will form his own impressions of the situation in Central Africa before the Monckton commission gets started. He is wise not to make his January visit too pointedly a central African one. By going to Ghana and South Africa—the two independent Commonwealth states in that continent as well as Nigeria, soon to be the third and biggest—he is holding the diplomatic balance. Meanwhile Lord Monckton must be wondering when his commission can set off. Mr Gaitskell is still apparently scrutinising the claims of the African names claimed by the Government to be "representative," and is pressing for an amendment of the commission's brief to enable it to consider the possibility of Nyasaland's secession from the federation. Sir Edgar Whitehead is at hand to urge Mr Macleod to agree to no such thing; and Mr Orton Chirwa, the president of the Malawi Congress party in Nyasaland, is also in London to point to the 15,000 loyal Bandamen recruited to his banner in a few weeks as a hint that secession must come.

Sir Edgar Whitehead is ostensibly here to get rid of the remaining clauses in Southern Rhodesia's constitution that give Britain a veto on local legislation on certain aspects of native affairs. As this veto has been a dead letter for years, it may not be unfair to surmise that Sir Edgar is here primarily as Sir Roy Welensky's envoy: to spy out the land, perhaps to discuss Mr Macmillan's trip, and to discover why a Conservative majority of 100 should not secure a full backing for Sir Roy's and Sir Edgar's case at the 1960 conference. Hints that, after all, this might not be so have worried Rhodesian political leaders lately. Perhaps to disguise his mission, Sir Edgar has issued a strong propaganda statement extolling Southern Rhodesia's native policy, with a sidekick at the wretched Colonial Office which he accused this week of neglecting Nyasaland for 60 years (Mr Macmillan can check this). Sir Edgar has been a dynamic and in some ways a liberal, if schoolmasterly, prime minister; but even his enlightened legislation on trade unions and apprenticeship cannot expunge troubled memories here of the illiberal acts that he passed during the emergency. He might be wiser, at least behind the scenes, to adopt a less uncompromisingly satisfied line.

SOUTH AFRICA

Timely Swan Song

The new Progressive party, of which the core is the ten breakaway United party MPs, has done well to adopt unhesitatingly a policy which offers political opportunity to all races—if not absolute equality—regardless of the fate which this will bring down on it from a purely white electorate at the next elections. Its "historic role" is quite evidently to voice in parliament truths which the UP never dared to voice, and accept the certainty that this can only be done for the duration of the present parliament's life. These will be vital years, in which an uninhibited and sustained swan song by the Progressives is far more important than their subsequent survival as MPs.

The party has come out for a common voters' roll, with property qualifications and entrenched safeguards (not yet explained) for the various racial groups. It demands abolition of the pass laws and all the oppressive machinery of racial segregation. As persons of any race may join the party, its MPs will again be able to meet people of all communities and voice their grievances. The Progressives have had to compromise on one thing—the republic, which splits their ranks as it does the other parties' (and has lost them one member); but if republicanism were a condition of liberalism in South Africa, few people in this country would have anything but a welcome for it.

As things are, the liberalism of British rule in the three High Commission protectorates is now giving them the role of political asylums for refugees from South African apartheid laws. Wisely, the Union government is playing ball over this. It has got round the awkward case of Mrs Mafekeng by letting her family join her after her escape to Basutoland. The case of the Christian couple who adopted a coloured waif abandoned in a church has been dealt with by letting them take the child to Britain. Britain's vestigial links with South Africa are indeed a boon to Dr Verwoerd and his colleagues, and likely to remain so.

HOMOSEXUALITY

Merely Unlawful?

None of the MPs lucky in the ballot for private members' bills this session has had the courage to sponsor a bill implementing the neglected recommendation of the Wolfenden committee, that homosexual acts taking place in private between adult males should no longer be a criminal offence. At least one possible draft of such a bill was toted around, but everybody knows the difficulty in finding a sponsor. Enlightened people can go on explaining until they are blue in the face that the change would not be tantamount to conferring the moral approval of the community on homosexual conduct; they can show that it is a symptom of totalitarian countries to assume that morality derives from the law, rather than from conscience or religious belief; they can keep on pointing out that the purpose of a bill would not be

The Economist

NOVEMBER 19, 1859

FRIENDLY SOCIETIES IN DIFFICULTIES

The large accumulations which the working classes have invested in their Friendly Societies are the topic on which those who wish to eulogise those classes most frequently insist, and the bad management of those societies is the point on which those who wish to depreciate those classes most frequently insist. The working classes, the latter tell us, save no doubt, but they are quite ignorant of the proper mode in which their savings should be invested; they desire, and properly desire, to make provision against sickness and against old age, but the societies from which they expect to obtain that provision are not unfrequently insolvent. The evidence, it is said, which we now have respecting the working classes on this point, prove that they have the steadiness to save, but that they have not, as yet, the sagacity to use their savings well. We fear that the main fact which is thus alleged against the working classes is very true. All the evidence on the subject which is of any value goes to show that a large number of Friendly Societies are on the verge of insolvency, if not actually insolvent; and that, in consequence, many of the steadiest and best of the working classes will never obtain the provision against sickness and old age which is justly due to them, and which they have calculated upon having. But, although we are quite sure that this is so, we are disposed to deny the inference respecting the lower classes which it is attempted to derive from it. We believe that the insolvency of the Friendly Societies by no means shows that those who contribute to them are less intelligent than they could in reason have been expected to be . . . and that it is not a reproach to the working classes that they have not succeeded in an attempt in which the higher classes could afford them no guidance, and most probably would have equally failed. We have, as we have frequently explained, no romantic ideas about the working classes. When it was not popular to do so, we took occasion to point out the greatness of their characteristic faults and the dangerous direction of their tendencies. But we are anxious that they should be censured only for their real faults, which are great enough, and not for mistakes which are venial, and would, it is probable, have been committed by others.

"... him who asks of the rustic the name of his native village."

Extracts from a 1907 Motoring Guide Book
"Through East Anglia in a Motor Car"
With acknowledgements to Messrs. A. & C. Co.

"It is not always possible to identify on a map the village through which the car is passing, nor always easy to consult the map even when travelling at moderate speed. Blessed be the villages that proclaim their titles, even by modest boards on the post-offices, as many do in East Anglia, for by such boards is the traveller saved from the scorn poured upon him who asks of the rustic the name of his native village. This is an almost universal phenomenon, so frequent in occurrence that one is tempted to speculate as to its origin; and that may be that the normal rustic, painfully conscious of the narrow limits of his own knowledge, feels that he has encountered a fool indeed when he meets anybody who is more ignorant than himself, although it be but as to a single and quite trivial point."

Over 150 depots throughout the country represent the contribution to the maintenance of road transport by the Kenning Motor Group—identified by the Kenning Shield, a guarantee of an efficient service.

DISTILLED, MATURED, BLENDED AND BOTTLED IN SCOTLAND

LIFE'S QUITE RELAXING...

Perhaps because in many ways it's so much easier today. Thanks to new materials and better ways of making those already well known, there's more time to spare for everyone. Ten years ago, for example, washing and ironing clothes took up a sizeable part of the housewife's day, and mending nets was a regular time-waster for fishermen. I.C.I.'s 'Terylene' has changed all that. This remarkable synthetic fibre is as happy in easy-to-care-for clothes as in fishing nets and cordage, and its great strength and immunity to rot, sunlight and weathering are finding it new uses in industry every day. 'Alkathene' is another I.C.I. product that makes for easier living. Easily laid tubes of this versatile material, frost-proof and flexible, enable farmers to take water supplies to any part of their land simply and inexpensively, and the same plastic in the form of colourful kitchenware is lightening and brightening housework throughout the world. Wherever you look, the story's the same: new plastics, new dyestuffs, new metals, new chemicals of every kind from I.C.I. are saving time and allowing hard-working people everywhere the opportunity for the occasional, well-earned yawn.

IMPERIAL CHEMICAL INDUSTRIES LTD., LONDON, S.W.1

ICI

to render homosexual conduct morally or socially desirable, but simply to state that the law is not an appropriate instrument for regulating it, a task better discharged in the confessional or consulting room than in court. But at the end of all this explanation, a large section of the brute public would still assume that the sponsor of such a bill was "in favour of queers."

One need is to find a form of words for the bill itself which would show that this is not true. A possible form is suggested in a pamphlet just published by the Church of England Moral Welfare Council.* The author points out that in addition to crimes which the law punishes, and sins of which it takes no cognisance, there is a class of immoral acts which the courts characterise as "unlawful." Contracts concerning unlawful acts (adultery is an example) will not be enforced by the courts, and such acts may give rise to the crime of conspiracy if committed in combination. If certain homosexual acts ceased to be crimes, they would automatically fall into this category, as acts contrary to the fundamental principles on which the law rests. To put the matter beyond all doubt, however, the author suggests that any statute implementing the Wolfenden proposals should specifically declare that the practice of homosexuality, whether male or female, is unlawful, before going on to specify under what conditions it should be treated as a crime. This is a suggestion which any MP who eventually has the courage to introduce such a bill would do well to consider.

**What is Unlawful?* By Quentin Edwards. Church Information Office. 1s. 6d.

JUGOSLAVIA

Dr Dedijer Goes to Manchester

AFTER several unsuccessful applications, Dr Vladimir Dedijer, a former member of the central committee of the Jugoslav communist party, has at last been given a passport so that he can take up a one-year research fellowship offered him two years ago by Manchester University. Dr Dedijer, the biographer of Marshal Tito and the friend of Mr Djilas, fell into disgrace in January, 1954, when Mr Djilas was expelled from the central committee for his heretical views; Dr Dedijer was the only member of the committee to defend his right to criticise the regime. A year later both men were given suspended sentences of imprisonment after they had given interviews critical of the regime to western newspapers. Since then Dr Dedijer has remained in obscurity, but out of prison; Mr Djilas's incautious pronouncements, however, landed him in prison nearly three years ago.

Dr Dedijer's appointment in Manchester is entirely non-political; the subject of his researches is to be the history of the Jugoslav partisan war. The Jugoslav government's initial refusal to give him a passport was believed to be due to criticism of the Soviet Union that Dr Dedijer had made during a lecture tour in Sweden early in 1957. It can also be fairly ascribed, at least in part, to the strong reluctance which the present regime, so willing to experiment in the economic sphere, so sturdily independent in the foreign field, has shown to any appreciable loosening of the country's political strait-jacket. The Jugoslav government is not likely to have experienced any change of heart about the country's political evolution; more probably, it has relented towards Dr Dedijer from a feeling of increased self-confidence and security. Still, the decision is welcome. If it heralds a more lenient attitude to Mr Djilas, it will be more welcome still.

BOOKS

A Dissimilar Namesake

The President's Cabinet

By Richard F. Fenno.
Harvard University Press. London: *Oxford University Press.* 339 pages. 45s.

THE American cabinet is a curious entity, whose title and mythology suggest an identity with the British cabinet which known of present-day practice support. It is not a real collectivity; it seldom decides, it imperfectly co-ordinates and it neither requires nor confers distinction on its membership. It exists as a crossroad for pressures and as an intermittently useful device for alleviating the President's political and administrative burdens. "At its worst, it is both useful and unmovable; at its best, it suffers from inherent incapacities." This is Mr Fenno's considered conclusion and in the preceding pages of his most enlightening and realistic book he explains why he thinks so.

A good deal of what he tells us we knew, in a general way, before. The national disposition to talk, which has so immensely stimulated and assisted the study of governmental institutions in the United States, has already made available a wealth of material about previous cabinets and even, in the case of the Eisenhower administration, has laid bare many of the "secrets" of a contemporary one. However, until Mr Fenno came along no one had sifted this information and put down what it had to tell us about the nature and role of the cabinet in the twentieth century. All the clichés about filling a gap and putting us in debt should be read by anyone who wants to understand modern American government.

In addition, there is a direct topical interest about Mr Fenno's findings on the Eisenhower cabinet, which supplement published sources with material drawn from discussion with White House officials. Mr Fenno presents a graphic picture of the extraordinary sessions, replete with visual aids, which seem to employ the techniques of both Dr Frank Buchman and Madison Avenue for the purpose of enabling any department head to "sell" his proposals to his colleagues. Although Mr Fenno shows considerable restraint in his comments on these goings-on he makes it quite clear that for all the talk about staff work and team spirit, the Eisenhower cabinet is practically inoperative as a forum for discussion, decision or co-ordination. From this it follows as a hardly surprising conclusion that "the Eisenhower cabinet probably spends less time and assigns less importance to the area of foreign relations in its discussions than any other cabinet of the period" (that is, since Wilson).

The cabinet is in fact, as Mr Fenno's title properly reminds us, only what the President of the day wants it to be. More than this; even if the President should wish to elevate it to the position as an organ of consultation, debate and party control that is occupied by its British namesake, there are restrictions imposed by the nature of American political life and institutions to prevent him. This Mr Fenno admirably illustrates by a wealth of examples and by cobwebbing factors. He shows how cabinets repeatedly fail to live up to popular myth about themselves and why they must so fail—because "in America there is simply no recognised reservoir of public men from which cabinet leaders are drawn"; because the President casts too

THE PAPER BULLETIN

big a shade for even the greatest cabinet member to grow very tall; because the centrifugal pressures of American politics pull cabinet members away from the general public to particular publics; because Congress is always there making hay of the neatest organisational blueprint and forcing every cabinet member to serve at least two masters, the man in the White House and the congressional committee. This and more are shown to great advantage in these pages.

One small point remains obscure. "The continued introduction of new members without compensating reductions may subject the cabinet to acute institutional indigestion and render it unwieldy as a vehicle for group thinking." (p. 100.) Does Mr Fenno mean that a cabinet ought to move on its stomach?

Leader of the Terror

Grivas: Portrait of a Terrorist

By Dudley Barker.
Cresset Press. 202 pages. 21s.

Grivas and the Story of Eoka

By W. Byford-Jones.
Hale. 192 pages. 21s.

GENERAL GEORGE GRIVAS is now waiting in Athens—so it is widely believed—for the propitious moment to launch a campaign that he hopes will bring him to supreme political power in Greece. His chances of success may not be very bright, but the story of his career so far does much to explain why, after four gruelling years of danger and privation in Cyprus, this ageing man of 61 should still feel tempted to encounter the wear and tear of political life.

As he looks back over his career, he cannot find much cause for satisfaction. Born a Cypriot, he became a naturalised Greek in order to further his ambitions as a professional soldier. But his career in the Greek army was abruptly and unexpectedly cut short in March 1945, when he was put [illegible] had let himself get too deeply involved in extreme right wing politics. He then tried to make his mark in politics, but on three separate occasions, in 1946, 1950 and 1951, he failed to get elected to parliament. After that he found an outlet for his frustrated ambition in working out in great detail (and after close study of communist guerilla and terrorist methods) a campaign for the union of Cyprus with Greece. Late in 1954 he was smuggled into Cyprus to put it into operation.

General Grivas did not imagine that the British could be got rid of by means of an armed Cypriot rising. But he hoped that a carefully graduated campaign of sabotage and murder, combined with intensive propaganda both in the island and abroad, would stir up the Cypriots into a more active desire to get rid of the British, make the position of the British increasingly difficult and finally provoke them into such reprisals that international public opinion, particularly at the United Nations, could be sufficiently strongly mobilised against them to force them to go. Grivas has succeeded in getting rid of the British, but not in uniting Cyprus with Greece; he returned to Athens a disappointed and embittered man.

Mr Dudley Barker has never met Grivas and claims no first-hand personal knowledge of any events in his career. But he has interviewed many of those who have, and he has produced a straightforward and well-balanced account of Grivas's early career, and, in much more detail, of his campaign in Cyprus. His matter-of-fact narrative emphasises, if anything, the cowardly and cold-blooded brutality of the methods that Grivas trained his gunmen to use. At the same time his objective account of the Eoka leader's mentality and background, and his description of the often unsatisfactory material with which he had to work, both explain, without excusing, the methods he used and emphasise how much the whole campaign depended on the energy and driving power of one man. It is a pity that this book does not have either an index or a map.

Colonel Byford-Jones has met Grivas, both before and after the emergency and has visited the island several times. Oddly enough, this has turned out to be more a disadvantage than an advantage. The author's accounts of his personal experiences tend to obstruct the narrative and confuse rather than illuminate the analysis of the situation during the emergency; they also betray a personal conceit that is always irritating and sometimes surprisingly naïve. Moreover the useful and serious material that the book contains is too often obscured by the melodramatic and often over-excited manner in which much of the story is presented. There are one or two mistakes; the extreme left-wing EDA did not emerge as the strongest party after the 1958 Greek elections and the Governor of Cyprus during the war was called Sir Charles, not Sir William, Woolley.

Turtle Bay Turmoil

The United Nations as a Political Institution

By H. G. Nicholas.
Oxford University Press. 224 pages. 21s.

"HAVE we too often treated the UN as a club, too seldom as a stage? (A club, moreover, in which the main object of membership is to dodge the bores?)" The answer to Mr Nicholas's question is Yes. For that reason alone his book should be read both by the members of the British delegation at Turtle Bay, and by all who have to do with the shaping of their instructions.

Heaven knows, the bores are certainly dodgeworthy. The soporific flow of banalities was bad enough at prewar Geneva; in a United Nations Assembly of 82 members, many of them new to sovereignty, eager to make their mark, and not yet weary of useless eloquence, the logorrhoea is a raging torrent. Understandably, many veterans of the vanished League of Nations still sigh for its relative manageability—and for its European "tone." But a government that wants to succeed, not suffer, at the United Nations ought instantly to transfer to some other post any of its representatives who is thus heard to sigh. "The postures of injured innocence" are the worst possible ones to adopt there. Mercifully, Britain's spokesmen now seem increasingly aware of these perils and possibilities; passive stonewalling is yielding to a more imaginative and active technique—especially in colonial matters.

Mr Nicholas's crisp account of how the United Nations really (as opposed to ostensibly) works should help both the practitioners of this technique and those who observe their struggles. It is not only far more readable than the many ponderous tomes already in print that purport to analyse the UN's workings, but also more penetrating. His comparisons are as illuminating as his occasional vivid word-pictures. He contrasts the Assembly with the House of Commons. He shows how the Security Council's handling of disputes resembles a government's approach—often equally unimpressive—to a labour dispute which, everyone knows, will in the end have to be settled by the usual bargaining between the parties concerned. He shows the parallels between the lobbying and vote-trading of the United Nations delegations and the similar processes of an American nominating convention.

Perhaps he overrates the role of the Secretariat. Few would quarrel with his remarks about Mr Hammarskjöld, "as subtle in his processes as his predecessor was crude," about the "perilous role" that the Secretary-General has had thrust upon him, and about the team of officials who "act as his antennae and sounding-boards" by keeping personal contact with delegates. But, as members of the Secretariat would themselves readily admit, they are not the only professional pourers of oil on the turbulent waters of Turtle Bay. Mention the delegates, who can be relied on to coax their more intransigent colleagues out of extreme positions, sometimes with startling success. One of the most heartening signs at the Assembly nowadays is the recruitment to this informal "fire brigade" of conciliators of a number of the "new nations," who had been expected to put all their energies into faction-fighting. But perhaps this story is not yet ready for telling.

Whodunit

The Campden Wonder

Edited by George Clark.
Oxford University Press. 155 pages. 18s.

THE Campden Wonder is one of the deathless mysteries. In 1660 William Harrison, the elderly and respectable steward of a rich lady in Chipping Campden, disappeared. His servant, John Perry, was suspected of murder and arrested. He accused his mother and brother of murdering Harrison and by so doing implicated himself as accessory. All three were tried for robbery and murder. On advice, they pleaded guilty to robbery, since they would benefit immediately from a recent indemnity. The judge refused to allow the charge of murder to proceed, since the body had not been found. Later, before another judge, they were charged again with murder, found guilty and hanged. Apart from the formal plea of guilty to the charge of robbery, which they afterwards repudiated, the mother and brother strenuously maintained their innocence throughout. Some two years later Harrison turned up, telling a most incredible story of having been kidnapped and sold as a slave in Turkey, whence in due course he escaped. He survived for some years as a respected resident of Chipping Campden; but there is a rumour that his wife hanged herself shortly after his return. The story is recorded in a pamphlet by Sir Thomas Overbury, a local magistrate.

It is a strange tale, which has mystified generations. Why did John Perry send himself and his closest relatives to the gallows for a crime which no one committed? What really happened to Harrison, since his story is past belief? Many essays, plays and novels have been written about the case. Sir George Clark, in an elegant little volume, has brought the main threads together. He republishes Overbury's original account and two of the best studies, by John Paget, who wrote an article on the case in 1860, and by Andrew Lang. He adds some new evidence, but it throws little further light. The court record and some signatures of Harrison from the records of the local grammar school, both recently discovered, prove at least that he existed and was absent during the crucial years, and that the Perrys were hanged for his murder. At least that eliminates one theory, that the story is pure fiction from beginning to end. Sir George adds a chapter by the late Lord Maugham on the legal aspects of the case—interesting but not leading towards a solution—and a not very informative psychological chapter by Dr Russell Davis.

So there it is. The reader's guess is as good as anyone's. Let him try: it is a fascinating game.

Savoyard in India

Fountain of the Elephants

By Desmond Young.
Collins. 319 pages. 18s.

BENOIT LEBORGNE, born in Chambéry, Savoy, in 1751, the son of an obscure tradesman, was honest, ambitious and adventurous. At 45, he was a millionaire, and unhappily married to an aristocratic termagant, who was ashamed of his origins. He consoled himself by devoting to good works the thirty years of life that remained to him, thus earning the exotic memorial erected at Chambéry by his grateful compatriots, which provides this biography with its title.

Leborgne started life by styling himself de Boigne and then securing a commission in Louis XVI's Irish Brigade. He left this after some years for service in the Russia of the Empress Catherine and of Potemkin, was taken prisoner by the Turks, turned up (in mysterious circumstances on which Mr Young throws new light) in India, where he persuaded Warren Hastings (no mean judge of men) to entrust him with an espionage mission overland to Russia. Next, he had all his baggage stolen and found himself penniless in Northern India at a time when roving brigands and war lords made such a loss more than usually disastrous. Eventually, after further vicissitudes, he joined Mahadaji Sindhia, the ambitious Maratha chieftain who was engaged in carving a new kingdom out of the disintegrating Mughal Empire.

De Boigne proved so outstanding an organiser, administrator and military leader that he made Sindhia the most powerful force in India outside the territories of the East India Company. Surrounded by intrigues and sordid temptations, which proved the undoing of innumerable other European adventurers, de Boigne was undeviatingly loyal to his master. Sindhia responded by giving de Boigne his wholehearted confidence, making him his Commander-in-Chief and loading him with riches. The mutual respect and trust that existed between the Englishman, Warren Hastings, the Indian, Sindhia, and the Savoyard, de Boigne, would have been rare between men of different races in any age, but it shines the brighter in eighteenth century India, pullulating with chieftains striving to fill with naked power the vacuum left by the Mughals. That within a few years of de Boigne's retirement and Sindhia's death the whole of their work was wiped out may have reduced their historical importance, but it adds to the dramatic interest of their story.

Mr Young's interpretations of character and motive, and his judgments, shrewd yet tolerant and humane, reveal the insight into men and affairs that comes from first-hand experience in positions of vantage and responsibility. For the general background of the period he draws on the established authorities, but in search of the more obscure facts of de Boigne's life he has carried out, over many years, painstaking and scholarly investigations in India, the Middle East, France and England. Among his metamorphoses, Mr Young has not been an editor for nothing, and he communicates his journalist's zest in the pursuit of a "story." Graphically he describes the twists and turns of the trail, gradually allowing us to unravel the truth with him so that many of these pages have the fascination of a good detective novel. As history his book, though not to be despised, is not terribly important. As civilised entertainment, it is outstanding.

Two for the Samovar

Entertainment in Russia

By Faubion Bowers. *Nelson.* 227 pages. 42s.

My Russian Journey

By Santha Rama Rau. *Gollancz.* 300 pages. 21s.

"WE would have looked odd anywhere —one child of four, dressed as a cowboy, one very beautiful Negro girl, one Indian, one American." In Russia, the Bowers family drew every eye, and was off to a flying start in the game of making new friends. Mr Bowers had two further advantages. As an American authority on international drama and dance, he gained access to Soviet theatrical and musical circles, and even had a revealing though chilly interview with Miss Ulanova. He also speaks enough Russian to get about on his own. "You have been in Leningrad nearly one week, and you have not applied until now to the Service Bureau," complained the indignant Intourist bear-leader. His survey of modern Russian ballet, drama, opera, dance, and concert music, with briefer notes on cinema, circus, operetta and variety, is thus no mere formal catalogue, but a penetrating study enriched by apt anecdotes from behind the scenes, and by the surprisingly blunt comments of the Russians themselves.

Mrs Bowers (or Miss Rau), with three travel books and a good novel to her credit already, did not just come along for the ride with their small son and his nurse. As an Indian, she confesses to frankly preferring the disorderly, haggling bazaars of Tashkent to the institutional visits which Intourist likes to prescribe. People as people were what she looked for in Russia, and she certainly found them. Youngsters already enmeshed in "the managing-to-stay-away-from-deadly-jobs-in-the-provinces race"; ordinary folk who spent their days off just "walking about"—home being overcrowded, entertainment too repetitive, sports too organised and disciplined; small silent children, already disciplined by variations on the stern theme, "*U nas nye plachet*" (*we* don't cry); breathtakingly generous individuals; others with a touching eagerness for contact with the outside world.

She learnt something of the problems of young lovers who have no privacy for wooing at home, no snug cinemas or pubs or cocktail bars—and no right to use a hotel in their own home towns. She endured, fascinated but baffled, the ordeal of trying to collect a parcel sent to Moscow from abroad. She noted the "frightening number of uniforms on all Russian streets." Telling her of the years of the worst terror, a Russian remarked that now it was better because "Khrushchev is a liberal too"; and she came away convinced that in a communist context he is, and that the loosening-up process he has started cannot now be reversed.

"Ah, writers—I knew you were rich. All writers are rich," said one of the Bowers's new friends. The gulf between the privileged security of the approved Soviet intellectual or artiste and the bleak life of the masses for whom he claims to speak emerges in both these books. Mr Bowers admires, and admirably evokes, the splendours of the Bolshoi and Art Theatres; but he found many Russians wearying of such "ingrown" perfection. One told him: "When I heard *Porgy and Bess*, I *felt* opera for the first time." Another complained: "*It's like forcible feeding.*" Muscovites stampeded to see an operetta which had been officially dubbed "degenerate"; they applauded every crack about the Party and the regime in Mayakovsky's long-banned plays and in other newly daring dramas. There was warm applause, and something visibly like relief, when one tired ballerina actually fumbled; a mere mistake has more human appeal than icy faultlessness, and Russian audiences are now demanding the human touch.

Mr Bowers thinks they will get more of it. "The eked-out happy ending" and compulsory optimism may persist on Soviet stages, but something more personal is seeping in, and though the Party is still usually right, love is now apt to triumph over the prigs and sneaks that the Party has bred. As to the limitless resources and perfect teamwork of the present system, Mr Bowers's diligent study leaves him with a suspicion that western actors and producers who naturally dream of complete state-sponsored security might change their minds if they saw how it has worked out in Russia.

Creator of Uruguay

Artigas and the Emancipation of Uruguay

By John Street.
Cambridge University Press. 420 pages. 52s. 6d.

ALTHOUGH Sir Home Popham's invasion of the River Plate in 1806 ended in disaster, it opened up brilliant prospects for British trade. Merchants in Britain hastened to embark, eager to make their fortunes in the New Arcadia, which Spain was losing. Rivalry between Brazil and Buenos Aires for control of the estuary, however, threatened to disrupt this valuable commerce, and over a long period Castlereagh and Canning devoted earnest attention to the problem. Eventually, in 1828, as a result of British mediation, the independent buffer state of Uruguay was created at the entrance to the Plate. Of course, no amount of painstaking negotiation by Ponsonby and others could have brought a new nation into existence around Montevideo had the local people not come to desire it. The man who did more than anyone else to foster a feeling of nationhood was the Uruguayan *caudillo* José Gervasio Artigas. He fought the Spaniards, the centralist forces from Buenos Aires and the Portuguese from Brazil to prevent them from dominating the Plate's eastern bank. He was in exile in Paraguay when Uruguay was born.

Dr Street has skilfully woven the biography of Artigas into the complex story of Uruguay's "emancipation" ("creation" is a better word). It is evident that, as he read the original documents in the archives of four countries, Dr Street developed admiration and even affection for the hero. One cannot fail to be impressed, indeed, by the guerilla leader who, living in rough and anarchic times, was able to give so much wise counsel on the need for federation (rather than centralisation) in the Plate; sought to increase the prosperity of his people by encouraging international trade (notably, with Great Britain); and tried, with the quite inadequate means at his disposal, to spread education. Artigas said that he found paper work tiresome; but, from his wild encampment at Purificación, he wrote — or dictated — a mass of memoranda for the guidance of his lieutenants in the vast area which, for some years, he strove to hold together. When issuing regulations for the distribution of land in the interior of Uruguay, he gave instructions that the settlers should be chosen from those whose need was greatest:

> The most unfortunate shall be the most privileged. Consequently free negroes, Indians, and poor creoles, all may be granted *estancia* lots, if with their work and their probity they are inclined towards their own happiness and that of the Province.

Artigas was denounced by his enemies as a bloodthirsty tyrant, who bound his victims in the hides of newly slain cattle, with only their heads exposed, leaving them in the sun to be squeezed to death as the hide dried and contracted. There is no reliable evidence that he himself was guilty of these enormities. Nor, unfortunately, does an authentic portrait of Artigas exist —apart from a sketch that was made, when he was very old, of his emaciated and toothless head, with the aquiline nose that had always been his most distinctive feature. Dr Street—doubtless out of respect for the virile hero—has not included that drawing among this book's illustrations, most of which are reproductions of Vidal's well-known water-colours of scenery.

OTHER BOOKS

Paperbacks:—

PAINTING IN THE FAR EAST. By Laurence Binyon. New York: *Dover Publications.* London: *Constable.* 317 pages. 16s.

This introduction to the history of pictorial art in Asia, particularly in China and Japan, is a reprint of the 1923 edition. There are some forty illustrations but unfortunately all in black and white, which does less than justice to the delicacy of the brushwork.

THE EYE OF THE EAGLE. By G. H. Dury. *Penguin.* 284 pages. 5s.

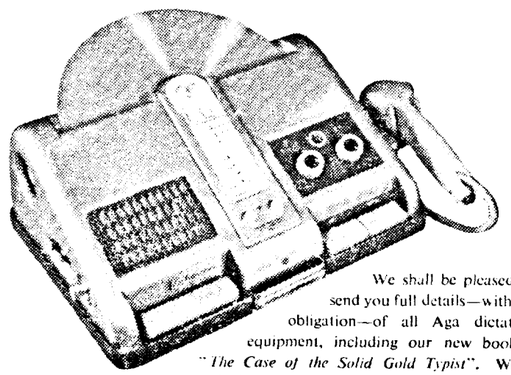
This well-written and copiously illustrated handbook is an introduction to geomorphology, the study of landscape formation, for the general reader.

THE NARRATIVE POEMS. William Shakespeare. Edited by G. B. Harrison. *Penguin.* 166 pages. 2s. 6d.

Cut typing costs as from now

The cost of typing is higher than you think. Using out-dated methods you are wasting time and money every day. *Stop this loss!* Instal Agavox—proved by users as the dictating machine that *really* cuts the cost of correspondence.

Besides the economic Agavox there is also the Agavox Tele-dictation System—advanced centralised dictating equipment which makes big savings and is reliable. It is available for operation with separately wired push-button telephones or through an existing private automatic exchange using dial telephones.



We shall be pleased to send you full details—without obligation—of all Aga dictating equipment, including our new booklet "*The Case of the Solid Gold Typist*". Write or telephone today.

New Tongues for Old

SIR—In your admirable article on the desirability of making provision for the study of contemporary Asia and Africa and their languages in our formal system of education, you refer to the fact that few schoolteachers can give advice about these studies. May I add that the School of Oriental and African Studies has arranged a series of conferences with the heads of independent and grammar schools in order to describe the university courses, places and scholarships that are offered, and the career opportunities that are open? Conferences of this kind have already been held in London, Liverpool, Bristol, Sheffield and Leicester and one is soon to be held in Glasgow. We are willing to hold such conferences in any part of the United Kingdom.

We are also at present beginning an investigation of the best ways of introducing these studies into the curricula of schools, and will provide on request short book lists on Asia and Africa for school libraries.—Yours faithfully,

C. H. PHILIPS
School of Oriental and African Studies, London, WC1

SIR—While in general agreeing with the article "New Tongues For Old," I would like in self-defence to state very briefly the circumstances which have impeded the teaching of modern Arabic at Cambridge. Your readers will be aware that large additional moneys were made available to universities for the development of oriental studies following the adoption by Parliament of the Scarborough report, and that the lion's share of these moneys went to a single institution, the London School of Oriental and African Studies. The very modest expansion effected at Cambridge was brought to an abrupt halt in 1951, and well-conceived plans for the orderly introduction of modern studies were thus almost completely nullified. Repeated representations made since that date for provision to teach modern Arabic have been repeatedly negatived. So far as Arabic teaching at Cambridge is concerned, failure to "modernise" the syllabus has certainly not been due to any unawareness of the urgency of the need on the part of—Yours faithfully,

A. J. ARBERRY
Professor of Arabic
Pembroke College, Cambridge

Europe's Post-war Liquidity

SIR—Your feature on this subject, undertaking to compare and contrast price and money supply movements among the United Kingdom, France and Germany, is confusing in one respect. A chart depicting liquidity, as measured by money supply divided by gross national product in current prices, is said to be limited in that it "takes no account of the velocity with which money circulates. . . ." But money supply divided by gross national product is the reciprocal of "velocity," in one of its definitions—namely, income velocity.

What your chart shows is that in Germany the currency reform reduced cash balances drastically, permitting little further rise in velocity, while in France rapid overt inflation immediately after the war reduced the value of cash balances relative to the value of current output and incomes so that there was little further margin for velocity to advance. In the United Kingdom, as in the United States, the monetary overhang from the war was reduced only gradually as current income (reflecting both rising prices and expanding real product) increased more rapidly than the monetary authorities permitted money supply to rise. This was reflected in increasing velocity. How long this can and will continue is an important question which you did not undertake either to ask or to answer.

In this connection, it may be noted that the Radcliffe Commission found no reason "for supposing, or any experience in monetary history indicating, that there is any limit to the velocity of circulation——" (page 133). Yet your chart, showing the reciprocal of income velocity, presents just such evidence in showing that in both France and Germany such a limit was apparently reached.—Yours faithfully,

ROBERT SOLOMON
Federal Reserve System, Washington, DC

West Indies

SIR—I should like, if I may, to comment on the letter from Dr Nevin. For while I think that his points concerning currency, migrants' remittances and the loss of skilled workers are well taken, he does, in my opinion, proceed to protest too much with regard to your own comments on Jamaica's attitude to a Customs Union.

The purposes of a West Indian federation are two-fold: the achievement of nationhood and the improvement of economic standards within the region. As the Governor General said when opening the recent Inter-Governmental Conference: "It would be idle to suppose that the fundamental requirements of nationhood exist in the West Indies today or that they can do so until the Federal Government has the strength and authority to speak with a sure and confident voice for the West Indies as a whole." A working customs union is a *sine qua non* of West Indian development. It is not possible unless Jamaica is prepared to move towards internal free trade. A federation where Jamaicans are not, for example, permitted to import rum from Trinidad or Barbados or severely restricted in importing textiles from Trinidad—as is now the case—would not contribute to either the achievement of nationhood or the improvement of economic conditions in the region. Nor would it help Barbados or Grenada if they were obliged to raise their tariffs to the level of the Jamaican tariff and got no *quid pro quo* from Jamaica for so doing.

All this is well realised in Jamaica where, unfortunately, the present high protectionism is regarded as the essential cause of their boom conditions and any reduction, even to help other federal territories, is not countenanced by either political party. As Dr Nevin will know from personal experience, a lowering of the Jamaican tariff could easily promote imports. It is not the loss of revenue from imports under a customs union that mainly worries the Jamaicans. Nor is it so much any likely outlawing of quotas following membership of GATT (which is hardly severe any longer on underdeveloped territories). It is simply unwillingness to adjust the economy to permit of internal free trade and unreadiness to take over from the United Kingdom the subsidisation of those units still unable to balance their budgets. If Dr Nevin does not want federation, he should say so; if he does, Jamaica must accept some minimum obligations to make it a reality.—Yours faithfully,

D. J. MORGAN
University of Manchester

Pravda on Rostow

SIR—You are clearly not familiar with the conventions of Soviet journalism, or you would not have troubled to reprint Mr Zhukov's characteristic abuse of Professor Rostow. Articles in *Pravda* are not meant to further the discussion of theoretical problems, but to furnish an outlet for the accumulated bile of the party's *agitprop* section. For a more considered estimate of the subject we shall have to await the comments likely to appear in more specialised journals. Soviet economists—unlike *Pravda* editors—are quite capable of understanding Keynesian modes of reasoning, though naturally restrained in their public utterances. A political spokesman like Mr Zhukov, on the other hand, can hardly be expected to react otherwise than he has done. The official investment in Leninist orthodoxy is too heavy to permit any major concessions to a different viewpoint. Indeed, thought-control could hardly be maintained if debate were to become genuine and the arguments of opponents to be met with something other than standardised abuse.

At the same time it seems a pity to one of your readers that you are apparently inclined to follow Professor Rostow's own example in picking a quite pointless quarrel over Marxism. As I ventured to point out in a letter which you published, the weak side of Professor Rostow's argument is his

sociology, or rather the absence of a genuinely sociological analysis. One need not be a Marxist—let alone a Leninist—to think that there is something extremely odd about a theory of development which systematically ignores social realities such as class conflict. The explanation would seem to be that the discussion of such topics is taboo in the United States. This naturally lays American writers open to polemical gibes in *Pravda*, which in turn help to promote the mistaken impression that the whole quarrel is over what took place in the nineteenth century. We shall not get very far with this discussion until American academics get over the compulsive habit of proving Marx wrong, with the help of arguments so naïve that even the editor of *Pravda* can dispose of them. Why not drop this subject and instead turn to the much more fruitful topic of structural similarities among all types of modern bureaucratised societies?—Yours faithfully,

London, NW3 G. L. ARNOLD

Marine Engines

SIR—Last week your comments on the new P and O Group liners concluded with a brief synopsis of the pros and cons of turbo-electric propulsion machinery *vis-à-vis* geared turbines, including the statement that the former reduces the risk of mechanical failure.

In turbo-electric machinery the mechanical gearing is replaced by an electric motor and electric generator, and the fact that the risk of breakdown is transferred from mechanical to electrical equipment does not necessarily imply any overall improvement in reliability, which is the shipowners' real concern.—Yours faithfully,

J. G. C. GIVEN

OXFORD
UNIVERSITY PRESS

The Role of the State

SIR—Professor Schwartz's letter in your issue of November 14th states that "the public interest may well run counter to that of both management and shareholders." One's whole concept of government is based on whether one accepts this statement or not.

For those who believe that "what is good for General Motors is good for the United States," the country's economic life must be left to businessmen (using the term in its widest sense) with government only interfering to protect against fraud or violence. The absorption of a less successful business by a more successful one must, according to this thesis, result not only in profit to the expanding concern but also to the country. Similarly, for ignorant or comatose shareholders to be replaced by wiser and wider-awake ones must also be to the ultimate benefit of the community in which they all live. So there can be no justification for government interference—so long as there is no question of fraud or misrepresentation.

The converse of this doctrine is "the gentleman in Whitehall knows best." This gentleman is the representative of the whole community—and if he does not in fact represent the community it is in the first instance the fault of the politicians whose policies he is paid to carry out, and ultimately of the electors who put the politicians there to represent them. His interference can only be supported by those who believe, as Professor Schwartz does, that there can be a long-term conflict between public interest and private profit. Once this has been accepted the theoretical justification for state control has been swallowed. It is then no longer a question of argument concerning doctrine but purely a question of how best to ensure that the gentleman in Whitehall does his job properly. But I wonder how many of those who are prepared to discuss means of protecting shareholders from take-over bidders, house-buyers from unqualified house agents, or even inefficient businesses from more efficient competitors would admit that they had accepted the principle of state control.—Yours faithfully,

Cambridge H. D. WALSTON

Turkey

SIR—The interesting article "Turkey's Perpetual Emotions" provokes me to some comments.

Your correspondent sums up the shortcomings of the main opposition party, the Republican People's Party as the failure to produce an alternative comprehensive social and economic programme. From this, your correspondent, with some significant reservations, tends to draw the conclusion that the political struggle in Turkey is mainly one about personalities, about who gets effective control.

Although its economic programme has not been worked out in detail (no opposition party anywhere can be expected to produce a comprehensive economic plan before coming to power), the Republican People's Party has consistently stood for certain main principles in the political, economic and social fields. These would constitute a political programme, even by Western European standards.

In politics, it stands for parliamentary democracy safeguarding the basic rights of individuals and the independence of the judiciary and of the universities. Even under single party rule, necessitated by the transition from a society obsolete in some respects to a modern and secular state, the aim of the Republican People's Party had been to lay down the foundations for parliamentary democracy in Turkey. In economics, it stands for a well defined and harmoniously operating mixed system of private and state ownership together with overall development planning. It has always been against inflationary methods of financing expenditure. It was proved right when the mistakes of inflationary policy were recognised with the stabilisation programme of 1958.

In social affairs, it stands for the recognition to labour of the rights of association and of strike. In addition, its aim is to broaden the basis of education, to maintain and, if possible, improve social services and to prevent further increases in the inequality of incomes. As the party which has been responsible for the profound social, economic and political transformation of Turkey since 1923 and also for introducing the income tax in 1949, the Republican Party is aware of the increased efforts which the execution of this programme will demand from the country.—Yours faithfully,

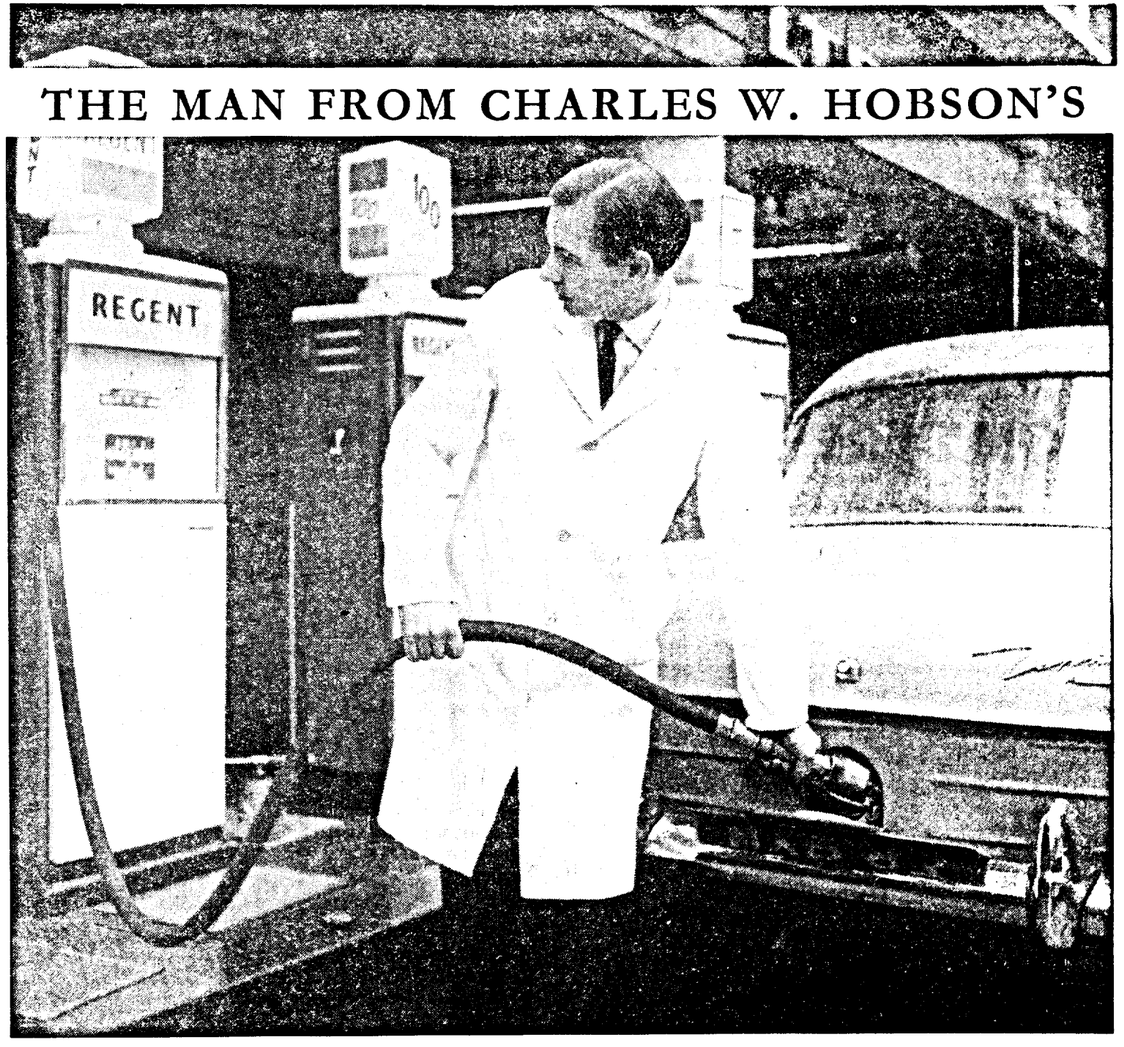
Ankara OSMAN OKYAR
Director PRP Research Unit

Engineers' Salaries

SIR—The Engineers' Guild survey has revealed the miserable level of salaries paid to professional engineers in this country. Your deduction that this implies that there is no shortage of engineers is quite possibly correct. Certainly, if we are satisfied with our present rate of technological development; if our industrial productivity is to remain stagnant; if we are content to build one motorway and one obsolete bridge every two years or so—then we have plenty of engineers. If, on the other hand, we seriously aim to double our standard of living in the measurable future, then there *will* be a shortage of engineers, and it will be acute.—Yours faithfully,

North Harrow J. K. RICKARD

THE MAN FROM CHARLES W. HOBSON'S



Every year Charles Hobson executives **and copywriters spend hundreds of hours working at the point of sale. They learn about customers' outlooks and shopping habits. They help to keep the thinking of all our advertising in touch with the realities of selling.**

Our photograph shows account executive W. M. Turnock serving a customer in a large London garage last month. The story of what he and other Charles Hobson executives learned first-hand about customers and their habits is contained in their reports. These are valuable sources of reference for all our work as an advertising agency.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

An American Tragedy?

WASHINGTON, DC

ONE of the commonest charges against Mr Charles Van Doren is that he has betrayed his fellow-intellectuals. By deceiving the millions of people who thought that the television question-and-answer show on which he appeared was a genuine test of knowledge, he has trodden underfoot that still tender shoot, popular respect for academic learning: so runs the argument of Mr Marquis Childs and other commentators. In fact, Mr Van Doren may have done more for the intellectuals who want to raise the standard of American television than he, or they, yet realise.

This is because, as was found by the radicals who sought to reform American capitalism towards the end of the last century, it takes the most dramatic exposure of misdoings to persuade the Americans to regulate what they have hitherto preferred to leave unregulated. Television is perhaps the last great hunting ground of the dinosaurs of *laisser faire*. If anything can lead to its being brought under control—and it is far from certain that anything can—it may be the aristotelian tragedy, enacted almost entirely in front of the cameras, of Mr Van Doren, a high-born young man brought low by a fatal weakness.

For a people with a reputation for being cynical, the Americans are very angry. The revelations, which reached a climax with Mr Van Doren's confession to a congressional subcommittee this month, and which are likely to be continued next month, have hit the country even harder than the affair of Mr Sherman Adams and Mr Goldfine last year. That was "politics"; this is the mass bamboozling of a nation by its favourite piece of sitting-room furniture. The indignation has been voiced by virtually all the newspaper columnists and the suggestion of one of them, Mr Roscoe Drummond, apparently persuaded about one televiewer in ten to switch off his set at 10 o'clock on Tuesday night as a demonstration of protest. *Time* magazine has been unwontedly waspish about the effect of the profit motive on television and the correspondence columns of the press, which ran dry throughout the Berlin crisis, are in full spate. Even the readers of the *New York Daily News*, a group of hard-boiled non-eggheads, show a majority against the view that the deception was justified in the holy name of entertainment.

This defence has been put forward by a number of people, most boldly by Mr Albert Freedman, the producer of the programme which led Mr Van Doren off the straight and narrow path. The carefully rehearsed question-and-answer show, runs the theory, was like a film or a magician's trick; and the money the contestants won by appearing to dredge their memories for the answers was simply their pay for being convincing actors. This naïve defence ignores the fact that no sane adult in a cinema or theatre thinks that the characters in the film are real or that the magician is truly cutting the lady in half, whereas the suspense in the "Twenty One" show depended largely on the general understanding that the contestants' agonies were genuine.

Most Americans see this distinction. But their reaction is not merely one of anger at having been deceived. There is also a widening suspicion that this is a specifically American tragedy: that the ease with which Mr Van Doren and the others were corrupted is the seamy side of a society which puts too much emphasis on material success. Thus poor Mr Van Doren is already, for many of his countrymen, a figure in the cold war, a symbol of the weaknesses through which Mr Khrushchev hopes to bury them.

There is likely, therefore, to be considerable pressure for reform when Congress reassembles in January. Comparatively few people are as restrained as the *Wall Street Journal*, which holds that no legislation is needed because the corruption has been killed by exposure. By now, no doubt, the surviving question-and-answer programmes are as clean as a whistle; but Congress's investigations, flitting like butterflies from flower to flower, provide a rather haphazard kind of exposure.

THE extent to which reform is likely to be achieved depends on which of two problems the reformers try to solve. The first is the problem of deception, involving those practices which, while falling short of actionable fraud, are designed to attract audiences by pretending that what they are seeing or hearing is something other than what it really is. The other problem is that of trying to haul the cultural level of television programmes out of the swamp of mass entertainment; although the recent exposures have turned some reformers' eyes hopefully in this direction, they will find such a task far more difficult.

One of the most encouraging results of the current heart-searching is the admission by Dr Frank Stanton, the head of the Columbia Broadcasting System, that the problem of deception goes far beyond the question-and-answer programmes. It includes the pretence that rehearsed discussions are really unrehearsed, the use of recorded laughter to prop up comedians' flat jokes, the practice of telling audiences when to applaud, and that strange no-man's land, somewhere between honest exaggeration and downright misrepresentation, where so many advertisements hover. The sensitive televiewer, sitting with finger-nails pressed into palms, might offer to extend the list indefinitely.

The Federal Trade Commission's closer watch on advertising has already discovered one ingenious advertiser who apparently tried to show how easy it was to see through his car windows by rolling them down before pointing the cameras at them. The Federal Communications Commission, which has a vague responsibility for watching over the contents of television programmes, is widening an inquiry which it is already conducting to take in some of these subjects. Unfortunately, many of Dr Stanton's colleagues, even in his own company, regard such devices as necessary and legitimate tools of their trade.

Some of the legislation being offered is designed to prevent a repetition of the trickery in the question-and-answer shows, making it punishable by imprisonment, fines or banishments from the ether, but it is a little late to lock that particular stable door. The hope of establishing some more flexible kind of control over television's bad habits depends chiefly on extending the functions of the Federal Communications Commission. This is not going to be easy. The commission is prohibited by the statute which created it from engaging in "censorship"; although the meaning of the word in this context has not yet been determined by the Supreme Court, Mr John Doerfer, the commission's chairman, is

known to be conservative in his own interpretation. The Supreme Court said in 1943 that the commission has the "burden of determining the composition" of broadcast traffic. But it has also ruled in another case that the commission has no supervisory control over programmes.

If this singularly reluctant knight is to be sent into action against the dragon, there are two or three extra weapons with which he might be equipped. At the moment the 560-odd local stations are the only part of the television system over which the commission has any control; their licences must be renewed every three years. There is widespread support for the belief that the three great networks, which supply a large part of the programmes which the local stations show, should also be brought under the commission's eye. But, if they were, it would almost certainly be necessary to give the commission wider sanctions beyond the single, ultimate, weapon which it now possesses, the right not to renew a broadcasting licence. No local television station has ever had its licence revoked and the commission's reluctance to resort to such extreme measures would be far stronger in the case of the enormously rich and powerful networks. One suggestion is that when the commission disapproves of particular practices it should be entitled, like the Federal Trade Commission, to issue "cease and desist" orders which can be enforced in the courts.

Unless and until Mr Doerfer is replaced by someone more eager to test the extent of the FCC's present powers, it may also be necessary for Congress to spell out more closely the "public interest, convenience and necessity" of which the commission is the appointed guardian. Some experienced legislators think that this might be done best by setting out the kind of programmes which the commission should seek to encourage; it would then be up to the commission to push its demand for improvements as far as it could in each individual case. Those who know just how much public indignation is required in contemporary America to generate a given amount of reform suspect that something along these lines—rather than, say, the more idealistic proposal to set up a public service network on the model of the British Broadcasting Corporation—is the best the reformers can hope for.

Herter in Hot Water

THE critics who complain that in the present Administration foreign travel takes the place of foreign policy may or may not be justified, but it is at least true that it is more difficult than it used to be to find out what the Administration thinks its foreign policy is. Nothing about Mr Dulles is more missed than his regular wide-ranging press conferences, full of food for thought, even if sometimes it was indigestible. The new Secretary of State, Mr Christian Herter, has held only three press conferences since he succeeded Mr Dulles in April and the most recent of these demonstrated why he distrusts this method of giving information.

A trained diplomat who believes in working behind the scenes, better at negotiation and committee work than at public appearances, Mr Herter does not shine at a press conference. Last week, when asked about his attitude to the border dispute between India and China, he replied that the United States was taking no position since it had not been appealed to and since it had no official knowledge of the rights or wrongs of the matter. This coldly correct answer shocked the friends of India and Mr Herter later stated, somewhat apologetically, that whatever the legal aspect of the issue he condemned the Chinese Communists morally for using force. While Mr Herter's candour may mean that President Eisenhower's popular reception in India next month will be less enthusiastic than it might have been, Mr Nehru himself can hardly complain if he is hoist with his own neutrality. Indeed, it has been suggested that he may find Mr Herter's impartiality helpful in damping down those Indians who are demanding war against the Chinese aggressor.

In the war at home, against Washington's current strong man, Mr Anderson, the Secretary of the Treasury, Mr Herter is far from neutral as his speeches this week have shown. Opening the annual National Foreign Trade Convention, he announced that no basic changes were contemplated in the procurement policies of the International Co-operation Administration, which handles the economic side of foreign aid. He has had to allow one small concession to Mr Anderson but for the present Mr Herter has repelled the main effort to extend to the ICA the so-called "Buy American" policy which has been promulgated for the Development Loan Fund in order to strengthen the American balance of payments. Next day Mr Herter assured representatives of the North Atlantic Treaty countries that balance-of-payments difficulties would not lead to any reduction in American support of Nato. But balance-of-budget difficulties still may; although Mr Herter did not mention these, his struggles with Mr Anderson are not yet over—and with Congress they have not yet begun.

Steel Truce

LAST week steel began to flow more rapidly and more smoothly than the industry had dared to hope after 116 days of idleness and with men who were working only because the courts had forced them to return for 80 days. At the end of the first week production of ingots had reached 45.9 per cent of capacity; this week at nearly 80 per cent it is far more than was forecast at first. Partly this is because damage to the furnaces is much less than was feared; partly it is because the men, even those wearing armbands reading "Ike's slaves," seem to be glad to be back on the job and earning something for Christmas. In this they will be luckier than many of the 500,000 workers laid off in the steel-using industries. The General Motors Corporation, the biggest producer of automobiles in the world, stopped making any cars last week and does not expect to begin again until the middle of December. It will take at least that long to restart the flow of steel sheets and other products, even to such a valued customer. A full and balanced flow of steel products, which take about six weeks to produce, is not likely before Christmas and the shortages caused by the strike probably will not be made good completely until March. Mr Mitchell, the Secretary of Labour, may have had to eat his hat (in cake) because unemployment did not fall below 3 million in October, but the November figures are likely to be worse.

Hardship in the steel and automobile centres is hardly visible in the retail trade figures for the country as a whole, which were 3 per cent higher in October, on a

My word! This is a good whisky

Thank goodness supplies of White Horse Whisky will be much better this Christmas. But farsighted families are making sure of their supplies of White Horse now. Our fathers' saying: "You can tell White Horse blindfold" is as true today as ever. Why not put the regular enjoyment of White Horse among your more lasting New Year resolutions?

Send your best Christmas wishes by White Horse

This year there will be a remarkable agreement between one enlightened Santa Claus and another. They will be giving each other the gift they would choose for themselves—White Horse of course. Some may very well be on its way to you. But—just in case—how about a bottle or two to present your compliments to yourself.

Retail prices: Bottles 37/6, ½-Bottles 19/6, ¼-Bottles 10/-, Miniatures 3/10

seasonally adjusted basis, than they had been in September and 9 per cent higher than they were a year earlier. Industrial production has edged downward a point, and the gross national product fell from the record annual rate of $484.5 billion in the second quarter to $478.6 billion in the third; but the second quarter was inflated by preparations for the steel strike, and these reductions may prove to be no more than postponements of activity.

Hopes that the boom will roll on to new heights in 1960 may be disappointed, however, if the steel strikers walk out again on January 26th, as they threaten to do if a settlement has not been reached when the court injunction is lifted. Mediation begins again next week and the President, as he must under the law, has reconvened his special board of inquiry, but it lacks the legal power to recommend a settlement. The chief hope at present is that neither side looks forward to the measures of compulsion which the President may recommend and Congress pass if the strike breaks out again. The proposal for a "summit conference" between labour and management which Mr Meany, the head of the American Federation of Labour and Congress of Industrial Organisations, has put forward and which the President seems inclined to accept, is an effort to avert this lightning.

Prospecting in the West

GOVERNOR ROCKEFELLER of New York got little change out of California's Republicans last week when he invaded the home state of his entrenched rival for the Republican presidential nomination. Mr Nixon. The "No Trespassing" signs bloomed on nearly every professional Republican lapel in the shape of "Stick with Dick" emblems; in Los Angeles Mr Rockefeller spoke with a huge portrait of the Vice President looming behind him. The Governor's attractiveness in informal exchanges was as great as ever, but the serious speeches assembled by a rather high-flown group of ghosts—including Mr Emmet Hughes, author of "America the Vincible," did not set the Sierras on fire.

The New Yorker had a warmer welcome in neighbouring Oregon, where the Governor, Mr Hatfield, could not hope for the vice-presidential nomination if Mr Nixon were the candidate, and in Washington. But the trip could only have confirmed Mr Rockefeller's suspicion that he had nothing to hope for from the Republican professional politicians, who are pledged almost to a man to the Vice President. Mr Rockefeller's only hope is to go over their heads to individual party members, which explains why Oregon and California were his first ports of call and why Wisconsin will be prominent in the mid-western trip which he expects to make in December. All three states have presidential primaries, at which members of the party express their preferences about its candidates, though these are not held until after the New Hampshire primary in March; this is the first hurdle which the Governor must make up his mind to take. For such voters Mr Rockefeller has made it absolutely clear that he would not accept the vice-presidential nomination, which he says is a less responsible job than the one he now holds. And he has gone on vigorously sharpening the differences between himself and the Vice President by emphasising more rapid economic growth as the way to spend more on education, defence, and other services while eventually

Solution for New Metals

FROM A CORRESPONDENT IN LOS ANGELES

WHAT happens when materials to be machined are as hard as the cutting steel of machine tools, or even harder? This is no academic question since the stainless steel, titanium and exotic metals needed to construct the latest supersonic aircraft and missiles are too tough for standard machining methods. The solution is provided by chemical milling, a young but fast-growing industry mainly centred in southern California.

The method was inspired by photo-engraving. This process for producing patterns by chemical treatment has been adapted—on a much grander scale—to the milling of parts made from hard metals. In chemical milling the complete piece is covered with a protective coating; this is removed from the parts to be machined and the piece is then immersed in a chemical solution. The unmasked parts are etched away by the fluid. The process can be controlled by varying the strength of the solution, the period of immersion and other factors.

Although this is the only way that certain very hard materials can be "machined," other advantages over machine tool milling are claimed for the process. Closer tolerances are possible, down to .002 of an inch, and milling is more uniform. Parts may be treated simultaneously, reducing costs. There are no restrictions as to shape, direction of cut or radius, or on the treatment of contoured surfaces, as there are with tool milling. Finally, chemical milling can be used to etch away metal merely to reduce its weight, which would be prohibitively costly with machine tooling. This is of basic importance to aircraft and missiles, which require parts combining lightness with great strength.

As an industry chemical milling is only a little over five years old. The process was developed by North American Aviation Inc., which applied for patents on it late in 1953; now more than 40 companies are licensed to use it, including all the big aircraft firms: Boeing, Douglas, Lockheed, the Convair Division of General Dynamics, Grumman, Northrop, Martin, Ryan, as well as North American itself. Many smaller specialist firms have also entered the field and are experimenting with new ways of applying the process.

THEIR combined sales in chemical milling were only about $5 million last year and most companies in the business have other interests. But the market is expanding rapidly and sales in 1959 are expected to show a marked increase over those last year. The government, of course, is the principal customer. Chemical milling is being used on parts of all the advanced missiles now in production. It will also be used on components of the B-70 bomber which is designed to fly at 2,000 miles an hour. To make such a speed possible it will be constructed of stainless steel, which presupposes the use of the chemical process for milling. The growing demand for the process, as defence moves into the supersonic age, is leading chemical milling companies to expand their capacity. In their forward planning, all are concentrating on improving the application of the process to titanium, zirconium, beryllium, and other rarer metals.

Though at present the fortunes of the industry are tied closely to defence, its research programme is concerned with a potential civilian market. There is the prospect of supersonic commercial airliners—Lockheed has announced plans for such a transport—and chemical milling may have uses outside the aircraft industry. The process can be applied to all kinds of metals; since it is used widely on aluminium and magnesium parts for aircraft, it could mill the same metals for other purposes, such as aluminium panels for facing or display. The market will be even broader if efforts to reduce the cost of the process are successful. For the next few years, however, the industry may be hard pressed to keep pace with all the military demands, even if its capacity were to be doubled.

reducing taxes. His insistence that "the purpose of America must surely be something more than personal comfort" and his suggestion that further reductions in the work-week should be postponed carry a barb when it is remembered that it is not long since Mr Nixon was advocating a four-day week.

Mr Rockefeller has no time to lose if he is to catch up with the Vice President. But Mr Nixon, in spite of his head start, has been rallying his troops in Indiana and Wisconsin, and casting apparently "benevolent" reflections upon Mr Rockefeller's inexperience in government and in national campaigning. Meanwhile a "New Yorkers for Nixon" headquarters has been set up, which includes among its founders many of President Eisenhower's wealthy supporters. Moreover, when the Nixon campaign begins to move, it will do so with the slickness associated with Mr Leonard Hall, Mr Eisenhower's own accomplished organiser of victory.

Rights versus Responsibilities

THE federal government is determined not to acquiesce in Mississippi's refusal to let justice take its course in last April's lynching case, when a young Negro, accused of raping a white woman, was taken from the county goal at Poplarville and murdered. Last week the local grand jury, apparently believing that to lynch in such circumstances was no crime, adjourned without hearing the testimony of agents of the Federal Bureau of Investigation who had studied the case thoroughly and had named a number of suspects in their report to the State Governor. Their "interference" was much resented in Mississippi. They did not find evidence, however, that any federal statute—the kidnapping laws, for example—had been violated and therefore the United States Department of Justice did not enter the case at that time. But now the department has asked that a special grand jury be summoned to hear the FBI's evidence and, it is hoped (probably vainly), to bring indictments. Moreover the Attorney General of the United States has said that the "travesty" of justice in Mississippi may lead him to recommend additional legislation on civil rights.

Meanwhile the existing legislation, passed in 1957, is getting its teeth into some of the other states which put their rights before their responsibilities. In Memphis, Tennessee, the Department of Justice has just filed the first suit under the Act against interference with the actual process of voting. The voting cases brought under the Act so far, which are now before the Supreme Court, deal with interference with the right of Negroes to register for voting, not with the final casting of ballots. Democratic party officials in Fayette County are alleged to have prevented Negroes from voting last August in the "white" primary election in which the party's candidates for local offices were being chosen; since in this part of Tennessee Democratic candidates are automatically elected, this action had the effect of disfranchising Negro voters. In this suit the federal government is intervening in a purely local election, in which no federal offices were at stake. This confirms the worst fears of the southern opponents of the 1957 Act who realised that it would intensify the attack on the indirect methods which are the modern way of maintaining white supremacy.

Hectoring the CAB

FROM A SPECIAL CORRESPONDENT

SINCE Congress established the five-man Civil Aeronautics Board in 1938, to encourage and regulate the growth of civil aviation, a total of twenty-four members have served on this independent, bipartisan commission. Some finished their six-year terms of office and were not reappointed by the President; others left before completing their terms, sometimes to become federal judges or to take better paying jobs with airline companies. But until Mr Louis Hector resigned last September, no one had ever given up one of these $20,000-a-year posts because he had decided that the board was not competent "to regulate a vital national industry in the public interest."

Mr Hector was no old and embittered political hack, wearied with the responsibilities of work on an administrative tribunal, but a brilliant young lawyer and former Rhodes scholar. He served on the board with distinction for two-and-a-half years before leaving what he was by then convinced was a hopelessly ineffective organisation. In his letter of resignation he told the President:

> The CAB is a creature imprisoned by its own structure and procedure. It is unable to form a clear policy. It is unable to make sound and comprehensive plans. It is unable to administer its affairs with vigour and dispatch.

To support his charges Mr Hector appended a seventy-page bill of particulars.

One of his most damning accusations was that the board makes a great show of court-room form and procedure, but that in fact it lacks judicial substance when allocating air routes and regulating fares, its main functions with the investigation of accidents. This view is shared by almost every lawyer who argues before it. Its inconsistent policy in awarding routes was cited by Mr Hector as particular evidence of its generally muddle-headed thinking.

MR HECTOR argued that the faults in the CAB, and in other regulatory commissions as well, are structural, arising from imperfect laws and procedures; "not with the Founding Fathers as members of the board do I think the CAB as now organised could fulfil its obligations to the American people." Nevertheless there are others, equally sincere but less kind, who believe that with better qualified members the board would work better.

By submitting his resignation without warning Mr Hector exposed a major weakness in both the current membership of the board and in the President's failure to take appointments to it seriously. At the time of Mr Hector's abrupt departure, not only was another, 74-year-old member, Mr Denny, anxious to retire, but the chairman, Mr James Durfee, had been promoted to a federal judgeship and was only waiting for confirmation by the Senate before resigning also. This left only two members to carry on the continuing work of the board and two members do not make a quorum. In addition these particular two members are poles apart: Mr Joseph Minetti is a lean, angular Democrat from New York City, while Mr Chan Gurney is a short, rotund, small-town Republican from South Dakota. Thus the net effect of Mr Hector's departure, and the incipient departure of both the chairman and Mr Denny, has been to paralyse the board. No arguments have been heard and no decisions handed down.

Now at last the President has appointed replacements to fill the board, at least until Mr Durfee goes. Mr Denny has been succeeded by Mr Whitney Gillilland, a Republican from Iowa who has had several governmental posts but has no previous experience of aviation or of a federal regulatory agency. But Mr Alan Boyd, who will fill out the three remaining years of Mr Hector's term and is also a young Democratic lawyer from Miami, was an air transport pilot in both the last world war and in Korea; moreover, he has been chairman of the Florida Railway and Public Utilities Commission and thus has some regulatory experience.

Both of the new members were sworn into office this week in what the Justice who administered the oath called "a double ring ceremony." It will not take long for the aviation industry to find out whether the two new boys can raise the standards of the board or whether, as Mr Hector claimed when he resigned, "to get the regulatory job done properly, a basic overhaul is necessary."

Everybody's doing it!

In the last few years a new motoring idea
has been sweeping the world off its feet. It is the motor scooter.

Roads in many lands are teeming with these happy little vehicles. Respectable city gentlemen keep their dignity on them. Traders go their rounds on them. Everywhere people buzz about on them like angry bees.

The motor scooter is a bright feather in the cap of the motor industry. It is both an engineering achievement and a social asset, for it introduces the pleasures of motoring to a wider public. It is essentially the vehicle of the young, a symbol of Youth's urge to dash about and enjoy life.

The hard-working two-stroke engine of the scooter presents special problems and requires special oil. Shell research has provided it. In Shell 2T Two-Stroke Oil, owners of scooters, bubble cars and all vehicles powered by two-stroke engines have a lubricant tailor-made to their needs which helps them to enjoy trouble-free running.

Shell welcome the motor scooter
and congratulate those who developed it.
It is a motoring enterprise after their own hearts.

Classless Consumers

THAT Soviet leaders promise improved living standards for their people is due in part to the impact of the prosperity of American workers. A recent study from the Department of Labour* of the transformation in their living and buying habits and those of their families since the beginning of the century shows a revolutionary advance both from economic and social standpoints.

The typical labourer of 1901 worked an average of 72 hours a week and 84-hour weeks were not uncommon. Today an American worker produces three times as much in 40 hours as his grandfather did in 70, while his wages, in spite of higher prices, buy two-and-one-quarter times as many goods and services. At the turn of the century the worker spent most of his income on the basic requirements—food, shelter and clothing. The balance had to cover all his other expenditures and provide for savings as well. Haunted by periodic unemployment and fear of a penniless old age, the worker in 1901 put aside whatever small amount he could spare "for a rainy day"; the social security benefits of today's wage-earner were completely unknown.

Rising wages have made it possible for the worker to spend a smaller proportion of his income on basic essentials and more on achieving a better and more comfortable mode of living, as Henry Ford predicted. Introducing the five-day week in his company in 1926, he argued that with increasing productivity a shorter working day would give the worker "more food, more and better goods, more books, more music—more of everything."

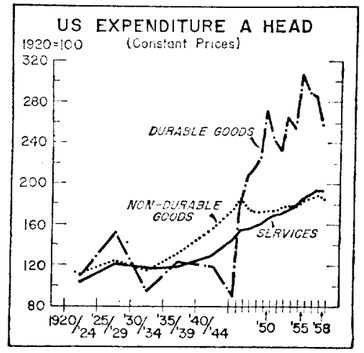
The changed pattern of the worker's expenditures reflects his growing importance as a consumer. At the turn of the century 43 per cent of his income went for food, despite the fact that his diet was based on potatoes, served according to an early survey "regularly for breakfast as well as at lunch and dinner." The 31 per cent he spent in 1950 bought better and more varied food than was available on the best tables fifty years before.

Travel, except on foot, was largely beyond the experience of the industrial worker of 1900. Even the growth of railway and urban tram lines found him spending less than 2 per cent for transport as late as the first World War. Today the popularity of the motor car has made transport the ranking item in the family budget after food and housing, accounting for one of every seven dollars spent. Nor does all of this go on motor cars; while the money spent for rail tickets has declined, outlays for travel by air and sea are on the increase.

The difference in standards of housing offers an even greater contrast between the worker of 1900 and today. As he prospered during the early years of the century he moved his family from the cramped and unhealthy conditions of the factory slums to a two-family terrace house in a "working class" neighbourhood, and in more recent years into one of the new suburban developments where, for the first time, he became a property owner. Today, through the expansion of low-cost mortgage facilities and instalment buying, three out of five workers own their homes; in their new communities they participate in the same activities as their white-collar neighbours and, not less important, send their children to the same schools.

As a consumer today's worker, with his higher wages and increased free time, constitutes with his family the most important group in the economy and his pattern of expenditure differs only slightly from that of Americans as a whole.**

The greatest gain in consumption has been in durable goods which have also shown, somewhat naturally, the most variation in the short run. Although industry may occasionally look upon the average consumer as an automatic spending device, it has not yet succeeded in gauging accurately just what and when he will buy, at least where durable goods are concerned. The consumer-led buying spree in 1955 touched off the over-expansion that culminated in the recession in 1957. A year later, when other sectors of the economy were showing improvement, the automobile industry (which had set the pace in 1955) lagged behind, apparently because the new models did not appeal to the potential customers.



Expenditures for non-durable goods and for services, now running at a rate of 40 and 32 per cent respectively of total spending, are much more predictable and "recession-proof" than hard goods. A year-by-year comparison over the past thirty years shows that, while the volume of consumption has gained, there has been only a small variation in the share of total income absorbed by these two categories.

The revolution of the past fifty years in the buying habits of workers, and therefore consumers, has been produced through the interaction of a number of factors, including increased productivity, higher wages and the availability of credit. Yesterday's luxuries have become today's necessities and frequently in terms not of just one of an item, such as a motor car or television set, but of two or even three to a family. The social evolution that has accompanied the revolution in consumption is equally significant. While the Soviet worker's paradise has become increasingly stratified, his American counterpart has achieved a virtually classless society where, in spite of a few remaining extremes of both poverty and wealth, on the whole the worker, the salaried employee and the business and professional man eat the same foods, live in similarly equipped and comfortable homes, drive the same cars and have the same leisure time interests and activities.

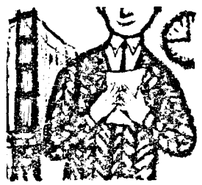
Instant Letters

AFTER instant coffee and instant tea, instant letters are on the way. This is something which the gigantic American continent and the slow-moving American postal system need a great deal more. The Post Office is spending close to $400,000 this year to develop a facsimile system whereby letters and documents fed into an electronic machine on one side of the continent could be sent in a flash, over the air-waves, to the other, where a second machine would reproduce them exactly, hand-writing and all. Because of the time difference, letters sent from the east to the west coast would actually arrive theoretically before they were written. Experimental letters are now being sent over a wire connecting Washington, DC, with Los Angeles, but if the system is ever in full swing wires will hardly carry the load of 20 or 30 billion letters a year.

This high-speed "fax-mail" could be a reality in five years, the Post Office estimates; at present it plans to limit the service to 178 cities which contain two-thirds of the population. But there are difficulties to overcome. One, the fear that letters would be secret no longer and might be subject to government censorship or malicious prying, should be banished by perfecting machines to do the whole job, probably even without unsealing the letter. The greater danger is that the invention may be suppressed, or at least delayed, to protect the vested interests of the railways and airlines, which carry the post today, and of the telephone and telegraph companies whose more costly services are threatened. Facsimile systems are already in use for industry and the armed forces and on December 1st the Western Union Company plans to open to the public one which will link New York, Washington, Chicago, San Francisco and Los Angeles. It will transmit material more cheaply than the telegraph, but it will be many times more expensive than the Post Office system: $8 or so for a 600-word page, compared with a fee which certainly will be no more than the present 7 cent rate for air mail and may be much less. Possibly the opposition from private enterprise will be softened by the announcement of the Post Office that, if it sets up a facsimile service, the facilities of Western Union and the American Telephone and Telegraph Company will be used.

A drawback of another kind is that no matter how rapidly or how secretly a letter spans the continent, it will face, at the other end, the ordeal of local delivery. Washington is only now rousing itself to ensure that letters posted before 5 o'clock in the afternoon are received the next morning in the immediate vicinity—and even this need not mean before a businessman leaves for the office.



The Economist Diary

For the better ordering of the working day, and for the comfort and delectation of secretaries, there is nothing to equal it.

A week's appointments at an opening; a book that lies open flat on the desk	A diary lay-out specially designed to meet the needs of the busy man
Bound throughout in red leather; title blocked in gold. Size: 10" x 8"	All information easily found by means of handy thumb-indexes
A memorandum book, an appointments register, and a complete reference book	72 pages of facts and figures covering the world; 32 pages of maps
42/- Price for UK only, including postage and purchase tax	Price overseas by surface mail Air rates on request **38/-**

SHORTER NOTES

Next June, just before the presidential nominating conventions, voters in North Dakota may signal which way the tide is flowing in the farm states when they elect a successor to Senator Langer, nominally a Republican, who died last week with five years of his term still to run. The Republican Governor will make an interim appointment, but recent Democratic gains in this Republican state make the election result doubtful. Senator Langer was launched on his career by the Nonpartisan Political League and was a sturdy friend of the farmer, but of almost nothing else—certainly not of consistency. He cast one of the two votes against the United Nations, opposed lend-lease, conscription and foreign aid, but defied his party to vote against the Taft-Hartley Act and against the confirmation of Mr Lewis Strauss as Secretary of Commerce. He won four terms in the Senate in spite of charges (of which he was acquitted) of corruption in state politics.

* * *

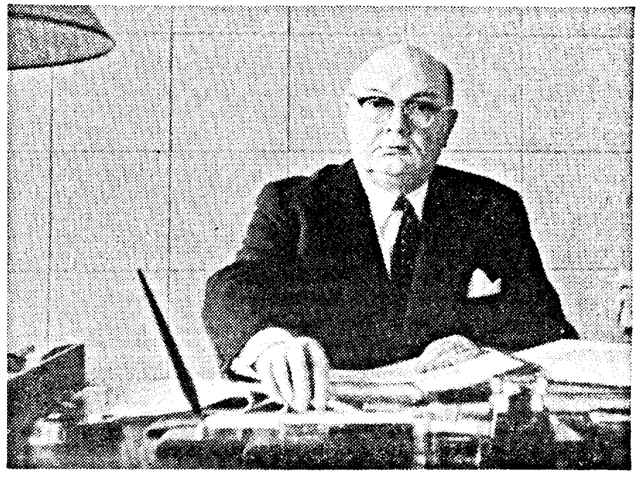
New York, not Washington, will hold a World's Fair in 1964. A commission appointed by the President took only six days to decide in favour of New York, which has a ready-made site (that of the 1939 fair), more accommodation for visitors, and more money. Austria, the only foreign competitor, has withdrawn. To finance the fair, the planners expect to sell $150 million of bonds, largely to businesses which will benefit from it, and to take in $200 million from leases, concessions and admissions.

* * *

The narrow stretch of water, through which all ships entering and leaving the great New York-New Jersey harbour must file, is to be spanned by a double decker suspension bridge carrying twelve lanes of traffic. By a mere 60 feet it will deprive San Francisco's Golden Gate Bridge of its title as the world's longest suspension bridge. The new bridge, which with approaches at either end will run three miles and cost $320 million, will link two boroughs of New York—Brooklyn and Staten Island—and will enable coastal traffic to by-pass congested Manhattan. So far more energy has been spent on naming than on building the bridge. One faction would call it after the early Florentine explorer Verrazano; the Staten Island Chamber of Commerce chartered a plane to carry a tail streamer which read: "Name it the Staten Island Bridge"; and the more literal-minded have opted for the Narrows Bridge.

IN **LIFE**–POINTS OF VIEW HAVE FOUR DIMENSIONS!

Experts' opinions secure a quality overseas readership for your advertisements



Photographed by Dominique Berretty

LIFE International presents special reports by world-famous experts, expressing length, breadth, depth of experience and a sense of "history in the making." That is why it has a world-wide audience of over 2,500,000 people; an audience of people who appreciate LIFE's unique photo-journalism, its comprehensive examinations of topical events, its infinite variety of editorial material.

This audience includes your best overseas customers—business executives and consultants, government officials and leading professional men in every field. They are readers who buy for themselves, their families, *and* their firms.

In LIFE International's advertising pages they see industrial products and consumer goods—prominently displayed in large pages, beautifully reproduced on quality paper.

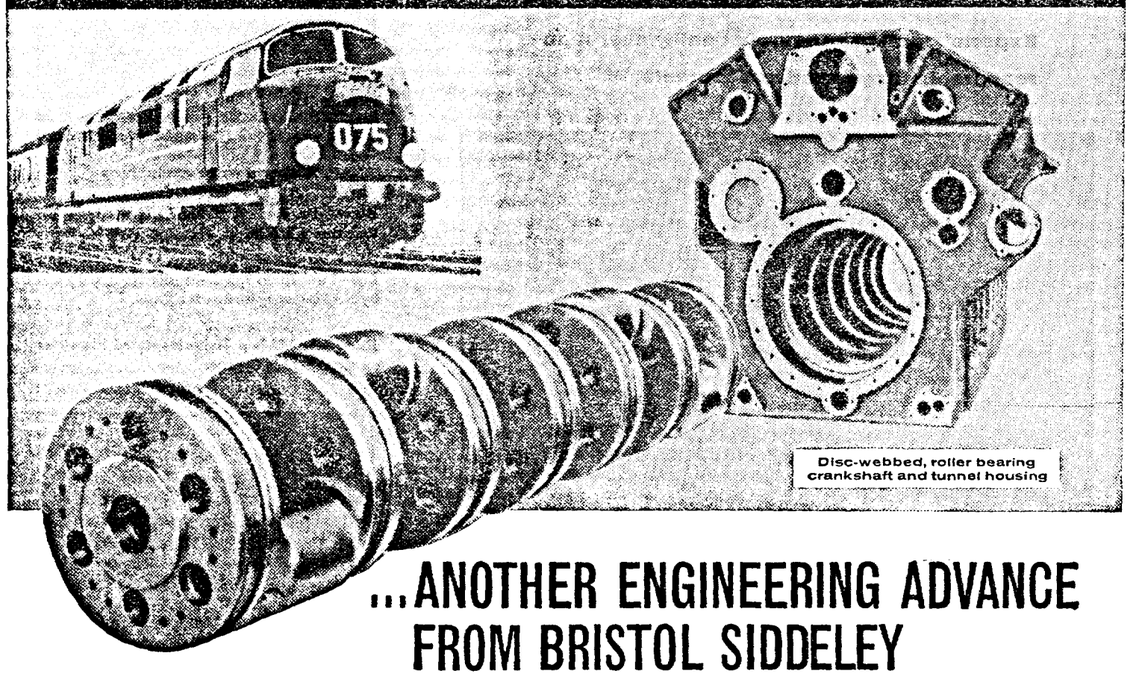
Maybach rail traction diesel engines—
from 400 to 2,000 hp—
can achieve 16,000 hours between major overhauls...



...ANOTHER ENGINEERING ADVANCE
FROM BRISTOL SIDDELEY

Bristol Siddeley Engines Limited produce Maybach* rail traction diesel engines. Covering a power range from 400 to 2,000 hp, these diesels are amazingly reliable and have shown that they can achieve major overhaul lives of 12,000 to 16,000 hours!

The *proven* basic design features of the whole range (straight 4 to 16-cylinder V) are the same, and each unit can be turbo-charged, or turbo-charged and intercooled. The range operates between 1,200 and 1,600 rpm and *combines the best performance and design qualities of high, medium and low-speed diesel engines:* light weight and compactness, excellent thermal efficiency and extremely long life.

Advanced design features. The pistons are pressure-oil cooled. This gives very efficient heat dissipation and reduces liner and gas ring wear to a minimum. The roller bearing, disc-webbed crankshaft is exceptionally rigid within its tunnel housing, and in practice withdrawal is not normally necessary before 12,000 hours running. So low is big end bearing wear that in some cases the protective lead flash has been found to be intact when examined after 15,000 hours running!

Since the cylinder bore and stroke, and the majority of components, are identical in all models, spares stocks are considerably reduced. Servicing also has been greatly simplified because much thought has been given to accessibility and the removal of components. And the engines are suitable for both hydraulic and electric transmission.

World-wide application. Maybach rail traction diesel engines are in service all over the world and have built up an unsurpassed record for reliable and economic operation. Bristol Siddeley Maybach engines power the new diesel hydraulic locomotives of British Railways Western Region and an additional order for a large number has just been placed.

For further information please write to: Maybach Sales Manager, Bristol Siddeley Engines Limited, PO Box 17, Coventry, England.

THE WORLD OVERSEAS

German Socialists Face the Facts

FROM OUR CORRESPONDENT

"MOVE with the times—move with the SPD"; the west German Social Democrats have just under two years in which to convince the electorate of the validity of their claim to be better qualified than the Christian Democratic Union to govern the two-thirds of Germany that is more or less free to run its own affairs. The framework of their argument was set up with remarkably little disputation at an extraordinary party conference at Bad Godesberg last weekend. A new basic party programme—there have been only five such statements over the last hundred years—was approved by 324 votes to 16.

Although it leaves many tactical decisions open, it repudiates an inexorably binding marxist strategy. Acknowledgment of the debt owed to the early fathers was paid with due piety in an exhibition of faded photographs and manuscripts mounted in the entrance hall. These officially branded curiosities, confined respectfully to the glass case, were scarcely heeded by the delegates (more than half of them under fifty years old) hurrying by to tackle the business of today. The business is pressing, as most socialists between Scandinavia and Israel well appreciate. So pressing that it even kept some friends away. There was a message from Mr Morgan Phillips, regretting the Labour party's inability to send a delegation, the chief reason being "our party's almost total preoccupation with the drafting of a new party programme which is to form the basis of discussion at our conference." There were murmurs of sympathy with a fraternal party likewise consecutively thrice rejected.

Herbert Wehner, a repentant one-time communist, was the outstanding performer at Godesberg; but not, as might have been expected, by reason of importunate representation of the left. At the Stuttgart conference last year he was elected one of the party's two deputy chairmen with the express object of gingering up Herr Ollenhauer's savourless leadership. Herr Ollenhauer has since modestly waived his claim to head any government that might be formed under socialist auspices, and has thus made way for a more forceful personality to pose in 1961 as the party's alternative to Dr Adenauer. Yet it says much for Herr Ollenhauer's quietly continuing influence as chairman that it was the uncomfortable Herr Wehner who played the chief part at Godesberg in persuading the bulk of the left wing to jettison long-cherished articles of faith for the sake of arriving nearer the approaches to power. His impassioned intervention in the debates on nationalisation and defence won over most doubters to the side of the executive.

In the sentence-by-sentence scrutiny of the new programme only two delegates voted against the passage laying down that

> the consumer's freedom of choice and the worker's freedom to choose his job are fundamentals of a socialist economic policy, while free enterprise and free competition are important features of it.

The party's economic specialist, Dr Heinrich Deist, had tried previously to elucidate the executive's cautious views on ownership. Public ownership of key industries was, he submitted, only the last of several means of exercising control; and he pointed to the sweet powers of a socialist minister of finance, and to those of the trades unions, wieldable through co-determination and other opportunities. With some justification, the unwavering nationalisers reproached the platform for equivocations that would be the cause of interminable dissension. But the majority appreciated that the new pronouncement, if not altogether clear, was at any rate clearer than anything that was voiced at Stuttgart last year, and would at the same time leave the leadership with some useful ground for manœuvre.

The conference gave almost as much time and care to formulating its attitude towards defence as it did to its views on economic controls. Confused, and at times strongly opposed, ideas within the party have long given it too irresponsible an air to win the confidence of voters living next door to the realities of communist east Germany and Czechoslovakia. The new formulation affirms the necessity for defence, treats conscription solely as an issue of temporary expediency, and rejects the use of "weapons of mass destruction." The platform aired its hopes that a socialist minister of defence would be spared the nuclear dilemma by the creation of a zone of controlled disarmament embracing the whole of Germany. In the meantime, it would be too much to expect the United States forces in Germany to spike their atomic guns in a lone act of renunciation.

Some of the old guard saw only a base opportunism in the executive's attempt to present a party shorn of its marxist beard and ready to cut a dash in uniform. They were uneasy at the respectful bow made to the churches, even though it was qualified by a demand for reciprocal consideration for unbelievers. They will be heard more loudly in the coming months when the new programme is discussed by local organisations. But they have been irreparably defeated, and they know it. As for their charge that too much has been left obscure, Herr Ollenhauer has promised prodigies of illumination when the party brass meet early next year to hammer out detailed election and government programmes based on the Godesberg directive.

It was noticeable that the platform was taking pains to efface the picture of disunity at the top that emerged sharply at the last party conference. The invidious business of forming a shadow cabinet is still being avoided, even though many party members contend that the electorate should be given an opportunity to become better acquainted with the men who could take over from Dr Adenauer's team. The ticklish issue whether Professor Carlo Schmid or Herr Willy Brandt should be presented for the chancellorship is being left for discussion nearer the hour. It is a melancholy thought, but it is none the less possible that Herr Brandt may still be urgently needed in Berlin in 1961.

Polish Writers in Jeopardy

MR ROSENTHAL, Warsaw correspondent of the *New York Times*, has been expelled for reporting "very deeply and in detail about the internal situation." Mr Rosenthal has certainly been writing very perceptive reports, particularly on Poland's economic difficulties and recent changes in the leadership. The authorities

did not challenge their accuracy; apparently he has just done his job as a journalist too well. (Another American remarked that the reasons Poland gave for his expulsion read like a citation for a Pulitzer prize.)

In his last reports Mr Rosenthal dealt with the fears and outspoken protests of Polish writers faced with a tightening censorship and increasing financial pressures. Perhaps he sealed his fate by revealing a striking case of Russian interference. The Soviet ambassador in Warsaw, he reported, had collected a group of Polish journalists and denounced to them their country's preference for western culture.

Mr Gomulka, as Mr Rosenthal reported, was certainly not pleased with this interference; but the Soviet envoy may have been encouraged to lay down the law both by his masters in Moscow and by recent actions of the Polish leaders. Moscow has always resented the freedom allowed to artists in Gomulka's Poland, and has treated Polish publications as carriers of "revisionist" germs. It may have considered that the tightening of political controls after the recent economic crisis made this a good moment to prod Mr Gomulka into taking further action against his intellectuals.

Official Polish spokesmen claim that the writers are dissatisfied because they are being asked to share in the general austerity. The writers reply that censorship is not an economic matter, and that financial pressures are being used to secure conformity. They point to significant changes in the leadership, particularly the replacement of Mr Morawski, who had control of cultural matters in the party secretariat during the liberal period, by Mr Ochab. They see the appointment of General Witaszewski as deputy chief of staff in charge of intelligence services as the symbolic return to power of a Stalinist. Many writers are said to be contemplating a boycott of the congress of their union early next month.

Gaullists Mull it Over

FROM OUR SPECIAL CORRESPONDENT IN BORDEAUX

THE author of the famous *Essays* was once mayor of Bordeaux. And Montaigne's detached scepticism was perhaps the best mood for those trying to understand the strange show presented in the town last weekend—the first congress of the neo-Gaullist UNR. This bewildering party claims the French head of state as its patron; it has within its ranks the president of the Assembly, the prime minister and many members of the cabinet. Its only function is to obey faithfully. The UNR has the trimmings of power and no power of decision. Appearances were deceptive in another way. All motions were finally carried almost unanimously. But this semblance of unity was reached after three days of crises and shouting, of insults and fisticuffs.

The bitterness of the debates can only be understood against the party's background. It is the heir of the Gaullist Rally (or RPF), which reached its peak in 1947 and then gradually vanished. Two years ago it was reduced to a handful of parliamentarians. It owes its revival to the Algerian *coup* and its parliamentary strength (210 deputies) to the implicit patronage of the triumphant general. For a time the UNR could couple "Long Live de Gaulle" with "French Algeria." Now that the general is seeking to extricate France from the war by promising Algerians self-determination, many neo-gaullists are worried, while some would even try to force the party to stick to its previous line.

M. Ali Mallem, the Moslem Algerian deputy, provided at the start a good illustration of the party's inner contradictions. He produced a lengthy and very bold report on the Algerian situation, emphatically dotting some of the awkward i's. The gist of his argument was that the president must negotiate with men who really represent the Algerian people and not with "prefabricated deputies." Yet on Friday evening, in the Algerian committee, M. Mallem said exactly the opposite: "We are not prefabricated deputies."

M. Mallem's retreat was induced by the mood of his audience. At that Friday session the secretive M. Soustelle, reluctant to commit himself as long as the issue is in doubt, made an open bid for the leadership of the opposition which was trying to tie the general's hands over Algeria. He continued his efforts during the last two days of plenary sessions when the congress moved to a sports arena on the other side of the Garonne. He would suddenly walk out in protest and then return to the microphone on the ground that it was "his duty to intervene"; or he would wave his hand to his too vociferous supporters to stop their rhythmic chanting of *sooss-tell*. But his outbursts were carefully calculated. He did not give the impression of a man spoiling for an immediate fight, but of a tactician acting for the record and thinking already of the succession to the general.

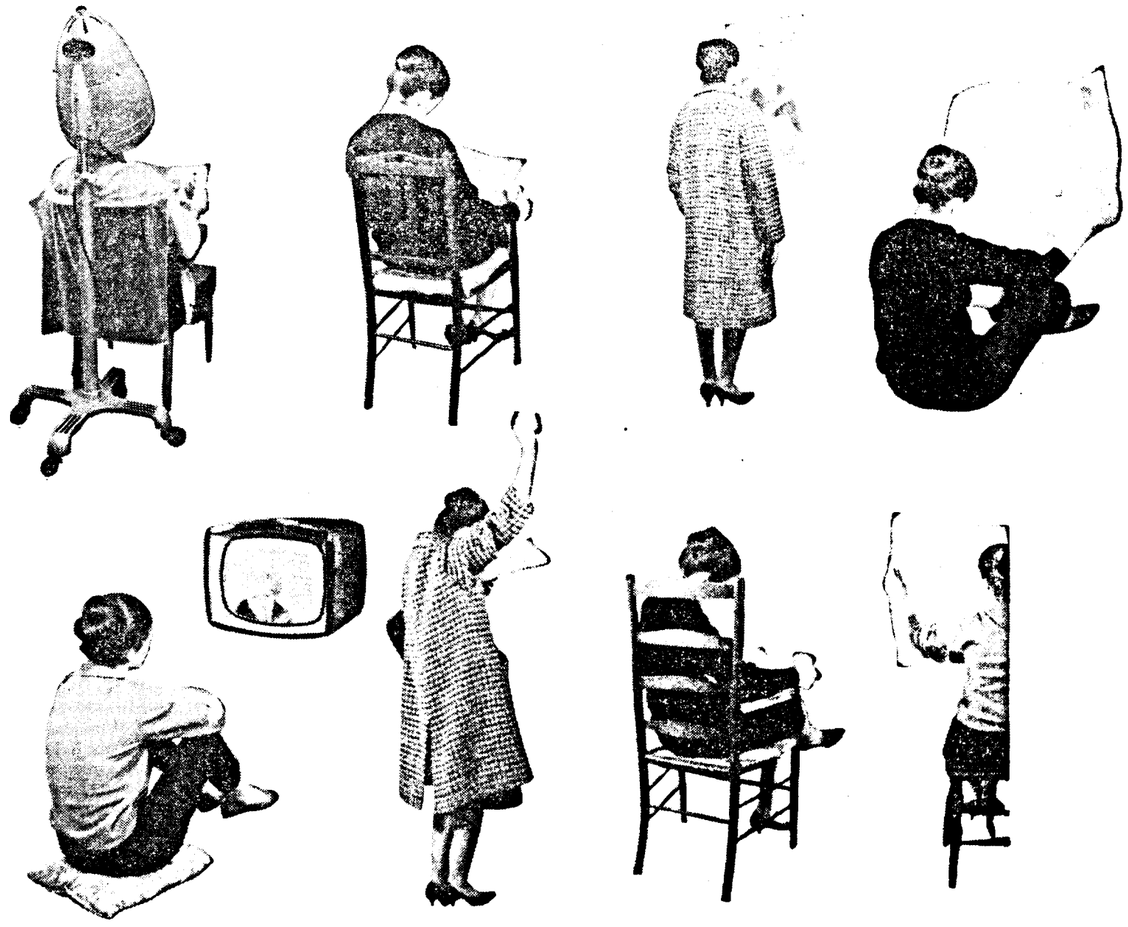
Such tactics were realistic. M. Soustelle's views on Algeria may correspond to the mood of the rank and file. But the UNR machine has nothing to learn from the political parties it despises about packing an assembly or the use of the block vote. In the lobbies the opposition uttered bitter complaints that the orthodox federation of the Seine, for instance, miraculously recruited a few thousand new members on the eve of the congress. And when it came to the election of the leading bodies in Bordeaux, the advocates of unconditional obedience to the general easily won the day and left little room for the friends of M. Soustelle.

M. SOUSTELLE had another reason for caution. He could not hope to break the spell of the general's personality. He was, in fact, careful to justify all his statements by years of gaullist fidelity. Other names and subjects (such as national greatness, contempt for the United Nations and the Anglo-American "good offices" mission in Tunisia last year; praise for the army and assurances of an eternal French presence in Algeria) were bound to set off applause. But nothing could compare with the enthusiasm aroused by the magic name of de Gaulle.

The official speakers were disarmingly frank about the party's dependence on its unofficial leader. The head of the parliamentary group said plainly that there was a large number of UNR deputies in the Chamber because people "had voted for him, not for us." M. Chaban-Delmas—the handsome mayor of Bordeaux, ex-general, ex-rugger international—tried to summarise the UNR's duty in a formula: "to follow de Gaulle and anticipate events." In the circumstances, it was hard for M. Chalandon, the young financier who until the congress had managed the affairs of UNR as its general secretary, to define a programme. He talked of industrial expansion, of workers' advancement and even claimed the association "capital-labour" as a gaullist invention (Mussolini's heirs might sue him for infringement of copyright), but he had an impossible task in trying to reconcile a programme with absolute fidelity to a man who does not care to reveal his designs. Without a draft from the Elysée, the orthodox UNR leaders must resign themselves to crystal gazing.

In between sessions delegates, with their badges, were easily distinguishable in the coffee-houses and restaurants of the town. It was a motley crowd. Poujadist shopkeepers, arguing about the threat of multiple and department stores, rubbed shoulders with ambitious dandies, the would-be Rastignacs of the new regime. Respectable middle-class ladies, ecstatic at the very mention of the general, mingled with strong-arm specialists who would have fitted perfectly into the setting of Chicago speakeasies at the time of prohibition. There were some ex-army types and a contingent of the small, slightly jingoist, beret-wearing Frenchmen who usually dominate Radical congresses.

The Facts of Graphis



93·75% of potential

buyers read advertisements (the other 6·25% do so, too, but won't admit it). There are usually more than approximately 537·4 ways of advertising to them. But only 1·00 of these ways is the best one. Graphis Publicity reckons to find this one approach that will achieve the greatest impact for a given expenditure. Correct campaign planning to find the right buyers, in the right place, at the right time, in the right mood; striking creative ideas to activate all the latest motivations. Smaller and medium appropriations; consumer or technical.
As a matter of fact, a pretty good advertising agency.

Graphis Publicity Ltd

Registered Practitioners in Advertising

Swan Yard, Upper Street, London N1 Telephone: CANonbury 7076

It rained in Bordeaux on Sunday. Those who did not rush back to Paris or the provinces after the congress had ended could return to the Alhambra, where M. Mallem had performed, to watch a personal appearance of Fernandel. But the UNR is no laughing matter. The trouble with dependence on a leader is that it acts as a screen. The immediate lesson of the congress is that General de Gaulle can rely on obedient UNR battalions and can, therefore, play the parliamentary game, while keeping absolute power. But it is impossible to tell what would happen to this strange party—which some want to transform into a mass movement—under the spur of such events as an economic crisis, the revival of the opposition, real trouble over Algeria or the departure of its leader. Some members are content with the gaullist victory at the congress. Others, and they are not just the lunatic fringe, frankly feel that the French monarch is too enlightened for them.

Testing Time for Kenya's New Governor

FROM A CORRESPONDENT IN NAIROBI

In his first speech to the Kenya Legislative Council last week the new governor, Sir Patrick Renison, announced that he intended to end the state of emergency declared in October, 1952. He said that the law would be reinforced to provide "a fully effective first line of defence against incipient lawlessness" and that measures would be introduced to enable the government of Kenya "to deal promptly and effectively with threats to public security as they may develop." The European reaction was typified by Mr Michael Blundell, who said that the governor was to be congratulated on the measures, but that "ultimately the public would judge them entirely on their success in maintaining law and order." In general, Asian opinion welcomed the governor's speech.

But the African elected members were dismayed at the threat to the Africans that they believed to be implicit in the new measures and which they thought to be underlined by the statements of Europeans. The fact that there are to be regulations under permanent legislation for the continued control of political organisations and of public meetings meant to them that purely African political movements like the Kenya Independence Movement would continue to be banned, and that the restrictions on public meetings, which, they claim, have prevented them from showing the true depth of African feeling on many matters, would not be lifted. The governor said that he hoped he would not need to use these controls and that he intended to give "sufficient rope" to see "how much, if at all, they must be used." But the African members point to an increasing number of prosecutions of Africans, including the "procession" charge against six elected members and the conviction of Lawrence Oguda, elected member for Nyanza South, as signs that control and "toughness" are dominant in a government which they regard as strongly influenced by four "local" European Ministers, all members of the New Kenya Group. In replying to these protests government speakers said that during the past 18 months the emergency powers had been considerably relaxed and that only those powers absolutely essential to the maintenance of law and order would be included in the new legislation.

Sir Patrick Renison

Mr Oguda was charged with sedition on the grounds that he had referred to the American War of Independence as an illustration of the fact that "people" always had to "fight for independence" and had suggested that if the constitutional conference next January failed, the Africans might refuse to pay the personal tax. His conviction—he is appealing against a sentence of 12 months' imprisonment—has undoubtedly increased the African elected leaders' fears about their own position in the political battle. Against this background, African opposition to the government seems likely to grow more bitter, unless Sir Patrick Renison can establish confidence and some personal relationship with the African leaders as he did with Dr Jagan in British Guiana. But Sir Patrick has not much time left before the constitutional conference.

The ending of the emergency has come in the middle of the controversy over Sessional Paper No. 10, which is designed to lead to the gradual opening of the white Highlands to non-European farmers. Local boards will examine all non-European applicants and can turn them down if—in the words of the Paper—

> the information before the Board, including any proposals for development submitted by the applicant, indicates that the proposed transferee is unlikely, for any reason, to be a good farmer of the holding.

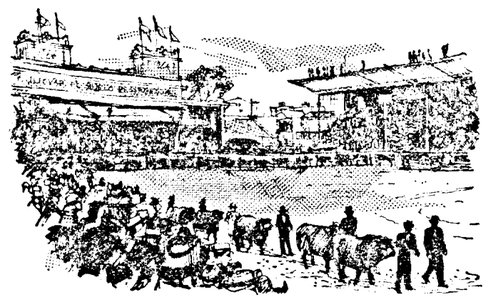
Rejected applicants can appeal to the governor for a final decision. After a lot of argument many meetings of Europeans have accepted the paper in principle but object strongly to the details. The divisional and regional boards are to be appointed by the minister of lands, from a panel of names sent in by bodies completely or overwhelmingly European in constitution. The Europeans are pressing for the boards to be elected by the local farmers; the United Party led by Group Captain Briggs is also asking that there should be no appeal to the governor if "either of the two lower boards has refused to sanction a transaction." Both African and Asian elected members are now saying that control will be in the hands of the local Europeans; the United Party's suggestion would certainly place it there completely.

Group Captain Briggs claims that "certain prominent European members of the New Kenya Group have stated at joint meetings with us that for various reasons they agree that it must be made possible for transfers in land to be refused on grounds of race at the discretion of the control boards." This has been denied by the New Kenya Group in a statement which says that "race of itself" should not be a cause of refusal. This still leaves the complication that race must be taken into account and if the European members of the group insist on this type of qualification, there will be discussion with, and possibly the resignation of, many of its Asian and African members. In any case, say the African elected members, the thing is a farce as far as we are concerned: we cannot afford to buy the land whilst the Europeans are getting freehold title. In fact, the existing leases are mainly on a 999-year basis, but it is true that very few Africans will be able to afford to buy. Many Asians have the cash, if they could persuade a European farmer to face a divisional board with his desire to sell to them, but very few Africans would be able to enter the Highlands except as tenants of European landlords. So Africans demand government finance to help the African buyer.

Suspicion that European influence inside and pressure outside the government is succeeding has been deepened by the statement that

> it is not the government's intention to press for the debate until ample opportunity has also been given to interested bodies to make clear to the government their views on the details of the proposals.

Thus, Kenya's new governor already faces his first severe test, for on his decisions may depend not merely the atmosphere at the constitutional conference but whether any African elected member will be prepared to attend it.



Meatless Days in Argentina

BY A CORRESPONDENT

A ceremonial duty of every Argentine president for the past seventy-five years has been to lead his cabinet, escorted by the presidential guard, round the ring at the cattle show held each August at Palermo. His presence there, among the pedigree Durhams, Shorthorns, Aberdeen Anguses, and their aristocratic owners, sets an official seal on a proud nation's chief glory: its superb livestock and its position as the world's leading meat exporter.

The Argentines' pride and satisfaction in their famous industry reached a climax during and after the second world war. While the rest of the world went on short rations, beef became cheaper and more plentiful than ever along the River Plate. Restaurants in Buenos Aires served steaks two inches thick and so wide they overflowed the plate, unskilled workers and farm labourers could afford to eat 3 or 4 lb of meat a day, and the very dogs, gorged on "waste products" like liver and kidneys, refused to touch any other food. The *asado* (meat broiled over an open fire) became an essential part of life; when an Argentine arranged a christening, a marriage, a political meeting, or a funeral, he was expected to provide a *kilo* of meat for every guest. Yet enough beef was left over to raise exports and foreign exchange reserves to record levels.

General Perón and his economic advisers, although they took advantage of the meat surplus, were not happy about what they called the colonial nature of the industry. "The English," the general said, "are trying to keep us a race of shepherds and cattle-drovers." The government's slaughterhouse monopoly fixed the prices paid to farmers so low that many of them were forced out of business; they and their *peones* moved to the cities to find work in the subsidised and tariff-protected industries of the "New Argentina." This policy also had political advantages: the wealthy ranch-owners suffered most, while the masses were provided with cheap food. A *peronista* marching song boasted that under the general's rule bellies were full:

Con Perón y con Evita
La pancita es llenita

The governments that came after General Perón hesitated to make any changes in his agricultural policies. Exports continued to be high, and the fixed prices encouraged a rapidly growing population to consume more and more beef. As a result, the stock of cattle on the *pampa* melted away:

	1955	1956	1957	1958
Cattle exported. (thousands)	1,800	2,500	2,500	2,600
Home consumption (thousands)	8,200	9,100	9,400	9,500
Consumption... (lbs. a head)	196	209	205	201
Cattle on range. (thousands)	—	46,950	43,980	40,500

This suicidal rate of slaughter clearly could not be allowed to continue, but until this year the government lacked the moral authority to impose a workable system of rationing. Meatless Tuesdays and Thursdays during which shops and restaurants were permitted to sell only fish, poultry, pork, and lamb, were tried but proved a failure; housewives simply bought a double supply of beef twice a week. At last, in December, 1958, President Frondizi abolished price controls and took steps that were designed to cut exports by 40 per cent. Within a week prices doubled and continued upwards. The index of retail meat prices (1943 = 100) rose from 882 in June, 1958, to 2,900 in December, 1958, and to 4,350 by June, 1959.

Public response was one of disbelief and shock. Well-to-do families continued to eat meat as before, but the majority of the population had to cut its meat consumption by half, and the poorest families could afford it only two or three times a week. Fish, chicken and pork have never been eaten much in Argentina, and since they cost almost as much as beef, the middle and lower classes have turned, unhappily, to bread, potatoes, spaghetti, and various dishes made of maize. A new cookery book of austerity recipes has become a best seller by extolling the virtues of vegetarianism, and the government has solemnly pointed out that "there are millions of people all over the world who enjoy excellent health although they eat meat only three or four times a week." Meat consumption this year is estimated to be about 140 lb a head (compared with 55 lb in Germany and 12 lb in Italy); the universal complaint is that "I always feel hungry."

This gastronomical frustration has undoubtedly had important, if not precisely measurable, political results. President Frondizi, who was elected last year, is now booed when he appears in newsreels. His Intransigent Radical party, which controls a majority of the lower house and every seat in the senate, is badly shaken: in provincial elections in Mendoza last August it fell to fourth place, barely ahead of the Communists. Peronism is making heavy gains among workers who have had to give up their *asados*, stew and sausages.

Marshal Tito's Cornucopia

FROM A CORRESPONDENT

"You must write the success story of Jugoslav agriculture," said my host as our lorry bounced along the dusty road between endless rows of tall maize plants. He was not a Jugoslav, but a visiting specialist in hybrid maize who had come to look at the results of its introduction to Jugoslavia from the United States. He examined the corn cobs with expert fingers, and found them very good. Between the rows of maize were giant golden pumpkins, and if we stood up and looked across the Vojvodina, the grain-belt of Jugoslavia, the maize fields stretched away to the horizon.

"Of course you must not judge Jugoslavia by the Vojvodina," I was told; great areas of the country—the karst region behind the beautiful Dalmatian coast, the black mountains of Montenegro—have very poor crops. Even in relatively good areas yield might not be expected to be as high as in the Vojvodina. Also, the maize fields we had examined had belonged to a state farm, and their standard of cultivation is greatly in advance of the national average.

But as one travels in other parts of the country—Slovenia, Croatia, Serbia, Bosnia—it becomes quite obvious that Jugoslav agriculture in all its sectors—state farms, co-operative farms and private holdings—is having an unprecedented success. The wheat harvest from Italian seed has been good (4 million tons), fruit is abundant, and it is possible that the maize harvest this year—a

year of indifferent weather in Jugoslavia—will produce 7 million tons, with a surplus for export exceeding the 550,000 tons of 1957, the year of perfect weather and bumper crops.

New building is going on everywhere, even in poorer regions, and not only on state and co-operative farms. A private peasant, whom your correspondent has known for years, who has the maximum permitted holding of 10 hectares (some of it poor land and some orchard and vineyard) has just replaced his earth-floored, one-roomed hovel by a new two-roomed brick-built house with a large storeroom in the roof. Thousands of other peasants are doing the same. Even the interiors of their houses are being transformed; many that used to be bare, have pots and pans (some traditional, most standard articles from the big store), curtains, ornaments (mostly hideous and modern) and furniture.

Some of this prosperity is due to the fact that a new class is emerging in the countryside—the semi-peasant, the family that has at least one member working in the nearby factory (heavy and light industry being dispersed throughout the country) and bringing in a regular wage. But the other reason is that, with modern knowledge and techniques, peasants are getting more out of their land and they can be certain of selling all they produce, with the possible exception of fruit. There is also plenty in the shops for them to spend their money on: good textiles, all sorts of household goods and gadgets, bicycles, washing machines, refrigerators, even television sets, motor cars and motor bikes. It is true that most peasants prefer to spend their money on their homes and land, and the roads in the interior are too bad for motorised transport, even if they made enough to buy a car, but the vision for the future is there for all to see. Primitive husbandry, antique wooden implements, home-made traditional clothes and ancient superstition are still to be found, but sociologists and ethnographical experts who wish to see them as part of a living tradition will have to hurry, for they are fast disappearing.

This new prosperity is all the more surprising since agriculture in Jugoslavia until the early nineteen-fifties was the Cinderella of Jugoslav planning, neglected in favour of her ugly sisters heavy and light industry. The planners (like Dr Bakaric) who fought for increased agricultural investments and a less doctrinaire attitude to the peasants had a long struggle before they got full backing. Changes were cautious and improvement so gradual that it was not until last year that the general trend of success became undeniably clear.

Tractor stations were abolished as far back as 1950 ; in 1951 there were 6,250 tractors in the whole country, now there are 28,000 (all owned by the "socialist" sector, but they can be hired out to private peasants). The unpopular and uneconomic co-operative farms were allowed to be disbanded in 1953, a cadastral tax on prewar land values instead of a punitive tax on profits came in 1957, and these two measures did more than anything to restore the peasants' confidence and make them inclined to respond to official exhortations to grow more. Fertilisers were offered at cheap, subsidised prices ; in 1952 80,000 tons of fertiliser were used, in 1959 over 1 million tons. Improved seed was sold cheaply and new breeds of stock were made available: pigs from England, Friesian and Emmenthal cattle, horses, poultry. Much of this was made possible by western economic aid, which also helped to establish tractor and fertiliser factories in Jugoslavia.

The results have abundantly justified these efforts. Statistics (admitted by critical foreign observers to be reliable) are even more telling than the atmosphere of bucolic euphoria induced by a succession of Breughel-like harvest scenes. Grain yield has increased every year since 1954, regardless of weather, as is shown in the following table:

CROP YIELD PER HECTARE (in tons)

	1954	1955	1956	1957	1958
WHEAT					
National average.....	0·75	1·28	0·99	1·59	1·23
State Farms	0·94 (25)	1·8 (40)	1·54 (53)	2·33 (40)	2·43 (98)
Working Co-operatives	0·96	1·7	1·52	2·21	2·23
MAIZE					
National average.....	1·22	1·6	1·3	2·2	1·65
State Farms	1·85 (50)	2·1 (30)	2·15 (65)	3·8 (73)	4·2 (154)
Working Co-operatives	1·8	2·0	2·3	3·6	3·9

(Figures in brackets are per cent above National Average)

One outstanding point about these figures is that the greatest increases have come in the "socialist" sector—the state farms, the few working co-operatives, the land worked by the general co-operatives. Such farms have many advantages not enjoyed by private owners, such as priorities, with a rebate on the cost of all supplies, their own tractors (usually one to 50-60 hectares on the state farms) and other heavy machinery which private peasants are not allowed to own but may hire—which often means taking a turn when conditions are not so favourable. State farms can employ as many seasonal workers as they need from the reservoir of (by western standards) cheap labour in the poorer parts of the country (Macedonia and Montenegro, where the unemployed are anything from 10-17 per cent of the total population).

Wages range from 15,000 dinars (about £15) a month for a skilled, to 7,000 dinars for an unskilled, worker, and there is no obligation to provide accommodation, as in the case of English hop-pickers. In some cases it is still cheaper to employ human labour than to buy new machines. State farms also pay lower taxes than private peasants (whose taxes average 12,000 dinars per hectare), and perhaps most important of all, the state farms are large compact estates instead of being divided into the wasteful strip system that is still the bane of many private holdings.

But the whole "socialist" sector in agriculture only represents 8 per cent of the total (23 per cent in the Vojvodina), and if agricultural output is to go on improving so that Jugoslavia can become a major food exporting country—which is the aim of present planning—a great part of the increased production will have to come from the private peasants. The drive is now on to cajole, entice or bully them into producing more of the kind of produce the state can sell on world markets. Improvement in livestock breeding, with an eye on the beef market, is the next big aim, and here again, state farms are expected to take the lead. Some have already made highly successful experiments with special fodder crops and silage from green maize. Private peasants are encouraged to follow suit. But as a threat to the recalcitrant, ignorant or lazy, minimum standards of cultivation are to be fixed according to local conditions. Peasants who persistently fall below these standards are liable to have their land taken away for periods of up to three years. And in case this may be thought a savage communist measure, the minister of agriculture insists that it is no worse than some English regulations.

Yet in spite of this threat the atmosphere is good in agricultural circles (private and official) in Jugoslavia. Success breeds success and confidence, and providing the present relaxed political atmosphere continues, Jugoslav agriculture may be expected to develop within a few years into a kind of communist version of Denmark.

a goodly company

And growing all the time. There are now seven enterprises in the Woodall-Duckham group.

But doesn't belonging to a group stifle initiative?
Depends on the group. With Woodall-Duckham, each firm is independent and responsible—yet can call on the resources of all seven.

So seven's company?
Yes. *Good* company.

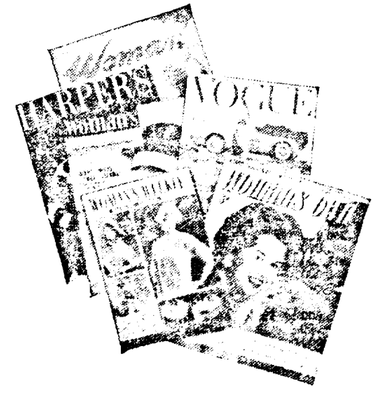
THE BUSINESS WORLD

Petticoat Battleground

It is nearly a year since the Daily Mirror group bought the somnolent business of Amalgamated Press, now renamed Fleetway, swept through its offices with the crusading vigour of a new broom and provoked a series of mergers in the magazine publishing world. To scotch the possibility of further empire building by the Mirror, Odhams Press bought up in rapid succession the Hulton and then the much bigger Newnes publishing business. In neither case were Odhams or the Daily Mirror group interested in specialised journals or popular, general interest magazines of the now defunct *Picture Post* type ; these have proved too vulnerable to competition from television. The prizes they coveted were the magazines written exclusively for women, in particular the half-dozen mass-circulation weeklies and some of the more promising monthlies that looked as if they would become weeklies in their turn.

The table on the next page shows that Odhams now controls four of the six best-known weekly papers, which between them have a circulation of between 10 and 11 million copies a week. Odhams founded the biggest seller of them all, the magazine *Woman*, twenty years ago. It has had many imitators, but none quite able to cap its steady sale of more than three million copies a week, year in, year out. The corresponding Newnes's paper *Woman's Own*, has roughly three quarters the sale of *Woman*. Odhams and Newnes each launched a new woman's paper a year ago, *Woman's Realm* and *Woman's Day*, to accommodate advertising for which there was no space in their established magazines ; these have reached, respectively, circulations of slightly more and slightly less than a million copies a week.



The two large circulation weeklies acquired by the Daily Mirror through Fleetway have nothing like the success of the Odhams and Newnes best sellers, although one of them, *Woman's Illustrated*, is written to much the same formula. The second, *Woman's Weekly*, is in complete contrast to the five already mentioned. Its pages are smaller and fewer ; they are totally without colour and they are printed throughout by letterpress. The bright photogravure printing of the other mass-circulation weeklies is held to explain their popularity with advertisers and readers ; the substantial sales of *Woman's Weekly*, which has none of these advantages, are something that the publishing trade regards with awe. The possible development of these two magazines, going gay with colour, say, and aggressively looking for more circulation would involve the trickiest question of all : who could print them ?

The attraction of Amalgamated Press for the Daily Mirror group must have been partly in the scope that the Mirror's planners could see for developing the less vigorous of the Amalgamated Press magazines, and these two weeklies in particular. Drastic changes have already been made inside the Fleetway organisation and bigger ones are contemplated. Odhams, on the other hand, acquired two empires in being when it bought controlling interests in Hulton and Newnes ; and so far as there has yet been any manifestation of policy towards its new properties, this has been to co-ordinate some common services and leave the separate publishing houses to compete for sales among themselves on what is described inside Odhams as the "Unilever pattern."

Both Fleetway and Odhams, however, share a common worry. Their magazines, weekly and monthly, are written largely for women who do a good deal of housekeeping. But there is a sizeable group of high-spending young women and girls without such domestic ties—for whom the hideous name of "teenage women" has been thought up. The National Magazine Company, the third largest publisher of woman's magazines in this country but a great deal smaller than Odhams or Fleetway, has paid considerable attention to this market. Its two newest magazines, *Vanity Fair* and *She*, are produced for just such young women. *Vanity Fair* was a resounding success from the outset, although very little was spent on promoting it. *She*, after a shaky start and a much more expensive launching, is also doing well—and has been described by one of the National Magazine Company's competitors as one of the most interesting experiments in publishing since the war.

Neither Fleetway nor Odhams intends to leave the National Magazine Company in sole possession of this market, but their plans for producing new magazines for the "teenage woman"

seem to be running into difficulties. A new weekly magazine from Odhams appears to have been put into cold storage for the time being; Fleetway is producing such a magazine, *Honey*, in the spring but it will be monthly, not weekly; and although monthly magazines are profitable and can have sizeable circulations, it is the weekly magazines that earn the really big money. Meanwhile *Vanity Fair*, nominally a monthly, is appearing much more often than twelve times a year; there have, for example, been two issues in the past four weeks. This could be the first step towards turning it into a fortnightly publication like the lushly produced and radically improved *Queen*.

HONEY is a monthly from necessity not choice; the capacity could not be secured to print, in colour, fifty-two issues a year. This shortage of colour printing capacity is the most important single factor in the market for women's magazines today. It makes it impossible for any publisher quickly to launch a new mass-circulation weekly to compete with those already on the market—and on the presses. This is in any case an expensive business; the annual printing bill for a new weekly produced at the relatively modest rate of one million copies a week would run to about £2½ million and nearly £500,000 would have to be spent on advertising and promoting the new magazine. A large, rotary photogravure press for colour printing costing £750,000 can produce 200,000 copies of the average woman's weekly paper every 24 hours, working round the clock. Publishers aiming at mass circulations well above the million mark in fact require the almost exclusive use of two or three such presses and the composing room and photographic facilities needed to set up a paper this size. There is enough slack in the printing industry to turn out new colour weeklies (like children's comics) if their circulation is kept well below the million, but circulations running above the million need new plant, and that takes at least eighteen months to lay down.

