The commission had few illusions about the civil engineering problems that would arise from its decision four years ago to adopt an alternating current system, feeding electric power at the industrial frequency of 50 cycles ac, at a pressure of 25 kV, direct from the grid into the locomotive. This was a technical advance, combining the relative cheapness and efficiency of grid supply with the greater robustness and technical advantages of the dc traction motor. But overhead wire conduction raised the problem of bridge clearances, which the older 660 V dc system with third rail conduction—as used by Southern region—would not have done; and 25 kV ac needs a minimum clearance of 11 inches against only 4 inches for the 1,500 V dc system that the Cock report in 1951 recommended the railways should use.

The London, Manchester and Liverpool main line, for instance, runs under 900 bridges of one kind or another, of which 700 afford too little clearance for the 25 kV overhead wires (and nearly 500 would also be too low to give the 4-inch clearance that 1,500 kV would require). However, the commission underestimated what this work would cost. The total outlay for this is now likely to be at least £150 million against the £118 million that was reckoned in 1956.

The commission never intended, because of the time and money it would take, to reconstruct every tunnel and every congested stretch near cities. Instead it planned to reduce the line voltage from 25 kV to 6.25 kV on the stretches of line under about 100 of the 700, and to design locomotives able to take both. The first such locomotive was handed over by AEI last week: its main transformer primary winding is in four sections, allowing working at 25 kV or 6.25 kV. Meeting the railways' weight specification of 80 tons gave manufacturers another problem: much was saved by redesigning the main transformer and the underframe—and using fibreglass for the roofing, doors, and bulkheads also helped.

STOCK EXCHANGE

How to Measure Turnover

An unsigned article in the latest issue of the *Stock Exchange Journal* considers the various problems that will have to be overcome in providing better figures of stock exchange turnover. The stock exchange Council is no doubt anxious to meet the recommendations of the Radcliffe committee that this should be done. As things are, big obstacles stand in the way of collecting more useful information, but with an increasingly mechanised stock exchange, new vistas are open to the Council. It is with this prospect in view that various questions are posed. Should the new figures be calculated according to the number of units of shares (as is done in New York), the nominal amount for the market value? Should turnover be calculated on a daily basis, or for the duration of an account? How is turnover to be defined?

The main need is to obtain some idea of turnover both in the number of units and in money terms. The essential first step is for the Council to ensure that all bargains are marked. It would be useful to have from jobbers figures both of their total sales and purchases; if these can be broken down into various groups so much the better. The article points out that while turnover in the gilt-edged market could best be calculated daily, calculation of turnover in other sections on this basis would give a false figure, because of the account system. The writer of the article fears that publication of further information could increase rather than lessen public suspicion about the working of the stock exchange—but recognises that the stock exchange should put the public right when special influences are at work.

WHISKY

Sober Freedom

Six months after whisky sales on the home market were freed from quota restrictions on most brands at the beginning

Central Banking Information

The Bank of England has agreed to tell more of what it is doing. Will it allow the public as deep and as frank an insight into its thoughts and actions as, for example, was given in a recent long speech by Dr Karl Blessing, president of the German Bundesbank?

Dr Blessing was explaining why the Bundesbank had raised the discount rate to 4 per cent. After the end of 1957, policy was directed mainly to three ends: to stimulate domestic economic activity, to strengthen the capital market and to promote capital exports to offset exchange surpluses. By mid-1959, these objectives were "more or less achieved"—and the central bank was beginning to see a danger to internal price stability. It asked the Government to spread out official building orders. It secured little response.

> We talk about co-ordinating cyclical policy in the European area, yet when it comes to co-ordinating measures that merely affect domestic activity we run into the greatest difficulties. The fact is, unfortunately, that in the cyclical policy game the central bank is always left "holding the baby."

The Bundesbank therefore fired a "warning shot" in early September, raising its discount rate from 2½ to 3 per cent. In succeeding weeks it became "more and more convinced that an investment boom had been added to the building boom." Its evidence, in summary, is

> (1) The labour market is extremely strained. (2) Order backlogs are growing and delivery periods lengthening. (3) The price climate has changed. (4) Capital expenditure is growing. (5) Demand for credit is rising.

The Bank has no regrets about its earlier policy of monetary ease: this helped to contain the recession. In changing course, it has "deliberately accepted the possibility" that short term funds may return from abroad. Exchange surpluses "may again cause us headaches." But there have been underlying changes since 1957, and the bank does not expect exports of capital to stop.

Dr Blessing had some pointed words about the domestic bond market, which after carrying rates down from 8 per cent to 5 per cent in little more than a year underwent a sharp change of mood ("defeatism" Dr Blessing calls it) in the summer. The Federal Government's first market loan had to be floated at a yield of over 6 per cent. These events show that the bond market "has unfortunately still not regained the intrinsic stability which it ought properly to have." Some institutions have gone so far as simply to throw on to the market bonds they had taken up for the purpose of placing.

Dr Blessing's conclusion is uncompromising but not austere:

> The past years have shown that it is possible to keep employment and production at a high level, and to reduce recessions to a tolerable size. . . . We have shown that we are determined to preserve the DM's purchasing power. We shall not let ourselves be deterred from doing so, even if employers and the employed show lack of self-discipline and self-control. The consequences would however . . . be equivalent to an economic recession. . . . Discipline pays. I hope that those concerned will grasp this fact, and will not compel us to bring even heavier guns out of our arsenal. We should prefer to be allowed to leave matters at the measures recently adopted.
>
> The saver and investor can depend on us. We shall not allow his rights and interests to be impaired, even though he cannot defend these as forcefully as other groups. Whoever tampers with the value of the DM will burn his fingers.

That ought to be clear enough.

of April, sales have still not risen much above those in 1958: at 2,797,000 proof gallons in the first six months of this financial year, they were only 0.3 per cent above the 1958 level, while those for the year 1958-59 were 11 per cent below those in 1938-39. Scottish Unionist MPs have been sufficiently disturbed by this apparent lack of vitality in sales of their national product to arrrange to meet the whisky trade to discuss what representations they should make to the Chancellor of the Exchequer for a reduction in the duty. The distillers would naturally be delighted by any such move, because the spirit duty remains at the peak level that it reached in 1948, while that on beer and some wines has been reduced. They do in fact feel, though they admit that six months' sales give inconclusive evidence, that duty may be one of the factors now holding sales down.

It is impossible to compare whisky sales with those of gin in these six months, because figures of releases from bond are not published monthly for gin as they are for whisky. But if market guesses are reliable, gin has been selling well this summer. If duty were the main restraint upon demand, one might expect a general fall in spirit sales (whisky costs rather more a bottle than gin, though in pubs both "nips" may cost the same); if gin sales have in fact gone on rising while those of whisky stand still, duty can hardly have been the chief culprit.

Certainly there are a number of other factors that might explain the failure of whisky sales to rise last summer; the abnormal temperatures made people want cooling as well as stimulating drinks, and gin lends itself better than whisky to mixing these. More fundamentally, the new freedom of whisky may merely have uncovered the extent to which the taste of the British drinker has changed in the last twenty rationed years, during the war and for long after while the American market was given priority.

LONDON OFFICE BUILDINGS

Buildings Go Begging

SINCE the war about 25 million square feet of office space has been built in new blocks in the City and West End of London, most of which has gone up within the past five years. This week it was revealed at a meeting of the London County Council that two newly-completed buildings are standing empty or partly empty, and have been so for some time. It was also asked whether, with 50,000 London families awaiting rehousing, the building of further new offices in central London ought to be stopped.

It is certainly true that London office rents have fallen in some cases in the past year. First-class offices, in terms of location and amenity, were being leased for about 30s. a square foot a year ago, but while this is still the rate for the very best properties, 25s. or even 22s. 6d. is more

How Big is Big?

IN April, 1956, the National Institute of Economic & Social Research published a list of 512 companies engaged in British industry that had net assets of more than £2.5 million in 1953-54, as a by-product of research into the sources and use of funds of public companies. This wider research was later taken over on a continuing basis by the Board of Trade, which has of necessity kept up to date the sampling frame upon which it is based and hence the data from which any such list of large companies could be culled. The institute has itself considered revising the list in accordance with the changes that have taken place in the asset pattern of companies since 1953-54; but it was decided that, if at any time such a revised list came into demand, it could most easily be supplied by the Board of Trade.

Some limited but interesting secondary research upon a number of these companies has recently been carried out by another organisation, the Institute of Economic Affairs. It made no attempt to bring the list up to date (beyond noting that 40 of the companies had vanished through mergers): but sent to most of the remainder a questionnaire asking about their capital, their employment, their build-up of costs and (indirectly) about their turnover. The answers it received from 151 of the 460 companies that it approached display, mainly, the heterogeneity of the sample: big businesses, the institute discovered, differ quite a lot from each other and moreover would rank in quite different orders according to the particular measure of bigness one chooses to apply.

As generalisations, these conclusions will surprise nobody: but the degrees of difference in business pattern, and of variance in ranking by different criteria, are worth recording. Even a "single" criterion may on examination dissolve into several aspects: how for example should one measure capital employed? Messrs Harris and Solly, who carried out this survey,* found for example that a company which ranked 4th out of 43 of these companies by net assets fell to 12th place by gross profits and to 15th by net equity earnings: and even the top company by net assets, though it earned the largest absolute return upon both total capital and equity, ranked only 29th by rate of return on equity (admittedly a measure of the intensity or efficiency of capital use, rather than of size). Numbers employed offer another basic order of ranking that differs from any measurement by capital employed; and turnover (calculated for a number of companies which gave details of payroll and of the proportion of labour costs to gross income) would offer yet another. The extent to which any of these companies, or any smaller company, might dominate in its own field is obviously another measure of "business power": but the authors here offer no evidence as to that.

The authors conclude that some "multiple index" might be the best way of indicating a company's "total economic weight"; it might link an absolute figure for annual net output (i.e., turnover less what it buys from outside) with a capital ratio indicating the "scale of operations" required to produce it. In this survey they were not able to make very satisfactory estimates of net output (comparatively few companies gave them estimates from which they could even roughly calculate it). This figure, to the outside observer who is constantly involved with statistics which make use of the concept of net output, such as national income figuring, would certainly seem the most useful measure of size for most practical purposes—supposing that companies can be persuaded to disclose it.

The study is powerfully solvent of generalisation about bigness in business according to any single criterion. But in demonstrating the difficulties of generalisation the authors have produced—again as a by-product—some interesting incidental data about their own sample of big British businesses.

common now. The range is a very wide one, and depends strongly on location (the Bank and Holborn being "In," while Route Eleven is still "Out," for instance). There is still considerable demand, though tenants are becoming more selective: as recently as three years ago offices were being let in the blueprint stage, but nowadays leases are seldom signed until after the building is completed. Some people are moving out of the central area: but one of the two buildings referred to by the LCC is just north of Putney Bridge, in a respectably decentralised area where rents are much lower. This building of twelve storeys has been empty since it was completed three months ago.

The other building instanced was Thorn House, in Upper St. Martin's Lane; Thorn Electric occupy five floors and showrooms in the building, and have been trying to let the other seven floors, without success, for about three months. This is slightly longer than has been the case in the past, but it is by no means disastrously so; it may take longer than that to complete legal work on the lease. According to one large City estate agent, 50-60,000 square feet of offices in a modern building in certain specific locations could not be easily found at present: as against this there are a number of buildings going up in both the City and the West End, and several bombed sites which are still apparently more economic as car parks than as office buildings. This market may eventually render unnecessary Mr Brooke's threat to stop all office building in central London. Even so, however, it will not mean that housing would necessarily pay on sites where offices do not.

FIRE

Danger in the Home

THE inquest held last Wednesday on five little Hertford children who died in a fire caused by a paraffin heater is—or certainly should—lead to heart-searching about the safety of certain types of household equipment. Some engineers have raised doubts about the wisdom of using radiant heaters of the paraffin-burning type in houses at all; as this particular tragedy shows, they can flare up in a draught and may turn a house within minutes into a raging inferno. It was such doubts, coupled with an increasing number of fires caused by oil-burning appliances (300 in 1950, 1,300 in 1957, against perhaps 12 million paraffin heaters in domestic use) that decided the Fire Research station of the Department of Scientific and Industrial Research to start its own investigation into oil-burning appliances but unfortunately these investigations take time to prepare and the preliminaries, including the construction of a wind tunnel for controlled reproduction of draughts, and approaches to manufacturers, had only just been finished before the inquest. A heater of the type that caused the Hertford fire was in fact the first that the station tested. The results, as quoted at the inquest, sounded alarming, though the maker concerned complained that the tests were unfair. Certainly there is no reason at this stage to think that they were due to any special features of this particular design of radiant heater: if valid, they would probably apply generally.

Just what happens when a radiant heater catches fire in a draught is still not clear: the sequence of events that might lead from an open door to a disaster, and how often they might occur, are something that the Fire Research Organisation has yet to discover. The Consumers' Association tested five radiant paraffin heaters a year ago and blew draughts on them from an electric fan in the expectation that they would catch fire, but none of them did. There are, however, 43 different types of radiant heater on the market and their sheer number may mean that it will be some time before the DSIR's investigations are completed. Reports from fire brigades suggest that a good number of fires caused by paraffin heaters are due to clumsiness and spilt fuel, but at least a third appeared to have been caused by defects in the equipment itself. It would be a mistake, however, to think that heaters burning paraffin are the only hazard. The British Standards Institution reported not so long ago that at least three cheap electric fires it had tested were frankly dangerous in the sense that the floor underneath them became overheated. There may be a need for some tightening up in safety regulations and safety standards.

EASIER HOARDING

Paper Gold

IT is more than three hundred years since English goldsmiths first developed the idea of holding gold in their safes against receipts which came to be used as money. Sixteen Johannesburg businessmen have formed the International Gold Corporation with much the same idea in mind, although Englishmen and other residents of the sterling area may not under existing regulations become customers. The new corporation has a capital of £25,000, and both the Standard Bank of South Africa and Johnson Matthey, bullion merchants, are associated with the scheme, which starts on January 1st. At a premium of up to 3½ per cent the corporation will sell bearer bonds against gold bars weighing between 50 grams and 1 kilogram. At current prices, plus 3½ per cent, the smallest bar would cost about £20 16s. and the largest £415 19s. Bigger bars will be sold on request. The Standard Bank will endorse the certificates, and hold the gold in London.

The certificates will be anonymous, freely transferable, and contain a promise that the gold they represent will be delivered free of charge anywhere it is legal to do so. They are therefore a stage nearer gold notes than the certificates available under the scheme operated by Samuel Montagu for delivery of gold in London or three other centres—with no commission charge. The buying and selling prices of the new units will be announced daily, and an agency has been set up in London in the hope that the present restrictions on dealing in gold in the sterling area will be lifted. Another hope held out by the company is that "an increase in the price of gold is inevitable." For anyone who agrees, or still regards all currencies as suspect, gold may be preferred to an investment that bears interest.

SUGAR AGREEMENT

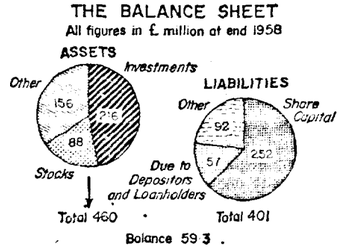
Quotas Cut for 1960

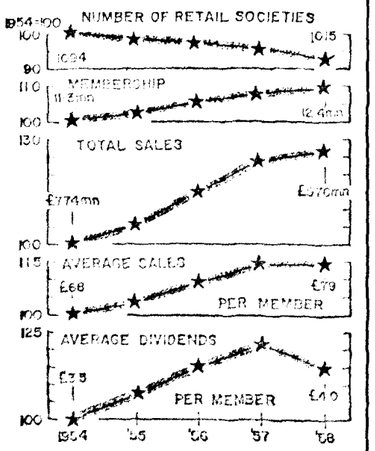
AFTER surviving a difficult year in which export quotas had to be cut by the maximum of 20 per cent, the International

Co-operative Retailing

Amalgamations are slowly reducing the number of retail co-operative societies. But over the last five years their membership has risen by more than a million and their sales by £200 million or 26 per cent.

Last year sales just kept pace with the rise in membership; but the average dividend paid out to consumer-members fell.





Sugar Agreement may have an easier passage in 1960. European demand on the "free" world market is no longer burdened by a record domestic crop. The latest estimates of the German company, F. O. Licht, put the new beet crop in Europe, excluding Russia, at 11.1 million tons, which is about 1.3 million tons smaller than the 1958-59 crop. Some European countries, notably France, have been making good this loss by buying on the world market, and Russia unexpectedly bought a large quantity from Cuba. These purchases, together with a firmer selling policy by Cuba, set off the recovery in prices. From a trough of 2.55 cents a lb in July the Cuban spot price rose to 3.17 cents in September, just over the theoretical minimum under the agreement of 3.15 cents. It has since slipped below 3.0 cents a lb, though forward quotations continue to command a respectable premium.

The turn for the better is reflected in the decisions of the sugar council at its meeting in Tangier last week. It puts the minimum requirements of the free market next year at 5.7 million metric tons, and the total available supply at 6.8 million tons; this includes an estimated supply from non-member exporters of 240,000 tons, a special "hardship" quota of 40,000 tons for Formosa, and a maximum carry-forward from 1959 quotas of 170,000 tons for Cuba and 22,000 tons for the Dominican Republic. The council has sensibly decided to restrict exports from the beginning of 1960, cutting quotas by 12½ per cent. This brings the total exportable supply to about 6 million tons, and leaves an apparent surplus of about 300,000 tons. This is probably a close enough balance to aim at just now; the council will have fuller information when it reviews the quotas in March. It will have to meet before then, if the market price averages less than 3.15 cents a lb for seventeen consecutive days, to decide whether further action is called for. Sugar's prospects are brighter than they were, but much will depend on political developments in Cuba.

HIDES & LEATHER

Recovery Under Way?

TANNERS will be glad to forget 1959. In the first four months prices of hides shot up by over 75 per cent, and in the following four the market held moderately steady at a little below the peak; it then fell like a stone, and towards the end of last month many hides were not much dearer than at the beginning of the year. Prices have now rallied. An Argentine ox hide (for sole leather) is now quoted at about 17d. a lb c & f UK, 2d. above the trough, while a New Zealand cow hide (for upper leather) has risen by 1½d. to about 21½d. a lb. It requires no great perspicuity to see that prices rose too far, and some people are confident that the fall will also prove to have been overdone.

Most tanners and users of leather bought heavily during the rise, and needed time to work through their stocks. When prices started falling tanners and their customers held off, thus accentuating the fall. The drought in Europe promised to bring an increase in slaughterings in some countries, and hence to a larger supply of hides, and this also may have encouraged buyers to stay their hand. Recent shipments of Argentine hides to Europe on consignment may have helped to weaken the market further. Buyers are now looking forward to an increase in cattle slaughterings in the United States next year, and to some recovery in slaughterings in Argentina, the largest exporter of hides.

The recent rally in British and Continental markets has followed a much firmer tone in Chicago and Buenos Aires. Some venturesome souls here, mostly dealers, it seems, have started to buy modestly, but most tanners are waiting to see whether the rally will last. After their chastening experience they can be forgiven for playing for time.

SHORTER NOTES

Mr Neville Faulks, QC, has submitted his report on the H. Jasper group of companies to the Board of Trade, which has declined to make it public at present because certain matters in it are *sub judice*. Mr F. Grunwald, managing director of H. Jasper and Company, will appear in court on Monday. The secretary of Camp Bird, a general mining and finance group, declined to comment on Thursday on reports that Camp Bird will help the State Building Society to regain full security for the £3,250,000 advanced for mortgages for Lintang Investments Ltd., for which the Jasper group originally bid.

★

An "exhaustive study" of whether the Post Office should set up a giro system on continental lines is being made by the Government following the qualified recommendation made by the Radcliffe committee. This was stated on Wednesday by the Postmaster General, Mr Reginald Bevins, in reply to a parliamentary question. Mr Bevins hopes to report his decision "quite soon."

★

The negotiated price for Commonwealth sugar in 1960 has been set at £44 8s. 10d. a ton, which is 13s. 2d. less than in 1959. Commonwealth exports to preferential markets remain at a maximum of 2,375,000 tons a year. The quantity sold at the negotiated price in 1960 has been increased by 3 per cent to 1,655,000 tons; the rest is sold at the world market price.

★

Shell Chemical Company has announced price cuts ranging up to £10 a ton—about five per cent—on four petrochemical solvents, monopropylene glycol, and most of the company's range of alkanolamines. The reason given for the reductions was that demand for these chemicals had grown, making higher production possible; Shell is already one of the largest British manufacturers of petrochemical solvents. The company added that it is now marketing 35 per cent of its industrial chemicals at "lower" prices.

United Dominions Trust has extended the scheme under which it co-operates with Continental finance houses (reported in *The Economist* of November 14th) to provide instalment finance for imported goods. It now has an arrangement with a leading finance house in Germany, the Netherlands, Sweden, Switzerland and Austria.

★

Wiggins, Teape is to raise £3.6 million by a rights issue to ordinary and preference shareholders. Ordinary shareholders are to be offered one ordinary share at 65s. for every ten already held and preference holders will be offered one 7 per cent preference share at 22s. for every four held. The issue will finance the purchase earlier this year of British Waxed Wrappings, a former subsidiary of Spicers.

★

Locana Corporation, whose two principal shareholders are Hambros Bank and Harrisons and Crosfields, is to extend its interests in European stocks by subscribing to shares in Sipelec, the new French investment trust sponsored by the Suez Canal Company. The trust, which was launched a few months ago, now holds some 40 investments (most of them in French companies) and will soon increase its issued capital from 500 million francs to 1,500,000 million francs.

COMPANY MEETINGS

THOS. W. WARD LIMITED

MR H. W. SECKER ON RECORD PROFITS

The Fifty-sixth Annual General Meeting of Thos. W. Ward Limited was held on November 27th at Sheffield. Mr H. W. Secker, OBE, chairman of the Company, presided, and, in the course of his report, said:

Reference has already been made to the loss we have all suffered by the deaths during the year of the President, Sir Ashley Ward, and the Deputy Chairman, Mr F. R. Stagg.

Both, in their differing spheres, were men of outstanding ability and vision, who, with their contemporaries, guided the Company's interests through the difficult years of the 1920's and early 1930's, and helped to build the solid foundation of the Group's interests, from which we are obtaining such successful results today. Their wise counsel will be greatly missed both in the Parent and Subsidiary Companies.

Sir Ashley Ward, a nephew of the founder, Mr Thos. W. Ward, joined the Company in 1892. He was appointed a Director in 1919, Joint Managing Director in 1927, also Chairman in 1941, and the first President of the Company in 1950 on retirement from the Chairmanship. He continued, however, to take an active interest in the affairs of the Group right up to the time of his death in March of this year. He was an outstanding leader because he was so essentially human, and he had a wide circle of friends both in business spheres and in the wider spheres of public life, to which he devoted considerable time and energy.

Mr F. R. Stagg, who died in November last, after a short illness, joined the Company in 1895. He was appointed a Director in 1927, Assistant Managing Director in 1938 and Deputy Chairman in 1950. A Constructional Engineer, he had a wide and unrivalled knowledge of all the Company's constructional installations, and it is largely due to his energy and foresight that our Subsidiary Companies concerned with Cement, Excavators and Cranes and Quarrying are such successful units today. He was a man of abounding enthusiasm in promoting the interests of the Ward Group of Companies.

Arising from the vacancies so created, Mr Arnold Carr, Assistant Managing Director, has been appointed Deputy Chairman of the Company in succession to Mr Stagg, and Mr Douglas F. Walton, who is responsible for the Rail and Railway Siding Construction departments, has been appointed a Director of the Company.

We have to be reconciled to the fact that at some point of time a business will be deprived of men of outstanding calibre, but unfortunately with them goes a wealth of knowledge and experience. It is essential, therefore, that considerable thought and attention should be given to the selection and training of staff to equip them with the knowledge to succeed to key positions when the occasions arise.

This question of training is constantly engaging our attention. In the last few years there has been a great increase in the provision of managerial and commercial courses, and we are doing everything possible to encourage the younger members of our staff to take advantage of the facilities available, whether during the day or evening classes. We consider such further education invaluable, but it is supplementary to, and cannot be a substitute for the knowledge and experience which is obtained in the thrust and parry of business life where the initiative, judgment and aptitude for taking responsibility is developed, and this must be impressed upon the younger generation.

In the concluding remarks of my review last year, I predicted it to be improbable that any recovery that might take place towards the end of the financial year to June 30, 1959, would be sufficient to offset the falling away already experienced, and warned shareholders that a reduction in Group profits must be expected. This prediction has happily not been fulfilled, for instead of a reduction in profits, I am able to present accounts to you which show the highest profits in the Group's history, despite a substantial reduction in turnover. This illustrates how difficult it can be for a Chairman of a large industrial group to make a prediction for a current financial year on the experience of the early months of that year, when there are so many outside factors affecting business today whose influence cannot be accurately assessed. As it turned out, the pace of the economic recovery in certain sectors of industry was very much faster than informed opinion anticipated. This improvement was influenced by certain factors which are now generally well known, but it may be of interest in setting the background if I briefly outline the position.

It will be remembered that my review on the 1958 accounts was made at a time when on the national scene there was a recession in the Steel Industry and amongst the heavier sections of the engineering trades, whilst there were cutbacks in buying by the nationalised industries and shipyards, and by lower orders from the construction industry. There was also a decline in exports. To a group with large interests of a merchanting nature, such drastic reductions in stock and order levels by the industries to which we are suppliers, could only react adversely on our own prospects of trade.

To counteract the slackness in trade in certain sectors, however, the Government took positive steps to stimulate the economy. In October, hire purchase controls were removed, giving liberalisation of credit terms, and an acceleration was announced of public investment on roads, railways, power, housing, etc., whilst the control of the Capital Issues Committee of borrowing in the United Kingdom was suspended. In November, the Bank Rate was reduced to 4 per cent, and at the end of December restrictions were lifted on the convertibility of sterling held by non-residents. These steps were followed by the Budget in April 1959, with measures for reduction in taxation and the restoration of investment allowances.

On the international scene, there was a much quicker change than was expected as a result of the speed and extent of the American recovery.

In general, therefore, the quicker rate of recovery in trade was due largely to the success of the Government measures, combined with the improvement in the American economy, but, in addition, certain sections of the Group have also benefited from particular circumstances which have operated to our advantage, and to which I refer specifically later in the review.

I ended my review last year by saying that our organisation was well equipped to turn to advantage the opportunities which a recovery in trade could bring. With all due modesty, the results now before you strikingly justify such a claim. Although there has been a successful outcome to our efforts, many difficulties have been encountered, which at times have caused some concern and involved awkward decisions of policy, for I have never known a financial year to show such an unusual pattern. More than ever, therefore, I would like to acknowledge the skill, enthusiasm, and hard work displayed by my colleagues on the Boards of the Parent and Subsidiary Companies, and by executives, staff and workpeople throughout the Group, and to thank them all for their valuable contributions to the excellent results which have been achieved.

GROUP ACCOUNTS

Group Profit before Taxation of £2,775,667 shows an increase of £176,089, compared with the previous year. Also, the incidence of taxation is reduced following the changes made in the last Budget, so that the charge is £92,300 lower than in the previous year. Because of the reduction in the rate of tax, we are able to bring back £116,224 from the provision for taxation made in the previous year. We have also brought back into profits £16,584 from Taxation Equalisation Reserve.

The comparative increase, after taxation and transfers from reserves, is therefore, £355,001, arising as follows:

	£
Increase in Profits before Taxation	176,089
Decrease in Charge for Taxation...	92,300
Increase in transfers from Reserves	86,612
	355,001

After deduction of the amount attributable to Minority Shareholders, the Group profit relating to our interests amounts to £1,421,524, compared with £1,071,302 in the preceding year, an increase of £350,222. Out of such figure of Group profit £381,892 has been retained in Subsidiaries Accounts, compared with £288,392 in the previous year, so that £1,039,632 remains to be dealt with in the accounts of the Parent Company, representing an increase of £256,722, in comparison with the figure of £782,910 for the previous year.

Group Turnover at £43,234,000 shows a decrease of £5,414,000, compared with the preceding year's figure of £48,648,000, equivalent to a drop of approximately 11 per cent.

The foregoing figures of Profit and Turnover include figures relating to E. H. Pickford & Company Limited for the eight months, and for Watsons (Metallurgists) Limited for three months since their respective dates of acquisition.

The major falls in turnover have arisen in the

Parent Company in those sections of the business engaged in Scrap Iron and Steel, Machine Tools and Industrial Plant, Foundry Supplies and Constructional Steelwork, whilst in Subsidiary Companies the falls have occurred in Engineering and the manufacture of Iron and Steel and Non Ferrous Metals. In all instances, these relate to sections of industry where there has been a general pronounced slackness in trade. Against this, our interests in Cement, Quarries, and the supply of plant and equipment to the building and constructional industries, have maintained, and in some cases increased, the level of turnover.

Fortunately we have in certain instances been able to earn a higher overall profit despite the reduced turnover, and in other instances we have managed to minimise the impact of the lower turnover on profit.

The largest decline in profits, however, occurred in those sections of the Group engaged in the heavy engineering industry and in the manufacture and supply of Machine Tools, where the drop in profits compared with the previous year approximated 20 per cent and was higher than the corresponding percentage decrease in turnover.

SCRAP IRON AND STEEL AND SHIPBREAKING

A year ago I drew your attention to the effect which the recession in the Steel Industry was having on these sections of our business. We were then buying scrap tonnages considerably in excess of our capacity to sell and thereby building up excessive stocks, which were hampering operations at our works. We could not ship the excess overseas as exports were limited and controlled by licences. In December, 1958, however, the Board of Trade issued open general licences and we were enabled to export and clear our excess stocks at very satisfactory prices. The open general licences were withdrawn early in March, 1959 for the heavier grades of scrap, but are still available for certain inferior grades. As I have told you earlier, the recovery in demand came more quickly than was anticipated, and during the last three months of the financial year we were almost back to the normal levels of deliveries and stocks.

A rather similar pattern was experienced in the important section of our business in defective and reusable iron and steel products. For the first half of the year there was a serious falling off in demand for the home market, but eventually we were able to find an outlet in overseas markets at satisfactory prices.

The overall position on the year was that although there was a considerable fall in tonnage delivered, profits have been higher than in the preceding year, mainly because of the higher prices which we were able to obtain overseas.

We were in the anomalous position of having an adequate supply of ships for breaking in our shipbreaking works, but in view of the lack of demand for scrap, our activities were seriously curtailed, so that on average for all our yards, we were only working at about 50 per cent of capacity during the year.

The recovery to a more normal level of demand which has taken place in recent months should be reflected in more profitable operations at our Shipbreaking Works during the current year.

DEVELOPMENT

Last year I informed you of the setting up of two new depots, one on a five acre site at Salford to deal with scrap in the Lancashire Area, and the other on a four acre site near Coventry to serve the Midlands area with contractors' plant, both for sale and hire.

These depots are now functioning, and judging from the results already shown, there is no doubt that they will provide a useful extension to the Wards service to customers and become valuable assets of the business.

CEMENT AND QUARRIES

Our cement interests have had a very successful year, showing further increases in tonnages dispatched, as the Government's measures to stimulate the economy, together with the expansion in the public works programme, has resulted in an increased demand for cement. During the year, Ketton Cement has been supplied to many important contracts, including sections of the London-Yorkshire Motorway and the Great North Road. The Ribblesdale Cement Ltd., in which our Ketton Portland Cement Subsidiary holds a 50 per cent interest, has now commenced an extension of its Cement Works, at which an additional kiln of large capacity is to be installed.

Turnover and Profits of our Quarrying interests in Westmorland and Derbyshire have been well maintained, and although there is a tendency towards slightly lower prices, reduction in costs have been achieved which offset their effect. In line with our policy of concentrating development on the larger quarry units we have sold the entire share capital of Pengwern and Gwydyr Quarries Ltd.

Further progress has been made during the year by North Lonsdale Tarmacadam Ltd. in the laying and construction of roadways.

ENGINEERING

The Subsidiaries engaged in this section of Industry had the common experience of suffering from the contraction in demand in the home market following the credit squeeze, and from import restrictions in overseas markets.

Despite such adverse conditions, Thomas Smith & Sons (Rodley) Ltd. maintained a reasonable level of production in Excavators and Cranes, and during the second half of the year there was some improvement in the order book position. Many journeys have been made overseas by Directors and Sales Engineers. Our Agents in many countries have been brought up to date with our latest developments, and a large number of overseas customers visited. Although there was some falling off in overseas orders, approximately 36 per cent of the total production was exported, which, in the circumstances, is very commendable. Profit margins again narrowed during the year so that, inevitably, there was a contraction in profits compared with the preceding year, but, in the circumstances, the results were not unsatisfactory. The order book is not nearly as good as we would like to see it, however, and prospects during the coming year are somewhat difficult to forecast.

We could not expect an improvement on the record results of last year, but it is very gratifying to find that the results of John Smith (Keighley) Ltd. are very little inferior to such record figures. Turnover has again been equalled, but margins have narrowed somewhat, so that the profits show a small decrease. It speaks well for the quality of their cranes that they can hold their sales under such competitive conditions, and the order book is quite satisfactory.

The recession in the Machine Tool Industry has adversely affected the order book of Fredk. Town & Sons Ltd., whilst there has also been a decline in business with overseas markets. Until a few years ago "Towns" shipments overseas accounted for something like 65 per cent of production, whereas this has been reduced to around 35 per cent. Competition is also much keener for the smaller amount of business offering. Having regard to such difficulties, the results have not been unsatisfactory, and should conditions in the Machine Tool Industry improve, then I feel that "Towns" are well equipped to share in the improvement.

The operations of Widnes Foundry & Engineering Co. Ltd. were severely affected by the curtailment of capital programmes by some of their biggest customers following the credit squeeze, so that profits are much lower than in the previous year, but there are signs of some improvement in demand in recent months.

Both companies concerned with the manufacture of Rails and Sidings, namely Darlington Railway Plant & Foundry Co. Ltd. and The Railway & General Engineering Co. Ltd., have had a satisfactory year, but with the completion of certain of the major capital programmes by the big Steelworks, and the contraction in capital expenditure by the Nationalised Industries, the order books are showing some decline, whilst conditions are becoming increasingly competitive for the smaller amount of business available.

It has been rather a disappointing year for Ensign Conveyor Co. Ltd., but it is hoped that improvements will follow from certain reorganisation which has recently been made.

MANUFACTURING OF IRON AND STEEL AND NON FERROUS METALS

The overall picture is that trading conditions were amongst the most difficult since 1938, and it is therefore distinctly creditable that the combined profits of the companies in this section were less than 1 per cent below those of the preceding year. The decline in demand affected the output of the Wolverhampton & Birchley Rolling Mills Ltd. which was 9½ per cent lower than in the previous year. In spite of such adverse conditions, with further mechanisation to reduce costs and further expansion into specialised production, earnings were maintained at a level comparative with the previous year. Fortunately demand has improved in recent months, and it is considered that conditions should remain favourable during the remainder of the current year. Development schemes are under consideration to expand production to give an improvement in quality and a reduction in costs.

As and from July 1, 1959, the complete merger of Midland Iron Co. Ltd. and Low Moor Best Yorkshire Iron Ltd. has been completed by their amalgamation into one company, under the title of Midland and Low Moor Iron & Steel Co. Ltd.

The outlook for Wrought Iron is not encouraging, and will be adversely affected by the curtailment in demand from the railways and mining industry. Against this, the production of special irons is being vigorously pursued. New applications have been developed during the year for the use of these specialities, and it is confidently expected that this specialised business will gradually expand and prove profitable.

In line with general experience, John Williams (Wishaw) Ltd. experienced a shortage of orders in the first half of the year, but in recent months there has been a considerable improvement, so that the present day order book is quite satisfactory. The electrification of the Steel Rolling Mills has now been completed and benefits should flow therefrom in the form of more efficient working and reductions in costs.

The year has been particularly difficult for Alexander Metal Co. Ltd. because of the shortage of work in the non ferrous foundries, allied to the instability of market prices of non ferrous metals. Conditions have recently shown some improvement, however, and there are possible grounds for expecting that future prospects will be somewhat brighter.

VEHICLES

I am well satisfied with the results shown by E. H. Pickford & Co. Ltd. for the period since our acquisition in October 1958, and in combination with our existing interests in The Deighton Motor Co. Ltd., we have a valuable stake in the prosperity of the Motor Car Industry.

MISCELLANEOUS

Although turnover of Dick's Asbestos & Insulating Co. Ltd. was well maintained, there was a contraction in profits results from the increasing severity of competition. There is a reduction in the volume of work available on Thermal Insulation Contracting throughout the country because of the contraction in the number of Power Stations in course of erection, and the reduction in the number of capital projects coming to completion. The decline in the Shipbuilding Industry also has an adverse effect, inasmuch as those companies which have traditionally specialised on marine insulation are now turning their attention to land insulation, and so aggravating the situation. The indications are that turnover is likely to be maintained during the current year, but that profit margins may be further narrowed.

I am well satisfied with the results so far shown by Watsons (Metallurgists) Ltd. which we acquired in March of this year. This Company which is under excellent management, specialises in the Supply and Crushing and Grading of Ferro Alloys, and enables us to extend the services which we can offer to the local Steel Industry.

In addition to consolidating their business in the supply of Industrial and Domestic Fuel, Ward, Longbottom Ltd. are developing the use and supply of fuel oils for industrial purposes as authorised distributors in the United Kingdom for Shell-Mex and BP Ltd. Satisfactory progress has also been made by George Hassall Ltd. of Stoke, and Frank Parker & Co. Ltd. of London in the respective fields of Merchanting Steel and Machinery, and Contractors Small Tools and Equipment.

PARENT COMPANY

Further to the comments I have already made on certain of the sections, I am pleased to report that we have had exceedingly good results from the sale and hire of Contractors' Plant, and that our Wagon Building and Repairing sections have maintained a very good level of activity. Satisfactory results have also been achieved in Railway Siding Construction, whilst our Works Dismantling activities have experienced their busiest time for many years.

We have recently purchased the Electric Railway from Swansea to Mumbles Pier on the Gower Peninsular, which covers a distance of 5¼ miles, and is known generally as the Mumbles Railway. It is the oldest passenger railway in the world, and first carried passengers in 1807 with horse-drawn vehicles on rails. A small section of track has been taken up to permit a new bus station to be made at Mumbles, but the main work of dismantling will not commence until after the closing of the railway on January 5, 1960.

We are also taking an active part in the dismantling of redundant machinery under the Government scheme for reorganisation of the Cotton Industry.

I often feel that our larger interests overshadow the many exceptional services performed by our Factory Planning and Installation department, and that shareholders are not therefore acquainted with some of the extremely complicated and specialised tasks undertaken. I think it may be of interest to refer to a contract recently completed on which as main mechanical engineering contractors we have been responsible for the installation of much of the machinery and equipment. This concerned the new Ship Hydrodynamics Laboratory of the National Physical Laboratory at Feltham, Middlesex, which was opened by HRH Prince Philip on Monday, October 19, 1959. The main aim of this research laboratory will be to build up basic knowledge for the design of ships that will enable high speeds to be maintained in rough seas without danger and with a minimum of discomfort.

One of the most important jobs which we carried out was the construction of the water tunnel or resorber which is U shaped, the vertical arms going 180 ft. into the ground in concrete lined shafts. Inside the shafts the steel tunnel of cylindrical sections had to be welded into position. All welding was carried out from the inside of the tunnel and every weld was ultrasonically tested. We also installed the track on the ship tank, which was a considerable achievement, as this had to be set to a tolerance of five thousandths of an inch over the 1,300 ft. length whilst following the curvature of the earth, which in that distance rather surprisingly is ½ in.

RAIL CHARGES

Despite the great pressure of road competition, and the recession in the Steel Industry during part of the year under review, tonnage placed on rail was well maintained, and over £1¼ million was paid to the British Transport Commission in freight charges.

During the last quarter of the financial year, rail tonnages and rail freight payments were higher than in any previous comparable period, and this reflects the close understanding that exists between the Commission and this Company.

There has been a growing appreciation by the Commission of traders' problems and a readiness to discuss and experiment, which is most heartening.

OVERSEAS TRADE

In face of intense and sometimes impossible competition, we have increased our Overseas Trade substantially. Directors and senior executives have travelled many thousands of miles, with satisfactory results, and I regard this as a major item in future development.

APPROPRIATION OF PROFIT

It will be seen from the Directors Report that it is proposed to increase the Final Dividend on the Ordinary Shares by 5 per cent, giving a total dividend for the year of 25 per cent less tax, compared with 20 per cent less tax for the previous year. It is also proposed to place £600,000 to General Reserve and to increase the carry forward by £45,781 to £728,076. Although we have added to the retained profits in the Parent Company by approximately £3,300,000 during the past five years, the rate of dividend now proposed is double that of five years ago. I therefore feel that we are keeping a fair balance between the present interests of the shareholders and the future needs of the business.

BONUS SHARES

Since the last bonus issue of one for one to Ordinary Shareholders on May 28, 1954, we have added to the retained profits of the business approximately £3,300,000. During the same period, in approximate figures, Fixed Assets have increased £600,000, and we have invested nearly £2 million in Subsidiary Companies. Your Board therefore consider it sensible that adequate recognition should be given in the capital structure to the fact that the major part of the profit retentions have been invested in assets of a permanent nature, hence the proposal to capitalise £2,200,000 from Revenue Reserves to be appropriated as bonus shares amongst the Ordinary Shareholders in the ratio of one for one. It should not be assumed that an increase in dividend will automatically follow from such an operation. On present indications, it is unlikely that this will be so, but the proposals for dividend for the current year will be determined as usual by the Directors in the light of the results achieved. Certain aspects connected with the proposals are under consideration by our legal advisers and when these are settled, the necessary meetings of shareholders will be convened for the purpose of giving effect to the proposed capitalisation.

BALANCE SHEET

Current Assets afford more than double cover for Current Liabilities. Stocks are slightly below the level of a year ago, but this is balanced by a small increase in Debtors. The combined total of Bank Balances and Tax Reserve Certificates is nearly £600,000 higher than at June 30, 1958

Total Net Assets after deduction of the Preference Capital, are equivalent to £5 12s. approximately per share on the £2,200,000 Ordinary Share Capital. Such figure is based solely on the book value of the Assets.

The Parent Company's Balance Sheet shows a similar pattern to that of the Group Balance Sheet. The increase in Shares in Subsidiary Companies reflects the purchase during the year of the entire Share Capital in E. H. Pickford and Co. Ltd. and Watsons (Metallurgists) Ltd.

FUTURE PROSPECTS

As Chairman of a Group which owes so much to the enterprise and initiative of individuals and which still retains ties of a "family" character, I am relieved that the bogy of Nationalisation has been removed for the present. But the optimism that might have been engendered by the return of the Government at the recent election should be tempered by the knowledge that although there has been an underlying improvement in industry in general during the last 12 months, there are still important sections to which the recovery has not spread. Furthermore, apart from the success of the motor car and heavy electrical industries, we are

not obtaining the results in the export field which we should. I mention these factors as a background, because as I have pointed out earlier in the review, we have major interests as suppliers to a wide range of industry, and our fortunes are largely bound up with the prosperity of the customers to whom we supply.

You will have gathered from my remarks on the individual sections of the Group that I consider the outlook to be reasonably satisfactory for our interests in scrap, shipbreaking, cement, quarries, supply of contractors plant, supply and construction of railway sidings, motor car distribution and in the re-rolling of steel, but I cannot be so sanguine about those sections of the Group which are concerned with heavy engineering and the machine tool industries.

We all hope that the Government will be successful in developing policies which will promote higher productivity in all sections of industry, and higher real incomes, without setting up inflationary pressures. If we can achieve conditions of prosperity and stability in this country, we shall be enabled to assist the undeveloped areas both of the Commonwealth and in other parts of the world. The need for this is unquestionable, then I think we may look forward to the future with hope and confidence.

The report and accounts were adopted and the dividends recommended declared. The retiring directors were re-elected and the auditors re-appointed.

LEETHEMS (TWILFIT)

The thirty-first annual general meeting of Leethems (Twilfit) Limited was held on November 26th at Southsea, Hants, Mr A. E. Downing, FCA (*the chairman*), *presiding*.

The following is an extract from his circulated statement:

We are pleased to record improved trading conditions during the latter part of the Company's financial year which are reflected in the increased profits.

By keeping in step with the demands of changing fashions our designers ensure that we are not only retaining but increasing our share of the lightweight corsetry trade. Contrary to the experience of others the demand for our traditional garments, made from the more rigid fabrics, is increasing.

Your Directors feel that the accumulated amounts retained and placed to Capital Reserve Account, aggregating £150,000, should be applied to paying up in full a further issue of Bonus Ordinary Shares in the ratio of one new Ordinary Share for every two existing Ordinary Shares held. In the absence of unforeseen circumstances it is hoped that in future it may be possible to justify a more liberal distribution of earnings to Ordinary shareholders and that in any event the 10 per cent dividend paid for each of the past five years will be maintained on the Ordinary Share Capital as increased by the proposed Bonus Shares.

The improved trading conditions during the latter part of the Company's financial year are being maintained.

The report was adopted and at a subsequent extraordinary general meeting the scrip issue proposals were approved.

THE INDIAN IRON AND STEEL COMPANY LIMITED

(Incorporated under the Indian Companies Act 1913)

SIR BIREN MOOKERJEE ON INDUSTRIAL PROBLEMS

The Annual General Meeting of The Indian Iron and Steel Company Limited, will be held on December 21st in Calcutta.

The following is an extract from the statement by the Chairman, Sir Biren Mookerjee, which has been issued to the shareholders along with the Directors' Report and audited accounts for the year ended March 31, 1959:

Production of Ingot steel at 608,205 tons showed a welcome improvement of 100,625 tons over the previous year, but the factors to which I drew attention last year continued to keep output well below plant capacity. There were no fewer than nine sporadic strikes in different Departments during the year and the discipline of the workers leaves much to be desired. Disorganisation of operations by reason of the extensions works continued and it will be some little time before facilities are freely available to enable the expanded plant gradually to be worked up to its full output capability.

I commented last year as an exception on the good performance of the Sheet Mills in 1957-58, and I should again like to commend their very creditable performance in having established a yet higher production record for 1958-59.

Production of castings at the Kulti foundries improved owing primarily to the operation of the Second Spun Pipe Plant, total output of castings being 147,325 tons against 115,969 tons in the previous year.

DOMESTIC MARKET

When all the plants in both the sectors get into production more or less according to schedule, my fear is that there will be so much iron and steel produced that it will be difficult for the producers to be able to dispose of their output.

As producers we are interested not only in producing more and more, but in selling what we produce at economic prices. The manufacturers in both the sectors are likewise interested in selling all that they produce in whatever form not only to the intermediate but to the ultimate consumers. Without an extensive domestic market not only for this, but for all other manufacturing industries, the persistence in calling for more and more production by new or the existing plants may, instead of promoting, actually retard the industrial development of the country by making the manufacture of goods unprofitable or the products unsaleable.

By and large and in the final analysis the consumer of all goods and services is the common man. It is, therefore, essential that the Government should ask not for more production and less consumption but for more production and more consumption to absorb what is produced. For this purpose several changes in the policy of the Government are necessary, the two most important of which are, first, the lowering of the selling prices by avoiding the setting up of Government Trading organisations and the mischievous idea of obtaining revenue by monopolistic high prices which is no more than indirect taxation without parliamentary control; and secondly, the increasing of the purchasing power of these consumers by reducing taxation, both direct and indirect. The whole burden of the taxation is practically carried by these people. Until it is considerably lightened, they will have no resources from which they can buy the goods produced.

But alleviation of taxation is not all. Cost of production must also be reduced and here, so far as the labour cost per ton of saleable product is concerned, industry finds itself faced with a further difficulty for so long as Government regards the establishment or expansion of industries primarily as a source of providing employment this cannot be done for two important reasons. First, of course, is that inflation has been constantly increasing the cost of living of all the consumers including the workmen. The latter therefore ask for increase in their wages from time to time. The industries on the other hand are handicapped by the compulsion to employ more men than are required. Whilst the problem of employment is an acute one, it cannot be solved merely by creating unnecessary jobs and increasing the cost of production and the burden on the consumer. The solution is to be found, if at all, in more production at lower costs and more consumption at lower selling prices as has been the case in other developed countries and not by adopting the reverse process.

EXPORT MARKET

It is commonly assumed that if the production of steel is beyond the demand of the domestic market, then the surplus can be exported, but on the existing selling price structure, loaded as it is with heavy excise duty, freight equalisation and various surcharges, I do not see where we can find foreign markets. In the Far East we are likely to be faced with severe competition from Japan and now probably China, and also from Australia, whose cost of production is such that I see exports have recently been made even to Russia. The Middle East and Eastern Europe will be more successfully covered by the USSR and her satellites, and the whole of Western and Northern Europe by Western Germany, France and the UK whose existing and potential capacity is in excess of the demand and who depend largely for their food and many essential raw materials on imports and must therefore export to pay for these imports. All these countries may become more formidable competitors than our planners seem to realise, and it is possible we may be entirely priced out of every foreign market worth capture.

If the iron and steel industry has to compete with other iron and steel making countries, then we must follow their ways and means of production and costing. What would this mean? We have firstly to see that the manning of our plants is if possible on a par with theirs or in any event is not allowed to exceed the level at which our labour cost per ton will be competitive with theirs; then that the wage structure is brought into line with their practice, namely, that every job has its assigned wage unlike in India where wages are increased yearly by automatic grade increments with corresponding increase of the cost of production from year to year.

After commenting on the Government's labour policy and productivity, the chairman continued:

FUTURE DIVIDENDS

The year under review is the last year for which shareholders will receive credit in respect of their dividends for income-tax paid by the Company. Under the provisions of the Finance Act, 1959, future dividends will be declared gross and the only credit that shareholders will receive will be for the tax that must be deducted at the prescribed rates on payment of their individual dividends. Some indications of the Company's future dividend policy will therefore be expected of me.

So far as the Preference shares are concerned, the dividend on these is expressed to be 5 per cent free of tax, and the dividend at this rate will in accordance with the provisions of the Finance Act, 1959, be grossed up to such an amount as after deduction of 30 per cent thereof would represent the previous amount payable free of tax and this gross dividend then paid to the individual shareholders under deduction of tax at the prescribed rates.

It will normally be the policy of your Directors, circumstances permitting, to apply so far as possible a similar principle in determining the future rate of gross dividend payable on the existing Ordinary share capital. It will be appreciated, however, that the ability of the Company to compensate its shareholders in this manner will to a large extent be dependent upon the saving under the new basis of corporate taxation and that for many years to come it will be necessary to make large reserve allocations out of profits in order to provide finance for the repayment of our very heavy loan liabilities.

ALLIED BAKERIES

EQUAL VOTING RIGHTS FOR "A" AND "B" SHARES

GROUP'S CONTRIBUTION TO PRICE STABILITY

The Twenty-Fourth Annual General Meeting of Allied Bakeries Limited was held on November 27th in London.

Mr W. Garfield Weston (the Chairman) presided and, in the course of his speech, said:

In this country, in Australia, and in South Africa we are among the leaders in every one of our major activities—in bread, in biscuits, in cake, in icecream and in other foods.

Our bakery division is continuing to operate at a very high level of efficiency and we have been successful, by using large scale advertising, in establishing "SUNBLEST" as our nationally known trade name. The quality of our bread and confectionery is unsurpassed—if I may slightly misuse a well known phrase—"We have never made it so good"; and, incidentally, we have never before made it in so many different, and equally good, varieties.

Although there is evidence that the national biscuit market is a contracting market I can assure you that we are certainly holding our own and that, also, we are continually seeking ways of utilising to even better advantage our most efficient factories and distribution organisation.

The sales of our grocery interests are steadily increasing and, our ice-cream interests, under the trade name of "Neilsons" are going from strength to strength.

We have had some wonderful results from our overseas companies—in Australia, New Zealand and South Africa—and, indeed, look forward to more great progress by them in the years to come.

The Chairman announced that his son, Mr Garry Weston, who for a number of years had been managing their biscuit subsidiaries in Australia, had been elected by the Directors as Vice-Chairman of the Company.

NEW VICE-CHAIRMAN'S REMARKS

Mr Garry Weston then gave a review of the financial accounts and, commenting on the record profit figure of £6,866,000, said that after various appropriations they were left with a net profit amounting to £3,290,000. He added: To appreciate the full significance of this net profit figure it is necessary to relate it to our sales of £125 million. We are, in fact, earning just about 6¼d. net profit after tax on every £1 of sales we make.

We are continuing to build up the strength of our organisation and this year we have ploughed back into the business for expansion, re-equipment and extension nearly £5,200,000.

Mr Garfield Weston, continuing his review, also commented on the net profit margin of 6¼d. per £ of sales, and said: I believe that the stability of any really great commercial organisation is based on large sales and on small profit margins. We have been promised an even better standard of living in this country, but this can only come from stabilisation of prices. Our organisation has its part to play in this; by utilising every available modern method to expand our sales, with ever increasing turnover we shall be able to keep our margins at a modest level. In this way we shall make a contribution to the stability of prices, and, at the same time, continue to give Shareholders a proper return on their money.

Commenting on the non-voting ordinary stock, Mr Garfield Weston announced that the Directors had decided to submit proposals to give the existing "B" shares equal voting rights with the "A" shares, it would not be their intention to give any form of compensation to "A" Shareholders. At the same time, in view of the group's diversification steps would be taken to change the Company's name.

Mr Garfield Weston concluded: Your Directors today declared a first interim of 6 per cent on the enlarged capital against equivalent of 5 per cent last year. On the basis of three interim dividends this would mean a total of 18 per cent. If expectations are realised it is hoped to declare a bonus of 3 per cent as in the last two years, so bringing up the total to 21 per cent against equivalent of 18 per cent.

The report and accounts were adopted.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY

(Incorporated in the Union of South Africa)

The annual general meeting of the Johannesburg Consolidated Investment Company, Limited, was held on December 1st in Johannesburg.

Mr D. A. B. Watson, who presided in the unavoidable absence of the Chairman, Mr H. J. Joel, said: Our investment income of £1,929,000 was less than that earned during the previous year, the decrease being of the order of £170,000. This reduction was the result largely of earlier unfavourable trading conditions in the platinum, base metal and copper industries. I am happy to report, however, that there has been a satisfactory improvement in the outlook for these and most of our other fields of investment, and if this improvement is maintained, it is fully expected to result in increased investment income during the current year.

The anticipated improvement in the earning capacity of our investments is reflected in the rise in their market value at June, 30, 1959, which value, after adding unquoted stocks at Directors' valuation, increased during the year from approximately £22,440,000 to £28,368,000. This increase of about £5,928,000 includes net additional investments made during the year at a cost of about £1,381,000, so that the actual appreciation in the market value of investments, both quoted and unquoted was about £4,547,000.

The profit from realisation of investments was £293,000, which is £140,000 less than the figure for the previous year. After allowng for various items of revenue and expenditure, he total profit of the company before taxation amounted to £2,041,000. which is about £300,000 less than that for the twelve months ended June, 1958.

Despite the reduction in gross profit, the charge for taxation for the year was considerably greater than that for the preceding year. Mainly because of the heavier provison for taxation the profit available after taxation for the year was £990,000, as compared with £1,940,000 in the previous year.

Owing to the net re-appreciation in the value of our portfolio and the materially improved outlook for our investments as a whole compared with the previous year, the transfer to Investment Reserve amounted to only £247,000 as compared with the transfer in the previous year of £1,738,000. We have been able to maintain the dividend at last year's rate of 4s. 6d. while leaving the carry forward practically unchanged.

The Chairman then referred in detail to the principal fields of investment in which the company was interested, namely diamonds, copper, platinum, gold, various base metals and South African industrial activities and continued:

I am confident that during the current year ending June, 1960, our income from investments will show an appreciable increase on the figure for last year, and, provided that there is no major depreciation in the book value of our investments, I am equally confident of our ability at least to maintain last year's rate of dividend. Whilst on the subject, I have to inform you that the Board of your company has decided that, commencing in January, 1960, consideration will in future, be given at that time each year to the payment of an interim dividend.

NATIONAL COMMERCIAL BANK OF SCOTLAND LIMITED

SUCCESSFUL COMPLETION OF MERGER

SATISFACTORY BUSINESS TRENDS CONTINUING

PROPOSED RIGHTS ISSUE OF SHARES

MR IAN W. MACDONALD ON THE GENERAL BANKING PICTURE

The First Annual General Meeting of The National Commercial Bank of Scotland Limited will be held on December 24th in Edinburgh.

The following is the Statement by the Chairman, Mr Ian W. Macdonald, CA, which has been circulated with the report and accounts:

Following the merger of the two Banks, your Board elected me as their Chairman, and thus I have the honour of submitting the first annual statement of the combined Institution.

I am glad to say that, as a result of careful and skilled planning and much hard work on the part of the officials and staffs of the two Banks—ably assisted by our professional advisers—everything went smoothly on September 16th, the appointed day. New Bank notes, cheques, stationery, name plates all appeared at the right time and places, thus minimising the degree of inconvenience experienced by our customers consequent upon the change of name. I am also happy to say that already there is solid evidence of co-operation and unity of purpose at all levels, and I feel sure that the combined Bank has the full support of the entire staff—some 3,500 strong.

FEATURES OF PAST YEAR

Before turning to our domestic finances, it is appropriate to look for a few moments at the British banking picture. The past year might be described as one of "no change" in official monetary policy. Credit, which was liberated in mid-1958, has remained unfettered, and the significant financial trends of 1959 are all related to this new-found freedom. After a slow start in the latter half of 1958, there was a violent upsurge of credit demand, and the two principal indicators—bank and hire purchase advances—confirmed that this was being met to a degree unprecedented in the past twenty years. Since July, 1958, advances by the London Clearing Banks have risen by 41 per cent.

Fortunately, this abnormally rapid growth has not so far been associated with any of the monetary symptoms of inflation. Bank deposits and the supply of money have not risen proportionately and the heavy sales by the Banks of Government investments to finance their lending appear to have been well absorbed out of net savings, which are currently reported at high levels. Similarly, the large increase in hire purchase debt has so far been largely financed from private sources without any strain on the monetary system. Overall, Britain has enjoyed a year of satisfactory economic balance and monetary stability.

POSITION IN SCOTLAND

Unfortunately, Scotland has not been quite so happily placed and, while there has been no widespread or general setback, some of our basic industries, such as shipbuilding, marine engineering, coal and steel have had a difficult and disturbing year. As a result, Scotland has been below the national average in its productive growth and has not shown up well in the unemployment figures.

In any banking review of 1959, reference must be made to the recently published Report of the Radcliffe Committee. Our special interest naturally lies in the references to Scottish banking principles and practices. As was to be expected, the Committee focused its attention on differences between Scottish and English banking and in particular on the circulation of Scottish bank notes. In the Report the Scottish system is commended and there are no proposals involving any material change in the pattern or functions of the Scottish Banks.

THE ACCOUNTS

I would now refer to the banking activity and results of the combined Institution since our former Governors reported to Shareholders and Stockholders a year ago. Our separate experiences prior to the merger followed the general banking trend—a modest rise in deposits, a sharp expansion in advances associated with substantial sales of Government investments, and a welcome improvement in earnings. This also has been the experience from the merger date to the close of the financial year on October 31st, and I am glad to say is still continuing. It will be seen that the first accounts of the combined Bank reflect these changes.

By way of explanation, the accounts now submitted for the period—approximately a year—to October 31, 1959, show one figure of profit which represents our joint earnings, partly while separate and partly while conjoined. Equally, the appropriations of profit for dividends and other purposes cover the full period since our last separate accounts. To facilitate comparison we have shown, both in the Profit and Loss Account and Balance Sheet, combined figures for the previous year. These figures are based on the last published accounts of the two Banks and, in our view, give a broad measure of comparison. It will be appreciated that there inevitably existed certain variations in pre-merger practices and classifications, but, as these were not material, we have not thought it necessary to adjust, to any extent, the published figures of the preceding year.

A CHANGE IN FORM

There is, however, one change in the form of the accounts to which I would like to refer. The Commercial Bank owned subsidiaries operating in the hire purchase field, but the combined Bank had no subsidiary companies at October 31, 1959, and therefore no consolidated Profit and Loss Account or Balance Sheet appears in the accounts now submitted. The reason for this change has already been intimated to Shareholders, but, for the purposes of record, I might briefly re-state the facts. In the closing months of 1958 we agreed with Lloyds Bank Limited to share, on a fifty-fifty basis, our respective hire purchase interests.

To achieve this end a new holding company, Lloyds & Scottish Finance Limited, was formed and this company acquired from the Commercial Bank its hire purchase investments in exchange for 50 per cent of its own issued capital. Accordingly our hire purchase interests are now represented by our shareholding in Lloyds & Scottish Finance, which appears in our Balance Sheet under Trade Investments. Correspondingly our income from hire purchase activities now comes to us by way of dividends paid by the new holding company.

MODEST RISE IN DEPOSITS

I would like to say a word or two by way of specific comment on the more important items which appear in the accounts.

Deposits at £236 million show a modest rise over the year of £9 million (4 per cent). This is rather less than the average increase over the same period of the English Clearing Banks. It is never possible to make any close analysis of the reasons for variations in deposits which fluctuate quite considerably from day to day.

Many Shareholders will have seen the new Notes of the National Commercial Bank. These are issued in denominations of £1, £5, £20 and £100 and take the place of Notes of similar denominations formerly issued by "National" and "Commercial." We have had many favourable comments on the designs and colours of the new Notes. As to circulation, the monetary value of all Notes, old and new, in the hands of the public at the Balance Sheet date amounted to £37 million—an increase of £1 million.

The Note Circulation of the Scottish Banks is undoubtedly a pointer to the state of the Scottish economy, and the fact that the circulation has been fairly constant over the past two years indicates a slowing down of economic progress during that period.

LIQUIDITY RATIO

Our liquidity ratio, which is measured by comparing cash and other quick assets (£110 million) with liabilities to the public by way of Deposits and Notes in Circulation (£273 million), works out at over 40 per cent, which we regard as satisfactory.

British Government investments at £68½ million are some £29 million below the combined portfolio of a year ago. This large reduction represents, in the main, sales to finance the growing volume of advances, which at £96 million are £30 million up on the year—an increase of approximately 45 per cent.

You will observe that Trade Investments stand at £6 million, whereof £5½ million is invested in Lloyds & Scottish Finance, to which I have already referred. This latter figure is £2½ million greater than that appearing for shares in subsidiary companies in the Commercial Bank Balance Sheet of a year ago, and the increase represents our 50 per cent share of additional hire purchase investments effected through Lloyds & Scottish Finance.

VALUATION OF PROPERTIES

In the course of the merger negotiations, the Boards of the two Banks agreed that professional valuations of the properties should be obtained.

It was recognised that over the years it had been the policy of each Bank to write down rather severely the historical cost of properties. The resultant figures in the respective Balance Sheets were clearly unrealistic from both a cost and market value viewpoint, and were not necessarily consistent in the degree of undervaluation. As anticipated, the professional valuations showed aggregate figures far in excess of both book values and historical costs.

There seems to be little advantage in entering properties in a Balance Sheet at an arbitrary amount not resting on any conventional basis, and accordingly your Board decided to restore the aggregate to a figure which, although still under cost, is more closely related to that basis and is substantially below market value. This operation involved the addition of £1½ million to the book value of properties, with a corresponding increase in capital reserves.

PROFITS AND APPROPRIATIONS

I indicated earlier that the changing pattern of banking business had resulted in a welcome improvement in our earnings. Moreover, the profits of our hire purchase associates have also been rising. In consequence the profit for the year (after tax) at £1,194,504 shows an improvement of approximately 36 per cent on the combined profits of the two Banks for the previous year. Out of these profits your Board have appropriated £250,000 to Contingencies Account, £200,000 to the Pension Funds and £10,000 to the Commercial Bank Widows' Fund, which will be the continuing fund for the combined Bank, the National Bank Annuity Fund now being a closed fund. Interim dividends paid prior to the merger are shown in the accounts. It is now recommended that on the two Preference Share issues final dividends be paid, making in all 10 per cent and 5 per cent respectively. You will recall that the Directors expected that, in the absence of unforeseen circumstances, a further dividend of 9 per cent would be recommended on the Ordinary Shares. Since the date of that announcement in March, 1959, the earnings position has improved to a degree which could not then be anticipated and your Board are now happy to recommend an additional dividend of 5 per cent, making 14 per cent actual, over and above the interim dividends of 6 per cent paid by each Bank prior to the merger.

CAPITAL STRUCTURE

In recent months your Board has been considering the adequacy of the Capital and Reserve structure of the Bank. You will see from the Balance Sheet that this amounts to some £13½ million. This might be regarded as a satisfactory foundation, for the time being, for our purely banking activities. We are, however, in the fortunate position of having, for our size, a relatively larger stake in hire purchase than any other Bank in the United Kingdom. As I have told you, our investment in Lloyds & Scottish Finance is approximately £5½ million, and it is anticipated that we shall make a further investment in this company during the current year. When this factor is brought into the reckoning, it becomes evident that the Bank's Capital and Reserve structure should be substantially enlarged. Your Board feel that the most appropriate method to broaden the base is by way of a rights issue to the Ordinary Shareholders on favourable terms.

Accordingly, as has been announced, it is proposed to seek the approval of Shareholders to an increase in capital which will enable the Directors to offer to Ordinary Shareholders one new share for every two held at a price of 25s. per new share. If this scheme is approved, the Bank's Capital and Reserves will rise from £13½ million to over £20 million. In making a proposal of this nature, it is desirable that the Ordinary Shareholders should have some indication of the dividend which, in the absence of unforeseen circumstances, your Directors would expect to be able to recommend for the current year on the enlarged Ordinary Capital. In my letter to Shareholders, which is issued with this statement, a dividend of 15 per cent is forecast for the current year.

THE DIRECTORATE

I would wish to finish this statement—as it was started—on a personal note. A year ago the Governors of the two Banks submitted to Shareholders and Stockholders a report on their stewardship in association with their Director colleagues. I am sure I voice the feelings of all of you in thanking Lord Saltoun and Lord Rowallan and the Extraordinary Directors for their valued services to the respective Institutions. It was with a considerable measure of regret that we decided that the structure of directorate in the combined Bank should be on what are now orthodox lines.

To Mr David Alexander in his capacity as General Manager, to his immediate colleagues, and to all other officials, managers and members of the staff we would offer our appreciation of their prodigious efforts which ensured the smooth flow of a most complicated series of technical operations associated with the merger.

NETHERLANDS BANK OF SOUTH AFRICA LIMITED

DIVIDEND 8¾ PER CENT

INSTITUTION'S GROWING STRENGTH

The Ninth Ordinary General Meeting of Shareholders of the Netherlands Bank of South Africa was held on December 1, 1959, Mr J. P. Kakebeke (the Chairman) presiding.

The following is an extract from his circularised statement:

POSITION OF THE BANK

ACCOUNTS

The internal economic difficulties experienced in the Union, particularly during the first six months of the financial year under review, and the lower national import and export values naturally affected the Bank's local and international business activities to some extent. A factor which similarly influenced our earning power was the lowering of the South African Reserve Bank's official discount rate and the delayed and halting adjustment made to this reduction by the short-term interest rate pattern in the Union.

Under the circumstances it is satisfactory that the net profit could be maintained at about last year's level.

It would appear as if we can look to the future with greater confidence. General economic prospects have improved to some extent. Particularly pleasing, for instance, has been the marked recovery in the Union's exports since the second quarter of this year, a development which is also reflected in the Bank's export financing figures since then. I am also pleased to state that the number of our connections and the business entrusted to us are still growing satisfactorily and continue to strengthen the entire structure of our institution.

Our development in the Federation was also maintained at a favourable level, particularly when it is borne in mind that economic conditions were, in broad outline, rather similar to those in the Union.

The results of our London office can be considered satisfactory.

During the year valuable services were rendered by our Representative Office in New York, which was opened in September, 1958.

Mention should also be made of the continued valuable co-operation with the Nederlandse Overzee Bank NV, Amsterdam and its branches, respectively affiliates, in Rotterdam, The Hague, Hamburg, Brussels and Antwerp.

As is customary, all additions to furniture, office equipment and stationery were written off while adequate provision has been made for taxation, possible bad and doubtful debts, depreciation of bank buildings and for the customary strengthening of the Staff Pension Fund.

NEW OFFICES

During this year a branch was opened in the new centre of Braamfontein in Johannesburg.

PARTICIPATIONS

It is our belief that, in keeping with similar developments in other countries, the Bank should also extend the scope of its activities into other financial fields, particularly in association with organisations already operating therein.

In the course of this year the total share capital of £200,000 of the Netherlands Finance and Investment Corporation Limited, established in Pretoria in 1949, was taken over from our affiliate, the Nederlandse Overzee Bank NV in Amsterdam.

The Bank also acquired this year a 25 per cent participation in the share capital of the South African Scottish Finance Corporation Limited. This company, established in Johannesburg in 1958, is engaged in hire purchase financing. With the other partners in the foregoing enterprise, namely the Commercial Bank of Scotland Limited, Lloyds Bank Limited and the British and Commonwealth Shipping Company Limited, it was subsequently decided to acquire approximately 85 per cent of the share capital of the Credit Corporation of South Africa Limited, one of the main hire purchase finance institutions operating in the Union. The Bank's participation in this instance will also amount to 25 per cent.

Finally, it was also decided to subscribe to the capital of the Federal Industrial Development Corporation Limited, established in the Federation earlier this year.

DIRECTORS' REPORT

In the Directors' Report it is proposed to increase the Reserve by £100,000 to £1,350,000.

Your Directors again recommend a dividend of 8¾ per cent, or 1s. 9d. per share, for the year under review.

The report and accounts were adopted.

BROOKE BOND & CO. LTD.

TRADING PROFIT UP BY £241,400

The Sixty-seventh Annual General Meeting of Brooke Bond & Co. Ltd. was held in London on November 27th. The following is an extract from the circulated statement of the Chairman, Mr John Brooke:

Group Net Profit after Tax for the year to June 30, 1959, is £2,231,006 compared with £1,758,399 last year.

The Trading Profit of £4,488,222 is £241,400 up on last year (a pity it's not a record). There was an extra benefit of £125,168 due to a reduction in the Reserve for unrealised profit on stocks (last year we had to reduce profits by £78,088 for this).

We have continued to earn fair profits throughout Great Britain, though not quite so good as in the preceding year, aided once again by stable prices on the tea market.

East Africa made the best showing, where your tea crop was a good one, and at last a successful braking effect has been exerted on production costs.

Profits in India, Ceylon and Pakistan were rather better; they would have been better still, but for the phenomenal rates of taxation imposed by the governments of these countries.

TEA SUPPLIES

World tea supplies were slightly in excess of consumption requirements during the period. This kept the market low for the plainer types which always suffer most under such conditions. Good teas remained at a remunerative level for those lucky (or clever) enough to produce them. There appears now to be a stronger statistical position in course of development. Production in 1959 has so far not exceeded that in 1958, whereas consumption continues to increase. This is particularly the case in India and the Middle East, where tea is recognised as the finest and cheapest beverage both to quench thirst and to revive drooping spirits.

Here at home spirits are high, and perhaps for that reason tea consumption has lagged a little behind the 1958 intake.

Some tea consumption at any rate has increased in Great Britain—that's the consumption of Brooke Bond Tea.

INCREASED WORLD SALES

Our sales volume shows an increase of nearly £11 million. £3 million of this sum came from increased sales of our packet teas throughout the world. The biggest part of the balance came from the new bulk tea trade with Bushells in Australia (reckoned in terms of £ million and lb million); and also from a useful increase in the rest of our bulk tea trade.

Progress in the sale of our packet teas is helped by the higher standard of living now being enjoyed by many peoples in Asia and Africa for whom a cup of tea—once an occasional luxury—is becoming a daily pleasure.

A year ago we carried out a revaluation of land and buildings in Great Britain.

There has also been a revaluation of some overseas properties this year, resulting in a further credit to Capital Reserves of £326,721.

To attempt a comparison of the total book value of Fixed Assets with their real value (whether market or going concern) is never easy, though we know the various revaluations in the last few years have brought the net book value of £11,755,384 to a point much closer to their real value.

Last year we referred to the high rates of taxation on our businesses in India, Ceylon and Pakistan. Direct taxation on the profits of companies in India has been reduced, but the advantage of this to shareholders has been practically wiped out by taxation on dividends.

In East Africa our current taxation charge has been considerably reduced by the new allowances to encourage agricultural development.

We always bring in as a commitment our legal liability for orders placed for buildings and machinery, amounting this year to £746,000. Over and above this total, we estimate that it will cost about £790,000 to bring to full bearing all our immature tea and coffee acreage, including the necessary buildings and machinery. This expenditure, mostly in East Africa, will be spread fairly evenly over the next four or five years.

Another project looming up is the large new tea packing factory we have started to build at Redbourn near London. The cost of this will be about £400,000.

SATISFACTORY CONDITIONS OVERSEAS

Our tea estates in North and South India, Ceylon and East Africa were visited by Mr Rutter during the year; without exception, his reports are extremely satisfactory.

Owing to severe drought conditions in South India, Ceylon and Tanganyika, yields were seriously reduced and account for a reduction of nearly 1 million lb of crop in the Group as a whole. However, properties in Assam and Kenya were not affected and showed handsome increases; Kenya's increase was nearly 1 million lb of made tea.

The planting out of new areas in Africa was completed to schedule, some 600 acres in all. Conditions in that country are rapidly changing and your Company continues to give every possible consideration to the welfare of its African employees. Rations have now been converted into wages value, so that each individual now receives only cash which can be spent as chosen.

Trading in the current year has been quite good, though of course it is never good enough to satisfy any of us. However, sales (as we say in the jargon) "show an increase over the corresponding period of last year." The tea market is hardening and maybe there will be a tendency for us to earn a bit less on the swings of distribution and a bit more upon the roundabouts of tea growing.

NEW STAFF SCHEME

We have recently started a Scheme to help our Staff purchase limited numbers of "B" Ordinary Shares, should they wish to do so.

The Scheme operates by means of a loan from the Company to Trustees.

The Trustees buy shares on the Stock Exchange upon application from employees. The staff then pay the Trustees for these shares by means of regular weekly payments over a period of about two years. When the employee has completed his payments to the Trustees for his shares the Company will then make him a small gift of "B" shares which the Trustees will purchase for the employee—a maximum of 40 "B" shares per employee.

So far, about 250 members of the staff are in the Scheme. If some of us have been surprised all of us have been greatly encouraged by this response.

The Report and Accounts were adopted.

W. & J. LAWLEY LIMITED

IMPROVED ORDER BOOK

The twentieth annual general meeting of W. & J. Lawley Limited was held on December 2nd in Birmingham, Mr H. J. Gaunt (chairman and joint managing director) presiding.

The following is an extract from his circulated address:

The Group Profit on Trading amounts to £107,525, compared with £108,285 in the previous year. In my last Report I said that after a lean period in the Ironfoundry Industry, our Order Book had improved. I am pleased to say that this improvement was maintained and our output increased in a satisfactory manner.

Our Subsidiary Company, in keeping with others in the same trade, found a considerable drop in orders, but this was arrested towards the end of our Financial Year and we are now working to capacity. At the moment this trend seems to be maintained and, naturally, both companies will use every endeavour to see that we take our share of this improvement.

Out of a Net Profit of £87,297 Taxation requires £42,097, leaving Profit after Taxation of £45,200. The Directors propose a Dividend of 25 per cent less tax the same rate as in the previous year.

The Consolidated Balance Sheet shows the financial strength of the Group. Revenue Reserves and Surplus total £168,360, an increase of £2,483 after having written off out of Reserves the Goodwill arising on Consolidation and amounting to £24,371. Since the Subsidiary Company was acquired on January 1 1956, that Company alone has been able to transfer £27,500 to Reserve, and it was now thought advisable to write off the figure of Goodwill which has appeared on the last three Consolidated Balance Sheets. The remaining figure of £168,360 is greatly in excess of the Company's Issued Share Capital of £120,000. Current Assets exceed Current Liabilities by £172,806.

As usual it is extremely difficult to forecast the future, but both Companies have a satisfactory number of orders on hand at present.

There are, however, claims for a shorter working week and increases in wages are being considered. What difference this will make to the stability of the trade I cannot foretell, as there is always a strong resistance from our customers to any price increase.

The report was adopted.

CROMPTON PARKINSON LIMITED

RECORD PROFITS

MR ALBERT PARKINSON'S REVIEW

The forty-sixth Annual General Meeting of Crompton Parkinson Ltd. was held yesterday in London, Mr Albert Parkinson, MBE, the Chairman, presided. The following is an extract from his statement:

Notwithstanding intensified competition and price reductions, we have succeeded in achieving an overall increase both in output and sales of many of our products and I consider myself fortunate to be able to report a year in which the Company's profits have been raised to record levels.

The consolidated net income of £1,253,021 shows an increase of £140,592. The Directors recommend a final dividend of 9 per cent on the Ordinary stock which, together with the interim dividend of 5 per cent makes a total distribution of 14 per cent for the year, subject to income tax, an increase of 2 per cent, compared with the previous year. A further scrip issue of fully paid shares will be allotted in the ratio of one new fully paid Ordinary share of 5s. for every four Ordinary stock units held.

OVERSEAS

It has been mainly in the field of the heavier capital equipment that orders have been shortest, but in quality and competitiveness our Australian organisation has proved well able to meet the position, and during the second half of the year there was an improvement of orders in transformers and other large products.

In India our activities continue at a high level with both factories of our associated manufacturing company fully extended. The manufacturing development which was agreed by your Board and our partners in that country has made it possible for our advance to continue unchecked.

Much of the technical effort of our works management and staff has been spent on improving still further your Company's products and the extension of our product ranges. During the year a further important order was placed with your Company by the British Transport Commission for complete sets of locomotive equipment. The manufacture of this order, which is the largest ever placed by the Commission for diesel-electric equipment, has commenced and will continue for the next two years. The Central Electricity Generating Board awarded Atomic Power Constructions Ltd., of which your Company is a founder member, a contract for the construction of a nuclear power station at Trawsfynydd in North Wales. The electrical equipment which will be supplied by your Company during the next few years will provide a valuable addition to the input of orders to our works.

I believe that there will be a general increase in demand during the current year but that we shall be faced with intensified competition in many of those traditional fields from which your Company normally derives the principal part of its income. For this reason I think that we can expect a year in which trading conditions will be considerably more difficult. I have referred to the Company's policy concerning expansion as it is to such activities that I believe we must look for the maintenance and development of your Company's profitability.

S. SIMPSON LIMITED

(Manufacturers of DAKS Clothing)

The twenty-sixth Annual General Meeting of S. Simpson Limited was held on November 26th in London.

Dr S. L. Simpson, the chairman, presided.

The following is an extract from his statement:

The consolidated balance sheet of the Company and its subsidiary companies shows current assets of £2,766,825. The aggregate of current liabilities and provisions is £775,229. The surplus of current assets over current liabilities is therefore £1,991,596.

Your Company pioneered the manufacture of high quality Lightweight Suits in this country, and the demand which has arisen during the past year in the home and overseas markets for our Lightweight Suits indicates that our research in the techniques of tailoring fine lightweight clothes has been of great benefit to this organisation and the retailers we serve.

SUBSIDIARY COMPANIES

Your wholly owned subsidiary Company, Simpson (Piccadilly) Limited has had another successful year with a record turnover and a record profit. The high reputation enjoyed by Simpson (Piccadilly) Limited for its selection and presentation of the finest quality merchandise is shown by the increased number of customers served during the year, including a great number of visitors from overseas.

Your wholly owned American subsidiary company, Simpson Imports Inc., New York, has again made substantial progress during the year. The Canadian wholly owned subsidiary, Daks Canada Limited, has been reorganised and a Marketing Manager, trained by S. Simpson Limited, has been transferred to Canada. During the month of October special trade shows were held in Montreal and Toronto.

MANAGEMENT CHANGES

Due to the expansion of your Company and the increasing fields of responsibility of the Directors, your Board has agreed upon certain changes of management. Major A. Huskisson has become Deputy Chairman of S. Simpson Limited and Simpson (Piccadilly) Limited. Mr H. Balcon has become Managing Director of S. Simpson Limited. Mr J. Apfel has become Associate Managing Director (Technical) of S. Simpson Limited. Major Huskisson has been a Director since 1940, and had been Managing Director of the Company since 1942; and his wide experience and knowledge will be fully utilised in the important function of co-ordinating the activities of the parent Company with its subsidiary companies. Mr Balcon has been with the Company for 33 years, and joined the Board in 1937. He was appointed Assistant Managing Director in 1947 and Deputy Managing Director in 1949. Mr Apfel has been with the Company for 35 years and has been Technical Director since 1949. In Simpson (Piccadilly) Limited your wholly owned subsidiary company, Mr F. Brame, who has been with the Simpson organisation for 30 years and who was appointed Assistant Managing Director of Simpson (Piccadilly) Limited in 1948 and Deputy Managing Director in 1951, has now been appointed Managing Director.

The report and accounts were adopted.

STAVELEY COAL & IRON

OUTLOOK MORE FAVOURABLE

The ninety-sixth Annual General Meeting of the Staveley Coal and Iron Company Limited was held on December 2nd in London, Mr John P. Hunt, Chairman, presiding.

The following is an extract from his circulated statement for the year ended June 30, 1959:

Last year I said that there was at that time little indication of improvement in the level of business activity although I viewed the future with confidence. At home, I regret to say, this slackness in trade continued until the end of the financial year and certain of the subsidiary companies operating in the machine tool and foundry industries have been less profitable. This reduction in profits has been largely offset by profits from the new acquisitions and increased profitability in those subsidiaries supplying the consumer market. Consequently the profits of the English companies in total are almost identical with those of a year ago.

RECESSION IN CANADA

The recession in Canada, aggravated by prolonged strikes in the West, has been more serious than in this country, with the result that our losses there have exceeded those of a year ago. Since the end of the financial year there are indications of an improvement in the level of Canadian business activity.

The consolidated profit before taxation for the year was £1,349,881, a decrease of £55,353 over the previous year. Due, however, to the release of income tax provisions, the profit available for distribution is £44,809 higher than last year. The directors are recommending a final dividend of 7 per cent, less income tax, making a total dividend for the year of 10 per cent, the same as that paid for the previous year.

During the financial year just ended the Group acquired for cash the issued share capital of Amasal Limited, who operate salt works principally at Stafford and a group of sales divisions located throughout the country handling the sales of "Saxa" table salt and associated products. During the current year the Amasal salt production will become fully integrated with The British Soda Company Limited and will add to that company's profitability and importance in the salt industry. By this acquisition the Group controls almost one quarter of the total production of salt in this country.

These acquisitions fit well into the industrial pattern of the Group and the Board is satisfied that they will yield adequate returns on the sums invested in their purchase.

IMPROVED ORDERS

As already indicated there has been some improvement since the end of the financial year in the general level of business activity both at home and in Canada. Orders have improved, although in the case of the machine tool subsidiaries they are still below factory capacity, nevertheless the outlook is more favourable than at this time a year ago.

While I cannot make any prediction as to the final outcome of the current year's trading, I can say that the profits for the first three months of 1959-60 are showing some improvement over the corresponding three months of the previous year.

The report and accounts were adopted.

THE CRITTALL MANUFACTURING COMPANY

LORD BRAINTREE ON DEVELOPMENTS IN ALUMINIUM FIELD

The thirty-fifth annual general meeting of The Crittall Manufacturing Company Limited was held on December 2nd in London, Lord Braintree (the Chairman) presiding. The following is an extract from his circulated statement:

When we met a year ago I had to report on a period during which we worked short-time a day a week over a period of four months. The decrease in house building, together with the restriction on credit generally, had an adverse effect on the building trade. I am pleased to tell you that there has been an improvement in the period under review, which is reflected in the fact that the total sales have increased by approximately 7½ per cent. The result of this improved turnover is that the Group profit before taxation is £679,697 compared with £628,835, which I feel can be regarded as satisfactory.

The improvement is mainly brought about by having enough work to maintain full-time production, but we are continuing to reduce costs by change of method generally involving increased mechanisation.

In spite of the fact that at the beginning of the period we were recovering from the restrictions of the previous year the improvement covers the whole period. Our grain silo business continues to make a substantial contribution to our turnover and has been a useful addition to our improved window business.

We have built a new shop at Silver End which will enable us to produce several times our previous volume of aluminium windows. In this connection, I should mention that we have just concluded an agreement with the firm of Curtisa S.p.A. of Bologna, who are recognised as being one of the most up-to-date designers and producers of curtain walling and the fenestration and clothing of building generally. Under this arrangement there will be the fullest exchange of information between the two Companies, and already it has had some beneficial effect on the design and appearance of some of the products to be made in the new factory.

Our export business continues to be about one-quarter of our total trade.

The statement then reviewed in detail the activities of the subsidiary and associated companies. After reviewing the financial results for the year, Lord Braintree continued:

The following figures show how each pound of income has been utilised:

	This year s. d.	Last year s. d.
Raw materials, supplies and services	10 10½	10 11¾
Wages, salaries and payments for the benefit of employees	7 2½	7 1¼
Depreciation	3¾	3½
Taxation	9½	10
Dividend	5	5¼
Amount retained in business	4¾	4¼
	20 0	20 0

Future Prospects.—There is undoubtedly an improved horizon in commercial and industrial building and we have great hopes for expansion particularly in the aluminium field.

The report was adopted and the total dividend of 15 per cent for the year was approved.

UNITED WINE TRADERS LIMITED

SUBSTANTIALLY IMPROVED PROFITS

SIR KENNETH MURRAY ON THE OUTLOOK

The seventh annual general meeting of United Wine Traders, Ltd., was held on November 26th at Suffolk House, Laurence Pountney Hill, London, E.C., Sir Kenneth Murray, chairman of the company, presiding.

The Secretary, Mr Geoffrey Butler, read the notice convening the meeting and the auditors' report.

The following is the chairman's statement circulated with the report and accounts for the year ended June 30, 1959:

I should like first to refer, with great regret, to the decision of Mr E. Price Hallowes early this year to retire from the Board at June 30, 1959, on his taking up residence abroad for reasons of health. As most Shareholders will know, he had been Vice-Chairman of the Company since its inception in 1952, and a well-known figure in the Wine Trade for over 50 years. His experience and knowledge will be sadly missed, particularly by his colleagues and myself.

We are, however, fortunate in having his son, Mr Geoffrey Hallowes, with all his experience in the trade, to succeed his father, and you will be invited at the Meeting to confirm Mr Geoffrey Hallowes' appointment as a Director. Mr Hennessy has been appointed Vice-Chairman in Mr E. Price Hallowes' place.

I am pleased to be able to report substantially improved figures for the year under review, the combined profits of the Group, after taxation, showing an improvement of £67,418 on the previous year's figures.

EXPANSION OF WHISKY EXPORTS

This increase is to a large extent accounted for by the successful development and extension of the Whisky Export Trade of one of the Operating Companies, Justerini & Brooks Ltd. Under the name of "J. & B. Rare," this Brand has now established itself not only in the USA, but also in South America, the Caribbean, and more recently in certain European countries.

Trading conditions in South East Asia are also of great interest to us, due to the firmly established position of our Brandy and Champagne export trade in these markets. After two years of comparative depression, I am pleased to report a steady improvement which is already reflected in our shipments to that part of the world. At the same time, our export trade with other countries of the Middle and Far East, and also Africa, have inevitably fluctuated with the current political situations and economic restrictions in those particular markets.

On this occasion I have left till the last a reference to Home Trade, though we attach as great importance to it as ever, and indeed it remains the backbone of our business. I am, therefore, particularly pleased to report improved results at home, even though they be less spectacular than the results in the Export markets, to which I have already referred.

CHANGING CONDITIONS

As regards the future, conditions in the Wine and Spirit trade are changing so rapidly that

concerns such as ours have to meet new conditions and keener competition from many directions. I would not go further as regards the future than to assure you that your Board is very much alive to these developments and is continually taking steps to meet them.

The opening of new markets and the preservation of old, involve a great deal of travelling by your Executive Directors and staff. For example, visits have been made during the year to territories as far apart as Malaya and America, as well as many countries in between, and I would take this opportunity of thanking all concerned, both at home and abroad, for their loyal and sustained efforts on the Company's behalf.

The Directors have decided to transfer £10,000 to General Reserve, and to reduce the Book Value of Goodwill to £36,000.

INCREASED DIVIDEND

In addition to the Preference dividend for the year, and an interim dividend of 10 per cent on the Ordinary Shares, which have already been paid, your Directors recommend payment of a final dividend of 20 per cent on the Ordinary Shares, making a total distribution on these Shares of 30 per cent. This compares with a total distribution last year of 25 per cent and, if approved, will enable a sum of £48,329 to be added to the Carry Forward.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring director, Mr Geoffrey M. Hallowes, was re-elected and the remuneration of the auditors, Messrs William S. Ogle & Co. and Messrs Gillespie Brothers & Co., was fixed.

HOLDERS INVESTMENT TRUST

CURRENT ASSETS APPROXIMATELY £3 MILLION

CAPITALISATION OF RESERVES

MR LIONEL BARBER'S STATEMENT

The twenty-sixth annual general meeting of Holders Investment Trust Limited was held on November 26th in London.

The following is the statement by Mr Lionel Barber, FCA (chairman), circulated with the report and accounts for the year ended July 31, 1959:

The net profit of the Group before taxation for the year ended July 31, 1959, was £1,298,599, compared with a profit for the previous year of £1,839,575. Although the net profit before taxation showed a fall of £540,976, we have had the benefit, in arriving at the taxation provision to be made, of the reduction in the standard rate of Income Tax from 8s. 6d. to 7s. 9d. in the £ for the Income Tax years 1959-60 and 1960-61, with the result that the net surplus after taxation showed a decline of only £166,224.

The Unquoted Investment shown in the Balance Sheet at £479 was acquired in the year 1952, and until this year had a market quotation. The holding is not now officially quoted and hence to comply with the Companies Act is shown separately.

TRADE RECESSION AFFECTS TURNOVER

Two factors applicable to William Hill (Football) Limited and William Hill (Glasgow) Limited contributed to the decrease in net earnings. Firstly there was a decline in turn-

over by 12 per cent, and secondly a lower rate of gross profit was earned. The decline in turnover was, in the opinion of your Directors, the effect of the trade recession on the spending power of the workers, who are of course our main customers. However, the turnover for the first few weeks of the current Football Season encourages me to expect that at least lost turnover will be regained.

I am pleased to say that the remaining subsidiary, debretta limited, showed an increased turnover and a larger profit. Proposals are in hand which, when completed, will provide a substantially greater productive capacity, to meet the growing demand for that Company's products.

BOARD'S POLICY OF DIVERSIFICATION

During the year several businesses were investigated with a view to acquisition, but none was considered as having the desired growth potential. The policy of making other investments to strengthen and diversify the affairs of the Trust continues.

A further instalment of £150,000 was paid to the Vendors of William Hill (Football) Limited, leaving only two further instalments to be met.

As you are aware, the 5 per cent Cumulative Redeemable Preference Shares amounting to £1,250,000 are redeemable at par at any time after July 31, 1959, and before July 31, 1971. It is not the intention of the Board to redeem any Preference Shares whilst the liability to the Vendors of William Hill (Football) Limited is outstanding.

The Consolidated Balance Sheet discloses current assets amounting to £2,933,427, of which £1,400,000 is in tax reserve certificates provided to meet the liabilities to Income Tax due on January 1, 1960, and January 1, 1961.

FREE ISSUE OF SHARES

In furtherance of the intention of your Board to increase the Ordinary Capital of the Company by way of capitalisation issue, as indicated in my Statement last year, you will be asked at the Annual General Meeting to authorise the capitalisation of £245,000 transferred from General Reserve by the issue of fully paid 2s. Ordinary Shares of the Company on the basis of one new share for every three existing Ordinary Units and/or "A" Non-Voting Shares.

In conclusion, it is with pleasure that I thank on your behalf all employees in the Group for their efficient and loyal service.

The report and accounts were adopted and the capitalisation of reserves was approved.

VICTORIA UNIVERSITY OF WELLINGTON
SENIOR LECTURER OR LECTURER IN ECONOMICS

Applications are invited for the above-mentioned post. Preference will be given to a candidate who is qualified in the field of Economic History or in Statistics and Econometrics. The salary for a lecturer will be £1,025 per annum, rising by annual increments of £50 to £1,275; for a senior lecturer the salary will be £1,325, rising by annual increments of £50 to £1,675 per annum. The initial salary will be determined according to the qualifications and experience of the appointee. University salaries are at present under review.
An allowance is made towards travelling expenses.
Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.
Applications, close, in New Zealand and London, on January 15, 1960.

THE UNIVERSITY OF MANCHESTER
Applications are invited for the posts of LECTURER IN SOCIAL ANTHROPOLOGY and LECTURER IN RURAL SOCIOLOGY in the Faculty of Economic and Social Studies. Salary on a scale £900 to £2,650 per annum with membership of F.S.S.U. and Children's Allowance Scheme. Initial salary according to qualifications and experience.—Applications should be sent, not later than December 12, 1959, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

AUSTRALIA
THE UNIVERSITY OF NEW SOUTH WALES
SENIOR LECTURER / LECTURER IN ECONOMICS

The University of New South Wales invites applications for appointment to the position of SENIOR LECTURER / LECTURER IN ECONOMICS in the Faculty of Commerce at Kensington.
Salary: Senior Lecturer, £A2,224 rising £A2,574 per annum. Lecturer, £A1,524 rising £A2,124 per annum.
Commencing salary according to qualifications and experience.
Applicants for lectureship must possess a degree with honours or possess equivalent qualifications; for appointment as senior lecturer applicants must possess a higher degree or equivalent qualifications.
Appointee will be eligible for "2 months' study leave on full salary after six years of service. Subject to passing a medical examination appointee will be eligible to contribute to the State Superannuation Fund.
First-class ship fares to Sydney of appointee and family will be paid.
Four copies of applications should be lodged with the Agent-General for New South Wales, 56-57, Strand, London, W.C.2, from whom a copy can be obtained by airmail in an envelope marked "University Appointment" to the Bursar, the University of New South Wales, Box 1, Post Office, Kensington, New South Wales, Australia, by December 24, 1959.

COMPANY AFFAIRS

Hawker Siddeley

THE unchanged ordinary dividend and preliminary profits figures of the Hawker Siddeley group caused little stir in the market: jobbers cautiously marked up the £1 ordinary shares by a shilling to 30s. on the ground that the rise in the group's United Kingdom earnings was slightly better than the directors seemed to expect when the £5,000,000 convertible debenture issue was made last April. In the event, the UK section's trading profits after depreciation and after a higher charge for "special development" of £2,965,720 (against £2,886,203 last year) rose from £5,688,201 to £5,985,926. The chairman, Sir Thomas Sopwith said last year that the group's orders for aircraft were "substantial" and throughout 1958-59 the aircraft division has been working on government contracts. The fact that earnings from these contracts are fairly predictable, and could be foreseen by the directors last April, suggests that the improvement in trading profits reflects to some extent the benefits of last year's reorganisation, which brought the Brush group into the industrial division and merged all the aviation companies into one aviation division.

Year to July 31	1958 £	1959 £
BRITISH GROUP:		
Trading profit*	8,574,404	8,951,646
Special development	2,886,203	2,965,720

Retained by subsidiaries	3,392,267	3,962,708
Retained by parent	73,975	73,975

* After depreciation.

Following the report from the chairman of A.V. Roe (Canada) issued in October, the fall in trading profits from £6,616,689 to £3,910,726 for the year to July 31st came as no surprise. But the Canadian group's contribution to Hawker Siddeley's total earnings has in fact fallen only from £1,897,495 to £1,232,757, thanks to lower taxes and the sale of the group's holding in Algoma Steel, which brought in some £712,000.

The 10 per cent ordinary dividend is again covered about 2¼ times by earnings (excluding profits from former years) and the £1 ordinary shares at 29s. 10½d. offer a yield of 6.6 per cent. But the real testing time for Hawker Siddeley is yet to come. As contracts for military aircraft run out—some of them are doing so now—the group will be forced to rely much more on the success of its other interests. At the same time, the group's role in a more rationalised aircraft industry is a question the directors will shortly have to consider.

Great Universal Stores

IN the six months to September 30th last turnover of the Great Universal Stores group reached a record level and trading profits jumped from £11,248,580 in the corresponding six months last year to £12,109,792, an increase of 7½ per cent. Moreover, a provision of £3,191,000 (against £664,000) has been made for unearned profit and collection charges on hire purchase business. The benefit of this upsurge in hire purchase business will be seen in the profits over the next year or so as these debts are collected. Current profits have benefited by about £300,000 from this year's cut in income tax and the latest six months' net profits of £4,805,875 compares with £4,128,123 in the same period last year.

The interim dividend is held at 7½ per cent, but it is payable on the equity as increased by the recent one-for-ten scrip issue. There is little doubt that the minimum total payment for the year can be taken as a maintained 35 per cent on the increased capital. The market had virtually discounted these very satisfactory results and at 51s. the 5s. "A" ordinary shares yield about 3¼ per cent without a vote.

Mercantile Credit

THE doubling of gross profit in the year to September 30, 1959, from £958,346 to £2,133,972, was broadly foreshadowed at the time of the preference share issue in September, but it is still a remarkable result; net profits show an even steeper increase from £442,310 to £1,052,226. In the nine months to June 30th last the company's HP debt soared from £26 million to £49½ million, including £7 million from newly acquired subsidiaries. A more up to date picture of hire purchase business will be given in the full report.

Ordinary shareholders are to receive a final dividend of 10 per cent on the capital as increased by the 100 per cent scrip issue, making an effective total of 15 per cent for the year as forecast at the time of the issue in August; for shareholders other than the banks, the comparable effective dividend last year was 8 per cent. The ordinary capital has been swollen not only by this scrip issue but also by the issue of shares to Westminster and Martins banks, each now holding 20 per cent of the issued ordinary capital. The payment for these shares, originally scheduled for four equal instalments with the last in March, 1960, was advanced because of the considerable expansion of business and completed during the summer. These shares and those received by the banks in the scrip issue will not rank in full for the final dividend.

No one expects the recent rate of expansion of hire purchase to continue; and the crop of bad debts and frauds have caused many companies to draw breath. Nevertheless, backed by the banks and with fresh capital (including £2½ million from the recent preference issue) Mercantile Credit is in a strong position to hold its own in this more competitive market for credit. At 29s. 3d. the 5s. ordinary shares yield 2.6 per cent.

Giltspur Investment

HIRE purchase has not been easy money for everybody. Giltspur Investment and Finance, a London investment company, shows in its report for the year to March 31st last, only recently published, a fall in group profits from £41,637 to £1,548, and it appears that this results from severe losses from bad debts incurred by its hire purchase subsidiary. The board (a new one was appointed in August) cannot be certain that further losses will not be suffered. The balance sheet shows that block discounting and hire purchase debtors amounted to £314,477; bank loans and acceptances of the whole group amounted to more than that, at £333,346.

Since the date of the accounts one of the company's two subsidiaries, Beaufort Plantations, has been sold at a "satisfactory price." The 2s. shares now stand at 5s. 3d.; earlier this year they were quoted at around 9s. The company has never paid a dividend.

Tate and Lyle

SATISFACTORY results have induced the directors of Tate and Lyle to loosen their purse strings. The ordinary dividend, which has been unchanged for four years, is now stepped up from the equivalent of 10⅚ per cent (allowing for the 60 per cent scrip issue) to 12 per cent, which is still covered almost 2½ times by earnings. The £1 ordinary shares rose after the announcement by 2s. 1½d. to 60s. 6d. to yield 3¼ per cent.

Trading profits for the year ended on September 30th last advanced by 8½ per cent, from £6,195,253 to £6,720,469. Sales of refined sugar to the home market rose by 48,656 tons to a new peak of 1,499,823 tons. There was a further fall in exports of 8,760 tons to 575,673 tons, but profits from exports were higher. Large economies have been achieved, partly no doubt as a result of the low level of raw sugar prices in recent months.

Within the last month Tate and Lyle has acquired a controlling interest in Canada and Dominion Sugar at the cost of something over £6 million. In his statement at the annual meeting, Sir Ian Lyle, the chairman, will presumably report on how this bid is being financed and also on his plans for the Canadian company, which has been experiencing difficult trading conditions.

Allied Bakeries

OPPONENTS of non-voting shares have found a redoubtable ally in Mr Garfield Weston, chairman of Allied Bakeries, who now proposes to enfranchise his non-voting "B" shareholders. At present the ordinary capital of £12.3 million is divided into an equal amount of "A" and "B" 5s. shares, "A" shareholders having one vote for every four shares held. It is now proposed to merge the two classes of shares, giving "B" shares equal voting rights with the "A" shares. The board of Allied Bakeries does not intend to follow the examples of House of Fraser and Pye in giving compensation to the "A" shareholders; "no case for compensation really arises so far as this company is concerned" as the two classes have always had identical rights except for votes. The gap between the prices of the "A" and "B" shares, which had been up to 5s. earlier this year, had narrowed to 1s. before this announcement.

The expansion of the company has continued at a remarkable rate. A rights issue early this year raised £2.8 million, and the cash flow from depreciation and retained earnings provided another £5.2 million; nevertheless, bank advances and short-term loans amounted to over £7¾ million at the end of March this year. This figure has since been substantially reduced both by current earnings and by a lease-lend deal involving a small number of the group's freehold shop properties. Nevertheless, it would not be surprising to see Allied Bakeries raising fresh capital before long, and it will be in a much more favourable position to do so.

Not only are "B" shareholders to be given a vote, but all ordinary shareholders in Allied Bakeries (soon to be changed to British Associated Foods) are promised an increase in dividend from 18 per cent to 21 per cent if the directors' expectation of the results for the year are realised. Since this news both "A" and "B" shares have risen by 2s. 4½d. and 3s. 6d. respectively to 38s. to yield 2.8 per cent on the forecast dividend.

Bigger Brewery Dividends

THE Chancellor's reduction of twopence a pint on beer duties and more particularly the long fine summer of 1959 have brought about a change of fortune for the brewing industry. Indeed Mr Edward Thompson, the chairman of Ind Coope, now asserts that "the industry is beginning to trade in more favourable conditions than it has enjoyed at any time since the period shortly after the war." Accounts of five important groups in the year to September 30th last all show an increase in sales and profits, in which other factors have also played their part. The brewing groups have spent vast sums in the last few years in modernising not only their licensed premises but, more important still, their production processes. In many cases also considerable economies are resulting from the merging of breweries into larger units, and it seems clear that this integration in the brewery trade will continue. Because of these numerous acquisitions it is not always possible to make an exact comparison with the figures shown for the previous year.

Mitchells and Butlers, trading in the Midlands and South Wales, has increased its trading profits by £448,761 to £2,638,257, but this includes almost five months' profits of the newly acquired Atkinsons Brewery. As forecast when the offer for W. Butler and Co. was made three weeks ago, the dividend is being raised from 13½ per cent to 15 per cent. In addition there is to be a tax-free capital distribution of 1½ per cent, the same rate as last year. If this latest offer is successful Mitchells and Butlers will become a very strong brewery group in the Midlands.

Ansells Brewery and Mitchells and Butlers held negotiations on a possible merger some years back but these fell through. The two companies, however, jointly own several new public houses in which the products of both companies are on sale. Profits before tax of Ansells have risen only slightly from £2,500,767 to £2,532,825 but after a smaller provision for tax, net profits are £220,767 higher at £1,371,476. The ordinary dividend is raised from 16 per cent to 19 per cent; it is still covered more than twice by earnings. It is therefore quite possible that this increased dividend will be maintained on the capital as increased by the proposed one for five scrip issue.

Flowers Breweries made trading agreements with both H. and G. Simonds and Whitbreads during the year. Group profits have jumped from £765,124 to £1,044,953 and the ordinary dividend is increased from 17 per cent to 18 per cent. The new ordinary shares issued to shareholders in September do not rank for the final dividend of 12 per cent, but the directors stated at the time of the issue that they hoped to maintain the higher dividend rate on the increased capital in 1959-60.

Hammonds United Breweries has continued its vigorous policy of expansion and has acquired both R. F. Case and John Aitchison during the year. Trading profits have risen from £793,599 to £908,788, but it is not clear how much of this 15 per cent increase can be attributed to these latest acquisitions. Hammonds, which operates mainly in Lancashire and Yorkshire, is raising its dividend from 14 per cent to 15½ per cent on capital increased not only in connection with mergers but also by a one for nine rights issue in the summer.

H. and G. Simonds which operates mainly in South and South-West England is raising its dividend from 12 per cent to 14 per cent. Trading profits have risen from £850,799 to £897,494, and a lower tax charge leaves net profits £93,755 higher at £478,573.

Beaverbrook Newspapers

BY contrast this week Beaverbrook Newspapers has announced a rights issue of non-voting 5s. "A" ordinary shares at 20s. per share on the basis of one for every twenty-four "A" ordinary shares held. An issue has been expected since the recent report mentioned a further expansion programme costing £1 million, but it was expected to be on a larger scale than the one now proposed, which will raise only £250,000. The issue is not being underwritten and certain institutional investors who have expressed strong views on the subject of non-voting shares may decide not to take up their shares. The "A" shares are currently quoted at 24s. 9d. and rights are worth about 3d. each.

National Commercial Bank of Scotland

THIS is the first balance sheet of the combined bank, which transacts about 30 per cent of banking business in Scotland under the vigorous chairmanship of Mr Ian Macdonald. Shareholders who have been asked for £7 million in a rights issue can find much to encourage them. Net disclosed profits for the year to October 31st are £1,194,504—a handsome figure for an undertaking of this size, and about 36 per cent larger than combined profits of the two banks a year ago. The improvement is attributed to three factors. Advances have risen by 45 per cent to £96 million, financed

† July

by the sale of gilt-edged securities; secondly, the Scottish banks have benefited from lower interest rates, as the proportion of interest bearing deposits is higher than in England; thirdly, additional profits have naturally been earned this year from hire purchase.

The hire purchase subsidiaries, which now include not only Scottish Midland Guarantee Trust (acquired in 1954) but also Olds Discount and interests in South Africa, were split off last year into a holding company, Lloyds and Scottish Finance, owned 50-50 by Lloyds Bank and the National Commercial (in which Lloyds has a direct interest of about 37 per cent). The results of the year's HP business will be apparent in a few weeks when the holding company publishes its balance sheet. The National Commercial's stake in the finance company has been raised from £3 million to £5½ million in the past year, and it will increase this further in the current year. That is the main reason for the big rights issue.

Metal Industries

SHAREHOLDERS will be encouraged by the directors' half-yearly statement showing that trading profits for the six months ended September 30th have risen from £679,000 to £850,000. The increase in the interim dividend from 4 per cent to 6 per cent is designed ostensibly to reduce the present disparity between the interim and final payments, but the directors say that if "present trends continue" the total ordinary payment will be increased from 14 per cent to 15 per cent. Sir Charles Westlake, the chairman, points out that these profits include a contribution from two recent acquisitions, Towler Bros. (Patents), Avo (instrument makers) and Taylor Electrical Instruments, whose earnings, he says, "have justified the forecasts." Just what proportion of earnings comes from these new acquisitions is not revealed, but Avo's fairly large Government contracts and the success of Taylor Electrical's new ultra-sensitive multi-meter suggests that their contributions have been quite substantial. It would be surprising if the heavy engineering sections had made any marked recovery in this period of slack trade. The £1 ordinary units yield 4.1 per cent on the forecast dividend of 15 per cent.

Allied Ironfounders

IN his last full report for the financial year to April 4, when the group's earnings fell by some 11 per cent, Mr W. H. Smith, the chairman, said that since March of this year sales had improved and the volume of orders in hand was higher than a year before. Now the doubling of the interim dividend from 3½ per cent to 7½ per cent suggests that this improvement may have gone a good deal further than the directors thought likely earlier in the year. Allied Ironfounders has paid an interim dividend of 3½ per cent and a final of 8½ per cent for the last three years; the market was therefore taken by surprise, and the £1 ordinary shares were marked up 10s. to 71s. but dropped back to 67s. 3d.

The building boom, which is concentrated mainly in the private sector, has so far lost none of its momentum, and may soon be reinforced by the Government's plan to improve old houses. At the same time, the boom in consumer durables (Allied Ironfounders makes Aga cookers and Rayburn boilers) shows no signs of slackening. Investors may, therefore, be well justified in hoping for a final payment of 12½ per cent, making a total distribution of 20 per cent. This would offer a yield of 5.6 per cent on the £1 ordinary shares at the current price.

Bowater

MINORITY shareholders in the group's packaging subsidiary, Bowater-Eburite, are to be offered one £1 ordinary share in Bowater Corporation for every five 5s. ordinary shares in Bowater-Eburite. At present some 44 per cent of the equity (representing 8,164,408 5s. ordinary shares) is held by minority shareholders. The holders will therefore be entitled to receive the corporation's final dividend for the year ending December 31st. During 1960 the Bowater directors will recommend a scrip issue in which both the Bowater-Eburite shareholders and the Corporation shareholders will be able to participate.

There are at least two obvious advantages to be gained from total control of Bowater-Eburite. Firstly, it will facilitate the heavy expansion programme which is to take place over the next two years and is designed to help Bowater-Eburite strengthen its hold on the increasingly competitive packaging market. Secondly, it will resolve the present conflict of interests between Bowater's newly acquired subsidiary, Bowater-Perga, and Bowater-Eburite. Both these companies have recently been competing with each other in the production of milk cartons.

Woolwich Equitable

THE most striking feature of the accounts of the Woolwich Equitable Building Society for the year to September 30th last is the substantial improvement in the intake of money during the year. Investments in shares rose by no less than 83 per cent, from £15.7 million to £28.7 million, while withdrawals were only £1.5 million higher at £12.9 million; net share receipts amounted to £15.8 million compared with £4.3 million in the previous year. These figures, however, include only three months of business after the reduction in its rate paid on shares from 3½ per cent to 3¾ per cent. The latest quarterly figures of the Building Societies Association have shown that the rate of withdrawals is going up and this trend has become more marked lately. The majority of building societies, which make up their accounts at the end of the year, are therefore not likely to be able to record such a good performance.

London Stock Exchange

FIRST DEALINGS:	Nov. 23	Dec. 7	Dec. 28
LAST DEALINGS:	Dec. 4	Dec. 24	Jan. 8
ACCOUNT DAY:	Dec. 15	Jan. 5	Jan. 19

STOCK markets developed an uncertain tone after the week-end. Rises in oil shares and the heavy industries kept the indices rising, and *The Economist* indicator was up by 3.8 points to 351.5 in the week to Wednesday's close; but hire purchase shares and stores declined. The weakness of sterling, the fall in the foreign exchange reserves and fears of a rise in Bank rate combined to weaken the market generally on Thursday.

Gilt-edged stocks were particularly affected by the rise in the United States bill rate to a new peak, and at the opening on Wednesday jobbers marked down most of the Funds fairly sharply. Among undated stocks 3½ per cent War Loan fell ½ to 66 7/16—a fall of 1⅛ over the week. Short dated stocks were also marked down and came in for persistent rather than heavy selling; 4½ per cent Conversion 1964 lost 7/32 at 99 19/32 after touching 100¼ earlier in the week. Among medium dated stocks 4 per cent Gas 1969-72 fell by ¼ on Wednesday to 92 15/16 but showed a net rise over the week of 1/8.

Bank shares have been active in anticipation of next month's dividend season. Over the week to Wednesday's close National Provincial put on 2s. 7½d. to 89s. 1½d., Lloyds gained 4s. 4½d. to 66s. 1½d. and Barclays 4s. 4½d. to 63s. 1½d. Insurance shares were dull.

The best performance among industrial shares was shown by the capital goods industries. Babcock and Wilcox closed 2s. 6d. better at 45s., Vickers gained the same amount at 32s. 1½d. and Reyrolle improved 4s. 6d. to 94s. 6d. Steel shares were also one of the brighter sections, with Dorman Long 2s. better at 65s., Colvilles 2s. 7½d. up at 67s. 1½d. and South Durham 1s. 4½d. up at 54s. 9d. Motor shares lost some of their recent firmness; Ford dropped 3s. 3d. to 103s. 3d. and BMC by 10½d. to 20s. 7½d. The spate of higher profits and dividend payments from brewery companies helped most brewery shares to advance. Ansells put on 3s. 4½d. to 87s. 7½d., while Ind Coope at 18s. 6d. and Bass at 78s. 9d. both showed gains of 3d. over the week. But Flowers lost 9d. to 22s. 6d. Stores shares lost ground; GUS "A" lost 1s. 4½d. at 51s., Marks "A" closed 7½d. down at 73s. and Gamage closed unchanged at 100s. Some American buying helped Philips Lamps to show a net gain over the week of 3s. to 141s. 6d. and GEC improved 1s. 3d. to 44s.

Oil shares were helped earlier in the week by the rally on Wall Street, but continental selling on Wednesday tended to offset the earlier gains. Even so, over the week Burmah were 1s. 3d. better at 46s. and BP improved 1s. 3d. to 52s. 9d.; exceptionally, Shell lost 3d. at 143s. 6d.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended November 28, 1959, there was an "above-line" deficit (after allowing for sinking funds) of £14,637,000 compared with a surplus of £2,880,000 in the previous week and one of £17,777,000 in the corresponding period of last year. There was a net expenditure "below-line" of £18,463,000 leaving a total cumulative deficit to date of £685,800,000 compared with £609,605,000 in 1958–59.

THE MONEY MARKET

ATTENTION this week has again been centred on the further rise in the United States Treasury bill rate to a new peak. The 91-day bill rate jumped from 4.279 per cent to 4.501 per cent while the rate on 182-day bills rose from 4.625 per cent to 4.891 per cent, only fractionally below its high point.

At last Friday's London bill tender the discount market syndicate repeated its bid of £99 3s. for the 91-day bills. The average rate of discount was virtually unchanged at £3 7s. 11.95d. per cent, now well over one per cent less than the equivalent US rate. The market also kept its bid unchanged for the shorter dated 63-day bills at £99 8s. 1d.

Credit has been uneven in Lombard Street this week. At the end of last week one or two houses were forced to borrow a very small amount from the Bank. Earlier this week, credit conditions were much easier, helped by the disbursement of half yearly interest on War Loan. On Wednesday, however, there was a complete change and money was very scarce. No official help was given and four or five houses had to borrow a small amount from the Bank of England at the penal rate.

(1) For a rough conversion to basis of June, 1947, multiply throughout by 1·534. (2) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (3) For a rough conversion to basis of June, 1947, multiply throughout by 1·561. (4) Surveys made twice a year; annual figures relate to October survey. (5) Figures relate to April survey. (6) In general males under 21 and females under 18 years of age. (7) Certain changes have been made in the classification and coverage of the Board of Trade's index numbers in this section. (8) The series for "all items" and "other items" have been revised throughout; quotations for Middle East and Venezuelan crude oil now replace the previous quotation for gasoline. Owing to a change in the tea quotation used, some revisions have also been made in the series for "all items" and "food" from June 2, 1959. (*) Revised figures for October 27th: fibres, 80·7; others, 130·4.

... there's an able branch manager at the bank we use. And behind him is a district head office which has a finger on all our local problems, as well as on the broader issues of the outside world. So we are very well served at both branch and head office levels ...

YOU
MR. POLICYHOLDER

are a power in the land

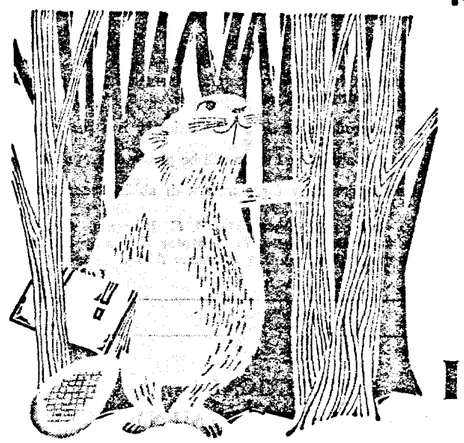
It's not likely that you took out your life assurance policy with the idea of becoming a big noise. You took it out for down-to-earth reasons: because it's a good way to save, because you believe in looking ahead, because—when all's said and done—the unexpected *can* happen and you wanted to protect your wife and children. It gives you a feeling of independence as well as a feeling of security.

All the same, through Life Assurance you are helping Britain's economy. Money from Life Assurance provides finance for industrial expansion, for new factories, for government and municipal projects. Our standard of living benefits directly from these. Life Assurance not only looks after tomorrow—it makes for a better today.

Through LIFE ASSURANCE

—a better life for you and for everyone

Issued by The Life Offices' Association, London, and Associated Scottish Life Offices, Edinburgh



planning a move to Canada?

APPOINTMENTS

BEA

OPERATIONAL RESEARCH

British European Airways offer appointments for graduates in their Operational Research team, to investigate a wide range of complex operational and organisational problems in Engineering planning, Airport operation, Advertising, Sales, and other fields. This work demands qualities of curiosity, imagination and integrity, as well as technical competence.

STATISTICIANS

A degree in statistics or in mathematics with statistics is essential; and some knowledge of Queueing Theory, Monte Carlo methods and stochastic processes would be an advantage.

ECONOMISTS

An honours degree in economics with a bias towards econometrics is essential. Some knowledge of theories of linear programming and allocation would be useful.

SCIENTISTS AND ENGINEERS

A degree or professional qualification in mathematics, physics, electrical engineering or psychology is essential.

Experience in O.R. would be an advantage, but where this is lacking training will be provided.

Applications, giving details of age, education and experience to Personnel Officer, Head Office, British European Airways, Bealine House, Ruislip, Middlesex.

A PUBLIC BODY (concerned with Agriculture) invites applications for the appointment of Deputy to the Chief Officer. An honours degree would indicate the type of background required of candidates, who must have had senior administrative experience. Commencing salary not less than £3,000 p.a. Maximum age 45 years. Pension arrangement available.—Detailed applications should be addressed to B. M. & Co., Alderman's House, Bishopsgate, London, E.C.2, by December 21, 1959, quoting reference AC.1 on outside of envelope.

ROAD RESEARCH LABORATORY (D.S.I.R.), Harmondsworth, Middlesex, requires Civil Engineers, Materials (Research) Engineers, in Senior Scientific/Scientific Officer grades, to be based on Tropical Section of R.R.L. and available for secondment to overseas territories to study locally available road-making materials, and help in developing methods of road-making appropriate to local conditions. Preference given to engineers with some field experience. After a period of laboratory training they will be posted for tours in British overseas territories, returning to work in the Tropical Section of the Road Research Laboratory between tours. Qualifications: 1st or 2nd Class Honours degree. At least three years' post graduate experience for S.S.O. grades. Starting salaries within the range S.O. £655 — £1,150, S.S.O. £1,233 — £1,460. Normal prospects of promotion to Principal Scientific Officer in mid-thirties (range up to £2,120) with possibilities of higher posts. Five-day week.—Forms from Ministry of Labour Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting E.347/9A. Closing date January 15, 1960.

NATIONAL HEALTH SERVICE TRAINING POSTS IN HOSPITAL ADMINISTRATION

The Minister of Health and the Secretary of State for Scotland invite applications for up to sixteen training posts in hospital administration, tenable for a period of three years beginning in the autumn of 1960.

A short list of applicants will be interviewed by a Selection Committee, and those selected will be given practical experience of all branches of hospital administration, together with courses of instruction at the University of Manchester or at the Hospital Administrative Staff College of King Edward's Hospital Fund for London.

Applicants, who should normally be not more than 30 years of age on September 1, 1960, must have discharged their obligations for National Service and should either:—

(i) have graduated (by September, 1960) from a British University, or

(ii) have obtained (by September, 1960) a professional qualification acceptable to the Selection Committee, or

(iii) have been employed in the hospital service for at least three years and have passed at least the intermediate examination for a professional qualification.

In exceptional circumstances consideration may be given to applications from persons without one of the above qualifications, or from those aged up to 35 years. Students due to take their final examinations in 1960 may apply.

Successful candidates will receive a salary during the training period commencing at £575 p.a. (plus an addition in the London area) with yearly increments of £30. Those already in the hospital service will retain their present salary scales if advantageous. Training fees will be met.

Further information and application forms can be obtained from University Appointments Boards or by writing to the Secretary, Ministry of Health, Savile Row, London, W.1, or to the Secretary, Department of Health for Scotland, St. Andrew's House, Edinburgh, 1. Completed application forms should be sent to the appropriate Ministry *not later than Saturday, January 30, 1960.*

FORD

require a

PRODUCT MARKET ANALYSIS ASSISTANT

* Applicants should preferably be Economics graduates and have some knowledge of Statistical techniques or market research.
* A real interest in the products of the motor industry is a pre-requisite.
* Salary will depend upon ability and there will be plenty of scope for initiative.
* This is an excellent opportunity for a man with ability, energy and drive.

Please send full particulars to Mr. H. G. Pearman, Training and Recruitment Department, Ford Motor Company Limited, Dagenham, Essex, quoting reference AMA.

Pfizer

TECHNICAL SERVICE DEPARTMENT

A vacancy has occurred in the Technical Service Department of Kemball, Bishop & Co., Ltd., which is now the Chemical Division of the Pfizer Group in this country.

The position will be based at the Pfizer Group headquarters, Sandwich, Kent.

The successful applicant should conform to the following:—

(1) Possess a good degree in Chemistry.

(2) Be aged under 35 years.

(3) Experience: In sales, sales development, or technical service (experience in plastics, coatings, metal cleaning and finishing or sequestration chemistry, though not indispensable, would be helpful).

(4) Capabilities: The right man must be capable of planning his work and have the ability to get things done. He should be versatile to work at the desk and in the field, involving a fair amount of travel. This may later extend to cover Pfizer Companies on the Continent.

Attractive salary with generous non-contributory Pension & Life Assurance Schemes.

Please write stating age, qualifications and experience to:—

Staff Recruitment Officer, Pfizer, Ltd., Richborough, Nr. Sandwich, Kent.

THE PFIZER GROUP

CHIEF STATISTICIAN

required by A. C. Nielsen Company Limited to manage their Statistics Division. The Company is one of an international group and serves some 160 clients in Great Britain. Of the British staff of 1,000, 700 are based at Oxford in a new building with first-class amenities.

The Statistics Division is responsible for sample design and maintenance for Nielsen research services and for statistical research into new projects and current operations.

The Chief Statistician will work in close contact with the Board and senior executives. He will meet managements of client companies on statistical matters. He will be responsible for 30 executives and office staff in his Division and must of necessity be a manager and have a good Honours degree with Statistics. He should possess good presence and ability to mix, and be in age group 30-45 with experience in industry and preferably in marketing research.

Salary commensurate with senior status of this post. Profit Sharing and Pension Plans. Full details education, qualifications, experience, age, etc., to Personnel Manager, A. C. Nielsen Company Limited, Nielsen House, Oxford.

ECONOMIST GRADUATE with some knowledge of statistics required to pioneer econometric studies of raw material purchasing in well-known firm. No age limit. Please indicate current salary or salary required. Applications should be accompanied by curriculum vitae, and state when available. Suitable applicants will be interviewed in London on December 30th. Appointee may be required to live and work in North of England.—Box 1243.

ASSISTANT required for Export Manager of medium sized Engineering firm, some 30 miles west of London. Candidates should be in the age group 24-28, have good spoken command of one or more European languages, have a grounding in export sales and, preferably, some technical experience. After an initial training period, some travel, mainly European, will be required.—Please write with full description of background and experience, present salary and salary required to Box 1248.

CENTRAL ELECTRICITY GENERATING BOARD

PLANNING DEPARTMENT

HEADQUARTERS, LONDON, S.E.1.

ENGINEERING DIGITAL COMPUTING SERVICE

COMPUTER PROGRAMMERS required in the System Planning Branch to deal with the solution by digital computer of a wide variety of technical problems to be found in the Electricity Supply Industry.

Previous experience in numerical analysis and the use of electronic digital computers, particularly a DEUCE computer, would be considered an advantage. Applicants should hold a University Honours Degree in mathematics, physics or engineering, or should have had considerable experience in programming.

Salaries on a scale within the range £1,029 to £1,495 p.a., according to duties and responsibilities.

Applications stating age, qualifications, experience, present position and salary, to the Personnel Officer, 24 30, Holborn, London, E.C.1., by 18th December. Envelopes should be marked "Confidential Ref. ECO 464."

CENTRAL OFFICE OF INFORMATION requires to appoint a Senior Officer to control the daily editing of a group of wireless Press services directed to the U.K. information posts in various regions of Africa and the Caribbean area. This appointment calls for someone of the liveliest mind who must already have held responsible posts on the staff of a newspaper, news agency or broadcasting organisation. Ability to make use of a wide knowledge of current affairs including constitutional and economic developments in Africa is essential. Candidates will be preferred who have lived in one or more of the African territories, engaged in journalism or public relations. The holder of the post must be able to give effective leadership to a small body of qualified staff. Salary between £1,395 and £1,660 (men); £1,345 and £1,600 (women).—Write, giving age, full details of experience and qualifications to Manager, (P.E.1956), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4. Only those candidates selected for interview will be advised.

WANTED

GROUP ACCOUNTANT

He will be head of the accountants in a British Group of Companies with wide European connections. This Group is chiefly concerned with research into the marketing of consumer goods.

This top accountant will be responsible only to the Director of Administration of the Group.

The better he is—the better he will be paid.

If you want to know more about this job write with details of yourself to:

VICE-ADMIRAL SIR GUY SAYER,

ATTWOOD GROUP OF COMPANIES LIMITED

CHANTREY HOUSE, ECCLESTON STREET, LONDON, S.W.1.

MANAGEMENT Accounting Adviser and a Marketing [illegible] required for the Management Services Department of the British Institute of Management. They will be responsible for the organisation of courses, seminars and conferences in their respective fields, and will be expected to provide information to enquirers in these fields with the assistance of an Information Officer and the Institute's extensive management library. They will act as Secretaries to the Institute's Management Accountant and Marketing Advisory Committees. Applicants for the Management Accounting vacancy should be qualified accountants with an interest in research and the organisation of research and discussion groups. This field will cover budgets, estimates and control information. O. & M. and company procedures. Those applying for the Marketing vacancy should preferably be graduates with management experience either with a sales team or with a department concerned with marketing a product or group of products. Starting salaries: £950-£1,050. Pension Scheme.—Applications to Mr. N. Gaisanne, Head of Management Services Department, BIM, 80 Fetter Lane, E.C.4, within seven days of publication of this advertisement.

For other appointments see page 1013

APPLICATIONS are invited for the newly created post of WORKS' COST ACCOUNTANT. Successful applicant will be fully qualified with complete knowledge of Cost Control and budgetary work and have previous commercial experience preferably in the furniture industry. Permanent post with excellent Salary and prospects.—Crondale Furniture Company, Ltd., Broad Road, Wealdstone, Middlesex.

STATISTICAL CLERK required by Arthur Guinness Son & Co. (Park Royal), Ltd. Minimum qualification G.C.E. Advanced level mathematics, but preferably A.I.S. Final or Degree. Salary according to qualifications, five-day week, three-four weeks' holiday per annum according to age, free luncheons, non-contributory pension scheme.—Please write giving details of age, qualifications and experience to Personnel Manager, Park Royal Brewery, London, N.W.10. Ref.: SC/E.

INDUSTRIAL MARKET RESEARCH

Expanding organisation requires a specialist with at least three years' experience in industrial market research work and capable of taking over the direction of U.K. research within a short period.—Apply Box 1242.

APPLICATIONS are invited from persons with a degree or diploma in SOCIAL SCIENCE or SOCIAL STUDIES and experience in one or more of the following fields: mental health, social administration, or social research—to participate in a survey which is being financed by THE NUFFIELD PROVINCIAL HOSPITALS' TRUST into mental health needs in the county of Anglesey. The survey is expected to take two or three years. The Department of Studies in Psychological Medicine and Social Science of the University of Liverpool are co-operating in the survey. Salary in the range £900-£1,400 according to qualifications and experience; travelling allowance; superannuation.—Further details obtainable from the undersigned to whom application forms must be returned by January 15, 1960. G. WYNNE GRIFFITH, County Medical Officer of Health, Shire Hall, Llangefni, Anglesey.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for appointment to an Assistant Lectureship in Statistics. The successful candidate will be required to teach theoretical statistics and some mathematics. Salary scale £700 x £50—£850 per annum plus £60 London Allowance; with superannuation benefits and family allowances. In assessing the starting salary consideration will be given to age and experience.

Applications, with the names of three referees, should be received not later than January 22nd by the Secretary, The London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. from whom further particulars may be obtained.

SALES RESEARCH EXECUTIVE required to evaluate and interpret television and marketing statistics to clients and advertising agencies. At least one year's experience in television planning and/or marketing required. Candidates must possess degree in economics or one of the social sciences and be familiar with handling of statistical material.—Applications in writing to Personnel Manager, Associated Television, Ltd., 17 Great Cumberland Place, London, W.1.

APPLICATIONS are invited for the post of GENERAL SECRETARY of the NORTHERN RHODESIA MINE WORKERS' UNION. Applicants must have had wide Trade Union experience in an administrative and negotiating capacity, and be able to prepare and present a case for arbitration and conciliation. The Northern Rhodesia Mine Workers' Union operates within the Mining Industry of Northern Rhodesia and has a membership of approximately 5,000 Europeans. The commencing salary offered will be commensurate with ability but will not be less than £2,000 per annum. Applications giving age, marital status, academic qualifications and full details of previous experience together with at least three references should be addressed to The President, Northern Rhodesia Mine Workers' Union, P.O. Box 75, Kitwe, Northern Rhodesia.

BBC requires Industrial Correspondent in Midland Region (Birmingham). Duties: under general direction of Regional News Editor to act as specialist correspondent and adviser on Industrial and Trade Union affairs concerned primarily with news programmes, both national and regional. Sound and Television; also to advise on reflection of industrial matters in other types of programmes. Qualifications: journalistic experience in field of industry and labour relations; ability to supply concise, balanced and rapid coverage of events for news bulletins, to describe technical developments clearly and accurately, and to broadcast effectively in Sound and Television. Wide knowledge of Midlands industries and labour relations in the region important. Salary £1,545 (possibly higher if qualifications exceptional) rising by five annual increments to £1,970 p.a. max.—Requests for application forms (enclosing addressed envelope and quoting reference G.1383 Ec) should reach Appointments Officer, Broadcasting House, London, W.1, within five days.

ACCOUNTANT

A unique opportunity is available for a Chartered Accountant to join the nucleus of a management team now being formed in the United Kingdom by the newly established subsidiary of a major American company.

Applicant must be of top executive quality, capable of using modern techniques to produce financial control data. Experience of engineering costing would be an advantage. Ample scope for advancement for a person with the necessary qualifications and personality. Initial salary in the region of £1,500 p.a. according to experience, qualifications, etc. Send full details, in strict confidence, to

Box No. 1249.

BROWN & POLSON require for their Finance and Administration Division, a young man, 23-28, with an Accountancy or Cost and Works Accounting Qualification. Experience in an industrial concern would be an advantage but applicants with solely commercial or auditing experience should not hesitate to apply. Experience within the Company will not be confined to its London headquarters but will include periods at the Manchester and Paisley Works. Salary, Profit Payment, Life Assurance and Pension Schemes are good and the Company is progressive in outlook and expanding. —Replies to Group Personnel Manager, Brown & Polson, Ltd., 125/130 Strand, London, W.C.2.

APPOINTMENTS REQUIRED

ADMINISTRATIVE OFFICER, H.M.O.C.S., aged 36, requires interesting and responsible post with future. Experienced S.E. Asia politics, economics and languages. Available for interview.—Please write Box 1251.

DATA Processing, Mathematics, Statistics. Young gentleman with experience and qualifications involving these subjects seeks suitable post.—Box 1250.

MALAYAN EXECUTIVE, early thirties, experienced commercial and industrial management, speaking several Asian languages, detailed knowledge Malaya, fair knowledge South-East Asia, wishes change to more active organisation, preferably based Malaya/Singapore. Present salary £4,500 but willing accept lower salary in growing enterprise.—P.O. Box 3612, Singapore.

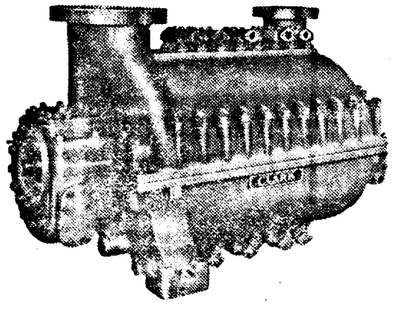
NOW...TWO GREAT NAMES

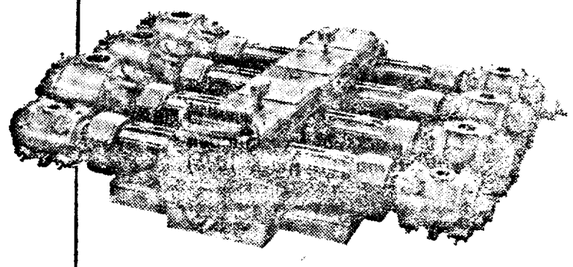
on one complete line of centrifugal and reciprocating compressors

This nameplate stands for teamwork between the U.K. and the U.S.A. It identifies each precision-made product in the complete line of Clark centrifugal and reciprocating compressors with motor and gas engine drives, manufactured in Glasgow by G. & J. Weir Ltd. These heavy-duty units, designed and engineered in the United States by Clark Bros. Co., are built with traditional British craftsmanship and are available for purchase in sterling. All parts of WEIR-CLARK compressors are identical and fully interchangeable with comparable Clark equipment built in the United States and under license in France and Italy. For complete performance and application data, write to:

CLARK BROS. CO. DIVISION, *Dresser (Great Britain) Ltd.*
197 KNIGHTSBRIDGE, LONDON S.W.7



WEIR-CLARK multi-stage, horizontally-split centrifugal compressors are extensively used in the refining and chemical process industries. These world-famed compressors are built in seven case sizes having from two to ten impellers each. Capacities of 2,000 to more than 150,000 cfm.



WEIR-CLARK motor-driven compressors are available in two, four, six and eight cylinder sizes. These units utilize the balanced/opposed design principle for vibrationless operation. They are widely used throughout the refining industry and as industrial air compressors in general industry.

no, Christmas isn't what it was

We must, must we not, regret the passing of the traditional tranquility of Christmas at home. The march of progress has trampled tradition into our neo-Wilton nylon carpets and erected T.V. in its place. But there is, *there is* one consolation. Whilst Christmas at home may have lost its calm, its chaotic effect on your business is rapidly lessening. No reason now why you can't close your business for two or three days, without any danger of ulcers. Raise your glass then (we'll join you) to business machines, which take care of routine, keep paperwork in its place, and never demand a holiday. As BULMERS have been saying for many a month, they *do* let you take time off yet still keep full control. A Merry Christmas to *all* business machine users.

MODERN INDUSTRIAL BUILDING FOR SALE OR LEASE IN HAMBURG'S FREE PORT AREA

(No Customs Duty)

Built 1956. Area of 25,825 sq. ft. has been leased by the City of Hamburg to present occupier until 1986. Extension possible. Favourable rental.

Building has waterside access and railway connection of free port railway.

The solidly constructed building consists of:

Ground Floor Workshop approx. 4,304 sq. ft.

Storage space approx. 3,980 sq. ft.

Office space approx. 807 sq. ft.

Cloak-rooms and washing rooms approx. 1,010 sq. ft.

Toilets and corridors approx. 885 sq. ft.

Heating plant room approx. 205 sq. ft.

1st Floor Personnel recreation room approx. 1,720,1,820 sq. ft. (Canteen, etc.)

Rooms are well lighted. Modern oil firing plant incl. large-scale hot water installation. Storage room has DEMAG hoist running on steel frame structure—carrying capacity 750 kg.

Building is in very good condition and is to be sold with complete equipment (also works machinery) at a favourable price.

Available at short notice.

data processing

DE LA RUE BULL

There's an important new name in data processing. It is the result of an Anglo-French alliance between The De La Rue Company Ltd. of London and Compagnie des Machines Bull of Paris. This agreement makes available throughout the British Commonwealth a comprehensive and fully-proved range of punched card and computer equipment for commerce, industry and research.

THE RANGE OF EQUIPMENT

The equipment ranges from simple card punches, sorters and tabulators to large-scale electronic computing systems capable of handling the most complex data processing operations. All are designed for use with sterling currency.

THE DE LA RUE COMPANY LTD.

A famous name for nearly a century and a half, De La Rue have diversified interests which include stamp and banknote printing, stationery, 'Formica' plastic products and Potterton heating equipment.

COMPAGNIE DES MACHINES BULL

Founded in Paris in 1931, it is today the largest organisation of its kind in Europe. Installed all over the world, Bull machines are compact, self-contained units planned for individual operation or for use in comprehensive systems.

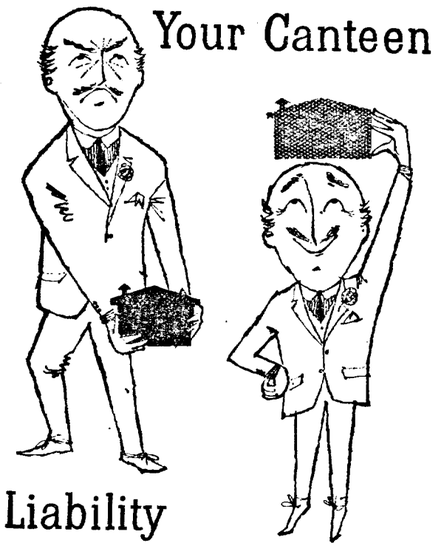
Your Canteen Liability or asset?



UNLESS your trade happens to be catering, unless you have a large and expert organization designed to supply, prepare and serve good food economically, the chances are that your canteen turns out indifferent food, causes a great deal of worry.

This is the simple but valid reason why so many firms—large and famous, small and up-and-coming—have now passed the complete responsibility for their catering arrangements over to the John Gardner Organization.

The first and most important result of this 'take over' is that the food served in the canteen and directors' room improves beyond recognition. Then considerable economies usually follow.

You may have been running a canteen for twenty years or you may be planning to design, equip and staff a new one. In either case helpful suggestions and clear quotations from John Gardner are gladly provided without charge or obligation.

Ask your secretary to write today for our 'Top Management Guide 12 to 2 Planning'.

One of six Weir ELECTROFEEDERS

This unit is one of six large Weir Electro-feed Pumps which are being supplied to the Hydro-electric Power Commission of Ontario, Canada, for their new Richard L. Hearn Generating Station. It is complete with 3,000 h.p. motor and variable speed fluid coupling. Its output is 735,000 pounds (328 tons) per hour, with a discharge pressure of 2,260 p.s.i. When installed, two of these pumps will be working together, with a third as a stand-by in each of the two Power Station Units 6 and 7.
Weir experience of feed pump design and manufacture is at your disposal, and consultation is welcomed on all questions involving power plant auxiliaries.

A new life begins for Northern Brazil

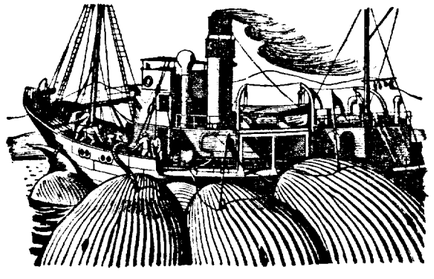
Brazil, once regarded by the outside world as a country of unproductive tropical jungle, has today a rapidly expanding industrial economy. This 'industrial revolution' is well under way in Northern Brazil, where a gigantic new hydro-electric plant is being constructed by the Companhia Hidroelétrica do São Francisco at Paulo Afonso, 200 miles up the São Francisco river. This project will supply power to the region on a scale previously undreamed of in Latin America. Immense difficulties had to be overcome—roads widened, new roads and bridges built, and over 11 million cu. ft. of rock excavated—before the first stage of the project was complete: a 2½ mile dam and a huge underground power station. Atlas Copco rock drills with Sandvik Coromant drill steels were used almost exclusively for these drilling operations, with great success.

The next stage, which involves excavating another 6 million cu. ft., is being carried out with the same equipment. Meanwhile, a new modern town has arisen on the site, anticipated as the nucleus of a thriving industrial community.

Keeping whales afloat

Compressed air is versatile. Atlas Copco provides the means for all its many applications. In the whaling industry, Atlas Copco equipment is used to keep the whales afloat until they can be processed in the factory ship. This is done by pumping air into them under pressure.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.



Atlas Copco puts compressed air to work for the world

For Trade *and* Aid

WHILE President Eisenhower is touring Asia, Mr Douglas Dillon, the American Under-Secretary of State in charge of economic affairs, is touring Europe. Properly handled, this could be a very important visit indeed. It could just conceivably be the exploratory prelude to the most important development in international economics since General Marshall launched his plan of 1947 on that flood tide in Atlantic affairs that has so spectacularly led on to fortune. A main reason why the decade and a half following the second world war has been so different in economic experience from the period 1918-33, for Americans as well as for the rest of us, lay in the fact of General Marshall's initiative. Now everything suggests that a new tide is racing which could determine whether the decade and a half from 1960 to 1975 will repeat the last fifteen years of success, but this time with Europe allied to America as intelligent benefactors and with the poorer countries outside Europe as the immediate recipients.

If—as seems all too dangerously possible—the tide is missed this time, it will be because western politicians are frightened of getting "too far ahead of public opinion." The key, as always, rests with simple folk in Europe and America. The need now is that just as many people in our modern western electorates as understand, say, the complexities of the internal combustion engine should understand also the relatively simple story of the main economic and social problems that are emerging for the sixties and seventies ahead. It is a story with two separate geographical settings, the poor countries and the well-to-do ones, and with two principal themes, finance and free trade.

In the poorer countries the dominating fact for the sixties and seventies is that the revolutions of rising expectations and industrial advance are going to create what might conveniently be called the equivalents of "several new Japans." The problem is to save these new countries from following the same road as their prototype did. When Japan was industrialising itself, it was not enabled to cover the balance of payments deficits, almost inseparable from that early stage of emergence, by ready borrowing abroad; the result was a series of economic crises, including the failure of foreign exchange banks, which helped to destroy the power of its middle classes and to make the pattern of its industry monopolistic and the philosophy of its government dictatorially *dirigiste*. When Japan entered the second stage of its industrial revolution, and became a major exporting power, the outside world did not welcome its cheap consumer goods (as helping to bring down their costs of living) but set up indignant protectionist barriers against them; this helped to make its government nationalist and aggressive as well. *Dirigiste* and nationalist, Japan in the thirties found its way into the fascist sphere; if forced to be *dirigiste* and nationalist, the new industrialising countries in the sixties and seventies are all too likely to fall into the Soviet and communist orbit.

In their hearts, almost all prominent statesmen in the richer countries recognise this problem. By a fortunate coincidence the main features of the current economies of what might be called the free and wealthy half-world—America and Europe combined—have put them into a particularly favourable position to meet its challenge. But by one of the ironies of history each of these features is at present in danger of being mismanaged and misread as an argument that the richest of us must become more cautious and more protectionist instead.

The first feature of America's and Europe's economy in the last fifteen years has been the unprecedented boom by which we have grown richer, and the consequent emergence of price inflation as our main internal economic problem (in place of the former problem of unemployment). The rapid growth of wealth should have made us all more able to help poorer countries, and the preoccupation with keeping down the cost of living should have made us all more willing to welcome the prospect of importing cheaper consumer goods from them. Instead, the tendency in foreign investment affairs (especially in Europe) has been to say that we cannot afford to export capital abroad because there is so great a demand for it at home, and the tendency in general economic management (especially in the United States) has been to tighten financial policy to beat inflation and then to increase protection to help those who are hurt by this tightening. A check has had to be imposed on the rate of industrial growth in order to keep prices down, and then restrictions on various forms of agricultural or textile imports have been imposed to put prices up again. This was the first set of illogicalities to appear.

A SECOND and more recent feature of the rich and free half-world's economy has been the remarkable strengthening of Europe's balance of payments relative to America's. This, again, ought to be a great advantage. A short while ago some people feared that the United States, which already holds half of the world's gold reserves, might tend to run a permanent surplus in any freely trading world, while everybody else would in such circumstances tend to run a permanent dollar deficit; since a country with inadequate reserves cannot for long invest or give away a deficit, the awkward implication was that only the United States might be able to help the poorer countries. Now, however, it has been shown that, at the recent level of relative interest rates, and at least at certain stages of the trade cycle, the flow of investment and aid money out of the United States can considerably exceed its surplus on commercial trade account, so that foreign exchange reserves have been falling in America and rising in Europe for more than two years. This is a sign that Europe could and should finance a larger measure of aid itself, which will be economically welcome and politically healthy. But, once again, the opportunity may be mishandled into being a misfortune, for America may run down its aid programmes before Europeans get theirs started; and the unusual spectacle of the weak dollar has even impelled some Americans into the absurdity of saying that the richest country in the world needs to impose new restrictions against imports in order to protect its balance of payments.

The third recent feature of the free world's economic scene has been the growth of regional free trading ideas in Europe, arising originally from an urge towards greater political unity among the six countries of the continental common market. Yet again, this is a development which ought to have helped the whole free world's economy to move in the way that it needs to be going. Free trading ideas, like measles, are apt to be contagious. Certainly an advance to liberalism has been the reaction in the rest of Europe where the seven nation free trade area has now been formed, and where a dramatic change now seems likely to come over the thinking of big business. A short while ago any British businessman calling on the Board of Trade was most likely to be clamouring for protection for his industry; now he is just as likely to be pressing for a scheme of freer trade, because he fears what may happen to his markets in France when the Germans can sell there over a lower tariff wall.

No doubt German businessmen calling on Dr Erhard will be expressing the same apprehension about British competition in Scandinavia. It is reasonable to suppose that similar pressures towards liberalism may grow in America, but the danger is that the initial reaction may be the other way; if European countries reduce tariff barriers against each other but not against America, then the American authorities may come under pressure actually to increase tariff or quota protections in their own country as a "defence against discrimination." This idea that it is logical to react to increased competition with one's exports by putting up the duties levied on one's imports belongs wholly to the era when unemployment was the capitalist world's abiding economic problem, and when price inflation did not exist.

The fourth feature of the economies of the western half-world since the war has been the growth of central planning and planners within them. There are now an unprecedented number of politicians, dons, civil servants and bankers who are regarded as being quite capable of going out to Timbuctoo and recommending what should be its level of real investment in five years' time and for what level of balance of payments deficit it is then likely to need finance. At first sight, the availability of these gentlemen should be a great help in the West's task of getting Asia and Africa on their feet. But the trouble is that their long-term estimates are almost invariably wrong, as indeed the most expert forecast of even so well-documented an entity as, say, Britain's probable balance of payments in 1960-61 is equally likely to be. The result is that foreign investment and aid programmes have started to be based on rigid annual votes and preconceived "plans" which become totally out of touch with emerging international opportunities and needs; and when national parliaments start to cut back these preconceived annual votes they almost always do the cutting for false emotional and political reasons.

BY far the best step now would be for America and Europe to vote their annual aid funds into some widely-based central organisation, perhaps linked with the OEEC, which could distribute the money flexibly among under-developed countries as needs arose and changed; no doubt some of the money must be earmarked for particular investment projects, but the organisation's main aim should be to keep in being a sort of revolving overdraft fund on which developing countries short of foreign exchange could draw, provided that their own internal economic policies were not the obvious main cause of their exchange shortage. National parliaments in the western countries should be kept as far as possible out of the business of determining day-to-day distribution of these funds. A much less sensible advance would be for each country to start setting up Eximbanks of its own, making tied loans to help its own exporters in a new wave of discriminatory trade offensives masked as aid.

There, then, is the nature of the present watershed. The ideal outcome of Mr Dillon's voyage of exploration would be the formulation of plans:

(a) to establish a new central fund for distributing Americo-European aid to Asia and Africa on a flexible system (delegated to the managers of that central fund); and

(b) to start extending the tariff cuts now being made within the two western European groups into a concurrent and wider (though no doubt initially less rapid) liberalisation of European and American tariffs and quotas in trade with the whole world.

The worst outcome would be if the opportunities now presenting themselves were somehow mishandled into becoming excuses for retreats by America into greater protectionism and unilateral cuts in aid. The most probable outcome, no doubt, is something between the worst result and the best, with some new mechanism for "co-ordinating" western aid programmes (but not for pooling or dramatically increasing them) and with new expressions of intent about liberalism in trade policies (though not where there are special interests whom liberalism would really hurt). But the prospects for humanity in the next two decades could be transformed if only there were to well up now a logical, pulsing demand from western electorates that only the best way forward is good enough.

Leap in the Light

Those who say that reformers have nothing to campaign for, because all the old reforms have been carried out, talk nonsense. Now, as half a century ago, more education is the nation's most pressing need

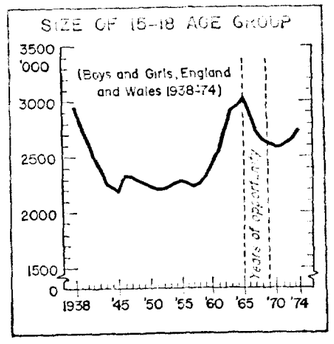
NOBODY now denies that Britain must become a far better educated nation; three party manifestos said as much two months ago. What has been much less certain is the pace, timing and proper order of the reforms which politicians can be pinned down to accept, and so to afford. It is the invaluable contribution of the report of the Central Advisory Council on Education (England) published this week, that it suggests what these should be, and sets out a specific long-term programme on which a start could, and should, be made in the New Year. In the words of the report*

> Nothing of this sort has hitherto been possible in English education. There has been no lack of aspiration, or the definition of objectives; but the attainment of them has been left to the mercies of the parliamentary timetable and of financial exigencies . . . there has not been support in public opinion for anything more. . . . [But] it should not be difficult to convince the public that there is as much need for a twenty year programme of educational development as there is for similar programmes of railway modernisation or of atomic generation of electric power.

The bulk of such a programme must be for young people aged 15 to 18, the age group with which the council was directly concerned. At present half of these have done with education altogether at 15; a quarter get some kind of further education, mainly part time and vocational and usually limited; and another quarter stay on in school for some time after 15. But only 10 per cent of the nation's youth are still in school at 17, and only a derisory 3 per cent reach universities. The council proposes that the country should advance, stage by stage, until by 1980 nobody is completely out of touch with education before 18; about 50 per cent of those between 15 and 18 will then be spending at least half their time in school or in further education, while the other 50 per cent are getting full time secondary education—a fourfold increase on present performance.

One motive for this bold prescription is social and personal: most people with money to spare would not wish that their own children, however dim-witted, should cease education at 15; and there is no reason in equity why poorer people's children should cease it then either. The other motive for the advance is national and economic: nothing less will suffice to staunch the present sorry waste of young talent.

With the guiding philosophy of the report *The Economist* is, not unnaturally, in agreement; the chairman of the council is the recent editor, and present vice-chairman, of this paper, who has educated those who serve the paper's present editorial tradition in their attitude to educational policy, and to much else besides. Before anybody questions the practicability, as distinct from the obvious desirability, of the programme, he should keep the profile of the teenage population over the next fifteen years firmly in mind. The picture will be of a peak of numbers towards which we are now starting to mount, followed by a valley, followed by another peak whose height cannot yet be assessed. Whatever plans are made for education, this profile (reproduced in the accompanying chart) is the fixed topography of the battlefield. It is obvious that, if a big push forward is to be made, the years of decline into the valley—1966 to 1968—are the years in which to make it; and the years 1960-65 are the years in which the forces must be mobilised, bearing in mind the time it takes to train teachers and teachers of teachers, and to build schools and colleges. Today's bulge is tomorrow's extra teachers: a German witness said to the council "we envy you your bulge." The council proposes that the opportunity be seized to make the biggest possible single step forward—the raising of the minimum



* *15 to 18*: Report of the Central Advisory Council for Education (England), Vol. I (Report) HMSO, 12s. 6d.

school leaving age to 16—some time between 1965 and 1968. Politicians must be brought to see that if the leaving age is not raised during those years, the following new upsurge of teenagers will make the advance impossible in our lifetimes.

This is the decisive step that determines most of the programme (a summary of the council's recommendations is given on page 1047). It is the practical means towards the council's wider end of a properly educated nation. It is, as the council propounds it, a step which would raise the legal leaving age for some not merely to 16, but to 16½. The council wants there to be only two leaving dates (Easter and July) in each school year, instead of the present three ; this is to ensure that the last year in school is not ruined as now by the attrition of a dwindling class. The council suggests that a local examination for a leaving certificate in the summer would encourage the brighter pupils to stay on even if they could " legally " leave at Easter, while the duller or more restive could leave a term earlier to get jobs before the brighter half invaded the job market, which might not quickly digest them all in one gulp. (This sensible change for the last year at school could be made during this Parliament, in order to improve the present secondary course, even while the leaving age remains at 15.) The council estimates that, simply to raise the leaving age in 1965, 21,300 extra teachers would be needed (with a ratio of one teacher to 17 pupils, or 19,100 to secure the maximum tolerable ratio of 1 : 19). But this increase would be in addition to the extra teachers who would be needed in any case to reduce the size of class ; in all, between 50,000 and 70,000 teachers would be needed in addition to the present 260,000.

To bring every class right down to the regulation limit of no more than 30, even more teachers would be needed. Some people would give that aim precedence over the extra year at school. The council, implicitly, does not agree ; and its reasons for preferring a longer school life are powerful. A rise in the leaving age would at once incite young people to stay on longer in sixth forms and in " extended courses " in modern schools, and to take GCE by the thousand more. It is utterly wrong to think (as so many dons do) that the ability is lacking. The report drives this point home with a telling census which the council arranged. This showed that half the national service recruits to the army who were rated in the two highest ability groups had left school at 15 ; among children of manual workers two-thirds of those in these groups had done so. But for the accident of birth, twice as many children could have taken GCE last year, plenty of them at A level ; and many could have gone on to compete successfully for places at the universities.

THIS is the overwhelming argument against resting satisfied with the present growth in the numbers voluntarily staying on at school for an extra year. Voluntary extension of education works too sluggishly. Parents who have not themselves stayed on are too slow to let their children do it. To make the extension compulsory will urge another echelon of young people to aspire to, and to achieve, higher education eventually, as well as giving them more secondary education now. The numbers, the economics and the opportunities of sixth forms in all types of school will improve—though the problem of the university bottleneck will no doubt get worse until new prescriptions prevail there, too. The implementation of the 1944 Act's scheme for county colleges (i.e., part-time compulsory further education) thus should not in logic precede, but should follow from and be made acceptable by, the raising of the leaving age. The latter is the flywheel that will impart momentum to the whole plan.

Nowhere is this truer than among the half million teenagers in the " second quartile " of the nation's brains, to whom the council devotes so much rightful and humane attention. It is convinced that this group, broadly speaking the top third of those who just fail the eleven plus, contains a reservoir of unused capacity—including, it insists, capacities which, though not verbal, are just as valuable as the more intellectual. The council's firm belief is that an extra school year at this level—in the improved modern school streams which it prescribes—will surely yield increasing, not diminishing, returns. Its objective for this " second quartile " is " to transform what is now a varied collection of plans for vocational training into a coherent national system of practical education." The report itemises the heartbreaking waste and discouragement of talent which the " evening class " system perpetuates ; and it calls for a longer and better school course integrated into a proper system of day-release and full-time sandwich-type courses that should not overstrain the young mind. This will need not only more teachers, but also more enlightened employers. Employers who have been crying out for better technicians are now offered a working blueprint for getting them ; the lack of this hitherto has been the most charitable excuse for their backwardness.

This is the programme. There are eight years at most to mount it. Can it be done ? Financially, there is no need to blench at the Crowther proposals. The council reckons that the total social cost when the programme has been mounted (i.e. the loss of young workers' output plus Exchequer cost) should not exceed £250 million a year. The education estimates might rise by 15 per cent or more, but by 1965-68 the national income should surely also have risen by at least that proportion. If the finance is so well within what we ought to be able to afford, it is hard to believe that the teachers cannot be found, too. The council itself is more worried about quality than quantity: naturally, for the demand is for teachers of sixth forms and of upper modern school forms—and the better the teachers, the more sure the benefits that the report aims to harvest. But it would be pusillanimous to reject the plan on anybody's objections that " there will not be enough good (or graduate or first-class honours) teachers." This would be like surrendering at the start of a war because one's officers looked rather a scratch lot. Battle improves them. This is not a leap in the dark that has been proposed to Sir David Eccles and the nation. It is a leap in, and into, the light.

Nato in the Thaw

As the Mulley report says, the West's true interest lies in the development of Nato's all-round strength

DECEMBER brings puddles and Nato muddles. Disarray in the alliance, and the acceptance of disarray, are normal. This may persuade the ministers arriving in Paris for their council meeting on Tuesday that normality is what divides them least. The ministers are only human. The political pressures behind them do not encourage new commitments. There is no visible western electorate concerned to put new thought or new money into Nato's military readiness. If the ministers believe they can get away with normality again this year, the likelihood is that they will. They may even feel satisfaction that nothing worse has come about.

After all, why worry, this December of all Decembers ? There is no crisis: Mr Khrushchev has not moved in Berlin. There is less apparent prospect of war in Europe in the next year than at any time in Nato's existence. The western big four are meeting next Saturday. They will send Mr Khrushchev their ideas on the time, place and agenda for the summit. Even then no one can be sure that the summit will be in April (even Mr Macmillan is not sure nowadays), or indeed that it will happen at all before there is a new President in the White House. Why hurry ? The Nato ministers are going to mull it all over. They will find, as they always do, that things are not quite as bad as they seem, or as the papers make out.

General de Gaulle may have said something at the Ecole Militaire, but France is not going to leave Nato tomorrow. Mr McElroy may have talked about cutting the American military commitment, but the United States is not going to pull out of Europe this year or next. Nato may not have enough troops on the ground, but the American nuclear deterrent is still there, backed by the British one ; and even the British deterrent is not derisory now. These arguments are all perfectly fair, if they are what the ministers are anxious to hear. After the familiar reiteration they can emerge, if not entirely content, at least comforted ; and Nato will soldier on.

If this is what happens in Paris next week—and, failing an unexpected United States initiative in looking to the future, it is what will happen—one or two simple things fall to be said. Nato can be any kind of an alliance in its second decade that its members want it to be. It can lend itself to any gimmick they choose to think up, from the joint exploration of space to the distribution of economic aid, if that is the way they prefer to keep it alive. But Nato began ten years ago as a military alliance ; it is still essentially that today. If its members think that the strategic balance in central Europe is now substantially favourable to the West, they can afford to leave Nato to soldier on. If they think that there is a Russian threat but that the best way to contain it is by the formation of independent nuclear striking forces, they should spend their substance on just that, and again leave Nato to soldier on. But they must know exactly what they are doing and why they are doing it.

Nato came into being to deter a specific military threat. Ten years ago this was assessed, as it should be now, in terms of the known Russian and satellite forces available to overrun Europe. The Lisbon (1952) target of 65 divisions, either ready or at one month's notice, was calculated by the soldiers on the basis of experience in the last war that one division in defence could contain three in attack, using conventional weapons only. At that time atomic bombs had barely entered into tactical calculations. The first big change in the equation came when it was realised that the United States had enough atomic weapons and aircraft for these to be used, by bombing communications and troop concentrations, to inhibit the arrival of Russian reinforcements on a European battlefield. The Nato divisional target was then scaled down to 30 or the equivalent ; when Britain actually got its own bombs, it promptly reduced its individual contribution by fully 25 per cent on land and 50 per cent in the air.

The second big change, which Nato is now experiencing, is the arrival of Russian tactical atomic weapons to face the West in central Europe. The present balance of forces reflects the fact that, leaving aside the military possibility of mutual suicide by the strategic use of megaton weapons, the Russians appear to be mounting just as many tactical nuclear weapons as the Nato forces. At the same time, although there are only 20 Russian divisions poised in east Germany, the Soviet Union has not significantly reduced the effective conventional force that Nato's Lisbon target was designed to meet.* In fact, some military experts believe that, though the Russians have fewer men under arms, mechanisation and re-equipment have made them far stronger than they were in 1948. On the western side, not even the revised target of 30 divisions has been met. Most of the atomic capability is being built up, but there are no more than 21 divisions on the ground at best ; the pessimists would say 16 effective divisions in Russian terms. The implications of this imbalance cannot be ignored.

IT is evident that the size of Russian attack that the West is capable of meeting strictly with conventional weapons is now almost minimal. The deterrent effect of the West's tactical atomic weapons is now almost entirely offset by the Russian development of these weapons. In fact, as before 1948, western policy still depends on the understanding that any local, conventional aggression in Europe will be " escalated " to global war. The major political question, which Nato still has to answer, is whether such a policy remains credible in the year 1959 when a Russian looking at the western alliance may begin to calculate that, in some five years' time, it could be so weak and muddled and fearful of atomic war that a quick and successful push on the ground would not bring nuclear retaliation.

If nothing else is done at the Nato council next week, the protagonists of independent defence should be required to explain how their policy answers this dilemma. Does it improve the likelihood of political unity in the next decade ?

* " The Soviet Union and the Nato Powers." Institute for Strategic Studies.

Will it impress the Russians as a defensive strategy? Can the reliance on nuclear weapons ever allow the West to enter disarmament talks with the necessary margin for manœuvre? It is not a sufficient reply that the Russians would never move if there was the slightest possibility that total disaster would overwhelm them and everyone else. It is far more logical to argue that there should still be a local conventional deterrent to limited aggression. Two chances of stopping a nuclear holocaust are ten times better than one. This has been Nato policy up to now: it ought not to be let slip by default.

YET this is what is happening. The Mulley report to the Western European Union assembly has achieved fame because it recommends the establishment of a European nuclear deterrent which, at present, could only come about as the gift of the British government. But the Mulley report is worth reading for what it says on the whole Nato problem. It affirms, quite plainly, that the Nato forces in Europe are still at a disadvantage because "their *raison d'être* has not been clearly defined." Is it impossible to attempt this now? Is it impossible to tell the western electorates that they have a choice in the defence of Europe? Must it be assumed that, faced with the understanding of what outright reliance on nuclear weapons means, the western peoples would necessarily reject such devices as continued military conscription, if conscription were a necessary safeguard against nuclear warfare? It depends, as ever, on how much the West is really prepared to give up for its security. The answer ought not to be prejudged.

The Mulley recommendation on a European deterrent has been injected into this debate, perhaps a trifle artificially. But it is there now, for Nato as well as WEU to take into account. If it is not the British government that has played this card, at least the impression has got round that the card is in the British hand to take one trick or another. To place the British deterrent in European hands might be a real gesture towards the Six. But it would require, as the Mulley report itself admits, a change in American legislation if the transatlantic exchange of nuclear information is to continue. For the moment, it seems unlikely that the proposal would be acceptable to General de Gaulle, for whom political calculations now seem to bulk largest. Should the independent French deterrent prove unexpectedly costly, the Mulley proposal might then become practical politics. But there are other items, besides General de Gaulle's sensibilities, that must be got out of the way first.

Action of the kind urged by the Mulley report as a whole to prevent the disintegration of western military unity is to be recommended. Even without France, there are steps towards the integration of conventional forces, including the present efforts to develop a common Anglo-German tank, that are both militarily and economically wise. But the nuclear problem is of a different calibre. If the Mulley plan were to mean anything at all, it would have to allow all the European allies, including west Germany, a say in the manufacture and delivery of nuclear weapons. This is, in the light of the present Russian interest in general disarmament, a recommendation of despair.

The coming talks with the Russians may show more clearly what the prospects for a general arms settlement may be. These chances should not be disrupted now by any new proposal to give nuclear weapons to west Germany. The hopeful atmosphere may change as a result of Russian action or inaction in the next months. If that happens, the argument for the Mulley proposal will be much stronger, if only as a device to reduce the number of independent nuclear powers. But at exactly the time that hope of effective disarmament may have to be given up, it will be all the more necessary for Nato to adjust its ideas on the strength of the conventional forces needed to contain any Russian pressure from the east. In this sense Nato will be wise to plan for the worst now. It would not take too long to hand over the British deterrent to a European authority; it will take years to lift Nato's conventional forces to anything like an effective force to balance the Russians. Now is the time to worry about it.

India and America

Mr Nehru and Mr Eisenhower have met against a startlingly changed background. Whatever follows, their meeting must in itself hearten their two countries' friends

HOW times change. The President of the United States is hailed in Delhi as "a messenger of peace" as he rides in on a flood of pledges to work for world disarmament. The Prime Minister of India is reported to be particularly anxious for American assurances of support against the aggressive tactics of communist China. One has a sense of having stepped with Alice through the looking-glass; everything on the other side is familiar, but the opposite way round.

Since Mr Nehru and Mr Eisenhower last conferred, almost exactly three years ago, much has indeed changed. In December, 1956, their closest bond was their solidarity in opposing the Anglo-French attack on Egypt. That, for all its importance, was a somewhat isolated episode. The Suez conflict provided only a temporary bridge between Delhi and Washington, whose general relationship at the time was distant and dogged by misunderstanding. True, substantial American aid was already flowing to India, which has by now received about two billion dollars' worth of it—more than the sum of all Russia's outlays on aid to non-communist countries. And through all vicissitudes there have been good friends of India in the United States, and vice versa. But on almost every practical question of policy the world's two largest democracies were, until quite recently, opposed, and resentful of each other's opposition.

India, uninterested in the fate of Europe, and feeling quite snug in the shelter of the Himalayas, had only two real international aims. One was to keep the leadership of the Asian-African campaign to liquidate the remains of colonialism; the other, to consolidate the new Asian freedom from western dominance by forging links with the communist powers, under the co-existentialist banner of *panch shila* and, in the case of China, under that of Asian solidarity and the spirit of Bandung. Americans, on the other hand, were giving top priority to the buttressing of their new allies and of other states in both Europe and Asia that felt exposed to communist pressure. Dispute was inevitable.

Indians suspected the United States of supporting the position of its Nato ally, Portugal, in Goa. They disliked its allies and clients in the Far East, and could see none but the most sinister reasons for its protection of Taipeh against Peking. The Seato and Baghdad alliances were to them a veiled form of neo-colonialism and a provocative intrusion into an Asian sphere which they wanted to see left out of the cold war. They particularly resented American military aid to Pakistan, and rejected all disclaimers from Washington of any intention of strengthening Pakistan's hand in the Kashmir dispute. Most of them agreed with Mr Nehru's sweeping denunciations of the whole idea of military alliances anywhere in the world; and when they did so, they thought only of the West's alliances, never of the Sino-Soviet alliance of 1950, which was in fact the first intrusion of a military block into the "Asian sphere of peace."

For their part, Americans regarded Delhi's denunciations as patronising and ill-informed. They felt, with some justice, that India was blind to the threats to western Europe and Asia against which they had hastily thrown up dykes in the form of alliances and military aid programmes. They found (as, indeed, did many Indians) Mr Nehru's equivocations about Hungary hard to stomach. They asked whether, after the experience of Korea, it could be seriously suggested that they should leave in the lurch any other small state that appealed for protection. They remarked sarcastically on India's firm military grip on Kashmir and its pious preaching of non-violence to everybody else. Much American feeling was summed up in a cartoon that showed a Krishna Menon-like figure ranting into a microphone, while another Indian worried: "Unless they give us more aid, we shan't be able to afford to put out any more propaganda against them."

INDIAN and American politicians are alike in being unusually lavish with impromptu comments on other people's affairs, often couched in rather aggressively moralistic tones. (There has been less friction of this kind since the death of Mr Dulles, and Mr Nehru has lately been struggling to restrain himself, though he dropped a brick of old-fashioned dimensions on German toes only last week.) Both India and the United States in practice enjoy the commonsense benefits of mixed economies; but Indians love to talk socialism to a degree that often frightens Americans, who, although they already have more of it, hate to use the word.

The meeting at the highest level three years ago in no way disposed of these controversies. Indeed, it was quickly followed by the further involvement of the United States in the Middle East, by way of the Eisenhower Doctrine and fuller participation in the Baghdad pact. Neither the American intervention in Lebanon in 1958, nor India's gleeful reaction to Baghdad's withdrawal from the pact, nor the seizure of power in Pakistan by the soldiers whom America had equipped, improved the relationship. Even today there are obviously many outstanding points of dispute: in Laos, for example, Indian and American differences of approach have been newly illuminated; at the United Nations assembly, India is a prominent champion of communist claims to the Chinese seat, the east European seat in the Security Council, and the presidency of next year's assembly session. But these are not being allowed to mar the great reconciliation of 1959.

THIS reconciliation is not just the product of China's jackbooted suppression of the Tibetan rising and occupation of Indian border areas. Before those events, Americans were already rapidly awakening to India's lynchpin role as free Asia's most stable democracy and most competent user of development aid. Soon after them came Mr Eisenhower's dramatic embarkation on his present course of personal diplomacy. Mr Nehru is now in a position to claim, as he claimed on Tuesday, that the great powers are at last carrying out the policies he had long urged upon them. Mr Eisenhower can likewise enjoy the thought that India, at last faced with a direct threat on its own frontier, can now see more clearly what has been preoccupying the West for the past decade.

The President will hardly be tactless enough to draw attention publicly to the fact that the Indian Prime Minister has in effect just proclaimed a Nehru Doctrine for the protection of Nepal and Bhutan; or to the ironic echoes awakened by Mr Nehru's insistence that he cannot agree to a "summit" meeting with Mr Chou En-lai without adequate preparation. There is no question of this meeting affecting either India's policy of military non-alignment or America's pledges to the allied nations which Mr Eisenhower has included in his tour. Nor, except in the most general way, can the Delhi talks do much to carry forward the plans for economic aid for India's third five year plan which are already under discussion in less exalted quarters. Mr Nehru cannot well admit publicly that his country is involved in a crucial economic rivalry with China; nor will he personally make any request for more American aid.

Great delicacy will also have to be used if Mr Eisenhower's visits to Karachi and Delhi are to have a beneficial effect on the familiar Indian-Pakistani ruptures, which have lately shown so many signs of healing. It would be a splendid thing if these visits led at last to an agreement on the re-distribution of the Punjab river waters; this would be a major breakthrough in the economic struggle in southern Asia. But if the visit yields no immediate and tangible results at all, there should be no cause for recrimination. A warm embrace between India and America has in itself enough meaning to hearten both nations—and all their friends.

NOTES OF THE WEEK

MR EISENHOWER

All to All

To be all things to all men, while hurtling half-way across the world in a riot of ceremonial pageantry and popular enthusiasm, is an astonishing feat—and so far Mr Eisenhower seems to have handled it most featly. In Rome his call on the Pope, despite the delicate historical relationship between the Vatican and the American presidency, went off in a comfortably relaxed, indeed in a homely (using the word in its British sense) atmosphere. President Gronchi was given some moral support for his forthcoming trip to Moscow, while the Italian government, which has shown little enthusiasm about that expedition, was reassured about Italy's place in the pattern of future negotiations in general.

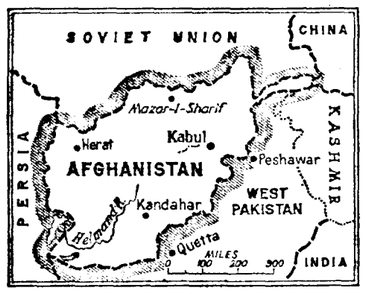
In Turkey, Mr Eisenhower found himself in a country directly bordering on Russia for the first time since he went to Korea immediately after his election to office seven years ago. The Turkish welcome was heartfelt, but his hosts' attitude to his hopes of an east-west *détente* was expressed, with characteristic forthrightness, in the phrase "peace but no concessions." And so to Karachi, where the military government had a well drilled and even more spectacular reception waiting for him. Here Mr Eisenhower was the guest not only of an ally, but also of one of the underdeveloped countries that look westward, with undiminishing expectation, for help in getting their economies through the stage of "take-off" into self-sustaining progress —an expression which Mr Nehru was using in Delhi while Mr Eisenhower was conferring with President Ayub Khan in Karachi. The reluctance of the United States to become involved, unless in the unexceptionable role of fairy godmother, in any of the issues that divide Pakistan and India, or Pakistan and Afghanistan, is clear enough. But there is much that a fairy godmother can do, in the course of executing her recognised duties, to divert her beneficiaries' attention from old feuds to new horizons; and President Eisenhower shows every intention of proceeding on these lines, whether in Karachi, Kabul, or Delhi.

AFGHANISTAN

Up in Central Asia

The most important mosque in Kabul looks more like a Russian Orthodox church than a place for Moslem worship. Built long before the recent surge of Soviet interest began to change the face of Afghanistan's capital city—it still reminds visitors from the south and west that they have passed through Arab and Persian lands and are in central Asia.

For long a buffer state between Russia and India, Afghanistan has emerged from its neglected international position of the past and taken its place among the sought-after neutrals. The competition between the Soviet Union and the United States has, for all practical purposes, been won by the Russians. In the northern reaches the Russians are busy building the strategic roads they dreamed of long ago but could not build because it would have annoyed the British rulers of India. The high mountains of the Hindu Kush no longer mark the southern limits of Russian activity. The Afghan army and air force are equipped



with Russian weapons and planes; the streets of Kabul are paved with Russian asphalt, and Russian buses run on them.

Revolution has not come to Afghanistan. A government largely composed of the king's relatives rules with an iron hand over sometimes unruly groups of tribes. But the ingredients of revolution are there—a ruling clique jealous of its privileges, an army becoming aware of its potential power, and the examples provided by none-too-distant neighbours. For these reasons the government may be trying to regain the balance between East and West that it enjoyed in former times and now appears to have lost. If this is so, then President Eisenhower's decision to pay a short visit to Kabul this week, on his way from Karachi to Delhi, was wise. As for the Afghans themselves, it is hard to find out what they think. In a charming but maddening oriental way they tell the Americans of their dislike of Russians, and the Russians how much cleverer they are than those people from the United States.

RUSSIA AND INDIA

Another Presidential Tour

MR EISENHOWER'S visit to New Delhi will be followed not long after by another presidential visit: Marshal Voroshilov, titular head of state of the Soviet Union, who had to postpone his journey because of illness, will be going in January. Admittedly a president of the presidium of the Supreme Soviet carries little effective weight in the Kremlin. The ageing marshal is something of a figurehead. But, to add significance to his Indian tour, Marshal Voroshilov will be accompanied by two important assistants, Mr Kozlov and Mrs Furtseva.

Mr Frol Kozlov is both a member of the party presidium and one of the two deputy prime ministers (Mr Mikoyan is the other). It was Mr Kozlov who went to New York in June for the opening of the Soviet exhibition. He is a specialist in industrial matters. Thus he will be able to talk in New Delhi about Soviet aid for the Indian five-year plan; and if agricultural questions crop up, he can call on his ambassador there, Mr Benediktov, who was once minister of agriculture. Mrs Ekaterina Furtseva, the only woman in the inner Soviet leadership, has thirty years of party work behind her and is reputed to enjoy Mr Khrushchev's particular confidence.

The importance of the delegation shows that the purpose is not purely ceremonial. Mr Khrushchev, like other people, is aware that a *détente* in Europe will, if anything, render the competition for influence with the neutrals keener than ever. By the pains he took to preach conciliation in the Sino-Indian frontier dispute, Mr Khrushchev has shown that he does not want his Chinese partner to throw away the Bandung card. The Soviet delegation to New Delhi will not only be out to repair any inroads Mr Eisenhower may have made on the Indian consciousness; it will also have to undo, as far as it can, the damage done by Russia's Chinese friends.

CENTRAL AFRICA

Next Best Thing?

MR GAITSKELL'S fervent bad judgment duly carried the Labour party last week into refusing to nominate members to the Monckton commission; and Sir Roy Welensky's fears (and other people's hopes) that men like Mr Bevan and perhaps even Lord Attlee might be allowed to come poking their noses into his Federal backyard are now ended. A boycott of the commission by African leaders and parties, both in and out of prison, seems certain to follow. In these depressing circumstances the Government's worst course (although some people suggested it) would have been to "balance" the absence of Labour privy councillors by not appointing any Conservative privy councillors either; this would have left the commission far too predominantly Rhodesian. It is arguable that the best course might have been to go to the other extreme: to revoke the appointment of the unofficial British and Rhodesian members already announced, and to send Lord Monckton out alone to the Federation (if both he and Sir Roy would have consented to the change; probably they would not have). But, all things considered, Mr Macmillan may have done the best he can by adopting a third and middle course. He has appointed three (generally left-of-right) Conservative ex-ministers to the commission; and he is now presumably hunting around to find three right-of-left "unofficial Labour" men of good will who will see the sense of ignoring the Gaitskell ban and make up the membership of the full commission.

If the Government is wise, its next step ought to be the widespread release of African detainees, including Dr Banda, before the commission sets to work. Even if this can be done, it would be idle to suppose that the commission can now start with a fair wind behind it. Yet one warning should be issued, both to white Rhodesians and the Labour party. The exaggerated outcry that the commission is now packed with federalists and settlers who will bring in a verdict for continued federation, and in the form the United Federal party demands, seems to overlook that similar objections were raised against the parliamentary mission to Malta in 1955 and the East African Royal Commission; yet from both came recommendations that were quite surprisingly radical. The way in which this commission has been born would seem likely to constrain it to a more liberal approach than many people expect; its findings should not be prejudged by anybody who does not want to run the risk of eventually looking very foolish.

LABOUR PARTY

In Search of Words

AFTER the shouting will have to come the drafting. Next week's meeting of the Labour Party's National Executive may give a glance at the two points on which Blackpool's orators were agreed—to open coffee bars, which would attract youth by dispensing jive and moral issues, and to make some public show of dressing down the "little Cæsars" on Labour local councils. But it will presumably also have to start coming to grips with the question of what to do about the party's constitution. One point that must be decided at the outset is whether there is to be a "party royal commission" to look into all parts of the constitution, including the party's peculiar structure (as the newest member of the executive, Mr Wedgwood Benn, has been advocating) or whether attention is to be concentrated on the rephrasing of the fundamental aims.

What the Crowther Report Recommends

1. Raising of the School Leaving Age to over 16 (see page 1041) sometime between 1965 and 1968. Pupils whose sixteenth birthdays fall in Sept-January would be free to leave school at following Easter, the remainder in July. The secondary modern schools' "extended course" to be adjusted to a 4¾ year basis, with a final term of special preparation entitling the leaver to a *leaving certificate*, based on a "formal assessment" or possibly a local—not national—examination. The council was divided on *awkward cases* (e.g. pregnant girls). The majority would make no special new provisions for these; a minority report proposes they be allowed to leave school before 16, but to remain as educational wards of the local educational authority, whose prescriptions for work or apprenticeship, etc, would be legally binding.

2. County Colleges (=one day a week further education to 18 for all school leavers as planned in the 1944 Education Act) to be developed *after*, not before, raising of the school leaving age because (a) if they were developed before the leaving age was raised the age groups involved would thereafter have to be adjusted, (b) more building would be needed for the colleges than the schools, (c) an extra year full-time would make later part-time work worthwhile but not the converse.

Meanwhile the Minister should *reaffirm his intention* to implement the County Colleges scheme eventually and to plan (for the late sixties) a *regional compulsory pilot scheme* to try it out. This would re-energise the growth of part-time release for general education purposes, which now wilts.

3. The Secondary Modern Schools (including the "modern streams" of comprehensive schools) should not be warped in development by concentrating on their small examinable minority who can attempt GCE. External examinations on a regional basis for those pupils (about one-third) who could take an examination below GCE "O" level. Responsibility allowances for teachers struggling with below-average pupils.

4. The Sixth Form (in grammar schools and top streams of comprehensives) will be increased in number by higher leaving age; this will bring into them more pupils who could be harmed by present undue degree of specialisation, under which four-fifths of *boys* have chosen their sixth form course by 13 or 14. Early specialisation therefore to be discouraged. The *principle of specialisation* ("narrow but deep thus teaching pupils to think") is upheld, but the report proposes better use of "minority time" to make scientists literate and arts specialists "numerate." It asks for non-university sixth form courses for some pupils. It lays main blame for the schools' loss of control of their sixth form "education" on the competitive struggle to get into the universities, who have intensified this by their entrance policies. Pressure to enter Oxford and Cambridge sets the pace. This long, analytical section may be described as the "Sixth Form Charter of Rights."

5. Further Education for technicians, craftsmen and operatives (all those not going to universities or institutions of technology) to be welded into a single system of education; a start to be made by reducing reliance on evening classes and extending day-release, providing more time for all courses, and reforming examination requirements. Part-time courses to be replaced later by "college-based" sandwich courses, with full time college "introductory courses." A new "alternative road" of full-time practical education to be introduced for "non-academics."

6. Types of School. The report avoids controversy over what are the best types of schools, but sets out conditions in which comprehensive schools may be introduced. While insisting that "we cannot afford to lose any good school whatever its classification," the council thinks that some grammar and modern schools will not be able to provide all the new courses recommended. It calls for more technical schools or technical sixths.

7. Teachers: The report calls for (a) *a report by the National Advisory Council on the Training and Supply of Teachers about the number of teachers needed to raise the school leaving age;* (b) a campaign to attract university graduates; (c) a "consideration" of "material rewards" for graduate teachers; (d) re-recruitment of married women whose children have grown up; (e) short-service teaching engagements; (f) taking clerical jobs out of teachers' hands; (g) hard-lying money for teachers in bad areas.

It rather looks as if Mr Gaitskell has now resigned himself to the narrower exercise. He will need every bit of support that he can get from the unions in the battles ahead, and they have no doubt indicated that they do not expect to be repaid for their pains by any apparent diminution of their weight in the party's counsels. Furthermore it now seems to have become accepted that Mr Morgan Phillips has won a new lease of life for himself at Transport House. So nothing very much can be expected in terms of reorganisation there.

Therefore, whatever small tidying up is done in other directions, it looks as if the real wrangling is to be over the rival formulations of aims. The Victory for Socialism group has already caucused and decided to come forward with its own formula rather than to stand pat on the original gem about "common ownership." Presumably it will take as literally as possible Mr Gaitskell's protest that the old bald commitment must be misleading because Labour clearly had no intention of nationalising "every little shop." It will suggest some form of wording that will rigidly commit Labour to nationalise every big shop instead. Whatever precise formula it finds the central elements in the party can be guaranteed to react against it, which is a comfort for Mr Gaitskell. But, unfortunately for him, they will react equally against any line of composition in which can be detected the fair hand of Mr Anthony Crosland, who more than any mythical "Frognal Gardens set" (Frognal Gardens is the leader's home street in Hampstead) is now regarded as Mr Gaitskell's really sinister adviser by the men of the centre and the left.

CEYLON

Hanging by a Thread

CEYLON'S politics have been reduced, by a quick succession of events, to something close to chaos. The parliamentary system hangs by a thread. By now, in almost any other Asian country, either the army would have taken over, or a lively brushfire of revolt would have flamed up in the hills. But Ceylon is a tight little island whose soldiers are few and unambitious; and even the most disgruntled politician cannot appeal to a tradition of guerrilla resistance such as exists in Burma, Indonesia, or even India. For the moment, the country remains remarkably quiet—though the quietness masks a mixture of bewilderment, alarm and indignation. It seems just possible that the elections now announced for March 19th will, in the event, be held.

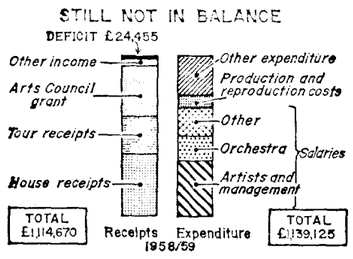
Mr Dahanayake's fast-multiplying opponents have, however, much reason to suspect him of seeking to forestall the voters' verdict. He has summarily dissolved parliament without consulting his cabinet. With parliament safely out of the way, he has dismissed five ministers and reappointed Mr de Zoysa, the finance minister, who had just resigned under a cloud of suggestions that he was connected with the murder of Mr Bandaranaike: he is using the government radio to argue his own case—specifically, to promote the interests of the privileged Buddhist orders on whose support he proposes to found a new party. It is hard to see such a party winning a free and fair election, for anti-clerical feeling has run high since Mr Bandaranaike was shot by a monk. And it is equally hard to imagine the governor-general, the civil servants, the police and the armed forces all putting their weight behind an attempt to impose a regime of bigotry.

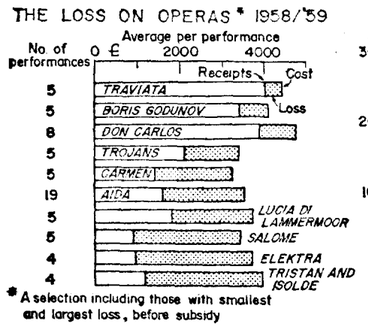
The party which Mr Bandaranaike created and held together, and which Mr Dahanayake has now abandoned, is in utter disarray. On the left, the main Marxist groups are divided by communal as well as ideological rifts. The stage may well be set for a come-back by the United National party which ruled until 1956. Its defeat then represented not only a swing to the left but also a chauvinistic reaction against its leaders' liberal acceptance of western ways of life. Ceylon is a relatively sophisticated country, and three years of turmoil over communal and religious issues seem to have led many people to look more kindly upon Mr Dudley Senanayake's level-headed, if cosmopolitan, notions. But will they be given the opportunity of voting him back into office?

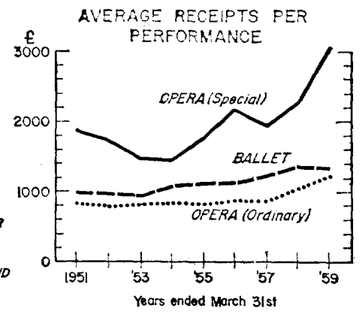
The Royal Opera House

Notwithstanding an increase of £60,000 in the Arts Council grant, Covent Garden was still running a deficit in the last financial year 1958–59, at the end of which its overdraft stood at £183,248.

More ballet was performed last year and average attendances fell, although ballet remained more popular than ordinary opera. But it was the special "international" opera performances at higher prices which were the best attended and these yield the highest revenue a performance.







MR MOORHOUSE

Whose Conscience?

NEITHER Egyptians nor British have any cause to be proud of the circumstances that led, at Port Said in mid-December, 1956, to the death of Mr Moorhouse, a subaltern in the West Yorkshire Regiment. This young officer was kidnapped by an Egyptian resistance group which seems to have been after somebody more important; in the search that followed they had either to take a risk, or leave their captive trussed up and unattended. They chose the second course, and by the time it was safe for them to look at him again, he was dead.

As Mr Selwyn Lloyd said in the Commons on Monday,

> such an occurrence surely cannot be a subject for celebration, however strong nationalist feelings may be.

British people may be pardoned, therefore, for finding the idea of a Moorhouse "museum" in Port Said repulsive. There has been, however, a danger that their reaction might get out of hand. Just when diplomatic relations between London and Cairo are in course of being re-established, this could do great harm; it has done some already. Not all places that call themselves museums, particularly in Mediterranean ports, are state institutions. This particular "museum" is an ignoble piece of private

enterprise, not the child of the Cairo government or of any public body.

Fortunately the odd group in London that planned a counter-museum, ridiculing the Egyptians' conduct at Port Said, has thought better of that idea. It remains disturbing that some of the British public have come as near as they have done, in the past ten days, to a shrill nationalist outburst of a kind they used to be content to leave to less fortunate and more immature peoples. We, the British, need to remember that we, too, have cause for a troubled conscience about Port Said and the death of Mr Moorhouse; can that have been why some of our voices have been raised so loud?

IRAQ

What Parties?

IN just over three weeks Iraq is supposed to return to normal. General Qasim promised the Iraqis in July that by January 6, 1960, the republic would have completed its difficult passage through a transition period. All the paraphernalia of representative government — political parties, elections, a permanent constitution and a national assembly—would replace the military government. There is no sign that the promises, so glibly made six months ago, can be carried out in the spirit in which they were made. The attempt, by assailants still unknown, to assassinate the general on October 7th did not calm Iraqi nerves; nor was his long stay in hospital conducive to the restoration of confidence. On December 3rd he went back to his office at the ministry of defence with every chance of finding that it would take longer to cure Iraq's troubles than it had to heal his own wounds.

Before he left hospital, General Qasim said he still intended to allow political parties to function by January 6th. The parties that emerge then will probably not be recognisable as descendants of the pre-revolutionary groups. There are still members of the old National Democratic Party in the government, but it is doubtful whether they can muster enough support to form an effective party. Nothing can be expected from the Baath Socialists. General Qasim recently said that it was they who were responsible for the Kirkuk riots last June and not the communists who had formerly been accused. The strength of the Baath was never great in Iraq, but it was well organised and at one time received valuable support from Syria—where, however, it is now in eclipse. Of all the party remnants and political factions in the country, only the communists appear to have confidence enough to set themselves up as a party with hope of governing Iraq. Their confidence is justified by the amount of backing they get from those in authority, not from any popular enthusiasm. It looks as if the general may have trouble in convincing anybody else that opposition to the communists is a worthwhile, and safe, undertaking.

LOCAL COUNCIL BY-ELECTIONS

A Liberal Tide?

IT is usually unsafe to draw generalised conclusions from local council by-elections, at which only 2,000 or so people may turn out to vote. But the trickle of Liberal successes at Labour's expense since the general election has now reached a stage where it deserves comment. The best published success was at West Ham last week where a Liberal sensationally broke into Labour's monopoly of the local council: he won by 1,406 votes to Labour's 662 votes (with the Tories getting 339) in a ward which Labour had held by a majority of 171 over the Liberals as recently as May of this year. This followed another Liberal gain from Labour in the previous week in a ward in the Teesside borough of Thornaby, a near Liberal gain in Cheadle (where a former rock solid Labour ward was held by Labour by only one vote), and sharply increased Liberal majorities over Labour in wards at Rochdale and Bradford. The Conservatives also seem to have made some advances in scattered local polls in the last few weeks, although not as notably as the Liberals.

All this does not necessarily mean that people who voted Labour as recently as October 8th are now deserting to other parties in droves. What it probably does mean, however, is that the Liberals in particular are finding it easier to attract to the polls large numbers of vaguely anti-socialist people with a gleeful determination to kick Mr Gaitskell while he is down, while dispirited Labour people are staying away. It may therefore be bad news for Labour that Liberals at West Harrow have nominated a candidate for what is likely to be the first by-election of the new Parliament; if the Liberals displace Labour in second place in this safe Tory seat, it will be a nasty blow for Transport House. Labour's really bad luck, however, is that the second by-election of this Parliament will be at Brighouse and Spenborough where the late Mr John Edwards's majority in October—only 47—was the lowest Labour majority in the country. It is not yet known whether the Liberals will enter a candidate here; generally speaking it is less easy for them to draw support away from either of the major parties in so desperately marginal a seat than it is in a safe one.

Normally, it would be absurd to start paying any attention to short term voting trends so early in a Parliament. But there are two reasons why early parliamentary by-election results may be more important than usual this time. One—as Mr Gaitskell frankly admitted at Blackpool—is that any marked Liberal gains over Labour now could begin to acquire a momentum of their own. The other is that Mr Gaitskell's task in holding his party together would be much easier if early by-elections showed a swing back to Labour (thus restoring his prestige among his own folk as a probable future Prime Minister) than it will be if the Labour vote in by-elections shows signs of falling drastically further away.

NIGERIA

Three Cornered Fight

THE Nigerian federal general election, which takes place on Saturday, will decide which party or coalition of parties will rule Nigeria after independence in October next year, and who will be prime minister. The campaign practically began last summer, but as time has gone on it has become progressively harder—as in some other elections—to guess at the outcome. There are 312 seats, of which 174 are in the Northern region. Earlier this year the betting was heavily that the Northern People's Congress, which is led by Sir Ahmadu Bello, the Northern premier (and to which the present Federal prime minister, Alhaji Abubakar Tafawa Balewa, belongs), would practically sweep the board in the North, and so dominate the Federation. The NPC was expected to gain a working majority by teaming up with the dominant party in the East, the National Council of Nigeria and the Cameroons, led by Dr Azikiwe, the Eastern premier; and the NCNC itself, which then expected to come out of the election rather badly, seemed willing to play the junior partner.

But since then three unexpected things have happened. First, the Action Group led by Chief Awolowo, the Western premier, has mounted a strong challenge throughout Nigeria; it is contesting almost every constituency. Secondly, as a cross current, the Action Group lost the Lagos council to the

AIR SUBSCRIPTIONS TO *THE ECONOMIST*

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

	Airmail	Air Freight*
Australia	£10 6s.	—
Canada	—	$25 or £9

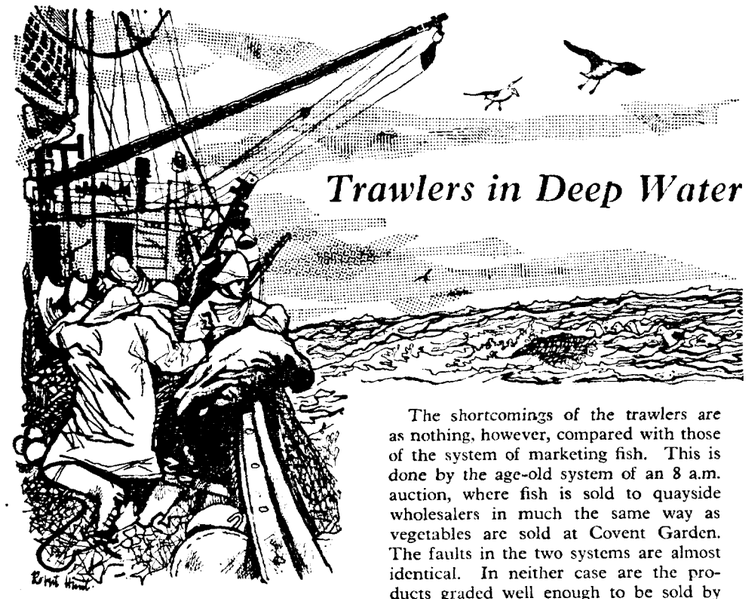
22 RYDER STREET, LONDON, S.W.1

NCNC; this showed that the latter was far from being a dead duck. Finally came the surprising result of the Northern Cameroons United Nations plebiscite, in which the trust territory voted against immediate integration with the Northern region. This was interpreted by many as a sign that the Northern People's Congress, the party of the Emirs, would not win the overwhelming victory which it expected out of loyalty to tradition. It was claimed as a victory by the Action Group; and, significantly, Dr Azikiwe moved away from his love-hate relationship with the NPC and began to co-operate closely with the muslim opposition party in the North, the Northern Elements Progressive Union. Dr Azikiwe was also annoyed when Sir Ahmadu said that Alhaji Balewa would be federal prime minister after the election. The Northern politicians, however, think that, as the radical vote in their region is split between Action Group and NEPU candidates, they will still win comfortably and be able to choose their partners at the centre. There is thus no love lost between the three regional parties, none of which seems to be in a position to win an overall majority. The safest forecast is for a period of acute political manœuvre in the pre-independence months.

SOUTH AFRICA

Casting the Stone

MR ORMSBY-GORE'S answers to Labour criticisms of the Government's refusal to intervene in South Africa's



Trawlers in Deep Water

IN the parliamentary debate that took note of Britain's historic decision to enter the seven nation free trade area in Europe, the main concern of the House of Commons seemed to be with fillets of frozen fish. To many people in the distant-water trawling port of Hull, which your special correspondent visited last week, the industry's concern about freer trade in these seemed wholly reasonable. Things have not been going well for the trawler owners for some time. Their costs have been rising; their catches have been falling; and the British public has given less overt support than trawler owners feel they deserve in their costly battle against Iceland's 12-mile limit. Unhappily, too, every change in fishing technique, as well as in fishing politics, seems to have taken this industry of stubborn individualists by surprise. The design even of new British trawlers is on the conservative side. Their methods of grading and preserving fish at sea are still rudimentary; and their nets are still made of sisal at a time when many people think that nylon is a better bet.

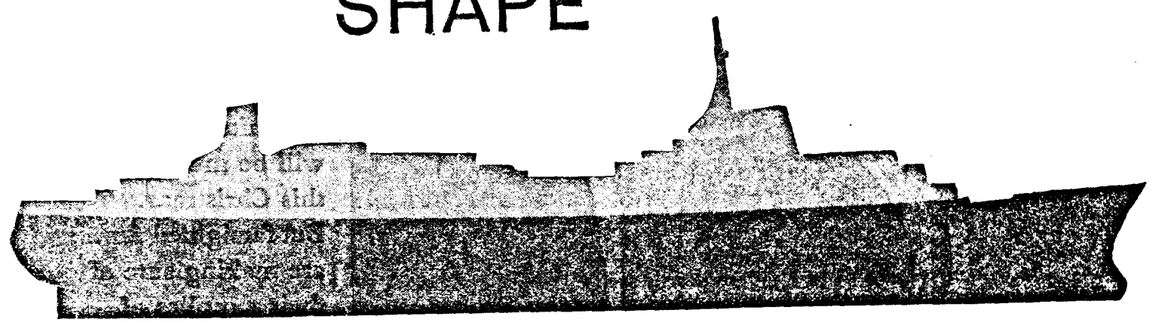
The shortcomings of the trawlers are as nothing, however, compared with those of the system of marketing fish. This is done by the age-old system of an 8 a.m. auction, where fish is sold to quayside wholesalers in much the same way as vegetables are sold at Covent Garden. The faults in the two systems are almost identical. In neither case are the products graded well enough to be sold by sample. Vegetables degenerate during their long wait in the petrol-laden air of London's markets; the fish at Hull, rushed back a day early in new £350,000 trawlers, are then left exposed in metal drums on the quayside until the auction takes place. At whatever time the fish are landed, the auction time is always the same. Especially in summer, therefore, some of the fish are in danger of losing their freshness before they reach the inland markets; and the criss-cross of telephone calls involved in selling the fish wholesale cost one major distributor £50,000 during last year alone.

To improve methods of fish distribution should be neither very difficult nor very expensive, though it would upset the small wholesalers and the "bobbers," the dockhands who still unload the ships by hand and basket. But the owners face another and thornier domestic difficulty —their high labour costs. Work at sea is hard and dangerous, and the average seaman's wage of around £20 a week before tax is not exorbitant by British standards. But the salary of skippers, which averages £4,000 a year and may reach double that figure, does seem high considering that a skipper has to have little special training beyond years of experience on the job. His is certainly the only job, for instance, which enables an enthusiastic and able manual worker who takes some short study courses to be fairly sure of paying surtax (provided he keeps his job) within fifteen years. The reason is that the skipper's pay is very highly geared—as it had to be in the days when fish was won by instinct—to the value of his catch. He gets one per cent of the gross takings plus ten per cent of the net profits; his mate gets another seven per cent of the profits. With the break-even point of a modern trawler at about £5,600 for a 20-day voyage, and with landings typically selling for between £7,000 and £8,000 over the year, the skipper's slice becomes substantial. With fishing done more and more by electronics and less and less by instinct, the piecework gearing may now be too high.

Here then are a formidable array of problems; but the conclusion of the inquiring outsider must be that they are neither insoluble nor soluble only —as the industry likes to think—with immediate Government help. The major lack in the industry today is freezing capacity; sufficient of this would take many years and much money to install. But foreign freezing capacity in plenty could be made available. Norway has a surplus and would be pleased to earn profits by freezing British fish; Iceland is also keen to expand its fish processing industry. Rather than build expensive British capacity, these facilities could and should be used.

Herein lies the error of the British trawler owners' antagonism to foreign fishers. In co-operation with the other members of the Outer Seven they could form themselves into a well integrated industry, whereas now they are forced to ask for protection. They may well have a case eventually for new Government help in constructing ships designed to fish outside the twelve-mile limits if the judgment of next year's conference on the law of the sea goes the wrong way; but certainly not until they have put their wholesale business and foreign relations in some sort of proper order.

A MIGHTY LINER TAKES SHAPE



1000 TONS OF ALUMINIUM in the superstructure of "CANBERRA" enable two or three hundred more passengers to be carried in this new 45,000 ton P & O ship. The owners and builders have chosen aluminium for this, the largest passenger liner bound through the Suez Canal, not only to enable them to carry more passengers per voyage, but also to cut six days off the time to Australia. British Aluminium have already supplied almost 800 tons of aluminium alloy plates and extruded sections to Harland & Wolff Ltd, the builders.

My word! This is a good whisky

Thank goodness supplies of White Horse Whisky will be much better this Christmas. But farsighted families are making sure of their supplies of White Horse now. Our fathers' saying: "You can tell White Horse blindfold" is as true today as ever. Why not put the regular enjoyment of White Horse among your more lasting New Year resolutions?

Send your best Christmas wishes by White Horse

This year there will be a remarkable agreement between one enlightened Santa Claus and another. They will be giving each other the gift they would choose for themselves—White Horse of course. Some may very well be on its way to you. But—just in case—how about a bottle or two to present your compliments to yourself.

domestic policy, during the debate on racial discrimination on Monday, were correct in terms of the exact provisions of the United Nations charter. But Mr Callaghan's frustrated outburst at the end reflected a widespread emotional feeling that they should be right morally as well; and one is bound to feel some sympathy for his effort to extract an outright condemnation of apartheid. Yet Mr Alport was obliged to resist. His stonewalling was not explained simply by Commonwealth solidarity; as Mr Callaghan said, the Commonwealth is divided on this as on so many issues—and on this one South Africa is, unofficially if not officially, in a minority of one. The real reasons for the Government avoiding an outright condemnation of South Africa are different. The first is that the majority against South Africa is prepared to condemn oppression only when the oppression is on grounds of colour; country after country that joins in condemning South Africa's domestic policy is run by an oppressive government, which would righteously resist any attempt by the United Nations to judge it. This is a doubtful bandwagon to jump on. The second reason is that Britain is itself vulnerable through the responsibility it has for territories in which the problem of colour discrimination, with or without political oppression, is unsolved. The intention is, of course, to solve it; and when this has been done—whether in Kenya, Nyasaland or Northern Rhodesia (or North Kensington)—it will be time enough to make official holier-than-thou pronouncements.

The peculiar problem which South Africa presents is that it is not only a sovereign state practising colour discrimination as a way of life, but it is also the only state which is unrepentantly increasing that discrimination. This is not true of the southern states of the United States, or, to take a Commonwealth instance, of the application of the "white Australia policy." Even Southern Rhodesia is moving in a direction against racialism. In short, South Africa sticks out like a sore thumb in a world in which non-white states are increasingly influential—especially when acting in concert—and very sensitive. This is a reason why there will have to be a term to Britain's official line. The tragedy of Monday's debate was that ill-informed or ill-disposed non-white people the world over will infer from the defeat of the Labour motion that the Government favours apartheid. Nothing could be more untrue. But the Government should rely on its own actions in its own bailiwick to prove it; there will be opportunity enough in 1960.

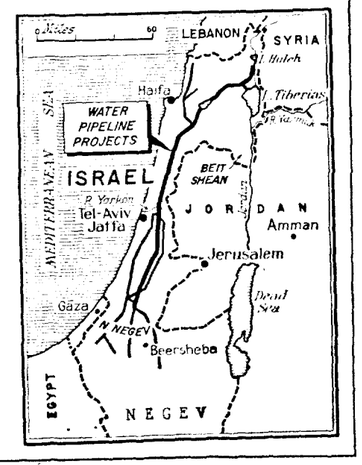
Flare-up Over the Jordan

EVER since 1956 when the Arabs turned down the Johnston master plan for sharing the Jordan waters, the Israelis have quietly gone ahead with their own part of the project. It could only be a question of time before this tranquility was exploded. On November 17th, the Jordanian prime minister, Mr Majali, pointed out what was going on in a challenging speech clearly intended for Cairo. The challenge was taken up; Cairo's propaganda machine got to work, committees were formed, and this week an emergency meeting of the Arab League was demanded. Cairo took the lead through the Arab League four years ago in throwing out the Johnston plan; now, as leader of the UAR, President Nasser speaks for his Syrian citizens, who are more nearly affected than the Egyptians themselves.

For the next year or so, the Israelis intended to finish various regional irrigation projects that make no use of international water. In order to compensate for the water that may be lost through the Jordanian-American scheme to divert the river Yarmuk, a canal has been designed to draw water from Lake Tiberias (which belongs to Israel) southward to the settlements in the Beit Shean region. Two pipelines are being built to bring water from the river Yarkon to the northern Negev. A huge pumping station is to be constructed on the western shore of Lake Tiberias. By themselves these schemes are unexceptionable; the point is that they are all on the periphery of the master plan and the day must come when *they are linked with the Jordan.*

The proposed link is a conduit from the Jordan just south of Lake Huleh to the northern tip of Lake Tiberias. In 1954 the Israelis abandoned work on this conduit because the Security Council objected to its passing through a demilitarised zone. But it is still the essential link in a plan fundamental to Israel's agricultural *development.*

In reprisal, the Arabs are threatening to divert the course of Jordan tributaries and even, according to Cairo, to run the head waters of the river into the Mediterranean at Tyre. This kind of talk is less disturbing to the Israelis than the fact that the balloon has gone up at a time when they are in the middle of negotiations with the Americans about costs. So far they have had no international help for a project whose total bill is expected to be in the region of £80 million. By putting off the critical day when the scheme touches the Jordan, they hope at least to raise some money for the important regional plans.



LAND

One-Tenth Urban

How much of Britain's land is now urban and how fast is town devouring countryside? These questions are often asked, but the various statistics gathered by the Ministry of Agriculture, local councils, and the voluntary Land Utilisation Survey are both complex and contradictory. Mr Robin Best of Wye College has now done a valuable service in collating these figures,* and even making some sense out of them. It seems that in 1950:—

(1) About 65 per cent of the surface area of England and Wales consisted of crops and grass in exclusive agricultural occupation. These 24 million acres (plus another 4½ million acres in Scotland) are the agricultural area which really matters.

(2) 10 per cent of land in England and Wales was used as rough grazings (mainly hills and moors).

(3) 6 per cent was wooded.

(4) Nearly 9 per cent was used partly for agricultural and partly for other purposes (e.g. service land, water gathering grounds). This category is growing.

(5) Urban development, including gardens and recreational land, covered only just under 10 per cent of land.

Clearly therefore England (and Scotland much less so) is still not nearly as "urbanised" as many people assume. But the urban area of England and Wales is growing by about 40,000 acres a year, most of it impinging on agricultural land of above-average quality and output. The county councils' development plans are attempting (with the Government's backing) to curtail this rate of growth, but Mr Best is surely behind the times in accepting the plans' allocations as a basis for his projections. More land than the plans provide is already urgently needed to meet the rising demand for roomier living conditions, and it is obviously going to have to be set free. A reasonable guess is that urban development of various kinds might

* The Major Land Uses of Great Britain. By Robin H. Best. Department of Agricultural Economics, Wye College. 10s. 6d. (post free).

swallow up to four million acres over the next half-century, although even this heavy loss (equivalent to perhaps 20 per cent of present British agricultural output) might well be fully offset by the increased value of home-grown vegetables plus the upgrading of adjacent farmland. The real nuisance to food production, in fact, may be not so much development itself as the disturbance to agriculture (and the inflation of land values) caused by the expectation of development. This certainly is something which sensible planning should try to combat, but a country which is still only one-tenth urban should not make any Canute-like attempt to hold back the whole tide.

PIGS

Pork from Canada

THE news that the Government is to authorise the importing of 25,000 tons of frozen pork from Canada, hitherto kept out by one of the few remaining dollar import bans, is welcome on several counts. First, of course, on the good old free-trading ground that it will make for a lower cost of living. Secondly, paradoxical though this may appear to some British farmers, the arrival of extra supplies of this particular form of pig meat should remedy some of the present acute lack of balance in the British pig industry. A shortage of British pork, resulting in high prices and early slaughtering of a proportion of potential bacon pigs, has led in turn to a shortage of baconers and hence an uneconomically diminished throughput for the curing factories. Faced with higher costs, the curers are prevented by the competition of Danish bacon from raising their price to the retailer ; they can respond only by offering less to the bacon-pig producer—who simultaneously finds his deficiency payments shrinking precisely because the pork-producer is getting higher prices in the market, since these determine the average return on which the deficiency payment is calculated. Anything which eases the pork shortage automatically reduces this scissors-like pressure on the bacon industry.

Finally, it is worth recalling that the Canadian farmer is not least among those to whom the British public owe some arrears of consideration. During the war four out of every five Canadian pigs were shipped to Britain in one form or another, a fact which inevitably altered Canada's production structure. After the war dollar restrictions abruptly cut Canadian pig producers off from the British market. These restrictions were accepted with a fair degree of philosophy at the time, but the philosophy has been tried pretty high by their long continuance. Caught between the unbridgeable dollar gap to the East and the unscalcable protectionist wall to the South, the Canadian farmer and the taxpayer who props him have had to wait a long time for an instalment of liberalisation. The present relaxation is particularly well timed because Canada is now at the peak of the pig-cycle and expecting a bout of especially heavy marketing ; moreover, the Canadian price-support system is shortly to be altered (very sensibly) to something nearer the British deficiency-payment scheme. The Canadians are hoping that this is only the first step back towards reassertion of their former right to free entry for their produce, and a review of the whole situation is expected in the new year. Despite the squeals of protest which even his present action has evoked from both Conservative and Labour MPs, Mr Hare should be encouraged to take the full plunge then.

The Economist

DECEMBER 10, 1859

SMITHFIELD SHOW

The character of the exhibition of fat stock in Baker Street this year comes up fully to that of any preceding show. Indeed it may truly be said that every year produces an improvement in the stock shown. This is due to two causes; first, the great improvement which stock of all kinds and breeds have undergone, and are still undergoing; and secondly, the greater knowledge farmers of all districts have obtained, by more frequent communications with each other, of the indispensable requisites for successful competition in Baker Street. It may safely be said there were scarcely any but good animals shown. There were not half-a-dozen animals in the yard of which a grazier or breeder might not fairly be proud. It was the first idea which struck one, it would probably be one of the earliest observations a visitor would hear on going into the cattle department,—"What a good lot of beasts." . . . In truth it is to the breeders of the stock, and the judicious attention they have paid to the right principles of breeding, that the merits of the Smithfield Club shows of the present time are mainly due. More judgment in feeding is undoubtedly exercised than in former days, but unless the grazier had the opportunity of selecting from stock of high breeding and symmetry, his best exertions would only produce the often misshapen mountains of fat which once formed the staple of this show. . . . The pigs, as of old, were marvels of fatness and early maturity. If we must say that we do not see the same sort of improvement in the pig classes which we have noted in cattle and sheep, it is probably, because for fineness of bone, aptitude to fatten, and early maturity, and, we may add, for the power to endure in life and without actual suffocation miraculous loads of fat, the force of nature —or art—can no further go. There was no falling off, however, in any of those particulars amongst the swine just shown in Baker Street. The implement and machinery department is well sustained. There were an unusual show of steam engines. The roots of all kinds were enormous. We noticed one root of yellow globe mangold marked as weighing 34 lbs. Some very fine mangold roots were ticketed as grown by Sir William Hayter on ground originally poor and sandy heath.

FRANCE

The Bazooka Dossier

M. FRANCOIS MITTERRAND has now been charged with concealing information from the police about the mock attempt on his life in October. This affair grows ever more involved and far-reaching. The latest move lends extra urgency to the question, "Qui Ment ?" asked by *Le Monde* in connection with M. Mitterrand, M. Debré (the French prime minister) and the Bazooka affair.

On January 16, 1957, in Algiers, one of General Salan's aides, Major Rodier, was killed with a bazooka bomb by counter-terrorists. M. Mitterrand, who was minister of justice at the time, says that he was sent evidence implicating M. Debré, whom he interviewed in consequence. M. Debré denies that any such interview took place. *L'Express,* however, has since published a full account, from an unnamed source, of the case against the prime minister, and it is a disturbing one. Briefly, this version says that M. Debré and M. Arrighi were the employers, for subversive purposes, of Major Rodier's murderers, MM. Kovacs, Castille and Fechoz. The murder was in excess of instructions. Even so (hints *L'Express*) M. Chaban-Delmas, then a minister, was able to protect M. Debré from M. Mitterrand, and M. Debré, in turn, was eventually able to protect his subordinates. Kovacs was allowed to escape to Switzerland, while his associates received "derisory punishments." The magistrate who laid the dossier compromising MM. Debré and Arrighi before M. Mitterrand was demoted to obscurity. Finally the attempt was made, through M. Pesquet, either to kill or to discredit M. Mitterrand himself.

Whether the allegations are true or not, the fact that they can be seriously made and attended to uncovers a little more of the stratum of violence in French public life. And, like the Audin affair, like the right-wing plot in October, the Mitterrand case affirms France's crying need for peace in Algeria. Only when the desperate men on both sides have been frustrated in their efforts to prevent a negotiated peace will the Fifth Republic's criminal elements retire to the shadows where they belong ; and not until then will General de Gaulle's own efforts to re-establish the decencies have a fair chance of success.

LIFE'S QUITE RELAXING . . .

Perhaps because in many ways it's so much easier today. Thanks to new materials and better ways of making those already well known, there's more time to spare for everyone. Ten years ago, for example, washing and ironing clothes took up a sizeable part of the housewife's day, and mending nets was a regular time-waster for fishermen. I.C.I.'s 'Terylene' has changed all that. This remarkable synthetic fibre is as happy in easy-to-care-for clothes as in fishing nets and cordage, and its great strength and immunity to rot, sunlight and weathering are finding it new uses in industry every day. 'Alkathene' is another I.C.I. product that makes for easier living. Easily laid tubes of this versatile material, frost-proof and flexible, enable farmers to take water supplies to any part of their land simply and inexpensively, and the same plastic in the form of colourful kitchenware is lightening and brightening housework throughout the world. Wherever you look, the story's the same: new plastics, new dyestuffs, new metals, new chemicals of every kind from I.C.I. are saving time and allowing hard-working people everywhere the opportunity for the occasional, well-earned yawn.

Share Transfers

SIR—I have read with interest that the Chairman of the Stock Exchange has drawn attention to the necessity for some simplification of the present cumbersome system of share transfers if a complete breakdown of the machinery is to be avoided. In modern conditions I fail to see the necessity either for the elaborate share certificates which are customarily issued, or for the present form of transfer deed.

A large number of investors deposit their share certificates with their bankers, brokers or other safe recipients and many more shares are registered in the names of nominee companies who act as agents for various trusts, estates and individuals. All these holders have the custody of vast numbers of paper certificates which in themselves have no intrinsic value: they are merely evidence of an inscription in the share registers of a company. The shareholder has no particular interest in the certificate: it is merely a piece of paper which has to be produced when he wishes to transfer his holding to another person.

The share registers of a limited company are in essence similar to the ledgers of a bank. In the one case there is a record of the individual holdings of stock or shares: in the other, of individual holdings of money. The holder of a bank account receives a statement of account at intervals which he accepts as evidence of his balance with the bank. Surely a similar statement from the registrar of a company would be acceptable to the majority of shareholders in place of a share certificate? Transfers of shares could be effected by the shareholders signing a transfer order similar in form and size to a cheque. The purchaser or his agent would in due course lodge the transfer order with the company together with a document similar to the "paying in slip" of a bank containing details of the purchaser for inscription in the company's registers. Transfer orders could be drawn for any required number of shares to facilitate delivery to different purchasers, which would eliminate the necessity of splitting certificates. The work of a company's share transfer department would be confined to posting "debits" and "credits" to shareholders' accounts—an operation which could be highly mechanised. The mechanics of transferring shares could be still further streamlined by the establishment of specialised concerns who would take over the whole business of share registration from companies, and would open accounts for firms and individuals through which lodgments and withdrawals of shares would pass by simple transfer.

The chief objection to this scheme from the point of view of the revenue authorities would be that stamp duty is payable on share transfer deeds on the amount of the consideration. If this duty must be imposed, cannot the stamps be affixed to the contract note?—Yours faithfully,

Bangkok J. H. DELACOUR

Telephone Tapping

SIR—Many people have expressed misgivings about the recent interception of a telephone message in Reading. But surely you go much too far when you state that the Reading police "should at once be disciplined."

At the time the telephone message was intercepted, the Reading police were conducting enquiries into a case of unnatural death at the request of the Coroner. It is surely the duty of the police, in a case of unnatural death, to enquire into all the relevant causes and motives, and to collect any evidence that there may be of any serious crime connected with the case. It is surely their duty to conduct these enquiries energetically and with initiative, within the rules of police procedure. The Reading police did not break any rules of police procedure in the course of these enquiries. Their action was not covered by the recommendations of the Birkett committee. If it is maintained that the Reading police should be disciplined for their conduct on this occasion, policemen will in future be continually looking over their shoulders to see if any politician or journalist is about to invent a new rule of procedure in criminal investigation, and to agitate for its retrospective application.

The two real weaknesses in our procedure revealed by this case would appear to be respectively technical and judicial. In the first place, it is altogether too easy for police, or other persons, to intercept telephone conversations without the knowledge of the Post Office or of either party to the conversation. Very many subscribers are today on party lines. The suggestion of your correspondent that any eavesdropping on the telephone should be made illegal seems an excellent way of closing this loophole. Secondly, if any body not a court, such as the General Medical Council, needs the powers to subpoena police officers and compel the disclosure of police evidence, its rules of procedure should be placed under judicial supervision; if it does not want this sort of reform, it should be prepared to relinquish these powers.—Yours faithfully, PETER C. PRICE

Reading

Chemical Sprays

SIR—In your recent note in which you drew attention to the danger of upsetting the ecological balance by the undue use of toxic insecticides, you overlooked, in common with many other people, a most important development which promises to rectify the situation. You did not mention the discovery and use of selective insecticides which make use of, and maintain, the ecological balance; for instance, selective systemic pesticides circulate within the plant, and kill off the rest while leaving predators of all kinds unharmed to mop up survivors. This method of pest control, in fact, is the preferred method if we are to avoid the development of strains of pests which are resistant to insecticides.

We are, however, only on the threshold of this change. The difficulty is cost: it is cheaper in the short run (though it may be dangerous in the long run) to apply insecticides of the "kill all" type which have a wide spectrum of toxicity; consequently more money has gone so far into the mass production of, and research into, these. But for many years now I have been urging that we need, both here and in America, an official research policy into pest control methods which work with, rather than against nature, and which would bring together creatively the work of chemists, entomologists, engineers and agriculturalists. There is, in short, no need whatever to despair about the present situation, which is temporary.

At the same time, let us keep these matters in perspective. Even the crude "kill all" insecticides that we have been using for the last twenty years or so, have preserved vast tonnages of vital foodstuffs and agricultural crops throughout the world from destruction, and have vastly enriched both farmer and consumer—and have incidentally made no mean contribution towards economising on Britain's import bill. They have—and will always have—a big part to play; what is important is discrimination in their application. For this we need not only the research to which I refer above, but also better training of our own farmers and operatives.—Yours faithfully, W. E. RIPPER

Docking, Norfolk

Air Conditioning

SIR—In your issue of October 3rd last there appeared an article under the title "A Cool Merger" in which it was stated that America's Carrier Corporation and Stone-Platt Limited have announced their plans for the production of carrier air conditioning plant in Britain.

We think it necessary to ask you to correct the error of fact in the above statement. This company is the proprietor of the registered Trade Marks Nos. 429,161, 578,981, 608,831 and 429.352, consisting of the word "Carrier" and registered in respect of goods that include air conditioning plant and we are accordingly the only company entitled to describe their products in Britain as "Carrier Air Conditioning Plant."—Yours faithfully,

R. S. ANDREWS

Carrier Engineering Company, London, SW1

BOOKS

Imperialism in Reverse

The End of Empire

By John Strachey.
Gollancz. 351 pages. 30s.

How tragic it is that inherited habit obliges the Labour party to regard its intellectuals as a class—a kind of person coming from outside the movement, men who may come in useful at tasks of drafting and oratory, but who are not the solid stuff of which a party must be made. Every group needs its intellectuals; least of all can a political party setting out to change things afford to underestimate the men who can tell it what to try to do, and why. Mr Strachey quotes in his preface another Labour intellectual, Mr Crossman, to explain "the purpose of the expenditure of pen and ink" involved in the long study of which this is the second volume:

> If I were challenged to say in a single sentence what is wrong with British Socialism, I should reply that it is bookless. The electorate can make do with the kind of popularisation possible in an article or a broadcast; those who presume to form public opinion cannot.