Any printer, therefore, undertakes considerable financial risk in installing new capacity to print a new magazine—and he has to do this long before he knows whether the magazine will be a commercial success. Nearly all the best-known woman's magazines in this country are printed in one of three printing plants. Of these, two are owned by the publishers, Odhams and Fleetway. Only the third, Sun Printers at Watford (a subsidiary of Hazell Sun Ltd.) is independent and does work in markedly varying proportions for both the big groups.

It is not, however, machine capacity alone that limits the number and size of colour weeklies. The key worker in photogravure printing is the colour retoucher, who prepares and touches up the colour pages. There are perhaps 700 of them and they form one of the printing industry's tightest craft unions with strict rules about recruitment and entry. About two-thirds of them work at Watford in the neighbouring printing works of Sun and Odhams and their earnings average £30 a week. With more colour retouchers, many magazines now printed monthly could and probably would be converted into weeklies; but, as matters now stand, it is impossible to prepare their colour pages in this country, and the print unions will not handle those prepared abroad.

Some of this work can be mechanised. There are experimental electronic colour-retouching machines which, it is claimed, would reduce the need for hand labour by as much as 30 per cent. But this would merely widen the bottleneck a little and allow more work to flow through; it does not remove the restriction itself. The only cure for the industry's labour shortage may lie in supplementing the existing photogravure plants by adding the web-fed offset system of colour printing that is becoming increasingly popular in the United States. If such presses were ordered now, it would still be three to four years before they were installed and working.

For independent printers like Sun or the Bemrose company at Liverpool, the business of printing such mass-circulation magazines carries its own special hazards. The ordinary commercial risk of a paper dying can be hedged by long-term printing contracts which secure that if a multiple publisher killed a magazine he would replace it with other work for the printers. But there is also the problem of the number of titles and the tendency for women to buy more than one. Is this necessarily permanent? The phenomenal jump in sales of these magazines is thought to be one aspect of the increased spending power of their women readers, with the magazines fulfilling the twin function of catalogue and advisory service. Most publishers think there are far too many magazines on the market, especially monthlies, and yet the number of titles continues to multiply.

It makes a deal of difference to the way in which a printer lays out his works whether women are going to give their custom to one or two mass-circulation giants as they have done in the past, or to spread it among several sizeable publications. If the remarkable success of the two newest Odhams-Newnes woman's weeklies were to be the beginning of a change by women towards buying more titles each week, it would follow that printers would have to provide a bigger ratio of composing and photographic facilities to press capacity than they would do if the demand continued to be concentrated on one or two giant-circulation magazines. Either way, large sums are involved. The difficulty of making the right guess may explain why even the biggest magazine groups are showing some preference for employing independent printers rather than increasing printing capacity at their own works.

At present, Daily Mirror 5s. ordinary shares stand at 28s. 10½d. to yield 4.3 per cent; Odhams 10s. ordinary at 36s. yield 4.9 per cent; but Hazell Sun 5s. ordinary shares at 16s. 6d. yield only 3.6 per cent on the basis of a 12 per cent dividend. This follows heavy buying of Hazell Sun shares in recent weeks, even though under present conditions it would seem almost impossible for either its customers or an outsider to make a takeover bid with any prospect of success. The danger to an independent printer like Sun comes not from outside bidders but in judging correctly the outcome of any war to the death that might be declared by Fleetway on Odhams' four entrenched mass-circulation weeklies. Assuming Fleetway can find the printing capacity it needs, the group is hardly going to be satisfied with circulations much below two million for either of its two weeklies, but is there room for six large weeklies in the present market? If there is not room for six weeklies, either Fleetway burns its fingers or one or other of the Odhams-Newnes weeklies will have to go.

Policy for Small Firms?

A correspondent raises the question whether Britain could do with a Poujade

NOWHERE outside the retail trade and perhaps agriculture does "small business," as a distinct economic interest in the community or even as a pressure group trying to promote one, play much part in the British political economy. It is there all right, at the base of the industrial pyramid: there are some 155,000 "manufacturing establishments" employing fewer than 10 people apiece, and establishments employing less than 100 may employ some 25 per cent of the industrial labour force and account for rather more than 20 per cent of its output. From time to time its access to finance has received the anxious attention of expert committees, from Macmillan to Radcliffe: of late its technical efficiency has become the concern of a special service of industrial consultancy sponsored by the British Productivity Council and the National Union of Manufacturers. Occasionally, as an aspect of property-owning democracy, it wins an odd kind word from a politician. But certainly neither the Government nor any organised body of influence in Britain has any deliberate policy of fostering the small firm.

Nobody can in fact give a clear-cut definition of a small firm. Considerable attention has been paid to the far end of the industrial spectrum: as for example when the National Institute of Economic and Social Research a few years ago listed about 500 of Britain's largest companies, the manufacturing firms among which, it appeared might be responsible for more than 40 per cent of the manufacturing output of this country. (By this year, the Institute of Economic Affairs recently estimated, 40 of the 512 had ceased to exist as separate entities, and "the largest 500" would by now have a substantial proportion of new members who had outgrown some on the earlier list.) At the micro-cellular end of industry's size range, much less is known: establishments employing fewer than 10 people fill in no detailed Census of Production returns. Even in retailing, where the National Council of Small Shopkeepers does exist to proclaim a special interest, one cannot assume, for example, that all the "independent retailers" in the trade statistics are in fact small firms. Smallness, again, is a relative term: the turnover of a small wholesaler, for example, might well exceed that of a sizeable factory, while his capital employed need not necessarily be more than the cost of installing a telephone; a repair organisation, on the other hand, may "add as much value" as a small factory, in a much lower turnover. Nor is it easy to generalise about trends towards increased concentration or relative growth in importance of larger business units. A recent attempt to repeat the pioneer study of industrial concentration made by Messrs. Leak and Maizels at the end of the war did not leave their successors wholly sure whether British business had become more concentrated or less.

BRITAIN'S comparative indifference, economically and politically, to these smallest among its productive undertakings is in curious contrast to the attention lavished on them in other free economies. The United Kingdom, indeed, is almost the only country in the West that has no official policy or organisation concerned with small firms. The origins of America's Small Business Administration go back to war conditions, but it has now been placed on a permanent footing. The Small Business Act of 1953 says:

> It is the declared policy of the Congress that the Government should aid, counsel, assist and protect so far as is possible the interests of small business concerns, in order to preserve free competitive enterprise, to ensure that a fair proportion of the total purchases and contracts for supplies and services for the Government be placed with small-business enterprises, and to maintain and strengthen the overall economy of the Nation.

Even in that land of big business the vast majority of firms are surprisingly small. Surveys have shown that nearly eighty per cent of the manufacturing firms in the USA employ fewer than 19 people; and among commercial firms the figure is well over ninety per cent. But the SBA does not define its clients simply

by attention to employment; it takes a combination of this and of turnover, of which the most important criterion that the firm in question does not dominate the trade. Aptly enough the Americans talk of small chickens and small elephants: in certain circumstances they would define a firm employing up to a thousand people as small.

The Small Business Administration has an annual budget of $250 million, and is extremely active. It provides technical and business advice to the firms which it certifies as "small." It promotes better management methods, and makes arrangements for short- and long-term loans either from its own funds or in collaboration with commercial banks. It also ensures that a "fair" proportion of Government orders and contracts are obtained by the firms for whose benefit it is set up. The Americans do not only pay lip-service to the principle that competition should be fostered; they also give the small man a real chance to make it come true.

SIMILAR organisations exist in practically all Western European countries. They are much older than their American counterpart and mostly trace their roots back to ancient craft organisations; yet they are not in the least reminiscent of the guilds in their modern structure and aims. Definitions vary from country to country. In Germany a small business is characterised by the owner having served his time as an apprentice and having taken the recognised examinations; his name is inscribed on a register and his rights and duties are defined by a constantly adapted body of legislation, which in particular stresses the regulation of apprenticeship; it has been claimed that nearly two-thirds of all properly trained apprentices in Germany serve their time in small firms. Roughly 750,000 firms, employing a total of about 4 million people, are recognised as small there; they are compulsorily, and quite powerfully organised..

In Sweden, too, the Swedish Artisans and Small Industry Organisation constitutes a power in the land; it has a membership of 35,000 firms, excluding overlapping membership. There are in all 115,000 firms in Sweden that employ less than fifty people each and of these 110,000 employ less than 25 people each; the total employment in the 115,000 firms is 500,000 people. Switzerland (in 1955) had 239,000 firms employing twenty or fewer people, as against 13,156 firms employing more than twenty people; the first group employed about 48 per cent of all the country's industrial workers. In France *artisanat* is legally defined; there are about 850,000 "entreprises artisanales," training at any one time about 150,000 apprentices. Like Germany, France has public bodies, the *Chambres de Métiers*, which are a form of compulsory trade association for these enterprises. Easily the most comprehensive definitions are used in Belgium, where a Minister of the Middle Classes, mainly concerned with small businesses, is a member of the Government, and in Holland where important institutions for the *Middenstand* foster small businesses. There is even an international Federation of Master Craftsmen, Small and Medium Enterprises whose headquarters are in Berne.

In the United States and the Continental countries help for small businesses is a reality and available on request. One of the principal tasks of the organisations mentioned above is consultation with Government departments. They are consulted or approach the Government concerned when economic legislation or taxation affecting small firms are under discussion. The organisations and the institutes linked with them do research on management problems such as inter-firm comparisons. The results of research into small business problems are then made freely available to small firms. American and Continental universities always appear ready to help business and many Continental universities like Munich, Vienna, St. Gall and many others have special institutes dealing with the problems of small business.

In many Continental countries the training of apprentices and in particular the problems of release from employment for further education and training at technical colleges, have a long tradition as well as legislation behind them; there appear to be very few of the difficulties still often encountered in this country. Being used to acting together in some respects, small businesses on the Continent have organised measures for mutual assistance. In some cases co-operative purchasing is employed to cheapen equipment, raw materials and semi-manufactured goods. Switzerland and Sweden run book-keeping centres where the accounts of small firms are speedily and regularly produced a few days after the primary records are sent in. Credit Guarantee Co-operatives, *Banques Populaires* and similar financial institutions offer cheap long-term credits for equipment, buildings and working capital on conditions specially adapted to the needs of small firms, thus providing a parallel to the activities of the American Small Business Administration.

DOES Britain need anything of the kind? The simplest answer is that its small businessmen do not seem to think so. The "social structure" of British business, for the present, seems to encourage the small-scale entrepreneur to identify his interests with those of the giant in public and in organisations, even though he may quite often grumble about his big brothers in private. It should not be ignored that the Socialist challenge to business, in its passing postwar heyday, was to big and small alike and gave an incentive to close ranks: the road hauliers and coal merchants were threatened with the same fate as the steelmasters.

If a sharpening of competition were generally to follow upon the abrogation of restrictive trade practices, as it has here and there, some issues might arise where the interests of bigness versus the small man come clearly into conflict. There is, no doubt, vast room for improvement in management and technique among Britain's thousands of small firms (though whether the country has the talent available, in every sense, to make all the boys in the class come out top is another matter). Encouragement for the individual innovator may well benefit the country's technical resources. But in political and social terms, again, conditions in which it would be easy for the bright young man to think of setting out for himself might be at least as desirable an end of policy as conditions in which he could buy a house or some shares in the company that employs him. To the sociologist, the failure of any small business movement to manifest itself in Britain will remain a puzzle: for the politician it could offer an opportunity. The promotion, and the projection, of small business might, for example, become a useful plank in the Liberals' platform—if they could persuade any small British businessmen to stand on it.

ROBERT SHARP'S GO HUNTING- FOR TALENT, MOSTLY

It really isn't at all easy to find people to do the simple things—like reading, thinking, writing, drawing—superlatively well.

Robert Sharp's, a fierce advertising agency with a view to success, can only hope to improve their service to clients if they find more people as tireless and spectacularly brilliant as [illegible] intend to become the partners, one day.)

If you think you are a great persuader, write—or draw—a postcard to us, convincing us of your talent. Anybody giving full details of their career will be disqualified.

It may well be you do not wish to be employed by an advertising agency. You may wish to employ one. Robert Sharp's offer you splendid prospects.

Painstaking research! Elegant analysis! Uninhibited advertisements! Mounting sales! If only Robert Sharp's, or any agency, could make this a guarantee!

All we can fairly say is that this unseen, desirable sequence of events is accomplished (not without welcome assistance from our clients) quite often, really, at 45 Albemarle Street.

45 Albemarle Street, London, W.1. HYDe Park 6351

Gunnar Ericson, President of the Facit Group — one of the world's leading business machine manufacturers and exporters.

Why are so many world-known business machines built **by Swedes?**

"I believe the answer to that is — Swedish technique and tradition.

You see, Swedes are mechanically gifted and have an almost reverent respect for [illegible] craftsmanship.

And as inventors, builders and designers, Swedes — also descendants of Swedes abroad — have made pioneering contributions to quality production of modern business machines.

In relation to her population, Sweden today produces more business machines than any [illegible] in the world.

And Facit, Sweden's leading manufacturer and exporter, which to date has produced more than 2 million business machines, has played a substantial role in this development."

If you would like to read the story of this achievement, your local Facit agent will gladly tell you why are so many..." — or you may write directly to Åtvidabergs Industrier, Stockholm 7, Sweden.

Factories in Sweden and West Germany. Sales and service offices in 102 countries.

BUSINESS NOTES

MOTOR INDUSTRY

Dagenham or Not?

It is no secret that the Ford Motor Company has in mind a programme of further expansion of its manufacturing facilities that may eventually add £45-50 million to the £75 million or so that it has invested since 1954; nor that the Board of Trade wants generally to discourage further large-scale development of industry in the congested area around London. There is still a good deal of room undeveloped or used for purposes such as car parks on Ford's 512-acre site at Dagenham (though the company's chances of substantially increasing its labour force in the district, without greatly widening its "catchment area" for workers, may be doubtful). From the company's point of view, there would be obvious advantages in considerable extensions at Dagenham, which has highly developed and integrated facilities supported by a network of ancillary plants nearby at places such as Aveley, Basildon, Woolwich and Walthamstow. But the Government is now committed to steer industrial development towards places of high unemployment; and the Scottish Office in particular places great hopes upon the possibility of establishing automobile manufacture in Scotland.

The new strip mill that the Government decided should be at Ravenscraig on the outskirts of Glasgow, which is due to begin producing in 1963, will form a new factor in the geographical pattern of flat steel supplies in Britain; there are reports that Pressed Steel, the country's most important independent builder of motor bodies, will move some production of motor parts to the Scottish factory where it has been building railway wagons. Ordinarily it is a good deal cheaper to transport sheet steel to be manufactured near a market, than to press it into parts near the strip mill, because in sending pressings one is generally transporting a fair amount of air. In the making of car bodies, again, which is the most heavily-capitalised department of car manufacture, the scope for economies of scale generally makes for the concentration of as much output as possible through one press shop. Decentralisation of some other department, such as engine lines, could well be a much more reasonable proposition. But Sir Patrick Hennessey said firmly this week, "I don't know anything about a new factory in Scotland. We certainly are not going to build one." The motor industry is at present becoming an even more dynamic force in the British economy; the Government should hesitate before trying to make it move against its own commercial judgment.

MACHINE TOOLS

Public Relations in Reverse

During the last year or two before the election, believing itself threatened with nationalisation if the Labour Party should get in, Britain's machine tool industry gave a little unwonted attention to the reputation it possesses with the British public in general: last week, out of danger and back in character, it was once again managing to get itself a bad Press. It is said to have approached the British Broadcasting Corporation asking that a talk recorded by Professor Seymour Melman of Columbia University, who spent some months this summer studying the European machine tool industry at the request of the European Productivity Agency, should not be broadcast. The BBC very properly refused: but the incident focused attention on the fact that a report on this industry prepared by the Department of Scientific and Industrial Research is also not to be published, again on the industry's insistence. At last week's meeting of the National Joint Advisory Council for Industry, when the Board of Trade presented figures showing that the industry's share of world machine tool exports had been falling, the trade unions also pressed for publication of, or some action upon, these reports.

Professor Melman's report to EPA said little directly about the British machine tool industry, of which he succeeded in seeing practically nothing. Its main conclusions were that radical changes in productive organisation in the tool industries of Western Europe might be required in view of the very powerful competition coming on an increasing scale from Russia and Eastern Europe, and that a variety of detailed inquiries bearing upon productive techniques should be set in train forthwith. The report does not appear to have been generally published, though EPA has circulated it to "interested bodies." The DSIR report is not likely to be published without the industry's assent, either, since the information British companies supplied was given on an undertaking that it would not be published. Any conclusions that the Board of Trade and/or the Minister of Science reach from reading these reports, however, are likely to become public: moreover, what ministers tell the NJACI "in private" has a tendency to be fairly widely and circumstantially reported.

The condition of the British machine tool industry and what, if anything, needs to be done about it are larger issues than can be settled in a radio talk or an EPA report: Professor Melman, who was concerned mainly to propose further research, was not pretending to settle them. Nor does the DSIR report sound exactly to be *dynamite*: this summer, ironically enough, some people in the industry were congratulating themselves that it would turn out to be "quite innocuous." What these incidents —not without precedent, unfortunately— reveal is the quite antediluvian attitude towards the wider public, and its right to be interested in their performance as key suppliers of engineering technique, still manifested by many of the manufacturers of machine tools. An uncommunicative industry is not necessarily an inefficient one. But in this kind of educated and technically interested democracy it will increasingly appear so.

AT THE MANSION HOUSE

Dollar in Perspective

The Mansion House dinner to the bankers and merchants of the City of London was postponed a few weeks this year to allow Mr Heathcoat Amory's potential successor ("whom I am very happy to be able to represent here to-night") time to prepare his traditional report on the state of the economy. In the event the Chancellor dealt rather summarily with domestic matters. He stated that while budget expenditure is running roughly in line with expectations, revenue has been rather better, so that the above-line surplus may turn out a little larger than the estimated £102 million. Mr Amory described the expansion of bank credit as "to be expected with the revival of the economy"; but "I shall continue to watch it carefully." There is not a great difference in emphasis between this and the comment by Mr Cobbold, Governor of the Bank of England: "I judge the increase in bank advances to have been helpful to industry and commerce as far as it has gone, but to need watching if it should continue much longer at the same pace." More significant, and quickly effective in Throgmorton Street,

was the Governor's reference (still a mild one) to the "marked and sometimes slightly disquieting" boom in equity prices.

Mr Amory dwelt at greater length on external influences, notably on America's payments deficit. His plea for a sense of perspective about this is very necessary. A few days later an academic economist well known to the public casually referred in a letter to *The Times* to America's "net" gold reserves (less short term liabilities) at $5,900 million; on this basis Britain's net reserves are a negative quantity of roughly the same amount. Mr Amory listed three main ways in which the British Government has felt able to help the United States in its difficulties resulting from special grants and military payments: by early repayment of debt; by removing barriers on dollar imports; and by playing its part in contributing to international aid. Economic and technical assistance from public funds in Britain has risen from £75 million in 1956-57 to £100 million in 1958-59, and a further substantial increase is taking place in the current year. In addition, private investment abroad totals about £300 million gross, or £200 million net.

Governor on Radcliffe

RESPONDING for the bankers and merchants, Mr Cobbold welcomed the Government's decision to review company legislation. "One great benefit from the Radcliffe enquiry," the Governor recognises, has been that it forced the City "to pull our institutions up by the roots and have a good look at them." Mr Cobbold also announced the Bank's view about the Radcliffe committee's recommendations that come within its own province: those referring to the status of the Bank and other policy matters will be dealt with by the Chancellor next week in the House of Commons debate (for which, regrettably, the volumes of evidence will still not be available).

As the Governor says, the one fundamental criticism in the report of financial institutions in general and the Bank in particular is that they should go further and faster in producing information and explaining themselves to the public. This general conclusion, Mr Cobbold now states, the Bank of England accepts. "I see much force in the argument that, in modern conditions, the Bank should develop research and information, as a service to the public, in a way which would have been quite foreign to our earlier traditions". The expanded annual report, it is now confirmed, will in due course be supplemented with "some other form" of publication; and as announced last month, the Bank has strengthened its administrative organisation to take on the growing load. If the Bank should continue to advance a little gradually, preferring quality to quantity of output and avoiding unnecessary multiplication of statistics, it asks its friend's forbearance.

Archaic Transfers

LORD RITCHIE OF DUNDEE, the chairman of the London Stock Exchange, called for an early revision of the share transfer system. This, he said, is

> archaic and a brake on business in the Stock Exchange and to the whole business community, but it is also a serious deterrent to new small investors to whom the present system is incomprehensible and who expect when they buy a thing and pay for it to get something in return and not after months of unavoidable delay.

Sombrely he added: "With business running at anything like the rate of recent weeks a complete breakdown would seem inevitable."

The post-election market boom has spotlighted the wastefulness of the present system in time and labour and its considerable scope for error. If the Stock Exchange is to cope with the expected increase in the volume of business which a growing investing public will bring, the need for reform looks urgent. With this in mind, the Stock Exchange has invited the Bank of England and several other banks, the issuing and acceptance houses and the Institute of Chartered Secretaries to form a committee to consider ways of cutting down the paper work now involved in a simple transfer of shares between one investor and another. Lord Ritchie remarked that one transaction involving, say, 100 shares, now entails in correspondence alone some twelve communications. It does not seem likely that much paper work would be saved by adopting the American system of delivery by blank transfer, for whatever was saved in executing and registering transfers, the work involved in tracing shareholders and clearing dividend payments would be very heavy.

The suggestion which may find more supporters is the wider use of bearer shares. This would bring its own problems—to the Government on exchange control and tax collection and to the individual who on loss or theft has difficulties about title. It would also be a step towards further anonymity among share owners at a time when concealment of share-owning interests is becoming increasingly undesirable. What is certain is that any change will have to be quite radical, and will have to involve a change in law. It is a subject that the proposed committee on the revision of the Companies Act must consider.

IN THE MARKETS

Bobbing About 300

THE behaviour of the stock markets this week confirms earlier indications that the potentialities of equity stocks may for the time being have been discounted far enough. Gilt-edged, with their useful turn in current yield, are still attracting steady demand; and the market this week has absorbed another good-sized issue, of £12 million for Hertfordshire County Council. Ordinary shares by contrast have experienced a setback that should have surprised nobody. In the middle of last week, for no obvious reason, prices shot up and lifted the *Financial Times* ordinary index by more than 10 points in two days, to 309.6. On Friday, when investors were reminded of some obvious truths by the speeches at the Mansion House, prices dropped on balance; and weekend reflections brought a sharp drop on Monday, with considerable sales by private investors. By Wednesday the *Financial Times* index was almost back to 300, its level before last week's boomlet. Steel shares at first stood apart from the decline, but investors were disappointed by the unchanged dividend from South Durham. The round figure of 300 may be exerting a general psychological influence. But the daily fluctuations are still much larger than before the election, when 4-point movements in the index were major events.

The Hertfordshire issue has been received quietly. The coupon is again 5¾ per cent, redemption dates are 1978-80, and the issue price was 98½, one point above the Middlesex issue three weeks before, to take account of the general rise in the gilt-edged market. The terms turned out to be just right. There was no multiple oversubscription, and Pember & Boyle, the brokers, were able to allot applications of up to £1,000 in full; those over £2,500 received 50 per cent. Dealings opened on Thursday at a premium of $\frac{3}{8}$-$\frac{7}{16}$.

COAL

Financing Those Stocks

UNLIKE other nationalised industries, the National Coal Board has an annual limit on the scale of its borrowings from the Treasury, on which it relies not only for its new capital for long-term fixed investment, but also for working capital. These working capital requirements have been swollen enormously during the last two years by the steady accumulation of unsold stocks of coal, which now amount to nearly 36 million tons and must stand in the Board's books at £110 million or more. These are the reasons why the Ministry of Power has again had to seek Parliament's approval for an order increasing the amount by which the Board's peak borrowings during this year can exceed those during last year from £75 million to £130 million. It is also the reason why the Minister is introducing a Bill to increase the Board's long-term borrowing powers. Though the industry has not required to borrow as much for long-term investment during the last four years as it planned, the unexpected rise in working capital requirements means that it will pass its present borrowing limit of £650 million (since 1947) during the first half of next year, about a year earlier than had been expected.

The Board has already cut back its plans for long-term investment; it is now under considerable public pressure to cut down its stocks by selling them off at bargain prices. Commercially, this is a frightening problem. How far would one need to depress coal prices to clear any substantial proportion of these 35 million tons? In an industry selling a homogeneous product, though in a variety of grades, could one sell the stocks off cheap without making the same cuts in price right across the industry's market? If this had to be done would it merely raise the industry's annual deficit without clearing much coal? So far the Board has clung to the argument that these stocks remain a lasting asset (not deteriorating much) that can perhaps be cleared over the coming years by depressing output below the point to which demand should, on all the figuring of past experience, soon begin gradually to recover. Actual consumption figures, however, remain depressing: in September, with industrial output in general 6-7 per cent above its level a year before, coal demand at home was still 2½ per cent down. The only useful if negative contribution that recovery has so far made to the coal industry's fortunes has been to reduce its labour force more than was expected. Over the next few months, seasonal influences may save the Board from adding very heavily to its huge stocks; it can only hope that by the spring recovery has gone far enough ahead to lift it too off the bottom.

RAILWAYS

Traffic on the Upturn

THE end of the recession was almost bound to mean some revival in railway freight traffics. But, considering that the boom has not yet spread to the capital goods and other heavy industries, particularly coal, which are substantial customers of British Railways, the rebound in rail shipments in the last few months is quite remarkable. Up to June this year the amount of general merchandise and minerals traffic being moved by rail was still falling: it was 4½ per cent down on last year, and receipts were down by more. Since June, the monthly totals have been running more than 5 per cent above 1958. This is virtually the first time since nationalisation that there has been such a sustained upturn in shipments of general merchandise. Part of this notable increase must undoubtedly represent business won back from the roads, regained by the railways' starting to make use of their commercial freedom and the growing promise of modernisation by offering a few large rail users—to begin with—attractive rates in return for an assurance of their custom over a reasonable period.

Perhaps partly because of these lower rates and because of the fierce competition generally prevailing between road and rail for new business, the revenue earned from these reviving traffics has been rising more sluggishly. Moreover, coal shipments, which account for nearly half by volume of all rail goods traffic but only a third or so of current freight earnings, are still falling—down by another 12 per cent so far this year. Even so, the upward surge in other rail shipments has been such that total freight receipts last month were higher than in October last year, by £46,000 on a total of £25 million. Prior to that month, freight earnings, at £230 million, were running £18 million below 1958—but of that £11 million was due to the further slump in coal movements. Passenger traffic has been better throughout the year, bringing in £120 million to the end of October, nearly £1 million more than in the same months of 1958 (which included the windfall gain in revenue from the prolonged bus strike in London). But 70 per cent of all rail revenue comes from freight; it could be that last summer may in time be looked back upon as a turning point for British Railways.

GAS

To the Salt Mines

HAVING given up most of its earlier hopes of finding much natural gas in Britain, the Gas Council has switched the emphasis

Synthetic Diamonds from De Beers

ONLY a few months after the General Electric Company of America produced its first synthetic diamond, work began at the laboratories of De Beers, the heart of the natural diamond syndicate, and in September last year the De Beers's scientists produced their first diamond. But this fact has rested unrevealed until this week, when the chairman of De Beers, Mr Harry Oppenheimer, said that the company is confident that it would be technically and economically possible to manufacture the synthetic diamonds on a commercial scale if it was found desirable to do so. But no decision to manufacture the synthetics would be made without consulting Société Minière du Beceka, the Congo producer of almost all natural abrasive diamond dust with which synthetics compete.

That company is a member of the syndicate and, since the contracts between the diamond producers and the Central Selling Organisation become due for renewal next year, there is a natural desire to close the ranks to meet not only the threat posed by General Electric's synthetics but by Russian discoveries of diamonds in Siberia and the activities of "illegal" diggers in Sierra Leone and merchants in Liberia. Once again, in fact, the diamond ring has proclaimed its willingness and ability to compete against "outsiders"—just as in June, when it offered a new and a better grade of natural diamonds for use in resin bonded wheels. De Beers has applied for patents, and it remains to be seen how General Electric will react to this application. The decision to produce synthetic diamonds in the United States was originally based in part on strategic considerations, but General Electric's production is now running at about 3½ million carats a year, priced at 21s. a carat (which is competitive with natural diamonds), and its attitude towards De Beers's patent application must be governed to some extent by straightforward commercial considerations.

PRODUCTION of the natural diamonds, which have been hotly chased by synthetics for use in resin bonded wheels, is of the order of 8 million carats a year. The American stockpile has not in recent months been buying this grade of stones, though it has been buying others; and sales of all grades of industrial stones are up by 86 per cent on the nine months of recession in 1958—a sure sign of the return of the sellers' market for abrasive diamonds.

American manufacturers of resin bonded wheels are now offering customers a choice between natural or synthetic stones. So far in this country and on the Continent, synthetic diamond wheels have only been sold in experimental quantities and only one firm, a German one, is offering its customers a choice. With the Central Selling Organisation offering a better grade of natural stones than it did for resin bonded wheels, competition between synthetic and natural diamonds may become focused on price: GEC may be able to bring its price down to 18s. or 19s. a carat and there can be little doubt that the syndicate could meet that price.

This possibility has been reflected in the stock market. Over the last few weeks, the price of the De Beers shares has been climbing rapidly. On election day, for instance, it was 173s. 9d. and by the end of last week it touched 199s. 4½d. Security precautions on the news of De Beers's synthetic had been rigorous; the buying of the shares cannot be attributed to a "leak," and, indeed, on the announcement by De Beers its shares were marked down by 7s. 6d. to 188s. 9d. The buying seems to have been prompted by the prospect that this will be a record year for diamonds and that the increase in the interim dividend foreshadows more liberal distribution policies.

of the explorations that it finances towards discovering a cheap way of storing gas underground. This would cut costs because production could be kept more steady throughout the year, with extra winter demand fed from stores filled in summer. If natural gas were imported by tanker and fed into holders connected to a national grid, the theoretical saving would be even greater. The search has led the Northern Gas Board to the holes left under the ground by Imperial Chemical Industries in a deep seam of rock salt on the north bank of the Tees.

These holes are normally kept safe from possible subsidence by the brine that ICI leaves in them: if the gas board used them as storage tanks it would have to replace gas with brine whenever it reduced the pressure of its stores. By special agreement the board has paid ICI to leave one cavity a third smaller than the rest. This needs no internal pressure to keep it safe. For £96,752 the board has bought itself a holder which is keeping at a pressure of 30 atmospheres as much gas as would a 10 million cubic foot low pressure holder costing £600,000. Running costs are lower, and the board expects to save £10,000 a year by keeping production steady over weekly periods, instead of reducing it at weekends.

Future possibilities opened up by this pilot project were outlined in a paper presented this week by Mr E. Crowther, chairman of the Northern Gas Board. He pointed out that if 30 of the larger holes left by ICI are used, and brine tanks and pumps to keep them safe constructed above ground, the board could store 1,350 million cubic feet of gas at a pressure of 45 atmospheres. Production could be kept steady throughout the year. This would cost more than £1 million, but the board could dispense with plant of a capacity of some 40 million cubic feet a day, which has a replacement value of between £4 million and £10 million, depending on its type. The saving on running this extra plant would probably alone make it worthwhile to build the storage system. Imported liquid methane would boil off at a high pressure and could be fed directly into the salt-mine caverns, saving running costs on pressure plants. With coal mines proved unsuitable and the right kind of natural cave apparently rare, this approach to the storage problem must have a strong appeal for the Gas Council.

CONSUMER DURABLES

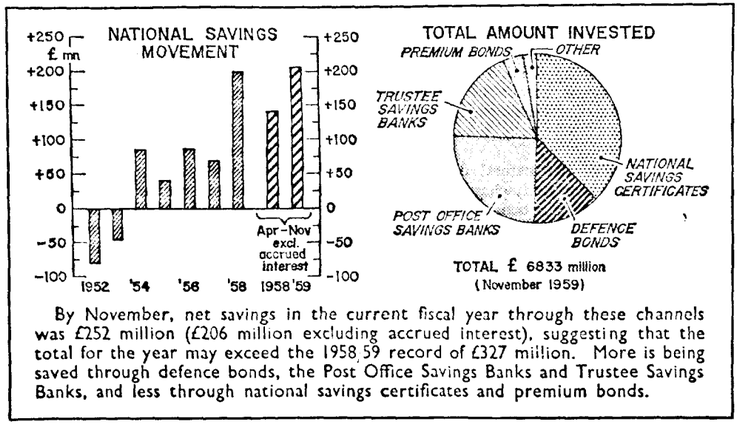
Any Room for Price Cuts?

Once again the Chancellor has been exhorting manufacturers to pass on the economies of rising output by cutting prices. Makers of durable goods have enjoyed the most spectacular boom in sales; where would any cuts in retail prices have to fall? The table shows how much the manufacturer gets from the price paid by the public. Most large domestic appliance makers expect to spend 30 per cent of the retail price—20 per cent if they sell through a wholesaler—on promotion costs. About 25 per cent. is spent on the sales force, which sells direct to the public, and miscellaneous selling costs, while about 5 per cent goes on advertising. Where goods are sold through wholesalers the 20 per cent spent on promotion goes, in about equal proportions, to advertising and miscellaneous selling costs. Thus, in the examples given in the table, only £31 10s. of the £83 paid for a washing machine, and £22 10s. of the £59 10s. paid for a refrigerator, cover manufacturing costs.

	Total price	Purchase Tax	Distributors' Margins	Manufacturer's Price
	£ s.	£ s.	£ s.	£ s.
Car	603 0	178 0	106 0	319 0
Washing machine	83 0	13 0	24 10	45 10
Refrigerator	59 10	9 10	17 10	32 10
Electric cooker	55 0	Nil	19 5	35 15
Electric iron	4 2	12	1 5	2 5

These costs can roughly be divided into materials and other bought-out parts, labour and overheads. Smaller manufacturers will have higher manufacturing overheads than the larger, but their distributive costs are often lower. In the motor industry bought-out steel and components may form 60-65 per cent of manufacturing costs, labour costs 25 per cent and overheads 10 per cent. Only the last will fall as production rises; though there are non-manufacturing overheads that may fall also, labour costs may rise if much overtime is worked.

Appliance makers are cautious about the gains they can make from price cuts. They argue that the public does not have a long enough memory for a cut to boost sales for long, unless it is reminded by extra advertising. Discounts offered by the retailer are considered to be much more effective in stimulating sales than the same reduction in the maker's price, since the buyer can be reminded of the "price cut" by the retailer whenever he looks at a machine. This kind of logic might drive the appliance industry into discount trading—would make the retailer subject to the price competition that already restricts the manufacturer's profit margin.



By November, net savings in the current fiscal year through these channels was £252 million (£206 million excluding accrued interest), suggesting that the total for the year may exceed the 1958/59 record of £327 million. More is being saved through defence bonds, the Post Office Savings Banks and Trustee Savings Banks, and less through national savings certificates and premium bonds.

INTERNATIONAL FINANCE

A Modern Monetary Standard

"A proper synthesis between the old gold standard rules and the new ideas of managed money": that is the theme of this year's Stamp Memorial lecture given on Thursday by Mr Per Jacobsson.* His views on this important problem of the postwar world have a special interest, for he not only runs the International Monetary Fund (at a brisk pace) but continues his active thinking on deeper questions of economic and monetary theory. As usual, he casts his net wide: the freeing of sterling, he ventures to guess in one of his asides, will be made complete, capital transactions included.

Mr Jacobsson has always been something of a go-between for the old and the new economics, and recent trends in thinking and in policies have moved towards his position. He distrusts the over-sharp contrast between then and now. On the one hand he quotes Bagehot from *Lombard Street*, "Money will not manage itself"; on the other, he has always stressed the role in the modern world of the adjustment of interest rates and monetary policy to even out disturbances, whether from domestic or international causes. But nowadays the public sector has a new importance, and fiscal policy with it; while in the private sector adjustments in costs and prices tend to be neglected (which Mr Jacobsson thinks dangerous). The old semi-automatic monetary standard is inapplicable.

The move towards a new international standard, as Mr Jacobsson points out, centres on the international institutions set up after the war, and especially on the IMF. Mr Jacobsson has himself made a major contribution to the efficacy and scope of IMF by playing down the idea of automatic rights and allowing larger facilities for borrowers who can show they are taking appropriate action themselves. A little disappointingly, he does not develop in his lecture the question of increasing the authority of the Fund to the point at which it would become a true world central bank, on the lines of the original Keynes plan, which has again been ventilated in a number of circles in recent years.

AIR CORPORATIONS

Answering the Select Committee

Answers from the two air corporations to criticisms made this summer by the Select Committee on Nationalised Industries were published this week. They repeat much of the information contained in the annual reports of both airlines that have appeared since the Select Committee made its report. BOAC, for example, replies to the Committee's biting comments on its general inefficiency by quoting the gradual lowering of its engineering costs and its abortive efforts at the recent conference of airlines in Honolulu to get fare reductions on some of its more important routes. (Other airlines, incidentally, have been severely critical of the way that BOAC set about getting those reductions and say that the corporation produced no figures to support its case.) British European Airways, which has managed to break even for the past 5½ years, was frankly unrepentant. It answered the Select Committee's criticisms that the ratio of its inspectors to engineering staff was too high (320 inspectors to 2,500 hourly rated engineers) by retorting that it could always improve the ratio by taking on more engineers. BEA also said once again what it said in evidence to the committee—that it had little chance of improving its costs which must inevitably be higher than those of a long-haul airline.

Neither corporation, however, made any reference to one of the Select Committee's major findings—namely the immense power wielded by the Minister of Transport (now the Minister of Aviation) over the corporations without a shred of statutory authority to support it. Both corporations have been frankly resentful in private of these criticisms: they consider that a gentleman's agreement of this kind has to be evolved with or without the knowledge of Parliament. But the Minister is not charged with the prime responsibility of running airlines on a commercial footing, while the chairmen of the air corporations are. Concessions to the Minister's views can have harmful commercial effects. BOAC, which, for example, wrote off in one way or another nearly £12 million in its last financial year, was anxious to use under-employed aircraft by operating cut-price flights to the West Indies, which it could do without international agreement because these are within British territory. The corporation asked the last Minister of Transport for permission to do so, and he refused: but there was no reason why he should ever have been asked in the first place. The only result was a few hundred pounds more added to BOAC's vast losses. Mr Sandys should give some thought to these unwritten powers when he comes to draft his promised bill on the licensing of air services.

Down with Fares

No fewer than 400 fare cuts announced by British European Airways this week promise to make next summer's timetable a paradise for Bradshaw enthusiasts and a nightmare for everyone else. The biggest cuts, of up to 40 per cent, have been made to Portugal, where the corporation is specially anxious to stimulate traffic; the rest range all the way down the scale to as little as 5 per cent. BEA has not, however, yet come out with the bright device of airmanship announced by Air France under which a man buying a full fare ticket can carry the rest of his family at half-price.

BEA relies more on holiday traffic for its bread-and-butter business than any of the other major airlines in Europe, most of which have long-haul routes and regard their flights inside Europe as little more than feeder services. Holiday traffic has an inconvenient way of crowding into peaks.

ATOMIC ENERGY

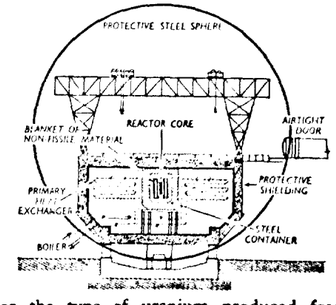
The Dounreay Experiment

The Atomic Energy Authority's £17 million breeder reactor at Dounreay began working last Saturday morning, twenty months behind schedule and after repeated postponements. To say this, is no criticism of the AEA's engineers: the delays are a measure of the difficulty of designing this particular type of reactor and are due in no small part to accidents with smaller prototypes that occurred in the United States when Dounreay was almost finished. These difficulties should not be under-rated. Breeder reactors are the only nuclear power generating systems now expected to produce electricity at really low cost, but no one seriously expects that a commercial power station could be working on these lines before 1970.

The core of a breeder reactor, which is not much more than football-sized in comparison with the mammoth structure of today's nuclear power stations, consists of almost pure fissile material—a potential atom bomb. By surrounding this with a blanket of some non-fissile material such as used-up natural uranium or thorium, the reactor can be made to "breed" fissile material in this blanket while fission is taking place in the core. The physicists' definition of "breeding" is the production of at least one and possibly more than one atom of new fuel in the blanket for every atom split inside the core. Nearly all nuclear reactors manufacture some new fuel—the Calder Hall type produces four new atoms of plutonium for every five atoms split. When working at full power the Dounreay reactor should produce six atoms for every five it consumes. The improvement is not therefore so dramatic as it sounds. The economics of the "breeder" system do not depend on its performance as a fuel factory so much as on its smallness.

Here the Dounreay reactor gives a somewhat misleading impression. The 135 ft steel shell that contains it is not an essential part of the structure; it is merely a safety precaution designed to contain any fire that might break out. The reactor itself occupies a comparatively small steel pot in the centre of the shell. Dounreay, which is only a pilot plant, should generate 15 megawatts of electricity at full power.

Because of its small size, the capital cost of a breeder reactor should be low enough to compete with that of a thermal station. It is the high capital cost of present-day nuclear power systems that makes them uneconomic and the small, compact breeder offers the only known break-through. But it is dangerous: the juxtaposition of inflammable sodium coolant and highly fissile core is unfortunate but at present inevitable. And breeders will not work economically on the type of uranium that can be extracted from the natural metal. To reach their specified "breeding" rate—which they must do because their fuel would otherwise be inordinately expensive—these reactors have to run either on plutonium



or the type of uranium produced from thorium. Plutonium technology has its own headaches, and it will be some time before it is introduced into Dounreay. Meanwhile this reactor is the biggest of its kind in the world, and for cheap electricity probably the most important. If it can be made to work commercially (it would be premature to assume this), it may offer cheaper costs than anything in the nuclear field until power is obtained from controlled fusion.

always at weekends and most particularly during high summer, when some flights can be fully booked eleven months in advance. In desperation BEA is therefore offering a variety of discounts to anyone prepared to take their holiday earlier in the summer, preferably travelling mid-week and if possible in the middle of the night. If the bait is taken, BEA will get better aircraft utilisation and win passengers whom it would otherwise turn away for lack of capacity at the height of the summer.

The corporation considers that by doing this it has effectively introduced into Europe the cut-rate, third-class services now operated only on the North Atlantic, where a frontal attack in favour of a flat-rate cut in fares would certainly have been rejected by other operators. Nor would a flat-rate cut have suited BEA ; on some routes traffic needs no encouragement, and the corporation only wants to sell cheap seats when it cannot find buyers at the standard price. It is merely trying to introduce the kind of flexible price policy that has been urged on other nationalised industries for years. But in BEA's case the exigencies of international control of air fares obliges it to adopt this irritating and bitty way of setting about it.

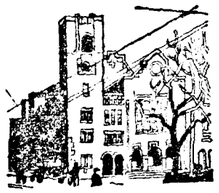
EMPLOYMENT

Market in Managers

ONE of the most obvious developments in the middle-class Sunday newspapers in recent years has been the rapid growth in display advertisements for business executives ; but the increase in the number of "classified" advertisements of managerial vacancies in the columns of the middle-class dailies, and of some weeklies, has proceeded just as fast. All this reflects the development of a more open market in managerial, as well as in technological talent. It is not confined, moreover, to the recruitment of young graduates: there is also a constant bidding for experienced managers up to the highest level. It seems that one traditional pattern in management —the slow rise slowly in a single firm—is being modified; changing jobs in the middle and higher ranges of management is becoming more frequent and also more systemised.

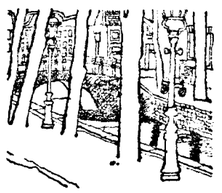
The days when a dissatisfied manager had to shop around among his own contacts, or the bars and golf-clubs of his own city, are passing. In part, this important change has been brought about by the activities of management consultants who specialise in finding skilled staff, of all ages and degrees of seniority, for expanding firms. They have become confidential middlemen between the man who wants to better himself (but does not want his present firm to know he is restless) and firms who need new staff—but, while wishing to cast a dragnet over the country, want only to interview a short list of men who come near to their exact specifications.

Hitherto, however, the size and characteristics of the market in managers has been unknown. Management Selection Ltd., one of these firms of consultants, has now made some investigations into it, with the aim of producing an index of executive employment. Its results show that the posts of over £1,000 a year advertised in the last quarter of 1958 and the first three of 1959 numbered 18,974 ; research and development jobs were the most numerous (6,151) with production (4,786) and sales (3,884) second and third respectively. About 150 general managerships were advertised on average each quarter. So far the figures show no decided trend ; for all managerial jobs demand seems to be rising, but the monthly movement in the various categories of post (general management, finance, sales, research, production and others) is irregular. These figures, however, promise to be interesting over a longer period ; and there is obvious scope for this market to expand with the growth in administration, and with the realisation of young and middle managers that their abilities are not as specialised to their own firm or industry as used to appear.



Berlage's Stock Exchange

Amsterdam Turns Inward



AMSTERDAM remembers its proud past as a financial centre ; but few bankers in Amsterdam today seem to hanker after it. The visitor is impressed with the air of solid realism and the total absence of *folie de grandeur*. But there seems more to it than that. Partly under pressure of outside circumstance, notably the upheaval in Indonesia, Holland has switched its sights and its capital since the war from overseas empire to home industry. It has faced, besides the great destruction caused by war and flood, a rapid increase in population and a big influx of people from Indonesia.

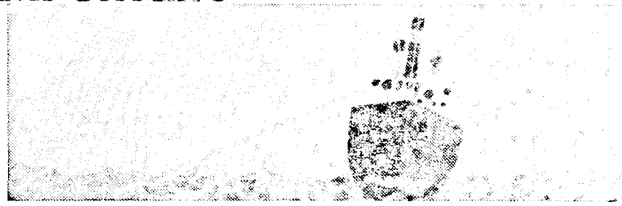
The response of the Dutch people, unable physically to expand their agricultural land much further into the sea, has been to industrialise. The upshot has been to transform southern Holland into one of the heaviest—and most modern—concentrations of industry in the world. Rotterdam has rebuilt a model of a twentieth century city centre, and work has started at the mouth of the Maas on the new "Europort."

All this has needed capital. Much has come from the United States and other foreign sources—in the first half of this year foreign purchases of Dutch securities were nearly £50 million. In addition the Netherlands Bank, concerned that industry and the municipalities should get their requirements at modest rates, imposes a ban on overseas issues in the Amsterdam market. It gives full freedom to the banks to place short-term funds abroad, and with the domestic market over-liquid the banks have $350-450 million in New York and other foreign centres, of which perhaps one-half has gone since the beginning of the year. Foreign exchange is also made available to Dutch enterprises for direct investment abroad, and there is an active market in Amsterdam in foreign securities.

The ban on foreign issues therefore looks anomalous. It was originally imposed to conserve foreign exchange reserves ; but these are now more than ample. In practice the restriction is a device to prevent a rise in Holland's interest rates, which at about 4½ per cent on long-term bonds are lower than in any centre except Zurich. Short-term rates are very low, though last week the Netherlands Bank felt obliged to raise its discount rate from 2¾ to 3½ per cent. If the authorities were prepared to allow long-term rates to rise by, say, one per cent, Holland might possibly fulfil the function of a Switzerland, as an international capital market for modest amounts. Some bankers advocate this ; but most seem to feel that Holland's international role has gone with its empire. Some add good riddance.

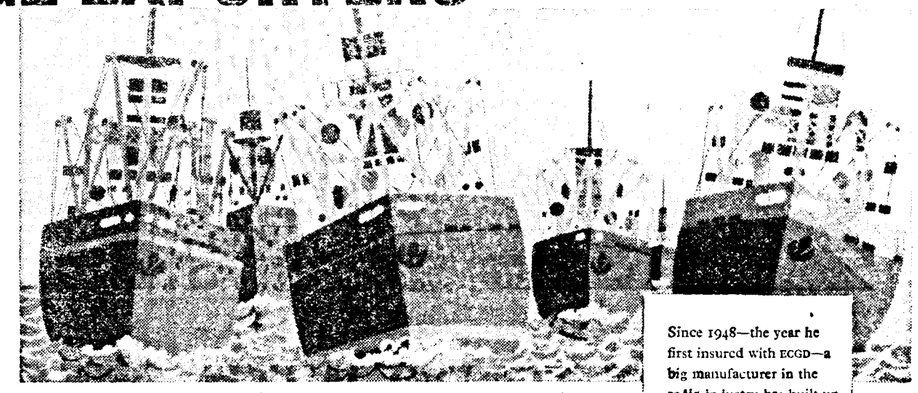
No one seriously entertains the idea that Amsterdam institutions could be the channel for other countries' money (say Germany's), in the same way as New York institutions channel foreign held dollars into international stocks. Some of Holland's domestic demands of the post-war years may soon subside ; and the country has already repaid in advance its postwar foreign loans from the World Bank and elsewhere. Some surplus for export of capital may therefore re-emerge. But it is not certain that the under-developed countries will be most in mind ; Indonesia has left a bitter taste.

SMALL EXPORTERS



In three years—backed by ECGD insurance—a small manufacturer increased his export turnover from a mere £97 to £103,000 a year.

LARGE EXPORTERS



Since 1948—the year he first insured with ECGD—a big manufacturer in the radio industry has built up his export turnover from £81,000 to over £2,000,000.

There's many an exporter in this country who could be doing even better business. ECGD insurance enables you to develop and expand overseas free from serious financial worries. If you're big already, there's still room for expansion. Last year fifteen companies with annual export turnovers of *a million pounds and more* took out ECGD insurance for the first time. Have a talk with *your* ECGD man.

EXPORT AND EXPAND THROUGH E·C·G·D

ECGD is a Government Department set up to help exporters. Its services are fully explained in the booklet 'Payment Secured'. Write for a free copy.

A LOT TO DO WITH STEEL

Simon-Carves build coke ovens to make coke for blast furnaces and gas for steelworks heating processes. They build complete power plants to supply steelworks with steam and electricity. Huntington Heberlein *(Simon-Carves subsidiary)* build plants to sinter iron ore fines and blast furnace dust *(economy in ore and coke and better blast furnace output)*. Simon-Carves *(and subsidiaries)* work in one way or another for practically all Britain's leading steelmakers, and for such famous overseas steelmakers as Tata Iron & Steel, Indian Iron & Steel, Government of India *(new Durgapur steelworks)* . . . Australian Iron & Steel . . . Iron & Steel Corporation of South Africa, Rhodesian Iron & Steel Corporation . . . Société Métallurgique de Normandie, Cockerill-Ougrée, Forges de la Providence . . .

STEEL?

In their experienced and resourceful way Simon-Carves *(and subsidiaries)* have had – for a long time – a lot to do with steel.

SIMON-CARVES LIMITED IS A LEADING COMPANY OF SIMON ENGINEERING GROUP

CHEADLE HEATH, STOCKPORT
AND SIMON HOUSE, DOVER ST, LONDON W.1

Turbine Gears Ltd • Simon Engineering (Midlands) Ltd
and other companies in Britain and overseas

CABLES

Mr McFadzean Reports

THE chairman of British Insulated Callender's Cables, Mr W. H. McFadzean, has taken the opportunity in his half-yearly statement to give his views on the competition that has engulfed the cable industry since the beginning of May. He implicitly denies the suggestions that the big companies have deliberately depressed prices to weaken their smaller competitors when he says that BICC tried to give a lead by fixing its prices at a level that would give a reasonable return to an efficient producer, but that this lead was not followed. He agrees that prices for low voltage mains cables and general wiring cables are now unprofitable, but states that these do not represent a substantial proportion of BICC's total turnover, so that the group's profits for the whole of 1959 should not differ materially from those for 1958. Whether BICC sought the price cutting or not, it is able to strengthen its position in the industry from it.

Mr McFadzean adds, however, the somewhat oracular statement that BICC wants its "proper share of markets—no more than that." He gives no clue to the share that he considers proper to BICC. But he does warn that a continuation of the present difficulties can cause temporary dislocation in the industry, and have "a serious permanent effect on certain companies unless there is a keen and sensible competition instead of the wholly uneconomic conditions applying today." Excess capacity and a lack of mutual trust between the companies in the industry are the factors that he blames for the price-cutting. BICC is taking steps to reduce capacity, and so are some other companies; he considers that "the problem of excess capacity is being gradually overcome." For the future, he sees two alternatives for the industry: continuation of the present competition, which means the survival only of the strong; or "companies . . . imposing on themselves a discipline that would enable any efficient company to take its share of the market and earn a reasonable return on its capital and efforts." The latter suggests some voluntary acceptance of the sort of prices that used to be set by the price-fixing agreements; perhaps BICC hopes to lead a return of prices upwards. Voluntary acceptance of price leadership is only normal in industries as oligopolistic as cables; certainly it seems that most cable makers would be happy to accept it, if the big companies gave the lead. But the industry may have to become more concentrated before this can happen.

ATOMIC ENERGY

Disposing of the Waste

FEW industries can have given rise to so much special legislation in so short a time as atomic energy. Following the various Atomic Energy Acts that created the Atomic Energy Authority (and recently increased the size of its Board) and the legislation governing the licensing of reactors and their insurance (which comes into force next spring), the government tabled yet another bill last weekend, dealing this time with the disposal of radioactive waste. The wording of existing laws dealing with nuisance and pollution cannot easily be stretched to cover the special risks associated with radioactivity, not least because the nuisance usually has to occur and be detected before action can be taken to stop it. But a special panel that reported to the Minister of Housing two years ago on waste disposal methods also pointed out that local authorities who administer most of these laws were unlikely to have staff sufficiently highly trained to deal with radiation hazards.

This special panel saw no harm in discharging faint traces of radioactive waste into drains, or burying them on rubbish tips provided the level of radioactivity was kept down to safe levels. It was, however, extremely alarmed at some of the practices it discovered when touring factories and laboratories where radioactive material was used. So far the amount of radioactive material handled outside the big plants of the AEA and the nuclear power stations is small, but over the years increasing amounts are likely to turn up in hospitals, laboratories and factories outside the big atomic energy installations: the twin dangers of ignorance and inexperience suggest that this could be a big danger to public health. The new bill provides that all these users will in future have to be registered and inspected and will need to have their plans for waste disposal passed by the Minister of Housing. (Waste can mean anything that has come into contact with radioactive materials, from cleaning materials to the corpses of experimental animals.) Where the volume or the intensity of the radiation cannot be brought down to safe levels, the material must be sent to a central disposal service. The radioactive materials used in industry are a case in point: at some stage they become too weak to be useful but still powerful enough to be dangerous. These are sensible precautions: perhaps the government could next turn its mind to the lethal chemicals in daily use in the farmyard.

BUILDING

Moving Out of Town

THE building industry has contrived, in one way and another, to call considerable attention to itself in the past week. The Building Exhibition—larger and seemingly more varied than ever before—opened on Wednesday; on the same day the Building Research Station of the Department of Scientific and Industrial Research published a completely new edition of the first volume of its manual, *Principles of Modern Building* (HMSO, £1), a completely re-written edition of the useful compendium of design and building techniques first published in 1938. Also on the same day there was the official opening—only slightly premature—of Kew Bridge House, a speculatively built office block which strikingly illustrates the case for building office buildings in outlying areas, rather than in the centre of London.

Kew Bridge House is an eight-storey block of about 50,000 square feet, owned and built by the Rodwell Group, a London firm of speculative builders, at a cost of about £300,000. Pleasant if not original in design, it was built of reinforced concrete, with curtain walling of exposed aggregate concrete; total construction time will be just under a year. By comparison with Central London buildings of similar size, the standard of amenity is high: there is a large canteen and a fair amount of space for car parking. The building is located at the end of the new Cromwell Road extension, with adequate public transport to the centre of London. A 35-year lease has been taken on the building by a subsidiary of Bowmakers Ltd, the industrial bankers.

The movement away from Central London has increased during the past five years; the Rodwell Group's properties, for example, are now divided almost equally between Central London and areas such as Kew. Government action has been slightly responsible for this dispersal—though the statement made at the opening of Kew Bridge House by Mr Brooke, the Minister of Housing and Local Government, that he was "determined to stop" office building in Central London, if believable, must have horrified all speculative builders present. But the economics of the situation are also conducive to out-of-town building: office building rents average 12s. 6d. a square foot in areas such as Kew, compared with more than 30s. a square foot in, say, Holborn. Among other things, this difference means that a higher standard of amenity can be offered to lessees and their employees than would be possible in the City, for the same price.

Even a rent of 12s. 6d. a square foot must mean a considerable profit for the speculative firms who have undertaken developments in outlying areas. Prices of land in outlying areas are rising sharply, however: in some cases available sites for commercial buildings have trebled in price in the last three years.

ESTATE AGENTS

How Professional Can They Get?

BASICALLY, an estate agent's job is more of a commercial than a professional nature: he is a go-between in the buying, selling or leasing of houses and land rather than an expert counsellor on the details of

the transaction (like a surveyor or lawyer). The notion that there should be a register of estate agents has been mooted for a great many years; and the demand that they should be controlled by some law or some qualified body has grown louder in recent years, owing at least in part to the number of questionable—and occasionally downright dishonest—practitioners in the business. Now no less than six organisations have spoken out in favour of making the registration of estate agents compulsory: at least four of them are each preparing a draft Bill which they hope to have passed to this end. The six bodies concerned are the Royal Institution of Chartered Surveyors; the Chartered Land Agents' Society; the Chartered Auctioneers' and Estate Agents' Institute; the Incorporated Society of Auctioneers and Landed Property Agents; the Valuers Institution, Limited; and the Incorporated Association of Architects and Surveyors. They represent six overlapping quasi-professions—whose members must have some degree of training, and in some cases must win their qualifications by a standardised examination. Members of all these six professions all, on the side, undertake the business of estate agent—hence the fact that all six groups feel entitled to claim an interest in the registration of estate agents.

It has been suggested that the function of estate agents should be registered, rather than the name—unlike the case of architects, who may practise architecture (itself a difficult profession to define) even if they are unregistered, as long as they do not call themselves architects. In the case of estate agents there are very few professional qualifications involved; little would be gained if a substantial number of them were allowed to carry on, unregistered, a possibly dishonest business (under some such title as "property agents"). On the other hand, registration of all people carrying on the business of "agent in the purchase, sale or lease of property rights" carries with it the danger that the group may become ossified, and that no new members may be able to enter the field. But in the postwar era, admittedly one in which the market for accommodation was made grey by rent restriction and which has not yet been fully freed, the problem has been primarily whether an estate agent was honest, rather than whether he was qualified—if there can be necessary qualifications for a go-between.

STERLING AREA TRADE

Recovery in Exports

RECOVERY in world demand was reflected in the exports of overseas sterling countries in the second quarter of this year. The value of their exports, including trade within the overseas sterling area, rose sharply to £996 million, which was £135 million, or 15½ per cent higher than in the same quarter of 1958. It seems likely that exports for the third quarter will show a broadly similar rate of increase over the third quarter of 1958, when the recession reached its trough. This hit the earnings of the overseas sterling area more sharply than those of other groups of primary producers.

Now their earnings appear to be recovering faster than the rest. Between the first half of 1958 and 1959 exports from overseas sterling countries rose by £131 million, over seven per cent, to £1,929 million, thanks mainly to bigger shipments to North America and Western Europe. The rebound is the more impressive because prices of sterling commodities showed little improvement over the period. In particular

TRADE OF OVERSEAS STERLING COUNTRIES

(£ million)

	U K	Other Sterling	Dollar area	OEEC area	Other non-Sterling	Total
Exports* to:						
Jan.-June—						
1958 ...	578	347	241	313	320	1,798
1959 ...	600	359	287	340	344	1,929
Imports from:						
Jan.-June—						
1958 ...	739	404	343	383	503	2,372
1959 ...	659	385	355	402	486	2,287

* Excluding Middle East oil.

raw wool, the principal export item, was still cheaper in the first half of 1959 than a year ago; though the volume of wool shipments rose by nearly a quarter the value rose by only one per cent to £212 million. Three commodities, rubber, copper and meat, accounted for over half the increase of £131 million, and in the first two commodities the rise in prices far outstripped the rise in volume.

Shipments of rubber rose by 11½ per cent in volume and even more sharply in value, by 35½ per cent to £159 million; and shipments of copper, three per cent up in volume, were nearly 40 per cent up in value at £64 million.

The overseas sterling countries' imports showed a modest recovery in the second quarter of this year, rising by £35 million, three per cent, to £1,196 million, compared with the second quarter of 1958. But imports in the first half of the year, at £2,287 million, were still four per cent lower than in the first half of 1958. The Board of Trade's analysis shows that Britain is losing ground. Between the first half of 1958 and 1959 overseas sterling imports from the main manufacturing countries fell by £55 million, or four per cent, to £1,469 million; but imports from Britain dropped by 11 per cent to £659 million and Britain's share of the market dropped sharply from 48½ per cent to 45 per cent. The United States, Germany, the other Western European countries taken together, and Japan all increased their shares, though the increase in the United States's share was mainly the result of large shipments of foodstuffs—mostly to India and sold on concessional terms.

ARGENTINA

Stability for the Peso?

THE Argentine Economics Minister, Senor Alsogaray, is touring the capitals of Europe arranging a stabilisation credit in which eight countries are expected to participate. The credits are required to reinforce the reserves of the central bank and to buoy up the peso, now afloat on the still unaccustomed waters of a free market. It strengthened from 110 to the dollar in June to about 83 in July and has remained fairly steady since then. Since July external reserves have risen from the near-vanishing point of $34 million to $230 million. The Argentine authorities want to supplement this reserve with further international short-term credit, repayable in instalments beginning 18 months after the credit is established and completed within 36 months.

The country's stabilisation programme was launched last December, and since then the amount drawn from the International Monetary Fund has been brought up to more than $100 million. A further approach to IMF is now being made, and the Argentine government is trying to raise as much extra as possible from private banks in the United States and Europe. A London syndicate is promising £6 million. As in the case of the other tranches of the private credits, this will be called up in full, redeposited in the lending country and will then figure in the gold and foreign currency reserves of the Argentine central bank. The service cost will vary according to the level of interest rates in the various centres, but in each case it will amount to the difference between the interest payable on the stand-by credit and the interest earned on the redeposited money. The London syndicate is headed by Baring Brothers and includes the Bank of London and South America and a number of clearing banks and acceptance houses.

Senor Alsogaray has not yet completed his tour, and the amount of credits he takes home with him will depend upon his ability to dispel the scepticism towards his country's stabilisation programme which has prevailed in some quarters. As part of his sales talk he will be able to point to the sharp rise in reserves; the reduction in imports; the fact that Argentina now exports gasoline and hopes to be self-sufficient in crude oil; the hopes for a substantial rise in meat exports next year; and the confidence the country's booming stock exchanges are showing in the present austerity measures. The acid test, however, will be the success or failure of the government's measures to check the rise in prices.

ELECTRIC ARC WELDING

Aluminium Transformation

A NEW use for aluminium, and potentially a significant one, was announced this week: a welding transformer with

Marvellous new cars... these 1960 Vauxhalls!

The 1960 Cresta

The 1960 Victor de Luxe

Victor £505+£211.10.10 PT (£716.10.10)
Victor Super £530+£221.19.2 PT (£751.19.2)

Victor Estate Car £605+£253.4.2 PT (£858.4.2)
Velox £655+£274.0.10 PT (£929.0.10)
Cresta £715+£299.0.10 PT (£1,014.0.10)

An admired car, and a much desired car. A car the fastidious and the knowledgeable will be proud to own. That's the 1960 Vauxhall Cresta.

Ask for speed, and it goes like the wind. Safety is its middle name — with that extra visibility all round, those powerful, reassuring brakes, and the road-hugging stability for which the 1960 Vauxhalls are famous.

Try it with a full load aboard . . . six if you like and luggage to boot. Make your own assessment of its 6-cylinder performance: its ability to tick along silently in traffic, to cruise at 70 all day, to accelerate up to mile-and-a-half-a-minute speeds when you're in a hurry. Check how easy it is to manoeuvre and to park when you can see all four wing tips from the driving seat.

Then ask your Vauxhall dealer about the new styling, the new features, the new colours, the luxury fittings inside and out. He'll enjoy demonstrating that all we claim is true. And we're pretty sure *you'll* enjoy the experience too.

Marvellous? Yes — it's a 1960 Vauxhall.

LIVERPUDLIANA No. 14

The Towne Clerkes Plate

Extract from the Liverpool orecedents (Municipal records) circa 1611

One of the earliest mentions of the Town Clerk appears in an entry on 16th August 1611.

". . . yet in ende by the Councell of this towne, Peter Tarbocke of Wytton in the County of Chester was elected and chosen to be Towne Clerke in steed of the said Mr. Hewett.

. . . That Peter Tarbocke . . . is and shall delyvr on New Yeresday next to the Maior of this towne then beinge in plate the some of flortie pounds and ten pounds more in plate on Midsomr. even. All wek. is to be bestowed on the Maior, marked with the Cormorant, the townes Armes on it."

Today the Town Clerk is not called upon to make a gift of plate to the Lord Mayor! but he is only too ready to give industrialists detailed information about Liverpool's great industrial estates at Speke, Aintree and Kirkby. If you want to expand productivity you will find good factory sites and generous financial terms available. Write to

AIR FRANCE

FAST

TO THE FAR EAST

OVER OR ROUND

Air France provides two main services to the Far East, both are fast and both luxurious.

OVER THE POLE. This is the finest direct route from Europe to Tokyo; 8,250 miles in 31 hours from Paris. There are now two services every week in each direction. Easy connections from London to Paris.

EASTERN EPICUREAN. This is the classic air route to the Far East via India. Leaves London three times a week, on Saturday, Monday and Wednesday, with return flights on Tuesday, Thursday and Saturday; calling at main centres. Like all Air France services the cuisine and comfort are unrivalled. Many passengers prefer to fly out by the Polar route and return via Eastern Epicurean, or vice versa.

The New and Bigger Boeing 707 Intercontinental will be flying from January 1960 on Air France services to New York, followed by services to Los Angeles, Tokyo, Central Africa and South America.

Full details of both services from your travel agent or

coils wound in anodised aluminium foil instead of copper, which is normally used. The new transformer is produced by the Ashton-Young Engineering Development Company, of Kingston-on-Thames. Rated for 175 amps continuous operation—the size commonly used for welding sheet metal up to ½ in thick—the new welding unit weighs only 67 pounds; the transformer is slightly smaller than a portable television set. Conventional copper-wound welding equipment for the same job weighs several hundredweight and can be moved only on a trolley.

Aluminium is somewhat less conductive than the same volume of copper; but its weight, volume for volume, is less than a third of copper's, with the result that the weight of the transformer coils, in which ordinary mains voltage is stepped up to that necessary for welding operations, is greatly reduced. In the new transformer the aluminium is used in the form of foil—slightly thicker than a milk-bottle top—and the metal is anodised, which makes unnecessary the separate insulation needed in copper-wound transformers. The transformer case is made of fibreglass, and natural air cooling (without the usual fan) is used, thus further reducing weight.

Research on aluminium transformer windings was carried on for Ashton-Young by Imperial Chemical Industries and Aluminium Union of Canada. The transformers will be assembled at the Bermondsey factory of Remploy, the National organisation which employs severely disabled persons. This is believed to be the first commercial application of the principle of aluminium-wound transformers, though an experimental power transformer made of aluminium was made in the United States a few years ago. The new transformer sells for £64, compared with £80 to £100 for other comparable welding equipment.

GROUND EFFECT MACHINES

Developing the Hovercraft

PLANS for the future development of the Hovercraft have become clearer with last week's statement from the National Research Development Corporation, which sponsored the invention. Commercial interest, reflected by 150 firm inquiries from potential users or producers, and rapid technical progress have encouraged the NRDC to back further development with its own money, which may mean paying for three new commercial prototypes of about 40-100 tons. One will be designed for use over smooth water, such as rivers—versions for over the open sea are not yet planned; another to operate over land and water, as might be called for in northern Canada, with its many lakes; and the third for use over land. Design will differ considerably between these types—those operating over water need buoyancy, while the land machine does not.

The specifications that will be issued for these types will therefore be necessarily broad. They are being drawn up by the NRDC subsidiary Hovercraft Developments Ltd., where the machine's inventor, Mr C. S. Cockerell, is in charge of technical development. It is hoped that these will help to stimulate thought about the hovercraft among engineers in other firms and other industries who may produce new ideas on the subject, while the NRDC hopes that some companies will offer to help finance the development of prototypes themselves. The Hawker Siddeley group has already shown interest, and possesses both the knowledge and the money to aid the project. But if no private finance is forthcoming, the NRDC will be able to pay for the prototypes itself.

The new prototypes are being built to allow trials of commercial-sized machines in the areas where they might be operated. Northern Canada, the interior of Australia, and the rivers of Africa and Asia are the areas from which most inquiries have come. The new machines, which should be in use by 1963, will be operated in such areas to learn what features the production versions should include. Development is still at an early stage, and suggestions that Hovercraft will soon be in commercial service remain premature; but this sounds a realistic technical programme.

HARD FIBRES

Dearer Sisal

AFTER holding steady for two and a half months, British East African sisal has gone up by £2, bringing the top grade to £92 a ton cif. Though prices are still about £8 below this year's peak, this year's average is about one-fifth higher than in 1958. Demand is usually strong at this time, because spinners have run down their stocks and are buying for the new season. But producers feared that some part of the big increase in shipments to Europe earlier this year had been put into stock, and that spinners would therefore buy sparingly now. Imports into the United States dropped by 10,000 tons to 44,000 tons between the first half of 1958 and 1959, but this was more than offset by the sharp rise of 30,000 tons to 190,000 tons in the imports of Western Europe, Japan and Australia. The firmness of the market suggests that European spinners are not over-stocked. They have been buying for delivery well into 1960, and some grades are becoming short.

Demand for sisal appears to have outstripped production this year. European countries had bumper harvests; the United States did, too, but American production of sisal twine is suffering from competition from henequen twine from Mexico and sisal twine from Europe. Mexican sales of henequen fibre to the United States, to be made into twine or padding, have risen so sharply that Mexico no longer has a burdensome stock. In other countries, particularly Japan, consumption of sisal has been helped by the shortage and high price of abaca. Output in British East Africa, the largest sisal producer, rose by seven per cent to 190,000 tons in the first nine months of 1959, compared with a year ago, and Brazilian exports are almost as large as in 1958. Brazil has long ceased to be a weak seller, and offers from that country have recently declined. Buyers would like to know whether this indicates a lack of supplies, or whether Brazilians are anticipating a more favourable exchange rate.

SHORTER NOTES

Motor output reached a new record level in October, when a total of 110,354 cars and 33,430 commercial vehicles was produced. The weekly average of cars produced was 27,589, compared with 24,348 in September and 25,116 last April, the previous record month. Exports of cars in October, at 49,892, were roughly one-fourth higher than in October, 1958.

★

There has been a notable increase in the rate of new machine tool orders placed by industry since about the spring of this year. In the five months from April to August machine tool makers received just over £24 million worth of new business from their British customers, against £18.7 million over the same period last year and £23.3 million in 1957. Orders from overseas, too, are not dwindling so fast now. The £6.7 million worth received in these five months is about the same as a year ago. Output has not yet improved, but the industry's order books at the end of August, worth just under £50 million, represented only 7-8 months' production.

★

France has repaid $200 million of credits drawn from the International Monetary Fund in 1957 and 1958.

£ Money for Government $

To Grips with a World Problem

GOVERNMENTS of every sort since the war have run into considerable difficulties in financing their activities. No one is very surprised that in Chile, where prices have been doubling with some regularity every two years, the main source of government borrowing is the central bank. Nor was it to be expected that France or for that matter Britain, at times when prices were rising by 5 per cent a year or more, would find it easy to continue to persuade investors to accept government obligations expressed in fixed (but depreciating) monetary units. But the acute difficulties that in 1958 afflicted the bond markets in the United States and Canada could not so easily be explained away simply as the result of inflation. Retail prices since the end of the Korean war have risen by less than 10 per cent in the United States, a rise that is smaller than that in any other important country, Germany included ; and American prices today are no higher than they were two years ago. The fact that the United States government has found difficulty in attracting investors at this time has demonstrated with force that the problem of securing adequate money for government in the postwar period is a world-wide one. It deserves a world-wide survey.

There are two major reasons for the new postwar difficulty. First, governments have much more to finance. In all western countries, the state's direct operations in the economic system have increased considerably since before the war—for military purposes or for social purposes, to develop new industries too large for private enterprise or old industries too unattractive for it, or simply to run industries and services for which the state happens to be responsible. Some part of public investment outlays in these fields has usually, and rightly, been financed through loans rather than current receipts. And most governments have also to refinance huge borrowings incurred to pay for the war itself.

But at the same time as there has been much more to finance, the general change of economic climate since the war has disfavoured the traditional means of financing it. Inflation self-evidently discourages lending for a fixed money return, and there has been inflation in plenty since the war. But even a conjuncture of generally buoyant trade and steady economic growth with no inflation of prices tilts the balance of investment advantage quite substantially, away from the fixed interest security towards the ordinary share with a flexible dividend. For the flexibility may be expected to be much more consistently upward than in the years when firms had to contend with prolonged trade depressions and could rely much less on help from the state. Looking back at the decade and a half since the end of the war, indeed, the surprising thing is that difficulties of government financing did not become marked much more quickly. This is partly because it has taken time to be sure that the major postwar change in investment climate is here to stay. By now, most investors have decided that it is. That is the basis of the cult of the equity—and of the financing problems of governments.

There are some people in the banking world who feel that the appropriate solution for this problem is to abolish it—that governments have no business in peacetime to be net borrowers in the capital market, that whether the government is financing long-term investment projects or not, the "overall" budget ought to be balanced from taxation alone. But the question of how much of the country's investment should be in the public sector is not primarily a financial one ; nor is there any basis for saying that whenever investment is undertaken by a public agency it must be financed from current revenue. If it is decided on political or economic grounds that a given volume of public investment is desirable, then it is surely up to the financial managers to devise the means of financing it. If at a time when the economy as a whole is not over-extended, public investment projects are discouraged because of the difficulty of financing them, that is likely to be a sign that finance is not doing its job. And in most countries that is not likely to be tolerated for long.

Living with the National Debt

Acceptance of the new circumstances involves a revision of old ideas about the national debt. This has gone a good deal further in Britain than in most other countries: the United States, for example, still imposes a ceiling on total Federal debt, and many observers there and in other countries were critical of the emphasis in the Radcliffe report (generally welcomed by people in Britain who had given thought to these questions) on the role that debt management does and should play in monetary policy.

Traditionally, the national debt was seen as a product of war, a temporary burden to be extinguished as soon as possible. Certainly nothing has ever matched war in creating public debt, and the two world wars in this respect surpassed all their forerunners. The increase in the debt in the last war was indeed generally so large that for the first time talk of extinguishing the debt disappeared. (Rare exceptions were neutral Switzerland, whose government still does not borrow, and defeated Germany, which could repudiate Hitler's borrowings and today has only a tiny internal debt.) In practice, the national debt has continued to rise in most countries since the end of the war, though at a much slower pace. But in relation to national income the debt has fallen, and in most countries (the notable exception is the United States) this ratio is smaller today than before the war. To a large degree that is a result of inflation, the classic means of reducing the burden of debt ; it is not accidental that of the countries listed in the tabulation overleaf the present ratio of debt to national income is lowest in France.

The concept of the national debt as a "burden," however, is of very limited validity. The fact that the government owes its citizens certain sums is not really a burden on the nation as a whole—for this reason "public debt" would be a far better appellation than "national debt." Public debt that is held internally provides for a future shift in distribution of income, from taxpayers as a whole to holders of government paper—which may itself, admittedly, lead to difficult problems of high tax rates. Increases in the debt that are accompanied by increases in real productive capacity in the

public sector may not even involve a transfer problem of this kind, since the future debt service will be matched by higher public or private real incomes.

Most governments and central banks now recognise that the size of the debt is less important than the maturity structure. The shorter the maturity of government paper, the higher the degree of liquidity—the easier is conversion into money. Finance during the war usually gave rise to a big increase in short-term debt, and monetary authorities soon became concerned to convert (or "fund") such debt into longer maturities. Moreover, with the passage of time large blocks of medium-term and long-term paper successfully issued during the war have approached maturity. Refinancing alone can be a major problem for a government bond market, whether of wartime borrowing (as in Canada's massive and ill-fated refunding operation in 1958), or of recent borrowing (as in the United States at present, where the current budget is broadly in balance).

Even those governments that still feel reluctant to finance public investment by an increase in debt, therefore, must find a way of attracting investors to buy their long-term bonds. How should they set about it? Some people feel that the only ultimate solution will be to give up the fixed monetary return, as countries in which inflation has been most serious have been forced to do. Interest and principal have there been linked to certain indices—the cost of living, the price of gold, leading industrial shares. Such devices undoubtedly bring in the money; but the effective interest charge is high, and above all the expedient marks, in the words of the Radcliffe committee, "a confession of failure" by the authorities in the stability of their own money. Significantly, when France reformed its finances last December it announced that it would issue no more indexed loans.

Pull of High Interest Rates

The alternative device that has secured much more favour in recent years has been, simply, an attractive rate of interest. It has long been argued from many sources that demand for fixed interest securities cannot necessarily be encouraged by raising the interest rate, particularly as this has the effect of depreciating the market value of existing portfolios. But in the past two years there has been some impressive experience to the contrary. The gilt-edged market in Britain was transformed by the 1957 increase in Bank rate to 7 per cent; at the same time as investors were reassured that the authorities meant to keep inflation in check, they were offered yields on Government bonds more attractive than they could remember. A second major psychological boost to gilt-edged came this autumn with the Conservative election victory and the reversal, for the first time in Britain, of the traditional relationship between gilt-edged and equities. Equities on the basis of their current dividends now yield, not more than gilt-edged but one per cent less, and the most popular shares may yield up to 3 per cent less. In the United States, as in other countries, the yield lines "crossed" some time ago; the Netherlands, where according to our correspondent institutions still regard equities as the "risk" investment, is one of the last countries in which the old relationship remains.

Once government bonds are yielding more than ordinary shares, the monetary authorities, provided always that they keep inflation in check, should not find it difficult to stimulate demand for bonds. Every further increase in their yield may now add to the differential in current income over that on shares; the investor whose preference stays with shares must then make more and more favourable assumptions about growth. The equity cult can become a luxury. A number of institutions in Britain are now busy with calculations about switching; and even on Wall Street, which not long ago was proclaiming its faith in equities and nothing else, last month's issue of Treasury notes at 5 per cent, quickly christened "the magic fives," has caused some reassessment. In Canada the authorities recently offered investors not only yields above 6 per cent but an exceptional option in choice of repayment dates; here, too, attractive terms appear to have brought the market round.

In these basic tendencies the main countries seem to have been moving together. But the techniques of government finance and the structure of the financial markets vary tremendously, so that the same apparent development in two countries may signify quite different things. For instance, an increase in Government borrowing through Treasury bills in Britain is almost sure to involve finance through increased bank credit. But in the United States no such inference can be drawn, because of the importance in this market of investors other than the banks. The broadness of the short-term market is also the reason why the Federal Reserve now prefers to confine its open market operations to this sector (before the "accord" of 1951, the Federal Reserve not only operated in long-term securities but pegged their price).

One key question in assessing the methods of government finance is the scope that exists for by-passing the market. The United States appears to be one of the few countries in which the Treasury stands quite exposed: it may overdraw at the Federal Reserve to only quite a small amount, and temporarily, and it exercises no influence of its own on investment of official funds, which proceeds on actuarial precepts. In Britain, by contrast, there is no legal limit to advances to the Treasury from the Bank of England (though only marginal and very temporary use of these facilities is made in practice); and very large official funds can and do adapt their investment to suit the Treasury's needs. In most other countries there is some limit to advances from the central bank, but also scope for influencing the investment of official funds. It should be noted that institutions other than the central bank can add to the Treasury's resources only in so far as they themselves draw funds from the public or central bank. But they can be used to manipulate the distribution of debt. In Britain in recent

† Industrial shares only. ‡ Average of months; see charts for recent trend.

years, the "departments" have been used to facilitate a continuous process of "funding" of debt into long-term maturities. They tend to keep market prices down rather than hold them up.

Thus in practice, the British Treasury, which in theory has great freedom to by-pass the discipline of the market, has made far better progress in avoiding an excessive concentration of short-term debt than the American Treasury, which must raise every cent from the market but may not do so (for over five years term) at more than 4¼ per cent. Yet the British system of channelling all official funds through the Treasury still has its dangers; if the scheme for special deposits were ever introduced, for example, it might provide the Treasury with cheap finance and lessen the pressure for it to pay adequate rates in the long-term market.

Because governments, and people generally, have to a large degree accepted the need for high interest rates, the problems of government financing today look distinctly less formidable than they did a short while ago. But the swing of opinion towards higher rates has brought other problems. For example, it is becoming increasingly difficult to use lower interest rates as a stimulus in a recession. Since investors feel that the recession is soon likely to be over, and interest rates soon likely to rise, the authorities may have to pump very large funds into the market to achieve a given reduction in rates. Investors in the United States, for example, will not be so easily tempted into a low-coupon stock in the next recession if they are still taking a loss on bonds they bought in 1958. There are real difficulties in making long-term interest rates flexible. The signs are that the long-term need is for them to remain high.

America's New Money Crusade

THE financing difficulties of the United States Treasury have become more acute, and widely publicised, during the past year and a half. But even today the general public, and overseas financial observers, often misinterpret the nature of the problem. Its real source is the excessive concentration of short-term maturities, rather than an excessive volume of public debt as such, or continuous large scale deficit financing. The problem of selling an adequate amount of long term Treasury securities to maintain a sound maturity distribution of the public debt has in fact been present ever since the war, which with its unparalleled scale of Federal spending brought the Federal debt up from $44 billion to $257 billion. With the passage of time, the need to repay or rearrange this debt has assumed increasing urgency. Through these years, however, government financing has been hindered by inflation, which has attracted many investors into equities and other investments largely immune from monetary depreciation.

Total Federal debt has continued to rise, though at nothing like its wartime pace. Federal budgets have shown rising deficits during periods of recession, partly because of reduced revenues and increased unemployment compensation, but also because of new spending plans calculated to speed recovery. Budget surpluses during periods of boom have been too small to offset the recession deficits, so the Federal debt has increased by about $30 billion since the end of 1946 to $290 billion today. This does not signify an equivalent shortfall in Federal revenue below current expenditure. The US Treasury does not distinguish capital items from the current budget in the way that many European countries do, yet plainly there are many capital items in the US budget which might justifiably be financed by loans. Total Federal investment in civil items, on a narrow definition, excluding much social investment, amounts to 8 per cent of all investment in the United States; if military items were included the figure would be 32 per cent.

In relation to national income and total national savings, budget deficits have rarely been very large, and they have been justified on Keynesian precepts. The total Federal debt, at 61 per cent of national income, is substantially below its ratio to national income in 1948 (when it was 96 per cent), and despite the massive increase in debt in the war years it is not too far above the ratio in 1938. Nor is the weight of the debt, as expressed by this ratio to national income, high by comparison with other countries (see the facing table). The trouble has been that too much of the increase, particularly in recent years, has been financed by Treasury bills and other very short term issues, though it should be noted that these have not been taken up primarily by the commercial banks. This has been reflected in a sharp rise in short-term interest rates. During this year a special distortion has come into play, and it can be removed only by Congress. The statutory ceiling of 4¼ per cent on new issues of bonds—defined in America as securities of more than five years' life—rules out the possibility of issuing such securities at current market terms.

Long before market yields rose to this point, however, the US Treasury refunded too many of its maturing securities (issued during the war) with shorter issues; and the longest term war time bonds are getting shorter with the passage of time. At the end of 1946, for example, there were $55 billion of marketable bonds outstanding due for redemption within 10 years. Twelve years later, at the end of 1958, this amount had shrunk to $30 billion.

The market for long term fully taxable Treasury bonds has suffered from intense competition from (1) higher yielding government guaranteed mortgages, issues of which have increased by over $50 billion since the end of 1946; (2) fully tax-exempt State and Municipal issues, which have increased by about $45 billion and may reach $8 billion in 1959 alone; and (3) industrial shares, which give a hedge against inflation, although since 1958 the yield has been below that on fixed interest bonds.

In recent years, investors who bought large amounts of long-term government securities during the war have made substantial liquidations in order to switch into more attractive investment media. The main savings institutions—the insurance companies, mutual savings banks, savings and loan associations, corporate pension funds, and local government pension funds—have reduced their total holdings of government securities from $42 billion twelve years ago to about $31 billion today. When the

Banking business of every description transacted.

rapid growth of institutional assets is taken into consideration, the decline in their holdings of "governments" is even more striking. In 1946 life assurance companies had 45 per cent of their assets invested in governments; the proportion now is only 7 per cent. Twelve years ago mutual savings banks had 63 per cent of their assets in governments; today they have 20 per cent.

It should be stressed that the government securities market is now free of official intervention, so the Treasury must compete openly with other borrowers. During the war, and up to March, 1951, the Treasury market had been rigidly pegged by the Federal Reserve System and the longest term 2½ per cent Treasury bonds were maintained above par. This process turned the Federal Reserve into an engine of debt monetisation, since it lost all control over the volume of bank reserves. It thus contributed to the postwar inflation. In March, 1951, the Federal Reserve declared its independence and unpegged the market. It has since confined its open market operations entirely to Treasury bills. Against the wishes of the Federal Reserve Bank of New York, Mr William Martin and his Board in Washington decided to confine their market actions to affecting the volume of bank reserves, relying on arbitrage in the market to spread the effect through the range of interest rates. The Federal Reserve has therefore intervened in the market for longer maturities only on a couple of occasions in order to correct a "disorderly" market; the last such intervention was in July, 1958. The Federal Reserve does not support or underwrite Treasury issues, or offer more than very small temporary and exceptional facilities for direct day to day finance. Nor is support for the Treasury available from government funds, which invest strictly on actuarial precepts. The independence of the Federal Reserve has been specifically approved by President Eisenhower, even when as in 1956 this involved a clash with his Secretary of the Treasury.

The market for US government securities has fluctuated over a wide range since March, 1951. Prices rose temporarily but quite sharply when the authorities during the two recessions were deliberately reducing interest rates; in the periods of recovery and boom, however, bond prices have slipped back more. The trend of interest rates has been upward; this autumn they have reached peaks since 1929. The Treasury and Federal Reserve recently conducted a joint study of the government security market to see whether steps should be taken to create a broader and more resilient market. The inquiry was focused particularly on the sharp decline of quotations in mid-1958 and on the ensuing heavy liquidation of speculative holdings. The report tentatively concluded that speculators had probably learned their lessons the hard way. It was intimated that the easy money policy may have been pushed too far in the 1957-58 recession to the point where lenders responded too actively to speculative demands for credit in that market. But the report added that "vigorous use of financial policy to promote economic stability runs the risk of being accompanied by instability in the financial markets, where flexible movement is an essential part of market mechanism. This appears to be a risk which we must take. . . ."

An Efficient Free Market

The market for US government securities has by far the largest volume of any financial market in the country. It handles each year a dollar volume of transactions of about $200 billion, or more than five times as much as the dollar volume of transactions in all corporate shares as well as bonds on the New York Stock Exchange. Notwithstanding the liquidations of recent years, investors other than the banks retain large holdings in governments, and the market is a broad one.

The trouble in this market has nothing to do with its mechanism—being clearly due to the reluctance of the Treasury to pay the competitive rate necessary to float a significant amount of long-term bonds in the existing market. The inadequate long-term Treasury offerings that were made were always severely criticised by Congressional advocates of easy money; in 1953, the Treasury was accused of paying far too much with its bonds of 3¼ per cent. During periods of prosperity market conditions were always unfavourable and would have demanded high rates; and during periods of recession the Treasury (much more justifiably) was always fearful of causing a further downward spiral in the economy by competing unduly with the market for mortgages, industrial bonds and municipal bonds. So there never seemed to be a good time to sell a sufficiently large amount of long-term bonds.

Now that the problem has become acute, the present Anderson-Baird debt management team in the Treasury seems determined to achieve some significant extension of maturities, a task which totally eluded Mr George Humphrey. But today Treasury determination is not enough: Congress must remove the statutory ceiling of 4¼ per cent. A pitched battle on this question and attacks on the Federal Reserve's restrictive policy are expected when Congress reconvenes in January. One of the greatest monetary debates since the days of William Jennings Bryan in 1896 has been shaping up. Today's crusade, for realistic interest rates, is a very different one.

The acuteness of the US Treasury's current problems is largely the outgrowth of the record peace-time deficit of $12½ billion in the fiscal year which began on July 1, 1958, and happened to coincide with a sharp business recovery and a huge private demand for credit. The Federal Reserve, which had pursued a monetary policy of extreme ease during the 1957-58 recession, switched to a restrictive one in the second half of 1958. This sudden reversal of underlying conditions brought about an unusually sharp rise in interest rates, and severe market depreciation of bonds bought at the cheap money crest.

* As reported in the Treasury Survey of Ownership. All issues calculated to final maturity except partially tax-exempt bonds, which are classified to earliest call date.

Yields in the present market, moreover, are much lower than the Treasury would have to pay to market a significant amount of new long-term bonds.

Since mid-1958, total Federal debt has

increased by about $15 billion. The marketable debt is up by about $21 billion; moreover, bills and other paper with less than one year to maturity have increased by $9 billion and the one to five year debt by $23½ billion. The problem of deficit financing was temporarily swept under the rug by heavy reliance on short term, near money financing, with temporary investors. During this period, industrial corporations may have raised their short-term holdings by $9 billion to $10 billion, miscellaneous investors, largely foreign accounts, by perhaps $6 billion, while commercial banks have reduced their holdings by over $5 billion (to finance their surging loans at a time when the Federal Reserve has held bank reserves in check). Much of the big increase in corporate holdings is attributed to the fact that corporate tax liabilities in this period of recovery from recession have been rising much more rapidly than tax payments. The Treasury must be prepared for an attrition here.

Some officials and not a few outside observers are hopeful that the American bond market is now near the peak in yields and the low point in prices—at least at the shorter end of the maturity range. The successful cash offering of the "magic fives" has encouraged this hope; and they are still over par. More than 100,000 individual investors subscribed to this issue, giving some evidence that investors may be switching some of their preference from low yielding common stocks to high yielding bonds. The Treasury has made great efforts to balance the budget in the current fiscal year, though its estimates may be thrown out by the steel strike, which is depressing corporate earnings. Certainly there should be a seasonal budget surplus available for debt retirement in the first six months of 1960.

Advance Refunding

But circles in the Federal Reserve also fear that there will be an excessive, unsustainable boom in inventories following the steel strike, creating big demands for credit. If this materialises, then liquidation of short-term government bonds by corporations to pay higher taxes, to rebuild inventories, and provide funds for plant expansion may more than offset the effects of the small seasonal budget surplus on the money market. Foreign accounts also may conceivably liquidate some of the recent big increase in their Treasury bill holdings if interest rates rise abroad. So it seems too early to be sure that there will not be some further rise in interest rates, and decline in bond prices, early next year—even if Congress does accept reality and lift the artificial 4¼ per cent limit. If it does not, the prospect will be bleak indeed.

The Treasury has now stated openly how it intends to tackle its problems once its hands are untied. The key problem now is not really financing but refinancing. Mr Julian B. Baird, undersecretary of the Treasury, has put the matter in the following way. Present debt under one year's maturity is $76 billion of the total marketable debt of $187 billion; perhaps $70 billion would not be excessive in view of the liquidity needs of the economy. But if everything that matures during the next two years were refunded into the under one-year range, this would reach $110 billion by October, 1961. Equally, congestion will develop in the one to five year range if the Treasury continues to be forced to confine all current debt extension in that range. There is already $64½ billion there, and a further $8 billion of originally longer obligations will be added within the next two years. Mr Baird further pointed out that the large volume of long-term tap 2½'s sold during the war are now in the intermediate area where they appeal to a different type of investor. The solution put forward for all this is advance refunding, to keep original long-term investors in long-term issues. Holders of securities in the now congested 1961 to 1965 maturities, for example, could be offered 10 to 13 year bonds; naturally the coupon would be much above that on their existing holdings. A conversion of this kind might also attract investors into really long-dated securities. Mr Baird has said that if, in addition to the extension required to keep even with the erosion caused by the passage of time, the Treasury could, in the next two or three years move, say, $20 billion out of the one to five year area into longer maturities, "it is our judgment that we would have a reasonably satisfactory structure of the marketable debt." He made clear, however, that the Treasury would make a cautious approach to advance refunding and would not attempt such an ambitious plan as the Canadian refunding last year, involving 40 per cent of the debt. It can only be hoped that Congress speedily removes the artificial barrier that is in the way of constructive action. Only then will the financing difficulties of the American government be shown up for what they are—the result not, as is so often loosely assumed, of profligacy in government housekeeping, but of technical problems of debt management and an ancient attempt to interfere with the freedom of the market.

Financing Britain's Debt

Although the national debt, in the sense in which we are using the term, is of such great importance for economic policy, there is in existing publications no adequate analysis of it, nor indeed is there any statement of its size, either in published documents or in any official documents that have been brought to our notice.

THE Radcliffe committee, although forced to make this biting comment on the needless secrecy of the monetary authorities', was able through figures produced especially for it to remove much of the time-honoured mystery. This article aims to give a straightforward account of the mechanics of official financing in Britain and its relationship to the economy as a whole.

The Radcliffe figures show that the gross debt of the public sector in Britain (central Government, nationalised industries and local authorities) rose from £9,111 million in 1935 to £34,186 million in 1952 and to £41,105 million at the end of March, 1958. During the war years 1939-45 this increase was naturally concentrated on the debt of the central Government. The debt charged on the Consolidated Fund rose from £6,764 million in 1935 to £8,163 million in 1939 prior to the outbreak of war and to £25,620 million by 1948. In 1958 the total stood at £27,232 million. Most of the recent increase in public debt, therefore, has been on account of the local authorities and the nationalised industries rather than that of the central Government. The total debt obligation of these public corporations and local authorities almost doubled in the years 1952-58, from £6,334 million to £11,107 million.

A more accurate picture of the debt is obtained if the portions of it held by official agencies are excluded. "Net" national debt on this basis has shown a somewhat smaller increase, from £8,385 million in 1935 to £30,727 million in 1958. Official holdings of Government debt are both large and increasing. In 1935 they amounted to only £328 million but by 1952 these internal holdings had risen to £4,697 million; six years later the total had reached £5,022 million.

Marketable gilt-edged securities other than Treasury bills represented 62.2 per cent of the total net debt in 1935. By 1952 their proportion had dropped to 48.2 per cent and in 1958 they accounted for 47.2 per cent. "Market" Treasury bills (i.e. bills held outside official agencies) formed a tiny 4.4 per cent of

£ Money for Government $

the total debt in 1935, but had risen to 9.6 per cent of the total by 1958. Issues of non-marketable National Savings securities rose rapidly in the war years and represented 21.4 per cent of the 1952 figure as compared with 12 per cent in 1935. Since then the aggregate of Savings securities, £5,786 million in 1952, has been virtually maintained, but their proportion has fallen to 18.7 per cent of the total debt. Even so, National Savings securities now total about two-fifths as much as marketable gilt-edged securities, whereas in 1935 they were less than one-fifth ; and these sources fill an important part of the Exchequer's current borrowing needs. Outstanding public issues of local authority debt have more than doubled since 1952 but their proportion of the total debt, at 7.8 per cent, is less than half what it was in 1935.

Lower Ratio to National Income

In spite of the very great increase in the total of the net national debt during the war, its ratio to the gross national product rose only from 204 to 213 per cent between 1935 and 1952, and since then has dropped steeply, to 168 per cent by 1958. The ratio of net national debt to total bank deposits was 430 per cent in 1935 ; by 1952 it had risen to 460 per cent and in 1958 to 485 per cent.

Public investment is more important proportionately in Britain's economy than in most others. The central Government's own direct investment in fixed assets is relatively small, but it makes large scale loans for capital purposes to public corporations and local authorities. Capital expenditure of the central Government amounted to only £41 million in 1938 ; by 1948 it was £114 million and ten years later it was more than twice that sum—at £243 million. By far the greatest part of capital expenditure of the public sector is that of the local authorities and public corporations. In 1948 this amounted to £552 million, but had almost doubled to £1,095 million in 1953, rising to £1,239 million by 1958. The aggregate investment of the public sector amounted to just over 45 per cent of total investment in both 1948 and 1953, but by 1958, after the boom in private investment, the proportion had dropped to just over 35.2 per cent. The actual figure was £1,514 million.

Taxes and Borrowings

This investment was financed by current revenue and taxes to the extent of about 67 per cent. The main forms of borrowing have varied over the years. Net sales of gilt-edged securities and of local authority stock on behalf of the authorities concerned together with receipts from National Savings more than accounted for the total in 1958. There was a net repayment of Treasury bills, and funds were needed for purchases of gold and repayment of sterling balances.

In 1938 issues of marketable securities for the public sector, at £81 million, were substantially less than the total of other issues, as estimated by the Midland Bank. This estimate of other capital issues in 1938 was £118.1 million, excluding all borrowings by the British Government, shares issued to vendors and those resulting from scrip issues, etc. Government securities have continued to weigh heavily in the market ; over recent years new issues of British Government stock have often amounted to more than double all other issues (as defined above).

The maturity structure of the net public debt has changed greatly since prewar days. Treasury bills, which formed a very small proportion of the total debt in 1935, now amount to 20 per cent of "outside" holdings of Government securities ; this percentage would be greater still if calculated on market values rather than nominal values. Bonds with a maturity of fifteen years or more, which formed the major part of prewar gilt edged securities (over 85 per cent), accounted for less than half the total in 1958. That is largely a result of the approach to maturity of stocks issued

Investors and Inflation

in the war ; the Treasury's recent issues have been mainly long-dated.

The market for Treasury bills consists primarily of the banks and discount houses, together with the overseas central banks and other owners of the sterling balances. The remainder of the bills, amounting to about 12 per cent, are held by large industrial and commercial concerns and to a small extent by insurance companies and other financial institutions. The banks are large holders of short bonds and their holdings also extend up to around the ten year range (and, in modest proportions, sometimes a little beyond that). Holdings of discount houses are almost entirely in short bonds of up to five years' maturity. Building societies have large holdings of medium and long dates but are tending to hold shorter dated stocks, while life insurance offices and pension funds are interested mainly in maturities of twenty years and over.

Government Broker's Tactics

It is sometimes suggested that the market in gilt-edged is not a large one. The Radcliffe inquiries revealed, however, that even in undated stocks as much as a third or more of the total issue comes into the market in a single year, while the turnover for short bonds has sometimes reached 100 per cent in six months. Following the Radcliffe committee's recommendation, figures are now being made available of the Government's operations in gilt-edged. The first quarterly figures, extending the Radcliffe series, were published three weeks ago. They relate to the period to end-March last, so that they have a lag of over seven months. But they do bring out the importance of the Government broker's operations and particularly of his operations in buying in the next maturities so as to minimise the disturbance to the market on the day of maturity. For example, in the first quarter of this year, the Exchequer redeemed £354 million of 2 per cent Conversion stock without offering a new stock or a conversion option. It is now shown that, in spite of this, during the quarter the net reduction in gilt-edged portfolios held by the banks and the public amounted to only £60 million. But in the previous quarter the government departments had made net purchases of debt from the public to the extent of £126 million.

When a new issue of government stock is made, applications for the stock are invited by prospectus from the public. However, the large blocks in which such stock is issued cannot be readily absorbed by the market in a matter of days—or, frequently, even months. Stock that is not sold to the public within the issuing period is taken up by government agencies and a part goes into the Issue Department of the Bank of England to be sold through the market in the next few months by the Government broker. Such stocks that are known to be "on tap" provide the authorities with one of their chief ways of influencing yields and prices in the gilt-edged market, and thus interest rates generally. A good example of this can be found in the performance in this market after the election ; generally, while prices have risen by up to three points, the present "tap" stock has been kept at slightly below its issue price so as to give it a decidedly attractive yield, enabling the Government broker to make substantial sales.

The Yield Gap

In the inflationary period since the war there has been much switching out of gilt-edged stocks into equities ; institutions such as life insurance offices, which had their fill of gilt-edged during the war, have not sold gilt-edged heavily but have concentrated their new investment in equities rather than fixed interest stocks. An important example of switching is that of the Church Commissioners whose large gilt-edged holdings have been heavily cut down in recent years and the proceeds invested largely in equities ; in this way they have been able to attain a considerable increase in income and at the same time more than maintain the value of their capital. In the post-election boom, however, yields on government bonds have become so attractive in relation to equity yields that buyers have come back in strength. This sustained demand has come both from individuals and institutions and illustrates the attraction of moderately high bond rates. In comparing the respective yields on equities and government bonds the most widely used indicator has been the difference between the yield on the *Financial Times* ordinary share index and the yield on 2½ per cent Consols. In August this year the yield on the ordinary index fell for the first time below that on Old Consols. Indeed the gap has now widened to over ¾ per cent—exceeding the gap that existed the other way around a year ago.

Old Problem in Canada

BY A CORRESPONDENT

IN 1834 a bill was introduced into the Upper Canadian legislature proposing "that the public debt of Upper Canada be transferred to England." The bill was passed and the Receiver General explained that its purpose was to compel "Capitalists in Upper Canada to look to other than Public Securities." Canada's much publicised financing problems of the past year or two stem from rather different predilections among investors. But the provision of capital to finance Canadian growth has nearly always been a cause for acute anxiety. The dozen or so years since the war have been among the least troubled in this respect.

Public finance has normally—even if not in 1834—been at the heart of the problem. In the nineteenth century Upper Canada (Ontario) set a limit to the coupon rate of interest payable on a new issue in London. As a result borrowing in London was possible only at the height of the booms. In both the canal-building era and that of railway building, Canada undertook huge projects involving considerable public indebtedness in its attempt to try to consolidate an economy separate from and competitive with the United States. Unfortunately, there was a tendency for such projects, begun during a boom, to mature during a recession. The problem of meeting interest payments on the debt was often acute.

During the first world war Canada's public debt increased by more than sixfold, to a level at which the desirability of reducing it was allowed to take a high priority throughout the 1920s and circumscribed economic policy to a considerable extent. In 1938, the total debt of all governments in Canada (federal, provincial and municipal) was roughly one and a half times the gross national product. During the second war the federal debt increased fourfold to some $17.5 billion. Total national debt at the end of the war, however, represented a somewhat smaller proportion of gross national product than in 1938 ; and until 1958, the ratio of the national debt to gross national product fell steadily.

Progress Before 1958

In the postwar period, until 1958, there was a persistent reduction in the proportion of the national debt accounted for by the federal government. Total federal debt was reduced by $2.3 billion (i.e. by about 12 per cent) between the end of 1945 and the end of 1957. By 1957 interest payments on the federal debt had declined to 2.2 per cent of national income, one of the lowest ratios since official national income figures became available in 1926. Moreover,

£ Money for Government $

changes in the structure of the federal debt further eased the raising of long term capital by other authorities and private borrowers. The burden of government issues in the long term bond market was reduced first by the growth in the volume outstanding of Canada Savings Bonds (a non-marketable small savings medium corresponding to National savings in Britain) and secondly, by the steady growth of the Treasury bill issue. Other government authorities accordingly found it much easier to finance investment by new issues, and between 1945 and 1957 the total of outstanding provincial debt increased by $3.2 billion (two and a half times) and the municipal debt by $2.6 billion (four times).

The holding of Canadian Government debt has markedly changed since 1938, as shown in the table. There has been a sharp

Holders of Government of Canada Debt	1938	1946	1956
		Per cent	
Non-Residents	32·5	6·2	3·8
General Public	22·4	35·6	35·9
Resident Corporations	19·5	22·3	17·8
Chartered Banks	17·7	19·6	16·6
Bank of Canada	4·2	11·0	15·9
Government Accounts	3·7	5·3	10·0

reduction in the importance of non-resident holders; a rise in the holdings of the general public (largely in Canada Savings Bonds); and a growth in official holdings, both in the Bank of Canada and in Government accounts. Some of these, such as the insurance fund, invest on strict actuarial principles; others may be used for purposes of debt management.

Financing in the war was at low interest rates; and as in other countries this policy was continued throughout the 1940's. The fear of a postwar deflation persisted for some time; it was thought that the big problem of debt management would have been impeded by greater flexibility in interest rates; and it was held that it would be inequitable to allow interest rates to rise and depreciate capital values of the existing debt.

During the 1950's, with inflation establishing itself as a more significant danger than recession, and with the growing distaste for more direct controls of the economy, Canada shared in the general move towards more flexible monetary policies. The problem of coping with the effects on the money supply of the growing inflow of capital was eased in 1950 when the Canadian dollar was removed from its official peg; this allowed the exchange rate to take much of the impact of a capital inflow. Interest rates became more flexible, but the Bank of Canada retained the view that there was an effective ceiling to rates. Its 1956 annual report, for example, said frankly:

> The degree of restraint that did seem feasible did not limit credit expansion as much as would have been desirable. One reason [was that] the overall rise [in interest rates] during the year was in the circumstances about as large and as rapid as could be digested without upsetting financial markets and investment practices upon porate investment depends, as well as housing finance'. . .'. ---

During 1956 the redemption yield on one long-term government bond had risen from 3.4 per cent to 4 per cent. The same bond now yields 5½ per cent.

The Great Refunding

This came about not so much by the Bank of Canada changing its view about tolerable interest rates, and risking the upset in the market from which it had previously baulked, but rather by a change of heart in the market itself. During early 1958 it became apparent that the Government's reaction to the recession would mean substantial borrowing. This was to be on a scale unprecedented since the war years. The market was prepared for this in the early part of the year by a substantial increase in the money supply. In the event, the raising of new money was combined with an enormous refunding operation, designed to deal with the approach to maturity of vast blocks of war time debt with a redemption date in the early 1960's. The rates of interest offered, at around 4¼-4½ per cent, were "historically high" and at the time they were decided upon must have seemed adequate for the major assault on the current cash problem and the problem of refinancing.

But the United States bond market collapsed before the operation was successfully digested by the Canadian market. There followed a period of great uncertainty. In the first place the collapse of the American market made borrowing in New York difficult. The availability of funds at only a small margin over the hitherto low domestic interest rates of the major capital-surplus country had been a prime factor keeping Canadian rates low despite the high demand for capital in relation to Canada's own domestic accumulation. Secondly, the disadvantages of fixed-interest stocks in an inflationary period (and the continuance of price increases in a depression gave added point to this) were aired more forcefully than before. It was also thought that the Canadian Government's financial problem might have taken a permanent turn for the worse. Two years of deficit financing appeared certain and the Conservatives, when in opposition, had condemned surplus budgeting in periods of prosperity. There was therefore no certainty that there would be a return to a policy of reducing the federal debt out of surpluses built up in times of prosperity—and public authorities might no longer find it easy to meet their needs in the capital market.

Finding a New Level

The Bank of Canada had given support to the market to help it absorb the new issues. But to hold up a market smitten by these grave doubts and glutted by the September refunding operations would have meant an increase in the money supply on a vast scale. In December, when the economy was showing some signs of recovery, as much as was felt safe had already been done. The Bank ceased its support for the new issues. Accepting that the prevailing uncertainty had already upset the market in the way that it had previously argued would follow from high rates, it allowed the market to drop to a level at which it was possible to re-establish confidence.

But confidence was not quickly re-established. One important depressing influence has been the very considerable volume of bonds sold by the banks in order to finance advances, at a time when the Bank of Canada has not been willing to increase the money supply. There is some evidence that in a fiercely competitive bid for custom the banks have encouraged long-term borrowers who were unsure of the wisdom of going to the market at current interest rates to seek bank accommodation. The Unemployment Insurance Fund, too, was a heavy seller of bonds early in the year, following high seasonal unemployment and the worsening of its finances caused by the government's extension of the period for which relief was payable. The volume of marketable holdings outside the chartered banks and Government accounts) rose from $5.6 billion at end-September, 1958, to $7.3 billion at end-July this year, a rise of more than 30 per cent. Those acquisi-

MATURITY OF CANADA'S MARKETABLE DEBT

10 years and over	2,727	7,589	5,739
Total	4,336	14,218	13,521

tions are the result of constant selling pressure from the banks and official funds; little wonder that interest rates have risen sharply.

It has become clear that the federal deficit in the current fiscal

year will be much less than was originally expected, and some confidence has returned to the market. But the authorities have taken no chances. In their September conversion operation they offered investors an unusually attractive double option—short-term bonds, with yields ranging over 6 per cent, that on their first maturity can be converted to long-term stock at the same high coupon. Thus investors can remain liquid and yet insure themselves against a fall in rates. These attractive terms on Government bonds could easily have made it difficult for other borrowers to raise money. Since then several large provincial issues have been successfully made at a normal premium over yields on government bonds.

Some of the potential threats to the market are now clearly receding. The Federal budget raised taxation, making it more likely that economic expansion will result in an early return to a balanced budget, and the finance minister has committed himself to the principle of "providing for the orderly retirement of the debt" in appropriate circumstances. Moreover, it seems possible that the Bank of Canada's policy of holding the money supply stable in the face of rising economic activity (on the ground that enough liquidity was created during 1958 to accommodate the recovery to date) may soon give way to a policy of allowing the credit base to rise *pari passu* with rising output.

Bank and Government

The relationship between the Bank of Canada and the Government has attracted much attention. Constitutionally, the Bank of Canada is the Canadian monetary authority; and although the legal position is such that in the event of a conflict with the Government over policy the Government would prevail if it chose to make an issue of it, the Bank in practice enjoys considerable latitude. It has independently engineered important changes in Canadian banking and in the capital market, and suggested others, some of which have met with Government disapproval.

The Government has the ultimate say; but it has given the appearance from time to time of preferring to ascribe sole responsibility for unpopular monetary developments to the Bank. This unfortunate attitude is not without parallels in the Bank itself—notably, the introduction of a variable Bank rate three years ago. The central bank knew that it could still influence interest rates through control of the supply of money, but under this indirect system its hand is less visible to the general public. The present Administration has also been encouraged in its denial of monetary responsibility by the critical attitude towards tight money taken up by the party while in opposition; it has preferred to accept a policy it knows to be about right while claiming that it is the policy of the Bank and not of the Government. With more experience of working together, and the increasing remoteness of statements made while in opposition, the Government and the Bank may manage to avoid conflicts in the future.

Monetary experience through the recent recession has posed a more intricate dilemma. The Government's anti-cyclical fiscal policies involved large borrowing operations, which the Bank of Canada was not prepared to support with a further increase in money supply; it feared, perhaps still more strongly than the Federal Reserve Board in Washington, that excess liquidity would lay the ground for future inflation. As a result, interest rates rose sharply, even more sharply than in New York. This attracted more American long and short term funds, which in turn raised the premium for the Canadian dollar. Thus because the reflationary policy through deficit financing strained the capital market and led to high interest rates, it also exerted a deflationary side-effect upon the economy through the appreciation of the exchange rate, which hampers exports. The appropriateness of a floating exchange rate has been brought into question by recent experience of this sort. But Canada will probably be reluctant to drop its floating rate, which has on the whole served it well. The root of the difficulty is whether in countering a recession of this kind one can prevent fiscal policy and monetary policy from pulling in different directions.

Belgium's Forced Loans

BY A BRUSSELS CORRESPONDENT

CUTTING the budgetary coat to the measure of the revenue cloth has long been a source of much perplexity in Belgium. The country's monetary organisation has not kept pace with the postwar growth in its economy; the methods of borrowing are defective and the machine seems to creak at every corner. This creaking can be heard by the public in a number of ways. To This is partly because the banks grew out of industry and, despite the 1936 legislation to keep the two activities distinct, they are still closely identified with the industrial groupings under the same financial hats. Partly, however, it is because the state has a direct interest in holding the liquid balances of all and sundry in the extremely efficient postal banking system.

This provides the state with an interest-free loan of more or less unshrinking dimensions amounting to some Belgian frs.25 billion, or in the neighbourhood of £180 million. The state's interest in maintaining and extending this source of funds is reflected in the reluctance of official institutions to accept payment by bank cheque, even a certified one. This means that shipping agents, for example, are put to the risk and inconvenience of carrying big sums in cash to clear and reforward cargoes, many hundreds of thousand-franc notes having to be counted several times over in the process; while the common man must waste time in paying his taxes, even if only for a dog, bicycle or radio licence, by filling in the cumbrous triptych for a postal payment.

The same official attitude appears again in the prohibition against even the biggest of commercial firms making a telephone call on credit; an interest-free deposit equivalent to the biggest two-month bill is required of all subscribers who, when they receive their accounts, must pay up in five days. By the same token, the Government's equivalent that the trading banks keep a large proportion of customers' deposits in the form of Treasury paper. The need for this has long passed, but the Government, having succeeded in issuing a large inexpensive forced loan, has not seen fit to dispense with it and restore to the banks their liberty of action.

Admittedly, the 1957 reform resulted in part of this loan being removed from the servitude of short-term rates. Some frs.20 billion is now semi-consolidated (though still ranking among the short-term issues) at 1⅛ per cent and a further frs.8.9 billion at 3¾ per cent. The Treasury is protected from the risk of having to repay its debts when bank deposits fall by arranging for the most liquid section of the banks' holdings to be in paper issued by the *Fonds des Rentes*. This is a Government Stock Equalisation Account managed by the National Bank, conducting its own open market operations and having its own overdraft facility at the National Bank.

The banks, however, are still subject to the rules setting down compulsory cover against deposits. They were also obliged to pass on the higher interest rates received to time-deposit customers

. . . there's an able branch manager at the bank we use. And behind him is a district head office which has a finger on all our local problems, as well as on the broader issues of the outside world. So we are very well served at both branch and head office levels . . .

—an obligation they were willing enough to assume, because of its publicity value in attracting new customers to the banking system. The impediments on the banks' freedom create a fundamental distortion in the relationship between interest rates, and make money comparatively dear to business borrowers.

If, however, the banks are somewhat hamstrung by the limitations imposed upon them, the Finance Ministry makes its own complaints about the anti-inflationary restrictions to which it is itself subject. The debt to the National Bank arising from the second world war is now consolidated at about frs. 34¼ billion; and the floating balance of the Treasury's paper that the Bank is allowed to hold is limited, by a Statutory Convention between the Minister and the Governor, at frs. 10 billion. In practice, this is used, not as a limitation on the Bank's capacity for open market operations, but as a restriction on the Treasury's overdraft capacity (including that of the para-state organisations other than the *Fonds des Rentes*).

National Bank Calls a Halt

In normal circumstances a large part of the overdraft sanction is always in use, and a period of undue pressure on the ceiling is the signal for the issue of a long-term loan to the public. It can happen, however, that in times of low interest rates and abundant liquidity, the Treasury misses the funding opportunity and is caught by the ensuing stringency with debts it can neither renew nor repay. This happened late in 1956, when the Treasury was faced with the virtual impossibility of paying civil servants their end-year salaries, and was only pulled out of its difficulties by emergency—not to say forced—short-term accommodation from the commercial banks. In the following year the overdraft at the National Bank went beyond the limit; and the Governor was under a legal obligation to put on a stern act as a sympathetic but rule-bound bank manager. The extra accommodation was granted, but only subject to conditions regarding repayment; and it was only by calling into the system short-term resources from the German and Swiss markets that the Government was able to ease the market stringency and restore matters to a normal basis.

These were exceptional events, but they are an obvious danger in a system that functions without an effective market in short-term instruments. The Treasury, though it has freed itself from the risk that a fall in bank deposits will result in the non-renewal of paper that the trading banks have been forced to hold against them, is still apt to find itself depending on the para-state organisations. These, conveniently, do not require the whole of their resources for housing finance, war damage repairs, industrial or agricultural credit and the other purposes for which they exist. The official savings institution alone is a home for fully frs.50 billion of Government and Government-guaranteed securities; and the influence of this and the other official institutions on government finance is clearly very considerable.

Borrowing for Current Expenditure

These shortcomings in the borrowing machinery are the more serious as the state habitually finances part of its current expenditure by borrowing. The sub-division of the budget into Ordinary and Extra-Ordinary accounts has ceased to have any real relation to the distinction between current and capital-account expenditure. Recently however, the University of Brussels, in its Department of Applied Economics, has compiled estimates of the net effect of Government capital operations.

Total fixed capital formation in Belgium as a whole, according to these estimates, was about frs.50.2 billion in 1948 and about frs.91.0 billion in 1958 (at current prices); to this the State contributed, in the respective years, frs.4.2 billion and frs.8.9 billion. On the other hand, in both these years the analysis of the budget data shows the State in deficit on current account, to the tune of

£ Money for Government $

frs.1.2 billion in 1948 and frs.13.3 billion in 1958. Though the 1958 figure is the highest in the eleven years, it is noteworthy that there was a deficit in all but two of the years. It is at this stage to be presumed that for 1959 the true deficit on current account will be even larger than last year.

These figures cannot easily be made to tally with those of the national debt. Excluding the debts arising from the first World War, which are subject to moratorium, the debt rose from frs.47 billion in 1938 to almost frs.300 billion by the end of 1954. Between then and the end of 1958 the total climbed to frs.345½ billion; and by August, 1959, there had been a further increase of over frs.16 billion to a total of frs.361.7 billion. By comparison, Belgium's gross national product is estimated by Brussels University—there are no official figures—at frs.338 billion in 1948 and frs.560 billion in 1958 (current prices). The total debt in August this year was thus about 65 per cent of last year's national product, and last year's growth in the debt was alone almost 4 per cent. In addition to the state debt proper, Belgium stands as guarantor for loans of about frs.105 billion. This includes domestic market loans issued by para-state organisations, and guarantees of the credit of the Congo Government and Sabena for borrowings in foreign markets.

The break-down of the debt at the end of 1958 shows frs.30.4 billion, to be external debt. This does not in all cases mean that the securities are held by foreign owners, since at least one of the loans issued in New York in recent years has been so framed as to appeal to owners of Belgian expatriated balances. Of the internal debt of frs.315.4 billion, the amount ranking as consolidated (over five years) is frs.193.3 billion; one to five year debt totals frs.26.1 billion and short-term debt frs.96.0 billion. The latter includes about frs.40 billion held by the National Bank and the trading banks, and over frs.25 billion of privately owned deposits in the postal banking system. The National Bank and the commercial banks account for at least frs.60 billion of the frs.219.4 billion ranking as consolidated and medium-term bonds. When allowance is made for the holdings of the *Caisse Nationale*, the state savings bank, the other para-state bodies, insurance funds and industrial companies from their surplus resources, it is obvious this is a market less for the private individual than for the corporate investor.

Since the war, indeed, there has been virtually no market for new issues of bonds of long life. New issues, made at interest rates varying in the more recent period between 4 and 4½ per cent, always at a slight discount, have been for ultimate redemption in 10-15 years. There is only about frs.20 billion in the market without a redemption date. As things stand maturities due in the immediate future do not seem to present any major problem; but over five years beginning in 1968 repayment obligations will call for conversion of bonds amounting to something like frs.50 billion.

Within the next ten years, it is to be hoped, Belgium will have succeeded in creating a money market, giving the banks an effective charter that will not muffle them in Treasury paper, and carrying the cyclical budgeting promised by M. Liebaert, the finance minister, to the point at which, over a period, the real current expenditure is covered out of real current accruals. To anybody looking at the present picture this may seem to be a lot to hope; but it is a fact that steps have been taken in recent years at a pace that would have seemed incredible a few years ago.

Threat from the Congo

Further progress, however, may depend on the absence of major setbacks; and the prospect of a serious reverse in Belgium's relationships with the Congo cannot, at the time of writing, be left out of account. There is an element in the Belgian political set-up that too often seeks to wear a political glove on the hand that grasps the economic or financial nettle. It has become clear the

the Congo, which has so long been a source of prestige and profit, must now for a time become a financial liability. The Minister for Congo Affairs, however, has defined his plan in terms larded with tenderness for the taxpayer ; can he have forgotten that a transfer of resources remains a transfer, whether it occurs by lending or by taxation?

The plan appears to be to finance the Congo by loans, which are to be obtained, by what may in the end turn out to be forced borrowings, from the big Belgian finance houses. There is admittedly a good ground in equity for expecting help to be put into the Congo by those who have taken most out of it in profits and dividends and capital appreciation. Nevertheless, the funds used will be some of those that would otherwise have been used to meet the big calls the Belgian Treasury makes each year on the limited capacity of the market. So far, the sums mentioned have appeared rather moderate, and everything depends on the Minister's forecast that the restricted help contemplated will be enough to put the Congo back on the road to prosperity, and still the evil tongues of racial antagonism. Should it turn out that more is needed, however, the need for some drastic reform of Belgium's financial institutions and budgetary practice may again come into the limelight.

Paying for Australia's Growth

BY AN AUSTRALIAN CORRESPONDENT

In recent years, the drive for development and the means provided by a high standard of living have combined to direct a quarter of Australia's national income into investment. In the last prewar year, ending June, 1939, total investment represented about 17.5 per cent of gross national product. A decade later, when much capital expenditure could be accounted as wartime arrears, the proportion had risen to 23 per cent. By 1958-59, when wartime arrears of capital spending had been made good, the share of investment in national product showed a further rise to 27 per cent.

Government policy has certainly played its part in supporting this concentration on investment. Public investment accounted for about one sixth of total investment before the war ; in 1948-49 it was a little more than a quarter and in 1958-59 considerably more than that, at 8 per cent of total national product. The public projects have been directed, as one would expect, towards the essential services or " infra-structure " of a rapidly expanding economy, in which population is growing by more than 2 per cent a year and the volume of production even faster. Among the largest outlays are those for fuel and power production ; water supply, sewerage and irrigation ; road, rail, air and sea transport facilities ; post office, radio and television communications ; and schools, hospitals and related social services. These, no doubt, are necessary foundations for growth ; and they must be provided by governments. In a rather special category is the large expenditure on housing, mostly for lower paid people, which is widely accepted as a proper function of government—although its proper extent is open to argument, especially when average housing standards are high, as they now are in Australia.

At the same time, a big expansion of investment has also occurred in the private sector, representing an increase from about 15 per cent of national product before the war to about 20 per cent now. The greater part of investment from abroad has gone into private industry, and this has greatly helped the economy, especially at the critical point of supporting Australia's overseas reserves.

Three basic considerations have been at stake in government financing methods of recent years. One, stemming particularly from the war, was the desire to keep interest rates low over the period of very heavy wartime borrowing. A second has been the need to curb inflation, especially after the war when direct controls had to be abandoned for various reasons. The third is the dominant objective of the Australian community to maintain full employment and the maximum rate of development.

Accepting Some Inflation

One can say that the last has been dominant. Certainly it has been pursued even at the cost of some rise of interest rates and a degree of inflation. It is not easy for European observers to comprehend the Australian attitude to inflation, probably because they do not fully appreciate the fruits of a rapidly expanding economy. A decline in the purchasing power of the pound by 2½ per cent a year does not prevent real incomes rising when rapid expansion ensures full employment, prompt introduction of new machines and processes, profits and tax revenues adequate to finance research, and optimistic expectations among politicians, entrepreneurs and wage earners alike. In the first years of the fifties, it is true, Australians themselves became inflation-conscious, and investors were attracted to equities rather than fixed-interest bonds as an inflation hedge. But once the steep increases in prices of the Korean period gave way to a gentler upward movement, fears about the future value of money calmed down. Companies have been able, by paying higher interest rates, to finance more of their needs through fixed-interest bonds, which involves a lower tax bill than equity finance ; and government bonds (also at higher rates) have not fallen into general disfavour.

As the balance of the economy has in most years tilted towards over-buoyant demand, it has been appropriate for the Australian federal government to run budget surpluses. From the proceeds of tax rates that are generally lower than in Britain, it has been able to direct a large sum into essential public investments, while still leaving enough purchasing power in private hands for growing expenditures on industrial capital and personal assets such as motor vehicles and housing. The use of inflationary finance, through direct government borrowing from the central bank, or to any marked extent, from the trading banks, has been avoided for the most part—though the central bank has increased its holdings of government bonds.

Commonwealth and States

The structure of government finance in Australia is such that all borrowing from the public on behalf of the federal government and the six State governments is done in the name of the former. The programme is determined early in each financial year at a meeting of representatives of the seven governments. This meeting—the Loan Council—agrees on the total to be raised by government loans in the year, on interest rates and terms, and on allocation of

the proceeds. The Commonwealth Bank and the Federal Treasury provide technical advice ; and since both the central bank and official funds under the control of the Treasury can if necessary give support to Federal loans, the success of the programme is therefore assured in advance. Generally the loan issues have proved to be within the capacity of the market, with only marginal support from the central bank. This achievement has of course been assisted by the contributions from federal revenue to public investment, which have kept down the total of market borrowing.

Over the five years to June, 1959, in which public investment totalled about £A2,300 million, about £A560 million has been

INTERNAL NEW CAPITAL ISSUES
(£A million)

	Company Issues for Cash			Government Loans	
	Ordinary	Preference	Debentures, etc.	Cash	Conversion
1954/55	85·3	6·2	32·0	122·4	253·8
1955/56	79·5	8·7	55·8	93·4	113·7
1956/57	68·0	3·3	56·4	97·7	222·4
1957/58	53·6	2·8	82·2	102·8	344·4
1958/59	70·0	2·0	144·0	174·3	259·1

contributed to capital purposes from the federal consolidated revenue ; a little more, almost £A600 million has been borrowed on government loans (at home and abroad), and about £A500 million has been borrowed from the Australian public in the names of numerous semi-government and local government authorities engaged in water supply, electricity generation, and so on. Total national debt has risen by only about £A430 million in the period, sinking funds and maturities having reduced oustandings. The issue of Treasury bills, hitherto made direct to the trading banks and representing the measure of government financing through credit creation, has declined by £A20 million over the five years since 1954.

Higher Rates and Special Features

The wartime objective of cheap borrowing has been abandoned by stages. A more realistic market has arisen, and it has recently developed important and novel features. During the abnormal conditions of war and the immediate postwar years, interest rates could be held down because investors were prepared to lend for patriotic reasons for a low return, and various controls and shortages inhibited spending. But as these influences weakened and inflation developed in response to the pressure to make up arrears of spending, a yield of a little more than 3 per cent was insufficient to attract funds into government bonds in Australia. In 1950 and 1951,

OTHER SOURCES OF FUNDS FOR GOVERNMENT CAPITAL EXPENDITURE
(£A million)

	Federal Consol. Revenue	Treasury Bills	State Consol. Revenue
1954/55	95·7	— 30	160·5
1955/56	101·9	5	155·9
1956/57	107·8	— 15	158·3
1957/58	123·5	— 10	157·0
1958/59	132·3	31	160·0

there were signs that Australian bondholders were becoming dissatisfied and were anticipating a rise in rates. Bond market yields rose steadily until they reached around 4½ per cent for longer-term issues by mid-1952. The next significant change was early in 1956, when rates rose above 5 per cent and then levelled out at slightly more than 5 per cent, which has been the rate for subsequent new issues. Most Australian government loans are now issued in two parts, comprising a longer-term issue at 5 per cent and shorter-term securities with lower yields.

Internal raisings in the financial year to mid-1959 exceeded £A200 million, compared with £A125 million in the previous year. The market's ability to absorb these offerings was aided by two new features, the issue of Special Bonds and the establishment of the short-term money market. The Special Bonds, first issued in October, 1958, bear interest at 4 per cent until the beginning of 1961, at 4½ per cent for the next two years and at 5 per cent for the remaining three years to maturity. Redemption value is also fixed on an escalator scale rising from par on July 1, 1959 (at one month's notice), to 103 at final maturity. But neither interest nor redemption value is variable, with the cost of living or any other index. Later issues carried similar terms with slight rate adjustments, and met a good market response. These yields of 4 to 5 per cent compare with 5 per cent on the 20-year security issued at par in May, 4½ per cent on the 9-year security issued at 99½, and 4 per cent on the 3-year security issued at 99½ in May last. These new bonds do not of course mark any departure in principle from the fixed interest return.

Creating a Money Market

The other new prop for the increased 1958-59 borrowing programme was the establishment of a short term money market, which continues to exert a favourable influence. It received the express approval of the central bank last March, when the Bank authorised certain money market dealers and granted them lines of credit on certain widely drawn conditions. The new market is required to direct its funds into government bonds with less than three years to run to maturity ; it is against such security only that the central bank undertakes to lend to the dealers. The Bank guarantees a market of last resort for the bonds, at its own price. The new money market attracted £A50 million within a few months, and has since expanded. The funds came from a variety of sources, including trading banks which previously had no way to employ profitably surplus funds overnight or at call, and from investors who had previously been confined to rather limited call and short-term investments, mainly with hire purchase finance houses. These houses indeed developed the first stages of a short-term market by accepting deposits and debenture money at terms from call to twenty years. The government now competes, indirectly through the money market, for these funds.

While the heavy flow of money initially seeking investment in the new market (causing a sudden surge of demand for the limited supply of short bonds) is not likely to be repeated, a steady flow of new money is likely to continue through these channels for the benefit of the public loan programme. This widening of the market for government bonds in Australia will be especially welcome because numerous large war loans issued at low coupons are now reaching maturity. Because of the conditions at the time of issue, when these loans attracted numerous new investors who may, even yet, not have become accustomed to permanent investment in securities, there is a danger that many holders will seek repayment.

The latest advance in improving the money market is legislation authorising the issue of a new type of three-month Treasury Note. In the past, Treasury bills have been held within the banking system yielding only 1 per cent interest. The new bills are specifically intended to be an anti-seasonal weapon of monetary policy, designed to offset the strong seasonal changes in liquidity affecting the Australian banking system, which arise from changes in export earnings and government revenues. The new bills will be available to the public as well as to banks and will yield a return consistent with market rates, at about 3 per cent.

In sum, the Australian public sector has been able to finance its essential activities without serious difficulty during the postwar period because the authorities have financed some capital items from current revenue, because they have met the demands of investors by raising interest rates and by developing the bond market, and because of the high credit standing that Australia continues to enjoy abroad.

£ Money for Government $

A New Leaf in France

BY A PARIS CORRESPONDENT

PUBLIC investment in France amounts to one-third of the country's total fixed investment. The public sector embraces far more than the traditional social services, postal services and broadcasting. Nationalised industries are responsible for the railways, gas and electricity services, coal mines, the bigger commercial banks, the Renault motor works, and a number of other industrial concerns. Obviously, therefore, finance of public expenditure is a big item. Traditionally, France's public finances have caused constant concern; but here, too, the financial *assainissement* of last December has produced a real change. Inflation did not prevent the raising of funds for public investment: finance can always be created and borrowing can always be arranged on certain terms. Through the years of inflation, the French Treasury financed its public needs in two main ways: by borrowing from the Bank of France and from the numerous official agencies that channel funds from the public; and by borrowing in the market on bonds with interest and sometimes redemption value, too, expressed not in fixed money units but variable in line with some other unit of value, such as gold, the price of ordinary shares, or turnover in a nationalised industry.

Both forms of finance tend to exacerbate inflation. The reforms recommended by M. Rueff last winter provided both for a reduction in public borrowing to the capacity that could be met by the market and for abandonment of indexing in the terms of public loans. The plan has worked. The market has been prepared to meet demands on fixed interest terms. French public finances today are sound.

Much attention in discussion of French public finances is focused on the *impasse*, and this entity is often misunderstood. The *impasse* simply represents the amount that the Treasury must secure by borrowing (from official agencies as well as the market). It is very different from the financial out-turn of the ordinary budget. Thus in 1958 the *impasse* was 690 billion francs and in 1959 it is expected to be just under 600 billion francs (compared with frs 1,000 billion in 1956 and 1957). In both the past two years the ordinary state budget itself has been in balance, even after debiting capital items such as war damage and subsidies for re-equipment. The need for borrowing by the Treasury has been attributable wholly to its own loans for capital purposes; total capital formation in the public sector was frs 1,515 billion in 1958. The same budgetary rigour is expected to be maintained in 1960.

It is too early to say how far past methods of public financing will be changed in the new financial climate. Since January, prices of government bonds have risen. But there has been a much steeper rise in ordinary shares, not so much on the old grounds of fear of inflation as on expectations of real economic advance. It remains to be seen whether old investment habits will continue. Since 1938, French prices have risen by thirty times. The "gilt-edged" investment has become the share and not the bond.

Between 1938 and 1958 the prices of shares in fact rose by 45 times. No one was interested in securities with a fixed return in depreciating francs. The two large long-term loans that have been floated by the Treasury in recent years have both been keyed to an index of inflation. In September, 1956, the 5 per cent loan was linked to prices of shares. In 1958, M. Pinay issued his second Gold Loan, with a coupon of 3½ per cent and a redemption value both based on the gold price. The other main sources of finance from the public are Treasury bonds, with a maximum maturity of three years.

But the Treasury has large sources of finance outside the market, from institutions that are obliged to entrust it with a part of their disposable funds. These include the deposit banks, whose holdings of special issues of Treasury bonds and other public scrip must not drop below a certain level.

The direct agencies of the Treasury usually provide substantial resources. First there is the Postal, Telephone and Telegraph Service, which administers the postal cheque accounts and the National Savings Bank. Secondly, the *Caisse des Dépots et Consignations* administers the funds of a certain number of social security organisations and of the ordinary savings banks; the *Caisse* grants loans, particularly to local authorities. It invests a part of its funds in state scrip and it is mainly through this intermediary that the Treasury maintains the price of state scrip when there is need to do so. Thirdly, the nationalised enterprises and the specialised public or semi-public banking establishments (Credit Agricole, Credit Foncier, etc.) float loans which are fairly well

	%	%	%	%
Yields				
French ordinary shares (295 securities)	2·99	3·38	3·01	3·31
Bonds:				
Rentes perpétuelles (irredeemables)	5·04	5·23	5·82	5·48
Rentes amortissables (dated stocks)	4·27	4·32	5·48	5·18
Nationalised industries—fixed revenue...	5·92	6·17	7·44	7·62
Nationalised industries—indexed revenue	3·94	3·13	3·39	3·77

in demand by the public and can provide temporary resources for the Treasury. The terms and conditions of the issue of these loans are closely supervised by the Treasury. Fourthly, *La Caisse des Collectivités administratives* (for the departments, communes, and the Algerian Treasury) is in practice administered by the state. Through the existence of the franc area, that is to say total convertibility of funds between Metropolitan France and the overseas countries of the French Community, the overseas issuing institutes deposit in the Treasury their holdings in France.

Finally, when the Treasury cannot secure funds for meeting its bills by the means above enumerated, it makes an appeal to the Bank of France. The advances are of two kinds: permanent advances (frs 50 billion since 1957) and provisional advances (subdivided in turn into ordinary advances within the limit of a present ceiling of frs 175 billion, and special advances). In 1957 this direct assistance of the Bank was particularly large (frs 450 billion). In 1958, in spite of the reduction of the *impasse* and the success of the 3½ per cent gold loan, these advances still rose by frs 80 billion.

In conclusion, it may be noted that by reason of the past inflation, the burden of public debt in France poses hardly any acute problems. The public debt represents at the present moment only one-third of the national income and is slightly lower than the total of cash assets and fixed bank deposits, whereas in 1938 it very nearly equalled the national income and reached a figure of double the cash assets. The volume of debt has risen from frs 434 billion to frs 7,973 billion; but the national income expressed in francs has risen much more. Interest on the public debt, which in 1938 was 16 per cent of the total current expenditure of the state, was no more than 3½ per cent in 1958.

Holland Trusts the Guilder

BY AN AMSTERDAM CORRESPONDENT

THE central government and local authorities are a major influence in the Dutch capital market; but they have not hitherto experienced the same difficulties in finding buyers for their bonds as have the governments of say the United States or Britain. The main financing problems of the Dutch authorities have been the direct consequence of the war. After the German occupation the Netherlands had to rebuild its sources of wealth and drastically reform the country's finances. The main development in the public debt in the last ten years has been the funding of floating debt. Treasury bills and notes, together with claims of the Netherlands Bank, and payments in anticipation of consolidated loans to be issued, amounted to 61 per cent of the total internal debt in 1948; by 1958 this had been cut to 29 per cent.

A gentlemen's agreement was reached between the central bank on the one hand, and a number of commercial banks and the central institutions of the agricultural credit banks on the other, providing for these to hold a cash reserve at the Netherlands Bank as specified by it. These measures were accompanied by budget surpluses through the years 1949 to 1954 amounting to a total of 2,460 million guilders, and by an increase in private savings. As a result, it was possible to reduce the floating public debt to a figure more in keeping with the requirements of sound financing.

Gradually, the Treasury could consolidate the internal debt by issuing long-term loans. On the whole, few difficulties were encountered. At the end of 1953 the internal floating debt amounted to 6,145 million guilders and the consolidated debt to 8,785 million guilders; by the end of 1955 floating debt was down to 3,963 million guilders against a consolidated debt of 10,987 million guilders. These funding operations were facilitated greatly by the structural changes that had taken place in the capital market.

In the first place, a markedly greater proportion of the nation's savings since the war has been entrusted to institutional investors —consisting of the official funds, two pension funds of government owned industries, the life assurance companies, the general savings banks, the central institutions of the agricultural credit banks and a number of pension funds of large private enterprises. This diversion of savings sources is the result of the growing importance of social provisions, including old-age pensions.

The second factor responsible for the structural change in the capital market lay in the new tax regulations on companies' profits introduced in 1940, and in the sharply increased income-tax scales. The higher tax on dividends, combined with steeper progression in the income-tax, left less scope for individual saving, and besides, made it less attractive for large shareholders to receive large dividends.

Thus the market for shares has been narrowed from both sides. Companies rely less on new share issues to finance expansion; and the powerful institutional investors are not willing to invest more than a very moderate amount in shares. This concentration of capital resources in the hands of the institutions which prefer and must prefer risk-avoiding investment—and fixed interest bonds are still regarded thus in Holland—has facilitated the financial operations of the Treasury to a large degree.

On the demand side in the capital market are to be found firstly the central government, secondly the local authorities, mainly municipalities and provinces, and thirdly, as another important category, private enterprise. Non-financial enterprises raised about 2,600 million guilders in the period 1946 through 1958. This includes nearly 900 million guilders issued by Royal Dutch-Shell, which was largely subscribed by foreign investors. The government in 1958 accounted for under 9 per cent of total investment in the Netherlands (compared with 12½ per cent in 1948) and took 11 per cent of public market issues.

The government has declared that its policy of financing takes into consideration not only the capital requirements of local governments, but also those of private enterprise. In practice, the four principal groups of institutional investors (government and private) invest a large portion of their funds in public securities. At the end of 1957 they held nearly 7,870 million guilders in Government paper and nearly 8,400 guilders in bonds of and loans to local government, government undertakings, and the like, which together made up 63 per cent of their total investments of over 25,500 million guilders at book value. Government funds held a still larger share of their funds in public investments—88 per cent. The holdings of all the institutions together accounted for about 53 per cent of the internal national debt.

Local authorities in the Netherlands are in a difficult position, because they depend almost entirely on the central government for the financing of their ordinary expenditures. In addition, local government loans must conform to the scale of interest rates set by the central government and to certain other conditions of issue. The original intention of this ruling was to prevent undesirable competition amongst the local governments themselves and between them and the Treasury.

Control, however, was too rigid and the scale of interest rates fixed by the central government showed little relationship to actual conditions in the capital market. Consequently, the local authorities were faced with major difficulties in 1956, when they were forced to finance capital expenditures with short-term loans. This has brought much concern to the central bank, and the local governments are gradually being freed from the impasse with the aid of the Bank for Netherlands Municipalities. This institution has centralised local borrowing to some degree by issuing its own bonds on the public market to an amount of nearly 1,100 million guilders in 1956 and 1957 and by obtaining a considerable loan from institutional investors.

In the past few years the guiding-line for Government policy has been to take into consideration the needs for capital resources of local authorities and private enterprise when drawing up the budget. There have been miscalculations, such as in 1957. In 1956 there were signs of over-expenditure, which became more acute in 1957. In both years there was a deficit on the current account of the balance of payments, and in summer 1957 the guilder was adversely affected by the exchange speculation of that time. Domestic confidence was also hit; the bond market weakened and yields rose. Foreign loans were raised, including a short-term loan from the International Monetary Fund. The central bank increased the discount rate twice, while a number of restrictions on international payment transactions were re-introduced. In this way and with the co-operation of the private banks, the difficulties could be overcome.

Present policy is directed mainly towards a consolidation of the floating debt of the municipalities which increased sharply in 1956 and 1957. This consolidation has been facilitated by relatively large purchases of Netherlands securities by foreign residents relieving the demand for long-term funds from Dutch savers. But the Government is still able to raise long-term finance in the market on terms notably below those in nearly all foreign centres. The Netherlands is one of the few countries in which bonds retain their original cachet of a "risk-free" investment and yield less than equities.

COMPANY MEETINGS

WANKIE COLLIERY COMPANY LIMITED

(Incorporated in Southern Rhodesia)

PROFITS MAINTAINED DESPITE LOWER COAL SALES

The following are extracts from the review by Mr T. Coulter, the chairman, which has been circulated with the report and accounts:

The profit for the year before taxation, but after providing for depreciation, debenture interest, debenture trustees' fees and directors' emoluments, was £1,372,044. This shows a small increase of £2,693 compared with last year which was brought about in part, despite lower sales tonnages, by an improvement in revenue from interest. At the end of the year there was a deficiency revenue of £91,024 which in terms of the coal price agreement is recoverable in future years.

A sum of £500,000 was provided for taxation, of which £45,000 has been transferred from the taxation equalisation reserve, and the balance of £455,000 provided from the profit for the year.

An amount of £285,000 was transferred to general reserve in conformity with the terms of the price agreement, and an amount of £100,000 has been transferred from general reserve to a new reserve specifically created to meet increased costs of replacements and obsolescence of assets.

Your directors have declared two dividends during the year. The total distribution was £659,726, which represents 1s. 3d. per share. There has been a reduction of the balance of £366,958 unappropriated profit at the end of last year by £27,682 to a figure of £339,276.

Current assets, not including stocks and stores, at £4,548,411, indicate a surplus of £3,485,437 as against current liabilities of £1,062,974.

SALES

The Company's financial year was given a bad start by heavily reduced sales during October and November, 1958, due to the copperbelt strike. It is calculated that some 150,000 tons of trade were lost. General sales were at a lower level than for the previous year, but an appreciable increase in demand during July and August helped to bring total sales output to 3,618,617 tons, only 293,274 tons less than for 1958. In view of the fact that export afforded no contribution to the sales output the result under all the circumstances is not unsatisfactory.

Our estimates indicate that the year ending August, 1960, should show a rather higher coal consumption in the Federation than we have experienced recently. Thereafter, as the impact of power generation at Kariba becomes more marked, demand from thermal stations and consequently the railways will fall and internal requirements are likely to decline to a low point in three or four years' time.

After this, however, it seems probable that increased demands from the general trade flowing from future industrial expansion will overtake the fall in requirements for thermal power purposes and reverse the trend, and may even maintain thermal power generation for some time at reasonable levels. In this connection it is satisfactory to note that in some of the model African townships now being planned, the use of solid fuels for heating and cooking purposes is envisaged. The Company is giving considerable attention to the distribution of coal amongst Africans and to their education in the use of coal.

It is obvious, however, that the Company will have to face several difficult years, but provided the position is as we see it at the moment we hope that, by drawing on unappropriated profits and with the assistance of our rising investment income, we will be able to maintain dividends at their present level.

We have continued our efforts to obtain export markets without achieving any great success. World coal surpluses have resulted in the development of a highly competitive market and the colliery's long distance from the port of Lourenco Marques remains a considerable handicap.

In order to explore the South American market, the Company's managing director, Mr Logan Wishart, recently accompanied a South African delegation to that part of the world. Whilst no immediate sales have resulted from the visit many useful discussions were held and a degree of goodwill was established which will facilitate future negotiations.

COAL PRICE

The notified average selling price of coal within the Federation, which in terms of the price agreement was fixed at 19s. 6d. per ton on November 1, 1958, has remained unchanged during the year. Earlier this year, however, we were asked by the Southern Rhodesia Government to consider the possibility of arriving at a stabilised coal price which would apply for a period of two years from November 1, 1959.

After making detailed and careful estimates it was agreed with the Government that the average notified price would be 20s. per ton for the period November 1, 1959, to October 31, 1961, subject to the Company's right to apply for a revision of the price in the event of any unforeseen factors arising during that time.

The stabilisation of coal prices in the Federation will be of considerable assistance to industrial consumers in planning future development, and it is hoped that as a result coal usage will increase. Our estimates show, however, that an average price of 20s. per ton is likely to result in the accumulation of further deficiency revenue by the end of the two-year period. Such deficiency of revenue is, in terms of the price agreement, recoverable in future years.

Last year I stated that the estimated maximum possible coal demand up to the start of power generation at Kariba in 1960 was not likely to exceed a rate of some 4,500,000 tons per annum. Now the indications are that this estimate was optimistic, although it is possible that for a short period immediately before Kariba power becomes available the demand rate may approximate that figure.

GENERAL

Investments now include an interest in Clay Products Limited. This company owns and operates a factory near Bulawayo producing first quality salt glazed ware, and the investment is expected to show satisfactory returns in future years.

The production of coke has for many years formed an important part of our undertaking, but, as with coal, demand has shown a decline over the last two years. One of the larger consumers of coke, the Rhodesian Iron and Steel Company Limited, is at present proceeding with the erection of its own coke making plant, which will result in a further reduction in demand during the current year. On the other hand, we can anticipate a corresponding increase in coal demand from that company for coke production, and long term estimates show that the overall market for our coke will eventually exceed the previous maximum tonnage sold.

Sales of "Wankie" tar from the by-products plant at No. 1 Colliery have increased by almost 100 per cent, and our output is fully sold for some further 12 months. With the rapid development of road communications in Central Africa, we can look forward to a continuing demand.

EAST ASIATIC RUBBER ESTATES

The thirty-sixth annual general meeting of East Asiatic Rubber Estates, Limited, was held on November 16th in London.

The following is an extract from the Chairman's circulated statement: The Profit of £83,278 after taxation was £8,436 less than the previous year's figure, despite the increased crop harvested. The production cost per pound was slightly lower than for 1957-58, but this saving was more than offset by the reduction in sales proceeds, which was mainly due to the reduced premium on our liquid latex production.

The replanting of old areas with modern high-yielding clones continues, a total area of 461 acres being scheduled for the current year.

The total 1958-59 output of 4,555,100 lb exceeded the previous year's crop by over 385,000 lb and was the highest obtained since the formation of the Company. For the first six months of the current year the crop totalled 2,405,000 lb, and given reasonable outputs for the remaining months there is a good possibility that the estimate of 4,410,000 lb for the year will be more than achieved.

Unless very large quantities should be thrown upon the market at any one time, a possibility which I do not expect, I am not unduly pessimistic about the future, and though we may see still somewhat lower prices, the demand for natural rubber continues on such a scale that there is little likelihood of any surplus of natural rubber for some time to come.

The report was adopted and a total distribution of 15 per cent approved.

BICC

Mr. W. H. McFadzean's Report to Stockholders of

BRITISH INSULATED CALLENDER'S CABLES LIMITED

on

TRADING RESULTS

for

THE HALF-YEAR TO 30th JUNE, 1959

Dear Sir/Madam,

I have to advise you that on the 11th instant your Directors declared the under-mentioned distribution on the Ordinary Capital :—

Interim of 4 per cent. actual (9.6 pence per £1 unit) less Income Tax at 7s. 9d. in the £ on account of the year ending 31st December, 1959. Net U.K. rate 7s. 0½d. in the £.

Warrants will be posted on 30th December, 1959, payable on 31st December, 1959, to Ordinary Stockholders registered in the books of the Company at the close of business on 12th November, 1959, and to the holders of Preference Shares and Ordinary Stock of Scottish Cables Limited who accepted the BICC offers, dated 23rd June, 1959, to acquire the whole of the Share Capital of Scottish Cables Limited in exchange for Ordinary Shares in BICC, or to whom notice has been given under Section 209 of the Companies Act, 1948.

Comparison between the figures for the half-year to 30th June last and those for 1958 is affected by the inclusion this year of new Group Companies, namely, The Telegraph Construction and Maintenance Company Limited from 1st January, 1959, and Scottish Cables Limited from 1st April, 1959. Even allowing for this, Sales show an improvement over both half-years of 1958 and the Surplus on Trading is up compared with the first six months of 1958.

Surplus on Trading for the half-year to 30th June last on a strictly comparable basis is, however, lower than that for the second half of 1958. This is due partly to the latter having been an exceptionally favourable trading period but mainly to the fact that our ever-increasing efficiency and steady building up of our overseas investments have been more than offset by the effects of the still fiercer competition experienced in several of our activities and in low voltage mains cables and general wiring cables in particular.

In my Statement last May on the BICC Group Accounts for 1958, I referred to the break-up of certain Trade Associations and stated it would be our endeavour to effect an orderly adjustment to the new conditions. In pursuance of this policy when the particular Trade Associations came to an end, for all practical purposes on 1st May last, we attempted to give a lead to the Cable Industry by determining our prices on a basis which would show a reasonable return to an efficient producer, which we certainly are. This lead was not, however, followed and what can only be described as uneconomic competition ensued with the result that prices today over a large range of low voltage mains cables and general wiring cables in particular, are on average considerably lower than they were last April. Your Board are all in favour of prices which are fair and reasonable to the consumer provided they also give a reasonable return to the efficient producer, which prices today certainly do not.

In our opinion the two main reasons for present conditions are excess capacity and the lack of mutual trust in the Industry following the break-up of Trade Associations.

Excess capacity has arisen for various reasons such as the creation of factories in overseas markets previously supplied from this country and technical changes, as, for example, the gradual replacement of rubber by thermoplastic cables for many purposes requiring new thermoplastic plant being installed and rendering rubber cable plant more and more under-loaded. As Stockholders are well aware from my Annual Statements, we have always tried to take all these factors into account in re-equipping our factories and we can rightly claim to have made, and indeed always will be ready to make, our full contribution to the adjustment of production capacity to demand. Certain other Companies have taken or are now taking similar action and other schemes of rationalization will almost certainly follow. It is therefore the opinion of your Board that although the desirable rationalization in the Industry is not yet complete, the problem of excess capacity is being gradually overcome.

Coming now to the second reason in our view for present conditions, namely, the lack of confidence and mutual trust within the Industry, one can understand this to some extent having regard to the capacity problem I have just dealt with, and to the fundamental change for a large section of the Industry from operating under long-established Trade Associations to unfettered competition. Such conditions were almost inevitable following the application of the Restrictive Trade Practices Act, but I am confident the experience gained from the last six months can stand the Industry in good stead in the future if we all take full heed of it. For the alternatives as we see them, are either a continuation of the present uneconomic competition—which can only mean the survival of the strong—or Companies in the industry imposing on themselves a discipline that would enable any efficient Company to take its share of the market and earn a reasonable return on its capital and efforts.

We in BICC certainly hope that the second alternative will prevail. The Cable Industry in Britain has a record of which it can be justly proud in the major part it has played in building up the whole Electrical Industry in this country and in many countries overseas : in the good and stable employment it has given to its employees ; and in the reward it has provided for those who have backed with their money and efforts what was, only 40 or 50 years ago, a new and risky Industry into the expanding and progressive Industry it is today. Present difficulties cannot affect this past record nor can they dim the medium and long-term prospects, for the Cable Industry has a great future. They can, however, cause a temporary dislocation and have a serious permanent effect on certain Companies unless there is a keen and sensible competition instead of the wholly uneconomic conditions applying today.

Let me once again make the BICC Group's position clear. We have spent large sums on research and technical developments, on keeping our factories and organization up to date and on constantly striving after a greater and greater efficiency to render full service to our customers. We want our proper share of markets—no more than that—and we want to sell our products at prices which are fair to our customers and will give a reasonable return on our capital and effort which is our due reward. I cannot think these aspirations can differ from those of any other efficient Company, and we are certainly ready and willing to play our full part in their achievement.

I have departed from my usual brief Statement on the Half-Yearly Accounts as I think it right Stockholders should have their Board's views on the present difficulties, particularly in the low voltage mains cables and general wiring cables field. The result of our home business in these products will not be satisfactory during the current half-year, but these products, important as they are, do not represent a substantial proportion of our total turnover, and all present indications are that in total our overall net profit for the whole of 1959 will not differ materially from that of 1958. We are well equipped to stand up to any competition through having a wide range of allied activities spread throughout the World, but a further objective of our policy must naturally continue to be that each of these activities should earn us a reasonable return.

Yours faithfully,

17th November, 1959. W. H. McFADZEAN, *Chairman.*

EXCEPTIONAL ITEMS—See Note (4)	8,000	219,000	4,000
TOTAL NET PROFIT OF THE GROUP—See Note (1)	£1,799,000	£2,081,000	£1,212,000
PROPORTION OF TOTAL NET PROFIT OF THE GROUP attributable to Members of the Holding Company —See Note (1)	£1,672,000	£1,908,000	£1,183,000

NOTES :—

(1) Sales and Profits for the half-year to 30th June, 1959, include those of The Telegraph Construction and Maintenance Company Limited and of Scottish Cables Limited, from 1st January, 1959, and 1st April, 1959, respectively.

(2) Investment Income for the second half of 1959 is expected to show some increase over the corresponding period of 1958.

(3) Taxation has been calculated on the basis of existing rates.

(4) Exceptional Items relate mainly to adjustments of Taxation Liabilities for earlier years.

MELIAS LIMITED
(Multiple Grocers)

SUCCESS IN 50TH YEAR

The Fiftieth Annual General Meeting of Melias Limited was held on November 12th in London, Mr G. Mason-Styrron, chairman and joint managing director, presiding.

The following is an extract from his circulated statement :

The year ended June 27, 1959, has again been one of very successful trading, resulting in a record turnover and profit. This is particularly gratifying, as during the year MELIAS, as constituted today, celebrated its 50th Anniversary. The actual beginning of MELIAS dates back well over 100 years.

The increase in turnover has not been quite so much this year as in the previous year, because towards the close of 1958, some areas felt the consequences of the reduced spending power caused by a certain amount of under-employment and loss of overtime pay. Early in January, these difficulties were overcome and the sales have progressed very satisfactorily since.

INCREASING TURNOVER

Price-cutting, which has now become the generally accepted way of trading, and competition, have grown even stronger. Only increases in turnover can produce better profits, as the already very small gross profit margins are being constantly reduced. All possible savings have been made but we have continued our TV, Press and Poster advertising campaigns as we consider these to be the most useful media for increasing the vital turnover.

As previously, we are giving you below a table showing you the profit figures of the last few years to enable you to see at a glance how successful we have been :

	Net Profit before Taxation and Depreciation of Freeholds
1956 (53 weeks)	£178,239
1957 (52 weeks)	£220,285
1958 (52 weeks)	£250,498
1959 (52 weeks)	£288,725

Last year Your Board decided to recommend a final Ordinary dividend of 15 per cent, making the total for the year 25 per cent and at the same time a "Special" interim dividend of 5 per cent was paid on account of the year now under review. This year we propose to recommend a final Ordinary dividend of 20 per cent, making the total dividend for the year 30 per cent ignoring the "Special" interim. At the same time we have decided to recommend payment of what I should like to call a Special Jubilee Bonus of a further 5 per cent.

EXPANSION IN CURRENT YEAR

The current year's trading so far has been very successful indeed, with further considerable increases in turnover.

As you will probably have seen from reports in the Press, we have recently acquired the John Bull Stores, Cardiff, group of shops. Although the number of their branches is not large (26 in all), their turnover figures are very good indeed. The purchase of the John Bull Stores group brings the number of our branches to well over 600. This, we hope, is only a stepping stone to further expansion as quickly as possible.

MALAYALAM PLANTATIONS LIMITED

MR H. W. HORNER'S STATEMENT

The annual general meeting of Malayalam Plantations, Limited, will be held on December 10th in London.

The following is an extract from the circulated address of the Chairman, Mr H. W. Horner :

The annual meeting is later than usual this year due to exceptional delay in the receipt from the East of the final accounts and other returns. The information available at this end enabled the Board to decide that the total dividend for the year should be 20 per cent.

The tea crop for 1958-59, at just under 20 million pounds, constitutes a record and the net average selling price realised is slightly higher than for 1957-58. The rubber crop, though larger than that for the previous year, fell very little below the estimated 7 million pounds. The profit for the year after taxation, at £336,597, is a little higher than that for 1957-58.

During the early months of the current financial year exceptionally unfavourable weather conditions adversely affected the intake of tea crops and, at the moment, there has been harvested considerably less than in the same period of 1958-59 although the rubber crop is slightly ahead. Given normal conditions for the remainder of the season, it is hoped to make up much of the tea so lost.

Tea prices have recently shown a welcome upward trend and, if this continues, we may hope to achieve final results comparable with those of the two preceding years.

COURT LINE LIMITED

INDUSTRY STILL HANDICAPPED BY UNPROFITABLE FREIGHT RATES

BRITAIN'S SHARE OF WORLD SHIPPING CONTINUALLY SHRINKING

THE HONOURABLE J. P. PHILIPPS ON DEADLY MENACE OF "FLAGS OF CONVENIENCE"

The thirtieth annual general meeting of Court Line Limited will be held on December 9th in London.

The following is the Statement by the Chairman, The Honourable J. P. Philipps, TD, which has been circulated with the report and accounts:

Ladies and Gentlemen, The British Tramp Shipping Industry is still suffering from unprofitable rates of freight and many other handicaps, and I fear there are few signs of any lasting relief from the present severe depression notwithstanding the large amount of tonnage now laid up and that already sold for scrap. The remaining war-built ships can now be regarded as virtually obsolete and most of them are unlikely to come back into service. Post-war construction, however, has been on a very large scale and a considerable number of orders have still to be executed. Even since 1956 the world NON-tanker fleet has increased by 7,515,000 gross tons or 10.6 per cent while the world tanker fleet has increased by 7,055,000 gross tons or 24.7 per cent. During the same period the British share of the total world fleet has fallen from 17.9 per cent to only 16.5 per cent. Thus fierce competition is assured in the future. To make matters worse, large new Tankers are now being employed to carry grain cargoes, for which, of course, they were never intended. I understand that approximately 75 per cent of the grain shipped at US Gulf ports to the Continent of Europe is now being carried in Tankers. In fact, of one week's chartering for the shipment of 123,000 tons of grain, 100,000 tons were shipped in large Tankers, and since last August Tankers have altogether been fixed to carry a quantity in excess of 1 million tons of grain which would have been sufficient to keep our whole fleet employed for nearly two years.

"A MATTER OF SHIPS OR TAXES"

Heavy over-building since the war is undoubtedly the main reason for the present anomaly of a severe slump in shipping coinciding with a boom in manufacturing industry. It is, therefore, extremely difficult to visualise any real benefit in any Government-sponsored "Scrap and Build Scheme" under which funds would be made available to owners to replace an old vessel by a new one, especially in view of the vast difference between the scrap price of some £40,000 and the new building cost of approximately £800,000. The greater part of the recent over-ordering of ships has been by those in a position to operate under "Flags of Convenience" and so earn large untaxed profits. Thus Britain's share of world shipping is continually shrinking and I can only repeat the warning I gave a year ago, when I said, "There is no doubt, under present conditions, our Industry is facing a deadly menace which can only have one ending, that is, the accelerated decline and final elimination of our Merchant Fleet, more especially the Tramp Section. There is only one way to remedy the situation and the Government need look no further than a revision of its taxation policy as it effects the Shipping Industry. Of course, if the maintenance of an adequate British Merchant Fleet is not regarded as a National necessity there is nothing more to be said. It is simply a matter of ships or taxes."

Unfortunately, no Government seems prepared to listen to old-established Shipowners who well realise the need to retain in the business profits earned in good times because they have learned by bitter experience that periods of plenty are usually followed by periods of famine and that history has a way of repeating itself.

THE YEAR'S RESULTS

In my last Report I referred to the fact that we had re-negotiated some of our forward freight contracts, four of which were extended until April-May, 1960. The result of this arrangement, as you will see from the Accounts, is that the operating surplus for the year under review is practically the same as for the previous year. Taxation, however, takes considerably more because in this year we have had no benefit from investment allowances and we have had to provide for the balancing charge arising during the year. This leaves only £316,000 net surplus available for appropriation compared with £556,500 in the previous year.

In order to relieve the charge for Profits Tax as much as possible your Directors have again decided not to recommend the payment of any Final Dividend for the year ended June 30, 1959. They have, however, decided to pay a Special Interim Dividend of 7d. per share, less Income Tax, for the year ending June 30, 1960. This Dividend will be paid on December 9, 1959, to those Shareholders on the Registers at the close of business on November 24, 1959. This procedure, which I hope will not have to be repeated after next year, has been brought about by the provisions of the 1958 Finance Act relating to the change in Profits Tax rates.

FLEET CHANGES

During the year under review the Company's two oldest vessels have been sold at satisfactory prices. The Company's Fleet now therefore consists of seven ships built between the years 1952 and 1957 with an average age of four years. As you will see from the Balance Sheet, our financial position is strong and we should, therefore, have no difficulty in paying for the two new ships which are on order from British yards for delivery in 1962 and 1963. By that time, it seems reasonable to hope that the laws of supply and demand will have brought the freight market more into balance again.

Of the seven vessels now in our Fleet, two are already trading at current rates of freight and a third will terminate her long-term contract in the near future. The rates ruling at present are barely sufficient to cover costs and cannot cover depreciation. It will be appreciated, therefore, that profits for the current year ending June, 1960, will be considerably lower than those now shown, in spite of the benefit received from the long-term contracts now expiring. Thereafter it is impossible to be optimistic unless there is a substantial recovery in freight rates next spring.

I think we owe a great debt of gratitude to all our Staff both ashore and afloat for keeping our Fleet running at a profit during these difficult times, and I am sure you will wish me to take this opportunity of thanking them all on your behalf.

THE PERAK RIVER HYDRO-ELECTRIC POWER COMPANY

ADVERSE EFFECT OF TIN EXPORT CONTROL REGULATIONS

The thirty-third annual general meeting of The Perak River Hydro-Electric Power Company Limited, was held on November 12th in London, Mr Hugh G. Balfour (the Chairman) presiding.

The following is an extract from his circulated statement:

The Company's operations during the year ended July 31, 1959, were adversely affected to a greater degree than during the previous year by the tin export control regulations under the International Tin Agreement. It is calculated that during our previous financial year ended July 31, 1958, the permissible exportable amount of tin for Malaya was 46,400 tons, while in the year under review the exportable amount was reduced by 30 per cent to 32,521 tons, representing what is known as a quota rate of 54.6 per cent on the basic Malayan output of 59,569 tons under the tin export control scheme.

Over 85 per cent of the Company's output of electricity is taken by the tin mining industry, and there is a direct relationship between the operation of the tin restriction scheme and the volume of the Company's business. Last year the number of units sold was 331.8 million as compared with 230.2 million for the year under review, a decrease of 101.6 million units or 30 per cent, corresponding to the reduction in the exportable amount of tin for Malaya.

CHENDEROH STATION

The year was an exceptionally bad water year, the average effective river flow in the Chenderoh River having been the lowest for 29 years. As a result only 142 million units were generated at the Chenderoh hydro-electric power station, which is 18½ per cent less than in the previous year. Under reasonable river conditions we expect to obtain 190 million units from the Chenderoh Station in a normal year, so there was a short-fall of 48 million units which had to be generated in our thermal power stations. In 1950 a Fuel Equalisation Reserve was created to offset the effect of abnormal conditions of river flow on the cost of generation in our thermal power stations, and since 1955 this Reserve has stood at £100,000. In view of the abnormally low water conditions this year we propose to draw £24,693 which has been placed to the credit of Net Revenue Account.

The two new 12 mW generating sets at Malim Nawar Power Station with ancillary boiler plant, water cooling tower, etc., were brought into operation during the year under review. Our Vice-Chairman, Mr Donald Brook, visited Malaya to attend the official opening of the Malim Nawar extension by the then Prime Minister of the Federation of Malaya, the Honourable Dato Abdul Razak bin Hussain, which took place on May 18, 1959. The Board are grateful to the Prime Minister for undertaking this function, particularly in view of the pressure of his duties immediately prior to the elections in the Federation.

Our subsidiary company, The Kinta Electrical Distribution Company Limited, continued to expand its business, although the average demand from consumers was slightly reduced.

Since the end of our financial year the permissible export amount of tin for Malaya for the period to the end of December, 1959, has been increased, and now represents a quota rate of 71 per cent, as compared with an average quota rate of 54.6 per cent during the year under review. If these better conditions continue the outlook for the current year should be more promising than for the year to July 31st last.

The report was adopted and a dividend of 5 per cent approved.

NEW ZEALAND LOAN AND MERCANTILE AGENCY COMPANY LIMITED

MR MICHAEL G. H. BROWN'S SPEECH

The sixty-fifth annual general meeting of New Zealand Loan and Mercantile Agency Company Limited was held on November 17th in London.

Mr Michael G. H. Brown, the chairman, presided and in the course of his speech said:

The latest information we have received from Australia indicates that weather conditions in Victoria and New South Wales have been reasonably satisfactory in the current season so far. Queensland, as is usual at this time of year, is in need of some good general rains.

In New Zealand seasonal conditions in both Islands are now satisfactory after a very dry period in Canterbury and North Otago.

The average prices for Australian and New Zealand greasy wools are still about 25 per cent higher at this point of the season than they were twelve months ago.

The estimated clip for the season in both countries is larger than last year and if it is achieved will set new records.

Lamb and mutton prices continue at extremely low figures which cause concern amongst the graziers of New Zealand.

However, the demand for cattle is strong as are the markets for butter and cheese.

The season, in the countries where we operate, is opposite to our own and they are now in the middle of their spring. It is impossible so early in their year to give you any estimate of the outturn of the year's working.

There are indications that, if the improvement in wool prices is maintained and the weather is reasonable, we should be able to absorb increased costs, due to recent wage awards, and put before you next year results as good as, perhaps we may hope better than, those you have just received.

The report and accounts were adopted.

THE BIRMINGHAM SMALL ARMS COMPANY

MR JOHN Y. SANGSTER'S CONFIDENCE IN GROUP'S FUTURE PROSPECTS

The Ninety-eighth Annual General Meeting of The Birmingham Small Arms Company Limited will be held on December 11th in Birmingham.

The following is an extract from the circulated statement of the Chairman, Mr John Y. Sangster:

It is gratifying to report an increased Trading Profit (£2,469,819 against £2,261,707) and recommend an increased Ordinary Dividend (12½ per cent against 11 per cent) for the third year in succession. The increased Trading Profit has been achieved notwithstanding less favourable results from our Steel Division which have been more than compensated by improved results in the other fields of industry in which we are engaged.

The Motor Cycle Companies, BSA, Triumph and Ariel Motor Cycles have enjoyed a satisfactory year, making collectively a most important contribution to the profits of the Group.

Buoyant trading conditions have prevailed in the Home Market more especially during the last six months of the Financial Year. In the export field our sales in the United States of America have shown a satisfactory expansion, but on the other hand the popularity of motor cycling in many of our traditional Export Markets has suffered some decline and our sales have been correspondingly reduced.

The sales appeal, both at Home and Overseas, of the new BSA "Sunbeam" and Triumph "Tigress" Scooters which went into production in the autumn of 1958 is fully up to expectations.

The outlook is even more favourable than it has been at any time during the past three or four years.

The Daimler Company's new 8-cylinder (V-8) 2½ Litre Sports Car has been accorded an excellent reception, and it is already clear that the demand will exceed the supply for a long time to come. The 3.8 Litre Daimler Saloon has established itself as one of the leaders in the specialist luxury class.

The financial results show a marked improvement and with the advent of new and attractive products the outlook is encouraging.

BSA Tools Division shows an increased profit as compared with the previous year. Having regard to the improved order position which has been fully maintained since the end of the financial year and to other favourable signs I believe we are justified in looking forward to a continuance of better trading conditions in the Machine Tool Industry.

The Steel Division of the Group has experienced a very difficult year. As to the outlook it seems probable that the present improvement in the demand for special steels will continue and that the more settled political conditions will encourage increased investment in capital goods. The results for the coming year should be better than they have been during the year under review.

The statement then reviewed the activities of the smaller units of the Group and continued:

Although long-term forecasting is always difficult my assessment of the prospects of the Group as a whole is that the information at present available justifies the conclusion that we can look forward with confidence to another successful year.

ROADS RECONSTRUCTION (1934) LIMITED

The Twenty-fifth Ordinary General Meeting of Roads Reconstruction (1934) Limited was held on November 16th at Weymouth Hall, Frome, Somerset. General Sir James Steele (the chairman) presided.

The Chairman's Statement circulated with the Accounts for the year ended March 31, 1959 was taken as read.

The Chairman then brought Shareholders up-to-date concerning the latest development in regard to the bid for the Company's shares by Thomas Roberts (Westminster) Limited.

In amplification of the information given in his Statement, the Chairman explained that interim figures for the first six months of the current year had now been made up showing an estimated profit subject only to Depreciation and Taxation of £154,500, this figure being about 10 per cent in excess of the corresponding profits of the record year to March 31, 1958 (£136,000). The present indications were that the favourable trend in the first six months should continue unless severe weather conditions set in.

As regards future dividend policy, the Chairman referred to the Board's Circular of November 5th in which a Final Dividend of 6 per cent, less Tax, on the increased Ordinary Share Capital had been forecast for the year to March 31, 1960. While forecasts must be made with caution in a trade so much affected by the weather and unforeseen fluctuations in demand, it appeared at present that a Final Dividend on the increased Ordinary Share Capital of 6 per cent, less Tax, should be well within reach. This Dividend together with the Interim already paid would be equivalent to 15 per cent, less Tax, on the Ordinary Share Capital as it now stands.

All the Resolutions put before the Meeting were passed unanimously.

22 RYDER STREET, LONDON, S.W.1

COMPANY AFFAIRS

SOUTH DURHAM

THE unchanged ordinary dividend of 12 per cent from South Durham Steel and Iron is not a very good start for the steel dividend season: the market was disappointed and on Wednesday morning the jobbers marked down prices of all steel stocks. South Durham itself lost 4s. to 56s. 9d. The advance of 10 per cent in South Durham's trading profits, from £7,092,696 to £7,847,094, is not, however, unsatisfactory when viewed in the light of the difficulties that the heavy engineering industries, its main customers, have had in shaking off recession—though the steady working through of long order books by the shipbuilders must not be overlooked.

The group's net earnings have risen from £2,641,117 to £2,692,885 after a heavier depreciation charge of £1,650,000 (against £1,350,000). The net profit figure is struck after a transfer to investment allowance reserve of £1,200,000 (against £250,000), reflecting investment allowances on the group's big expansion programme, of which the third stage is due to be completed by 1963. At the same time a bigger interest charge on the 6 per cent debenture stock (which is convertible into ordinary shares at par next March) of £480,000, against £156,333, reflects the first full year's servicing of this stock.

	Years ended October 3	
	1958	1959
Consolidated earnings:	£'000s	£'000s
Trading profit	7,093	7,847
Interest	430	718
Depreciation	1,350	1,650
Tax	2,307	1,545
Net Profit	*2,835*	*3,748*
Ordinary dividends	552	686
Retained earnings	2,050	2,000

Last October, the Finance Corporation for Industry exercised its option to take up £2 million of South Durham's ordinary shares at par in exchange for £2 million of its outstanding loan (which last year amounted to £22½ million) to the company. Thus the issued share capital of South Durham is now £10 million. On this basis, earnings work out at about 42 per cent and cover the 12 per cent dividend about 3½ times. If all the present holders of the 6 per cent redeemable debenture stock decide to convert next March, that would raise the ordinary share capital to £14 million and earnings would fall to about 31 per cent. The yield on the £1 shares at 57s. is 4.1 per cent. As a result of the directors' cautious dividend policy about £2 million will again be ploughed back into the business as the group's own contribution to the financing of its big capital needs.

MITCHELLS AND BUTLERS

SINCE Mr Charles Clore drew shareholders' attention to brewery companies in May the market has developed a more sensitive nose for take-over opportunities: the shares of W. Butler and Company of Wolverhampton rose by 7s. to 50s. in the fortnight preceding the bid by Mitchells and Butlers of Birmingham. The terms of the offer are three £1 ordinary shares in Mitchells and Butlers for every five £1 ordinary shares in W. Butler, plus 12s. 6d. cash for each unit. With Mitchells and Butlers shares standing at 73s. 9d. the offer is worth 56s. 9d., and since the offer was announced W. Butler shares have put on another 4s. 6d. to 54s. 6d.

Both companies have benefited from past mergers. It is three years since W. Butler took Frederick Smith under its wing and six months since the successful Mitchells and Butlers bid for Atkinsons Brewery, which brought 360 public houses into the group. But this is a much bigger bid, for W. Butler, whose trading profits advanced from £724,748 to £801,000 in the year to September 30, 1959, and whose ordinary dividend was effectively raised by 1½ per cent to 9 per cent, owns about 900 public houses.

The present bid could bring about a rationalisation of the business of the two companies. Their fields of operation overlap in Staffordshire, Shropshire and Warwickshire and it is to be expected that unprofitable houses will be closed and the properties sold to pay for development on new, better-paying sites. In the case of the Atkinson empire, taken over this year, Mitchells and Butlers have gone ahead quietly with its rationalisation policies. It is not unreasonable to expect even more caution in the rationalisation of the brewing plants: the company seems to be sensitive to the problems of staff redundancy. But these are the problems which an industry with no assuredly expanding market must face: mergers, unless they produce economies, make little sense.

GLAXO LABORATORIES

IN his statement with the 1958-59 accounts, Sir Harry Jephcott, the chairman of Glaxo Laboratories, paints a brighter picture than he did a year ago. He then drew attention to acutely competitive conditions, especially in overseas markets. A few months later, the half-yearly report to December 31, 1958, revealed a reduction in sales by 3 per cent and in profits by 9 per cent. Since then, however, events have moved more favourably for the group, with the result that for the full year to June 30th sales rose by 2 per cent and trading profits rose by 1½ per cent, from £5,310,166 to £5,387,617. This recovery cannot be attributed to any lessening of the competitive pressures: it is due rather to "further manufacturing economies" and to the successful introduction of new products. Of these, "Grisovin", introduced by Glaxo, is an antibiotic, curative of most fungal infections of the skin and is the first that can be administered orally. "Dictol", put on the market by Glaxo's recently acquired subsidiary, Allen and Hanbury, is a vaccine used to immunise cattle against lungworm infestation and is the first such vaccine to be made available on a commercial scale.

Sir Harry stresses the importance of developing new products and he compares the relatively small expenditure on medical and pharmaceutical research in Britain with the sums spent in the United States, Japan and the common market countries. Research in this field is becoming increasingly costly (shareholders in Glaxo know this from the large appropriations to reserves every year) and often a new discovery makes a product on which much time and money has been spent obsolete almost overnight.

It is therefore clear that the efforts Glaxo is making in developing overseas markets will be intensified; between them Glaxo and Allen and Hanbury have 25 subsidiaries trading overseas and they have net assets of nearly £7 million; one of the immediate results of the merger between these two companies has been the establishment of a combined export organisation. The market for some of the group's products, Sir Harry says, remains "uncertain" but he is much more confident about the "prospects of making headway" than he was a year ago. The 10s. ordinary shares, which have remained consistently on a low yield basis, now stand at 58s. 6d., yielding 2½ per cent on the effectively increased dividend of 14 per cent.

BSA

THE full report from BSA shows that the advance in trading profits from £2,261,707 to £2,469,819 in the year to July 31st is mainly attributable to the success of the motor cycle and car divisions of the group, which together account for practically half of the group's total sales. Mr John Sangster, the chairman, says that the abolition of hire purchase restrictions and the cuts in purchase tax last April made for "buoyant conditions" in the home market; but exports have suffered from a change in private transport habits in some of the group's traditional markets, with the result that total sales of motor cycles have fallen slightly. The "Sunbeam" and "Triumph" scooters, which went into production in March, 1958, have done well, but delivery dates have not been met owing to a shortage of skilled labour. These difficulties, says Mr Sangster, have now been resolved and he also hopes that the current production of scooters will be doubled in the next four months. In the motor division, the new V 8 sports model, designed specifically for the American market, has met with an "excellent reception," and a new saloon model is to be introduced to the home market.

In the machine tools division the sudden drop in orders at the beginning of the financial year coincided with the running-down of a long order book. But from the beginning of 1959 orders began to pick up and by July 31st there were more orders on the books than at any time in the previous three years. This branch of industry has been slow to recover from the recession, but BSA's experience suggests that the corner may have been turned.

The steel side of the business was affected by the cut in the defence programme, which led to a big fall in orders from the aircraft industry to which the group supplies high-quality steel for jet engines. But the outlook, Mr Sangster says, is more encouraging. The reorganisation programme and the £1,500,000 development programme at Sheffield will make the group less dependent on the aircraft industry. The Government have placed a contract with BSA for the production of automatic rifles which are now being supplied to the army and these contracts will be completed in 1962. The £1 ordinary shares at 60s. 9d. yield 4.1 per cent on the 1958-59 ordinary dividend of 12½ per cent, which is covered about 2½ times by earnings.

ROADS RECONSTRUCTION

CIRCULARS continue to pour through the letter boxes of bewildered shareholders in Roads Reconstruction. Thomas Roberts (Westminster), the bidders for one half of the preference and ordinary capital of the company, referred in a circular at the end of last week to the company's intention to modify the voting rights of the preference shareholders. Such a proposal would have to be made at a separate class meeting in the form of a special resolution which would have to be passed by at least a 75 per cent majority. Now Thomas Roberts claims to own over 25 per cent of the issued preference capital, excluding any acceptances of its offer, which has been extended another week.

General Sir James Steele, the chairman of Roads Reconstruction, swiftly refuted this claim and said that it did not appear from the company's register that Thomas Roberts or its nominees held such a large proportion of preference shares nor were they holders of a big amount of ordinary shares. He points out that the resolutions to increase the authorised capital and to make a scrip issue of four 2s. 6d. shares (each with a vote) for every three 10s. ordinary shares held required only a simple majority and would increase the votes of ordinary shareholders from 900,000 to 2,100,000. These resolutions will not be put to the vote however until after the extended offer of Thomas Roberts has expired but if Thomas Roberts (Westminster) is anxious to gain control of the company it may have to revise its offer for the ordinary shares, for Sir James Steele describes the number of proxies already received in support of the proposals of the Roads Reconstruction directors as "most encouraging."

At the annual meeting this week he confirmed that the trading profits of Roads Reconstruction for the first six months of the current year were about 10 per cent *higher than those for the same period in* 1957-58 when profits were running at a record level. But in the face of all these statements from the directors, the current market price of the ordinary shares still remains below the offer price of 32s. 6d., which, it must again be stressed, is only for half the shares held.

CANADA AND DOMINION SUGAR

ANOTHER partial bid—this time with a transatlantic flavour—was made last month by Tate and Lyle when it offered to purchase at $25 per share half the outstanding equity shares of Canada and Dominion Sugar Company which it did not already own. The English company has built up an investment in Canada and Dominion Sugar Company since 1953 and at the time of the offer held 12.7 per cent of the total capital of this leading Canadian sugar refiner. Sir Ian Lyle and Mr Peter Runge (respectively the chairman and the joint deputy chairman of Tate and Lyle) are both on the Canadian board and Tate and Lyle have been actively engaged in advising the company and supplying technical services and staff.

Although this offer was recommended by the board it has aroused opposition from a body of shareholders who say that the

How Much Growth for EMI?

GRAMOPHONE record sales still account for about half of EMI's sales but this year's slight recession in gramophone record sales seems hardly to have touched the big recording groups. EMI's total sales, in fact, rose by 2½ per cent, from £65,905,000 to £67,532,000. Mr J. F. Lockwood, the chairman, said this week that although the record market had been contracting, the group has been able to raise its share of the total home market. He believes, however (despite the latest Board of Trade figures which indicate a revival), that this market is likely to go on contracting, and for that reason alone shareholders will be comforted by the success of the group's industrial division. Sales of 45 rpm records have risen "substantially" and are helping to offset the loss in earnings caused by the sharp fall in demand for the 78 rpm records, and the 1959-60 accounts will help to show how far the group's contribution to the disc price war, in offering newly recorded long-playing classical discs at 22s. each, is succeeding.

Mr Lockwood is surely right when he says that the demand for records will only rise as disposable personal incomes increase. He is therefore justified in not pinning his faith on any further big advances in earnings from this side of the business. The possibilities of the group's developments on the electronic computer division look more promising. The "Emidic" computer has met with a good deal of success and present orders (from BEA, the Government, and commercial and industrial undertakings) amount to about £2 million. The electronic machine tool system has become widely accepted in the United States, and in this country the system is to be adopted in the motor and shoe trades: it is already employed by the guided weapon industry. One of the largest television studios in the world is to be built at Wembley by Associated-Rediffusion, which have placed a large order for television equipment with EMI; and a substantial order for colour television equipment has come from China. In the group's consumer durables division, sales of recording equipment, record players and car radios have all reflected the boom.

Throughout the year American buying of EMI's 10s. ordinary units has prompted the interesting question of just what proportion of the company's share capital is held in the United States. The question was answered this week by the chairman, who estimated that about 25 per cent of the equity is now held in the United States. This is "well below the average over the last five years." At one time as much as 40 per cent of the equity was in fact held by US investors but their holdings were diluted by their legal inability to take up the "rights" issue in July. They will, however, be able to take up the new shares resulting from the 50 per cent scrip issue, and the rise of 9s. 10½d. to 81s. on the day before that issue was announced reflects some pretty shrewd investment forecasting on the other side of the Atlantic. The scrip issue will capitalise all the share premium account of £2,900,000 arising from the "rights" issue and about £113,000 from a reserve created after the revaluation of the group's properties (which revealed a book surplus value of about £3 million). The value of fixed assets in the company's books has been written up from £8,942,000 to £11,801,000. The directors forecast a dividend of not less than 14 per cent on the capital as increased by the scrip issue and this compares with the equivalent of 13½ per cent on the present capital for 1958-59. The July "rights" issue paid off the group's overdraft of some £4 million and Mr Lockwood sees no prospect of any further cash issue in the immediate future. This fact and the strong cover of about 3½ times on the dividend points to the possibility of more generous dividends, but EMI's ordinary shares have been caught up in the craze of American investing in electronic stocks and at 79s. 4½d. they yield only 2.6 per cent. Mr Lockwood's assessment of the future may lead to a more realistic appraisal in the market.

offer of $25 per share " may seem adequate but only in relation to current operations rather than future prospects." At the beginning of the year the shares stood at around the offer price but in June the customary quarterly dividend of 30c was halved to 15c and the price of the shares dropped to $18 before the offer. The chairman has reported that earnings for the first five months of the current year were substantially lower than for the same period in the previous year and that despite some recent improvement he could give no assurance of an early return to the higher earning levels of past years.

This forecast seems to have swayed shareholders for when the offer closed on November 12th total acceptances amounted to over one million of which Tate and Lyle will take up 676,435 shares, the maximum it offered to accept. These shares together with those already held will give Tate and Lyle a controlling interest of approximately 56 per cent. Nevertheless a shareholders' committee, headed by Mr G. M. Drummond, one of the largest individual shareholders and the grandson of a former president of the company, has requisitioned a special meeting at the end of this month, at which the committee will seek fuller information about the background of the bid. The committee is also anxious to ensure that the interests of the large body of minority shareholders in a company controlled from across the seas are adequately recognised and safeguarded.

TUBE INVESTMENTS

THE full report of Tube Investments does not include a statement from the chairman this year. But the directors' report does give some clue to the fall in profits which is not immediately apparent from a straightforward comparison of trading profits, which are shown to have gone up from £16,104,804 to £16,782,643. But the latter figure includes the trading profits of both British Aluminium and Reynolds TI Aluminium for seven months and once these are excluded, profits appear to have fallen by about 10 per cent. A general decline in demand in the first quarter of 1958-59 to which last year's report referred persisted into the early months of 1959 and was particularly severe in the steel tube division. Since then, the directors add, there has been a strong recovery in all sections. But during the first months of the financial year some sections were not working to capacity and this together with the effect of " a considerable volume of export orders accepted at narrow margins " resulted in the fall of profits.

While total profits from all sections of the business have risen by £677,839 this increase is swallowed up almost entirely by the rise of £640,083 in the amount set aside in depreciation. But a higher income from investments (including the British Aluminium shares bought before the formal offer) and a large tax rebate of £492,915 has left the net profit £455,040 higher at £6,458,460 so that the ordinary dividend of 20 per cent is covered well over three times. With British Aluminium as a subsidiary, TI now possesses over £50 million in net fixed assets and nearly £50 million in net current assets. Against these assets, over £60 million is held in reserves while the issued ordinary capital amounts to just under £17 million. A scrip issue would thus obviously be justified. At 118s. 3d.xd. the £1 ordinary shares yield about 3½ per cent.

CROMPTON PARKINSON

THE yield of 4.0 per cent on the 5s. ordinary shares of Crompton Parkinson standing at 17s. 6d. suggests that some investors are confident that the current boom in consumer durables will not be long in working through to the capital goods trades. Certainly the long-term view of the heavy side of the electrical industry must take account of the steady rise in electricity consumption at home and the more slowly-growing markets of the underdeveloped areas abroad. But the short-term prospects for the industry look far less promising. The chairman, Mr Albert Parkinson, speaks of " intensified competition " and narrowing profit margins in many of the traditional fields in which the company operates ; and he forecasts that 1959-60 will be a " considerably more difficult year than the previous one." Not least among the reasons for Mr Parkinson's caution is the effect of the Restrictive Practices Act which has forced many Trade Associations (including the cablemakers), to which the group belonged, to wind themselves up. Among the group's largest customers are the nationalised industries. The British Transport Commission has placed its largest contract for diesel-electrical equipment for its railway modernisation scheme with Crompton Parkinson ; and the Central Electricity Generating Board has commissioned Atomic Power Constructions Ltd—the consortium to which the group belongs and which recently joined forces with GEC-Simon Carves—to build a nuclear power station at Trawsfynydd in North Wales.

The group's total income rose from £2,687,577 to £2,755,691, but this was due simply to a rise in income from trade investments from £144,931 to £261,663. This increase is mainly due to bigger remittances from the group's interests in India where, Mr Parkinson says, sales remain at a high level and where orders on hand for the group's lighter products, such as instrument transformers, are at a record level. Net earnings rose by £140,592 to £1,253,021 and the ordinary dividend was raised from 12 per cent to 14 per cent (covered 2.3 times by earnings). Shareholders are to receive a one-for-four scrip issue. The directors say that this does not necessarily mean a bigger payment next time. But the equivalent payment to the 1958-59 dividend on the increased capital is 11.2 per cent, which suggests that the 1959-60 payment may have to be adjusted—to, say, 12 per cent.

FIRST DEALINGS:	Nov. 11	Nov. 23	Dec. 7
LAST DEALINGS:	Nov. 20	Dec. 4	Dec. 24
ACCOUNT DAY:	Dec. 1	Dec. 15	Jan. 5

OFFICIAL comments at last week's Mansion House dinner on the equity boom had a delayed effect on stock markets. The weekend gave many private investors time to consider the cautious tone of the remarks of the Governor of the Bank of England and on Monday jobbers marked down prices in the face of a large volume of selling orders. The general weakness of industrial equities was accompanied by a rally in gilt-edged stocks with the exception of War Loan which still apeared to be affected by " the no date for War Loan " decision. On Wednesday there was a further fall in business and markings at 18,537 were the lowest since October 2nd. Over the week to the close on Wednesday *The Economist* indicator lost 3.1 points to 349.6.

Turnover in gilt-edged stocks has not been big but a steady amount of buying and the absence of sellers helped most of the Funds to improve over the week. But undated stocks were generally dull and 3½ per cent War Loan closed 3/16 down at 67 7/16. Short dated stocks were strong with 4½ per cent Conversion 1964 gaining ⅛ at 100 3/16. Corporation loans were unsettled on the Hertfordshire issue which was heavily oversubscribed by short-term investors. Even so, the new 5¼ per cent Middlesex 1980 stock closed at a premium of 1⅛ after being 1⅞ at one time—a rise of 7/16 on the week.

Since Monday, industrial equities have been steadily slipping from their high levels reached last week. Until the announcement of the unchanged dividend from South Durham the steel section was to a large extent unaffected by the wave of selling, and any selling that did take place was quickly absorbed by institutional buying. On Wednesday steel shares were marked down heavily, but on further consideration of South Durham's profit figures most stocks closed above their worst and showed net gains over the week. Not surprisingly, South Durham was the exception and lost 2s. 6d. at 77s. 6d.; more typically, Dorman Long closed 2s. 10½d. better at 63s. 9d., Colvilles put on 3s. 4½d. to 65s. 3d. and Steel Company of Wales gained 3s. at 49s. 1½d. Stores shares were again active on news of record retail sales but over the week prices presented a mixed appearance. GUS "A" gained 1½d. at 58s. and Gamage, which has been rising steadily over the past few weeks, improved another 4s. 9d. to 100s. By contrast Marks and Spencer "A" shares lost 3s. 1½d. at 73s. 10½d. and House of Fraser eased 2s. to 46s. Heavy buying from America sent EMI shooting up to a new " high " of 81s. 6d. on Monday but following the announcement of the scrip issue the shares eased to 75s. 6d., to show a rise of 6s. on the week. In motors, Fords were active and after touching 112s. 6d. slipped back to 111s., showing a net gain of 5s. 6d. Other motor shares eased a little.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended November 14, 1959 there was an "above-line" surplus (after allowing for sinking funds) of £28,879,000 compared with a surplus of £17,924,000 in the previous week and one of £31,862,000 in the corresponding period of last year. There was a net expenditure "below-line" of £8,232,000 leaving a total cumulative deficit to date of £663,457,000 compared with £553,001,000 in 1958–59

THE MONEY MARKET

THE discount market lowered its concerted bid for 91-day bills by 2d. to £99 3s. at last Friday's Treasury bill tender and its allotment at this price was halved from 53 per cent to 26 per cent. As more outside applicants made more competitive bids, the average rate of discount rose by only 4.93d. to £3 7s. 9.55d. For the shorter dated 63-day bills the market reduced its bid by a 1d. to £99 8s. 1d. but nevertheless its allotment of these bills rose from 75 per cent to 90 per cent, for although there were £10 million more bills on offer, applications were a little down.

The United States Treasury bill rate rose this week from 4.089 per cent to a new peak of 4.332 per cent. This sharp rise is attributed partly to the running off of bills by steel companies to obtain funds for rebuilding their stocks. A further factor in this rise is the belief that a new Treasury short-term issue will be announced soon.

Although there has been some improvement in credit conditions in Lombard Street this week the demand for fresh money has remained keen. Rates for overnight loans have rarely fallen below 2⅛ per cent ; a small amount of official help has been given.

This cable cost a fortune

The jib structure of the excavator appeared to be in good working order. Suddenly the bridle rope broke. Down came everything and up went the daily costs owing to production delays and loss of profits.

—and two people could have prevented the accident

An accident like this, caused by the fretted corrosion of a strong-looking bridle rope, need never happen – if a qualified Engineer Surveyor regularly inspects machinery. But first it is the responsibility of someone at top-level — a director, the secretary or chief engineer — to see that *all* their industrial machinery is inspected *and* insured by specialists.

1859 — 1959

Vulcan inspects and protects

Vulcan, who this year celebrate a century of experience—and look forward to learning more every day—provide just such a service. It costs no more than insurance and inspection by 'general practitioners'. Our appointment is always welcomed by company engineers and insurance brokers—because they know that if defects are to be found, a Vulcan Engineer Surveyor will find them, and prevent the accident that would have happened.

MAY WE SEND YOU FREE 'Vulcan'—a journal for all users of plant and machinery with reports of accidents and safety hints. Write to Dept. 17.

THE **Vulcan**

PRODUCTION MANAGEMENT TRAINING SCHEME

Carreras Limited wish to recruit several young men as Production Management trainees in cigarette manufacturing at their new factory in Basildon New Town, Essex.

Candidates, who should be in the age group 18-25 years, should have had a good general education; some further training to degree standard in technical or scientific subjects will be an advantage but is not essential, provided that the trainee is willing to undertake further studies in appropriate subjects.

A good commencing salary will be paid and this, in conjunction with the prospects of advancement, subject to ability only, should appeal to men who wish to make a career in modern industry.

Applications should be made to:—

PERSONNEL MANAGER,
CARRERAS, LTD.,
CHRISTOPHER MARTIN ROAD,
BASILDON, ESSEX

NIGERIA

The Investment Company of Nigeria Ltd. invites applications for a Senior Accountant for service in Lagos. His main responsibilities will consist of critical appraisal of schemes put forward by applicants for financial assistance, and control and supervision of assisted businesses. Candidates should possess a recognised qualification and have had several years' experience in a responsible commercial position. Starting salary £2,200 to £2,600 p.a., depending on experience. Contributory pension scheme. Accommodation provided free, with main furnishings and household equipment; servants free (2). Passages paid for wife and children (up to three in number). Car provided with allowance for running expenses. Initial contract for 15 months in Nigeria and three months' leave including travelling. The position is one of responsibility and has suitable prospects for advancement. Preference is likely to be given to a man of about 35 years of age or under. Write giving full details of qualifications and experience to the Secretary, Commonwealth Development Finance Co. Ltd., 27-32 Old Jewry, London, E.C.2.

COMMERCIAL RESEARCH ASSISTANT

Quaker Oats Ltd. require a Market Research Assistant in the Commercial Research Department at their Southall Office. Applicants should be men, up to the age of 30, with a background of statistical theory, probably with an Degree in the Social Sciences including Statistics or the intermediate A.I.S. or the R.S.S. Certificate; two or more years' experience in Market Research is essential.

Please apply to:
Personnel Manager (CR2),
Quaker Oats Ltd.,
Bridge Road, Southall, Middx.

A YOUNG GRADUATE holding a good degree in economics or statistics is required by a London Merchant House to prepare commodity reports analysing price trends and market organisation. Previous experience is not essential but the candidate must be a man of ability who is interested in making a study of commodity markets.—Write Box No. 1239.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for a Research Assistantship in the Economics Research Division. Salary within the range £450–£575 a year. Starting salary according to age and qualifications. Applications, including a statement of the candidate's field of interest, should be received by the Secretary, Economics Research Division, The London School of Economics and Political Science, Houghton Street, London, W.C.2, not later than November 30, 1959.

ORDERS for advertisements in *The Economist* are accepted on condition that they are liable to rejection at the discretion of the Editor; that while every effort will be made to publish an advertisement on a specified date, no guarantee is given; and that white on black, reverse blocks or large sizes of black-faced type may be stippled or lined at the Editor's discretion.

Plessey

EXCEPTIONAL OPPORTUNITY IN MANAGEMENT

A major division of the Plessey Company at Ilford is engaged on the design, development and manufacture of high-quality wave filters, transformers, inductors and allied electronic components to M.O.S. and other exacting specifications.

The Company seeks to appoint a suitably qualified man as DIVISIONAL MANAGER, directly responsible to the Group Director for the control of this division. The salary and prospects of this appointment offer an unusual opportunity to a man with the necessary drive and initiative.

Applications stating age, experience and qualifications will be treated in the strictest confidence and should be sent to A. M. Brown, Executive Director (Personnel), The Plessey Company Ltd., Vicarage Lane, Ilford, Essex, quoting DHA 9.

ASSOCIATION OF UNIT TRUST MANAGERS APPOINTMENT OF SECRETARY

Applications are invited for the post of full-time Secretary for the above-mentioned Association. Preferably, Applicants should be between the ages of 30 and 45, have a professional qualification, and a leaning towards Public Relations work. Salary of £2,000 per annum plus pension rights will be offered. Applications stating age and giving full particulars of experience should be made to the Secretary of the Association, 16 Coleman Street, London, E.C.2.

UNIVERSITY OF BIRMINGHAM

GRADUATE SCHOOL IN HIGHWAY AND TRAFFIC ENGINEERING

In connection with the expansion of the Graduate School in Highway and Traffic Engineering, applications are invited for the following posts:

Lectureship in Traffic Engineering—Statistics

The person appointed will join the Traffic Engineering section to deal with the analysis of experimental results. A good degree in statistics is essential. Experience in the application of statistics to traffic problems would be an advantage but is not essential as the candidate will receive the appropriate guidance.

Lecturerships in Road Materials (three vacancies)

(a) Concrete, (b) Bitumens, Tars and Asphalts, (c) Soils. Applicants for any of these three subsections should have specialised knowledge in design, laboratory and site work.

These appointments will carry F.S.S.U. and family allowance benefits. Initial stipends, in the scale £900 x £50 to £1,350; £1,150 x £75 to £1,650, will be related to qualifications and experience.

Applications (four copies), with the names of three referees, should be sent before December 31, 1959, to the Deputy Registrar, The University, Edgbaston, Birmingham, 15, from whom further particulars may be obtained.

PARTNERSHIP OPENING exists on the statistical side of one of the larger and well-established member firms of the London Stock Exchange. Applicants must have considerable experience and other qualifications inherent to the position which affords an exceptional opportunity. Replies will be treated with the strictest confidence.—Write Box NV56, c/o 95 Bishopsgate, E.C.2.

STATISTICIAN

An International Company manufacturing food products requires a Junior Statistician at their Head Office in London. Qualifications include a Degree in Economics/Statistics and a knowledge of French, German or Spanish would be an advantage. Salary will depend on age and qualifications. The prospects are good and the Company has a contributory Pension Scheme.—Applications to:—The Secretary, Liebig's Extract of Meat Company Limited, Thames House, Queen Street Place, London, E.C.4.

UNIVERSITY OF SOUTHAMPTON

Applications are invited from university graduates for the post of SENIOR ADMINISTRATIVE ASSISTANT in the SECRETARY and REGISTRAR'S OFFICE. University administrative experience desirable but not essential. Salary scale, £900 x £50 to £1,100. Placing according to experience and qualifications. Family allowances. F.S.S.U. Duties will relate to a number of general university activities, including Committee work and the planning and equipping of new buildings.

Further particulars from the Secretary and Registrar, to whom applications (six copies) containing the names of three referees should be sent not later than December 5, 1959.

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences. This term is used in a wide sense to include not only Economics, Government, etc., but equally, fields such as Education, Jurisprudence and Social Medicine. Simon Research Fellowships or within the range of £1,000—£1,600, Simon Research Fellowships or within the range of £1,850—£2,250 per annum (Simon Senior Research Fellowships), according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience. Applications should be sent by January 15, 1960, to the Registrar, the University, Manchester 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

AN economist is required by a London firm to fill a senior post undertaking research into commodity trends and market organisation. The candidate should be a graduate with a qualification in economics and should have had several years' experience of research into commodities, preferably including commercial experience.—Write Box No. 1258.

UNION CARBIDE

TRAINING MANAGER

We require a man, aged about 30, to organise and administer MANAGEMENT DEVELOPMENT and TRAINING throughout the Company. Applicants must have good industrial commercial experience, particularly in the training field and should preferably be University Graduates. The Company is expanding rapidly and there are exceptional opportunities in this important work.

Write full details in confidence to:
Administration Manager,
UNION CARBIDE LIMITED,
103 Mount Street, London, W.1.

THE GLACIER METAL CO. LTD. STATISTICIAN. The Operations Research Department of the Company requires a statistician for work on investigations into costing, economic forecasting, linear programming, quality control and the provision of other statistical and operations research services. Applicants should have a degree in economics with statistical training and experience, or in statistics with industrial or economic research experience. The preferred age range is 25 to 40. The total salary range is £950 to £1,600, starting in the lower half of the bracket.—Personnel Manager (Ref.: 2291), The Glacier Metal Co., Ltd., Ealing Road, Alperton, Wembley, Middx.

THE QUEEN'S UNIVERSITY OF BELFAST

The Senate of The Queen's University of Belfast invites applications for a LECTURESHIP or ASSISTANT LECTURESHIP in SOCIAL STUDIES from April 1, 1960, or such other date as may be arranged. Salary for Lecturer £900 by £50 to £1,100 and thereafter by £75 to £1,550; salary for Assistant Lecturer £700 by £50 to £850, both plus F.S.S.U. Initial placing on the scale will depend on experience and qualifications. Candidates should be qualified to teach Social Administration but ability to teach Public Administration also would be a desirable additional qualification.

Applications should be received by January 11, 1960. Further particulars may be obtained from G. R. Cowie, M.A., LL.B., J.P., Secretary.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the full-time posts of ASSISTANT in the Research Section of the Faculty of Economic and Social Studies. The successful candidates will be expected to pursue research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology, General Sociology or Industrial Sociology and should be graduates in any of these subjects or in Modern History or Economic History. There are vacancies in Grade II (which carries the status of Assistant Lecturer) and Grade III. The salary scales are as follows: Grade II, £700 to £850 per annum; Grade III, £600 to £650 per annum. Applications should be sent not later than December 18, 1959, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

As the result of a grant from the Nuffield Foundation the Department of Social Anthropology and Sociology plans to carry out a study of a Lancashire town, and applications are invited for a RESEARCH FELLOW; initial salary within the range £900-£1,000 per annum, the appointment to be for two years from a date to be arranged. Applicants should have training in Sociology or Social Anthropology and field experience in one of these subjects. The successful candidate will be required to carry out a study of a section of the working-class population of the town. The appointment carries membership of the Children's Allowance Scheme. Application forms and further particulars may be obtained from the Registrar, the University, Manchester 13, to whom applications should be returned by not later than December 18, 1959.

GRADUATE IN ECONOMICS OR STATISTICS, man or woman, living in the vicinity of London or Oxford, wanted for 12-18 months to assist in Transatlantic study of the economics of medical services. Full-time or part-time worker, but must be available, if necessary, for travel in the United States.—Write to The Professor of Economic Organisation, Merton College, Oxford.

MSL *have been retained to advise on the appointment of a*

MANAGEMENT ACCOUNTING SERVICE

One of the oldest City firms of chartered accountants is establishing a new department to meet demands from its clients for assistance in introducing management accountancy techniques and modern systems.

The firm wishes to appoint a Manager who will be given full control of the new department and responsibility for its development. The Manager must have personal qualities which would allow him to be considered for partnership in a few years.

Minimum requirements for the appointment include chartered accountant qualification plus at least three years' consultancy experience installing management accounting systems in manufacturing and process industry. Candidates must at present be holding a supervisory appointment in a consultancy firm or a senior accountancy post in industry. Age range 35-45.

Initial salary is open to discussion, but about £3,500 is envisaged.

Please send brief details in confidence, quoting reference S.2610/T, to W. J. Voinez, Ltd., in no circumstances will a candidate's identity be disclosed to our client unless he gives permission after a confidential interview at which he will be given full details of the appointment.

MANAGEMENT SELECTION LIMITED
17, Stratton Street, London, W.1.

LIBRARIANS, Grade IV, Pensionable posts at (a) Veterinary Laboratory, Weybridge, Surrey, under the MINISTRY OF AGRICULTURE, FISHERIES AND FOOD, and at (b) Military Engineering Experimental Establishment, Christchurch, Hants, under the WAR OFFICE, for men and women at least 22 on 1.11.59. *Qualification:* Fellowship or Associateship of Library Association, or Diploma of London University School of Librarianship. For (a) a knowledge of French and German is desirable, and experience in a medical, scientific, or technical library an advantage. For (b), experience of library work (preferably in a technical library) is essential. Salary (men) £635 (25 or over) rising initially to £1,055, with promotion prospects.—Write Civil Service Commission, 6 Burlington Gardens, London, W.1, for application form, quoting 8002/59/TL. Closing date December 10, 1959.

PIRELLI LIMITED

CENTRAL BUYING OFFICE

Finance and Documents Departments

As a result of continuing expansion in the business of their Central Buying Office in London (which handles purchases for Pirelli Companies throughout the World), Pirelli Limited propose to appoint an ASSISTANT TO THE MANAGER OF THE FINANCE AND DOCUMENTS DEPARTMENT. Starting date will be by arrangement.

Applications are therefore invited from men who meet the following specifications:—

(a) Age 26-33.

(b) Educated to at least Sixth Form Grammar or Public School level.

(c) Not less than three years' practical experience in banking, and essentially with a sound knowledge of foreign exchange, the discount market and accounting procedures.

For a man of real ability this is a first-class career opportunity with an expanding and progressive organisation; details of the appointment, together with salary and other conditions of service, will be discussed with candidates selected for interview. Written applications, *mentioning* age, education and career to date and quoting reference C.B. O.2, should be sent to the Personnel Manager, Pirelli House, 343-345, Euston Road, London, N.W.1.

TRADE ASSOCIATION invites applications for the appointment of a young man with experience in the field of marketing and distribution of foodstuffs. A high standard of education and a sound grasp of economics are essential. The post will carry a commensurate four-figure salary. Applications should be accompanied by a *curriculum vitæ*.—Box 1236.

RESEARCH IN ECONOMICS AND FINANCE

HOUBLON-NORMAN AWARDS

THE TRUSTEES OF THE HOUBLON-NORMAN FUND invite applications for FELLOWSHIPS or GRANTS in aid of RESEARCH into the working of industry and finance in Great Britain and elsewhere and the economic conditions affecting them.

FELLOWSHIPS, which are intended for experienced research workers, are awarded for full-time research for one year, which may be renewed for a second year. GRANTS are awarded for either full-time or part-time work. The amount of the awards, which will take effect from October 1, 1960, will depend upon the circumstances of the candidate and the probable expenses of his work.

Applicants must be British subjects normally resident in the United Kingdom. The Trustees are prepared to relax this rule only in exceptional circumstances.

Forms of application, which may be obtained from the Secretary of the Fund, c/o the Bank of England, London, E.C.2, should be returned not later than March 1, 1960.

THE REED PAPER GROUP

Reed PAPER GROUP

MARKET RESEARCH

The Reed Paper Group is further extending its market research facilities and is creating new appointments in its market research unit, mostly of a senior nature. The unit's field of activity covers a wide range of products and markets, from paper and board through packaging and further processing operations to laminated plastics. The unit is located in London.

Applicants should be experienced in industrial market research, technical sales or other related fields, and should preferably have an honours degree in economics or other relevant subject.

The prospects for successful candidates are excellent. Together with attractive starting salaries and other benefits which include participation in the group's house purchase and non-contributory pension schemes, these posts offer the possibility of real satisfaction and opportunities for original and stimulating work.

Applications, which will be treated in strict confidence, should set out full details of qualifications and experience and be addressed to:—

Mr. J. S. McGavin, Group Personnel Division,
Albert E. Reed & Co. Ltd., Larkfield, Nr. Maidstone, Kent.

Quoting Ref. No. MR/22.

THE ELECTRICITY COUNCIL

DEPUTY COMMERCIAL AND DEVELOPMENT ADVISER

Applications are invited for the superannuable post of Deputy Commercial and Development Adviser to the Council.

Applicants should be well informed on the technical and commercial problems and development of the Electricity Supply Industry and possess a sound knowledge of economics, statistical methods, and forecasting. Corporate Member of the Institution of Electrical Engineers would be an advantage.

Salary within the scale £3,600 — £4,000 p.a.

Applications stating age, present appointment, salary, qualifications and experience should be forwarded to D. Moffat, Winsley Street, W.1, to arrive not later than December 4, 1959. *Quote Ref.* ECN 60.

AEI

A.E.I.-HOTPOINT LTD.

THIS NEW APPOINTMENT arises from a planned expansion of the Company's operations.

STAFF TRAINING OFFICER

Duties: He will be responsible to the Company's Education and Training Manager for:—

(i) The organisation and planning of training courses for Commercial and Administrative Staff.

(ii) The development of techniques of presentation, trainers' manuals, training of other instructors.

(iii) Assisting the Training Manager by taking over the detailed administration and implementation of training programmes held in London Headquarters' training centre.

(iv) The giving of advice on further education to all employees in the London area who seek it.

Since this post is a new appointment, there is ample scope for the use of initiative and judgment in the part which he will play within the development of the Company's training activities.

Experience: Suitable candidates may at present be employed as Training Officers within up-to-date and highly organised industries. A University degree and/or professional qualification in addition to personal experience in organising and running training courses are essential.

Location: London, Kensington.

Age Range: 27-40 years.

Salary. The Company expects a high standard of performance from its staff and is prepared to pay above average salaries to men with ability and initiative. A first-class contributory pension scheme and other benefits are provided.

Applications, giving details of work history and training should be sent to:—

D. W. York, Personnel Developments Manager, Ref. 12 3.E,
A.E.I.-Hotpoint Ltd., 33, Grosvenor Place, London, SW.1.

An invitation is extended to experienced marketing executives to apply for the post of

SALES PROMOTION MANAGER

with a manufacturer of durable consumer goods.

This appointment is of unusual and challenging interest in that the firm already has a record of rapidly increasing sales progress and intends to build up from this position.

The Sales Promotion Manager will be directly responsible to the Sales Director for the planning of promotional campaigns. For this purpose he will control the Company's market research, information, advertising, display and public relations services; a printing department will also be under his direction.

Applications are invited from men under 35-45 years of age with a good general education, a proved record of success in this field and wide knowledge of home and overseas markets for durable consumer goods.

A good salary is offered together with non-contributory pension plan, life assurance and other benefits.

Letters of application, with full details of age, education, experience and present salary, should be sent *in confidence to*

THE WALLACE ATIWOOD COMPANY

MANAGEMENT CONSULTANTS,
CHANTREY HOUSE, ECCLESTON STREET, S.W.1,

who are acting on behalf of the Company.

TRADES UNION CONGRESS invites applications for post of Assistant in Research and Economic Department. Sound knowledge of economics and related subjects essential; industrial bereavement an additional qualification. Further particulars may be obtained before December 4th from Sir Vincent Tewson, TUC, 23-28 Great Russell Street, London, W.C.1.

LIL

LAPORTE INDUSTRIES LIMITED

has the following vacancies at its Group Headquarters in London:

LEGAL ASSISTANT

Barrister or Barrister required in the Legal Department to undertake general legal work and advise, including negotiations and drafting of commercial agreements. Applicants should preferably have had commercial or industrial experience.
Age 30 to 35.
Salary £1,500 to £1,750 per annum depending on qualifications and experience.
Pension Scheme.

SECRETARIAL ASSISTANT

Chartered Secretary required as Assistant to the Secretary. Applicants should have experience of general company secretarial work including pensions and administration.
Age 28 to 34.
Salary £1,000 to £1,200 per annum depending on qualifications and experience.
Pension Scheme.

Applications, stating age, qualifications, experience, present salary and position, and indicating the vacancy sought to THE GROUP PERSONNEL MANAGER, LAPORTE INDUSTRIES LIMITED, HANOVER HOUSE, 14 HANOVER SQUARE, LONDON, W.1, quoting ref. LIL/ET 67.

INDUSTRIAL ECONOMISTS

The United Kingdom Atomic Energy Authority, Production Group, Risley, Warrington, Lancashire, require Economists or Statisticians in the Economics Section of the Commercial Directorate.

(a) SENIOR COMMERCIAL ECONOMIST
To lead a section of five people and to be responsible to the Commercial Manager (Economics) for the economic policies leading to full commercial exploitation of the resources of the Group. The duties also include responsibility for the analysis of the forward market trends in fissile materials and the preparation of short and long term sales programmes and sales budgets.

(b) COMMERCIAL TECHNOLOGIST
To be responsible to a Senior Physicist for the assessment of the commercial implications of fissile and fissile products in nuclear reactors. Key responsibility to be discharged by means of technical and economic analyses of reactor systems and fuel cycles.

QUALIFICATIONS AND EXPERIENCE
For both posts good degree and preferably Post-graduate Honours degree or be corporate members of a Senior Engineering Institution.
For post (a) wide experience in the use of economics techniques in industry.
For post (b) reactor operating experience would be an advantage.

SALARIES
Post (a) Salary within range £2,555 — £3,165 according to qualifications and experience.
Post (b) Salary within range £1,845 — £2,455 according to qualifications and experience.
Generous Superannuation. Staff Housing Scheme. Send postcard for application form, quoting reference P/97/320, to Staff Officer at above address.
Closing Date: December 7, 1959.

STATISTICIAN. Analytical European Service Limited require for their London office, a qualified Statistician, aged 23-30. A good knowledge of sampling theory and multivariate analysis is required.—Write to International Technical Executive, A.E.S. Limited, 3 Vere Street, W.1, giving details of qualifications, experience, salary required.

AN ASSISTANT is required in the Market Research Department of a large international Airline. Age 22 to 30 years, preferably with a degree in Commerce or Economics. Sales experience an advantage. Successful candidate will be based in London but must be prepared to travel within the E.M.A. Write giving age and personal details and full particulars of experience to Box 3235.

COUNCIL OF EUROPE RESEARCH FELLOWSHIPS

The Council of Europe awards annually a number of Fellowships intended primarily to encourage research into the following questions, considered in the light of their present-day importance and political, legal, economic, agricultural, social, educational and specific problems connected with European integration: the European civilization (philosophy, history, literature and the arts).

The Fellowships are each of the value of 600,000 French francs and tenable for a period of eight months. The next awards will be made in July, 1960.

Candidates are normally the nationals of a Member State of the Council of Europe or of a State which has acceded to the European Cultural Convention. Refugees from European countries not members of the Council, legally resident in the territory of a Member State, are also eligible for awards.

The British Council assists in publicity and recruitment for these Fellowships in the United Kingdom. Further particulars and forms of application, which must be submitted before March 1, 1960, may be obtained from the Director, Universities Department, Education Division, The British Council, 65 Davies Street, London, W.1.

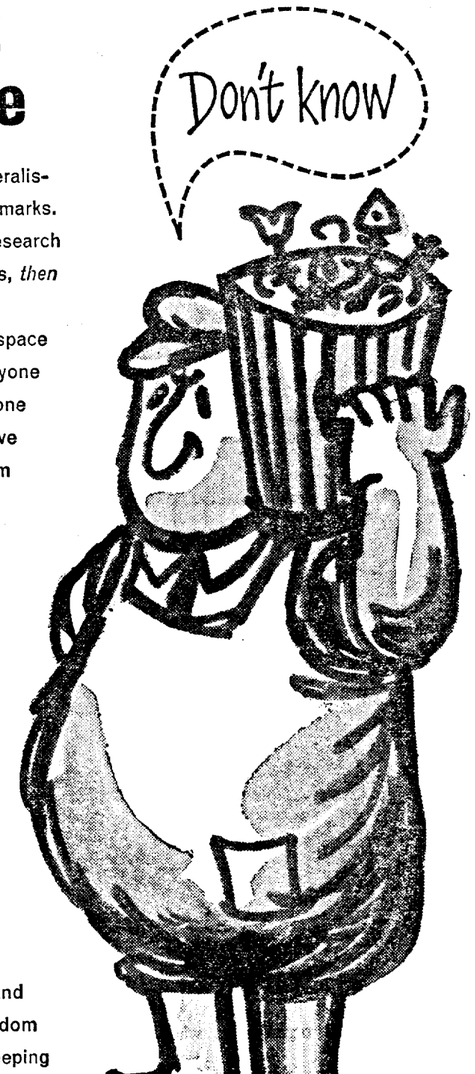
Random sample

People don't just make sweeping generalisations any more, one iconoclast remarks. Thanks to the advance of market research techniques they take random samples, *then* make sweeping generalisations.

What he meant was, you don't just take space in a paper and announce 'Nearly Everyone Uses I.C.I. Silicones' just because someone thinks it would make a good slogan. You've got to find out if it's true, by taking a random sample. You ought to pick names from the voters' list, but if you want to cheat you ask more or less the first person you meet 'Do you use I.C.I. Silicones?' If he says 'Don't know' you start asking him, how about his new raincoat, hasn't he noticed how it simply sheds the water, and what about the furniture polish his wife uses, doesn't it give a marvellous easy shine, and did he happen to notice that she isn't having that trouble with her cakes sticking to their paper cases any more, and is he by any chance a paint technologist, because if he is he probably knows all about the heat-resistant properties of silicone paints—all that sort of stuff.

Anyway, when you've got it written down and thanked him very much, there's your random sample. *Now* you can make your sweeping generalisation:



Nearly everyone uses

When communications break down . . .

Communications in the home can be subject to all kinds of stresses and strains. Sometimes they break down entirely! And communications in a business enterprise are no less unpredictable — where there are no internal telephones. Communication Systems Ltd. can remove this element of uncertainty; they can install an up-to-date internal telephone service which is exactly suited to the needs of any organisation, large or small. In happy homes — as in up-to-date offices — good communications are essential!

Malayan microhighway

"In a country committed to a policy of economic and social development a first-class telephone system is a primary requirement"

W. STUBBS
Director-General Telecommunications, Malaya

The new, independent Malaya, with its vast industrial potential, has embarked upon a vigorous programme of economic expansion which, in due course, will be of tremendous benefit to its people. High on the list of priorities in this programme has been the provision of a really first-class system of communications which will not only cater for immediate needs but which can be expanded to meet increased development.

This important system, planned, manufactured and installed by S.T.C. for the Pan-Malayan Telecommunications Department, went into operation on 26th September. Its route of 270 miles, which cuts across some of the most difficult terrain in the country, will connect Kuala Lumpur and Seremban with Malacca, Tampin, Kluang, Johore Bahru and Singapore, and provides 600 telephone circuits with 240 telephone circuits on the spurs.

S.T.C. is very proud to have been chosen to play the major role in establishing this new super-high-frequency or microwave main-line trunk telephone network—a tribute to the company's wide experience in the development and manufacture of this type of system and to their proved ability to undertake complete installations in all parts of the world.

One of the Calor Propane fleet of 10-ton tankers.

DESTINATION—
Britain

THAT means anywhere in Britain. On any site where heat is needed Calor Gas is available. Day and night the big Calor Gas tankers (the largest Propane tanker fleet in Britain) carry Britain's newest industrial fuel to sites beyond the reach of power lines and gas mains. But not only to remote sites; many factories in major cities are finding in Calor Gas a cleaner, quicker, cheaper solution to their various heating problems.

CARGO— Heat

Heat in all its forms — heat for furnaces and blowtorches, heat for cooking meals and raising chickens by the thousand. Heat on tap anywhere in the factory, on the farm, wherever you need it. Calor Propane is stored in bulk tanks on the site and piped to any number of outlet points. Calor Propane speeds the job, burns clean, never lets you down. Calor Propane is also available in cylinders—a mobile modern fuel!

Gouging with Oxy/Propane.

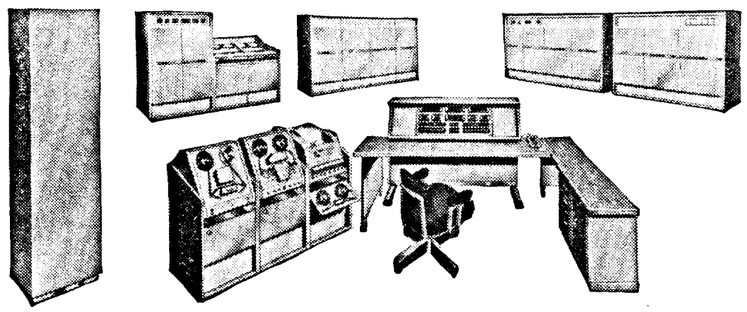
ELECTRONIC SYSTEMS



Whatever your business...whatever its size...Burroughs build equipment to meet your every data processing requirement!

The reason Burroughs can meet your every data processing requirement is this: Burroughs produce the widest range of business machines in the world.

In adding machines, Burroughs offer you a choice of full-keyboard and multiple-total models. It's the same with accounting machines—you have a choice with Burroughs. To name three: new low-cost, fully automatic Director accounting machine... Sensimatic, with unlimited programming flexibility... Sensitronic, for automatic electronic accounting. In electronic computing equipment, too, Burroughs can virtually custom-fit a machine to your job. For business computations it's the new Burroughs F2000 ... for more complex, medium-range computing, the new desk-size E101... and for large-scale computing, the new Burroughs 220.

No problem is too small ... no application is too big for Burroughs data processing equipment. And the beauty of it is, a Burroughs machine will pay for itself in savings, over and over again.

Speaker's Notes for Blackpool

THIS Saturday, in the Opera House at Blackpool, Mr Gaitskell must either vindicate his decision to sit back as a silent spectator for seven weeks or else forfeit much of the prestige that he gained during the election campaign. There is already a sizeable list of items on the debit side of his decision not to give earlier expression to his views. It must have seemed to him more than a little depressing that his announced willingness to hearken unto wisdom from whatever quarter should have so relentlessly generated a further round of the old reckless imputations of personal intrigue and a competitive scramble by the party hearties to man the least tenable bastions. To make up for all this, Mr Gaitskell's speech on Saturday has got to be very good.

It has to inspire the kind of loyalty that makes enthusiasts live for a cause rather than incline towards the kind that makes a cause commit suicide for the sake of the enthusiasts. It must call a practical-minded country to idealism while persuading the left's own idealists to look reasonably practical-minded to the country. And Mr Gaitskell has to face the further and reverse difficulty that some of his solidest supporters, particularly in the trade unions and on local councils, need lessons in looking like idealists at all.

The Labour leader has to convince the country that his party seeks the liquidation of class warfare, not its prosecution—least of all within the party itself. In the House of Commons there is much more of a balanced mixture of classes on the Opposition benches than on those of the Government. Yet in many constituency parties the reverse impression is given; they so often seem to be the last home of the dwindling minority who actually like to think of themselves as proletarian, and whose favourite sport is hating the salariat and the boss. Moreover, inside the parliamentary party itself the post-election recrudescence of activity among the usually dormant trade union members is partially taking the disagreeable form of objecting to the intellectuals expressing themselves in public about the party's future. The very tendency to speak and think of two categories of Labour supporter, trade unionist and intellectual (by which is frequently meant, oddly enough, journalists), shows one thing that is seriously wrong. Labour has so far failed to provide a climate that is hospitable to the by no means negligible technocratic and managerial element among the left-minded members of the middle class.

At Blackpool Mr Gaitskell has to prepare his party for the long process of building up a total impression that will commend it to the British public. Many elements in the party will have to co-operate; but one thing nobody else can do for him. He must make it absolutely plain that if the party wants him as leader, it must let him lead. It must not lay man-traps for him at regular annual intervals just for the fun of seeing how good he is at not falling into them. His tactical skill, which is considerable, is an asset that is supposed to be directed to outflanking the Tories and impressing the country. It ought not to be dissipated in playing out an elaborate private game, under the intrigued but derisive gaze of the public.

The structural ambiguities of the Labour "movement" and the doctrinal embarrassments of Marx-sounding party aims are connected issues: they both spring from a party constitution that was published in 1918. Mr Gaitskell can say, and should say, that it is hardly the mark of a radical, reforming, go-ahead party to let itself be tied to the fusty language and creaking machinery

devised when it was the small, aspiring association of the political outsiders and underdogs forty years ago. There is hardly a line of the elaborate series of aims and objects, including the famous self-immolating words about public ownership, that has any contemporary ring at all.

Mr Gaitskell may well agree with those who argue that explicit pledges made in the election cannot be ceremonially dumped overboard as soon as it has been lost. But he must surely now strive to make the party see that, long before the next election, it must straighten out its own mind about the distinction between means and ends. This should not take the form of yet another batch of official party pamphlets, into which unwieldy committees always edit compromise phrases to placate old-fashioned socialists and thus give outside critics so much to laugh and snap at. It should take the form of many more unofficial essays, such as those printed in the Fabian party's latest tract, *Where?* (which is discussed on page 845), and a flexible development of issues as they come up in the House of Commons.

From this flows the need to give any commission that the party may set up to re-examine its constitution at least two clear directives. The first is that if there needs to be a written statement of Labour party aims at all (and a wise decision would be to say that there need not), it should be extremely broad and extremely short. It should be no more than some ringing beatitudes which sum up the practical idealism of the movement. It must at all costs not be the kind of text on which scholastic glosses cling like barnacles and which will look in a few years' time as much like a line from "The Boy Friend" as the present formulation. The second directive must be that however the structure is rejigged the result must be to leave Mr Gaitskell and his parliamentary party free to sort out ends and means according to the developing political situation. Labour MPs, not the annual Labour party conference, must henceforth be the recognised masters of their own activities in their own House.

Finally, the Labour party cannot afford any longer to convey the impression that there are whole areas of society in relation to which its critical faculties are numb with disuse simply because its own vested interests are involved. Mr Gaitskell will doubtless be suitably severe at Blackpool about the Labour councils who make themselves out to be petty dictators. If the public voted against the officer class in 1945, to some extent it voted against the n.c.o. class in 1959; and local councillors are the easiest of Labour's unpopular n.c.o.s to attack just now.

But Mr Gaitskell will be making a mistake if he does not also say something about the trickier and larger problem of the trade unions. The advice which is offered to the Labour party on the subject of its relations with the unions is sometimes misunderstood. It is not argued, or at least it cannot sensibly be argued, that the party ought to sever all institutional links with the unions, and particularly the financial link. (To some extent the object of taking the importance away from the union block vote would be achieved anyway if some of the importance could be taken away from the annual conference.) What is suggested is much less dramatic, though admittedly the more old-fashioned trade unionists may neither like nor understand it. It is simply that in its discussion of such contemporary issues as anti-inflationary policy, human freedom, decent treatment of dissenters, restrictive working practices and fuel or other industrial policies, Labour must, where necessary, show itself to be as independent of the sectional and institutional pressure of the unions as the Tory party's pamphlets and policies have been of some of its business backers—from the workers' charter to the Restrictive Trade Practices Act and the proposals for a free trade area. A new indication of this independence, following upon what Mr Gaitskell said last time he was in Blackpool, would not only enhance his stature in the right way; it would do more than any other single gesture to set the party right with the public.

Stockholm's Two Faces

The free trade venture of the Seven is welcome for its own sake. Can it also be made the starting-point for a new European approach?

LIKE the moon, the convention initialled in Stockholm last weekend is one of those things that present two unmistakably different faces to the world, the one shining and inviting, the other obscure. As an episode in European affairs the new European Free Trade Association may raise more questions than it answers, but as an episode in British policy it is plainly a remarkable advance. A hundred years ago Britain, emerging from a long era of mercantilist protectionism, was riding on a tide of unprecedented prosperity. The force behind that tide was the industrial revolution, and the vehicle was free trade; Richard Cobden himself was in Paris negotiating the famous trade treaty with France which was the first to contain the most-favoured-nation clause. In the first half of this century the world relapsed into a second era of protectionism, shadowed by war and slump. Now the Stockholm treaty is one landmark in the new postwar surge towards freer trade which has accompanied a new phase of general economic growth.

Clearly and firmly, in the black and white of a convention, the British government has put the interests of expanding markets abroad and of industrial change at home before that of protecting an existing static order of things; this is a choice that radicals of all parties ought to support. The impulse for the move, it is true, has come from outside, from the six-country common market of the European Economic Community, which has set off the whole process of competitive trade liberalisation in Europe. The venture itself falls well short, in economic terms alone, of the original British aim of a free trade area for all western Europe. But the net result will be to bring to Britain something of the same invigorating impulse from outside that is already running like an electric current through French industry.

Because of the limited size of the new scheme, the government is being subjected to fiercer protests from certain individual industries than it might be if the group were larger; most of the weight of competition from Swedish paper, Danish bacon and Norwegian fish will tend to fall on Britain. The answer to this is not to retreat (and ruin the whole venture) but to go forward. In agriculture, for example, where the deal still rests on an exceedingly delicate bargain, with the British government balancing precariously between the pig-breeders at home and the Danes, it is unlikely that the scheme can work well over any long period without a much greater effort to develop common policies among the trading partners. In fish the British have offered freer trade but are still seeking to link this to the question of fishing limits, against the protests of the Norwegians; it is difficult to see how there can be anything like a satisfactory solution of this unless a much closer working partnership can be developed between the fishing, freezing and distributing industries of the member countries.

For the bulk of British industry, however, the protection that is to be swept away is simply out of date. Industries like instruments and dyestuffs, which grew up in the shadow of high protective barriers, need the protection no longer. The new free trade area is no more than is healthy for an

Free Trade Club — *The Convention Summarised*

A COMPARISON between the new convention for a European Free Trade Association and the common market provides a striking illustration of the differences in economic philosophy which have made it so difficult for the two groups to come to terms: the one designed essentially to achieve free trade with the minimum of commitments, the other using free trade as an instrument of integration.

The one feature common to the two schemes is that both provide for **the removal of tariffs and quotas** within the areas involved. In the new association tariffs are to be cut by 20 per cent next July 1st to catch up with the two cuts made by then in the common market. Eight further cuts of 10 per cent will remove all tariffs within the area by January 1970, as in the common market, unless plans are made later to speed things up. Portugal, whose economy is less developed than the rest, has until 1980 to get rid of its tariffs, though it will enjoy the normal advantages of the free trade area in other countries. As in the common market import quotas will be globalised and increased by 20 per cent each year (on July 1st). Arrangements are also made to ensure that no quota will be excessively small at the beginning. Simple rules provide for the removal of the protective element in revenue duties and other taxes.

On virtually every other issue the two schemes are worlds apart. Those who drafted the common market treaty believed that it would be impossible to create equal competitive conditions within an economic union if differences in **external tariffs** caused widespread differences in the costs of raw materials and semi-manufactures imported from outside. The common tariff was also a political symbol of the will of the Six to act as one in their relations with others. In the new free trade area the members retain their individual tariffs towards the outside world. To avoid the "deflections of trade" described above, goods will only enjoy the benefits of free trade area treatment on one of two conditions: if less than 50 per cent of their value consists of materials imported from outside; or if they have been produced by certain processes within the area. In general importers will be able to choose which condition they prefer, but the process rule must apply to textiles, most of which must be spun, woven and finished in Europe. A wide range of raw materials will get the benefit of area treatment whether they are produced inside the area or not—an additional liberal move.

In the crucial matter of external policy, as in other matters, the philosophy of the new association is thus to allow the members maximum freedom, and to cope with problems as they arise—a sharp contrast with the community approach of devising common policies in advance. If a member feels it is being damaged by "deflection of trade" the problem can come before the Council as a "matter of urgency," or be dealt with through the "complaints procedure" which is a *Leitmotiv* of the convention.

Internally the new association has no funds for helping development in backward areas, or for re-adapting redundant industries and workers, and no arrangement for harmonising labour costs upward, as in the common market. The only important internal regulations are the **rules of competition.** Two provisions, a straight ban on export subsidies and an article requiring public-owned industries to compete fairly, are as rigorous as those in the Rome treaty. But as yet, there are no rules akin to those in the common market to deal with private cartels. Once again the association relies on consultation and the "complaints procedure" and requires the Council to consider by the end of 1964 whether further provisions are needed. There are no provisions for freeing movement of labour or capital but there is a clause endorsing freedom of establishment to the extent necessary to make free trade work.

Like the common market, the new association provides for **escape clauses,** both to protect a country in payments difficulties and to protect a particular industry or area where the freeing of trade has produced unemployment. In both cases there is an eighteen months' period of grace. After that, further restrictions or further joint action to help may be approved by the Council of Ministers acting by majority vote.

This **Council of Ministers** from member governments, with a secretariat attached, will be the principal organ of the new association. It has no executive body comparable to the European Commission and no court of justice, but "examining committees" of outsiders may be set up to hear complaints. Recommendations to governments on such complaints, and escape clauses, provide the two principal occasions when a majority vote (four out of seven) applies in the Council. In the common market, by contrast, majority voting (weighted) will in time apply to a broad range of common policies.

The new association contains provisions for **agriculture,** based on the bilateral deals between Denmark and Britain and between Denmark and Sweden. The tariff cuts agreed in these will be extended to the whole group. In **fish,** Britain has agreed to lift the tariff on canned and preserved fish and frozen fish fillets. But the issue may be reopened if imports of fish fillets approach 24,000 tons. It has also reserved the right to reconsider these arrangements if fishery limits change.

Beside the Rome treaty the new association seems a somewhat naked document. The underlying philosophy, of solving problems as they arise, instead of in advance, leaves a great deal to trust. But just as those who have underestimated the ability of the seven to reach agreement have been proved wrong, so it would be a great mistake to underestimate the sense of partnership they have already developed. The seat of the group is likely to be Paris, where contact will be made with the Six through OEEC. The Seven have not taken up the proposal of the European Commission for a liaison committee in Brussels, but they have told the Six that they are prepared to resume negotiations if there is a prospect of success.

industrial economy which must earn its keep in world markets in any case.

In European affairs, the new free trade association is only a starting point. The basic problem of Britain's relationship to the Six of the common market has changed very little since the Stockholm plan was initiated. An acute observer has outlined three tactical motives for the new grouping: to demonstrate that a free trade area could be made to work; to keep the countries outside the common market together so that their bargaining positions would not crumble in a series of bilateral deals; and to encourage the Six to talk by bringing pressure to bear on their exports. Some people still feel that as the pressure on German exports grows, the Six will feel more inclined to do a deal. But so far the new scheme seems to have had just the opposite result. The effect of the new association has been to draw the Six together and encourage them to push on faster than ever on their own.

It is true that the Six have also responded by fresh gestures towards a world-wide freeing of trade. These should be taken up and put to the test. With the United States in its present potentially more protectionist mood, the goal at next year's world-wide tariff talks in Gatt (the General Agreement on Tariffs and Trade) should be a general surge forward towards free trade; otherwise there may be a surge back. The objections put forward in London—that the United States is not prepared to make tariff concessions, and that nobody is likely to make tariff cuts which benefit Asian exporters just when quotas are being removed—are reasons for a determined and generous British approach to these world negotiations. But the most enlightened moves in Gatt will not, of themselves, resolve the European problem. The bridge between the two groups in Europe remains, in the phrase of *Le Monde*, a "bridge of sighs."

In London, at present, the inclination is to wait for a while in the hope things get better. As things are, and failing any fundamental reappraisal of British policy towards Europe, this may well be sound tactics; certainly it would be unwise to press schemes that have no chance of being accepted now. But some other members of the Stockholm group—Austria, Denmark, which have large exports to the Six—cannot afford to wait for very long. The present moment may be unpropitious for negotiation; but in the next few months the Seven will have to sit down and sort out among themselves a real negotiating position.

Views are almost as varied among the Seven as among the Six. The danger is that, like the Six, the Seven will only manage to agree on a lowest common denominator in which limiting factors like Switzerland's dislike of any sort of farm deal, Britain's difficulty in accepting harmonised tariffs, and Austria's treaty-bound caution over political commitments, set the score. If the Seven hope one day to get anywhere at all with the Six-run part of Europe, they will have to try and work, instead, towards a highest common factor. Austrian, Danish and Swedish willingness to accept some tariff harmonisation, the Scandinavian plan for an agricultural deal on the lines of (but, let it be hoped, more liberal than) the Rome treaty, and the new awareness of some people in Britain that political commitments may mean political influence too, provide possible starting points.

There is the danger that the new creation from Stockholm will meet with two reactions here: carping criticism of the damage to particular industries, and insular resignation as the facts of the division in Europe sink in. The proper reaction is to give whole-hearted support to a new, exciting trading venture, and to make it the launching platform for a new approach to Europe.

Running the Gauntlet

General de Gaulle is paying a high price for his bomb

FRANCE has emerged from the United Nations debate on nuclear tests in a minority of one. For General de Gaulle it is not an unfamiliar distinction. He recounts in his memoirs that, when he finally left London for Algiers during the war, a relieved Mr Eden confided to him that Fighting France had caused more trouble than all the other exiled allies put together. The general took it as his due: "I don't doubt it," he said blandly, "France is a great power." The criterion is instructive. The Gaullist idea of being a great power is to behave like one.

France is doing what the three nuclear powers have already done. It has just voted alone at the United Nations as the United States and the Soviet Union would be prepared to vote alone, with their immediate retainers, if they judged it necessary to resume their own tests at any time. As a demonstration of sovereign intention, of the power policies that General de Gaulle means to pursue, M. Jules Moch's diplomatic performance in New York is likely to have a more resounding effect than the eventual hatching of a real French bomb in the Sahara. The bomb, after all, will be of 1945 vintage; the general's policies seem increasingly to belong to the era that ended in 1940.

Five years ago the French bomb might have got past the United Nations. It is, in fact, the chief source of French recrimination now that everyone else was allowed to get away with it before General de Gaulle came along. But time jogs by, and small powers take to measuring radio-activity. The Assembly votes against France and Britain at the time of the Suez crisis hastened the political transformation. Last week, even some Nato allies refused to rally to the general's side. On November 20th the Assembly called on France to refrain from its Sahara tests by 51 votes to 16, with 15 abstentions. The majority depended on the Afro-Asian countries, the Soviet block, and the three left-wing mavericks: Cuba, Venezuela and Jugoslavia. But Canada, Norway, Denmark and New Zealand joined in. Even worse, the bulk of the Latin Americans, who could have prevented a two-thirds majority against France in the old days, chose to abstain, and so did the Australians, Greeks and Turks. The rump remaining to France was reduced to its common market partners, the United States and Britain, five Latin Americans, Israel, and

the right-wing group of Spain, Portugal and South Africa.

On November 21st France was left entirely alone. The Afro-Asian motion asking the three nuclear powers to reach an agreement at Geneva to which other states might adhere, and advising these other states to refrain from tests of their own in the meantime, was carried by 60 votes to 1. Among the 20 abstentions were the United States and Britain. For a regime that claims to be going up in the world this was a nasty blow. French spokesmen, from the general downwards, have contended that France's refusal to adhere to a testing agreement is based on a desire to secure the prior cut-off in fissile material for military purposes and the abolition of existing bomb stocks. This argument has been given short shrift now, and deservedly so; but it is not all that long since it was being voiced as general western policy.

Nothing that the Assembly said or did last week can be expected to deter General de Gaulle from his nuclear ambition. Indeed, the latest rebuffs are calculated to confirm him in it. M. Moch declared that the vote against the Sahara tests was likely to make French opinion more dissatisfied with the United Nations than before. This is true, but does it really mean that the general intends to run the gauntlet year after year until his full nuclear armoury exists? The strain on the western alliance is already perceptible. And this year's Algerian debate is still to come.

While France seems assured of American and British backing on Algeria, newly encouraged by General de Gaulle's self-determination proposals of September 16th, it remains to be seen whether the Latin Americans, in particular, will be any more ready to obey the western whip than they were last week over the French bomb. A year ago the motion recognising the Algerian people's right to independence failed to win a two-thirds majority by only one vote; the United States abstained. Although General de Gaulle should, by rights, fare better this time, the picture of French foreign policy being built up in the minds of the uncommitted countries is disturbing. Will France, for example, really be able to let Algeria choose its own future when the oilfields and the atom proving grounds are in the Sahara, and when, possibly, the independent nuclear striking force may have to be kept in North Africa in order to pursue its global role well clear of Nato's orbit?

THE last illusions that Nato may have entertained about the terms of General de Gaulle's future association should have been removed by his remarks at the Ecole Militaire early this month, and by the items of the new defence budget. General de Gaulle made no secret of his dislike for integrated defence systems within the western alliance. Although he envisaged ready co-operation on the actual field of battle, it would have to be a matter of each to his own part, and the French part would include a nuclear striking force: "As France can be destroyed from any corner of the world, we also must be able to reach any corner of the world."

The military budget, besides providing for a force of half-a-million men in Algeria next year, has allocated £30 million for the development of nuclear weapons, and other heavy spending is devoted to the construction of 50 Mirage IV jet bombers for carrying the bomb and for research into intermediate-range missiles. The scope of this design has evidently overtaken the earlier intention to use French atomic knowledge merely to prise nuclear co-operation out of the Americans. The general intends to lead a major military power, capable, if necessary, of protecting its own interests independently, and giving priority at all times to those interests above existing alliances.