The lucidity, style and system that have marked all his books put Mr Strachey in the forefront of the very few who seek to fill this (for the most part, unfelt) need of British socialism. This does not mean that he is less often wrong than other people who lack his exceptional powers of exposition. To be wrong is permissible; what is not permissible, for a political movement, is to be unaware. It can be recalled that in 1936 ("The Theory and Practice of Socialism") Mr Strachey wrote that the Labour movement could make "no decisive advance" so long as it excluded the Communists from "full participation in working-class activity." That was when he believed, as he does not now, that the working class gained no benefit from industrial progress under capitalism. It was also the time when he believed that the capitalist empires, including the British, were desperately set on further expansion; while Russia, being a socialist power, was not even interested in recovering its lost provinces—the Baltic states, say, or Bessarabia, or eastern Poland.

Many things have changed; it is to Mr Strachey's credit that he takes in the changes and is prepared, in the light of them, to think it all out again. This involves him, after 23 years, in another vast theoretical exposition; the delightful surprise is that the result can be readable, stimulating, and positively enjoyable even for readers who are barely interested in socialism at all. He has set out to think again in the light of the fact that the old imperialist powers, and notably Britain, are actually liquidating their empires of their own volition. Where, then, is the inevitability of imperialist war? What is more, Britain without India continues to prosper and to expand its economy, as does Holland without Indonesia. Where is the doctrine of the economic compulsion to build empires?

In his search for an answer Mr Strachey passes the history of the British Empire in review, beginning with a brilliant account of early British rule in India, a passage which by itself would make the book worth while, combining as it does ruthless exactitude with narrative charm and even (since he is not without piety for his own British Indian ancestors) with affection. One conclusion he comes to is that Marxists and right-wing imperialists have joined to foster the belief that empires are more profitable, and economically more necessary, than they are. Unearned wealth from Bengal may, he still thinks, have given a decisive push to British economic growth in the eighteenth century, but in modern times the profits of empire have been marginal, and it is now decidely more profitable to give colonies up than to resist their urge to independence.

Does it follow that no new world empires will arise? It does not; however, the resistances are by now strong and the risks, in an age when any serious candidate must face a hostile super-power armed with nuclear weapons, are forbidding. Mr Strachey concludes that "an end of the imperialist epoch is both possible and a precondition of our survival." He goes on to think about the possible rôle of Britain in a post-colonial world, and concludes, rather gropingly, that it is to be a supplier of capital for the development of the colonial countries which Britain has, or will have, released from subject status.

Since at this final stage of his argument Mr Strachey is in effect trying to write a foreign policy, in the broadest sense, for a future Labour government, it is a pity that just at this point he ceases to trust his logic, takes short cuts, and becomes woolly. Correctly assessing the enormity of the gap (both in existing standards and in rates of growth) between the rich and the poor countries, he concludes that Britain ought to try to help—but not from self-interest; this he finds unproved:

> The truth is that there is only one conclusive reason why we should help the peoples of the under-developed world: and that is because it is right for us to do so. *It is morally right.*

Is that the only conclusive reason? And if it is, how does it come about that this moral obligation applies (as Mr Strachey argues in another passage) to poor countries that have been British colonies in preference to poor countries that have not? One can only assume that his preoccupation with British imperial history has left him haunted by some idea of atonement. But surely that is not the point. The point is that the world will work better for everybody if it is making general progress than if, while some parts are forging dizzily ahead, other parts are falling into misery and chaos.

The relevance of this apparently metaphysical distinction to British foreign policy is seen at a glance on page 273, where Mr Strachey makes one of his rare and trivial references to Europe. The potentiality of world economic expansion, he there remarks,

> sets such schemes as Commonwealth preference and the European common market in perspective. They must be seen and judged by whether or not they contribute to the development of the part of the underdeveloped world with which we are associated, and by so doing to world development as a whole.

Even with a good idea, it is possible to go too far. A country has to live with all its neighbours, not merely some of them, and a future Labour government that allows its European policy to be governed by the breath-taking criterion quoted above will be liable to come a cropper that will leave its capacity to help its liberated former colonies seriously diminished. But it is a sad fact that, for all the effect it has on Mr Strachey's view of world politics, the space between the North Sea and the Mediterranean might be tundra.

"The Little Terror"

A Study in Infamy: *The Hungarian Secret Police*

By George Mikes.
André Deutsch. 175 pages. 15s.

When shadowing a suspect, "jumping on or off buses is inadvisable"; in theatres and cinemas, "officers should generally sit behind the suspect, in order to keep an eye on his neighbours as well"; when following a suspect into a block of flats, "it is desirable to walk quietly, but a stealthy attitude should not be adopted. . . ." These hints on how to be a good secret service man, taken from a Hungarian secret police (AVO) manual, suggest that some AVO men may not be very well endowed with common sense. Some indeed are not. A group of them in a small town near Budapest, told to watch a certain man, disguised themselves as employees of the waterworks, built a hut in the road, and stayed there for days watching their victim. The AVO lecturer who told this story commented: "Their activities created some surprise and even provoked some comment because there were no waterpipes in the neighbourhood."

These extracts from the official manuals issued to the Hungarian secret police, which were smuggled out of the country and came into the possession of Mr Mikes, illustrate the more ludicrous side of secret service life. But the overwhelming effect of the extracts published in this book is one of horrified surprise: surprise at the fantastic thoroughness and complexity of the spy system built up by the AVO; horror, not only at the physical suffering which the AVO inflicted on its victims, but even more at the appalling weight of fear, suspicion, treachery and moral turpitude that the system imposed on a whole country. So hated was the AVO that, during the Hungarian revolution of 1956, the only victims of mob violence were known members of the secret service.

By now the world has been well briefed on the more spectacular aspects of the AVO—its horrifying prisons, its brutal methods of interrogation, its mock trials. In this book Mr Mikes concentrates on the fantastic apparatus of day-to-day control: the infiltration of AVO men into groups where some careless grumbling may breed suspicions of conspiracy; the shadowing of suspects; the censoring of letters; the elaborate arrangements for carrying out secret searches; above all, what Mr Mikes calls "the Little Terror," the "silent and ubiquitous army of terrifying and terrified police informers," which, as he himself says, "in the long run undermined people's courage, morale and mutual confidence." Most of these wretched people are recruited through blackmail—because the AVO has discovered something that might get them into trouble with their employers or the authorities, or even their families.

In the first section of his book, Mr Mikes gives an historical account of the Hungarian secret police from 1944 to the present day. The AVO was disbanded after the 1956 revolution. The name has been permanently dropped, but the organisation has been quietly resurrected. Under a communist regime, the chief instrument of political power is the secret or political police. In Hungary it may be now veiled in obscurity; but Kadar can no more manage without it today than could Rakosi in his day.

Cotton and Change

Social Change in the Industrial Revolution

By Neil Smelser.
Routledge. 452 pages. 40s.

It is a rare pleasure to welcome a book at once so original and so exciting. Mr Smelser has boldly attempted to interpret the economic and social history of the Lancashire cotton industry during the industrial revolution in terms of recent sociological theory. Starting from the view that as an economy progresses the social structures within it become more differentiated from each other, he goes on to assert that this very process possesses definite regularities and sequences that can be analysed systematically. The next step is to construct a model of such social change and finally to use it as a framework for discussion of the actual course of events.

One great merit of this approach is that it has enabled Mr Smelser to assemble his material with quite remarkable clarity and precision. There is much of absorbing interest in the chapters on the cotton industry itself, but undoubtedly the greatest attention will be paid to the second half of the book dealing with the consequences of change for the industry's workers. The emphasis is placed upon the family economy and the break in the economic relationship of parents and children that technical changes brought about. General agitation, trade unionism, factory legislation are all seen in this light. Only when he comes to the difficult question of structural change in consumption and savings does one feel that the theory is being laboured to embrace savings banks, co-operatives and the like.

Admittedly in the early chapters the model does not seem to add much to an understanding of the process of industrial growth from a purely economic standpoint. Its real role there seems to be to give a framework for the more important interpretation of social changes. Here the gain from the model is obvious, and the analysis is an enormous improvement on the work of both optimistic and pessimistic schools of thought, whose weaknesses Mr Smelser in fact points up very clearly. We see that in the factories it was not so much their physical evils as their social context that was changing; the ideals of factory reformers are shown to vary as technological changes modified roles and earning power within the family. This line of argument is hammered home time and again, and now that technological changes are again causing agonising social pressures the book is doubly welcome.

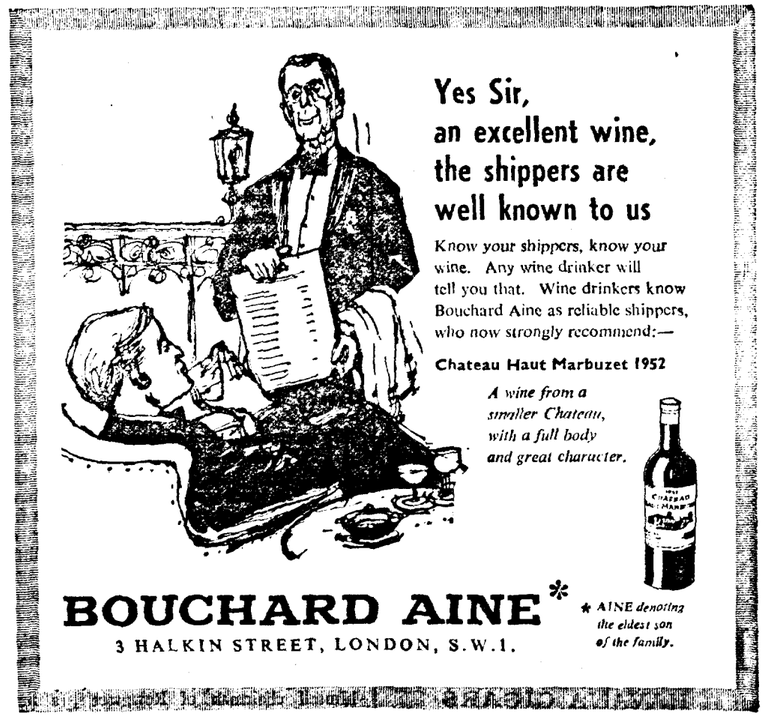
Northern antiquarians may be offended by tiny points of detail, but no matter; it is a fine work.

Satellite or New Style Nation?

Contemporary Canada

By Miriam Chapin.
Oxford University Press. 337 pages. 50s.

In a book distinguished for its total absence of complacent optimism, Mrs Chapin takes a searching new look at virtually every corner of Canadian life. Her scrutiny ranges from coast to coast, over the complexities of provincial variety: from the influence of Christianity to "scramble corners" for pedestrians; from trade unionism to the part played by national banks in national cohesion; from the National Ballet to the state of gaols. A shrewd and widely informed observer, with a knack of vivid and trenchant summary,



A man is known
by the company he keeps

The brandy—Remy Martin V.S.O.P.

A host is known
by the cigar he offers

Not every guest is a connoisseur. But few ever fail to detect the subtlety or appreciate the compliment of a fine Havana.

And the host who offers H. Upmann Havana Cigars enjoys an extra satisfaction. He knows that in flavour, in aroma, and in body, they bear fragrant witness to the skill and reputation of the cigar maker — and also to his own good taste.

H. UPMANN
HABANA

H. UPMANN
HAVANA CIGARS

she contrives to give form and significance to this variegated mass of material, with only an occasional hint of breathlessness. That there are inaccuracies is scarcely surprising, but it is surprising that the documentation is sporadic, and that there are such remarkable gaps in the main river systems depicted in the end-paper map.

A US citizen from Vermont, Mrs Chapin approaches her subject with useful detachment. A resident of Montreal since 1932, she has an insider's knowledge—though not always understanding. To suggest that the Canadian declaration of war in 1939 was "the last sigh of subservience" to Great Britain is surely undiscerning. Canada went to war because its basic interests were at stake. There are other questionable judgments and generalisations, especially in the sections on the nature of Canada's Parliamentary government and on the significance to Canada of the Commonwealth.

On the other hand there are many brilliant and revealing passages. Mrs Chapin's examination of the problems involved in Canada's relationship with the United States is especially penetrating and provocative, as is her illuminating discussion of the role of French Canada within a nation that has had, perforce, to "cherish" diversity. She concludes that only by "a reconciliation of internal discords not yet imagined" can Canada "stand against the pressure to become a satellite of the United States." No one, in her opinion, "can foresee the result of the struggle for independence. . . . Indeed, Canada may never attain full nationhood, because it finds itself in a time when a new world order may be emerging, in which strict nationality is not as important as it was. . . ." Some Canadians believe that their country has attained "full nationhood," though this may well be nationhood of a new kind, which does not depend on a self-contained, exclusive type of sovereignty, as unattainable to Canada as it would be anachronistic in this new world order.

Why So Slow?

Prescription for Partnership

By William Wallace.
Pitman. 244 pages. 25s.

PARTNERSHIP is the goose of industrial relations that never seems to lay the golden egg. Ever since the turn of the century a small group of enthusiasts have been urging co-partnership as a panacea for industrial relations; yet the number of firms operating such schemes is little greater today than it was twenty years ago. What is the explanation of this disappointing record?

Mr Wallace's book answers this question fairly, even though it is in essence a tract for the partnership idea. Mr Wallace was himself chairman of Rowntree's, a firm with a long tradition of sound business and lively co-partnership; as a businessman he handles his evidence well. But the main meaning of partnership to him goes deeper than facts and figures; it is a reflection of his belief—and of Joseph and Seebohm Rowntree before him, both noted Quakers—in the dignity of man.

Philosophically, the case for industrial partnership is cast-iron. A worker, like anyone else, is not interested only in money; a scheme that gives him a higher status in his firm with no cut in his wage is welcomed accordingly. Morale goes up—the most common result of co-partnership, Mr Wallace found—and, as long as the trade unions agree to the scheme, good labour relations are assured. Moreover, many of the traditional arguments against partnership are shown here not to hold water. Most of the failures—through unsatisfactory workers' response or wages getting out of hand—came about because partnership was seen quite wrongly as a massive incentive scheme. For this, piece rates and bonuses related directly and immediately to output are much more suitable techniques.

Partnership is, in fact, a poor method for raising output and profits—especially in the short run. It appeals to the industrial visionary but not to the cost accountant, the linear programmer and the profit seeker. Since these latter form the bulk of influential businessmen, partnership can never appeal to the majority of firms. There is also an element of paternalism in partnership which can, unless carefully watched, get out of hand. Liberals who urge that work should be closer integrated into an employee's social life should note from the lavish, but intellectually disturbing, communities built round Olivetti factories at Ivrea how suffocating even the best of employers' intentions can become. The paternalism of the state is already a part of our private lives; should that of employers be padded around our working lives as well?

Partnership has clearly, from Mr Wallace's account, been a success at Rowntree's. But two general doubts remain. Partnership, whether it be in the form of profit sharing, share bonuses or, as in Germany, workers' representation on the board, can make good relations better. But few would claim that it would solve the really urgent industrial questions of the hour: how to make the really bad relations in the docks, shipbuilding and sections of engineering even average. Secondly, doubts remain about some of the profit-sharing schemes recently introduced by such giant firms as Imperial Chemical Industries and Courtaulds, and toyed with by others such as Unilever. The gross profits in these firms are spent first and foremost on preserving the company ethos—by distributing morocco-bound books to shareholders, shares to workers, top hat pensions to directors, and so on; net profits are a residual to be distributed only after building up the atmosphere of the Organisation Man. This voluptuous generosity (at the expense of a large body of scattered, and consequently powerless, shareholders) is far from the austere spirit that led Joseph Rowntree to start his scheme. The pity is that the two may come to be confused in the public mind

The Age of Swift

English Literature in the Early Eighteenth Century 1700-1740

By Bonamy Dobrée.
Oxford University Press. 713 pages. 42s.

THE great project of an Oxford History of English Literature is being realised slowly and in a somewhat piecemeal fashion. Its plan is quite different from that of the renowned old Cambridge History. Instead of each volume being composed of articles contributed by a variety of scholars, each Oxford volume is written by a single expert, who covers a whole period or section of English literature. The advantage is in consistency of tone and judgment; the disadvantage (apart from dangers of bias) the extreme slowness in getting the series completed. This volume, chronologically the seventh, has taken Professor Dobrée over twenty years to complete; and we are still awaiting Volume IV from Professor F. P. Wilson, the other general editor of the series, not to mention Volumes I, VI, VIII, IX, X, XI and XII from other distinguished pens.

Instead of grumbling, however, let us be thankful for this massive addition, for it is massive in bulk as well as in learning, a splendid two-guineas-worth, stout and well produced. Professor Dobrée wears his erudition lightly, and his markedly informal style makes his material pleasantly digestible for the non-specialist reader, while the chronological tables and the ample bibliographies (common to all the Oxford History volumes) make this an invaluable reference book for the student. It is not designed to be read through from cover to cover, but without undue labour it could be, for the period is brimfull of interest and Professor Dobrée is not in the least a pedantic guide.

The drama, his particular field, was in a poor way after 1700, and he does not attempt to boost it. The middle section of the book deals with those important writers who, without being creative in the fullest literary sense, played such an important part in the cultural life of the time—the philosophers, moralists, critics, aestheticians and chroniclers of various kinds. The creative writers are given, as it were, a double treatment. The early work of Defoe, Swift and Pope is considered, alongside the essayists, in the first part of the book, which deals with the years 1700-1720; and we meet them again in their maturity, in the third section, when the years 1720-40 are dealt with. It is because he is so conscious of changes in the political and literary temper from decade to decade that Professor Dobrée has chosen this arrangement, and it does make for enlightenment.

On Defoe he writes with considerable shrewdness and humour, and argues with some subtlety that Swift is a truly sane and healthy moralist, even in the fourth book of "Gulliver's Travels." One minor tiresomeness is that when, in passing, he refers to the work of some contemporary critic, he does not give, even in a footnote, a precise reference to the book from which he is quoting. On the whole, however, Professor Dobrée's urbane manner is well suited to the period he is examining, and the book is a treasury of scholarly information, most agreeably conveyed.

Trivial, Fond Record

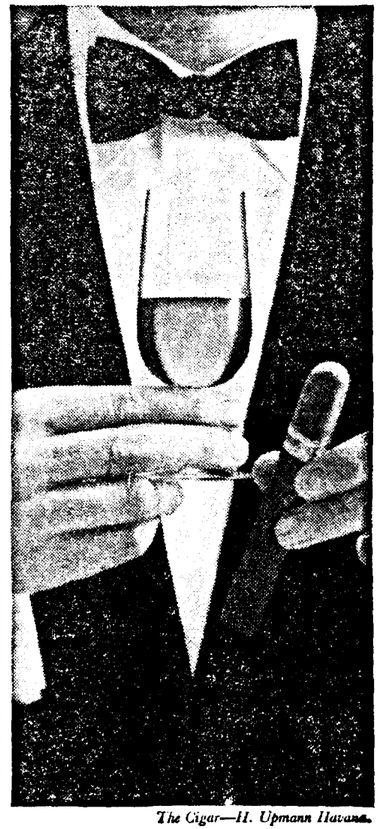
Unofficial History

By William Slim.
Cassell. 251 pages. 21s.

THIS is a humane, intelligent soldier sitting at ease, recalling the little battles, the unimportant skirmishes and the less serious events that dotted and enlivened his career before he rose to command a victorious army. In sensing the self-critical humility of his account of the unsuccessful battle at Gallahat and the decisive authority that controlled the campaign that led up to a victory (which logistically seemed impossible of achievement) at Deir-ez-zor, his listeners—for Sir William's style is that of a man talking, fluently and easily, not of a man slaving at a desk—will know why and how he, more than perhaps anyone else, turned defeat into victory in the wearing, tearing campaign in Burma.

It is the lack of vanity and pretence that, after some of the other war memoirs, makes Sir William's writings so refreshing. In "Defeat into Victory" he said what he wanted to say about the war, not uncritically but fairly, and if in that book geniality was combined with instruction, in this latest one, designed he says for amusement, instruction peeps through the geniality. The facts are, he confesses, "a shade blurred here, a trifle out of perspective there, and perhaps a little, in this corner and that, consciously arranged to hold the design together." Some of the earlier chapters appeared originally in *Blackwoods* and the Kiplingesque tone of *the "Maga" is certainly present, as in* Sir William's *conte* about an incorrigible rogue called Chuck. It lurks too in Sir William's comment that when the British army is called upon to fight, two factors are constant: the battle will always be fought uphill and always at the junction of two or more maps. In his day, Sir William fought with as many maps and up and down as many hills with as much success as many of his contemporaries. It is a lack in them and not in Sir William that they have not occasionally kicked off their field boots as he has done here and sat in their slippers, recalling their careers and battles without rancour.

A man is known
by the company he keeps



The Cigar—H. Upmann Havana

A host is known
by the brandy he serves

To serve your guests an indifferent brandy is more insult than compliment. The correct thing to serve after meals is a cognac of liqueur quality. This is why the perfect host gladly pays that little bit more for a really fine liqueur brandy like Remy Martin. A genuine Fine Champagne V.S.O.P. Cognac. A brandy defined by French law as *Fine Champagne* because it is made exclusively from grapes grown in the two finest districts of Cognac. And it is reassuring to remember that Remy Martin make *nothing* less good.

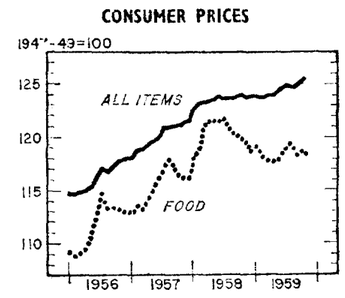
AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Boom Bent But not Bust

WASHINGTON, DC

THE steel strike, whether it has been ended by the recent court injunction or merely held over, still dominates the American economy. The industry has bounded back into full production in the five weeks since the Supreme Court ordered the steel workers back to the mills for an 80-day cooling-off period; but the impact of the stoppage lingers. The directly-related industries—the railways and coal mines—have shared in this unexpectedly quick revival, just as they suffered when the furnaces shut down in the summer. But steel consumers, slower to feel the effects in the summer, because they had accumulated huge stocks before the strike, are now slower to recover, because the small stocks they still have are seriously unbalanced and because re-stocking takes time. Even after the steel operatives went back to work on November 7th men were being laid off in steel-using industries that had run out of supplies—60,000 workers in the first week, another 40,000 in the second—and the process is still going on.



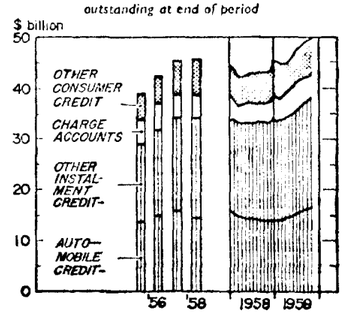
A new survey of business purchasing agents indicates that steel shortages have forced a quarter of all manufacturers to curtail production, and that some of them do not expect to return to normal before next spring. For example, the General Motors Corporation—the biggest of the automobile manufacturers—produced only 11,798 cars last month; a year ago the company was making as many in a day. Total motor output was 50 per cent below schedule for the month. The industry plans to make up the deficit with a record production in the first quarter of the new year, which will give the national economy an unseasonal bulge in the winter months. For the more distant future the delays brought on by the strike will probably mean a longer life for the industrial boom which the strike interrupted and thus may help the Republicans to hold on to the Presidency in next November's election.

By lasting for almost four months the strike sent some economic indicators plunging down as fast as they plunged in the early months of the postwar recessions. But there was an important difference. The plunge this year was caused by a failure of supply; final demand continued to rise, though more slowly than before. The chief measure of economic activity, the gross national product, fell by 1.2 per cent in the third quarter of 1959 from its peak annual rate of $484.5 billion in the second quarter. The big shift was in business stocks which, instead of accumulating at an annual rate of $10 billion, as they had done in the April-June quarter, were drawn down at the rate of $1 billion a year. Although the direct and indirect effects of the strike have lasted well into the fourth quarter, no further decline is expected in the gross national product and the authorities are once again talking confidently about its crossing the $500 billion mark in the new year.

While it is commonly claimed that the strike did no permanent damage to the economic structure, it should be noted that its effects on wages and prices will not be known until a final settlement is reached. The strike would turn out to have been a fearful extravagance if the same old inflationary push upward were to be renewed after labour and management had been left to sit out their differences for so long. The "temporary" damage caused by the strike, some of which was obviously more than just temporary, chiefly affected employment, prices and the balance of trade.

Half a million strikers were out of work for a third of a year, and at least as many workers in industries dependent on steel were laid off for equal or shorter periods. The loss of wages is estimated at $1.75 billion. And this does not allow for those who were unemployed before the strike and who were forced to continue in idleness because the demand for labour declined. In this sense the strike has aggravated the problem of long-term unemployment, although lately the number of men at work has been the highest in history except for a few midsummer peak periods.

Prices have been described as "reasonably stable" in the past eighteen months, but recently they have started to creep up again. The tendency has been strengthened by the pressure on steel supplies. This has affected the buyers of cars; the popularity of the 1960 models, particularly the three small newcomers, coupled with the expectation that the steel strike would stop production, started a brisk demand for everything on wheels this autumn and thus for a change cars have not been selling at a discount.

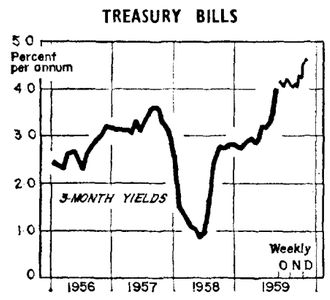


The steel strike has also had a direct impact on foreign trade. Imports of steel had been rising for more than a year before the strike, and they naturally swelled still further when the greater part of domestic production was cut off. Imports still account for less than 5 per cent of American steel consumption, and are mainly wire products and nails; but two years ago imports were less than 2 per cent of consumption. Meanwhile, the strike reduced exports to a trickle, and it is presumed that the foreign suppliers who leaped into the breach will not all withdraw voluntarily. In none of these three categories—employment, prices and trade—did the strike cause new damage. It confirmed situations that already existed and postponed the day when the difficulties would be solved.

In other areas, the impact of the strike has not been so clear-cut.

It has had two opposite effects on the demand for credit, for instance. In so far as there was "scare" buying of 1960 automobiles, the strike contributed to the continuing rise in hire purchase credit which has been going up by $500 million a month since July, with cars leading the way. On the other hand, the strike may have eased the demand for business loans, by curtailing the supply of steel available for production and by releasing funds which would normally have been tied up in stocks. Nevertheless the demand for loans has been heavy, and since the middle of the year they have gone up by almost twice as much as they did in the same period of last year. In the weeks since the output of steel was resumed the Treasury bill rate has climbed to new heights; part of the rise is attributed to steel, part to the general tightness of money and part to the seasonal demand for funds.

Construction has been declining unseasonably since early summer for a variety of reasons. The steel strike is one of them, but the tightness of credit is perhaps most important, particularly where the financing of private houses is concerned. Work has been or will have been started on 1,300,000 new private dwellings this year, compared to 1,100,000 last year, but last year the trend was sharply upward and this year it has been gradually—and now more sharply—downward. In the public sector, construction on the federally-financed highway system has also been delayed because Congress took so long to give in to President Eisenhower's demand for a higher petrol tax to finance the programme. And since that legislation provided less than enough to keep everything on schedule, there is more uncertainty about the years ahead.



In one important area—business investment in plant and equipment—the gentle rise has continued, in spite of the strike, and is expected to continue through 1960. Such investment this year promises to be nearly 10 per cent more than last year's $30.5 billion—the low point of the recession—and next year's may do as well again. The growth has been general, and it has been characterised by much greater increases in spending for equipment than for plant. In total, 1959 will have been a satisfactory economic year in spite of a most serious strike. It has demonstrated that a good boom is hard to break.

Democrats' Trial Run

THE liberal Democrats took over New York City last weekend, to honour Mrs Roosevelt, to inspect potential presidential candidates for 1960 and to draft a preliminary version of the platform on which they hope—although less confidently than they did a year ago—to win next year's election. In fact this gathering was almost a preview of the July convention in Los Angeles, except that it lacked the climax which comes when the presidential nominee is finally chosen. But there was plenty of bargaining in smoke-filled rooms with financial backers and local leaders—New York State has the biggest block of votes at the convention. And there were plenty of candidates wooing publicity, the elder statesmen of the party and popular acclaim. The latter came when each made his five-minute speech at the dinner—and Mr Stevenson won on both length and loudness of applause. But this did not mean that he was the favoured candidate for 1960. Rather did it underline the present weakness of his party—its nostalgia for its past, failures as well as successes, and its lack of any hero on which to build its future.

The divisions within the party, over strategy as much as over policy, were emphasised by the absence from the meetings of Senator Lyndon Johnson, who has given effective leadership to the Democratic majority in Congress but in directions which do not satisfy the liberals. Presumably he stayed away to dramatise his distrust of the National Advisory Committee which was responsible for last week's arrangements in general and for the draft platform in particular. This committee was set up originally after the 1956 disaster to give Democrats outside Congress, especially the liberals, a louder voice in the party's councils. Its influence is growing steadily, particularly now that it includes the leading southern moderate, Governor Collins of Florida. In present circumstances, nevertheless, it is a little hollow for the draft platform to accuse the Republican Administration of failing "to provide the bold and creative leadership required of the United States in this nuclear age."

Unfortunately for the Democrats the President has made peace, the most popular issue with the voters, a very Republican affair; in an attempt to win back a share in it, the Advisory Committee advocates the establishment of a National Peace Agency—an independent department in the government. Elsewhere in the platform, long-winded and conventionally New-Dealing as it is, there are a few more signs of the new approaches to the problems of the nineteen-sixties which, according to a growing number of thoughtful commentators, are what the American people want. Even though this platform is sure to be thoroughly modified before an election is fought on it, it gives the new Democratic leader something to work with—if only his party can agree on a good one.

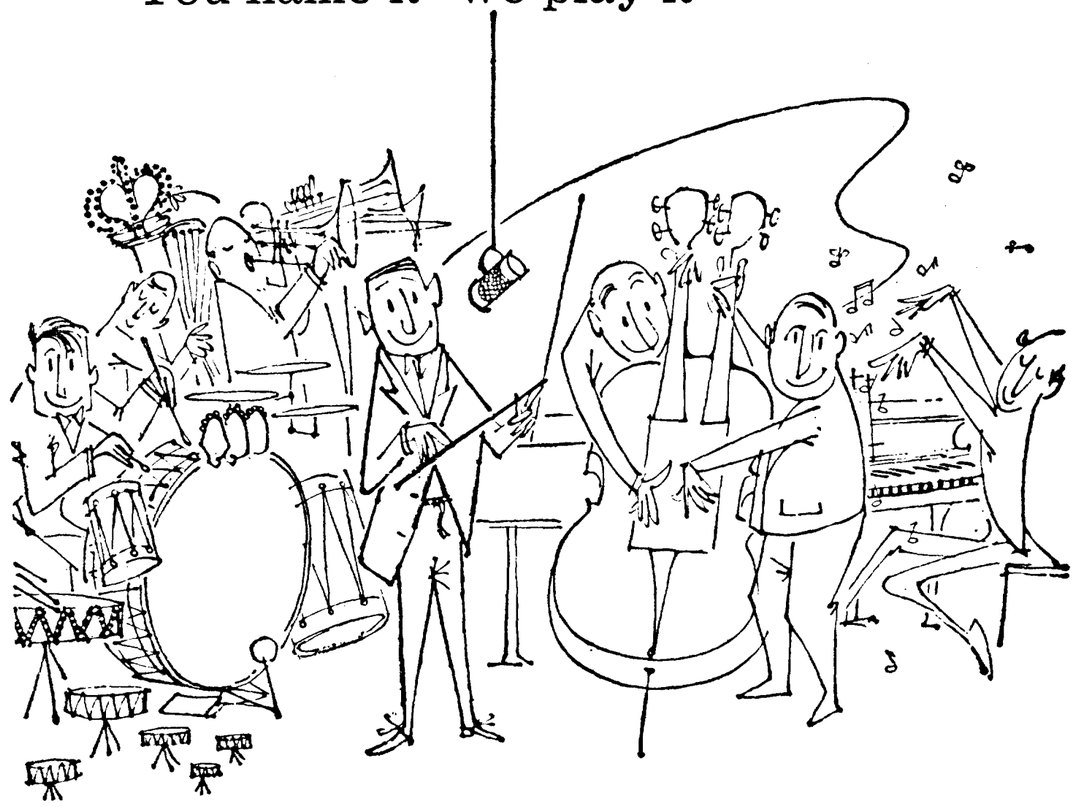
Example for Steel

THE big steel companies must feel increasingly out in the cold as other disputes, of less importance to the economy and some of equally long standing, are being settled. For the first time, an agreement seems almost certain to be reached in a dock strike within the 80-days cooling-off period prescribed by the Taft-Hartley Act; this would be a heartening achievement for collective bargaining, which has been given a bad name by the steel dispute. During the next three years dockers on the east coast are to receive an increase in pay and other benefits worth 41 cents an hour, and the employers win the right to install labour-saving machinery, something which the steel employers already have.

Substantial concessions have had to be made to win the union's consent to this. The size of work crews is not to be cut, as the employers wished, and union members are to receive compensation if work which they could have done goes elsewhere because of new methods of packing goods in large containers. The exact amount is to be settled by arbitration if it cannot be fixed voluntarily. This may be a wasteful and stop-gap method of meeting the problems, both human and economic, created by automation, but at least both sides recognise that they exist. Dockers in ports from Maine to Virginia will be voting while *The Economist* is in the press on whether to accept the master contract worked out in New York City, which usually sets the pattern for the whole eastern seaboard; they are not likely to reject it, but employers along the Gulf may.

Elsewhere the steelworkers' union is seeking agreements with industries which normally wait for steel to lead the way, but which now feel that they can afford to wait no longer. Two leading manufacturers of tins, fearful of their supply of tinplate, have agreed to a new three-year contract providing for wage increases of 21 cents an hour; this is a trifle less generous than the union's settlement with the Kaiser Steel Corporation, which it is hoping to establish as a general model. It has also opened

You name it—we play it



We play it high. We play it low. We play every octane of the petrol pops. We also get new music thrown at us regularly to try out on our barrel organs (catalytic crackers in the school books).

Still some of the people in our refineries sigh for the old days. Though we worked hard, things seemed simpler then. We weren't expected to get anything more than oil, petrol and a few chemicals from crude. Today we have turned super-professional and use the white coats provided. And we wrestle with a rush of new grades for new lubricants, chemicals and detergents. The enthusiasts in our research department seem to think there are no limits to what can be made from oil.

How do we hear you calling the tune? Through our marketing people of course. It seems you're pumping more insecticides into your garden. Your wife is lathering up more detergents than ever before. You're bathing more children in more plastic baths. The news is passed on to the Shell refineries. If you drive past one lighting up the night, you'll be pleased to know the professionals in there are turning the taps you want turned. You name it—we play it.

YOU CAN BE SURE OF SHELL

"Get me WHITAKER I want the facts on this,"

said the Managing Director

The Managing Director is an intelligent man. He knows where to go for the facts he is constantly needing. Whitaker's Almanack keeps these facts at his fingertips.

Whitaker's Almanack for 1960 is just out, packed full of the facts and figures that your work continually calls for. International and home affairs, U.N.O., sport, scientific discoveries, the Peerage, the Commonwealth and foreign countries, all aspects of business, Government and public offices—these and a thousand other subjects are dealt with in the new Whitaker.

HOW THEY VOTED

October's General Election has given us new M.P.s, a new Government, a new party line-up. All the figures: party strengths, majorities big and small, non-voters . . . all the facts: the new Cabinet, the new Speaker, Parliamentary summary—you'll find them in the new Whitaker's Almanack.

formal negotiations with the major manufacturers of aluminium for the first time since July, when the contract which was about to expire was extended to avoid a strike. Agreements of this kind, with users of steel and with manufacturers of aluminium, one substitute for steel, build up the pressure against the steel employers. Before he left Washington the President made an eleventh hour appeal to both sides to reach a voluntary agreement so that the government would not have to step in. He did not single out either side for special blame. But the companies have made themselves look pig-headed by turning down flatly all the suggestions of the Secretary of Labour for bringing a third party into the dispute to reconcile the quite small differences which remain.

THE NEXT PRESIDENT?—I

John F. Kennedy

While Senator Kennedy does not intend to make a formal declaration until the New Year that he is seeking to become the Democratic candidate for the Presidency at the convention which meets in Los Angeles on July 11, 1960, he has long been campaigning for the nomination with mounting intensity. A correspondent in Washington describes this man who is generally acknowledged to be ahead, for the moment, of all other Democratic contenders.

SENATOR JOHN KENNEDY of Massachusetts is the presidential candidate whose popular image contrasts most sharply with his real personality. The general impression is of a handsome, dashing, colourful Democrat who has many of the happy qualities associated with youth: high spirits, impulsiveness, a warm heart and an easy direct approach to life. Senator Kennedy is indeed handsome, but behind the boyish mask lies a convoluted and complex personality.

Extraordinarily self-contained and self-possessed, he is capable of an emotional detachment about himself and those around him that is extraordinary in a relatively young man (he is 42) and rare at any age. He has many admirers and a large and devoted staff, but almost no intimates outside his family circle. Egotism and a fierce will to succeed are Senator Kennedy's ruling characteristics. In the service of his own ambition, he is wily and coldly calculating, but not hypocritical. Candour is probably his most engaging personal trait. Senator Kennedy is unashamedly a man on the make.

His intellectual qualities are his strongest point. He is the most widely read of all the candidates and has himself written two books. Well-versed in history, government, economics and foreign affairs, he has great intellectual curiosity and is astute in "picking the brains" of the many experts whom he cultivates. He has good taste in speechwriters, too, and his addresses sparkle with urbane allusions and erudite quotations. If he were elected, he would be the most literate President since Wilson and would return the institution of the brains trust to the importance it had in the Roosevelt Administration.

Mr Kennedy is also an effective politician and would make a strong party leader. Elected to the House of Representatives in 1946 and to the Senate six years later, he has had thirteen years of the cut-and-thrust of legislative politics. He knows the ways of Congress and has earned the respect, if not the personal affection, of his colleagues, most of them his seniors by many years. He has toiled faithfully at the routine drudgery and his quickness of mind and mastery of detail were impressive in the debates on the labour reform Bill which he managed on the floor.

As a political chieftain in his native Massachusetts, Senator Kennedy has built a strong personal organisation and kept the local politicians, some of them unsavoury, at arm's length. In the drawn-out and complicated pre-convention manœuvres which have been under way for more than a year and which will continue until next July, Mr Kennedy has acted as his own manager and chief strategist. He has yet to make a serious mis-step. There can be no question that here is a man with a solid core of ability, native political skill and much finesse.

NEVERTHELESS, there are several grounds for doubt about Senator Kennedy. One is his Roman Catholic religion. There is irony in this because Mr Kennedy, like most of his rivals in both parties, is close to being a spiritually rootless modern man. He performs the prescribed devotions of his faith, but his accession to the Presidency would no more mean "the Pope in the White House" than the election of an Episcopalian would signify the coming to power of the Archbishop of Canterbury.

Another cause of distrust in Senator Kennedy is the possible influence over him of his father, Mr Joseph Kennedy, the former ambassador to Britain. The elder Mr Kennedy has privately voiced anti-Semitic sentiments and has publicly expressed isolationist, "Fortress America" views; he also aligned himself with the late Senator McCarthy. The younger Kennedy is impeccably liberal in his voting record and does not share his father's private or public prejudices. Yet these worry many liberals.

More serious are the criticisms of those who profess to see in Senator Kennedy's record a dismaying pattern of retreat before pressure. Over a period of several years, he gradually altered his views on the relations between church and state until he had arrived at a highly simplified position that was acceptable to most Protestants but objectionable to many of his fellow Catholics. During his early years in the Senate he voted to support the farm programme of Mr Benson, the Secretary of Agriculture, but after the opposition of the farm states cost Senator Kennedy the nomination for the Vice Presidency in 1956, he shifted to an anti-Benson line. The leaders of the trade unions are divided on whether he made too many concessions to the conservatives in Congress during the drafting of the labour law.

His most spectacular surrender was to a part of his own Irish-American constituency in Boston. While he was running for the Senate in 1952, and until 1956, he vacillated on McCarthyism and evaded the moral challenge which it posed. Mr Kennedy has offered the defence that the issue of McCarthyism was a matter on which he did not have a strong, automatic reaction of his own. He has expressed some envy for liberals who instinctively and unhesitatingly rose to battle against McCarthy. This defence is revealing. It raises the query—on what issues does Senator Kennedy feel deeply and respond instinctively? This awkward question must be asked of presidential aspirants because in the American system of government so much depends upon the convictions and personal style of the man at the apex of power.

The tentative answer in Senator Kennedy's case must be that he has no reservoir of deep feelings about public issues. His approach is almost wholly cerebral. His tolerant, humane, liberal opinions are not nourished by any discernible hatred for injustice or any fellow feeling for the suffering and the deprived. This emotional thinness is distressing to those liberals who regard the struggle for civil rights for the Negro as the touchstone in domestic

politics and assistance to the underdeveloped countries as the touchstone in foreign affairs. Mr Kennedy's stated views on both these great issues are adequate, but his critics fear that if he were burdened by the enormous weight of the Presidency he might have neither the self-consistent philosophy nor the emotional stamina to persevere in those views.

These doubts may do Senator Kennedy a serious injustice, but there is nothing he can do between now and the nominating convention to disprove them. It is in this sense that it is unfortunate that he has had no executive experience. Any public man can learn quickly enough the routines of administration, but only through the trial-and-error of executive action can he demonstrate the depth and character of his convictions. Unfortunately for Senator Kennedy, he seems destined never to acquire any proper preparation for the post of chief executive. For if he is not nominated for the highest office his fellow Democrats appear determined to consign him, for vote-catching purposes, to what it usually the dusty futility of the Vice Presidency.

Protection for Migrants

An American Secretary of Labour must expect to be sniped at by both trade unions and businessmen but now Mr Mitchell has drawn the fire of a new set of adversaries, the Department of Agriculture and the farming organisations. For some time he has been concerned over the low wages and poor living conditions of the 400,000 migrant native farm labourers, whom he calls the "excluded Americans." Now he is requiring farmers who use federal or state employment agencies for recruiting their seasonal labour to pay their itinerant workers the wages "prevailing in the area" and to provide them with transport and housing which is up to local standards. The Department of Agriculture, with the encouragement of "corporate" farmers who will be the principal sufferers from the new regulations, opposes these strongly on the grounds that they will raise farming costs considerably; and they have been denounced by the Secretary of Agriculture as involving

Lessons of the Freeways

FROM A SPECIAL CORRESPONDENT

With the building of the 41,000 mile interstate highway system, the United States is turning into one vast complex of freeways; these are the limited-access roads planned, like the new British motorways, to move large numbers of cars as safely and as rapidly as possible over long distances. Most people are familiar with their massive construction, intricate design and vast cost, and with their gargantuan appetite for land, particularly for "cloverleaf" approaches. But apparently neither the public nor many of the officials involved realise how many new problems the freeways create.

The expert in handling traffic on them must be a specialist both in fluid-flow physics and in human psychology. Moving large numbers of cars safely, at today's high speeds, depends on knowing what people, with all their inefficiency and often plain contrariness, are likely to do next and getting them, unobtrusively, to do the right thing.

In one sense, the traffic engineers have been successful. Freeways cost from $3 million to $15 million a mile to build, and everything about them is expensive. It cost $1 million to provide adequate signs for Denver's eleven-mile Valley Highway. It costs $32,000 a day just to police the freeways in southern California. Because of the danger of floods, this road system must maintain 156 pumps in low spots and under-passes; it is also the largest single user of irrigation water in southern California because it landscapes thousands of acres. Yet in spite of such formidable expenses, the freeways carry people more safely and at a lower cost a head than ordinary roads; this is because they move so many more vehicles.

Problems begin, however, the moment that a designer gets to work. One is that freeways must be fitted in to the existing roads; it would be disastrous to discharge a huge flow of traffic just outside a town and leave it to find its own way. How frequently the motorist should be able to get on and off a freeway also causes much heart-burning. Too many exits and entrances would frustrate its only excuse for existence, the rapid movement of traffic over long distances; this is why, if a driver misses his turning, he must go on to the next even if it is 20 miles away.

For the same reason, and to reduce accidents, the "dividers" between the two sets of lanes are being made higher and more impenetrable all the time. Sometimes trees hide the lights of oncoming traffic; sometimes the lanes are a hundred yards or more apart. Given the least chance, a driver who changes his mind and wants to turn back will make a U-turn right across the dividing strip.

The very size of the operation creates its own frustrations. An interruption of one minute may halt a mile of vehicles and a five-minute block will have stationary drivers cursing five miles back. Sometimes people act like lemmings bent on suicide. Wind creates unexpected hazards. Tall vehicles such as caravans and high-sided lorries are not allowed on the Kansas freeway when the velocity reaches 25 miles an hour because they are easily turned over, and may block the road for hours. Motorists on 40-mile stretches without a turn-off are warned that headwinds will eat up their fuel supply faster than they think; even so the number stranded with empty tanks goes up astronomically when such winds rise.

Many motorists are unaccustomed to driving on freeways and panic when faced with the unexpected. But the commonest accident is a rear-end collision, which may pile up a number of cars, and is caused by sudden slowing-down and stopping. The engineers are urging manufacturers to install three-way rear lights, green for constant or increasing speed, amber for slowing down, red only when stopped.

Many other devices are being discussed: methods of reporting instantaneously to the controller whenever a car stops on a freeway; closed television circuits to keep trouble-spots under his eye; special wireless channels to which car radios may be tuned; and a computer which will give warning of trouble before it develops. The time may come when special driving skills will be required for a licence which is good on freeways, and when older cars as well as older drivers may be barred from them. Recently Detroit found that it had no law to keep horses, bicycles, funeral processions and even pedestrians off its freeway and it had to pass one.

The chief lesson for designers and traffic controllers to learn is that there is no substitute for vigilance and intelligent foresight. For example, it should have been foreseen that a multi-lane freeway must have shoulders wide enough to park on on both sides of each lane; a car in trouble which has to cut across half a dozen lines of high-speed traffic is asking for more.

TWA NEW LONG-RANGE INTERCONTINENTAL BOEING 707

On November 24 TWA introduced the new Long Range Boeing 707 Intercontinental — the world's fastest and largest Jetliner — only 7½ hours non-stop London to New York. Leave London 5 p.m., arrive New York 7.30 p.m. Cocktails with your friends in Mayfair — dinner in Manhattan! Just a few restful, luxurious hours in the air and you're *there*, non-stop. Your return flight New York - London takes only 6 hours 25 minutes! And if you're going beyond New York fly on TWA's mighty Jet fleet, again non-stop, coast to coast or to America's major cities. Choose De Luxe or Thrifty Economy Service.

For Reservations see your Travel Agent or call TWA

TWA FASTEST JETLINERS NON-STOP USA

" federal intervention and administrative control and regimentation . . . so repugnant to agriculture."

But the often appalling working and living conditions of these American migrants who follow the seasonal crops around the country are also receiving belated attention from Congress and from certain state authorities. An official survey* has characterised them as occupying " the lowest level of any major group in the American economy " ; earning an average of less than $900 a year, they do not come under minimum wage legislation and as transients are not entitled to such welfare benefits as unemployment insurance and compensation for injuries. Yet the mechanisation of agriculture has increased the need for large numbers of temporary workers at harvest time ; the picker who distinguishes between ripe and green fruit has yet to be replaced by a machine.

The 450,000 Mexicans, Canadians, West Indians and Japanese who enter the United States temporarily each year under labour contracts to help fill this need are cared for better than are the native American migrants, who are mostly Negroes and Puerto Ricans. The latest agreement between the United States and Mexico, which supplies about 95 per cent of this foreign labour, provides that these *braceros* may now work as ranch hands as well as crop pickers and they are guaranteed employment, transport, housing and insurance. In an attempt to extend such protection to migrant domestic farm workers a Senate subcommittee is holding hearings on Bills which would establish minimum wage standards for them, register the crew leaders who recruit and transport (and not infrequently exploit) them, and protect the migrants' children who customarily work beside their parents in the fields. Several states have already adopted legislation controlling the crew leaders, while New York, Pennsylvania, and Delaware have housing codes covering the migrant labour camps and Maryland hopes to have them before the next harvest. But this piecemeal approach and the differing standards in different states have led the National Advisory Committee on Farm Labour to propose that native workers be protected not only by the federal minimum wage law but also by federal enforcement of adequate housing, safety and health standards.

No Longer Long

THE resounding defeat of Governor Long in the Democratic primary election in Louisiana has finally killed his attempts to by-pass the constitutional prohibition against a Governor succeeding himself in that state. The primary is held to decide who will represent the Democrats in the coming gubernatorial election and has in fact usually been the deciding contest ; this year, however, there may be more effective Republican opposition. Governor Long had originally planned to resign from office and hand over to his Lieutenant-Governor for a few months while he himself ran again for election; but in the end he was forced to stand for the secondary post while backing a puppet for the governorship.

In its wisdom, now revealed for the first time, the Louisiana electorate rejected them both and the future Governor will be chosen in the January run-off between Mayor deLesseps Morrison of New Orleans and the hill-billy singer and former Governor, Mr Jimmy Davis, neither of whom secured, on his first ballot, the absolute majority over the other ten candidates which is required for victory. Mr Morrison, who tried unsuccessfully to win the governorship in 1956, is a Roman Catholic and has been a vigorous reform Mayor since 1946. In last week's contest he had a considerable majority over his opponent, sweeping south Louisiana and also winning the Negro vote from Governor Long. But this lead could be wiped out in January if the votes of the defeated candidates are switched to Mr Davis, who is more acceptable both to the segregationists and to rural Protestants in the north.

The result of the primary seems to mark the collapse of the Long family's political power in Louisiana, though the writing was on the wall in August when the State Legislature—whose acquiescence he once claimed to rent rather than buy because it was cheaper—refused the Governor's request for a special session. The rebellion was provoked by his peculiar behaviour during the summer. After twice being committed to a mental hospital and having a heart attack, he dismissed his many doctors and psychiatrists on the grounds that he knew as much as they did. He then conducted a violent campaign for re-election, pressing, among other schemes, his plan for a two-ply highway system: one for sane people and the other "for nuts and drunken drivers." The flight of the Governor's fair-weather supporters can scarcely have been slowed by his announcement that " if I am crazy now, then I have been crazy all my life."

Mr Long's defeat, if it is indeed the end of " Ole Uncle Earl," frustrates his alleged desire to rival the political martyrdom of his even more notorious brother Huey. It leaves Senator Russell Long, Huey's son, as the dynastic heir and he is said to covet the governorship when it comes up again in 1964. But the able young Senator will find the family political machine shattered and the anti-Long forces greatly strengthened by his uncle's recent excesses.

**Farm Labour Fact Book,* US Department of Labour, 1959, 240 pp., $1.00.

SHORTER NOTES

The Federal Reserve Board has allowed so-called country banks, which have to keep a reserve of 11 per cent of their demand deposits, to count as part of that reserve any cash they have in hand in excess of 4 per cent of demand deposits. Until now only the amounts actually placed with the Reserve Banks were credited as reserves. This change is the first step in what will be a gradual implementation of the new law authorising the counting of all cash holdings. The chief effect of the present move will be to allow country banks to meet their particular need for larger cash holdings, especially at Christmas time, without penalising their reserves. The Reserve Board regards the move not as a modification of its general policy of tight credit but as part of the operation by which it customarily provides more money at this time of year.

* * *

The Supreme Court has refused to review the judgments made in lower courts earlier this year on three cases which had been brought to test the validity of the Administration's ban on travel to Communist China. Thus the ruling of the lower court stands ; it found that the government's policy was legally valid on two grounds ; firstly, that Congress had specifically authorised the President to restrict travel ; and, secondly, that his power to conduct foreign affairs independently of Congress includes the authority to prevent any travel which might endanger the national interest. The Supreme Court's ruling caused some surprise since counsel in the three suits had relied heavily on its decision in 1958 which questioned the Executive's right to refuse to issue a passport and stated that the Constitution protected the citizen's right to travel.

East Haven, Connecticut, has a Trolley Museum which offers genuine tram rides every Sunday afternoon. Traditionalists approach the museum from the old Boston post road. Students of social change take exit 51 from the Connecticut turnpike.

OUTER SEVEN

EXPORTS TO DENMARK

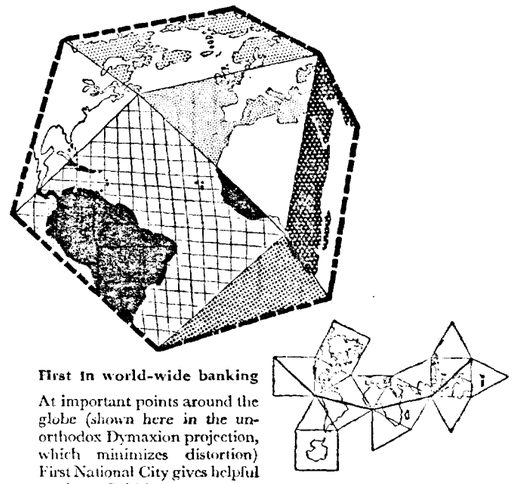
Your plans for trading with the Outer Seven may include Denmark. If so it will be in your interest to work with a well-connected and up-to-date sales organisation.

Denmark is not an easy market. However good your products, an individual approach and prompt, first class service are essential. We act as sole agents and distributors for a number of smaller manufacturers and also for big industrial groups. Our sales staff is well qualified both commercially and technically, and our organisation is strong enough to handle more lines. We would thus be interested in discussing with export-minded concerns the possibility of introducing their proven products. Food products and textile-consumer goods are excluded.

Please communicate with the Managing Director.

BOEG—THOMSEN A/S

48, Svanemøllevej, Copenhagen, Ø.



First in world-wide banking

At important points around the globe (shown here in the unorthodox Dymaxion projection, which minimizes distortion) First National City gives helpful service to British exporters.

78 branches in 27 countries

Why The First National City Bank can do more for you overseas

WORLD-WIDE COVERAGE. First National City spans the globe, with 78 branches in 27 countries, equipped to handle personal and business accounts, loans, advances and securities.

LARGE STAFF. 6,300 skilled personnel overseas and 9,200 in New York are ready to help in every way.

PERSONAL SERVICES. We will be pleased to give our business friends a letter of introduction to any of our branches to ensure for them a warm welcome and personal attention.

FACTS QUICKLY AVAILABLE. Up-to-date credit and economic information are readily available through our world-wide branch system.

LOCAL INFORMATION. First National City can also call on many thousands of knowledgeable banking correspondents in every important centre of commerce. Their exact information about local conditions can make all the difference to your business.

Call on us at either of our two London branches, and find out for yourself how much we can help you.

Plain talk about management control

A data processing system, from the smallest punched card installation to the big jumbo sized computer, is simply a device to give you time to think. It doesn't need most of next month to work out last month's figures, and so you can go to your management meetings with facts that are news as well as history. You can get your figures early enough to take the right action. You can reload your plant before you miss the market, spot dead weight before you begin to feel it drag, blow out the bottlenecks before they begin to clog the works. The true picture of a company is a dynamic one, influenced not only by its own affairs, but by national, industrial and human factors.

A data processing system can take into account any factors you decide are relevant to your company's business. This is the beginning of scientific management control.

Plain talk about I·C·T

I·C·T make the widest range of data processing equipment in the world — computers, electronic calculators, punched card machines. Something to fit any company of any size.

I·C·T are specialists in data processing

I·C·T equipment will earn every penny of its keep in helping your organisation to run smoothly. Extend it to its limit and it becomes an instrument of management. I·C·T are using all their formidable resources to extend the techniques and applications of modern data processing. They are far more than just manufacturers of equipment. They are specialists in the use of data processing machines to promote and assist scientific management.

I·C·T are at your service

I·C·T will examine your problems and tell you precisely what they can do to help you. They are ready to advise you and to educate your staff in data processing techniques. This is I·C·T service, using all the resources of Hollerith and Powers-Samas, two pioneers of data processing.

REFORMING SAUDI ARABIA—I

The Saudis Take Stock

FROM OUR MIDDLE EAST CORRESPONDENT

Riyadh

For the first time in years, too many men are chasing too few jobs in Saudi Arabia. A prolonged business depression is the price the country has had to pay for reckless expenditure on imports used largely for the purpose of conspicuous waste. The crisis broke last year after heavy drawings had been made on the central monetary agency in an effort to redress an adverse balance of trade. At par, the Saudi riyal is worth 3.75 to the dollar. When, last year, it reached six to the dollar on the open market it was clearly time for drastic measures to be taken if the national till were not to be completely emptied.

To stop the drain, Amir Faisal, who is crown prince, foreign minister and minister of finance, forced through a series of austerity measures. The import of some luxuries was stopped altogether; the issue of import licences for some of the less luxurious luxuries was strictly curtailed. All but essential projects, or rather projects believed to be essential, were brought to a halt. The abrupt reversal of a ten-year-old inflationary process led straight to depression and despite grumbling and unemployment, deflationary pressures were kept up as a deliberate act of policy.

Although many business men look back with longing on the days when money ran away like water in the desert *wadis*, the effects of the present depression should not be exaggerated. The figures show that, while the import of luxury items and materials for construction has been cut back, foodstuffs and other essentials are being brought into the country in good quantity. After one full year of austerity, total imports fell from a record level of $220 million in 1957 to $214 million—a trifling difference. Incomplete figures for the current year indicate a further, though by no means sensational, drop. This is the more remarkable as the Arabian American Oil Company, the kingdom's only great industry, has cut its capital investment programme to about half of what it was because of the sluggish state of the international oil market.

The social effects of unemployment are less marked in Saudi Arabia than in more advanced communities. Much of the labour force is casual or at least semi-casual. Workers drift in and out of jobs at will and those laid off in recent months have drifted back to the villages or deserts from which they came. Many would have laid themselves off anyway.

Apart from the balance-of-payments crisis, which is being gradually resolved, there is the problem of the government's debts. Outside the country there have been wild stories that the government was three, or five, years in debt to the oil company. In fact, the debt is not crippling and never has been. According to a well-placed Saudi source, the internal debt of the government, owed mainly to local bankers, merchants and contractors, is about 350 million riyals. This figure is hard to sort out because the creditors have been known to submit bills for twice, or three times, what they were really owed in the fond hope of eventually being able to compromise on some reasonable figure. The royal debt is thought to be about 80 million riyals and the external debt about $40 million. A total national debt of around $115 million should be wholly manageable for a country with a virtually guaranteed oil income of some $350 million a year. If bonds could be issued to spread the debt over a longer term, say ten years, the problem could be shrugged off. But Saudi Arabia lacks the financial institutions capable of carrying out such an operation; the result is that the debt is always a weight around the government's neck. A greater part of the external debt is made up of short-term loans guaranteed by the oil company.

Good results have already been achieved by the austerity programme. A dollar no longer buys six riyals; the current rate is just under 4.75. Cover for the paper riyal, mostly in the form of foreign exchange, has climbed from an uncomfortably low ebb to the satisfactory level of 70 per cent. The recovery has been accompanied by less welcome features, such as the slowing down of sound projects like road-building and the tendency to economise by letting the salaries of government officials fall into arrears. But, while recognising that there is much amiss, financial and trading circles have been surprised by the speed with which the crisis of the riyal has been averted.

The main weakness of the Saudi economy in the past was the absence of a basic financial law. Those in power, or with access to the right quarters, drew the country's money as they liked. The lack of control meant that nobody knew what would happen next, nor indeed what was happening at the moment. The result was a scramble to cash in before it was too late.

The first step to correct this weakness was Amir Faisal's decision to enforce respect for budget estimates. Much friction was provoked by this radical departure from previous practice. No proper accounts had been kept and it was difficult to determine what debts were owed to whom. The patience of Amir Faisal, and those who thought like him, was sorely tried. But much of this work has now been accomplished. When King Saud goes forth to distribute largesse, which he still does, it is his own money that he is spending—money allotted to him in the current budget. Whether the King is satisfied with his present allocation is another matter. Many of his subjects wish that the civil list was more generous—on the ground that there would then be more coaches on the gravy train.

One conspicuous result of the new order is a reduction of the authority of the famous foreign advisers—the Palestinians, Syrians, Egyptians, Libyans and others who have exercised so much influence on Saudi affairs in past years. Gradually they have been edged from the centres of power, and the state, by and large, is now run by Saudis. At Amir Faisal's elbow stand Amir Fahad and Amir Sultan, the ministers of education and communications. Apart from King Saud himself, these three are the most able of the 35 surviving sons of the late King Abdul Aziz. A local wag has remarked that it is all to the good for the owners of the firm to be back in control of its affairs. In the old days, when the foreign advisers were in power, their interests were strictly short-term. The firm of Faisal and Brothers has more at stake.

(To be concluded)

A Canadian View of Australia

FROM OUR OTTAWA CORRESPONDENT

NEARLY 20 years ago Mr R. G. Menzies called for the development of "horizontal relations" between Commonwealth countries to supplement their "vertical relations" with Britain. The theme has lately been recalled by a message from Mr Menzies to the *Financial Post*, of Toronto, which has just put out a 44-page supplement on Australia; this must be the fullest treatment ever given to the sister-Dominion in a Canadian publication. "We have a good deal in common," Mr Menzies wrote:

> Climatically, of course, there is a great deal of difference; economically there is very little. Your north is cold; ours is semi-tropical. But in one sense they are both similar: they are both frontier areas.

Taking up the theme, the *Financial Post* wrote:

> Australia's population is strung out in a thin belt around three sides of its coast in as long and thin a belt as Canada's. . . . Like Canada it consists of widely scattered settlements clinging to the one hospitable edge of the country. Like Canada it has huge empty stretches even along the edge. And like Canada it has the constant irritation of uninformed people looking at the map and saying "Look at all the space they are doing nothing with."

These two countries have usually seen each other mirrored in an English (or Scottish) reflector. It may be an English book (such as Mr John Pringle's recent "Australian Accent"); or it may be an Australian writer who, in a valiant effort to get outside his subject, tries to see Australia from the point of the view of the other country he knows best. In either case the use of a British mirror distorts the picture for Canadians; and no doubt the same is true the other way round. So much of what Australians feel it necessary to say to the people of the British Isles just does not need saying to a Canadian, because it is experience they have in common, the normal state of existence in the so-called "new countries."

The similarity of Australia's problems to Canada's, and the basic similarity of the two peoples' outlook, even when their solutions diverge most widely, emerges from many of the articles in the Canadian paper. It appears in what Sir Bernard Heinze says about Australian development in the arts. He uses a phrase which surely Mr Vincent Massey will envy. After the early days of exploration and development, he says, this is "the second stage of pioneering." The parallels are equally clear in Sir George Paton's article about university problems, in articles about transport (always a vital subject in sparsely-settled countries like these two), and about the financial and constitutional arrangements of a federation.

SIR GARFIELD BARWICK, the Australian Attorney-General, explores a constitutional paradox. He explains that the central government in Australia is vested with powers that are enumerated on a list; all the residuary powers are retained by the states. The Australian government, unlike the Canadian, has no residuary powers. As he makes clear, it was the deliberate choice of the Australian constitution-makers to reject the Canadian pattern (34 years older) in favour of the American emphasis on states' rights. But the sequel has been surprising: the Canadian provinces, which were envisaged by the founding fathers as something more like English county councils, have surrendered far fewer of their rights to the central government than the Australian states have. The centralisation has taken place in the country which set out to bolster the rights of the states.

The wartime surrender of taxing powers to the central government appears to have become permanent in Australia: the only protest against the system of "tax reimbursement grants," on which the Australian states live, was uttered at last summer's conference by the representative of Victoria—who eventually accepted the plan. But two Canadian provinces are actually raising their own taxes: Ontario collects corporation income taxes; Quebec collects both personal and corporate taxes. The other provinces let Ottawa do the collection but take the revenue (13 per cent of personal income tax and nine per cent of corporation profits) which is recognised as their share. Again, the surrender of the borrowing powers of the Australian states to the Loan Council, which is inevitably dominated by the federal treasury, has no parallel in Canada, where the provinces raise their own loans wherever they like. A quarter of their total debt is owed to foreign lenders.

Similar paradoxes arising out of equally similar problems appear in current economic developments. Both countries are proud of their rapid rate of development; both mean to push it forward. Manufacturing industry has, in fact, grown faster and further in Australia than in Canada, according to the *Financial Post*. Australians employed in manufacturing are shown as 126 per cent of the 1949 figure, while the figure for Canada is 110 per cent of 1949. A comparison based on the value added to raw materials by factory processing shows Australia at three times the level of 1949 and Canada at less than twice 1949. The volume index of factory production prepared by the Australia and New Zealand Bank reached 138 per cent of 1953-54 at the end of last year. Canada's official index, converted to a 1953-54 base, was still at about 116 per cent—though this gap may have narrowed during 1959. One final comparison shows 30 per cent of Australia's employed labour force engaged in manufactures, against 25.6 per cent for Canada. Primary production employs less than 14 per cent of the Australian labour force and 16 per cent of the Canadian. Canada also appears to have a larger proportion of its employment in the tertiary industries and services.

THESE figures are not, at first sight, what one would expect from the relative rates of development and relative degree of foreign investment, shown in some other new calculations. Adjusting figures to match Canadian statistics, the paper says that Australia's new investment in capital facilities has represented between 19 and 20 per cent of gross national product consistently in every year since 1951. Canada's has been higher, but much more variable, ranging between 21.3 per cent and 27.7 per cent. Canada also appears from these calculations to have been far more dependent on foreign capital. Its current account deficits over the last five years are shown to have averaged 15 per cent of its external spending. Australia's came to 11 per cent.

A Canadian correspondent writing from Canberra contrasts Australian and Canadian attitudes to foreign investment and the need for new capital. Much as Australians want foreign capital, he says, the official Australian view is that the country is already getting all the capital it can use. Manpower, not capital, he reports, is the limitation on pace of development. "A Canadian interpreting this view," says the correspondent, "is bound to see it as a determination not to get involved in the inflationary sort of boom which Canada suffered between 1955 and 1957." Much of this difference in attitude, if it is correctly reported, is no doubt explained by the different balance-of-payments positions of the two countries. Australia has "balance-of-payments difficulties" in the sense of the term accepted by the International Monetary Fund, the General Agreement on Tariffs and Trade and all the most respectable people. Canada's balance of payments continues to present an irresistible surplus through boom and recession alike, because the inflow of capital is unrestrained and apparently limitless. This year again it covers a current account deficit of more than $1,500 million and keeps the Canadian dollar at a heavy premium which does some branches of the economy a good deal of harm. Canadians are increasingly disposed to envy Australia its ability and determination to retain control over its external exchanges. The

banking on EMIDEC

Mr. Jones negotiates a merger; Mr. Robinson buys a car; Mrs. Brown pays her dressmaker. In 40,000 current accounts spread over 15 West End branches of Barclays Bank Ltd. the money is on the move, and the flow quickly becomes a torrent.

Barclays choose EMIDEC

More people in Britain are now using banks than ever before. To ensure the greatest possible efficiency, despite the ever-increasing volume of business, Barclays have ordered an EMIDEC 1100 electronic computer. Designed by E.M.I. Electronics Ltd., it will be the first of its kind for any British bank.

The EMIDEC 1100 is an advanced machine employing magnetic core and transistor techniques and is capable of operating at very high speeds. The Barclays installation will live on a diet of information transmitted by teleprinters from the bank's West End branches. In this way Barclays are ensuring that they will be able to meet modern conditions with the most advanced methods available.

E.M.I. Electronics Ltd. is one of the leading automation organisations in this country. In addition to office computers it manufactures analogue computers, machine tool control systems, process control equipment, closed circuit television and a wide range of other devices.

EMIDEC computers have been selected by many other major organisations, including:

AIR MINISTRY · B.M.C. · SAINSBURY'S · BOOTS · GLAXO MINISTRY OF LABOUR · I.C.I. (PLASTICS DIVISION) KODAK · B.A.O.C. · B.E.A. · MINISTRY OF PENSIONS

Literature giving full details of EMIDEC computers will be sent on request.

sophisticated are beginning to ask why too much foreign capital should not justify, equally with too little, a formal claim that Canada is in "balance-of-payments difficulties." The more these two countries learn of each other, the more their basic policies will require such reconsideration ; and the more they both will profit.

Sicily's Odd Man Out

FROM OUR ROME CORRESPONDENT

SIGNOR MILAZZO'S regional government in Sicily fell on Monday, when two unidentified members of its heterogeneous majority voted against the budget, which was thereupon thrown out by 45 votes to 44. These *francs-tireurs* are thought to come from the ranks of the "independents" who left the right-wing parties to join Signor Milazzo last July when the Sicilian regional elections confirmed, in a qualified way, the popularity of his experiment. His government rested on a precarious majority of 46 (out of 90). In addition to his own party, the dissident Social Catholic movement, it was supported by the Communists and Socialists and by some independents from the Right.

Just before the final vote on the budget Signor Milazzo had obtained a majority for a clause authorising him to spend 200 million lire on propaganda for Sicilian autonomy. His defeat comes at a crucial moment in the controversy over the regions. The left and left-centre parties in Rome are pressing to implement the clause in the constitution which lays down that all Italy should be divided into 19 regions, each with its own assembly. Umbria is agitating for its own statute. The right-wingers, including part of the Christian Democrats, oppose any further extension of regional autonomy beyond the four regions which now enjoy it (Sicily, Sardinia, Trentino-Alto Adige and Val d'Aosta), since they fear that regionalism would lead to a left-wing predominance in central Italy. None of the existing regions except Sardinia has left its government in Christian Democrat hands. Signor Fanfani and his group have belatedly espoused the regional cause. Just over a year ago Signor Fanfani's centralising policy—he was then prime minister and party secretary—provoked a reaction which caused the Christian Democrats in Sicily to split, put Signor Milazzo in power and left the majority of the Christan Democrats in opposition. Reasons of prestige, and the fear that the Sicilian example might prove contagious, make them anxious to recover power in Palermo and there have been negotiations with Signor Milazzo since the party congress in October. But the party is divided: should it aim at a left-centre government in Sicily with Signor Milazzo, or a right-centre with the Liberals, Monarchists and neo-fascists ?

Meanwhile relations between the Socialist party and Signor Milazzo have become strained. The Socialists feel that Signor Milazzo is procrastinating over economic and agrarian reform. They have been pressing him to publish the plans for the implementation of land reform prepared by the previous assembly. They think some of his friends took fright at the prospect that once the budget was approved, these plans might have been put into execution. The region has substantial funds in its coffers ; it could, if it chose, make a start on land reform and embark on a planned industrial development. The Socialist party's central executive discussed withdrawing support from Signor Milazzo, but decided to stick to him on account of the party's commitment to a policy of regional autonomy. Its doubts may have helped to weaken Signor Milazzo's position. There is some reason to think that Signor Nenni, the Socialist leader, contemplated an agreement with the Christian Democrats in Sicily even without Signor Milazzo ; but Signor Nenni has his own left wing, which has not got to the point of being prepared to throw the Communists over.

Since his defeat, Signor Milazzo has sought to justify his incongruous formula for government by explaining the viewpoint of the poor Sicilian landlords (he is one himself), who have nothing in common, he says, with the rapacious industrialists of the north. Next Tuesday, December 15th, the assembly meets to appoint a new junta. The outcome is as problematic as it was in July. The Christian Democrats have 34 seats, the Communists 21, the Socialists 11, Milazzo nine and the neofascists nine.

What Africans Ask

BY AN AFRICAN CORRESPONDENT

AT this stage the Labour party must have enhanced its reputation among Africans by its decision to boycott the Monckton commission. The Africans in the Federation had thought that the commission would be properly balanced by the requirement that thirteen of its members should be from the federation, thirteen from the United Kingdom and two from the Commonwealth. They had hoped that those from outside the federation would be impartial, objective and uncommitted. They anticipated that the representatives from the federation would be supporters of Sir Roy Welensky, and with a few exceptions this has proved to be correct.

But the British representatives already chosen are all believed by the Africans to be pro-settler. The two Commonwealth representatives are authorities in their respective fields of study, but nothing more. The Africans had hoped that at any rate one of the Commonwealth representatives would come from Malaya, with its different races and nationalities. They would have preferred not to have an Australian representative, since Australia discriminates against its aboriginals and against Asians ; moreover, Australia's voting record at the United Nations on apartheid in South Africa has been overwhelmingly pro-South African.

In Southern Rhodesia, where there is no African organisation, African moderates who are respected by the African community because they are all successful professional men have declared that the Southern Rhodesian representatives on the commission are unacceptable ; they have demonstrated their disapproval by sending a cable to Mr Gaitskell. The two congresses in Northern Rhodesia, and the Malawi Congress and the Congress Liberation party in Nyasaland, have also declared their representatives on the commission to be unacceptable.

Thus the voice of the Africans of Central Africa has spoken against the composition of the Monckton commission. Mr Macmillan's refusal either to alter the commission's terms of reference or to change its membership suggests that the opinion of Africans is again to be ignored. What hope is there that the recommendations of the Monckton commission will be acceptable to them ? What hope is there that the conference due next year will produce a just solution of the problems of the federation ? How, Africans are asking, can Sir Roy Welensky's supporters on the commission agree to giving Nyasaland self-government with a legislature and an executive that are elected by the Nyasas themselves ? How can they permit the secession of Nyasaland from the federation and its association with those countries which it believes will not threaten its rights ? In brief, how can Sir Roy's government agree to a federal reconstruction which will involve the abdication of power by the privileged minority ?

It should be noted that Southern Rhodesian Africans are in favour of self-government for Nyasaland, and they do not believe that if the federation were weakened or dissolved Southern Rhodesia would join South Africa. In 1922, when there was no anti-English government in South Africa, the white Rhodesians voted against such a merger. They would again, strengthened by the many

South Africans taking refuge there from Afrikaner rule. Further, Africans in Southern Rhodesia would revolt against being taken into the Union against their will; and they believe that the world (including Great Britain) would not allow another 2,500,000 Africans to be surrendered to apartheid. On the contrary, Africans in Southern Rhodesia believe their present disabilities must be alleviated. In Southern Rhodesia they want a liberal franchise, not geared to a money income based on the artificially high wages of the white workers, and a bill of rights written into the constitution. But after the Conservative government's record over the African Affairs board, the federal franchise and the Devlin commission they are doubtful indeed if their modest requests will get much of a hearing. Their hope is in the growth of independence throughout Africa.

German Catholics and Communism

FROM A CORRESPONDENT

THE decision in October by Professor Wegner, Director of the Institute of Church Law at Münster, to seek "temporary asylum" in east Germany is the second such incident in as many years to disturb the solid propriety and nearly solid Catholicism of Westphalia's capital. Professor Wegner, a Berliner by birth, an admirer of Rosa Luxemburg, a convert to Catholicism, married to a Jewess, was reckoned something of an intellectual eccentric even before the present trouble began to brew last July. Like Dr Hagemann before him, he cannot therefore be taken as an example of anything at all. Still, if not an example, he is at least a reminder that the division of Germany is not merely geographical but lies across many an uneasy intellectual and academic heart. The repugnance of life in east Germany, the mass flight of the faculty of Halle, where apparently Professor Wegner means to seek asylum, are of course points as well taken by intellectuals as by anyone else. But where the preoccupation is with ideas, not all, it seems, about west Germany is good, and not all about east Germany is bad.

So far as Catholics are concerned, the authoritative word on relations with Communists was spoken in Pius XII's Christmas message of 1956. Strongly influenced by events in Hungary, the late Pope warned the faithful that only those obliged to do so by their office, religious or secular, should seek contact with Communists; the idea of intellectual dialogue was illusory. The overwhelming majority of west German Catholics, headed by Dr Adenauer, entirely agree. Communist equals wicked, if not damned, and that is that. But a small minority of Catholic intellectuals, of whom the foremost is Walter Dirks, co-editor of the *Frankfurter Hefte*, took humble but firm issue with the Pope. Particularly since an exchange between Herr Dirks and Cardinal Wendel of Munich on the Christmas message, sniping has been constant between, on the one hand, the ultra-conservative *Deutsche Tagespost* and *Mann in der Zeit* (a paper sponsored by the bishops and allied by mutual approbation with Dr Adenauer) and, on the other, the *Frankfurter Hefte*, the *Werk-Hefte katholischer Laien* and a few other individuals of the press and radio.

The views of these "left-wing Catholics," as their opponents dub them, can scarcely be summarised or generalised, but one point seems common. They consider it dangerous for Christianity, in particular the Roman Catholic Church, to allow itself to be represented as the counter-power to communism in a struggle for the world. There is no total war; the one creed is a perversion whose spread is made possible by the negligences of the other. The communist faith has fundamental features which have a rightful appeal to humanity whether European or Afro-Asian and which Christians must not seem to oppose. Discussing an article by Emil Franzel, who sees an affinity between the "rigorist" wing of the Church and communism, Walter Dirks wrote:

> What binds the Christian, partly in appearance, partly in reality, with many (not with all, not with the Stalinist) Communists, and with many (not with all, not with the *étatiste*) Socialists is not moral rigorism but restlessness in the cause of mankind, criticism of inhumanity, the claim to a human brotherhood.

On this basis, competition, dialogue, conversion are possible.

Such views might perhaps be taken as only an especially Christian version of the old absurdity that Left can speak to Left, were it not that they merge with other ideas current among some German Catholics which have no left-wing basis at all. The most lucid, and within restricted circles most influential, of current attempts to find common ground with communism is the work of the Jesuit scholar, Gustav Wetter. Father Wetter's concern is not with any supposed solidarity of the Left nor for that matter with parallels between the authoritarianism of the Catholic Church and communism in the manner of old-style liberals; it is with a certain community of concepts and of patterns of thought, whether in organisation or in philosophy, between the two systems. Aquinas, Innocent III, Las Casas would have hated communism; but at least they would have understood it. As Father Wetter has himself exemplified in debate with communist officials, Catholic and Communist seem to know better what the other is talking about than does either in debate with the contemporary humanist.

Dismay at contemporary western values is one element in the work of another Jesuit, Klemens Brockmöller, whose book "Christentum am Morgen des Atomzeitalters" was nearly a best-seller in 1954 and has been a factor in such discussions ever since. But this is not the distinctive element. Troubled glances at western "materialism" in the context of discussion on communism are not of course confined to Catholics; witness Karl Barth's letter to a pastor in the German Democratic Republic which caused some stir this time last year. The distinctive elements in Father Brockmöller's book are a Spenglerian pessimism about the prospects of European civilisation and ideas perhaps developed from the late Pope's emphasis that Christianity should not allow itself to appear exclusively identified with any one culture. The result is a vision of a new people, Asian, African and perhaps indeed Soviet, uncorrupted by luxury and capable of faith, who may by conversion become the new carrier of Christianity.

Apart from the seven days' wonder of Father Brockmöller, all these speculations of left-wing Catholics and certain Jesuits pass the average German entirely by. He is certainly not parish-pump bound in his faith as, for instance, the enormous response to the bishop's call last Lent for funds for the Afro-Asian poor, or the strongly marked feeling that John XXIII may represent a new era in the Church's history, testify. But as regards the higher foreign policy of the Church, especially towards communism, his motto

RUBBER TRENDS

seems to be as it is in secular affairs: No experiments. Furthermore, even so far as the intellectuals are concerned, the pessimism which clouds many of them, the tendency to underestimate the virtues and victories of the West in the world conflict, may only be the temporary result of the spiritual shell-shock from which Germany has suffered since its defeat and is still suffering. It may then be that these speculations will come to nothing more than a small footnote in a *Geistesgeschichte* of mid-century Germany. On the other hand it is just possible that more might be heard of them when Germany at last comes to grips with its recent past, recovers its spiritual self-confidence and returns to its traditional experiment with ideas.

Austrian Socialists' Gains

AUSTRIA had a spate of party conferences last month. On November 12th and 13th, the top men of the middle-class People's party met in the seclusion and Victorian splendour of the Südbahnhofhotel at Semmering. At the same time their partners in the coalition, the Socialists, were deliberating in the more work-a-day atmosphere of Vienna; while the leading members of the Freedom party, which provides the parliament with a rudimentary opposition of eight deputies, had a meeting at Salzburg. The People's party looked inward and decided on reform, which is to be more fully discussed at the party congress in February. But Dr Pittermann, the Socialists' chairman and the vice-chancellor of the Republic, declared, in an extrovert way, that there was no point in Austria trying to get on the European common market band-wagon. The respective preoccupations of the two major parties are characteristic of their present states of mind.

In the Viennese municipal election on October 25th, the voting pattern of the general elections in May was repeated; the People's party lost votes not only to the Socialists but also to the Freedom party. Although they are by no means faced with a landslide, the leaders of the People's party are frankly worried and puzzled by the loss of voters in the midst of the general prosperity. The party's thinkers are now making references to a rather obscure "malaise of the middle class," while its tacticians cast wistful glances in the direction of those countries where the socialists are the losers, and where the conservative parties are solely responsible "not only for the production, but also for the distribution of national wealth."

But the leaders of the People's party have another problem on their hands: since the formation of the new cabinet in July, the Socialists have claimed an increased share of responsibility inside the government that is out of proportion to their increased share of popular support. They began to take more interest in economic affairs—until then a middle-class preserve—before the general elections, and the relationship between the two coalition partners has recently been extremely strained by differences over economic policy. During the discussion of the finance bill for 1960 the partnership nearly broke up; the breach was patched up with no time to spare before the deadline, on October 22nd, for the presentation of the bill to parliament. At the same time, the Socialists have achieved solid success in the conduct of foreign affairs: Dr Kreisky, the new foreign minister, has carried through the overdue reorganisation of the ministry itself; he is responsible for the formulation of the government's policy towards European economic groups; some outstanding questions, such as Austria's recognition of the Danube convention of 1948, and the conclusion of a consular treaty with Russia, were resolved last month.

The Socialists are not only successfully active inside the government; outside it, they have retained the support of the working-class, while making significant advances among the middle-class itself. The reasons for this are not as obscure as the strategists of the People's party believe. They have placed too much reliance on prosperity as the final deterrent against socialism; in their propaganda, they are attacking not the current, but an earlier version of socialist doctrine; the voter has not been slow to spot the error. Austria's left-wing has by now been completely purged of Marxist relics; its leaders have recognised that they must deal with economic problems without the help of obsolete ideological instruments, and it was this recognition that made their successful inroads into the field of economic policy possible.

The middle-class leadership, on the other hand, have committed a number of serious blunders in their treatment of the coalition system. This sacred cow of Austrian politics is still a popular and lively animal, and the People's party's leaders, on several occasions in recent months, have tended to underestimate its vitality. During the election campaign in the spring, they created the impression that their party might be able, and willing, to govern single-handed; last summer Herr Raab, the Chancellor, handled the protracted negotiations on the new cabinet extremely clumsily, so that his party got much of the blame for straining the coalition too far. The Socialists, on the other hand, emerged from the election campaign and the subsequent negotiations as firm defenders of the coalition system. Finally, the local organisations of the People's party are now on the whole weaker and narrower than those of the Socialists. They tend to be careless about problems of political patronage and rewards for devoted service to the party; they also ossify quickly because they keep their young people outside in the cold too long.

Apart from references to a hidden weakness, signs of any offensive action by the People's party have so far been absent. It will now have to begin by overhauling its creaking apparatus; the formulation of policy will have to be reserved for a later date. There is some hope, however that the present coalition deadlock may be resolved in a different manner. While the system of government through the all-powerful coalition committee has been consolidated over the past few years, the parliament has slowly receded into obscurity; now, both parties appear to be interested in salvaging it. This is an essential constitutional reform for Austria. If it is successful, it may bridge the gap between the rulers and the voters. It would also relieve the dreary jockeying for positions inside the coalition, on the one hand by making it possible for one party to assume the sole responsibility for running the country, and on the other by strengthening the now impotent parliamentary opposition.

An Idea for Aid

IN a Gaullist era, the direct influence of M. Jean Monnet and the band of friends who did so much to bring the European communities into existence is inevitably reduced. But as a source of ideas they remain important. The ideas that emerge from M. Monnet's action committee have a way of percolating outward to Brussels, and then perhaps back to Paris and on to Bonn, until they appear, one day—modified perhaps, and some time later, but none the less there—in the policies of governments.

Last month's meeting of M. Monnet's committee produced much that was familiar—a suggestion that trade problems should be tackled on a world-wide or an Atlantic basis, and a proposal for an Atlantic conference. But one section of the resolution that was passed went beyond the ordinary. It was a suggestion that the six common market countries should undertake a gradual pooling of their exchange reserves, both as a backing for their own evolving common economic policies, and to enhance their ability to aid the undeveloped world. In Brussels the European commission is already being advised by Professor Triffin, of Yale University,

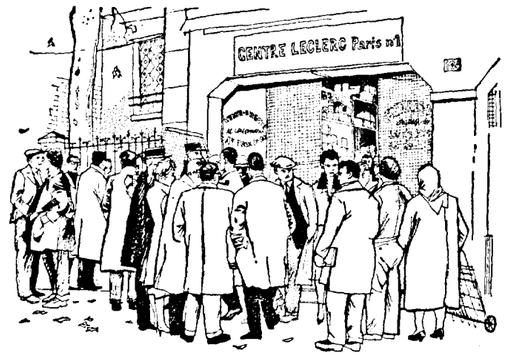
probably the man best qualified to devise and implement such a scheme.

There need be no doubt of the value of such a project if it were ever realised. To make a common economic policy really effective and expansionist, an economic union needs some such device. An article on page 702 of *The Economist* of November 21st suggested that any massive increase in European capital exports to the undeveloped world would require a major expansion of world liquidity. In the past the International Monetary Fund has lacked the political authority to carry out such big and long-term transfers of resources. Here at least is a part answer—a scheme for enhancing liquidity on a European basis within a system which has political teeth.

As an outsider Britain might well see such a project as a competitive threat to the status of sterling. Certainly, if Britain were in the scheme, sterling would stand to gain greatly from it. But the scheme has a chance of success just because it involves a greater pooling of sovereignty than Britain has yet been prepared to accept.

M. Leclerc Comes to Paris

FROM OUR PARIS CORRESPONDENT



AN unpretentious shop in the Parisian suburb of Issy-les-Moulineaux has created a stir among the public and panic among grocers. The shop, a converted garage, has no gadgets, no luxury trimmings. But the housewives are queueing outside it and M. Poujade has raised his old battle-cry of "unfair competition." M. Leclerc, the price cutter, has come to Paris.

The Leclerc formula is simple. Shops on his model buy straight from the factory and sell to the public at wholesale prices (they thus avoid certain local taxes on retail trade). The difference in price with the orthodox retail shops varies from commodity to commodity, but M. Leclerc claims that, on an average, his level is twenty per cent lower. The Leclerc shop can manage with the wholesaler's profit margin alone by cutting down overheads to a minimum and maintaining a very quick turnover. In order to do this, it concentrates on branded goods and limits its staff and amenities. The initial capital outlay is also kept down; this is why there are no Leclerc self-service shops. The new development does not perturb the elegant *épiceries fines* which cater for Parisian gourmets, but it does worry the small local grocers.

The experiment is not new. M. Edouard Leclerc began it ten years ago in his native Brittany. There are by now sixty Leclerc distribution centres outside Paris, though he owns only two of them. The first to be set up in the heart of the capital has been opened this month. The amount of publicity that the movement has been getting may be due to the fact that it coincides with an official attempt to keep the cost of living down.

After the devaluation and financial reforms of last December, French retail prices rose less than the experts had foreseen. But since the summer, and partly as a result of the drought, food prices have resumed their climb. The government, determined to limit wage increases, keeps an anxious eye on the cost-of-living index. Last month it launched a campaign to reduce the prices of a selected range of foodstuffs and other groceries. Multiple stores, trying to crush the Leclerc experiment, welcomed the move. Frightened small shopkeepers followed suit.

Demonstrative price reductions—as M. Pinay well knows—tend to be ephemeral. Official hopes are now based on the growing impact of competition.

It is usually forgotten abroad that the French industrial revolution of recent years has been accompanied by a concentration of trade. True, after the war France seemed a seller's paradise, and visiting Britons could return Napoleon's compliment about a nation of shopkeepers. Even when acute shortages disappeared and inflation was halted, small shopkeepers survived on the margin, partly through tax evasion. Gradually, however, the laws of the market reasserted themselves.

Between the beginning of 1954 and of the current year, the total number of shops in France was reduced by 34,000 (to 808,000). The net figure gives no idea of the real process, since each year family businesses predominate among the shops wound up, while new registrations are mainly companies and are often branches of an existing chain. If the turnover figures are looked at, the trend is more striking still. A recent trade survey revealed that the new self-service stores are doing particularly good business and that Paris is preparing for an invasion of supermarkets.

Nobody likes to be squeezed out in the name of economic progress. Shopkeepers who were feeling the pinch were the backbone of the poujadist movement and largely accounted for its surprisingly high poll in 1956. Two years later they deserted their leader and voted for the neo-gaullists, hoping presumably that the laws of the market would end with the Fourth Republic. How wrong they were! The new government is less affected than its predecessors were by the parliamentary pressure of small tradesmen, craftsmen or producers. It has encouraged foreign competition, and the French foreign exchange reserves are now sufficient to enable the authorities to step up imports if home prices get out of hand. The government has also set up an advisory committee which, in M. Rueff's own words, "will X-ray the French economy," searching for restrictive practices to eliminate. Shopkeepers can expect more competition, not less.

Against this background of concentration, M. Leclerc does not really appear to be on the side of the giants. Despite poujadist protests, he still seems to belong rather to the rearguard of individual shopkeepers fighting against the trade's big battalions. By cutting down both the initial outlay and running costs, he seeks an answer to the challenge of the financially powerful chains. Already many shopkeepers have been compelled to pool their buying. All this may prove of no avail to arrest the process of concentration of retail trade. The American group, Grand Union, recently disclosed its intention of setting up 22 supermarkets in the Paris area. Others will follow. Supermarkets may not fit the accepted picture of Paris, but the French, for all their predilection for fine food and shops with individuality, are not immune to the "American" trends spreading throughout western Europe. Nor, for that matter, are they exempt from the workings of economic laws. It was in Paris, after all, that just over a century ago M. Felix Potin—cutting out middlemen, resisting price increases, and so on—carried out the first revolution in the food and grocery business.

WINE!

Harveys Guide to a Merry Christmas

In homes, stately and otherwise, all over the country, the grand strategy of the Christmas dinner is being planned. How about the item that adds the final touch—the wine? Here at Harveys we have every kind of wine, from the modest to the magnificent. In the medium and low price ranges alone there are Burgundies, Bordeaux and Rhone wines for every course on the Christmas menu, and for informal parties, too. Here are some of the most attractive of them:—

Hors-d'oeuvre and fish

BORDEAUX BLANC
7s. *a bottle*, 4s. *a half-bottle*.
A medium-dry white wine. Agreeably light for opening the meal and exceptional value at this price.

Fish and chicken

MEURSAULT 1955
12s. *a bottle*, 6s. 6d. *a half-bottle*.
A deliciously mellow and dry white Burgundy, from a very good year. Medium-bodied, with a delightful bouquet.

Entrées and white meat

CHATEAU LA MOULINE, Moulis 1955
9s. 9d. *a bottle*, 5s. 3d. *a half-bottle*.
A delightful claret from the *commune* adjoining Margaux. Light and smooth, from an excellent vintage.

Turkey and game

CHATEAU RIPEAU, St. Emilion 1955
15s. *a bottle*, 8s. *a half-bottle*.
A beautiful Château-bottled claret. The finer wines of this district have truly been called the "Burgundy of Bordeaux", with their fullness of body, flavour and colour.

CHATEAU NENIN, Pomerol 1953
19s. *a bottle*.
A Château-bottled claret of the very highest quality. Mellow and fruity, from an outstanding vintage. A fine bottle.

POMMARD, Côte de Beaune, 1953
12s. *a bottle*, 6s. 6d. *a half-bottle*.
A smooth, medium-bodied red Burgundy. Sunny and mellow, from a famous year. Excellent with chicken, game, steak or any red meat, as well as cheese.

CHATEAUNEUF DU PAPE 1956
10s. *a bottle*, 5s. 6d. *a half-bottle*.
A fine, strong red wine from the sun-drenched valley of the Rhone. Very palatable, with a depth of body greater even than a Burgundy. Full of flavour.

GRAND HERMITAGE, Red 1954
12s. *a bottle*, 6s. 6d. *a half-bottle*.
A Rhone wine with a delicious, heady bouquet. An outstanding wine.

Fruit and dessert

SAUTERNES SUPERIEUR
11s. *a bottle*, 6s. *a half-bottle*.
A fine, rich white wine, golden in colour and golden in flavour. Ideal accompaniment to all sweet desserts. Very pleasant too with a good round cheese, such as well-matured Cheddar.

Wine-and-cheese evenings

BEAUNE 1953
11s. *a bottle*, 6s. *a half-bottle*.
A full-bodied red Burgundy from the famous '53 vintage—excellent for drinking now. Mellow and soft as velvet, but of considerable alcoholic strength.

MEDOC 1955
7s. 6d. *a bottle*, 4s. 3d. *a half-bottle*.
A typical, full-bodied red Bordeaux of fine flavour. Excellent value from an excellent vintage.

Ask for these from your local supplier of Harvey's wines, or write to either:

JOHN HARVEY AND SONS LTD.
12 Denmark Street, Bristol.

or

JOHN HARVEY AND SONS LTD.
40 King Street, St. James's, London, S.W.1.

Six bottles or more will be sent free of carriage charges.

Another travel freedom...

COOKS *new* LETTER OF AUTHORITY

As a busy executive, you pre-plan your visits abroad as far as possible, but unforeseen prospects may put your journey out of joint. Now . . . if before you go, you make your complete travel arrangements through Cooks or Dean & Dawson, you can carry a Cooks letter of authority to provide you with all kinds of travel services at any of their four hundred offices in fifty-seven *different countries*—hotels, private cars, air and surface tickets, all at your command. You simply sign the account to authorise settlement in the United Kingdom, and go on your way.

This new letter of authority is available to business houses in account with Cooks or Dean & Dawson, at whose local offices full details and application forms may be obtained.
The service is world-wide!

WITH THIS LETTER AND A BOOK OF COOKS TRAVELLERS CHEQUES YOU CAN GO AS YOU PLEASE ANYWHERE IN THE WORLD

THE BUSINESS WORLD

Mr Sandys's Turn

ALTHOUGH his plans for the aircraft industry are not so very different from those of his predecessor at the defunct Ministry of Supply, Mr Duncan Sandys, the Minister of Aviation, may find himself obliged to re-state them in the House of Commons before the Christmas recess in order to answer the charges now circulating in parts of the industry. The core of the policy is simple and has not changed since it was first propounded by the then Minister of Supply, Mr Aubrey Jones, in 1958. By that date it had become clear that, once defence cuts had taken effect, this country could not support an aircraft industry consisting of a score of companies employing 260,000 people. It looked as though there might be work for an industry employing 150,000. The question then was how they should be organised, and it is on this question of organisation that the existing companies and the government part company.

The reason for the survival of so many small companies in an industry where size is a good yardstick of efficiency lay in the amount of direct financial help they had been accustomed to receive from the government, while the military demand was still high, to meet the cost of developing new aircraft. Because of this, few companies bothered to increase their permanent capital much: and large, sometimes huge, bank overdrafts are a common feature in the accounts of aircraft manufacturers. But when it cut defence expenditure, the government also decided to stop financing the development of civil aircraft. This removed one of the industry's major sources of working capital, at a time when market conditions were least favourable for new aircraft issues. To find the resources needed to develop modern civil aircraft—and the industry had to build civil aircraft if it was to survive at all—the Ministry of Supply suggested that medium-sized companies should pool their resources by amalgamating into four or five large production units.

The aircraft industry's dislike of this policy is evident from its extreme reluctance to amalgamate. On the engine side matters moved swiftly and smoothly. The bulk of the industry's output was already produced by Rolls-Royce; Bristol and Hawker Siddeley amalgamated their two engine companies to form a single unit capable of competing with Rolls-Royce, which was what the government wanted. There are other small engine manufacturers, including Alvis, Blackburn and Napier, but their production is highly specialised and does not affect plans for the industry as a whole.

On the airframe side of the industry, the picture is very different. All the bigger companies, Hawker Siddeley, Bristol, Vickers-Armstrongs, de Havilland, Shorts, Handley Page, English Electric, pursue their own independent paths, occasionally carving up some of the smallest companies between them. Thus de Havilland and Westland, the helicopter manufacturers, recently each took over separate divisions of Saunders Roe; Hawker Siddeley has bought Folland Aircraft and made a bid last week for Blackburn Aircraft. With the exception of the Blackburn offer, these deals are hardly what Mr Aubrey Jones had in mind when he orginally advised the industry to amalgamate, and they are certainly not what Mr Sandys expects. But the Blackburn company has at the moment a certain amount of work in hand, and its design and production facilities are good. Its decision to go in with Hawker Siddeley probably means that the Blackburn management saw that a small, efficient company had more chance of surviving in the aircraft industry under the umbrella of a large group like Hawker Siddeley.

HAD Mr Jones's original policy been allowed to run its natural course, so that work went only to large companies with adequate production resources, the desired concentration of the industry into a few hands would have come about automatically, whether the industry was prepared to co-operate in the policy of amalgamation or not, and without the need to exert any pressure on individual companies. But other government departments regard the local pockets of unemployment that would inevitably have resulted from this with great alarm. Any minister responsible for aircraft production is under constant pressure from his colleagues to place work with companies in Scotland, or Northern Ireland, or anywhere else in Britain where MPs' constituents live, so that companies can go on building unwanted and often inefficient aircraft, when this is the very thing that the minister is trying to stop.

If companies can build aircraft out of their own resources, without coming to the government for financial help, no one would want to stop them. But those that have tried to do this are becoming increasingly disillusioned with the results. The market for civil aircraft is temporarily sated; airlines are awaiting delivery of the hundreds of jet airliners that they have on order and are undecided about what other types of aircraft they will need. Sales are temporarily at a standstill; one consequence of this has been that British manufacturers are doing less civil business than they expected. The smooth

transition that was hoped for from military to civil production has not taken place. Mr Sandys has moved to the Ministry of Aviation at a time when it is beginning to look as if the industry may not, after all, be able to finance its own civil development—simply because it cannot find enough current business out of which to do so.

Mr Sandys appears to have persuaded the government that he may, after all, have to give the industry more financial aid for its civil work than was originally expected. This immediately alters his relationship with the aircraft industry. The government has already sunk so many hundreds of millions of pounds into aircraft, most of it without return, that any minister who proposes to invest yet more government funds in civil airliners must first of all be able to present the Treasury with convincing evidence that he will not be throwing good money after bad. In the case of military aircraft, the acid test is technical: whether or not the design is a good one. But with civil aircraft something more is wanted. The best design in the world will not sell if buyers have less than full confidence in the company that proposes to build it.

THE fact has to be faced that there is only one British company in this industry in which overseas buyers have confidence: that is Rolls-Royce. Vickers-Armstrongs has made a successful name overseas with the Viscount; the company's standing abroad is not as high as that of Rolls-Royce or of the biggest American aircraft manufacturers, but it is certainly higher than that of any other British aircraft manufacturer and is probably comparable in the international civil market with such American companies as Lockheed. After Vickers comes Hawker Siddeley; the Indian government recently preferred to buy an airliner off the drawing board from Hawker Siddeley than to buy a practically identical, but fully proved, machine from Handley Page. Any other, smaller civil manufacturer is going to find it very difficult indeed to sell airliners abroad unless its designs are so highly specialised that buyers have no option. From this point of view Short's experiment in concentrating on the production of extremely large and extremely small freighter aircraft is one of the most interesting, if risky, commercial ventures in the industry.

If Mr Sandys can find aircraft companies able to design good commercial aircraft, and able to sell them abroad, he must still satisfy himself that those companies have sufficient resources to get the aircraft into production, turn them out in adequate numbers, and deliver them on time. "Resources" in this sense is beginning to mean something more than factories, machine tools, drawing offices and cash in the bank. It also means some other source of income to tide over the long gestation period of a civil aircraft. Vickers-Armstrongs, English Electric and, of recent times, Hawker Siddeley, all have substantial interests outside aviation to give their businesses a broad base (although Hawker Siddeley is having some trouble digesting its new purchases). Other aircraft companies are beginning to diversify but have not carried it to the stage where it could offset the vicissitudes of the aircraft market.

In the present state of the aircraft market, as a matter of hard fact, there may be work for only two major airframe manufacturing groups, rather than three; Mr Sandys has told the industry this. The two strongest airframe manufacturing units, on the criterion just laid down, are Vickers-Armstrongs and Hawker Siddeley. Vickers-Armstrongs, although it is working with English Electric on the design of the RAF's extremely advanced Canberra replacement, has shown no signs of wanting to amalgamate with any other aircraft company. Since the first days of the Viscount, Vickers has preferred to expand its own capacity and retain responsibility for its own aircraft; it now has three civil airliners in production and a fourth on the drawing board. Hawker Siddeley, on the other hand, will foster anyone's chickens. The group consists still of a number of separate companies. Some of the industry's medium-sized manufacturers (medium-sized by British standards) may already be planning to approach Hawker Siddeley with an offer to amalgamate. But collecting aircraft companies as if they were stamps or butterflies will not necessarily make Hawker Siddeley a strong producer; the resilient and newly streamlined Hawker management will face one of its stiffest tests in rationalising and integrating its new bag of assets.

The state of the aircraft market has brought a new and pressing urgency to the reorganisation of the industry. Britain has lost the market for long-range jet aircraft; the day of the Viscount is nearly over and the danger is that the industry may lose the market for the Viscount's replacement to foreign competitors. Most airlines consider that this should be a pure jet airliner; the French have such a machine already in service, the Americans one under construction, and in this country de Havilland is completing the design of one for British European Airways. Work was started on this aircraft as a private venture, but under present circumstances it would not be surprising if de Havilland asked Mr Sandys for a grant of some kind towards its construction. Mr Sandys may indeed find himself having to choose between de Havilland and Vickers-Armstrongs, since Vickers has recently decided to produce a scaled-down version of its big VC 10 jet for this medium-range market. With the growing possibility that its Vanguard may prove an expensive failure, and with the heavy cost of developing the VC 10 to carry, Vickers-Armstrongs may well feel unwilling to finance the development of yet a third airliner, this small VC 11. Yet there is growing evidence of foreign interest in such a machine and Vickers-Armstrongs is unquestionably in a stronger position to sell a Viscount replacement to its own Viscount customers than de Havilland would be.

What under these circumstances does Mr Sandys do? Refuse financial help to de Havilland and give it to Vickers-Armstrongs, which would in any case need the order from British European Airways that de Havilland has already secured for 24 medium jets in order to put production of its own medium jet on a commercial footing? Or support de Havilland, knowing that the company's chances of export sales are a good deal slimmer than Vickers? Or should he order a shot-gun wedding (the phrase is being used in the industry) between the two companies and produce a composite aircraft called the VC 121?

If Mr Sandys were minded to imitate Mr Khrushchev (to whom he is being compared by some of his private critics) he might at this stage be quoting the proverb about its being easier to lead a horse to water than to make it drink. He has told the industry that its chances of work are slim; told it that he will give financial help, withheld by his predecessor, to companies with sound civil projects; and told it the kind of conditions under which that help will be forthcoming. The tantrums of the Fairey Aviation company over its Rotodyne contract seem to indicate that the industry is disposed to believe Mr Sandys is once again back under its thumb. Several million pounds of public money have been invested in the development of this aircraft. Fairey was offered a contract this summer to cover the company's further development costs and has now returned it, unsigned, on the ground that still more money will be needed to cover, presumably, expenses involved in getting the aircraft certified for civil use. The Society of British Aircraft Constructors would be doing its members a service if it warned them that Mr Sandys is being a good deal more generous to the industry than many people think, not without grounds, he has any reason to be, and that he will face a hard fight with the Treasury to prove his case for such financial help as he is promising.

To imply that the new Minister of Aviation is trying to nationalise the industry is nonsense. There is nothing to stop any manufacturer from building as many aircraft of whatever shape and kind he likes, so long as he can raise the money privately and does not expect the taxpayer to provide it. But if the industry wants public money, it cannot complain if that money comes with strings attached to it. The only condition on which Mr Sandys insists as Mr Jones did before him is that the recipient shall have solid resources behind them. Nobody outside the aircraft industry would call this an unreasonable requirement.

Brands in the Branches

BY A CORRESPONDENT

Self-service multiples, handling more varied stocks, are easing the manufacturer's problem of "getting distribution for the product"

ANY food manufacturer today knows that his best chance of keeping up with Britain's rising standards of living lies in selling quality and convenience as well as sheer comestibles. The standards are rising throughout the pyramid of incomes, and indeed faster at the base of the pyramid; vast numbers of people are now rising into the modest affluence when they can indulge their taste for better qualities rather than larger quantities of food. This attraction of quality and variety, and of the service element now built into so many prepared and pre-cooked products of the food manufacturing industry, enables that industry to look forward to a fair share in growing prosperity; it also provides an incentive to compete for consumers' extra income with ever wider variety. The domestic market is now far from the day when every housewife bought her own basic ingredients, and made her own pies and puddings, baby foods and soups; more and more branded and partly prepared food products continue to come on to the market. All these new products can only be sold through shops; every manufacturer's first concern must be to "get distribution." Will "the trade" take it?

In any calculations on this point, the multiples must loom large. They are becoming more important to the food manufacturer not only because their total sales are growing more rapidly than those of the co-operative movement and the independent, but also because self-service is increasing their interest in branded goods and, because the breakdown of resale price maintenance is removing an incentive to compete in such fields as soft drinks using their own labels. Moreover, with the growth of buying groups and voluntary chains, many characteristics of the multiple today may equally apply to the combination of wholesalers and independent shops tomorrow.

Traditionally multiples have severely limited the assortment in their stocks so that only one or two brand leaders in a particular field could hope to be stocked. Moreover, they have matched their centralised buying by a most jealous guard on sales representatives' access to their branches. Finally, they have been a good deal keener than other sectors of the trade on rationalising their operations to cut costs. Modern developments, self-service in particular, are modifying the first two of these policies but underlining the third.

STOCK assortments are now increasing rapidly—not only because the customer demands a wider choice but because self-service reduces the marginal cost of stocking an extra line. In counter service, all assistants need (ideally) to know the prices, locations and characteristics of all the items stocked, and it is impossible to divide trade into departments without asking the customer to pay separately in each department. A self-service assortment of stock is not cramped by these limitations: it may easily number 3,000 lines instead of 1,000. The grocer will still try to stock only two leading cocoas out of three, or three leading makes of jam out of half a dozen, estimating that brand preferences for the rejected lines will generally not be strong enough to lose him a sale. But the largest size of Horlicks or the more exotic types of marmalade are much more likely (firm for firm and district for district) to be carried in a self-service shop. Their absence may mean lost sales, and though their turnover is slow, their presence now causes little trouble.

It follows that the manufacturer, even if he cannot convince the retailer that he is the leader or the second in the field, may nevertheless get distribution today provided that he has a loyal though limited clientele; the insistence of a relatively few consumers may do him more good than mere acceptance by many. Having got his product into the shops' stock, the manufacturer next wants to make sure that it is favourably placed—literally and metaphorically—in the shops to derive full benefit from the consumer advertising he is doing. To do this he must get his representative into the shops. Here he finds that the old resistance—based on a fear that an unscrupulous representative would over-sell a branch manager as well as wasting his time—is in some cases breaking down. One

reason is that with larger branches it is often economical for the goods to be delivered direct. Another that with self-service, the visitor who calls at the busiest time is not taking anyone "off the counter." Most of all, reputable firms have shown that they will not abuse the privilege.

Sales depend first on not running out of stock and second on display. The competition for satisfactory display has led many manufacturers whose goods require it to supply permanent stands, racks and containers for them, and self-service has accelerated this development. Cadbury and Wrigley do this in the confectionery field, and the pattern is the same in practically every "non-food" class where suppliers are seeking outlets in supermarkets, such as paperbacks, nylons, and lamp bulbs. In many of these cases, the equipment is only part of a complete "rack jobbing" service. Here the supplier takes responsibility for the stock and display from week to week; the retailer simply provides the space, and accepts a lower margin on the goods that are sold.

Where rack jobbing is inappropriate the more alert suppliers, particularly those in contact with the American market such as Hedley and Heinz, are now offering to dress the shelves for the complete commodity group they are interested in; soaps and synthetic detergents for Hedley, soups for Heinz. Unblushingly they explain that they allot appropriate shelf space to rival products in accordance with independent retail audit research figures of relative sales. The typical retailer has no objections. It is indeed reported from the United States that manufacturers are now "renting" eyelevel shelf space from the retailer, so as to keep their competitors' products in secondary display positions. The retailer might like that even better.

THE third feature of the multiple—rationalisation to cut costs—is now receiving new emphasis. The era of mass consumption is also the era of mass distribution. Distributors, particularly the new supermarket companies, are beginning to look at the jobs they do in the scientific ways that the production engineer and the method study man have brought to the factories. But most operations in distribution are as subject to the shape and design of the package as a British change dispenser would be to the threepenny bit. Here, too often, the ingenious brains that marry low-cost production with value to the consumer take no account of the pipe-line in between.

The bigger distributors have successfully insisted on the right to set their own selling prices; with recent policy changes by Schweppes and Beechams some of the last bastions of resale price maintenance in the grocery trade (though not in the pharmaceutical or confectionery trades) have fallen. In any case most manufacturers have never wished to print prices on their cartons or labels, since a change would render valueless the stocks of packaging materials, that the economies of scale in printing make it worth their while to hold. If goods are to be marked with their prices, as they must be in self-service, the distributor must do it. He does it with rubber stamps—which require a suitable blank space or "price spot" on the carton—or, less cheaply, with labels. The manufacturer can help merely by designing the pack with a price spot in the right place. Opinion is not unanimous about where the right place is, but ease of access in the outer cartons that packs arrive in and ease of handling at the checkout, point to the ends of tins and packets, not to their sides or faces. Too many packets make no provision for this; too many tins have embossed numbers on the top end which prevent a clear rubber-stamp impression; too many bottle tops are covered with meaningless designs, slogans or instructions. To one manufacturer of boot polish, the highly-decorated lid of whose product offers no place for the price, a distributor sent a sample showing how the design was disfigured by the superimposition of a price-label. "This is how we present your product to the consumer" he said. "Our design has always been like this and is going to stay like this" was the reply.