The plan has already been criticised on economic grounds by M. Raymond Aron, and doubts have been voiced in the National Assembly. Britain's chastening experience in the style of expenditure needed to sustain an effective nuclear armament has been untiringly quoted. But the hard fact remains that the mood of the chief forces supporting the Fifth Republic is not averse to General de Gaulle's conception of military grandeur. For the army, in particular, it holds out the prospect of added prestige in the state and growing demands on the national resources. If this preoccupation were to lead to social and industrial unrest in France itself the general would have to think again, but clearly such a development seems far from his thoughts. So the obvious legacy of the military *coup d'état* that brought General de Gaulle to power eighteen months ago is coming about. Why should France accept this burden? It is easy enough to blame the United States Senate, or Anglo-Saxon exclusiveness, or the Algerian war itself. But the true motive seems to be in General de Gaulle's own words: "I don't doubt it. France is a great power."

The Economist

NOVEMBER 26, 1859

ENGLAND AND FRANCE

It is unquestionable that we have only too much ground for uneasiness and complaint in reference to the tone assumed by the French newspapers when they speak of England, and to the feeling which . . . has been sedulously excited against England in the susceptible breasts of our neighbours across the Channel. It is not permitted us to doubt the prevalence or the vehemence of this feeling;—the reports of every traveller and every observer, official or non-official, confirm the fact. It is, too, scarcely possible to believe that such a feeling could have been so widely spread if the authorities had sincerely desired to control or counteract it; though it is not easy to conceive any good or prudent reason which should lead them to foster or approve it. The truth probably is that the French Government has seen the growth of these unfriendly sentiments with satisfaction, and has tacitly if not actively encouraged them; but that it has felt and acted thus not with any definite design of permitting national hatred to reach a point where it will break out into open hostility—still less with any fixed purpose of exasperating bad passions as a preliminary to a meditated war;—but with the intention of proceeding *just far enough* to persuade England that France is thirsting for the conflict, and has arrived at such a state of morbid and wild susceptibility that, if thwarted in the slightest matter, she will incontinently rush to arms,—and therefore that we must abstain from thus thwarting her, and in fact must humour her caprices and her sensibilities just as we should those of a delirious patient or a fractious child. . . . Be this as it may [the Emperor] seems to have at last become aware that he has gone too fast and too far; and he can now meet the remonstrances which in all probability have been addressed to him on the subject by referring to two significant facts. He has, it seems, directed the Minister of the Interior to issue a caution—most mildly-worded, it is true—to the public journals to adopt a more benign and becoming tone towards a friendly and faithful ally; and he has also permitted—for in a case of an autocracy so positive and pervading as his, whatever is not prevented may be held to be permitted—he has permitted one of his most noted adherents to address a series of letters to the *Journal des Débats* full of the best feeling and the soundest sense.

The Army's Case

The Army now has a much better case for a larger share of the defence budget than has the Navy or the RAF

THE army's problem is really the kernel of the present British defence problem. This is a proposition which a traditionally maritime and anti-military country finds hard to accept. Yet examine the uses to which the services have been put since 1945.

Britain has acquired at vast expense, but not of course used, a thermonuclear deterrent of its own; what its influence may be on events in the future, when set against the major deterrent possessed by our American allies and by the Russians, is purely conjectural. The Royal Air Force has, in the past fifteen years, been in action only briefly—in Korea, Malaya, Kenya and Suez—and the importance of any of its costly aircraft in any of these roles was marginal. The Royal Navy has maintained its watch and guard; but its most important activities since 1945 have broadly been similar to the RAF's, less in bringing firepower to bear than in putting infantrymen in position to fight. In Europe, the Rhine Army's presence has been the decisive British factor in Nato, militarily in deterring the Russians, psychologically in reassuring our allies; overseas, the decisive fighting has been done by the army.

This is to put matters in an exaggerated form which no airman or sailor could accept. But it is plainly true that the arrival of airpower, missiles and atom weapons has bridged the Channel and, by making Britain a promontory of the continent, made it a military power in a new sense. So far this has only been recognised to the point that everyone pays lip service to the interdependence of the services—most forcefully expressed in Lord Montgomery's "one service" thesis. This cannot be said too often. But in practice the jobs of all the services—apart from the function of the big deterrent which is to prevent big wars from happening—revolve round and lead up to the job that the infantryman has to do.

Yet since the war the army has suffered to an unconscionable degree from unclear thinking, infirmity of purpose, false economy and neglect instead of priority. To Mr Duncan Sandys must unquestionably go the first credit for drastically rethinking the army's problem and for making the critical (but not sacrosanct) decision to rebuild it as an all-regular force. Under his regime, too, the vast task of re-equipping it with up-to-date weapons and transport was at any rate begun at long last. How late in the day all this came, and how much remains to be done, emerges from a report by a study group of the Army League* which was published this week. It reflects current thinking among an increasing number of defence experts; but in many ways even the Army League understates rather that overstates the army's case.

The study group accepts the framework of the defence white papers of 1957 and 1958 in setting out a coherent army policy. This means that it accepts the presumption that a new world war would be nuclear, apocalyptic and short, and that the army's essential role is not to fight global war at all, but first to maintain the defensive shield in Europe and second to provide a limited war and cold war force for overseas. Its report is, accordingly, concerned essentially with the distribution, arming, transport and recruitment of an all-regular army of 180,000, in terms of current official policy.

There are three reasons for suggesting that these are not necessarily and immutably the right terms. First, it is not entirely impossible that the nuclear stalemate (or nuclear disarmament?) might lead to a situation in which the Russians had to be matched by conventional forces armed only with conventional weapons. Such a revolution (welcome to many people) would certainly require far larger Nato forces, including British ones. One thus cannot exclude the possibility that the conscript might have to be brought back, both for military and political reasons. It would seem elementary foresight to leave enough legislation on the statute book to make a new call-up possible fairly quickly. Fortunately the conscription issue did not play so big a part in the election as had been generally expected, and it should not now be regarded as politically impossible for this to be done. Secondly, those who accept the idea of a regular army of 180,000 derive reassurance from the territorial army of 110,000, and from reserves of 600,000. But the territorials may be a wasting asset, and certainly we shall not always have 600,000 reservists; these will age, and will not be replaced by trained former national servicemen. The casualties incurred in fighting on, say, the Korea scale would very soon make a big dent in the regular strategic reserve, which amounts to only four divisions. Thirdly, the recent decline in recruiting begins to put in doubt again the achievement of a regular army of even 180,000.

YET this strength, even if achieved, must be set against formidable commitments: the Central Treaty Organisation (once called the Baghdad Pact), Seato, Korea, Malaya, many colonial and some residual Commonwealth defence liabilities. At present the threat that could be met by purely conventional means is a limited one; this reinforces the Army League's central proposition—that, for the purpose of deterring or halting aggression short of nuclear war (including resort to "tactical" weapons), a sizeable and rapidly transportable army is by far the most flexible instrument of national policy. It is elementary sense to give the small forces available the transport and equipment that can improve efficiency to the utmost. This has not been done.

The Army League report underlines everything that was said on this subject in the Grigg report, and adds more. It is a heavy indictment. It falls in part on the innate conservatism of the army, in part on the blindness of defence thinking, but largely on the system of Treasury control which operates with peculiar viciousness in the case of the army's weapons. Over 50 per cent of the army's budget is pay (civilian and military), which cannot be cut; the sort of all-round squeeze for which the Treasury traditionally asks every year therefore falls either on the works vote or the equipment vote. If the works vote (at present £30 million a year) is skimped, the recruits have nowhere to live, and if the technical equipment sub-vote (which averages a mere £25 million a year) is skimped, they have no guns to fire.

In consequence, of course, totally insufficient funds and manpower have been devoted to the urgent research needed into new conventional army weapons. For example, the opportunity of harnessing the new missile and electronics technology to producing a decisive anti-tank weapon has been fumbled. Yet thinking in Shape is dominated by the overwhelming weight of Soviet tanks, which the west cannot match. Nor can an airborne force overseas fly in its heavy tanks—tankless, it may have to fight tanks. A decisive new anti-tank weapon would do more to redress the tactical and strategic balance in favour of the west than almost anything else. This is worth stressing in a week when the War Office is just taking over the development and research department of the old Ministry of Supply.

Not only has the army lacked the modern equipment attributable to its own vote; it also lacks the transport aircraft, and the amphibious landing vessels which would have to come out of the votes of the other services, who prefer to put their money on their own deterrent roles. Once again, plainly, what is lacking is a basic appreciation of the new prime importance of the army's role. The Army League's report should help. One other thing, however, is needed. This is to raise the prestige of an army career; the problem of getting enough good officers has not been solved, at the very moment when a new doubt arises about getting enough men.

It is clear that if the army were to get all the new equipment and transport which the Army League report discusses the bill would run into hundreds of million pounds. But it would be an illusion to think that there are going to be economies in pay or pensions or amenities or resettlement schemes to set off against them. A good modern army (we have not yet got one) is going to prove very expensive; in the usual polite annual struggle against the admirals and air marshals, it is time this year for outside commentators to declare that they stand upon the generals' side.

NOTES OF THE WEEK

CENTRAL AFRICA

Lord Monckton's Men

ALL that now seems to stand between the Labour party and co-operation in the work of the Monckton commission in Central Africa are the interpretation of the brief, the standing of some of the Africans appointed to it, and the restriction of British parliamentarians to privy councillors. Behind those remaining difficulties lurks the shadow of *sub rosa* pacts with Sir Roy Welensky. It should certainly be possible to meet the Labour party on privy councillors. Then Mr Callaghan could go. Sir Roy can hardly insist on his pound of flesh at this point.

Mr Gaitskell doubted if some of the five Africans appointed to the commission would win African confidence generally. It is certainly true that all of them do not seem to measure up to the robust independent stature of Mr Laurence Katilungu, president of the African mineworkers' union, who has agreed to serve and is nobody's fool. But once political leaders were excluded on the Central African side (black or white) the field was inevitably narrow. The men who are serving are brave—not time-serving. Moreover, Mr Gaitskell ought not to overlook how remarkably moderate are the white representatives whom Sir Edgar Whitehead and Sir Roy Welensky have put up. There seem to be no die-hards among them; there is one Toddite. The general impression is that this is a moderate group of men—in any case, it is a group which six well-chosen British parliamentarians will dominate. The way is open to Labour to exercise almost the influence which they hoped for in the purely parliamentary commission they first demanded.

The wording of the brief is more difficult. It has been agreed with Sir Roy. It does not specifically state that the commission can recommend the secession of Nyasaland or disbandment of the Federation. But everybody knows in his heart that the commission's job is to find out what, if anything, will induce the Africans to accept a measure of federation, and to tell us. If it becomes plain to members that nothing, absolutely *nothing*, will induce 6 million Africans to agree to work *any* form of federation, federation will fail—and Lord Monckton is not the man to rule that the commission must ignore this. If he did, what would prevent a minority walking out and saying so? Labour will have a heavy responsibility to bear before history if it refuses to help investigate the facts because it wants to humiliate Sir Roy Welensky in advance over a mythical procedural rumpus.

CIVIL SERVICE

Available Hercules

THERE is a tradition in some parts of Whitehall that one ought to pretend that senior civil servants have no influence upon policy. Those who believe in this blinkered approach to public affairs will regard the news that Sir Frank Lee is to become the senior economic civil servant at the Treasury from January 1st next, after having been permanent secretary at the Board of Trade since 1951, as merely a formal reshuffle. They will believe that the remarkably liberal history of the Board of Trade since 1951 has been a strictly political coincidence; they will see no cause for wonder that successive Conservative ministers at the Board have resisted pressure for protectionism from Lancashire, introduced the Restrictive Trade Practices Act and moved towards freer trade with Europe—a trio of achievements that nobody would have forecast when the Conservatives came to power. But those who heretically disbelieve in spontaneous ministerial combustion will regard Sir Frank's appointment as a very welcome injection into the Treasury indeed.

Undeniably, it creates problems at the Board of Trade, even though the able head civil servant at the Defence Ministry is taking Sir Frank's old place. In recent years the Board of Trade has often seemed to be about five times too large—in the sense that the number of major policy matters thrown up within it each day must far exceed the number of papers that could normally and decently be expected to pass across one permanent secretary's desk. It has overcome this difficulty by the happy accident that the experienced Sir Frank, as permanent secretary, has been on occasions the equivalent of at least five men. It was presumably to fill this gap that the Board of Trade was given so strong a ministerial team in Mr Maudling and Mr Erroll last month, while Mr Amory was left with less experienced

junior ministers at the Treasury ; the Chancellor has got Sir Frank as Mr Erroll's transfer fee. But the awkward implication for the future of a reorganised Board of Trade could be that it will be necessary to keep two top calibre ministers there for a long time, one in a formally rather subordinate position.

The longer term implication for the Treasury will also need watching. At the age of 56, Sir Frank Lee steps into a centralised economic planner's job which was created only three years ago, which some people think is still too wide, and which might have been sub-divided now if Sir Frank had not been made available on Sir Roger Makins's retirement. The man has been found to fit the job. But it will be a pity if in these next few years the whole structure of British economic administration becomes firmly based on the assumption that Frank Lees grow on gooseberry bushes; come the date of his retirement, the country might easily forget that they don't.

DR ADENAUER'S VISIT

What Did They Agree?

DR ADENAUER'S press conference in London on November 19th, at the end of his visit, provided the only public statement of what was actually agreed between the two heads of government. Quite the outstanding point, which has caught the attention of the German press as well as of Dr Adenauer personally, was the British Government's supposed renunciation of "disengagement." It is as well to be clear what this means. The British Government seems merely to have renounced an idea which it had never entertained: a complete withdrawal of troops from the east-west frontier that runs through western Germany, leaving it (and presumably eastern Germany too) naked. It has not given up the idea of a zone, possibly in central Europe, where armaments would be limited. Those who hope for some gradual, step-by-step reduction of the accumulating arms in central Europe need not be too alarmed. It is only incredible that Dr Adenauer should have entertained such a crude version of British policy that his fears needed to be allayed in this way.

The second major issue between the allies was Berlin. Here a difference in objectives is still pretty apparent. The British explained that they did not regard Berlin as the only topic for a summit meeting, but they did feel that it was the one issue where there was a good prospect of agreement. The Germans are reluctant to see Berlin discussed at all ; they feel any interim agreement would merely weaken the west's position there ; so it was agreed that Berlin should be discussed at the summit meeting in the broader context of the German question. On one interpretation this could mean going back to the western package plan which imposed several weeks of unwrapping on the Geneva conference in May and June before the Berlin issue, which originally prompted the conference, was unveiled. Those who want a summit meeting to reach decisions may have to think of quicker ways of cutting the string.

The third matter—and here there seems to have been a real measure of agreement—was the idea of developing political consultation within Western European Union. But whether such an arrangement can bridge the gap caused by basic differences in the political objectives of the Six and Britain is another question. A consensus of opinion in west Germany evidently feels that the visit served to put an end to the unnecessary misunderstandings of the last few months and to remind the two sides of the great common interests the two countries obviously share. But the real differences of interest are still there.

GERMANY

Meaning of a Trade Pact

AN east German delegation signed an important trade agreement last Saturday in Moscow. Trade exchanges between the Soviet Union and east Germany are to be raised to the value of 7,500 million roubles next year and to at least 42,500 million roubles in the following five years. Quotas may be increased each year, but the lists of commodities provided for in the basic long-term agreement are by themselves fairly impressive.

Between 1960 and 1965 the Soviet Union is to supply east Germany with more than 40 million tons of coal, 12 million tons of iron ore and 15 million tons of pig iron and rolled steel ; 17 million tons of crude oil ; and substantial quantities of aluminium, copper, lead and zinc. Raw cotton, foodstuffs and varying industrial goods (such as excavators) complete the Soviet list. In exchange, east Germany is to provide chiefly industrial goods, transport equipment, complete chemical, cement and other industrial plants, as well as chemical products, precision instruments and consumer goods.

The long-term agreement fits into the pattern of integration which "Comecon," the communist council of mutual economic aid, is seeking gradually to establish throughout the Soviet block. Since all the members of the block have economic plans formulated up to 1965, these can be dovetailed into each other by means of trade pacts of equal duration. Similar agreements have, or will be, signed by all the communist countries in Europe both with Russia and among themselves. Clearly in Moscow's eyes east Germany is a full member of the block, not a potential outsider. While the Bonn government tenaciously pursues the integration of western Europe, the other third is being more firmly embedded in its place in the communist common market.

ENGINEERING CLAIM

Hours Off

THE engineering employers' offer to their 3 million workers to reduce their working week from 44 to 42½ hours without loss of pay is likely to be the key decision in this winter's round of wage bargaining. The unions have not accepted it, but the indications are that if they can push hours down a little further—say to a 2 hour reduction instead of a 1½ hour reduction—they may agree to forgo a direct wage increase this year. To some extent, of course, all this is shadow play. Average hours actually worked in engineering are now 47 a week; for the industry as a whole the employers' present offer really amounts to a promise that on average 4½ hours, instead of 3, will be paid for at overtime rates. If actual hours worked remain the same as now, it will be the equivalent of a disguised increase in wages of between 4½ and 5 per cent. Why is the increase being offered in this disguised way?

Two factors on the employers' side probably account for the choice, and both are economically welcome. First, the increased cost of a reduction in hours will not be evenly spread. At one extreme, the limping business without buoyant orders on hand should suffer less from sending its workers home twenty minutes earlier each day than it would from paying a straight wage increase. At the other, the really prosperous firm which will have to pay higher rates for more overtime is the one best placed to afford it. The second thing favouring a reduction in hours rather than straight wage increases is that there is something finite and perhaps superficially more respectable about it. It can be regarded as a step towards the concrete goal of a 40-hour week and not just another wage increase in which the sky is the limit. Foreign observers, whose opinion about the course of British wage inflation is important, may share this view.

On the union side, a demand for a reduction in hours was at first largely a pre-election manœuvre to avoid an unpopular series of wage demands; the unions could not claim this year that the cost of living index—the base of many wage claims—had gone up. Now, after the election, the unions still seem to have no desire at all to force a showdown.

What about the national interest? If engineering employers freely feel that they can afford the equivalent of a 4½ or 5 per cent wage increase, after a year of boom, then no major national interest is served by saying that they should not grant it. Even larger independent concessions by firms that feel they can afford more—such as the recent offers by Fords and ICI—are also obviously welcome. The important economic point is that the Ministry of Labour should not exert any pressure to follow suit upon industries that are not paying their way so well. For example, this

is a year when the shipbuilders, whose yards are still sunk in recession, should grant smaller concessions than the engineering industry.

TUC

Confession of Impotence

WHILE the unions in engineering have been opening new pastures, the timid hearts in the TUC have suffered another defeat from the Electrical Trades Union. After nearly two years of attempting to inquire into allegations that this union has been guilty of election and other malpractices, Tuesday of this week was to have been a day of reckoning. The ETU's communist leaders were summoned to Congress House. But then Mr Foulkes remembered that he was leading the engineering unions' team in their wage claim on the same day and refused to come. The TUC has retorted that the ETU leaders have been evading discussions because they know that the charges against them have so much substance, and its anti-climactic punishment is therefore that it will not discuss the matter with them any more.

The communist general secretary of the ETU is due for re-election by his members in a few weeks time ; the hope of the TUC, as of everybody else, is that under the shadow of present publicity the ETU's vote-counters will not now find it easy to disqualify blocks of anti-communist votes. But whichever way this particular election goes, the TUC has now effectively admitted that it cannot or will not inquire into allegations of union malpractices. The case for the equivalent of a Companies Act for trade unions is thus overwhelming.

PORTUGAL

On the Warpath

GENERAL HUMBERTO DELGADO, the defeated candidate in last year's Portuguese presidential election, has been in London this week and will be visiting other European capitals before returning to his place of exile in Brazil. It is customary in Portugal for an opposition candidate to be nominated for presidential contests, but General Delgado is the only one who did not retire before the vote. He also made history by using the thirty-day election period in which speech is comparatively free to proclaim that his first act as president would be to get rid of the prime minister, Dr Salazar. Despite the obstacles that were put in his way, General Delgado won nearly a quarter of the votes. Shortly afterwards he had the foresight to seek asylum in the Brazilian embassy in Lisbon and thence slipped away to Brazil.

The general's outspokenness has put heart into a somnolent opposition. Dr Salazar retaliated by altering the electoral law to prevent a recurrence of this unpalatable demonstration ; in so doing he emphasised to the opposition that the only way to get rid of him would be by military coup. General Delgado believes that a significant number of majors and captains are ripe for violent action, and that the senior officers, although satisfied with the existing order, would not stand in the way of a determined attempt to overthrow it. On the other hand, conspiracy is not easy in a small country of small towns where an efficient police can discover what is going on without much difficulty ; three minor revolts in the past eighteen months were quickly suppressed.

As a young man General Delgado helped Dr Salazar to power and he was at one time among the dictator's closest advisers. But his declared intention is not to replace one authoritarian regime by another ; at present he envisages rule by a military junta only for the eighteen months or so that it would take to prepare free elections. To critics who are apprehensive about what would happen if the country were suddenly pushed into democracy after thirty years of one-man rule, the general's reply is that neither swimming nor democracy can be learnt from a book.

LABOUR PARTY

Notwithstanding Orders

THE muddled and at times heated exchanges inside the parliamentary Labour party about whether or not to have standing orders have ended in a compromise. There are to be no standing orders, but everyone is to carry on as if there were. This is to be an experimental exercise in the Tory technique of implicit discipline. Unfortunately, since most Labour members do not belong to clubs, it is not possible to pass the word among them about the proper standards of good party conduct quite so inconspicuously. So the general effect of greater freedom on the Left is somewhat spoiled by the detailed code issued by Mr Gaitskell to replace the standing orders. This leaves matters very much as they were. Labour MPs can speak but not vote against the party line (provided their speeches are not too insulting) ; they may abstain on grounds of acute conscience ; they must clear resolutions with the whips before entering them on the order paper. If they are persistently unruly the whip can be withdrawn, and they can be reported to the national executive for disciplinary action.

It may well be asked what, in that case, the battle of the standing orders was about. The answer, oddly enough, is "Nothing much." Mr Bevan and other rebels and ex-rebels thought all along that it was the standing orders that caused them, or nearly caused them, to be chucked out of the party. The suspension of these orders was therefore a great symbolic issue for them, as it was for the diehard right-wing trade unionists who voted against the suspension to the very end. But apparently this was all a mistake. The right to discipline members and expel them if they persist in rebellion never did derive from standing orders, so it seems, and it continues without them.

Perhaps all this is not quite so unimportant as it sounds. One suspects that, like other insubstantial essences such as "the spirit of Camp David," the spirit of greater permissiveness among backbenchers which presently permeates both sides of the House will continue to be invoked in the Labour party for some time to come. In any case, the party now has a Deputy Leader who believes in principle that any MPs who want to put a motion on the order paper should be allowed to do so.

FABIAN ESSAYS

Uncommon Sense

IF only the participants in the Labour party's re-think were all as sensible as the five contributors to "Where ?", the timely tract* which the Fabian Society has rushed out for the Blackpool conference, the party might get somewhere. With the partial exception of Mr Robert Neild, they do not have anything very new to say. But they do see quite plainly that Labour keeps losing because it is out of date—and that, at least, is a mercy.

They all want to thump petty, bullying and secretive Labour councillors hard. This is excellent in itself. But it is the easiest gesture to make of those that are needed to "tear off the false mask of sectionalism, class-consciousness and even intolerance," and there is some danger that it will therefore become the only one that is made. It is more splendid that the TUC's Mr Alan Birch (of the shopworkers' union) should say once again that the unions are in a mess and that they are bringing the party they are tied up with into disrepute. Now that the Fabians have him in their stable, could not they induce him to carry further his reiterated rumination about the possible need for "fairly radical changes" in the trade union movement's outlook and structure ?

* "Where ?" By Anthony Wedgwood Benn, Alan Birch, Douglas Jay, Robert Neild, Ralph Samuel. Fabian Tract 320. 2s. 6d. 36 pages.

On nationalisation, the tract includes an expanded version of Mr Douglas Jay's original article in *Forward*; and a much less politically hagridden piece by a non-politician, Mr Robert Neild, of the National Institute of Economic and Social Research, who supplies an intellectually lucid set of arguments for dropping the renationalisation of iron and steel. But perhaps the most important essay is a crisp contribution on organisation from Mr Anthony Wedgwood Benn, based presumably on his experience of working inside Transport House on the party's television programmes. Its main interest lies in Mr Benn's suggestions for renovating Transport House and fitting it to do effective staff work for the parliamentary party—and even more in the fact that he should need to make them. His article implies an extraordinary tale of administrative weakness, which suggests that at the head office at least nothing has been learnt from the Wilson report. The party should not allow Mr Morgan Phillips's personal comeback during the campaign, gratifying as that doubtless was, to stand in the way of a shake-up of the party bureaucracy from top to toe.

SOVIET UNION

East-West Books Clubs

WHILE Mr Georgi Zhukov, the Soviet expert in foreign cultural relations, is actively seeking new pacts with Britain, the United States and France (he arrived in London on Sunday), the British Council has not been too happy about its latest treatment at the hands of the Soviet censorship. A major exhibition of British books and periodicals was opened in the Lenin Library in Moscow last Saturday. But, in spite of previous self-censorship, a few of the 4,000 items had to be removed at the last moment. Copies of *The Economist* found themselves on the Soviet index, together with other periodicals and books by Bertrand Russell, Aldous Huxley, A. L. Rowse, Hugh Trevor-Roper, Allan Bullock and John Wheeler-Bennett; and even with such innocent-sounding titles as a biography of Margot Fonteyn and Michael Tippett's *Moving into Aquarius*.

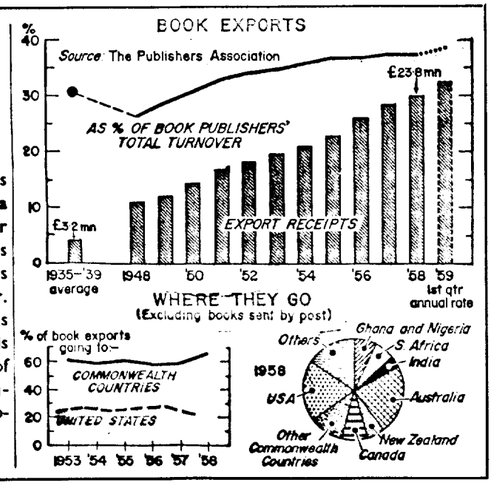
Such stalinist antics should not be taken too tragically. Cultural co-existence cannot be established overnight. Mr Zhukov, it is to be hoped, will have been tackled sufficiently energetically in London this week that he may have a word or two with the censors when he goes home. As it is, the Russians have given everyone a sound idea of the type of British book that they don't like to see around—and which Dr Charles Hill ought soon to be pushing on to the overseas market in some quantity.

Dr Hill has announced the names of the panel which is to advise him what books to make available abroad in low priced editions, in order to counter the Russian output of cheap English language books. It is a fairly composed committee. The excitement in the publishing world will now die down until the first list of titles is announced—and the terms on which the copyright holders are to be recompensed. Since only £500,000 is being spent on the scheme, including subsidies to periodicals, there will not be much in it for the British publishers; the other parts of Dr Hill's plans, such as the expansion of British Council facilities for teaching English and the provision of more information posts, may have more effective impact.

With this financial restriction, it ought not to be the panel's object to republish the Dickensian and other classics that the Russians are distributing already. But, as they have shown, the Russians are not likely to go in for some of the works of Orwell and Huxley, or for historians like Trevor-Roper, Bullock—and Churchill. And of course good reporting about life behind the iron curtain should find a place in the

Selling Books Abroad

Receipts from exports account for more than a third of the total turnover of British book publishers and the proportion seems likely to have risen this year. The destination of books sent through the post is not recorded; of the rest of overseas sales, Commonwealth countries took two-thirds last year.



panel's recommendations, even if in translation. The ration of angry young men ought to be limited—for one thing, their sufferings are so much less acute than those of 99 per cent of Asian readers.

SOUTH AFRICA

Disapproval by Boycott?

NOBODY need doubt the sincerity of those who are trying to use the weapon of a consumers' strike as a protest against the South African government's racial policies. Nobody disputes that Britons with scruples need not drink South African sherry in their own homes if they wish, although they will be making a rather obscure ideological point if they then start drinking Spanish sherry instead. But one must frankly doubt whether those who are now trying to mount a really intense and well-publicised boycott of South African goods in Britain are not making a mistake. If a boycott did have a big effect on South African trade, it might upset many farmers in the Union. It would injure the South African economy, and thus South African natives too, even though the sponsors of the campaign try to argue that it would not. But if the farmers then complained to their government, they would merely be told that were the floodgates to be opened to communism they would lose their entire farms (besides having their daughters married to Africans). In fact, the usual effect of an attack from outside is to rally public opinion to the government of the day, however misguided.

On the other hand if, as is much more likely, the campaign meets with only a small response from a handful of intellectual people, the Union government will be hardened in its contempt for *kaffir-boeties* the world over, as not only fools but also people of no real substance or influence. When trade does not dip after Oxford common-rooms ban South African wine and fruit (they will hardly affect exports of wattle-bark) the Union government will draw its own conclusion: that trade and politics are two things. In large degree they will be right. The most that voluntary boycotts of goods can be is a moral reinforcement to an attitude of disapproval. The South African government need be—and is—in no doubt that its policy encounters massive disapproval in Britain. But the pressure to force it to change its policy must come from inside South Africa. Signs are not wanting that it will.

SAUDI ARABIA

The Disputed Oasis

BURAIMI is more famous than it deserves to be. A minor oasis in the depths of the Arabian peninsula, it is at present occupied in part by the Shaikh of Abu Dhabi and in part by the Sultan of Muscat and Oman, both of whom enjoy British protection. It is often described as being "oil-rich" but no oil has flowed there yet, and what is known of the geology has not tempted any oil company to drill any test wells. In 1952 two of the Buraimi villages were occupied by a small detachment of Saudi troops who had been sent across the sands to support a long-standing Saudi claim to them and to the desert hinterland. In 1955 an international arbitration tribunal failed to settle the status of the oasis and, with British help, the Trucial Oman Levies chased the Saudis away.

In 1956, nationalist pressure forced King Saud to break off diplomatic relations with Britain at the time of the Suez expedition. Since then the Saudis have answered any suggestion that these relations might be resumed by saying that the business of Buraimi would have to be settled first. On Tuesday, Mr Ormsby-Gore, Minister of State, met Abdul Rahman Azzam, formerly secretary-general of the Arab League and now King Saud's personal representative, in New York to discuss Anglo-Saudi affairs. The hope was once more raised that diplomatic relations would soon be resumed.

The Saudis have long used Buraimi as an excuse for not taking a step which, however useful or sensible, might expose them to criticism from their Arab brothers. Now that Egyptian newspapers have boldly said that President Nasser was ready to let bygones be bygones, the Saudis may feel that it is safe to do the same. They have said again and again that the Buraimi problem must be settled, but they have not made binding statements concerning how a settlement could be arranged or even what it should be. In Britain, the Saudi statements have been interpreted as meaning that a settlement would have to give the Saudis what they claim. In fact, it is likely that King Saud would agree to accept the findings of another international tribunal. This may be what Mr Azzam is telling Mr Ormsby-Gore.

ARAB REFUGEES

Bid for Sanity

ONCE again the United Nations has embarked on the weary treadmill of debate on the future of the Palestinian refugees. The assembly has to decide under what terms to renew the mandate for the United Nations Relief and Works Agency which expires in June. Since most of the million Arab refugees depend entirely on the agency, there can be no question of putting it out of business. But the United States, which supplies nearly three-quarters of its $38 million budget, has been making a bid for sanity by suggesting that the agency's life should be extended for a very short period and then only on condition that the Arabs and Israelis agree to start negotiating something better than the present makeshift solution. Unfortunately this is not a case where the country that pays the piper calls the tune; however toughly the Americans bargain to begin with, they will always be expected to yield at a certain point rather than produce a deadlock from which the refugees would be the immediate sufferers.

Neither the Israelis nor the Arab states have budged from their familiar positions; both stand pat on the particular United Nations resolutions that suit them. The Israelis reiterate that they are ready at any time to negotiate, but only as part of a general peace settlement. The Arabs maintain that there is no need for discussion as the assembly has declared long ago that all refugees who want to return to their former homes should be allowed to do so. Mr Hammarskjöld's proposal earlier this year that member governments should work out a programme for integrating the refugees in the countries where they now live has been aired by two or three countries including Ceylon, Liberia and the United States, but it has already been made impracticable by determined Arab opposition.

In these constricting circumstances there is no better tool than Unrwa for keeping refugees alive, and it is sad news that the British deputy director, Mr Leslie Carver, was killed in a motor accident last week. He had held this post since 1952 under three different directors, all of them American and all obliged to spend much of their time fund-raising or lobbying at UN headquarters. Mr Carver had more responsibility on the ground than anyone else, and he will be remarkably hard to replace.

ADULTERY

The Archbishop's Remedy

THE Archbishop of Canterbury's *obiter dictum* at the Canterbury Diocesan Conference that "the time is coming when adultery ought to be made a criminal offence," has given rise to a nice crop of bizarre headlines in the Press (including one misleading great big black one: "Adultery by the Primate") and some flabbergasted general comment. But the Archbishop's proposal is not as revolutionary as many people appear to think. The late Dr Hensley Henson, Bishop of Durham, made a similar suggestion some time ago, and the Primate is already on record as stating that adultery is more harmful in its social effects than a homosexual act. Furthermore, adultery is a crime under the Indian Penal Code, and in the overwhelming majority of jurisdictions in the United States. Thirty-seven of these also punish fornication. In most states these laws are not enforced, but in others they are not dead letters. In Boston, for example, in 1948, 248 people were arrested for adultery, in Los Angeles four, and in

The Economist Diary

Specially designed to create an atmosphere of peaceful co-existence between the busy man, his secretary, and the world at large.

A week's appointments at an opening; a book that lies open flat on the desk

Baltimore three. In England, adultery was punished by the common law courts in the sixteenth century (*R v Ranyer* 1558 *Midd. S.P.R. Mich. I. Eliz.*), but exclusive jurisdiction then passed to the ecclesiastical courts.

If the Primate is really serious in wishing adultery to be punished today, he has no need to wait upon the vagaries of the legislature. The jurisdiction of the ecclesiastical courts over moral offences has never been abolished, although it has not been exercised since the middle of the nineteenth century. Some judges have expressed an opinion that it could not be exercised today, but it has never in fact been abolished by Act of Parliament.

The proper course then, for a zealous churchman who supports the Primate's stand is to bring a prosecution in the Archdeacons' Court by a process appropriately named "promoting the office of the Bishop." Once jurisdiction had been revived in a test case, other prosecutions could follow. The punishment imposed in the Archdeacons' Court would be some form of ecclesiastical penance, such as wearing a white sheet for a stated period (last imposed in the 1850s) or reciting a series of prayers in church. Should the offender prove contumacious, the ultimate sanction would be excommunication. Since criminal prosecutions are not subject to time limits, in the absence of statutory limitation some interesting possibilities for prosecuting past offences would arise, including among the great. Some people might find attractions in this line of thought ; but on the whole, we think, much wiser not.

PEST KILLERS

Farmers' Chemical War

BRITAIN has had its own equivalent to America's cranberry scare (see page 862), and perhaps with rather more reason. Anxiety in this country about the growing armament of anti-pest chemicals used in farming—weed-killers, insecticides, fungicides—was brought to a head a few weeks ago when a farmer's wife in Herefordshire was fatally poisoned by water from a well contaminated by arsenate potato-haulm killer. In this tragic instance, the moral to be drawn was the need for stricter standards of care in using particularly toxic substances. Direct and immediate danger to human life is not, however, the whole story. In his maiden speech last Friday, Mr John Farr, the new Conservative member for Harborough, made a point which up till now has had far too little attention.

The very efficiency of chemical armaments makes their use equivalent to throwing a spanner into the ecological works—with results impossible, in the present state of knowledge, to calculate in advance. The most obvious disturbance to the biological balance of the countryside is the effect of enthusiastic and ill-timed DDT spraying on hive bees. The direct loss to beekeepers is heavy and well attested. The indirect loss, to farmers and fruit-growers themselves through the resulting break in the pollination process, is as yet very much less than the improvement in yields due to pest eradication. But the possibly quite incidental extermination of a predator could bring about a plague of its natural prey. What this danger amounts to is, quite simply, unknown. It may be imminent and serious, or remote and negligible. The same may be said of the "long-run build-up of toxic sprays and chemicals in our soil" to quote Mr Farr.

To make these points is not to range oneself alongside those inveterate anti-technologists to whom all laboratory products are the work of the devil. The moral is not to scrap the chemical armoury and go back to the hoe for weeds (and presumably to the thirty-bob wage level at which the hoe was an economic proposition). Nor is it to adopt an impotent resignation in the face of pests. It is to devote a great deal more energy and money to research, not merely into the short-run side-effects of chemical warfare (as is already done under the scheme set up following the Zuckerman working party report in 1953), but also into its results in that long run in which hubristic attitudes to Nature are apt to reap their due penalty.

MEXICO

Visitor from Moscow

MOSCOW's decision to send no less a person than Mr Mikoyan to open the Soviet trade fair in Mexico City is evidence of Russia's alert eye for the Latin American chance. Washington's unsure touch in dealing with its southern neighbours has created openings that no Russian cold warrior can be expected to ignore. Besides making the most of such sore points as the anti-Yankee sound and fury in Cuba and Panama, the Soviet Union is probing the possibilities in more important, though less immediately promising, territories. Last year there was a trade agreement with Argentina ; now, apart from the venture into Mexico, which may be extended into Venezuela, the Russians are playing host to a Brazilian trade mission.

Mr Mikoyan brings his offer of long-term credit to Mexico at a time when the republic is faced with a situation in which its main exports—cotton, coffee and lead—are fetching low prices. At present 80 per cent of Mexico's trade goes to the United States, and in October President Lopez Mateos paid a friendly call on Mr Eisenhower at Camp David. The two presidents produced a joint statement of magnificent cordiality in which they promised to keep in touch with one another over such delicate subjects as the production of lead and zinc. All the same, the Mexicans are bound, at this moment, to be interested in learning what the Soviet Union has to offer.

Mr Mikoyan also has some diplomatic fences to mend. A few weeks ago, two Russian foreign service officials were asked to leave because of their undiplomatic practices in connection with Mexico's rail strikes, and the secretary-general of the Mexican communist party is now awaiting trial for his part in the affair. Although in the last 30 years Mexico's revolutionary order has shaken down into respectable conservatism, Mexican business men and diplomats have found it politic never to let the image of national revolution be quite buried. Mr Mikoyan's visit will stir uncomfortable memories in American minds.

KENYA

Shattered Hopes

IT is now clear that the division between the Kenya National party, which was multiracial under African leadership, and Mr Mboya's Kenya Independence movement is fast disappearing. The African leaders of the Kenya National party have this week shed some of their most influential Asian support, because they are no longer prepared to admit in public (though they might still accept in private) that a future Kenya constitution should have any provision for reserved seats for Asians or Europeans. This means that Mr Muliro and Mr Arap Moi have had virtually to adopt Mr Mboya's and Dr Kiano's policy —which is adult suffrage on a common role and self-government (if not independence) in 1960.

This is bitter news for Mr Macleod and Sir Patrick Renison, the new governor. With whom are they now to negotiate? The Kenya National party was their main black hope, but even its degree of moderation and inter-racial co-operation is fading. It is painfully plain that Mr Blundell's New Kenya party, an intendedly multiracial party under European leadership, is not offering a policy that could be implemented in the 1960 conference without a violent African reaction. African opinion is in no mood to accept anything less than Mr Nyerere is going to get in Tanganyika—and Mr Nyerere will almost certainly get a common roll and a majority of African seats in both the legislative and executive councils. It is therefore useless for the New Kenya party to campaign on vague proposals for qualified franchises at this stage; there are unhappy signs that more and more Kenya Europeans, realising this, are beginning to listen to Group-Captain Briggs's siren call for a "united white front" in London.

The racial gulf has yawned wide again. It has done so at a time when the Kenyan railway strike has been proving a fairly impressive test of African solidarity—and the strikers are out mainly on racial grounds. Mr Macleod should inquire into the follies of the local administration which have driven men like Muliro and Ngala back into the arms of Mboya and Odinga. But it is now late in the day.

LAING FOR COMPLETION ON TIME

Co-operating for two years with the Architects and Consulting Engineers, the Group's Research and Development Centre put its testing facilities, casting and construction experience into the development of LAINGSPAN.

Here, at Arnold near Nottingham, school accommodation for 720 pupils was constructed in 15 months and is now occupied.

Architects: Architects and Building Branch of the Ministry of Education in collaboration with Nottinghamshire Education Committee.

Consulting Engineers: A. J. & J. D. Harris

LETTERS

The Liberals Protest

SIR—In last week's article "The Liberals' Next Steps" you assert again that Liberals in the Rochdale by-election promised protection for cotton. You have never produced any evidence to support this allegation. I suggest that you do so or withdraw it.

I took some part in the Rochdale by-election and I have been for eight years the Liberal spokesman on cotton. I have never at any time—including the Rochdale by-election, when I spoke for Mr Kennedy at the opening of his campaign in the Town Hall—advocated protection for cotton. In truth—as *The Economist* has noted on more than one occasion—I have continuously opposed protection for cotton.

I heard Mr Kennedy speak on a number of occasions during the by-election and I read his election literature. In neither speech nor written word did he indicate or imply that he would support protection for cotton. I know of no other leading Liberal spokesman in that by-election who advocated protection for cotton. As far as I am aware, Liberal candidates in Lancashire have always fully supported the line I have taken on cotton. If you have evidence to support your allegation you should publish it; if you have not, I request you to withdraw it and I suggest you will owe the Liberal Party, and particularly Liberals in Lancashire, an apology.—Yours faithfully,
House of Commons ARTHUR HOLT

[Representatives of the local cotton employers' association at that by-election recommended Rochdale to vote Liberal rather than Tory, specifically on the grounds that the Government would not promise to protect cotton enough. At that moment, when the Liberals' main need was to get over their freer trading image to the country, the party had an historic opportunity to seize the headlines by saying bluntly and sharply that it stood for even less protectionism than did the Government. Instead, Mr Kennedy began to say that he was very new to the issue, and that cotton was a complicated problem, etc.; and Mr Holt, whose previous and subsequent outspokenness had been admirable, knows quite well that he himself chose to become more muted instead of blunter. Mr Holt has made up for this with magnificent courage on the issue since; he got specific credit from *The Economist* when he did; and he still triumphantly held Bolton at the general election. Liberal voters should now forget that by-election of the long spoon; our point last week was that those who plan future Liberal tactics should not do so.—EDITOR.]

SIR—Just after the Torrington by-election in 1958 *The Economist* published a leader so inaccurate in its accusations of protectionism and pacifism that I was forced in self-defence to reply. You neither commented on my reply nor substantiated your charges. You now repeat them in "The Liberals' Next Steps" and imply that as a consequence of these policies many votes that were then "easy to come by . . . were bound to be easy to go away again later." In fact, the Liberal vote at Rochdale and Torrington—the two constituencies you mention—in the general election of 1959 was higher than in the by-elections of 1958.

As for the policies themselves, I can only quote your own comment on our agricultural policy: "In its analysis of the agricultural situation—and in most of its policy recommendations—this report [the Liberal Party report on agriculture] stands head and shoulders above its Conservative and Labour counterparts." The suggestions I made to deal with local problems were derived from the admirable report made by The Economist Intelligence Unit, "Our Forgotten Countryside," now on sale.

There is, however, one point which your article does not make. One of the main steps the Liberal party can take is to persuade those who agree with it in private to say so in public.—Yours faithfully,
London, W8 MARK BONHAM CARTER

[This requires broadly the same comment as Mr Holt's letter above, if Mr Bonham Carter insists that we must use the tiresome device of editorial footnotes in order to go on rattling old bones. The Torrington by-election of 1958 happened to coincide with the publication by the Tories of a rather courageous and therefore unpopular agricultural price review; the use that Mr Bonham Carter then made of this issue did not bring over the Liberal image in what we regard as its best light. The last sentence of his letter is baffling. After all, all that we have recommended is that Liberal candidates would be wise to continue to say in public, even at times when the squeeze is on, the excellent things that they are saying both in public and private at times when it is not.—EDITOR.]

Women's Magazines

SIR—May I comment on your account of the "Petticoat Battleground," where you very rightly draw attention to the crippling shortage of colour retouchers in the photogravure section of the trade. You are, however, wrong in suggesting that any relief could be found by turning to web fed offset. The retouchers for the offset process are members of the same union, the Society of Litho Artists, Designers and Engravers; though they are in a different section, they are interchangeable for purposes of union policy, as also are the letterpress process engraving workers.

SLADE has, since the war, preached to its members the extraordinary doctrine that there is bound to be a recession in their trade and that the most restrictive policy on intake is necessary, to such a degree that at the present time the employers in the process engraving trade are under the strongest pressure to reduce the intake of apprentices for the very years that coincide with the school leaving "bulge."

As you well know, Sir, the trend of print in the last decade has been towards ever more illustration in colour. You will not be surprised that under the shelter of a firmly "closed shop" and of this restrictionist policy, the acutest shortage of labour now prevails in all the illustration producing sectors of the printing trade. Desperate employers compete for staffs at wages far above the union-negotiated rates. For these men of course, this is "all right, Jack." From the national point of view it is not so right that some print is priced out of existence and some print workers, who have recently submitted to an arbitrated settlement of their own claims, should be priced out of a job. Manufacturers' ring prices, including those of printing blockmakers, are now rightly subject to searching inquiry by the Restrictive Practices Court; labour restrictive practices undergo no such scrutiny. The equity of this is hard to see.—Yours faithfully, ADAM MAITLAND
London, SW7

Horse Racing

SIR—Your article "Boldly in Hazard," in my opinion, was misleading in its conclusion that owners of racehorses and breeders of bloodstock can be classed in the category of "a few very rich men." Only a small minority of the members of the Racehorse Owners Association own more than five racehorses (some 8 per cent) and the interest of the remainder varies from a mere half-share in one horse only.

The fact should not be overlooked that, whilst a few comparatively wealthy owners may have succeeded in winning some of our more important races in recent years, and will no doubt continue to do so, they were in several instances neither domiciled nor resident in this country. Furthermore, there is undoubtedly a very substantial section of our population, and in all walks of life, whose main hobby or occupation is allied to the horse, its breeding and its racing. Many of such people to my personal knowledge are compelled to make considerable financial sacrifice to enable them to support and enjoy their overriding interest.

A reference to royalty may connote wealth, but the expression "the Sport of Kings," historically applied to horse-racing, should be read with intelligence and in its true context.—Yours faithfully,
H. AUBREY EASTON
The Racehorse Owners Association Ltd.
London, EC4

Mr Speaker Morrison

SIR—I refer to your editorial note entitled "Parliamentary Pensions," a title amply justified, if I may say so, by the course of the debate. In commenting on the second

reading of the Bill for Mr Speaker Morrison's retirement, you say:

> It is gratuitously offensive to imply that Lord Dunrossil accepted a great ceremonial office like the Governor-Generalship of Australia in order to get extra money.

It was much more than an implication to that effect that came from the Labour benches. Mr Pannell thought it unfortunate "that the acquisitive sense of one Speaker has led him astray from the course of history."

I write mainly in the hope that publicity may be given in your columns to the only fair or generous remarks made about the retiring Speaker in this unedifying debate, in which irrelevance and personal interest seemed the main theme of speakers of all parties. The exception was the speech of Sir Charles Mott-Radclyffe, who said:

> Happily, in our public life there are still many men, of whom Mr Speaker Morrison is one of the most distinguished, who judge high offices and appointments not by what they can get out of them but by what they can contribute to them. We should be proud that an ex-Speaker of this House should have felt able to accept an invitation to serve a Commonwealth country in the high post of Governor-General.

I first met Mr Speaker Morrison in the year 1921. I have known him as a friend off and on ever since; I have never known a man who cared less about money or material considerations. The Australians will find him completely without "side," and a man of outstanding character, who dominates any company by his personality.

Of one thing I am certain. Mr Pannell and Mr Mellish are barking up the wrong tree. I am certain that Sir Charles Mott-Radclyffe is right. If this appointment does not prove an inspired choice, of one of the most remarkable public men of our time, I shall be greatly mistaken.—Yours faithfully,
Brooks's JOHN SENTER
London, SW1

The Cameroons

SIR—In your comment of Saturday, November 14th, on the Northern Cameroons plebiscite you described the result as "wildly unrealistic, however democratic." These comments seem to have been based on a totally erroneous interpretation of the plebiscite result. For it is incorrect to say, as you did, that the Northern Cameroonians have voted "to be torn bodily from the country of which they are an integral part." The choices before the people were: (1) do you want the Northern Cameroons to remain part of Northern Nigeria after independence? or (2) do you want to postpone a decision on the future of the territory until a later date in the future?

The people voted very heavily against the first choice. And in doing so they did not, it should be emphasised, vote against remaining part of the Nigerian Federation. They have only expressed their loss of confidence in the present Government of Northern Nigeria whose party, the Northern People's Congress, supported the first alternative. And in this respect they were neither "unrealistic" nor "misguided." For even *The Economist* itself has at different times condemned the feudal and unprogressive autocracy which today dominates Northern Nigeria. It is only natural for the people to express their resentment at the first opportunity. As for "inexperience," we think that the high poll of 87 per cent adequately makes up for whatever experience the people might have lacked.

As the only major political party which sponsored the second alternative, the Action Group is completely satisfied that when the time comes for the Northern Cameroons to take a decision on their future, they will choose to remain in a Middle Belt State within the Federation of Nigeria.

In our view it should not be necessary to separate the territory from Nigeria, even temporarily. This is why the Action Group has, in a three-point policy statement, urged that a final plebiscite should be held in the Northern Cameroons after next month's federal elections but before Nigerian independence on October 1, 1960.—Yours faithfully, S. O. SHONIBARE
Action Group Campaign Committee, Lagos

American Education

SIR—Mr De Pillis's letter on this subject is unconvincing. His statement that New England has "the highest state university tuitions in the country" is misleading. According to an American Council on Education publication of 1956, only the lightly populated northern tier of New England states had anything describable as high tuition or fees, compared with other state universities. Mr De Pillis's own institution, the University of Massachusetts, serves roughly half New England's population; it quoted tuition of $100 per annum, plus $38.50 in "other fees." The University of Connecticut charged a "university fee" of $150 (no tuition); that of Rhode Island, $200. The University of California charged an "incidental fee" of $84 per annum (clearly the word "tuition" is unpopular, if the fact is not); that of Oregon, $189; that of the third Pacific state, Washington, $183. (All these figures are for state residents; outsiders always pay more.) Thus two of the three West Coast universities are more expensive than those of Massachusetts or Connecticut.

Insofar as Mr De Pillis *has* a point about the relative inadequacies or expensiveness of state-supported education in New England, does this not suggest deeper factors at work? Why this lag in New England? Surely it is because for generations it was mainly the old Anglo-Saxon element in the population who were interested in higher education, and who gave their money, energy and devotion to private colleges and universities, the Harvards, Yales or Amhersts. The later arrivals from other parts of Europe tended (quite naturally) to regard higher education in general as the citadel of privilege and a mistrusted intellectualism. Thus New England conservatism, both of the blue-blood and the immigrant variety, has slowed the growth of state-supported higher education, until recently. That these attitudes are changing does not mean that they never existed. Nor is there anything disparaging or undemocratic about *The Economist's* having dared to refer to them. —Yours faithfully,
South Ascot RICHARD W. LYMAN

The Village that Committed Suicide

SIR—It is difficult to accept that "the Coal Board's ill-conceived redundancy scheme" is the main reason for the high proportion of men remaining unemployed in Cwmllynfell, since unemployment benefit and the Coal Board redundancy compensation both depend on a man's not refusing any reasonable offer of alternative employment. Neither the Ministry of Labour nor the Coal Board pay benefits to men who "choose" to remain unemployed where other work is available.

The main factor is, clearly, the amount of alternative employment available in the district and not the existence of a compensation scheme. About half a dozen men made redundant from Cwmllynfell and Steer collieries did not qualify for compensation under the board's scheme—yet all this group remained unemployed nine months after the closures. It could not be said that these men were being "invited" to remain unemployed.

At the other end of the country, in Northumberland, about 750 men were made redundant at roughly the same time by the closure of three collieries. All except 93 of them were in work again before the end of the full compensation period under the board's scheme. The difference between the story at Cwmllynfell and in Northumberland reflects the difference in employment opportunities; the explanation clearly lies here, not in any shortcomings of the Coal Board or the miners.—Yours faithfully,
NOEL GEE

Bank Architecture

SIR—I have not paid particular attention to the Midland Bank premises in Piccadilly, but I should like to have it explained to me how a building—even in Piccadilly Circus—can be held to resemble Shrove Tuesday in the town of my adoption. It would be interesting to have your comment in a similar space-time symbolism, of the proposed erection in the same circus, which has recently been the subject of some discussion.

On grounds of accuracy may I remind you that the correct spelling is "Middlesbrough"?—Yours faithfully,
Saltburn-by-the-Sea W. G. WILLIS

My Year with the Woodpeckers

Nearly 60 photographs in colour and black and white 21s.

HEINZ SIELMANN

Foreword by James Fisher

A faithful account, full of intriguing information, of a year spent filming the shy and beautiful woodpeckers of Europe. 'Nothing less than fabulous . . . splendidly illustrated.' PETER SCOTT.

'Theatre World' Annual

edited by Frances Stephens

The latest edition of this annual, indispensable to all who are interested in the living theatre, illustrated with hundreds of photographs. 25s.

The Antique Collector's Handbook

George Savage

This book, by an authority on the subject, is a mine of valuable information for the professional and layman alike, illustrated with drawings and diagrams. 25s.

The Collected Correspondence and London Notebooks of

Books from Overseas

DIPLOMACY IN THE NUCLEAR AGE
LESTER B. PEARSON
The winner of the Nobel Peace Prize in 1957 here speaks of the new difficulties that face the diplomat, and the new hazards that beset diplomacy today. (Harvard University Press) 16s net

THE TRUMAN-MACARTHUR CONTROVERSY AND THE KOREAN WAR
JOHN W. SPANIER
Fundamentally, the aim of this book is to explore the question whether the time-honoured principle in America of civilian supremacy over the military is compatible with the waging of limited war in today's world. (Harvard University Press) 3 line-drawings 52s net

GOVERNMENTS AND POLITICS OF SOUTHEAST ASIA
Edited by
GEORGE McTURNAN KAHIN
The book discusses the historical background, contemporary social and economic setting, governmental organization and political processes of six of the largest states of Southeast Asia—Thailand, Burma, Indonesia, Malaya (including Singapore), Vietnam and the Philippines. (Cornell University Press) Maps and Charts 52s net

A PUBLIC DEVELOPMENT PROGRAM FOR THAILAND
Report of a Mission Organized by the International Bank for Reconstruction and Development
This report makes a thorough analysis of Thailand's economy, and appraises its potential for future growth. (The Johns Hopkins Press) 48s net

THE RUSSIAN PUSH TOWARD JAPAN
Russo-Japanese Relations 1697-1875
GEORGE ALEXANDER LENSEN
This is the first scholarly and comprehensive treatment of the early beginnings of Russia's relations with Japan, and of the Russian drive toward Japan. (Princeton University Press) Illustrated 80s net

THE SCHUMAN PLAN
A Study in Economic Co-operation 1950-1959
WILLIAM DIEBOLD Jr.
This book analyses in detail the work of the Coal and Steel Community during its formative years, and considers the broad questions: has the new arrangement created a cartel, superstate socialism, or a competitive market? How has the Schuman Plan affected production, trade, and prices? What are its key problems, now and in the future? (Council on Foreign Relations) 57s 6d net

ON THE GAME OF POLITICS IN FRANCE
NATHAN LEITES
The intricate, ritualized 'rules of the game' that govern French parliamentary strategy and tactics are here explained in detail. (Stanford University Press) 36s net

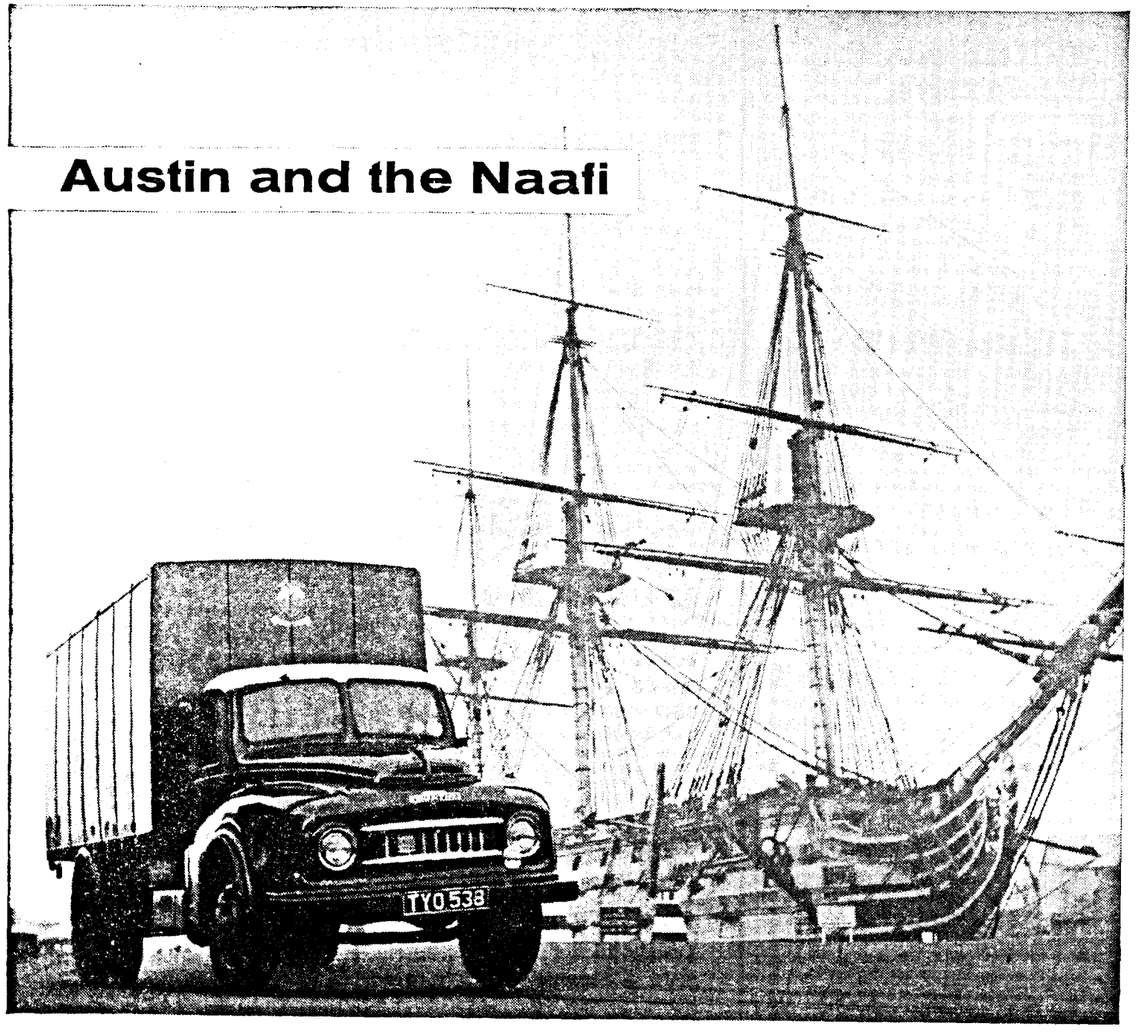
THE ITALIAN FASCIST PARTY IN POWER
A Study in Totalitarian Rule
DANTE L. GERMINO
In this study, based on all the available sources, Professor Germino describes the functions of the party, explains how it was organized to perform its tasks, and discusses conflicts between the party and other power elements in the dictatorship. (University of Minnesota Press) 36s net

VOLTAIRE'S POLITICS
The Poet as Realist
PETER GAY
'. . . . an excellent book, which will render real service to all students of Voltaire and of his period, and also has much to offer to the general reader. It is a pleasure to read an academic work so completely free of jargon and written in such taut and lively prose.' *The Times Literary Supplement* (Princeton University Press) 48s net

THE ECONOMICS OF COMPETITIVE COEXISTENCE
Japan, China, and the West
H. MICHAEL SAPIR
This report shows how Japan is being challenged by Red China in the field of foreign aid and technical assistance to underdeveloped countries in South Asia. (National Planning Association) Paper cover 16s net

OXFORD UNIVERSITY PRESS

Austin and the Naafi



THE SHIP, as any small boy will know, is Nelson's *Victory*. 154 years ago she fought at Trafalgar. Now she lies peacefully in Portsmouth harbour beside today's naval giants.

Passing the famous ship is part of another fleet—the Austin fleet of Naafi. This diesel 5 tonner is distributing cakes and pastries to canteens aboard H.M. ships. A 100 per cent reliable vehicle is essential. For the driver must finish deliveries by 10 a.m. stand-easy or risk a riot!

Round the world

All round the world Naafi serves the troops—and where Naafi goes, Austins go. 3 and 5 tonners put in long hours and high mileages for Naafi warehouses. Others work for bakeries—and it's mostly nightwork here, with a midnight to 5 a.m. start and a 100-mile-plus journey ahead.

On most forces' stations where there are outlying units, Naafi's Austin mobile canteens are in action. Open fields, cart tracks, ice and mud never stop these vans.

Overseas, Naafi's mobile canteens serve troops in Cyprus, in Singapore, Hong Kong, Tripoli. Other Austins are at work for Naafi from Aden to Malaya.

An increasing stake

Naafi started using Austins 4 years ago. Today they have standardised on Austin 1 ton petrol-engined chassis for mobile canteens. Mr. J. P. Macdonald, Controller of Transport, says, "We have found the Austin chassis better suited for our mobile canteens than any other vehicle. Austins do a good hard job of work for us and are getting an increasing stake in our fleet."

A word about the Austin range

Austin offer a wider range than any other manufacturer in this country today. ¼-2 ton vans, 2-7 ton trucks, prime movers for 15 ton gross train weights, chassis units for any type of bodywork. All with 12 months' warranty and backed by B.M.C. Service.

Austins for the Naafi home fleet are supplied by Maskells (Brixton) Ltd.

BOOKS

A Sensitive Plant

Prelude to Israel: *An Analysis of Zionist Diplomacy, 1897-1947*

By Alan R. Taylor.
Philosophical Library, New York. 136 pages. $4.75.

IT is twenty years this year since the British, by issuing the Palestine White Paper of 1939, thwarted the hopes of Zionists who had pinned their faith on Britain, and caused their movement to transfer its main effort to the United States. Only ten years later—in January, 1949—the state of Israel held its first elections, and secured recognition by a mass of fellow states which had, in accordance with diplomatic practice, awaited this hallmark of stability. That gap of ten years was filled by the Zionists with a highly successful compound of what Dr Taylor (of Howard University, Washington, DC) describes as "planning and organised effort." The part of his book that describes it is the most interesting part, for the early history of Zionism has been adequately covered by many writers who wrote in times less highly charged with emotion than have been the years since the war.

Plenty of books have been written about that final decade also, but none of them, so far, can be described as a dispassionate account of what happened. Some tell only the bits of the story that are to Zionism's credit; others, and fewer, to its discredit. All are crossed with prejudice. Perhaps no Jew has yet felt up to the more scholarly task, so darkly is it shadowed by genocide and tragedy; but why have Gentiles quailed at it? The reason is, perhaps, that Israelis are so new to nationhood, and Zionists outside Israel so hen-with-one-chick-ish, that both flare up at criticism, however much this may be what the courts call fair comment. Thus in Britain an author (in America, it is said, also a publisher) is hard to find, because Zionist watchdogs make the sequel to some adverse judgment a spate of time-consuming, unrewarding polemics about bias. "Why expose myself," think potential writers, "to the fag and irritation of this flood of correspondence about a partisanship I do not feel," and they turn to another subject. The loser is Israel, for the result has been a stifling of the kind of comment that is a tonic for any nation's health.

Dr Taylor's book is a good start in the right direction. Zionists will tend to write it off because it recognises points at which Mr Bevin showed horse sense, or President Truman naïveté, and makes no bones about a connection between terrorism and diplomacy; yet it is a mistake to discount the whole because parts are not to one's taste. Most of it is level-headed and well founded.

It describes the process whereby leaders, who had in the early 1900s (after fruitless approaches to Sultan and Kaiser) fastened on Britain as the right helper, between 1939 and 1942 transferred their diplomatic effort from London to Washington with the instinct that causes birds to shift their habitat or animals their pasture. It examines the care, the committees and the societies whereby they prepared to exercise, first, pressure on America to press Britain, and later (seeing that this would be needless) direct pressure upon the government of the United States. In the mind of the British reader, it must here rouse speculation about how far, during the war, anyone in London had time to grasp the importance of this change. Perhaps it was underrated because, for the duration, the image of the Jew in the British mind was that of a victim, not a planner.

The book, which is succinct but well documented on sources in English, sticks to the main lines, never bothering about embroidery such as descriptions of the superb oratory and generosity that marked some of the campaigning, or of the forms to which propaganda and fund-raising stooped towards the end of its period. It describes the evasiveness of Roosevelt, and the switherings of Truman between his sympathy for suffering, his anti-colonialism, his annoyance with Bevin, and his ready ear for Jewish buddies on the one hand, and the State Department and Pentagon on the other, always coming out in favour of the buddies in the end. It leaves on the gentile mind an impression of dogged Machiavellianism allied to a capacity for spotting the weak point at which to apply the pressure—a combination that commands attention and respect, but a form of respect that is tinged with misgiving.

For Dr Taylor sees, as any good contemporary historian should see, that the slice of life he describes is no more than a slice. There is another to follow. And in a last chapter he expresses his doubts whether Zionism, though so successful in the short run of the last sixty years, can go on being so in its present shape. What happens if the Diaspora—at present "willing to help but not prepared to become part of Zionism's experimental state"—changes its mind and want to be "in-gathered"? Or if it grows cool because it takes fright at the Zionist attempt to build up a double loyalty, and an identity with Israel, in the breasts of citizens of third states. Maybe there is a middle way between these two alarming extremes, but the factors that might open it up are so variable that prophecy is impossible. To draw attention to them is to awaken sympathy for a country with Israel's origins, as well as misgivings about it. As one absorbs the perspective of this book one begins to see reasons, other than those of temperament, why the Irish are so jaunty, and the Zionists so touchy, about criticism of their state-at-any-price campaigns. Both campaigns carry the distinction of success. But the Irish are over the hump of life's complications, the Israelis still beset with them.

The Suicide Bombers

The Divine Wind

By R. Inoguchi, T. Nakajima and R. Pineau. *Hutchinson.* 224 pages. 25s.

ON October 25, 1944, five bomb-laden Japanese planes deliberately crashed into an American naval force off the Philippines, sinking one escort carrier and damaging three others; and that dramatic act inaugurated the suicide bombing campaign by "Kamikaze" pilots (euphemistically called Special Attacks by the Japanese) that was to continue until Admiral Ugaki, commander of the Fifth Air Fleet, personally led a final mission on August 15, 1945—after the Emperor's order to lay down arms had been broadcast. It was during the fierce struggle for Okinawa between March and June, 1945, that the campaign reached its zenith, with hundreds of young Japanese pilots attempting to achieve immortality by immolating themselves on the decks of Allied warships; and at one time, in April of that year, they were inflicting such losses and damage that it seemed just possible that they might succeed in driving away the fleet upon which the American land forces entirely depended. Happily countermeasures, combined with a whole succession of Japanese errors, eliminated the danger. Yet the Kamikazes—forerunners of the guided missile era—did prove one of the most effective anti-ship air weapons of the whole war; and everyone who underwent attack by them will remember the nerve-racking tension of watching them approach through a hail of gunfire, and climb for the final dive from only a few hundred feet overhead. Incidentally it was during the Okinawa campaign that the Royal Navy first came in for its full share of suicide attacks; and Admiral Vian's aircraft carriers then proved (as the illustrations in this book dramatically show) the enormous value of their armoured flight decks. Though often hit they were always in action again far more quickly than their American counterparts.

To westerners the whole conception of such a form of warfare has a nightmarish, Kafka-like unreality about it; and perhaps the greatest interest in this account from the hands of two Japanese naval officers who played a prominent part in the organisation and execution of the campaign lies in its revelation of the mentality that made it both possible and joyfully acceptable. The pilots selected for the purpose felt, we are told, like "gods without earthly desires"; they were filled with "a frenzy of

A man is known

The brandy—Remy Martin V.S.O.P.

A host is known
by the cigar he offers

Not every guest is a connoisseur. But few ever fail to detect the subtlety or appreciate the compliment of a fine Havana.

And the host who offers H. Upmann Havana Cigars enjoys an extra satisfaction. He knows that in flavour, in aroma, and in body, they bear fragrant witness to the skill and reputation of the cigar maker — and also to his own good taste.

H. UPMANN
HAVANA CIGARS

joy and emotion"; and they often left behind them letters or poems about cherry blossom in spring, or about going to their deaths with their mothers' photographs in their bosoms, whose glutinous sentimentality would be unbelievable were it not so fully and factually documented.

Of course the campaign bore within it from the very start the seeds of its own defeat; and it would probably have been far more effective had the attackers sought out the precious tankers and supply vessels on which the Allied fleets utterly depended —instead of wasting themselves on targets of secondary importance such as the picket destroyers. Yet there may be here a useful lesson about the extremes to which an oriental nation can drive its subjects when it faces—or believes that it faces—extinction.

Mr Roger Pineau's work in translating and editing Japanese accounts of the last war is already well known over here as well as in America. In the present instance his scholarly care in correcting false statements and incorrect claims keeps the whole story in proper historical perspective. Yet one reaches the end without really being any nearer to solving the riddle of how it was all possible. Probably to European minds it will remain unintelligible; but it may be worth remembering that it actually happened.

New Modern Histories

France

By Albert Guérard.

Italy

By Denis Mack Smith.

University of Michigan Press. London: *Mayflower.* 614 pages and 547 pages. 70s. and 60s., respectively.

EVERY generation needs its own History of the Modern World, and every university press hankers after one. From Ann Arbor, under the editorship of Dr Allan Nevins, we have the not-unfamiliar benefaction: a series for those "thoughtful people" who have grasped that the United States has "irrevocably accepted" its global role, but still needs "a comprehension of the fast-changing world situation." This is splendid if it means that historians like the late Mr Guérard can be employed to write the big books that they clearly have in them, and to write with lucidity, wit and understanding. But it emphatically will not do to present this bulky, and in many ways admirable, piece of chronicling and lucubration as anything approaching a "biography of a nation" without allowing its author to say a word about how France actually makes its living.

Some truisms seem to be in order. It is essential to an appreciation of French policy and French politics in the last hundred and fifty years to know something about France's economic state and how it came about. Why was France so persistently over-estimated as a power in the nineteenth century? Should we not be told about the industrial revolution that never came off, and why? There are just two paragraphs about economic development when it at last came under the Second Empire; the rebuilding of Paris by Haussmann gets about as much. The next thing is that the Panama scandal bursts upon the unwary reader. Is it really so undesirable to give some of the background of the Third Republic's industrial activity? How was France able to fight the first world war at all? These omissions do not seem to be Mr Guérard's fault; the idea underlying the series may be.

It is necessary to pay tribute to Mr Guérard's qualities, to his cautious explanation that he does not purposely inflict "arrant pro-French propaganda" on his readers, and to his balanced attitude particularly on France's modern colonial problems. But the British purchaser may be informed of the book's high francophile strain in dealing with the last war and of some of its author's more original ideas on recent events. Thus he suggests that France in 1946 should have dispensed with a written constitution altogether; an interesting proposal but one hardly fitted to those times. He believes that French colonisation of the Sahara—with American help—is wholly acceptable to the neighbouring African states. On the Algiers coup of May, 1958, he avers that "if Massu—or more probably Salan—had been forced into the position of a Franco he could have relied upon the full sympathy of the Free World." Even for a Gaullist, this is not an entirely happy suggestion. And for a historian it is not really apt to make popularised comparisons like that of Bonaparte's marriage to Marie Louise with "Hitler winning Princess Elizabeth of England." Such failings detract from some miracles of compression and many excellent word-portraits, particularly those on Thiers and Guizot.

★

Mr Mack Smith has given an excellent exposition of the last century of Italian history: if he is primarily interested in political history he sets out the economic evolution of Italy with clarity and skill—it is this which becomes the key to all the rest. The specialist on Cavour and Garibaldi, well versed as he also is in Mazzini, Crispi and the others, has here taken time and space to examine the causes and results of underdevelopment in Italy. The Italy that was united in 1861 was desperately short of capital when the very fact of unity created vast new financial claims. It is true that quite unnecessary amounts were spent to bad purpose on the army, both then and in later periods. But the Piedmontese army and administration had to be expanded up to some kind of national scale, and the resistance of recalcitrant southerners, who were termed brigands, called for military suppression on no small scale; it was, incidentally, one reason for the final destruction of the temporal power of the Papacy in 1870 that, so long as Pius IX owned territory, it was used as a brigands' refuge and base.

Modern Italian industry may be said to have been founded with the first factory built in 1872 at Milan by Pirelli, who had been one of Garibaldi's volunteers; soon after, Breda founded the steel works of Terni. Lack of capital, however, led to a persistent policy of large state subsidies to industry, which of course reached a climax under Mussolini. The Terni steelworks began the tradition of industrial concerns dependent upon the state and with journalistic interests, a system which in a slightly modified form is today under fire in the shape of Enrico Mattei's great, modern gas and oil concern, ENI. Lack of capital, again, added a special significance to Italy's choice of ally. The Triplice, synchronising as it did with a period of phenomenal economic expansion in Germany, brought with it considerable German economic domination; in the years before 1915 the Banca Commerciale Italiana in particular was equated with German financial influence. Lastly, lack of capital left the south of Italy undeveloped until American funds were devoted to its reclamation after 1945.

If one reflects upon Mr Mack Smith's history of Italy since 1861 it seems quite extraordinary that this country of poverty was in fact constructed into a political entity. When Prussia made Germany it was already like the bones beneath the flesh; it had established economic control through the *Zollunion,* and the Prussian army had shown itself to be invincible. But remote Piedmont had no such advantages. Thanks to poverty, corruption became an important element in the politics of the new Italy, but corruption is often transitional rather than destructive.

Principles and Particulars

Essays in World Economics

By J. R. Hicks.

Oxford University Press. 269 pages. 21s.

PROFESSOR HICKS has repeatedly proved himself to be equally at home among the abstractions of quasi-mathematical pure theory and in the human world with which policy must deal. He has the necessary intellectual versatility—wide as that of an astrophysicist who should also be a competent engineering consultant; he has a style whose quality reflects both extreme clarity of thought and those good manners towards the reader which do not always accompany intellectual distinction; and he has, as his preface to this collection of essays makes clear, a philosophy that saves him from assigning an absolute priority to economic ends. These qualifications, brought to bear on the discussion of practical economic problems, enable him to set his topics in a perspection of general principles, without losing sight either of the knobby particular characteristics of each, or of the political and social realities of the total situation of which they form part.

Most of these essays have already appeared, over the last twelve years, either in learned journals or book reviews or in the proceedings of various societies and conferences. They fall into two main sections: the first dealing with varying degrees of particularity, with the vicissitudes of the British economy in the postwar world; the second with policy problems in a number of underdeveloped areas. Hindsight occasionally shows Professor Hicks to have erred (in plenty of good company) on particular points of judgment. He was, in 1949 and in 1953, deeply pessimistic about Britain's ability to trade in the American market, and only a little less so about the dollar gap in general. Elsewhere, however, time has fully vindicated him. To re-read the famous presidential address to Section F of the British Association, delivered in 1955, on the implications of the "Labour Standard," or the paper on "The Instability of Wages," printed in the *Three Banks Review* in the following year, is to recognise an early diagnosis of what looks like being the economic crux of the 1960s; a diagnosis, typically, owing a great deal to its maker's appreciation of social as distinct from purely market forces. While the papers on underdeveloped countries are mostly more specialised (the particular developmental problems of Ceylon, federal finance in Nigeria, unimproved value rating in East Africa) they give the same sense of perspective, of the placing of concrete instances in a setting that makes them intelligible. And one, more general, essay on "National Economic Development in the International Setting" deserves to stand as a classic.

Professor Hicks apologises in his preface for "bringing out a volume of essays of this kind instead of the collection of theoretical essays for which I have often been asked." He gives comprehensible reasons for his choice. Readers less professionally concerned with pure theory than the students to whom the apology is addressed may be grateful that he found these reasons sufficient.

The Acts of the Archæologists

The Tombs of St Peter and St Paul

By Engelbert Kirschbaum, S.J. Translated from the German by John Murray, S.J.

Secker and Warburg. 247 pages. 45s.

MOST scholars, Protestant as well as Catholic, are agreed that St Peter was martyred in Rome under Nero, between the years AD 64 and 67. The tradition that his grave lies beneath the high altar of St Peter's Basilica dates back to Constantine; but until the excavations ordered by Pius XII in 1939, archæologists had been unable to put it to the test. The final report was presented to the Pope in 195', and Fr Kirschbaum has based his book on the findings. He has also made full use of subsequent professional debate, especially the brilliant series of articles published by José Ruysschaert in the *Revue d'Histoire Ecclésiastique.* Tourists visiting the now easily accessible *scavi* may prefer the earlier and simpler work of Professor Joycelyn Toynbee and Mr Ward Perkins, but by all students of the subject Fr Kirschbaum's

A man is known
by the company he keeps

The Cigar—H. Upmann Havana.

A host is known
by the brandy he serves

To serve your guests an indifferent brandy is more insult than compliment. The correct thing to serve after meals is a cognac of liqueur quality. This is why the perfect host gladly pays that little bit more for a really fine liqueur brandy like Remy Martin. A genuine Fine Champagne V.S.O.P. Cognac. A brandy defined by French law as *Fine Champagne* because it is made exclusively from grapes grown in the two finest districts of Cognac. And it is reassuring to remember that Remy Martin make *nothing* less good.

PRIDE OF COGNAC

REMY MARTIN

book will be preferred, since he had the inestimable advantage of being personally responsible for much of the operation.

The primary task of the archæologists was to establish whether Constantine, when he began the construction of his basilica in 333, was relying on literary or architectural evidence to determine the site of Peter's grave. Their first great discovery came on reaching the original Constantine pavement, when they found that the floor level of the basilica on the south was seven metres above the original ground level, the whole southern side of the church being supported by an immense platform of millions of tons of earth, constructed to level the side of the Vatican hill. Directly afterwards, they established that instead of being built on the site of Nero's circus, as formerly supposed, the basilica had been constructed over a pagan necropolis, dating mainly from the middle of the second century, but with traces of grave constructions going back to the reign of Domitian (81-96). Constantine must have had compelling reasons to undertake this extraordinary engineering feat, and to flout the Roman law's protection of graveyards as sacred places, when a far preferable site was close at hand to the south. His reasons were made clear when the excavators came across a third century wall, covered with *graffiti* left by pilgrims, including the name of Christ, lying just under the pavement. Behind this, and in direct line with the later altars of Gregory the Great, Callixtus II, and Clement VIII, they discovered an earlier wall of AD 160, covered in red plaster, on which had been scratched the name of Peter. Against the wall, which had been constructed to enclose the graveyard, a monument had been built at the same date, at the foot of which lay an empty grave. There seems little doubt that the monument is the *tropaion* referred to by Gaius in AD 200 as marking the tomb of the apostle. Beneath this monument, at a slightly higher level than the grave, a pile of bones was found, and proved on examination to be those of an elderly man with his skull missing. It is worth noting the venerable Roman tradition that the skull of St Peter is preserved in a reliquary over the high altar at St John Lateran. Has the grave of Peter then been discovered? The question, on the evidence, cannot be answered categorically. What the excavations have accomplished is to move back the Constantine tradition two hundred years, and to establish that, within a hundred years of his death, this spot was venerated by Christians as Peter's burial place.

Fr Kirschbaum also considers the evidence for the authenticity of St Paul's tomb on the Ostian way, but here his sources are of necessity secondary, and his account lacks authority. Only a new series of excavations beneath the confessio of St Paul's can throw more light on the matter. Such an undertaking would surprise the Church authorities, but today surprises at the Vatican are not quite the rare occurrences they have been in the past.

Plain Man's Dickens

The Maturity of Dickens

By Monroe Engel.
Harvard University Press. London: Oxford University Press. 214 pages. 25s.

MR ENGEL has written a short, straightforward and matter-of-fact account of the major themes in the novels of Dickens and of the degree to which they reflect what Dickens consciously set out to do in his writing and what he profoundly felt about the society of his time. His attitudes are first illustrated by extensive quotation from his letters, particularly from those he wrote as active editor of the various magazines which occupied him during most of his writing life. Then the novels themselves are grouped and described and the author's major intentions analysed.

The result is something of a paradox. One is grateful to Mr Engel for a simple, direct approach and especially grateful for some quotations in the letters which the general reader would be likely to miss—Dickens's reaction, for instance, to "colourless, shapeless" writing: "I would as soon dine off an old glove, as read such pale literary boiled veal," or his contempt, still apposite, for the social world which is

> wrapped up in too much jewellers' cotton and fine wool and cannot hear the rushing of the larger worlds and cannot see them as they circle round the sun.

But when the discussion turns to the great novels, the simplicity and straightforwardness defeat their own object. By sparely stating a great symbolic theme, Mr Engel in some way robs it of its power to move and disturb us. The truth is that literary criticism of this kind to be really satisfactory must itself have some creative and evocative power. An Edmund Wilson or a Lionel Trilling can enhance the reader's whole capacity to feel and understand. But Mr Engel lowers the temperature so much that even the symbolic themes begin to lose their poetry and the very effort to explain clearly the greatness of the books threatens to diminish their greatness. This impoverishing lack of style is all the more disappointing in that Mr Engel is clearly a most honest and painstaking scholar and has written, within limits, a sound book.

Chinese Marxism

The Soul of China

By Amaury de Riencourt.
Cape. 318 pages. 21s.

THIS is another book which endeavours to explain what has happened in China, and it does so by reference to the past, comprising not only the last hundred years or so, but the whole of Chinese history going back to the ages before Confucius. The author holds a general theory of the development of civilisations derived from Spengler and Toynbee; this theoretical framework, however, is not essential to his account of Chinese history, which is marked by interesting speculations and flashes of insight, though not always by accurate knowledge. His main point is that the Chinese have always sought an "all-embracing system which explains and co-ordinates everything"; such an ideology was established by the old Confucian orthodoxy together with the civil service examination system, which "ground all non-conformists to dust."

The impact of the West in the nineteenth century shattered the old economic and political order of China, and Confucianism was discredited along with it; the Chinese intelligentsia looked for something to replace it which would provide a similar total explanation of the universe adjusted to modern science and a similar authority for society adjusted to the conditions created by modern technology. To minds with this craving, Western empiricism and pragmatism gave no adequate satisfaction; piecemeal investigations and provisional hypotheses did not meet their need. "What," asks Mr de Riencourt, "could the Chinese, with their long tradition of synthetic integration behind them, understand in this incredible jumble?" They were rendered less accessible to Western liberal thought than to German historicism as formulated by Hegel and Marx.

Marxism in China has become a militant religious faith, providing "a vast perspective of history which was not disparaging to Asia's past" and a guide to organised action untroubled by uncertainties or doubts. As a result "Red China is a more up-to-date, more ruthless, more efficient version of what the Celestial Empire had been for thousands of years." There is much to be said for this view, but the author's argument would be stronger if it were not mixed up with so much Spenglerism in its conception of world history.

Artigas and the Emancipation

By John Street.
Cambridge University Press. 52s. 6d.

Publication of this book, which was reviewed last week, has been delayed until December 1st.

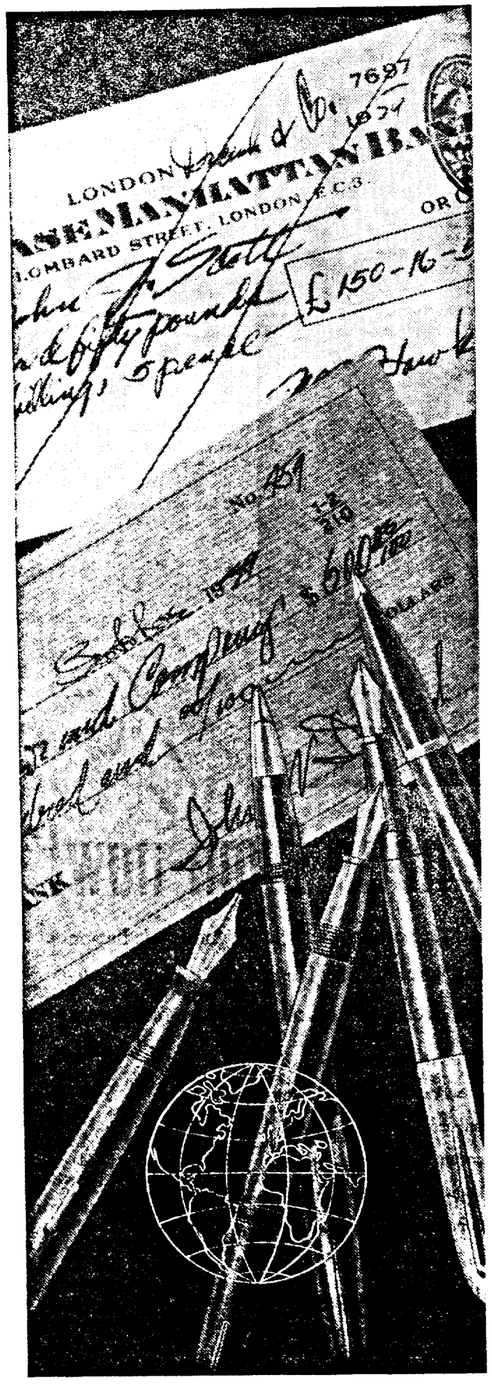
'Pier Wharf, half an hour from now!'

An urgent call... a waiting load... perhaps perishable goods – it happens every day. And the Independent haulier can give prompt, expert service. There's no red-tape to delay his decisions or slow up his performance.

It's one of the advantages of the *personal service* you get when you call in Free Enterprise Road Haulage... service that has won many long-standing regular customers in every branch of commerce and industry. They like the close attention the Independent haulier always pays to their special instructions. And they know it's his keen competition that has held down the price of Road Haulage since de-nationalisation.

The Free Enterprise Haulier puts *you* first

Get in touch with your local area office of the Road Haulage Association, or directly with the Head Office, 146 New Bond Street London W1 MAYFAIR 9050



How do you pay . . . by cheque or check?

Differences in language and customs, however small or subtle, can be important to people in Britain doing business with America.

As a U.S. bank with branches in London, Chase Manhattan knows the differences and similarities, can do much to make your dealings with the States more pleasant and more profitable. Chase Manhattan knows, too, the differences in customs and trade practices *within* the states . . . for its network of correspondent banks is the largest in America.

In fact, almost anywhere you do business, Chase Manhattan's network of more than 51,000 correspondent banks and branches around the world can get up-to-the-minute information for you, and provide you with every type of modern banking service—promptly, efficiently, and on a personal, *localized* basis that practically puts you on-the-scene yourself.

Why don't you talk to the people at Chase Manhattan . . . in either of the London branches.

THE CHASE MANHATTAN BANK

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Southern Cross

WASHINGTON, DC

A GRIEF ago, as Dylan Thomas would have put it, the United States learned that Latin Americans no longer loved it for its blue eyes and for being part of the same continent. The painful awakening which began when the Vice President, Mr Nixon, was spat upon in Caracas last year is now continuing with the discovery that the Latin American hostility is caused by more than temporary economic difficulties, and is unlikely to be removed by the comparatively minor efforts at appeasement which the United States has so far been willing to make. The resolutions which Cuba's trade union federation, beards abristle, passed last weekend express the dark suspicions that lurk in many Latin American breasts. These are that the United States "helps the dictators" because it prefers order to freedom south of Texas; that it expects special privileges for its citizens; and that it thinks of its Latin neighbours, when it thinks of them at all, as mere pawns (plus a bishop or two) for use in the cold war.

To Dr Castro's bitter attacks, and to the recent riots in Panama, the United States is responding in just the way that was to be expected after President Eisenhower had told a press conference that he was baffled. An advisory committee has been appointed, including the President's brother, Dr Milton Eisenhower. The State Department has sent to Panama Mr Livingston Merchant—the man it flings into diplomatic breaches now that Mr Murphy is retiring—to discuss the Panamanians' complaints about the operation of the Canal Zone. A university dons' study commissioned by the Senate Foreign Relations Committee has suggested that the United States should be more generous with economic aid and beastlier to dictators; but any thought that this foreshadows a more liberal approach by Congress next year must be balanced against the reported plan of a number of nostalgic wielders of the big stick to "bring Cuba to its senses" by cutting the import quota for Cuban sugar. These reactions are wearily familiar. The only change is that in the present heightened state of alarm the more extreme proposals—whether conciliatory or repressive—are getting closer attention.

The State Department has not set its face blankly against any concessions to Panama or Cuba. It is admitted that the Panamanians have some grounds for complaint about the way the United States has carried out the 1955 agreement regulating its occupation of the Canal Zone. Too many goods from third countries have been finding their way into the commissariats in the Zone; the provision that Panamanians and Americans should be paid the same wages for doing the same work has been stultified because it turns out that Americans have a monopoly of the better jobs. Changes may be offered in both fields, and it may even be possible to let the Panamanians fly their flag over the Zone if this makes their residual sovereignty seem less ghostly to them. The Cubans might just conceivably be mollified if the agents of ex-President Batista in Florida were kept under stricter watch, though it seems to be impossible to close all the hundred-odd airstrips in the southern part of the state to them. The trouble is that the State Department is unwilling to make any concessions so long as Dr Castro is whipping up, and the Panamanian government winking at, their respective mobs; and neither may be willing, or able, to call off the mobs now that they have been in cry.

The Americans' dismay is all the sharper because in the hope of removing two sources of Latin America's discontent—the shortage of public funds for development and the drop in the price of the primary commodities that the region exports—they have already bent before the wind. Last April's agreement to set up an Inter-American Development Bank confessed the inadequacy of the argument which Washington has used throughout this century: that private capital is sufficient for the needs of the area, if only the feckless Latins will run their countries honestly and efficiently enough to attract it. Something, though not very much, has also been done to implement the vague promise made by Mr Dulles eighteen months ago about sharing the burden which the recession had laid on the hemisphere's primary producers. Hitherto the United States has declared that, as a consumer, it will have no part in commodity agreements designed to raise export prices for producers. Now it has acquiesced cheerfully enough in a coffee agreement between the Latin Americans and growers in Africa; and a serious attempt has been made in the State Department to work out acceptable arrangements for other commodities, although so far Mr Douglas Dillon is said to have rejected them all for the sake of the domestic consumer.

UNFORTUNATELY, in spite of these gestures and the end of the recession, Latin America's bones are still sticking through its skin. Although the world price of sugar and that of some of the Andean metals has begun to struggle upwards again, the continuing glut of coffee (which accounts for a quarter to a third of United States imports from the area) means that the average price the Latins get for their products is still far below what it was in 1956 and 1957. All in all, the region earned no more dollars in the first half of this year than it did in the recession-benighted first half of 1958; its share in the total imports of the United States was smaller than it has been for some years. Nor is capital flowing in from the United States fast enough to build the industry needed to support a population that will reach half a billion or more by the end of the century. One estimate is that up to $3 billion of extra capital will be required from abroad each year for the next decade or so in order to achieve an annual increase of 4 per cent a head in the income of Latin Americans. Last year the flow of private investment from the United States was less than half a billion dollars. This was smaller than in either of the previous years and the genuflection to Latin wishes in the shape of the Inter-American Development Bank—the total capital of which is $1 billion—will bring only modest help.

It is not surprising that Americans are swallowing hard as they see Mr Mikoyan touring Mexican industrial plants this week and Brazil preparing to send an economic mission to the Soviet Union. But the political implications of the problem are far wider than the issue of communism. The United States has run up hard against two facts. One is that the Latin Americans are not insulated, as it was rather trustfully hoped they would be, from the nationalism at large in the world. This is most obvious in Panama, the one country where the United States occupies a slice of

territory. But it is also shown in the growing reluctance of Latin American delegations at the United Nations to have their arms twisted by big brother ; at one time in this session eight of them—the largest number ever to rebel on a cold war issue—were voting against the United States in the fight between Turkey and Poland for a seat on the Security Council. The other unpleasant fact is that a social revolution is stirring with which the United States, forgetful of its own revolutionary youth, has so far been unable to identify itself.

Very little has been done, for instance, to carry out the recommendation made by Dr Milton Eisenhower almost a year ago that the United States should treat democratic governments more warmly than dictatorships. The former ambassador to Cuba has been replaced by one more sympathetic to the Cuban reformers but the ambassador to Nicaragua, a friend of the very undemocratic President Somoza, remains. Nicaragua and the Dominican Republic continue to receive small amounts of military aid for "hemisphere defence," in spite of an abortive attempt by Senator Morse this year to strike them from the list, and there is a team of military advisers in darkest Paraguay. So far the United States has also been unable to muster much enthusiasm for the redistribution of land ownership demanded by the Latin American reformers. Mr Chester Bowles, one of the best informed liberals in foreign affairs, argued in the *New York Times* last Sunday that it will have to do so if it is to have a chance of retaining their confidence.

Admittedly, it is not always easy to tell which governments are dictatorships ; although the list has now dwindled in theory to three, it is reasonable to raise eyebrows about several others. The State Department also claims that it can only show its preferences in subtle ways. But it begins to look as if something blunter may be necessary. The irony is that the Americans, who were abused in the nineteen-twenties for insisting on their right to intervene in Latin American affairs, are now being abused for insisting on the pure doctrine of non-intervention even when this prolongs the life of the surviving dictatorships. By the terms of the charter of the Organisation of American States, they are almost certainly in the legal right in this ; but, as Mr Dulles discovered, legal rights sometimes fray under the rub of social change. If by the year 2000 Latin America's half-billion people are to be a counterbalance, on the side of the West, against China's industrialised billion, the United States may soon have to make clear where its sympathies lie.

No Thanks for Cranberries

THE only Americans who seem sure to have eaten cranberries with their traditional Thanksgiving turkey on Thursday are ambitious presidential candidates such as Mr Nixon and Senator Kennedy of Massachusetts, the biggest cranberry-growing state. Both were campaigning in Wisconsin, another cranberry area, when Mr Flemming, the Secretary of Health, Education and Welfare, issued his warning that shipments from Oregon and Washington had been found to be tainted with aminotriazole, a weed-killer which has produced cancer in rats over a two-year testing period.

The enthusiasm with which both Mr Nixon and Senator Kennedy swallowed their cranberries implied that Mr Flemming had been hasty, if not panicky. So did the comments of Mr Benson, the Secretary of Agriculture. But it was in May that the Food and Drug Administration refused to approve the slightest trace of aminotriazole in foodstuffs, as it is compelled to do under the 1958 amendments to the Food and Drug Act, even though it is said that a man would have to eat 15,000 pounds of cranberries a day for years to run any risk. Unless Congress gives the government more discretion next year the law will continue to bar any substance that produces cancer in either animals or humans. Mr Flemming's public announcement came only when some growers sent suspect berries to market.

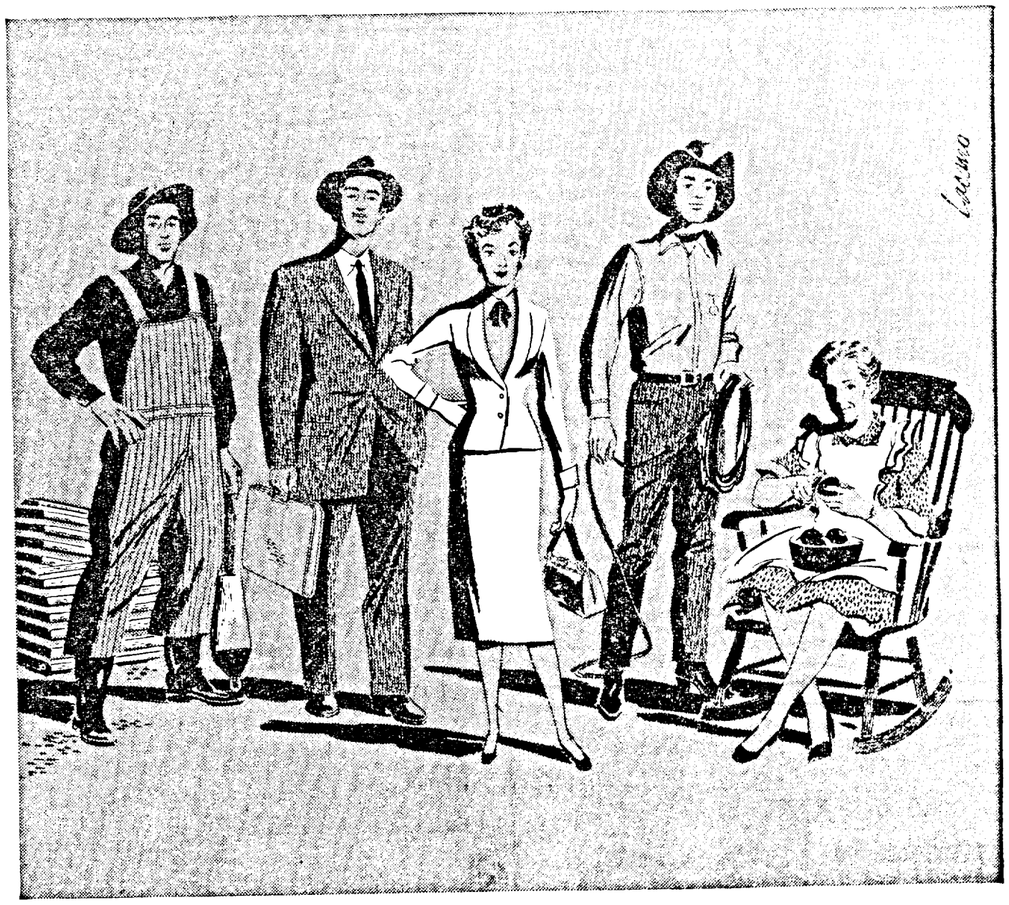
Working round the clock to save the growers from disaster, the analysts of the government and of private laboratories had cleared about 15 million pounds of cranberries by this week, but Americans normally eat 70 million pounds, about two-thirds of their annual consumption, at Thanksgiving and Christmas. Growers began to use aminotriazole to free the cranberry bogs of weeds in 1957, before its use was authorised by the Department of Agriculture ; in 1958 the department agreed to the use of the chemical provided it was within a few days after the harvest. This year, however, many growers disregarded this condition ; moreover, even some of the 1958 cranberries are tainted. In September the co-operative which handles three-quarters of all sales banned the use of the weed-killer. This ban, now official, raises another problem for the growers ; no substitute for aminotriazole is likely to be as cheap and effective.

If misery loves company, the cranberry growers may soon be happier. The 1958 Act tightened the controls on all substances added to food and put the burden of proof of their innocence on the manufacturer ; in the past the under-staffed Food and Drug Administration had to prove that a substance was dangerous. This change was made because of the enormous growth since the war in the use of pesticides, hormones, emulsifiers and other "additives" whose long-term effects may not be as benevolent as their immediate ones. When the new provisions all come into force in March the battle between industry and the guardians of the consumer seems sure to break out on other fronts.

Striking a Balance

THE steel strike, which arose from the refusal of the companies to be parties to an inflationary increase in wages, is probably going to bring an inflationary deficit, although only a little one, in this year's Budget. Receipts from taxes on corporations are falling so much as a consequence of the strike that there is now little prospect of the small surplus which had been forecast for the 1960 fiscal year which ends on June 30th. But revenues should pick up quickly once the strike is finally settled and it should also have the effect of prolonging the boom, and therefore of ensuring plentiful receipts from taxation, well into 1961. As a result President Eisenhower expects to be able to balance the 1961 Budget, the last which he will present to Congress, even though expenditures are estimated at a record $81 billion, $2 billion more than for the current fiscal year. This increase is the unavoidable outcome of high interest charges on the federal debt and of the rising costs of programmes already authorised by Congress, particularly for supporting farm prices.

Rising costs, both because prices are going up and because more must be spent on research projects as they reach the stage of producing weapons, mean that the 1961 defence budget is in effect smaller than this year's, even though the total figure of $41 billion is almost the same. When he was not banging at golf balls on his recent "holiday" in Georgia, the President was banging together the heads of his military advisers, and their enforced agreement on how the savings are to be made is being ratified in Washington this week. According to the detailed reports of these supposedly secret negotiations the main method of cutting back expenditure is to be the well-tried one of pushing still farther into the future the dates on which various of the new weapons will become operational.



WHICH OF THESE AMERICANS IS A CUSTOMER FOR EUROPE?

A Texas cowboy, a Maine lobsterman, an Iowa farmer's wife, a Chicago corporation lawyer, a New York department store buyer. These are but a few of the incredibly varied types who are classified as Americans and comprise the American market. They differ radically from each other and other Americans in tastes, desires, needs and ways of life, and, naturally, in the kind of merchandise they buy.

Banks abroad desiring to obtain a favorable position for their customers in U. S. markets are invited to use the facilities of Manufacturers Trust Company. Through our complete branch coverage in New York City and our thousands of correspondent banks throughout the United States, we are exceptionally well equipped to obtain data on local market conditions in the United States and to handle all types of banking transactions.

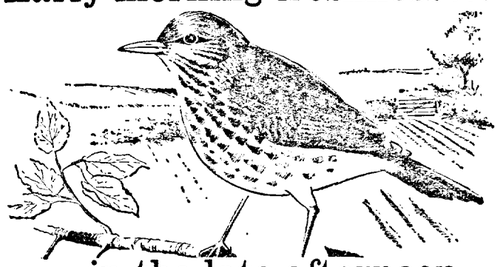
who

made 90,000 wagons?

The Pressed Steel Company. Who wanted these wagons? Britain, India and Australia. Who uses these wagons? Almost everyone. Almost certainly you.

PS means Pressed Steel, and the Pressed Steel Company means, besides railway wagons, car bodies and refrigerators in just about every country in the world.

Early morning freshness...



...in the late afternoon

Outside it may be sultry, but the overpowering heat and dust-laden city air cannot enter this office. A Temperature Room Air Conditioner maintains a clear, cool flow of air, fresh as morning dew, throughout the work-long day. It filters out the irritating dusts, controls temperature and humidity, is unobtrusive and easily fitted in any room or office.

LIVING FACTS

- Promotes comfortable, healthy conditions
- Dispels fug and staleness
- Conditioner can be flush mounted inside or out
- Window or wall fitting with simple installation in glass-fronted and concrete multi-storey buildings
- Water or air-cooled
- An installation with a conditioner in every room is less than half the cost of a central station system

TEMPERATURE

LIMITED

ROOM AIR CONDITIONERS

Make life fit for living!

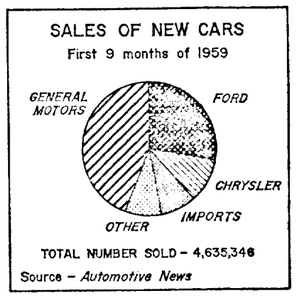
For next year at least, although probably not for long after that, there is to be no cutting back of American strength overseas or of military aid to allies, even though the $1.3 billion estimated for the latter is now added to the defence budget for the first time and to some officers must look like an easy place to economise. And in future the foreign share of military spending will have a strong and experienced defender at the highest level. General Williston Palmer, now deputy commander of the American forces in Europe, has been appointed to the new post of director of military assistance in the Defence Department and will rank with the Joint Chiefs of Staff. He will handle all details of allocating arms to allies, making sure that they go where they will do most good from a purely military point of view.

Ford's Fortunes

FROM A CORRESPONDENT IN NEW YORK

No sooner had the Ford Motor Company introduced its new small-sized car than the Ford Foundation announced a public offering of two million of its Ford shares for the second time in the last nine months. The foundation, which is America's largest tax-exempt charitable institution, has picked a favourable time to diversify its investments still further. The company is enjoying a good year for both sales and earnings and the prospect is that 1960 will be even better; in its output of new Fords, it is well ahead of its perennial rival in the low-priced field, the Chevrolet produced by the General Motors Corporation, which is not being made at all at the moment because of a shortage of steel; Ford's foreign operations are also doing well, particularly in Britain. Quarterly dividends, which were cut from 60 cents to 40 cents a share in the last half of 1958, have just gone up to $1.20—the regular dividend and an extra of the same amount—so that total payments for 1959 amount to $2.80 a share as against $2.00 last year. The foundation, incidentally, will receive the extra dividend, which alone will bring it in over $20 million, before selling its shares.

As the foundation made its offering the company announced tersely that it was abandoning production of its medium-priced Edsel car, which had been introduced in the autumn of 1957. The short and unhappy life of the Edsel is the latest evidence of how uncertain the automobile industry has become; once it considered itself an infallible judge of just what the public wanted in the way of style and price.



The demise of the Edsel is also a blow to the market researchers whose allegedly scientific surveys had virtually dictated its form and birth. Ford made another bad, although somewhat less expensive, mistake with its luxury Continental, which has now been downgraded to the price class of General Motors' Cadillac, still the first choice of the rich buyer. With the help of hindsight, experts are saying that Ford might by now have had a much larger share of the car market if it had used the money spent on the Edsel and Continental to develop a small car sooner. As it is, Ford is continuing to diversify its line of products; its new "compact" Falcon will be followed next spring by still another small car, the Comet.

The erratic performance of the automobile industry, and of Ford itself, is reflected in the price of Ford's shares; offered to the public early in 1956 at $64.50 each, they fell to a low of under $36 a share during the recession of 1957. This decline was accompanied by a reduction in the number of Ford shareholders; over 300,000 had participated in the original offering of 10.2 million shares, to the delight of the company's managers, who hoped that every shareholder might become a prospective customer. Now, presumably, there will be another increase in the number of investors in the company. Ford's shares have been improving in price ever since the recession ended and the foundation, which has been anxious to lessen its dependence on the company's prosperity, lost no time in going to the market. Last April it sold two million shares at $56.50 each; Ford shares are now trading at around $77 and, if this price prevails at the time of the public offering in mid-December, the foundation will obtain some $150 million to invest elsewhere.

Fair Exchange

When Mr Khrushchev was in the United States in September, he launched a violent and quite unexpected attack upon the State Department for obstructing the exchange programme begun in 1958; high officials feared that this might mean that the Russians were seeking an excuse to withdraw from it. Last week, when a new two-year agreement was signed in Moscow, it became apparent that Mr Khrushchev had simply been trying to browbeat the State Department into giving him more of the exchanges which Russia values—those of industrial delegations which help the Soviet Union to modernise its technology. The Americans are more interested in contacts between ordinary people, teachers and youth groups.

Both sides have had to compromise but both have some cause for satisfaction. The number of industrial delegations has been increased considerably and there will also be a trickle—85 from each country in two years—of students and young instructors. The exchange of university professors, which has been slow to materialise, should begin next year, with men from four American universities (Harvard, Yale, Columbia and Indiana) changing places with their opposite numbers at Moscow, Kiev, Tashkent, and Leningrad. If this seems like a slow and stately minuet, it must be remembered that such exchanges are governed by the strictest reciprocity.

The most notable agreement, reached by the atomic energy chiefs of both countries and yet to be approved by the governments, is one for the exchange of scientists specialising in the peaceful uses of atomic power. A Russian group under Professor Yemelyanov has just completed a two-week tour of non-secret atomic energy installations in the United States, similar to that arranged for Mr McCone in the Soviet Union, and there is cautious talk of the two countries collaborating on costly projects such as a big atom smasher. More immediate results may be expected from the medical field where, for the first time, joint research is to be carried out on poliomyelitis, heart disease, and cancer.

One of the great stumbling blocks in exchanging orchestras, troupes of dancers and singers is one which the Russians have had great difficulty in believing: that the United States cannot simply instruct its nationals to take part and that it lacks the money to pay for such foreign performances. Only three big attractions are to be exchanged, fewer than the Russians would have liked; but they include the United States Marine Band, a ballet troupe, and "My Fair Lady." For the Russians who have no hope of visiting the United States—only 366 individuals did so in 1958 and 1959 compared with 12,000 Americans who went to Russia—a fairer picture of the United States may emerge from the exchange of films which was finally begun this month with "Marty" in Moscow and "The Cranes are Flying" in Washington. New efforts are also to be made to exchange non-controversial film and television broadcasts, an abortive part of the old agreement.

Wall Street's Policeman

NEW YORK

THE Securities and Exchange Commission, the body responsible for maintaining law and order in America's capital markets, has become of more than academic interest to those concerned with amending British practice in this field. But though British eyes are now trained westward for inspiration, it should not be forgotten that the principle of "full disclosure," which is central to the American legislation, was borrowed from the British Companies Act.

The SEC's method of protecting the investing public is to ensure that companies operate "in a goldfish bowl" where facts and figures are concerned. Once it has done this its policing powers are limited and it does not set out to protect the public from the consequences of speculation.

The SEC was created after the collapse of the stock market in 1929 and the sensational exposures by a Senate committee of the way Wall Street had conducted its affairs in the preceding boom. It has not always proved comfortable to live with, but it has played a major part in restoring public confidence in the banking and investment community.

To keep it free of political interference, the SEC was set up as one of the independent regulatory agencies, and in its day-to-day operations it is limited only by its own enabling legislation. Nevertheless, the commission must go to Congress each year, report in hand, for its funds; it operates today on a budget of $8 million a year, about a third of which it recoups in fees. The five commissioners are appointed by the President with the consent of Congress.

THE SEC administers seven pieces of legislation. From these it has derived considerable freedom (in carefully defined situations) to make its own rules, which have the force of law. The breadth of these rule-making powers has been a major bone of contention, but the courts have repeatedly confirmed it.

Under these Acts, the filing of false statements is fraudulent; and the concept of fraud goes beyond its common law definition to include the omission of relevant facts, whether or not there was any intention to defraud. The SEC's own powers to mete out punishment are somewhat limited. In some circumstances it can prevent a new issue coming to market, delist a security or revoke the registration of a broker or dealer. But in the end it must fall back on the courts.

The first measure passed by Congress was the Securities Act of 1933 which required the registration of new issues (above a minimum size) under the supervision of the Federal Trade Commission. Another Bill the following year established the SEC as an independent agency; called for registration statements and periodic reports from all companies whose shares are listed on the exchanges; required the registration of stock exchanges, brokers and dealers; prohibited manipulation in securities; and gave to the Federal Reserve Board authority to restrict the amount of credit used in the purchase of securities by fixing margin requirements. In 1940, investment companies were brought within the full jurisdiction of the SEC, and in the same year professional investment advisers were required to register.

In applying the principle of full disclosure, the SEC goes far beyond anything required by British practice. In registering a new issue a company is bound by the law to reveal any fact which might influence the decision of a potential investor. A company must, for instance, disclose its capital assets and liabilities; submit a certified balance sheet covering the previous three years; list its directors and principal officers, giving the remuneration they receive and the securities they hold; name any investors owning more than 10 per cent of any class of shares; state the price at which the new issue is to be offered; specify the underwriters and the commissions to be paid to them. A copy of the prospectus must be filed with the commission and sent in full to anyone making a purchase. To keep on the right side of the SEC's rules is a complex operation, and saddles the issuer with heavy legal fees.

In the case of new issues, the SEC is in a strong position to exact compliance with its requirements. If in its view the material is misleading, inaccurate or inadequate, the commission can issue a "stop order" to prevent the issue coming to the market. In practice, it uses this weapon sparingly because it prefers persuasion and because it wants to avoid the impression that it is ruling on the soundness of an offering. To give potential investors time to digest the facts, a waiting period of 20 days is imposed after registration of a new issue before sales can be sought. Until all these formalities are completed, any printed attempt to stir up interest is taboo; word-of-mouth publicity is not forbidden but is risky.

The registration of outstanding listed securities calls for much the same type of information as is required for new issues. The initial registration is kept up to date by means of annual reports and companies must also file semi-annual statements of earnings and profits. With the experience of the nineteen-twenties much in mind, American law endeavours to see that "inside information" gets out, and that "insiders"—defined as officers, directors and anyone holding more than 10 per cent of the shares—do not grow rich at the expense of unsuspecting investors.

A company must notify the commission, within the month in which it occurs, of any development which might be of interest to shareholders, such as changes of policy, legal proceedings instituted by or against the company, stock options, and so on. Moreover, "insiders" must submit a monthly report on any changes in their own holdings and are debarred from making short sales. While the small investor may not avail himself of this mass of information, there is a large corps of security analysts who do. Perhaps the most serious remaining weakness of American law is that companies not listed on the stock exchanges do not usually have to file reports with the SEC.

In recent years, the commission has given special attention to solicitations of proxies; it issued a complete revision of its rules in 1956. The great majority of these communications represent unopposed solicitations by management for its own re-election and for approval of matters requiring the consent of shareholders. But in a proxy contest the shareholder is wooed by competing factions seeking not his shares, as in the English "take-over" bid, but his vote. The SEC has established detailed and extensive rules on the amount, type and accuracy of the information that must accompany solicitations to shareholders whether they are opposed or unopposed; all such material must be filed with it ten days before use.

The commission's rules also enable stockholders to express their views. In a proxy contest, the SEC insists on extensive and detailed disclosure of the personal background and financial interests of all those remotely engaged in the fight. Last week it dispatched a peremptory telegram instructing Mr A. M. Sonnabend—who had announced his intention of ousting the present management of the Alleghany Corporation—to say no more until he had filed a proxy statement with the SEC. If its rules are infringed, the commission cannot (as in the case of a new issue) halt the contest; if cajolery fails its only course is to seek a civil injunction in the courts.

IN its war on share manipulation, the commission relies mainly on widely publicised exhortation; last month it introduced television viewers to its new animated cartoons urging the public to "investigate before you invest". But in the increasingly speculative market of the last two years the SEC has stepped up its detective operations against shady operators.

It is in this branch of its work, however, that the SEC is most criticised, either for throwing its weight about unduly or, more frequently, for being too slow off the mark Congress was annoyed, for instance, that Mr Lowell Birrell could escape the country, together with a reputed $10 million gathered illicitly over a period of four years, before the SEC was on his trail. And it was equally disturbed to find that one of the companies of Mr Goldfine (the Boston industrialist whose friendship was fatal to Mr Sherman Adams, the President's Chief Assistant) was six years in arrears with its annual reports to the SEC. The commission's reply to this sort of criticism is that the extent to which it can turn to the courts to enforce its regulations is limited by its resources; that it must give priority to maintaining general standards; and that it cannot prevent financial malpractices altogether.

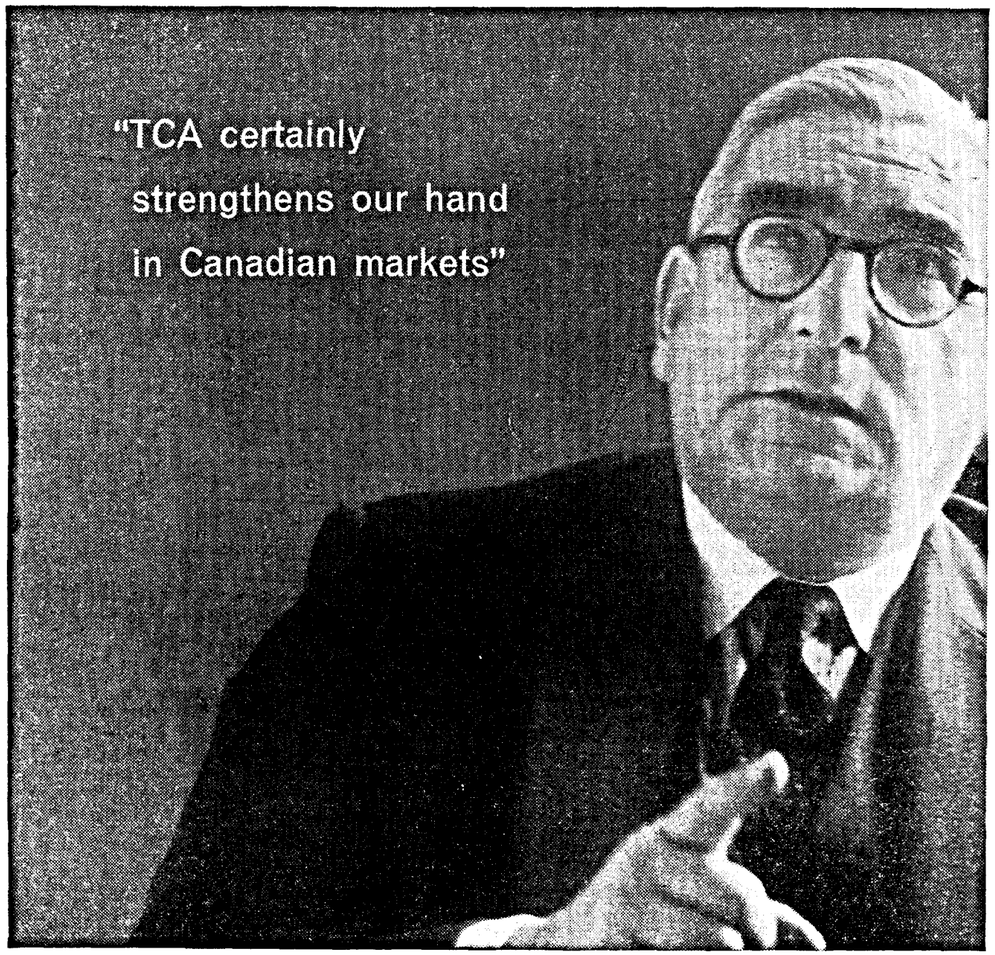
▲ *Man with a confident look has a face made from the 'Cariflex' latex designed for the manufacture of foam rubber. His air of assurance is shared by manufacturers using 'Cariflex' general purpose rubbers.*

Shell has given a new look to the world's rubber industry, which now demands a greater supply of rubber than natural sources can provide. Man-made rubber, to an ever-increasing extent, is *Shell*-made rubber ... **Cariflex**, General purpose styrene-butadiene rubber **Cariflex** is manufactured to standard specifications but with the hallmark of quality that distinguishes all things made by Shell. Available in twenty different types of dry rubber and latex, comprising hot and cold polymers, oil masterbatches, carbon black masterbatches and hot and cold latices, **Cariflex** is used for many industrial and mechanical products, latex foam, toys, tyres and footwear. Ask your Shell Company for details. *Think from today in terms of* **Cariflex**.

Cariflex

SHELL MADE RUBBER

Issued by Shell International Chemical Company Limited and Bataafse Internationale Chemie Mij. N.V. For further information consult your Shell Company (in the U.K., apply to Shell Chemical Company Limited).



You may already be doing reasonably well in Canadian markets. But could you do better? Are you getting your share of the new business that's lined up for British firms in Canada? Or could you somehow tighten up your marketing operations? It might help if you and your executives were to make a few reconnoitres into the business heart of Canada. You needn't lose any time or sleep. It's easy enough to fly overnight, *any night*, by TCA—Canada's own international airline—and get down to business the very next morning. And you'll find your bargaining power is increased when you know that TCA Air Freight can help you by-pass any distribution problem . . . *with the only daily direct-delivery service to all Canada.*

FLY TCA—DE LUXE CLASS

You can really relax aboard a giant TCA Super G Constellation. You'll like the fully reclining seats: good food and drink: attentive service. And the chances are you'll meet some of the many Canadian business men who always fly TCA.

Your Travel Agent is the man to see

Labour Goes to Law

As the unsatisfactory course of the steel dispute makes it increasingly likely that Congress will again be considering labour legislation at its next session, the labour legislation which it approved last summer is coming into effect. The first, and so far the only, person to profit from it, apart from the lawyers, is Mr John L. Lewis. The new law abolished the non-communist oath which the Taft-Hartley Act had required from union officials and which Mr Lewis had refused to take on principle. As a result his United Mine Workers, or rather their catch-all subsidiary, District 50, is now free to organise new branches and has lost no time in doing so, particularly in chemical factories. Already it has more members among taxi drivers, petrol station attendants and so on than has the main union among miners.

Other unions, however, are finding the new Act a serious drain on their finances—far more costly to the labour movement as a whole, they claim, than the corruption the law is designed to prevent. The heaviest new expense is that of bonding individually officials who handle union money instead of including them all in a single, relatively cheap coverage. Details of the law must be printed and circulated to members; so in many cases must new constitutions. Then there are legal expenses involved in drawing these up and in preparing the various reports which must be filed with the Department of Labour. The department has opened a special division to deal with them, and the National Labour Relations Board has also had to reorganise in preparation for the flood of appeals which it expects under the new Act. Many of its provisions are far from precise, and it is likely to be years before they have all been interpreted in the courts; conflicts are still arising over the meaning of parts of the original Taft-Hartley Act, passed in 1947.

Meanwhile, however, the Supreme Court has cleared the way for an all-out attack on Mr Hoffa, the head of the Teamsters' Union, whose malpractices inspired the new law but who was already being dealt with under existing powers long before it was passed. By refusing to hear his appeal against the monitors who were appointed in January, 1958, to supervise his activities and to protect the rights of the union's members, the Supreme Court has freed the monitors to get on at last with their task of cleaning up the union. They hope to get rid of Mr Hoffa and his most notorious subordinates within six months, but it will be surprising if they can dispose of him so easily. Not only can he hamper their work by keeping them short of funds—they are financed out of the union treasury—but he has not yet exhausted by any means all of the delaying manœuvres provided by the law.

Humane, Not Killers

FROM A SPECIAL CORRESPONDENT

In recent months officers of the Army Chemical Corps, with the help of some members of Congress, have been responsible for a publicity campaign to make chemical and bacteriological warfare popular. Their intention is to increase public knowledge of, and therefore public acceptance of, weapons which have hitherto been abhorred. The Russians are believed to have them ready for active service and the Army is therefore pressing for more money to spend on them and also for a change in the declared policy which forbids their use except in retaliation.

The reason why it may be possible to influence public opinion in favour of these weapons is that a new type, described as "humane," is being developed by the Army; these are called "psycho-chemicals" and are designed to incapacitate temporarily rather than to kill. There are two groups of these new agents, one loosely called by the Army "off the rocker," the other "on the floor." According to Lieutenant General Trudeau, who is in charge of research and development:

> One is psychological in action and disturbs the normal behaviour pattern of the individual, causing either apathy, fear, disorientation, or personality withdrawal. The other type is physically incapacitating—these materials would cause an enemy to be unable to fight due to temporary blindness, lowering of blood pressure, temporary paralysis or anaesthetic-type action.

Most of these agents are derivatives of drugs and compounds known to the medical profession and used either experimentally or therapeutically. The exact chemical nature of the specific drugs undergoing intensive research and development is kept secret, but their effects are said to be harmless and temporary.

A few of the psycho-chemicals have, however, been shown to congressional committees. In one such demonstration, a mouse was put into a cage with a cat, and the cat naturally killed the mouse. The cat was then injected with one of the new drugs and a second mouse was introduced; now the parts were reversed and a four-footed David chased a cowering and frightened feline Goliath around the cage. In another demonstration, to show the anaesthetic-like effects of a drug said to be 1,000 times more potent than the best pain reliever known to medical science, it was introduced invisibly into a chamber containing active animals. In less than a minute they were in comas, completely unable to move and completely oblivious to pain. An antidote was administered and they were brought back to their normal state. Soldiers subjected to one of the new agents ignore the commands of their sergeant—but this unthinkable event has been shown only on film.

There are many suggestions about how the psycho-chemicals might be used. For example, they might be introduced into a city's water supply before an invasion; one, derived from lysergic acid, resists the effects of both boiling and chlorination. Or innocent-looking lorries could circle missile sites and strategic air bases, before a surprise attack, blowing out clouds of psycho-chemicals and thus knocking out the country's defences. But the timing would have to be arranged very carefully since, in the present stage of development, the new drugs affect the human body for only twenty-four hours.

Just how near the Army actually is to this sophisticated type of warfare is its secret and it is still a matter of conjecture whether it will ever actually become practicable. Most observers agree that these drugs are available now, at least in the laboratory, to be put in a glass of water or used in a closed situation. But to make, store and handle them in quantity or spread them effectively over a large, open space is quite a different matter.

Shorter Note

The Treasury is offering new inducements to holders of savings bonds in order to stem the flow of money out of such securities which forces the government into fresh borrowing. Holders of $1.6 billion worth of bonds maturing next year, which pay interest of only 2½ per cent, have been allowed to exchange them this month for a 4¼ per cent note maturing in 1964. This is the first step in the "advance refunding" of the public debt which is expected to ease the Treasury's refinancing problems. Holders of other savings bonds on which interest is accumulated are to be allowed to exchange them, without any tax penalty, for an issue which pays interest semi-annually. This move will be particularly popular with retired people who need current income.

THE WORLD OVERSEAS

Not Much Time for Lord Monckton

FROM A CORRESPONDENT IN NORTHERN RHODESIA

SINCE the Conservative party's return to power in Britain, Sir Roy Welensky, the prime minister of the Central African Federation, has been proclaiming that there is little need to worry. Readings of the human barometer by those who perhaps have more time to study it indicate otherwise.

The white population is not, and never has been, in the least likely to cause violent trouble, whatever the future may hold, despite occasional mutterings from Lord Malvern and Sir Roy Welensky about Boston tea parties. The Dominion party, with its apartheid policy, may gain some support from depressed United Federal party followers who are unable to swallow the party line that the Monckton commission was a victory for Sir Roy, and who find difficulty in reconciling the old bellicose demand for Dominion status in 1960 with the current pretence that no such demand ever existed. But only in Southern Rhodesia is the Dominion party likely to be strong. How many adherents the United Federal party may lose to the Central Africa party can hardly be assessed. The former has never been at a lower ebb, but it is still the only really well-organised party, and its most dissatisfied members abhor the liberal Central Africa party almost as much as the Dominionites do.

The danger of course lies with the Africans. In Nyasaland, according to the pro-Federal party newspapers, many Africans, disillusioned with Dr Banda's Congress, are joining the United Federal party or the Central Africa party. The headquarters of the CAP dispute the word "many." The state of emergency remains, but cannot last for ever, and the release of Dr Banda and his henchmen within a few months is generally expected. Official pronouncements that the new Legislative Council is working well can only be attributed to wishful thinking. The day of African nominated members is over. One of them, the Rev. A. D. Kayira, has already resigned after having his house burned down, and the others have experienced considerable intimidation. Even moderate Africans, like Mr Kumbikano of the Central Africa party, insist on the immediate need for an elected and reasonably representative government in Nyasaland, as a prerequisite to the 1960 London conference.

Dislike of federation, and of the federal government and party, is pathological, and a boycott of the Monckton commission, however unwise, is not unlikely unless the demands for an elected government are met with some fairly generous compromise. Unemployed Nyasalanders still—as they have done for years—drift down to Southern Rhodesia, which they profess to dislike, or to South Africa, which they have reason to detest, since they are obliged there to conceal their origin to escape fines, gaol, or "voluntary" labour on the farms as "unauthorised foreign natives." The Nyasaland peasant still scratches subsistence from the soil. Sir Roy Welensky, possibly rightly, blames the British Government for Nyasaland's poverty and he can fairly claim some material gain for Nyasaland from the federation, although Africans say that the amount of development funds spent on European and Asian schools is out of proportion. Sir Roy, however, persists in the Belgian error that economic development will solve all problems. The Europeans are too materialistic to understand that the things that really matter in the federation are the removal of African fears and hates, reasonable or unreasonable; the removal of the African inferiority complex, fostered by colour discrimination; and the canalising, instead of damming, of the flood waters of African nationalism.

In Northern Rhodesia the pond is only slightly ruffled by the vociferous demands of the United National Independence party for African self-government and by the tactics of Mr Harry Nkumbula and the National Congress of exploiting any government action that is displeasing to Africans. Mr Nkumbula, who has quite ineffectively ordered his diminishing followers to stop smoking as a protest against federation, is no longer likely to provide leadership and unity. Nor is Mr Mainza Chona, the North's first African barrister and president of the "rebel" Congress, nor Mr Paul Kalichini, another new entry to politics, who heads the United National Independence party.

In Northern Rhodesia, as in Nyasaland, the most popular leader, Mr Kenneth Kaunda, is in gaol together with his top lieutenants—but not for much longer. He will undoubtedly lead the illiterate mobs in the towns and in some of the rural areas where the chiefs are weak. This might not matter very much if the Central Africa party, which had the solid support of those Africans educationally and financially qualified to vote in the March elections, can consolidate that support into membership and branches and give African voters some political self-expression and an alternative to the attractions to be offered by Mr Kaunda. But the Central Africa party lacks organisation and funds and, more important, real workers.

IN Southern Rhodesia, Mr Garfield Todd, anathema to most of the Europeans, has become in effect an African leader and is likely to be followed, at least for a time, even by those emergent African politicians now in prison. But on both the Southern Rhodesian and the Federal voters' roll the number of African voters is not significant. In the South, the hatred of federation is not an African emotional driving force. Nevertheless, there are factors which may soon lead to nationalist feeling equalling that in Northern Rhodesia, if not that in Nyasaland, notably the growing land shortage in the restricted African reserves and the declaration of an emergency, with its consequent unpleasantness, where no emergency existed. The bitterness of the men arrested under the emergency who have since been released is as great as could be expected.

Racial discrimination continues and none of the territories will contemplate legislation to forbid it. The Federal government hesitates even about the very small advancements proposed for African railway employees, and will not accept the mining companies' offer to hand over the Copperbelt Technical Foundation and make it multi-racial. African apprenticeship is still a promise on paper. The appointment of one or two Africans instead of European women clerks in a Salisbury bank provokes much protest in the press, and advancement talks between managements and the European union in the mines drag interminably on. In an attempt to guard against the natural results of frustration, extraordinary legislation is still being produced. For example, in Northern Rhodesia a new bill will restrict appeals against any convictions resulting in sentences of less than £5 fine with alternative imprisonment. Another bill will outlaw boycotts, and yet another will require the conveners of political meetings to provide facilities for the recording of the proceedings in such manner as the police may specify.

All this gets the Federation, which cannot last without the consent of the majority of its peoples, nowhere. The peoples of both northern territories will never give their consent unless they are assured that when they get representative government they will have the right to secede if they wish at that time. The Federation must meantime be decentralised by the return to territorial control of a number of activities—for example, medical services and higher education—which vitally affect Africans; this would give faith to Africans that the right of secession is really meant. Liberals realise that a time must be set for the attainment of fully representative government—that is, one elected by a majority of Africans on the voters' roll. The time may well vary—five or ten years in Nyasaland, perhaps fifteen in Northern and Southern Rhodesia; but talk of a multi-racial society needs quick translation into action, by legislation if necessary. The humiliation of the human spirit is the deepest cause of extreme black nationalism.

Britain, Germany and Trade

FROM OUR BONN CORRESPONDENT

HOW far Dr Adenauer and the Prime Minister, in their talks last week, really removed the differences between the two governments is still obscure. It was something that they paid lip service to the necessity for averting an economic war in Europe. If the Chancellor means business he will have something to say about this when he meets General de Gaulle next month. Since 27.3 per cent of west Germany's exports go to the Seven, and only 23 per cent to the Six, Bonn does have a major trading interest in inducing the French, if it can, to make the common market less of a tight trading block than it threatens to be, and consider offering the outsiders better terms. But can it? The political obstacles look just as massive now as they did a year ago.

Anglo-German differences over the approach to the summit have lost something of their original urgency as the date of the fabulous meeting has been progressively postponed. Dr Adenauer has conceded that it would be escapism to hold a summit conference without discussing the future of Berlin. But he is adamant about the stand that should be made. It is no secret that he has warmly welcomed Mr Acheson's warning that a change in the status of Berlin would be "the symbol and the beginning" of the withdrawal of American troops from Europe.

This week's news about Anglo-German relations is news of trade, and is good. The British Embassy in Bonn made known on Monday how it hopes once again to help British and German business men to trade more profitably with each other. Largely because of the guidance and support given to specific branches of industry twelve months ago, British exports to west Germany were running at an annual rate of £135 million during the first nine months of this year—an increase of 21 per cent on the annual rate of £111 million for the corresponding period of 1958. German imports to Britain were running at an annual rate of £136 million. These are gratifying results in any circumstances. They are worth pursuing all the more when the two biggest industrial countries of the Six and the Seven are in danger of being driven apart by their commitments to rival trading groups. Since, at the moment, Anglo-German trade is increasing so substantially, it is not surprising that some of its sponsors are eyeing it prayerfully as the pilot cable of a bridge between the common market and the little free trade area. If the Prime Minister and Dr Adenauer meant what they said in London last week, the bridge-builders are thinking along the right lines. They have an encouraging following. The mail received at the Bonn embassy this year from British firms reconnoitring the German market is already a third more than last year's.

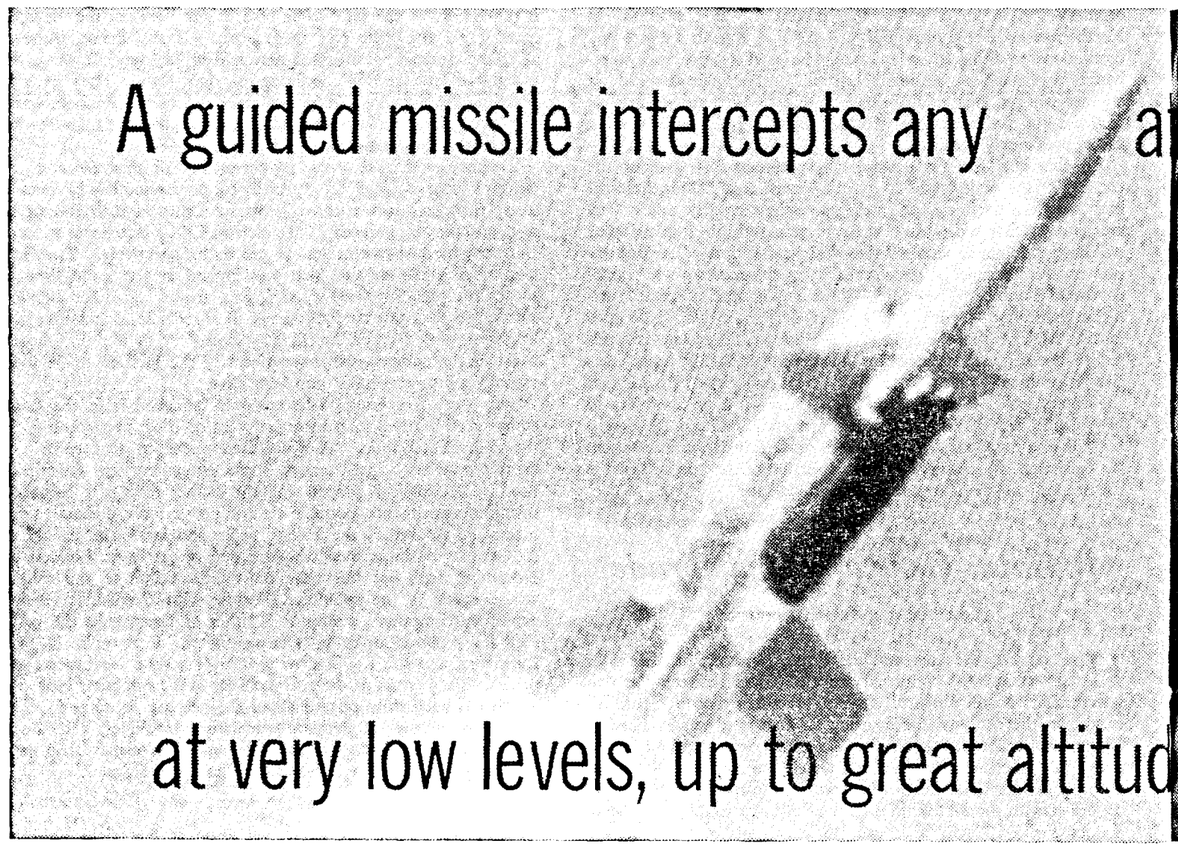
To the surprise of many of them, British manufacturers of machine tools and toys were specially recommended last November to try their luck in Germany. In consequence of their intelligent response, the two industries have increased their exports to western Germany by 86 per cent and 31 per cent respectively. The German retail trade mission that was invited at the same time to survey the pre-Christmas wonders of Harrods and other London stores, and then to examine some of their roots in Manchester and Bradford, placed orders worth £150,000 after their return home. Most of the contacts which members of the mission made individually a year ago have been kept alive.

This week five hundred letters were launched from the Bonn embassy advising British manufacturers of their opportunities in the Federal Republic. They were addressed to a miscellany of firms producing carpets, cranes, sports equipment, cosmetics, slot machines, electrical gadgets for the home, industrial furnaces, scientific instruments, portable electric power tools, cinema equipment, and machinery for making paper and ice. The twenty or so German business men who are due to arrive in London on November 29th are this time mostly executives of the calibre whose oracle is the computer. Along with Germany's leading expert on computers, Professor Walther of Darmstadt, the party includes representatives of Demag, Bosch, Farbwerke Höchst, Lufthansa, and the Kaufhof, as well as of several insurance companies. They are to be the guests chiefly of the computer industry, which has been duly primed about the present openings in Germany for selling gargantuan calculating machines, tabulators, punchcard equipment, and like weapons of efficiency that have been supplied hitherto mainly from the United States.

THIS year's choice of likely, yet again at first sight unlikely, fields for British initiative is further evidence of the growing appreciation that, with good will and a little planning, highly industrialised states can be as usefully complementary to each other as, without it, they can be destructively competitive. The Board of Trade reckons that by 1963 British manufacturers could raise the value of their exports to western Germany to £150 million annually. Some other ways of helping them attain this objective were also announced this week. An Anglo-German Trade Council, born on November 11th in modest circumstances—and in the inappropriate but dearly loved setting of the American Club at Godesberg—is to be reared purposefully as soon as a sufficient number of influential German godparents can be found. Next year there is to be officially sponsored British representation for the first time at the international furniture fair at Cologne in February, the international toy fair at Nuremberg in March, the international household goods and hardware fair at Cologne in March, and the international packaging fair (Interpack) at Düsseldorf in October. Lastly, negotiations are afoot for bringing out an Anglo-German trade supplement to the Düsseldorf *Handelsblatt*, probably in February.

Thus at least among business men Anglo-German relations seem to be unfolding on the whole usefully and amicably. (There is still mistrust among them here and there in other markets.) And the British and German journalists who assembled in London last week under the auspices of the International Press Institute to discuss their own lively sector of hostilities agreed as good as unanimously that there were sound reasons for calling a truce. It is the political front that remains uncertain.

A guided missile intercepts any attacking aircraft



at very low levels, up to great altitud..

...AND BRISTOL SIDDELI SUPPLY THE POWER

Bristol Siddeley Engines Limited produce the Thor ramjet. Two Thors power the missile in the Bristol/Ferranti Bloodhound guided weapon system. This system forms the most effective defence against air attack at very low, up to very high altitudes. And the great flexibility and development potential of the ramjet ensures that Bloodhound will be able to intercept any attacking aircraft for many years to come.

The ramjet is the simplest air-breathing engine that has ever been devised and the Thor is virtually a stainless steel tube which can be lifted by two men. A thrust of over 20,000 lb at Mach 3 can be expected from a typical ramjet of the Thor's size.

At speeds of Mach 2.5 and upwards, the ramjet has a lower specific fuel consumption and a lighter weight than any other prime mover, and the higher the speed the greater its efficiency.

In fact, it is the most efficient powerplant for long-range flight at high supersonic speeds within the earth's atmosphere.

BRISTOL SIDDELEY ENGINES LIMITED

POWER FOR THIS

The Bristol Siddeley Marine Proteus powers the world's fastest naval vessels, the "Brave" class Royal Navy patrol boats built by Vosper Ltd. Three Proteus deliver a total of 10,500 hp—give these 96-ft boats a speed of over 50 knots. The Marine Proteus is quick-starting, flexible, reliable and holds large reserves of power for acceleration.

...AND THIS

The Bristol Siddeley Olympus high-thrust turbojet powers the Avro Vulcan V-bomber—gives this delta-winged deterrent carrier a performance unsurpassed by any aircraft in its class. Current Olympus versions deliver 17,000-lb thrust dry—24,000 lb with reheat. Even more advanced Olympus versions are rated at 33,000 lb with reheat.

...AND THIS

Bristol Siddeley Maybach diesels designed for a wide variety of applications, range from 200-3,000 hp. Here is a British Railways diesel hydraulic locomotive powered by two Type MD 650 engines, developing a total of 2,200 hp. A large number of Maybach diesel engines have been ordered by British Railways alone.

How, indeed? Or even choose a career *until* he has some practical experience of what it involves. How can a man say with certainty "This is for me" until he knows what it is all about?

When a man decides on Unilever, he does not choose a career: he chooses a wide area *in which to find it.* The Unilever Management Development Scheme allows a man to change direction as experience sharpens or develops his ambition. In fact, the diversity of Unilever demands that a man has breadth of outlook rather than a narrow knowledge of a particular job.

But the aim is specific. It is to develop men to the status of professionals in the art of management, men who can move easily from one particular sphere of activity to another with complete confidence in their ability to succeed in any of the 400 separate companies in Unilever. In short, they will be professional managers.

The confidence of a professional, which distinguishes the man trained in management from the man who 'just manages', is obtained in Unilever. The very scope of our organisation enables a man to advance through a variety of experience, instead of merely repeating one experience several times.

Arts man or scientist, the potential manager is the man who accepts the fact that the rewards in industry (and they are many) come to the man who is prepared to become a 'professional' at his job. In Unilever, that job is management.

* * * * *

"Six Men on Business" is a book which describes how the Unilever system of training for management works in practice. Perhaps it could help you decide on the next step towards a career. You are invited to write to the address below for a copy. If you are at a University your Appointments Board or Committee can provide one.

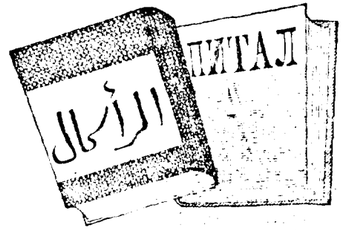
Unilever PERSONNEL DIVISION (PRC/172), UNILEVER LIMITED, LONDON, E.C.4

Progressive Party's Brave Bid

FROM OUR CORRESPONDENT IN SOUTH AFRICA

NOWHERE is the path of the political reformer harder than in South Africa, where all power is concentrated in the hands of a small white minority, which is itself divided on fundamental issues, including the vital one of how to extend political rights to the non-white peoples. It is generally recognised that the present position is untenable ; but neither major party has thus far been prepared to face the issue squarely. The Nationalists are trying to by-pass the problem by purporting to build up a system of self-government in the areas reserved for African occupation ; but they have no plan for the urban Africans or for those living on European-owned farms, who between them form the bulk of South Africa's labour force. The United Party recognises the need to provide a political outlet for these people, but because of the conservatism of the white electorate it feels unable to make more than a token gesture to people whose claim to a share in the government is infinitely greater than that of the tribesmen about whom nationalism professes to be so concerned.

Orientalists and Communists



BY A CORRESPONDENT

WHEN several hundred orientalists met at Cambridge in 1954 it was still unusual to see a Russian delegation mixing freely with western ones at an international convention. Being new, the Russians were sought after by everybody. Dignified professorial types eagerly snatched up Russian handouts and when the Soviet delegation announced a showing of films on the fabled cities of central Asia, Tashkent and Samarkand, there was a record turnout. The publications were scholarly enough, but they were carefully filled out with bits of the communist party line ; the films took no notice of the glorious remnants of the past and showed happy Tatar peasants driving tractors on collective farms. When the orientalists gathered again, at Munich in 1957, the Russian presence was taken for granted and an invitation to hold the XXVth sessions of the International Congress of Orientalists in Moscow, in 1960, was accepted. In the great world of orientalists the Russians had arrived.

The history of oriental studies in Russia is long and distinguished. It contains such world-famous names as Barthold and Krachkovskiy, who flourished both before and after the revolution. The Soviet regime lost no time in emphasising the importance of oriental scholarship, while criticising tsarist and bourgeois scholars in general for delving too deeply into the past and for ignoring the awakening eastern peoples. Eastern countries, they said, should not be regarded merely as repositories of outworn civilisations, but as modern states with modern problems and aspirations. There are those in the West who feel the same way. Sometimes there are complaints from governments and oil companies, which both contribute liberally to the support of oriental studies, that it is difficult to get orientalists interested in anything that happened after the thirteenth century.

Much of the activity of the first Soviet orientalists was taken up with the many linguistic and other cultural problems presented by the creation of the new eastern republics in Turkestan and the Caucasus ; but there was a fairly steady output of work on the east in general and on the political function of oriental studies. This was clearly described as a weapon to use against western imperialism and colonialism. At present the study of eastern countries and affairs is actively pursued in oriental institutes and in institutes of ethnography, history and economics. The output of publications exceeds that of any other country.

It would be a great mistake to suppose that the deliberately political slant given by the Soviet government and the Communist party to the work of Soviet orientalists as a whole necessarily robs it of all academic value. The fact that Zudin's "Pushto Dictionaries" may primarily have been designed to serve the Soviet Union's political or commercial ends in Afghanistan does not detract from the intrinsic merits of these remarkable works. The same goes for many other philological and literary works by writers of great competence in which propaganda and political flavour is either completely absent or is confined to a few token manifestations. In Semenov's "Syntax of Modern Written Arabic," for example, only a simple proposition—Religion is the opium of the people—connects it unmistakably with communism.

Whether the West should now begin to attach to oriental studies the same political significance as the Russians do is a delicate and controversial question. Many orientalists argue that this would result in the prostitution of scholarship to politics. The fact must be faced, however, that in the Soviet Union an important part of oriental scholarship is being made to serve the political purposes of denigrating the West in the eyes of the East, and of assembling and disseminating a Marxist-Leninist version of oriental history. These activities cannot be brushed aside as propaganda, nor can they be balanced by counter-propaganda. They demand what they are not now receiving—the concentrated attention of western scholarship with western standards of integrity. Without such attention the Soviet campaign of scholarly vilification of the West is likely to gain ground. Who could have believed, only a decade ago, that the Marxist version of oriental history might one day be within sight of acceptance by the peoples of Asia and Africa as the only authentic one?

There has always been a considerable amount of misunderstanding about the scope and nature of Soviet oriental studies. The Russians' apologists abroad may insist that their interest in the coming congress is not greater than that of the British Government in the congress at Cambridge in 1954—when Mr Anthony Nutting, as Minister of State, gave a large tea-party. But the Russians would think it absurd, and even wrong, to deny their political interest, although this does not mean that they will turn the Moscow meetings into a propaganda jamboree. It is more likely that they see it as a crucial stage towards their long-term objective of assuming the cultural, political and economic mentorship of Asia and Africa. Western orientalists, particularly those going to Moscow next year, ought to bear this in mind. They may sincerely believe that present-day politics and ideology have no place in oriental studies ; but they should not forget that the Russians believe exactly the opposite.

When it finally became clear that the United party, in spite of promptings from its own liberal wing, was incapable of a forward move and that its reactionary wing was even suggesting a retrogressive step in a bid for Nationalist votes, a dozen United party MPs decided to form a new party. The group included the Cape leader of the United party, Dr Jan Steytler, and Mr H. G. Lawrence, a veteran parliamentarian and parliamentary leader of the United party, and it has the active support of the mining magnate, Mr Harry Oppenheimer.

The Progressive party was founded at a conference in Johannesburg on November 13th and 14th. It committed itself to a bold and far-reaching programme of political and constitutional reform aimed at giving all races a share in the country's administration. For the first time in South Africa's history parliamentarians wholly dependent on white voters have made specific proposals for sharing political power with the non-whites, who outnumber the whites by four to one. They have said unequivocally that merit and not colour should constitute the basis of a man's political rights. For the first time too a white political party, dependent on white voters, has admitted without equivocation that non-white voters will eventually outnumber the white, adding only that by then government should be in civilised hands. In other words, civilisation, not colour, is to be the criterion of fitness for leadership.

All this is revolutionary in South Africa. White extremists have condemned the proposals as treason to the white man, while their black counterparts complain that they are but a refinement of the usual white man's trick to retain power in perpetuity. And in between are the white "realists" in the United party who declare that the programme is so far in advance of public opinion that it stands no chance of acceptance and that the Progressives have written themselves off as a potential political force.

SIGNIFICANTLY, however, the bulk of the powerful English-language press has given the new party and its intentions a warm welcome. In the words of the responsible *Cape Times*, the new party's plans "have all the freshness of a hopeful sanity." The paper's attitude indicates the relief with which some South Africans at least have welcomed the fresh political thinking and the political courage and realism of the new party.

It is true, of course, that some of the new party's most difficult decisions are still to be taken. A commission of experts is now to be appointed to draft a constitution which must embody these basic principles :

(1) The right of all, irrespective of race, colour or creed to participate in government in accordance with their degree of civilisation.
(2) The creation of a South African nation based on western concepts.
(3) Constitutional safeguards to protect any group from dominating other groups.
(4) A reduction of the central government's powers over the provinces.
(5) A Bill of Rights entrenching fundamental human freedoms for all.
(6) The maintenance of the rule of law and an independent judiciary.

The commission's thorniest task will be to establish effective constitutional checks and balances so that no one race or group can obtain a permanent stranglehold on the future state. There are many, including Nationalists, who believe that it is not possible to achieve this ideal. And South Africa's experience with the Coloured vote, when the Nationalists circumvented the entrenched clauses of the South Africa Act by use of the courts and an enlarged Senate, lends substance to this view. At the same time, there are constitutional experts who believe that in a federal instead of a unitary system, and with a rigid constitution perhaps based on the American model, it should be possible to provide the necessary safeguards for minorities. This will involve, among other things, a considerable strengthening of the rights and powers of the provinces and perhaps even the creation of one or two predominantly black provinces in what are now the African reserves.

Then there is the problem of deciding what qualifications will be needed for the franchise on a common electoral roll and what provision is to be made for those who fail to qualify on a special communal roll. The intention is to apply the same criteria to all races, but the qualifications laid down will obviously determine not only the size of the non-white vote, but also where the balance of political power is likely to lie for the foreseeable future. This is clearly of crucial importance.

On the rather emotional question of republicanism the Progressives have come under some fire from various quarters. One of their original sympathisers, Professor I. S. Fourie, MP, has refused to join the new party mainly because he says it has adopted an equivocal attitude towards the establishment of a republic by leaving the matter for future decision. The new party, he believes, should have come out openly in favour of a democratic republic within the Commonwealth in opposition to an authoritarian republic divorced from the Commonwealth such as many Nationalists contemplate. The Nationalists, too, are critical of the Progressives' undecided attitude, for republicanism (so the Nationalists argue) is the crucial issue of South African politics. The Progressives, however, were faced with the implacable and often unreasoning opposition to republicanism of large sections of the community who are potential supporters of the new party.

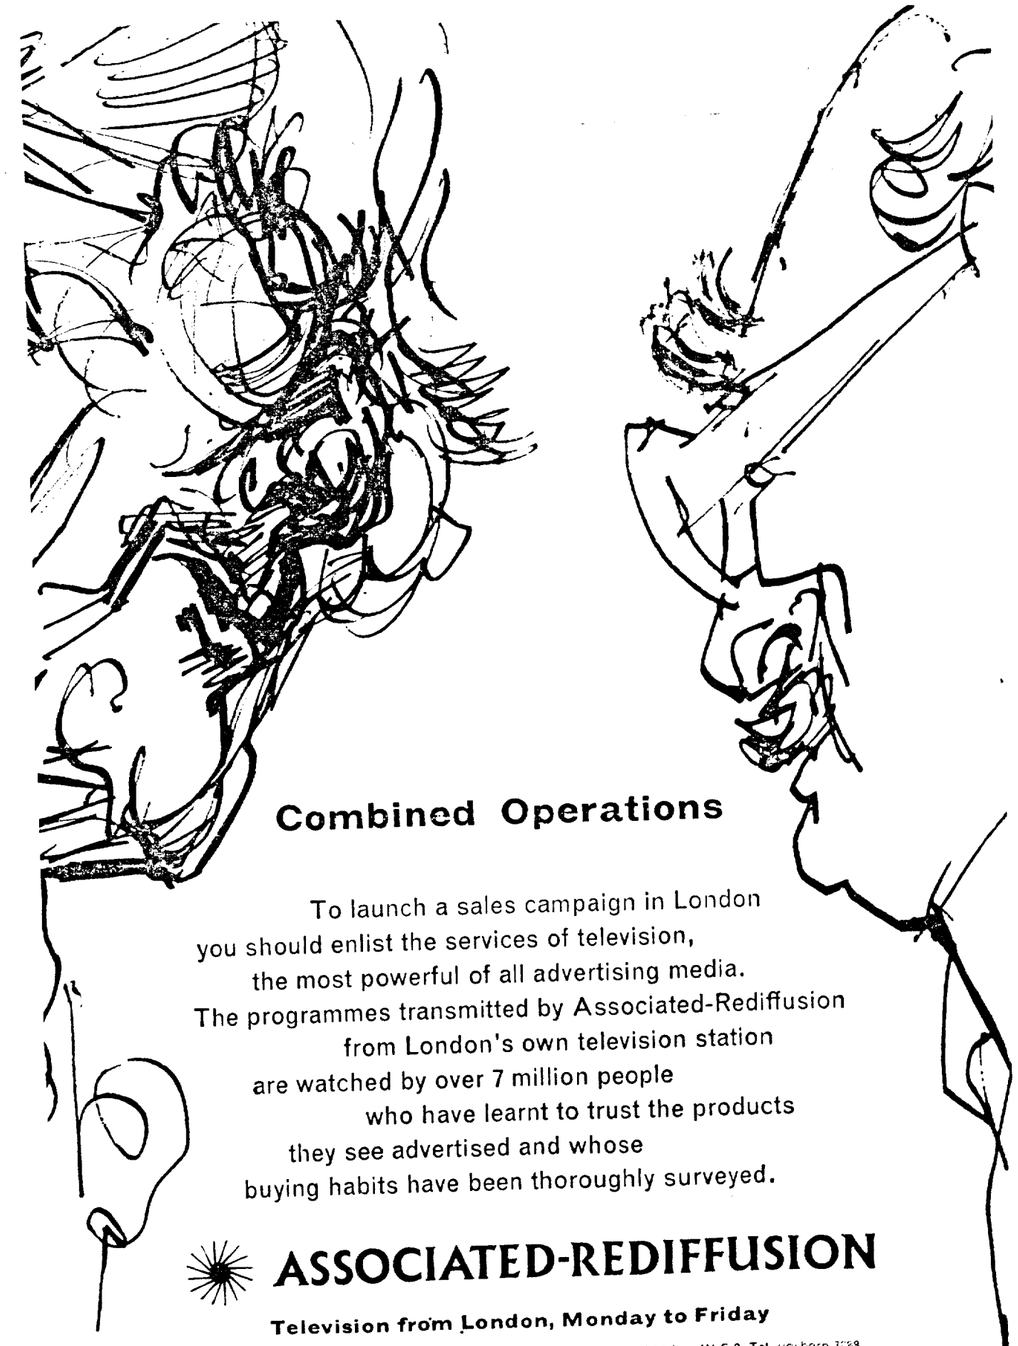
This apart, moderate South Africans of all races have warmly welcomed the new party's undertaking to abolish the hated pass laws and with them the system of controlling the influx of Africans into urban areas ; to grant Africans freehold title to property in urban areas, a right which they are demanding with growing insistency ; to discourage the migratory labour system, with its evil effects on family life and the economy of the reserves, by the creation of a stable labour force in the urban areas ; to restore the freedom of workers to establish trade unions of their own choosing and to give unskilled African workers the right to form their own unions ; to repeal the job reservation law which has caused so much resentment and which constitutes a permanent threat to the well-being of non-white workers ; and finally, to support the wage system of "the rate for the job" for all races and to insist on a basic minimum unskilled wage throughout the country.

It remains to be seen, of course, how much electoral support the Progressives can command. The recent provincial elections showed a position of near-stalemate between the two major parties. Whether a radical and courageous programme such as the Progressives propose to propagate will win widespread support from a notoriously reactionary white electorate seems a little doubtful at this stage. But Africa is changing rapidly and the impact of events beyond South Africa's borders is already becoming discernible in the political climate as more whites realise that the Union cannot indefinitely remain out of step with the rest of this emergent continent. The new deal which the Progressive party envisages is long overdue ; in the words of a responsible commentator, either this policy must eventually prevail or South Africa has no future at all.

Guide to the Algerian Negotiations

FROM OUR PARIS CORRESPONDENT

HIGH hopes lead to bitter disappointments. French correspondents in Tunis had hinted that the Algerian rebel leaders gathered there were ready to accept General de Gaulle's terms. So the rebels' reply on November 20th came as a shock to Paris. The leaders of the Algerian government-in-exile made



What price precision?

The Man at the Top must time his appointments unerringly. Where time is money, Movado Kingmatic precision is indispensable.

The Kingmatic is handsome, robust, elegant, Swiss. It is self-winding and waterproof. The price of constant accuracy?

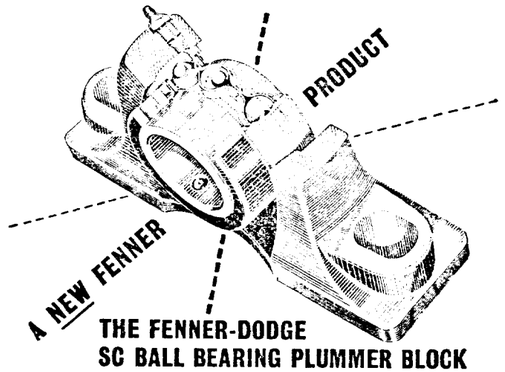
who

can turn out a railway wagon every 13 minutes?

The Pressed Steel Company. What sort of a railway wagon? Just any sort for any climate for any gauge for anywhere in the world (though the complicated ones take a little longer).

PS is for Pressed Steel, and the Pressed Steel Company mean business, expanding business. Next year they open Europe's largest and most automated refrigerator factory at Jersey Marine, near Swansea.



THE FENNER-DODGE SC BALL BEARING PLUMMER BLOCK

A sealed bearing with relubrication facilities giving longer life under arduous conditions.
Easy to fit housing designed to give adequate spanner room and elongated bolt holes allow lateral adjustment.
Separate collar provides bearing to shaft fixing without distortion of inner race.
Special seal designed for low frictional losses and keeps grease in and dirt out.
Deep groove ball bearing with long inner race distributes loads over greater shaft area, and is fully self-aligning.

LARGEST MAKERS OF V-BELT DRIVES IN THE COMMONWEALTH

it plain that they want to conduct negotiations on their own terms and, far from showing the expected signs of faith in General de Gaulle, they openly proclaimed their mistrust of French intentions. The shock was followed by another from New York, where the General Assembly of the United Nations asked France not to proceed with its atomic tests. The French public, reading every day about the country's rising international status or about General de Gaulle's power and prestige in the world, were scarcely prepared for such a result.

To escape from illusion and indignation it is necessary to stick to the facts about the bargaining over an Algerian settlement. On September 16th General de Gaulle made his long-awaited proposal recognising Algeria's right to self-determination. He promised that within four years after the end of the fighting the Algerians would be allowed to shape their own destiny at the polls. Their choice would not be limited to *francisation* (complete integration within France) or home rule in close association with France. They would be able to opt for secession. If they did, which the general described as most unlikely and disastrous, France would stop its economic aid, preserve its control over Sahara oil, and "regroup and resettle" all those who opted for France. The third solution thus looked very much like partition.

The general's plan was presented on a take-it-or-leave-it basis; still, after twelve days of deliberations in Tunis, the rebels replied. They welcomed the principle of self-determination, but argued that independence could not be reduced to partition and that a free vote could not take place while the country was dominated by the French army. But peace could be immediate, they concluded, if the French accepted political as well as military negotiations for a cease-fire. Both sides had thus made concessions. General de Gaulle, in admitting the future possibility of choice between three solutions, destroyed the fashionable slogan that Algeria must for ever remain an integral part of France. The rebels dropped their demand for a prior recognition of independence. Wide differences remained, however, about the control of the referendum and the guarantees with which it must be surrounded.

Soon after, it seemed that the French authorities were moving backwards. Admittedly, two ministers said publicly that General de Gaulle's offer of a year before still stood and that rebel representatives could come to Paris to sign a truce. But several important figures (the prime minister, the minister of defence and both the delegate-general and the commander-in-chief in Algeria) publicly interpreted the new French plan in a most restrictive fashion. In particular, they insisted that any referendum must be held under exclusive French authority and that the army must keep sufficient forces to run it. Such and similar statements were designed to reassure the French settlers and army officers; they did not inspire confidence among the insurgents.

General de Gaulle took the matter up again at his press conference on November 10th. The president did not disavow his subordinates, but he repeated and elaborated his original plan. He coupled it with a new invitation to Paris. The leaders of the insurrection, he said, could discuss the conditions of a cease-fire with the French authorities in Paris at any time, openly or secretly, and would be free to return if the talks failed. He added that Algerians of all political complexions would be allowed to take part in discussions about the form and contents of the poll. But such discussions would happen in due time and not, as the rebel leaders had asked, before the cease-fire.

The limelight then shifted to the secret meetings of the rebel government in Tunis. Journalists hopefully revealed that the insurgents had turned into left-wing gaullists and were only trying to find a formula that would make it easier for the general to carry his reluctant army with him. But the rebel reply, published on November 20th, did not confirm these fanciful interpretations; it condemned various French declarations as a mockery of self-determination and argued, therefore, that guarantees for a free vote were now more necessary than ever; it nominated five delegates to discuss these guarantees with the French.

Insult, provocation, fraud—such were the first French press reactions. The Algerian plenipotentiaries have no need to ask for visas. They are all safely in detention in France. Four of them, including M. Ben Bella, were on the famous airliner that, in October, 1956, left Rabat for Tunis but landed in Algiers instead. M. Ben Bella is reputed to enjoy great prestige with the rebels, particularly those in the field. The Algerian guerrillas may well mistrust a politician like M. Ferhat Abbas, who joined the rebellion when it was well under way. M. Ben Bella and his fellow-prisoners, on the other hand, were all members of the small committee that started the insurrection just over five years ago. Another possible reason for the rebel choice of plenipotentiaries is that the leaders of the insurrection are not at all convinced that General de Gaulle would risk trouble with his army in Algeria in order to reach a settlement. To move M. Ben Bella, whose name is hated by the settlers, from the Aix Island fortress to a conference room in Paris would be, for the rebels, a proof that the general was in earnest.

The road from jail or deportation to national leadership is well trodden, as (to go no further afield than North Africa) President Bourguiba and King Mohammed can testify. But the quarrel is not only over persons. There is a difference of substance. General de Gaulle offered talks about a cease-fire. The FLN replies that it is ready to discuss the guarantees for self-determination, the conditions necessary for a free vote. Some hopeful French liberal gaullists have been suggesting one way out of the electoral dilemma: a prior agreement by both sides on, in effect, the result. No election can now be free in Algeria, they argue. If it is run by the army, the French will dictate the result; if not, the outcome will be independence. Neither side can be expected to accept the victory of the other. The French should, therefore, lean towards independence, the FLN should accept a form of association, and they should go to the polls together, advocating the same solution.

Yet this only shifts the difficulty. If the agreement is to be secret, the insurgents will have, in the meantime to rely on the general's word; if it is open, and backed by guarantees, the general will not be able to avoid testing the discipline of his officers in Algeria. One day it may come to this. Neither side is yet moving in this direction. The French have not replied officially to the latest rebel statement from Tunis, but President de Gaulle dismissed it last weekend during his Alsatian tour when he declared that he did not intend to talk with men who are *hors de combat*.

The next round now opens in the United Nations. The rebel government-in-exile has sent three of its leading men to reinforce its delegation in the lobbies. It is easy to foresee what sort of brief they will present to their Afro-Asian friends: self-determination is splendid, but freedom of choice requires to be guaranteed;

if the French refuse to discuss such guarantees, the United Nations should request them to do so or provide its own services. Once again the French delegation will boycott the meetings. France may be condemned in its absence. In any case, no one in Paris expects that either side will budge from its position before the end of the debate.

Nato's Alloy Link

BY OUR SPECIAL CORRESPONDENT

NEIGHBOURING states are often hostile. It is part of American world strategy to defy this law by making them congruent pieces in its pattern of defence. Greece and Turkey present a particular problem in these jigsaw mechanics. Latecomers into the alliance, they are at once an appendage to the European defence system and a link in the longer Eurasian line of battle. Circumstances and the Americans persuade them to work together, but tradition and local disputes militate against the even friendship that is a prerequisite of effective co-operation.

Izmir, which most people still know better as Smyrna, is the headquarters of the Allied Land Forces Southeastern Europe and of the Sixth Allied Tactical Air Force, both of which are responsible to the Southern Europe headquarters in Naples. At Izmir a group of determinedly hopeful American officers, assisted by Turkish and Greek officers (in the proportion of roughly 3 to 2) and a handful of British, French and Italians try to organise, equip, train and above all integrate the Greek and Turkish units that in wartime would come under Nato's command. From the military point of view their assignment is formidable ; diplomatically it is perhaps even more daunting.

Everyone in Nato pays automatic respect to the creed that the security of Greece and Turkey is indivisible. A glance at an atlas confirms how decisively the defence of the two countries would be linked if the Russians should ever try to gain control of the Dardanelles or advance south across the Bulgarian frontier.

The governments admit that any threat to the security of one country imperils the security of the other, but despite persistent American hammering of this point, very little of its spirit has yet been translated into action on the ground. The only medium for co-ordinating the training of the two forces is at the Izmir headquarters, and even here, where the air is more American than Turkish, the Greek contingent has only recently returned after having been called home for most of a year during the heat of the Cyprus problem. While they were away, the Americans had to fall back on the awkward expedient of flying backwards and forwards from Izmir to Athens, their function as go-betweens stripped of its usual disguise.

The Cyprus settlement, and the end of one phase in a weary tussle, has brought high hopes and a slight actual improvement. There is now, at last, some liaison between the Greek and Turkish commands on their respective segments of Bulgaria's southern frontier. Teams of Greek and Turkish officers are now allowed to inspect some of the installations in each other's country—so long as the mission is made seemly by having an American at its head. But the list of visible signs of integration is still short ; and it is kept so not only by the impediments of political suspicions, but by the failure to standardise equipment ; this makes any significant interchange of personnel impracticable.

As members of Nato, Greece and Turkey join in the general large-scale manœuvres but so far there has been no question of their working as partners in limited training operations. The exception was the anti-submarine manœuvres in the northern Aegean early in September, in which only the Greek, Turkish and British fleets took part. As an exercise, these were more diplomatically significant than militarily rewarding ; even so, the result has been something less than friendship between the Greek and Turkish navies, whose traditions do not happily mix.

Even if Turkey and Greece were pulling wholeheartedly together, their combined weight makes them no giant. Both countries carry a very heavy defence burden ; Greece, for instance, spends 7 per cent of its gross national product on defence. This is a higher proportion than any other western European country except Britain and France, and puts the Greek delegation in a strong position when defence costs are thrashed out at the Nato meeting in Paris in December. But quite apart from the lack of co-ordination between the two forces, the requirements of internal security, inadequate communications and yesterday's equipment also gravely handicap the south-east European command.

ON paper, the Greek and Turkish units constitute more than half the land forces assigned to the whole of Nato. The Turks have three army headquarters at Istanbul, Konya and Erzurum and contribute 20 divisions, which at full strength would be 500,000 men ; the Greeks have one army headquarters and 12 divisions of about 13,000 men each. In both cases a fair proportion of the total strength is tied up with internal security and is not immediately available to Nato.

The area to be defended is formidably large. Greece has the Albanians to the west and the Bulgarians to the north-east ; with the Jugoslavs in between Greece is on resolutely good terms. Turkey has a 200-mile frontier with the Soviet Union and 700 miles of Black Sea coast, and it is expected that any Russian attack would engage Persia and Turkey simultaneously. The Soviet Union has a substantial build-up of forces in the Caucasus and it is calculated at Izmir that the discrepancy in manpower between the Nato and opposing land forces is something like one to 8 ; for the Greek and Turkish air forces (which are equipped with Canadian jets that have been passed on from Nato service elsewhere) the discrepancy is believed to be one to 10. The road, rail and pipeline network is still very limited, and although a lot of American and local money is being spent fast, the problems are complicated by difficult and often mountainous terrain. Civilian casualties would inescapably be heavy, and wartime planning allows for both Athens and Istanbul being knocked out.

Bilateral plans for establishing a base for American intermediate-range ballistic missiles in Turkey are on the way to fulfilment, and a statement on the control of the warheads is imminent. Turkey is already receiving supplies of the Honest John short-range rocket. Greece, for its part, is confident of receiving certain nuclear tactical weapons before the end of the year. But despite this incipient modernisation, the south-eastern European link seems composed of rather old-fashioned metal for a modern tug-of-war. The Turkish and Greek contingents could play a decisive part against local aggression, and by their presence and readiness might inhibit the Soviet Union from starting a war by proxy. They cannot be expected to deter a powerful aggressor or to hold him for more than a little time.

But this time gained could be vitally important in giving the supreme commander a breathing space in which diplomatic action might still be possible, and in which to reflect on how big a weapon to use next. The United States Strategic Air Command bases, and the great aircraft carriers of the Sixth Fleet, as they show the flag in Istanbul and Piræus, are the visible and impressive signs of the last resort.

WE'RE USING NATIONAL DAILIES THIS YEAR, BUT FIRST ON OUR LIST IS RADIO TIMES

Whatever other media we decide to use, we always head our list of publications with RADIO TIMES.

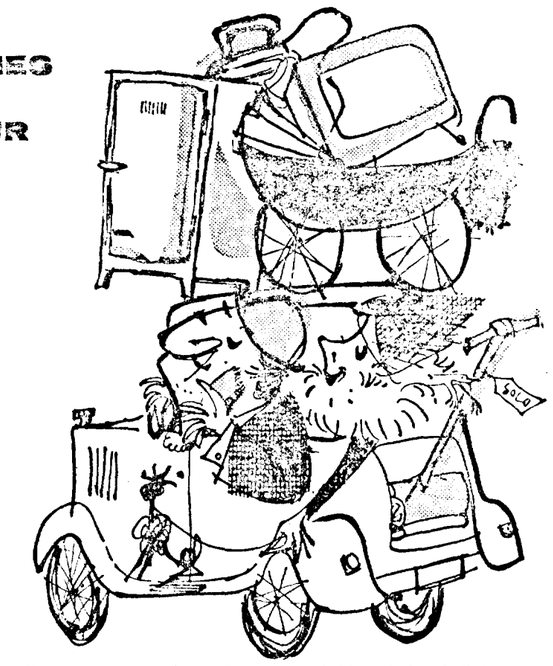
Our product is sold to car owning families. By advertising in six National Dailies, we know we can reach 79% of them.*

But RADIO TIMES alone covers 66% of all members of car owning households, a far greater proportion than any other publication. Obviously RADIO TIMES must be first on our list. With RADIO TIMES and even only two National Dailies we can reach 86% of our market.*

**Figures of unduplicated readership based on special tabulation by IPA, fieldwork period—January to December 1958.*

YES, IT PAYS TO PUT RADIO TIMES FIRST ON THE LIST

Enquiries to: Head of Advertisement Department, B.B.C. Publications, 35 Marylebone High Street, London, W.1



Families that have a car buy not only products like petrol and oil, tyres, car radios, polishes and accessories. They also form an important market for consumer durables and top-quality household goods.

who makes the biggest small refrigerator ever?

The Pressed Steel Company. They make the Prestcold Packaway. Its outside is so small it can be fitted anywhere in a kitchen (and it has been!). Its inside is big enough to hold a week's supply of food.

PS means Pressed Steel, and the Pressed Steel Company mean business, big business. Next spring they're opening the largest and most automated refrigerator factory in Europe, at Jersey Marine, near Swansea.

THE BUSINESS WORLD

Standard Needs a Triumph

JUST what kind of a niche Standard "on its own" can carve itself in the British motor industry of the sixties has been an idly fascinating problem for any onlooker since the beginning of this year, when it became finally clear that its tractor production at Banner Lane and in France would be split off and sold to Massey-Ferguson. The problem had become a busily fascinating one for the directors of Standard about three years before that. At the outset, when it became clear that Massey-Ferguson wanted to control production of its own tractor, it was not necessarily a matter of Standard's going it alone. But the attractive possibility of a merger fell through because difficulties arose over relative share prices, and Massey-Ferguson's interest in making motorcars proved evanescent. Approaches from Rover, again, came to nothing, largely over the price. But, throughout the many months of negotiations, the Standard board had to be making up its mind what kind of position it might have to gain and hold as a single medium-sized motor manufacturer. This meant, essentially, what kind of car it thought it could sell.

The divorce went through without ill feelings. "Only time will show, perhaps," says Alick Dick, managing director of Standard-Triumph, "who was the husband and who was the wife. However, we got the alimony." The alimony—negotiated after a year in which tractor sales, after a dip, had conveniently returned to a peak—seemed very fair. Standard received £14.9 million for its tractor assets (less the engine plant), representing a capital profit of £5 million, of which it distributed nearly £4 million in cash at 2s. 6d. a unit to its shareholders (who subsequently over-subscribed a "rights" offer to buy Massey-Ferguson's 25 per cent interest in the Standard equity). This left Standard—which now prefers to call itself Standard-Triumph International Ltd.—with £14 million in the bank, taxation liabilities of about £4 million to pay off soon, and about £6 million already committed to the investment of building itself a new position in the British motor industry.

Whatever "packages" of car the group's management hoped it would be able to sell in future, the divorce was bound in any case to set it three massive business problems. Tractors represented some 75,000 of the 160,000 units it was producing: bereft of tractors, that output had to be made up with cars as rapidly as possible in order to spread the administrative overheads over as many units as before. This meant obtaining twice the supplies of car parts and components. It meant providing facilities for twice the production and assembly at the group's own plants, while at the same time organising the physical separation of quite closely-integrated car and tractor plants at Coventry. It also meant—and this was perhaps most formidable of all for a management inevitably oriented towards production, since the marketing of half its output had been done by somebody else—arranging the distribution of twice as many motor vehicles, and probably more than twice as many in the home market.

THE first two tasks were in practice inextricable: the only way the group could get the extra supplies it wanted was by making more of its cars itself, as well as making more cars. This process had been set in train already, as part of the exercise which was anyway necessary to free Standard from what amounted to a straitjacket on its car production. Until July last year Standard had no facilities whatever for building, painting, or trimming the bodies of its cars. It relied upon Fisher and Ludlow for the production of its Eight and Ten small cars. After BMC purchased Fisher and Ludlow in 1953 assurances were given that supplies to Standard—650-750 bodies a week—would be maintained: on the other hand, BMC was naturally not interested in putting in new plant for the expansion of a competitor's output. Production of the Vanguard was in the hands of Pressed Steel. Effectively, therefore, the group's output of cars was limited by outside suppliers.

In July, 1958, Standard bought Mulliners Ltd., the Birmingham body builders that was already making painting and trimming shells for its Triumph TR3, Standard Companion and small trucks; Mulliners, earlier in the year, had already acquired Forward Radiator and had begun to increase press-work capacity there. In Coventry Standard began to build a new paint and trim department at its Canley works—now complete and in operation—and bought the factory at Tile Hill where Fisher and Ludlow had been making bodies for the now discontinued Austin A35 for a further paint and trim plant. Body sub-assemblies for the Triumph Herald, which has built up to half Standard-Triumph's car output by now, come from Forward Radiators and from three independents, Carbodies Ltd., Sankey, and Hall Engineering. Lord Tedder, in his statement to shareholders with the accounts this week remarked, "We now plan to extend further the pressing and body assembly part of the business and to increase our capacity beyond 180,000 units per annum."

That capacity of 180,000 will not begin to come in until April, when first operations should begin at the new final assembly hall which will adjoin the body assembly paint and

trim department at Canley; it will house three assembly lines 1,000 feet long. Ever since the summer the building and installation of equipment in this hall (which will bring in and store bodies overhead, and supply other components from a basement below the assembly lines) has proceeded alongside the transfer of equipment between Canley and Banner Lane and the building up of car production. The moving of a large number of machine tools, including transfer lines for certain of the car engines, from Banner Lane, seemed a rather formidable as well as complicated exercise to the Standard-Triumph management. But in practice it was carried through smoothly, with only two minor accidents; and, inside eight weeks, before the stocks of 13,000 engines and other components that had been built up to tide over full production at the car plant were exhausted, the whole changeover was complete. Since it was finished, on August 31st, car output from Canley has been virtually doubled—from 300 cars a day to just on 600. This is effectively 150,000 cars and commercial vehicles a year; before the end of the year, the directors are confident, output will pass the former rate for cars and tractors combined.

Getting enough cars made to replace the loss of tractors is thus already almost done: this was a job of production engineering about which Standard-Triumph was always confident. Getting them sold—even to willing buyers—is another matter. The company had recently been selling as many as 60 per cent of its cars abroad—partly because about 100 a week are the TR3 sports car, of which some 95 per cent are exported, largely to the United States. For sales that represented only half its production, and about the same proportion of profits, that degree of dependence on uncertain and often none too profitable overseas markets was acceptable; but for a medium-sized car manufacturer on its own, it is not.

So the group's marketing problem at home is to try to arrange efficient distribution of a higher proportion—Alick Dick says at least 50 per cent—of an output at least doubled and possibly more. This was not easy: the group had channelled so much of its postwar expansion into exports and tractors had not up to this year been passing through the hands of its dealers many more cars than Standard and Triumph probably were in 1938. But over the last two years the group has vastly increased its sales force, has taken over distribution itself for its largest selling area, London, and has strengthened its spares department and its service network, in preparation for the huge increase in throughput. Today, the selling capacity is there. Even so dealers who are being asked to increase their own stocks and working capital to move this larger supply of cars to the customer need to be confident about the cars in question—and that the company they are being asked to work with is in the business to stay.

ALL of these productive and commercial problems eventually hinge—as does the future staying-power of Standard-Triumph—on the kind of cars it has decided to offer. This is a matter of ideas rather than ironmongery. If the package of requirements and attractions has been nicely gauged to fill a niche in motoring demand, engineering them into the car, though not infallible, is a more dependable exercise. The Triumph Herald has been (so far in small numbers) on the market now for six months: its considerable impact is a matter of record. But its "package" of ideas gives some pointers to the position Standard-Triumph hopes to establish in the motor industry.

First, it signalled a resignation from the rat race. Standard, in numbers responsible for less than ten per cent of British car market, had continued until this year to compete directly with the giants, BMC and Ford, with its entire range. One of the facts of automotive life in Britain today is that no independent producer in the range up to a quarter of a million cars (except Vauxhall, with General Motors behind it) can match those two giants in terms of sheer "car for the money." From the Herald onwards, Standard-Triumph can be taken as having ceased to try (as Rootes had done long before).

The Standard management finds it none too easy, talking to the outsider, to explain its approach with the Herald in terms of any statistical assessment of potential demand at different points of the price range: designing the most expensive fashion article in modern society must draw heavily on inner conviction. But it puts the ideas behind the Herald in terms of "motorists' requirements." These were, it felt when it was planning the car in 1956-57, partly the new needs of an age of mass motoring: ease in parking, the need for very little service and for the lowest possible repair costs on the largest, most vulnerable and most expensive organ of a car's anatomy, its steel skin.

Abroad, it felt that independent suspension on all four wheels had become a real requirement. At home, for the motoring male, it was something else different, to add to the Herald's trouble-free lubrication and the construction with easily removable panels on a chassis. And those differences would give the mere male the good excuse he may need to let his wife pay slightly over the odds for what Standard hoped would sell (her) the car most of all: good looks and just a savour of snob appeal. As production builds up it should bring down costs, but there is no intention of making the car cheaper: Standard-Triumph aims to hold the price and develop this range of cars.

To call this deliberate appeal to be rather more discriminating than the Joneses cold-blooded would be untrue: Standard-Triumph's commitment to its dapper and accomplished brainchild is as much emotional as commercial. It may well, in a rich society where many hanker after distinction rather than opulence, be the logical approach for the medium-rank producer—leaving the bitter though potentially rewarding battle to extend the market at the bottom to the giant manufacturers. In the Herald, the policy has so far made a most successful debut: though technically the question of "putting more into the car" may come up sooner than later. Seekers after motoring happiness of a *recherché* kind might not necessarily buy more down-to-earth cars simply because one may accelerate faster or another have a higher top speed. But a car selling distinction cannot afford to be lacking in any obviously measurable aspect of performance: one must not give the Joneses an easy retort.

Standard-Triumph is confident that it can find a similarly sunny niche, farther up the price range, for other models. The 1½-2 litre range, one of the most competitive in the world, would not seem to offer much room. Farther up there is probably more scope for saleable originality, though the higher one goes, the smaller the market one has to dig oneself into. The eventual output at which the group is aiming—

say 250,000—will require relatively large numbers for cars that deliberately eschew cheapness for originality. Perhaps the biggest remaining question mark about the Herald, for example, is whether the slightly more discriminating market at which it is aimed can yet accommodate the 100,000-150,000 a year that a total volume of the above order would seem to require for the group's most popular model. Until very recently, few models even from the giant makers were being sold in such numbers.

WHAT conclusions, or impressions, can be formed at this point in Standard's metamorphosis? First, certainly, that in terms of technique and production the changeover has been well prepared and impressively carried through. Standard-Triumph has a good way to go with this development and integration of manufacture: it should end with an organisation much more effectively under its own control. That organisation is still one scattered through a variety of plants in Coventry and Birmingham and the group is still doing little of its own presswork; on the other hand the form of chassis-plus-panels construction adopted for the Herald does appear particularly well suited to a complicated and still evolving pattern of body manufacture. Most important, the Herald so far seems to have proved a most acceptable package—admittedly in a period when demand for all kinds of cars has boomed.

Although Lord Tedder was entitled to emphasise in his statement that the Herald accounts for only 50 per cent of production, and that output of other models is rising, it is clear that Standard's main gamble for viability is based, so far, on the Herald—now, perhaps, more on getting it distributed and sold than on producing enough of it. The group will clearly have a good deal on its hands over the next twelve months—during which some already discernible models from other producers, perhaps closely competitive with the Herald, will be arriving on the market. Nor can it afford to wait long if its next original contribution, farther up the range, is to compete with the intensive selling efforts the giants will be putting into larger models already on the market or not far off. For no other car manufacturer will the next two years be as critical.

The speed of the start has been impressive. It has already enabled Standard-Triumph to declare a better interim dividend than was anticipated, and has led the market to hope that the group may do well enough to maintain its final dividend, even in this financial year of transition. The severance payment from Massey-Ferguson has solved the group's immediate problems of liquidity: it does not expect to need fresh capital for, say, the next three years. Yielding 5.2 per cent, on a 12 per cent dividend covered more than three times, the shares at 11s. are fairly conservatively priced for this industry; its equity also represents a substantial assemblage of motor manufacturing assets. In marketing rather than technical terms, Standard-Triumph's future remains an obvious gamble, but so does any other medium-sized motor producer, in the early sixties.

Ajax Inhales Oxygen

A redesigned open hearth furnace makes up some of the lead that pneumatic processes have gained in making steel with oxygen

OXYGEN has become a magic word in steelmaking technology since the war: but for steel industries based primarily upon the open hearth process—as are the American, the British, and incidentally the Russian—this magic word has generally had a somewhat hollow ring. It was in the open hearth furnace that oxygen made its debut as a tool for the steelmaker, during the early postwar years; but the most dramatic results from its use have been achieved almost without exception from the Bessemer convertor—or rather from the specialised vessels developed from it for pneumatic steelmaking with oxygen (most of which blow from the top, not the bottom as a Bessemer convertor does).

As a result, in their new plant, a number of Britain's major companies have turned "back to Bessemer" or to these other processes. The Steel Company of Wales is using oxygen in a bottom-blown Bessemer plant at Abbey Works: both Colvilles and Richard Thomas and Baldwins are to use the Austian "L-D" process in their new strip mill plants, while the latter is also installing Oberhausen "Rotor" vessels (to pre-refine hot metal for an open hearth shop) at Redbourn. Several companies are interested in the Swedish "Kaldo" process.

These Continental processes make steel so cheaply as to pose a question, if not a challenge, to any company deciding to put down steel capacity today. But the response cannot always be the same. United Steel's Appleby-Frodingham works at Scunthorpe makes its steel in ten big tilting open hearth furnaces: in 1956, these had an effective capacity of about 1,200,000 ingot tons a year. At that time, when the company decided that by late 1959 it would need additional steel capacity equivalent to the output of another such furnace, it recognised that oxygen convertor processes might make the steel more cheaply. But it was not then clear whether the Continental processes could deal with iron of the high phosphorus content that Appleby-Frodingham's blast furnaces smelt from British ores (even now, none yet have on a regular commercial basis). Moreover, an L-D, "Rotor" or "Kaldo" plant, to be of fully economic size, would have offered more steel than the extra amount United Steel were thinking of.

Some existing capacity could have been taken out of operation at Appleby-Frodingham to offset the extra output that a large indivisible unit for pneumatic steelmaking with oxygen would have provided. But the investment would have been costly: and the company did not feel justified in commiting extra capital for premature replacement of furnaces which, as it was, were making steel more efficiently than most in Britain.

IN this investment dilemma, therefore, what might have seemed technically an optimum solution was ruled out. Appleby-Frodingham had already in mind one way to get some of the extra output required from its melting shops: the

installation of all-basic refractory roofs in its tilting open hearth furnaces, which allow higher operating temperatures and longer roof lives than the "acid" silica roofs used in its basic furnaces. These offered higher working temperatures and more rapid operation of the process of oxidising impurities from the iron that is the main business of any steel furnace. Another new factor was the tonnage oxygen plant that British Oxygen was building to serve the steel works of Scunthorpe. It was logical for the firm to consider, once again, oxygen in the open hearth process. Appleby-Frodingham had already tried "oxygen lancing" in 1950-51, with discouraging results. The technique could raise output, but it reduced the yield of steel from the charge, slightly increased costs, and irritated the melting crew, who complained that its tangle of pipes and tubes was dangerous. So the experiments at Scunthorpe had been abandoned, though oxygen continued to be used to assist combustion of the coke-oven gas used as fuel. (It is only fair to say that other British steelworks, in particular the melting shops of the Steel Company of Wales, have made continuous and successful use of oxygen for carbon removal, combustion, and the pre-refining of hot metal).

In 1956, before it could begin experiments with oxygen lancing again, the Appleby-Frodingham management had to explain the problem it faced of competition from cheaper Continental processes to its unions. They listened, and then accepted the necessity. So, later, did the local council, when the oxygen-blown furnace began to produce an unusual volume of dusty smoke, before gas-cleaning plant could be put in and brought through its teething troubles. By mid-1957 the company decided the tests merited special modification and reconstruction of one of its newer furnaces: oxygen blowing and the normal open hearth furnace did not quite fit together.

These modifications are quite radical; indeed, this furnace can no longer be operated as an ordinary open hearth furnace. The high rate of blowing with oxygen passes out of the furnace a large volume of dust-laden gas; so a gas-cleaning plant had to be put in. To limit the burden on this the slag pockets and regenerator chambers under each end of the open-hearth furnace had to be sealed with a casing of steel plate to prevent the infiltration of air from outside that is normal with these furnaces. The slag pockets and regenerators, however, could be made much smaller, and were in fact doubled up, with two under each end of the furnace. This makes it possible, when one pocket and chamber are choked with slag and dust, to switch the flow over to the other set, so that the cleaning of these pockets, which ordinarily interrupts operations on an open hearth furnace, can go on while the furnace is operating. Oxygen is fed into the furnace from lances mounted on special gear at each end of the furnace, inserting and retracting automatically; it can also be fed in with the fuel, or in the regenerators to enrich the air heated there. Reconstruction of the modified furnace, from "gas out" to "gas in," took only 27 days.

The results of oxygen blowing in the modified furnace have been quite radical, too. Describing recent operations with the two furnaces that have now been fitted for this "Ajax" process to the Institute of Fuel last month, Mr Jackson summed it up:

> . . . the average weekly production is well above the British record, the fuel consumption is no more than one-fifth of good British practice, and the cost of fuel plus oxygen is no more than half the average fuel cost in standard open hearth practice.

These two 300-350-ton furnaces, with a normal charge of no more than 210 tons, are producing 4,500-5,000 tons of crude steel per week, which compares with outputs of some 3,000 tons a week for a similar open hearth furnace operated normally.

Comparisons in the table put both processes, with oxygen lancing and without, at their best; the ordinary open hearth furnace is charging about 15 per cent of scrap, while the Ajax furnace uses entirely hot iron. There is a slightly lower yield of metal from the materials charged; rather more iron is left in the slag. But in quality, and in performance in the mill, the Ajax steel fully matches that made in the normal process; and the operator's control over conditions in his furnace is so much improved that this kind of furnace serves exceptionally well for special qualities of steel. This control, and the ability to set and hold conditions in the furnace at the melter's discretion, offers the chance of much better "scheduling" of an open hearth shop than is normally possible.

APPLEBY-FRODINGHAM has thus obtained all the extra steel it wanted without more than modifications to its existing capacity. The changeover to basic roofs offered increases of 10 per cent or so in eight of the ten furnaces; the fitting of the other two for the Ajax process has increased their annual outputs to date by some 55-60 per cent. Operating costs have been reduced substantially in the Ajax furnaces in comparison with the rest; moreover, if one were building such a furnace from scratch, instead of modifying an existing plant, there would probably be quite substantial reductions in capital cost.

How far is this process a sufficient reply from the open hearth to the oxygen-blown convertor processes? Mr Jackson still thinks that on a green field site, building entirely anew, the pneumatic processes might offer somewhat lower costs; but that with high phosphoric irons, their margin would be a pretty narrow one. In continuous operations making standard steels, again, the convertor processes would be hard to touch for cost; but the Ajax process probably retains the traditional advantage of the open hearth in flexibility for making a wide range of steels. It uses 1,500-1,600 cubic feet of oxygen per ton of iron, against the 500 cubic feet other open hearth techniques with oxygen have used, and the 2,000 cubic feet used in say, the L-D convertor. It was a decisive and rather courageous step to settle for an open hearth process that cannot operate without oxygen. And in some ways the process represents an advance towards theoretically "ideal" steelmaking processes.

Appleby-Frodingham began operating its first Ajax furnace in January, 1958; the second has been running since June; a third is to be converted. It is not the only effective use of oxygen in the open hearth furnace; and though some of United Steel's competitors appear to have had their interest in such processes rekindled by it, none appears to be following this pattern directly in its own experiments with oxygen. But the process was devised as an answer to an operating requirement, not as an innovation to defend the open hearth process against more rapidly-advancing competitors. What Appleby-Frodingham wants to sell is cheap steel, not steelmaking processes. Technically, its figures are impressive enough. But it is even more impressive as an answer to Appleby-Frodingham's immediate investment problem—and it seems certain to occupy a larger position in the changing future pattern of United Steelmaking.

BUSINESS NOTES

RADCLIFFE REPORT

The Government's Decisions

OPENING Thursday's debate on the report of the committee on the working of the monetary system, the Chancellor of the Exchequer delivered the Government's verdict on the leading recommendations about domestic economic policy. He mainly rejected them. The reactions of the Treasury to the report turn out to have been very close to the line taken in these columns.

At the outset Mr Amory made the point that the committee had underestimated the role of monetary policy in regulating the economy. Monetary policy must be supported by fiscal policy working in the same direction, and there might be occasion for more specific measures such as those used to stimulate capital investment; but the Government sees no reason to qualify its general aversion from direct controls. Nor is the Chancellor prepared to accept the committee's categorisation of situations into "normal," "excess liquidity" or "emergency." In particular, there are obvious dangers in a package marked "For emergency use only." Mr Amory rightly insisted that his hands must not be fettered; the measures available must be used as and when the authorities think necessary, not according to any predetermined formula. The Chancellor made no specific reference to special controls over bank liquidity or to their extension to other financial institutions.

Bank and Treasury

Nor did the Chancellor suggest that he shared the scepticism of the committee about the efficacy of Bank rate. On the argument about who should announce Bank rate movements, he is making what is apparently the only important change resulting from the committee's recommendations. However, he is sensibly not following the committee's own recommendation that changes in Bank rate should be made by the Chancellor and on his authority; this would be misleading to the world since no one has suggested that the initiative should not continue to come from the Bank. The Government's proposal is exactly in line with the compromise suggested here—that the announcement should be made by the Bank but on the authority of the Chancellor.

The Government and the Bank have accepted the committee's general outline of the functions of the Bank in relation to the Government, and of the part-time directors within the Bank. The formulation of policy is in practice in the hands of the Governors, and the function of the part-time directors is mainly advisory. This will henceforth be recognised in formal terms. The Bank Court has delegated to the Governors a standing authority to settle changes in Bank rate with the Chancellor on behalf of the Bank. The Governor will be free to have discussions with the Committee of Treasury and other part-time directors, but he will not put specific proposals before them.

Announcing Bank Rate

The usual (but not inevitable) procedure for a change in Bank rate will then be: On the day before a change, after the usual informal discussions, the Governor will put a formal written proposal to the Chancellor; on the same day the Chancellor will convey his formal written approval. On the day of the change (still apparently a Thursday in the normal case) the Governor will report to the Court. The final decision will thus be made by the Bank and announced in the usual way—with the rider that the decision is with the Chancellor's approval.

The Chancellor rejects the suggestion for a new standing committee of the Bank, the Treasury and Board of Trade, which he regards as superfluous. But in future the Bank will be represented formally, as in the past it has been informally from time to time, on various existing Whitehall economic committees.

Financing Public Corporations

Mr Amory rejects the proposal that the local authorities, like the nationalised industries, should be given full access to finance from the Exchequer—just as he rejects the suggestion from other quarters that the nationalised industries, like the local authorities, should be made to borrow in the market. He points out the distinction that the local authorities have their own credit standing and can pledge their assets, and that they have in practice drawn on sources of funds that would not have been available to the government. The only change here is that the government will collect and publish information about the extent and terms of local authority borrowing.

More Information

The one section of the report that the Chancellor, along with outside observers, has warmly welcomed is that calling for more information about financial matters. Mr Amory has instigated an urgent study of these recommendations. He would like to see comprehensive and consistent figures on operations of the banking system; information on holdings of and transactions in gilt-edged securities and Treasury bills; and on the financial position of companies. New direct inquiries will be needed.

His one reservation in this sphere is on news about the reception of new government issues in the market. He is prepared to consider a more "dignified" form of announcement than the disingenuous traditional formula used for issues of Treasury controlled official funds; but he is not prepared to go as far as announcing, on the first day, the amounts taken up by the public.

INVESTMENT REFORM

Companies Act Inquiry

ON Thursday, Mr Maudling, President of the Board of Trade, announced the terms of reference of the promised committee of inquiry into the Companies Act. The chairman will be Lord Jenkins, and his colleagues will be named shortly. Their duty will range widely:

> To review and report upon the provisions and workings of the Companies Act 1948, the Prevention of Fraud (Investments) Act 1958, except in so far as it relates to industrial and provident societies and building societies, and the Registration of Business Names Act 1916 as amended; to consider in the light of modern conditions and practices, including the practice of take-over bids, what should be the duties of directors and the rights of shareholders; and generally to recommend what changes in the law are desirable.

These are comprehensive terms indeed—they include, it will be noted, the knotty problem, half law and half practice, of directors and shareholders—and it is not to be expected that the Committee will find answers to them in a mere matter of a few months. But that does not mean that reforming action need be delayed on other fronts. Mr Maudling disclosed that the Chancellor will be introducing a Building Societies Bill in this Session. And he is himself considering whether new legislation is desirable to control the soliciting of unsecured loans and deposits—a matter on which the Prevention of Frauds Act has been found completely wanting; preventive action on this need not, he said on Thursday, await the outcome of the committee of inquiry.

NEW CURRENCY

Note Well

THE Bank of England feels that it would be a good thing if people looked more closely at their banknotes. Its new designs bearing the Queen's portrait will go some way towards bringing this about. The £1 and 10s. notes will be made equal in size. Both will be as long at the present £1 note, but half an inch narrower—that is, longer and less deep than the present 10s. note. New £5 notes the same size as the present £1 notes will be issued, and £10 notes of exactly the same dimensions will accompany them. Three denominations of notes in three different and easily recognisable sizes will thus be replaced by four denominations of notes of equal length, with two narrower than the others. The broader notes will represent values five and ten times as much as the value the public has grown to associate with notes of that size. Each note will have a different dominant colour (though subsidiary colourings introduced for security reasons will reduce the distinctiveness between them). The reason for this limited diversity is that the Bank feels there is only a narrow range between a note large enough to be easily handled (the size of the present 10s. note) and small enough to fit into wallets without folding (some people cannot get the present "fiver" into theirs). The new series will not go as far as the single size, single colour of the United States dollar notes ; but that surely is a bad precedent.

To judge by the time interval between the introduction of the new £1 note (early next year), the new 10s. note (a year later) and the £5 and £10 notes ("as soon as possible thereafter"), the Bank's contention that the process of design and production cannot be hastened is well borne out. The new series will reduce the cost of printing the notes.

These will be the first notes in Britain to bear the sovereign's portrait, and the brighter design is welcome. More important, perhaps, is the reintroduction of the £10 note. The demand for notes of high denominations has been strikingly illustrated by the reception of the present £5 note. In February, 1957, the old fivers, glorious relics of a bygone age, comprised 15 per cent by value of all notes in circulation: this percentage has now more than doubled. There might also be a demand for a note between £1 and £5. But the most pressing need is better coinage, which is the responsibility not of the Bank but the Royal Mint. Mr Heathcoat Amory should be giving urgent attention to the radical, sensible suggestions made recently by his deputy master.

THE EXCHANGES

Sterling and Bank Rate

STERLING has been giving a less impressive performance in the exchange markets in the past few weeks, and at times the Exchange Account is believed to have stepped in with some official support. This modest weakening offers no ground for concern. The spot rate on the US dollar is still above par, and in the forward markets sterling is at a premium on the dollar, the mark and most other currencies. What has happened is that part of the usual seasonal demand for dollar commodities has been experienced later in the year than usual (partly because of the high confidence in sterling during the usually difficult third quarter). At the same time, a certain amount of foreign funds has been withdrawn from London to take advantage of higher interest rates in New York and elsewhere. The official discount rate now stands at the same level, 4 per cent, in London, New York and Frankfurt—and bill rates are up to 1 per cent higher in New York.

How far can interest rates in London remain below those in the other main centres? International considerations today, unusually, call for the London authorities to sit tight as long as possible ; a narrowing or reversal of the differential below New York would embarrass the American authorities in their attempt to check the outflow of gold. After the impressive gains of the past two years, London can afford to see funds return across the Atlantic. If the reserves did fall by a modest amount in coming weeks as a result of short-term money transfers, that ought not in itself to call for an increase in Bank rate. However, the authorities must also look to domestic considerations ; and these might point in a different direction. If the authorities fear the beginning of a boom in private investment some time next year, they might be inclined to increase Bank rate on that ground, as a warning to the banks (whose advances are still increasing) and to industry.

AEI

Reshuffle Completed

THE internal reorganisation of Associated Electrical Industries, begun nearly two years ago, will be completed by the end of the year. AEI's three constituent companies, British Thomson-Houston, Metropolitan-Vickers and Siemens Edison Swan, are to be renamed AEI (Rugby), AEI (Manchester) and AEI (Woolwich) respectively: between them they will be responsible for management of fourteen product divisions, which in turn will have their own managerial and engineering staffs, and a fair amount of autonomy. Nine of these divisions were created earlier this year, and the other five—cables, construction, telecommunications, radio and electrical components, and instrumentation—were named this week. The parent company, of which Lord Chandos is chairman, remains responsible for the group's finance; AEI-Hotpoint will remain a separate entity, and AEI's association with John Thompson in nuclear power plant construction will not be affected.

The reorganisation was first prompted by the change in the electrical industry brought about by the Restrictive Trade Practices Act. While the industry's price-fixing and quota agreements were in force, it was advantageous to have several subsidiary companies that purported to compete with each other ; with the abandoning of the agreements, it automatically became desirable to rationalise production. This last stage carries rationalisation to its logical conclusion: in future there will be no duplication of products between divisions (though there will be few if any changes in the present location of plant and equipment).

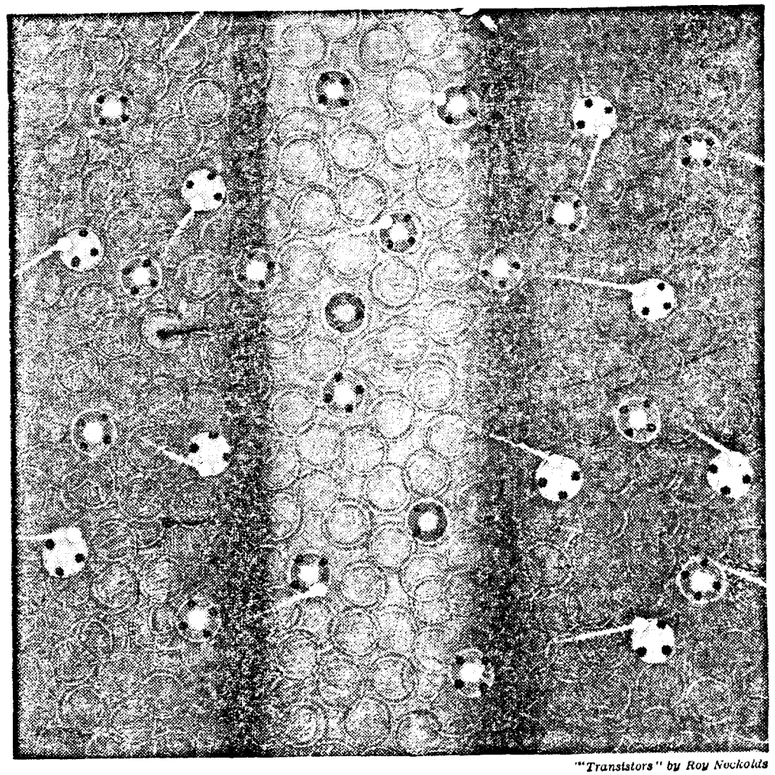
Lord Chandos noted this week that in the future AEI will gain the advantages of a completely unified structure, as well as trading under a single name—as do its chief competitors, English Electric and GEC. This establishment of a group image will not be carried out completely, however; many trade marks associated with the old management subsidiaries will be retained, though the products will henceforth be sold by AEI.

HAWKER SIDDELEY

The Difficulties of Diversification

THE Hawker Siddeley Group's search for work outside the aircraft industry has led it to a remarkable decision—to set up a 270-strong atomic energy division. A team of this size is most unlikely to get nuclear power plant orders from under the noses of the giants of the industry, even in shipping, where Hawker Siddeley is concentrating. Every atomic energy group in the country has submitted designs to the Admiralty-sponsored committee looking at nuclear merchant ships. English Electric is proposing the same type of reactor as that which is under development at Hawker Siddeley—using an organic chemical to perform the function carried out in large reactors by graphite—but English Electric is backed by American know-how. Both companies have, incidentally, chosen a type of reactor that is temporarily out of favour with the Atomic Energy Authority.

But David can still hit Goliath for six on occasion, and Hawker Siddeley may yet make an impact on the market for research reactors. At the Geneva atomic energy conference a year ago, the group was given blue-prints for the Argonaut research reactor developed by the Argonne National Laboratory in the United States. This is the nearest thing to a do-it-yourself reactor yet invented. Argonne assembled it, for a gimmick, during the first week of the conference and Hawker Siddeley built its own anglicised version, Jason, in seven weeks. Hawker Siddeley was given the design and know-how, as Argonne had done for American manufacturers. Except for its instru-



"Transistors" by Roy Nockolds

Gazing into the crystal

Modern crystal gazers can now foretell the future with some accuracy—if the crystals into which they are gazing are those of germanium or silicon.

These two substances—known as semiconductors—are the basis of Electronics' newest and perhaps most significant development—the transistor.

This device, which fulfils a similar function to a radio valve, is beginning to revolutionise electronics in many of its applications. Unlike the valve, the transistor needs no filament and operates at very low voltages and currents. Another advantage is its minute size—in some cases no larger than the head of a match. The transistor, in a variety of forms, is already being used in hearing aids, computers, instruments for nuclear power stations, portable radios and record players, and future applications will include radar, submarine telephone repeaters, and V.H.F. mobile radio.

The Mullard Company has played a leading part in the development and production of transistors, accumulating a great wealth of know-how on which you, as a designer or user of electronic equipment, are free to draw.

Mullard

Technical Information Services

Mullard Technical Information Services cover almost every field of electronics. If you have an applications problem, write to the address below.

MP542G

Player's No. 3 are in a class by themselves.
(So, on the whole, are the people who smoke them.) They are part and parcel of that pleasantly ordered kind of existence, where everything is *unobtrusively* correct. You might expect to pay over the odds for such a *distinguished* cigarette—but they cost 4/4 for 20, or 21/8 for 100. Incidentally, the Christmas boxes this year have a pleasing "Book of Hours" design.

People who can buy Player's No.3 – by the hundred

nentation and its British screw threads, Jason is a carbon copy of Argonne's original design. As research reactors go, it falls nto the scooter class: that is, useful for teaching, for production of the simpler adio-active materials—and specially useful for pilot trials of the fuel layout inside big power producing reactors. Hawker Siddeley was obliged to build its own Jason, at a cost of £50,000, plus another £48,000 for fuel (American fuel would cost approximately £16,000) as a demonstration model, although the reactor also has some practical use for the group's own work. It has sold one to the Atomic Energy Authority and should sell a second to the Admiralty but the potential market in this country is for probably no more than five—unless an unexpected number of training colleges find £35,000 for the stripped-down teaching version. The overseas market is potentially big but highly competitive. Hawker Siddeley has a certain amount of subcontract work, including potentially valuable orders for special graphites, from the Atomic Energy Authority, and will probably get more. But winning a toe-hold in this industry will demand determination—which is one thing that Hawker Siddeley has not lacked.

CABLES

An Olive Branch?

THE increase of 7½ per cent in the price of low voltage mains cables announced by British Insulated Callender's Cables last Tuesday has not yet been followed by the other large producers—Associated Electrical Industries, Crompton Parkinson and Pirelli General—but they and the smaller companies are unlikely to miss this opportunity to reduce their losses. After price cuts in mains cables by over 20 per cent, compared with those ruling under the former price fixing arrangements, a rise of 7½ per cent cannot leave much margin for profit. Such cable is largely made by the bigger companies in the business. A rise in the price of the household sizes of cables will be needed before the small companies can feel safer; they sell relatively more household cables than mains cables. But this is the section of the industry in which there is most surplus capacity, and BICC may not want to increase prices there until it sees that capacity has been reduced nearer to demand.

One small step further towards the reduction of capacity in the industry has been taken by BICC in buying Metropolitan Cable and Electric, a small private cable maker. Manufacture will be transferred from its works in Essex to the BICC factory at Erith during 1960.

HIRE PURCHASE COMPANIES

Time They Grew Up

AFTER a year of unrestrained expansion, in which the nation's hire purchase debt has surged from £500 million to around £800 million, finance houses are asking themselves whether they can afford in their own interests to go on searching for business unselectively on the principle that volume will look after bad debts. The recently uncovered rash of frauds by motor dealers in Lancashire and elsewhere, which affects many of the big finance companies, has caused even this thrustful industry to draw breath. Companies forced to repossess cars are also seeing the danger of the irresponsible competition in repayment terms since official controls were lifted: someone who has been allowed to put 10 per cent down and spread his repayments over four years has little to fear from repossession.

The method of operation that the finance companies have chosen for themselves, that of dealing not direct with the public but with the retail agent, means that the quality of their business is decided very largely by the quality of the dealers. A finance house that accepts business from a dealer without having fully satisfied itself about his honesty (and perhaps even of his existence) has only itself to blame if it finds it has been financing wrecks.

The recent troubles have revived interest in the desirability of finance houses dealing with the public direct, hitherto dismissed as administratively impractical. A number of leading companies have already made half-way moves in this direction by offering a direct approach, for their next purchase, to people who have completed their contracts satisfactorily. A big handicap in the way of the direct finance transaction is the inadequacy of credit reporting in Britain. This week the "Industrial Bankers" Association suggests in its half-yearly report that finance houses should co-operate to pool their credit information for use amongst themselves. An obvious instrument for this, one would think, is Hire Purchase Information, which maintains a comprehensive and efficient information service on every vehicle subject to a hire purchase agreement. It ought not to be too difficult to extend this to information about the hirers themselves.

Meanwhile, the finance houses have noted with interest that the Beneficial Finance Company of the United States is about to set up shop in London: this is not what all of them have had in mind in thinking of international expansion. An old aspect of the reports is that the American company is thinking largely of straight cash loans; the scope for these is closely circumscribed by the Moneylenders Act.

SYNTHETIC FIBRES

Limbering Up

COMPETITION has been growing on the fringes of the synthetic textile industry among the more exotic new fibres. In the past few days the two main producers of acrylic fibres, Courtaulds in this country and the American Chemstrand company in Northern Ireland, have cut prices by in some cases as much as 28 per cent and Courtaulds has announced that capacity for producing these fibres at its Grimsby plant is to be doubled from 10 to 20 million lb of yarn a year. With the 10 million lb being produced yearly by Chemstrand, this would make output of acrylic fibres roughly equal to the present output of "terylene," although this, too, is being expanded. Courtaulds also announced that it was doubling the output of two even more exotic, special-purpose fibres based on polyethylene and polypropylene without, however, giving any indication of the size of current production. This is bound to be small in comparison with that of the established synthetics, since these two yarns are used only by industry, and then for applications where their special properties are important. But those applications, ropes, filter cloths and the like, also happen to form an important part of the industrial market for nylon and "terylene."

The prices of these new synthetics are in the region of 100 pence per lb (some of these fibres are very light) compared with 24d. a lb for viscose rayon staple, still the cheapest textile fibre, natural or synthetic, on the market. Nevertheless they must by now be accounting for close on a quarter of the total output of synthetic yarns. Production in October was 47.2 million lb, 32 per cent higher than production in October, 1958, when the textile industry was in a bad way. Since then production of all types of rayon, viscose and acetate, yarn and staple, has been rising; but the fact remains that Courtauld's viscose producing plant at Grimsby has never yet been worked up to its full capacity of 100 million lb of yarn a year. There is a good deal of slack in the viscose producing side of the industry in spite of this yarn's cheapness: were it not for the boom in rayon carpets and mixtures of rayon—the carpet industry is taking 40 million lb of yarn a year—the traditional backbone of the synthetic fibre industry would be in a bad way. This could explain why Courtaulds is not only expanding its interest in the new synthetic yarns, but is branching into new industries. Its North Wales rayon factory at Flint, closed some years back when the group was painfully reorganising at the bottom of a textile slump, is being reopened not as a textile factory, but for the production of bleached pulp for the paper industry.

CREDIT TRANSFERS

The Banks Agree

THE clearing banks are now preparing to introduce a major extension of facilities for easier transmission of payments through "credit transfers" direct to the account of the recipient, in addition to the traditional cheque facilities. The banks have doubtless been influenced by the recommendation of the Radcliffe committee that unless existing institutions provided improved facilities, consideration should be

given to establishment of a giro system by the Post Office. A sub-committee of the banks has recently completed an exhaustive report, and as a first step, and a minimum aim, the banks intend to extend and develop within a few months (and probably re-name) the "traders' credit." This is the system through which one can cover a number of payments with one cheque by giving one's bank standard credit slips showing the name and location of the accounts to be credited.

Such transfers, together with other credit transfers for instalments to building societies, hire purchase houses and the like apparently add up to 150 million items a year—almost one fifth the number of cheques. But hitherto the traders' credit method has not readily been available to the private customer. It has been necessary to produce a certificate from the creditor—whose bank charges may be increased by this transaction while those of the paying customer fall—sanctioning the transfer. This is one of the questions now being reconsidered; there are also some legal complications, and the question of whether to have a centralised clearing for credits as well as for debits (provided in the cheque clearing).

The biggest immediate question is that of providing for cash instalments to hire purchase companies. During the squeeze the banks, which had seen the hire purchase houses grow fat while their own activities were restricted by official directives, imposed stiff terms on collections of hire purchase instalments. The recipient finance houses were debited by 1s. for each collection, and payments were not accepted on Saturday mornings. The finance houses searched long for an alternative means of transfer, and even worked out an elaborate scheme to be operated by the sub-postmasters. Now the atmosphere between hire purchase and the banks has improved, and it seems likely that the banks will offer a more acceptable system. This might conceivably be streamlined by providing standard paying-in books and centralised accounts of finance companies at bank head offices. But the companies also badly want the banks to levy their charge from the paying-in customer.

OVERSEAS TRADE

Imports and Exports High

RECORD British exports of £306 million in October did not result from freakish bunching in deliveries of a few costly items such as ships and aircraft. The detailed figures show that the improvement was widely spread. Imports also rose on a broad front to £360 million, reflecting British industry's growing needs. Taking September and October together the average value of exports was £276 million fob; this was ten per cent higher than a year ago, when exports were still falling. The main increase was to the non-sterling area, thanks to the rapid growth in sales to North America and Western Europe. But exports to the sterling area increased by two per cent to £109½ million, whereas in the first eight months of this year they were seven per cent less than a year ago.

Shipments of engineering products, the largest group, rose by seven per cent to £115 million, compared with September-

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. An effective credit information service and skilled assistance and advice are available to United Kingdom merchants and manufacturers seeking new business connexions in Asian markets.

The Irano British Bank (Incorporated in Iran)

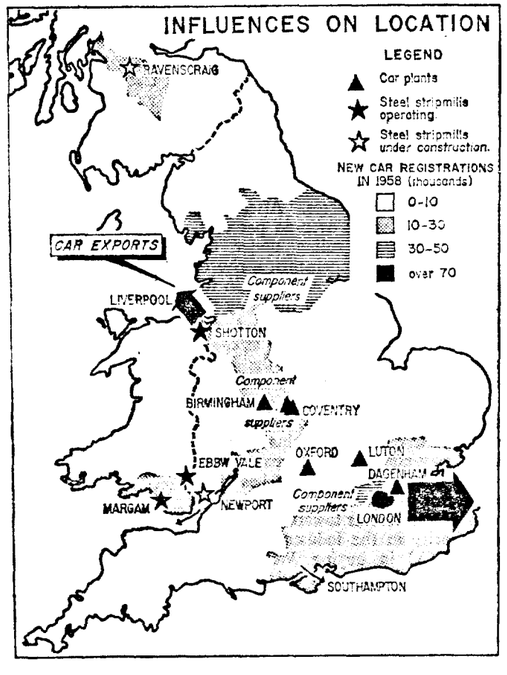
Motors Expanding—But Where?

BRITAIN'S motor industry is now, rather belatedly, reaping the benefits of the expansion programme upon which it began in 1954. Most of the plans have now fairly fully matured and the extra capacity is not only available but is fully employed. Production, 769,000 cars in 1954, was still only 860,000 in 1957 as an after-effect of Suez and the perhaps over-precipitate cuts in production schedules that it induced; only in 1958 did production rise significantly, to 1,051,000, still leaving much surplus capacity. Output now is running at over 1,400,000 a year—close to the figure that general forecasts for the industry as a whole had suggested might be reached in 1965. Next year production should rise further, demand permitting, and by the second half of the year it may reach some 1,750,000 cars—plus perhaps 450,000 commercial vehicles.

The British Motor Corporation alone should have capacity by then for 600,000 cars or more, depending on how far they can squeeze more of their babies from the present plant before the new buildings intended to double capacity can be finished, or can find more capacity in the existing plant for the larger models. Ford will have capacity for at least 500,000 cars and possibly 600,000—which suggests that further new models may be on the way. Vauxhall will have raised its capacity from about 160,000 cars to around 200,000, which is the limit in the building that it erected under its 1954 programme. Standard (STI) are a special case because of the re-organisation, and will have capacity for over 150,000 cars.

BMC has been the first to announce further plans in detail: it intends to spend £49 million in the next three years compared with the £39 million that it has spent in the last five years. This would raise its capacity to one million vehicles in two years—750,000-800,000 cars—and perhaps to some 1,200,000 vehicles, 900,000-950,000 of them cars, by 1962. Ford has announced that it will spend another £50 million, and Vauxhall are planning a further large expansion too.

These are the plans that are arousing such solicitous interest amongst Government authorities concerned with trying to persuade industry towards "black spots" of unemployment. Scotland, the most publicly pressing candidate, does not look too well situated, as the map shows, for anything except (prospectively) steel. South Wales may seem a little more likely to succeed in attracting these rich plants.



who made Britain's first production all-steel car body?

In 1926 the Pressed Steel Company made the first-ever all-steel car body to come off a British production line. Today they make car bodies at the rate of three a minute

PS means Pressed Steel, and nowadays the Pressed Steel Company can mean a car body or a railway wagon or a Prestcold refrigerator just about anywhere in the world.

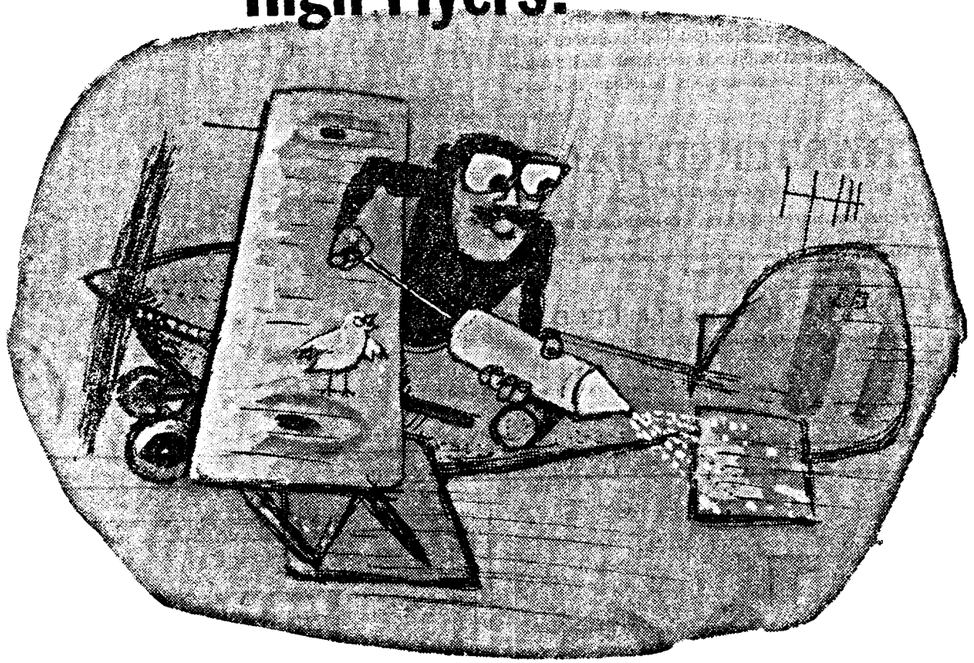
Good News for Hi-Fi High Flyers!



For high-flying hi-fi fans, a splendid vista stretches endlessly ahead. Those twin bugbears of stereo in the stratosphere—ice outside the aircraft and overcrowding inside it—have surrendered to a massed attack from the scientists who work on chemicals from oil. As ever, the Esso Chemicals Division took a keen interest in the fray.

High flying is all right—the sun's usually out and you're clear of the main roads—but it gets a bit parky up there. Ice tends to form on the wings and things. One solution is to spray on a fluid called iso-propyl alcohol, which de-ices the aeroplane. It's made from propylene, of which Esso Chemicals have plenty.

Hi-fi-ing is all right, too, although you used to need a small airship to carry all the necessary equipment. Then transistors came along. Open any transistorised gubbins and you'll probably find the parts embedded in a plastic potting compound. This is an epoxy resin, which also starts out as propylene—of which Esso *still* have plenty. And so stereo in the stratosphere flies slowly into the sunset, de-iced and uncrowded. Yes, it's a rich, full life for hi-fi high flyers. (And Esso Chemicals *still* have lots of propylene. Want some?)

Note to Manufacturers

Besides propylene, we can offer you many other chemicals from oil; they are listed below. If YOUR *business uses chemicals, ask your secretary to contact the Esso Chemicals Department, 50 Stratton Street, London, W1. Telephone: Hyde Park 7030.*

BUTYL RUBBER · AROMATIC SOLVENTS (Solvesso 100 and 150)
ETHYLENE · BUTADIENE · PROPYLENE · NAPHTHENIC ACIDS · 'C' OIL
POLYISOBUTYLENE · OXO ALCOHOLS · HIGHER OLEFINS
DICYCLOPENTADIENE · SULPHUR · HEPTENE · AROMATIC TAR

ESSO MEANS BUSINESS IN CHEMICALS

October, 1958, despite a sharp fall in ships and railway vehicles. Shipments of non-electric machinery shot up by 17 per cent to £51 million, while electric machinery rose by 10 per cent to £18½ million. Cars and chassis remained buoyant at £17.2 million, 12 per cent more than a year ago, while commercial vehicles recovered sharply to £7.3 million, nearly one-third higher than a year ago. Textiles did well (cotton textiles at last showing a modest increase), and shipments of metals rose by a fifth to £40½ million. Chemicals, one of the most buoyant items this year, showed a further increase of 16 per cent to £25 million.

United Kingdom Trade By Areas

	Sept./Imports		Sept./Exports	
	Oct. av. £ mn.	% change on year ago	Oct. av. £ mn.	% change on year ago
North America ...	65·8	+17	48·8	+26

Western Europe ..	97·1	+10	77·5	+18
Soviet E. Europe ..	12·1	+13	5·7	+31
Other	23·3	−16	22·2	Nil
All non-sterling	**225·8**	**+10**	**166·7**	**+17**
All sterling ...	**117·6**	**+ 7**	**109·4**	**+ 2**
Total	**343·4**	**+ 9**	**276·1**	**+10**

The average value of imports in September-October was £343½ million, nine per cent more than a year ago, and industrial materials accounted for almost all of the increase. Imports of basic raw materials and semi-manufactures rose by 17 per cent to £139 million, while imports of manufactures rose by nearly 30 per cent to £34½ million, with engineering products accounting for most of the increase. Food, beverages and tobacco imports were two per cent higher at £131 million, largely owing to higher prices of dairy products, while imports of fuel fell by four per cent to £38 million, due entirely to lower prices of petroleum. As with exports, the bulk of the increase was in trade with North America and Western Europe, and total imports from non-sterling countries rose by 10 per cent to £226 million. But imports from sterling countries were not far behind; they rose by seven per cent to £117½ million, compared with September-October last year.

EV INDUSTRIALS

Who Owns Whom?

The last few months have been a critical period of transition and development. There have been four different chairmen, seven resignations from the board and seven new directors have been appointed.

This in the present chairman's own words is the background to EV Industrials' curious history since control of the company passed to Henry Briggs (Trust) early this year. An investigation into dealings in the company's shares is now being made by the Fraud Squad.

The facts are not at all clear—even though Mr Sidney Newman, who became

the chairman of EVI as a result of a proposal by Mr Francis Cradock, has held a press conference. It does however appear that the company was controlled (and may still be controlled) by Mr Francis Cradock, the managing director of Henry Briggs (Trust), which is a Midlands investment company. Mr Cradock has said that he has been selling shares for some months past and that "it was all part of a programme I started last April." Mr Newman has said that the original purchase of the shares (which was made through Robert Fraser and Partners, of which Mr Newman is a director) was financed by a bank loan of £1,300,000, which was backed by a large block of EVI shares as security. He then went on to say that when Mr Cradock was unable to liquidate this "bridging" advance, that the bank insisted that Mr. Cradock should sell these shares. These sales, Mr Newman said, began in June. Henry Briggs (Trust) has said that the bank loan was repaid two months ago and "that the original and sole method of repayment was carried out," and it claims that the programme of selling its shares in EVI was a "long term engagement carried out with the full co-operation of the bank."

In answer to a question Mr Newman said that he believed the bids made by Camp Bird and the Bank of Alderney in August for EV Industrials were "genuine." It is on the bid of 35s. (compared with the then market price of 26s. 6d.) made by this bank registered in the Channel Islands that attention has been focused. Mr Edmund Stekel is one of the two directors of the Bank of Alderney, the other being Mr Seymour Kraft, and he says that he has named the "mysterious bidder" to the Fraud Squad.

An investigation into the affairs of the EVI group is being made by Peat Marwick and Mitchell and their report will be presented at a special meeting of the company when no doubt further details will be given of the two companies—H. and C. Davis and Westminster Construction—which were recently acquired by EVI from Henry Briggs (Trust) for £850,000. Mr Newman emphasised that EVI was not itself concerned in the investigation by the Fraud Squad and his summing up was: "I don't know who controls the company but it is in first class shape." The 5s. ordinary shares, which had been marked down on the news of the investigation, then regained 2s. 9d. to 21s. 9d. only to fall back again to 20s.

★

On Tuesday, Mr Justice Vaisey, on a motion brought by Mr Harold Cowan, granted an injunction restraining Mr Seymour Kraft, Mr Edmund Stekel, and Lower Perak Rubber Estates from holding an extraordinary general meeting this Friday on the grounds that since March Mr Kraft and Mr Stekel had acted as directors of the company without being properly qualified to do so under the company's articles of association which stated that each director must acquire £200 of the company's stock within two months of his appointment. Lower Perak Rubber was taken over in March and in June its assets of £80,000, almost entirely in cash, were transferred to the Bank of Alderney.

MACHINE TOOLS

Imports to Pay Ten Per Cent

The cut in the tariff on imported machine tools and the end of the arrangements whereby a large proportion of these imports came in duty free should make for greater simplicity. Whether the machine tool industry stands to get more protection or less from these changes is not yet clear. They were suggested last January by the Machine Tool Trades Association, which includes both manufacturers and importers among its members and the Board of Trade, after considering what the industry's customers had to say, has now decided to adopt them.

In future all metal working machine tools imported into this country will pay a flat 10 per cent *ad valorem* rate of duty (other than the few, never more than one or two per cent of total machine tool imports, that are made in the Commonwealth and come in preferentially free of duty). Previously the non-preferential tariff was 17½ per cent. But payment of this duty was remitted where the importer or buyer could satisfy the Board of Trade that a particular machine was not available from British manufacturers, or could only be delivered after unacceptable delay, or where the foreign import was clearly better for the job than a similar British machine. There was a good deal in the industry's argument that this provision made for friction with its customers and placed a heavy burden on the importer, who was usually the person who had to prove the case for remission for his customer—and sometimes failed.

The MTTA argued, further, that the new 10 per cent duty, which it offered as a *quid pro quo*, would probably not be a very powerful deterrent where a British customer really insists upon an American or Continental machine in preference to what tool makers here can offer him. Certainly during periods of shortage British industry has been prepared to pay quite high premiums over British prices for quick delivery of foreign tools. In the past few years it has been buying about a quarter of its new tools abroad and though there are no official figures, possibly up to half of these imports have escaped duty. But one is not at all sure whether the new 10 per cent tariff on all imports will mean roughly the same degree of protection for British tool makers. Presumably the Board of Trade thinks so. If the provision for duty free imports of machine tools, moreover, can be abandoned in favour of a single lower rate of import duty, then could not the same arguments be used to support similar changes for imports of other types of machinery that can still qualify for duty remission?

ENGINES

Novelty from Germany

A NEW type of internal combustion engine is being developed by NSU, the German car and motor cycle makers, in association with the Curtiss-Wright Corporation, which has acquired the American rights for the engine. Invented by Herr Felix Wankel, it seems basically the development of a well-known type of pump into an engine. A three-sided rotor which rotates on an eccentric course inside a four-sided chamber. As a pump, the rotor sucks and discharges a fluid or gas ; operating as an engine, it sucks in the charge in the same way, and explodes it—by a sparking plug—to drive the rotor around, and then discharges the exhaust gas into the atmosphere. High efficiency and low weight are claimed for the engine—a fuel consumption of 0.45 lb per bhp/hour, nearly as good as a large aero engine, and 29 bhp from an engine weighing 20 lb, or 100 from one weighing 100 lb—but detailed technical data and descriptions have not yet been released.

Assessment of the engine's merits will have to await these details but there are some features of the design that make British engineers wonder how so high an efficiency could be obtained. A large area of metal would seem to be exposed to the combustion flame, with consequently high heat losses ; the movement of the rotor seems small in relation to the combusion space ; and the central bearing seems to be heavily loaded, which may make an expensive type of bearing essential and could involve frictional losses. These factors may be offset by features of the design not yet disclosed ; but if the heat losses have been reduced by insulating the combustion flame from the moving parts, this is an improvement that could also be applied to piston engines. Small sizes of such an engine would in theory seem those likely to be most successful, at least in the early stages of development ; motor cycles would be an obvious use, which might explain NSU's interest. It is concentrating on the development of engines of under 100 bhp, while Curtiss-Wright are concentrating on those of higher powers, including one in the 750-5,000 bhp class.

DEPARTMENT STORES

Alterations as Usual

STORES in the West End which have been re-building, redecorating and extending their premises have had to look closely at the way in which the necessarily inexact items of goodwill and time affect the complicated arithmetic of costs. In most instances it has been decided to keep one part of the store open while the contractors hammer away in another. But Littlewoods Stores will close down their Oxford Street premises completely for 18 months from Christmas Eve, while their present building is redecorated and joined to the new one which will be erected alongside it. Five months' building time will thus be saved in an operation which will convert about 20,000 square feet of trading area on two floors to about 23,000 square feet at street level, spread over the present and the new building.

The alternative was to keep the store partially open, and let the contractors spend 23 months on the job. The company has apparently calculated that the loss of 23 months' partial trading will be more than offset by the reduction in building costs and the extra five months' full trading which the close-down will bring about. A high value has been put on the goodwill which, the Littlewoods managers feel, would be lost if customers were to enter the shop during the re-building. In this kind of multiple store the "walk-around" customers are particularly important and these are not easy to satisfy while construction is in progress.

Employees at the Oxford Street store have all been told of the close-down and offered jobs at other Littlewoods stores. Those who do not accept this offer will, the company says, be compensated according to their length of service.

OIL PROFITS

The Shell Figures

THE third quarter results of the Royal Dutch/Shell group include for the first time earnings of Canadian Eagle which previously has figured in the group results only to the extent of dividends received. The figures compare favourably with those of a year ago when profits were scarcely beginning to shown signs of a recovery but the net profits are below those for the second quarter when the item of "operating expenses, selling and admin. expenses ; oil purchases, royalties, etc.," was unusually low at £320 million ; this figure has now risen to £356.7 million.

SALES AND INCOME
(£ million)

	1958 3rd qtr.	1959 1st qtr.	1959 2nd qtr.	1959 3rd qtr.
Sales:—				
Including duties...	606·9	591·8	601·9	664·6
Excluding duties..	445·3	458·3	445·1	479·7
Net income	34·3	37·1	45·6	44·2
Gross income/sales†	*18·1*	*18·1*	*18·9*	*18·0*
Net income/sales†..	*7·7*	*8·1*	*10·2*	*9·2*

† After deducting sales taxes and excise duties, etc., from turnover.

Figures for the first nine months of the year show that net income for the group has risen from £105.8 million to £126.9 million and although this rise might well be offset to some extent by tax adjustments in the last quarter of the year the earnings of Shell Transport for 1959 seem likely to be around 70 per cent, tax free, against last year's 66⅔ per cent on the old capital, on which a dividend of 18¾ per cent, tax free, was paid.

STOCK EXCHANGE

Towards a Mechanised Market

THIS week overworked and hard pressed stock exchange dealers welcomed the introduction of a number of innovations designed to make the pace of business less killing. For the first time the new account began on a Monday and a new seven-day settlement period came into force which, in effect, gives dealers one extra day in which to pass names and settle accounts. Badges appeared for the first time on the lapels of all House members ; this should help members when they check and confirm bargains—two necessary steps in any transaction which in the post-election boom have too easily gone astray. In boom times the turnover of jobbers' and brokers' clerks between firms can cause a good deal of confusion on the floor of the House and the badges will help to show who works for whom.

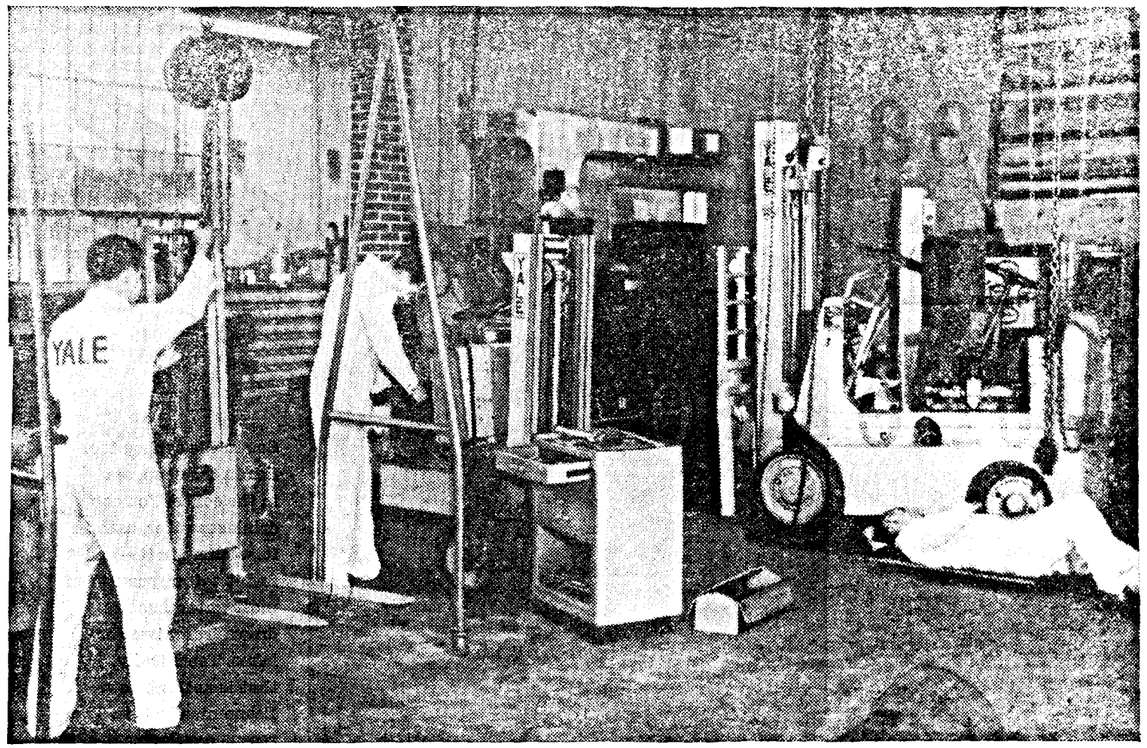
At the same time the badges will also help things along when the settlement is cleared through the Hollerith punch card machines which are to be installed next June. Certain securities have already appeared in the Stock Exchange Official List with code numbers in preparation for the installation of these electronic machines. The aim is not only to speed up the settlement but also to raise the number (at the moment it is only 160) of registered securities which pass through the settlement department. Eventually, it is hoped that all quoted securities and all member firms will have code numbers: these will be fed into the machines and do the settlement work which now keeps so many lamps burning so late in Throgmorton Street.

With an increasingly mechanised stock exchange (where the latest innovation is an electric sign which flashes the changes in exchange rates and which replaces blackboards and chalk), and the realisation by more and more broking firms that they, too, must adopt mechanical and electronic aids, perhaps half the problems facing the proposed committee of City institutions to look into the transfer system will have been solved.

EQUITY INVESTMENT

What Should the Unions Do?

PENSION funds, life assurance funds and investments trusts are all big investors in equities. But institutions which in a sense are outside the City are not. Indeed,



behind the dependable trucks–is dependable **SERVICE**

When you purchase a Yale industrial truck — or Yale fleet of trucks — you get more than top quality and superb, economical performance. You are backed by the skill and training of the men in Yale's sales and service offices. You can always look forward to prompt, efficient service whenever you need it. For further information, contact your Yale Sales and Service Representative :

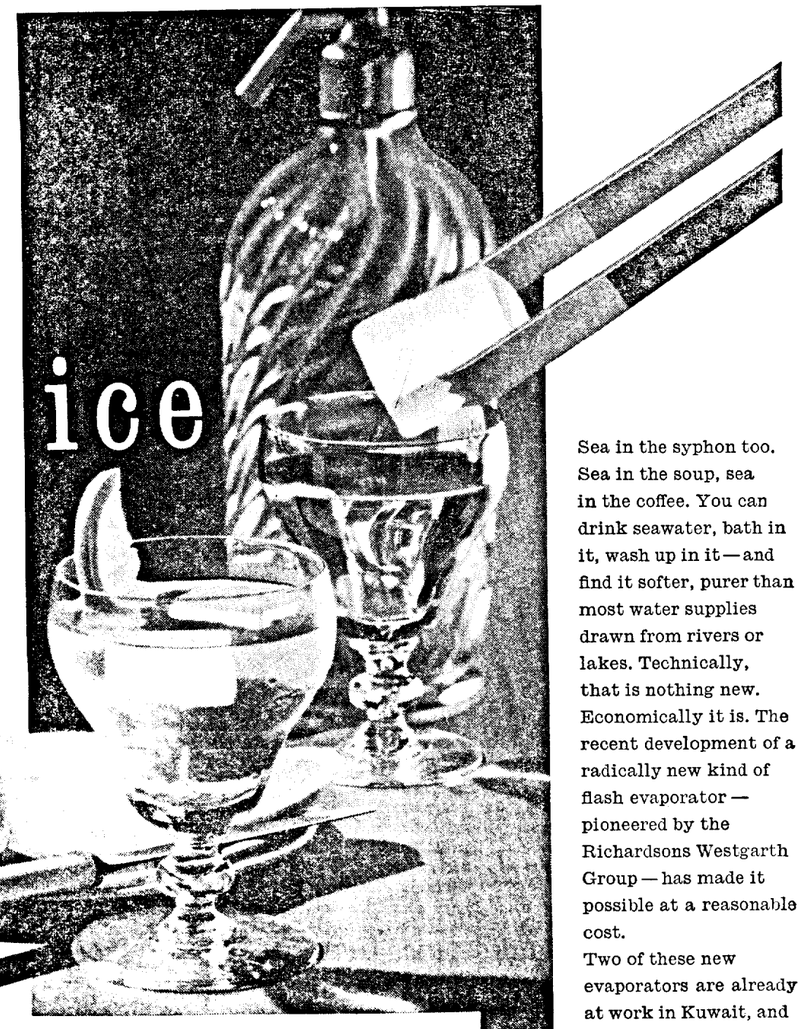
Sea in the ice



Sea in the syphon too. Sea in the soup, sea in the coffee. You can drink seawater, bath in it, wash up in it—and find it softer, purer than most water supplies drawn from rivers or lakes. Technically, that is nothing new. Economically it is. The recent development of a radically new kind of flash evaporator—pioneered by the Richardsons Westgarth Group—has made it possible at a reasonable cost.
Two of these new evaporators are already at work in Kuwait, and four more are under construction for the Arabian Gulf area.
Heated by steam at sub-atmospheric pressure, and in conjunction with other steam-using plant—turbines, process heating etc.—running costs can be so low that it is worth looking into as an economical source of pure water even in temperate zone countries.

the Church Commissioners and Manchester City Council among these institutions can be labelled as successful pioneers in switching their funds away from gilt-edged towards equities. If the local authorities follow the cult of the equity, what should the trade unions do?

So far the unions have not shown much interest in the equity market, although some unions do hold a small proportion of their funds in this form. Mr Desmond Hirshfield thinks they should. His firm acts as auditors to the National Union of Railwaymen and he has spoken at their congress of the need for a more realistic investment policy. He is the author of a scheme to set up a new unit trust designed primarily for investment of trade union funds in equities. He has acted entirely on his own initiative without any explicit backing from the movement but he remains hopeful of its co-operation. Mr Hirshfield envisages a minimum, initial capital in the trust of £1 million, of which 40 to 50 per cent would be invested in equities, 30 to 40 per cent in gilt-edged and about 10 per cent in other fixed interest stocks.

The big obstacle to any scheme of this kind is a natural, and not altogether unjustified, prejudice on the part of the British unions and their members to the investment of their money in industries and companies with which they may have to negotiate on wages and against which they may come into conflict. Mr Hirshfield believes that this trust may help to overcome this prejudice because by participating in it, no union will be investing directly in any one industry or any one company. The trust, if it is set-up, will not hold more than 5 per cent of the equity in any one company.