Other manufacturers, however, have realised some of the special implications of open display. The product must be easily stacked, or, if it is small and slippery, like meat pastes or confectionery, enclosed in a "display outer"—usually of thin cardboard with the lid folding back into a display card. It must be identifiable from any angle with its name on every face of the packet, or with a colour and design on every face that mark it out from others in the same commodity group. It must be easy for the customer to pick up with one hand, and adequately protected against the customer who will examine, finger, squeeze and return it to the shelf. Nor is it only the consumer's pack which is receiving attention. The "outer" case in which it is received at the shop, usually a fibreboard carton, is just as important to the retailer. The Campbell's soups which are packed in Canada come in flat cases only one tin deep; this uses more fibreboard, but finds favour with retailers not only because all tins are exposed for price-marking once the lid is off, but also because it is handled and stacked more easily. No one, however, has yet designed the perfect outer pack for tinned goods, from which they could be slid bodily on to the display shelves without individual handling.

IN general, the latest methods used by manufacturers for stimulating sales of a particular brand do not make for distributive efficiency. The grocer does not like to keep customers waiting while he searches through his stock of cornflakes so that a youngster can complete his set of circus characters. Nor does he enjoy finding that the TV advertisement says model Red Indians are in the packet while the stock he has been sent only contains cowboys. He gets a small allowance for handling (and financing) soap coupons, but he is conscious of the risk of loss involved in this new form of currency; nor is he inclined to argue with the customer who offers coupons in part payment for her purchases even though these do not include the products to which the coupons refer.

As for "bargain packs," unless a grocer gets adequate notice, he may have to leave money locked up in full-price stocks that remain on his hands while the "special offer" runs its course. Fortunately for him, the war of bargain packs has in some cases reached a stage where he can refuse to buy and stock the full-price article at all. Many of the special offer campaigns have been self-defeating—to the extent that brand loyalties which can survive a rival's "3d. off" have not been built up. Retailers are resigned to the fact that no manufacturer would ever be satisfied with the steady or steadily rising sales that would enable the shops to know how much to order. Stimulation by fits and starts will continue to be the rule; but retailers feel entitled, at least, to full and timely information about manufacturers' marketing plans.

BUSINESS NOTES

WORLD MONEY MARKET

London Regains its Poise

ALL the main financial centres are now looking outward at developments abroad. The moves towards convertibility a year ago went a long way to restore a measure of unity to the world money market and the results are very much in evidence. Funds are more sensitive to movements in interest rates, and small differentials may lead to substantial transfers. This is a sign that the market is working well; the movements are generally in a direction that helps to balance world payments and are quite different from capital transfers occasioned by loss of confidence or exchange speculation. For a time last week it looked as

GILT-EDGED SINCE THE ELECTION

	Oct. 8	Nov. 20	Dec. 4	Dec. 10
	Net prices			
Short Bonds				
Funding 2½% 1956–61	97²⁹/₃₂	96¹⁵/₃₂	98⁷/₁₆	98¹⁵/₃₂
Conversion 4½% 1962	100¹⁷/₃₂	101	99²¹/₃₂	100¹⁹/₃₂

Consols 2½%	49¹/₁₆	52⁹/₁₆	50¹¹/₁₆	50⁹/₁₆

though London had not taken the point at all. Britain's first commercial loss of reserves for two years led the stock exchange to talk itself into the likelihood of an early increase in Bank rate and consequent depression for gilt-edged.

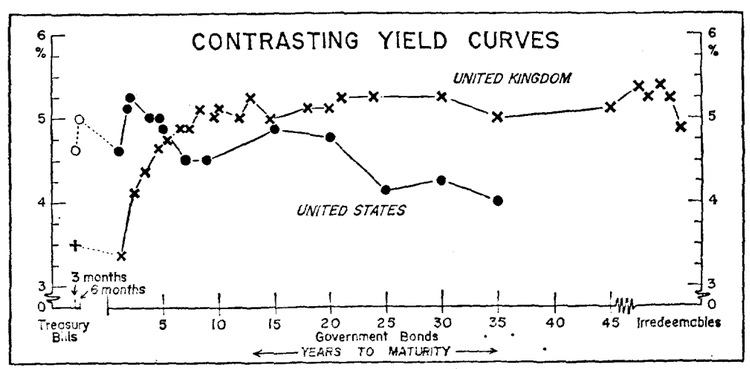
This week the whole market has recovered its poise. The fall in gilt-edged has been checked. The post-election honeymoon may be over, but buyers stepping in to take advantage of the slightly lower prices showed that the new investment demand at current returns is not over. The market has been helped by a recovery in spot sterling, which on Tuesday regained parity with the US dollar. Industrial shares, which in their recent fluctuations seem to have taken the 300 point on the *Financial Times* index as their baseline, received a big lift on the opening of the Christmas account from the further sharp rally on Wall Street. This carried the Dow Jones average within 3 points of its August peak of 678. Wednesday's rally in London brought *The Economist* ordinary indicator back to its peak of 352.7 (1953 = 100).

New York and Congress

BUT London has not been allowed to forget either New York or Germany this week. The German central bank published a stern warning by Dr Karl Blessing to the government and other public authorities that they should not rely on the market being able to absorb all the demands resulting from their fiscal softness. And in New York the Treasury bill rate rose to new heights—4.638 per cent for the three months' issue and only a shade under 5 per cent for the six months' issue. This led to talk of whether the Federal Reserve could continue to hold the discount rate at 4 per cent, though specialists on Wall Street point out that stringency is to be expected at the year-end (and this year withdrawals of funds by foreign banks for window dressing are likely to be a big additional influence); there has not been an increase in the discount rate in December for the past forty years. But few people would care to predict further. The corporations' very large holdings of short-term government paper are a constant threat to the market, and a renewal of business recovery when the steel strike is settled would almost certainly involve substantial liquidations.

The other major uncertainty over this market is whether Congress on its return in January will do anything about the ceiling of 4¼ per cent on new government issues of over five years' life, which is causing increasing congestion in the short-term market with the passage of time. It is this ludicrous ceiling that is responsible for the strange relationship of yields in New York today—5 per cent on six months' money and 4 per cent on thirty-five year bonds. This "downward sloping" yield curve is normally a reflection of investors' expectations that interest rates will soon fall. A diminishing number of investors in the United States have that belief today; the pattern of yields is the result of unnaturally freezing the supply of medium and long-dated maturities and concentrating all borrowing into the short end of the market.

In London the yield curve has the opposite shape (broadly what may be regarded as its normal one) and the contrast has an important lesson for the market. While the London Treasury bill rate is more than 1 per cent lower than in New York, there is a differential of almost exactly the same amount but in London's favour on long-term securities. Yields on British Government securities are thus not only high historically in relation to 4 per cent Bank rate, they are high in relation to today's levels in other countries. The implication surely is that gilt-edged may have little to fear even if the London authorities do feel obliged to follow other centres and raise Bank rate.



Bank Rate and Sterling

WILL they be? There can be little doubt that London could not, and should not, hold out against the world trend for any very long time, nor that before too long a rise in Bank rate will be prompted by domestic considerations. Bank rate, as the Government has mercifully agreed with the critics of Radcliffe, is a market weapon and changes are not to be regarded as world shattering shifts of policy. The Bank of England encouraged last week's rise of ½ per cent, to just over 3½ per cent in the Treasury bill rate, but the margin below Bank rate is not yet unduly small. There seems no reason why the Bank should at present be forced into a change before it feels that the time is ripe. It recognises that the return of funds to the United States is welcome to the authorities there. It would presumably not be unduly worried if, say, up to £100 million of balances in sterling were shifted to New York; such transfers involve no weakening in the net balance of

reserves to liabilities. What is much more difficult to judge is how much more money is likely to move.

A good deal of international funds that are sensitive to interest differentials have gone already. This week there appears to have been no large movement after the further rise in the United States bill rate, perhaps because banks are preparing for their end-year window dressing. The premium on sterling against New York in the forward market, which tends to move in line with the interest differential, has remained unchanged. But the influence of differing monetary conditions on the reserves is not limited to the amount of sensitive "arbitrage money." When interest rates are high in the United States and credit is tight, the impact on the exchanges is likely to be diffused through countless ordinary commercial operations, just as the very different influence of exchange speculation has in the past been diffused through leads and lags in commercial payments. There is now some cost incentive, as distinct from any speculative incentive, to go short on sterling. But one would never expect the running down of sterling balances and increase in sterling credits to be taken to the lengths for these reasons that they were when the future of the exchange was called in question.

PRICE CUTTING

Nem Con

MR HEATHCOAT AMORY went to some pains in a public speech this week—as no doubt he had the day before in private to representatives of business—to emphasise that

> I am not asking for a price freeze—or for that matter for a wage or dividend freeze—nor am I saying that there is room for all prices to be cut now or that I am dissatisfied with what has been happening.

Nevertheless, he was anxious to discuss with business, as represented by delegations from the Federation of British Industries, the National Union of Manufacturers, the British Employers' Confederation and the Association of British Chambers of Commerce, any possible steps that could be taken to maintain the relative stability of prices Britain has now enjoyed for 18 months.

The businessmen, according to the anodyne communique issued after the talks, were also, broadly, on the side of virtue. They agreed that inflation was still a very real risk; that stability was a good thing; and that they shared responsibility with the Government, the trade unions, the nationalised industries and the distributive trades for maintaining this good thing. But it is not easy to see what the "careful and speedy study" that they promised of the Chancellor's appeal can lead to in practice. They have undoubtedly great influence in business affairs; but this ordinarily falls well short of attempting to influence members' pricing policies, which are a matter of individual companies' circumstances. Nor does exhortation come as easily to trade associations as to a Chancellor. His ear-stroking may have a restraining influence; it is his monetary and fiscal policies that determine the matter.

WORLD BANK

£10 million Issue

THE International Bank for Reconstruction and Development will regard the terms for its third stock issue on the London market as being on the dear side, for this £10 million of 18-23 year stock carries a 5 per cent coupon and is offered next Wednesday at 96½. So the redemption yield to final date is £5 5s. 6d. per cent, sternly in line with the highest grade borrowing rates now prevailing in the London market. It is not to be supposed that the World Bank finds itself under any pressure to raise new money in London at the present time; more probably, its concern is rather to encourage a more active market interest in its bonds here. Its two existing issues, both of £5 million at 3¾ per cent, are officially quoted on the stock exchange with a putting-off point spread and markings, when they occur, evidently owe more to the Bank's sinking fund buying than they do to general investment interest. A £10 million issue is a much more realistic unit for the Bank to adopt for cultivating wider investment support here.

Interest on the stock is payable gross, without deduction of British income tax, which is a natural attraction to non-resident investors. Another point in its favour is the sinking fund operation of £278,000 annually starting in the year ending August 15, 1965, which will have redeemed at least half of the stock by the date of final payment in 1982. The relatively high coupon will make no tangible difference to the Bank's lending terms; averaged out over its total loan capital of $1,963 million (of this $1,638 million is payable in US dollars) it can have no significance. The Bank has lately been relying, perhaps more than it would wish, on short maturities sold in New York; further steps in its longer-term operations may bring the Bank to Europe again before too long—perhaps it will be Zurich's turn next.

STEEL

Back to 95 per cent

IN November steel output in Britain passed the record level touched in May, 1957: at 458,600 ingot tons a week, the equivalent of nearly 23,850,000 tons a year, it was the highest in the industry's history and as much as 30 per cent above output a year before. The recovery in its demand

has broadened: October deliveries of almost every steel product were higher than in September, even those of plate and heavy sections. There has been a marked expansion in demand from the constructional engineering industry and from general engineering. Pig iron production in November was 18-19 per cent higher than a year before: this too is back towards the levels of late 1957. The steady increase in output since the summer, taking up the slack in the industry, has been in response to orders that are now being placed further ahead and in larger quantities; there seems no doubt that a substantial number of customers are now doing their best to rebuild stocks. The comfortable margin of steel in hand upon which the "metal-using" industries were used to rely in the postwar period enabled them to cut their orders much more than their consumption during last year's mild recession as the Steel Board's table shows. Steelmakers hope this habit of carrying relatively large stocks will, equally, boost orders as the upswing continues next year.

STEEL PRODUCTION, CONSUMPTION AND INDUSTRIAL ACTIVITY

* Based on October and in some cases November figures. † Weighted according to their steel content.

The four more steel dividends announced this week have brought no real surprises; only the more heady market optimists could have been disappointed, for example, by United Steel's results. Steel share prices today reflect the removal of the nationalisation threat; steel companies' financial results (the first four of which are discussed in Company Affairs on page 1114), more soberly, reflect business during a financial year (to 30th September) during which production in the industry dipped as much as 19 per cent below the year before and did not show much general recovery until the early summer. United Steel's very broadly based experience includes very lean times in some departments against relatively successful trading elsewhere: it suggests, moreover, that a year of operation below capacity offered the industry economies in operating to set against the heavier burden of unit capital charges.

CROSSE AND BLACKWELL

Soup War Hots Up

THE two giants of the canned soup industry—Heinz and Crosse & Blackwell—have recently been forced to acquiesce in the fierce price-war in canned soups among retailers by the increasing popularity of packet soups and, more important, by the entry in the British market of Campbell's from the United States, which enjoys about 80 per cent of the American market. On Tuesday evening the directors of Crosse and Blackwell announced that they had received an offer of 72s. for each £1 unit; the identity of the bidder has not been disclosed. The offer places a value of some £9,700,000 on the group's ordinary shares, with a nominal value of £2,700,000, and on Wednesday (after the bid and not before it) the £1 ordinary shares shot up 15s. 3d. to 70s. Rumours about the identity of the bidder have been going the rounds in Throgmorton Street as fast as denials have issued forth from companies concerned. So far Beechams (who were involved in take-over rumours about C and B last July), Schweppes and Heinz have denied any knowledge of the bid. So, too, have General Foods of America.

The field of likely bidders has thus been narrowed, and the popular favourite is Campbell's whose actual (as against threatened) impact on the market has so far been small. To this American giant (whose net earnings after tax last year amounted to some $35 million) £9.7 million is probably a relatively cheap way of gaining Crosse & Blackwell's one-third share of the British market in canned soup, as well as sizeable interests in other food products, from vinegar and pickles to baked beans, boiled sweets and chocolates. Meanwhile shareholders of Crosse and Blackwell will have to wait for the further details promised by the directors and their advice on whether or not to accept. With the net assets of the group worth around 54s. 6d. a share there seems little doubt that they will recommend acceptance—unless some potential rival bidder acts fast. One encouraging feature about the affair has been the directors' scrupulous observance of the code of procedure in take-over bids recommended by the recent committee of City institutions. For once, shareholders as a body have been given information before it has become available to a lucky few; in Tuesday's dealings the price of the Crosse and Blackwell shares actually fell.

SCIENTIFIC POLICY

Lord Hailsham's Advisers

WHEN he was appointed Minister for Science two months ago, Lord Hailsham stressed the importance to him, as a layman, of technical guidance from the 15-man Advisory Council for Scientific Policy. This composite *eminence grise* has been advising successive governments on scientific matters for more than twelve years. This team of advisers may gain more power now that it is guide and mentor to a single minister with whole-time responsibil for science than when it was advising the government at large: however, its membership is widely chosen, and it has always enjoyed what might be described as "distinguished amateur status." The Advisory Council's report for the year ending September 30th suggests that it is sufficiently broadly based to avoid any danger of becoming a pressure group for any single kind of scientific effort, however fashionable. Its advice to the government on the biggest single issue of current scientific policy—space research—is presented with a clear-sighted realism and logic that will not endear the members of the committee to some of their interested colleagues.

After examining the arguments for an independent British space research programme the council concludes that they do not hold water. Space, it concedes, is exciting, stimulating, challenging; but "the magnitude of the effort involved in a substantial programme of space exploration is so great as to put its development and operation beyond the reasonable capacity of any but the wealthiest of nations," among which the council does not count Britain. It would be "the grossest folly" to undertake space research at the expense of crippling other branches of science. This is strong language for an official document, and in case there may be any doubt left in the readers' minds about its meaning, the committee goes on to say that Britain ought not to attempt to send rockets round the moon or to the planets, nor to try to put a man into orbit.

The council considers the expenditure of between £100,000 and £200,000 in total, on a programme involving the installation of British instruments in satellites to be launched by American rockets as part of an international space research effort, as "perfectly proper." But it has the gravest doubts, on grounds of cost, about the wisdom of modifying Britain's one big military rocket. Blue Streak, to give this country its own independent satellite launcher—though the odds are, as it happens, that the government will go ahead with this modification for Blue Streak, with or without the committee's blessing.

The report's conclusion on space research could, in sort, be summed up in one sentence: "We do not think that the scientific and technological return to be expected is likely to be commensurate with that cost." A space research programme complete with British launching rockets, as distinct from cautious experiments with earth satellites, might cost this country £100 million each year out of the £250 million or so that the government is at present spending on research as a whole. The repercussions that expenditure on this scale on one programme would have on the money available for research in other and perhaps more immediately rewarding branches of science explain why the Advisory Council has exhorted Lord Hailsham to close his heart and his pocket to the rocketeers.

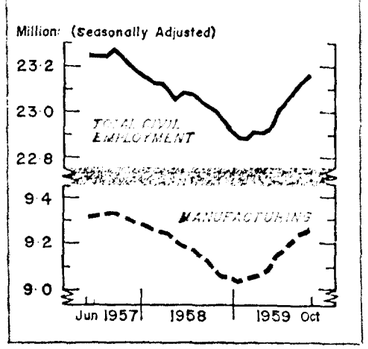
Who Wants Scientists?

LORD HAILSHAM'S advisers have saddled themselves with an embarrassing incubus in the form of a triennial estimate prepared with the help of the Ministry of Labour of the demand for, and probable supply of, scientists. Experience since the first of these estimates was prepared in 1956 suggests that to invite industry to guess how many qualified scientists and engineers it would like to recruit during the next three years is asking a fairly silly question, and gets some silly answers. In 1956 the Advisory Committee on Scientific Manpower expected only 35,000 new scientists and engineers to have qualified by 1959; in fact 41,000 did. The number of scientists and engineers employed in Britain therefore rose from 119,700 to 143,300, a much bigger net increase than had been predicted; and most of the newly qualified people went into industry.

One factor that affected its forecasts was the earlier assumption that "not far short of half" of all scientists and engineers on research and development (including re-

Recovery in Employment

By October, after allowing for seasonal factors, there were 275,000 more people in civil employment than in February and 150,000 more than a year before; yet the number was still 100,000 short of the post-war peak in September, 1957. Although most of the recent increase has been in manufacturing employment, even taking into account longer working hours this has risen by only 2½ per cent during the last twelve months, compared with a rise of 10 per cent in output.



search in universities) were engaged on defence work: it would now estimate the proportion as about a third. Leaving out the universities, the proportion on defence work in 1955-56 would have been about 40 per cent: and with defence cuts, this proportion has now fallen to only 25 per cent. More disconcerting discrepancies, however, occur between the numbers of extra scientists that separate industries calculated that they would need, and the numbers they have in fact taken on. The electrical engineering industries, which include electronics, estimated they would want 43 per cent more scientists; in fact they took on fewer than ten per cent new men. The chemical industry thought it would want 20 per cent more, but the numbers it employed actually increased by more than 45 per cent. The miscellaneous industries grouped under "other metal goods" estimated in 1956 that they would want about a third more scientists by 1959; in fact the numbers they employed actually fell during the period. Industry in general took on about 28 per cent more technically qualified people, whereas it had expected to need 36 per cent more: it is only fair to add that from 1955-56 to the beginning of 1959, its output had risen little more than 2-3 per cent.

This seems to bear out the sceptical conclusions if not the actual calculations of Professor Jewkes' recent acid attack on the Advisory Committee's 1956 estimates. It also throws considerable doubt on the committee's new forecasts about the supply and demand of scientists up to 1962. Industry, influenced no doubt by leaner times last year, was notably more cautious about the number of new scientists it thought it will want to take on; an extra 39,000 would seem to cover all needs, equal to an increase in numbers of 22 per cent. Balancing this against the numbers likely to be trained during the period, the committee thinks that about 6,000 jobs in science and engineering may still be going begging three years from now. But bearing in mind the amount of surmise and speculation behind the estimates from which these figures are prepared, the outside observer may be more inclined to guess that the supply and demand for scientists and engineers may be roughly all square by the early 1960s, if indeed they are not already, and that an actual surplus may appear in certain fields. Brilliant individuals will always be scarce, in science as everywhere else, but any general shortage of technically qualified people as such seems to have vanished, for the moment, with the rest of the inflation.

£298 million fob, were £7½ million below the October record. Re-exports, however, dropped sharply by £5 million to £9½ million, and the apparent trade deficit increased by nearly £10 million to £49.3 million. The rise in exports in recent months has almost matched the growth in imports. The Board of Trade states that after eliminating normal seasonal variation,

UNITED KINGDOM TRADE

the value of imports in the three months September to November was seven per cent higher than in the three previous months, and the value of exports six per cent higher. Taking the average of the first eleven months of the year imports were six per cent above the average for the whole of 1958, whereas exports were only 4½ per cent above the 1958 average.

EURATOM

The London Talks

WHEN he was in London last week for his first formal talks with the Atomic Energy Authority under the new UK-Euratom agreement, the president of the Euratom organisation, M. Hirsch, repeated what he had already said in New York, namely, that western Europe has no need for commercial atomic power now or for many years in the future. This once again served notice on British and American manufacturers that it is no use their looking to Euratom to provide them with the market for nuclear power stations that they cannot find at home. These hard facts are taking some time to sink in. Industry on both sides of the Atlantic still cherishes wistful hopes of milking Euratom of some of its very substantial income; there was acute disappointment in the United States at the reaction of public utilities in the six countries to the government-backed offer to help them erect American-designed nuclear power stations. It had been assumed in America that there would be a queue of applicants anxious to take up this offer; in fact only one of the five tenders submitted was a firm one, two contained important reservations and two were so vague that they were not worth serious consideration at this stage.

Euratom's main task is research—research to find a form of nuclear power that may be competitive ten years from now. But this is the objective of every country with an atomic energy programme already in existence: co-operation between the Euratom organisation and the Atomic Energy Authority may take the form of a co-ordinated policy in which the two organisations consult in advance to avoid duplicating each other's research. Thus Euratom is extremely interested in prospects for fast breeder reactors, of which Dounreay is the largest working prototype. Scientists from Euratom have spent some time visiting Dounreay; they now intend to build a fast breeder reactor of their own during the next two years, but to a completely different design, since there is no point in producing the twin of an experimental reactor already in operation. This type of co-operation based on a mutual exchange of information may prove more fruitful to both sides than the discouragingly tepid language of the diplomatic agreement between this country and Euratom might suggest. Like a good many scientific exchanges it is, however, based on old personal contacts; Euratom's research director was one of the original members of the old Tube Alloys team that worked on the atom bomb in Britain in the early days of the war.

OVERSEAS TRADE

Exports Remain High

IMPORTS and exports fell slightly in November from the high levels of the previous month. Imports dropped by £3 million to £357 million cif while exports, at

AIR POOLS

Less Competition Than Ever

THE Minister of Aviation, Mr Sandys, has blandly welcomed the recently signed pooling agreement between the British Overseas Airways Corporation in this country and the Canadian, Indian and Australian airlines, TCA, Air India and Qantas. This is in line with the current tendency to make such agreements. The Swiss and Scandinavian airlines have one; the French, German, Italian and Belgian airlines have just formed their own pool; British European Airways has similar agreements with practically every airline in Europe. But it does not follow that the tendency should be welcomed. The Dutch airline, KLM, stayed out of the recent "Airunion" pool because it considered the scheme bad for business. American airlines stay out because anti-trust laws do not allow them to join such associations.

When airlines join a traffic pool they agree not to compete. Under normal conditions they would schedule their flights, perfectly properly as the passenger might think, for the most popular hours of the day; in a pooled service (so the theory runs, although the timetables often contradict it) all the schedules are spread out across the clock, and if one airline loses because it operates at an unprofitable hour when traffic is thin, its partner compensates it out of the profits earned during busier hours. The essence of a traffic pool as the airlines under-

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. An effective credit information service and skilled assistance and advice are available to United Kingdom merchants and manufacturers seeking new business connexions in Asian markets.

stand it is an agreement to restrict competition and divide profits. The recent BOAC agreement is no exception. In some cases the exchange of profits is a one-sided business; time and again in Europe a traffic pool has been the only way that a big airline like BEA can get a small, probably impecunious or heavily subsidised national airline to allow it to increase services to that country, the small airline obtaining what amounts to a retainer from the big one. This may also have happened to BOAC.

Of the agreements formed recently between the bigger international airlines, that of Swissair and SAS is far the most significant since the two operators are actually sharing each other's aircraft fleets and rationalising engineering and maintenance. Unfortunately, the new BOAC pool agreement does not follow this new pattern. There is no sharing of aircraft, nor any rationalisation of maintenance and ground handling. The agreement seems unlikely to help BOAC cut down its huge staff overheads along routes where traffic is not heavy enough to justify them. It may have been too early to get the other partners to accept the idea of merging into what might be described as Air Commonwealth; but there is no evidence that BOAC pressed them very hard to do so.

ALUMINIUM PRODUCTS

Peak Output Regained?

SPEAKING of Tube Investments' year, Sir Ivan Stedeford said last week that trading came in like a lamb but went out like a lion rampant. Skipping the "rampant," the phrase also describes this year's business in the British aluminium fabricating industry (in which TI, in partnership with Reynolds Metals, now has the largest stake). Demand has been increasing throughout the year, especially in the second half. Most fabricators are now working pretty close to capacity, particularly for rolled products, after several painful years of working well below it. Delivery dates have lengthened—again, more for rolled products than for extrusions. Total deliveries this year will probably regain the 1955 peak of 313,000 tons, which would mean an increase of ten per cent over last year's deliveries of 283,000 tons. Exports have played a part in the recovery; shipments in the first ten months rose by nearly 40 per cent to 39,600 tons, compared with a year ago.

The latest figures of deliveries go no further than August. Between the first eight months of 1958 and 1959 total deliveries went up by 14 per cent to 205,000 tons, with rolled products showing a rise of 17 per cent to 99,000 tons, and extrusions an increase of 15 per cent to 45,000 tons; deliveries of forgings and castings increased less rapidly, by eight per cent to 60,000 tons. Sales of sheet and strip have been boosted by the boom in consumer durables, though transport of all kinds accounts for the main increase in tonnage. The market for foil has continued to grow but not, strangely, for other forms of packaging. The electrical industry and road transport seem largely responsible for the bigger sales of extruded products, which should do better still next year if the revival in the capital goods industries broadens out.

In the United States the recovery in demand for aluminium appears to have been checked, and some major producers have recently had to cut back output of aluminium ingot. This is probably no more than a temporary pause, caused mainly by the effects of the steel strike. The Aluminum Company of Canada, on the other hand, is now raising output from 75 to 77 per cent of capacity; this is still below the rate at which American companies are operating, but in the middle of this year Alcan was running at only 65 per cent of capacity. Sir Ivan Stedeford is not alone in his view that while the recession in aluminium is becoming less severe, "it is likely to be quite a time yet before the considerable over-capacity is taken up."

MANAGEMENT

A More Business-like BIM

FOR the first time since it was set up in 1947, the British Institute of Management now looks as if it is becoming economically viable without a government grant. In its last accounting year, ending March 31, 1959, it had an excess of income over normal expenditure of £20,172, compared with a deficit of £30,208 the previous year. However last year it was helped by a £10,000 Government grant, which it did not receive in the year before. This year it is receiving its final Government grant of £5,000.

This improvement in the institute's financial position has been achieved partly by an increase in income from collective subscribers and partly by administrative economies. The number of collective subscribers has nearly doubled (to 2,732 in April 1959) since 1955; and the income received from them rose from £67,058 in 1955-56 to £83,337 in 1958-59. On the other side of the account the Institute's staff has been cut from 168 in April 1957 to 123 now, and total administrative costs were brought down from their 1957-58 peak of £176,429 to £150,959 in 1958-59. This year BIM is budgeting for a further cut of nearly £4,000.

Financially, therefore, the record shows a great improvement. Two policy changes in the role of the institute, moreover, may mean that the economies will not detract from its usefulness to business members. First, the BIM has, with one specialist exception, abandoned the idea of high-powered staff offering expert advice in favour of employing mainly younger men, whose job it is to answer the many elementary enquiries received, and to know where to get the information for the more complicated ones. Helped by a specialist advisory committee, the staff now effects a liaison between those companies wanting information and those able to supply it. This change, quite apart from its value as an economy, is a wise one; the institute was never, understandably enough, able to attract men of a high enough calibre to command respect in industry.

The second change in the role of the institute has been its partial decentralisation through the establishment of regional councils in January 1958 and of branch committees: ten of its staff are now at regional offices. It has also managed to improve relations with other management bodies, which for many years were often antagonistic. The Institute's main role is to act as the national management body in relations with other countries, to be the focus of interest and information concerning good management practice, but to leave to the other bodies the more detailed and specialist approaches. It is unfortunate that the interest of top managers in the Institute has declined; many of them have gone from its Council, and the number of those attending the last two annual conferences showed a marked drop on the early years. It is now trying to rekindle the interest of top managers through regional conferences and by small discussions limited to them. The BIM has not achieved the high hopes that were held by some at its birth; but it looks as if those who were recently predicting, or hoping for, its early death were also wrong.

MACHINE TOOLS

Attention to Weaknesses

WHATEVER its attitude to other critics, the British machine tool industry is clearly taking some notice of the report by the Department of Scientific and Industrial Research upon its research and development facilities and its employment of technically qualified personnel. It was announced this week that representatives of the Machine Tool Trades Association had been discussing implications of this report with DSIR—and with the Ministry of Education: meetings are continuing, and some significant change in the industry's research organisation does now appear to be likely.

A statement from DSIR recorded that the machine tool manufacturers agreed that more advantage should be taken of further educational facilities for young technicians, and promised to discuss the improvement of curricula in technical schools and courses. On the research side, it was noted that DSIR is financing two university studies, at Manchester and Birmingham, into

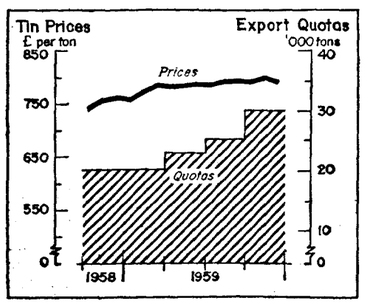
machine tool technique (and is contemplating the finance of three other research studies). The industry agreed to strengthen contacts between its own designers and engineers and research workers in universities; moreover, it undertook to formulate its own views on the form of research organisation most suited to the machine tool industry ought to take, and to report fully upon this when it has done so.

TIN MARKET

Exports Increased

FEW people expected the tin council to increase export quotas in the first quarter by as much as 6,000 tons. The new rate is 36,000 tons, equal to about 95 per cent of actual exports before control was introduced in December, 1957. Tin prices weakened before the council met in London last week, owing partly to the lack of American demand, but mainly in anticipation of some increase in export quotas. Since the announcement prices in London have shown little change, chiefly because prompt and nearby supplies to this market are still short. On Thursday cash tin closed at £791½ a ton, a little higher than a week ago, and three months' tin showed almost no change at £789 a ton. No business was done in the closing "ring." With prices kept in such a narrow range by the operations of the manager of the buffer stock, trading on the market has languished.

The council had to fix the new quotas without knowing whether the American steel companies will continue to operate beyond January 26th, when the injunction sending the strikers back to work for the eighty-day "cooling-off" period expires. But if events prove that the council has



over-estimated demand, the manager of the buffer stock has ample funds to support the market. The council disclosed that the buffer stock held 13,990 tons at the end of June, and that it is taking over 2,417 tons from the Board of Trade from December 28th; the sale of this tin will complete the disposal of the British strategic stock.

The chairman of the council announced this week that 10,000 tons are likely to be in the buffer stock at the end of December, and said that tin to be sold on the Board of Trade's behalf is not included in the stock. This makes the more puzzling the fact that the stock is well above most private guesses. The council, the chairman continued, has still not agreed on its interpretation of article VII of the agreement: whether exports can be restricted when the stock is less than 10,000 tons. Consumers are no doubt in favour of ending export control once stocks in producing countries have been run down to a normal level, but producers are split—and it is not difficult to see why. While exports are controlled each country's share of the total quota can only be changed slowly, under the provisions for re-distributing annually one-twentieth of the total among the most efficient countries. If exports were freed Malaya, for example, would stand to increase its share of the market, while the shares of Bolivia and Indonesia contracted, at a faster rate than at present. The chairman also announced that Russia had indicated that its exports to the free world next year would not exceed the ceiling of 13,500 tons observed in 1959.

RAILWAY REDUNDANCY

A Promise Made

THE Transport Commission has evidently decided that it is not only pay that is causing the recent heavy erosion of railway staff, but also the fear of prospective redundancy. So far the actual amount of redundancy on the railways has been very small—only 14,000 or so in the last two and a half years out of a total labour force of just over half a million. But clearly many railwaymen are looking ahead to the later stages of modernisation when the railways are promised a more streamlined mode of operation, and railwaymen though more highly paid will be fewer. This is still some years ahead: it was to counter any demoralisation in the meantime that the commission decided to issue its assurance this week that no men in railway conciliation grades in service in January, 1958, would be discharged as redundant.

This, the commission is keen to point out, is so far only a statement of principle. The details have still to be negotiated with the unions, and the assurance was given on the understanding that redundant staff would be willing to accept other work offered by the commission, even in another part of the country. In the amplified redundancy agreement settled with the unions two years ago, the railways already have one of the best arrangements of almost any British industry for resettling staff no longer needed in their present jobs. And normal wastage, which is very high on the railways—78,000 people left last year and another 55,000 were recruited—should enable the railways to achieve their streamlining without sacking many men. But certain kinds of skilled men are proving difficult to keep. The shortage has lately become most noticeable in most of the heavy industrial areas, but it is most acute in London at the Western Region's principal depot at Old Oak Common near the many light engineering factories of Acton and Willesden. Since the beginning of November Western Region has been forced to cancel a number of its suburban services. This week's assurance regarding redundancy may help in general, but the railways will probably have to wait for the next pay review, which is now not likely to be made until well into 1960, for any major attempt to stem the tide.

PAINT

Courtaulds Buys American

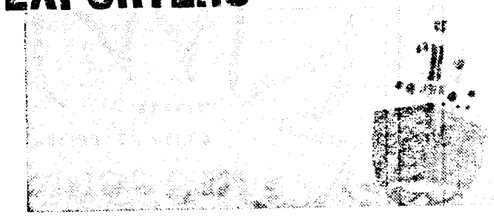
AN agreement which has been concluded to allow Courtaulds, through its subsidiary Group Developments, the exclusive use of the manufacturing know-how and paint "formulations" of the American Glidden International company suggests that the group regards paint as one of the more important of its attempts to diversify its products. Glidden is one of the largest American makers of domestic and industrial paints; Courtaulds already owns one paint company in Britain, Cellon, which originally made aircraft dope but now produces marine and industrial paints as well. The Glidden agreement will not affect Cellon at once, but it will eventually mean that production methods may be modified and new products added to its range—the agreement covers all types of protective finish as well as normal paint. With the experience of Cellon combined with that of Glidden, Courtaulds should be well placed to strengthen its position in the paint industry; expansion of the group's production facilities in this field would seem the next step that it will need to take. It possesses the resources and much of the basic engineering knowledge required, besides producing raw materials for some types of paint.

POST OFFICE MECHANISATION

From Prototype to Practice

THE mechanised parcel sorting office that the Postmaster General opened in Leeds last Tuesday is the first operational installation of this kind in Britain. It is a somewhat belated translation into practice of a prototype machine installed at the Paddington parcel sorting office in 1938. The Leeds installation consists of twelve machines, each operated by one man and able to sort up to 900 parcels an hour into 22 different channels—though up to 40 can be provided by this type of machine. It is dependent, like all existing sorting machines, on human control; the operator reads the address, when the parcel is brought to him

SMALL EXPORTERS



In three years – backed by ECGD insurance – a small manufacturer increased his export turnover from a mere £97 to £193,000 a year.

LARGE EXPORTERS

Since 1948 – the year he first insured with ECGD – a big manufacturer in the radio industry has built up his export turnover from £81,000 to over £2,000,000.

There's many an exporter in this country who could be doing even better business. ECGD insurance enables you to develop and expand overseas free from serious financial worries. If you're big already, there's still room for expansion. Last year fifteen companies with annual export turnovers of *a million pounds and more* took out ECGD insurance for the first time. Have a talk with *your* ECGD man.

EXPORT AND EXPAND THROUGH E·C·G·D

ECGD is a Government Department set up to help exporters. Its services are fully explained in the booklet 'Payment Secured'. Write for a free copy.

by a conveyor, and presses the button appropriate to its destination. The parcel then falls through a trap door on to a conveyor, and is automatically carried to the correct despatch point. The machine can sort half as many parcels again in a given time as hand sorting can, but the biggest gains come from substituting conveyors for labour in the movement of the parcels within the office. How large the saving in cost will be is something the Post Office hopes to learn from the Leeds installation. But over 70 per cent of the total cost of the postal services is labour cost, so the gains should be substantial.

Letter sorting by machine is already being tried out. At Southampton machines have been installed that separate letters from packets, along with more complex equipment to arrange the letters facing the same way, ready for sorting. These automatic letter facers also cancel the stamps and separate the printed papers from the letters; their operation depends on the use of special stamps, from which the machines can distinguish the position and type of the letters. Twelve more of these machines were ordered from Elliott Brothers last month for new installations in Leeds, Liverpool and London.

Such machines precede the actual sorting of letters by destination in the postal process; this sorting is already done by a machine unhappily called Elsie at Norwich and several other towns. A letter sorting machine, like the parcel sorter, places a letter in a channel selected by the operator; it has 144 channels, three times the number that can be reached manually, and thus reduces the number of times that one letter need be sorted, as well as sorting twice as fast as a man can.

COMMONWEALTH SUGAR

A Million Saved

NEXT year Britain will pay about £1 million less for the sugar that it buys from the Commonwealth at a fixed price. This is the main outcome of the annual negotiations between Commonwealth producers and the Ministry of Food and Agriculture that ended in London last week. The maximum quantity of raw sugar that producers can sell in Britain and other preferential markets in 1960 remains at 2,375,000 tons, and the quantity sold at the negotiated (fixed) price has been increased by a further 3 per cent to 1,655,000 tons; the Commonwealth sugar agreement provides for such increases when British consumption exceeds 2,550,000 tons a year. Almost all the negotiated price sugar is sold to Britain, and the price for 1960 has been fixed at £44 8s. 10d. a ton, which is 13s. 2d. a ton less than in 1959. Commonwealth marketings in excess of 1,655,000 tons are sold at the world price (plus preference), which has recently recovered to about £28 a ton. This comparison is not as unfavourable to the negotiated price as it seems; but for the protective arrangements under which most of the world's sugar is produced, the price on the residual world market would be appreciably higher than it is.

British consumers will not gain immediately from the reduction in the fixed price. Under the curiously round-about scheme devised to permit private trading in Britain, the fixed price is paid by the Sugar Board, which then resells that sugar at the lower world price, recouping its loss by a surcharge (varied infrequently) on all sugar consumed here. It seems that an effort is to be made to keep that fixed price steady in future years. The Ministry states that a full review of the price fixing arrangements under the agreement took place on the basis of up-to-date returns of costs, and that the system was confirmed. It then adds, mysteriously, that "an arrangement was made to restrain prices in 1961, 1962 and 1963." Following four years in which the fixed price went up by £4 7s. a ton, an effort to avoid any further cost inflation is to be welcomed. It is encouraging to learn that Commonwealth producers evidently believe this to be as much in their own interest as Britain's.

AGRICULTURAL MACHINERY

Bucolic Affluence

BRITISH manufacturers of tractors and agricultural machinery appear to be on their way to another record year, both at home and in export markets. All of the major tractor producers report increases in production during the first nine months of this year, compared with a year earlier. Exports of tractors during the first nine months were worth £48 million, an increase of nearly ten per cent on the same period in 1958. Exports of implements and machinery are running at about the same level as last year—about £12.5 million in the past nine months—though there are wide variations between types; there has been a big drop in sales of combine harvesters, for instance. Large increases have been reported in exports of tractors to the United States and Canada, which seems somewhat surprising in view of the fact that roughly two-thirds of the industry is composed of American and Canadian subsidiaries or licensees. In fact, sales to North America account for only about one-seventh of all tractor exports, even at this year's high rate; both western Europe and the rest of the Commonwealth—led by Australia—are more important markets.

What never ceases to be surprising is the continued strength of home demand for both tractors and machinery. British agriculture is already easily the most highly mechanised in the world; yet it continues to buy tractors at a rate which would suggest either that the number per farm is growing at compound interest or that they are being replaced with increasing—and very possibly uneconomic—rapidity.

The range of specialised machines exhibited at the Smithfield Show and Agricultural Machinery Exhibition held at Earls Court this week displays an increasing number of expensive refinements such as impulse starters, countershaft discbrakes and hydrostatic drives. Even the more natural functions are now aided, by such devices as a mechanical midwife—for cows.

SHORTER NOTES

Mr John Dalgleish, chairman and managing director of Camp Bird, has stated that he was invited in a personal capacity by the controlling shareholders of the Jasper group "to evolve a solution" to the Lintang/Jasper affair. He stated that his proposals, which involved the taking over of the "beneficial shareholdings of the present majority holders in the Lintang/Jasper companies," were now being studied by those concerned. Any investment by Camp Bird in the proposed consortium would be "of a minor nature." The proposals will be submitted to the Stock Exchange and other authorities when the negotiations are complete. The shareholders' committee of the State Building Society announced that it viewed "with some misgivings the present negotiations with Camp Bird."

*

The auditors of both Camp Bird and its subsidiary, Hartley Baird, make certain reservations on the accounts of the companies for the year to April 30th. As last year, the main qualification on Camp Bird's accounts concerns the prospect of recovery of expenditure on mine development and exploration and other expenditure which has risen from £653,704 to £985,191. In the auditors' report on the accounts of Hartley Baird doubts are expressed concerning the recovery of amounts owing to the group by fellow subsidiaries and associated companies totalling £667,850.

AMSTERDAM, HOLLAND

(Aircraft and Engineering)

FIRST "FRIENDSHIP" AIRLINERS DELIVERED IN 1958: SUCCESSFUL DEMONSTRATION FLIGHTS

TRIBUTE TO BRITISH INDUSTRY

The Annual General Meeting of N.V. KONINKLIJKE NEDERLANDSE VLIEGTUIGENFABRIEK FOKKER was held in Amsterdam on September 29th, and the following is a summary of the report presented by the Board of Directors:

REVIEW

In accordance with the production schedule for the F.27 "Friendship" drafted three years ago, flight testing of the first production aircraft destined for *Aer Lingus Teoranta* began on March 23, 1958. The tests took several months and the transfer of the first plane, together with the second one, to *Aer Lingus* was made on November 19th. Twenty-two days later the third "Friendship" aircraft left for Eire; the fourth aircraft to come off the line was handed over to the Norwegian company, *Braathens South American and Far East Air Transport AS* on December 22nd, and delivery of further F.27's has continued according to plan.

After carrying out a number of demonstration flights, *Aer Lingus* started their first "Friendship Routes" from Dublin to Glasgow and Liverpool on December 15th. The Dublin-Paris route followed on December 17th.

Twenty-four F.27's are expected to be delivered by October, 1959. Deliveries by the FOKKER licensee in the USA—*Fairchild Engine and Airplane Corporation*—progressed at a similar pace. The first American-built aircraft began flying on April 12th and three "Friendship" aircraft manufactured by *Fairchild* were put into regular service by West Coast Airlines on September 27th. *Fairchild* will have delivered some 60 F.27 aircraft by October.

Output has progressed satisfactorily since, and reports from customers and *Fairchild* concerning the technical performance and commercial results of the "Friendships" delivered in 1958 are most favourable. By the end of October, 1959, some 75,000 flying hours will have been accumulated in regular airline operation. The number of aircraft sold so far, however, unfortunately falls short of expectations.

Current orders for the "Friendship" amount to 54 and the rate of output was maintained throughout 1958.

A certain amount of anxiety was felt in respect of *FOKKER Industria Aeronautica SA* in Rio de Janeiro (*Fokker-Rio*), although from the technical point of view this enterprise proved itself capable of standing on its own. An order for 100 FOKKER S.11 training aircraft was carried out on behalf of the Brazilian government.

PERSONNEL

The staff at the Schiphol and Dordrecht plants numbered 4,128 and showed but little change compared with the previous year.

A small increase in personnel was recorded in respect of *Avio-Diepen*. The staff of the FOKKER concern in the Netherlands rose to 4,800 during 1958.

The intensive training of newly recruited staff was practically completed. Only a few courses remained to be arranged for the retraining of present staff. 160 pupils passed through the training centre at Schiphol, and a further 25 were trained at Dordrecht.

PRODUCTION ACHIEVEMENTS

Although the contract for the manufacture of Hunters under licence neared its completion, output continued to rise. The entire order was completed in February, 1959. Mention should be made in this connection of the friendly co-operation with *Meatschappij voor Vliegtuigbouw Aviolanda NV*, as well as with the Belgian aircraft industry.

Output of expendable fuel tanks for the Hunters continued throughout the year, and the order was completed in 1958.

The organisation kept ready at Schiphol for the supply of spares and specialised assistance in emergencies was found to work satisfactorily.

REPAIRS AND INSPECTIONS

Maintenance work was carried out on a number of Dutch and Belgian aircraft as well as on aircraft and helicopters of the Royal Netherlands Navy.

The Ypenburg maintenance workshops were organised to undertake the IRAN of a number of Republic F. and RF.-84F jet aircraft of the Royal Netherlands Air Force.

The work started in 1957 for the inspection and maintenance of Douglas C.47 aircraft of the American Air Force was completed in 1958.

SUBSIDIARY ACTIVITIES

A special department was set up at Dordrecht during 1958 for chemical milling. This new process will greatly simplify the manufacture of certain spare parts. Work is progressing on the manufacture of radar aerials for *Hollandse Signaal Apparatenfabriek* (Netherlands Signal Equipment Factory) and also on the production of a new type of aerial to be used by the Civil Aviation Control authorities which is now installed at Schiphol Airport. Modifications to the aerial were also carried out on behalf of the Royal Netherlands Air Force.

Besides radar aerials, FOKKER made a batch of galleys for *KLM*'s Lockheed Electras and Douglas DC-8's and received from other sources orders for air-conditioning plants for ships and land installations. Sales of the FOKKER-Eckold metal-sheet shaping machines showed a slight temporary decline. Two new products were put on the market, the FOKKER "Hot Joggle" machine for hot and cold joggling and the FOKKER "Bond Tester," an electronic inspection device for the non-destructive testing of bonded metal compounds.

AIRCRAFT DEVELOPMENT

The Construction Department at Schiphol was kept fully occupied during the year by trials and further development of the "Friendship."

The modifications involved in the building of a heavier engine (Rolls-Royce "Dart" RDa 7 developing 1,900 hp) in one of the prototype aircraft took seven months. Buyers now have the choice of either the RDa 7 or the RDa 6 (1,600 hp).

Apart from its normal passenger configuration which provides between 32 and 40 seats, the "Friendship" is now available in a mixed passenger and freight version. This type is suitable for the transport of both passengers and freight in any desired proportion.

Further versions of the "Friendship" are available as executive aircraft and as military transports. In the latter case provision is made for the dropping of parachute troops and of military equipment. Constructional adjustments to meet further specialised requirements of buyers claimed a large part of the capacity available during the year under review.

Following the demonstration flight to India in 1957, another successful demonstration flight to South America began on April 27, 1958. Additional tanks were fitted to the aircraft for the 2,500-mile Atlantic crossing from Africa to Brazil. After the aircraft arrived in Rio de Janeiro on April 29, the extra fuel tanks were dismantled and numerous flights were carried out.

At the request of the Brazilian Air Force a flight was made to La Paz, the capital of Bolivia, which lies at an altitude of 13,000 feet. On its return to Schiphol on July 1st, the aircraft had flown 32,000 miles on this tour. The President of Brazil, His Excellency Dr J. Kubitschek, was one of a total of 1,465 passengers carried during 104 flights totalling 136 flying hours. Other demonstration flights to Yugoslavia, Austria, Germany and Sweden were also made during the year.

Studies with a view to the further development of the "Friendship" design continued to be carried out with the support of the Netherlands Institute for Aircraft Development, and discussions on new developments were also held with *Fairchild*, the American licensee.

PROSPECTS

Although the reluctance to place orders for aircraft, which was a marked feature of the aircraft market in 1958, continues to be noticeable, signs of a revival in the aircraft industry are making themselves felt. Discussions with various prospective buyers, which were broken off in 1957 or 1958 in view of the recession, have now been re-opened.

The Company's interest in repairs and maintenance work remains unchanged, and it is hoped to expand its activities in this field. Efforts are continually being made to improve co-operation with other aircraft manufacturers, particularly within the Common Market. The naval patrol aircraft specifications, which have been drawn up by the NATO countries, are a promising example of such co-operation. A group consisting of *Breguet* (France), *Sud-Aviation* (France), *Dornier* (Germany) and FOKKER put forward the design for the Breguet 1150, which was accepted, and work on the design and construction of the first prototype is now under way. The Company has undertaken to manufacture the mid-wing sections together with engine nacelles, and it is hoped that the design phase will soon lead to the production of the aircraft. It is felt that such a co-operative effort is most favourable to the continued expansion of the West European aircraft industry.

Plans for ordering a successor to the Hunter are taking shape as a result of negotiations between the Netherlands and Belgian governments, and it is hoped that this will lead to a joint effort of the Benelux industries.

Although the Company will have a share in the manufacture of the "Hawk" missile, which is being built by a European group representing five countries, this project ushers in a new era in which it is expected that production of military equipment by aircraft manufacturers will tend to drop. It is felt, therefore, that the Company did well to undertake the production of civil aircraft beginning with the "Friendship" airliner.

At the same time the need is felt to expand the manufacturing programme to include industrial products not directly connected with the aircraft industry.

"FRIENDSHIP", TRIBUTE TO BRITISH INDUSTRY

The FOKKER F.27 Friendship is a fine example of Anglo-Dutch co-operation, in which the British aircraft industry is playing a very important part.

The Netherlands have always been one of Britain's largest customers in military and civil aviation.

FOKKER is one of its oldest customers, dating back nearly 40 years. Large numbers of British engines, landing gears, instruments, etc., were used, and only since the war some 800 jetfighter aircraft of British design have been built under licence in the Netherlands.

Direct British exports to the Netherlands in the postwar period total more than £25 million.

From the outset the FOKKER F.27 Friendship was designed around products of the British aircraft industry, for which much research and development work was done in Britain. Rolls-Royce, Rotol, Dowty, Dunlop and many others benefit from their important share in Friendship production.

The British share in Friendship production is even more important than the Dutch share itself, because of the following facts:

1. More than one-third of the Friendship's value is British.

2. Licence-production of a British turboprop feederliner in the United States is inconceivable at the present moment.

3. The F.27 Friendship has opened the American market for British aircraft products.

4. Up till now, and probably also in the future, the American market for the F.27 is larger than the direct market for FOKKER.

5. The result of this is that already now the British share in Friendship production exceeds the Netherlands share by a considerable margin.

6. If all the spares and those rotational parts, all of British make, which have to be changed during the lifetime of the aircraft are taken into account, however, the British share may amount to as much as three times the direct Netherlands' interest in Friendship production.

7. The value of these British products, involved in large-scale F.27 production cannot for all practical purposes be matched by the export of British aircraft in this category.

F.27 aircraft have been ordered by: *Aer Lingus Teoranta, Aerovias Ecuatorianas (AREA), Aerovias Venezolanas (AVENSA), Aloha Airlines, Ansett-ANA, Austral. Dept. of Civil Aviation, Banco de Mexico, Braathens SAFE, Bonanza Air Lines, Butler Air Transport, Butler Aviation, Champion Spark Plug Co., Continental Can Corp., East West Airlines (Australia), General Tyre and Rubber Co., Guinea Airways, Helmut Horten GmbH, Ideal Cement Co. Iran: HIM The Shah, Iranian Oil, Johns-Manville Corp., Kimberley-Clark Corp., KLM Royal Dutch Airlines, Mac. Robertson Miller Airlines, Murray Corp., Neth. Dept. of Civil Aviation, Noland Co., Northern Consol. Airlines, Olin Mathieson, Ozark Air Lines, Pacific Airlines, Pakistan International Airlines, Philippine Air Force, Philippine Air Lines, Piedmont Airlines, Quebecair, Queensland Airlines, Reynolds Metal Co., Reynolds Tobacco Co., Raytheon, Royal Netherl. Air Force, Trans-Australia Airlines, Trans Mar de Cortes, Union Carbide, United Steel, West Coast Airlines, Westinghouse Electric Corp., Whitney, Wien Alaska Airlines.*

FINANCIAL RESULTS

Operating profits for the year 1958 made it possible to increase by Fls.4,480,000 the reserve for non-recurring expenses and for initiating production of the "Friendship."

A Bankers' syndicate was found which was prepared to provide the necessary credit facilities for the production of the "Friendship," and also gave its assistance in financing the sales of some aircraft.

It is proposed to distribute a 5 per cent dividend in respect of preference shares, and an 8 per cent dividend in respect of ordinary shares.

The report, the accounts, and the proposals put forward by the Board of Directors were adopted.

RALEIGH INDUSTRIES LIMITED

A MORE SUCCESSFUL YEAR

MR GEORGE WILSON'S REVIEW

In his statement to the Shareholders, Mr George Wilson, the chairman, says:

It is with much pleasure that my colleagues and I present to you the Directors' Report and Accounts for the year ending July 31, 1959. As you will already have seen from the preliminary announcement the profit of the Group before tax was more than doubled, and while this still falls some considerable way short of the profit earned in the year ended July 31, 1956, it does represent a sharp reversal of the trend of the last two years.

REVIEW OF THE ACCOUNTS

The increase in trading profit from £822,665 to £1,722,567 has made it possible to raise the distribution to the Ordinary Shareholders from 8 per cent to 12 per cent for the year, with a considerable increase in the amount of profit retained in the business. Our liquidity has also improved materially, the net current assets at £5,338,375 showing an increase of £1,428,218 over last year. In addition there are large balances owing by associated companies (former subsidiaries) which will be repaid over a period of years.

Book debts, including instalments outstanding on gradual payment accounts, have risen by more than £1,850,000, but stocks and work in progress have been reduced by over £1,300,000. Our indebtedness to our bankers has been reduced by nearly £900,000.

In relation to this more favourable liquid position, our major expansion programme has now been completed and our capital expenditure during the next few years will therefore show a substantial reduction compared with recent years. At the date of the Balance Sheet the commitments not provided for in these Accounts were approximately £285,000.

In my view there are two main reasons for the improved position which we have to show this year; firstly the excellent reception by the public of our new moped, and secondly the fruition, at least in part, of the many measures that have been taken over the past two years to improve our manufacturing efficiency and cut our costs. I will deal with both of these matters at greater length below.

REVIEW OF TRADING

Last year you may recall that I had to report a drop in turnover of some 5 per cent. This year I am happy to say that trend has been reversed and we achieved an increase in excess of 7 per cent.

By far the most significant contribution to this result has been achieved by our new moped, which met with an immediate response from the public. An indication of its reception can be gathered from the fact that during the ten months of our last financial year during which the Raleigh moped was available to the public, its sales amounted to more than one and a half times the total sales of mopeds in this country for the previous twelve months. It can, in fact, without any exaggeration fairly claim to have set the moped fashion in this country.

By contrast, I am unable to report any recovery in the sale of bicycles. On the contrary we have experienced a further drop in sales both at home and overseas compared with the previous year. That this is the general pattern is made quite clear by a study of the figures for the British cycle industry as a whole, from which it is evident that in spite of their failing to achieve last year's levels the cycle sales of this Group represented an increased percentage of the total sales of British manufactures.

Sales of our Sturmey-Archer range of products also showed a small decrease compared with the previous year both at home and overseas. This is not altogether surprising for, as I have pointed out previously, the fortunes of our Sturmey-Archer business are inevitably linked very closely with those of the bicycle.

OVERSEAS COMPANIES

During the year there have been some significant changes in our overseas companies. Late in the year we disposed of our controlling interest in Raleigh Industries of East Africa Limited to the United Africa Company Limited. The activities of this subsidiary were exclusively of a trading nature and with the increasing economic development of those territories we came to the conclusion that the task of merchandising our bicycles could more effectively be carried out by a group who were specialists in the territories concerned and whose organisation and experience of selling to the native was without equal. We have every expectation that under the new direction the sales of our products in the East African territories will go from strength to strength.

I have also to report that during the year we reached an agreement with Tube Investments Ltd. for the merger of the cycle interests of the two Groups in both South Africa and Ireland. In South Africa we have disposed of our controlling interest in Raleigh Industries of South Africa Limited to a jointly owned Company in which this Company will have a 49 per cent holding. The Irish merger has not yet been finally implemented and therefore no effect has been given to it in the Accounts under review. Our agreement with Tube Investments extends also to Mexico where we have decided to set up a joint factory for the manufacture of the products of both Groups. Progress on this undertaking is already well advanced. In both Mexico and Ireland this Company will own 51 per cent of the equity of the joint companies.

I am entirely satisfied as to the wisdom of this step which will enable the products of both Groups in these countries to be manufactured in one factory instead of in two as at present and must lead to a significant increase in operating efficiency and economy, quite apart from the benefits to be derived from the pursuit of a related merchandising policy for the various marks, the individual identity of which will however be scrupulously safeguarded.

MANUFACTURING EFFICIENCY

At the beginning of my remarks I mentioned that increased manufacturing efficiency was one of the two prime causes of the improvement in the Company's profit during the past year. As I mentioned in my statement last year, we have for some time been much exercised with the problem of improving our manufacturing efficiency and reducing our costs. This is essentially a gradual process, and results cannot be expected to come overnight, but there can be no doubt that during the past year many of the measures we have taken have borne fruit and contributed materially to a lowering of our manufacturing costs in spite of yet another wage award, which was announced in October of last year.

Vital extra impetus has been given to this drive by the introduction during the year of new blood into our factory management. Three of the key executive posts in the factory, including the most senior of all, have been filled by men recruited from outside our Group, while at the same time the whole structure of our factory management has been radically amended. The results of this major reorganisation are already making themselves felt in terms of still greater efficiency and this is a process which I have every confidence will continue and indeed grow in momentum.

I make no secret of the fact that I regard this as one of the most significant events of this past year.

DESIGN AND DEVELOPMENT

As part of our factory reorganisation, we have set up an entirely new division charged with overall responsibility for research and product design and development. I believe this to be a move of immense importance for the long term future of the company.

While obviously you would not expect me to refer in detail to the work on which this division is engaged, I can tell you that it has already proposed a number of fundamental changes not only to our manufacturing processes but also to the range and the design of our products, and a number of these are expected to take effect before the end of the current financial year. Not the least significant achievement of this new division is that it has already pointed the way to developments which we expect will enable us to employ the whole of our factories, which now cover a floor space of over 60 acres.

SADDLE MANUFACTURE

Before leaving the past year, I have to report on the acquisition by the company, by an issue of shares, as from the beginning of this calendar year of the saddle interests of J. B. Brooks Industries Limited. This Company with whom we have had the closest association for many years is probably the oldest and the best known of all companies connected with the manufacture of cycle saddles. This purchase has already made a significant contribution to the Group's profits for the year and we are confident that with the new outlets now available to it, its business can be expanded beyond anything hitherto achieved.

FUTURE PROSPECTS

So much for the highlights of the past financial year. What then of the future?

In my remarks on the moped I referred to the fact that the Raleigh moped set the fashion in this country, and I think it true to say that everyone has been surprised at the extent of the demand. Other manufacturers have not been slow to follow our lead and competition in this market is now extremely keen, particularly from the Continent and I do not therefore anticipate that our sales for the current year will exceed those of last year.

Ideas on moped design move fast and we, for our part, have already projected our thoughts well into the future, and are at present engaged in planning a programme which we are satisfied will enable us to maintain a leading position in this new and exciting market.

The prospects for the bicycle are difficult to foresee. For the past three years sales in both our home and export markets have declined. There are a number of reasons which have led to this—in the home market the great extension of motorised transport and the increased competition from television sets and the ever widening range of modern mechanical domestic appliances, and on the export side the embargo on imports into some of our principal markets and the temporary decline in the purchasing power in other major markets due to the fall in the level of commodity prices.

On the other hand on the home market there has been a pronounced swing of recent origin from the fully equipped adult machine to the sports and junior range and this factor coupled with the sharp increase in the birth rate immediately after the last war, must, at least for a while, as the "birth bulge" passes through the 15 to 20 age group, give rise to an increased home demand. Motorisation on the other hand can be expected to gain added momentum.

Again overseas there is the factor to which I referred last year of the inevitable if sporadic rise in the standard of living which in the long run can only have the effect of swelling the ranks of potential cyclists in the hitherto relatively under-developed countries. Further, there is already an indication of a partial, if somewhat irregular recovery in world commodity prices which can only have a beneficial effect on the demand for our products from the primary producing countries.

All these factors make the task of assessing the future level of cycle sales extremely difficult as to some extent they cancel each other out, but on balance I feel there are reasonable grounds for anticipating that the level of our cycle sales both at home and overseas will exceed that of the previous year. So far this year we show a modest increase in both our home and export markets. Sales of our Sturmey-Archer products also reflect this trend.

A new departure has been our entry into the field of sub-contract work for other industries where we have already negotiated a considerable volume of business. We are hopeful that this will make a worthwhile contribution to our total turnover during the current year.

LOCAL MANUFACTURE

There is, however, one proviso to which any forecast of cycle sales must be subject, and I refer to the ever present threat of a ban on imports into our principal markets. This may arise either from a shortage of foreign exchange or from a desire to encourage local manufacture.

I make no apology for referring to this matter again as it is to my mind the principal danger to our overseas sales which continue to account for some two-thirds of our total bicycle output.

We have already lost such markets as Indonesia, India, South Africa, Eire, Brazil, Argentina and Mexico and there are certain other major markets where we have reason to believe this problem may become acute within the next twelve months.

SHORTAGE OF STEEL

In any forecast of the trend of events during the remainder of the current financial year the present acute shortage of steel looms very large. Delivery is now around three to four months and shows no signs of improving. Every effort has been made to supplement our supplies from continental and other sources, but the position is extremely serious and there can be no guarantee that our production programme may not be affected before the year is out.

LABOUR AND MATERIAL COSTS

The cost of labour and the price of our raw materials during the remainder of our current financial year is yet another factor which is not easy to evaluate. As I have already mentioned, there was a labour award of approximately 4 per cent in October last year and there is now every indication that a further concession either in the form of a new wage award or a reduced working week may be made by the employers during the course of the current financial year.

Prices of raw materials have once more shown a tendency to rise after a period of relative stability, and any accentuation of this trend must inevitably have an immediate effect on our costs of manufacture.

TRADE WITH EUROPE

As the largest manufacturer of bicycles in either the Common Market or the Outer Seven, we are grateful for the part that Her Majesty's Government has played in the bringing into being of the so-called Outer Seven.

Further, I am hopeful that before so very long some form of rapprochement will be reached between the Common Market countries and the Outer Seven as this can only be to the ultimate benefit of all concerned and not least, of this Company.

CONCLUSION

I have endeavoured to place before you as clearly as I can the reasons which have led to our increased profit during the past year and to present to you some of the problems and opportunities which face us in the future.

While I feel there are grounds for satisfaction at the reversal of the trend of the last two years and the modest improvement in our cycle sales so far this year, this is no time for complacency for an enormous amount still remains to be done before we can recapture the prosperity which we achieved in 1956.

THANKS TO STAFF AND WORKPEOPLE

This past year has seen an unprecedented degree of reorganisation and redeployment in many sections of our manufacturing division with all the human problems which this entails. Furthermore, the most rigid economies have been imposed in every section of the Company and have affected everyone. All these personal and economic problems have been cheerfully faced by all grades of employees and it must be a matter of much satisfaction to them to see the improvement in the Company's position. May I on your behalf convey to them all my sincere thanks for their support, loyalty and cheerfulness throughout a difficult and testing period.

We are not out of the wood yet, but at least the daylight is beginning to filter through and this is a source of great encouragement to us all.

SPURLING MOTOR BODIES LIMITED

PURCHASE OF L. RUMBOLD & CO.

MR W. . SPURLING'S RETIREMENT

The twenty-second Annual General Meeting of Spurling Motor Bodies Limited was held on December 10th at The Refectory, Finchley Road, Hendon.

Mr C. J. Calderwood, who presided in the absence of Mr W. F. Spurling, said he was sure he was voicing the feeling of all stockholders in saying how sorry they were that indisposition prevented the Chairman from being present.

Speaking for his fellow-directors, Mr Calderwood said how much they regretted Mr Spurling's decision to retire from active participation in the affairs of the Group, and how they missed his wise counsel and dynamic personality.

Mr C. J. Calderwood and Mr H. H. Higginson have been appointed Joint Managing Directors. For the time being Mr W. F. Spurling will remain Chairman.

The following are extracts from the circulated speech of the Chairman:

"During my last year as an active director of the Group turnover was £4,800,000—an increase of £494,000 over the previous year.

"The early months of the current year have been very busy in all divisions, and I feel confident that that will continue.

"The net profits of the Group for 1958/9 were £138,370 compared with £125,789 for the previous year. After provision for taxation there is a balance of £74,927 available. From this, dividends amounting to £8,312 have been paid on the preference shares of the Company, and interim dividends (one of 5 per cent and one of 2½ per cent) on the ordinary stock units; these latter accounted for £13,219. This leaves an available sum of £53,396, from which it is proposed to pay a final dividend of 12½ per cent on the ordinary stock units. This will take £22,969 so that we are left with an undistributed balance of £30,427. Adding this to the balance of £185,398 brought forward from 1957/8 gives a total of £215,825. From this we propose to transfer £20,000 to General Reserve (bringing the total to £220,000) and to carry forward the sum of £195,825.

"The interim dividend for the current year will be considered and paid at the end of May 1960, and, provided the trend of business continues to be satisfactory, it should not be less than 7½ per cent."

Mr C. J. Calderwood made special reference to a matter which the Chairman could not mention in his review of the year, because negotiations were still in progress—the acquisition by the Group of L. Rumbold and Company Limited and its associated company Harris (Kilburn) Ltd. These carry on well-established businesses in light engineering; in the manufacture of aircraft seats and in the interior finishing and sound-proofing of aircraft.

The take-over was completed on November 23, 1959, and all stockholders were informed by letter.

Immediately after the Annual General Meeting, an Extraordinary General Meeting was held for the purpose of amending the Articles of Association to permit the appointment of a President of the Company, the first holder of that office to be Mr William Freemon Spurling.

ANGLO-TRANSVAAL CONSOLIDATED INVESTMENT COMPANY LIMITED

CHAIRMAN'S REVIEW

VIGOROUS WIDESPREAD PROSPECTING BACKED BY RECORD LIQUID RESOURCES

VAST DEVELOPMENT OF FISHING INDUSTRY

GOLD MINES SOUND INVESTMENT DESPITE OCCASIONAL DISAPPOINTMENTS

The Twenty-sixth Annual General Meeting of the Anglo-Transvaal Consolidated Investment Company Limited, was held on December 4th in Johannesburg.

Mr S. G. Menell, the Chairman of the Company, presided, and in the course of his address to members said:

I have pleasure in presenting for your approval the Twenty-sixth Annual Directors' Report and Accounts for the year ended June 30, 1959.

The Accounts before you reflect a net profit of £961,000, which is an increase of £17,000 on last year's figure. A surplus of £314,000 arising from the sale of certain shares to the American-South African Investment Company, Limited, is shown separately. From the aggregate profit of £1,275,000 we have provided £169,000 for taxation, depreciation of investments, and exploratory expenditure, and £300,000 has been placed to General Reserve. This leaves a balance of £806,000, to which must be added last year's carry-forward of £394,000, making £1.2 million available for appropriation.

The dividend on the Ordinary and "A" Ordinary shares was increased from 50 per cent to 60 per cent, and, in addition, an amount of £175,000 standing to the credit of the Profit and Loss Account was distributed by way of a bonus in the form of Participating Preference Shares. These appropriations, together with the payment of the usual preference dividends, etc., left a balance unappropriated of £392,000 to be carried forward to the current year.

The Balance Sheet discloses an excess of assets over liabilities of approximately £7 million. This figure, however, does not include the surplus of £4.5 million by which the market value of quoted investments exceeds the book value at June 30, 1959. With the Revenue Reserves now standing at £4.2 million, and taking into consideration the additional amount of £1.6 million, being the Company's proportion of the undistributed net profits (after providing for taxation) of the subsidiary companies of the Group, the Balance Sheet reflects a sound position.

STRONG CASH POSITION

Our strong cash position places the Company in a more liquid position than ever before in its history. There has also been a further increase in our permanent sources of income from dividends and other recurring items which has been a significant feature of our operations during the last few years. The summary of our various interests, which is incorporated in the Report and Accounts before you, will bring you up-to-date in regard to the operations of the various Group companies. There are a few features, however, that I would like to deal with at this meeting.

During the year under review we formed a wholly owned subsidiary, the Anglo-Transvaal Finance Corporation (Pty.) Limited, as the medium for handling funds for investment, and also the Group insurance business.

POTENTIAL NICKEL MINE

The Group continues its vigorous policy of prospecting for minerals, which is conducted mainly through Middle Wits. We have been active in prospecting operations and drilling programmes in the Transvaal, Orange Free State, and the Rhodesias. Our work in Southern Rhodesia has recently established an attractive Nickel prospect which holds out promise of developing into a producing mine.

The recent arrangements for the merger of Middle Wits. and Rooderand serve to concentrate our Group exploration activities in Middle Wits. These two Companies had complementary interests and the terms of the merger were considered to be in the best interests of the shareholders of both Companies.

FISHING INDUSTRY EXPANSION

The industrial interests of the Group have enjoyed a year of comparative prosperity, during a time when the general industrial activity of the country tended to slacken.

Amongst Anglo-Transvaal Industries' activities, an outstanding year's operation was achieved by their subsidiary, The South Atlantic Corporation, which has deep sea trawling and major engineering interests. Since your Group entered the fishing industry approximately ten years ago, it has been responsible for doubling the catch of trawled fish. This development has led to the establishment of large modern processing factories, which besides catering for the Union's requirements have increased the exports of their products from £400,000 in 1950 to over £2,300,000 this year.

FERRO-MANGANESE EARLY SUCCESS

The Ferralloy Ltd. plant at Cato Ridge recently made an auspicious start with the production of high carbon ferro-manganese of excellent quality. One of the factors which has materially contributed to the success of this project in the relatively short space of time since its inception in 1957, has been the circumstance of being able to mine a better grade of ore—and at a lower mining cost. This resulted in the production of ferro-manganese containing a high manganese content and an unusually low content of deleterious impurities at a cost which should enable the Company to operate on a very profitable basis, even at the present low world price for ferro-manganese. The proposed merger of Ferralloys and Associated Manganese will place the latter Company in a strong position with regard to the sales of its minerals either as raw materials or as semi-processed metals in the form of ferro-manganese, and possibly eventually, in addition also pig iron.

GROUP RESEARCH SUCCESSES

Within the Group we maintain a central laboratory which not only handles routine analyses and investigations, but also carries out applied research in respect of our various existing operations and potential new ventures. In particular it is concerned with problems of ore dressing and with the improved recovery of metals from their ores. In this direction the Anglovaal Laboratory has achieved some notable successes, particularly in improving processes used for the recovery of gold and uranium. At the Hartebeestfontein mine, for example, an improved process known as the "Reverse Leach" was developed in the laboratory and then applied at the mine. The pulp from the mill is treated first for the recovery of uranium and then for the recovery of gold. The yield of both uranium and gold has been increased.

At Virginia, where conditions are different, the "Hot Ferric Leach" process was evolved at the laboratory for improving the extraction of uranium from the type of ore at that mine. This process is now in operation at the Virginia mine, and has resulted in an improvement in the uranium recovery.

These processes have resulted in increasing the profits of each of the Hartebeestfontein and Virginia mines by some £150,000 to £200,000 per annum.

One more recent success has been a process for the economic concentration of nickel found at the newly discovered deposit located in Southern Rhodesia.

OVERALL SOUNDNESS OF GOLD SHARE INVESTMENTS

The problems at the Merriespruit Mine have no doubt been a shock to shareholders and investors who have come to regard a gold mining lease area as an investment in which the amount of money expended to bring a mine to production is rarely in jeopardy.

Indeed, the main underlying incentive for undertaking gold mining activities on the principal South African goldfields and for continuing the search for extensions of these, has been the unique nature of the stratified gold-bearing conglomerates of the Witwatersrand system. These, for some 70 years, have supported large-scale mining operations, first on the Witwatersrand, then on the Far East Rand, on the Far West Rand, in the Klerksdorp area, and, latterly, in the Orange Free State and the Bethal area. Although the percentage payability of the principal gold-carrying horizons varies from district to district, and also, frequently, from mine to mine, these conglomerates on the whole, from the earliest times, were recognised as being persistent and reliable gold carriers over wide areas. In this important respect, they differ

radically in character and in reliability from the other types of auriferous igneous ore-bodies which, before the opening up of the Witwatersrand, constituted the main source of the world's gold supply. Because of the capricious nature of the gold distribution in these other occurrences, gold mining investments carried with them the stigma of being of a highly speculative class. With the opening up of the vast South African goldfields based on the exploitation of the gold-bearing conglomerates, however, a major stable industry, now of long standing and with a substantial future still ahead, came into being. The predictability of operations, and the conditions lending themselves to forward planning with precision, were early proved to be of such an order as to have led the large South African gold mines to come to be regarded as gold factories rather than as gold mines, viewed in the speculative sense.

The progress made by the South African gold mining industry and its expansion to the present magnitude can be gauged from the following summarised statistical information.

The Witwatersrand was proclaimed as a goldfield in 1886. Dividends distributed between 1892 and 1896 reached an average of £1½ million per annum. In 1958, 54 producing gold mines, of which 22 in addition produce uranium oxide as a by-product, crushed over 65 million tons at an average recovery grade of 5.2 dwts, and distributed over £42 million in dividends, equivalent to approximately 13s. per ton milled. Significant also in South Africa's contribution to the world's gold output is the fact that in 1887 South Africa contributed under 1 per cent of the total world's gold output, whereas in 1958 this figure was over 58 per cent, excluding Russia.

The dollar price of gold which was fixed in 1934 at 35 dollars an ounce and has remained pegged at that level ever since, is unrealistically low not only in relation to world monetary requirements but also in relation to the economics of gold mining in South Africa.

The cost of bringing a large gold mine to production during the period 1934/39 was between three and four million pounds. The average expenditure to date on similar mines established after the war is between ten and twelve million pounds. The increase in capital cost of some 200 per cent is also reflected in higher working costs as the average cost during the period 1934/39 for mines established in that period was approximately 20s. per ton milled, whereas for the mines established in the postwar era the cost during 1959 has averaged some 60s. per ton milled.

Fortunately many of the new mines, by which I mean those started after the war, contain exceptionally high grade ore and are yielding good rewards to investors. The new mines which have reached production although not yet operating at their planned capacity in most instances are already producing some 50 per cent of South Africa's record rate of gold output and are paying dividends of about £30 million per annum despite large profit retentions for expansion purposes, loan repayments and the like. The capital employed in these new mines for gold mining purposes, including retained profits, already amounts to some £300 million. About £35 million has also been expended on uranium installations on these mines.

That this sound position exists despite the present low gold price is a tribute to the inherent soundness of the gold mining industry in South Africa. At times the industry has gone through difficult periods, particularly on those mines where the gap between the value of the ore milled, at the then prevailing gold prices, and the costs of production became critically narrow. In this respect history is repeating itself and the disappointments experienced by some of the new mines is attributable to this. Since the inception of our gold mining industry, however, there have been instances of mines on the major South African goldfields having failed to come to production or to continue as separate entities, but these are relatively few in number, and their incidence does not in any significant measure detract from the long history of the overall prosperity of the South African gold mining industry.

OVERSEAS INVESTORS

Largely owing to the exceptional attraction of British Industrial shares, London has not, as yet, resumed the role of being a centre of activity in South African gold shares.

However, there are indications that British investment institutions, which made the City of London the financial centre of the world by following a policy of investing around the globe, are now taking a different viewpoint of the unwarranted reports on South Africa's instability which had been circulating for so long. As this revival of interest occurs at a time when British industrial shares are enjoying an apparently unprecedented boom, we may expect that when this condition subsides, there will be an accelerated interest in our market, because our system of private enterprise unchanged for generations, should attract all classes of investors.

CONCLUSION

In conclusion, I would like to record my appreciation of the assistance I have received from my co-Managing Director Mr B. L. Bernstein, and my other colleagues on the Board, and to them and to the staffs in the Head and London Offices of the parent company, and the mines and industries of the Group, I express my thanks for the services they have rendered to the Group during the year under review.

The Report and Accounts for the year ended June 30, 1959, were then adopted, and the retiring Directors, Messrs B. E. Hersov and C. H. Leon, were re-elected.

The joint Auditors' remuneration for the year was fixed.

WHITEFRIARS INVESTMENT TRUST LIMITED

MR L. LARHOLT'S REVIEW OF COMPANY'S POSITION

The Twenty-Fifth Ordinary General Meeting of Whitefriars Investment Trust Limited was held on December 7th in London, Mr L. Larholt, the chairman, presiding.

Referring to the Accounts to April 30, 1959, and the Directors' Report thereon, the Chairman said:

In view of recent comment upon the Directors' Report and Statement of Accounts now under review, I would take this opportunity of clarifying certain aspects of the affairs of the Company, the subject of such comment.

Reference has been made to Directors' Fees totalling £11,447 for the year. Of this total, your Board received £3,380.

I am pleased to state that your Board has appointed an additional Director, namely, Mr T. R. R. Whittaker, a Chartered Accountant. Mr Whittaker was appointed after the notice convening the Annual General Meeting and accordingly retires and offers himself for re-election.

Although the final dividend forecast could not be paid, profits covering it were earned and it was only a technical point which prevented a distribution.

TURNER AND SAVAGE LIMITED

The non-availability of pre-acquisition profits for dividend purposes has had some bearing upon the estimate earlier made by your Directors when a forecast of a 30 per cent Final Dividend was given. Your Directors had anticipated that, of the total dividend income to be received from this Subsidiary, a smaller proportion than £31,977 would fall to be capitalised, with a correspondingly increased "Revenue" proportion available for distribution.

In the event, however, the inclusion in the Accounts of the proportions determined by the Company's Auditors, whilst having the effect of reducing the total available for "income" distribution, results nonetheless in a strengthening of the "capital" position in that £31,977 has been carried to reserve—by way of writing down the cost of the Investment in the Subsidiary.

COPESTAKE, CRAMPTON & COMPANY LIMITED

The surplus of £76,748 on the realisation of this investment was assumed to be available for distribution, but unfortunately the provisions of Article 114 of the Articles of Association preclude this.

I will not disguise the fact that I do not agree with this method of dealing with profits. Profits are earned to be distributed and in my opinion the Article was never intended for such a transaction as Copestake, Crampton & Company Limited. This was quite an undertaking and involved realisation of assets and gradual closing down of the business. The transaction was completed in the year now under review and it was a severe blow to be told that a rigid interpretation of the Company's Articles prevented distribution of this profit.

I do not dispute that the crediting of such profits to Capital Reserve can only strengthen the structure of the Company. However, the acquisition of the Ross Ensign group has already resulted in a most substantial increase of the Capital Reserve Account and further accretions, however desirable, are not really needed.

I am in active negotiation for a project which although different to Copestake, Crampton & Company Limited will also involve a large-scale purchase and sale of shares. Any profit made would fall to be dealt with in the same manner unless we amend Article 114 or find some alternative. I am at the moment in consultation with the Company's advisers and other expert opinion and we shall certainly

remedy matters before the close of the current year.

ROSS LIMITED AND ASSOCIATED COMPANIES

This Group comprises Ross Limited as the main Company, with Ross Ensign Limited and Barnet Ensign Limited as associates. Since the acquisition of the whole of the Issued Share Capital of this Group took place subsequently to the close of the financial year of your Company (April 30, 1959) nothing is, of course, reflected in the Accounts to that date. Your Company acquired Assets of £800,000 on this purchase, the greater part of which will be credited to Capital Reserve.

There was earlier an agreement to sell the freehold of the Clapham premises for £242,000 with an arrangement for a lease back to Ross Limited. Subsequently, after further consideration, the Board of Ross Limited (of which I am the Chairman) decided that in view of the fact that the Company had sufficient liquid funds for its requirements, the burden of a substantial figure of rent, annually, together with other commitments, was disproportionate to the advantages likely to accrue from the receipt of the proceeds of the sale. Accordingly, negotiations are now taking place for the cancellation of the Agreement.

Apart from the substantial Asset value of Ross Limited, we have acquired a company making a useful profit. With the abandonment of camera manufacture, Ross Limited, which prior to 1958 had suffered losses, is now making profits and its Directors expect that the profit in the current year is likely to be in the region of £75,000. In this group there are substantial losses available for tax relief.

You will shortly hear of the application by Ross Limited for full patent rights in respect of a Rotor Angle Meter. The development of this machine was undertaken in conjunction with a leading electrical Authority in the United Kingdom and is one which in future may well be fitted to the largest Alternators manufactured. It fulfils a long-felt want and offers a novel method of measuring and controlling comparative output. We feel there are ramifications as yet unexplored to which this invention may be adapted.

Furthermore, we hope shortly to announce interesting acquisitions which have long been the subject of negotiation but which have now reached finality.

We have signed confirmation for the purchase of a company as from June 1st last dealing in electrical and electronic equipment in which the Vendor guarantees a net profit of £80,000 per annum for two years. He proposes to retire after this period, but it should not be too difficult to maintain and I hope improve on this figure. Contracts should be ready for exchange this week, when the usual notice will be sent to Members. It is proposed that the purchaser of this Company shall be Ross Limited.

Similarly, we have completed negotiations for the purchase of another company and have made a formal offer in agreed terms. Immediately we receive acceptance we shall proceed with completion and advise Members. This should produce a further income to the Company of £70,000 per annum. In this instance, the purchasing company will be Whitefriars Investment Trust Limited.

You will appreciate therefore that our Company is progressing in a most satisfactory manner with a large asset value and steadily increasing income.

The Report and Accounts were adopted.

BARCLAYS BANK DCO

ANOTHER YEAR OF PROGRESS

The Thirty-fourth Ordinary General Meeting of Barclays Bank DCO will be held on January 4th in London.

The following are extracts from the circulated statement by the chairman, Mr J. S. Crossley, for the year ended September 30, 1959:

The postwar years have been notable for the steady expansion of our activities. I am glad to report another year of progress.

We now have 1,197 offices in operation handling, on March 31st last, some 638,000 current accounts and 810,000 savings accounts. During the last ten years current accounts have risen in number by over 57 per cent; over the same period savings accounts have increased by no less than 300 per cent.

The balance sheet reflects the continuation of this growth with increases of £62 million in the total of deposits and of £21 million in the figure for acceptances, guarantees, indemnities, etc., compared with a year ago.

The increase in the total of our advances to customers has been somewhat less marked than was the case last year. This item is now in the ratio of 41 per cent to deposits as against 43 per cent in 1958. Trade bills show a small reduction but there has been an increase of £26 million in the total of investments. This is mainly represented by an increase in short-term Government bonds in London.

PROFIT AND LOSS ACCOUNT

Unfortunately, expansion of a bank's business and of its gross income—our experience this year—does not automatically bring an increase in net earnings. In spite of the expanding business the estimated profit for the first half of our financial year, which was published in June, showed a significant reduction over the comparable period in the previous year, the figure of £525,000 having fallen from £584,000 in 1958. During the second half of our year there was some improvement but, notwithstanding this, the total figure for the year of £1,218,512 shows a reduction of £48,843, and this in spite of additional tax relief. For this there are two main reasons. The first is the factor of increasing costs which continues to cause us concern. The second reason is that, in certain territories we have been transacting business on less remunerative terms. There is one further factor, however, which should not be overlooked; this is the actual rate of expansion itself.

It is now three years since we were deprived overnight of the large and profitable business which we had built up in Egypt. I am still unable to give stockholders any information as to the progress of our claim for compensation.

In my last statement to stockholders I suggested that business conditions in 1958 had been dominated by uncertainty—an uncertainty caused mainly by the recession in business activity in the USA. Although towards the end of that year conditions seemed to be improving it was hardly possible at that time to assess either the depth or the probable duration of the depression. The outlook accordingly remained unsettled.

With the passage of another year one can now say that the skies are clearing and that the effects of the depression are passing off. In the USA, in the United Kingdom and in Western Europe business activity has confidently resumed its upward trend and has thereby improved the outlook for many of the territories with which this Bank is concerned.

Perhaps the most remarkable phenomenon of the past year has been the persistent strength of sterling. The true test of any currency, however, depends ultimately on its purchasing power and the important fact to record is that the purchasing power of the pound has been stable for the better part of two years. This is of profound significance to a world so much of whose trade is carried on in sterling and, in particular, to the countries of the Commonwealth whose currencies are based on it. It is a sure sign of returning confidence in this country and in its policies.

The improvement that has taken place in our economic circumstances will not only allow us to speak with more authority but will provide us with the opportunity—and I believe also the obligation—to make a bigger contribution to the tasks ahead. It should, however, be an increasing contribution to an increasing total and, preferably, with greater contributions from other Western European countries. It is much to be hoped that its effect will not be neutralised by some commensurate reduction in aid from any other country which might promote discouragement all round.

FULL CONVERTIBILITY

We now have the opportunity to take a constructive step forward by freeing the pound completely from all restrictions for residents and non-residents alike, for capital as well as for current payments. Such a move would not only be welcomed throughout the world; it would also, I believe, by restoring to the pound the prestige of a fully convertible currency, add much to its stature. Sometimes it may pay to discard from strength. The move towards convertibility at the end of last year did not prove a source of embarrassment. Indeed the subsequent firmness of the pound derived in part from that very cause. When people know that they can get their money out freely they seldom want to do so. Funds may very well flow towards London when once sterling is free; for it must not be forgotten that the United Kingdom can also offer opportunities favouring investment.

There are always people ready enough to argue against any bold course of action, on the grounds that conditions are not quite ideal—they seldom are; but by waiting for the absolutely perfect moment to arrive, there is always the risk of missing reasonably good chances that come along. Are we likely to experience much more favourable conditions than now exist? It seems to me that the underlying situation is as favourable at this moment as can reasonably be expected. While it is doubtless true that we have "never had it so good" it is also certain that we shall not always have it so good. Let us move now, therefore, while the trend remains favourable. It is certainly the case that the sterling reserves are not superabundant, but it is nothing new for Britain to work on small margins. The great business of the City of London was built on confidence in the first place and not upon accumulated reserves. The conditions under which it grew to greatness imposed the obligation to conduct its affairs with prudence as well as business acumen. Men and their policies mean more than bullion.

TUBE INVESTMENTS LIMITED

HEALTHY UPTURN IN TRADE

ALUMINIUM INTERESTS EFFECTIVELY INTEGRATED

A healthy upturn in trade was reported by Sir Ivan Stedeford, KBE, Chairman of Tube Investments Limited, in his annual statement to stockholders.

The movement back to increased activity, said Sir Ivan, was not felt to a marked extent until April, with 8 months of the financial year gone, but it was progressive, enabling TI to make good much of the shortfall. Total trading profits for the year, after depreciation, were £12,417,000, just about the same as the year before, but including 7 months' profits of the British Aluminium Company and Reynolds TI Aluminium Ltd. If adjusted for comparison, they showed a reduction of about 10 per cent on the previous year's record profits, this resulting from reduced turnover and margins. Since the beginning of the current year the improvement in trade had gathered momentum, and in this context the Board recommended a final dividend of 12½ per cent, making a total of 20 per cent for the year—an increase of 2½ per cent.

Discussing the acquisition of British Aluminium Company, he said that the voting rights of the British Aluminium shares held by TI and Reynolds Metals in their own right had been vested in Reynolds TI Aluminium Ltd. The Ordinary capital of this company had been rearranged, and was now held as to 51 per cent by TI and 49 per cent by Reynolds Metals. From this it followed that control of British Aluminium, exercised through Reynolds TI Aluminium with voting powers covering 96 per cent of the equity, was firmly in TI's hands. TI has been able to finance this substantial operation by only a small addition to its equity and by a cash payment of some £10 million. Nevertheless, by the end of the year, the liquid position was virtually unimpaired. Even with this considerable investment, only a little over one-fifth of TI's funds were at present employed in aluminium. Reynolds TI Aluminium had agreed to acquire for about £5 million the aluminium foil business of Venesta Ltd. Plans were in the making for a major expansion scheme.

The Canadian British Aluminium Company, at Baie Comeau, with the first two stages of the project completed, was running at its rated capacity of 80,000 tons a year. Discussions with the Consolidated Zinc Corporation, British Aluminium's 50/50 Australian partners, had confirmed the potentialities of the bauxite and power concessions of the Commonwealth Aluminium Company in Australasia.

There were welcome signs that the recession which hit the world's aluminium industry two years ago was becoming less severe, but it was likely to be quite a time yet before the considerable over-capacity was taken up. TI believed that its aluminium interests were now well disposed and effectively integrated and that it would be able to gain the maximum benefits from any improvement in trade that came along.

RECORD ELECTRICAL SALES

Another record year was achieved by the Electrical Division, the Simplex Electric Company's Creda range of electric cookers earning a popularity second to none, which the new Mercury Four promised to enhance, and the Debonair spindryer maintaining its lion's share of a widening market. The same design team recently introduced a new domestic appliance, the Creda "Corvette," which provides quickly warm, hot and boiling water "on tap" at the kitchen sink. It was TI's intention to enter the market for domestic refrigerators next year. The Division's industrial side was recovering more slowly; in the cable industry over-capacity and price chaos brought disappointing results.

The Steel Tube Division was considerably affected by the recession, but hopes for the current year were firmly based on full order books. The last year had brought home the truth that, when output is well below capacity, significantly increased costs per unit of output were an unavoidable by-product of high mechanisation. As production recovers, so costs level out, and happily this was TI's experience. Developments during the year included the completion of a modernised plant to produce stainless steel tubes at yet lower costs, successful trials in the hot extrusion of beryllium, and progress in new low cost ways of seamless tube making. TI's tube manufacturing interests in Canada, India and Argentina all returned substantially increased profits. Capacity was being doubled in India, where a mill for rolling steel strip was also being installed.

Substantial extensions to the factory of TI Cycles of India were under way. Provision was being made for the manufacture of saddles, chains and other important components. The extensions, when completed, would make this cycle factory among the best in the world. With TI's increasing investment in India, it was agreed with the company's Indian partners to bring all of the cycle and steel tube interests there under one company—Tube Investments of India Limited, which was recently formed for the purpose. The new company was now a subsidiary in which Tube Investments hold 60 per cent of the equity. Its results for the year had been consolidated.

The present surge in consumer demand had not coincided with one for capital goods. TI's experience closely conformed to this national pattern; nevertheless, a number of its engineering companies increased their turnover, if at lower margins. Sales of rolling mills and like plant nearly doubled those of three years ago. Good export contracts were completed and despatched and others were in progress. One of the smaller companies achieved record sales with its redesigned range of mechanical and hydraulic guillotine shears and like equipment. It had developed machines for the internal polishing of stainless steel tubes, and was at present completing two for Russia. TI was now Britain's major maker of polytetrafluorethylene products, and had started manufacture of glands and seals in Italy. At the Chesterfield Tube Company plans had been accelerated to modernise the extrusion presses and furnaces for stainless steel tube and plant for processing steel cylinders. The company was now equipped with ample low-cost capacity to meet the full range of demand. A "know-how" agreement had been reached with an Australian company to share in TI's bus, railcar and building prefabrication techniques.

STEEL DEVELOPMENTS

Both of the major steel units started the year with weak demand, volume being maintained at around 70 per cent capacity. The upturn came earlier at Park Gate Iron & Steel Company, and the requirements of the finishing mills soon reached a level which could only be satisfied by the purchase from outside of mild steel semis to supplement TI's own production. A major scheme of modernisation and expansion was being studied in consultation with the Federation and the Iron & Steel Board. The recession took longer to lift at Round Oak Steel Works, where the new electric arc furnaces had come into commission. The company was now favourably placed to meet the revival in demand for its traditional business as a supplier of rounds, forging bars and constructional sections. Of greater importance to TI was its requirements from Round Oak of high quality steel at the right cost for tube making. Steps had been taken which, it was believed, would underwrite this requirement. If they proved effective they should yield substantial benefits to Round Oak and the Steel Tube Division.

The concentration of manufacture in the reorganised cycle factories at Smethwick had been completed; production could now be tailored to meet changing requirements. The resulting economies had enabled the Cycle Division to make a satisfactory contribution to TI's results. Good progress had been made in the development of motorised machines. Well designed and efficient "mopeds" bearing the names of "Norman" and "Phillips" had been well received in what promised to be a growing market. Production for several months ahead had been sold of the "Sunwasp," an attractive all-British scooter.

OVERSEAS AGREEMENTS

Excess cycle manufacturing capacity, which had presented serious difficulties at home, had become an even more serious problem in certain overseas countries. TI's factories in South Africa and Ireland had for some years been operating well below their capacity, as also had those of Raleigh Industries. During the year TI and Raleigh had merged interests in these two countries, so that the respective makes of bicycles could be manufactured there economically in one factory. In the amalgamated company in South Africa, TI has a 51 per cent interest and Raleigh Industries 49 per cent. In Eire, Raleigh Industries had a 51 per cent and TI 49 per cent interest. Management was with the company with the controlling interest. It was intended also to establish with Raleigh Industries a cycle company in Mexico. These overseas cycle partnerships with Raleigh Industries, or any others which might follow, did not foreshadow a similar development in the United Kingdom, nor in other overseas countries, as, for instance, India, where the market was large enough for both.

An encouraging increase was made in sales to Europe, but TI's largest export markets were again Canada and the USA, with the Eastern Block moving up to third place. By a high degree of co-ordination among the plants of subsidiaries, TI had been able to accept a number of large export orders for precision tubes

against keenest world competition. The largest, worth over £3 million, came from the USSR.

TOMORROW'S MANAGERS

With Government encouragement for a good balance of expenditure and savings by persons and corporations, and for the sharpening of incentives for the wage earner, salaried staff and companies alike—industry would not flinch from the big changes which lie ahead, or the heavy capital expenditure needed to meet them. A prerequisite was the training and development of the men needed to tackle the technical and commercial tasks that accompany great projects. Now that National Service has ended, and the "bulge" was coming through schools and universities, industry faced the immediate responsibility of recruitment and training of the right numbers and mixtures of men to be the managers for the future.

This responsibility was being shouldered with urgency and care in TI. Personnel and Training work had been vigorously intensified. Apprentice courses were being expanded. TI's first sandwich course students had gained their Diplomas of Technology; and, with increased recruitment of university graduates, TI was stimulating management selection and development from men of widely differing ages and educational backgrounds. While this would never exclude recruiting new blood from outside, TI's aim was to satisfy future needs largely from within its own companies.

CAPITAL EXPENDITURE NEEDS

TI's capital expenditure had continued at a steady but reduced rate; schemes designed for increased productivity were given priority over those where just expansion of production was the main objective. TI now intended to press on as fast as possible with its capital development plans.

The Common Market in Europe presented Britain with a serious challenge which would grow stronger. The Outer Seven Market, though born out of disappointment, was welcomed for its likely direct outcome, and its implication that some association with the Common Market might be worked out. But the chances were that Britain would be faced across the Channel by an integrated system of great industrial resources, attacking world markets with the strength of a huge protected market behind it.

If Britain were to continue to be prosperous in a world of great industrial power blocks, or free trade, said Sir Ivan, she must raise her industrial efficiency far beyond anything she had yet achieved or attempted. She should spend capital to the limit of her resources. By the introduction of investment allowances, the Government had shown that it recognised the urgency of large scale industrial development. But he believed that much more was needed; a crusade to make British industry, for its size, the best equipped in the world.

Major-General Sir Francis de Guingand, KBE, CB, DSO, and Mr E. L. Burton, BA, ACA, were appointed directors during the year. A new member of the Board was to be Lord Plowden, KCB, KBE, who would be joining TI on January 1st next and would also become a Vice-Chairman and Chairman of The British Aluminium Company Limited. Lord Reith had intimated that he did not seek re-election to the Board. He would, therefore, be retiring as from the end of the coming Annual General Meeting. Two members of the Board, Mr Walter Hackett, Jr, and Mr R. D. Young, BSc, had been appointed Assistant Managing Directors. Both had spent their business lifetime with TI. Their long experience and intimate knowledge of TI's widespread affairs would be of great value in their new overall responsibilities.

HARRIS LEBUS LIMITED

IMPROVED RESULTS

The Twelfth Annual General Meeting of Harris Lebus Limited was held on December 4th in London, Sir Laurence Watkinson, KBE, CB, MC, the chairman, presiding.

The following is an extract from his circulated review for the fifty-two weeks to July 10, 1959:

We have achieved a trading profit of £480,246. The improvement on last year's result can be attributed mainly to the removal of hire purchase restrictions—let us hope they will not return—and other measures taken to stimulate the economy of the country, together with the fact that the attractive design and value of our products have been well recognised by our customers. Income tax and profits tax amount to £283,915, leaving a net profit of £188,629 as compared with £127,848 last year.

Your Board recommend an increase in the dividend to 7 per cent.

During the course of the year we purchased a Bedding factory in London which has traded successfully for many years under the name of Eventide (Bedding) Limited.

In August last we purchased a half-share in a furniture business carried on in Lagos, Nigeria. Though its turnover at present is comparatively small, we feel that that company can look forward to rapid expansion and a profitable future.

The level of the export trade, although not high, has been somewhat increased.

It is gratifying to find that public confidence in the economy has been re-established. Furniture sales are continuing at a high level, our order book has never in recent years been in a more healthy state, and our factories are operating at full capacity. But competition in the furniture trade remains strong.

The report and accounts were adopted.

KENNINGS LIMITED

HEAD OFFICE:—
CLAY CROSS,
DERBYSHIRE.

Est. 1878

Directors:—
G. KENNING, D.F.C., T.D., M.A.
(Chairman and Joint Managing Director)

(Joint Managing Director)
A. B. GRIFFITHS, O.B.E., M.A., F.S.A.A.
R. D. COOKE, M.I.M.I. (Secretary)

Salient features of the circulated Report of the Directors and the Chairman's Statement

Mr. George Kenning, the Chairman, said that the year had been one of continued expansion in all departments and in particular to Car Contracts, Self Drive Hire, G.K. Tyre Services and Petrol service stations.

The final dividend recommended on the 5/- Ordinary Shares was 14%, making 19% for the year. This represents a dividend of 22.24% on the capital as it existed before the Rights Issue made in May.

Mr. Kenning continued by remarking that the year just reviewed had been favourable, and that subject to the usual provisos the Board could see no reason why the current year would not be as successful.

POTATO MARKETING BOARD

CHAIRMAN'S ANNUAL REPORT

The Annual General Meeting of the Potato Marketing Board was held on December 9th at Agriculture House, Knightsbridge, SW1, the chairman, Mr J. E. Rennie, presiding.

The following is an extract from his speech:

Anyone who grows potatoes is investing a great deal of money in his crop, so great is the cost of growing it nowadays. However careful and skilful, he cannot control its yield owing to the vagaries of the British weather. That, of course, is a risk inseparable from most forms of agriculture. But with potatoes the risk is much greater than with many other farm ventures. The national yield varies so greatly that a variation of 1½ million tons is possible on a human consumption requirement of about 4½ million tons. Yet the public demand is extraordinarily rigid and is little affected by price. Indeed, in recent years, the highest rate of consumption was not in the 1956-57 season with a surplus of over a million tons and consequently low prices, but in the comparatively short season of 1957-58 when retail prices were often twice as high.

Our whole purpose is to bring as much stability as possible to what has always been a fluctuating and uncertain market, by first stabilising the acreage and then by using the riddle in conjunction with a buying programme to control any surplus and ensure the public gets the best of the season's crop. Last year the Government stated in the House of Commons that the acreage was sufficient in years of normal yield to meet all our own requirements of maincrop potatoes; and I may say the acreage planted this year is almost exactly the same as then. The whole of their quota was not planted by all producers, but the acreage allocated was exceeded by other producers who must pay the Board's special contribution of £10. This yielded the sum of £200,000, which has already been used to help bolster the market by buying a quantity of potatoes mainly of a type which being undesirable for some sections of the trade were having a depressing influence. The public and retailers have appreciated the better sample on 1½ in. riddle. We for our part intend to insist on a better sample being turned out by producers and merchants to eliminate the faults we sometimes see and which have such a depressing effect on the market, lowering the price producers get.

This year due to the dry weather there was more corky scab than usual—scabby potatoes are unsightly, and although the cooking and eating qualities are not affected the housewife wants a potato that is not only clean but looks clean. If producers send to market too much of this kind of produce the market must break. And, as you all know, signs that this might be about to happen appeared six weeks ago.

The choice before the Board was either to let the market slip, which would certainly bring nearer the date of a Government payment, or to use its own resources to prevent a collapse, which would bring loss to all of us. The Board judged that buying operations well within its means could steady the market. We decided, therefore—and our decision was well received—to intervene directly by a buying programme. But the Board's funds are not intended to provide the Guarantee Parliament has said shall be given to the Potato industry.

May I emphasise to all producers the necessity of at least maintaining the present acreage and increasing the proportion of the quality varieties?

BIRMID INDUSTRIES

IMPROVED EARNINGS

The Annual General Meeting of Birmid Industries Limited, was held on December 8th at Birmingham, The Most Honourable The Marquess of Exeter, KCMG, the chairman, presiding.

The following is an extract from his circulated address:

The Annual Accounts for the year ended July 31, 1959, show an improvement in earnings over those of the previous year.

Your Directors recommend the payment of a 20 per cent Dividend, an increase of 2½ per cent overall on last year's payment and it is proposed that the distribution shall now be wholly in the form of dividend rather than in dividend plus bonus as has been the practice in recent years.

The Directors have also given thought to the present capital structure of the Company and propose to recommend a scrip issue of shares in the proportion of one share for every two shares held. Resolutions to this end will be submitted to the Annual General Meeting.

DIVIDEND PAYMENTS

For the same reasons in considering dividend policy, the Directors feel that the coming year would be a suitable time for introducing the practice of paying some part of the total distribution as an Interim Dividend. Provided the earnings remain satisfactory, therefore, the Directors propose to make an interim payment in May next on account of the year ending July 31, 1960, but this should not be taken to imply that the total payment for the year would be increased thereby.

Taxation at £1,051,527 against net profits of £1,077,938 still takes an unduly large slice of our earnings, despite the reduction of 9d. in the pound.

The first half of the year under review was difficult for all our subsidiaries. Demand was lower than formerly in all sections. In particular, the market for aeronautical products, in which your light alloy foundries largely specialise, was, and unfortunately so continues, at a very low ebb. The second half of the year saw a steady increase in demand in other directions, especially the motor trade. Whilst prices here are very keen, we are beginning to reap the benefit of the modernisation plans carried out in recent years.

Total Group Sales for 1958-59 were almost identical with those of the previous year.

We have now largely finished with expenditure on new expansion and re-equipment projects. Some of these schemes are of a pioneering character and, being of recent introduction, are not yet operating at full efficiency or with the full additional order book which will ultimately justify the enterprise. As I write, there are better prospects of the additional business needed than there were a year ago.

The outlook for the aircraft industry is not at the moment very encouraging. On the other side, there is currently a steady expansion in the motor vehicle industry and, whilst competition is very keen and profit margins low, we have our full share of what business is going, with the prospect of increased output in those sections during the coming year.

The report was adopted and the increase in the authorised capital to £6 million and the scrip issue of one share for every two held were approved.

RANSOME & MARLES BEARING COMPANY

MR E. W. SENIOR'S CONFIDENCE

The forty-third Annual General Meeting of Ransome & Marles Bearing Company Limited was held on December 3rd at Newark, Notts, Mr E. W. Senior, CMG, the Chairman, presiding.

The following is an extract from his circulated statement for the year ended June 30, 1959: The reduced demand referred to last year continued well into 1959, and it was only in the last three months of the financial year that sales began steadily to increase.

The Engineering Industry had to meet, from October 1958 onwards, an increase in wages which was not passed on to our customers in increased prices, in fact the level of prices is, in general, lower than a year ago.

Consequently, as compared with last year, there is a drop in the consolidated net trading surplus from £1,423,755 to £1,182,056. This surplus is, however, higher than in any year other than 1958. The net profit of the Group is £609,396 as compared with £666,581.

The Directors recommend a final distribution of 10 per cent less tax and a bonus of 2½ per cent less tax, a net total dividend of £153,125.

It will be noted that the cash position has improved from £567,887 to £1,322,185. This will be needed partly to finance the increasing turnover and partly to meet other commitments. The capital commitments, which stood at £248,000 at the end of the financial year, are now over £500,000. I have no doubt that this policy of capital expenditure to develop not only production capacity but also productivity and quality is absolutely essential to continued success of the business, but all our efforts to maintain stable prices can be nullified if any increases in wage rates resulting from the present negotiations in the Engineering Industry, or reduction in hours, are not matched by at least a corresponding rise in productivity which I am satisfied can be done.

AUSTRALIA

Import restrictions have made a continuing and satisfactory development of our Australian business difficult, and having regard to the developing potential of the Australian market, your Board had come to the conclusion that it would be desirable to manufacture there. When the Australian Government decided to invite tenders from Bearing Manufacturers for the Government owned Bearing Factory at Echuca, Victoria, a factory of greater capacity than the one we had in mind, it was decided that we should put in a bid on behalf of your Company, Skefko, Luton, and SKF, Gothenburg. The bid has just been accepted and arrangements are now proceeding for taking over the factory and for the formation of an Australian manufacturing company of which the shareholders will be your Company, Skefko and SKF. It is pointed out that this joint venture does not affect either the independent action of the two sales companies, or the relations between Ransome and Marles and SKF in other respects.

I referred earlier to the increase in demand in the latter part of our financial year; this trend has continued, with a resultant increase in our order book and output running at a high level. There is every reason to expect the economy to continue to expand and we can, I feel, look forward to a satisfactory year.

The report and accounts were adopted.

THE CANADIAN BANK OF COMMERCE

MR NEIL J. McKINNON ON ECONOMIC CONDITIONS

The *ninety-third* annual general meeting of The Canadian Bank of Commerce was held on December 8th in Toronto.

Mr Neil J. McKinnon (the President), *in the* course of his speech, said: When we met a year ago we had passed through a mild recession and were on the verge of a forward movement in economic activity. Many lacked confidence in the outlook at that time but the advance during the year dispelled doubts and we may now anticipate that this year there will be a greater production of goods and services than we have experienced in any peacetime period.

The latest figures for Gross National Product, those for the second quarter, indicate a seasonally adjusted annual rate of $34.7 billion, an increase of about 7 per cent over last year, and of about 5½ per cent on a constant dollar basis. It seems likely that despite temporary hindrances to production the final half of this year will show a similar increase.

This is perhaps remarkable because this has been a year of some strain in certain respects. A severe winter had an adverse effect on employment, and the weather generally did not help to increase crops. The lumbermen's strike in British Columbia and the protracted steel strike in the USA both had retarding effects. It is not yet possible to judge the full effect of the US steel strike on Canadian manufacturing, which appears at present to be resuming an upward trend. But a large demand for durable goods and a high level of disposable personal income are buoyant factors.

Mr McKinnon said that capital investment in 1959 exceeded forecasts made earlier in the year and the outlook for 1960 was for greater expenditure for machinery and industrial construction. He added: Increased demand for loans of all types, particularly by smaller borrowers, caused a rapid increase in bank loans in the early part of the year. In the absence of leadership, through a central bank interest rate or otherwise, the chartered banks took steps to stabilise a situation which was impairing confidence in capital markets.

Summarising the general position, Mr McKinnon said: Economic conditions here and abroad suggest that we may be reasonably confident about the immediate outlook. The industrial picture looks currently sound provided it is not marred by strikes of the seriousness of this past year. Consumer spending, which has been running at high levels throughout most of the year, promises to continue to do so next year. Capital investment, with the exception of housing, may be somewhat larger than this year. It is more difficult to discern a constructive pattern in our external trade. Much will depend on competitive conditions here and abroad, the level of our dollar in international markets and the level of prosperity in the nations which provide our foreign markets. Inflationary tendencies appear to have subsided and our growth is taking place against a background of reasonably level prices. Although the near-term outlook is promising, much of our national income is based on export markets for natural and semi-processed products and much of our industry depends on a still small, although growing, domestic market. We are greatly influenced by the international environment and we should seek to understand its movement and direction in advance of its impact on us. Equally, we must seek to maintain a business climate which will give the necessary incentives to individuals and corporations to grow and expand.

VICE-PRESIDENT'S REMARKS

Reviewing the bank's balance sheet, Mr J. P. R. Wadsworth, Vice-President and General Manager, said that personal savings deposits had reached a record total of $1,368 million and loans had increased by $188,671,000 during the year. He added that in spite of the large expansion of loans, a strong liquid position had been maintained with quick assets at 53.5 per cent of liabilities to the public.

Mr Wadsworth pointed out that intensive efforts during the year accelerated the clearing of cheques in transit, reducing the total of transit items by $78.5 million. Since a little more than half of those items consisted of cheques drawn on branches of the bank, that action resulted in a reduction of general deposits of approximately $40 million. He added: This, together with the withdrawal of funds, mentioned in last year's report, which had been temporarily on deposit, resulted in a net reduction in total deposits of $64,617,000. Mr Wadsworth emphasised that the assets represented by transit items did not earn interest. He concluded: Profits after taxes increased by $906,033, and income taxes increased by $2.1 million. After providing for dividend payments of $9,163,828 an amount of $1,954,552 was carried forward, increasing the balance of undivided profits to $3,121,636.