On political grounds, some unions will wish to have no part in this Trust and indeed a scheme on somewhat similar lines with a bigger initial capital and a bigger proportion of its funds pre-empted to equities failed to receive the TUC's blessing some months ago. Even so, many unions have been disturbed by the fall in the value of their gilt-edged investments and they are realistic enough to see the advantages of widening the spread of their portfolios. But this realism may prompt them to ask:

why start the trust now when equity prices are so high?

A switch at this moment from gilt-edged to equities would entail some loss of income to the unions, whose primary need is to keep the yield on their portfolios high. But the total assets of the unions are now about £86 million, of which about £40 million represents investment funds, and the new trust would only absorb a small proportion of these funds.

ANGLO-ISRAEL SECURITIES

Investing in Israel

LAST September 150,000 £1 shares in Anglo-Israel Securities were placed at par with leading financial institutions and in particular with several merchant banks. Now the public is to be invited to subscribe on the same terms for a further 850,000 shares. This issue, which is not being underwritten, will be on tap for a limited period. Application will be made to the Stock Exchange for a quotation for these shares within three months of the publication of the accounts for the period ending March 31, 1961.

It is the directors' intention to invest the major part of the trust's funds in Israeli equities, but until opportunities for suitable investments arise funds will be invested in fixed interest securities with a dollar flavour, preferably carrying conversion rights. The chairman, Sir Henry d'Avigdor-Goldsmid, MP, is confident that conditions are now ripe for investment in Israel and claims that "Israel is out of the Klondyke days." He foresees no difficulty in remitting dividends to this country at the official rate of exchange. Yields on Israeli equities are in the range of 9 to 10 per cent, so that a good return can be looked for since the board intends to distribute income "up to the hilt." This issue will appeal especially to Jewish investors; at this stage it rests on its auspices rather than upon achievement.

TRAFFIC ENGINEERING

Trained Minds Needed

THE traffic engineering study group set up by the Institution of Civil Engineers is a second important step to promote the application of specially trained minds and a little science to the country's fast growing traffic problems. A few months ago a chair of highway and traffic engineering was established at the University of Birmingham. If these are belated moves, they are none the less welcome. There are few trained traffic engineers in Britain and the need for them grows apace as vehicles crowd on to the roads and spending on new and improved highways mounts.

The Ministry of Transport and a few local highway authorities have staff with some kind of training in traffic engineering. But apart from courses run in recent years by the Road Research Laboratory, and occasional short courses or post-graduate research facilities at one or two universities, there has been no means by which professional engineers engaged on road problems could get systematically abreast of modern traffic engineering knowledge. The civil engineers' new study group should do a lot to promote the interest of more senior engineers: it already has 460 members, including members of other professional bodies. The new department at Birmingham—a city that already has taken the lead in Britain in making a more scientific approach to traffic problems—will go some way towards giving the necessary training to newly qualified civil engineers.

SHORTER NOTES

The London Chamber of Commerce has prepared a new edition of its useful 5s. booklet "Trading With The Soviet Union." It gives a full description of the Russian system of trading, lists the 29 foreign trade corporations and 105 regional economic councils that largely decide the details of that country's overseas purchases, and provides much advice on licensing, contract terms, documents and other matters that the growing number of importers and exporters here need to know.

★

The Chief Inspecting Officer of Railways reports that the number of railwaymen killed and injured in 1958 was the lowest since the war, but that the proportion of railway accidents caused by "human error" was still rising. Fourteen of the eighteen passengers killed in train accidents last year died because drivers passed signals set at danger.

★

An agreement appears to have been reached at last between British European Airways and the Ministry of Aviation over the terms on which BEA is prepared to operate the Fairey Rotodyne. BEA refused to order the aircraft unless the Government was prepared to indemnify the corporation for any losses due to the machine's high operating costs; the Ministry has now offered what amounts to a subsidy of £1.4 million.

★

Oil tanker freight rates are higher now than they have been for the past year. But they are still too low for most tankers built during the war to be run profitably, and the recovery, such as it is, has taken place solely because charterers have suddenly been seeking more vessels for loading in the Persian Gulf up to the end of the year than happen to be presently available there.

HARPER

expands...

The Harper Group of industrial companies enters neavy engineering by the addition of Samuel Platt Ltd., manufacturers of heavy machine-tools, and ironfounders, at Wednesbury, Staffordshire.

The Harper Group is now expanding in many directions. Today—electronics, nucleonics, automation devices, photometrics, airports, small engines, petrol and electric vehicles. Tomorrow—diverse additions with the latest technologies.

When an already successful concern links hands with the Harper team, the new Member receives at once all the benefits of the Harper network, outlets, and skill in achieving quickly the expansion previously envisaged but somehow elusive in isolation.

And now should be further assisted by the expansion into America that the Group is actively planning.

Successful industrial concerns, if fitting into the network, can become Members and expand with Harper.

COMPANY MEETINGS

PETER BROTHERHOOD LIMITED

HIGHER VALUE OF SALES

MR A. MARCUS NEAL'S CONFIDENCE IN CURRENT YEAR'S RESULTS

The fifty-second annual general meeting of Peter Brotherhood Limited was held on November 24th at Winchester House, Old Broad Street, London, E.C., Mr A. Marcus Neal, JP, ACGI, AMICE (Chairman of the company) presiding.

The secretary (Mr Joseph Gerrard) read the notice convening the meeting and the report of the auditors.

The chairman said: Ladies and Gentlemen, before dealing with the Accounts I think I should refer to the sudden death of Ernest Markham, one of our Directors, in April of this year while on a business visit to the Continent on behalf of the Firm.

Mr Markham joined us forty years ago after service as a Naval Engineer Officer during the 1914-18 war; he represented us for some years on the North East Coast but on being elected to the Board fifteen years ago he moved to Peterborough as Director in charge of Sales.

Latterly, Mr Markham's health had not been good but his unexpected death was a great shock to his colleagues and, I know, to his many friends and acquaintances generally.

RESULT OF YEAR'S OPERATIONS

If I may, Ladies and Gentlemen, I will now refer to the Accounts, which follow the usual pattern and which, I am pleased to say, show a gross profit for the year of £530,204 against £532,758 last year.

It will perhaps be remembered that in my statement twelve months ago I said that last year's result was considered exceptional and that, in the opinion of your Board, it was unlikely to be repeated this year. This view was contributed to by the facts that the sum total of our Order Book had diminished somewhat and that last year's profit was considered to be abnormal for reasons connected with last year's trading to which I then called attention.

Shortly after our last Annual General Meeting, however, our Order Book was increased by contracts approximating a million pounds in value and, although this fact must have had some bearing on our final result, the comparability of this year's profit with that of last year is undoubtedly mainly attributable to improved efficiency in General and Works Management and to bringing into full use the £120,000 worth of machine tools to which I referred at this time last year as having recently been purchased.

BALANCE SHEET FIGURES

Referring to the Balance Sheet you will observe that the value of Fixed Assets is higher than at March, 1958, by £21,188 resulting, in the main, from the expenditure on Plant and Buildings during the year of £99,088 (which includes the balance of the aforementioned £120,000), less, of course, provision for our annual overall depreciation.

In further consideration of expenditure on machine tools, a footnote to the Balance Sheet shows an estimated Capital Commitment at March, 31, 1959, of £3,000 and it will, I am sure, be of interest to Shareholders to know, that, since then, in continuance of our policy of keeping thoroughly up to date, further orders for special machine tools have been placed to an approximate value of £100,000, for delivery in 1960.

Under Current Assets the total value of Stores and Work in Progress is shown to be less than at March 31, 1958, by £66,383.

STORES AND WORK IN PROGRESS

As the value of the Stores has increased by £16,610 it follows that the reduction in the value of the Work in Progress amounted to £82,993.

As I have remarked before, some variation in the value of Work in Progress as at March 31st must be expected from year to year in view of the fact that in a business of this type, manufacturing a large and varied range of specialised Engineering products, there is bound to be a fluctuation in the amount of unfinished work on the floor from time to time.

The Cash position standing at £167,138, with tax reserve certificates to the value of £150,000, indicates that we have been able to finance our development out of current revenue without unduly straining our resources—a satisfactory position, which we feel is, to some extent, attributable to our conservative policy in the past.

From the Liabilities side of the Balance Sheet we note that the Current Liabilities amount to £546,337 against Current Assets of £1,829,205, a surplus of current assets over current liabilities of £1,282,868.

TRADING PROFIT AND DIVIDEND

Dealing with the question of Trading, the value of our sales for the twelve months is some two and a half per cent higher than last year's figure, while the gross trading profit shows a decrease, as already stated, from £532,758 to £530,204.

Of this trading profit of £530,204 taxation absorbs £250,000, leaving us with a net profit figure available for allocation of £280,204, which, but for a welcome reduction in taxation, would have been slightly less than last year's figure.

On considering the question of dividend to be paid, your Board has decided, in view of the results, to recommend the payment of a Final dividend of 20 per cent, less tax, making, with the 5 per cent, less tax, interim dividend already paid, a total dividend of 25 per cent, less tax, for the year, on the increased Ordinary Capital.

In addition to the payment of the aforementioned dividend, and allowing for the preference and interim dividends already paid, we further recommend the allocation of £100,000 to General Reserve, increasing this reserve to £425,000, and the addition of the balance of £14,206 to Carry Forward, increasing this item to £164,696.

PROSPECTS FOR IMMEDIATE FUTURE

Shareholders will doubtless be interested in prospects for the immediate future, and I am pleased to report that, with more than half the current year gone, we have every confidence that the results we shall report to you on our working for the year ending March, 1960, will be no less favourable than those we are considering today.

Looking further ahead, the orders on our books covering machinery for power plants and for the chemical industry, for brewing, textile and printing machinery, for turbines, industrial filters and air and gas compressors are satisfactorily maintained and, if we can continue to meet competition by keeping costs of production down, I have every expectation that, in the absence of untoward circumstances, our goodwill and happy relations with those who deal with us will ensure continuity of work for the foreseeable future.

TRIBUTE TO STAFF AND WORKPEOPLE

In conclusion, Ladies and Gentlemen, I should like to pay a tribute to my co-directors, the staff and the workpeople, both in the factory and outside, for their loyal co-operation with, and services to, the firm, without which the activities of the Company could not have been so smoothly and satisfactorily carried on throughout the year.

The report and accounts were unanimously adopted and the dividend, as recommended, was approved.

The retiring director, Mr William Thompson, MIPE, was re-elected and the remuneration of the auditors, Messrs Whinney, Smith & Whinney, having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors, staff and employees.

SMITH'S STAMPING WORKS (COVENTRY)

A BUSY BUT DIFFICULT YEAR

The sixty-fourth annual general meeting of Smith's Stamping Works (Coventry) Limited was held on November 23rd at Birmingham, Mr H. B. T. Wilde, FCA, presiding in the absence of the Chairman, Mr S. Bramhall, MBE, through illness.

The following is an extract from his circulated statement for the year ended August 1, 1959:

The profits of the Group are £286,226 compared with £509,053. The provision for depreciation is £142,117 against £118,620. Our financial position remains sound; the excess of current assets over current liabilities being £1,124,458 against £1,206,200 a year ago.

There has been a marked increase in demand in recent months for the type of forgings for which the Company is particularly equipped. The present order book is substantial and the rate of inflow of orders is still increasing. We feel that we are not departing from our prudent practice in recommending a final dividend of 7½ per cent, making 12½ per cent for the year.

Your Board have always placed considerable emphasis on the need to spread our load as widely as possible by obtaining contracts from a diversity of manufacturing interests. This policy is beginning to bear fruit as the tempo of demand is now rising in all sections of industry with the possible exception of aircraft.

The past year has been a very difficult one and at the same time a very busy one, owing to the constantly changing pattern of our contracts and the large amount of development work carried out.

The report and accounts were adopted.

RHODESIAN SELECTION TRUST GROUP OF COMPANIES

Companies in the Group are incorporated in either Northern or Southern Rhodesia

The following is an abridgment of the Statement dated October 15, 1959, by the Chairman, Sir Ronald L. Prain, OBE, which has been circulated to members.

COPPER

Our main business is the production and sale of copper. During the past year the combined production of the mines in the group was 188,224 tons, representing 6.5 per cent of the free world's production of primary copper. The following table shows the detail of this production:

COPPER PRODUCTION 1958/59	long tons
Mufulira	88,056
Roan Antelope	80,932
Chibuluma	19,236
Total	188,224

The published ore reserves of the group are shown in the following table:

ORE RESERVES

	short tons 000's omitted	Grade % Total copper	% cobalt
Mufulira	177,093	3·31	—
Roan Antelope	95,560	3·05	—
Chibuluma	7,984*	5·04	0·22
Baluba (undeveloped)	112,000	2·41	0·16
Chambishi (undeveloped)	35,000	3·37	—
Total	427,637		

** Does not include an ore occurrence, estimated at 2,000,000 tons (4.74 per cent total copper ; 0.05 per cent cobalt), 8,000 feet west of the mine, indicated by drilling 1957/59.*

With this predominant interest in copper, we cannot be isolated from the main events that occur in the world copper industry. The present situation is basically one where the recent rapid advance in mine output has temporarily exceeded the growth in demand, but it would be a miracle if mine output in this industry, which has to be planned years in advance, should at any one time exactly balance the world demand which is subject to so many influences which cannot be foreseen. However, the general trend of copper consumption must, in my opinion, be upwards if short-term variations in demand are disregarded. This trend is based on an affinity between world population, coupled with improved standards of living, and the uses which are traditional to copper. Provided that the industry is prepared to ensure that the price of copper is kept within bounds which will not encourage substitution, there seems to me to be no reason why copper consumption should not maintain and increase its characteristic growth factor. I have not in any way altered the opinion which I have expressed over the years, namely that copper has prospects which few other commodities can equal in promise. The present over-supply is a temporary situation and at reasonable prices the consumption growth of the future should be such that in the next decade it will test the ability of the mining industry to provide enough copper to meet this expansion. I am not apprehensive as to the industry's ability to do so.

PRODUCTION POLICY

One further factor comes into the picture, namely the willingness of the copper industry to adjust its production rate at times of low consumption in order to avoid exaggerated swings in price. In the last two years the industry has demonstrated its willingness to adopt such a production policy and this would appear to indicate a greater realisation not only of the industry's self-interest, but of its responsibility to the consuming industry of the world to maintain a price range which is not excessive, thus eliminating such violent movements as characterised the industry some years ago with the consequential distortion of the true balance between supply and consumption.

The price of copper quoted by the London Metal Exchange during the year varied within an upper limit of £260 and a lower limit of £191 15s. per ton, which in a normal year would be an excessive range but which is not surprising considering the strikes which occurred in Rhodesia, Canada and the United States and the very strong buying movement which characterised the first half of 1959 and which was based on fears of a strike in the American mines after the end of June. This strike eventually began in August, effectively shutting down most of the United States copper industry; and, at the time of writing, this strike is still in progress. The situation has also been aggravated by a strike in Chile which began earlier this month. Owing to the stocking-up which had occurred in the first half of the year, these strikes have not yet had any drastic effect on prices but if they are prolonged there will doubtless be a sharp temporary increase. Much will thus depend on the length of these strikes and on the strength of general business activity in the United States and Europe during the last quarter of 1959.

The possibility of improving the traditional international marketing methods is a question which continues to exercise the minds of many producers, and of most of the industry associations of Europe.

INDUSTRIAL RELATIONS

The main event of the year was the strike by the European union, which lasted from September 12 to November 4, 1958, the longest strike in the history of the Copperbelt. An important result of this strike was the request by the companies and the union to Government to engage the services of an industrial relations expert to examine the negotiating machinery which had been in force for so long on the Copperbelt. As a result of this Sir Frederick Leggett, KBE, CB, spent some weeks on the Copperbelt and evolved certain proposals for changes in this negotiating machinery. His proposals were accepted by the companies and the union, and led to the setting up of a Mining Joint Industrial Council which has operated successfully since then. The new proposals also provide for many questions to be discussed at a lower organisational level than hitherto and for a slower tempo of negotiation, which we think is an advantage under Copperbelt conditions.

MISCELLANEOUS

I mentioned last year that the copper companies would be submitting evidence to a commission of inquiry which was to be set up to examine the whole rating structure of the Rhodesia Railways. The commission sat towards the end of last year and published a report in May. It is not yet known whether the commission's recommendations are acceptable to the Federal Government, or, if acceptable, when they are likely to be implemented. Just before the commission's report was published the Rhodesia Railways introduced what they described as a "temporary surcharge" on all goods rates, including copper, and this virtually cancelled out the small reduction of 25s. per short ton in May, 1958.

Shareholders in the companies of our group now number over 40,000. The annual general meetings of these companies are held in Salisbury towards the end of each calendar year. For the past six years informal shareholders' meetings of Roan Antelope Copper Mines Limited and Rhodesian Selection Trust Limited have been held in London and New York ; these meetings have always been well attended and at those held earlier this year shareholders expressed a wish that they should again be held in 1960. I propose therefore to call these meetings in the usual way except that, for various reasons, meetings will be held in April instead of in January or February as in past years.

ROAN ANTELOPE COPPER MINES LIMITED

Production of ore was 5.5 million tons compared with 5.7 million tons the previous year, due principally to the effect of the strike early in the financial year.

Production for the year was planned on the basis of a curtailed programme as our contribution towards the correction of the imbalance in the overall world supply/demand position and our production target was 80,000 long tons of copper. Despite the strike, production amounted to 80,932 long tons, due to the mining of higher grade ore and to the treatment of holding furnace slag which had accumulated over past years.

The average cost of production increased from £138 to £154 per ton due to higher mineral royalties and increased bonus scheme payments resulting from the higher copper price and to the inclusion for the first time of the cost of refining a proportion of the production in Rhodesia.

FINANCIAL RESULTS

Sales for the year amounted to 80,617 long tons which, apart from metallurgical and weighing differences, exactly matched the production.

The average price at which our copper was sold was £220 per ton, an increase of £43 per ton. The profit margin per ton of copper increased from £39 during the previous year to £68, and on this basis the gross profits

amounted to £5,505,000. To this has to be added the increase in the value of copper stocks amounting to £56,000. Interest earned, less interest paid, and miscellaneous minor items brought this profit to £5,959,000, which is almost exactly double the corresponding figure for the previous year.

Tax liability on this profit amounts to £1,910,000. The appropriation for replacements is £1,100,000, a considerable advance on the previous year. Replacements reserve at the end of June, after making this appropriation, amounted to £2,049,000.

The appropriation to general reserve has been put at £1,300,000. This is arrived at after taking into account participation in prospecting companies, a further contribution towards the capital cost of Ndola Copper Refineries Limited and the sums which we are committed to lend to the Federal Government in respect of development finance.

The balance available for dividend is £1,708,000. An interim of 3d. per share, less taxes, was paid last July. The board's recommendation for the final is 7d. per share, less taxes. The total for the year is thus 10d. per share, which is exactly double that of the previous year.

MINE POSITION

After the end of the strike the former policy of hoisting ore of lower grade than normal while operating under production restriction was abandoned in order to offset the effect of the interruption. Normal mining sequences were reverted to with a consequent increase in grade of ore hoisted during the second half of the year.

NDOLA COPPER REFINERIES LIMITED

In August of last year this plant commenced operations. These were almost immediately shut down as a result of the Copperbelt strike. Operations were resumed in November, 1958, and continued uninterrupted throughout the rest of the year. This erratic start affected the efficiencies and rate of production, so that during the financial year it was only possible to produce 31,990 tons of electrolytic copper. These operations resulted in a gross profit of £240,000. With adjustments this profit was raised to £264,000. Depreciation is £48,000 and transfer to general reserve £100,000. A dividend of 3½ per cent gross, less Rhodesian taxes, will cost £103,000, leaving a carry forward of £13,000.

This is the refinery's maiden dividend and two-thirds of it will go to Roan Antelope Copper Mines, the remaining one-third going to the other shareholder, British Insulated Callender's Cables Limited.

In a normal year it is expected that the dividend should be 10 per cent gross, less taxes. Owing to an over-expenditure on capital account and to cover working capital, it will be necessary to engage in some temporary borrowing of up to £600,000 from the banks which will be repaid over a short period out of refinery profits. Until this operation is completed the dividend will have to be less than the full 10 per cent.

The second stage of the refinery is expected to be ready for operation early in 1960. Owing to current favourable conditions for the disposal of fire refining grade copper, this extension may not be used in the immediate future. However, arrangements are expected to be made for copper from other companies to be refined there not later than 1962.

MUFULIRA COPPER MINES LIMITED

Production of ore totalled 4.1 million tons as compared with 4.4 million tons during the previous year. The reduction is due primarily to the effects of the curtailment programme and the strike. Production amounted to 88,056 long tons of copper as compared with 93,000 tons planned before the strike.

The average cost of production increased from £136 to £149 per ton. This was due mainly to higher mineral royalties and increased bonus scheme payments due to the higher copper price. Mining costs were £2.9 per ton greater than those for the previous year, mainly because of special development work in the western section of the mine. Other departmental costs showed an improvement of £2.2 per ton.

FINANCIAL RESULTS

Sales for the year amounted to 87,521 tons which, apart from metallurgical and weighing differences, exactly matched the production.

The average price at which our copper was sold was £228 per ton, an increase of £40 per ton compared with the previous year. The profit margin increased from £52 to £80 for the year under review, and on this basis the gross profits amounted to £7,022,000. To this has to be added the increase in the valuation of copper stocks amounting to £295,000. Interest earned and minor adjustments brought this gross profit to £7,574,000 compared with £4,900,000, equivalent to an increase of 55 per cent. Tax liability on this profit amounts to £2,410,000.

The appropriation to replacements reserve this year has been set by the board at £1,200,000 which compares with £750,000 appropriated in the previous year. The replacements reserve stands at £1,811,000 which is sufficient to cover all expenditure authorised by the board until June 30, 1960.

The appropriation to general reserve has been put this year at £1,300,000, compared with £1,250,000. This provision covers mainly certain capital payments in respect of participation in prospecting companies and the sums which we are committed to lend to the Federal Government in respect of development finance.

The balance available for dividend is £2,751,000. An interim of 1s. 9d. per share, less taxes, was paid last July. The board has now recommended a final of 3s. 9d. gross per share, less taxes. If this recommendation is accepted in general meeting, the total for the year will amount to 5s. 6d. gross per share, less taxes, an increase of 69 per cent over the total dividend for the previous year.

CHIBULUMA MINES LIMITED

Despite the strike, production in terms of ore was 513,000 tons compared with 485,000 tons the previous year. The grade fell slightly from 4.70 per cent total copper to 4.67 per cent.

Copper for the year from mine production amounted to 19,236 long tons. This compares with a total output for the previous year of 27,177 long tons, of which over 9,000 long tons came from a stock-pile of concentrate. Costs have been shown on a different basis from those of previous years, for reasons which I explained fully in my 1958 statement. The figures for the previous year are therefore not comparable. The costs for the past year averaged £144 per ton for all forms of copper.

The cobalt refinery at Ndola operated throughout the year except during the strike period, and continued to experience certain operating difficulties. In spite of this the cobalt matte production was 7,741 short tons compared with 6,645 short tons during the previous year. Costs on the new accounting basis, including freights, overseas costs, refining charges and mineral royalties, and after crediting revenue from the sale of 1,025 long tons of copper recovered as a by-product, averaged 13s. 3d. per lb of cobalt metal on a delivered USA basis.

Copper sales totalled 19,073 long tons at an average price of £217 per ton.

FINANCIAL RESULTS

The gross trading profit shown on the profit and loss account was £1,488,000. The net profit came to £1,345,000 as compared with £1,352,000 during the previous year.

The terms of our agreement with the United States Government oblige us to repay in each year metal to a value equivalent to 75 per cent of the previous year's net profits after adding back interest payable. During the past year we delivered cobalt metal to a value of £1,183,000, which was allocated firstly against accrued interest and secondly against redemption of loan capital. The loan was thus reduced at June 30th to a sum of £2,917,541. During the current year our obligation will amount to £1,130,000 worth of metal and we expect the loan outstanding at the end of June, 1960, to have been reduced to approximately £1,900,000.

The board this year has appropriated £200,000 from profits to replacements reserve. Of the balance of profit for the year, £1,150,000 has been transferred to general reserve.

TECHNICAL PLANS

The main technical development concerns the Chibuluma West scheme. During the year we announced that as a result of the discovery of ore some 8,000 feet to the west of the existing mine, we had decided to sink shafts, with a view to mining approximately 10,000 tons of ore a month, all of which would be treated through the existing mill. This development is expected to take four years to bring to completion, and to add 4,000 long tons of copper to the regular annual production of Chibuluma.

RHODESIAN SELECTION TRUST LIMITED

The total revenue for the year, which is represented almost entirely by dividends from Mufulira Copper Mines Limited, amounted to £1,746,000. Administration and sundry expenses reduced this figure to £1,631,000 compared with £915,000 for the previous year. There are no taxes payable on this income.

The board has appropriated the sum of £150,000 to general reserve leaving the free cash resources of the company approximately unchanged.

This leaves a sum of £1,566,000 available for dividend, after bringing in the balances brought forward from the previous year and certain tax adjustments from past years. An interim of 4d. per share, less Rhodesian taxes at 7s. 6d. in the £, was paid last July. The board has now recommended the payment of a final of 9d. gross per share, making a total for the year of 1s. 1d.

gross, costing £1,531,000, thus resulting in a balance of £35,000 being carried forward.

This total dividend compares with 7d. for the previous year.

BALUBA AND CHAMBISHI

The future of the undeveloped Baluba orebody also continues to engage the attention of the directors. The possibilities of opening up this orebody are being examined and include the possibility of integrating the operation with that of the neighbouring property of Roan Antelope.

The directors' report of the Chambishi company indicates that the question of the development of that orebody continues to be examined. The two main examinations are concerned with the possibility of starting development as an open-pit operation and the question of the metallurgy involved in the treatment of oxidised ores in the upper levels.

Prospecting in Southern Rhodesia is undertaken by Rhodesian Selection Trust Exploration Limited. This company has concentrated its main endeavours during the past year on copper exploration in the Lomagundi area. The results based on soil chemistry and pitting and some drilling are interesting and encouraging, but it is too early to say more than this.

CONCLUSION

In looking forward, it seems to me that the future prosperity of your companies, which are well endowed with ore reserves, with excellent plant and equipment, and with a first-class organisation, will depend on three major factors.

The first, and without doubt the most important, is the satisfactory evolution of the political future of the territories in which we operate. The second is the behaviour of the copper market in the years to come, and the ability of the industry to evolve production and marketing policies which will ensure that there is neither too much over-production with its consequential distressing effect on price, nor any excessive shortage with its equally distressing effect on prices and resultant loss of markets. The responsibility increasingly shown by the industry in this respect holds promise for the future.

The third factor is the ability of our mines to maintain costs at a viable level. Our geographical situation, and other factors over which we have no control, result in only about two-thirds of our costs being incurred on our mines and thus capable of being affected by the efficient plant or the good organisation to which I have referred. It is still sometimes believed that our mines are among the cheapest producers in the world. It is many years since this statement was true, and I have never hesitated to advise shareholders accordingly. The only assurance I can give is that we shall continue to regard our responsibility in this respect of this factor as among our foremost.

Of one thing I am certain, that the copper mines of central Africa are an indispensable part of the structure of modern civilisation and will be required to play an increasingly important part in the world's industrial developments for the foreseeable future. The energies of your directors will continue to be addressed to ensuring, as far as lies in their power, that these companies will play their full part in the development of central Africa and in the world copper industry.

The Chairman also commented briefly on the present and prospective political and economic situation in the Federation.

Expansion Policy to continue

The Annual General Meeting of Debenhams Limited was held in London on November 24. Mr. John Bedford, O.B.E., Chairman and Managing Director presided.

TRADING RESULTS

The Consolidated Trading Profit for the year ended 31st July, 1959, of £6,421,485 shows an increase of £615,977 on the figure for the previous twelve months. Approximately 85% of this profit is produced by Subsidiary Companies whose financial year ended in January. Although the year under review has not been free from difficulty as regards the consumer trade, the general improvement in the economy of the country, which permitted an easing of credit restrictions and a reduction in taxation to the benefit of both the business community and the private individual, had a stimulating effect and was reflected in a higher level of spending in our stores.

The net profits after taxation retained by Subsidiaries are £821,209 (practically the same as last year) and the amount available for appropriation by the Parent Company is £1,946,572 compared with £1,325,584.

DIVIDEND

The Directors recommend that a final dividend of 1s. 2d. per share be paid on the Ordinary Shares, making 1s. 8d. per share for the year against an equivalent 1s. 4½d. per share last year, the total net distribution being £1,322,919 compared with £980,907.

ACCOUNTS

In the Consolidated Balance Sheet practically all the major items show substantial increases.

The growth in the Group has been produced partly by enlarging its representation throughout the country and partly by the continuance of our development programme at a large number of existing stores.

FINANCE

It is the intention to make a rights issue of 2,600,623 Ordinary Shares at 20s. per share on the basis of one new Ordinary Share for every ten existing Ordinary Shares held at the close of business on the 31st October, 1959.

It is also the intention of your Directors to take this opportunity of implementing the proposals, whereby members of the Staff of the Group should be encouraged to become shareholders in the Company.

ADDITIONS TO THE GROUP

Three new businesses have been acquired: Edward Grey, Ltd., Birmingham (branches at Dudley, Walsall, Rugby, Leamington, Stourbridge and Worcester); L. F. Stone & Sons, Ltd., Romford; Frederic Corder & Son, Ltd., Ipswich.

BUILDING PROGRAMME

In 1960 extensions are planned at the following stores, Sherriff & Ward Ltd., Winchester; Busbys' Ltd., Harrogate; Ranby's Ltd., Derby; Bon Marche (Gloucester) Ltd.; Woolland Bros. Ltd., Knightsbridge; Style & Gerrish Ltd., Salisbury; Bobby & Co. Ltd., Worcester; Kennards Ltd., Redhill.

SUPERMARKET

Our first venture in the Supermarket type of trading was opened at Kennards, Croydon. Judging from immediate results there is every indication that the new enterprise will be a successful one, and plans are in hand for opening others in the near future.

STAFF

The scheme of employees' shareholdings is a desirable development in the history of the Company. The number of its shareholders is increasing yearly — the figure is now in the region of 51,000. The value of their holdings depends to a great extent on the skill and enterprise of the staff, and it is of utmost importance that their keenness should be encouraged by their being given an opportunity to obtain a stake in the Company for which they work.

CONCLUSION

Now that the rise in raw material costs has been halted we have been able to reduce the price of much of our own branded merchandise, which is of high quality and competitive in price. The resulting increase in sales has justified this action. The acceleration of our development programme and the expansion into the Chain Store field will, we believe, improve the efficiency and profitability of the Company. The sales for this year (excluding new businesses acquired), show a satisfactory increase over last year, which was a record year.

DEBENHAMS LIMITED

91, WIMPOLE STREET, LONDON, W.1

STANDARD-TRIUMPH INTERNATIONAL

RECORD PROFIT IN AN EVENTFUL YEAR

LORD TEDDER'S REVIEW OF ACTIVITIES

The fifty-sixth annual general meeting of Standard-Triumph International Ltd., will be held at 12 o'clock noon on December 16th at Fletchamstead Highway, Coventry.

The following is the statement by the Chairman, Lord Tedder, GCB, which has been circulated with the report and accounts.

The year under review has been most eventful; we have achieved a profit which is a record in the Company's history; we have introduced the Triumph Herald: we have disposed of our tractor assets to Massey-Ferguson and have terminated our agreement with them; we have carried out an internal reorganisation of the Company's group structure, and we have put in hand a considerable programme of expansion of our vehicle manufacturing facilities.

The consolidated profit of the Company and its Subsidiaries is £4,080,893, after depreciation and other charges amounting to £2,780,209. Provision for taxation takes £1,857,154, leaving a Group profit for the year, after taxation, of £2,223,739.

TRACTORS

On August 28, 1959, the Ordinary Stockholders approved the sale of tractor assets (excluding the plant engaged on producing tractor engines) to Massey-Ferguson in terms of my circular letter to Stockholders on August 5, 1959, for £14.9m. This sale gave rise to a capital profit of £5,016,910, out of which a capital distribution of 2s. 6d. per 5s. Ordinary Stock Unit was made on September 1, 1959, to members on the register on August 5, 1959. This absorbed £3,920,781, leaving a balance of £1,096,129 which is included in the Capital Reserves.

As part of the disengagement with Massey-Ferguson our agreement with them, which would have expired on January 1, 1966, was terminated on August 31, 1959. At the same time, they agreed to dispose of their holding of 7,757,938 Ordinary Stock Units in our Company to J. Henry Schroder & Co. Limited and Helbert, Wagg & Co. Limited, at a price of 5s. 9d. per unit, less expenses, ex the right to receive the distribution of 2s. 6d. per Ordinary Stock Unit. The Bankers in turn offered these Units ex the above right to the other Ordinary Stockholders of the Company at the same price of 5s. 9d., as of right, in the proportion of three Stock Units for every ten Stock Units held, applications for excess units being permitted. The Directors are gratified that Stockholders indicated their confidence in the future of the Company by substantially oversubscribing the offer.

Your Directors wish to record their appreciation of the services rendered by the Company's Accountants, Bankers, Lawyers and other professional advisers during the complex and protracted negotiations.

DIVIDEND RECOMMENDATION

Your Directors have given very careful consideration to the Ordinary Dividend distribution in respect of the year ended August 31, 1959, and have decided to recommend a repetition of last year's dividend of 12 per cent, less tax, which is covered over 3½ times by available earnings.

PRODUCTION

As part of the sale to Massey-Ferguson we agreed not to sell tractors until May 1, 1961, but we shall be free from restriction thereafter. This restriction does not apply to engines, where we have already secured contracts to replace a considerable part of the surplus capacity becoming available, and we are seeking to absorb the balance.

The output of cars and tractors rose from a combined total of 147,616 last year to 158,856 this year—a modest increase wholly attributable to cars. This production represents a total of about 650 units per working day. Car production alone is now running at almost 150,000 units per annum (some 600 per day).

Provided no unforeseen circumstances arise, we anticipate that before the end of 1959 we shall be making cars at the combined rate of cars and tractors during our last financial year.

We shall not have the additional facilities available to raise our output above this figure until the Spring of 1960, but from then onwards we shall be able to increase progressively to 180,000 per annum (735 per day).

It will not be possible during the current financial year completely to make up the shortfall caused by the loss of tractors. However, with the plans we have in hand for increasing our production as rapidly as possible, we shall not be far short of attaining our immediate objective which is to match last year's total unit figures.

EXPANSION

Over the past three years we have been unable to increase our car sales because we have been unable to get sufficient painted and trimmed bodies to meet our demand. The installation of the new body paint and trim plant at Canley, the purchase of the Coventry factory of Fisher & Ludlow and our acquisition of Mulliners are leading us to a position where, by the end of this year, this situation will have been rectified.

We are also approaching the limit of our existing final assembly facilities. In anticipation of this, your Board last year authorised a new plant due to come progressively into operation next year. This scheme, together with new administration offices which are necessary following the vacation of Banner Lane; new canteen facilities resulting from our greater concentration of employees at Canley; and the modernisation and development of our engine, gearbox and axle plant—to all of which we are fully committed—will absorb approximately £6m.

We now plan to extend further the pressing and body assembly side of the business and to increase our capacity beyond the rate of 180,000 units per annum.

CAPITAL AVAILABLE FOR EXPANSION

As you will see from the Consolidated Balance Sheet, the sale of our tractor assets leaves us with a bank balance of almost £14m after payment of the capital distribution on September 1, 1959.

We have since received some £3m for tractor stocks. Out of the £17m thus available we have paid off all tractor creditors, amounting to about £3m; we have to meet taxation liabilities amounting to about £4m in the near future and, as previously stated, we are committed to capital expenditure of £6m.

The Directors wish to emphasise that the balance remaining of some £4m is no more than is required, having regard to the further capital projects to which I have referred and the additional working capital which will be necessary.

INTERIM DIVIDEND

The expansion of car production, which was planned to replace the loss of tractor production, has proceeded more quickly than could have been anticipated when Stockholders were circularised last August. Accordingly, we decided to announce that, in the absence of unforeseen circumstances, it is our intention to pay an interim dividend of 5 per cent, less tax, in May, 1960.

EMPLOYEES' SPECIAL FUND

In order to conform to Inland Revenue requirements it is advisable to exhaust this fund progressively, and no allocation has therefore been made to it this year. In the meantime, the fund will continue to be applied to the objects for which it was created. We are now examining the best way to replace it, bearing in mind Government legislation in connection with retirement benefits, and, as a preliminary step, £50,000 has been appropriated to a special account for this purpose. Future provisions of this description will be dealt with as part of our costs and will not, therefore, appear as separate items in our Accounts.

TRIUMPH HERALD

I do not think that I need dwell upon the wonderful reception this car has received, not only from the public but from motoring correspondents both at home and throughout the world. We have had our development problems in building up production because we are undertaking, for the first time since the war, the pressing, body assembly, paint and trim of a motor car. There is no doubt, however, that with these difficulties largely behind us, we are about to reap the full benefits of the world-wide demand for this model.

OTHER MODELS

The Atlas Van, Vanguard Saloon, Estate Cars and Triumph TR3 are all in demand well beyond present capacity. An impression seems to be growing that we are relying solely on the Triumph Herald for our future production. This is not so as these other models still account for over 50 per cent of our current output, and we are increasing their production all the time.

EXPORTS

Our car exports last year were the highest ever recorded in the Company's history. Sales to the United States were 25,000. This year we anticipate raising the overall figure to the USA to 31,000. The TR3, so successful in Rallies, has now established itself as one of the world's greatest sports cars.

OVERSEAS MANUFACTURE

We are continuing to expand overseas. Plans have been approved for the building of a new assembly factory in Belgium to supply the Common Market countries, and work is to start immediately. In Italy we are now producing locally over 50 per cent of the Triumph Italia which has been enthusiastically received in that market.

The only other company to which I need refer is our associate in Australia. Its recovery following its reorganisation last year has been remarkable, and its Management are to be congratulated on their efforts.

COMPANY REORGANISATION

Although not completed until after the end of the year under review, I feel I must refer to the reorganisation that we have just put into effect. A "family tree" is included with the accounts which shows in graphic form our new structure. The rapid rise in output in the last months and the general increase in tempo of the organisation as a whole is in no small way attributable to the policy of decentralisation which we have adopted.

Our resources are now more effectively employed and we have gone a long way towards ensuring the continuity of a vigorous and youthful management team.

CONTRACTORS, SUPPLIERS, DISTRIBUTORS AND EMPLOYEES

On behalf of my colleagues and myself I should like to record our gratitude to our Contractors; to our Suppliers, to our Distributors and Dealers as well, for their help and co-operation in this eventful year.

I would particularly like to record my appreciation to and admiration of all employees of the Company, both staff and works, and especially to those who have been concerned in the great movement of plant and machinery at our Coventry factories following the sale of tractor assets. It is difficult to describe adequately what is involved in disintegrating an integrated production. All I can say is that many thousands of tons of car and tractor equipment, worth well over £6m—much of it extremely delicate—had to be uprooted, transported and resited. This was effected with little loss of production, but certainly with the loss of many leisure hours and was fully completed in under eight weeks.

It is such achievements as this which give me confidence that British Industry, and not least our Company, can and will successfully compete even though, as we all know, our industry faces tough world competition.

Copies of the Accounts may be obtained on application to the Secretary, Standard-Triumph International Limited, Coventry.

THE CEMENTATION COMPANY LIMITED

INCREASE IN TRADING PROFIT

The Thirty-ninth Annual General Meeting of The Cementation Company Limited will be held on December 16th at Grosvenor House, Park Lane, London, W. The following is an extract from the circulated statement by the Chairman, Mr A. R. Neelands.

The trading profit of the Group for the year under review, before charging taxation and before deducting pre-acquisition profits of a newly-acquired subsidiary taken to capital reserve, is £1,144,649 as compared with £1,031,640 last year.

We have transferred to general reserve £100,000, and £150,000 has been transferred to the general reserve of a subsidiary company.

Your directors recommend a dividend payment of 12½ per cent, as last year, on the Ordinary shares which, due to an increase in capital and a reduction in the rate of United Kingdom income tax, will absorb £244,043 against £215,625 last year.

On December 31, 1958, your Company acquired as a wholly owned subsidiary, by purchase of its issued Ordinary share capital, The Demolition & Construction Company Limited, a company well known in this country for its activities in civil engineering, building and demolition work. The offer made to, and accepted by, the shareholders of The Demolition & Construction Company Limited was five Cementation Ordinary shares of 5s. each for every two Ordinary shares of £1 each in Demolition & Construction. As a result of this acquisition the issued Ordinary share capital of your Company has increased from £3 million to £3,187,500.

The shares issued on the acquisition of Demolition & Construction rank for a full year's dividend and in order to make a fair comparison the full year's profit of Demolition & Construction has been included in the Group trading profit figure of £1,144,649. The part of the net profit of Demolition & Construction for the year ended March 31, 1959, earned in the nine months prior to its acquisition on December 31, 1958, has been transferred to capital reserve.

PARENT COMPANY AT HOME AND ABROAD

We took the opportunity offered to us some time ago of acquiring for the Commonwealth and certain other countries patent rights relating to Vibroflotation. This is a method of increasing the density and thereby the load-bearing capacity of granular materials not amenable to treatment by other methods, and we have now in progress a number of contracts at home and abroad using Vibroflotation, including one for the United Kingdom Atomic Energy Authority at the site of the new Winfrith Heath research station.

A further addition made during the year to the range of our specialist activities is soil stabilisation, a well-established method of soil compaction, with a wide application to highway engineering. In addition to work at home, we have contracts in Kenya and Rhodesia, and the interest being shown in adjoining territories indicates a promising future in this field.

In the United Kingdom our major civil engineering contracts at Cashlie in Scotland and at Nant-y-Moch and Ffestiniog in North Wales continue to make their scheduled progress. In South Wales we are still active on drifting work for the National Coal Board, and elsewhere we also have a number of worthwhile contracts of a more general nature in progress.

The volume of piling work being undertaken remains at its consistently high level.

The specialist services of the Cementation department remain in demand both at home and overseas.

BRITISH SUBSIDIARY COMPANIES

Demolition & Construction has had a successful year, and among recent civil engineering projects awarded are the Main Quay Contract at Teesport for the Tees Conservancy Commission, and works for the London County Council in connection with flood relief on the River Wandle.

John Thom Limited now includes our drilling department.

Quickset Water Sealers and Thermacoust have had a satisfactory year. Quickset's turnover and profit have increased considerably, both in its contracting and sales divisions: so also in the case of Thermacoust. Cementation (Muffelite) has maintained sales of Barrymount anti-vibration and shock mounts and the testing facilities afforded by the new laboratory at Hersham are attracting an increasing volume of work.

THE GEOPHYSICAL GROUP OF COMPANIES

In recent years the volume of exploratory work suitable for geophysical methods has decreased considerably. Pressure of competition has risen correspondingly and this, combined with heavy overheads necessarily incurred in the maintenance of expensive equipment has resulted this year in disappointing returns from Geoprosco, but we have confidence that conditions in those industries on which its success so largely depends will again turn in its favour.

COMMONWEALTH SUBSIDIARY COMPANIES

The overall position can be considered satisfactory. Our South African company has maintained its position and has returned an increased profit, despite the fact that during the year the general level of economic activity in South Africa has remained static or declined slightly.

The prospects for our Rhodesian company are equally good. At Mufulira we have obtained further contracts for mine shaft sinking from the Mufulira Copper Company, who are well pleased with our progress. Some road contracts, embodying soil stabilisation in Rhodesia and Kenya, have been obtained.

At Kariba the Company's work on foundation consolidation continues satisfactorily and is scheduled for completion in the autumn of 1960.

Our Canadian company shows good results.

As forecast last year, our affairs in New Zealand have suffered as a result of the Government's anti-inflationary measures, but it is pleasing to report that recently there have been strong indications of recovery and prospects for the future are encouraging.

LEEDS PERMANENT BUILDING SOCIETY

Mr Douglas Crockatt's Review of Record Year

The 111th Annual Meeting of the Leeds Permanent Building Society was held in Leeds on November 23, 1959. Mr Douglas Crockatt (The President) in the course of his speech said:

The one hundred and eleventh year of the Society's long history has been marked by outstanding progress. The Society has grown notably in size whilst its traditional financial strength has been even further increased.

We began the financial year under review with a satisfactory and regular flow of investment money from existing and new shareholders. This continued almost to the end of our financial year although latterly heavier withdrawals have produced a drop in the net inflow.

INTEREST RATES

The net intake of investment money into building societies is being affected by recent economic changes and by the continuance of the very high rates of interest paid in all forms of National Savings.

Last May the Building Societies Association, of which this Society has been a loyal member for many years, recommended an all-round reduction in interest rates. It proposed that the rate charged to owner-occupier borrowers should not exceed 5½ per cent, and that the interest paid to paid-up shareholders should not exceed 3½ per cent. So far as our existing members are concerned, we put these rates into effect as from October 1, 1959, giving due notice of our intention so to do.

Borrowers in the movement, hitherto paying 6 per cent, have good reason, of course, for satisfaction. A very few shareholders have not been prepared to accept the reduction of ¼ per cent., and have withdrawn their holdings. These form a small minority of our members, and it affords great satisfaction to the Board that so many existing investors continue to increase their holdings, and that new shareholders and depositors continue to come forward in great numbers.

LARGE INFLOW OF SAVINGS

We have taken into our shares and deposit accounts the sum of £26,089,000 and have paid out in withdrawals at short notice or on demand, the vast sum of £16,093,000 to our investors for their own purposes; we have also made cash payments of interest in total amounting to £1,339,000. These transactions resulted in a net increase in shares and deposit balances of no less than £12,537,000.

RECORD LOANS FOR HOUSE PURCHASE

The net inflow, added to the amount received in mortgage repayments, has enabled us to lend the vast sum of £20,092,542 in new advances.

This figure constitutes a record for the Society. It has been lent to the ordinary man-in-the-street to enable him to buy his own house. The proportion lent to those buying their own homes and upon houses in course of erection for owner occupation is no less than 99.91 per cent of the whole. Moreover only .74 per cent of the total mortgage debts in our balance sheet consists of sums exceeding £5,000. These facts emphasise the strictness with which this Society has kept to the true functions of a Building Society. They illustrate the socially beneficial operations of the vast majority of societies, which, like ourselves, remain true to their origins.

PENDING LEGISLATION

A few societies, with deceptively safe-sounding names, trading upon the fine reputation which building societies generally enjoy, operate in a way quite foreign to the traditions of the movement, frequently lending investors' money on speculative property deals or in industrial and commercial fields. It is clear that the time has come to check this misuse of the structure and name of a building society. We welcome the Government's intention to introduce legislation designed to this end. We hope that it will be clear, comprehensive and stringent.

TRUSTEE STATUS

The House Purchase and Housing Act 1959, which became law in June last, provides that deposits in societies conforming to certain standards of financial stability and practice will be accorded trustee status. The Leeds Permanent's Balance Sheet shows a measure of security of more than double the standard required, and the Society was accordingly included in the first list of societies officially approved for this purpose.

The House Purchase and Housing Act also provides that "designated" societies may apply for the loan of Government funds to enable them to lend more money than hitherto on houses built before 1919. It has not been necessary during the year under review to seek Government assistance in this way. Nevertheless, we have during the year advanced on houses completed before 1919 the sum of £1,569,000 nearly twice as much as we lent on similar properties in the previous year. We have not, however, relaxed those standards of selection which we think it proper to adopt when considering the older type of security.

ASSETS

The total assets of the Society at September 30, 1959, stood at £129,227,842. The increase during the year of £13,100,942 is a record one. The Society has doubled its assets during the last seven years.

STRENGTH IN LIQUIDITY

During the year our liquid resources have increased to £22,930,000 representing 17.74 per cent of total assets, as compared with 16.17 per cent. last year. The Society holds no investments which have no fixed date of redemption, nor any holdings redeemable only at the option of the issuer. No less than £9,000,000 could be realised at once or within one month.

VERY HIGH RESERVES

The recommendation of the Building Societies Association is that each member society should aim to *attain* reserves of at least 5 per cent of the current total assets. We have maintained reserves of more than 5 per cent for over twenty years, during which time the assets have increased from £33 million to over £129 million, and we have lent over £220 million to borrowers to enable them to own their own homes—an achievement of which our members may be justly proud.

The reserves today, taking into account an amount of £763,000 set aside for future taxation, and after writing down the Society's gilt-edged securities to market value, amount to more than £7,482,000, or 5.79 per cent of the total assets, 6.19 per cent of the Share and Deposit balances, and 7.14 per cent of the mortgage assets.

APPROPRIATIONS

Our year's operations resulted in a surplus of £524,612 compared with £401,000 last year. With the amount brought forward from last year, together with other income, provisions no longer required and now released, and postwar credits now brought in, the total transferable surplus amounted to £913,338. Of this sum, £650,000 has been appropriated to General Reserve, £94,199 has been written off the Society's investments, and the balance of £169,139 has been carried forward to next year.

Our post-war credits amount to £137,838 and now that they have received statutory recognition under the Finance Act, 1959, it is proper that they should be included and brought into our General Reserve.

The opportunity has been taken this year to write down our investments to market value. The sum involved on September 30 was £94,199, but all our securities are dated, and their value on redemption exceeds the value in the balance sheet by £150,000.

BRANCH OFFICES

During the year we have opened three new branch offices, at Belfast, Maidstone and Wakefield. New offices at Reading and Southport are nearing completion, and we own premises at Cardiff, Newcastle upon Tyne and Scunthorpe, where we hope to complete and open new branches during 1960.

THE LATE SIR CHARLES DAVIES

Immediately prior to our last annual meeting the Society suffered a severe loss in the death of Sir Charles Davies, a Director since 1935, our President from 1953-56 and General Manager from 1940-58. He has been much missed during the past year's work by his colleagues on the board and staff of the Society.

To fill the vacancy we have been fortunate indeed in the election of Brigadier J. Noel Tetley, DSO, TD, LID, DL.

We extend our warm thanks to our many agents in all parts of the country for their loyalty to the Society.

THE BRITISH MOTOR CORPORATION LIMITED

SUCCESS OF NEW MODELS

The eighth annual general meeting of The British Motor Corporation, Ltd., will be held on December 15th at Birmingham.

The following is an extract from the statement of the executive chairman, Sir Leonard Lord, KBE, circulated with the report and accounts for the year to July 31, 1959.

The motor industry is one in which the manufacturer has from time to time to face a period of fundamental change. In the financial year of 1958-1959 now under review we passed through such a phase, and one quite unprecedented for its extent and ramifications. Never before has your Corporation, its principal subsidiaries, or any of its British competitors, launched so many entirely new products in the short space of a year.

Therefore it is with considerable pleasure that I report our "Operation Change-Over" to have been pre-eminently successful. It began in September, 1958, with the announcement of the Austin A.40, and concluded, so far as the financial year was concerned, with the public release of the Austin A.99 in July last. Between these dates six other models were also released, namely, the Wolseley 15/60, the Austin A.55 Mark II, the MG Magnette Mark III, the Morris Oxford Series V., the Riley 4/68 and the Wolseley 6/99. All eight were entirely new models; each without exception won immediate public acceptance.

Such was the smoothness and efficiency of this operation that the loss of output compared with the previous year's record of 504,712 vehicles was only 4 per cent, and of the 486,048 vehicles produced in the year, 92,854 were new models. But for the wave of labour disputes which swept over industry in general and the motor industry in particular, we could have achieved simultaneously a record production and record change-over to new models.

In the last two months of the year we also introduced important improvements in the larger sports cars. We produced 44,889 sports cars in the year, of which 40,115 were exported.

The turnover of the Corporation for 1958-59 was £265 million to maintain the record level and resulted in the favourable figures shown in the Consolidated Profit and Loss Account. Accordingly, we have been able to propose a final dividend of 12½ per cent on the ordinary share capital as increased by the issue of three new shares for each ten held in April, 1959.

REVOLUTIONARY SMALL CAR

By far the most important investment completed and put into service in the year was the £10m devoted to establishing production facilities for a new small car of revolutionary design. Known respectively as the Austin Seven and the Morris Mini-Minor, no small car has ever had such a welcome as this one.

Production in the year under review was 486,048 vehicles. From August 1st until October 31st we made 147,309, and currently we are producing at the rate of 750,000 per annum. When the extra facilities become progressively available in eighteen months to two years the magical figure of 1 million units a year will be within our reach.

Apart from any unforeseen major international upheaval, profits can be expected to rise over the next two years. This, coupled with our existing resources, would appear to make it unnecessary to raise fresh capital.

This year 235,914 of our cars were newly registered in the home market, representing 39 per cent of the total registrations of new cars in Great Britain. Including light and heavy commercial vehicles, home registrations reached 302,398 units, which is highly satisfactory in a year of so much change.

This year's exports accounted for over 40 per cent of all vehicles produced by us, with total sales of 198,107 units compared with 214,005 in the previous year. The difference of 15,898 reflects availability of vehicles and not any dearth of orders. In fact, even before the advent

of the new models, export demand was very strong. The USA became even more dominant amongst our world markets.

The trend towards assembly in overseas markets and in some instances progressive manufacture, of which I gave warning in 1956, is significantly increasing. Today BMC cars are being assembled in thirteen Plants in eight countries, and are being manufactured to a substantial degree in three others, with projects well in hand for a further five.

Our prospects more than ever depend on united efforts to increase production, the avoidance of major dislocations of factory programmes and, in short, our ability to satisfy our eager customers in the least possible time. It is to that task that we are now devoting our energies.

THE WALL PAPER MANUFACTURERS LIMITED

ANNUAL GENERAL MEETING HELD 25th NOVEMBER, 1959

Welcoming stockholders to the sixtieth Annual General Meeting of the Company held at the Midland Hotel, Manchester, on Wednesday, 25th November 1959, Mr. A. Whittle stated that with increased sales the Company had achieved the highest profit in its history. After referring to the retirement from the Board of Mr. H. Kinder, after over fifty years' service, and of Mr. E. F. West, through ill-health, Mr. Whittle reported a gross profit for the year of £4,950,463, an increase of £878,586. Net profit after provision for taxation and minority interests was £2,245,076, compared with £1,659,214 the previous year. The Board recommended a final dividend to the deferred stockholders of 15%, making 20% for the year as against 18¼%.

Mr. Whittle stated that all the main sections of the Group had made substantial contributions to the final profit with almost all sections showing higher profits; those from the Walpamur, Sanderson and Canadian Groups were considerably greater.

The reserves of the Company built up over many years of prudent finance are being used to strengthen each group and current results show how effective the expansion has been. The Company's growth has been in two different directions; the first, the re-building or extension of almost all its many factories, merchant houses, retail shops, showrooms and research units; the second, the acquisition or setting up of sales outlets at home and abroad. The building programme now nearing completion will, when finished next year, have been spread over more than a decade. The extensions and modernising of the wallpaper factories have enabled the Company to meet the demand for wallpaper which has risen by about 50% in the last seven or eight years. The Walpamur and Sanderson Groups have greatly extended their net-work of distributive outlets whilst the retail shop organisation has grown by the acquisition of shops offered to the Company. The most recent addition, since the closing of the financial year, is that of S. & H. Morris Ltd., an old and well-respected chain of very large retail shops. Manufacturing and distribution abroad are steadily expanding; the Walpamur Company has many factories and depots in the Dominions and the Sanderson Group has acquired a number of long-established specialised houses in the Dominions and the U.S.A., experienced in the marketing of furnishing fabrics and wallpaper. The Canadian Group, after a year in which record profits were gained, has just purchased the oldest wallpaper manufacturing company in the U.S.A.—the Birge Company—whose products are known to the trade throughout the world. The Board is confident that this broad-based expansion overseas will, in time, substantially add to the Company's prosperity. Indeed, all the subsidiaries abroad are already trading profitably. The developments that will follow from the formation of the European Common Market and of the Outer Seven Group are being carefully studied and the Board is confident of meeting the challenging task of selling its products in these markets.

The holding of the price level, Mr. Whittle thought, was the leading economic event for business during the last year. The next national struggle will be that of increasing production. Higher production at lower costs is essential if full employment and wide social services are to be maintained.

On behalf of the stockholders, Mr. Whittle expressed thanks to the executives, staffs, and workpeople.

The report and accounts were adopted.

NEEPSEND STEEL & TOOL CORPORATION LIMITED

FULL ORDER BOOK

The thirty-ninth Annual General Meeting of Neepsend Steel & Tool Corporation Limited was held on November 24th at Neepsend, Sheffield, Sir Stuart C. Goodwin, DL, JP, LLD, the President, in the Chair.

The following is an extract from his circulated statement for the year ended March 31, 1959:

Since the end of our financial year we have purchased The Century Drill Works Ltd.

Last year I advised you that conditions in the Steel Industry might not be so favourable as in the year under review at that time. This certainly has proved to be the case, and it was only by stringent economies, etc., that we have emerged from this critical period without more serious repercussions upon our year's trading.

It is, therefore, with great relief that I am able to inform you that the depression of the late autumn of last year and early spring of this year has now receded and that practically all our firms are on full time with prospects of being exceedingly busy for a period ahead. Prices are necessarily keen to meet the competition of our foreign competitors, but with a full order book we can look forward with reasonable confidence and satisfaction.

The trading profits for the year before taxation have amounted to £1,105,196 as against a figure of £1,260,119 in the previous year.

The total of issued Capital and Reserves now amounts to over £5 million.

The report and accounts were adopted.

J. & F. STONE LIGHTING AND RADIO

The twenty-sixth annual general meeting of J. and F. Stone Lighting and Radio Limited was held on November 25th in London, Mr D. G. Nairn, OBE (the Chairman), presiding.

The following is an extract from his circulated statement:

For the year to June 30, 1959, the Group net profits before taxation amounted to £526,775. The outstanding event affecting your Group was the removal on October 28, 1958, of restrictions on hire purchase transactions. Thus, during the period from July to October, 1958, the Management was struggling against all the difficulties of trading under the restrictions which prevailed up to that date. The momentum of income collections from contracts entered into in earlier periods was running down, and those four months were indeed a difficult period from that point of view.

What happened when these restrictions were removed? From then to the end of the year we effected a substantial increase in turnover mainly through the medium of Hire Purchase and Rental agreements. The profit on this type of trading, however, takes time to mature.

Dealing with the accounts, the provision for taxation amounts to £246,000, and the net profit after tax is only some £28,413 less than it was in the preceding year.

I am not predicting a spectacular rise in profits in the current year, but on the indications at present before us, there should be an increase in profits in the year to June 30, 1960.

The report was adopted and a final dividend of 20 per cent making 30 per cent approved.

REGIS PROPERTY COMPANY

INCOME AGAIN EXPANDED

The twenty-first Annual General Meeting of Regis Property Company Limited was held on November 24th in London, Sir Aynsley Bridgland, CBE, the chairman, presiding.

The following is an extract from his circulated statement for the year ended June 30, 1959:

The reorganisation of the capital of the Company to which our late Chairman referred last year has now been completed but, subject to your approval, we propose to increase the Authorised Capital. I would emphasise that we do not intend to issue at the moment any fresh capital.

RESULT OF YEAR'S OPERATIONS

As forecast last year, our income has again expanded. The figure for Excess of Rents over Outgoings stands at £575,529 against £518,710 for the previous year. This is due to the receipt of increased rents on some leases of flats which became decontrolled by the 1957 Rent Act, as well as to further increases in rental from our office properties. Profits, subject to taxation, have risen by £67,098 to £244,354. Provision for Taxation has absorbed an additional £32,798, so that the Net Profit of the Group for the year is £120,021 as against £85,721 last year.

The increases in income from rents have by no means come to an end and it is expected that there will be further expansion over the next few years. Here I should like to remind shareholders that the increases in rents on our flats do not by any means compensate us today or for the years during which we have been compelled to subsidise our tenants. Rents are not yet sufficiently high to meet the increased costs of services, etc., which we have to pay. In other words, our rents on flats so far show only a very modest return on the capital invested. The 1939 Act stipulated that tenants were not to be placed in a worse rental position than that which obtained in that year. I have never been able to understand why the obvious corollary that landlords should not be worse off either did not apply. As it turned out this Company for nearly 20 years had to subsidise its tenants to a substantial amount each year for costs of services which it had to maintain under rent restriction and for which it could get no relief.

DIVIDEND RECOMMENDATION

Last year the Directors said that they expected to be able to recommend a dividend in a full year on the increased share capital at the rate of 8 per cent per annum. Your Board now recommends a final dividend of 3 per cent less income tax. This means that together with the two interim dividends already paid the total paid for the year is slightly better than the figure forecast.

We are constantly on the alert to increase our portfolio where further advantageous purchases can be made. Such purchases are not made by us on a basis of future hopeful expectations but only on a cold assessment of the facts as far as we can judge. Of the total book value for our properties of £11,403,298 shown in our Consolidated Balance Sheet no less than £8,862,209 is represented by freeholds—a very strong position. The report was adopted.

RHOKANA CORPORATION LIMITED

(Incorporated in Northern Rhodesia)

MINING PROFIT INCREASED IN SPITE OF STRIKE

GROWING IMPORTANCE OF INVESTMENT INCOME

MR H. F. OPPENHEIMER REVIEWS CHANGING CONDITIONS ON COPPERBELT

The 37th annual general meeting of Rhokana Corporation Limited will be held at Salisbury, Southern Rhodesia, on December 17, 1959.

The following are extracts from the review by the chairman, Mr H. F. Oppenheimer, which has been circulated with the annual report and accounts:

I feel sure that members will approve of the recommendation of the Directors that the share capital of the Company should be brought more into line with the total amount permanently employed, by utilising £22.5m. of the "profits appropriated for capital expenditure" to allow a capitalisation bonus issue of nine fully paid ordinary shares for each ordinary and "A" stock unit held.

Large appropriations from profits to provide for annual capital expenditure have been made over many years and by June 30, 1958, these totalled £28.8m. It has been decided to transfer the balance of £6.3m. available after providing the £22.5m. required for the capitalisation issue to writing down the fixed assets of the Company, which after deducting depreciation and the amount of £6.3m. stand in our books at £14.8m.

At the forthcoming annual general meeting, members will be asked to pass resolutions increasing the nominal capital of the Company to £26.5m., and to approve the capitalisation of £22.5m. so that the new shares may be issued early in the new year.

COPPER PRICE

By the beginning of our financial year, the price of copper on the London Metal Exchange had risen from the low levels ruling during the early months of 1958 to just over £200 per ton. The steady rise in prices was accelerated by the strike on the Northern Rhodesian Copperbelt from September 12 to November 4, 1958, and by the steps taken by many of the large producers to cut their outputs so as to bring copper production into line with consumption.

The price was thereafter generally well maintained between £220 and £250, as many consumers at this time also built up inventories against the possibility of strikes in the United States. These eventually began in August, 1959, and resulted in a reduction of over 80 per cent of America's normal production of copper, but the effects of the steel strike on American industry, together with the large stocks of copper which had been built up, assisted in maintaining the price of copper within the pre-strike limits.

There is, however, no doubt that by now the world stocks of copper have been appreciably reduced, but Chilean production has now been resumed, and provided American conditions are soon restored to normal, there is no reason to believe that there will be a real shortage of copper.

PRODUCTION

Although a high level of production was achieved at our mine in the second half of the financial year, it was not possible to make up the full amount of copper lost during the strike of our European daily paid employees at the end of 1958, and our finished production for the year was 13,000 tons less than our programme of 90,000 long tons. However, because of an increase of £38 per ton in the price we received for our copper the profit from mining operations was considerably greater than the previous year.

Good progress has been made during the year at the No. 2 Shaft at Mindola, which is expected to start hoisting ore in the first quarter of 1960, and which will permit greater flexibility in our mining operations. Intensive research in our laboratories has enabled our consulting engineers to design an improved process for the extraction of cobalt which will reduce the cost of production. The revised process should be in operation early in 1960.

INVESTMENT INCOME

This year our net income from investments was again greater than the profit from our mining operations. This focuses attention on the very large share interest which we have in Nchanga Consolidated Copper Mines Limited and Mufulira Copper Mines Limited, from which our dividend revenue arises. As we also have a major stake in Bancroft Mines Limited and Chibuluma Mines Limited, from which in due course we can expect satisfactory dividends, our income from dividends and interest should form an increasingly important proportion of our total income. We are also interested in Baluba Mines Limited and Chambishi Mines Limited where large copper deposits have been proved and which will in due course be opened up, and we have a stake in a number of exploration companies.

Rhokana Corporation is therefore a large investment company as well as an active mining company, and over the past few years we have been able to follow up our investments and, at the same time, place the company in a sound cash position to provide its share of the capital which will be required for this purpose at a later date.

This year an amount of £500,000 was transferred to general reserve, which now stands at £5,500,000 and, at the same time, we have been able to recommend a final dividend of 32s. 6d. net per £1 unit of stock which, together with the interim dividend of 7s. 6d., makes a total dividend distribution of 40s. net per unit for the year.

Conditions on the Copperbelt have changed very rapidly since the copper mines were originally discovered and, as local and government authorities are now able to provide most of the services at present run by the mining companies for the benefit of their employees, we have been endeavouring to find a means whereby we could hand over such services and amenities to the proper controlling bodies and to bring about a greater degree of integration between the Kitwe Municipal Council and our own Nkana Mine Township. One important step was the introduction of the home ownership scheme in 1957 for our European employees.

We have also provided a number of benefits and services for our African employees, and it is our aim, whenever it is possible to do so within the limits set by the complex conditions and circumstances of the Copperbelt, to establish the same rights and privileges for our African employees as for our European. We hope therefore to be able to announce shortly a scheme for home ownership for our African employees and, although it will take time, we are hopeful that it will be possible for all our employees to be able to take a full share in the provision and running of the services and amenities which are part of an established civic community.

Copies of the annual report and accounts may be obtained from the London office of the Corporation, 40 Holborn Viaduct, E.C.1.

PICKFORD, HOLLAND & COMPANY

EFFECT OF RECESSION IN STEEL TRADE

The annual general meeting of Pickford, Holland & Co. Limited was held on November 19th at Sheffield, Mr Ronald Steel (the chairman) presiding.

The following is an extract from his circulated statement:

Shareholders are well aware that steel manufacturers are our most important customers and that during the year under review there has been a serious recession in the steel trade. This has inevitably resulted in a substantial reduction in our turnover and consequently in our trading profit. The recession has been specially felt in those districts where ingot production is most dependent on the shipbuilding and structural steel using industries, and this has had a serious effect on our Crook works. In May we were unavoidably compelled to close down the tunnel kiln at these works after large stocks of basic bricks had been built up to meet immediate orders.

In South Wales the output of steel was less affected by the recession and consequently our works at Blaenavon showed a considerable improvement on the previous year. Here a highly efficient fully automatic brick press which we ordered in December 1956 started production after the financial year end, and these works are well able to take advantage of any likely increase in local demands.

Now as regards the future and the dividend distribution, if it had been necessary to make a decision this summer we should have been compelled to recommend a reduction in the basic rate of dividend previously paid. But steel production for July and August, although 10½ per cent down on similar months in 1957, is well above the 1958 level and most of our customers feel convinced that steel output will continue to rise; so it is reasonable to hope that they may be reaching the end of their high stocks of refractory bricks and that their demand upon us for the rest of this financial year will be commensurate with the increased ingot output which they all anticipate. Moreover, the tunnel kiln at Crook has been lit up and production started again in the middle of September. Therefore your directors consider that we should refrain from altering the basic rate of dividend and hope that the general optimism prevailing will be reflected in an increase in our trading profit during the first six months of 1960. They cannot however recommend the payment of the usual bonus of 2½ per cent.

The report and accounts were adopted.

RHODESIAN ANGLO AMERICAN LIMITED

(Incorporated in Northern Rhodesia)

COMPANY WELL EQUIPPED TO CONTINUE ACTIVE INVESTMENT POLICY

MR H. F. OPPENHEIMER REVIEWS DEVELOPMENTS IN THE FEDERATION

The 30th annual general meeting of Rhodesian Anglo American Limited will be held at Salisbury, Southern Rhodesia, on December 17th, 1959.

The following are extracts from the review by the Chairman, Mr H. F. Oppenheimer, which has been circulated with the annual report and accounts:

The year since my last statement has been an eventful and important one for the Federation of Rhodesia and Nyasaland and therefore for our Company, whose prosperity must tend to reflect the state of the Federation's economy.

THE FEDERATION

We have seen the crisis in Nyasaland and a state of emergency declared in all three territories; the recovery from the low levels of early 1958 in the price of copper and other metals on which the economy is largely based; the long strike on the Copperbelt; the completion of the great Kariba Dam from which power will flow at the beginning of 1960; and the correction of the adverse balance of payments position.

The low price of copper, which touched £160 early in 1958, came at a time when imports were running at a high level, and it was necessary to impose restrictive credit measures. These measures, together with rising prices for copper and other exports, brought about a rapid improvement, which was, however, temporarily checked in October, 1958, by a strike on the Copperbelt. This lasted 54 days and not only seriously affected the output of the copper mines but restricted business activity in the Federation.

The dispute was resolved by the adoption of the proposals of Sir Frederick Leggett, who was invited to the Copperbelt by the Northern Rhodesian Government at the request of the copper-mining companies and their employees, but it was not until May, 1959, that his recommendation that a joint industrial council should be formed was implemented. This council, which consists of employer and employee representatives, should allow matters affecting European daily paid employees to be discussed in an atmosphere of mutual confidence and goodwill, and I am hopeful that it will create a relationship in which fear and suspicion will have no place. This is particularly important as during the years ahead the desire of our African employees for legitimate advancement in the industry will require a practical and level-headed approach.

The progress of the Federal economy was fortunately only temporarily curtailed and, with the improvement in the balance of payments, it was possible for the Government to remove all the credit restrictions and to proceed vigorously with their development plans; these plans are of the greatest importance in paving the way for the raising of the standards of living of the people in the more remote and less prosperous areas of the Federal territories.

We therefore welcome the news that an Industrial Development Corporation is to be established in the Federation next year, and we have offered to contribute to its capital. It is hoped that this Corporation will be active in promoting manufacture for the home market.

ACCOUNTS

Our own accounts for the year reflect an encouraging advance on last year. Our net profit after taxation was £3,854,213, an increase of more than £1 million on the previous year. We have transferred the sum of £500,000 to general reserve, which now stands at £4,500,000.

We have also been able this year to recommend a final dividend of 3s. 9d. per stock unit (net) on the increased capital, which, with the interim dividend of 1s. 3d. per unit (net), makes a total of 5s. for the year, an increase of 1s. on the total dividend for the previous year.

Our investments, which are virtually all in the Federation, were valued at the year end (at market prices or at cost where unquoted) at £63 million. At the end of October this figure had risen to £87 million. Our cash resources place us in a strong position to continue an active investment policy in mining, exploration and industrial enterprises.

Recently the cash copper price on the London Metal Exchange has been more than £250 per ton, the highest figure it has reached for over two years. Chilean production, however, has now been resumed and provided American conditions are soon restored to normal, it is improbable that there will be a real shortage of copper. This is important as it is essential that copper should be freely available at prices which are fair to both producers and consumers if its use is to continue to expand.

Rhokana Corporation and Nchanga Consolidated Copper Mines both declared substantially increased dividends last year, and each company at its year end, in order to bring its equity capital more into line with the capital employed in the business, made a capital bonus issue.

Bancroft Mines resumed production as planned on April 1, 1959, after a year's interruption, and current operations and development at the mine are entirely satisfactory.

Revenue from sales of Rhodesia Broken Hill's lead and zinc production continued to be affected by the relatively low prices for these metals, and the profit for the year ended 31st December, 1958, was substantially below that for the previous year. An improvement in prices, particularly of zinc, had, however, already begun last year and, as this trend has continued during the current year, profits for 1959 can be expected to show some recovery.

In Broken Hill's last annual report reference was made to the possibility of installing the Imperial Smelting Process which would materially improve the recovery of lead and zinc not only from currently produced ore but also from stockpiled material at present untreatable. Careful investigations have been continued into all the technical and financial aspects of the installation of this plant and I am hopeful that the process will be adopted.

With the continued upward trend in the world's industrial activity, particularly in Europe, our major investments should show increasing returns over the next few years, provided that the political progress of the Federation continues satisfactorily.

The Federal Government has demonstrated that it has a real desire to implement its policy of racial partnership, and it is encouraging that the Europeans in Rhodesia have not allowed the violence and disorder which occurred in Nyasaland to cause them to deviate from a courageous and determined attempt to set a new pattern in Africa. My confidence in the economic stability of the Federation has been reinforced, and I believe that if the political problems there continue to be tackled with commonsense, patience and human sympathy, this great experiment in Central Africa will succeed.

Copies of the annual report and accounts may be obtained from the London office of the company, 40, Holborn Viaduct, E.C.1.

THE INDUSTRIAL FINANCE AND INVESTMENT CORPORATION, LIMITED

DIVIDEND INCREASED

MR J. N. BUCHANAN ON THE SATISFACTORY OUTLOOK

The thirty-fourth annual general meeting of The Industrial Finance and Investment Corporation, Ltd, will be held on December 17th at 82, King William Street, London, E.C.

The following is the statement of the chairman, Mr J. N. Buchanan, DSO, MC, which has been circulated with the report and accounts for the year ended June 30, 1959:

In considering the accounts now before you, it is of interest to recall that in 1953 the Ordinary share capital of the company was £625,000 compared with £1,160,000 at June 30, 1959. Out of the difference of £535,000 no less than £415,000 has been produced by capitalisation of reserves; nevertheless, the Group Reserves and Profit and Loss carried forward today amount to £510,000. The latter figure, of course, disregards the difference of £1,190,000 between the market value of quoted securities and the values at which they are carried in the books of the Group.

Since the date of the Balance Sheet, an issue of 290,000 Ordinary shares at 30s. per share has been made, which will add a further approximate £140,000 to Share Premium Account.

RECENT INVESTMENTS

Shareholders will remember that in March, 1958, we acquired all the issued shares of Star Investments, Ltd, which company held all the issued shares of Dawnay, Day & Company, Ltd. The increase in the cost of shares

in subsidiaries from £594,887 to £1,087,035, shown in the holding company's balance sheet, is no more than a transfer of the shares of Dawnay, Day & Company, Ltd., from Star Investments, Ltd., to The Industrial Finance and Investment Corporation, Ltd.

In the circular sent to shareholders on July 1, 1959, it was stated that through a subsidiary the company had purchased a controlling interest in certain hire-purchase finance companies and a business factoring ball and roller bearings. These acquisitions took place in the latter part of the financial year and, in consequence, the profit shown only reflects the situation over a short period. Meanwhile, further investments in hire-purchase finance companies have been made from which satisfactory developments are expected.

FINAL DIVIDEND

In considering the final dividend recommended of 3 per cent on the Ordinary share capital as at November 23, 1959—making 10 per cent for the year to June 30, 1959—it should be borne in mind that this payment makes a total of 10½ per cent for the year on the capital actually paid up during the year under review, as against 9¾ per cent for the previous year. A sum of £100,000 has been added to Investment Fluctuation Reserve and the amount carried forward on Profit and Loss Account has been increased by £9,000. So much for 1958-59.

HIGH LEVEL OF ACTIVITY

During the first four months of the current year (1959-60) activity has been at a high level and a number of interesting financial transactions have been completed, with further propositions in course of negotiation.

Provided the present enthusiasm for economic expansion and well-being is tempered with reasonable restraint, your company can look forward to another satisfactory year.

THE ROVER COMPANY LIMITED

SUCCESSFUL MODEL CHANGES

The sixty-fourth annual general meeting of The Rover Company Limited will be held on December 17th in Birmingham.

In the course of his circulated review the Chairman, Mr S B Wilks, states: During the last two years we have changed our whole range of models by introducing the Series II Land-Rovers and the new 3-litre Rover car besides making radical changes in our existing car range which now consists of two models, the Rover "80" and the Rover "100." This changeover is now complete and the reception accorded to these new models and the size of our order book augur well for their future success.

Mr Wilks then reviews the progress of their overseas companies and, after referring to the financial results for the year, continues: The outlook for the motor industry and for industry generally in this country appears to be one of expanding prosperity, and we have plans in hand for increasing our production capacity so that we may share in this expansion.

We cannot, however, afford to be complacent. The future outlook in Europe is very uncertain. It is too early to forecast what effect the new American "compact" cars are likely to have on the British motor industry generally and this Company in particular. These "compact" cars will clearly be far better suited to many of our principal export markets than the larger cars at present being manufactured in America, and it is quite possible that with the gradual removal of restrictions on dollars we shall be faced with increasing American competition.

At home there seems to be a real risk that in the next year or two industry may be subjected to great pressure to pay higher wages without any assurance of a corresponding increase in productivity. This was undoubtedly one of the major causes contributing to the financial crisis in 1957 and a repetition of that situation, particularly if accompanied by a continuation of the succession of unofficial strikes which the motor industry has experienced recently, would seriously affect our ability to hold our place in export markets.

The dividend is increased to 27 per cent and a share for share scrip issue is proposed.

IND COOPE LIMITED

NET PROFIT RISES BY £444,300

MR EDWARD THOMPSON EXPECTS GOOD CONDITIONS TO CONTINUE

Profits.—The net profit of Ind Coope Limited for the year, after allowing for depreciation and paying loan capital interest and taxes, was £2,122,853, including £242,369 Taylor Walker's net balance. This compares with £1,678,562 in the previous year.

Dividend.—The total dividend for the year to August 29, 1959, is 15½ per cent, compared with 14 per cent for the previous year.

Here are some highlights from the Annual Report to the Group's shareholders by Mr Edward Thompson, MBE, TD, their Chairman:

Trading Pattern.—"The Profit of the Ind Coope group for the year to August 29th shows a welcome return to the upward trend of recent years, after the setback in 1957-58 . . . there seem to be sound reasons for believing that our industry is beginning to trade in more favourable conditions than it has enjoyed at any time since the period shortly after the war.

Three Leaders.—"We have Britain's three best selling beers in their own particular markets—Double Diamond, Skol Lager and Long Life canned beer.

"Sales of Double Diamond have now recovered after a slight falling away during the trade recession.

"Skol is now established as the leading lager brewed in this country and the public has accepted that its character and quality compare favourably with the best Continental lagers.

"In the canned beer market, Long Life has also established the paramount position. Sales during the summer months and since then have increased to our fullest expectations.

The Future.—"Your Board and Management are looking forward this year to what will probably be a period of consolidation after the Group's rapid growth and development in recent years.

"Trading conditions in the country generally are certainly better than they were at this time last year. This, together with the benefits of the Budget concession in reducing the price of beer, provides good reason to hope that the present good trading conditions will continue."

PRETORIA PORTLAND CEMENT COMPANY LIMITED

(Incorporated in the Union of South Africa)

The Sixty-fourth Ordinary General Meeting of Shareholders will be held in Johannesburg on 4th December.

The following is an extract from the circulated Statement by the Chairman, Mr B G Twycross, dated 13th November, 1959:—

TRADING RESULTS

At £858,040 the trading profit on cement was £232,622 higher than for the previous year. This improvement, in spite of a rising cost structure, was due to an increase in sales and a revision in the selling price of cement referred to in my Statement to Members last November. Investment Income and Interest showed an appreciable increase due principally to the inclusion of a non-recurring amount of £86,947 in respect of dividends declared by the associated Companies.

As required by the Price Control authorities, £252,864 was appropriated from profits and placed to the credit of Fixed Assets Replacement Reserve, and from this Reserve an amount of £352,864, representing part of the cost of replacing fixed assets during recent years, was transferred to General Reserve. In addition, an amount of £297,136 was appropriated from profits to General Reserve, which now stands at £3,100,000.

TAXATION

Capital Expenditure in recent years has resulted in the Company receiving substantial initial and other depreciation allowances for tax purposes. The incidence of these allowances in this year's Accounts consequent upon the coming into operation of the new plant at Slurry, is reflected in the provision for taxation being only £12,445 more than for the previous year, despite a higher trading profit.

There is therefore a contingent liability for future taxation, and the desirability of establishing a provision for deferred taxation in next year's Accounts is under consideration.

CAPITAL EXPENDITURE

Slurry factory.—The new dry process plant has operated satisfactorily during the year under review. Plans for the installation of a second dry process unit are complete.

SUBSIDIARY AND ASSOCIATED COMPANIES

The Eastern Province Cement Company Limited showed a satisfactory profit for the year.

The Premier Portland Cement Company (Rhodesia) Limited increased its shareholding in Chilanga Cement Limited. In order to finance this transaction, the Premier Company issued 285,439 of its reserve shares at 39s. The fact that your Company did not participate in this issue is reflected in the Consolidated Accounts, in that the Premier Company is now no longer a subsidiary of your Company.

Although production was well maintained by the Premier Company, there was a slight decrease in sales of cement owing to the completion of the Kariba dam wall and the general decline in building activities in the Federation.

The Cape Portland Cement Company Limited reported an increase in its trading profit, due to the increase in the price of cement and sales.

EASTWOODS LIMITED

SIR THOMAS MOORE FORESEES FURTHER PROSPERITY FOR BUILDING INDUSTRY

The thirty-ninth Annual Meeting of Eastwoods Limited was held on November 19th in London.

Sir Thomas Moore, Bt, CBE, MP, chairman, in the course of his speech said:

The trading profit of the Group for the year to March, 1959, was £1,078,000, which is £106,000 above the comparable figure for the preceding year. Nevertheless, our last financial year was a difficult period for most sections of the building industry. Competition was intense, profit margins on many of our commodities were cut very fine and building contractors were taking longer credit.

Government policies for stimulating activity in the building industry were not felt to any marked degree until the spring of this year, but when the fine weather started last February there was a big upsurge in activity which was widened and gathered momentum throughout the summer and indeed right up to the present time

However, the impact of demand has again been felt in varying degree by different sections of the industry. First and foremost, the brick industry came under intense pressure for supplies very early in the year and has responded magnificently to this challenge. Nevertheless, the delivery dates for common bricks have unavoidably lengthened as the demand increased but it is expected that supplies will be more plentiful next year.

Our own Fletton and Stock brick works are producing at the absolute limit of our manufacturing capacity and so far this year have both made and sold more bricks in the seven months to the end of October than ever before in the same comparable period.

The demand for cement this year is also again expanding very satisfactorily after the standstill experienced in the previous 12 months. We are confident that this strong demand will continue, since, quite apart from the greater volume of building generally, the roads programme is at last being pushed forward at a pace more in keeping with the needs of a rather desperate situation.

The demand for the other building materials we produce, including concrete tiles, concrete pipes, and sand and ballast has also been at a higher level than in the previous year.

But in spite of all this increased trading activity and pressure of demand the cement industry and Fletton brick industry have contributed much to the price stability of the building industry. The price of Portland Cement has not been increased since July, 1957, and the last increase in the price of Fletton bricks took place in April, 1957.

Now that the same Government have happily been returned to power with their hands strengthened and policies approved, we can look forward to a continuation of steady progress and well-founded prosperity in the building industry for some years to come. It is apparent that the greatest danger to our prosperity on the home front could arise from unjustified wage demands unrelated to increased production or prosperity, and inflation could, if allowed to get out of hand, again threaten all the hard-won gains of the past year.

The report and accounts were adopted.

INDUSTRIAL DEVELOPMENT CORPORATION OF SOUTH AFRICA LIMITED

The Twentieth Annual General Meeting of the Industrial Development Corporation was held on November 24th under the Chairmanship of Dr H. J. van Eck. The Corporation was established on October 1, 1940, and has an issued capital of £58,200,000.

An amount of £3.6 million was involved in the 24 applications for financial assistance which the Corporation had accepted during the year ended June 30, 1959. Repayments and redemptions received in this period amounted to £1,930,000.

Net profits before tax showed an increase of £24,000 over the 1958 figure and amounted to approximately £575,000, the highest hitherto achieved; £500,000 had been appropriated to General Reserve, which now stood at £2 million. Investments on June 30th totalled £64,800,000.

In referring to Recon Investments which was now the holding company for the Amato Group, Dr van Eck stated that commendable progress had been made and the Scheme of Arrangement for the Group which had been approved by the Courts in December, 1958, had been justified. There was every indication that the prospects of the creditors were already improved by comparison with what the position would have been in a forced liquidation.

Important developments with which the Corporation had been associated during the year included its participation in SAFMARINE, as a result of which control of that Company had been established in South African hands, the successful conclusion of negotiations for a credit loan of $8½ million (about £3 million) from the Chase Manhattan Bank of New York and the establishment of the Phillips Carbon Black Company at Port Elizabeth in collaboration with the Phillips Petroleum Company of Bartlesville, Oklahoma. It was expected that the new company would in due course be in a position to meet the Union's total consumption of carbon black which was used with rubber in the manufacture of motor tyres. All our requirements of carbon black were at present imported.

The textile industry had again had a difficult year, but the outlook was now brighter as a result of the realistic duties on imported textiles which had recently been introduced. Both The Good Hope Textile Corporation and Fine Wool Products were extending their operations in view of the more encouraging prospects in the industry.

The Corporation's Annual Report commented on the medium-term facilities being given to the exporter in many overseas countries through specialist organisations, with Government backing. The individual firm in South Africa had to rely on its normal facilities to finance exports, often involving extended credit. The IDC was in a position to undertake this type of business where the period involved was more than a year and as such usually outside the normal scope of the Accepting and Commercial Banks. In Dr van Eck's view the substantial relaxation of import control in 1957 was one of the primary braking factors on the Union's development. This resulted in a flood of imports in that year to a value of some £80 million more than in the previous twelve months. The Report also referred to the necessity for improving the productivity of the individual wage-earner if our ultimate goal of raising real earnings was to be achieved.

STOTHERT & PITT LIMITED

The 76th annual general meeting of Stothert & Pitt, Limited, was held on November 16th at Bath.

Mr R. A. Riddles, CBE (the chairman), presided and, in the course of his speech, said:

The trading profit for the year is satisfactory and completed sales reached a new record figure. All departments were fully employed during the year.

The profit margin has fallen slightly and in the increasingly competitive trading conditions which now exist, I feel that the way to increase profits in future years will be to increase turnover—not a simple matter, but a policy we shall pursue with energy and determination.

The progress made in the year under review represents a very solid achievement. This year it is more difficult than ever to prophesy with any measure of exactitude the prospects for the future. Overseas trade has always represented a very substantial portion of our business and here German and Japanese competition is increasing, largely due to lower labour costs and the granting of longer credit facilities.

Our order book in the Crane Section is less than it was a year ago, as unfortunately output has not been matched by the volume of new orders. Our position is strong and healthy and we are exerting the maximum possible effort to secure orders arising from the general upward trend which is now becoming discernible.

The report was adopted and a total distribution of 20 per cent approved.

CORONATION SYNDICATE LIMITED

The fifty-fourth annual general meeting of Coronation Syndicate, Limited, will be held in Johannesburg on December 17th.

The following is an extract from the circulated review of the Chairman, Mr S. F. Dench:

Your Company's subsidiary, Homestake Gold Mining Company Limited, abandoned seven of the claims held at the Tbekwe Mine. The other subsidiary, Arcturus Mines Limited, acquired and pegged a further 20 Gold Reef Claims. These were the only alterations to your Company's properties.

After charging £35,262 for depreciation, the net profit earned by the Group for the year, as reflected in the Consolidated Profit and Loss Account, amounted to £186,696 as compared with £183,061 for the previous year.

An amount of £52,766 has been provided for taxation and £40,000 has been transferred to General Reserve. Dividends, including dividend No. 15 of 4d. per share, totalled 7d. per share and accounted for £93,917. There remains an unappropriated balance carried forward of £18,415 as against £18,402 brought in from last year.

Muriel Mine: The working profit at the mine was £123,024, which was £4,377 higher than for the previous year. Working costs were 59s. 11d. per ton milled against last year's figure of 60s. 3d.

Exploratory work continued on the exclusive prospecting area adjacent to the Muriel Mine.

Arcturus Mine: The working profit, at £105,020, before charging depreciation, was down by £3,947 on that for last year. The rise in working costs, from 49s. 8d. in 1958 to 50s. 10d. per ton milled in the year under review, is due to the increase in development footage.

THE NATIONAL BANK OF AUSTRALASIA

(Inc. in Victoria)

MAINTENANCE OF GENERAL PROSPERITY

The Ordinary General Meeting of The National Bank of Australasia Limited was held on November 25th in Melbourne.

Mr H. D. Giddy, the Chairman, presided and, in the course of his speech, said:

Our Balance Sheet totals, £334 million, are £21 million higher and are an all-time record.

The year has produced an increase of £19 million in deposits and a decrease of £7 million in advances. Gross earnings were £430,000 higher, but working expenses increased by £436,000. However, a reduction of £63,000 in taxation provisions permitted an increase of £57,000 in net profit, and for the first time this figure exceeded £1 million.

The banking legislation passed by the Federal Parliament early this year was given Royal Assent in April last, and for the first time in the history of the Commonwealth there is to be established a true Central Bank unfettered by ordinary commercial banking responsibilities. The Central Bank is to be called the Reserve Bank of Australia and will have its Head Office in Sydney.

Further evidence of the trend towards greater maturity of our Banking System and financial structure was provided in February last, when the Central Bank decided to support, under certain conditions, a limited number of authorised dealers in the development of an official short-term money market. Another interesting step is the legislation recently introduced into the Federal Parliament to provide for the issue of Seasonal Treasury Notes. In addition to these important developments, private enterprise has established during the past year more facilities for the provision of long-term finance.

These developments in our money market provide an expanded field for investment and give further opportunities for many more of our own people and overseas friends to have a real stake in our financial and industrial growth.

It seems reasonable to conclude that, over all, Australian business and industry should be more active in 1959-60 than during 1958-59. All this is highly desirable, provided that as a people we continue to make our savings and are sufficiently wise not to dissipate the success achieved over recent years in bringing the economy back to a sounder basis.

There still is unused productive capacity available to cope with the greater volume of purchasing power. Without making proper use of our potentials in this direction, we could easily pay the price of further inflation.

This is the one unhappy possibility in what appears otherwise to be a promising outlook. Given reasonable cost and price stability, a further improvement in our real standard of living could be expected.

In his report on domestic matters, the Chairman states:

Fifteen new Branches and thirteen Receiving Offices were opened during the year, and we operated at 860 points in Australia, one in Papua and three in London on September 30, 1959.

The report and accounts were adopted.

COBALT DEVELOPMENT INSTITUTE

The Cobalt Development Institute, which groups the world's leading cobalt producer companies, held its fourth Annual General Assembly in Brussels, on November 9, 1959. Mr H. Robiliart, Managing Director of the Union Minière du Haut-Katanga and Chairman of the Cobalt Development Institute, presided. The Assembly examined and approved the activities and financial management of the "Centre d'Information du Cobalt" (CIC) which, as is well known, is the executive organisation for the Institute.

Mr V. Van Vinckenroy, CIC Managing Director, outlined the Centre's present activities and submitted the 1960 research programme and budget proposals which were unanimously approved by the Assembly.

At the meeting, it was decided that a great part of the coming year's research effort will be devoted to the magnetic applications of cobalt, since the latter possesses unique properties in this particular field. In another connection, CIC is already giving full attention to the prevention of air pollution by automobile exhaust gases. It appears indeed that cobalt catalysts may ensure complete combustion of these gases, and thus provide a practical solution to a problem which arises in an urgent and often acute form in most large towns and which, in future, is likely to lead to strict preventive measures being taken by the responsible authorities.

The Institute also decided to grant several scholarships to university graduates who, under the guidance of eminent professors, wish to perform original research work relating to cobalt.

It will be recalled that the results of the CIC sponsored investigations are widely circulated, in particular in the "Cobalt" quarterly review, published in English and French editions, whose first four issues have been most favourably received in scientific and technical circles.

The "Centre d'Information du Cobalt," whose head office address is 35 rue des Colonies, Brussels, is at the disposal of cobalt users to supply them with any information they may request concerning this metal and its applications. The organisation is represented in the United States by the Cobalt Information Center, at the Battelle Memorial Institute, Columbus, Ohio.

APPOINTMENTS

SENIOR RESEARCH OFFICER

(Revised Advertisement)

Applications are invited from men or women for the above post. The Senior Research Officer will assist the Director in the conduct of the Foundation's research programme and have specific responsibility for the Statistical Service. Opportunity to play a full part in other aspects of the Foundation's work will be given.

Candidates should be honours graduates with considerable post-graduate research experience. They should *either* have a good academic qualification in Mathematical Statistics or have given evidence of high ability in the application of statistical methods to research in educational psychology. Qualifications and experience in Education and/or Psychology are also looked for though this requirement might be partially waived for candidates with high qualifications in statistics. Varied teaching experience, experience as an educational psychologist, proven ability to write technical material intelligibly would be additional qualifications.

Salary on the scale £1,700 x £50 — £2,000 with placement according to qualification.

Applications (closing date December 31, 1959) in three copies and with the names of three referees, should be sent to the Director, N.F.E.R., 79 Wimpole Street, London, W.1, from whom further details of the post can be obtained.

Those candidates who made an earlier application for a similar post and who wish their applications to stand need not apply again. They are asked to inform the Director of this by postcard.

For other appointments see page 925

EXPERIENCED highly qualified language teacher required for full-time appointment in London College.—Box 1247.

APPOINTMENT REQUIRED

SEARCHER offers International Trade/Technical Literature abstracting; Bibliographical Reviewing; English and Foreign Patent Screening; Specialised Reporting.—Apply Box 1241.

TRAVEL

WINTER SPORTS THROUGH COOKS

You can choose from a wonderful selection of inclusive holidays at over 100 resorts! A few examples of eight-day holidays with rail and sea travel are:

ADELBODEN	£26 17s.	PARTHENEN	£21 18s.
LAUTERBRUNNEN	£24 0s.	IGLS	£33 17s.
AROSA	£28 11s.	KITZBUHEL	£25 16s.
DAVOS	£29 11s.	ORTISEI	£27 13s.

and if you book early Cooks guarantee Couchettes (sleeping accommodation) on the Special Trains. You can also travel by air. Write for FREE 112-page programme "Winter Sports" to THOS. COOK & SON LTD., Dept. H/C/RO, Berkeley Street, London, W.1, and branches, or from any office of Dean & Dawson, Pickfords or appointed booking agents.

EDUCATION

SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 14-week courses.—Write, Organising Secretary, DAVIES'S, 2 Addison Road, W.14. PARK 8392.

EXPERT POSTAL TUITION

for Examinations—University, Law, Accountancy, Costing, Secretarial, Civil Service Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2), METROPOLITAN COLLEGE ST. ALBANS or call at 30 Queen Victoria Street, London, E.C.4.

BUSINESS AND PERSONAL

9/- a line.

REMPLOY SPONSORSHIP SCHEME

Send for details which show an attractive proposition to manufacturers.

COMPANY AFFAIRS

British Motor

THE most significant feature of the British Motor Corporation's full report is the plan to spend a further £49 million on a new expansion programme. Over the last five years the group has spent some £39 million on what Sir Leonard Lord, the chairman, calls "operation change-over" which culminated in the new models announced this year. Sir Leonard Lord says that now the new models have been successfully launched "profits can be expected to increase over the next two years and this, together with our existing resources, would appear to make it unnecessary to raise fresh capital." It is intended to spend about £15 million in the current financial year, £20 million next year, and then £14 million in 1961-62. With a cash flow of at least £9 million, liquid resources of some £27 million and the current annual rate of production at 750,000 units—which is expected to expand to the "magical" figure of one million units within two years—there is no reason to doubt that BMC can remain self-sufficient. But whether the underlying assumption that the motor boom will maintain its present momentum is justified is another question.

Sir Leonard Lord says that the most important investment during the year was the £10 million spent in providing production facilities for the Austin Seven/Morris Mini-Minor. Output of this model is now running at 4,000 units a week and plans are afoot to double this output as soon as possible. The new production facilities which the plan will entail will also enable the group to launch another range of light commercial vehicles.

In the next few years BMC stands to gain not only from any boom that benefits all motor manufacturers, but also from the fact that for the first time since the corporation was set up in 1952 the group is producing what the chairman calls "specifically BMC models" and thus will reap the benefits from the economies arising from a more rationalised range of products.

Sir Leonard says that the home market order book "has never been stronger" and is nearly three times as large as it was in 1958. The group enjoys just under 40 per cent of the total home market, and about 40 per cent of its total production in 1958-59 was exported. Of total exports 35 per cent went to the United States and exports to the whole of North America rose by no less than 49 per cent. Australia, once BMC's largest export market, has now dropped to third place, but Sir Leonard points out that this reflects the establishment of local production facilities rather than any appreciable falling-off in demand. The directors are now considering setting up production facilities in South Africa and New Zealand. At 21s. 6d. the 5s. units offer a yield of 4.2 per cent—a yield well above that of some other motor equities, but one that has already discounted future expansion some way ahead.

Joseph Lucas

THE trading profits of Joseph Lucas (Industries) for the year ended on July 31st advanced by 5½ per cent, from £6,873,545 to £7,258,619, and Mr A. B. Waring, the chairman, points out that it was not so much the increase in output of the British motor industry (which went up by only 2½ per cent) as the change-over to an unprecedented number of new models, which enabled the group to achieve new production records in 1958-59. Mr Waring refers to the success of British-made mopeds (as underlined by Raleigh's results) and bigger sales of new scooters, following the ending of the credit squeeze and last April's cuts in purchase tax, as two important factors in helping to push up the group's profits.

The worst effects of the cuts in the defence programme have not yet been felt by the group. The demand for Lucas's equipment used in jet and turbo-prop engines, especially from foreign aircraft manufacturers, is still buoyant—although for how much longer is problematic, especially as the bulk of these exports are based on military contracts, and Mr Waring admits: "there will be a decline in the aircraft industry." Few people will doubt that he is right, and shareholders will be particularly pleased that the directors' plans for diversifying the business—first referred to in last year's report—are now bearing some fruit. In the electronic field the group acquired G. & E. Bradley; the tractor disc-brake business formerly operated by the Goodyear Tyre and Rubber Company was also taken over; and an agreement has been entered into with AEI and GEC for the manufacture of all-glass headlamps. A foothold has been secured in the common market with the setting up of a factory (in association with Ducellier-Bendix Air Equipment) to produce a special type of distributor pump not yet made in France. How far diversification and the current boom in the motor industry will make good any loss in production and profit suffered by Joseph Lucas in supplying the aircraft industry is still uncertain. But in looking at the yield of 3.8 per cent offered by the £1 ordinary shares at 64s. 9d. investors will note that the dividend of 12½ per cent is covered as much as three times.

S. Smith and Sons

IT is not a coincidence that the 4s. ordinary shares of S. Smith and Sons, standing at 18s. 3d., also yield 3.8 per cent for its dividend of 17½ per cent is also covered about three times by earnings and the future prospects are very much the same as those of Joseph Lucas. The rise of 6½ per cent in the trading profits of S. Smith and Sons, from £3,382,306 to £3,603,101, seems to have stemmed from the increase of 7 per cent in the group's turnover. As had been expected, the sharp fall in orders from the aircraft industry (whose difficulties Mr Ralph Gordon-Smith, the chairman, thinks are only temporary) made substantial inroads into bigger earnings from the booming motor industry. Mr Gordon-Smith points out that it is impossible to meet the ever-growing demand for motor components from the group's under-employed aviation component plant, owing to the specialised nature of the products involved. The directors are therefore budgeting for smaller profits in 1959-60, and they have decided to expand manufacturing capacity for automobile products and for appliances for domestic products to help offset the fall in earnings from the aviation side of the business (which is expected to be even more severe than in 1958-59).

Rover

IN his statement with Rover's full report the chairman, Mr S. B. Wilkes, says that the relatively modest rise of 6½ per cent in the group's 1958-59 trading profits, from £1,781,715 to £1,902,046, was mainly attributable to the changeover to new models. The new models have been well received and the group's order books "augur well for their future success." Mr Wilkes also refers to the abortive negotiations with Willys Motor to form an association between the two companies, and to the talks with Standard Motor on the possibility of a merger. He says that he believes it is in the best interests of shareholders to examine possibilities of this type whenever they arise, although he is confident that the group standing on its own feet will be able to maintain its position in the industry. The outlook for the motor industry he regards as one of expanding prosperity, and plans are afoot to increase the group's productive capacity. But Mr Wilkes is not complacent. He thinks the effect of the new "compact" American cars will be greater in export markets than at home. Even so, this should not worry Rover unduly with its main export, the Land-Rover, remaining virtually unchallenged overseas. The 1958-59 dividend was raised from 22½ per cent to 27 per cent and a one-for-one scrip issue is proposed. The market is now plumping for a 1959-60 dividend of 15 per cent on the larger capital, as increased by the scrip issue. On the 27 per cent dividend the 5s. ordinary units at 27s. 10½d. yield 4.8 per cent.

COPPER DOING NICELY

INVESTORS in the Rhodesian copper companies have had a good though not a bumper year, and can almost certainly count on another good one in 1959-60. Profits and dividends recovered sharply in the twelve months to June 30th, with Roan Antelope, from the Rhodesian Selection Trust stable, leading the field by earning and distributing twice as much as in the lean year of 1957-58. In the extreme case of Rhokana, a scrip issue will bring the price of the shares down from an unwieldy £36 to a more marketable 72s.

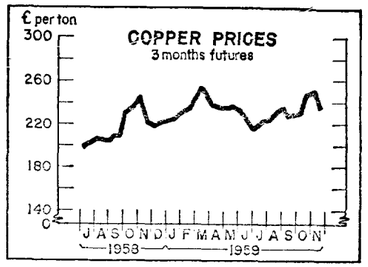
These past and prospective joys are partly adventitious. In the first half of the financial year copper prices were supported by the strikes that occurred in North America and Rhodesia, and in the second half by heavy buying in the United States in anticipation of a strike after the labour contracts expired at the end of June. The Rhodesian mines partly made good the loss of production caused by the 54-day strike of European workers last autumn, and higher prices took care of any fall in sales. The RST group nearly reached its output target of 193,000 tons. In the other group Nchanga, which ends its year on March 31st, intended to raise output from 121,000 to 150,000 tons and only fell 10,000 tons short of it; Rhokana's output fell by 9,000 tons to 77,000 tons and Bancroft, after getting over its flooding difficulties, resumed operations on April 1st and is now at its scheduled rate of 50,000 tons a year. This year Nchanga could raise its output further to about 165,000 tons, again by stepping up operations at its two open pits.

The Anglo American mines do not break down their costs, but their experience is unlikely to have differed significantly from the others. Roan's average cost of production rose by £16 to £154 a ton, owing to higher royalties and employees' bonuses (which are both related to the price of copper) and to the cost of refining part of its output at the new Ndola refinery. Its average selling price went up by a quarter to £220 a ton, while the profit margin jumped up by three-quarters to £68 a ton, and total profits almost doubled to £5.5 million. Mufulira's costs rose slightly less, by £13 to £149 a ton; though mining costs were £2 18s. a ton higher, mainly owing to development in the western section, milling and smelting costs fell by £2 4s. a ton.

Cobalt production at Chibuluma made a small profit last year; on the new accounting basis costs were 13s. 3d. a lb while the selling price was 14s. 3d. In the continued depressed state of the cobalt market it is fortunate that Chibuluma is able to deliver its entire output to the United States government to service and repay the loan. The loan should be repaid before the middle of 1962, by which time cobalt should be somewhat above the present price of 12s. 6d. a lb.

The recovery in profits has enabled the companies to set aside more money for replacements and general reserve. Roan's replacement appropriation has almost doubled to £1.1 million, which is considered to be much more in line with average requirements over the years, and that reserve now stands at over £2 million, sufficient for all expenditures authorised this year. Both groups have long passed the hump of big capital expenditures, but their future needs are not small. Bancroft's capacity is to be doubled in time, and Mufulira's capacity will be half as large again when the development of the western section is completed in mid-1962. And both groups are committed to helping to finance general economic development in the Federation.

PROSPECTS for the current year are reasonably clear. It began with world production of copper running well ahead of consumption, and in July Sir Ronald Prain, chairman of Rhodesian Selection Trust, characteristically announced that his group would cut output in the July-December period to 90 per cent of the high post-strike rate achieved in January-June. In the event the job of adjusting demand to supply fell on the American mines and



smelters when their workers struck in August. The decline in prices (reflected in RST's returns for the June-September quarter) was reversed and copper bounded up to £250 a ton in London early this month. It has since fallen back to about £235 a ton. American buying of copper in Europe has subsided, and some American companies have reached agreement with some of their workers, though not with the principal union concerned in the strikes.

The complete ending of the strikes will bring further weakness, though this will be cushioned for a time by the need to rebuild stocks, especially in the United States, and by the rise in world consumption. Hence neither of the Rhodesian groups is likely to push output up to the limit of capacity this year, and the average price received may not be much above last year's average of about £220 a ton. But at this figure, as the annual reports show, the copper companies can manage nicely, and have little to fear from competition from other metals and plastics.

Labour relations remain the most unpredictable element in their fortunes, but it is worth noting that both Sir Ronald and Mr Harry Oppenheimer, chairman of Anglo American, are hopeful about the new machinery for settling disputes with the European union.

Investors know that the bumper profits of the mid-1950's are not likely to return. But they have a stake in a growth industry, and the Rhodesian copperbelt is as well placed as any other to share in that growth. To those who look on copper shares as a long-term investment, the prevailing yields are not too low.

Joshua Hoyle

DIVERSIFICATION is not a policy that appeals to all Lancashire cotton firms. Last December, for instance, the chairman of Joshua Hoyle, Mr A. Duckett, said that while diversification would be pursued to the extent that it was in the "best interests" of shareholders, such a policy had to yield pride of place to consolidation. The directors now seem to have turned their backs even more firmly on the idea of diversification, for they intend to reduce the share capital of the company by making a capital repayment to shareholders. They are among the few who have decided to leave the choice of investment of the compensation moneys to shareholders, instead of investing the moneys themselves either inside or outside the cotton industry. Joshua Hoyle will receive £418,000 in compensation from the Government for the machinery that will be scrapped and this will raise its total cash resources to over £1½ million. The directors propose to reduce the ordinary share capital of £1,962,967 by not less than half, by making a cash repayment of not less than 1s. per 2s. share. That repayment will absorb nearly £1 million and will not leave much cash in the bank for any really ambitious schemes for diversification.

Currently, the 2s. shares stand in the market at 3s. 7½d. and now they are in a sense cum a capital distribution of not less than 1s. Once that distribution is made, could the 1s. units sustain a price of, say, 2s. 6d. In the year to September 30th, last, the group made a loss, after depreciation and tax, of £109,521, almost exactly £100,000 higher than the loss of £9,515 made in 1957-58. The dividend of 5 per cent, paid in the form of a final dividend and not as in 1957-58 when an interim and a final of 2½ per cent each were declared, is paid out of the accumulated carry forward. The decision to pay any dividend at all in face of this trading loss has to be taken as a sign of confidence. In the latter months of the financial year trade was beginning to pick up for Joshua Hoyle, as it was for other cotton and rayon concerns. So far this improvement has been maintained and the directors say that the indications are that a profit will be earned, making it possible to pay a "reasonable" dividend. If Joshua Hoyle can adjust itself to a lower level of output, concentrating production on its most modern machines, then 2s. 6d. might not be too high a price to pay for its ordinary shares.

National Commercial Bank of Scotland

WHEN the Commercial Bank of Scotland merged with the National Bank of Scotland last September a final dividend of 9 per cent was forecast on the new capital. In fact the final dividend has been set at 14 per cent. Despite the substantial increase in the payment the shares still yield only 3 per cent on the basis of a total dividend of 20 per cent—an indication of the continued expansion anticipated by investors from the bank's substantial hire purchase interests. The Commercial Bank of Scotland was the first bank in Britain to enter hire purchase; as far back as 1954 it purchased the Scottish Midland Guarantee Trust, which together with Olds Discount is now controlled by Lloyds and Scottish Finance, a company which in turn is jointly owned by Lloyds Bank and the National Commercial. The group also has important hire purchase interests in South Africa and other parts of the Commonwealth.

The National Commercial, in which Lloyds Bank has a 37½ per cent interest, is also to make a rights issue which will raise about £7 million. A large part of this money will presumably be used to finance its hire purchase interests; Mr Ian Macdonald will no doubt have more to say on this in next week's statement with the full report and accounts. Mr Macdonald disclosed in his statement at the time of the merger that hire purchase commitments of Olds Discount and Scottish Midland Guarantee Trust amounted to between £50 and £60 million. The new shares are being offered on the basis of one for every two held at 25s. per share and with the shares standing at 67s. 6d. x.d. the rights are worth about 28s. A dividend of 15 per cent is forecast on the increased capital and on an estimated "ex all" price of 53s. 3d. the shares will yield only 2.8 per cent. The market is clearly hoping that this dividend forecast will again be well exceeded.

South Durham

ON October 1st the Finance Corporation for Industry exercised its option to take up two million of South Durham's £1 ordinary shares at par. It has now sold these shares to Morgan Grenfell, and Rowe and Pitman and Cazenove and Company are placing them at 52s. 6d. each (cum the 8 per cent final dividend) free of stamp and commission. On the basis of the placing price the FCI will make a profit of some £3¼ million; this compares with a loss made in the year to March 31, 1959, by the corporation of over £2 million.

The FCI has asked that in making the placing offers be made to its shareholders on a basis which has regard to the size of their holdings in the corporation. The Bank of England holds 30 per cent of the FCI capital and presumably the Bank will not take up any of these shares on its own account. The rest of the capital is held by insurance companies and investment trusts and it is with these institutions together with some pension funds that the bulk of these shares will be placed. At least 150,000 shares will be available to the market and it is hoped that dealings will start on December 2nd. The shares reached a peak of 61s. 9d. before the company's results, but because of disappointment with the dividend the shares have fallen back to 53s. 4½d.

Raleigh Industries

RALEIGH'S trading profits for the year to July 31st have jumped by no less than 78 per cent, from £1,341,095 to £2,394,016, and the ordinary dividend has been raised from 8 per cent to 12 per cent. The market hardly needed the whole weekend to digest these results; on Monday jobbers marked up the £1 ordinary shares by 3s. 3d. to 43s. 10½d. (to yield 5.6 per cent). A slightly higher depreciation charge of £461,449 (against £411,097) and an increase in tax from £107,333 to £210,000, still leaves net earnings more than doubled at £1,722,567 (against £822,655) so that earnings on the £4 million in ordinary shares have risen from only 13½ per cent to 32 per cent.

In 1957-58 the group's earnings fell by a little under 40 per cent. The recession at home and in Raleigh's overseas markets and fiercer competition from foreign manufacturers in West Germany and Holland, as well as in China and Japan, brought down sales of Raleigh bicycles sharply. At that time the group's expansion programme had just been completed and the group was unable to utilise it, so that overhead costs made appreciable inroads into the group's resources. This year sales must have been boosted by the lifting of hire purchase controls and by the reduction in purchase tax on bicycles from 30 per cent to 25 per cent in the last Budget.

Probably an even more important factor in Raleigh's recovery is the success of its moped, launched on the market last October, and to which the directors referred last May when they said that the introduction of the moped "and the effect of a number of economies which have been made within the group" pointed to a recovery in profits. Deliveries of mopeds from all manufacturers rose from 9,000 to 70,000 in 1958-59 and there can be little doubt that Raleigh's one-gear, clutchless machine has proved one of the more popular of the "mechanised bicycles."

Ind Coope

BY taking Benskin's of Watford and Taylor Walker of London under its wing, Ind Coope has grown from being the biggest brewery in the Midlands to being the biggest brewery in the whole of the country. It owns seven large breweries, eleven bottling plants, 42 depots, over 40 hotels (including the Leofric in Coventry), over 5,000 public houses and about 330 wine and spirit shops, including those of Victoria Wine (where Ind Coope has just made a generous offer for the minority equity holding). It is thus not simply big, but broadly based. Its annual turnover is of the order of £50 million and in the year to August 31st, which includes eight months trading of Taylor Walker, it made a

gross profit of £5,319,552. Excluding Taylor Walker the profit was £4,786,413. That profit, however, was only bigger than the £4,627,361 earned in 1957-58 because the hot summer in the last two months of the financial year boosted sales, especially of draught beers and lager.

Ind Coope's management has been described as American—in the complimentary sense that it is energetic, thrustful and radical in decision. Breweries have been closed and others modernised. New public houses have been built and others closed—or their sites sold (though as the chairman, Mr Edward Thompson, says, the number of pub sites that have high values in alternative uses is small). A close eye is kept on the value of the properties as going concerns but the properties have not been formally revalued in the books, for Mr Thompson claims that as these values fluctuate with changes in trade the revalued figures might be misleading.

A good deal of money has been spent on bringing both the breweries and the public houses up to date. But tied houses are not enough in this competitive age. Like other breweries, Ind Coope has signed reciprocal trade agreements. In addition, it has advertised and sold on a national scale three packaged beers: bottled "Double Diamond" (sales of which have now recovered from the slight falling away during the trade recession); "Skol" lager (which was introduced in May and sales of which have been so high that it is planned to add 50 per cent to productive capacity by next April); and canned "Long Life" (where a market has been established in which sales are rising but in which profit margins are smaller than for premium brand bottled beers).

The directors are now looking forward to a period of consolidation following the years of growth. Having mentioned the reduction in the beer duty, Mr Thompson went on to say that there seem "to be good reasons for believing that the industry is beginning to trade in more favourable conditions than it has enjoyed at any time since the period shortly after the war." But he admitted that "it is still too early to say whether there has been a reversal in the long downward trend in personal spending on beer in relation to expenditure on other types of consumer goods and services." Against this background, other breweries have in their own way done much what Ind Coope has done. But what Ind Coope has done demonstrates that in this industry ability to hold on to one's share of the market and then to increase it depends on size and a willingness to turn away from the old, comfortable ways. This the 35,000 ordinary shareholders of its 5s. units will remember in looking at the yield of 4.3 per cent offered at 18s. 3d. on a dividend of 15¾ per cent, covered about 1¼ times.

Unit Trusts

CONSERVATIVE victory stimulated the unit trusts into a burst of activity which so far shows no sign of slacking. The **Community Unit Trust,** formed last May, have made a new and very ambitious block offer of 15 million units at 3s. 1d., payable in full on application. This is the third offer to be made by "Cupids," whose portfolio consists of some 130 securities. The initial offer was made at 2s. 6d. a unit—the lowest price ever offered by a unit trust—and the second offer at 2s. 7½d. a unit. The **Shield Unit Fund,** which was launched last January, also made an offer this week of 2½ million units at 13s. 6½d. a unit. This is Shield's third block offer, the first was for 5 million units at 10s. and the second for one million units at 11s. 2d. The trust's portfolio consists of some 200 securities, all but 9 per cent industrial equities.

The Bank-Insurance group is splitting **"Scotbits"** units, which can be sold over the counter in all Scottish banks, into four. The managers say that since the "over-the-counter" service was introduced in September, 1957, some 869,000 transactions have taken place, the average purchase being of 45 units. Since October 1st about £450,000 has been invested in "Scotbits" and it is hoped that lower priced units will stimulate sales still more. The **Crosby Unit Trust** is also arranging the sale of its units over the counter, at the branches of the Royal Bank of Scotland.

The Scottish flavour in the unit trust movement has also been brought to the fore by the news that the Bank-Insurance group is launching a new trust, **Scotshares,** with a portfolio of industrial equities which have Scottish interests. The initial portfolio includes, for instance, Distillers as well as some equities like Morphy-Richards, whose Scottish interests are not so immediately apparent. The initial offer of 5 million units at 5s. a unit, to yield an estimated £3 10s. per cent, opens on St. Andrews's Day.

Barclays Bank DCO

BARCLAYS BANK DCO has maintained its dividend for the year to September 30, 1959, at 9 per cent. Some buyers had no doubt been hoping for a further one per cent, despite the fall of £59,000 in disclosed profits for the six months to end-March. (This is still the only bank to publish half-yearly profit figures.) But there appears to have been some improvement more recently; disclosed profits for the full year to September 30th have fallen by £48,000 to £1,219,000. Following the chairman's statement last December that dividends should be governed more by earnings of the year under review than by future prospects, this encouraging recovery in recent profits may lead to an increase in the dividend next year. Since the announcement of an unchanged dividend the £1 stock units have fallen back by 5s. to 48s. 10½d.; on the 9 per cent dividend they yield 3¾ per cent.

THROUGHOUT the week markets have had an uncertain tone. Business contracted further on Wednesday when prices drifted lower and buyers came in to help many of the leaders to close above their worst. Over the week to Wednesday's close *The Economist* indicator dropped 1.9 points to 347.7. On Wednesday the number of bargains marked at 17,484 were the lowest since October 2nd. Gilt-edged securities drifted lower over the week, and on the news of a further rise in bank advances most of the Funds were marked down sharply at the opening on Wednesday. This induced some institutional buyers to come in and buy so that over the week most Government stocks showed only fractional losses. In undated stocks 3½ per cent War Loan lost 1/16 to 67 5/16, and in medium dated stocks 4½ per cent Conversion 1964 closed the same amount lower at 100 5/16. Some longer-dated stocks showed small net gains; typically, 4 per cent Gas 1969-72 put on ⅜ at 92¼. The new 5¼ per cent 1978-80 Hertfordshire loan came on offer on Wednesday and fell ⅛ to ¼ premium: in sympathy the premium on the 5½ per cent 1980 Middlesex loan also fell ⅛ to 1 5/16.

Industrial equities, despite Wednesday's rally, drifted lower over the week. Switching operations into the Funds was one of the main reasons for the general decline in industrial ordinary shares. Steel shares were affected by news of the FCI's deal in South Durham Iron, whose shares made a loss over the week of 6s. 1½d. at 53s. 4½d.; Colvilles lost 1s. 3d. at 64s. 6d. and Dorman Long eased 9d. to 63s. Exceptionally, Steel Company of Wales improved 4½d. at 49s. 6d. News of more expansion plans from the motor industry made for a bright motor section. BMC put on 1s. 1½d. at 49s. 6d., Standard improved 7½d. to 11s. but Ford lost 4s. 6d. at 106s. 6d. on the further denial that Ford of America intended to bid for the minority interest. Breweries were an active section; the sharpest rise was seen in Hewitt Bros., which shot up by 26s. 3d. to 137s. 6d. after touching 140s. at one time following the capital plans and dividend forecast; Ansells jumped 7s. 4½d. to a new peak of 87s. Heavy American buying of Philips Lamps pushed the price up by 6s. 6d. to 138s. 6d.

Oils drifted lower, although on Wednesday the Shell group's quarterly earning figures helped most of the leaders to improve a little. Even so, over the week Burmah lost 9d. at 44s. 9d., Shell eased 1s. 3d. to 143s. 9d. and BP closed 1s. 9d. down at 51s. 6d. A small amount of buying in the gold share market found dealers short of stock and led to some substantial rises. FSG closed 17s. 3d. better at 197s. 1½d.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended November 21, 1959, there was an "above-line" surplus (after allowing for sinking funds) of £2,880,000 compared with a surplus of £28,879,000 in the previous week and one of £25,695,000 in the corresponding period of last year. There was a net receipt "below-line" of £7,877,000 leaving a total cumulative deficit to date of £652,700,000 compared with £572,852,000 in 1958-59.

THE MONEY MARKET

AT last Friday's Treasury bill tender the discount market maintained its bid at £99 3s. for the £230 million of 91 day bills offered and allotted. The market's quota at this price was 44 per cent, compared with only 26 per cent the previous week; the average rate of discount rose by 2½d. to just under £3 8s. per cent. The market also maintained its bid at £99 8s. 1d. for the 63-day bills and secured an allotment of 91 per cent; the average rate of discount was virtually unchanged at £3 9s. 0.30d. This Friday £220 million of 91 day bills will be offered together with £60 million of the shorter dated bills.

The United States Treasury bill rate fell back slightly from last week's peak of 4.332 per cent to 4.279 per cent. An issue of 320 day bills has been allotted this week at an average rate of 4.860 per cent, the highest rate paid on a short term issue since 1929.

In contrast to recent weeks there has been a surplus of money in Lombard Street this week and on Wednesday the authorities sold a small amount of very short dated bills. There has been a keen demand for bills, with February maturities changing hands at 3 11/32 per cent.