SMITHS

a name with a world of meaning

S. SMITH & SONS (ENGLAND) LIMITED

CRICKLEWOOD WORKS, LONDON N.W.2

BEKOH CONSOLIDATED RUBBER ESTATES LIMITED

INCREASED PROFIT

The annual general meeting of this company was held on December 2nd in London.

The following are extracts from Mr A. A. Estall's circulated Review:

The accounts for the year ended March 31, 1959, submitted with this review show a profit of £46,811 as compared with £28,376 for the previous year. Your Directors recommend a final dividend of 7½ per cent less income tax (making a total of 10 per cent for the year).

The cost of production including Government duty, rent and cesses plus London expenses amounted to the equivalent of 16.24d. per lb. Against this the net proceeds of the rubber crop plus cesses recovered and sundry receipts is equivalent to 20.92d. per lb: thus the profit is 4.68d. per lb for the year as compared with 3.55d. for the previous year.

The combined crop harvested was just short of 2,400,000 lb. For the current year it is hoped to produce 2,500,000 lb and to the end of September, 1959, that harvested totalled 1,192,000 lb. The crop will gradually increase year by year as the young areas reach maturity.

Of the current year's crop the major portion is being sold on arrival in the United Kingdom "to meet the market," but as an insurance it has been deemed prudent to sell forward in equal monthly deliveries during the months of January-June, 1960, a total of 268,800 lb at a price of just over 30d. per lb cif UK.

The report and accounts were adopted.

SUNGKAP PARA PLANTATIONS

The Thirty-fourth Annual General Meeting of Sungkap Para Plantations Limited was held on December 3rd in London, Mr P. B. L. Coghlan (the Chairman) presiding.

The following is an extract from his circulated review:

The substantial and welcome increase in the Trading Profit for the year under review—£25,329 compared with £12,275 for the previous year—was due very largely to the improvement in the price of rubber during the year which enabled the Company to realise an average price of 28.37d. per lb (against 26.35d. per lb) for the total output for the year.

It was particularly satisfactory that we were able to take full advantage of the upward trend in price by a substantial increase in production.

An important factor in the Company's relatively high profit-earning capacity is the considerably higher output now being achieved.

Altogether I think I may say that the Accounts give a satisfactory picture. Equally encouraging is the progress of the immature areas which, without exception, are developing well. Crops are continuing to improve and annual outputs at the rate of 900,000 lb or more should be capable of early fulfilment.

Prospects for the current year are bright and, provided there are no substantial reductions in current prices, it is hoped that even better results will be achieved than those now before you.

The Accounts were adopted and the dividend of 22½ per cent less tax, approved.

BANK OF MONTREAL

CANADA'S STRONG AND HEALTHY ECONOMIC RECOVERY

The One Hundred and Forty-second Annual General Meeting of the Bank of Montreal was held on December 7th in Montreal.

Mr G. Arnold Hart, the President, in the course of his speech, said:

The economic recovery, which got under way slowly and somewhat haltingly in 1958, has steadily gathered strength this year, although the prolonged steel strike in the United States has had some temporary deterrent effects in Canada in recent months. The commonly accepted measure of our overall business activity—the gross national product—has been rising consistently and may well approach $35 billion in 1959 as a whole, compared with $32½ billion in 1958.

A rise in business activity of the order of 7 per cent in one year is above average, but to a significant extent it has represented simply a reversal of the former recessionary trends and a re-emergence of deferred demands.

An important aspect of the recovery, both last year and this, but one that is perhaps inadequately appreciated, has been the striking improvement in efficiency achieved by many firms in many lines. Thus, while employment has expanded and unemployment has dwindled, the rise in employment has been far outstripped by the rise in production.

In short, the recovery experienced by the Canadian economy this year has been strong, healthy, and on a broadening base. It has been a real recovery, little inflated by price increases, and shortages of goods, manpower and productive capacity are neither present nor in prospect. But it has not in any sense of the work been a boom.

The President then outlined the problems confronting those seeking and those granting credit in a period of tight money and concluded: I suggest that we shall ultimately look back on the "tight money period" of 1959 as one in which, by taking thought, and by putting up with the disciplines of monetary restriction, we in Canada laid a solid foundation for orderly, stable and enduring economic progress, rather than the heady delights, and subsequent headaches, of inflation, boom and recession.

GENERAL MANAGER'S ADDRESS

In the course of his address, Mr R. D. Mulholland, the general manager, said: Our net profits amounted to $12,191,060 compared with $10,356.690 in the previous year. Out of our net profits an amount of $10,684,730, equivalent to $1.85 per share, has been provided for regular and extra dividends, as compared with $1.65 for the preceding year. Total assets of the Bank at the end of the fiscal year stood at $3,260 million, a comparatively small decline of $18 million. This reduction, in a period of expanding business, reflects the consequences of a much broader monetary pattern.

Our traditionally strong liquid position has been maintained. Our total deposits amounted to $2,998 million, a decrease of $40 million for the year. Deposits have declined steadily during the year and are now $79 million lower than last year excluding personal savings. Our personal savings deposits increased by $39 million, accompanied by a rise of 132,000 in the number of personal savings accounts.

Loans in Canada show a record increase for any one year in the Bank's history.

TELOGOREDJO UNITED PLANTATIONS

The twenty-sixth annual general meeting of Telogoredjo United Plantations Limited will be held on December 30th in London.

The following is an extract from the circulated review of the chairman and managing director, Mr C. C. Iveson:

The Profits of the Subsidiary Companies, after allowing for Indonesian taxation, amounted to Rp.4,352,757 and at the date of the issue of these Accounts there are unremitted Profits of Rp.12,756,782.

After allowing for Debenture Interest and Sinking Fund the loss for the year amounted to £15,831 as against £19,215 for 1957.

There are three important events which have occurred recently and which affect your Company. Firstly, the introduction of the Indonesian Monetary Measures. Secondly, the announcements of the UK and USA Governments of their intention to liquidate their strategic stockpiles of natural rubber over a period of years, and thirdly, the currently strong demand for natural rubber, resulting in high prices. It is disquieting and not in the best interests of the industry that we should see prices at the high levels now ruling, the continuance of which will inevitably encourage the greater usage of synthetics at the expense of the natural product. It is satisfactory, however, to note that both the UK and USA Governments intend to dispose of their natural rubber stockpiles in an orderly manner over a lengthy period. It is reasonable to assume therefore that their disposal arrangements will not unduly disrupt world markets, and at the same time in the long term, may have a healthy corrective influence at periods when natural rubber is temporarily in short supply.

APPOINTMENTS REQUIRED

YOUNG man, unmarried, Public School and Oxford; competent linguist, including Russian, seeks active position with future.—Write Box 1252.

ENERGETIC top-class Administrator (42) seeks post as CHIEF EXECUTIVE of Industrial or Commercial organisation with expansion policy. At present Director of engineering companies. Basic qualifications Finance and Economics, but wide experience of industrial management in all its aspects as both Consultant and Senior Executive. Present salary £6,750 plus substantial benefits. Negotiations in strict confidence.—Box 1254.

TOP management executive, English, resident Switzerland, free to travel, graduate engineer, linguist, worldwide experience consumer goods manufacture and management supervision of subsidiaries, seeks association with progressive company as consultant, manager or supervisor for Continental or overseas operations or development.—Box 1284.

APPOINTMENTS

MATHEMATICIAN

BEA

require a man with good mathematical ability for work connected with programming future service patterns and traffic flow. Applicants should have a degree in Mathematics or in Economics with statistics. A keen interest in the field of linear programming techniques is essential.

Salary in the range of £930-£1,120.

Applications to Personnel Officer, Head Office, British European Airways, Beaufne House, Ruislip, Middlesex.

For further appointments see pages 1124 and 1125

THE UNIVERSITY OF MANCHESTER

As the result of a grant from the Nuffield Foundation the Department of Social Anthropology and Sociology plans to carry out a study of a Lancashire town, and applications are invited for a RESEARCH FELLOW, initial salary within the range £950-£1,000 per annum, the appointment to be for two years from a date to be arranged. Applicants should have training in Sociology or Social Anthropology and field experience in one of these subjects. The successful candidate will be required to carry out a study of a section of the working-class population of the town. The appointment carries membership of the Children's Allowance Scheme. Application forms and further particulars may be obtained from the Registrar, the University, Manchester 13, to whom applications should be returned by not later than December 18, 1959.

COMPANY AFFAIRS

No Shocks from Steel

ALL the steel companies draw up their accounts to September 30th. This facilitates comparison of trading experience between companies, though it has the minor disadvantage that financial information about the industry as a whole is available for only one particular period. This year's accounts only partially reflect the sharp recovery in steel output which is now in full steam. To give a true basis of comparison, all the figures below show net earnings and earnings cover after charging amounts set aside for the fixed assets replacement reserve.

Steel Company of Wales reported on Thursday afternoon a rise in trading profits of over £1 million to £23,290,814. The dividend of 10 per cent for the full year (compared with 9 per cent in 1957-58) is as forecast in July. The market seemed satisfied.

United Steel's products cover almost as wide a range as the whole of the steel industry—from heavy steel plates for the shipbuilders to medium strip for the motor trade—so its profits indicate to some extent the trading experience of all the steel makers. The directors report that trading profits have risen in the year to September 30th from £20,511,000 to £22,011,000; and the group's net earnings are up from £7,086,000 to £7,834,000 after charging £17,648,000 (against £16,732,000) for depreciation and £2,000,000 (compared with £1,700,000) to replacement reserve, and slightly lower tax of £8,301,000.

With the final payment of 4 per cent, making a total ordinary distribution for the year of 15 per cent (against 12½ per cent) shareholders in United Steel are the first in the industry so far this year to enjoy a higher dividend. The ordinary dividend absorbs £2,021,000 compared with £1,467,000 and is covered by earnings about 2½ times. The directors say that the amount "available for appropriation" is £7,091,000 against £7,233,000 last year, but the fall in this figure is mainly due to an additional charge to the fixed assets replacement reserve of £736,000; there was no charge last year. At the same time the debenture redemption sinking fund this year absorbed £150,000. The absence of any news of the hoped-for scrip issue put the £1 shares back 1s. 6d. to 75s. 3d. on Wednesday, offering a yield of 4 per cent.

Thomas Firth & John Brown reports that trading profits have dropped from £6,306,055 to £5,566,445; but a lower tax charge of £1,607,786 (against £2,611,723) leaves net earnings slightly up at £2,019,280 compared with £1,849,570 last year. This figure is struck after charging £648,000 (against £599,000) to replacement reserves, and depreciation absorbs £660,721 compared with £664,600. The final ordinary dividend of 6 per cent, making a total payment of 10 per cent, on the capital as increased by the 25 per cent scrip issue last August means an effective increase in the distribution of just over one-eighth and was foreshadowed by the chairman at the time of the scrip issue. As Thomas Firth's main customers are the heavy engineering industries the results were in line with market expectations. Even so, the £1 ordinary units fell by 1s. 1½d. to 49s. 9d. on the news. Clearly, the fact that the group supplies the motor industry with alloy steel and rolled steel bars has done much to prevent profits from sliding too far, and the ordinary dividend is comfortably covered 2¼ times by earnings.

Whitehead Iron and Steel's main customers are also in the heavy engineering industries, especially the railways and the shipbuilders. Here too the fall in trading profits from £1,407,770 to £1,143,559 was not surprising; net earnings declined from £668,480 to £454,779 after charging depreciation of £169,821 (against £151,887) and tax of £319,059 (including £128,549 representing an over-provision added back) compared with £617,218. The charge to the replacement reserve remains unchanged at £200,000. The directors have decided to maintain the final ordinary dividend at 15 per cent, making 25 per cent; and they say that the results are in line with their forecast at the time of the interim payment. They add that "the favourable trading results from June, 1959, onwards arising from full working time have offset the reduced profits in the earlier part of the financial year." There is little doubt, too, that the rolled strip mills, which supply the motor industry and other consumer durable trades like the radio and television makers, have been working flat out and have also helped to cushion the fall in earnings which even now cover the dividend only 1½ times. On Wednesday the £1 ordinary shares fell 1s. 3d. to 49s. 6d. to yield 3¾ per cent.

Metal Box

TRADING profits of Metal Box in the six months ended September 30th fell from £4,405,000 in March-September, 1958, to £3,835,000, and in spite of a lower tax charge of £1,574,000 (against £1,940,000) the net profit attributable to the holding company is down from £2,026,000 to £1,837,000. This represents the first setback in the group's earnings for many years. It was a jolt to investors, who take growth by Metal Box almost for granted. They found no consolation in the increase in the interim dividend from 3¼ per cent to 4 per cent, and the £1 ordinary shares, which had climbed from 67s. earlier this year to a peak of 80s., were marked down on Monday by 3s. 6d. to 75s. Even now they yield no more than 2.3 per cent—on the market's assumption that the year's total dividend will still be 10 per cent, compared with last year's equivalent of 8⅓ per cent.

In his report for 1958-59 the chairman, Sir Robert Barlow, forecast that the group would be "hard put to it" to hold profit margins at the levels then prevailing. Investors might have heeded the warning. Total turnover in the six months ended September 30th rose by £1 million over the corresponding six months of 1958 to £39 million; the average profit margin, apparently, has dropped from 11.6 per cent. to 9.8 per cent. The increase in the volume of sales was greater than the increase in their value because of price cuts and because savings arising from improved techniques were passed on to purchasers. The printing strike this summer also made some inroads into the group's earnings.

The directors are confident that the present setback will be short-lived. In October and November, they say, trade has been improving and the group's total earnings in 1959-60 are expected to be "about the same" as last year. Their confidence is reflected in the new expansion programme, which will be financed partly from the profit on the sale of the group's holding in Steel Company of Wales since the election. Four new factories are to be built; one is for plastics in this country, two are overseas and the fourth will produce cans for the processed food trades in Scotland.

Turner and Newall

CAUTION has been the keyword at Asbestos House over the years, so that the raising of the final dividend from 10 per cent to 15 per cent (after a maintained 5 per cent interim) came as a pleasant surprise to the market; the £1 shares jumped by 10s. to 98s. 6d.

Year to September 30.	1958	1959
	£	£
Gross profit	15,093,895	15,773,892
Depreciation	2,715,252	3,203,287
Development	487,472	522,659
Tax	7,214,187	6,108,939
Net profit	5,973,524	6,894,925
Replacement	1,000,000	500,000
Ordinary dividend	1,887,964	2,681,456
Ordinary dividend (per cent)	15	20
Retained by subsidiaries	501,317	1,701,516
Retained by parent	2,449,892	2,237,609

In their interim statement the directors referred to some reduction in profits in the six months to March 31st, although this decline was "not of significant character." In fact in the full year to September 30th gross trading profits rose by £679,997 to £15,773,892, indicating that the lost ground had been more than regained in the second half of the year. But the improvement is offset to a large extent by an increased charge for depreciation of £3,203,287, against £2,715,252 last year, and there has been a fall in income accruing from trade investments and other investments. Profits before tax are therefore down slightly from £13,187,771 to £13,003,864. However, a lower tax charge—£6,108,939 against £7,214,187—leaves net profits £921,401 higher at £6,894,925. The increased ordinary dividend absorbs £793,492 more at £2,681,456, but is still covered 2.4 times by earnings. As usual, large sums are ploughed back in free reserves and replacement reserves—the total amount this year has risen from £3,951,209 to £4,439,125.

The yield on the £1 ordinary shares is now 4.0 per cent, the same as a year ago. The optimism of investors then has been justified—thanks largely, it would appear, to the Chancellor's tax cuts.

Decca

SHAREHOLDERS of the Decca Record Company are used to the need for patience, though this year the gap between the end of the group's financial year and the publication of the preliminary figures has been further narrowed by six weeks. And the results for the year ended March 31st are good, in present circumstances. The group's trading profit rose by 11¾ per cent from £2,953,000 to £3,300,000. A higher depreciation charge of £887,000 (against £735,000) and an almost unchanged tax charge of £1,003,000 leave net earnings up by 9 per cent, from £931,000 to £1,013,000. The unchanged ordinary dividend of 20 per cent is covered 1¾ times by earnings and offers a yield of 4¾ per cent on the 10s. shares at 47s. 6d.

The group's turnover rose by 4 per cent, to £21,800,000 (compared with a rise of 2½ per cent for Electrical and Musical Industries). This confirms that the big recording groups have been virtually unaffected by the slackening in pace of the record boom. In the current year Decca's record sales have so far been "substantially greater" than in the same period of 1958-59. At the same time, the group will have benefited from the manufacturing agreement with Radio Corporation of America, which has been working since May, 1958.

Clearly, other sections of the group have also contributed to the bigger earnings in 1958-59. Sales of gramophones, television sets and radios should all have reflected the current boom in these trades. And the Decca Navigator continues to do well: if hirings have increased at the same rate as in 1957-58, income from this source will also have made an appreciable contribution to the group's earnings. It would be welcome if the full report emulated the example of EMI and showed what proportion of turnover is attributable to different activities.

Granada

A YEAR ago Granada's non-voting "A" ordinary shares, which were then being dealt in outside the stock exchange, stood at around 52s. 6d. They were given an official quotation last April (when they were quoted at 79s. 6d.) and have since risen to 105s. 3d. In the year to September 26th the trading surplus was £2,108,562 (against £1,109,694) and the net profit was more than trebled at £797,290, compared with £257,129. The ordinary dividend of 80 per cent was foreshadowed by the directors last April, but, in addition, shareholders will receive a special twenty-fifth anniversary payment of 10 per cent. Granada's profits still lag behind those of ATV and Associated Rediffusion. The reason lies in a special agreement with Associated Rediffusion. This was originally designed to protect Granada from heavy losses in the early days, but today cuts into Granada's profits. The agreement ends in 1960 and the expansion in the group's earnings of around £2 million that can then be expected has already been largely discounted in the market. At the current price the "A" ordinary shares yield 3¼ per cent.

Arthur Guinness

ALTHOUGH the chairman spoke last year of "the difficult and competitive years" which he believed lay ahead, the reduction in profits before tax from £8,154,000 to £7,420,000 in the year to September 30th came as a great surprise to the market. This figure is after charging depreciation of £1,085,000, against £988,000 last year. The tax charge is cut substantially from £4,172,000 to £3,198,000 so that the net profit is raised from £3,980,000 to £4,222,000, out of which an unchanged ordinary dividend of 28 per cent absorbs £2,144,000. In addition, however, to mark the bicentenary of the company, a bonus payment of 5 per cent is to be made.

It is unfortunate that in this anniversary year the profits are disappointing. If the breakdown of profits is again published in the full report it will reveal where the fall in profits has been most marked. The subsidiary William Nuttall may have suffered a considerable reduction in sales along with other manufacturers of sweets during the hot summer. One would expect quite a different picture from the Dublin and Park Royal breweries. At 73s. 3d. (following a fall of 8s. 9d.) the 10s. shares yield about 3¼ per cent on the maintained dividend, excluding the special bonus.

Bass, Ratcliff

AN increase in dividend from 46 per cent to 57½ per cent is the cheering news for shareholders from the preliminary profits announcement of Bass, Ratcliff and Gretton. Nevertheless, the £1 ordinary shares fell on the news by 3s. 9d. to 75s., to yield 3½ per cent. The fall reflects the market's disappointment that there was no mention of the long overdue scrip issue. Last year the chairman, Mr C. A. Ball, referred to the obstacle presented by the holding of £268,871 of Bass ordinary stock by its subsidiary, Worthington and Company; under company law, no shares, even under a scrip issue, may be allotted to a subsidiary. But this ought not to be insuperable.

Bass now has trading agreements with both Watney Mann and William Hancock, the South Wales brewery. Its trading profits for the year to September 30th shows a small increase of £66,606 to £3,005,157; the company had to charge £246,291 for stock losses as a result of the reduction in beer duty. A lower tax bill leaves net profits £199,381 higher at £1,444,227, so that the sharply increased dividend is still covered almost 2¼ times.

Raleigh Industries

THE jump of nearly 8 per cent in Raleigh's trading profits in the year to July 31st, the raising of the ordinary dividend from 8 per cent to 12 per cent and the rise of 7 per cent in the group's turnover announced a few weeks ago tended to obscure some of the very real problems now facing the group. Mr George Wilson, the chairman, knows this, and points to the problems in his annual statement. He says that the advance in the group's earnings was attributable to two main factors: the success of Raleigh's new "moped" and the increased efficiency and lower costs arising from the group's major reorganisation plan, which is now completed. But Mr Wilson does not expect sales of mopeds to expand this year, owing to the increasing competition in that market. At the same time sales of bicycles have declined at home and overseas. Clearly hire purchase freedom at home has enabled more people to indulge their preferences for private motor transport and has also, apparently, offset any boost to cycle sales that might have followed the cuts in purchase tax in the last budget. As standards of living rise, sales of cycles tend to fall; but Mr Wilson hopes that this tendency will be temporarily offset in this country as the postwar "birth bulge" passes through the 15-20 age group.

Overseas, the group has had to contend with import restrictions in some of its principal markets—no small obstacle when exports take up two-thirds of total cycle production. The agreement with Tube Investments to set up a joint factory in South Africa and one in Mexico is obviously the most effective answer to a high tariff wall.

The balance sheet shows a stronger financial position. Net current assets have increased by £1.42 million to £5.33 million, capital commitments are down from £475,000 last year to £285,000 and the bank overdraft has been reduced from £2,676,817 to £1,790,284. Raleigh's earnings in the immediate future depend on the continuing success of its moped and on its ability to maintain its share of that rapidly expanding market. In the longer run, the

new policy of undertaking sub-contracting work for other industries can be taken as a sign that the directors are already aware of the need to broaden the base of the group's activities still further.

Tube Investments

"TRADING in the year under review came in like a lamb and went out like a lion rampant." The improvement in trading between April and end-July enabled Tube Investments to make up much of the ground lost in the previous eight months, and the recovery has since gathered momentum. This is the encouraging news that the chairman, Sir Ivan Stedeford, has for shareholders in his annual statement.

In a comprehensive review of the group's activities, Sir Ivan admits that a high price was paid for British Aluminium but he is confident that the earnings cover for the TI dividend will not be materially affected by this investment in the years before it will yield profits on a "commensurate scale." The statement discloses that Tube Investments now holds 47 per cent of the British Aluminium equity; 4 per cent is held by Reynolds TI Aluminium, 45 per cent by Reynolds Metals while the remaining 4 per cent is held by miscellaneous shareholders. The voting rights of Tube Investments and Reynolds Metals have been vested in Reynolds TI Aluminium in which Tube Investments now again has a 51 per cent interest. The aluminium side accounts for just over one-fifth of TI's total funds.

The electrical division of TI again produced record results and it is intended by next summer to add refrigerators to the successful Creda range of electric cookers, spin dryers and water heaters. Full order books reflect the extent of the recovery in the steel tube section in the last months of 1958-59. Although the iron and steel section was working well below capacity in the early part of the financial year, both Park Gate and Round Oak are now flourishing and a major scheme for modernisation and expansion is being studied.

Sir Ivan reports a "steady if an unsensational improvement" in the cycle section. During the year TI and Raleigh Industries merged their interest in South Africa and Ireland, where both companies have been working below capacity for some years. There is no suggestion, however, for any such arrangement in this country or in countries such as India where the market is large enough for the two. The success of Tube Investments in recent years has been largely a reward for good management, and it is clear that this is recognised; personnel and training work is being extended. Since publication of the full results the £1 ordinary shares have strengthened further, and at 123s. yield barely 3¼ per cent.

Unit Trusts

SCOTSHARES, the unit trust launched on St Andrew's day by the Bank-Insurance group with a portfolio of industrial equities with Scottish interests, has proved a powerful magnet to the thrifty Scots. The initial offer of 5,000,000 units at 5s. each was "oversubscribed" three times. The managers say that around 15,000,000 units have been sold to over 35,000 investors and some 5,250,000 were sold over the counters of Scottish banks. The average purchase was 200 units at a cost of £50. The success of the offer, although due partly no doubt to the desire of the Scottish investor to have a stake in Scottish industry, was probably mainly attributable to the yield of £3 10s. —which today's market thinks of as attractive. "Scotbits," whose portfolio consists of Scottish investment trusts, banks and insurance companies, offers a current yield of £2 15s.

The **Commonwealth Unit Fund**, formed last July under the chairmanship of Mr Peter Thorneycroft, has made its second block offer. This is of 2,000,000 units at 11s. 5d. each at a yield of £3 15s. per cent. In the five months since the trust was launched the units have appreciated by some 14.6 per cent. At present the trust's portfolio consists of 125 investments in companies throughout the Commonwealth; share yields for a number of these continue to be relatively high as a result of the weakness in commodity prices.

Barclays DCO

DISCLOSED net profits of Barclays DCO in the year to September 30th dropped by £48,843 to £1,218,512, despite a lower tax bill. Mr Julian Crossley, the chairman, attributes this to increases in costs, particularly of salaries and pensions, and to a less favourable structure of rates in certain territories. But the fall in the rate of current profits may also be due to the exceptional pace of expansion; in the past five years 345 new offices have been opened (bringing the total to 1,197), and many of these "cannot yet be considered as fully established."

Some improvement in commodity prices —which the chairman says has gone neither fast nor far—is reflected in the increase in deposits of £62 million to £602 million. It has also brought a sharp recovery in the bank's acceptance business from £39.6 million to £60.4 million. The increase of £16 million in advances, to £248.3 million, is at a slightly lower rate than last year and the ratio of advances to total deposits has fallen from 43 per cent to 41 per cent. The figures show an increase in the gilt-edged portfolio from £58.8 million to £77.7 million, reflecting a rebuilding of the bank's portfolio of short term bonds.

The bank has widened its hire purchase interests in South Africa by acquiring a substantial holding in United Dominions Corporation (South Africa), a subsidiary of United Dominions Trust. Barclays Overseas Development Corporation, the bank's subsidiary, had another successful year, showing a slight increase in profits; its total loans and investments rose from £8.2 million to £8.6 million.

London Stock Exchange

FIRST DEALINGS:	Nov. 23	Dec. 7	Dec. 28
LAST DEALINGS:	Dec. 4	Dec. 24	Jan. 8
ACCOUNT DAY:	Dec. 15	Jan. 5	Jan. 19

ON Monday the weakness of sterling, continued uncertainty about Bank rate and the Chancellor's week-end plea for lower prices combined to keep prices weak in all sections of the market. But on Tuesday the improvement in sterling made for a firmer tendency, although buying remained selective. On Wednesday the strong overnight rally on Wall Street overshadowed any initial disappointment with the first batch of steel dividends, and most sections of the market—including the funds—advanced on a broad front.

Gilt-edged stocks attracted some institutional buying and turnover markedly increased on Wednesday, though short bonds were still weak. In the week to Wednesday 3½ per cent War Loan gained ¼ to 66, and in short-dated stocks 4 per cent Conversion 1964 put on 3/32 to 93⅜. In medium-dated stocks 4 per cent Gas 1969-72 improved 1/16 to 93½. Foreign bonds were quiet, but Home Corporation stocks moved in sympathy with the funds; 5 per cent LCC 1980-83, for example, closed ¼ better at 98⅛, bank shares lost some of last week's gains with Lloyds down 10½d. at 65s. 3d. and National Provincial 1½d. easier at 66s. 1½d.; exceptionally Barclays put on 4½d. to 63s. 6d.

Rises in industrial equities were scattered freely in all sections, and over the week to Wednesday's close *The Economist* ordinary share indicator rose 1.2 points to its former peak of 352.7. A strong demand for steel shares developed before the dividend announcements, but some disappointment over the lower profits from Whitehead and Thomas Firth and the absence of a scrip issue from United Steel put most steel shares back from the peak levels reached earlier in the week. Even so, over the week United Steel gained 6d. to 75s. 3d., Whitehead improved 1s. 6d. to 114s. and Dorman Long put on 6d. to 65s. 6d. Thomas Firth closed 1s. down at 49s. 6d. and steel Company of Wales lost 1s. to 48s. 6d.

Heavy engineering shares continued last week's firmness with Vickers up 7½d. at 32s. 9d. In electricals the sharp rise in EMI on Wall Street prompted a rise of 3s. to 80s. 3d. in London, and substantial American buying of Philips Lamps caused them to shoot up 8s. 6d. to 150s.; Decca put on 1s. 6d. following the higher profits figures. Turner and Newall improved 11s. 3d. to 100s. on the bigger profits and higher dividend. Aircraft shares were stimulated by the imminent rationalisation of the industry, which should bring its corresponding crop of mergers. Shipping shares were also active.

Oil shares were quiet but the undertone, helped by the strength of Wall Street, remained firm. Burmah closed 6d. better at 46s. 6d. and Shell gained 1s. to 144s. 6d.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended December 5, 1959, there was an "above-line" deficit (after allowing for sinking funds) of £32,903,000 compared with a deficit of £14,637,000 in the previous week and one of £32,477,000 in the corresponding period of last year. There was a net expenditure "below-line" of £38,332,000 leaving a total cumulative deficit to date of £757,035,000 compared with £660,025,000 in 1958-59.

THE MONEY MARKET

At last Friday's Treasury bill tender, following the rise in New York and some pressure from the Bank of England in the money market, the rate for 91 day bills in London rose by ⅛ per cent to £3 10s. 7.23d., its highest for a year. This followed the lowering of the syndicate's bid by 8d. to £99 2s. 4d. and at this price the market's allotment was increased from 46 per cent to 54 per cent. For the 63-day bills offered the market lowered its bid by 5d. to £99 7s. 8d. and secured an allotment of 90 per cent. The further rise in the United States Treasury bill rate for three months bills to 4.638 per cent still leaves the margin over the London rate at over one per cent.

Despite a large amount of official help last Thursday two or three houses had to borrow a moderate amount from the Bank. Conditions eased over the week end and on Monday and Tuesday a few balances were unlent. On Wednesday however credit was short in spite of £9 million of Government disbursements and although the authorities gave a fairly large amount of help four or five houses were again forced to borrow from the Bank. February bills have changed hands at 3 15/32 per cent.

([1]) Retained imports. ([2]) Owing to changes in classification. 1959 figures are not strictly comparable with those for earlier years. ([3]) Average for second quarter. ([4]) Average for third quarter. ([5]) 1956 figures include re-exports of second-hand aircraft and exposed cinematograph film. ([6]) In 1959, indices for total imports and exports but not for the classes, are adjusted to include trade with the Channel Islands. ([7]) Average for fourth quarter. ([8]) Figures in *italics* are not strictly comparable with 1959 figures; the major differences are that the 1956 and monthly 1958 figures for OEEC countries exclude Spain and for the Sterling Area include Iraq. ([9]) November figures: total imports 329·4, UK exports 275·4, re-exports 10·9.

NOTICE OF OFFER FOR SALE

Dimplex

DIMPLEX LIMITED

(Incorporated under the Companies Act, 1929)

Share Capital

Authorised:		Issued and Fully Paid:
£250,000	in 1,000,000 Ordinary Shares of 5s. each	£250,000

The Company has no Mortgages, Debentures or other Loan Capital or Bank Overdrafts outstanding.

MINSTER TRUST LIMITED

OFFER FOR SALE

300,000 Ordinary Shares of 5s. each at 19s. 0d. per share

PAYABLE IN FULL ON APPLICATION

The Application List for the Ordinary Shares now offered will open at 10 a.m. on Wednesday, 16th December, 1959, and will close on the same day.

The Offer for Sale shows (inter alia) that:

1. In 1949 the Company acquired the registered design for the "Dimplex" permanently oil-filled, thermostatically controlled electric radiator. After considerable developments and modifications, the pressed steel radiator in its present form was evolved and the Company changed its business to the manufacture of these radiators and "Dimplex" water radiators. Since 1949 the Company has extended its range of products and in addition now manufactures, under the "Dimplex" name, the well-known range of skirting board style Convector Heaters, Infra-red domestic heaters, fires and commercial heaters, and overhead radiant heaters, oil-filled towel rails, both chromium-plated and enamelled, and copper water radiators for open circuit installation.

2. Net Assets of the Group, excluding goodwill, amounted at 30th June, 1959, to £386,071.

3. The Directors are of the opinion that, subject to unforeseen circumstances, the profits of the Company for the year ending 30th June, 1960, calculated on the basis used in the Accountants' Report, will be not less than £225,000. In that event, it would be the intention of the Directors, subject to unforeseen circumstances, to pay a dividend or dividends in respect of the year ending 30th June, 1960, totalling not less than 25 per cent., less tax, on the issued Ordinary Share Capital of £250,000 payable as to an Interim Dividend at the rate of 10 per cent., less tax, in April, 1960, and a Final Dividend of 15 per cent., less tax, payable in October, 1960.

Copies of the Offer of Sale, on the terms of which alone applications will be considered, and Forms of Application, are obtainable from:—

B. HANSFORD & CO.
Kent House, Telegraph Street, London, E.C.2

and from

APPOINTMENTS

MSL *have been retained to advise on the appointment of an*

EXPORT SALES MANAGER

for the European company of a successful international group with manufacturing units in Holland, Canada and Australia, marketing a range of non-ferrous consumer durables.

The Export Sales Manager will be responsible for the development of 9 territorial markets, each under its own resident Manager, stretching from Scandinavia to the Far East. The post, although located in Holland, will involve considerable travel, mostly in Europe. The company is international in outlook and career prospects are good. Initial earnings about £3,000.

Candidates must be aged between 30-40 and have had at least 10 years' sales experience, which should include selling in the field, directing and leading a sales force, responsibility for sales promotion and a knowledge of export. A degree or professional qualification, and fluency in French, German or Dutch are desirable.

Please send brief details in confidence, quoting reference S.1948, to P. J. H. Fryer. In no circumstances will a candidate's identity be disclosed to our client unless he gives permission after a confidential interview at which he will be given full details of the appointment.

MANAGEMENT SELECTION LIMITED
17, STRATTON STREET, LONDON, W.1.

TRAINING POSTS. Vacancies exist for men aged 23-26 with industrial, service or university background and good academic record, for interesting training posts with the Engineering Components Group of Companies whose main factory is situated in Slough.

Suitable applicants will be trained over a period of two years with a view to appointment to permanent positions of responsibility, and selection will therefore be critical.

Please reply stating age, educational attainments, service and industrial experience to the Personnel Manager, Engineering Components Limited, Liverpool Road, Slough, Bucks.

MSL *have been retained to advise on the appointment of an*

ECONOMIST

for a company over 5,000 strong, manufacturing consumer goods in pleasant surroundings in the West of England. He will be responsible for establishing a new department to advise management of the *implications of market trends and economic conditions* for company policies, and will have wide terms of reference.

Candidates must have a degree or equivalent in economics and a sound knowledge of statistical methods. They may either have experience in providing economic reports to management and now be ready to run their own department, or they may be recent graduates with high academic qualifications who will be given guidance and training for a few years. Age range therefore 22 to 30 and commencing salary up to £2,000.

Please send brief details in confidence, quoting reference S.2059, to R. W. H. Lubbock. In no circumstances will a candidate's identity be disclosed to our client unless he gives permission after a confidential interview at which he will be given full details of the appointment.

MANAGEMENT SELECTION LIMITED
17, STRATTON STREET, LONDON, W.1.

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences. This term is used in a wide sense to include not only Economics, Government, etc., but equally fields such as Education, Jurisprudence and Social Medicine. Value, within the range of £1,200–£1,800 per annum (Simon Research Fellowships) or within the range of £1,850–£2,250 per annum (Simon Senior Research Fellowships), according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience. Applications should be sent by January 15, 1960, to the Registrar, The University, Manchester 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the full-time posts of ASSISTANT in the Research Section of the Faculty of Economic and Social Studies. The successful candidates will be expected to pursue research in Economics, Economic Statistics, Government, *Social Administration*, Social Anthropology, General Sociology or Industrial Sociology and should be graduates in any of these subjects or in Modern History or Economic History. There are vacancies in both Grade II (which carries the status of Assistant Lecturer) and Grade III. The salary scales are as follows:—Grade II, £700 to £850 per annum; Grade III, £600 to £850 per annum. Applications should be sent not later than December 18, 1959, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

Comptroller

• THIS new appointment is with a large and established group of Unit Trusts in London.

• HE will have responsibility for all the administration and accounting work. He must be a Chartered Accountant with wide and up to date personal experience of modern accounting techniques, including the use of machines. It is also desirable that he should have knowledge of share registration and transfer work.

• HE should be between 35 and 40 and the starting salary will be about £3,000, but dependent on age and experience.

• BRIEF details should be sent in confidence to us as the company's advisers on the understanding that nothing will be disclosed to the company without permission.

Letters should be addressed to Sir Hilary Biggs.

JOHN TYZACK & PARTNERS LTD

10 HALLAM STREET · LONDON W1

CADBURY BROTHERS LIMITED

invite applications

from men (preferably under 40) with an Honours Degree in Mathematics or Science or Economics with Statistics.

for an opening in their

STATISTICAL CONTROL ORGANISATION

A scientific approach to quality control, coupled with experience in applied statistics, are essential qualifications.

This is a new post offering a wide field of interest and excellent prospects.

Applications should include details of qualifications and experience and be addressed to the Personnel Director,

CADBURY BROTHERS LIMITED, BOURNVILLE, BIRMINGHAM

A

COMPANY SECRETARY

(a Chartered Accountant)

is required for the London office of Messrs. Gonzalez Byass Limited

He will, essentially, be a man of good social standing, having preferably had some experience in the Company Secretary's office of a first-class, but not necessarily large, commercial concern and he will be responsive to the unusually pleasant atmosphere associated with the wine trade.

His duties will be mainly on the accountancy side in the supervision and co-ordination of the firm's accounts with those of its subsidiaries, but he will be able to take broad-gauge responsibility covering the many types of work which can fall to the lot of the Company Secretary, perhaps more in the medium-sized business than in the very large organisation.

The ability to deal with a wide range of insurance and trade mark matters would be a desirable qualification.

The age of the successful applicant will be between 30 and 40, the minimum salary envisaged is £2,000, but will be open to negotiation with the ideally suitable candidate, and there are certain expense allowances. A contributory pension scheme will be applicable within six months.

Initial brief written applications in the strictest confidence (names will not be disclosed without the candidate's consent) to Ref: R.136.

SENIOR STAFF CONSULTANTS LTD.,
141, NEW BOND STREET, LONDON, W.1.
who are advising on this appointment.

COLOMBO PLAN

Applications are invited for an appointment as PROFESSOR or SENIOR LECTURER IN ECONOMICS at the University College, Colombo, under the Technical Co-operation Scheme of the Colombo Plan. Would be required to organise the department and set up research section and to lecture to students preparing for London B.Sc. Should hold good honours degree in Economics, a research degree and have at least five years' University teaching experience. Specialised knowledge of Economic Theory, Banking and Accounting particularly useful. Salary between £2,000 and £3,000 per annum, according to qualifications and experience plus *tax free* overseas allowance of £1,175 per annum (married and £675 per annum (single) plus other allowances. Provision for two years with possibility of renewal. Contract with United Kingdom Government. For further information and application forms write Ministry of Labour (E.9), 26-28 King Street, S.W.1, quoting E9/71/TCS/CEY.

NEW APPROACH TO FINANCE WORK

Ford of Dagenham have now reached a size and complexity which require a new and imaginative approach to finance work. The existing system of accounting, profit budgetting, cost control, forecasting and analysis is being augmented by a wider ranging service to management.

Only men of the highest possible calibre who are capable of appraising complicated data and understanding all the implications of important policy matters are being assigned to this work.

Applications from men between the ages of 25 and 30 are now invited. Salary and prospects will be most attractive but the standards set are uncompromising and it is unlikely that men without a good honours degree or professional qualification will be accepted.

Replies should be addressed to Mr. H. G. Deville Ford Motor Company, Limited, Dagenham, Essex.

LONDON MERCHANT BANKERS require ASSISTANT, College graduate, post National Service, for Investment Department. Career. Some initial acquaintance with Economics and finance essential, languages useful.—Write Box DE/13, C.C.15 Bishopsgate, E.C.2.

MILK MARKETING BOARD

require

SENIOR ECONOMIST for an interesting appointment in the Economics and Intelligence Department of their Marketing Division.

Applications are invited from experienced men in the age group 30-37 with a good Honours degree, preferably in Agricultural Economics and with a knowledge of statistics.

YOUNGER MAN with similar qualifications for an appointment in the same department.

Attractive commencing salaries and excellent prospects.

Applications, in writing, to Chief Personnel Officer, Milk Marketing Board, Thames Ditton, Surrey.

STATISTICAL OFFICERS required by EAST AFRICA HIGH COMMISSION for posting to DAR-ES-SALAAM and NAIROBI initially. Appointment on two years' probation for permanent and pensionable establishment. Commencing salary (including Inducement Pay) according to qualifications and experience in scale £1,056 rising to £1,341 a year. Outfit Allowance £30. Free passages. Liberal leave on full salary after tour of 30-36 months. Candidates, under 40, should have Higher School Certificate or equivalent, and preferably higher qualifications in Economics, Statistics or allied subjects. Experience preferably supervisory, in statistical or similar office essential. Duties will include maintenance of statistical series and field studies on subjects such as family budget, agricultural, industrial and distribution surveys. Write to the Crown Agents, 4 Millbank, London, S.W.1, State age, *name in block letters*, full qualifications and experience and quote M3A/52"45/EN.

INVESTMENTS MANAGER

required to work in Pensions Department of a large Industrial Company at London Head Office. Applicants who should be between 40 and 50 years of age must have an extensive knowledge of Stock Exchange practice and the ability to collect, analyse and present financial information and data. Training and experience should have been received through service with Investment Trusts, Investment Departments of Banks, Insurance Companies or Pension Funds. Salary in accordance with age and experience, should be in the region of £2,750-£3,250. Applications should write in detail quoting No. 944 to Box N 1071 c/o Charles Barker & Sons Ltd., Gateway House, London, E.C.4.

MAGDALEN COLLEGE, OXFORD

The College proposes to elect shortly an OFFICIAL FELLOW AND TUTOR, or LECTURER, in ECONOMICS. It is intended that he should take up his duties on October 1960. Application forms and full particulars may be obtained from the Senior Tutor, Magdalen College, Oxford, to whom applications should be made not later than January 1, 1960.

EAST MIDLANDS GAS BOARD

ASSISTANT STATISTICIAN

A vacancy occurs in the Commercial Manager's department of the Board at their Headquarters in Leicester for an Assistant Statistician. The post is open to graduates in economics with qualifications and/or experience in statistical work and preference will be given to those who have knowledge or experience of market research.

The commencing salary will be within Grades A.P.T. V/VI (£620-£744) of the National Salary Scales according to qualifications and experience.

The position is pensionable and the successful candidate will be required to pass a medical examination.

Applications stating age, experience, qualifications, present appointment and salary, together with the names of two referees, should be sent to the Secretary of the Board, Pevensley House, University Road, Leicester, within 14 days of the appearance of this advertisement.

A. GWYNNE DAVIES,
Secretary.

COMMONWEALTH CORRESPONDENT is required for the London Press Service which is sent daily by wireless to all parts of the world as part of the official Overseas Information Services. The CENTRAL OFFICE OF INFORMATION seeks for this post an accomplished journalist or writer with much topical broadcasting experience, whose work has called for a wide knowledge of affairs within the Commonwealth as a whole. The correspondent, who should have a keen understanding of economic and constitutional subjects, will be responsible for reporting on current Commonwealth developments and writing explanatory items and articles on Commonwealth topics. Personal acquaintance with one or more of the member States of the Commonwealth (apart from the United Kingdom) is desirable. The post is graded SENIOR INFORMATION OFFICER (unestablished); salary £1,395 (to £1,660 men); £1,345 to £1,600 (women).—Write giving age, full details of qualifications and experience to Manager (P.E.992), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4. Only those candidates selected for interview will be advised.

For further appointments and other classified advertisements see pages 1113 and 1124

UNIVERSITY OF OXFORD

Lectureship in Economic Statistics

The University proposes to appoint with effect from 1st October, 1960, a Lecturer in Economic Statistics. Stipend on the scale £1,000-£1,750 per annum, plus F.S.S.U., and children's allowances of £50 per annum for each child. Eight copies of applications, with names of two referees, by 31st January, 1960, to Secretary of Faculties, University Registry, Oxford, from whom further particulars may be obtained.

"Which?"

The December issue of "Which?" reports on
anti-freeze compounds
Christmas hampers
model train sets
toy sewing machines.

Annual subscription for 12 issues of "Which?", published by the Consumers' Association, costs £1, to Box C. 333 High Holborn, London, W.C.1.

REMPLOY SPONSORSHIP SCHEME

Send for details which show an attractive proposition to *manufacturers*.

Write to the Managing Director, Remploy, Ltd., 25-28 Buckingham Gate, S.W.1, or telephone VICtoria 6621 (12 lines).

DIRECTORS' SECRETARIES

We have a few genuinely top calibre secretaries *awaiting sufficiently* attractive opportunities. If you can offer the right post, please let us know at once.

THE WIGMORE AGENCY,
78 WIGMORE STREET,

PLUG IN **K.I.C.** FOR

ECONOMICAL PROCESS PLANT EXPANSION PROGRAMMES

Organised to serve the process industries, Kellogg International Corporation can strengthen the process engineering departments of most companies during their expansion programmes.

When faced with the problems of executing both large and small capital expenditures, many companies have found that plugging in the Kellogg engineering staff to supplement their own engineering facilities results in optimum capital investments for new plants.

KIC is equipped to deliver engineering manpower at any point in the planning of a new plant—from the early development of a new process through the pilot plant stage, to the design of the commercial plant, to the procurement of equipment and materials, the construction of the complete facilities, and finally to placing the plant in operation.

The broad experience of KIC, plus the constant flow of advanced technical data from Kellogg's Research Laboratories in the United States, has been used by many firms to make objective economic analyses of process schemes, as well as to help hurdle specific road blocks in the development of new processes.

Optimum *over-all economies* in plant expansion are obtained by assigning full responsibility to Kellogg for *all* necessary services. In this way, Kellogg can complete any new plant at a pre-determined cost.

Inquiries are cordially invited concerning KIC's co-ordinated engineering, procurement, and construction service.

SUCCESSFUL COMPANIES USE THE **Stenorette**

'FOR FOUR VERY GOOD REASONS'

— *says* **W. G. SHARP** *

*W. G. Sharp, O.B.E., Managing Director, Fresh Meat Division, of Armour and Company Ltd., British subsidiary of the largest meat producing organisation in the world, which employs over 35,000 people. In addition to meat (and meat by-products) the Company also markets a wide variety of canned goods, dried fruit and dairy produce.

"Cost, efficiency, reliability and simplicity of operation are the four very good reasons why our organisation use Stenorettes. Their cost is well below that of other dictating machines, they are extremely efficient both for dictating or transcribing and after several years of constant use we can vouch for their reliability.

As for simplicity of operation, there's no doubt about it; a Stenorette is a pleasure to use.

Machine dictation makes such a difference. The typist is typing whilst the executive is dictating, and no time is wasted when he is interrupted by the telephone. In fact, taking it all round, we've found that our Stenorettes double our dictation output".

The new Stenorette makes it even easier to save time. Transistorised for immediate readiness *always* (no 'warming-up' period), restyled for faster-than-ever operation and giving well over 30 minutes continuous recording time per cassette, the new Stenorette is the best business buy ever. You owe it to yourself to know about it. (Had you heard, too, *about the new Grundig Memorette? Battery-powered, using the same tape cassette, it takes dictation or transcribes it anywhere*). Ask your secretary to post the coupon.

Please send me illustrated literature about the new Stenorette and the Memorette Dictating Machine.

This Chemical "BOILS" on Ice

It's one of more than 100 inorganic and organic fluorine chemicals made by Allied Chemical, world's largest producer of fluorine, hydrofluoric acid and compounds derived from them

Fluorine chemicals are pacing developments throughout industry. The rocket and missile field, for example, is evaluating elemental fluorine and halogen fluorides.

The story is the same in less glamorous areas:

Plating. B&A metal fluoborates are vital to plating of metals, alloys and plastics.

Chemical Processing. Boron trifluoride is a versatile catalyst for petroleum, synthetic rubber, plastics, dyestuffs and other industries.

Light Metals. B&A alkali fluoborates help produce superior aluminum, simplify and improve magnesium casting.

Electrical Equipment. Many improvements in electrical and electronic equipment are made possible by sulfur hexafluoride, an inert dielectric gas.

Executive Office: 40 Rector Street, New York 6, N. Y. • **European Office:** 40 Avenue des Arts, Brussels 4, Belgium

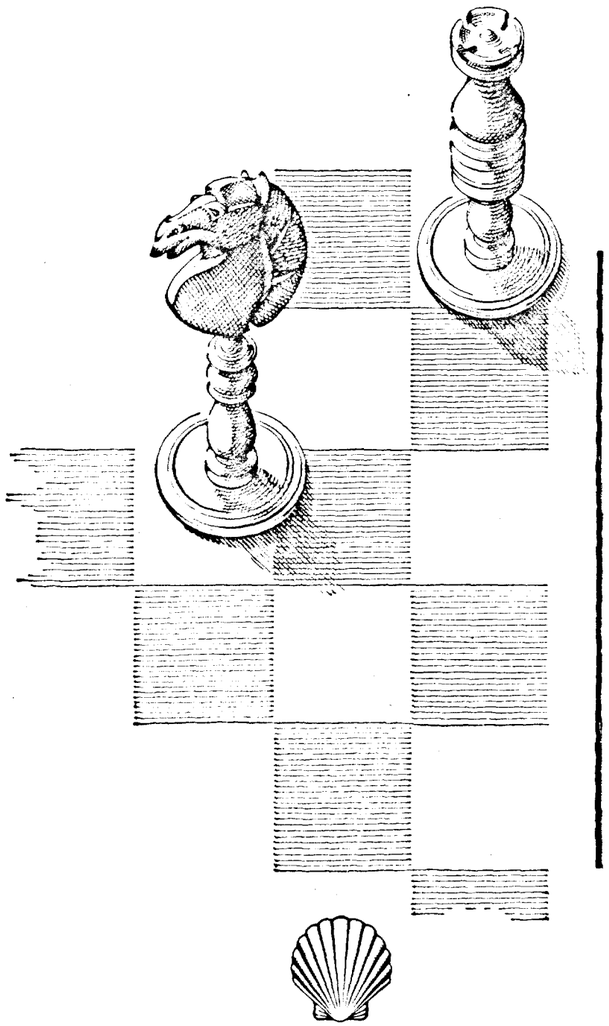
Chemical that boils at below-freezing temperatures supplies the "push" to many of today's new aerosols for household and industrial use. The liquid, one of Allied Chemical's fluorine-based GENETRONS, is also used in air conditioning and refrigeration.

INSIDE STORY ON FLUORINE. The above is just a small part of the fluorine story. We know, because it's our story too. Allied Chemical has been in the fluorine industry for fifty years. For information on how fluorine chemicals can be used in your industry, write on your company letterhead, indicating your field of interest, to Allied Chemical International, Fluorine Dept. 14 40 Rector Street, New York 6, N. Y. Cable: ALCHEMIC NEWYORK. Or, contact your nearest Allied office

The capitalized names are trademarks of Allied Chemical

Allied Chemical

Knight's move, or castle's?



Can Shell be sure? Those who want to make a career in Shell often ask, "Where am I likely to be in 15 years' time?" Geologists, physicists, geophysicists, chemists, engineers, chemical engineers, economists and arts men: they all want to know where they are going to get to.

We may have a pretty shrewd idea, but we cannot always know for certain; partly because things move very fast these days, partly because people change their ideas as they go along.

The aim, however, is to plan a man's career several moves ahead. He may move in a direct line like a Castle. Or he may move like a Knight, sideways and forward. For instance, the chemist, engineer or chemical engineer can move from the operational to the commercial square; the geologist or physicist from exploration to production; the arts man from Marketing to Personnel Administration . . . and all towards top management.

As the oil industry and the chemicals-from-petroleum industry expand, the variety of moves a man can make is constantly increasing.

this is the world of SHELL

THERMOTANK IN SOUTH AFRICA

Now they can give of their best

at a Johannesburg Building Society

Staff in the new headquarters of the United Building Society, the largest in South Africa, are continents away from the heat or chill of the nearby Johannesburg streets. Thermotank air conditioning provides perfect comfort in this ten-storey building, one of a series of the Society's offices throughout the Union which have Thermotank installations. Other Thermotank contracts in South Africa include the head office of the national power authority, the Electricity Supply Commission; the air conditioning of seven department stores; brewery plant, hospitals, and fan equipment for gold mines.

Thermotank can plan, design and install air conditioning equipment for any requirement in any part of the world.

A WORLD OF BETTER CLIMATES WITH THERMOTANK

Here are a few more examples of world-wide service from Thermotank:
BRITAIN Conversion of the liner s.s. 'ORCADES' carried out, providing an installation with a capacity of 14,000,000 B.t.u's per hour.
UNITED STATES Contracts for Texas Instruments, Standard Oil, American Telephone and Telegraph Company, John Hopkins University, Ford Motor Company and General Motors.
MIDDLE EAST Installations include the Fao Port Control and Wireless Station Building on the Persian Gulf and the Iraq Spinning and Weaving Company's mills near Baghdad.
AUSTRALIA Full air conditioning for the Melbourne office of Bank of Australia and New Zealand. Also hospitals, hotels, schools, laboratories and current shipping including two 19,000-ton vessels.

ANOTHER MAJOR CONTRIBUTION TOWARDS HOLDING

DOWN THE PRICE OF POWER TO INDUSTRY AND THE HOUSEHOLDER

English Electric again chosen to build Britain's largest single-shaft generating sets to produce 700,000 kilowatts

-CAPABLE OF SUPPLYING 6,100 MILLION UNITS-

MOST OF LONDON'S ANNUAL NEEDS

FIRST AGAIN

For the third time in recent years, The English Electric Company is to design and construct for the C.E.G.B. the first generating sets of their type and size developing all their power in one shaft:—

1955 FIRST 200,000 kW
1958 FIRST 275,000 kW
NOW FIRST 350,000 kW

The Central Electricity Generating Board is ordering for its Drakelow 'C' Power Station two of the most powerful single-shaft steam turbo-generators ever planned. This £5,000,000 project will have been won by English Electric in direct competition, and as a result of the great advances in technical design and operating efficiency that the Company has been able to make available to the C.E.G.B.

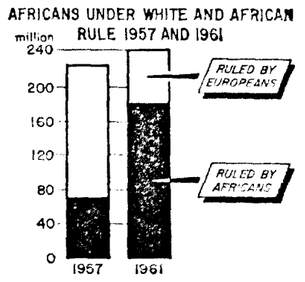
African Deadlines

IN Africa the Colonial Secretary, the British Government and the British people face a year of unprecedented decision. The inexorable advance of African independence is pressing hard against colonial territories in which substantial white communities are settled. In 1960 white citizens have got to be put in the power of black. Indeed, in this last fortnight of 1959, the process has already started.

The past week has been a memorable one in Africa's history. This is not merely, or even mainly, because of Nigeria's pre-independence election. From that election the conservative Northern People's Congress has emerged as the largest party, but the big gains by Dr Azikiwe's nationalist and radical alliance in all three regions look as if they have been the most significant pointer to the future. The voice of nationalism and probably of pan-Africanism will soon be heard from the centre of a big Federation of 35 million African people. In the same week, to the west of Nigeria, General de Gaulle has conceded that full independence is also the goal of all the states of the French community, not just of Guinea and Mali; while, to the south, the Belgian Congo has started its six-week-long poll in what may prove to be its pre-independence election also. But the really momentous announcement has come from Tanganyika, where Mr Nyerere has won the decisive point that the next election (in September) will be fought for responsible government on a common roll.

For the first time a sizeable community of white settlers, as well as Asians, will thereby pass under the authority of a predominantly and increasingly African party and government. This is the watershed in African developments. The "white belt," which used to be thought of as extending from Somaliland to the Cape, is cracked open. And this is being done in a country which, in terms of trained African cadres, is even worse off than Nyasaland. True, the white settlers are barely 20,000 strong and many of them are Greeks and Germans; true, the Colonial Office is going to insist on a qualitative franchise which will ensure (broadly) that only literate Africans get the vote; true, the non-Africans are to have 21 seats reserved to them in a house of 71; true, race relations have been good in Tanganyika and Mr Nyerere himself has been as moderate as he is modest. None of this can obscure the fact that power over the future and fortunes of white settlers is, rightly because inexorably, being transferred to Africans. Link these things with what is going on in west Africa and the Congo basin, add the independence of Somalia, and the implications for policy in Kenya and Central Africa become very sharp indeed.

In Kenya they are so sharp that Britain can no longer avoid the point of them. Gradualists have run out of further expedients to use, and African ambition threatens to explode in violence if the big decision is not now made. Mr Macleod is very prudently reconnoitring the field before the colony's constitutional conference in London in January, for there is every sign that this will reach no agreement. He has also given himself some slight elbow room until May, when a conference will be held with Mr Nyerere in order to decide upon



NIGERIA

The Hon. Alhaji Abubakar Tafawa Balewa is prime minister of the Nigerian Federation, and deputy leader of the strongest party, the Northern People's Congress. Though a nominee of Sir Ahmadu Bello, the powerful Northern premier, he has his own views on Nigeria's future.

The Hon. Dr Nnamdi Azikiwe, leader of an alliance between the National Council of Nigeria and the Cameroons and the Northern Elements Progressive Union, was formerly premier of the Eastern Region, and is Nigeria's veteran nationalist (aged 53). Likely to be deputy premier and foreign minister, he would tend to the Bandung block line abroad.

EAST AFRICA

The Hon. Dr Tom Mboya was educated at a Roman Catholic mission and Ruskin College; at 29 he is general secretary of the Kenya Federation of Labour and also deputy leader of the Kenya Independence Movement. He is in fact, though not in title, the leader of the Kenya African elected members.

The Hon. Julius Nyerere, aged about 34, was educated at a Roman Catholic mission and Edinburgh University; he organised the Tanganyika African National Union which won a majority at the 1958 election of elected members of all races. Next year he will be effectively in charge of Tanganyika.

CENTRAL AFRICA

Dr Hastings Banda took a medical degree in Chicago and Edinburgh; practised in London; became the London HQ of Nyasaland's resistance to Federation in 1953. At the age of 54, after an absence of nearly 20 years, he returned to be president of the Nyasaland National Congress in 1958; is now in detention.

Kenneth Kaunda (30, mission-educated) is president of the Zambia National Congress, the extreme and perhaps larger half of the Northern Rhodesian National Congress. He broke with the more moderate Hon. Harry Nkumbula after the 1958 constitution was introduced. Mr Kaunda has been detained in a rural area.

Josuah Nkomo is president-general in exile (he is in London) of the banned Southern Rhodesian National Congress. Aged about 45, he rose to political power in the Bulawayo Railway Workers' Union, and though opposed to federation asks only for relatively moderate political advances for Africans in Southern Rhodesia.

the composition and powers of the new Tanganyikan council of ministers—as well as such formally portentous matters as whether Mr Nyerere himself is to be called chief minister or merely leader of government business. This uncertainty about the exact terms to be used in Tanganyika may serve to brake Mr Mboya's impatience for a few more weeks ; it may preserve some small room for manœuvre when he demands an African elected majority, an African ministry and self-government for Kenya. But the basic choice is whether the Colonial Secretary is going to make the settlement with Mr Mboya or with the Europeans.

By now there should be no doubt in anyone's mind about this. The multi-racial parties in Kenya are plainly not going to work. The Europeans have moved too slowly, and Africa has moved too fast, for these parties to succeed in the growing atmosphere of racial suspicion there, in which Mr Mboya has played his cards as ruthlessly as he has played them well. It has yet to be seen what Professor Mackenzie, the constitutional adviser sent to Kenya at the African leaders' insistence, will make of the proposals of the New Kenya group, which seems to think that the realities of transferring power can still be muffled in fancy franchises that do not quite give black Africans the majority vote. They cannot. The choice before Mr Macleod is little wider than a decision between maintaining full Colonial Office control (partly delegated to the white settlers) which means holding African nationalism down by force—and will lead nowhere—or making a settlement with Mr Mboya. It will be all Mr Macleod can do to get as good a deal from Mr Mboya for the Kenya whites and Asians as Mr Nyerere has given in Tanganyika: a transitional period, but effective transfer of power this coming year. It will be far better to accept now that the 65,000 white men in Kenya must take the road on which the 20,000 white men of Tanganyika have this week set foot.

AND so to the hardest problem of all. Mr Macmillan, during his flight over thousands of miles of African-held territory on his way to Salisbury and Pretoria, will do well to bear the realities of East Africa in mind. It will be impossible to put first 20,000 and then 65,000 white settlers under African government, whatever the actual terms or timetable of doing so, without creating a precedent that will shake Central Africa to the roots. The Nyasalanders, who already argue that they have more trained Africans than Tanganyika with whom to sustain self government, will point out that the interests of far fewer (7,000) European settlers have to be taken into account in their country. The African National Congresses in Northern Rhodesia will argue that the interests of only a few more white settlers than in Kenya (75,000 of them) hold them back. But in this they are wrong. The essential difference is that, to the south, 220,000 white settlers in Southern Rhodesia hold the citadels of political power. Everywhere else except in the Rhodesias a unilateral decision by the British Government could (and very soon should) bring a black government into prompt existence ; but in the Rhodesias the immediate consequence of any such British attempt would be to drive Southern Rhodesia into South Africa's hands.

What Mr Macleod ought to want in Central Africa is African-dominated territorial legislatures and ministries in

Nyasaland (almost immediately) and in Northern Rhodesia (soon), but associated in a Federation (under that or some other name) with a Southern Rhodesia in which African preponderance is impossible of attainment, with or without bloodshed, for some time. Eventually, of course, African nationalism is going to become as irresistible in Southern Rhodesia as everywhere else. If the white Southern Rhodesians are ruling a separate and isolated country when it rises to boiling point, everybody has seen from South Africa what tragedies will occur ; if the region they ruled were then part of a steadily advancing federal state, associated with African partners who had learned the responsibilities of office in their own districts, and with a federal business community that drew much of its prosperity from the Northern Rhodesian copper belt, every sane step towards a Kenyan or West Indian solution would become that much easier for them to accept.

It is one of the ironies of history that it is African hatred of the word and image of Federation that may now do most to make this solution impossible. If it is impossible, then no liberal in this country would support what Sir Roy Welensky might like to mean by partnership between himself and Britain: a skilful political bargain whereby, in exchange for fair words, continued colonial prerogatives and new preambles, Britain would find that it had, in the cause of giving the Federation a further period of probation, undertaken to keep all forms of African nationalism down by force. Anybody who looks at the dramatically changing map of Africa (see *page* 1144) must see why there is such desperate reason to wish that federation could succeed, partnership become real, a temporary buffer be created between Southern Africa and the advancing northern tide, the white minority prepare to cede control and the Africans to take it over responsibly, with all suspicion spent. The only logical objective of British policy at the end of 1959 is to search and search again for any structure of federation that has any hope of working in this way ; no places of pride in African history will be accorded to those, black or white, who have chosen to boycott the Monckton commission, and to abdicate from the task of finding out.

Afro-Irish Assembly

As new members come forward and habitual attitudes pall, the United Nations Assembly is becoming less stereotyped in its moods. But the danger of ineffectiveness remains.

LIKE an iceberg upside down, the United Nations' glassy crags rise from Turtle Bay with most of their bulk above the surface and only a fraction below. But, as with other icebergs, it is the bit below the waterline that matters. Most of the UN Assembly's visible activities are calculated to confuse the average observer. Should he accept the Russian complaint that America dominates the assembly, the French complaint that the Asians and Africans dominate it, or the curiously belated recognition by some western commentators that America no longer dominates it ? If, as is now said, it has become the smaller nations' instrument for restraining the great powers, why has it done no more about disarmament than hand the problem back to the powers to settle ? Why, if Asia and Africa are now so dominant, has the assembly failed to adopt even a very moderate resolution on Algeria ?

The 1959 session, which ended in the small hours of Sunday morning, resembled earlier ones in too many ways. Twin torrents of oratory and paper were, for three months, daily flushed away into a kindly oblivion. Brevity was the exception, predictable repetition the rule. (The Belgian foreign minister, Mr Wigny, remarked at an early stage that most of the speeches would have been monotonous if they had not been pitiable—but this thought did not stop him from adding his quota.) With a single voice, five hundred delegates claimed to speak for suffering humanity, for peace ; after which pious gesture, most of them fell to chaffering over their particular interests. One must look closely to find, somewhere in this voluble crowd, men working for a general good.

The relatively mild tone of this year's debates was largely a mere reflection of the better atmosphere in the world outside. With Washington and Moscow getting on so famously, the other member governments might have seized the opportunity to offer helpful initiatives of many kinds. Instead, the feeling of relaxation encouraged many of them to mount their pet hobby horses and ride off in all directions ; and, as usual, it was hard to find anyone ready to make himself unpopular by heading them off. Of the various debates on themes almost wholly divorced from reality, those in the social and cultural committee were outstanding. This committee's chief claim to fame in 1959 was its decision that " freedom of information " should not extend so far as to entitle journalists, those notorious nuisances, to " seek " information ; at most, they could " gather " it. At one point, while its female members were debating whether the highly hypothetical rights of the world's children began at birth or at conception, the males fell almost silent, too numbed or perhaps too embarrassed to intervene. It was left to the redoubtable Princess Ping Peang of Cambodia to strike a rare note of honesty by revealing that several of the speeches had sent her off to sleep.

Little wit quickens these soporific exchanges. One had to wait a long time to hear an Irish delegate remark that failure to help backward countries would show that " the most underdeveloped territory in the world lies directly beneath men's hats." Indeed, the main function of the speechmaking is to fill in time while votes are canvassed, or compromise sought, in the corridors and lounges and in closed caucus meetings. This explains the occasional difficulty in getting a debate started at all (as in the cases of disarmament and Algeria this year). Perhaps a supply of pre-recorded, non-controversial oratory could be piped like " Muzak " through the headphone system to provide the necessary atmosphere ; delegates could then use their negotiating time to better effect, for they would no longer have to sit and listen just in case something significant was actually said. Better still would be a rule that no speeches should be made until a resolution had been tabled ; ideally, indeed, no speeches until after the voting (when many delegates

insist, in any case, on giving a lengthy explanation of their votes).

But the voting figures can be almost as misleading as the speeches. Many newspaper headlines, for instance, presented this session's voting on Algeria as a success for the Afro-Asian group. In fact, it was the French who were much relieved by the outcome, while the representatives of the Algerian rebels in New York were correspondingly cast down. This was not just because, with 39 votes in favour, 22 against and 20 abstentions, the necessary two-thirds majority was not secured. What signified was that the eleven Arab delegations could get only the ten communists and a mere 18 of the remaining 61 members to join them. They did not even get the full Afro-Asian vote (Cambodia, Iran, Japan, Laos, Siam and Turkey abstained); they got only five Latin Americans, little inclined though these republics now are to follow a United States lead; by watering down their text nearly to meaninglessness they finally won the support of Sweden, but they still got none of the other usually sympathetic Scandinavians, nor even Ireland. And as the assembly becomes more sophisticated, delegations are—very wisely—becoming less interested in illusory voting victories based on numbers, and more concerned to win over those members whose independence of judgment is widely respected.

Mr Khrushchev's advice to the delegates that they should vote only for resolutions that all members can accept is still being ignored (not least by the three Soviet delegations); but the growing desire to obtain, in an assembly where no one group now prevails, support broad enough to sustain a claim that it really represents the general will, has led almost all parties to draft their resolutions more temperately, and to conciliate opinion by showing more restraint in their speeches. There are naturally exceptions. Most of them are familiar. Nobody is surprised to hear Mr Lequerica of Spain having a crack at "social-revolutionary Genghis-Khanism," or Mr Shukairy insisting that disarmament and Israel are incompatible. But this year, despite the general mood of moderation, some jarring notes have also been struck by the newest UN member, Guinea, and have reverberated through the whole African group and beyond.

AFRICA gave the 1959 assembly its strongest flavour. It is odd how the seating order in the assembly hall sometimes takes on a symbolic character. This year, it brought Ghana and Guinea to the two ends of the front row (and banished France to the very back). African questions have been unprecedentedly prominent during the session: the French nuclear tests in the Sahara; Algeria, Cameroons, Somalia, Togoland; the status of Portugal's colonies, the violence in Ruanda-Urundi, and the familiar group of items involving South Africa. Messrs Endeley, Foncha and Ifeagwu swelled the ranks of the British delegation, MM. Houphouet-Boigny, Senghor, and others those of the French; and the prospect loomed that by next year the assembly would be trying to make room in its already overcrowded chambers for the delegations of Nigeria, Somalia, Cameroons, Togoland, and possibly Mali and other new members. Little wonder that Mr Hammarskjöld is just setting off on a remarkably intensive African tour.

President Sekou Touré's personal appearance left a more vivid mark on the assembly than Mr Khrushchev's. At the end of November a small but significant omen was to be observed: Mr Charles King, the permanent representative of Liberia, turned up in flowing robes to preside over a committee session. Keeping up with the Tourés (the president's brother leads the Guinea delegation) is a task that has led the whole African group into some strained situations, and weakened the already loosening cohesion of the larger Afro-Asian caucus. The Guinea delegation's needless attack on Israel embarrassed Ghana; its intransigence over the future of the Cameroons led to a painful split in the anti-colonialist ranks; its general conduct is making the veterans in the Bandung group a little less enthusiastic than they ought to be about next year's African influx. But the magnetic field which the Guineans' exuberant actions have created among other African delegates is a fact that cannot be denied.

In the second row of this year's assembly seating sat the Irish, whose quite different exuberance has also marked the session. When the delegates from Dublin first appeared at Turtle Bay three years ago, it was expected that their main contribution would be to end the unhappy alphabetical juxtaposition of Iraq and Israel. (Israel's other flank, formerly also resting against an Arab neighbour, is now shielded by Italy; and the Irish, Israelis and Italians relish among themselves the claim to be the joint delegation of New York City). Previous experiences, as at Strasbourg, misled some observers into expecting endless variations on the theme of partition. Instead, the Irish have startled the assembly by providing it with a flow of stimulating initiatives on almost every other subject.

At this session, Mr Aiken, the foreign minister, spent two months in New York and personally presented the Irish initiatives on Tibet and on the halting of the spread of nuclear arms from nation to nation. Mr Boland, the permanent representative at the UN, has won such widespread respect, in spite of the irritation that the recent Irish moves have caused to all the great powers in turn, that he is a strong candidate for the presidency of the next assembly (though his elevation would be a sad loss to the floor). The small, young, and bouncy Irish delegation has shown how much impact can be achieved by a UN member which cannot be branded as a mere tool of one of the big blocks, if it sets out not to gain some narrow sectional interest but to stir up the general conscience of the assembly on broad issues. Its liveliness is thus the exact opposite of Guinea's.

Perhaps the assembly needs a few more Irelands of this kind. Moderation is certainly gaining ground; but moderation can slide imperceptibly into inertia. It is good to see how many of the newer member states have rallied to help the by now old established "fire brigade"—of which the Scandinavians are the main nucleus—that can usually be counted on to work for conciliation and to ease the assembly out of futile deadlocks. The assembly cannot afford many more humiliating tangles of the kind typified by this year's deadlock over a Security Council seat. But it also cannot afford to lapse into quiescence, leaving disarmament to the Ten, nuclear tests to the Three, and Laos and almost everything else to the secretary-general, whose growing load of responsibilities has its disquieting features. If the United Nations idea is to survive and succeed, somebody has to keep the sluggish monster of Turtle Bay from lying down in its tracks. As well as Scandinavians to coax, it needs more honorary Irish to goad.

Hungarian Inquest

East and West continue to dispute the rights and wrongs of what happened in Budapest three years ago; Hungary has to live with the consequences

ECHOES of what happened in Hungary in the late autumn of 1956 are still reverberating, three years later, across the iron curtain. In Budapest the proceedings of the Hungarian party congress were shot through with references to those October days. In New York the United Nations General Assembly, after discussing Hungary in an acrimonious atmosphere far removed from the "spirit of Camp David," renewed Sir Leslie Munro's watching brief.

For all practical purposes the episode is closed. But the non-communist world feels compelled to go on protesting against the consequences of a tragedy which it failed to prevent. And the communists, having fabricated one of history's great lies about the Hungarian revolt, apparently feel a compulsive urge to go on repeating it—in the hope, maybe, that enough repetition will abolish the truth. Even Mr Khrushchev apparently felt compelled to reveal quite unnecessarily, in a speech to a Budapest factory audience, that the Soviet leaders had been divided about the wisdom of sending their troops back into Hungary in November, 1956.

Perhaps the people least interested in recalling the events of 1956 are the Hungarians themselves. Their consciences are not troubled; they are not preoccupied with foisting a lie on the world. The past is important to them because of the cause it gives their rulers for continued repression, and because it demonstrates the futility of any sudden new dash for freedom. Otherwise, without regret for the past or much hope for the future, the Hungarians are—by all reports, with stolid resignation—preoccupied with coming to terms with the present.

It is not an agreeable present. True, the "megalomania" of the Stalinist planners is now thoroughly discredited, and the material situation of the Hungarians has steadily improved over the last three years. After the revolt, the Hungarian economy was in a parlous state. But massive injections of economic aid—foodstuffs, industrial raw materials, and credits—from the rest of the communist block have put it on its feet again in a remarkably short time. And although they cannot expect to go on getting special economic help from their communist neighbours, the Hungarians can hope for a modest but steady improvement in their living standards—provided they work hard enough, and that sanity prevails among the planners. But it was not material difficulties and deprivations that drove the Hungarians to revolt three years ago. It was—as Mr Khrushchev virtually admitted during his recent visit to Budapest—the intolerable character of the tyranny that Rakosi had fastened upon them.

THAT tyranny was swept away during the October revolt. Today it is not so intolerable, but it has in effect been reimposed to a considerable extent. Rakosi's secret police, the AVH, have been restored in all but name; their powers have been slightly curtailed but they are as ubiquitous as ever. The information steadily trickling out of Hungary of trials and executions, both of those who took part in the 1956 revolt and of those accused of "counter-revolutionary" activities since, cannot be categorically proved. But it is, to quote the words of Sir Leslie Munro in his report to the UN Assembly, "based on evidence the cumulative force of which commands the most serious attention." No credence can be placed on the denials of the Hungarian authorities themselves. For instance, the categoric denial by the Hungarian minister of the interior at the party congress, that there either were or had been any minors in Hungarian prisons, is refuted by the Hungarian press itself which has on numerous occasions published reports of sentences imposed on young people for their counter-revolutionary activities.

Every section of the community has lost the gains it briefly made three years ago. The workers' councils, which sprang up everywhere during the revolt, were dissolved piecemeal and then formally abolished in November, 1957. The right to strike, proclaimed by the Hungarian TUC during the revolt, was speedily done away with: a decree of January, 1957, provides the death penalty for those inciting others to strike. The peasants, who celebrated the revolt by abandoning the collective farms, have for the past year been under ruthless pressure to rejoin them. The independent youth organisations which were formed all over the country during the revolt have been suppressed; all youth activities are again firmly under communist control. So are the schools, the universities, the legal profession. Most of the writers—those, that is, who are not in prison—have been forced to acquiesce with silent hostility in the regime.

NOTHING that was said or done during the recent party congress introduced any rays of light into this sombre picture or suggested that the regime contemplated any change. Contrary to rumour the old team remains in charge, practically unchanged. With Russian support and Russian garrisons, possessing the apparatus of repression and aware that the Hungarians now appreciate the futility of active resistance, Mr Kadar and his colleagues addressed the congress with a sickening self-confidence. Between them they made it quite clear that they have no intention whatsoever of sharing their power with anyone; those who "adopt a hostile stand" towards the regime will be curbed and punished; the "socialist transformation of the countryside" will be completed within a few years as a preliminary to the "total transformation of the social system"; every effort will be made to root out the admittedly still prevalent bourgeois ideas. In the Hungarian context both Mr Kadar and his patron, Mr Khrushchev, may be accounted moderate men. (It may be significant that in his speech to the party congress Mr Khrushchev, while condemning Rakosi, made no mention at all of Imre Nagy.) But it may not be easy to pursue the course that the Kadar regime has mapped out without falling back into Rakosist excesses.

Nor is it easy for the outside world to do anything about the present state of affairs in Hungary, beyond deploring it at the United Nations. Mr Khrushchev may prefer modera-

tion in Hungary ; he may even feel uncomfortable about the Soviet intervention in 1956. But he implied that in similar circumstances the Soviet Union would intervene again if necessary, and he made it clear that he has no intention of discussing Hungary with any western leaders. Those who try to raise the matter are, he said, " betting on a dead horse." Mr Khrushchev in Budapest and Sir Leslie Munro at the United Nations have both gone back to Hungary's revolt against Austrian domination a hundred and ten years ago to find similarities that justify, the one, Russia's intervention in Hungary, and the other, the West's continuing concern in what happens to the Hungarians.

It is also relevant to point out one vital difference between then and now. In 1849 the British government, enthusiastically supported by public opinion, successfully threatened Russia and Austria with war to stop them from bullying the Sultan into surrendering a band of Hungarian rebels, including Kossuth, who had taken refuge on Turkish soil. Today no great power dare back its demands on behalf of any small power or oppressed people with the threat of war, let alone the reality. Economic pressure is still possible, although rarely advisable, since it is liable only to cause more hardships to those it is meant to be helping ; anyway, in the case of Hungary, whose economy is closely tied in with the communist block, it is bound to be ineffective.

There remains the pressure of world opinion. Over the past three years this has been brought to bear pretty intensively on the Hungarian regime—with, it must be confessed, little obvious effect. This does not in any way mean that the Hungarian question should be, in Sir Leslie Munro's graphic phrase, " swept under the carpet." Public opinion in the free world is right to continue to protest as strongly as possible whenever trustworthy reports of individual repression filter out of Hungary. Such unwelcome publicity may, conceivably, influence a government that is anxious, as the Kadar government in spite of its defiant attitude plainly is, to achieve some measure of respectability.

Of more uncertain value is the present annual debate on Hungary at the United Nations ; this tends to descend into an angry slanging-match in which the fate of Hungary is submerged beneath general charges and counter-charges. It is an excellent thing that the United Nations should keep the problem of Hungary alive in the world's conscience by publishing at regular intervals a factual and objective account of conditions inside the country. But there is a case for abandoning the Assembly's emotional annual debate on Hungary ; this is bound to stir up ill-feeling between east and west without doing the Hungarians any practical good.

The plain fact is that whatever hopes the Hungarian people may have of achieving some amelioration of their present condition are bound up with the future course of east-west relations. If the present efforts to bring about a *détente* fail, the Hungarians may expect their situation at best to remain as it is, at worst to deteriorate. But if east-west suspicions were to diminish and east-west understanding were to improve, then the Hungarians (and all the other peoples of eastern Europe), might just possibly find some of the deadweight of oppression lifted from their backs. It will not be freedom, but it may be an improvement ; and who knows where such an improvement, once started, might end ?

Pre-Summit Summit

The different attitudes to summit policy which the four western heads of government have the task of reconciling this weekend

THE western summit in Paris this weekend (December 19th-21st) has to look forward, not back. But while the big four are bending their minds to the meeting with Mr Khrushchev, the echoes of allied disagreement, however muffled, must still carry into their discussions from the Nato Council debates. President Eisenhower and General de Gaulle are to talk things over privately today (December 19th) ; the American abstention in the United Nations vote on Algeria is only one of the points to be cleared up. The Americans have gone over to the offensive, as our Paris correspondent reports on page 1165. Mr Herter and General Twining have impressed on all their allies that the continuance of United States responsibility for the defence of western Europe is conditional on full participation by the Europeans themselves. Although the chief French spokesmen, M. Debré and M. Couve de Murville, have rolled over and played dead on the military integration issue, both the Americans and British are stirring up German fears for Nato's efficiency and unity. The need to secure the integration of European air defences is now held particularly urgent.

Through the Germans, the United States and Britain are trying to keep General de Gaulle safely in line for Nato. But on summit policy, both Americans and British in their official statements to Nato have made concessions. They have accepted the Franco-German argument that Berlin's future must be tied to the German question as a whole in any talks with the Russians ; and Mr Selwyn Lloyd, echoing Dr Adenauer, has called disarmament " the most fruitful field " for discussion.

The outcome of the Paris talks is intended to be a note (or rather three notes) to Moscow, suggesting a time, place and agenda for an east-west summit conference. The earliest, and most optimistic, suggestion for the date is April 20th, the first convenient time after President de Gaulle returns from London on April 8th (Easter falls on April 17th). It may be harder to decide whether to offer a formal agenda to Mr Khrushchev, and if so what to put on it, because earlier discussions have not reconciled existing disagreements. When, and if, some compromise has been reached the need for further western consultations before the summit may require the creation of a working party of officials. When it has done its work there may have to be a second meeting of western leaders on the eve of encountering Mr Khrushchev in person.

MORE than any leading statesman except Mr Khrushchev, **Mr Macmillan** has made the idea of an east-west summit conference his own. As he told the new House of Commons soon after it assembled (in the debate on the Address, on October 27th), his visit to Moscow confirmed him in his conviction of the need for a summit conference. He allowed himself during the general election campaign (September 30th) a rash prophecy that the date of the summit meeting would be fixed " within a few days," and he has continued to insist since, in spite of douches of cold water from General de Gaulle, that the meeting should be " at the earliest practicable date, in order to keep up the momentum."

What made Mr Macmillan go to Moscow was his concern, felt since the Russian declaration on Berlin in November, 1958, that

the situation in Europe was dangerous and was getting worse. Berlin is to him the prime topic for east-west talks at this stage. **Mr Selwyn Lloyd** was the member of the foreign ministers' conference at Geneva last summer who most doggedly kept alive the view that agreement on Berlin was possible. When the ministers broke up on August 5th they had not reached even an interim agreement on Berlin and they seemed, to the naked eye, still to be far from it; however, the news that Mr Khrushchev had been invited to Washington made it permissible to put the best face on what had been done up to then. Mr Lloyd was thus able, without striking a discordant note, to state his firm belief that " our discussions about Berlin have been of benefit." The relative success of the Camp David talks, which enabled the United States government to agree to a summit conference, also enabled the British Government to adopt as a settled opinion the thesis that an interim agreement on Berlin was now within reach of the powers if they chose to grasp it. Belief in summit conferences as a system of diplomacy can also by now be called a fixed British view. Again to quote Mr Lloyd's concluding statement at Geneva:

> I hope for a system which will consist of periodic meetings at which the great problems affecting the peace of the world may be considered by heads of governments.

Mr Macmillan's talks with Dr Adenauer in London in November brought the only qualification that has appeared in the British view of the summit. An Anglo-German compromise view of the agenda for the east-west summit would appear to include general disarmament, the German question with Berlin, and east-west relations generally. This is a compromise that may work well so long as things go smoothly ; but what if they do not ? It remains the British view that an interim agreement on Berlin is the most likely single possibility for a successful negotiation between the heads of government. And, since Mr Macmillan and Mr Lloyd are thinking not of a single grand assize, but of a series of summit conferences edging their way forward on different subjects in turn, they are not basically averse to an agenda that would offer a single modest, but distinct, chance of success.

FOR long an opponent of any summit meeting without (in the Dullesian phrase) adequate preparation, **President Eisenhower** has now come to favour it, though with a restrained rapture. The Eisenhower initiative in east-west relations last summer was principally concerned with improving Soviet-American contacts, of which Mr Khrushchev's tour and his own return visit to Moscow next spring are only part. It seemed to be chiefly as a gesture to Britain and France that Mr Eisenhower agreed to include them in these exchanges by envisaging the idea of a summit meeting to be held some time before the end of 1959.

The conclusive argument for him, as for **Mr Herter**, the Secretary of State, has been that since the Camp David meeting in September the Russian ultimatum on west Berlin has been lifted. It thus became possible for the United States to consent to the resumption of negotiations. In Mr Eisenhower's words at his press conference on September 28th, after the Camp David talks:

> We agreed . . . that these negotiations should not be prolonged indefinitely, but there could be no fixed time limit on them.

Even although Mr Eisenhower has since inclined to Mr Macmillan's views on the desirability of holding the summit this year, he has been prepared to allow General de Gaulle to set the pace, apparently believing that this is a necessary contribution to western unity. But the indications from Washington are that the United States agrees with the British contention that little progress can be expected on any issue at the summit, except on an interim arrangement for west Berlin. Thus, Mr Herter specifically told his press conference on November 24th that he now believed a new arrangement on Berlin could be worked out that would be better than the one existing at present. Mr Herter said that the Russians had " come a very long way " in their attitude on the Berlin question in the past year.

It seems probable, in the light of the foreign ministers' last exchanges at Geneva, that both the United States and Britain might be prepared to reduce their Berlin garrisons and accept some common restraints in return for renewed guarantees of right of access, perhaps with a United Nations " presence."

IN **General de Gaulle's** opinion (as he told his press conference on November 10th) the impulses pushing Mr Khrushchev towards a summit conference include the present balance of military power, the Russian people's concern to secure liberty and a better life, and the rising power of communist China. For himself, the general has never betrayed public anxiety to hasten such a meeting, although he has expressed himself as favourable in principle. In fact, his opposition to the Anglo-American wish to call a full summit before the end of this year was all too evident, and the present international situation has developed from his insistence on November 10th on three conditions for a summit conference. These were that the improvement of international relations should continue, that the western chiefs of state should reconcile their differences, and that he should have personal talks with Mr Khrushchev (arranged for Mr Khrushchev's visit to France, March 15th-29th) beforehand.

General de Gaulle has consistently upheld the west German position, particularly over the question of Berlin, in all discussions about the summit. French policy has given greater priority to securing the integration of west Germany into the west European political and economic community than to efforts to reunite Germany. Clearly it expects little from a summit meeting on Germany, and has sound, if selfish, reasons for delaying its consent to one. While the general has not voiced any disagreement with Dr Adenauer's suggestion that disarmament might provide the chief subject at the summit, French nuclear ambitions seem to preclude particular interest in this topic, too, except in the terms that M. Jules Moch has already put to the United Nations. These were that France insists on the right to become a nuclear power, irrespective of arrangements between other states, so long as full disarmament measures, including the cut-off of fissile material at the factory and the destruction of existing stocks of nuclear weapons, are not accepted by the other powers, presumably as part of a general nuclear and conventional settlement.

General de Gaulle has usually visualised the summit as an isolated, and decisive, peak, such as Teheran, Yalta and Potsdam (from which he was excluded) appeared to him to be. From this has sprung some, if not all, of his distrust of the idea. So far, he has not responded to Mr Macmillan's conception of a series of peaks. He has, however, made it clear that he does not wish to attend a meeting confined, as at the last Geneva summit in 1955, to expressions of mutual good will without any concrete diplomatic results.

LIKE General de Gaulle, **Dr Adenauer** is evidently in no hurry for a summit meeting. But he has left it to General de Gaulle to conduct the rearguard action in public, to insist on lengthy preparations and to upset the timetable by arranging to entertain Mr Khrushchev in March. Dr Adenauer, in contrast, has been making an effort not to appear obstructive in public. At a press conference after he had met General de Gaulle on December 3rd, he indicated that the summit conference might take place in Paris in the second half of April.

At one time it was expected that west Germany might attend the summit meeting whenever matters affecting Germany were discussed. Last week Dr Adenauer told a group of Christian Democrats at Bonn that he would not press to attend except when and if his allies wanted him. Once more he is prepared to leave the safeguarding of his interests to General de Gaulle ; at this stage it is more important to him to keep the east Germans away than to be there himself.

The German Chancellor evidently regards disarmament as the proper main topic for the summit agenda. Aid to the undeveloped countries is another subject on which he and General de Gaulle agree ; Dr Adenauer is also anxious for some plain things to be said to the Russians about not interfering in the internal affairs of other states.

The Chancellor has little enthusiasm for a discussion on Berlin, for he fears that any new arrangement there could only weaken the West's position. In Paris at the beginning of this month he and General de Gaulle agreed that the legal basis of the Berlin statute must not be put in question, though this would not exclude a revision limited to technical matters. Dr Adenauer would not want to see even such a limited technical discussion except in the context of a negotiation about the German question as a whole ; and nobody in Bonn, any more than anywhere else, expects anything from that.

NOTES OF THE WEEK

HOUSE OF COMMONS

Plums and Pains

BOTH Prime Ministers and nowadays "Shadow" Prime Ministers have their powers of patronage. The difference is that when one is in office, just having won an election, it is easier to overshadow those who have been disappointed in the distribution of plums. No one is more conscious of this than Mr Macmillan, whose present main problem seems to be not that of satisfying ambitious politicians but of retaining an unambitious one. Mr Heathcoat Amory has, on several occasions, taken Mr Macmillan by the arm and said that so far as he and the Chancellorship are concerned enough may soon be enough. Some time after the passage of next year's Finance Bill, perhaps. . . . After what happened over *The Times* and Mr Selwyn Lloyd this may not be widely believed in the country. The likelihood of the need for a change may not even be seriously believed by the Prime Minister, who is probably confident that he will in the end persuade Mr Amory to stay—for what could be nicer than having a man who is at once so competent and so unassuming living next door? But the Chancellor's wish not to stay much longer certainly is widely believed throughout the Cabinet—and makes for an intenser brand of loyalty to the man who will appoint his successor.

Mr Gaitskell's "shadow" appointments on the other hand cannot have quite the same conclusive ring. So long as the "1951 rule," by which only those who served in Lord Attlee's Government and those elected to the Parliamentary Committee spoke regularly from the front bench, was in force, a surprising range of Labour members nursed illusions that they could expect office in a Labour Government. The ending of the rule and the selection of backbenchers to lead on important topics for the Opposition has brought a bump of reality. This explains a good deal of the present ill-humour within the parliamentary Labour party. It manifested itself, for instance, in the defeat of Mr Wedgwood Benn, who had been chosen by Mr Gaitskell as the Opposition's spokesman on transport, for the chairmanship of the party's transport committee by a trade union member, Mr Popplewell. Mr Roy Jenkins and Mr Douglas Jay, two Gaitskellite economists, were also rebuffed in the election of officers in the finance committee. However, most of Mr Gaitskell's new dispositions are justifying themselves in debate; last week saw a particularly brilliant front bench inaugural from Mr Benn.

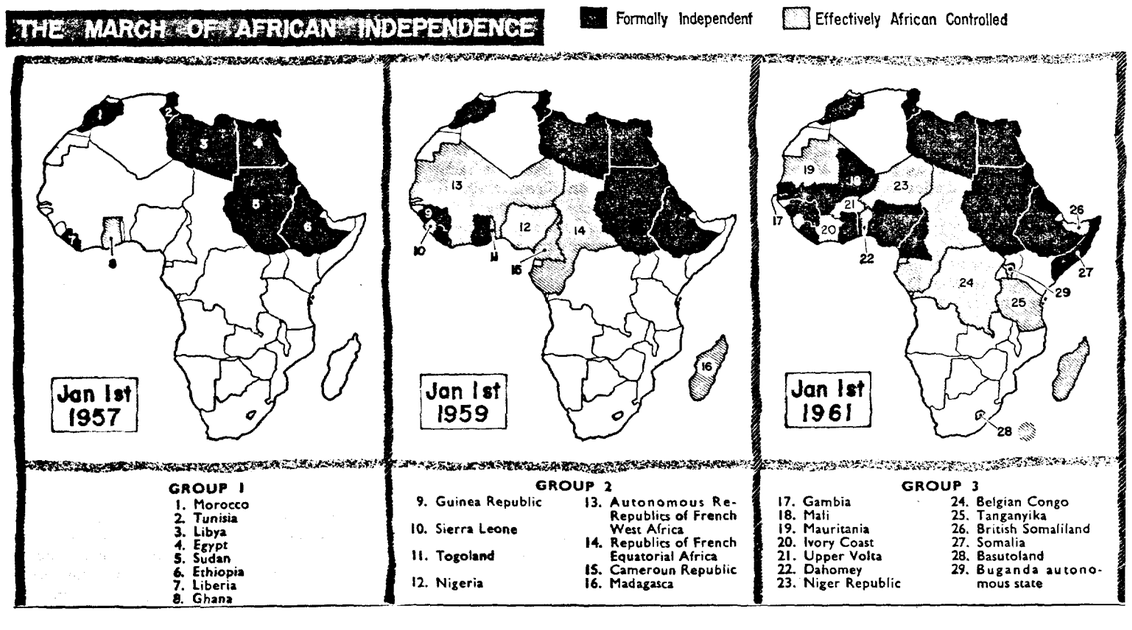
Temperate Tories

THERE was so much talk on the immediate morrow of the election about the dangers of the Tories going hog wild with success that one of the party's main moods in the period up to the recess has been a determination to disprove it. There has been much less pressing of specifically Tory views so far than many had expected. But these are early days. One of the main reasons why specific pressure points have been slow to develop is that the older members with their established hobby horses have yet to complete their sounding out of the exceptionally large number of new boys, many of whom have still to make their maiden speeches. The main points of friction are likely to be those where economic liberalism co-exists uneasily with traditional Tory protectionism. A recent move within the party to advocate the cutting of housing subsidies, for example, struck new members who had won marginal seats in urban areas as being an interesting intellectual exercise but politically unpleasant.

Conversely a protectionist by principle like Mr Robin Turton is applauded on the Tory benches for old time's sake, especially when he is scoring points off a Liberal like Mr Arthur Holt. But in private, with many a nostalgic sign of regret, Mr Turton is regarded as a stranded whale. Yet when it comes to the crunch of horticulture the protectionist pressure is likely to present a severe test of the Government's liberal intentions.

The pressure for birching, on the other hand, is not so great as had been expected, as far as the parliamentary party is concerned. There is indeed some reluctance to make any move which would give the Tory women outside any excuse to shrill out an unnerving cheer. The real discontents revolve around the pig—because of the bacon agreement with Denmark, pork imports from Canada, and current discussions over Polish trade; Schedule A income tax; private patients' prescription bills; and the evidence being submitted by government departments to the Royal Commission on the government of London. London members, many of whom have had the frustrating experience of sitting in permanent opposition to Sir Isaac Hayward, or dealing with him as mayors of Conservative boroughs, are less enamoured of the present powers of the LCC than civil servants in Whitehall, who enjoy dealing with the efficient bureaucracy of County Hall.

(*See* "**African Deadlines**," *page 1137*)



LABOUR AND NATO

Atoms for Germans

THE fuss inside the Labour party about Mr Mendelson's motion on the order paper against the supply of "tactical atomic weapons and missiles of nuclear capability" to western Germany did not amount to very much. Only fifty-two members turned up to the joint meeting of the party's foreign affairs and defence groups to discuss it, even though there had been 116 names on the motion. Mr Bevan easily persuaded those who came that the motion was badly worded, that the party had not receded from its position at the Scarborough conference against the equipment of west German forces with nuclear weapons before summit talks, and that the "shadow cabinet" would demand a debate of its own after Christmas.

But the lull in the party discussion may be deceptive. The rearmament of Germany is a very sensitive issue and many Labour members feel that it must be made symptomatic of their determination to act like an Opposition and not like a responsible government. Men like Mr Denis Healey and Mr George Brown, who have made themselves very expert at the intellectually intriguing calculus of deterrence, so closely allied to the philosophic theories of games, are in some danger of falling very far out of touch with those colleagues who feel in their bones that they just do not want the Germans to have access to nuclear bombs.

Most Labour members are not over-impressed by the argument that for the time being the Americans will hold the warheads, since the whole argument for letting the Germans and other Europeans have deterrent weapons of any sort rests on the supposition that a purely American deterrent is ceasing to be credible. And they are likely to think it over-sophistical for the party which is against German nuclear armament to fight to the last ditch on the proposition that west German forces in Nato should have the short-range Little John missiles but not the longer-range Matadors and Maces. After all, they will conclude, the Germans are ingenious chaps and if they are allowed a small weapon of this sort it will not be long before they have a larger one.

EUROPE

Mr Thorneycroft Speaks Out

THE outstanding, in a sense dominating, speech in Monday's debate in the House of Commons on the new European Free Trade Association was made by Mr Peter Thorneycroft, back in the House after an illness. With great moderation, and complete loyalty to his former ministerial colleagues, he set out to lead the House along towards a greater understanding of the essentially political choice that confronts Britain in western Europe. While he did not say (as the Liberals did) that Britain should adhere to the Treaty of Rome, Mr Thorneycroft made it plain that the bridging of the gulf in Europe required a political decision, a sacrifice of sovereignty, and common action of the type for which, as yet, only the Treaty of Rome provides.

One historical note was also of interest. Mr Thorneycroft pointed out that it was he, who as President of the Board of Trade, drafted the original free trade area proposal and put it before the cabinet. He now said: "I see no prospect whatever of . . . resuming talks in Europe on the basis of this proposal." He alone, too, of all those who spoke, seemed aware that western Europe, with all its problems, is only one part of a continent that is divided—between east and west—already.

A creditable parallel effort to educate the Labour party in European realities was made by Mr Roy Jenkins. Like Mr John Edwards earlier this year, he realised that both Labour's own philosophy and the need to come to terms with the community required a good many forms of common action—rules of competition, joint efforts to deal with redundancy and develop backward areas, common full employment policy, harmonised tariffs—that have more in common with the Rome treaty than with that of the Seven. His observations are timely. In response to the Swedish suggestion for a resumption of negotiations, a committee of the European commission has just reported that the introduction of such provisions would be an essential prerequisite of any possible merger with the Six.

The House as a whole showed rather more awareness than it did in February of the dangers of the division in western Europe, but there was no consensus of opinion on the solution. The poor attendance and the slender coverage given to the debate in the press demonstrate, once more, that too many British minds are still closed to this subject.

The American View

MR MAUDLING, when he wound up the Commons debate, took the opportunity to refute the view, "which often comes from across the Atlantic," that there is no political content in the new Stockholm agreement. Political unity, he held, must be measured not by institutional forms but by political will. His remark was no doubt prompted by his encounter with Mr Dillon the week before; indeed, the debate threw a good deal of light on the view of the United States. The Americans, as Mr Amory made clear, accept and tolerate the European Free Trade Association as a commercial arrangement legally consistent with the General Agreement on Tariffs and Trade. But they are not prepared to come out in the open and give the scheme the public blessing the British have been asking from them. Having long ago backed the European community as a means of uniting Europe, they have made it plain that they see no reason for attaching the same political significance to the Seven.

This is important to bear in mind before the meeting of the Organisation for European Economic Co-operation due on January 14th, for it would be a pity if the good work which could be set in train then were hampered by illusions. The Americans have two clear purposes in mind for OEEC or some linked organisation: a joint effort to aid the undeveloped countries, and talks on Atlantic or world-wide reductions in trade barriers.

What the United States cannot be expected to show interest in is a new plan for a deal between the Six and Seven involving discrimination against itself. The Americans just now are less interested in the relation between the two groups than in the American balance of payments. That is why they endorse the attitude of the European Commission that the next effort to get tariffs down will have to be world-wide in scope.

Because there is no ultimate prospect of a complete removal of tariffs on an Atlantic or world-wide basis, and because Britain is a part of Europe, the need for a European negotiation remains. But as more than one speaker pointed out in the Commons debate, OEEC may not be the best place for this, just because it is a new political approach that is needed.

CROWTHER REPORT

For Political Decision

SIR DAVID ECCLES, in introducing the Crowther report on the education of teenagers last week, subscribed to its aspirations and general principles, but made it clear that he would not prepare to act on its recommendations until he had sounded public opinion about it. So far the report has had a generally, though not uniformly, favourable reception from the national press; but it has encountered much more opposition from educational bodies and the specialist press under their control. In fact, educationists disagree on the central recommendation—the report's top priority for the raising of the school leaving age to 16.

The specialist opposition to Crowther can be divided into three parts. The *Times Educational Supplement* represents the most wavering part. It pointed out that its own view had always been to put county colleges (compulsory part-time education to 18) before raising the school leaving age, but declared that the council's contrary argument

> is the strongest part of the report. While we can see our way clearly to what might happen in an extra year at school, and the recruitment of something like 18,000 more teachers that is planned now presents no impossible difficulty, county colleges would require far more building and the question of what they should do and what kind of teachers should do it are hopelessly vague.

But it does not indicate that it is entirely convinced by the argument yet. *Education*, the official organ of the Association of Educational Committees, is much more flatly opposed to compulsory raising of the leaving age, which it believes "must contend with the promising trend towards [later] voluntary leaving"; it is obviously afraid that the presence of resentful sixteen year old pupil-conscripts may ruin the refreshing atmosphere of present classes of sixteen year old pupil-volunteers.

There is here a clear and understandable clash of educational aims, between which politicians (not simply educationists) ought to make the choice. *Education*, supported by many leading state school headmasters, thinks that the main national aim should be to concentrate on the best possible education for those children whose parents are intelligent enough to want them to stay on; the Crowther report thinks that it is more important to spread education more widely, among children who are less privileged in the sort of parents they have.

A little below this level of argument the *Schoolmaster*, which is the voice of the National Union of Teachers, has accepted the recommendation for a later leaving age, but grumbles that two, instead of one, leaving dates in the final year is "half a cake"; on county colleges it says that it must "protest against the somewhat glib and facile plans for a piecemeal introduction." It is not unfair to characterise the union's attitude as being in favour of much more money for every educational advance at once.

OFFICES BILL

Bad Offices

LAST Friday, in a thinly attended House, 124 Opposition MPs and five Tories successfully defied the Government's advice by giving a second reading to a Labour private member's bill, which provides for the inspection and compulsory improvement of offices. The object of the exercise is said to be to provide office workers with an inspectorate "something similar" to that which protects factory workers under the Factory Acts. As there are at least four times as many offices as factories in the country (over one million against 250,000), this in itself would be a huge undertaking. But in fact the bill, following upon the Gowers report of ten years ago, goes much further. The primary concern of present factory legislation is with health and safety; the primary concern of the regulations proposed for offices—about the numbers of wash-basins per worker, adequate facilities for hanging coats, statutory space between desks, etc.—is to achieve a "great increase" in office workers' welfare. The philosophy behind the bill is "improvement within six months of the bill's enactment—or else."

Perhaps it is unfair to attack such detailed provisions of the bill as the six months clause; all its sponsors agreed that they would accept rewriting in committee. But advances could not be magically achieved by the appointment of inspectors alone. They could be achieved only by devoting many more building resources to patching up offices, at the expense of building new factories and houses (which has not been Labour policy hitherto); or by closing small sub-standard offices altogether and throwing their workers temporarily out of employment (which is not said to be Labour policy now); or by both.

How fast do the sponsors of the bill really want these processes to go? There is a strong case—even at the expense of abruptly closing down some slum offices and creating some temporary unemployment—for enforcing the full rigours of the Public Health Act of 1937; there may well be a case for strengthening the right of entry of Public Health Officers into offices (at the moment they can take action only if grossly insanitary conditions are brought to their attention). If the replacement of old offices by new ones was plainly taking a disproportionately small share of national resources, while everything else was booming, there would be a case for going even further; but this is hardly an accurate picture of the pace of change just now.

The aptest comment on some of the reformist arguments used in the debate was unconsciously provided by one of the bill's supporters, when he talked of overcrowding in the House itself and claimed that:

> The relative death rate among MPs is rather higher than that of any other occupation in the world.

If so, what does Mr Hale want a new bill to do for Parliament? Insist that a new chamber be built, or a number of members compulsorily unseated, within six months of its enactment? Or, alternatively, send an inspector to close the whole show down?

IRELAND

Talking Irish

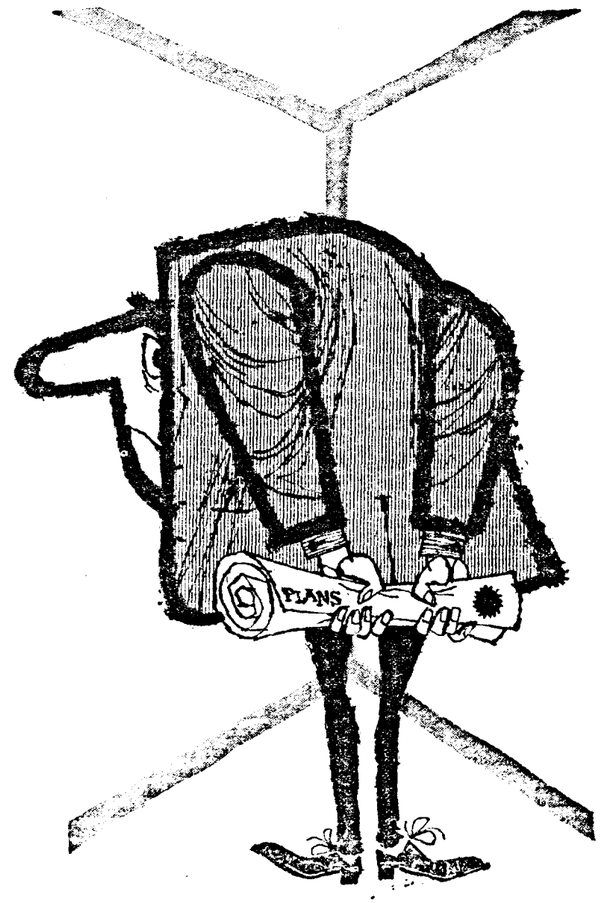
CONNOISSEURS of Mr Butler's Irishisms seem to think it most unsporting to expose the Irish to them. They are mistaken. The Irish are more sophisticated than many people assume. The message will have been understood in Dublin.

Of course Mr Butler is not such a crude fellow as to have introduced the word "sanctions" into the exchange (this was done by the journalist who asked the question, with the result that some of the press reports, following a recent bad habit, incorporated the questioner's term into the direct quotes of the Minister's reply). A trade war such as went on between John Bull and Mr De Valera's part of his other island in the 'thirties is not for one moment contemplated. But what in fact is happening is that the Irish, frightened by the division of Europe into a six and a seven which seem equally inhospitable to their particular situation, are asking for special treatment in London. They want the British Treasury to treat their home farmers as if they were in the same position as Irish immigrants in Britain—that is, as if they were British.

There is no reason in the wide world why Britain should grant such an expensive petition; but some Tories might discuss something resembling it if they exacted a *quid pro quo*. Ireland now has for the first time since dependence two equally sensible leaders of the Government and of the Opposition. Both Mr Sean Lemass and Mr James Dillon (whose parliamentary talents are so prodigious that even the Fine Gael, which he recently rejoined, was unable to avoid acknowledging them by making him its leader) lack the usual economic scales before their eyes. They need just a little jollying along to turn from words to deeds their realisation that, if they expect special treatment from Britain, they must make the IRA understand that the party is now over, the "patriot game" has been played out.

Oranges and Lemons

THAT this is no game for the Ulster Government was quite rightly made clear in the House of Commons on Wednesday by Colonel Grosvenor, who now has the satisfaction of sitting for Fermanagh



Cornered?

This-a-way and that-a-way have gone all your pretty dreams. Not even the excavators are on the site yet!
And that on top of the delay over planning permission . . . draft plans . . . second thoughts—and third! Tight corner you are in, Sir. Listen. *Next time, contact Costain first.* A straight line from your office—or your adviser's—to ours is the shortest distance between those building problems and their solution. Our skills, experience and resources are unmatched.

Here, for example, are a few projects recently completed by Costain:

TRANSISTOR FACTORY SWINDON · THE KARIBA TOWNSHIP
BEA WEST LONDON TERMINAL · IBADAN TEACHING HOSPITAL · BP RESEARCH STATION

It's never too soon to call in Richard COSTAIN Limited

BUILDING & CIVIL ENGINEERING CONTRACTORS, LONDON, ENGLAND

Home Branches: Bristol · Canterbury · Grays · Newcastle · Plymouth MIDDLE EAST · RHODESIA · NIGERIA · CANADA · WEST INDIES · SOUTH AMERICA

and Tyrone with a vast majority, instead of a narrow minority, of his constituents' votes behind him. Since the Sinn Fein bureau in Dublin "declared war," four policemen have been killed, there have been 318 incidents (though some pretty ridiculous and half-baked ones have been added in to reach that total), and the burden of damages and special precautions on the Ulster Treasury has been £750,000.

Why should Dublin be allowed to laugh this off? What used to happen under Mr De Valera was that the IRA boys would be locked up in the Curragh (which duly became a school for terrorists, though fortunately not a very efficient one) between elections and were released just in advance of the poll. The current excuse for doing nothing is that Ireland is a full signatory of the European Human Rights Convention and that Mr Lawless, whose case is being pleaded in Strasbourg, and anyone else who feels affronted at being denied his sovereign privilege of running amok among his country's neighbours might bring the helpless Irish Government to court.

This will not wash. There is nothing contrary to human rights about a law which would prevent the Sinn Fein bureau in Dublin from openly inciting violence against a neighbouring country. But the really important change of attitude would be for the Southern Irish guards on the border to be made to understand that bonuses and promotion depend on their collaborating on a night and day basis with their Ulster opposites to prevent gunmen nipping across in the night. Too many outlaws have become police captains in the past for this to be an easy transformation to bring about. But it ought to be faced.

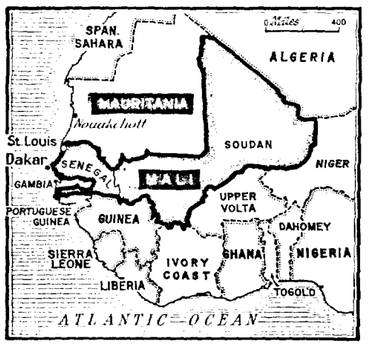
If, however, Dublin is to be lectured, it would help if Belfast would not be so self-righteous. The latest cabinet reshuffle there is not reassuring. Mr Topping, who has given up the Ministry of Home Affairs, was an Orange poacher turned gamekeeper. Starting from outside the charmed circle of Ulster landed gentry, he gained prominence in the Orange Order by demagoguery. But once he obtained a responsible position in the Government he started acting responsibly. He even banned an Orange band from marching provocatively through a Catholic area. For this he received the ultimate contumely of being booed at an Orange rally on the anniversary of the Boyne. Possibly as a result, he came to realise that he would never make the Premiership when Lord Brookeborough retires in another year or two and started angling for the Recordership of Belfast, which carries a higher salary than cabinet office and a pension. Now that he has secured this non-political plum, he is replaced in the key Ministry of Home Affairs by Mr Brian Faulkner, who as Government Chief Whip was responsible last year for the brusque public rejection of an overture to the Government from an important group of Catholic laymen; he said it was meaningless without endorsement by the bishops. It must be hoped that he will not be deterred by his predecessor's experiences from acquiring greater generosity with higher office.

FRENCH AFRICA

Fiat Mali

GENERAL DE GAULLE, en route for St. Louis-du-Sénégal to preside over the executive council of the French Community, stopped on December 10th at Nouakchott, the infant capital (pop. 100) of Mauritania. There he told the Mauritanians that they were now their own masters and would get every help from France on their road to nationhood. At St. Louis he for the first time publicly agreed to the wish of the Senegalese and Soudanese leaders to form a wholly independent state of Mali within the French Community.

Details are still to be worked out, but three consequences of this revolution in the general's attitude are already clear. First, the original conception of the Community as a closely-knit whole, sharing a judicial economic and defensive structure, has been jettisoned. M. Houphouët-Boigny, of the Ivory Coast, may adhere to it, but others



need not. Secondly, if France's influence in Africa can be preserved, General de Gaulle has taken the best way to do it. Mali will continue to rely on France, and will not receive the kind of rebuff that Guinea did. Moreover, the general made it plain at Nouakchott that he expected the Malian route to be taken by other members of the community, such as Mauritania itself and Madagascar, whose prime minister, M. Tsiranana, had already said he wanted to.

Finally, while it is true that any plan which preserves close and fruitful co-operation between France and its former subject peoples without injuring their pride or freedom can rest on its merits as such, it also seems probable that General de Gaulle feels that the invention of a loose, Community, with "international sovereignty" as its watchword, will give him a useful card in the poker game he is playing in Algeria with the rebels, the settlers, and the Army. Mali could provide a precedent for Algerian independence.

PERSIA

Mr Eisenhower's Call

ON Monday, December 14th, President Eisenhower went from New Delhi to Teheran. The Persians gave him their version of the red-carpet treatment he has received at every stop by spreading (literally) rich carpets along his route from Mehrabad airport to Teheran. He stayed only five and a half hours; long enough, however, to address a poorly-attended joint session of parliament and to discuss the state of the world with the Shah. He told the parliament that, in the long run, military strength alone would not bring about a just and permanent peace. The non-communist world, he said, could still lose its freedom if it did not also strengthen its spiritual and economic health. With the Shah the President presumably discussed the campaign of vilification being waged against the Persian ruler and his government by the Soviet radio, and the need for continuing United States military and economic aid.

Persia's most recent crisis might involve the United States because of its commitments to the Cento powers. The Shatt al-Arab river, formed by the Tigris and Euphrates, is the boundary between Persia and Iraq. From time to time General Qasim has dropped veiled hints about lost Iraqi territory, but it was not until December 2nd that he revealed what he was talking about. He said that in 1937, under foreign pressure, Iraq granted Persia five square kilometres of territory along the river. He threatened, if outstanding border problems were not settled forthwith, to regard the 1937 arrangements as void and take the territory back.

On December 10th, Mr Alam, the Persian foreign minister, said that General Qasim's claim was contrary to all international conventions; Persia had been trying to settle the problem of the Shatt for 22 years; and if Iraq persisted in making trouble, the Persian government would take the necessary steps in the national interest. This exchange led to reports of troop movements and the clatter of rifle fire along the border. General Qasim had chosen a conveniently obscure spot, as far as Arabs are concerned, to pick a fight. He should not, however, underestimate the Persians' determination. The Shatt is a vital outlet to them.

TUNISIA

Looking for Help

OF all the statesmen who have been entertaining Mr Eisenhower, the one most recently returned to office is the President of Tunisia. Mr Bourguiba was confirmed as president last month by the country's first general election. Thanks to the well-oiled machinery of his neo-Destour party and a complete lack of effective opposition he won more than 99 per cent of the votes.

Mr Bourguiba has for long been regarded as a model of what the western-orientated statesman should be. He has bought no expensive Russian arms, he has accepted no Russian economic aid and his ideas for a solution in Algeria are based more on common sense than emotion. He is regularly denounced by Cairo radio for supporting the West, and as regularly praised by Baghdad for helping the Algerian rebels.

There are signs, however, that Mr Bourguiba is beginning to wonder if it would be more profitable for him if his intentions were less well known to his friends. On December 10th, in his weekly fireside chat to the nation, he said that the Americans were less generous than the French used to be. United States aid last year amounted to $20 million and 40,000 tons of wheat. In 1956, before it was suspended as a result of Tunisian help to the Algerian nationalists, French aid had amounted to more. To achieve a modest increase in the standard of living and full employment in Tunisia would take an additional $15 million and 130,000 tons of wheat. It would not be surprising if, once the Algerian problem were settled, France offered substantial aid again. But Mr Bourguiba's needs are urgent. Rich America and poor Tunisia, he said, do not consider the problem from the same point of view: "If it becomes apparent that we shall not be able to count on American aid, then we shall look for help elsewhere." He did not say where "elsewhere" was, but he obviously hoped Mr Eisenhower would understand.

ICFTU

Lack of Union

THE rift that already exists in international labour policy between the communist World Federation of Trade Unions and the western International Confederation of Free Trade Unions looks, from last week's stormy ICFTU congress, to be spreading to the western camp itself. The key differences are those between the British and American union leaders, and they exist on several levels. First, the Americans want all ICFTU pronouncements to give a much more militant warning of the communist menace. The British unions are less excited about this. They regard employers, not communists, as the main targets of unions; moreover, unlike the American unions, they still have a sizeable smattering of communist officials in their midst and familiarity with them has bred detachment, if not contempt.

Secondly, the Americans, perhaps to show that they are still left wingers, are also militantly anti-imperialist. They are apt to favour giving ICFTU funds to almost any African nationalist who claims that he is a trade union leader; following their own domestic tradition, they are willing to set up union head offices first and find men to join the union later. The British believe that the proper way to build up unions in under-developed countries is to start recruiting at the bottom and work upwards towards the branch and head office; they think that to finance union bosses in advance of union memberships is to invite malpractices. When the British are accused of saying this merely to keep potential nationalist leaders down, they make pointed remarks about the state of trade unionism in Liberia. The Americans are indignant because, as the largest contributors to ICFTU's funds, they feel that they should have the major say in how its money is spent; moreover, in the hierarchical structure of many primitive societies, the American system of union recruitment from the top might well be more effective.

These squabbles came to a head at the congress because the Americans wanted to remove Mr Oldenbroek from his post as general secretary of ICFTU. They suspect both his background (as a Dutchman, he represents an "imperialist" country) and his administrative ability; the British, though not finding him an easy man to work with, are at least thankful that his ideas about how to organise the ICFTU and spend its money come reasonably close to their own. During the congress debate Mr Meany, president of the American AFL-CIO, seems to have misplayed his hand; he is no diplomat and lost support from many continental European countries through his threat to go it alone in Africa. At the end of the conference, and in spite of a promise of reorganisation, Mr Oldenbroek's position was still in doubt.

THE CALL-UP

Conscription Tapers Off

THE announcement that 50,000 men whose call-up had been deferred until after June, 1960, are not now to be called up at all will bring happiness to a great number of homes. Only about 60,000 men are now liable to be called up, and some of these may be spared too. The twenty-year-long story of conscription in Britain thus seems to be almost at its end. The result is a general satisfaction which is as keenly felt by the politicians as by the public; and the army, which has always wanted to be an all-regular force, seems to be no less enthusiastic. Everybody is waiting to wave flags when the power to conscript recruits is finally removed from the statute book.

But should it be removed? If we can do entirely without national service in any form, as the white paper of 1957 argued, well and good. The criticisms of that white paper's argument tended to die away as the pessimists, who had forecast that the army would not get even the questionably low strength of 165,000 regulars, were proved wrong, and as it became possible to raise the recruiting ceiling to 180,000. But after an excellent year during 1958's minor economic recession, voluntary recruiting has been tailing off again recently, and now the army is talking behind the scenes about the prodigies of police-work and shield-wielding in Nato which 165,000 men can do. This ought to worry people more, because the decision to raise the recruiting ceiling to 180,000 was a tacit admission at the highest level that the original target strength of 165,000 was too low; and if we can now get only 165,000 after all, that admission should still be remembered. Other countries, both richer than Britain (e.g. America) and poorer than it, still find it necessary to run a part-regular, part-conscript force. By all means let us suspend the call-up after next June if the recruiting figures still permit it; but it would be wiser to keep in being some power to maintain a contingent and selective liability to serve.

INDONESIA

Peking Resists a Ban

IT is tempting to regard China's quarrel with Indonesia, which flared up last week with an angry exchange of messages between the two foreign ministers, as just one more instance of Peking's aggressive policy towards other Asian countries. But this is true only in the general sense that the Chinese communists are trying to treat the Indonesians as though they were bearers of tribute at the court of imperial China. The quarrel itself is different in kind from the quarrel with India or the earlier probing on the Burma border. The Indonesian government has banned trade by aliens in rural areas from January 1st. In practice, this will mean driving some 300,000 Chinese traders out of business in the countryside. Communist China is resisting the ban and the quarrel concerns the propriety of this resistance as much as that of the ban.

On paper, the issue of Indonesia's 2,500,000 Chinese was settled under a treaty signed during the Bandung conference by the Chinese and Indonesian foreign ministers. Nearly five years later the treaty is still not in force; it has been ratified, but the instruments of ratification have never been exchanged. The treaty sounded sensible at the time; it required the Chinese minority in Indonesia to choose between Chinese and Indonesian citizenship. But it is never likely to mean much so long as China continues to regard all descendants of Chinese abroad as Chinese citizens for ever. When Dr Subandrio, the Indonesian foreign minister, was in Peking some weeks ago, his attempt to explain the ban to Mr Chou En-lai was rudely received. Since then, the Chinese embassy in Jakarta has been sending its officials into the villages to incite Chinese traders to resist the ban and distributing leaflets in the same vein. In retaliation, Indonesia has banned all travel outside Jakarta for Chinese diplomats, except the ambassador.

The Indonesians justify their ban as being

an attempt to remove remnants of colonialism, and Dr Subandrio charges the Chinese with "monopolistic-capitalistic" speculation, hoarding and smuggling. It may, however, cause them more trouble than it is worth. South Vietnam has tackled a similar problem more humanely by turning its Chinese into Vietnamese citizens.

SPAIN

Absent Friends

SPAIN, where President Eisenhower goes on Monday, was not at first intended to be part of his ceremonial tour. But three days after his itinerary was announced, a night and day were sliced off the president's visit to Paris and Madrid was quietly added. The Spanish government, which had invited the president to stay at the time of his visit to London in August, had complained at being left in the cold.

Strategic interest explains these second thoughts; the United States now has four air bases in Spain and may later be discussing the possibility of setting up missile bases. But it is possible to be polite to an ally and yet avoid the appearance of accepting its form of government uncritically. Twenty years after the end of the civil war, many men and women are still in prison for having been on the losing side. Many new prisoners have lately been added to their numbers by a procedure which by-passes the civil courts, and on grounds that are trivial in themselves. In April, a group of Spanish intellectuals presented a petition to their ministry of justice suggesting that it was time to allow these wounds to heal. The appeal for a general amnesty for political prisoners and exiles has had wide and serious support in Spain and outside.

It has also prompted a British petition, signed by an impressive list including a group of well-known lawyers who have for some time concerned themselves actively with the state of civil liberties in Spain. Mr Jeremy Thorpe, the new Liberal member of parliament, who was delegated to present *this appeal to the minister of justice on* December 15th, was refused a visa. The petition has now been sent to Paris so that President Eisenhower should have the chance of reading it before he takes off for Madrid. If it reminds him of the gaps in the welcoming crowds, it may have done some good. General Franco could perfectly well adopt more civilised principles of justice; his American visitor might encourage him.

FIJI

Island in Trouble

THE riots in Suva last week seemed an improbable outburst in Arcady; nominally connected with a strike of oil company employees, they were in fact caused mainly by troubles about sugar. The Wholesale and Retail Traders' Union, to which the oil company men belong, returned to work on Tuesday with the promise of a 16 per cent increase in wages. (They had originally demanded that wages be doubled.) But the rioters themselves seem to have been mostly Fijian teddy boys, letting off steam about a complex political disturbance based on racial clashes.

Almost half the population of 360,000 in Fiji are Indians, brought over at the end of the nineteenth century as indentured labour for the sugar plantations; today they form the majority of the sugar industry's labour force, and sugar is Fiji's main export. Rapidly increasing in numbers, the Indians are pressing on the means provided by an industry faced with a world surplus of its product, in a colony which last year overproduced its quota. The main interests of the Colonial Sugar Refining Company, which controls Fijian production, are in Australia, where this year some of the crop has been ploughed into the soil. When the Honeyman Commission recommended higher wages for company employees in Fiji, earlier this year, the company retorted that production in Fiji was becoming economically impossible. But so far they have proposed closing only one mill, and have tried to interest the Indians in switching to rice growing. The Indians decline to take up what they regard as a messy and uncertain crop, but they have no room to expand in any other way: *the 1874 Act of Cession is* considered by Fijians to have guaranteed Fijian land rights for ever, and they still hold 85 per cent of the land, compared with the Indians' 1½ per cent.

Yet unless the Indians become less dependent on sugar, their prospects are unhappy, and so therefore is the outlook of Fiji as a whole. Suggestions that they should all be sent back to India, or that the Fijians' tenure should be invaded, raise more problems than they settle. In particular, they indicate how hard it will be to devise a constitution for a future Indo-Fijian state; Indians, whose demands for fuller representation on the legislative council have in the past been resisted by Europeans and Fijians, will grow more anxious to have the power to safeguard their interests. The governor is waiting for the report of a commission under Sir Alan Burns, which spent July till September investigating problems of land and population; new solutions to these must be found if Fiji is to progress politically.

EGGS

Lion Through the Looking Glass

THERE is a pleasantly Lewis Carroll flavour about the story of the grocer who last week got into trouble for bleaching the official lion-mark off several dozen eggs. There were customers, he said, who regarded the absence of the mark as a guarantee of freshness and its presence as a warning of something less. Facing a steady demand for "farm" eggs (as the unmarked product is perversely known), which his local suppliers were temporarily unable to meet, he took this means of satisfying it. His conscience was perfectly clear. He had, personally, no doubt that the lion-marked eggs were as fresh as fresh could (reasonably) be. His customers wanted fresh eggs; he supplied them. If he also made an extra profit by pandering to their irrational lion-phobia, what worse had he done—he might have added—than the clients of motivational researchers do every day?

The legal prohibition against obliterating the lion-mark was not, of course, aimed at this kind of ploy, which never entered the drafters' innocently confident minds. The *lion, after all,* was to be a badge of quality, likelier to be counterfeited than expunged. The aim of the clause under which the grocer was prosecuted was to ensure that ingenious poultry-farmers should not present themselves at the shop counter as customers, buy back their eggs at the subsidised price, take them home, bleach them, send them in to the packing station, collect a fresh dollop of subsidy, present themselves again at the counter . . . and so *da capo.* Not, of course, *ad infinitum;* like all proposed perpetual-motion machines, this sequence would run down eventually, when the stamped, bleached, re-stamped, re-bleached eggs got too elderly to pass the packing-stations' candling tests. But before the law protecting the board's unappreciated heraldry has been extensively used for this purpose, it has been enrolled (somewhat unfairly?) to solve the unforeseen problems which arise when a mark of quality gets the reputation of designating the second-rate.

NATO

Some More Equal

ON the acrimonious eve of the Nato *ministers' meeting,* M. Paul-Henri Spaak again raised the question of the alliance's responsibilities in the field of foreign aid. The secretary-general has been a persistent advocate of a more active approach to non-military co-operation in Nato; and his views have been made more topical by the American insistence that the burden of foreign aid should be more equitably shared.

The council has to consider not only what should be done about aid, but what part Nato, as such, should play. A military alliance is under a disadvantage in such an undertaking. Its efforts would be likely to be conceived as an economic counterpart of the defence effort, an answer to the Communist aid-and-trade offensive—or even if they were not, they would be thought to be by the under-developed countries to whom they were addressed. The strategic aspects of aid are always in the background; if it were handled by a Nato body, they would

DISTILLED, MATURED, BLENDED AND BOTTLED IN SCOTLAND

All part of the success story of EMI

(Photograph from BBC's "Small World.")

Golden-voiced Maria Callas, one of the greatest living sopranos in the world, records for Columbia.

(Photograph from ABC's "Oh, Boy!")

The top British 'pop' singer Cliff Richard. His disc "Living Doll" has sold more than a million copies for Columbia.

With the National Research Development Corporation the EMIDEC team has developed a large Computer, EMIDEC 2400. This is one of the most advanced data processing systems in the world. Here an engineer removes a standard panel for inspection.

MUSIC, MUSIC, MUSIC . . . whether your taste runs to classical, mid-brow or 'pop', your kind of gramophone records are produced within the EMI Group. "His Master's Voice", Columbia, Parlophone, Capitol, MGM, Mercury and Emarcy—these world-famous labels are all issued by EMI Records Ltd.

ELECTRONIC BRAINS . . . the wonder of our age. EMI are leaders in this challenging field. For example, EMI Electronics Ltd. produced the first British range of all-transistor computers; and the name EMIDEC, though not known by the man in the street, means much in certain quarters of the Armed Services, Government Departments and large businesses.

HOME, SWEET HOME . . . Your TV programmes—many of them come to you through EMI cameras, studio and transmitting equipment. Sound radio? Nine out of ten recorded BBC programmes are made on Emitape—by EMI. The pocket recorder you use, the electric heater, your electric iron and blanket, most of your gramophone records—not to mention your new stereo reproducer—are all probably manufactured within the EMI Group of Companies.

ON THE LOOK-OUT

EMI are always on the look-out for ambitious men and women. If you are interested in a career with EMI, write describing your talents, interests and qualifications, to the Group Personnel Manager, EMI Ltd., Hayes, Middlesex.

An illustrated booklet containing the Group's Report and Accounts and Chairman's Review for 1958-9 is available from the Group Public Relations Officer.

EMI

quickly edge their way into the foreground.

Distant outside countries are not, however, the only possible recipients; in Europe, and among the members of Nato themselves, the disparities of wealth are strident and dangerous. Greece, Turkey, Portugal, and southern Italy, at one end of the scale, live on a totally different standard from north-west Europe and North America. Disparate social foundations do not make a strong military structure, as some people at Nato headquarters have always realised; but there has never been a consistent policy to do anything about it.

Here again, indeed, while it is clear that Nato has an interest in what ought to be done, it is questionable that Nato is the right body to do it. Other international agencies, and notably the Organisation for European Economic Co-operation, exist for purposes of this kind and could usefully be addressed to them. This does not deprive the Nato council of a part to play; more might get done if the council would agree with its members on the bare outlines of a common programme, to be tackled in detail at OEEC and wherever else is appropriate.

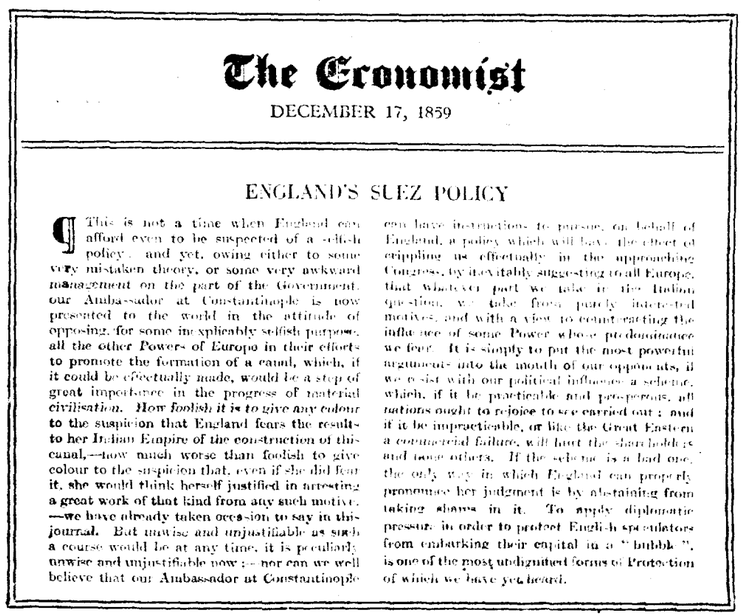
BRITISH COUNCIL

Tempting the Teacher

THE down-to-earth intelligence of the British Council's latest annual report makes nonsense of the tiresome habit which represents the council as a society for the protection of depressed madrigal makers. In his summary of the council's principal tasks the director-general, Sir Paul Sinker, blows away some of this dust by observing that his staff are neither do-gooders nor propagandists; although they do not seek short-term political or commercial results, they are in no way detached from British interests. The council now operates in some 70 countries and does its main work in the developing areas of the world. One of its most exacting new jobs is to try to fill some of the gaps that loom when a colonial government removes itself, men and baggage, from a freshly independent state.

The council's most important single task is helping overseas countries to get the English teachers they need. Recently there has been a change of emphasis; instead of concentrating on English courses at its own institutes, the council is doing what it can to help the various ministries of education to improve and expand the English lessons in the existing schools and colleges. This involves help with syllabuses and textbooks, the provision of special training courses for local teachers, and (the most difficult part) persuading British teachers to come out. Since, following the 1957 White Paper on the overseas information services, extra money was provided to encourage British teachers to serve for limited periods overseas, the council has managed to fill hundreds of posts; even so, the recruitment drive is still in its infancy and young teachers especially are in short supply.

The council is trying to do two things. The first is, by direct grants or assistance, to improve the material conditions under which the teacher has to work overseas. The second, and much more complicated, undertaking is to overcome the psychological factors that operate against a teacher trying to get a suitable job at home at the end of an overseas contract. Working closely with the overseas teaching unit of the Ministry of Education, the council hopes to convince the local education authorities of the value to a teacher of overseas service. About the public usefulness of such service there can be little dispute.



The Economist

DECEMBER 17, 1859

ENGLAND'S SUEZ POLICY

This is not a time when England can afford even to be suspected of a selfish policy; and yet, owing either to some very mistaken theory, or some very awkward management on the part of the Government, our Ambassador at Constantinople is now presented to the world in the attitude of opposing, for some inexplicably selfish purpose, all the other Powers of Europe in their efforts to promote the formation of a canal, which, if it could be effectually made, would be a step of great importance in the progress of material civilisation. How foolish it is to give any colour to the suspicion that England fears the result to her Indian Empire of the construction of this canal,—how much worse than foolish to give colour to the suspicion that, even if she did fear it, she would think herself justified in arresting a great work of that kind from any such motive,—we have already taken occasion to say in this journal. But unwise and unjustifiable as such a course would be at any time, it is peculiarly unwise and unjustifiable now;—nor can we well believe that our Ambassador at Constantinople can have instructions to pursue, on behalf of England, a policy which will have the effect of crippling us effectually in the approaching Congress, by inevitably suggesting to all Europe, that whatever part we take in the Indian question, we take it from purely interested motives, and with a view to counteracting the influence of some Power whose predominance we fear. It is simply to put the most powerful arguments into the mouth of our opponents, if we resist with our political influence a scheme, which, if it be practicable and prosperous, all nations ought to rejoice to see carried out; and if it be impracticable, or like the Great Eastern a commercial failure, will hurt the shareholders and none others. If the scheme is a bad one, the only way in which England can properly pronounce her judgment is by abstaining from taking shares in it. To apply diplomatic pressure, in order to protect English speculators from embarking their capital in a "bubble", is one of the most undignified forms of Protection of which we have yet heard.

REDUNDANCY

The Cost of Being Sacked

WHEN a firm that has been engaged in uneconomic short-time working lays off its redundant workers, there is a gain in economic efficiency to the community, but some social loss and some hardship to the individual. The worker suffers a sharp blow to his feeling of security and also—in degrees varying from the long-term unemployment that has followed the dismissal of men in the Welsh coalmines to the few days' loss of work typically suffered in the London area—he loses hard cash. But, until now, no one has known how much.

An excellent pilot survey by the Acton Society Trust* (the second of its studies on redundancy) has now ferreted out some surprisingly down-to-earth facts about the redundant worker and his employer. Some of them fit in with the gloomy and traditional picture of Britain as an immobile society. With the exception of one isolated aircraft firm, only 3 per cent of redundant workers in the society's sample moved house in order to find a new job; of the rest over three-quarters said that they would accept a reduction in wages—an average of nearly £2 a week—rather than have to move. But other findings did not fit in with the traditional picture at all. Sixty per cent of these redundant workers eventually took jobs not only in a new industry but in a new trade. The length of unemployment increased sharply as the worker became less skilled, but not as he became older. Only 12 per cent of those who found new jobs did so through an employment exchange.

The second part of the report describes the redundancy experience of fifty vehicle workers in the Midlands. On average, these men were out of work for about eight weeks; they earned £4 6s. 5d. a week less in their new job than they did in their old; and half of them had to use up their savings while unemployed. The loss of wages in this case was unusually high because the motor firm had paid well; at the other extreme, the majority of workers declared redundant by a South of England aircraft manufacturer actually earned more in their new jobs than they had done in their old ones. But this last instance—it was the instance in which a large number of workers proved willing to move house—was probably almost unique.

* "Redundancy." Acton Society Trust. 40 pages. 5s.

LETTERS

Rules for Unit Trusts

SIR—The article in your issue of December 5th is seriously misinformed in several respects. For example:

1. It is untrue to say that in what you loosely refer to as the "cash fund" type of trust "there is no possibility that the managers can ever be placed in an invidious or equivocal position towards the unit holders.
2. The grounds of objection of this company to some "block offers" are not correctly stated.
3. You say that the abuses have never justified a unit holder in complaining "that he has been robbed of his shirt; the most he could ever say is that he was short of a button or two." That is not quite true: some unit trust managers have been in the habit of levying a charge on realisation ranging up to 9 per cent, without making this clear, which we are sure you would not dismiss as a mere button or two. It is fair to add that there is reason to hope that at last official action will be taken to end this practice.
4. In referring to a tax disadvantage, you say "the unit trust manager has to find his costs out of his net income." Unit trust managers are taxed like other business enterprises and can charge their costs against their gross income. It is unit holders—that is, if you like, the trust—who have to find expenses out of net income.
5. You support the claim for higher charges by reference to the increase in costs of management which has occurred since these costs were "imposed." This is as manifestly absurd as suggesting that the stock exchange scale of commissions should be raised from an average of 1¼ per cent to 5 per cent because brokers' costs have quadrupled since it was laid down.

We regret to have to refer to shortcomings in unit trust management at a time when an attempt is being made to put an end to those shortcomings. But the hands of those making the attempt will not be strengthened if the weaker brethren can claim that all is well, calling in aid such evidence as your article.—Yours faithfully,

E. W. I. PALAMOUNTAIN

Municipal and General Securities Company Limited
London, EC4

Aid

SIR—Your excellent article "For Trade and Aid" recommends a central fund from which official aid for underdeveloped countries can be distributed. This is needed, but is it necessary to create a new instrument for this purpose? Would it not be possible to adapt the functions of the World Bank, already so deeply involved in this field, so that it could achieve this new purpose? If the richer countries were to deposit annually funds with the World Bank, which that institution could then use for aid purposes, the bugbear of political identification of aid would have been removed.

Aid normally takes the form of two kinds of investment; social and productive. It might be worthwhile creating a system whereby the World Bank "took up" issues of the aid-receiving governments, the bonds bearing only a nominal rate of interest to carry the bank's handling charges. In this way the receiving countries would have to take some note of public debt into their budgetary calculations, though this burden would be a relatively mild form of discipline, designed to ensure that the various forms of aid are kept in some sort of balance.

Productive investment, when it does not take the form of private development, should be channelled through internal sources. Might not the World Bank develop a relationship with the central banks, perhaps in conjunction with the IMF, which could best be described as turning it into a super-central bank? The central banks of the aided countries work with their national development boards or authorities and it is arguable, surely, that a strengthened World Bank could co-ordinate at the higher level. International confidence in many of the currencies concerned would also improve in the knowledge of the relationship existing between the World Bank and the central banks.

I cannot pretend to deal with such a subject very deeply in a brief letter, but I hope I have said enough to suggest a way in which aid could be relieved of its present "political over-tones" and at the same time be administered in such a way as to allay the fears said to be felt by Sir Oliver Franks and others.—Yours faithfully,

C. J. CASSERLEY

Jamaica Industrial Development Corporation,
London, W1

Trawlers

SIR—I appreciate your continued interest in the trawling industry, but I should like to comment on the article on this subject which appeared last week. I accept that "things have not been going well for the trawler owners for some time." But I cannot agree that the British trawler owners have been taken by surprise by every change in fishing technique or that the design of British trawlers is "on the conservative side."

How can these things be said of an industry which revolutionised trawl fishing in 1882 by introducing the steam trawler and which has, moreover, pioneered every fishing ground in the North Atlantic, particularly those areas around Iceland, Greenland and Bear Island. The recent announcement of a part-freeze part-conventional trawler—the "Lord Nelson"—which is to be built at a cost of about £400,000, is an example of the industry's continual drive to introduce modern equipment into the trawling fleet.

The methods of grading and preserving fish at sea may seem rudimentary to the uninitiated, but they are very little different from any other country's method. One must remember that the main demand is still predominantly for fresh fish, and the methods used to preserve that fish at sea in a fresh state are as modern as is possible under the conditions. Contrary to your belief, fish is graded and is divided on board into shelfed and unshelfed fish. Shelfed fish means that it is individually packed in ice on the shelves in the fishroom of a trawler and kept at a temperature of 32 degrees fahrenheit. Unshelfed fish is bulk packed in the trawler's fishroom. A visit to any fish auction will show the difference in price between the two grades.

The marketing conditions of fish may leave a lot to be desired. The marketing system, however, is not under the control of the trawler owners, but many owners are entering this field with the sole purpose of improving handling conditions ashore. In fact, in Grimsby in the New Year a completely new method of landing fish will be introduced, when the most modern type of conveyor belt systems of unloading will be installed.

British trawler owners are not antagonistic to foreign trawlermen and you do not explain that British trawlers do not enjoy equal landing rights with other countries. Certainly every British trawler owner wants to co-operate within the framework of the European Free Trade association, but he must have equal landing rights in those countries and assurances of a just and equitable financial share in the return from any investment in the type of scheme you suggest.—Yours faithfully,

T. W. BOYD

Hull Fishing Vessel Owners' Association, Hull

Shattered Hopes

SIR—For some years you have pursued the illusion of inter-racial agreement in Kenya. Even now you shrink from the conclusion that Mr Macleod must impose his own solution and that he must choose to bring colonial rule to an end rapidly and according to a time-table established early in 1960. If, as you assert, Tanganyika will have its common roll in 1960 and also responsible government, then Kenya must be promised the same at latest by 1964. No one will deny the dangers of such a decision but far greater tragedies are likely to attend those who shirk it. Unfortunately the notion that Africa can still be made more British than it already is is having an interminable death-rattle.—Yours faithfully,

CHARLES JANSON

Conakry, Guinea

BOOKS

Malthus, Darwin and the Human Race

Royal Society of London: *Notes and Records, Vol. XIV, No. 1, 7s. 6d.*

The Risks of Progress: *The Fawley Foundation Lecture*
By Lord Adrian.

Obtainable from the Vice-Chancellor's Office, University of Southampton.

THE special number of its Notes and Records with which the Royal Society has celebrated the centenary of the "Origin of Species" provides a series of critical and biographical portraits of "the four personalities who, more than any others, helped to create an intellectual environment for Charles Darwin's thoughts"—to quote the words of Sir Edward Salisbury's "Epilogue." The four are Darwin's grandfather Erasmus, Lyall, Hooker—and the Reverend T. R. Malthus. Malthus (whose life and work are brilliantly summed up here by Professor H. J. Habakkuk) was not, of course, a natural scientist; but his theory of population, specifically the early theory of the "arithmetical and geometrical ratios," provided the perfect starting-point for a demonstration of the necessity of natural selection. Population—human or animal—presses on the means of subsistence; checks operate to keep down the constantly accruing surplus; how, and on what principles? Darwin read the "Essay on Population" in 1838; and explicitly testified to its illuminating and crystallising effect on his thought. There is a certain irony in the notion of the great intellectual landslide of the mid-nineteenth century being set in motion by a Church of England clergyman; and an age of compartmentalised thought may look back with some regret at this cross-fertilisation of the social and natural sciences.

If Darwin made good use of Malthus, however, the same can hardly be said of what the social sciences—or rather their unscientific camp-followers—made of Darwin. The doctrine of the survival of the fittest was in social affairs the perfect weapon for complacent justifiers of mutual irresponsibility and general callousness. In a muddled, submerged and fortunately ineffective way, drawing its strength from bad genetics, bad economics, and wailing-wall snobbery, it continues to serve the same purpose. Yet there is much to be said, a century after the "Origin of Species," for taking a fresh look at the selective principle. Inevitably, environment does determine selection; increasingly, however, it is human agency, not nature, that determines environment. The crude "Darwinismus" that assigned an absolute value to the "fitness" relevant to jungle warfare may be mercifully discredited. But it should not in turn discredit a more realistic concern with the nature of the two-way interaction between humanly created environment and the quality of the people and institutions which that environment favours or penalises.

One aspect of that concern is lit up by Lord Adrian's Fawley Foundation Lecture delivered recently at the University of Southampton under the title "The Risks of Progress." Partly, it deals with the ethics of knowledge; with the sacred liberty of pure science and the expedient pragmatic limits on the application of its practical fruits. Partly, and relatedly, it deals with the genetic effects, calculable and incalculable, of those changes in the environment for which the science of today is particularly responsible; on the one hand those of atomic radiation, on the other those of medicine. Radioactivity is a cause of mutations, the overwhelming majority of which are harmful. It is true that natural radioactivity—from cosmic rays and radioactive minerals—amounts to some thirty times that caused by bomb tests, not to mention mass miniature radiography campaigns; and that no one suggests a general migration from the world's highlands, or a prohibition of granite buildings, on the grounds that life in high altitudes and in the proximity of granite imposes a genetic risk. It is also, uncomfortably, true that even in the most optimistically envisaged, totally bomb-free future the growing use of atomic power means a growing possibility of atomic accidents—with genetic effects no less painful because they are incidental to peaceful progress and not to warlike destruction.

Lord Adrian is at pains to set these risks in perspective. Even if the mutation rate were doubled—which might happen if the daily dose of radiation from all causes rose to five times its present value—it would take "many generations" of interbreeding, given the proportion of recessive genes, for the present incidence of congenital defect to double in consequence. Meanwhile, however, the life-preserving progress of medical science is increasingly enabling harmful mutations to persist, so that the genetic threat would grow even with a static level of radiation and no increase in the mutation rate.

On balance, nevertheless, Lord Adrian is no alarmist. The progress of science is not after all totally lopsided. Against the genetic side-effects of these increases in radio-activity for which it is responsible, and against the genetic consequences of the powers with which it has endowed the humanitarian imperative (which Lord Adrian does not question) to preserve even defective lives, there can be confidently set "an increase in our understanding of the ultimate structure of living matter . . . of the whole molecular mechanism of inheritance and growth." Setting the time-scale of genetic change against the time-scale of this accelerating growth of understanding—which ultimately means power—Lord Adrian sees an adequate safety-margin. It is not within his remit to consider that other pair of crucial time-scales, that of technical and social development and that of sheer human multiplication. But the link between Darwin and Malthus still has its counterpart today.

Fruitful Visit

Journey to America

By Alexis de Tocqueville. Translated by George Lawrence. Edited by J. P. Mayer. *Faber.* 394 pages. 42s.

"TOCQUEVILLES" are still rising and consequently there is certain to be a market for this translation of the notebooks Tocqueville kept during his brief but fruitful visit to the United States. Whether we should think them worth translating if we did not know what the end product was to be is more doubtful, but since we do know, these chips from the workshop are of great interest. They are not, perhaps, of such great interest in themselves as the English (and Irish) notebooks were, for they revealed an experience of Tocqueville that did not find direct expression in a great book; they had the interest of novelty. In these American notebooks, the interest or the pleasure is rather to be got from seeing how Tocqueville collected and worked up his raw materials. The notebooks make the great book much more intelligible and both illustrate and account for some of its more striking limitations. Of course much of this is not strictly new, since we had already been introduced to Tocqueville's methods and their limitations in Professor Pierson's admirable "Tocqueville and Beaumont in America"; but not everybody has read Professor Pierson, and Mr Mayer has used a superior text.

First of all we see that Tocqueville took a great many pains and took intelligent pains. The impression formed by some that "Democracy in America" was written more to prove a point than to report on a society is shown to be false. If we consider how short a time Tocqueville spent in America, he covered a great deal of ground and examined in some detail a great many aspects of American society. His own interests are manifest, the references back to French experience and problems constant. Thus Tocqueville, then and later, thought that one of the great French failings was the weakness of religious feeling

and that one reason for that weakness was the association of the Church with the *ancien régime*. The, to him, surprising growth of the Roman Catholic Church in America—its apparent ability to flourish in a democratic society—was a ground for possible hopefulness in France. If it was not yet the age of "Américanisme" in the French church, it was the age of Lammenais and Lacordaire. Yet Tocqueville did not fully grasp the degree to which Catholicism (outside Maryland and Louisiana) was a phenomenon explicable almost entirely in terms of Irish and German immigration.

Nor did he assess with any justice the character or importance of Jacksonian Democracy. There is a revealing report of a conversation with Nicholas Biddle, the head of the assailed Bank of the United States. It is possible that Biddle was only trying to take Tocqueville for a ride, but it is more likely that he believed that Jackson was impotent because nearly all the "gens bien," as the French used to put it, were against him. Biddle and his bank were to learn better quite soon. There were intelligent doctrinaire Jacksonians whom Tocqueville could have interviewed, to his and our profit, but he does not seem to have done so. Tocqueville visited French Canada with profit for the future author of the "Ancien Régime." But he does not seem to have felt the coming crisis that led to Papineau's rebellion and to the Durham report and there is no sign that he suspected what a revolutionary turn British policy was to take.

It is possibly unkind to reproach Mr Mayer for not doing more than he has done, but is it quite adequate to refer readers to "Tocqueville and Beaumont in America" instead of providing an adequate if brief annotation of the text of the notebooks? Where an attempt is made to do this, it is not always successful. For instance, Calhoun had not been Secretary of State when Tocqueville was in America. Some of Tocqueville's mistakes (about circuit and district courts for example) are left uncorrected, and if the translation is clear, it is not totally satisfactory. Thus "good child" for "bon enfant" is a perfect example of the "faux ami."

Making Partition Inevitable

India Wins Freedom

By Maulana Abul Kalam Azad.
Longmans. 252 pages. 30s.

COULD the partition of India have been avoided? Post-independence memoirs by both Indian and British eye-witnesses suggest that the British, the Congress Party and the Muslim League all helped, in varying measure, to pave the way. One important contributory factor was Lord Linlithgow's failure to show the same admirable determination to press home the 1937 negotiations to implement the Federal provisions of the 1935 Act as he showed in steering India through the Congress rebellion of 1942 and other crises of the war. The autobiography of the late Maulana Abul Kalam Azad (discreetly ghost-written by Professor Humayun Kabir) reinforces the evidence of other authorities, Indian and British, that the Congress Party's twice repeated underestimate of the strength of Muslim support for the League was, at the very least, as important. First, the Maulana recalls that when in 1937 he was negotiating, as a member of the Congress High Command, the formation of the Uttar Pradesh Congress Ministry, he went out of his way to secure, in writing, the Muslim League's agreement to nominate two members as coalition ministers in the Congress government. The Maulana characterises Mr Nehru's subsequent failure to include any League nominees in the Ministry as "a great mistake." Most authorities would agree with him that "Jawaharlal's action gave the Muslim League in the UP a new lease of life. All students of Indian politics know that it was from the UP that the League was reorganised. Mr Jinnah . . . started an offensive which ultimately led to Pakistan."

Secondly, the Maulana reveals that the 1946 Cabinet Mission's plan for a federation was based on his own scheme, which was substantially accepted by the Congress (a) as drafted by him and (b) as eventually published by the Cabinet Mission. After Congress acceptance, Mr Nehru, in a speech described by his latest biographer and obvious admirer, Dr Michael Brecher, as "one of the most fiery and provocative statements in his forty years of public life," declared that the "Congress was committed to participate in the Constituent Assembly, but nothing else," and Dr Brecher adds that this speech "sparked the collapse of the Mission" and "was a serious tactical error," a view which the Maulana sorrowfully elaborates over several pages. He points out that it was "inexorably" followed by Mr Jinnah's proclamation of "direct action" and the "Great Calcutta Killing." (This, in turn, was the Muslim League's biggest single contribution to ending all hope of Congress-League agreement.) The Maulana's criticisms should carry all the more weight because he is not remotely "anti-Nehru," to whom, indeed, "as friend and comrade" he dedicates his book.

The Maulana's already high reputation as a level-headed and chivalrous political opponent will be enhanced by many of these pages. He pays warm tributes to, *inter alios*, Lord Wavell for his sincerity and sympathetic understanding, and to Lord Mountbatten without whose leadership, as first Governor-General of independent India, "it is doubtful if we could have got over the difficulties with such expedition and efficiency."

The Maulana, who was an eminent philosopher and Islamic scholar, seized his opportunities as Minister of Education, first, to set up a Commission, noteworthy for the collaboration of British and American, with Indian, educationists, which produced an outstanding report on the problems of university education in India. Secondly, he initiated, and himself contributed to, the first history of philosophy ever published in which Western and Eastern systems were authoritatively and reciprocally assessed. Thirdly, he commissioned an Indian historian to prepare, with strict regard for academic integrity, a definitive study of the Mutiny of 1857, to which, also, he contributed a scholarly chapter. With characteristic self-effacement the Maulana makes no mention in his autobiography of these achievements or of his Commentary on the Qurân, regarded by many as the greatest contribution to Islamic theory during the last four hundred years. But when the fevers of the political battles in which he spent so much of his life have long been forgotten, it is by these achievements that the Maulana is likely to be remembered by educationists, philosophers, and historians, both in his own country and everywhere that intellectual integrity is prized.

It Takes All Sorts . . .

They Came as Strangers: *The Story of Refugees to Great Britain*

By Francesca M. Wilson.
Hamish Hamilton. 286 pages. 25s.

IT was eleven years last week that the world forswore discrimination by signing the Universal Declaration of Human Rights, and yet here are we miserable sinners in the midst of a World Refugee Year. To mark it, Miss Francesca Wilson has decided to proclaim Britain's record, over the centuries, in the matter of asylum. This she has done without being smug, which is creditable.

It is easy to define why asylum is sought. Why is it given? At first in England, the prime motive was respect. Most early refugees sought it on grounds of religion, and the respect was for people whose faith was strong enough to impel them to abandon home and possessions for its sake. Pity, and an urge to be a rescuer, takes first place when the refugee is political. "Shall we throw them back to the police of Metternich," thunders Hobhouse in 1825, and Bevin echoes him in 1945 about the Anders Poles. Very occasionally, a practical note of self-interest creeps in:

> All the common soldiers in the guards are cashiered [writes Henry Savile to Charles II just before the repeal of the Edict of Nantes] which would be no disadvantage to you in a dispute with this crown, for you would have them all if you pleased.

Just so, nearly three centuries later, did we "have" the Jewish scientists who had been cashiered by Hitler.

Baser reactions crop up, of course. Anyone who shared a kitchen with fellow evacuees in 1940 knows how swiftly blood can rise in such a context. Wat Tyler's men fell on and murdered the Flemings, and even Queen Victoria was, notes

Greville, "vastly displeased with the Kossuth demonstration, especially at seeing him received in Manchester with as much enthusiasm as attended her own visit."

One fact that emerges from the book is that our refugees, though they brought us endless practical advantages ranging from felt hats to the reading room at the British Museum, never gave us creative works of art. Possibly the reason is the economic one that a castaway must concentrate on getting trousers and bread before he buys an easel; as Virginia Woolf used to proclaim, creative work calls for £500 a year and a room of one's own. The nearest refugees get to endowing us artistically is with the Hallé orchestra and—if Britain may count her—with Pavlova.

In dealing with so limitless a subject, disciplines are called for. One (not observed by Miss Wilson) is to confine oneself to first generation newcomers, and after that to rate them assimilated and out of range. (Some, notably the Huguenots, were assimilated only slowly, and others, such as the *aristos* after 1789, not at all.) Miss Wilson has not invented enough such curbs and so her book tends, at points, to sink to the level of a catalogue. But she has a good subject, and enlivens it with some unusual portraits and quotations. The English, though they hate "abroad," have never striven to make their guests conform to their own staid image, so that she has plenty of bright peacocks and prickly cranks on whom to dwell.

Forty-five Days in 1940

Narvik

By Donald Macintyre.
Evans. 224 pages. 18s.

THE campaign in Northern Norway in 1940 started with the German seizure of the iron-ore port of Narvik by a *coup de main*, aided by a local quisling. The Germans on shore were supported by destroyers, which were sunk by British naval forces in two spirited actions. The last of these two actions took place on April 13th, but not until May 28th was Narvik captured from the Germans. What occurred in the intervening 45 days makes a melancholy story.

After the sinking of the German destroyers the Royal Navy had at its command insufficient forces to capture Narvik in the face of the German troops installed in the town. Subsequently British military forces were disembarked some 30 miles to the north-westward at Framstad. Unhappily the military commander had received instructions that enabled him successfully to resist the wish of the naval Commander in Chief for a descent on Narvik with the minimum of delay. Meanwhile considerable forces of Germans, moving rapidly northwards up Norway, by overrunning airfields as they went were daily increasing the difficulty of the final Allied assault. Fortunately some French troops, Chasseurs Alpins and Foreign Legion, became available and on May 12th, at the small village of Bjerkvik, occurred the Allies' first successful assault landing of the war. Two French and one Norwegian battalions were then concentrated south of Bjerkvik for the capture of Narvik. On May 28th the assault troops were successfully landed on a beach to the north of Narvik, with supporting fire from British destroyers. The port and town soon fell despite the intervention of German dive bombers, which by that date were based upon airfields within operating range of Narvik. The total casualties incurred in the assault were 150 French and Norwegians killed and wounded. Had the assault taken place before Narvik was within dive-bomber range, the losses would have been even lower.

Captain Macintyre has a graphic style and his descriptions of the various actions, naval and amphibious, are vivid and clear. It would seem that Captain Macintyre did not himself take part in these operations, but the reviewer, who was present at some of them, can testify how successfully the atmosphere of those frustrating days has been created. Also he can confirm the accuracy, save for trifling details, of the descriptions of many of the events.

Admiral of the Fleet, the Earl of Cork and Orrery, and the French General Béthouart are clearly men after Captain Macintyre's own heart; in them he finds an echo of his own gallant and determined spirit. But the British military commander, and his staff officers who staged what almost amounted to a revolt against the Admiral's pressure to attack Narvik, receive rough treatment at Captain Macintyre's hands.

In so well written a piece of history it should be remarked that the maps and photographs fall far short of matching the quality of the text. The maps are confusingly drawn and at almost unusably small scales; a number of the photographs are ill-chosen and some of their captions range from the inaccurate to the fatuous.

Doubtful Thomas

The Gospel According to Thomas

Coptic Text established and translated by A. Guillaumont, H.-Ch. Puech, G. Quispel, W. Till, and Yassah'Abd Al Masih.
Collins. 62 pages. 18s.

IN 1945, thirteen papyrus volumes were discovered near Nag Hamâdi in Upper Egypt, the remains, probably, of an early gnostic library. A fragment of one of these, a collection of 114 sayings of Jesus, allegedly recorded by the Apostle Thomas, is now published in Coptic and English. The publishers, and the Sunday Press, have made the most out of the discovery of this new "gospel," but have failed to mention that a German translation of the text has been available for nearly eighteen months. The comparison with the Dead Sea Scrolls was probably inevitable, but the two sets of manuscripts have nothing in common, the scrolls relating to a period contemporary with or just before the time of Christ, while the present compilation is post-Christian, probably dating from the middle of the second century AD, the manuscript itself being not earlier than 450 AD. The lateness of the compilation is clearly indicated by the Coptic "monachoi" in the text, the obvious reference to monks being veiled by the translation "solitaries."

Whatever the sayings may tell us about the conundrums of the gnostics, they throw no new light on Christian belief. Their obscurity, ambiguity and contradictions contrast starkly with the simple clarity of the synoptic gospels. To be told that the kingdom of God is within you and without you, that the living shall not die, but that the dead are not alive, that on the day when you were one you became two ("But when you have become two, what will you do?"), may be meaningful to a Buddhist, but hardly to a Christian. This farrago of nonsense is brought to a fitting conclusion by the "gospel's" closing words on Mary Magdalen: "Jesus said: See, I shall lead her, so that I will make her male, that she too may become a living spirit resembling you males. For every woman who makes herself male will enter the Kingdom of Heaven."

Thomas was notorious in his lifetime for his scepticism. It is not too difficult to conjecture what he would have thought of this "fifth gospel," the authorship of which he has been gratuitously assigned.

Another travel freedom...

COOKS *new* LETTER OF AUTHORITY

As a busy executive, you pre-plan your visits abroad as far as possible, but unforeseen prospects may put your journey out of joint. Now . . . if before you go, you make your complete travel arrangements through Cooks or Dean & Dawson, you can carry a Cooks letter of authority to provide you with all kinds of travel services at any of their four hundred offices in fifty-seven different countries—hotels, private cars, air and surface tickets, all at your command. You simply sign the account to authorise settlement in the United Kingdom, and go on your way.
This new letter of authority is available to business houses in account with Cooks or Dean & Dawson, at whose local offices full details and application forms may be obtained. The service is world-wide!

WITH THIS LETTER AND A BOOK OF
COOKS TRAVELLERS CHEQUES
YOU CAN GO AS YOU PLEASE ANYWHERE IN THE WORLD

THE LIQUEUR YOU PREFER TO BE OFFERED

Drambuie

Next time take the liqueur that everyone is drinking. The ancient recipe for Drambuie includes old Scotch whisky, heather honey and delicate herbs.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Crossed Fingers on the Trigger

WASHINGTON, DC

PRESIDENT EISENHOWER has now drawn up the last defence budget which his Administration will present to Congress; he is ending not with a bang, but with a whimper. The missing bang is the sound, long hoped for by the Administration's critics, but once more denied to them, of the President slamming his door in the face of the advisers who tell him that a balanced budget is more important than a balanced armoury; the whimper comes from the service commanders, who will once again have to do with fewer arms than they want. Although the budget will not be official until it is shown to Congress in January, it is known that Mr Eisenhower proposes to spend a total of slightly over $41 billion on defence in the next fiscal year. The critics may reasonably have a dreamlike feeling that they have been here before. This sum is only a little larger than the amount spent last year and the amount being spent this year, and in fact—because of the rising cost of new weapons—it will almost certainly buy less firepower. Indeed, the new defence budget is hardly any bigger, and as a proportion of the national income is a good deal smaller, than the first one which Mr Eisenhower presented to Congress toward the end of the Korean war.

If the President's budgetary axe-work has drawn fewer howls than usual this year, one reason is that it was completed with unusual and merciful speed so that he could leave Washington for his world trip; another is that even generals feel that they must talk more softly about missiles when something like the faint rustling of doves' wings is to be heard in the air. But all the old grievances still exist. Not only is the total size of the defence budget virtually unchanged, but so is the way that it is divided among the three services. Each of them is still faced with familiar frustrations. The Navy, which has been trying for the last two years to get a second atomic-powered aircraft-carrier, has been told once again that it must make do with old-fangled oil. The Army, which complains bitterly that most of its equipment dates from the war period and that it gets barely enough money to cover wear and tear, will have to postpone for another year its ambition to fit itself out with modern weapons. Even the Air Force, for so long the darling of American strategists, is being forced to lop 20,000 men off its strength and to forgo some of the new aircraft which it dreams about.

Although this sounds as if the budget-makers were merely saying "as you were," two significant changes underlie the apparent sameness of the figures. The first is the hastening of the end of the day of the manned fighter and bomber. It was announced a few weeks ago that the most advanced fighter on the planning board, the F-108, which would have been propelled by a rocket at three times the speed of sound, had been scrapped. Now virtually the same thing has happened to its brother in the bomber world, the six-rocket B-70; although two prototypes are to be built in 1963, they will be little more than hollow shells, since no money is provided for the special bombing and navigation equipment they need. Less advanced models are also suffering. Production of the B-58 Hustler—the last of the bomber line now that the B-70 is to be stifled at birth—has been cut so drastically that by the end of next year only about forty of them will have joined the 1900 B-47s and B-52s in the Strategic Air Command.

Understandably, even less attention is being drawn to the other change implicit in the defence budget. The doctrine of massive retaliation, which the Administration refused stubbornly to bury long after it lay down publicly and died, is at last being quietly covered with a few spadefuls of unhallowed earth. If the United States wanted to retaliate with nuclear weapons against a conventional attack from Russia, as the doctrine implied, it would have had to make sure first that it could destroy the Russians' ability to strike back in kind. Mr McElroy, the retiring Secretary of Defence, tacitly admitted that this was becoming impossible when he told Congress earlier this year that the Soviet Union would have three times as many inter-continental missiles as America between 1961 and 1963. He has just repeated his prophecy, although without specifying exactly how wide he now thinks the margin will be; and the new budget, the last one that could conceivably have closed the gap, clearly does not provide enough money to do so.

BUT, even if the Americans are losing their ability to strike first in safety, the Administration still trusts that it can prevent the Russians from doing so. It seems to have acquired some reassuring new information. Mr McElroy's original estimate of a three-to-one Soviet lead in missiles was based on a calculation of the number the Russians intend to produce, rather than on what they could produce if they set their missile industry working full blast. He was sharply criticised for making such assumptions. Now the Department of Defence is saying that, even if the Russians build all the missiles they can, their lead will stay within tolerable limits. Because these weapons are not yet perfectly reliable or accurate, the Soviet Union needs four or five missiles to make sure of destroying one base in the United States (and would need about ten if the base were protected against blast). Thus a lead of three to one is not enough to knock out America's missile sites and its fifty long-range bomber bases as well.

It should be recognised, however, that this amounts to a policy of crossed fingers. It assumes that the far from all-seeing eyes of the Central Intelligence Agency can detect Russia's entire missile capacity. One blind spot could be fatal; if the Russians turned out to have 300 missiles next year, instead of under a hundred, America might be as naked as the day it was born. Recently Mr McElroy announced that preparations to keep part of the manned bomber force permanently airborne are being carried a stage further. Unfortunately, this public statement increases the risk that in a crisis the Russians might be tempted to strike first before the bombers get out of reach of their missiles. The nervous tension is therefore bound to be considerable until 1963, when the mobile and almost invulnerable Minuteman and the anti-missile missile Zeus may, Mars willing, be ready.

At least the Administration, with fingers crossed and teeth clenched, seems to have made up its mind to run the risks involved in the missile gap of 1961-63. It has not shown as much decisiveness about two other strategic questions confronting it. One is

whether it is desirable to go on equipping the Army with tactical nuclear weapons. Work is still proceeding on such ingenious devices as the Davy Crockett, an atomic bazooka that can be fired by two men. No one has yet answered the critics who say that, if these mice of the nuclear zoo are used in a war, the process is unlikely to stop before the elephantine intercontinental missiles go clumping their way around the world. Moreover, a study published this month by the Washington Centre of Foreign Policy Research, one of the liveliest groups of thinkers about strategy, points out that these tactical nuclear weapons cannot compensate for the numerical inferiority of the West's armies if the Russians also possess these arms. But apparently the Administration has not yet decided whether they should be fired in combat or simply kept as a deterrent to stop the Russians from using theirs.

Nor has any decision been reached on the even more fundamental question of finding a strategy to replace massive retaliation. *Look* magazine has recently printed excerpts from a book by General Taylor, the former Chief of Staff of the Army, in which he repeats his opinion that a more flexible force (meaning, in effect, a bigger Army) is needed to deter a conventional attack by Russia or China. Instead, it seems that the withdrawal of two divisions from Germany was being seriously considered by President Eisenhower as a possible way of saving dollars until the generals and diplomats united in rejecting it. Even though the Army will keep its present strength next year, there are persistent rumours that another attempt will be made to cut it the year after. Thus the only innovations in the defence budget are the dropping of one or two old ideas; there is no sign of the new ones which are needed to replace them.

Dose for Drugs

So many wonderful new drugs have been discovered since the war that it is said that 90 per cent of today's prescriptions could not have been filled twenty years ago. But these remedies also command wonderful prices; this bears hardly on the ill, particularly as those most in need of medicines are often the elderly and the retired. For this reason Senator Kefauver's hearings on the high price of drugs, which began this month, are certain to attract far greater interest than his earlier investigations of high prices for steel, automobiles and bread. Presumably by now the Senator has abandoned any hope of a presidential nomination for himself, but a regular crop of headlines throughout the winter will help him to make certain that Governor Faubus does not pull his Senate seat out from under him next year in Tennessee.

The first hearings, on the prices of medicines derived from cortisone which are used to combat arthritis, produced some staggering charges: that the Schering Corporation, one of the five firms which produce the bulk of such drugs, charged chemists $17.90 for 100 tablets of prednisolone, under the brand name of Meticortelone, which it cost $1.57 to make, and that arthritic sufferers were charged $29.83; that a small firm sold the drug to chemists, under its scientific name, for $2.70; that the big firms sell their trade-marked drugs abroad and to the government (under competitive bidding) at far lower prices than those the American public pays. The answer which the industry has been preparing for six months is that the committee's figures ignore the tremendous investment in research needed to produce a new remedy; in the case of cortisone it took the Merck Company seven years to recover its $21.8 million outlay. Small companies bear none of the burden of the $190 million being spent this year on research. The weak point in this argument is that much more is spent by the big concerns on "detail men"—travelling salesmen to press their wares on doctors and chemists—and on floods of literature and free samples.

Even when allowance is made for such costs, the profit on prednisolone amounted to 49 per cent. Successful remedies, of course, must pay for the costly failures but, when the final balance is struck, the drug trade is at least twice and perhaps three times as profitable as the average business. This is no crime, but the committee suspects that the industry's use of cross-licensing and patents to restrict supplies and keep prices up freezes out small concerns and violates the anti-trust laws. The industry denies this and argues that, where prices are identical, this is proof of price-cutting competition, not of collusion. But when its witnesses let slip the admission that it is not in their interest to cut prices, they demonstrate that their scientific achievements are not matched by equally farseeing economic policies.

Parties Pass the Hat

The only significant decision to emerge from the meeting of the Republican National Committee in Chicago last week concerned the party's strategy for next year's congressional elections. Since a good Republican presidential nominee has little difficulty in raising the money needed for his own campaign, and since it is a mathematical impossibility for the Republicans to regain control of the Senate in 1960 with only one-third of the seats falling vacant, the committee agreed that most of the available funds should be devoted to contests for the House of Representatives. Party leaders believe that the Republicans could win the 66 additional seats which they need for a majority there if they concentrated their resources on certain marginal constituencies. The committee responsible for organising this election campaign then announced that it would ask the party for $2 million, double the sum granted in 1956, to finance that effort.

As the Republican chances of winning the Presidency have mounted so has the generosity of party supporters, and nearly $1½ million came in during the first eight months of this year. Furthermore, since the "1000 club" was started in November, with the aim of getting 1,000 members who would pay a subscription of $1,000 each, it has collected nearly three-quarters of that goal; and on January 27th President Eisenhower will address, over a closed television and radio circuit, fund-raising dinners which are being held simultaneously in forty-one states.

At first sight the position of the Democrats looks equally good. They had received over $1 million by August, which is considerably more than in the corresponding period of 1955; several dinners at $100 a plate are planned similar to those already held in honour of Mr Truman and Mrs Roosevelt; and in addition they can depend upon large grants from labour organisations. But the deficit still left over from Mr Stevenson's disastrous 1956 campaign continues to be a terrible drain on their resources. Nearly one-third of this year's income has been devoted to paying off a part of these outstanding bills, leaving the national committee with scarcely enough to cover current expenses.

Another cause of financial distress is the fact that many state organisations are behind in their subscriptions to the central committee; only one-quarter of the 1957-59 estimates have been fulfilled. The southern states are particularly laggard, and some of them have indicated that they are deliberately retaliating against the party's chairman, Mr Paul Butler, for his attacks on reactionary southern Democrats. He has countered this by threatening that states whose payments are in arrears will be penalised when seats are assigned for the convention in Los Angeles next July. Democratic officials, despite their sad experience with Mr Stevenson in 1956, hope that, once the 1960 presidential campaign gets going, then the funds required for that and for the congressional elections will pour in.

THE NEXT PRESIDENT?—II

Hubert H. Humphrey

Senator Humphrey has not yet declared formally that he is a candidate for the Democratic presidential nomination next year, but he admits that his courtship of the nomination has reached the stage of "going steady." A correspondent in his home state of Minnesota describes the most progressive of the Democratic contenders.

If there were any likelihood that in 1960 the American voter would want as his new President a man who is the exact opposite of Mr Eisenhower, the prospects of Senator Hubert Horatio Humphrey of Minnesota would be brighter than they are today. For he, unlike Mr Eisenhower, has a compulsion to do: a man of inexhaustible energy, he really cannot comprehend what he calls "this halting, foot-dragging, no-start Administration." As President, he would never be found short of either words or ideas—his weakness, indeed, might lie in the opposite direction—and he is proud to be known as the most liberal of the potential Democratic candidates for the Presidency.

All this is not to say that the Minnesota Senator disagrees with President Eisenhower on every issue. In foreign affairs, a field in which he has become one of the Senate's foremost spokesmen, Mr Humphrey is more often than not a persuasive champion of the Administration's line. But on economic policy and other domestic matters he is frequently a savage critic of what he terms the Republican Administration's "double-entry book-keeping" approach to humanitarianism: "Republicans care about dollars. Democrats care about people." There are few influential men in Congress today who have retained this youthful idealism as well as has Mr Humphrey.

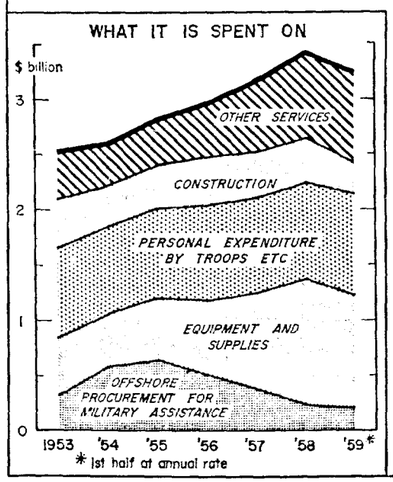
Although he has only a few grey hairs to match his retreating hairline, the 48-year-old Senator has not forgotten the Great Depression of his youth. A native of a small town in South Dakota, on the western rim of his adopted state, he watched his father's pharmaceutical business erode in the panicky nineteen-thirties as the parched soils eroded under the prairie winds of the "dust bowl" in which he lived. With his university career interrupted because he had to help his father he did not get his degree until 1939; then he taught school in Minnesota for a short time until he plunged into practical politics.

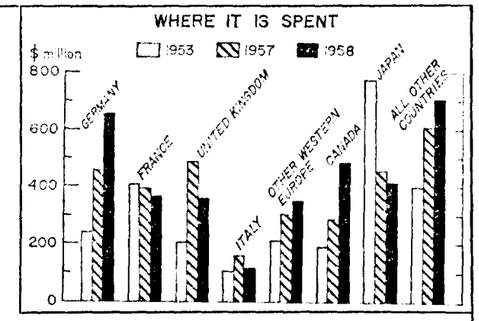
Elected Mayor of Minneapolis, the principal city of his beloved upper midwest, in 1945, Mr Humphrey won national attention by cleaning up vice and gambling and by giving the city a "strong" government in spite of the weaknesses of its charter. This he accomplished through the combativeness of an exuberant personality and by aggressive, imaginative attention to civic chores. He averaged two speeches a day and it was then that his machine-gun delivery and strident, ubiquitous voice first earned him a reputation for glibness and double talk which, nurtured by his Republican opponents, pursues him to this day. His appetite for speaking at length on any, and most, issues may weigh more heavily than any other factor against his ambition for high national office. But as Mayor, Mr Humphrey won bipartisan support—far transcending the labour-intellectual, university-liberal backing which elected him initially—from a community that had grown used to a figurehead in City Hall. In 1948 he was elected Senator and his second six-year term expires in 1960.

Earlier in 1948 he had been catapulted into the national limelight at the Democratic convention in Philadelphia, when he introduced a resolution that put a liberal plank on civil rights

Military Spending Abroad

The second largest source of dollar earnings by foreign countries—first place is held by American imports of merchandise—is expenditure abroad by the armed forces of the United States. After running at an annual rate of about $600 million during the years immediately after the war, these outlays mounted sharply with the outbreak of the Korean dispute and the establishment of the North Atlantic Treaty Organisation. They cover not the total cost of defence operations abroad but only the amounts actually received by other countries. Not all of this spending brings in dollars since some of the bills are paid in local currencies earned through sales of American farm surpluses, etc. Furthermore, these expenditures are offset to some extent by sales of American military equipment and services to allied countries, which amounted to $300 million in 1958.





These countries, particularly those in Europe, have benefited economically as well as militarily from American purchases of equipment, either for the use of the country concerned or for transfer to third parties, under the mutual assistance programme. These outlays have been tapering off as have dollar earnings from the construction of bases, which have been particularly important in Canada, Spain, Morocco and the Nato countries. But the drop has been compensated for by increased buying of supplies, mainly petroleum products and fresh foods, for American use abroad. The places which earn most from the off-duty purchases of American servicemen and their families may be places where there are no American troops; an example is Hongkong, a leave centre for American servicemen stationed elsewhere in the Far East. The sharp rise in German dollar earnings is explained by the tapering-off of German contributions to the support of American forces.

for Negroes into the party platform; he called upon Democrats to forsake "the shadow of states' rights and walk forthrightly into the bright sunshine of human rights" and thus precipitated a walkout by southern delegates; they have never forgotten or forgiven him. But the Negroes and other minority groups of voters have not forgotten either that as Mayor he made Minneapolis the first city in the country to boast a Fair Employment Practices Code prohibiting discrimination in hiring for reasons of race, creed or nationality. Today Senator Humphrey counts on Negro support—and with reason—as one of the mainstays of his bid for the Democratic presidential nomination.

Other mainstays are the National Farmers' Union, the left-wing agricultural group which is particularly strong in Minnesota and neighbouring states, and some sections of the trade union movement, notably the powerful automobile workers. Among his closest supporters are a little group of progressive intellectuals who advise him on policy and the conduct of his campaign. Among them are Mr Leon Keyserling and Mr Robert Nathan, both influential liberal economists, and Mr Joseph Rauh, founder of Americans for Democratic Action, a progressive anti-Communist group with which Mr Humphrey himself has close connections.

THE Senator is not afraid of being accused of radicalism: he believes the United States has no excuse for slums in its cities or for failing to provide scholarships for needy students or inadequate pensions for old people. Nevertheless he also supports free enterprise in private industry—as all American politicians must. And he once prepared for a re-election campaign by sponsoring a Bill to outlaw the Communist party. This has left a lasting bad taste in the mouths of some liberals, who accuse him of insincerity and expediency in supporting a measure which they consider to be both poorly drafted and an attack on constitutional freedom.

The man who talked for three hours with President Nasser and for eight hours with Mr Khrushchev is the Senate's chief spokesman on disarmament, a lay expert on international medical research, an advocate of broader use of farm surpluses as instruments of foreign policy, a key strategist on complex agricultural and labour issues, a deft parliamentarian and a consummate politician. He claimed at the end of the last session of Congress to have sponsored more successful Bills than any other member, apart from a few committee chairmen, although some of his major measures—like his Bill on agricultural subsidies, on which he is the Administration's chief foe—were cut down by presidential veto. Along with constant demands for stronger executive leadership in foreign relations, particularly where disarmament is concerned, Mr Humphrey has been prodding the President, with some success, to support repeal of the Connally Amendment by which Congress crippled the work of the Court of International Justice.

The Senator is reputed to be his party's most skilful and energetic campaigner. Once a teacher, he has never in thousands of speeches lost sight of what he considers it is his mission to teach—America's role in the world and its responsibility to the under-privileged and the have-nots. Certainly it is a tribute to his vocal and educational zeal that Minnesota, which once sent isolationists to Congress, now elects internationalists almost entirely. While Mr Humphrey's interests long ago grew far broader than his own region, he is a tireless servant of his constituents—even when they are Republican businessmen. He tells his staff

> to assume that the constituent is right in any argument with this great, sprawling government. The government has plenty of people to prove he is wrong.

This is the man of whom Mrs Eleanor Roosevelt said a year ago: "Senator Humphrey comes closest of all potential Democratic presidential nominees to having the 'spark of greatness' needed in the White House." Nevertheless, only if the delegates to the Democratic convention next July decide that they need a strongly liberal platform, especially as regards civil rights for Negroes, and a strong candidate to stand on it, and need them more desperately than they need southern support, only then will Mr Humphrey stand a real chance of the presidential nomination.

Disillusioned Oil

FOR the first six months of next year nearly 1,530,000 barrels of all kinds of oil may be imported daily into the United States, compared with 1,450,000 during the past six months. The changes in the import regulations contain various provisions giving the Department of the Interior greater flexibility in allocating quotas between regions and between companies and also do something to alleviate the objections of oil producers on the west coast to the free entry of Canadian petroleum. But the main beneficiaries will be Venezuelan producers since 90 per cent of the extra 80,000 barrels a day will be residual fuel oil, most of which comes from Venezuela. The increase has been permitted because industrial consumers on the east coast of the United States rely on this type of oil for heating their plants and demand is going up with the cold weather and the ending of the steel strike.

Coal producers, who supply an alternative fuel, naturally protested against the increase in imports but were over-ruled by the Department of the Interior. It is determined to see that the restrictions, imposed to check the falling-off in the number of new wells drilled in the United States, do not bring the higher prices which were what the domestic producers really wanted. So far the department has been successful—too successful in the opinion of the domestic producers; until recently prices have actually been falling ever since the mandatory quotas were imposed on imports last April. Nor have the quotas brought any rise in output from most existing American sources; until the allowable production was increased to ten days this month Texas wells, which bear the brunt of all cut-backs, had been limited ever since July to the unprecedentedly low rate of the equivalent of nine days' output a month.

All of this merely proves, as the international petroleum companies always contended, that the troubles of the independent American oil companies arose not from imports but from a general lack of balance between supply and demand, particularly in refinery capacity which was over-expanded at the time of the Korean war. The industrial boom which is forecast for 1960, provided that the steel strike is not resumed, will do much to meet the immediate difficulty and over the next few years the demand for oil, both at home and abroad, is expected to grow so much that the balance will tip the other way, with supply, not demand, becoming inadequate. Not that all the industry's problems will be solved even then: already concerned about the growing competition of natural gas in the heating field, it is now disturbed by the discovery that the average American car is being driven fewer miles each year. This means that petrol consumption is not going up as much as it might and the trend may be accelerated by the popularity of smaller cars which use fewer gallons to the mile.

No Smoking—Official

LAST month an official warning about the dangers of smoking cigarettes, couched in the strongest language yet used, was issued by the Public Health Service and published in the *Journal of the American Medical Association*. The scientific studies cited were, for the most part, well known and of the statistical type which some research workers, among them those employed by the tobacco companies, do not consider conclusive.

AUTHORITY IS A FACT OF LIFE

"I played golf barefoot until I got into high school", reminisces Sam Snead in his advice to golfers (LIFE International, July 6th, 1959).

As a winner of 103 professional tournaments, he is an authority, typical of many authorities writing for LIFE International. His remarks, of interest to both the golfer and the non-golfer, are typical, too, entertaining and informing thousands of businessmen around the world.

And side by side with these reports are LIFE International's big advertising pages, used by many of the world's most famous companies. There, readers can find information on a wide range of consumer and industrial goods for themselves, their families and their companies.

TO PROMOTE YOUR SALES OVERSEAS, ADVERTISE IN LIFE INTERNATIONAL

The *Journal* itself does not think that the evidence presented is sufficient to indict cigarette smoking as the chief cause of lung cancer. Early this month, however, Dr Auerbach, a well-known investigator, told the AMA that his five-year study of lung tissue showed beyond any doubt that cigarette smoking produces the changes which lead to cancer of the lung; if this evidence is accepted, it will supply a missing anatomical link.

The chief conclusions reached by the Health Service, which it feels that it cannot withhold from the public, are that the weight of present evidence points to smoking, and particularly cigarette smoking, as the principal cause of the great rise in cancer of the lung; that abstaining from cigarette smoking is beneficial, even after long exposure; that no method of treating tobacco or filtering the smoke has proved to be of much use in reducing the danger; and that until tobacco can be made safe, the best thing to do is to stop smoking.

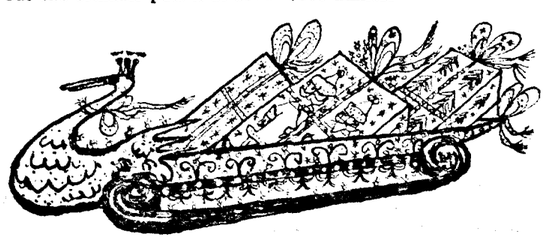
The remarks about filters are the cruellest blow to the tobacco interests, although they will take some comfort from more recent tests carried out by the *Reader's Digest* which show that some of the brands put on the market lately are efficient filters of nicotine and the cancer-producing tars. Filter-tipped cigarettes were the salvation of the industry in 1953 when the link between cancer and cigarettes first became widely known; about half the cigarettes now sold are filter-tipped, compared with just over 1 per cent in 1952. With this indirect recognition (on the part of both smokers and tobacco manufacturers) that the health issue is a real one, consumption of cigarettes rose by more than 20 per cent in the last five years, while the population went up by only 11 per cent.

Unless Americans take the Health Service seriously, consumption is expected to go on growing, partly because of increases in the population, partly because more women are smoking; at present about 60 per cent of all American men and about 30 per cent of all women over 18 smoke cigarettes. The industry, which has become highly competitive, is doing its best to promote smoking through the constant introduction of new brands, menthol and mint flavourings, porous cigarette paper (for a cooler smoke) and costly advertising. It might be wiser to spend more money on efforts to take the danger out of smoking, particularly now that some research-workers are charging that it helps to raise the death-rate from other diseases as well as lung cancer.

Too Pretty to Open

NEW YORK

Most of the packages now flowing in a tidal wave over American post office counters bear beneath their brown paper exteriors a brightly coloured and seasonal lining. Exploiting the notion that a present is only as expensive as it looks, the industry which supplies the papers, ribbons and labels for wrapping up these gifts has seen, since the war, a remarkable expansion in its market. And 1959 promises to bring the best-wrapped Christmas yet, with quality, colouring and design far more attractive and imaginative than anything to be found in Britain. Nobody is quite sure how much Americans spend each year on these trimmings, but one estimate puts it at about $200 million.



Traditionally, wrapping papers have been carried by stationers and department stores in company with greeting cards and other Christmas paraphernalia. But in the last few years supermarkets and grocery shops, which can make more profit on their non-food items, have been happy to find room on their crowded shelves at Christmastime for large displays of wrapping equipment. More recently merchandise has begun to be "gift-wrapped" before it leaves the factory. When Hiram Walker whisky arrived "pre-gift wrapped" at the liquor stores its sales shot up by 20 per cent; today all the main distributors of liquid good cheer follow this example at Christmas.

The retail shops are large buyers of gift wrapping materials for their own use and some manufacturers specialise in meeting their bulk requirements; one of these supplies its customers with a machine which ties elaborate bows automatically. Most of the stores gift-wrap purchases at no extra cost, but recently a few of them have started taking the wrapping-up business more seriously —at the customer's expense. Saks Fifth Avenue, which offers to wrap your presents "elegantly," "wittily" or "classically," has luxurious papers and boxes designed exclusively for its use. This service costs from seventy-five cents to a hundred dollars; the latter amount delivers your gift to its destination on a life-size, gilded sled, bedecked with velvet bows and ribbons. And when the last Christmas package has been wrapped, lace hearts for St Valentine's day will replace the imitation ermine "stockings" and novelty Christmas boxes now on the shop's packing counters.

Before the war the gift-wrapping business was in the hands of a few well-established concerns—the oldest dates back more than a hundred years. In its postwar prosperity, much of the field has been seized by newcomers; even today the main competitors do not number more than about eight or nine, although they include the big producers of greeting cards who have moved into the high quality end of the trade. The Minnesota Mining and Manufacturing Company (of "Scotch" tape fame) added first ribbons and then decorative papers to its industrial empire, and Papercraft Corporation, with sales this year at an estimated $10 million, has become a giant in the trade in the last fifteen years.

Under such slogans as "It isn't a gift if it isn't wrapped," manufacturers have carried on a sizeable advertising campaign. A booklet entitled "Gifts Too Pretty to Open" provides a do-it-yourself manual on advanced techniques, and raises the tempting possibility of omitting the gift altogether. But in spite of a booming market, the industry has one major problem: some 70 per cent of its sales are crowded into the pre-Christmas season. To smooth out this seasonal hump, producers are trying hard to make the public more conscious of gift-wrapping at other times of the year. If birthdays, school-leaving celebrations and weddings were only approached in the proper wrapping spirit, the industry believes its sales might multiply tenfold.

SHORTER NOTES

This year a chain of American shops is selling a do-it-yourself Christmas tree, which it is claimed can be assembled even by a child. Forty-six genuine fir branches are packed with a bare tree trunk which has rows of evenly-spaced holes. The branches are bundled according to size, with explicit directions about fixing the longer ones in the bottom holes. The trunk can be kept for use in future years when fresh boughs can be purchased, or even collected.

* * *

The European car is leading the revenge of the old world upon the new. In Chicago a drive-in cinema—normally an indigenous and purely American institution—has been forced to give small foreign cars special recognition. A ramp has been specifically designed just for them, with tiny parking spaces and a reduction of 25 per cent in the price for admission.

THE WORLD OVERSEAS

Generals and Fighting Men

FROM OUR PARIS CORRESPONDENT

Thursday

Without Stalin's help Nato finds it increasingly difficult to preserve unanimity, or even an appearance of it. A "good show" seemed particularly desirable this week, since the ministerial meeting of the Nato council was in effect a curtain raiser for the gathering of the western Big Four, whose weekend task it is to decide the date, place and agenda for the summit meeting with Mr Khrushchev. Yet the ministers opened their session on Tuesday in the new building at the Porte Dauphine in an atmosphere reverberating from the explosion of the Twining bomb. At a military committee meeting on December 10th, General Twining, chairman of the American Joint Chiefs of Staff, put the blame for the poor military shape of the alliance on the continental members; he singled out France as the main culprit. Leaked to the press, his words caused a major row.

General Twining did not reveal anything new. It was everybody's secret that France had resorted to passive resistance ever since General de Gaulle's memorandum of September, 1958, met no response. (In that memorandum the general proposed an overhaul of the alliance and a special status for the three powers with worldwide interests, namely the United States, Britain and France.) Of the various French moves since then, it was the refusal to integrate air defences that really perturbed General Norstadt. Politically, matters were probably precipitated by General de Gaulle's defence of the French attitude in his now famous statement of November 3rd that "integration has had its day."

General Twining's indictment and its leakage to the press have been variously interpreted. The French coupled the incident with the American abstention in the United Nations debate on Algeria, and concluded that there was a deliberate American counter-attack. The Americans tried to minimise the matter as the natural outburst of a soldier who needs a political agreement so that he can proceed with urgent technical problems. It is generally agreed, however, that the trouble goes deeper than that. The American administration is under pressure to cut its commitments. Mr Herter, nevertheless, told the council on Tuesday that the United States would continue to contribute its share and keep its full contingent in Europe. But finding their own efforts increasingly burdensome, the Americans do seem to be growing less patient of obstruction from others.

The French popular press dramatised the incident as a showdown. Two meetings between Mr Herter and M. Couve de Murville failed to persuade either side to budge from its position. It was decided to leave the matter to General de Gaulle and President Eisenhower, who are to meet on Saturday afternoon. They may decide to gloss over their differences as they did in September, and the matter may somehow be shelved for a couple of months. The French seem at this stage to be retreating under pressure and anxious to avoid an open fight. But Nato is clearly finding peaceful co-existence an awkward idea to get used to. It also finds it difficult to lead a quiet life with General de Gaulle.

What is General de Gaulle's long-term objective? The best answer is provided by the general himself in *Le Salut*, the third and final volume of his memoirs. Admittedly, the book deals with the last phase of the war and its aftermath. But it was written shortly before the general's return to power and published less than three months ago. There, he defines "the vast design that I have formed for my country":

> To ensure for it security in western Europe by preventing a new Reich from threatening it again. To collaborate with West and East, if need be to contract the necessary alliances with one side or the other, without ever accepting any kind of dependence. . . . To bring about a regrouping, from the political, economic and strategic viewpoint, of the states touching on the Rhine, the Alps and the Pyrenees. To make this organisation into one of the three world powers and, if one day it proves necessary, the umpire (arbiter) between the Anglo-Saxon and Soviet camps.

Gaullist foreign policy can be looked at against the background of this aspiration. At one time General de Gaulle favoured, as a solution of the German question, a federation of small states and an international control over the Ruhr. This did not come off; presumably he considers the existing division of Germany as a second best. He still seems to cherish the hope, or the illusion, that the west German state, for all its economic strength, will be France's junior partner in the western continental coalition. With this political purpose in mind he agreed, a year ago, that France should stand by its commitment to enter the common market. His four successive meetings with Dr Adenauer have made Bonn and Paris the axis of this continental alliance. French efforts to bring in Spain are consistent with the general design; so is the exclusion of Britain, which—the general quotes Sir Winston Churchill's word for it—will always choose the "open sea" rather than Europe. In any case, the whole purpose of the operation is to put Paris on a par with the "Anglo-Saxons."

General de Gaulle made his bid for a higher status in the Atlantic alliance without waiting to get all the necessary cards in his hand. The not quite silent struggle that followed inside Nato, and is still unfinished, has been mentioned above. But the determination to create a French nuclear striking force fits into the same pattern. Authoritative French spokesmen justify France's coming atomic tests not only on the British precedent, but also by western Europe's need to have its own deterrent now that, the United States having become vulnerable, the "Anglo-Saxons" may be tempted to contract out of European conflicts. General de Gaulle's own explanation is less European than French. He said at the Ecole Militaire on November 3rd that since France might be exposed to destruction from any point in the world, it needed to be able to strike anywhere; and "atomic armament would be the basis of this force—whether we make it or buy it." It may be argued that an effective worldwide deterrent of its own is beyond France's means. The fact remains that a nuclear striking force under French control is regarded by General de Gaulle as indispensable to an independent foreign policy.

Before the gaullist plan has fully unfolded, its difficulties and contradictions have begun to show themselves. The first is that the German alliance, now an inherent part of the design, seems barely consistent with an east-west balancing act. Deferential as they are in their dealings with the French, the west Germans know what their own vital strategic need is; they are not inclined to choose French military support in preference to American. Dr Adenauer arrived in Paris at the beginning of December in a state of alarm at the thought of first a British, and then an American, withdrawal from continental Europe.

Equally, the link with Dr Adenauer precludes a Franco-Soviet

alliance. General de Gaulle has often been thought to be thinking about this "auld alliance." There was the 1944 precedent; there is also his own proclivity for thinking of nations as unchanging entities, disregarding alike the changes in their societies and the complexion of their regimes. It may be possible for him to see Mr Khrushchev's projected visit as the visit of the reigning Tsar to an heir of the French monarchs. But the bargain with the Tsars needed a German threat. When Dr Adenauer was coming to Paris, Mr Khrushchev called him the chief opponent of *détente*. When Dr Adenauer left, the French and German governments announced their complete agreement on Berlin, the German question, and the summit meeting. What common ground does this leave between General de Gaulle and Mr Khrushchev?

The French president has reasons of his own—apart from German promptings—to show no haste for summit talks with the Russians. The time may not in his view be ripe for France to play its proper part in a world settlement, however gradually arrived at. He needs time to disentangle his troops from Algeria and adapt them to modern conditions; time to forge his nuclear weapons and the means of delivering them; time, too, to consolidate his bid for continental leadership. While these efforts are being made, it may suit him well that the pace of world diplomacy should be slowed down; this is a matter on which he can agree with Dr Adenauer. His tactics of cautious intransigence have so far been a relative success; he may be expected to go on making the most of his limited means. This is why the Twining incident is certainly not the last of its kind.

Victory for the Archbishop

FROM OUR CORRESPONDENT IN NICOSIA

For an island hardly noted for its political decorum Cyprus's first presidential election has been a singularly conventional affair. Archbishop Makarios was elected by the majority which all the pundits forecast, the election campaign was devoid of new issues and polling day passed off without any serious incidents. On the face of it, everyone seems back where they were three weeks ago—but with two important differences. On the one hand, the implementation of the Zurich and London agreements is assured (this was the only thing that could be described as an "issue" in two weeks of verbal vendetta), and on the other hand, the theory that Archbishop Makarios is the one and only representative of the Greek Cypriot people has been publicly punctured.

The archbishop's victory is best regarded as satisfactory rather than overwhelming. Of the votes polled, he claimed exactly two-thirds—no doubt a sufficiently satisfactory majority but, all the same, considerably less than it would have been six months ago. The breakdown of the voting has revealed that the great majority of the archbishop's votes came from villagers who voted for him largely because he is head of the Greek church—and who philosophically accept the London agreements because Archbishop Makarios says that is the thing to do.

In the more politically conscious towns, the archbishop's figures were less impressive. In Famagusta Mr Clerides actually had a majority of about 2,000; in Limassol the archbishop was only about a thousand ahead. (In Nicosia, rather surprisingly, polling was in the approximate ratio of 9,000 to 4,000, which discredited claims by the Clerides camp that they would get at least 50 per cent of the capital's votes.) Mr Clerides, it is plain, was almost entirely dependent on the votes of communist-led workers. A few days before the election its spokesman claimed that the left wing could at any time turn out some 80,000 voters; Mr Clerides's total poll was just over 71,000. Even when allowance is made for left-wing exaggeration it is clear that Mr Clerides's Democratic Union party is almost farcically tiny.

At the same time, it would be premature to write it off completely. Although it seems fated to disintegrate, it contains some of the most influential political families—and some of the most capable men—in the island: powerful figures, of "moderate" right-wing outlook, whom any sensible president-elect would like to have on his side. As it happens, there are two portfolios in the cabinet now going begging and several ambassadorships soon to be filled—not to mention the 35 Greek seats in the first house of representatives. It is possible that some of the right-wing moderates in the Democratic Union might yet be reconciled with the archbishop. This might, of course, embroil him with the more diehard elements in the Edma party, who are in favour of consigning all the Clerides men to outer darkness; but it is a calculated risk which the archbishop—now a superb performer on the political tightrope—could profitably take in the interests of broadening and consolidating his government.

In the parliamentary elections, provisionally fixed for January 10th, much will obviously depend on the exact method of voting in the island's six multi-member constituencies (which correspond to the existing six administrative districts). Already there is the first rumble of a political storm over this issue; for the Democratic Union and the communist Akel party both have been urging some system of proportional representation—for obvious reasons—while some of the archbishop's supporters are in favour of a single ticket, majority vote system, which if carried to extremes could mean that the minority party or parties would get no seats at all. The island's constitutional commission has ruled against proportional representation, but is still busily trying to work out a suitable formula. If the result of its protracted deliberations seems to load the system unduly in favour of Archbishop Makarios, his opponents will create an unholy rumpus. Meanwhile Akel is cautiously watching and waiting, though it still seems unlikely that it will come out on its own. Freed from proscription, its organisation has gained power and momentum in the past two weeks.

In contrast to the feverish intrigue and manœuvring in Greek quarters, there is a sense of almost monolithic serenity about Ataturk Square. Perhaps the most significant feature of Archbishop Makarios's victory has been the pleasure which it has given the Turks. The archbishop's most statesmanlike achievement in the past nine months has been to convince the Turkish leaders that he intends scrupulously to carry out the London agreements—in which Turkish interests are generously safeguarded. The chances of gradually creating harmonious relations between the two communities and so making the agreement work are increased by his victory, and on balance it is probably in this context that the world should view the event.

We regret that we can no longer accept orders for the 1960 edition of The Economist Diary. The size of the edition was substantially greater than for 1959 but it was, nevertheless, insufficient to meet the heavy demand from home and overseas.

We suggest that to ensure that you are not too late next year, you instruct us to notify you when the 1961 edition is ready. All you need do is to write your name and address on the back of a postcard and send it addressed to:

1961 DIARY, THE ECONOMIST, 22 RYDER ST. LONDON SW1

India Likes Ike

FROM OUR CORRESPONDENT IN INDIA

Delhi overpowered President Eisenhower with its billion dollar welcome. Even Mr Nehru had never seen such crowds before. Admirably timed and managed, the president's visit, whatever its outcome, has bestowed a halo of affection upon him. Mr Nehru described his coming as "a blessing for India and the world." Mr Eisenhower took everyone by storm with his simplicity and his pink cheeks. America could not have sent a better ambassador to India, for each time the president grinned another stereotype of American crudeness dissolved. However, this does not mean that India has swallowed the American outlook, but rather that there is a friendly agreement to differ. America sees the world as red or white; India sees it as rich or poor.

Thus on the fourth day, at the Ramlila grounds, the champions of alignment and non-alignment stood smile to smile before the

Japan and Korea: a Diplomatic Triangle

BY A CORRESPONDENT

Fourteen years have now passed since Japan was compelled by defeat in the Pacific war to relinquish the sovereignty over Korea which it had held since 1910. The lost colony is Japan's nearest neighbour, but Tokyo does not have regular diplomatic relations with either South or North Korea. In accordance with the decisions of the United Nations it has recognised the South Korean government as the only lawful authority in Korea, but negotiations to establish diplomatic relations have always until now been bogged down over preliminaries, particularly Korean financial claims against Japan arising from the period of Japanese rule. Bitter feelings have also been aroused in Japan by the South Korean exercise of a fisheries jurisdiction over large areas of the high seas between the two countries—a jurisdiction which Japan, now lacking a navy, has been unable to resist—and in Korea by Japanese treatment of the Korean minority of more than half a million still remaining in Japan. Up to the middle of this year, however, there seemed to be a prospect that Japanese-Korean relations would gradually straighten themselves out. But these hopes have been dashed by the dispute over the repatriation of Koreans from Japan, not to South, but to North Korea, which has not only intensified the tension between Tokyo and Seoul, but has also—probably at the outset without the deliberate intention of the Japanese government—involved Japan in the position of taking sides with a Communist regime against a non-Communist one in East Asia.

At the end of the Pacific war in 1945 the Koreans in Japan numbered nearly three million and were of two categories—those who had voluntarily emigrated there (or had been born there) before the war and those who had been compulsorily drafted there for industrial labour during the war, mostly from what is now South Korea. During the American occupation Koreans in Japan were quite free to go to South Korea and a majority of them did so. As those who remained belonged to a liberated people in an enemy country, they enjoyed a certain privileged position in the early days of the occupation, and the Japanese complain that some of them made use of it in various ways at the expense of the Japanese. Their good time was at any rate brief, for after the Japanese recovery of sovereignty in 1952 they began to suffer from both official and unofficial discrimination. Many became unemployed. The Japanese would have liked to see them all go home. But after the Korean war there was widespread unemployment and destitution in South Korea which stopped further movement back to that country. But towards the end of 1958 agents of the Communist government in Pyongyang began to invite the Koreans in Japan to come to North Korea, where they were promised well-paid employment. The desire of the North Korean authorities for their labour was probably genuine enough, for North Korea holds the only important coal and mineral resources of the Korean peninsula, and the large-scale flight of refugees to the South before and during the Korean war has created a shortage of labour. As most of the Koreans in Japan had been mining or metal workers, they were very suitable for filling the gap. The Communists, however, undoubtedly also had in mind that a voluntary—or apparently voluntary—migration of Koreans to North Korea would greatly increase the prestige of their regime.

A communist organisation in Japan promoted a petition for repatriation to North Korea which gained over 100,000 signatures—with the inducement, it is alleged, of small cash payments in advance of expenses for those who signed on. The South Korean government, hearing of this, at once protested and declared that, as the only Korean government recognised *de jure* by Japan, it had the right to be a party to any arrangement covering the future of the Korean minority there. The Japanese government, however, refused to accept this argument, and declared that on humanitarian grounds it would not prevent Koreans in Japan from going wherever they wished. South Korea then challenged the claim that the proposed migration would in fact be voluntary, and described it as a "deportation".

This put the Japanese on the defensive, for the Home Ministry had been notoriously anxious to get rid of as many Koreans as possible. To clear itself of the charge of compelling Koreans to go to a Communist country against their will the Japanese government now sought to bring the International Red Cross into the affair as a guarantor of freedom of choice. Meanwhile, in order to avoid having to negotiate an agreement directly with the North Korean government, which it did not recognise, Japan put up the Japanese Red Cross to arrange conditions for the repatriation with the North Korean Red Cross, though both societies were in fact acting as agents for their governments. Japan originally proposed that the International Red Cross should set up a kind of tribunal to which any Korean claiming to be under undue pressure to go to North Korea could appeal. The North Koreans, however, refused to agree to this, and the Japanese accepted a compromise, whereby the International Red Cross would undertake a merely advisory function with regard to the repatriation. After some delay the International Red Cross finally agreed to act in this capacity, and the agreement between Japan and North Korea was signed on August 13th.

Already during the summer South Korea threatened to take all possible measures, including the use of force, to prevent the "deportation" of Koreans from Japan to North Korea. But Russian ships have now been sent to Niigata to fetch the first batch to North Korean ports, so that the voyages are under the full protection of Soviet power. It remains to be seen whether the South Koreans will accept defeat or whether they will try to carry out some form of forcible reprisals against Japan. Strange as it must seem to anyone who knew the powerful Japan of the old days, South Korea is now far stronger than Japan in terms of military and naval power, but the Korean army and navy are formally still part of the United Nations forces in Korea under an American supreme command, so that any independent action against Japan would be deeply embarrassing to the United States. The Americans have indeed done everything they can diplomatically to prevent the conflict from developing to the point it has now reached.

gaze of a million people. In his "cold war address," Mr Eisenhower expounded America's anti-communist policy. He stated in Gandhian jargon what Mr Murphy had stated bluntly in Washington on the eve of the president's "blitz-peace" tour. To Mr Eisenhower's argument that only freedom could ensure peace, Mr Nehru gently pointed out that not all the "free" world was free yet. To the president's suggestion that Gandhi would have supported mutual self-defence, Mr Nehru maintained that the Mahatma's key message was "hold enmity towards no one," and he gave a warning that "any action which leads to an increase in world tensions is a crime against humanity." America has explained its stand, and hinted that pacts are there for the asking. India remains unaligned, despite Mr Chou En-lai's efforts to succeed where Mr Dulles had failed.

But under the non-alignment India is presenting a new face to America: at long last Mr Nehru has publicly thanked America for its aid and has said that if more aid comes it will be welcome. Readers and television viewers back in Wenatchee or Milwaukee, learning of India's love of "Ike," will cease to imagine that India is pink. India is not pink, it is neutral and worried. Indeed, perhaps half of the gigantic crowd which cheered Mr Eisenhower cheered because "Amrika" is India's friend, as China is not. The remainder of the crowd was probably divided between those who attend *tamashas* anyway, those who think that this visit bestows "summit status," as one paper put it, on India, and those who, like millions of fans elsewhere, just like Ike.

Is this "Ikitis" a fleeting fever? Probably not. The seeds of a maturing friendship were planted in the Gettysburg address: the Suez crisis watered its roots; economic aid, and Chinese aggressiveness, have strengthened the trunk. Lately, for the first time in years, Indian-American relations have been free from brinkmanship or gurumanship, and with the "summit" in the offing the old quarrel about methods is losing its edge. America has begun to toy with co-existence just when India is getting singed by communist expansionism. The spectrum of disagreement has been narrowed from the moral to the practical. There is only one real bone of contention left for India and America to pick—Pakistan. (The Chinese seat in the United Nations is a mere splinter.) Indians hope that Mr Eisenhower will exert his influence further to reduce Indo-Pakistani tension by bringing pressure to bear upon General Ayub. The recent thaw with Pakistan has already been chalked up to Mr Eisenhower's credit, whether it is the approach to solution of the canal waters problem, or the settlement of the Bengal borders, or the harmonious tone of the present trade negotiations. This only leaves Kashmir. Indians feel that time must be allowed to pass before Kashmir can be tackled. Not all Mr Eisenhower's charm will cut any ice there. As Mr Nehru told correspondents: "When we meet it is not with a view to finding a solution to any problem."

China must have loomed as large as life on the two leaders' horizon, but India did not ask for military aid, nor did America offer it; both want a peaceful settlement, because the Eisenhower Doctrine and the Nehru Doctrine meet on the Macmahon Line.

It is really on the economic front that India hopes that the visit will make the difference between freedom and frustration. Everyone knows that in American circumstances an outgoing president and an election year mean the perpetuation of things as they are. Fortunately for India, the crucial billion dollars a year will not be required until 1961, the first year of the third plan. In the meantime the Indians are glad to think that they have found in Mr Eisenhower a powerful advocate, as one minister put it, who may yet set the tone for the future if he follows up his promise:

> I shall be quick to speak out on every possible occasion that India is becoming one of the great investment opportunities of our time, an investment in the strengthening of freedom, in the prosperity of the world. . . . As you prosper the whole free world will prosper; Americans, Asians, Africans, Europeans will buy goods from India . . . you will be able to buy more from them. . . . The best means for a nation determined to maintain its independence are private investment from outside, governmental loans from others and, where necessary, grants from other free and friendly nations.

Could it be that President Eisenhower has in mind a Colombo Plan type of approach to Marshall Aid for India? This is the question anxiously asked by those who appreciate the sacrifices involved in "take-off." They wonder whether the president will succeed, faced as he is with an America *jittery* for its dollar, a Europe that is tight-fisted, and a complacent free world which may not realise before it is too late for India the wisdom of jejune clichés like these: prosperity, like freedom, is indivisible; charity well understood ends at home; a stitch in time saves nine.

Ceylon Loses its Halo

FROM OUR CORRESPONDENT IN COLOMBO

The departing Devil, say the Sinhalese, delights in smashing up the pots and pans. With almost fiendish glee, Ceylon's caretaker prime minister, Mr Dahanayake, and his colleagues have reduced parliamentary government to a shambles.

Ceylonese pride themselves on having achieved freedom without shedding blood, and in their first days of independence "a little bit of England" was all too familiar a phrase. Outsiders, especially British commentators, fostered this self-indulgent myth, and a generation of Ceylonese has been raised in the belief that the cordial transfer of power was a richly deserved gift; as if their country, the best bred boy in the imperial classroom, had carried off the award for good conduct on prize day. Ceylon has been held up as an example of the successful transplantation of British parliamentary traditions in Asian soil. But today, although the tea and rubber which the British planted still grow well, and provide more than half the island's earnings, this transplanted democracy is being shaken to the roots.

Mr Dahanayake took everybody by surprise when he dissolved parliament two weeks ago. His colleagues in the governing Freedom party, who had hoped to survive the remaining eighteen months of the parliamentary term, had not been consulted. But he could scarcely have done better in the circumstances. A week earlier a no-confidence motion had left him with a humiliating one-vote majority. There was open mutiny in the party's ranks and the press kept up its demand for dissolution. Without awaiting the further humiliation of being denied the presidency of the party, he advised the governor-general to dissolve parliament. Awakened at midnight by newspapermen, the other ministers were furious at being so callously sold down the river, and started to mutter dark insinuations about Mr Dahanayake's motives. He acted swiftly. Summoning an emergency meeting of the cabinet, he blithely announced his resignation from the party. He did not, he said, "want to have his throat cut in broad daylight," and he would form a new Democratic party with a strongly anti-Marxist programme.

Next day the Freedom party held what was probably the most rowdily farcical political meeting in Ceylon's history and, refusing to accept Mr Dahanayake's resignation from the party, proceeded to expel him. Anything they can do, I can do better, was his response: he proved it by sacking five ministers and one junior minister, and recalling to his cabinet Mr Stanley de Zoysa, the former minister of finance, who had been forced to resign only three weeks earlier under pressure from these same men.

Each new day now brings some shattering event, melodramatic, monstrously comic and chaotic. Is there a sinister method in this madness? Is Mr Dahanayake clearing the way for arbitrary power? Rumours that Mr de Zoysa's return would be followed by the re-

admission of his brother, a deputy inspector-general of police, to the police force as the head of a new security set-up, have caused further anxiety. But the prime minister himself has solemnly promised to go ahead with the arrangements for a free and peaceful election on March 19th. Now freed from the real cares of office, he may be simply acting true to form. For two decades he has been the most adventurous of lone-wolf politicians, and his actions now are in keeping with his eccentric and histrionic nature.

Although the election campaign is already in full swing, the picture is still confusing. New parties have sprouted like salvinia in the rice fields, while the gains made by independents in the local elections of the past few weeks indicate widespread distrust of all parties. Of the major parties, the United National party has fared best. The present conditions suit its leader, the ex-prime minister, Mr Dudley Senanayake, ideally. All attempts to get the three parties of the left together have failed. The former food minister, Mr Philip Gunawardena, goes his own way, diluting his Marxism with nationalism. He now claims the leadership of the "popular front" which Mr Bandaranaike led in 1956, and which broke up after the Cabinet crisis of last May. His programme is a jazzed-up version of the murdered premier's manifesto, and he is trying to mobilise Sinhalese Buddhist feeling. The Freedom party is discredited and broken. Mrs Bandaranaike has now given a definite "no" to all the appeals that she should lead the party; so it will not be able to exploit the popular sympathy for her. The "Trotskyite" party of Dr N. M. Perera, the former Leader of the Opposition, has lost some ground since just after the murder. If the people rally round militant nationalist slogans, the conservative and pro-western UNP will find a tough opponent in Mr Gunawardena, who is pledged to nationalise all foreign estates and banks, to take over denominational schools and declare Ceylon a republic. The local elections in Colombo on Saturday, December 19th, will provide a first trial of strength.

More Power for Soviets

Communism equals Soviet power plus electrification of the country. When Lenin produced this famous, though rather over-simplified, equation Russian output of electricity was ridiculously small. Next year Soviet production should approach the impressive level of 300 billion kWh. It is a figure that Lenin could scarcely have imagined, but the voice from Moscow still repeats that it is not enough to keep up with the ever growing demand. *Pravda* has now published a speech made by Mr Khrushchev on November 28th in which he revealed an ambitious 20-year plan of electrical expansion—2,300 billion kWh by 1980. He made this speech to a conference of experts who had met to discuss ways of speeding up the building of power stations and of cutting costs. Simultaneously, the party's central committee issued an appeal to save electricity and eliminate wastage estimated at several billion kWh a year. "Switch off, light is precious"—such posters will soon be seen, not only in factories and public institutions, but in housing blocks as well.

During the present seven-year plan (1959-1965) both the Soviet output of electricity and total generating capacity are to be more than doubled. The authorities are nevertheless campaigning for higher production and lower consumption, because they want to harness electricity for industrial purposes. This is considered to be one of the keys to higher productivity; and the further expansion of industrial production is now chiefly dependent on higher output per man.

Soviet Output of Electricity (billion kWh)

1959 est.	1960 plan	1965 plan	1970 plan	1975 plan	1980 plan
261	291	500-520	900	1,500	2,300

Last year the Soviet planners revealed two important changes in their policy for fuel and energy. In fuel, the emphasis is to be gradually shifted from coal to oil and natural gas; in power, it will be switched, at least temporarily, from hydro-electric to thermal generation. The reasons for the change are empirical, as Mr Khrushchev explained in August of last year at the opening, paradoxically enough, of the Kuibyshev hydro-electric station. Water power stations are cheap to run, he argued, but slow and expensive to build. The Kuibyshev station took nine years to build; the Stalingrad one, to be completed soon, will have taken ten years. Water resources will not run away and while construction methods are being improved it is wise to concentrate on thermal stations fed with cheap fuels.

This does not mean that water power stations have been dropped altogether. During the present plan the giant Bratsk hydro-electric station (capacity: 3.16 million kW; annual output: 22 billion kWh) is to be completed on the Angara river and an even bigger one is to be started at Krasnoyarsk on the Yenissey. Mr Khrushchev has now confirmed that big water power stations, with a capacity of 5-6 million kW, will play a prominent part in the 20-year programme. But the bulk of the new capacity is to come temporarily from thermal stations. These will be big—experts favour a capacity of 2.4 million kW—and located near cheap sources of fuel. Since cheap fuel lies mainly in the eastern parts of the Soviet Union, development will be most rapid there and by 1965 the eastern regions should account for 46 per cent of the electricity generated in the country. This is in keeping with the general shift of the economy.

The recent conference did not end without complaints. Turbines are not always delivered on time and construction, in general, is too slow. The time of construction of a large thermal station must, it seems, be reduced to between three and four years. Experts, now returning to their jobs, will have to adopt new methods. They will also have to seek every possible way of saving electricity.

SOVIET USE OF ELECTRICITY AND PRODUCTIVITY PER WORKER

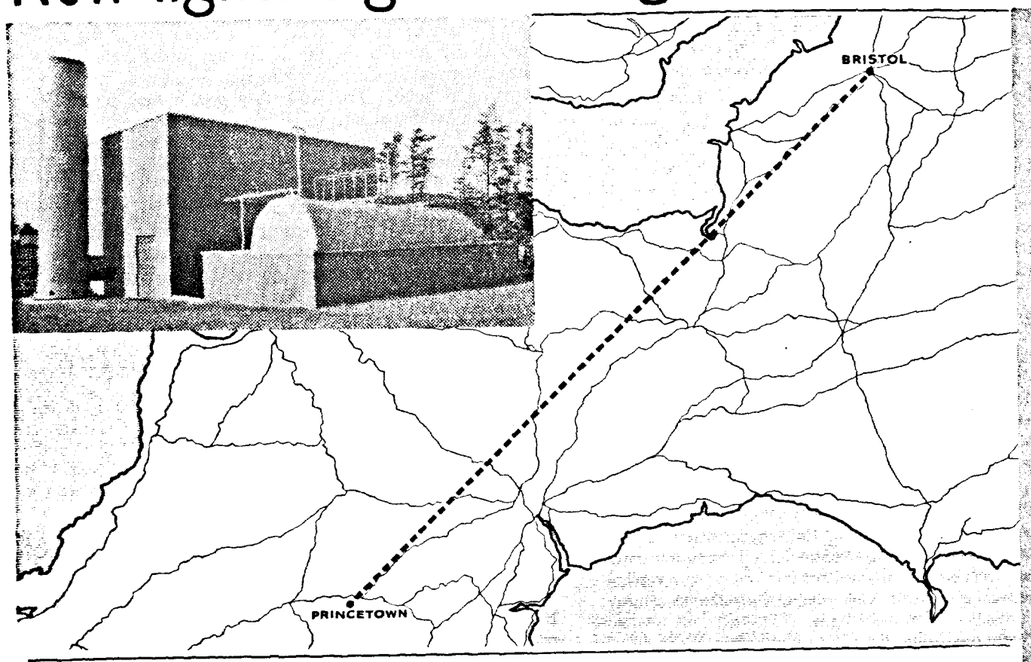
(Percentage of US levels)

Branch of Industry	Annual consumption of electricity per worker US level equals 100	Annual output per worker US level equals 100	Branch of Industry	Annual consumption of electricity per worker US level equals 100	Annual output per worker US level equals 100
Ferrous metals	44·3	49·1	Paper	43·2	42·1
Coking coal	57·6	49·1	Cotton textiles	28·5	37·7
Oil refineries	33·1	43·4	Woollen textiles	34·2	45·1
Metal machine tools	66·7	74·4	Artificial fibres	29·8	18·5
Cement	30·5	35·5	Meat	44·3	53·2
Bricks	31·0	43·5			

Source: Voprosy Ekonomiki; table based on Soviet data for 1956 and US figures for 1954.

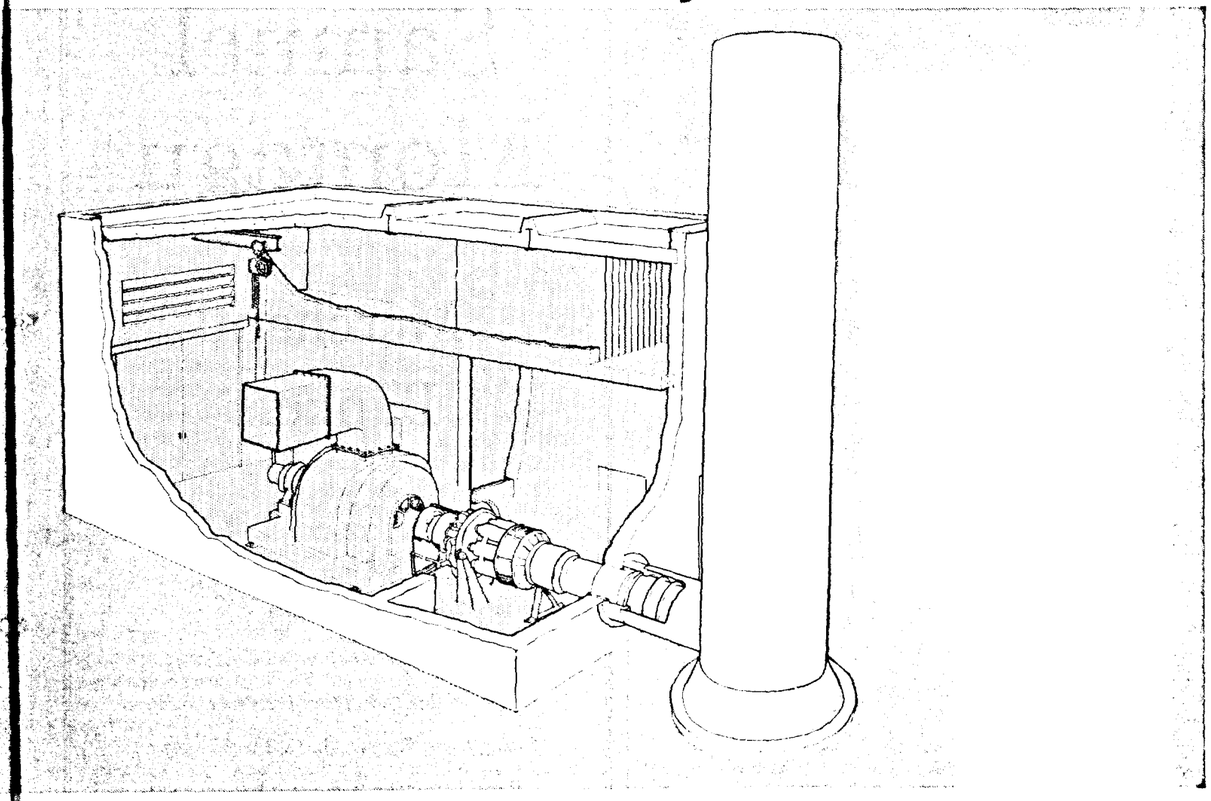
The details of the long-term plan are not yet known. It has not yet been disclosed when the switch back to water resources will take place, or how big a part is allowed for atomic energy. For the time being, the emphasis is on speed and economy, on quick and cheap results. The above table demonstrates that Soviet planners take the use of electricity in industrial processes as a fair yardstick of modernisation and, therefore, of workers' productivity. Now that the inflow of manpower has been slowed down and working hours are being reduced, the matter has become particularly urgent. Forty years after Lenin's dictum, more electric power for industry remains an important task in the "construction of communism." Electrification is also regarded as one of the chief means of challenging the industrial supremacy of the United States.