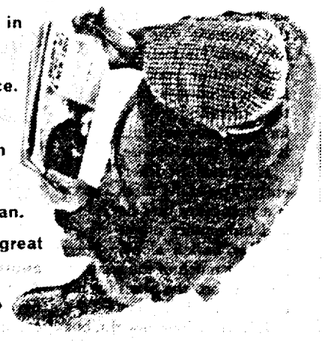
PEOPLE LIKE JACK AND JACK AND JACK ARE WORTH MILLIONS

They have added something like £500 million to the nation's net savings in twelve years through industrial life assurance. Ten million families save in this way, with the help of the Home Service Insurance Man. Together, they form a great thrift movement that helps people to help the nation by helping themselves.



Issued by The Industrial Life Offices Association

'I read about it in 'Cover'. . .'

. . . the magazine issued by the Provincial Insurance Company to its friends and connections in the United Kingdom. Each number deals with a variety of aspects of insurance business in non-technical language and prints articles of general interest not only to the man who sells and services insurance but also to executives who have responsibility for their Company's insurance arrangements. May we put your name on our free mailing list?

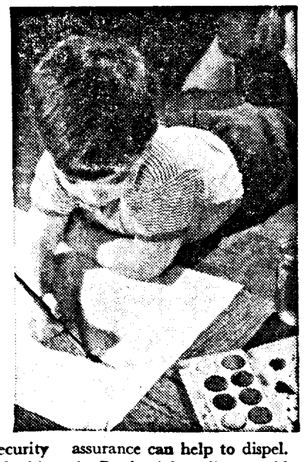
A world of his own



He is in another world, so absorbed that for the moment you are forgotten. He feels secure because you, his father, are always there to comfort and provide for him. He never thinks it could be otherwise.

But you know differently. You know there is a possibility that he and his mother might one day be left alone, and that much of the security and comfort, the plans for his future, would be gone.

It is an anxious thought, but one which adequate life assurance can help to dispel. A Prudential policy could never take your place, but it could make a lot of difference to your son's future.

For advice on personal life assurance plans . . .
Ask the man from the

'Keeping up with the Joneses'

The well-known haulage firm of E. H. Jones Ltd., Greenwich, say that one of their big 8-wheeler tankers has so far run 250,000 miles without any major repair. *(You've guessed right . . . it's a Leyland 'Octopus'!)*

Of course, what E. H. Jones Ltd. doesn't know about looking after the welfare of their large road fleet just isn't worth knowing, but they tell us that, given normal routine servicing and a good driver, any Leyland will run more-or-less trouble-free for years on end.

E. H. Jones ought to know! They've concentrated on Leylands of varying capacities since World War No. 1 and *every year they send us repeat orders.* We don't ask for a better testimonial to our trucks.

Vehicles operating at top-mark reliability and economy are a "must" in a big haulage concern like Jones . . . and Leylands form the basis of their fleet. Is there any moral in this little story? Well, perhaps it is that you can depend upon carefree transport if you keep your ideas in line with the Joneses.

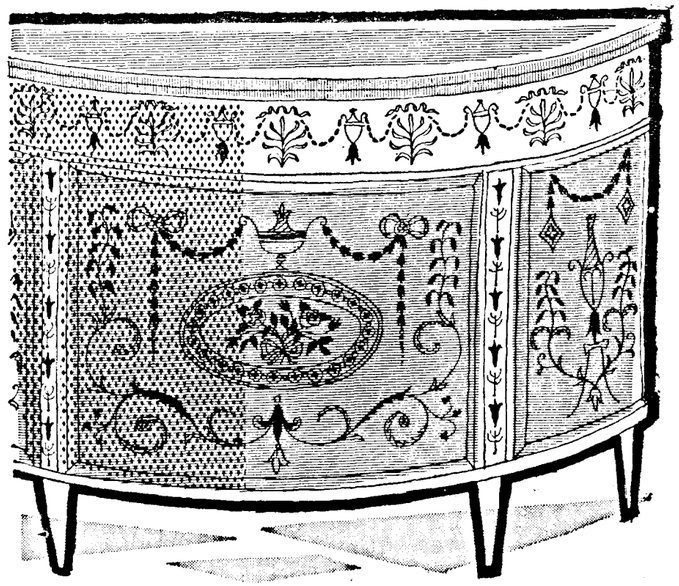
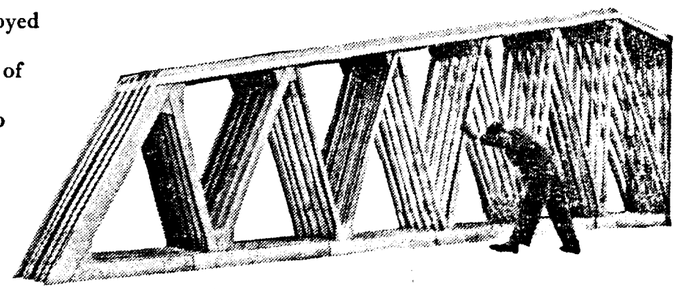
ANNUS MIRABILIS



The ancients—and the great 18th century craftsmen, too—knew the advantages of layered wood. But until recently, plywood was suspect because of the inadequacy of the glues used. New adhesives were developed for aircraft manufacture during the war, so that today the glue line becomes the strongest part of the structure.

Line of Life

Aero Research Ltd., now CIBA (A.R.L.) Ltd., made the first urea-formaldehyde and resorcinol-formaldehyde glues produced in Great Britain. Aerolite is the most widely used synthetic resin adhesive in this country, and is employed for purposes ranging from the construction of heavy timber roof members (as in the photo of a lattice truss by Rainham Timber Engineering Co. Ltd.) to miscellaneous repairs in the home.



Aerolite & Aerodux glues for wood

Aerolite and Aerodux are registered trade names.

Coo! Castrol House and WALLSPAN all the way up!

WALLSPAN CURTAIN WALLING — BY WILLIAMS & WILLIAMS — ON LONDON'S NEWEST LANDMARK. VERY SPECIAL WALLSPAN TOO — PRE-ASSEMBLED — GOES UP QUICKER — MAKES BUILDINGS READY SOONER

Castrol House, Marylebone Road, London — new offices for C. C. Wakefield & Co. Ltd. A development of the Hammerson Group of Companies.
Architects: Gollins, Melvin, Ward and Partners in association with Sir Hugh Casson, Neville Conder and Associate.
Contractors: Sir Robert McAlpine & Sons Ltd.

Buildings go up much quicker with PRE-ASSEMBLED WALLSPAN. Most of the assembly is done at the factory while the building is still in its early stages. When the Wallspan is needed, it arrives at the site in complete pre-assembled units — goes up in a fraction of the time it takes by other methods. On the tower of Castrol House for instance, it went up at the rate of 2 floors a week!

forward looking building products

Occupy your building sooner— ask your architect about PRE-ASSEMBLED WALLSPAN

WILLIAMS & WILLIAMS

Williams & Williams also make steel windows of every description, ALOMEGA and other aluminium windows, movable steel and glass partitioning, ALUMINEX patent glazing and many other products.

tool box for industry

From British Oxygen comes yet another new service to industry: an "off-the-shelf" tool supply for the machines that make machinery.

Drawing on a vast "library" in steel set up by the Woodside Die Sinking Company—a BOC Company—Britain's production engineers can now tool-up one machine or an entire production line with ready-made, standardised parts.

Wherever it is used, this revolutionary service brings valuable savings in both time and tooling costs.

Pye at Dounreay

The Pye Instrument Group has supplied all the equipment to the U.K. Atomic Energy Authority for the irradiated fuel element laboratory at Dounreay. In addition to supplying equipment, Pye Ltd. acted as consultants and designers on all matters in that laboratory relating to instrumentation and remote handling and viewing. The illustration above shows manipulators working in conjunction with a television camera to handle and measure a sample from the fast reactor.

The Pye Instrument Group Consists of: Pye Atomics Division; Pye Industrial Television Division; Faraday Electronic Instruments Ltd; Labgear Ltd; W. G. Pye & Co. Ltd; Pye Telecommunications Ltd; Unicam Instruments Ltd; W. Bryan Savage Ltd; W. Watson & Sons Ltd.

Fire worries for Mr. Care

That fire engine gave you a start, didn't it, Mr. Care?

Indeed it did, Mr. Carefree.

It could be your home that's on fire.

Yes – it sends cold shivers down my spine.

And I bet your house isn't fully insured.

That's why I hate fire engines.

If I were you, I'd get fixed up with The Northern.

Won't it mean a lot of fuss?

Not in the least. The Northern are such friendly, helpful people.

Thanks for the tip. I'll get in touch with them right away.

YOU'LL BE ON GOOD TERMS WITH THE

Northern

A Passage to Asia

ALTHOUGH the journey on which President Eisenhower set off on Thursday will take him to eleven countries of Europe, Asia and Africa, his travels will be more interesting for what happens at each end than for what happens in between. New Delhi and Paris are the places that may earn the President's grand tour a mention in the history books. In most of the other nine countries his stay will be so brief that he will hardly have time to fix his clasp on the shoulder of the local leader and his smile on the eyes of the watching crowds. It is all too easy this time to believe the State Department's ritual protestation that he is not going to negotiate about anything; the most he can do in these places is to urge a few generalities upon his hosts. But in New Delhi and Paris it will be different. In India Mr Eisenhower has an opportunity to carry a stage further the transformation of American foreign policy which he began this summer. To be specific, having accepted the premise that it is possible to negotiate a *détente* with Mr Khrushchev in Europe, he can now proceed to divert some of the attention of American policy from Europe to Asia and Africa, the new centres of the east-west struggle.

In Paris the President's task will be to make sure that his European allies accept the logic of this; in particular, he has to persuade the French and the Germans to agree to his ideas about the next step in negotiating with Mr Khrushchev. For once, the cynics seem to be wrong about Mr Eisenhower. In Washington, as well as in Europe, it has been fashionable to look on the President's tour as a sentimental journey by a man about to wave farewell to public life. According to that theory, the journey will be an exercise in public relations rather than in serious diplomacy, and the hope that it will yield any practical results is nullified by the fact that in a few months' time—when the nominating conventions meet at Los Angeles and Chicago—the President will be effectively at the end of his power. But this almost certainly underestimates Mr Eisenhower's purpose.

It may be unlike him to think in terms of the grand design, but this is precisely what he appears to be doing. As he prepares to set foot in India for the first time, he seems to look upon his visit as a means of recalling to the Asians the friendship which the Americans have traditionally felt for the former colonial territories. Since 1947, because of the Russian threat to Europe, the United States has been obliged to concentrate most of its attention directly across the North Atlantic. Europe has had first call on American money, and, in the series of quarrels between colonisers and colonised, the Americans have had to align themselves with the former more often than their natural instincts would have preferred; this at least is how the President is thinking. But now some relaxation, if not a settlement, may be in sight in Europe. As a result the United States may be able to return, cautiously but perceptibly, to its ancient attachment. Asia and Africa may gain in priority as Europe loses. In the peculiar Janus-like relation which the United States maintains with the two areas, the second face may break into a belated smile.

If this is what Mr Eisenhower plans to tell Mr Nehru, it strengthens the belief that he is trying to make 1959 a turning-point in postwar history. It is hard to argue, as some of the President's critics have tried to argue, that he was manœuvred into negotiations with Mr Khrushchev against his will when

he is using so adroitly the opportunities which the negotiations have opened for him. Nor is it a fair criticism to say that this trip would have been more useful six years ago. The necessary conditions have only recently been created. But Mr Eisenhower still faces two great problems if he is really intent on developing American policy in this direction.

One is that the Asians and Africans are likely to want practical evidence that there really is a change ; and economic aid will be their immediate test. Last weekend one of those leaky taps which seem to be essential to the process of government in Washington let drip the news that the President will ask Congress for a bigger foreign aid appropriation next year, despite earlier rumours that he was going to ask for a reduced one. Congress, however, may continue its recent habit of cutting a thicker slice from his request than it did in the previous year ; and, even as a token of the Administration's good will, this gesture has to be balanced against the recent decision that loans for development purposes—the nub of the foreign aid programme—must be spent in the United States, where they can buy substantially less than they can abroad. One or two American journalists have suggested that the most valuable result of the President's journey will be to send him home with a keener awareness of the necessity for economic aid to the poor countries. Perhaps the President is less in need of enlightenment on this point than the American public is. It is encouraging that the State Department is trying to persuade the journalists who are going on the tour to emphasise the local background in their reports.

But, unless the Americans can reduce permanently the present deficit in their balance of payments, there are limits to the amounts they can be expected to distribute in foreign aid. In New York it is now hoped that an improvement in exports will bring next year's deficit down to somewhere near $2 billion from this year's $4 billion. But there is no confidence that the improvement will last into 1961 ; and in 1961 India begins its third five-year plan, on which the future of a free Asia possibly hinges, and for which the Indians estimate that they will need help from abroad amounting to about a billion dollars' worth of foreign exchange each year.

By contrast, the Development Loan Fund, the principal American source of such help, has been able to provide India with only $195 million in the last two years and now has only half a billion dollars—of which India, on past performance, is likely to get about a quarter—left in its coffers. It is clear that, even if Mr Eisenhower's political testament consisted solely of the words "aid India," and even if Congress were willing to oblige, the United States could not close the gap by itself. It will be necessary for the old world to redress the balance of the new: Europe must open its purse more.

Thus the President is reminded that American policy towards the underdeveloped countries is intimately linked with American policy towards Europe. This is his second difficulty. Can Janus distribute benevolent glances in both directions at once ? Europe still has a substantial claim on the flow of American munificence. By far the biggest of the reported increases in next year's requests for foreign aid funds is for military assistance and most of the extra money is likely to go on modernising the North Atlantic Treaty Organisation's forces. Moreover, the colonial powers have not yet finished the task of liquidating their territorial holdings overseas. In coming years there may still be crises in north-west Africa, involving the French, and in east and central Africa, involving the British, which will test the Americans' divided loyalties. It is too much to hope that they will get through the next few sessions of the General Assembly of the United Nations without occasionally—between the temptations of voting with their Afro-Asian friends and with those in Europe—finding themselves stuck, like Buridan's ass.

Nor is this all. President Eisenhower's ambition to redistribute the weight of American influence in the world depends on the success of his negotiations with Mr Khrushchev. It seems to be generally assumed in Washington that, when he meets the allied leaders in Paris on December 19th, he will be able to overcome General de Gaulle's doubts about going to the summit at all, and to allay Dr Adenauer's misgivings about negotiating an interim settlement for Berlin once the summit is reached. But a new complication may be introduced into the argument when he gets to Paris.

Influential people in the United States Administration are credibly reported to be looking with a more tolerant eye on the idea that the west Berliners' freedom might be protected by the United Nations rather than by the present allied garrison. This is obviously not their first choice ; but it might conceivably be a position they would be ready to fall back on if the negotiations otherwise seemed doomed to failure. Neither Dr Adenauer nor General de Gaulle is likely even to entertain such a proposal—naturally enough. Thus the entire edifice which Mr Eisenhower is trying to construct rests on uncertain foundations. If his attempt to arrange a settlement with Mr Khrushchev collapses, then the hopes the President is carrying to India are likely to be stifled at birth.

The Economist

DECEMBER 3, 1859

BELOW THE SUMMIT

¶ The invitations to the Powers of Europe have been at length issued, and that addressed to England received, to meet in general Congress on the affairs of Europe with special reference to the condition of Italy. . . . It has been suggested by the *Times* that the Premier himself should be the English plenipotentiary at Paris. We think the proposal not a very desirable one, and still less likely to be carried out. It is not likely that just about the time of the meeting of Parliament the Prime Minister could well be spared by the English Cabinet, unless the end to be attained were one of first-rate magnitude. Parliament is summoned for the 24th January, and the Congress will not be really at work before the end of the first week in January . . . . But we do not believe that even at a less inconvenient time it would be . . . . desirable that England should be represented by any minister who would be elevated above the authority of the Foreign Office, and feel independent for the time of the Executive Government at home. What is really important is, to bring the popular and all but universal feeling of the English nation to bear in the most effective way on the conduct of our representative at Paris. How can this be best done ? We reply, by having a representative at Paris who will feel himself strictly responsible to the Home Government,—who will not imagine himself at liberty to compromise his instructions for the sake of conciliation,—who will feel it absolutely necessary to refer home every proposal that is in the least inconsistent with his instructions. The popular conviction, as expressed in the discussions of the House of Commons, will influence the Home Government, and prevent it from being warped by any mistaken wish to conciliate ; and if the authority exercised by the Home Government over the English plenipotentiary is as real and efficient as that exercised by the nation over the Government, we have no reasons to fear any concessions to foreign Powers of which we should disapprove.

Blunder at Blackpool ?

Mr Gaitskell took a brave stand at his party's post-election conference. But was it the right stand?

BEFORE an audience that was to the left of him, but before an electorate outside that is to the right of his party, Mr Gaitskell tried to take up a middle of the road position at Blackpool last week. The difficulty about being in the middle of the road is that one is liable to be hooted at by everybody who comes along. It is overwhelmingly likely that Mr Gaitskell will survive the kicks he is now getting from the party activists' angry left Foot ; Labour leaders have frequently before seemed to be in jeopardy before the assaults of these activists, and always they have survived. What is much less certain is whether he will succeed in his task of what is generally called changing Labour's face before the country—but might more aptly be called straightening those parts of Labour's anatomy that are at present most temptingly proffered to the public to kick.

Probably inevitably, Mr Gaitskell chose at Blackpool to do battle over only one of the factors that lost Labour votes in October ; less inevitably, the issue he chose was to demand that, in effect, next year's conference must change clause four of the Labour party's constitution—which at the moment appears to pledge Labour to the eventual nationalisation of all the means of production, distribution and exchange. There was considerable courage in this part of his statement. It may therefore seem harsh to judge that in picking clause four as his only enemy Mr Gaitskell has chosen the line of some, but still least, resistance; and that he may therefore be using up his ration of courage in the least profitable place. If Mr Gaitskell turns tail on this issue, he will now be lost; but if, as is much more probable, he remains head, it is far from certain that he will win very much.

The consequence of his choice of issue is that the main interest in politics in the next twelve months is to be focused, not on any failures of the Government, but on an absurd vote-repelling clause in Labour's constitution which three-quarters of the electorate until now probably never knew existed. Mr Gaitskell's hope is that, if and when he gains a victory on this issue, after banner headlines saying that he may be forced to resign, the public will assume that an apocalyptic change has taken place in the appearance that Labour presents to the public. But his eventual victory is likely to take the form of a compromise change in a piece of obscure constitutional phraseology, with the object of making it obscurer still. The Tories may easily be able to portray such a "victory" as a driving of Mr Gaitskell from pillar to post.

If Mr Gaitskell was to lay his leadership at stake last week —and lay it this brave man had to—one would have thought that he would have been wiser to make his battle aim a change in a different part of his party's constitution: in the part which limits his policy-making powers rather than that which wafflingly defines the party's aims. If he had said that henceforth the powers of the annual conference must be devalued, and those of himself and the parliamentary party increased, he would have had to face even wider (though not necessarily bitterer) opposition than his assault on the sacred cow of clause four evoked. But the fruits of any victory—even a compromise victory—would surely have been much greater. He would then have been in a much stronger position steadily to change his party's policies—including perhaps in three years' time to drop the renationalisation of steel and road haulage from his programme, as quietly as the nationalisation of cement and sugar has been dropped before. He would not have had to fight every change through the annual party conferences, by desperate reliance on the unions' block votes (among which—and this is a very important change indeed—Mr Cousins's million votes can no longer safely be counted as on his side). Moreover, by devaluing the importance of these block votes, along with that of the conference itself, he would have paved the way for the declaration of greater independence from unpopular union pressure which Labour so desperately needs but at which Mr Gaitskell at Blackpool did not even dare to hint.

All this speculation about the better choice to have made at Blackpool, however, now belongs to the realms of what might perhaps have been. For the next twelve months it is on clause four that the battle is joined. Our special correspondent at the conference—who beneath the shadow of Blackpool tower conceived a greater sympathy for Mr Gaitskell's difficulties than distant observers in London might readily grant—contributes below a blow-by-blow account of its opening rounds. It is a story to which commentators will have to return many times in the coming year, for Blackpool has seen the launching of a crucial struggle that will determine what sort of alternative government this country is to have.

Mr Gaitskell's Survival

BY OUR SPECIAL CORRESPONDENT AT BLACKPOOL

FOR Mr Gaitskell, last weekend's Labour conference started very badly indeed. Throughout that first grim Saturday there seemed no limit to the extent to which this extraordinary party was prepared to denigrate its leader. Part of the trouble lay in the happenstance of seniority which placed Mrs Barbara Castle in the chair, and therefore with the right of making the opening speech to the delegates. Following upon her keynote address full of socialist uplift, Mr Gaitskell's relentlessly analytical inquest must have sounded to many bloodlessly anticlimactic. (If only the new year's chairman, Mr Brinham, could have opened the proceedings how different things might have seemed. As this worthy trade union official demonstrated when he answered the discussion on youth on Saturday morning, he has acquired to perfection the chloroforming use of automatic speaking, a style that must owe its origin to the language of the Army Council Instruction.)

Mrs Castle's speech was not, as a matter of fact, very extreme in content ; nor were the rhetorical questions, with which she had planned to put Mr Gaitskell on the spot, particularly drastic. But the contrapuntal relationship between the pronouncements of red-blooded chairwoman and cold-blooded leader gave the fundamentalists the text they needed. They were helped by Mr Gaitskell's

perhaps excessive austerity. His was the cleverly organised speech of a man who is not an instinctive orator. At his desk in London he had picked out those suggestions of Mr Douglas Jay and others which were obvious non-starters—change of name, severance of the link with the unions, forging of a link with the Liberals. Then he "threw them out of the window." He exploited the fashionable preoccupation with appearances to justify the telling of home truths to the "small cliques of doctrine-ridden fanatics out of touch with the mainstream of social life in our time" (which, although he did not actually say so, is a pretty fair description of a sizeable portion of the delegates). And he took his stand against the forty-year-old statement of aims which lends colour to the fear of the deproletarianised worker that if he votes Labour he is buying an earthquake. But for all the art in his speech, he did not really come over as the middle-of-the-roader he wanted to appear to be; much more than at any other Labour conference since 1955, the fundamentalists now marked him down as a man of the right. Mr Gaitskell might have got a slightly less dusty response if he could have edited down his initial analysis of the defeat with its rather academic phrasing, and have given the delegates something more to applaud about before bringing them to their rendezvous with reality. But he had decided on the cold douche and he stuck to it.

This douche was a relief to the many younger Labour candidates who had come away from the election sharing Mr Gaitskell's views about nationalisation. If he had not spoken out so plainly they would have felt badly let down. But it was symptomatic of the atmosphere within the conference hall that when a single one of them, Mr Dick Taverne, who fought Putney, spoke up in support of his leader's views (and added sensible observations about ending class warfare within the party) this was considered an exceptionally courageous thing to do.

OTHERWISE, as Mr Gaitskell sat on the platform silently taking his medicine, an extraordinary parade of affronted fundamentalists passed through the rostrum to ladle it out. Their undoubted hero was Mr Michael Foot; after explaining that he was expert at losing elections, he did at least argue, with blazing conviction, that if the whole campaign had been fought his way, as a crusade against the "evil, disgraceful and rotten society in which we live," he would have expected to win. But most of the others gave the impression that they clasped defeat to their bosoms as a familiar friend. There was the grizzled transport worker from Coventry who, in a quiet Scottish accent, said almost affectionately of Mr Gaitskell that "I do like the little feller," but rather spoilt the effect by adding that he reminded him of another "little feller" called Harry Truman who was "the biggest rat who ever entered this world," because he had ordered the bomb to be dropped on Hiroshima. Naturally enough he ended, to applause, that he would "rather lose a battle at any time on socialism than on anything else." There was also the Welsh candidate from Ormskirk who, provided the movement stuck to its socialist principles, did not mind if it won in 1964, 1974 or 1984.

The reason the fundamentalists are like this is because for them their whole reason for existence is the conviction that socialism supplies a fundamental critique of present-day society and all its values. Therefore the abandonment of the tattoo-mark of common ownership, which is the guarantee that no true socialist need bear the insult of being accepted as wholly respectable in contemporary terms, must mean an unethical slide into moral relativism, and imperceptible, unsignposted slithering over to the "other side." These fundamentalists have a right to be worried about Mr Gaitskell, just as Mr Gaitskell, seeing the way the world is going, has a right to be worried stiff about them.

Understandable, after the traumatic experience of the afternoon, Mr Gaitskell's supporters spent the Saturday evening in a state of inspissated gloom. The feeling of crisis at that time can hardly be exaggerated; it is as a result of certain things that were said in the bars then that press stories have since begun to appear alleging that this or that Labour dignitary is a potential instigator of palace revolution. Some of the more volatile political personalities, including even uncommitted members of the National Executive, were preparing that evening to behave as if they had never known Mr Gaitskell. It was being said that all would depend on Mr Bevan, who, as usual, was keeping his own counsel about the content of his winding up oration. Rumour had it that if Sunday went like Saturday Mr Bevan would draw strength from the audience and polish Mr Gaitskell off by coming down flatly against changing the constitution. Some interesting names would then have been discovered to have been on the same side.

BUT Sunday was different. Looking back, it was the infelicities of a professional dramatist that marked the dramatic turn of the tide. Mr Benn Levy, the bearded playwright who looks like the prophet Moses, had every right to assume from the frantic applause for Mr Foot's Marat-like denunciations of Mr Gaitskell (pointed finger and all) that the delegates wanted the leader out of the party. So Mr Levy said so; and it immediately became apparent that most people thought this was going a bit too far. Mr Gaitskell's champions were now clamouring to get to the rostrum to prove that they existed. Mr Charles Pannell laid about him in an extremely robust manner, praising Mr Gaitskell to the skies and abusing the "bellyachers." There were boos, but, by attacking, Mr Pannell had given the loyalists for the first time a chance to applaud. The conference heard sympathetically a bank chairman, Lord Pakenham, crack a (good) joke, assert the lack of spiritual values in the nationalised industries and testify to Mr Gaitskell's integrity. It heard out Mr Denis Healey, even blunter than Mr Gaitskell about the growing gap between the party workers and the people, and it applauded enthusiastically when Mrs Shirley Williams brilliantly demonstrated the hitherto rather neglected possibility of combining Gaitskellism with fervour.

The succession of big names in the trade union movement who spoke up for Mr Gaitskell (all except Mr Cousins, who predictably spoke the other way) brought home what should have been apparent all along—that the fundamentalists were not abnormally strong in numbers at this conference, even though they were more than ever on view. But since there was no motion and no vote they could not be doused by the union block vote. This is the kind of conference there would be if voting and block voting were to cease. It is perhaps too near the event to decide whether the public in general would get a dimmer view of the Labour party from the appearance of fundamentalist predominance that results than it does now from the sight of the crude system of weighted trade union power by which conference and parliamentary party are kept more or less in line. But the party leaders can hardly be blamed if they conclude that voteless conferences are too uncomfortable to be true. And the unions will not be sorry to have had this chance of demonstrating their indispensability just at the time when there is so much talk of changing the constitution.

What of the future? This still depends largely on the enigmatic Mr Bevan. Few men have his gift of saying so much so eloquently without indicating whose side he is on. He rescued Mr Gaitskell on Sunday all right, but only in the negative sense that he did not denounce him. He warmed over the delegates' raddled hearts by his characterisations of the affluent society as an ugly and a vulgar one. But those who are concerned over the party's public reputation must have had qualms at his preposterous allegation of a Tory plot to create ten to fifteen per cent unemployment that was in some way foiled by the approach of the election.

Mr Gaitskell must now plod on pushing his constitutional amendments through the machinery of the National Executive and getting them ratified by another conference. Much will depend on whether anyone, and if so who, is planning the kind of psychological guerrilla warfare along this route that might drive the leader at last to the point of concluding that the Labour movement will never make a political party that is worth being led. Mr Gaitskell would only be human if, at one stage last Saturday, he had felt nearer to throwing in the sponge than anybody before Blackpool would have forecast; but by Sunday evening his present determination was clearly not to throw in the sponge, but to rub with it.

Diplomatically Speaking

Britain and Egypt have at last buried the hatchet raised at Tel el-Kebir 77 years ago. The resumption of diplomatic relations means more than merely exchanging ambassadors

WITHOUT diplomatic relations with the United Arab Republic, the British Government had either to do without a Middle East policy, or to try to frame one that took only indirect account of the most significant state in the region. This prolonged abstention did not issue from any calculation of self-interest; rather it was imposed by inhibitions that held the British back from plunging in where they got so badly scalded three years ago. Now that in both London and Cairo the balance of convenience has pointed unmistakably to the need for some form of reconciliation, the plunge has at long last been taken.

The hostilities of 1956 were followed by a period in which no sensible alternative to inaction existed. After a year or so, inaction had ceased to be imperative; as time went on it became less and less masterly. No sustained or purposeful attempt was make to pick up the pieces; instead such opportunities as occurred, admittedly not very seductive in themselves, were allowed to pass with an air of disinterest. This was, of course, the hangover from the choleric emotions of 1956. The outraged and outrageous mood of that year made it impossible for London to see Cairo straight; the obsession that President Nasser must be got rid of was hard to shed. The search for a working relationship with Nasser's Egypt, a logical consequence of the Anglo-Egyptian agreement of 1954, was erased from practical politics until the present day.

Of the many causes of the deterioration after 1954, the most potent was the incontinent profession of anti-imperialism that suited President Nasser's book at this time, but induced in the British a sense of bitterness and betrayal. The revolutionary in whom hopes had been placed as an honest man anxious to improve the popular lot was loosing his considerable energy in a stream of demagoguery. Will the new start be wrecked in the same way? On the British side, there is no place in the grey mood of today for emotive factors like a sense of betrayal. In Egypt, the question is whether President Nasser is now prepared to give priority to running his country over the striking of provoking attitudes.

The Anglo-Egyptian agreement of 1954 ought to have been the start of a new and better phase in the West's relations with Egypt, but it was not. President Nasser sowed distrust wholesale in the West, first by the vehemence of his bid for Arab leadership, and secondly by his uncritical faith in his ability to do business with the Russians on his own terms. On both these fronts he may by now have learnt something from experience.

It is not very long since nervous Arab governments from Baghdad to Benghazi thought President Nasser might turn them out of office any day. The adoring Arab masses confidently expected him to come and liberate them from whatever oppression his Cairo radio had taught them existed locally. This has changed: he is no longer a serious menace to any Arab government. He may retain the devotion of many Arabs—he has always been more popular outside Egypt than at home—but the future of the Middle East does not depend upon him alone. The Arab unity upon which he once hoped to build an empire is not likely to be achieved by him or by anyone else in the foreseeable future. The Arabs, and their friends, agree that unity is desirable, but there is no consensus of opinion how it is to be brought about, or who is to do it.

Egypt's neighbours have chosen their policies without much help from President Nasser. The Sudanese, governed by a divided army, remain resolutely independent. The Libyans, with bright new oil riches in sight, are less interested in the blessings of Arab unity than they might once have been. The Saudis are busy mending their financial fences; the problems they face are domestic and need not affect the world beyond their own borders. The Lebanese, still counting up the cost of a crazy revolt largely inspired and financed from Cairo, have regained a workable balance between their warring factions. The Jordanians, living precariously between hostile neighbours on subsidies from outside, have nothing except troubles to offer to a new master. Even Nasser's Syrian citizens are being allowed to find economic happiness in their own way while he tends their foreign relations and military affairs for them.

Farther away across the desert, the Iraqis have still to decide their future. Seventeen months of a revolutionary government have nearly ruined the country. There is nothing President Nasser can do about the situation in Baghdad except watch in fascinated horror while the Iraqis drift about on a sea of indecision. For a time in 1958 he deceived himself that their purpose in revolting against the Hashemite regime was to join his crusade for Arab unity. But it did not work that way; the Iraqi leaders were not so confident of their gains that they could afford to share them. There are signs that Nasser would go to great lengths to see General Qasim removed from office, but there is no reason to believe that this would do any more for Arab unity than did the revolution which put General Qasim in.

President Nasser enjoyed a remarkable but brief success as an idol without an ideology to back him up. So long as the Iraqis choose to use General Qasim as their idol instead, they can call on the whole Marxist-Leninist ideology to prop him up. Pretty but pointless speeches about Arab unity

delivered in Cairo may not be enough to compete with a new religion that offers salvation on earth to those who will be converted to it. The change in Nasser's position has not come from the usual quarters—from self-seeking Arabs and from his old enemies—but from the threat of communism in Iraq. The future of the Middle East now depends on whether the Iraqis can, or want to, break away from communism.

THE turn of events in Iraq has affected the whole of President Nasser's thinking about the position of the United Arab Republic between East and West. He has advanced from the days when he was indiscriminately abusing the imperialists and extolling the Soviet Union. He has now had time to appreciate the discomfort of having all his friends in one quarter. By last spring he had moved far enough to speak out roughly against Mr Khrushchev for interfering in Arab politics. Mr Khrushchev accepted this rebuff without retaliation, thus giving President Nasser one more reason to congratulate himself on his ability to manage the Russians; however, the Egyptian leader has since then been casting his net wider afield. A significant sign of the times is his decision to switch a number of students from their studies in the Soviet Union to universities in the West; the language difficulties that were mentioned as the reason for this change seem a less probable explanation than that Nasser was struck by the unwisdom of introducing a Russian-trained intellectual nucleus into his country.

So far the Soviet Union, which coasted into the Middle East on the back of western blunders, has avoided the same blunders itself. Whatever Russia's ultimate plan for the eastern Mediterranean, there have been no reprisals in the form of a brusque withdrawal of aid or trade. The relations between the Soviet Union and the local communist parties are again deliberately vague. Money and munitions are still being delivered, and last week a Russian mission arrived in Cairo to take charge of the first stage in the construction of the Aswan Dam. Who, in this still immature relationship, is managing whom is another matter.

President Nasser has learnt that the neutrality he has always professed means balancing countervailing forces from a central position rather than throwing his weight from one extremity to another. This reappraisal on his part coincides with a shift in the policy of the western powers, who no longer respond to Russian economic competition in the Middle East by dashing to the unsubtle extremes of bribery or boycott. For a couple of years or more after the nationalisation of the Suez canal, American policy towards the United Arab Republic was as negative and as purposeless as Britain's own. The change came with the realisation that this made everything altogether too easy for the Soviet Union and that Russian competition, no less than President Nasser himself, was a phenomenon that would have to be lived with.

American aid and investment projects in the UAR are still on a small scale, but recent visitors to Egypt included the director of the Development Loan Fund and a vice-president of the First National Bank of New York. Mr Rucinski, the Middle East director of the World Bank, now apparently sees his way to providing a substantial bank loan for widening the Suez canal. West Germany, Italy and Japan have been particularly active in exploring ways of promoting trade and investment. All this is good, solid ballast for President Nasser's new, and more genuine, balancing act.

Three years ago he was at the peak of his prestige in the Arab world; at the same time he was being edged by western cold shoulders into a critical dependence on the Soviet Union. This state of affairs no longer holds. Among the Arabs, President Nasser has missed opportunities and been repaid with a relative isolation. In his relations with the non-Arab world, the drift is in his favour. There are no longer such strong temptations to divert him from his tasks at home into a bid to cut a world figure. From the western point of view, this is all to the good. Britain and the UAR may still have a lot of distrust to sweat out, but never before have the governments in Cairo and London been in a position to face each other as dispassionately as they can now begin to do. There have been false starts before; it would be folly and worse if they cannot do better this time.

Burying Radcliffe

A growing uneasiness about the Government's attitude to monetary policy has been gently and wisely laid to rest.

THE Chancellor, said Mr Harold Wilson indignantly, had come to the House last week to bury Radcliffe, not to praise him. To the extent that the charge was justified, the interment was a good thing, too. Nobody in his senses ever supposed that all the most controversial economic and political problems of the world could be solved by this committee of one lawyer, one businessman, one banker, one retired civil servant, two trade union leaders, one moral philosopher, one central banking analyst and one Glasgow professor. The Radcliffe committee performed valuable services by publishing a lucid analysis of the working of the British capital market, by wringing more economic statistics out of a conventionally obscurantist officialdom, and by giving the Bank of England that sharp prod in the administrative ribs which it (like other nationalised concerns) urgently needs about once every decade. But once it reached the field of making what the Chancellor gently called its "thought-provoking contribution to monetary theory," the committee ran into a major difficulty.

The reason was obvious. To quote Mr Enoch Powell in the debate:

> The great divide in politics, the divide between those who believe in a centrally-controlled, planned economy and those who believe in a freely developing economy, does not skirt the frontier of monetary policy, but runs slap through the middle.

The committee therefore had the choice of splintering into several minority reports (as, in not dissimilar circumstances, the 1956 royal commission on divorce did) or of achieving unanimity by fuzzing the issues.

It chose the latter. It did come down broadly in favour of monetary weapons rather than physical controls, but it threw in a few compromise phrases and suggestions about strengthening the apparent status of the Treasury *vis-à-vis* the Bank of England, about specially favourable financing facilities for local authorities, and about the possible usefulness of physical controls in an "emergency." These suggestions presumably enabled the trade unionists and any other vaguely left-inclined member(s) of the committee to sign the report. Unfortunately —in a train of events not dissimilar to those that befell the Labour party's policy statements during the last Parliament— it soon became clear that the compromise phrases were achieving much more publicity than was the broad content of the report.

In recent weeks, therefore, the Radcliffe report has had a baleful influence on economic discussion and on the image of British economic policy reflected round the world. The financial press now has a file-full of instances where liberal minded leaders of economic opinion and policy abroad have gone out of their way to tell journalists how disturbing it is that Britain, once the home of independent central banking, should appear to favour changes that would make the Bank's subordination to the Treasury more explicit. The idea that (to quote the cautious Mr Amory) the committee "perhaps underestimated the part that can be played by monetary policy" has been even more widely spread. Questions were being asked whether this report might somehow "force" the British Government to abandon the broad economic philosophy that has served it so well since late 1957. There should be cheers for the Chancellor because, by accepting the useful recommendations of the committee and rejecting the unfortunate trimmings, he has set this disturbed attitude of mind to rest. This is a story that should be remembered in future when deciding how widely or narrowly the terms of reference of committees of inquiry ought to be drawn.

NOTES OF THE WEEK

THE SUMMIT

Taking It Easy

ALL one can hear now is the patter of dragging feet. Mr Khrushchev says he wants an early summit but, of course, he is willing to wait for the other side. He declared in Budapest on Tuesday that, while the summit could still be held before his talks with General de Gaulle next March, it was the general who wanted the talks to come first and he (Mr Khrushchev) was simply fitting in with the French:

> General de Gaulle wants to have an exchange of views with me before the conference. His wish is not unfounded.

This self-restraint is admirable. All the same, the impression left by both sides is not one of undue haste.

The truth seems to be that the more preparatory meetings there are, the less prospect Mr Khrushchev sees of progress towards a German settlement. He put the blame for this in Budapest on Dr Adenauer, who, he said, was the only western leader who denied that an "abnormal position" existed in Berlin. But Mr Khrushchev seems unlikely to take any new steps in Germany before the ten-power disarmament conference begins next year, and while the nuclear test talks remain mildly hopeful. The view has been gaining ground in London that these negotiations may offer better prospects for Russian policy than the summit itself.

But the Soviet press and radio have been uneasy about this hesitancy on the summit path. Soviet broadcasts have been picking on Dr Adenauer's insistence on careful preparation. British suggestions that Mr Khrushchev may decide to wait till the next American president has been elected have been dismissed as a mere ruse to shift the blame. The Soviet public is still being assured that east-west relations have sensibly improved, but the western critics of peaceful coexistence are duly frowned upon. Mr Dean Acheson has been designated the "tired drummer boy of the cold war" on the strength of his remarks to the Nato parliamentarians last month; others under displeasure for their recent oratory are M. Spaak, Herr Strauss, and a new militarist face to terrify Russian children, Mr Harold Watkinson.

GERMANY AND FRANCE

Friendship without Agreement

FEW liaisons depend so much for their value on permanence as the new Franco-German *entente*. But the underlying differences are great, and much care is needed to conceal them. On the eve of Dr Adenauer's visit to Paris in the mid-week, the German press was not free of worries about the French partner; it had been upset by the searching of a German ship last month by French warships and by the activities in Germany of the French Algerian counter-terror organisation, the "Red Hand." Sources of deeper concern arose from General de Gaulle's concept of an independent French role in world politics and defence. But Dr Adenauer is a patient man with a vision, who has no intention of jeopardising what has been achieved within the European Community for the sake of what has not.

Still, a difference was allowed to come out into the open. At a press conference on Tuesday the German spokesman, Herr von Eckardt, made it clear that his government did not sympathise with the idea of a nuclear third force in Europe, and it did believe in the integration of Nato forces. That is a decided contrast with President de Gaulle's known views. But it appeared on Wednesday that Dr Adenauer had succeeded in shifting the general a little, if only temporarily and on the surface. The Chancellor then told the press that the two sides had agreed on the necessity of integrated defence within Nato. A French spokesman later dismissed the differences between them as "philosophical." How long it will be before these philosophies intrude once more on policies remains to be seen.

Thus Dr Adenauer did not return empty-handed to Bonn. Quite apart from the agreement of the two men to maintain their existing ties within the European Community, he took with him an assurance on Berlin on which he apparently sets much store. His visit to London in November did not remove his fear that the British, and the Americans behind them, might contemplate a separate deal on Berlin. The French leaders assured him that at a summit meeting the issue must be linked, not just formally but in substance, to all the other pieces in the west's Geneva package plan. Dr Adenauer, for his part, has returned to a well-worn theme, that progress in disarmament must be tied to progress on political questions—meaning German unity.

A diligent effort is in progress to tie any subjects on which agreement is attainable to others on which it is remote.

WESTERN EUROPEAN UNION

A Ghost Walks

EUROPE is crowded with ghosts of international organisations, born of good intentions, never nourished with political resolve, and now struggling for even a shadowy existence in face of the flesh and blood of the Six and Seven. At Strasbourg the Council of Europe, in Paris the Organisation for European Economic Co-operation, are looking desperately about for something to do. But no European organisation is so inured to the phantom life as Western European Union, the body set up in 1954 to provide a respectable framework for German rearmament after the death, stillborn, of the European Army. For five years its Council and its Assembly have achieved nothing but a library full of unimplemented resolutions.

Meetings like Dr Adenauer's with President de Gaulle and the meeting of the Ministers of the Six in Strasbourg last month have borne in on the British Government, however, that political processes are going on in Europe from which it is left out. Casting about for an organ for consultations in which it, too, can play a part, it has hit on the seven-power WEU. Despite some French suspicions, both the French and German governments have agreed that the function of WEU might be extended. When the Assembly of WEU met in Paris this week, a British spokesman formally proposed that a meeting of the Council of Ministers should be held immediately after any political consultations by the Six on external affairs. The idea is good. The weakness is that without some more fundamental agreement between the British and the Six on the issues that divide them, WEU must remain a house without foundations.

A substantial further idea for animating it was, however, put forward by Mr F. W. Mulley, the Labour MP, as *rapporteur* of the defence committee, and gained the Assembly's assent. This idea is a joint WEU deterrent, which would include the British nuclear effort. It does not at present enjoy the public backing of the Government; but with development costs of the nuclear deterrent now so clearly outgrowing national resources, and relations with western Europe so badly in need of improvement, it is a less fanciful proposition, in domestic terms, than it would have been a little while ago. It does, however, beg many questions about future east-west relations in Europe. It is also, for its purpose, two or three years too late. What might then have been presented as an imaginative gesture is almost certain to be seen by the French today as a last-minute British ploy to deprive them of their bomb. The result may be less harmony, not more.

"WHITE" AFRICA

Labour's Mind Made Up?

THE conflict between white and black in Africa is evidently a godsend to the Labour party at the moment; amid all other divisions, it provides an emotional issue on which the Gaitskellite wing can combine with—indeed outdo—all other sections of the party in its adoption of a strong moral line. Under Mr Gaitskell's direct leadership, Labour is coming out, even more strongly after the election than before it, as champion of the African nationalist. It will be surprising now if it joins the Monckton commission, so long as the terms of reference bear any relation to those that Lord Home agreed with Sir Roy Welensky. If Labour boycotts the commission, the African party leaders are likely to do the same, and the result will be a considerable loss of authority by the commission. That will not worry Sir Roy Welensky, who never wanted a commission at all. He wants the field to be free for straight inter-government discussions, uncomplicated by any findings about the state of African opinion, at the 1960 constitutional conference; the misfortune is that Labour is helping him.

The Labour party has made its stance plainer in the row that it seeks to raise over the Prime Minister's visit to South Africa. As he refused to refuse to go, Labour tried to make him condemn the South African government's policy in advance. He naturally replied that it was a domestic matter for South Africa; but in an endeavour to embarrass him with his hosts, Labour has now put down a motion condemning colour discrimination for early debate in the House. Mr Macmillan is entitled to insist that he must be able to visit South Africa, as he does Russia, without necessarily approving the policy of the government there—just as the Duke of Edinburgh must be able to visit Ghana, without putting the Royal seal on the repressive legislation with which Dr Nkrumah, in his own all-black context, comes near to emulating Dr Verwoerd. This need not inhibit Mr Macmillan from saying, again, that his view of apartheid is fully expressed by British policy in Kenya, Tanganyika and Basutoland, and in the preamble to the constitution of the Federation of Rhodesia and Nyasaland, all of which are disliked in the Union. He will do well, therefore, not to be mealy-mouthed in the debate. The Conservatives would be mad to be manœuvred now into appearing as the champions of white *baasskap* anywhere in Africa.

TELEPHONE TAPPING

The Invisible Nark

THE widespread public anxiety in 1957 over the official tapping of private telephone conversations by the police, when it was revealed that the then Home Secretary had passed the transcript of a tapped conversation to the Bar Council for use in certain disciplinary proceedings, was only allayed by the appointment of a special committee of privy councillors chaired by Lord Birkett. This committee's report assured the public that telephone tapping was rare, that it took place only under the personal warrant of the Home Secretary, that it was used as a last resort in cases of serious crime or state security, and that, apart from the foolish Bar Council lapse, evidence obtained was used for detection and not to secure a court conviction. The Birkett committee recognised the case for telephone tapping, subject to these stringent conditions, but added an express rider that under no circumstances should information obtained be made available to private individuals or bodies, or domestic tribunals "of any kind whatsoever." The emphasis on this last point was doubtless dictated by the absence of binding rules of evidence in many such tribunals.

Now, scarcely two years later, the Reading police have handed the transcript of a tapped telephone conversation to the General Medical Council, which was taking proceedings to strike off its register a local doctor accused of adultery with a woman patient. Had a warrant for telephone tapping been granted under these circumstances, the matter would have been grave enough, but the situation now revealed by the Home Office is much worse: a warrant was never applied for. The woman witness who was the other party to this telephone conversation apparently agreed to the tapping at police subornation, and the police simply listened in on an extension. The Home Office itself is therefore hardly to blame, but the arrogant action of the Reading police, who should at once be disciplined, makes nonsense of the whole elaborate system of safeguards described by the Birkett committee. The time is now ripe for legislative action.

It is quite clear what form that action should take. Under section 58 of the Post Office Act, tampering with postal packets is already a criminal offence; apparently interference with telephone calls is not, presumably largely because telephones had hardly been invented when Post Office Acts were first drawn up. No time should be lost in creating a new misdemeanour of unauthorised tapping of private telephone calls, with a punishment appropriately severe.

ITALY

Signor Segni in London

GOOD news, in diplomacy, is usually not news at all. Italy and Britain have no great differences to settle, no diametrically opposed international attitudes to reconcile. Inevitably, therefore, the visit to London this week of Signor Segni and Signor Pella, the Italian prime minister and foreign minister, attracted less attention than many a less amicable visit would get. But that the British Government welcomes Anglo-Italian talks as an important and useful part of the intricate pattern of western consultations is demonstrated by Mr Macmillan's prompt acceptance of Signor Segni's invitation to pay a return visit to Rome early next spring.

Italy has not found it easy to chip out a satisfactory niche for itself in the councils of the West. Not strong enough to claim equal rank with the big three, it is too big to be treated as a minor power; unlike Germany, it presents no special "problem" to keep it in the forefront of attention; it is too heavily committed to the anti-communist alliance, and too deeply involved in, and attracted by, the idea of a European union, to seek the distinction of standing aloof. Yet to judge by its participation in the western powers' pre-summit diplomatic exchanges, Italy's claim to have a special contribution to make to western diplomacy (which is reinforced by its membership of the ten-nation disarmament commission) is gaining recognition.

For Britain the Italian government's diplomatic activities can have a particular significance. The fact is that this country badly needs a sympathetic, reasonably influential friend in western Europe. Britain's attitude towards the Six, and sponsorship of the Seven, have given currency to plenty of dark suspicions about British motives and designs. Neither General de Gaulle nor Dr Adenauer is well-fitted to understand the British point of view—let alone explain it to anyone else. The Italian government, on the other hand, seems not only willing, but anxious, to make the best of the British. It has reservations about the dominance of France and Germany in the European community, and would be glad to see Britain associated as closely as possible in the affairs of Europe. Relations between the Six and the Seven were among the principal subjects discussed at this week's Anglo-Italian talks. Britain and Italy alone can hardly hope to construct a bridge between the two groups; but it will be something if the British point of view can be sympathetically, or even accurately, described within the councils of the Six.

LAW ENFORCEMENT

Matters of Judgment

TWO cases of apparent judicial lack of judgment have arisen in recent weeks. A magistrate has used language of almost incredible violence in sentencing a young delinquent convicted of a minor offence, and a high court judge has hurried a jury into reaching a decision. "I will leave this court in ten minutes," said the judge, "and if by that time you have not arrived at a conclusion, you will be kept locked up here all night." The Press has quite rightly taken up both these cases and dealt out some astringent criticism, so fulfilling one of its most vital functions as watchdog for individual liberties.

The attempt to carry the matter further in the House of Commons—especially the motion by a group of Labour members, censuring the judge—is quite another matter. It is true that the British constitution knows no rigid separation of powers; as Bagehot pointed out, its efficient secret is the fusion of legislature and executive. The doctrine of the final supremacy of Parliament over the judges is also firmly established, but in practice judges are accorded an almost total independence. Accordingly questions concerning the conduct of their office may not be asked in Parliament, and only an extreme case of judicial misconduct, which no one suggests arises in the present case, leads to a joint address of both Houses to remove a judge from the Bench. Magistrates may be dismissed by the Lord Chancellor for "inability or misbehaviour," but the power is rarely exercised. If every judicial error were to be made the subject of a parliamentary motion, the independence of the judiciary would be at an end. If passed, such a motion would place a judge in an intolerable position; if defeated, Parliament would seem to be condoning conduct which may indeed be reprehensible.

In any case, as is pointed out by a Conservative amendment to the Labour motion, any miscarriage of justice caused by a judge's error of judgment can be put right by the Court of Criminal Appeal; and that court's presiding officer, the Lord Chief Justice, has a special responsibility as head of the Queen's Bench Division for supervising the conduct of his fellow judges. The present Chief Justice, during his brief tenure of office, has not been remarkable for reticence, especially when overseas, and can be relied upon to deliver any necessary rebuke.

COMMERCIAL RADIO

To do with Trade

IT is easier for a camel to pass through the needle's eye than for a motion favouring the establishment of a commercial radio station to pass through the House of Lords. But one might at least have expected their lordships to hold a more enlightening debate than they did about Lord Teynham's motion last week. As Britain's ration of the long and medium wavelengths is already fully utilised, a commercial radio station would either have to take a frequency away from the BBC (which, admittedly, now often sends out the same programme on several frequencies) or else squeeze into the VHF band (which only 2 million British radio sets can receive now, but which 60 per cent of the population is likely to be able to listen to by 1965). After claiming a large share of the VHF range for ambulances and other essential services, Lord Chesham, for the Government, opined that "there just would not be room in it for a complete new sound programme for national coverage"; but perhaps "by a careful deployment of frequencies there might be room for a number of very low-powered local stations with very restricted coverage."

It is obviously desirable that these local stations (if there really is room for them) should be started as soon as the potential audience for them makes economic sense. Four aspiring commercial companies are already registered. It might have been supposed that debate in the Lords would start from acceptance of this point, and go on to wrestle with two broad questions. First, since advertising has proved a golden source of finance for television, it would be nice to draw some finance from it for sound radio too. This does not necessarily mean that any new stations should go simply to the highest commercial bidder; the idea of some local stations being attached, say, to universities, but partly financed by advertising, has great attractions. Alternatively, if it is argued that advertising can finance only light entertainment, there is an arguable case for attracting some of the British money which now finances so much light entertainment from Radio Luxembourg back to finance light entertainment from London, whether or not the nationwide Light Programme concerned continues to be operated by the BBC.

Secondly, everybody knows that a principal and welcome effect of breaking the BBC's television monopoly has been to make the BBC, on its sound as well as its television programmes, much more enterprising in exercising freedom of comment on the air; indeed the BBC is now magnificently less nervous about questions of "political balance" than independent television, which is scared because its policy about advertisements is so constantly under political attack. Some people would say that this removes one of the arguments for breaking the BBC's monopoly further. Others would claim that a further breach of the monopoly would help to remove the restrictions on free comment that remain.

There were here plenty of profitable channels for debate. But not for many of their lordships. The tone of the House was set by Lord Greenhill who talked about the "nefarious intentions" of supporters of the idea of commercial radio, who have "one aim only—namely, the lining of their own pockets." The nasty fellows must not be allowed into any more people's drawing rooms because they have something to do with trade.

CULTURAL EXCHANGES

Far To Go

WHEN Mr Macmillan left Moscow in March it was agreed that teams should meet at least once a year to discuss cultural relations. With all the panoply of

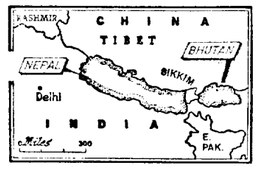
delegations, credentials, and "equally authentic" texts, a cultural agreement for the twelve months beginning next April was signed in London on Tuesday. The very word, as an accredited British cultural delegate once wrote, is like a knell. Everyone will approve of cultural relations being improved, widened, deepened, or whatever they are, and of the governments doing their bit. But the sad fact is that what governments, and especially the Soviet government, are prepared to commit to paper in this field is always a little way behind reality.

Thus one may suspect that the decision that three medical specialists from each country shall spend *a fortnight* in the other is not more, but less, than the medical men are doing already. Four Fellows of the Royal Society, and four members of the Soviet Academy of Scientists, three weeks each; it is not many, or long. Two research workers each, up to ten months: better. Twenty post-graduate students each way, for a whole academic year: much better. The Old Vic, a party of headmasters *and headmistresses*, an art exhibition each way, the Kirov Theatre Ballet, *Sir Thomas Beecham*—all very well; but this sort of thing goes on already and needs no sealing-wax to hallow it. Cultural agreements ought to establish a framework within which human intelligences can communicate, not tell everybody where to go.

However, what everybody must hope is that these first tottering governmental steps are an earnest of a wish to get somewhere. The agreement says nothing about any books, any journals, any printed matter at all; that interesting invention of Gutenberg's might never have been made. We may suppose that the British side did not fail to mention the subject; it can only be that the Russians would have none of it.

But the truth is that Soviet corporations, planning bodies, and learned institutions do buy British publications, some of them on quite a scale; they pass them round, and they make digests which circulate in mimeographed form, all quite respectably, among their staffs and members. The numerous class of Soviet intellectuals is important enough to insist on keeping abreast in this way of what foreigners are saying, and sophisticated enough to stand the shock. By now there is no real reason why the Soviet government should not draw the sensible conclusion and allow its private citizens to subscribe to foreign journals, or order foreign books, directly. Equally, there is no reason of substance why it should go on wasting its money, and crowding the air, by jamming the BBC; but that, at least, is something that it has agreed to think about.

A Nehru Doctrine



WHEN on November 27th Mr Nehru in a speech to the Indian parliament declared that India would defend Nepal against any aggression by China, many of his hearers thought at first that "Nepal" was a slip of the tongue for Bhutan, to which the Indian prime minister had already given a guarantee. But he later confirmed, when questioned, that he had indeed intended to include Nepal in his statement. His reference to the whole range of the Himalayas as the line on which India meant to stand made his declaration one of great significance, for it implied a general conception of defence of the Indian subcontinent, which may complicate relations between India and Nepal as well as between India and China.

Nepal is today internationally recognised as a sovereign state and is a member of the United Nations. At the beginning of the century, however, it was by no means clear that Nepal was in an entirely different category from major Indian States such as Hyderabad and Kashmir which were subject to British-Indian "paramountcy." Only in 1923 did Britain specifically recognise Nepal by treaty as independent. When, therefore, power was transferred in Delhi in 1947, Nepal was not reckoned among the Indian States which were invited to accede to the new Indian Union, and made no move to join it of its own accord.

Relations between Delhi and Katmandu were established as between two sovereign states, and India did not question Nepal's right to remain separate from India, as it did question the right of Hyderabad. On the other hand, there were soon signs that Delhi took a somewhat paternalistic interest in the affairs of Nepal, and regarded it as being in some sense part of India. The revolution which overthrew the hereditary ministerial regime of the Rana family in Nepal in 1950-51 was organised from Indian territory and openly favoured by the Indian government. But the change did not produce a Nepal subservient to control from Delhi; the new political leaders turned out to be no less concerned than the Ranas had been to maintain Nepalese independence; some of them even sought to take advantage of Nepal's geographical position between India and China by balancing diplomatically between the two. Nepal now accepts economic and technical aid from both India and China as well as from America and Russia.

Nepal, as it now exists, was a dynastic creation of the eighteenth century incorporating several different peoples and tribes. The official language, that of the Khas, is akin to Hindi, but the important Magar and Gurung peoples—from whom the British Gurkha regiments have always been mainly recruited—speak languages akin to Tibetan, and there is an area in the north-west where the population is purely Tibetan. Since the introduction of parliamentary democracy into Nepal its internal politics have shown great instability, and there is a tendency for pro-Indian and pro-Chinese factions to emerge.

China has territorial claims on Nepal as well as on India, and could use them, backed by a show of strength, to bring Nepal increasingly under Chinese influence. Successful political subversion in Nepal would bring Chinese power well to the south of the Himalayas and down to the edge of the Gangetic plain. Mr Nehru's declaration may be taken as a warning, not only to China not to invade Nepal, but also to Nepal not to yield to China.

ANTARCTICA

Cold Peace

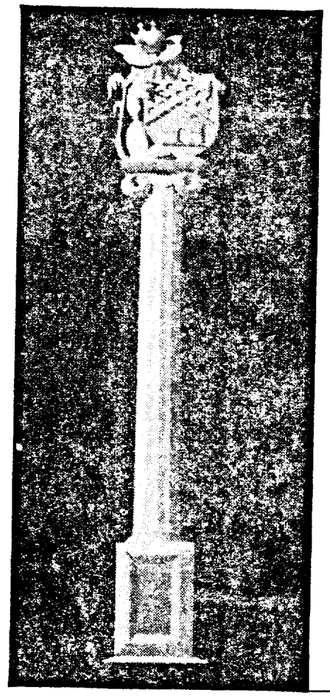
IT is a start, of sorts. Antarctica was the lowest hurdle on the international circuit; all the same, it is something to see the twelve-nation group, including the Soviet Union, safely over it together. Now nuclear weapons will not be tested in one continent at least, inspectors can range at will there to prevent military activities, and aerial observation can be conducted over any area at any time. It has taken fifteen months of preparatory talks and six weeks of formal negotiation to settle these, and other points, in the thirty-year treaty signed in Washington on Tuesday. Settling Antarctica's affairs will not mean that many people sleep more comfortably of nights, except, of course, the ambassadorial circle that bore the burden of the Washington talks. But it is a sensible step forward that the Soviet Union has agreed to put independent inspection into practice in one corner of the globe (the Arctic corner will be a much more difficult proposition). Outer space is the next diplomatic hurdle of this kind.

It is plainly desirable that the habit of scientific co-operation in Antarctica, stimulated by the International Geophysical Year, should now be encouraged under the treaty. By deciding to continue the political *status quo*, the twelve powers have prevented new rivalries and put old ones, including the Argentinian and Chilean quarrel with Britain, into the deep freeze.

POWER STRIKE

Undimmed

LAST Monday's one day strike in London power stations, organised by a group of shop stewards who were dissatisfied with the progress of their pay



Are you certain

that your business and private affairs will be so managed that your family will have no worries? Are you fortunate enough to be able to rely on a friend to act as your executor? Will he really be able to deal with everything as you would wish?

Even if you are satisfied on all these points, it will still be to your advantage to ascertain what services we can render in connection with trusts, executorships and similar matters. We have over fifty years of experience, and it is our particular aim to render a personal and sympathetic service.

You are invited to consult the Manager of any National Provincial Bank branch.

National Provincial

for friendly service

NATIONAL PROVINCIAL BANK LIMITED

To every young husband...

Now you have someone else to think of, think well ahead . . . be prepared, with Assurance, for any eventuality the future may have in store. For wise Assurance it will pay you to have a word with a Scottish Mutual representative. For details without obligation, write to one of the offices below.

THE SCOTTISH MUTUAL

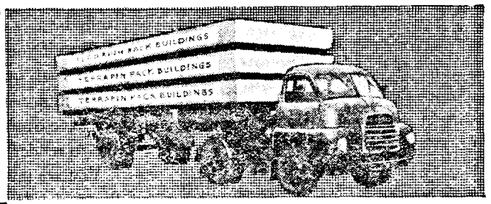
ASSURANCE SOCIETY

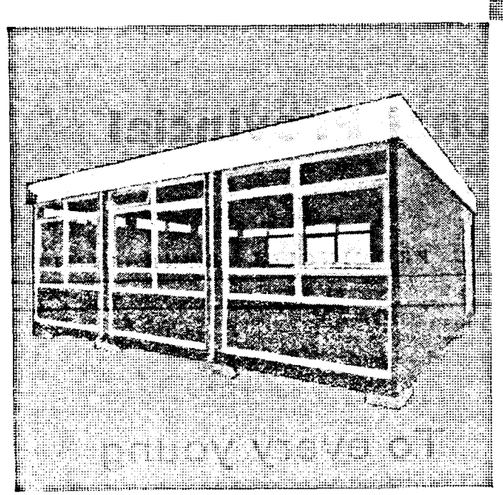
Head Office · 109 St Vincent Street · Glasgow C2 · London Office · 6 Bell Yard · Law Courts · WC2

Telephone: City 6321 Telephone: Chancery 9411

In our case all we needed was 600 sq. ft. of extra office space—we 'phoned Terrapin...

. . . In next to no time three Terrapin Pack Units arrived on our site and . . .





8 hours later our office was ready for occupation—that's 'Terrapinability'

Terrapins are not just pre-fabricated buildings they are factory made building units of standard dimensions and are delivered to the site in *pack* form, ready for single or multi-span erection—complete from floor to roof, including doors, windows, roof covering, floor covering, interior and exterior decoration, glazing, lighting system, and rainwater pipes—all for 30/- to 35/- per sq. ft. of floor space, erected on your site.

Dismantling and re-erection can be carried out quickly, and at incredibly low cost, without fear of damage. Move them *when* you like, *where* you like, and as often as you like.

Prepare your own estimates:

Terrapin Broadsheet No: T.P.3 contains full details and shows you how to estimate your own costs. Write or 'phone for your copy NOW.

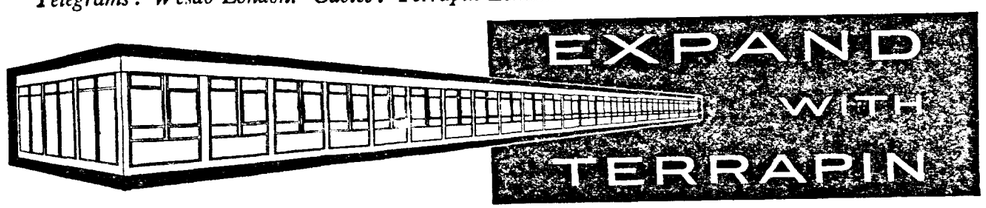
Telegrams: Wesdo London. Cables: Terrapin London.



claim, was a flop. Instead of the 14,000 strikers forecast by the more sanguine leaders of the shop stewards' committee, only 4,000 men actually stopped work and power supplies were unaffected. Officials of most of the five unions concerned were openly hostile to the strike, and even the Electrical Trades Union—which likes to work on the basis that any strike is official until it is proved otherwise—was not enthusiastic.

The interesting point about the power workers' action, however, is that, as well as being a flop, it was possibly illegal. By the Conspiracy and Protection of Property Act of 1875, strike action in gas or water undertakings was made illegal providing that it was done "wilfully and maliciously and in the knowledge that the action would deprive the consumer of supply." This clause was extended to cover power stations in the 1919 Electricity Supply Act. One would like to hear the electricity generating boards' opinion on whether the men offended against it.

MALTA

"Scram Out of Malta"?

On his way to Kenya next week—after his private chat with Mr Mboya—Mr Macleod is to try his charm on Mr Mintoff. He is likely to find that cross Maltese as intransigent as when he walked out of office in April, 1958. During the interregnum of governor's rule (the interim constitution is less advanced than that of British Guiana), the administration has tried to get Malta launched on the conversion of its economy from one wholly dependent on the naval base to one largely sustained by civil industry and exports. The Hives committee has tried to lure industry to the island with Ulster-type incentives, and Messrs C. H. Bailey have been turning over part of the naval dockyard to ship repairing. At the beginning of last month the Maltese government weighed in with its own five-year development plan to provide the "infrastructure" for the change-over—water, roads, electricity, technical education, tourist advertising, and so on, to the tune of £20 million.

The plan is not above criticism, as Dr Balogh argues in a letter published on page 959. But there are two deeper difficulties. Although the plan's nominal objective is "full employment," its practical objective is the more modest one of merely making Malta viable. In the Malthusian situation in Malta, full employment, emigration and "equivalence" (to British living standards as demanded by Mr Mintoff) are all dependent variables in the equation; more of one means more or less of the others.

The second difficulty is Mr Mintoff. He has responded to the government's efforts to get Maltese redevelopment started by doing all he can to wreck the commercial dockyard scheme and to frighten off other businessmen. The ban on overtime operated by his trade union has effectively turned away valuable ship repairing business. This, Mr Mintoff calculated, would show that you cannot run Malta without Mintoff and force the British government to treat with him; when he heard of Mr Macleod's visit, he triumphantly commented that he would meet him if "he has any favourable statement to make on our well known constitutional requests for independence." The time is coming when the Maltese people will have to be asked if they endorse Mr Mintoff when he speaks for them in these terms. If they do, Mr Macleod should turn to serious consideration of Mr Mintoff's demand—echoing Mr Mboya—that Britain "scram out of Malta." There is sense in trying to save Malta from ruin against Mr Mintoff's will—or even against the will of the Malta Workers' Union—but not against the will of the Maltese.

CYPRUS

The Last Lap

Sir Hugh Foot announced on Tuesday the imminent ending of the state of emergency in Cyprus. Most of the emergency regulations have in fact already been cancelled. The most important effect of the complete ending of the emergency will be the lifting of the ban on Akel, the extreme left-wing, communist-controlled party. This is a sensible step. Although proscribed, Akel has been managing to function pretty effectively. Its annual congress was forbidden last autumn; but in October Akel's general secretary openly held a press conference in Nicosia at which he announced that the congress had been successfully held in secret and expounded the party line. Now Akel will no longer enjoy the advantages of martyrdom.

Unfortunately, whether proscribed or legalised, the Cypriot communists have had their capacity for making mischief considerably increased by the decision of the new Democratic Union, formed three weeks ago, to put up Mr John Clerides, QC, as a rival candidate to Archbishop Makarios in the presidential election on December 13th. Last week there was protracted bargaining between Akel and the archbishop over the terms of its electoral support. Evidently its price, presumably in terms of seats in the new Cypriot assembly, was too high for the archbishop; on Friday of last week, Akel announced that it would support Mr Clerides for president.

No doubt Mr Clerides is standing from the best motives. But his supporters in the Democratic Union are a motley collection, mostly right-wing, but with some left-wing dissidents as well; they are united by their dislike of the Zurich and London agreements (although they say that they accept these as a *fait accompli*), by their distrust of the archbishop's "dictatorial tendencies," and by having been passed over in the distribution of offices under the new regime. It will be a very great pity if they, and their tactical allies in Akel, succeed in seriously dividing the island just when—as Sir Hugh Foot said on Tuesday—it is entering "the last lap" before independence. The last lap may yet prove the hardest.

NATIONALISATION

Behind the Veil

The practice of using adjournment debates to ventilate grievances about the nationalised industries gets round the rule which prevents the use of parliamentary questions for the purpose, but does not solve the probably insoluble problem of combining public accountability with freedom from day-to-day parliamentary interference. Last week's debate in the Commons about delays to three parcels handled by British Road Services—on the face of it a "day-to-day" question if ever there was one—was originally interesting for this reason alone. One could derive some entertainment—and instruction about Labour's possible future tactics in this sort of debate—from the spectacle of Mr Wedgwood Benn, Labour's new shadow Minister of Transport, hurriedly echoing in the last available minute the Government defence of British Road Services against the charge of underpaying, mismanaging and discouraging its staff. One could admire the way in which Mr John Hay, joint parliamentary secretary to the Ministry of Transport, filled his constitutional role of messenger-boy between Parliament and Transport Commission with perfect propriety. One could agree with him that the mistakes complained of could equally well have occurred in any private enterprise haulage concern. But then there emerged, almost casually, a remark which Mr Gaitskell, for one, ought to ponder.

British Road Services, said Mr Hay, was worried about its shortcomings. It had plans to improve its services. But it was keeping these plans dark because otherwise its private competitors would improve theirs too. Is this right? Long ago, one of the attractions of public enterprise was supposed to be precisely that it would break down the barriers of secretiveness which, in a competitive world, wastefully impede the spread of the best practices; it was to be a powerful levelling-up agency, putting innovations of technique and management at the disposal of all, instead of monopolistically and immorally guarding them to the public loss and detriment. Mr Gaitskell has indicated that one of the new sorts of nationalisation that might now find its way into the Labour party's programme, in order to discourage the others, is the nationalisation of parts of key industries (precisely on the analogy of BRS) instead of the establishment of giant state monopolies. If so, is he happy with the Conservative Government's new ruling that one of the few genuinely unassailable advantages—in theory—of this

sort of public enterprise be permanently forgone, for the same reasons as lead a fashion house to keep next season's waistline under lock and key?

HUNGARY

Mr Kadar Reports

THREE years ago there were "temporary serious difficulties" in Hungary. But today these have been successfully overcome, the correct lessons have been drawn from past mistakes, and everything is now pretty well for the best and likely to become more so. Thus, in effect, spoke Mr Kadar on Monday, the opening day of the seventh Hungarian communist congress. It was the kind of speech that might be calculated to discomfit the United Nations as it prepared to take up the Hungarian question once again. But Mr Kadar must also have had his own reasons for putting a smooth face on the past and a confident one on the future.

Although the membership of the Hungarian communist party is now only about *half of the pre-1956 figure of 900,000*, it must seem a far cry to those early November days of *1956* when the party was completely disorganised and utterly discredited. Moreover, Mr Kadar has successfully survived three gruelling years as top communist boss in Hungary; and if he has failed to win the willing support of the Hungarian people, he has successfully ridden over the factions and intrigues within the party leadership, and, more important, retained the support and approval of the Russians—as Mr Khrushchev's reassuring presence on the platform in Budapest demonstrated.

Yet in his report to the congress Mr Kadar could not altogether avoid uncovering the fragile foundations of his party's power. He denied rumours current in Budapest that the Soviet forces were soon to be withdrawn. He said that they were not stationed in Hungary for "domestic political reasons" but because of certain unsolved international questions. This explanation will convince few people and is not borne out by the reported disposition of the Soviet troops in Hungary—in garrisons round Budapest and provincial centres, not as a field force. Mr Kadar also made it clear that there was no intention of re-introducing the multi-party system; this, he said frankly, would only favour the counter-revolution. And he picked out for special mention "our organisations under the *ministries of interior and justice*"—which include the secret police, the successors of the hated AVO, who are responsible for the continued repression, about which disturbing reports still trickle through to the West.

DIRTY RIVERS

Gardy Loo!

IT is satisfactory that the private member's bill on river pollution, introduced by Mr James Ramsden, should have received all-party support at its second reading last Friday. It is not, in principle, an ambitious bill; it provides merely that the powers now exercised by the River Boards set up in 1948 over pollution in non-tidal waters should be extended to tidal estuaries. But this simple aim covers many difficulties of drafting, and Mr Ramsden is going to need the aid which the Government has promised him in making some fairly considerable amendments in committee. At what point does an estuary cease to be an estuary? Why should a set of riparian authorities oversee the sewage-disposal arrangements of a seaside town? On the other hand, if that town's sewage is swept along the coast and into their estuary, what remedy have they? Tides and currents are no respecters of municipal boundaries. Despite these difficulties, there is a wider reason for welcoming the bill.

The social services in this country virtually began with sewage, in the days of Edwin Chadwick; although there are not many votes on the subject, it is high time that it was restored to something like its former primacy. The nineteenth century learned the hard way that individuals could not be left to deal as they pleased with their own slops and sewage; the vastly more overcrowded twentieth century, although medically armoured against the worst effects of communal insanitation, is only grudgingly learning that the same holds good of municipalities and even of river basins. The discharge of untreated sewage anywhere, by any authority, ought to be as intolerable to public opinion as the robust old habit of crying "Gardy loo!" and emptying the close-stool out of the window. Inland local authorities must establish sewage farms; there is no reason, in economics or social justice, why an authority which happens to have a river or estuary handy should exonerate itself from that duty by turning its waterway into a sewer. The right kind of official policy is going to involve being very much tougher towards arguments by local authorities that it is not "reasonably practicable" to dispose of sewage otherwise than with a communal cry of "Gardy loo!"; it is also going to involve, eventually and civilisedly, the spending of a lot more money.

CENTRAL EUROPE

The Richer Communists

A SPECIAL kind of communist variety show took place at the Karl-Marx-Stadt opera house in east Germany at the beginning of last week. Pretty Saxon girls demonstrated the latest products of the people's own clothing industry; hundreds of children in young pioneers' uniforms trotted across the stage, waving red flags; Soviet troops showed their skill as entertainers. Cheer-leaders conducted the audience in hand-clapping and rhythmic shouts of "*Freund-schaft, Freund-schaft.*" Herr Grotewohl and Mr Novotny, the Czechoslovak president, watched with benign smiles. Mr Novotny and the Czechoslovak prime minister, Mr. Siroky, left the hospitable east German soil, after a week's stay, on November 25th.

Demonstrations of German-Czech friendship are not mere formalities in Karl-Marx-Stadt, the former Chemnitz, so close to the old Sudetenland from which the Germans were driven after the war. For all the formal reconciliation between east Germany and Prague, real working relations based on the ordinary trust and confidence of friendly states have been a tender plant, slow to grow. But the time has come, in the view of the communist rulers generally, for the German Democratic Republic to be given every chance to prove itself as a separate state and its worth as a full member of the Soviet block. This is what the Czechoslovak state visit must mean, if it means anything.

The Czech and east German communists are now running the two most prosperous countries of the Soviet block, a position that places certain obligations upon them. The upshot of their latest talks is that they have undertaken to co-operate more closely in the development of their engineering, chemical and consumer goods industries; more, and more direct, contacts between their many research and planning institutes are also contemplated. The joint communiqué when the talks ended on November 26th pinned hopes on this co-operation for the success of the "socialist camp" in the economic competition with capitalism; not only they themselves, the leaders seemed to suggest, but their poorer Balkan neighbours would benefit from the forcing of technical progress in the two most advanced of the Communist states.

SOVIET UNION

Latvian Upsets

MR KHRUSHCHEV'S experiments in economic decentralisation were bound to raise political problems in the non-Russian republics. This is confirmed by repeated reports of changes in leadership,

IN LIFE
NEWS IS ONLY
THE BEGINNING!

Influential people read
LIFE INTERNATIONAL for its searching
examinations of world-wide topics

News of people, places, events is the end product for many media. But LIFE INTERNATIONAL makes news its point of departure—for a most comprehensive analysis.

LIFE INTERNATIONAL draws together all the threads. That is why it is read by people who need to be informed: leading people in business, government and the professions in 120 countries around the world; people who appreciate the unique standard of LIFE's photo-journalism, the stimulating diversity of its full-length features and special issues, the authority of its expert opinions.

LIFE's readers not only buy for themselves, but also influence the buying habits of others. In LIFE INTERNATIONAL's advertising pages they see first-class industrial products and consumer goods—prominently displayed in large pages, beautifully reproduced on quality paper.

Drawing by JOHN WARD A.R.A. on board a P & O ship

Why do more and more busy people travel to Australia by P & O?

Good health . . . good food . . . good company . . . *a good chance to catch up with unfinished work.* These are the reasons why more and more busy people decide to travel to Australia by P&O. And the choice of a P&O trip to Australia is wholly practical. Because only a sea voyage can give you the physical and mental refreshment, the time to rest, read and *think* that gets you there right on top of your form.

Good Health Brilliant sunshine . . . bracing sea air . . . perfect relaxation. You can *feel* a P&O voyage doing you good. You walk off the ship fit, tanned, physically renewed, mentally refreshed.

Good Food Gastronomic masterpieces . . . or the simplest of plain food . . . P&O cater for the most diverse tastes. You can be sure that there's exactly what you want—every day of your memorable trip to Australia.

Good Company Businessmen . . . writers soldiers . . . doctors . . . a P&O ship always carries a fascinating cross-section of society. And here are so many pleasant places to meet: sunlit decks . . . cool lounges . . . quiet bars.

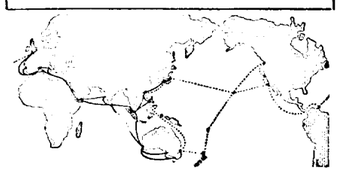
Good Work Time to read . . . to digest . . . to prepare. On a P&O voyage you can cope with the mass of work that there's never time for ashore. You'll have *new* energy and a fresh point of view. A P&O trip is a practical proposition for any professional man.

DON'T FORGET YOUR WIFE!

What's good for you is good for your wife and family, so they'll enjoy the benefits of a P&O voyage too—even if they have to follow you out later. There are nurseries and trained children's hostesses on every ship. Incidentally more and more men than ever before are taking their wives with them on normal business trips.

Air-and-Sea If you're in a hurry, you have the best of both worlds by flying part-way, sailing the rest. Or flying out, sailing home. Whatever combination of air and sea travel suits you best can be arranged with your travel agent.

Pacific Outlets P&O is not only a great Commonwealth lifeline, with all the traditions of the British Mercantile Marine, but a magnificent outlet to the Pacific too. P&O routes extend all over the Far East and across the Pacific to the West Coast of Canada and the United States of America.



P&O

P&O FIRST CLASS TO AUSTRALIA IS AN INVESTMENT

particularly in the republics of Central Asia and in the Baltic States. The biggest reshuffle so far took place in Latvia last week. Mr Jan Kalnberzin, the veteran leader, was kicked upstairs to the presidency of the Latvian republic and was replaced in the key job of party secretary by Mr Arvid Pelshe. Mr V. Latsis, the writer, was dismissed from the premiership.

This is the second reshuffle in Latvia this year. Mr E. K. Berklav was removed from the deputy premiership and the party presidium in July. He was charged with ignoring all-Soviet needs, obstructing the progress of heavy industry and trying to channel all investments into consumer goods for local use. Should Mr Kalnberzin be charged with similar sins, the case would be really interesting, because he is a lifelong communist. Now 66, he joined the party in 1917. He took part in the Latvian rising and in the Russian civil war and then studied in Moscow at the Communist University and the Institute of Red Professors. He returned to Latvia in 1936 and was arrested three years later. But in 1940, after the entry of Soviet troops, he became the party's first secretary, a post he had kept until last week. By 1952 he was a member of the central committee of the all-Soviet party and five years later he became a candidate to the presidium. It would be remarkable if a man who had served faithfully for so long were now condemned for indulging in nationalist deviation.

The charges still remain to be seen. What seems certain is that the Baltic States present exceptional difficulties for Moscow. Latvia, Lithuania and Esthonia were annexed by the Soviet Union only twenty years ago and then, for a time, were under German control. Collectivisation was completed in these parts only ten years ago and "kulak" resentment has not yet died down. Nationalist and political memories of the pre-communist past must still be alive. These feelings were compressed in the stalinist straitjacket but are now being released. Mr Khrushchev has still to find how to keep nationalist contagion in check while proceeding with economic decentralisation.

DIVORCED WIFE'S SISTER

Decease and Divorce

LORD MANCROFT is trying again. It is nearly eleven years since he introduced in the House of Lords a private member's bill to enable a man whose marriage had ended in divorce to marry his sister-in-law or a woman her brother-in-law. In view of the tremendous storm that the Deceased Wife's Sister's Marriage Act (enabling a widower to marry his sister-in-law) provoked in 1907, Lord Mancroft was under no illusions that his bill, which on the face of it seemed a logical and harmless corollary of that Act, was uncontroversial. But in fact it was openly opposed in the debate only by the Archbishop of Canterbury and the then Bishop of London. This, however, was opposition enough for the Labour Government, though it could hardly be accused of disliking contentious measures, to refuse to give the bill facilities, and it was withdrawn.

Since then, Lord Mancroft has been a member of a Conservative Government, and the substance of his bill was referred to the Royal Commission on Marriage and Divorce, which in 1956 expressed itself in favour of it by sixteen votes to three. So Lord Mancroft, who has now reverted to private membership, has introduced a new bill in the House of Lords; this would enable a divorced person to marry, during the lifetime of his or her former spouse, any person whom he or she could lawfully marry if that spouse were dead—in other words, aunts or uncles and nieces or nephews by marriage as well as sisters-in-law or brothers-in-law.

It will be interesting to see if the Archbishop repeats his argument against the earlier bill: that the right to marry the brother or sister of a divorced spouse would disturb the carefree relationship of husband, wife and in-laws by opening a door to "unlicensed thoughts and desires," and that the security of every home would thus be threatened. The same fear, the late Lord Simon pointed out, was expressed in 1907 over the "Deaser" Bill and was subsequently proved to be groundless. Most people will dismiss it as preposterous, and will hope that the present Government, with the backing of the royal commission, will allow the new bill to go forward. The point to emphasise is that it would not make divorce easier but that, by making certain marriages legal, it would enable a few broken homes to be remade and the children resettled.

LETTERS

Malta

SIR—The Colonial Secretary has in a Parliamentary answer (Hansard, November 24th, Question 39, Col. 187) referred to my views in connection with a question on the insufficiency of the new Malta development plan to sustain employment. I ask for the courtesy of your column to reply to him. The relevant paragraph of the Malta report is 17, which reads as follows:

> A net increase of 6,000 must therefore be catered for, over and above any decline in service and crown employment. . . Government and service employment may decline by about 3,000 over the period, so far as can be foreseen at present. If this is so, the question resolves itself into this form: is the proposed investment in industrial development and other economic services of such an order that it can fairly be expected to create employment for a labour force of about 9,000? . . . For any new employment created in new industrial development, *further employment will be created in the general distributive, personal and similar forms of services* (my italics). Therefore the forecasts of net new jobs needed to maintain full employment is reduced to about 5,000. Whether calculations are made by direct "pounds per new job" calculations, or by working down on the normal capital to output relationship (2:1) and breaking down output into "added value" to be broadly the same as elsewhere, it appears that the 5,000 new direct industrial jobs can be achieved. . . ,

There is no doubt that the *re-employment* of 3,000 men who became redundant from the services has been counted in the "new" employment which is supposed to create an equal amount of additional new employment in the service industries. This is a fallacy, as the re-employment of people who lose their employment cannot create additional employment. The calculation is further falsified by the fact that the service industries are suffering from underemployment, and even genuine "new" employment will probably not lead to their expansion, but to the fuller use of existing capacities. A further point which is difficult to understand is how a "normal" capital-output ratio can be assumed for Maltese industrial development when capital-output ratios in "industry" vary from .02 to 40. It depends entirely on what industry it is proposed to attract to Malta. Light engineering industries, which would be the most likely starters, would demand a far higher ratio than 2. The insufficiency of the plans is thus made clear, and it would seem to be desirable that Ministers, before approving such plans and defending them in Parliament, should have the opportunity of consulting expert advice which obviously is not now available to them.—Yours faithfully,

T. BALOGH

Balliol College, Oxford

South Africa

SIR—In the note "Disapproval by Boycott?" in *The Economist* last week, you suggest that "the pressure to force it [the South African Government] to change its policy must come from inside South Africa." In adding that "signs are not wanting that it will," you seem to be pinning great hope on the Progressives. I do no less than hold this hope myself, but your correspondent in South Africa throws the ball back to you at the end of his report on the Pro-

gressives in the same issue. "It seems a little doubtful," he writes, "whether the Progressives will win support from a notoriously reactionary white electorate. But Africa is changing rapidly *and the impact of events beyond South Africa's borders is already becoming discernible in the political climate* as more Whites realise that the Union cannot remain out of step with the rest of this emerging continent."

One brief comment on the Progressives is necessary. I see their appearance as one of the most important and welcome recent events, second only to the growing revolt against Afrikaner nationalism of its intellectuals. But the Progressives were not elected as Progressives, and may, therefore, be only a little more representative of White opinion than the Liberal Party was five years ago with precisely the same policy. The Liberals had, to some extent, prepared the way for the Progressives, and both have moved from their former positions, under the impact of internal and external pressures. This also applies to the Afrikaner rebels. But none of them can be allowed to obscure the essential truth of the South African scene (the Liberals in fact proclaim it), that extra-parliamentary means of action (including appeals for help from abroad) are the only means by which people unrepresented in Parliament can force the Whites to relinquish the benefits they draw from White domination. These benefits are drawn at African expense.

You concede—and you are the first (at last) to do so—that the boycott might "upset many farmers in the Union," but you claim "that the usual effect of an outside attack is to rally public opinion to the Government." That is the usual effect of internal pressure, too, *in the short term.* This last is the operative phrase because the pressures from inside and outside have a salutary effect quite soon afterwards. "Massive disapproval in Britain," whether supported by action or not, has precisely the same effect, incidentally, on people who believe you are either with or against them. At least action like boycott is more likely to achieve its aims than the formality of protest.

Apartheid may well carry the seeds of its own destruction, and if left to run its course, may wreck the economy and be the cause of much bloodshed. But when would the end come by this means alone? And would the Africans who stand for non-racial co-operation of the races (still in the majority) still stand for it then, when Whites at home and abroad have in the interim stood aloof from their struggle?—Yours faithfully,

London, NW3 PATRICK VAN RENSBURG

Machine Tools

SIR—This Association is considerably dismayed by the article appearing in your issue for November 21st concerning machine tools. It does not seem to maintain your usual level of factual correctness.

So far from trying to suppress Professor Melman's broadcast, the association offered its assistance in preparing a balanced programme in which both sides of the picture could be displayed. The basic reason for the report of the Department of Scientific and Industrial Research not being published at the present time is that in their approach to members of the industry the DSIR representatives initiated voluntarily the suggestion that information given by members would not be divulged.

The unfairness of your report seems to be summarised in the final sentence, where you describe the industry as "uncommunicative." For our part we have been discouraged, particularly in the more recent past, at the complete lack of notice afforded in the general press, which appeals to what you so rightly describe as "the wider public having the right to be interested in the performance of key suppliers of engineering technique," in respect of several positive items of news and several publications concerning the industry published by us.—Yours faithfully, H. O. BARRETT

The Machine Tool Trades Association
London, WC2

Italy

SIR—I read in *The Economist* recently a correspondence from Rome, "The Vanoni Plan Reappraised," in which some comments were made on Professor Saraceno's report on the re-examination of the Vanoni Plan.

Your correspondent criticises the author of the report on the grounds of its not making any mention of the fact that the cause of the delay in investing in the South was the high cost of electricity there. But:

1. The electricity tariffs in Italy are governed by regulation on the basis of which the maximum prices, the same throughout Italy, for the supply of electric power are laid down. As a consequence of this unification, the prices in force in the various regions, provided the characteristics of supply are the same, fall within such a narrow range that the difference between them certainly cannot constitute a reason for giving preference to one region rather than to another, where the setting up of new industries is concerned. All the more so as electric power notoriously constitutes an average of between 1 per cent and 2 per cent of the total cost of the product. This percentage is overstepped only in exceptional cases.

2. As a matter of fact, the most important factor for the development of industrial initiative is a sufficient availability of electric power, in addition, naturally, to other factors, such as the existence on the spot of cheap capital, of skilled labour, of certain amenities, etc. The availability of electric power in Southern Italy—I should be glad to quote figures at your request—more than meets the demand that may be called forth by the advance of industrialisation. This is confirmed, without any possibility of doubt, by the intense rate of increase which in the South—as well as in the rest of Italy—the construction of new electric power plants has enjoyed since the end of the last world war. This increase has permitted the formation of a wide margin of generation capacity, to cater for any foreseeable demand.

3. A further proof that the level of the prices of electric power cannot be the cause of any delay in investments in Southern Italy is given by the fact that the maximum prices laid down in the whole of Italy by the tariff regulations now in force are, by and large, lower than those applied in the other countries of the European Common Market.—Yours faithfully,

VITTORIO DE BIASI
President

Associazione Nazionale
Imprese Produttrici e Distributrici di Energia Elettrica
Milan.

Arab Refugees

SIR—May I point out that your comments last week on Israel's attitude towards the Arab Refugee settlement are somewhat incorrect.

Israel's will to negotiate even without the framework of a general peace settlement was stated by Ambassador Eban before the Special Political Committee of the General Assembly on November 17, 1958:

> If such a solution by integration were actually carried out and if the international assistance, offered in 1955, were available, Israel would be prepared to pay compensation, even before the achievement of a final peace settlement, or the solution of other outstanding problems.

The same undertaking was reiterated by Mr Ben Gurion, the Prime Minister, when he addressed a group of journalists on November 29, 1959.—Yours faithfully,

London, NW8 VIVIENNE BLOCH

Adultery

SIR—Your note on adultery as an offence cognisable by the ecclesiastical courts in England prompts me to inform you of the position in Scotland. The Act of 1581, which was the last to define adultery as a crime, has probably lapsed into desuetude during the 18th century. However, another Act of 1600 making it an offence for persons divorced for adultery to marry whomsoever they are declared to have committed adultery with may still be in force, and for this reason divorce decrees in Scotland do not now name the paramour. Just as it would be interesting if the Archbishop of Canterbury revived the offence of adultery before his courts, so equally interesting, but different, effects might be observed if the Scottish courts were to resume the practice of naming the paramour.—Yours faithfully,

Eastbourne ROWLAND BOWEN

BOOKS

All Is Not Gold

"F. E." The Life of F. E. Smith, First Earl of Birkenhead

By his son, The Second Earl of Birkenhead. *Eyre and Spottiswoode.* 572 pages. 63s.

F. E. SMITH was one of those now legendary pre-first-world-war figures who came down from Oxford already fully armed with all the qualities for glittering prizes at the Bar and in politics: fluent trenchant oratory proved from the first and against the best at the Union; a capacity for relentlessly intense intellectual concentration when required (he beat the great Holdsworth for the Vinerian Law Scholarship); and an arrogant self-confidence. All his maiden speeches all his life were triumphs. The prize-winning youth was father of the prize-winning man.

To himself even more than to his many admirers, F. E.'s whole upward rush from bourgeois northern origins to high places among the top people in the land was excitingly dramatic; he even exaggerated the ordinariness and poverty of his start to make it seem more dramatic still. Through it all he played as he worked with unrepentant gusto; and, his son says in this very honest book, "in the end this tremendous appetite for life was to prove too much for him." "When he broke, he broke quickly"; he was 58 when he died.

Was it at the end, the too-early end, success? Of his talents and triumphs there has never been any question. "Everything 'F. E.' undertook," John Buchan wrote, "he did easily, as with his left hand, and with a superb gesture of unconcern. He was Aristotle's Magnificent Man, the last exponent of the Eighteenth Century Grand Manner." Winston Churchill, who rated friendship with F. E. as "one of my most precious possessions," has vividly described his "impressive and enviable gift" of ordered argument, whether from the Woolsack or on political occasions: "For all the purposes of discussion, argument, exposition, appeal or altercation F. E. had a complete armoury. The bludgeon for the platform; the rapier for a personal dispute; the entangling net and unexpected trident for the Courts of Law; and a jug of clear spring water for an anxious perplexed conclave." Lloyd George and Michael Collins alike admired and trusted him. In his forty-third year, when he was already in the van of a famous generation of pleaders, he became first Solicitor-General and then Attorney-General in the Cabinet; at forty-six, to the shock of all the conventional, including King George V, he was Lord Chancellor.

This was success enough for any man, but was it success enough for F. E.? He did not, for all his brilliance and the reforming zeal and panache of his Lord Chancellorship, ever reach the top rung that he felt was in his grasp. "If they will give me formal recognition," he wrote to J. L. Garvin in 1910, when for four years his sustained forays against the entrenched Liberals had already given fresh heart to the Tories, "I am certain that in two years I can undertake a considered campaign in the country which will itself win 30 or 40 seats"—words that echoed the ebullient confidence of Lord Randolph Churchill a generation before. But it was Lord Randolph's son, F. E.'s contemporary sparring partner, friend and then colleague, who lived on to lead the party and the nation. Indeed, when F. E., by accepting the Woolsack in 1919, chose the path away from political leadership, he was implicitly recognising that the height was not for him.

Loyal always, to the point of personal risk, to the friends and causes which he chose—the Lords, Ireland, Lloyd George, the Coalition—he did not always choose them either well or consistently. Pungent and pugnacious partisan though he was, he was never really a party man. "I never remember a time," he wrote to Austen Chamberlain (also in 1910 when he was clamouring to lead a raging Tory campaign in the country), "when so many men in England were sick of mere party cries and faction." What he wanted was a coalition; and when war did bring Lloyd George's Coalition he stuck to it, as Churchill did, beyond the point where the party men returned to their stations. He was, in politics, an "against" rather than a "for"; and his foe, increasingly, was socialism. Of the Liberals, when they were at the peak of their power, he said apocalyptically, "in the decade of convulsion which the Government invites, the Liberal party will find its permanent sepulchre." As Secretary of State for India in his last political fling from 1924 to 1928 he was seized of the historic significance of his task, but was not in tune with the trends that were leading on to independence—any more than Winston Churchill was.

His son's biography of him, rewritten from a much earlier memoir, is a very long and very interesting but not a very good book. It is strung together rather than woven together; it is oddly unfinished and poorly buttoned-up; it lacks the "ordered texture of argument" or exposition that was F. E.'s own highest art. But, for a son's tribute, it is very fair and, though unconfident in its criticism, simply honest; it is very well worth reading for its picture of a famous man who, despite his scintillation, his charm and—for all the wounds inflicted by his rhetoric and sarcasm—his magnanimity, did not have the stamina, the ballast, the natural depth or the intuitive touch to stay the course for the most glittering of all the prizes. Winston Churchill, only two years younger than F.E., acquired all these things—but then he has lived for nearly thirty years longer.

Terse Words on the Bomb

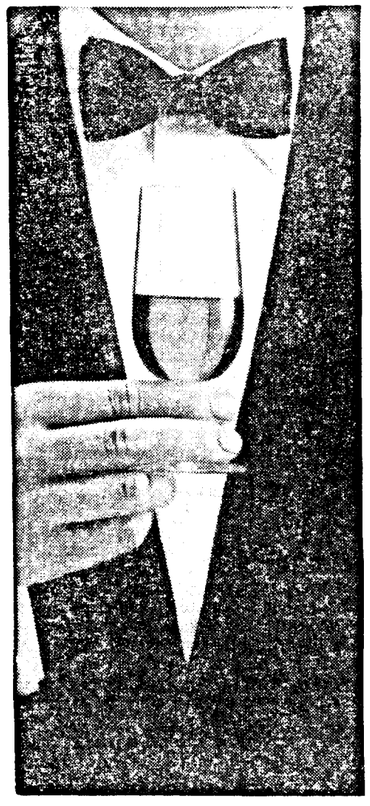
Strategy for Survival

By Wayland Young.
Penguin. 95 pages. 2s. 6d.

MR WAYLAND YOUNG, after despairing of the world's future without disarmament, and profoundly doubting the prospects of disarmament along the lines now being explored at Geneva and the United Nations, plumps very strongly for the non-nuclear club plan to which Lords Simon of Wythenshawe and Russell gave birth in the House of Lords earlier this year and which was adopted as a compromise with the Ban-the-Bombers by the Labour party in time for the general election.

The strategy of the non-nuclear club is to make total nuclear disarmament easier by confining the bomb, in the interim, to Russia and America; but whereas the Labour party was content to advocate that Britain should negotiate a multilateral pact to renounce the independent manufacture and deployment of the bomb, Mr Young wants members of the non-nuclear club to refuse to permit either Russian or American nuclear weapons systems to be based on their territories as well. Thus the two mutual strategic deterrents would be withdrawn completely to Russian and American soil—or the world's oceans. Mr Young recognises that the weakness of this plan is that it would, if pursued to its logical end, denude the Nato shield of its own deterrent power, and lay open Europe to a Russian attack in overwhelming force which American possession of a long-range nuclear striking force in America would be unlikely to deter, especially if (though this point is not made) Russia's long-range rockets are more effective than America's first-strike forces. So Mr Young in turn compromises by suggesting that, for a preliminary period, Nato forces (and Russian forces in East Germany) should retain small tactical nuclear weapons, defined by him as nuclear weapons of a kiloton, or fifty tons TNT equivalent. These, he thinks, would maintain stalemate on the ground, even though both the nuclear powers would have to promise members of the non-nuclear club (Britain, France, etc., on the western side, and Poland, Czechoslovakia, etc., on the other side of the iron curtain) not to initiate their use. But would even this plan—reminiscent of the arguments to make limited nuclear war possible—really maintain a ground deterrent? It seems to presuppose that small nuclear bombs are a substitute for

A man is known
by the company he keeps



A host is known by the brandy he serves

To serve your guests an indifferent brandy is more insult than compliment. The correct thing to serve after meals is a cognac of liqueur quality. This is why the perfect host gladly pays that little bit more for a really fine liqueur brandy like Remy Martin. A genuine Fine Champagne V.S.O.P. Cognac. A brandy defined by French law as *Fine Champagne* because it is made exclusively from grapes grown in the two finest districts of Cognac. And it is reassuring to remember that Remy Martin make *nothing* less good.

PRIDE OF COGNAC

REMY MARTIN

divisions on the side of the defence ; military experts are beginning to doubt this. So does Mr Young ; he is ready to risk a weakening of the west for the wider objective of confining the bomb to the superpowers, but he also advocates—and here he is very fair—much larger conventional forces to be maintained by members of Nato and presumably by the non-nuclear powers generally. In logic this looks a good solution—a shield of 65 divisions armed with modern conventional weapons would probably deter the Russians in central Europe, though possibly not in Asia or even in Turkey or the middle east. But the prospects of raising such forces seem to be dim.

It follows that Mr Wayland Young's plan might well greatly weaken the west's power to deter limited incursions that could "escalate" to something worse ; and the question also arises whether the enforced withdrawal of American aircraft to America, the abandonment of all the ground-based intermediate range missiles—which can only be deployed against Russia from Europe—would in fact not create tempting possibilities for a successful Russian pre-emptive nuclear strike, which some American strategists fear during the period of the "missile gap." Finally Mr Young's arguments that China would in the end also refrain from the bomb seem weak in the light of Chinese stalinist attitudes today. His arguments in fact carry one back, inexorably, to the need to master the problem of inspection and control ; if these were mastered, the non-nuclear club, at least with its avowed objective, would not be needed. But these criticisms made, it must in fairness be said that this is one of the tersest and best-argued cases for the non-nuclear club to have appeared ; it deserves to be widely read and discussed in the context of political and technological realities.

A Brick of a Bishop

Mackenzie's Grave

By Owen Chadwick.
Hodder and Stoughton. 254 pages. 25s.

It is a great pity that most readers, and therefore most authors also, since even authors must live, fight shy of books about missionaries. Biographers in particular are crying out for new subjects, yet here is a whole series of characters, most of them exciting, many of them eccentric, who still lack any biographies except a few horrid bits of hagiography sponsored by ecclesiastical publishers. Meanwhile, the general public remains ignorant of some of our greater men, and even serious historians misread—and miswrite—the history of regions such as Africa, whose development has been influenced at least as much by the missionary as by the politician and the big businessman.

Here at last is a book that treats a missionary subject in an adult manner, at once scholarly and entertaining. The story that Dr Chadwick has to tell is as tragic as any in the history of missionary enterprise. In 1861 a little expedition set out up the Zambezi to plant a Christian mission in the very darkest heart of Africa. After travelling hundreds of miles through unknown, dangerous country, fighting several pitched battles with slave-raiders, enduring dreadful hardships from famine and disease, and losing four of their number, including their leader, Bishop Mackenzie, the survivors were rescued by a relief expedition, who obliged them, much against their will, to withdraw from this untenable outpost to the healthier neighbourhood of Zanzibar. (As a matter of fact, the vaunted healthiness of Zanzibar was merely comparative ; as late as 1905, Sir Charles Eliot wrote of that island, "Whether it is advisable to spend more than two days there is doubtful, for the climate is by no means healthy.")

Dr Chadwick brilliantly sketches in this odd little group of Victorian heroes. Chief among them were Scudamore—"they always thought of him as 'dear Scudamore,' and yet it moved insensibly into 'dear old Scudamore'"—Procter, who was rather deaf and played the flute, Rowley, "too odd, too angular, too individual to be a fine leader of men," and the endearing Waller, "a hairy, tweedy man," who carried all his possessions in a fishing basket. Lastly, there was Mackenzie, a saint if ever there was one, in Livingstone's words, "quite a brick of a bishop." Mackenzie shared with Livingstone a deep religious sense and "a participation in the mystique of affection for Africa" ; unfortunately he also shared with him an incapacity for dealing with what would nowadays be described as "problems of logistics." It was Mackenzie who displayed "an unusual ability for losing himself on journeys," but it was Livingstone who had, quite wrongly, assumed that the Zambezi was a natural highway for commerce and Christianity, and who had therefore sent the expedition out on a journey where better pathfinders than Mackenzie might be excused for losing themselves.

Although started at the instigation of the Presbyterian Livingstone, who was never a man to worry himself over sectarian differences, the Central African Mission was an Anglican venture, having, as Dr Chadwick says, "much in it of the Oxford Movement, of the attempt by Newman and Keble and the others to teach the bishops that they were 'Apostolic men'." Hence the presence of a bishop as the leader of the expedition. The Tractarians believed that a bishop should do as the Apostles did and lead the spearhead of a missionary attack ; he should not be a general commanding his army from some safe headquarters in the rear. So the little company chugged away up the Zambezi in the *Pioneer* steam-boat, taking with them the Bible, "The Christian Year," "The Origin of Species," and, for light reading, some of the stories of Miss Yonge—the masculine Waller not surprisingly found "Heartsease" "a poor twaddling novel." In their medicine-chest they had some remarkable pills christened "the Rousers," which, Livingstone assured them, would render African fever "not a whit more dangerous than the common cold." Within a year Mackenzie himself was dead of that same fever and three of his companions were to follow him. The mission was doomed from the start ; when Tozer and Steere—perhaps in another book Dr Chadwick will tell us more about Steere's remarkable character and career—sailed up the Zambesi under Tozer's sheltering umbrella they were perfectly right to disregard the protests of the survivors and adopt a policy of *reculer pour mieux sauter*.

Yet Mackenzie had done his work. He had left his bones in Africa, and what the African Church needed, and still needs, was not only hospitals and schools and mission stations, but also the bones of its bishops. Mackenzie's grave is one of the foundation-stones of modern Nyasaland, and that remote mound by the Ruo river is an earnest that Christian principles may yet prevail in the settlement of the problems of that distressful country.

Introduction to Money

The Economics of Money

By A. C. L. Day.
Oxford University Press. 255 *pages.* 7s. 6d.

In assessing, as in writing, such an introductory textbook as this, a certain amount of split-mindedness is needed. On the one hand, the critic must apply tests drawn from such expert knowledge as he may himself possess of the job in hand : tests for correctness of analysis, realism of judgment, up-to-dateness, scrupulousness in indicating first approximations and over-simplifications as they occur, elegance and economy of presentation. On the other, he must make an imaginative effort to strip himself of the very qualifications needed to apply these tests ; to put himself in the shoes of the beginner, the total ignoramus (or, worse and more probable, the victim of popular fallacy) for whom the book is in fact intended. He must ask himself : "Suppose I were starting from scratch, what would this mean to me?"—with, as an occasional rider, "Suppose I were not only starting from scratch in this particular field, but were unused to handling abstract ideas and not especially well equipped to deal with them?"

Mr Day's "The Economics of Money" passes all the first set of tests with flying colours, scoring especially high on contemporaneity. Monetary institutions and, behind the façade of those institutions, the realities of monetary practice have changed to an extent that makes even quite modern formulations of accepted doctrine misleading. When one compares Mr Day on, for instance, open market operations with any previous account of the matter, or notes his ability to set in perspective the international monetary problems of the postwar years, his advantage is seen to lie not merely in the fact that he is writing in 1959, and not in 1955 or 1950, but also in his attitude of mind. He is not modifying, or patching, or putting a contemporary face on, the accepted ideas of 1950 or 1955 (let alone, as happens too often, those of the 1930s, or even the 1920s) in the light of later events. He is starting from things as they are and fitting events and ideas solidly into the framework of today—not without realising, and making his readers realise, that the flux still goes on and that the framework is provisional. Moreover, his presentation is extremely neat ; tightly knit, freshly conceived, its parts mutually coherent and mutually signposted, its sparse metaphors consistent, its balance of description and analysis nicely calculated, its structure the aesthetically satisfying work of a civilised mind.

Only—one wonders—has that mind made the essential imaginative effort to lay itself alongside other minds very much less well equipped by nature and by training? The "intelligent general reader" who is the Home University Library's target can be credited, certainly, with a genuine desire to get to grips with his subject, and a readiness for sustained concentration greater than that of the wider "popular" audience. But he is given few concessions—in the way of familiar example, topical or historical allusion, recapitulation, reminder, change of tempo to suit the difficulty or relative simplicity of the matter in hand—to sustain him on what cannot be other than an exacting journey. As an exponent of the elements, *in vacuo* as it were, Mr Day is practically unbeatable. As a putter-across of those elements, one would be delighted to see him succeed, because such success would speak well for public intelligence and morale ; but one has one's doubts.

On Two Fronts

The Achilles Heel

By Manès Sperber.
Andre Deutsch. 224 pages. 18s.

Mr Manès Sperber belongs to that group of European ex-communists who have spent their later years fighting on two fronts : against Stalinism and against the new "Right." Members of this group (Mr Koestler being probably the most eminent) find themselves in a difficult position. They are intent on exposing the inhumanities of Soviet rule and seek to warn democracy against communist subversion. But, at the same time, they do not want to become the champions of McCarthyism and the automatic allies of reaction. They are like men caught between two fires, riposting now in one direction, now in the other. Their force lies in personal integrity, in their austere refusal to accept compromise. Their battle cry is "A plague on both your houses!" In the lead essay of this collec-

tion Mr Sperber defines his attitude eloquently:

> No, we do not want the McCarthys and their sort on our side in our struggle against Stalinism, any more than we want the Sartres and their sort on our side in our simultaneous struggle against the McCarthyists.
>
> There does not exist a single truth which we should smother for tactical reasons, nor any form of baseness which we should be prepared to gloss over, even provisionally.

This is all very well, but it is by no means easy to apply in practice. Were there no "truths" worth smothering about the Soviet Union at the time of Stalingrad? Mr Koestler noted with sharp insight that the war was being fought against lies and in the name of half-truths. Probably so; but such are not the kind of ideas that rally a democracy in its hour of mortal trial. Ibsen showed in *The Wild Duck* that men's lives depend on certain sheltering lies. So does their political survival.

The limitations of Mr Sperber's intransigence emerge clearly when he turns to the actual case. His view of the Rosenberg affair is entirely beside the point. The question was (and remains) the problem of whether or not the law under which the Rosenbergs were condemned to death had been falsely made retroactive. To say that the verdict was just and balk at the sentence is to miss the underlying difficulty. Mr Sperber's essay on T. E. Lawrence is also rather indecisive. And, oddly enough, he does not grapple with the theme of Lawrence's alleged "élitisme." The best image of Lawrence's literary art remains R. P. Blackmur's "Everlasting Effort." Lawrence's role in the mythology of politics has yet to be dealt with. But Mr Sperber is not only a political essayist and novelist. He is also a psychologist and sometime disciple of Adler. His considerations of anti-Semitism and his study of the Freud-Fliess correspondence are both first-class work. Here, indeed, there are no truths that need be smothered.

Scottish Chancellor

John Maitland of Thirlestane and the Foundation of the Stewart Despotism in Scotland

By Maurice Lee, Jr.
Princeton University Press. London: *Oxford University Press.* 326 pages. 48s.

THOSE who imagine that the notion of a New Monarchy in Renaissance Europe can now be safely relegated to the historical wastepaper basket, along with that of the overmighty subject, the rising middle class and similar outworn concepts, would do well to consider the case of the Stuart kings of Scotland. For what did James VI endeavour to create in his dominions, if it was not a new Monarchy? There was only one remedy for a semi-bankrupt crown, lacking reliable officials or a standing army, confronted by an aristocracy of unequalled turbulence and beset by a Kirk of incomparable zeal. This was the time-honoured solution of enforcing law and order, creating a bureaucracy and allying with what could be mustered in the way of a middle class. James's efforts in this direction secured him the reputation of being the most successful king of Scotland since Robert Bruce.

But it is doubtful whether he would have accomplished much without the aid of John Maitland of Thirlestane, long overshadowed by his elder brother, Mary Stuart's Maitland of Lethington, but now at last the subject of a full-scale biography. Maitland was the epitome of the tireless middle-class administrator, the privy councillor who never missed a meeting and whose anti-aristocratic policy helped to create the machinery that made possible a century of Stuart absolutism. Gaining the king's favour during the period of the dominance of the Duke of Lennox, he became Secretary in 1584 and secured the office of Chancellor three years later, retaining it until his death in 1595. For most of this brief period he was the king's principal adviser, responsible for handling a variety of problems ranging from the maintenance of diplomatic relations with England to the subjugation of Huntly and Errol, the Catholic Earls. His greatest achievement was probably the Parliament of 1587, which succeeded in annexing the church's temporalities and in giving parliamentary representation to the lesser landowners. All these tasks were performed against a background of staggering crudity and violence, for in sixteenth century Scotland dissident nobles were likely to revenge themselves by savage raids on the royal bedroom, while hapless clansmen were known to have been roasted alive. Yet the Chancellor got little help from his royal master, who was capable of yelling at a refractory minister, "I will not give a turd for thy preaching," leaving the more diplomatic Maitland to restore relations with the aggrieved Kirk. James could do nothing to save him when he fell in 1592 before the inevitable coalition of resentful magnates, egged on by the Queen herself. On his death the king produced an appropriate sonnet, but was subsequently observed to be "very merry, saying that he would no more use chancellor or other great men in those his causes, but such as he might convict and were hangable."

Professor Lee tries to guard himself against exaggerating Maitland's importance by pointing out his financial incompetence and his numerous errors of judgment. But his conclusion that this cautious and unenterprising Scot deserves to be ranked with Cromwell and Richelieu is one which the attentive reader is unlikely to swallow. The book is scholarly, but it seldom goes outside the printed sources and is often exceedingly dull. One misses the memorable vignettes that were such a feature of Professor Willson's "James VI and I." Instead we get rather turgid prose and some notable examples of academic understatement. Of these the assertion that James "showed little interest in the opposite sex" is perhaps the most remarkable.

POSITIVE ADVANTAGES IN MOVING TO NORTHERN IRELAND

Branch factory now larger than parent plant

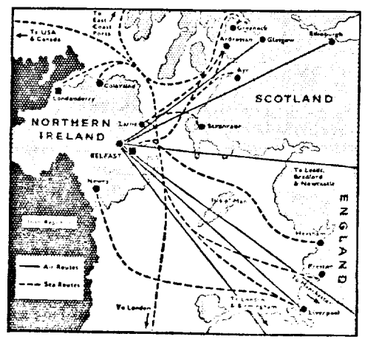
Mr. J. A. Moore, Director U.K. Optical Bausch & Lomb Ltd., reviewing his company's progress in the Board of Trade Journal, says:

"Why does an English company choose to set up a branch factory in Northern Ireland? In the case of the U.K. Optical Company Ltd, the war was over, and the company planned a substantial increase in its productive capacity. Lacking permission to build in the London area, where the parent Mill Hill factory is located, the company learned of, among others, a vacant 60,000 sq. ft. factory in Lurgan, Co. Armagh, and in 1946 arranged to lease it from the Northern Ireland Ministry of Commerce. Since then, the production area has been more than doubled and the branch factory has far outstripped the parent. In 1956, moreover, the company improved its export sales potential through association with an old-established American concern, the Bausch & Lomb Company of Rochester, N.Y. The British concern was renamed U.K. Optical Bausch & Lomb Ltd. After the war we aimed at a more diversified output within the optical field. Spectacle frames and sun-glasses, as well as lenses, are now made in Lurgan. In London, production includes lenses, spectacle cases and various ophthalmic instruments.

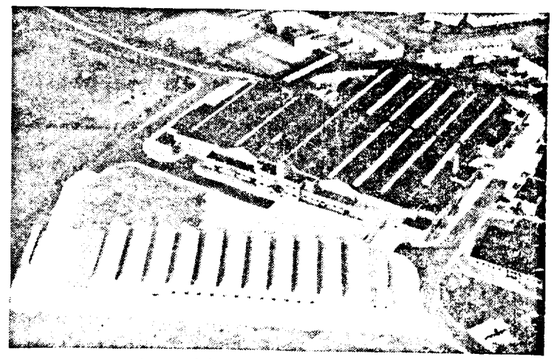
Mr. J. A. Moore, Director U.K. Optical Bausch and Lomb Ltd.

Production area more than doubled

The Lurgan factory, a wartime one, was extended four years later, when the Ministry added a further 40,000 sq. ft. of production space. Finally in 1957, the firm took over yet another 30,000 sq. ft. With 15,000 sq. ft. of offices and canteen space, the plant now occupies 145,000 sq. ft. This history of expansion, of course, is the best evidence that U.K. Optical – one of the three largest concerns in the British spectacle industry – is well contented with its reception in Northern Ireland. Something over 600 workers are employed in Lurgan, almost twice as many operatives as the firm employs in England. There is room for further expansion on the eight-acre site. At the beginning, there were naturally doubts about the wisdom of establishing a factory in Northern Ireland. At first sight, Lurgan seemed a long way from London and from the English market; the Irish Sea seemed to increase the distance. In fact, this problem of distance and isolation proved a negligible one. Company executives have generally found it pleasant to move from London to the calmer tempo of Lurgan, a typical Ulster provincial town set amid busy farmland. With a fast, frequent and convenient air service from nearby Nutts Corner airport, the door-to-door travelling time to Mill Hill is something like three hours. It is not onerous to travel, say, to monthly board meetings in London; a 'Telex' installation provides day-to-day communication at reasonable cost. In addition, the Lurgan unit has always exercised a high degree of local autonomy. Nor have freight transport costs been a problem, for the company's products have a high value for weight. The use of container services has overcome occasional early difficulties in shipping goods across the Irish Sea; spectacle glass is brought in from North Wales.



In addition to fast sea-freight services Northern Ireland is well served by passenger and freight air services to and from the leading industrial centres of Great Britain.



Aerial view of the U.K. Optical factory at Lurgan.

We have found, indeed, a number of positive advantages in moving to Northern Ireland. A vacant factory was the original inducement; the company has since been impressed by the Ministry of Commerce's eagerness to help in plans for further expansion. One facet of government assistance in Northern Ireland is the ease of personal access to everyone in the Ministry – including the Minister himself. This informality leads to quick planning, quick decisions and quick action. In turn, the factory has become one of the showplaces in Northern Ireland's drive for new industry; U.K. Optical's experiences form an excellent advertisement for Northern Ireland.

Working to fine limits of accuracy

The company has been equally well pleased with the labour force of Lurgan and district. The manual dexterity of the linen workers has readily been adapted to the precise operations of the optical industry. Time and motion study has been freely used, and the work is broken down into a great many operations – but many require a great deal of accuracy. In lens production, in particular, the operatives work to fine limits of accuracy.

Industrial relations have always been very good – in part because of the company's own efforts in this field, which include schemes for sickness benefit and pensions, but also because of the nature of the local people. The Lurgan worker seems to take a very keen

NORTHERN IRELAND MEANS BUSINESS

Within the past fourteen years 140 British and American firms, large and small – and including many who are recognised internationally as leaders in their respective fields – have selected Northern Ireland as the location for new plants to serve the United Kingdom, European, British Commonwealth and other overseas markets.

But there is nothing new or tentative about Northern Ireland's industrial background. There is here, in Government, in management and in workers, a long experience in meeting the exacting needs of progressive manufacturing businesses.

In Northern Ireland there is plentiful available labour of first class rating – men and women of the kind who have a world-wide reputation for the high quality of their products and their inherent skill in engineering and other manufacturing processes.

The Northern Ireland Government can offer a wide selection of plant sites and can provide individual facilities which make all the difference to the ease and speed and cost of bringing a new factory into being and into production.

There is, in Northern Ireland, a continuing programme of Advance Standard Factory building – some of these are ready to walk into now. Standard Factories built to order or Special Purpose Factories to meet individual structural requirements can readily be negotiated.

Over and above all this, the Northern Ireland Government is able to ease considerably the initial burden of capital costs by paying as much as one third (33⅓%) not only of the cost of building a factory but also of the cost of machinery for the plant.

In many other ways, which can only be summarised here (but details of which the Ministry of Commerce will very gladly supply) the Northern Ireland Government is able to make the path plain, the way simple and the result a success. And without needless red-tape!

THE ADVANTAGES IN A NUTSHELL

1 Plentiful trainable labour
2 Possibility of multiple shifts
3 Little absenteeism: low labour turnover
4 High output per man
5 33⅓% capital grants for plant, machinery and new buildings
6 Grants towards transfer of machinery to Northern Ireland
7 Government factories to meet your needs on rental or repayment
8 Grants for training and services
9 Concession rents
10 Industrial fuel rebate
11 Housing priorities
12 Active help by Government departments

works for progressive industries

YOU CAN BE THERE IN 2 HOURS

By B.E.A. from London 1¼ hrs.–Birmingham (direct) 1 hr. 50 mins.
Glasgow 1 hr.–Manchester 1½ hrs.

For details of how Northern Ireland's development plans can help you write to: NORTHERN IRELAND DEVELOPMENT COUNCIL (Chairman: The Viscount Chandos) · 13 LOWER REGENT STREET · LONDON · SW1 · (Tel: WHI 0651) or 99 PARK AVENUE, NEW YORK 16, N.Y. · (Tel: Murray Hill 2-6820) or, if you prefer, direct to THE MINISTRY OF COMMERCE · CHICHESTER STREET BELFAST · (Tel: Belfast 28271) All enquiries will be treated in the strictest confidence.

interest in his job, and is adaptable and easily trained. Six of the twelve senior executives are Ulster people who have risen from the shop floor; the rest of the labour force has been recruited locally.

Low labour turnover

There has never been any shortage of good workers. Absenteeism – for any reason – averages something like 2½ per cent. The labour turnover is remarkably low – and, among the 350 male workers, has been as low as two employees in a year. The Amalgamated Engineering Union represents the workers in the factory – there is a self-contained branch, which workers are encouraged to join, but no closed shop. The union has co-operated very well, for example, in occasional short-time working made necessary by fluctuations in frame production; such fluctuations are scarcely avoidable, since spectacle frames have become in part a fashion industry.

U.K. Optical has also enjoyed very good relations with the Lurgan community. Not only has it given needed employment during a period when the linen industry has been contracting; the weekly

Lens manufacture in the new 30,000 sq. ft. extension at Lurgan.

wage-packets contribute significantly to the town's commerce. Whenever possible, the firm buys materials and services locally, and the traffic is occasionally reversed when the tool room helps a local garage. Part of the town's social life is focused on the factory; this includes canteen dances and an annual flower show which has become a local institution. Similarly the firm's executives and their wives have found themselves drawn swiftly into the life of the town.