New lightweight turbo-generator cuts costs...delivers 3 million watts by remote control...



At exactly 12.07 hours, on Friday, 11th December, Mr C. R. *King*, the Chairman of The Electricity Council, pressed a button at Bristol. Two minutes later and a hundred miles away a completely new type of turbo-generator fed 3 million watts into Princetown.

This new pocket power station, driven by a Bristol Siddeley aero gas turbine engine, runs itself unmanned. It needs very little maintenance, and is so light and compact that it can be put just where electrical power is needed.



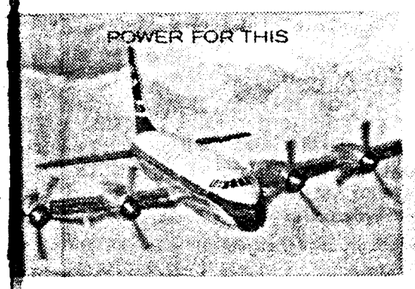
...AND BRISTOL SIDDELEY SUPPLY THE POWER

The new Proteus-powered generator supplied to the South Western Electricity Board represents an important engineering advance. Designed specifically for critical peak-lopping and emergency use, it is in effect an automatic, pocket-sized power station which can be operated by remote control.

The secret lies in the use of the Bristol Siddeley Proteus gas turbine as motive power for the 3 megawatt alternator. One of the most compact powerplants in the world, the Proteus reaches its full power of 4,250 hp within 30 seconds of a cold start. And 3 megawatts are fed into the national grid within two minutes *at a capital cost which is actually lower than that of any other method*. Its reliability is already so well proven that its service life between overhauls, under peak-lopping conditions, is anticipated at 10 years.

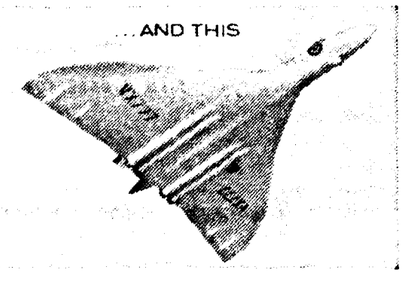
The South Western Electricity Board are to be congratulated on the speed with which they have taken advantage of this new power source and the venture will be closely watched by engineers all over the world.

BRISTOL SIDDELEY ENGINES LIMITED



The Bristol Siddeley Proteus powers the Britannia airliner. Four Proteus give this 130-seat aeroplane a speed of over 400 mph—a range of over 5,000 miles. Britannias are in service with twelve airlines all over the world and with Royal Air Force Transport Command.

The Bristol Siddeley Marine Proteus powers the world's fastest naval vessels, the "Brave" class Royal Navy patrol boats built by Vosper Ltd. Three Proteus deliver a total of 10,500 hp — give these 96-ft boats a speed of over 50 knots. The Marine Proteus holds huge reserves of power for acceleration.



The Bristol Siddeley Olympus high-thrust turbojet powers the Avro Vulcan V-bomber—gives this delta-winged deterrent carrier a performance unsurpassed by any aircraft in its class. Current Olympus versions deliver 17,000 lb thrust dry—24,000 lb with reheat. And later versions are rated at 33,000 lb.

THE BUSINESS WORLD

A Brief for Mr Marples

THE most notable point about the "pink zone" scheme for Christmas traffic in central London does not lie in the particular measures that it employs but in the mere fact that some positive action has actually been taken. The brutal truth is that this is the first time any moderately comprehensive attempt has been made to deal with traffic congestion in any large area of inner London. Mr Marples has done something about motor traffic in Britain's largest city: moreover, with a characteristic flair for public relations, the new Minister of Transport has managed to secure the good will of most motorists as well as of other road users.

The pink zone was never intended, by the London Travel Committee that devised it, to be more than a temporary expedient to prevent this year's Christmas traffic from grinding to a complete standstill. It is still due to end on January 16th, mainly, it appears, because of difficulties over using the Royal Parks as storage space for cars. But it has given all Britain's congested cities a glimpse of what can be done to make better use of their existing roads. And the impetus may be maintained if Mr Marples goes ahead with his idea of asking Parliament to give the Ministry of Transport powers to take more direct charge of central London traffic (in an area rather larger than the pink zone) for an experimental period of two years or so.

These powers lie at the hub of the problem. Since 1924 the Ministry of Transport has been the nominal traffic authority for the London traffic area, which covers roughly everything within 25 miles of Charing Cross. But before it can do anything it has to consult the London and Home Counties Traffic Advisory Committee, a 45-strong body representing an even greater multitude of interests; and the Home Office, if the police will be called upon for enforcement; and then, in practice, it still has to work through individual local authorities. Even in the county of London, a much smaller area, the list of highway, street lighting, bridge, improvement, planning, and police authorities with whom the Ministry is obliged to work, reads like a version of the *Twelve Days of Christmas*. With more powers of initiative and execution for his ministry, pending any permanent changes that the Royal Commission on London Government may recommend, Mr Marples said last week that he would endeavour to "concentrate on a manageable area (of London) and make some impact on it" and thus, by example, hope to stimulate ideas and action in other cities. In short, he envisages the ministry acting during this lengthy experiment in the manner of the traffic department of most American cities.

Some simple and immediate steps could be taken in such an experiment to secure the utmost use of the roads for moving traffic; they would give a worth-while economic return on the relatively small sums that they would cost. There are first straightforward devices of what is rather grandly called "traffic engineering," which often means no more than using common sense in organising a city traffic system. It includes making the motorist "lane conscious" by painting lines on the main routes through the city and at the principal junctions and roundabouts (removing if need be the lamp and pedestrian islands that so often create bottlenecks), and by introducing what is called "tidal flow"—opening, say, two lanes of a three-lane road or bridge for incoming traffic in the morning and giving outward traffic two of the three for the evening peak. One can mark certain outside lanes for turning traffic only, prohibiting U-turns, and limit sharply the intersections where right-hand turns can be made (substituting, for example, a series of left turns into a road that crosses the original route at traffic lights). A good deal more one-way routing would still be possible, even in the West End of London. Pedestrians could at last be obliged to "cross over on the green and not in between" at light-controlled crossings, and only on crossings. Traffic signs could be made clearer, placed to give the motorist ample time and the pedestrian ample view, and standardised in pattern.

THE greatest single relief of traffic congestion will come, however, by denying vehicles free kerb-side parking space. Here the thousands who get there first each day impose the cost of this space, in terms of delay, on the traffic that wants to move later. The principle is now accepted that motorists will have to pay to park either at a metered space, where the hindrance to others ought to be minimal, or in a garage off the street, where a stationary vehicle is an impediment to nobody; it is taking an unconscionable time to convert fully into practice. Parking meters should regulate the use of the kerb-side space that can sensibly be offered to the short-term parker; and if no one is allowed to park anywhere else "down-town," off-street garages should become a commercially viable

proposition. The first of these meters, installed in a small area of London's west end, have already stimulated the construction of a handful of new garages and another one is going up in Bristol where meters are soon to appear.

But the procedure created by the Road Traffic Act, 1956, which sanctioned the use of meters, has proved cumbrous and deficient. Provision for a full public inquiry and the hearing of all objections to each scheme is reasonable enough, if time-consuming, provided local authorities can be persuaded to see the considerable benefits that meters bring and introduce them soon enough and over a suitably large an area. But the effectiveness of meters depends upon the extent to which the ban on free street parking nearby is enforced. Mistakes of drafting in the Act have prevented the police employing contractors to assist the selective towing away of defaulting cars and the procedure for applying the law to motorists who park their cars illegally is still too long drawn out.

Mr Marples may have to adopt the practice of on-the-spot fines for the breaking of ordinary traffic rules, and to recruit special traffic patrols to assist the police. But he has acted quite rightly in refusing the demands for off-street garages to be subsidised (beyond the use of net revenue from parking meters). Those who choose to commute by car to the centre of cities should be prepared to pay the full economic price of garaging their vehicle while it is idle, as should those who enjoy the privileges of living there. The shopper, the visitor, the commercial traveller, and all the other "stoppers" for a short period must be prepared to pay for occupying the kerb near their destination (and there is no reason why meter charges should not vary, as in American cities, roughly according to the pressure of demand for the spaces available). And experience in the pink zone has shown how well the unloading and loading of commercial deliveries can be fitted into a limited number of off-peak daytime hours.

Apart from a concession on rateable charges in some cities, the American "downtown" garage charges, and gets, the full economic price for off-street parking. In Britain, it appears that multi-storey garages can now be built for about £300 per car space, plus the cost of acquiring sites, if they have open-sides, as the LCC now allows. This capital cost would be lower if the cars were driven to their stalls by attendants (customer-parking takes more space). With site values in the centre of the cities, the economic charge for eight hours' parking, allowing for a load factor during the day of about 75 per cent and the profits on a service station, could run up to 10s. For an underground garage, such as the one now being built under Finsbury Square, where site costs are purely nominal but construction more costly, it would be rather less for an eight-hour day. Once the commuter understands that this is the price of parking his car where it is allowed and that he stands a very good chance of having to pay considerably more, immediately in a fine on the spot if he tries his luck where parking is not allowed, his own personal "costing" of commuting by car will become much more realistic. To the extent that commuters are prepared to pay that cost—and in an increasingly motorised community many will be—then off-street garages will become a profitable business. The announcement of a rough timetable for future metering schemes by the local authorities concerned would encourage garage operators not to wait for the meters actually to appear, but to have the garage ready by the time they do.

All this may smack of "restrictionism," with none of the bold planning that the various road pressure groups delight in lobbying for. But Britain is much too compact a country, and its cities too crowded and sprawling already, to be able ever to redevelop its built-up areas to every single one of the cars its population is likely to possess and to the amount of road traffic that might choose to go into them and mill around. The United States, which is as large and in terms of sheer land space as undeveloped a country as an affluent, automobile-conscious society is ever likely to be has found that spending money on urban motorways and other new road construction in its cities is a "bottomless pit" that creates more problems and solves none. Increasingly, American city after city is turning to public transport as the most efficient and economic mover of people in densely built-up areas. Pedestrian malls downtown, periphery garages, and rapid transit services in between is the broad, simplified direction in which thinking there has been moving.

MR MARPLES is thinking of setting up a long-term study group to include architects and town planners as well as highway and traffic engineers. Only in some all-embracing survey such as this suggests is one ever likely to find a way of reconciling the desire to use personal transport in place of public transport with the facts of city life. Most of London's present congestion, on its arterial roads at peak hour and in the centre all day long, is caused by the cars of the six or seven per cent of the capital's 1¼ million commuters who come in that way. If only a fifth of all commuters did so, over two square miles of parking space alone would have to be provided for them. Even the expensive-looking scheme of replanning that won first prize this week in the Road Campaign Council's competition "New Ways for London" would cater for only three times the number of vehicles that came into the inner area in 1954 and would, the author reckons, take twenty years to complete.

As the city worker becomes more affluent he moves further out and is more likely to own a car. The more the car is used for off-peak travel the more uneconomic become the peak-hour services that urban transport and railway services are expected to provide; the more cars that are used to go to work in, the more difficult it becomes to run bus services adequately and more people shift to the crowded tubes and railways. This has been the experience of London since the end of petrol rationing nine years ago. Efforts to budge the hours people prefer to come into, and leave, work have been made for thirty years, with little real effect. Britain is fortunate enough still to have public systems transport in its cities. The people are certain to go on needing them, and if stronger incentives to encourage staggering of hours are more likely to keep them in business, then such incentives may have to be given. It would never be practical or equitable to keep private vehicles out of cities altogether; and natural "ecology," reinforced by the price mechanism for parking space, will always tend to keep the use of cars to a level that the roads can actually cope with. After easing the present congestion by applying traffic engineering methods and clearing the cities of parked vehicles, will come the time for study of the resulting flow of traffic, to see where the shoe particularly pinches and what works of major road investment and re-planning can profitably be undertaken. But the shoe will always be too small.

Tax and the Foreign Investor

INVESTORS on both sides of the Atlantic are now moving their money far more freely beyond their own frontiers. They have been encouraged by the moves to convertibility in Europe and by the promise of closer economic union. But for every one who has moved his funds around, perhaps a dozen are held back by the complications—above all of tax. This is bad enough at home; once an investor steps outside his own country his tax position may become less favourable, or more; almost inevitably it becomes complex. This article sets out the general considerations that apply to the taxation of investment in Britain and on the European continent by American investors, and in the United States by British investors—and these can be very different as between, say, surtax payers and tax-exempt pension funds.

American investors in British securities are nearly all penalised by the British tax system (as American investors are in most Continental securities, though to a smaller degree). The details are spelled out below by our New York correspondent. Yet profits of American companies are subject to notably higher taxation than are company profits in Britain. The paradox results from differences in the two tax systems and from an underlying difference in the concept of the nature of a company. In the United States, a company is regarded without reservation as a distinct taxable entity; and a business man's Administration taxes company profits at a flat rate of 52 per cent (subject to certain depletion allowances to extractive industries). Dividends are subject to additional income tax, levied on the recipients at the rate determined by their place on the income tax scale. The British conception embodies two significant differences, one of principle and one of form. The element of overlap in the taxation of profits (that is, between the corporation that earns them and the individual who receives part of them as dividends) is now limited to the 10 per cent profits tax. Companies in practice pay to the Inland Revenue a basic rate of 48¾ per cent in tax (on unfranked income), but, on the distributed profits, the 38¾ per cent income tax element ranks as payment on behalf of the shareholders' personal liability. A British company is a taxpayer in respect of its undistributed profits; it is a tax collector in respect of its distributed profits. The final settlement is determined by the circumstances of the individual shareholder, who may obtain repayment if he is not liable to tax at the standard rate which has been deducted from his dividend or will be liable to an additional assessment if he pays surtax.

But the comparative lightness of taxation on the British company as such has little attraction for the American investor. His dividends are received after deduction of 38¾ per cent British tax; and, unlike a British investor with a low tax rating, he cannot claim any reimbursement from the Inland Revenue. He can indeed offset British tax against his personal tax in the United States. But the main burden of taxation on profits and dividends there is the 52 per cent impersonal charge on corporate profits; and an American investor cannot set off against this any British tax he has suffered on dividends. So American investors in the medium and low tax brackets find they cannot make full use of their British tax credit, and that investment in a British security does involve some additional personal tax.

Conversely, however, British investors who pay a high marginal rate of tax gain a special advantage by investing in American companies, since they can set off the 52 per cent indirect tax on an American company's profits against their liabilities to British tax. American dividends paid to British investors are subject to a withholding tax of 15 per cent. A British investment trust that receives $85 from an American dividend of $100 is relieved of any English income tax or profits tax on this dividend, provided the American company has paid United States tax at least at the equivalent of 9s. 9d. (that is the UK standard rate of 7s. 9d. plus 2s. profits tax) in the £ (48.8 per cent). The $85 dividend, which compares with $100 received by an American company or individual, is worth a gross equivalent to the British investment trust of $139. In effect, the United Kingdom investor is getting a special credit because company tax is higher in the United States than in Britain. Since prices on Wall Street are determined mainly by American demand, this makes American securities look unnaturally cheap to some British investors. The minority report of the Tax Commission recommended the curtailment of double tax relief where it produced this result.

INDIVIDUALS also gain special benefit from investing in American securities if their average rate of UK income tax is higher than 15 per cent (3s. in the pound). The higher the individual's average rate of tax, the larger will be the equivalent in gross income from UK sources provided by his American dividend. By contrast, pension funds and others exempt from British taxation have nothing to gain from the tax credit available for American corporate taxation, and they cannot recover the 15 per cent American withholding tax. These funds therefore tend to avoid American stocks, just as they have a limited interest in domestic securities that have a low UK net rate of tax. American tax-free funds face a similar, and more formidable, discouragement to investment in Britain. These artificial tax influences on various groups, causing them to favour or avoid different types of investment, are undesirable. They can never be wholly eliminated; but a reciprocal agreement between the tax authorities in Britain and the United States on, say, remission of tax to tax-exempt funds overseas ought not to be impossible to reach.

Because of lower corporation tax, a company in Britain can afford to pay a higher dividend from its pre-tax earnings than a company in the United States: company profits are worth more to the investor in Britain than to his American counterpart. Nor is the comparison greatly affected, as has been suggested recently, by the fact that British dividends are usually declared gross and paid net, after deducting tax at 7s. 9d., while American dividends are paid at the declared rate. This difference in fact embraces a further and compensating difference. The dividend received by the British

investor is subject to no further income tax from the recipient (though he may be liable for surtax or be able to reclaim income tax); but the recipient of the dividend paid gross by the American company is subject to full personal tax. In effect dividends in both countries are declared gross. The real difference in treatment therefore is represented by the difference in personal tax rates in the two countries. To sum up, with a notional example. From profits before tax of 10, a British company declaring a dividend of 3 will be able to put half as much again to reserve as most American companies. British investors will receive only just over $1\frac{3}{4}$ net from this payment, while Americans receive their full 3; for middle income investors in Britain that will be the end of the matter, but investors similarly placed in the United States must pay full personal tax on the dividend income they receive.

Americans Investing in Europe

BY OUR NEW YORK CORRESPONDENT

POTENTIAL American investors in European securities divide into three groups in their reaction to the income tax withheld by the British authorities. These are the individual investor subject to US income tax; the mutual fund, which passes its United States tax liabilities on to shareholders instead of paying them directly; and the pension fund or charitable trust, which is exempt from all domestic taxation.

The individual taxpayer faces the greatest complications. If he invests in British securities his dividends are paid after deducting income tax at $38\frac{1}{4}$ per cent. British tax is not recoverable, though it can be offset against the individual's liabilities to American taxation on this income. There is no double taxation; yet the different tax structures in the two countries in practice penalise most individual investors in British securities.

The American investor can offset the British tax on his dividend against the average rate—not the marginal rate—of his domestic tax liability. Thus, he can make full use of the $38\frac{1}{4}$ per cent credit only if his average rate of United States tax is $38\frac{1}{4}$ per cent—a tax bracket that is reached only by annual incomes of $44,000 or more. To the smaller investor, the $38\frac{1}{4}$ per cent British tax looks very stiff, particularly since in America he is accustomed to receiving his dividends gross and paying tax on them, after receipt, at the rate of tax appropriate to his income. In the United States there is no penalisation of "unearned" income; indeed the first $50 of dividend income and 4 per cent of the total is tax free. But the American investor is subject to tax (at a lower rate) on capital gains on foreign as well as domestic stocks. This means that investors in income tax brackets below $38\frac{1}{4}$ per cent, get the worst of two tax worlds. It is no consolation to tell the American investor that the US Treasury takes, in two bites, a larger total cut out of company profits than is the case in Britain.

To Americans in an income tax bracket of $38\frac{1}{4}$ per cent or higher, the British income tax is not a deterrent to investment in Britain. To those in a somewhat lower bracket—between, say, 25 per cent and 38 per cent—it tends to act as a psychological deterrent even where the extra tax paid is compensated by, say, higher returns. The average American investor today is looking for capital gains rather than income. But the same investor who will largely ignore the yield when investing in an American security will often rebel at the idea of paying the British Treasury a "bonus." In so far as he is interested in yield, the American investor should ignore this element of "wasted" tax and simply compare the net yield between an American and British security.

In practice he expects a higher yield from a foreign investment to compensate for the risk he believes to be inherent in all such purchases. If the London market (or individual stocks) appeared to possess outstanding prospects of capital gains compared with Wall Street, the element of wasted tax would be largely forgotten; but as the two markets tend to move together, this conjuncture is unusual. Experienced investors—for instance, the banks who manage individual portfolios—look mainly for capital gains in foreign securities, just as they do in domestic securities. For them, the absence of the close contact that American institutions have long maintained with corporate management may be a bigger deterrent than the withholding tax.

IN Continental countries, the individual American investor fares better (on taxes—not on information). In the Netherlands his taxes are refunded in full; in France and Italy he pays only a 15 per cent tax on his dividends; in Germany 25 per cent and in Belgium 30 per cent. These taxes, like those on British securities, can be credited against domestic liabilities; it takes an annual income of only $7,500 to utilise in full credit of 15 per cent.

The volume of American investment in foreign securities by individuals is never likely to be large in total, and will probably be confined, for the most part, to those in a fairly high tax bracket. But individual taxpayers have some advantages in offsetting foreign taxes that the two other investing groups do not possess. The real significance of the British withholding tax, indeed, is its impact on institutional investors who might in other circumstances be substantial buyers. Since an American mutual fund pays no taxes in its own right (its shareholders are assessed for United States tax on their dividends individually), it gains no benefit from the credit on tax paid on British securities. The deduction of $38\frac{1}{4}$ per cent thus appears as an unmitigated additional burden. Exceptionally, individual securities may on occasion offer prospects of capital growth that outweigh this loss of income. Lazard Frères and Eurofund bought British shares for their mutual funds before the election—but they were among the few.

American tax law makes one concession: a mutual fund with 50 per cent or more of its total assets invested abroad can pass on to its shareholders the credits of taxes withheld. As yet only two or three small funds make use of this provision. The stipulated percentage of assets held abroad might conceivably be lowered say to 25 per cent, but this would still not affect the main stream of mutual funds which would not want such a large proportion of their portfolios in foreign stocks.

American institutions are faced with the same problem in most Continental countries, although the lower rates of taxation make it less burdensome. In the Netherlands, mutual funds (like individual investors) can recover taxes withheld. It was the absence of any deterrent to institutional buying that brought such stocks as Royal Dutch and Philips Lamps into Wall Street's orbit; the buying of German and French securities is motivated, for the most part, by expectation of capital gains.

Pension funds, college endowment funds, and the numerous foundations and charitable trusts in the United States are exempt from all domestic taxation. On dividends from British securities, these institutions are subject to the full withholding tax, and, like the mutual funds, they can do nothing with the credits. Unlike the average individual investor, they must look carefully at yields. These institutional investors feel strongly that in investing abroad they should enjoy the same tax exempt status as similar institutions in those countries. (Institutional investors in Britain have the same grievance about the tax withheld by the United States.) So far the American institutions have not persuaded the British Treasury to give way. They enjoy no special treatment in other European countries either, and their buying of foreign securities other than of leading Dutch stocks, has been very small.

BUSINESS NOTES

AIRCRAFT MERGERS

Gretna Wedding

THE proposed merger between the de Havilland and the Hawker Siddeley aircraft manufacturing groups looks less like a shotgun wedding than an elopement to Gretna Green. It may present the Ministry of Aviation with almost as many new headaches as it cures. The Government wants to see aircraft manufacturing—as distinct from engine production—concentrated in the hands of Hawker Siddeley and the Vickers-Armstrongs groups. From Hawker Siddeley's point of view the purchase of de Havilland has several attractions. It buys Hawker a major stake in the missile industry, since de Havilland builds both the 2,500 mile ballistic Blue Streak and the airborne Firestreak missile. It also brings Hawker back into the jet transport market from which it was ousted by de Havilland itself, when the latter won an order for British European Airways' 24 medium range jets against Hawker's competition. The value of the de Havilland group lies less in its assets but more in its orders; a bigger grouping might be able to build these up to substantial size.

But the merger threatens to introduce a new clash of interests between the Government's two chosen groups, Hawker and Vickers. The best business for makers of civil aircraft—indeed the only business open to British manufacturers in the sixties—is likely to be for a medium-range jet. By acquiring de Havilland, Hawker takes over the orders and the part-finished drawings for just such a machine. But Vickers also intends to put one into production as a replacement for its Viscount; since this aircraft is a scaled-down version of the company's big VC 10 jet the technical and financial burden of manufacturing it are expected to be correspondingly reduced.

A big aircraft manufacturing company stays in business only by producing a fair range of aircraft for a number of markets. Can Vickers or Hawker willingly come to a gentleman's agreement to stay out of the other's cabbage patch? The trouble is that they largely occupy the same cabbage patch. In terms of public interest it seems bizarre for two companies in a contracted aircraft industry to compete against each other with near-identical aircraft. An article in last week's issue examined the difficulties of exporting civil aircraft. Vickers have much more experience in this field than Hawker. For de Havilland to have merged with Vickers, for which there were a number of good arguments, would have meant at least the radical modification of the new de Havilland jet. By eloping with Hawker Siddeley, de Havilland has a better prospect that the aircraft will reach production.

The Marriage Price

SEPARATE negotiations were being conducted by de Havilland with Vickers and with English Electric right up to the last minute. These negotiations have been protracted, no doubt because it was difficult to settle on a price. Hawker Siddeley appears to be offering a generous price. For each £1 ordinary share in de Havilland Hawker offers one £1 ordinary share and for every four de Havilland $5\frac{1}{4}$ per cent preference shares three Hawker $5\frac{1}{2}$ preference shares plus 30s. in cash. On the eve of the bid, Hawker shares stood at 29s. $10\frac{1}{2}$d., ex the maintained final dividend of 7 per cent, and de Havilland shares at 22s. 6d. On Thursday the de Havilland shares rose to 27s.

This price can hardly be justified by de Havilland's recent earnings, which have been depressed by the special expenditure on the Comet and other civil aircraft to the point where the 1957-58 dividend was passed; it obviously looks to the goodwill which springs from de Havilland's interests in civil jet airliners and missiles. Paper is again being offered for paper, as in a number of earlier Hawker bids. Full acceptance would add another 8,770,918 shares to Hawker's ordinary capital on top of the 2,750,436 shares involved in the offer to Blackburn shareholders. Whatever de Havilland and Blackburn may be worth to Hawker in the long run, such large blocks must fetter the market price of Hawker ordinary in the short run. They have reacted to 28s. 9d. and the convertible debenture from $112\frac{1}{2}$ to 109. The chance of large scale conversion next year is not a strong one since the present price of 109 imparts a value of 32s. for the ordinary.

This debenture did much, but not all, to solve Hawker's own financial problems. If the de Havilland merger goes through it will have to think also of that company's need for new finance, although one object of merging was to qualify for a government subsidy towards civil aircraft design. Will investors find the new giant, controlling the biggest aircraft group in the Commonwealth, any more attractive than they did the two separate concerns? Hawker Siddeley, under Sir Thomas Sopwith and Sir Roy Dobson, has been an active bidder—for DOSCO and the Brush Group as well as aircraft companies—but several of these acquisitions have yet to emerge to the stage of high earnings achievement. Again, by bidding for de Havilland, Hawker is taking only a first step. Unless it is followed by a drastic rationalisation of the aircraft's manufacturing capacity in this country, can that step carry the group forward?

THE ECONOMY

Still Below Capacity

IN July last year, at the low point of the mild recession of 1958, a sample of companies in Britain's metal-using industries told the National Institute of Economic and Social Research that on average they were producing 20 per cent less than their plant capacity, worked as they would reasonably like to work it, would have allowed. They added that to reach this full rate of "preferred capacity" working, however, they would have needed 7 per cent more employees and a 3 per cent increase in working hours. At the end of last month a rather larger sample from the same industries told the institute that their current rate of working, on the average, was still 15 per cent below capacity—but that to achieve 100 per cent of this "preferred capacity" they would still require as large an increase in employment and hours as before.

In crude arithmetic, this new figure would match what has happened to output in these industries and appears to have happened to capacity. Metal-using production probably rose about 10 per cent in the 16 months between the two inquiries; against that the institute reckons that investment in these industries, in the period, may have added 5 per cent to their capacity.

Productive capacity in these industries is growing at perhaps 3-4 per cent per year. These latest findings suggest that even if the rapid rise in industrial output this year were to continue unabated, these industries at least would encounter no general limitations on the side of capacity next year. But what the institute's inquiry also emphasised is the patchiness, so far, of the boom in engineering. It was told that companies making cars, consumer durables, and components for them were working to full capacity—though they were also beginning to spend heavily on new plant, and expecting to go on raising output in the next six months. Most other metal-using industries, taken together, had only increased their output a little; they are working well below capacity, they do not expect their output to rise much in the next six months, and they expect to invest no more in 1960 than in 1959. A good deal of the unused capacity in these less busy firms, however, is

" structurally " spare and likely to remain so —for example in shipbuilding, aircraft, and parts of cable manufacturing. Some of the apparent room for further expansion, thus, exists precisely where no immediate expansion can be expected.

How Much Sheet Steel?

ONE factor that some engineering companies told the institute was limiting their output, apart from capacity and labour, was the supply of steel ; in motors and consumer durables, in particular, customers have been complaining that they cannot get enough sheet to match the output they would like to produce. This pressure on supplies is likely to last into the second half of next year, when extensions to capacity at the three existing strip mills should begin to increase sheet production quite substantially. Already completed capacity at the Steel Company of Wales, as it comes into full operation, should offer the biggest addition to supplies ; but Richard Thomas & Baldwins will be getting some extra output from its remotored mill, and a large extension at John Summers will come into operation by the end of the year. Total strip mill capacity will then be about 400,000 tons more than it is now.

This extra capacity will be working for a full year in 1961, raising production further. The Steel Company of Wales, moreover, will be spending another £30 million on increasing its steelmaking capacity to 3,650,000 ingot tons a year and putting in a continuous slab-casting plant and a new 48-inch hot strip mill. It will not build new steelmaking capacity, but will modify what it has—perhaps by changing its new Bessemer plant over from bottom-blowing to more efficient ways of making steel with oxygen? It was moreover announced this week that Richard Thomas & Baldwins is bringing forward its Newport scheme by a full year ; this new strip mill will begin operations at the beginning of 1962 instead of the beginning of 1963 as was decided last year. It will thus begin working at about the same time as the strip mill at Colvilles.

The project has also been revised to increase the capacity of the mill at Llanwern, Newport, from about a million tons of crude steel and about 600,000 tons of finished steel to about 1.4 million ingot tons and 850,000 tons of strip mill products. The Newport plant will supply some slabs to Ebbw Vale for rolling down into sheet and strip, as well as feeding its own hot and cold mills. It is now to be a continuous mill, not a semi-continuous mill for later conversion to continuous working, as was at first decided. Colville's strip mill at Ravenscraig is still planned as a semi-continuous mill, and no increase in its initial capacity of 500,000 tons of finished steel seems to be planned ; but some modifications may be made to allow more of its finished steel to be produced as sheet, and less as light plate, if demand should require.

CROSSE AND BLACKWELL

Two Bidders

THE Nestlé Alimentana Company of Switzerland has thrown its gauntlet into the expanding, but highly competitive, British market for foods of better quality and greater convenience with its bid of 72s. in cash for the 2,700,000 shares of Crosse and Blackwell. But this challenge has not gone unanswered ; Fisons has come forward with a better bid of 82s. in cash. The directors of Crosse and Blackwell will give their views to shareholders as soon as possible: at the moment, the ball is back in Nestlé's court. If it wants C and B badly, it will have to raise its bid, and the fact that on Thursday C and B shares closed at 83s. 9d. shows that the market expects this. On the face of it, the entry of the biggest fertiliser manufacturer in this country into this story seems odd though Fisons's directors are at pains to dispel surprise by pointing to their " substantial investment " in the food industry through Fisons Milk Products in Northern Ireland and their interest in the grocery trade through the sale of " proprietary medicinal products of a nutritional character." They have been contemplating further substantial investments in the food industry for some time, but Nestlé's bid prompted them to quick action. A merger between C and B and Nestlé would seem to be more natural. For Nestlé the attractions of such a match are obvious. It would give it a one-third stake in Britain's £18½ million canned soup market and a small extra share (in the shape of Elizabeth Lazenby's) in the £6½ million packaged soup business to combine with its own Maggi line, which does much better on the Continent than it does here. Crosse and Blackwell's sell a third of the pickles bought in Britain and a tenth of the baked beans, as well as proportionately much smaller shares of the canned peas, meat and fish paste, and confectionery. Both companies have widespread interests—Nestlé has nearly 150 factories in five continents ; C and B has subsidiaries in America, Australia and South Africa.

But, reasonable as the purchase must look to Nestlé from these points of view, it now faces a competitor and must pay more to gain its end. Nestlé seems to be counting first on the prospect that European standards of living will continue to rise and thus cause a switch to demand for foods of convenience. Its second assumption is that European free trade (amongst the 13) will really happen. Then the large canning plants belonging to Crosse and Blackwell could can foods designed for the European market and sell them in quantities of the kind a firm of the size of Nestlé is used to. The advantages of concentrating production in a few plants best suited to the purpose have already been acknowledged by a mounting number of mergers among firms in the six countries of the common market.

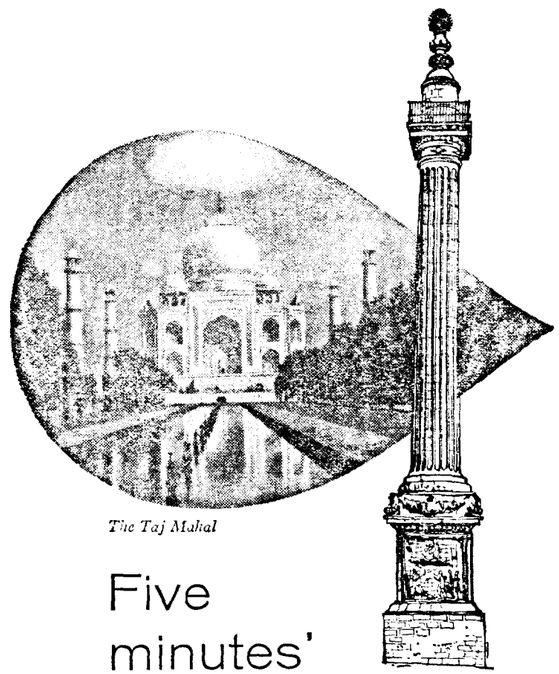
AIR CORPORATIONS

Saving Whose Face?

AT the end of Tuesday's debate on the borrowing powers of the two air corporations, the Minister of Aviation casually slipped in the statement that he was going to authorise the British Overseas Airways Corporation to cut fares on certain routes to the West Indies, Africa and the Far East which, being British territory, are outside the jurisdiction of the fare-controlling International Air Transport Association. There is a lot to be said for curbing the far-reaching authority of IATA by occasional acts of defiance and there is everything to be said for allowing airlines to cut fares whenever they choose. But there is a great deal to be said against going about it in the way that Mr Sandys has done.

The Government has promised new legislation to rationalise the present unworkable arrangements for licensing air services—in other words, it has promised to re-define the spheres in which it will allow competition between the nationalised air corporations and the independent air lines. A draft bill is expected soon after Christmas. Meanwhile an application submitted by three independent airlines to cut fares to half the present level on just these routes where BOAC is to be allowed to cut rates —has been on ice since last spring. The last Minister of Transport, Mr Watkinson, had been expected to give his decision for or against these applications as far back as last June. The difference between these proposals and those recently submitted by BOAC and rubber-stamped by Mr Sandys with a despatch that the independent airlines must envy is this : the independent airlines wanted to cut fares by half, BOAC by 10 to 20 per cent.

This seems, therefore, not the strongest issue for Mr Sandys to pick for his quarrel with IATA, especially since the international discussion on fares held in October broke down at least in part because BOAC, far from taking a lone stand in favour of wholesale fare cuts, refused to support American moves to cut fares to South America, on the Pacific and to the Middle East. BOAC wanted to cut fares only on those routes where it absolutely needed to do so in order to fill empty seats. The Minister has probably been convinced that BOAC's financial results next year and the year after will indeed be black unless every conceivable device is used to attract traffic and find work for surplus aircraft. But the decision suggests that the independent airlines may be the ones to suffer ; when Mr Sandys talks of " working out solutions " on the question of their half-price fares which will give " some reasonable satisfaction to both parties " they are not likely to be much comforted.



The Taj Mahal

Five minutes' walk

FROM THE MONUMENT

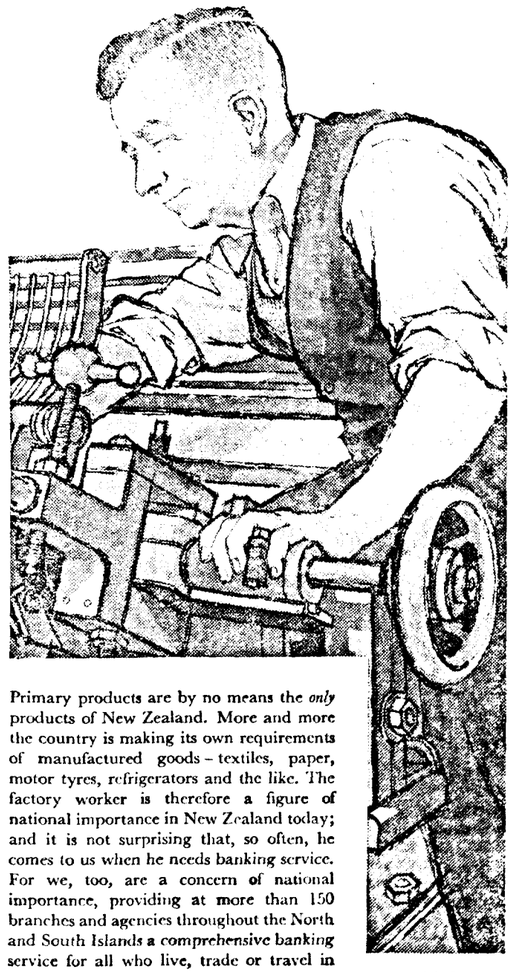
Five minutes' walk from the Monument of London could take you inside The Hongkong and Shanghai Banking Corporation . . . and, *for business purposes*, inside India.
The same walk could take you inside the other territories where we are established.
We can provide you with up-to-date credit information and advise you on many other aspects of business with the Far East.
As the largest British bank established by the Far East for the Far East, with branches in 20 countries and a network of agencies in all other principal trading centres, we are in a unique position to help you.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

HEAD OFFICE: HONG KONG
LONDON OFFICE: 9 GRACECHURCH STREET EC3

Branches throughout the Far East; also in New York, Hamburg and Paris. Offices of our Subsidiary in San Francisco and Los Angeles.

In New Zealand he's a national institution
. . . and so are we!



Primary products are by no means the *only* products of New Zealand. More and more the country is making its own requirements of manufactured goods – textiles, paper, motor tyres, refrigerators and the like. The factory worker is therefore a figure of national importance in New Zealand today; and it is not surprising that, so often, he comes to us when he needs banking service. For we, too, are a concern of national importance, providing at more than 150 branches and agencies throughout the North and South Islands a comprehensive banking service for all who live, trade or travel in New Zealand. It follows, then, that whenever you need information about some aspect of New Zealand's national life, you should get in touch first with the *National* Bank of New Zealand.

THE NATIONAL BANK

OF NEW ZEALAND LIMITED

Head Office: 8 Moorgate, London, E.C.2. (MONarch 8311)
West End Branch: 13 Charles II Street, London, S.W.1. (TRAfalgar 6791)

Gunnar Ericsson, President of the Facit Group — one of the world's leading business machine manufacturers and exporters.

Why are so many world-known business machines built **by Swedes?**

"I believe the answer to that is — Swedish technique and tradition.
You see, Swedes are mechanically gifted and have an almost reverent respect for quality, precision and craftsmanship.
And as inventors, builders and designers, Swedes — also descendants of Swedes abroad — have made pioneering contributions to quality production of modern business machines.
In relation to her population, Sweden today produces more business machines than any other country in the world.
And Facit, Sweden's leading manufacturer and exporter, which to date has produced more than 2 million business machines, has played a substantial role in this development."

If you would like to read the story of this achievement, your local Facit agent will gladly send you a free copy of our brochure "Why are so many..." — or you may write directly to Åtvidabergs Industrier, Stockholm 7, Sweden.

FACIT

Factories in Sweden and West Germany.
Sales and service offices in 102 countries.

Obsolete Aircraft

THE debate produced some of the most severe criticisms of BOAC's management yet voiced in the House of Commons. Successive speakers, apparently acutely embarrassed, said there was something very wrong with the top direction of the corporation and its ability to work as a team; the moderation of MPs' language made their strictures carry more weight than the usual cheerful abuse might have done. Mr Sandys skated discreetly over these points; he neither criticised, nor defended the way that the corporation is managed. He did however, raise a point that has considerable bearing on the corporation's future and, indirectly, on government policy. This was the question of losses on obsolete aircraft. The Minister hit sharply on the head the old bromide about a jet race; airlines had bought jet aircraft "because jet aircraft are cheaper to operate. They are more economical to run and it is very difficult to compete with other airlines if one's operating costs are heavier than theirs."

It is precisely this fact that has knocked the bottom out of the market for second-hand piston-engined and turbo-prop aircraft. For many years new aircraft, especially long-range piston-engined ones, have tended to be more expensive to operate than the older types they replaced, but were bought because they offered certain advantages in performance. The retired aircraft therefore found a ready market among airlines with more interest in operating economy than in performance. Consequently the sale of old aircraft usually provided a substantial part of the purchase price of new fleets.

BOAC had a below-the-line deficit of £6½ million as well as a loss of £5 million on its operating account last year because it had not provided sufficiently rapidly for the depreciation of its fleet. The price that it is likely to get for its Douglas 7C aircraft, and later for its Britannias as both are replaced by jets is likely to be so low that, said the Minister, "it might conceivably be better to continue to use some of these aircraft for a longer period in subsidiary roles." This was one of the most loaded sentences in his whole speech. The only use to which BOAC can put such aircraft is the kind of cut-price charter, trooping and holiday tour work now reserved for independent airlines. The corporation has doubtless been pressing the Minister hard for permission to spread its operations into these fields, and its financial position is such that he is bound to listen.

IN THE MARKETS

Equities Go Ahead

THE equity markets in London have moved to new peaks this week carrying *The Economist* indicator up 7.2 points to 359.9 (1953 = 100). On Wall Street the August peaks have been all but regained. Gilt-edged have generally been dull, which has not helped the reception of the World Bank's loan of £10 million in London, the terms of which were in any case finely drawn. The strength of the sponsorship of six leading merchant banks ensured a full subscription; but dealings started on Thursday at a discount of ⅛. By contrast, but not unexpectedly, Wednesday also saw a stampede to take up the offer for sale of 300,000 shares at 19s. in Dimplex, Ltd., a medium sized company manufacturing heating equipment. The aggregate of investors' applications, for what the figure signifies, was 24½ million shares.

The main source of encouragement for the industrial market continues to be the signs of revival in the capital goods industries. This week shipping shares have at last found some joy in the small rise in freight rates. The batch of results from steel companies has pleased the market on its second thoughts, and this week steel shares have been firm, after some falls last week. Aircraft shares have enjoyed a special boost from the Hawker-de Havilland merger and talk of more. But this revival in the shares of capital goods industries has not been at the expense of consumer industries; store and hire purchase shares have risen gently, though these are generally close to their peaks.

HIRE PURCHASE

Restrictions Again?

GUESSES about any early rise in Bank rate have abated in the past two weeks. The argument—and it is a respectable one—is that the authorities would surely be reluctant to exert a general restraint on the economy just when the heavy capital goods industries, and the areas depressed by a heavy concentration of them, are showing tentative signs of revival. It would seem more likely that if the boom in consumer goods goes on, the authorities might be more ready to search for selective rather than general measures to restrain the booming Midlands and South. The two main types of selective measures that Conservative governments have used in the past are increases in purchase tax and official controls on the terms of hire purchase contracts. Hire purchase controls, though probably more objectionable in principle, might be the easier to put over in a Tory parliament.

Ironically enough, they would also find some welcome among the hire purchase finance houses, if they did not go too far. In the past year, hire purchase finance houses have not done too well in matching their new freedom with a new sense of responsibility. Reckless competition in ever easier terms of repayment has now taken a predictable toll. Even the biggest companies are licking their wounds inflicted by dealers' frauds and hirers' defaults. The proportion of accounts in arrear and bad debts are commonly running twice as high as a year ago.

Hire purchase houses still do not seem to have drawn the moral. "So long as unsound terms are widely advertised," Sir Mark Turner has said in the latest annual report of Mercantile Credit (its own bad debt ratio has risen very little), "they cannot be ignored by dealers even of the highest class." That may be so. But should standards of business be inescapably set by the worst hire purchase practice? Expansion can be bought at too dear a price. Some finance houses see this point; but they do not yet see how, in this growing and turbulent business, collective voluntary restraint could effectively be arranged. So they have a private hankering for a gentle statutory control; the trouble, as they know, is that once official control is back there is no guarantee that it will be gentle.

One welcome result of these recent shocks from hire purchase defalcations has been to encourage more competition in the service charges made to the public. Rates of 6 per cent nominal, rather than the general 7 per cent, are becoming increasingly common on new cars, and rates on machinery—where the HP houses have felt the competition of bank advances—are often down to 4 per cent, with even lower rates quoted in particular competitive situations. Such rates involve an element of "loss-leading" for a finance house (though not necessarily for a bank-finance house group considered as a whole). The smaller finance houses without a bank connection are thus being put to the test. Competition of this kind is the natural and welcome result of the banks' entry into the field.

STERLING

Show of Strength

THE Treasury announced on Thursday that it would not renew its stand-by credit at the International Monetary Fund. This credit has never been employed. It was first arranged in the Suez crisis, together with an actual drawing of $561 million. When $200 million of the drawing was repaid in spring this year, the amount of the stand-by credit automatically rose by that amount to $938½ million. The facility costs only $2 million a year to keep open, and its discontinuation at this time is a sensible gesture by the British authorities of their confidence in the underlying strength of sterling. It should serve as another reminder that the recent outflow of funds from London has been occasioned purely by interest arbitrage. The Treasury is also considering whether to speed up repayment of the remaining portion of the IMF drawing, which is due to be made in monthly instalments of about $15 million through 1960 and 1961. The end-year instalments on postwar loans from the United States and Canada will involve a total service charge of $184 million at the end of the month.

COMPANY LAW

The Jenkins Committee

EVEN before the first word of evidence is heard, it is possible to say that the Jenkins committee will have a less explosive effect on British company law than the Cohen committee had—merely because there is less to put right. But the committee has been given very wide terms of reference which go beyond a conventional re-examination of the 1958 Act so that they can embrace the rights of shareholders and the duties of directors and the soliciting of unsecured loans and deposits from the public. The first point needs definition—if it is possible to do so; the second certainly needs control. A good deal of the committee's work seems likely to concentrate on these two issues. British company law and practice needs review and the job has been given to a strong, well-balanced committee.

A formidable array of legal talent on the committee is led by its chairman, Lord Jenkins, whose rapid advance through the ranks of the judiciary is sufficient testimony to his authority. In addition, there is Mr K. W. Mackinnon, QC, a Bencher of the Middle Temple; Mr Hilary Scott, a partner of a leading firm of City solicitors, Slaughter and May; Mr J. A. Lumsden, a partner of the Glasgow firm of solicitors, Maclay, Murray and Spens; and Professor L. C. B. Gower, who has written the most up-to-date book on company law, radical in tone and which argues, in particular, against the idea that directors are simply trustees for shareholders. The one industrialist on the committee, Mr F. A. Bingen, deputy chairman of Imperial Chemical Industries, also has long legal experience, having served as the head of ICI's legal department for ten years before joining the board in 1951. Banking is represented by Mr W. Watson, treasurer of the Bank of Scotland, Edinburgh; and the trade unions by Mr. R. Smith, the secretary of the Union of Post Office Workers. Financial journalism is admirably represented by Mrs Margot Naylor, who has done as much as anybody to keep a vigilant eye on the interests of small investors; and accounting by Mr W. H. Lawson, a partner in Binder, Hamlyn and Company, who was largely responsible for the amicable merger between the two senior accounting bodies and who quite recently undertook an examination of the affairs of the State Building Society.

The City itself is represented by an eminent three-quarter line. They are Mr F. R. Althaus, senior partner of Pember and Boyle, the investment brokers, and deputy chairman of the Stock Exchange Council; Mr Leslie Brown, the secretary of the "Pru" who is one of the most highly esteemed among all the investment managers of insurance companies; the experience and judgment of the merchant banks will be represented by Sir George Erskine of Morgan Grenfell and Mr G. W. H. Richardson of J. Henry Schroder. In all, it would be difficult to devise a better team than this.

COTTON INDUSTRY

Lancashire's Artful Dodgers

BUSINESS in the Lancashire textile industry is booming. The turn-round from recession has come quickly; the need to replenish stocks has been encouraged by the firmness of raw cotton prices and the knowledge that much of the machinery is to be scrapped by March 31. And as delivery dates lengthen, some buyers may be ordering for the sake of getting a place in the queue. Spinners and weavers are working much closer to capacity than they were in January, and shift-working is gradually spreading. Most mills, apart from those closing down, have enough work to keep them fully employed into May. Cotton shares have continued to rise.

The prospect of continuing prosperity is apparently tempting a few people to try to profit from the reorganisation scheme at public expense. Two members from cotton towns claimed in the House of Commons last week that some people whose firms have applied for the premium rate of compensation for leaving the cotton industry altogether intend to resume business under a different name. The special committee of the Cotton Board is now investigating the two cases that have been brought to its attention. Under the terms of compensation it is the firm that must cease business, not its owners. Thus it is difficult to see how this loophole can now be closed, though the President of the Board of Trade, Mr Maudling, said during his visit to Lancashire last week that the special committee would enforce very strictly its restrictions about people going out of business.

HOW SHARE PRICES HAVE RISEN

	Price. April 23*	Price. Dec. 16	Current yield
Fine Spinners	25/-	32/3	6·20
Lancashire Cotton...	44/6	66/9	5·24
J. & P. Coats.....	25/3	33/1½xd	6·04
English Sewing.....	31/6	49/6	5·05
Ashton Bros.	24/-	35/-	5·71
Horrockses Crewdson	33/6	40/6	....
Joshua Hoyle	2/3¾	3/10½xd	2·58
Courtaulds	31/10½	62/3	3·75

* Government announced its proposals on April 24.

The scope for these cotton phonies seems limited to weaving (spinning requires much more capital) and even in weaving it is restricted by the supply of looms. When the Government announced its proposals in April dealers held about 5,000 second-hand looms; nearly all of them have since been sold — mostly, perhaps, to firms remaining in business. And firms that are scrapping machinery may have a few thousand looms not eligible for compensation. Mr Erroll, Minister of State at the Board of Trade, has found it "encouraging to know that there are firms with sufficient confidence in the industry to be ready to re-invest their compensation in it." Some firms in Lancashire who have decided to stay in do not find it so easy to be quite so polite to others that want to be paid to go but without actually doing so.

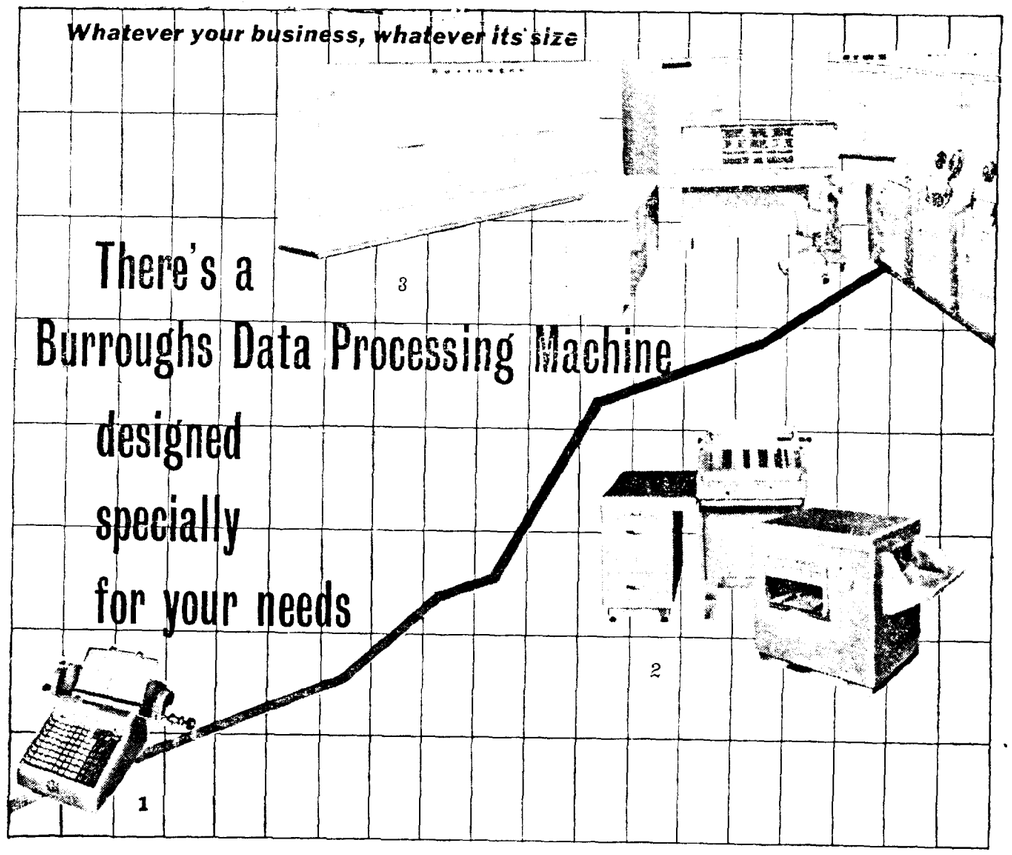
RESTRICTIVE PRACTICES

Like Baker, Like Carpetmaker

THE Restrictive Practices Court this week delivered judgments on two restrictive trading agreements, ruling that both were contrary to the public interest and hence would have to be abandoned. On Wednesday the Court under Mr Justice Pearson gave a reserved judgment on the agreement of the Federation of Wholesale and Retail Bakers; on Thursday, under Mr Justice Upjohn, it ruled against the agreement of the Federation of British Carpet Manufacturers.

The bakers' agreement had recommended a maximum retail price for bread, and fixed retailers' margins; a similar agreement among Scottish bakers was ruled against by the Court in Edinburgh last July. The federation had contended that the agreement benefited the public, in particular by limiting the margins retail bakers charge. The scheme was a continuation of the one used by the Government during the war: though in the Court's view the federation had made a serious attempt to evolve a price-fixing formula, it held that it was neither necessary nor realistic to take the Ministry's wartime methods as a foundation. The Court held that while the recommended prices were, in theory, maximum prices, they had in effect acted as *minimum* prices as well; whether or not otherwise beneficial, they had not been so by virtue of being called "maximum" prices. Some of the bakers' profits indicated that they could afford to cut prices if they wished to; although sales of bread confectionery have been falling, none have done so. These same high profits, in the Court's view, made it difficult to justify any claim that the consumer was being protected by the agreement.

The carpet manufacturers' agreement contained a "standard of trading" purporting to define various qualities of carpets; it fixed the prices of these standard qualities; it prohibited direct sales to large consumers (e.g. the LCC); it fixed wholesale discounts; and it restricted the number of wholesalers. All of these clauses were found to be contrary to the public interest; in concluding a brisk 90-minute judgment, *Mr Justice Upjohn remarked that the agreement* "had been sunk very nearly without trace." The Court also ruled against a clause that regulated export prices, as the restriction stood last August 16th. On that



Burroughs make a full range of business equipment—that's why, whatever the size of your business, there's a Burroughs system exactly fitting your needs.

Burroughs forward-looking design and precision engineering ensure that each machine, in each class, has all the versatility and the advanced automatic features required by today's modern accounting methods.

Whether your business calls for an adding machine, an accounting machine, or a large electronic computer, you can be sure that a Burroughs machine will give you the right answers—faster, easier, and at a big saving in operating cost.

Your local Burroughs man is available now to demonstrate how you can streamline your accounting with Burroughs data processing equipment. Or write to:

Burroughs Adding Machine Ltd.,
Avon House, 356-366 Oxford Street,
London, W.1. Tel: HYDE Park 9861

1. **New Burroughs Shuttle-Carriage Adding Machine**—for vertical and shuttle listing work on tape or wide forms—easy, speedy, flexible.
2. **New Burroughs Sensitronic with Automatic Reader**—electronic accounting machine providing ledger-keeping with visible record and magnetic storage. Trial balancing made completely automatic when linked to auto reader with individual form handling.
3. **New Burroughs 220 Electronic Computer System**—the most complete electronic data processing system in production today.

THE FENNER-DODGE SC BALL BEARING PLUMMER BLOCK

A sealed bearing with relubrication facilities giving longer life under arduous conditions.
Easy to fit housing designed to give adequate spanner room and elongated bolt holes allow lateral adjustment.
Separate collar provides bearing to shaft fixing without distortion of inner race.
Special seal designed for low frictional losses and keeps grease in and dirt out.
Deep groove ball bearing with long inner race distributes loads over greater shaft area, and is fully self-aligning.

LARGEST MAKERS OF V-BELT DRIVES IN THE COMMONWEALTH

LAING FOR COMPLETION ON TIME

Co-operating for two years with the Architects and Consulting Engineers, the Group's Research and Development Centre put its testing facilities, casting and construction experience into the development of LAINGSPAN.

Here, at Arnold near Nottingham, school accommodation for 720 pupils was constructed in 15 months and is now occupied.

Architects: Architects and Building Branch of the Ministry of Education in collaboration with Nottinghamshire Education Committee.

Consulting Engineers: A. J. & J. D. Harris

date the federation awoke to the fact that its export regulations could have been incorporated in a separate agreement and thus have avoided registration under the Act. It accordingly passed a resolution amending the agreement, and sent this to the Board of Trade. The Board of Trade, however, ruled that they had merely varied an existing agreement, and had not in fact created a new one. This issue must now be decided by the High Court ; unless it is held that the federation has actually created a separate agreement to contain its export restrictions, they too will fall.

CIGARETTES

A Penny Off Piccadilly

ONLY twopence separates Piccadilly No. 1 cigarettes from Players and Senior Service, and some smokers think Piccadilly are just as good a smoke. But cigarette smokers are almost proverbially reluctant to change brands and the twopence difference between 4s. 1d. and 3s. 11d. for twenty, makes an enormous difference in size of sale. Players and Senior Service are two of the four most popular brands while Piccadilly and all other brands that sell at more than 3s. 11d. have between them no more than 1-1½ per cent or so of the total market. The cut of one penny that the Rembrandt-Rothmans-Carreras group are making in the price of Piccadilly No. 1 next month—for exactly the same cigarette—could make a difference. Most smokers still buy only one packet at a time, and now that they will not have to fork out that extra penny, over the two florins, the company is clearly hoping that some may be tempted to switch.

But Woodbine Export, which have been selling extraordinarily well since they first appeared in parts of the country last September, are also four shilling cigarettes. And filter cigarettes, which in three years have grown to take as much as an eighth of the total market and mainly sell at 3s. 4d. and 2s. 6d. for twenty, have been perceptibly filling in the previous void between and below the two really big selling peaks of 3s. 11d. and 3s. But the Rembrandt-Rothmans-Carreras group has to rely on competition alone if it is to consolidate its place in the tobacco industry as a small independent manufacturer. Expansion by further mergers would not seem to be on the cards, for the smaller tobacco companies struggling to maintain their comparatively small sales could hardly be attractive to the group while the seemingly obvious partnership with Gallaher (if either had a mind to it) would stumble across the problem of Imperial Tobacco's shareholding in Gallaher. As an independent, therefore, the group has to find its own way and under the leadership of Mr Anthony Rubert and Mr R. Plumley it has signified its intention of doing so by selling the shares that Carreras held in other tobacco companies.

While its managers are tackling the external problem of the market they have also to solve the belated internal problem of making the merger between Rothmans and Carreras viable. The basic task is to reconcile the interests of the controlling shareholder, Rembrandt, with those of the voteless "B" shareholders in Carreras who own the bulk of that company's equity. The answer that the group's directors have evolved is to concentrate production at the new factory at Basildon, with Carreras making Rothmans' cigarettes, as well as its own, at a fair price (which is to be formally recognised in a long term manufacturing agreement), and to amalgamate research and distribution services but to leave each company to devise and to run their own selling and promotion campaigns. But even with all the good will and fair-mindedness which characterise the new management of the group this still requires some tightrope-walking skill. It can only be successful, if the brands of cigarettes made by the two companies are not direct competitors, either in type or price. At the moment, especially as Carreras has stopped manufacturing some small-selling uneconomical brands, they are not, and in the future each company is likely to continue to exploit different kinds of markets.

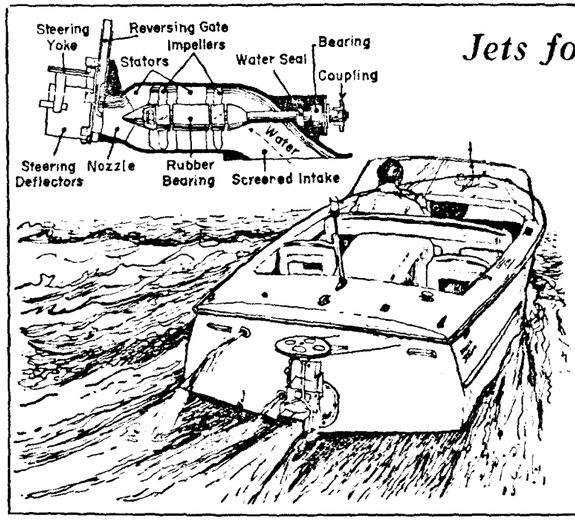
TRUCK ACTS REFORM

Wages through the Bank

THE Payment of Wages bill published this week provides, as foreshadowed in the Queen's Speech, for repeal of the outmoded sections of the Truck Acts forbidding payment of wages to manual labourers other than in cash. The bill will legalise payment of wages to those employees who specifically request it in writing, by cheque, by transfer to a bank account or by postal order or money order. The only case in which written consent of the employee will not be needed is for payment by postal order or money order when he is away, either on account of his work or of illness.

This provision will come into force one month after the passing of the Bill, and those for other payments with these orders or for transfers direct to bank accounts after six months. The provision permitting payment by cheque will await an order from the Minister of Labour, who will want to satisfy himself that the innovation does not cause disruption among retailers and the banks. This is sensible enough. The real economy is to be gained from bank transfers to employees who already have accounts.

Jets for the Sporting Boatman



DOWTY, the makers of aeronautical and hydraulic equipment, this week entered the market for pleasure boating with a jet-propelled speedboat—the jet being of water, not gas. The simple "burbine" is driven by a petrol engine ; the jet is turned to steer the boat. Previous water jets, dating from the eighteenth century, were ejected below the waterline ; this new system, invented in New Zealand, is claimed to be more efficient because it ejects into the air. The efficiency of this unit is claimed to compare with that of a propeller as mounted on speedboats, though it is theoretically lower. It costs a little more than the propeller, rudder and other gear that it replaces. If sold separately, as it may be later, it would cost about £175. The Dowty "Turbocraft" is made of fibreglass ; with its Ford Zephyr engine it does 35½ mph. Dowty has assigned 60,000 sq. ft. of factory space to a new subsidiary, Dowty Marine, for its manufacture, and optimistically hopes to sell 4,000 by next May, mostly to export markets. Fairey Marine, the biggest British boat builder, makes 1,000 boats a year, mostly dinghies. Despite the large output planned, the "Turbocraft," at £798, costs more than comparable conventional boats. The Healey Ski-master, another inboard-engined boat which also does 35-36 mph, costs £650, and an outboard boat would cost £400-£500, for speeds of around 30 mph.

Cheques given to those without them may save the employer time, but they are likely to be a nuisance to everyone else.

NRDC

Geese and Swans

THE National Research Development Corporation now has ten years' experience behind it of fostering other people's brain children and its annual report to June 30th shows that it is at last beginning to get the hang of the job. The purpose of setting up the Corporation was not to pay for research but to smooth the frequently difficult transition from laboratory to commercial development for inventions which happen to be made outside industry, usually in universities or publicly owned research establishments and just occasionally in private workshops, and can gain no support from private business. That help was intended to take two forms: commercial advice, which included proper patent protection, and financial help to build a working prototype that could be demonstrated to possible customers.

In the past, the NRDC has sometimes been tempted to give financial help to some very lame ducks indeed. It is impossible to tell how much money it has sunk into abortive projects; unlike the Department of Scientific and Industrial Research, the Corporation does not publish the size of its individual grants. But in its past financial year it spent £600,000 in helping the development of some 30 separate projects, and the total it has spent on development during the whole ten years is just under £2 million. Its income from patents and repayments of money loaned for development was more than £300,000, which is equal to about a third of its total outgoings.

The Corporation's current annual report gives the impression that the list of projects it supports has been severely pruned, although it claims to have dropped only four during the past year. It still supports Dr Gabor's work, still unproved, on a new type of cathode tube for colour television, and it still continues to back some unusual systems of mechanical transmission. But against this, it can point to a good many workaday products arising from work in government laboratories, such as ditch cleaners, pitch stabilisers and an impressive record of development in computers and in drug production ranging from new sources of cortisone to current work on what may prove to be a new family of antibiotics comparable in importance to the penicillins.

The corporation's work here is mainly to co-ordinate research in various centres, to see that it is properly patented, and to negotiate with interested manufacturers such as Glaxo or Distillers. A certain amount of judicious publicity that NRDC acquired through its support of fuel cells (taken over from the Ministry of Power) and of the Hovercraft, one of the workable ideas from private inventors that it has fostered, certainly seems to have made it easier for NRDC to find customers in industry for its clients.

Dial for Power

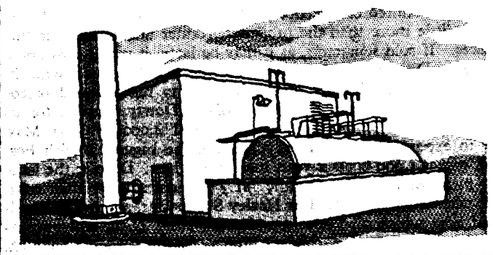
A NEW unmanned power station on Dartmoor has equipment which will telephone its Bristol control room, 100 miles away, when something goes wrong: and the engineer in charge can correct the fault and check the results of his work before ringing off. The 3,000 kilowatt station was opened a week ago by the South Western Electricity Board, to provide 80 to 100 hours of stand-by and peak-load power a year. The important innovation in its "Datofonic" remote control system is that it works through the ordinary public telephone lines.

An earlier version of this "Datofonic", which has been developed by Sound Diffusion (Auto-Thermatic), Ltd, would answer questions and volunteer information to its distant controlling engineer in a voice rather reminiscent of the old-fashioned "I Speak Your Weight" machines. The Mark II, installed for the first time on Dartmoor, "bleeps" as well as talks. It speaks to the trunk operator when it puts a call through to the control room, and announces its identity by voice. But it answers the engineer's questions about running conditions in coded bleeps which flash indicator lights and turn dials. These same pulses can start, stop and adjust the generating equipment.

Up to 40 different instructions can be bleeped down to Dartmoor through a single control unit costing £1,200. The Dartmoor end cost a further £1,200; up to 24 similar sub-stations could be worked (each costing another extra £1,200) from the single control unit in Bristol. The cost of each operation is simply the cost of the telephone call.

Electricity boards are among the main users of remote control equipment in Britain, but the privately rented telephone lines that they normally use are comparatively expensive to run. The Post Office has decided to allow public utilities employing continuously manned control rooms to use the new system on the ordinary subscriber lines, and Sound Diffusion (Auto-Thermatic) sees the electricity, gas and water authorities as large potential customers. The South Western Electricity Board has combined the new system with a control centre at Bristol, housed in something more like a board room than an engineer's workshop. Round the walls runs a 70-ft diagram representing 2,000 miles of high voltage mains and 2,800 sub-stations. The control engineer is guided by it to direct his field operating engineers, by telephone or VHF radio. The pattern inevitably brings to mind the possibility of a fully automatic system, with a computer at the centre and a man in a comfortable office to watch it, while bleeping units replace men in the field.

Less spectacular, perhaps, is the use of the Bristol Siddeley Proteus turbo generator (adapted from the Britannia aero engine) to power the new station on Dartmoor. This station cost about £27 for every kilowatt it will produce, compared with £40 to £50 per kW for a full-scale steam turbine station and about £32 per kW for a diesel standby unit. The gas turbine has the advantage in reliability and can be brought into service exceedingly quickly. But the electricity generated will cost about a third more than would the power produced by diesel plant manufactured by the same company.



STOCK EXCHANGE

Bigger Subscriptions

MODERNISING the London stock exchange is not a costless operation and its members have been told this week by the chairman, Lord Ritchie, that there is likely to be a substantial increase in subscription rates in the year which begins on March 25th. In warning members of this increase, Lord Ritchie says:

> The Council have recently made a preliminary investigation into future expenditure, the outcome of which is that they have come to the conclusion that if the stock exchange is to be kept constantly abreast of modern requirements it will be necessary for the undertaking to increase its revenue.

Among the items for which the Council has to make provision is the mechanisation of certain departments of the stock exchange, especially the settlement department, the plan to re-build the "House," and an increase in staff. Modernisation is necessary if a bigger volume of business is to be handled with ease and few members can have cause for complaint if they are asked to pay more to provide better facilities for themselves and their customers. They may have worn themselves out this year in coping with the unprecedented volume of business but they have at the same time earned a fat income for their labours.

JUTE AND DUNDEE

Markets and Margins

PRICES of raw jute and jute goods have risen sharply. In Pakistan, the principal exporter of raw jute, the acreage was reduced this year and the crop has proved to be somewhat smaller than the trade expected and poorer in quality. In India, the principal exporter of jute goods, stocks of hessian and bags in Calcutta are low, owing mainly to a sharp rise in exports this year. Thus there seems some justification for an increase in prices, though perhaps not as much as speculators in Calcutta and Pakistan have secured, encouraged by the report that Indian mills are to be allowed to buy a large quantity of low grade jute from Pakistan. Jute firsts in Pakistan are now quoted at about £102 a ton cif for early shipment, which is about £10 a ton dearer than a month ago, and the shortage of certain higher grades is reflected in larger premiums. In Calcutta, a 10 oz 40 in. hessian cloth has risen in the last month by over 4s. to 64s. per hundred yards fob, and the standard jute bag has risen by about 10s. to 166s. per hundred bags. Prices of yarn and cloth in Dundee were raised by about £5 a ton last month.

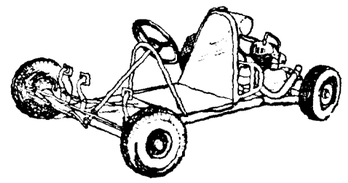
Output in the Dundee industry has recovered this year, thanks mainly to the sharp rise in sales of floor coverings, including tufted carpets. Between the first nine months of 1958 and 1959 output of jute yarn and cloth rose by nearly eight per cent. Yet Dundee can never feel secure. In the House of Commons last week Mr Erroll confirmed that the United Kingdom Jute Goods Association and the Indian Jute Mills Association had asked for the mark-up on imported cloth to be reduced. The Jute Control, the sole importer of Indian and Pakistani jute goods, used to protect the home industry completely by selling those goods at the much higher prices charged by Dundee (and incidentally making a tidy profit at the consumers' expense). In July, 1957, the Board of Trade decided to shave the degree of protection, not only for the consumers' sake, but because it encouraged substitution which was hardly in Dundee's own interest. On two standard grades of hessian, accounting for the bulk of imported cloth, the Control's mark-up was cut from a current rate of 40 per cent to a fixed rate of 30 per cent. Though the Minister has not yet replied to the associations' request, Dundee does not expect the present margin to remain indefinitely. But no one expects control to be abolished, and the UK Jute Goods Association would no doubt be dismayed if it were: its importer members have grown accustomed to a quiet and sheltered life, buying goods on the Jute Control's behalf.

MOTOR SPORT

Go, Kart, Go

THE latest innovation in the unending quest for cheap motor racing is a contraption called a go-kart. Introduced some years ago in North America, it began to appear in Britain this year, and enthusiasm has been so stirred that the RAC has decided to take the machines under its control. It is preparing rules for their design and racing, and there are expected soon to be 50-60 manufacturers. The essence of the go-kart is the simplest possible four-wheeled vehicle and one that can give its driver the most impression of speed for the least actual achievement of speed—or the most thrills for the least risk. To achieve this the driver sits as near to the road as possible, has no body or mudguards to protect him, and no springs to cushion his ride. The highest speed so far achieved is 50 mph, by a "Class 4" go-kart with a 197 cc motor cycle engine, the most powerful unit allowed. Go-karts sell for £100-£150 complete, but many are sold as kits, tax free, for £65-£105—suggesting that assembly costs must be very low.

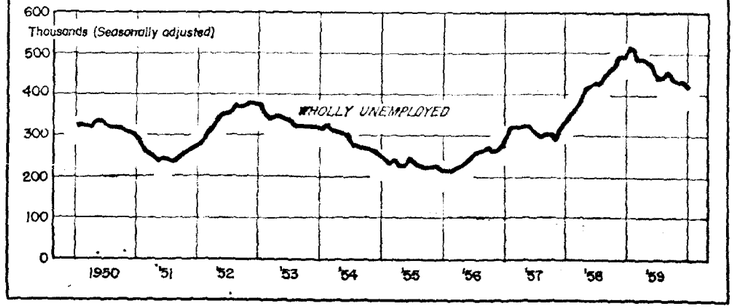
Go-karts will be raced on special temporary or permanent circuits; these, the RAC lays down, must not have straights more than 100 yards long nor corners with a radius of less than 15 feet. The minimum



age for the drivers is 16, but they must hold a full driving licence. The motor racing purist may consider this a retrograde move, bringing the sport one step nearer to dirt-track racing; but it should provide a cheap, harmless and relatively safe form of entertainment—three factors that the RAC is anxious to maintain. Apart from this primary purpose, racing, the go-kart has many other potential applications. In North America children are allowed to drive them; British fathers are already reported to be showing interest in them, ostensibly for their children, who would be able to drive them on private roads. Others may see some merit in them for road use, and add the equipment needed to turn them into something more closely resembling a normal car. Whatever uses may be found, one thing is sure: the world will become yet a noisier place.

Unemployment in the 1950's

Between November 16th and December 7th, total unemployment in Britain fell by 10,000 to 421,000 or 1.9 per cent of all employees. At the same time the number of vacancies remaining unfilled rose slightly to 251,000. Both changes were an improvement on the expected seasonal pattern. Reading from the chart below, where the numbers wholly unemployed are plotted, after allowing for recurring seasonal factors, it is seen that during the 1950's unemployment varied between 200 and 500 thousand or roughly between 1 and 2½ per cent of workers. Patches of relatively high unemployment still persist, particularly in Scotland, where, in December, 4.3 per cent of workers were still unemployed compared with 4.4 per cent in December last



LEYLAND MOTORS

To Spain and the US

LEYLAND MOTORS, Britain's largest manufacturer of heavy commercial vehicles, buses and coaches, announced this week that it has bought a substantial shareholding in Empresa Nacional de Automobiles SA, the Spanish makers of Pegaso commercial vehicles and—until two years ago—of the Pegaso sports car, the most luxurious, beautiful, expensive and exclusive sports car in the world. Leyland are already well represented in Spain through a marketing subsidiary, Leyland Iberica; together with ENASA they account for almost all the heavy diesel vehicles sold in that country. At first sight, this makes their financial association with ENASA seem strange; especially since the Spanish company is owned by the Instituto Nacional de Industria, a financing agency of the Spanish government in which several Spanish banks also have an interest. In practical terms, ENASA is virtually a nationalised company.

The two companies have interchanged technical information under an agreement for some time; now two members of Leyland's board will become directors of ENASA and Pegaso vehicles will be manufactured with an increasing proportion of Leyland parts, at what is very possibly the most modern and most expensive automobile plant in Europe. Leyland already have subsidiaries in Belgium, Holland and Denmark; now, in addition to importing vehicles into Spain—which pay heavy rates of duty—they will be represented as manufacturers—a move which will also help them to get round future import quotas.

The company has also announced plans for marketing its wide range of diesel trucks in the United States, through a newly-formed company, Leyland Motors (USA) Inc. The new company is a subsidiary of Jaguar Cars, Inc., of New York, which is in turn a subsidiary of Jaguar of Coventry; it already possesses an extensive retail organisation and service network in the United States. Leyland has not previously sold commercial vehicles in the United States; it has, however, sold a substantial number of diesel engines to American bus and commercial vehicle makers, competing successfully in this field against American engine manufacturers.

SHOE POLISH

Competition in Shoeshines

BRITAIN'S boot and shoe polish manufacturing industry is marked by a high degree of price leadership, which is not altogether surprising since with one exception—Kiwi, made by a subsidiary of an Australian company—the major brands are all produced by subsidiaries of Reckitt and Colman Holdings. Reckitt's largest-selling brand, Cherry Blossom, is estimated to account for at least half of the total market. Under these circumstances it is somewhat surprising that one of the smaller companies in the industry should take the initiative in cutting prices—especially in the face of price increases by the rest of the industry. The price-cutting firm is English Waxes, which has a small share of the market through its Dove polish, and which in addition makes shoe polish—and other polishes as well—to be sold under various retailers' brand names.

A few weeks ago the price of Cherry Blossom polish (which has always been the lowest-priced brand, dubbed a "grocery polish" by the trade since it is sold through grocers as well as through more exclusive shoe stores or even more exclusive boot makers) was increased from 9d. to 10½d. At that time the prices of other Reckitt and Colman polishes—Nugget and Wren's—rose from 10½d. to one shilling, as did the price of Kiwi. This represented an increase of just over 20 per cent to the manufacturers, after making allowance for retailers' and wholesalers' margins. The reason given for the increase was higher raw material costs. This week English Waxes reduced the price of its polish from 10½d. to 10d., stating that its action was due to competition and that raw material costs have in fact remained stable. In any case it is difficult to see how a change in material costs could affect one manufacturer differently from another: the main ingredients of all shoe polishes are carnauba wax (which is imported from Brazil and to a lesser degree from South Africa), high-volatility white spirits, and dyes.

SHORTER NOTES

Both Associated British and the Rank Organisation are putting up cinema admission prices by threepence next month, and sixpence extra will be charged for some seats in the more prestigious cinemas. These increases are intended to hold revenue up in face of the falling attendances. The fall in admissions may in fact be slowing down, though the impact of last summer's fine weather makes it difficult to see the trend clearly.

*

St Martin Preserving, the jam and marmalade manufacturers who lost the battle to control Chivers to Schweppes, has now made a bid of three of its own ordinary shares (quoted in the market at 7s.) for every ordinary share in Foster Clark, makers of jellies, custard powders and other food products and canners of fruit and vegetables. St Martin Preserving also cans vegetables and bottles fruit. On this news, the Foster Clark shares gained 5s. to 18s. 9d.

*

Contractors' new orders for construction work totalled £371 million during the third quarter, according to provisional figures collected by the Ministry of Works. This was a decline of £20 million compared with the preceding quarter; precise comparison with the same quarter of 1958 is not possible, owing to a change in the basis of the Ministry's statistics, but this year's figure represents an increase of roughly £60 million on the third quarter of last year. The value of housing orders for private developers rose by £10 million, to £109 million; by contrast orders for new public authority housing fell by £8 million compared with the second quarter, to £57 million. Other new orders for public authorities fell by £11 million to £95 million and orders for private industrial building fell by £8 million to £55 million, the same level as in the first quarter of this year. Very few large contracts were placed during the third quarter.

*

Following the increase by Aluminium Limited, the Canadian parent company, Alcan (UK) Ltd. has raised its price for aluminium ingot by £6 to £186 a ton delivered. This is the first change since April 1, 1958, when the price was reduced from £197 a ton.

*

Ranks, the millers, is raising its final dividend from 5 per cent to 7½ per cent, making 12½ per cent for the year ended August 29th against 10 per cent. Group profits before tax have risen from £7,251,000 to £7,260,000, but the tax charge is cut from £4,039,000 to £3,650,000 and there is a tax credit adjustment for previous years of £370,000 against £47,000. The net profit attributable to the parent company has thus risen from £3,215,000 to £3,862,000. At 28s. 3d. the 10s. units yield 4½ per cent.

People who can buy Player's No. 3 — by the hundred

Player's No. 3 are in a class by themselves. (So, on the whole, are the people who smoke them.) They are part and parcel of that pleasantly ordered kind of existence, where everything is *unobtrusively* correct. You might expect to pay over the odds for such a *distinguished* cigarette but they cost 4/1 for 20, or 21/8 for 100. Incidentally, the Christmas boxes this year have a pleasing "Book of Hours" design.

COMPANY MEETINGS

JOSEPH LUCAS (INDUSTRIES) LIMITED

RECORD RATE OF PRODUCTION

FURTHER EXTENSION OF OVERSEAS ACTIVITIES

MR A. B. WARING'S STATEMENT

The Sixty-second Annual General Meeting of Joseph Lucas (Industries) Limited was held in Birmingham on Monday, December 14th. Mr A. B. Waring, Chairman, presided and in his statement to the members said:

Since our last meeting there have been changes in the Board of Directors. First of all we have to record with great sorrow the death of Mr F. H. Walker immediately following his retirement. During the greater part of his working life he carried particular responsibility for the commercial development of the business; soon after the end of the war he was obliged for reasons of health to give up full-time work, but continued to give the Board the benefit of his experience and advice as a Consulting Director. His loss will be keenly felt by his many friends both in the Company and in the Motor Trade generally.

BOARD CHANGES

There have been two new appointments to the Board during the year. The Company has been fortunate in obtaining the services as members of the Board of the Earl of Halsbury, FRIC, FInstP, and Mr Sydney Barratt, BA. Lord Halsbury is widely known for his scientific work, having been Managing Director of the National Research Development Corporation since 1949, after previously holding senior appointments in Industry. Mr Sydney Barratt is well known in British Industry as Chairman of Albright & Wilson Ltd, one of the leading British Chemical Companies; he has been intimately concerned for many years with its expansion and development as a major industrial organisation and his advice and experience will be of great value to your Board. Shareholders will have every reason to give these gentlemen their confidence and extend to them a whole-hearted welcome when the resolutions confirming their appointments are submitted to the Meeting.

It is with the greatest regret that we have to report the death of Mr John Lucas, who was the great-grandson of the founder of our business. He was not a Director of this Board but he was the Director and General Manager of Joseph Lucas (Sales and Service) Ltd. He was only thirty-six years of age and his passing brought much sorrow; in addition it brought to an end the family membership of the business at the fourth generation.

I must also refer to the retirement during the year of Dr E. A. Watson, OBE, DSc, a Director of the Executive Company, who had been Chief Engineer of the Lucas Organisation since 1930. He made outstanding contributions in the fields of automobile and aircraft electrical equipment design, and he had also been a member of the Gas Turbine Collaboration Committee, founded by the Ministry of Aircraft Production for the purpose of developing the original "Whittle" jet engine to the stage of manufacture and practical application.

THE ACCOUNTS

The Consolidated Profit and Loss Account of the Company and its Subsidiaries for the year ended July 31, 1959, shows a surplus on Trading of £7,258,619 compared with £6,873,545 for 1958 and £7,078,422 in the previous record year ended July 31, 1955. After bringing into account Other Income and Exceptional Items and making provision for Taxation the Net Profit is £2,527,437 which compares with £2,241,956 last year.

The Directors recommend the payment of a Final Dividend on the Ordinary Shares and on the Redeemable Preference Shares of 2s. 0d. a Share, which, with the Interim Dividend of 6d. a Share already paid, makes 2s. 6d. a Share less tax for the year. This disregards the special Interim Dividend of 6d. a Share less tax which was declared this time last year and paid out of these accounts because of the change in the basis for calculating the liability to Profits Tax. Confirmation of the Dividends on the Preference Shares is also asked.

The net dividends recommended for the year to July 31, 1959, amount to £1,287,722 and after further recommended allocations of £100,000 to Employees' Funds and £500,000 to General Reserve there remains £603,089 to be carried forward.

THE YEAR IN THE MOTOR INDUSTRY

For the year which is covered by the Accounts the output of cars increased by 2½ per cent compared with the previous year. In retrospect the year was a most significant and notable one in the affairs of the British Motor Industry. It was notable, not so much for the total number of vehicles produced during the year, which was only a little in excess of the previous year, but for the new models that were introduced and for the stimulus that these brought to the trade. No fewer than twenty-seven new models of motor cars were put into production, probably a greater number than in any other year in the history of the Industry. These all showed most imaginative developments in engineering and styling and were received with wide popular approval and provided the British industry with a stimulating and encouraging advance over its overseas competitors. There is no question whatever that British cars have advanced technical and aesthetic characteristics which suit them for any market in the world.

The initial production difficulties associated with so large a programme of new models limited output in the early months of the year, but once these were overcome production rose to a rate which exceeded all previous records and this increase has continued into the early months of the current financial year. The removal of hire-purchase restrictions, the reduction of purchase tax on cars from 60 per cent to 50 per cent, the lowering of the Bank Rate, and the Government's general policy of expansion, together with the fine summer, produced an unprecedented demand from the home market for these new cars. Helped by this buoyancy at home the manufacturers maintained their position in the export markets in the face of intensified competition from French and German and Italian manufacturers. Approximately half of the vehicles produced were sold overseas, the Industry retaining its position as the Nation's leading exporter of finished goods. The total value of vehicles and parts exported amounted to almost £500 million, making a major contribution to this Country's remarkable economic recovery. A vital element of these overseas earnings has been the dollar harvest following the dramatic increase in the number of cars sold in the United States and Canada. Five years ago these North American countries were taking fewer than 50,000 British cars a year, whereas last year they bought more than 250,000, equal to 25 per cent of our total car production. Whilst this achievement reflects the highest credit on British Manufacturers—who have regained the lead from the German Manufacturers as the principal supplier of foreign cars to the United States—such a concentration of business is to some extent a cause for concern as any setback there would inevitably have the most serious repercussions here. It is a significant development that the American Manufacturers have felt it necessary to introduce a new range of cars which are "small" cars judged by their standards. These cars are, however, still larger than the popular cars made in large volume by the European Manufacturers, and it remains a matter of interesting conjecture how far this new development will affect the imports of British and European cars into the United States.

The effect has yet to be seen of the recent Government move in abolishing import quota restrictions including those on imports of foreign vehicles. Because the quotas were increased about a year ago the imports of foreign vehicles into the United Kingdom doubled during 1959, but in all they accounted for less than 5 per cent of the domestic market. These vehicles are, of course, subject to customs duty and delivery charges. Sales of imported cars will undoubtedly increase as long as the home demand for vehicles for early delivery is in excess of supply.

COMMERCIAL VEHICLE AND TRACTOR BUSINESS IMPROVING

The Heavy Commercial Vehicle Industry started the year with production well below capacity, but the complete elimination of the 30 per cent Purchase Tax in the April Budget brought about an immediate improvement and now, with the threat of nationalisation removed as a result of the election, current conditions have improved still further. Sales of Light Commercial Vehicles were quite depressed before the Budget, but they likewise benefited from the removal of Purchase Tax with the result that total production showed an 8 per cent increase for the year. The Tractor Manufacturers increased output and maintained their position as by far the largest in Europe. British designed and manufactured tractors enjoy the highest reputation and are exported to all countries, including North America.

The output of motor cycles showed improvement on the previous year, and in the latter months reflected the benefit of the easement of the credit and hire-purchase restrictions. British made Scooters and Mopeds have contributed very largely to the improved result in this field.

THE AIRCRAFT INDUSTRY

Our Companies engaged in the manufacture of Aircraft Equipment have had another busy year, although as foreshadowed previously the reduction in the military aircraft programme has begun to have its effect. Fortunately for us we are closely involved in the manufacture of equipment for jet and turbo-prop engines, and in this field the British Manufacturers have maintained supremacy and have continued to supply large numbers of engines to many Foreign Aircraft Manufacturers, including those in the USA. In fact, the exports of the Aircraft Industry reached a further record in the past year.

The ability of the Aircraft Industry to maintain its export figures without support from military contracts is problematical. Much of the business included in the export total is of a military nature, but more important is the fact that progress in development of aircraft and aero engines stems from research for military needs or from military projects which are later adapted for civil use. The current successful American civil aircraft are adaptations from aircraft previously ordered for military transport purposes under the US Government contracts. Development for the future centres largely round the design of supersonic airliners and vertical take-off machines for which it is impossible for the cost of the research and development work to be carried by any one firm from its own financial resources. A vigorous Aircraft Industry is of vital national importance. Not only is it an employer of craftsmen, but in particular it deploys a large number of technicians and technologists who are concerned with development and research into new techniques which involve a wide range of activities. These include, amongst many other things, electronics, new materials, treatment of metals, new processes and a whole variety of mechanical engineering problems: the results of this research and development have applications throughout a wide range of other industries. If this fundamental activity declines then the whole of British Industry will be the poorer for it and a major sphere of activity for the most brilliant of our scientists and engineers will be restricted so that they will tend to find outlets for their ingenuity elsewhere, probably on the other side of the Atlantic.

NEW DEVELOPMENTS

During the year the Company extended its activities in several directions. In the electronic field it acquired the Share Capital of G. & E. Bradley Limited, a small company well established in electronic research and development. Our chassis engineering business has been augmented by the purchase of the tractor disc brake business formerly operated by Goodyear Tyre & Rubber Company (Great Britain) Limited. An agreement has been entered into with Associated Electrical Industries Limited and The General Electric Company Limited for the manufacture of all-glass sealed beam headlamps at a newly constructed factory, for which the capital is being jointly subscribed.

OVERSEAS ACTIVITIES

In last year's report, reference was made to our need to work our way into the Common Market in Europe if we are to avoid being excluded from this integrated area of 170 million people with a current industrial capacity greater than that of the USSR. We have opened our own centres in five of the principal European cities and have now taken a first step towards establishing ourselves as a manufacturing concern on the Continent. A Company has been formed in France, Roto Diesel, SA, for the manufacture of the distributor type of diesel pump already developed and manufactured in this country by our subsidiary CAV Limited. The ownership of the French Company is shared equally between ourselves and Ducellier-Bendix-Air Equipment, who are the predominant French Company engaged in our class of business. The distributor type of pump is not yet available to Continental manufacturers and it is expected that it will be in big demand for light high-speed diesel engines which are increasing in popularity. We already have an arrangement whereby batteries are manufactured under licence in France. Licence agreements for the manufacture of electrical and diesel equipment in Spain have also been entered into, and other negotiations are in progress for the proper establishment of our interests in Europe and elsewhere, especially having in mind the development of the Free Trade Association of which this country is a member and which therefore may have a more immediate effect on our fortunes than the Common Market from which we are at present excluded.

Further afield also our activities are being extended; arrangements have been made with Chloride Electrical Storage Company for the setting up of joint enterprises in Malaya and Ceylon for the local manufacture of batteries. A similar arrangement may be extended to other parts of the World.

The amount involved to the end of the Financial Year in these new enterprises at Home and on the Continent substantially exceeded £1 million; the appropriate assets and liabilities have been included in the Consolidated Balance Sheet, and the cost of goodwill and manufacturing rights dealt with as shown in the Accounts.

Manufacturing operations in Canada have had a most severe setback following the cancellation by the Canadian Government of the development of the aircraft on which much of our fortunes were centred. In Australia our vehicle electrical equipment manufacturing activities are not yet profitable. The volume of business has not reached the level that had been expected, while competition from both American and Continental sources has become extremely keen. Our factory is fully equipped to meet the Australian Motor Industry's requirements of electrical and other equipment and is striving to obtain a growing share of the available business.

GROUP RESEARCH CENTRE

Our research and development organisation has been further enlarged and improved during the year. A Group Research Centre for the study of fundamental problems is now getting into its stride and this will in due course leave the well established experimental laboratories associated with our principal Subsidiary Companies freer to concentrate on the development of their particular specialised products. These and other measures, coupled with the efforts of our scientists, designers and production engineers, enable us constantly to improve the quality and performance of our products and at the same time to reduce their costs.

In accordance with the practice of recent years, a brochure is enclosed with the Accounts to give Shareholders an explanation of some special facet of the Company's activities. This year the brochure is entitled "Metal Matters," providing an outline of the intensive research into the characteristics and performance of the principal metals used in Lucas products.

CURRENT YEAR'S PROSPECTS

The prospects for the current year are good. At the present time there is every indication that the Road Vehicle Industry will break all previous records in both the home and the export markets. On the other hand there will be a decline in the Aircraft Industry. New activities at home and abroad which the Company is now pursuing have still some years of development in front of them before they can make an effective financial contribution. The current tendency for non-ferrous metals and other raw materials to rise in price, together with modifications to earnings, may cost anything between £1 million and £2 million in the coming year.

In conclusion, the Directors are glad of this opportunity to express their gratitude and appreciation to the executives, the staff and the workpeople throughout the Lucas Organisation, both at home and overseas; 4,000 of them have now completed twenty-five years of service, a record of which we are very proud. The Company is fortunate in their loyalty and enthusiasm which, founded as they are on the experience of the past, give us confidence to meet the challenging future.

The Report and Accounts were adopted.

NORTH ATLANTIC SECURITIES CORPORATION

The fifth annual general meeting of North Atlantic Securities Corporation was held on December 10th in London, The Right Honourable Lord Latymer (the chairman) presiding.

The following is an extract from his circulated statement:

Our gross income, including double taxation refunds, underwriting commission and fees, again shows an increase. After expenses and taxation, slightly over 5½ per cent has been earned on the issued capital.

An interim dividend of 1½ per cent was paid in April last. The Board now recommends payment of a final dividend of 3½ per cent, making 5 per cent for the year, which is an increase of ½ per cent on last year's distribution. At the time of writing the steel strike in the United States is still in progress. The indirect effects of this strike on the economy of the United States are difficult to forecast, particularly if there should be no early settlement of the strike. In these circumstances an estimate of income for the current year is more than usually hazardous. However, we hope that our revenue will be at least maintained in the current year.

The value of the net assets of the Corporation at September 30, 1959, was £2,180,457, equivalent to 7s. 3½d. per share, as compared with £1,862,621, equivalent to 6s. 2½d. per share at the previous year-end.

The report was adopted.

AUSTRALIA AND NEW ZEALAND BANK LIMITED

ANOTHER YEAR OF EXPANSION

SIR GEOFFREY C. GIBBS REVIEWS OPERATIONS

The Ninth Annual General Meeting of the Australia and New Zealand Bank Limited will be held on January 6th at 71, Cornhill, London. E.C.

The following are extracts from the statement by the Chairman, The Honourable Sir Geoffrey C. Gibbs, KCMG, circulated with the report and accounts for the year ended September 30, 1959:

AUSTRALIA

During the past year, Australia has proved the increasing maturity and diversity of her industry by maintaining a high level of business activity despite the effects of factors beyond her control. As a result, growth and development have continued to be dominant features of the economy.

The factors giving concern a year ago included decreases in business activity in the major industrial countries of the world and in world commodity prices. It had been anticipated that the less favourable world markets for Australia's major products would reduce export receipts and cause an adverse balance of payments with lower liquidity, falling farm incomes, restricted spending and the other accompaniments of a fall in export proceeds.

In the event, however, there was a most gratifying improvement in oversea trading, particularly in the final quarter of the financial year 1958-59. This improvement was due to a group of factors all of which were significant; the most important, of course, was the considerable rise in wool prices after the weakness which had persisted for some 18 months, a rise which has been maintained in the current season.

In addition to the improvement in wool prices, there was unexpected strength in export prices for meat, due to demand from the USA for certain grades for admixture with locally grown beef in the processed meat trades.

A further influence which greatly assisted exports of dairy products was the absorption of surpluses which had overhung the United Kingdom market for some time.

Perhaps the most encouraging development, however, was the inflow of capital from overseas for direct investment in Australian industry and for portfolio investment in Australian securities.

Instead of a relatively heavy deficit on international trade and financial transactions for the year as a whole, as originally anticipated, there was only a slight deficit which in itself had no material effect either on the level of spending in Australia or the liquidity of the financial system. This has had a considerable psychological effect on business generally in the current year. The improvement in commodity prices which became evident in the months from January to June, 1959, shows every likelihood of continuing. The outlook for Australia's exports, particularly wool, is good and there is every indication that international trade will be favourable for primary commodities during the current financial year.

CONFIDENCE IN THE FUTURE

The success achieved in the past year has engendered confidence in the future. This confidence is firmly based on population increase, industrial expansion, building activity and development of national resources. The high level of activity and buoyant prices on the Stock Exchange reflect this confidence, in which oversea investors are sharing to an increasing degree.

Banks are in a strong liquid position and stand ready to play their part in meeting the financial requirements of further, well-balanced, national development. With buoyant business conditions in Australia and encouraging prospects in export markets, particularly for wool, the outlook for the present year is good. The seasonal outlook is, on the whole, satisfactory.

NEW ZEALAND

The past year has been one of consolidation in New Zealand, and one in which the country has made an excellent recovery from its balance of payments crisis of 1957-58. Confidence in the outlook has returned and the restrictions imposed to deal with earlier difficulties have been eased.

New Zealand's oversea reserves, which last year were maintained only by extensive oversea borrowing, have now been further strengthened by the effects of import licensing and greatly improved export earnings. Net oversea assets rose from the low point of £NZ42 million early in 1958 to more than £NZ100 million in the middle of 1959. This improvement has enabled import restrictions to be relaxed to some extent and has provided prospects for a return to greater freedom.

MONETARY AND FISCAL POLICIES

In the year ended last March the net balance of Government and overseas transactions and continued restraint upon bank credit removed much of the buoyancy of earlier years, but, improved rural incomes, together with minor taxation relaxations and increases in expenditure are providing some stimulus to consumer spending.

Bank lending has remained closely controlled by the Central Bank's reserve ratio policy. The trading bank's task in restraining advances has not been an easy one, particularly as the Capital Issues Control has made it difficult for borrowing customers to turn to the capital market to obtain funds to repay bank lending. Under these circumstances, potential borrowers, who might well have made an important contribution to long-term productive capacity have suffered from the restraints imposed to solve immediate problems.

To enable such investment opportunities to be taken up, without creating inflationary pressures, additional emphasis is being placed on the need for greater saving. It is most disappointing that the trading banks have not as yet been permitted to offer savings account facilities to assist in stimulating savings. It is to be hoped that, with the return of calmer conditions, the authorities may concede a greater freedom to the capital market and the economy generally.

AUSTRALIA AND NEW ZEALAND SAVINGS BANK LIMITED

An important event during the year was the extension of the activities of ANZ Savings Bank to all points of our representation in the States of South Australia and Tasmania as from September 17, 1959. This move should stimulate savings in these two States and make a worthwhile contribution to the growth of the Savings Bank; it also means that the facilities of our Savings Bank are available at all our branches and agencies in Australia.

Good progress has been achieved during the year in extending our connection and increasing the aggregate of depositors' balances. On September 30, 1959, we had 416,000 depositors, an increase of 80,000, and the total of Depositors' Balances and Other Accounts had increased during the year by over £A16 million to £A66 million.

After providing for taxation and making further transfers to contingencies the Savings Bank made a profit of £A240,510 for its third full year of trading. The result compares with £A161,486 in the previous year.

ACCOUNTS AND DIVIDENDS

It is satisfactory to report continuing growth in our Balance Sheet. Total assets have increased by £A20 million to £A459 million, and if we add to this the total of the Savings Bank's assets, the combined total is now well over £A500 million. On the assets side we have been able to add £A14 million to our portfolio of Australian Government Securities, thus taking advantage of the high coupon stocks that have been available. On the liabilities side, Current, Deposit and Other Accounts at £A376 million show a further improvement.

The profit and loss account again includes the dividend from the Savings Bank but this year this is paid, at the same rate, on the larger capital. Profits (after taxation and transfer to Contingencies Reserve) amounted to £A1,050,710, an increase of nearly 1¼ per cent on last year's figures, and your Directors have recommended a final dividend for the year of 8 per cent less tax which, together with the interim dividend of 4 per cent already paid, maintains the year's distribution at 12 per cent less tax.

COMPAGNIE D'OUTREMER POUR L'INDUSTRIE ET LA FINANCE

BRUSSELS, BELGIUM

ACQUISITION OF LIMITED PARTNERSHIP IN BANQUE LAMBERT

The annual general meeting of COMPAGNIE D'OUTREMER POUR L'INDUSTRIE ET LA FINANCE was held in Brussels on November 26th under the chairmanship of Mr Gutt.

REVIEW

The introduction to the report presented by the Board of Directors contains an analysis of the economic situation in Belgium. If Europe as a whole daily gives fresh evidence of renewed vitality, the report finds certain signs of obsolescence in the Belgian economy. They are evident notably as regards demography, technology, industrial equipment, economic policy and the financial system.

A notable event in the financial year 1958-1959 of COMPAGNIE D'OUTREMER was the acquisition in April 1959 of the limited partnership of the *Banque Lambert* whose ties with the Company were already strong. This operation resulted in an increase in capital from B.Frs.1.300m. to B.Frs.1,750m. In addition, the Company acquired in 1959 a substantial interest in *Electrorail*, a Belgian holding company of the *Empain* group.

The Company's investments and various participations are shown in the balance sheet at B.Frs.1,700m., with real estate standing at B.Frs.196.6m. net. The following table shows the evolution in the geographical distribution of these assets since the end of the previous financial year:

	Sept. 30, 1958 %	Sept. 30, 1959 %
Europe	22·1	40·80
America	44·5	34·35
Africa	30·8	22·60
Miscellaneous	2·6	2·25
	100·0	100·00

The very substantial increase in European assets was due primarily to the material contribution of the *Banque Lambert*, and the relative importance of investments in other continents has decreased in consequence. In addition, the African assets have suffered from the fall of the prices of Congolese shares on the Brussels Bourse.

Investments in terms of branches of activity were distributed as follows:—

	Sept. 30, 1958 %	Sept. 30, 1959 %
Real Estate	6·2	7·2
Banks, Insurance and Finance Companies	8·4	25·6
Petroleum	31·5	22·3
Public Utilities and Electrical Engineering	15·0	22·8
Mines and Metals	15·3	12·3
Paper	2·6	1·0
Food, Agriculture and Commerce	13·3	5·2
Building	3·0	2·8
Cash and Equivalent	4·7	0·8

At the moment, the *Banque Lambert* is the most important single asset of COMPAGNIE D'OUTREMER. It is expanding at a favourable rate in all its departments. On January 1, 1959 deposits amounted to B.Frs.3,014m. as against B.Frs.2,411m. a year earlier, while credits granted rose from B.Frs.1,968m. to B.Frs.3,588m. The Bank has successfully placed several issues on behalf of private and public Belgian, foreign and international institutions, thus strengthening the initiative taken in this field in previous years. Profits for the current financial year appear favourable.

The *Lambert* group carries on an important fiduciary activity, both by issuing on the Brussels Bourse bearer certificates representing foreign registered shares and by managing mutual investment funds. Both activities are now being concentrated within a specialised subsidiary, *Sogès SA*. On September 30, 1959, the total market value of the Rhodesian, South African, American and Canadian stocks introduced in Brussels by the *Lambert* group amounted to B.Frs.4,300m. The assets of *Fonds International de Placement* (*FIP*) reached B.Frs.558.6m. on September 30th, as compared with B.Frs.143.3m. the year before.

In 1959, the group was one of the promoters of the European Investment Fund *Eurunion*, which has met with great success in European markets. Total assets of *Eurunion* stood at B.Frs.778.9m. on September 30, 1959.

Among the banks in which the group has an interest, the report mentions the *Berliner Handels-Gesellschaft* which has profited from the high level of activity in Western Germany, the *Société Congolaise de Banque* "*Socobanque*," which showed a slight increase in deposits in 1958, despite the unfavourable situation in Congo, the *Amsterdam Overseas Corporation*, New York, which recently acquired *Northern Finance Corporation*, Minneapolis. The report finally mentions the participation taken by *Banque Lambert* in *Banque Nationale de Développement Economique du Maroc* established in 1959.

The petroleum industry is represented in the portfolio of COMPAGNIE D'OUTREMER mainly by the *Petrofina* group. In addition to a substantial holding in the parent company, COMPAGNIE D'OUTREMER has interests in both *Canadian* and *American Petrofina*. Investments of the *Petrofina* group amounted to B.Frs.4,200m. for 1958, and the 1959 budget has been fixed at B.Frs.4,500m. Results for 1958 inevitably suffered from the drop in prices, but improved results are anticipated for the current financial year, owing to the trend towards more normal conditions in the markets of the company and its subsidiaries.

Among the other petroleum stocks held by COMPAGNIE D'OUTREMER, the report mentions *Petrobelge*, *Francarep* and *Great Plains Development Company of Canada Limited*. In 1959, the company sold its share in *Triad Oil* at a substantial profit.

The "Public Utilities and Electrical Engineering" sector today represents 23 per cent of the Company's assets. The report emphasises in this respect the need for the Belgian electricity industry to rationalise its structure both through concentration of its means of production and by the reorganisation of its distribution system. The substantial share in *Electrorail* acquired by COMPAGNIE D'OUTREMER in 1959 has increased the Company's interest in this sector, hitherto represented through its holding in *Sofina*. The consolidated portfolio of the latter was estimated at the end of 1958 at B.Frs.5,238m. against B.Frs.4,150m. at the end of 1957. As its portfolio includes a substantial portion of American stocks, including those of public utility companies, *Sofina* has largely benefited from the rise on the New York Stock Exchange. The distributable net earnings of *Sofina* amounted to B.Frs.169.2m. in 1958, as against B.Frs.155.1m. in 1957 and B.Frs.120.4m. in 1956. The dividend has been increased from B.Frs.210 to B.Frs.240.

Another important asset of COMPAGNIE D'OUTREMER includes holdings in the mines and metals sector, among others notably 100,000 *Tanganyika Concessions Limited*, 30,000 *Rhodesian Anglo-American Limited*, 50,000 *Rhodesian Selection Trust Limited*, 15,000 *De Beers Consolidated Mines Limited*, as well as participations in the *Rio Tinto* group, the *Newmont Mining Corporation*, *Aluminium Limited* and several new gold mines in South Africa.

The holdings in the "Food, Agriculture and Commerce" sector currently stand at only 5.2 per cent of the Company's total assets, as compared with 13.3 per cent a year ago. As these holdings are located in the Belgian Congo, they have been affected by the drop in prices of Congolese shares. *Bralima*, the leading brewery in the Belgian Congo, maintained its dividend at B.Frs.120. Two new production installations have been put into operation by this company, in the framework of a considerable programme of expansion. The improvement in sales since the end of 1958 has continued in 1959 and has favourably affected the Company's results. Gross earnings for the first six months of 1959 amounted to B.Frs.93m., as compared with B.Frs.84m. for the corresponding period in 1958.

Compagnie d'Elevage et d'Alimentation du Katanga "Elakat," which operates a cold storage chain in Katanga and the Eastern part of the Belgian Congo, has lowered its dividend from B.Frs.110 to B.Frs.80. For the first six months of 1959 operating results and income from the portfolio reached B.Frs.15.7m. as against B.Frs.17.8m. for the same period in 1958.

Belgika operates mainly palm, rubber and coffee plantations. Its earnings declined during 1958 owing to the fall in world agricultural prices. The dividend has been maintained at B.Frs.10. For 1959 *Belgika* anticipates an improvement in earnings from its agricultural activities, and this improvement is expected to do more than offset certain falls in its income from rents and investments.

RESULTS

Net earnings of COMPAGNIE D'OUTREMER for the financial year ended September 30, 1959, amounted to B.Frs.61,775,080. With B.Frs.981,905 brought forward, distributable earnings amounted to B.Frs.62,756,985. After transferring B.Frs.3,088,000 to the legal reserve, it has been decided to distribute B.Frs.58,500,000, equivalent to B.Frs.45 net for each of the 1,300,000 Ordinary shares, and to carry forward the resulting balance of B.Frs.1,168,985.

GLAXO LABORATORIES HOLDS POSITION IN FACE OF INTENSIFIED COMPETITION

OVERSEA MARKETS A MAJOR FACTOR OF CONTINUING GROWTH

'Research more and more vital to our prosperity'—SIR HARRY JEPHCOTT

The twenty-fifth annual general meeting of Glaxo Laboratories Limited was held on December 14th in London, Sir Harry Jephcott, DSc, FRIC, FPS, *presiding. The following is an* extract from his statement circulated to members with the Report and Accounts for the year to June 30, 1959:

Commenting on the financial results for the year ended June 30, 1959, the Chairman said:

On several past occasions I have reminded you that export sales by the Parent Company and sales by our oversea subsidiaries together account for about two-thirds of our total turnover. This year, for the first time, our subsidiary companies at home and abroad have contributed over half of our total turnover and *profitability.*

He added: In again placing to reserve over half of the profits available for distribution, your Directors are continuing a policy that has proved its value during the past twelve years of rapid expansion in a period of almost continuous cost inflation. In this industry the speed of technical advance makes for an exceptionally high rate of obsolescence.

In recognition of the need to maintain our research, irrespective of the profitability of any one year's trading, we set up some years ago a reserve for Research and Development roughly *equal to twelve months'* expenditure. Our expenditures under that head have doubled in the meantime, and we have increased our reserve accordingly.

TRADING CONDITIONS

Reviewing trading conditions, Sir Harry said that a year ago he thought it prudent to warn stockholders that the relatively favourable trading conditions the company had enjoyed for more than two years were passing and that it might prove impossible to maintain the level of profitability attained in 1957-58. These warnings proved to be fully justified by events, particularly in the first half of the year under review.