The consequence is an efficient, contented factory with an annual output of up to 6,000,000 lenses and something over three-quarters of a million spectacle frames. The lenses and frames, incidentally, are sold separately. Three main varieties of lens are produced; single vision, both toric and meniscus; fused bifocals; and, on only a small scale, solid bifocals. The range of frames has been a wide one, for it is a changing market, and the company has experimented with many designs and materials."

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The Next President

WASHINGTON, DC

Now is the time, with the next presidential election less than a year away, when even the sharpest-eyed observers begin to suffer from an odd blurring of their political vision. The nearer the election comes, the harder it seems to be to separate the qualities that make a good candidate from those that make a good President. Mr Eric Sevareid, that shrewd and stylish commentator, points out the importance of the distinction in his preface to a recently published book about the major candidates*: "The requirements for winning the race are by no means always identical with the requirements for discharging the office once it is won." Yet the articles which follow his preface, written by nine well-known Washington journalists, show how difficult it is to keep the two apart. The authors, honourably intent on being objective and impartial, have assembled a good deal of useful information about the candidates. But, with two or three exceptions, they give the reader very little help in deciding what kind of President each man would make if he got inside the White House. Indeed, in some cases—notably the chapter on Senator Symington—they shy away from the delicate questions that have to be asked about a man's fitness for the Presidency.

This preference for thinking about what happens before November 8, 1960, rather than after it, is partly the result of the way in which Americans pick their leaders. When a party is a fragile container holding together a number of mutually suspicious regions and ideologies, the party managers can hardly be blamed if they judge a candidate by his ability to keep the container intact; and the tests they apply sometimes have little to do with his ability to run the United States later on. When, in addition, the candidate has to win approval in a number of the primary elections which various states hold to enable voters to express their views on potential contenders for the Presidency, and then from the highly-excited ladies and gentlemen at his party's national convention, the gleam of his teeth is liable to be as important as the cut of his character. But the problem goes deeper than this. The qualities which will make a good President are not easy to detect. Thus the temptation is increased to pick a man on the calculable basis of how he will fare at the polls rather than on the incalculable basis of how he will fare as President afterwards.

But the matter need not be left entirely in the lap of the gods. Even the hardest-boiled professional politician, buttonholed at a cocktail party and asked to name the man of his choice, is liable to start by saying whom he would choose if he could put the candidate in question into the White House without going through the formality of an election. (It is surprising how often, among Democrats, the choice is Senator Lyndon Johnson.) There are a number of characteristics which it is plainly desirable for Mr Eisenhower's successor to possess during the four or eight years for which he will hold office. The prescription varies; Democrats, in particular, tend to construct a hypothetical President who turns out to be what logicians would call a Not-Eisenhower. But it is possible to find fairly general agreement on three qualities.

The first is a close and compassionate understanding of what is going on in the rest of the world. This is more than just an intellectual grasp of current events, as President Eisenhower has demonstrated most successfully. He often seems to know fewer details of international affairs than the journalists who question him at press conferences; but he has an instinct for a mood or a trend which keeps his judgment remarkably sure. His successor will need the same flair as that which led the President to reassess Mr Khrushchev's purposes and thus to change the whole course of American foreign policy this summer. He will also need the quality—that transparent honesty and good will—which has enabled Mr Eisenhower to keep the affection of the uncommitted nations when more brilliant men like Mr Dulles have lost it.

But, in addition, the next President will need something that Mr Eisenhower does not possess. If, as now seems almost certain, he is going to negotiate with Mr Khrushchev at a whole series of summit conferences, he will have to carry in his head a store of detailed knowledge about current problems. This implies a long and close interest in foreign policy, for which even the most zealous coaching after the election will be no substitute. Senator Johnson, whose work in Congress is chiefly concerned with domestic matters, is likely to find this his weakest point.

A reflective temperament, sympathy, an open and sensitive mind: these are the essence of the first qualification. It is a test in which many people would say that Mr Adlai Stevenson and Senator Hubert Humphrey scored highly. The second qualification, unfortunately, seems to require a rather different kind of temperament. It can be argued that the most trying decisions which the President will have to take in the next few years will arise from a series of crises in East-West relations. If Mr Eisenhower's current attempt at negotiation fails, the first crisis may be close at hand; even if tensions are relaxed, no one in Washington believes that the danger of clashes in the Middle East—not to mention the Far East—will be wholly dispelled. There is thus a school of thought which holds that the chief requirement for the next President is a toughness and clarity of mind which will enable him to take decisions quickly and correctly in an emergency; in particular, he must combine a willingness to take risks with a cool enough judgment to ensure that the risks are calculated ones.

The **Republicans** seem certain to choose as their presidential nominee either :—
Mr Richard Nixon, Vice President of the United States; or
Mr Nelson Rockefeller, Governor of New York State.

The **Democrats** have a much wider range of possibilities, including Senator Kefauver of Tennessee and a number of State Governors—Mr Brown of California, Mr Meyner of New Jersey, Mr Williams of Michigan. But the presidential nominee is likely to be one of the following:—
Senator Hubert Humphrey of Minnesota;
Senator Lyndon Johnson of Texas, the party's Senate leader;
Senator John Kennedy of Massachusetts;
Mr Adlai Stevenson, the nominee in 1952 and 1956;
Senator Stuart Symington of Missouri.

* *Candidates 1960.* Edited by Eric Sevareid. Basic Books, Inc. 369 pages. $4.95.

This emphasis on the importance of decision-making is typical of the group of public servants of whom Mr Dean Acheson, the former Democratic Secretary of State, is the most articulate spokesman. The quality which they seek was possessed in high degree by President Truman; his decisions to send American help to Greece and Turkey in 1947, and to intervene militarily in Korea in 1950, are classic examples of the kind of quick-punching determination which these men admire. Among the present candidates they find the same quality in Senator Johnson; others claim to detect it in Governor Rockefeller and, less confidently, in Vice President Nixon and Senator Humphrey. It is those who rate this qualification most highly who look with the wariest eye on Mr Stevenson's reputation for being indecisive. One of the great problems of American foreign policy at the moment is that it seems to require both this toughness and also the breadth of understanding for which Mr Stevenson is famous; and the two qualities rarely flower fully in one man.

The third qualification is perhaps the most important, since the extent of the President's influence over the country depends on it. It is generally assumed that, whoever wins next November's election, and whatever his party, he will wield the presidential power more actively than Mr Eisenhower has done; that is, there will be a greater display of the "executive energy" which the nation's founders hoped for. But a good deal will depend on two factors. One is the ability of the new President to pick his advisers skilfully, and to use them well. This is a knack which Governor Rockefeller has demonstrated more convincingly than any of his rivals. The other is the President's willingness to lavish a loving care upon the niceties of everyday politics: to know whom to put pressure on, and how to apply it best, in order to exert his leadership as effectively as possible. This was one of President Roosevelt's great strengths, and is one of Mr Eisenhower's most obvious deficiencies; among next year's likely candidates there is no manipulator in sight with half the skill of Senator Johnson.

If these factors are lacking, the most energetic flow of ideas from the White House is liable to trickle away into frustration and inconclusiveness. All the major candidates seem to be aware that the United States will have to put out new efforts in the next decade if it is to meet the Russian challenge; but the difficulty will be to stir public opinion out of its present apathy. The powers of the Presidency will have to be used to the utmost. It would be a miracle if a candidate were found who combined this skill at political manipulation with all the other qualities that are needed for the office. There seem remarkably few Lincolns or Roosevelts in sight at the moment; but if the candidates are tested by these stringent standards in the coming year it may at least help—as Mr Sevareid puts it—to separate the men from the boys.

Future articles will discuss the leading presidential candidates individually.

Bipartisan Aspirations

THE President's breakfast with the congressional leaders of both parties and his pre-departure broadcast to the country are both obviously designed to stress, for the benefit of those he is about to visit, that world peace is not only his own personal "basic aspiration" but also that of everyone, and every party, in the United States. Indeed, it is just because he does symbolise the basic aspiration of the American people that they have given him such huge majorities. But the foreign officials whom Mr Eisenhower will be seeing are well aware that he cannot be elected again and they would certainly feel more confident of the future if they had some assurance that the next President will share not only Mr Eisenhower's basic aspiration but also his views on how it should be given practical application.

However, the suggestion that a leading member of the Democratic party—ex-President Truman was mentioned—should accompany Mr Eisenhower was hardly feasible. The President regards this as his personal mission and by now he is enough of a politician to wish that his own Republican party should get all the credit for it. Nor do the Democrats want to be inhibited from criticising the President's initiative should it turn out to be a liability to the Republicans in the coming election campaign. While at this early stage it is only retired statesmen with no hope of office—Mr Dean Acheson, in particular—who denounce the new policy of negotiating with the Russians, if it fails the potential Democratic Presidents will all be delighted that they were not closely associated with it.

Nevertheless there is a real need—which is not being filled—when an Administration is reaching the end of its life for some sort of bipartisan approach to the details, as well as the aspirations, of foreign policy. There were several Republicans in the Truman government and in its later days Mr Dulles was actually working in the State Department. But the attempt to bring Mr Stevenson into the Eisenhower Administration in a somewhat similar way to years ago was not successful. And the situation is made worse at the moment by the changes which are taking place among the career diplomats. The only high-ranking professional who will be with President Eisenhower throughout his trip is Mr Robert Murphy and he is retiring as soon as he gets home.

Capital Caution

FROM A CORRESPONDENT IN NEW YORK

THE preliminary survey of plans for capital investment in 1960, which has just been released by the McGraw-Hill Publishing Company, suggests that the increase next year is likely to be smaller than the experts had expected. This year spending on plant and equipment has been checked by the steel strike, but for this very reason it was thought that in 1960 such expenditures might rise by 15 to 20 per cent—almost as much as in 1956. Instead, business as a whole plans to spend only 10 per cent more than it is doing now. Manufacturing companies expect to spend 19 per cent more, but this is only because the steel industry had to postpone all its plans for the last half of 1959 and expects an increase of 76 per cent in 1960. A few other industries are in the same boat, but most of the plans are more modest.

A survey made in November catches most companies before their budgets for the next year are completed, and in good times actual spending usually exceeds the paper estimates. But in 1960 any increase greater than 15 per cent will take some doing. Manufacturing companies may raise their sights, but they will be plagued by the shortage of steel. The makers of industrial machinery have almost exhausted their stocks of steel and their deliveries will not be back to normal for from four to six months. For the same reason, it is hard to visualise much increase in commercial construction beyond the present scheduled rise of 9 per cent.

Two industries which could increase their expenditures sharply if they wanted to are oil and electric power. But the glut of petroleum products is leading the oil companies to think of ways to reduce expenditures, not of how to raise them. This situation may change before 1960 is over if demand grows enough to strengthen the prices of oil products, but it is hard to see it changing very fast. The electricity companies are happy to order new generating equipment now that it is cheaper, but they will not get it until 1961.

If a 1956-style boom is coming in capital goods, it is still a year away. By next spring, manufacturing firms may be operating at close to 90 per cent of capacity in an attempt to make up the losses caused by the strike. This is a level which in the past has released

THE MAN FROM CHARLES W. HOBSON'S

Every year Charles Hobson executives **and copywriters spend hundreds of hours working at the point of sale. They learn about customers' outlooks and shopping habits. They help to keep the thinking of all our advertising in touch with the realities of selling.**

Our photograph shows account executive W. M. Turnock serving a customer in a large London garage last month. The story of what he and other Charles Hobson executives learned first-hand about customers and their habits is contained in their reports. These are valuable sources of reference for all our work as an advertising agency.

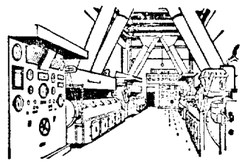
CHARLES W. HOBSON LIMITED, 12/13 CONDUIT STREET, LONDON W.1

Tate and Lyle are sweet on Coal

TROPICAL PLANTATIONS for cane sugar, English fields for sugar beet. And, for Tate and Lyle, British coal to begin the processes that put an endless supply of pure sugar into the larders of Britain.

The shrewd men who direct this great sugar business choose coal because coal, efficiently burned on mechanical stokers, provides accurately controlled heat for the lowest cost per lb. of steam; because coal—mechanically stoked—burns smokelessly; and because the coalfields of Britain can supply all industrial demands for generations to come.

When it's your turn to make a decision about fuel, remember Tate and Lyle. Their experience could profitably sweeten your financial cup of tea.



Here are some key facts and figures about the Tate and Lyle power houses at their refineries in London and Liverpool

The boiler houses at the three Tate and Lyle refineries raise together 890,000 lbs. of steam per hour at 650 lbs. per sq. inch at 82% efficiency, which pass through turbines to generate 24 Mw. of electricity of which 4 Mw. is re-exported to the grid. The steam then goes to the process, and the power and heating operation has an overall thermal efficiency of 72%. The coal burnt amounts to over 300,000 tons per annum of washed smalls.

PROGRESSIVE INDUSTRY IS GOING FORWARD ON

COAL

ISSUED BY THE NATIONAL COAL BOARD

a surge of new construction. By that time the oil and electric power industries may also be ready to join the parade. The railways, which have shelved most of their plans to buy new goods wagons because the steel strike hurt their business, will undoubtedly want them next year.

The deferring of many plans for new capital investment will provide a welcome relief to the money market. The companies included in the survey, questioned about their financing plans, indicated that $6.3 billion would be needed from external sources to finance capital expenditures in 1960—or only about $500 million more than in this year. (This is not an estimate of the total of new issues, which include funds raised for working capital.) More than 80 per cent of the funds required for capital spending are expected to come from internal sources such as retained earnings and depreciation and depletion allowances. This is a high degree of reliance on internal financing, even allowing for the fact that preliminary financial plans often underestimate the eventual need for public issues of securities.

According to the survey manufacturers expect to finance nearly all their 1960 capital spending from internal sources. Estimates in this field have usually proved too low in the past. But the present plans for raising less than $800 million in the money market for new plants and equipment could be increased considerably without approaching the 1957 total of nearly $3 billion. The petroleum industry also proposes to finance nearly all its capital expenditures in 1960 from internal funds. The electricity and gas companies will rely, as usual, on the money markets, but they do not plan to spend much more next year than they did in 1959. The real pressure on the money markets will come late in 1960 or in 1961, particularly if businessmen seek short-term funds early next year in the belief that long-term interest rates will fall as 1960 goes on, and that they will save money by refunding these obligations later.

Senator Kennedy's Catechism

LIKE Al Smith, who in 1928 became the only Roman Catholic ever to be nominated for the Presidency, Senator Kennedy is undergoing a public cross-examination to discover whether his freedom of action if he reached the White House would be circumscribed by his religious beliefs. Protestant groups and enterprising newspapers naturally wanted to know the views of the leading Roman Catholic contender for the Presidency once the American bishops of his faith had publicly denounced the use of government funds to disseminate in under-developed countries information on artificial methods of birth control.

Up to now not a penny of foreign aid funds has been spent in this way and no country has requested help in controlling the growth of its population. But the Indian Ambassador to the United Nations has just said that India would welcome it and in years to come the question may be far from academic. That rapidly falling death rates and continued high birth rates make more difficult the task of economic betterment in backward areas is not disputed. The foreign aid programme is involved in two ways: because it may be thwarted by this rapid growth in numbers and because efforts to improve living conditions may themselves be a cause of the trouble. Last summer the Draper committee, which was appointed by the President to study foreign aid, seemed to suggest, in heavily-veiled language, that information on birth control should be made available to countries receiving economic assistance if they asked for it. This position has been supported by the Protestant Council of Churches.

In his press conference this week the President said forcefully that the matter was not one for the government and that if foreign countries wanted such assistance they should address themselves to private organisations. Senator Kennedy disdained such sidestepping of the issue. He rightly declared that it would be unbecoming of the government, which has never advocated birth control in the United States (although the population is increasing very rapidly) or in Europe, to urge it on the brown and yellow races; this is a problem for the under-developed countries themselves. But, if the question of providing information came to him as President, he would decide it in the best interests of the United States. Other possible candidates—Governor Rockefeller, Mr Stevenson and Senator Humphrey—believe that such assistance should be provided to countries requesting it. Only Senator Symington, who has probably given less thought to the problem than anyone, was unequivocally in favour of birth control abroad—perhaps because any religious controversy is bound to make Democratic politicians even more timid about entrusting their hopes to a Roman Catholic and thus to improve the presidential chances of less controversial candidates.

Wall Street's Meagre Diet

FROM A SPECIAL CORRESPONDENT

AT a time when the prices of most ordinary shares which are traded on Wall Street are moving sluggishly, a few favoured issues have shot up by leaps and bounds while others have fallen drastically. These divergences have been masked by the market averages, which have remained fairly static for the past two months. But the managers of institutional portfolios, who have often attributed their lack of interest in British and European securities to the thinness of foreign markets, have become painfully aware that this condition also prevails at home. These professionals are turning more and more to secondary distributions—sales of shares through underwriters—in preference to the stock market, where the lack of buyers usually forces them to make big price concessions when they are disposing of large blocks of securities. The meagreness of the supply of shares was an important and perhaps welcome element in the upward thrust of prices during the recent bull market, but now that demand has slackened and the desire to lighten holdings of equities is widespread it has become obvious that a thin market has its drawbacks.

Trading volume has declined in spite of the rapid growth in the number both of shareholders and of shares outstanding. At the end of 1958, there were just over 5 billion shares listed on the New York Stock Exchange with a total value of $276 billion; since then a record number of stock splits and dividends has increased the number of shares still further while the rise in equity prices has raised their total value to over $300 billion. The total number of shareholders is also higher. Yet since 1951 the rate of turnover has ranged between 12 per cent and 19 per cent compared with an average turnover of about 40 per cent in the nineteen-thirties and of 119 per cent in 1929. This means that the total value of a very large number of listed shares is being determined by a very small portion of them. In October, when 61 million shares changed hands, about $5 billion was added to the total value of listed shares, indicating that major swings in prices can result from minor fluctuations in turnover. In recent years the number of shares bought and sold has not amounted to a significant proportion of the total; the biggest trading day, just after the President's heart attack in 1955, saw 7.7 million shares change hands and total values declined by about 4 per cent. But this is no guarantee that there will never be an upsurge in trading volume, accompanied by wider price fluctuations.

The thinness of the market has several causes. The tax laws, which treat as ordinary income a gain made when a security has been held less than six months and exact a maximum of 25 per cent on a

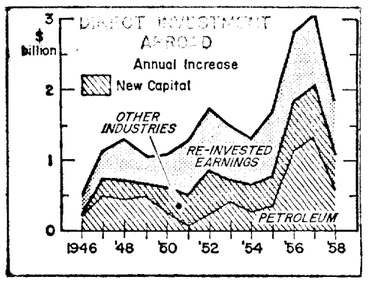
Business Moves Abroad page 972

Business Moves Abroad

SINCE the war American businesses, like American holiday-makers, have taken to going abroad, and by now the migration of American capital in search of markets and higher profits is well-established. Direct investments abroad, in branches, subsidiaries and foreign affiliates, amounted altogether to only $7.9 billion in 1943; by the end of 1958 they reached a total of $27.1 billion in terms of book value alone. Their actual worth was probably close to $50 billion, according to an estimate by the McGraw-Hill Department of Economics. Direct investment now represents the lion's share of the whole $41 billion of private American holdings abroad. Earnings on direct investments amounted to about $3 billion in 1958, a recession year; reinvestment of earnings



accounts for much of the spectacular growth in the American holdings.

Even more remarkable is the estimate by McGraw-Hill that American-controlled firms abroad sold about $30 billion worth of goods in 1958, nearly twice the value of American exports. Ten years earlier such sales were about equal to exports, then worth $12 billion. About 3,000 firms, including 99 of the 100 largest American corporations, have undertaken foreign operations and many of the businessmen involved believe that sales from foreign plants will continue to increase far more rapidly than exports.

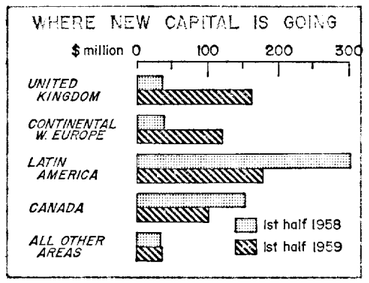
This growing stake in foreign operations inspires, in those concerned, a more liberal attitude towards trade policy; protection at home can bring retaliation abroad. But many trade unionists and members of Congress are beginning to protest about the "export of jobs" which results when American capital and know-how link hands with lower foreign wage scales. To give only one example, the International Harvester Company, which once exported 15,000 tractors a year from the United States, now exports only 1,000; more tractors are being sold abroad than ever before, but from its foreign plants. Moreover, the migration of private capital contributes (if only temporarily) to the deficit in the balance of payments.

Last year the value of direct investments rose by only $1.8 billion, but this is still substantially more than the postwar average. Moreover, the petroleum industry, which accounted for 40 per cent of all direct investment between 1950 and 1958, was responsible for most of the decline in the rate of growth in 1958. In the first half of 1959 the flow of new capital into direct investment abroad was 13 per cent higher than it had been in the first half of 1958.

These balance of payments figures fail, however, to give a complete picture of the part played by American-controlled companies in the economies of foreign countries because their growth is being financed to an increasingly large extent in foreign capital markets and out of the subsidiaries' own internal resources. Last year the Department of Commerce began a survey—admittedly not quite complete—to discover what resources are available to such companies and how they are spent.* In 1958 spending on property, plant and equipment totalled $3 billion, of which only $.8 billion came from the United States; such spending amounted to 17 per cent of the total for all American companies at home and abroad.

The McGraw-Hill Department of Economics has also started a survey of foreign spending by manufacturing and petroleum companies. It concludes that in 1959 this is likely to rise only 5 per cent above spending in 1958 and will remain below that for 1957. But spending on manufacturing plant alone is being expanded by 26 per cent and will be higher in 1959 than it was in 1957. Moreover, by 1960 manufacturing companies expect to be spending 47 per cent of their foreign outlays in Western Europe compared with less than 40 per cent in 1957; this would be a larger share than that going to Canada and Latin America together.

Direct investment abroad is prompted more by the desire to tap new markets or to preserve old ones than by low foreign wage-scales. These do not always mean low costs of either labour or production. A study by the National Industrial Conference Board concludes that only in Britain and Western Europe are costs in general lower than they are in the United States. Stronger incentives

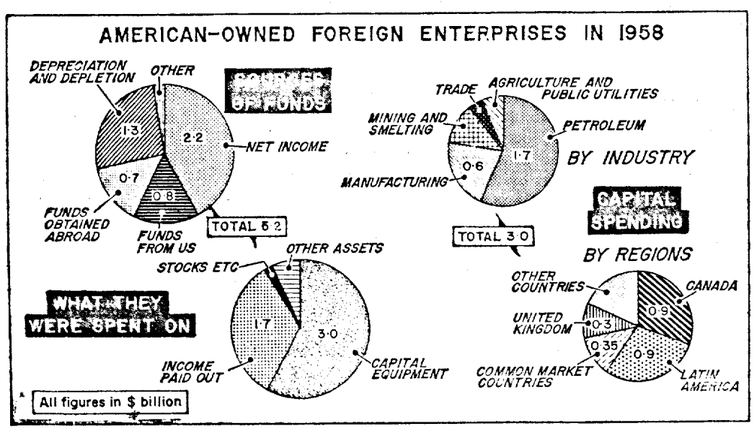


are the desire to evade tariff barriers and the considerable advantage of being able to adapt output to a specific market—smaller refrigerators for Europe, for example, and ones with room for wine bottles in Italy.

In 1958, the first year of the European Common Market, new investment in the countries belonging to it held up well, in spite of the recession, at just over $90 million a year, while new capital flowing into the United Kingdom fell from $157 million in 1957 to $58 million. (The sharp rise in 1959 owed much to one large transaction—the purchase of British Aluminium.) France and Italy scored the greatest gains. Elsewhere, new investment in Latin America fell from over $1 billion to $288 million (mainly because of less interest in petroleum leases) and in Canada from $584 million to about $400 million. The Far East was a net loser, but Africa and the Middle East continued to gain because of new investment in petroleum.

Much emphasis has been placed on the need to replace government-financed foreign aid with private capital, partly to lighten the taxpayer's load, partly because private capital is a bringer of new techniques. But in 1958 no new capital went, for example, to India on balance; in general private capital for factories is attracted by the prosperous markets of highly developed countries. Moreover, 85 per cent of the foreign capital spending of American companies in 1958 was for expanding and modernising established enterprises—those created in 1950 or even earlier.

* *Survey of Current Business*, October, 1959.



Flowers in the desert

Flowers grow, even in the wastelands of Mexico . . . the flow[illegible] of cactus. A brief shower . . . and the sands blaze into short life with scarlet mariposa lily, verbena and desert dandelion. But where man-made channels water the desert, blossom comes more surely and profitably—in the pinky-white form of cotton. Nearly half a million irrigated acres are under cotton cultivation in Baja California del Norte. The whole valley area of this corner of Mexico depends on cotton—and nematodes were seriously endangering this all-important crop.

For some years, yields had been steadily decreasing in many of the cotton fields and by 1956 the situation was causing alarm. The presence of nematodes was suspected and an infestation survey was carried out—with startling results. Nearly a fifth of the entire cotton acreage was found to be seriously infested with nematodes and it was, therefore, decided to carry out a comprehensive series of trials with Nemagon soil fumigant. Once again, the results were startling.

Dosage rates as low as ½ gallon per acre (5 litres per hectare) gave *yields 2½ times those obtained in untreated soils—together with larger bolls—yet there was no diminution in quality of the cotton lint or seed.* Furthermore, there was a marked reduction in cultivation and irrigation costs as a result of the far more rapid growth. These were readily-apparent benefits of treatment with this important soil fumigant developed by Shell. From the power of Nemagon, will come more—and more profitable—'flowers in the desert'.

Nemagon
Trade Mark

Nemagon is one of a series of Shell pesticides that offers control over virtually every major world pest—aldrin for insects in the soil, endrin for those which attack foliage and flower, dieldrin for persistence and public health uses, Phosdrin for close-to-harvest application and D-D for nematode control.

IN AGRICULTURE . . . YOU CAN BE SURE OF SHELL CHEMICALS

Issued by Shell International Chemical Company Limited and Bataafse Internationale Chemie Mij. N.V. For further information consult your Shell Company (in the U.K., apply to Shell Chemical Company Limited).

A shine in their eyes

In front of the shop window . . . a home begins, dining table, chairs and sideboard. Curtains and carpets and interior-sprung mattress. Clothes line and washing-machine. A home built first in two-minds-with-but-a-single-thought, now seen with starry eyes through plate glass windows and in shiny catalogues. A home in the making, chemical formula for domestic bliss.

Chemical formula? Ketones for the fine lacquer finish on the hardwood furniture. Detergents for the scouring of the wool of the carpet. Plastics for the curtains and for the clothes line. Epikote resins for the durable finish on the washing-machine. Synthetic rubber for the foam filling of cushions. All, by Shell.

Shell industrial chemicals help to build many homes—and many products. In the range of Shell chemicals are ketones, alcohols, glycol ethers and hydrocarbon solvents; resins, plastics and detergents; base chemicals and additives; glycols, synthetic rubber, synthetic glycerine. Ask your Shell Company how Shell chemical research and production can best serve you.

Shell Ketones

Shell Ketones—particularly methyl isobutyl ketone—are all-important constituents of the fast-drying, long-lasting nitrocellulose lacquers which are so widely used in wood and metal coatings. Ketones are also used in the manufacture of vinyl and acrylic lacquers, in extraction processes for drugs, pharmaceuticals and perfumes and in the manufacture of synthetic resins, plastics and rubber accelerators. Like all Shell industrial chemicals, Shell Ketones serve many industries. Your Shell Company will give you full details.

Continued from page 971

gain made when it has been held longer, are a deterrent to frequent trading. Similarly, the concept of dollar averaging, a system favoured by institutions and individuals who can count on a constant flow of fresh funds which are used for regular purchases of the same issues, tends to freeze shares in portfolios. Some institutions disdain dollar averaging. But, because of the size of their commitments, most institutions must be long-term investors; their purchases reduce the number of shares available for trading.

While long-term investment has been encouraged, short-term transactions have been curtailed. The imposition of margin requirements—now standing at 90 per cent—has cut down the activities of traders. Before the Federal Reserve Board had the authority to regulate margins, speculators could and did purchase shares with comparatively little cash, hoping for a quick rise in prices. This generated an unhealthy amount of risky trading that served to accelerate the 1929-30 disaster; with today's high margins the individual is well protected against being wiped out and there is no danger of an excessive amount of credit going into the equity market. But the advantages afforded by margin requirements are offset, to some degree, by a decline in trading depth.

The Stock Exchange has itself contributed to thinner markets by increasing commissions on purchases of equities. Commission charges have gone up three times since 1947, with the last rise, in 1958, amounting to an average of 13 per cent. Merrill Lynch, Pierce, Fenner & Smith, the nation's largest brokerage firm, fought the increase on the ground that it was hardly consistent with the exchange's campaign to increase the number of small shareholders. It was also a blow at speculators. Trading volume actually rose after the new scale of charges was established, but this was because of the resumption of the bull market and the increased demand for shares. In the last few months there has been an increase in the activity of members of the stock exchange trading for their own accounts, but the amount done on behalf of the public has fallen sharply.

The combination of the capital gains tax, higher margins and higher commission charges has not only reduced the total floating supply of shares, but has also concentrated the attention of traders upon those issues having relatively few shares outstanding. Institutional investors like to confine their buying to corporate blue chips, such as General Motors, du Pont, International Business Machines and US Steel, which have a high number of shares and shareholders and which are less vulnerable to violent swings in price. Sophisticated speculators seeking large short-term gains do not purchase these issues unless circumstances clearly indicate a big new wave of demand; instead, they seek out ones whose prices will soar if there is a small rise in demand. A group of such issues, which have comparatively few shares outstanding and which are closely held, are listed on both the New York Stock Exchange and the American Stock Exchange; frequently their prices fluctuate 10 or 20 per cent in a single day.

Steel's Working Conditions

THE deadlock in the steel negotiations, which makes it seem probable that the strike will be resumed when the present injunction against it expires on January 26th, has arisen not from any inability to agree on wages or other payments but from the management's insistence that in any settlement it must be given greater control over local working conditions. To the labour leaders the companies' intransigence on this point suggests that they are using the anti-labour climate in Congress and the country as an opportunity for trying to break the steel workers' union. To the men themselves the companies are simply attempting to "eliminate jobs" and speed up work and are attacking the safeguards won by labour during long years of struggle. The men therefore rallied behind their leaders' call for a strike far more enthusiastically than they would have done had the dispute been on the less emotional question of wages.

Local working rules are the thousands of customs and work practices which have grown up during the detailed application to particular steel mills of wider industrial agreements; they naturally vary considerably from plant to plant and even from process to process within a plant. They may involve wages and hours but usually concern some aspect of working conditions—work loads, the number of men on a job, calculations of overtime, breaks for refreshment, seniority and promotion. In *Business Week* recently an example was given of a team of twelve men doing a job which only needed ten; to eliminate the two spare men would have saved over $7 an hour, some of which would have gone to the men remaining as a reward for extra work and responsibility. But under Section 2B the cut cannot be made unless the union agrees—and it is not likely to do so.

SECTION 2B is the clause in the union's 1947 agreement with the maior companies which protects these local rules except where the management makes a basic change in the conditions of production. Modernisation and the installation of automatic processes constitute such a change and the union insists that, in taking its stand on Section 2B, it is not opposing automation or the changes in work rules which this necessitates. Indeed, the union says that it welcomes investment in new and better facilities. But it is resisting attempts to reorganise the use of manpower where there have been no technological improvements in the plant; it argues that this means over-work for some at the expense of the jobs of others. The dispute is therefore concerned chiefly with older steel mills in which restrictive work rules have grown up over long periods of time and have been frozen into local practice.

On their side the steel companies assert that the industry uses manpower wastefully. Therefore they want more freedom to change work rules, particularly those concerning the number of men on a job and their working schedules, when such changes would make production more efficient and eliminate idle time. But, as the presidential board of enquiry pointed out, the managers have not as yet offered compensation to those workers who might become redundant under such a system.

The steel industry has maintained an almost united front so far but an important maverick was the Kaiser Steel Corporation which signed a separate contract on October 26th. As well as providing for concessions on wages and welfare this gave responsibility for changing local work rules to a small joint committee from management and labour. The other companies rejected this solution on the grounds that it would cost them more than it would Kaiser and would almost certainly be less effective. This is because most of their facilities are older than are those of the Kaiser Corporation, which was founded during the last war and is modern both in its plant and in its labour relations; it is less troubled with work rules and it treats them with a flexibility that is not found elsewhere. The heart of the industry's refusal of the new Kaiser contract seems to be management's desire to have direct control over the workers in a plant.

However, the other companies have offered to delay a decision on work rules for a year provided that the question is submitted to a study committee and, if that fails, to binding arbitration. This proposal was unacceptable to the union which claimed that it would only delay, not counter, what is held to be the industry's determination to reduce its work force; furthermore the union felt that the question as submitted in the companies' proposal was phrased so narrowly that it could only be settled in their favour.

The exchanges try to narrow price spreads, but there is no way of preventing big gains and losses when the number of shares involved is so small.

For example, shares of the Fairchild Camera & Instruments Corporation, which is one of the most publicised electronics firms, sold for $283 last week, $30 more than the previous closing price. In all, 4,100 shares of Fairchild were traded, which represents less than one per cent of the 495,000 shares outstanding. As a result of a single day's trading the value of Fairchild shares increased by almost $15 million or roughly $5,400 for each share that changed hands. If a total turnover of less than one per cent can bring such a great rise, it can also bring a great fall; in August, Fairchild shares dropped $44 in three trading days, a loss of about 25 per cent for those who had bought just before the break.

Institutional investors recognise that the market's evident thinness can accentuate a decline just as it has magnified the upturn. There is little, however, that anyone can do about it. No one favours any change in margin requirements, for example, nor is there any chance of a reduction in commission charges. Even more surprisingly, there is little sustained sentiment for changing the laws on capital gains. There have been some suggestions that the law should be made more flexible; this would help to thaw out portfolios. For example, the Investment Bankers' Association, when it met in Florida this week, supported proposals to reduce the capital gains tax, particularly on shares which have been locked up for a long time, and pointed out that this would mean more trading, and hence more revenue for the Treasury, as well as greater stability for share prices. But there is unlikely to be much congressional support for either argument.

When Television is Sick . . .

BETWEEN now and Christmas television's sordid cupboards will be turned inside out by a host of government investigators. This week the Federal Trade Commission discussed with the industry's leaders ways of eliminating deceptive advertising. On Monday the Federal Communications Commission, the government agency which was so backward about interfering with rigged quiz shows, is beginning broad hearings on the practices and malpractices of television. Two days later a House committee will pick up its hearings where it left off after Mr Charles Van Doren offered his celebrated confession. The Department of Justice is preparing a report for the President on deceptive practices, and a Senate subcommittee is thinking of looking at the rating systems, which supposedly measure the popularity of individual programmes, to see if they too are rigged.

Any hopes which sponsors, advertisers and the industry may have cherished that the scandal would die down before Congress reassembles early in January have been frustrated by the discovery of a new vein of corruption: payola. This is the entertainment industry's expressive term for the bribes paid by gramophone record companies to disc jockeys, who can turn a new song into a goldmine by playing it on their programmes of recorded music. Some of these gentlemen have been unhorsed abruptly; many are being interviewed by the New York authorities in the wake of charges that payola is widespread. The most influential disc jockey, Mr Dick Clark, who has a vast teenage following, has been forced by the American Broadcasting Company to give up his considerable interests in recording and music publishing firms.

According to Dr Stanton, the candid head of the Columbia Broadcasting System, "something has to be done before it is done to us." The risk of new legislation may not be this acute, but the fear of it is driving the industry to put its own house in order, or at least to give the impression that it is busy doing so. The chairman of Young and Rubicam, the important advertising agency, has failed to persuade CBS and ABC that what the industry and its advertisers need is a panel of distinguished outsiders to draw up a code of conduct, but only because Dr Stanton feels that this would be "passing the buck" and an abdication of the networks' own responsibilities. One of the reforms being discussed at CBS is a move toward the "magazine concept," under which the network, instead of its advertisers, would provide the programmes—in short something like British commercial television. Such a noble experiment might free CBS from the devil of government control, but undertaken alone it seems equally certain to land it in a deep blue sea of deficits. Advertisers pay television $1 billion a year, partly to be identified with their own shows. The National Broadcasting Company's decision to appoint a "citizens' advisory committee" is a safer, if somewhat meaningless, course.

SHORTER NOTES

In spite of all the discussion of railway mergers, and the Interstate Commerce Commission's encouragement of these plans as a cure for the unhealthy economic condition of many railways, the first such merger takes place only this month. It was originally proposed, and turned down, 34 years ago. It unites the Norfolk and Western Railway Company with the Virginian Railway Company; the two lines, with 2,748 miles of track between them, serve the Pocahontas coal-producing region. The merger is expected to bring savings of $1 million a month, but it may mean that as many as 40 per cent of the employees will lose their jobs.

* * *

While visiting New Delhi on December 11th President Eisenhower will open the American exhibit at the World Agricultural Fair. It will include models of four American types of farm—dairy, poultry, wheat and general—and will cover some five acres at a cost of $2 million. The two-month-long fair will stress methods of increasing food production. Among the other countries participating are Russia and Communist China.

* * *

Even though there was a loss of $528,873 according to one calculation, 1958-59 was the New York Metropolitan Opera Company's most successful financial season for twelve years. A different, but equally valid, accounting method produced a profit of $3,150.

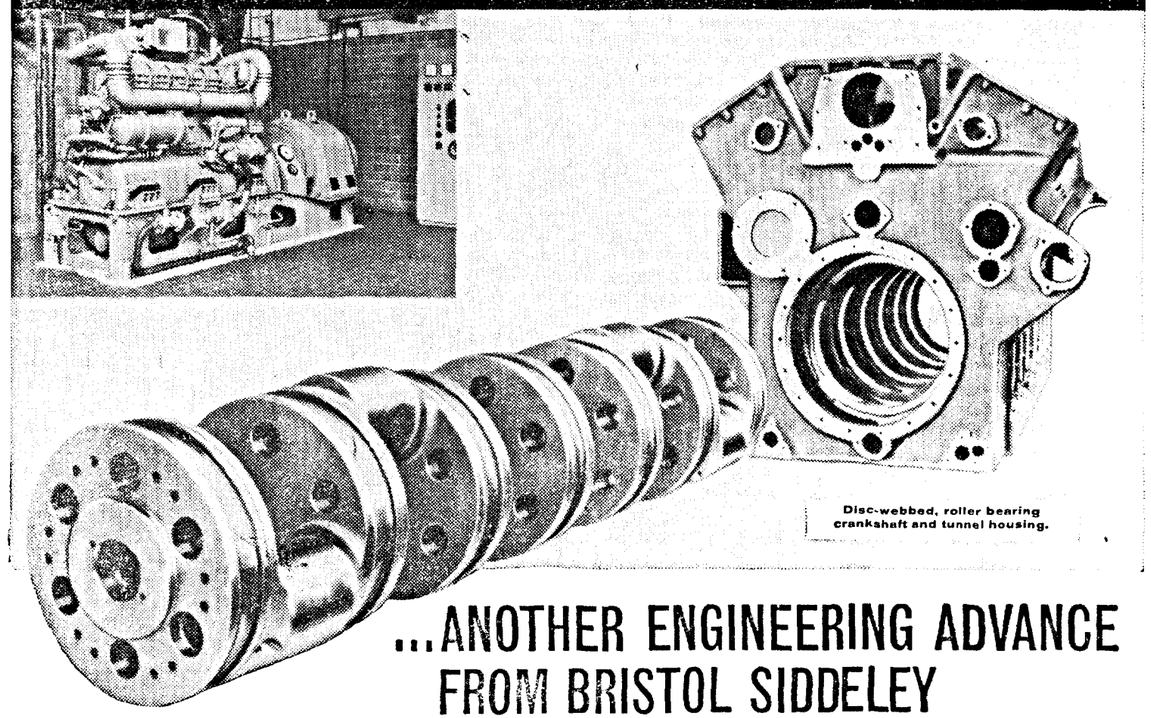
Corrections:—The first article in the series "Bill of Health" appeared in the issue of August 29th, not August 20th, as was stated at the end of the series. Several of the surveys referred to in these articles were undertaken by the Health Information Foundation Incorporated, of 420 Lexington Avenue, New York City, which is an independent research organisation sponsored by the drug companies.

In an article entitled "One Sheep, One Vote" in *The Economist* of October 15, 1959, it was stated that live sheep are being sent to the United States from New Zealand; this should have been Australia.

Maybach industrial diesel engines–from 300 to 1,800 hp–
can achieve 16,000 hours between major overhauls...



Disc-webbed, roller bearing crankshaft and tunnel housing.

...ANOTHER ENGINEERING ADVANCE
FROM BRISTOL SIDDELEY

Bristol Siddeley Engines Limited produce Maybach* diesel engines. Covering a power range from 300 to 1,800 hp, Maybach diesels are amazingly reliable and have shown that they can achieve major overhaul lives of between 12,000 and 16,000 hours.

The *proven* basic design features of the whole range (straight 4 to 16-cylinder V) are the same, and each unit can be turbo-charged, or turbo-charged and intercooled. The range operates between 1,200 and 1,600 rpm and *combines the best performance and design qualities of high, medium and low-speed diesel engines:* light weight and compactness, excellent thermal efficiency and extremely long life.

Advanced design features

The pistons are pressure-oil cooled. This gives very efficient heat dissipation and reduces liner and gas ring wear to a minimum. The roller bearing, disc-webbed crankshaft is exceptionally rigid within its tunnel housing, and in practice withdrawal is not normally necessary before 12,000 hours running. So low is big end bearing wear that in some cases the protective lead flash has been found intact when examined after 15,000 hours running!

Since the cylinder bore and stroke, and the majority of components, are identical in all models, spares stocks are considerably reduced. And during servicing semi-skilled labour can be used because great thought has been given to easy accessibility and removal of components.

World-wide application

Bristol Siddeley Maybach diesel engines are designed for a wide variety of industrial applications, from stationary and mobile light and power generator sets to oil-drilling rigs and pumping stations. Maybach diesel engines are in service all over the world and have built up an unrivalled record for reliable and economic operation.

For further information please write to: Maybach Sales Manager, Bristol Siddeley Engines Limited, PO Box 17, Coventry, England.

BRISTOL SIDDELEY ENGINES LIMITED

Gunnar Ericson, President of the Facit Group — one of the world's leading business machine manufacturers and exporters.

Why are so many world-known business machines built **by Swedes?**

"I believe the answer to that is — Swedish technique and tradition.

You see, Swedes are mechanically gifted and have an almost reverent respect for quality, precision and craftsmanship.

And as inventors, builders and designers, Swedes — also descendants of Swedes abroad — have made pioneering contributions to quality production of modern business machines.

In relation to her population, Sweden today produces more business machines than any other country in the world.

And Facit, Sweden's leading manufacturer and exporter, which to date has produced more than 2 million business machines, has played a substantial role in this development."

If you would like to read the story of this achievement, your local Facit agent will gladly send you a free copy of our brochure "Why are so many..." — or you may write directly to Åtvidabergs Industrier, Stockholm 7, Sweden.

THE WORLD OVERSEAS

Sweet Reason on Algeria

FROM OUR SPECIAL CORRESPONDENT AT THE UNITED NATIONS

By Wednesday the United Nations Assembly's public debate on Algeria was at last properly launched—on a flood tide of sweet reasonableness. Even before the formal opening of the debate on Monday, it had been pretty clear that only one issue was at stake. Would the assembly accept a resolution whose Arab, Asian and African sponsors were diplomatically anxious to make no reference to spades as spades ; or would a decisive number of delegates listen to those who thought it better to pass no resolution at all? On both sides generous tribute has been paid to "men of good will" thanks to whose recent initiatives, it is almost fulsomely emphasised by most speakers, a solution in Algeria now seems much nearer. Whatever their private reservations, in public delegates of a notable variety of governments have vied with one another in hailing the approach of a new and radiant day, and have presented their arguments mainly in terms of a choice between tactics—the actual goal may not be very clearly defined, but it is stoutly assumed that it is scarcely in dispute at all. Times have indeed changed.

Arab spokesmen have seemed more concerned to praise General de Gaulle than to badger him. Mr Mongi Slim of Tunisia, who opened the debate on Monday morning on a rigorously unimpassioned note which sounded like a choirmaster's tuningfork, quoted copiously and appreciatively from the General's utterances.

On Wednesday afternoon, Mr Georges Hakim of Lebanon, while minutely analysing the inconsistencies between the various French statements on Algeria, placed his analysis in a framework of resounding compliments to the "high statesmanship" of the "great leader of a great nation." True, on Tuesday the irrepressible Mr Shukairy got into the act with a speech which, after beginning with a promise of "no recriminations, no indictment," veered to references to "Paris, whose streets are murmuring under the muddy boots of militarism and colonialism." But by his own peculiar standards even he was notably restrained; and the private consensus of opinion among the Arabs here, including most particularly the Algerian representatives, was that Mr Shukairy might have been better employed in some other committee of the assembly. One Arab suggested to your correspondent that the one jarring note in ten Arab speeches might serve a useful purpose by pointing up the statesmanlike moderation of the others.

More jarring notes may yet be heard. On Wednesday Señor Lequerica of Spain, in the course of handing out verbal bouquets all round, let slip an unhappy phrase about the United Nations "keeping its fingers out of the pie." As for Russia, the present interesting stage of its relations with France suggested that its views might well be couched in cautious terms.

The general aroma of good intentions seems too strong to be easily dissipated. The British and Australian delegates, who on Wednesday joined with their American and Canadian colleagues in an Anglo-Saxon chorus of appeals for the debate to be left to tell its own tale without the adoption of any resolution at all, took pains to praise Mr Slim's opening speech. On all sides appeals to precedents were deployed in a most Anglo-Saxon manner. Sir Pierson Dixon cited Cyprus—the most encouraging item missing from this assembly's agenda—as showing the 1958 session's wisdom in not passing any resolution on a dispute when agreement was "almost within reach." Mr Slim, referring to the Algerians' nomination of five imprisoned leaders as their chief representatives in the proposed discussions with the French government, remarked that neither Britain nor France had had cause to regret their acceptance of Dr Nkrumah and the King of Morocco as negotiators brought straight from detention. Mr Fawzi added Gandhi, Nehru, and others to this list.

At the end of the day the Burmese delegate formally introduced a joint Asian-African resolution, whose terms were as restrained as had been expected. Again the contrast with the 1958 assembly was most striking. Then, the same group had presented a draft which referred specifically to the conflict in Algeria as a war, to the country's right to independence, to negotiations, and to the insurgent leadership by its full style and title as provisional government. Even after the deletion of the last reference this resolution had mustered only 35 votes. This week's text speaks of hostilities, not war (an Algerian here remarked to your correspondent that this was a more modest expression than even the French President himself had used); of self-determination, not independence: of rather vaguely defined pourparlers, not negotiation; and of "the two parties concerned," not otherwise specified.

To vote against this, it has been remarked here, is practically to vote in favour of sin. Accordingly Wednesday's reluctant westerners will presumably continue to avoid any criticism in specific terms and will stress the value of not adopting any resolution at all. But it need hardly be said that, for all the present appearances of sweetness and light, France's allies remain painfully embarrassed. The French thirst for grandeur may have been slaked with verbal bucketfuls during the debate, but the French, who have absented themselves throughout, have made clear their abhorrence of any resolution passed by an organisation whose name is now something of a bad word in Paris. British and American spokesmen on Wednesday left some uncertainty whether in the event they would actually vote against the present resolution or further irritate Paris by abstaining. They left no doubt about the relief with which their delegations would greet a decision not to press the resolution to a vote. No such decision seems likely. A number of European and Latin American delegates are understood to be equally unhappy about how exactly to distribute their favours. Obviously some very nice calculation is involved for those who genuinely want an early solution in Algeria. In the United Nations context, sweet reasonableness can sometimes present subtler and more painful dilemmas than are involved in old style head-on collisions.

Italy in the Thaw

FROM OUR ROME CORRESPONDENT

The first signs of a thaw in east-west relations threw Italy's home politics into disarray. For twelve years and more the existence of the cold war was a basic assumption of Christian Democrat power and the chief justification of political alignments in Italy. It will be long before the disorder is composed. Indeed, should the thaw set in in earnest, the cracks in the ice of Italian

politics are bound to widen. But the government, at least, has had time to get over the shock, thanks to the delayed departure for the summit, and is ready to welcome President Eisenhower (due in Rome on December 4th) with a decent appearance of being convinced of the benefits and the urgency of détente. Opinion has come a long way from the time when the government-inspired radio and press ridiculed or deplored Mr Macmillan's well-meant attempts to press for east-west talks.

It is trite to repeat that since the days of Guelph and Ghibelline Italy's domestic politics have constantly tended to polarise round the main contending parties in Europe. This has been as true since the war as it was in the thirteenth century; the east-west conflict has been the main issue in Italian politics and has given ideological colouring to the clash of domestic interests which is a natural feature of the country's present stage of economic development. But if the great powers of east and west shift their positions in relation to each other, party political life in Italy will be thrown into confusion until the contending groups in Italy can adjust themselves to the change. In such an upheaval, who will survive? This is as big a problem for the Communists as for the Christian Democrats, for the Confederation of Industries as for the trade unions: each group feels itself in danger of losing its international backing and the slogans which sustain it in the fight. This threat (for that is what it is seen as) comes at a time when the first timid efforts at an industrial revolution in the south are bringing the northern industrial interests and the advocates of state enterprise into keener opposition than ever.

As might be expected, the Communists have acted quicker than their opponents. Signor Togliatti has already stolen a march on the Socialists by announcing that his party will support any government—even this one—that shows a serious intention of putting through even moderate reforms. This double move to the right to outbid the Socialists in moderation is a well-known gambit of Signor Togliatti's; he calls it the quail's hop. He first made it in 1944 when he astonished and irritated the Socialists by agreeing to collaborate with the monarchy. But his most outrageous performance was the Communist vote in favour of Article 7, which incorporated the Concordat and the Lateran Treaties in the Constitution of the Republic. It is not surprising that the old leader should repeat a manœuvre that has served him in the past, but this does not prove that the Italian Communist party under his leadership is really in a condition to face up to the problems of détente. The Communist party under Signor Togliatti is an inflexible doctrinaire body, still wedded, in spite of some unhappy readjustments, to the methods and dogma it perfected in Stalin's day. Paradoxical as it may seem, the existence of a big, stolidly "revolutionary" Communist party, shorn, since the Hungarian revolt, of its revisionist intellectuals, is a conservative factor in Italian politics. Not unless it passes under the leadership of Giorgio Amendola, the most imaginative of the younger leaders, will the party be in a condition to understand and serve Mr Khrushchev. When that happens it will be almost indistinguishable from the Socialists.

The only political party which is spiritually prepared for a détente in world affairs is in fact the Socialist; and in theory this party should have found the way smoothed for its long-projected understanding with the Catholics. But the time factor for this is out. Both sides have dallied too long. The marriage contemplated twelve years ago by De Gasperi and Nenni ought to have been consummated between Nenni and Fanfani, but Nenni missed the appointment at his party's Venice congress in 1956, and Fanfani muffed it at Naples last January. The intrigue goes on, as it is bound to, but no one has much confidence that these particular protagonists will ever pull it off.

A third party opposes the match between Catholics and Socialists. The Social Democrats, who lost their left wing to the Socialists last spring, have received a shot in the arm: Eugenio Reale's group, which left the Communist party after the Hungarian revolt and failed to find a home with the Socialists, this week officially joined the Social Democrats. Both operations, the exit of Matteotti and the entry of Reale, go to show that, whatever the intentions of its leaders, the Social Democrat party is a barrier, not a bridge, between Catholics and Socialists.

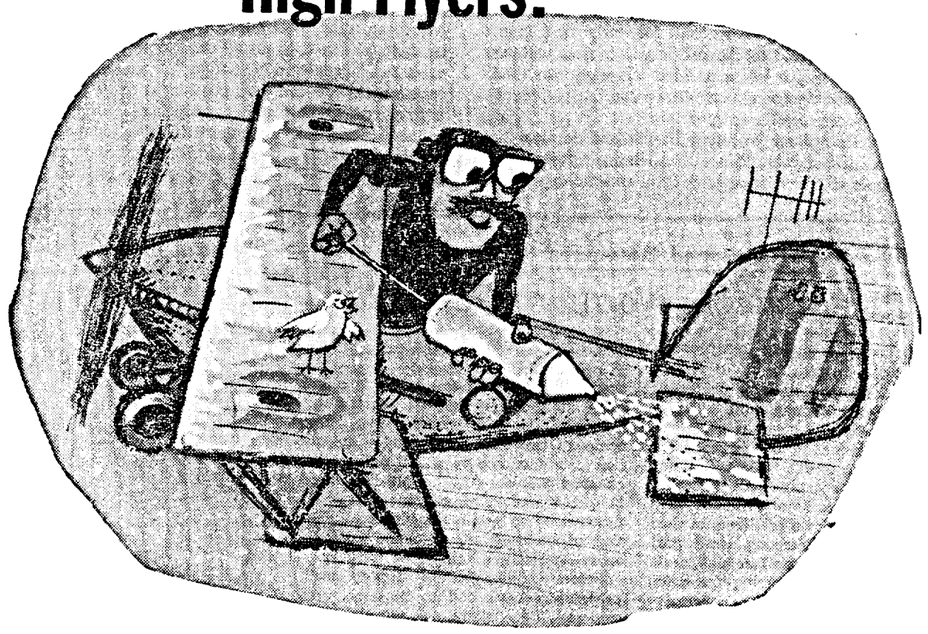
The thaw, if it comes, will break at a difficult time for the Christian Democrats, whose unity is threatened by the conflict between social pressures from below and vested interests above. The party assize at Florence ended in a victory for the centre, on the surface; but there is no doubt that the party is being carried along by force of circumstance in the direction of reform and that its leaders are more and more committed to a policy of planned development for the south. The rate of industrial expansion in the north, with the rapid rise of living standards there, accentuates the backwardness of the south and generates intolerance. Signor Milazzo's breakaway from orthodox Christian Democracy in Sicily, whatever its immediate political causes, was an expression of this discontent. The Christian Democrats, as the party of government, cannot be indifferent to it. Just as the first years of Christian Democrat domination were characterised by the land reform, so today, if the party is to survive, it has to address its energies to the development of the south. Already, since the congress, the minister of the budget, Signor Tambroni, has announced that the Vanoni scheme is to be re-elaborated in the form of a fully-fledged development plan. Other measures, such as an agricultural plan, have been announced.

It is easy to spot the weak points in such ministerial promises and to suspect that the reforms, when they come, will be bland and incomplete. It may even turn out that the whole manœuvre, like the land reform itself, may serve in part as a smoke screen. For all that, as De Gasperi always saw very clearly, the country is moving to the left.

How long will it take to develop the south, and is there really time to do things the hard way, are questions for the detached observer. Italian politicians are now involved in the preliminary phase, the phase in which vested interests feel the threat and are feverishly preparing to meet it. Their first step is to seek protection under cover of the common market. "Big industry is pressing us to hurry forward" is a phrase one heard repeatedly from members of the Italian delegation last week in Strasbourg.

It is one of Italy's misfortunes that a country with no national foreign policy beyond the defence of its foreign trade and of emigration (the Alto Adige question is marginal) is saddled with the diplomatic machinery of a big power. The foreign ministry, a first-class diplomatic instrument with nothing to do, is exposed to pressure from Italy's stronger allies in the common market. Thus it was inevitable that Signor Pella should agree with the French at Strasbourg that the timetable for the common market should be shortened. Up to date, President Gronchi is the only important Italian prepared to assert that Italy's interests are closer to those of the Anglo-Saxon powers than to those of France and Germany. Mr Eisenhower's visit will be an opportunity for the Italian president to expound this view. It will also be a chance for Signors Segni and Pella to disentangle themselves a little from French and German pressure. But it is a chance that they will find it difficult to take; for the great and growing industrial interests of north Italy feel themselves more drawn to the developed western Europe of the common market than to the social reformers and nationally-minded planners who press for an all-out effort to develop Italy's south.

Good News for Hi-Fi High Flyers!



For high-flying hi-fi fans, a splendid vista stretches endlessly ahead. Those twin bugbears of stereo in the stratosphere—ice outside the aircraft and overcrowding inside it—have surrendered to a massed attack from the scientists who work on chemicals from oil. As ever, the Esso Chemicals Division took a keen interest in the fray.

High flying is all right—the sun's usually out and you're clear of the main roads—but it gets a bit parky up there. Ice tends to form on the wings and things. One solution is to spray on a fluid called iso-propyl alcohol, which de-ices the aeroplane. It's made from propylene, of which Esso Chemicals have plenty.

Hi-fi-ing is all right, too, although you used to need a small airship to carry all the necessary equipment. Then transistors came along. Open any transistorised gubbins and you'll probably find the parts embedded in a plastic potting compound. This is an epoxy resin, which also starts out as propylene—of which Esso *still* have plenty. And so stereo in the stratosphere flies slowly into the sunset, de-iced and uncrowded. Yes, it's a rich, full life for hi-fi high flyers. (And Esso Chemicals *still* have lots of propylene. Want some?)

Note to Manufacturers

Besides propylene, we can offer you many other chemicals from oil; they are listed below. If YOUR *business uses chemicals, ask your secretary to contact the Esso Chemicals Department, 50 Stratton Street, London, W1. Telephone: Hyde Park 7030.*

BUTYL RUBBER · AROMATIC SOLVENTS (Solvesso 100 and 150)

ESSO MEANS BUSINESS IN CHEMICALS

Morocco's New Worries

FROM A CORRESPONDENT IN RABAT

AFTER months during which the Moroccan government, led by Mr Abdallah Ibrahim, lost much of its popular support, it has recently scored some remarkable successes. The prospects for the future, however, with labour trouble and a round of wage demands threatening, are still not very encouraging. Mr Ibrahim was called upon by King Mohammed last December to form a non-party government that would prepare the country for its first elections, the first two stages of which, for rural and municipal assemblies, are now tentatively scheduled for early next year. Although Mr Ibrahim was told to choose his government without regard for party affiliations, it has a decided left-wing bias, and enjoys the support of the 650,000-strong Moroccan labour federation, the *Union Marocaine du Travail*.

The government decided not to follow France and devalue the currency at the end of last year. Since then, its main tasks have been the maintenance of the existing price level and the expansion of Morocco's export trade. Over the first six months of this year both aims were achieved: the cost of living showed a fall of over 6 per cent, and for the first time since the war Moroccan exports outstripped imports by a total of 295 million francs.

But the blocking of Morocco's franc zone " operations account " by France on June 30th, the eve of the opening of the new Bank of Morocco, started a serious financial and economic crisis. It was at this point that confidence in the government evaporated. The devaluation of the Spanish peseta only aggravated the situation since Spain and Morocco are direct competitors in European markets, and Morocco's failure to devalue had already made its products 17 per cent dearer in French markets. As a result, the Moroccan franc, after climbing slowly during the first six months of 1959, slumped to an all-time low of 500 to the dollar. The cries for " economic liberation " from France were intensified, especially as the ties were considered to be coupled with political concessions. On October 19th Mr Abderrahim Bouabid, the economics minister, announced his programme for a 20 per cent devaluation and a series of stringent exchange control measures to limit the flight of capital. By getting a loan of $25 million from the International Monetary Fund, he turned a devaluation " defeat " into an economic liberation " victory." Economic and financial talks between France and Morocco, based on these changes, are expected to be held in Paris shortly.

The simultaneous abrogation of Tangier's royal charter was an inevitable part of the new economic measures ; not only was there a continuous " bleeding " of capital from Morocco through this free money market, but thousands of pounds' worth of luxury goods were also being smuggled into Morocco each month through Tangier. Now, faced with the economic integration of Tangier with Morocco, many small, though legitimate, Tangier businesses are threatened with extinction ; of the several hundred banks and exchange bureaux only about fifteen are expected to survive. Plans are going ahead for constructing a " free port " area in an attempt to promote Tangier as an ocean-going shipping port and to develop an entrepôt trade. It is also intended, with improved road and rail facilities, to make the port a gateway into the provinces of northern Morocco.

The major diplomatic problem inherited by the Ibrahim government was that of the presence of foreign troops—American, Spanish and French—in the country. It was announced in October that all Spanish troops had withdrawn into the presidios of Ceuta and Melilla. But there are still some 14,000 French troops in Morocco, as well as 10,000 American military personnel with 11,000 dependants. The Americans are deployed in one naval and four air force bases built during the French protectorate. The Moroccans have never recognised the legal existence of these bases, because no agreement was ever signed between the United States and the Moroccan government. When Mr Ibrahim returned from a visit to the United States early in November he announced that President Eisenhower had " recognised the sovereignty of Morocco over the American bases " and accepted the principle of general withdrawal. The Moroccans hope that President Eisenhower will sign an agreement during his visit to their country on December 22nd.

Mr Eisenhower's visit and the bases agreement are a definite success for Mr Ibrahim, who can now ask France to accept the principle of the general withdrawal of its forces. Another success is the support that Morocco secured in the United Nations for its petition against the intended French nuclear tests in the Sahara.

Australia's Untapped Resources

Red Riches in Northern Queensland

FROM OUR CORRESPONDENT IN AUSTRALIA

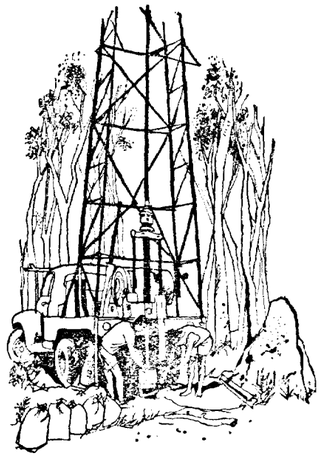
THE aircraft from Cairns, after three hours' flying across the scrub country of Cape York, emerged over the blue waters of the Gulf of Carpentaria. For your correspondent's benefit, it flew very low along the coastline at Pera Head. One could see the tracks of turtles on the white sand, the shadows of sharks in the shallows. But most striking were the cliffs. They were 18 or 20 feet high, and terra cotta red: solid bauxite, the raw material of aluminium. The aircraft climbed again, and some 20 miles farther north crossed the estuary of the Embley River. A red roof announced WEIPA in large white letters. This was a mission house. To one side of it, huddled among the palm trees on the beach, lay an aboriginal village ; to the other were the neat rows of a white man's camp. Beyond was a red airstrip: bauxite again. One landed on bauxite, got it in one's hair, probably drank it in one's tea.

This huge deposit was discovered in 1955 by a geologist of Consolidated Zinc Proprietary Ltd. After some months of prospecting that company, seeking a partner with experience in aluminium, joined with the British Aluminium Company to form the Commonwealth Aluminium Corporation (Comalco), each partner having a 50 per cent interest. (British Aluminium then really was British ; but last year the American company, Reynolds Metals, together with Tube Investments, bought it up.) The next step was to get a lease from the Queensland government. The agreement, signed in 1957, is for a term of 84 years, with a possible extension for another 21 years. It covers an area of 2,770 miles, but from 1960 this starts to shrink, until in 1977 it is 1,000 square miles. The company undertakes to spend a steeply rising amount each year, and to establish an alumina plant (the intermediate stage in the manufacture of aluminium) on Queensland soil, with the ultimate intention of building a smelter in Australia or on Australian-administered territory.

Before mining could begin much preparatory work had to be done. An exploration company, a subsidiary of Consolidated Zinc, has been drilling all over the vast area, bringing up thousands of samples foot by foot, washing them, and sending them away in carefully docketed bags for analysis. This work is more or less completed now, and the disposition of the bauxite is known in detail.

In general it is known that the total proved resources of this part of Northern Australia exceed 3,000 million tons, of which probably 2,000 are of " metal grade "—that is, yielding about 50 to 55 per cent of their weight in alumina. These figures include an area inland from Comalco's lease, on which the Aluminium Company of Canada (Alcan) is prospecting ; and smaller deposits on the other side of the Gulf of Carpentaria, where Comalco has another lease. No less than a third of the world's resources of metal grade bauxite seem to lie in north Australia. And on the Weipa side the ore is only one or two feet below the surface.

In other ways, too, Comalco's planning has reached a detailed stage. Work has been going on to find sites for a port and



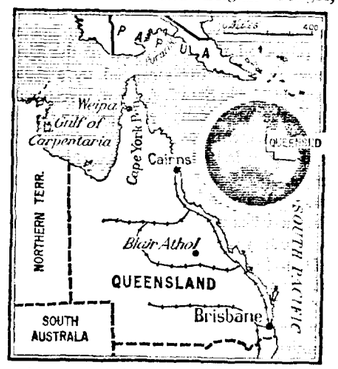
for the alumina plant, a water supply for the town, and local materials for building. An excellent deep-water harbour could be made with some dredging, and the plant could be near it ; the water supply could come from a river 40 miles away or perhaps from underground sources near the plant ; and promising experiments have been concluded using (guess what) bauxite as an aggregate with cement in building.

A major decision still has to be made: What source of power? There are two or three possibilities, and the choice between them will dictate the site for a smelter. The smelter, as distinct from the alumina plant, requires a vast amount of power, which is not available at Weipa itself. One possibility is to dam the Purari River in Papua, build the smelter on the coast nearby, and ship the alumina 500 miles. A second possibility is to use the Blair Athol coalfield in Central Queensland, a huge deposit of black coal which could be cheaply worked by open-cast methods, and over which the company has acquired a five-year option. The alumina would have to go by sea round Cape York and would probably meet its power on the coast at the nearest point to Blair Athol. Yet a third possibility now being investigated is to take the alumina to the south island of New Zealand—though that would not please Queensland.

Plans and preparations are thus far advanced ; but it remains to complete the matter of money and markets. The two go together in aluminium production. Producers and consumers are usually linked, and markets are lined up before the investment is made. It is a very heavy investment. An aluminium smelter of the optimum capacity of 240,000 tons of ingot metal would cost £A100 million ; the alumina plant to feed it £A45 million ; power supplies perhaps as much as £A80 million. The whole process on this scale would therefore cost about £A225 million, and half that capacity about £A125 million.

Formidable as those figures are, they are no larger than they would be elsewhere. Nor are they too large seen against total world demand for aluminium which, although it has only lately regained a balance with supplies, will rise steeply with the latest surge in the world economy. The report of the United States government's policy commission in 1950 forecast a consumption in that country of 4.5 million short tons by 1975, and this figure already looks like being nearer 10 million tons. By 1975 the " free world " might well require 50 million tons of bauxite a year—2½ times the present level. But Australia must face the fact that there is plenty of bauxite on this planet, and the question is whether these particular deposits will be exploited in preference to those of other countries.

Against Australian bauxite one might cite its remoteness from the big markets ; the high cost of all-white labour competing with coloured labour elsewhere (most bauxite occurs in the tropics) ; and its late appearance on the world scene, at a time when the big aluminium companies were already interested, if not committed, elsewhere—in the Caribbean, the Guianas, and more recently parts of West Africa. There are proposals for aluminium production in Guinea, Ghana and the French and Belgian Congos,



making use of the untapped hydro-electric resources of the rivers. And the United States government, anxious to save such countries for " the West," is sometimes prepared to guarantee its investors against expropriation and political upheaval.

In favour of Australian bauxite and alumina, however, is the fact that their distance from the west coast of the United States or Canada is not much greater than that of African bauxite from the United States, even from Gulf ports: 6-7,000 nautical miles as opposed to 5-6,000. The longer sea transport in any case would be offset by there being no haul by road or rail at the outset. Australia's bauxite is so accessible that its alumina plant will be built, on bauxite, alongside a wharf loading point. And its extent is greater than that of all the African deposits added together.

Besides, there are nearer markets: the developing countries of south-east Asia, India, Japan—though Japan is likely for some time to be a customer for bauxite rather than for alumina or aluminium. The immense Weipa bauxite deposits are the only big known reserves strategically placed to serve the long term needs of this Pacific area. Above all, there is Australia itself, a rapidly expanding market on the very doorstep. Its consumption of 28,000 tons of aluminium in 1958 would, if the present rate of expansion continues, rise to well over 60,000 tons in 1967 and in 10 years or so could approach 100,000 tons.

The higher cost of white labour would be partly justified by greater mechanical skill. But other advantages are here implicit. There would be no black nationalism to add its special risks to the enterprise, no danger of sudden demands for a bigger share of the proceeds, no bar on the repatriation of earnings, no threat of expropriation. The government of Queensland (one of the Right) will change its colour some day, but not as drastically as all that. Australian interests can claim that no other producer (actual or potential) within the sterling area offers a comparable security and stability.

The disadvantage of having appeared late on the scene is nevertheless hard to assess. But since geologically and politically Australian bauxite is particularly well favoured, and since geographically it is at a disadvantage only in European markets, it will be strange indeed if such wealth is for long allowed to remain in the earth.

But on the home front, although it has been riding on a wave of popular acclaim, the government is threatened with a general strike and a round of wage demands.

The strike threat is connected with the political situation. The UMT, the Moroccan labour federation, is supported by the left-wing neo-Istiqlal and the new Union of Popular Forces led by Mr Mehdi ben Barka, but it has been having trouble with the "free" trade unions, which are supported by the right-wing Istiqlal party of Mr Allal el Fassi. During demonstrations and brawls the police and security forces have arrested members from both sides. This impartiality does not suit the UMT. As all police, security and armed forces are under the command of the conservative-minded Crown Prince Moulay Hassan and all left-wing factions identify him with the El Fassi Istiqlal, the security forces are accused of collusion with the "free" trade unions. If the UMT were to call a general strike in protest, it would be one more move in the campaign against the Crown Prince and the monarchy.

Internally, the government's new economic measures depend on a policy of price-pegging. Nearly a hundred firms and traders have been fined sums ranging between 5,000 and a million francs for arbitrarily raising their prices. However, the government has also ordered a general five per cent wage increase, and it expects private enterprise to absorb this without raising prices. Now the UMT has demanded a 20 per cent wage increase for all workers in the printing trade, and it is feared that this is the first of a wave of such demands.

Thus Morocco proceeds towards its first elections. The King has announced his wish to turn the country into a constitutional monarchy, and any postponement will only endanger him. Indeed, the King has little choice but to try to turn the country into a constitutional monarchy before the country turns itself into a republic. But one may doubt whether Morocco, with its disease of political fission and its habit of plots and intrigue, is really ready for such a democratic experiment.

Bonfires in Panama

BY A CORRESPONDENT

TWICE last month Panamanian demonstrators, bearing their national flag, which it is forbidden to fly inside the Canal Zone, have surged towards the zone's frontier as "a symbolic act of reaffirmation of sovereignty." In the first, and more serious, riots on Panama's independence day, November 3rd, some 80 people were injured in the free-for-all against American troops and their own National Guard; later in the day the American embassy had its windows broken and its flag torn down and burnt. In the second incident, on November 29th, the soldiers were better prepared and protected themselves with sandbags and tear gas without opening fire, and the rioters contented themselves with burning two effigies of Uncle Sam just outside the zone's entrance. Diplomats on both the American and Panamanian sides have tried to handle these incidents as delicately as they can, but the border is now heavily guarded and American residents hesitate to go outside the zone.

In recent years the United States government has made a genuine effort to improve relations with the small republic that lies across one of the world's most important trade routes. Four years ago the rent paid for the Canal Zone was increased from $430,000 to $1.9 million a year. At the same time the invidious distinction between the wages paid to American citizens and to Panamanians (the "gold" and "silver" standard) was officially abolished. The American ambassador and the general who administers the zone have been meticulously careful about protocol and the way they wield their immense influence in the affairs of the republic.

But discontent still grows. Almost all of the higher salaried positions in the zone are still held by Americans; and there is an unofficial but effective colour bar that is highly irritating to the overwhelming majority of Negro, Indian, or *mestizo* blood. A decline in tourism and the reductions in American naval appropriations have caused considerable unemployment in Panama City, where one-quarter of the nation's million inhabitants are concentrated. Above all, Panamanians would like a larger share of the Canal's $90 million revenue from shipping tolls.

Economic discontent has recently been finding an outlet in attacks against the English language. Panamanians are fond of American films, but groups of students now organise demonstrations against the practice of printed subtitles, and demand dubbed-in Spanish voices in place of Hollywood's "gutteral grunts." Canal Zone signs that print the republic's name without an accent on the last letter are frequently defaced or torn down. And until bi-lingual signs were put up a few months ago, many Panamanians made it a practice to station their cars in front of "No Parking" placards, claiming that they could not understand this foreign language.

These grievances are shrewdly exploited by Panama's principal opposition party, the Third Nationalist party (TPN) led by the former president Señor Arnulfo Arias. Panama has had ten presidents in the past ten years and since 1936 no elected president has managed to last out his term. Señor Ernesto de la Guardia, the present holder of the office, is a hard-working and cautious friend of the United States. His administration, though handicapped by a deficit of about $8 million a year, has encouraged foreign investment and begun a programme of well-drilling and road-building in the hinterland. He has kept the *balboa*, the hardest currency in Latin America, at par with the American dollar. Already this year he has survived transport strikes, student riots, an attempted assassination, and two abortive invasions. He will now probably last out his term until next May, and his National Patriotic Coalition (CPN) has nominated another moderate, Señor Ricardo Arias, the ambassador to the United States, to succeed him.

The opposition, which is divided between eight splinter parties, is not likely to confine itself to peaceful electioneering. The TPN has started a movement to restore the civil rights of Señor Arnulfo Arias, which were taken away after he was deposed by a revolution in 1951, so that he may once again be a candidate. Another opposition leader, Señor Roberto Arias, Dame Margot Fonteyn's husband, is in exile in London after the failure of his invasion in May. The youngest and most anti-American candidate is the TPN congressman, Señor Anquilino Boyd, who calls for the nationalisation of the Canal.

Unless these opposition groups are able to concentrate on one candidate, the government is likely to win again, and to continue its friendly policy towards the United States. The prospects of a Panamanian Nasser are exceedingly remote. But political and economic unrest within Panama, disturbed conditions elsewhere in the Caribbean, and the need to satisfy suspicious public opinion throughout Latin America are likely to give the United States many more anxious moments about its strategic waterway.

SEND A GOODWILL GIFT TO A REFUGEE

Pleads Pat Smythe

"Spare a thought in World Refugee Year for those out in the cold—the people who still don't belong anywhere in spite of years of waiting. In obsolete barrack rooms in Europe; in leaky shacks on Hong Kong or Korean hillsides; in vast sprawling encampments in the Holy Land; homeless under the chill skies of North Africa—in all these places and many more, multitudes of men, women and children have little joy in their hearts this Christmas".

10/- provides 48 good meals for orphans.

£5 gives 20 undernourished children a 13 weeks' course of vitamin tablets.

Please send a gift now to E.C. Relief, Barclays Bank Ltd., Old Bank, High Street, Oxford.

Electrical Aids in Industry

Data Sheet **No. 9**

Lighting

Data Sheet No. 7 dealt with some actual applications of factory lighting. Further applications are given here.

Drawing Offices

It is fair to say that in no part of a factory is good lighting more important than in the drawing office. The draughtsman's task is extremely exacting and unless the illumination is up to required standards, mistakes, loss of time and greater fatigue will result.

The essential requirements are: high value of illumination, absence of shadows and absence of reflection.

One of the major problems is the reflection of the light sources by shiny tracing paper, instruments, set-squares etc., and particularly by the extra-hard pencil leads often used. Another problem is that caused by the shadows ahead of T-squares and by the variety of angles at which drawing boards are set.

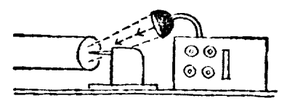
Fluorescent lighting is particularly suitable because of its comparative freedom from shadow, its natural colour and because it can be localised with respect to drawing boards to avoid reflections while at the same time giving enough light upward and sideways to satisfy the general lighting requirements of the office.

A lighting solution which has been successfully employed for tracing is to light from beneath and through the paper which is fixed on to a translucent panel, thus eliminating the problems of shadow and reflection.

Machine Shops

The problems of machine-shop lighting vary so widely that it is impossible to lay down rigid rules which are applicable to all types of machine. Certain maxims, however, have proved in practice to be satisfactory in various trades.

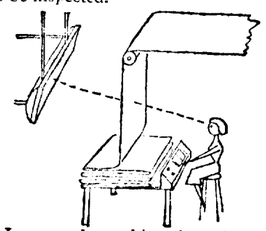
There is a strong case for the provision of local lighting on many machines to enable the direction of light to be varied to suit the work, or to boost the illumination for fine work.



In shops employing certain machine tools, particularly circular saws, the possibility of stroboscopic effects can be avoided by splitting lamps among the phases of a three-phase supply or by using twin lamp fittings with a split-phase circuit.

Where safety goggles are used, extra illumination should be provided to compensate for the reduced light reaching the eyes.

Silhouette inspection of fabrics or profiles can often be used to advantage by placing a light source behind the material to be inspected.



In general, machine-shop lighting is essentially an empirical science, based largely on a combination of general and local lighting, which offers immense scope for ingenuity.

For further information, get in touch with your Electricity Board or write direct to the Electrical Development Association, 2 Savoy Hill, London, W.C.2. Telephone: TEMple Bar 9434.

Excellent reference books on electricity and productivity (8/6 each or 9/- post free) are available—"Lighting in Industry" is an example.

E.D.A. also have available on free loan in the United Kingdom a series of films on the industrial uses of electricity, including one on industrial lighting. Ask for a catalogue.

THE BUSINESS WORLD

Rules for Unit Trusts

AUNTIE has always kept a close eye on unit trusts since they started here twenty-seven years ago. They had a Board of Trade inquiry all to themselves before the war when everybody was inclined to say that the Companies Act of 1929, though needing a little brushing up and modernising here and there, was still a pretty adequate measure. The 1948 Companies Act put this complacent view right—until it is now time for another. The Jenkins Committee (as we may as well start calling it) will be studying the improvement of the company law, with take-overs and relations between directors and shareholders for good measure. It will also be reviewing the Prevention of Fraud (Investments) Act, 1958. So far as unit trusts have any corner of their own in our mercantile law, it is under this discouraging title. Official attitudes towards unit trusts seem almost to have taken as their starting point the implicit assumption that they were conceived in sin and bound to grow into a swindle. (And so, perhaps, some of them might have done but for the fact that the depositary trustees always had the securities and the cash first before they issued a single unit.)

One or two building societies and an occasional savings bank in trouble have put the perspective right. The new affluence has widened popular interest in ordinary shares and the unit trust is now admitted as a respectable member of the junior financial establishment. And not so junior either. The movement, after all, can comprehend a diversity of talent—Rothschilds who have been in St. Swithin's Lane for a century and a half, a former Chancellor of the Exchequer (Mr Peter Thorneycroft), the recently retired doyen of City Editors (Sir Oscar Hobson), a liberal sprinkling of academic economists following Keynes a generation later into the City, and the founding fathers of the business, Municipal and General Securities (with Mr Ian Fairbairn as the keeper of the movement's conscience though not everywhere accepted as its father confessor). These names—and there are others too—give a strong impression of respectability; they would not, even on first acquaintance, be automatically associated with the need to prevent them from committing fraud in connection with investments.

Nor, indeed, is that a view that the public has lately been taking of the offers of new units which several of the groups have made. Since the election, eight "block" offers have been made to the public (two to launch new unit trusts) and they have attracted some £10 million. The Radcliffe report estimated that between mid-1958 and mid-1959 the value of holdings in unit trusts actually doubled, from £60 million to £120 million—this last figure including about £25 million of capital appreciation. The score now could easily be £150 million. With a level of personal savings higher than at any time in history and the increasing interest of the small man in equity share investment, the ground was clear for another leap forward by the unit trusts.

This is a big success story in a mere matter of eighteen months. Good luck has helped, with the tide in the ordinary share market flowing strongly in favour of any buyer who did not make an utter fool of himself. Success could breed a dangerous complacency were it not for the fact that from the very start of the movement in the thirties there have always been at least two strongly held views about the ways in which it should conduct its business. This difference is still very much in evidence. A few weeks ago, an association of unit trust managers was formed after many months of discussion, and with the initial good fortune of Sir Oscar Hobson as chairman. M and G have conspicuously stayed out of the association on grounds of undeniable logic: it has no rules at this stage, so what is the point of an association? It has, however, some objects that seem very acceptable. This does seem a case where strict logic could lead the balance of judgment astray. Hamlets without Princes, a Building Societies Association without the Halifax, and an effective unit trust association without the M and G are all in the end unthinkable. M and G will, in fact, be associated with the new body in the discussions with the Board of Trade about the revision of the regulations governing unit trusts.

THERE are some weaknesses here. In the beginning, attention was concentrated on how selling prices were fixed and some managers were justifiably criticised in the early days for adding in small extras in calculating them. A good deal less attention, however, was paid to the way in which re-purchase prices were to be fixed and the little extras that might be deducted from the price. But the really big argument that has been going on in the movement for more than twenty years is about the "cash fund" versus the "appropriation" method in operating a unit trust. On this, it is important to note that all the recently formed trusts are of the cash fund type. In this type, there is no possibility that the managers can ever be placed in an invidious or equivocal position towards the unit holders. If in the rounding off of a price a purchaser pays a fraction above the mathematically strict price, the benefit accrues to the fund (in which he is a participant) and not to the manager. If, as can happen in the appropriation fund, the managers are in the position of principals in the purchase of

underlying securities and the buying and selling of units, they stand to make adventitious profits over and above the service fees they charge for managing the trust. They can make losses too, and it does not follow, because the unit holder gets an absolutely impeccable deal from a cash fund, that he may not occasionally get a distinctly favourable one from an appropriation fund. Several of the bigger management groups who run their trusts in this way have now arrived at a "heads you win" answer— that securities may be appropriated into the fund at cost or market value, whichever is the lower. In this way, the managers forgo any chance of profit although they stand to incur a loss.

There is in all this some danger of excessive puritanism. It is far better to be outside any compromise or confusion about whether one is acting as an agent or as a principal. That is the only unimpeachably safe rule in any financial relations. But there are occasions even outside the field of unit trusts where good behaviour rather than any clear definition of practice has to be relied on to preserve the essential distinction. And on all the recent evidence, at any rate, it hardly seems that managers running trusts on the appropriation method have been making a killing at the unit holders' expense, by riding the two horses at once.

This is one main point of difference between M and G and the rest. Another is whether it is right to make "block offers" —issues of large round amounts of units at a fixed price, tantamount to a prospectus issue of shares. Such offers can go wrong just as a trustee issue sometimes goes wrong—the market rises in the days between the fixing of the terms and the opening of the list, in which case the stags come pouring in, or the market falls and the issue is a flop. The block offer has the great advantage of attracting attention and making a worthwhile operation for the managers. It is open to the criticism that so long as the price is fixed it cannot be precisely right—and indeed if it goes markedly wrong the managers have to curtail the offer or withdraw it. Here again, the only test is the pragmatic one—the test of whether the method works conveniently and fairly for the investor and provides a return for managers who, however devoted to the public, are still presumably in business to earn a crust or two.

ALL this is rather boldly drawn and perhaps a little too simple for the scholiasts in the unit trust movement or perhaps at the Board of Trade. But it does seem that the movement has by now acquired a repute and a capacity for independent and decent thinking that justify getting rid of the idea that a policeman must always be nearby on the beat to keep it in order. This it is broadly capable of doing for itself. No unit holder has ever been able to complain that he has been robbed of his shirt; the most he could ever say is that he was short of a button or two. That does not dispose of the case for sensible public control or indeed of realistic official help. A property owning democracy is hard to reconcile with a 2 per cent stamp duty, and the unit trusts also have to find settlement duty too. So the small man in unit trusts has to pay 2½ per cent before he is allowed the opportunity of the sensible pooling of risks that is offered as the common recipe for his investment problem. The unit trust managers, too, have long suffered under the grievance that, whereas the lordly ones in the investment trusts can charge their management expenses against their gross income, the unit trust manager has to find his costs out of his net income.

On the side of control, the regulations must continue to cover such things as management charges, the calculation of buying and selling prices and yields, and general provisions about advertising, trustees and the disclosure of management accounts. But on the question of management charges, is there not a case for a more flexible approach? Could not competition be allowed to determine to a much greater extent than hitherto the level of management fees? May it not be worth paying rather more for a special quality of brains? There are some examples in the investment trust field where a special ability in management has been given its head and has done fantastically well for stockholders. Why should the benefits of expertise of this kind be denied to unit holders merely because an official at the Board of Trade decides that they should not be allowed to pay for it?

In the ordinary case, the maximum charge now allowed to a unit trust is 13¾ per cent over twenty years, of which the initial loading charge is usually restricted to 5 per cent. Some forward-looking (not rapacious) managers regard these charges as inadequate. Costs of day-to-day management have increased since they were imposed. Trusts who run savings schemes (which broadly must be regarded as Good Things) have additional costs to carry. Given competition between managements, their charges are not likely to get out of hand. But given a tight control on what they can charge, the risk is that ability and enterprise may be stunted. There have been undesirable features about the unit trust movement in the past. Official control has served a valuable public purpose and it must be continued. But it could in future be framed in a way that gives the unit trusts the opportunity to expand their service to the small investor (even if that were to mean that they made more money) rather than in a way that assumes as a first hypothesis that managements are bound to act in a fashion that must be inimical to their unit holders.

BUSINESS NOTES

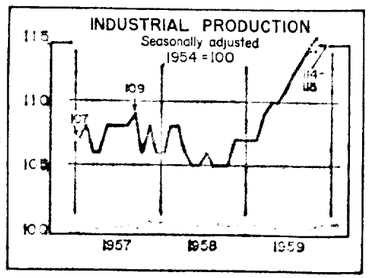
THE ECONOMY

Recovery Into Boom

To find another twelvemonth in which Britain's industrial output rose as much as 9 per cent, one needs to look back through the statistics to the second half of 1953, during several months of which the index of industrial production was 9-10 per cent above the levels of late 1952. Then, too, recovery from a mild recession had begun the autumn before: from the turn it rose just on 11 per cent in eleven months, as against the rise of nearly 9 per cent between the index for October last year, 105 (1954 = 100) and the provisional index for this September, 114. Since then, moreover, production appears to have gone up again: the preliminary indications, which judged by the latest wave of revisions could be conservative, suggest it may reach 114-115.

It would only be customary to add warnings against drawing any too close a parallel between the period where recovery merged into the beginning of the 1953-55 boom and the present emergence of the 1959-? boom. But it would also only be reasonable to record the fact that by most measures the economy looks more strongly based for expansion than it did then. In late 1953 Britain's labour force in civil employment was larger than it had ever been before, and the number unemployed, some 300,000 people, represented a rate of 1.5 per cent or less. Today there are still about 130,000 fewer people in civil employment than there were at the postwar peak of September 1957, and the 431,000 people unemployed represent 2 per cent of the insured population.

Measurement of the slack in industrial capacity was even less advanced then than it is now: but net fixed investment by private companies, to take one very oblique indicator, had been falling for the three years before 1953, whereas it rose by about half between 1955 and 1958. In October, about half the manufacturers reporting to the FBI on trends in their business said that they were working to capacity, as against only 40 per cent in June. But the National Institute of Economic and Social Research, in its bi-monthly *Economic Review*, published this week, feels that "this probably exaggerates the rate at which capacity utilisation is rising" (it is itself, once again, making more direct inquiries). Certainly the economy appears today somewhat farther from being overloaded than it did at the beginning of the last boom.



Expansion Without Tears

BOTH the National Institute and the London & Cambridge Economic Service, which also published its quarterly survey of the economy this week*, reckon that allowing for seasonal influences, expenditure on personal consumption levelled off in the third quarter, though remaining perhaps 3½ per cent higher than a year before. There may already have been some slackening in purchases of durable consumer goods, which had increased so rapidly between autumn 1958 and the middle of this year: as new figures this week once again show, the rate of increase in hire purchase debt has slackened. Even the sharp rise in consumer spending during the second quarter of the year did not quite match the rise in personal incomes after tax, and in the third quarter this "disposable income" appears to have gone on rising slightly: so presumably personal saving will have increased once more. Exports, which had risen sharply in the second quarter of the year, also levelled out in the third quarter (allowing for seasonal factors), while imports rose: but since September exports have gone up again.

On the assumption that business decisions about fixed investment will have been more favourable following the election, most observers would expect private as well as public investment to go on rising. Consumption expenditure may rise gradually: incomes are not growing as fast, but there remain comfortable margins of personal saving. One would expect a quickening increase in investment in stocks, to match the rapid rise in output: the process of rebuilding stocks of materials, as distinct from work in progress and stocks of finished goods, has no more than begun. Higher incomes in primary producing countries have already benefited the central reserves, and from now on are likely to help British exports. All in all, these economic surveyors expect output to go rising, though more slowly—and see no need in the coming months for any official restraint on demand.

IN THE MARKETS

London and New York

"THE Bank of England have today decided, with the approval of the Chancellor of the Exchequer, that there shall be no alteration in the rate of discount this day." The Bank's announcement on Thursday was awaited in the City for more than its new form. The weakening of sterling and the fall in the reserves in November as a result of transfers of short-term funds to take advantage of rising interest rates abroad has brought the question of how long London can resist the world trend. Gilt-edged prices have accordingly suffered their first significant setback since the election. In the money market, the Bank of England has given a mild pull on the credit reins.

Another depressing influence is the weight of new issues in this market. Last Friday the authorities brought forward another corporation loan, of £4 million for West Bromwich, bringing a total of three local issues for £26 million in just over a month. The coupon on the West Bromwich issue is again 5¼ per cent, and the price of 98½ is also the same as for the preceding Hertfordshire issue; maturity dates, at 1977-79, are one year shorter. The new issue was over-subscribed on Wednesday, but after the fall in the market it opened on Thursday at a discount of ⅛. The gilt-edged market has also been given notice of a forthcoming issue by the World Bank; and the government has substantial maturities to deal with early in the new year.

By Thursday the fall in gilt-edged and in sterling had affected industrial shares; the *Financial Times* ordinary index dropped by 3.6 points. A contributory influence may have been Wednesday's set-back on Wall Street. Earlier, a strong rise on Wall Street encouraged steady gains in London ordinary shares; *The Economist* index rose by 3.8 to 351.5 in the week to Wednesday. Investors were turning their attention to oil shares and the capital goods industries. Financial houses and stores lost some of their lustre as some investors began to indulge in long-range fears about a curb to the consumption boom.

Wall Street had enjoyed gains in ten successive sessions, raising the Dow Jones industrial average by 30 points to 664—within 14 points of the August peak. The market is still highly sensitive to adverse rumours from the steel industry; Wednes-

day's dip was attributed to a statement by the industry that it had made its last offer to the union. Yet if the steel strike is settled, most people expect short-term interest rates to rise still further, as corporations run off their large holdings of Treasury bills.

STERLING

The Reserves Fall

NOVEMBER'S movements of gold and convertible currencies brought a loss of £18 million, or $50 million, to Britain's central reserves. This is not an insignificant amount, and the fall is the first since the crisis of 1957 that is not attributable to special payments. The reserves are now a little under $3,000 million—compared with $1,850 million at the worst point in 1957. Last month's fall met with little surprise, and sensibly caused no alarm.

It has been clear for some weeks that London is losing funds to centres where interest rates have recently been raised; and published figures had shown that Germany's reserves of gold and foreign exchange, which were falling through the first three quarters of this year, rose by fully £60 million in the first three weeks of November. The withdrawal of foreign funds from London, which coincides with delayed demands for dollars for commercial transactions, is not at an end. On Wednesday, before the announcement of the gold figures, sterling dipped below its parity on the US dollar for the first time this year.

Against this background, the figures of sterling balances in the July-September quarter have a dated look. Holdings of all countries rose by £72 million, to £3,434 million. The non-sterling countries added £43 million (Western Europe accounting for £32 million of the increase); and sterling countries, which usually draw on their London funds in the third quarter, this year added £29 million. Plainly this was an element in the unusual strength displayed by sterling in that quarter.

The Arbitrage Calculation

INTERNATIONAL movements of short-term funds today flow through a wide variety of investment media. Over the past year, for example, foreign funds employed in London have been invested less in Treasury bills and more in higher yielding short-term corporation loans or deposits with reputable hire purchase finance companies. In New York, rates on six months' Treasury bills have often been considerably above those on three months' bills. It is therefore not possible to point to any single interest rate differential between centres. Comparing like with like, however, there is a distinct though modest turn to be gained from moving short-term money from London to New York, even after meeting the cost of forward exchange cover. The three months' Treasury bill rate in New York this week has risen to a new peak of 4½ per cent, compared with 3.4 per cent in London. Against this margin of 1.1 per cent the discount on forward dollars represents an annual cost of about 0.8 per cent, which leaves a net differential of about ⅜ per cent in favour of moving funds from sterling into dollar Treasury bills.

Another pull has been from London banks bidding for three months' dollar deposits at rates rising to 4⅛ per cent. One reason for the ability of non-American banks to compete for dollar deposits, which may be deployed in New York or London, is that under regulation Q the Federal Reserve Board has fixed maximum rates of interest on time deposits paid by member banks at 2½ per cent for three months' money and 3 per cent for six months.

The attraction of higher rates in Frankfurt has had little effect on foreign funds since there is virtually no organised money market in that centre and there are very few short-term securities in which foreign money can find temporary investment. But the higher interest rates in Germany and the tightening of bank reserve requirements have led German banks and merchanting houses to repatriate working balances previously kept abroad. Appreciable withdrawals of German balances have been made from London, New York and Zurich.

WORLD BANK

Cwthmen Take the Money

A NOTABLE addition to the attributes of Commonwealthmanship was pointed out this week by Mr Eugene Black, president of the World Bank, in an address to the Institute of Bankers in London. Mr Black, who ought to know, cited: "the (Commonwealth's) ability to obtain large loans from the World Bank." The Commonwealth has borrowed from the bank about £530 million, or one-third of all its loans—impressive, but perhaps not too surprising, since the Commonwealth populations represent a good deal more than one-third of those the bank is trying to help.

Mr Black seems to feel that Britain has done well from the bank. It did not release the last of its paid-in sterling subscription until October; and British companies have obtained orders arising out of World Bank loans worth £140 million, which is 50 per cent more than the British Government has subscribed to the bank's capital. But Mr Black welcomes, in retrospect, the general principle of limiting government contributions in ready money, since it has made the bank dependent on the support (and thus the respect) of private investors subscribing to its bonds. It is from market sources that the bank will continue to draw its funds. So far the bank has raised only two issues of £5 million each in London, in 1951 and 1954. Mr Black foreshadowed another issue "in the not too distant future."

The World Bank is the most promising international institution for the promotion of economic development: its rate of lending continues to be 75 per cent above that in 1954-57. But the new look now being undertaken by the United States at its international commitments threatens to leave a gap in international financing at a time when the demands of developing countries are increasing and when moves by some of them to full sovereignty are diminishing their chances of securing credit on their own name from private investors. The proposed International Development Association, whose articles are being drafted by the executive directors of the World Bank for submission to member countries, will add something, but not very much—about $150 million a year. Mr Black's comments this week may do something to reassure those who have been sceptical of IDA. He hopes the articles will leave the bank a good deal of flexibility; and he makes it clear that "conditions should always be attached to assistance." Many people will agree that aid can be made much more effective economically when it is disbursed by an international organisation rather than through bilateral channels, where it is only too likely to be affected by political and strategic aims of the lending country and suspicions on the part of the receiving country.

THE DOLLAR

Sense from New York

MUCH of the loose talk about the weakness of the United States dollar and of America's finances generally has spread outwards from the bankers of New York: it has often been left to London to give a due perspective. All the more welcome, therefore, is the sober appraisal by Dr Roy L. Reierson, chief economist of the Bankers Trust Company, in his recent address in Texas on "The Discipline of the Balance of Payments." Dr Reierson straight away points to the great underlying reserve of strength, the $19½ billion of gold that still remains after all the publicised losses. This is half as large again as the gold reserves of the whole of Western Europe; and it exceeds the total of short-term dollar balances held in the United States by foreigners and international institutions.

Almost $12 billion of the gold, it is true, is needed as the statutory 25 per cent cover against Federal Reserve notes and deposits. The remaining $7½ billion of "free" gold indeed provides perfectly respectable banking cover for the foreign dollar liabilities; but as Dr Reierson says, there is no reason why any foreign fears about future convertibility should not be reassured by reducing, or even eliminating, the requirement for 25 per cent domestic cover. It serves no purpose: American citizens cannot convert their notes into gold or indeed hold gold bullion in the United States at

A tale of Twenty-two Cities

From Tunisia to India, from Aden to Iraq are the Cities, twenty-two of them—in fifteen states. They all have this in common: every one is in an area where a dramatic transformation is taking place, a transformation from a traditional past to modern statehood. Every one, too, contains a branch of The British Bank of the Middle East, a Bank dating back to 1889 and closely associated with the rapid development taking place today. Tunisia, Libya, Lebanon, The United Arab Republic, Syrian Region, Abu Dhabi, Iraq, Jordan, Saudi Arabia, Kuwait, Bahrain, Qatar, Muscat and Oman, Dubai and Sharjah, Aden and India: these are the territories where The British Bank of the Middle East operates. It has intimate knowledge and experience of their political, economic and financial affairs. If you are interested in new markets and the limitless possibilities of development in this vast area, The British Bank of the Middle East can give you the reliable help and advice you need.

"... the very poor penetrative power of a motor-horn"

Extracts from a 1907 Motoring Guide Book
"Through East Anglia in a Motor Car"
with acknowledgments to Methuen & Co

Was the other car meeting us or going in the same direction? In the same direction surely, for though the cloud of dust was coming nearer to us, it was not approaching very fast. So we determined to pass as soon as might be, and, "giving her a little more gas", we were very soon "on terms" as a racing man would say, with a two-seated car going along the middle of the road at a fair pace. Once, twice, thrice our horn sounded, but the occupants of that car never heard us. At last, keeping well to the offside of the road, and when our bonnet was level with their rear off-wheel, Mr. Johnson and I gave a simultaneous and stentorian yell; and the two pairs of goggles that were turned upon us, who were then as nearly always, ungoggled, clearly covered four eyes starting with surprise. It was a lesson to them and to us of the very poor penetrative power of a motor-horn in relation to motor-cars in front, and of the necessity of looking behind you now and again, especially if you be in a noisy car.

all, and in 1945 the statutory cover was cut from 40 per cent without fuss.

High interest rates in New York have in fact succeeded in attracting funds from abroad, so that this year's larger total United States deficit has been accompanied by a smaller outflow of gold. But Dr Reierson agrees that the deficits cannot continue unchecked. He sees no solution in protectionism, and would be loth to interfere with the outflow of private capital. But, he notes, "some selective reductions in the size of our foreign grant and loan programme seem unavoidable." These reductions can be moderated if steps are taken to tie the aid to imports of American goods —and Dr Reierson makes the point that such programmes are not part of "the regular flow of commerce."

The implications of this analysis are twofold. Europe must shoulder more of the burden of overseas aid—a point that is now being rightly made from all directions. And, Dr Reierson says, the United States must follow European countries towards competitive prices, greater productivity and fewer restrictive practices. It is certainly a change for Europe to be regarded as a model in these matters.

STEEL

Electric Expansion

In five years' time, when the six 110-ton electric arc furnaces that Steel, Peech & Tozer plans to instal in its Templeborough melting shop come into full operation, Sheffield will have the largest electric steelmaking plant in the world (though it will have lost a local landmark in the fourteen 120-foot chimneys that now clear the waste gas from Templeborough's open hearth furnaces). Today, Steel, Peech & Tozer produces about a million ingot tons a year from these 14 100-ton furnaces and from the seven 60-ton furnaces in its Rotherham melting shop, which is to be demolished completely: when the electric furnaces are all in commission, they will give it a capacity of 1,350,000 ingot tons.

This latest step in United Steel's reconstruction of its steelmaking capacity hugely develops a fresh chapter in the rather general change that is beginning in the steelmaking techniques of the British steel industry. This change has shifted what a few years ago seemed one of the most settled patterns of any growing technology towards a much readier acceptance of converter processes using oxygen, towards new versions of the open hearth (in particular United Steel's own Ajax process, described in last week's issue of *The Economist*) and towards electric steel, which until very recently was confined to the production of alloy and special steels.

The development of electric steelmaking for ordinary carbon steels may almost be said to date from a report produced by America's Battelle Institute, which to date might rank as the most effective ever produced by any sponsored research institute. This, some years ago, compared the costs of bulk steel production in arc furnaces with those of converter processes and the open hearth, emphasising the way in which the stability of electricity costs, relative to those of coke oven gas or even of fuel oil, was reinforcing the inherent economies in capital cost that an electric furnace offers—to which have to be added its possibilities of precise control and easier scheduling for the supply of steel at frequent intervals.

Steelmaking Costs Shift

Up to 1958 electric steel production in Britain, almost exclusively of alloy or special qualities—as for example in United Steel's big electric furnaces at Samuel Fox in Stockbridge—did not exceed 1¼ million ingot tons a year. During the last two years two smaller companies, Brymbo and Round Oak, have switched over to electric furnaces, adding a capacity of some 500,000 tons a year—of carbon steel—to that total. By the time that Steel, Peech & Tozer's new plant comes fully into operation electric steel production may be nearer treble than double the 1958 figure.

United Steel has itself released no estimates of comparative costs. As between big electric furnaces and an openhearth installation, the capital cost of an electric plant would ordinarily be reckoned as a third to 40 per cent lower than the open-hearth installation that would be required to give the same output. The running costs are higher with electricity: but for a cold metal shop—and Steel, Peech & Tozer is a cold metal shop without its own iron production, which in future may well take even more of the whole United Steel group's circulating scrap—the total costs begin to offer a significant advantage over the open hearth once one passes a capacity of say 750,000 tons a year.

Any change that will involve, eventually, manning six furnaces instead of 21 will require a good deal of discussion with labour: the new plant, eventually will require perhaps 700 men fewer than the two existing melting shops do. But the change will proceed by degrees, beginning with four electric furnaces, of which the first will begin operating in January, 1963. Two open-hearth furnaces at the Sheffield end of the Templeborough melting shop will be closed down in two years' time and others in succession later: some of the remaining furnaces will be fitted with special oil burners to maintain output during the interim and others given basic roofs after the pattern of those recently installed at Appleby-Frodingham. United Steel has not yet completed its negotiations with the Yorkshire Electricity Board over the price of the 750 million kwh a year that the new plant will require: this price and the availability of scrap will be two major factors governing the costs it can achieve in practice.

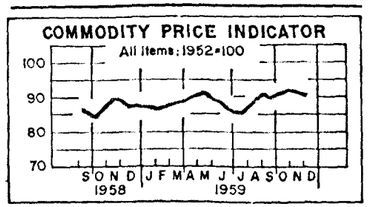
LONDON TRAFFIC

Too Good to Last?

The Minister of Transport's hastily concocted plans for controlling Christmas traffic in the West End of London came into effect this week, with spectacular results on Monday which became progressively less spectacular—though still impressive—later on in the week. The plan involves the promise of strict enforcement of existing parking regulations within a "pink zone" bounded by Edgware Road, Marylebone Road, Southampton Row, Kingsway, the Strand, Pall Mall and Park Lane; in addition, about twenty temporary car parks, most of them free, have been set up outside the zone. On Monday traffic in the zone was estimated at 30 per cent lower than normal: by Wednesday this had risen to 20 per cent below normal, though there was little congestion. Thursday was considered to be the first real test of the scheme, because of its late shopping hours: the number of cars in the "pink zone" was back to normal, and while traffic moved fairly steadily, there were jams just outside the zone.

The most centrally located temporary car parks were fairly heavily used; the one on the Mall, for instance, was packed to more than its intended capacity by noon on Wednesday. Those in outlying districts were much less used; and even if all the temporary car parks were used to their capacity, they would hold only about 2,500 cars. Ancillary effects of the scheme were both good and bad: buses (presumably more heavily loaded) were able to move easily through the West End, though congestion in the City delayed some of them up to an hour on Monday.

On Tuesday buses were on time, except in Oxford Street, where trucks unloading goods caused delays. The protests of some shopkeepers that the scheme would ruin trade appear to have been premature: one large Oxford Street store reported that its business was fully up to expectations in the early part of the week. Of the two private parking garages within the zone, one is customarily full (in such space as it has not let off for storage purposes) and so felt no change; the other—jointly run by Lex and



Commodity prices have weakened in the past month, *The Economist* indicator dropping by over two per cent. The decline in rubber, copra, metals, tea, cocoa and sugar has more than offset higher prices for wool and other fibres.

Selfridges—experienced only a slight increase over its normal peak rate of about two-thirds full, an increase that was probably due to Christmas rather than to Mr Marples's plans. The Minister has now had the kudos from his appeal to motorists' consideration and self-interest—perhaps too soon; it now remains to be seen what results he can get with firmer measures.

BANK CREDIT

Gilt-edged and Advances

THE big funding sales of gilt-edged stock achieved by the Government broker during the weeks of buoyancy following the election have made a clear impact on the course of bank credit. The earlier rise in the banks' liquid assets, which resulted from the government's borrowing on Treasury bills at a time when the gilt-edged market was unreceptive, was reversed in the four weeks to November 18th and, despite a further rise in advances, total deposits fell. The amounts of official sales in this period will under the new system be made known next August. Mr Christopher Saunders, formerly deputy director of the Central Statistical Office, aptly says in the current issue of *The Banker* that the new figures

> reach the candour of a bikini, which has been said to reveal all—except what really matters. We may be sure that the ultimate modesty of the authorities will be preserved, but at least we can now know—six months or so after she has left the beach—roughly what she looked like.

Contrary to the indications of the individual bank statements, the detailed figures show that advances net of extraneous items have perceptibly slackened in their pace of growth, with a rise of £36 million. As the banks' liquidity ratios dropped from an average of 34.4 per cent to 33.6 per cent, some of them may on their own volition tell their managers to ease up in their lending. Much may depend on the course of the gilt-edged market before the end of the year, when the banks need a cushion of surplus liquid assets to meet the attrition in the revenue season; at the moment the government broker is doing little funding.

If the authorities do not make the market sanction work, they will presumably consider whether they should, for the first time, bring in special weapons to freeze bank liquidity and induce a check to advances. At the end of last week's debate on the Radcliffe report, Mr Anthony Barber, the new Economic Secretary to the Treasury, stated that the Government is re-examining the question of whether to use special deposits of variable liquidity ratios (as preferred on balance by the committee). It seemed implicit in Mr Barber's remarks that the authorities have definitely decided that they want some special addition to market sanctions on liquidity.

Stock Transfers in America

BY A NEW YORK CORRESPONDENT

AMERICAN procedure for registering and transferring stocks saves paper work by using a stock certificate which bears on its back the equivalent of a transfer deed; it saves time by requiring companies listed on the New York Stock Exchange to maintain a "transfer agent" in the immediate vicinity and by obviating the need for both buyer and seller to sign the same document; and it saves leg work by having taxes deducted through the Stock Clearance Corporation. Every business day is a settlement day and a customer must receive his stock certificate within four days of making a purchase.

A few companies—General Motors for instance—keep their own agent in New York, but most appoint a bank to act on their behalf. To act as a check on the transfer agent, the New York Stock Exchange also requires companies to name a separate bank or trust institution to act as "registrar". The requirements of the American Stock Exchange (which deals in the securities of smaller companies) are necessarily more flexible; for instance only companies with a large turnover in their securities must maintain a transfer agent in New York.

A seller signs his name on the back of the stock certificate. His broker "guarantees" his signature and states that the necessary taxes have been paid. The stock certificate is then "negotiable", with neither seller nor broker knowing the name of the buyer. When the day's transactions have been cleared the buyer's broker inserts his client's name on the back of an appropriate stock certificate above the signature of the seller and dispatches it to the transfer agent.

The transfer agent issues a new certificate for old; records the data for his own use and for the company; and forwards both old and new certificates to the registrar. The registrar's task is the relatively simple one of ensuring that the agent does not over-issue the stock of any company. The duplicate certificates are then returned to the agent who files the cancelled one away and hands the new one made out in the name of the purchaser and duly signed by himself and the registrar to the buyer's broker.

In practice no more than a score of institutions are involved in this work and the Stock Clearance Corporation provides an invaluable sorting office at each stage. A single bank acting alternately in the role of agent and registrar may process five or six million certificates in a year. One of the largest in the field, the Chase Manhattan Bank, has a thousand employees in its agency department operating three eight hour shifts. A company may pay its agent five hundred dollars a year or a hundred and twenty-five thousand dollars a year depending on the volume of transactions and the range of services required; these may include a daily report on transactions in its stock, the handling of dividends and communications to stockholders.

Most brokerage houses are to some extent mechanised. Eight of them have installed elaborate electronic equipment of their own and several others plan to do so. For the benefit of banks and brokerage houses, International Business Machines Corporation recently opened a data processing centre operated on somewhat the same principles as a launderette; the Radio Corporation of America will launch a similar project in the New Year.

What Happens in London

This is a summary of the communications involved in a purchase of shares on the London Stock Exchange. The number of communications recorded is less than the twelve recently referred to by Lord Ritchie because communications between the seller and his broker have been omitted:

(1) The client tells his broker that he wishes to buy, say, 100 shares in X Ltd.

(2) The broker gets in touch with his dealer in the House, who buys the 100 shares in X Company from a jobber.

(3) A contract note is then sent to the client informing him that the purchase has been made on his behalf and setting out the price, brokerage, stamp duty, etc.

(4) A few days later the client is sent an account by his broker reminding him of the amount due on the settlement day.

(5) The client sends his cheque.

(6) The broker sends a receipt for this amount to the client.

(7) By this time the broker will have drawn up the transfer deed (having sent it to the Share and Loan department to get the contract stamp affixed), and this will be sent to his client.

(8) The client then signs the transfer deed (sometimes wrongly), has his signature witnessed, and sends the transfer deed back to his broker.

(9) The next communication is between the registrar of X Ltd. and the client. The client eventually receives the share certificate representing his holding in X Ltd. after several weeks, and sometimes months, of waiting. The shareholder then acknowledges the receipt of his certificate.

INDIA

Non-Convertible Rupees

BRITAIN has granted India an additional line of credit of £19 million under Section 3 of the Export Guarantees Act. This forms part of the joint international programme agreed last March at a meeting called by the World Bank to see India's external finances through to the end of the second five-year plan in the spring of 1961. Britain's previous credit of £28½ million granted under the same procedure has been fully used.

Despite this support, India remains very short of sterling and it has been resorting to special expedients to finance part of its external trade. The use of non-convertible rupees, in particular, is spreading as India negotiates trade agreements with iron curtain countries. The latest of these was signed recently with Czechoslovakia. Part of this agreement is a credit under which Czechoslovakia will advance Rs.23 crores (£17 million) to help India set up three industrial plants during the third five-year plan. The repayments are to extend over thirteen years and the rate of interest will be at the usual 2½ per cent. Under another part of the agreement India is to import engineering goods and equipment, paying in non-convertible rupees which will be used by Czechoslovakia to pay for imports of iron ore, manganese, jute, mica and tea from India.

These discriminatory barter deals are contrary to obligations under the International Monetary Fund. India has been criticised from Washington on this score, but it has so far replied that this is the only way in which trade can be conducted with iron curtain countries. The readiness of the iron curtain countries to accept non-convertible rupees may in due course constitute a threat to other exporters to India who, apart from any credit arrangements they may make, normally insist on payment in convertible sterling. The threat to British traders is further intensified by the emergence of a free market in non-convertible rupees in New York where the current rate is 5.80 to the dollar as against the official rate of 4.75, or roughly 16¾ rupees to the pound against the official rate of 13.30. British merchants are unable to use this market; operators from other addresses will have fewer inhibitions about using cheap rupees for the familiar switching deals.

AUSTRALIAN TRADE

Wool Earnings Rise, Imports Increased

AFTER dropping shortly after the new season began in August, wool prices have held steady at levels that should satisfy growers and consumers alike. In the last two weeks prices have firmed, but there is no sign of a marked rise in the offing. Most buyers will hope that the market remains steady. The recovery in world consumption of wool now appears to be slowing down. According to the Commonwealth Economic Committee, the rate of consumption in ten leading countries in the third quarter was only slightly higher than in the second quarter, whereas the second quarter's rate was about 10 per cent higher than in the first. Compared with a year ago, consumption in the third quarter showed an increase of 21 per cent.

The improvement in the growers' fortunes is shown by the latest returns from Australia. In the first four months (July to October) of the 1959-60 season Australia sold 415½ million lb, which was 52½ million lb, or 14 per cent, more than in the same period of last season, while receipts rose by over £A32 million, or 46 per cent, to £A102.6 million; the average realised price rose by nearly 13d. to 59½d. a lb. The recovery in wool, Australia's principal export, plus higher earnings from meat and dairy products, has enabled the Commonwealth government progressively to liberalise its import policy.

On December 1st the import ceiling was raised by another £A25 million to £A875 million a year, and discrimination against dollar imports was almost eliminated. The government also gave notice that from October 1, 1960, imports of motor vehicles from the dollar area will be freed for the first time since 1936. The latest relaxation mainly affects items in the administrative import category—raw materials, semi-finished and finished industrial goods. In addition about fifty components and materials for industry, covering trade worth about £A6 million a year, are now being licensed on a sales replacement basis (virtually free of restriction); and import quotas in categories A and B, largely consumer goods, have been increased by five per cent.

IRON CURTAIN BONDS

Czech Bounces

THE Czechoslovak default on three loans in two months must take some of the attractiveness out of Iron Curtain bonds, some of which were marked up sharply last week on the news of a call by the Foreign Compensation Commission for the registration of claims against the Soviet Union. The Order in Council that will set in motion this registration is only a step towards the opening of negotiations.

The Czechs have given no reason for their failure to pay the 3 per cent half-yearly interest owing on the 6 per cent first mortgage debentures by the former Skoda Works (now the V.I. Lenin Works Plzen). Czechoslovakia had already defaulted on the State loan of 1922 and the City of Prague loan of the same year. It is not clear whether these defaults spring from policy decisions or merely from administrative bungling: only £21,580 of interest payments this year are involved. Questions are to be asked next week in Parliament.

AIR SAFETY

Lessons of Nettuno

NO one will ever know why an experienced pilot of British European Airways should have been more than two miles outside his proper, ten-mile wide civil air lane on the day when, thirteen months ago, his Viscount collided head-on over Nettuno near Ostia with an Italian fighter practising aerobatics. The collision was not, as it happens, due to the poor state of the air traffic control system as it existed in Italy at the time. On such a clear day the Viscount pilot could easily see the Italian coastline with which the air lane coincided on this particular leg of his route; had he kept to his prescribed course and not strayed into a zone reserved for military aircraft there would have been no danger.

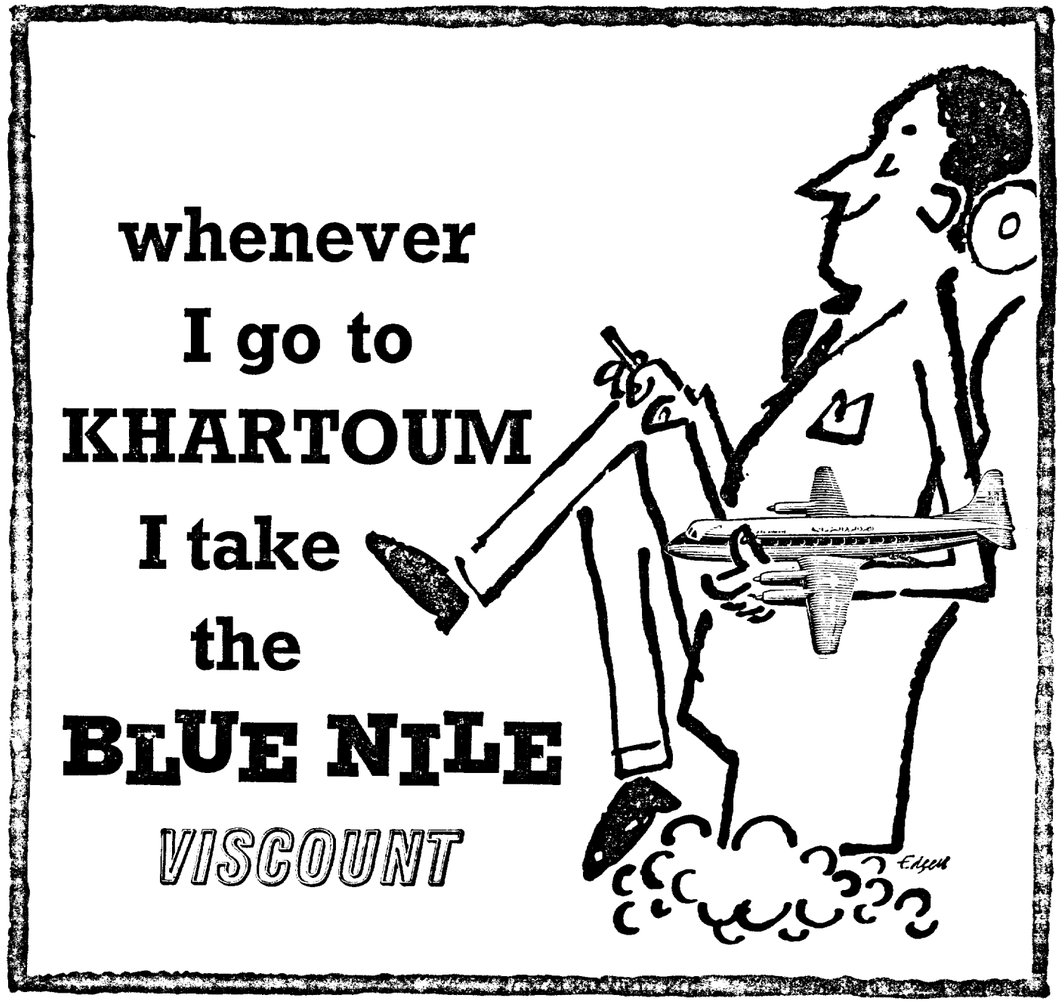
The Italian Ministry of Defence which conducted the inquiry handled this aspect of the accident with great tact and delicacy. The fact that the BEA pilot was technically in the wrong was merely used by the court of inquiry as an argument for putting in more and better navigating aids. But even if the Italian chain of navigating beacons had been installed and properly working (which they were not) at the time of the accident, the Viscount still could not have used them, because it carried a different type of navigational aid working on a completely different principle. Hence the plea made by the Italian investigators, who included one of Italy's most respected civil pilots, that airlines should be encouraged to fit aircraft to use whatever navigating aids are provided along their routes.

The Ministry of Aviation is at present holding talks with its European counterparts about a unified air traffic control system for the whole of Western Europe. This will have to be a standardised system, and as an earlier international meeting discovered at Montreal, it is not easy to get agreement on standardisation when competing navigation systems are involved.

TRANSPORT

Electrifying the Railways

IT takes time to rebuild a railway line, and longer still if it is to be electrified with the minimum possible interference to normal traffic operations. By concentrating first upon the London (Euston) to Birmingham, Liverpool and Manchester prong of its programme of trunk line electrification, the Transport Commission is hoping to complete the conversion of this 495-mile route by 1964, three years earlier than was originally envisaged. Part of the first stage, Crewe to Manchester, is already open for trial running and crew training: the remainder is scheduled to be in operation next September, and the Crewe to Liver-



Every Monday a Sudan Airways VISCOUNT 831 (maintained and crewed by Airwork) flies from London to the Sudan. **This is the only air service to cater specially for the Sudan.** Passengers who wish to break their journey at Rome, Athens*, or Cairo may do so and continue their journey by the next plane at no extra cost. The return flight from Khartoum will be on Thursdays. **VISCOUNT comfort . . . Rolls-Royce Speed.**

The latest Viscount—the 831—is larger, much faster and even more luxurious than its predecessors. In a perfectly relaxed atmosphere, you can eat and drink, read and talk (nearly everyone on board will have a common interest in the Sudan) or simply sleep, lulled by the soothing hum of the four Rolls-Royce jet-prop engines. An unusual feature of this flight will be a Free Information Service on all matters relating to Sudanese business, political, and social life. This will be very helpful to newcomers and to those returning after a long leave of absence. If you have business in the Sudan, ask your travel agent about the new Blue Nile Viscount.