He continued: Since the beginning of 1959 the overall position has improved. The achievement of further manufacturing economies has strengthened our position at home and, though competitive pressures have in no way abated, the decline in turnover and profitability has been arrested. The market for antibiotics shows some signs of restored stability, but some types of business are still being conducted at low and barely remunerative price levels. Above all, we have benefited in recent months from the introduction of new products.

Over the whole year there was a modest (2 per cent) increase in Group turnover compared with the preceding year. The year's results owe a good deal to the relatively steady progress made throughout the period by Allen & Hanbury's, by the Murphy Chemical Company and, above all, by the Glaxo oversea companies.

Sales of our proprietary infant foods on the home market have again increased, and today, approximately 50 years after the first Glaxo baby food was introduced to British mothers, the company's infant foods still set a standard of excellence by which competing products are judged. The sales of some recently introduced pharmaceuticals and antibiotics have also been encouraging, and our position in the veterinary field has been strengthened by the introduction of several new vaccines.

The parent company's trading position has been strengthened in the last few months by the introduction of new products, one of which—Grisovin (griseofulvin)—represents an important advance in chemotherapy.

Griseofulvin is an antibiotic, curative of most fungal infections of the skin. Unlike the drugs and other therapeutic agents hitherto used in treating these conditions, it is administered orally and consequently attacks the skin fungi from within.

Not only is it highly effective, therefore, but it is also the first product of its kind. We take pride in the fact that its use for these purposes and the techniques for its large-scale production were developed within the Glaxo organisation.

Allen & Hanburys, Ltd. are to be congratulated upon the further increase in profitability shown in their accounts for the past year, both turnover and profits having exceeded those of any previous year The improved figures largely result from the elimination of operations that were no longer profitable and from the introduction to the medical profession of a series of new products that have been well received. It is reasonable to expect that with every succeeding year the full benefit of our merger will become more apparent.

Murphy Chemical Co., Ltd.: The turnover and profitability of the Murphy Chemical Company also show a most satisfactory increase, particularly in the home market, and this in spite of severe competition. Oversea sales were more than maintained, and current research should result in further products becoming available for this market. Their range of new materials offered in the horticultural and agricultural markets has been considerably widened.

THE SEARCH FOR NEW MEDICAMENTS

The importance of the search for new medicaments was emphasised by the chairman, and in this connection, he said: The future depends largely on our ability successfully to develop and market new products in response to a steadily changing incidence of disease.

The efforts we have made, and are now making, in the field of immunology are already producing beneficial results in reducing the incidence of certain diseases among the susceptible age groups of the population.

These considerations, he added, help to explain the vital part played by technical, as distinct from economic, competition in our industry. However efficient we may be in producing and selling our existing products, the discovery of an effective new medicament or, for example, a more economical synthesis of an existing medicament, can render obsolete a product or group of products that may have taken us years to perfect.

Research in this field becomes increasingly costly as the techniques it employs and the conditions with which it is concerned grow more complex. If only for this reason, the size and depth of our own research programme, despite its mounting cost, must be progressively increased, for it becomes more and more vital to our continued prosperity.

A high proportion of our present UK turnover of ethical medical specialities arises from products introduced within the past five years. Five years hence the proportion will be still higher and many of the products now of major importance may well be obsolete. This is a distinguishing feature of pharmaceutical trading and the one that leads to our preoccupation with research.

Referring to the Group's oversea investment, Sir Harry said: At the end of the last war there were six Glaxo oversea subsidiaries in existence. To-day there are nineteen with an aggregate turnover about seven times what it was in 1945. Glaxo and Allen & Hanburys between them have twenty-five oversea subsidiaries, with a combined turnover considerably higher than the home and export sales of the Parent Company.

The merger between ourselves and Allen & Hanburys Ltd. has not only significantly increased the oversea resources of the Group, but has also required us to take a fresh look at our oversea business as a whole.

At home, a combined export organisation has been established with a three-fold function: to conduct the export activities hitherto separately conducted by Glaxo and Allen & Hanburys; to assist the process of unification already taking place oversea; and to service the continuing and growing needs of the oversea subsidiary companies. We shall give legal form to this joint activity by incorporating a new subsidiary company to be known as Glaxo-Allenburys (Export) Ltd.

In the years to come, we must look to export business in general, and to our oversea companies in particular, for a major part of the continuing growth in sales and profitability that are essential to the efficiency and vitality of the Group as a whole.

PROSPECTS FOR THE FUTURE

Sir Harry Jephcott concluded: We have begun the new financial year with a satisfactory high level of sales at home, with worthwhile progress made towards restoring our position in export markets and with many of our oversea companies in a stronger technical and financial position than before.

The world market for some of our major products is still uncertain, but our prospects of making headway are, I believe, better now than they were 12 months ago. The Group as it exists to-day is stronger and better equipped technically and financially than ever before.

The Report and Accounts were adopted.

BERKELEY PROPERTY & INVESTMENT CO. LTD.

EXPANSION POLICY

The Thirty-fifth Ordinary General Meeting of this Company was held on December 16th in London, Mr J. H. Hambro, CMG, chairman, presiding. The following is an extract from his circulated statement for the year ended June 30, 1959:

Since the last Annual General Meeting there has been a substantial increase in the Ordinary share capital of the Company, which now stands at £2 million. Immediately following last year's meeting a fully paid scrip issue increased the issued Ordinary share capital by £250,000. After the year ended on June 30, 1959, there was a Rights Issue of 3,000,000 Ordinary Shares of 5s. each, increasing the issued capital by a further £750,000.

On the Consolidated Profit and Loss Account the first item which must obviously attract your attention is the increase of some £30,000 in the income from properties and investments, and the drop of some £50,000 in the income received from our trading subsidiaries. It is your Board's policy to liquidate its investments in the businesses not connected with property. Nevertheless there remains one non-property investment which yielded no profit in respect of the year and we shall dispose of this when opportunity occurs.

RESULT OF YEAR'S OPERATIONS

These changes have resulted in a reduction in profit from £374,329 to £355,771 but after adjustments the amount available for distribution is £185,051 against £186,329 last year.

In order to facilitate the Rights Issue to Ordinary Shareholders made at the end of July a second interim dividend of 6 per cent was paid making a total of 10 per cent for the year to June 30, 1959. As stated at the time the Board does not propose to recommend the payment of a final dividend for that year.

The reinvestment of the proceeds of the sale of the subsidiary Company and the completion of the apartment block in Vancouver, mentioned in my last year's statement, have resulted in an increase of some £600,000 in the value of the Company's freehold and leasehold properties the total of which stands at £5,735,901.

FURTHER INVESTMENT IN PROPERTIES

The recent Rights Issue has resulted in our Company having the means to continue the expansion of its property investments under the favourable conditions which now exist. This issue resulted in the Company raising approximately £1,200,000; part of this is already being invested in properties in this country and it is your Board's intention to use the balance for Canadian investment or development.

We have recently made an internal valuation of our properties in this country but not of those in Canada. Taking the figures of this internal valuation, and the Canadian properties at cost, proportions between the two countries are 73 per cent and 27 per cent. In this country 61 per cent of our properties are residential, 31 per cent offices and shops and 8 per cent light industrial. In Canada they are 23 per cent residential, 64 per cent offices and shops and 13 per cent light industrial. These ratios are based on the properties owned at the date of the Balance Sheet.

O.K. BAZAARS (1929) LIMITED

(Incorporated in the Union of South Africa)

A SUCCESSFUL YEAR

INCREASED VOLUME OF SALES AND TRADING PROFIT

GOOD PROGRESS WITH EXTENSIONS AND NEW BRANCHES

The thirtieth annual general meeting of O.K. Bazaars (1929), Limited, will be held on December 23rd, at Johannesburg. The following are extracts from the Report of the Directors for the year ended June 30, 1959:

Your Directors have pleasure in presenting their Report and the statement of Accounts for the year ended June 30, 1959.

The figures quoted below have been taken from the Consolidated Accounts which show the state of the affairs of the company and its subsidiaries.

CAPITAL AND RESERVES

During the year under review, the Authorised Capital of the company was increased by £236,000 by the creation of 220,000 Ordinary, 124,000 "A" Ordinary and 600,000 "B" Ordinary Shares, all of 5s. each. The Issued Capital was increased by £283,117 by allotments in terms of the resolutions passed by shareholders on March 20, 1959. The revised capital structure is shown in detail in the notes attached to the Accounts. The premiums paid on the shares so issued have been placed to Share Premium Account, which after deduction of the expenses of the Issue, has increased by £1,913,831. There have been transferred out of this year's profits £300,000 to Capital Reserve in the holding company and £63,100 to General Reserve in subsidiary companies.

PROFIT AND APPROPRIATION

The Group trading profit for the year is £2,413,070 compared with £2,156,563, for the previous year, from which charges and appropriations have been made as shown below.

DIVIDENDS

In addition to the Interim Dividend of 1s. per share paid on July 31, 1959, the Directors now recommend a Final Dividend of 2s. 1½d. per share on the Ordinary, "A" Ordinary and "B" Ordinary Shares, making a total distribution for the year of 3s. 1½d. per share.

GENERAL

The Company had a successful year, increasing its volume of sales and its trading profits over the previous year. Stocks at the year end were approximately 7½ per cent more than in June, 1958, due to the additional turnover and the opening of new branches. We again pay tribute to our South African manufacturers who are responsible for most of our requirements, and it is gratifying to record that not only have they given us good service, but they have continued to improve the standard of their products; nevertheless it is still necessary to import from abroad. We do not consider it in the best interests of the country to give protective tariffs to local industries until they have achieved a high standard of quality at competitive prices with world markets. Provision for the replacement, renewals and modernisation of shop fittings and equipment has this year been increased by an amount of £239,372, so as to enable us to continue our policy of modernising our shop layout and sales presentation.

Trading operations of certain subsidiaries in the Union have been transferred to the parent company and to a fellow-subsidiary, with the object of reducing the number of trading companies in the Group, and effecting economies in administration and accounting. Our trading operations in Rhodesia have from July 1, 1959, been transferred to a wholly-owned subsidiary company registered in Southern Rhodesia.

DEVELOPMENT

In December, 1959, the large extensions to the Company's branches at Port Elizabeth and

Wynberg (Cape) will have been completed, and good progress is being made with the extensions to Salisbury and with the new branch at Rosebank (Johannesburg). A branch was opened at Carletonville (Far West Rand) on October 29, 1959. We are planning to commence in 1960/61 building operations on new branches on sites already acquired for the purpose at Vereeniging (where we are inadequately housed) and at Bellville (Cape), Pinetown (Natal), Sasolburg (Orange Free State) and Lusaka (Northern Rhodesia). New warehouses were completed at Salisbury and Bloemfontein during the year and the warehouse at Durban will be completed next year.

Early in 1960, a start will be made with the building operations on the quarter-acre site adjoining our Johannesburg shop. Extensions at Boksburg, Potchefstroom, Brakpan, Roodepoort, Germiston and Benoni are also in contemplation. Funds will be required for these projects, a major portion of which will be recoverable from Federated Stores Limited over a period of years. At June 30, 1959, the amount of such recoverable outlays was £640,924.

SUNDRY DEBTORS

Whilst we have continued our policy of selling general merchandise for cash, we have, nevertheless, in the furniture and household appliances departments granted credit facilities to our customers under hire purchase terms. These departments have expanded.

MANAGEMENT AND STAFF

The Company's continued progress has been achieved under the competent and enterprising direction of the Joint General Managers, Messrs. Stanley Cohen and Leonard M. Miller, who are the sons of the Joint Managing Directors. They have the co-operation and assistance of a team of young loyal and efficient management executives, of whom we are justly proud. We appreciate the important part played in our business by our staff, and we extend to them all our thanks and appreciation for their continued loyal co-operation and hard work. This year, as in previous years, bonuses were paid to the staff.

HEENAN GROUP LIMITED

RECORD TRADING RESULTS

The fifty-seventh annual general meeting of Heenan Group Limited was held on December 14th at Worcester, Mr Charles L. Hill, the Chairman, presiding.

The following is an extract from his circulated statement:

The Group net profit, before taxation, at £521,469 is the highest ever recorded and compares with £419,481 last year. Taxation takes £262,589 against £250,167 and the net profit of the Group is £258,880, which compares with £169,314 in 1958.

During the year, W. G. Bagnall Limited was sold to W. H. Dorman & Company Limited Stafford, with effect from September 1, 1958, and accordingly no profits from this former subsidiary are included in the Accounts.

The downward trend in the order position, to which I referred in my last Statement, continued during the first half of the year, but thereafter there was a marked recovery and the year ended with a balance of orders of £3,600,000 compared with last year's figure for the present Group companies of £4 million.

The Group's cash and marketable investments have increased considerably. This complete change in the position in the short space of a year after a long period of scarcity of funds is due to many factors and it is fortuitous that they have occurred at the same time. Your Board is taking steps to acquire other engineering or allied businesses and so spread the interests of the Group to engineering, and negotiations are proceeding.

REVIEW OF OPERATING COMPANIES

Heenan & Froude Limited.—In the Engine Test Plant Section the demand for special plant has absorbed a high proportion of design capacity.

The record sales last year in the Eddy-current Coupling Section have been maintained and business in the conveyor field has continued satisfactorily. In the Electronic Engineering Section sales continued to advance and an 80 per cent increase over the previous year was recorded.

In the Industrial Cooler Section the number of customers supplied increased slightly, but the total sales value was down due to a falling-off in demand for quantity supply of Coolers for large plant installations.

There has been a slight improvement in sales of Automatic Wire and Strip Forming Machines.

The Municipal Engineering Division has had a good year, the value of contracts received being more than double that for the previous financial year.

Fielding & Platt Limited at the end of the year had orders on the books slightly in excess of the previous year, but again as before, a substantial proportion of these are for long term delivery. However, inquiries remain active and it is thought that a number of capital equipment schemes under negotiation are likely to mature during the next few months.

Production and sales of Malleable Iron and Grey Iron Castings by **Court Works Limited** were maintained at around the levels of the previous year with an unchanged balance of orders in hand.

Morton Machine Company Limited had a satisfactory year's trading, the output of mixing machinery to the Food Trade being the highest for many years. Export sales were world-wide and represented over 20 per cent of total production.

IWEL Engineering Limited traded at a reduced profit due to the lower level of orders received during the year. Since the close of the financial year substantial overseas orders for IWEL equipment have been received from Jugoslavia and South Africa.

The profits of **Associated Locomotive Equipment Limited** represented a reasonable return on capital but were well below the record achieved last year. Efforts are being made to broaden this subsidiary's activities outside the railway field.

The report was adopted and the total distribution of 15 per cent (10 per cent last year) was approved.

THE WALMSLEY (BURY) GROUP

(Manufacturers of Pulp and Paper Making Machinery and Equipment)

PROMISING NEW FIELDS OF DEVELOPMENT

The twenty-seventh annual general meeting of the Walmsley (Bury) Group Limited was held on December 11th at Bury.

Mr Alan Green, MP (the Chairman) presided and, in the course of his speech, said: The consolidated profit for the year ended June 30, 1959, is £832,501, as compared with £888,317. After charging taxation, the profit becomes £419,551, against £429,779. We are proposing a total dividend of 20 per cent, less tax.

Total assets exceed current liabilities by £3,570,447, this being the balance sheet figure of the capital employed.

During the year progress has been made on several development lines, for example the application of the Inverform principle, the manufacture of large high pressure cylinders and of new screening equipment. These are all promising fields for the immediate future.

Last year I had to point out that the pace of paper mill expansion throughout the world had considerably slowed down and that in consequence competition was inevitably much keener. This year I can report a noticeable revival in activity but competition retains its sharp edge. We have come very well through the period of quiescence, as our record shows. At no time have we been in any fundamental lack of work although the future has at times looked thin.

About four-fifths of the orders so obtained within the past year have been for export to countries as far east as Finland, as far west as Newfoundland, as far south as New Zealand, and at many points in between.

We have to make the necessary arrangements to grow in step with our customers' needs. We are taking steps now to expand our facilities and we shall not fail to examine any promising method of increasing our resources or of making them more flexible in use.

In this connection Mr Green said that certain proposals were now at an advanced stage of examination, and he hoped it would be possible to put them before Shareholders very shortly.

ENCOURAGING PROSPECTS

Mr Green continued: In general the prospects for the future are encouraging in that the order book is good for the next 12 months and there is a considerable tide of new and important inquiries. I must, however, repeat that competition in all markets is vigorous and of a high standard. We cannot afford any complacency at any level in our organisation. To possess the ability to deliver the right article at the right price when the customer wants it is the job to which your Board devotes constant care and attention. I hope that none of us, nor the country, is going to be carried away with the idea that it is automatic and easy in present circumstances to improve our position. We can do better for ourselves, but only if we continue to meet home and overseas competition.

Your Company is today in a healthy state. We are moving now into a future which, in my opinion, presents a stimulating challenge which we are equipped to meet if we recognise that its circumstances are different from those which have obtained in the past.

The report was adopted.

JOHN SMITH'S TADCASTER BREWERY COMPANY LIMITED

LARGER OUTPUT AND SALES

The sixty-seventh annual general meeting of this company, was held on December 15th at Tadcaster, Mr W. H. D. Riley-Smith, TD, chairman, presiding.

The following is an extract from his statement:

In the first half of the past financial year your company experienced the foggiest and dreariest winter and in the second half year the sunniest and driest summer ever enjoyed in living memory. The results were a depressing falling off in trade followed by an inspiring uplift, helped along by the Chancellor's welcome reduction in duty. The final result has been an increase in output and sales both to John Smith's customers and to our new Whitworth customers and the results translated into financial terms are to be seen in the accounts.

One of the effects of the lower rate of beer duty was to place a burden upon your company of carrying the reduction in duty on stocks on hand. This item, which amounted to £49,083, has been charged against the Trading Profit of the year and applies not only to the stocks at the Brewery but includes also rebates granted to our tenants and other customers to cover the adjustment in value of the stocks held by them. Two other provisions in the Budget also require comment, one is the change in the basis of charging Licence Duty, the benefit of which is to some extent off-set by the fact that the Trade has to stand part of the reduction in beer duty. The second item is the abolition of the payment of Monopoly Value which for a long time has appeared to be unfair and out-of-date.

DIVIDEND RAISED

The Profit before taxation of £1,221,084 shows an increase of £89,795 over the previous year and is the highest ever achieved. Taxation absorbs £626,000, being equivalent to 10s. 3d. in the £ of the profits for the year compared with 11s. 5d. last year. The profit after taxation of £595,084 is £108,795 higher than that of the previous year. After bringing in £45,000 being over-provisions for taxation arising mainly from the reduction in the standard rate of income tax, £305,000 is appropriated to Reserves and a final dividend of 8 per cent is recommended on the Ordinary shares, which, with the interim dividend of 3½ per cent, makes a total distribution of 11½ per cent compared with 10½ per cent for last year.

In April last we opened the new Marples Hotel in Sheffield and other new properties opened are The Travellers Rest, Crossgates, Leeds, the Frigate, Marske, and the John O'Gaunt, Sheffield. The past year has been one of consolidation of our acquisition of Whitworth, Son & Nephew Ltd. We continue to maintain a useful export trade to Belgium. We have been alive to the growing demand for Lager in this country and have concluded a trading arrangement with the Alken Brewery in Belgium for the importation of bulk supplies of their Lager for bottling at Tadcaster. Alken Lager has had a good reception in our trading area. It is hoped that this trading arrangement may also benefit our export trade.

The report and accounts were adopted.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

YEAR OF EXPANSION

The annual general meeting of this company was held on December 10th in London.

Mr Robert Annan, chairman, in the course of his speech, said:

It is gratifying to be able to report a material increase in the profits earned by the Group in the year under review and to recommend for the second year in succession an increase in dividend.

The Consolidated Profit and Loss Account of the operating company shows a profit for the year, after charging taxation, of £2,364,000, which is an increase of £651,000, or 38 per cent, when compared with the previous year.

An interim dividend of 1s. 3d. per Ordinary share, less tax, was paid on June 30th and, as the operating company has now declared a Final dividend of 3s. 9d. per share, less tax, your Directors recommend the payment of a like dividend on the increased Ordinary Capital of the parent Company ranking for dividend.

NEW MINES DOUBLE OUTPUT

The gold mining industry in the Union of South Africa continued to expand and is now producing nearly a million and three-quarter ounces each month. This expansion is due mainly to the new mines of the Far West Rand and the Orange Free State. These new mines have practically doubled their output of gold and have more than doubled their profit from gold in the last four years. Our investment is mainly in these mines and has in almost every case brought us increased dividends in the past year.

The discovery of the Witwatersrand dates back more than seventy years. Since then, exploration in which all the groups have taken part has resulted in the discovery of new mining areas to the east and to the west of the original field, extending into the Orange Free State.

In pursuance of this policy we have recently secured options on mineral rights over an aggregate area of 60,000 morgen, that is over 125,000 acres.

We are maintaining our policy of exploration in various parts of the world, concentrating on areas known to be mineral bearing.

RECENT ACQUISITIONS

As the result of an offer made last March we acquired the whole of the remaining capital of The African Land and Investment Co., Ltd., in which for many years we owned control. To this company we have now transferred, with Treasury consent, all the administrative and technical services hitherto provided to the various South African companies in our Group by New Consolidated Gold Fields Ltd. Its name has now been changed to "Gold Fields of South Africa Limited" which is the original name under which this Group was founded in 1887.

For the last forty years The Consolidated Gold Fields of South Africa, Ltd. has been purely a holding company owning the entire issued capital of the operating company, New Consolidated Gold Fields Ltd., which was formed because the powers conferred by the Memorandum of Association of the parent Company were too limited and could not then be enlarged.

Subsequent changes in the law have now made possible the desired alteration of the Memorandum. We therefore propose to merge the two companies, adopting a new Memorandum and Articles of Association, making Consolidated Gold Fields the main operating company of the group and eliminating the cumbersome two-company structure.

In July and August we made offers to acquire the entire share capital of three companies engaged like ourselves in mining finance, namely, the Anglo-French Exploration Co., Ltd., The H.E. Proprietary Ltd., and New Union Goldfields Ltd. The result was most gratifying as in each case over 90 per cent acceptance was secured. We are, therefore, proceeding under provisions of the Companies Acts to acquire the outstanding balance and make them wholly-owned subsidiaries.

The business of Anglo-French has been similar to our own and about half the value of its investments is in companies already associated with our Group, strengthening our holdings in the Far West Rand and in the Orange Free State.

In New Union we have acquired a finance company of South African registration, administering a group of mining and industrial companies. It holds extensive rights over gold, coal and other mineral areas, including holdings in the Kinross gold field. Its name will be changed to Gold Fields Finance Company (S.A.) Limited.

Through the South African H.E. Proprietary we have again increased our interest in West Wits, Harmony and Free State Saaiplaas. Through the parent H.E. Proprietary we have new interests in Canadian mining and in industrial concerns in the United Kingdom.

AN OFFER FROM S. AFRICA

Finally, as announced in the Press this morning, we have just accepted an offer from the South African Mutual Finance Corporation (Proprietary) Limited to purchase 250,000 Ordinary Shares out of our unissued capital at a price of 89s. 3d. a share not ranking for the final dividend now recommended.

This transaction is in accord with our desire to encourage the investment of South African capital in the mining industry which forms such an important part of the country's economy.

The outlook for the future is encouraging. Results for the first five months of the current financial year have been fully up to expectations. Profits of the operating gold and copper mines have been increasing and the platinum companies have resumed the payment of dividends. If this is maintained there will be a further increase in our investment income and it should also be reflected in the results of our new subsidiaries. Operating conditions in South Africa where our main interests lie are favourable.

The report was adopted and the absorption of New Consolidated Gold Fields Limited approved.

CARRERAS, LIMITED

PROGRESS OF RE-ORGANISATION

SPRINGBOARD FOR COMPANY'S FUTURE OPERATIONS

On the occasion of an Extraordinary General Meeting of Carreras, Limited, held in London on December 14, 1959, the Chairman, Mr A. E. Rupert in the course of his address said:

The Accounts before you cover a period of eight months ended June 30, 1959. I have already addressed shareholders at the Annual General Meeting in February of this year and consequently cannot add a great deal.

We are all extremely busy with the necessary re-organization as outlined in my last address and these Accounts reflect a tidied-up situation designed to form a spring-board for your Company's future operations.

The general position of your Company's affairs is no better and no worse and the trading results enabled the Directors to recommend a dividend on the Ordinary and "B" Ordinary shares at the same rate as for the past two years.

ACCOUNTS

Group profits are slightly below those for the corresponding period of the previous year. The profits of the parent company show some improvement but this was offset by a fall in the profits of the Canadian subsidiary due to some degree to the charging against profits of some exceptional non-recurring items in connection with its re-organization.

Provision has been made for writing off machinery which has no place in the new Basildon factory and for assisting staff who moved to Basildon and compensating old servants and others who for personal reasons could not serve the Company at its new location and were prepared to continue service at Arcadia Works for as long as the Company needed them.

Your Canadian subsidiary has gone through a period of similar re-organization in relation to outmoded plant and general streamlining of operations in the manufacturing unit in Quebec City.

Your Board deemed it prudent to dispose of certain investments in competitor companies which has resulted in a substantial capital gain to your Company, which of course to some degree reflects the lower overdraft figures shown.

Leaf drying and packing will in future be carried out by specialists in these functions and your Board has accordingly disposed of the Lytton packing plant in Southern Rhodesia and has made arrangements for the disposal of a similar plant in Leamington, Ontario.

The Balance Sheet and the Consolidated Balance Sheet show a new item described as "Group Companies." The amounts shown under these headings were the aggregate balances arising in the normal course of trading operations with other members of the Group and included amounts due to the Company in respect of the sales of Carreras products to the trade in the United Kingdom by the newly-formed marketing company to which I will make reference later.

UNITED KINGDOM OPERATIONS

Production commenced at Basildon in April and the move is now almost complete.

As a result of integrated action in research, packaging and purchasing, your Company now has available to it the advantages of Rembrandt/Rothmans technical assistance in these fields. Your Company has also taken over from Rothmans such plant as is suitable for installation at Basildon.

Streamlining of Carreras and Rothmans distribution has been achieved by the formation of a non-profit-making joint marketing organization namely Carreras Rothmans Marketing Division Limited.

Cigarette sales are on the increase, mainly in filter brands, and small-selling uneconomical brands have been withdrawn.

CANADA

The Canadian interest in your Canadian subsidiary amounts, as you know, to about 30 per cent. In the spirit of partnership which I dealt with in my annual address, it is our desire in due course to offer greater participation to Canadians, which can only bring strength to our operations in Canada.

I am particularly pleased to be able to inform you that the Right Honourable Louis St Laurent, formerly Prime Minister of Canada, has joined the Board of the Rock City Company who, I am sure, will benefit greatly from the wide experience which he brings with him.

DIRECTORATE

Since the period of the Accounts Mr E. R. Adler and Mr M. J. Adler have resigned from the Board of Carreras Limited.

I am particularly pleased to inform you that Mr Edmund de Rothschild has signified his willingness to serve upon the Board of your Company and I am sure that you will agree with me that the experience which he will bring to your Board will be of the utmost value.

In conclusion I should like to thank the press for their most kind interest in your Company's affairs and for the degree of confidence which they have shown.

The Report and Accounts were adopted.

McKECHNIE BROTHERS LIMITED

SUBSTANTIALLY IMPROVED RESULTS

CONTINUED PROGRESS ENVISAGED

The annual general meeting of McKechnie Brothers Limited was held on December 17th in Birmingham.

The following is an extract from the circulated statement of the chairman Mr John Duncan McKechnie:

In my Statement last year I expressed confidence in our continued progress towards improved results. It is, therefore, with pleasure that I report an increase of £416,225 in the Group profit before taxation, the comparative figures being £943,834 and £527,609. The trading results in the UK and overseas improved and there was an approximate gain of £135,000 in metal values compared to a loss of approximately £125,000 in the previous year.

During the year the Group's capital additions, amounted to £883,592. The Parent Company's expenditure totalled £738,026, of which £667,098 was spent on the new factory at Aldridge and the remainder on new plant and buildings elsewhere. The Subsidiary Companies' expenditure totalled £145,566, of which £136,589 was spent overseas on plant and buildings. The financing of this heavy expenditure and the acquisition of African-French Metals Holdings (Pty.) Ltd. reduced our liquid resources from £986,000 in 1958 to £246,000 this year. Our further capital commitments, which amount to £302,000 are expected to be financed out of revenue.

UNITED KINGDOM

Towards the end of the year it became evident that it was costing more to finance the business, partly due to increases in the prices of raw materials and partly to capital requirements. In view of this position the Board decided to sell all the Group's investments held in the UK at a considerable profit on cost.

The past year has not been without its production and administration difficulties.

It is almost six years since work was started on the new factory at Aldridge, but it was practically finished by the end of the year, apart from the installation of more new plant. The final transfer from the old works was completed during the year, except for the ingot department which will be moved shortly. The cost of the new factory exceeded the original estimate, due to rises in prices and additional plant and buildings being required. However, we now have a very fine factory and there is no doubt that your Board's foresight in this venture will become more and more apparent in the future.

The Sulphate of Copper trade continued to cause us serious anxiety and we had to face up to a reorganisation at our Widnes Works which necessitated a regrettable reduction in staff and employees. This works' contribution to our profits has been seriously affected by poor prices for Sulphate of Copper during the past two years, but we are hopeful that the steps we have taken will improve the position in due course.

OVERSEAS

Our Overseas Companies in South Africa and New Zealand continued to make a good contribution to the Group's profits. These Companies are well managed and I have great confidence in their future. Here again the foresight of your Directors in establishing these Companies has been well justified.

A small associated company in which our South African Subsidiary, Eachairn Investment Co. (Pty.) Ltd., was interested has proved a disappointment and the investment therein has been written off, as shown in the Consolidated Accounts.

The past year has been one of reorganisation for Progressive Welder in Canada and, whilst it appears to be settling down, it is too early to say more.

Your Board feels that it must continue to conserve its resources and is recommending a final dividend of 10 per cent as before. It will be noted that this year the dividend is covered about 2½ times.

In addition, the Board is recommending a distribution of 5 per cent out of non-taxable profits.

CURRENT YEAR

We have no new major capital items in view at present and have entered a period of consolidation.

The year has commenced favourably for the Group and I anticipate improved results subject to there being no sudden change in trading conditions.

The report and accounts were adopted.

W. & C. FRENCH LIMITED

DIFFICULT TRADING CONDITIONS

The annual general meeting of W. & C. French Limited was held on December 18th in London.

The following is an extract from the circulated statement of the Chairman and Managing Director, Mr Charles S. French:

The Trading results for the Company's financial year to March 31st last are disappointing, but the decline was not altogether unexpected. The Trading Profit for the year at £569,641 is £177,457 less than last year. The Net Profit at £253,227 is subject to taxation of £126,000, so that the Taxed Profit is £127,227 as against £233,460 last year, a decrease of £106,233.

The Directors recommend that the Bonus Dividend of 10 per cent which has been paid on the Ordinary and "A" Ordinary Shares for the last two years, shall now be consolidated, making a total Dividend of 25 per cent. The Directors feel that the recommendation is justified having regard to the earnings cover.

As for the current year the present volume of work is being maintained at the level of last year, and in consequence our resources are being fully employed. There are a number of contracts in hand, however, particularly for building work, which were taken at keen prices during a period of severe competition, and where the margins of profit are very narrow. Despite the favourable working conditions of the recent summer, therefore, the profits for the current year may not necessarily show any material improvement over the preceding year.

ALLIED LEATHER INDUSTRIES

The annual general meeting of Allied Leather Industries Limited was held on December 11th in London, Mr H. G. Barlow (chairman and joint managing director) presiding.

The following is an extract from his circulated statement: The consolidated accounts show a Group Trading Profit of £165,609, Income Tax and Profits Tax require £86,056, leaving a net profit of £79,553.

The abnormally high profit is largely due to the fact that when we took stock in June, 1958, hide prices had reached a very low level and we had to write our stocks down in accordance with replacement costs at that time. Hides, however, recovered their value slowly during the first eight months of our trading year so that we recovered the stock losses during this period and in the last four months of our trading year hides rose suddenly to the highest prices they have reached since the Korean war. Fortunately these peak hide prices have not been maintained, as we were finding it impossible to obtain sufficiently high prices for our leather to recover our costs; and undoubtedly some of our profit for this past trading year will be required to cover this difference between the cost of hide and the price obtained for the finished leather.

Further progress has been made in the repair side of our business.

The reduction in Purchase Tax, to which I referred last year, has undoubtedly helped the sale of our leather goods production.

The report was adopted and a total distribution of 10 per cent approved.

SECOND INDUSTRIAL TRUST LIMITED

TAKE-OVER BIDS AND MERGERS

The forty-eighth annual general meeting of the Second Industrial Trust Limited, was held on December 10th in London. Sir Edwin S. Herbert KBE, LLB, the chairman, presided and, in the course of his speech said:

After deducting all outgoings the net revenue is some £11,000 up at £135,973.

We commenced the current financial year with a Government likely to remain in office for the full term. Whatever the political colour of the Government this can only be a good thing, since what lies ahead can be measured in some degree.

At the moment the economic barometer would appear to be set fair. Industry and commerce with one or two notable exceptions are very buoyant. Heavy industry has lagged behind in the general surge forward but, in my view, it must follow the general trend before long. Shipping may perhaps have longer to wait.

I would like to refer to the subject of take-over bids and mergers which has been much in the news in recent months. I do not want to cover all the ground which has been dealt with so fully in the press: I only want to stress one particular aspect of the problem.

NEED FOR FULL INFORMATION

There have been a number of instances of offers made in the last twelve months where the Shareholders concerned have had too little information on which to come to a decision. In some cases the offer is made by an agent on behalf of a Principal, whose identity is not disclosed. Again, if the offer is made on the basis of an exchange of Shares, insufficient information is given to assess the value of the Shares offered in exchange, a value which may or may not coincide with their current market price. On the other hand Shareholders to whom the offer is made, frequently do not receive sufficient information from their own Board of Directors to enable them to calculate, on present market values, the worth of the assets which they are asked to give up. It is clear from what I have just said that it is essential that if take-over bids or mergers, which in most cases are fundamentally sound, are not to fall into disrepute with the investing public, then full disclosure of all the necessary information should be made by both parties at the earliest possible opportunity.

A number of bodies are setting up Committees to make further studies of this problem and no doubt it will also be considered by Lord Jenkins' Committee. This discussion is all to the good. My only comment at the moment is that the facts of individual cases differ so widely that in my opinion the only solution is a recognised practice rather than statutory regulation, a remark which may well apply also to other matters to be considered in relation to possible amendments of the Companies Act.

Having in the past criticised the issue of non-voting Shares, I am glad that I can again record that a number of companies in the past year have decided to enfranchise Shares hitherto without a vote. Nevertheless, there are still too many companies with a large number of their equity Shareholders voiceless in the affairs of the companies which, in very large measure, they own.

The report and accounts were adopted and the total dividend of 15 per cent for the year (against 14 per cent) was approved.

NORTH KALGURLI (1912)

MINE IN GOOD SHAPE

The Annual General Meeting of North Kalgurli (1912) Limited was held on December 16th in London, Mr H. A. Kemlo, chairman, presiding.

The following is an extract from his circulated statement: Our accounts cover 13 four-weekly periods to the end of March, 1959. The current year will run to March 29, 1960, and at the end of the year, and at the beginning of the following year, our returns will cover periods of six weeks so as to eliminate additional office work.

We treated 361,213 tons of ore, producing 84,770 ounces of gold, as against 340,204 tons for 75,185 ounces last year. We also treated 1,819 tons of stored concentrates producing 4,107 ounces of gold. Our gross mining income after allowing for the reduction of the concentrates stockpile was £1,075,027 against £953,111 last year, and our net profit was £162,827 against £143,462. The net profit was adversely affected by rising costs.

It is proposed to repeat last year's final dividend of 6d. a share making 10½d. a share for the year.

In September and October I paid a visit to Kalgoorlie. The Mine is in good shape and we can be reasonably confident about the future.

Reviewing the overall development scope, the immediate and long-term prospects offer a wide range of objectives which, with careful planning, should ensure maintenance of ore reserves for many future years.

The report and accounts were adopted.

DICTOGRAPH TELEPHONES

The twenty-third annual general meeting of Dictograph Telephones Limited was held on December 10th in London, Mr Philip V. Summer (the chairman) presiding.

The following is an extract from his circulated statement:

The volume of work completed this year was higher than that of the previous year and the Accounts show a substantial increase in profit. Export trade continues difficult, and variable.

The Consolidated Profits before Taxation amount to £281,806 against £214,103 last year. The amount provided for taxation is £131,479 (last year £117,426). The Consolidated Profits after Taxation are £150,327 (£96,677 last year).

A Final Dividend of 10 per cent less Income Tax is proposed, making a total Dividend for the year of 20 per cent.

Although Intercommunication is the mainstay of the business, and our loudspeaking Master Station is famous everywhere, our installation department is by no means solely engaged in installing intercommunication telephones. The sales and rental of Staff Location Systems, Time Control Systems, e.g. electric clock systems and time recorders, and products ancillary thereto, increased satisfactorily during the year.

Grampian Reproducers Limited make a large variety of electronic equipment, particularly amplifiers, microphones and loudspeakers, and during the past year have developed a dynamic microphone which has been received very favourably by the electrical trade.

Again we finished the year under review with a good order book, and sales results in the current year are also satisfactory.

The report was adopted.

SAMUEL OSBORN & COMPANY LIMITED

SUCCESSFUL EFFORTS TO IMPROVE MANUFACTURING EFFICIENCY

The fifty-fourth annual general meeting of Samuel Osborn & Co. Limited was held on December 11th at Sheffield.

Mr Frank A. Hurst (chairman and managing director), presided, and, in the course of his speech, said:

Last year, you will recall, I stated that whilst trading conditions during the first nine months of the period then under review had been good, the last three months had felt the effects of the recession and that these were still in evidence at the time of the Annual General Meeting. Our present accounts refer to the year ended July 31, 1959, and the recession continued throughout the whole of the period to which they relate.

The Manufacturing and Trading Profit for the year under review amounted to £1,093,948 and it is disappointing that this again is less than in the preceding year. The turnover for the year was substantially reduced but I am happy to be able to report that, notwithstanding reduced sales, the profit of the main manufacturing companies has been at the same level as in the previous year and the overall decrease in profit is almost wholly accounted for by a decrease in the profits of other subsidiaries, including the overseas selling companies. This causes us satisfaction in that it indicates that although there has been keen competition our efforts to improve our manufacturing efficiency have been successful.

As I have stated, the turnover was reduced substantially, and in view of this it may be queried why we have proposed to increase the dividend, as announced in our Report and Accounts for the year. The explanation is that since the end of the financial year our turnover has increased and we have a much heavier order book load. Prospects are better now than they were at this time last year, and, despite the reduced turnover, our main factories were able to operate almost as satisfactorily as in the previous year, therefore the Board felt it only right and proper that the shareholders should participate, particularly in view of the conservative distributions of earlier years.

EXPORT TRADE

With regard to export trade I have to report that there was a considerable drop; desperate competition has been and is, in fact, being experienced and we suspect that some of the prices quoted by our overseas competitors are completely unrelated to production costs.

The European Common Market is now an accomplished fact and we must expect to find it increasingly difficult to maintain our trade in those countries comprising the market. On the other hand, an agreement between what is known as the "Outer Seven" has now been negotiated, and we must hope that it will bring benefits to this country, although certain sections of industry, including our own, may have further competition to face from one or two highly industrialised members of that group.

Last year I noted that the Government was embarking upon measures which it hoped would stimulate trade, and it is pleasing to us all to recognise that the measures taken have been so successful. It is my opinion, however, that there is still some extravagance in Government spending which calls for attention so that taxation may be further reduced in order to help us to face up to our fiercest competitors.

CONTROL OF IMPORTS URGED

In my last year's speech I referred to what to me seems an inexplicable reluctance on the part of the Board of Trade to put into effect a simple system of control of imports which has been strongly advocated by many sections of industry, in order to safeguard our home market against dumping by our overseas competitors. What has been suggested by us is nothing more or less than the same system we in this country have to follow when selling to certain countries abroad, of stating on our invoices the equivalent home market value of the goods concerned.

All efforts to persuade our authorities to be realistic have so far failed, but I consider that in a matter so serious as this the views of industry cannot continue to be ignored indefinitely.

MINWORTH METALS LIMITED

The nineteenth annual general meeting of Minworth Metals Limited was held on December 14th in London, Sir John Fox, OBE (the chairman), presiding. The following is an extract from his circulated report:

Bearing in mind that the early months of the year were overshadowed by the general recession in the steel industry, I am sure it will be felt that the results for the year are most gratifying. The trading profit for 1959 is greater than that of 1958 by 31 per cent. We continue to improve and develop our technique and this work, year by year, has been reflected in our results. Plant and buildings are well maintained and during the year we have brought into commission a new laboratory and additional factory extensions.

During the year the price of ferro-tungsten fluctuated between 6s. 6d. per lb in July, 1958, to a maximum of 8s. 9d. in June, 1959, finishing the year at 8s. 7d., an overall difference in the year equivalent to £188 per ton. Whilst this increase resulted in some stock gain, it must not be assumed that the satisfactory figures before you are due to this cause.

The group trading profit for the year was £124,347. After deducting United Kingdom taxation amounting to £62,196, there is left, after adding back taxation provisions of previous years no longer required, an available balance of £66,786. Your directors feel justified in recommending a dividend of 30 per cent, requiring £33,583 after deduction of income tax, and they propose that the balance of £33,203 be retained for use in the business of the group.

At an extraordinary general meeting resolutions will be submitted to authorise an increase in capital and a one for two scrip issue to be provided for by capitalisation of £91,384 from general reserve. It must not be assumed from this that the amount distributed by way of dividends will be increased. We are fully satisfied with the current trading results to date. Again it is my pleasant duty, on behalf of the shareholders and the board, to extend our thanks to all our staff, without whose co-operation and willing assistance the continued progress of the company would not have been possible.

The report was adopted and the proposed scrip issue approved.

KENWELL PROPERTY HOLDINGS LIMITED

RAPID DEVELOPMENT

The thirty-sixth annual general meeting of this company was held on December 11th in London, Sir Cyril Black, JP, DL, MP, FRICS, FAI, chairman, presiding.

The following are the main features from his circulated statement:

Position Strengthened.—When your present Directors took control on November 24, 1958, the Company was a "shell" and its only substantial asset consisted of cash. There have been very substantial changes in the capital position, thus greatly strengthening it.

Further Acquisitions.—At June 30th last the Group owned freehold and leasehold properties at a book cost or valuation totalling £864,816. Since then we have acquired the share capital of two further property investment Companies, which own properties in Manchester, Bournemouth and Hull. The properties owned by the Group have a total book cost or valuation of £1,037,028, and we have negotiations well advanced for the acquisition of further properties.

Future Earnings.—Further purchases of property will be made. Earnings during the current year are likely to be very substantial.

Capital Increase and Bonus Issue.—It is proposed to increase the Authorised Share Capital to £1 million by the creation of 500,000 5½ per cent Cumulative Preference Shares of £1 each and to issue to Ordinary Stockholders by way of capitalisation 240,984 fully paid Preference Shares on a one-for-ten basis.

DIVIDEND FORECAST

At the Meeting the Chairman announced that in the absence of unforeseen circumstances, the Directors would pay an interim dividend in May of 7½ per cent, less tax, and recommend a final dividend of 12½ per cent, less tax, making a total distribution of 20 per cent, less tax, for the year.

The report and accounts were adopted and the increase of capital was approved.

COMPANY AFFAIRS

Dividends from the Steelmakers

IMMEDIATELY after the election, the buying of steel shares represented the release of pent-up desires and demands. With the threat of nationalisation removed, buying brought the yields on steel equities down to correspond with economic facts instead of political fears. Some of the buyers thought ahead to the present dividend season and they rightly anticipated higher dividends. Only the wildest optimists will be disappointed with the dividends. Some individual shares suffered a slight check immediately after the dividend declarations but in the recent market rally, steel shares have been in the forefront and most prices are at the year's peak.

Economics must now rule investors' preferences. First, the dividends are well covered, even though the year to September 30th was a poor one for the heavy steelmakers in its earlier months. This year profits should rise; but the industry still has big investment programmes to complete and the need for self-financing will remain pressing (though not quite so pressing as it was in the days when a Labour victory still seemed possible). Secondly, demand for steel has been rising since the summer and the makers of heavy steels are beginning to enjoy some of the prosperity that the makers of lighter steels have enjoyed throughout the year. Thirdly, though it is clear that the pricing policies of the Iron and Steel Board, based on replacement costs, do not allow the British steel companies to earn such high profits as American steel producers when the industry is working well below rated capacity, those policies, given a reasonable flow of export orders, do ensure that even when capacity is as underemployed as it was this year profits remain fairly good.

The slightly surprising feature of the preliminary figures from **Colvilles** is that in spite of a decline in the group's output of coke, pig-iron and steel ingots and castings, trading profits advanced by 6 per cent, from £11,152,075 to £11,813,912, in the year to end-September. The explanation may be that since the middle of the financial year the recovery in demand for light products, to which the directors referred in the summer, has spread to the heavier products of the group. The directors now say that "all present indications point to an increasing pressure of demand for all classes of steel." The ordinary dividend has been raised from 13 per cent to 14 per cent and although some optimists were hoping for 15 per cent the market was well satisfied and the £1 ordinary shares gained 4s. 6d. to 72s. 3d. to yield 3.9 per cent.

Net profits before a transfer of £2,000,000 to capital reserve, as in the previous year, have risen from £2,214,850 to £3,675,091. Taxation fell from £4,437,034 to £3,676,817 and depreciation is almost unchanged at £2,363,646; the charge for "additional depreciation" (that is for fixed assets replacement) is down from £270,028 to £98,358. The group's reserves will benefit from a windfall of some £2,000,000 arising from over-provisions for tax in previous years and certain non-recurring items.

The directors say that the construction of the new slabbing mill at Ravenscraig is proceeding steadily and plans for the 500,000 ton strip mill project, which is expected to begin production in 1963, are well advanced. Under an agreement with the Ministry of Power the Government will help finance this project by up to £50,000,000: the remark that the directors "think it desirable that as great a proportion as possible of the total capital expenditure for the strip-mill scheme should come from the company's own resources" suggests that the present cautious dividend policy, as underlined by an earnings cover on the ordinary dividend of 5.4 times, is likely to continue for some time to come.

Stewarts and Lloyds forecast its results for the year to October 3rd at the time of the rights issue in October. The final payment is now formally declared at 8 per cent, making an unchanged total dividend of 11 per cent for the year. The same payment has been forecast for the current year on the capital as increased by the rights issue. Although the sales of the group fell by only 3 per cent, from £123 million to £118½ million, trading profits after depreciation fell by 22 per cent from £14¼ million to £11 million. Net profits have fallen by 20 per cent from £6.6 million to £5.4 million, but the dividend cover for the ordinary dividend is still almost four times on the old capital.

Stewarts and Lloyds ingot production rose by 7 per cent and tube output was also slightly higher. Deliveries to customers other than the oil industry showed a considerable increase but a fall of over 100,000 tons in those to the oil industry resulted in total deliveries for the year being 4 per cent down at 833,000 tons.

The improvement in trade announced at the time of the rights issue has continued apart from business with the oil companies. The directors also say that the proceeds from the issue will eliminate the overdraft of £11¼ million but further bank borrowing will be necessary in the current year to meet the continued expenditure on capital development. The £1 shares at 56s. 6d. yield just over 4 per cent.

John Summers is the biggest sheet supplier in the steel industry and the 7 per cent rise in trading profits in the 53 weeks ended October 3rd, from £12,554,521 to £13,436,122, was expected. The ordinary dividend has been raised from the equivalent of 10½ per cent to 12½ per cent on the capital as increased by last May's one-for-two scrip issue; and the directors say that they hope to pay an interim dividend for the current financial year of 6 per cent (against the equivalent of 4 per cent). The £1 ordinary shares at 77s. yield 3.3 per cent on the latest dividend covered about 2½ times by earnings—the lowest return currently offered by a steel equity. But on the basis of a total distribution for 1959-60 of 14½ per cent the yield at this price would be around 3¼ per cent.

Depreciation, including the appropriation to fixed assets replacement reserve, is slightly higher at £4,292,330 (against £4,216,340) and a higher tax charge of £4,020,000 (against £3,760,000) has left net earnings at £4,148,654 (compared with £3,048,404). The charge for taxation is struck after crediting £440,000 (against £172,000) in respect of investment allowances, reflecting the expansion scheme at Shotton, and after writing back £320,000 (against £200,000) from over-provisions in previous years. Over the last two years Shotton has been working to full capacity.

Trading results from the **Steel Company of Wales** for the year ended September 30th were much as expected. The ordinary dividend of 10 per cent had already been forecast and compares with the equivalent of 9 per cent for 1957-58; and as the principal customers of Steel of Wales are the motor trade and other durable consumer industries (as well as the canners) the rise in trading profits of 5 per cent, from £22,181,916 to £23,290,814, was not surprising. A higher depreciation charge of £6,646,515 (against £6,108,228) was more than offset by the fall in the tax charge from £6,000,000 to £5,000,000 and an almost unchanged amount set aside for fixed assets replacement reserve left net earnings higher at £4,229,150, compared with £3,038,847. The ordinary dividend is covered 2½ times by earnings.

The boom in the motor industry brought prosperity to Steel of Wales in 1957-58 and again, but in still greater measure, in 1958-59. At the same time the revival in sales of consumer durables must have contributed to bigger profits. Now the directors have announced a further development programme, costing about £30 million, which is designed to raise the group's output of sheet to 3.65 million tons by 1962, as well as increase its production of tinplate. The cash flow of about £11 million suggests that in order to finance the new programme the directors may be forced to extend the group's already heavy borrowings. A more generous dividend policy thus seems no closer than it did last year. At 49s. the £1 ordinary shares yield 4.1 per cent.

Distillers

AN increase in the interim dividend of Distillers from 4 to 5 per cent, now formally declared, had been promised as a step towards reducing the disparity between the two payments, but the half yearly results are such that a final dividend of 10 per cent has become a distinct possibility. That would raise the total dividend for the year from the equivalent of 12½ per cent to 15 per cent.

Group trading profits for the six months to September 30th advanced by 14¼ per cent, from £12,841,000 to £14,686,000; lower income accruing from trade investments and an increase in minority interests have left the parent's net profit before tax some 11½ per cent higher at £14,512,000 (compared with £13,032,000). Favourable trading results have been maintained in the second half of Distillers' financial year, but the directors say that the outcome is more difficult to assess, for now that Scotch whisky is freely available the seasonal pattern of demand is changing. They are however confident that the full year's results will be satisfactory. The interim report makes no mention of Distillers' industrial interests, but in August the chairman referred to "increased industrial activity from which your company should benefit" and it seems clear from the half year's results that it has done so. Since these results were announced, the 10s. ordinary shares have risen by 1s. 1½d. to 36s. 10½d., to yield just over 4 per cent on the assumption of a 15 per cent dividend.

International Computers and Tabulators

THE £1 ordinary shares of International Computers and Tabulators have been strongly favoured by United States investors and before the results were announced this week they offered only 2 per cent on a forecast dividend of 8 per cent. ICT, which resulted from the merger of Powers-Samas Accounting Machines with British Tabulating Machines, includes in its results for the year to September 30th only nine months profits of Powers-Samas. Total profits of the group before tax were £2,329,000, which compares with £2,025,000 earned separately by the two companies in their last full financial years. A fuller picture of the extent to which profits have risen will be seen in the full accounts, for the depreciation charge where equipment is rented by customers is usually high; out of British Tabulating Machine's gross profit of £3,766,000 for 1958, no less than £1,740,000 was charged for depreciation.

The surprise in these results is that the ordinary dividend is 10 per cent, as opposed to the 8 per cent forecast at the time of the merger. A conservative dividend policy had been hinted at in view of the costs of development overseas, and since the shares issued as rights last July will participate in all future dividends, the directors must surely be confident that 10 per cent can be maintained on the enlarged ordinary capital. The rights issue together with an issue of 5½ per cent debentures will bring in about £8 million. A loan of £2 million from the FCI has been repaid and the rest of the new money is being used to pay off overdrafts of over £5 million. The £1 shares (of which Vickers holds 38 per cent) are currently priced at 71s. to yield 2¾ per cent on the 10 per cent dividend.

Associated Commercial Vehicles

EARNINGS of Associated Commercial Vehicles have followed an erratic course over the past few years and the preliminary statement for the year ended September 30th is as encouraging as last year's was depressing. In 1957-58 profits before tax slumped from £1,030,000 to £432,000, but this year they have climbed back to £966,000. No information about depreciation is given in the preliminary statement but the directors say that the net profit, after tax of £439,432 (against £258,155), is up from £163,003 to £538,238. The ordinary dividend has been raised from 15 per cent to 17½ per cent, which is 2½ per cent better than the forecast made earlier in the year.

The directors attribute the sharp recovery in the group's earnings to the benefits of last year's reorganisation and rationalisation policies and—perhaps more important—to the abolition of the purchase tax on commercial vehicles in April. The removal of the nationalisation threat following the election has prompted many road hauliers to speed up their vehicle replacement programmes, so the boom in commercial vehicle sales may continue for some time to come and the recovery in ACV's earnings may not be short-lived. Lord Brabazon, the chairman, has at last got the expanding home market he has so constantly been exhorting the Government to create, and with ACV's exports still buoyant in an increasingly competitive market, the yield of 5.1 per cent on the £1 ordinary shares at 69s. 6d. may not put too big a discount on the future.

London and Lancashire Insurance

IN order to finance further expansion, mainly abroad, London and Lancashire Insurance is to make its first cash issue for nearly seventy years. To make for a broader market the £1 units are to be subdivided into 5s. units and one new 5s. share is to be offered at 35s. for every five 5s. units held. Following this news the £1 stock units fell by 12s. 6d. to 173s. 9d. so that the rights are worth 5s. 6d. per £1 unit, or 1s. 4½d. per 5s. unit. The new shares will not rank for the final dividend of 20 per cent to be declared in May, which will leave the full year's dividend unchanged at 37½ per cent. The directors expect to maintain this rate for 1960 on the capital as increased by the rights issue. The chairman, Mr R. M. Preston, says that it is doubtful if the recent unsatisfactory fire and accident experience in North America will show any improvement in the current year but he is confident that "normal conditions will return in the next few years." At an estimated ex rights price of 42s. the new 5s. stock units will yield around 4½ per cent.

Firth Cleveland

THE 4s. ordinary shares of Firth Cleveland, the industrial holding company, were put on the market as recently as last July. The offer of four million of the shares was over-subscribed three times, but when dealings began the price did not rise much above the issue price of 16s. 6d. Investors who then bought the shares must be very satisfied, for they are now quoted around 31s. This week alone they have risen by 7s., following the news that Firth Cleveland is to acquire Broadmead Ltd., a private company which owns about 300 shops dealing in radio and television sets and electrical and domestic appliances. Broadmead is a successful enterprise created from small beginnings. Mr John James, the founder and chairman of Broadmead, opened a single shop in Bristol in 1946 and the company has since expanded into the largest radio and electrical retail chain in this country. His group now includes John G. Murdoch, which was acquired in 1957.

Broadmead's annual profits over the last four years have averaged £883,000. The purchase price is £5,800,000, of which half is to be in cash and the other half in 2,416,667 4s. ordinary shares in Firth Cleveland (representing just over 13 per cent of its equity). Broadmead is thus being valued at 6½ times its pre-tax profits. Mr James is to join the Firth Cleveland board and is to supervise the running of not only the Broadmead chain of 300 shops but also the 200 shops already owned by the Firth Cleveland group, which include Max Stone, Civic Radio Services, Escott Brothers and in the furniture field, Wolfe and Hollander. These shops make up only part of Firth Cleveland's interests, which include metal and engineering divisions.

The estimate in the prospectus of Firth Cleveland's profits before tax was £1.8 million for 1959, but the chairman has recently estimated that this figure will be "comfortably exceeded." A dividend of 24 per cent was then forecast for the year (of which an interim of 10 per cent has recently been paid), but the founder shares, which are privately held and represent more than half the equity, do not rank for any dividend until they are converted into ordinary shares on July 1, 1961. The market is clearly optimistic about the prospects of Firth Cleveland, as the current yield on the 4s. ordinary shares is only 3 per cent.

Mercantile Credit

DOUBLE your money seems to be the keynote of the annual report and accounts of Mercantile Credit for the year to September 30th last. The group's profits (including only nine months' trading of Mutual Finance, the most recent major acquisition) more than doubled, rising from £442,310 to £1,052,226, and the ordinary dividend has been raised from 8 per cent to 15 per cent. The consolidated balance sheet shows an increase in hire purchase business, net of unearned finance charges, from £24 million to £49.8 million while unearned finance charges of almost £5 million compare with just over £2 million in 1958. The chairman, Sir Mark Turner, attributes this "rather larger proportionate increase" to the lengthening of the terms on new business. The group's liquid assets—this year all in cash—have risen from £1,372,000 to £2,300,964. The big increase in hire purchase business has been financed in three ways, by bank loans and acceptances, by deposits from the public and by new capital. Bank loans and acceptances have more than doubled, from £8.2 million to £17.8 million, while deposits from the public have risen from £11 million to £20.8 million. The placing of shares with the Westminster Bank and Martins brought in approximately £4 million and the issue of 6½ per cent preference shares last September brought in another £2½ million, of which the final half was payable at the end of November.

The 5s. ordinary shares at 27s. 9d. are some way below their peak—as are other HP shares—but nevertheless they yield only just over 2½ per cent.

Salts (Saltaire)

ILLINGWORTH MORRIS already holds over 60 per cent of the ordinary capital of Salts (Saltaire). In October, 1958, when it held four million of the 5s. ordinary shares it made a bid for a similar number of shares at 7s. each, leaving those who did not accept the partial bid or who were late in doing so out in the cold as minority shareholders in a subsidiary. The directors of Salts (Saltaire) felt that the price was not unreasonable "in the present state of the textile industry," but they made an unsuccessful attempt to persuade Illingworth Morris to extend its offer to all ordinary shareholders. Some thirteen months later Illingworth Morris has announced its intention to make an offer to purchase the remaining shares at 8s. per share.

Trade in the textile industry has taken a considerable turn for the better since the first bid was made; indeed the net profits of Salts (Saltaire) for the six months to September 30th of £252,476 compare favourably with £355,220 for the whole of the previous year to March 31st. The price of the 5s. shares has reflected this improvement and the shares were quoted at 8s. 6d. before this offer was announced. The partial bid made thirteen months ago encountered well merited criticism and the offer to minority shareholders of a price below that of the market seems an odd way of putting matters right.

Walmsley (Bury)

THE Treasury has given its consent to the issue by Walmsley (Bury) of 250,000 £1 shares to the Beloit group of Wisconsin, USA. Both companies are leading manufacturers of paper making machinery. This is part of an agreement between the two companies for co-operation and the exchange of information. Beloit acquires a 20 per cent interest in the Walmsley equity at 110s. per share, which is close to the current market price of 107s. 6d. The proceeds will be used by Walmsley for the expansion of manufacturing facilities in Lancashire.

The chairman of Walmsley, Mr A. Green MP, points out that through this agreement the company will be able to participate to a much greater extent in the development of new machines than it could on its own because of restricted market facilities.

Beloit has agreed that if it wishes to dispose of its share in Walmsley within ten years it will be up to Walmsley to find the buyer so that control will not be affected. Beloit is a private company but under the agreement Walmsley has the option to acquire up to $3 million of the Beloit shares if these are offered to the public within ten years. Before the agreement can be carried through shareholders in Walmsley will have to give their approval to the scheme by authorising the increase in capital.

Daily Mirror

ON February 28th the share premium account of Daily Mirror Newspapers stood at £12,707,894, following the issue of shares on the take over of Amalgamated Press at the beginning of the year. Now £8,159,659 of this account is to be capitalised and a 100 per cent scrip issue is to be made in "A" ordinary shares. As with the recent rights issue of Beaverbrook Newspapers the shares to be issued will carry no vote. At present there are in issue about 16 million 5s. ordinary stock units and 16¼ million "A" (non voting) stock units and this issue will raise the number of non voting shares to about 49½ million. In view of the effects of the printing dispute on the profits of Fleetway Publications, an increase in the final dividend beyond the strict equivalent of 7½ per cent seems unlikely and an unchanged interim of 10 per cent on the old capital is to be paid on January 1st. At the year's peak of 29s. 5d., the 5s. "A" ordinary shares yield 4¼ per cent while the voting rights add another ninepence to the price of 5s. ordinary units. This is yet another case where the weight of non-voting stock has been increased by the simple device of the scrip issue. It will do nothing to abate the criticisms that are levelled at non-voting shares.

London Stock Exchange

FIRST DEALINGS:	Dec. 7	Dec. 28	Jan. 11
LAST DEALINGS:	Dec. 24	Jan. 8	Jan. 22
ACCOUNT DAY:	Jan. 5	Jan. 19	Feb. 2

FAVOURABLE business news, good company statements and some heavy buying by institutional investors helped markets to advance on a broad front throughout the week, though on Wednesday a fair amount of profit-taking caused most prices to close below their best. Over the week to the close on Wednesday *The Economist* indicator rose 7.2 points to a new "high" of 359.9. Most of the Funds closed lower over the week. Undated stocks were particularly dull with 3½ per cent War Loan ⅝ down at 65¼ and in medium dated stocks 4 per cent Gas (1969-72) lost ⅛ at 91⅛. Short-dated stocks were fairly firm and 4½ per cent Conversion 1962 put on ⅛ to 100⅛. Home Corporation loans were idle with 5 per cent LCC 1980-83 falling ⅛ to 97⅛.

Particularly active sections in the industrial equity market were steels—stimulated by the industry's record output figures and this week's crop of satisfactory company news—and aircraft shares, on the prospects of mergers within the industry; and textiles were buoyant on reports that Lancashire was working flat out to cope with the high level of demand which has developed at a time when the industry has had to contract under the Government's reorganisation scheme. In steels, Stewarts and Lloyds gained 3s. 6d. to 56s. 6d., Steel Company of Wales advanced 4½d. to 48s. 10½d. and Colvilles, which showed the biggest rise in the steel section, put on 6s. 7½d. to 72s. 1½d.; South Durham closed 2s. 1½d. better at 55s. The best rise among aircraft shares was seen in De Havilland which jumped 3s. 3d. to 22s. 3d. ahead of the announcement of the proposed merger with Hawker Siddeley. In textiles Lancashire Cotton closed 3s. 9d. up at 66s. 9d., English Sewing Cotton improved 3s. 6d. to 49s. 6d. and Fine Spinners gained 3s. 3d. to 32s. 3d.

Engineering shares continued their recent rally with R. A. Lister 5s. 6d. better at 55s. and Vickers 9d. up at 33s. 6d.; Davy-United advanced 1s. to 112s. 9d. on the group's contract to build the £4 million strip mill at Newport for Richard Thomas and Baldwin. Philips Lamps rose by 7s. 6d. to 157s. 6d. on heavy American buying. Store shares were fairly active on hopes of record Christmas sales and Marks "A" closed 6d. better at 64s. 6d., GUS "A" improved 4s. 4½d. to 74s. 6d. and House of Fraser closed 1s. better at 45s. 9d. The slight recovery in freight rates and fall in the amount of world shipping laid up revived interest in shipping shares: Cunard improved 9d. to 21s. 9d., P & O deferred put on 2s. 3d. to 47s. 6d. and British and Commonwealth closed 3s. 3d. better at 46s. 9d. Other industrial equities which scored good gains over the week included ACV which put on 3s. 6d. following the bigger profits and dividend. International Computers closed 2s. better at 73s. on the better-than-forecast dividend and Ranks gained 3s. to 28s.

THE MONEY MARKET

THE discount market lowered its bid by a further 3d. to £99 2s. 1d. for 91 day bills at last Friday's Treasury bill tender and the average discount rate rose by just under $\frac{1}{16}$ per cent to £3 11s. 6.91d. The market's allotment at the basic price fell from 54 per cent to 48 per cent and it seems that slightly higher bids were received from outside institutions.

By contrast the United States Treasury bill rate for three months bills fell from its peak of 4.638 per cent to 4.535 per cent; the margin over the London rate thus narrowed to slightly under one per cent. The rate for the six months bills also fell this week from the record level of 4.969 per cent to 4.833 per cent.

Credit conditions in Lombard Street once again eased towards the week-end and on Saturday some balances were unlent. It has been a different story this week, however, and two or three houses were forced to borrow from the bank both on Monday and on Wednesday, when no assistance of any kind was given by the authorities. Rates for overnight loans have ranged up to 3½ per cent and February bills have changed hands at this rate, with March maturities and "hot" bills at 3⅝ per cent.

WOOLWICH EQUITABLE
has successful year

Investors' Funds up by £16,300,000
Record Loans on Private Dwellings Assets over £156,000,000

Sir Thomas Spencer, the Chairman, presided at the One hundred and twelfth Annual General Meeting, held at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.2, on December 15th. The following are points from his speech.

Pre-1919 Houses

On 16th June, 1959, two days after the House Purchase and Housing Act, 1959 became operative, the Society was designated as affording trustee status to investments on deposit. Thereupon we became one of the first participants in the new House Purchase Scheme under the Act, and by 30th September had completed loans of £1,150,000 on sound pre-1919 houses under the Scheme and had drawn advances from the Exchequer of £595,925.

Interest Rates

Share Account interest was reduced on 1st July from 3½% to 3¼%. No change was made, however, in either the interest rate of 3% on Personal Deposits or the yield of up to 4½% on the Triple-Bonus Savings Shares. Income tax on all share and deposit interest is borne by the Society.

There was a reduction from 6% to 5½% in the rate of interest charged in respect of all applications for new loans on owner-occupied private dwelling houses received on or after 25th May. It was also decided similarly to reduce from 1st October, 1959, the rate of interest on existing mortgages on private dwelling houses.

These changes in interest rates involved no material alteration in the already adequate but by no means excessive margin from which we meet our management expenses and taxation on our net surplus of revenue, and make reasonable transfers to General Reserve.

Shares and Deposits

Share receipts for the year amounted to £28,721,647. Share withdrawals, apart from interest paid out, were £12,917,971 and, including interest compounded at 30th June, the share balances increased by the record total for any year of £16,155,485. The balance due to depositors increased in the year by £158,167.

The introduction in February of Share Accounts in £1 units (and fractions thereof) in lieu of our £50 'D' shares, with passbooks taking the place of share certificates and facilities for compounding share interest, has been well received by our investors.

Mortgages

There was a record total of new mortgage loans of £27,358,915. These comprised 15,597 new loans together with 3,226 additional loans to existing borrowers. Only 254 of the new loans exceeded £3,000 and £27,166,456 (over 99%) went to purchasers of private dwelling houses for owner-occupation.

Mortgage balances increased in the year by nearly £15 million to £133,345,741, secured by 109,675 separate mortgages on properties widely spread throughout the country. The average sum due from each borrower was £1,216. Only one in a thousand of these balances exceeded £5,000.

Reserves, Investments and Total Assets

The balance of surplus available for appropriation was £798,845. £50,000 was written off the book value of one of our longer-dated Government Securities and £650,000 was transferred to the General Reserve, which nowstandsat£6.550,000. The balance carried forward was thus £98,845.

Investments and cash and Bank balances amounted to £21,226,129 and represented 13.61 per cent. of total assets at 30th September. All the investments are redeemable at or within fixed dates and their total redemption values exceed their book values by over £1 million. Total assets increased by £17,624,079 to £156,001,748.

Staff

Our General Manager, Mr. Alexander Meikle, was re-elected in June last as Chairman of The Building Societies Association for a second year of office. We have been glad to give him all possible support in that post.

Our staff have responded to the needs of a very busy year with efficiency, vigour and enthusiasm. The organisation is in excellent shape and ready to handle a further increase in our business activities.

Directors' Responsibilities

Building societies are mutual institutions which must care equally for their investors and borrowers. Their Directors have the fiduciary responsibility of ensuring that no avoidable risks are taken in lending the investors' funds which, in very great measure, should always be employed in the making of loans to purchasers of homes of their own. These principles are constantly observed by the Board of the Woolwich.

The Directors' Report and Annual Accounts for the year ended 30th September, 1959 were duly adopted.

WOOLWICH EQUITABLE BUILDING SOCIETY
CHIEF OFFICE: EQUITABLE HOUSE, WOOLWICH, S.E.18

Copies of the full text of the Chairman's Speech and of the Annual Accounts are available at any of the Society's Offices.

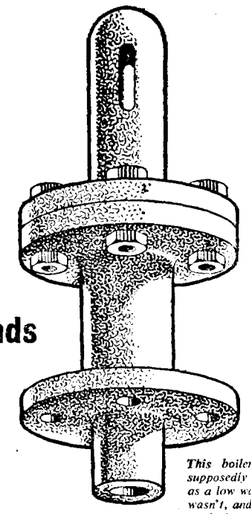
This boiler fitting cost thousands of pounds



This boiler fitting was supposedly doing its job as a low water alarm. It wasn't, and the resultant explosion not only cost the firm a boiler house, but a crippling loss of profits.

—and two people could have prevented the accident

An accident like this, caused by a defect in the working parts of the apparatus, need never happen—if a qualified Engineer Surveyor regularly inspects machinery. But first it is the responsibility of someone at top-level—a director, the secretary or chief engineer—to see that all their industrial machinery is regularly inspected and properly insured by specialists.

1859 1959

Vulcan inspects and protects

Vulcan, who this year celebrate a century of experience—and look forward to learning more every day—provide just such a service. It costs no more than insurance and inspection by 'general practitioners'. Our appointment is always welcomed by company engineers and insurance brokers—because they know that if defects are to be found, a Vulcan Engineer Surveyor will find them, and prevent the accident that would have happened.

MAY WE SEND YOU FREE

'Vulcan'—a journal for all users of plant and machinery with reports of accidents and safety hints. Write to Dept. 17

By order of the Board, T. F. TURNER, Secretary. Montreal, December 14, 1959.

CANADIAN Pacific Railway Company (Incorporated in Canada with Limited Liability) Dividend Notice, Ordinary Capital Stock. At a Meeting of the Board of Directors held today a final dividend of Seventy-five cents per share on the Ordinary Capital Stock was declared in respect of the year 1959 payable in Canadian Funds on February 29, 1960, to shareholders of record at 3.30 p.m. on January 8, 1960. By order of the Board, T. F. TURNER, Secretary, Montreal, December 14, 1959.

REMPLOY SPONSORSHIP SCHEME

Send for details which show an attractive proposition to manufacturers.

Write to the Managing Director, Remploy, Ltd., 25-28 Buckingham Gate, S.W.1, or telephone VICtoria 0021 (12 lines).

"THE WORLD'S FINEST CAMERAS": Leica, Rolleiflex, Contaflex, Retina, etc., now freely available. Illustrated booklet free from Wallace Heaton Ltd., The Camera Specialists, 127 New Bond Street, London, W.1.

ART GALLERY. No promotion or hanging fees. Unknown painters accepted. Please help any amateur you know who lacks confidence.—Suggest writing to BCM/GALLERY, London, W.C.1.

"Which?"

The December issue of "Which?" reports on
anti-freeze compounds
Christmas hampers
model train sets
toy sewing machines.
Annual subscription for 12 issues of "Which?", published by the Consumers' Association, costs £1, to Box C, 333 High Holborn, London, W.C.1.

OH—Aunt Jemima! Almost overlooked her in the Christmas rush. But she's mad about 13 Cid Sherry. Claims it's the finest Amontillado Spain produces. I'll send her a bottle—pronto!

A FILM WORTH SEEING is taken with a 16mm. Paillard Bolex Cine Camera, £220. City Sale & Exchange Ltd. 66, Cheapside, London, E.C.2.

SECOND-HAND BOOKS. The Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (*periodicals excluded*).

SHARE A FLAT LTD., 175 Piccadilly, HYD 2545, infinite care, right person or right flat.

WHAT ARE THE FACTS about homosexuality? Should the law be changed? Decide for yourself after reading "SOME QUESTIONS AND ANSWERS ABOUT HOMOSEXUALITY," obtainable from The Albany Trust, 32 Shaftesbury Avenue, London, W.1. Price 1s., postage 4½d.

EDUCATION

SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 14-week courses.—Write, Organising Secretary, DAVIES'S, 2 Addison Road, W.14. PARK 8392.

EXPERT POSTAL TUITION

for Examinations—University, Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical non-examination courses in business subjects. Write today for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (Dept. 23), METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

AIR SUBSCRIPTIONS TO *THE ECONOMIST* 22, RYDER STREET, LONDON, S.W.1.

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

everyone appreciates
Caltex service...

Scenes like this occur throughout the Eastern Hemisphere, where Caltex is serving the peoples of many lands. Caltex serves not only by marketing high grade fuels and lubricants to motorists through its tens of thousands of service stations... but also in many other ways.

Caltex activities include finding crude oil, refining it into gasoline, kerosene, diesel oil, fuel oil, lubricating oils and asphalt stocks, and transporting this variety of petroleum products in over 70 countries, to where they may be used in local industry, in farming, in construction, and in all forms of transportation.

In these and in other ways Caltex serves not only the public but the economy of many lands.

...in Great Britain, look for the familiar REGENT sign!

BRITISH INSURANCE

Background to Mergers

THE boom in insurance shares got under way in the spring of this year. More sophisticated investors and dealers noted the possibilities latent in insurance shares as early as the autumn of 1958, but the public's fancy was not caught until six months later. Then insurance equities began to move up even more quickly than industrial ordinary shares. The results for 1958 had begun to appear; a number of new issues on favourable terms to shareholders were announced; and the market began to buzz with talk of mergers, some of which was well founded and some not.

Last year the total premium income of the British insurance companies rose by £83 million to £1,425 million; the non-life premium income of the nineteen leading offices whose results are analysed in Tables VI and IX rose by £26½ million to £661 million. The growth was less than in 1957 but it was achieved in a year in which world trade contracted and it demonstrated that the insurance offices could expand their business without the spurious help of inflation—even though premium rates, especially in the United States, have still fully to catch up with prices. Bonuses on with-profits life policies were raised again and dividends on share capital, paid traditionally out of non-life interest income, were increased. Investors for their part had no reason for complaint, with fourteen offices raising their dividends, compared with eleven in 1956 and only five in 1957.

Underwriting losses on the non-life accounts of British insurance companies in North America were less severe than in the immediate past; the 24 offices that operate in United States, as Table X shows, were in the red to the tune of $34 million last year, compared with $58 million in 1957 and $34 million in 1956. This improvement in the United States was sufficiently strong to swing the global results from fire and accident underwriting back into the black, though when the profits from marine insurance (down by £1¼ million to £2¼ million) and overhead expenses (including the considerable cost of pensions and tax) are brought into account, Table VI still shows a deficit on the non-life underwriting business of the nineteen leading composite offices of £5.3 million. But this compares with a deficit of £8.6 million in 1957 and it seems probable that it will be reduced again this year.

The possibility of growth in insurance could not be ignored by investors who were prepared to discount expansion in industry so readily, and the new issues announced by some of the insurance companies on favourable terms to shareholders suggested that directors of the offices concerned, too, were thinking that further expansion was possible. So far this year four companies have sought new money—the Royal Exchange (£5.7 million); the Atlas (£1.4 million); the Eagle Star (£4.5 million); and the Yorkshire (£1.1 million, which together with the proceeds of the sale of its American subsidiaries gives it £3 million to re-deploy).

New issues are an established practice in the insurance world, but the new money raised so far this year already amounts to more than was raised in any of the five preceding years. It is presumably needed first to reinforce working capital resources in order to finance an expansion in the scale of operations, especially for some offices abroad, and secondly, to bring free reserves back into line with premium income earned on fire, accident, marine and aviation accounts. Free reserves have been declining proportionately in recent years as premium income has risen and as underwriting losses have cut deeply into the surplus of non-life net interest over net dividends. There is clearly an advantage in widening the capital base if further expansion is planned and if the offices have to think of accepting heavy new liabilities, such as for nuclear power. But obviously there would be nothing to be said for using new capital to bolster up unsound underwriting.

GROWTH implies competition—and competition in insurance as well as in industry seems to be implying amalgamation. Mergers are a familiar feature of the history of insurance and all the leading offices have in the past acquired smaller companies. But this year has already witnessed something more than a fashionable revival. There has been the merger between the Commercial Union and North British and Mercantile; the gentlemanly struggle between the Yorkshire and the mutual office, Norwich Union Fire, to acquire Scottish Union and National; the bid by Eagle Star to acquire Midland Employers' Mutual; and, more recently still, the proposed merger between the Royal Exchange and the Atlas. Specific factors, no doubt, prompted each of these mergers. The amalgamation of Commercial Union and North British established a powerful group in the United States; the merger of the Royal Exchange and the Atlas is a logical development of co-operation between the two offices in the American market; the counter-bids for Scottish Union suggested that the two bidders thought a more fruitful use could be made of its resources; and a merger between Eagle Star and Midland Employers' Mutual would make the merged institution better balanced in motor insurance and in

life and annuity business than the individual offices were. At the same time, however, the insurance offices, whatever they may promise about preserving the separate entity of a business and of paying due regard to the interests of the staff, are aware that amalgamation can produce economies in operation and can provide an access to new markets (or, as in North America, ensure that the door to that market remains open). They might not like to see a Mr Clore shouldering his way in, but so long as the mergers are arranged between themselves they recognise, to use the words of Mr Charles F. Trustam, last year's chairman of the British Insurance Association, "the benefits of economy and efficiency in administration" which can result.

No merger, whether in insurance or elsewhere, makes much sense unless economies in operation and administration are obtained. There is as little point in an insurance combine duplicating offices, staff and management (particularly where in the past they have failed to secure the results that justify the money spent) as in a Mr Jasper retaining an unprofitable shop on a valuable property site. In a business as highly competitive as insurance the opportunity for reducing management expenses, as held out for instance by mechanisation and by the use of electronic computors, argues the case for size. Moreover, especially in underwriting, business that a small office could not hope to attract comes to a large one.

NOWHERE have these facts been so painfully brought home to the insurance companies as in the United States. The merger between the Commercial Union and North British, the decision to operate the United States business of the Atlas, Royal Exchange and the Sun in that market under one management (followed not many months later by proposals to merge all the business of the Royal Exchange and the Atlas), the withdrawal of the Yorkshire Insurance (because it was too small), and the closing down and consolidation of branches and subsidiaries by other British companies have all been prompted, at least in part, by the run of underwriting losses in the United States. Increases in American premium rates, to offset the effects of inflation on claims and expenses, have been delayed by the state insurance commissioners. Competition even at inadequate rates of premium has been fierce not only from the American insurance companies, which, like the British offices, operate through the established agency system, but from cut-rate companies which sell insurance direct to the public. In the last few years these companies have been skimming off an increasing amount of the cream of the business, making it more difficult for the agency companies to apply for an increase in rates or to charge fully for extending the scope of the cover of their policies.

The choice facing the British insurance companies in the United States is the unsettling one of either withdrawing from the market or of becoming much bigger within it. Full or partial merger of interests does at least secure some of the benefits of large scale operation in the United States. Administrative economies can tip the balance between profit and loss in a market where an underwriting margin of 5 per cent of the premium income is reckoned to be a good one. Size does reduce costs, as is shown in the following table, based on the experience of companies underwriting fire, accident and marine insurance throughout the United States:

Premium Income $ million	Average Expense Ratio %
Over 200	39.0
101 - 200	39.3
51 - 100	40.7
26 - 50	43.1
Up to 25	44.5

Geography itself makes it difficult for a relatively small organisation to give adequate service (and at the same time to spread its risks) in all parts of the United States. Size gives the offices the opportunity to do so, but concentration of effort for British insurers normally means keeping to the Eastern states, where the risks of costly hurricanes are higher. The larger groups are also better able to control the quality of their business than a smaller office, which is more likely to run into a "take it or leave it" attitude from an agent to whom it is suggested, for instance, that the weight of motor insurance on his book is excessive.

If, as seems likely, underwriting results in the United States go on improving, the desire of British insurance companies to merge and to lose some of their individuality may become less pressing. But this is a business where the advantages of size are there for all to see in the operations of the biggest of the offices. Concentration in the face of competition may seem as acceptable a solution here as it seems to be for a good number of British industrial companies.

Investing a Million Pounds a Day

ASSETS of British insurance companies have for some years been increasing by about a million pounds a day. For that reason alone, insurance companies, like pension funds, must always be active investors. At the same time, because of the sheer weight of their money in the investment market, they can never be volatile investors; if they switched portfolios in the same way as an individual investor they would wreak havoc with the market—their market. Decisions to change direction in investment policy have to be implemented over a period of years: what the insurance funds are doing at any one time reflects past decisions as well as present predilections.

This simple background must constantly be kept in mind in considering the course of insurance portfolios in recent years, and particularly in the latest period. Insurance funds, as everyone knows, are going out of gilt-edged and into equities. To an important extent, that movement is still part of adjustment to the violent distortion of insurance portfolios that took place during the war. Between 1937 and 1947, holdings of gilt-edged jumped from £490 million to £1,110 million—or from 29 per cent to 43 per cent of the insurance companies' invested assets. That was clearly an excessive proportion; it would have been excessive if there had been no inflation and no new preference for stakes in real assets rather than securities with a fixed money return.

But the insurance companies could not simply unload their excess gilt-edged. In practice they have made few substantial sales. The balance of their portfolios has been adjusted over the years by deployment of new money, the bulk of it going into equities. Still the disclosed share of equities in invested assets at end-1958 was no more than 18.5 per cent, compared with around 10 per cent in 1937 and 1947; mortgages were up to 13.6 per cent and real property to 8.9 per cent. Gilt-edged still took up over 26 per cent—only a little below the proportion in 1937. During 1958, a number of insurance offices returned as net buyers of gilt-edged, and while the share of gilt-edged in invested assets continued to fall, the absolute total rose. Debentures, too, became very attractive at yields of 6 per cent and upwards. These high coupons, and the

industrial recession, together succeeded for a short time in countering the pull of equities. But few insurance investment managers had any serious second thoughts about their commitment to equities.

The insurance companies have naturally gained much benefit from the appreciation of their stock exchange securities since the beginning of 1958. This has strongly reinforced their depleted inner reserves. Last year's rise in fixed-interest stocks was very welcome, but it did not go far towards repairing the ravages of a decade of falling values. It has been the boom in equities that has put some offices into a very comfortable position and enabled almost all of them to report a margin in hand at the end of 1958. Moreover, interest income lost none of its buoyancy in a period during which some prophets of doom had predicted reduced dividends

on industrial equities. And the opportunity arose to acquire leading blue chips at lower prices. The insurance companies' appetite for equities, causing them to step in as buyers after relatively modest falls in prices, was a major influence underpinning equity markets and then contributing to their notable rise.

Prices of leading blue chips as measured by *The Economist* indicator rose by 40 per cent during 1958. The Actuaries' Investment Index, which covers a wider range of stocks, shows a rise of one third; its index of fixed interest stocks rose by around 7 per cent. An insurance company with the asset distribution shown in Table I would have made a capital profit of 9 per cent of the market value of its assets at the beginning of the year, even on the more conservative basis of the Actuaries' index. Most insurance balance sheets materially understate the current value of the equity assets. The life offices (including the life and annuity departments of the composite insurance companies) thus understate the proportion of ordinary shares in their portfolios, shown in Table IV at an average of 19.1 per cent of total assets. Last year's appreciation for them must therefore have been well over 9 per cent. Non-life assets likewise include equities at written-down prices. There are also substantial overseas holdings, mainly dollar stocks. These general fund investments did not suffer such severe depreciation in 1957 as life and annuity assets; they too must have had a comfortable margin in hand at the end of last year.

Some important adjustments were made to balance sheet valuations in 1958 (see Table V). Insurance companies, like the banks, are allowed to maintain hidden reserves, and these are allocated amongst the different classes of assets as the directors think fit. The directors' only obligation is to certify that the "assets are in the aggregate fully of the value stated" in the balance sheet and explain how stock exchange securities are valued. Within this requirement, some groups of assets may be overvalued provided that other groups are undervalued by at least the same amount. Nearly all the insurance companies write their assets down (mainly out of profits on sales, but sometimes out of transfers from revenue account) but they seldom, if ever, write them up. In recent years some life offices have, however, departed from this traditional practice to a limited extent. Last year's adjustments by the Prudential are reflected in Table V and they must be allowed for in deducing the disposition of new investment funds during the year.

INSURANCE assets provide for two different types of liability. Life and annuity contracts together with capital redemption policies are long term business, the bulk of which will not mature for payment for many years to come. Fire, accident, marine and aviation insurance, on the other hand, is short term business, as most policies are annual contracts. The guiding principle of insurance investment policy is common on both sides of the business: assets should match liabilities in amount and term. Outgoings under life policies and annuities can be predicted with sufficient accuracy to make matching of assets and liabilities almost entirely a technical problem. Matching does not preclude investment either in assets with no fixed redemption (including ordinary shares and real estate) or in very short dated assets such as mortgages, in proportions appropriate to the policies on the books. The main difficulty in building up a matched portfolio may be to find the requisite dated stocks, and optional redemption dates make perfect matching impossible in practice. Non-life business, by contrast, from time to time involves insurers in unusually large claims which they pay on the nail. Although the total results of each year's trading can be forecast within fairly close limits, as is evident from Tables VIII and XI, liquid assets have to be much larger than those that suffice in life and annuity business. The biggest contrast in the asset holdings of the two types of fund is the much smaller share of mortgages and property in non-life funds; their holdings of gilt-edged are rather smaller and are concentrated into shorter dated stocks.

Only about one-fifth of the total resources of the British insurance companies relate to non-life contracts. Moreover, fully two-thirds of the total premium income from fire, accident, marine and aviation insurance is received for overseas business, the

Pension Funds

A new survey made by the Radcliffe committee shows that pension funds hold a higher share of their assets in both gilt-edged and equities than the insurance companies. Mortgages and real property are notably lower.

reserves held against this liability being in the main invested in the appropriate country. In particular, the important dollar business of the British insurance companies is more than covered by dollar assets and free reserves. Investment on the London Stock Exchange is therefore mainly by the life funds. But sterling investment of non-life funds is not negligible. Out of total assets of £5,151 million included in Table I, £906 million were in respect of fire, accident, marine and aviation insurance, and possibly £350 million of these were in London securities.

How much further will the insurance companies go into equities? Each company has its own answer. At the end of 1958 the proportion of the total assets of life offices and of the life departments of the composite insurance companies included in Table IV invested in ordinary shares ranged (at book values) from 37.6 per cent at the Scottish Widows to 7.5 per cent at the Wesleyan and General, and that for non-life assets from 26.4 per cent at the Eagle Star to 5.5 per cent at the Atlas (Table III). At market values, the proportions would be higher. Significantly, Scottish Widows showed only a marginal increase in its equity holding in 1958, the share having fallen from 41.4 per cent a year before. Other offices at the top end of the range also seemed to be going slow in equities last year.

There is no hard and fast rule that sets limits of prudence in insurance investment policy. For the life offices, the statutory balance sheet certificate is less restrictive than it appears to be. Depreciation of fixed interest stocks can be offset, with perfect propriety, by reserves released by raising the rate of interest underlying the actuarial computation of the liabilities. Future premiums on existing policies will be invested more profitably after a fall (and less profitably after a rise) in the price of fixed interest stocks, so that the actuarial reserves, which are the liabilities discounted at compound interest after allowing for mortality, can be reduced (or after a rise in gilt-edged prices may need to be increased); to this extent there is built-in security in investing life funds in fixed interest securities. No such reduction of liabilities, however, can be made to cover a fall in the price of equities, except to the extent that it reflects a rise in the long-term rate of interest. Insurance boards must, therefore, always have in mind the size of the investment reserves when determining their stake in equities.

Yields on life and annuity funds rose last year to the highest level since 1932, although the pace of increase was less than in 1957. It will be more difficult this year to maintain total yields, which are conventionally based on the life and annuity funds (not on the assets) and thus allow for changes in prices only to the extent that assets are written up or down through the revenue account. Running yields on fixed interest stocks have fallen from their peak of over 6 per cent but are still around 5½ per cent. The current return on equities with sufficient growth potential to interest the life offices is much lower than that—though the actual return, calculated on the prices at which the insurance companies bought these stocks, may easily be higher. The chairman of the National Provident has pointed out that "for several years the average return which we have been able to obtain on new investments has been less than the high rate of interest earned on the existing fund . . . up to 1957 the overall yield continued to rise due to increasing income from existing investments, particularly the ordinary shares portfolio (but it) could not be expected to rise indefinitely." But surely this conjuncture is a natural one given the market's faith in growth stocks.

High yields on their assets are the mainspring of the bumper bonuses on participating life policies that have been declared by some offices, and the historically high rates which have been paid by all of them. The specialist ordinary life offices (the first two groups in Tables II and IV) earned nearly 6 per cent gross and 5 per cent net last year on their total assets.

Earnings on the non-life assets of the offices included in Table VI rose last year by £1,900,000, or 9½ per cent, compared with a rise of £1½ million in 1957. But the rapid growth of interest income from non-life assets owes more to the build-up of funds from the rising tide of premium income than to high interest rates and increased dividends on ordinary shares. In the last two years the fire, accident and marine and aviation premium income of the nineteen leading offices included in Table VI rose by £80 million, or 13¾ per cent, and their non-life reserves increased by £47 million to £619 million. Provided that losses from underwriting can be avoided, it should be possible to step up many insurance dividends again this year.

Private Pensions and the State

THE prospect of graduated pensions from the State over and above the flat National Insurance pension is now approaching reality; the government's scheme is on the statute book in the shape of the National Insurance Act. Actuaries and other pension consultants are brought to grips with the problems that have been in prospect since publication of the Labour party's scheme in 1957. These problems are made no easier by the fact that the new scheme is also designed to prevent the National Insurance Fund from running into the red and that far from being subsidised by the State, the graduated pensions are to provide a subsidy to the basic National Insurance benefits. It is not surprising therefore that the benefits in relation to contributions under the State scheme will be difficult to fit in with conventional pensions planning, whether or not the employer decides to contract out.

The date for the introduction of the new arrangements is to be fixed by ministerial order, but the white paper has indicated that it cannot be before April, 1961. The delay will be welcomed by the life offices, whose documentation departments in many cases are still weighed down with replacing company pensions schemes approved under Section 388 of the Income Tax Act 1952, under which the insurance company is a party to the contract, with schemes approved under Section 379, under which the insurance policy is simply an asset of the fund, and for which the 1956 Finance Act gives more favourable tax treatment.

The basic arithmetic of the State scheme, outlined in *The Economist* of October 18, 1958, and January 17, 1959, is that each contribution by an employed person and his employer amounting to £15 for men or £18 for women will provide a pension of 1s. a week at pension age, whether the contribution is paid at age 25 or 60. This provision, although contrary to normal pensions practice, provides a valuable incentive for the employment of older workers; one reason why employers hitherto have been reluctant to take on older people is that they would have to make higher contributions to their pension scheme. At the same time, because of the element of subsidy in the State scheme to the basic National Insurance Fund, the actual benefit could be provided more cheaply under a private scheme for male employees of ages below about 55.

The graduated scheme operates only for employees earning between £9 and £15 a week. These are narrow limits, which cover a minority of all employees. This band of the earnings scale

is now to be treated differently from those either above or below. Another aspect of this limited earnings belt is the lengthy time taken to build up additional pension credits. For an employee earning £10 a week, both employee and employer contribute an additional 10d. a week or 1s. 8d. in all, so that it will take three and a half years to earn an additional 1s. a week pension for male workers and longer for women. Even at the other end of the scale, an employee earning £15 a week throughout his working life will secure an addition of only 41s. a week. A pension for a male member carries with it a half-rate pension for his widow.

The key question for employers is whether they should join the Government scheme on behalf of their workers or whether they should contract out (individuals have to follow the course chosen by employers for all their workers in a given category). In principle, the Government scheme is sympathetic to the extension of private schemes, and provisions for contracting out are much more liberal than under the Labour scheme. Yet, in practice, the dice still seem to be loaded against it. There are three necessary conditions for contracting out. Weekly contributions to basic National Insurance giving the minimum pension (of £2 10s. for a single person and £4 a week for a man and his wife) will for contracted out employees be 18s. 2d. (8s. 3d. from the employer and 9s. 11d. from the employee); for employees earning £11 a week or less this will be more than they would pay for the basic pension plus the additional graduated benefits. The basic contribution for employees earning less than £9 will be only 15s. 4d. (8s. 4d. from the employee and 7s. from the employer). Those who contract out and do not contribute to the Exchequer subsidy to the lower paid participants through their graduated contributions must therefore pay a higher basic rate. Secondly, benefits under the private scheme have to be equivalent to the maximum benefits that the employees would get under the graduated State scheme. Thirdly, adequate reserves have to be held for each member who has contracted out and the prescribed benefits must be transferable to another private scheme or the State scheme on a change of employment.

What then is the balance of argument for being in or out? It is clear that graduated pensions are here to stay, and that henceforward they are going to form a feature of the National Insurance Scheme. And it seems almost a corollary that benefits are unlikely to remain indefinitely at their present levels; inflation and competitive bidding by politicians between them are likely to be an insuperable pressure against the principle of fixed benefits and contributions. It is this that makes contracting out such an uncertain proposition. On considerations of foreseeable immediate costs some employers would certainly be able to save by contracting out; but if the State benefits are subsequently raised, they might find that they had incurred a substantial additional liability in practice, though not legally, to increase pensions up to the new State levels.

SINCE it will take a long time on the present basis for pensions to build up from the graduated contributions, the need for existing schemes will remain; but for many firms their purpose and character will change. Employees earning less than £11 a week will certainly have to pay bigger contributions than in the State scheme —though their benefits will also be higher. Many may be best served by a private scheme supplementary to the State scheme. Some employers may think in terms of graduated benefits from the State supplemented by a flat benefit from the private scheme, reversing the traditional relationship (though many works funds are already on a flat benefit basis).

It may be necessary to make new arrangements for funding in respect of the contracted out portion, whether the fund is assured or privately administered. The common single premium balance table calls for no contributions from the employer until an employee is well in to the thirties, and many other methods of funding will present similar difficulties for private schemes, which will now have to build up the stipulated reserve to meet transfer values. In many cases, presumably, special provision will have to be made for this reserve. For higher paid employees, the amount of pension derived from the graduated contributions is likely to be small in relation to the total benefits they can obtain from private schemes, and there will usually be sufficient margin in their pensions to offset the hazards of contracting out.

Much of the detailed application of the scheme is to be laid down by departmental regulations, and until all these are published and the Inland Revenue has indicated its attitude on a number of matters, some important elements in the choice remain unclear. As a result, employers have been deferring final decision until nearer the time that the scheme comes into force, and in particular until after the election. But the life offices are anxious that decisions should not be put off until the last minute.

House Purchase through Life Assurance

LAST year thirty insurance companies lent £60 million for house purchase through their endowment assurance schemes. That compares with £375 million lent by building societies, including a portion that will be ultimately repaid on the maturity of an endowment assurance policy. Total loans on house purchase made by members of the British Insurance Association, it is stated in the Radcliffe report, reached £410 million at the end of 1957. Most of the insurance offices last year, like the building societies, were strictly rationing their advances, though a dozen or so of them continued to lend relatively freely. Only one-third of the life offices in this country run their own house purchase schemes, but these offices make up a majority by size, the other offices remain content to issue endowment assurance policies that are accepted by a building society as a means of repaying a loan.

Before the war only a handful of life offices ran house purchase schemes. The Daltonian era of ultra-cheap money brought a number of offices into the business, attracted by the relatively high yields on mortgage advances. In 1948 insurance offices lent about £30 million in this way, usually at not more than 4 per cent. Since then, like the building societies, these departments have expanded, though dearer money put a brake on their growth. The rise in the long term rate of interest made house purchase loans and mortgages less attractive in relation to yields on stock exchange securities, so that by the beginning of 1958 the 6 per cent rate of interest set by building societies had fallen below the yield offered by good class fixed interest stocks.

But it is more than considerations of yield that keeps offices active in this sphere. Besides providing a relatively high and a relatively stable yield on a well-secured asset, these schemes are a fruitful source of new life assurance business. The premium that the policyholder pays on his endowment assurance can be of as much interest to the life office as the rate of interest he pays on the loan. That is perhaps why some of the offices have been slightly less restrictive than the building societies in their lending policies and why they can afford to give rather more weight to the personal standing of the borrower, as opposed to the survey value of the

MAXIMUM PROTECTION...

for a man's family in the form of capital and income.

MINIMUM COST...

by combining two different contracts in one composite policy. For as little as £28 13s. 2d. per annum, a man at age 30 can secure for his dependants a capital sum of £1,000 and, in addition, a maximum income benefit at the outset to the value of £9,000, payable in annual instalments of £300. Full particulars of this Family Protection Scheme and other examples of outstanding value in life assurance will be sent on request.

house, than can a building society. Last year, certainly, those offices that charge a fixed rate over the whole term of the loan were glad to accept at a high rate of interest propositions that the building societies for lack of funds had to turn down. That helps to explain why mortgages, of which house purchase loans represent the lion's share, were second only to equities as the depository for the record amount of new money which flowed into the insurance companies' coffers last year.

There are important tax advantages in repaying a loan by means of an endowment assurance policy; but these are obtainable by linking it with a loan from a building society. In what ways then do the insurance offices compete? They make good use of their contacts with the public: last year, for example, two-thirds of the advances were made by industrial-cum-ordinary offices which are in very close touch with a large number of owner-occupiers and potential house purchasers. Again, to a borrower paying the standard rate of income tax, the life offices can offer relatively attractive terms, especially where the loan is of a good size.

Sixteen out of the thirty offices quote a fixed rate of interest, the remainder having the power, like the building societies, to vary the rate. To some borrowers a fixed rate can be attractive, and certainly those who secured loans at 4 per cent have no reason to regret their bargain. Where the offices have power to vary the rate, the increases made in recent years have not been steep: rates on most of the outstanding loans did not go above 5 per cent (with only one office going up to 6 per cent). The house purchaser is obviously best advised to borrow at a fixed rate from a life office when money is historically cheap and from a building society at a fluctuating rate when he thinks it is dear.

LOANS amortised by endowment assurance policies, whether the loan is made by a life office itself or by a building society, require bigger monthly payments than a straightforward advance from a building society. In the long run, however, they will be as cheap as that advance if the endowment assurance policy does not participate in profits; that policy will in effect give life cover throughout the period at no ultimate cost to the policyholder. But where the policy is with profits, the endowment assurance scheme is relatively less expensive than a building society loan so long as bonuses are not sharply reduced and so long as the borrower is liable for income tax at the standard rate on a sufficient portion of his income to secure the full benefit of tax relief on the premiums on the policy and on the interest on the loan. That point is illustrated in the accompanying arithmetic example, where the calculations have deliberately been based on representative rates of

THE LIFE OFFICES' TERMS

A survey of house purchase loans through endowment assurance policies made by 30 insurance offices reveals quite a wide range of practice, but broadly the following are the terms on which the offices are willing to lend:

Eligible property: Owner-occupied houses, limited by some offices to those built since 1919.

Income requirements: Service of the loan should not normally exceed a quarter of the borrower's income.

Amount lent: Within the limit of £3,000–£5,000, the maximum advance is normally limited to 80 per cent of the surveyor's valuation, the range being 70 to 85 per cent.

Rate of interest: Today usually 5½ per cent, the range being between 5½ and 6½ per cent. The majority of offices fix the rate of interest for the duration of the loan.

Repayment: The endowment assurance policy by which the loan is repaid usually has to mature before the borrower reaches the age of 65, subject normally to a maximum term of 30 years. A few offices insist on a with-profits policy, but most offer a choice.

Fringe benefits: A few offices pay part or the whole of the survey and legal fees and stamp duty. Some offices operate a deferred house purchase scheme which gives holders of eligible policies the right to a loan on acceptable property, with the surrender value of the policy being taken into account in fixing the size of the loan.

premium and on a conservative rate of reversionary bonus. The lower ultimate cost, is the chief attraction of repayment through endowment assurance to the man with a sufficiently high income.

Often too, an insurance company, whose aim is to match an income-yielding asset against its maturing liabilities, is willing to let the loan run for a greater number of years than a building society, which has to match its advances against the rate of repayments and the flow of new money. Thus building societies that are prepared to accept repayment through the agency of an endowment assurance will usually limit the term of the loan to 20 years. Nearly all the policies of the insurance companies run for 25 years and several run up to 30 years, provided that the policy matures before the borrower is 65 (or, in a few instances, 70). As the premium charged is tied to the age of the borrower, that makes the life office schemes particularly attractive to the young man. He also has the opportunity to join the deferred purchase schemes run by a few life offices. In these schemes he pays his premiums on an endowment assurance until he wants to buy a house and then he can take out a loan at the current rate of interest, with the surrender value of his policy being brought into account in fixing the size of the loan.

The area, however, in which the insurance companies can compete and are willing to compete with the building societies has definite boundaries. Repayments, which each year amount to about a third of the new sums advanced, give the life offices some flexibility, but as many borrowers simply repay one loan and immediately take out another on a different house, the mortgage advances of a life office are virtually all long term assets. Where the rate charged on these loans can be varied, the return to the insurance company cannot for long be far out of step with the market; and, recently, the insurance companies have reduced their rates in line with the building societies.

For the borrower, such a loan is much on a par with a building society advance, and if his income is low, it offers him no real advantage. Where the rate is fixed, the borrower gains only if market rates move above the rate he is charged and only so long as he stays in the same house; if he moves to another one, he has to pay the new going rate. The insurance company that charges a fixed rate has, at the same time, sacrificed some of its freedom to switch into higher-yielding assets if market rates move up and, if they move down, it is faced with the possibility that some borrowers will exercise their option to repay the loan with money borrowed at a cheaper rate elsewhere. In all, therefore, the life offices' house purchase schemes are a useful supplement to building society advances—and that is all most of the life offices wish them to be.

Trends in Mortality

BY AN ACTUARIAL CORRESPONDENT

THE premium on an endowment assurance is governed by two elements: the expected rate of mortality, which expresses the statistical chance of dying at any given age, and the rate of interest that the insurance company expects to realise over the life of the policy. With a short term life policy in which there is no payment on maturity the rate of mortality is paramount in the premium calculation. As the term of the policy grows longer the rate of interest becomes more important, especially when the sum assured is payable on maturity whether the individual survives or not. But in any premium calculations on life or endowment assurance policies the rate of mortality is never so unimportant that it can be disregarded. And during this century it has been possible to adjust premium rates to a marked decline in mortality rates among all sections of the population, whether assured or not.

A new standard table of mortality, the A 1949-52, has recently been prepared by the Institute and Faculty of Actuaries. It is based upon the mortality experience of lives assured under life and endowment policies during the years 1949-52. On the assumption of a rate of interest of 3 per cent and rates of mortality as shown in this table, the theoretical annual premium for a 30 year endowment assurance for a life aged thirty at the time the policy is effected includes a charge of 7s. 6d. per cent for death cover; that charge would be even less if a rate of interest of more than 3 per cent were assumed. The charge compares with one of 11s. 3d. per cent if mortality is assumed to be at the level of the previous standard table, the A 1924-29, and 21s. 7d. per cent on the earlier table, the O[M] table that was based on the mortality experience of assured lives during the years 1863-93.

Mortality among assured lives depends not only on age but on the number of years that have elapsed since the policy first came into force. To put it at its simplest: a man aged 30 assured by an insurance company for the first time at that age is a good risk, as otherwise the company would not have issued a policy to him at the normal rate of premium. On the other hand a man to whom the company first issued a policy when he was 25 may or may not be still a good risk by the time he has reached the age of 30; his health and circumstances may have changed. Because the insurance companies have this power of "selection"—the power to reject or to accept a new proposal for assurance—the mortality statistics among assured lives show that the chance of dying in the next few years for those who have just taken out policies is less than that among policyholders who have reached the same age but who effected policies when they were younger. The effects of "selection" wear off gradually over the years, and it is a justifiable statistical simplification to assume, as the standard mortality tables assume, that the effects of selection have worn off completely after a definite number of years have passed. These assumptions have to be made in calculating the "ultimate" rates of mortality, that is those rates where mortality is assumed to vary with age only. In the latest standard table the effects of selection are assumed to have worn off after two years of the date of effecting the policy: in its predecessor after three years; and in the O[M] table after five years. As therefore these tables are based upon different "select periods," a fully accurate comparison between them cannot be made. Nevertheless, a comparison between these tables does show that the trend has been for the mortality rates to fall to a greater degree than can be attributed solely to differing select periods.

The following figures show rates of mortality according to these different tables after the effects of selection have worn off at the ages 30, 50 and 70. In addition, figures for the actual mortality experience of assured lives between 1953-56 are also shown, but these are crude rates based on relatively small data:

Age	Ultimate rates of mortality			
	O[M]	A 1924-29	A 1949-52	Actual Experience 1953-56
30	·00747	·00241	·00116	·00089
50	·01545	·00764	·00599	·00506
70	·06219	·05327	·04543	·04006

In this table, an attempt has been made to show the rates when mortality is assumed to vary with age only. The next table shows the corresponding rates in the first year of assurance. The decline, as shown in comparing the three standard tables, in the

rate of mortality in the first year of assurance may, of course, reflect changing standards of selection by the insurance companies in accepting or rejecting proposers after judging the state of their health.

Age	Rates of mortality in first year of assurance			
	O [M]^{5}	A 1924–29	A 1949–52	Actual Experience 1953–56
30	·00312	·00162	·00068	·00063
50	·00746	·00455	·00305	·00240
70	·03322	·02847	·02022	·01639

Present indications are that the 1957 figures for mortality in the first year of assurance show a slight improvement over each of the four preceding years taken separately as well as over those four years taken as a whole (as set out in the above table).

THESE two tables demonstrate that for both ultimate and first year rates, the proportionate reductions in mortality have been more marked at the age of 30 than at the age of 50 and more marked at 50 than at 70. A general indication of all these trends is given in the next table, which expresses the rate of mortality in the different groups at about the middle of this century as a percentage of the rates applicable in the middle of the 1920s:

Age:	30	50	70
All assured lives (ultimate rates)* ...	48%	78%	85%
All assured lives (first year rates)* ..	42%	67%	71%
Male population†	41%	74%	94%
Male annuitants (ultimate rates)	...	...	85%
Male annuitants (first year rates)	...	...	81%

* Under whole life and endowment assurances. † The rates of mortality for the 1920's are taken as midway between English Life Tables 9 and 10.

This comparison shows that in the last quarter of the century the improvement in mortality among men over the population as a whole has been better at the age of 30 than among assured lives, once the effects of selection have worn off; at the age of 50 it has been similar, and it has been worse at the age of 70. This is not a result of the change in the length of the select period, nor of the choice of the three specific ages. If, for instance, the data for assured lives were adjusted to exclude the same number of years since effecting a policy it would still be found that the population statistics showed a better improvement in mortality compared with assured lives at all ages below 50 and a smaller one at all ages over 60. There is at the moment no certain explanation why this has happened.

Underwriting—the Turn?

THE best that can be said about accident insurance in 1958 is that less money was lost than in either of the two previous years. But the 1958 results of the fire and accident business of the twenty-three leading insurance companies included in tables VII and VIII are sufficiently encouraging to suggest that the tide has at last turned. An underwriting profit of 3 per cent before charging overhead expenses in the fire department is meagre enough but it does represent a marked improvement on the marginal balance in hand in 1957. The fire and accident departments together achieved an underwriting profit of £5 million last year, compared with an underwriting loss of £1 million in 1957. But after meeting overhead expenses and tax, they were still running at a loss in all but a few companies. Table VI shows that the total net trading loss was £5.3 million.

Underwriting losses on fire and accident business in North America and unprofitable motor insurance all over the world have been the prime causes of the trials that have beset insurers since 1955. If underwriting in the United States had done no more than break even, an overall profit on underwriting after charging overhead expenses and tax would have been achieved. But in assessing the contribution that insurance makes to Britain's dollar earnings, investment income has to be taken into account and allowance has to be made for the excess reserves for the unexpired term of policies that have to be made by American law.

The sharpest thorn in the flesh of the insurance companies is motor insurance. In 1958 the members of the British Insurance Association (which comprises virtually all British insurers except Lloyd's underwriters) incurred underwriting losses of nearly £10 million on their motor account, from a premium income of £260 million. Underwriters on Lloyd's in the 1956 account made a profit on motor insurance from their premium income of £8.7 million and they may manage to do so again in the 1957 account. It was the big claims on marine, fire and accident insurance that cut into profits at Lloyd's in the 1955 and 1956 accounts and look likely to do so again in the 1957 account.

This was the fourth consecutive year in which motor departments ran into the red. The problem is the same all over the world: premium rates have lagged behind rising claims. In America rates in some States have recently been raised and other increases are pending. At home, Mr Charles F. Trustam, the retiring chairman of the British Insurance Association, has said that if the present trends in costs of motor claims continue "some increase in premium rates will be inevitable—sooner or later."

There is a good chance that non-life underwriting results will show a further improvement this year. The decisive factor will be the important business in North America, and in particular in the United States, where the improvement that first became apparent in 1958 seems to be continuing. Non-life insurance is a cyclical business and last year could have been the beginning of the end of a troublesome period.

WILL YOU GET A PENSION?

People not in pensionable employment are now able to provide themselves with a pension on very favourable terms.

In view of the widely differing circumstances of the individuals concerned, we have designed two separate forms of contract, of which one or the other can be adapted to suit most requirements.

Write for our booklet "Your Pension—Which Way?" for full details of these two plans.

Young and Healthy?

Then medical examinations don't bother you and Life Assurance is yours more or less for the asking. But you can't afford big premiums yet and if you wait until you can, your health may not be quite what it is today. That is why you should know about the Progressive Benefits policy now. It gives you the usual sort of Whole Life or Endowment policy with the important difference that you can add as many as five more policies *over the next fifteen years*, whatever your state of health may be. As far as the Progressive Benefits policy is concerned you are *always* in the pink of good health. Write for full details to:
